A Unique Computable Name Code
for Alphabetic Account Numbering

Design

A completely new approach to assigning code numbers is described.
A ten-position code based on the last name, first name, and middle in-
itial is developed. Five additional positions are used in this particular
system to describe date of birth, sex, eye color, and height. These 15
positions result in a unique number. In actual practice at motor vehicle
bureaus, this coding system has produced less than .025% duplication.

Tables to permit the assignment of codes are included, which will make
the system advantageous for all customers who desire to use an alpha-
meric numbering system.

The technique described in this manual has been implemented on the IBM
650 and 1401 systems and is applicable to System/360. For further in-
formation contact your state and local government industry representative.

INTRODUCTION

There are many inherent advantages in establishing a number to represent alphabetic data. Prime among these are:

1. The ease with which data processing equipment of all sizes and types can use numerical as opposed to alphabetic data.

2. The speed of sorting. The processing cycle from the receipt of data to the completion of processing generally involves sorting. In many applications two sequences are required: assigned number sequence and alphabetic sequence. A number that produces an alphabetic sequence is extremely desirable, especially if the number occupies fewer positions than the corresponding alphabetic information.

3. The desirability of maintaining only one master file in alphameric sequence. Great savings in time, money, personnel and space, and improved operating efficiency are possible through the consolidation of several files into one. A single consolidated record leads to economies in such basic areas as mailing, inquiry, and storage costs. In fact, the rental of an electronic system might be justified entirely on the basis of postage savings.

An alphameric number must have the following characteristics in order to be useful to a data processing system:

1. The number developed must be unique for every person in the file. The only duplicates should be for identical input data.

2. The number, when sorted, should place this file into nearly perfect alphabetic sequence, and the few that may be out of sequence should be reasonably close to sequence for ease of location.

3. The number must be able to be computer-developed with a minimum of preliminary manual or machine operation. In addition, it should be adaptable to almost any computer.

4. The length of this number must be reasonable, considering the room necessary to store the number itself and any machine sorting or merging that is to be done with it.

The system described on the following pages presents a method whereby name and physical data are automatically converted to a 15-position code number which makes all the foregoing advantages possible and has all the necessary characteristics described above.

The particular code described was developed for use in driver licensing and motor vehicle registration. It is based on the last name, first name, and middle initial of an individual, plus additional information concerning age and physical characteristics.

The divisions of motor vehicles of large states where this method is in use have so far produced few duplicate numbers and have been 90.1% accurate in listing to alphabetic sequence.

For operations such as accounts receivable, subscription fulfillment, direct mail, voter registration, charitable organizations, income tax (state and city), and insurance (life and fire and casualty), the physical data portion of the code may be modified to include more pertinent factors than eye color, height, and birth date, which are used by the division of motor vehicles. Some alternate factors would be a partial address, application source, occupation, etc.

THE CONCEPT OF THE CODE

Harry L. Sankin, born December 12, 1918, having brown eyes, and being 5' 8" tall, will be used to illustrate the concept of the code and show how it is determined.

ALPHABETIC DATA

The Social Security agency has discovered that, while there are about 1,250,000 different last names in use by Americans, about 48% of the people share the 1,514 most common names. Using these names as the starting point, this system has developed a Last Name Table comprising 8,118 common five-letter combinations found in the second through sixth letters of the last name (see Appendix). Each combination is identified by a four-digit number. It has been established that the use of the first letter of the last name plus the four-digit number representing the next five letters produces an alphabetic sequence which is from 85 to 95% accurate.

To illustrate, the first portion of the code for Harry L. Sankin would be based on the initial S, and next five letters, ANKIN, of the last name. From the Last Name Table the computer selects the four-digit number corresponding to ANKIN — namely, 0437. This is placed next to the initial to form the first five positions of the code:

S0437

If, in searching the table, no entry is found that corresponds to the five letters (or fewer if the last name contains fewer than six letters), the number corresponding to the next letter combination in alphabetic sequence is used. For example, the last name Sankirt would be coded on the basis of the initial S and the letters ANKIR. The Last Name Table has entries for ANKIN (0437) and ANKO (0438). Thus, the first portion of the code would be:

S0438

Thus, names containing more than six letters, as well as those of six or less not corresponding exactly to an entry in the table, will be slightly out of alphabetic sequence. As previously noted, however, this occurs only in a small percentage of cases, and, when it does, the entry is not far from its proper location in the file.

So far, the code has replaced six alphabetic characters with one letter and four digits. The next part of the code is a three-digit number representing the first four letters of the first name. It has been discovered that over 90% of first names can be found in 768 four-letter combinations. From the First Name Table (see Appendix), also through a table-lookup operation, the computer assigns a three-digit number to each first name. For Harry, HARR yields the number 316. Therefore, at this point the code developed for Harry L. Sankin is:

S0437 316

These eight positions represent ten alphabetic characters.

The last part of the alphabetic structure deals with the middle initial. This is a unique two-digit code that permits greater discrimination. The alphabetic data portion of the code for Mr. Sankin, when 73 is appended for the letter L, is now:

S0437 31673

These ten positions represent eleven alphabetic characters. If used in a punched card file, sorting would be reduced 50% — from 22 passes to eleven.

PHYSICAL DATA

This section illustrates the development of additional characters for the code, to fulfill the requisite that there be a unique number for each individual. Since many common names can be found, the remainder of the code is based on personal characteristics. One approach to this "unique data" uses five positions and is made up as follows:

Month of birth — a single-character code set up according to the following table:

1	January	7	July
2	February	8	August
3	March	9	September
4	April	0	October
5	May	–	November
6	June	&	December

An advantage of this scheme is that it enables grouping by month of birth with a single-column sort.

Year of birth — the actual year of birth, ranging over a century and containing two digits, 00 through 99.

Sex and eye color — a single-character code set up according to the following table:

1	Male — Black or none listed	7	Female — Black or none listed
2	Male — Brown	8	Female — Brown
3	Male — Grey	9	Female — Grey
4	Male — Blue	0	Female — Blue
5	Male — Hazel	–	Female — Hazel
6	Male — Green	&	Female — Green

Here the advantage is the ability to group by a combination of two different factors on one pass through a sorter.

Height code — a one-digit code which, while variable (since an individual's height may change over the years), is included for the sake of finer distinction between similar names. To reduce the variability, the heights have been set up on ranges as follows:

1	0-60 inches
2	61-62 inches
3	63-64 inches
4	65-66 inches
5	67-69 inches
6	70-71 inches
7	72-99 inches

Depending on the nature of the file and its use, this portion of the code can be modified. One alternative would be to include an additional five ranges of height using the codes 8, 9, 0, -, and &. This would reduce duplicates considerably. A second alternative would be to use the additional expansion possibility to recode duplicates encountered within the structure of the basic 15 positions.

For example, if a duplicate 15-position code were encountered, the last digit of the second entry could be recoded to provide a unique number using an additional height table:

8	0-62 inches
9	63-66 inches
0	67-69 inches
-	70-71 inches
&	72-99 inches

The probability of encountering triplicates is so small that it is impractical to make provisions for such an occurrence in the code structure, although alphabetic characters could be used within the basic 15 positions.

To complete the illustration used earlier, the remainder of the code for Mr. Sankin would be:

Month of birth (December)	&
Year of birth (1918)	18
Sex (male) and eye color (brown)	2
Height range (5'8")	5

Combining these with the portion derived from alphabetic data gives:

S0437 31673 &1825

Another approach to "unique data" uses the complete birth date and sex, eliminating eye color and height. This could produce a 16-position code without using special characters. Sex is indicated by adding "50" to month of birth for females, thereby permitting expansion to 12 duplications for each sex:

Males				Females		
Range of				Range of		
Mo.	Day	Year		Mo.	Day	Year
01-12	01-31	00-99	Original	51-62	01-31	00-99
13-24	01-31	00-99	1st dup.	63-74	01-31	00-99
25-36	01-31	00-99	2nd dup.	75-86	01-31	00-99
37-48	01-31	00-99	3rd dup.	87-98	01-31	00-99
01-12	32-62	00-99	4th dup.	51-62	32-62	00-99
01-12	63-93	00-99	5th dup.	51-62	63-93	00-99
13-24	32-62	00-99	6th dup.	63-74	32-62	00-99
13-24	63-93	00-99	7th dup.	63-74	63-93	00-99
25-36	32-62	00-99	8th dup.	75-86	32-62	00-99
25-36	63-93	00-99	9th dup.	75-86	63-93	00-99
37-48	32-62	00-99	10th dup.	87-98	32-62	00-99
37-48	63-93	00-99	11th dup.	87-98	63-93	00-99

Under this approach, Mr. Sankin would be:

S0437 31673 121218

SUMMARY

This system of coding has been developed and perfected for driver license control and motor vehicle applications. It has been in use at state divisions of motor vehicles for some time. Since it was started, few duplicate code numbers have been found. Also, it is of great significance that the sequence of names has been 90.1% accurate overall in listing to alphabetic sequence, with greater perfection of sequence for the most common names.

Many types of business and government organizations dealing with large numbers of persons will find that this coding system will:

1. Provide machine-calculated code numbers that are 85-95% accurate in alphabetic sequence.

2. Greatly reduce (by at least 50%) the number of passes required to sort into alphabetic order on unit record equipment.

3. Eliminate the need for maintaining one file in assigned number sequence and another in alphabetic sequence.

4. Enable the user to verify the correctness of the number as input data using the source data alone.

5. Aid in identification by permitting "decomposition" of the number back into an approximation of name.

6. Eliminate the need for keeping track of previously issued identification numbers, since each number is "self-issuing".

7. Eliminate the need to store individual data (birth date and sex) as part of a master record, since it is extractable from the name code.

APPENDIX

The tables shown in this section are included to
enable all IBM customers to avail themselves of the
advantages of a computable name coding system.
Contained here are the

Middle Initial Table	–	27 combinations
First Name Table	–	768 combinations
Last Name Table	–	8,118 combinations

MIDDLE INITIAL TABLE

The middle initials are represented as follows:

A – 61	J – 71	No middle initial – 00
B – 62	K – 72	S – 82
C – 63	L – 73	T – 83
D – 64	M – 74	U – 84
E – 65	N – 75	V – 85
F – 66	O – 76	W – 86
G – 67	P – 77	X – 87
H – 68	Q – 78	Y – 88
I – 69	R – 79	Z – 89
