CDO User's Guide

Climate Data Operators
Version 1.1.0
January 2008

Uwe Schulzweida, Luis Kornblueh – *MPI for Meteorology*

Ralf Quast – *Brockmann Consult*

Contents

1. Introduction

The Climate Data Operators (**CDO**) software is a collection of many operators for standard processing of climate and forecast model output. The operators include simple statistical and arithmetic functions, data selection and subsampling tools, and spatial interpolation. **CDO** was developed to have the same set of processing functions for GRIB and netCDF datasets in one package.

The Climate Data Interface (CDI) is used for the fast and file format independent access to GRIB and netCDF datasets. The local data formats SERVICE, EXTRA and IEG are also supported.

There are some limitations for GRIB and netCDF datasets. A GRIB dataset must be consistent, similar to netCDF. That means all time steps must have the same variables, and within a time step each variable may occur only once. NetCDF datasets are supported only with 2-dimensional, 3-dimensional and 4-dimensional variables and the attributes should follow the GDT, COARDS or CF Conventions.

The user interface and some operators are similar to the PINGO package. There are also some operators with the same name as in PINGO but with a different meaning. Appendix A gives an overview of those operators.

The main **CDO** features are:

- More than 300 operators available
- Modular design and easily extendable with new operators
- Very simple UNIX command line interface
- A dataset can be processed by several operators, without storing the interim results in files
- Most operators handle datasets with missing values
- Fast processing of large datasets
- Support of many different grid types
- Tested on many UNIX/Linux systems, Cygwin, and MacOS-X

1.1. Building from sources

This section describes how to build **CDO** from the sources on a UNIX system. **CDO** uses the GNU configure and build system to compile the source code. The only requirement is a working ANSI C compiler.

First go to the `download` page (`http://www.mpimet.mpg.de/cdo`) to get the latest distribution, if you do not already have it.

To take full advantage of **CDO** features the following additional library should be installed.

- Unidata netCDF library (`http://www.unidata.ucar.edu/packages/netcdf/index.html`) version 3 or higher. This is needed to read/write netCDF files with **CDO**.

1.1.1. Compilation

Compilation is now done by performing the following steps:

1. Unpack the archive, if you haven't already done that:

```
gunzip cdo-$VERSION.tar.gz    # uncompress the archive
tar xf cdo-$VERSION.tar       # unpack it
cd cdo-$VERSION
```

2. Run the configure script:

```
./configure
```

   Or with netCDF support:

```
./configure --with-netcdf=<netCDF root directory>
```

   For an overview of other configuration options use

```
./configure --help
```

3. Compile the program by running make:

```
make
```

The program should compile without problems and the binary (`cdo`) should be available in the `src` directory of the distribution.

1.1.2. Installation

After the compilation of the source code do a `make install`, possibly as root if the destination permissions require that.

```
make install
```

The binary is installed into the directory <`prefix`>`/bin`. <`prefix`> defaults to `/usr/local` but can be changed with the `--prefix` option of the configure script.

Alternatively, you can also copy the binary from the `src` directory manually to some `bin` directory in your search path.

1.2. Usage

This section descibes how to use **CDO**. The syntax is:

```
cdo  [Options]  [Operators]
```

1.2.1. Options

All options must be pleaced before the first operator. The following options are available for all operators:

-a Convert from a relative to an absolute time axis.

-b <nbits> Set the number of bits for the output precision. The valid precisions depends on the file format:

<format>	*<nbits>*
`grb`	`1 - 32`
`nc, nc2, srv, ext, ieg`	`32/64`

For `srv`, `ext` and `ieg` format a `L` or `B` can be added to set the byteorder to Little or Big endian.

-f <format> Set the output file format. The valid file formats are:

File format	*<format>*
GRIB version 1	`grb`
netCDF	`nc`
netCDF version 2	`nc2`
SERVICE	`srv`
EXTRA	`ext`
IEG	`ieg`

-g <grid> Define the default grid description by name or from file.
Available grid names are: `t`<RES>`grid`, `r`<NX>`x`<NY>, `gme`<NI>

-h Help information for the operators.

-m <missval> Set the default missing value (default: `-9e+33`).

-R Convert GRIB data from reduced to regular grid.

-r Convert from an absolute to a relative time axis.

-s Silent mode.

-t <partab> Set the default parameter table name or file.
Predefined tables are: `echam4 echam5 mpiom1`

-V Print the version number.

-v Print extra details for some operators.

-z szip Compress GRIB records with szip.

1.2.2. Operators

There are more than 350 operators available. A detailed description of all operators can be found in the **Reference Manual** section.

1.2.3. Combining operators

All operators with a fixed number of input streams and one output stream can pipe the result directly to an other operator. The operator must begin with "-", in order to combine it with others. This can improve the performance by:

- reducing unnecessary disk I/O
- parallel processing

Use

```
cdo sub -dayavg ifile2 -timavg ifile1 ofile
```

instead of

```
cdo timavg ifile1 tmp1
cdo dayavg ifile2 tmp2
cdo sub tmp2 tmp1 ofile
rm tmp1 tmp2
```

1.2.4. Operator parameter

Some operators need one or more parameter.

- STRING

  Unquoted characters without blanks and tabs. The following command select variables with the names `pressure` and `tsurf`:

  ```
  cdo selvar,pressure,tsurf ifile ofile
  ```

- FLOAT

  Floating point number in any representation. The following command sets the range between `0` and `273.15` of all fields to missing value:

  ```
  cdo setrtomiss,0,273.15 ifile ofile
  ```

- INTEGER

  A list of integers can be specified by *first/last[/inc]*. To select the days 5, 6, 7, 8 and 9 use:

  ```
  cdo selday,5/9 ifile ofile
  ```

  This is the same as:

  ```
  cdo selday,5,6,7,8,9 ifile ofile
  ```

1.3. Grid description

In the following situations it is necessary to give a description of a horizontal grid:

- Changing the grid description (operator: setgrid)
- Horizontal interpolation (operator: interpolate, remapXXX and genXXX)
- Generating variables (operator: const, random)

As now described, there are several possibilities to define a horizontal grid. Predefined grids are available for global regular, gaussian or icosahedral-hexagonal GME grids.

1.3.1. Predefined grids

The following pre-defined grid names are available: `r<NX>x<NY>`, `t<RES>grid` and `gme<NI>`

Global regular grid: `r<NX>x<NY>`

`r<NX>x<NY>` defines a global regular grid. The number of the longitudes `<NX>` and the latitudes `<NY>` can be selected at will. The longitudes starts at 0° with an increment of (360/`<NX>`)°. The latitudes go from south to north with an increment of (180/`<NY>`)°.

Global gaussian grid: `t<RES>grid`

`t<RES>grid` defines a global gaussian grid. Each valid triangular resolution can be used for `<RES>`. The longitudes starts at 0° with an increment of (360/nlon)°. The gaussian latitudes go from north to south.

Global icosahedral-hexagonal GME grid: `gme<NI>`

`gme<NI>` defines a global icosahedral-hexagonal GME grid. `NI` is the number of intervals on a main triangle side.

1.3.2. Grids from data files

You can use the grid description from an other datafile. The format of the datafile and the grid of the data field must be supported by this program. Use the operator 'sinfo' to get short informations about your variables and the grids. If there are more then one grid in the datafile the grid description of the first variable will be used.

1.3.3. SCRIP grids

SCRIP is a Spherical Coordinate Remapping and Interpolation Package. It is using a common grid description in netCDF. You can use it to describe curvilinear grids or unstructured grid cells. For more information about this format see [SCRIP]. This grid description format is only available if the program was compiled with netCDF support.

SCRIP grid description example of a curvilinear MPIOM1 GROB3 grid (only the netCDF header):

```
netcdf grob3s {
dimensions:
        grid_size = 12120 ;
        grid_xsize = 120 ;
        grid_ysize = 101 ;
        grid_corners = 4 ;
        grid_rank = 2 ;
variables:
        int grid_dims(grid_rank) ;
        float grid_center_lat(grid_ysize, grid_xsize) ;
                grid_center_lat:units = "degrees" ;
                grid_center_lat:bounds = "grid_corner_lat" ;
        float grid_center_lon(grid_ysize, grid_xsize) ;
                grid_center_lon:units = "degrees" ;
                grid_center_lon:bounds = "grid_corner_lon" ;
        int grid_imask(grid_ysize, grid_xsize) ;
                grid_imask:units = "unitless" ;
                grid_imask:coordinates = "grid_center_lon grid_center_lat" ;
        float grid_corner_lat(grid_ysize, grid_xsize, grid_corners) ;
                grid_corner_lat:units = "degrees" ;
        float grid_corner_lon(grid_ysize, grid_xsize, grid_corners) ;
                grid_corner_lon:units = "degrees" ;

// global attributes:
                :title = "grob3s" ;
}
```

1.3.4. PINGO grids

PINGO uses a very simple grid description in ASCII format to describe regular longitude/latitude or global gaussian grids. All PINGO grid description files are supported by **CDO**. For more information about this format see [PINGO].

PINGO grid description example of a T21 gaussian grid:

```
Grid Description File
(Comments start at non digit characters and end at end of line)
First part: The dimensions.
64 32 = Number of longitudes and latitudes
Second part: The listed longitudes.
2 means equidistant longitudes
0.000000 5.625000 = Most western and second most western longitude
Third part: The listed latitudes.
32 means all 32 latitudes are given in the following list:
 85.761  80.269  74.745  69.213  63.679  58.143  52.607  47.070
 41.532  35.995  30.458  24.920  19.382  13.844   8.307   2.769
 -2.769  -8.307 -13.844 -19.382 -24.920 -30.458 -35.995 -41.532
-47.070 -52.607 -58.143 -63.679 -69.213 -74.745 -80.269 -85.761
```

1.3.5. CDO grids

All supported grids can be also described with the **CDO** description ASCII formatted file. The following keywords can be used to describe a grid:

gridtype	STRING	type of the grid (gaussian, lonlat, curvilinear, cell)
gridsize	INTEGER	size of the grid
xsize	INTEGER	size in x direction (number of longitudes)
ysize	INTEGER	size in y direction (number of latitudes)
xvals	FLOAT ARRAY	x values of the grid
yvals	FLOAT ARRAY	y values of the grid
xnpole	FLOAT	x value of the north pole (rotated grid)
ynpole	FLOAT	y value of the north pole (rotated grid)
nvertex	INTEGER	number of the vertices for all grid cells
xbounds	FLOAT ARRAY	x bounds of each gridbox
ybounds	FLOAT ARRAY	y bounds of each gridbox
xfirst, xinc	FLOAT, FLOAT	macros to define xvals with a constant increment
yfirst, yinc	FLOAT, FLOAT	macros to define yvals with a constant increment

Which keywords are necessary depends on the gridtype. The following table gives an overview of the default values or the array size for the different grid types.

gridtype	lonlat	gaussian	curvilinear	cell
gridsize	xsize*ysize	xsize*ysize	xsize*ysize	**ncell**
xsize	**nlon**	**nlon**	**nlon**	gridsize
ysize	**nlat**	**nlat**	**nlat**	gridsize
xvals	xsize	xsize	gridsize	gridsize
yvals	ysize	ysize	gridsize	gridsize
xnpole	0			
ynpole	90			
nvertex	2	2	4	**nv**
xbounds	2*xsize	2*xsize	4*gridsize	nv*gridsize
ybounds	2*ysize	2*ysize	4*gridsize	nv*gridsize

The keywords nvertex, xbounds and ybounds are optional if the area weights are not needed.

CDO grid description example of a T21 gaussian grid:

```
gridtype = gaussian
xsize    = 64
ysize    = 32
xfirst   =  0
```

```
xinc     = 5.625
yvals    = 85.76  80.27  74.75  69.21  63.68  58.14  52.61  47.07
           41.53  36.00  30.46  24.92  19.38  13.84   8.31   2.77
           -2.77  -8.31 -13.84 -19.38 -24.92 -30.46 -36.00 -41.53
          -47.07 -52.61 -58.14 -63.68 -69.21 -74.75 -80.27 -85.76
```

CDO grid description example of a global regular grid with 60x30 points:

```
gridtype = lonlat
xsize    =   60
ysize    =   30
xfirst   = -177
xinc     =    6
yfirst   =  -87
yinc     =    6
```

For a lon/lat grid with a rotated pole, the north pole must be defined. As far as you define the keywords xnpole/ynpole all coordinate values are for the rotated system.

CDO grid description example of a regional rotated lon/lat grid:

```
gridtype = lonlat
xsize    = 81
ysize    = 91
xfirst   =  -19.5
xinc     =    0.5
yfirst   =  -25.0
yinc     =    0.5
xnpole   = -170
ynpole   =   32.5
```

Example **CDO** descriptions of a curvilinear and an unstructured grid can be found in Appendix B.

1.4. Time axis

A time axis describes the time for every timestep. Two time axis types are available: absolute time and relative time axis. **CDO** tries to maintain the actual type of the time axis for all operators. The operators for time range statistic (e.g.: monavg, ymonavg, ...) create an absolute time axis.

1.4.1. Absolute time

An absolute time axis has the current time to each time step. It can be used without knowledge of the calendar. This is preferably used by climate models. In netCDF files the relative time axis is represented by the unit of the time: "`day as %Y%m%d.%f`".

1.4.2. Relative time

A relative time is the time relative to a fixed reference time. The current time results from the reference time and the elapsed interval. The result depends on the calendar used. **CDO** supports the standard Gregorian, 360 days, 365 days and 366 days calendars. The relative time axis is preferably used by weather forecast models. In netCDF files the relative time axis is represented by the unit of the time: "*time-units* `since` *reference-time*", e.g "`days since 1989-6-15 12:00`".

1.4.3. Conversion of the time

Some programs which work with netCDF data can only process relative time axes. Therefore it may be necessary to convert from an absolute into a relative time axis. This conversion can be done for each operator with the **CDO** option '-r'. To convert a relative into an absolute time axis use the **CDO** option '-a'.

1.5. Parameter table

A parameter table is an ASCII formated file to convert code numbers to variable names. Each variable has one line with the code number, the name and the description with optional units in a blank separated list. It can be used only for GRIB, SERVICE, EXTRA and IEG formated files. The **CDO** option '-t <partab>' sets the default parameter table for all input files. Use the operator 'setpartab' to set the parameter table for a specific file.

Example of a **CDO** parameter table:

```
  134  aps       surface pressure [Pa]
  141  sn        snow depth [m]
  147  ahfl      latent heat flux [W/m**2]
  172  slm       land sea mask
  175  albedo    surface albedo
  211  siced     ice depth [m]
```

1.6. Missing values

Most operators can handle missing values. The default missing value for GRIB, SERVICE, EXTRA and IEG files is $-9e+33$. The **CDO** option '-m <missval>' overwrites the default missing value. In netCDF files the variable attribute '_FillValue' is used as a missing value. The operator 'setmissval' can be used to set a new missing value.

The **CDO** use of the missing value is shown in the following tables, where one table is printed for each operation. The operations are applied to arbitrary numbers a, b, the special case 0, and the missing value $miss$. For example the table named "addition" shows that the sum of an arbitrary number a and the missing value is the missing value, and the table named "multiplication" shows that 0 multiplied by missing value results in 0.

addition	**b**	**miss**
a	$a+b$	$miss$
miss	$miss$	$miss$

subtraction	**b**	**miss**
a	$a-b$	$miss$
miss	$miss$	$miss$

multiplication	**b**	**0**	**miss**
a	$a*b$	0	$miss$
0	0	0	0
miss	$miss$	0	$miss$

division	**b**	**0**	**miss**
a	a/b	$miss$	$miss$
0	0	$miss$	$miss$
miss	$miss$	$miss$	$miss$

maximum	**b**	**miss**
a	$max(a,b)$	a
miss	b	$miss$

minimum	**b**	**miss**
a	$min(a,b)$	a
miss	b	$miss$

The handling of missing values by the operations "minimum" and "maximum" may be surprising, but the

definition given here is more consistent with that expected in practice. Mathematical functions (e.g. *log*, *sqrt*, etc.) return the missing value if an argument is the missing value or an argument is out of range.

All statistical functions ignore missing values, treading them as not belonging to the sample, with the side-effect of a reduced sample size.

1.6.1. Mean and average

An artificial distinction is made between the notions mean and average. The mean is regarded as a statistical function, whereas the average is found simply by adding the sample members and dividing the result by the sample size. For example, the mean of 1, 2, $miss$ and 3 is $(1 + 2 + 3)/3 = 2$, whereas the average is $(1 + 2 + miss + 3)/4 = miss/4 = miss$. If there are no missing values in the sample, the average and mean are identical.

2. Reference manual

This section gives a description of all operators. Similar operators are grouped to modules. For easier description all single input files are named `ifile` or `ifile1`, `ifile2`, etc., and an unlimited number of input files are named `ifiles`. All output files are named `ofile` or `ofile1`, `ofile2`, etc. Further the following notion is introduced:

$i(t)$	Timestep t of `ifile`
$i(t, x)$	Element number x of the field at timestep t of `ifile`
$o(t)$	Timestep t of `ofile`
$o(t, x)$	Element number x of the field at timestep t of `ofile`

2.1. Information

This section contains modules to print information about datasets. All operators print there results to standard output.

Here is a short overview of all operators in this section:

info	Dataset information listed by code number
infov	Dataset information listed by variable name
map	Dataset information and simple map
sinfo	Short dataset information listed by code number
sinfov	Short dataset information listed by variable name
diff	Compare two datasets listed by code number
diffv	Compare two datasets listed by variable name
npar	Number of parameters
nlevel	Number of levels
nyear	Number of years
nmon	Number of months
ndate	Number of dates
ntime	Number of time steps
showformat	Show file format
showcode	Show code numbers
showname	Show variable names
showstdname	Show standard names
showlevel	Show levels
showltype	Show GRIB level types
showyear	Show years
showmon	Show months
showdate	Show dates
showtime	Show time steps
pardes	Parameter description
griddes	Grid description
vct	Vertical coordinate table

2.1.1. INFO - Information and simple statistics

Synopsis

<operator> `ifiles`

Description

This module writes information about the structure and contents of all input datasets to standard output. The information displayed depends on the actual operator.

Operators

info Dataset information listed by code number
Prints information and simple statistics for each field of all input datasets. For each field the operator prints one line with the following elements:

- Date and Time
- Code number and Level
- Size of the grid and number of Missing values
- Minimum, Mean and Maximum
  The mean value is computed without the use of area weights!

infov Dataset information listed by variable name
The same as operator info but using the name instead of the code number to identify the variables.

map Dataset information and simple map
Prints information, simple statistics and a map for each field of all input datasets. The map will be printed only for fields on a rectangular grid.

Example

To print information and simple statistics for each field of a dataset use:

```
cdo info ifile
```

This is an example result of a dataset with one 2D variable over 12 time steps:

```
   -1 :       Date   Time Code Level   Size   Miss :    Minimum     Mean  Maximum
    1 : 1987-01-31 12:00  139     0   2048   1361 :     232.77   266.65   305.31
    2 : 1987-02-28 12:00  139     0   2048   1361 :     233.64   267.11   307.15
    3 : 1987-03-31 12:00  139     0   2048   1361 :     225.31   267.52   307.67
    4 : 1987-04-30 12:00  139     0   2048   1361 :     215.68   268.65   310.47
    5 : 1987-05-31 12:00  139     0   2048   1361 :     215.78   271.53   312.49
    6 : 1987-06-30 12:00  139     0   2048   1361 :     212.89   272.80   314.18
    7 : 1987-07-31 12:00  139     0   2048   1361 :     209.52   274.29   316.34
    8 : 1987-08-31 12:00  139     0   2048   1361 :     210.48   274.41   315.83
    9 : 1987-09-30 12:00  139     0   2048   1361 :     210.48   272.37   312.86
   10 : 1987-10-31 12:00  139     0   2048   1361 :     219.46   270.53   309.51
   11 : 1987-11-30 12:00  139     0   2048   1361 :     230.98   269.85   308.61
   12 : 1987-12-31 12:00  139     0   2048   1361 :     241.25   269.94   309.27
```

2.1.2. SINFO - Short information

Synopsis

<*operator*> `ifiles`

Description

This module writes information about the structure of all input datasets to standard output. The information displayed depends on the actual operator.

Operators

sinfo Short dataset information listed by code number
Prints short information of a dataset. The information is divided into 4 sections. Section 1 prints one line per variable with the following information:

- institute and source
- parameter table and code number
- horizontal grid size and number
- number of vertical levels and zaxis number

Section 2 and 3 gives a short overview of all horizontal and vertical grids. And the last section contains short information of the time axis.

sinfov Short dataset information listed by variable name
The same as operator sinfo but using the name instead of the code number and parameter table to identify the variables.

Example

To print short information of a dataset use:

```
cdo sinfo ifile
```

This is the result of an ECHAM5 dataset with 3 variables over 12 time steps:

```
   -1 : Institut Source   Table Code    Time   Typ  Grid Size Num  Levels Num
    1 : MPIMET   ECHAM5.3   128  129 constant F32       2048   1       1   1
    2 : MPIMET   ECHAM5.3   128  130 variable F32       2048   1       4   2
    3 : MPIMET   ECHAM5.3   128  139 variable F32       2048   1       1   1
  Horizontal grids :
    1 : gaussian     > size      : dim = 2048  nlon = 64  nlat = 32
                       longitude : first = 0  last = 354.375  inc = 5.625

```

2.1.3. DIFF - Compare two datasets field by field

Synopsis

<operator> `ifile1 ifile2`

Description

Compares the contents of two datasets field by field. The input datasets must have the same structure and the fields must have the same header information and dimensions.

Operators

diff Compare two datasets listed by code number
Provides statistics on differences between two datasets. For each pair of fields the operator prints one line with the following information:

- date and time
- code number and level
- size of the grid and number of missing values
- occurrence of coefficient pairs with different signs
- occurrence of zero values
- maxima of absolute difference of coefficient pairs
- maxima of relative difference of non-zero coefficient pairs with equal signs

diffv Compare two datasets listed by variable name
The same as operator diff. Using the name instead of the code number to identify the variable.

Example

To print the difference for each field of two datasets use:

```
cdo diff ifile1 ifile2
```

This is an example result of the difference of two datasets with one 2D variable over 12 time steps:

```
                Date  Time Code Level  Size  Miss : S Z     Absdiff     Reldiff
   1 : 1987-01-31 12:00 139      0  2048  1361 : F F  0.00010681  4.1660e-07
   2 : 1987-02-28 12:00 139      0  2048  1361 : F F  6.1035e-05  2.3742e-07
   3 : 1987-03-31 12:00 139      0  2048  1361 : F F  7.6294e-05  3.3784e-07
   4 : 1987-04-30 12:00 139      0  2048  1361 : F F  7.6294e-05  3.5117e-07
   5 : 1987-05-31 12:00 139      0  2048  1361 : F F  0.00010681  4.0307e-07
   6 : 1987-06-30 12:00 139      0  2048  1361 : F F  0.00010681  4.2670e-07
   7 : 1987-07-31 12:00 139      0  2048  1361 : F F  9.1553e-05  3.5634e-07
   8 : 1987-08-31 12:00 139      0  2048  1361 : F F  7.6294e-05  2.8849e-07
   9 : 1987-09-30 12:00 139      0  2048  1361 : F F  7.6294e-05  3.6168e-07
  10 : 1987-10-31 12:00 139      0  2048  1361 : F F  9.1553e-05  3.5001e-07
  11 : 1987-11-30 12:00 139      0  2048  1361 : F F  6.1035e-05  2.3839e-07
  12 : 1987-12-31 12:00 139      0  2048  1361 : F F  9.3553e-05  3.7624e-07
```

2.1.4. NINFO - Print the number of parameters, levels or times

Synopsis

<*operator*> `ifile`

Description

This module prints, according to the actual operator, the number of variables, levels or times of the input dataset.

Operators

npar Number of parameters
Prints the number of parameters (variables).

nlevel Number of levels
Prints the number of levels for each variable.

nyear Number of years
Prints the number of different years.

nmon Number of months
Prints the number of different combinations of years and months.

ndate Number of dates
Prints the number of different dates.

ntime Number of time steps
Prints the number of time steps.

Example

To print the number of parameters (variables) in a dataset use:

```
cdo npar ifile
```

To print the number of month in a dataset use:

```
cdo nmon ifile
```

2.1.5. SHOWINFO - Show variables, levels or times

Synopsis

<operator> `ifile`

Description

This module prints, according to the actual operator, the format, variables, levels or times of the input dataset.

Operators

showformat Show file format
Prints the file format of the input dataset.

showcode Show code numbers
Prints the code number of all different variables.

showname Show variable names
Prints the name of all different variables.

showstdname Show standard names
Prints the standard name of all different variables.

showlevel Show levels
Prints all levels for each variable.

showltype Show GRIB level types
Prints the GRIB level type for all different z-axis.

showyear Show years
Prints all different years.

showmon Show months
Prints all different months.

showdate Show dates
Prints all different dates.

showtime Show time steps
Prints all time steps.

Example

To print the code number of all variables in a dataset use:

```
cdo showcode ifile
```

This is an example result of a dataset with three variables:

```
129 130 139
```

To print all months in a dataset use:

```
cdo showmon ifile
```

This is an examples result of a dataset with an annual cycle:

```
1 2 3 4 5 6 7 8 9 10 11 12
```

2.1.6. FILEDES - Dataset description

Synopsis

<*operator*> `ifile`

Description

This module prints, according to the actual operator, the description of the parameters, the grids or the vertical coordinate table.

Operators

pardes Parameter description
Prints a table with a description of all variables. For each variable the operator prints one line listing the code, name, description and units.

griddes Grid description
Prints the description of all grids in a file.

vct Vertical coordinate table
Prints the vertical coordinate table.

Example

Assume an input dataset having three parameters with the names geosp, t and tslm1. To print the description of these parameters use:

```
cdo pardes ifile
```

Result:

```
129  geosp          surface geopotential (orography) [m^2/s^2]
130  t              temperature [K]
139  tslm1          surface temperature of land [K]
```

Assume all variables of the dataset are on a T21 gausssian grid. To print the grid description of this dataset use:

```
cdo griddes ifile
```

Result:

```
gridtype  : gaussian
gridsize  : 2048
xname     : lon
xlongname : longitude
xunits    : degrees_east
yname     : lat
ylongname : latitude
yunits    : degrees_north
xsize     : 64
ysize     : 32
xfirst    : 0
xinc      : 5.625
yvals     : 85.76058 80.26877 74.74454 69.21297 63.67863 58.1429 52.6065
            47.06964 41.53246 35.99507 30.4575 24.91992 19.38223 13.84448
            8.306702 2.768903 -2.768903 -8.306702 -13.84448 -19.38223
            -24.91992 -30.4575 -35.99507 -41.53246 -47.06964 -52.6065
            -58.1429 -63.67863 -69.21297 -74.74454 -80.26877 -85.76058
```

2.2. File operations

This section contains modules to perform operations on files.

Here is a short overview of all operators in this section:

copy	Copy datasets
cat	Concatenate datasets
replace	Replace variables
merge	Merge datasets with different fields
mergetime	Merge datasets sorted by date and time
splitcode	Split code numbers
splitname	Split variable names
splitlevel	Split levels
splitgrid	Split grids
splitzaxis	Split zaxis
splithour	Split hours
splitday	Split days
splitmon	Split months
splitseas	Split seasons
splityear	Split years
splitsel	Split time selection

2.2.1. COPY - Copy datasets

Synopsis

<operator> `ifiles ofile`

Description

This module contains operators to copy or concatenate datasets. Each input dataset must have the same variables with complete time steps.

Operators

copy Copy datasets
Copies all input datasets to `ofile`.

cat Concatenate datasets
Concatenates all input datasets and append the result to the end of `ofile`. If `ofile` does not exist it will be created.

Example

To change the format of a dataset to netCDF use:

```
cdo -f nc copy ifile ofile.nc
```

Add the option '-r' to create a relative time axis, as is required for proper recognition by GrADS or Ferret:

```
cdo -r -f nc copy ifile ofile.nc
```

To concatenate 3 datasets with different time steps of the same variables use:

```
cdo copy ifile1 ifile2 ifile3 ofile
```

If the output dataset already exist and you wish to extend it with more time steps use:

```
cdo cat ifile1 ifile2 ifile3 ofile
```

2.2.2. REPLACE - Replace variables

Synopsis

replace `ifile1 ifile2 ofile`

Description

Replaces all common variables of `ifile2` and `ifile1` with those of `ifile1` and write the result to `ofile`. Both input datasets must have the same number of time steps.

Example

Assume the first input dataset `ifile1` has three variables with the names geosp, t and tslm1 and the second input dataset `ifile2` has only the variable tslm1. To replace the variable tslm1 in `ifile1` with tslm1 from `ifile2` use:

```
cdo replace ifile1 ifile2 ofile
```

2.2.3. MERGE - Merge datasets

Synopsis

<operator> `ifiles ofile`

Description

This module reads datasets from several input files, merges them and writes the resulting dataset to `ofile`.

Operators

merge Merge datasets with different fields
Merges time series of different fields from several input datasets. The number of fields per time step written to `ofile` is the sum of the field numbers per time step in all input datasets. The time series on all input datasets must have different fields and the same number of time steps.

mergetime Merge datasets sorted by date and time
Merges all time steps of all input files sorted by date and time. After this operation every input time step is in `ofile` and all time steps are sorted by date and time. Each input file must have the same variables and different time steps.

Example

Assume three datasets with the same number of time steps and each dataset with different variables. To merge these datasets to a new dataset use:

```
cdo merge ifile1 ifile2 ifile3 ofile
```

Assume you have split a 6 hourly dataset with splithour. This produces four datasets one for each hour. The following command merges them together:

```
cdo mergetime ifile1 ifile2 ifile3 ifile4 ofile
```

2.2.4. SPLIT - Split a dataset

Synopsis

<operator> `ifile oprefix`

Description

This module splits a dataset to several files with names formed from the field header information and `oprefix`.

Operators

splitcode Split code numbers
Splits a dataset into pieces, one for each different code number. Appends three digits with the code number to `oprefix` to form the output file names.

splitname Split variable names
Splits a dataset into pieces, one for each variable name. Appends a string with the variable name to `oprefix` to form the output file names.

splitlevel Split levels
Splits a dataset into pieces, one for each different level. Appends six digits with the level to `oprefix` to form the output file names.

splitgrid Split grids
Splits a dataset into pieces, one for each different grid. Appends two digits with the grid number to `oprefix` to form the output file names.

splitzaxis Split zaxis
Splits a dataset into pieces, one for each different zaxis. Appends two digits with the zaxis number to `oprefix` to form the output file names.

Example

Assume an input GRIB dataset with three variables, e.g. code number 129, 130 and 139. To split this dataset into three pieces, one for each code number use:

```
cdo splitcode ifile code
```

Result of '`dir code*`':

```
code129.grb code130.grb code139.grb
```

2.2.5. SPLITTIME - Split time steps of a dataset

Synopsis

<operator> `ifile oprefix`

Description

This module splits time steps of a dataset to several files with names formed from the field header information and `oprefix`.

Operators

splithour Split hours
Splits a file into pieces, one for each different hour. Appends two digits with the hour to `oprefix` to form the output file names.

splitday Split days
Splits a file into pieces, one for each different day. Appends two digits with the day to `oprefix` to form the output file names.

splitmon Split months
Splits a file into pieces, one for each different month. Appends two digits with the month to `oprefix` to form the output file names.

splitseas Split seasons
Splits a file into pieces, one for each different season. Appends three characters with the season to `oprefix` to form the output file names.

splityear Split years
Splits a file into pieces, one for each different year. Appends four digits with the year to `oprefix` to form the output file names.

Example

Assume the input GRIB dataset has time steps from January to December. To split each month with all variables into one separate file use:

```
cdo splitmon ifile mon
```

Result of '`dir mon*`':

```
mon01.grb  mon02.grb  mon03.grb  mon04.grb  mon05.grb  mon06.grb
mon07.grb  mon08.grb  mon09.grb  mon10.grb  mon11.grb  mon12.grb
```

2.2.6. SPLITSEL - Split selected time steps

Synopsis

splitsel,*nsets[,noffset[,nskip]]* `ifile oprefix`

Description

This operator splits a dataset into pieces, one for each adjacent sequence $t_1, ..., t_n$ of time steps of the same selected time range. Appends three digits with the sequence number to `oprefix` to form the output file names.

Parameter

nsets	INTEGER	Number of input time steps for each output file
noffset	INTEGER	Number of input time steps skipped before the first time step range (optional)
nskip	INTEGER	Number of input time steps skipped between time step ranges (optional)

2.3. Selection

This section contains modules to select time steps, fields or part of a field from a dataset.

Here is a short overview of all operators in this section:

selcode	Select variables by code number
delcode	Delete variables by code number
selname	Select variables by name
delname	Delete variables by name
selstdname	Select variables by standard name
sellevel	Select levels
selgrid	Select grids
selgridname	Select grids by name
selzaxis	Select zaxes
selzaxisname	Select zaxes by name
selltype	Select GRIB level types
seltabnum	Select parameter table numbers
seltimestep	Select time steps
seltime	Select times
selhour	Select hours
selday	Select days
selmon	Select months
selyear	Select years
selseas	Select seasons
seldate	Select dates
selsmon	Select single month
sellonlatbox	Select a longitude/latitude box
selindexbox	Select an index box

2.3.1. SELECT - Select fields

Synopsis

selcode,*codes* `ifile ofile`

delcode,*codes* `ifile ofile`

selname,*varnames* `ifile ofile`

delname,*varnames* `ifile ofile`

selstdname,*stdnames* `ifile ofile`

sellevel,*levels* `ifile ofile`

selgrid,*grids* `ifile ofile`

selgridname,*gridnames* `ifile ofile`

selzaxis,*zaxes* `ifile ofile`

selzaxisname,*zaxisnames* `ifile ofile`

selltype,*ltypes* `ifile ofile`

seltabnum,*tabnums* `ifile ofile`

Description

This module selects some fields from `ifile` and writes them to `ofile`. The fields selected depend on the actual operator and the parameters.

Operators

selcode	Select variables by code number Selects all fields with code numbers in a user given list.
delcode	Delete variables by code number Deletes all fields with code numbers in a user given list.
selname	Select variables by name Selects all fields with variable names in a user given list.
delname	Delete variables by name Deletes all fields with variable names in a user given list.
selstdname	Select variables by standard name Selects all fields with standard names in a user given list.
sellevel	Select levels Selects all fields with levels in a user given list.
selgrid	Select grids Selects all fields with grids in a user given list.
selgridname	Select grids by name Selects all fields with grid names in a user given list.
selzaxis	Select zaxes Selects all fields with zaxes in a user given list.
selzaxisname	Select zaxes by name Selects all fields with zaxis names in a user given list.
selltype	Select GRIB level types Selects all fields with GRIB level type in a user given list.
seltabnum	Select parameter table numbers Selects all fields with parameter table numbers in a user given list.

Parameter

codes	INTEGER	Comma separated list of code numbers
varnames	STRING	Comma separated list of variable names
stdnames	STRING	Comma separated list of standard names
levels	FLOAT	Comma separated list of levels
ltypes	INTEGER	Comma separated list of GRIB level types
grids	INTEGER	Comma separated list of grid numbers
gridnames	STRING	Comma separated list of grid names
zaxes	INTEGER	Comma separated list of zaxis numbers
zaxisnames	STRING	Comma separated list of zaxis names
tabnums	INTEGER	Comma separated list of parameter table numbers

Example

Assume an input dataset has three variables with the code numbers 129, 130 and 139. To select the variables with the code number 129 and 139 use:

```
cdo selcode,129,139 ifile ofile
```

You can also select the code number 129 and 139 by deleting the code number 130 with:

```
cdo delcode,130 ifile ofile
```

2.3.2. SELTIME - Select time steps

Synopsis

seltimestep,*timesteps* `ifile ofile`

seltime,*times* `ifile ofile`

selhour,*hours* `ifile ofile`

selday,*days* `ifile ofile`

selmon,*months* `ifile ofile`

selyear,*years* `ifile ofile`

selseas,*seasons* `ifile ofile`

seldate,*date1[,date2]* `ifile ofile`

selsmon,*month[,nts1[,nts2]]* `ifile ofile`

Description

This module selects user specified time steps from `ifile` and writes them to `ofile`. The time steps selected depends on the actual operator and the parameters.

Operators

seltimestep	Select time steps Selects all time steps with a time step in a user given list.
seltime	Select times Selects all time steps with a time in a user given list.
selhour	Select hours Selects all time steps with a hour in a user given list.
selday	Select days Selects all time steps with a day in a user given list.
selmon	Select months Selects all time steps with a month in a user given list.
selyear	Select years Selects all time steps with a year in a user given list.
selseas	Select seasons Selects all time steps with a month of a season in a user given list.
seldate	Select dates Selects all time steps with a date in a user given range.
selsmon	Select single month Selects a month and optional an unlimited number of time steps before and after this month.

Parameter

timesteps	INTEGER	Comma separated list of time steps
times	STRING	Comma separated list of times (format hh:mm)
hours	INTEGER	Comma separated list of hours
days	INTEGER	Comma separated list of days
months	INTEGER	Comma separated list of months
years	INTEGER	Comma separated list of years
seasons	STRING	Comma separated list of seasons (DJF, MAM, JJA, SON)
date1	STRING	Start date (format YYYY-MM-DDThh:mm)
date2	STRING	End date (format YYYY-MM-DDThh:mm)
nts1	INTEGER	Number of time steps before the selected month [default: 0]
nts2	INTEGER	Number of time steps after the selected month [default: nts1]

2.3.3. SELBOX - Select a box of a field

Synopsis

sellonlatbox,*lon1*,*lon2*,*lat1*,*lat2* `ifile ofile`

selindexbox,*idx1*,*idx2*,*idy1*,*idy2* `ifile ofile`

Description

Selects a box of the rectangular understood field. All input fields must have the same horizontal grid.

Operators

sellonlatbox Select a longitude/latitude box
Selects a longitude/latitude box. The user has to give the longitudes and latitudes of the edges of the box.

selindexbox Select an index box
Selects an index box. The user has to give the indexes of the edges of the box. The index of the left edge may be greater then that of the right edge.

Parameter

lon1	FLOAT	Western longitude
lon2	FLOAT	Eastern longitude
lat1	FLOAT	Southern or northern latitude
lat2	FLOAT	Northern or southern latitude
idx1	INTEGER	Index of first longitude
idx2	INTEGER	Index of last longitude
idy1	INTEGER	Index of first latitude
idy2	INTEGER	Index of last latitude

Example

To select the region with the longitudes from 120E to 90W and latitudes from 20N to 20S from all input fields use:

```
cdo sellonlatbox,120,-90,20,-20 ifile ofile
```

If the input dataset has fields on a T21 gaussian grid, the same box can be selected with selindexbox by:

```
cdo selindexbox,23,48,13,20 ifile ofile
```

2.4. Conditional selection

This section contains modules to conditional select field elements. The fields in the first input file are handled as a mask. A value not equal to zero is treated as "true", zero is treated as "false".

Here is a short overview of all operators in this section:

ifthen	If then
ifnotthen	If not then
ifthenelse	If then else
ifthenc	If then constant
ifnotthenc	If not then constant

2.4.1. COND - Conditional select one field

Synopsis

<operator> `ifile1 ifile2 ofile`

Description

This module conditional selects field elements from `ifile2` and writes them to `ofile`. The fields in `ifile1` are handled as a mask. A value not equal to zero is treated as "true", zero is treated as "false".

Operators

ifthen If then

$$o(t,x) = \begin{cases} i_2(t,x) & \text{if } i_1(t,x) \neq 0 \quad \wedge \; i_1(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = 0 \quad \vee \; i_1(t,x) = \text{miss} \end{cases}$$

ifnotthen If not then

$$o(t,x) = \begin{cases} i_2(t,x) & \text{if } i_1(t,x) = 0 \quad \wedge \; i_1(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) \neq 0 \quad \vee \; i_1(t,x) = \text{miss} \end{cases}$$

Example

To select all field elements of `ifile2` if the corresponding field element of `ifile1` is greater than 0, use:

```
cdo ifthen ifile1 ifile2 ofile
```

2.4.2. COND2 - Conditional select two fields

Synopsis

ifthenelse `ifile1 ifile2 ifile3 ofile`

Description

This operator conditional selects field elements from `ifile2` or `ifile3` and writes them to `ofile`. The fields in `ifile1` are handled as a mask. A value not equal to zero is treated as "true", zero is treated as "false".

$$o(t,x) = \begin{cases} i_2(t,x) & \text{if } i_1(t,x) \neq 0 \quad \wedge \; i_1(t,x) \neq \text{miss} \\ i_3(t,x) & \text{if } i_1(t,x) = 0 \quad \wedge \; i_1(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = \text{miss} \end{cases}$$

Example

To select all field elements of `ifile2` if the corresponding field element of `ifile1` is greater than 0 and from `ifile3` otherwise, use:

```
cdo ifthenelse ifile1 ifile2 ifile3 ofile
```

2.4.3. CONDC - Conditional select a constant

Synopsis

<operator>,*c* `ifile ofile`

Description

This module creates fields with a constant value or missing value. The fields in `ifile1` are handled as a mask. A value not equal to zero is treated as "true", zero is treated as "false".

Operators

ifthenc If then constant

$$o(t,x) = \begin{cases} \text{c} & \text{if } i(t,x) \neq 0 \quad \wedge \; i(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) = 0 \quad \vee \; i(t,x) = \text{miss} \end{cases}$$

ifnotthenc If not then constant

$$o(t,x) = \begin{cases} \text{c} & \text{if } i(t,x) = 0 \quad \wedge \; i(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) \neq 0 \quad \vee \; i(t,x) = \text{miss} \end{cases}$$

Parameter

c FLOAT Constant

Example

To create fields with the constant value 7 if the corresponding field element of `ifile` is greater than 0, use:

```
cdo ifthenc,7 ifile ofile
```

2.5. Comparison

This section contains modules to compare datasets. The resulting field is a mask with 1 if the comparison is true and 0 if the comparison is false.

Here is a short overview of all operators in this section:

eq	Equal
ne	Not equal
le	Less equal
lt	Less than
ge	Greater equal
gt	Greater than
eqc	Equal constant
nec	Not equal constant
lec	Less equal constant
ltc	Less then constant
gec	Greater equal constant
gtc	Greater then constant

2.5.1. COMP - Comparison of two fields

Synopsis

<operator> `ifile1 ifile2 ofile`

Description

This module compares two datasets field by field. The resulting field is a mask with 1 if the comparison is true and 0 if the comparison is false. The type of the comparison depends on the actual operator.

Operators

eq Equal

$$o(t,x) = \begin{cases} 1 & \text{if } i_1(t,x) = i_2(t,x) \quad \wedge \; i_1(t,x), i_2(t,x) \neq \text{miss} \\ 0 & \text{if } i_1(t,x) \neq i_2(t,x) \quad \wedge \; i_1(t,x), i_2(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = \text{miss} \quad \vee \; i_2(t,x) = \text{miss} \end{cases}$$

ne Not equal

$$o(t,x) = \begin{cases} 1 & \text{if } i_1(t,x) \neq i_2(t,x) \quad \wedge \; i_1(t,x), i_2(t,x) \neq \text{miss} \\ 0 & \text{if } i_1(t,x) = i_2(t,x) \quad \wedge \; i_1(t,x), i_2(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = \text{miss} \quad \vee \; i_2(t,x) = \text{miss} \end{cases}$$

le Less equal

$$o(t,x) = \begin{cases} 1 & \text{if } i_1(t,x) \leq i_2(t,x) \quad \wedge \; i_1(t,x), i_2(t,x) \neq \text{miss} \\ 0 & \text{if } i_1(t,x) > i_2(t,x) \quad \wedge \; i_1(t,x), i_2(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = \text{miss} \quad \vee \; i_2(t,x) = \text{miss} \end{cases}$$

lt Less than

$$o(t,x) = \begin{cases} 1 & \text{if } i_1(t,x) < i_2(t,x) \quad \wedge \; i_1(t,x), i_2(t,x) \neq \text{miss} \\ 0 & \text{if } i_1(t,x) \geq i_2(t,x) \quad \wedge \; i_1(t,x), i_2(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = \text{miss} \quad \vee \; i_2(t,x) = \text{miss} \end{cases}$$

ge Greater equal

$$o(t,x) = \begin{cases} 1 & \text{if } i_1(t,x) \geq i_2(t,x) \quad \wedge \; i_1(t,x), i_2(t,x) \neq \text{miss} \\ 0 & \text{if } i_1(t,x) < i_2(t,x) \quad \wedge \; i_1(t,x), i_2(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = \text{miss} \quad \vee \; i_2(t,x) = \text{miss} \end{cases}$$

gt Greater than

$$o(t,x) = \begin{cases} 1 & \text{if } i_1(t,x) > i_2(t,x) \quad \wedge \; i_1(t,x), i_2(t,x) \neq \text{miss} \\ 0 & \text{if } i_1(t,x) \leq i_2(t,x) \quad \wedge \; i_1(t,x), i_2(t,x) \neq \text{miss} \\ \text{miss} & \text{if } i_1(t,x) = \text{miss} \quad \vee \; i_2(t,x) = \text{miss} \end{cases}$$

Example

To create a mask with 1 if the elements of two fields are the same and 0 if the elements are different, use:

```
cdo eq ifile1 ifile2 ofile
```

2.5.2. COMPC - Comparison of a field with a constant

Synopsis

<operator>,*c* `ifile ofile`

Description

This module compares all fields of dataset with a constant. The resulting field is a mask with 1 if the comparison is true and 0 if the comparison is false. The type of the comparison depends on the actual operator.

Operators

eqc Equal constant

$$o(t,x) = \begin{cases} 1 & \text{if } i(t,x) = c \quad \wedge\ i(t,x), c \neq \text{miss} \\ 0 & \text{if } i(t,x) \neq c \quad \wedge\ i(t,x), c \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) = \text{miss} \quad \vee\ c = \text{miss} \end{cases}$$

nec Not equal constant

$$o(t,x) = \begin{cases} 1 & \text{if } i(t,x) \neq c \quad \wedge\ i(t,x), c \neq \text{miss} \\ 0 & \text{if } i(t,x) = c \quad \wedge\ i(t,x), c \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) = \text{miss} \quad \vee\ c = \text{miss} \end{cases}$$

lec Less equal constant

$$o(t,x) = \begin{cases} 1 & \text{if } i(t,x) \leq c \quad \wedge\ i(t,x), c \neq \text{miss} \\ 0 & \text{if } i(t,x) > c \quad \wedge\ i(t,x), c \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) = \text{miss} \quad \vee\ c = \text{miss} \end{cases}$$

ltc Less then constant

$$o(t,x) = \begin{cases} 1 & \text{if } i(t,x) < c \quad \wedge\ i(t,x), c \neq \text{miss} \\ 0 & \text{if } i(t,x) \geq c \quad \wedge\ i(t,x), c \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) = \text{miss} \quad \vee\ c = \text{miss} \end{cases}$$

gec Greater equal constant

$$o(t,x) = \begin{cases} 1 & \text{if } i(t,x) \geq c \quad \wedge\ i(t,x), c \neq \text{miss} \\ 0 & \text{if } i(t,x) < c \quad \wedge\ i(t,x), c \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) = \text{miss} \quad \vee\ c = \text{miss} \end{cases}$$

gtc Greater then constant

$$o(t,x) = \begin{cases} 1 & \text{if } i(t,x) > c \quad \wedge\ i(t,x), c \neq \text{miss} \\ 0 & \text{if } i(t,x) \leq c \quad \wedge\ i(t,x), c \neq \text{miss} \\ \text{miss} & \text{if } i(t,x) = \text{miss} \quad \vee\ c = \text{miss} \end{cases}$$

Parameter

c	FLOAT	Constant

Example

To create a mask with 1 if the field element is greater than 273.15 and 0 if not, use:

```
cdo gtc,273.15 ifile ofile
```

2.6. Modification

This section contains modules to modify the metadata, fields or part of a field in a dataset.

Here is a short overview of all operators in this section:

setpartab	Set parameter table
setcode	Set code number
setname	Set variable name
setlevel	Set level
setltype	Set GRIB level type
setdate	Set date
settime	Set time
setday	Set day
setmon	Set month
setyear	Set year
settunits	Set time units
settaxis	Set time axis
setreftime	Set reference time
setcalendar	Set calendar
shifttime	Shift time steps
chcode	Change code number
chname	Change variable name
chlevel	Change level
chlevelc	Change level of one code
chlevelv	Change level of one variable
setgrid	Set grid
setgridtype	Set grid type
setzaxis	Set zaxis
setgatt	Set global attribute
setgatts	Set global attributes
invertlat	Invert latitude
invertlon	Invert longitude
invertlatdes	Invert latitude description
invertlondes	Invert longitude description
invertlatdata	Invert latitude data
invertlondata	Invert longitude data
maskregion	Mask regions
masklonlatbox	Mask a longitude/latitude box
maskindexbox	Mask an index box
setclonlatbox	Set a longitude/latitude box to constant
setcindexbox	Set an index box to constant
enlarge	Enlarge fields
setmissval	Set a new missing value
setctomiss	Set constant to missing value
setmisstoc	Set missing value to constant
setrtomiss	Set range to missing value

2.6.1. SET - Set field info

Synopsis

setpartab,*table* `ifile ofile`

setcode,*code* `ifile ofile`

setname,*name* `ifile ofile`

setlevel,*level* `ifile ofile`

setltype,*ltype* `ifile ofile`

Description

This module sets some field information. Depending on the actual operator the parameter table, code number, variable name or level is set.

Operators

setpartab	Set parameter table Sets the parameter table for all variables.
setcode	Set code number Sets the code number for all variables to the same given value.
setname	Set variable name Sets the name of the first variable.
setlevel	Set level Sets the first level of all variables.
setltype	Set GRIB level type Sets the GRIB level type of all variables.

Parameter

table	STRING	Parameter table file or name
code	INTEGER	Code number
name	STRING	Variable name
level	FLOAT	New level
ltype	INTEGER	GRIB level type

Example

To assign the parameter table echam5 to the input dataset use:

```
cdo setpartab,echam5 ifile ofile
```

2.6.2. SETTIME - Set time

Synopsis

setdate,*date* `ifile ofile`

settime,*time* `ifile ofile`

setday,*day* `ifile ofile`

setmon,*month* `ifile ofile`

setyear,*year* `ifile ofile`

settunits,*units* `ifile ofile`

settaxis,*date,time[,inc]* `ifile ofile`

setreftime,*date,time* `ifile ofile`

setcalendar,*calendar* `ifile ofile`

shifttime,*sval* `ifile ofile`

Description

This module sets the time axis or part of the time axis. Which part of the time axis is overwritten depends on the actual operator.

Operators

setdate	Set date Sets the date in every time step to the same given value.
settime	Set time Sets the time in every time step to the same given value.
setday	Set day Sets the day in every time step to the same given value.
setmon	Set month Sets the month in every time step to the same given value.
setyear	Set year Sets the year in every time step to the same given value.
settunits	Set time units Sets the base units of a relative time axis.
settaxis	Set time axis Sets the time axis.
setreftime	Set reference time Sets the reference time of a relative time axis.
setcalendar	Set calendar Sets the calendar of a relative time axis.
shifttime	Shift time steps Shifts all time steps by the parameter sval.

Parameter

day	INTEGER	Value of the new day
month	INTEGER	Value of the new month
year	INTEGER	Value of the new year
units	STRING	Base units of the time axis (minutes, hours, days, months, years)
date	STRING	Date (format YYYY-MM-DD)
time	STRING	Time (format HH:MM)
inc	STRING	Optional increment (minutes, hours, days, months, years) [default: 0hour]
calendar	STRING	Calendar (standard, 360days, 365days, 366days)
sval	STRING	Shift value (e.g. -3hour)

Example

To set the time axis to 1987-01-16 12:00 with an increment of one month for each time step use:

```
cdo settaxis,1987-01-16,12:00,1mon ifile ofile
```

Result of '`cdo showdate ofile`' for a dataset with 12 time steps:

```
1987-01-16 1987-02-16 1987-03-16 1987-04-16 1987-05-16 1987-06-16 \
1987-07-16 1987-08-16 1987-09-16 1987-10-16 1987-11-16 1987-12-16
```

To shift this time axis by -15 days use:

```
cdo shifttime,-15days ifile ofile
```

Result of '`cdo showdate ofile`':

```
1987-01-01 1987-02-01 1987-03-01 1987-04-01 1987-05-01 1987-06-01 \
1987-07-01 1987-08-01 1987-09-01 1987-10-01 1987-11-01 1987-12-01
```

2.6.3. CHANGE - Change field header

Synopsis

chcode,*oldcode,newcode[,...]* `ifile ofile`

chname,*ovar,nvar,...* `ifile ofile`

chlevel,*oldlev,newlev,...* `ifile ofile`

chlevelc,*code,oldlev,newlev* `ifile ofile`

chlevelv,*var,oldlev,newlev* `ifile ofile`

Description

This module reads fields from `ifile`, changes some header values and writes the results to `ofile`. The kind of changes depends on the actual operator.

Operators

chcode	Change code number Changes some user given code numbers to new user given values.
chname	Change variable name Changes some user given variable names to new user given names.
chlevel	Change level Changes some user given levels to new user given values.
chlevelc	Change level of one code Changes one level of a user given code number.
chlevelv	Change level of one variable Changes one level of a user given variable.

Parameter

code	INTEGER	Code number
oldcode,newcode,...	INTEGER	Pairs of old and new code numbers
var	STRING	Variable name
ovar,nvar,...	STRING	Pairs of old and new variable names
oldlev	FLOAT	Old level
newlev	FLOAT	New level
oldlev,newlev,...	FLOAT	Pairs of old and new levels

Example

To change the code number 98 to 179 and 99 to 211 use:

```
cdo chcode,98,179,99,211 ifile ofile
```

2.6.4. SETGRID - Set grid type

Synopsis

setgrid,*grid* `ifile ofile`

setgridtype,*gridtype* `ifile ofile`

Description

This module sets the grid description of all fields with the same grid size as the new grid.

Operators

setgrid	Set grid Sets the grid description of all fields.
setgridtype	Set grid type Sets the grid type of all grids to a user given value.

Parameter

grid	STRING	Target grid description file or name
gridtype	STRING	Target grid type (curvilinear or cell)

Example

Assumed a dataset has fields with 2048 gridpoints without or with wrong grid description. To set the grid description of all input fields to a T21 gaussian grid (2048 gridpoints) use:

```
cdo setgrid,t21grid ifile ofile
```

2.6.5. SETZAXIS - Set zaxis type

Synopsis

setzaxis,*zaxis* `ifile ofile`

Description

This operator sets the zaxis description of all variables with the same number of level as the new zaxis.

Parameter

zaxis	STRING	Zaxis description file or name of the target zaxis

2.6.6. SETGATT - Set global attribute

Synopsis

setgatt,*attname,attstring* `ifile ofile`

setgatts,*attfile* `ifile ofile`

Description

This module sets global text attributes of a dataset. Depending on the actual operator the attributes are read from a file or can be specified by a parameter.

Operators

setgatt Set global attribute
Sets one user defined global text attribute.

setgatts Set global attributes
Sets user defined global text attributes. The name and text of the global attributes are read from a file.

Parameter

attname,attstring	STRING	Name and text of the global attribute (without spaces!)
attfile	STRING	File name which contains global text attributes

Note

From the supported data formats only netCDF can work with global attributes.

Example

To set the global text attribute "myatt" to "myattcontents" in a netCDF file use:

```
cdo setgatt,myatt,myattcontents ifile ofile
```

Result of '`ncdump -h ofile`':

```
netcdf ofile {
dimensions: ...

variables: ...

// global attributes:
                :myatt = "myattcontens" ;
}
```

2.6.7. INVERT - Invert fields

Synopsis

<operator> `ifile ofile`

Description

This module inverts 2D fields on a rectangular grid. Depending on the actual operator the field, only the data or only the grid description is inverted.

Operators

invertlat Invert latitude
Inverts the latitude of a field.

invertlon Invert longitude
Inverts the longitude of a field.

invertlatdes Invert latitude description
Inverts only the latitude description of a field.

invertlondes Invert longitude description
Inverts only the longitude description of a field.

invertlatdata Invert latitude data
Inverts only the latitude data of a field.

invertlondata Invert longitude data
Inverts only the longitude data of a field.

Example

To invert the latitudes of a 2D field from N->S to S->N, use:

```
cdo invertlat ifile ofile
```

2.6.8. MASKREGION - Mask regions

Synopsis

maskregion,*regions* `ifile ofile`

Description

Masks different regions of a field. The elements inside a region are untouched, the elements outside are set to missing value. All input fields must have the same horizontal grid. The user has to give ASCII formatted files with different regions. A region is defined by a polygon. Each line of a polygon description file contains the longitude and latitude of one point. Each polygon description file can contain one or more polygons separated by a line with the character &.

Parameter

regions	STRING	Comma separated list of ASCII formatted files with different regions

Example

To mask the region with the longitudes from 120E to 90W and latitudes from 20N to 20S on all input fields, use:

```
cdo maskregion,myregion ifile ofile
```

For this example the polygon description file `myregion` must contain the following four coordinates:

```
120  20
120 -20
270 -20
270  20
```

2.6.9. MASKBOX - Mask a box

Synopsis

masklonlatbox,*lon1*,*lon2*,*lat1*,*lat2* `ifile ofile`

maskindexbox,*idx1*,*idx2*,*idy1*,*idy2* `ifile ofile`

Description

Masks a box of the rectangular understood field. The elements inside the box are untouched, the elements outside are set to missing value. All input fields must have the same horizontal grid.

Operators

masklonlatbox Mask a longitude/latitude box
Masks a longitude/latitude box. The user has to give the longitudes and latitudes of the edges of the box.

maskindexbox Mask an index box
Masks an index box. The user has to give the indexes of the edges of the box. The index of the left edge may be greater then that of the right edge.

Parameter

lon1	FLOAT	Western longitude
lon2	FLOAT	Eastern longitude
lat1	FLOAT	Southern or northern latitude
lat2	FLOAT	Northern or southern latitude
idx1	INTEGER	Index of first longitude
idx2	INTEGER	Index of last longitude
idy1	INTEGER	Index of first latitude
idy2	INTEGER	Index of last latitude

Example

To mask the region with the longitudes from 120E to 90W and latitudes from 20N to 20S on all input fields, use:

```
cdo masklonlatbox,120,-90,20,-20 ifile ofile
```

If the input dataset has fields on a T21 gaussian grid, the same box can be masked with maskindexbox by:

```
cdo maskindexbox,23,48,13,20 ifile ofile
```

2.6.10. SETBOX - Set a box to constant

Synopsis

setclonlatbox,*c*,*lon1*,*lon2*,*lat1*,*lat2* `ifile ofile`

setcindexbox,*c*,*idx1*,*idx2*,*idy1*,*idy2* `ifile ofile`

Description

Sets a box of the rectangular understood field to a constant value. The elements outside the box are untouched, the elements inside are set to the given constant. All input fields must have the same horizontal grid.

Operators

setclonlatbox Set a longitude/latitude box to constant
Sets the values of a longitude/latitude box to a constant value. The user has to give the longitudes and latitudes of the edges of the box.

setcindexbox Set an index box to constant
Sets the values of an index box to a constant value. The user has to give the indexes of the edges of the box. The index of the left edge may be greater then that of the right edge.

Parameter

c	FLOAT	Constant
lon1	FLOAT	Western longitude
lon2	FLOAT	Eastern longitude
lat1	FLOAT	Southern or northern latitude
lat2	FLOAT	Northern or southern latitude
idx1	INTEGER	Index of first longitude
idx2	INTEGER	Index of last longitude
idy1	INTEGER	Index of first latitude
idy2	INTEGER	Index of last latitude

Example

To set all values in the region with the longitudes from 120E to 90W and latitudes from 20N to 20S to the constant value -1.23, use:

```
cdo setclonlatbox,-1.23,120,-90,20,-20 ifile ofile
```

If the input dataset has fields on a T21 gaussian grid, the same box can be set with setcindexbox by:

```
cdo setcindexbox,-1.23,23,48,13,20 ifile ofile
```

2.6.11. ENLARGE - Enlarge fields

Synopsis

enlarge,*grid* `ifile ofile`

Description

Enlarge all fields of `ifile` to a user given grid. Normally only the last field element is used for the enlargement. If however the input and output grid are rectangular, a zonal or meridional enlargement is possible. Zonal enlargement takes place, if the xsize of the input field is 1 and the ysize of both grids are the same. For meridional enlargement the ysize must be 1 and the xsize of both grids must have the same size.

Parameter

grid STRING Target grid description file or name

Example

Assumed you want to add two datasets. The first dataset is on a T21 grid (2048 field elements) and the second dataset is only a global mean (1 field element). Before you can add these two datasets the second dataset must be enlarged to the grid size of the first dataset:

```
cdo enlarge,t21grid ifile2 tmpfile
cdo add ifile1 tmpfile ofile
```

Or shorter using operator piping:

```
cdo add ifile1 -enlarge,t21grid ifile2 ofile
```

2.6.12. SETMISS - Set missing value

Synopsis

setmissval,*miss* `ifile ofile`

setctomiss,*c* `ifile ofile`

setmisstoc,*c* `ifile ofile`

setrtomiss,*rmin*,*rmax* `ifile ofile`

Description

This module sets part of a field to missing value or missing values to a constant value. Which part of the field is set depends on the actual operator.

Operators

setmissval Set a new missing value

$$o(t,x) = \begin{cases} \text{miss} & \text{if } i(t,x) = miss \\ i(t,x) & \text{if } i(t,x) \neq miss \end{cases}$$

setctomiss Set constant to missing value

$$o(t,x) = \begin{cases} \text{miss} & \text{if } i(t,x) = c \\ i(t,x) & \text{if } i(t,x) \neq c \end{cases}$$

setmisstoc Set missing value to constant

$$o(t,x) = \begin{cases} c & \text{if } i(t,x) = \text{miss} \\ i(t,x) & \text{if } i(t,x) \neq \text{miss} \end{cases}$$

setrtomiss Set range to missing value

$$o(t,x) = \begin{cases} \text{miss} & \text{if } i(t,x) \geq rmin \wedge i(t,x) \leq rmax \\ i(t,x) & \text{if } i(t,x) < rmin \vee i(t,x) > rmax \end{cases}$$

Parameter

miss	FLOAT	New missing value
c	FLOAT	Constant
rmin	FLOAT	Lower bound
rmax	FLOAT	Upper bound

Example

Assume an input dataset has one field with the temperature in the range from 246 to 304 Kelvin. To set all values below 273.15 Kelvin to missing value use:

```
cdo setrtomiss,0,273.15 ifile ofile
```

Result of '`cdo info ifile`':

```
   -1 :       Date  Time Code Level   Size  Miss :    Minimum     Mean  Maximum
    1 : 1987-12-31 12:00  139     0   2048     0 :     246.27   276.75   303.71
```

Result of '`cdo info ofile`':

```
   -1 :       Date  Time Code Level   Size  Miss :    Minimum     Mean  Maximum
    1 : 1987-12-31 12:00  139     0   2048   871 :     273.16   287.08   303.71
```

2.7. Arithmetic

This section contains modules to arithmetically process datasets.

Here is a short overview of all operators in this section:

expr	Evaluate expressions
exprf	Evaluate expressions from script file
abs	Absolute value
int	Integer value
nint	Nearest integer value
sqr	Square
sqrt	Square root
exp	Exponential
ln	Natural logarithm
log10	Base 10 logarithm
sin	Sine
cos	Cosine
tan	Tangent
asin	Arc sine
acos	Arc cosine
atan	Arc tangent
addc	Add a constant
subc	Subtract a constant
mulc	Multiply with a constant
divc	Divide by a constant
add	Add two fields
sub	Subtract two fields
mul	Multiply two fields
div	Divide two fields
min	Minimum of two fields
max	Maximum of two fields
atan2	Arc tangent of two fields
monadd	Add monthly time series
monsub	Subtract monthly time series
monmul	Multiply monthly time series
mondiv	Divide monthly time series
ymonadd	Add multi-year monthly time series
ymonsub	Subtract multi-year monthly time series
ymonmul	Multiply multi-year monthly time series
ymondiv	Divide multi-year monthly time series
muldpm	Multiply with days per month
divdpm	Divide by days per month
muldpy	Multiply with days per year
divdpy	Divide by days per year

2.7.1. EXPR - Evaluate expressions

Synopsis

expr,*instr* `ifile ofile`

exprf,*filename* `ifile ofile`

Description

This module arithmetically processes every time step of the input dataset. Each individual assignment statement must end with a semi-colon. The basic arithmetic operations addition +, subtraction −, multiplication ∗, division / and exponentiation ^ can be used. The following intrinsic functions are available:

sqrt(x)	Square Root of x
exp(x)	Exponential of x
log(x)	Natural logarithm of x
log10(x)	Base 10 logarithm of x
sin(x)	Sine of x, where x is specified in radians
cos(x)	Cosine of x, where x is specified in radians
tan(x)	Tangent of x, where x is specified in radians
asin(x)	Arc-sine of x, where x is specified in radians
acos(x)	Arc-cosine of x, where x is specified in radians
atan(x)	Arc-tangent of x, where x is specified in radians

Operators

expr	Evaluate expressions The processing instructions are read from the parameter.
exprf	Evaluate expressions from script file Contrary to expr the processing instructions are read from a file.

Parameter

instr	STRING	Processing instructions (without spaces!)
filename	STRING	File with processing instructions

Example

Assume an input dataset contains at least the variables 'aprl', 'aprc' and 'ts'. To create a new variable 'var1' with the sum of 'aprl' and 'aprc' and a variable 'var2' which convert the temperature 'ts' from Kelvin to Celsius use:

```
cdo expr,'var1=aprl+aprc;var2=ts-273.15;' ifile ofile
```

The same example, but the instructions are read from a file:

```
cdo exprf,myexpr ifile ofile
```

The file `myexpr` contains:

```
var1 = aprl + aprc;
var2 = ts - 273.15;
```

2.7.2. MATH - Mathematical functions

Synopsis

<operator> `ifile ofile`

Description

This module contains some standard mathematical functions. All trigonometric functions calculate with radians.

Operators

abs Absolute value
$o(t,x) = \mathrm{abs}(i(t,x))$

int Integer value
$o(t,x) = \mathrm{int}(i(t,x))$

nint Nearest integer value
$o(t,x) = \mathrm{nint}(i(t,x))$

sqr Square
$o(t,x) = i(t,x)^2$

sqrt Square root
$o(t,x) = \sqrt{i(t,x)}$

exp Exponential
$o(t,x) = \mathrm{e}^{i(t,x)}$

ln Natural logarithm
$o(t,x) = \ln(i(t,x))$

log10 Base 10 logarithm
$o(t,x) = \log_{10}(i(t,x))$

sin Sine
$o(t,x) = \sin(i(t,x))$

cos Cosine
$o(t,x) = \cos(i(t,x))$

tan Tangent
$o(t,x) = \tan(i(t,x))$

asin Arc sine
$o(t,x) = \arcsin(i(t,x))$

acos Arc cosine
$o(t,x) = \arccos(i(t,x))$

atan Arc tangent
$o(t,x) = \arctan(i(t,x))$

Example

To calculate the square root for all field elements use:

```
cdo sqrt ifile ofile
```

2.7.3. ARITHC - Arithmetic with a constant

Synopsis

<operator>,*c* `ifile ofile`

Description

This module performs simple arithmetic with all field elements of a dataset and a constant. The header and date information in `ofile` is the same as in `ifile`.

Operators

addc Add a constant
$o(t,x) = i(t,x) + c$

subc Subtract a constant
$o(t,x) = i(t,x) - c$

mulc Multiply with a constant
$o(t,x) = i(t,x) * c$

divc Divide by a constant
$o(t,x) = i(t,x)/c$

Parameter

c FLOAT Constant

Example

To sum all input fields with the constant -273.15 use:

```
cdo addc,-273.15 ifile ofile
```

2.7.4. ARITH - Arithmetic on two datasets

Synopsis

<operator> `ifile1 ifile2 ofile`

Description

This module performs simple arithmetic of two datasets. The header and date information in `ofile` is the same as in `ifile1`.

Operators

add Add two fields
$o(t,x) = i_1(t,x) + i_2(t,x)$

sub Subtract two fields
$o(t,x) = i_1(t,x) - i_2(t,x)$

mul Multiply two fields
$o(t,x) = i_1(t,x) * i_2(t,x)$

div Divide two fields
$o(t,x) = i_1(t,x)/i_2(t,x)$

min Minimum of two fields
$o(t,x) = \min(i_1(t,x), i_2(t,x))$

max Maximum of two fields
$o(t,x) = \max(i_1(t,x), i_2(t,x))$

atan2 Arc tangent of two fields
The *atan*2 operator calculates the arc tangent of two fields. The result is in radians, which is between -PI and PI (inclusive).
$o(t,x) = \text{atan2}(i_1(t,x), i_2(t,x))$

Example

To sum all fields of the first input file with the corresponding fields of the second input file use:

```
cdo add ifile1 ifile2 ofile
```

2.7.5. MONARITH - Monthly arithmetic

Synopsis

<operator> `ifile1 ifile2 ofile`

Description

This module performs simple arithmetic of a time series and a time step with the same month and year. For each field in `ifile1` the corresponding field of the time step in `ifile2` with the same month and year is used. The header information in `ifile1` must be the same as in `ifile2`. Usually `ifile2` is generated by a call of the module MONSTAT.

Operators

monadd Add monthly time series
Adds a time series and a monthly time series.

monsub Subtract monthly time series
Subtracts a time series and a monthly time series.

monmul Multiply monthly time series
Multiplies a time series and a monthly time series.

mondiv Divide monthly time series
Divides a time series and a monthly time series.

Example

To subtract a monthly time average from a time series, use:

```
cdo monsub ifile -monavg ifile ofile
```

2.7.6. YMONARITH - Multi-year monthly arithmetic

Synopsis

<operator> `ifile1 ifile2 ofile`

Description

This module performs simple arithmetic of a time series and a time step with the same month of year. For each field in `ifile1` the corresponding field of the time step in `ifile2` with the same month of year is used. The header information in `ifile1` must be the same as in `ifile2`. Usually `ifile2` is generated by a call of the module YMONSTAT.

Operators

ymonadd Add multi-year monthly time series
Adds a time series and a multi-year monthly time series.

ymonsub Subtract multi-year monthly time series
Subtracts a time series and a multi-year monthly time series.

ymonmul Multiply multi-year monthly time series
Multiplies a time series and a multi-year monthly time series.

ymondiv Divide multi-year monthly time series
Divides a time series and a multi-year monthly time series.

Example

To subtract a multi-year monthly time average from a time series, use:

```
cdo ymonsub ifile -ymonavg ifile ofile
```

2.7.7. ARITHDAYS - Arithmetic with days

Synopsis

<operator> `ifile ofile`

Description

This module multiplies or divides each time step of a dataset with the corresponding days per month or days per year.

Operators

muldpm Multiply with days per month
$o(t,x) = i(t,x) * days\_per\_month$

divdpm Divide by days per month
$o(t,x) = i(t,x)/days\_per\_month$

muldpy Multiply with days per year
$o(t,x) = i(t,x) * days\_per\_year$

divdpy Divide by days per year
$o(t,x) = i(t,x)/days\_per\_year$

Example

Assume an input dataset is a monthly mean time series. To compute the yearly mean from the correct weighted monthly mean use:

```
cdo muldpm ifile tmpfile1
cdo yearavg tmpfile1 tmpfile2
cdo mulc,12 -divdpy tmpfile2 ofile
```

Or all in one command line:

```
cdo mulc,12 -divdpy -yearavg -muldpm ifile ofile
```

2.8. Statistical values

This section contains modules to compute statistical values of datasets. In this program there is the different notion of "mean" and "average" to distinguish two different kinds of treatment of missing values. While computing the mean, only the not missing values are considered to belong to the sample with the side effect of a probably reduced sample size. Computing the average is just adding the sample members and divide the result by the sample size. For example, the mean of 1, 2, miss and 3 is (1+2+3)/3 = 2, whereas the average is (1+2+miss+3)/4 = miss/4 = miss. If there are no missing values in the sample, the average and the mean are identical.
In this section the abbreviations as in the following table are used:

sum	$\sum_{i=1}^{n} x_i$
mean resp. **avg**	$n^{-1} \sum_{i=1}^{n} x_i$
mean resp. **avg** weighted by $\{w_i, i = 1, ..., n\}$	$\left(\sum_{j=1}^{n} w_j \right)^{-1} \sum_{i=1}^{n} w_i \, x_i$
Variance **var**	$n^{-1} \sum_{i=1}^{n} (x_i - \overline{x})^2$
var weighted by $\{w_i, i = 1, ..., n\}$	$\left(\sum_{j=1}^{n} w_j \right)^{-1} \sum_{i=1}^{n} w_i \left(x_i - \left(\sum_{j=1}^{n} w_j \right)^{-1} \sum_{j=1}^{n} w_j \, x_j \right)^2$
Standard deviation **std**	$\sqrt{n^{-1} \sum_{i=1}^{n} (x_i - \overline{x})^2}$
std weighted by $\{w_i, i = 1, ..., n\}$	$\sqrt{\left(\sum_{j=1}^{n} w_j \right)^{-1} \sum_{i=1}^{n} w_i \left(x_i - \left(\sum_{j=1}^{n} w_j \right)^{-1} \sum_{j=1}^{n} w_j \, x_j \right)^2}$

Here is a short overview of all operators in this section:

ensmin	Ensemble minimum
ensmax	Ensemble maximum
enssum	Ensemble sum
ensmean	Ensemble mean
ensavg	Ensemble average
ensvar	Ensemble variance
ensstd	Ensemble standard deviation
enspctl	Ensemble percentiles

2.8.1. ENSSTAT - Statistical values over an ensemble

Synopsis

ensmin `ifiles ofile`

ensmax `ifiles ofile`

enssum `ifiles ofile`

ensmean `ifiles ofile`

ensavg `ifiles ofile`

ensvar `ifiles ofile`

ensstd `ifiles ofile`

enspctl,p `ifiles ofile`

Description

This module computes statistical values over an ensemble of input files. Depending on the actual operator the minimum, maximum, sum, average, variance, standard deviation, or a certain percentile over all input files is written to `ofile`. The date information for a time step in `ofile` is the date of the first input file.

Operators

ensmin Ensemble minimum
$o(t,x) = \mathbf{min}\{i_1(t,x), i_2(t,x), \cdots, i_n(t,x)\}$

ensmax Ensemble maximum
$o(t,x) = \mathbf{max}\{i_1(t,x), i_2(t,x), \cdots, i_n(t,x)\}$

enssum Ensemble sum
$o(t,x) = \mathbf{sum}\{i_1(t,x), i_2(t,x), \cdots, i_n(t,x)\}$

ensmean Ensemble mean
$o(t,x) = \mathbf{mean}\{i_1(t,x), i_2(t,x), \cdots, i_n(t,x)\}$

ensavg Ensemble average
$o(t,x) = \mathbf{avg}\{i_1(t,x), i_2(t,x), \cdots, i_n(t,x)\}$

ensvar Ensemble variance
$o(t,x) = \mathbf{var}\{i_1(t,x), i_2(t,x), \cdots, i_n(t,x)\}$

ensstd Ensemble standard deviation
$o(t,x) = \mathbf{std}\{i_1(t,x), i_2(t,x), \cdots, i_n(t,x)\}$

enspctl Ensemble percentiles
$o(t,x) = \mathbf{pth\ percentile}\{i_1(t,x), i_2(t,x), \cdots, i_n(t,x)\}$

Parameter

p INTEGER Percentile number in 1, ..., 99

Example

To compute the ensemble mean over 6 input files, use:

```
cdo ensmean ifile1 ifile2 ifile3 ifile4 ifile5 ifile6 ofile
```

Or shorter with filename substitution:

```
cdo ensmean ifile[1-6] ofile
```

To compute the 50th percentile (median) over 6 input files, use:

```
cdo enspctl,50 ifile1 ifile2 ifile3 ifile4 ifile5 ifile6 ofile
```

Or shorter with filename substitution:

```
cdo enspctl,50 ifile[1-6] ofile
```

2.8.2. FLDSTAT - Statistical values over a field

Synopsis

fldmin `ifile ofile`

fldmax `ifile ofile`

fldsum `ifile ofile`

fldmean `ifile ofile`

fldavg `ifile ofile`

fldvar `ifile ofile`

fldstd `ifile ofile`

fldpctl,p `ifile ofile`

Description

This module computes statistical values of the input fields. According to the actual operator the field minimum, maximum, sum, average, variance, standard deviation or a certain percentile is written to `ofile`.

Operators

fldmin Field minimum
For every gridpoint $x_1, ..., x_n$ of the same field, it is:
$o(t,1) = \mathbf{min}\{i(t,x'), x_1 < x' \leq x_n\}$

fldmax Field maximum
For every gridpoint $x_1, ..., x_n$ of the same field, it is:
$o(t,1) = \mathbf{max}\{i(t,x'), x_1 < x' \leq x_n\}$

fldsum Field sum
For every gridpoint $x_1, ..., x_n$ of the same field, it is:
$o(t,1) = \mathbf{sum}\{i(t,x'), x_1 < x' \leq x_n\}$

fldmean Field mean
For every gridpoint $x_1, ..., x_n$ of the same field, it is:
$o(t,1) = \mathbf{mean}\{i(t,x'), x_1 < x' \leq x_n\}$

weighted by area weights obtained by the input field.

fldavg Field average
For every gridpoint $x_1, ..., x_n$ of the same field, it is:
$o(t,1) = \mathbf{avg}\{i(t,x'), x_1 < x' \leq x_n\}$

weighted by area weights obtained by the input field.

fldvar Field variance
For every gridpoint $x_1, ..., x_n$ of the same field, it is:
$o(t,1) = \mathbf{var}\{i(t,x'), x_1 < x' \leq x_n\}$

weighted by area weights obtained by the input field.

fldstd Field standard deviation
For every gridpoint $x_1, ..., x_n$ of the same field, it is:
$o(t,1) = \mathbf{std}\{i(t,x'), x_1 < x' \leq x_n\}$

weighted by area weights obtained by the input field.

fldpctl Field percentiles
For every gridpoint $x_1, ..., x_n$ of the same field, it is:
$o(t,1) = \mathbf{pth\ percentile}\{i(t,x'), x_1 < x' \leq x_n\}$

Parameter

p	INTEGER	Percentile number in 1, ..., 99

Example

To compute the field mean of all input fields, use:

```
cdo fldmean ifile ofile
```

To compute the 90th percentile of all input fields, use:

```
cdo fldpctl,90 ifile ofile
```

2.8.3. ZONSTAT - Zonal statistical values

Synopsis

zonmin `ifile ofile`

zonmax `ifile ofile`

zonsum `ifile ofile`

zonmean `ifile ofile`

zonavg `ifile ofile`

zonvar `ifile ofile`

zonstd `ifile ofile`

zonpctl,*p* `ifile ofile`

Description

This module computes zonal statistical values of the input fields. According to the actual operator the zonal minimum, maximum, sum, average, variance, standard deviation or a certain percentile is written to `ofile`. All input fields must have the same rectangular grid.

Operators

zonmin	Zonal minimum For every latitude the minimum over all longitudes is computed.
zonmax	Zonal maximum For every latitude the maximum over all longitudes is computed.
zonsum	Zonal sum For every latitude the sum over all longitudes is computed.
zonmean	Zonal mean For every latitude the mean over all longitudes is computed.
zonavg	Zonal average For every latitude the average over all longitudes is computed.
zonvar	Zonal variance For every latitude the variance over all longitudes is computed.
zonstd	Zonal standard deviation For every latitude the standard deviation over all longitudes is computed.
zonpctl	Zonal percentiles For every latitude the pth percentile over all longitudes is computed.

Parameter

p	INTEGER	Percentile number in 1, ..., 99

Example

To compute the zonal mean of all input fields, use:

```
cdo zonmean ifile ofile
```

To compute the 50th meridional percentile (median) of all input fields, use:

```
cdo zonpctl,50 ifile ofile
```

2.8.4. MERSTAT - Meridional statistical values

Synopsis

mermin `ifile ofile`

mermax `ifile ofile`

mersum `ifile ofile`

mermean `ifile ofile`

meravg `ifile ofile`

mervar `ifile ofile`

merstd `ifile ofile`

merpctl,*p* `ifile ofile`

Description

This module computes meridional statistical values of the input fields. According to the actual operator the meridional minimum, maximum, sum, average, variance, standard deviation or a certain percentile is written to `ofile`. All input fields must have the same rectangular grid.

Operators

mermin Meridional minimum
For every longitude the minimum over all latitudes is computed.

mermax Meridional maximum
For every longitude the maximum over all latitudes is computed.

mersum Meridional sum
For every longitude the sum over all latitudes is computed.

mermean Meridional mean
For every longitude the area weighted mean over all latitudes is computed.

meravg Meridional average
For every longitude the area weighted average over all latitudes is computed.

mervar Meridional variance
For every longitude the variance over all latitudes is computed.

merstd Meridional standard deviation
For every longitude the standard deviation over all latitudes is computed.

merpctl Meridional percentiles
For every longitude the pth percentile over all latitudes is computed.

Parameter

p INTEGER Percentile number in 1, ..., 99

Example

To compute the meridional mean of all input fields, use:

```
cdo mermean ifile ofile
```

To compute the 50th meridional percentile (median) of all input fields, use:

```
cdo merpctl,50 ifile ofile
```

2.8.5. VERTSTAT - Vertical statistical values

Synopsis

<operator> `ifile ofile`

Description

This module computes statistical values over all levels of the input variables. According to actual operator the vertical minimum, maximum, sum, average, variance or standard deviation is written to `ofile`.

Operators

vertmin Vertical minimum
For every gridpoint the minimum over all levels is computed.

vertmax Vertical maximum
For every gridpoint the maximum over all levels is computed.

vertsum Vertical sum
For every gridpoint the sum over all levels is computed.

vertmean Vertical mean
For every gridpoint the mean over all levels is computed.

vertavg Vertical average
For every gridpoint the average over all levels is computed.

vertvar Vertical variance
For every gridpoint the variance over all levels is computed.

vertstd Vertical standard deviation
For every gridpoint the standard deviation over all levels is computed.

Example

To compute the vertical sum of all input variables, use:

```
cdo vertsum ifile ofile
```

2.8.6. TIMSELSTAT - Time range statistical values

Synopsis

<operator>,nsets[,noffset[,nskip]] `ifile ofile`

Description

This module computes statistical values for a selected number of time steps. According to the actual operator the average, minimum, maximum, sum, average, variance or standard deviation of the selected time steps is written to `ofile`. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Operators

timselmin Time range minimum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same selected time range, it is:
$o(t, x) = \mathbf{min}\{i(t', x), t_1 < t' \leq t_n\}$

timselmax Time range maximum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same selected time range, it is:
$o(t, x) = \mathbf{max}\{i(t', x), t_1 < t' \leq t_n\}$

timselsum Time range sum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same selected time range, it is:
$o(t, x) = \mathbf{sum}\{i(t', x), t_1 < t' \leq t_n\}$

timselmean Time range mean
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same selected time range, it is:
$o(t, x) = \mathbf{mean}\{i(t', x), t_1 < t' \leq t_n\}$

timselavg Time range average
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same selected time range, it is:
$o(t, x) = \mathbf{avg}\{i(t', x), t_1 < t' \leq t_n\}$

timselvar Time range variance
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same selected time range, it is:
$o(t, x) = \mathbf{var}\{i(t', x), t_1 < t' \leq t_n\}$

timselstd Time range standard deviation
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same selected time range, it is:
$o(t, x) = \mathbf{std}\{i(t', x), t_1 < t' \leq t_n\}$

Parameter

nsets	INTEGER	Number of input time steps for each output time step
noffset	INTEGER	Number of input time steps skipped before the first time step range (optional)
nskip	INTEGER	Number of input time steps skipped between time step ranges (optional)

Example

Assume an input dataset has monthly means over several years. To compute seasonal means from monthly means the first two month must be skipped:

```
cdo timselmean,3,2 ifile ofile
```

2.8.7. TIMSELPCTL - Time range percentile values

Synopsis

timselpctl,*p*,*nsets*[,*noffset*[,*nskip*]] `ifile1 ifile2 ifile3 ofile`

Description

This module computes percentile values over a selected number of time steps in `ifile1`. The algorithm uses histograms with minimum and maximum bounds given in `ifile2` and `ifile3`, respectively. The default number of histogram bins is 100. The default can be overridden by setting the environment variable CDO_PCTL_NBINS to a different value. The files `ifile2` and `ifile3` must be the result of corresponding timselmin and timselmax operations, respectively. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same selected time range, it is:
$o(t, x) =$ **pth percentile**$\{i(t', x), t_1 < t' \leq t_n\}$

Parameter

p	INTEGER	Percentile number in 1, ..., 99
nsets	INTEGER	Number of input time steps for each output time step
noffset	INTEGER	Number of input time steps skipped before the first time step range (optional)
nskip	INTEGER	Number of input time steps skipped between time step ranges (optional)

Environment

CDO_PCTL_NBINS	Sets the number of histogram bins. The default number is 100.

2.8.8. RUNSTAT - Running statistical values

Synopsis

<operator>,nts `ifile ofile`

Description

This module computes running statistical values over a selected number of time steps. Depending on the actual operator the minimum, maximum, sum, average, variance or standard deviation of a selected number of consecutive time steps read from `ifile` is written to `ofile`. The date information in `ofile` is the date of the middle contributing time step in `ifile`.

Operators

runmin Running minimum
$o(t+(nts-1)/2,x) = \mathbf{min}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x)\}$

runmax Running maximum
$o(t+(nts-1)/2,x) = \mathbf{max}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x)\}$

runsum Running sum
$o(t+(nts-1)/2,x) = \mathbf{sum}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x)\}$

runmean Running mean
$o(t+(nts-1)/2,x) = \mathbf{mean}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x)\}$

runavg Running average
$o(t+(nts-1)/2,x) = \mathbf{avg}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x)\}$

runvar Running variance
$o(t+(nts-1)/2,x) = \mathbf{std}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x)\}$

runstd Running standard deviation
$o(t+(nts-1)/2,x) = \mathbf{std}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x)\}$

Parameter

nts	INTEGER	Number of time steps

Environment

`RUNSTAT_DATE`	Sets the date information in ofile to the "first", "last" or "middle" contributing time step in ifile.

Example

To compute the running mean over 9 time steps, use:

```
cdo runmean,9 ifile ofile
```

2.8.9. RUNPCTL - Running percentile values

Synopsis

runpctl,*p*,*nts* `ifile1 ofile`

Description

This module computes running percentiles over a selected number of time steps in `ifile1`. The date information in `ofile` is the date of the medium contributing time step in `ifile1`.
$o(t + (nts - 1)/2, x) =$ **pth percentile**$\{i(t, x), i(t + 1, x), ..., i(t + nts - 1, x)\}$

Parameter

p	INTEGER	Percentile number in 1, ..., 99
nts	INTEGER	Number of time steps

Example

To compute the running 50th percentile (median) over 9 time steps, use:

```
cdo runpctl,50,9 ifile -runmin,9 ifile -runmax,9 ifile ofile
```

2.8.10. TIMSTAT - Statistical values over all time steps

Synopsis

<operator> `ifile ofile`

Description

This module computes statistical values over all time steps in `ifile`. Depending on the actual operator the minimum, maximum, sum, average, variance or standard deviation of all time steps read from `ifile` is written to `ofile`. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Operators

timmin Time minimum
$o(1,x) = \mathbf{min}\{i(t',x), t_1 < t' \leq t_n\}$

timmax Time maximum
$o(1,x) = \mathbf{max}\{i(t',x), t_1 < t' \leq t_n\}$

timsum Time sum
$o(1,x) = \mathbf{sum}\{i(t',x), t_1 < t' \leq t_n\}$

timmean Time mean
$o(1,x) = \mathbf{mean}\{i(t',x), t_1 < t' \leq t_n\}$

timavg Time average
$o(1,x) = \mathbf{avg}\{i(t',x), t_1 < t' \leq t_n\}$

timvar Time variance
$o(1,x) = \mathbf{var}\{i(t',x), t_1 < t' \leq t_n\}$

timstd Time standard deviation
$o(1,x) = \mathbf{std}\{i(t',x), t_1 < t' \leq t_n\}$

Example

To compute the mean over all input time steps, use:

```
cdo timmean ifile ofile
```

2.8.11. TIMPCTL - Percentile values over all time steps

Synopsis

timpctl,p `ifile1 ifile2 ifile3 ofile`

Description

This module computes percentiles over all time steps in `ifile1`. The algorithm uses histograms with minimum and maximum bounds given in `ifile2` and `ifile3`, respectively. The default number of histogram bins is 100. The default can be overridden by setting the environment variable CDO_PCTL_NBINS to a different value. The files `ifile2` and `ifile3` must be the result of corresponding timmin and timmax operations, respectively. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.
$o(1,x) = \textbf{pth percentile}\{i(t',x), t_1 < t' \leq t_n\}$

Parameter

p	INTEGER	Percentile number in 1, ..., 99

Environment

`CDO_PCTL_NBINS`	Sets the number of histogram bins. The default number is 100.

Example

To compute the 90th percentile over all input time steps, use:

```
cdo timmin ifile minfile
cdo timmax ifile maxfile
cdo timpctl,90 ifile minfile maxfile ofile
```

Or shorter using operator piping:

```
cdo timpctl,90 ifile -timmin ifile -timmax ifile ofile
```

2.8.12. HOURSTAT - Hourly statistical values

Synopsis

<operator> `ifile ofile`

Description

This module computes statistical values over time steps of the same hour. Depending on the actual operator the minimum, maximum, sum, average, variance or standard deviation of time steps of the same hour is written to `ofile`. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Operators

hourmin Hourly minimum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same hour, it is:
$o(t, x) = \mathbf{min}\{i(t', x), t_1 < t' \leq t_n\}$

hourmax Hourly maximum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same hour, it is:
$o(t, x) = \mathbf{max}\{i(t', x), t_1 < t' \leq t_n\}$

hoursum Hourly sum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same hour, it is:
$o(t, x) = \mathbf{sum}\{i(t', x), t_1 < t' \leq t_n\}$

hourmean Hourly mean
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same hour, it is:
$o(t, x) = \mathbf{mean}\{i(t', x), t_1 < t' \leq t_n\}$

houravg Hourly average
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same hour, it is:
$o(t, x) = \mathbf{avg}\{i(t', x), t_1 < t' \leq t_n\}$

hourvar Hourly variance
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same hour, it is:
$o(t, x) = \mathbf{var}\{i(t', x), t_1 < t' \leq t_n\}$

hourstd Hourly standard deviation
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same hour, it is:
$o(t, x) = \mathbf{std}\{i(t', x), t_1 < t' \leq t_n\}$

Example

To compute the hourly mean of a time series, use:

```
cdo hourmean ifile ofile
```

2.8.13. HOURPCTL - Hourly percentile values

Synopsis

hourpctl,p `ifile1 ifile2 ifile3 ofile`

Description

This module computes percentiles over all time steps in `ifile1` of the same hour. The algorithm uses histograms with minimum and maximum bounds given in `ifile2` and `ifile3`, respectively. The default number of histogram bins is 100. The default can be overridden by setting the environment variable CDO_PCTL_NBINS to a different value. The files `ifile2` and `ifile3` must be the result of corresponding hourmin and hourmax operations, respectively. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same hour, it is:
$o(t, x) =$ **pth percentile**$\{i(t', x), t_1 < t' \leq t_n\}$

Parameter

p	INTEGER	Percentile number in 1, ..., 99

Environment

CDO_PCTL_NBINS	Sets the number of histogram bins. The default number is 100.

Example

To compute the hourly 90th percentile of a time series, use:

```
cdo hourmin ifile minfile
cdo hourmax ifile maxfile
cdo hourpctl,90 ifile minfile maxfile ofile
```

Or shorter using operator piping:

```
cdo hourpctl,90 ifile -hourmin ifile -hourmax ifile ofile
```

2.8.14. DAYSTAT - Daily statistical values

Synopsis

<operator> `ifile ofile`

Description

This module computes statistical values over time steps of the same day. Depending on the actual operator the minimum, maximum, sum, average, variance or standard deviation of time steps of the same day is written to `ofile`. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Operators

daymin Daily minimum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same day, it is:
$o(t, x) = \mathbf{min}\{i(t', x), t_1 < t' \leq t_n\}$

daymax Daily maximum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same day, it is:
$o(t, x) = \mathbf{max}\{i(t', x), t_1 < t' \leq t_n\}$

daysum Daily sum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same day, it is:
$o(t, x) = \mathbf{sum}\{i(t', x), t_1 < t' \leq t_n\}$

daymean Daily mean
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same day, it is:
$o(t, x) = \mathbf{mean}\{i(t', x), t_1 < t' \leq t_n\}$

dayavg Daily average
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same day, it is:
$o(t, x) = \mathbf{avg}\{i(t', x), t_1 < t' \leq t_n\}$

dayvar Daily variance
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same day, it is:
$o(t, x) = \mathbf{var}\{i(t', x), t_1 < t' \leq t_n\}$

daystd Daily standard deviation
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same day, it is:
$o(t, x) = \mathbf{std}\{i(t', x), t_1 < t' \leq t_n\}$

Example

To compute the daily mean of a time series, use:

```
cdo daymean ifile ofile
```

2.8.15. DAYPCTL - Daily percentile values

Synopsis

daypctl,p `ifile1 ifile2 ifile3 ofile`

Description

This module computes percentiles over all time steps in `ifile1` of the same day. The algorithm uses histograms with minimum and maximum bounds given in `ifile2` and `ifile3`, respectively. The default number of histogram bins is 100. The default can be overridden by defining the environment variable CDO_PCTL_NBINS. The files `ifile2` and `ifile3` must be the result of corresponding daymin and daymax operations, respectively. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same day, it is:
$o(t, x) =$ **pth percentile**$\{i(t', x), t_1 < t' \leq t_n\}$

Parameter

p	INTEGER	Percentile number in 1, ..., 99

Environment

CDO_PCTL_NBINS	Sets the number of histogram bins. The default number is 100.

Example

To compute the daily 90th percentile of a time series, use:

```
cdo daymin ifile minfile
cdo daymax ifile maxfile
cdo daypctl,90 ifile minfile maxfile ofile
```

Or shorter using operator piping:

```
cdo daypctl,90 ifile -daymin ifile -daymax ifile ofile
```

2.8.16. MONSTAT - Monthly statistical values

Synopsis

<operator> `ifile ofile`

Description

This module computes statistical values over time steps of the same month. Depending on the actual operator the minimum, maximum, sum, average, variance or standard deviation of time steps of the same month is written to `ofile`. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Operators

monmin Monthly minimum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same month, it is:
$o(t, x) = \mathbf{min}\{i(t', x), t_1 < t' \leq t_n\}$

monmax Monthly maximum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same month, it is:
$o(t, x) = \mathbf{max}\{i(t', x), t_1 < t' \leq t_n\}$

monsum Monthly sum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same month, it is:
$o(t, x) = \mathbf{sum}\{i(t', x), t_1 < t' \leq t_n\}$

monmean Monthly mean
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same month, it is:
$o(t, x) = \mathbf{mean}\{i(t', x), t_1 < t' \leq t_n\}$

monavg Monthly average
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same month, it is:
$o(t, x) = \mathbf{avg}\{i(t', x), t_1 < t' \leq t_n\}$

monvar Monthly variance
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same month, it is:
$o(t, x) = \mathbf{var}\{i(t', x), t_1 < t' \leq t_n\}$

monstd Monthly standard deviation
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same month, it is:
$o(t, x) = \mathbf{std}\{i(t', x), t_1 < t' \leq t_n\}$

Example

To compute the monthy mean of a time series, use:

```
cdo monmean ifile ofile
```

2.8.17. MONPCTL - Monthly percentile values

Synopsis

monpctl,p `ifile1 ifile2 ifile3 ofile`

Description

This module computes percentiles over all time steps in `ifile1` of the same month. The algorithm uses histograms with minimum and maximum bounds given in `ifile2` and `ifile3`, respectively. The default number of histogram bins is 100. The default can be overridden by setting the environment variable CDO_PCTL_NBINS to a different value. The files `ifile2` and `ifile3` must be the result of corresponding monmin and monmax operations, respectively. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same month, it is:
$o(t, x) =$ **pth percentile**$\{i(t', x), t_1 < t' \leq t_n\}$

Parameter

p	INTEGER	Percentile number in 1, ..., 99

Environment

CDO_PCTL_NBINS	Sets the number of histogram bins. The default number is 100.

Example

To compute the monthly 90th percentile of a time series, use:

```
cdo monmin ifile minfile
cdo monmax ifile maxfile
cdo monpctl,90 ifile minfile maxfile ofile
```

Or shorter using operator piping:

```
cdo monpctl,90 ifile -monmin ifile -monmax ifile ofile
```

2.8.18. YEARSTAT - Yearly statistical values

Synopsis

<operator> `ifile ofile`

Description

This module computes statistical values over time steps of the same year. Depending on the actual operator the minimum, maximum, sum, average, variance or standard deviation of time steps of the same year is written to `ofile`. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Operators

yearmin Yearly minimum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same year, it is:
$o(t, x) = \mathbf{min}\{i(t', x), t_1 < t' \leq t_n\}$

yearmax Yearly maximum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same year, it is:
$o(t, x) = \mathbf{max}\{i(t', x), t_1 < t' \leq t_n\}$

yearsum Yearly sum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same year, it is:
$o(t, x) = \mathbf{sum}\{i(t', x), t_1 < t' \leq t_n\}$

yearmean Yearly mean
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same year, it is:
$o(t, x) = \mathbf{mean}\{i(t', x), t_1 < t' \leq t_n\}$

yearavg Yearly average
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same year, it is:
$o(t, x) = \mathbf{avg}\{i(t', x), t_1 < t' \leq t_n\}$

yearvar Yearly variance
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same year, it is:
$o(t, x) = \mathbf{var}\{i(t', x), t_1 < t' \leq t_n\}$

yearstd Yearly standard deviation
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same year, it is:
$o(t, x) = \mathbf{std}\{i(t', x), t_1 < t' \leq t_n\}$

Note

The operators yearmean and yearavg computes only an arithmetical mean!

Example

To compute the yearly mean of a time series, use:

```
cdo yearmean ifile ofile
```

To compute the yearly mean from the correct weighted monthly mean, use:

```
cdo mulc,12 -divdpy -yearmean -muldpm ifile ofile
```

2.8.19. YEARPCTL - Yearly percentile values

Synopsis

yearpctl,*p* `ifile1 ifile2 ifile3 ofile`

Description

This module computes percentiles over all time steps in `ifile1` of the same year. The algorithm uses histograms with minimum and maximum bounds given in `ifile2` and `ifile3`, respectively. The default number of histogram bins is 100. The default can be overridden by setting the environment variable CDO_PCTL_NBINS to a different value. The files `ifile2` and `ifile3` must be the result of corresponding yearmin and yearmax operations, respectively. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same year, it is:
$o(t, x) =$ **pth percentile**$\{i(t', x), t_1 < t' \leq t_n\}$

Parameter

p	INTEGER	Percentile number in 1, ..., 99

Environment

CDO_PCTL_NBINS	Sets the number of histogram bins. The default number is 100.

Example

To compute the yearly 90th percentile of a time series, use:

```
cdo yearmin ifile minfile
cdo yearmax ifile maxfile
cdo yearpctl,90 ifile minfile maxfile ofile
```

Or shorter using operator piping:

```
cdo yearpctl,90 ifile -yearmin ifile -yearmax ifile ofile
```

2.8.20. SEASSTAT - Seasonal statistical values

Synopsis

<operator> `ifile ofile`

Description

This module computes statistical values over time steps of the same season. Depending on the actual operator the minimum, maximum, sum, average, variance or standard deviation of time steps of the same season is written to `ofile`. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`. Be careful about the first and the last output time step, they may be incorrect values if the seasons have incomplete time steps.

Operators

seasmin Seasonal minimum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same season, it is:
$o(t, x) = \mathbf{min}\{i(t', x), t_1 < t' \leq t_n\}$

seasmax Seasonal maximum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same season, it is:
$o(t, x) = \mathbf{max}\{i(t', x), t_1 < t' \leq t_n\}$

seassum Seasonal sum
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same season, it is:
$o(t, x) = \mathbf{sum}\{i(t', x), t_1 < t' \leq t_n\}$

seasmean Seasonal mean
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same season, it is:
$o(t, x) = \mathbf{mean}\{i(t', x), t_1 < t' \leq t_n\}$

seasavg Seasonal average
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same season, it is:
$o(t, x) = \mathbf{avg}\{i(t', x), t_1 < t' \leq t_n\}$

seasvar Seasonal variance
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same season, it is:
$o(t, x) = \mathbf{var}\{i(t', x), t_1 < t' \leq t_n\}$

seasstd Seasonal standard deviation
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same season, it is:
$o(t, x) = \mathbf{std}\{i(t', x), t_1 < t' \leq t_n\}$

Example

To compute the seasonal mean of a time series, use:

```
cdo seasmean ifile ofile
```

2.8.21. SEASPCTL - Seasonal percentile values

Synopsis

seaspctl,*p* `ifile1 ifile2 ifile3 ofile`

Description

This module computes percentiles over all time steps in `ifile1` of the same season. The algorithm uses histograms with minimum and maximum bounds given in `ifile2` and `ifile3`, respectively. The default number of histogram bins is 100. The default can be overridden by setting the environment variable CDO_PCTL_NBINS to a different value. The files `ifile2` and `ifile3` must be the result of corresponding seasmin and seasmax operations, respectively. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`. Be careful about the first and the last output time step, they may be incorrect values if the seasons have incomplete time steps.
For every adjacent sequence $t_1, ..., t_n$ of time steps of the same season, it is:
$o(t, x) =$ **pth percentile**$\{i(t', x), t_1 < t' \leq t_n\}$

Parameter

p	INTEGER	Percentile number in 1, ..., 99

Environment

`CDO_PCTL_NBINS`	Sets the number of histogram bins. The default number is 100.

Example

To compute the seasonal 90th percentile of a time series, use:

```
cdo seasmin ifile minfile
cdo seasmax ifile maxfile
cdo seaspctl,90 ifile minfile maxfile ofile
```

Or shorter using operator piping:

```
cdo seaspctl,90 ifile -seasmin ifile -seasmax ifile ofile
```

2.8.22. YHOURSTAT - Multi-year hourly statistical values

Synopsis

<operator> `ifile ofile`

Description

This module writes to `ofile`, according to the actual operator, the minimum, maximum, sum, average, variance or standard deviation of each hour and day of year in `ifile`. The date information in an output field is the date of the last contributing input field.

Operators

yhourmin Multi-year hourly minimum

$$o(0001, x) = \mathbf{min}\{i(t, x), \mathrm{day}(i(t)) = 0001\}$$
$$\vdots$$
$$o(8784, x) = \mathbf{min}\{i(t, x), \mathrm{day}(i(t)) = 8784\}$$

yhourmax Multi-year hourly maximum

$$o(0001, x) = \mathbf{max}\{i(t, x), \mathrm{day}(i(t)) = 0001\}$$
$$\vdots$$
$$o(8784, x) = \mathbf{max}\{i(t, x), \mathrm{day}(i(t)) = 8784\}$$

yhoursum Multi-year hourly sum

$$o(0001, x) = \mathbf{sum}\{i(t, x), \mathrm{day}(i(t)) = 0001\}$$
$$\vdots$$
$$o(8784, x) = \mathbf{sum}\{i(t, x), \mathrm{day}(i(t)) = 8784\}$$

yhourmean Multi-year hourly mean

$$o(0001, x) = \mathbf{mean}\{i(t, x), \mathrm{day}(i(t)) = 0001\}$$
$$\vdots$$
$$o(8784, x) = \mathbf{mean}\{i(t, x), \mathrm{day}(i(t)) = 8784\}$$

yhouravg Multi-year hourly average

$$o(0001, x) = \mathbf{avg}\{i(t, x), \mathrm{day}(i(t)) = 0001\}$$
$$\vdots$$
$$o(8784, x) = \mathbf{avg}\{i(t, x), \mathrm{day}(i(t)) = 8784\}$$

yhourvar Multi-year hourly variance

$$o(0001, x) = \mathbf{var}\{i(t, x), \mathrm{day}(i(t)) = 0001\}$$
$$\vdots$$
$$o(8784, x) = \mathbf{var}\{i(t, x), \mathrm{day}(i(t)) = 8784\}$$

yhourstd Multi-year hourly standard deviation

$$o(0001, x) = \mathbf{std}\{i(t, x), \mathrm{day}(i(t)) = 0001\}$$
$$\vdots$$
$$o(8784, x) = \mathbf{std}\{i(t, x), \mathrm{day}(i(t)) = 8784\}$$

Example

To compute the hourly mean for all days over all input years, use:

```
cdo yhourmean ifile ofile
```

2.8.23. YDAYSTAT - Multi-year daily statistical values

Synopsis

<operator> `ifile ofile`

Description

This module writes to `ofile`, according to the actual operator, the minimum, maximum, sum, average, variance or standard deviation of each day of year in `ifile`. The date information in an output field is the date of the last contributing input field.

Operators

ydaymin Multi-year daily minimum

$$o(001,x) = \mathbf{min}\{i(t,x), \mathrm{day}(i(t)) = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{min}\{i(t,x), \mathrm{day}(i(t)) = 366\}$$

ydaymax Multi-year daily maximum

$$o(001,x) = \mathbf{max}\{i(t,x), \mathrm{day}(i(t)) = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{max}\{i(t,x), \mathrm{day}(i(t)) = 366\}$$

ydaysum Multi-year daily sum

$$o(001,x) = \mathbf{sum}\{i(t,x), \mathrm{day}(i(t)) = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{sum}\{i(t,x), \mathrm{day}(i(t)) = 366\}$$

ydaymean Multi-year daily mean

$$o(001,x) = \mathbf{mean}\{i(t,x), \mathrm{day}(i(t)) = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{mean}\{i(t,x), \mathrm{day}(i(t)) = 366\}$$

ydayavg Multi-year daily average

$$o(001,x) = \mathbf{avg}\{i(t,x), \mathrm{day}(i(t)) = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{avg}\{i(t,x), \mathrm{day}(i(t)) = 366\}$$

ydayvar Multi-year daily variance

$$o(001,x) = \mathbf{var}\{i(t,x), \mathrm{day}(i(t)) = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{var}\{i(t,x), \mathrm{day}(i(t)) = 366\}$$

ydaystd Multi-year daily standard deviation

$$o(001,x) = \mathbf{std}\{i(t,x), \mathrm{day}(i(t)) = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{std}\{i(t,x), \mathrm{day}(i(t)) = 366\}$$

Example

To compute the daily mean over all input years, use:

```
cdo ydaymean ifile ofile
```

2.8.24. YDAYPCTL - Multi-year daily percentile values

Synopsis

ydaypctl,p `ifile1 ifile2 ifile3 ofile`

Description

This module writes to `ofile` a certain percentile of each day of year in `ifile1`. The algorithm uses histograms with minimum and maximum bounds given in `ifile2` and `ifile3`, respectively. The default number of histogram bins is 100. The default can be overridden by setting the environment variable CDO_PCTL_NBINS to a different value. The files `ifile2` and `ifile3` must be the result of corresponding ydaymin and ydaymax operations, respectively. The date information in an output field is the date of the last contributing input field.

$$o(001, x) = \textbf{pth percentile}\{i(t, x), \text{day}(i(t)) = 001\}$$
$$\vdots$$
$$o(366, x) = \textbf{pth percentile}\{i(t, x), \text{day}(i(t)) = 366\}$$

Parameter

p	INTEGER	Percentile number in 1, ..., 99

Environment

`CDO_PCTL_NBINS`	Sets the number of histogram bins. The default number is 100.

Example

To compute the daily 90th percentile over all input years, use:

```
cdo ydaymin ifile minfile
cdo ydaymax ifile maxfile
cdo ydaypctl,90 ifile minfile maxfile ofile
```

Or shorter using operator piping:

```
cdo ydaypctl,90 ifile -ydaymin ifile -ydaymax ifile ofile
```

2.8.25. YMONSTAT - Multi-year monthly statistical values

Synopsis

<operator> `ifile ofile`

Description

This module writes to `ofile`, according to the actual operator, the minimum, maximum, sum, average, variance or standard deviation of each month of year in `ifile`. The date information in an output field is the date of the last contributing input field.

Operators

ymonmin Multi-year monthly minimum

$$o(01,x) = \mathbf{min}\{i(t,x), \text{month}(i(t)) = 01\}$$
$$\vdots$$
$$o(12,x) = \mathbf{min}\{i(t,x), \text{month}(i(t)) = 12\}$$

ymonmax Multi-year monthly maximum

$$o(01,x) = \mathbf{max}\{i(t,x), \text{month}(i(t)) = 01\}$$
$$\vdots$$
$$o(12,x) = \mathbf{max}\{i(t,x), \text{month}(i(t)) = 12\}$$

ymonsum Multi-year monthly sum

$$o(01,x) = \mathbf{sum}\{i(t,x), \text{month}(i(t)) = 01\}$$
$$\vdots$$
$$o(12,x) = \mathbf{sum}\{i(t,x), \text{month}(i(t)) = 12\}$$

ymonmean Multi-year monthly mean

$$o(01,x) = \mathbf{mean}\{i(t,x), \text{month}(i(t)) = 01\}$$
$$\vdots$$
$$o(12,x) = \mathbf{mean}\{i(t,x), \text{month}(i(t)) = 12\}$$

ymonavg Multi-year monthly average

$$o(01,x) = \mathbf{avg}\{i(t,x), \text{month}(i(t)) = 01\}$$
$$\vdots$$
$$o(12,x) = \mathbf{avg}\{i(t,x), \text{month}(i(t)) = 12\}$$

ymonvar Multi-year monthly variance

$$o(01,x) = \mathbf{var}\{i(t,x), \text{month}(i(t)) = 01\}$$
$$\vdots$$
$$o(12,x) = \mathbf{var}\{i(t,x), \text{month}(i(t)) = 12\}$$

ymonstd Multi-year monthly standard deviation

$$o(01,x) = \mathbf{std}\{i(t,x), \text{month}(i(t)) = 01\}$$
$$\vdots$$
$$o(12,x) = \mathbf{std}\{i(t,x), \text{month}(i(t)) = 12\}$$

Example

To compute the monthly mean over all input years, use:

```
cdo ymonmean ifile ofile
```

2.8.26. YMONPCTL - Multi-year monthly percentile values

Synopsis

ymonpctl,*p* `ifile1 ifile2 ifile3 ofile`

Description

This module writes to `ofile` a certain percentile of each month of year in `ifile1`. The algorithm uses histograms with minimum and maximum bounds given in `ifile2` and `ifile3`, respectively. The default number of histogram bins is 100. The default can be overridden by setting the environment variable CDO_PCTL_NBINS to a different value. The files `ifile2` and `ifile3` must be the result of corresponding ymonmin and ymonmax operations, respectively. The date information in an output field is the date of the last contributing input field.

$$o(01,x) = \textbf{pth percentile}\{i(t,x), \text{month}(i(t)) = 01\}$$
$$\vdots$$
$$o(12,x) = \textbf{pth percentile}\{i(t,x), \text{month}(i(t)) = 12\}$$

Parameter

p	INTEGER	Percentile number in 1, ..., 99

Environment

`CDO_PCTL_NBINS`	Sets the number of histogram bins. The default number is 100.

Example

To compute the monthly 90th percentile over all input years, use:

```
cdo ymonmin ifile minfile
cdo ymonmax ifile maxfile
cdo ymonpctl,90 ifile minfile maxfile ofile
```

Or shorter using operator piping:

```
cdo ymonpctl,90 ifile -ymonmin ifile -ymonmax ifile ofile
```

2.8.27. YSEASSTAT - Multi-year seasonal statistical values

Synopsis

<operator> `ifile ofile`

Description

This module writes to `ofile`, according to the actual operator, the minimum, maximum, sum, average, variance or standard deviation of each season in `ifile`. The date information in an output field is the date of the last contributing input field.

Operators

yseasmin Multi-year seasonal minimum
$o(1,x) = \mathbf{min}\{i(t,x), \text{month}(i(t)) = 12,\ 01,\ 02\}$
$o(2,x) = \mathbf{min}\{i(t,x), \text{month}(i(t)) = 03,\ 04,\ 05\}$
$o(3,x) = \mathbf{min}\{i(t,x), \text{month}(i(t)) = 06,\ 07,\ 08\}$
$o(4,x) = \mathbf{min}\{i(t,x), \text{month}(i(t)) = 09,\ 10,\ 11\}$

yseasmax Multi-year seasonal maximum
$o(1,x) = \mathbf{max}\{i(t,x), \text{month}(i(t)) = 12,\ 01,\ 02\}$
$o(2,x) = \mathbf{max}\{i(t,x), \text{month}(i(t)) = 03,\ 04,\ 05\}$
$o(3,x) = \mathbf{max}\{i(t,x), \text{month}(i(t)) = 06,\ 07,\ 08\}$
$o(4,x) = \mathbf{max}\{i(t,x), \text{month}(i(t)) = 09,\ 10,\ 11\}$

yseassum Multi-year seasonal sum
$o(1,x) = \mathbf{sum}\{i(t,x), \text{month}(i(t)) = 12,\ 01,\ 02\}$
$o(2,x) = \mathbf{sum}\{i(t,x), \text{month}(i(t)) = 03,\ 04,\ 05\}$
$o(3,x) = \mathbf{sum}\{i(t,x), \text{month}(i(t)) = 06,\ 07,\ 08\}$
$o(4,x) = \mathbf{sum}\{i(t,x), \text{month}(i(t)) = 09,\ 10,\ 11\}$

yseasmean Multi-year seasonal mean
$o(1,x) = \mathbf{mean}\{i(t,x), \text{month}(i(t)) = 12,\ 01,\ 02\}$
$o(2,x) = \mathbf{mean}\{i(t,x), \text{month}(i(t)) = 03,\ 04,\ 05\}$
$o(3,x) = \mathbf{mean}\{i(t,x), \text{month}(i(t)) = 06,\ 07,\ 08\}$
$o(4,x) = \mathbf{mean}\{i(t,x), \text{month}(i(t)) = 09,\ 10,\ 11\}$

yseasavg Multi-year seasonal average
$o(1,x) = \mathbf{avg}\{i(t,x), \text{month}(i(t)) = 12,\ 01,\ 02\}$
$o(2,x) = \mathbf{avg}\{i(t,x), \text{month}(i(t)) = 03,\ 04,\ 05\}$
$o(3,x) = \mathbf{avg}\{i(t,x), \text{month}(i(t)) = 06,\ 07,\ 08\}$
$o(4,x) = \mathbf{avg}\{i(t,x), \text{month}(i(t)) = 09,\ 10,\ 11\}$

yseasvar Multi-year seasonal variance
$o(1,x) = \mathbf{var}\{i(t,x), \text{month}(i(t)) = 12,\ 01,\ 02\}$
$o(2,x) = \mathbf{var}\{i(t,x), \text{month}(i(t)) = 03,\ 04,\ 05\}$
$o(3,x) = \mathbf{var}\{i(t,x), \text{month}(i(t)) = 06,\ 07,\ 08\}$
$o(4,x) = \mathbf{var}\{i(t,x), \text{month}(i(t)) = 09,\ 10,\ 11\}$

yseasstd Multi-year seasonal standard deviation
$o(1,x) = \mathbf{std}\{i(t,x), \text{month}(i(t)) = 12,\ 01,\ 02\}$
$o(2,x) = \mathbf{std}\{i(t,x), \text{month}(i(t)) = 03,\ 04,\ 05\}$
$o(3,x) = \mathbf{std}\{i(t,x), \text{month}(i(t)) = 06,\ 07,\ 08\}$
$o(4,x) = \mathbf{std}\{i(t,x), \text{month}(i(t)) = 09,\ 10,\ 11\}$

Example

To compute the seasonal mean over all input years, use:

```
cdo yseasmean ifile ofile
```

2.8.28. YSEASPCTL - Multi-year seasonal percentile values

Synopsis

yseaspctl,*p* `ifile1 ifile2 ifile3 ofile`

Description

This module writes to `ofile` a certain percentile of each season in `ifile1`. The algorithm uses histograms with minimum and maximum bounds given in `ifile2` and `ifile3`, respectively. The default number of histogram bins is 100. The default can be overridden by setting the environment variable CDO_PCTL_NBINS to a different value. The files `ifile2` and `ifile3` must be the result of corresponding yseasmin and yseasmax operations, respectively. The date information in an output field is the date of the last contributing input field.

$o(1,x) = \textbf{pth percentile}\{i(t,x), \text{month}(i(t)) = 12,\ 01,\ 02\}$
$o(2,x) = \textbf{pth percentile}\{i(t,x), \text{month}(i(t)) = 03,\ 04,\ 05\}$
$o(3,x) = \textbf{pth percentile}\{i(t,x), \text{month}(i(t)) = 06,\ 07,\ 08\}$
$o(4,x) = \textbf{pth percentile}\{i(t,x), \text{month}(i(t)) = 09,\ 10,\ 11\}$

Parameter

p	INTEGER	Percentile number in 1, ..., 99

Environment

`CDO_PCTL_NBINS`	Sets the number of histogram bins. The default number is 100.

Example

To compute the seasonal 90th percentile over all input years, use:

```
cdo yseasmin ifile minfile
cdo yseasmax ifile maxfile
cdo yseaspctl,90 ifile minfile maxfile ofile
```

Or shorter using operator piping:

```
cdo yseaspctl,90 ifile -yseasmin ifile -yseasmax ifile ofile
```

2.8.29. YDRUNSTAT - Multi-year daily running statistical values

Synopsis

<operator>,nts `ifile ofile`

Description

This module writes to `ofile` running statistical values for each day of year in `ifile`. Depending on the actual operator, the minimum, maximum, sum, average, variance or standard deviation of all time steps in running windows of wich the medium time step corresponds to a certain day of year is computed. The date information in an output field is the date of the medium time step in the last contributing running window. Note that the operator must be applied to a continuous time series of daily measurements in order to yield physically meaningful results. Also note that the output time series begins (nts-1)/2 time steps after the first time step of the input time series and ends (nts-1)/2 time steps before the last. For input data which are complete but not continuous, such as time series of daily measurements for the same month or season within different years, the operator yields physically meaningful results only if the input time series does include the (nts-1)/2 days before and after each period of interest.

Operators

ydrunmin Multi-year daily running minimum

$$o(001,x) = \mathbf{min}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \mathrm{day}[(i(t+(nts-1)/2)] = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{min}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \mathrm{day}[(i(t+(nts-1)/2)] = 366\}$$

ydrunmax Multi-year daily running maximum

$$o(001,x) = \mathbf{max}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \mathrm{day}[(i(t+(nts-1)/2)] = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{max}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \mathrm{day}[(i(t+(nts-1)/2)] = 366\}$$

ydrunsum Multi-year daily running sum

$$o(001,x) = \mathbf{sum}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \mathrm{day}[(i(t+(nts-1)/2)] = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{sum}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \mathrm{day}[(i(t+(nts-1)/2)] = 366\}$$

ydrunmean Multi-year daily running mean

$$o(001,x) = \mathbf{mean}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \mathrm{day}[(i(t+(nts-1)/2)] = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{mean}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \mathrm{day}[(i(t+(nts-1)/2)] = 366\}$$

ydrunavg Multi-year daily running average

$$o(001,x) = \mathbf{avg}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \mathrm{day}[(i(t+(nts-1)/2)] = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{avg}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \mathrm{day}[(i(t+(nts-1)/2)] = 366\}$$

ydrunvar Multi-year daily running variance

$$o(001,x) = \mathbf{var}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \mathrm{day}[(i(t+(nts-1)/2)] = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{var}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \mathrm{day}[(i(t+(nts-1)/2)] = 366\}$$

ydrunstd Multi-year daily running standard deviation

$$o(001,x) = \mathbf{std}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \mathrm{day}[(i(t+(nts-1)/2)] = 001\}$$
$$\vdots$$
$$o(366,x) = \mathbf{std}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \mathrm{day}[(i(t+(nts-1)/2)] = 366\}$$

Parameter

nts INTEGER Number of time steps

Example

Assume the input data provide a continuous time series of daily measurements. To compute the running multi-year daily mean over all input time steps for a running window of five days, use:

```
cdo ydrunmean,5 ifile ofile
```

Note that except for the standard deviation the results of the operators in this module are equivalent to a composition of corresponding operators from the YDAYSTAT and RUNSTAT modules. For instance, the above command yields the same result as:

```
cdo ydaymean -runmean,5 ifile ofile
```

2.8.30. YDRUNPCTL - Multi-year daily running percentile values

Synopsis

ydrunpctl,*p*,*nts* `ifile1 ifile2 ifile3 ofile`

Description

This module writes to `ofile` running percentile values for each day of year in `ifile1`. A certain percentile is computed for all time steps in running windows of which the medium time step corresponds to a certain day of year. The algorithm uses histograms with minimum and maximum bounds given in `ifile2` and `ifile3`, respectively. The default number of histogram bins is 100. The default can be overridden by setting the environment variable CDO_PCTL_NBINS to a different value. The files `ifile2` and `ifile3` must be the result of corresponding ydrunmin and ydrunmax operations, respectively. The date information in an output field is the date of the medium time step in the last contributing running window. Note that the operator must be applied to a continuous time series of daily measurements in order to yield physically meaningful results. Also note that the output time series begins (nts-1)/2 time steps after the first time step of the input time series and ends (nts-1)/2 time steps before the last. For input data which are complete but not continuous, such as time series of daily measurements for the same month or season within different years, the operator yields physically meaningful results only if the input time series does include the (nts-1)/2 days before and after each period of interest.

$$o(001,x) = \textbf{pth percentile}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \text{day}[(i(t+(nts-1)/2)] = 001\}$$
$$\vdots$$
$$o(366,x) = \textbf{pth percentile}\{i(t,x), i(t+1,x), ..., i(t+nts-1,x); \text{day}[(i(t+(nts-1)/2)] = 366\}$$

Parameter

p	INTEGER	Percentile number in 1, ..., 99
nts	INTEGER	Number of time steps

Environment

`CDO_PCTL_NBINS`	Sets the number of histogram bins. The default number is 100.

Example

Assume the input data provide a continuous time series of daily measurements. To compute the running multi-year daily 90th percentile over all input time steps for a running window of five days, use:

```
cdo ydrunmin,5 ifile minfile
cdo ydrunmax,5 ifile maxfile
cdo ydrunpctl,90,5 ifile minfile maxfile ofile
```

Or shorter using operator piping:

```
cdo ydrunpctl,90,5 ifile -ydrunmin ifile -ydrunmax ifile ofile
```

2.9. Regression

This sections contains modules for linear regression of time series.

Here is a short overview of all operators in this section:

detrend	Detrend
trend	Trend
subtrend	Subtract trend

2.9.1. DETREND - Detrend time series

Synopsis

detrend `ifile ofile`

Description

Every time series in `ifile` is linearly detrended. For every field element x only those time steps t belong to the sample $S(x)$, which have $i(t,x) \neq \text{miss}$. With

$$a(x) = \frac{1}{\#S(x)} \sum_{t \in S(x)} i(t,x) - b(x) \left(\frac{1}{\#S(x)} \sum_{t \in S(x)} t \right)$$

and

$$b(x) = \frac{\sum_{t \in S(x)} \left(i(t,x) - \frac{1}{\#S(x)} \sum_{t' \in S(x)} i(t',x) \right) \left(t - \frac{1}{\#S(x)} \sum_{t' \in S(x)} t' \right)}{\sum_{t \in S(x)} \left(t - \frac{1}{\#S(x)} \sum_{t' \in S(x)} t' \right)^2}$$

it is

$$o(t,x) = i(t,x) - (a(x) + b(x)t)$$

This operator has to keep the fields of all time steps concurrently in the memory. If not enough memory is available, use the operators trend and subtrend.

Example

To detrend the data in `ifile` and to store the detrended data in `ofile`, use:

```
cdo detrend ifile ofile
```

2.9.2. TREND - Trend of time series

Synopsis

trend `ifile ofile1 ofile2`

Description

The values of the input file `ifile` are assumed to be distributed as $N(a+bt, \sigma^2)$ with unknown a, b and σ^2. This operator estimates the parameter a and b. For every field element x only those time steps t belong to the sample $S(x)$, which have $i(t,x) \neq$ miss. It is

$$o_1(1,x) = \frac{1}{\#S(x)} \sum_{t \in S(x)} i(t,x) - b(x) \left(\frac{1}{\#S(x)} \sum_{t \in S(x)} t \right)$$

and

$$o_2(1,x) = \frac{\sum_{t \in S(x)} \left(i(t,x) - \frac{1}{\#S(x)} \sum_{t' \in S(x)} i(t',x) \right) \left(t - \frac{1}{\#S(x)} \sum_{t' \in S(x)} t' \right)}{\sum_{t \in S(x)} \left(t - \frac{1}{\#S(x)} \sum_{t' \in S(x)} t' \right)^2}$$

Thus the estimation for a is stored in `ofile1` and that for b is stored in `ofile2`. To subtract the trend from the data see operator subtrend.

2.9.3. SUBTREND - Subtract a trend

Synopsis

subtrend `ifile1 ifile2 ifile3 ofile`

Description

This operator is for subtracting a trend computed by the operator trend. It is

$$o(t,x) = i_1(t,x) - (i_2(1,x) + i_3(1,x) \cdot t)$$

where t is the time steps.

Example

The typical call for detrend the data in `ifile` and to store the detrended data in `ofile` is:

```
cdo trend ifile afile bfile
cdo subtrend ifile afile bfile ofile
```

The result is identical to operator detrend:

```
cdo detrend ifile ofile
```

2.10. Interpolation

This section contains modules to interpolate datasets. There are several operators to interpolate horizontal fields to a new grid. Some of those operators can handle only 2D fields on a regular rectangular grid. Vertical interpolation of 3D variables is possible from hybrid model level to height or pressure level. Interpolation in time is possible between time steps and between years.

Here is a short overview of all operators in this section:

remapbil	Bilinear interpolation
remapbic	Bicubic interpolation
remapcon	Conservative remapping
remapdis	Distance-weighted averaging
genbil	Generate bilinear interpolation weights
genbic	Generate bicubic interpolation weights
gencon	Generate conservative interpolation weights
gendis	Generate distance-weighted averaging weights
remap	SCRIP grid remapping
interpolate	PINGO grid interpolation
intgridbil	Bilinear grid interpolation
remapeta	Remap vertical hybrid level
ml2pl	Model to pressure level interpolation
ml2hl	Model to height level interpolation
inttime	Time interpolation
intntime	Time interpolation
intyear	Year interpolation

2.10.1. REMAPGRID - SCRIP grid interpolation

Synopsis

<operator>,grid `ifile ofile`

Description

This module contains operators to interpolate all input fields to a new grid. Each operator is using a different remapping method. The interpolation is based on a special SCRIP library version. For a detailed description of the remapping methods see [SCRIP].

Operators

remapbil Bilinear interpolation
Performs a bilinear interpolation on all input fields. This interpolation method works only on rectangular grids.

remapbic Bicubic interpolation
Performs a bicubic interpolation on all input fields. This interpolation method works only on rectangular grids.

remapcon Conservative remapping
Performs a first order conservative remapping on all input fields.

remapdis Distance-weighted averaging
Performs a distance-weighted average of the four nearest neighbor values on all input fields.

Parameter

grid STRING Target grid description file or name

Environment

`NORMALIZE_OPT` This variable is used to choose the normalization of the conservative remapping. By default, NORMALIZE_OPT is set to be 'fracarea' and will include the destination area fraction in the output weights; other options are 'none' and 'destarea' (for more information see [SCRIP]).

Note

For this program the author has converted the original Fortran 90 SCRIP software to ANSI C. In case of any problems send a bug report to CDO and not to SCRIP!

Example

Say `ifile` contains fields on a rectangular grid. Remap all fields bilinear to a T42 gaussian grid:

```
cdo remapbil,t42grid ifile ofile
```

2.10.2. GENWEIGHTS - Generate SCRIP grid interpolation weights

Synopsis

<operator>,grid `ifile ofile`

Description

Grid interpolation can be a very time consuming process. Especially if the data is on an unstructured or on a large grid. In this case the SCRIP interpolation process can be split into two parts. First generation of the interpolation weights, this is the most time consuming part. These interpolation weights can be reused for every remapping process. This method works only if all input fields are on the same grid and a possibly mask (missing values) does not change. This module contains operators to generate SCRIP interpolation weights of the first input field. Each operator is using a different interpolation method.

Operators

genbil Generate bilinear interpolation weights
Generates bilinear interpolation weights and write the result to a file. This interpolation method works only on rectangular grids.

genbic Generate bicubic interpolation weights
Generates bicubic interpolation weights and write the result to a file. This interpolation method works only on rectangular grids.

gencon Generate conservative interpolation weights
Generates first order conservative interpolation weights and write the result to a file.

gendis Generate distance-weighted averaging weights
Generates distance-weighted average weights of the four nearest neighbor values and write the result to a file.

Parameter

grid STRING Target grid description file or name

Environment

`NORMALIZE_OPT` This variable is used to choose the normalization of the conservative interpolation. By default, NORMALIZE_OPT is set to be 'fracarea' and will include the destination area fraction in the output weights; other options are 'none' and 'destarea' (for more information see [SCRIP]).

Note

For this program the author has converted the original Fortran 90 SCRIP software to ANSI C. In case of any problems send a bug report to CDO and not to SCRIP!

Example

Say `ifile` contains fields on a rectangular grid. Remap all fields bilinear to a T42 gaussian grid:

```
cdo genbil,t42grid ifile remapweights.nc
cdo remap,t42grid,remapweights ifile ofile
```

2.10.3. REMAP - SCRIP grid remapping

Synopsis

remap,*grid*,*weights* `ifile ofile`

Description

This operator remaps all input fields to a new grid. The remap type and the interpolation weights of one grid are read from a netCDF file. The netCDF file with the weights must follow the SCRIP convention. Normaly these weights come from a previous call to module GENWEIGHTS or was created by the original SCRIP package.

Parameter

grid	STRING	Target grid description file or name
weights	STRING	Interpolation weights (SCRIP netCDF file)

Note

For this program the author has converted the original Fortran 90 SCRIP software to ANSI C. In case of any problems send a bug report to CDO and not to SCRIP!

Example

Say `ifile` contains fields on a regular grid. Remap all fields bilinear to a T42 gaussian grid:

```
cdo genbil,t42grid ifile remapweights.nc
cdo remap,t42grid,remapweights ifile ofile
```

2.10.4. INTGRID - Grid interpolation

Synopsis

<operator>,grid `ifile ofile`

Description

This module contains operators to interpolate all input fields to a new grid. All interpolation methods in this module work only on rectangular grids.

Operators

interpolate PINGO grid interpolation
This is the grid interpolation from PINGO. The basis of the interpolation is an underlying continuous field which is constructed in the following way. For two neighboured longitudes x_1 and x_2 and two neighboured latitudes y_1 and y_2 of the input grid every point at longitude x and latidude y with $x_1 \leq x \leq x_2$ and $y_1 \leq y \leq y_2$ is assigned the value

$$\begin{aligned} a &= a_{11} + (a_{21} - a_{11})\frac{x - x_1}{x_2 - x_1} + (a_{12} - a_{11})\frac{y - y_1}{y_2 - y_1} \\ &\quad + (a_{22} - a_{21} - a_{12} + a_{11})\frac{(x - x_1)(y - y_1)}{(x_2 - x_1)(y_2 - y_1)} \end{aligned}$$

where a_{ij} is the value at longitude x_i and latitude y_j. If one of the four values a_{11}, a_{12}, a_{21}, a_{22} is the missing value, then a is also the missing value. Afterwards the underlying continuous field is expanded by a half mesh width. For a detailed description of this interpolation method see [PINGO].

intgridbil Bilinear grid interpolation
Performs a bilinear interpolation on all input fields. This implementation is faster than remapbil. The complete source grid must be inside the target grid. Missing values are not supported yet!

Parameter

grid	STRING	Target grid description file or name

Example

Say `ifile` contains fields on a rectangular grid. To interpolate all fields bilinear to a T42 gaussian grid, use:

```
cdo intgridbil,t42grid ifile ofile
```

2.10.5. REMAPETA - Remap vertical hybrid level

Synopsis

remapeta,*vct[,oro]* `ifile ofile`

Description

This operator interpolates between different vertical hybrid levels. This include the preparation of consistent data for the free atmosphere. The procedure for the vertical interpolation is based on the HIRLAM scheme and was adapted from [INTERA]. The vertical interpolation is based on the vertical integration of the hydrostatic equation with few adjustments. The basic tasks are the following

- first integration of hydrostatic equation
- extrapolation of surface pressure
- PBL profile interpolation
- interpolation in free atmosphere
- merging of both profiles
- final surface pressure correction

The vertical interpolation corrects the surface pressure. This is simply a cut-off or an addition of air mass. This mass correction should not influence the geostrophic velocity field in the middle troposhere. Therefore the total mass above a given reference level is conserved. As reference level the geopotential height of the 500 hPa level is used. Near the surface the correction can affect the vertical structure of the PBL. Therefore the interpolation is done using the potential temperature. But in the free atmosphere above a certain n (n=0.8 defining the top of the PBL) the interpolation is done linearly. After the interpolation both profiles are merged. With the resulting temperature/pressure correction the hydrostatic equation is integrated again and adjusted to the reference level finding the final surface pressure correction. A more detailed description of the interpolation can be found in [INTERA].

Parameter

vct	STRING	File name of an ASCII dataset with the vertical coordinate table
oro	STRING	File name with the orography of the target dataset (optional)

Example

To remap between different hybrid model level data, use:

```
cdo remapeta,vct ifile ofile
```

2.10.6. INTVERT - Vertical interpolation

Synopsis

ml2pl,*plevels* `ifile ofile`

ml2hl,*hlevels* `ifile ofile`

Description

Interpolate 3D variables on hybrid model level to pressure or height level. The input file must contain the log. surface pressure (LSP/code152) or the surface pressure (APS/code134). To interpolate the temperature, the orography (GEOSP/code129) is also needed.

Operators

ml2pl Model to pressure level interpolation
Interpolates 3D variables on hybrid model level to pressure level.

ml2hl Model to height level interpolation
Interpolates 3D variables on hybrid model level to height level. The procedure is the same as for operator mh2pl except that the pressure levels are calculated from the heights by: $plevel = 101325 * exp(hlevel/-7000)$

Parameter

plevels	FLOAT	Pressure levels in pascal
hlevels	FLOAT	Height levels in meter (max level: 65535 m)

Environment

`EXTRAPOLATE` If set to 1 extrapolate missing values.

Example

To interpolate hybrid model level data to pressure levels of 925, 850, 500 and 200 hPa, use:

```
cdo ml2pl,92500,85000,50000,20000 ifile ofile
```

2.10.7. INTTIME - Time interpolation

Synopsis

inttime,*date*,*time*[,*inc*] `ifile ofile`

intntime,*n* `ifile ofile`

Description

This module performs linear interpolation between time steps.

Operators

inttime Time interpolation
This operator creates a new dataset by linear interpolation between time steps. The user has to define the start date/time with an optional increment.

intntime Time interpolation
This operator performs linear interpolation between time steps. The user has to define the number of time steps from one time step to the next.

Parameter

date	STRING	Start date (format YYYY-MM-DD)
time	STRING	Start time (format hh:mm)
inc	STRING	Optional increment (minutes, hours, days, months, years) [default: 0hour]
n	INTEGER	Number of time steps from one time step to the next

Example

Assumed a 6 hourly dataset starts at 1987-01-01 12:00. To interpolate this time series to a one hourly dataset, use:

```
cdo inttime,1987-01-01,12:00,1hour ifile ofile
```

2.10.8. INTYEAR - Year interpolation

Synopsis

intyear,*years* `ifile1 ifile2 oprefix`

Description

This operator performs linear interpolation between two years time step by time step. Appends four digits with the year to `oprefix` to form the output file names.

Parameter

years INTEGER Comma separated list of years

Example

Assumed you have two monthly mean datasets over a year. The first dataset has 12 time steps for year 1985 and the second for year 1990. To interpolate the years between 1985 and 1990 month by month, use:

```
cdo intyear,1986,1987,1988,1989 ifile1 ifile2 year
```

Example result of '`dir year*`' for netCDF datasets:

```
year1986.nc year1987.nc year1988.nc year1989.nc
```

2.11. Transformation

This section contains modules to perform spectral transformations.

Here is a short overview of all operators in this section:

sp2gp	Spectral to gridpoint
sp2gpl	Spectral to gridpoint (linear)
gp2sp	Gridpoint to spectral
gp2spl	Gridpoint to spectral (linear)
sp2sp	Spectral to spectral
spcut	Cut spectral wave number
dv2uv	Divergence and vorticity to U and V wind
dv2uvl	Divergence and vorticity to U and V wind (linear)
uv2dv	U and V wind to divergence and vorticity
uv2dvl	U and V wind to divergence and vorticity (linear)

2.11.1. SPECTRAL - Spectral transformation

Synopsis

sp2gp `ifile ofile`

sp2gpl `ifile ofile`

gp2sp `ifile ofile`

gp2spl `ifile ofile`

sp2sp,*trunc* `ifile ofile`

spcut,*wnums* `ifile ofile`

Description

This module transforms fields on gaussian grids to spectral coefficients and vice versa.

Operators

sp2gp Spectral to gridpoint
Convert all fields with spectral coefficients to regular gaussian grid. The number of latitudes of the resulting gaussian grid is calculated from the triangular truncation by:
nlat = $NINT((\text{trunc} * \boxed{3} + 1.)/2.)$

sp2gpl Spectral to gridpoint (linear)
Convert all fields with spectral coefficients to regular gaussian grid. The number of latitudes of the resulting Gaussian grid is calculated from the triangular truncation by:
nlat = $NINT((\text{trunc} * \boxed{2} + 1.)/2.)$

Use this operator to convert ERA40 data e.g. from TL159 to N80.

gp2sp Gridpoint to spectral
Convert all gaussian gridpoint fields to spectral coefficients. The triangular truncation of the resulting spherical harmonics is calculated from the number of latitudes by:
trunc = $(\text{nlat} * 2 - 1)/\boxed{3}$

gp2spl Gridpoint to spectral (linear)
Convert all gaussian gridpoint fields to spectral coefficients. The triangular truncation of the resulting spherical harmonics is calculated from the number of latitudes by:
trunc = $(\text{nlat} * 2 - 1)/\boxed{2}$

Use this operator to convert ERA40 data e.g. from N80 to TL159 instead of T106.

sp2sp Spectral to spectral
Change the triangular truncation of all spectral fields. The operator performs downward conversion by cutting the resolution. Upward conversions are achieved by filling in zeros.

spcut Cut spectral wave number
Set the user defined wave numbers to zero.

Parameter

trunc	INTEGER	New spectral resolution
wnums	INTEGER	Comma separated list of wave numbers

Example

To transform spectral coefficients from T106 to N80 gaussian grid use:

```
cdo sp2gp ifile ofile
```

To transform spectral coefficients from TL159 to N80 gaussian grid use:

```
cdo sp2gpl ifile ofile
```

2.11.2. WIND - Wind transformation

Synopsis

<operator> `ifile ofile`

Description

This module converts divergence and vorticity to U and V wind and vice versa.

Operators

dv2uv Divergence and vorticity to U and V wind
Calculate U and V wind on a gaussian grid from spherical harmonic coefficients of divergence and vorticity. The U and V wind must have the names u and v or the code numbers 131 and 132. The number of latitudes of the resulting gaussian grid is calculated from the triangular truncation by:
nlat $= NINT((\text{trunc} * \boxed{3} + 1.)/2.)$

dv2uvl Divergence and vorticity to U and V wind (linear)
Calculate U and V wind on a gaussian grid from spherical harmonic coefficients of divergence and vorticity. The U and V wind must have the names u and v or the code numbers 131 and 132. The number of latitudes of the resulting gaussian grid is calculated from the triangular truncation by:
nlat $= NINT((\text{trunc} * \boxed{2} + 1.)/2.)$

uv2dv U and V wind to divergence and vorticity
Calculate spherical harmonic coefficients of divergence and vorticity from U and V wind. The divergence and vorticity must have the names sd and svo or code numbers 155 and 138. The triangular truncation of the resulting spherical harmonics is calculated from the number of latitudes by:
trunc $= (\text{nlat} * 2 - 1)/\boxed{3}$

uv2dvl U and V wind to divergence and vorticity (linear)
Calculate spherical harmonic coefficients of divergence and vorticity from U and V wind. The divergence and vorticity must have the names sd and svo or code numbers 155 and 138. The triangular truncation of the resulting spherical harmonics is calculated from the number of latitudes by:
trunc $= (\text{nlat} * 2 - 1)/\boxed{2}$

Example

Assume a dataset has at least spherical harmonic coefficients of divergence and vorticity. To transform the spectral divergence and vorticity to U and V wind, use:

```
cdo dv2uv ifile ofile
```

2.12. Formatted I/O

This section contains modules to read and write ASCII data.

Here is a short overview of all operators in this section:

input	ASCII input
inputsrv	SERVICE input
inputext	EXTRA input
output	ASCII output
outputf	Formatted output
outputint	Integer output
outputsrv	SERVICE output
outputext	EXTRA output

2.12.1. INPUT - Formatted input

Synopsis

input,*grid* `ofile`

inputsrv `ofile`

inputext `ofile`

Description

This module reads time series of one 2D variable from standard input. All input fields must have the same horizontal grid. The format of the input depends on the actual operator.

Operators

input ASCII input
Read fields with ASCII numbers from standard input and stores them in `ofile`. The numbers that are read are exactly that ones which are written out by output.

inputsrv SERVICE input
Read fields with ASCII numbers from standard input and stores them in `ofile`. Each field must have a header of 8 integers (SERVICE likely). The numbers that are read are exactly that ones which are written out by outputsrv.

inputext EXTRA input
Read fields with ASCII numbers from standard input and stores them in `ofile`. Each field with a header of 4 integers (EXTRA likely). The numbers that are read are exactly that ones which are written out by outputext.

Parameter

grid STRING Grid description file or name

Example

Assume an ASCII dataset contains a field on a global regular grid with 32 longitude and 16 latitudes (512 elements). To create a GRIB dataset from the ASCII dataset use:

```
cdo -f grb input,r32x16 ofile.grb < my_ascii_data
```

2.12.2. OUTPUT - Formatted output

Synopsis

output `ifiles`

outputf,*format*,*nelem* `ifiles`

outputint `ifiles`

outputsrv `ifiles`

outputext `ifiles`

Description

This module prints all values of all input datasets to standard output. All input fields must have the same horizontal grid. The format of the output depends on the actual operator.

Operators

output ASCII output
Prints all values to standard output. Each row has 6 elements with the C-style format "%13.6g".

outputf Formatted output
Prints all values to standard output. The format and number of elements for each row must be specified by the parameters *format* and *nelem*.

outputint Integer output
Prints all values rounded to the nearest interger to standard output.

outputsrv SERVICE output
Prints all values to standard output. Each field with a header of 8 integers (SERVICE likely).

outputext EXTRA output
Prints all values to standard output. Each field with a header of 4 integers (EXTRA likely).

Parameter

format	STRING	C-style format for one element (e.g. %13.6g)
nelem	INTEGER	Number of elements for each row

Example

To print all field elements of a dataset formatted with "%8.4g" and 8 values per line use:

```
cdo outputf,%8.4g,8 ifile
```

Example result of a dataset with one field on 64 grid points:

```
 261.7    262  257.8  252.5  248.8  247.7  246.3  246.1
 250.6  252.6  253.9  254.8    252  246.6  249.7  257.9
 273.4  266.2  259.8  261.6  257.2  253.4    251  263.7
 267.5  267.4  272.2  266.7  259.6  255.2  272.9  277.1
 275.3  275.5  276.4  278.4    282  269.6  278.7  279.5
 282.3  284.5  280.3  280.3    280  281.5  284.7  283.6
 292.9  290.5  293.9  292.6  292.7  292.8  294.1  293.6
 293.8  292.6  291.2  292.6  293.2  292.8    291  291.2
```

2.13. Miscellaneous

This section contains miscellaneous modules which do not fit to the other sections before.

Here is a short overview of all operators in this section:

gradsdes1	GrADS data descriptor file (version 1 GRIB map)
gradsdes2	GrADS data descriptor file (version 2 GRIB map)
smooth9	9 point smoothing
setrtoc	Set range to constant
setrtoc2	Set range to constant others to constant2
timsort	Sort over the time
const	Create a constant field
random	Create a field with random values
rotuvb	Backward rotation
mastrfu	Mass stream function
histcount	Histogram count
histsum	Histogram sum
histmean	Histogram mean
histfreq	Histogram frequency
wct	Windchill temperature (C)
fdns	Frost days where no snow index per time period
strwin	Strong wind days index per time period
strbre	Strong breeze days index per time period
strgal	Strong gale days index per time period
hurr	Hurricane days index per time period

2.13.1. GRADSDES - GrADS data descriptor file

Synopsis

<operator> `ifile`

Description

Creates a GrADS data descriptor file. Supported file formats are GRIB, SERVICE, EXTRA and IEG. For GRIB files the GrADS map file is also generated. For SERVICE and EXTRA files the grid must be specified with the CDO option '-g <grid>'. This module takes `ifile` in order to create filenames for the descriptor (`ifile.ctl`) and the map (`ifile.gmp`) file. "gradsdes" is an alias for gradsdes2.

Operators

gradsdes1 GrADS data descriptor file (version 1 GRIB map)
Creates a GrADS data descriptor file. Generated a machine specific version 1 GrADS map file for GRIB datasets.

gradsdes2 GrADS data descriptor file (version 2 GRIB map)
Creates a GrADS data descriptor file. Generated a machine independent version 2 GrADS map file for GRIB datasets. This map file can be used only with GrADS version 1.8 or newer.

Example

To create a GrADS data descriptor file from a GRIB dataset use:

```
cdo gradsdes2 ifile.grb
```

This will create a descriptor file with the name `ifile.ctl` and the map file `ifile.gmp`.
Assumed the input GRIB dataset has 3 variables over 12 time steps on a T21 grid. The contents of the resulting GrADS data description file is approximately:

```
DSET ^ifile.grb
DTYPE GRIB
INDEX ^ifile.gmp

```

2.13.2. SMOOTH9 - 9 point smoothing

Synopsis

smooth9 `ifile ofile`

Description

Performs a 9 point smoothing on all fields with a rectangular grid. The result at each grid point is a weighted average of the grid point plus the 8 surrounding points. The center point receives a weight of 1.0, the points at each side and above and below receive a weight of 0.5, and corner points receive a weight of 0.3. All 9 points are multiplied by their weights and summed, then divided by the total weight to obtain the smoothed value. Any missing data points are not included in the sum; points beyond the grid boundary are considered to be missing. Thus the final result may be the result of an averaging with less than 9 points.

2.13.3. SETRANGE - Set range to constant

Synopsis

setrtoc,*rmin*,*rmax*,*c* `ifile ofile`

setrtoc2,*rmin*,*rmax*,*c*,*c2* `ifile ofile`

Description

This module sets part of a field to a constant value or missing values. Which part of the field is set depends on the actual operator.

Operators

setrtoc Set range to constant

$$o(t,x) = \begin{cases} \text{c} & \text{if } i(t,x) \geq rmin \wedge i(t,x) \leq rmax \\ i(t,x) & \text{if } i(t,x) < rmin \vee i(t,x) > rmax \end{cases}$$

setrtoc2 Set range to constant others to constant2

$$o(t,x) = \begin{cases} \text{c} & \text{if } i(t,x) \geq rmin \wedge i(t,x) \leq rmax \\ \text{c2} & \text{if } i(t,x) < rmin \vee i(t,x) > rmax \end{cases}$$

Parameter

rmin	FLOAT	Lower bound
rmax	FLOAT	Upper bound
c	FLOAT	New value - inside of range
c2	FLOAT	New value - outside of range

2.13.4. TIMSORT - Timsort

Synopsis

timsort `ifile ofile`

Description

Sorts for every field position the elements in ascending order over all time steps. After sorting it is:
$o(t_1, x) < o(t_2, x) \qquad \forall (t_1 < t_2), x$

Example

To sort all field elements of a dataset over all time steps use:

```
cdo timsort ifile ofile
```

2.13.5. VARGEN - Generate a field

Synopsis

const,*const*,*grid* `ofile`

random,*grid* `ofile`

Description

Generates a dataset with one field. The size of the field is specified by the user given grid description. According to the actual operator all field elements are constant or filled with random numbers.

Operators

const	Create a constant field Creates a constant field. All field elements of the grid have the same value.
random	Create a field with random values Creates a field with rectangularly distrubuted random numbers in the interval [0,1].

Parameter

const	FLOAT	Constant
grid	STRING	Target grid description file or name

2.13.6. ROTUV - Rotation

Synopsis

rotuvb,*u,v,...* `ifile ofile`

Description

This is a special operator for datsets with wind components on a rotated grid, e.g. data from the regional model REMO. It performs a backward transformation of velocity components U and V from a rotated spherical system to a geographical system.

Parameter

u,v,... STRING Pairs of zonal and meridional velocity components (use variable names or code numbers)

Example

To transform the u and v velocity of a dataset from a rotated spherical system to a geographical system use:

```
cdo rotuvb,u,v ifile ofile
```

2.13.7. MASTRFU - Mass stream function

Synopsis

mastrfu `ifile ofile`

Description

This is a special operator for the post processing of the atmospheric general circulation model ECHAM. It computes the mass stream function (code number 272). The input dataset must be a zonal mean of v-velocity (code number 132) on pressure levels.

Example

To compute the mass stream function from a zonal mean v-velocity dataset use:

```
cdo mastrfu ifile ofile
```

2.13.8. HISTOGRAM - Histogram

Synopsis

<operator>,bounds `ifile ofile`

Description

This module creates bins for a histogram of the input data. The bins must be adjacent and have non-overlapping intervals. The user has to define the bounds of the bins. The first value is the lower bound and the second value the upper bound of the first bin. The bounds of the second bin are defined by the second and third value, aso. Only 2-dimensional input fields are allowed. The ouput file contains one vertical level for each of the bins requested.

Operators

histcount Histogram count
Number of elements in the bin range.

histsum Histogram sum
Sum of elements in the bin range.

histmean Histogram mean
Mean of elements in the bin range.

histfreq Histogram frequency
Frequency of elements in the bin range.

Parameter

bounds FLOAT Comma separated list of the bin bounds (-inf and inf valid)

2.13.9. WCT - Windchill temperature (C)

Synopsis

wct `ifile1 ifile2 ofile`

Description

Let `ifile1` and `ifile2` be time series of temperature and wind speed records, then a corresponding time series of resulting windchill temperatures is written to `ofile`. The wind chill temperature calculation is only valid for a temperature of T <= 33 C and a wind speed of v >= 1.39 m/s. Whenever these conditions are not satisfied, a missing value is written to @ofile. Note that temperature and wind speed records must be given in units of C and m/s, respectively.

2.13.10. FDNS - Frost days where no snow index per time period

Synopsis

fdns `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily minimum temperatures TN and `ifile2` be a corresponding series of daily surface snow amounts. Then counted is the number of days where TN < 0 Celsius and the surface snow amount is less than 1 cm. The temperature TN must be given in units of Kelvin. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

2.13.11. STRWIN - Strong wind days index per time period

Synopsis

strwin*[,v]* `ifile ofile`

Description

Let `ifile` be a time series of daily maximum horizontal wind speeds VX, then counted is the number of days where VX > v. The horizontal wind speed v is an optional parameter with default v = 10.5 m/s. A further output variable is the maximum number of consecutive days with maximum wind speed greater than or equal to v. Note that both VX and v must be given in units of m/s. Also note that the horizontal wind speed is defined as the square root of the sum of squares of the zonal and meridional wind speeds. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Parameter

v	FLOAT	Horizontal wind speed threshold (m/s, default v = 10.5 m/s)

2.13.12. STRBRE - Strong breeze days index per time period

Synopsis

strbre `ifile ofile`

Description

Let `ifile` be a time series of daily maximum horizontal wind speeds VX, then counted is the number of days where VX is greater than or equal to 10.5 m/s. A further output variable is the maximum number of consecutive days with maximum wind speed greater than or equal to 10.5 m/s. Note that VX is defined as the square root of the sum of squares of the zonal and meridional wind speeds and must be given in units of m/s. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

2.13.13. STRGAL - Strong gale days index per time period

Synopsis

strgal `ifile ofile`

Description

Let `ifile` be a time series of daily maximum horizontal wind speeds VX, then counted is the number of days where VX is greater than or equal to 20.5 m/s. A further output variable is the maximum number of consecutive days with maximum wind speed greater than or equal to 20.5 m/s. Note that VX is defined as the square root of the sum of square of the zonal and meridional wind speeds and must be given in units of m/s. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

2.13.14. HURR - Hurricane days index per time period

Synopsis

hurr `ifile ofile`

Description

Let `ifile` be a time series of daily maximum horizontal wind speeds VX, then counted is the number of days where VX is greater than or equal to 32.5 m/s. A further output variable is the maximum number of consecutive days with maximum wind speed greater than or equal to 32.5 m/s. Note that VX is defined as the square root of the sum of squares of the zonal and meridional wind speeds and must be given in units of m/s. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

2.14. Climate indices

This section contains modules to compute the climate indices of daily temperature and precipitation extremes.

Here is a short overview of all operators in this section:

eca_cdd	Consecutive dry days index per time period
eca_cfd	Consecutive frost days index per time period
eca_csu	Consecutive summer days index per time period
eca_cwd	Consecutive wet days index per time period
eca_cwdi	Cold wave duration index wrt mean of reference period
eca_cwfi	Cold-spell days index wrt 10th percentile of reference period
eca_etr	Intra-period extreme temperature range
eca_fd	Frost days index per time period
eca_gsl	Growing season length index
eca_hd	Heating degree days per time period
eca_hwdi	Heat wave duration index wrt mean of reference period
eca_hwfi	Warm spell days index wrt 90th percentile of reference period
eca_id	Ice days index per time period
eca_r10mm	Heavy precipitation days index per time period
eca_r20mm	Very heavy precipitation days index per time period
eca_r75p	Moderate wet days wrt 75th percentile of reference period
eca_r75ptot	Precipitation percent due to R75p days
eca_r90p	Wet days wrt 90th percentile of reference period
eca_r90ptot	Precipitation percent due to R90p days
eca_r95p	Very wet days wrt 95th percentile of reference period
eca_r95ptot	Precipitation percent due to R95p days
eca_r99p	Extremely wet days wrt 99th percentile of reference period
eca_r99ptot	Precipitation percent due to R99p days
eca_rr1	Wet days index per time period
eca_rx1day	Highest one day precipitation amount per time period
eca_rx5day	Highest five-day precipitation amount per time period
eca_sdii	Simple daily intensity index per time period

eca_su	Summer days index per time period
eca_tg10p	Cold days percent wrt 10th percentile of reference period
eca_tg90p	Warm days percent wrt 90th percentile of reference period
eca_tn10p	Cold nights percent wrt 10th percentile of reference period
eca_tn90p	Warm nights percent wrt 90th percentile of reference period
eca_tr	Tropical nights index per time period
eca_tx10p	Very cold days percent wrt 10th percentile of reference period
eca_tx90p	Very warm days percent wrt 90th percentile of reference period

2.14.1. ECACDD - Consecutive dry days index per time period

Synopsis

eca_cdd `ifile ofile`

Description

Let `ifile` be a time series of daily precipitation amounts RR, then counted is the largest number of consecutive days where RR is less than 1 mm. A further output variable is the number of dry periods of more than 5 days. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Example

To get the largest number of consecutive dry days for a time series of daily precipitation amounts, use:

```
cdo eca_cdd rrfile ofile
```

2.14.2. ECACFD - Consecutive frost days index per time period

Synopsis

eca_cfd `ifile ofile`

Description

Let `ifile` be a time series of daily minimum temperatures TN, then counted is the largest number of consecutive days where TN < 0 Celsius. Note that TN must be given in units of Kelvin. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Example

To get the largest number of consecutive frost days for a time series of daily minimum temperatures, use:

```
cdo eca_cfd tnfile ofile
```

2.14.3. ECACSU - Consecutive summer days index per time period

Synopsis

eca_csu*[,T]* `ifile ofile`

Description

Let `ifile` be a time series of daily maximum temperatures TX, then counted is the largest number of consecutive days where TX > T. The number T is an optional parameter with default T = 25 Celsius. Note that TN must be given in units of Kelvin, whereas T must be given in degrees Celsius. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Parameter

T	FLOAT	Temperature threshold (Celsius, default: T = 25 Celsius)

Example

To get the largest number of consecutive summer days for a time series of daily minimum temperatures, use:

```
cdo eca_csu txfile ofile
```

2.14.4. ECACWD - Consecutive wet days index per time period

Synopsis

eca_cwd `ifile ofile`

Description

Let `ifile` be a time series of daily precipitation amounts RR, then counted is the largest number of consecutive days where RR is at least 1 mm. A further output variable is the number of wet periods of more than 5 days. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Example

To get the largest number of consecutive wet days for a time series of daily precipitation amounts, use:

```
cdo eca_cwd rrfile ofile
```

2.14.5. ECACWDI - Cold wave duration index wrt mean of reference period

Synopsis

eca_cwdi*[,nday[,T]]* `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily minimum temperatures TN, and let `ifile2` be the mean TNnorm of daily minimum temperatures for any period used as reference. Then counted is the number of days where, in intervals of at least nday consecutive days, TN < TNnorm - T. The numbers nday and T are optional parameters with default nday = 6 and T = 5 Celsius. A further output variable is the number of cold waves longer than or equal to nday days. Note that both TN and TNnorm must be given in the same units. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

Parameter

nday	INTEGER	Number of consecutive days (default: nday = 6)
T	FLOAT	Temperature offset (Celsius, default: T = 5 Celsius)

Example

To compute the cold wave duration index for a time series of daily minimum temperatures, use:

```
cdo eca_cwdi tnfile tnnormfile ofile
```

2.14.6. ECACWFI - Cold-spell days index wrt 10th percentile of reference period

Synopsis

eca_cwfi*[,nday]* `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily mean temperatures TG, and `ifile2` be the 10th percentile TGn10 of daily mean temperatures for any period used as reference. Then counted is the number of days where, in intervals of at least nday consecutive days, TG < TGn10. The number nday is an optional parameter with default nday = 6. A further output variable is the number of cold-spell periods longer than or equal to nday days. Note that both TG and TGn10 must be given in the same units. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

Parameter

nday	INTEGER	Number of consecutive days (default: nday = 6)

Example

To compute the number of cold-spell days for a time series of daily mean temperatures, use:

```
cdo eca_cwfi tgfile tgn10file ofile
```

2.14.7. ECAETR - Intra-period extreme temperature range

Synopsis

eca_etr `ifile1 ifile2 ofile`

Description

Let `ifile1` and `ifile2` be time series of maximum and minimum temperatures TX and TN, respectively. Then the extreme temperature range is the difference of the maximum of TX and the minimum of TN. Note that TX and TN must be given in the same units. The date information for a time step in `ofile` is the date of the last contributing time steps in `ifile1` and `ifile2`.

Example

To get the intra-period extreme temperature range for two time series of maximum and minimum temperatures, use:

```
cdo eca_etr txfile tnfile ofile
```

2.14.8. ECAFD - Frost days index per time period

Synopsis

eca_fd `ifile ofile`

Description

Let `ifile` be a time series of daily minimum temperatures TN, then counted is the number of days where TN < 0 Celsius. Note that TN must be given in units of Kelvin. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Example

To get the number of frost days for a time series of daily minimum temperatures, use:

```
cdo eca_fd tnfile ofile
```

2.14.9. ECAGSL - Growing season length index

Synopsis

eca_gsl[*,nday*[*,T*[*,fland*]]] `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily mean temperatures TG, and `ifile2` be a land-water mask. Then counted are the number of days between the first occurrence of at least nday consecutive days with TG > T and the first occurrence after 1 July of at least nday consecutive days with TG < T. The numbers nday and T are optional parameter with default nday = 6 and T = 5 Celsius. The number fland is an optional parameter with default value fland = 0.5 and denotes the fraction of a grid point that must be covered by land in order to be included in the calculation. A further output variable is the start day of year of the growing season. Note that TG must be given in units of Kelvin, whereas T must be given in degrees Celsius. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Parameter

nday	INTEGER	Number of consecutive days (default: nday = 6)
T	FLOAT	Temperature threshold (Celsius, default: T = 5 Celsius)
fland	FLOAT	Land fraction threshold (default: fland = 0.5)

Example

To get the growing season length for a time series of daily mean temperatures, use:

```
cdo eca_gsl tgfile maskfile ofile
```

2.14.10. ECAHD - Heating degree days per time period

Synopsis

eca_hd*[,T1[,T2]]* `ifile ofile`

Description

Let `ifile` be a time series of daily mean temperatures TG, then the heating degree days are defined as the sum of T1 - TG, where only values TG < T2 are considered. If T1 and T2 are omitted, a temperature of 17 Celsius is used for both parameters. If only T1 is given, T2 is set to T1. Note that TG must be given in units of kelvin, whereas T1 and T2 must be given in degrees Celsius. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Parameter

T1	FLOAT	Temperature limit (Celsius, default: T1 = 17 Celsius)
T2	FLOAT	Temperature limit (Celsius, default: T2 = T1)

Example

To compute the heating degree days for a time series of daily mean temperatures, use:

```
cdo eca_hd tgfile ofile
```

2.14.11. ECAHWDI - Heat wave duration index wrt mean of reference period

Synopsis

eca_hwdi*[,nday[,T]]* `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily maximum temperatures TX, and let `ifile2` be the mean TXnorm of daily maximum temperatures for any period used as reference. Then counted is the number of days where, in intervals of at least nday consecutive days, TX > TXnorm + T. The numbers nday and T are optional parameters with default nday = 6 and T = 5 Celsius. A further output variable is the number of heat waves longer than or equal to nday days. Note that both TX and TXnorm must be given in the same units. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

Parameter

nday	INTEGER	Number of consecutive days (default: nday = 6)
T	FLOAT	Temperature offset (Celsius, default: T = 5 Celsius)

Example

To compute the heat wave duration index for a time series of daily maximum temperatures, use:

```
cdo eca_hwdi txfile txnormfile ofile
```

2.14.12. ECAHWFI - Warm spell days index wrt 90th percentile of reference period

Synopsis

eca_hwfi*[,nday]* `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily mean temperatures TG, and `ifile2` be the 90th percentile TGn90 of daily mean temperatures for any period used as reference. Then counted is the number of days where, in intervals of at least nday consecutive days, TG > TGn90. The number nday is an optional parameter with default nday = 6. A further output variable is the number of warm-spell periods longer than or equal to nday days. Note that both TG and TGn90 must be given in the same units. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

Parameter

nday INTEGER Number of consecutive days (default: nday = 6)

Example

To compute the number of warm-spell days for a time series of daily mean temperatures, use:

```
cdo eca_hwfi tgfile tgn90file ofile
```

2.14.13. ECAID - Ice days index per time period

Synopsis

eca_id `ifile ofile`

Description

Let `ifile` be a time series of daily maximum temperatures TX, then counted is the number of days where TX < 0 Celsius. Note that TX must be given in units of Kelvin. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Example

To get the number of ice days for a time series of daily maximum temperatures, use:

```
cdo eca_id txfile ofile
```

2.14.14. ECAR10MM - Heavy precipitation days index per time period

Synopsis

eca_r10mm `ifile ofile`

Description

Let `ifile` be a time series of daily precipitation amounts RR, then counted is the number of days where RR is at least 10 mm. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Example

To get the number of days with precipitation greater than 10 mm for a time series of daily precipitation amounts, use:

```
cdo eca_r10mm rrfile ofile
```

2.14.15. ECAR20MM - Very heavy precipitation days index per time period

Synopsis

eca_r20mm `ifile ofile`

Description

Let `ifile` be a time series of daily precipitation amounts RR, then counted is the number of days where RR is at least 20 mm. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Example

To get the number of days with precipitation greater than 20 mm for a time series of daily precipitation amounts, use:

```
cdo eca_r20mm rrfile ofile
```

2.14.16. ECAR75P - Moderate wet days wrt 75th percentile of reference period

Synopsis

eca_r75p `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily precipitation amounts RR, and `ifile2` be the 75th percentile RRn75 of daily precipitation amounts at wet days for any period used as reference. Then calculated is the percentage of wet days with RR > RRn75. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

Example

To compute the percentage of wet days where the daily precipitation amount is greater than the 75th percentile of the daily precipitation amount at wet days for a given reference period, use:

```
cdo eca_r75p rrfile rrn75file ofile
```

2.14.17. ECAR75PTOT - Precipitation percent due to R75p days

Synopsis

eca_r75ptot `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily precipitation amounts RR, and `ifile2` be the 75th percentile RRn75 of daily precipitation amounts at wet days for any period used as reference. Then calculated is the ratio of the precipitation sum at wet days with RR > RRn75 to the total precipitation sum. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

2.14.18. ECAR90P - Wet days wrt 90th percentile of reference period

Synopsis

eca_r90p `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily precipitation amounts RR, and `ifile2` be the 90th percentile RRn90 of daily precipitation amounts at wet days for any period used as reference. Then calculated is the percentage of wet days with RR > RRn90. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

Example

To compute the percentage of wet days where the daily precipitation amount is greater than the 90th percentile of the daily precipitation amount at wet days for a given reference period, use:

```
cdo eca_r90p rrfile rrn90file ofile
```

2.14.19. ECAR90PTOT - Precipitation percent due to R90p days

Synopsis

eca_r90ptot `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily precipitation amounts RR, and `ifile2` be the 90th percentile RRn90 of daily precipitation amounts at wet days for any period used as reference. Then calculated is the ratio of the precipitation sum at wet days with RR > RRn90 to the total precipitation sum. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

2.14.20. ECAR95P - Very wet days wrt 95th percentile of reference period

Synopsis

eca_r95p `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily precipitation amounts RR, and `ifile2` be the 95th percentile RRn95 of daily precipitation amounts at wet days for any period used as reference. Then calculated is the percentage of wet days with RR > RRn95. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

Example

To compute the percentage of wet days where the daily precipitation amount is greater than the 95th percentile of the daily precipitation amount at wet days for a given reference period, use:

```
cdo eca_r95p rrfile rrn95file ofile
```

2.14.21. ECAR95PTOT - Precipitation percent due to R95p days

Synopsis

eca_r95ptot `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily precipitation amounts RR, and `ifile2` be the 95th percentile RRn95 of daily precipitation amounts at wet days for any period used as reference. Then calculated is the ratio of the precipitation sum at wet days with RR > RRn95 to the total precipitation sum. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

2.14.22. ECAR99P - Extremely wet days wrt 99th percentile of reference period

Synopsis

eca_r99p `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily precipitation amounts RR, and `ifile2` be the 99th percentile RRn99 of daily precipitation amounts at wet days for any period used as reference. Then calculated is the percentage of wet days with RR > RRn99. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

Example

To compute the percentage of wet days where the daily precipitation amount is greater than the 99th percentile of the daily precipitation amount at wet days for a given reference period, use:

```
cdo eca_r99p rrfile rrn99file ofile
```

2.14.23. ECAR99PTOT - Precipitation percent due to R99p days

Synopsis

eca_r99ptot `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily precipitation amounts RR, and `ifile2` be the 99th percentile RRn99 of daily precipitation amounts at wet days for any period used as reference. Then calculated is the ratio of the precipitation sum at wet days with RR > RRn99 to the total precipitation sum. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

2.14.24. ECARR1 - Wet days index per time period

Synopsis

eca_rr1 `ifile ofile`

Description

Let `ifile` be a time series of daily precipitation amounts RR, then counted is the number of days where RR is at least 1 mm. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Example

To get the number of wet days for a time series of daily precipitation amounts, use:

```
cdo eca_rr1 rrfile ofile
```

2.14.25. ECARX1DAY - Highest one day precipitation amount per time period

Synopsis

eca_rx1day*[,mode]* `ifile ofile`

Description

Let `ifile` be a time series of daily precipitation amounts RR, then the maximum of RR is written to `ofile`. If the optional parameter mode is set to 'm', then maximum daily precipitation amounts are determined for each month. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Parameter

mode STRING Operation mode (optional). If mode = 'm' then maximum daily precipitation amounts are determined for each month

Example

To get the maximum of a time series of daily precipitation amounts, use:

```
cdo eca_rx1day rrfile ofile
```

If you are interested in the maximum daily precipitation for each month, use:

```
cdo eca_rx1day,m rrfile ofile
```

Apart from metadata information, both operations yield the same as:

```
cdo timmax rrfile ofile
cdo monmax rrfile ofile
```

2.14.26. ECARX5DAY - Highest five-day precipitation amount per time period

Synopsis

eca_rx5day*[,x]* `ifile ofile`

Description

Let `ifile` be a time series of 5-day precipitation totals RR, then the maximum of RR is written to `ofile`. A further output variable is the number of 5 day period with precipitation totals greater than x mm, where x is an optional parameter with default x = 50 mm. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Parameter

x	FLOAT	Precipitation threshold (mm, default: x = 50 mm)

Example

To get the maximum of a time series of 5-day precipitation totals, use:

```
cdo eca_rx5day rrfile ofile
```

Apart from metadata information, the above operation yields the same as:

```
cdo timmax rrfile ofile
```

2.14.27. ECASDII - Simple daily intensity index per time period

Synopsis

eca_sdii `ifile ofile`

Description

Let `ifile` be a time series of daily precipitation amounts RR, then the mean precipitation amount at wet days (RR > 1 mm) is written to `ofile`. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Example

To get the daily intensity index for a time series of daily precipitation amounts, use:

```
cdo eca_sdii rrfile ofile
```

2.14.28. ECASU - Summer days index per time period

Synopsis

eca_su*[,T]* `ifile ofile`

Description

Let `ifile` be a time series of daily maximum temperatures TX, then counted is the number of days where TX > T. The number T is an optional parameter with default T = 25 Celsius. Note that TX must be given in units of Kelvin, whereas T must be given in degrees Celsius. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Parameter

T	FLOAT	Temperature threshold (Celsius, default: T = 25 Celsius)

Example

To get the number of summer days for a time series of daily maximum temperatures, use:

```
cdo eca_su txfile ofile
```

2.14.29. ECATG10P - Cold days percent wrt 10th percentile of reference period

Synopsis

eca_tg10p `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily mean temperatures TG, and `ifile2` be the 10th percentile TGn10 of daily mean temperatures for any period used as reference. Then calculated is the percentage of time where TG $<$ TGn10. Note that both TG and TGn10 must be given in the same units. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

Example

To compute the percentage of time where the daily mean temperature is less than the 10th percentile of the daily mean temperature for a given reference period, use:

```
cdo eca_tg10p tgfile tgn10file ofile
```

2.14.30. ECATG90P - Warm days percent wrt 90th percentile of reference period

Synopsis

eca_tg90p `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily mean temperatures TG, and `ifile2` be the 90th percentile TGn90 of daily mean temperatures for any period used as reference. Then calculated is the percentage of time where TG $>$ TGn90. Note that both TG and TGn90 must be given in the same units. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

Example

To compute the percentage of time where the daily mean temperature is greater than the 90th percentile of the daily mean temperature for a given reference period, use:

```
cdo eca_tg90p tgfile tgn90file ofile
```

2.14.31. ECATN10P - Cold nights percent wrt 10th percentile of reference period

Synopsis

eca_tn10p `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily minimum temperatures TN, and `ifile2` be the 10th percentile TNn10 of daily minimum temperatures for any period used as reference. Then calculated is the percentage of time where TN < TNn10. Note that both TN and TNn10 must be given in the same units. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

Example

To compute the percentage of time where the daily minimum temperature is less than the 10th percentile of the daily minimum temperature for a given reference period, use:

```
cdo eca_tn10p tnfile tnn10file ofile
```

2.14.32. ECATN90P - Warm nights percent wrt 90th percentile of reference period

Synopsis

eca_tn90p `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily minimum temperatures TN, and `ifile2` be the 90th percentile TNn90 of daily minimum temperatures for any period used as reference. Then calculated is the percentage of time where TN > TNn90. Note that both TN and TNn90 must be given in the same units. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

Example

To compute the percentage of time where the daily minimum temperature is greater than the 90th percentile of the daily minimum temperature for a given reference period, use:

```
cdo eca_tn90p tnfile tnn90file ofile
```

2.14.33. ECATR - Tropical nights index per time period

Synopsis

eca_tr[,*T*] `ifile ofile`

Description

Let `ifile` be a time series of daily minimum temperatures TN, then counted is the number of days where TN > T. The number T is an optional parameter with default T = 20 Celsius. Note that TN must be given in units of Kelvin, whereas T must be given in degrees Celsius. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile`.

Parameter

T	FLOAT	Temperature threshold (Celsius, default: T = 20 Celsius)

Example

To get the number of tropical nights for a time series of daily minimum temperatures, use:

```
cdo eca_tr tnfile ofile
```

2.14.34. ECATX10P - Very cold days percent wrt 10th percentile of reference period

Synopsis

eca_tx10p `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily maximum temperatures TX, and `ifile2` be the 10th percentile TNx10 of daily maximum temperatures for any period used as reference. Then calculated is the percentage of time where TX < TXn10. Note that both TX and TXn10 must be given in the same units. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

Example

To compute the percentage of time where the daily maximum temperature is less than the 10th percentile of the daily maximum temperature for a given reference period, use:

```
cdo eca_tx10p txfile txn10file ofile
```

2.14.35. ECATX90P - Very warm days percent wrt 90th percentile of reference period

Synopsis

eca_tx90p `ifile1 ifile2 ofile`

Description

Let `ifile1` be a time series of daily maximum temperatures TX, and `ifile2` be the 90th percentile TXn90 of daily maximum temperatures for any period used as reference. Then calculated is the percentage of time where TX > TXn90. Note that both TX and TXn90 must be given in the same units. The date information for a time step in `ofile` is the date of the last contributing time step in `ifile1`.

Example

To compute the percentage of time where the daily maximum temperature is greater than the 90th percentile of the daily maximum temperature for a given reference period, use:

```
cdo eca_tx90p txfile txn90file ofile
```

A. Hints for PINGO user

Some **CDO** operators have the same name as in PINGO but the meaning is different. The following table gives an overview of those operators.

Operator name	**CDO**	PINGO
min	Minimum of two fields	Time minimum
max	Maximum of two fields	Time maximum
daymean	Daily mean	Multi-year daily mean
daymin	Daily minimum	Multi-year daily minimum
daymax	Daily maximum	Multi-year daily maximum
monmean	Monthly mean	Multi-year monthly mean
monmin	Monthly minimum	Multi-year monthly minimum
monmax	Monthly maximum	Multi-year monthly maximum
seasmean	Seasonally mean	Multi-year seasonally mean

There are also some **CDO** operators with the same functionality as in PINGO but the name is different. The following table gives an overview of those operators.

	CDO	PINGO
Maximum of two fields	max	max2
Minimum of two fields	min	min2
Field mean, min, max	fldmean, fldmin, fldmax	meanr minr, maxr
Time mean, min, max	timmean, timmin, timmax	mean, min, max
Daily mean, min, max	daymean, daymin, daymax	daymeans, daymins, daymaxs
Monthly mean, min, max	monmean, monmin, monmax	monmeans, monmins, monmaxs
Yearly mean, min, max	yearmean, yearmin, yearmax	yearmeans, yearmins, yearmaxs
Running mean	runmean	runmeans
Seasonally mean	seasmean	seasmeans
Multi-year daily mean	ydaymean	daymean
Multi-year monthly mean	ymonmean	monmean
Multi-year seasonally mean	yseasmean	seasmean

B. Grid description examples

B.1. Example of a curvilinear grid description

Here is an example for the **CDO** description of a curvilinear grid. xvals/yvals describes the position of the 6x5 quadrilateral grid cells. The first 4 values of xbounds/ybounds are the corners of the first grid cell.

```
gridtype  : curvilinear
gridsize  : 30
xsize     : 6
ysize     : 5
xvals     :  -21  -11    0   11   21   30  -25  -13    0   13
              25   36  -31  -16    0   16   31   43  -38  -21
               0   21   38   52  -51  -30    0   30   51   64
xbounds   :  -23  -14  -17  -28       -14   -5   -6  -17        -5    5    6   -6
               5   14   17    6        14   23   28   17        23   32   38   28
             -28  -17  -21  -34       -17   -6   -7  -21        -6    6    7   -7
               6   17   21    7        17   28   34   21        28   38   44   34
             -34  -21  -27  -41       -21   -7   -9  -27        -7    7    9   -9
               7   21   27    9        21   34   41   27        34   44   52   41
             -41  -27  -35  -51       -27   -9  -13  -35        -9    9   13  -13
               9   27   35   13        27   41   51   35        41   52   63   51
             -51  -35  -51  -67       -35  -13  -21  -51       -13   13   21  -21
              13   35   51   21        35   51   67   51        51   63   77   67
yvals     :   29   32   32   32   29   26   39   42   42   42
              39   35   48   51   52   51   48   43   57   61
              62   61   57   51   65   70   72   70   65   58
ybounds   :   23   26   36   32        26   27   37   36        27   27   37   37
              27   26   36   37        26   23   32   36        23   19   28   32
              32   36   45   41        36   37   47   45        37   37   47   47
              37   36   45   47        36   32   41   45        32   28   36   41
              41   45   55   50        45   47   57   55        47   47   57   57
              47   45   55   57        45   41   50   55        41   36   44   50
              50   55   64   58        55   57   67   64        57   57   67   67
              57   55   64   67        55   50   58   64        50   44   51   58
              58   64   72   64        64   67   77   72        67   67   77   77
              67   64   72   77        64   58   64   72        58   51   56   64
```

B.2. Example description for unstructured grid cells

Here is an example of the **CDO** description for unstructured grid cells. xvals/yvals describes the position of 30 independent hexagonal grid cells. The first 6 values of xbounds/ybounds are the corners of the first grid cell.

```
gridtype  : cell
gridsize  : 30
nvertex   : 6
xvals     :  -36   36    0  -18   18  108   72   54   90  180
              144  126  162 -108 -144 -162 -126  -72  -90  -54
                0   72   36  144  108 -144  180  -72 -108  -36
xbounds   :  339    0    0  288  288  309       21   51   72   72    0    0
                0   16   21    0  339  344      340    0   -0  344  324  324
               20   36   36   16    0    0       93  123  144  144   72   72
               72   88   93   72   51   56       52   72   72   56   36   36
               92  108  108   88   72   72      165  195  216  216  144  144
              144  160  165  144  123  128      124  144  144  128  108  108
              164  180  180  160  144  144      237  267  288  288  216  216
