Additional Features: The Membership and Mailing List System is designed to meet the needs of associations by producing standard printouts of selected input. Input inclusion/exclusion and sequencing criteria are entered through a simple ANALYZE command. This feature provides great flexibility to your customer. For example, the system does not arbitrarily send follow-up notices for dues or publication invoices after a fixed period. Your customer can implement a 30- or 60-day follow-up policy by simply entering the appropriate 30- or 60-day parameter into the ANALYZE command prior to running the follow-up procedure. Analysis report formats have been established for each major file. The user of the ANALYZE command in conjunction with these report programs gives the user a dynamic listing capability to answer needs as they occur. The ANALYZE command can also be used without a subsequent report to develop statistical profiles (demographic analysis) of the membership.

The optional files are implemented and descriptions are supplied to the programs by answering a questionnaire. The responses are then entered into a Systems Control File. Other options addressed on the questionnaire include such policy matters as invoicing frequency and dues proration for new members.

An inquiry capability is provided through the Data File Utilities (DFU) to indicate individual records on the System/32 display screen or to print the records.

PROGRAM PRODUCTS

System/32 Membership & Mailing List System (cont'd)

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/32 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This System/32 Industry Application Program will execute on all models of the IBM System/32.

Information regarding disk allocation and usage (master and transaction files) and recommended backup levels and diskette requirements are available in the *Installation Guide*.

The OCL and file sizes, as distributed, will be fixed at the maximum capacity and normal distribution for the 5-megabyte file.

Any changes to file sizes should be carefully reviewed by the customer and IBM Systems Engineering to determine the necessity for more storage, estimate the time required to convert OCL procedures, and estimate throughput performance.

SOFTWARE REQUIREMENTS

The Membership and Mailing List System programs for IBM System/32 are written in IBM System/32 RPG II and operate under control of IBM System/32 System Control Program (5725-SC1). In addition, the IBM System/32 Utilities program product (5725-UT1) must be available for sorting of data (SORT), entering transactions with the Data File Utilities (DFU) and for making source program corrections with Source Entry Utility (SEU). If compilation of the RPG II source programs is required, the IBM System/32 RPG II Compiler (5725-RG1) and Source Entry Utility (SEU), for making RPG II program corrections, must be available.

CONVERSION

The Membership and Mailing List System requires loading of a large volume of data. This may make use of the System/32 keyboard inadvisable for conversion input. Programs are supplied to load the files from diskettes produced by the 3740 Data Entry System. Discussing conversion approaches and schedules with your customer or prospect will be a key element in your installation planning process.

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

**5230 DATA COLLECTION SYSTEM
SUPPORT for SYSTEM/32
5725-M3A****PURPOSE**

The 5230 Data Collection System Support for System/32 program provides the manufacturer with a convenient, practical means of preparing shop floor data for processing by the System/32 Manufacturing Management Accounting System (MMAS) application programs. Data collected by the 5230 Data Collection System is edited, consolidated, and formatted for processing by the MMAS Payroll, Inventory Management, and Production Status and Costing IAPs or for user-written manufacturing management systems (with appropriate changes to the output modules).

This IAP offers current System/32 MMAS account upgrading in the manufacturing industry. It is primarily intended for the manufacturer with 50 to 250 employees.

HIGHLIGHTS

- Interrelated to MMAS applications:
 - Elapsed time calculation for Payroll
 - Material receipt and issue data for Inventory Management
 - Job time for Production Status and Costing
- Management reports generated as a byproduct of data entry
 - Option to print or not print all reports except error reports and audit summaries
 - Labor report by supervisor for checking
 - Attendance and absentee reports
- Provides internal cross-checking and editing
 - Jobs started checked against jobs stopped
 - Employee time on jobs checked against time and attendance record
 - Transaction records checked for complete and accurate entry
- Provides automatic generation of machine-readable data
 - Reduces transcription errors
 - Eliminates time keeper calculation of elapsed time
 - Supports up to 40 different shifts to provide added flexibility for special starting times, lunch and other break times, and unique weekend schedules.
- Can be installed without customer
 - System tailoring procedure facilitates account growth by allowing on-site changes to file sizes and determination of functions used
 - File maintenance and audit procedures
 - Easy-to-use runbook
 - Step-by-step installation activity plan provided by the *Application Reference Manual*
 - User's information supplied to the supervisor by the *Application Reference Manual*

DESCRIPTION

The 5230 Data Collections System Support for System/32 provides two phases of operations: 5230 personalization phase and a data conversion phase.

The 5230 personalization provides a menu of actions from which the users select those that best fit their operation. Using the menu selections and loop definitions for up to three 5231 Controllers with up to four loops each, this phase creates the personalization records required to personalize the 5230 Data Collection System.

The data conversion phase prepares the data received from the 5230 Data Collections System for processing by the MMAS applications. The data can be accepted through the data communications facilities, the cards, or the diskette offered as output options by the 5230 Data Collection System.

Both material transactions and labor transactions are prepared. The material transactions are edited, listed, formatted, and stored for later use by the Inventory Management and Production Status and Costing applications. Labor transactions are expanded, edited, checked for accuracy, and adjusted for break and lunch times. They are also adjusted for lunch and shift start-stop time variances. The elapsed time for time and attendance and job time is calculated, and job time applied to overlapping jobs is apportioned to the jobs. Time and attendance totals are checked against job time totals with warning messages printed for differences that exceed user-prescribed limits. A correction procedure is included to allow for changing incorrect labor transactions. The results of the labor transaction processing are stored for later use by the Payroll and Production Status and Costing applications.

Reports are printed, at the user's option, for material transactions and for labor transactions. The material transactions report is a single listing. Labor transaction reports provide labor-related information suitable for management review and checking by supervisors for correctness. Attendance and absentee reports are also printed.

This program augments the MMAS cross-application Constants File with its own questionnaire responses. These records allow the

application to select certain options for the procedures to be used. The questionnaire responses are keyed during initial installation and may be changed as needed.

An *Application Reference Manual* provides a step-by-step installation activity plan including sample input and maintenance data forms, file loading sequences, and control forms with suggested procedures. This manual also provides information on the day-to-day use of the application.

The *Runbook* provides the operator with a detailed and easy-to-use set of instructions showing all the activities.

An *Application Logic Manual* is provided, as optional licensed material, for use by the self-sufficient customer and for systems engineering continuing support. It describes the architecture of programs, procedures, data base cross-references, data dictionary, and detailed descriptions of the program.

The 5230 Data Collection System Support for System/32 is a ready-to-execute program. It includes source code, object code, execution procedures, and the *Application Logic Manual*, if ordered as optional basic material.

CUSTOMER RESPONSIBILITIES

IBM will provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/32 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The IBM 5230 Data Collection System Support for IBM System/32 will execute on all models of the IBM System/32. The programs are compiled assuming a 16K system. If data communications features are to be used, the Binary Synchronous Communications Adapter (#2074) must be installed in the IBM 5230 System Unit. If card output from the IBM 5230 System is to be used, the Data Recorder Attachment (#3200) may be installed on the System/32 only.

SOFTWARE REQUIREMENTS

The IBM 5230 Data Collection System Support program for the IBM System/32 is written in IBM System/32 RPG II Programming language and executes under control of the IBM System/32 System Control Program (5725-SC1 Version 3). IBM System/32 Utilities licensed program (5725-UT1), which includes Sort, Data File Utility, and Source Entry Utility, is required for execution of the program. The IBM System/32 RPG II Compiler (5725-RG1) is required if modifications to the source code are necessary. In addition, one of the following MMAS applications should be installed.

- Payroll (5725-M32)
- Inventory Management (5725-M35)
- Production Status and Costing (5725-M31)

Additional Materials:

Data Collection Application Workbook (GH20-0203) ... *IBM 5230 Data Collection User's Guide* (GA34-0040)

DOCUMENTATION

(available from Mechanicsburg)

Runbook (SB30-0092) ... *Application Reference Manual* (SB30-0093) ... *Logic Manual* (LB30-0094).

SYSTEM/32 MANUFACTURING MANAGEMENT ACCOUNTING SYSTEM (MMAS)

- PRODUCTION STATUS AND COSTING ... 5725-M31
- PAYROLL ... 5725-M32
- ACCOUNTS PAYABLE ... 5725-M33
- ACCOUNTS RECEIVABLE ... 5725-M34
- INVENTORY MANAGEMENT ... 5725-M35
- PRODUCT DEFINITION AND COSTING ... 5725-M36
- GENERAL LEDGER ... 5725-M37
- SALES ANALYSIS ... 5725-M38
- ORDER ENTRY AND INVOICING ... 5725-M39

PURPOSE

The System/32 Manufacturing Management Accounting System (MMAS) provides manufacturers with a powerful aid in managing the business.

MMAS offers flexible applications specifically designed for the manufacturing industry. MMAS provides key reports to help management direct and control their business effectively.

MMAS offers opportunities for new name and first systems account sales in the manufacturing industry. It is primarily intended for the manufacturer with 20 to 250 employees.

HIGHLIGHTS

- Independent or interrelated applications approach:
 - Modular design facilitates sequential application installation
 - Single data entry results in multiple application updates
 - Modular design allows users to choose the applications that address problem areas
- Wide variety of reports and report options included:
 - Management reporting is a byproduct of normal data entry
 - Certain reports (statements, 941-As, and W-2s) can be saved on diskette for later printing
 - Detail or summary listings within a range of keys is supported in many reports
- Uses recognized accounting techniques and terminology to provide a solid accounting system:
 - Clear audit trails and control techniques are provided
 - Sample user-oriented forms for data preparation, file creation, audit and control are provided
 - Security code deters unauthorized inquiry or execution of key programs in each application
 - A Journal Reference Numbering System supplies audit trail for any application that automatically generates transactions into the General Ledger
- Provides manufacturers with an easy-to-use method for organizing and using manufacturing information such as bills-of-material, product cost, and shop order or job cost.
- MMAS can be installed without customer programming capability:
 - System tailoring procedure facilitates account growth by allowing on-site changes to file sizes and determination of functions used
 - File maintenance and audit procedures
 - Easy-to-use runbook
 - Supervisor and operator self-study courses are available
 - Step-by-step installation activity plan provided by the *Application Reference Manual*
 - User's information supplied to the supervisor by the *Application Reference Manual*

DESCRIPTION

The Manufacturing Management Accounting System is a set of nine independent yet interrelated, ready-to-execute applications for the small manufacturer:

- Order Entry and Invoicing
- Sales Analysis
- Accounts Receivable
- Inventory Management
- Product Definition and Costing
- Payroll
- Accounts Payable
- General Ledger
- Production Status and Costing: The system combines two data entry approaches - operator-oriented and batch-oriented. Support is provided for transaction entry through the System/32 keyboard or through a diskette created on a 3740 Data Entry System. The nine easy-to-operate applications can be installed in separate stages at different times and still be an interrelated system.

The only requirement is that Order Entry and Invoicing (5725-M39), and/or Inventory Management (5725-M35), and/or Accounts

Receivable (5725-M34) must be installed before Sales Analysis (5725-M38).

Each application has certain requirements records within a cross-application Constants File which contain questionnaire responses. These records allow the application to select certain fields for editing, report formats, file sizes, and functions to suit each customer's needs. The questionnaire responses are keyed during initial installation and may be changed as needed. The System Tailoring Procedure allows these responses to be entered.

The System Tailoring Procedure utilizes the answers to a series of questions regarding a manufacturer's requirements. It provides the following:

- Tailoring the application and Operator Control Language (OCL) on-site at installation time.
- Allows the user to activate and deactivate provided functions as the user's business changes.
- All provided functions are included in the programs but only required functions are executed.
- File sizes may be expanded or contracted as needed by rerunning the System Tailoring Procedure.

An *Application Reference Manual* provides a step-by-step installation activity plan including sample numbering systems, sample input and maintenance data forms, file loading sequences, control forms with suggested procedures. Volume II of the *Application Reference Manual* provides information on the day-to-day use of the application.

The *Runbook* provides the operator with a detailed and easy-to-use set of instructions showing all the activities necessary to run the MMAS programs on a System/32. The Operator Reference Card is provided for the operator as a reminder of the major operational functions of each procedure. It is intended to be used once the operator is thoroughly trained in the particular application.

Instructional material in the form of self-study courses is provided for the System/32 supervisor and operator to train them in the use of the *Application Reference Manual* and *Runbook*. The two courses are not application dependent. Therefore, only one copy of each course is needed per customer no matter how many applications are installed.

An *Application Logic Manual* is provided, as optional licensed material, for use by the self-sufficient customer and for systems engineering continuing support. It describes the architecture of programs, procedures, data base cross-references, data dictionary, and detailed descriptions of each program.

Features: The Manufacturing Management Accounting System consists of nine full-function, ready-to-execute applications. MMAS includes source code, object code, execution procedures, and the *Application Logic Manual*, if ordered as optional basic material.

These are some general features which all applications have:

- Designed to fit industry requirements
- Security codes to deter unauthorized use of master files
- In-house inclusion/exclusion of functions to be executed
- OCL procedures, Sort specifications, and processing programs are packaged into logical work units which simplify system operation
- Monitoring of execution sequence prevents execution of a program until preceding programs have been completely and successfully executed
- Compatible online/offline data entry through the system console or by means of diskettes created on a 3740 Data Entry System
- Dynamic Backup and Recovery System forces periodic backup of master files and edited transactions, and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files
- Reprint options are possible because file updating is separated from report writing functions
- Some report printing can be deferred to a more convenient time
- Selective printing options are available for many report functions

PRODUCTION STATUS AND COSTING (5725-M31)

This program provides management information on jobs or shop orders from the point of release to the shop floor through the closing process. Also, it provides a means to build and maintain a job select file for retaining and releasing repetitive or standard jobs. This file contains information at an operation and material level.

Jobs or shop orders may be released from the job select file and/or manually, based on individual requirements. During the release function the shop data base is created to provide for editing of feedback from the shop floor and for management reports. In addition to the creation

System/32 MMAS (cont'd)

of a shop data base, the release function creates a job worksheet to move with the work and a group of labor tickets for labor reporting.

The report function provides a variety of production and accounting reports such as Job Status, Work List, and exception reporting for quantity variance or cost variance. These reports reflect variance from projection on both production and accounting information and may be obtained in summary or detailed format.

The updating function records information from the shop floor to the shop data base at the operation and material detail level. Updates to the shop data base occur via labor, move, material issue, miscellaneous, outside operations and material receipts transactions. These transactions reflect the activity (hours and cost) and movement (quantity) of jobs or shop orders as they progress through the manufacturing facility. Transactions may be entered either manually or from other applications (Payroll, Inventory Management, and Accounts Payable) via the application interface.

Upon completion of a job, the closeout function produces closeout reports in both production and accounting formats to allow the analysis of labor and cost projections against actual. After producing these reports the closed jobs or shop orders are removed from the shop data base.

PAYROLL (5725-M32)

This hourly/salary/executive payroll provides for regular, overtime, premium, vacation, and sick pay. It may be run weekly, biweekly, semimonthly, monthly. Hours may be entered daily or by pay period; if selected, balancing time worked to attendance may be accomplished daily or weekly. Exception hours provide time and one-half, double time, double time and one-half, and triple time capabilities. Rates may be selected from the Employee Master Record or keyed in as an override. Shift differential capabilities are provided for second and third shift. The differential may be defined as a percentage of the rate or cents to be added to the rate.

Vacation/Holiday pay may be part of a regular pay check or on a separate check. A bonus payment is paid on a separate check with a flat percentage of income tax deducted. Sick pay may be fully non-taxable or only liable for income tax. Wages subject to Federal Unemployment Insurance (FUI) and State Unemployment Insurance (SUI) are determined.

The ability to handle taxable or non-taxable adjustments, pay advances and employer-paid union benefits (taxable and non-taxable) is also provided. Once the gross earnings is calculated, deductions will be taken to reach net pay. In addition to calculating present Federal and FICA taxes, a standard tax algorithm is provided to calculate most present state taxes based upon customer-provided data. Local taxes may also fit the standard tax algorithm provided. The state disability insurance deductions also use a standard algorithm based upon customer-provided data. Miscellaneous deductions may be taken by percent, fixed amount, hourly rate, upper limit, or cyclic within a user-specified frequency. Union deductions may be taken by percent, hourly rate, or fixed amount within a user-specified frequency.

Handwritten paychecks and paychecks never cashed (reversals) are also supported by the application. Once the payroll register and checks are printed, many analysis reports are produced: Labor Distribution, Job Distribution, Miscellaneous Deductions, Union Deductions, YTD/OTD Earnings, Workmen's Compensation Worksheet, and Payroll Journal. The presently formatted W-2 and 941-A reports are also provided.

The capability is provided to pass transactions to the General Ledger application, if installed. These transactions will be applied toward company use only. Payroll may be on either a cash or accrual basis. If the cash basis is selected, no transactions are passed to the General Ledger.

ACCOUNTS PAYABLE (5725-M33)

Accounts Payable provides an Open Payables and Cash Disbursements function on either an accrual or cash basis. Invoices and credit memos entered may be multilined and distributed by job, item number, cost type and General Ledger account number. Entries may be for standard or one-time vendors and may be open or prepaid. Credit memos may be entered manually or initiated automatically based upon a prior entered invoice.

A Purchase Journal provides the audit trail for cost transactions entering into the General Ledger system and into the open payables file. An Open Payables Report is provided in due date or vendor sequence. This turnaround document provides a mechanism to indicate payment by data, vendor or invoice, including partial payments, for Cash Disbursements. Invoices may be entered or placed in hold status to prevent inadvertent payment of invoices in question.

A Cash Requirements Report is used to assist the controller in insuring sufficient funds are available and proper invoice selection was made before the checkwriting procedure begins. The Cash Disbursements Journal provides an audit trail for its transactions entering the General Ledger application and acts as the Check Register. Checkwriting and reconciliation are also provided.

A Vendor Analysis Report indicates key business volumes and discounts lost and taken for previous year and current year.

ACCOUNTS RECEIVABLE (5725-M34)

Accounts Receivable supports a combination of both open-item and balance-forward customers. Billing transactions are directly keyed or accepted from Order Entry and Invoicing if that application is installed.

All transactions (that is, invoices, cash receipts, adjustments, and credit memos) are retained in an Open-Item File. This file may be purged daily or monthly at the user's request. An Aged Trial Balance with current plus four past periods is provided. It has multiple printing options (summary, detail, selected line, within limits). Delinquency Notices may also be printed. Late charges can be calculated for balance forward customers.

Two optional formats are provided for the customer statements which are printed at month-end. The capability is provided to delay the printing of the statements until a more convenient time without affecting the closing of the books. An account status inquiry feature is also provided.

INVENTORY MANAGEMENT (5725-M35)

Inventory Management maintains a perpetual inventory and on-order status for each item. It calculates and prints on demand numerous management figures including: Economic order quantity, dollar profit and percent of profit, average monthly usage, turnover rate, and reorder point. Management reports are also provided: ABC Analysis Report, two types of Stock Status, Inventory Analysis Report, Physical Inventory Checklist, On-Order Status Reports, Inventory Valuation and Variance Report, and Inventory Reorder Report. It can also interface with Order Entry and Invoicing, Sales Analysis, Product Definition and Costing, and Production Status and Costing.

PRODUCT DEFINITION AND COSTING (5725-M36)

Product Definition and Costing provides manufacturers with an easy-to-use method of organizing bills-of-material and item information and calculating product costs using bills-of-material. Costs are built from raw material up to the finished end-item. Assembly costs may be recalculated when there is a change in the bill-of-material or in the assembly labor or material costs or burden. The user can simulate the effect of proposed cost changes in end-item costs due to changes in labor, material or burden cost.

For all product costs the total cost of purchased parts is maintained separately as material cost. These costs are calculated and maintained level by level and make it possible for the user to identify the added value (labor, burden) for products and assemblies for tax purposes.

Management reports can be produced when required since the cost information is stored in the Product Definition and Costing data base. These reports include costed bills of material, cost reports reflecting either real or potential cost changes and variances (simulations), and special vendor where-used and final assembly where-used lists. The basic formats used for parts lists and where-used lists are single level, indented and summarized.

GENERAL LEDGER (5725-M37)

General Ledger combines all the transactions affecting the financial status of the company during the month. They may be entered directly as a General Journal Entry or may have been previously entered through interface with Accounts Payable or Payroll. At month-end closing time, Audit Registers and the Financial Statement Worksheet are provided to help verify that the user is still in balance before proceeding into the actual closing. The reports will also aid in generation of any necessary closing entries.

An Income Statement and Balance Sheet are standard report outputs. The user can define these reports with an easy-to-use format description procedure. The financial reports can illustrate current financial data as compared to budget or historical information.

Users may define their own chart of accounts or use a suggested account structure provided with the application. The fiscal year start month is user-defined. Multiple company support for up to ten companies is included. Any transactions passed from Payroll or Accounts Payable are applied to the first company only.

SALES ANALYSIS (5725-M38)

Sales Analysis reports summarize the activity and highlight the performance of items, customers, and/or salespersons. Selected reports may be printed in detail or summary, depending on the option selected at printing time. Since all data used in Sales Analysis can be entered through Order Entry and Invoicing, it should be installed to obtain full benefit of the Sales Analysis application. If Sales Analysis is installed with Accounts Receivable alone, only Salesperson and Customer Sales Analysis can be obtained; or with Inventory Management alone, only Item Sales Analysis can be obtained.

ORDER ENTRY AND INVOICING (5725-M39)

This postbilling program includes order entry and edit, invoicing, and preparation of an invoice register and price lists. The Order Acknowl-

System/32 MMAS (cont'd)

edgement will show warehouse location, while the picking list is printed in warehouse sequence. Pricing options include selection of the actual selling price, a discount percent from a list price, operator-entered price, or a contract price by customer. Up to six user-assigned discount percentages by item and up to three tax percentages are provided. Quantity break prices can be established optionally by item.

Order status and backorder status is provided by item, customer, or due date. Support is also provided for partial shipments and backordering or cancellation of the balance of the order. This application provides data for input into Inventory Management, Accounts Receivable, and Sales Analysis.

Two invoice formats are available. Picking list is optional and can be run either at order entry time or just prior to billing. Order acknowledgements are optional and may optionally be printed with prices.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day to day operation lies solely with the customer.

Installation of System/32 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Each of these IBM System/32 Industry Application Programs will execute on 16K or 24K models of the IBM System/32. The programs are compiled assuming either a 16K or 24K system. It is not intended that any one customer install all nine applications on one IBM System/32. Because of volume and time constraints, there may be a requirement for providing offline keying on an IBM 3740 Data Entry System. If an IBM 3742 is to be used, it must have the 128-character record features (#5455 and #4004).

The Manufacturing Management Accounting System is intended to be an independent yet interrelated set of applications. Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries. Because of this, no other user-written program may co-reside with any MMAS application unless stringent coding requirements for these programs are met to insure compatibility with the MMAS applications.

SOFTWARE REQUIREMENTS

The application programs are written in IBM System/32 RPG II Programming language and execute under control of the IBM System/32 System Control Program (5725-SC1 Version 2). IBM System/32 Utilities licensed program (5725-UT1), which includes Sort, Data File Utility, and Source Entry Utility, is required for execution of the programs. The IBM System/32 RPG II Compiler (5725-RG1) is required if modifications to the source code are necessary.

**SYSTEM/32 SHIPPING CONTROL for
SUPPLIERS TO THE AUTOMOTIVE INDUSTRY
5725-M44****PURPOSE**

System/32 Shipping Control for Suppliers to the Automotive Industry provides solutions for many problems associated with planning, controlling and reporting shipping dock transactions for the automotive supplier. Shipping Control for Suppliers to the Automotive Industry addresses the requirements for both release orders and discrete quantity orders by generating a wide variety of planning reports, shipping documentation and reporting of completed shipping transactions, which assists suppliers in effectively managing and controlling their shipping operations.

Shipping Control for Suppliers to the Automotive Industry offers opportunities for new name and first system account sales as well as established data processing accounts in the automotive industry. It is intended for automotive suppliers starting with enterprise locations with at least 50 employees or 2 million dollars in sales, and ranging up to the size of manufacturing plants of the automotive companies.

DESCRIPTION

Shipping Control is an operator-oriented system for suppliers to the automotive industry. The system is designed to operate in conjunction with Release Control for Suppliers to the Automotive Industry (5725-M45), or as a stand-alone application interfaced to the customer's release order processing and/or discrete order processing systems through customer-supplied programs. The application is designed for the needs of the automotive supplier by incorporating both batch and interactive modes of operation. All reports and shipping documents generated in the application are designed to meet the needs for both the automotive original equipment manufacturers and the replacement market.

An installation guide provides a step-by-step installation activity plan including sample reports and maintenance user data forms, control forms with suggested procedures, and other information necessary for a successful installation.

The runbook provides the operator with the detailed instructions necessary to effectively operate Shipping Control and provide accurate and timely management reports for planning, controlling, reporting and documenting shipping activity.

HIGHLIGHTS

Provides key planning reports:

- Schedule and Status Report showing the daily shipping schedule for current week, behind schedule position, current release position and last shipment date and quantity.
- Load and Routing Report showing projected daily shipments in terms of net, tare and gross weight with the associated carrier and routing instructions.
- Container requirements reports showing detailed container requirement by customer and/or container part number.
Allows selection and printing of shipping documents in a batch mode or through interaction between the system and the operator.
- Picking slips may be printed in customer, part number, or location sequence.
- Load sheets selected in interactive mode allow the operator to view the customer's requirements and the total weight buildup as parts are assigned to the load.
- Shipper documents designed to meet the requirements of the original equipment manufacturer and the replacement market.
- Bills of Lading may be printed in the formats required for direct shipments or shipments through consolidation points.

Provides a wide variety of reports of completed shipping transactions. Data files of shipping transactions are available for interfacing to other applications areas through user-supplied programs.

Creates advanced shipping notification data files for most of the major automotive manufacturers. Audit reports of all generated files are provided.

Interfaces with Release Control for Suppliers to the Automotive Industry (5725-M45) without programming modification.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the following:

- Making all decisions regarding the application processing options (refer to *Installation Guide* for a discussion of system options).
- Acquiring all forms and supplies.
- Gathering all master file data and generating all master files.
- Preparing schedules.
- Providing for installation assistance if required.

- Providing any programs which might be required to interface with existing user systems. Specifically, if discrete quantity orders are to be processed in the shipping application, the order file must be prepared in the proper format.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Shipping Control has been designed for a minimum configuration of IBM System/32 mdl A12. The IBM System/32 mdl B12 can be used if the printing of cut form bills-of-lading is not required. It is recommended that users of Shipping Control review with their marketing representatives their direct access storage requirements which are a function of the size of the master data files and transaction volumes. The size of the user's files will dictate the size of the disk storage capacity required. Listed below is a guideline which will be helpful in determining the user disk requirements.

Shipping Control for Suppliers to the Automotive Industry was designed to fit on the IBM System/32 with 5-megabyte disk capacity and the 80 cps Printer (mdl A22) assuming the following volumes:

1,700	Customer Master Records
800	Destination Master Records
1,000	Item Master Records
200	Routing Master Records
4,000	Order Records
800	Open Shipping Activity Records
450	Advanced Shipping Notification Records

These volumes are not restrictive but can be used as a guide to determine if the customer's shipping control system and files can be contained within the minimum system. The minimum IBM System/32 (mdl A12) is supported if the customer daily transactions can be handled by a 40-cps printer.

The file sizes set in the distributed OCL reflect these volumes for a 5-megabyte file.

Any changes to the file sizes should be carefully reviewed by the customer and IBM Systems Engineer to determine the necessity for more direct access storage, estimate of time required to convert OCL Procedures, and estimate of throughput performance.

SOFTWARE REQUIREMENTS

The programs in Shipping Control for Suppliers to the Automotive Industry are written in IBM System/32 RPG II and operate under the control of IBM System/32 System Control Program (5725-SC1). In addition, the IBM System/32 Utilities licensed program (5725-UT1) must be available for sorting of data (SORT) and Source Entry Utility (SEU) for making procedure or RPG II source program modifications.

If compilation of the RPG II source programs is required, the IBM System/32 RPG II Compiler (5725-RG1) must be available.

**SYSTEM/32 RELEASE CONTROL for
SUPPLIERS to the AUTOMOTIVE INDUSTRY
5725-M45****PURPOSE**

System/32 Release Control for Suppliers to the Automotive Industry provides the automotive parts suppliers with solutions to many problems associated with processing and maintaining release orders from the major automotive manufacturers.

Release Control offers a means of easily maintaining accurate release information which may be used to better manage the planning of shipments, fabrication activities and material acquisitions.

Release Control offers opportunities for new name and first system account sales as well as established data processing accounts in the automotive industry. It is intended for automotive suppliers starting with enterprise locations with at least 50 employees or 2 million dollars in sales, and ranging up to the size of manufacturing plants of the automotive companies.

DESCRIPTION

Release Control is an operator-oriented system for suppliers to the automotive industry. The system is designed to operate in conjunction with Shipping Control for Suppliers to The Automotive Industry (5725-M44), or as a stand-alone application.

An installation guide provides a step-by-step installation activity plan including sample input and user data forms for file maintenance, control forms with suggested procedures, and other information necessary for a successful installation.

The runbook provides the operator with information necessary to effectively operate Release Control to provide accurate and timely management reports.

HIGHLIGHTS

- Provides for key entry of release data with the ability to tailor the operator prompting to the specific release document.
- Provides for the processing of machine-readable release data as if it were key entered.
- Audit reports are printed showing release status before and after update.
- Processes shipping activity and adjustments to update release status and to maintain shipping history.
- Provides management reports in detail and summarized formats.
- Allows inquiry into the release and shipping history files for quick resolution of customer or supplier questions.
- Comes complete with source code, ready-to-execute procedures and object code.
- Is documented with an installation guide, application logic manual and an operator runbook.
- Provides for file maintenance to generate, list, update or delete master file records.
- Designed to interface with the Shipping Control for Suppliers to the Automotive Industry licensed program (5725-M44) without program modification.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the following:

- Acquiring all forms and supplies
- Gathering all master file data and creating all master files
- Preparing run schedule
- Providing for installation assistance if required

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Release Control has been designed for a minimum configuration of IBM System/32 mdl A12 (Matrix Printer) or B12 (Line Printer).

It is recommended that users of the IBM Release Control for Suppliers to the Automotive Industry review with their marketing representatives their direct access storage requirements which are a function of the size of the master data files and transaction volumes. The size of the user's file will dictate the storage capacity required.

The minimum system was designed to handle the following approximate volumes:

- 800 releases (customer/part number) with an average of three destinations each.
- 6,000 shipping history records, before a purge is necessary.

The file sizes set in the distributed OCL reflect these volumes for a 5-megabyte file.

Any changes to the file sizes should be carefully reviewed by the customer and IBM Systems Engineer to determine the necessity for more storage, estimate of time required to convert OCL procedures, and estimate of throughput performance.

SOFTWARE REQUIREMENTS

The programs in Release Control for Suppliers to the Automotive Industry are written in IBM System/32 RPG II and operate under the control of IBM System/32 System Control Program (5725-SC1). In addition, the IBM System/32 Utilities licensed program (5725-UT1) must be available for sorting of data (SORT) and Source Entry Utility (SEU) for making procedure or RPG II source program modifications. If compilation of the RPG II source programs is required, the IBM System/32 Compiler (5725-RG1) must be available.

**SYSTEM/32 CONSTRUCTION MANAGEMENT
ACCOUNTING SYSTEM (CMAS)**

JOB COSTING ... 5725-M61
ACCOUNTS PAYABLE ... 5725-M62
PAYROLL ... 5725-M63
GENERAL LEDGER ... 5725-M64

PURPOSE

The System/32 Construction Management Accounting System (CMAS) provides the construction industry with a complete, yet flexible method for managing their Payroll, Accounts Payable, Job Costing, and General Ledger.

CMAS offers opportunities for new name and first systems account sales in the construction industry. It is primarily intended for the general contractor with 1 to 7 million dollars in contracts per year, 25 to 250 employees; or the subcontractor with \$65,000,000 in contracts per year, 35 to 250 employees.

CMAS offers flexible applications specifically designed for the construction industry. CMAS key reports help construction management effectively direct and control their business.

The Construction Management Accounting System consists of four full function ready-to-execute applications. CMAS includes source code, object code and execution procedures.

HIGHLIGHTS

- Independent or interrelated applications approach
 - Modular design facilitates sequential application installation.
 - A journal reference numbering system ties the four applications together when multiple CMAS Applications are installed.
 - Single data entry results in multiple application update
- Wide variety of reports and report options included
 - Management Reporting is a byproduct of normal data entry
 - All applications provide for multicompany entries and reports
 - Field reporting allows for projecting profit and loss by job
- Uses recognized accounting techniques and terminology to provide a solid accounting system.
 - Clear audit trails and control techniques are provided
 - Sample user-oriented forms for data preparation, file creation and audit and control are provided
 - Security code deters unauthorized inquiry or execution of key programs in each application
- CMAS can be installed without customer programming capability
 - System tailoring procedure on-site to facilitate account growth changes
 - Display Screen input prompting and output report formats are tailored to meet specific customer requirements
 - Complete, system-controlled, operator oriented input prompting
 - Complete file maintenance and audit programs and procedures
 - Installation and operator self-study training exercises are provided to each customer

DESCRIPTION

The Construction Management Accounting System is a set of four independent, interrelated, ready-to-execute applications for the small to medium size contractor/subcontractor. The system combines two approaches - operator-oriented and batch reporting. This approach and programming system provides a sound accounting base by doing Payroll with Labor Distribution, Accounts Payable with Subcontract Accounting, Job Costing with Management Reporting and General Ledger with Financial Statements.

The four easy-to-operate programs may be installed in separate stages at different times and still be a totally interrelated system, that is, payroll data may be passed by the system directly to general ledger and job costing, etc.

Each application contains a requirements file with user questionnaire responses which allows the application to select input formats, report formats, and functions to suit each customer's needs. These responses are keyed in during initial installation and may be changed as customer needs change.

The systems tailoring procedure controls the prompting of input records and fields to be entered, the types of reports and fields on reports, and data files used for output.

Systems tailoring procedure is a procedure requesting the answers to a series of questions regarding a contractor's company requirements. Systems tailoring provides the following:

- Tailoring the system on-site at installation time

- Application reprogramming is not required as business changes because system tailoring parameters can be changed by the customer
- The programs contain all the announced functions, but only required functions are performed by the system
- Applications may be installed in any sequence
- System tailoring options include the following:
 - Multiple companies or single
 - Multiple states or single
 - Multiple unions or no unions
 - Custom formatting of Balance Sheets and Income Statements

An installation guide provides a step-by-step installation activity plan including suggested numbering systems, sample input and maintenance user data forms, control forms with suggested procedures, and other activities necessary for a successful installation.

The runbook provides the operator with activities necessary to effectively operate CMAS as an accounting system to provide accurate and timely management reports.

Two self-study guides lead the user through the installation guide, runbook, and associated materials to assist the self-sufficient customer.

JOB COSTING (5725-M61)

General Journal entries with cost distribution may be entered with distribution by company, job, pay item, cost code, and cost type.

Job Costing automatically updates the General Ledger component, if available. General Ledger is then updated on a monthly basis.

Job Costing is automatically updated by the Accounts Payable application, if installed. Payroll reports, when used with the Job Cost reports provide a total perspective of job status.

Job Cost management reports are provided with unit costs, budget comparison, and projected profit or loss based on field reporting of percent complete or quantity 'put-in-place'. Income reporting with distribution provides the basis for cash flow reports by company and by job.

ACCOUNTS PAYABLE (5725-M62)

Invoices and credit memos entered may be multiline and distributed by company, job, pay item, cost code, and cost type. The entries may consist of vendor, miscellaneous, estimated or subcontract invoices. Prepaid invoices are permitted on all of the invoice types. Credit memos may be entered manually or initiated automatically based on a prior enter invoice.

Subcontract accounting provides for automatic movement and accountability of retainage and change orders. Subcontracts are maintained on either a balance forward or open items basis. Subcontract status reports by job and by vendor denote the contract amount, change orders, billed amount and date, payment amount and date, retention, and taxes.

An accrued accounting system provides for timely job cost information, while a cash flow handling capability indicates job cash position through the general ledger.

The Accounts Payable application provides an Open Payable and Cash Disbursements function. An Open Payable report is provided in due date or vendor sequence. This turnaround document provides a mechanism to indicate payment by date, job, vendor, or invoice, including partial payments for Cash Disbursements.

Invoices may be entered or placed on hold status to prevent inadvertent payment of invoices in question.

A Cash Requirements report is used to assist the controller in insuring funds are available and proper invoice selection was made before the check writing procedure begins.

Check writing and reconciliation are provided. The check format provided includes a user-indicated check stub length to adapt the size of the remittance advice. Stub overflow initiates a separate supplementary stub.

An Accounts Payable trial balance is available in job or vendor sequence.

A Vendor Analysis Report indicates key business volumes by quarter and year.

PAYROLL (5725-M63)

This hourly/salary distributed payroll provides for regular, overtime, premium, vacation, sick and travel pay. It may be run weekly, biweekly, semimonthly, or monthly. Exception hours provide time and one-half, double time, double time and one-half, and triple time capabilities. Rate selection may be standard, selected by craft, or keyed in as an exception overtime or premium rate.

PROGRAM PRODUCTS

System/32 CMAS (cont'd)

- Clear audit and accounting procedures aid in maintaining an in-balance Payroll system.
- Handwritten checks (payoffs, special, etc.) are easily handled.
- Standard union deductions are used to prepare two standard union deduction reports. Multiple union reporting is supported.
- Workmen's compensation calculations and a workmen's compensation worksheet report provide a mechanism for weekly tracking of insurance premiums.
- A standard tax algorithm calculates federal, FICA, and all state income taxes based on customer-provided data. Local taxes may fit the standard tax algorithm provided.
- Deductions by percent, fixed amount, upper limit, and miscellaneous deductions.
- Taxable or non-taxable adjustments
- State Disability Insurance is calculated and reported.
- Federal Unemployment Insurance and State Unemployment Insurance are calculated and reported.
- Check writing and reconciliation are provided.
- A payroll journal provides a clear audit trail of entries to the CMAS General Ledger application.
- Labor cost management reports are provided with unit cost, budget comparison, and projected profit or loss based on field reporting of percent complete or quantity put-in-place. The reports are available with distribution by company, job, pay item, cost code, cost type, and job class.
- 941-A, W-2, and Certified Payroll reports are provided.

GENERAL LEDGER (5725-M64)

General Journal entries may be entered for end of month closings or for out-of-balance conditions.

Journal entries identified by journal names and numbers are indicated on the Financial Statement Worksheet and Trial Balance Listing. These entries are automatically accepted from the Payroll, Accounts Payable, and Job Costing applications.

On an out-of-balance condition, a procedure is provided to rearrange the entries into journal reference number sequence and print out a selective audit listing. This listing can be compared with the monthly journals to quickly identify the out-of-balance entry.

An Income Statement and Balance Sheet are standard report outputs which provide the user with the flexibility of defining these reports with an easy-to-use format description procedure. This definition may be changed as needs vary.

Financial reports can illustrate current financial data as compared to budget or historical information.

Users may define their own chart of accounts or use a suggested account structure provided with the application. The fiscal year start date is user defined.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/32 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This IBM System/32 program will execute on all models of the IBM System/32.

It is recommended that users of IBM Construction Management Accounting System (CMAS) review with their Marketing Representatives their direct access storage requirements which are a function of the size of master data files and transaction volumes. The size of the user's files will dictate the size of the storage capability required. Listed below are some guidelines which should be helpful in determining user disk requirements.

Distributed System for System/32 5 Megabyte file (1,968 Blocks)

Files	Number of Blocks*
System Control Programming	239
SORT Executable Code	34
CMAS Executable Work Units	98

* These block figures are for the System/32 feature only.

Application Files (Online all the time)

- Payroll System - 250 Active Employees Design 476
 - Payroll System File - 3 Records
 - Employee Master - 250 inactive, 250 active employees
 - Current Hours - 1,400 Distributions/Pay Period
 - Employee Deductions - 2,000 Deductions for active or inactive
 - Check Reconciliations - 1,250 Outstanding Checks (250 checks x 5 weeks)
 - Job Classifications - 65 Job Classes
 - Distribution - 160 Payroll Distribution Codes
 - Active Labor Cost Distributions - 700 Weekly Distributions
 - Union Master Deductions - 80 Union Deductions 10 Unions + (10 Unions x 7 deductions/union)
 - Monthly Union Deductions - 3,000 deductions
 - Tax Tables Federal/State/Local - 30 tax brackets (Federal, single, weekly, 10 \$ Brackets)
 - Employee State and Local Taxes - 2,000 Deductions with additional withholding (2 states x 2 locals x 500 active/inactive employees)
 - Insurance File - 155 Insurance company masters
 - Insurance Summary - 1,200 Employee Workmen's Compensation
- Accounts Payable - 1,200 checks design 401
 - Payables Systems File - 3 records
 - Active Vendor Master - 900 name and address
 - Checks Written - 1,200 check/month
 - Open Payables Distribution - 1,000 Outstanding Invoices with three distributions per invoice (3,000 records)
 - Active Subcontracts - 1,000 Subcontracts
 - Payables Work File - 1,400 Invoices and distributions
- Job Costing - 100 Job Vouchers/Month Design 117
 - Job Costing Systems File - 3 records
 - Job Work File - 400 Job Vouchers/ Batch
 - Job Name Master - 240 Active Jobs
 - Job Cost Detail - 2,100 Costing Entries (Active Job Costing Distributions + Income Distributions)
- General Ledger - 200 Journal Entries/Month 389
 - General Ledger Systems File - 3 records
 - General Ledger Work File - 200 General Journal Entries
 - General Ledger Chart of Accounts - 800 accounts
 - Temporary General Ledger Account Transactions - 9,200 entries
 - General Ledger Format - 400 formatting records

Application Work Files Area

- (Loaded by Application) 208
 - Paid for CMAS User 6
- Total Blocks 1,968

The OCL and file sizes, as distributed, have been fixed at the maximum capacity with normal distribution for the 5 MB file.

Any changes to file sizes other than those shown above should be carefully reviewed by the customers and IBM System Engineering to determine the necessity for more storage, estimate of time required to convert OCL procedures, and estimate throughput performance.

The IBM System/32 disk is backed up by dumping the disk to multiple diskettes. IBM-supplied system programs are provided to the user on diskettes initially and should be retained by the user for backup. The user-created application data files must also be backed up on diskette. Users are required to provide their own backup diskettes for CMAS procedures, programs, and data files.

Number of User-Supplied Diskettes Required for Backing Up the System/32 Distributed System and Data Files

	System/32 Back Up*	
	Single Level	Double Level
Payroll	18	36
Accounts Payable	12	24
Job Costing	8	16
General Ledger	13	26
All 4 Applications	38	76

* Includes Backing Up: Daily Transactions; CMAS Machine-Readable Object Programs; Disk-Resident Application Files

It does not include SCP 5725-SC1, Utilities 5725-UT1, RPG II 5725-RG1 machine-readable materials (PID shipment) or any other programs, procedures, data files, and spare diskettes to replace damaged or worn diskettes.

The System/32 user will require either the sum of the backup diskettes for each application installed or 38 diskettes, whichever is less.

SOFTWARE REQUIREMENTS

The CMAS licensed programs are written in IBM System/32 RPG II and operate under control of IBM System/32 System Control Program (5725-SC1). In addition, the IBM System/32 Utilities licensed program (5725-UT1) must be available for sorting of data (SORT) and Source

PROGRAM PRODUCTS

**SYSTEM/32 RPG II
5725-RG1**

PURPOSE

System/32 RPG II provides the following capabilities:

- RPG II Language Level
- System/32 Device Support
- Auto-Report
- Binary Synchronous Communications (BSC)

DESCRIPTION

RPG II Language Level: The RPG II language is supported as on the System/3 mdl 6. Overlays are automatically generated when necessary. Differences do occur due to different devices and SCP function.

System/32 Device Support: All the devices available on the System/32 are supported by System/32 RPG II, except the diskette drive. Through the use of System/32 OCL, the diskette drive is supported as an offline multivolume sequential input, output or update file. The shared input/output access method is also supported. The following expanded device support is provided:

- **SET/KEY Display Support:** The field light capability (System/3 mdl 6) has been replaced by a prompting capability which will use messages stored either in the program or the library to prompt the operator.
- **CONSOLE File Support:** Through the use of normally coded File Description and Input Specifications, the CONSOLE File (keyboard/display) is supported in a buffered interactive mode. The operator is prompted by field name, one field at a time.

All input is buffered and overlapped with processing. The program is coded to process records as from any other sequential input device.

Auto-Report: Auto-Report is included with the System/32 RPG II compiler and includes the following features:

- **Copy:** Specifications may be cataloged in the library and included in any RPG II program via the COPY statement. It is especially useful for cataloging the File Description and Input Specifications for which overrides may be coded to specify such things as control levels. By using the COPY statement, only one description of the file need be cataloged and changed for all programs using the file.
- **Page Headings:** Page headings can easily be specified on Output Specifications without the need for Output Indicators or end positions. The heading is centered over the report complete with page numbers and date.
- **Simplified Report Specifications:** A report may be produced by listing on Output Specifications the fields desired in the order desired. On one Output Specification, the field, column heading, and an indication for column totals may be entered. The column headings, fields, and column totals are automatically generated.

Binary Synchronous Communications (BSC): The Telecommunications Specification is supported in System/32 RPG II. Support of Binary Synchronous Communications will be provided by System/32 to communicate with:

- Another System/32 with RPG II
- System/34 with RPG II and Assembler
- System/3 with ML/MP, CCP or RPG II
- System/7 with MSP/7
- S/360 with any of the following:
BTAM
TCAM/NCP*
CICS/DOS, CICS/OS
- S/370 with any of the following:
BTAM
TCAM/NCP*
VTAM/NCP
CICS/DOS, CICS/OS, CICS/VS
IMS/VS
- S/360 mdl 20 with BSCA IOCS
- 3741 mdl 2 or 4
- A 3747
- A 5110 Computer System supported as a 3741 mdl 2 or 4
- 5231 mdl 2, Receive mode only. Supported as a 3741 mdl 2 or 4
- 5280 Distributed Data System

- * **Note:** The 3704/3705 Emulation Program (EP) or the Partitioned Emulation Program (PEP) extension to 3704/3705 NCP can be used to emulate the 2701.

The BSC support for System/32 is supported on the host system as System/3 BSC.

The RPG II device names are DISK, PRINTER, CRT, CONSOLE, KEYBOARD and BSCA. The user indicators (U1-U8) may be turned on and off in the RPG II program. The status of these indicators may then be tested by OCL. The DSPY operation code is not supported. See

"System/32 Device Support" for the expanded definition of SET/KEY which replaces the function.

- Header specification entries have been added to specify UDATE formats of mm/dd/yy, dd/mm/yy, yy/mm/dd and to designate the edit character to be used with the Y edit code. The Shared I/O Access Method is supported. The MOVEA and SETLL operation codes are supported.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

System/32 RPG II supports all models of the IBM 5320 and the following special features:

- #1005 Additional Storage
- #2074 BSCA
- #1100 1255 Attachment
- #3200 Data Recorder Attachment

SOFTWARE REQUIREMENTS

A current version of IBM System/32 System Control Programming (5725-SC1) is required.

SYSTEM/32 MOTOR FREIGHT ACCOUNTING SYSTEM (MFAS) 5725-T21

PURPOSE

This application provides small to medium size general commodity or specialty motor freight carriers with a powerful aid in managing their business.

The MFAS Revenue Accounting IAP offers conventional revenue accounting functions to the small and medium size general commodity and specialty carrier in the motor freight industry. These functions are divided into the five categories of (1) Freight Bill Entry and Daily Reports, (2) Accounts Receivable, (3) Interline Payables, (4) Shipment Analysis, and (5) Owner/Operator Accounting.

The application is designed to help the general freight and specialty carrier manage revenue accounting requirements and report prime motor freight sales and operational data.

The entry of data from a coded copy of the freight bill establishes records for daily statistical reporting, accounts receivable, interline payables, shipper/consignee and interline statistics and shipment analysis.

The entry of the owner/operator accounting data produces records of owner/operator freight bill revenue, expenses, charges, advances, and settlement amounts. Owner/operator accounting will also produce settlement sheets detailing those items used in settling with the owner/operator. Owner/operator accounting is by owner and/or driver or unit.

HIGHLIGHTS

- Wide variety of reports and report options included:
 - Management and operational data reporting is a byproduct of normal data entry
 - Detail or summary listings within a range of keys is supported in many reports
 - Statements for freight bill accounts receivable optionally printed on stock paper or preprinted forms with or without tear off portion for turnaround document.
- The Motor Freight Accounting System can co-reside in the System/32 with the Distribution Financial Accounting System and all application areas with the exception of owner/operator accounting can supply data to general ledger.
- Uses recognized accounting techniques and terminology to provide a solid accounting system:
 - Clear audit trails and control techniques are provided
 - Sample user-oriented forms for data preparation, file creation, audit and control are provided
 - Security code deters unauthorized execution of programs
 - A journal reference numbering system supplies an audit trail for any area that generates transactions for the DFAS General Ledger
- Can be installed without customer programming capability:
 - System tailoring procedure facilitates account growth by allowing on-site changes to file sizes and determination of functions used
 - File maintenance and audit procedures provided
 - Detailed runbook
 - Operator self-study course is available
 - Step-by-step installation activity plan provided by the *Application Reference Manuals*
 - User's information supplied to the supervisor by the *Application Reference Manuals*

DESCRIPTION

The Motor Freight Accounting System is a ready-to-execute application for the small to medium size motor carrier.

The system uses the Data File Utility as its data entry approach. Support is provided for transaction entry through the System/32 keyboard or through a diskette keyed offline on a 3740 Data Entry System. The Motor Freight Accounting System Revenue Accounting IAP can be installed with the Distribution Financial Accounting System General Ledger, Accounts Payable, and Payroll IAPs in separate steps, at different times and be an interrelated system.

The System Tailoring Procedure utilizes the answers to a series of questions regarding a carrier's requirements. It provides the following:

- Tailoring the application on-site at installation time.
- Allows the users to change selections of provided functions as the business changes.
- All provided functions are included in the programs but only required functions are executed.
- File sizes may be expanded or contracted as needed by rerunning the System Tailoring Procedure.

Volume 1 of the *Application Reference Manual* provides a step-by-step installation activity plan including sample input and maintenance data forms, file loading sequences, and control forms with suggested procedures. Volume 2 of the *Application Reference Manual* provides information on the day-to-day use of the application.

The *Runbook* provides the operator with a detailed set of instructions showing all the activities necessary to run the procedures on a System/32. The Operator Reference Summary Card is provided for the operator as a reminder of the major operational functions of each procedure. It is intended to be used once the operator is thoroughly familiar with the particular procedure.

Instructional material with exercises is provided to train the operator in the use of the *Runbook*.

An *Application Logic Manual* is provided, for use by the self-sufficient customer and for systems engineering continuing support. It describes the architecture of programs, procedures, data base cross references, data dictionary, and detailed descriptions of each program.

Application Description: The Motor Freight Accounting System is a full function, ready-to-execute application. Included are Source Code, Object Code, execution procedures, and the *Application Logic Manual*.

These are some general features which the Motor Freight Accounting System has:

- Designed to fit industry requirements
- Security codes to deter unauthorized use of master files
- In-house inclusion/exclusion of functions to be executed
- OCL procedures, Sort specifications, and processing programs are packaged into logical work units which simplify system operation
- Monitoring of execution sequence prevents execution of a program until preceding required programs have been completely and successfully executed
- Compatible online/offline data entry through the System/32 console or by means of diskettes keyed offline on a 3740 Data Entry System.
- Dynamic Backup and Recovery System forces periodic backup of master files and edited transactions and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files
- Reprint options are possible because file updating is separated from report writing functions
- Selective printing options are available for many report functions

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/32 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM System/32 Industry Application Program feature will execute on all models of the IBM System/32 which have 24K bytes of main storage. The programs are compiled assuming a 24K system. Because of volume and time constraints, there may be a requirement for providing offline keying on an IBM 3740 Data Entry System. If an IBM 3742 is to be used, it must have the 128-character record features (128-character feature #5455 and feature group A #4004).

SOFTWARE REQUIREMENTS

The application programs are written in IBM System/32 RPG II Programming language and execute under control of the IBM System/32 System Control Programming (5725-SC1 Version 5). IBM System/32 Utilities licensed program (5725-UT1), which includes Sort, Data File Utility, and Source Entry Utility, is required for execution of the programs. The IBM System/32 RPG II Compiler (5725-RG1) is required if modifications to the source code are necessary.

PROGRAM PRODUCTS

**SYSTEM/32 UTILITIES
5725-UT1****PURPOSE**

The following utilities are provided with the Utilities licensed program:

- Data File Utility (DFU)
- Sort
- Source Entry Utility (SEU)

The following data base management functions are provided as part of DFU:

- Data File Creation and Maintenance
- Data File Inquiry
- Data File List

DESCRIPTION

All functions of the above utility take advantage of cataloged RPG II File Description and Input Specifications. To use any of the functions, the user need only know the name of the file and the name of the cataloged RPG II specifications. The functions will prompt for all the other information necessary to tailor the job to the user's task. Field names are included with the prompts to aid the user in selecting the data fields to be used.

Data File Creation and Maintenance: This function provides the necessary capabilities to create and maintain data files in a data base. Maximum use is made of the display to prompt the operator by field name for the data to be entered. For update, the data currently in the field is displayed. This function operates only with indexed sequential files. Highlights include:

- Formatted Report for an Audit Trail
- Auto-Duplication of Fields
- Control Totals
- Generated Keys
- Modulus 10 and 11 Self-Check Digit

Data File Inquiry: This function provides the necessary capability to allow inquiry into a file. Any indexed file may be inquired into. The records are displayed showing the current status of the information in the file. Highlights include:

- Retrieval by record key
- The capability to roll forward or backward in key sequence through the file.
- The ability to optionally print a record with the 'PRINT REC' command key.
- All displayed fields include column headings for easy identification.

Data File List: This function provides the capability to list and summarize selected information from any indexed or sequential file in the data base. The function is very useful for obtaining one-time reports and for creating recurring management reports. Highlights include:

- Page headings including date and page number
- Column headings
- Edited data fields
- Column totals - both final and subtotals
- Selection based on record codes and/or field values
- Sort-Ascending or Descending
- Summary list with totals only
- Retrieve and print data from a related file
- Calculate and print additional fields

Sort: The System/32 Sort utility provides the function and capability of the proven System/3 Sort. Highlights include:

- Selection based on field contents: for example, record codes
 - Support of any data field
 - ADDR0UT (Tag) Sort
 - Summary Sort
 - Automatically allocated work file
 - Ascending or descending sequence

Source Entry Utility (SEU): SEU can be used to create and maintain OCL procedures, RPG II and FORTRAN IV source statements and SORT source statements. Highlights include:

- Sort formats to aid in entering Sort statements.
- RPG II and Auto-Report formats to aid in entering RPG II and Auto-Report statements.
- Optional RPG II and Auto-Report syntax checking
- Optional resequencing of statements in library.

- The ability to move statements around in a program.
- The ability to include statements from another library member.
- The ability to delete statements.
- Statement insertion.
- Rolling forward or backward through cataloged statements.
- Optional listing of statements.
- Use of display to show statement being entered or updated.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

IBM System/32 Utilities licensed program supports all models of the IBM 5320 and #1005 Additional Storage.

SOFTWARE REQUIREMENTS

A current version of IBM System/32 System Control Programming (5725-SC1) is required to support IBM System/32 Utilities licensed program (5725-UT1).

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**SYSTEM/32 FILE CONVERSION UTILITY (FCU)
5725-UT2****PURPOSE**

The File Conversion Utility (FCU) is a stand-alone System/32 utility accepting input from and providing output to 5321 Magnetic Card Unit or fixed disk (Link Direct Access Method [LDAM], sequential, direct or indexed sequential file organization).

DESCRIPTION**Functions**

- Convert numeric fields to packed, unpacked or signed binary.
- Convert monospace EBCDIC characters to lowercase or to proper noun (characters following blank or hyphen and first character of field converted to uppercase; all others converted to lowercase).
- Convert lowercase EBCDIC to uppercase.
- Format numeric data for word processing (insert minus sign, insert decimals, right or left justify, suppress leading zeroes and trailing blanks).
- Resequence fields in an output record
- Insert constant data.
- Process selected records (include or exclude based on field comparison).
- Display audit totals (sum, maximum and minimum) for packed or unpacked numeric fields over an entire file.
- Combine a primary Magnetic Card, LDAM or System/32 file with a secondary input file to produce a merged output file. (The secondary file must be indexed by a field in the primary file.)
- Can process up to 512-byte records.
- Support all System/32 Keyboard/Display character sets for update. Supports Magnetic Card data.
- Access variable-length fields separated by field separator characters.
 - Proper noun conversion exceptions. Names requiring nonstandard capitalization (such as von Fleet, McKinley, O'Connor) can be properly converted to upper/lowercase by defining special conversion specifications.
 - Abbreviation expansion.
- LDAM records up to 512K bytes can be processed when 24K bytes of main storage are available.

User instruction and/or input is provided the utility through data specification forms similar to forms used by RPG.

This utility provides support for the sharing of stored information between application programs. The utility provides the user with the capability of converting a file formatted for IAP or data processing applications to a format acceptable to the word/text processing applications. Similarly, data entered into Document Libraries can be used by other data processing programs after conversion by the utility (each user installation requires analysis for limitations).

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

IBM System/32 File Conversion utility supports all models and features of the IBM 5320. For IBM 5321 Magnetic Card Unit support to LDAM support, the Word Processor feature. (#6002) on 5725-SC1 is required. 24K bytes of main storage is required for processing records greater than 256 bytes.

SOFTWARE REQUIREMENTS

A current version of IBM System/32 System Control Programming (5725-SC1) is required to support IBM System/32 File Conversion Utility (5725-UT2).

TERMS and CONDITIONS: See PP Index

SYSTEM/32 STATISTICAL SYSTEM 5725-XA1

PURPOSE

The System/32 Statistical System is a set of routines offered for use by Problem Solvers to satisfy their needs in statistical data analysis. This licensed program is a set of four major tools: Stepwise Linear Regression Analysis, Factor Analysis, Analysis of Variance, and Orthogonal Polynomial Curve Fitting.

This flexible statistical system accepts user-supplied commands and data which instruct the system to perform one or more of the above analyses. Many options are available to the user, as described below.

- Orthogonal Polynomials Curve Fitting - derivatives can be obtained ... polynomials can be reentered for evaluation at a specified set of points.
- Analysis of Variance - four factors are allowed ... balanced designs can be analyzed, using factorial techniques ... a program for arranging the Analysis of Variance table to conform to specific design needs is included.
- Factor Analysis - twenty-five variables are allowed ... eigenvalues produced using the QR algorithm matrix output from programs can be used as input for later analyses ... orthogonal and oblique reference frames are possible.
- Stepwise Linear Regression Analysis - matrix output can be used and pooled with other matrices for use as input in later analysis ... twenty-five variables are allowed ... deletion and entry of variables are automatic.

In addition, many output report options may be selected by the user.

HIGHLIGHTS

- Data input to the Statistical System can be entered from the keyboard at the time of execution or read from the disk (stored from a previous run) or read from disk where the data had been created offline and transferred from diskette.
- Output to be retained will be saved on disk.
- Although FORTRAN coding knowledge is desirable, it is not required to use the Statistical System.
- Prompting messages on the display device will aid the user in selecting options available.
- Interactive response is provided for the user via the keyboard.
- Error checking and associated messages will be furnished.

CUSTOMER RESPONSIBILITIES

This program is distributed in machine-readable form (diskette). It is the customer's responsibility to provide for safekeeping of the diskette to ensure continued operation (back-up). A *User's Guide* is also provided. Procedures for installation are furnished.

SPECIFIED OPERATING ENVIRONMENT:

HARDWARE REQUIREMENTS

The IBM System/32 Statistical System is designed to operate on all models of the IBM System/32.

The IBM System/32 Control Storage Increment (#1500) is required.

FORTRAN graphics on IBM 5320 B and C models are provided by the 64-character EBCDIC print belt or by a new 48-character FORTRAN print belt. This new belt is recommended and may be ordered as #9492 as the belt provided with the system, or as feature #5552 as an additional print belt.

IBM 5320 A models automatically provide FORTRAN graphics.

SOFTWARE REQUIREMENTS

The IBM System/32 System Control Programming (5725-SC1), Version 6 or later is required.

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**SYSTEM/32 RETAIL DATA PREPARATION
5725-XA2****PURPOSE**

The System/32 Retail Data Preparation licensed program is designed to satisfy the basic functional requirements of retailers. It is available for a System/32 with 32K. It provides flexible, ready-to-execute programs specifically designed for processing transaction log data produced on 5265 Point-of-Sale Terminals.

HIGHLIGHTS

- Transaction data may come from diskettes created on 5265 Point-of-Sale Terminals (TP or hand carry).
- Processing frequencies are user-specified, governed only by file capacities and execution of prerequisite programs.
- File sizes can be periodically reallocated.
- Process-convert-separate transaction log data.
- Establish control counts.

Publications: The *RMAS General Information Manual* contains a description of RMAS and its application features and functions as they may be used by a typical customer. It contains three sections. The first introduces IBM's retail offering, as it pertains to the 5265 terminals, with special attention to the licensed programs, of which Data Preparation is the only one for System/32. The second provides more detailed information on the major functions and operations associated with the application programs. The last section reviews installation and planning tasks, and customer responsibilities.

The *Data Preparation User's Guide* provides the technical planning, reference, and operational information needed to understand, install, manage, and use Data Preparation.

A *Logic Manual* is provided, as licensed material, for use by the self-sufficient customer and for the systems engineer in maintaining and modifying Data Preparation. The *Logic Manual* contains information on naming conventions, controls, program functions and specifications, problem determination and resolution steps and other application-independent information. In addition, the *Logic Manual* will contain information that is relevant to the application, such as program descriptions, cross-reference lists and data dictionary.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in the installation of IBM licensed programs. However, the responsibility for personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/32 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The minimum system configuration is an IBM System/32 consisting of:

- IBM 5320 System Unit mdl A01 (with 3.2 megabytes of disk storage)
- Two #1005 Additional Storage special features (to 32K)

Although there is nothing inherent in the design of the IBM System/32 Retail Data Preparation program to prevent the use of the minimum system configuration stated above, the system configuration for a particular customer must be able to accommodate the expected business volumes, data base size, and operating requirements.

The amount of disk storage required is influenced by:

- The volume of daily transactions
- The frequency of processing

SOFTWARE REQUIREMENTS

The IBM System/32 Retail Data Preparation programs are written in IBM System/32 RPG II programming language and execute under control of the IBM System/32 Control Program (5725-SC1) (Version 8 or later). The IBM System/32 Utilities licensed program (5725-UT1), which includes Sort, Data File Utility, and Source Entry Utility, is required for execution of the programs. The IBM System/32 RPG II compiler (5725-RG1) is required if modification of the source code is desired.

PROGRAM PRODUCTS

**SYSTEM/32 SUBROUTINE LIBRARY - MATHEMATICS
SL-MATH (5725-XM1)**

PURPOSE

The Subroutine Library - Mathematics (SL-MATH) is a set of basic computational subroutines for the solution of mathematical problems. It includes a wide variety of subroutines, but is not exhaustive in terms of either functions performed or methods used. It provides powerful tools for the solution of many problems in industry, science, and engineering. The subroutines, which are designed as computational building blocks, operate on data that resides in main storage.

Included are three subroutines dealing with optimization. The solution of a standard linear programming problem by (1) the revised simplex method with bounds and ranges and (2) the revised dual simplex method is provided. The third optimization subroutine provides for the solution of a capacitated network flow problem (generalized transportation problem). Sample programs will be provided for two of the optimization subroutines.

HIGHLIGHTS

Some of the characteristics of SL-MATH are:

- The subroutines are purely computational in nature. They do not contain references to external devices, but operate exclusively on data already contained in main storage. The user must prepare a main program calling the SL-MATH subroutines and must furnish, as part of this program, the input/output and, possibly, other operational routines for the total solution of the problem.
- All subroutines comply with the FORTRAN IV conventions. They are called by means of the FORTRAN CALL statement, and are executed according to the normal rules of FORTRAN IV.
- The numerical mathematics part often provides multiple algorithms for one problem class, allowing the user to choose the method appropriate to the specific problem.
- Certain classes of errors are detected and flagged. The program takes appropriate action and warns the user.

CUSTOMER RESPONSIBILITIES

The Subroutine Library - Mathematics is distributed in machine-readable form (diskettes). It is the customer's responsibility to provide for safekeeping of the diskettes to ensure continued operation (back-up). A *User's Guide* is also provided. The user must be familiar with FORTRAN and must prepare a main program.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The storage requirements for a specific problem will depend on the routines used, the size of the main program, and the data storage requirements. The IBM System/32 Control Storage Increment (#1500) is required.

FORTTRAN graphics on IBM 5320 mdl B and C models are provided by the 64-character EBCDIC print belt or by a new 48-character FORTRAN print belt. This new belt is recommended and may be ordered as Specify #9492 as the belt provided with the system, or as feature #5552 as an additional print belt.

IBM 5320 A models automatically provide FORTRAN graphics.

SOFTWARE REQUIREMENTS

The SL-MATH subroutines require the following:

- IBM System/32 System Control Program (5725-SC1) Version 6 or later is required.
- IBM System/32 FORTRAN IV (5725-FO1)

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

**SYSTEM/32 WORD PROCESSOR/32
5725-XX1**
PURPOSE

The Word Processor/32 (WP/32) licensed program provides a set of office-related word processing functions to process text information from a keyboard, store it in document form, and operate on and print this information in a batch mode.

DESCRIPTION

Word Processor/32 (5725-XX1), combined with the System/32, offers a comprehensive office data and word processing system.

The Word Processor/32 licensed program provides programming that supports System/32 word processing features:

- 5321 Magnetic Card Unit
- Dual Case Keyboard/Display with keys and functions corresponding to standard typewriter keyboards
- Print features, including superscripting and subscripting

This combination of licensed program and System/32 hardware features provides a comprehensive systems solution for:

- Document and letter generation from stored and original text
- Document editing at the magnetic card typewriter or via batch edit
- Creation, maintenance, sequencing, and selection of lists used for mass mailing or miscellaneous administrative support
- Sharing data for word processing and data processing use
- Production statistics reports

It provides functions ranging from automatic printing of data from magnetic cards prepared at a magnetic card typewriter, to comprehensive formatting and editing of long documents stored in a document library on the System/32 nonremovable disk storage facility.

Word Processor/32 will execute with System/32 System Control Program (SCP), 5725-SC1. SCP feature #6002 is required.

HIGHLIGHTS

- Existing functions of the Magnetic Card Selectric® typewriters are enhanced by providing automatic printing and extended word processing functions on the System/32.
- Multiple input media
 - Magnetic cards recorded on (standard features supported):
 - Magnetic Card Selectric®
 - Magnetic Card II
 - Magnetic Card/A
 - Magnetic Card Executive®
 - Communicating Magnetic Card Selectric® (in nonteleprocessing mode)
 - Format Feature on Magnetic Card II and Magnetic Card/A for input or output
 - Standard System/32 keyboard redefined to support one of twelve-character arrangements (requires Dual Case Keyboard and Display feature #3400.)
 - Diskette created on 3741 or 3742 in monospace or upper/lowercase convention. (3742 requires the 28-character blocking feature #5455).
- Comprehensive document formatting including:
 - Stored formats for standard settings such as margins, tabs, line spacing, page length, etc.
 - Headings and footings
 - Page numbering
 - Footnote control and numbering
 - Line numbering
 - Automatic pagination control including ability to keep blocks of text together or reserve white space on a page (for insertion of figures and tables) and controlled start/end of pages (sections, chapters, etc).
 - Right margin justification
 - Line ending adjustment to accommodate change (no adjust is an option).
 - Centering
 - Superscript/Subscript, Word Underscore
- Document Generation from a combination of original text and prestored text. Documents can range from simple letters built from paragraphs to multi-page specifications.
- Media Handling Efficiency through storage and retrieval of documents from System/32 nonremovable disk.
- Insertion of variables at designated places within text, such as tailoring a form letter with name and address and personal comments.
- Decimal Arithmetic performed on numeric symbol values.

- Keyboard efficiencies including:
 - Automatic paragraph and section numbering
 - Encoding/Expansion using three character 'symbols' to generate long names or phrases commonly used
 - Global change
 - Support of tables with:
 - Easy definition and entry
 - Headings centered on columns
 - Headings repeated on multipage tables
 - Blank space optionally padded with fill characters
 - Right, left, and decimal alignment
 - Automatic layout of table between margins
- Forms fill-in with prestored definition of form and position of variables
- Mass mailing including:
 - Conditional generation of paragraphs or whole letters based on a test or comparison
 - Easy definition and edit of name and address files
 - Sequencing of letters; for example, into zip code order
 - Direct access to contents of a System/32 data processing file with data conversion to a format suited to text printing (unpacked, commas inserted, decimals inserted, names converted to upper/lowercase, etc.)
- Preparation of code-compatible magnetic cards for revision or playout at a magnetic card typewriter, except proportional spacing at Magnetic Card Executive.
- Revision of disk-resident text with editing instructions entered from magnetic card, System/32 keyboard, or diskette created on 3741 or 3742. Change list printed during edit provides ease of proofing. Author/operator 'comments' or instructions can appear in proof copy with automatic deletion in final print.
- Production statistics control information trailer sheet printed at the end of each task giving as appropriate: Date, operator, author, department, task name, number of output pages, number of output cards, number of input lines.
- Production statistics reports printed daily, weekly, or monthly detailing production volumes and system utilization by author, department, and job, including year-to-date summary.
- Administrative lists (personnel listings, telephone directories, sales and inventory summaries, document logs of location of incoming and outgoing correspondence, etc.) supported by:
 - Formatting and printing of lists with headings, page numbers, etc.
 - Word processing-oriented definition and update of lists
 - Sort and selection of lists via typist-oriented commands
- Document security prohibiting read/write access by unauthorized WP/32 users
- Alternate use of the System/32 for word processing and data processing applications

CUSTOMER RESPONSIBILITIES

- Document security including Security Key assignment and Document Class assignment
- Manual operations and backup procedures
- Data conversion
- Implementor, system operator, and typist training
- Installation of hardware and prerequisite programs
- System/32 operation
- Installation of the licensed program

SPECIFIED OPERATING ENVIRONMENT
HARDWARE REQUIREMENTS

IBM System/32 with at least 3.2 million bytes of disk storage, 50 lpm line printing speed, and 16K bytes of main storage capacity (an IBM 5320 System Unit mdl B or C).

SOFTWARE REQUIREMENTS

This Word Processor/32 licensed program is distributed as IBM System/32 load modules. It is released to execute with Version 6 of the IBM System/32 System Control Program (SCP), 5725-SC1, and all subsequent versions and modifications unless so stated in a future revision of this document. Some production statistics report generation programs are written in RPG.

SCP feature #6002 is required.

Notes:

Do not reproduce without written permission

PP 5725-XX1.2

Mar 83

Major Revision

PROGRAM PRODUCTS

Word Processor/32 (cont'd)

1. There is no increase in printing throughput on C model systems over B model systems for Word Processor/32 applications.
2. Some applications executing complex PRINT task in a 16K main storage environment may exhaust available main storage. If this occurs, it will be called to the attention of the IBM System/32 operator by a message, and will require the operator to rerun the PRINT task preceded by a PROOF task. The print speed, when executing most print tasks, will be less than rated printer speed. The speed of printing is dependent upon factors such as memory size and the complexity of the task formatting requirements of the application.
3. Thorough evaluation of each prospect's throughput and file sizing requirements must be made prior to proposal of either 16K main storage or 3.2 million bytes of fixed disk storage, or both.

Support is provided for the following:

IBM 5321 Magnetic Card Unit
IBM 5321 Magnetic Card Unit Attachment
Dual Case Keyboard and Display
Half Line Space
48-character EBCDIC Print Belt
64-character EBCDIC Print Belt
96-character Artisan Print Belt
96-character Modified Courier Print Belt

Magnetic Card Typewriters supported by Word Processor/32 must have the Paragraph Indent Feature.

DOCUMENTATION

TERMS and CONDITIONS: See PP Index

SYSTEM/32 LETTER WRITING APPLICATION 5725-XX2

PURPOSE

System/32 Letter Writing Application licensed program provides the System/32 user with the additional data processing capability of printing personalized letters for large volume distribution. The Letter Writing Application licensed program is directed toward the user with a System/32 installed or on-order, whose primary volume letter generation or response is nonexistent or presently done by means of preprinted forms or flyers.

DESCRIPTION

The Letter Writing programs produce a letter in upper and lower case with the ability to insert name and addresses into the address line, and other variable information into the body of the letter. When inserting variable information, the text line is spread, the phrase inserted, and unnecessary blanks deleted. The resulting line length must not exceed 80 positions or data will be lost. A maximum of 73 phrase characters, including phrase separator (>), blanks, and shift designator (-), can be entered for any one name and address record for insertion into the body of the letter. Multiple phrases are separated in the phrase field of the name and address record by the phrase separator (>), and are used sequentially as phrase insert characters. Logical OR symbols (| - upper shift 1) are encountered in the letter text. Labels can be produced from the Name and Address File as one-, two- or three-up across the page for mailing purposes. A statistical detail or summary report may be printed showing the number of name and address records on file by zip code or one of two user-specified codes (5 alphanumeric positions each).

The system has three primary files, a Name and Address file, a Letter Text file and a Title Table file.

The Name and Address file contains first and last name, address information, a letter code, a title code and 2 user codes. It also has space for limited phrases which may be inserted automatically into the body of the letter. The letter code specifies which letter, from the Letter Text file, the individual is to receive. This code may be changed if desired, so that all addresses in the name and address file get the same letter.

The Letter Text file contains fixed format text lines along with control information for the selection of salutation format (casual or formal), letter style, tab stops, date location and spacing, and name and title default values, if they are not present in the name and address record. The casual format allows use of first names or nicknames in the salutation line while containing the surname in the address name line. Suffixes to the last name (Jr., Sr., etc.), may be specified to print on the name line but omitted from a formal salutation.

The Title Table file contains thirty-six titles which may be specified in the name and address record by a title code. This information is automatically inserted into the name line of the address and salutation line, if desired.

File creation is in the form of diskettes from the 3740 Data Entry System or through the System/32 keyboard. Maintenance is via the System/32 keyboard only.

Text changes to the Letter Text file are limited to one line at a time. All text changes to the Letter Text file are done as a replace function. This means that the entire line displayed on the CRT, a maximum of 40 characters including blanks, must be retyped. (40 characters represents 1/2 line.) Changes to the Name and Address file are handled in the same manner on a field by field basis.

HIGHLIGHTS

- Full operator guidance through interactive CRT prompting for ease-of-use.
- Input from either the System/32 keyboard or diskettes from the 3740 Data Entry System. Maintenance is from System/32 Keyboard only.
- Routines for creation and maintenance of name and address records and their translation into upper/lowercase characters.
- Routines for creation and maintenance of text files made up of multiple letters and their translation into upper/lowercase characters.
- Routines for creation and change of title table file, which contains up to 36 title descriptions for insertion into the name line.
- Letters printed in block, modified block, or personal format.
- Casual or formal salutation.
- Variable phrase insertions into the body of the letter from the phrase field of the name and address record.

- User codes in the name and address record.
 - A three-position letter identification code in the name and address record to specify the letter to be printed from the letter text file.
 - Two user codes of 5 alphanumeric positions each in the name and address record to allow selective processing and sorting by user-defined data when printing labels or letters.
- Selective printing of letters from the text file by a letter identification code in the name and address record.
- Label printing 1-, 2-, or 3-up with optional print alignment pattern.
- Selective printing of labels or letters for any valid range of zip codes, or range within one of the two user-specified codes.
- Additional selective printing capability for restart of letters or labels (skip X number of records, print Y number of records).
- Sort and print labels or letters in sequence by zip code, or one of two user codes, or original entry sequence.
- Print total at the end of each label or letter run to show the number of labels or letters printed.
- Print a brief statistical report showing detail or summarized total for name and address records on file, by zip code, or one of two user-specified codes.
- Print proof listing for all, or selected, labels or letters.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the following:

- Personnel selection and training: The customer is responsible for selecting at least one person who will oversee the installation and at least one person to assume the duties of an operator. The customer is also responsible for the coordination and education of the various departments affected by the installation.
- Providing for installation assistance if required and completing the file sizing necessary to insure adequate disk space for proper installation.
- Acquiring all forms and supplies.
- Making all decisions regarding the application processing options or user codes in the name and address records.
- Gathering data for name and address file and generating all master files.
- Providing any programs that may be required to interface with existing user programs, PPs or IAPs.

SPECIFIED OPERATING ENVIRONMENT

Due to the unique upper and lower case printing requirements of IBM System/32 Letter Writing Application, throughput performance will not be enhanced by upgrading from an IBM 5320 mdl B2X to a mdl B3X. However, the joint letter writing/data processing user may require a mdl B3X for increased throughput when using a monospace print belt for data processing applications.

It is recommended that IBM representatives review their direct access storage requirements with their customers that have the System/32 Letter Writing Application. Storage requirements are a function of the size of the master data files and transaction volumes. The size of the master files will also dictate the size of the diskette storage capacity required.

The Letter Writing Application was designed to execute on all B and C models of the IBM System/32. The following file capacities are programmed into the Letter Writing OCL statements:

- 1,898 name and address records (256 characters each) in the Name and Address file
- 1,898 lines of text (96 characters each) in the Letter Text file
- 36 records in the Title file

With the above file size allocations, the Letter Writing Application requires a minimum of 478 blocks of available data file area on the system's fixed disk for proper execution. This space is required only while using the Letter Writing Application, and may be returned for the use of other applications after Letter Writing tasks have been completed.

The above file volumes are not restrictive but can be used as a guide to determine if the Letter Writing files can be contained within the system where other Application files are also online. Further information regarding disk allocation, diskette requirements, and file size modifications are contained in the *Application Reference Manual/Runbook* (SH30-0207).

Any changes to file sizes should be carefully reviewed by the customer and IBM Systems Engineering to determine the necessity for more storage, estimate the time required to convert OCL procedures, and estimate throughput performance.

System/32 Letter Writing Application (cont'd)**HARDWARE REQUIREMENTS**

This IBM System/32 licensed program was designed to execute on all line printing B and C models of the IBM System/32. Matrix printing is not supported. In addition to the system, a 96-character print belt (RPO #GG0339) is required for the upper/lowercase type. Program maintenance may be performed on all models of the IBM System/32. Dual Case Keyboard and Display (#3400) for the IBM System/32 is not supported by the IBM System/32 Letter Writing Application.

SOFTWARE REQUIREMENTS

The Letter Writing programs are written in IBM System/32 RPG II and operate under control of the IBM System/32 System Control Program (5725-SC1). In addition, the IBM System/32 Utilities licensed program (5725-UT1) must be available for sorting of data. If procedure and source program modifications are to be made, Source Entry Utility (SEU) must be installed.

If compilation of the RPG II Source Programs is required, the IBM System/32 RPG II Compiler (5725-RG1) must be available.

System and File Backup: The System/32's disk is backed up by dumping the disk to multiple diskettes. IBM-supplied system programs are initially shipped to the user on IBM-provided diskettes which should be retained by the user for backup. The user created application data files (Name and Address file, Letter Text file and Title file) may be backed up on one or more diskettes (depending on the size of the file), using the file backup procedure provided in the Letter Writing Application. The user is required to provide backup diskettes for procedures, programs, and data files.

RPOs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

**SYSTEM/32 JOB ANALYSIS SYSTEM (JAS/32)
5725-XX3****PURPOSE**

The System/32 Job Analysis System (JAS/32) is a powerful tool to aid management in the planning, supervising, and controlling of project-oriented work by the critical path method. It is designed to be easily used by nontechnical personnel.

The JAS/32 operates under the System/32 System Control Program, (5725-SC1). Depending on main storage availability, the JAS/32 has the ability to handle 275 to 736 activities or work items and relationships per subnet.

HIGHLIGHTS

- Front-to-back interfacing of up to 10 subnets to form a network with up to 7,360 activities.
- Up to 10 subnets per master file.
- Up to 32 calendars.
- Four types of time relationships between work items.
- Multiple starts and ends.
- Reports easily modifiable.
- Progress reporting specifying actual start date and/or remaining duration.
- Three types of schedule dates: Actual, data, scheduled.
- Nine levels of milestones.
- Free-form or fixed-data input.

CUSTOMER RESPONSIBILITIES

All users should know the various features of this system before attempting to use it for actual project control. Users will need to know the fundamentals of the critical path technique before they can prepare input.

The customer must describe the activities which form the project network. This data may be recorded on diskettes for entry into the System/32 using an IBM 3740, or it can be entered directly from the keyboard. Processing and report requests may also be entered in either fashion.

The customer should provide for safekeeping of the diskette to ensure continued operation (backup). A *User's Guide* will also be provided. Procedure for installation will be furnished.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The JAS/32 is designed to operate on all models of the IBM System/32.

SOFTWARE REQUIREMENTS

- IBM System/32 System Control Programming (5725-SC1), Version 6 or later Source Entry Utility licensed program (5725-UT1).

TERMS and CONDITIONS: See PP Index

**SYSTEM/34 BASIC ASSEMBLER AND
MACRO PROCESSOR
5726-AS1****PURPOSE**

The Basic Assembler licensed program is a symbolic programming language used to write programs or subroutines for the IBM System/34. Source programs written in this language are processed by the Basic Assembler licensed program to produce relocatable object programs which are subsequently converted to executable format by the System/34 System Support Program Overlay Linkage Editor facility. The System/34 Libraries are used to store the source statements, relocatable object programs and executable 'load' programs.

The Basic Assembler may also be used for assembly of relocatable subroutines for use with System/34 RPG II and COBOL. The subroutines written in the Basic Assembler language are coded by the user and separately assembled. The process of program linking is accomplished during compilation of the RPG II and COBOL source programs.

HIGHLIGHTS

Some of the features provided by the Basic Assembler licensed program are:

- Mnemonic Operation Codes
- Symbolic Referencing of Storage Addresses
- Automatic Storage Assignment
- Address Displacement Calculation
- Convenient Data Representation
- Operand Field Expressions
- Source Identification - Sequence Fields
- Assembler Instructions
- Cross-Reference Listings
- Error Checking and Diagnostic Messages

DESCRIPTION

System/34 Macros: System/34 Macros provide support to the Assembler user through the Macro Processor for the following System Support Program facilities: Disk functions, printer operation, keyboard and display screen access, 1255 device control, binary synchronous communications, SNA/SDLC communications and other SSP services such as Timer, EOJ, Message Log, program load.

The macros are supplied to provide an interface to existing SSP support.

The BSC Macros provide communication with:

- Another System/34 (RPG II or Basic Assembler)
- System/32 (RPG II or Basic Assembler)
- System/3 (MLMP, CCP or RPG II)
- System/7 (MSP/7)
- System/360 (BTAM or TCAM/NCP)*
- System/370 (BTAM, TCAM/NCP, VTAM/NCP, CICS/VS or IMS/VS)*
- 3741 mdl 2 or 4
- 3747
- 5231 mdl 2 (Receive Mode only) - supported as 3741 mdl 2 or 4
- 5280 Distributed Data System
- Series/1 (supported as a System/3)
- * **Note:** The 3704/3705 Emulation Program (EP) or Partitioned Emulation Program (PEP) extension to 3704/3705 NCP can be used to emulate the 2701.

Additional macros and macro extensions will provide support for the Interactive Communications Feature (SSP-ICF) provided by the System/34 SSP. Specific support is for:

- System/370 IMS/VS (IRSS and SNA/SDLC), CICS/VS, and CICS/DOS/VS using BSC or SNA/SDLC protocols
- System/3 mdl 15 CCP using BSC protocols
- System/34, System/32, 5110, 3741, 5230 using BSC protocols (point-to-point only)

The assembler macros will support the loadable SORT interface from the System/34 Utilities Program and the SSP checkpoint/restart facility.

Additional System/34 macros provide interfaces to the scientific instruction set.

Additional macros may be written by the user using the macro definition language provide.

All macro instructions are expanded into Assembler source language statements by the Macro Processor that in turn can be processed by the Basic Assembler.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

IBM System/34 Basic Assembler and Macro Processor licensed program runs on all models of the System/34 and supports all features.

SOFTWARE REQUIREMENTS

The current release of IBM System/34 Basic Assembler and Macro Processor licensed program operates under control of the current release of IBM System/34 System Support Licensed Program (5726-SS1).

Program Use During Customer Preinstallation Testing: The System/34 Basic Assembler and Macro Processor licensed program (5726-AS1) is available to customers for preinstallation testing on IBM Test Center systems in accordance with IBM's Program Testing Policy.

DOCUMENTATION
(available from Mechanicsburg)

System/34 Basic Assembler and Macro Processor Licensed Program Specifications (GC21-7677) ... System/34 Basic Assembler and Macro Processor Reference Manual (SC21-7705) ... System/34 Reference Summary (GX21-7674).

RQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

**SYSTEM/34 BASIC
5726-BA1**
PURPOSE

BASIC (Beginners All-purpose Symbolic Instruction Code) is a high-level interactive language for users who have commercial data processing requirements or who need to solve business, technical, and scientific problems. IBM System/34 BASIC is designed to be easy-to-learn, easy-to-use, and easy-to-remember, enabling the programmer or casual user to concentrate on the application aspects of the programming task. The System/34 BASIC implementation uses a design such that code not executed does not take up main storage, and program size is not limited to region size. System/34 BASIC has the ease-of-use characteristics of an interactive interpreter, and yet offers some of the performance advantages of a compiler.

System/34 BASIC is designed in accordance with the American National Standard Minimal BASIC (x3.60-1978) as understood and interpreted by IBM as of September 1979.

HIGHLIGHTS

System/34 BASIC offers the following functions and advantages to the user:

- Variable and function names can be up to 8 characters long.
- Longer variable and function names provide many unique names and improve the readability of BASIC programs.
- Program lines can be up to 4 display screen lines long. Read/write lists and other statements that extend for more than one line can be entered as one statement.
- A BASIC program line can contain multiple BASIC statements. Multiple statements on a line can shorten a program.
- BASIC program lines can be selectively renumbered. By renumbering program lines you may move lines within a program.
- The number of program statements is not limited by region size.
- Allows the user to stop program execution, examine or change variables, and then resume execution.
- The display may be formatted using the FIELDS parameter of the INPUT and PRINT statements. Most of the screen formatting capability of SFGR may be performed in BASIC.
- The screen may also be formatted using formats created by the screen format generator SSP Utility or by the Screen Design Aid (SDA) portion of the Utilities Program.
- Checks the syntax of each source statement. If a syntax error occurs, the operator can press the HELP key to automatically display the syntax and explanation of the BASIC statement used.
- BASIC program execution flow may be traced and displayed or printed. Simple commands control the start and stop of tracing.
- Provides a HELP function that displays descriptions of the BASIC commands, statements, and intrinsic functions. The HELP function also displays the syntax of each BASIC command and statement.
- BASIC program lines can contain a label. A line can be referenced with either a line number or a label. Labels can simplify programming.
- BASIC procedures may be created. BASIC procedures contain BASIC commands which are used to control the loading and running of BASIC programs. BASIC procedures may also contain BASIC statements, comments and data.
- BASIC supports input and update operations for user switches and local data areas.
- BASIC supports all System/34 file organizations and file access methods (see "Software Requirements").
- Fields of a disk file can be in zoned decimal, packed decimal, binary (1, 2, 3, and 4 bytes), or alphanumeric format. Files may be interchanged between BASIC, COBOL, and RPG.
- You can read and write library source members and OCL procedure members from a BASIC program.
- Logical (AND, OR, NOT) and Relational (for example, >, <, =, <=, >=, and <>) operators are provided.
- Input/Output may be formatted with the FORM or IMAGE statement or will assume default formats, if unformatted.
- Command keys provide forward and backward full screen paging through a program and the roll keys provide up and down line-at-a-time paging when the BASIC list command is being used.
- Supports the following matrix operations:
 - Addition
 - Subtraction
 - Multiplication by a scalar
 - Setting of all elements to a constant

– Creation of an array of index elements that specifies ascending or descending sequence of the data associated with each index element.

- Matrix multiplication, matrix inversion and determinant calculation suggested user-defined functions are provided in the BASIC reference manual.
- ADDROUT SORT files can be read by BASIC.
- A parameter (XREF) on the LIST command provides a cross-reference of a BASIC program.
- The BASIC OCL command procedure converts a BASIC source member into a BASIC member ready to be executed. All invalid statements are flagged and changed to comment statements. This procedure can simplify conversion of programs from another system.
- Support for Multiple Requestor (MRT) programs.
- Support for interactive communications (SSP-ICF).
- Support for timed wait in (SSP-ICF) as an intrinsic function.
- Cross-reference program listings provided.
- An error message may be written on the error line of a display.
- Enhanced support for multiple spooled printer files in one program.
- Support for additional error control on the file OPEN statement.
- Support for specifying, on the OPEN statement, a value for disk file extension when using extendable disk files.
- Additional TRACE support.
- Library name added to program listings.
- Support added to trap all run time syntax errors.
- Option added to BASICP, and BASICR to print HELP STATUS.

DESCRIPTION

BASIC Design Overview: System/34 BASIC is an interactive compiler; it provides the ease-of-use characteristics of an interactive interpreter. For example, some characteristics are: Syntax checking after each statement is entered; capability to run the program immediately; capability to stop program execution, examine or change variables, and then resume execution. After each statement is entered, it is changed to an internal source text. It is because the program is maintained in this internal source text that it can easily be changed, corrected, or executed by the programmer.

System/34 BASIC also provides some of the performance advantages of a compiler. The primary advantage of a compiler is improved execution performance over that of an interpreter. System/34 BASIC provides this advantage when there is sufficient region-size to contain all of the program during execution, because the source text is compiled only once for that execution of the program.

Support for Multiple Requestor (MRT) Programs: BASIC has added support to allow users to code MRT (multiple requestor) programs. This capability can provide improved performance in some situations. By recoding an SRT program as an MRT program, users can reduce the number of active copies of the program to 1. In the case of frequent swapping, performance may be improved by using more MRT programs. Caution must be exercised to ensure that MRT programs are not used in situations that could cause multiple users to wait for an excessive amount of time. To run a BASIC MRT program, a BASIC procedure must be written by the user.

Support for Interactive Communications (SSP-ICF): BASIC users may code programs that handle communications using SSP-ICF. No restrictions are placed on the BASIC programmer. All subsystems available to the RPG II and COBOL programmer are available to the BASIC programmer except that BASIC does not support the encryption routine for the Finance Subsystem.

Support for Timed Wait in SSP-ICF as an Intrinsic Function: BASIC users may use the SSP-ICF function of a timed wait. This capability is provided as an intrinsic function. The BASIC programmer need only place a timer interval of 'HHMMSS' in the intrinsic function and the timer wait is set. A 'WAITIO' operation is used to test the completion of the operation.

Cross-reference Program Listings Provided: BASIC supports an option in the LISTP command and the BASICS procedure to provide a sorted cross-reference listing used in the program as follows:

- line numbers
- labels
- variable names
- user-defined functions

The cross-reference listing has two sections - one section for variables, arrays, and user-defined functions, and a section for line numbers and

S/34 BASIC (cont'd)

labels. This assists users in documenting and debugging BASIC programs.

An Error Message may be Written on the Error Line of a Display: BASIC allows users to display a user-defined error message on the error line of a currently-attached display. This function places up to 78 characters on the last line of the display after saving the previous contents of the line and locking the keyboard. When the operator presses the Error Reset key, the previous contents of the line are redisplayed and the keyboard is unlocked. This function can be used to provide operator guidance during entry/edit applications.

Enhanced Support for Multiple Spooled Printer Files in One Program: Restrictions that were originally placed on the BASIC user when spooling printed output have been removed. Users are no longer restricted in the number of print files opened or the number of times they are opened and closed.

Support for Additional Error Control in the File OPEN Statement: BASIC allows users program control of additional file error conditions that were previously trapped by the system. The user is able to intercept errors such as:

- opening an indexed file for direct or consecutive update or output
- opening a direct file for consecutive output
- opening a consecutive file for direct output
- opening a direct or consecutive file for indexed access

Support for Specifying, in the OPEN Statement, a Value for Disk File Extension when Using Extendable Disk Files:

BASIC allows users to specify a file extend value on the disk file OPEN statement. Previously, this was defaulted to by BASIC and the user could not override it with the OCL. Users may also specify that a file is not extendable.

Additional TRACE Support: The TRACE function has been enhanced to allow STEP mode (in STEP mode one statement is executed each time the ENTER key is pressed). To start this function, the keyword STEP has been added to the TRACE statement. This enhancement provides greater flexibility when debugging complex programs.

Support Added to Trap All Run-Time Syntax Errors: Run-time syntax errors are intercepted as conversion errors. Also, the OPEN statement has been modified to permit users to explicitly specify NOSHR.

Option Added to BASICP and BASICR to Print HELP STATUS: An option has been added to BASICP and BASICR to allow the user to obtain a listing of the same information provided by HELP STATUS in BASIC mode. This information is useful to improve performance and/or storage utilization of programs that are initiated with BASICP or BASICR.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/34 BASIC licensed program will run on models of the IBM System/34 having at least 48K bytes (mdl BXX) of main storage. The minimum region size is 24K bytes. Programs may require a larger region size. A larger region size than is required may improve performance.

IBM System/34 BASIC requires a print belt with a minimum of 64 characters to print all of the uppercase characters on the IBM 3262 or 5211 printer. A print belt with a minimum of 96 characters is required to print lower case characters.

When BASIC is installed with the Multinational Character Set feature, keyboards that do not contain the \$, # or < symbols are used, these characters must be entered as their two character hexadecimal equivalent.

SOFTWARE REQUIREMENTS

All IBM System/34 licensed programs are designed to operate in an environment that includes the System Support Program (5726-SS1) or its equivalent.

The BASICR Operation Control Language command provides the capability to evoke a BASIC program without using BASIC command mode. BASICR also supports the use of a procedure that could contain // FILE OCL to override parameters in a BASIC file OPEN statement.

The System Support Program (5726-SS1) or its equivalent must be configured for extended disk data management to use BASIC support for deleted records.

FORTRAN programs or programs using the Scientific Instruction Set may not be executed concurrently with BASIC command mode or program execution.

BASIC does not support logical processing of unformatted sequential access files created by the System/34 FORTRAN IV licensed program (5726-FO1).

Source Entry Utility (SEU as part of Utility Program, 5726-UT1) is available to help the data entry person enter BASIC source statements into a library source member. Previously entered source statements may also be changed with SEU. A BASIC program must be in a library source member in order to use SEU. The SEU scan feature may also be useful when changing a BASIC program.

The SORT program can be used to sort all BASIC disk data record files.

COMPATIBILITY

Differences do exist between 5100/5110 BASIC and System/34 BASIC. Conversion of most source programs will be required. An outline of these differences will appear in the *System/34 BASIC Reference Manual*.

Program Use During Customer Pre-installation Testing: The System/34 BASIC licensed program (5726-BA1) will be available to customers for pre-installation testing on IBM Test Center systems in accordance with IBM's Program Testing Policy.

DOCUMENTATION

(available from Mechanicsburg)

System/34 BASIC Licensed Program Specifications (GC21-7841) ... System/34 BASIC Reference Manual (SC21-7835).

TERMS and CONDITIONS: See PP Index

**SYSTEM/34 BASIC SUBSET
5726-BA2**

PURPOSE

This program is intended to support the Preconfigured IBM System/34 System Support Program Subset (5726-SS2).

BASIC (Beginner's All-purpose Symbolic Instruction Code) is a high-level interactive language for System/34 users who have commercial data processing requirements or who need to solve business, technical, and scientific problems. System/34 BASIC is designed to be easy-to-learn, easy-to-use, and easy-to-remember, enabling the programmer or casual user to concentrate on the application aspects of the programming task. The System/34 BASIC implementation uses a design such that code not executed is kept out of main storage, and program size is not limited to region size. System/34 BASIC has the ease-of-use characteristics of an interactive interpreter and yet offers some of the performance advantages of compiled code (see BASIC Design Overview).

System/34 BASIC is designed in accordance with the American National Standard Minimal BASIC (x3.60-1978) as understood and interpreted by IBM as of October 1979.

HIGHLIGHTS

System/34 BASIC offers the following advantages to the user:

- Variable and function names can be up to 8 characters in length. Longer variable and function names improve the readability of BASIC programs.
- A source statement can be up to four display screen lines in length. Thus, read/write lists and other statements that extend for more than one line can be entered on one statement.
- A BASIC program line can contain multiple BASIC statements. Multiple statements on a line shorten a BASIC program.
- BASIC program lines can be selectively renumbered. By renumbering program lines, you may also move lines within a program.
- The number of statements in a program is not limited by the region size.
- You can stop execution of a program or a BASIC procedure to examine or change variables and then resume execution.
- BASIC checks the syntax of each source statement. When a syntax error occurs, the cursor is positioned under the error.
- BASIC program lines can contain a label. You can reference a line with either a line number or a label. Labels improve program readability.
- BASIC has two entry modes: Program and data. When program mode is active, you can enter BASIC program lines and BASIC commands, which are syntax-checked as they are entered. When data mode is active, you can enter any data that you want to save in a library source member. The data is not syntax-checked.
- When data mode is active, you can create BASIC procedures which can be used to load and run BASIC programs. BASIC procedures can contain BASIC commands, BASIC statements, comments, and input data.
- BASIC supports input and update operations for user switches and the display station local data area.
- BASIC supports all System/34 file organizations and file access methods (see "Software Requirements").
- The fields of a disk file can be in zoned decimal, packed decimal, binary (1, 2, 3, and 4 bytes), or alphanumeric format; thus, you can create and update files in BASIC that can also be used by RPG II.
- You can read to and write from library source members and System/34 procedure members from a BASIC program.
- BASIC allows multiple print files.
- BASIC can use display screen formats created by the screen format generator SSP utility program (\$SFGR).
- You can write to and read from the display screen using the PRINT FIELDS and INPUT FIELDS statements. The display screen is formatted by a character array in the PRINT FIELDS or INPUT FIELDS statement. A single field can be formatted by a character expression.
- After BASIC programs are entered, they can be saved in either library source or library subroutine members. For enhanced performance when loading a program, save it in a subroutine member.
- After BASIC procedures are entered, BASIC saves them in library source members.
- The procedure command, BASICP, allows you to execute BASIC procedures from System/34 command mode.

- The procedure command, BASICR, allows you to execute BASIC programs from System/34 command mode.
- The procedure command, BASICS, allows you to convert a source member containing a BASIC program into a subroutine member and to obtain a listing of all syntax errors (if any exist) in the program. The BASICS procedure command must be entered from System/34 command mode.
- BASIC stores numbers internally in a decimal, floating-point format. This format can prove the magnitude and accuracy required by the scientific user and the discrete penny accuracy required by the accountant and commercial user.
- BASIC supports logical (NOT, AND, OR) and relational (<, >, >=, <=, <>, =) operators.
- Input and output can be formatted with the FORM statement, and output can be formatted with the IMAGE statement. If unformatted, input and output will assume default formats.
- When the BASIC LIST command is entered, command keys provide forward or backward, full-screen paging through a BASIC program or a BASIC procedure, and the roll keys provide up and down, line-at-a-time paging.
- BASIC supports the following matrix operations:
 - Addition
 - Subtraction
 - Multiplication by a scalar
 - Setting of all elements to a constant
 - Creation of an array of index elements that specify the ascending or descending sequence of the data associated with each index element.

DESCRIPTION

BASIC Design Overview: System/34 BASIC subset is an interactive compiler; it provides the ease-of-use characteristics of an interactive interpreter. Some of these characteristics are: Syntax checking after each statement is entered (if program mode is active); the capability to run a BASIC program immediately; and the capability to stop program execution, examine or change variables, then resume execution. After each statement is entered, it is changed to an internal source text. Because the program is maintained in this internal source text, it can easily be changed or corrected by the programmer.

System/34 BASIC subset also provides some of the performance advantage of compiler code. The primary advantage of a compiler is improved performance over that of an interpreter. System/34 BASIC subset provides this advantage when there is sufficient region size to contain all of the program during execution, because the source text is compiled only once for that execution.

When sufficient region size is not available, the compiler fetches as much source text as storage permits, compiles it, executes it, and goes back for more source text. Code not executed is not compiled.

For example, if there is sufficient storage for the main loop of a program, the source text for the main loop might need to be compiled only the first time through the loop, and, if compiled, can be used throughout the execution of the loop.

Using the BASIC Licensed Program: BASIC is invoked by entering the procedure command, BASIC. Once BASIC is invoked, a program can be entered from the keyboard, loaded from a library subroutine member (SUBR or R) or loaded from a library source member (SOURCE or S). As each statement is entered from the keyboard or from a library source member, its syntax is checked. Execution of a program can be started at any time with the RUN command. BASIC can also be used to enter and update other library source members.

The following System/34 BASIC Subset (5726-BA1) function is *not* supported:

- BASIC HELP

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

This IBM System/34 BASIC Subset (5726-BA2) runs on all models of IBM System/34 having at least 48K bytes of main storage. The

PROGRAM PRODUCTS

S/34 BASIC Subset (cont'd)

minimum region size is 24K bytes. Some programs might require a larger region size.

SOFTWARE REQUIREMENTS

This IBM System/34 BASIC Subset (5726-BA2) operates under the control of the IBM Preconfigured System/34 System Support Program Subset (5726-SS2), or Release 7 of 5726-SS1 while it is available, or its equivalent.

The System/34 BASIC Subset (5726-BA2) consists of parts of System/34 BASIC (5726-BA1) stabilized at Release 7. No release update or enhancements are planned.

The procedure commands, BASICR and BASCIP, allow you to invoke a BASIC program or a BASIC procedure, respectively, from System/34 command mode. The procedure command, BASICS, allows you to convert a library source member containing a BASIC program into a library subroutine member and to obtain a listing of all syntax errors (if any exist) in the program. The procedure commands, BASIC, BASICP, and BASICR, also support the use of a procedure that could contain a // FILE OCL statement which can be used to override parameters in a BASIC OPEN statement.

BASIC does not support the logical processing of unformatted sequential access files created by the System/34 FORTRAN IV licensed program (5726-FO1).

System/34 Licensed Utility Programs: The Source Entry Utility (SEU) portion of the Utilities Subset (5726-UT2) can be used to enter BASIC source statements into a library source member. The syntax of these statements must be checked later by BASIC. SEU can also be used to change programs that were previously entered with SEU or BASIC. Programs changed by SEU must be in library source members. The SEU scan function might also be useful for changing a BASIC program.

The Sort portion of the Utilities Subset (5726-UT2) can be used to sort BASIC disk record files.

COMPATIBILITY

Differences do exist between 5100/5110 BASIC and System/34 BASIC. Conversion of most source programs will be required. An outline of these differences appears in the *System/34 BASIC Reference Manual*.

Program Use During Customer Pre-installation Testing: The IBM System/34 BASIC Subset (5726-BA2) will be available to customers for pre-installation testing on IBM Test Center systems in accordance with IBM's Program Testing Policy.

**SYSTEM/34 BUSINESS REPORT/APPLICATION
DEVELOPMENT SYSTEM (SYSTEM/34 BRADS)
5726-BR1****PURPOSE**

The IBM System/34 Business Report/Application Development System brings data base power to users of the IBM System/34. Using BRADS, users can productively develop and install system-justifying applications, often without becoming or hiring programmers.

Users can also expand the value of applications which run on their IBM System/34 by querying the data bases and by developing new reports.

HIGHLIGHTS

System/34 BRADS may be used to:

- Create, maintain and update data files.
- Create screen-driven data entry programs.
- Retrieve information from the files using a simple query.
- Create formatted reports using prompted report generation screens.
- Develop complete applications through use as a:
 - Highly productive development tool. The System/34 BRADS facilities can be used to create applications that execute under the control of System/34 BRADS.
 - Program generator for screens and reports. The screen and report programs generated by BRADS can be added to other BASIC programs to create applications that execute independently or in conjunction with System/34 BRADS.
- Create additional queries and reports for applications by creating BRADS file definitions.
- Provide design documentation maintained as a by-product of System/34 BRADS, which fulfills much of the user's documentation requirements.

Files may be shared for input among workstations while executing QUERY, REPORT, or COPY commands.

System/34 BRADS also contains a spread sheet generator facility which may be used to:

- Produce forecasts showing expected revenues, operating costs, capital expenditures, taxes, and other expenditures.
- Try a variety of what-if adjustments on the original spread sheet data to investigate alternative plans.
- Produce reports that examine the differences (variances) between plans or between plans and actual performance.
- Produce reports showing percentage relationships between rows or between columns (for example, growth from month-to-month).
- Consolidate or deconsolidate plans and evaluate performance of separate operating entities (for example, departments, companies, products).
- Combine historical and predictive data together.

The spread sheet generator facility provides the user flexibility in addressing applications such as:

- Balance Sheets
- Budget Planning and Forecasting
- Cash Requirements and Forecasting
- Commercial Loan Evaluation
- Common Sizing Analysis
- Comparative Analysis
- Consolidation and Deconsolidation
- Investment Analysis
- Material and Labor Requirements
- Manpower Projection
- Merger and Acquisition Analysis
- Product Planning
- Profit and Loss Statements
- Real Estate Investment

CUSTOMER RESPONSIBILITIES

IBM may provide normal marketing assistance and guidance. The responsibility of personnel selection and training, installation and continued day-to-day operation lies solely with the customer. The customer is responsible for error detection and analysis, and submission of APARS, but can obtain phone assistance from the Atlanta National Market Support Center.

The customer is responsible for applying any program fixes distributed by IBM Central Service.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/34 Business Report/Application Development System (System/34 BRADS) is designed to operate on all models of the IBM System/34 having at least:

- 96K bytes of main storage
- One Printer
- One 1920-character display with keyboard

Since BRADS is an SRT requiring a 64K region, additional main storage will enhance performance when more than one workstation is operating concurrently. System/34 BASIC requires a minimum of 64 characters to print all of the BASIC characters. A printer with a minimum of 96 characters is required to print both upper and lower case characters.

SOFTWARE REQUIREMENTS

The IBM System/34 Business Report/Application Development System (System/34 BRADS) programs are written in IBM System/34 BASIC programming language, and are designed to execute under control of Release 7 or later of System/34 System Support Program (5726-SS1) and System/34 BASIC (5726-BA1), or Preconfigured System/34 System Support Program Subset (5726-SS2) and System/34 BASIC Subset (5726-BA2). System/34 Utilities (5726-UT1 or 5726-UT2), which includes SORT, is required for execution.

Customer Education: First time System/34 BRADS users should read self-study manuals: *System/34 BRADS Learning 1 and Learning 2*. A similar publication, *System/34 BRADS Learning 3*, covers the spread sheet generator facility.

DOCUMENTATION

**SYSTEM/34 COBOL COMPILER AND LIBRARY
5726-CB1**

PURPOSE

IBM System/34 1974-level COBOL is a licensed program that operates under control of the System/34 System Support Program (5726-SS1). The compiler and library are disk resident. The compiler requires as input a COBOL source language program and produces as output, by means of the system's Overlay Linkage Editor, a System/34 machine language object program cataloged in an object library. A source program listing, diagnostic messages, and main storage map can also be requested.

This compiler is designed according to the 1974 standard, which makes it more compatible with other COBOL compilers. The high level of function makes it more valuable to users who wish to do the major development of application programs centrally and then distribute the source code for final development and testing to a System/34.

Enhancements

- Language extensions to support workstations and interactive communications using SSP-ICF.
- The COBOL SORT/MERGE verbs are supported for up to eight input files. Multiple sorts are allowed in the same program.
- Nested IF statements are supported.
- ADD, SUBTRACT, and MOVE CORRESPONDING are now supported. This will aid users allowing a reduction in the number of instructions required to edit group items for printing or data conversion of group items.
- Support for abbreviated combined relations will allow users to code implied subjects and operands such that the following statement will be valid:
If A = B, OR C...
- Substring capability has been added so the user can now use the verbs STRING and UNSTRING to combine or take apart fields respectively. These powerful instructions are useful in text processing.
- Table processing has been enhanced to support the ASCENDING/DESCENDING options and the functions:
 - SEARCH
 - SEARCH ALL
- Variable length tables are also supported by the OCCURS DEPENDING ON option to allow the user to restrict table searches to valid data only and thus save processing time.
- The INSPECT verb replaces the 1968-level EXAMINE. The function has been enhanced to allow use to multiple characters.
- File processing support:
 - The record DELETE option is supported.
 - Add to sequential files is supported via the OPEN WITH EXTEND option.
 - The START verb will support NOT LESS THAN as well as EQUAL keys which will allow the user to do generic searches on indexed files.
 - Optional files are supported to allow the user to continue to run even if some of the files do not exist.
 - The DYNAMIC ACCESS option is supported so that a user can now process the same file both sequentially and randomly without having to doubly define the file.
 - The user can specify top and bottom margins for a printer file.
 - The FILE STATUS function is supported so that the user can interrogate the result of a file operation.
 - USE after STANDARD ERROR/EXCEPTION is supported to allow the user to combine error/exception logic in one section of the program.
 - RERUN is supported. This allows a user to checkpoint long running programs and restart them from the last checkpoint in case of a program failure. Multiple programs using RERUN can be executing at the same time.
- The value clause for level 88 supports multiple values. The THROUGH option also allows users to easily do range checking.
- Multiple result fields in arithmetic statements are supported.
- The REMAINDER option of the DIVIDE is supported.
- The RENAMES capability has been extended with:
 - Level 66 items
 - THROUGH option is supported
- The edit character of '/' for data edits is allowed.
- The COPY function supports the REPLACING option. This allows users to replace copied character strings, either entirely or partially, to fit the requirements of the source program.

- The 1974 DEBUG module is supported. This gives the user a special group item called DEBUG-ITEM which can be processed at desired debug points in the program. This support also includes both compile and execution time switches for suppression of the debug function.
- Additional debug support of EXHIBIT and TRACE.
- Additional compiler options include:
 - A cross-reference listing of data names and labels.
 - Flagging of all statements exceeding a specified FIPS (Federal Information Processing Standard) level.
 - Syntax-only compiles to allow users to check syntax prior to generating object code.
- Semi-interactive syntax checking is provided to allow users to compile and correct source programs without requiring a source listing printout.
- Enhanced support for multiple spooled printer files in one program.

Industry Standards: System/34 COBOL is designed according to the following industry standards as understood and interpreted by IBM as of September, 1978:

- American National Standards (ANS) COBOL, X3.23-1974 ANS COBOL is identical to ISO 1989-COBOL, approved in February, 1978 by the International Organization for Standardization. The following ANS processing modules are included:

```

2 NUC 1, 2
2 TBL 1, 2
2 SEQ 1, 2
2 REL 0, 2
1 INX 0, 2
2 SRT 0, 2
1 SEG 0, 2
2 LIB 0, 2
1 DEB 0, 2
1 IPC 0, 2
  
```

The first digit above represents the level of the modules included in the compiler; the second digit represents the lowest level specified for American National Standard COBOL (0 implies that the module may be completely missing from a standard compiler); the third digit represents the highest level specified in the standard.

- December 1975 Federal Information Processing Standard, (FIPS PUB 21-1), Low-Intermediate level. However, additional support is provided for many features of higher FIPS level.

The following exceptions apply to the above standards:

- The DELETE function is implemented by marking deleted records with a hexadecimal FF in position one of the record. When operating with DELETE mode files, the user is excluded from placing a hexadecimal FF in this position.
- No position in a key for indexed random READ or indexed START statements can be hexadecimal FF.

Additions: In addition to the standard language, the following additional features are provided:

- Extensions to the modules of American National Standard COBOL listed above include certain language elements which are defined in higher levels of the American National Standard COBOL than those listed.
- The following extensions are also supported:
 - Use of apostrophe instead of quotes.
 - Extended data types of computational-3 (packed) and computational-4 (binary).
 - Indexed file support for CORE-INDEX.
 - Additional debugging support with EXHIBIT and TRACE.
 - ACCEPT from console.
 - DISPLAY upon console.
 - File definition using the FILE CONTROL entries of SELECT and ASSIGN.
 - Standard error handling using FILE STATUS and the USE procedure in the DECLARATIVES SECTION.
 - Extensions to standard file processing verbs for:
 - OPEN/CLOSE
 - READ/WRITE
 - Support for display format indicators as boolean data types (0,1) and turning them on and off via the SET statement.
 - Acquire and release workstations and SSP-ICF sessions supported through ACQUIRE and DROP.
 - Support for UPSI switches.
 - ACCEPT/DISPLAY statements support reading and writing of the work station local data area (WSDA).

Additional Compiler Features:

S/34 COBOL Compiler and Library (cont'd)

System/34 COBOL offers additional compiler features which can be chosen by the programmer:

- **FIPS Flagger** - Issues messages identifying statements and clauses in a COBOL source program that exceed a user-specified FIPS level.
- **Symbol Cross-Reference** - Produces two alphabetic listings of user-specified names; one of names defined in the Data Division and one of names defined in the Procedure Division.
- **Semi-Interactive Debugging** - Builds a file that can be retrieved and displayed at a work station. The file that is created contains source statements, merged diagnostics and summary information. The file can be moved by an IBM-supplied procedure to a library member, which can then be reviewed and updated using SEU (Source Entry Utility). The source can then be reintroduced to the compiler. Inserted messages will be ignored by the compiler.
- **Syntax Checking Compilation** - Scans a source program for syntax errors. If errors are found, error messages are generated. No object code is produced.
- **Parameter Prompting** - Allows the user to request prompt screens for the specification of parameters needed for entering, updating, compiling, or executing COBOL programs.
- **Multiple Printer Files** - Allows the specification of up to 15 different printer files in the same program.
- **Standard Program Linkage** - Allows programs written in System/34 COBOL to call or be called by other programs written in System/34 COBOL, System/34 FORTRAN, or System/34 Assembler language.

Disk File Support: The access methods supported by System/34 COBOL, based on physical data organization, are as follows:

- **Sequential Organization**
 - Consecutive processing - including update in place and consecutive add (extend).
 - Random processing - by relative record number, including updating.
- **Indexed Organization**
 - Random processing - by key or relative record number.
 - Sequential processing - by key including file loading.
- **Direct Organization**
 - Random processing - by relative record number, including updating and file loading.
 - Consecutive processing.

Standard System/34 disk labels are mandatory for all disk files, nonstandard labels cannot be used except as data records within a file.

Record size can range from 1 byte to 4,096 bytes, and records may be processed as blocked or unblocked. The block size for a given file may be varied between programs up to a maximum block size of 9,999 bytes. Logical records may span physical disk sectors, blocks, tracks, or cylinders.

Offline multivolume files are supported. (System/34 allows these files only on the diskette magazine facility.)

Workstation Support: Low-volume, unformatted, line-at-a-time workstation support is provided with the ACCEPT and DISPLAY verbs. File processing has been extended to support a TRANSACTION organization type. Using this organization type, the user can define one file that supports single or multiple workstations, and single or multiple SSP-ICF sessions in any combination. Since the support is provided in a COBOL logic file, the user codes standard COBOL verbs, with extensions where necessary, to accomplish the job.

Enhanced Support for Multiple Spooled Printer Files in One Program: COBOL provides enhanced support for multiple spooled print files in a program. This enhancement removes a previous restriction of eight spooled print files in a program. Also, these printer files can be opened or closed at any time. Any spooled print files that are closed during the execution of a program will be marked as 'Ready to Print', and will be printed by the spool writer according to the print files position in the spool queue, regardless of whether or not the program has ended. Any COBOL programs compiled prior to Release 8 will have to be recompiled in order to utilize this function. The restriction of 25 total files in a COBOL program still applies.

Data Communications: The System/34 Interactive Communications Feature (SSP-ICF) is supported for the COBOL user via TRANSACTION organization type. Standard COBOL verbs, with extensions where necessary, may be used since this organization type provides a COBOL logical file support.

Operational Considerations: The System/34 COBOL compiler runs on all models of System/34. The compiler will execute on a minimum system of 32K bytes. The System/34 COBOL compiler requires an 18K-byte region for execution. Additional main storage may allow

faster compilation of a large source program. The Overlay Linkage Editor constructs overlays (if necessary and possible) to fit the object program into the available main storage. The region size required for an object program is a function of source program complexity and its ability to be overlaid.

The System/34 COBOL compiler accepts source statements from the source member on disk, from a procedure member on disk, or from a display station keyboard. Compiler output can consist of a source listing and diagnostic messages on the printer, messages on the display screen, an object module on disk, and a diagnosed source file.

During execution of the COBOL object program, input is accepted from the keyboard, from a library procedure member (if that procedure is defined as the system input device), or from data files on disk. Output from the executing COBOL program is to the printer, display screen, or to data files on disk.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/34 COBOL licensed program runs on all models of IBM System/34.

SOFTWARE REQUIREMENTS

The current version of the IBM System/34 COBOL licensed program operates under control of the current version of the IBM System/34 System Support Program (5726-SS1).

CONVERSION/COMPATIBILITY

There is a high degree of compatibility between the System/34 COBOL compiler and System/38 COBOL, the System/3 subset '68 COBOL, System/32 PRPQ COBOL, and System/34 PRPQ COBOL compilers. Differences do exist and some conversion effort will be required.

Installation of System/34 licensed programs is a customer responsibility.

Program Use During Customer Pre-installation Testing: The IBM System/34 COBOL (5726-CB1) will be available to customers for pre-installation testing on IBM Test Center systems in accordance with IBM's Program Testing Policy.

**CLIENT ACCOUNTING AND FINANCIAL REPORTING
SYSTEM FOR SYSTEM/34
(Single Program mode) (CAFRS)
5726-C21**

PURPOSE

The IBM System/34 Client Accounting and Financial Reporting System (CAFRS) offers the public accounting profession a comprehensive aid to solving the problems of client accounting. It assists the certified public accountant, public accountant, or bookkeeper in operating a more profitable and productive practice.

HIGHLIGHTS

CAFRS can be installed without in-house programming capability:

- File sizes may be changed, within limits, as needed, by the system tailoring procedure to allow additional clients to be serviced or to offer optional processing features to more clients
- File load and maintenance procedures provided
- System-controlled master and transaction file backup procedures
- Easy-to-use runbook
- Step-by-step installation activity plan and detail user's information supplied by application reference manual

CAFRS provides ease of use options to the user:

- Designed to fit industry requirements
- OCL procedures, sort specifications, and processing programs are packaged into logical work units which simplify system operation
- Monitoring of procedures, prevents execution of a program until preceding programs have been completely and successfully executed
- Compatible online/offline file maintenance and transaction data entry via the System/34 keyboard or diskettes created on the 3740 Data Entry System
- Dynamic backup and recovery system forces periodic backup of master files and edited transactions and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files
- Reprint options are possible because file updating is separated from report writing functions
- Selective printing options are available for many report functions

CAFRS uses recognized accounting techniques and terminology to provide a solid accounting system:

- Sample user-oriented forms for data preparation, file, creation, audit and control are provided
- Clear audit trails and control techniques are provided
- Standard types of accounting reports, such as journals, ledger, trial balance and financial statements plus special supporting analyses and lists, are provided

DESCRIPTION

The Client Accounting and Financial Reporting System is a ready-to-execute application for the small accounting firm.

It combines two data entry approaches; operator-oriented and batch-oriented. Support is provided for transaction entry through the System/34 keyboard or through a diskette created on a 3740 Data Entry System.

The application has certain records within a control file which contain questionnaire responses. These records allow the application to select file sizes and functions to suit each firm's needs. The questionnaire responses are keyed during initial installation and may be changed as needed. The system tailoring procedure allows these responses to be entered.

The system tailoring procedure utilizes the answers to a series of questions regarding the firm's requirements. It provides the following:

- Tailoring the application on-site at installation time.
- Allows the user to activate and deactivate provided functions as requirements change.
- All provided functions are included in the programs but only required functions are executed.
- File sizes may be expanded or contracted, as needed, by rerunning the system tailoring procedure.

An *Application Installation Guide* provides a step-by-step installation activity plan including sample numbering systems, sample input and maintenance data forms, file loading sequences, control forms with suggested procedures. The *Application Reference Manual* provides information on the day-to-day use of the application.

The runbook provides the operator with a detailed and easy-to-use set of instructions showing all the activities necessary to run the programs on a System/34. The *Procedure Reference Summary* is provided for the operator as a reminder of the major operational functions of each procedure. It is intended to be used once the operator is thoroughly trained in the particular application.

Instructional material in the form of a self-study course is provided for the operator for self-training in the use of the runbook (System/32 only).

An *Application Logic Manual* is provided for use by the self-sufficient customer and for systems engineering continuing support. It describes the architecture of programs, procedures, data base cross-references, data dictionary, and detailed descriptions of each program.

The System/34 licensed program makes available Client Accounting and Financial Reporting System on System/34 in single program mode. The System/34 licensed program supports one work station, no spooling, no multiprogramming and no file sharing.

It is designed to allow flexibility in the options included to meet an individual client's special needs:

- Up to 13 periods per fiscal year
- Automatically calculated journal entries based upon algorithms previously defined by the accountant
- Multiple special purpose journals with source code, related accounts, and headings specified by client
- Ability to correct prior periods
- Extensive chart of account flexibility to provide desired heading and account description information, up to 9 levels of subtotals for combining accounts, spacing and paging control
- Optional titles and formats for financial statements

Support is provided for the optional consolidation of multiple clients. Maintenance is provided for eliminating entries. Controls are included to force fiscal period alignment of clients being consolidated. The same processing capabilities are available for the consolidated client as for others.

Optional features and reports are available for any client, such as:

- Last year comparative data on financial statements
- Print suppression of zero-balance accounts on financial statements
- Balance sheet
- Income and expense statement
- Combined department income and expense reporting
- Income and expense comparison to budget
- Income and expense account balance comparison to a specified account balance, by department
- Income and expense account balance comparison to a client-specified base, such as number of rooms, square feet, or miles driven
- Supporting schedules
- Statement of changes in financial position with related worksheet and ability to process adjustments
- Reporting of financial ratios, defined by client, with comparison to industrial averages
- Employee payroll register
- Printing of 941-A and W-2 forms
- Accountant's transmittal letter
- Notes to the financial statements

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer. For customers who have modified their installed System/32 IAPs and who choose to have IBM make the same modifications on the System/34 product, the reinstallation of the modifications on the new product will be at additional charge under SES. The customer is responsible for transferring data files from one system to the other. Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

This IBM System/34 licensed program will execute on all models of the System/34, in Single Program Mode. The programs are compiled assuming a 32K minimum system. Because of volumes and time

Do not reproduce without written permission

PROGRAM PRODUCTS

CAFRS (cont'd)

constraints, there may be a requirement for providing offline keying on an IBM 3740 Data Entry System. If an IBM 3742 is to be used, it must have the 128-Character Record feature (#5455) and Feature Group A (#4004).

For presentation purposes on the reports, left and right parentheses have been included to indicate a credit or debit dollar amount opposite of an account's normal balance. The 64-character set feature is required for the System/34 to print the parentheses.

Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries. Because of this, no other licensed program or user-written program may co-reside with this Application unless stringent coding requirements for these programs are met to insure compatibility with the Client Accounting and Financial Reporting System. The *Application Logic Manual* discusses in detail the coding conventions used for the development of CAFRS.

SOFTWARE REQUIREMENTS

The IBM System/34 licensed programs are written in IBM System/34 RPG II programming language and executed under control of the IBM System/34 System Support Program (5726-SS1). IBM System/34 Utilities licensed program (5726-UT1), which includes Sort, Data File Utility, Source Entry Utility, and Work Station Utility is required for execution of the programs. The System/34 RPG II Compiler (5726-RG1) is required if modifications to the source code are necessary.

**SYSTEM/34 CLIENT ACCOUNTING AND
FINANCIAL REPORTING SYSTEM (CAFRS II)
5726-C22**

PURPOSE

The IBM System/34 Client Accounting and Financial Reporting System (CAFRS II) offers the public accounting profession a comprehensive aid to solving the problems of client accounting. It helps the certified public accountant, public accountant, or bookkeeper to operate a more profitable and productive practice.

HIGHLIGHTS

- File sizes may be changed, within limits and as needed, by the system tailoring procedure to service additional clients or offer optional features to more clients.
- File load and file maintenance procedures are provided.
- System-controlled master and transaction file backup procedures are provided.
- Easy-to-use runbook and operator self-study courses are available.
- Step-by-step installation activity plan and detailed user's information are supplied in the application reference manuals.
- OCL procedures, sort specifications, and processing programs are packaged into logical work units which simplify system operation.
- Monitoring of procedures prevents execution of a program until preceding programs have been completely and successfully executed.
- Compatible online/offline file maintenance and transaction data entry.
- Dynamic backup and recovery system, optional at system tailoring, forces periodic backup of master files and edited transactions, and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files.
- Selective printing options are available for many report functions.
- Standard types of accounting reports, such as journals, ledgers, trial balances, and financial statements, plus special supporting analyses and lists, are provided.

DESCRIPTION

The Client Accounting and Financial Reporting System II is a ready-to-execute application.

It combines two data entry approaches: Operator-oriented and batch-oriented. Support is provided for transaction entry through a System/34 workstation or through a diskette created on a 3740 Data Entry System.

The application has certain records within a control file which contain questionnaire responses. These records allow the application to select file sizes and functions to suit each firm's needs. The questionnaire responses are typed in during initial installation and may be changed as needed. The system tailoring procedure allows these responses to be entered.

An *Application Reference Manual* provides a step-by-step installation activity plan, including sample numbering systems, sample input and maintenance data forms, file loading sequences, and control forms, with suggested procedures. The *Application Reference Manual* provides information on the day-to-day use of the application.

The *Runbook* provides the operator with a detailed and easy-to-use set of instructions showing all the activities necessary to run the programs on a System/34.

Instructional material in the form of a self-study course is provided for operator self-training in the use of the *Runbook*.

An *Application Logic Manual* is provided, as basic licensed material, for use by the self-sufficient customer and for continuing SE support. It describes the architecture of programs, procedures, data base cross-references, data dictionary, and detailed descriptions of each program.

The Client Accounting and Financial Reporting System II (CAFRS II) is designed to allow flexibility in the options included to meet an individual client's special needs:

- Up to 13 periods per fiscal year.
- Automatically calculated journal entries based on algorithms defined by the accountant.
- Multiple special purpose journals with source code, related accounts, and headings specified by client.
- Ability to correct prior periods.
- Extensive chart of account flexibility to provide desired heading and account description information, up to 9 levels of subtotals for combining accounts, and spacing and paging control.

- Optional titles and formats for financial statements.
- Consolidation is provided for clients with more than one business entity. Maintenance is provided for eliminating entries. Controls are included to force fiscal period alignment of clients being consolidated. The same processing capabilities are available for the consolidated client as for others.

Features

- Last year comparative data on financial statements
 - Print suppression of zero balance accounts on financial statements
 - Balance sheet
 - Income and expense statement
 - Combined departmental income and expense reporting
 - Income and expense comparison to budget
 - Income and expense account balance comparison to a specified account balance, by department, such as gross sales
 - Income and expense account balance comparison to a client-specified base, such as number of rooms, square feet, or miles driven
 - Supporting schedules
 - Statement of changes in financial position with related worksheet and ability to process adjustments
 - Reporting of financial ratios, defined by client, with comparison to industrial averages
 - Employee payroll register
 - Printing of presently formatted 941-A and W-2 forms
 - Notes to the financial statements
 - 8-1/2" x 11" general ledger or a full-size general ledger
 - Trial Balance with both current and year-to-date data, or year-to-date only
 - Cumulative general ledger
 - Automatic reversing entries
 - Budget amounts on budgeted income statements variable by period
 - Choice of four customer-entered footnote messages
 - Choice of four customer-entered disclaimer messages relating to auditability of reports
- The System/34 CAFRS II Application Program supports the following functions which take advantage of the System/34:
- Workstations are used for file maintenance, data entry, and inquiry.
 - All programs are online with the exception of the system tailoring procedure.
 - Spooling and priorities are used for printed output.
 - Operator selection of screens from a menu screen.
 - All files are 'shared.'
 - Multiple, interactive display stations may operate concurrently.
 - Multiple programs may operate concurrently.
 - Error messages and operator communications are displayed on the screen.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, for installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when operated in the following specified operating environment:

HARDWARE REQUIREMENTS

This licensed program will execute on all models of the IBM System/34 with a minimum of 48K bytes of main storage. Performance of application programs, as shipped, may be enhanced by increased print speeds and/or increased main storage. If an IBM 3742 is to be used, it must have the 128-character set feature (#5455) and feature group A (#4044). IBM 3741s must have feature group A (#4002).

PROGRAM PRODUCTS

CAFRS II (cont'd)

For presentation purposes on the reports, left and right parentheses have been included to indicate a dollar amount opposite an account's normal balance. The 64-character set feature is required for the System/34 to print the parentheses.

Although nothing in CAFRS II prevents the use of the minimum system configuration, the system configuration for a particular customer must be able to accommodate the expected business volumes, data base size, and operating requirements.

SOFTWARE REQUIREMENTS

IBM Client Accounting and Financial Reporting System II is written in IBM System/34 RPG II programming language and executed under control of the IBM System/34 System Support licensed program (5726-SS1). It also requires the IBM System/34 Utilities licensed program (5726-UT1).

IBM Client Accounting and Financial Reporting System II is shipped with object code included (compiled for a 24K user area). Standard modifications use the system tailoring procedures and require no recompiling. Nonstandard modifications to the RPG II source programs require the IBM System/34 RPG II Compiler (5726-RG1).

**SYSTEM/34 OVER-THE-COUNTER INVOICING AND
ACCOUNTS RECEIVABLE INQUIRY FOR DISTRIBUTORS
MANAGEMENT ACCOUNTING SYSTEM II (DMAS II)
5726-DM5**

PURPOSE

IBM System/34 DMAS II is designed to satisfy the data processing needs of a broad spectrum of distributors.

Some distributors have special needs relative to credit management and immediate invoice printing for over-the-counter order entry business.

With Over-the-Counter Invoicing and Accounts Receivable Inquiry (5726-DM5), a DMAS II user may inquire into accounts receivable information including detailed transaction activity and quickly print an invoice for a specific order.

HIGHLIGHTS

- Search for customer number based on customer name
- Obtain accounts receivable detail information for credit management purposes
- Know a customer's accounts receivable status prior to releasing goods
- Print an invoice for a single order, at the counter
- Allocate inventory required to satisfy the order
- Print invoices for a range of orders
- Print a duplicate copy of an invoice

DESCRIPTION

These capabilities are realized by using specialized routines easily called by the entry of short keywords which enable the user to quickly perform the operations without switching menus or answering multiple option prompts.

The licensed program enhancements have been specifically designed for quick turnaround, over-the-counter business, typical of some DMAS II users. The enhancements eliminate the necessity of manually producing invoices by enabling the user to quickly produce an invoice on the system. The time to prepare an invoice is significantly reduced as is the potential problem of costly incorrect pricing. The customer receives a timely, easily read, machine-prepared invoice which is accurate and complete. In addition, the DMAS II user is aided in the control of credit by being able to display complete account status including detailed transaction activity.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection, training, and continued day-to-day operation lies solely with the customer.

Installation of this System/34 licensed program is a customer responsibility.

Customer Installation Tasks

- Copy the installation procedure to disk
- Execute the installation procedure following displayed information
- Operating instructions will be printed during the installation process
- Read the operating instructions runbook carefully before executing the new operating procedure
- Following the operating instructions, execute the operating procedure

Modifications: The modification of this enhancement or the addition of new ones may be done by a programmer experienced in RPG II and the System/34.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration requirements are an IBM System/34 with:

- 5340 System Unit with Diskette 1 Drive, 8.6 MB of disk storage and 48K (mdl B11) or 64K (mdl C11) bytes of main storage depending on the application
 - 64K for Billing, alone or in combination with any of the other DMAS II applications
 - 48K may be used in certain environments when neither Purchasing nor Billing is included

- A minimum of one IBM 5256 or 5211 or 3262 B1 Printer
 - A second printer (5256), dedicated to over-the-counter invoice printing, is recommended.

Although there is nothing inherent in the design of DMAS II to prevent the use of the minimum system configurations stated above, the system configuration for a particular customer must be able to accommodate the expected business volumes, data base size and operating requirements.

The standalone DMAS II File Size Procedures are unaffected by this enhancement. A particular customer's file size requirements may vary depending on individual use of the system and applications. While it is the customer's responsibility to determine the necessary file size, you may contact your IBM representative for guidance.

SOFTWARE REQUIREMENTS

These programs are written in IBM System/34 RPG II programming language and execute under control of the IBM System/34 System Support Program (5726-SS1). The IBM System/34 Utilities (5726-UT1) must be ordered for use with the system. The IBM System/34 RPG II (5726-RG1) must be available if modifications to the application programs are expected. These enhancement programs operate in conjunction with DMAS II, augmenting rather than replacing DMAS II. DMAS II Billing is prerequisite to the use of the DMAS II Over-the-Counter Invoicing function. DMAS II Accounts Receivable is required as a prerequisite to using the Accounts Receivable Inquiry function.

The Over-the-Counter and Accounts Receivable Inquiry licensed program will operate in conjunction with DMAS II FDPs such as 5798-NXY and/or 5798-NXZ; however, these FDPs are not required.

RPGs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

**DISTRIBUTORS MANAGEMENT ACCOUNTING SYSTEM
(DMAS) FOR SYSTEM/34**

BILLING ... 5726-D4A
ACCOUNTS RECEIVABLE ... 5726-D4B
INVENTORY CONTROL ... 5726-D4C
SALES ANALYSIS ... 5726-D4D

PURPOSE

These modular licensed programs are available for either a 32K or 48K IBM System/34. The application function and data base are exactly the same as the IBM System/32 DMAS offering. These applications run in single program mode on the IBM System/34. Performance improvements in the larger memory size version come from the reduction of overlays, incorporation of larger blocking factors, and use of dual I/O areas. This is most beneficial for the customer who has no requirement for an interactive workstation system in the near future.

When all four programs are installed they constitute an interrelated application set with an integrated data base. These applications have the industry-oriented function and marketing support that will capture the interest of your distribution prospect. They can help the users manage their two largest business assets, accounts receivable and inventory, and give them profit performance data on their products, customers, and salespersons. These programs can also help the user increase operational efficiency and customer service.

The open order file, warehouse sequenced picking lists and automated pricing and discounting methods can help improve order processing speed and accuracy. The inventory control system provides information to the buyers that will help them optimize inventory investment by identifying the obsolete, slow moving, and unprofitable items and help increase inventory turns and service levels. Automatic credit limit checking, variable credit terms, late charges on open item and balance forward accounts, delinquency notices, and aged receivables reports provide tools for reducing bad debt losses and increasing cash flow. Daily, monthly, and on demand sales reports help monitor the attainment of the distributor's sales objectives.

The Payroll, Accounts Payable, and General Ledger programs of the Distribution Financial Accounting System (DFAS) can co-reside with DMAS. With DMAS and DFAS, you can address the major data processing requirements of the Distribution customers and can select the applications that best meet their needs.

DESCRIPTION

BILLING (5726-D4A)

A postbilling system with data entry from the System/34 display station and/or from diskettes keyed on a 3740 Data Entry System, with editing, invoicing, invoice register, and a salesperson's recap. Features include:

- Open orders file with listing by customer and/or item that provides for printing order acknowledgements or picking lists.
- Ship-to address file
- Variable price selection methods
 - Contract pricing
 - Unit price or extended price entered by operator
- Variable item discount or markup flexibility
 - Operator override of discount/markup percent
 - Quantity discount for up to 5 quantity break ranges
 - Combination of customer class (8) and item class (99) selects discount/markup percent. Markups can be greater than 100%.
 - Choice between discounting or marking up is controlled by code in customer record
- Variable trade discount on invoice total
 - Selection of one of 5 discount percents, based on code in customer record
 - Selection of one of 5 discount percents, based upon invoice amount
- Variable payment terms and cash discounts
 - One of 9 cash discount percents
 - One of 10 term descriptions (for example, 2% 10, net 30)
 - Terms and discount percents based on customer code
- Broken case pricing with surcharge
- Pricing unit conversion - when inventory unit differs from selling unit
- Container charges automatically applied
- Price list
- Optional invoice format with or without a tearstrip (profit stub)
- Daily backorder slips
- Federal Excise tax calculated

- State sales tax (standard) plus two local sales taxes
- Monthly tax totals report

ACCOUNTS RECEIVABLE (5726-D4B)

A combined balance forward and open item method, with data editing, monthly statements, and delinquency notices. Features include:

- Balance forward or open item selectable by account
- Late charges for both open item and balance forward accounts
- Future dating
- Credit limit checked during order edit if Billing is installed
- Monthly statements and delinquency notices
- Aged trial balance monthly or on demand - summary or detail
- Statements by job or branch location
- Aging of customer invoices with three past due periods

SALES ANALYSIS (5726-D4D)

Sales and profitability figures by salesperson, customer, item, and item class. Availability of the information in the following reports is dependent upon the applications selected and their installation sequence.

- Daily sales recap by salesperson (data from Billing or Accounts Receivable)
 - Sales dollars
 - Cost
 - Gross profit
 - Gross profit percent
- Monthly salesperson sales analysis - current and year-to-date (data from Billing or Accounts Receivable)
 - Sales dollars
 - Cost
 - Gross profit
 - Gross profit percent
 - Number of orders
- Monthly customer sales analysis - current and year-to-date (data from Billing or Accounts Receivable)
 - Sales dollars
 - Gross profit
 - Gross profit percent
 - Drop ship sales - year-to-date only
 - Gross profit amount
- Monthly salesperson/customer sales analysis - current and year-to-date (data from Billing or Accounts Receivable)
 - Date of last sale
 - Sales dollars
 - Gross profit
 - Gross profit percent
 - Number of orders
- Monthly salesperson/customer/item class sales analysis - current and year-to-date (data from Billing)
 - Sales dollars
 - Gross profit
 - Gross profit percent
 - Number of orders
 - Totals by customer and salesperson
- Monthly item and item within item class sales analysis - current and year-to-date (data from Billing or Inventory)
 - Quantity
 - Sales dollars
 - Gross profit
 - Gross profit percent
 - Number of orders
 - Up to 99 item classes

If Sales Analysis is the first or only DMAS program installed, the customer must provide data entry and edit programs.

INVENTORY CONTROL (5726-D4C)

A system which allows management to obtain the information needed for purchasing and profitability analysis, including a perpetual inventory system and a physical inventory system. Features include:

- Stock Status Review - on demand, selectable for
 - All items, items within limits, active items only
 - Sequence by vendor, item class, or item
 - Exceptions only: Below minimum, cost deviation, *backordered*, or quantity zero

PROGRAM PRODUCTS

DMAS for S/34 (cont'd)

- Current stock position: On hand, on order, *backordered*, on reserve
- Sales and cost information: This month and year-to-date
- Stock Status Report - monthly
 - Year-to-date drop shipped quantities
- Inventory Analysis Report - on demand in sequence by
 - Item number
 - Date of last sale
 - Gross profit year-to-date
 - Profit % year-to-date
 - Months' supply on hand
 - Extended cost on hand
 - Vendor number
 - Item class
 - Vendor/item class
 - Alternate cost on hand
 - Sales year-to-date
- Basic Unit Cost - average cost method
- Alternate Cost - last cost method
- Multiple Warehouses

FUNCTIONS

- Integrated data base which simplifies file maintenance and provides for more efficient disk utilization.
- User-maintained constants file is used in most programs which allows operator to modify data subject to change, such as late charge rate, tax rates, terms, or aging dates, without the need to change and recompile programs.
- Specific load and maintenance programs are included for each master file.
- Easy-to-use printed runbook for each application
- Contains additional space in item and customer master records for customer use.
- OCL procedures, sort specifications, and processing programs are cataloged into logical work units which optimize system utilization.
- Automatic monitoring of execution sequence prevents execution of a program until preceding required programs have been completely and successfully executed.
- Offline 3741 data entry diskette formats.
- Dynamic file space checking capability of transaction edit programs tells the operator in advance when a file is approaching its maximum size so that action may be taken in time to prevent an interruption in processing.
- Dynamic backup and recovery system provides for periodic backup of master files and edited transactions, and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files.
- Reprint options are possible because file updating is separated from report printing functions. Reports or parts of reports can be reprinted to provide extra copies, or some report printing can be deferred to a more convenient time.
- Selective printing allows the operator to control the printing mode for reports by entering a keyboard response to prompts on the CRT. In this way, for example, reports may be printed for a range of customers or items, or only for accounts with balances or past due amounts.
- Inquiry programs, with data retrieval options selectable at program run-time, provide current information from the customer and item master files.

File Size and Application Function Tailoring Capability: All necessary programs and procedures for file allocation are included with DMAS. The customer can allocate file space during installation and change file space allocations as business volumes change, and may control the operation of some application functions by file maintenance and by operator-controlled run time options.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility. For customers who have modified their installed System/32 IAPs and who choose to have IBM make the same modifications on the System/34 product, the reinstallation of the modifications on the new

product will be billable under SES. It is the customer's responsibility to transfer data files from one system to the other.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration requirement is an IBM System/34 with:

- 32K or 48K bytes of main storage
- 8.6 megabytes of disk storage
- 40 characters per second matrix printer
- IBM 5251 mdl 11 Information Display Station

SOFTWARE REQUIREMENTS

- IBMSystem/34 System Support licensed program Version 1 (5726-SS1)
- IBM System/34 Utilities licensed program (5726-UT1)

Instructional Materials

Operator Introduction and Exercises: These materials, consisting of a Student Guide, audio cassettes, and System/32 diskettes, will help the operator learn and practice IAP operation without using the customer data files. One copy will be provided at no charge to the customer.

One copy of the following material is supplied via SLSS when program number and initial library are specified.

Audio Cassettes (2)	SV30-0002
System/32 Diskettes (3)	SV30-0003
Student Guide	SR30-0171
Advisor Guide	SR30-0169
Runbook	SR30-0170

DOCUMENTATION

PROGRAM PRODUCTS**LUMBER DEALERS MANAGEMENT ACCOUNTING SYSTEM (LDMAS)
FOR SYSTEM/34 (Single Program Mode)**

BILLING ... 5726-D4E
ACCOUNTS RECEIVABLE ... 5726-D4F
INVENTORY CONTROL ... 5726-D4G
SALES ANALYSIS ... 5726-D4H

PURPOSE

These modular programs are available for either a 32K or 48K IBM System/34. The function and data base are exactly the same as the System/32 LDMAS offering. These applications run in single program mode on the IBM System/34. Performance improvements in the larger memory size version come from the reduction of overlays, incorporation of larger blocking factors, and use of dual I/O areas.

When all four programs are installed, they constitute an interrelated application set with an integrated data base. They can help the users manage their two largest business assets, accounts receivable and inventory, and give them profit performance data on their products, customers, and salespersons. These application programs can also help the user increase operational efficiency and customer service.

The Payroll, Accounts Payable, and General Ledger programs of the Distribution Financial Accounting System (DFAS) can co-reside with Lumber Dealers Management Accounting System application programs. With LDMAS and DFAS, the major data processing requirements and the applications best meeting your prospect's needs can be selected.

HIGHLIGHTS

- An automated estimate preparation procedure provides the capability to bid on more jobs for increased business.
- Lien expiration notification helps dealers avoid losing their rights to file a lien when they have not been paid for the delivered material.
- The complexities and error potential of pricing by different units of measure such as board foot, square foot, and linear foot, should be reduced because applicable conversions are automatically applied.

For example, one 8-foot length of 2x4 is converted to the correct number of board feet. A roll of roofing paper is converted to its pricing unit, square feet. A length of molding, priced by the linear foot, is not converted.

- A unique billing and inventory technique can handle a large number of items with a reduced number of item records. For lumber items, which are sold in different lengths but accounted for in board feet, one item record can be used for one size and grade such as 2' x 4' Redwood Common. The item number and up to 12 sales quantity/length combinations are keyed. The detail is printed on the invoice. This method, in addition to optimizing file space, can permit greater billing throughput and simplified handling of price changes.

DESCRIPTION**BILLING (5726-D4E)**

A postbilling system with data entry from the System/34 display station and/or diskettes keyed on a 3740 Data Entry System. Editing, invoice printing, invoice register, and sales summary. Features include:

- Ship-to address file
- Variable price selection methods
 - Operator entry of price
 - Contract price file
 - Customer code selects either the list price, or, one of six prices, discounts from list price, or markups from cost
- Price conversion, with computations for square foot, linear foot, and board foot items.
- Estimate preparation
- Price list printing - six prices in addition to list price
- State sales tax and one local sales tax
- Customer code selects 1 of 6 payment terms

ACCOUNTS RECEIVABLE (5726-D4F)

A combined balance forward and open item method, with data editing, monthly statements, and delinquency notices. Features include:

- Balance forward or open item selectable by account
- Lien expiration date checking
- Late charge capability for both open item and balance forward accounts
- Credit limit checked during order edit if Billing is installed
- Variable statement format - two options
- Aged trial balance monthly or on demand

- Statement by job for contractors or by branch for multilocation wholesalers

INVENTORY CONTROL (5726-D4G)

A system which allows management to obtain the information needed for purchasing and profitability analysis, including reports to assist in taking inventory. Features include:

- Stock Status Review - on demand, selectable for
 - All items, item within limits, active items only
 - Sequence by vendor (optional), item class, or item
 - Exceptions only: Below minimum or cost deviation
 - Current stock position: On hand, on-order, and available
 - Sales and cost information: This month and year-to-date
- Stock Status Report - monthly
 - Current stock position
 - Activity during the month
 - Year-to-date drop shipped quantities
- Inventory Analysis Report - on demand in sequence by
 - Item number
 - Date of last use or sale
 - Months' supply on hand
 - Extended cost on hand
 - Vendor number
 - Item class
 - Vendor/item class
 - Alternate cost on hand
 - Year-to-date sales
- Basic Unit Cost - Standard cost method
- Alternate Cost - average cost
- Multiple Warehouses

SALES ANALYSIS (5726-D4H)

Sales and profitability figures by salesperson, customer, item, and item class. Availability of the information in the following reports is dependent upon the applications selected and their installation sequence.

- Daily sales recap by salesperson (Data from Billing or Accounts Receivable)
- Monthly salesperson sales analysis (Data from Billing or Accounts Receivable)
- Monthly customer within salesperson sales analysis (Data from Billing or Accounts Receivable)
- Monthly customer sales analysis (Data from Billing or Accounts Receivable)
- Monthly item and item within item class sales analysis (Data from Billing or Inventory)
- Monthly item class within customer sales analysis (Data from Billing)
- The ability to report sales information for groups of items which do not have inventory records on file
- If Sales Analysis is the first or only Lumber Dealers Application Program installed, the customer must provide data entry and edit programs.

FUNCTIONS

- Integrated data base which simplifies file maintenance and provides for more efficient disk utilization
- User-maintained constants file is used in most programs which allows operator to modify data subject to change, such as late charges rate, tax rates, terms, or aging dates, without the need to change and recompile programs.
- Specific file load and maintenance programs are included for each master file
- Easy-to-use printed runbook for each application
- Contains additional space in item and customer master records for customer use
- OCL procedures, sort specifications, and processing programs are cataloged into logical work units which optimize system utilization
- Automatic monitoring of execution sequence prevents execution of a program until preceding required programs have been completely and successfully executed
- Dynamic file space checking capability of transaction edit programs tells the operator in advance when a file is approaching its

LDMAS for S/34 (cont'd)

- maximum size so that action may be taken in time to prevent an interruption in processing
- Dynamic backup and recovery system provides for periodic backup of master files and edited transactions, and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files
 - Reprint options are possible because file updating is separated from report printing functions. Reports or parts of reports can be reprinted to provide extra copies, or some report printing can be deferred to a more convenient time
 - Selective printing allows the operator to control the printing mode for reports by entering a keyboard response to prompts on the CRT. In this way, for example, reports may be printed for a range of customers or items, or only for accounts with balances or past due amounts.
 - Inquiry programs, with data retrieval options selectable at program run time, provide current information from the customer and item master files
 - Offline 3741 data entry diskette formats

Executive Guide (G580-0121) ... General Information Manual (GH30-0166) ... Application Logic Manual (LH30-0169) ... Application Reference Manual (SH30-0168)

TERMS and CONDITIONS: See PP Index

File Size and Application Function Tailoring Capability: All necessary programs and procedures for file allocation are included with the application programs. The customer can allocate file space during installation and change file space allocations as business volumes change, and may control the operation of some application functions by file maintenance and by operator-controlled run time options.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility. For customers who have modified their installed System/32 IAPs and who choose to have IBM make the same modifications on the System/34 product, the reinstallation of the modifications on the new product will be billable under SES. It is the customer's responsibility to transfer data files from one system to the other.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration requirement is an IBM System/34 with:

- 32K or 48K bytes of main storage
- 8.6 megabytes of disk storage
- 40 characters-per-second matrix printer
- IBM 5251 mdl 11 Information Display Station

SOFTWARE REQUIREMENTS

- System/34 System Support licensed program Version 1 (5726-SS1)
- System/34 Utilities licensed program (5726-UT1)

Instructional Materials

Operator Introduction and Exercises: These materials, consisting of a *Student Guide*, audio cassettes, and System/32 diskettes, will help the operator learn and practice IAP operation without using the customer data files. One copy will be provided at no charge to the customer.

One copy of the following material is supplied via SLSS when program number and initial library are specified. Additional copies may be obtained by ordering them individually from Mechanicsburg.

**SYSTEM/34 DISTRIBUTORS MANAGEMENT
ACCOUNTING SYSTEM II (DMAS II)**

BILLING ... 5726-D41
ACCOUNTS RECEIVABLE ... 5726-D42
INVENTORY CONTROL ... 5726-D43
SALES ANALYSIS ... 5726-D44
PURCHASING ... 5726-D46

PURPOSE

IBM System/34 DMAS II is a workstation application system that puts data processing in the hands of the using departments. Customer orders can be entered from the order desk, cash posted to customer accounts by the Accounts Receivable clerk, purchase orders created online by a buyer, and stock receipts entered by either warehouse or receiving department personnel. This can result in stock balances that reflect realtime data, lead to improved customer service, fewer lost sales, and optimum inventory investment; at the same time, greater control can be provided over the entire purchasing process and the cash commitment it involves.

HIGHLIGHTS

- Interactive data entry is designed for simplicity and operator efficiency. Using this method, an operator gets a maximum amount of system-provided information in response to entering a minimum amount of data. Screen displays guide the operator through the data entry operation in a logical sequence. Data entry errors are signalled and descriptive data from master files is displayed to aid in visual verification. Errors are corrected interactively.
- The additional processing capability of the System/34 allows System/32 DMAS customers to convert to System/34 DMAS II using diskette entry and batch processing. This DMAS capability has been retained to facilitate the transition of customers using batch processing and diskette entry to that of interactive online processing. Concurrent with batch operations, the customer can use the Workstation Operator Instruction Course. This capability provides for the processing of existing daily work, the training of operators and the ability to put new applications 'online' at a controlled pace.
- Multiple, interactive display stations may operate on one job or concurrently on different jobs. Several workstations can be used for customer order entry, while others may be used for posting payments, creating purchase orders, or entering inventory receipts. While this is occurring, a batch job may be running in the background. These capabilities dramatically increase the efficiency of entering data from the various centers of activity in a distribution business.
- The alpha search feature allows inquiry about customers and items when the workstation operator does not have the customer or item number available. By keying a portion of either the customer's name, or city, or both, the system will locate and display all customers meeting that criterion. Similarly item name, item class, or both can be used to display items. An optional search field can be used when the customer or item is to be found by other than the first portion of the customer or item name.
- Comprehensive inquiry offers current data on demand. Displays show key information such as customer accounts receivable summaries, aged receivables status, customer sales and billing summaries, realtime item inventory balances, item sales summaries, item price and cost data, vendor purchasing data, and active purchase orders for any item. In addition, a credit check which includes a summary of all A/R, all in transit to A/R, and all orders in process for a customer can be obtained. Alpha search can be used to locate desired customer and item inquiry data.
- Order status inquiries show the current status of customer or purchase orders in process or on file in the system. The user may choose to display all orders or only those meeting selection criteria.
- Comparative sales analysis provides inquiry displays which show historical comparisons and ratios. Quantitative figures and graphical comparisons are displayed for both item and customer data. Latest-month data can be compared to the preceding month, to the same month in the preceding year, and to the latest 12-month average. Also, the current year-to-date data can be compared to the same period-to-date data in the previous year. The latest 13-month figures for any customer or item can be displayed in bar graph form. The various comparative sales analyses can show dollar sales, dollar profit, and quantity sold (items) or number of orders (customer) data, as selected by the user.
- Interactive file maintenance permits easy and accurate additions and corrections to master files from any workstation. Field descriptions, field lengths, and explanations of coded data are provided, while entered data is edited for reasonableness. A special feature allows rapid review and/or change of any or all item list prices. New prices are edited for reasonableness, as a protection against gross keying errors.
- All application procedures may be executed from a menu screen. Menu screens simplify the operators' duties by displaying a list of job numbers, with descriptions, that can be run. This reduces operator keying time and errors.
- Application options may be selected, depending on the type, at install time, run time, or by overriding standard data during data entry. Files may be resized as necessary to accommodate growth. Warning messages signal when files are approaching their capacity.
- Diskette magazine support for master file backup and recovery for all five DMAS II application programs.
- Enhanced auditability and control.
 - Order Reconciliation list.
 - System balancing to optional operator-entered control totals and the notation of any forced control totals.
 - Transaction registers.
 - Backing up of transaction files and master files.
 - System-produced notations of price-related operator overrides in the Billing application.
 - Financial data (receivables amounts and stock on hand) cannot be altered through file maintenance operations.
 - Sales statistics from deleted records are stored in summary form through year end, so that year-to-date sales and cost amounts balance to controls.
 - All pages of transaction registers (Invoice Register, Inventory Transaction Register, Receivables Transaction Register, Items Ordered/Received Register) are numbered with a perpetual serial page count to prevent valid report copies from being inadvertently destroyed or lost unnoticed.
- Prompting to override default options.
- No customer programming capability is required. An education program is provided that is intended to help the customer attain operational self-sufficiency.
- Each application may be installed separately or in conjunction with the others. However, when Billing is installed, its output automatically serves as input to the Accounts Receivable, Inventory Control, and Sales Analysis; output from Purchasing updates related data in the inventory records, if Inventory Control is also installed.
- Reserved user space in master records.
- Basic screen functions across applications.
 - Ability to change mode between entry and review.
 - Cancel function may be performed.
 - Ability to add or insert new lines.
 - 1 to 8 lines may be entered and edited per body screen.
 - Ability to delete transactions.
 - Screens displayed in logical sequence.
 - Ability to unlock keyboard to make changes during review or entry.
- Flexible backup/recovery/restart to minimize the recovery process.

DESCRIPTION**BILLING (5726-D41)**

- Dynamic stock on-hand balance maintained and quantity available may be allocated to orders as they are entered. This allocate feature is optional with postbilling and standard in prebilling.
- Post- or prebilling methods available. Users may select either method, and change their choice at a later time.
- Credit limit checking (if A/R is installed) warns when customers' posted balance exceeds 90% of their credit limit.
- Extended credit check option displays total due currently posted in A/R, plus future and in-transit to A/R charges, plus total of all orders in process. Comparison to credit limit and orders on credit hold are shown.
- Price check during order entry option will display complete order pricing data prior to picking list printing.
- Back orders are automatically reentered for customer and items that qualify.
- The printing of picking lists and invoices may be initiated following entry of an order. After an order has been entered, any operator may initiate the printing of a picking list on a printer located in the warehouse. The operator can also expedite delivery by calling for the printing of particular invoices to that warehouse.
- Alpha search on customer and item.
- Diskette and online workstation data entry.
- Multiprogramming allows for other batch and/or workstation jobs to operate concurrently.
- Multiple order entry workstation.

PROGRAM PRODUCTS

S/34 DMAS II (cont'd)

- Orders may be entered for new customers and for new items not on file. No file maintenance required prior to entering orders.
- Flexible pricing, including: Discount from list or markup from cost, item quantity discounts, contract prices, or manually entered overrides.
- Operator override allows the operator to override defaults and information contained in master file data records.
- Orders may be cancelled, corrected, released to invoicing or retained in the file for later processing.
- Invoices/credit memos may be entered directly and changed, cancelled or remain in file for later processing.
- Picking documents and invoices printing flexibility:
 - For a particular warehouse or all warehouses
 - Within order number or invoice number limits
 - Based on 'all ready to be printed' or up to a specified number (for example, first 20).
 - Can be directed to different printer
 - The standard picking list printing sequence (list organization and content) can be overridden.
- An on-reserve warning is displayed when the quantity available of an item is less than the quantity on reserve.
- Interactive File Maintenance permits easy, accurate customer master file maintenance from any workstation.

ACCOUNTS RECEIVABLE (5726-D42)

- Cash application is simplified. The operator can select invoices for payment from a display of all of a customer's open items and selectively apply payments.
- Balance forward or open item. Either method is selectable for each account. The individual accounts can be changed from one method to the other at the end of an accounting period.
- Multiple cash entry workstations.
- Diskette and online work station data entry.
- Statements with past and future aging, late charges, and optional remittance tear strips are prepared monthly.
- Aged Trial Balance and a Customer Account Status Report are available on demand. An option allows the Aged Trial Balance to be sequenced by customer within salesperson.
- Delinquency notices are available.
- Multiprogramming allows for other batch and/or workstation jobs to operate concurrently.
- Deferred statement printing is provided for. Data is saved on diskettes for the printing of statements at a more convenient time.
- A zero-balance statement option permits the printing or bypassing of statements for customers with zero amount due, but who had transactions during the latest month.
- Print paid open item proof, and paid item list.

INVENTORY (5726-D43)

- Dynamic stock-on-hand balances maintained. Sales, receipts and adjustment are immediately reflected in the quantities available.
- Alpha search on item.
 - Item price, cost, and quantity sold inquiry capability.
- Multiprogramming allows for other batch and/or workstation jobs to operate concurrently.
- A stock status report, stock status review and a variety of other analytical reports can provide stock movement data to assist in the buying process, optimize inventory investment, and provide a high level of customer service.
- Broken case quantities maintained.
- Accounting for warehouse and drop shipments.
- Multiple warehouse activity supported. Inventory balances can be maintained separately for multiple warehouses. Inventory Analysis reports can show either the items in all warehouses, or only those in a specific warehouse.
- Two costing methods are supported: Average cost, for calculation of profit, and last cost, which usually represents your current replacement cost. Both costs can be displayed during item balance inquiry.
- Backorder release lists, one in item sequence and one in order number sequence, show customer orders being held pending receipt of backordered items.
- Physical inventory lists assist when taking inventory.

- Diskette and online work station data entry.
- Quantity on reserve and on backorder.
- Interactive File Maintenance permits easy, accurate item master file maintenance, including item price changes by item class, from any work station.

SALES ANALYSIS (5726-D44)

- Sales analysis reports assist in answering questions like:
 - What is selling and what is not selling?
 - Which profitable items should be promoted and which unprofitable ones should be dropped?
 - Which customers are profitable?
 - Which salespersons are effective and profitable?
- Depending on other licensed programs installed, reports are sequenced:
 - By item.
 - By item within item class.
 - By item class within customer within salesperson
 - By customer
 - By customer within salesperson
 - By salesperson.
 - Within limits
- Deferred printing of reports.
- Comparative Sales Analysis displays show historical data about items and customers at any workstation.
 - Data displayed is dollar sales, dollar profit, and quantity sold (items) or number of orders (customers).
 - Analyses for a sales territory or an item class show four comparisons of latest period data to previous time periods. Quantitative data and the ratio between periods is shown.
 - Analyses for a single customer or item show four comparisons of latest period data to previous time periods. These analyses show quantitative data and ratios for sales, profits, and orders for that item or customer.
 - Trend charts, showing up to 13 months of sales, profit, or order history for a single customer or item are displayed in bar graph form.
 - Comparative Sales Analysis data is collected and retained on file as the result of month-end DMAS II processing.

PURCHASING (5726-D46)

- Build order by scan through vendor's line, identifying desired items and accepting or overriding normal order quantity - as alternative to key entry of individual items. Scan can be confined to items with below minimum availability status.*
 - Item inventory status can be displayed.*
 - Quantity/price break points can be displayed. Program assigns vendor price appropriate to quantity ordered.
 - Cumulative order weight and cost displayed and updated as order is modified during entry.
- Handles items that are ordered from more than one vendor.
- Orders can be entered for items that are not on the file.
- Orders can be entered for vendors who are not on the file.
- A standard general ledger account number is assigned to the order, but the operator can assign a different number to the order or to any item(s) on it.
- Messages can be entered to be associated with an order or a particular item on the order, and to appear only on the screens and reports destined for specific operating areas (for example, on the purchase order for the vendor, or on receiving reports and displays for the warehouse).
- Total order weight and cost is displayed after order entry, and updated if the order is modified at entry time.
- Orders can be held for later approval and/or can be printed individually or in batches at any time.
- Purchase orders can be printed on the system printer, or on a workstation printer (for example, at the buyer's desk), as predetermined by the user.
- When the purchase order has been entered, it updates Quantity on Order in the item records.*
- Multiple-warehouse activity is supported.
- Daily purchase order reconciliation report
 - Log of all orders
 - Transaction and status record for each order
 - Summary reconciliation of status changes and activities for all orders

* If the DMAS II Inventory Control application is installed.

S/34 DMAS II (cont'd)

- Summary of open order dollar value by order status and buyer
- Report of shipments expected, by due date
 - For expediting
 - For warehouse labor scheduling
- Receiving lists and reports, to aid in
 - Warehouse operations and space planning
 - Checking receipts with minimum clerical effort
 - Determining stocking locations for incoming merchandise
 - Maintaining audit trail
- Extensive order status reports and displays - with multiple selection criteria.
- Item purchase order search, and display of status
- Interactive application of receipts to open orders
 - Updates purchase order quantities
 - Dynamically updates quantities available to fill customer orders*
 - Updates quantity on order and quantity on hand in item records*
 - Updates open order cash commitments
- Accounts Payable input
 - Interactive reconciliation of vendor invoice quantities and amounts to purchase order and receiving data.
 - Closing report for quantities approved for payment, with cost by assigned General Ledger account numbers.
 - Interactive input of vendor invoice Accounts Payable data, for transfer via diskette to the DFAS II Accounts Payable application.
- Operator can override defaults and information obtained from master file data records.
- Multiprogramming allows for other workstation and/or batch jobs to operate concurrently.
- Multiple workstations can enter purchase orders concurrently.

AUTOMATED INSTALLATION AID

DMAS II Self-Install, an interactive installation method consisting of a workbook and diskette, enables customers to install any of the existing DMAS II applications with little or no SE assistance. These applications include Billing, Accounts Receivable, Inventory Control, Sales Analysis, and Purchasing. They may be installed in any sequence. DMAS II Self-Install is designed for the novice who is installing an application for the first time. It is also intended for the experienced DMAS II user who wishes to add a new DMAS II application.

DMAS II Self-Install consists of:

- An installation workbook that guides the user step-by-step through the planning and installation of a DMAS II application. File sizing and run time options are explained and then entered by the user in the workbook. The workbook should be ordered so the customer can use it prior to installation.
- Data forms for all application master files are included along with lists of descriptions for the information fields in all the forms.
- A set of programs, invoked by one command, that prompts for workbook responses, calculates disk/diskette requirements, initializes required diskettes, loads programs to DMAS II libraries, and backs up all files and libraries. The programs are included with the application code shipped from PID.

PTF APPLICATION SERVICE AID

This new service aid will provide an improved method of support and control for application of PTFs, as well as an automated audit trail of the activity. This service aid has been designed so that customers can increase their self-sufficiency by being able to apply their own PTFs and refreshes.

This aid provides the following features:

- The total or partially automatic replacement of corrected modules in a refresh.
- Built-in safeguards to prevent inadvertent replacement of modified modules.
- Source code image PTFs additionally provided with refresh diskettes to facilitate manual application to modified modules.
- Cross-reference listings of PTFs contained in refresh.
- Audit trail listing of PTFs applied during refresh session.
- Automatic logging of PTF numbers into the library log.

Customer Education

Distribution Customer Executive Seminar: A half-day seminar to introduce distribution executives to the concepts, features, and advantages of System/34 and DMAS II.

Distribution Industries End-User Orientation: A half-day seminar for department heads, covering the concepts, features, and advantages of System/34 and DMAS II.

Buyer Orientation: A class for purchasing agents and buyers, covering the concepts, features, and advantages of INVEN/34. The capabilities and benefits of DMAS II-Purchasing are also discussed.

Instructional Materials

DMAS II Workstation Operator Instruction: This Workstation Operator Instruction Course will provide hands-on experience to the workstation operator in the daily operations of DMAS II Billing, Inventory Control, Accounts Receivable, Comparative Sales Analysis, Purchasing, Inquiry, and Interactive File Maintenance. It will co-reside with DMAS II. A major advantage of this feature allows the customer to train operators on new applications and new operators on existing applications, while also operating DMAS II.

The self-study course consists of an Advisor Guide, Study Guide, Audio Cassettes and System/34 Diskettes. One set will be provided, at no charge to the customer, when the initial DMAS II order is first placed.

Additional components may be obtained by ordering them individually. An additional complete set of this material can be supplied via SLSS when ordered under bill-of-forms number SBOF-4031. Material and form numbers are as follows:

Advisor Guide	SR30-0256
Study Guide	SR30-0257
Audio Cassettes	SV30-0504
Diskettes	SV30-0505
Binder	SV30-0156

Note: A copy of the *DMAS II System Operator Instruction Study Guide* (SR30-0254) is also provided when ordering SBOF-4031.

Recommended Prerequisites: *System/34 Operating Concepts* (T2020) ... *System/34 Work Station Users Guide* (SR30-0240).

DMAS II System Operator Instruction: A self-study course to provide hands-on experience to the System/34 operator in the daily, weekly, and monthly operations of DMAS II. One copy of this guide, provided at no charge to the customer, is supplied via SLSS when ordering the *DMAS II Workstation Operator* course (SBOF-4031).

Note: The DMAS II System Operator Instruction requires the diskettes (SV30-0505) used in the DMAS II Workstation Operator Instruction Course.

Recommended Prerequisites: *System/34 Operating Concepts* (T2020) ... *System/34 Work Station Users Guide* (SR30-0240) ... *System/34 System Operations* (D2050).

Data Base Conversion Programs: These programs are available for customers converting from System/32 DMAS to System/34 DMAS II Release 2.

Responsibility for conversion rests with the customer, although assistance via SES may be available. To help the customer convert DMAS to DMAS II Release 2 data files, data base conversion programs will be included at no extra charge in the licensed machine-readable material ordered with DMAS II Release 2. They are supplied to all new users of DMAS II, along with the publication *Data File Conversion Instructions* (SH30-0195).

The feature #7041 diskettes contain programs and pertinent OCL for converting the ten permanent data files. The conversion is performed on the System/34. The programs assume that no changes were made in the DMAS Application Program data base.

CUSTOMER RESPONSIBILITIES

Installation of System/34 licensed programs is a customer responsibility. IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer. The customer has responsibility for providing data base conversion programs when either the conversion is from a system other than that described above, or the conversion is from a System/32 DMAS installation in which the licensed program data base has been changed.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration requirements are an IBM System/34 with:

- 5340 System Unit with Diskette 1 Drive, 8.6 MB of disk storage and 48K (mdl B11) or 64K (mdl C11) bytes of main storage depending on the application (see below)
- One IBM 5256, 5211 or 3262 Printer

S/34 DMAS II (cont'd)

- One IBM 5251 Display Station mdl 11
- 64K for Billing or Purchasing, alone or in combination with any of the other DMAS II applications
- 48K may be used in certain environments when neither Billing nor Purchasing is included.

Although there is nothing inherent in the design of DMAS II to prevent the use of the minimum system configurations stated above, the system configuration for a particular customer must be able to accommodate the expected business volumes, data base size and operating requirements.

The amount of disk storage required is influenced by:

- The number of applications installed
- The volume of daily transactions
- The number of customer, item and ship-to records
- The number of open customer orders and unpaid invoices
- The number of purchase orders on file
- The number of contract items and items with quantity discounts
- The number of vendor and vendor/item records
- The number of Accounts Payable entry records stored

Additionally, a main storage capacity greater than the stated minimum required will often provide improved performance. For example, performance is affected by:

- The number of DMAS II application tasks operating concurrently.
- The number of workstations operating concurrently on the same or different applications, and
- Any other applications operating concurrently.

SOFTWARE REQUIREMENTS

The programs are written in IBM System/34 RPG II programming language and executed under control of the IBM System/34 System Support Program (5726-SS1), Release 5, or later. The IBM System/34 Utilities (5726-UT1) must be ordered for use with the system. IBM System/34 RPG II (5726-RG1) must be available if modifications to the programs are expected.

PAYROLL ... 5726-D6C**

PURPOSE

These three IBM System/34 applications provide the distributor with an aid for managing the business.

HIGHLIGHTS

- Independent or Interrelated applications approach:
 - Modular design facilitates sequential application installation
 - Single data entry results in multiple application updates
 - Modular design allows users to choose the applications that address their problem areas
- Wide variety of reports and report options included:
 - Management reporting is a byproduct of normal data entry
 - The 941-As and W-2s are saved on diskette and may be printed later
 - Detail or summary listings within a range of keys is supported in many reports
- Uses recognized accounting techniques and terminology to provide a solid accounting system:
 - Clear audit trails and control techniques are provided
 - Sample user-oriented forms for data preparation, file creation, audit, and control are provided
 - Security code deters unauthorized execution of key programs in each application
 - A journal reference numbering system supplies an audit trail for any application that generates transactions into the General Ledger
- The System/34 application program may co-reside, but not interact, with the Motor Freight Accounting System (5726-T21) and with certain Distribution IAPs which have System/34 application programs (DMAS, FDMAS, LDMAS) or that were converted using conversion guidance from Menlo Park.
- Can be installed without customer programming capability:
 - System tailoring procedure facilitates account growth by allowing on-site changes to file sizes and determination of functions used
 - File maintenance and audit procedures provided
 - Easy-to-use runbook
 - Step-by-step installation activity plan provided by the *Application Installation Guide*
 - User's information supplied to the supervisor by the application reference manuals

DESCRIPTION

These three applications are independent yet interrelated, ready-to-execute applications for the small distributor:

- General Ledger
- Accounts Payable
- Payroll

The system combines two data entry approaches: Operator-oriented and batch-oriented. Support is provided for transaction entry through the System/34 keyboard or through a diskette keyed offline on a 3740 Data Entry System. The three easy-to-operate applications can be installed in separate stages at different times and still be an interrelated system.

Each application has certain requirements records within a cross-application Constants File which contain questionnaire responses. These records allow the application to select certain fields for editing, file sizes, and functions to suit each customer's needs. The questionnaire responses are keyed during initial installation and may be changed as needed. The System Tailoring Procedure allows these responses to be entered.

The System Tailoring Procedure utilizes the answers to a series of questions regarding a distributor's requirements. It provides the following:

- Tailoring the application on-site at installation time
- Allows the user to change selection of provided functions as business changes.
- All provided functions are included in the programs but only required functions are executed.
- File sizes may be expanded or contracted as needed by rerunning the System Tailoring Procedure.

An application installation guide provides a step-by-step installation activity plan including sample numbering systems, sample input and maintenance data forms, file loading sequences, and control forms with

suggested procedures. The application reference manual provides information on the day-to-day use of the application.

The runbook provides the operator with a detailed and easy-to-use set of instructions showing all the activities necessary to run the programs on a System/34. The procedure reference summary card is provided for the operator as a reminder of the major operational functions of each procedure. It is intended to be used once the operator is thoroughly trained in the particular application.

An application logic manual is provided for use by the self-sufficient customer and for systems engineering continuing support. It describes the architecture of programs, procedures, data base cross-references, data dictionary, and detailed descriptions of each program.

The System/34 application program makes available the Distribution Financial Accounting System on a System/34 in single program mode. The System/34 application program supports one workstation, no spooling, no multiprogramming, and no file sharing.

Applications Description - The three applications are ready-to-execute applications. Each includes source code, object code, execution procedures, and the application logic manual.

These are some general features which all three applications have:

- Designed to fit industry requirements
- Security codes to deter unauthorized use of master files
- In-house inclusion/exclusion of functions to be executed
- OCL procedures, Sort Specifications, and processing programs are packaged into logical work units which simplify system operation
- Monitoring of execution sequence prevents execution of a program until preceding required programs have been completely and successfully executed
- Compatible online/offline file maintenance and transaction data entry via the System/34 keyboard or diskettes created on the 3740 Data Entry System
- Dynamic Backup and Recovery System forces periodic backup of master files and edited transactions and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files
- Reprint options are possible because file updating is separated from report writing functions
- Some report printing can be deferred to a more convenient time
- Selective printing options are available for many report functions

GENERAL LEDGER (5726-D6A)

This application combines all the transactions affecting the financial status of the company during the period. They may be entered directly as a General Journal Entry or may have been previously entered through interface with Accounts Payable or Payroll. Support is provided for either a 13-period or 12-month fiscal year. At period-end closing time, audit listings and the Financial Statement Worksheet are provided to help verify that the user is still in balance before proceeding into the actual closing. The reports will also aid in generation of any necessary closing entries.

An Income Statement and Balance Sheet are standard report outputs. The user can design the format of these reports with an easy-to-use format description procedure. The financial reports can illustrate current financial data as compared to historical information, also to budget information on the Income Statement. The capability is provided to format Income Statements by subdivisions of a company, such as department. Several companies' financial information may be combined into one Balance Sheet and Income Statement. A Statement of Changes in Financial Position Worksheet is provided.

Users may define their own Chart of Accounts or use a suggested account structure provided with the application. The fiscal year start period or month is user-defined. Multiple company support for up to ten companies is included. Any transactions passed from Payroll are applied to company number one only.

ACCOUNTS PAYABLE (5726-D6B)

The Accounts Payable application provides an Open Payables and Cash Disbursements function on either an accrual or cash basis. Invoices and credit memos entered may be multi-lined and distributed by General Ledger account number. Entries may be for standard or one-time vendors and may be open or prepaid. Credit memos may be entered manually or initiated automatically by referencing a prior entered invoice. Invoice payments may be assigned to a vendor other than the original vendor. Invoices may be controlled through the application based upon a voucher number entered with the invoice.

A Purchase Journal provides the audit trail for cost transactions entering into the General Ledger system and into the Open Payables

S/34 DFAS (cont'd)

File. An Open Payables Report is provided in due date or vendor sequence. This turnaround document provides a way to select for payment by date, vendor, or invoice, including partial payments, for Cash Disbursements. Invoices may be entered or placed in hold status to prevent inadvertent payment. A Cash Requirements Report is used to assist in insuring sufficient funds are available and proper invoice selection was made before the checkwriting procedure begins. The Cash Disbursements Journal provides an audit trail for its transactions entering the General Ledger application and acts as the Check Register. Checkwriting and reconciliation are also provided.

A Vendor Analysis Report indicates key business volumes and discounts lost and taken for previous year and current year. An additional analysis report by business volume per vendor is also provided. Multiple company support for up to 10 companies is provided.

PAYROLL (5726-D6C)

This hourly salary executive payroll provides for regular, overtime, premium, vacation, and sick pay. It may be run weekly, biweekly, semimonthly, monthly. Hours may be entered daily or by pay period. Exception hours provide time and one-half, double time, and one-half, and triple time capabilities. Rates may be selected from the Employee Master Record or keyed in as an override. Shift differential capabilities are provided for second and third shift. The differential may be defined as a percentage of the rate or cents to be added to the rate.

Vacation/Holiday pay may be part of a regular pay check or on a separate check. A bonus payment is paid on a separate check with a flat percentage of income tax deducted. Sick pay may be fully nontaxable or only liable for income tax. Wages subject to Federal Unemployment Insurance (FUI) and State Unemployment Insurance (SU) are determined.

The ability to handle taxable or nontaxable adjustments, pay advances, and employer-paid union benefits (taxable and nontaxable) is also provided. Once the gross earnings is calculated, deductions will be taken to reach net pay. In addition to calculating present Federal and FICA taxes, a standard tax algorithm is provided to calculate most present state taxes based upon customer-provided data. Local taxes may also fit the standard tax algorithm provided. The state disability insurance deductions also use a standard algorithm based upon customer-provided data. Miscellaneous deductions may be taken by percent, fixed amount, hourly rate, upper limit, or cyclic within a user-specified frequency. Union deductions may be taken by percent, hourly rate, or fixed amount within a user-specified frequency.

Handwritten paychecks and paychecks never cashed (reversals) are also supported by the application. Once the payroll register and checks are printed, many analysis reports are produced: Labor Distribution, Miscellaneous Deductions, Union Deductions, YTD/QTQ Earnings, Workmen's Compensation Worksheet, and Payroll Journal. W-2 and 941-A reports are also provided.

The capability is provided to pass transactions to the General Ledger application, if installed. These transactions will be applied towards company one only. Payroll may be on either a cash or accrual basis. If the cash basis is selected, no transactions are passed to the General Ledger.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Each of these licensed programs will execute on all models of the IBM System/34 in Single Program Mode. The programs are compiled assuming a 32K minimum system on IBM System/34. Because of volume and time constraints, there may be a requirement for providing offline keying on an IBM 3740 Data Entry System. If an IBM 3742 is to be used, it must have the 128-character record features [128-character (#5455) and feature group A (#4004)].

The three applications are intended to be independent yet interrelated. Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries.

Each application may co-reside, but will not interact with the Distribution IAPs and may also operate as stand-alone applications.

The Distribution IAP must have a Constants File with a record length of 64 characters. The original shipments of the Food and Paper IAPs for 24K machines had 59-character records. The customers that received

these original shipments will have to update their IAPs to the larger record size before they will co-reside with DFAS.

SOFTWARE REQUIREMENTS

The IBM System/34 Application Programs are written in IBM System/34 RPG II programming language and executed under control of the IBM System/34 System Support Program (5726-SS1 Version 1). IBM System/34 Utilities licensed program (5726-UT1), which includes Sort, Data File Utility, Source Entry Utility, and Work Station Utility is required for execution of the programs. The IBM System/34 RPG II Compiler (5726-RG1) is required if modifications to the source code are necessary.

Instructional Materials

DFAS Operator Instructions (SBOF-3584)

One copy is supplied via SLSS when program number and initial library are specified. Additional copies can be obtained by specifying SBOF-3584 which includes the following:

**BILLING ... 5726-D65
ACCOUNTS RECEIVABLE ... 5726-D66
INVENTORY CONTROL ... 5726-D67
SALES ANALYSIS ... 5726-D68**

PURPOSE

These licensed programs are for either a 32K or 48K IBM System/34. The application function and data base are exactly the same as the System/32 Food Distributors Management Accounting System (FDMAS) offering. These applications run in single program mode on the System/34. Performance improvements in the larger memory size version come from the reduction of overlays, incorporation of larger blocking factors, and use of dual I/O areas.

When all four application programs are installed, they constitute an interrelated application set with an integrated data base. They can help users to manage their two largest business assets, accounts receivable and inventory, and give profit performance data on products, customers, and salespersons. These application programs can also help the user increase operational efficiency and customer service.

The open order file, slot-sequenced picking lists and automated pricing and discounting methods can help improve order processing speed and accuracy. The inventory control system provides information to the buyer that will help optimize inventory investment by identifying the obsolete, slow moving, and unprofitable items, and help increase inventory turns and service levels. Automatic credit limit checking, variable credit terms, late charges on open item and balance forward accounts, delinquency notices, and aged receivables reports provide tools for reducing bad debt losses and increase cash flow. Daily, monthly, and on-demand sales reports help monitor the attainment of the distributor's sales objectives.

The Payroll, Accounts Payable, and General Ledger licensed programs of the Distribution Financial Accounting System (DFAS) can co-reside with Food Distributors Management Accounting System Application Programs. With FDMAS and DFAS, the major data processing requirements of the food distribution customer can be addressed, and the applications that best meet the customer's needs may be selected. If Billing is used in the prebilling mode, a compatible Inventory Control System must be installed before or with the Billing licensed program.

DESCRIPTION

BILLING (5726-D65)

A prebilling system (when used with a compatible inventory control system) with postbilling capability, with data entry from the System/34 display station and/or from diskettes keyed on a 3740 Data Entry System, with editing, invoicing, invoice register, and a salesperson's recap. Features include:

- Open orders file with listing by customer and/or item that allows either case labels or picking list in warehouse (slot) sequence
- Ship-to address file
- Variable pricing methods, including:
 - Contract pricing
 - Customer class pricing (six classes)
 - Cost plus pricing
 - Catchweight pricing
 - Broken case pricing and surcharge
 - Special charges and allowances
 - Case label charges
 - Cash and trade discounts
- Sales and tobacco tax
- Credit limit checking
- Automatic invoice numbering
- Special deals
- Automatic substitution
- Suggested retail price on invoice and case labels

ACCOUNTS RECEIVABLE (5726-D66)

Accounts Receivable provides for the recording, controlling, and reporting of money owed for merchandise sold or services rendered. Recognizing that a major portion of a wholesale food distributor's assets may be tied up in accounts receivable, the application procedures are designed to provide timely information that helps your customer.

- Maximize profit and return on investment through tight control over all accounts due
- Minimize losses from bad debts through appropriate attention to slow paying accounts
- Maintain customer goodwill through prompt, accurate record keeping

The major features of Accounts Receivable include:

- Balance forward or open item selectable by account
- Late charges for both open item and balance forward accounts on monthly statements
- Credit limit checked during order edit if Billing installed
- Monthly or weekly statements and delinquency notices
- Aged trial balance monthly or on demand - summary or detail
- Aging into four aging periods

INVENTORY CONTROL (5726-D67)

Inventory control involves the recording of items received, sold, and on-hand, the updating of item costs and the recording of activity dates.

Inventory Control can provide accurate, periodic reviews of the status of each item, while identifying any exception conditions, to assist management in deciding what to buy, how much to buy and how often to buy.

Inventory Control provides information that helps:

- Maintain records of all items physically in stock as well as on-order, providing control and auditing for this major investment
- Arrange for timely, economical ordering of stock
- Minimize investment required to meet a specific service level, by highlighting overstocked or slow moving items.

The major features of Inventory Control include:

- Data entry and edit
- Two cost figures - last cost and burdened cost
- Maintenance of broken case quantities
- Warehouse location (slot)
- Physical inventory aids
- An array of reports to assist in:
 - Buyer ordering
 - Inventory management
 - Transaction recording and control
 - Inventory accounting

SALES ANALYSIS (5726-D68)

Sales Analysis offers sales and profitability figures by salespersons, customer, item, and item class. Availability of the information in the reports is dependent upon the applications selected and their installation sequence. Major Sales Analysis Reports include:

- Daily sales recap by salesperson (data from Billing or Accounts Receivable).
- Monthly salesperson sales analysis - current and year-to-date (data from Billing or Accounts Receivable).
- Monthly customer sales analysis - current and year-to-date (data from Billing or Accounts Receivable).
- Monthly customer sales analysis - current and year-to-date (data from Billing or Accounts Receivable).
- Monthly item and item within item class sales analysis - current and year-to-date (data from Billing or Inventory).
- Monthly item class, within customer, within salesperson sales analysis - current and year-to-date (data from billing).

If Sales Analysis is the first or only application program installed, the customer must provide data entry and edit programs.

FUNCTIONS

- Integrated data base which simplifies file maintenance and provides for more efficient disk utilization.
- User-maintained constants file is used in most programs which allows operator to modify data subject to change, such as late charge rate, tax rates, terms, or aging dates, without the need to change and recompile programs.
- Specific file load and maintenance programs are included for each master file.
- Easy-to-use printed runbook for each application.
- Contains additional space in item and customer master records for customer use.
- OCL procedures, sort specifications, and processing programs are cataloged into logical work units which optimize system utilization.

FDMAS (cont'd)

- Automatic monitoring of execution sequence prevents execution of a program until preceding required programs have been completely and successfully executed.
- Dynamic file space checking capability of transaction edit programs tells the operator in advance when a file is approaching its maximum size so that action may be taken in time to prevent an interruption in processing.
- Dynamic backup and recovery system provides for periodic backup of master files and edited transactions, and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files.
- Reprint options are possible because file updating is separated from report printing functions. Reports or parts of reports can be reprinted to provide extra copies, or some report printing can be deferred to a more convenient time.
- Selective printing allows the operator to control the printing mode for reports by entering a keyboard response to prompts on the CRT. In this way, for example, reports may be printed for a range of customers or items, or only for accounts with balances or past due amounts.
- Inquiry programs, with data retrieval options selectable at program run-time, provide current information from the customer and item master files.
- Offline 3741 data entry diskette formats.

Executive Guide (G580-0120) ... General Information Manual (GH30-0156) ... Application Logic Manual (LH30-0159) ... Application Reference Manual (SH30-0158).

TERMS and CONDITIONS: See PP Index

File Size and Application Function Tailoring Capability: All necessary programs and procedures for file allocation are included with the application programs. The customer can allocate file space during installation, change file space allocations as business volumes change, and may control the operation of some application functions by file maintenance and by operator-controlled runtime options.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration requirement is an IBM System/34 with:

- 32K or 48K bytes of main storage
- 8.6 megabytes of disk storage
- 40 characters-per-second matrix printer
- IBM 5251 mdl 11 Display Station

SOFTWARE REQUIREMENTS

IBM System/34 System Support licensed program (5726-SS1 Version 1), and System/34 Utilities licensed program (5726-UT1).

Instructional Materials

Operator Introduction and Exercises: These materials, consisting of a *Student Guide*, audio cassettes, and System/32 diskettes, will help the operator learn and practice IAP operation without using the customer data files. One copy will be provided at no charge to the customer.

One copy of the following material is supplied via SLSS when program number and initial library are specified. Additional copies may be obtained by ordering them individually from Mechanicsburg.

Audio Cassettes (2) (SV30-0002) ... System/32 Diskettes (3) (SV30-0003) ... *Student Guide* (SR30-0171) ... *Advisor Guide* (SR30-0169) ... *Runbook* (SR30-0170)

DOCUMENTATION
(available from Mechanicsburg)

Licensed Program Specifications (GH30-0531) Installation Considerations for Single Program Mode Applications (SH30-0514) ... Runbooks: System Operations (SH30-0526) ... Billing (SH30-0527) ... Accounts Receivable (SH30-0528) ... Inventory Control (SH30-0529) ... Sales Analysis (SH30-0530)

Since application functions and data base are identical to System/32 versions of these application programs, the following available System/32 publications provide appropriate information.

SYSTEM/34 3270 DEVICE EMULATION 5726-EM1

PURPOSE

The IBM 3270 Device Emulation licensed program allows the IBM System/34 and locally attached IBM 5250 Information Display System devices to appear as an IBM 3270 Control Unit and devices to a host system.

HIGHLIGHTS

- System/34 appears to a host system as a 3271 under Binary Synchronous Communications (BSC) or as a 3274 under System Network Architecture/Synchronous Data Link Control (SNA/SDLC).
- A locally attached 5251 mdl 11 appears to a host system as a 3277 mdl 2 Display Station.
- A 5256, 5211, and 3262 printer locally attached to a System/34 will appear to the host system as a 3288 mdl 2 printer.
- Up to 16 device addresses are supported under BSC and up to 16 logical units under SNA/SDLC.
- The licensed program operates under System Support Program (5726-SS1) and the Interactive Communications Feature (SSP-ICF), #6000 or #6001).
- The Work Station Control Expansion A or B feature (#4900 or #4901) is required on the 5340 System Unit.
- Auto-call support is available with SNA/SDLC
- Numeric lock support

DESCRIPTION

The 3270 Device Emulation licensed program is a utility program that supports both BSC and SNA/SDLC 3270 line protocols through SSP-ICF. No user code is required.

The 3270 Device Emulation program will allow the System/34 to appear to a host system as a 3271 mdl 2 (BSC) or a 3274 mdl 1C (SNA/SDLC) Control Unit. It will also allow the 5251 mdl 11 Display Station locally attached to a System/34 to appear to a host system as a 3277 mdl 2 Display Station. Keyboard Numeric Lock (#4690) on 3277 displays is optionally supported. The 5256 printers locally attached to a System/34 and the 5211 or 3262 printer on the System/34 will appear to the host system as a 3288 mdl 2 printer. The 3284 mdl 2 and 3286 mdl 2 printers are emulated as the 3288 mdl 2. Output to be printed can also be spooled.

Only the EBCDIC typewriter keyboards and EBCDIC transmission code are supported. Certain keys are in different locations on the 3277 and the 5231. Function keys on the 3277 will be mapped onto the 5251 keyboard to provide the same functions; that is, Field Mark, Erase Input, PA and PF keys. The copy command is not supported. However, the 5250 Print key can provide an equivalent function in many cases. The light pen and magnetic stripe reader are not supported.

Emulation of the 3270 devices allows the System/34 to reside on a multipoint communications link that supports a 3270. Since this program translates the data stream, host application programs will, generally, require no changes to support the System/34 when running under this device emulation. 'Screen wrap' is not supported. If the last position (24,80) on the screen is a field attribute character, it will be repeated in the first position (1,1).

Many users have large investments in 3270 application programs; and many host systems, especially under BSC, only support a single device type on a given communications line. The 3270 Device Emulation program will provide the System/34 user with an easy means of introducing an intelligent system into such a network. The end user at the System/34 will be able to execute the same host applications as with the 3270. At the same time, other applications can be developed on the System/34.

Host systems that support 3271 mdl 2 or 3274 mdl 1C control units on a multipoint network can have the System/34 with the 3270 Device Emulation program co-resident on that network. Such host system communication subsystems include: System/370 IMS/VS, CICS/VS, TSO, and System/3 mdls 15A, 15B, 15C and 15D CCP.

With Release 8, the 3270 Device Emulation Program has been modified to emulate the 3270 keyboard numeric lock feature. This change provides the capability of locking out all characters in a numeric field except 0-9, decimal sign, minus sign, plus sign, comma, space and DUP.

BSC Considerations: For BSC, the 3270 Device Emulation program emulates the 3271 mdl 2 control unit, the 1920-character 3277 mdl 2 display station, and the 3288 mdl 2 printer. The 3284 and 3286 printers are also emulated, but as a 3288.

The System/34 with the 3270 Device Emulation program acts as the 3271 mdl 2 control unit. The 5251 mdl 11 Display Station serves as the 3277; and the 5256, 5211, and 3262 printers serve as the 3288.

No auto-call support is available in BSC.

Only one line is supported.

The maximum receive buffer size supported will be 4096 bytes. This will include all line control characters.

The 3270 Device Emulation Program may generate BSC error status to the host under somewhat different conditions than the 3271. Customer host programs dependent on such specific link level 3270 BSC error status may require modification. The reference manual will detail these conditions.

SNA/SDLC Considerations: For SNA/SDLC, the 3270 Device Emulation program emulates the 3274 mdl 1C control unit, the 1920-character 3277 mdl 2 display station, and the 3288 mdl 2 printer. The 3284 and 3286 printers are also emulated but as a 3288.

The System/34 with the 3270 Device Emulation program acts as the 3274 control unit on a multipoint (nonswitched) or point-to-point (switched or nonswitched) line. The 5251 mdl 11 display station serves as the 3277; and the 5256, 5211, and 3262 printers serve as the 3288 (or 3287 in SCS mode only). Up to 16 devices (logical units) are supported using SNA/SDLC protocols.

Multiple lines can be used concurrently.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/34 3270 Device Emulation licensed program runs on all models of the System/34 with a minimum of 64K bytes of main storage. Communications to a host system requires a communications adapter on the System/34 (#2500, #3500, or #4500). Work Station Control Expansion A or B (#4900 or #4901) is also required.

SOFTWARE REQUIREMENTS

The IBM System/34 3270 Device Emulation licensed program will operate under control of the current release of the IBM System/34 System Support Program (5726-SS1) and the Interactive Communications Feature SSP-ICF, (#6000 or #6001).

SYSTEM/34 COMMUNICATION SUPPORT COMPATIBILITY

The 3270 Device Emulation licensed program can coexist in a System/34 with other communication support (that is, programs using remote 5250s, batch BSC, MRJE, SRJE, SSP-ICF, or System/34 Assembler macros). However, 3270 Device Emulation communications support can only share a communications line concurrently with SSP-ICF.

Program Use During Customer Preinstallation Testing: The System/34 3270 Device Emulation (5726-EM1) licensed program will be available to customers for preinstallation testing on IBM Test Center systems in accordance with IBM's Program Testing Policy.

STUDENT ADMINISTRATION SYSTEM FOR SYSTEM/34 (Single Program Mode)

STUDENT RECORDS ... 5726-E31
 STUDENT ACCOUNTING ... 5726-E32
 STUDENT SCHEDULING ... 5726-E33

PURPOSE

The IBM Student Records licensed program, which provides the data base and file maintenance functions, is a prerequisite for either or both of the other packages.

These three applications provide the school with a powerful aid in managing its student recordkeeping functions.

The system design of these packages incorporates many significant features:

- General - System tailoring to the school's unique requirements for number of periods in a school day, number of terms (or semesters) in a year, state reporting cycles, etc. All input specifications are described in terms familiar to school administrators and require no detailed knowledge of data processing techniques. Data files are shared among applications.
- Student Records - Provides common data base and file maintenance functions for the other applications. Basic record keeping and reporting functions essential for secondary schools are also included.
- Student Accounting - Consists of an Attendance Accounting Application and a Mark Reporting Application.
- Student Scheduling - Supports both machine scheduling and 'arena' scheduling of students to classes. Provides many reports to assist the principal and counselor in the scheduling process.

HIGHLIGHTS

- Interrelated applications approach:
 - Modular design allows users to choose the applications that address their problem areas.
 - Modular design facilitates sequential application installation
 - Single data entry results in multiple application updates
- Wide variety of reports and report options included:
 - Management reporting is a byproduct of normal data entry
 - Optional sequences and selection within a range is supported in many reports
- Uses recognized accounting techniques and terminology to provide a solid student accounting system:
 - Clear audit trails and control techniques are provided
 - Sample user-oriented forms for data preparation, file creation, audit and control are provided
 - Security codes deter unauthorized execution of key programs in each application
- Can be installed without customer programming capability:
 - Designed to fit industry requirements
 - System tailoring procedure facilitates account growth by allowing on-site changes to file sizes and determination of functions used
 - File maintenance auditability provided
 - Easy-to-use runbook
 - Step-by-step installation activity plan and detailed user information provided by the *Application Reference Manual*

DESCRIPTION

These three applications are an interrelated and ready-to-execute set of applications for the small school district or large secondary schools:

- Student Records
 - Data Base and Maintenance
- Student Accounting
 - Attendance Accounting and Mark Reporting
- Student Scheduling
 - Assignment of students to classes

The system combines two data entry approaches: Operator-oriented and batch-oriented. Support is provided for transaction entry through the System/34 keyboard or through a diskette keyed offline on a 3740 Data Entry System. Student Records is a prerequisite to the other applications which can be installed at different times.

Each application has certain requirements records within a cross-application Constants File which contain questionnaire responses. These records allow the application to select certain fields for editing, file sizes, and functions to suit each customer's needs. The questionnaire responses are keyed during initial installation and may be changed as needed. The System Tailoring Procedure allows these responses to be entered and maintained.

The System Tailoring Procedure utilizes the answers to a series of questions regarding a school's requirements. It provides the following:

- Tailoring of the application at installation time.
- Allows users to change their selections of provided functions as the environment changes.
- All provided functions are included in the programs but only required functions are executed.
- Files may be resized as needed by rerunning the System Tailoring Procedure.

The *Application Installation Guide* provides a step-by-step installation activity plan including sample input and maintenance data forms and file loading sequences. There is only one *Application Installation Guide* which is delivered with the Student Records application. It contains information pertinent to all three applications. Each *Application Reference Manual* provides information on the day-to-day use of the application.

The runbook provides the operator with a detailed and easy-to-use set of instructions showing all the activities necessary to run the programs on a System/34. The *Procedure Reference Summary* is provided for the operator as a reminder of the major operational functions of each procedure. It is intended to be used as a quick reference once the operator is thoroughly trained in the particular application.

An application logic manual is provided for use by the self-sufficient customer and for systems engineering continuing support. It describes the architecture of programs, procedures, data base cross-references, data dictionary, and detailed descriptions of each program.

The System/34 licensed program makes available the Student Administrative System on System/34 in single program mode. It supports only one workstation, no spooling, no multiprogramming and no file sharing.

APPLICATIONS DESCRIPTION

The three applications are ready-to-execute. Each includes source code, object code, execution procedures, and the application logic manual.

These are some general features which all three applications have:

- Designed to fit industry requirements
- Security codes to deter unauthorized use of master files
- In-house inclusion/exclusion of functions to be executed
- OCL procedures, Sort Specifications, and processing programs are packaged into logical work units which simplify system operation
- Monitoring of execution sequence prevents execution of a program until preceding required programs have been completely and successfully executed.
- Compatible online/offline file maintenance and transaction data entry via the System/34 keyboard or diskettes created on a 3740 Data Entry System
- Dynamic Backup and Recovery System forces periodic backup of master files and edited transactions and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files
- Reprint options are possible because file updating is separated from report writing
- Selective printing options are available for many reports

STUDENT RECORDS (5726-E31)

The Student Records area represents a systems solution to the problem of recording, retrieving, manipulating, and reporting student data. The student record is the key to the school's student accounting system. It is a vital source of information necessary to the implementation of the other applications. In addition to providing data to and collecting data from the scheduling, mark reporting, and attendance accounting applications, it contains student personal data for counseling. This data includes the student's name, school code, year of graduation, current grade level, sex, birth date, address, and a number of other data elements. It also contains student attendance information, the student's current schedule and mark reporting information, and the school's curriculum for the current school year. From these files, many reports can be provided for the school administration, teacher, counselors and parents.

As the Student Records system is designed to be an ongoing system, it is not necessary to recreate all of the basic files at the beginning of each school year. Programs are provided to accomplish a year-to-year transition by indicating the promotion of qualified students to the next grade level, and their new school, if that is indicated at promotion time. An important aspect of the student records application is the file maintenance functions. Programs are provided to update information in each of the files in the student records application as well as performing the year end transition functions (student transfers between schools, promotions of students from one grade level to the next, etc.)

S/34 Student Administration System (cont'd)

The integrity of the data in the files is maintained through the use of extensive editing of the data when it is entered into the system and through complete backup and recovery procedures which are an integral part of the package.

Output reports include:

- Student Listings
- Name and Address Labels
- Ethnic Distribution Report
- Student Profiles
- Student Schedules
- Room Schedules
- Instructor Schedules
- Class Rosters

STUDENT ACCOUNTING (5726-E32)

The Student Accounting package consists of two applications, Attendance Accounting and Mark Reporting.

The Student Records Package, which provides the data base and file maintenance functions, is a prerequisite to this package.

• Attendance Application

The maintenance of attendance records is an important aspect of Student Accounting. In many states the amount of state aid for public education is based on average student attendance. Under manual methods, a considerable amount of time is expended by teachers and staff personnel in keeping records and accumulating data for state reports. The Attendance Accounting application simplifies such tasks by collecting original data at the source through the use of attendance data gathering documents, enabling reports to be prepared accurately and rapidly, and reducing clerical transcriptions.

Output reports include:

- Daily Absence Phone List
- Daily Absence Report
- Unresolved Absence Report
- Student Attendance Register
- Student Category Register
- School Category Register

• Mark Reporting Application

The Mark Reporting application provides a means of recording student progress data for reports to parents and to school personnel. The prime data processed by this application are the student marks, which may be either numeric marks or alphabetic marks with optional plus or minus signs. In addition, up to two comments may be selected from a list of 99 user-defined comments and associated with each student's graded course. The Mark Reporting application is designed to fit the needs of many schools by providing a selection of reports and processing methods from which to choose. Output reports include:

- Report Card
- Labels for Permanent Records
- GPA Listings
- Mark Analysis
- Exception Reports

STUDENT SCHEDULING (5726-E33)

The Student Scheduling licensed program [Student Records (5726-E31) is a prerequisite] processes student course requests against a manually prepared master schedule of classes to produce a schedule of classes for each student. To assist the school administrator in preparing this master schedule of classes, the following reports are produced from the student course requests: Student Verification Report, Course Verification Report, Course Request Tally Report, and Potential Conflict Matrix. Once the master schedule of classes has been prepared, student requests are processed by the Main Scheduler programs, or, schools may wish to use the arena scheduling option. Whether the class assignments are accomplished through machine scheduling or arena scheduling, the results are the same: A data base reflecting each student's class assignments. For those students who could not be completely scheduled because of a conflict in their course requests, a Student Conflict report can be printed to assist the school administrator in resolving that student's conflict. Once a final scheduling run has been processed, the school may optionally run the student hall scheduler which will assign the student to study halls during any unassigned time in the school day.

Output reports include:

- Student Request Verification
- Course Request Verification
- Course Request Tally Report
- Potential Conflict Matrix
- Student Conflict Report
- Student Schedules

Programs are provided to pass basic student identifying information from Student Records to the Scheduling program. Once scheduling is completed and the scheduled term is about to begin, the student data records will be updated to reflect the student's current schedule of classes. One of the primary objectives of the Student Scheduling Package is to provide for the variety of scheduling philosophies present in today's secondary school environment. This flexibility is accomplished by offering a number of basic scheduling features and options which include:

- Scheduling of up to 4 terms, or semesters
- Up to 24 periods in a school day
- Up to 20 requests per student
- Flexibility in course requests - section requests, instructor requests, term requests, free time requests, and alternates
- Add-on scheduling
- Study hall scheduling option
- Arena scheduling option

Student scheduling is far more than a clerical chore. The basic educational philosophy of an institution is reflected in the manner in which students are assigned to a class section. For example, many school systems permit varying degrees of student-elected alternates and teacher preferences. This illustrates the need for flexibility in a student scheduling system in order to accommodate a wide spectrum of educational policies. The student scheduling package provides administrators with a variety of optional system features which can be used to tailor the scheduling system to coincide with the school's policies.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration requirements are an IBM System/34 with

- 48K bytes of main storage
- 8.6 megabytes of disk storage
- Character or line print capability with 132 print positions and the 48-character set
- IBM 5251 mdl 11 Display Station

The licensed programs are designed to process data recorded on the IBM System/34 keyboard or on a diskette created by the IBM 3740 Data Entry System. Because of volume and time constraints, there may be a requirement for providing offline key entry on an IBM 3740 Data Entry System. If an IBM 3742 is to be used, it must have the 128-Character Record feature (#5455) and Feature Group A (#4004).

The marketing representative must be careful when determining the printing, disk space, and key entry requirements. Some installations can use the character printer, but others may require greater print capability, and a larger disk file to handle the number of students and the printing volumes associated with them.

The three applications are interrelated. Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries. Because of this, no other licensed program or user-written programs may co-reside unless stringent coding requirements for these programs are met to insure compatibility with the Student Administration System. The *Application Logic Manual* discusses in detail the coding conventions used for the development of the Student Administration System.

PROGRAM PRODUCTS

S/34 Student Administration System (cont'd)

Because of the printing volumes and timing constraints involved in the Mark Reporting applications, an 80-cps printer is recommended as a practical minimum.

SOFTWARE REQUIREMENTS

The IBM System/34 licensed programs are written in IBM System/34 RPG II programming language and executed under control of the System/34 System Support licensed program (5726-SS1). IBM System/34 Utilities licensed program (5726-UT1), which includes Sort, Data File Utility, Source Entry Utility, and Work Station Utility is required for execution of the programs. The IBM System/34 RPG II Compiler (5726-RG1) is required if modifications to the source code are necessary.

PROGRAM PRODUCTS

**SYSTEM/34 FORTRAN IV
5726-FO1****PURPOSE**

IBM System/34 FORTRAN IV processes programs written in the IBM System/34 FORTRAN IV language, producing output suitable for execution with the IBM System/34 System Support Program (5726-SS1).

The System/34 FORTRAN IV language contains those features defined in American National Standard Basic FORTRAN, X3.10.1966; language extensions supported by IBM 1130, IBM System/3 and IBM System/32 Basic FORTRAN, and additional features and capabilities previously available only with certain Full FORTRAN compilers. These features include:

- Correction or modification of a program in a semi-interactive mode at the workstation by displaying a source program file into which the compiler has interspersed diagnostic messages. The compile turnaround time can be reduced because the programmer can start to correct or modify the program without waiting for a listing.
- Logical data, logical expressions, and logical IF are supported.
- Logical elements (constants, variables, and arrays) contain true or false values.
- Operation symbols are used in logical expressions:

.NOT. (negation)	.LT. (less than)
.AND. (conjunction)	.LE. (less or equal to)
.OR. (union)	.EQ. (equal)
	.GT. (greater than)
	.NE. (not equal)
	.GE. (greater or equal to)
- Logical expressions evaluate elements to obtain true or false values.
- Logical assignment statements define a relationship - placing the value of a logical expression in a variable or array element.

The System/34 FORTRAN IV library contains mathematical and service subprograms required during execution to perform arithmetic operations, input and output constant conversions and input/output control.

System/34 FORTRAN IV is supplemented by a commercial subroutine package which is equivalent in function to the System/32 Package insofar as is meaningful in terms of System/34 devices and data management.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/34 FORTRAN IV licensed program runs on all models of the System/34. FORTRAN graphics on the IBM 5211 Printer are provided by any 64-character or 96-character print belt or by the 48-character FORTRAN print belt. The IBM 5256 Printer automatically provides FORTRAN graphics.

SOFTWARE REQUIREMENTS

The current release of the IBM System/34 FORTRAN IV licensed program operates under control of the current release of IBM System/34 System Support licensed program (5726-SS1).

Program Use During Customer Pre-installation Testing: The IBM System/34 FORTRAN IV licensed program (5726-FO1) is available to customers for pre-installation testing on IBM Test Center systems in accordance with IBM's Program Testing Policy.

**SYSTEM/34 FINANCIAL INSTITUTIONS
CUSTOMER ACCOUNTING SYSTEM**

CUSTOMER INFORMATION FILE ... 5726-F11
DEMAND DEPOSIT ACCOUNTING ... 5726-F12
SAVINGS ACCOUNTING ... 5726-F13
INSTALLMENT LOAN ACCOUNTING ... 5726-F14

PURPOSE

These four IBM applications provide broad application support for the small commercial bank. The Customer Information File licensed program (CIF) includes the data base, application conversion procedures, and file maintenance procedures for the system. It is a prerequisite for the Demand Deposit Accounting, Savings Accounting and Installment Loan Accounting licensed programs, which may be installed independently of each other.

The Customer Information File licensed program enables the bank to associate all of a customer's checking, savings, and installment loan accounts with a single record that contains common information about customers and their relationship to the bank. This enables the bank to make decisions based on a broader knowledge of the status of the customer's accounts. Account and customer information is accessed by account number for daily transaction processing, and by customer name for management reports, inquiries, etc. The Demand Deposit Accounting, Savings Accounting and Installment Loan Accounting licensed programs support the three most important data processing applications in a commercial bank. Each of these licensed programs contains a variety of functional options, enabling the bank to tailor the application to its own requirements.

HIGHLIGHTS

- Can be installed without customer programming capability:
 - Step-by-step installation activity plan and detailed user guidance is provided in the application installation guide.
 - System Tailoring Procedure accommodates account growth by allowing on-site changes to file sizes and functions used.
 - Application conversion procedures are provided.
 - Conversion aids are provided to assist in consolidating the master data from a customer's account records into a single CIF record.
 - Strict DP controls are enforced during conversion.
 - File maintenance is provided.
- Accounting and Control Techniques
 - Two levels of security codes help deter unauthorized access to programs and data.
 - Sample audit trail and control techniques are documented.
 - Sample user-oriented forms for data preparation, file creation, audit and control are provided.
- Interrelated Application Design
 - Data base design reduces file space requirements.
 - Common procedures add new accounts and provide file maintenance for all installed applications.
 - Access to all application accounts through the CIF Master Record.

DESCRIPTION

These four applications are an interrelated and ready-to-execute set of applications for the small commercial bank:

- Customer Information File
 - Data base, file maintenance, application conversion and customer-oriented reports.
- Demand Deposit Accounting
 - Processing of checking accounts with optional functions of overdraft banking, automatic funds transfer, and combined statements.
- Savings Accounting
 - Processing of savings accounts, both regular savings accounts and time deposit open accounts.
- Installment Loan Accounting
 - Processing of installment loan accounts, including simple interest, add-on, and discount loans.

The system provides transaction and file maintenance data entry through the System/34 keyboard or through a diskette keyed offline on a 3740 Data Entry System. The bank may optionally elect to use the 1255 Magnetic Character Reader (MCR) to capture transactions for Demand Deposit Accounting, Savings Accounting, and Installment Loan Accounting. An installation questionnaire and data capture programs are provided to support the 1255 MCR.

At installation time, the options provided in the system are selected through a System Tailoring Procedure which allows the user to:

- Tailor the application to use only the functions wanted.
- Change the functions to be executed as the environment changes.

- Resize files as the bank's business expands, or if the bank wishes to revise its original estimates.

There is an application installation guide provided with the Financial Institutions Customer Accounting System. It is shipped with CIF and provides instructions for installing and converting all of the Financial Institutions Customer Accounting System licensed programs. It contains guidance on installation planning, data gathering, and the use of the installation and conversion procedures. Samples of all required input data and control forms are included. An application reference manual is provided for each of the four licensed programs. These manuals contain information on the daily operations of the applications. Included is information on procedure scheduling, the operation of each procedure and the implementation of sound operational controls.

An application runbook and a procedure reference summary is provided for each application. The application runbook provides the operator with an easy-to-use set of instructions showing all the activities necessary to run the procedures on a System/34. The procedure reference summary is provided for the operator as a reminder of the functions and use of each procedure. It is intended to be used as a quick reference once the operator is thoroughly trained in the particular application.

An operator instruction manual with exercises is provided for operator training in the use of the runbook. The course is not oriented specifically to financial applications. Therefore, only one copy of the course is needed per customer regardless of which of the IAPs are installed. The course is System/34 only.

An application logic manual is provided for each application as basic licensed material. It is mainly useful for the self-sufficient customer and for systems engineering support. The manual describes the architecture of the Financial Institutions Customer Accounting System, and the logic of the programs and procedures. Data base cross-references and a data dictionary are also included.

The System/34 Financial Institutions Customer Accounting System executes on System/34 in single program mode. The System/34 licensed programs support one workstation, no spooling, no multiprogramming and no file sharing.

The four licensed programs are ready-to-execute applications. Each includes source code, object code, execution procedures and the application logic manual. These are some general features common to all four applications:

- Two levels of security codes help deter unauthorized access to programs and data.
- Application processing is tailored by the customer by including or excluding functions to be executed.
- OCL procedures, Sort specifications, and processing programs are packaged into logical work units which simplify system operation.
- Monitoring of execution sequence prevents execution of a program until the required preceding programs have been successfully executed.
- File maintenance and monetary transactions may be entered via the System/34 keyboard or diskettes created on a 3740 Data Entry System.
- Monetary transactions may be entered via the 1255 Magnetic Character Reader.
- A single set of Customer Information File (CIF) procedures enters and edits application conversion data for all applications and creates the master files.
- A single set of CIF procedures establishes new accounts and performs master file maintenance for the four applications.
- The backup and recovery design forces periodic backup of master files and transactions. This provides for tracking of what procedures need to be rerun in recovery to recreate the master files. Three generations of backup diskettes can be maintained, each containing a complete set of master files and transactions.
- Reprint options permit printing multiple copies of reports.

CUSTOMER INFORMATION FILE (5726-F11)

The Customer Information File licensed program supports three general functions of the System/34 Financial Institutions Customer Accounting System:

- Application Conversion
- Master File Maintenance
- Cross-Application Reports

CIF is a prerequisite for Demand Deposit Accounting, Savings Accounting, and Installment Loan Accounting and is installed in conjunction with the installation and conversion of each of those licensed programs. The conversion process creates a CIF Master File

S/34 Financial Institutions Customer Acctng Sys. (cont'd)

(which contains customer-related data for each of the bank's customers) and separate Account Master Files for DDA, Savings and Installment Loans. The Account Master Files contain account-related data for each account in the three applications. The system maintains linkage from each customer's CIF record to the account master record for checking, savings, and installment loan accounts. In addition, a cross-reference file provides an access path from each account master record to all of the customers associated with the account, based on the account number.

Application Conversion: Separate programs are provided to enter and edit the customer and account data and to build the data base during application conversion. A two-phase conversion procedure is established for each application. During the first phase the data that is less subject to change (such as customer name and address, account type, etc.) is entered. The master data from each customer's account records is consolidated into a single CIF record. A unique access key is developed for each customer and all master records are created. At this stage the records can be maintained, but monetary transactions cannot be processed. This phase may take place over several weeks or months.

During the second phase the remaining data, such as account balances, are entered, edited and loaded into the master records created in the first phase. The records are placed in active status and the application is ready for daily processing.

Strict batch controls are implemented for both phases of conversion. The controls will not permit either phase to proceed if edit errors exist in any records or if the monetary controls do not balance.

File Maintenance: All maintenance of inter-application master files is performed by CIF programs. A single operator procedure is provided to add new customers or new accounts to any converted application. Another procedure is used to change the data in these master files - including such actions as changing an address, placing an account in dormant status, etc. Monetary data can only be changed through application transaction processing. A separate procedure is provided to change the operator and supervisor security codes.

Cross-Application Reports: A basic set of cross-application reports is provided. The advanced customer may wish to extend the use of the CIF data base through additional user-written report programs. (If these programs are to co-reside with the Financial Institutions Customer Accounting System, they must meet stringent coding requirements to insure complete compatibility.)

The following items are provided:

- A Customer Services Report, summarizing the number of customers using installed applications or combinations of applications.
- Mailing Labels, to assist the bank in selective marketing of its services, may be printed according to customer selection criteria established by the execution of the Customer Services Report.
- A Customer Profile showing information for an individual customer and the customer's account status.
- A Customer Inquiry, displayed on the console workstation, and containing a subset of the information printed for a Customer Profile. Inquiry may be by full or partial customer name, customer key, or an account number.
- A Spread Report showing the distribution of accounts and the total deposits for up to five user-supplied ranges of DDA and Savings account balances.
- A Master File List, in customer key sequence, to assist in the maintenance of customer and account data.

DEMAND DEPOSIT ACCOUNTING (5726-F12)

The Demand Deposit Accounting licensed program provides daily transaction processing and reporting for checking accounts for a commercial bank. The licensed program includes broad support for the standard processing functions and for two major optional functions - Overdraft Banking and Automatic Funds Transfer (AFT).

The customer Information File (5726-F11), which provides the data base and file maintenance functions, is a prerequisite for this product.

Standard DDA Functions: Transactions can be entered from the System/34 keyboard, a diskette created on a 3740 Data Entry System, or a 1255 Magnetic Character Reader.

Transactions can be posted against the current, available or collected balance in the account. The bank must select one of these options at installation time to apply to all DDA accounts.

Either one or two classes of float may be used for deposits to calculate the collected balance for accounts. The bank specifies the number of days it requires to collect each class.

The bank must assign one of the supported service charge options to each DDA account. In addition, if Savings Accounting (5726-F13) is installed, the service charge may be waived based on either a minimum

or average balance maintained in the customer's savings account. The supported service charge options are:

- Free Checking
 - No service charge.
- Single Plan
 - A fixed monthly service charge.
- Special or Thrift
 - A fixed monthly charge plus an extra charge for each item designated by the bank as 'service chargeable'.
- Minimum Balance & Charge Per Item
 - The same as the Special or Thrift Option except that provision is made for a charge for each item in a deposit. The service charge is zero if a bank-specified minimum or average current balance is maintained in the account during the statement period.
- Three-Two-One
 - The service charge for the account will be one of three fixed monthly charges, or will be zero, depending on the relationship of the minimum current balance for the period to three ascending balance levels designated by the bank. The account will be charged amount 1 if the minimum current balance is below level 1, amount 2 if it is between level 1 and level 2, amount 3 if it is between level 2 and level 3, and no charge if it is above level 3.
- Volume Earnings
 - The service charge is determined by calculating the cost of servicing the account, subtracting from this amount a credit for the amount the bank earned on the average collected balance, and charging the account the difference. The bank may include a fixed monthly cost, a cost per service-chargeable item, and a cost per item deposited in the cost computation. The earnings credit is a specified percentage of the average collected balance for the statement period. If the earnings credit exceeds the cost, the service charged is zero.

Stop payment actions may be ordered against a check, based on check amount or serial number. In addition a 'stop all' action may be initiated to prevent the posting of any checks to the account.

A hold for a specific amount may be specified against an account, or the account may be frozen - in which case all transactions against it are rejected.

The bank may specify a short list factor which applies to all accounts. When the daily number of checks for an account reaches the specified level, the checks are added together to form a single item for account posting and statement printing. A list of the checks that were combined to produce this single item is printed for filing in the customer's account folder. The short list factor may be overridden to always short list or never short list an account regardless of the number of checks.

The bank must select one of two procedures for determining how to handle an account when there are not sufficient funds to post all checks that are presented. They may choose to post each item individually until the balance is insufficient and then reject those items that cannot be posted; or, add all checks together and either post them or reject them.

Overdraft Banking: The overdraft banking function may be invoked for any specific account. If a check would normally cause the posting balance to fall below zero, a loan sufficient to cover the check is automatically advanced. Loans are always advanced in user-defined increments, with a credit limit specified for each account. The loan balance is maintained separate from the checking account balance, and deposits do not reduce the loan balance. Finance charges are accrued daily and added to the loan balance when the monthly statement is printed. A user-defined minimum payment is also calculated at statement time and automatically deducted from the DDA account balance. The overdraft banking format of the standard statement shows the running balance of the overdraft loan, its associated transactions, and the loan status.

Automatic Funds Transfer (AFT): The AFT function provides periodic transfers of funds from a checking account to another account - such as a savings or installment loan account. If Savings Accounting (5726-F13) or Installment Loan Accounting (5726-F14) is installed, the deposit or payment is also automatically credited. If the credit is to some other account, it is listed on a report and must be credited offline. The account holder may designate a frequency of weekly, biweekly, monthly or quarterly for the transfer. A number of transfers may be established against a single account.

Customer-Oriented Reports: These reports are all produced on preprinted forms. The sample forms shown in the documentation may be ordered through SSD.

Account statements are printed monthly. One of the five service charge options or free checking must be assigned to each account. The bank

PROGRAM PRODUCTS

S/34 Financial Institutions Customer Acctng Sys. (cont'd)

may offer each customer either the standard statement or a 'combined' statement. The combined statement includes the status of selected customer savings or installment loan accounts, if they exist on an installed Savings Accounting Program (5726-F13) or Installment Loan Accounting Program (5726-F14).

The NSF Notice is a combination form which is used to notify the customer either of checks drawn on insufficient funds, or of an overdraft loan advance:

Auditor Confirmation Notices are generated on request, based on a multiple start point systematic sample technique. The random start points can be selected by the auditor.

Internal Reports: The reports produced for use within the bank include:

- Transaction Entry and Edit Reports
- Trial Balance and Activity Journal
- Unposted Items Report
- Service Charge Journal
- Overdrawn and Drawing Against Uncollected Funds Report
- Significant Balance Change Report
- Inactive and Dormant Accounts List
- Inactive and Dormant Account Activity Report
- Account Status Change Report
- Stopped Items List
- Closed and Zero Balance Accounts List
- Short Lists
- Overdraft Banking Trial Balance Report
- AFT Debits List and AFT Credits List
- AFT Journal
- Stop/Hold Journal

SAVINGS ACCOUNTING (5726-F13)

The Savings Accounting licensed program provides daily transaction processing and reporting for regular savings accounts and time deposit open accounts.

The Customer Information File (5726-F11), which provides the data base and file maintenance functions, is a prerequisite for this licensed program.

Standard Functions: Transactions may be entered from the operator console, a diskette created on a 3740 Data Entry System or a 1255 Magnetic Character Reader. If Demand Deposit Accounting (5726-F12) is installed, Automatic Funds Transfers (AFT) to savings accounts will be merged by the system into the daily transactions and automatically credited to the designated accounts.

A hold for any amount may be specified against an account, all withdrawals may be stopped, or the account may be frozen - in which case all transactions against it will be rejected.

Up to eight different account plans, based on combinations of the interest calculation techniques, and the compounding and crediting options discussed below, may be offered at one time.

Interest Calculation Techniques: The licensed program supports both regular savings deposits and time deposit open accounts. The Low Reference Balance and the Day of Deposit to Day of Withdrawal (DOD-DOW) interest calculation techniques may be selected for savings deposit account plans. Time deposit open account plans may be based on either, (1) a requirement that the funds be on deposit for at least one complete interest period, or, (2) a requirement that they be on deposit for at least ninety consecutive calendar days.

For Low Reference Balance accounts, interest is calculated and compounded either quarterly or semiannually. Grace periods at the beginning of each month and end of the period may be defined, and either the LIFO or FIFO posting option must be selected for each plan.

For all except Low Reference Balance accounts, interest is accrued daily, and the bank may elect to compound interest continuously, daily, quarterly or semi-annually.

The bank may elect to credit interest to the account (add it to the account balance) either quarterly or semiannually.

Customer-Oriented Reports: For both regular savings deposit and time deposit open accounts, the bank may choose to provide pass-books, periodic statements, or may do both. The system records and reports 'no-book' transactions against a passbook account.

Interest earned during the preceding year may be reported to the customer each January on 1099 forms.

Auditor Confirmation Notices are generated on request, based on a multiple start point systematic sample technique. The random start points can be selected by the auditor.

Internal Reports: The reports produced for internal use within the bank include:

- Transaction Entry and Edit Reports
- Trial Balance
- Activity Journal
- Unposted Items Report
- Special Activity Report
- Earnings Journal
- Inactive and Dormant Accounts
- Closed Accounts
- No Book Transactions List
- Transaction History Report
- Accrual Report
- Account Status Change Report
- Stop/Hold Journal

INSTALLMENT LOAN ACCOUNTING (5726-F14)

The Installment Loan Accounting licensed program provides daily transaction processing for installment loan accounts for a commercial bank. The application includes broad support for the handling of the common interest calculation types, accrual and refund methods, and provides a variety of other features.

The Customer Information File (5726-F11), which provides the data base and file maintenance functions, is a prerequisite for this licensed program.

Standard Functions: Transactions may be entered from the operator console, a diskette created on a 3740 Data Entry System, or a 1255 Magnetic Character Reader. If Demand Deposit Accounting (5726-F12) is installed, AFT payments to installment loan accounts will be merged by the system into the daily transactions and automatically applied to the designated accounts.

For simple interest loans, interest is accrued daily. For precomputed (add-on and discount) loans, interest is accrued monthly on the loan's anniversary day (the day of the month on which payment is scheduled), by either the rule of 78s or straight-line accrual methods, or on a cash basis. Payment schedules are monthly or quarterly.

Early payoff calculations for precomputed loans use either the rule of 78s or straight-line method. They are performed monthly on, or up to 15 days after, the anniversary day. These calculations are performed monthly for all loans including those on a quarterly payment schedule. A loan paid off prior to the first regular monthly accrual will earn either one full month's interest or interest computed at a daily rate for the number of days outstanding.

Credit life and accident and health insurance are supported. Earnings and collections on each type of insurance are maintained and reported separately. Early payoff calculations include insurance earnings.

Dealers can be associated with a loan and earn a portion of the interest. Dealers will earn by the same schedule and method that the bank earns. Bank earnings and dealer earnings are reported separately on a daily and monthly basis. The bank's recourse to dealer is identified.

The bank may choose to print reminder notices and late notices and to assess late charges for accounts missing a payment. A percentage of the payment may be allowed to fulfill the payment obligation and prevent late charges from being assessed.

Payments may be applied first to either past due amounts or to the current payment, based on a bank-selected option. Late charges are assessed only if the current payment has not been paid. The bank has the option to permit automatic deduction of late charges from a payment. The late charges will only be deducted after the current month's payment obligation is fulfilled, past due amount is satisfied, and full payments are applied to the loan balance. A separate late charge payment is also accepted.

Loan extensions may be granted, thereby deferring payments for some number of months. The bank may require a fee for extensions.

Notices of Interest can be produced on request for all or selected accounts. These notices are also produced automatically at the end of each month for accounts closed during the month.

Payment notices can be printed for simple interest loans, advising customers of payments due.

Auditor confirmation notices are generated on request based on a multiple start point systematic sample technique. The random start points can be selected by the auditor.

S/34 Financial Institutions Customer Actng Sys. (cont'd)

Internal Reports: The reports produced for use within the bank include:

- Transaction Entry and Edit Reports
- Trial Balance
- Update Totals
- Earnings Update Summary
- Transaction Journal
- Unposted Items Report
- Suspected Closed Report
- Special Activity Report
- Exception Report
- New Loans Report
- Late Charge Assessments Report
- Collection Report
- History Merge
- Monthly Earnings Report
- Dealers Monthly Earnings Report
- Monthly Insurance Company Report
- Closed Loans Report
- Transaction History Report
- Aged Delinquency Report
- Dealers Trial Balance
- Loan Class Report
- Loan Plan Report
- Collateral Insurance Expiration Report

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Each of these IBM System/34 licensed programs is compiled assuming a minimum 48K system and will execute on all models of the IBM System/34 in single program mode equipped with a minimum of 48K of memory. Because of volume and time constraints, there may be a requirement for offline keying on an IBM 3740 Data Entry System and/or transaction entry through the IBM 1255 Magnetic Character Reader. If an IBM 3741 is to be used, it must have Feature Group A (#4002). If an IBM 3742 is to be used, it must have 128-character feature (#5455) and Feature Group A (#4004). In addition, the Proof Keyboard Feature (#5901 or #5902) is desirable, but is not required.

All models of the IBM 1255 Magnetic Character Reader (MCR) that can be attached to the IBM System/34 are supported by these licensed programs. The Dash Symbol Transmission Feature (#3215) cannot, however, be installed if the customer wishes to use the MCR data capture programs supplied with the programs. Consult the sales manual for ordering instructions and any restrictions that pertain to attachment of the 1255 MCR to the System/34.

The four applications are closely interrelated. Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries. Because of this, no other licensed program or user-written programs may co-reside unless stringent coding requirements for these programs are met to insure compatibility with the Financial Institutions Customer Accounting System. The application logic manual discusses in detail the coding conventions that are used.

SOFTWARE REQUIREMENTS

The IBM System/34 feature licensed programs are compiled in System/34 RPG II programming language and executed under control of the IBM System/34 System Support Program (5726-SS1). IBM System/34 Utilities licensed program (5726-UT1), which includes Sort, Data File Utility, Source Entry Utility and Work Station Utility is required. Only the Sort Utility, however, is required for execution of the programs. The IBM System/34 RPG II Compiler (5726-RG1) is required if modifications to the source code are necessary. The

Customer Information File (5726-F11) is a prerequisite for Demand Deposit Accounting (5726-F12), Savings Accounting (5726-F13), and Installment Loan Accounting (5726-F14).

PROGRAM PRODUCTS

**SYSTEM/34 MANAGEMENT SYSTEM FOR LAW FIRMS
5726-F52***[No longer available, effective June, 1983.]***PURPOSE**

The IBM System/34 Management System for Law Firms licensed application program offers the partners in a law firm a practical, convenient means of capturing time and disbursement data, and organizing that data into meaningful working documents and management reports.

The application program is designed for the small to medium sized law firm. It is a complete set of programs designed to assist the law firm in time and disbursement accounting, billing and accounts receivable. These programs capture and store data which is then organized into reports to aid law partners in effectively controlling and managing the firm's business functions. In addition, it can be utilized with the MMAS General Ledger System licensed application program (5726-M37) to provide traditional general ledger functions such as balance sheet, income statement and other reports describing the financial status of the firm.

The System/34 Management System for Law Firms includes the components necessary for a controlled flow of daily time entries, disbursement entries (made on behalf of a client) and billing information, from data capture to final reports. Other entries, such as time or disbursements transfers, cash receipts, accounts receivable journal entries, file maintenance, and accounts receivable writeoffs, are supported. A series of comprehensive reports, with frequency of many of the reports being user-determined, is provided to the law firm.

HIGHLIGHTS

- Provides Missing Time Report which flags individuals who have reported less time than the firm standard
- Provides a turnaround document for billing information on demand or periodically with all of the necessary information to make billing decisions and update computer stored records.
- Provides disbursement-only billing information memos on demand or periodically
- Prints client bills in a variety of formats
- Calculates the variance between the firm investment of time for a bill and the actual amount received on the bill
- Provides aged accounts receivable reports
- Prepares aged reports of unbilled time and disbursements
- Analyzes billed and unbilled time
- Provides a file sizing program to create file sizes based on individual user needs
- Provides system tailoring procedures for user to select functions
- Designed to be used with the General Ledger licensed program.
- Provides initial file loading, record addition, and data entry capabilities through keyboard entry or 3740 Data Entry System.
- Provides data entry for daily transactions through keyboard or 3740 Data Entry System
- Provides file maintenance on existing master file records which use DFU (keyboard only)

DESCRIPTION**TIME and DISBURSEMENT ACCOUNTING**

The Time and Disbursement Accounting application controls recorded unbilled time and disbursement entries made by the firm on behalf of a client, and provides a broad range of management reports. The major Time and Disbursement Accounting features are:

- Additional time recording steps are not required of the professional staff.
- Aged unbilled time and disbursement reporting triggers billing activity and should help improve cash flow.
- Time and disbursement information is maintained in detail with totals accumulated at the matter and client levels.
- One of two billing rates can be selected per individual.
- Time and client disbursement description codes are user-defined.
- Narrative can be included or omitted as required.
- References to an individual can be suppressed on selected reports.
- A single disbursement journal handles both firm and client disbursements.
- All or selected time or client disbursement records can be transferred from client-to-client, matter-to-matter, attorney-to-attorney, or date-to-date.

- All information is automatically adjusted and all transfers are listed for control and auditing purposes.
- Nonbillable time can be tracked for management analysis.
- Billing Proofs can be used to verify billing attorney instructions.
- A broad range of time and disbursements reports is provided:
 - Weekly Time Report
 - Missing Time Report
 - Individual Time Summary
 - Individual Unbilled Time Summary
 - Disbursements Journal
 - Billing Journal
 - Unbilled Time and Disbursements

The billing information function of the application processes time and client disbursement records to provide billing information to assist in the billing process. Features of the billing information function are:

- Produces Billing Information Memos on demand showing all reported activity performed by the firm for a client. This report is used by the billing attorney as a turnaround document to record decisions on actual amounts billed and/or written off.
- Enables the billing attorney to bill without relieving time entries (payment on account), by relieving time and client disbursement entries, or by relieving client disbursements only.
- Prints client bills in a variety of formats
- Produces Matter Billing Summary reports showing billing analysis for the billing attorney, the matter, or the client.
- Shows billing variance (the dollar difference between time value and fees billed) and billing realization (the ratio, expressed as a percentage, between fees billed and the value of the individual's reported and billed time).
- Prepares retainer lists showing billable retainer amounts.

ACCOUNTS RECEIVABLE

The Accounts Receivable application offers a systematic procedure of recording and reporting client fee and disbursement bills, receipts and write-offs as well as the firm's cash receipts. Features of the Accounts Receivable application are:

- Aging of client accounts
- Allocation of fees and write-off amounts
- Summary or detail printing of the Aged Receivables Report
- Advance payments for fees and disbursements
- Allows entry of billing information into Accounts Receivable without any supporting time or client disbursement entries
- Cash Receipts/Write-off Journal
- Paid Open Bill and Write-off Report
- Inactive Client/Matter List

Features: Included as part of this application program are several features designed to enhance day-to-day operation.

File maintenance is a part of every application within the program. Maintenance may be performed on descriptive data in all major files but not on auditable totals and dollar amounts.

Checking procedures guide the correct sequence of operations to maintain data integrity. When an operation is not successfully completed due to missing or incorrect information, or due to an attempt to perform an operation out of sequence, the operator is notified that corrective action must be taken. The operator can then correct problems before running subsequent tasks, which are dependent upon the accuracy of prior input for proper reporting.

Backup and recovery routines maintain a dynamic tracking history which records previously executed tasks. If recovery is necessary, the recovery routines guide the user in recovering required data developed since the last data back-up point.

Reprint options are available for most reports. Reports can be reprinted to provide extra copies. If recovery is needed to recreate data files, report printing is bypassed, thus saving time.

Selective printing allows the operator to specify various options to control the content and level of detail contained in reports.

Printing options include:

- Range printing. For example, the operator may specify client identifiers as limits so that information is printed only for the group of clients whose identifiers fall between those specified.
- Selection of specific data. For example, the operator may select to print only matters whose unbilled disbursement totals exceed a specified amount.

S/34 Management System for Law Firms (cont'd)

- Selection of detail level. For example, the operator may optionally request a detailed report or a summary report.
Users may modify information that is subject to change, such as report selection criteria and aging periods.
- Individual security codes for time and disbursement accounting, accounts receivable and maintenance are user-assigned at installation time. These codes may be periodically changed as authorization changes dictate.
- File sizes, which are determined at installation time, may be resized in the future to accommodate the firm's growth.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 application programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration requirement is an IBM System/34 with:

- 32K bytes of main storage
- 8.6 megabytes of disk storage
- 40 characters per second matrix printer
- IBM 5251 mdl 11 Information Display Station

Because of volume and time constraints, there may be a requirement for providing offline keying on an IBM 3740 Data Entry System. If an IBM 3742 is to be used, it must have the 128-character record features 128-character (#5455) and feature group A (#4004).

SOFTWARE REQUIREMENTS

IBM System/34 System Support licensed program (5725-SS1 Version 1), and System/34 Utilities licensed program (5726-UT1).

TERMS and CONDITIONS: See PP Index

**SYSTEM/34 PUBLIC BUDGETING AND ACCOUNTING SYSTEM (PBA)
5726-G21**

PURPOSE

The IBM System/34 Public Budgeting and Accounting System (PBA) provides a workstation-oriented financial control, planning and accounting system for public institutions. It assists users in meeting financial reporting requirements, preparing budgets through online budget preparation and tracking, and controlling expenditures through management reports. The system also provides periodic reporting of expenditure and revenue accounts, and preparation of Balance Sheet and General Ledger as well as year-end closing statements.

HIGHLIGHTS

- The System/34 hardware and software functions (spooling, inquiry, multiprogramming) are integral parts of the PBA application design.
- Workstation data entry is designed for simplicity and ease of use. Screen displays provide guidance for entering data. Error messages are displayed. The incorrect data can then be corrected by the operator.
- Interactive data entry, concurrent edit, and correction from multiple workstations with batch programs operating from the job queue.
- Data entered into the multiple workstations is immediately edited for errors.
- Journal entry, cash receipt, purchase order, voucher, cash disbursement, and labor distribution transactions are posted to revenue, expenditure, labor distribution, and general journals.
- Audit trails for transactions from entry to period-end closing are provided by a journal reference numbering system.
- Accounting year is established by choice of first fiscal month or period. Yearly cycle can be 12 months or 13 periods.
- As an option, encumbrance accounting is performed. Liquidation occurs through the processing of an outstanding encumbered purchase order file.
- Labor and material costs can be accumulated by project.
- Budget reports are printed containing the previous two years' actuals and present projected amounts.
- Percent of budget spent is tracked both for current month and for year-to-date.
- A trial balance for balance sheet, revenue, and expenditure accounts by fund is produced to ensure fund integrity prior to printing final reports.
- Reports can be produced periodically or on demand.
- Single fund general ledger as well as fund trial balance are produced.
- Accounts payable checks are produced on demand.
- An expenditure approval listing is produced identifying expenditures by item.
- Multiple payments to a vendor are accumulated, totaled, and printed on a single check.
- Current chart of accounts is printed.
- Outstanding payable checks are tracked and reports of outstanding checks are printed after check reconciliation.
- Inquiry into master files concurrent with data entry and batch programs.
- System tailoring procedure permits the user to select optional functions and determine the size of files used by the application. Functions and file sizes may be modified as the environment changes by re-executing the tailoring procedure.
- Source code, ready-to-execute procedures, and object code provided. No additional systems design, programming, or compiling is required.
- File load programs for all master files are provided. Data can be entered from diskette during file load.
- Online file maintenance of master files with direct file updating and printed registers for control and auditing.
- Master file backup to diskettes and optional transaction file backup to diskettes.
- Password security helps deter authorized use of application functions.
- Documentation for PBA includes an application installation guide, an application reference manual, runbooks, and an application logic manual.

- Self-study instructional materials are also available for operator education.

DESCRIPTION

Special functions and features of the PBA application are:

- Budget preparation and tracking
 - Online direct entry and edit
 - Direct file updating through workstations
 - Printed worksheet with previous year's figures
 - Estimated expenditure and revenue reports
 - Final budget report for publication
- Revenue and expenditure accounting
 - Online data entry and edit
 - Inquiry provides up-to-date account balance information
 - Journals that provide complete audit trails for transaction processing
- General Ledger
 - Required month and year-end reports
 - Complete audit trail
- Purchase order encumbering/Accounts Payable
 - Encumbrance accounting as an option
- Purchase Orders are checked against account balance
 - Check approval listing, check registers, and check writing are provided
 - Complete audit trail is provided
 - Inquiry provides review of outstanding purchase orders

PBA is a set of ready-to-execute application programs for public institutions and schools. The application has certain required records within an application control file which contain questionnaire responses. File sizes and functions can be selected to suit the user's needs. The questionnaire responses are entered during initial installation and may be changed as needed.

The System Tailoring Procedure allows these responses to be entered or modified. It provides the following:

- Tailors the application and Operator Control Language (OCL) on-site at installation time
- Allows the user to activate and deactivate provided functions as the user's business changes
- All functions are included in the application programs, but only required functions are executed
- Allows changes to file sizes as needed by rerunning the System Tailoring Procedure.

The application installation guide for PBA provides detailed step-by-step instructions for use in preinstallation, installation and postinstallation activities in order to achieve productive operation. These instructions include sample account numbering structure, sample input and maintenance data forms, file loading sequences, and control forms with suggested procedures.

The application reference manual is provided to enable the user to understand the application from a functional and operational standpoint. It contains information for the installation manager to supervise the system console operator, and to run the application from a total systems viewpoint. It also provides the user department manager with information needed to supervise the workstation operator and to understand the application at a detailed level.

Runbooks are provided for the systems console operator and for the workstation operator. These runbooks contain detailed instructions for the application procedures, an overview of the system and application flow, system consideration, hints for troubleshooting, and all of the error messages that can be generated.

An application logic manual is provided, as licensed material, for use by the self-sufficient customer and the systems engineer for maintaining and modifying PBA. Information on architecture, naming conventions, controls, program functions and specifications, relationships among files, and other information applicable to the application is presented.

Instructional support is provided to facilitate installation and operation. The Installation Planning self-study material provides guidance in the use of the application installation guide and the application reference manual. Instructional material for self-study is provided for the systems console operator and the application workstation operator to instruct them in the use of the runbook.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI Section, in the installation of

PROGRAM PRODUCTS

S/34 PBA (cont'd)

IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer. Installation of the System/34 is also a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

This licensed program will execute on all models of the IBM System/34 with a minimum of 48K bytes of main storage. The PBA Survey Guide provides the necessary information and questions for determining the prospect's qualification and application fit. Areas covered are function, storage capacity, and justification.

Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries. Design features have been incorporated into the PBA application to allow for co-residency of other applications and/or user-written programs with minimum restrictions. Consult the PBA application logic manual for further explanation of these restrictions.

SOFTWARE REQUIREMENTS

The IBM System/34 application programs are written in IBM System/34 RPG II programming language and executed under control of the IBM System/34 System Support licensed program, 5726-SS1. The IBM System/34 Utilities licensed program, 5726-UT1, which includes Sort and Work Station Utility, is required for execution of the programs. The IBM System/34 RPG II licensed program, 5726-RG1 is required if modifications to the source code are desired.

Licensed Program Specifications (GH30-0435) ... Reference Manual (SB30-0323) ... Runbook (SB30-0324) ... Installation Guide (SB30-0332) ... Logic Manual (LB30-0325).

TERMS and CONDITIONS: See PP Index

HOSPITAL FINANCIAL MANAGEMENT SYSTEM (HFMS) FOR SYSTEM/34 (Single Program Mode)

PATIENT BILLING ... 5726-H11
ACCOUNTS RECEIVABLE ... 5726-H12
PAYROLL ... 5726-H13
GENERAL LEDGER/ACCOUNTS PAYABLE ... 5726-H14

PURPOSE

The IBM Hospital Financial Management System offers the small hospital a disk data-based system comprised of a series of programs and procedures that perform the accounting, management reporting and statistical functions for patient billing, accounts receivable, payroll and general ledger/accounts payable.

Presentation of timely information enables management to observe trends and deviations from the hospital's planned financial position. This enables Hospital Management to quickly spot problems and initiate corrective action. More important, it provides a basis upon which to institute plans to improve the financial position. The accuracy of the accounting information is mandatory because of reporting requirements placed upon the hospital by regulatory agencies.

Completeness of hospital operating information provides the basis for review, analysis, and cause and effect relation studies of such things as rate setting, reimbursement analysis, patient mix, and services performed. A comprehensive information base provides the justification for decisions regarding future operations and services.

Five applications are supported by HFMS. They are patient billing, accounts receivable, payroll, and general ledger/accounts payable. General ledger and accounts payable are marketed together as one offering. Each of the other applications is a separate offering. Each application may be installed and operated independently or as an integrated system.

HIGHLIGHTS

- An integrated series of offerings that can be installed in any sequence for standalone or integrated operation
- The HFMS offering consists of:
 - Source Code and Object Code
 - Ready-to-Execute Procedures
 - Predefined File Sizes
 - Installation Guides
 - Operator Runbooks
 - Installation Supervision Self-Study Instructions
 - Operator Self-Study Courses With Machine Exercises (System/32 only)
 - Hospital Application-Oriented Specifications for Data Entry and Control Forms
 - Technical Documentation for problem determination
- Simplicity of operation characterized by application-oriented commands, prompting, responses, and messages
- Complete hospital disk data base
- Complete file load and maintenance programs
- Backup/recovery procedures imbedded in the application flow
- Comprehensive data entry editing with errors explained to facilitate correction
- Inquiry facility for Patient Billing and Accounts Receivable
- Optional entry of batch transaction input through diskettes prepared on the 3740 Data Entry System
- Comprehensive accounting controls through a defined audit trail
- User-defined system control file entries for adapting HFMS to customer requirements

The System/34 programs make available the Hospital Financial Management System in single program mode. They support one workstation, no spooling, no multiprogramming, and no file sharing.

DESCRIPTION

PATIENT BILLING (5726-H11)

The system provides for accurate and timely posting of inpatient and outpatient charges to produce patient bills and provides the basis for the revenue statistics needed for third-party reporting, cost reimbursement, internal rate setting, and revenue analysis.

The offering has five logical subsystems: Census, posting, billing, revenue usage, and statistics.

The census subsystem tracks the location of inpatients and processes all outpatient activity. Census reports are produced in various sequences which serve the needs of different users in the hospital. The census reports and the daily recap are used to verify the accuracy of the reported day's activity. The generation of the final census triggers the automatic generation of room charges to the posting subsystem.

The posting subsystem enters all routine and ancillary charges including room charges from the census subsystem into the inpatient and outpatient billing files. Charges can be automatically priced by the system or overridden by keyboard entry. It produces reports necessary to verify the accuracy of the information, automatically prepares the daily revenue entries for the General Ledger (5726-H14) and updates the detail revenue file records.

All detail posted charges are saved by the system on an accumulated charges file, which is used by the billing subsystem to prepare detail patient bills. Accounts Receivable (5726-H12) will post payments against accounts not yet final billed into the accumulated charges file.

The billing subsystem uses the information in the inpatient and outpatient billing files and the accumulated charges file to print patient bills. The detail bills for both inpatients and outpatients include a complete chronological detail of charges and a 'summary of charges' at the end of the bill. Inpatients' final detail bills are automatically produced after discharge. Outpatient emergency (one-time visit) detail final bills are automatically produced after the patient visit, while recurring outpatient final detail bills are produced when requested by the hospital. After the detail final bill is produced, the billing record is deleted. Prior to this deletion, it is transferred to the accounts receivable file if Accounts Receivable (5726-H12) is installed.

Detail cycle bills can also be requested for any current inpatient account. This bill shows the balance as of the last cycle bill and a detailed summary of current charges. Requesting cycle bills does not alter the processing or format of the detail final bill which will eventually be produced.

Summary bills can be printed on demand (inquiry) for any inpatient or outpatient account not yet final billed. The bill is in summary format containing all charges as of the last posting period.

The revenue usage subsystem is driven by the inpatient and outpatient charges from the posting subsystem. Daily and monthly revenue reports are produced in detail or in summary by departments, showing usage of individual services within the current period and year-to-date. The statistics subsystem maintains and reports patient statistics by medical service and patient category for both inpatients and outpatients, ancillary utilization statistics by department for all inpatients and for five outpatient categories, and departmental revenues by six financial classes.

ACCOUNTS RECEIVABLE (5726-H12)

Managing the hospital's Accounts Receivable has become an increasingly complex task. Required interaction with patients and many third parties (including private and public insurance companies and various governmental agencies) has created an explosion in clerical tasks. This has resulted in a difficult control problem in the hospital business office. The offering has three logical subsystems to aid in the collection of accounts receivable and in controlling the large volume of data involved. They are daily posting, statement writing, and reporting.

The posting subsystem creates receivable accounts either through keyboard entry or by accepting transferred inpatient and outpatient accounts which have been final billed from the Patient Billing offering (5726-H11). The subsystem accepts a full range of transactions such as payments, adjustments, late charges, and bad debt recoveries. If Patient Billing (5726-H11) is installed, payments can be accepted against active billing accounts and posted as credit charges. Controls, procedures, edit and audit reports assist the accounts receivable department in making sure transactions are posted to the correct accounts. This automated posting procedure eliminates many clerical tasks and frees business office personnel to concentrate the majority of their time analyzing and pursuing collection of open accounts.

The posting subsystem maintains a separate account for each patient for each hospital visit. However, the ability to assign a guarantor number (family number) is provided. The facility enables the system to group all accounts for one family together for statement writing and accounts receivable reporting. The system has further facilities to handle both active and bad debt accounts with separate controls, to transfer from patient to insurance and from insurance to patient, and to generate entries for the General Ledger (5726-H14).

The Statement Writing Subsystem generates balance-forward statements and includes a number of options that allow users to operate the system to meet their unique requirements. Statements can be written on a weekly, biweekly, or monthly cycle to smooth the business office workload. Statements can be written for all financial classes or only selected financial classes (financial class denotes primary method of payment, such as self-pay, Medicare, Blue Cross, Welfare, etc.). Finance charges can be assessed at the option of the user. Statements can be either family statements or individual account statements.

The Reporting Subsystem provides the user with a flexible information system to be used in handling the unique patient and third-party collection problems encountered in a hospital receivables system. Aged receivables reports can be produced in varying sequences or as various exception reports to help hospital personnel zero-in on specific

S/34 HFMS (cont'd)

collection problems or to satisfy specific information needs. The age of accounts can be calculated based on discharge date, date of last payment, or date insurance was filed. Reports can be produced for all open accounts or selected accounts based on financial class, range of dollar balances, and age since discharge date, last payment date, or date insurance was filed. If patient number is assigned to all accounts, the aging reports can be printed for all accounts for a patient alphabetically by patient name.

A selective Detail Status Report facility is provided in the system for the user to retrieve reports showing all detail transactions for any specific account or group of accounts, based on financial class or patient number.

The system handles the processing for both Active and Bad Debt Accounts. A report showing all accounts that have been transferred to bad debt can be run at any time.

An Account Balance Inquiry can be requested at any time to be displayed on the System/34 or printed or both. This allows the business office to retrieve the most current information regarding any account when it is required.

The Patient Account record and all Detail Transactions for an account are maintained in the system until a user-specified number of days after the account zero balances or until the account is deleted from the system as an uncollectable bad debt. At the time an account is deleted from the system, a one page report is printed showing all the detailed information for the account. This report is then filed for reference purposes.

PAYROLL (5726-H13)

Within the hospital, personnel represents the most valuable and the most expensive resource. While an efficient mechanism for prompt employee payment and bookkeeping is essential, the emphasis today is necessarily on astute management - planning, scheduling, and monitoring - to ensure the most productive use of this valuable and costly personnel resource. The offering addresses these needs through four logical subsystems: Payroll Processing, Labor Distribution, Benefits Analysis, and Personnel Reporting.

The biweekly Payroll Processing subsystem calculates hourly and salaried employee earnings, calculates statutory and voluntary deductions, accrues vacation and sick leave, accumulates quarter and year-to-date totals needed for 941-A and W-2 reports, and prints the employee's check. It also provides necessary reports to show a complete audit trail of each payroll run and to perform check reconciliation. The system calculates and deducts tax-sheltered annuities, federal withholding taxes, and Federal Insurance Compensation Act (FICA) withholding. Rates are supplied to the programs from a system control file to avoid program recompilation as rates change. The data fields needed to calculate existing state, county, or city withholding taxes are included in the date base and an exit point is provided in the program for the inclusion of a user-written subroutine to calculate these taxes. However, the earnings statement and reports have provisions to print only one non-federal withholding tax.

The ability to process voided checks as a separate run is provided. Batches are created of the checks to be voided and the data is entered in a manner similar to normal time card entry. The void check run follows the same sequence of events as normal payroll run except that checks are not written.

Vacation and sick leave hours are accrued based on actual hours worked and a hospital-defined accrual rate that can vary by employee.

The system will handle up to 10 types of voluntary deductions that can vary among employees regarding the frequency and method of calculation. These hospital-defined voluntary deductions are calculated, deducted, and reported each pay period on both a current period and year-to-date basis.

The labor distribution subsystem produces current and year-to-date reports each pay period by using the extended employee time records and budgeted and year-to-date balances from the position control file. These reports show hours and dollars (actual, budget, and variance) categorized by productive and non-productive time. This subsystem produces the departmental expense entries for the General Ledger application (5726-H14).

The benefits analysis subsystem produces reports for both included and contributory benefits each pay period. Included benefits are generally those that are completely paid by the hospital, such as vacation, sick leave and holidays. Contributory benefits are generally those that are partly paid by the hospital and partly by the employee, such as life insurance and health insurance.

The Included Benefits Report shows vacation and sick leave hours carried over, accrued, taken and remaining for each employee and department. Holidays taken are also noted on this report. The Contributory Benefits Report provides an analysis of the amount paid by the hospital for life and health insurance on a total cost basis and cost-per-hour basis for each employee, position classification, and department.

The personnel reporting subsystem provides reports to assist the personnel department in effectively using the people resource of the hospital.

An up-to-date Employee Status Report for each employee in the hospital is produced by the system whenever a change is made on an employee's record. All additions, changes, or deletions of employee information are thoroughly edited by the system and printed on Maintenance Reports. An Employee Personnel Profile is produced for employee verification of pertinent data. It serves as a turnaround document for entering changes into the system.

Employee listings by name and number are printed for reference purposes. An Annual Employee Benefits Report is produced for each employee showing total earnings, included benefits and contributory benefits. The Turnover Report provides an analysis of employee terminations by department showing the reason for each termination. Union Listings by employee within union can be produced when required.

GENERAL LEDGER/ACCOUNTS PAYABLE (5726-H14)**GENERAL LEDGER**

In order to provide increased patient care, hospitals must work from a sound financial base. In order to develop that base, the hospital executive must have detailed hospital operating information that is accurate, timely, and complete. The hospital must establish a plan, and since they are controlled to cost-dependent prices, they must work within that plan. The general ledger application provides the information that is key to more effective management through three logical subsystems: Daily processing, accounting period-end updating, and accounting period-end financial reporting.

The daily processing subsystem produces a journal of the day's valid transactions and adds them to the accumulated transaction file. Transaction validity is established through the use of the batch proof report. All transactions can be entered as miscellaneous journal entries. However, other offerings of the Hospital Financial Management System automatically provide journal entries from Patient Billing (5726-H11), Accounts Receivable (5726-H12), Payroll (5726-H13) and General Ledger/Accounts Payable (5726-H14) which will substantially reduce keying time. All transactions from whatever source are thoroughly edited by the system.

The accounting period-end updating subsystem provides the detail and summary trail balances. They are produced at the close of each accounting period. The system is designed to handle either 12 or 13 accounting periods per fiscal year. The trial balances can be run as many times as necessary to insure that all closing and correcting entries for that accounting period have been processed and the ledger is in balance. The system then updates the General Ledger Accounts file by extracting all entries for the accounting period (from the Accumulated Transaction File and summing these entries with the balance as the end of the last accounting period) to obtain the new year-to-date balance of each account in the General Ledger Accounts File. The updated General Ledger Accounts File is then used to produce the Financial and Management reports by the accounting period-end reporting subsystem.

Comparative schedules of Patient Revenue, Miscellaneous Revenue, Deductions from Revenue, and Expenses are produced showing variances on a current month and year-to-date basis for either this year versus last year or this year versus budget or both.

The format of the Balance Sheet, Income Statement, Pre-Cost Allocation Schedule, Per Diem Revenue Report, and Per Diem Expense Report can be tailored to the user's requirements through the use of the Report Description Master file. This file contains a record for each physical line that appears on each of the reports. By adding, changing or deleting records in this file, characteristics of the reports such as the number of lines, levels of total, and line and total descriptions, can be changed to meet the needs of the user. This feature, along with the ability to define the chart of accounts desired, provides a flexible financial information system that can be defined by the user to produce financial reports to assist in creating and maintaining financial stability for the hospital.

ACCOUNTS PAYABLE

Inflation has caused a rapid increase in the cost of supplies in all departments of the hospital. An accurate, efficient Accounts Payable system has become a requirement. It is one of the basic tools needed by hospital management to assist in reducing and controlling the cost of providing health care because most of the hospital's supplies expense originates through Accounts Payable. Approved vendor invoices must be accurately recorded, efficiently analyzed, and accurately distributed to affected cost centers.

The key element of expense control can only be obtained if the proper departments are given the information they need. For example, purchasing agents require information regarding standard vendor terms and business volume. The financial officer needs timely information regarding open Accounts Payable to analyze cash requirements. Available cash must be used effectively to take advantage of all discounts through prompt payment. The business office needs an

PROGRAM PRODUCTS

S/34 HFMS (cont'd)

efficient method of recording items, reporting to management, and accurately distributing supplies expense to appropriate cost centers.

The Accounts Payable application meets these objectives and satisfies these needs through four logical subsystems: Transaction entry, check writing, expense distribution, and reporting.

The transaction entry subsystem performs an extensive edit on all approved invoices and credit memos. The required information is keyed into the system and a Proof Report is printed to balance to controls. Any errors are corrected prior to further processing. These transactions are accumulated with any prior unpaid items and a Cash Requirements Report is printed to provide a current listing of all unpaid items listed by invoice within vendor. The items to be paid are noted on the Cash Requirements report and control totals are developed. Items to be paid can be selected in either of two ways: All invoices for a vendor or only certain invoices within a vendor can be selected. The computer operator uses this report to enter a notification of items to be paid into the system. A Payment Journal is printed by the system showing all transactions selected to be paid. This report is used to balance to the control totals, and any keying errors are corrected prior to the writing of checks.

Further flexibility is provided by the system because a check for any items may be typed at any time and entered into the system with a different code to designate a demand check. The transactions for these demand checks flow through to the expense distribution, but no computer checks are prepared. This facility provides the hospital maximum flexibility for taking advantage of discounts and creating of special checks such as travel advances.

The checkwriting subsystem produces the Check Registers, Checks, and Remittance Advices for those items checked on the cash requirements report. The system allows for multiple check writing runs during the month which, in conjunction with the ability to handle demand checks, provides the flexibility needed to control the payment of outstanding accounts payable items. Check reconciliation reports are included to allow the user to control the reconciling of checks and produce an Aged Outstanding Check Register.

Once each accounting period, the Accumulated Transaction file is sorted by General Ledger number and the expense distribution subsystem is run. An Accounts Payable Distribution Report is produced and summary expense entries are created for entry into the General Ledger system.

The reporting subsystem provides analysis of year-to-date purchases and discounts taken based on information in the Vendor Master file. This file contains one record for each permanent or temporary vendor used by the system to obtain vendor name, address, and discount terms information. The amount of purchases, credit memos and discounts for each vendor are also maintained in this file and Vendor Analysis Reports can be printed whenever desired.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

These IBM System/34 programs will execute on all models of the IBM System/34 in single program mode.

Information regarding disk allocation and usage (master and transaction files) and recommended backup levels and diskettes requirements are available in the *HFMS Installation Guides*.

The OCL and file sizes, as distributed, will be fixed at the maximum capacity assuming all five applications are to be installed on a 8.6 megabyte file.

Any changes to file sizes other than those shown above should be carefully reviewed by the customer and IBM Systems Engineering to determine the necessity for more storage, estimate time required to convert OCL procedures, and estimate throughput performance.

SOFTWARE REQUIREMENTS

The IBM System/34 Application Programs are written in IBM System/34 RPG II programming language and executed under control of the IBM System/34 System Support Program (5726-SS1 Version 1). IBM System/34 Utilities licensed program (5726-UT1), which includes Sort, Data File Utility, Source Entry Utility, and Workstation Utility is required for execution of the programs. The IBM System/34 RPG II Compiler (5726-RG1) is required if modifications to the source code are necessary.

TERMS and CONDITIONS: See PP Index

**MEDICAL GROUP MANAGEMENT SYSTEM
5726-H15 (Single Program Mode)**

PURPOSE

The IBM Medical Group Management System is primarily intended for a group of up to 99 doctors using a single accounting system.

HIGHLIGHTS

- Wide variety of reports and report options included:
 - Management reporting is a byproduct of normal data entry
 - Detail or summary listings within a range of options is supported in many reports
- User recognized accounting techniques and terminology to provide a solid accounting system:
 - Clear audit trails and control techniques are provided
 - Sample user oriented forms for data preparation, file creation, audit and control are provided.
 - Security code deters unauthorized execution of all programs in the application
 - A Reference Number may be used to supply an audit trail for any transaction entered into the system
- Designed to be installed without customer programming capability:
 - System tailoring procedure facilitates account growth by allowing on-site changes to file sizes and determination of functions used
 - File maintenance and audit procedures
 - Easy-to-use runbook
 - Step-by-step installation activity plan provided by the *Application Installation Guide*
 - User's installation and daily operating information supplied to the supervisor by the application reference manual

DESCRIPTION

The system combines two data entry approaches: Operator-oriented and batch-oriented. Support is provided for transaction entry through the System/34 keyboard or through diskette created on a 3740 Data Entry System.

The application has requirements records which contain Questionnaire responses stored in a Constants File. These records allow the system to select certain fields for editing, report formats, file sizes, and functions to suit each customer's needs. The Questionnaire responses are keyed in during initial installation and may be changed as needed. The System Tailoring Procedure allows these responses to be entered.

The System Tailoring Procedure uses the answers to a series of questions regarding a medical group's requirements to build the system. It provides the following:

- Tailoring the application and Operation Control Language (OCL) on-site at installation time.
- All provided functions are included in the programs but only required functions are executed.
- Allows the user to activate and deactivate provided functions as the user's business changes.
- File sizes may be increased or decreased as needed by rerunning the System Tailoring Procedure.

An application installation guide provides a step-by-step installation activity plan including sample numbering systems, sample input and maintenance data forms, file loading sequences, and control forms with suggested procedures. The application reference manual provides information on the day-to-day use of the application.

The runbook provides the operator with a detailed and easy-to-use set of instructions stating all the activities necessary to run the programs on a System/34. The procedure reference summary is provided for the operator as a reminder of the major operational instructions for each procedure. It is intended to be used once the operator is thoroughly trained in the application.

An application logic manual is provided for use by the self-sufficient customer and for systems engineering continuing support. It describes the architecture of programs, procedures, data base cross-references, data dictionary, and detailed descriptions of each program.

The System/34 licensed program makes available the Medical Group Management System on System/34 in single program mode. The System/34 supports one workstation, no spooling, no multiprogramming and no file sharing.

The application is ready-to-execute. It includes source code, object code, execution procedures, and the application logic manual as basic material.

Features

- Designed to fit business requirements
- Security codes to deter unauthorized use of master files
- In-house inclusion/exclusion of functions to be executed

- OCL procedures, Sort specifications, and processing programs are packaged into logical work units which simplify system operation
- Monitoring of execution sequence prevents execution of a program until preceding required programs have been completely and successfully executed
- Compatible online/offline data entry through the System/34 keyboard or by means of diskettes created on a 3740 Data Entry System.
- Dynamic Backup and Recovery System forces periodic backup of master files and edited transactions and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files
- Reprint options are possible because file updating is separated from report writing functions
- Some report printing can be deferred to a more convenient time
- Selective printing options are available for many report functions
- Cash accounting by doctor
- History transactions kept on the disk for the number of months specified

The Medical Group Management System licensed program is intended to provide a balance forward accounts receivable system for a group of up to 99 doctors using a single accounting system.

The licensed program provides the ability to bill patients on a monthly basis. Third parties (insurance companies) can be billed as required. It provides accounts receivable information including status reports and aged trial balances in order to control accounts receivable.

An optional Daily Charge Slip system is provided to print an appointment list showing patient appointment information and patient charge slips for recording patient charges, diagnoses and procedures. The charge slips can then be used as turnaround documents for input into A/R.

A practice analysis system is also optional and provides statistical reports for each doctor on a calendar year basis.

Inquiry is provided allowing the user to locate a guarantor record by keying either the guarantor's last name and first initial or the guarantor's account number.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

This licensed program will execute on all models of the IBM System/34. The programs are compiled assuming a 32K minimum system. Because of volume and time constraints, there may be a requirement for providing offline key entry on an IBM 3740 Data Entry System. If an IBM 3742 is to be used, it must have the 128-Character Record feature (#5455) and Feature Group A (#4004).

Many functions have been included to protect the integrity of the master files, programs, procedures and libraries. Because of this, no other licensed program or user-written programs may co-reside unless stringent coding requirements for these programs are met to insure compatibility with the Medical Group Management System. The *Application Logic Manual* discusses in detail the coding conventions used for the development of the Medical Group Management System.

SOFTWARE REQUIREMENTS

The IBM System/34 licensed programs are written in IBM System/34 RPG II programming language and executed under control of the IBM System/34 System Support licensed program (5726-SS1). IBM System/34 Utilities licensed program (5726-UT1), which includes Sort, Data File Utility, Source Entry Utility, and Workstation Utility, is required for execution of the program. The IBM System/34 RPG II Compiler (5726-RG1) is required if modifications to the source code are necessary.

DOCUMENTATION

(available from Mechanicsburg)

**SYSTEM/34 MEDICAL GROUP MANAGEMENT SYSTEM II
5726-H16****PURPOSE**

The IBM System/34 Medical Group Management System II is designed to provide an accounts receivable and third-party claims system for doctors, groups of doctors, or clinics. The basic system is derived from the System/32 Medical Group Management System IAP. For System/32 users, programs are provided to convert master files from the System/32 to the System/34 format.

HIGHLIGHTS

- The System/34 hardware and software functions - spooling, inquiry, and multiprogramming - are integral parts of the application design.
- Workstation data entry is designed for simplicity and ease-of-use. Screen displays provide guidance for entering data.
- Data entry for multiple work stations with batch programs operating from the job queue.
- Inquiry into master files concurrent with data entry and batch programs.
- System tailoring procedure permits the user to select optional functions and determine the size of files used by the application. Functions and file sizes may be modified as the environment changes by reexecuting the tailoring procedure.
- Source code, ready-to-execute procedures, and object code provided. No additional systems design, programming, or compiling is required.
- File load programs for all master files are provided. Data can be entered from the workstation or diskette.
- File maintenance of master files and printed registers for control and auditing.
- Optional master file backup to diskettes and transaction file backup to diskettes.
- Password security to deter unauthorized use of application procedures.
- Documentation for the Medical Group Management System II includes an application installation guide, an application reference manual, a runbook, and an application logic manual. Self-study instructional materials are also available for operator education.
- Extensive control features and documents are included to assist in establishing audit trails.

DESCRIPTION

The Medical Group Management System II is a set of ready-to-execute application programs for groups of doctors. The application has certain required records within an application control file which contain questionnaire responses. Users can select file sizes and functions to suit their needs. The questionnaire responses are entered during initial installation and may be changed as needed. The System Tailoring Procedure allows these responses to be entered or modified. It provides the following:

- Tailors the application and Operator Control Language (OCL) on-site at installation time.
- Allows the user to activate and deactivate provided functions as the user's business changes.
- All functions are included in the application programs, but only required functions are executed.
- Allows changes to file sizes as needed by rerunning the System Tailoring Procedure.

The application installation guide for the Medical Group Management System II provides detailed step-by-step instructions for use in preinstallation, installation and postinstallation activities in order to achieve productive operation. These instructions include sample numbering systems, sample input and maintenance data forms, file loading sequences, and control forms with suggested procedures.

The application reference manual is provided to enable the user to understand the application from a functional and operational standpoint. It contains information for the installation manager to supervise the system console operator, and to run the application from a total systems viewpoint. It also provides the user department manager with information needed to supervise the workstation operator, and to understand the application at a detailed level.

A runbook is provided for the systems console operator and for the workstation operator. This runbook contains detailed instructions for the application procedures, an overview of the system and application flow, system considerations, hints for troubleshooting, and all of the error messages that can be generated.

An application logic manual is provided, as licensed material, for use by the self-sufficient customer and the systems engineer for maintaining and modifying the Medical Group Management System II. Information on architecture, naming conventions, controls, program functions and

specifications, relationships among files, and other information applicable to the application is presented.

Instructional support is provided to facilitate installation and operation. The Installation Planning Self-Study material provides guidance in the use of the installation guide and the application reference manual. Instructional material for self-study is provided for the systems console operator and the application workstation operator to instruct them in the use of the runbook.

Functions and Features

- Support designed as 'family' billing system
- User-defined fiscal year-ending month
- Preprinted charge slips
- Sequential charge slip reference numbers
- Charge slip reconciliation
- Supplemental statements used by patients to file major medical claims or for income tax purposes
- Supplemental claims used for rebilling insurance
- Third-party claims printed at any time during the month
- Four different claim formats
- Superbill statements
- Reference number optional on all accounting entries for ease of auditing
- Selective aging reports
- Selective printing of collection messages on patient statements
- Finance charge applied to selected accounts
- Revenue report by doctor comparing current year to past
- Analysis for each doctor of procedures and diagnoses on a calendar year basis
- Cash accounting by doctor
- History transactions kept on disk for the number of months specified

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified environment:

HARDWARE REQUIREMENTS

This IBM licensed program will execute on all models of the IBM System/34 with a minimum of 48K bytes of main storage.

Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries. Design features have been incorporated into the application to allow for co-residency of other applications and/or user-written programs with minimum restrictions. Consult the application logic manual for further explanation of these restrictions.

SOFTWARE REQUIREMENTS

The IBM System/34 licensed programs are written in IBM System/34 RPG II programming language and executed under control of the IBM System/34 System Support licensed program (5726-SS1). The IBM System/34 Utilities licensed program (5726-UT1), which includes Sort, Data File Utility, Source Entry Utility, and Workstation Utility, is required for execution of the programs. The IBM System/34 RPG II Compiler (5726-RG1) is required if modifications to the source code are desired.

PROGRAM PRODUCTS

**SYSTEM/34 IDEOGRAPHIC GENERATOR/SORT
5726-IG1****PURPOSE**

This IBM System/34 program consists of two utilities that provide users with the capability of designing ideographic characters and of arranging ideographic records according to various sequences.

DESCRIPTION**IDEOGRAPHIC SORT**

The Ideographic Sort utility arranges records in an output file according to the user's specifications and the data in each record of the original file.

Sort selects records from the original file and places them in an output file in the order you have defined (ascending, descending, or special sequence). The sorted output file can contain all or some of the records from the original file. The sorted file can also contain all or some of the fields from each record of the original file.

The user has the ability to select between five types of control fields for sorting the ideographic fields in the records.

1. Stroke/Radical/Tie-Breaker
2. Radical/Stroke/Tie-Breaker
3. Single Pronunciation/Stroke/Radical/Tie-Breaker
4. Single Pronunciation/Radical/Stroke/Tie-Breaker
5. Character Type

Sort tables are provided, addressed by an ideographic hexadecimal value, which contain as entries the 2-byte sequence numbers for each of the five types of control fields. One or more of the five tables are utilized to sort the fields by one of the above five rules. Sei-on or alphameric pronunciation control fields may optionally be selected by the user.

This method allows the user to define his own sorting sequence, and with equal ease, support the more common sequences like:

- Single Pronunciation
- Japanese Word Dictionary
- Telephone Book
- Word Index Type (A) and (B)
- Kanji Dictionary Type (A) and (B)

The customer may optionally include additional field(s) in the record which gives the pronunciation(s) of the field being sorted.

The fields in the original file can be all ideographic fields, all alphameric fields, or a combination of ideographic and alphameric fields. One can select and sort on any type of field.

The Ideographic Sort program can be used with DFU to generate a file of the locations (addresses) of the records in the original file so you can process and print the records in a different sequence without changing their order on disk and without creating another file with the same data.

The Ideographic Sort program also provides the following functions contained in the regular System/34 sort:

- Multiple record types
- Record selection based on field contents
- ADDROUT (tag) sort
- Tagalong sort
- Summary tagalong sort
- Automatically allocated work file
- Ascending, descending, or user-defined sequence
- Dynamically adjusts to region size available
- Reformatting of records in a file

IDEOGRAPHIC CHARACTER GENERATOR

The Ideographic Character Generator utility can be used by System/34 operators and programmers to graphically create, change, and delete user-defined characters. Up to 4,370 user-generated ideographic characters can be added and maintained in addition to the 7,190 characters in the preprogrammed character set.

The ideographic character generator allows the interactive creation and change of characters. Thus, the user can review the appearance of a new or changed character before writing it into the user-defined character file. A printout of the new character in a large format as well as the actual size can be requested to update a user directory of characters.

The character generator also allows the entry of sort information to update the sort master table for characters created, changed and deleted in the user-created character file. In addition, the single

pronunciation files for a portion of the preprogrammed characters in the sort master table can be changed.

This utility also prints all or portions of the user-defined, user-generated characters in convenient formats for documentation.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The IBM System/34 Ideographic Generator/Sort licensed program runs on all models of the System/34 equipped with Work Station Control Expansion C (#4902).

SOFTWARE REQUIREMENTS

The current version of the IBM System/34 Ideographic Generator/Sort licensed program (5726-IG1, #9143 or #9149) operates under control of the current version of the IBM System/34 System Support Program (5726-SS1, #9143 or #9149).

Educational Allowance: The IBM System/34 Ideographic Generator/Sort licensed program qualifies for the IBM Educational Allowance Plan. See Announcement Letter GS79-110.

Program Use During Customer Preinstallation Testing: The IBM System/34 Ideographic Generator/Sort licensed program (5726-IG1, #9143 or #9149) is available to customers for preinstallation testing on IBM Test Center systems in accordance with the IBM Program Testing Policy.

RPOs ACCEPTED: No

Ordering Information: Contact IBM.

PROGRAM PRODUCTS

**SYSTEM/34 IDEOGRAPHIC CHARACTER GENERATOR
SUBSET (5726-IG2)**

PURPOSE

This IBM System/34 program consists of a utility that provides users with the capacity of designing additional ideographic characters.

DESCRIPTION

The Ideographic Character Generator utility can be used by System/34 operators and programmers to graphically create, list, change, and delete user-defined characters. Up to 4,370 user-generated ideographic characters can be added and maintained in addition to the 7,190 characters in the preprogrammed character set.

The Ideographic Character Generator utility allows an interactive graphic creation and change of a new or changed character before writing it into the user-defined character file. A printout of the new character in a large format, as well as the actual size, can be requested to update a user directory of characters.

This utility also prints all or some of the user-defined characters in convenient formats for documentation.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM System/34 Ideographic Character Generator Subset runs on all models of the System/34 equipped with Work Station Control Expansion C (#4902).

SOFTWARE REQUIREMENTS

The current version of the IBM System/34 Ideographic Character Generator Subset (5726-IG2) operates under control of the current version of the IBM System/34 System Support Program (5726-SS2).

Program Use During Customer Preinstallation Testing: The IBM System/34 Ideographic Character Generator Subset (5726-IG2) is available to customers for preinstallation testing on IBM Test Center systems in accordance with the IBM Program Testing Policy.

Educational Allowance: The IBM System/34 Ideographic Character Generator Subset (5726-IG2) qualifies for the IBM Educational Allowance Plan. See Announcement Letter GS79-122, dated October 25, 1979.

MEMBERSHIP AND MAILING LIST SYSTEM FOR SYSTEM/34 (Single Program Mode) 5726-K11

PURPOSE

Associations are constituted to serve their memberships. Their prime functions are information retrieval and dissemination, establishment of standards and ethics, research, and representing their members to external agencies. Items of general interest are disseminated through association publications sent through the postal service. However, the need often exists to make specialized mailings to selected members with specific characteristics. Information exchange also takes place at events sponsored by associations. Associations, then, have data processing needs characterized by large data bases which must be processed in total but with the ability to process individual records or groups of records on a selective or exception basis.

HIGHLIGHTS

The Membership and Mailing List System provides an economical approach for the needs of business and professional associations. It addresses the following areas:

Data Base Management

- Interrelates up to 10 master files into a single data base
- Nonredundant data base (duplicate records eliminated)
- Can be installed as: Single file system (members are individuals); dual-file system (members are companies with mailing sent to and events attended by individuals). Usage of other master files is optional as needed.
- Full maintenance procedures.

Cash Accounting

- Invoices generated for dues and publications
- Balance forward accounts maintained for dues
- Cash application through file maintenance runs

Mailing Labels

- One-up or four-up
- Names and addresses vertically and horizontally aligned
- Produced from the data base on user-defined selection criteria
- Zip code changes noted and count shown

Membership and Association Services

- Membership cards
- 3" x 5" information cards
- Membership rosters, dynamic listings, and profiles
- Data file inquiry

Analyze Procedure

- Provides a means to select and sequence subsets from the data base
- Used for: Statistical profiles; input to all of the above runs; input to a preformatted dynamic listing program - for management review and analysis.
- Installation through a system control file which allows implementation of user options and printed descriptions without recompilation
- Inquiry capability to display or print individual member's records
- Comprehensive transaction editing prior to update
- Member identification codes can be chosen by the association (11 characters or less) - A suggested format is included.

DESCRIPTION

The Membership and Mailing List System organizes the vital records of an association into a comprehensive data base. The data base is modular in design so that only those portions which are required for user-desired functions need to be implemented. For example, if the association does not maintain its membership in a chapter structure, the chapter file is not used. Similarly, if it has no interest in knowing who sponsored a member for membership, the sponsor file is not used. The basic decision to be reached regarding the optionality of files, however, concerns the manner in which the association structures its membership and what dues functions are required. A typical difference between business associations and professional organizations is that business associations tend to have companies as members, while professional organizations tend to have individuals as members. The Membership and Mailing List System accounts for this difference by separating the dues function from the mail function. Data required to implement these two functions is separated into two discrete files: The dues file and the mail file.

If your customer has company members with individuals within the company receiving mail, both files would be used (dual file system). If, however, the members of the association are individuals, either the dues file or the mail file, or both, may be used. If partial payments are to be accepted and the association has only one publication that it distributes, the dues file should be implemented. If the association has multiple publications with different payment rates and accepts full payment only, the mail file should be implemented. However, whichever file is implemented, the basic cash accounting and mailing functions are provided. The optional nature of the data base files is implemented through a Systems Control File without need for recompilation. Consult the *Membership and Mailing List System Installation Guide* for further information.

The following sections describe system highlights in three important functional areas: Accounting, mailing, and service.

Accounting Functions

Invoicing: Invoices are generated for both dues and publications. The dues invoice shows the balance brought forward, the current dues amount, and a new total owed. An optional special charge amount (such as an initiation fee) can also be included. First dues billing for new members can be prorated. Publication invoices can handle amounts for two separate publications (mail file). Both types of invoices as well as follow-up notices are prepared on user-defined billing cycles and frequencies.

Cash Application: Cash can be applied to dues on a partial payment basis (dues file only) or on a full payment required basis. Payments for publication subscription can be applied in even increments of the base subscription rate with automatic calculation of the 'paid to' date. Cash receipts can also be applied for registration fees for association-sponsored events.

Mailing Functions

Mailing Labels: Mailing labels are prepared for user-defined subsets of the data base. The selection is dynamic. User defined parameters for inclusion/exclusion and sequencing are keyed prior to the label run. The labels can be printed one-up or four-up with names and addresses horizontally and vertically aligned. Changes in zip code (if the labels are sequenced by zip code) can be highlighted to facilitate mailing bundling. Mailing type is noted, that is sample publications.

Circulation Reports: This report recaps totals by state, zip code, or type of mailing for each mailing. It can be used for advertising ratesetting by showing circulation demographics.

Membership/Association Service Functions

Membership Cards: Membership identification cards can be prepared showing member's name and current membership period.

3" x 5" Information Cards: These cards can be prepared with user-defined inclusion/exclusion and sequencing criteria. They are useful for such functions as convention registration, direct sales follow-up, etc.

Rosters: Periodic alphabetic listings of the membership, mailing lists, or event participation can be prepared for reference.

Membership Profile: Profiles of all information regarding members can be printed and sent for review and correction. Therefore, it can serve as a turnaround document to maintain the accuracy of the data base.

Additional Features: The Membership and Mailing List System is designed to meet the needs of associations by producing standard printouts of selected input. Input inclusion/exclusion and sequencing criteria are entered through a simple ANALYZE command. This feature provides great flexibility to your customer. For example, the system does not arbitrarily send follow-up notices for dues or publication invoices after a fixed period. Your customer can implement a 30 or 60 day follow-up policy by simply entering the appropriate 30 or 60 day parameter into the ANALYZE command prior to running the follow-up procedure. Analysis report formats have been established for each major file. The use of the ANALYZE command in conjunction with these report programs gives the user a dynamic listing capability to answer needs as they occur. The ANALYZE command can also be used without a subsequent report to develop statistical profiles (demographic analysis) of the membership.

The optional files are implemented and descriptions are supplied to the programs by answering a questionnaire. The responses are then entered into a systems control file. Other options addressed on the questionnaire include such policy matters as invoicing frequency and dues proration for new members.

An inquiry capability is provided through the Data File Utilities (DFU) to indicate individual records on the System/34 display screen or to print the records.

The System/34 licensed program makes available the Membership and Mailing List System on System/34 in single program mode. The System/34 supports one workstation, no spooling, no multiprogramming and no file sharing.

PROGRAM PRODUCTS

S/34 Membership and Mailing List System (cont'd)

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

This licensed program will execute on all models of the IBM System/34.

Information regarding disk allocation and usage (master and transaction files) and recommended backup levels and diskette requirements will be available in the *Installation Guide* (LB30-0235).

The OCL and file sizes, as distributed, will be fixed at the maximum capacity and normal distribution for utilizing 5 megabytes of disk.

Any changes to file sizes should be carefully reviewed by the customer and IBM Systems Engineering to determine the necessity for more storage, estimate the time required to convert OCL procedures, and estimate throughput performance.

SOFTWARE REQUIREMENTS

The Membership and Mailing List System programs for the IBM System/34 are written in IBM System/32 RPG II and operate under control of IBM System/34 System Support Program (5726-SS1). In addition, the IBM System/34 Utilities licensed program (5726-UT1) must be available for sorting of data (Sort), entering transactions with the Data File Utilities (DFU) and for making source program corrections with Source Entry Utility (SEU). If compilation of the RPG II Source Programs is required, the IBM System/34 RPG II Compiler (5726-RG1) and Source Entry Utility (SEU), for making RPG II program corrections, must be available.

CONVERSION

The Membership and Mailing List System requires loading of a large volume of data. This may make use of the System/34 keyboard inadvisable for conversion input. Programs are supplied to load the files from diskettes produced by the IBM 3740 Data Entry System. Discussing conversion approaches and schedules with your customer or prospect will be a key element in your installation planning process.

DOCUMENTATION

TERMS and CONDITIONS: See PP Index

5230 DATA COLLECTION SYSTEM SUPPORT FOR SYSTEM/34 (5726-M3A)

PURPOSE

The IBM 5230 Data Collection System Support for System/34 provides the manufacturer with a convenient, practical means of preparing shop floor data for processing by the Manufacturing Management Accounting System (MMAS) application programs. Data collected by the IBM 5230 Data Collection System is edited, consolidated, and formatted for processing by the MMAS Payroll, Inventory Management, and Production Status and Costing IAPs, or for user-written manufacturing management systems (with appropriate changes to the output modules).

HIGHLIGHTS

- Interrelated to MMAS applications:
 - Elapsed time calculation for Payroll
 - Material receipt and issue data for Inventory Management
 - Job time for Production Status and Costing
- Management reports generated as a byproduct of data entry
 - Option to print or not print all reports except error reports and audit summaries
 - Labor report by foreman for checking
 - Attendance and absentee reports
- Provides internal cross-checking and editing
 - Jobs started checked against jobs stopped
 - Employee time on jobs checked against time and attendance record
 - Transaction records checked for complete and accurate entry
- Provides automatic generation of machine-readable editing
 - Reduces transcription errors
 - Eliminates time keeper calculation of elapsed time
 - Supports up to 40 different shifts to provide added flexibility for special starting times, lunch and other break times, and unique weekend schedules
- Can be installed without customer programming capability
 - System tailoring procedure facilitates account growth by allowing on-site changes to file sizes and determination of functions used
 - File maintenance and audit procedures
 - Easy-to-use runbook
 - Step-by-step installation activity plan provided by the *Application Reference Manual*
 - User's information supplied to the supervisor by the *Application Reference Manual*

DESCRIPTION

The 5230 Data Collection System Support for System/34 licensed program provides two phases of operations: 5230 personalization phase and a data conversion phase.

The 5230 personalization provides a menu of actions from which users select those that best fit their operation. Using the menu selections and loop definitions for up to three 5231 Controllers with up to four loops each, this phase creates the personalization records required to personalize the 5230 Data Collection System.

The data conversion phase prepares the data received from the 5230 Data Collections System for processing by the MMAS applications. The data can be accepted through the data communications facilities, or the diskette offered as output options by the 5230 Data Collection System.

Both material transactions and labor transactions are prepared by the application program. The material transactions are edited, listed, formatted, and stored for later use by the Inventory Management and Production Status and Costing applications. Labor transactions are expanded, edited, checked for accuracy, and adjusted for break and lunch times. They are also adjusted for lunch and shift start-stop time variances. The elapsed time for time and attendance and job time is calculated, and job time applied to overlapping jobs is apportioned to the jobs. Time and attendance totals are checked against job time totals with warning messages printed for differences that exceed user-prescribed limits. A correction procedure is included to allow for changing incorrect labor transactions. The results of the labor transaction processing are stored for later use by the Payroll and Production Status and Costing applications.

Reports are printed, at the user's option, for material transactions and for labor transactions. The material transactions report is a single listing. Labor transaction reports provide labor-related information suitable for management review, and checking by foremen for correctness. Attendance and absentee reports are also printed.

This program augments the MMAS cross-application Constants File with its own questionnaire responses. These records allow the application to select certain options for the procedures to be used. The questionnaire responses are keyed during initial installation and may be changed as needed.

An application reference manual provides a step-by-step installation activity plan including sample input and maintenance data forms, file loading sequences, and control forms with suggested procedures. This manual also provides information on the day-to-day use of the application.

The runbook provides the operator with a detailed and easy-to-use set of instructions showing all the activities.

An application logic manual is provided for use by the self-sufficient customer and for systems engineering continuing support. It describes the architecture of programs, procedures, data base cross-references, data dictionary, and detailed descriptions of the program.

Data Collection System Support for System/34 executes on System/34 in single program mode. The System/34 feature supports one workstation, no spooling, no multiprogramming and no file sharing.

Applications Description - The 5230 Data Collection System Support for System/34 is a ready-to-execute program. The application program includes source code, object code, execution procedures, and the application logic manual.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM 5230 Data Collection Support for System/34 will execute on all models of the IBM System/34 with a minimum of 48K of main storage with a 64-character print set (specify codes #9496 or #9498). The programs are compiled assuming a 48K system and operate in single program mode. If data communications features are to be used, the Binary Synchronous Communications Adapter feature (#2074) must be installed in the IBM 5230 System Unit.

SOFTWARE REQUIREMENTS

The IBM System/34 feature application programs are written in System/34 RPG II programming language and executed under control of the IBM System/34 System Support Program (5726-SS1). IBM System/34 Utilities licensed program (5726-UT1), which includes Sort, Data File Utility, Source Entry Utility, and Workstation Utility is required for execution of the programs. The IBM System/34 RPG II Compiler (5726-RG1) is required if modifications to the source code are necessary.

MANUFACTURING MANAGEMENT ACCOUNTING SYSTEM (MMAS) FOR SYSTEM/34

- PRODUCTION STATUS AND COSTING ... 5726-M31
- PAYROLL ... 5726-M32
- ACCOUNTS PAYABLE ... 5726-M33
- ACCOUNTS RECEIVABLE ... 5726-M34
- INVENTORY MANAGEMENT ... 5726-M35
- PRODUCT DEFINITION AND COSTING ... 5726-M36
- GENERAL LEDGER ... 5726-M37
- SALES ANALYSIS ... 5726-M38
- ORDER ENTRY AND INVOICING ... 5728-M39

PURPOSE

The IBM Manufacturing Management Accounting System (MMAS) provides the manufacturer with a powerful aid in managing the business.

MMAS offers flexible applications specifically designed for the manufacturing industry. MMAS provides key reports to help management direct and control their business effectively.

HIGHLIGHTS

- Independent or interrelated applications approach:
 - Modular design facilitates sequential application installation
 - Single data entry results in multiple application updates
 - Modular design allows users to choose the applications that address problem areas
- Wide variety of reports and report options included:
 - Management reporting is a byproduct of normal data entry
 - Certain reports (Statements, 941-As, and W-2s) can be saved on diskette for later printing
 - Detail or summary listings within a range of keys is supported in many reports
- Uses recognized accounting techniques and terminology to provide a solid accounting system:
 - Clear audit trails and control techniques are provided
 - Sample user-oriented forms for data preparation, file creation, audit and control are provided
 - Security code deters unauthorized inquiry or execution of key programs in each application
 - A Journal Reference Numbering System supplies audit trail for any application that automatically generates transactions into the General Ledger
- Provides manufacturers with an easy-to-use method for organizing and using manufacturing information such as bills-of-material, product cost, and shop order or job cost.
- MMAS can be installed without customer programming capability:
 - System tailoring procedure facilitates account growth by allowing on-site changes to file sizes and determination of functions used
 - File maintenance and audit procedures
 - Easy-to-use runbook
 - Step-by-step installation activity plan provided by the *Application Installation Guide*
 - User's information supplied to the supervisor by the application reference manuals

DESCRIPTION

The Manufacturing Management Accounting System consists of nine full-function, ready-to-execute applications. MMAS includes source code, object code, execution procedures, and application logic manual.

There are some general features which all applications have:

- Designed to fit industry requirements
- Security codes to deter unauthorized use of master files
- In-house inclusion/exclusion of functions to be executed
- OCL procedures, Sort specifications, and processing programs are packaged into logical work units which simplify system operation
- Monitoring of execution sequence prevents execution of a program until preceding programs have been completely and successfully executed
- Compatible online/offline data entry through the system console or by means of diskettes created on a 3740 Data Entry System
- Dynamic Backup and Recovery System forces periodic backup of master files and edited transactions, and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files
- Reprint options are possible because file updating is separated from report writing functions
- Some report printing can be deferred to a more convenient time
- Selective printing options are available for many report functions

PRODUCTION STATUS AND COSTING (5726-M31)

This application provides management information on Jobs or Shop Orders from the point of release to the shop floor through the closing process. Also, it provides a means to build and maintain a job select file for retaining and releasing repetitive or standard jobs. This file contains information at an operation and material level.

Jobs or Shop Orders may be released from the job select file and/or manually based on individual requirements. During the release function, the shop data base is created to provide for editing of feedback from the shop floor and for management reports. In addition to the creation of a shop data base, the release function creates a job worksheet to move with the work, and a group of labor tickets for labor reporting.

The report function provides a variety of production and accounting reports such as Job Status, Work List, and exception reporting for quantity variance or cost variance. These reports reflect variance from projection on both production and accounting information and may be obtained in summary or detailed format.

The updating function records information from the shop floor to the shop data base at the operation and material detail level. Updates to the shop data base occur via labor, move, material issue, miscellaneous, outside operations and material receipts transactions. These transactions reflect the activity (hours and cost) and movement (quantity) of Jobs or Shop Orders as they progress through the manufacturing facility. Transactions may be entered either manually or from other applications (Payroll, Inventory Management, and Accounts Payable) via the application interface.

Upon completion of a job, the closeout function produces closeout reports in both production and accounting formats to allow the analysis of labor and cost projections against actual. After producing these reports, the closed Jobs or Shop Orders are removed from the shop data base.

PAYROLL (5726-M32)

This hourly/salary/executive payroll provides for regular, overtime, premium, vacation, and sick pay. It may be run weekly, biweekly, semimonthly, monthly. Hours may be entered daily or by pay period; if selected, balancing time worked to attendance may be accomplished daily or weekly. Exception hours provide time and one-half, double time, and triple time capabilities. Rates may be selected from the Employee Master Record or keyed in as an override. Shift differential capabilities are provided for second and third shift. The differential may be defined as a percentage of the rate or cents to be added to the rate.

Vacation/Holiday pay may be part of a regular pay check or on a separate check. A bonus payment is paid on a separate check with a flat percentage of income tax deducted. Sick pay may be fully nontaxable or only liable for income tax. Wages subject to Federal Unemployment Insurance (FUI) and State Unemployment Insurance (SUI) are determined.

The ability to handle taxable or nontaxable adjustments, pay advances, and employer-paid union benefits (taxable and nontaxable) is also provided. Once the gross earnings is calculated, deductions will be taken to reach net pay. In addition to calculating present Federal and FICA taxes, a standard tax algorithm is provided to calculate most present state taxes based upon customer-provided data. Local taxes may also fit the standard tax algorithm provided. The state disability insurance deductions also use a standard algorithm based upon customer-provided data. Miscellaneous deductions may be taken by percent, fixed amount, hourly rate, upper limit, or cyclic within a user-specified frequency. Union deductions may be taken by percent, hourly rate, or fixed amount within a user-specified frequency.

Handwritten paychecks and paychecks never cashed (reversals) are also supported by the application. Once the payroll register and checks are printed, many analysis reports are produced: Labor Distribution, Job Distribution, Miscellaneous Deductions, Union Deductions, YTD/QTD Earnings, Workmen's Compensation Worksheet, and Payroll Journal. W-2 and 941-A reports are also provided.

The capability is provided to pass transactions to the General Ledger application, if installed. These transactions will be applied towards company one only. Payroll may be on either a cash or accrual basis. If the cash basis is selected, no transactions are passed to the General Ledger.

ACCOUNTS PAYABLE (5726-M33)

The Accounts Payable application provides an open payables and cash disbursements function on either an accrual or cash basis. Invoices and credit memos entered may be multi-lined and distributed by job, item number, cost type and General Ledger account number. Entries may be for standard or one-time vendors and may be open or prepaid. Credit memos may be entered manually or initiated automatically based upon a previously entered open invoice.

A Purchase Journal provides the audit trail for cost transactions entering into the General Ledger system and into the open payables file. An Open Payables Report is provided in due date or vendor sequence. This turnaround document provides a mechanism to indicate payment

MMAS for S/34 (cont'd)

by date, vendor, or invoice, including partial payments, for Cash Disbursements. Invoices may be entered or placed in hold status to prevent inadvertent payment of invoices in question.

A Cash Requirements Report is used to assist the controller in insuring sufficient funds are available and proper invoice selection was made before the checkwriting procedure begins. The Cash Disbursements Journal provides an audit trail for its transactions entering the General Ledger application, and acts as the Check Register. Checkwriting and reconciliation are also provided.

A Vendor Analysis Report indicates key business volumes and discounts lost and taken for previous year and current year.

ACCOUNTS RECEIVABLE (5726-M34)

The Accounts Receivable application supports a combination of both open-item and balance-forward customers. Billing transactions are directly keyed, or accepted from Open Entry and Invoicing, if that application is installed.

All transactions (that is, invoices, cash receipts, adjustments, and credit memos) are retained in an Open-Item File. This file may be purged daily or monthly at the user's request. An Aged Trial Balance with current plus four past periods is provided. It has multiple printing options (summary, detail, selected line, within limits). Delinquency Notices may also be printed. Late charges can be calculated for balance forward customers.

Two optional formats are provided for the customer statements which are printed at month end. The capability is provided to delay the printing of the statements until a more convenient time without affecting the closing of the books. An account status inquiry feature is also provided.

INVENTORY MANAGEMENT (5726-M35)

The Inventory application maintains a perpetual inventory and on-order status for each item. It calculates and prints on demand numerous management figures including: Economic order quantity, dollar profit and percent of profit, average monthly usage, turnover rate and reorder point. Management reports are also provided: ABC Analysis Report, two types of Stock Status, Inventory Analysis Report, Physical Inventory Checklist, On-order Status Reports, Inventory Valuation and Variance Report, and Inventory Reorder Report. It can also interface with Order Entry and Invoicing, Sales Analysis, Product Definition and Costing, and Production Status and Costing.

PRODUCT DEFINITION AND COSTING (5726-M36)

Product Definition and Costing provides manufacturers with an easy-to-use method of organizing bills-of-material and item information, and calculating product costs using bills-of-material. Costs are built from raw material up to the finished end-item. Assembly costs may be recalculated when there is a change in the bill-of-material or in the assembly labor or material costs or burden. The user can simulate the effect of proposed cost changes in end-item costs due to changes in labor, material or burden cost.

For all product costs the total cost of purchased parts is maintained separately as material cost. These costs are calculated and maintained level by level, and make it possible for the user to identify the added value (labor, burden) for products and assemblies for tax purposes.

Management reports can be produced when required since the cost information is stored in the Product Definition and Costing data base. These reports include costed bills-of-material, cost reports reflecting either real or potential cost changes and variances (simulations), and special vendor where-used and final assembly where-used lists. The basic formats used for parts lists and where-used lists are single level, indented and summarized.

GENERAL LEDGER (5726-M37)

This application combines all the transactions affecting the financial status of the company during the month. They may be entered directly as a General Journal Entry or may have been previously entered through interface with Accounts Payable or Payroll. At month-end closing time, Audit Registers and the Financial Statement Worksheet are provided to help verify that the user is still in balance before proceeding into the actual closing. The reports will also aid in generation of any necessary closing entries.

An Income Statement and Balance Sheet are standard report outputs. The user can define these reports with an easy-to-use format description procedure. The financial reports can illustrate current financial data as compared to budget or historical information.

Users may define their own Chart of Accounts or use a suggested account structure provided with the application.

The fiscal year start month is user-defined. Multiple company support for up to ten companies is included. Any transactions passed from Payroll or Accounts Payable are applied to the first company only.

SALES ANALYSIS (5726-M38)

Sales Analysis reports summarize the activity and highlight the performance of items, customers, and/or salespersons. Selected

reports may be printed in detail or summary, depending on the option selected at printing time. Since all data used in Sales Analysis can be entered through Order Entry and Invoicing, it should be installed to obtain full benefit of the Sales Analysis application. If Sales Analysis is installed with Accounts Receivable alone, only Salesperson and Customer Sales Analysis can be obtained; or with Inventory Management alone, only Item Sales Analysis can be obtained.

ORDER ENTRY AND INVOICING (5726-M39)

This postbilling application includes order entry and edit, invoicing, and preparation of an Invoice Register and Price Lists. The Order Acknowledgement will show warehouse location, while the Picking List is printed in warehouse sequence. Pricing options include selection of the actual selling price, a discount percent from a list price, operator-entered price, or a contract price by customer. Up to six user-assigned discount percentages by item and up to three tax percentages are provided. Quantity break prices can be established optionally by item.

Order status and backorder status is provided by item, customer, or due date. Support is also provided for partial shipments and back ordering or cancellation of the balance of the order. This application provides data for input into Inventory Management, Accounts Receivable, and Sales Analysis.

Two invoice formats are available. Picking List is optional and can be run either at order entry time or just prior to billing. Order Acknowledgements are optional and may optionally be printed with prices.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continuing day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Each of these licensed programs will execute on all models of the IBM System/34 with a minimum of 48K of main storage. The programs are compiled assuming a 48K minimum system. It is not intended that any one customer install all nine applications on one IBM System/34. Because of volumes and time constraints, there may be a requirement for providing offline keying on an IBM 3740 Data Entry System. If an IBM 3742 is to be used, it must have the 128-character record features [128-character (#5455) and feature group A (#4004)].

The Manufacturing Management Accounting System is intended to be an independent yet interrelated set of applications. Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries. Because of this, no other application program or user-written program may co-reside with any MMAS application unless stringent coding requirements for these programs are met to insure compatibility with the MMAS applications.

SOFTWARE REQUIREMENTS

The IBM System/34 application programs are written in System/32 RPG II programming language and executed under control of the IBM System/34 System Support Program (5726-SS1 Version 1). IBM System/34 Utilities licensed program (5726-UT1), which includes Sort, Data File Utility, Source Entry Utility, and Workstation Utility is required for execution of the programs. The IBM System/34 RPG II Compiler (5726-RG1) is required if modifications to the source code are necessary.

PURPOSE

The IBM System/34 Manufacturing Accounting and Production Information Control System (MAPICS) provides an integrated and comprehensive workstation-oriented accounting, financial, and manufacturing control system for the small-to-medium manufacturer and some of the like process industries. The Accounts Payable, General Ledger, and Payroll applications are designed to meet the needs of both the manufacturer and the distributor. These three applications are included in the twelve applications of MAPICS, and are also marketed as Distribution Financial Accounting System II (DFAS II) to the distribution industries.

HIGHLIGHTS

- The System/34 hardware and system software functions - spooling, inquiry, multiprogramming - are integral parts of the MAPICS application design.
- Workstation data entry is designed for simplicity and ease-of-use. Screen displays provide guidance for mandatory input and for fields that may be overridden. Error messages signal errors which can then be corrected interactively by the operator.
- Interactive data entry, concurrent edit and correction for multiple applications through multiple workstations while batch programs operate in the background.
- Inquiry into master files concurrent with data entry.
- System tailoring procedures permit the user to select optional functions and reports, and to determine the sizes of all files used by the applications. Functions and file sizing may be modified as the customer environment changes by reexecuting the tailoring procedures.
- Source code ready-to-execute procedures, and object code are provided. Although no additional systems design, programming, or compiling is required, the system design incorporates features to assist the user in the modification of source code.
- File load programs for master files are provided, as well as file conversion programs for System/32 MMAS and DFAS files, System/34 MMAS and DFAS files, and System/3 and System/32 DCSS files to the System/34 format.
- Online file maintenance of most master files with optional file maintenance reports.
- Optional system procedures for master file backup and restart.
- Password security helps deter unauthorized use of applications and functions within applications. A higher level of security helps protect selected master file data.
- Documentation for each application includes a reference manual, a runbook, and a logic manual. From an overall MAPICS system perspective, an installation guide, a reference manual, a runbook, and a logic manual are provided. Self-study instructional materials are also available for operator education.
- Sample documents are provided for both data collection and data entry.
- Control features and documents are included to assist in establishing audit trails.

DESCRIPTION

MAPICS is a set of twelve independent, but interrelated, ready-to-execute applications for the small to medium-sized manufacturer:

- Order Processing and Accounting Applications
 - Order Entry and Invoicing
 - Inventory Management
 - Accounts Receivable
 - Sales Analysis
- Financial Applications

- General Ledger
- Accounts Payable
- Payroll

- Manufacturing Applications
 - Product Data Management
 - Material Requirements Planning
 - Production Control and Costing
 - Capacity Requirements Planning
- Data Collection
 - Data Collection System Support

These applications are designed for marketing in any combination and installing in any sequence, with the following exceptions:

- Sales Analysis requires at least one of the other Order Processing and Accounting applications.
- Material Requirements Planning requires both Inventory Management and Product Data Management.
- Production Control and Costing requires the Inventory Management application. (Although Product Data Management is not an absolute requirement, its use is highly recommended.)
- Capacity Requirements Planning always requires the Inventory Management application and either Product Data Management or Production Control and Costing.

Each application has certain required records within a cross-application control file which contain questionnaire responses. These records allow the users to select report formats, file sizes, and functions to suit their needs. The questionnaire responses are entered during initial installation and may be changed as needed. The System Tailoring Procedures allow these responses to be entered or modified. It provides the following:

- All functions are included in the application programs but only required functions are actually executed.
- Allows the user to activate and deactivate provided functions as the user's business changes
- Tailors the Operator Control Language (OCL) on-site at installation time
- File sizes may be expanded or contracted as needed by rerunning the system tailoring procedure

The *MAPICS Installation Guide* provides instructions for planning the installation of one or more MAPICS applications. One installation guide is provided for the twelve MAPICS applications.

Reference manuals provide an explanation of the system to enable the user to understand the applications from a functional and operational standpoint. Manuals are provided at two levels. A reference manual for MAPICS operations gives guidance to the installation supervisor on managing and running the applications from a total-system viewpoint. One management operations manual is provided for MAPICS operations covering all twelve applications.

Individual reference manuals for each application instruct the workstation manager on how to conduct day-to-day operations of the application.

Similarly, one runbook is provided for the system console operator and individual application runbooks for the workstation operators. The console operations runbook contains detailed step-by-step instructions for operating MAPICS at the console. Included are an overview of the system and application flow, system considerations, hints on troubleshooting, and all of the error messages that can be generated by any of the applications in the offering.

The individual application runbooks provide a summary of the application and workstation operations, application and screen flow, application messages, and a detailed description of how to run each procedure in the application.

The MAPICS system logic manual is provided as licensed material for use by the self-sufficient customer, and for the systems engineer in maintaining and modifying MAPICS. Information on system architecture, naming conventions, system controls, system program functions, and specifications, relationship among system files, and other information applicable to all applications is presented in this system manual.

In addition, logic manuals for maintaining and modifying each application are available. Information relevant only to the subject application, such as program descriptions, cross-reference lists, and data dictionary, is presented.

Instructional support is provided to facilitate installation and operation. The Installation Planning Self-Study material provides guidance in the use of the installation guide and the reference manual. Other self-study

S/34 MAPICS (cont'd)

instructional material is provided for the systems console operator and for the application workstation operator to train them in the use of the runbooks. Only one copy of each manual is needed per customer no matter how many applications are to be installed.

Modular Application and Systems Training (MAST) is available to help identify and quantify benefits for top executives. MAST aids the customer in planning an effective implementation and includes techniques to assure top priority and the commitment of all the necessary resources. To assist in determining Management function and fit, there is a MAPICS features course for all MAPICS applications. In addition, for Inventory Management, Product Data Management, Production Control and Costing, and Material Requirements Planning, there are concepts, implementation, and using-the-system courses to make the customer more self-sufficient and reduce the effort and time required to install these applications.

PRODUCTION CONTROL AND COSTING (5726-M41)

The Production Control and Costing application provides for shop packet creation and for the tracking and costing of an ordered item as it is manufactured; it also measures work center utilization and efficiency plus queue analysis and control functions, similar to the IPICS FDPs. The application also creates, maintains, and updates the operation and miscellaneous charge information associated with jobs within the user's shop. It requires the installation of Inventory Management and has optional interfaces with Accounts Payable, Payroll, and Product Data Management as well as accepting data from Data Collection System Support (Product Data Management is highly recommended). Open operation information may also be passed on to Capacity Requirements Planning.

This application uses information which Inventory Management creates and maintains in conjunction with its own information to produce all necessary reports to track and cost an order. In addition, it produces a prioritized worklist by work center to assist production control in moving work through the shop in the most efficient manner.

The capability of accepting transactions via the workstation and/or diskette is provided in order to support Data Collection System Support diskette output. The transactions passed via the Data Collection System Support interface are labor, (operations) moves, and machine times. The labor transaction depends on the user's request of a Payroll interface. If the Payroll interface has been requested, the labor transactions are passed through Payroll to Production Control and Costing.

Additional functions include inquiry of order status, item status, and work center status, as well as report printing of order status and open order exceptions.

IBM System/34 MAPICS Production Control and Costing requires the use of the MAPICS Inventory Management (5726-M45) application.

PAYROLL (5726-M42)

The Payroll application starts with the basic employee time record as input and handles the calculation of wages, taxes, deductions, checkwriting, and file updating for both salaried and hourly pay plans. Employee time data may be entered from a workstation or can be passed from the Data Collection System Support application. Payroll can interface with both the General Ledger and Production Control and Costing applications. Transactions may be passed to General Ledger on either a cash or accrual basis during printing of the payroll distribution journal. Relative to MMAS, the accrued procedures have been modified to precisely relate pay periods to accounting periods. Job-related data for both hourly and salaried employees can be passed to the Production Control and Costing application.

Current payroll data is entered from time cards or job reports either daily or weekly, and is edited to validate employee and job information. A user with an incentive payroll must manually calculate gross pay and then enter it into the system. In addition to calculating present Federal and FICA taxes, a standard tax algorithm is provided to calculate most present state taxes based upon customer-provided data. Local taxes may also fit the standard tax algorithm provided. The state disability insurance deduction also uses a standard algorithm based upon customer-provided data. Wages subject to Federal Unemployment Insurance (FUI) and State Unemployment Insurance (SUI) are determined. Deduction programs compute voluntary deductions for a specific pay period as well as one-time and union deductions. All necessary reports are furnished including payroll register, deduction reports, checks, Federal 941-A reports, and W-2 reports.

Support for up to 20 companies, a manual payroll check procedure, and the ability to handle an employee working in multiple states, counties, cities, unions, jobs, or shifts on the same day are provided to give the user wide flexibility. Labor distribution of payroll hours and dollars is done in the same detail as the basic employee time record, that is, department, work center, job number, operation.

Several other reports are printed:

- Vacation, holiday, and sick pay register
- Year-to-date and quarter-to-date earnings register

- State and local tax register
- Check reconciliation register
- Workmen's compensation worksheet
- Union deduction register
- Paychecks (with option to print employee address)
- Governmental reports Federal 941-A, W-2 (and associated registers)

ACCOUNTS PAYABLE (5726-M43)

The Accounts Payable application keeps accurate and detailed records of vendor invoices and credit memos from the time they are entered into the system until they are paid and the check reconciled. Although Accounts Payable can be installed on a standalone basis, it is frequently used with the General Ledger application to which it can distribute the dollar amounts spent against the proper account numbers. There also exists an interface to Production Control and Costing by which Accounts Payable can pass job-related purchase information.

Transaction auditing is aided by a journal referencing scheme which causes every transaction affecting General Ledger to refer to a particular journal and line number within that journal. A double-entry bookkeeping method keeps transactions in balance.

Procedures for handling manual checks, petty cash, and check reversals are provided, as well as online selection of invoices for payment selection including partial payments, selection by date, and selection by vendor and invoice. Credit memos can be automatically generated, allowing the user to reverse a previously entered invoice without having to rekey all the invoice's indicative information and distribution.

Support is provided for up to 20 companies. Key reports include a new aged payables report, two vendor analysis reports, plus normal accounts payable audit trails such as purchase journal, cash requirements reports, and cash disbursements journal. When checks are printed, options are available to make the checks payable to 'assignees' (due to factoring by the vendor) and to print remittance advice 'overflow' data on a separate remittance advice form.

ACCOUNTS RECEIVABLE (5726-M44)

The Accounts Receivable application keeps detailed records of customer charges, cash payments, credit and debit memos, and other adjusting entries from the time they are entered into the system until they are paid or otherwise applied. The application allows for a combination of open item and balance-forward handling of individual customer accounts. Interfaces with Order Entry and Invoicing, Sales Analysis, and General Ledger are provided.

Invoices and credit memos can be entered directly and/or received from the Order Entry and Invoicing application. Cash receipts and adjustments are entered into the system directly, update the accounts receivable immediately, and can generate General Ledger transactions via an interface. The application provides optional late charges by customer for both open-item and balance forward accounting and support for up to 20 companies.

As required, the user can generate account status reports for a single customer or a group of customers as well as an aged trial balance in any of the following forms:

- Summary or detail
- Past-due accounts only
- Delinquent accounts only
- Minimum balance
- Aging based on current status
- Aging based on date of next statement
- Future aging of invoices

Additionally, statements and delinquency notices can be printed at user-determined frequency. The following features are provided:

- Option to age unapplied cash/adjustment
- Ability to identify credit memo by a unique number, but still relate the credit memo back to a specific invoice number
- Ability to apply cash, without knowing specific invoice numbers

INVENTORY MANAGEMENT (5726-M45)

The Inventory Management application processes all transactions affecting the status of the inventory balances. It is a central application which can interface with Order Entry and Invoicing, Sales Analysis, Product Data Management, and Data Collection System Support applications. Inventory Management is a prerequisite for installing either Material Requirements Planning, Production Control and Costing, or Capacity Requirements Planning.

The basic functions of this application provide the 'in's and out's' of inventory accounting plus the ability to cycle count the physical

S/34 MAPICS (cont'd)

inventory. The reporting functions include calculating current inventory investment and the annual inventory turns, as well as valuation techniques for tax reporting. Finally, you have the ability to release purchase and manufacturing orders and track their progress until each order is closed out.

The application provides for inventory valuation based on average, last, or standard costs as well as LIFO and FIFO options. Physical inventory checklists can be generated for multiple or selected warehouses, with or without cycle count options. In addition to printing a stock transaction register for audit control, a stock status report can be printed for all items or on an exception basis, and a stock status review can be had by item or by item within vendor.

A component 'availability check' is performed during the release phase, and items and orders with shortages are identified on special exception reports. At order release time, component allocation for manufacturing orders can be done to ensure that component inventory needs are accounted for between order release time and the actual withdrawal from stock.

Transactions can be entered from diskette or workstation. Transactions entered from diskette go through batch edit and batch update; transactions entered through a workstation are edited immediately and can update balances either immediately or later, in accordance with a System Tailoring option. In either case, an audit trail of all transactions is produced.

PRODUCT DATA MANAGEMENT (5726-M46)

The Product Data Management application maintains bills of material, product options, routing, and work center data bases and provides for costed retrievals and cost simulation. In interfacing with Inventory Management, Material Requirements Planning, Production Control and Costing, and Capacity Requirements Planning, this application is an information point for bills of material and routings. Order Entry and Invoicing also require Product Data Management in order to enter end items with standard options.

The ability to perform inquiry into the product structure and routing files is provided. Application highlights include the capability for multiple screen displays, mass replace, mass delete, and 'same-as-except' functions which facilitate maintenance to the product structure file. In addition to option handling techniques, use of engineering effectivity date simplifies engineering change control procedures. Labor and overhead rate tables can be used for costing in lieu of routing and work center files.

Several reports can be printed:

- Listings of item master, feature/option table and work center master
- Retrievals of product structures and routings
- Cost reports including management cost summary and cost variations

GENERAL LEDGER (5726-M47)

The General Ledger application is the terminal point of all accounting entries; it integrates completely with Accounts Payable and Payroll and accepts cash receipts and adjustment entries from Accounts Receivable. Though it can be installed apart from the other applications, a large number of ledger entries result from the distribution of expenses incurred through Accounts Payable. Therefore, most General Ledger users will likely install Accounts Payable and/or Payroll.

Each transaction entered is assigned a journal number and a unique line number within that journal. This journal reference number is kept with the transaction until it is posted to the master record during period-end closing. Transactions coming from other interfacing applications also use this reference numbering scheme. This makes auditability easier throughout the application. Thorough editing of all data at entry time, plus the fact that a double-entry bookkeeping system is used ensures that all credit entries are offset by an equal value of debit entries, and provides for smooth period closings. Diskettes can be used for processing recurring entries. The application gives the user support for up to 20 companies and choice of either a 12-month or 13-period fiscal year. The general ledger listing displays (by account number) transaction original journal reference numbers, to provide a clear and easily used audit trail of all transactions.

The balance sheet and income statement can be formatted to the user's particular requirements by use of a format file which permits special spacing, user-specified columnar printing, user-specified totaling, and up to 73 accounts to be totaled and printed with one line of description. By exploiting the capabilities of the format file, the user can produce departmentalized and/or combined (not consolidated) statements for multiple companies. Both the balance sheet and income statement can be comparative to last year and the income statement can also be comparative to budget figures.

SALES ANALYSIS (5726-M48)

The Sales Analysis application consolidates all sales and credit memo transactions affecting customers, salespersons, and items that have

been entered into the system. Input can come from Order Entry and Invoicing, Inventory Management, or Accounts Receivable; at least one of these applications must be installed as a prerequisite.

Data is passed to Sales Analysis via interface files as shown:

Customer-related data can come from	Salesperson-related data can come from	Item-related data can come from
OE&I A/R	OE&I A/R	OE&I IM

Either 12-month or 13-period reporting may be selected by the user. These transactions are posted to summary files which provide a historical data base for management reports. Summary files may also be corrected by file maintenance with an entry list providing an audit control.

Provision has been made for multicompany support for up to 20 companies for customer summary analysis, for flagging specific items for inclusion in sales analysis, and for inquiry into the summary files from the workstation. The reports included in the application are sales by customer, salesperson, and item with the option to display comparative data as well.

The System/34 MAPICS Sales Analysis application requires the use of at least one of the following MAPICS applications:

- Order Entry and Invoicing (5726-M49)
- Accounts Receivable (5726-M44)
- Inventory Management (5726-M45)

ORDER ENTRY AND INVOICING (5726-M49)

The order entry function is a key starting point for activity in a manufacturing organization. For make-to-order products, this function describes the item to be manufactured and when the item is required. For products to be shipped from inventory, it streamlines the order processing so items can be shipped promptly. It interfaces with Inventory Management by directly updating quantity on hand data, with Accounts Receivable by providing invoice summary information, and with Sales Analysis by providing item, customer and salesperson data. The data stored in the open order files can also be analyzed by Material Requirements Planning. Customer open orders can be passed to Capacity Requirements Planning.

As orders are entered, customer data is validated and, if accounts receivable is installed, a credit check is performed. Initial ship dates may be established on the basis of inventory availability or manufacturing orders, and item pricing data is checked for validity and completeness. The term 'orders' includes regular and blanket orders. A blanket order specifies a single item with multiple ship dates and specific quantities. Both order types may be entered in a similar manner. Invoicing may be accomplished by either direct entry or from orders previously entered into the system. Invoicing encompasses the computation of prices, taxes, and invoice totals. Pricing can be based on established contract prices, quantity breaks, markup from cost, or discounting from list price. Order acknowledgments, picking lists, invoices, and bills of lading can be printed.

If Product Data Management is installed, orders can be entered for end items which have standard options associated with them. Since these options may be required, they are checked at entry time to make sure the data is sufficient.

As soon as the Open Order files have been updated, the user has immediate access to current information such as:

- All orders for a particular item
- All orders for a particular customer
- Details for a particular order
- Blanket order status
- Customer status

The application also handles credit memo printing and the posting of back orders to the open order files. Support for up to 20 companies is provided as well as the generation of worksheets for general ledger input, commission accounting, and taxing body reporting.

DATA COLLECTION SYSTEM SUPPORT (5726-M4A)

The Data Collection System Support application provides an interface between a 5230 Data Collection System and the Payroll, Inventory Management, and Production Control and Costing applications. Inventory and labor transactions can be entered at conveniently located terminals, so information can be entered as it occurs, thereby eliminating many manual steps before this data can be processed on the System/34. Therefore, it provides a link between shop floor reporting and the MAPICS applications, and is designed as an integrated labor-reporting, payroll, and production control system.

The Data Collection System Support Application allows customers to define unique shop floor actions which are suited to their requirements.

S/34 MAPICS (cont'd)

The output from this definition phase is used by the 5231 Controller. Programs are provided so that data from the shop floor can be transmitted to the System/34, or the diskette can be carried to the System/34. Elapsed time is then calculated (based on user options regarding shift start/stop times, lunch breaks, and other paid/unpaid breaks) and prepared for payroll processing as attendance records or job records. The application will also apportion the time of an employee who works on overlapping jobs.

The application produces attendance, absentee, and labor reports, which provide a complete audit trail. Labor transactions may also be entered on the 5251 Display Station, as well as 5230 stations, to utilize the elapsed time calculations for payroll processing prior to installing a 5230 system.

MATERIAL REQUIREMENTS PLANNING (5726-M4B)

The Material Requirements Planning application is divided into three parts: Master Production Scheduling Planning (MPSP), Material Requirements Planning (MRP), and Order Release Planning (ORP). This application interfaces with and requires installation of Inventory Management and Product Data Management. It also interfaces with Order Entry and Invoicing to the extent that it can compare a master production schedule against customer orders. Firm planned and planned orders can be passed to Capacity Requirements Planning. MPSP determines the production schedule for master-level items (designated by a code in the item master record). Master-level requirements can be compared to forecast and/or customer orders to evaluate the manufacturing plan. Typically, planning requirements for master-level items is an interactive process. This process is simplified by various reports and workstation inquiries. The Material Requirements Planning reports include requirements planning, purchase planning, order recommendation, and cash analysis reports. A shortage report can be generated in the order release cycle if the user chooses to do an availability check. In addition, order release/review and requirements by item inquiries are supported.

Material Requirements Planning will take the approved output of MPSP and generate a total material plan to meet this schedule. This new plan can either be rebuilt (generation) or it can consist of differences from a previous plan (net change). Order recommendations produced from MRP become input to order release. The planner can review changes and approve orders scheduled for release.

IBM System/34 MAPICS Material Requirements Planning requires the use of both the MAPICS Inventory Management (5726-M45) and MAPICS Product Data Management (5726-M46) applications.

CAPACITY REQUIREMENTS PLANNING (5726-M4G)

The Capacity Requirements Planning Application is designed to analyze a company's production plan in terms of its plant capacity. This is a very useful tool for a company that wishes to identify those work centers and time periods when overload or underload conditions may be expected to develop. The application allows the production manager to meet the short term overload or underload condition by entering a temporary increase or decrease in work center capacity for a specified time period in the future.

Medium term analysis using the capacity planning run can help a company distinguish between scheduling problems and capacity problems that require changes to the base capacity of a work center.

The production plan used by the application is based on capacity requirements from several sources: Open orders, firm planned orders, planned orders, and under some restrictions, customer orders. Accurate start dates and operation durations are imperative for each manufacturing operation whether these operations come from Production Control and Costing or from Product Data Management's standard routings.

When the production plan and plant capacity have both been defined, capacity planning is ready to schedule and accumulate the workload by user-defined time period. This process will produce analysis files for workstation inquiry or report printing, and may be repeated to help users tune their plant capacity to the current production plan.

Capacity Requirements Planning is a dependent application. It requires orders (customer, open, firm planned and/or planned) and specifications (routing and/or open operations). The minimum support for Capacity Requirements Planning is:

Inventory Management (5726-M45) and Product Data Management (5726-M46)

or

Inventory Management (5726-M45) and Production Control and Costing (5726-M41).

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training,

installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Each of these licensed programs will execute on all models of the IBM System/34 with a minimum of 48K of main memory - with the exception of the Manufacturing applications, which require 64K of main memory. A user area of 28K is required for all applications except the Manufacturing applications (Product Data Management, Material Requirements Planning, Capacity Requirements Planning, Production Control & Costing), which require a minimum user area of 42K.

MAPICS is intended to be an independent yet interrelated set of applications. Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries. Design features have been incorporated into the MAPICS applications to allow for co-residency of other applications and/or user-written programs with minimum restrictions. (Consult the MAPICS logic manual for a fuller explanation of these restrictions.)

SOFTWARE REQUIREMENTS

The IBM System/34 MAPICS application programs are written in IBM System/34 RPG II programming language and execute under control of the IBM System/34 System Support Program (5726-SS1). The IBM System/34 Utilities licensed program (5726-UT1), which includes Sort, Data File Utility, Source Entry Utility, and Work Station Utility, is required for execution of the programs. The IBM System/34 RPG II Compiler (5726-RG1) is required if modifications to the source code are desired. All programs must be release 6 or later.

The IBM System/34 MAPICS Material Requirements Planning, Capacity Requirements Planning, Production Control and Costing, and Sales Analysis applications require the use of other MAPICS applications as prerequisites. Refer to the descriptions of these four MAPICS applications for the specific requirements.

**SYSTEM/34 DISTRIBUTION FINANCIAL
ACCOUNTING SYSTEM II (DFAS II)****PAYROLL ... 5726-M42
ACCOUNTS PAYABLE ... 5726-M43
GENERAL LEDGER ... 5726-M47****PURPOSE**

The IBM System/34 Distribution Financial Accounting System II (DFAS II) provides an integrated and comprehensive workstation-oriented financial control system for the small to medium-sized distributor. The Accounts Payable, General Ledger, and Payroll applications are designed to meet the needs of both the manufacturer and the distributor. These three applications are also included in the twelve applications of the IBM System/34 Manufacturing Accounting and Production Information Control System (MAPICS) and are also marketed collectively as DFAS II to the distribution industries.

HIGHLIGHTS

- The System/34 hardware and software functions - spooling, inquiry, multiprogramming - are integral parts of the DFAS II application design.
- Workstation data entry is designed for simplicity and ease-of-use. Screen displays provide guidance for mandatory input and for fields that may be overridden. Error messages signal errors which are then corrected interactively by the operator.
- Interactive data entry, concurrent edit, and correction for multiple applications, through multiple workstations while batch programs operate in the job queue.
- Inquiry into master files concurrent with data entry.
- Online file maintenance of all master files with optional file maintenance reports.
- Each application may be installed independently or in combination with other applications.
- System tailoring procedures permit the user to select optional functions and reports, and to determine the sizes of all files used by the applications. Functions and file sizing may be modified as the customer environment changes by reexecuting the tailoring procedures.
- Source code, ready-to-execute procedures, and object code are provided. Although no additional system design, programming, or compiling is required, the system design incorporates features to assist the user in the modification of source code.
- File load programs for master files are provided, as well as file conversion programs for System/32 DFAS files and System/34 Single Program Mode DFAS files to the System/34 DFAS II format.
- Password security helps deter unauthorized use of applications and functions within applications. A higher level of security helps protect selected master file data.
- Optional system procedures for master file save and restore.
- Documentation for each application includes a reference manual, a runbook, and a logic manual. From an overall DFAS II system perspective, an installation guide, a reference manual, a runbook, and a logic manual are provided. Self-study instructional materials are also available for operator education.
- Sample documents are provided for both data collection and data entry.
- Control features and documents are included to assist in establishing audit trails.
- DFAS II can co-reside with DMAS II.

DESCRIPTION

The Distribution Financial Accounting System II (DFAS II) is a set of three independent, yet interrelated, ready-to-execute applications for the small to medium-sized distributor.

These applications are designed for marketing in any combination and installing in any sequence.

Each application has certain required records within a cross-application control file which contain questionnaire responses. These records allow the user to select report formats, file sizes, and functions to suit each customer's needs. The questionnaire responses are keyed during initial installation and may be changed as needed. The System Tailoring Procedure allows these responses to be entered or modified. It provides the following:

- Tailors the application and Operator Control Language (OCL) on site at installation time
- All functions are included in the application programs, but only required functions are executed

- Allows changes to file sizes as needed by rerunning the System Tailoring Procedure

The installation guide for DFAS provides instruction for planning the installation of one or more DFAS II applications. One installation guide is provided for all three applications of DFAS II.

Reference manuals are provided to enable the user to understand the applications from a functional and operational standpoint. Manuals are provided at two levels. A reference manual for DFAS II operations contains information for the installation manager to supervise the system console operator, and to run the applications from a total systems viewpoint. One such manual for DFAS II operations covers all three applications. Individual reference manuals for each of the three applications provide the user department manager with information needed to supervise the workstation operator and to understand the application at a detailed level.

Separate runbooks are provided for the systems console operator and for the workstation operator. The DFAS II system runbook for console operation contains detailed instructions for the application procedures, an overview of the system and application flow, system considerations, hints for troubleshooting, and all of the error messages that can be generated by any of the applications in the offering. One systems runbook is provided for DFAS II.

Runbooks for the workstation operator are provided for each application and include a summary of the application and workstation operations, application and screen flow, application messages, and a detailed description of how to run each procedure associated with the application.

Logic manuals are provided, as licensed material, for use by the self-sufficient customer and for the systems engineer. An application logic manual, for maintaining and modifying DFAS II, presents information on system architecture, naming conventions, system controls, system program functions and specifications, relationship among system files, and other information applicable to all applications.

In addition, logic manuals for maintaining and modifying each application are available. Information relevant only to the application, such as program descriptions, cross-reference lists, data dictionary, etc., is presented.

Instructional support is provided to facilitate installation and operation. The Installation Planning Self-Study material provides guidance in the use of the installation guide and the reference manual. Instructional material for self-study is provided for the systems console operator and for the application workstation operator to instruct them in the use of the runbooks. Only one copy of each is needed per customer no matter how many applications are to be installed.

PAYROLL (5726-M42)

The Payroll application starts with the basic employee time record as input and handles the calculation of wages, taxes, deductions, checkwriting, and file updating for both salaried and hourly pay plans. Payroll can interface with the General Ledger application. Transactions may be passed to General Ledger on either a cash or accrual basis during the printing of the payroll distribution journal.

Current payroll data is entered from time cards or job reports either daily or weekly, and is edited to validate employee and job information. A user with an incentive payroll must manually calculate gross pay and then enter it into the system. In addition to calculating present Federal and FICA taxes, a standard tax algorithm is provided to calculate most present state taxes based upon customer-provided data. Local taxes may also fit the standard tax algorithm provided. The state disability insurance deduction also uses a standard algorithm based upon customer-provided data. Wages subject to Federal Unemployment Insurance (FUI) and State Unemployment Insurance (SUI) are determined. Deduction programs compute voluntary deductions for a specific pay period as well as one-time and union deductions. All necessary reports are furnished including payroll register, deduction reports, checks, 941-A reports, and W-2 reports.

Support for up to 20 companies, a manual payroll check procedure, and the ability to handle an employee working in multiple states, counties, cities, unions, jobs, or shifts on the same day are provided to give the user wide flexibility. Labor distribution of payroll hours and dollars is done in the same detail as the basic employee time record; that is, department, work center, job number, operation.

Several other reports are printed:

- Vacation, holiday and sick pay register
- Year-to-date and quarter-to-date earnings register
- State, county and local tax register
- Check reconciliation register
- Workmen's compensation worksheets
- Union deduction register
- Paychecks (with option to print employee address)
- Government reports 941-A, W-2 (and associated registers)

ACCOUNTS PAYABLE (5726-M43)

S/34 DFAS II (cont'd)

The Accounts Payable application keeps accurate and detailed records of vendor invoices and credit memos from the time they are entered into the system until they are paid and the check reconciled. Although it can be installed on a standalone basis, it is frequently used with General Ledger to which it can distribute the dollar amounts spent against the proper account numbers while printing the purchase journal and the cash disbursements journal.

Transaction auditing is aided by a journal referencing scheme which causes every transaction affecting General Ledger to refer to a particular journal and line number within that journal. A double-entry bookkeeping method keeps transactions in balance.

Procedures for handling manual checks, petty cash, and check reversals are provided as well as online invoice entry and payment selection which includes partial payments, selection by date, and selection by vendor and invoice. Credit memos can be automatically generated, allowing the user to reverse a previously entered invoice without having to rekey all the invoice's indicative information and distribution.

Support is provided for up to 20 companies. Key reports include a new aged payables report, two vendor analysis reports, plus normal accounts payable audit trails such as purchase journal, cash requirements reports, and a cash disbursements journal. When checks are printed, options are available to make the checks payable to 'assignees' (due to factoring by the vendor) and to print remittance advice 'overflow' data on a separate remittance advice form.

GENERAL LEDGER (5726-M47)

The General Ledger application is the terminal point of all accounting entries integrated completely with Accounts Payable and Payroll. Though integrated, it can be installed apart from the other applications. Since a larger number of ledger entries result from the distribution of expenses incurred through Accounts Payable, a majority of General Ledger users will likely install Accounts Payable.

Each transaction entered is assigned a journal number and a line number within that journal. This journal reference number is kept with the transaction until it is posted to the master record during period-end closing. Transactions coming from other interfacing applications also use this reference numbering scheme. This makes auditability easier throughout the application. Thorough editing of all data at entry time plus the fact that a double-entry bookkeeping system is used ensures that all credit entries are offset by an equal value of debit entries, and provides for smooth period closings. Diskettes can be used for processing recurring entries. The application gives the user support for up to 20 companies and a choice of either a 12-month or 13-period fiscal year. The general ledger listing displays the transaction original journal reference number, providing a clear and easily used audit trail of all transactions.

The balance sheet and income statement can be formatted to the user's particular requirements by use of a format file which permits special spacing, user-specified columnar printing, user-specified totaling, and up to 73 accounts to be totaled and printed with one line of description. Through the capabilities of the format file, the user can produce departmentalized and/or combined (not consolidated) statements for multiple companies. Both the balance sheet and income statement can be comparative to last year and the income statement can also be comparative to budget figures.

AUTOMATED INSTALLATION AID

Available at no additional charge, the DFAS II Self-Install feature (#7443) should be ordered with the first DFAS II application. It is an interactive installation method consisting of a workbook and diskette, enabling customers to install any of the existing DFAS II applications with little or no SE assistance. These applications include Payroll, Accounts Payable, General Ledger. They may be installed in any sequence. DFAS II Self-Install is designed for the novice who is installing an application for the first time. It is also intended for the experienced DFAS II user who wishes to add a new DFAS II application. DFAS II Self-Install consists of:

- An installation workbook that guides the user step-by-step through the planning and installation of a DFAS II application. File sizing and run time options are explained and then entered by the user in the workbook. The workbook should be ordered through Mechanicsburg so the customer can use it prior to installing the application.
- Data forms for all application master files are included along with lists of descriptions for the information fields in all the forms.
- A set of programs, invoked by one command, that prompts for workbook responses, calculates disk/diskette requirements, initializes required diskettes, loads programs to DFAS II libraries, and backs up all files and libraries. These programs are included with the application code shipped from PID when feature #7443 is specified.

The *DFAS II Self-Install Installation Workbook* (SH30-0653) should be ordered by form number from Mechanicsburg when feature #7443 is ordered.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, and continued day-to-day operation lies solely with the customer. Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Each of these licensed programs will execute on all models of the IBM System/34 with a minimum of 48K of main memory.

DFAS II is intended to be an independent yet interrelated set of applications. Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries. Design features have been incorporated into the DFAS II applications to allow for co-residency of other applications and/or user-written programs with minimum restrictions. Consult the DFAS II logic manual for further explanation of these restrictions.

Although nothing inherent in the design of the DFAS II applications prevents the use of the minimum system configurations stated above, the system configuration for a particular customer must be able to accommodate the expected business volumes, data base size, and operating requirements.

SOFTWARE REQUIREMENTS

The IBM System/34 application programs are written in IBM System/34 RPG II programming language and executed under control of the IBM System/34 System Support Program (5726-SS1). The IBM System/34 Utilities licensed program (5726-UT1), which includes Sort, Data File Utility, Source Entry Utility, and Work Station Utility, is required for execution of the programs. The IBM System/34 RPG II Compiler (5726-RG1) is required if modifications to the source code are desired. Release 2 or any later release of these licensed programs is required.

PROGRAM PRODUCTS

**CONSTRUCTION MANAGEMENT and
ACCOUNTING SYSTEM for the SYSTEM/34
CMAS/34**

JOB COSTING ... 5726-M66
GENERAL LEDGER ... 5726-M67
ACCOUNTS PAYABLE ... 5726-M68
PAYROLL AND LABOR COSTING ... 5726-M69
REVENUE ACCOUNTING ... 5726-M6A

PURPOSE

The IBM Construction Management and Accounting System for the System/34 (CMAS/34) provides an integrated and comprehensive workstation-oriented accounting and financial control system for the small-to-medium size construction firm and related project-oriented business. The Payroll and Labor Costing, Accounts Payable, Job Costing, Revenue Accounting, and General Ledger applications are designed to meet the needs of the construction industry.

HIGHLIGHTS

- The System/34 hardware and system software functions - spooling, inquiry, multiprogramming - are integral parts of the CMAS/34 application design.
- Workstation data entry is designed for simplicity and ease-of-use. Screen displays provide guidance for mandatory input and for fields that may be overridden. Messages signal errors which can be corrected interactively by the operator.
- Interactive data entry allows concurrent edit and correction for multiple applications and multiple workstations while batch programs operate in the background.
- Offline input of transactions from diskettes prepared on a 3740 Data Entry System is supported except for the Revenue Accounting application and the Committed Cost/Cost History feature. Diskette support does *not* include file loading and maintenance transactions to any master files.
- Special inquiries are provided for the job cost, labor cost, open payable, subcontract status, contract status, and open receivables files.
- System tailoring procedures permit the user to select optional functions and reports and to determine the sizes of all files used by the applications. Functions and file sizing may be modified as the customer environment changes by re-executing the tailoring procedures.
- All object programs and procedures are resident with the exception of System/32 CMAS file conversion programs, system tailoring programs, security file change programs, and file sizing programs.
- Source code, ready-to-execute procedures, and object code are provided. Although no additional systems design, programming, or compiling is required, the application design incorporates features to assist the user in the modification of source code. These features include user interface branches in procedures, reserved user space in master file records, and detailed program documentation.
- Provides the file maintenance of all master files with audit reports.
- Procedure documentation reflects restart/no-restart capability of each of the main line procedures.
- Password security helps deter unauthorized use of workstations, applications, and functions within applications.
- Sample input forms are provided for data entry.
- Control features and sample control documents are included to assist in establishing audit trails.
- Multiple company support for up to 99 companies.

DESCRIPTION

CMAS/34 is a set of five interrelated, ready-to-execute applications for small-to-medium size contractors. Four of the applications (Payroll and Labor Costing, Accounts Payable, Job Costing, and General Ledger) are independent and can be marketed in any combination and installed in any sequence.

Revenue Accounting is a dependent application. The Job Costing application *must* be installed prior to installing Revenue Accounting.

JOB COSTING (5726-M66)

Costing journal entries with cost distribution may be entered with distribution by company, job, pay item, cost code, and cost type. Job Costing passes transactions to the General Ledger, if installed. General Ledger is then updated on a monthly basis. Job Costing is automatically updated by the Accounts Payable and Revenue Accounting applications if installed. Payroll and Revenue Accounting reports, when used with the Job Cost reports provide a total perspective of job status.

Job Cost management reports are provided with unit costs, budget comparison, and projected profit or loss based on field reporting of percent complete or quantity 'put-in-place.' Income reporting with

distribution provides the basis for cash flow reports by company and by job. If the Committed Cost/Cost History feature (#6021) of the Accounts Payable application (5726-M68) is installed, Job Cost Management reports are available which optionally can include committed cost. Also, a cost history report is available which optionally can include all detail cost and income records for a project. You can select which projects to accumulate cost history when you establish a record in the Job Name file. Special inquiry into the job cost and labor cost (if available) files provides immediate access to job cost information.

Special emphasis is given to providing a complete audit of transactions affecting the job costing file and general ledger. A job cost detail transaction register (optional) highlights items posted to the general ledger by cost distribution for the accounting month close.

Jobs indicated as Time-and-Material jobs (jobs without estimates) will be processed without cost projections. Without this feature, these jobs would always project cost overages equal to actual costs incurred, which is inaccurate. Change orders and revised estimates can be accounted for via an optional change order file which is processed against the original estimates. Up to 99 change orders per cost distribution record may be maintained. The costing reports will show change order detail or optionally net the change orders against the original estimate and print a revised estimate summary line per cost item.

A standard master job costing file enables users to store frequently used cost items which can be duplicated into the job cost file when those cost items are used on a new job. This is especially useful to a home builder for storing the cost descriptions and estimates for a standard house plan and copying that plan to the costing file without having to retype all the details.

GENERAL LEDGER (5726-M67)

The General Ledger application is the terminal point of all accounting entries; it interfaces with Payroll and Labor Costing, Revenue Accounting, and Accounts Payable, and accepts journal entries from Job Costing. Though it can be installed apart from the other applications, a large number of ledger entries result from the distribution of expenses incurred through Accounts Payable and Payroll and Labor Costing. Therefore, a majority of General Ledger users will likely install Accounts Payable and/or Payroll and Labor Costing.

Each transaction entered is assigned a journal number and a unique line number within that journal. This journal reference number is kept with the transaction until it is posted to the master record during period-end closing. Transactions coming from other interfacing applications also use this reference numbering scheme. This makes auditability easier throughout the application. Thorough editing of all data at entry time plus the fact that a double-entry bookkeeping system is used, ensures that all credit entries are offset by an equal value of debit entries and provides for smooth month-end closing. The application gives the user support for up to 99 companies and supports a 12-month fiscal year. The general ledger listing displays (by account number) transaction original journal reference numbers, providing a clear and easily used audit trail of all transactions.

The balance sheet and income statement can be formatted to the user's particular requirements by use of a format file which permits special spacing, user-specified columnar printing, user-specified totaling, and up to 118 accounts to be totaled and printed with one line of description. By exploiting the capabilities of the format file, the user can produce combined statements for multiple companies. Both the balance sheet and income statement can be comparative to last year and both can also be comparative to budget figures.

ACCOUNTS PAYABLE (5726-M68)

The Accounts Payable application keeps accurate and detailed records of vendor invoices and credit memos from the time they are entered into the system until they are paid and the check reconciled. Although Accounts Payable can be installed on a standalone basis, it is frequently used with the General Ledger application to which it can distribute the dollar amounts spent against the proper account numbers. There also exists an interface to Job Costing by which Accounts Payable can pass subcontract or material purchase costs to specific jobs. In addition, equipment repair parts or services processed through Accounts Payable can be distributed to the equipment cost file in the Payroll and Labor Costing application, if installed. Job expenses, disbursements, and subcontract retention are passed to Revenue Accounting, if installed.

Transaction auditing is aided by a journal referencing scheme which causes every transaction affecting General Ledger to refer to a particular journal and line number within that journal. A double-entry bookkeeping method keeps transactions in balance.

Procedures for handling manual checks (partial as well as fully prepaid), petty cash, and check reversals are provided. Selection of invoices for payment includes partial payments, selection by date, and selection by vendor and invoice. Credit memos can be automatically generated,

CMAS/34 (cont'd)

allowing the user to reverse a previously entered open invoice without having to retype all the invoice's indicative information and distribution.

Support is provided for up to 99 companies. Key reports include an aged payables report, vendor analysis report, plus normal accounts payable audit trails such as purchase journal, cash requirements report, and cash disbursements journal. When checks are printed, options are available for reconciliation and to print remittance advice 'overflow' data on a separate remittance advice form.

Subcontract accounting is a subsystem within the Accounts Payable application. It provides for automatic movement and accountability of retainage and taxes. Subcontracts can be maintained on either a balance forward or open item basis. Subcontract status reports by job and by vendor specify the contract amounts, change orders and/or revisions, billed amounts to date (by date, if open item), payment amount to date (by date, if open item), retention and taxes. Controls help insure that the subcontract status file remains in balance with the job costing file if the Job Costing application is installed.

Committed Cost/Cost History Feature (#6021)

The optional Committed Cost/Cost History feature to Accounts Payable adds the capability to enter and track purchase order activity and pass the information to the Accounts Payable data entry function when the invoice is received. It provides an analysis of future cash requirements for committed purchase orders. Inquiries can be made into the Open Purchase Order file to check the status of any purchase order line item. Reports can be run in Purchase Order, Vendor, or Job sequence. Committed Costs can be optionally included on applicable Job Costing reports if the Job Costing application (5726-M66) is installed. This feature does not support data entry.

PAYROLL AND LABOR COSTING (5726-M69)

The Payroll application starts with the basic employee time record as input and handles the calculation of wages, taxes, direct burden, deductions, checkwriting, and file updating for both salaried and hourly pay plans. Employee time data may be entered from a workstation or can be entered via diskettes on a 3740 Data Entry System. Payroll can interface with both the CMAS/34 General Ledger, Job Costing, and Revenue Accounting applications. Transactions may be passed on to General Ledger during printing of the payroll distribution journal. Job-related data for both hourly and salaried employees can be passed to the Job Costing application. Labor costs are used by the Revenue Accounting application.

Current payroll data is entered from time cards or job reports either daily or weekly, and is edited to validate employee and job information.

In addition to calculating present federal income and FICA taxes, a standard tax algorithm is provided to calculate most present state income taxes based upon customer-provided data. Local income taxes may also fit the standard tax algorithm provided.

The state disability insurance deductions also use a standard algorithm based upon customer-provided data. Wages subject to Federal Unemployment Tax Act (FUTA) and State Unemployment Tax Act (SUTA) are also determined.

Deduction programs compute voluntary deductions for a specific pay period as well as one-time and union deductions. Included at customer option are employer-paid union fringes, workmen's compensation, Federal Unemployment Tax Act (FUTA), and State Unemployment Tax Act (SUTA). Employer-paid direct burden (FICA, FUTA, SUTA, workmen's compensation, and union benefits) is calculated automatically and optionally costed to jobs based on several methods which are tailored at install. The calculated burden may be distributed to a standard cost code selected by the contractor or distributed to each individual labor cost record. The appropriate accounts in the General Ledger are also updated if the General Ledger application is installed. Any additional burden required for local codes can be calculated by a user-written program and interfaced to the system via procedure interface and an 'other burden' field in the current hours record.

Support for up to 99 companies, a manual payoff check procedure, and the ability to handle an employee working in multiple states, localities, unions, jobs, at different rates on the same day are provided to give the user wide flexibility. Labor distribution of payroll hours and dollars is done in the same detail as the basic employee time record; that is, job number, pay item, cost code, cost type, and job class by company.

Reports furnished include payroll register, deduction reports, monthly union reports, certified payroll register, checks, 941-A reports, and W-2 reports.

Several other reports are printed:

- Year-to-date and quarter-to-date earnings register
- State and local tax register
- Check reconciliation register
- Workmen's compensation earnings worksheet
- Workmen's compensation premium worksheet
- Workmen's compensation and insurance report

- Union calculation register
- Union stamp report
- Paycheck formats are provided in the original System/32 CMAS format and a new CMAS/34 format. This new CMAS/34 format provides options to print employee address and the amount of the check printed in words. It also provides a free form check stub which shows deduction detail and hours worked at each rate of pay.

REVENUE ACCOUNTING (5726-M6A)

The Revenue Accounting application performs normal accounts receivable functions such as entry of invoice and cash receipts information, posting to open receivables and Temporary General Ledger Work File (TEMGEN), printing statements and delinquency notices, printing management reports, calculating late charges, and allowing discounts for prompt payment. Job Costing (5726-M66) is a prerequisite application.

In addition, Revenue Accounting has added functions specifically addressing the requirements of the construction industry. These functions are:

- Entry of detail line items for job invoices so that Job Costing income records are updated.
- Defining eight invoice types (Job, Retention, Work Order, Equipment, Employee, Material, Standard, and Cash), each one with associated General Ledger account numbers, to reduce coding requirements for source documents.
- Cash can be applied by customer, job, or invoice, so manual coding of cash receipts is minimized.
- The ability to process statements 'as of' a certain date so that priority work can proceed without interruption; for example, payroll processing.
- The ability to request Open Receivables Analysis reports by customer, job, or non-job to aid in managing receivables.
- Capturing retention information in invoice processing to aid in managing retention accounts receivable.
- Printing of a Retention Due listing to aid in tracking and billing of retention.
- A Progress Billing subsystem that includes interactive review and change as an aid to determining billable amounts for completed work.
- Conforming to all CMAS/34 conventions with one exception - diskette data entry is not supported.
- Interfacing with Job Costing, Accounts Payable, Payroll and Labor Costing, and General Ledger, if these applications are installed.

A significant feature of this application is Progress Billing. Progress Billing assists the contractor in preparing monthly invoices. It accumulates costs from the Job Cost file and calculates the preliminary billable amount based on job progress. The contractor can adjust the billable amounts at the workstation before printing a final report. The format of the final report is similar to that of the American Institute of Architect's (AIA) billing form.

The functions of the interfaces are:

Revenue Accounting requires job billing and cost information from the Job Costing file for the Progress Billing subsystem, and for verification of job billings. Job billing detail from invoicing updates Job Costing via the TEMGEN file.

While Job Costing is the only prerequisite application, Revenue Accounting also interfaces with the other CMAS/34 applications.

Without Accounts Payable, data must be manually entered and maintained for job expenses incurred, disbursements made, and subcontract retention, if the financial position report is used.

Without Payroll and Labor Costing, labor costs must be kept in Job Costing, if the financial position report is used.

Without General Ledger, accounting entries produced by Revenue Accounting Invoice, Cash Receipt, and Late Charge journals must be manually posted. Therefore, it is recommended that all five CMAS/34 applications be installed.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

PROGRAM PRODUCTS

CMAS/34 (cont'd)**SPECIFIED OPERATING ENVIRONMENT**

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration for any *single* CMAS/34 application is an IBM System/34 with:

- IBM 5340 System Unit with Diskette 1 Drive, 8.6 Mb of disk storage and 48K (Mdl B11).
- One system printer, either line printing at 160 lines per minute, or serial printing at 40 characters per second.
- One application per IBM 5251 Display Station (mdl 11)

Although there is nothing inherent in the design of the CMAS/34 applications which prevents the use of the minimum system configuration stated above, the system configuration for a particular customer must be able to accommodate the expected business volumes, data base size, and operating requirements.

The amount of disk storage required is influenced by the:

- Number of workstations attached
- Library sizes (number of applications installed - all programs resident)
- Number of records in the required master files
- System tailoring options taken
- Volume of daily transactions

Installation of more than one CMAS/34 application concurrently will require more disk capacity than the minimum disk configuration of 8.6 megabytes.

Disk File Requirement: CMAS/34 requires substantially more library and file space than CMAS on System/32. Failure to use the CMAS/34 File Sizer to determine disk space requirements could result in a system configuration that is insufficient to meet customer requirements.

Remote Data Entry Performance: If data entry programs are to be used with remote workstations, consideration should be given to the impact on performance (time between pressing the enter key and the return of the next display) caused by the much slower data transfer rates inherent with teleprocessing communication facilities. Customers should be made aware of the performance differences between locally attached workstations (1,000,000 bps) and remote workstations communicating at rates of 1200, 2400, 4800, or 9600 bps. Refer to the *IBM System/34 Concepts and Design Guide* (SC21-7742) for additional performance considerations.

SOFTWARE REQUIREMENTS

CMAS/34 application programs are written in IBM System/34 RPG II and System/34 Work Station Utility (WSU) and execute under control of the System/34 System Support Program (5726-SS1), Release 7 or later, and System/34 Utilities (5726-UT1), Release 7 or later, which includes Sort, Data File Utility, Source Entry Utility, and Work Station Utility. Sort and WSU are required for execution of the programs. The System/34 RPG II Compiler (5726-RG1) is required if modifications to the source code are desired.

The CMAS/34 Job Costing application (5726-M66) is a prerequisite application to installing CMAS/34 Revenue Accounting (5726-M6A).

The CMAS/34 Accounts Payable application (5726-M68) is a prerequisite application to installing the Committed Cost/Cost History feature (#6021). In addition, if the following licensed programs are installed, they must be at or above the specified modification level and PTF level before installing the Committed Cost/Cost History feature:

- Job Costing (5726-M66) V1, Mod. 3
- General Ledger (5726-M67) V1, Mod. 2, PTF #0038
- Accounts Payable (5726-M68) V1, Mod. 4
- Payroll and Labor Costing (5726-M69) V1, Mod 9, PTF #0294
- Revenue Accounting (5726-M6A) V1, Mod. 0, PTF #0001
- Cross Application (#7043) V1, Mod. 4

Educational Allowance: The standard education allowance applies.

**CONSTRUCTION MANAGEMENT ACCOUNTING SYSTEM
(CMAS) FOR SYSTEM/34 (SINGLE PROGRAM MODE)**

JOB COSTING ... 5726-M61
ACCOUNTS PAYABLE ... 5726-M62
PAYROLL ... 5726-M63
GENERAL LEDGER ... 5726-M64

PURPOSE

The IBM Construction Management Accounting System (CMAS) provides the construction industry with a complete, yet flexible, method for managing their Payroll, Accounts Payable, Job Costing, and General Ledger.

CMAS offers flexible applications specifically designed for the construction industry. CMAS key reports help construction management effectively direct and control their business.

HIGHLIGHTS

Independent or interrelated applications approach

- Modular design facilitates sequential application installation
- A journal reference numbering system ties the four applications together when multiple CMAS applications are installed
- Single data entry results in multiple application update

wide variety of reports and report options included

- Management reporting is a byproduct of normal data entry
- All applications provide for multicompany entries and reports
- Field reporting allows for projecting profit and loss by job

Uses recognized accounting techniques and terminology to provide a solid accounting system

- Clear audit trails and control techniques are provided
- Sample user-oriented forms for data preparation, file creation, and audit and control are provided
- Security code deters unauthorized inquiry or execution of key programs in each application

CMAS can be installed without customer programming capability

- System tailoring procedure on-site to facilitate account growth changes
- Display screen input prompting and output report formats are tailored to meet specific customer requirements
- Complete, system-controlled, operator-oriented input prompting
- Complete file maintenance and audit programs and procedures
- File sizing procedure to assist in relocating master and work files

DESCRIPTION

The Construction Management Accounting System is a set of four independent, interrelated, ready-to-execute applications for the small to medium-sized contractor/subcontractor. The system combines two approaches: Operator-oriented and batch reporting. This approach and programming system provides a sound accounting base by doing Payroll with Labor Distribution, Accounts Payable with Subcontract Accounting, Job Costing with Management Reporting and General Ledger with Financial Statements.

The four easy-to-operate applications may be installed in separate stages at different times and still be a totally interrelated system; that is, payroll data may be passed by the system directly to general ledger and job costing, etc.

Each application contains a requirements file with user questionnaire responses which allows the application to select input formats, report formats, and functions to suit each customer's needs. These responses are keyed in during initial installation and may be changed as customer needs change.

The systems tailoring procedure controls the prompting of input records and fields to be entered, the types of reports and fields on reports, and data files used for output.

Systems tailoring procedure is a procedure requesting the answers to a series of questions regarding a contractor's company requirements. Systems tailoring provides the following:

- Tailoring the system on-site at installation time
- Application reprogramming is not required as business changes because system tailoring parameters can be changed by the customer
- The programs contain all the announced functions, but only required functions are performed by the system
- Applications may be installed in any sequence

- System tailoring options include the following: Multiple companies or single; multiple status or single; multiple unions or no unions; custom formatting of Balance Sheets and Income Statements

An installation guide provides a step-by-step installation activity plan including suggested numbering systems, sample input and maintenance user data forms, control forms with suggested procedures, and other activities necessary for a successful installation.

The runbook provides the operator with activities necessary to effectively operate CMAS as an accounting system to provide accurate and timely management reports.

Two self-study guides lead the user through the installation guide, runbook, and associated materials to assist the self-sufficient customer.

These application programs make the Construction Management Accounting System available on a System/34 operating in single program mode. The programs support one workstation, no spooling, no multiprocessing and no file sharing.

Application Description: The Construction Management Accounting System consists of four full-function, ready-to-execute applications. CMAS includes source code, object code and execution procedures. The four applications have the following functions:

JOB COSTING (5726-M61)

General Journal entries with cost distribution may be entered with distribution by company, job, pay item, cost code, and cost type.

Job Costing automatically updates the General Ledger component, if available. General Ledger is then updated on a monthly basis.

Job Costing is automatically updated by the Accounts Payable application if installed. Payroll reports, when used with the Job Cost reports provide a total perspective of job status.

Job Cost management reports are provided with unit costs, budget comparison, and projected profit or loss based on field reporting of percent complete or quantity put in place. Income reporting with distribution provides the basis for cash flow reports by company and by job.

ACCOUNTS PAYABLE (5726-M62)

Invoices and credit memos entered may be multiline and distributed by company, job, pay item, cost code, and cost type. The entries may consist of vendor, miscellaneous, estimated or subcontract invoices. Prepaid invoices are permitted on all of the invoice types. Credit memos may be entered manually or initiated automatically based on a prior enter invoice. Partial payment is not supported.

Subcontract accounting provides for automatic movement and accountability of retainage and change orders. Subcontracts are maintained on either a balance forward or open item basis. Subcontract status reports by job and by vendor denote the contract amount, change orders, billed amount and date, payment amount and date, retention, and taxes.

An accrued accounting system provides for timely job cost information while a cash flow handling capability indicates job cash position through the general ledger.

The Accounts Payable application provides an Open Payable and Cash Disbursements function. An Open Payable report is provided in due date or vendor sequence. This turnaround document provides a mechanism to indicate payment by date, job, vendor, or invoice, including partial payments for Cash Disbursements.

Invoices may be entered or placed on hold status to prevent inadvertent payment of invoices in question.

A Cash Requirements report is used to assist the controller in ensuring funds are available and proper invoice selection was made before the check writing procedure begins.

Check writing and reconciliation are provided. The check format provided includes a user-indicated check stub length to adapt the size of the remittance advice. Stub overflow initiates a separate supplementary stub.

An Accounts Payable trial balance is available in job or vendor sequence.

A Vendor Analysis Report indicates key business volumes by quarter and year.

Diskette input for Accounts Payable invoices is provided.

PAYROLL (5726-M63)

This hourly/salary distributed payroll provides for regular, overtime, premium, vacation, sick, and travel pay. It may be run weekly, biweekly, semimonthly, or monthly. Exception hours provide time and one-half, double time, double time and one-half, and triple time capabilities. Rate selection may be standard, selected by craft, or keyed in as an exception overtime or premium rate.

PROGRAM PRODUCTS

CMAS for S/34 (cont'd)

Clear audit and accounting procedures aid in maintaining a Payroll system in balance.

Hand-written checks (payoffs, special, etc.) are easily handled.

Standard union deductions are used to prepare two standard union deduction reports. Multiple union reporting is supported.

Workmen's compensation calculations and a workmen's compensation worksheet report provide a mechanism for weekly tracking of insurance premiums.

A standard tax algorithm calculates Federal, FICA, and many state income taxes on the basis on customer-provided data. Local taxes may fit the standard tax algorithm provided.

Deductions by percent, fixed amount, upper limit, and miscellaneous deductions.

Taxable or non-taxable adjustments.

State Disability Insurance is calculated and reported.

Federal Unemployment Insurance and State Unemployment Insurance is calculated and reported.

Check writing and reconciliation are provided.

A payroll journal provides a clear audit trail of entries to the CMAS General Ledger application.

Labor cost management reports are provided with unit cost, budget comparison, and projected profit or loss based on field reporting of percent complete or quantity put in place. The reports are available with distribution by company, job, pay item, cost code, cost type, and job class.

941-A, W-2, and Certified Payroll reports are provided. Diskette input for payroll hours is supported.

GENERAL LEDGER (5726-M64)

General Journal entries may be entered for end-of-month closings or for out-of-balance conditions.

Journal entries identified by journal names and numbers are indicated on the Financial Statement Worksheet and Trial Balance Listing. These entries are automatically accepted from the Payroll, Accounts Payable, and Job Costing applications.

On an out-of-balance condition, a procedure is provided to rearrange the entries into journal reference number sequence and print out a selective audit listing. This listing can be compared with the monthly journals to quickly identify the out-of-balance entry.

An Income Statement and Balance Sheet are standard report outputs which provide the user with the flexibility of defining these reports with an easy-to-use format description procedure. This definition may be changed as needs vary. The user may carry over account transactions from one month to the next without performing a monthly close.

Financial reports can illustrate current financial data as compared to budget or historical information.

Users may define their own chart of accounts or use a suggested account structure provided with the application. The fiscal year start date is user-defined.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility. For customers who have modified their installed System/32 IAPs and who choose to have IBM make the same modifications on the new System/34 product, the reinstatement of the modifications on the new product will be at an additional charge under SES. It is the customer's responsibility to transfer their data files from one system to the other.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Each of these licensed programs will execute on all models of the IBM System/34 with a minimum of 48K of main storage in single program mode. The programs are compiled assuming a 48K minimum system.

Information regarding disk allocation and usage (master and transaction files) and recommended backup levels and diskette requirements is available in the CMAS logic manuals and installation guides.

The OCL and file sizes, as distributed, are fixed at the maximum capacity assuming all four applications are to be installed utilizing five megabytes of the file.

Note: When a customer's volumes require additional disk capacity, file allocations can be modified to meet requirements by utilizing the CMASFILE procedure. (See the information under "Distributed System for System/32" below.)

SOFTWARE REQUIREMENTS

The IBM System/34 licensed programs are written in IBM System/34 RPG II programming language and executed under control of the IBM System/34 System Support Program (5726-SS1 Version 1). The IBM System/34 Utilities licensed program (5726-UT1), which includes Sort, Data File Utility, Source Entry Utility, and Work Station Utility is required for execution of the programs. The System/34 RPG II Compiler (5726-RG1) is required if modifications to the source code are necessary.

Distributed System for System/32:
5 Megabyte file (1968 Blocks)

Files	Number or Blocks*
System Control Programming	239
SORT Executable Code	34
CMAS Executable Work Units	98

* These block figures are for the System/32 feature only.

Application Files (online all the time)

Payroll system - 250 Active Employees design 476

- Payroll System File - 3 Records
- Employee Master - 250 inactive, 250 active employees
- Current Hours - 1400 Distributions/Pay Period
- Employee Deductions - 2000 Deductions for active or inactive
- Check Reconciliations - 1250 Outstanding Checks (250 checks x 5 weeks)
- Job Classifications - 65 Job Classes
- Distribution - 160 P/R Distribution Codes
- Active Labor Cost Distributions - 700 Weekly Distributions
- Union Master Deductions - 80 Union Deductions 10 Unions + (10 Unions x 7 deductions/union)
- Monthly Union Deductions - 3000 deductions
- Tax Tables Federal/State/Local - 30 tax brackets (Federal, single, weekly, 10 \$ Brackets)
- Employee State and Local Taxes - 2000 Deductions with additional withholding (2 states x 2 locals x 500 active/inactive employees)
- Insurance File - 155 Insurance company masters
- Insurance Summary - 1200 Employee Workmen's Compensation

Accounts Payable - 1200 Checks design 401

- Payables System File - 3 records
- Active Vendor Master - 900 name and address
- Checks Written - 1200 checks/month
- Open Payables Distribution - 1000 Outstanding Invoices with three distributions per invoice (3000 records)
- Active Subcontracts - 1000 Subcontracts
- Payables Work File - 1400 Invoices and distributions

Job Costing - 100 Job Vouchers/Month Design 117

- Job Costing Systems File - 3 records
- Job Work File - 400 Job Vouchers/Batch
- Job Name Master - 240 Active Jobs
- Job Cost Detail - 2100 Costing Entries (Active J/C Distributions + Income Distributions)

General Ledger - 200 Journal Entries/Month 389

- General Ledger Systems File - 3 records
- General Ledger Work File - 200 General Journal Entries

PROGRAM PRODUCTS

CMAS for S/34 (cont'd)

- General Ledger Chart of Accounts - 800 accounts
- Temporary General Ledger Account Transactions - 9200 entries
- General Ledger Format - 400 formatting records

Application Work Files Area (loaded by application)	208
Paidfor CMAS User	6
*Total Blocks	1968

* The total blocks number is for the System/32 IAP only.

The OCL and file sizes, as distributed, have been fixed at the maximum capacity with normal distribution for the 5 megabyte file.

Any changes to file sizes, other than those shown above, should be carefully reviewed by the customer and the IBM Systems Engineer to: Determine the necessity for more storage, estimate the time required to convert OCL procedures, and evaluate throughput performance.

System Backup: The System/32 and System/34 disk is backed up by dumping the disk to multiple diskettes. IBM-supplied system programs are initially provided to the user on diskettes which should be retained by the user for backup. User-created application data files must also be backed up on diskette. The user is required to provide backup diskettes for CMAS procedures, programs, and data files.

Number of User-Supplied Diskettes Required for Backing Up the System/32 Distributed System and Data Files

	System/32 Back Up*	
	Single Level	Double Level
Payroll	18	36
Accounts Payable	12	24
Job Costing	8	16
General Ledger	13	26
All 4 Applications	38	76

* Includes Backing Up: Daily Transactions; CMAS Machine-Readable Object Programs; Disk Resident Application files. It does not include System Control Program (5725-SC1), Utilities (5725-UT1), RPG II (5725-RG1) machine-readable materials or any other programs, procedures, data files, and spare diskettes to replace damaged or worn diskettes.

The System/32 user requires either the sum of the backup diskettes for each application installed or 38 diskettes, whichever is less.

**PERSONAL TEACHING AID/34 for the SYSTEM/34
5726-PT1**

PURPOSE

The IBM System/34 Personal Teaching Aid/34 licensed program provides an author with an easy-to-use tool to write educational materials in the form of courses for presentation to a student on the System/34. The author using the System/34 presents text, asks questions, evaluates and responds to answers and, in general, guides the student through a learning experience. Also, the product can collect data on the student's answers and courses completed. When analyzed, this data can assist the user in determining the progress being made by the student.

HIGHLIGHTS

- Completely menu and prompt-driven for ease of operation by students, authors, and the supervisor.
- Supports multiple students on the same or different courses concurrently.
- Supports multiple authors on different courses concurrently.
- Written in BASIC and requires the BASIC program product (5726-BA1) for execution. Nevertheless, the user does not need to learn BASIC or know how to program.
- Operates concurrently with other System/34 programs and languages except FORTRAN (5726-F01) programs and programs using the Scientific Instruction Set (5726-SS1).
- The basic license (5726-PT1) may be ordered with an optional feature (#6025):
 - Basic license allows a student to take a course written by an author on a System/34 different from the one used by the student.
 - Feature allows an author to build a course on a System/34 for use by students on that system as well as other System/34 units.
- Provides answer matching so that appropriate text can be displayed for correct, incorrect, and unexpected answers.
- Provides for multiple correct and/or incorrect answer processing ('OR' logic).
- Course material sectioned for easy arrangement of concepts covered in course.
- Provides scoring capability with weighted question values.
- Provides capability for course to be taken by student in scoring mode or practice mode.
- Provides 'JUMP TO' function both unconditionally and conditionally on score or count of correct answers.
- Ability to chain to user-written BASIC programs for inclusion as course material.
- Ability to include external screens (\$\$FGR members) as course material.
- Permits author maintenance functions for existing courses.
- Includes security features to inhibit unauthorized access to course material, student answers, and student scores. This is in addition to the System/34 integrated security.

DESCRIPTION

The offering is a course writing *tool* which the course developer or author uses in preparing course material for students. Students can take courses at their own rate of speed and capabilities.

The product is used by the supervisor to register courses and students, and to maintain the application. The author uses the application to develop and maintain a course, while the student uses it to take a course.

The IBM Personal Teaching Aid/34 is made up of two parts. The feature (#6025) to the application is a *tool* which uses a set of BASIC programs for developing and maintaining courses. The basic license (5726-PT1) consists of a set of BASIC Programs which retrieve course material from disk and interact with the student. The supervisor maintains the application files and is responsible for allowing students to take the proper courses and authors to modify only their own courses. The supervisor also is responsible for printing student responses and scores when this data is needed.

The *Application Installation Guide/Reference Manual/Runbook* (User's Guide) provides the user with all the information necessary to install the product. This document also provides step-by-step instructions for operating the application as a student, an author, or the supervisor.

The *Application Installation Guide/Reference Manual/Runbook* provides execution instructions for the sample course shipped to the user of the basic license (5726-PT1) by PID as part of the machine-readable materials on diskette. This document provides course and

student registration instructions for the supervisor as well as execution instructions for the student.

The *Application Installation Guide/Reference Manual/Runbook* provides build instructions for creating a sample course. Following the instructions in this document, the user of the feature (#6025) builds a course which can be executed upon completion. Also, authors of courses are given a discussion of tips and techniques to help develop courses which are easy to change and maintain.

The basic license (5726-PT1) and the feature (#6025) each have a separate *Application Logic Manual*. These documents are provided as licensed documentation for use by the self-sufficient user in maintaining and modifying the product. Information on naming conventions, application program functions and specifications, file record layouts, and other information pertaining to the application is presented in these manuals.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of this System/34 licensed program is also a customer responsibility.

The customer must:

- Install the licensed program by following the instructions in the *User's Guide* (SB30-0473).
- Read the *User's Guide* carefully before executing the new licensed program menu options.
- Follow the *User's Guide* to execute the licensed program menu options.

SPECIFIED OPERATING ENVIRONMENT

Support, as described under Programming Services, will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration for this product is an IBM System/34 with:

- IBM 5340 System Unit mdl D11 (8.6 megabytes of disk storage and 96K bytes of main storage).
- One system printer, either a serial printer or a line printer with a 96-character print belt.
- One IBM 5251 Display Station (mdl 11 or mdl 12).

SOFTWARE REQUIREMENTS

Release 7 or later of the following licensed programs are required:

- System Support licensed program (5726-SS1)
- BASIC licensed program (5726-BA1)

PROGRAM PRODUCTS

**SYSTEM/34 RPG II
5726-RG1****PURPOSE**

IBM System/34 RPG II provides the following capabilities:

- RPG II Language Level
- System/34 Device Support including WORKSTN (work station) device and Interactive Communications Feature (SSP-ICF)
- Auto-Report
- Binary Synchronous Communications (BSC)

HIGHLIGHTS

- The RPG II device names are DISK, PRINTER, CRT, CONSOLE, SPECIAL, KEYBOARD, BSCA and WORKSTN.
- The support for SSP-ICF using the WORKSTN file support.
- The user indicators (U1-U8) may be tested and turned on and off in the RPG II program. The status of these indicators may then be tested by OCL. The indicators can also be set on or off using OCL.
- The user program may access a work station local data area which provides program-to-program or program-to-OCL data interchange.
- Header specification entries have been added to specify the number of display formats associated with a WORKSTN file.
- Data Structures may be defined for the work station local data areas or to redefine other fields without allocating additional storage.
- A program using a WORKSTN file may support multiple work stations or communication sessions with specified unique data fields and indicators saved and restored automatically by work station or communication sessions.
- The TIME operation may be used to obtain time-of-day and date from the system.
- Field end position may be omitted and the compiler will calculate the end position within an output record.
- The user may control spacing and skipping of the compiler listing.
- OCL option to avoid halting for terminal errors found during compilation.
- Subroutine to retrieve message text from a message member.

DESCRIPTION**SYSTEM/34 DEVICE SUPPORT**

All the devices available on the System/34 are supported by System/34 RPG II, except the diskette drive. Through the use of System/34 OCL, the diskette drive is supported as a transaction or master file and librarian Save/Restore device. The shared input/output access methods are also supported. The following expanded device support is provided:

- **WORKSTN File Support** - Language entries support one or more 5251 Display Stations and 5252 Dual Display Stations or SSP-ICF communication sessions as a primary or demand file. The 5252 represents two work stations. The WORKSTN device support allows the programmer to treat the display station or communication session as a sequential update file using the normal RPG II logic. Multiple display stations and/or multiple communications sessions may be attached to the WORKSTN file. The programmer need only be concerned with the single user (display station or communications session) logic. Data fields and indicators that are unique to each user are so indicated by the programmer and RPG II saves and restores those fields and indicators automatically. Display formats for use with the WORKSTN file must be created using the SSP Screen Format Generator Routine (SFGR). Printer output coding for work station printers is the same as that for the system printer and, furthermore, is reassignable at execution time using OCL.
- **CONSOLE File Support** - Through the use of normally coded File Description and Input Specifications, the CONSOLE File (5251 or 5252) is supported in a buffered interactive mode. The operator is prompted record-by-record with display formats generated by the compiler. Keying of one record is buffered and overlapped with processing of the previous record. The program is coded to process records as from any other sequential input device. The user must specify display size to be used.
- **KEYBOARD and CRT File Support** - The display formats used for these files will use six lines of forty characters each or twenty-four lines (twelve lines for the 960-character display) of seventy-nine characters each depending on the maximum record length specified in the program for the file. The KEYBOARD support includes support of 24 command functions.
- **PRINTER File Support** - Multiple printer files may be specified in a single program. The System/34 OCL is used to assign an RPG II

printer file to the system printer or a work station printer at execution.

- The SSP Data Management routines are not included in the generated object program since those routines are a sharable part of the SSP.

AUTO-REPORT

Auto-Report is included with the System/34 RPG II compiler and includes the following features:

Copy - Specifications may be cataloged in a library and included in any RPG II program via the COPY statement. It is especially useful for cataloging the File Description and Input Specifications for which overrides may be coded to specify such things as control levels. By using the COPY statement, only one description of the file need be cataloged and changed for all programs using the file.

Page Headings - Page headings can easily be specified on Output Specifications without the need for Output Indicators or end positions. The heading is centered over the report complete with page numbers and date.

Simplified Report Specifications - A report may be produced by listing on Output Specifications the fields desired in the order desired. On one Output Specification, the field, column heading, and an indication for column totals may be entered. The column headings, fields, and column totals are automatically generated.

Auto-Report Function Modified to Prevent Program Name Duplication - The Auto-Report function has been modified so that the program name in columns 75-80 of the Header Specification will no longer be propagated through the source program. This change prevents overlaying portions of comment records and retains existing data from the original program.

BINARY SYNCHRONOUS COMMUNICATIONS (BSC)

The Telecommunications Specification is supported in System/34 RPG II. Support of Binary Synchronous Communications will be provided by System/34 to communicate with:

- Another System/34 with RPG II or Basic Assembler
- System/32 with RPG II or Basic Assembler
- System/3 with ML/MP, CCP or RPG II
- System/7 with MSP/7
- System/360 with either of the following:

BTAM*
TCAM/NCP*

- System/370 with any of the following:

BTAM*
TCAM/NCP*
VTAM/NCP*
CICS/VS*
IMS/VS*

- 3741 mdl 2 or 4
- 3747
- 5231 mdl 2 (supported as 3741 mdl 2 or 4 in transmit mode only)
- 5280 Distributed Data System
- Series/1 (Supported as a System/3)
- 5110 (as a 3741)
- POWER/VS (as a 2780)

* **Note:** The 3704/3705 Emulation Program (EP) or the Partitioned Emulation Program (PEP) extension to 3704/3705 NCP can be used to emulate the 2701.

Limited programming support is provided by System/34 RPG II Telecommunications Specifications for the following devices: (an approved RPQ (S40186) is required.)

- 6640 Document Writer
- Office Systems 6 Information Processor
- 6240 Magnetic Card Typewriter - Communicating
- 6670 Information Distributor
- Displaywriter System

The BSC host support for System/34 is generated on the host system as System/3 BSC.

S/34 RPG II (cont'd)**SPECIFIED OPERATING ENVIRONMENT**

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/34 RPG II licensed program runs on all models of System/34 and supports the Communications Adapters (#2500, #3500) in BSC mode.

SOFTWARE REQUIREMENTS

The current release of the IBM System/34 RPG II licensed program operates under control of the current release of the IBM System/34 System Support licensed program (5726-SS1).

COMPATIBILITY

System/32 RPG II Considerations: The RPG II language is supported as on the System/32. Overlays are automatically generated when necessary. Differences do exist due to different devices and SSP function. System/32 RPG II programs must be recompiled on System/34 with the following considerations.

- Object program size will differ due to the SSP Data Management and control block changes. The size may be larger or smaller depending on the particular logical files used in the user program and the overlay structure generated by the compiler.
- RPG II CONSOLE, KEYBOARD, and CRT files will display information differently because of the larger display screen. Keying will also be slightly different.
- If any subroutines are called via EXIT or SPECIAL files, those Basic Assembler subroutines must be reviewed and modified as required to execute correctly on System/34. IBM-written System/34 Basic Assembler subroutines SUBR01 and SUBR95 are supplied with the RPG II program product to support conversion of System/32 RPG II programs that include SUBR01 or SUBR95.

Program Use During Customer Pre-Installation Testing: The IBM System/34 RPG II Licensed Program (5726-RG1) is available to customers for pre-installation testing on IBM Test Center systems in accordance with IBM's Program Testing Policy.

SYSTEM/34 RPG II SUBSET 5726-RG2

PURPOSE

This program is intended to support the Preconfigured System/34 System Support Program Subset (5726-SS2).

RPG II is a symbolic programming language that is commercially-oriented and specifically designed for writing application programs that meet common business data processing requirements. The System/34 RPG II Subset compiler translates programs written in RPG II subset into object programs that are executed under the Preconfigured System/34 System Support Program Subset.

HIGHLIGHTS

- Display station support which allows an RPG II program to communicate with display stations by using the WORKSTN file facility. WORKSTN file support allows concurrent interaction of multiple display stations with the same program. Four calculation operation codes support the WORKSTN file:
 - ACQ acquires a display station for a program.
 - REL releases a display station from a program.
 - NEXT forces the next input to the RPG II program to come from a specified display station.
 - POST provides for the retrieval of status information for a specified display station attached to a WORKSTN file.
- Subroutines are provided to support multiple display stations in a WORKSTN file:
 - SUBR20 reads and updates the external indicators (U1-U8) for a specified display station.
 - SUBR21 reads and updates the display station local data area for a specified display station.
 - SUBR22 allows an RPG II program to read records from a transaction file that has been created by the Work Station Utility program.
- User exception/error handling capability for the WORKSTN file allows the user to control the program logic flow if exception/error conditions occur on an operation to a WORKSTN file.
- Data structures which allow the user to redefine the same data area multiple times using different data formats. Data structures enable a user to:
 - Specify subfields of a file (thereby reducing the number of MOVE and MOVEL operations needed)
 - Perform an operation on a portion of a field by referencing a subfield
 - Use the same internal storage area for multiple record types
- Expanded CONSOLE support which allows complete record prompting through use of screen formats. The RPG II format generator generates screen formats for the CONSOLE file from the RPG II input specifications (either 960- or 1920-character screens).
- Subroutine SUBR01 which allows data to follow a // RUN statement either in a procedure or from the keyboard.
- Subroutine SUBR23 which retrieves messages from a user message member.
- Calculation operation codes:
 - TIME gives the time-of-day and, optionally, the system date.
 - SHTDN tests whether the system operator has requested shutdown.
- Multiple printer support which allows up to eight printer files in a program.
- The specification of a primary file is optional. If there is no primary file, the RPG II programmer must set on the LR indicator to go to end of job.
- The cross-reference support which provides the ability to include a cross-reference listing of symbols used in an RPG program in the compiler listing.
- Delete-capable file support which allows records to be deleted from delete-capable files through the use of DEL on the output specifications.
- Addition of records to delete-capable files processed randomly by relative record number.
- The job queue support which allows the capability of placing RPG II compilation requests on the input job queue.
- NOSTOP/REPLACE procedure options which eliminate halts for terminal errors and duplicate library members.
- The storage index entry is allowed for files processed sequentially within limits.
- The SORTA operation code which allows the records in an array to be sorted into ascending or descending sequence.

- The figurative constants *BLANK, *BLANKS, *ZERO, and *ZEROS supported for the calculation specifications.
- The /TITLE statement which provides heading information at the top of each page of the compiler listing.
- Currency symbol support which allows you to specify a symbol other than the dollar sign (\$) as the currency symbol.
- Extended printer support which allows record lengths of up to 198 characters to be specified for the 5225 printer.
- Short form calculations

The following features of System/34 RPG (5726-RG1) are *not* supported:

- Auto-Report
- Telecommunications

DESCRIPTION

RPG II SOURCE LANGUAGE SPECIFICATIONS

To use System/34 RPG II Subset, the programmer defines a program by coding combinations of the following source language specifications:

- Control specification which provides information about the program to be compiled and describes the system being used
- File description specifications which describe all of the program files
- Extension specifications which describe all tables, arrays, and record address files
- Line counter specifications which indicate the length of the forms used in the printer and specify the overflow line
- Input specifications which describe the records and fields in the input files and also describe data structures
- Calculation specifications which describe the calculations to be performed on data
- Output specifications which describe the records and fields in the output files and also specify the display screen format names for WORKSTN files

The RPG II SUBSET COMPILER

The RPG II Subset compiler is a program that translates an RPG II subset source language program into an executable object program. The RPG II Subset compiler produces:

- A source program listing
- Diagnostic messages
- A main storage map
- An object program stored in a library
- A cross-reference listing of symbols (on request)

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

This IBM System/34 RPG II Subset (5726-RG2) runs on all models of System/34.

SOFTWARE REQUIREMENTS

This IBM System/34 RPG II Subset (5726-RG2) operates under the control of the IBM Preconfigured System/34 System Support Program Subset (5726-SS2), or Release 7 of 5726-SS1 while it is available, or its equivalent.

The IBM System/34 RPG II Subset (5726-RG2) consists of parts of System/34 RPG II (5726-RG1) stabilized at Release 7. No release update or enhancements are planned.

COMPATIBILITY

System/34 RPG II Subset is highly source-compatible with System/32 RPG II (5725-RG1). System/32 RPG II programs can be recompiled using System/34 RPG II Subset with the following considerations:

- Object program size will differ due to System/34 System Support licensed program data management and control block changes.
- CONSOLE files will prompt for a record at a time rather than field by field.
- Any Assembler language subroutines called via EXIT or SPECIAL files should be reviewed and modified to execute on System/34.
- RPG II subset does not support Telecommunication Specifications or Auto-Report.

Do not reproduce without written permission

PROGRAM PRODUCTS

**SYSTEM/34 SYSTEM SUPPORT PROGRAM
5726-SS1**

HIGHLIGHTS

IBM System/34 System Support Program (SSP) provides the following control program capabilities:

- Single Program/Multiple Program Modes
- Input Job Queue
- Main Storage Management
- Disk File Sharing
- Operation Control Language
- System Utilities
- Data Management
- System History Area
- Print Spooling
- User Access to Spool
- Interrupt/Resume
- Overlay Linkage Editor
- Synchronous Data Link Control (SDLC) as a part of Systems Network Architecture (SNA)
- SNA Remote Job Entry Utility Programs (SRJE and SRJE WITH MLU)
- Binary Synchronous Communications (BSC)
- Support for the Auto-Call Feature of the Multiline Communications Adapter (MLCA)
- MULTI-LEAVING Remote Job Entry System Utility Program (MRJE)
- Multiple User Library Support
- Operator ID and Password Security to the file/library level
- Support for the 1255 Magnetic Character Reader
- Control Program Support for Compilers and Utilities
- Support for directly attached and remote workstations (display stations and printers)
- Support for both 1,920- and 960-character displays
- Support for up to four communications lines
- System HELP Facility
- System Measurement Facility
- Interactive Communications Feature Support
- Support for 5250 Magnetic Stripe Reader
- Support for the Multinational Character Set
- Support for 5211, 5262 Translation Capability
- Expanded VTOC allows up to 2,008 user library/file entries
- Spool function
- Support for work station History File scroll capability
- ASSIGN/FREE support for systems using near maximum nucleus size
- ASSIGN/FREE allocation and use for temporary storage of a user's Local Data Area
- RELOAD/Release update support
- Support in Batch BSC for Assembler language users to receive variable length records
- Auto-Response Facility

DESCRIPTION

Single Program/Multiple Program Modes: The System/34 may be used in the single program mode which is very similar to the operation of a System/32. When the SSP is configured in the single program mode, one operator enters commands and OCL. The programs invoked by the OCL execute one at a time, in sequence, in a single region.

The Display Stations attached to a System/34 are designated at SSP configurations as either command- or data-capable. A command-capable station can be used to invoke procedures, control commands and OCL as well as being used for data input/output in user programs. A data-capable station may be used only for user-programmed data input/output and must be acquired by a user RPG II or Basic Assembler program which has been invoked from a command station. A command-capable station must be located near the System Unit for

use as the system console. In single program mode, there can be only one command-capable station.

The SSP can be configured to allow the System/34 to operate in the multiple program (multiprogramming) mode. Operators at multiple command-capable stations may concurrently invoke control commands, OCL and procedures. Multiple programs can execute concurrently.

Input Job Queue: Multiple program mode of the SSP provides an Input Job Queue facility. The input job queue contains a list of jobs that are to be executed in sequence concurrently with other batch or operator-interactive jobs. The jobs in the queue can be placed there by any command-capable station or OCL procedure. The station that places the job on the queue is released from that job and, therefore, becomes available for other work. Job queue priorities can be specified to control a job's position in the job queue.

Main Storage Management: The System/34 manages main storage as a pool of noncontiguous 2,048-byte segments and 'swaps' entire programs to and from disk as required to fit an active program into main storage (a program that is inactive might, for example, be waiting for data input or a message response from a display station).

System/34 main storage management allows the total main storage required by all active tasks to exceed actual user main storage. Performance considerations will dictate to what extent user main storage may be overcommitted.

The System/34 SSP occupies a minimum of 14K bytes of main storage. This value may be increased in 2K-byte increments to include printer Spool support, increase number of active tasks, or to optimize system performance. This resident nucleus area contains SSP functions such as data management for disk, printer and workstations; buffers for workstation I/O and printer spooling; and an SSP work area used for task control. When remote workstations are active, an additional area of main storage is reserved for line buffers and SDLC data management.

Disk File Sharing: Disk data files on System/34 may be accessed concurrently by multiple programs for input, update, or add operations. Protection of data against concurrent update by two programs is provided by locking the disk sector(s) until released by the accessing program. An OCL parameter is provided to allow or prevent the file sharing of a specified file.

Operation Control Language (OCL): System/34 OCL is compatible with System/3 OCL with the following exceptions:

- A command statement which has the capability to pass parameters to the indicated procedure is used in place of the System/3 CALL.
- Capability for specifying default values for missing OCL parameters.
- Logical IF statement provides for condition checking within procedures. It is possible to execute different steps based on tests performed in OCL.
- Other differences brought about by devices and system function.

System/34 OCL is compatible with System/32 OCL with exceptions such as the following:

- Additional commands, statements, and parameters have been incorporated into System/34 OCL.
- Some operator-entered commands do not invoke OCL procedures or utility programs on System/34. Therefore, a System/32 procedure using those commands will require change.
- Some utility functions such as COMPRESS must run dedicated, that is, cannot run in multiprogramming mode with other programs. Therefore, System/32 procedures using those commands must be changed.
- System/34 in multiprogramming mode, or either mode with printer spool, will not honor the System Log statement. Logging to the System History Area is still performed and messages are displayed to the operator's display screen but will not be printed as they are displayed in this mode.
- System/34 does not support offline multivolume diskette files except on the Diskette Magazine Drive.
- The disk file rebuild of the System/32 Utilities has been replaced by an automatic disk file integrity check at IPL (optional).

OCL procedure commands and control commands are provided to support the SSP facilities and the management of a multiprogramming system. Key functions in addition to those above include print spool queue and input job queue management, disk file sharing control, display station and printer assignment at execution time, region size, OCL-to-program communications (in a 256-byte local data area accessible and modifiable through OCL and user programs), reserve disk space for a job, add job names to the input queue, select communication line, branch to a specific point in a procedure, specify

S/34 System Support Program (cont'd)

the next menu to be shown to the operator, display user formats for input data prompting and display station-to-system console station communications.

Systems Utilities: System/34 SSP also provides enhanced function for those utilities and new utility programs to allocate files, rename files, build display formats, build job menus and other common functions.

Data Management: This SSP provides data management support for the disk, the display, the keyboard and printers. The support for disk also allows the user to optionally specify space for more than 200 disk files, up to a maximum of 920 on mdls XX1 to XX3 and 984 for mdls XX4 and XX5. The display station data management supports multiple direct and remote units of the 5250 Information Display System, for both 1,920- and 960-character displays. This display station data management manages all input and output to the display stations including the retrieval of display formats from a disk library and merging program data prior to displaying the format on the display.

Diskette - The System/34 SSP includes utility programs to fully support the diskette unit and the Diskette Magazine drive as a Save/Restore device. The Diskette 1 in 128- or 512-byte sector formats are supported. In addition, the Diskette 2D (2-sided Double-density) is supported in 256 or 1,024-byte sector formats.

The Diskette Magazine support allows input/output operations to begin on any one of 23 specified diskettes and overflow automatically to the next diskette in the magazine, to the next magazine, or from one individual slot to the next.

System History Area: System/34 provides a history area on disk which contains all recently executed OCL statements and all messages issued to the log device. The messages and data may be retrieved and redisplayed on the display station or printed. Either all the OCL statements or only those originally displayed may be printed as a hard copy log of the activity of the system. Individual display station operators will only be able to display or print entries created from that display station.

Entries are time stamped and include the job identification generated by the SSP to assist in determining the sequence of activity on the system. A configuration option allows the user to prevent History File from being overwritten. This option, which can be overridden at IPL, allows the system to save the History File.

Print Spooling

Print spooling is supported by the SSP as an option in either single program or multiple program mode. When spooling is configured in the SSP and indicated at execution time, printer output requests are intercepted and stored on disk. Spool writers are used to retrieve the print records from disk for printing. A print queue is maintained of job names whose printer data is yet to be printed, or specified as 'Retained after Printing'. System console commands are provided to start/stop, restart (at a page number), cancel, hold/release, change priority of and display jobs in the print queue. Print spooling is supported for any and all printers attached to the system simultaneously. In addition, multiple logical print files, up to 8, from a single RPG II program may be directed to one printer or separate printers.

A specified display station can be configured to be the controlling station for a spooled workstation printer. The spool control commands and spool-issued messages are available to the display station operator to control the output directed to the printers associated with that display station.

The size of the primary spool disk file is specified when the SSP is configured. The spool intercept routine will allocate up to five additional extents if necessary. These extents will be freed up by the spool writer as they become empty.

User Access to Spool: A utility permits spooled data to be copied to a data file which may be saved on diskettes, restored for later use, and viewed on a display station. While viewing the output, the user can elect to print a copy of the information. The entire report or selected pages can be printed without re-executing the job.

Interrupt/Resume: The operator may interrupt a processing program, execute another job, such as inquiry into a file, and return to the processing program. Processing of the interrupted program will resume when the operator indicates the completion of interrupting activity.

Overlay Linkage Editor: The Overlay Linkage Editor facility converts relocatable object modules, produced by FORTRAN and the Basic Assembler program, to executable programs. Overlay structures may be created automatically or as designated by the user.

This facility is not required for Basic Assembler subroutines to be included in RPG II programs.

A System/34 SRJE (SNA Remote Job Entry) utility program is included with the SSP to provide data communications capability to the following System/370 remote job entry programs:

DOS/VSE/POWER/VS
Remote Entry Services (RES)
Job Entry Subsystem 2 (JES2)
Job Entry Subsystem 3 (JES3)

Synchronous Data Link Control (SDLC) as a Part of Systems Network Architecture (SNA): The System/34 SSP provides an interface to support data communications with a host System/370 (4300, S/370 mdls 115 through 168, 303X, 308X) operating under DOS/VSE, OS/VS1, MVS, or any of these operating systems when running under VM/370. Attachment is through a 3704 or 3705 operating under NCP/VS.

System/34 SNA Remote Job Entry (SRJE) has been enhanced to support Multiple Logical Units (SRJE with MLU). This support is an incremental improvement to the current System/34 SRJE in the SSP. SRJE supports a single logical punch unit which may be a READER, a WRITER, or a PUNCH. The CONSOLE requires the current active device to pause to allow console messages. SRJE with MLU supports multiple logical units, up to 10, which may be three READERS, three PUNCHES, and a CONSOLE all active concurrently.

The following host subsystems are supported:

RES
JES2
JES3
DOS/VSE/POWER/VSE

The attachment and operation has been tested to each of the above subsystems. These host subsystems currently support MLU on the 3770/3790. The host subsystems are not required to make any coding changes to support this attachment.

The following changes must be made by the IBM customer to use this support. On the host subsystem, the definition of the System/34 must be changed from a Single Logical Unit to MLU. On the System/34, the SRJE procedure has a new parameter - the number of sessions desired. SRJE with MLU does require an additional 2K of nonswappable memory in the System/34.

If a customer does not want to use SRJE with MLU, but just SRJE, then no changes should be made. There is no impact on memory and no changes to the SRJE procedure or to the host subsystems. The original SRJE support still exists.

This utility provides capabilities similar to the batch workstation utility program for RES, JES2 and POWER/VS that is available with the IBM System/32. This support includes the ability for SRJE to be initiated from a procedure from any workstation without operator intervention. When the auto-call feature of the MLCA is used, the initiation of SRJE will call a predetermined phone number without requiring operator intervention to place the call.

Support for the Auto-Call Feature of the Multiline Communications Adapter (MLCA): The support for the System/34 Auto-Call feature (of MLCA) allows the user to have the system automatically attempt phone calls on a switched line to another device or system. This support is provided external to the user programs in such a way that no changes to user source code are necessary. Phone numbers are referenced through new OCL parameters.

Highlights

- Ability to call multiple locations from a single batch BSC step (through an OCL loop) and retrieve/send data from/to each location without operator intervention
- Ability to define phone numbers or lists of phone numbers that can be referenced in OCL for communication on any line that is an auto-call line.
- Ability to specify a time interval to wait after the call has been placed before considering it incomplete.
- Automatic retry of incomplete calls a specified number of times before considering call a failure and logging an error message.
- Support for phone numbers of up to 22 characters to facilitate international calls.
- Support for a separator (SEP) character option to allow the system to wait for an additional dial tone when dialing through to another network.
- Support for an End of Number (EON) character option to allow users to signal their hardware when short numbers are used.
- Support for MRJE and SRJE to be executed and call a predetermined number, without operator intervention for placing the call.
- Auto-call support is provided when using batch (RPG or Assembler) MRJE, SRJE, SNA 3270 Device Emulation, and the following subsystems of SSP-ICF: BSCCL, CICS, CCP, SNA Upline Facility, SNA Peer.

Binary Synchronous Communications: The SSP provides Binary Synchronous Communications (BSC) data management for System/34

S/34 System Support Program (cont'd)

RPG II and Basic Assembler and Macro Processor programs. For the devices supported, this BSC data management appears the same as the program support provided by the System/32 RPG II data communications support (an additional BSC capability on System/34 permits transmission of multiple data files to or from 3741 diskettes). A system utility is also provided to select certain communications characteristics at program execution time such as: Line type, terminal address, line speed, error retry count, etc. The Basic Assembler program product includes BSC macro support.

MULTI-LEAVING Remote Job Entry System Utility Program (MRJE): The MRJE System Utility program permits a System/34 to function as a remote job entry (RJE) workstation for submission of jobs to a central System/370. The central OS processing is performed under control of one of the following: HASP II, ASP, RES or JES2, JES3. The System/34 MRJE will also operate with VM/370 Remote Spooling Communications Subsystem (RSCS) as a HASP workstation. MRJE operates under control of the System/34 SSP and communicates with the central system over a point-to-point (switched or nonswitched) communication line via the Communications Adapter in BSC mode. Host System RJE programming support should be generated specifying System/3 as the supported terminal.

Highlights of the MRJE program are:

- Full MULTI-LEAVING support permits concurrent System/34 device operation.
- Card I/O operation is simulated by disk storage.
- Compression and expansion of blanks and duplicate characters may be performed for increased line utilization.
- At the user's option, the MRJE automatically selects a default for any MRJE message requiring an operator response.
- Disk storage is supported for jobstream input and output and for individual data set output.
- A print utility program is provided for printing 'punch' and printer data streams which were directed to disk storage during the RJE session.
- MRJE Utility control statements may be entered through the keyboard or a limited set may be entered from a file on disk storage.
- MRJE can be initiated from a procedure from any workstation.
- When the auto-call feature of the MLCA is used, the initiation MRJE will call a predetermined phone number without operator intervention.
- The initiating workstation functions as a console for operator communication.
- All MRJE Utility control statements and central system commands and all messages are logged in the System/34 History File.

Note: The diskette drive is not supported by the MRJE Utility.

Multiple User Library Support: The System/34 SSP provides for multiple user libraries. Parameters and OCL statements allow the user to specify a library name. If the library is not specified, the default is to the system library (#LIBRARY).

Operator ID and Password Security to the File/Library Level: Each operator who signs on to a System/34 display station is prompted for an identification and optionally a password. This data is then checked by the SSP before allowing the operator any further access to the system.

Also, files and program libraries can be restricted to authorized users. These users can be further classified by type of use. An additional option allows the creation of audit entries in the system history area for each use of a secured file/library.

Security permits the optional additional check of operator badge identification at sign-on, if the workstation has an attached 5250 Magnetic Stripe Reader.

IBM 1255 Support: The System/34 SSP includes subroutines (SUBR08 or SUBR25) which can be linked into a user-written RPG II, COBOL or Basic Assembler program to interface the program to the 1255 Attachment feature. SUBR08 and SUBR25 provide for the reading of data from documents (checks) and returning that data to the program when requested by program logic. It can also return to the program the stacker selection that was made, and indicators that tell field validity and document type.

Control Program Support for Compilers and Utilities: The SSP provides the control program services for RPG II, COBOL, FORTRAN, Basic Assembler and the Utility licensed programs. Included are disk data management, printer and spool support, program library maintenance, OCL and procedure support, and main storage allocation and management.

The language compilers and utilities function like user batch programs. In a multiprogramming environment, multiple copies of a compiler or utility may operate concurrently if necessary resources are available.

Support for Directly Attached and Remote Display Stations and Printers: The System/34 may be configured to support the 5251, 5252, 5291 and 5292 display stations and the 5219 D01 and D02, 5224, 5225, and 5256 printers attached to the System/34, and communicate with 5251 mdls 2 and 12 on one to four communication lines. Remote workstations may be used to perform most of the same functions as the directly attached stations.

Switched network backup and speed select modem features are not supported under program control when communicating with 5251 mdls 2 or 12.

Application programs and IBM program products which support directly-attached 5219 D01 and D02, 5224, 5225, 5251, 5252, 5256, 5291 and 5292 devices will also support the remotely-attached devices without change. However, the system console function may not be assigned to a remote display station.

Support for Both 1,920- and 960-Character Displays: The System/34 may be configured to support 1,920- and 960-character display stations. All SSP display formats will be supported on either display size. Some formats (such as message displays) will present fewer lines when output is directed to a 960-character display. Either size display can be assigned as the system console.

Support for Up to Four Communication Lines: The System/34 may be configured to support four communication lines, each in either BSC or SDLC protocol. Each can be either switched, leased, or leased with Switched Network Backup.

They are accessed via OCL (with the default being line 1). No user programming is required.

Switched network backup and speed select modem features are not supported under program control when communicating with 5251 mdls 2 or 12.

HELP Facility: The SSP includes a HELP facility to aid users in executing many of the functions of the System/34. HELP provides the user with the capability of displaying prompts which contain the syntax, default parameters, keywords, and general descriptions of procedure commands.

System Measurement Facility: System/34 includes System Measurement Facility (SMF) routines which, in conjunction with control storage routines, may be invoked to monitor system activity, system device, and SSP work area utilization, and record this data in a disk file. A report program is provided so that the file may be listed to provide information useful in analysis of system performance with the current application work load or in anticipation of added application work load.

Expanded VTOC Allows up to 2,008 User Library/File Entries: The disk Volume Table of Contents (VTOC) has been increased to allow entries for up to 2,008 user files and libraries resident on the system in addition to the system files. The previous maximum number of entries was 984.

Spool Function: The spool support treats each print file separately and allows any number of print files in a user program. This allows independence between print files created in the same program so that spool file space can be freed as each print file completes printing.

The maximum spool file size is 76,800 blocks. In addition, the maximum page number that can be supported in a RESTART command is 65,535.

A number of commands and the information they display to aid the operator in controlling spool files are:

STATUS PRT Command

- An indication of print files being copied by the User Access to the Spool File Utility
- The page number currently being intercepted
- The page number currently being printed by the writer

STATUS WRITER Command (new)

- The ID of the printer
- The ID of the subconsole that controls the printer
- An indication of whether the writer is stopped or started
- The spool ID and procedure name of the print file that the writer is currently printing
- The forms number that the writer is currently printing
- An indication of whether a spool writer message is pending
- Number of separator pages
- Residency and priority indications

S/34 System Support Program (cont'd)
CHANGE Command

- A parameter allows the operator to change the DEFER attribute (YES/NO) of a currently intercepted print file
- Parameters allow the operator to change the residency, priority, and separator page attributes of the writer for any individual printer

Support for Work Station History File Scroll Capability: A procedure, HISTCRT, facilitates problem determination by allowing the operator to easily view history file entries on the display. When the HISTCRT procedure is executed, the first screen shows the most current history entries. While viewing the entries, the user can:

- Use the Roll Up and Roll Down keys to scroll through the entries
- Use a command key to view the oldest or newest entry, or change the number of lines to be scrolled
- Use HELP to obtain an explanation of the command keys
- Enter scan characters to locate a specific entry
- Use command keys to choose selection criteria for the entries or parts of entries that are to be viewed

The use of scan characters assists the user in locating information. When an entry is found that contains the specified scan characters, the entry is displayed and the scan characters are highlighted and underlined. The operator can continue scanning, forward or backward, for more entries with the same characters, or scanning can be stopped by removing the scan characters. Up to 20 scan characters can be specified during each scan operation.

ASSIGN/FREE Support for Systems Using Near Maximum Nucleus Size: The ASSIGN/FREE support issues a message and performs STOP JOB,ALL and STOP SESSION control commands when the last 2K of storage is allocated to ASSIGN/FREE space. This action will be taken even if the system is configured with the maximum nucleus size. This causes the system to stop, allowing the operator to take appropriate action to reduce the load on the system by selectively restarting jobs. As ASSIGN/FREE space becomes available, the remaining jobs can be restarted by the operator.

ASSIGN/FREE Allocation and Use for Temporary Storage of a User's Local Data Area: The allocation of ASSIGN/FREE space provides more efficient usage. The allocation algorithm looks for space on a 'best fit' basis, which reduces fragmentation and improves utilization.

The users' Local Data Area (LDA) is placed in the system ASSIGN/FREE space during a job step initiation. Each LDA requires 256 bytes. The system allocates 256 bytes of ASSIGN/FREE space the first time a LOCAL OCL statement or LOCAL procedure control expression substitution is encountered in a job step. This space is freed when a // RUN statement is encountered. If the job step does not reference the LDA, no additional ASSIGN/FREE space is used. This may improve performance in job steps that have multiple OCL references to the LDA. This support does not affect statements placed after the // RUN statement.

RELOAD/Release Update Support: RELOAD preserves certain system names and parameters across the installation of a new release. The names and parameters that will not be reset are:

- Workstation Parameter Member Name
- Print Belt Image Name
- Startup Procedure Name
- Line Printer Translate Table Name
- SNA/SDLC Parameters

Batch BSC Support for Assembler Language Users to Receive Variable Length Records: Assembler language users have support in Batch BSC to receive variable length records. The data can be blocked or unblocked. The user must specify a parameter RECFMT=F (fixed) or RECFMT=V (variable) for this support. The record length is returned in the DTF field \$BSRCL. The maximum expected record length must be specified when the file is opened. Transparency, blank truncation, compression, and ITB mode cannot be used.

Auto-Response Facility: The System/34 Auto-Response Facility allows users to specify response options to be taken automatically when error messages are displayed at the system console. Normally, processing stops until the system console operator responds to a message with an option value. Auto-response allows a user to select messages to which the system will respond with an option value and then continue processing. The use of this facility is particularly valuable when a system must run without an operator in attendance.

Only messages sent to the system console can be answered by auto-response. The selected option value must be a value that is allowed for the message. Messages issued by the SSP, communications components, program products, and user-created programs can be responded to automatically.

The RESPONSE procedure allows users to specify the source member that contains the option values to be applied to the messages, and the name of the library that contains the source member. The RESPONSE procedure calls the \$ARSP utility, which reads the auto-response values and applies them to the appropriate messages.

Once the utility has been run, the system will respond automatically to all messages for which auto-response values exist. If the system is not to respond automatically to a message, the utility must be run again to remove the default values.

Interactive Communications Feature Support: The interactive communications feature includes support for program-to-program communications to other systems or devices using BSC and SNA/SDLC as well as communications between programs within the same system. The feature also allows programs on other systems to initiate System/34 procedures and allows System/34 programs to initiate programs or procedures on other systems without remote system operator intervention. To facilitate incoming procedure requests, the interactive communications support can maintain a connection on a communications line when no System/34 application program is active.

Support for 5250 Magnetic Stripe Reader: Provides the capability of reading numeric encoded information from a magnetic stripe on a wide range of credit cards, identification cards and documents. The magnetic stripe may be encoded with up to 128 ABA characters, including control characters. This feature enhances system data security by providing the ability to read an operator identification card without being displayed.

Support for the Multinational Character Set: Provides the capability of displaying the 188-character Multinational Character Set to facilitate the interchange of information between systems with different language groups. The keyboards do not include the additional characters of the Multinational Character Set. All characters may be entered via a single or multiple key sequence.

Support for 5211 Translation Capability: For users with translation capability, the IMAGE statement permits the specification of a translation table for each display station or job on the input job stream. This provides for character substitution when using a print belt on the 5211 which does not contain all the characters in the printer data stream.

Configuration of the SSP: Configuration of the SSP involves an interactive process of responding to displayed prompts to select options and specify buffer sizes and work area sizes. Configuration is typically performed immediately following initial installation of the SSP on the user's system but may be repeated later to change specified options or sizes.

The SSP provides default values for all variables and will adjust these defaults dynamically depending on the user system configuration. The values may also be altered at IPL to temporarily select or omit function or alter performance characteristics of the system.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/34 System Support Program runs on all models of System/34 and supports all features. The system configuration required to support the Communications Adapters (#2500,#3500) in SDLC mode via System/34 SSP (5726-SS1), requires a minimum of 48K bytes of main storage.

SOFTWARE REQUIREMENTS

All IBM licensed programs for System/34 are designed to operate in an environment that includes the System/34 System Support licensed program (5726-SS1) or its equivalent. The SSP order should be entered via AAS at the same time as the system order. IBM's ability to provide concurrent hardware maintenance is dependent upon functions provided by the SSP or its equivalent.

Program Use During Customer Pre-Installation Testing: The IBM System/34 System Support Program (5726-SS1) is available to customers for pre-installation testing on IBM Test Center systems in accordance with IBM's Program Testing Policy.

PROGRAM PRODUCTS

**SYSTEM/34 SYSTEM SUPPORT PROGRAM (SSP)
INTERACTIVE COMMUNICATIONS FEATURE (SSP-ICF)
FEATURE #6000, #6001**

PURPOSE

Support is offered as a feature of the IBM System/34 System Support Program (SSP) (5726-SS1) and provides for Interactive Communication (BSC and SNA/SDLC), Remote Procedure Initiation on the System/34, and Communications Line Monitoring on a multipoint line (System/34 as a tributary station).

DESCRIPTION

System/34 SSP Interactive Communications feature (SSP-ICF) provides support for:

- Interactive communications between application programs
- Multiple concurrent communication sessions over the same data link
- Multiple concurrent user application programs which use communications
- An application program interface which is substantially independent of link protocol (BSC or SDLC)

Interactive communications differs conceptually from batch communication in that the sequence of messages is not necessarily predetermined. Either party in the communications session can logically start, alter or terminate the conversation. The logical communication path connecting two programs which are exchanging messages is called a session. SSP-ICF allows for multiple concurrent sessions to be used by one or more application programs in the System/34.

The application program access to SSP-ICF is available at two levels. Both are a logical extension of the System/34 workstation interface. The first is through special predefined screen format names that serve as operation codes to control evoking programs, sending data, and issuing special commands to SSP-ICF. The second is through assembler programming and supports all of the functions in the first level plus the added flexibility of supporting situations that may occur when communicating to systems which are not part of the standard SSP-ICF support.

This application program interface allows the user program to be shielded from most of the uniqueness of the communications protocols (BSC or SNA/SDLC) and the communications support for the remote systems (e.g., IMS/VS, CICS/VS, or CCP). For example, with proper design, users can develop programs for their current BSC network and then easily move to an SNA network without significant change to the communications interface within existing application programs.

With Release 8 modifications, evoked SRT programs perform output as the first operation. This removes a restriction that an evoked SRT program must perform input as the first operation. An SRT program initiated by EVOKE may perform input or output as the first operation. This capability applies only to SRT programs; the system restrictions for MRT processing still apply.

Included with SSP-ICF is support for languages, devices, and communications systems as listed below:

Note: System/34 link connections are either point-to-point or multipoint tributary only (except for connection to 5250 devices or another System/34 using SDLC).

- **BSC**
 - System/3 mdl 15 with CCP
 - System/370 with IMS/VS (version 1.1.4) via IRSS
 - System/370 with CICS/VS (version 1.3.0), OS/VS or DOS/VS with BTAM (System/34 as a System/3)
 - System/34 with SSP-ICF, RPG II, COBOL, or Basic Assembler*
 - 5110 (as a 3741, point-to-point only)*
 - System/7 with MSP/7 (System/7 as a System/3)*
 - System/3 with RPG II T/P or ML/MP*
 - System/32 with RPG II or Basic Assembler*
 - 3741 mdl 2 and mdl 4 (no multiple file support, point to point only)*
 - 3747 (point-to-point only)*
 - 5231 mdl 2 (as a 3741)*
 - 5280 Distributed Data System
 - Series/1 (as a System/3)*
 - System/370 with: (System/34 as a System/3)
 - OS/VS, DOS/VS BTAM*
 - OS/VS TCAM*
- These devices are only supported for single communication sessions over a data link.
- **SNA/SDLC**
 - SDLC to System/34 using SSP-ICF
 - System/34 with SSP-ICF
 - SNA/SDLC to System/370 using NCP/VS and TCAM Direct (TCAM 10) or VTAM, or ACF/NCP/VS and ACF/TCAM or ACF/VTAM

- System/370 IMS/VS (version 1.1.4) using SLU Type P protocols
- System/370 CICS/VS (version 1.3.0) OS/VS (System/34 as a 3790)
- System/370 CICS/VS (version 1.3.0) DOS/VS (System/34 as a 3790)
- System/370 with user-written communications support using SNA protocol profiles TSP 3 or 4 and FMP 3 or 4.

REMOTE PROCEDURE INITIATION

The remote procedure initiation facility is available to help support distributed processing applications. With this enhancement, programs in another system can send a message to the System/34 which will cause a procedure to be evoked. The evoked procedure may use any of the procedure capabilities of the System/34. The program(s) within the procedure may or may not use SSP-ICF. Using this capability, an application program can communicate interactively with a program in the evoking system. If the evoked procedure is an executing MRT procedure, the session from the evoking program will be attached to the MRT program.

DATA COMMUNICATIONS LINE MONITORING

During the configuration procedure, interactive communications can be included in the system. If it is, specific questions will be asked to determine which communication subsystem types to include (for example, CICS or IMS/IRSS). Multiple subsystems may be configured, identified with a logical name, and associated with a specific data communications line connection. The configured subsystems may be activated (ENABLED) during the IPL procedure (auto-enable) or by the system operator after IPL. Once the connection is made, the System/34 SSP-ICF will maintain the connection to the communications link (until disabled), even though no user application program is active.

Note: This facility is a function of SSP-ICF and not available to other System/34 communication support (such as batch BSC, MRJE, or SRJE).

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section of these pages, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/34 Interactive Communication Feature (SSP-ICF) runs on all mdls of the System/34 with a minimum of 64K bytes of main storage. SSP-ICF support for communications between programs residing in the same System/34 does not require a communications adapter. Communication to another system or device requires a communications adapter on the System/34 (#2500 or #3500).

SOFTWARE REQUIREMENTS

The IBM System/34 Interactive Communications Feature (SSP-ICF) will operate under control of the current release of the System/34 System Support Program (5726-SS1).

SYSTEM/34 COMMUNICATIONS SUPPORT COMPATIBILITY

SSP-ICF communications support does not replace previously announced System/34 communication support. SSP-ICF communications support can coexist in a System/34 with other communications support (that is, programs using remote 5250s, batch BSC, MRJE, SRJE, or previously announced System/34 SNA Assembler macros). However, SSP-ICF communications support and other communications support cannot share a communications adapter concurrently.

PROGRAM PRODUCTS

**SYSTEM/34 SYSTEM SUPPORT PROGRAM - SSP
FINANCE SUBSYSTEM (Feature #6010, #6011)****PURPOSE**

The IBM System/34 System Support Program Finance Subsystem, operating with the Interactive Communications Feature (ICF), can communicate with the IBM 3601 Finance Communication Controller, 4701 Finance Communication Controller, and 3694 Document Processor.

DESCRIPTION

3694 Document Processor: Communications with the 3694 is in batch mode via SDLC. The Check Processing Executive (CHX/3694) licensed program (5748-F53) must be used in the 3694. User applications must be written for the System/34 to receive the Allitems File from the 3694 and to transmit the User Edit Routines, Statement Sort Tables and Cycle Sort Tables to the 3694. See the CHX/3694 page for a list of the manuals that will be necessary to write the System/34 application program to communicate to CHX/3694.

3601/4701 Finance Communication Controller: The Finance Subsystem allows a System/34 to communicate with 3601s and/or 4701s via SDLC. A controller application program (none provided as part of this subsystem) can send procedure start requests to the System/34. Once a program is loaded in the System/34, the Finance Subsystem allows program-to-program communication between the controller and the System/34. The 3601 or 4701 will provide control for the devices attached to it and they will appear as command-capable work stations to the System/34. See the M36XX and M47XX pages for the devices that are supported by these controllers.

The Finance Subsystem uses the workstation interface which ICF supports. This interface shields the user application from the System/34 and 3601/4701 communication protocol requirements. RPG II, COBOL, and Assembler languages can be used with the Finance Subsystem.

Diskette Transfer Utility: The Finance Subsystem includes a diskette transfer utility which is used to support 3601 installations. Application programs that reside in a 3601 will be generated on a System/370, 303X, or 4300 which has been configured to support the 3600 Finance Communication System. A set of service programs (included in the System/370, 303X, or 4300 support) will produce a file which can be loaded into the System/34 through existing utilities. The file can then be communicated to the 3601 through the diskette transfer utility. The 3601 uses the data to create an operational diskette for use when the 3601 is IPLed.

DES Subroutine: Data encryption/decryption capability is provided in the DES subroutine which can be used in an RPG II, COBOL, or Assembler program. The DES subroutine complies with the United States Federal Information Processing Data Encryption Standard (DES) algorithm. The DES subroutine is used in conjunction with an application program (such as 5798-RDP) to generate Personal Identification Numbers (PINs) for use with the 3624 Consumer Transaction Facility.

CUSTOMER RESPONSIBILITIES

The customer is responsible for installation and use of this licensed program and for providing the application program which resides in the 3601, 3694, or 4701.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/34 Finance Subsystem requires a minimum main storage size of 96K bytes. A communications adapter (#2500, #3500, or #4500) is required on the System/34.

Note: The IBM System/34 Finance Subsystem provides support for only a subset of the total IBM 3601/4701 communication protocols. The application program in the IBM 3601/4701 must conform to this subset.

The IBM 3601s, 3694s, and 4701s can be multidropped on the same communications line (16 devices maximum) and they may co-reside with remote IBM 5251 Display Stations and/or IBM System/34s that are configured as secondary SDLC devices.

SOFTWARE REQUIREMENTS

The IBM System/34 Finance Subsystem is an optional feature of the System/34 SSP. Prerequisite: SSP-ICF (#6000, or #6001) must also be installed for the Finance Subsystem to operate.

Support Programs: The following programs have been developed to support installations of the Finance Subsystem:

- IBM 3600 Online Terminal Support for System/34 FDP (5798-RAA).
- IBM 4700 Online Terminal Support for System/34 PRPQ (5799-BGB).

- IBM System/34 Application Support for the IBM 3624 Consumer Transaction Facility FDP (5798-RDP).
- IBM 3694 Check Processing Executive/General Support
 - Document Control Section Edit FDP (5798-RFL)
 - Table Preparation Facility FDP (5798-RFK)
 - Allitems File Translation Facility FDP (5798-RJF)

TERMS and CONDITIONS: See PP Index

Ordering Information: Contact IBM.

**PRECONFIGURED SYSTEM/34
SYSTEM SUPPORT PROGRAM SUBSET
5726-SS2**

PURPOSE

The Preconfigured IBM System/34 System Support Program Subset (SSP) provides the following Release 7 subset of the 5726-SS1 control program capabilities:

- Single Program/Multiple Program Modes
- Input Job Queue
- Main Storage Management
- Disk File Sharing for Input, Update, and Add
- Operation Control Language
- System Utilities
- Data Management
- System History Area
- Print Spooling
- User Access to Spool File
- Interrupt/Resume
- Multiple User Library Support
- Operator ID and Password Security to the File/Library Level
- Control Program Support for Compilers and Utilities
- Support for Directly Attached Display Stations and Printers (one to four displays and one or two 5256 Printers and one or two 5225 or 5224 Printers)
- Support for either 1920- or 960-Character Displays. These cannot be intermixed.

DESCRIPTION

Single Program/Multiple Program Modes: The System/34 may be used in the single program mode which is very similar to the operation of a System/32. When the SSP is in the single program mode, only one operator enters commands and OCL. The programs invoked by the OCL execute one at a time, in sequence, in a single region.

In order to use single program mode, the user must select this option during/at each Initial Program Load (IPL). When in single program mode, the user still has support for functions such as printer spooling, job menus, user libraries, and interrupt/resume.

The display stations attached to a System/34 are designated as command-capable. A command-capable station can be used to invoke procedures, control commands and OCL, as well as being used for data input/output in user programs. The mode of a command-display station can be changed to data mode.

A data-capable station may be used only for user-programmed data input/output, and must be acquired by a user RPG II program that has been invoked from a command station. In single program mode, there can be only one command display station.

This SSP is preconfigured to allow the System/34 to operate in the multiple program (multiprogramming) mode. Operators at multiple command-capable stations may concurrently invoke control commands, OCL, and procedures. Multiple programs can execute concurrently.

Input Job Queue: Multiple program mode of the SSP provides an input job queue facility. The input job queue contains a list of jobs that are to be executed in sequence concurrently with other batch or operator interactive jobs. The jobs in the queue can be placed there by any command-capable station operator or OCL procedure. The station that places the job on the queue is released from that job and, therefore, becomes available for other work.

Main Storage Management: The System/34 manages main storage as a pool of noncontiguous 2048-byte segments and 'swaps' programs to and from disk as required to fit an active program into main storage (a program that is inactive might, for example, be waiting for data input or a message response from a display station).

System/34 main storage management allows the total main storage required by all active tasks to exceed actual user main storage. Performance considerations will dictate to what extent user main storage may be overcommitted.

The preconfigured System/34 occupies 18K bytes of main storage. This value may be increased or decreased in 2K-byte increments by excluding spool support or changing the size of the system work area and buffers. (This system work area will automatically expand and contract to its specified size based on the system workload without user intervention.) This resident nucleus area contains SSP functions such as data management for disk, printer, and work stations; buffers for workstation I/O and printer spooling; and an SSP work area used for task control.

Disk File Sharing: Disk data files on System/34 may be accessed concurrently by multiple programs for input, update, or add operations. Protection of data against concurrent update by two programs is provided by locking the disk sector(s) until released by the first accessing program. An OCL parameter is provided to allow or prevent the file sharing of a specified file.

Operation Control Language (OCL): System/34 OCL is compatible with System/3 OCL with the following exceptions:

- A command statement which has the capability to pass parameters to the indicated procedure is used in place of the System/3 CALL.
- Capability for specifying default values for missing OCL parameters.
- Logical IF statement provides for intelligence within procedures. It is possible to execute different steps based on tests performed in OCL.
- Other differences brought about by devices and system function.

System/34 OCL is compatible with System/32 OCL with exceptions such as the following:

- Additional commands, statements, and parameters have been incorporated into System/34 OCL.
- Some operator-entered commands do not invoke OCL procedures or utility programs on System/34. Therefore, a System/32 procedure using those commands will require change.
- Some utility functions such as COMPRESS must run dedicated (that is, cannot run in multiprogramming mode with other programs). Therefore, System/32 procedures using those commands must be changed.
- System/34 in multiprogramming mode or either mode with printer spool, will not honor the System Log statement. Logging to the system history area is still performed, and messages are displayed to the operator's display screen but will not be printed as they are displayed in this mode.
- System/34 does not support offline, multivolume diskette files except on the diskette magazine drive.
- The disk file rebuild of the System/32 utilities has been replaced by an automatic disk file integrity check at IPL (optional).

OCL procedure commands and control commands are provided to support the SSP facilities and the management of a multiprogramming system. Key functions, in addition to those above, include print spool queue and input job queue management, disk file sharing control, display station and printer assignment at execution time, region size, OCL-to-program communications (in a 256-byte local data area, accessible and modifiable through OCL and user programs), reserve disk space for a job, add job names to the input queue, branch to a specific point in a procedure, specify the next menu to be shown to the operator, display user formats for input data prompting and display station to system console station communications.

Systems Utilities: System/34 SSP provides functions for utility programs that allocate files, rename files, generate load modules from user-created display formats, build job menus, and other common functions.

Data Management: This SSP provides data management support for the disk, the display, the keyboard, and printers. The support for disk also allows the user to optionally specify space for more than 200 disk files, up to a maximum of 920 on mdls XX1 to XX3 and 984 for mdls XX4 and XX5. This display station data management manages all input and output to the display stations, including the retrieval of display formats from a disk library, and merging program data prior to displaying the format on the display.

SSP utility programs fully support the diskette unit and the diskette magazine as a save/restore device. The Diskette 1 in 128- or 512-byte sector formats is supported. The Diskette 2D (2-sided double density) is supported in 256- or 1024-byte sector formats.

The diskette magazine support allows input/output operations to begin on any one of 23 specified diskettes and overflow automatically to the next diskette in the magazine, to the next magazine, or from one individual slot to the next.

System History Area: System/34 provides a history area on disk which contains all recently executed OCL statements and all messages issued to the log device. The messages and data may be retrieved and redisplayed on the display station or printed. Either all the OCL statements or only those originally displayed may be printed as a hard copy log of the activity of the system. Individual display station operators can display or print history file entries created only at their own display station.

Entries are time-stamped and include the job identification generated by the SSP to assist in determining the sequence of activity on the

Preconfigured S/34 System Support Program (cont'd)

system. The user can prevent the history file from being overwritten during an Initial Program Load (IPL).

Print Spooling: Print spooling is supported by the SSP in either single program or multiple program mode. When spooling is active, printer output requests are intercepted and stored on disk. Spool writers are used to retrieve the print records from disk for printing. A print queue is maintained of job names whose printer data is yet to be printed, or specified as 'Retained after Printing'. System console commands are provided to start/stop, restart (at a page number), cancel, hold/release, change priority, and display jobs in the print queue. Print spooling is supported for any and all printers attached to the system simultaneously. In addition, multiple logical print files, up to 8, from a single RPG II program may be directed to one printer or separate printers.

The size of the primary spool disk file is 48 blocks. The spool intercept routine will allocate up to five additional extents if necessary. These extents will be freed up by the spool writer as they become empty.

The print spooling function can be turned off at IPL. The print spool file size can be changed at IPL.

An OCL statement is provided for use in passing parameters from the user job to print spool, such as forms alignment (yes/no), special form required, number of copies, priority, and deferred printing.

User Access to Spool: A utility permits spooled data to be copied to a data file which may be saved on diskettes restored for later use, and viewed on a display station.

While viewing the output, the user can elect to print a copy of the information. The entire report or selected pages can be printed without re-executing the job.

Interrupt/Resume: The operator may interrupt a processing program, execute another job such as inquiry into a file, and return to the processing program. Processing of the interrupted program will resume when the operator indicates the completion of interrupting activity.

Multiple User Library Support: The System/34 SSP provides for multiple user libraries. Parameters and OCL statements allow the user to specify a library name. If the library name is not specified, the default is to the system library (#LIBRARY).

Operator ID and Password Security to the File/Library Level: Each operator who signs on to a System/34 display station is prompted for an identification and, optionally, a password. This data is then checked by the SSP before allowing the operator any further access to the system.

Also, files and program libraries can be restricted to authorized users. These users can be further classified by type of use. An option allows the creation of audit entries in the system history area for each use of a secured file/library.

Control Program Support for Compilers and Utilities: This SSP provides control program services for RPG II Subset (5726-RG2), BASIC Subset (5726-BA2), and Utilities Program Product Subset (5726-UT2). Included are disk data management, printer and spooling support, program library maintenance, OCL and procedure support and main storage allocation and management.

The language compilers and utilities function like user batch programs. In a multiprogramming environment, multiple copies of a compiler or utility may operate concurrently if necessary resources are available.

Support for Directly Attached Display Stations and Printers: This SSP allows the System/34 to support a maximum of four 5251 mdl 1 or mdl 11 displays or two 5252 displays and up to two 5256 printers and up to two 5225 (or 5224) printers as locally attached devices. Remote device support is not provided.

Support for Either 1920- or 960-Character Displays: When using this system support, the System/34 supports up to four, either 1920- (5251 mdl 11) or 960- (5252 or 5251 mdl 1) character display stations, but not a mixture. All SSP display formats will be supported on either display size. Some formats (such as message displays) will present fewer lines when output is directed to 960-character display.

Configuration of the SSP: The software automatically configures itself during the first IPL after the system has been copied to the system disk. Workstation IDs and addresses are fixed. No other configuration capability is supported.

Some preconfigured values and options may be altered at IPL to temporarily select or omit functions or alter performance characteristics of the system.

The following System/34 hardware features are *not* supported by the preconfigured SSP (5726-SS2):

- All Communications Adapters
- 5211 and 3262 Line Printers
- 5250 Magnetic Stripe Reader
- 5251 mdl 2 and 12 Displays

- 1255 Magnetic Character Reader
- Multinational Character Set Feature
- Additional Work Station Adapter for 9 to 16 Local CRTs

The following optional System/34 SSP software (5726-SS1) functions are *not* supported by the Preconfigured SSP Subset (5726-SS2):

- BSC
- MRJE
- SRJE
- SNA/SDLC
- ICF Subsystem
- MICR SUBR08
- MICR SUBR25
- SMF
- Subconsole
- Checkpoint/Restart
- Remote Work Station Support
- HELP
- Extended Index Data Management
- Multinational Conversion Utility
- I-exchange (Extended 5280 Support)
- MLCA
- Auto-Call
- FORTRAN and COBOL execution
- Overlay Linkage Editor
- SSP-ICF

In addition, the system configuration function (CNFIGSSP) is not supported.

Program Use During Customer Preinstallation Testing: The Preconfigured System/34 System Support Program Subset (5726-SS2) is available to customers for preinstallation testing on IBM Test Center systems in accordance with IBM's Program Testing Policy.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The Preconfigured IBM System/34 System Support Program Subset runs on all models of the System/34 containing Microcode feature #9850.

The IBM System/34 Subset licensed programs are designed to operate in an environment that includes the Preconfigured IBM System/34 System Support Program Subset (5726-SS2), or Release 7 of 5726-SS1 while it is available, or its equivalent. The SSP order should be entered via AAS at the same time as the system order.

The Preconfigured System/34 System Support Program Subset (5726-SS2) consists of parts of System/34 SSP (5726-SS1) stabilized at Release 7. No release update or enhancements are planned.

SOFTWARE REQUIREMENTS

There are no programming requirements for operation of the Preconfigured IBM System/34 System Support Program Subset on System/34.

**SYSTEM/34 MOTOR FREIGHT ACCOUNTING SYSTEM
MFAS (Single Program Mode)
5726-T21**

PURPOSE

Revenue Accounting: This application provides small to medium size general commodity or specialty motor freight carriers with a powerful aid in managing their business.

The IBM System/34 MFAS Revenue Accounting licensed program offers conventional revenue accounting functions to the small and medium size general commodity and specialty carrier in the motor freight industry. These functions are divided into the five categories of (1) Freight Bill Entry and Daily Reports, (2) Accounts Receivable, (3) Interline Payables, (4) Shipment Analysis, and (5) Owner/Operator Accounting.

The application is designed to help the general freight and specialty carrier manage revenue accounting requirements and report prime motor freight sales and operational data.

The entry of data from a coded copy of the freight bill establishes records for daily statistical reporting, accounts receivable, interline payables, shipper/consignee and interline statistics and shipment analysis.

The entry of the owner/operator accounting data produces records of owner/operator freight bill revenue, expenses, charges, advances, and settlement amounts. Owner/operator accounting will also produce settlement sheets detailing those items used in settling with the owner/operator. Owner/operator accounting is by owner and/or driver or unit.

HIGHLIGHTS

- Wide variety of reports and report options included:
 - Management and operational data reporting is a byproduct of normal data entry.
 - Detail or summary listings within a range of keys is supported in many reports
 - Statements for freight bill accounts receivable optionally printed on stock paper or preprinted forms with or without tear off portion for turnaround document.
- The Motor Freight Accounting System can co-reside in the System/34 with the Distribution Financial Accounting System and all application areas with the exception of owner/operator accounting can supply data to general ledger.
- Uses recognized accounting techniques and terminology to provide a solid accounting system:
 - Clear audit trails and control techniques are provided
 - Sample user-oriented forms for data preparation, file creation, audit and control are provided
 - Security code deters unauthorized execution of programs
 - A journal reference numbering system supplies an audit trail for any area that generates transactions for the DFAS General Ledger
- Can be installed without customer programming capability:
 - System tailoring procedure facilitates account growth by allowing on-site changes to file sizes and determination of functions used
 - File maintenance and audit procedures provided
 - Detailed Runbook
 - Step-by-step installation activity plan provided by the *Application Installation Guide*
 - User's information supplied to the supervisor by the *Application Reference Manual*

DESCRIPTION

The Motor Freight Accounting System is a ready-to-execute application for the small to medium size motor carrier.

The system uses the Data File Utility as its data entry approach. Support is provided for transaction entry through the System/34 keyboard or through a diskette keyed offline on a 3740 Data Entry System. The Motor Freight Accounting System Revenue Accounting licensed program can be installed with the Distribution Financial Accounting System General Ledger, Accounts Payable, and Payroll Application Program in separate steps, at different times and be an interrelated system.

The System Tailoring Procedure utilizes the answers to a series of questions regarding a carrier's requirements. It provides the following:

- Tailoring the application on-site at installation time
- Allows the user to change the selection of provided functions as business changes
- All provided functions are included in the programs but only required functions are executed
- File sizes may be expanded or contracted as needed by rerunning the System Tailoring Procedure

The *Application Installation Guide* provides a step-by-step installation activity plan including sample input and maintenance data forms, file loading sequences, and control forms with suggested procedures. The *Application Reference Manual* provides information on the day-to-day use of the application.

The Runbook provides the operator with a detailed set of instructions showing all the activities necessary to run the procedures on a System/34. The *Procedure Reference Summary* is provided for the operator as a reminder of the major operational functions of each procedure. It is intended to be used once the operator is thoroughly familiar with the particular procedure.

The System/34 Motor Freight Accounting System runs in single program mode. The System/34 licensed program supports only one work station, no spooling, no multiprogramming and no file sharing.

Application Description: The Motor Freight Accounting System is a full function, ready-to-execute application. Included are the *Application Reference Manuals*, *Installation Guide*, a Runbook, Source Code, Object Code, execution procedures, and the *Application Logic Manual*.

These are some general features which the Motor Freight Accounting System has:

- Designed to fit industry requirements
- Security codes to deter unauthorized use of master files
- In-house inclusion/exclusion of functions to be executed
- OCL procedures, Sort Specifications, and processing programs are packaged into logical work units which simplify system operation
- Monitoring of execution sequence prevents execution of a program until preceding required programs have been completely and successfully executed
- Compatible online/offline data entry through the System/34 Keyboard console or by means of diskettes keyed offline on a 3740 Data Entry System.
- Dynamic Backup and Recovery System forces periodic backup of master files and edited transactions and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files.
- Reprint options are possible because file updating is separated from report writing functions
- Selective printing options are available for many report functions

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/34 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/34 licensed program will execute in single program mode on all models of the System/34 which have 48K bytes of main storage. The programs are compiled assuming a 48K system. Because of volume and time constraints, there may be a requirement for providing offline keying on an IBM 3740 Data Entry System. If an IBM 3742 is to be used, it must have the 128-Character Record feature (#5455) and Feature Group A (#4004).

The Motor Freight Accounting System is designed to co-reside with the Distribution Financial Accounting System. No other licensed programs or user-written programs may co-reside with these applications unless stringent coding requirements for the programs and procedures are met. The *Application Logic Manual* discusses these coding conventions.

SOFTWARE REQUIREMENTS

The IBM System/34 licensed programs are compiled in System/34 RPG II programming language and executed under control of the System/34 System Support Program (5726-SS1). System/34 Utilities licensed program (5726-UT1), which includes Sort, Data File Utility, Source Entry Utility and Work Station Utility, is required for execution of the programs. The System/34 RPG II Compiler (5726-RG1) is required if modifications to the source code are necessary.

TERMS and CONDITIONS: See PP Index

**SYSTEM/34 UTILITIES
5726-UT1**

PURPOSE

The following utilities are provided with the IBM System/34 Utilities licensed program:

- Data File Utility (DFU)
- Sort
- Source Entry Utility (SEU)
- Workstation Utility (WSU)
- Screen Design Aid (SDA)

Each display station using DFU, Sort, WSU Generator, SEU, and SDA has its own copy of the utility (multiple copies can be executing at one time). Only one copy of a specific WSU-created module can be executing at one time; however, one WSU module services multiple display stations. All models of the IBM 5251/5252 Display Stations are supported by these utilities.

DESCRIPTION

DATA FILE UTILITY (DFU)

The following disk data file management functions are provided as part of DFU:

- Data File Creation and Maintenance (Indexed Files, Sequential Files, or Direct Files)
- Data File Inquiry (Indexed Files, Sequential Files, or Direct Files)
- Data File List (Indexed, Sequential or Direct Files)

All functions of the above utility take advantage of cataloged RPG II File Description and Input Specifications. To use any of the functions, the user need only know the name of the file, a name to be assigned to the job description, and the name of the cataloged RPG II specifications. The functions will prompt for all the other information necessary to tailor the job to the user's task. Field names are included with the prompts to aid the user in selecting the data fields to be used.

Previously, DFU copied the entire field from the previous record when the DUP key was pressed in ENTER, UPDATE, or INQUIRY mode. If non-DUP characters were inserted into the field, DFU stopped copying from the previous record. In Release 8, DFU was modified to allow the operator to override 'DUP' characters in a field as required. This support enables an operator to key over a portion or all of the 'DUP' characters in a field and, upon pressing the ENTER key, have only the portions of the field containing 'DUP' characters duplicated. The remaining characters in the field will be recorded as keyed.

Data File Creation and Maintenance: This function provides the necessary capabilities to create and maintain Indexed or Direct data files on disk. You can only change records in an existing sequential data file. Maximum use is made of the display to prompt the operator by field name for the data to be entered. For update, the data currently in the record is displayed. Highlights include:

- Formatted Report for an Audit Trail
- Auto Duplication of Fields
- Control Totals
- Generated Keys
- Modulus 10 and 11 Self-Check Digit
- Record sequencing

Data File Inquiry: This function provides the necessary capability to allow inquiry into any indexed file, sequential file, or direct file. The records are displayed showing the current status of the information in the file. Highlights include:

- Retrieval by record key for indexed files and relative record number for direct files and sequential files
- The ability to roll forward or backward through the file by key sequence for indexed files, and by relative record number for direct files and sequential files
- The ability to print selected records with the 'PRINT REC' command key
- All displayed fields include column headings for easy identification

Data File List: This function provides the capability to list and summarize selected information from any indexed, direct or sequential file on disk. The function is very useful for obtaining one-time reports and for creating recurring management reports. Highlights include:

- Page headings including date and page number
- Column headings
- Edited data fields
- Column totals - both final and subtotals

- Selection based on record codes and/or field values
- Sort, ascending or descending, on up to five fields
- Summary list with totals only
- Retrieve and print data from a related index master file
- Calculate and print additional result fields

The System/34 DFU capabilities include the data file management capabilities of System/32 DFU. In addition, DFU and RPG II source specifications created and saved on System/32 may be loaded to a System/34 library and used to execute a comparable job on System/34.

SORT

The System/34 Sort utility provides the function and capability of the proven System/32 Sort. Highlights include:

- Multiple record types
- Record selection based on field contents, including by comparison to system date
- Support of all data fields except binary
- ADDROUT (Address out) Sort
- Tag Along Sort
- Summary Tag Along Sort
- Automatically allocated work file
- Sort into ascending, descending or user-defined sequence
- Reformatting of records in a file
- Dynamically adjusts to region size available

System/34 extensions include:

- Multiple input files
- Equal control field ordering
- ALTSEQ by field
- Loadable SORT interface

The Sort Control Specifications used by System/32 may be used on System/34 and will result in the same data file output.

SOURCE ENTRY UTILITY (SEU)

SEU can be used to create and maintain OCL procedures, display format specifications, 1255 control specifications, RPG II, Auto Report, WSU, Display Formats, FORTRAN, Assembler and source statements. Highlights include:

- Display Formats are provided for the fixed-format statements (for example, RPG II, WSU) to aid in key entry of fields.
- Free-form display format for any statements to be entered.
- User-defined display formats may be used.
- Optional RPG II and Auto-Report syntax checking.
- Optional resequencing of statements in library.
- The ability to move statements in a member.
- The ability to include statements from any source or procedure library member in the system or user library.
- The ability to delete statements.
- Statement insertion.
- Rolling forward or backward through cataloged statements.
- Optional listing of statements.
- Use of display to show statement being entered or updated.
- Scan capability controlled by a character mask.
- Global replace option

With Release 8 modifications, SEU has been changed to default the number of lines per statement and the roll factor to 16 for 1920-character displays, and to 4 for 960-character displays. Previously, the default values were 8 and 2, respectively. This change allows viewing of a larger segment of the displayed source at one time.

WORKSTATION UTILITY (WSU)

WSU provides an easy-to-use set of specifications for defining interactive data entry programs which support one or more display stations. Specifications describe the following program variables:

- Job (name, number of workstations, region size)

S/34 Utilities (cont'd)

- Optional Transaction File (a special direct organization disk file created and managed by WSU to contain key entered records)
- Master Files (up to 20 disk files accessed or updated by the program)
- Display Formats (formats to be displayed on the 5251 Display Stations to prompt for data entry and/or display error messages)
- Calculations (the arithmetic, logical edit or I/O operations to be performed in conjunction with the entry of data in response to a display format)
- RPG II File Description and Input specifications are referenced for a description of the transaction and master files.

The WSU specifications are processed by the WSU Generator and the SSP Screen Format Generator Routine (\$SFGR utility) to produce:

- An object definition module to be executed by WSU when the job is invoked.
- Display Formats
- System/34 OCL procedures to control execution of the job when invoked.

Highlights

- Logical combination of display format description and calculation specifications.
- Automatic management of the transaction file with each workstation's records logically separate.
- Operator review, correction and insertion of transactions.
- Each operator may sign-on, sign-off, and resume entry independently.
- Recovery of the transaction file after system failure is provided.
- Different WSU-generated programs may be executing concurrently.
- WSU programs execute as MRT (multiple requester terminal) programs to optimize performance.
- WSU programs will dynamically adjust to larger region size to reduce overlay fetches from disk or to smaller execution region size if memory needs to be constrained.
- The number of active workstations can vary and is transparent to programmer-supplied logic.
- WSU allows the user to specify display formats using a variable starting line number.
- Masking of Command and Function Keys.
- Capability to access the originating workstation ID for a transaction.
- Options at generation to replace existing programs, control portions of the output listing, and suppress OCL generation.
- Random additions to indexed master files
- Online debugging via DEBUG operation code
- WSU transaction file update capability (SUBR22)
- WSU edit date fields greater than 6 characters
- WSU optional 'SR' in subroutines

SCREEN DESIGN AID (SDA)

SDA provides an interactive approach to designing, creating and maintaining display formats and job menus. Increased productivity can result by eliminating the amount of clerical work associated with coding specification sheets, transcribing source code, and correcting transcription or coding errors.

Highlights

- Create a new WSU/SFGR source specification member.
- Add new WSU/SFGR source specifications to an existing member.
- Update entire formats in an existing WSU/SFGR source member.
- Delete entire formats from a source member.
- Update, insert and delete individual source specifications via SEU.
- Display formats in an SFGR LOAD member.
- Create and update MENUs and their associated source members.
- Create from an SFGR source member an RPG II skeleton program to use the formats.
- Help function which displays text describing the use of SDA.
- Generation of WSU programs for master file inquiry, maintenance, or transaction file creation.

- Field level syntax checking.
- Random format update.
- Optional source specification sequencing.

Program Use During Customer Pre-Installation Testing: The System/34 Utilities licensed program (5726-UT1) is available to customers for pre-installation testing on IBM Test Center systems in accordance with IBM's Program Testing Policy.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/34 Utilities licensed program runs on all models of the System/34. Each of the five programs in the Utilities licensed program requires a minimum of 14K (14,336) bytes of main storage. Sort, DFU and WSU will take advantage of additional main storage if it is available.

SOFTWARE REQUIREMENTS

The current release of the IBM System/34 Utilities licensed program operates under control of the current release of IBM System/34 System Support licensed program (5726-SS1).

TERMS and CONDITIONS: See PP Index

SYSTEM/34 UTILITIES SUBSET 5726-UT2

PURPOSE

This program is intended to support the Preconfigured IBM System/34 System Support Program Subset (5726-SS2).

The following utilities are provided with this Utilities Program Subset:

- Workstation Utility (WSU) Execution Support
- Data File Utility (DFU)
- Sort
- Source Entry Utility (SEU)

Each display station using DFU, Sort, and SEU has its own copy of the utility (multiple copies of the same utility can be executing at one time). Only one copy of a specific WSU-created module can be executing at one time; however, one WSU module can service multiple display stations.

WORKSTATION UTILITY (WSU) EXECUTION SUPPORT

Data entry, update, and inquiry programs written in WSU can be executed using this support. Generation support for WSU is provided with Release 7, 5726-UT1 and 5726-SS1.

Highlights

- Each operator may sign-on, sign-off, and resume entry independently.
- Recovery of the transaction file is provided after a system failure.
- Different WSU programs may be executing concurrently.
- WSU programs execute as multiple requester terminal (MRT) programs to optimize performance.
- WSU programs will automatically adjust to a larger execution region size to reduce overlay fetches from disk or to a smaller execution region size if memory needs to be constrained.
- The number of active workstations can vary and be transparent to the programmer-supplied logic.

Utilities to support:

- Copy a file, changing the record length
- Extract specific records from a file
- Rebuild a WSU transaction file

DATA FILE UTILITY (DFU)

The following disk data file management functions are provided as part of DFU:

- Data file creation and maintenance (indexed files, direct files)
- Data file inquiry (indexed files, sequential, or direct files)
- Data file list (indexed, sequential or direct files)

All functions of the above utility take advantage of cataloged RPG II File Description and Input Specifications. To use any of the functions, the user need only know the name of the file, a name to be assigned to the job description, and the name of the cataloged RPG II specifications. The functions will prompt for all the other information necessary to tailor the job to the user's task. Field names are included with the prompts to aid the user in selecting the data fields to be used.

Data File Creation and Maintenance: This function provides the necessary capabilities to create and maintain indexed or direct data files on disk. Maximum use is made of the display to prompt the operator by field name for the data to be entered. For update, the data currently in the field is displayed. Highlights include:

- Formatted report for an audit trail
- Auto duplication of fields
- Control totals
- Generated keys
- Modulus 10 and 11 self-check digit
- Record sequencing

Data File Inquiry: This function provides the necessary capability to allow inquiry into any indexed file, sequential file or direct file. The records are displayed showing the current status of the information in the file. Highlights include:

- Retrieval by record key for indexed files and relative record number for direct files and sequential files
- The ability to roll forward or backward in key sequence for indexed files and by relative record number for direct files and sequential files
- The ability to print selected records with the 'PRINT REC' command key

- All displayed fields include field headings for easy identification

Data File List: This function lists and summarizes selected information from any indexed, direct, or sequential file on disk. The function is very useful for obtaining one-time reports and for creating recurring management reports. Highlights include:

- Page headings including date and page number
- Column headings
- Edited data fields
- Column totals - both final and subtotals
- Selection based on record codes
- Selection based on field content
- Sort, ascending or descending, on up to five fields
- Summary list with totals only
- Calculation on record fields to obtain result fields
- Retrieve and print data from a related index master file
- Calculate and print additional result fields

The System/34 DFU capabilities include the data file management capabilities of System/32 DFU. In addition, DFU and RPG II specifications created and saved on System/32 may be loaded to a System/34 library and used to generate and execute a comparable job on System/34.

SORT

System/34 Sort provides the function and capability of the System/32 Sort. Highlights include:

- Multiple record types
- Record selection based on field contents, including by comparison to system date
- Support of all data fields except binary
- ADDR0UT (tag) sort
- Tagalong sort
- Summary tagalong sort
- Automatically allocated work file
- Ascending, descending, or user-defined sequence
- Dynamically adjusts to region size available
- Reformatting of records in a file

System/34 extensions include:

- Multiple input files
- Equal control field ordering (file merge)
- ALTSEQ by field

The Sort Sequence Specifications used by System/32 can be used on System/34 and will result in the same data file output.

SOURCE ENTRY UTILITY (SEU)

SEU can be used to create and maintain OCL procedures, RPG II, display screen formats, and sort source statements. Highlights include:

- Display Formats for the fixed-format statements (for example, RPG II) to aid in key entry of fields.
- Free form display format for any statements to be entered.
- User-defined display formats may be used.
- Optional RPG II syntax checking.
- Optional sequencing of statements in a member.
- The ability to move statements in a member.
- The ability to include statements from another source or procedure library member in the system or user library.
- The ability to delete statements.
- Statement insertion.
- Rolling forward or backward through cataloged statements.
- Optional listing of statements.
- Use of display to show statement being entered or updated.
- Scan capability controlled by a character mask.
- Global replace option

PROGRAM PRODUCTS

S/34 Utilities Subset (cont'd)

The following System/34 Utilities (5726-UT1) functions are *not* supported:

- WSU compilation
- SDA Screen Design Aid

Program Use During Customer Pre-installation Testing: The IBM System/34 Utilities Subset (5726-UT2) is available to customers for pre-installation testing on IBM Test Center systems in accordance with IBM's Program Testing Policy.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

This IBM System/34 Utilities Subset runs on all models of the System/34 supported by 5726-SS2. Sort, DFU, and SEU require a minimum of 14K (14,336) bytes of main storage. Sort and DFU will take advantage of additional main storage if it is available. WSU programs may require more memory than is available on a minimum system.

SOFTWARE REQUIREMENTS

This IBM System/34 Utilities Subset (5726-UT2) operates under control of the IBM Preconfigured System/34 System Support Program Subset (5726-SS2), or Release 7 of 5726-SS1 while it is available, or its equivalent.

The System/34 Utilities Subset (5726-UT2) consists of parts of System/34 Utilities (5726-UT1) stabilized at Release 7. No release update or enhancements are planned for System/34 Utilities Subset (5726-UT2).

DOCUMENTATION

(available from Mechanicsburg)

PROGRAM PRODUCTS

**IBM SYSTEM/34 BUSINESS MANAGEMENT
ACCOUNTING SYSTEM**

General Ledger	5726-XBB
Accounts Payable	5726-XBC
Accounts Receivable	5726-XBA
Payroll	5726-XBD
Inventory Accounting	5726-XB9
Billing	5726-XB8

PURPOSE

These multi-industry licensed programs are written in System/34 BASIC programming language and are an extension of the Business Management Accounting System programs with accounting functions that are identical to those available for Datamaster. The IBM System/34 Business Management Accounting System licensed programs provide the user with powerful tools to perform business accounting while providing additional management information. The programs contain functions applicable to a wide range of industry classifications.

The program design provides an accounting base of information and incorporates a flow of information in terms that are familiar to the user. This base of information is then available to improve productivity through the managerial reporting provided by the programs. The fundamentals of accounting provided by the applications give the entry level user the benefits of an automated accounting system without the expense or requirement of a programming staff.

HIGHLIGHTS

- Master Menu displays all applications installed.
- Programs and procedures required to run the applications will reside in the application library on disk. Master files, interface files, data entry files and work files will also be disk resident.
- Built-in auditability and control characteristics through the use of familiar five-column journals, sequential journal numbering and inter-application data integrity.
- Program documentation is designed to promote customer self-sufficiency during installation and operation.
- The Atlanta National Market Support Center (formerly the ACSC) provides a direct customer toll free number for questions related to installation and operation of these applications.
- Ease-of-use is enhanced through:
 - Menu driven task selection
 - Consistent data entry programs and procedures for all applications
 - Common file maintenance techniques including user-defined field defaults
 - Use of generally accepted accounting terminology
- Installation-time tailoring options allow the user to select key functions and perform file sizing.
- A program update (PTF) procedure is provided to aid the operator in applying program updates provided by the Atlanta National Market Support Center (ANMSC) or the Program Information Department (PID).
- System/34 BRADS file definitions are provided with the applications for selected master files.
- Optional security code by application for each company.
- Multi-company support.
- File sharing capability supporting concurrent operations for any workstations signed on to that company.
- Full screen file load is provided to support loading of the customer master, item master and item balance files.

DESCRIPTION**IBM SYSTEM/34 GENERAL LEDGER (5726-XBB)**

The IBM System/34 General Ledger application is a multi-industry application designed to accomplish the basic accounting functions of posting journal entries to the General Ledger, generating financial statements, and producing special journals. The programs are based on double entry accounting principles in accordance with generally accepted accounting practices. Transactions may be directly entered as general journal entries and also received as summary entries from the IBM System/34 Billing, Accounts Receivable, Payroll and Accounts Payable applications, if installed.

Functions and Features

- Calendar-driven 1 to 13 period support
- User-defined fiscal year
- Optionally combined financial statements for multiple companies
- User-defined statement formatting

- Special journal capabilities which allow the user to tailor journal formats
- Previous year history maintained for comparative statements
- Budget and encumbrance support
- Annual ledger capability
- Page width option allowing statements on 8-1/2 x 11 paper
- Future fiscal year posting
- Automatic year-end closing.

IBM SYSTEM/34 ACCOUNTS PAYABLE (5726-XBC)

The IBM System/34 Accounts Payable application is a multi-industry offering designed to assist the user in controlling the outflow of cash and maintaining accurate records of liabilities to trade and other vendors. Payable items are handled on an accrual basis and vendor analysis reporting allows the user to determine key purchase volumes and discounts taken or lost for the current and previous year. Summarized journal information can be passed to the IBM System/34 General Ledger application, if installed.

Feature and Functions

- Allows one-time vendor checks
- Cash discount by percent or amount on invoice total or line items
- Supports multiple General Ledger distributions per invoice
- Payment selection by due date and/or by vendor/invoice
- Partial payment support
- User-defined excessive check amount warning
- Debit memos available
- Vendor open-item inquiry
- Manual checks
- User-tailorable five-column Purchase and Cash Disbursement Journals
- Default General Ledger distribution by vendor
- Default vendor cash discount percent
- Check reversals

IBM SYSTEM/34 ACCOUNTS RECEIVABLE (5726-XBA)

The IBM System/34 Accounts Receivable application is designed to assist the user in managing one of the most important assets of a business--the money owed by its customers. This multi-industry offering provides timely information to help improve cash flow, and reduce bad debt losses through control of accounts receivable. Invoice transactions can be entered directly into the Accounts Receivable application and also received from the IBM System/34 Billing Application. Cash Receipts and Adjustment transactions are entered through the Accounts Receivable data entry menu option. Accounts Receivable can also pass summarized accounting information to the IBM System/34 General Ledger Application, if installed.

Functions and Features

- Supports entry of non-Accounts Receivable cash such as vending machine receipts
- Open Item or Balance Forward account type selection by customer
- Cash and COD sales support
- Partial and over payment of invoices
- Statement selection by customer
- Supports invoices with future due dates
- Current plus four past due periods
- Optional late charges by customer
- Consolidated statements for multi-branch companies
- Interactive cash entry for open item customers
- User-tailorable five-column Sales and Cash Receipts and Adjustment Journals
- Full screen file load is provided to support loading a large volume Customer Master file.

PROGRAM PRODUCTS

S/34 Business Management Accounting System (cont'd)

IBM SYSTEM/34 PAYROLL (5726-XBD)

The IBM System/34 Payroll application is a multi-industry solution that performs basic payroll computations and produces payroll checks with earnings statements and supporting reports. Both hourly and salaried payroll processing is supported. Individual earnings may be taxed for up to three taxing jurisdictions per time and adjustment transaction. Summarized accounting information can be transferred to the IBM System/34 General Ledger application, if installed.

Features and Functions

- Weekly, bi-weekly, semi-monthly and monthly pay frequency
- Shift differentials as a percent of employees hourly rate or a fixed dollar amount
- Hourly, exempt and non-exempt salaried employees
- Payroll calculations provided for:
 - Gross Pay
 - Federal Income Tax (FIT)
 - Federal Insurance Contributions Act (FICA)
 - State and Local Taxes
 - State Disability Insurance (SDI)
 - Federal Unemployment Tax Act (FUTA)
 - Earned Income Credit (EIC)
 - Net Pay
- Taxable and non-taxable adjustments
- Automatic deduction based on:
 - Percent of taxable gross
 - Rate per hour worked
 - Flat dollar amount per pay period
- Resetting deductions (i.e., bonds)
- Automatic benefits (with optional maximums) can be calculated using the same algorithms used for automatic deductions
- Separate checks available for vacation and bonus payments
- Tip accounting with optional minimum hourly guarantee
- Workmen's compensation worksheet
- Detailed earnings and deductions shown on earnings statement

IBM SYSTEM/34 INVENTORY ACCOUNTING (5726-XB9)

The IBM System/34 Inventory Accounting Application offers management reports which help the user to optimize inventory levels. Up-to-date reports reflecting stock movement, on-hand positions, sales and cost information enhance purchasing decisions. The Inventory Accounting application can receive summarized sales information from the IBM System/34 Billing application.

Features and Functions

- Support for up to three warehouses per item
- Broken-case handling
- Pricing conversion
- Both returns and allowances supported
- Maintains both average and last cost for an item
- Both stock movement and financial information maintained
- Suggested reorder quantities based on user supplied:
 - minimum balance
 - maximum balance
 - lead time
 - pack size
 - vendor minimum
- Item inquiry including both item master and item balance information
- Inventory analysis based on sales, cost and profit amounts
- Full screen file load is provided to support loading large volume Item Master and Item Balance files.

IBM SYSTEM/34 BILLING (5726-XB8)

The IBM System/34 Billing Application is a multi-industry billing application providing the user with the ability to create invoices for customer orders already picked and shipped. Customer and item names, prices and tax information are automatically retrieved from the Billing Application master files during invoice entry. Summarized data is optionally available to the IBM System/34 Accounts Receivable, General Ledger and Inventory Accounting Applications, if installed.

Features and Functions

- Post billing

- Selective printing of invoices
- Five standard prices
- Pricing conversion
- Broken-case pricing
- Flexible terms and invoice discounts
- Federal excise tax
- Special charges and comments
- Credit memo support with returns and allowances
- Billing on non-inventory items
- Cash and COD sales
- Invoices for one-time customers
- Up to three sales taxes per invoice, maximum of 50 taxing bodies
- Optional profit tear strip on invoices
- User-tailorable five-column Sales Journal
- Data entry overrides of master file data
- Full screen file load is provided to support loading large volume Customer Master and Item Master files.

PROGRAM DOCUMENTATION

The documentation provided for each application is designed to help the user understand, install and operate the application. The materials are consistent in size and format with the IBM System/23 Datamaster publications and:

- Introduce new application users to automating typical business tasks in a way that invites use, reinforces efforts to learn and use, and builds confidence and willingness to reuse after learning
- Are written in "friendly", user-oriented language
- Are visually attractive with multi-color printing
- Are small in size to be usable in a space-limited work area
- Are presented in a step-by-step task fashion that guides the user through installation and operation
- Are designed to assist in communication with the Atlanta National Market Support Center (ANMSC)
- Provide tables of contents along with master indexes (one per application) that pinpoint information

The following materials are available for each application.

Introducing

This book is intended for all users of the application. The owner/executive, installer, operator, user department, programmer and consultant can use this book as their first source of information about the application. The book is designed to be a general introduction to how the application fits within the user's business.

Learning

This learning package consists of a book, cassettes, and a sample data files diskette. The learning consists of separate exercises which guide the operator through aspects of daily operations in a very step-by-step fashion. The learning package refers the operator to specific sections of the Running book so that, in addition to application training, the operator becomes familiar with the format of the Running book.

Installing

This book details the steps to follow in installing and tailoring the application, collecting and recording the data, entering it, and scheduling operator training.

Running

This book contains information the operator needs in order to run the application.

Using

This package contains a book and a forms pack. The book is intended primarily for user department personnel who are not System/34 operators. It has the information required by the user to:

- Prepare input for submission to the operator
- Analyze reports
- Submit changes to files
- Aid in using the reports to help manage the business
- Understand alternative uses of the reports

The forms pack contains reproducible camera ready copies of all input forms, preprinted IBM forms, and any control logs peculiar to that application that are required to install and run the application. Instructions for using the forms are printed on the back of each form. The

PROGRAM PRODUCTS

S/34 Business Management Accounting System (cont'd)

forms in the forms pack are on 8-1/2" x 11" paper. The customer can order additional forms from a printer or IBM's System Supplies Division. Preprinted forms will be documented in actual size for the user to provide to his printer.

Messages

Messages for each application are printed as separate pages which are delivered with each application library.

Application Program Manual

A separate application program manual is available as optional material. It contains record formats, logic flows, and other technical information to be used primarily by the experienced BASIC programmer interested in understanding the detail design of the application.

CUSTOMER RESPONSIBILITIES

IBM may provide normal marketing assistance and guidance. The responsibility for personnel selection and training, installation and continued day-to-day operation lies solely with the customer.

The customer is responsible for error detection and analysis, and submission of APARs.

IBM Central Service is responsible for the development and distribution of program fixes, but the customer has the responsibility to apply fixes to the program.

Note: Where changes in Law or Industry Standard (local or national) change program function requirements on delivered programs, IBM may furnish program changes, but it is not obligated to make these changes available. References to tax reports and calculations for the System/34 Disk Business Management Accounting System applications reflect the 1982 version of the tax law.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM System/34 Business Management Accounting System Programs (General Ledger, Accounts Payable, Accounts Receivable, Payroll, Inventory Accounting, and Billing) are written in BASIC and operate on an IBM System/34 with the following minimum configuration:

- 1 - 5340 System Unit Model D21 (8.6 megabytes of disk storage, 2D diskette and 96K bytes of main storage)
- 1 - System printer, either a serial printer or a line printer with a 96-character belt
- 1 - 5251 Display Unit (Model 11 or Model 12)

SOFTWARE REQUIREMENTS

The System/34 Business Management Accounting System Programs are written in System/34 BASIC programming language, and execute under control of:

- System/34 System Support Program - (5726-SS1 Release 7 or later)
- System/34 BASIC - (5726-BA1)
- System/34 Utilities - (5726-UT1)

or

- Preconfigured System/34 System Support Program Subset - (5726-SS2)
- System/34 BASIC Subset - (5726-BA2)
- System/34 Utilities Subset - (5726-UT2)

System/34 Utilities (5726-UT1 or 5726-UT2), which include SORT, are required for execution.

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**SYSTEM/34 JOB ANALYSIS SYSTEM
JAS/34 (5726-XP1)****PURPOSE**

The IBM System/34 Job Analysis System (JAS/34) is a powerful aid to management for planning, scheduling, supervising, and controlling project-oriented work through the use of the critical path method. Designed to be easily used by non-technical personnel, the JAS/34 functions consist of an interactive data entry processor, network processor, and a report processor.

HIGHLIGHTS

- Front-to-back interfacing of up to 10 subnets to form a network with up to 14,720 activities.
- Accommodates up to 10 subnets per master file.
- Allows interactive creation of JAS/34 input records.
- Handles interactive correction of JAS/34 input records.
- Provides for interactive insertion of additional JAS/34 input records.
- Supports up to eight workstations by the interactive data entry processor.
- Handles up to 32 calendars.
- Has four types of time relationships between work items.
- Offers multiple starts and ends.
- Modifies reports easily modifiable.
- Progress reporting specifying actual start date and/or remaining duration.
- Provides levels of milestones.

DESCRIPTION

Interaction between the user and the interactive data entry processor will be provided by a series of workstation display screens to which the user responds by entering the data requested on the screen. When appropriate, flow from screen to screen will be automatic, or under user control. Data entry may also be accomplished by using batch input records entered via the Source Entry Utility (SEU) or entered via an IBM 3741 from a diskette created offline.

JAS/34 can handle up to 1,472 activities or work items and relationships per subnet, depending on region size. To get maximum flexibility, control records are used. JAS/34 is written in the System/34 Assembler language.

CUSTOMER RESPONSIBILITIES

All users should know the various features of this system before attempting to use it for actual project control. Users will need to know the fundamentals of the critical path technique before they can prepare input.

The customer must describe the activities which form the project network. This data may be recorded on diskettes for entry into the System/34 using a 3740, or it can be entered directly from the keyboard using the Source Entry Utility, or it can be entered with guidance from the system by using the interactive data entry processor.

The customer should provide for safekeeping of the diskette to ensure his continued operation (back-up). A *User's Guide* will also be provided. Procedure for installation will be furnished.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The interactive data entry processor requires a minimum of 24K bytes of main storage and, therefore, requires an IBM System/34 with at least 48K bytes of main storage. All other modules of JAS/34 require a minimum of 14K bytes of main storage and, therefore, will run on any model of the IBM System/34 which has a 14K region available. JAS/34 will take advantage of additional main storage if it available.

SOFTWARE REQUIREMENTS

JAS/34 must be used under control of the IBM System/34 System Support Program (5726-SS1). The IBM System/34 Utilities (5726-UT1) are required.

If assembly of the source machine-readable material is desired, the IBM System/34 Basic Assembler and Macro Processor (5726-AS1) is required.

DOCUMENTATION

TERMS and CONDITIONS: See PP Index

**WORK STATION SEARCH FACILITY/34
FOR THE SYSTEM/34 (WSF/34)
5726-XR1****PURPOSE**

The Workstation Search Facility/34 provides System/34 Workstation users with a powerful tool to search disk files rapidly for records meeting terminal user-selected search criteria. This facility is designed to be used as a means of selecting records for further processing by user-written inquiry, file maintenance, order entry, and other programs. This offering will allow the user to define the searches required that will best aid the organization.

WSF/34 is applicable to any industry classification. Manufacturers and distributors can use the facility for customer and item searches; hospitals for patient or guarantor; schools for student lookups, etc.

HIGHLIGHTS

- Reduces the need for alphabetically sorted master file listings.
- Ease-of-operation allows non-DP personnel within the organization to search their files for information.
- Keyword in Context (KWIC) technique for searching alphabetic fields without requiring data base changes by the user. Blanks and special characters (if preceded or followed by a blank position) are considered delimiters.
- User-defined literals are excluded during the index creation process (for example, THE, AND, CO, INC, etc.)
- Use of up to eight-character search argument with null characters within the argument. This facility may be used in those cases where the exact spelling of the search criteria is unknown.
- Use any combination of six logical search operators (equal, less than, less than or equal, greater than, greater than or equal, or not equal).
- AND/OR logic to define the relationship between the primary, secondary and tertiary searches.
- Both 960- and 1920-character screens are supported and are workstation independent.
- Indices may be created without knowing the data processing file structure, and all standard System/34 data file organizations are supported.
- Optional user-defined security passwords to prevent unauthorized use of searches
- Creation of up to 13 cross-reference indices per tailoring session for fast searching of high use data fields.
- Supports all data field formats with the exception of binary fields.
- Displays up to 20 matches at a time.
- Allows forward and backward paging, termination of a search or start of a new search at any time.
- Second level display on a selected line provides additional data from the selected master record. This screen displays unformatted data directly from the record.
- User-oriented tailoring procedure that will allow the user to easily define the required searches and then will generate the required RPG II source programs and required OCL and invoke the required compiles and execution of the index creation program.

DESCRIPTION

WSF/34 (5726-XR1) is an application product designed to process System/34 disk records. It is a cross-industry offering and will execute in conjunction with licensed program and non-licensed program users.

The operator will define through an interactive workstation session the search required, up to 76 characters of information to be displayed on matching master records. Additionally, information such as the name of the file, record size and approximate number of records will be required. The Application Reference/Runbook will provide the operator with an explanation of the required and optional fields to be entered during this session. Each response will be edited as the information is entered.

The offering can reduce the need for referencing voluminous printed reports by displaying up to 20 records at a time that meet search criteria. If more than 20 records meet the criteria, the screen display can be paged forward or backward to allow a review of all matched records. Also, when the desired record is displayed, you can select to have the entire contents of the record, as it appears on disk, to be further displayed.

The WSF/34 application consists of four programs: An interactive entry/edit program, a tailoring program, and two skeletal programs which, when copied and modified by the tailoring program, provide user unique Index-build and Search programs.

The first segment consists of two programs. The first is an interactive entry/edit program in which unique tailoring answers to three or more displays are supplied. The second is a tailoring program that uses these

answers to modify the two skeleton source programs of the other two segments, and also creates operational procedures that are self-initiating. The first and second segments will be run sequentially as one session if the user does not want to modify the source prior to compilation. The sequential operations of this session would be:

1. Answers to displays are temporarily stored on disk.
2. Answers are used to tailor two skeleton source programs and create tailored procedures.
 - a. Index-build program
 - b. Search program
 - c. Procedures to run the Index-build and Search programs
 - d. Procedures to compile the Index-build and Search programs
3. Compilation of Index-build and Search programs.
4. Run the Index-build program which:
 - a. Creates unique search pointer files
 - b. Creates procedure and utility statements for a sort
5. Sorts pointer files into alpha order.

If the user wants to modify the source code before compilation, only sequential operation steps 1 and 2 will be performed. The users will need to be familiar with the source entry utility (SEU) to be able to modify either the Build-pointers or Search program source code. They will also need to know how to compile the source programs because the compile procedures of step 3 will not be created.

The second segment consists of the tailored Build-search-pointers program. This program determines which data fields of a particular master file are to have pointer files created, as specified by the answers created during the running of the interactive entry/edit program. The build pointers program then creates one or more pointer records per master record for each search. If the user chose not to modify the build-pointers program before compiling, it will run automatically when both the interactive and tailoring programs are finished.

The build-pointers program can also be run as a standalone program. The pointer files should be recreated after records are added or changed in the master file. The build-pointer program can be run any time.

The third segment of the WSF/34 application consists of the tailored search program. A workstation user initiates a particular search program by entering the name that was assigned during the running of the interactive entry/edit tailoring session. The search program returns a display allowing the user to key in the search request parameters. Records that match the search criteria are then displayed to the workstation user.

During the tailoring process, control logs are filled out that will aid the user in maintaining the search and index data base. Copies of these control logs, along with data entry forms, are provided to facilitate the actual entry during the tailoring process.

The WSF/34 Application Reference/Runbook provides the user with the information necessary to install WSF/34, execute tailoring of searches, and defines how the user would approach special situations. This document provides step-by-step instructions for operating the application.

The *WSF/34 Application Logic Manual* is provided as licensed documentation for use by the self-sufficient user if modifying, and for the systems engineer when maintaining WSF/34. Information on naming conventions, application program functions and specifications and other information pertaining to the application is presented in this manual.

Instructional information regarding the execution of the sample problem is provided in the WSF/34 Application Reference/Runbook. The sample program will include a master file and tailoring instructions so that a user becomes self-educated on the tailoring and search programs and procedures.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration for WSF/34 application is an IBM System/34 with:

Do not reproduce without written permission

PP 5726-XR1.2
Dec 83

PROGRAM PRODUCTS

WSF/34 (cont'd)

- IBM 5340 System Unit with Diskette 1 drive, 8.6 megabytes of disk storage and 48K (mdl B11).
- One system printer, either line printing at 160 lines-per-minute, or serial printing at 40 characters-per-second.
- One IBM 5251 Display Station (mdl 11)

SOFTWARE REQUIREMENTS

The WSF/34 application programs are written in IBM System/34 RPG II programming language and execute under control of the IBM System/34 System Support Program (5726-SS1, Release 2, Release 3 required for 960-character display support). IBM System/34 Utilities Program Product (5726-UT1), which includes Sort, Data File Utility, Source Entry Utility, and Workstation Utility, is required for execution of the programs. The IBM System/34 RPG II Compiler (5726-RG1) is also required.

PROGRAM PRODUCTS

**5727-AP1 - APF/36
SYSTEM/36 5224/5225 ADVANCED PRINTER FUNCTION****PURPOSE**

The System/36 5224/5225 Advanced Printer Function (APF/36) allows the System/36 to use special functions on the 5224 mdls 1 and 2, and the 5225 mdls 1-4 Printers. APF/36 consists of a forms generation utility and an alternate character set capability and facilities for creating logos and generating bar graphs and bar codes.

HIGHLIGHTS

APF/36 allows the user to:

- Define alternate character sets and symbols, including OCR-A characters.
- Define large characters (up to nine times normal size).
- Cause UPC (Version A), Code 39 (A-Z, 0-9, *), or EAN type bar codes to be generated.
- Build logos and emblems.
- Allow bar graphs to be generated.
- Produce a customized form which can be merged with spooled application report data.
- Select elements from the large (2x2) characters provided (2 print positions high and 2 print positions wide).
- Select or expand elements from a set of standard size (1x1) characters provided.

CONSIDERATIONS

The bar codes that this licensed program prints represent a reasonable facsimile of Code 39 (A-Z, 0-9, *), UPC (Version A), and EAN bar codes. Users must test all bar codes printed in conjunction with this licensed program to make sure that the wand or scanning mechanisms used are able to adequately read the codes generated. Nonglossy paper is recommended. The OCR-A characters shown in the *APF/36 User's Guide* also represent a reasonable facsimile which would have to be tested by the users on their own wand or scanning mechanisms.

This bar code printing ability was tested with an INTERMEC® visible light hand wand mdl 1240 and a mdl 1 bar code reader.

The OCR-A printing ability was tested with a Recognition Product®, Inc. OCR wand mdl 30 and an IBM 5265.

This in no way represents an endorsement of INTERMEC®, Recognition Products, Inc.®, or any other non-IBM product.

® Registered Trademark of Interface Mechanisms, Inc.

CUSTOMER RESPONSIBILITIES

Users must test all bar codes presented in conjunction with this licensed program to make sure that the wand or scanning mechanisms used are able to adequately read the code generated.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Minimum system requirements are:

- IBM System/36, any model.
- Minimum region size is 34K bytes.
- IBM 5251 mdl 11, 5291 or 5292 Display Station.
- An IBM 5224 mdl 1 or 2 or an IBM 5225 mdls 1-4.

Note: When utilizing the IBM 5225 Printer mdls 1-4, factory EC 323150 or no-charge field bill of material (FBM) 6844756 must be installed, and for the IBM 5225 mdl 1, factory EC 987958 or no-charge FBM 6840638 must be installed.

APF/36 support requires 887 blocks of disk space.

In addition:

- For each logo file created by the user, 20 blocks will be reserved.
- For each alternative character set file created by the user containing 48 characters, 204 blocks will be reserved.
- For alternative character set created by the user containing 96 characters, 406 blocks will be reserved.
- For each forms control file created by the user, 40 blocks will be reserved.

The size of a copied spool entry will depend on the amount of user data.

- Minimum disk storage requirements:

- A logo-file - 20 blocks.
- An alternate character set file for 48 characters - 204 blocks.
- An alternate character set file for 96 characters - 406 blocks.
- A forms control file - 40 blocks.
- A copied spool entry is dependent upon the amount of user data.
- APF/36 library - 100 blocks.

SOFTWARE REQUIREMENTS

IBM System/36 System Support Program (5727-SS1).

COMPATIBILITY

The user interfaces and files are compatible with the System/34 5224/5225 Advanced Printer Function Programming RPO (5799-BFN).

CONVERSION (not applicable)**SECURITY/INTEGRITY**

The same as the System/36 System Support Program (5727-SS1).

PERFORMANCE

Overall performance of APF/36 is dependent on the type of characters being created and printed and their dot intensity. Performance information is available in the *APF/36 User's Guide*.

IBM System/36 5224/5225 Advanced Printer Function Specifications (GC21-7981) ... IBM System/36 5224/5225 Advanced Printer Functions User's Guide (SC21-7984).

RPOs ACCEPTED: Yes

PROGRAM PRODUCTS

**SYSTEM/36 ASSEMBLER and MACRO PROCESSOR
5727-AS1****PURPOSE**

The System/36 Assembler licensed program is a symbolic programming language used to write programs or subroutines for the System/36. The System/36-supplied macro instructions perform system services and provide device support for the Assembler user.

SPECIAL SALES INFORMATION

The Assembler is intended for use where customer requirements cannot be satisfied by other forms of available program support.

HIGHLIGHTS

Some of the features provided are:

- Mnemonic Operation Codes
- Symbolic Referencing of Storage Addresses
- Automatic Storage Assignment
- Address Displacement Calculation
- Convenient Data Representation
- Operand Field Expressions
- Source Identification - Sequence Fields
- Assembler Instructions
- Cross-Reference Listings
- Error Checking and Diagnostic Messages

DESCRIPTION

Assembler: The System/36 Assembler licensed program is a symbolic programming language used to write programs or subroutines for the System/36. Source programs written in this language are processed by the System/36 Assembler licensed program to produce relocatable object programs which are subsequently converted to executable format by the System/36 System Support Program Overlay Linkage Editor facility. The System/36 libraries are used to store the source statements, relocatable object programs and executable 'load' programs.

The System/36 Assembler may also be used for assembly of relocatable subroutines for use with System/36 RPG II, COBOL, and FORTRAN programs. The subroutines written in System/36 Assembler language are coded by the user and separately assembled. The process of program linking is accomplished during compilation of the RPG II, COBOL, and FORTRAN source programs.

System/36-Supplied Macro Instructions: System/36-supplied macro instructions provide support to the Assembler user through the Macro Processor for the following System Support Program facilities: Disk functions, printer operation, keyboard and display screen access, binary synchronous communications, and other SSP services such as Timer, EOJ, Message Log, program load.

The macro instructions are supplied to provide an interface to existing SSP support.

The BSC Macro instructions provide communication with:

- Another System/36 (RPG II or Basic Assembler)
- System/34 (RPG II or Basic Assembler)
- System/32 (RPG II or Basic Assembler)
- System/3 (MLMP, CCP or RPG II)
- System/7 (MSF/7)
- System/38 (CPF)
- System/360 (BTAM)*
- System/370 (BTAM,VTAM/NCP, CICS/VS or IMS/VS)*
- 3741 mdl 2 or 4
- 3747
- 5231 mdl 2 (receive mode only) - supported as 3741 mdl 2 or 4
- 5280 Distributed Data System
- Office Systems/6, 6580 Displaywriter
- Series/1 (supported as a System/3)

* Note: The 3704/3705 Emulation Program (EP) or Partitioned Emulation Program (PEP) extension to 3704/3705 NCP can be used to emulate the 2701.

Additional macro instructions will provide support for the Interactive Communications feature (SSP-ICF) provided by the System/36 SSP. Specific support is for:

- System/370 IMS/VS (IRSS and SNA/SDLC), CICS/OS/VS, and CICS/DOS/VS using BSC or SNA/SDLC protocols

- System/3 mdl 15D CCP using BSC protocols
- System/36, System/34, System/32, 5110, 3741, 5230 Office Systems/6, 6580 Displaywriter using BSC protocols (point-to-point only)

The assembler macro instructions will support the loadable sort interface from the System/36 System Support Program SORT utility.

Additional macro instructions provide interfaces to the scientific instruction set.

Additional macro instructions may be written by the user using the macro instructions definition language.

All macro instructions are expanded into Assembler source language statements by the Macro Processor that in turn can be processed by the System/36 Assembler.

CUSTOMER RESPONSIBILITIES (not applicable)**SPECIFIED OPERATING ENVIRONMENT**

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

IBM System/36 Assembler and Macro Processor licensed program executes on all models of the IBM System/36.

SOFTWARE REQUIREMENTS

The current version of the IBM System/36 Assembler and Macro Processor operates under control of the current version of the IBM System/36 System Support licensed program (5727-SS1).

COMPATIBILITY

System/34 Assembler programs that do not use IBM-supplied macro instructions and system interfaces can be assembled on System/36 and will execute. System/34 Assembler programs that use IBM-supplied macro instructions require conversion.

CONVERSION

There is a significant difference between IBM System/34 and IBM System/36-supplied macro instructions. System/36 Assembler programs may require different macro instruction parameters and keywords than System/34.

SECURITY/INTEGRATION (not applicable)**PERFORMANCE CONSIDERATIONS (not applicable)****DOCUMENTATION**

SYSTEM/36 BASIC 5727-BA1

PURPOSE

System/36 BASIC (Beginners All-purpose Symbolic Instruction Code) is a high-level interactive language for users who have commercial data processing requirements or who need to solve business, technical, and scientific problems.

HIGHLIGHTS

System/36 BASIC offers the following functions and advantages to the user:

- Alternative index paths are supported for indexed files. The paths are dynamically maintained. Program coding for an alternate index path is the same as for the indexed file. Alternate index paths must be created by BLDINDEX.
- Variable and function names can be up to 31 characters long and can contain underscore. Longer variable and function names allow more unique names and improve the readability of BASIC programs.
- Program lines can be up to 4 display screen lines long. Read/write lists and other statements that extend for more than one line can be entered as one statement.
- A program line can contain multiple BASIC statements. Multiple statements on a line can shorten a program.
- The program can read the cursor position row and column when a function key is pressed.
- BASIC program lines can be selectively renumbered. By renumbering program lines you can move lines within a program.
- A storage index will be automatically allocated when the performance of accessing a large indexed file can be improved. Coding of the index size in the program is eliminated.
- A program can access up to 255 display formats.
- Multiple Requesting Terminal (MRT) programs can continue processing when a permanent I/O error is caused by a terminal being powered off or by a remote terminal line failure.
- Program versions can be tracked with the modification reference number and date/time stamp in the source member directory entry, the compile listing, and the subroutine/load member directory entry.
- The number of program statements is not limited by region size.
- The user can stop a running program to examine or change variables, and then can resume execution.
- The display screen can be generated using any of the following:
 - The Screen Design Aid (SDA) utility.
 - The FIELDS parameter of the BASIC INPUT and PRINT statements. This method provides most of the formatting capability of SFGR.
 - The screen format generator (SFGR) SSP utility.
- The syntax of each source statement is checked. If a syntax error occurs, the operator can press the Help key to display the syntax and explanation of the BASIC statement used.
- BASIC program execution flow may be traced and displayed or printed. Simple commands control the start and stop of tracing.
- A Help function is provided that displays descriptions of the BASIC commands, statements, and intrinsic functions. The Help function also displays the syntax of each BASIC command and statement.
- BASIC program lines can contain a label. A line can be referenced with either a line number or a label. Labels can simplify programming.
- BASIC procedures can be created. BASIC procedures contain BASIC commands which are used to control the loading and running of BASIC programs. BASIC procedures can also contain BASIC statements, comments and data.
- BASIC supports input and update operations for user switches and local data areas.
- BASIC supports all System/36 file organizations (see "Software Requirements").
- A disk file can be assigned to a user for the duration of multiple job steps.
- The execution of each BASIC command can be logged to the history file.
- Fields of a disk file can be in zoned decimal, packed decimal, binary (1, 2, 3, and 4 bytes), alphanumeric format, or unformatted. Files with this type of data (except formatted) can be interchanged between BASIC, COBOL, and RPG.
- Library source members and OCL procedure members can be read from and written to a user library using a BASIC program.
- Logical (AND, OR, NOT) and Relational (for example, >, <, =, <=, >=, and <>) operators are provided.
- Input/Output may be formatted with the FORM or IMAGE statement. If unformatted, the Input/Output will assume default formats.
- Paging is provided through command keys and roll keys:
 - Command keys allow forward and backward paging by screen.
 - Roll keys provide up and down paging by line when the BASIC LIST command is used
- The following matrix operations are supported:
 - Addition
 - Subtraction
 - Multiplication by a scalar
 - Setting of all elements to a constant
 - Creation of an array of index elements that gives ascending or descending sequence of the data associated with each index element.
- Matrix multiplication, matrix inversion, determinant calculation and suggested user-defined functions are described in the *BASIC Reference Manual*
- Addroot SORT files can be read by BASIC.
- The BASICS procedure command converts a BASIC source member into a BASIC member ready to be executed. All invalid statements are dropped. This procedure can simplify conversion of programs from another system.
- Multiple Requesting Terminal (MRT) programs are supported.
- The Interactive Communications feature (SSP-ICF) is supported.
- Timed wait in SSP-ICF is supported as an intrinsic function.
- Cross-reference program listings are provided.
- An error message can be written on the error line of a display.
- Multiple spooled printer files are allowed in a single program.
- User can trap errors in procedures.
- User error control is supported on the file OPEN statement.
- A value for disk file extension when using extendable disk files can be specified on the OPEN statement.
- All run-time syntax errors can be trapped.
- Command keys are now allowed in INPUT and LINPUT.
- User can create his own collating sequence.

DESCRIPTION

BASIC (Beginners All-purpose Symbolic Instruction Code) is a high-level interactive language for users who have commercial data processing requirements or who need to solve business, technical and scientific problems. System/36 BASIC is easy to learn and easy to use, allowing the programmer or the casual user to concentrate on the application aspects of programming. The System/36 BASIC implementation uses a design that prevents nonexecuted code from taking up main storage. Program size is not limited to region size. System/36 BASIC has the ease-of-use characteristics of an interactive interpreter and yet offers some of the performance advantages of a compiler.

The System/36 BASIC licensed program is designed in accordance with the American National Standard Minimal BASIC (x3.60-1978) as understood and interpreted by IBM.

BASIC Design Overview: System/36 BASIC is an interactive compiler. This means it provides the ease-of-use characteristics of an interactive interpreter. Some of these characteristics are:

- Syntax checking after each statement is entered.
- The capability of running the program immediately.
- The capability to stop the program execution, to examine or change variables, and then resume execution.

After each statement is entered, it is changed to internal source text. Because the program is maintained in this internal source text, it can be easily changed, corrected or executed by the programmer.

System/36 BASIC also provides some of the performance advantages of a compiler. The primary advantage of a compiler is improved execution performance over that of an interpreter. This advantage is provided by System/36 BASIC when there is sufficient region size to contain all of the program during execution. In this case, the source text is compiled only once for that execution of the program.

PROGRAM PRODUCTS

System/36 BASIC (cont'd)

CUSTOMER RESPONSIBILITIES (not applicable)

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/36 BASIC licensed program will run on all models of the IBM System/36. The minimum region size is 28K bytes. Programs may require a larger region size. Increasing region size may improve performance.

The IBM System/36 BASIC licensed program requires a print belt with a minimum of 64 characters to print all of the uppercase characters on the IBM 3262 printer. A print belt with a minimum of 96 characters is required to print lower case characters.

When the System/36 BASIC licensed program is installed with the Multinational Character Set feature and keyboards that do not contain the \$, # or < symbols, these characters, if used, must be entered as their 2-character hexadecimal equivalent.

SOFTWARE REQUIREMENTS

All IBM System/36 licensed programs are designed to operate in an environment that includes the System Support Program (5727-SS1) or its equivalent.

The BASICR Operation Control Language command provides the capability to evoke a BASIC program without using BASIC command mode. BASICR also supports the use of a procedure that could contain // FILE OCL to override parameters in a BASIC file OPEN statement.

BASIC does not support logical processing of unformatted sequential access files created by the IBM System/36 FORTRAN IV (System/34-compatible) licensed program (5727-FO1) or FORTRAN floating-point data.

Source Entry Utility (SEU as part of Utility Program, 5727-UT1) is available to help the data entry person enter BASIC source statements into a library source member without using the System/36 BASIC licensed program. In this case, no syntax checking is done until the source code is processed by the System/36 BASIC licensed program.

Previously entered source statements can also be changed with SEU. A BASIC program must be in a library source member in order to use SEU. The SEU scan feature may also be useful when changing a BASIC program.

The SORT program can be used to sort all BASIC disk data files.

COMPATIBILITY

System/34 BASIC programs must be transported to the System/36 in source format. A LOAD or BASICS command must then be used to translate BASIC source statements in System/36 BASIC subroutine members. No source statement changes are required.

Minor differences exist between System/23 Datamaster BASIC and System/36 BASIC. An outline of these differences is available in the *IBM System/36 BASIC Reference Manual*.

Differences do exist between 5100/5110 BASIC and System/36 BASIC. Conversion of most source programs will be required. An outline of these differences is available in the *IBM System/36 BASIC Reference Manual*.

BASIC will execute concurrently with System/36 FORTRAN programs.

CONVERSION

If a program used CURROW, CURCOL, or USERID as a variable name, the program must be changed (these are now reserved names). BASIC MRT procedures must be rewritten due to the new Local Data Area specification, and region size must be raised to 28K if it has been set to a lower value in a System/34 procedure.

Programming With BASIC (SC21-9003) ... *IBM System/36 BASIC Licensed Program Specifications* (GC21-9011) ... *BASIC Summary* (SC21-9012) ... *BASIC Messages* (SC21-7943).

RPOs ACCEPTED: Yes

**SYSTEM/36 BUSINESS REPORT/APPLICATION
DEVELOPMENT SYSTEM (SYSTEM/36 BRADS)
5727-BR1****PURPOSE**

The System/36 Business Report/Application Development System brings data base power to users of the IBM System/36. With BRADS, users can productively develop and install system-justifying applications, often without becoming or hiring programmers.

Users can also expand the value of applications which run on their IBM System/36 by querying the data bases and by developing new reports.

HIGHLIGHTS

System/36 BRADS may be used to:

- Create, maintain and update data files.
- Create screen-driven data entry programs.
- Retrieve information from the files using a simple query.
- Create formatted reports using prompted report generation screens.
- Develop complete applications through use as a:
 - Highly productive development tool. The System/36 BRADS facilities can be used to create applications that execute under the control of System/36 BRADS.
 - Program generator for screens and reports. The screen and report programs generated by BRADS can be added to other BASIC programs to create applications that execute independently or in conjunction with System/36 BRADS.
- Create additional queries and reports for applications by creating BRADS file definitions.
- Provide design documentation maintained as a by-product of System/36 BRADS, which fulfills much of the user's documentation requirements.

Files may be shared for input among workstations while executing QUERY or COPY commands. Files may be shared while executing reports if the access method is 'input only'. Directories may not be shared.

System/36 BRADS also contains a spread sheet generator facility which may be used, for example, to:

- Produce forecasts showing expected revenues, operating costs, capital expenditures, taxes, and other expenditures.
- Try a variety of 'what-if' adjustments on the original spread sheet data to investigate alternative plans.
- Produce reports that examine the differences (variances) between plans or between plans and actual performance.
- Produce reports showing percentage relationships between rows or between columns (for example, growth from month-to-month).
- Consolidate or deconsolidate plans and evaluate performance of separate operating entities (for example, departments, companies, products).
- Combine historical and predictive data together.

The spread sheet generator facility provides the user flexibility in addressing applications such as:

- Balance Sheets
- Budget Planning and Forecasting
- Cash Requirements and Forecasting
- Commercial Loan Evaluation
- Common Sizing Analysis
- Comparative Analysis
- Consolidation and Deconsolidation
- Investment Analysis
- Material and Labor Requirements
- Manpower Projection
- Merger and Acquisition Analysis
- Product Planning
- Profit and Loss Statements
- Real Estate Investment

CUSTOMER RESPONSIBILITIES

IBM may provide normal marketing assistance and guidance. The responsibility of personnel selection and training, installation and continued day-to-day operation lies solely with the customer.

The customer is responsible for applying any program fixes distributed by IBM Central Service.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/36 Business Report/Application Development System (System/36 BRADS) is designed to operate on all models of the IBM System/36 having at least:

- 128K bytes of main storage
- One IBM Printer
- One 1920-character IBM Display with keyboard
- 30.8 megabytes of disk storage

Additional main storage will enhance performance when more than one workstation is operating concurrently. System/36 BASIC requires a printer with a minimum of 64 characters. A printer capability of at least 96 characters is required to print both upper and lower case characters.

SOFTWARE REQUIREMENTS

The IBM System/36 Business Report/Application Development System (System/36 BRADS) programs are written in IBM System/36 BASIC programming language, and are designed to execute under control of Release 1 or later of the System/36 System Support Program (5727-SS1), which includes Sort and System/36 BASIC (5727-BA1).

Customer Education: First time System/36 BRADS users should read *System/36 Brads Concepts* and self-study manuals: *System/36 BRADS Learning 1 and Learning 2*. A similar publication, *System/36 BRADS Learning 3*, covers the spread sheet generator facility.

SYSTEM/36 COBOL COMPILER AND LIBRARY 5727-CB1

PURPOSE

The IBM System/36 1974-level COBOL Compiler and Library is a licensed program that operates under control of the System/36 System Support Program (5727-SS1).

HIGHLIGHTS

Enhancements

- Language extensions to support workstations and interactive communications using SSP-ICF.
- The COBOL SORT/MERGE verbs are supported for up to eight input files. Multiple sorts are allowed in the same program.
- Nested IF statements are supported.
- ADD, SUBTRACT, and MOVE CORRESPONDING are now supported. This will reduce the number of instructions required to edit group items for printing or to do data conversion of group items.
- Support for abbreviated combined relations will allow users to code implied subjects and operands such that the following statement will be valid:
If A = B, OR C...
- Substring capability will allow the user to use the verbs STRING and UNSTRING to combine or take apart fields respectively. These powerful instructions are useful in text processing.
- Table processing will support the ASCENDING/DESCENDING options and the functions:
 - SEARCH
 - SEARCH ALL
- Variable-length tables are also supported by the OCCURS DEPENDING ON option to allow the user to restrict table searches to valid data only and thus save processing time.
- The INSPECT verb replaces the 1968-level EXAMINE. The function has been enhanced to allow use of multiple characters.
- File processing support:
 - Alternate index paths.
 - The record DELETE option is supported.
 - Add to sequential files is supported via the OPEN WITH EXTEND option.
 - The START verb will support NOT LESS THAN as well as EQUAL keys which will allow the user to do generic searches on indexed files.
 - Optional files are supported to allow the user to continue to run even if some of the files do not exist.
 - The DYNAMIC ACCESS option is supported so that a user can now process the same file both sequentially and randomly without having to doubly define the file.
 - The user can specify top and bottom margins for a printer file.
 - The FILE STATUS function is supported so that the user can interrogate the result of a file operation.
 - USE after STANDARD ERROR/EXCEPTION is supported to allow the user to combine error/exception logic in one section of the program.
- The value clause for level 88 supports multiple values. The THROUGH option also allows users to easily do range checking.
- Multiple result fields in arithmetic statements are supported.
- The REMAINDER option of the DIVIDE is supported.
- The RENAMES capability has been extended with:
 - Level 66 items
 - THROUGH option is supported
- The edit character of '/' for data edits is allowed.
- The COPY function supports the REPLACING option. This allows users to replace copied character strings, either entirely or partially, to fit the requirements of the source program.
- The 1974 DEBUG module is supported. This gives the user a special group item called DEBUG-ITEM which can be processed at desired debug points in the program. This support also includes both compile and execution time switches for suppression of the debug function.
- Additional debug support of EXHIBIT and TRACE.
- Additional compiler options include:
 - A cross-reference listing of data names and labels.
 - Flagging of all statements exceeding a specified FIPS (Federal Information Processing Standard) level.

– Syntax-only compiles to allow users to check syntax prior to generating object code.

- Semi-interactive syntax checking is provided to allow users to compile and correct source programs without requiring a source listing printout.
- Enhanced support for multiple spooled printer files in one program.

DESCRIPTION

The System/36 COBOL Compiler and Library is a licensed program that operates under control of the System/36 System Support Program (5727-SS1). The compiler and library are disk resident. The compiler requires as input a COBOL source language program, and produces as output, by means of the system's Overlay Linage Editor, a System/36 machine language runnable program cataloged in a user library. A source program listing, diagnostic messages, and main storage map can also be requested.

This compiler is designed according to the 1974 standard.

Industry Standards: IBM System/36 COBOL is designed according to the following industry standards as understood and interpreted by IBM:

- American National Standards (ANS) COBOL, X3.23-1974 ANS COBOL is identical to ISO 1989-COBOL, approved in February, 1978 by the International Organization for Standardization. The following ANS processing modules are included:

2 NUC	1, 2
2 TBL	1, 2
2 SEQ	1, 2
2 REL	0, 2
1 INX	0, 2
2 SRT	0, 2
1 SEG	0, 2
2 LIB	0, 2
1 DEB	0, 2
1 IPC	0, 2

The first digit above represents the level of the modules included in the compiler. The second digit represents the lowest level specified for American National Standard COBOL (0 implies that the module may be completely missing from a standard compiler). The third digit represents the highest level specified in the standard.

- December 1975 Federal Information Processing Standard, (FIPS PUB 21-1), Low-Intermediate level. However, additional support is provided for many features of higher FIPS level.

The following exceptions apply to the above standards:

- The DELETE function is implemented by marking deleted records with a hexadecimal FF in position 1 of the record. When operating with DELETE mode files, the user is excluded from placing a hexadecimal FF in this position.
- The ALTERNATE RECORD KEY clause is not supported. Comparable function may be utilized by defining additional indexed file access paths outside the COBOL program.
- RERUN is supported for syntax checking only.

Additions: In addition to the standard language, the following additional features are provided:

- Extensions to the modules of American National Standard COBOL listed above include certain language elements which are defined in higher levels of the American National Standard COBOL than those listed. The following extensions are supported:
 - Use of apostrophe instead of quotes.
 - Extended data types of computational-3 (packed) and computational-4 (binary).
 - Additional debugging support with EXHIBIT and TRACE.
 - ACCEPT from console.
 - DISPLAY upon console.
 - File definition using the FILE CONTROL entries of SELECT and ASSIGN.
 - Standard error handling using FILE STATUS and the USE procedure in the DECLARATIVES SECTION.
 - Extensions to standard file processing verbs for:
 - OPEN/CLOSE
 - READ/WRITE
 - Support for display format indicators as boolean data types (0,1) and turning them on and off via the SET statement.
 - Acquire and release workstations and SSP-ICF sessions supported through ACQUIRE and DROP.
 - Support for UPSI switches.
 - ACCEPT/DISPLAY statements support reading and writing of the workstation local data area (WSDA).

Additional Compiler Features:

System/36 COBOL offers additional compiler features which can be chosen by the programmer:

S/36 COBOL Compiler and Library (cont'd)

- Alternative index paths are supported for indexed files. The paths are dynamically maintained. Program coding for an alternate index path is the same as for the indexed file. Alternate index paths must be created by BLDINDEX.
- FIPS Flagger issues messages identifying statements and clauses in a COBOL source program that exceed a user-specified FIPS level.
- Symbol Cross-Reference produces two alphabetic listings of user-specified names. One of the names is defined in the Data Division and one of the names is defined in the Procedure Division.
- Online programming is supported by the diagnosed source member output option of the compiler. Diagnostic messages and summary information are inserted into appropriate places of the source member. The member may then be viewed/changed by SEU (Source Entry Utility).
- Online programming also provides an automatic cycle that enables you to enter a program, compile it, review/correct compile errors (via SEU), and recompile the program without leaving the display or using a printer. The inserted diagnostics are dropped on the next compile or may be optionally dropped by SEU.
- Many compile options such as print/noprint, source/nosource, xref/noxref, and debug/nodebug can be overridden from the online prompts.
- When the performance of accessing a large indexed file can be improved, a storage index will automatically be allocated. Coding of the index size in the program is eliminated.
- Up to 255 display formats may be accessed from a workstation file defined in a program.
- Multiple Requesting Terminal (MRT) programs can continue processing when a permanent I/O error is caused by turning the power off at a display station or by the failure of a communications line to a remote display station.
- Program versions can be tracked with the modification reference number and date/time stamp in the source member directory entry, the compile listing, and the subroutine/load member directory entry.
- Syntax Checking Compilation scans a source program for syntax errors. If errors are found, error messages are generated. No object code is produced.
- Parameter Prompting allows the user to request prompt screens for the specification of parameters needed for entering, updating, compiling, or executing COBOL programs.
- Multiple Printer Files allows the specification of up to 25 different printer files in the same program.
- Standard Program Linkage allows programs written in System/36 COBOL to call or be called by other programs written in System/36 COBOL, System/36 FORTRAN, or System/36 Assembler language.

Disk File Support: The access methods supported by System/36 COBOL, based on physical data organization, are as follows:

- Sequential Organization
 - Consecutive processing, including update in place and consecutive add (extend).
 - Random processing, by relative record number, including updating. This requires that the file be described as RELATIVE in the COBOL program.
- Indexed Organization
 - Random processing, by key or relative record number.
 - Sequential processing, by key including file loading.
 - Dynamic processing, combined random and sequential processing.
- Direct Organization
 - Random processing, by relative record number, including updating and file loading.
 - Consecutive processing.
 - Dynamic processing, combined random and sequential processing.

Standard System/36 disk labels are mandatory for all disk files. Nonstandard labels cannot be used except as data records within a file.

Record size can range from 1 byte to 4,096 bytes, and records may be processed as blocked or unblocked. The block size for a given file may be varied between programs up to a maximum block size of 9,999 bytes. Logical records may span physical disk sectors, blocks, tracks, or cylinders.

Workstation Support: Low-volume, unformatted, line-at-a-time workstation support is provided with the ACCEPT and DISPLAY verbs. File processing has been extended to support a TRANSACTION

organization type. Using this organization type, the user can define one file that supports single or multiple workstations, and single or multiple SSP-ICF sessions in any combination. Since the support is provided in a COBOL standard file, the user codes standard COBOL verbs, with extensions where necessary, to accomplish the job.

CUSTOMER RESPONSIBILITIES (not applicable)**SPECIFIED OPERATING ENVIRONMENT**

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/36 COBOL Compiler and Library licensed program runs on all models of IBM System/36.

SOFTWARE REQUIREMENTS

The current version of the IBM System/36 COBOL Compiler and Library licensed program operates under control of the current version of the IBM System/36 System Support Program (5727-SS1).

CONVERSION/COMPATIBILITY

No conversion of source programs from System/34 COBOL '74 compiler is required. There is a high degree of compatibility between the System/36 COBOL compiler and System/38 COBOL, the System/3 subset '68 COBOL, System/32 PRPQ COBOL, and System/34 PRPQ COBOL compilers. Differences do exist and some conversion effort will be required.

SECURITY/INTEGRITY (not applicable)**PERFORMANCE CONSIDERATIONS**

The System/36 COBOL Compiler and Library licensed program runs on all models of IBM System/36. The minimum region size is 24K bytes. Additional main storage may allow faster compilation of a large source program. The Overlay Linkage Editor constructs overlays (if necessary and possible) to fit the object program into the available main storage. The region size required for an object program is a function of source program complexity and its ability to be overlaid.

The System/36 COBOL Compiler accepts source statements from the source member on disk, from a procedure member on disk, or from a display station keyboard. Compiler output can consist of a source listing and diagnostic messages on the printer, messages on the display screen, an object module on disk, and a diagnosed source member.

During execution of the COBOL object program, input is accepted from the keyboard, from a library procedure member (if that procedure is defined as the system input device), or from data files on disk. Output from the executing COBOL program is to the printer, display screen, or to data files on disk.

PURPOSE

System/36 DMAS is a workstation application system that puts data processing in the hands of the using departments. Customer orders can be entered from the order desk, cash posted to customer accounts by the accounts receivable clerk, purchase orders created online by a buyer, and stock receipts entered by either warehouse or receiving department personnel. This can result in stock balances that reflect realtime data, lead to improved customer service, fewer lost sales, and optimum inventory investment. At the same time, vendor invoices can be entered by accounts payable personnel, journal entries processed by the bookkeeper and paychecks created by the payroll department. All of this can provide the user with the ability to exercise control over all aspects of his business using the facilities of one system.

System/36 DMAS includes the Inventory Management application which is a tool designed to assist buyers and management with the replenishment ordering of many different types of inventory. It incorporates innovative inventory management techniques that can, through better buying, help reduce the overall inventory investment - and the costs associated with acquiring and carrying inventory - while helping to assure that the right items are available to satisfy high levels of customer demand.

Facilities are provided to ease conversion of System/34 DMAS customers to System/36 DMAS. All that is required is that they back up their System/34 DMAS II master files and then restore them on System/36. The restore procedure is part of the System/36 DMAS installation process.

System/36 DMAS includes all the System/34 DMAS II, DFAS II and INVEN/3 functions. It incorporates system functions to take advantage of the workstation and multiprogramming capabilities of the System/36.

HIGHLIGHTS

- Interactive data entry is designed for simplicity and operator efficiency. Using this method, an operator gets a maximum amount of system-provided information in response to entering a minimum amount of data. Screen displays guide the operator through the data entry operation in a logical sequence. Most data entry is edited for reasonableness. Errors are signalled to the user along with descriptive data from the master file, which is an aid to visual verification. These errors can then be corrected interactively by the user.
- Multiple, interactive display stations may operate on one job or concurrently on different jobs. Several workstations can be used for customer order entry, while others may be used for posting payments, creating purchase orders, or entering inventory receipts. While this is occurring, a batch job may be running in the background. These capabilities dramatically increase the efficiency of entering data from the various centers of activity in a distribution business.
- The alpha search feature allows inquiry about customers and items when the workstation operator does not have the customer or item number available. By keying a portion of either the customer's name, or city, or both, the system will locate and display all customers meeting that criterion. Similarly, item name, item class, or both can be used to display items. An optional search field can be used when the customer or item is to be found by other than the first portion of the customer or item name.
- Comprehensive inquiry offers current data on demand. Displays show key information such as customer accounts receivable summaries, aged receivables status, customer sales and billing summaries, item inventory balances, item sales summaries, item price and cost data, vendor purchasing data, and active purchase orders for any item. In addition, a credit check which includes a summary of all accounts receivable (A/R), all in-transit to A/R, and all orders in process for a customer can be obtained. Alpha search can be used to locate desired customer and item inquiry data.
- Order status inquiries show the current status of customer or purchase orders in process or on file in the system. The user may choose to display all orders or only those meeting selection criteria.
- Comparative sales analysis provides inquiry displays which show historical comparisons and ratios. Quantitative figures and graphical comparisons are displayed for both item and customer

data. Latest-month data can be compared to the preceding month, to the same month in the preceding year, and to the latest 12-month average. Also, the current year-to-date data can be compared to the same period-to-date data in the previous year. The latest 13-month figures for any customer or item can be displayed in bar graph form. The various comparative sales analyses can show dollar sales, dollar profit, and quantity sold (items) or number of orders (customer) data, as selected by the user.

- Interactive file maintenance permits easy and accurate additions and corrections to master files from any workstation. Field descriptions, field lengths, and explanations of coded data are provided, while entered data is edited for reasonableness. A special feature allows rapid review and/or change of any or all item list prices. New prices are edited for reasonableness, as a protection against gross keying errors.
- All application procedures may be executed from a menu screen. Menu screens simplify the operators' duties by displaying a list of job numbers, with descriptions, that can be run. This reduces operator keying time and errors.
- Application options may be selected, depending on the type, at install time, run time, or by overriding standard data during data entry. Files may be resized as necessary to accommodate growth. Warning messages signal when files are approaching their capacity.
- The applications are integrated so that output from one becomes input (where appropriate) to others without the need to re-key the information. The highlights below identify, for each application, the other applications to which data is made available, or whose records are updated. Additionally, master files are shared between applications (where appropriate) to conserve file space, minimize file maintenance effort, and update the minimum number of records.

Data is provided from

- Billing to:
 - Accounts Receivable
 - Inventory Control
 - Sales Analysis
 - General Ledger
- Accounts Receivable to:
 - Billing
 - Sales Analysis
 - General Ledger
- Inventory Control to:
 - Billing
 - Sales Analysis
 - Purchasing
 - Inventory Management
- Purchasing to:
 - Inventory Control
 - Accounts Payable
- Inventory Management to:
 - Purchasing

Master files are shared as follows:

- Customer master:
 - Billing
 - Accounts Receivable
 - Sales Analysis
- Item/Item Balance masters:
 - Billing
 - Inventory Control
 - Sales Analysis
- Vendor master:
 - Purchasing
 - Accounts Payable

- Diskette magazine support for master file backup and recovery of all DMAS application programs.
- Auditability and control.
 - Order Reconciliation list.
 - System balancing to optional operator-entered control totals and the notation of any forced control totals.
 - Transaction registers.
 - Backing up of transaction files and master files.
 - System-produced notations of price-related operator overrides in the Billing application.
 - Financial data (receivables amounts and stock on hand) cannot be altered through file maintenance operations.
 - Sales statistics from deleted records are stored in summary form through year end, so that year-to-date sales and cost amounts balance to controls.

PROGRAM PRODUCTS

S/36 DMAS (cont'd)

- All pages of transaction registers (Invoice Register, Inventory Transaction Register, Receivables Transaction Register, Items Ordered/Received Register) are numbered with a perpetual serial page count to prevent valid report copies from being inadvertently destroyed or lost unnoticed.
- Prompting to override default options.
- No customer programming capability is required. Education programs are provided that are intended to help the customer attain operational self-sufficiency.
- Each application may be installed separately or in conjunction with the others. However, when Billing is installed, its output automatically serves as input to the Accounts Receivable, Inventory Control, General Ledger and Sales Analysis applications; when Accounts Receivable is installed, its output serves as input to General Ledger and Sales Analysis; when Purchasing is installed, some output serves as input to Accounts Payable.
- Reserved user space in master records.
- Basic screen functions across applications.
 - Ability to change mode between entry and review.
 - Cancel function may be performed.
 - Ability to add or insert new lines.
 - 1 to 8 lines may be entered and edited per body screen.
 - Ability to delete transactions.
 - Screens displayed in logical sequence.
 - Ability to unlock keyboard to make changes during review or entry.
- Flexible backup/recovery/restart to minimize the recovery process.
- Ease-of-installation: The Customer Service and Financial Applications use an improved installation and tailoring procedure which reduces the number of decisions and actions required of the user, and simplifies the entire installation process.
- Complete Documentation: Facilitates easy installation, operator and supervisor education, and efficient operation.
- Password and Resource security deter unauthorized use of the applications and functions within applications. A second level of DMAS security protects selected master file data.

DESCRIPTION

BILLING (5727-D41)

- Dynamic stock on-hand balance maintained and quantity available may be allocated to orders as they are entered. This allocate feature is optional with postbilling and standard in prebilling.
- Post- or prebilling methods available. Users may select either method, and change their choice at a later time.
- Credit limit checking (if A/R is installed) warns when customers' posted balance exceeds 90% of their credit limit.
- Extended credit check option displays total due currently posted in A/R, plus future-dated and in-transit charges, plus total of all orders in process. Comparison to credit limit and orders on credit hold are shown.
- Price check during order entry option will display complete order pricing data prior to picking list printing.
- Back orders are automatically reentered for customer and items that qualify.
- The printing of picking lists and invoices may be initiated following entry of an order. After an order has been entered, any operator may initiate the printing of a picking list on a printer located in the warehouse. The operator can also expedite delivery by calling for the printing of particular invoices to that warehouse.
- Alpha search on customer and item.
- Diskette and online workstation data entry.
- Multiprogramming allows for other batch and/or workstation jobs to operate concurrently.
- Multiple order entry workstation.
- Orders may be entered for new customers and for new items not on file. No file maintenance is required prior to entering orders.
- Flexible pricing, including: Discount from list or markup from cost, item quantity discounts, contract prices, or manually entered overrides.
- Operator override allows the operator to override defaults and information contained in master file data records.
- Orders may be cancelled, corrected, released to invoicing or retained in the file for later processing.
- Invoices/credit memos may be entered directly and changed, cancelled or remain in file for later processing.

- Picking documents and invoices printing flexibility:
 - For a particular warehouse or all warehouses
 - Within order number or invoice number limits
 - Based on 'all ready to be printed' or up to a specified number (for example, first 20).
 - Can be directed to different printer
 - The standard picking list printing sequence (list organization and content) can be overridden.
- An on-reserve warning is displayed when the quantity available of an item is less than the quantity on reserve.
- Interactive File Maintenance permits easy, accurate customer master file maintenance from any workstation.

ACCOUNTS RECEIVABLE (5727-D42)

- Cash application is simplified. The operator can select invoices for payment from a display of all of a customer's open items and selectively apply payments.
- Balance forward or open item. Either method is selectable for each account. The individual accounts can be changed from one method to the other at the end of an accounting period.
- Multiple cash entry workstations.
- Diskette and online workstation data entry.
- Statements with past and future aging, late charges, and optional remittance tear strips are prepared monthly.
- Aged Trial Balance and a Customer Account Status Report are available on demand. An option allows the Aged Trial Balance to be sequenced by customer within salesperson.
- Delinquency notices are available.
- Multiprogramming allows for other batch and/or workstation jobs to operate concurrently.
- Deferred statement printing is provided. Data is saved on diskettes for the printing of statements at a more convenient time.
- A zero-balance statement option permits the printing or bypassing of statements for customers with zero amount due, but who had transactions during the latest month.
- Print paid open item proof, and paid item list.

INVENTORY CONTROL (5727-D43)

- Dynamic stock-on-hand balances maintained. Sales, receipts and adjustment are immediately reflected in the quantities available.
- Alpha search on item.
 - Item price, cost, and quantity sold inquiry capability.
- Multiprogramming allows for other batch and/or workstation jobs to operate concurrently.
- A stock status report, stock status review and a variety of other analytical reports can provide stock movement data to assist in the buying process, optimizing inventory investment, and providing a high level of customer service.
- Broken case quantities maintained.
- Accounting for warehouse and drop shipments.
- Multiple warehouse activity supported. Inventory balances can be maintained separately for multiple warehouses. Inventory Analysis reports can show either the items in all warehouses, or only those in a specific warehouse.
- Two costing methods are supported: Average cost, for calculation of profit, and last cost, which usually represents your current replacement cost. Both costs can be displayed during item balance inquiry.
- Backorder release lists, one in item sequence and one in order number sequence, show customer orders being held pending receipt of backordered items.
- Physical inventory lists assist when taking inventory.
- Diskette and online workstation data entry.
- Quantity on reserve and on backorder.
- Interactive File Maintenance permits easy, accurate item master file maintenance, including item price changes by item class, from any workstation.

SALES ANALYSIS (5727-D44)

- Sales analysis reports assist in answering questions like:
 - What is selling and what is not selling?
 - Which profitable items should be promoted and which unprofitable ones should be dropped?
 - Which customers are profitable?

PROGRAM PRODUCTS

S/36 DMAS (cont'd)

- Which salespersons are effective and profitable?
- Depending on other licensed programs installed, reports are sequenced:
 - By item.
 - By item within item class.
 - By item class within customer within salesperson.
 - By customer.
 - By customer within salesperson.
 - By salesperson.
 - Within limits.
- The user can preserve the sales analysis detail data for additional analysis of his own design.
- Deferred printing of reports.
- Comparative Sales Analysis displays show historical data about items and customers at any workstation.
 - Data displayed is dollar sales, dollar profit, and quantity sold (items) or number of orders (customers).
 - Analyses for a sales territory or an item class show four comparisons of latest period data to a variety of comparable previous periods. Quantitative data and the ratio between periods is shown.
 - Analyses for a single customer or item show four comparisons of latest period data to previous time periods. These analyses show quantitative data and ratios for sales, profits, and orders for that item or customer.
 - Trend charts, showing up to 13 months of sales, profit, or order history for a single customer or item are displayed in bar graph form.
 - Comparative Sales Analysis data is collected and retained on file as the result of month-end DMAS processing.

PURCHASING (5727-D45)

- Build order by scan through vendor's line, identifying desired items and accepting or overriding normal order quantity - as alternative to key entry of individual items. Scan can be confined to items with below minimum availability status.*
 - Item inventory status can be displayed.*
 - Quantity/price break points can be displayed. Program assigns vendor price appropriate to quantity ordered.
 - Cumulative order weight and cost displayed and updated as order is modified during entry.
- * If the DMAS Inventory Control application is installed.
- Handles items that are ordered from more than one vendor.
- Orders can be entered for items that are not on the file.
- Orders can be entered for vendors who are not on the file.
- A standard general ledger account number is assigned to the order, but the operator can assign a different number to the order or to any item(s) on it.
- Messages can be entered to be associated with an order or a particular item on the order, and to appear only on the screens and reports destined for specific operating areas (for example, on the purchase order for the vendor, or on receiving reports and displays for the warehouse).
- Total order weight and cost is displayed after order entry, and updated if the order is modified at entry time.
- Orders can be held for later approval and/or can be printed individually or in batches at any time.
- Purchase orders can be printed on the system printer, or on a workstation printer (for example, at the buyer's desk), as predetermined by the user.
- When the purchase order has been entered, it updates Quantity on Order in the item records.*
- Multiple-warehouse activity is supported.
- Daily purchase order reconciliation report
 - Log of all orders
 - Transaction and status record for each order
 - Summary reconciliation of status changes and activities for all orders
 - Summary of open order dollar value by order status and buyer
- Report of shipments expected, by due date
 - For expediting
 - For warehouse labor scheduling
- Receiving lists and reports, to aid in
 - Warehouse operations and space planning
 - Checking receipts with minimum clerical effort
 - Determining stocking locations for incoming merchandise
 - Maintaining audit trail

- Extensive order status reports and displays - with multiple selection criteria.
- Item purchase order search, and display of status
- Interactive application of receipts to open orders
 - Updates purchase order quantities
 - Dynamically updates quantities available to fill customer orders*
 - Updates quantity on order and quantity on hand in item records*
 - Updates open order cash commitments
- Accounts Payable input
 - Interactive reconciliation of vendor invoice quantities and amounts to purchase order and receiving data.
 - Closing report for quantities approved for payment, with cost by assigned General Ledger account numbers.
 - Interactive input of vendor invoice Accounts Payable data, for transfer to the Accounts Payable application.
- Operator can override defaults and information obtained from master file data records.
- Multiprogramming allows for other workstation and/or batch jobs to operate concurrently.
- Multiple workstations can enter purchase orders concurrently.

INVENTORY MANAGEMENT (5727-D46)

When used with the proper information from the buyer and the data processing department, Inventory Management can:

- Generate suggested orders for each vendor line indicating which items should be reordered, and in what quantities. The orders can also be adjusted to meet many different restrictions, such as total order value, volume or weight.
- Project demand forecasts for each item. Once the buyer has reviewed and accepted these forecasts, they will be used in subsequent Inventory Management operations to project future needs.
- Estimate annual costs of various ordering frequencies for each vendor line to aid the buyer in the selection of the best ordering strategy.
- Show the inventory investment needed to operate at specified service levels, while indicating actual inventory performance.
- Prints up to 22 ranking reports which list projected volumes and inventory levels for items and vendors. These reports will highlight items with unusually high or low stock levels and help identify items with profit potential as well as possible problem areas. They also help determine which items or vendor lines should be tracked more closely.
- Notify the buyer and data processing department of exceptional conditions that may require action or review.

The Inventory Management data base and operating mode can be temporarily modified so that users can use varying discount, order frequencies, vendor lead times, and other elements to simulate a wide variety of conditions. They can then run the product functions in this 'what-if' mode and use the resulting analysis to assess the impact of the changing factors. When the system is taken out of this simulation mode, the user may either cancel the 'what-if' conditions that were entered, or retain them in the permanent data base.

The Inventory Management program library also includes two interfaces to System/36 DMAS. The first extracts information from System/36 DMAS Inventory Control files to automatically update the data base. The second interface passes ordering information to System/36 DMAS Purchasing, which then uses this data to print purchase orders, help control outstanding orders, and help receive and pay orders.

GENERAL LEDGER (5727-D47)

- System design based on a suggested account structure provided with the application, but may be tailored to fit user chart of accounts (up to seven-digit number).
- Supports either 13-period or 12-month fiscal year.
- User-defined fiscal year starting month or period.
- Supports up to 20 companies.
- Journal reference numbering system provides clear audit trail from source of entry to period-end closing.
- Accepts pertinent transactions from Accounts Payable, Payroll, Accounts Receivable, and Billing applications if installed.
- Edits input transactions to validate general ledger accounts and checks for debit/credit balance by entry groups.
- Selectively prints journals.
- Prints general ledger financial statement worksheet, and Statement of Changes in Financial Position.

PROGRAM PRODUCTS

S/36 DMAS (cont'd)

- User-specified format for Balance Sheet and Income Statement.
- Combines dollar amount for like account numbers to produce a combined Income Statement and Balance Sheet for multiple companies.
- Formats Income Statement by subdivisions of a company, such as departments.
- Prints a Comparative Income Statement (current versus last year or budget, with percentage of variance).

ACCOUNTS PAYABLE (5727-D48)

- Workstation allows the user to enter transactions, perform an immediate edit, and correct any errors while the source document is still available.
- Online inquiry displays vendor open payables information. Multiple line distribution of invoices.
- Balances total invoice amount to line distribution amounts.
- Data from prewritten checks can be entered for distribution to provide single audit trail.
- Check reversal capability.
- Selects invoices for payment by 'paging' and selects invoices based on date, vendor number, and/or particular invoice (allows partial payments).
- Resets Open Payables File to original condition if operator decides not to proceed from payment selection to checkwriting.
- Places invoices in hold status to prevent inadvertent payment of invoice in question.
- Prints aged open payables report (detail or summary).
- Lists open payables by due date and vendor.
- Prints cash requirements report.
- Prints cash disbursement journal and purchase journal.
- Provides checkwriting and reconciliation.
- Accepts pertinent transactions from the Purchasing Application, if installed and interfacing.
- Distributes to the General Ledger, if installed.
- Supports up to 20 companies.
- Prints vendor analysis report by vendor number or dollar expenditure, and includes year-to-date purchases and discounts taken and lost.

PAYROLL (5727-D49)

- Provides hourly/salary/executive payroll for regular, overtime, premium, vacation and sick pay.
- Payroll frequency specified by employee: Weekly, biweekly, semi-monthly or monthly.
- Shift differential maintained as cents to be added to the appropriate rate or as a percentage of the appropriate that must be added to it.
- If both 'Attendance' and 'Labor' transactions (job-related details) are entered, the system balances the two figures within a user-specified tolerance. Balancing is done by employee for each day and/or each pay period.
- Applies shift pay as either direct or indirect expense.
- Identifies abnormally large gross earning amounts and large check amounts.
- Ability to 'protect' executive pay checks with an extra level of security clearances.
- A standard tax algorithm calculates most present state taxes based on customer-provided data. Local taxes may fit the standard tax algorithm.
- Calculates Federal withholding and FICA taxes.
- Support is provided to calculate most present state disability insurance deductions based upon customer-provided data.
- Wages subject to Federal Unemployment Insurance (FUI) and State Unemployment Insurance (SUI) are determined.
- Miscellaneous deductions by percent, fixed amount, hourly rate, upper limit and cyclic within a user-specified frequency are provided.
- Makes taxable or nontaxable adjustments.
- Makes deductions for multiple unions.
- Union deduction by percent, hourly rate, and fixed amount within a user-specified frequency are provided.

- Union deductions may be employer- or employee-paid and be taxable or non-taxable.
- Vacation/holiday pay may be part of a regular pay check or on a separate check.
- Provides checkwriting and reconciliation.
- A payroll journal provides an audit trail of entries into the General Ledger application, if installed and activated.
- Provides 941-A and W-2 reports.
- Payoff check capability.
- Support is provided to write a separate check for a bonus payment with a flat percentage of income tax deducted.
- Supports up to 20 companies.
- Accrual accounting option relates pay periods to accounting period.
- Accumulated hours (including overtime) for both hourly and salaried employees.
- Supports up to three simultaneous state and local taxing bodies per employee.
- Terminates employee with one transaction.
- Supports nine pay cycles.
- Provides option to print employee address on check.
- Deducts non-FIT taxable pension.

CROSS-APPLICATION SYSTEM SUPPORT (5727-D4A)

The Cross-Application System Support module provides functions that are common to many of the System/36 DMAS applications; and is required to be installed along with the first DMAS application. Instead of including these functions in each of the other DMAS products, they are packaged here in one place - the Cross-Application Support module. Some of the System/36 DMAS areas that are supported by the Cross-Application System Support functions include:

- Installation
- Main menu selection function
- General disk file management
- File backup
- Restart, restore and recovery
- Application or program fixes

DMAS INSTALLATION AIDS

The applications (Billing, Accounts Receivable, Inventory Control, Sales Analysis, Purchasing, Inventory Management, General Ledger, Accounts Payable and Payroll) can be installed in any sequence. However, Inventory Management must have basic inventory accounting information to operate. This information is provided by the Inventory Control module, or the customer's own inventory accounting application (which must be installed and operational prior to installing Inventory Management). The CrossApplication System Support is a prerequisite for any one or all these applications. It is also intended for the experienced DMAS II user who wishes to add a new DMAS II application.

Self-Install Workbooks (*Installation Made Easy*, SH30-0689 and SH30-0730) provide step-by-step guidance through the planning and installation of the above DMAS Customer Service and Financial Applications. File sizing and run time options are explained in the workbooks. The workbooks should be ordered prior to installation. Data entry forms for master files are included that describe the information in the fields of each record type in the files.

A set of programs is included in the product that will assist with the installation tasks. These programs are initiated by one command, and provide prompts for workbook responses, calculate disk/diskette requirements, initialize the required diskettes, load the programs to System/36 DMAS libraries, and back up all of the DMAS files and libraries.

For Inventory Management, installation guidance and procedures are provided in the *Program Description and Operations Manual*.

PTF APPLICATION SERVICE AID

This service aid is available for the Customer Service and Financial Applications, and provides an improved method of support and control for application of PTFs, as well as an automated audit trail of the activity. This service aid has been designed so that customers can increase their self-sufficiency by being able to apply their own PTFs and refreshes.

This aid provides the following features:

- The total or partially automatic replacement of corrected modules in a refresh.

PROGRAM PRODUCTS

S/36 DMAS (cont'd)

- Built-in safeguards to prevent inadvertent replacement of modified modules.
- Source code image PTFs additionally provided with refresh diskettes to facilitate manual application to modified modules.
- Cross-reference listings of PTFs contained in refresh.
- Audit trail listing of PTFs applied during refresh session.
- Automatic logging of PTF numbers into the library log.

Customer Education

An IBM Guided Learning Center (GLC) or an IBM Customer Center can provide a list of courses available for System/36 and System/36 DMAS. Additionally, interactive self-study courses (S/36 DMAS Operator Instruction), will be available at program availability. The course teaches workstation and system console operators how to use System/36 DMAS. All components of the course can be ordered using the SBOF number or individual components can be ordered by form number.

The self study courses consist of the following:

Customer Service Applications Operator Instruction (SBOF-1395)

System Operator Study Guide (SR30-0269) ... Workstation Operator Advisor Guide (SR30-0270) ... Workstation Operator Study Guide (SR30-0271) ... Four 2D Diskettes (SR30-0526) ... Binder for the above components (SR30-1056).

Inventory Management Training Aid (SV30-0527)

Financial Applications System Operator Instruction (SBOF-1126)

System Operator's Study Guide (SR30-0901) ... 1-inch, 3-ring easel binder (SR30-0324).

Financial Applications Workstation Operator Instruction (SBOF-1128)

Advisor Guide (SR30-0900) ... Study Guide Volume 1 (SR30-0902) ... Study Guide Volume 2 (SR30-0903) ... Sample Runbook (SR30-0906) ... 2-inch, 3-ring easel binder (SR30-0327) ... Education diskettes (used with Workstation Operator Guide Volume 2) (SV30-0706).

CUSTOMER RESPONSIBILITIES

Installation of System/36 licensed programs is a customer responsibility. IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer. The customer has responsibility for providing data base conversion programs when the conversion is from a system other than a System/34. Implementation of the security procedures provided in this program product is the customer's responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration requirements are an IBM System/36 with:

- 5360 System Unit with a Diskette unit, 30MB of disk storage and 128K bytes of main storage.
- One IBM 5224, 5225, 5226 or 3262 Printer.
- One IBM 5251 Display Station mdl 11 or one IBM 5291 or 5292 Display Station.

Although there is nothing inherent in the design of DMAS to prevent the use of the minimum system configurations stated above, the system configuration for a particular customer must be able to accommodate the expected business volumes, data base size and operating requirements.

The amount of disk storage required is influenced by:

- The number of applications installed
- The volume of daily transactions
- The number of customer, item and ship-to records
- The number of open customer orders and unpaid invoices
- The number of purchase orders on file
- The number of contract items and items with quantity discounts
- The number of vendor and vendor/item records
- The number of Accounts Payable entry records stored

Additionally, a main storage capacity greater than the stated minimum required will often provide improved performance. For example, performance is affected by:

- The number of DMAS application tasks operating concurrently.

- The number of workstations operating concurrently on the same or different applications, and
- Any other applications operating concurrently.

SOFTWARE REQUIREMENTS

The programs are written in the IBM System/36 RPG II programming language and execute under control of the IBM System/36 System Support Program (5727-SS1). The IBM System/36 RPG II Compiler (5727-RG1), the IBM System/36 Utilities (5727-UT1), as well as the System/36 DMAS source programs, must be available if modifications to the programs are expected.

DOCUMENTATION

(available from Mechanicsburg)

The following publications support System/36 DMAS and are available now:

Executive Brochure (G580-0457) ... Reports and Displays: Customer Service Applications (G230-0245) ... Reports and Displays: Financial Applications (G280-0255) ... Customer Service Applications: General Information Manual (GH30-0690) ... Financial Applications: General Information Manual (GH30-0696) ... Inventory Management Availability Notice (GB30-2559) ... Executive Perspective of Computer-Assisted Inventory Management (GB30-0793).

The following publications will be available September 16, 1983:

Installation Made Easy Workbooks: ... Customer Service Applications (SH30-0689) ... Financial Applications (SH30-0730)

The following publications will be in stock at DMAS availability:

Licensed Program Specifications (GH30-0695) ... Billing Reference Manual (SH30-0676) ... Accounts Receivable Reference Manual (SH30-0673) ... Inventory Control Reference Manual (SH30-0680) ... PROGRAM PRODUCTS

**SYSTEM/36 FORTRAN IV
5727-FO1****PURPOSE**

The System/36 FORTRAN IV (X3.10-1966) licensed program processes programs written in the System/36 FORTRAN IV (System/34 compatible) language, producing output suitable for execution with the System/36 System Support Program (5727-SS1).

HIGHLIGHTS

- FORTRAN will run concurrently with BASIC on the System/36.
- Up to 255 display formats may be accessed from a program.
- Program versions can be tracked with the modification reference number and date/time stamp in the source member directory entry, the compile listing, and the subroutine/load member directory entry.
- Online programming is supported by the diagnosed source member output option of the compiler. Summary information is placed at the beginning and end of the source member. Diagnostic messages are inserted in front of statements that contain errors. The member may then be viewed/changed by SEU (Source Entry Utility).
- Online programming also provides an automatic cycle that enables you to enter a program, compile it, review/correct errors found by the compiler (using SEU), and recompile the program without leaving the display or using a printer. The inserted diagnostics are ignored during the next compilation or can be removed by SEU.
- Many compilation options such as source/no source, map/no map, text/no text, object/no object, and subroutine/no subroutine library name can be overridden from the online prompts.
- Logical data, logical expressions, and logical IF are supported. Logical elements (constants, variables and arrays) contain true or false values.
- Operation symbols are used in logical expressions:

.NOT. (negation)	.LT. (less than)
.AND. (conjunction)	.LE. (less or equal to)
.OR. (union)	.EQ. (equal)
	.GT. (greater than)
	.NE. (not equal)
	.GE. (greater or equal to)
- Logical expressions evaluate elements to obtain true or false values.
- Logical assignment statements define a relationship - placing the value of a logical expression in a variable or array element.
- Support for Local Data Area (LDA) sizes up to 512 bytes to provide more flexibility in passing data between job steps.
- The compiler defaults to the current user library to improve programmer productivity.

DESCRIPTION

System/36 FORTRAN IV (X3.10-1966) licensed program processes programs written in the System/36 FORTRAN IV (System/34 compatible) language producing output suitable for execution with the System/36 System Support Program (5727-SS1).

The System/36 FORTRAN IV (System/34 compatible) language contains those features defined in American National Standard Basic FORTRAN X3.10-1966; language extensions supported by System/34 Basic FORTRAN and additional features and capabilities previously available only with certain full FORTRAN compilers.

The System/36 FORTRAN IV library contains mathematical and service subprograms required during execution to perform arithmetic operations, input and output constant conversions and input/output control.

System/36 FORTRAN IV is supplemented by a commercial subroutine package.

CUSTOMER RESPONSIBILITIES (not applicable)

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/36 FORTRAN IV (IBM System/34 compatible) licensed program runs on all models of the IBM System/36. FORTRAN IV graphics on the IBM 3262 Printer are provided by any 64-character or 96-character print belt or by the 48-character FORTRAN IV print belt. The IBM 5224 and 5225 Printers provide FORTRAN IV graphics.

SOFTWARE REQUIREMENTS

The current release of the IBM System/36 FORTRAN IV (System/34 compatible) licensed program operates under control of the current release of IBM System/36 System Support licensed program (5727-SS1).

COMPATIBILITY

System/36 FORTRAN IV language is source compatible with IBM System/34 FORTRAN IV.

Programs must be recompiled to execute on the System/36. Some compiler-supplied procedures, such as 'FORTMOVE', are not supported because the function is provided in another manner with System/36.

CONVERSION

No conversion of source programs from System/34 is required.

SECURITY/INTEGRITY (not applicable)

PERFORMANCE (not applicable)

SYSTEM INTEGRITY

The same as the System/36 System Support Program (5727-SS1).

DOCUMENTATION
(available from Mechanicsburg)

Programming With FORTRAN IV (SC21-9005) ... IBM System/36 FORTRAN IV (System/34 Compatible) Licensed Program Specifications (GC21-9010) ... FORTRAN IV (System/34 Compatible) Messages (SC21-9055).

RPQs ACCEPTED: Yes

PROGRAM PRODUCTS**SYSTEM/34 to SYSTEM/36 MIGRATION AID**
5727-MA1**PURPOSE**

The System/34 to System/36 Migration Aid is a set of System/34 and System/36 programs and procedures that assist the user in moving System/34 applications to a System/36. This Migration Aid does not address conversion of MRJE or SRJE communications applications.

The Migration Aid allows a user to do the major part of the migration (the library analysis work) on the installed System/34 prior to the arrival of the System/36. Source program compilations are run on the System/36.

The Migration Aid runs on a 48K minimum System/34 and all models of the System/36. The use of the Migration Aid can relieve the user of many time consuming tasks, ensure greater migration accuracy, and improve user productivity during the migration.

HIGHLIGHTS

- Easy to use (menu- and prompt-driven).
- Identifies source and OCL differences in reports.
- Makes limited modifications to OCL statements and command procedures.
- Generates OCL to save/restore the System/34 user files.
- Generates OCL to move user library members from the System/34 to the System/36.
- Generates procedures to compile System/34 source that must be recompiled on the System/36.
- Runs generated recompilation procedures with minimal user intervention.

DESCRIPTION

The System/34 to System/36 Migration Aid provides an automated, structured method of moving System/34 source, procedures, and data files to the System/36. The Migration Aid is easy to use. It is structured such that after careful planning of the conversion activities by someone who is familiar with the System/34 installation, the actual running of the Migration Aid may be done by a system console operator. The Migration Aid provides the following functions:

- Create a control file of the names and sizes of libraries and data files installed on the System/34.
- Display a user selection list of the names of those libraries and files.
- Identify load members in a user library without a matching source member.
- Attempt to identify the type of source members in a library.
- Calculate an estimate of the required number of diskettes to save all selected source, procedure members, and data files and, optionally, initialize the estimated number of diskettes.
- Analyze operation control language, procedures and menu commands for specific differences that may require change.
- Create operation control language to save System/34 user libraries (source and procedure members only) and data files on diskette.
- Create operation control language to restore user libraries and data files on the System/36.
- Create operational control language to compile identified source programs on the System/36.
- Copy user data files, source and procedure members from System/34 to the System/36.
- Recompile identified source programs on the System/36.
- Maintain audit trails of migration activities.

The Migration Aid identifies and creates compile OCL for the following source programs:

- RPG II
- RPG II Auto Report
- Display Formats
- Menus
- Message Members
- Data File Utility (DFU) (some manual assistance is required)
- Workstation Utility (WSU)
- FORTRAN
- COBOL
- Assembler

CUSTOMER RESPONSIBILITIES (not applicable)

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

A minimum of a 48K IBM System/34 with 26K bytes of user area is required to run the Migration Aid. The Migration Aid runs on any model of the IBM System/36.

On the IBM System/34, disk storage equal to the largest library to be migrated, plus approximately 350 blocks for the Migration Aid library and work files.

A sufficient number of diskettes to store the libraries and files being saved. The Migration Aid estimates the number of diskettes required. On the IBM System/36, approximately 300 blocks of disk storage are required for the Migration Aid library and work files.

SOFTWARE REQUIREMENTS

The current version of the IBM System/34 System Support Program (5726-SS1), or the IBM System/34 System Support Program Subset (5726-SS2) is supported.

The IBM System/36 Release 1 System Support Program (5727-SS1).

The IBM System/36 Utilities licensed programs and appropriate language compilers are required to recompile programs being migrated from IBM System/34 to IBM System/36.

COMPATIBILITY

The Migration Aid is a stand-alone application. It uses System/34 System Support Program, System/36 System Support Program, and Utilities licensed programs and appropriate language compilers. The Migration Aid has no dependencies on any other related announced programs.

CONVERSION

The Migration Aid addresses migration of user applications from System/34 to System/36. The Migration Aid supports System/34 Release 9 migration to System/36. Subsequent enhancements to System/34 will not be addressed directly, but the Migration Aid can be used to migrate to System/36 at any time.

SECURITY/INTEGRITY

The Migration Aid accesses user libraries and files on the System/34. The person responsible for running the migration must have access and update security clearance to all libraries and files that will be migrated using the Migration Aid, if security is on the System/34.

PERFORMANCE

Overall performance of the Migration Aid is dependent upon the size of the libraries and files to be migrated. Normally, the major portion of the migration time will consist of diskette handling and recompilations on System/36.

PURPOSE

The System/36 Manufacturing Accounting and Production Information Control System (MAPICS) provides an integrated and comprehensive workstation-oriented accounting, financial, and manufacturing control system for the small-to-medium manufacturer and some of the like process industries.

HIGHLIGHTS

- The System/36 hardware and system software functions (spooling, inquiry, multiprogramming) are integral parts of the MAPICS application design.
- Workstation data entry is designed for simplicity and ease-of-use. Screen displays provide guidance for mandatory input and for fields that may be overridden. Error messages signal errors which can then be corrected interactively by the operator.
- Interactive data entry, concurrent edit and correction for multiple applications through multiple workstations while batch programs operate in the background.
- Inquiry into master files concurrent with data entry.
- System tailoring procedures permit the user to select optional functions and reports, and to determine the sizes of all files used by the applications. Functions and file sizing may be modified as the customer environment changes by reexecuting the tailoring procedures.
- Ready-to-execute procedures, and object code are provided.
- Source code is available.
- File load programs for master files are provided.
- Online file maintenance of most master files with optional file maintenance reports.
- Optional system procedures for master file backup and restart.
- Password security helps deter unauthorized use of applications and functions within applications. A higher level of security helps protect selected master file data.
- Documentation for each application includes a reference manual, a runbook, and a logic manual. From an overall MAPICS system perspective, an installation guide, a reference manual, a runbook, and a logic manual are provided. Self-study instructional materials are also available for operator education.
- Sample documents are provided for both data collection and data entry.
- Control features and documents are included to assist in establishing audit trails.

DESCRIPTION

MAPICS is a set of 13 independent, but interrelated, ready-to-execute applications for the small-to-medium manufacturer consisting of:

- Cross-Application System Support
- Order Processing and Accounting Applications
 - Order Entry and Invoicing
 - Inventory Management
 - Accounts Receivable
 - Sales Analysis
- Financial Applications
 - General Ledger
 - Accounts Payable
- Manufacturing Applications
 - Inventory Management
 - Product Data Management
 - Material Requirements Planning
 - Production Control and Costing
 - Capacity Requirements Planning

- Data Collection
 - Data Collection System Support

These applications are designed for marketing in any combination and installing in any sequence, with the following exceptions:

- All applications require Cross-Application System Support.
- Sales Analysis requires at least one of the other Order Processing and Accounting applications.
- Material Requirements Planning requires both Inventory Management and Product Data Management.
- Production Control and Costing requires the Inventory Management application. (Although Product Data Management is not an absolute requirement, its use is highly recommended.)
- Capacity Requirements Planning always requires the Inventory Management application and either Product Data Management or Production Control and Costing.

Each application has certain required records within a cross-application control file which contain questionnaire responses. These records allow the users to select report formats, file sizes, and functions to suit their needs. The questionnaire responses are entered during initial installation and may be changed as needed. The System Tailoring Procedures allow these responses to be entered or modified. It provides the following:

- All functions are included in the application programs but only required functions are actually executed.
- Allows the user to activate and deactivate provided functions as the user's business changes.
- Tailors the Operator Control Language (OCL) on-site at installation time.
- File sizes may be expanded or contracted as needed by rerunning the system tailoring procedure.

The *MAPICS Installation Made Easy Workbooks* provides instructions for planning the installation of one or more MAPICS applications. Three separate installation workbooks are provided to cover all the MAPICS applications.

Reference manuals provide an explanation of the system to enable the user to understand the applications from a functional and operational standpoint. Manuals are provided at two levels. A reference manual for MAPICS operations gives guidance to the installation supervisor on managing and running the applications from a total-systems viewpoint. One management operations manual is provided for MAPICS operations covering all applications.

Individual reference manuals for each application instruct the workstation manager on how to conduct day-to-day operations of the application.

Similarly, one system runbook is provided for the systems console operator, and individual application runbooks for the workstation operators. The console operations runbook contains detailed step-by-step instructions for operating MAPICS at the console. Included are an overview of the system and application flow, system considerations, and hints on troubleshooting. All of the error messages that can be generated by any of the applications in the offering are contained in a Systems Messages Manual.

The individual application runbooks provide a summary of the application and workstation operations, application and screen flow, and a detailed description of how to run each procedure in the application.

The MAPICS system logic manual is provided as licensed material for use by the self-sufficient customer, and for the systems engineer in maintaining and modifying MAPICS. Information on system architecture, naming conventions, system controls, system program functions, and specifications, relationship among system files, and other information applicable to all applications is presented in this system manual.

In addition, logic manuals for maintaining and modifying each application are available. Information relevant only to the subject application, such as program descriptions, cross-reference lists, and data dictionary, is presented.

Instructional support is provided to facilitate installation and operation. Self-study instructional material is provided for the systems console operator, and for the application workstation operator to train them in the use of the runbooks. Only one copy of each manual is needed per customer no matter how many applications are to be installed.

Modular Application and Systems Training (MAST) is available to help identify and quantify benefits for top executives. MAST aids the customer in planning an effective implementation and includes techniques to assure top priority and the commitment of all the

PROGRAM PRODUCTS

System/36 MAPICS (cont'd)

necessary resources. To assist in determining Management function and fit, there is a MAPICS features course for all MAPICS applications. In addition, for Inventory Management, Product Data Management, Production Control and Costing, and Material Requirements Planning, there are concepts, implementation, and courses that use the system to make the customer more self-sufficient and reduce the effort and time required to install these applications. To learn more about how to use MAST, refer to the *MAST Manufacturing Education Guide* (GH30-0241).

PRODUCTION CONTROL AND COSTING (5727-M41)

The Production Control and Costing application provides for shop packet creation and for the tracking and costing of an ordered item as it is manufactured; it also measures work center utilization and efficiency plus queue analysis and control functions. The application also creates, maintains, and updates the operation and miscellaneous charge information associated with jobs within the user's shop. It requires the installation of Inventory Management and has optional interfaces with Accounts Payable, Payroll, and Product Data Management as well as accepting data from Data Collection System Support (Product Data Management is highly recommended). Open operation information may also be passed on to Capacity Requirements Planning.

This application uses information which Inventory Management creates and maintains in conjunction with its own information to produce all necessary reports to track and cost an order. In addition, it produces a prioritized worklist by work center to assist production control in moving work through the shop in the most efficient manner.

The capability of accepting transactions via the workstation and/or diskette is provided in order to support Data Collection System Support diskette output. The transactions passed via the Data Collection System Support interface are labor, (operations) moves, and machine times. The labor transaction depends on the user's request of a Payroll interface. If the Payroll interface has been requested, the labor transactions are passed through Payroll to Production Control and Costing.

Additional functions include inquiry of order status, item status, and work center status, as well as report printing of order status and open order exceptions.

System/36 MAPICS Production Control and Costing requires the use of the MAPICS Inventory Management (5727-M45) application.

PAYROLL (5727-M42)

The Payroll application starts with the basic employee time record as input and handles the calculation of wages, taxes, deductions, checkwriting, and file updating for both salaried and hourly pay plans. Employee time data may be entered from a workstation or can be passed from the Data Collection System Support application. Payroll can interface with both the General Ledger and Production Control and Costing applications. Transactions may be passed to General Ledger on either a cash or accrual basis during printing of the payroll distribution journal. Job-related data for both hourly and salaried employees can be passed to the Production Control and Costing application.

Current payroll data is entered from time cards or job reports either daily or weekly, and is edited to validate employee and job information. A user with an incentive payroll must manually calculate gross pay and then enter it into the system. In addition to calculating present Federal and FICA taxes, a standard tax algorithm is provided to calculate most present state taxes based upon customer-provided data. Local taxes may fit the standard tax algorithm provided. The state disability insurance deduction also uses a standard algorithm based upon customer-provided data. Wages subject to Federal Unemployment Insurance (FUI) and State Unemployment Insurance (SUI) are determined. Deduction programs compute voluntary deductions for a specific pay period as well as one-time and union deductions. All necessary reports are furnished including payroll register, deduction reports, checks, Federal 941-A reports, and W-2 reports.

Support for up to 20 companies, a manual payroll check procedure, and the ability to handle an employee working in multiple states, counties, cities, unions, jobs, or shifts on the same day are provided to give the user wide flexibility. Labor distribution of payroll hours and dollars is done in the same detail as the basic employee time record, that is, department, work center, job number, operation.

Several other reports are printed:

- Vacation, holiday, and sick pay register
- Year-to-date and quarter-to-date earnings register
- State and local tax register
- Check reconciliation register
- Workmen's compensation worksheet
- Union deduction register
- Paychecks (with option to print employee address)
- Governmental reports Federal 941-A, W-2 (and associated registers)

ACCOUNTS PAYABLE (5727-M43)

The Accounts Payable application keeps accurate and detailed records of vendor invoices and credit memos from the time they are entered into the system until they are paid and the check reconciled. Although Accounts Payable can be installed on a stand-alone basis, it is frequently used with the General Ledger application to which it can distribute the dollar amounts spent against the proper account numbers. There also exists an interface to Production Control and Costing by which Accounts Payable can pass job-related purchase information.

Transaction auditing is aided by a journal referencing scheme which causes every transaction affecting General Ledger to refer to a particular journal and line number within that journal. A double-entry bookkeeping method keeps transactions in balance.

Procedures for handling manual checks, petty cash, and check reversals are provided, as well as online selection of invoices for payment selection including partial payments, selection by date, and selection by vendor and invoice. Credit memos can be automatically generated, allowing the user to reverse a previously entered invoice without having to rekey all the invoice's indicative information and distribution.

Support is provided for up to 20 companies. Key reports include an aged payables report, two vendor analysis reports, plus normal accounts payable audit trails such as purchase journal, cash requirements reports, and cash disbursements journal. When checks are printed, options are available to make the checks payable to 'assignees' (due to factoring by the vendor) and to print remittance advice 'overflow' data on a separate remittance advice form.

ACCOUNTS RECEIVABLE (5727-M44)

The Accounts Receivable application keeps detailed records of customer charges, cash payments, credit and debit memos, and other adjusting entries from the time they are entered into the system until they are paid or otherwise applied. The application allows for a combination of open item and balance-forward handling of individual customer accounts. Interfaces with Order Entry and Invoicing, Sales Analysis, and General Ledger are provided.

Invoices and credit memos can be entered directly and/or received from the Order Entry and Invoicing application. Cash receipts and adjustments are entered into the system directly, update the accounts receivable immediately, and can generate General Ledger transactions via an interface. The application provides optional late charges by customer for both open-item and balance forward accounting and support for up to 20 companies.

As required, the user can generate account status reports for a single customer or a group of customers as well as an aged trial balance in any of the following forms:

- Summary or detail
- Past-due accounts only
- Delinquent accounts only
- Minimum balance
- Aging based on current status
- Aging based on date of next statement
- Future aging of invoices

Additionally, statements and delinquency notices can be printed at user-determined frequency. The following features are provided:

- Option to age unapplied cash/adjustment
- Ability to identify credit memo by a unique number, but still relate the credit memo back to a specific invoice number
- Ability to apply cash, without knowing specific invoice numbers

INVENTORY MANAGEMENT (5727-M45)

The Inventory Management application processes all transactions affecting the status of the inventory balances. It is a central application which can interface with Order Entry and Invoicing, Sales Analysis, Product Data Management, and Data Collection System Support applications. Inventory Management is a prerequisite for installing either Material Requirements Planning, Production Control and Costing, or Capacity Requirements Planning.

The basic functions of this application provide the 'in's and out's' of inventory accounting plus the ability to cycle count the physical inventory. The reporting functions include calculating current inventory investment and the annual inventory turns, as well as valuation techniques for tax reporting. Finally, you have the ability to release purchase and manufacturing orders and track their progress until each order is closed out.

The application provides for inventory valuation based on average, last, or standard costs as well as LIFO and FIFO options. Physical inventory checklists can be generated for multiple or selected warehouses, with or without cycle count options. In addition to printing a stock

PROGRAM PRODUCTS

System/36 MAPICS (cont'd)

transaction register for audit control, a stock status report can be printed for all items or on an exception basis, and a stock status review can be had by item or by item within vendor.

A component 'availability check' is performed during the release phase, and items and orders with shortages are identified on special exception reports. At order release time, component allocation for manufacturing orders can be done to ensure that component inventory needs are accounted for between order release time and the actual withdrawal from stock.

Transactions can be entered from diskette or workstation; from diskette to go through batch edit and batch update; transactions entered through a workstation are edited immediately and can update balances either immediately or later, (based on a System Tailoring option. In either case, an audit trail of all transactions is produced.

PRODUCT DATA MANAGEMENT (5727-M46)

The Product Data Management application maintains bills of material, product options, routing, and work center data bases and provides for costed retrievals and cost simulation. In interfacing with Inventory Management, Material Requirements Planning, Production Control and Costing, and Capacity Requirements Planning, this application is an information point for bills of material and routings. Order Entry and Invoicing also require Product Data Management in order to enter end items with standard options.

The ability to perform inquiry into the product structure and routing files is provided. Application highlights include the capability for multiple screen displays, mass replace, mass delete, and 'same-as-except' functions which facilitate maintenance to the product structure file. In addition to option handling techniques, use of engineering effectivity date simplifies engineering change control procedures. Labor and overhead rate tables can be used for costing in lieu of routing and work center files.

Several reports can be printed:

- Listings of item master, feature/option table and work center master
- Retrievals of product structures and routings
- Cost reports including management cost summary and cost variations

GENERAL LEDGER (5727-M47)

The General Ledger application is the terminal point of all accounting entries; it integrates completely with Accounts Payable and Payroll and accepts cash receipts and adjustment entries from Accounts Receivable. Though it can be installed apart from the other applications, a large number of ledger entries result from the distribution of expenses incurred through Accounts Payable. Therefore, a majority of General Ledger users will likely install Accounts Payable and/or Payroll.

Each transaction entered is assigned a journal number and a unique line number within that journal. This journal reference number is kept with the transaction until it is posted to the master record during period-end closing. Transactions coming from other interfacing applications also use this reference numbering scheme. This makes auditability easier throughout the application. Thorough editing of all data at entry time, plus the fact that a double-entry bookkeeping system is used ensures that all credit entries are offset by an equal value of debit entries, and provides for smooth period closings. Diskettes can be used for processing recurring entries. The application gives the user support for up to 20 companies and choice of either a 12-month or 13-period fiscal year. The General Ledger listing displays (by account number) transaction original journal reference numbers, providing a clear and easily used audit trail of all transactions.

The balance sheet and income statement can be formatted to the user's particular requirements by use of a format file which permits special spacing, user-specified columnar printing, user-specified totaling, and up to 73 accounts to be totaled and printed with one line of description. By exploiting the capabilities of the format file, the user can produce departmentalized and/or combined (not consolidated) statements for multiple companies. Both the balance sheet and income statement can be comparative to last year and the income statement can also be comparative to budget figures.

SALES ANALYSIS (5727-M48)

The Sales Analysis application consolidates all sales and credit memo transactions affecting customers, salespersons, and items that have been entered into the system. Input can come from Order Entry and Invoicing, Inventory Management, or Accounts Receivable; at least one of these applications must be installed as a prerequisite.

Data is passed to Sales Analysis via interface files as shown:

Customer-related data can come from	Salesperson-related data can come from	Item-related data can come from
OE&I A/R	OE&I A/R	OE&I IM

Either 12-month or 13-period reporting may be selected by the user. These transactions are posted to summary files which provide a historical data base for management reports. Summary files may also be corrected by file maintenance with an entry list providing an audit control.

Provision has been made for multicompany support for up to 20 companies for customer summary analysis, for flagging specific items for inclusion in sales analysis, and for inquiry into the summary files from the workstation. The reports included in the application are sales by customer, salesperson, and item with the option to display comparative data as well.

The System/36 MAPICS Sales Analysis application requires the use of at least one of the following MAPICS applications:

- Order Entry and Invoicing (5727-M49)
- Accounts Receivable (5727-M44)
- Inventory Management (5727-M45)

ORDER ENTRY AND INVOICING (5727-M49)

The order entry function is a key starting point for activity in a manufacturing organization. For make-to-order products, this function describes the item to be manufactured and when the item is required. For items shipped from inventory, it streamlines the order processing so items can be shipped promptly. It interfaces with Inventory Management by directly updating quantity on hand data, with Accounts Receivable by providing invoice summary information, and with Sales Analysis by providing item, customer and salesperson data. The data stored in the open order files can also be analyzed by Material Requirements Planning. Customer open orders can be passed to Capacity Requirements Planning.

As orders are entered, customer data is validated and, if accounts receivable is installed, a credit check is performed. Initial ship dates may be established based on inventory availability or manufacturing orders, and item pricing data is checked for validity and completeness. The term 'orders' includes regular and blanket orders. A blanket order specifies a single item with multiple ship dates and specific quantities. Both order types may be entered in a similar manner. Invoicing may be accomplished by either direct entry or from orders previously entered into the system. Invoicing encompasses the computation of prices, taxes, and invoice totals. Pricing can be based on established contract prices, quantity breaks, markup from cost, or discounting from list price. Order acknowledgments, picking lists, invoices, and bills of lading can be printed.

If Product Data Management is installed, orders can be entered for end items which have standard options associated with them. Since these options may be required, they are checked at entry time to make sure the data is sufficient.

As soon as the Open Order files have been updated, the user has immediate access to current information such as:

- All orders for a particular item
- All orders for a particular customer
- Details for a particular order
- Blanket order status
- Customer status

The application also handles credit memo printing and the posting of back orders to the open order files. Support for up to 20 companies is provided as well as the generation of worksheets for general ledger input, commission accounting, and taxing body reporting.

DATA COLLECTION SYSTEM SUPPORT (5727-M4A)

The Data Collection System Support application provides an interface between a 5230 Data Collection System and the Payroll, Inventory Management, and Production Control and Costing applications. Inventory and labor transactions can be entered at conveniently located terminals, so information can be entered as it occurs, thereby eliminating many manual steps before this data can be processed on the System/36. Therefore, it provides a link between shop floor reporting and the MAPICS applications, and an integrated labor-reporting, payroll, and production control system.

The Data Collection System Support Application allows customers to define unique shop floor actions which are suited to their requirements. The output from this definition phase is used by the 5231 Contoller. Programs are provided so that data from the shop floor can be transmitted to the System/36, or the diskette can be carried to the System/36. Elapsed time is then calculated (based on user options regarding shift start/stop times, lunch breaks, and other paid/unpaid breaks) and prepared for payroll processing as attendance records or job records. The application will also apportion an employee's time who works on overlapping jobs.

The application produces attendance, absentee, and labor reports, which provide a complete audit trail. Labor transactions may also be entered on the 5251 Display Station, as well as 5230 stations, to utilize

PROGRAM PRODUCTS

System/36 MAPICS (cont'd)

the elapsed time calculations for payroll processing prior to installing a 5230 system.

MATERIAL REQUIREMENTS PLANNING (5727-M4B)

The Material Requirements Planning application is divided into three parts: Master Production Scheduling Planning (MPSP), Material Requirements Planning (MRP), and Order Release Planning (ORP). This application interfaces with and requires installation of Inventory Management and Product Data Management. It also interfaces with Order Entry and Invoicing to the extent that it can compare a master production schedule against customer orders. Firm planned and planned orders can be passed to Capacity Requirements Planning. MPSP determines the production schedule for master-level items (designated by a code in the item master record). Master-level requirements can be compared to forecast and/or customer orders to evaluate the manufacturing plan. Typically, planning requirements for master-level items is an interactive process. This process is simplified by various reports and workstation inquiries. The Material Requirements Planning reports include requirements planning, purchase planning, order recommendation, and cash analysis reports. A shortage report can be generated in the order release cycle if the user chooses to do an availability check. In addition, order release/review and requirements by item inquiries are supported.

Material Requirements Planning will take the approved output of MPSP and generate a total material plan to meet this schedule. This new plan can either be rebuilt (generation) or it can consist of differences from a previous plan (net change). Order recommendations produced from MRP become input to order release. The planner can review changes and approve orders scheduled for release.

System/36 MAPICS Material Requirements Planning requires the use of both the MAPICS Inventory Management (5727-M45) and MAPICS Product Data Management (5727-M46) applications.

CAPACITY REQUIREMENTS PLANNING (5727-M4G)

The Capacity Requirements Planning Application is designed to analyze a company's production plan in terms of its plant capacity. This is a very useful tool for a company that wishes to identify those work centers and time periods when overload or underload conditions may be expected to develop. The application allows the production manager to meet the short term overload or underload condition by entering a temporary increase or decrease in work center capacity for a specified time period in the future.

Medium term analysis using the capacity planning run can help a company distinguish between scheduling problems and capacity problems that require changes to the base capacity of a work center.

The production plan used by the application is based on capacity requirements from several sources: Open orders, firm planned orders, planned orders, and under some restrictions, customer orders. Accurate start dates and operation durations are imperative for each manufacturing operation whether these operations come from Production Control and Costing or from Product Data Management's standard routings.

When the production plan and plant capacity have both been defined, capacity planning is ready to schedule and accumulate the workload by user-defined time period. This process will produce analysis files for workstation inquiry or report printing, and may be repeated to help users tune their plant capacity to the current production plan.

Capacity Requirements Planning is a dependent application. It requires orders (customer, open, firm planned and/or planned) and specifications (routing and/or open operations). The minimum support for Capacity Requirements Planning is:

Inventory Management (5727-M45) and Product Data Management (5727-M46)

or

Inventory Management (5727-M45) and Production Control and Costing (5727-M41).

CROSS-APPLICATION SYSTEM SUPPORT (5727-M4X)

Cross-Application System Support provides the following functions used by all other applications in MAPICS:

- Copy all master files and optionally the data entry files to diskette.
- Compress files and all remaining disk space.
- Reorganize the records within the master files by removing deleted records and repositioning records to improve performance.
- Reformat data entry files.
- Print file sizing and record count information for each file.
- Display the current modification level of each installed application and the PTF level of each module in an application.
- Verify what pointers from one record to another are correct within files and between files.

- Apply programming temporary fixes.
- Indicate the current status of applications on the system.
- Print a listing of all jobs run since the last master file save.
- Copy all master files from save diskettes back to fixed disks.
- Install, tailor or re-tailor an application.
- Maintain security passwords.
- Activate and reactivate application interfaces requested during system tailoring.
- Reset the file record count history.
- Load master files from records created on diskette.
- Display the status of internal system control file data, data entry files, jobs scheduled on the job queue, and system tailoring questionnaire responses.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance and guidance. The responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer. Implementation of the security procedures provided in this program product is the customer's responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

These products are designed to operate with a minimum configuration of an IBM System/36 with:

- 128K bytes of main storage.
- 30 megabytes of disk storage.
- 2D Diskette.
- One IBM printer, either line or serial, with 132 print positions.
- One IBM Display Station with 1920-character display and 83-key Keyboard.

SOFTWARE REQUIREMENTS

The IBM Manufacturing Accounting Production Information Control System (MAPICS) programs are written in IBM System/36 RPG II programming language and are designed to execute under control of:

- IBM System/36 System Support Program (5727-SS1).

The following MAPICS program product is required to execute the remaining MAPICS applications:

- IBM System/36 Cross-Application System Support (5727-M4X).

If modifications are made to the application programs, the following product must also be available:

- IBM System/36 RPG II Compiler (5727-RG1)
- IBM System/36 Utilities (5727-UT1).

Although there is nothing inherent in the design of the IBM System/36 MAPICS applications which prevents the use of the minimum system configurations above, the system configuration for a particular customer must be able to accommodate the expected business volumes, data bases and operating requirements.

The amount of disk storage required is influenced by:

- Number of applications installed.
- Volume of daily transactions.
- Number of records in the required master files.

Additionally, a main storage capacity greater than the stated minimum required will often provide improved performance. For example, performance is affected by:

- Number of applications operating concurrently.
- Number of workstations operating concurrently within the same or different applications.

PURPOSE

The System/36 Construction Management and Accounting System (CMAS) provides an integrated and comprehensive workstation-oriented accounting and financial control system for the small-to-medium size construction firm and related project-oriented business. The Payroll and Labor Costing, Accounts Payable, Job Costing, Revenue Accounting, and General Ledger applications are designed to meet the needs of the construction industry.

HIGHLIGHTS

- Incorporates the results of successful experience with CMAS, CMAS/34, and feedback from the field.
- Uses an improved installation and tailoring procedure which reduces the decisions and actions required of the user, and makes the entire install/tailor process easier.
- Provides easy online access to system control information to assist in problem determination.
- Complete documentation facilitates faster installation - spooling, inquiry, multiprogramming - are integral parts of the System/36 CMAS application design.
- The System/36 hardware and system software functions - spooling, inquiry, multiprogramming - are integral parts of the System/36 CMAS/ application design.
- Workstation data entry is designed for simplicity and ease-of-use. Screen displays provide guidance for mandatory input and for fields that may be overridden. Messages signal errors which can be corrected interactively by the operator.
- Interactive data entry allows concurrent edit and correction for multiple applications and multiple workstations while batch programs operate in the background.
- Offline input of transactions from diskettes prepared on a 3740 Data Entry System is supported except for the Revenue Accounting application and the Committed Cost/Cost History feature. Diskette support does not include file loading and maintenance transactions to any master files.
- Special inquiries are provided for the job cost, labor cost, open payable, subcontract status, contract status, and open receivables files.
- System tailoring procedures permit the user to select optional functions and reports and to determine the sizes of all files used by the applications. Functions and file sizing may be modified as the customer environment changes by re-executing the tailoring procedures.
- All applications require Cross-Application System Support.
- All object programs and procedures are resident with the exception of system tailoring programs, security file change programs, and file sizing programs.
- Source code is available at no additional charge. Ready-to-execute procedures, and object code are provided. Although no additional systems design, programming, or compiling is required, the application design incorporates features to assist the user in the modification of source code. These features include user interface branches in procedures, reserved user space in master file records, and detailed program documentation.
- Provides the file maintenance of all master files with audit reports.
- Procedure documentation reflects restart/no-restart capability of each of the main line procedures.
- Password security helps deter unauthorized use of workstations, applications, and functions within applications.
- Sample input forms are provided for data entry.
- Control features and sample control documents are included to assist in establishing audit trails.
- Multiple company support for up to 99 companies.

DESCRIPTION

System/36 CMAS is a set of five interrelated, ready-to-execute applications for small-to-medium size contractors. Four of the applications (Payroll and Labor Costing, Accounts Payable, Job Costing, and General Ledger) are independent and can be marketed in any combination and installed in any sequence.

Revenue Accounting is a dependent application. The Job Costing application must be installed prior to installing Revenue Accounting.

Cross-Application System Support is required to execute the System/36 CMAS application.

Each application has certain required records within a cross-application control file which contain questionnaire responses. These records allow the users to select report formats, file sizes and functions to suit their needs. The questionnaire responses are entered during initial installation and may be changed as needed. The System Tailoring Procedures in Cross-Application System Support allow these responses to be entered or modified. It provides the following:

- All functions are included in the application programs but only required functions are actually executed.
- Allows the user to activate and deactivate provided functions as the user's business changes.
- Tailors the Operator Control Language (OCL) on-site at installation time.
- File sizes may be expanded or contracted as needed through the system tailoring procedure.

The *System/36 CMAS Installation Made Easy Workbook* provides instructions for planning the installation of one or more System/36 CMAS applications.

Reference manuals provide an explanation of the system to enable the user to understand the applications from a functional and operational standpoint. Manuals are provided at two levels. A System Reference Manual for System/36 CMAS operations gives guidance to the installation supervisor on managing and running the applications from a total systems viewpoint. One management operations manual is provided for System/36 CMAS operations covering all applications.

Individual reference manuals for each application instruct the workstation manager on how to conduct day-to-day operations of the application.

Similarly, one system runbook is provided for the systems console operator and individual application runbooks for the workstation operators. The console operations runbook contains detailed step-by-step instructions for operating System/36 CMAS at the console. Included is an overview of the system and application flow, system considerations and hints on troubleshooting. All of the error messages that can be generated by any of the applications in the offering are included in a messages manual.

The individual application runbooks provide a summary of the application and workstation operations, application and screen flow, and a detailed description of how to run each procedure in the application.

The *System/36 CMAS System Logic Manual* is provided as licensed material for use by the self-sufficient customer, and for the systems engineer in maintaining and modifying System/36 CMAS. Information on system architecture, naming conventions, system controls, system program functions, and specifications, relationship among system files, and other information applicable to all applications is presented in this system manual.

In addition, logic manuals for maintaining and modifying each application are available. Information relevant only to the subject application, such as program descriptions, cross-reference lists, and data dictionary, is presented.

Instructional support is provided to facilitate installation and operation. Self-study instructional material is provided for the systems console operator and for the application workstation operator to train them in the use of the runbooks. Only one copy of each manual is needed per customer no matter how many applications are to be installed.

JOB COSTING (5727-M66)

Costing journal entries with cost distribution may be entered with distribution by company, job, pay item, cost code, and cost type. Job Costing passes transactions to the General Ledger, if installed. General Ledger is then updated on a monthly basis. Job Costing is automatically updated by the Accounts Payable and Revenue Accounting applications if installed. Payroll and Revenue Accounting reports, when used with the Job Cost reports, provide a total perspective of job status.

Job Cost management reports are provided with unit costs, budget comparison, and projected profit or loss based on field reporting of percent complete or quantity 'put-in-place'. Income reporting with distribution provides the basis for cash flow reports by company and by job. If the Committed Cost/Cost History feature (#6021) of the Accounts Payable application (5727-M68) is installed, Job Cost Management reports are available which optionally can include committed cost. Also, a cost history report is available which optionally can include all detail cost and income records for a project. You can select which projects to accumulate cost history when you establish a record in the Job Name file. Special inquiry into the job cost and labor

System/36 CMAS (cont'd)

cost files (if available) provides immediate access to job cost information.

Special emphasis is given to providing a complete audit of transactions affecting the job costing file and general ledger. A job cost detail transaction register (optional) highlights items posted to the general ledger by cost distribution for the accounting month close.

Jobs indicated as Time-and-Material jobs (jobs without estimates) will be processed without cost projections. Without this feature, these jobs would always project cost coverage equal to actual costs incurred, which is inaccurate. Change orders and revised estimates can be accounted for via an optional change order file which is processed against the original estimates. Up to 99 change orders per cost distribution record may be maintained. The costing reports will show change order detail or optionally net the change orders against the original estimate and print a revised estimate summary line per cost item.

A standard master job costing file enables users to store frequently used cost items which can be duplicated into the job cost file when those cost items are used on a new job. This is especially useful to a home builder for storing the cost descriptions and estimates for a standard house plan and copying that plan to the costing file without having to retype all the details.

GENERAL LEDGER (5727-M67)

The General Ledger application is the terminal point of all accounting entries; it interfaces with Payroll and Labor Costing, Revenue Accounting, and Accounts Payable, and accepts journal entries from Job Costing. Though it can be installed apart from the other applications, a large number of ledger entries result from the distribution of expenses incurred through Accounts Payable and Payroll and Labor Costing. Therefore, a majority of General Ledger users will likely install Accounts Payable and/or Payroll and Labor Costing.

Each transaction entered is assigned a journal number and a unique line number within that journal. This journal reference number is kept with the transaction until it is posted to the master record during period-end closing. Transactions coming from other interfacing applications also use this reference numbering scheme. This makes auditability easier throughout the application. Thorough editing of all data at entry time plus the fact that a double-entry bookkeeping system is used, ensures that all credit entries are offset by an equal value of debit entries and provides for smooth month-end closing. The application gives the user support for up to 99 companies and supports a 12-month fiscal year. The general ledger listing displays (by account number) transaction original journal reference numbers, providing a clear and easily used audit trail of all transactions.

The balance sheet and income statement can be formatted to the user's particular requirements by use of a format file which permits special spacing, user-specified columnar printing, user-specified totaling, and up to 118 accounts to be totaled and printed with one line of description. By exploiting the capabilities of the format file, the user can produce combined statements for multiple companies. The balance sheet and income statement can be comparative to last year and to budget figures.

ACCOUNTS PAYABLE (5727-M68)

The Accounts Payable application keeps accurate and detailed records of vendor invoices and credit memos from the time they are entered into the system until they are paid and the check reconciled. Although Accounts Payable can be installed on a stand-alone basis, it is frequently used with the General Ledger application to which it can distribute the dollar amounts spent against the proper account numbers. There also exists an interface to Job Costing by which Accounts Payable can pass subcontract or material purchase costs to specific jobs. In addition, equipment repair parts or services processed through Accounts Payable can be distributed to the equipment cost file in the Payroll and Labor Costing application, if installed. Job expenses, disbursements, and subcontract retention are passed to Revenue Accounting, if installed.

Transaction auditing is aided by a journal referencing scheme which causes every transaction affecting General Ledger to refer to a particular journal and line number within that journal. A double-entry bookkeeping method keeps transactions in balance.

Procedures for handling manual checks (partial as well as fully prepaid), petty cash, and check reversals are provided. Selection of invoices for payment includes partial payments, selection by date, and selection by vendor and invoice. Credit memos can be automatically generated, allowing the user to reverse a previously entered open invoice without having to retype all the invoice's indicative information and distribution.

Support is provided for up to 99 companies. Key reports include an aged open payables report, vendor analysis report, plus normal accounts payable audit trails such as purchase journal, cash requirements report, and cash disbursements journal. When checks are printed, options are available for reconciliation and to print remittance advice 'overflow' data on a separate remittance advice form.

Subcontractor accounting is a subsystem within the Accounts Payable application. It provides for automatic movement and accountability of

retainage and taxes. Subcontracts can be maintained on either a balance forward or open item basis. Subcontract status reports by job and by vendor specify the contract amounts, change orders and/or revisions, billed amounts to date (by date, if open item), payment amount to date (by date, if open item), retention and taxes. Controls help insure that the subcontract status file remains in balance with the job costing file if the Job Costing application is installed.

Committed Cost/Cost History Feature (#6007)

The optional Committed Cost/Cost History feature to Accounts Payable adds the capability to enter and track purchase order activity and pass the information to the Accounts Payable data entry function when the invoice is received. It provides the ability to analyze future cash requirements for committed purchase orders. Inquiries can be made into the Open Purchase Order file to check the status of any purchase order or purchase order line item. Reports can be run in Purchase Order, Vendor, or Job sequence. Committed costs can be optionally included on applicable job costing reports if the Job Costing application (5727-M66) is installed. This feature does not support diskette data entry.

PAYROLL AND LABOR COSTING (5727-M69)

The Payroll application starts with the basic employee time record as input and handles the calculation of wages, taxes, direct burden, deductions, checkwriting, and file updating for both salaried and hourly pay plans. Employee time data may be entered from a workstation or can be entered via diskettes on a 3740 Data Entry System. Payroll can interface with the System/36 CMAS General Ledger, Job Costing, and Revenue Accounting applications. Transactions may be passed on to General Ledger during printing of the payroll distribution journal. Job-related data for both hourly and salaried employees can be passed to the Job Costing application. Labor costs are used by the Revenue Accounting application.

Current payroll data is entered from time cards or job reports either daily or weekly, and is edited to validate employee and job information.

In addition to calculating present federal income and FICA taxes, a standard tax algorithm is provided to calculate most present state income taxes based upon customer-provided data. Local income taxes may also fit the standard tax algorithm provided.

The state disability insurance deductions also use a standard algorithm based upon customer-provided data. Wages subject to Federal Unemployment Tax Act (FUTA) and State Unemployment Tax Act (SUTA) are also determined.

Deduction programs compute voluntary deductions for a specific pay period as well as one-time and union deductions. Included at customer option are employer-paid union fringes, workmen's compensation, Federal Unemployment Tax Act (FUTA), and State Unemployment Tax Act (SUTA). Employer-paid direct burden (FICA, FUTA, SUTA, workmen's compensation, and union benefits) is calculated automatically and optionally costed to jobs based on several methods which are tailored at install. The calculated burden may be distributed to a standard cost code selected by the contractor or distributed to each individual labor cost record. The appropriate accounts in the General Ledger are also updated if the General Ledger application is installed. Any additional burden required for local codes can be calculated by a user-written program and interfaced to the system via procedure interface and an 'other burden' field in the current hours record.

Support for up to 99 companies, a manual payoff check procedure, and the ability to handle an employee working in multiple states, localities, unions, jobs, at different rates on the same day are provided to give the user wide flexibility. Labor distribution of payroll hours and dollars is done in the same detail as the basic employee time record; that is, job number, pay item, cost code, cost type, and job class by company.

Reports furnished include payroll register, deduction reports, monthly union reports, certified payroll register, checks, 941-A reports, and W-2 reports.

Several other reports are printed:

- Year-to-date and quarter-to-date earnings register
- Check reconciliation register
- State and local tax register
- Workmen's compensation earnings worksheet
- Workmen's compensation premium worksheet
- Workmen's compensation and insurance report
- Union calculation register
- Union stamp report
- Two paycheck formats are provided - one format provides options to print employee address and the amount of the check printed in words. It also provides a free-form check stub which shows deduction detail and hours worked at each rate of pay.

REVENUE ACCOUNTING (5727-M6A)

PROGRAM PRODUCTS

System/36 CMAS (cont'd)

The Revenue Accounting application performs normal accounts receivable functions such as entry of invoice and cash receipts information, posting to open receivables and the Temporary General Ledger Work File (TEMGEN), printing statements and delinquency notices, printing management reports, calculating late charges, and allowing discounts for prompt payment. Job Costing (5727-M66) is a prerequisite application.

In addition, Revenue Accounting has added functions specifically addressing the requirements of the construction industry. These functions are:

- Entry of detail line items for job invoices so that Job Costing income records are updated.
- Defining eight invoice types (Job, Retention, Work Order, Equipment, Employee, Material, Standard, and Cash), each one with associated General Ledger account numbers, to reduce coding requirements for source documents.
- Cash can be applied by customer, job, or invoice, so manual coding of cash receipts is minimized.
- The ability to process statements 'as of' a certain date so that priority work can proceed without interruption; for example, payroll processing.
- The ability to request Open Receivables Analysis reports by customer, job, or non-job to aid in managing receivables.
- Capturing retention information in invoice processing to aid in managing retention accounts receivable.
- Printing of a Retention Due listing to aid in tracking and billing of retention.
- A Progress Billing subsystem that includes interactive review and change as an aid to determining billable amounts for completed work.
- Conforming to System/36 CMAS conventions with one exception - diskette data entry is not supported.
- Interfacing with Job Costing, Accounts Payable, Payroll and Labor Costing, and General Ledger, if these applications are installed.

A significant feature of this application is Progress Billing. Progress Billing assists the contractor in preparing monthly invoices. It accumulates costs from the Job Cost file and calculates the preliminary billable amount based on job progress. The contractor can adjust the billable amounts at the workstation before printing a final report. The format of the final report is similar to that of the American Institute of Architecture's (AIA) billing form.

CROSS-APPLICATION SYSTEM SUPPORT (5727-M6X)

The Cross-Application System Support program product is required to execute the System/36 CMAS application.

Cross-Application System Support provides the following functions used by all applications in System/36 CMAS:

- Copy all master files and optionally the data entry files to diskette.
- Compress files and all remaining disk space.
- Reorganize the records within the master files by removing deleted records and repositioning records to improve performance.
- Reformat data entry files.
- Print file sizing and record count information for each file.
- Display the current modification level of each installed application and the PTF level of each module in an application.
- Verify that pointers from one record to another are correct within files and between files.
- Apply programming temporary fixes.
- Indicate the current status of applications on the system.
- Print a listing of all jobs run since the last master file save.
- Copy all master files from save diskettes back to fixed disk.
- Install, tailor or re-tailor an application.
- Maintain security passwords.
- Activate and deactivate application interfaces requested during system tailoring.
- Reset the file record count history.
- Display the status of internal system control file data, data entry file, jobs scheduled on the job queue, and system tailoring questionnaire responses.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance and guidance. However, the responsibility for providing accurate ordering information, personnel

selection and training, installation, and continued day-to-day operation lies solely with the customer. Implementation of the security procedures provided in this program product is the customer's responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

These products are designed to operate with a minimum configuration of an IBM System/36 CMAS with:

- 128K bytes of main storage.
- 30 megabytes of disk storage.
- 2D Diskette.
- One IBM Printer, either line or serial, with 132 print positions.
- One IBM 1,920-character Display Station.

SOFTWARE REQUIREMENTS

IBM System/36 CMAS program product was written in System/36 CMAS RPG II programming language and was designed to execute under control of:

- IBM System/36 System Support Program (5727-SS1)
- IBM System/36 Workstation Utility (5727-UT1)
- IBM System/36 Cross-Application System Support (5727-M6X).

If modifications are made to the application programs, the following products must also be available:

- IBM System/36 RPG II Compiler (5727-RG1).
- IBM System/36 Utilities (5727-UT1).

Although there is nothing inherent in the design of the System/36 CMAS applications which prevents the use of the minimum system configuration stated above, the system configuration for a particular customer must be able to accommodate the expected business volumes, data base size, and operating requirements.

The amount of disk storage required is influenced by the:

- Number of workstations attached
- Library sizes (number of applications installed - all programs resident)
- Number of records in the required master files
- Volume of daily transactions
- System tailoring options taken

Installation of System/36 CMAS applications concurrently may require more disk capacity than the minimum disk configuration of 30 megabytes.

PROGRAM PRODUCTS

5727-OS1 - SYSTEM/36 OFFICE MANAGEMENT SYSTEM

PURPOSE

The System/36 Office Management System (OMS/36) is a set of related office functions which can be used by principals and secretaries to improve their productivity. OMS/36 complements the text handling functions provided by the System/36 Text Management System.

HIGHLIGHTS

- File and find documents (Text Management System licensed program required).
- Process documents (Text Management System licensed program required).
- Local document distribution.
- Open mail.
- Check outgoing mail.
- Maintain name, address and telephone directory.
- A calendar function to create, maintain and print calendars.
- File offline correspondence.
- Maintain user profiles.
- Menu linkage to Text Management System and Advanced Printer Function.
- Label printing.

DESCRIPTION

OMS/36 functions are easy to use and are menu driven. They contain extensive help text for users and are designed to be used without the need for special training or hard-copy reference manuals. It runs under the System Support Program (SSP) of the System/36, and requires the Text Management System to be installed. Both system and text printers will be supported for output.

OMS/36 provides menu access to the Text Management System and other related functions such as Advanced Printer Function and problem solving in BASIC.

The major functions provided are:

- File and find documents.
- Local document distribution.

Document Distribution provides local document distribution services to users of the System/36. A user at any workstation can prepare documents using the Text Management System and distribute them to other office users on the same system. The distribution facilities provide mail services with a private online in-basket and out-basket for each user. Documents may be sent to another user even if the recipient is not currently using the system.

Related services provided by Document Distribution include:

- Stored distribution lists (multiple recipients of a document).
- Message handling (for short, immediate communications).
- Hard-copy printout of documents sent to nonusers of office services (electronic mail basket does not exist).
- Tracking of outgoing mail until delivery.

- Open mail.

All incoming documents are placed in the user's online in-basket file. The Open Mail function allows a user to review the contents of his in-basket. An item may be viewed, filed, printed, kept or deleted.

- Check outgoing mail.

Office Services maintains a record of documents sent to other users that have not been acknowledged. This function provides the user with a list of documents mailed to OMS/36 users on a single scrollable screen.

- Maintain directory.

The directory function allows a user to develop a name, address, and telephone directory that may be used for inquiry, document distribution, labels and telephone directories.

- Calendar Function.

The Office Management System (OMS/36) calendar function allows the user to create, maintain, view and print calendars. Various levels of access can be selected.

The user can:

- Schedule appointments on calendars. Add, update, delete, copy, add notes to and reschedule appointments.

- View your calendar and other calendars by day or by week. The user can also view the free time (unscheduled time) on a calendar for a specified date.

- Print calendars for specified days or weeks.

- Select access levels for each calendar. Assign access (no access, read access, or update access) for all users (public access), or for a specific user.

- Select how times will be entered, shown, and printed in either AM/PM or in 24-hour (international) time.

- Select whether a message is given when someone tries to schedule an appointment in a time slot that is already occupied or that is outside the normal scheduling period.

- Filing of offline correspondence.

Document information can be entered and used later to locate a filed document.

- Maintain user profiles.

The user profile allows the user to customize or tailor his operating environment. Entries may be changed at any time. Default values are taken from the user's profile by both the Text Management System and Office Management System functions.

- Menu linkage is also provided to System/36 BASIC. If System/36 BASIC is installed, the user will have a BASIC session started in which BASIC programming can be done.

- Menu linkage to Advanced Printer Function. This provides menu access to APF/36 from the OMS/36 menus.

CUSTOMER RESPONSIBILITIES (not applicable)

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum hardware requirements are:

- IBM System/36, any model.
- One IBM Printer (3262, 5219 mdl D01 or D02, 5224, 5225 or 5256). If an IBM 3262 Printer is used, a print belt with upper and lower characters should be considered.
- One IBM 5251 mdl 11, 5291 or 5292 Display Station.
- The IBM System/36 Office Management System requires a minimum of 2,500 blocks of disk space.

SOFTWARE REQUIREMENTS

IBM System/36 System Support Program (5727-SS1), Release 1 or later, and the Text Management System licensed program. The licensed program requires 64K bytes of user memory to execute.

SECURITY/INTEGRITY

Same as the System/36 System Support Program (5727-SS1).

PROGRAM PRODUCTS

**SYSTEM/36 RPG II
5727-RG1**

PURPOSE

The System/36 RPG II Compiler is a licensed program that operates under control of the System/36 System Support Program (5727-SS1). It provides the following capabilities:

- RPG II Language Compiler.
- Auto-Report.
- Support for System/36 devices including WORKSTN (workstation) device and Interactive Communications feature SSP-ICF.
- RPG II support for Binary Synchronous Communications (BSC).

HIGHLIGHTS

- Full procedural files that combine sequential and random disk access methods into one file definition statement. This can simplify programs by eliminating the need to have two file statements that access the same physical file in order to process randomly, sequentially, and add records.
- Exception output by name enables output statements to be given a name instead of an indicator, and allows that name to appear in Factor 2 of an EXCPT operation. This simplifies programming and debugging by eliminating the use of a unique set of indicators with EXCPT to control the output statements.
- When the performance of accessing and large index file can be improved, a storage index will automatically be allocated. Coding of the index in the program is eliminated.
- Up to 255 display formats can be accessed from a program.
- Alternative index paths are supported for indexed files. The paths are dynamically maintained. Program coding for an alternate index path is the same as for the indexed file. Alternate index paths must be created by BLDINDEX.
- Multiple Requesting Terminal (MRT) programs can continue processing when a permanent I/O error is caused by turning the power off at a display station or by the failure of a communications line to a remote display station.
- Program versions can be tracked with the modification reference number and date/time stamp in the source member directory entry, the compile listings and the subroutine/load member directory entry.
- Online programming is supported by the diagnosed source member output option of the compiler. Diagnostic messages and summary information are inserted into appropriate places of the source member. The member can then be viewed/changed by SEU (Source Entry Utility).
- Online programming also provides an automatic cycle that enables you to enter a program, compile it, review/correct errors (using SEU) and recompile the program without leaving the display or using a printer. The inserted diagnostics are ignored during the next compile or can be removed by SEU.
- Many compile options such as print/noprint source, program size, debug/nodebug can be overridden from the online prompts.
- The RPG II device names are DISK, PRINTER, CRT, CONSOLE, SPECIAL, KEYBOARD, BSCA and WORKSTN.
- Support is provided for SSP-ICF using the WORKSTN file support.
- The external indicators (U1-U8) may be tested and turned on and off in the RPG II program. The status of these indicators may then be tested by OCL. The indicators can also be set on or off using OCL.
- The user program may access a Local Data Area of up to 512 bytes which provides program-to-program or program-to-OCL data interchange.
- Data structures can be defined for the Local Data Area or used to redefine other fields without allocating additional storage.
- A program using a WORKSTN file can support multiple workstations or communication sessions with specified unique data fields and indicators saved and restored automatically for the currently active workstation or communication sessions.
- The TIME operation can be used to obtain time-of-day and date from the system.
- Field end position may be omitted and the compiler will calculate the end position within an output record.
- The user can control spacing and skipping of the compiler listing.
- A subroutine to retrieve message text from a message member is provided.
- RPG uses the System Overlay Linkage Editor (OLE). The flexibility of user-determined overlays may improve performance.

- The compiler defaults to the current user library to improve programmer productivity.

DESCRIPTION

The System/36 RPG II Compiler is a licensed program that operates under control of the System/36 System Support Program (5727-SS1). It provides the following capabilities:

- RPG II language compiler.
- Auto-report.
- Support for System/36 devices including WORKSTN (workstation) device and Interactive Communications feature SSP-ICF.
- RPG II support for Binary Synchronous Communications (BSC).

SYSTEM/36 DEVICE SUPPORT

System/36 RPG II supports all the devices available on the System/36 except the diskette drive and 8809 tape (8809 Tape hardware will not be available until May 1984. Disk files can be shared by more than one program. The following expanded device support is provided:

- **WORKSTN File Support** - System/36 RPG II supports one or more display stations or SSP-ICF communication sessions as a primary or demand file. The WORKSTN device support allows the programmer to treat the display station or communication session as a sequential combined file using the normal RPG II logic. Multiple display stations and/or multiple communications sessions may be attached to the WORKSTN file. The programmer need only be concerned with the single user (display station or communications session) logic. Data fields and indicators that are unique to each user are so indicated by the programmer and RPG II saves and restores those fields and indicators automatically.
- **Display formats for use with the WORKSTN file** must be created using the Screen Design Aid (SDA) which is part of the Utilities licensed program. The system facility for compiling existing source code for screen formats, SSP Screen Format Generator Routine (SFGR), can also be used.
- **CONSOLE File Support** - Through the use of normally coded file description and input specifications, the CONSOLE file is supported in a buffered interactive mode. The operator is prompted record-by-record with display formats generated by the compiler. Keying of one record is buffered and overlapped with processing of the previous record. The program is coded to process records as from any other sequential input device.
- **KEYBOARD and CRT File Support** - The display formats used for these files will use 6 lines of 40 characters each or 24 lines of 79 characters each depending on the maximum record length specified in the program for the file. The KEYBOARD support includes support of 24 command function keys.
- **PRINTER File Support** - Multiple printer files may be specified in a single program. The System/36 OCL is used to assign an RPG II printer file to the natively attached printer or a workstation printer at run time.

AUTO-REPORT

Auto-Report is included with the System/36 RPG II compiler and includes the following features:

Copy - Specifications may be cataloged in a library and included in any RPG II program via the COPY statement. A copy statement is especially useful for cataloging the file description and input specifications for which overrides may be coded to specify such things as control levels. By using the COPY statement, only one description of the file need be cataloged and maintained for all programs using the file.

Page Headings - Page headings can easily be specified on output specifications without the need for output indicators or end positions. The heading is centered over the report complete with page numbers and date.

Simplified Report Specifications - A report can be produced by listing on output specifications the fields in the order desired. On one output specification, the field, column heading, and an indication for column totals can be entered. The column headings, fields, and column totals are automatically generated.

BINARY SYNCHRONOUS COMMUNICATIONS (BSC)

The telecommunications specification is supported in System/36 RPG II. Support of binary synchronous communications will be provided by System/36 to communicate with:

- Another System/36 with RPG II, Assembler or SSP-ICF BSCSEL subsystem
- System/34 with RPG II, Assembler or SSP-ICF BSCSEL subsystem
- System/32 with RPG II or Assembler

PROGRAM PRODUCTS

System/36 RPG II (cont'd)

- System/3 with (MLMP) CCP, or RPG II
- System/7 with MSP/7
- System/38 (CPF)
- System/360 with BTAM*
- System/370 with any of the following:
 - BTAM*
 - VTAM/NCP
 - CICS/VS*
 - IMS/VS*
- 3741 mdl 2 or 4
- 3747
- 5231 mdl 2 (supported as 3741 mdl 2 or 4 in transmit mode only)
- 5280 distributed data system
- Series/1 (supported as a System/3)
- 5110 or 5120 (as a 3741)
- 6640 Document Writer
- Office Systems/6 Information Processor
- 6240 Magnetic Card Typewriter - Communicating
- 6670 Information Distributor
- 6580 Displaywriter System
- POWER/VS (as a 2780 or 3780)

* Note: The 3704/3705 Emulation Program (EP) or the Partitioned Emulation Program (PEP) extension to 3704/3705 NCP can be used to emulate the 2701.

The BSC host support for System/36 is generated on the host system as System/3 BSC.

System/34 RPG II Considerations: If any System/34 assembler subroutines are called via EXIT or SPECIAL files, those assembler subroutines must be reviewed and modified as required to execute correctly on System/36.

CUSTOMER RESPONSIBILITIES (not applicable)**SPECIFIED OPERATING ENVIRONMENT**

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/36 RPG II licensed program runs on all models of IBM System/36 and supports the communications adapters (#2500 and #4500) in BSC mode.

SOFTWARE REQUIREMENTS

The current release of the IBM System/36 RPG II licensed program operates under control of the current release of the IBM System/36 System Support licensed program (5727-SS1).

COMPATIBILITY

The System/36 RPG II source programs are source compatible with System/34 RPG II. System/34 RPG II programs and screen formats must be recompiled to execute on the System/36.

CONVERSION

No conversion of source programs from System/34 is required.

PROGRAM PRODUCTS

**SYSTEM/36 SYSTEM SUPPORT PROGRAM (SSP)
5727-SS1**

PURPOSE

The System/36 System Support Program (SSP) provides control programming functions for the System/36. These functions support user application programs and IBM licensed programs and provide a number of independent general system integrity and ease-of-use facilities.

System/36 SSP is layered to enhance productivity for all of its users. HELP menus and text, prompted procedures, and Operations Control Language are all available. Procedure Control Expressions allow building additional user procedures with full job stream control using substitution, branching, and some arithmetic functions.

HIGHLIGHTS

The System/36 SSP and SSP features provide the following control program capabilities:

- System Guided Operation.
- Over 2,000 Screens of Online HELP Text.
- User Application Help Support.
- Simple Configuration.
- Alternate Index Support on Disk.
- System/34 Source Code Compatibility.
- Multiple Program Mode.
- Input Job Queue
- Main Storage Management
- Operation Control Language (OCL) and Procedure Control Expressions.
- Sort/Merge Facility.
- System Utilities.
- Data Management for Disk and Diskette, plus Local and Remote Displays and Printers.
- Inquiry (Interrupt) Function.
- User/Resource Security.
- System History Facility.
- Spooling.
- Overlay Linkage Editor.
- Online Programming Support.
- Elastic Workload Management.
- Auto Response for System and User Messages.
- System Measurement Facility.
- Support for Diagnostic Operations.
- Support for Batch BSC.
- Remote Workstation Protocol.

Special Features (optional):

- Support for Communications Products.
 - BSC, SNA/SDLC, and X.21 (#6001)
 - Interactive Communications Feature SSP-ICF (#6002)
 - Multiple Session Remote Job Entry (MSRJE) (#6004)
 - 3270 Device Emulation (#6003)
 - Data Encryption Standard (DES) Subroutine for Banking (#6005)
 - Distributed Disk File Facility (#6006)
- Extended SSP Feature (#6000).
 - Diskette I-Format Support
 - Multinational Character Set.
 - Tape Save/Restore and Data Interchange Support (available 2Q84)
 - 1255 Magnetic Character Reader Support (available 2Q84).

DESCRIPTION

System Guided Operation: The System/36 SSP is built to generally work without the need of publications. After signing on to the system, the operator can see the MAIN HELP menu. Options are chosen based on what the user wants to do. Each menu screen leads to another screen with additional options or to the execution of some command or procedure. There are about 140 Help menus supplied, but the path taken for any specific task uses only a few. Each operator can use a

command key to set any one of these as a sign-on help menu depending on individual experience level.

In addition, the Help menus can be bypassed by displaying a user-defined menu for specific applications. Also, each operator can use a command key to set the default sign-on application menu. The user need only define the menu and the job associated with each menu option. When the operator selects an option from the menu, the system displays it and runs the procedure or command associated with the selected option.

Over 2,000 Screens of Help Text: Help text is available to make the execution of system commands and procedures easy for the users, whether they are programmers or operators. This additional support can be removed from disk if/when it is not needed. When available, it gives an explanation of all the Help available on the system, describes the function of each selected procedure, and tells what command keys are active. Thus, the system can be operated without keying any commands.

User Application Help Support: Help text support similar to that used by system functions is available for programming use. Each menu and its option can be easily described using the Screen Design Aid (SDA) utility. No other programming is required.

Application help text, describing areas on the screen, can also be defined on screen formats using SDA. Different help text screens can be displayed based on cursor location at the time the help key is pressed. Using this facility, operator instructions can easily be added to existing applications by simply changing screen formats used by the application.

Simple Configuration: Configuration of the system involves an interactive process of responding to displayed prompts to tailor hardware and software definitions. Configuration is typically performed immediately following initial installation of the SSP on the system, but may be repeated later to change specified options or values. The system is tailored to the user's definitions by updating the master configuration record and doing an Initial Program Load (IPL) of the system. Careful and complete planning will ease system configuration.

Meaningful configuration defaults are provided for several system variables and system files based on the size of the system (main storage and disk capacity). Local workstations can be automatically configured. Workstation IDs and default values for display station and printer characteristics are assigned for the user.

Each menu and prompt is supported by an extensive set of defaults and automatic functions as well as Help text.

Alternate Index Support on Disk: This facility makes it possible to save disk storage and improve performance with applications that require multiple access paths to the same data. Alternate index files can be built for indexed files as necessary. Each alternate index file contains keys and pointers. An alternate index file can also contain duplicate keys. These files are used like any other indexed file and are maintained automatically by the SSP disk data management for all applications.

System/34 Source Code Compatibility: Any assembler or high-level language source program or procedure can be saved on diskette at a System/34 and restored to the System/36. RPG, COBOL or FORTRAN programs are simply recompiled to take advantage of System/36 object generation improvements in storage use or run-time performance. Some changes necessary in Assembler macros and procedure statements to take advantage of the System/36 architecture are documented in a Conversion manual, *Converting from IBM System/34 to IBM System/36*.

Multiple Program Mode: The SSP is designed to allow the System/36 to operate in the multiple program (multiprogramming) mode. Operators at multiple command-capable display stations may concurrently start control commands, OCL, and procedures. Multiple jobs and programs can execute concurrently.

Input Job Queue: The SSP also provides a job queue facility. This queue contains a list of jobs that are to be processed in sequence concurrently with other batch or operator-interactive jobs. The jobs in the queue can be placed there by an operator at any command-capable display station or by a procedure. The display station that places the job on the queue is released from that job and, therefore, becomes available for other work. Job queue priorities can be specified to control a job's position in the job queue.

Main Storage Management: The System/36 manages main storage as a pool of separate (noncontiguous) 2,048-byte segments and 'swaps' programs to and from disk as required to fit an active program into main storage (a program that is inactive might, for example, be waiting for data input or a message response from a display station).

System/36 main storage management allows the total main storage required by all active tasks to exceed actual user main storage, allowing the system to support a very elastic workload. Performance considerations will dictate to what extent user main storage may be overcommitted.

PROGRAM PRODUCTS

System/36 SSP (cont'd)

The System/36 SSP occupies a minimum of 36K bytes of main storage. This value may be automatically increased in 2K-byte increments to include printer spool support, increase number of active tasks, or optimize system performance. This resident nucleus area contains SSP functions such as data management for disk, printer and display stations; buffers for workstation I/O and printer spooling; and an SSP work area used for task control. When remote workstations are active, an additional area of main storage is dynamically reserved for line buffers and SDLC data management.

Operation Control Language (OCL) and Procedure Control Expressions: OCL is the user interface to run jobs and programs. It allows specification of job control information which is easy to use and keyword driven.

Procedures consist of one or more OCL statements. They allow up to 255 levels of nesting, up to 64 variable-length parameters, and control of the inquiry options allowed if the procedure is interrupted with the ATTN key.

Normally, OCL statements are written in procedure form, stored in a user library, and provided to the application operator as options to be selected from a user menu.

Procedures can be very flexible using Procedure Control Expressions which are provided. Functions include conditional processing of statements, simple arithmetic, character string comparisons, parameter substitutions, branching, message display, and disk/diskette file existence tests. Special OCL statements provide debugging assistance to programmers.

Sort/Merge Facility: This facility includes the same sort/merge functions available with the System/34 Utilities program product, only it is part of the System/36 base SSP. Support includes multiple record type sort with record selection dependent on field contents. Records may be sorted in any sequence. Addrout, tag along, and summary tag along sort are allowed. All data fields, except binary, are supported. Work file space is automatically allocated and multiple input files are allowed. Up to eight files can be merged together, and both equal control field and alternating sequence by field are allowed.

Systems Utilities: System/36 SSP also provides enhanced function to create, copy, save, restore, and rename files; build display formats, build menus and other common functions.

Enhancements to the library support include new directory fields to contain date/time of creation and subtype, easier to use library listings along with new information (such as number of diskettes needed to make a copy), and library extension when required to complete a job.

The SSP provides data management support for the disk, diskette, display stations and printers. The display and printer workstation data management supports multiple direct and remote units of the workstation devices which can be attached. The display station data management manages all input and output to the display stations including the retrieval of display formats from a disk library, and merging program data prior to displaying the format on the display, and displaying associated application help text based on cursor position.

Disk data files on System/36 may be accessed concurrently by multiple programs for input, update, or add operations. Protection of data against concurrent update by two programs is provided by locking disk records until released by the accessing program. An OCL parameter is provided to allow various levels of file sharing for any file. Also, files are optionally allocated by the system to the disk drive currently being used least.

Disk files can be designated as extendable at file creation. In addition, immediate access is provided for all records that are added by a user program, regardless of file organization.

The System/36 SSP includes utility programs to support the diskette unit and the diskette magazine drive as a save/restore and data interchange device. The diskette 1 in 128- or 512-byte sector formats are supported. In addition, the diskette 2D (2-sided double-density) is supported in 256- or 1,024-byte sector formats.

The diskette magazine support allows input/output operations to begin on any one of 23 specified diskettes and overflow automatically to the next diskette in the magazine, to the next magazine, or from individual slot to the next.

Inquiry (Interrupt) Function: The operator may interrupt a processing program, start another job, such as inquiry into a file, and return to the processing program. Processing of the interrupted program will resume when the operator indicates the completion of interrupting activity. An OCL option will suppress this capability to prevent operators from accidentally changing their job environment.

User/Resource Security: Each operator who signs on at a System/36 display station is prompted for a user identification and, optionally, a password. This data is then checked by the SSP before allowing the operator any further access to the system. For each user, there is a profile that can contain a default sign-on HELP menu and a default user menu. This user profile contains additional information, like a password, when security is active.

Also files and program libraries can be restricted to authorized users. These users can be further restricted by type of use. An SSP option allows the creation of audit entries in the system history file for each use of a secured file or library.

Security permits the additional check of operator badge identification at sign-on if the display station has an attached 5250 Magnetic Stripe Reader.

System History Facility: System/36 provides a history area on disk which optionally contains all recently executed OCL statements and all messages issued to the logging device. The messages and data may be retrieved and redisplayed on the display station, printed, or copied to a disk file. The system history facility gives an operator flexibility in selecting the segment of the history area to display, print or copy. For example, an individual display operator is able to select entries created at a single workstation. If the history area is displayed, the operator also has the capability of scrolling backward and forward through the history entries.

Entries are time stamped and include the job identification generated by the SSP to assist in determining the sequence of activity on the system. A configuration option allows the user to automatically save the system history area in a disk file when the system history area becomes full. This option can be overridden at IPL time.

Print Spooling: Print spooling is supported by the SSP for all printers, whether local or remote. When spooling is active, printer output requests are intercepted and stored on disk. Spool writers are used to retrieve the print records from disk for printing. A print queue is maintained of job names whose printer data is yet to be printed, or specified as 'retained after printing'. System console commands are provided to start/stop, restart (at a page number), cancel, hold/release, change priority of and display jobs in the print queue. Print spooling is supported for any and all printers attached to the system simultaneously. In addition, multiple logical print files from a single program may be directed to one printer or separate printers.

A specified display station can be configured to be the controlling display station for a spooled workstation printer. The spool control commands and spool-issued messages are available to the display station operator to control the output directed to the printers associated with that display station.

The size of the primary spool disk file is specified when the SSP is configured. Defaults vary depending on the disk storage ordered. The spool intercept routine will allocate up to five additional extents if necessary. These specific extents will be the same size as the primary spool file and will be freed up by the spool writer as they become empty.

Spooled data may also be copied to a data file, viewed or printed or transferred to another System/36.

Overlay Linkage Editor: The Overlay Linkage Editor facility combines object modules, produced by RPG II, COBOL or FORTRAN and the Assembler program, to create an executable load module. Overlay structures may be created automatically or as designated by the user.

Online Programming Support: System/36 provides a procedure which allows automatic chaining from the Source Entry Utility to a compiler and optionally back to the Source Entry Utility for corrections, if necessary. This programming aid allows routing the compiler output to a display.

Elastic Workload Management: On System/36, assign/free space can access 2K of storage anywhere in main storage. The allocation algorithm looks for space on a quick-fit basis. The allocation of this space has been designed to provide the most efficient usage.

A user's Local Data Area (LDA) is placed in the system assign/free space during initiation of a job step. Each LDA includes 512 bytes for passing information from one job step to another. The system will never change any of the user's LDA during a job.

Auto Response for System and User Messages: The System/36 Auto Response Facility allows users to specify response options to be taken automatically when system messages are displayed. Normally, processing stops until the operator responds to a message with an option value. Auto response allows a user to select a message to which the system will respond with a user-defined option value and then continue processing.

Auto response values are supplied for selected messages and these values may be changed by the user. In addition, responses to other messages can be added to the auto response list.

The use of this facility is particularly valuable when a system must run without an operator in attendance.

A NOHALT facility allows the user to easily manage what severity levels to activate for auto response depending on the types of jobs running.

System Measurement Facility: System/36 includes System Measurement Facility (SMF) routines which, in conjunction with control storage routines, maybe started to monitor system activity, system device, and SSP work area utilization, and record this data in a disk file. A report

PROGRAM PRODUCTS

System/36 SSP (cont'd)

program is provided so that the file may be listed to provide information useful in analysis of system performance with the current application workload or in anticipation of added application workload.

Remote Operations and Support Facility: It is possible to designate a local or remote display station as a system service device. When this is done via a command from an authorized operator, the designated display station can be signed-on and used to run most of the console diagnostic-type programs.

Support for Batch BSC: The SSP provides Binary Synchronous Communications (BSC) data management for System/36 RPG II and Assembler and Macro Processor programs. A system utility is also provided to select certain communications characteristics as program processing time such as: Line type, terminal address, line speed, and error retry count. The Assembler licensed program includes BSC macro support.

Remote Workstation Protocol: The System/36 may be configured to support models of display stations (5251 mdls 11 and 12, 5291 mdl 1, 5292 mdl 1) and printers (5219 mdl D01 and D02, 5224 mdls 1 and 2, 5225 mdls 1, 2, 3 and 4, 5256 mdls 1, 2 and 3) attached to the System/36, and communicate with 5251 mdl 12. Remote workstations may be used to perform most of the same functions as the directly-attached stations.

Application programs and IBM program products which support directly-attached models of 5251 mdl 11, 5291 mdl 1, 5292 mdl 1, 5224 mdls 1 and 2, 5225 mdls 1, 2, 3 and 4, 5219 mdls D01 and D02, and 5256 mdls 1, 2 and 3 devices will also support the remotely-attached devices without change. However, the system console function may not be assigned to a remote display station.

Special Features (Optional): See individual pages for:

- Extended SSP feature (#6000)
- SSP Communications feature (#6001)
- Interactive Communications feature (#6002)
- 3270 Device Emulation feature (#6003)
- Multiple Session Remote Job Entry feature (#6004)
- Data Encryption Standard Subroutine for Banking feature (#6005)
- Distributed File Facility feature (#6006)

CUSTOMER RESPONSIBILITIES (not applicable)

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM System/36 System Support Program runs on all models of System/36 and supports all features.

SOFTWARE REQUIREMENTS

All IBM licensed programs for System/36 are designed to operate in an environment that includes the System/36 System Support licensed program (5727-SS1) or its equivalent. The SSP order should be entered via AAS at the same time as the system order. IBM's ability to provide concurrent hardware maintenance is dependent upon functions provided by the SSP or its equivalent.

COMPATIBILITY

Due to the broad base acceptance of the System/34, a high degree of compatibility has been maintained. The high-level languages need only be recompiled to run on System/36. Also, most procedures written for the System/34 will run unchanged on System/36. Differences in the SSP are documented in *Converting from System/34 to System/36* (SC21-9053). Also see compatibility statements within the individual System/36 System Support Program "Feature" pages.

CONVERSION

Conversion from System/34 is addressed in a conversion manual (SC21-9053) and via a System/34 to System/36 Migration Aid licensed program (5727-MA1). Also see compatibility statements within the individual System/36 System Support Program "Feature" pages.

SECURITY

User and resource security are provided as part of the base SSP. Usage is optional. The customer can limit user access with passwords plus menu and badge reader restrictions. He can also limit read/write access for files and libraries. In addition, the keylock on the service panel can be used to restrict its use. The tools are provided but the selection and application of security controls is the customer's responsibility.

PERFORMANCE CONSIDERATIONS

Performance depends on many features. A major consideration is the number of users. The System/36 was designed to provide satisfactory response time as the number of display stations increases. Priority is given to interactive jobs by default.

Disk data management considerations are very important and include file organization, the use of in-storage indexes, multiple indexes, and file placement. System/36 keeps usage counters to automatically build files on the least-used disk spindle. The System Measurement Facility is designed to help a customer identify potential areas for improving job throughput and response time. There are also many other factors discussed in the *System/36 Concepts and Programmer's Guide* if performance is a critical factor and tailoring for performance is necessary.

SYSTEM INTEGRITY

IBM will accept APARs describing any situation where the installation of the System/36 System Support program product (5727-SS1) causes an exposure to the system integrity of the SSP. System integrity, in this context, is defined to mean control of user authorization to the system or its files and libraries.

RPQs ACCEPTED: Yes

PROGRAM PRODUCTS

**SYSTEM/36 EXTENDED SYSTEM SUPPORT PROGRAM
FEATURE #6000 - 5727-SS1****PURPOSE**

The System/36 Extended System Support feature provides support for:

- Diskette I Format
- Multinational Character Set
- Tape Save/Restore and Data Interchange
- 1255 Magnetic Character Reader Attachment

DESCRIPTION

This feature supports I-Format diskette recording and multinational character sets. Use of the I-Format feature allows reading and writing of information on a System/36 diskette in a blocked and spanned format for better utilization of diskette space. This format allows a common exchange format for the System/34, System/38 and 5280 systems.

The second function of Extended SSP is Multinational Character Set support. This means the ability to display the 188 characters not supported in the specified base SSP 96-character code set. The keyboards do not include the additional characters, but they may be entered with single or multiple key sequences.

Another function of the Extended SSP is subroutines (SUBR08 and SUBR25) to interface to the 1255 Attachment feature. These subroutines allow RPG II, COBOL or the Assembler to read data from documents (checks). They can also return to the program the stacker selection that was made and indicators that tell field validity and document type (available 2Q84).

Also the 8809 Magnetic Tape Attachment hardware feature will be supported by an Extended SSP feature enhancement (available 2Q84).

System/36 will support 1/2-inch magnetic tape in addition to diskette as a save/restore or data interchange device. Tape provides a larger capacity media for backing up applications and data files, in addition to providing a high capacity data interchange media. Programming support is at the system utility level and has the following characteristics:

- Save/Restore
 - Files
 - Libraries (except #LIBRARY)
- Data Interchange Utility Support
 - EBCDIC data format
 - Label support
 - 1) IBM standard labeled tapes
 - 2) Nonstandard labeled tapes
 - 3) Nonlabeled tapes
 - Logical record lengths of 18 to 4,096 bytes
 - Read/write fixed-length blocked records with block length of 18 to 32,767 bytes
 - Read only of variable-length unblocked records
 - Multivolume files
 - Multifile volumes
- Additional Utility Support
 - Catalog files/libraries of a selected tape
 - Initialize tape labels and/or CLEAR a selected tape
 - List contents of a selected tape file

Save/Restore operations may be done in 'streaming' mode at normal 100-inches per second. In this mode, the user is capable of backing up files of up to 43 megabytes of data on a standard 2400-foot reel of tape (equivalent to 36 2D diskettes). The actual performance depends on factors such as system activity, task priority and media condition.

Data Interchange support provides the user with support to interchange data between systems on 1/2-inch magnetic tape with either IBM standard labels or as unlabeled tapes (nonstandard labels are bypassed). Nonstandard label support allows only the reading of a tape's first file. Interchange processing is done in a 'start/stop' mode at normal 12.5 inches per second.

SYSTEM INTEGRITY

IBM will accept APARs describing any situation where the installation of the System/36 System Support Program (5727-SS1) causes an exposure to the system integrity of the SSP. System integrity, in this context, is defined to mean control of user authorization to the system or its files and libraries.

RPQs ACCEPTED: Yes

PROGRAM PRODUCTS

**SYSTEM/36 SYSTEM SUPPORT PROGRAM
COMMUNICATIONS FEATURE #6001 - 5727-SS1****PURPOSE**

The Communications feature supports the autocal adapter and the X.21 line adapter in the MLCA. The logic base for Multiple Session Remote Job Entry (MSRJE), 3270 Device Emulation (3270 DE) and Interactive Communications feature (SSP-ICF) is contained in the Communications feature; this includes CNFIGICF, ENABLE/DISABLE and data management.

HIGHLIGHTS

- Autocall Support.
- X.21 Support.
- Base support for MSRJE, 3270 DE and SSP-ICF.

DESCRIPTION**Autocall**

The support for the System/36 autocall feature of the Multiple Line Communications Adapter (MLCA) allows the user to have the system automatically attempt phone calls on a switched line to another device or system. This support is provided external to the user programs such that no change to user source code is necessary. Phone numbers are referenced through OCL parameters and configuration records.

The following functions are available:

- Ability to call multiple locations from a single batch BSC program by looping through the OCL without operator intervention
- Ability to define lists of phone numbers.
- Ability to specify a wait time between calls and a retry count for incomplete calls.
- Up to 22 characters per phone number (international calls), including separator (SEP) characters for dialing delays and an end of number (EON) character.
- Autocall is supported in MSRJE, batch BSC, 3270 DE (SNA) and SSP-ICF (BSCCL, CICS, CCP, SNUF, SNA Peer).

X.21

This feature provides an interface for attachment to either an X.21 switched or X.21 nonswitched network. Both BSC and SDLC communications are supported. Refer to Facilities L3 to L6 (switched) or N3 to N6 (nonswitched) in the M2700 pages for the networks and data circuit-terminating equipment (DCE) that are supported. The network establishes the data rate and supplies the clock. The System/36 can communicate via the X.21 Adapter with devices that do not have native X.21 Adapters. These devices must be attached to the network via an X.21bis DCE. This method of attachment uses the CCITT V.24/28 interface. Refer to facilities K3 to K5 (switched) and M3 to M5 (nonswitched) in the M2700 pages for the list of devices that can be attached via an X.21bis DCE.

Switched Networks: Communications at 2400, 4800, 9600 and 48,000 bps are supported. Autocall function is provided for switched lines.

Note: X.21 switched requires the MLCA Expansion feature (#4501).

Nonswitched Networks: Transmission may be at speeds of 2400, 4800, 9600 bps for multipoint operations. Some X.21 networks may not support multipoint operations. The installation of these features is dependent on the availability of an X.21 network that is compatible with IBM's implementation of an X.21 as described in the *IBM Implementation of X.21 Interface General Information Manual (GA27-3287)*. The no-charge codes that specify the type of network attachment must be accurately entered with the order. Limitations: Cannot be installed with an integrated modem, CCITT Interface, DDS Adapter, or Analog Wideband Adapter on the same Line Base Adapter. **Note:** The X.21 Adapter cannot be configured to support switched lines on a System/36 that has an Autocall Adapter installed. When an X.21 Adapter is operating at 48,000 bps, the other lines cannot exceed an aggregate rate of 9600 bps. Maximum: One per Line Base Adapter, four total for nonswitched, three total for switched. Field Installation: Yes. Prerequisites: Line Base corresponding to the line using the X.21 Adapter. See *Multiline Communications Adapter Configurator* for possible combinations of features.

Base support for MSRJE, 3270 DE and SSP-ICF

CNFIGICF: The configuration and definition process for MSRJE, 3270 DE, and SSP-ICF is provided. This procedure allows the user to define the specific communications environment for each subsystem and line. This procedure is similar to the one on the System/34; however, it has been simplified and made easier to use by asking fewer questions about an environment and by having help text with each screen.

ENABLE/DISABLE: The ENABLE/DISABLE commands control the starting and stopping of MSRJE, 3270 DE and the subsystems of SSP-ICF.

Data Management: ICFDM, ICFCTL, and a common SNA for MSRJE (SNA), 3270 DE (SNA), and SSP-ICF (SNUF) is provided.

CUSTOMER RESPONSIBILITIES (not applicable)

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment.

HARDWARE REQUIREMENTS

The IBM System/36 Communications feature runs on all models of IBM System/36. Communications to another system or device requires a communications adapter on the System/36, either the Single-Line Communications Adapter (#2500) or the Multiple-Line Communications Adapter (#4500).

SOFTWARE REQUIREMENTS

The IBM System/36 Communications feature will operate under control of the current release of the IBM System/36 System Support Program (5727-SS1).

COMPATIBILITY

The Communications feature provides the base support for MSRJE, 3270 DE, SSP-ICF, autocall and X.21. It can coexist with the remote workstation support and batch BSC.

CONVERSION

Autocall phone lists must be reentered into the system when converting from a System/34. X.21 lists must also be reentered. SSP-ICF configurations must be reentered and are divided into two areas: Line environment and subsystem environment.

PROGRAM PRODUCTS

**SYSTEM/36 SYSTEM SUPPORT PROGRAM
INTERACTIVE COMMUNICATIONS FEATURE (SSP-ICF)
FEATURE #6002 - 5727-SS1**

PURPOSE

System/36 SSP Interactive Communications feature SSP-ICF provides support for:

- Interactive communications between application programs.
- Multiple concurrent communication sessions over the same data link.
- Multiple concurrent user application programs which use communications.
- An application program interface which is substantially independent of the link and logical protocols (BSC and SNA/SDLC).

HIGHLIGHTS

System/36 SSP-ICF consists of:

- A common user interface for application programs.
- Several subsystems.
 - INTRA - allows application program-to-program communications within the same System/36.
- BSC Subsystems.
 - CCP - System/3 mdl 15D CCP
 - CICS - CICS/OS/VSE and CICS/DOS/VSE
 - IMS - IMS/VSE IRSS (BTAM)
 - BSCEL - System/3 Batch BSC, 3740 BSC, Office Systems BSC, System/34 and System/36 BSC.
- SNA Subsystems.
 - SNA Upline Facility (SNUF) - CICS/VSE (LU-0) and IMS/VSE (LU-P).
 - SNA Peer - System/34 and System/36 (LU-6.0).
 - SNA Finance Subsystems - 4701 and 3601, 3694 (LU-0).

Note: The SNA Upline and Finance Subsystems use different LU-0 command sets.

DESCRIPTION

Interactive communications differs conceptually from batch communications in that the sequence of messages is not necessarily predetermined or scheduled. Either party in the communications session can logically start, alter or terminate the conversation. The logical communication path connecting two programs which are exchanging messages is called a session. SSP-ICF allows for multiple concurrent sessions to be used by one or more application programs in the System/36.

The application program access to SSP-ICF is available at two levels. Both are logical extensions of the System/36 workstation interface. The first is through special predefined 'screen format' names that serve as operation codes to control evoking programs, sending data, and issuing special commands to SSP-ICF. The second is through assembler programming and supports all of the functions in the first level plus the added flexibility of supporting situations that may occur when communicating to systems which are not part of the standard SSP-ICF support.

The application program interface allows the user program to be shielded from most of the uniqueness of the communications protocols (BSC or SNA/SDLC) and the communications support for the remote systems (e.g., IMS/VSE, CICS/VSE, or CCP). With proper design, users can develop programs for their current BSC network and then easily move to an SNA network without significant change to the communications interface within existing application programs.

An SRT program started by an EVOKE operation can send or receive on the first operation. This capability applies only to SRT programs; system restrictions for MRT processing require the first operation to be input.

Included with SSP-ICF is support for languages, devices, and communications systems as listed below:

Note: System/36 data link connections are either point-to-point or multipoint tributary only (except for connection to 5250 devices, System/36, System/34 or Finance terminal products using the Finance Subsystem).

- **BSC protocols:**
 - IMS/VSE (Version 1.1.6) via IRSS (BTAM) (System/36 as a System/3).
 - CICS/OS/VSE (Version 1.6.0 and subsequent releases) using BTAM or CICS/DOS/VSE (Version 1.6.0 and subsequent releases) with BTAM-ES (System/36 as a System/3).
 - System/36 with SSP-ICF, RPG II, COBOL, BASIC, or Assembler*
 - System/34 with SSP-ICF, RPG II, COBOL, BASIC or Assembler*

- System/3 mdl 15D CCP
- System/3 mdl 15D RPG II*
- System/38 (as a System/3)
- System/32 (as a System/3)*
- 3741 mdl 2 or 4 (point-to-point only)*
- 3747 (point-to-point only)*
- 5110 (as a 3741)*
- 3780 (as a System/34)*
- 5120 (as a 3741)*
- 5231 mdl 2 (as a 3741)*
- 5260 (as a 3741)*
- 5280 (as a 3741)*
- System/23 Datamaster (as a 3741)*
- 6580 Displaywriter*
- 5520*
- Office Systems/6, 6640, 6670*
- Series/1 (as a System/3)*
- System/7 (as a System/3)*
- S/370 with System/36 (as a System/3)
- OS/VSE, DOS/VSE BTAM*

* These devices are only supported for a single session over a data link.

- **SNA/SDLC**
 - System/36 using SSP-ICF
 - System/34 using SSP-ICF
 - ACF/NCP/VSE (Version 1 Release 3) and ACF/VTAM (Version 2)
 - ACF/VTAME on VSE
 - IMS/VSE (Version 1.1.6) (as a 3790) using ACF/NCP/VSE, ACF/VTAM
 - CICS/OS/VSE (Version 1 Release 6.0 and subsequent releases) (as a 3790) using ACF/NCP/VSE, ACF/VTAM
 - CICS/DOS/VSE (Version 1 Release 6.0 and subsequent releases) (as a 3790) using ACF/VTAME on VSE
 - 4701, 3601, 3694
- **Internal Protocol**
 - System/36 using SSP-ICF (INTRA) for application program-to-program communications within the same system.

CUSTOMER RESPONSIBILITIES (not applicable)

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment.

HARDWARE REQUIREMENTS

The IBM System/36 Interactive Communications feature (SSP-ICF) runs on all models of IBM System/36. SSP-ICF support for communications between programs residing in the same System/36 does not require a communications adapter. Communications to another system or device requires a communications adapter on the System/36, either the Single-Line Communications Adapter (#2500) or the Multiple-Line Communications Adapter (#4500).

SOFTWARE REQUIREMENTS

The IBM System/36 Interactive Communications feature (SSP-ICF) will operate under control of the current release of the IBM System/36 System Support Program (5727-SS1) and the Communications feature (#6001).

COMPATIBILITY

SSP-ICF communication support can coexist with other communication support (that is, programs using remote 5250s, batch BSC or 3270 Device Emulation or Multiple Session Remote Job Entry).

CONVERSION

Programs written for the System/34 using SSP-ICF need to be recompiled. Some of the error return codes have been dropped under some of the subsystems. Review *Converting from the System/34 to the System/36* for details. System/34 configuration members for the subsystems must be re-entered. On the System/34, there is one configuration member per subsystem definition. For System/36, there are two members: 1) a line member describing the link attributes; and 2) a subsystem member defining the subsystem attributes. This allows sharing of common link definitions.

PROGRAM PRODUCTS

**SYSTEM/36 SYSTEM SUPPORT PROGRAM
3270 DEVICE EMULATION FEATURE #6003 - 5727-SS1****PURPOSE**

The 3270 Device Emulation feature is a utility program that supports both BSC and SNA/SDLC 3270 line protocols. No user code is required.

HIGHLIGHTS

- System/36 appears as a 3271 mdl 2 under BSC or as a 3274 mdl 1C under SNA.
- A locally-attached display (5251 mdl 11, 5291, 5292) appears as a 3277 mdl 2 Display.
- Any attached printer (3262, 5219, 5224, 5225, 5256) appears as a 3288 mdl 2 Printer, including spooled remote printers.
- One BSC line and/or up to four SNA lines are supported.

DESCRIPTION

The 3270 Device Emulation feature allows the System/36 to appear to a host system as a 3271 mdl 2 (BSC) or a 3274 mdl 1C (SNA) Control Unit. It also allows the 5251 mdl 11, the 5291, and the 5292 Display Stations, and 5150 PC with 5250 Emulation mode, that are locally attached to a System/36, to appear to a host system as a 3277 mdl 2 Display Station. The Keyboard Numeric Lock (#4690) on 3277 Displays is optionally supported. The 5256, 5219, 5224, 5225 and 3262 Printers attached to a System/36 will appear to the host system as a 3288 mdl 2 printer. Spooled remote printers are also supported.

Only the EBCDIC typewriter keyboards and EBCDIC transmission code are supported. Certain keys are in different locations on the 3277 and the 5251, 5291 and 5292 keyboards. Function keys on the 3277 are mapped onto the 5251, 5291 and 5292 keyboards to provide the same functions. These keys are Field Mark, Erase Input, PA and PF keys. The copy command is not supported. However, the 5251, 5291, 5292 Print Key can provide an equivalent function in many cases. The light-pen and magnetic stripe reader are not supported.

Emulation of the 3270 devices allows the System/36 to reside on a multipoint communications link that supports a 3270. Since this program translates the data stream, host application programs will, generally, require no changes to support the System/36 running under this device emulation. 'Screen wrap' is not supported. If the last position (24,80) on the screen is a field attribute character, it will be repeated in the first position (1,1).

A maximum of 127 input fields per screen is supported. If a 3270 screen has more than 127 input-capable fields, it will be rejected by 3270 Device Emulation. When using BSC, the 5250 character set is translated into the 3277 BSC standard character set. The 3278 SNA standard character set is used when the host link is SNA. 3270 DE, MSRJE, and SSP-ICF (SNUF) can share one communications port on the System/36.

The following host subsystems are supported: IMS/VS (ACF/VTAM), CICS/VS (OS, ACF/VTAM and VSE, ACF/VTAME), TSO (ACF/VTAM), and System/3 mdl 15D CCP. The 3270 Keyboard Numeric Lock feature is supported. This provides the capability of locking out all characters in a numeric field except 0-9, decimal sign, minus sign, plus sign, comma, space and the dup key.

BSC Considerations: For BSC, the 3270 Device Emulation feature emulates the 3271 mdl 2 Control Unit, the 1920-character 3277 mdl 2 Display Station, and the 3288 mdl 2 Printer. The System/36 acts as the 3271 mdl 2 Control Unit; the 5251 mdl 11, 5291 and 5292 Displays serve as the 3277; and the 5256, 3262, 5219, 5224 and 5225 Printers serve as the 3288.

Automatic calling is not supported. Only one point-to-point non-switched or one multipoint line is supported.

The maximum receive buffer size supported is 4,096 bytes. This includes all line control characters. The 3270 Device Emulation feature may generate BSC error status to the host under somewhat different conditions than the 3271. Customer host programs dependent on such specific link level 3270 BSC error status may require modification. The reference manual describes these conditions.

SNA Considerations: For SNA, the 3270 Device Emulation feature emulates the 3274 mdl 1C Control Unit, the 1,920-character 3277 mdl 2 Display Station, and the 3288 mdl 2 Printer. The System/36 acts as the 3274 control unit; the 5251 mdl 11, 5291, 5292 and 5150 PC Displays serve as the 3277; and the 5256, 3262, 5224, 5225 and 5219 Printers serve as the 3288 (or 3287 in SNA Character String (SCS) mode only). Up to 16 devices (logical units) are supported per line. Up to four lines can be used concurrently. Point-to-point, switched or nonswitched, and multipoint (nonswitched) lines are supported.

CUSTOMER RESPONSIBILITIES (not applicable)**SPECIFIED OPERATING ENVIRONMENT**

Support will be provided for this program when it is operated in the following specified operating environment.

HARDWARE REQUIREMENTS

The IBM System/36 Device Emulation feature (3270 DE) runs on all models of the System/36. Communications to another system requires a communications adapter on the System/36, either the Single-Line Adapter (#2500) or the Multiple-Line Communications Adapter (#4500) and Workstation Controller Expansion (#4900).

SOFTWARE REQUIREMENTS

The IBM System/36 Device Emulation feature (3270 DE) will operate under control of the current release of the System/36 System Support Program (5727-SS1) and its Communications feature (#6003).

COMPATIBILITY

The 3270 Device Emulation can coexist in a System/36 with other communications support (that is, programs using remote 5250s, batch BSC, MSRJE or SSP-ICF).

CONVERSION

System/36 3270 Device Emulation is compatible with the System/34 3270 Device Emulation (3270 DE) program product (5726-EM1). The 3270 DE is a utility program which means that the System/36 version should be loaded onto a System/36 and not the System/34 version. System/34 configuration members for the subsystem must be reentered. For the System/34, there is one configuration member per subsystem definition. For System/36, there are two members: 1) a line member describing the link attributes, and 2) a subsystem member defining the subsystem attributes. This allows sharing of common link definitions.

SECURITY (not applicable)**PERFORMANCE CONSIDERATIONS (not applicable)****DOCUMENTATION**
(available from Mechanicsburg)

3270 Device Emulation Guide (SC21-7912) ... 3270 Device Emulation Messages (SC21-7945).

PROGRAM PRODUCTS

**SYSTEM/36 SYSTEM SUPPORT PROGRAM
MULTIPLE SESSION REMOTE JOB ENTRY
FEATURE #6004 - 5727-SS1**

PURPOSE

System/36 Multiple Session Remote Job Entry (MSRJE) provides a common user interface for performing the RJE function to a host system running RES, JES2, JES3, RSCS and POWER/VSE. Multiple readers, writers, punches (disk files), and a console are supported. The maximum number of devices are supported.

HIGHLIGHTS

- Multiple sessions supported:
 - Up to 15 Readers*
 - Up to 15 Printers*
 - Up to 15 Punches*
- For SNA protocols, one line can be shared with 3270 DE and SSP-ICF (SNUF subsystem).
- Consistent and common user interface regardless of the line protocols.
 - * Note: 7 sessions when using BSC protocols, 15 for SNA.

DESCRIPTION

The MSRJE feature provides functional support as a remote job entry workstation. Both BSC (multileaving) and SNA line protocols are supported. RES, JES2, JES3, RSCS (BSC only), and POWER/VSE (SNA only) are the host subsystems supported.

Multiple devices are supported and can run concurrently. The maximum number of devices is (Note: Some host subsystems support fewer devices than the maximum shown):

For Hosts Connected:	SNA	BSC
Readers	15	7
Printers	15	7
Punches	15	7
Console	1	1

In addition, the Reader is supported with an input queue of up to 32 requests. The first 15 (7 BSC) entries will be assigned to a Reader. The remaining entries will be queued until a Reader becomes available. A user may request a reader, submit some work to it, and then ask to be released from the Reader.

Printers and Punches are supported with an extensive and powerful Forms Control Table. All of the System/36 printer functions are supported. Disk files can be built directly from the RJE Punch data stream. All file types are supported. At the conclusion of building a file, a System/36 user procedure may be started.

Both Printer and Punch data streams can be received as compressed data without further processing at time of receipt. Another utility is provided to allow processing of the compressed data streams.

Autocall is supported in both BSC and SNA. MSRJE uses the multileaving BSC protocols and can be defined as either a System/3 or a System/360. In SNA, MSRJE is defined as an 'SNA Terminal' with Multiple Logical Units (MLU).

CUSTOMER RESPONSIBILITIES (not applicable)

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment.

HARDWARE REQUIREMENTS

The IBM System/36 Multiple Session Remote Job Entry (MSRJE) feature runs on all models of IBM System/36. Communications to a host system requires a communications adapter on the System/36, either the Single-Line Communications Adapter (#2500) or the Multiple-Line Communications Adapter (#4500).

SOFTWARE REQUIREMENTS

The IBM System/36 Multiple Session Remote Job Entry (MSRJE) feature will operate under control of the current release of the IBM System/36 System Support Program (5727-SS1) and the Communications feature (#6001).

COMPATIBILITY

MRJE communication support can coexist in a System/36 with other communication support (that is, programs using remote 5250s, batch BSC, or 3270 Device Emulation or SSP-ICF).

CONVERSION

MSRJE is not compatible with either MRJE or SRJE on the System/34 and must be converted by performing the following:

- Use CNFIGICF to define the operating environment.
- Reenter the forms control table (FCT). (The System/34 FCT can be used as a starting point, but not all printer functions were support-

ed. There also was not any definition for building disk files; this is a new function).

- Convert any data files or library members which contain the RJE utility control statement.
- Educate the System/36 end users on the operation of both the System/36 MSRJE and SSP and the Host subsystem.

PROGRAM PRODUCTS

**SYSTEM/36 SYSTEM SUPPORT PROGRAM
DATA ENCRYPTION STANDARD (DES)
SUBROUTINE FOR BANKING FEATURE #6005 - 5727-SS1****PURPOSE**

The DES subroutine can be used to encrypt or decrypt sensitive data or to generate personal identification numbers (PINs). Typically, DES is used to generate PINs for use with the 3624 Consumer Transaction Facility.

HIGHLIGHTS

The DES subroutine can be used in an RPG II, COBOL or Assembler application program. It cannot be used in a BASIC program.

DESCRIPTION

The encryption/decryption subroutine complies with the United States Federal Information Processing Data Encryption Standard (DES) algorithm (National Bureau of Standards FIPS 46). It also complies with the American National Standards Institute Data Encryption Algorithm (ANSI X3.92-1981).

CUSTOMER RESPONSIBILITIES

The DES algorithm is implemented in software. Security of the key that is used by the algorithm is a user responsibility. For more information about data security and cryptography, see the *IBM Data Security Through Cryptography Manual* (GC22-9062).

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment.

HARDWARE REQUIREMENTS

The IBM System/36 Data Encryption Standard (DES) Subroutine for Banking can be used on all models of IBM System/36.

SOFTWARE REQUIREMENTS

The IBM System/36 Data Encryption Standard (DES) Subroutine for Banking requires the current release of the IBM System/36 System Support Program (5727-SS1). Other prerequisites include the following SSP features: Communications feature (#6001) and Interactive Communications feature (#6002).

COMPATIBILITY

This feature is compatible with the DES subroutine that is included in the System/34 Finance Subsystem (5726-SS1, feature #6010/#6011).

CONVERSION (not applicable)**SECURITY/INTEGRITY**

Security of the key that is used by the algorithm is a user responsibility. For more information about key security and cryptography, see the *IBM Data Security Through Cryptography Manual* (GC22-9062).

PERFORMANCE CONSIDERATIONS (not applicable)**DOCUMENTATION**

(available from Mechanicsburg)

The Data Encryption Standard (DES) Subroutine for Banking is covered in the Finance Subsystem chapter of the *IBM Interactive Communications Feature Reference Manual* (SC21-7910).

SYSTEM INTEGRITY: (not applicable)

RPQs ACCEPTED: Yes

PROGRAM PRODUCTS

**SYSTEM/36 SYSTEM SUPPORT PROGRAM
DISTRIBUTED DISK FILE FACILITY (DDFF)
FEATURE #6006 - 5727-SS1**

PURPOSE

DDFF target data manager allows System/34 application programs to access System/36 data files without changing any user code. The user programs use standard data management in RPG II, Assembler and COBOL to access a disk file. Just as the physical location on the disk is not contained in the user programs, neither is the physical system location. Programs running on a System/34 may access data files on that System/34, another System/34, a System/36 or a System/3 mid 15D.

HIGHLIGHTS

- DDFF target data manager.
- Uses SNA peer (PEER) subsystem of SSP-ICF.
- Allows a System/34 running a user program to access System/36 disk data files.

DESCRIPTION

The Distributed Disk File Facility (DDFF) target data manager allows a System/34 RPG II or COBOL program to access a disk file located on a System/36. A System/34 Assembler program can access remote files if the program conforms to standard coding techniques (that is, if no special data management techniques are used).

The DDFF program is designed to be a companion program to another DDFF program running on a System/34 (5799-BCP). The System/36 DDFF target supports all of the System/34 access methods for remote file access except:

- Consecutive Output (CO)
- Direct Output (DO)
- Indexed Sequential/Random Input (ISRI)
- Indexed Output (IO/IOU)
- Dummy Open
- Sector Mode Data Management (ZPAM)

CUSTOMER RESPONSIBILITIES (not applicable)

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment.

HARDWARE REQUIREMENTS

The IBM System/36 Distributed Data File Facility (DDFF) runs on all models of IBM System/36. Communications to another system requires a communications adapter on the System/36, either the Single-Line Communications Adapter (#2500) or the Multiple-Line Communications Adapter (#4500).

SOFTWARE REQUIREMENTS

The IBM System/36 Distributed Disk File Facility (#6006) will operate under control of the current release of the IBM System/36 System Support licensed program (5727-SS1), the Communications feature (#6001), and the Interactive Communications feature (#6002).

COMPATIBILITY

DDFF uses the SNA Peer subsystem of SSP-ICF and does not restrict the use of any of the System/36 communications support.

PROGRAM PRODUCTS

5727-TX1 - SYSTEM/36 TEXT MANAGEMENT SYSTEM

PURPOSE

The System/36 Text Management System (TMS/36) provides the user with a library of programs for document creation, revision, viewing, merging user data files, spelling aids, and printing functions. Data processing and document processing can be performed concurrently using the multiprogramming capabilities of the System/36. These functions are performed through a 1,920-character, multipurpose 5251, 5291 or 5292 Display Station. The same display station can be used for both data processing and document processing.

HIGHLIGHTS

- A high level of ease-of-use characteristics:
 - Menu-driven access to all functions.
 - Help text at all levels
 - Self-guided operation for the novice user
 - Online documentation of all major functions.
 - Online exercises to familiarize the user with the Text Editor functions.
- Document library functions provide the means to:
 - Show index of document names.
 - Show list of document names and subjects.
 - Document processing options:
 - View
 - Delete
 - Revise
 - Create a new document
 - Copy a document
 - Print a document
 - Find a document
 - Merging user data into a document
 - Spelling aids
 - Find documents through various search options.
 - Support individual document libraries for each user or sharing of document libraries.
- Document maintenance functions:
 - Automatically generated defaults for each user provide ready-to-use formats for each document.
 - Specify, recall, and modify document profile information such as:
 - Description
 - Headings
 - Footings
 - Print control
 - Editing options
 - 13 or 20 lines can be keyed or displayed at one time.
 - Add or insert words, lines and paragraphs of text within a document. Text affected is shown in reverse image before completing the function.
 - 'Find' character function to assist in locating the end of the area to move, copy or delete.
 - Include lines of text from another document in the same or a different library.
 - Adjust one or more paragraphs for margin setting, words continued on the next line, and alignment to the right-hand margin.
 - Find words of text and optionally replace with new words. Each word found may be optionally viewed prior to replace.
 - GOTO function to move forward or backward within a document or to a specific line.
 - Format controls (margins and tab settings) can be changed any time and are saved in the document profile.
 - Center text within the current margin settings on one or more lines.
 - Shift columns of information.
 - End options to save and optionally print the document.
 - User-defined symbols to identify lines of changed text in the printed output.
 - 110-character line length with left-to-right windowing.
- Spelling Support:
 - Supports English dictionaries for general, medical and legal uses. The general dictionary contains 130,000 English words and acronyms.

- Addendum dictionary for user-supplied acronyms and words (including non-English).
- Spelling verification. Misspelled words shown in reverse image.
- Spelling assistance will show up to five possible alternate words for each active dictionary.
- Synonym support will show as many synonyms as will fit in the display area.
- Flexible Document Printing Options:
 - Quality print on the 5219 mdl D01 and D02 Print Wheel Printer, providing font selection, cut sheet paper drawer selection, envelope hopper selection, and ribbon-saving option.
 - Single or multiple documents at one time. Multiple copies of each document can also be obtained.
 - Override default printer device.
 - Special spacing and skipping for the 5224/5225 Printers.
 - Standard headings/footings per page.
 - Floating data and page numbers in headings and footings.
 - Page numbering options.
 - Draft of final printing.
 - Cover page option.
 - Print on Office Systems products (6580 Displaywriter, 6670, 6640) when binary synchronous communications are used.
 - Print text with data merged from user files.
 - Print table of contents.
 - Standard or special forms.
 - Large character printing for foils when APF/36 is installed.
- Recoverability:
 - Integral part of the Text Management System design.
 - Recovery option screen is presented to the user if work files are found on disk. User can return to last page worked on.
 - Automatic user library reorganization/expansion if required.
- Data File Support:
 - Interactive data definition and record definition list.
 - Simple interface for:
 - Data entry/update (Data File Utility required)
 - Data list (Data File utility required)
 - Data selection and sort with data merge prior to print.

DESCRIPTION

TMS/36 gives the user a library of programs that provide document creation, revision, viewing, merging user data files, spelling aids, and print functions. Data processing and document processing can be performed concurrently using the multiprogramming capabilities of the System/36. The same display station can alternately be used for data processing and document processing.

With the implementation of System/36 security support, users can control access to documents containing sensitive information on a document library basis.

TMS/36 is designed for ease-of-installation and use. After the library is copied to the system, it is ready for execution. A user who is familiar with the System/36 and the 5251, 5291 and 5292 Display Stations should be able to use the TMS/36 application program without referring to any documentation other than the online information and HELP text.

Online information is provided to aid the inexperienced user or to provide a quick review of a function. Pressing the HELP key within programs will cause information about the current screen to be displayed.

All TMS/36 functions are requested from menus. The application prompts the operator for information only as needed. Where appropriate, defaults to these prompts are indicated for ease-of-use. HELP screens are available through the HELP key.

Documents are kept in a document library for each user. This allows duplicate document names by different users.

Various text functions are available to manipulate the document, through the use of cursor location and pressing command keys.

Printing can be directed to various printers on the system including the letter quality, cut sheet feed, 5219 (mdl D01 or D02) Printer. Through binary synchronous communications, the 6670, 6640 and 6580 Displaywriter products are also supported.

PROGRAM PRODUCTS

TMS/36 (cont'd)

TMS/36 utilizes features available in the System/36 System Support Program. These features include multiple user library support, multiprogramming, local and remote transparency of display stations, print spooling, security, and binary synchronous communications.

CUSTOMER RESPONSIBILITIES

The responsibility for providing accurate ordering information, personnel selection and training, installation and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum hardware requirements are:

- IBM System/36, any model.
- One IBM Printer (3262, 5219 mdl D01 or D02, 5224, 5225 or 5256). For maximum readability, an upper/lower case print belt is recommended if using the 3262 Printer with TMS/36.
- One IBM 5251 mdl 11, 5291, or 5292 Display Station.

The TMS/36 library requires 2,500 blocks of disk space. For each user-id, a minimum document library of 50 blocks will be reserved. The user document library can increase. In addition to permanent disk space, a minimum of 40 blocks of temporary work file space will be used for each user when creating or revising a document. If file expansion is necessary, the work files will automatically be increased.

The option of sending to a letter quality printer (such as the 6670, 6640, or the 6580 Displaywriter) requires the appropriate communications features.

SOFTWARE REQUIREMENTS

The IBM System/36 System Support Program (5727-SS1), Release 1 or later. The largest program requires 60K bytes of user memory to execute. BSC communications support is not required to use the basic functions. DFU is required if the facilities of data file list, update, and creation are used (merging data with documents does not require DFU). The printing of large characters for foils requires that the Advanced Printer Function licensed program be installed.

COMPATIBILITY (not applicable)

CONVERSION

A utility procedure is provided to convert System/34 Text Editor PRPQ documents into a format that can be processed by TMS/36.

SECURITY/INTEGRITY

Same as the System/36 System Support Program (5727-SS1).

PERFORMANCE (not applicable)

DOCUMENTATION

(available from Mechanicsburg)

IBM System/36 Text Management System Licensed Program Specifications (GC21-7978) ... IBM System/36 Text Management System User's Guide (SC21-7979).

SYSTEM INTEGRITY

RPQs ACCEPTED: Yes

PROGRAM PRODUCTS

**SYSTEM/36 UTILITIES
5727-UT1**

PURPOSE

The following utilities are provided with the System/36 Utilities licensed program:

- Data File Utility (DFU)
- Source Entry Utility (SEU)
- Workstation Utility (WSU)
- Screen Design Aid (SDA)

Each display station using DFU, SEU, and SDA has its own copy of the utility (multiple copies can be executing at one time). Only one copy of a specific WSU-created program can be executing at a time; however, one WSU program can service multiple display stations. All display stations supported by System/36 are supported by these utilities. All the utilities are supplemented by help text for improved easy-of-use.

DESCRIPTION

DATA FILE UTILITY (DFU)

The following DFU disk data file functions are provided to handle indexed, sequential or direct files as part of the DFU:

- Data file creation and maintenance
- Data file inquiry
- Data file list

All functions of DFU use stored RPG II file definition and input specifications. DFU defaults to the current user library. To use any of the functions, the user needs to know the name of the file, a name to be assigned to the job description, and the name of the stored RPG II file definition specifications. The functions prompt for all the other information necessary to tailor the job to the user's task. Field names are included with the prompts to aid the user in selecting the data fields to be used.

Data File Creation and Maintenance: (Enter/Update) This function provides the necessary capabilities to create and maintain indexed, sequential, or direct data files on disk. Maximum use is made of the display to prompt the operator by field name for the data to be entered. For update, the data currently in the record is displayed. Highlights include:

- Creation of indexed, sequential, and direct files.
- Support of alternate access paths for indexed files.
- Support for 99 record types.
- Support for 1,024-byte record length.
- No limit on print lines of data.
- Support for up to 200 display formats.
- Auto duplication of fields or portions of fields.
- Formatted report for an audit trail.
- Roll function key support.
- Control totals.
- Generated keys.
- Modulus 10 and 11 self-check digit.
- Record sequencing.

Data File Inquiry: This function provides the necessary capabilities to allow inquiry into any indexed, sequential, or direct file. The records are displayed showing the current information in the file. Highlights include:

- Retrieval by record key for indexed files and relative record number for direct files and sequential files
- The ability to roll randomly through a file or roll forward or backward through the file by key sequence for indexed files, and by relative record number for direct files and sequential files
- Support for alternate access paths for indexed files
- The ability to print selected records with the 'PRINT REC' command key
- All displayed fields include column headings for easy identification

Data File List: This function provides the necessary capability to list and summarize selected information from any indexed, direct or sequential file on disk. The function is useful for obtaining one-time reports and for creating recurring management reports. Highlights include:

- Support of alternate access paths for indexed files.
- Page headings including date and page number
- Column headings

- Edit data fields
- Column totals - both final and subtotals
- Selection based on record codes and/or field values
- Sort, ascending or descending, on up to five fields
- Summary list with totals only
- Retrieve and print data from a related index master file
- Calculate and print additional result fields

SOURCE ENTRY UTILITY (SEU)

SEU can be used to create and maintain OCL procedures, messages, display formats, RPG II, auto-report, WSU, FORTRAN, Assembler, SORT, BASIC and COBOL source statements. Highlights include:

- Default to current user library.
- Display formats are provided for the fixed-format statements (for example, RPG II, WSU) to aid in key entry of fields.
- Prompted SORT specifications.
- Time-stamp and reference number in member.
- Upper and lower case scan and scan/replace capability.
- Subtype support to identify members.
- Free-form display format for any statements to be entered.
- User-defined display formats may be used.
- Support for diagnostic source file.
- Use of display to show member name and library name being entered or updated.
- Scan capability controlled by character mask.
- Global replace option.
- Change member name and library.
- Optional RPG II and auto-report syntax checking.
- Optional resequencing of statements in a member.
- The ability to move and/or copy statements in a member.
- The ability to include statements from any source or procedure library member in any library.
- The ability to delete statements.
- Statement insertion.
- Rolling forward or backward through statements.
- Optional listing of statements.
- Use of display to show statement being entered or updated.

WORKSTATION UTILITY (WSU)

WSU provides an easy-to-use set of specifications for defining interactive data entry programs which support one or more display stations. Specifications describe the following program variables:

- Job (name, number of workstations, region size)
- Optional transaction file (a special direct organization disk file created and managed by WSU to contain key entered records)
- Optional master files (up to 20 disk files accessed or updated by the program)
- Display formats (formats to be displayed on the display stations supported on the System/36, to prompt for data entry, display user-defined help text and/or display error messages)
- Optional execution arrays (up to 75 single dimension arrays or tables can be specified).
- Processing (the arithmetic, logical edit, or I/O operations to be performed in conjunction with the entry of data in response to display format.
- RPG II file description and input specifications are referenced for a description of the transaction and master files.

The WSU specifications are processed by the WSU generator and the SSP screen format generator routine (\$SFGR utility) to produce:

- An object definition module to be executed by WSU when the job is invoked.
- Display formats.
- System/36 OCL procedures to control execution of the job when invoked.

Highlights include:

System/36 Utilities (cont'd)

- RPG II compatible execution time array support.
- NOHALT options on WSU errors for unattended operations.
- Generation produced load members are time stamped and reference numbered.
- Logical combination of display format description and processing specifications.
- Support of alternate access paths for indexed files.
- Management of the transaction file with each workstation's records logically separate.
- Up to 245 user-defined display formats.
- Operator review, correction, deletion and insertion of transactions.
- Independent operator sign-on, sign-off, and resume entry support.
- Subtype support to identify WSU members in a library.
- Recovery of the transaction file after system failure.
- Different WSU-generated programs running concurrently.
- WSU programs running as MRT (Multiple Requester Terminal) programs to optimize performance.
- WSU programs that dynamically adjust to a larger user-specified region size to reduce overlay fetches from disk or to a smaller user-specified region size if memory needs to be constrained.
- Support for display formats using a variable starting line number.
- Masking of command and function keys.
- Capability to access the originating workstation ID for a transaction.
- Options at generation to replace existing programs, control portions of the output listing, and suppress OCL generation.
- Random additions to indexed master files.
- Online debugging via DEBUG operation code.
- WSU transaction file update capability via RPG II SUBR22.
- WSU edit date fields greater than six characters.
- WSU optional 'SR' in subroutines.

SCREEN DESIGN AID (SDA)

SDA provides an interactive easy-to-use method of designing, creating and maintaining display formats and job menus. Increased productivity can result by eliminating the amount of clerical work associated with coding specification sheets, transcribing source code, and correcting transcription or coding errors. Highlights include:

- Member selection display at setup.
- Print format images and source specifications.
- Creation of a new WSU/\$SFGR source specification member.
- Subtype support to identify members.
- Adding new WSU \$SFGR source specifications to an existing member.
- End of job functions.
- Viewing formats in a \$SFGR load member.
- Updating, inserting and deleting individual source specifications using SEU.
- Creating, updating and deleting menus and their associated source members and help text.
- Updating formats in an existing WSU \$SFGR source member regardless of order of 'D' specifications.
- Block move and field change length operations in update mode.
- Deleting formats from a source member.
- Up to 255 display formats in a \$SFGR LOAD member.
- Creation of an RPG II skeleton program to use \$SFGR formats.
- Help specification and comment statement recognition.
- Help function which displays text describing the use of SDA and information being prompted for.
- Generating WSU programs for master file inquiry, maintenance, or transaction file creation.
- Field level syntax checking.
- Time stamping and reference numbering source members and load members.
- Optional source specification sequencing.
- Support for the 5292 mdl 001 color display.

- Recover from interrupted SDA run.
- Compiling a \$SFGR format source member.

CUSTOMER RESPONSIBILITIES (not applicable)**SPECIFIED OPERATING ENVIRONMENT****HARDWARE REQUIREMENTS**

The IBM System/36 Utilities licensed program (5727-UT1) runs on all models of the IBM System/36. DFU, SEU, and WSU require a minimum 18K (18,432) bytes of main storage. SDA requires 24K (24,576) bytes of main storage. DFU and WSU will take advantage of additional main storage if it is available.

SOFTWARE REQUIREMENTS

The current release of the IBM System/36 Utilities licensed program operates under control of the current release of IBM System/36 System Support licensed program (5727-SS1).

COMPATIBILITY

The System/36 Utilities licensed program is a functional superset of the System/34 Utilities program product except SORT. SORT is packaged with the System Support licensed program. Some user interfaces have been changed to improve ease-of-use. The default library has been changed on System/36 from #LIBRARY to the current user library. DFU and WSU source programs are completely upward compatible.

CONVERSION

The Screen Design Aid (SDA) and the Source Entry Utility (SEU) are interactive utilities that require no conversion from System/34 to System/36. The user interfaces have been changed to improve ease-of-use. The default library has been changed for System/36. Source maintained by SDA and SEU on System/34 is compatible with System/36. The Data File Utility (DFU) and the Workstation Utility (WSU) source programs from System/34 must be recompiled to run on System/36. No other changes to source programs are necessary to migrate System/34 DFU and WSU programs to System/36.

SYSTEM/36 BUSINESS MANAGEMENT ACCOUNTING SYSTEM

General Ledger ... 5727-XB2
 Accounts Payable ... 5727-XB3
 Accounts Receivable ... 5727-XB4
 Payroll ... 5727-XB5
 Inventory Accounting ... 5727-XB6
 Billing ... 5727-XB7

PURPOSE

These multi-industry licensed programs are written in System/36 BASIC programming language and are an extension of the Business Management Accounting System programs with accounting functions that are identical to those available for the System/34. The System/36 Business Management Accounting System licensed programs provide the user with powerful tools to perform business accounting while providing additional management information. The programs contain functions applicable to a wide range of industry classifications.

HIGHLIGHTS

- Master Menu displays all applications installed.
- Applications feature either stand-alone or co-resident installation with other IBM System/36 Business Management Accounting System applications.
- Programs and procedures required to run the applications will reside in the application library on disk. Master files, interface files, data entry files and work files will also be disk resident.
- Built-in auditability and control characteristics through the use of familiar 5-column journals, sequential journal numbering and inter-application data integrity.
- Program documentation is designed to promote customer self-sufficiency during installation and operation.
- Ease-of-use is emphasized through:
 - Menu-driven task selection
 - Consistent data entry programs and procedures for all applications
 - Common file maintenance techniques including user-defined field defaults
 - Use of generally accepted accounting terminology
- Installation-time tailoring options allow the user to select key functions and perform file sizing.
- System/36 BRADS file definitions are provided with the applications for selected master files.
- Optional security code by application for each company.
- Multi-company support.
- File sharing capability supporting concurrent operations from any workstation signed on to that company.
- A file load facility is provided for selected large volume master files from multiple workstations.

DESCRIPTION

SYSTEM/36 GENERAL LEDGER (5727-XB2)

The System/36 General Ledger application is a multi-industry application designed to accomplish the basic accounting functions of posting journal entries to the General Ledger, generating financial statements, and producing special journals. The programs are based on double entry accounting principles in accordance with generally accepted accounting practices. Transactions may be directly entered as general journal entries and also received as summary entries from the System/36 Billing, Accounts Receivable, Payroll and Accounts Payable applications, if installed.

Functions and Features

- Calendar-driven 1 to 13 period support
- User-defined fiscal year
- Optionally combined financial statements for multiple companies
- User-defined statement formatting
- Special journal capabilities which allow the user to tailor journal formats
- Previous year history maintained for comparative statements
- Budget and encumbrance support
- Annual ledger capability
- Page width option allowing statements on 8-1/2" x 11" paper
- Future fiscal year posting
- Automatic year-end closing.

SYSTEM/36 ACCOUNTS PAYABLE (5727-XB3)

The System/36 Accounts Payable application is a multi-industry offering designed to assist the user in controlling the outflow of cash and maintaining accurate records of liabilities to trade and other vendors. Payable items are handled on an accrual basis and vendor analysis reporting allows the user to determine key purchase volumes and discounts taken or lost for the current and previous year. Summarized journal information can be passed to the System/36 General Ledger application, if installed.

Functions and Features

- Allows one-time vendor checks
- Cash discount by percent or amount on invoice total or line items
- Supports multiple General Ledger distributions by vendor
- Payment selection by due date and/or by vendor/invoice
- Partial payment support
- User-defined excessive check amount warning
- Debit memos available
- Vendor open-item inquiry
- Manual checks
- User-tailorable 5-column Purchase and Cash Disbursement Journals
- Default General Ledger distribution by vendor
- Default vendor cash discount percent
- Check reversals

SYSTEM/36 ACCOUNTS RECEIVABLE (5727-XB4)

The System/36 Accounts Receivable application is designed to assist the user in managing one of the most important assets of a business-- the money owed by its customers. This multi-industry offering provides timely information to help improve cash flow, and reduce bad debt losses through control of accounts receivable. Invoice transactions can be entered directly into the Accounts Receivable application and also received from the System/36 Billing Application. Cash Receipts and Adjustment transactions are entered through the Accounts Receivable data entry menu option. Accounts Receivable can also pass summarized accounting information to the System/36 General Ledger Application, if installed.

Functions and Features

- Supports entry of non-Accounts Receivable cash such as vending machine receipts
- Open Item or Balance Forward account type selection by customer
- Cash and COD sales support
- Partial and over payment of invoices
- Statement selection by customer
- Supports invoices with future due dates
- Current plus four past due periods
- Optional late charges by customer
- Consolidated statements for multi-branch companies
- Interactive cash entry for open item customers
- User-tailorable 5-column Sales and Cash Receipts and Adjustment Journals
- Full screen file load is provided to support loading a large volume Customer Master file.

SYSTEM/36 PAYROLL (5727-XB5)

The System/36 Payroll application is a multi-industry solution that performs basic payroll computations and produces payroll checks with earnings statements and supporting reports. Both hourly and salaried payroll processing is supported. Individual earnings may be taxed for up to three taxing jurisdictions, and can be transferred to the System/36 General Ledger application, if installed.

Features and Functions

- Weekly, bi-weekly, semi-monthly and monthly pay frequency
- Shift differentials as a percent of employees hourly rate or a fixed dollar amount
- Hourly, exempt and non-exempt salaried employees
- Payroll calculations provided for:

Gross Pay
 Federal Income Tax (FIT)

System/36 Business Management Accounting Sys. (cont'd)

Federal Insurance Contributions Act (FICA)
 State and Local Taxes
 State Disability Insurance (SDI)
 Federal Unemployment Tax Act (FUTA)
 Earned Income Credit (EIC)
 Net Pay

- Taxable and non-taxable adjustments
- Automatic deduction based on:
 - Percent of taxable gross
 - Rate per hour worked
 - Flat dollar amount per pay period
- Resetting deductions (i.e., bonds)
- Automatic benefits (with optional maximums) can be calculated using the same algorithms used for automatic deductions
- Separate checks available for vacation and bonus payments
- Workmen's compensation worksheet
- Detailed earnings and deductions shown on earnings statement

SYSTEM/36 INVENTORY ACCOUNTING (5727-XB6)

The System/36 Inventory Accounting Application offers management reports which help the user to optimize inventory levels. Up-to-date reports reflecting stock movement, on-hand positions, sales and cost information enhance purchasing decisions. The Inventory Accounting application can receive summarized sales information from the System/36 Billing application.

Features and Functions

- Support for up to three warehouses per item
- Broken-case handling
- Pricing conversion
- Both returns and allowances supported
- Maintains both average and last cost for an item
- Both stock movement and financial information maintained
- Suggested reorder quantities based on user supplied:
 - Minimum balance
 - Maximum balance
 - Lead time
 - Pack size
 - Vendor minimum
- Item inquiry including both item master and item balance information
- Inventory analysis based on sales, cost and profit amounts
- Full screen file load is provided to support loading large volume Item Master and Item Balance files.

SYSTEM/36 BILLING (5727-XB7)

The System/36 Billing Application is a multi-industry billing application providing the user with the ability to create invoices for customer orders already picked and shipped. Customer and item names, prices and tax information are automatically retrieved from the Billing Application master files during invoice entry. Summarized data is optionally available to the System/36 Accounts Receivable, General Ledger and Inventory Accounting applications, if installed.

Features and Functions

- Post billing
- Selective printing of invoices
- Five standard prices
- Pricing conversion
- Broken-case pricing
- Flexible terms and invoice discounts
- Federal excise tax
- Special charges and comments
- Credit memo support with returns and allowances
- Billing on non-inventory items
- Cash and COD sales
- Invoices for one-time customers
- Up to three sales taxes per invoice, maximum of 50 taxing bodies
- Optional profit tear strip on invoices
- User-tailorable 5-column Sales Journal

- Data entry overrides of master file data
- Full screen file load is provided to support loading large volume Customer Master and Item Master files.

PROGRAM DOCUMENTATION

The documentation provided for each application is designed to help the user understand, install and operate the application. The materials are consistent in size and format with the System/34 publications and:

- Introduce new application users to automating typical business tasks in a way that invites use, reinforces efforts to learn and use, and builds confidence and willingness to reuse after learning
- Are written in 'friendly', user-oriented language
- Are visually attractive with multi-color printing
- Are small in size to be usable in a space-limited work area
- Are presented in a step-by-step task fashion that guides the user through installation and operation
- Are designed to be helpful when used with telephone support
- Provide tables of contents along with master indexes (one per application) for convenient information location

The following materials are available for each application:

Introducing

This book is intended for all users of the application. The owner/executive, installer, operator, user department, programmer and consultant can use this book as their first source of information about the application. The book is designed to be a general introduction to how the application fits within the user's business.

Learning

This learning package consists of a book, cassettes, and a sample data files diskette. The learning consists of separate exercises which guide the operator through all aspects of daily operations in a step-by-step fashion. The learning package also refers the operator to specific sections of the Running book so that, in addition to application training, the operator becomes familiar with the format of the Running book.

Installing

This book details the steps to follow in installing and tailoring the application, collecting and recording the data, entering it, and scheduling operator training.

Running

This book contains information the operator needs in order to run the application.

Using

This package contains a book and a forms pack. The book is intended primarily for user department personnel who are not System/36 operators. It has the information required by the user to:

- Prepare input for submission to the operator
- Analyze reports
- Submit changes to files
- Aid in using the reports to help manage the business
- Understand alternative uses of the reports

The forms pack contains reproducible camera ready copies of all input forms, preprinted IBM forms, and any control logs peculiar to that application that are required to install and run the application. Instructions for using the forms are printed on the back of each form. The forms in the forms pack are on 8-1/2" x 11" paper. The customer can order additional forms from a printer or IBM's System Supplies Division. Preprinted forms will be documented in actual size for the user to provide to his printer.

Messages

Messages for each application are printed as separate pages which are delivered with each application library.

Application Program Manual

A separate application program manual is available as optional material. It contains record formats, logic flows, and other technical information to be used primarily by the experienced BASIC programmer interested in understanding the detail design of the application.

System/36 BRADS (5727-BR1)

System/36 BRADS licensed program provides the facility for a non-programmer to define files, create and maintain the files, build file inquiries and generate reports from the file data. The System/36 Business Management Accounting System programs will support the capability by providing selected System/36 BRADS file definitions with the applications. Thus, the task of definition, file creation and maintenance is accomplished as part of the application. A user who has System/36 BRADS can build inquiries and develop additional

PROGRAM PRODUCTS

System/36 Business Management Accounting Sys. (cont'd)

reports for the defined files to help meet requirements, unique to the user, not contained in the applications.

CUSTOMER RESPONSIBILITIES

IBM may provide normal marketing assistance and guidance. The responsibility for personnel selection and training, installation and continued day-to-day operation lies solely with the customer. Implementation of the security procedures provided in this program product are the customer's responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

These products are designed to operate with a minimum configuration of an IBM System/36 with:

- 128K bytes of main storage.
- 30 megabytes of disk storage.
- 2D Diskette.
- One IBM Printer, either line or serial with 132 print positions.
- One IBM Display Station with 1,920-character Display and 83-key Keyboard.

SOFTWARE REQUIREMENTS

The System/36 Business Management Accounting System (BMAS) programs are written in IBM System/36 BASIC programming language, and execute under control of:

- System/36 System Support Program (5727-SS1)
- System/36 BASIC (5727-BA1)
- System/36 Utilities (5727-UT1)

PROGRAM PRODUCTS

**SYSTEM/36 WORKSTATION SEARCH FACILITY
5727-XR1****PURPOSE**

The System/36 Workstation Search Facility provides the workstation user with a powerful, yet easy-to-use, tool to display records from disk files based on display station user-selected search criteria. This System/36 product is based on the proven System/34 Workstation Search Facility. The product applies to any industry classification.

HIGHLIGHTS

- Ease-of-operation allows personnel without data processing experience to search and display information from their data files.
- Keyword in Context (KWIC) technique provides the capability to select words and character strings within alphabetic fields.
- An 8-character search argument allows null characters to be inserted in those cases where the exact spelling of the search criteria is unknown.
- Any combination of six logical search operators (equal, less than, etc.) can be used.
- The operator may combine AND/OR logic to define the relationship between the three search argument fields.
- Optional user-defined security passwords prevent unauthorized use of searches.
- Creates up to 13 cross-reference indices based on keywords for each master file. This provides fast searching of high use data fields.
- Displays up to 20 selected records at a time and allows forward and backward paging through selected records.
- Second level display on a selected line provides additional data from the selected master record. This screen displays unformatted data directly from the record.
- Reduces the need for alphabetically sorted master file listings.
- User-oriented tailoring procedure will allow the user to easily define the required searches, generate the required RPG II source programs and required OCL, and invoke the required compiles and execution of the index creation program.
- All standard System/36 data file organizations are supported.

This product offers a full-function, user-oriented aid for searching data files based on operator-entered criteria. This offering is applicable in any industry classification and is usable with all IBM-supported System/36 file organization techniques.

Each industry has unique requirements for searching master files. Additionally, each user will have specific needs over and above common industry needs. The offering supports up to three search arguments which allows the operator to minimize the number of potential matches by entering as much information as is available.

As the requirements of the business change, searches can be recreated to support the new business requirements.

DESCRIPTION

This product (5727-XR1) is designed to process System/36 disk records. It is a cross-industry offering and will execute in conjunction with most licensed programs.

The operator will define through an interactive workstation session the search required, with up to 75 characters of information to be displayed on matching master records. Additionally, information about library and file name will be required. The *Application Installation Guide/Reference Manual/Runbook* will provide the operator with an explanation of the required and optional fields to be entered during the session. Each response will be edited as the information is entered.

The offering can reduce the need for referencing voluminous printed reports by displaying up to 20 records at a time that meet search criteria. If more than 20 records meet the criteria, the screen display can be paged forward or backward to allow a review of all matched records. Also, when the desired record is displayed, the entire contents of the record can be selected, as it appears on disk, to be further displayed.

The product application consists of four RPG II programs: An interactive entry/edit program, a tailoring program, and two skeletal programs which, when copied and modified by the tailoring program, provide user-unique index-build and search programs.

The *Application Installation Guide/Reference Manual/Runbook* provides the user with the information necessary to install the product and execute tailoring of searches. This document provides step-by-step instructions for operating the application. Instructional information regarding the execution of the sample problem is provided. The sample program will include a master file and tailoring instructions so that a user becomes self-educated on the tailoring and search programs and procedures.

The *Application Logic Manual* is provided as licensed documentation. Information on naming conventions, application program functions and specifications and other information pertaining to the application is presented.

CUSTOMER RESPONSIBILITIES

The customer is responsible for error detection and analysis. If assistance in correcting the problem is required, the customer must submit the request to IBM on the Authorized Program Analysis Report (APAR). IBM is responsible for developing and distributing program updates, but the customer has the responsibility to apply the update to the program.

Implementation of the security procedures provided in this program product is the customer's responsibility.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration for this product application is an IBM System/36 with:

- 5360 System Unit, 30 megabytes of disk storage and 128K bytes of main storage.
- One IBM printer (either a line printer or serial printer)
- One IBM Display Station

SOFTWARE REQUIREMENTS

The program is written in IBM System/36 RPG II and executed under control of the IBM System/36 System Support Program (5727-SS1). The IBM System/36 RPG II Compiler (5727-RG1) is also required.

PROGRAM PRODUCTS

**OS ASSEMBLER H
5734 - AS1****DESCRIPTION**

This two-pass assembler provides a significant improvement in performance on any OS MFT or MVT system having a region size of at least 180K or any VS1 or VS2 system with 192K of virtual memory given to the assembler.

Default options, instruction set selection (Standard, Scientific, Commercial or Universal) and modifications to ddnames can be made at the time the assembler is added to an installation's OS system. Assembler H has functional extensions to OS/MFT/MVT Assembler F and the OS/VS System Assembler, supports all features of these two processors and is upward compatible.

Features

- Ability to compile two or more assemblies in one job-step.
- Can specify default and lock-out options at SYSGEN time.
- Ability to suppress all error messages below a specified level of severity.
- Up to nine continuation lines may be used for a statement.
- Previous definition requirements are relaxed for EQU, ORG, CNOP, DC and DS statements.
- Literals are cross-referenced.
- Macro definitions may occur anywhere in the source stream and macros may be redefined at any point.
- Dictionary sizes are not artificially limited and will expand to occupy all space available in a region.
- New system variable symbols &SYSTIME, &SYSDATE and &SYSPARM are available for use. The latter is a read-only SECT variable whose character value is specified in the PARM field of the EXEC JCL card.
- New assembler operations LOCTR, PUSH, POP and AREAD are provided. In addition, the use of OPSYN is much less restricted than in assembler F.
- Support for the new machine instructions announced for the S/370 mdls are included in an extension to Assembler H.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Assembler H uses the Standard Instruction Set. User programs may use any instruction set -- the set to be used is specified at SYSGEN time. Assembler H will operate on any S/360 mdl supported under OS (Release 17 or later, PCP, MFT and MVT) or on S/370 with MFT, MVT, VS1 or VS2 satisfying the following requirements:

Minimum region size for MFT or MVT is 180K.

Minimum virtual storage in VS1 or VS2 is 192K.

In addition to the standard OS requirements, Assembler H requires space in auxiliary storage for the following data sets: System input (selectable through JCL) ... Macro instruction library, either system or private or both ... One intermediate workfile which must be Direct Access (2301, 2303, 2305, 2311, 2314, or 3330/3333) ... Print output (selectable through JCL). Of these data sets, the system input and the single workfile are required. Any, or all, of the remainder may be omitted if the corresponding function is not used; e.g., no punch output data set is needed if the NODECK option is specified.

Note: Distribution of Assembler H is via tape. Therefore, access to at least one 2400/3400 magnetic tape unit is required for installation.

SOFTWARE REQUIREMENTS

A simplified installation procedure for including Assembler H in an OS system is provided. PARM field options, ddnames for required data sets and the Instruction Set (Standard, Scientific, Commercial or Universal) may be specified or the standard default values may be used.

The OS System requirements are: Release 17 (or later) for OS, OS Utilities, Linkage Editor E or F and the Sequential and Partitioned Access Methods are required.

DOCUMENTATION

Specifications (GC26-3743)

PROGRAM PRODUCTS

COBOL INTERACTIVE DEBUG (5734-CB4)

PURPOSE

COBOL Interactive Debug provides COBOL programmers the ability to debug programs conversationally at a terminal using high-level language.

COBOL Interactive Debug operates under TSO or CMS through a comprehensive set of subcommands which enable the programmer to modify, dynamically monitor, and completely control the execution of his COBOL object program.

HIGHLIGHTS

Using COBOL Interactive Debug subcommands, the COBOL programmer can dynamically and symbolically:

- Establish points (*breakpoints*) in the procedure division at which program execution is to be unconditionally suspended and control returned to the user at the terminal.
- Establish *conditional* breakpoints in the procedure division which are effective only when certain conditions are detected by the debug monitor. Such conditions might be, for example, any change in value of a data field, or a change to a specified value.
- Specify that at breakpoints certain actions automatically take place (for example, changing or displaying the value of a data item), after which execution will automatically be resumed, or, control returned to the terminal.
- Remove/list established breakpoints.
- Resume execution at a specified source statement.
- Trace the execution of the COBOL object program by requesting a display of the names/line-numbers of all executed COBOL source procedures.
- Display selected COBOL source statements.
- List the status of COBOL files.
- Manipulate (display/modify/compare) the contents of COBOL data items.
- Obtain a system dump of the region in which the COBOL program is executing.
- Request information about the function, syntax, or operands of the Interactive Debug subcommands (TSO only).

A powerful feature is the WHEN subcommand which allows the user to specify data fields to be continuously monitored for either a change in value or a change to a prespecified value.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

COBOL Interactive Debug operates on all hardware/system configurations supported by TSO (the Time Sharing Option of OS and OS/VS2).

COBOL Interactive Debug requires approximately 46K bytes of main storage. All data set and main storage requirements of the COBOL object module itself must be met, as well as sufficient storage to hold the debug dictionary and tables, and working storage space. As an example, a typical session may require 14K of main storage for table and working storage space. A program with 450 entries in the data division may require 12,000 bytes for the dictionary.

Under TSO of OS and OS/VS2: The Time Shared region must provide approximately 12K bytes of main storage for use by TSO itself. The TSO Monitor Program, Command Scan, and the service routine PUTGET and PUTLINE are assumed to reside in the time sharing link pack area (LPA) and do not figure into the user region requirement. The TSO PARSE service routine requires 20K bytes of main storage and may reside in the LPA. If no LPA resident, it must be figured into the user region requirement. OS Releases 20.1, 20.6, 21.0 and 21.6 must apply PTF US00969 of PARSE and Release 1 of OS/VS2 must apply PTF UY70023.

COBOL Interactive Debug operates on the minimum CMS virtual machine configuration.

Under CMS, the TESTCOB command and its largest subcommand modules require approximately 241K bytes of user storage. An additional 25K bytes of table space is GETMAINed by TESTCOB.

In a 320K virtual machine, approximately 53K bytes will be available for the user program and its associated library modules.

In a 512K virtual machine, approximately 241K bytes will be available for the user program and associated library modules.

SOFTWARE REQUIREMENTS

COBOL Interactive Debug operates as a Command Processor under TSO or CMS. It is designed for use with specially generated object modules as produced by either the OS/VS COBOL Compiler (5740-CB1) or the OS Full American National Standard COBOL Compiler, Version 4 (5734-CB2). Operation under CMS requires VM/370 Release 2 or later for use with OS/VS COBOL; VM/370 Release 1 with

Programming Level Change (PLC) 13 or later for use with OS COBOL Version 4.

When the COBOL Interactive Debug program is to be used, a fifth data set is needed to compile a COBOL source program. This data set is the interactive debug data set, which must be also available at execution time if debugging is to be done. To display source statements during debugging sessions, the compiler output listing must be saved at compile time on a sixth data set.

COMPATIBILITY

No COBOL source changes are required to use the COBOL Interactive Debug. The user merely indicates via a compile time parameter (TEST) that the program may be executed with COBOL Interactive Debug.

A COBOL object program compiled with the interactive debugging option can be executed in a background environment without recompilation. Generated code will require more space.

When executing OS/VS COBOL or Version 4 object code under CMS, there are execution time restrictions in the following areas:

- ISAM, VSAM*
- SORT
- Segmentation
- TCAM
- Various I/O-related restrictions

* The CMS restriction against VSAM in OS/VS COBOL object execution is removed as of VM/370 Release 3. Operation of the OS/VS COBOL under CMS is described in the *IBM OS/VS COBOL Compiler and Library General Information* (GC28-6470).

Detailed information on the operation of Version 4 COBOL under the CMS component of VM/370 can be found in the *IBM VM/370, OS Full American National Standard COBOL Compiler and Library, Version 4, CMS User's Guide* (SC28-6469).

Intermixing of COBOL and Assembler object modules is allowed when using COBOL Interactive Debug.

The COBOL Interactive Debug program product adheres to the syntactic conventions of the TSO Command Language. Commands which are common with TSO TEST have the same meaning.

PERFORMANCE CHARACTERISTICS

Compile Time -- Compile Time performance of the IBM OS Full American National Standard COBOL Compiler, Version 4, which supports the TEST/NOTEST option, will not be affected when NOTEST is specified. When the TEST option is selected, compiler speed degradation will not exceed 5%.

Execution Time -- Execution time CPU requirements depend on the type and frequency of the debugging functions selected by the terminal user. Since monitoring is performed at every statement boundary, there will be a uniform execution time overhead in the absence of debugging subcommands.

A COBOL object program compiled with the Interactive Debug option will execute in a background environment in approximately the same time as if NOTEST were specified at compile time.

DOCUMENTATION (available from Mechanicsburg)

Specifications (GC28-6485) ... *General Information Manual* (GC28-6454).

PROGRAM PRODUCTS

**TSO COBOL PROMPTER
5734-CP1**

PURPOSE

The TSO COBOL Prompter provides TSO COBOL users with the capability of conversationally entering the required job parameters to execute a COBOL compilation.

HIGHLIGHTS

The COBOL Prompter conversationally interacts with the terminal user and prompts for job parameter information which has been omitted or incorrectly entered.

Dynamically allocates required data sets for compilation in the TSO foreground.

Invokes the following COBOL Compilers:

OS Full American National Standard COBOL Version 3 (5734-CB1)

OS Full American National Standard COBOL Version 4 (5734-CB2)

OS/VS COBOL (5740-CB1)

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Operation of the COBOL Prompter under TSO requires the minimum TSO configuration.

DOCUMENTATION: (available from Mechanicsburg)

Time Sharing Option Guide (GC28-6698) ... COBOL Interactive Debug and (TSO) COBOL Prompter General Information (GC28-6454) ... Specifications (GC28-6435).

PROGRAM PRODUCTS

**TSO ASSEMBLER PROMPTER
5734-CP2**

PURPOSE

The TSO Assembler Prompter operates as a command processing program under the control of the Time Sharing Option of the IBM Operating System. The Prompter is a means for the programmer to invoke the System Assembler to process source data sets and to produce object modules. The prompter returns to the programmer any error and informational messages that are generated, allowing the programmer to correct his error at the terminal.

HIGHLIGHTS

The programmer creates, modifies, saves and retrieves his source data set at his terminal, using the TSO command EDIT. He then uses the prompter command ASM to process the data set and obtain his object module. The ASM command invokes the assembler prompter, which in turn invokes the assembler. The prompter makes sure that the programmer has specified appropriate data set names. If he has not, the prompter requests him to do so. Through the ASM command, the programmer can specify the assembler options and request any assembly listing to be printed at the terminal.

PROGRAM PRODUCTS

**CONSUMER GOODS SYSTEM (COGS)
ALLOCATION - OS (5734-D32)
ALLOCATION - DOS (5736-D31)**

PURPOSE

COGS-Allocation provides the consumer goods processor with the ability to determine how much of various finished products to make and ship to stocking locations to satisfy service and inventory objectives while satisfying shipping incentives and restrictions. Simulation of the ordering process is included to allow a preview of the effects of management policy alternatives.

DESCRIPTION

The processor of consumer goods not only produces his wares, but must efficiently distribute these to the marketplace. The trend is to stock merchandise as close as possible to the major markets which results in complicated distribution processes (i.e., remote distribution centers to manage and multiple inventories to control).

This program addresses the distribution and inventory control problems. It also allows the user to tailor an order and allocation system to his needs. The following modules are included:

- **Service Point Order Review:** The decision of when to order a shipment of products for a distribution center or when to order production for replenishment of the distribution network is made. Considerations are present stock status, forecasted future requirements, management service objectives, lead times and other related factors.
- **Service Point Printout:** Produces an online listing substantiating the decisions made in order review. Output can be detailed or an exception (i.e., all items or only those items designated for order). Items failing special service tests, as well as programmed diagnostic messages, are always printed.
- **Production/Order Quantity Calculation:** Employs a technique called variable interval allocation which determines how much of a finished product to ship to each distribution center to satisfy management inventory objectives and meet shipping constraints. Management has three basic allocation policies to choose from:
 1. Item service specified - minimize item inventory.
 2. Item group service specified - minimize item group inventory.
 3. Item group inventory budget specified - maximum item group service.

COGS - Allocation supports both push and pull type distribution systems. In the pull environment, the program determines the proper mix of products ordered for a distribution center to balance inventory according to inventory and service objectives while satisfying shipment size constraints. In the push environment, the program decides how best to distribute batches of lots of manufactured products throughout the distribution network to achieve balance among the centers.

- **Allocation Print:** Prints in detail the results of the production/order quantity calculation mode. Recommended item and item group quantities are shown as are specified minimum and maximum order sizes. Parameters established by users are included in print-out to assist evaluation.
- **Simulation:** Provides the capability to view the ordering process for up to 52 time periods in the future. The output is in the form of a plot by item. This useful feature allows the consumer goods processor to evaluate alternative inventory and service policies before selecting the ones best for his business.
- **Card to File Processor:** Provided to expedite preparation of data for running the sample problem included with program material. It can be used in present form for normal COGS - Allocation data preparation. However, the user will most likely want to prepare his own.

CUSTOMER RESPONSIBILITIES

The program requires specific information about the products and stocking locations it will be servicing. Knowledge of the areas of the company influencing its decisions (i.e., distribution, production, marketing and finance) is also needed.

Consequently, the person responsible for implementing and controlling this program should be familiar with the policies and objectives of the company, as well as the individual functions mentioned and should be aware of existing interrelationships.

Data Requirements

- COGS - Allocation assumes the customer has an inventory record keeping system carrying current inventory information (e.g., on-hand, on-order, back-order, price, lead-time, etc.) by item by stocking location. Item and item group production/order/shipping minimums and maximums are also required.
- The program further requires that a customer has a forecasting method or system capable of supplying item/location forecasted usage with projections of future needs plus a measure of forecast error (MAD).

- The customer must supply his own program to collect the necessary information from the inventory and forecast files and assemble data into the format specified by COGS - Allocation.

Processing Requirements: Control parameters necessary to tailor the program to the customer's needs (e.g., service objectives, review time intervals, allocation policy choice, simulation options, etc.) must be supplied and properly formatted.

Output Considerations: As described earlier, the program prints out an allocation listing showing quantities to order. This same information is supplied on magnetic tape (except when operating in simulation mode) for input to the customer's order/production/shipping document writing program.

Use: The COGS - Allocation program becomes part of a company's distribution control system consisting of inventory record keeping (stock status), forecasting, ordering and updating (file maintenance).

This program controls the ordering process, deciding when and how much to order for the distribution network to satisfy customer service, inventory investment and order size objectives. It also provides management with the means, through simulation, to test the effectiveness of these objectives.

Being only part of a system, it relies upon the user to provide the necessary linkages to and from other parts of the system.

SPECIFIED OPERATING ENVIRONMENT

COGS ALLOCATION - OS

HARDWARE REQUIREMENTS

The OS version of COGS - Allocation requires an IBM S/360 mdl G40 (128K) or larger Processing Unit with decimal and floating-point arithmetic ... a card read punch ... a printer ... four 2311 Disk Storage Drives ... two magnetic tape drives ... a 1052 console printer.

COGS - Allocation requires a 100K region under MVT or a 100K partition under MFT. It can be executed on the minimum machine configuration with a PCP nucleus that does not exceed 28K.

SOFTWARE REQUIREMENTS

All routines in COGS - Allocation are written in PL/I. The OS version of COGS - Allocation will function with PCP, MFT or MVT control programs. These programs are:

- OSPrimary Control Program (PCP) (360S-CI-566)
- Multi-programming with a Fixed Number of Tasks (MFT) (360S-CI-505)
- OSMultiprogramming with a Variable Number of Tasks (MVT) (360S-CI-535)

In addition to one of the control programs listed above, preparation and operation of the OS version of COGS - Allocation require the following programs:

- OS Sequential and Partitioned Access Method (360S-DM-508)
- OS Linkage Editor E (360S-ED-510)
- OS PL/I F (360S-NL-511)
- OS PL/I Subroutine Library (360S-LM-512)
- OS Utilities (360S-UT-506)
- OS Sort/Merge (360S-SM-023)

In addition, this program product runs under OS/VS1 or OS/VS2.1. The program is not supported under OS/VS2.2. The program also operates in a VM/370 environment under control of one of the supported OS or OS/VS systems, excluding OS/VS2.2.

COGS ALLOCATION - DOS

HARDWARE REQUIREMENTS

Minimum S/360 Configuration: S/360 mdl 30F (65K) with Decimal Arithmetic (#3237)** ... Floating Point Arithmetic (#4427) ... 1051 Attachment (#7915) ... 1051 Control Unit mdl N1 ... CPU Attachment (#3130) ... 1442 Card Read Punch mdl N1 ... 1052 Printer Keyboard mdl 8 ... 1443 Printer mdl N1 (with Selective character set #6042 with 63 character set typebar (#9089)) ... 24 Additional Print Positions (#5558) ... 2311 Disk Units mdl 1 (3 required including system residence) ... 2415 Tape Unit mdl 1 (2 required).

** A partition with a minimum of 54K bytes is required for execution of COGS Allocation.

SOFTWARE REQUIREMENTS

COGS - Allocation operates under the control of Disk Operating System/360 or Disk Operating System/VS. In addition, this program product also operates in a VM/370 environment under the control of DOS/360 or DOS/VS. Source code is written in PL/I. DOS features used are:

PROGRAM PRODUCTS

**CONSUMER GOODS SYSTEM - S/360 and S/370
COGS - FORECASTING OS (5734-D33)
COGS - FORECASTING DOS (5736-D32)**

PURPOSE

This program is designed to give the consumer goods processor the ability to select a proper forecasting model for a provided set of data and the facility to monitor the model's forecasting reliability.

DESCRIPTION

The program, when provided with the proper input data, is able to produce short term (one year or less) forecasts, using a technique called adaptive forecasting. A simulator phase of the system enables the user to evaluate the reliability of the forecast model. The system also includes the facilities to perform the following functions: Establish a forecast model for an SKU (Stock Keeping Unit) ... establish a measure of reliability of the forecast of demand for an SKU ... build and maintain necessary system files -- reporting.

HIGHLIGHTS

The ability to fit a forecasting model to historical data for the purpose of projecting future demand.

The ability, through simulation, to evaluate the model fitted to assist in the choice of the best model.

The ability to update the forecast model being used with current demand in such a way to balance stability and responsiveness in the model.

The ability to monitor the adopted model's performance.

The means of screening all information presented for its validity and reasonableness.

The flexibility to adopt the working day calendar to which the data corresponds.

The ability to interface with some existing customer files with only a minor modification.

Use: The user must provide input data in prescribed format which describes the product and its environment to the system. This data when given to the application program will generate all the files required to operate the system with the exception of a sales master file. The sales master file is user created and maintained.

CUSTOMER RESPONSIBILITIES

The program requires a minimum of two years sales history. It is the customer's responsibility to update and maintain a sales master file.

The final decision as to which forecast model is to be used is left to the user. The program furnishes the user with data upon which to base his selection.

SPECIFIED OPERATING ENVIRONMENT

COGS FORECASTING - OS

HARDWARE REQUIREMENTS

The OS version of COGS - Forecasting requires an IBM S/360 mdl G40 (128K) or larger Processing Unit with decimal and floating-point arithmetic ... a card read punch ... a printer ... four 2311 Disk Storage Drives ... two magnetic tape drives ... a 1052 console printer.

COGS - Forecasting requires a 102K region under MVT or a 102K partition under MFT. It can be executed on the minimum machine configuration with a PCP nucleus that does not exceed 26K.

SOFTWARE REQUIREMENTS

All routines in COGS - Forecasting are written in PL/I. COGS - Forecasting will function with PCP, MFT or MVT control programs. These programs are:

- OS Primary Control Program (PCP) (360S-CI-566)
- OS Multiprogramming with a Fixed Number of Tasks (MFT) (360S-CI-505)
- OS Multiprogramming with a Variable Number of Tasks (MVT) (360S-CI-535)

In addition to one of the control programs listed above, preparation and operation of the OS version of COGS - Forecasting require the following programs:

OS Sequential and Partitioned Access Method	360S-DM-508
OS Linkage Editor E	360S-ED-510
OS PL/I F	360S-NL-511
OS PL/I Subroutine Library	360S-LM-512
OS Utilities	360S-UT-506
OS Sort/Merge	360S-SM-023

In addition, this program product runs under OS/VS1 or OS/VS2.1. The program is not supported under OS/VS2.2. The program also

operates in a VM/370 environment under control of one of the supported OS or OS/VS systems, excluding OS/VS2.2.

COGS FORECASTING - DOS

HARDWARE REQUIREMENTS

S/360 mdl 30F (65K) *** with Decimal Arithmetic (#3237) ... Floating Point Arithmetic (#4427) ... 1051 Attachment (#7915) ... 1051 Control Unit mdl N1 ... CPU Attachment (#3130) ... 1442 Card Read Punch mdl N1 ... 1052 Printer-Keyboard mdi 8 ... 1443 Printer mdl N1 (with Selective Character set (#6402) and 63 character set type bar (#9089) ** ... 24 Additional Print Positions (#5558) ** ... 2311 Disk Units (2 required - including system residence) * ... 2415 Tape Unit mdl 1 (2 required).

The main storage required to compile, link-edit and execute the application program under the control of DOS is 63,000 bytes.

- * One disk unit not occupied by the Disk Operating System (DOS) is required for data, programs and working storage for COGS - Forecasting.
- ** Any control unit and printer (132 positions) compatible with DOS may be substituted for these units.
- *** A minimum partition size of 56K bytes is required for execution of DOS - COGS Forecasting.

SOFTWARE REQUIREMENTS

COGS - Forecasting is written in PL/I and it operates under the control of the Disk Operating System/360 or Disk Operating System/VS. In addition, this program product also operates in a VM/370 environment under the control of DOS or DOS/VS. The minimum system must be include:

PROGRAM PRODUCTS

CODE AND GO FORTRAN (5734-FO1)**PURPOSE**

Code and Go FORTRAN, which operates under the Time Sharing Option (TSO) of the IBM Operating System and CMS, as well as in a batch environment, provides programmers with a high-speed processor for compiling, loading and executing programs written in the FORTRAN IV language with extensions for list-directed input/output.

Code and Go FORTRAN opens the area of rapid response time sharing to many programmers who are already familiar with the FORTRAN language. Its simplicity and ease-of-use is particularly suited to the 'problem-solver,' who writes, debugs, and executes relatively short programs at the terminal; and to the 'production programmer', who debugs sections of a large program online before running that program through a standard batch compiler.

As a batch processor Code and Go FORTRAN's compile-load-go mode of operation eliminates much system overhead and is thus ideally suited for processing large numbers of small jobs.

HIGHLIGHTS

- Code and Go FORTRAN is a high-speed facility which operates in the TSO foreground and OS batch environments.
- Code and Go FORTRAN supports the FORTRAN IV Language and the DEBUG facility.
- List-directed input/output facilitates data entry and output by freeing the user from standard FORTRAN data format restrictions. With list-directed I/O in effect, no FORMAT statements are required and data items may be entered in any typing or column position.
- (Use of list-directed input/output requires an installation to have the FORTRAN IV Library Mod II (5734-LM3)).
- FORTRAN keyboard input format (free from source) permits the user, in writing his FORTRAN source program, to ignore all card-column dependencies. (A standard form option is also provided.)
- A SIFT utility is provided for two way conversion between standard and free form source, thus ensuring source format compatibility with the other OS FORTRAN Compilers. Under CMS the SIFT utility provides for a one-way conversion from free form source to standard FORTRAN source.
- Object programs are compiled directly into main storage.
- All subprograms in the OS FORTRAN IV Library are available to Code and Go programs, as are user-written programs previously compiled into object code by a batch compiler.
- Diagnostic messages are displayed at the user's terminal when the processor is operating in the TSO foreground or CMS environment.
- Through the TSO EDIT command the FORTRAN Syntax Checker may be used to check source programs on a statement-by-statement basis prior to compilation.
- Prompting the TSO user for correct specification of compilation parameters is a built-in feature of the compiler.
- The processor can be invoked under CMS with the CMS command GOFORT.
- A source listing option is provided for batch users.
- Batch users can cause object modules to be saved for later link editing and execution.
- Batch users can optionally suppress execution of the compiled program.

COMPATIBILITY

All valid source programs compilable on FORTRAN IV (G1) (5734-FO2), or on FORTRAN E, G and H compilers, compile on Code and Go FORTRAN with the standard form option in effect.

A SIFT utility which may be run in a batch mode or be invoked by the TSO CONVERT Command converts the format of FORTRAN source programs from free form to standard form or vice versa. The SIFT utility is available for users who create a Code and Go FORTRAN source program using free form source and later wish to compile it on another FORTRAN IV compiler. In this case, the user should recognize that not all FORTRAN IV compilers support all of the language features of Code and Go FORTRAN (e.g., the DEBUG facility, and list-directed input/output). Data sets used and produced by Code and Go FORTRAN programs are completely compatible with those used and produced by the Operating System.

Under CMS the SIFT utility provides for a one-way conversion from free form source to standard FORTRAN source.

The disk formats of CMS data sets are not compatible with OS, however, the data sets are transferable through utilities or card and tape. It should be noted that ASCII data sets are not allowed under CMS.

The language level supported by the Code and Go FORTRAN processor is compatible with and encompasses the American National Standard (ANS) FORTRAN.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

IBM TSO foreground operation requires the minimum TSO configuration. For batch operation under IBM MVT or MFT, a minimum area of 88K bytes of main storage is required. In IBM VS1 and VS2 a minimum of 128K bytes of virtual storage is required. To run under CMS the minimum CMS configuration is required.

PERFORMANCE

Elapsed time from start of compilation to start of execution for 100 statement programs is generally three to four times faster than FORTRAN IV (G or G1) operating in the TSO foreground, and two to three times faster in a batch environment.

The object code produced by Code and Go FORTRAN is less efficient than FORTRAN IV (G1) (5734-FO2) object programs.

DOCUMENTATION: (available from Mechanicsburg)

OS/360 Time Sharing Option Guide GC28-6698 ... FORTRAN Program Products for OS and OS with TSO, General Information GC28-6824 ... OS/360 Code and Go FORTRAN GC28-6823 ... System/360, FORTRAN IV Language GC28-6515.

PROGRAM PRODUCTS

OS FORTRAN IV (G1) (5734-FO2)**PURPOSE**

FORTRAN IV (G1) is an extended version of FORTRAN IV (G), adapted to run in Time Sharing Option (TSO) environment, under CMS, and in an OS (batch) mode.

HIGHLIGHTS

A compile time option is provided which allows the introduction of source programs in either BCD or EBCDIC character codes. The output of the compilers (source listing and literal data in the object programs) will utilize the original, untranslated character codes. At object time, literal A-format and H-format input and output data will not be translated; D, E, F and I-format input data may be either in BCD or EBCDIC code representation.

- FORTRAN IV (G1) complements the Code and Go FORTRAN processor (5734-FO1) in its ability to save object programs and produce source listings in the TSO environment.
- Object code listing and storage map options are available.
- Users who have the FORTRAN IV Library (5734-LM3), may use the new FORTRAN IV list-directed I/O statements to simplify data entry and output at the terminal or other data set.
- TSO editing and syntax checking facilities are available for the creation and modification of FORTRAN IV (G1) source programs at a TSO terminal.
- Compilation progress and diagnostic messages may be directed to the terminal or suppressed.
- The compiler's entire listing data set may be optionally directed to the terminal.
- The processor may be invoked most conveniently by the TSO FORTRAN Prompter (5734-CP3) which conversationally interacts with the terminal user to obtain the necessary compilation parameters.

The processor may be invoked under CMS with the CMS command FORTGI.

COMPATIBILITY

All source programs compiled by the FORTRAN IV (E), (G) and (H) compilers can be compiled by FORTRAN IV (G1). Source programs written in the FORTRAN keyboard input format may be converted to standard form by a SIFT utility provided with the Code and Go Processor. Data sets used and produced by the FORTRAN IV (G1) programs are completely compatible with those used and produced by the operating system.

The disk formats of CMS data sets are not compatible with OS, however, the data sets are transferable through utilities or card and tape. It should be noted that ASCII data sets are not allowed under CMS.

The language level supported by FORTRAN IV (G1) is compatible with and encompasses the American National Standard (ANS) FORTRAN. Language extensions beyond ANS FORTRAN are:

- IMPLICIT statement allowing extended implicit classification by first character of a name.
- An extended type statement, including length specification.
- G-conversion, extended to cover all numeric and logical data type.
- Multiple entry points to subprogram, and non-standard returns from subroutines.
- Arrays of up to seven dimensions.
- PAUSE statement extended to permit output of messages.
- NAMELIST statement permitting input/output and conversion without an explicit I/O list and FORMAT statement.
- Extended subscripts.
- Hexadecimal constants and FORMAT code.
- Support of the direct (BDAM fixed length only) data access method.
- Compatible extension to the READ and WRITE statements to provide direct access data organization in support of direct access storage devices.
- Mixed mode arithmetic.
- The T-specification, permitting printed output to begin at any print position.
- STOP statement allows the processing of codes for testing by OS Job Control Statements.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

FORTRAN IV (G1) and its object programs require the Scientific Instruction Set. FORTRAN IV (G1) operates on any IBM S/360 or S/370 processor supported under OS and having enough core storage to satisfy the following requirement: Minimum region size for MFT, MVT is 90K ... Minimum user region for TSO is 110K ... Minimum processor for PCP is 128K.

Minimum virtual storage for VS1 and VS2 is 128K. In order to run under CMS, the minimum CMS configuration is required.

SOFTWARE REQUIREMENTS

An installation procedure for including FORTRANIV (G1) into an OS system is provided. PARM field options may be specified or the standard default values may be used. An installation procedure is also provided to include the processor under CMS.

The OS system requirements are:

For time sharing use, TSO option is required. A currently supported release of OS is required for batch use.

One of the following FORTRAN IV Libraries is required:

FORTRAN IV Library (Mod II) provides the list-directed I/O function and employs improved numeric conversion routines which are identical to those in FORTRAN IV (G1) (and Code and Go FORTRAN). It also provides special support for FORTRAN IV (H-Extended).

The Type I FORTRAN IV Library distributed with OS (not available under CMS) may be used if list-directed I/O is not desired. Due to the different conversion routines employed, this library and FORTRAN (G1) will produce slightly different results when performing conversions between external decimal constants and internal hexadecimal value.

The OS Utilities, Assembler F or Assembler H, Linkage Editor E or F, and the Sequential and Partitioned Access Methods are also required for OS.

PERFORMANCE

The FORTRAN IV (G1) compiler has the same performance and source program capacity as the FORTRAN IV (G) compiler.

Performance under CMS is a function of the number of users of the system.

DOCUMENTATION

(available from Mechanicsburg)

OS/360 Time Sharing Option Guide GC28-6698 ... FORTRAN IV Language GC28-6516 ... OS/360 FORTRAN IV (G1) Processor Program Product Specifications GC28-6854.

PROGRAM PRODUCTS

**OS FORTRAN IV (H EXTENDED) COMPILER
5734-FO3****PURPOSE**

The FORTRAN IV (H Extended) Compiler program product, with the FORTRAN IV Library (Mod II) program product, provides OS and CMS FORTRAN users with increased performance and additional functional capabilities.

DESCRIPTION

The compiler provides a compile time option which allows the introduction of source programs in either BCD or EBCDIC character codes. If a cross-reference listing and/or a structural source listing is requested, a data set for each option must be defined.

This product includes language extensions to the Full FORTRAN language. OS Full FORTRAN language is compatible with and encompasses the American National Standard (ANS) FORTRAN. The language includes the following extensions to ANS FORTRAN:

- IMPLICIT statement allowing extended implicit classification by first character of a name.
- An extended type statement, including length specification.
- G-conversion, extended to cover all numeric and logical data types.
- Multiple entry points to subprograms, and non-standard returns from subroutines.
- Arrays of up to seven dimensions.
- PAUSE statement extended to permit output of messages.
- NAMELIST statement permitting input/output and conversion without an explicit I/O list and FORMAT statement.
- Extended subscripts.
- Hexadecimal constants and FORMAT code.
- Support of the direct (BDAM fixed length only) data access method.
- Compatible extensions to the READ and WRITE statements to provide direct data organization in support of direct access storage devices.
- Mixed mode arithmetic.
- The T-specification, permitting printed output to begin at any print position.
- STOP statement allows the processing of codes for testing by OS Job Control statements.

Enhancements to the OS Full FORTRAN language are:

EXTERNAL Statement Extension ... the EXTERNAL statement is extended to provide the capability to 'detach' the names of FORTRAN-supplied library functions and subroutines. This feature provides the user with the advantage of being able to supply his own functions or subroutines in the place of FORTRAN-supplied library functions and subroutines. The extension is achieved by the use of an ampersand prefixed to the function or subroutine name in its appearance in the EXTERNAL statement.

List-Directed I/O ... List-Directed I/O facility enables the user to read and write formatted data without having to specify a FORMAT statement. In List-Directed READ or WRITE statements, an asterisk is substituted for the FORMAT statement number.

Automatic Function Selection ... This facility simplifies the user's task of referencing built-in and library functions by obviating the need for coding specific or data dependent function names. Automatic Function Selection is requested by means of a new specification statement, GENERIC.

The processor can be invoked under CMS using the CMS command FORTHX.

The three most significant features of the FORTRAN IV (H Extended) Compiler program product are the ability to handle extended precision arithmetic and to support asynchronous I/O.

Extended Precision ... FORTRAN is used extensively to solve complex scientific problems. As the number of operations performed on a piece of data increases, so do the accumulated errors due to truncation. Higher precision, therefore, has to be used in certain stages of the computation to maintain the desired result significance.

The FORTRAN IV (H Extended) Compiler provides extended precision support to assure optimum accuracy of computational results.

Asynchronous I/O ... In the large systems area, where the requirement for reading and writing large logical records is frequent, this feature will offer significant performance improvement. (This feature is not available under CMS.)

Automatic Precision Increase Option ... this feature enables the compiler to convert single precision floating point calculations to double precision and/or double precision floating point calculations to extended precision. The Automatic Precision Increase option is a useful tool in precision conversion.

Automatic Precision Increase assists in overcoming precision problems encountered in converting second generation FORTRAN programs to OS floating point format.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The FORTRAN IV (H Extended) Compiler supports all IBM OS machine configurations currently supported by the OS FORTRAN IV (H) Compiler.

In MFT and MVT, a minimum of 160K bytes of main storage is required for operation of the compiler, inclusive of data management.

In VS1 and VS2, 192K bytes of virtual storage, and in CMS, a virtual machine of at least 600K bytes of virtual storage is required for the compiler. The standard instruction set and floating point option are required.

SOFTWARE REQUIREMENTS

The FORTRAN IV (H Extended) Compiler requires no additional data sets beyond the SYSIN, SYSPRINT, SYSLIN, SYSPUNCH, SYSUT1 and SYSUT2 data sets currently required by the FORTRAN H Compiler depending upon the execution options selected.

Extended precision divide instruction is simulated for processors with extended precision instruction set. Extended precision add, subtract, multiply and divide instructions are simulated by the OS Supervisor for processors not having the extended precision hardware.

The extended precision simulator is also available with CMS.

Operating Environment: The FORTRAN IV (H Extended) Compiler operates as a separate component under OS MFT, MVT, VS1 and VS2, as well as under CMS.

The FORTRAN IV Library (Mod II) (5734-LM3), or its equivalent, is required when compiling and executing under the FORTRAN IV (H Extended) Compiler.

For extended precision floating point simulation, the Extended Precision Simulation is required.

COMPATIBILITY/CONVERSION CONSIDERATIONS

The FORTRAN IV (H Extended) Compiler program product will compile programs written for the OS FORTRAN H Compiler. Object code compatibility will also be assured. Thus, users will not have to recode nor recompile their FORTRAN programs when obtaining this program.

The disk format of CMS data sets are not compatible with OS, however, the data sets are transferrable through utilities or card or tape. It should be noted that ASCII data sets are not allowed under CMS.

PROGRAM PRODUCTS

**SYSTEM/7 FORTRAN IV
HOST COMPILER and LIBRARY
5734-FO4 - OS; 5736-FO1 - DOS**

PURPOSE

Provides high-level FORTRAN IV Language support for the System/7 user, enhances the System/7 Host Program Preparation Facility II, and offers to the System/7 user the ease and speed of coding in the FORTRAN language.

System/7 FORTRAN IV (S/360/370 OS, DOS Host Compiler and Library) processes source programs written in System/7 FORTRAN IV, which is an extension of American National Standard Basic FORTRAN, X3.10-1966. The FORTRAN processor is installed on a host S/360 or S/370 under the facilities of OS/VS1, OS/VS2, DOS/VS, Operating System, or the Disk Operating System; and produces relocatable object code that is suitable, after link-editing and formatting, for execution on a System/7.

System/7 FORTRAN IV requires the use of Host Program Preparation Facility II for processing object and load modules. The required facilities are:

- MSP/7 Macro Library/Relocatable, which contains IBM supplied sensor-based, input/output, and supervisory macros that are used by the System/7 FORTRAN IV programs,
- ASM/7 which assembles the MSP/7 macros,
- LINK/7, which link edits the compiled object code and combines it with appropriate library and sensor-based subprograms to form a load module, and
- FORMAT/7, which accepts the output of LINK/7 and produces a System/7 storage load.

DESCRIPTION

Compiler

- Supports all devices available to S/360/370 FORTRAN IV compilers during compilation.
- Device statement support for the 5022 Disk Storage Module, the 129 Data Recorder, the 7431 Line Printer, the 5028 Operator Station, and BSCA during execution.
- Access, through CALL statements, to MSP/7 functions (including sensor-based input/output).
- Extensive syntax checking and diagnostics.
- Time and Space optimization for enhanced object-time performance.

Library

- Sensor-based subroutines per ISA S61.1
- Mathematical subprograms for exponential, natural logarithm, square root, sine, cosine, arctangent and hyperbolic tangent.
- Subprograms for extensive error handling and diagnostics, format conversion of numeric data, and input/output operations for the 5022 disk device (formatted and unformatted direct access and unformatted sequential records) and the 5028 Operator Station (ASCII data).
- Environment specification macro instructions to identify the user's FORTRAN input/output environment when configuring a storage load module for System/7.
- Modular and reentrant.

CUSTOMER RESPONSIBILITIES

- Understand the application they wish to perform and provide the appropriate hardware and software design.
- Generate a supporting system nucleus using the facilities of MSP/7 Host Program Preparation Facilities II on a S/360 or S/370.
- Provide the required user-written programs and link edit these programs with the MSP/7 nucleus on a S/360 or S/370.
- Load and test the resulting object programs on a System/7.

Note: Generation of the supporting nucleus requires a thorough understanding of MSP/7. The user should consider attending the required MSP/7 education courses, or requesting IBM to provide this nucleus through Systems Engineering Services.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Host System (for compilation)

The system configuration required on the host is an IBM S/360 or S/370 CPU with at least 40K bytes of main storage available to the compiler, exclusive of the storage required by data management and the overlay supervisor (overlay supervisor exists for OS/VS1, OS/VS2, and OS only). Source programs of 250 cards can be processed in the minimum storage available to the compiler.

The Floating Point feature must also be installed in the host System.

A minimum system configuration requires the following devices:

- 1 - Input device
- 1 - Output device
- 1 - Console Typewriter
- 1 - Disk Storage Device

For its residence on the host, the compiler and library require the following number of tracks on an IBM 2314:

OS	15 Compiler
	12 Library
DOS	11 Compiler (in the core-image library)
	19 Library

An additional 21 tracks are required for DOS if the compiler object modules are also kept in the relocatable library.

System/7 (for execution)

The minimum system configuration for executing on System/7 is the following:

- 1 - IBM 5010 Processor Module - 6K or larger
- 1 - IBM 5028 Operator Station

To use FORTRAN direct-access or sequential I/O statements unformatted, an IBM 5022 Disk Storage Module is also required plus additional memory required by Symbolic File Support access methods. Use of the 5022 disk device also requires the Disk Support System (DSS/7) service programs.

SOFTWARE REQUIREMENTS

IBM System/7 FORTRAN IV runs under the facilities of OS/VS1, OS/VS2, DOS/VS, Operating System or Disk Operating System. The object modules produced by System/7 FORTRAN IV must be link-edited using LINK/7 and the resultant load module must be formatted using FORMAT/7 prior to execution on a System/7 machine. Both LINK/7 and FORMAT/7 are system control-type programs that execute on the host machine. The System/7 Host Macro Assembler and the MSP/7 Macro Library/Relocatable are required for preparing the nucleus and for those user applications that utilize sensor-based subprograms.

COMPATIBILITY

The host compiler accepts source programs written in System/7 FORTRAN IV, which is an extension of American National Standard Basic FORTRAN, X3.10-1966 and produces object modules that are acceptable to LINK/7 for link-editing. The System/7 FORTRAN IV compiler will also accept source programs written in ANS Basic FORTRAN. Its language level is similar to stand-alone System/7 FORTRAN, with minor differences due to hardware restrictions.

System/7 FORTRAN IV can process on the 5022 Disk Storage Module, formatted and unformatted direct-access data sets that are compatible with System/3 data sets.

RPOs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

FORTRAN INTERACTIVE DEBUG (5734-FO5)

DESCRIPTION

FORTRAN Interactive Debug provides FORTRAN programmers the ability to debug programs conversationally at a terminal using high-level language.

FORTRAN Interactive Debug operates under TSO and CMS through a comprehensive set of subcommands which enable the programmer to control, monitor, and modify executing FORTRAN programs. The programmer can interact with an executing FORTRAN program in a simple, natural, 'FORTRAN-like' fashion. He can refer to program locations by FORTRAN statement labels or by TSO or CMS line numbers. He can access or change values of FORTRAN variables by specifying the corresponding symbolic FORTRAN variable names.

FORTRAN Interactive Debug operates under TSO on programs compiled by FORTRAN IV (G1) or Code and Go FORTRAN program products using the TEST compiler option.

HIGHLIGHTS

Capabilities available at program execution from a TSO or CMS terminal are:

- Setting breakpoints at statement numbers or at line numbers.
- Displaying and changing values of variables.
- Tracing the execution of FORTRAN programs.
- Tracing back subroutines and the last 10 transfers prior to the execution of the current statements.
- Ascertaining the statement number of the currently executing statement.
- Taking automatic action based upon evaluation of a specified arithmetic or logical condition.
- Displaying parts or all of the source program.
- Correcting invalid arguments passed to FORTRAN library routines.
- Conditional execution of Debug subcommands.
- Providing information (HELP) about the syntax and semantics of Debug subcommands (TSO only).
- Providing an execution frequency count for each FORTRAN source statement.
- The WHEN subcommand which allows the user to specify data fields to be continuously monitored for either a change in value or a change to a prespecified value.
- Dynamic control of the FORTRAN Extended Error Handling Facility.
- Listing all breakpoints and WHEN conditions.

In addition, the following support is provided for VS FORTRAN (5748-FO3):

- Character data type
- Extended precision data type
- Non unity lower bound arrays
- Assumed size arrays
- Ability to debug LANGLVL(66) and LANGLVL(67) programs

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

FORTRAN Interactive Debug operates on all hardware/system configurations supported by the IBM Time Sharing Option of OS and the CMS component of VM/370. A typical 100 statement FORTRAN program is expected to be compiled and interactively tested in a 169K TSO region.

The TSO Terminal Monitor Program, Command Scan, and the service routines GETLINE, PUTLINE and PUTGET are assumed to reside in the time sharing link pack area and do not figure into the user region requirement.

SOFTWARE REQUIREMENTS

FORTRAN Interactive Debug operates under the Time Sharing Option of OS, MVS/370, MVS/XA and the CMS component of VM/370. It operates on and in conjunction with programs compiled by FORTRAN IV (G1) Compiler (5734-FO2), or by the Code and Go FORTRAN Compiler (5734-FO1) or by the VS FORTRAN Compiler (5748-FO3). The FORTRAN IV Library (Mod II), 5734-LM3, with Extended Error Handling is required for programs compiled using Code and Go FORTRAN compiler (5734-FO1). The VS FORTRAN Library (5748-LM3) is required for programs using VS FORTRAN Compiler (5748-FO3). FORTRAN IV (G1) Compiler (5734-FO2) may use either VS FORTRAN Library (5748-LM3) or FORTRAN IV Library (Mod II) (5734-LM3).

COMPATIBILITY

No changes are required to the FORTRAN source program to use the FORTRAN Interactive Debug. The user merely indicates at compile time on the EXEC area or in the CMS command line that the TEST option is to be invoked. This will signal to the compiler that the program may be executed with FORTRAN Interactive Debug.

FORTRAN Interactive Debug is compatible with any Code and Go FORTRAN G1 or VS FORTRAN program that runs under TSO EDIT, except for programs containing debug packets. FORTRAN Interactive Debug becomes fully compatible with these programs if the background debug packets are removed for FORTRAN IV (G1) Compiler (5734-FO2) and Code and Go Compiler (5734-FO1). For VS FORTRAN (5748-FO3), the debug packets may be left in, and the TEST compiler option will override them.

A FORTRAN source program can be compiled with the TEST option in the foreground or the background. The object program produced can then be executed without the presence of this product as well as with it. The generated code will require more space than if it had been compiled without the TEST option.

The FORTRAN Interactive Debug program product adheres to the syntactic conventions of the TSO command language. Commands which are common with TSO TEST have the same meaning.

PERFORMANCE CHARACTERISTICS

Compile Time -- FORTRAN Interactive Debug will require the latest level of the FORTRAN G1 and Code and Go Compilers to facilitate the TEST/NOTEST option. Compile time performance will not be affected when NOTEST is specified.

Execution Time -- Execution time CPU requirements depend on the type and frequency of the debugging functions selected by the terminal user. Since monitoring is performed at every statement boundary, there will be a uniform execution time overhead in the absence of debugging subcommands.

PROGRAM PRODUCTS

**ELECTRONIC PAYMENT SYSTEMS SUPPORT
CHECK PROCESSING CONTROL FEATURE
DEPOSIT PROCESSING FEATURE
5734-F11 (#6072-#6073)**

DESCRIPTION

The Electronic Payment Systems Support/Check Processing Control System (CPCS) - Deposit Processing Feature provides the application support necessary to incorporate the IBM 3895 Document Reader/Inscriber into a fully integrated check-processing system. The 3895 is an online, high speed device that optically reads data from up to three numeric OCR fields, including the hand or machine-printed amount on a check or deposit slip and inscribes that amount in magnetic ink on the ABA code line.

When used in conjunction with the data base facility, online operator control, full restart/recovery and image processing provided by CPCS, the Deposit Processing Feature for the 3895 offers commercial banks an integrated approach to item capture, online microfilming, MICR inscribing, proof of deposit, item correction, endpoint distribution and control and information retrieval.

By integrating this function into CPCS, the CPCS user will have full facilities for:

- Reading, inscribing, sorting and processing of MICR documents on the 3895 for subsequent processing on the IBM 3890 Document Processor.
- Distribution to 6 or 12 stackers on the 3895 prior to distribution to 6, 12, 18, 24 30, or 36 stackers on the 3890.
- Item numbering - supported on the 3890 and the 3895.
- Microfilming supported on the 3890 and the 3895.
- Merge feeding of control slips - supported on the 3890 and the 3895.
- An integrated data base which provides comprehensive audit and control capabilities through unique item identification. The item number, assigned on 3895 runs, is passed through image matching for printing on kill lists or for other final disposition of items.
- Single region operation, where all task and data management is integrated.
- Data security with unique password control of an operator's access to various tasks; duplexing of critical data sets.

HIGHLIGHTS

The Deposit Processing Feature of CPCS, together with the 3895, provides the following capabilities:

- MICR reading of encoded data on the MICR code line, optical character recognition (OCR) of hand or machine-printed amount fields and bar-code recognition of special documents.
- Online MICR inscribing of recognized amounts and/or other fields such as process control or "on us".
- Online microfilming of all items under program control.
- Unique sequential item numbering as well as batch number printing on the face of every prime pass document to provide detailed audit trail facilities.
- Online systems status reporting for better workflow control.
- Online float statistics by batch.
- Online reject correction through display terminals.
- Online deposit balancing through display terminals to accomplish proof of deposit.
- Online inscribing of non read and corrected items in a subsequent 3895 pass following balancing.
- Preparation of item information and control for subsequent high-speed processing and for archive functions.
- Collection of statistics for operations management and cost accounting.

In conjunction with the data base facility, online operator control, full restart/recovery and image processing provided by CPCS, the Deposit Processing Feature now offers commercial banks an integrated approach to item capture, MICR encoding, proof of deposit, item correction and endpoint distribution and control.

CUSTOMER RESPONSIBILITIES

The potential benefits to be derived from automating functions of the proof department require many new operating procedures. Some of the areas for special user consideration involve work flow planning, personnel training and coordination of conversion and testing.

The customer is also responsible for the tasks required to tailor the system to his specific operational environment. Some of these tasks are:

- To provide stacker-select edit routines that analyze each document image processed by the capture, key-entry and proof-of-deposit functions.
- To assemble and maintain Document Identification Handler (DIH) data in an OS/VS data set for use by the 3895. The program product, Document Identification and Description Macros (DIDM) (5748-F12), can be used to construct the DIH data.
- To provide the data and build a sort-pattern data set for processing different types of work on the 3895.
- To provide the parameters required to generate the program product.
- To provide required data sets, such as the bank name and address data set, endpoint tables, and optionally, an authorization/security table.
- To generate an OS/VS system and allocate disk space for data sets.
- Optionally, to provide programs for float analysis and investigations using the data base provided by the program product.
- Optionally, to provide the programs necessary to generate adjustment advices to customers based on the actions taken during the proof of deposit/adjustments function.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum Configuration: CPCS - Deposit Processing Feature is designed to operate on an IBM S/370 mdl 135 and up with 384K bytes of main storage and conditional swapping. In addition to a card reader, a 132-print position printer and other requirements for either OS/VS1, OS/VS2 Release 1.7 (SVS) or OS/VS2 Release 3.7 (MVS), the following features and input/output devices are necessary:

- 2 Disk storage modules on any appropriate Direct Access Storage Facility (2314, 2319, 3330, 3340 or 3350).
- 1 3803 Tape Control (or equivalent 2803).
- 2 3420 Magnetic Tape Units mdl 3 (or equivalent 2400 Series) (three if disk capture/restore option is selected).
- 1 3272 Control Unit mdl 1 or 2.
- 3 3277 Display Stations mdl 2 with alphameric keyboard attached to 3272 Control Unit.
- 1 3895 Document Reader/Inscriber.
- 1 3896 Tape-Documents Converter.

In addition to the above, either a dedicated 132-print-position printer or an additional dedicated tape drive is required for CPCS printed output. If the latter, the transfer of data to hardcopy will be delayed until the magnetic tape can be printed in a background region/partition. To avoid this delay, it is recommended that a printer be dedicated to the job.

Typical Configuration: (CPCS - With Deposit Processing and CPCS 3890 Features)

- 1 S/370 mdl 148 (1024K bytes)
- 1 3505 Card Reader
- 1 3811 Printer Control Unit
- 1 3211 Printer
- 2 3890 Document Processors, with item numbering/endorsing, three pocket modules and microfilming.
- 2 3272 Control Units mdl 1 or 2.
- 30 Display Stations mdl 1 or 2 with alphameric keyboard *.
- 1 3284 Printer mdl 1.
- 1 Disk storage facility with four 3330 Disk Storage modules (eight drives) and one 3830 Storage Control with feature #8170 two channel switch.
- 1 3803 Tape Control Unit mdl 2.
- 4 3420 Magnetic Tape Units mdl 3.
- 2 3895 Document Reader/Inscribers with microfilming attached to a block multiplexer channel.
- 2 3896 Tape-Documents Converters.

The appropriate system configuration for each user is highly dependent on user volumes, processing techniques and performance requirements.

PROGRAM PRODUCTS

CPCS/Deposit Processing Feature (cont'd)

This configuration information is intended only as a guide. The IBM marketing representative can assist in detailed configuration planning.

Consideration should be given to device data rates for their impact on system throughput. In addition, if the computer is used for batch processing concurrently with check processing, examine the data rates of shared devices to avoid system slowdown. See the *Factors Affecting Throughput* section of the *CPCS Deposit Processing Feature General Information Manual* for additional considerations.

SOFTWARE REQUIREMENTS

Deposit Processing Feature is written to operate under the release levels of OS/VS which are prerequisite to the Selectable Units (SUs) or Independent Component Release (ICR) containing 3895 SCP support. This support consists of environmental recording, editing and printing (EREP) facilities and error recovery procedures (ERP). The appropriate levels are:

OS/VS1 Release 6 with the EREP Modifications and the 3895 SU.

OS/VS SVS Release 1.7 with EREP Modifications and the 3895 ICR.

OS/VS2 MVS Release 3.7 with the Scheduler SU, Supervisor 1 SU, Supervisor 2 SU, Scheduler/IOS SU, EREP Modifications and the 3895 SU.

CPCS - Deposit Processing Feature will operate under subsequent releases of these operating systems unless otherwise identified.

CPCS - Deposit Processing Feature is written in Assembler language and COBOL and is distributed in source form. The following is a list of programs used by the CPCS - Deposit Processing Feature.

OS/VS1 5741-VS1
OS/VS2 5742-017 (SVS) or 5752-VS2 (MVS)
OS/VS Utilities
OS/VS Linkage Editor F
OS/VS Primary Data Management (BSAM, QSAM, BPAM)
OS/VS Assembler F
OS/VS Basic Direct Access Method (BDAM)
OS/VS Basic Telecommunication Access Method (BTAM)
ANS COBOL
ANS COBOL Library

See *DP Guide for Ordering Programs (ZZ20-3651)* for program numbers.

To assist 3895 customers in developing Document Identification Handler data, the Document Identification and Description Macros program product provides a macro-level language capability for identifying various types of documents and the locations of their OCR data fields.

PROGRAM PRODUCTS

**TELECOMMUNICATIONS CONTROL SYSTEM
TCS (5734-F31)**

PURPOSE

The Telecommunications Control System (TCS) is a teleprocessing (TP) system providing a wide scope of message and network control functions. It supplies complex but easy-to-use communications services and access to a wide variety of standard, online, application programming services.

TCS was designed to meet the demanding requirements of the securities industry in the following areas: Large network, high throughput, sophisticated CCAP-like message switching, and high reliability combined with powerful network control facilities. These requirements for TCS have been specified by the securities industry; they are, however, general in nature, and are not restricted to that particular industry.

TCS runs under OS/VS1 or OS/VS2 (SVS or MVS) on a S/370 in conjunction with the Telecommunications Access Method (TCAM or TCAM NCP/VS Direct).

TCS supports line speeds of up to 50,000 bits per second and a wide range of line controls. Examples of supported items are: Full-duplex teletypewriters, keyboard printers, video display terminals, audio units, concentrators, and other processors.

DESCRIPTION

TCS handles message switching, data collection, and remote printing; it also performs communications and message control for inquiry, conversational file updating, time sharing, executive query, and so on. It can also handle -- concurrently -- different types of terminals, applications, and message types. Each entity can be assigned a different option for buffering, line control, queuing (main storage or disk), message handling, and restart. Message handling (consisting of routing and optional analysis) is specified by the user via a high-level language. Different message handling techniques can be chosen for each line, application, and message type.

TCS can accommodate, simultaneously, messages for application programs running under other control programs (CICS, TSO, GIS), and those using OS/VS. Groups of application programs can run in separate regions, or partitions, and application-to-application communication can be performed. In these circumstances, any application program group can fail without bringing down any other group or the message control program.

Terminals and lines can be shared by applications - with equal efficiency - while performing data collection, conversational file updating, time sharing inquiry, and many other operations.

TCS can optionally reside in multiple processors connected by leased lines. Any given terminal connected to one such processor has access to the applications in any of the other processors, and can also switch messages to terminals connected to the processors.

The TCS program product specifically contributes the following optional functions to the combined TCS/TCAM package:

ALTERNATE STATION AND APPLICATION NAMES: Any station or application can be assigned more than one name. The system recognizes all such names as synonymous.

ROUTING CONTROL: In many situations, TCS can exert control over the routing of messages. For example: A given station can be directed to accept only specific kinds of messages, or traffic from specific origins; broadcast messages may be entered only at predetermined locations, and access to specific applications can be limited.

POWERFUL ERROR HANDLING: The TCS user can employ a high level of program logic in error handling. The user may select from a large number of options: Literally, hundreds of different identifiable error conditions; tailored error message formats; user-selected message priority level; and many other features.

ELABORATE RESTART FACILITIES: The presence of a special monitor allows TCS to be restarted with minimal operator intervention. After any given type of restart, TCS can initiate many discrete actions; various restart messages, the resetting of sequence numbers, and so on.

POWERFUL OPERATOR CONTROL FACILITIES: TCS offers a vast number of functions that are highly desirable in a medium-to-large TP system. Some of these facilities are: Action on multiple lines; selective queue status display on a regular basis; throughput and traffic statistics measurement; dynamic message rerouting; and dynamic extra message copy generation. The system can be directed to handle all but the most serious malfunctions without manual intervention. A complete retrieval facility is provided: Any message can be retransmitted to any station or application; retrievals can be specified by origin and/or destination, sequence number, or time of day.

SAVING UNSENT MESSAGES: Unsent messages may be saved on a sequential data set before the system is closed, and then reentered into the system later -- for instance, after a system regeneration. The user can choose among several options to determine which messages to save.

ADDITIONAL LINE CONTROL TYPES: TCS fully supports freewheeling stations as well as four kinds of full-duplex line control -- mainly for teletypewriter use.

Essentially, TCS provides a high throughput, rapid-response, reliable teleprocessing system, tailored for the needs of each user. The *TCS Concepts and Facilities Manual* (GH20-1207) contains further details. It introduces, discretely, TCS and TCAM concepts both to readers who are experienced in the field and to readers who have no previous teleprocessing knowledge.

CUSTOMER RESPONSIBILITIES

Before installing the program product, the customer must order and satisfactorily install all required communications equipment ... meet minimum machine configuration requirements ... generate an OS/VS1 or OS/VS2 system with TCAM ... train all persons instaling, operating, or maintaining TCS in OS/VS ... have a thorough knowledge of the message switching and order handling functions ... train system analysts, programmers and operators ... develop system conversion procedures and schedules.

This program product is released to work with the following operating systems and TCAM release levels (for as long as they themselves are current):

- OS/VS1 or OS/VS2 and TCAM Levels 5, 8, and 9.
- OS/VS1 or OS/VS2 (SVS) and TCAM NCP/VS Direct (Level 10).

TC will also support OS/VS2 (MVS) and TCAM NCP/VS Direct.

TCS is written in the OS Assembler language and uses TCAM and TCS macros under Operating System Virtual Storage 1 (OS/VS1) (5741-020) or Operating System Virtual Storage 2 (OS/VS2) (5742-010).

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

In addition to the machine and device requirements of TCAM, TCS requires the following:

Minimum region or partition size of 25K in an OS/VS system in a V=V environment (this does not include main storage requirements for the order edit application program).

The terminal device support of any TCS system is determined by the level of TCAM operating with that system; in addition, all releases of TCS up to and including the support of TCAM NCP/VS Direct Support freewheeling teletypewriters; Teletype (registered trademark of the Teletype Corporation, Skokie, Illinois) Model 28, and full-duplex terminals using AT&T 4VH, AT&T FINAC, AT&T 81D1 or Western Union 117 line control.

For full-duplex line control, the RPQ configuration is as follows:

Line Control	Control Unit	Control Unit
	2702	2703
FINAC	E40435	E53506
	851057	851030
	M40316	851029
81D1		A03394
	Not Available	M29185
		853017
4VH		853018
	Not Available	E57294
		M29185
WU117		853017
		853018
	E40840	E51544
	851039	E51037
		851038

Full-duplex support under the 3705 Communications Controller in the level of Emulation Program (EP) is concurrent with the availability of PRPQ #P85010-5799AGN.

DOCUMENTATION: (available from Mechanicsburg)

PROGRAM PRODUCTS

OS FORTRAN IV LIBRARY (MOD II) (5734-LM3)**PURPOSE**

OS FORTRAN IV Library (Mod II) contains mathematical and service subprograms required by the OS FORTRAN IV (H Extended) Compiler (5734-F03). These are two main types of subprograms. The first computes mathematical values, such as the square root or sine, of data arguments supplied during problem program execution. The second group communicates with the operating system to obtain services, such as input/output, for the problem program. These subprograms are combined, as needed, with the compiler output during linkage editing to form a complete, executable problem program.

DESCRIPTION

Features: In addition to the OS FORTRAN IV Library functions, this program product has the following features and capabilities:

- Function and input/output conversion support for two new data lengths: REAL *16 and COMPLEX *32.
- New conversion routines for all data, providing greater accuracy and the same results as conversions by the FORTRAN IV (H Extended) Compiler.
- Support for new FORTRAN input/output features:
 - Asynchronous input/output, which provides high-speed capabilities for reading and writing unformatted, sequential data. In the MFT environment, this feature requires the ATTACH option (not available under CMS).
 - List-Directed I/O, which permits reading and writing of formatted data without a FORMAT statement (not available under CMS).
- Support for Automatic Function Selection, which allows the simplest form of a function name to serve for all lengths and types of data arguments.
- Support for Automatic Precision Increase, which, when invoked, promotes all single precision floating point variables, constants, and functions to double precision and/or double precision variables, constants, and functions to extended precision floating point.
- Support for tape data sets written in the American National Standard Code for Information-Interchange (also referred to as ASCII).
- The FORTRAN IV Library (Mod II) contains all the features of the FORTRAN IV Library (Mod I) (5734-LM1), which has now been withdrawn.

COMPATIBILITY

Upward compatibility with the OS FORTRAN IV Library is maintained. Object modules and datasets valid for the OS FORTRAN IV Library are accepted by this program product. Due to the greater accuracy of conversion routines, results of calculations may not always be identical to previously obtained results.

ASCII data sets are not allowed under CMS.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

OS FORTRAN IV Library (Mod II) operates under OS on the same hardware configurations as the FORTRAN IV (H Extended) Compiler. The standard instruction set and the floating point options are required. Extended precision floating point instruction set is optional.

SOFTWARE REQUIREMENTS

This program product operates under Operating System (MFT, MVT, VS1, VS2 and under CMS).

The FORTRAN IV Library (Mod II) supports the FORTRAN IV (H Extended) Compiler (5734-F03), the FORTRAN IV (GI) Compiler (5734-F02) and Code and Go FORTRAN (5734-F01).

The Extended Precision Simulation is required for the simulation of extended precision floating point.

Performance under CMS is a function of the number of users of the system.

PROGRAM PRODUCTS

**OS PL/I RESIDENT LIBRARY
5734-LM4**

DESCRIPTION

This program product is used in conjunction with the OS PL/I Optimizing Compiler. For the complete compilation and execution of a PL/I program, the following program products are required:

- OS PL/I Optimizing Compiler (5734-PL1) - For compilation.
- OS PL/I Resident Library (5734-LM4) - For link-editing.
- OS PL/I Transient Library (5734-LM5) - For execution.

For a processor in which programs are compiled, but not link-edited or executed, only the compiler is required. For a processor in which programs are link-edited but not compiled or executed, only the resident library is required. For a processor in which programs are executed but not compiled or link-edited, only the transient library is required. The three products are available packaged together (as 5734-PL3) or individually.

The OS PL/I Resident Library consists of those subroutines which, when link-edited under OS with the object module produced by the OS PL/I Optimizing Compiler, form a load module or object program for subsequent execution under OS. To execute a load module, the OS PL/I Transient Library is required.

When operating under the CMS component of VM/370, the OS PL/I Resident Library is required when loading the object module, as produced by the OS PL/I Optimizing Compiler, prior to execution. The OS PL/I Transient Library is required during the subsequent execution.

The functional areas serviced by subroutines of this library are as follows:

- Mathematical routines (e.g., SIN, COS).
- Data type conversions (e.g., Pictured Character to Float).
- Edit, List- and Data-Directed I/O (Stream I/O).
- System Control Program Interfaces, including:
 - Program Management and (optionally) Tasking.
 - Storage Management.
 - Display.
 - Timer Facilities.
 - Error Handling.

but excluding those routines loaded during execution.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Link Edit: Approximately 37 tracks of 3330 or equivalent direct access storage space are required for the resident library subroutines. Devices are required as for the Linkage Editor.

Execution under the IBM Operating System: The main storage requirements of the object program are a function of the PL/I facilities used. The decimal and floating point instruction sets are required. If extended floating point calculation is explicitly used in the object program, the extended floating point instruction set is automatically simulated (if not present on the machine) by the OS Extended Precision Simulator. The timer feature is required if use is made of the TIME built-in function or the DELAY statement. The object programs produced by the PL/I Optimizing Compiler can utilize all input/output devices supported by BSAM, QSAM, BISAM, QISAM, VSAM, BDAM and TCAM.

Execution under CMS: When executing a PL/I object program under CMS, all of the processor features that are used when operating under the IBM Operating System are required.

SOFTWARE REQUIREMENTS

Release 3.1 of the resident library is supported on OS Release 21, OS/VS2 (SVS) all releases, OS/VS1 Releases 1 through 7, OS/VS2 (MVS) through Release 3.8 and the CMS component of Releases 1 through 6 of VM/370, until March 31, 1982. After March 31, 1982, Release 3.1 of the resident library is no longer current.

Release 4.0 of the resident library is supported on OS/VS1 Release 7, OS/VS2 (MVS) Release 3.8 and the CMS component of Release 6 of VM/370, and subsequent versions, releases and modifications, unless otherwise stated in a modification of the specifications.

Under OS, the resident library load modules reside in PLI.PLIBASE and PLI.PLITASK. Resident library load modules may be placed in LINKPACK using the shared library facility. This facility may also be used by application programs running under CICS/VS.

PL/I multitasking facilities can be used only on an MVT or VS2 system.

All object programs require BSAM and QSAM in the generated operating system. Programs using INDEXED or VSAM data sets require ISAM or VSAM, and those using REGIONAL data sets require BDAM. Programs using TRANSIENT files require TCAM. The use of TCAM also requires the generation of a TCAM message control program to direct messages to and from the disk queues. The timer system generation option is required if use is made of the TIME built-in function or the DELAY statement.

Under CMS, the library resides on the system disk as PLILIB TXTLIB S2. In the CMS environment, the following features are not available:

- Multitasking.
- Teleprocessing file support.
- INDEXED file support.
- PL/I SORT facilities.
- PL/I Checkpoint/Restart facilities.
- ASCII data sets.
- BACKWARDS attribute with magnetic tapes.
- PL/I FETCH and RELEASE statements.
- VS or VBS record formats

For additional information about the object time restrictions under CMS, refer to the publication *OS PL/I Optimizing Compiler CMS User's Guide* (GC33-0037).

Object programs may be executed as application programs in the CICS environment. The usability of PL/I programs in the CICS/VS environment is increased by Release 3 of the OS PL/I Optimizing Compiler under OS/VS.

DOCUMENTATION: (available from Mechanicsburg)

OS PL/I Optimizing Compiler General Information Manual (GC33-0001) ... *OS PL/I Resident Library Specifications* (GC26-3992).

MVS SYSTEM INTEGRITY APPLIES: Yes

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**OS PL/I TRANSIENT LIBRARY
5734-LM5****DESCRIPTION**

This program product is used in conjunction with the OS PL/I Optimizing Compiler and the OS PL/I Checkout Compiler.

For the OS PL/I Optimizing Compiler, to compile, link-edit, and execute a PL/I program, the following program products are required:

- OS PL/I Optimizing Compiler (5734-PL1) - For compilation.
- OS PL/I Resident Library (5734-LM4) - For link-editing.
- OS PL/I Transient Library (5734-LM5) - For execution.

For a processor in which programs are compiled, but not link-edited or executed, only the compiler is required. For a processor in which programs are link-edited but not compiled or executed, only the resident library is required. For a processor in which programs are executed but not compiled or link-edited, only the transient library is required. The three products are available packaged together (as 5734-PL3) or individually.

For the OS PL/I Checkout Compiler, to translate and interpret a PL/I program, the following program products are required:

- OS PL/I Checkout Compiler (5734-PL2) - For translation and interpretation.
- OS PL/I Transient Library (5734-LM5) - For interpretation only.

The transient library consists of those load modules loaded dynamically during object program execution, thus minimizing the space occupied by the object program. These load modules reside in the link library (PLI.LINKLIB); they are transient and are automatically loaded when required, by the system macros LINK, LOAD and XCTL. Transient library load modules may be placed in LINKPACK.

The principal functions of the transient library modules are:

- Error and interrupt handling.
- Opening and closing files.
- Record-oriented and stream-oriented input/output transmission.
- Program initialization and storage management.

A transient library module remains in main storage for as long as it is required by the problem program being executed.

Support for the ASCII character set is provided for object programs by QSAM. Object programs can create and access data sets in ASCII provided the data sets are on magnetic tape with formats, U, F, FB, D or DB. These data sets will be supported by STREAM files and by RECORD SEQUENTIAL BUFFERED files using the CONSECUTIVE environment option. Only character data may be written onto an ASCII data set. This support is not available when operating under CMS.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Approximately 30 tracks of IBM 3330 or equivalent direct access storage space are required for the transient library subroutines.

The main storage requirements of the object program are a function of the PL/I facilities used. The decimal and floating point instruction sets are required. If extended floating point calculation is explicitly used in the object program, the extended floating point instruction is automatically simulated (if not present on the machine) by the OS Extended Precision Simulator. The timer feature is required if use is made of the TIME built-in function or the DELAY statement. The object programs can utilize all input/output devices supported by BSAM, QSAM, BISAM, QISAM, VSAM, BDAM and TCAM.

SOFTWARE REQUIREMENTS

Release 3.1 of the transient library is supported on OS Release 21, OS/VS2 (SVS) all releases, OS/VS1 Releases 1 through 7, OS/VS2 (MVS) through Release 3.8 and the CMS component of Releases 1 through 6 of VM/370 until March 31, 1982. After March 31, 1982, Release 3.1 of the transient library is no longer current.

Release 4.0 of the transient library is supported on OS/VS1 Release 7, OS/VS2 (MVS) Release 3.8 and the CMS component of Release 6 of VM/370, and subsequent versions, releases and modifications, unless otherwise stated in a modification of the specifications.

PL/I multitasking facilities can be used only on an MVT or VS2 system.

All object programs require BSAM and QSAM in the generated operating system. Programs using INDEXED or VSAM data sets require ISAM or VSAM, and those using REGIONAL data sets require BDAM. Programs using TRANSIENT files require TCAM. The use of TCAM also requires the generation of a TCAM message control program to direct messages to and from the disk queues. The timer system generation option is required if use is made of the TIME built-in function or the DELAY statement.

Under CMS, the library resides on the system disk as PLILIB TXTLIB S2. In the CMS environment, the following features are not available:

Multitasking.
Teleprocessing file support.
INDEXED file support.
PL/I SORT facilities.
PL/I CHECKPOINT/RESTART facilities.
ASCII data sets.
BACKWARDS attribute with magnetic tapes.
PL/I FETCH and RELEASE statements.
VS or VBS record formats.

For additional information about these restrictions, see *OS PL/I Optimizing Compiler: CMS Users Guide* (GC33-0037)

Object programs may be executed as application programs in the CICS environment. The usability of PL/I programs in the CICS/VS environment is increased by Release 3 of the OS PL/I Optimizing Compiler under OS/VS.

DOCUMENTATION: (available from Mechanicsburg)

PROGRAM PRODUCTS

REQUIREMENTS PLANNING (5734-M51)

PURPOSE

This program product offers a mechanized approach to detailed requirements planning for a large segment of manufacturing industries. It uses the Item Master and Product Structure files created by the Chained File Management System. It performs time series planning to determine planned orders for finished products, assemblies, sub-assemblies, parts and material based upon the input of forecasts and/or customer orders.

Requirements Planning determines the net requirements for finished products and component parts, establishes planned orders based on the predetermined order policy, and offsets the planned orders with respect to lead times. Additional capabilities include projecting demand ... consideration of safety stock, allocated quantity, shrinkage factors ... planned order policies include discrete, fixed quantity, least unit cost, and part period balancing ... modifying planned order policies by considering number-days-supply, minimum-maximum-multiple quantities, and cutoff dates ... offsetting by a fixed or a calculated lead time. Processing variations include: Complete generation of requirements, Requirements Alteration (revisions to gross requirements), and Plan Order Adjustment (revisions to planned orders). A customizing procedure permits a user to tailor the system to meet his specific requirements. OS/360 Requirements Planning uses many of the concepts of the Requirements Planning subsystem discussed in the *IBM Production Information and Control System (GE20-0280)*.

The Chained File Management System is used to create and maintain a central information system for a manufacturing organization. The system contains generalized programs to organize and maintain Item Master, Product Structure, Routing and Work Center data on direct access files. CFMS is required and provided with OS/360 Requirements Planning.

DESCRIPTION

OS/360 Requirements Planning consists of three programs: The Requirements Generation Program, the Print Exception Program and the Chained File Management System.

The inputs to the Requirements Generation Program are from card, magnetic tape or disk and contain the gross requirements by shop day, calendar date or time period. Card input is by date and quantity only. These requirements can be generated manually from a forecast, from customer orders, or from OS/360 Inventory Control (5734-M52). This input spans a user-specified number of planning periods into the future.

The output of the Requirements Generation Program is in the form of planned orders for purchased and manufactured items. Orders for manufactured items are available for input to a capacity planning function, and orders to be purchased are available to a purchasing function. A considerable amount of flexibility is provided to enable the extraction of as much or as little information as desired for printing. Three types of reports are provided: Detailed requirements, planned orders that have been adjusted through Plan Order Adjustment and an exception report. The Print Exception Program is used to print the exceptions generated from the Requirements Generation program.

The Chained File Management System provides manufacturing organizations with easy-to-modify programs that establish and maintain basic information files describing the structure of products and their manufacturing procedures. Logic diagrams explaining the retrieval of this information in fundamental applications is also supplied.

The Requirements Generation Program requires that the Item Master and the Product Structure files are organized using the Chained File Management System.

HIGHLIGHTS

- Three programs are provided to assist the user in performing requirements planning: The Requirements Generation Program performs the actual time series requirements generation; the Print Exception Program prints notices for the exceptions that were discovered during requirements generation; and the Chained File Management System creates and maintains a central manufacturing data base.
- Functions performed by the Requirements Generation Program include gross requirements determination, net requirements determination, plan orders and offset requirements.
- Many options are provided within the functions. These include projection of demand ... safety stock quantity ... allocated quantity ... shrinkage factor ... discrete, fixed quantity, least unit cost, part period balancing and user order policies ... minimum-maximum-multiple, number-days-supply, maximum quantity and cutoff date modifiers to order policies ... fixed and calculated lead time ... product structure offset adjustment ... product structure scrap factor ... user's exits for engineering change effectivity of product structure.
- Three types of processing variations are provided by the Requirements Generation Program. These include: Complete generation of requirements, Requirements Alteration (revisions to gross requirements), and Plan Order Adjustment (revisions to plan orders).

- Three types of reports are provided. These include: Detail report of requirements, plan orders that have been adjusted through Plan Order Adjustment and an exception report created by the Print Exception Program.
- The Requirements Generation Program provides two optional methods for printing detail requirements. These include printing of item indicative information, gross requirements, open orders, net requirements, plan orders and offset requirements in random sequence, as requirements are generated, or at the completion of generating requirements in the sequence that the Item Master file is organized.
- Provision is made to store gross requirements, open orders and plan orders in either an Item Master or Subordinate Item Master file, both of which are created and maintained by the Chained File Management System. When the Subordinate Item Master file is used, any combination of the gross requirements, open orders and plan orders will be stored as one separate record for each item. The linkage between the two files will be created by the Requirements Generation Program.
- Input to the Requirements Generation program is from card, magnetic tape or disk and contains gross requirements by shop day, calendar date or time period. Card input is by date and quantity only.
- A customizing procedure permitting the user to select the functions and options necessary to tailor the Requirements Generation Program to meet his specific requirements.
- The Chained File Management System provides disk file chaining to link Product Structure records with Item Masters, to link Routing records to Item Masters, and Routing records to Work Center Masters ... the user designs his own record layouts by incorporating his own information plus certain required data ... low level coding is automatically maintained ... assembly to sub-assembly continuity is verified.
- The Chained File Management System is modular in design, permitting the user to select only features that suit his needs ... bi-directional chaining is provided ... a run activity control technique aids in restart and reconstruction, and facilitates additional retrieval features.
- Tailoring of the generalized source program of the Chained File Management System to the specific needs of each user's installation is performed by a special customizing program ... the user prepares parameter cards to specify his needs ... macros are provided for sequential or random access to master files ... retrieval program may be written in Assembler, PL/I or COBOL.

USE

OS/360 Requirements Planning is direct access file oriented utilizing data contained in the Item Master, Product Structure and Subordinate Item Master (optional) files. The records within these files are created and maintained by the Chained File Management System.

Frequency of use of OS/360 Requirements Planning will depend on the user needs of his production planning function. Typically, each scheduled program run would be a complete generation of requirements with the input of gross requirements spanning from the current time period to the last time period in the planning horizon. The Plan Order Adjustment (optional) method of processing enables the system to stop processing after each level of planned orders has been developed. This allows the planned orders to be reviewed and, if necessary, readjusted before the next level of requirements is determined. Thus, either complete requirements generation or Plan Order Adjustment would normally be performed on a scheduled basis. Requirements Alteration processing (optional) provides for regeneration of requirements due to changes to the original gross requirements input. In this instance, only the altered gross requirements are input to the system. Requirements Alteration processing would normally be performed between scheduled complete requirements generation or Plan Order Adjustment program runs.

CUSTOMER RESPONSIBILITIES

A thorough knowledge and understanding of this program before installation ... customize OS/360 Requirements Planning to meet user requirements ... a thorough knowledge and understanding of the Chained File Management System ... provide and maintain a shop calendar that resides on a direct access device ... define contents and format of the Item Master, Product Structure, and Subordinate Item Master files ... maintain accurate up-to-date data ... provide open orders to the system ... provide file organization and maintenance of the Item Master, Subordinate Item Master, and Product Structure files through the use of the Chained File Management System.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum machine configuration includes an IBM S/360 or S/370 Processor with main storage of 128K bytes or more for PCP (S/360 only) and MFT, and 256K bytes or more for MVT and appropriate I/O

PROGRAM PRODUCTS

Requirements Planning (cont'd)

units to satisfy the OS/360 requirements for system console, system input, system output, system residence and system data sets. The only additional requirements are direct access storage for the data sets. OS Requirements Planning requires a minimum of an 80K byte partition or region for PCP, MFT and MVT. User core requirements may vary due to the selection of user options.

SOFTWARE REQUIREMENTS

S/360 Requirements Planning is written in Assembler language. It uses the macro language facility and operates under control of OS/360 Multiprogramming with a Variable Number of Tasks (MVT). This program product also runs under all OS/VS operating systems. In addition, the program also operates in a VM/370 environment under the control of any OS or OS/VS system.

DOCUMENTATION: (available from Mechanicsburg)

Application Description Manual (GH20-0751) ... Specifications ... (GH20-4005)

CONNECTION RECORD FEATURE (#6015)

The OS/360 Requirements Planning Special Feature #6015 extends the support of OS/360 Requirements Planning to make it possible to generate connection records. The connection record provides information regarding parent-component relationships of all orders planned during a requirements generation run. These may be used as input to OS Capacity Planning -- Finite Loading (5734-M54) to link component orders with parent orders.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The minimum system requirements for OS/360 Requirements Planning Special Feature #6015 are similar to those necessary to support OS/360.

The minimum machine configuration includes an IBM S/360 or S/370 Processor with main storage of 128K bytes or more for PCP (S/360 only) and MFT, and 256K bytes or more for MVT and appropriate I/O units to satisfy the OS requirements for system console, system input, system output, system residence, and system data sets. The only additional requirements are direct access storage for OS/360 Requirements Planning data sets. This support requires OS/360 Requirements Planning as a prerequisite. OS Requirements Planning with Special Feature #6015 requires a minimum of an 80K byte partition or region for PCP, MFT and MVT. User core requirements may vary due to the selection of user options.

SOFTWARE REQUIREMENTS

The program is written in Assembler language. It uses the macro language facility and operates under control of OS/360 (PCP, MFT or MVT). OS/360 Requirements Planning (5734-M51) is required. This program product also runs under all OS/VS operating systems. In addition, the program also operates in a VM/370 environment under the control of any OS or OS/VS system.

DOCUMENTATION: (available from Mechanicsburg)

Application Description Manual (GH20-0751) ... Specifications (GH20-4005).

PROGRAM PRODUCTS

**OS PL/I OPTIMIZING COMPILER
5734-PL1**

PURPOSE

The OS PL/I Optimizing Compiler is designed specifically for generation of very fast object programs. Good all-around performance is achieved through the incorporation of the best design features of a number of well-proven compilers. The compiler operates under the IBM Operating System and under the Conversational Monitor System (CMS) component of Virtual Machine Facility/370 (VM/370).

DESCRIPTION

Main features offered include:

Improved Optimization - Object code can be optimized to a much greater extent than has previously been possible for PL/I users.

Advanced Level of PL/I - A powerful implementation of PL/I with language extensions and developments beyond the PL/I F level. New features include the DEFAULT statement, file variables, entry variables, new compile-time preprocessor facilities and structured programming statements.

Virtual Storage Systems - The products operate efficiently at both compile and execution time on virtual storage systems. The ability to use large virtual storage permits the full range of PL/I debugging features to be used.

VSAM Support** - Support for the use of data sets created with or converted to VSAM. In most cases, VSAM will be used directly; where this is not possible the ISAM Interface will be used.

Extensive Debugging Aids - Clear and specific diagnostic messages at compilation and execution times, plus a comprehensive range of options, reduce the time and effort required for program checking.

Use with OS PL/I Checkout Compiler - The OS PL/I Optimizing Compiler and the OS PL/I Checkout Compiler (5734-PL2) have been designed as a pair. Used together, the two compilers can increase the efficiency of both programmer effort and machine usage.

ASCII Support* - ASCII data sets can be created and accessed using QSAM.

Communication with FORTRAN, COBOL and Assembler - This compiler facilitates communication between PL/I object modules and FORTRAN, COBOL or Assembler object modules. See *OS PL/I Optimizing Compiler: General information Manual* (GC33-0001). For details, see *OS PL/I Optimizing and Checkout Compilers Language Reference Manual* (SC33-0009) and *OS PL/I Optimizing Compiler Programmer's Guide* (SC33-0006).

Time Sharing - This compiler can be used with the Time Sharing Option of the IBM Operating System or the CMS component of VM/370. The compiler can be invoked from a remote terminal and compiler diagnostic messages and listings can be received at the terminal. Under TSO only, the user can be prompted at the remote terminal for job parameters that are omitted or incorrectly entered. Data sets required for compilation are dynamically allocated.

The compiler can be used to write interactive application programs. Execution of a program compiled by the OS PL/I Optimizing Compiler may be interrupted from the terminal by use of the attention button (or equivalent).

Teleprocessing Support* - Messages can be read and written from TCAM queues.

Extended Precision Arithmetic - Floating point calculations are optionally performed on fractions of approximately 33 decimal digits. The OS Extended Precision Simulator is automatically invoked if the instructions are not present on the machine.

Extended Graphic Character Set Support - New functions, available on Release 4 only, improve the usability of PL/I for applications requiring large character sets. This is accomplished by defining a new data type, GRAPHIC, which defines two-byte string data (graphic string data). For detailed information see *OS and DOS Optimizing Compiler: Extended Graphic Character Set Support Supplement* (SC26-3971).

* This feature is not available at object time when running under CMS.

** This feature is available under CMS at object time as of VM/370 Release 3, except that no ISAM Interface is provided.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Compilation under the IBM Operating System: The compiler will operate in a 54K partition under MFT, in a 56K region under MVT or in a 76K region with TSO. With VS, partition and region sizes are rounded up to a multiple of 64K.

Additional memory, either real or virtual, can be used to reduce compilation time, by reducing the use of auxiliary storage (SYSUT1) used by the compiler.

The machine must include the floating-point and decimal instruction sets. The timer feature is required if the time taken for compilation or the time of compilation are to be recorded.

Approximately 146 tracks of 3330 or equivalent direct access storage space are required for compiler residence.

Execution under the IBM Operating System: The main storage requirements of the object program are a function of the PL/I facilities used. The decimal and floating point instruction sets are required. If extended floating point calculation is explicitly used in the object program, the extended floating point instruction set is automatically simulated (if not present on the machine) by the OS Extended Precision Simulator. The timer feature is required if use is made of the TIME built-in function or the DELAY statement. The object programs produced by this compiler can utilize all input/output devices supported by the following access methods:

BSAM, QSAM, BISAM, QISAM, VSAM, BDAM and TCAM.

Time Sharing under TSO: Any TSO terminal can be used to interact with the compiler provided that the correct character set is available. If a 2741 is used, the most suitable keyboard configuration is PTTC/EBCD with either the #9571 or the #9591 print element. The TSO Message Control Program must be suitably set up to accept the character codes from this terminal. Other keyboards can be used but may not be as convenient as the above.

Suitable display terminals are the 3275 mdl 2 and 3277 mdl 2 Display Stations. With these terminals, the most suitable keyboard is the 78 EBCDIC Typewriter Keyboard #4633.

Compilation and Execution under CMS: To operate the compiler under CMS, a minimum of 320K of virtual storage is required for the CMS virtual machine.

When executing a PL/I object program under CMS, the same processor features are required as are used when executing under the IBM Operating System.

Under CMS, the compiler and libraries support those I/O devices which are supported under the IBM Operating System provided they are supported by VM/370. For a list of devices supported by VM/370, see the *IBM Virtual Machine Facility/370 Planning and System Generation Guide* (GC20-1801).

SOFTWARE REQUIREMENTS

Release 3.1 of the compiler is supported on OS Release 21, OS/VS2 (SVS) all releases, OS/VS1 Releases 1 through 7, OS/VS2 (MVS) through Release 3.8 and the CMS component of Releases 1 through 6 of VM/370, until March 31, 1982. After March 31, 1982, Release 3.1 of the compiler is no longer current.

Release 4.0 of the compiler is supported on OS/VS1 Release 7, OS/VS2 (MVS) Release 3.8 and the CMS component of Release 6 of VM/370, and subsequent versions, releases and modifications, unless otherwise stated in a modification of the specifications.

Subroutine Libraries: A subroutine library is required during link-edit of a compiler output module (or when loading an object module under CMS). A second library is required for execution of the object program. Each library is available as an IBM program product:

OS PL/I Resident Library (5734-LM4) - For link-editing.

OS PL/I Transient Library (5734-LM5) - For execution.

For a processor in which programs are compiled, but not link-edited or executed, only the compiler is required. For a processor in which programs are link-edited but not compiled or executed, only the resident library is required. For a processor in which programs are executed but not compiled or link-edited, only the transient library is required. The three products are available packaged together (5734-PL3) or individually.

Compilation Under the IBM Operating System: The access methods used directly by the compiler are BSAM and QSAM. BPAM is used if required for compile-time preprocessing. The timer system generation option is required if the time taken for compilation or the time of compilation are to be recorded.

Execution Under the IBM Operating System: PL/I multitasking facilities can be used only on an MVT or VS2 system.

All object programs require BSAM and QSAM or VSAM in the generated operating system. Programs using INDEXED data sets require ISAM or VSAM, and those using REGIONAL data sets require BDAM. Programs using TRANSIENT files require TCAM. The use of TCAM also requires the generation of a TCAM message control program to direct messages to and from the disk queues. The timer system generation option is required if use is made of the TIME built-in function or the DELAY statement.

Time Sharing: This compiler can be invoked from a remote terminal when using the Time Sharing Option of the Operating System or under CMS.

PROGRAM PRODUCTS

OS PL/I Optimizing Compiler (cont'd)

Compilation and Execution under CMS: There are no additional restrictions on the language accepted by the compiler under CMS. Programs compiled under CMS will execute under the IBM Operating System but the following features are not available when executed under CMS:

- Multitasking.
- Teleprocessing file support.
- INDEXED file support.
- PL/I Sort facilities.
- PL/I Checkpoint/Restart facilities.
- ASCII data sets.
- BACKWARDS attribute with magnetic tapes.
- PL/I FETCH and RELEASE statements.
- VS or VBS record formats.
- VSAM data sets (Note 1).

Note 1: This restriction is removed as of VM/370 Release 3.

For additional information about the object time restrictions under CMS, refer to the publication *OS PL/I Optimizing Compiler: CMS User's Guide* (SC33-0037).

Execution under CICS: Object programs may be executed as application programs in the CICS environment. The usability of PL/I programs in the CICS/VS environment is increased by Release 3 of the OS PL/I Optimizing Compiler under OS/VS.

COMPATIBILITY

Compatibility between different releases of the OS PL/I Optimizing Compiler and the OS PL/I Resident and Transient Libraries: For the successful link-editing of object modules, the resident library must be from a release corresponding to, or later than the compiler used. Object modules from different releases of the compiler can be link-edited together provided that the release of the resident library is at least as recent as the latest compiler used.

For successful execution, the transient library must be from a release corresponding or subsequent to that of the resident library used.

The OS PL/I Optimizing Compiler is compatible with the OS PL/I F Compiler and the DOS PL/I D (Version 4) Compiler in the following respects:

	With PL/I F (Version 5)	With PL/I D (Version 4)
Source Language	Yes*	Yes**
Data Sets	Yes	Limited
Compiler Restrictions	Yes*	Yes**
Object Code	No	No

* For more information, see the *OS PL/I Optimizing Compiler General Information Guide* (SC33-0006).

** For more information, see the *DOS PL/I Optimizing Compiler Programmer's Guide* (GC33-0008).

Compatibility with the OS PL/I Checkout Compiler: The OS PL/I Optimizing Compiler and OS PL/I Checkout Compiler (5734-PL2) have been designed as a pair. The primary aim of the Checkout Compiler is to reduce time and effort spent on program checkout, while the Optimizing Compiler is primarily concerned with providing increased system throughput when the program is in production use. Thus, used together the two compilers can increase the efficiency of both programmer effort and machine usage. The conversational PL/I language features applicable to the Checkout Compiler are syntax checked by the Optimizing Compiler but otherwise ignored. A summary of the compatibility of the two products is shown below.

Compatibility with the DOS PL/I Optimizing Compiler: The OS PL/I Optimizing Compiler implements a superset of the DOS language and the high degree of compatibility between these two compilers provides a convenient migration path from DOS to OS. A summary of the compatibility between the two products is shown below:

	W/Checkout Compiler	W/DOS Optimizing Compiler
Source Language	Yes*	Yes
Data Sets	Yes	Limited
Compiler Restrictions	Yes*	Yes
Object Code	Yes	No

* For more information, see the *OS PL/I Optimizing and Checkout Compilers Language Reference Manual* (SC33-0009).

Features:

Extensive Optimization: Object code can be optimized to a much greater extent than has previously been possible with IBM PL/I compilers. Optimization is optional, the options available to the programmer being:

OPT(TIME) - Object code optimized to reduce the time required for execution of the object program. The secondary effect may be a reduction in object program size.

NOPT - No optional optimization, permitting fastest compilation. This is the standard default setting.

Advanced Level of PL/I: The level of PL/I supported by the compiler is more extensive than the language supported by the OS PL/I F (Version 5) and the DOS PL/I D (Version 4) Compilers. It contains the following new features:

VSAM Support ** - Current RECORD I/O language in existing programs, written to use ISAM data sets, automatically runs on VSAM. New environment options allow PL/I Support for more VSAM features in new programs compiled on Release 3 of the compiler.

DEFAULT Statement - The programmer can now override the standard language default attributes for all identifiers and descriptors by use of the DEFAULT statement. This statement can also be used for subsequent reversion to the standard defaults.

ENTRY Attributes - Internal entry constants need not be declared with the ENTRY attribute. The use of entry variables is introduced to PL/I.

File Variables - Increased capability for data base handling is provided by the introduction of file variables.

Based Variables - A locator variable used to qualify a based variable can now be subscripted or based.

Preprocessor Functions - The use of compile-time preprocessor functions has been simplified. Two additional string built-in functions, LENGTH and INDEX, are available. The RESCAN and NORESCAN options can be used to qualify the activation of a preprocessor variable. Additional built-in functions, COUNTER, COMPILETIME and PARMSET, are available. Statements %NOTE, %PRINT and %NOPRINT are introduced. Arguments to preprocessor procedures may be specified by keyword reference as well as positionally.

The %INCLUDE Facility - Using the compiler option INCLUDE will improve compile speed if the inclusion of external text is the only preprocessor function used.

The CHECK Condition - Variables that are based, defined or parameters, in addition to automatic, controlled and static variables, can be used with the CHECK condition.

The VARYING Attribute - Variables that are BASED or DEFINED can be used with the VARYING attribute.

Record Input/Output - Variables that are parameters or defined, or arrays or structures of varying strings, can be used in record oriented input/output statements. Parameters that are CONNECTED arrays or structures can similarly be used.

Comparison of Labels - Label constants and label variables can be compared in IF statements.

Array and Structure Assignments - Assignments to arrays of structures can include arrays that are not arrays of structures.

The REFER Option - Greater flexibility is available in the use of the REFER option in self-defining structures. More than one REFER option can be used in each structure. In some structures, use of REFER is not restricted to the end of the structure.

Dynamic Variables in the ENVIRONMENT Option - Expressions such as maximum record length, blocksize, etc., for record I/O may be specified by variables in the ENVIRONMENT option, which are accessed at the time the file is opened.

Structured Programming Statements - the ease with which Structured Programming Techniques can be utilized is increased in the compiler by the SELECT group, and the LEAVE, DO UNTIL and DO REPEAT statements.

ASCII Support* - Object programs can create or access data sets in ASCII provided the data sets are on magnetic tape with formats U, F, FB, D or DB. These data sets will be supported by STREAM files and by RECORD SEQUENTIAL BUFFERED FILES using the CONSECUTIVE environment option. Only character data may be written onto an ASCII data set.

* This feature is not available at object time when running under CMS.

** This feature is available under CMS at object time as of VM/370 Release 3, except that no ISAM interface is provided.

Time Sharing: This compiler can be invoked from a remote terminal when using the Time Sharing Option of the IBM Operating System or the CMS component of VM/370. In this mode, it will support line numbers

PROGRAM PRODUCTS
OS PL/I Optimizing Compiler (cont'd)

(in addition to statement numbers) in diagnostic messages. Compiler error messages can be received at the user's terminal. Under TSO only, the user can be prompted at the remote terminal for job parameters that are omitted or incorrectly entered. Data sets required for compilation are dynamically allocated.

The compiler can be used to write interactive application programs. Execution of a program compiled by OS PL/I Optimizing Compiler may be interrupted from the terminal by use of the attention button (or equivalent).

Extensive Debugging Aids: The extensive diagnostics available at compilation and execution times minimize the time and effort required for program debugging. Where possible, the compiler will make an assumption as to the intended meaning of an erroneous statement. Diagnostic messages produced by the compiler are in the categories of termination error, severe and other errors, and warnings. Messages for each category are listed in statement number order, each message indicating:

- The number of the erroneous statement, and the portion of the statement involved.
- The exact nature of the error.
- Any assumptions made, or actions taken by the compiler.

Other aids to program debugging include:

- Control over interrupt and error handling. Error handling functions may be built-in or programmer-defined.
- Powerful flow-tracing facilities, including statement number trace facilities, statement counting facilities, the CHECK condition, the SNAP option and dynamic dumping facilities.
- Communication with the program during execution by use of the DISPLAY statement, or attention condition.
- A compiler option to allow the programmer to check only the syntax of his programs. This avoids the burden of complete compilation when serious errors are found.

Communication with FORTRAN, COBOL and Assembler: Subject to certain rules the compiler will allow communication between PL/I object modules and FORTRAN, COBOL or Assembler object modules. Data may be passed as arguments and automatically remapped if required. See *OS PL/I Optimizing Compiler: General Information Manual* (GC33-0001). For details, see *OS PL/I Optimizing and Checkout Compilers Language Reference Manual* (SC33-0009) and *OS PL/I Optimizing Compiler Programmer's Guide* (SC33-0006).

Compiler Options: In addition to the option for object code optimization, the wide range of options includes control over:

- Main storage allocation for compilation.
- Preprocessing and processing characteristics.
- Input/Output features including:
 - Source program listings.
 - Attribute and cross-reference tables.
 - Object program listings in Assembler code.
 - Storage maps.
 - Use of terminal for all compiler listings with TSO or CMS.
 - Punched card decks.

The default settings for all options can be altered or selected options can be deleted from usage.

Additional Facilities: Provisions are made for:

- Accessing the system CHECKPOINT/RESTART program, thus providing recovery facilities in the event of system or machine failure during long production runs.
- Accessing the sort routines of the system Sort/Merge program directly from a PL/I object program.

Note: The CHECKPOINT/RESTART and Sort/Merge facilities are not available when running an object program under CMS.

OS PL/I CHECKOUT COMPILER Release 3 5734-PL2

DESCRIPTION

Interpretive Processing: The Checkout Compiler provides comprehensive facilities for checking and debugging PL/I programs. It provides many of these functions because it is an interpretive processor in both background and foreground.

Processing is divided into two stages: Translation and interpretation. During translation, the original PL/I source code is translated into a more elemental form; this process is roughly equivalent to conventional compilation. During interpretation, the coded text is interpreted under control of the Checkout Compiler to achieve the same effect as conventional execution. The design emphasis is on high translation speed. Interpretation speed is adequate for debugging purposes.

Diagnostic Capabilities: Because the Checkout Compiler is interpretive, it has the following features which assist the programmer in developing and debugging his programs:

- During translation, the compiler carries out extensive syntactic and semantic checks, and provides lucid diagnostic messages about the errors it discovers.
- Diagnostic messages are available in either a full or short form, selected by compiler option. The full-form messages are detailed and make the identification of errors very simple, thus minimizing the need to refer to supporting publications.
- During interpretation, the compiler acts as an execution monitor. This enables it to detect and report errors as they occur. Processing is not allowed to continue to the point where secondary errors may obscure the exact nature of the original problem. Detailed error information, such as the names and values of variables involved in an interrupt, is provided. Current statement number and procedure name are also given when an error is found.
- The Checkout Compiler detects illegal branching outside the bounds of the user's program and intercepts addressing of storage not belonging to the program.
- A user option allows the compiler to continue interpretation after attempted compiler fix-up, up to a specified maximum number of errors.
- Since the translation process retains the identity of each PL/I source statement, execution time errors can be pinpointed and reported in PL/I terms. Therefore, debugging can usually be completed at the source level without the need for storage dumps.

Debugging Facilities: In addition to the existing powerful debugging features of PL/I (e.g., the CHECK prefix option for program tracing and ON-units for interrupt handling), the Checkout Compiler implements new checking aids: The CHECK and NOCHECK statements allow tracing of identifiers to be turned on and off dynamically ... a continuous record of the last N (a compiler option) program branches is automatically saved; PUT FLOW causes this list to be printed ... FLOW and NOFLOW allow printing of branch points to be turned on and off dynamically ... PUT ALL provides a simple means of printing information on variables, files, ON-units ... PUT SNAP causes the printing of a backward calling trace.

The compiler also provides an option for maintaining and printing statement execution counts. This helps the programmer to detect redundant code, test all paths through his program and tune the performance of production programs.

General Operation: Program compilation is fast, due to the Checkout Compiler's very high translation rate and its low start-up overhead. Throughput is further improved by allowing single external procedure programs to be translated and immediately executed without link editing. This permits processing of multiple programs within a single job step or command.

Since all programs are executed under control of the Checkout Compiler, an error in one program will seldom affect the processing of subsequent programs included in the same job step. Furthermore, compiler options are available to limit the total number of statements executed and the total SYSPRINT output and, thus, help prevent runaway situations.

Procedures can also be saved for later link editing (or loading, if operating under CMS) and execution (under Checkout Compiler control) with modules produced by:

- The Checkout Compiler itself.
- The OS PL/I Optimizing Compiler.
- OS Assembler and FORTRAN and COBOL compilers using the Interlanguage Communications routines supplied as part of the Checkout and Optimizing Compilers.

Batch Processing: The Checkout Compiler operates under OS as a conventional batch processor to help debug programs quickly and thoroughly.

Batch operation can be made even more productive, with the option to continue interpretation after errors have been diagnosed and fixed-up. Thus several run-time errors may be diagnosed in a single turnaround.

Conversational Processing: The compiler operates under the OS Time Sharing Option (TSO), or the Conversational Monitor System (CMS) component of VM/370.

• Program Build and Translation

In conversational mode, the programmer ordinarily builds his program at the terminal, using the EDIT facility of TSO or CMS. The compiler can then be invoked from the terminal, and diagnostic messages will be printed there. Messages concerning errors detected during translation are issued as each phase of translation is completed. Compiler options provide flexibility in choosing whether processing is to continue or the programmer is to gain control when errors are found. If he gains control, then he can modify his source program and commence a fresh translation immediately, without waiting for output from a background compilation run.

The HALT option allows the user to gain control before the first execution of each external procedure. This allows breakpoints to be inserted in the program if desired.

• Interpretation

During interpretation, the programmer may interact with the executing program or with the Checkout Compiler itself. Information about the progress of interpretation may be delivered directly to the terminal, allowing the programmer to monitor program events as they occur. Interpretation may be interrupted by the programmer at any time. Execution errors which are encountered cause the Checkout Compiler to suspend interpretation and report the details of the problem to the terminal user.

The following facilities are available to the terminal user to stop the program and gain control during execution.

- The terminal interrupt key. This stops the program unless an ATTENTION ON-unit is active, in which case the programmer has specified the action to be taken.
- The STEP subcommand which causes interpretation to be suspended after execution of a specified number of statements.
- A HALT statement in the PL/I source program.
- Programmed breakpoints inserted using the AT and ABOVE subcommands.

The processor also stops during interpretation when it discovers an error.

Corrective Action: When interpretation is stopped, almost any PL/I statement may be executed immediately to display and alter the values of variables or to perform scratch pad calculations. These statements, known as immediate PL/I, can introduce new variables and labels in addition to performing operations on variables declared in the original source.

The programmer may also:

- Display active ON-units.
- Display information on the status of files.
- Obtain a flow trace.
- Invoke additional debugging aids.
- Resume interpretation at any point in the program.

Temporary source-level modifications may be made conversationally using the AT and ABOVE subcommands. Permanent corrections can be made to the source as well as to the code being interpreted, using the following 'Source Management' facilities:

- Syntax corrections made by the compiler can also be merged into the source.
- Current source is available for listing at the terminal at any time.
- Attributes of and references to variables are available on request during interpretation.
- Source can be located, rearranged, modified, verified and renumbered using a range of editing subcommands.
- TSO dataset and CMS file manipulation subcommands can be invoked without leaving the PL/I environment.
- Current source can be saved at any time.
- Retranslation is simplified - thus assisting the modification of declarations made in the original source.

Language Level: Because of language extensions and developments, the level of PL/I exceeds that supported by the OS PL/I (F) Compiler. New features include the ability to vary the default attributes of variables (DEFAULT), to FETCH and RELEASE procedures dynamically,

PROGRAM PRODUCTS

OS PL/I Checkout Compiler R3 (cont'd)

and the addition of FILE and ENTRY variables, and structured programming statements.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

For operation under MFT and MVT at least 100K bytes of main storage of an IBM S/360 or S/370 must be available. Both the compiler and user program use this area.

In a TSO environment, an additional 18-20K will be required in the user's region. Main storage in excess of the basic requirement will be used to reduce I/O activity and hence, to improve performance.

To operate under VS1 and VS2 the compiler requires a minimum virtual partition or region of 128K.

Standard decimal and floating point instructions are mandatory. The extended floating point instruction set will be simulated by the Operating System (if not present on the machine) if extended floating point precision is explicitly used in the program. Programs in execution are able to use any of the devices supported by the access method being used (BSAM, QSAM, BISAM, QISAM, VSAM, BDAM or TCAM). The IBM 3330 and 2305 are supported; however, when accessing its workfiles, the Checkout Compiler will not make use of the multiple request and Rotational Position Sensing features. The IBM 3211 Printer is supported, and the IBM 3505 and 3525 special features are fully supported when specified via JCL.

The compiler together with its associated data sets occupies approximately 250 tracks of IBM 3330 or equivalent of direct access storage space.

A suitable terminal to be used to interact with the Checkout/Optimizing Compilers is an IBM 2741. If this terminal is used, the most suitable keyboard configuration is PTTC/EBCD with either the #9571 or the #9591 print element. The TSO Message Control Program must be suitably set up to accept the character codes from this terminal. Other keyboards can be used but may not be as convenient as the above.

Suitable display terminals are the IBM 3275 mdl 2 and 3277 mdl 2 Display Stations. With these terminals, the most suitable keyboard is the 78 EBCDIC Typewriter Keyboard #4633.

Minimum System Configuration - CMS: To operate the compiler under CMS, the minimum CMS virtual machine size of 320K bytes is required.

When executing a PL/I program under CMS, the same processor features are required as are used when executing under the IBM Operating System. Under CMS, the PL/I Checkout Compiler and Transient Library support those I/O devices which are supported under the IBM Operating System provided they are supported by VM/370. For a list of the devices supported by VM/370, see the *IBM Virtual Machine Facility/370 Planning and Generation Guide* (GC20-1801).

SOFTWARE REQUIREMENTS

The compiler is designed to operate under currently supported releases of the IBM Operating System and under all subsequent releases, versions and modifications - including VS1 and VS2 - unless otherwise stated in a revision of the Specifications. The Time Sharing Option (TSO) of the Operating System is required for conversational mode.

The compiler also operates (from compiler Release 2.1) in conversational mode under Release 2 and all subsequent releases of the Conversational Monitor System (CMS) component of the Virtual Machine Facility/370 (VM/370).

Under IBM Operating System: The minimum data management access methods required by the compiler are BSAM and QSAM. If compile-time preprocessing is specified, or if translated text is to be link-edited, BPAM will also be required. Programs using INDEXED or VSAM files require ISAM or VSAM and those using REGIONAL files require BDAM. Programs using TRANSIENT files require TCAM. ASCII data sets can be created and accessed using QSAM.

During interpretation under OS, ASCII data sets can be created or accessed provided they are on magnetic tape with format U, F, FB, D or DB records. These data sets will be supported by STREAM files and by RECORD SEQUENTIAL BUFFERED files using the CONSECUTIVE environment option. Records in these files may contain CHARACTER data only.

Under CMS

The following language cannot be executed under CMS:

- Teleprocessing file support.
- INDEXED file support.
- PL/I SORT facilities.
- PL/I Checkpoint/Restart facilities.
- ASCII data sets.
- BACKWARDS attribute with magnetic tapes.

- PL/I FETCH and RELEASE statements.
- VS and VBS record formats.

In addition, the object code of programs compiled under CMS cannot be transferred to OS, or vice versa. (The Optimizing Compiler may be used to create object code which is transferrable between the operating systems.)

For additional information about the restrictions under CMS, refer to the publication *OS PL/I Checkout Compiler General Information Manual* (GC33-0003).

COMPATIBILITY

Compatibility with PL/I (F) (360S-NL-511): With the exception of sterling pictures and constants, the language implemented by the Checkout Compiler includes all of the language implemented by PL/I (F). Programs written for the F Compiler can, therefore, be processed by the Checkout Compiler. However, there are a few minor implementation differences and language changes which are detailed in the *Checkout Compiler General Information Manual*. Most are beyond the range of normal program usage. Object modules that have been compiled by the PL/I (F) Compiler, and modules from the PL/I (F) Compiler Subroutine Library, cannot be incorporated into programs compiled by the PL/I Checkout Compiler. Such programs should be recompiled with the Checkout Compiler.

Compatibility with the PL/I Optimizing Compiler (5734-PL1): With the exception of the special purpose language features listed below, there is full source language compatibility between the Checkout Compiler and the OS PL/I Optimizing Compiler. The Checkout Compiler implements language features associated with its debugging facilities which the Optimizing Compiler does not share. The Optimizing Compiler implements PL/I optimization features which the Checkout Compiler does not. Each compiler checks the syntax of the statements that are implemented only by the other, but otherwise ignores them.

Modules of translated text from the Checkout Compiler and object modules from the Optimizing Compiler can be combined (by link-edit or CMS load), to run together under control of the Checkout Compiler. The following language features are implemented under the PL/I Checkout Compiler but not the PL/I Optimizing Compiler.

- PUT SNAP
- PUT FLOW
- PUT ALL ('option')
- HALT
- FLOW, NOFLOW
- CHECK, NOCHECK (as language statements; does not apply to the CHECK condition prefix)

In addition, subcommands recognized during conversational use of the PL/I Checkout Compiler under TSO and CMS would not be accepted by the PL/I Optimizing Compiler.

The checkout compiler can interpret multitasking statements under CMS, but multitasking statements compiled by the OS PL/I Optimizing Compiler cannot be executed under CMS.

The following language features are implemented under the PL/I Optimizing Compiler but not by the Checkout Compiler.

- ORDER, REORDER
- TOTAL

Compatibility with the DOS PL/I Optimizing Compiler (5736-PL1): There are significant differences between the PL/I language implemented by the PL/I Checkout Compiler and that implemented by the DOS PL/I Optimizing Compiler. If the Checkout Compiler is used to develop programs for subsequent compilation by the DOS Optimizer (e.g., if the Checker is used under CMS under VM, and the DOS Optimizer is used under DOS under VM), care should be taken to ensure that PL/I Language features used are supported by both compilers.

As an aid to users, a list of the principal differences between the levels of PL/I Language supported by the two compilers is given below. (Note: The list is intended as a guide only, and is not guaranteed to define all possible differences.) Users are recommended to refer to the following two publications:

- OS PL/I Checkout and Optimizing Compilers: Language Reference Manual* (GC33-0009)
- DOS PL/I Optimizing Compiler: Language Reference Manual* (GC33-0005)

Principal differences between the PL/I Language levels supported by the PL/I Checkout Compiler and the DOS PL/I Optimizing Compiler.

a. Input/Output

Control of program input/output is the area of language where most differences between the two compilers exists. In general a DOS program must contain much more information about the dataset associated with a file than is required in an OS program, and there

OS PL/I Checkout Compiler R3 (cont'd)

are important differences in the options of the ENVIRONMENT attribute of files. Particular differences are:

The following OS ENVIRONMENT options are not recognized under DOS:

NCP, REGIONAL (2), REREAD, TOTAL, TP, TRKOFL

The following DOS ENVIRONMENT options are not recognized under OS (although many of them can be specified in JCL):

ASSOCIATE, CMDCHN, COLBIN, EXTENTNUMBER, FILESEC, FUNCTION, HIGHINDEX, INDEXMULTIPLE, MEDIUM, NOFEED, NOLABEL, NOTAPEMK, OFLTRACKS, OMR, RCE, STACKER, UNLOAD, VERIFY, VOLSEQ, WRTPROT.

There are no EXCLUSIVE files under DOS (so no NOLOCK option and UNLOCK statement).

There are no TRANSIENT files under DOS (so no PENDING condition).

Under DOS, the only options that can be specified in an OPEN statement are: INPUT, OUTPUT, PAGESIZE, LINESIZE and TITLE. INPUT and OUTPUT can only appear if the file is declared CONSECUTIVE UNBUFFERED. TITLE cannot be specified for a CONSECUTIVE UNBUFFERED file, a file associated with a magnetic tape, or for a file with a unit record device specified explicitly in the MEDIUM option.

Under DOS, V-format records are not allowed on a REGIONAL (3) file.

Input (primary and included) to the DOS PL/I Optimizing Compiler must be 80-byte fixed length records. The PL/I Checkout Compiler accepts F and U-format records with lengths up to 100 bytes, and V-format records up to 104 bytes.

b. Compiler Options

The following options usable with the PL/I CHECKOUT Compiler are not supported by the DOS PL/I Optimizing Compiler:

BLOCK, CAPS/ASIS, COMPATIBLE, DIAGNOSE, ERRORS, FORMAT, HALT, ISASIZE, LMESSAGE/SMESSAGE, NUMBER, OBJECT, RUN, SEQUENCE, SMAN, STEP, STEPLINES, STMT, TERMINAL and VERIFY.

The following options usable with the DOS PL/I Optimizing Compiler are not supported by the PL/I Checkout Compiler:

DECK, DYNBUF, GOSTMT, INCLUDE, LINK, LIST, LIM-SCONV, MAP, OFFSET, OPTIMIZE and WORKFILE.

LINK on DOS is equivalent to OBJECT on OS.

c. Other Features

Features available under OS but not under DOS include: Multitasking ... FETCH and RELEASE ... Extended floating point.

In addition:

Under DOS, the library name for included text must consist of one character.

Certain statements that can be processed by the PL/I Checkout Compiler, and can be accepted but not processed by the OS PL/I Optimizing Compiler, will be treated as errors by the DOS PL/I Optimizing Compiler. (For differences between the OS Optimizing and Checkout Compilers [including Checker-only statements] see Appendix L of the *OS PL/I Optimizing and Checkout Compilers: Language Reference Manual* (GC33-0009).

Compatibility Between Releases: Correct execution is not guaranteed where modules translated by Release 1 of the PL/I Checkout Compiler are interpreted by Release 2 or Release 3. Thus, mixtures of Release 1, 2 and 3 modules are not supported. For Release 2.0 and subsequent releases the normal compatibility rules apply; e.g., Release 2.0-compiled modules may be interpreted on Release 2.1, 2.2 or 3.0 of the compiler and transient library.

PERFORMANCE

The primary design objective of the compiler is to improve programmer productivity by providing fast program translation and highly comprehensive checkout and debugging facilities. The implementation of these features is made possible by the interpretive nature of the processor. Design emphasis has been placed on extensive object time checking and control rather than execution speed. Although object time performance will be significantly slower than that of conventional compilers, it should be entirely adequate for program checkout.

The following statement of PL/I Checkout Compiler Release 2 capabilities is based on actual measurements made on a S/370 mdl 155 using 3330 direct access devices. Note that the measurements were made in 'batch' mode, without the internal source file; i.e., using the NOSMAN option.

Compiler Performance Under MFT and MVT: This compiler will operate at roughly the following speeds PROVIDED IT IS GIVEN AMPLE PROVISION OF MAIN STORAGE (see notes below).

Processor time for translation:

(1 + number of statements translated) / 45 seconds

Processor time for execution:

(1 + number of statements executed) / 1200 seconds

The effect of the SMAN option, applicable where programs are to be conversationally debugged under TSO, is that the compiler requires on average 15% more time to translate a given program. If there is significant contention for main storage between compiler phases and the program being translated with the SMAN option, up to 10K more storage may be needed to achieve this performance, since the SMAN option increases the size of the internal compiler files. The SMAN option has a negligible effect on the time required for execution.

Note that in general execution and (to a much lesser extent) translation performance of the Checkout Compiler is strongly influenced by the amount of main storage available.

Elapsed time for execution will be between four and ten times longer than that for executing the same program compiled by Version 5 of the PL/I (F) Compiler at OPT=0.

Execution times for certain individual programs may vary widely from these estimates.

Storage Requirements under MFT and MVT: Storage requirements depend on the size of the program. Small programs can be translated in 100K bytes. On the other hand, a program with a large number of identifiers might require more than 150K.

For execution, a small program using only a small amount of data might run effectively in 100K, while a more complicated program with larger data or I/O buffer requirements might require more than 150K.

The speed of operation of the compiler will be improved if more than the minimum storage is provided.

Storage Requirements under VS1 and VS2: VS1 and VS2 allow partitions/regions to be defined as multiples of 64K bytes; hence, the minimum partition/region size required by the Checkout Compiler is 128K. The virtual storage required by a particular program is variable in the same way as discussed for the MFT/MVT case. However, larger virtual partitions/regions will, in general, enhance performance provided there is sufficient real memory available such that excessive paging activity does not occur.

Storage Requirements under CMS: The minimum CMS virtual machine size of 320K bytes may be used. This is sufficient for most PL/I programs, but large programs might require a larger virtual machine.

Prerequisite: A subroutine library is required during interpretation of a translated program. The library is available as an IBM program product, the OS PL/I Transient Library (5734-LM5). Note: A single copy of this library can be used with both the OS PL/I Checkout and Optimizing Compilers.

**VIDEO/370
DOS (5736-RC3)
OS (5734-RC5)**

DESCRIPTION

VIDEO/370, IBM's Visual Data Entry Online System which runs on S/360 or S/370 is an online data entry program product for both transcriptive and distributive means of collection and verification of source data. It performs most of the functions of the 29 Card Punch, 59 Verifier, 129 Card Data Recorder, 50 Magnetic Data Inscrber 50 and DATA/360-2260 functions with cost reduction facilities made possible by an online local or remote 3270 System and computer program logic. VIDEO/370 is of most significance to customers who are using keypunches, key-to-tape or off-line key clusters to disk, and to those who have a requirement for source data entry.

DOS/VIDEO/370 is a key entry system which operates under the Disk Operating System (DOS) and DOS/VS. OS/VIDEO/370 is a key entry system which operates under the Operating System (OS), MVT, VS1 and VS2. This program provides a method of entering source data online by local or remote 3270 System terminals to disk file(s), and paging, correcting and verifying this data to produce input to a customer's program eliminating all unit record operations. VIDEO/370 supports any number of displays within processor storage limits, addressing limits and response limits of the processor (see "Hardware Requirements"), operating system limits, and 2311, 2314, 2319, 3330/3333, 3340 or 3350 direct access storage limits.

The CICS feature of DOS/VIDEO/370 enables the online portion of the product to run as an application program under the control of CICS/DOS-Standard (5736-XX7) and CICS/DOS/VS (5746-XX3). The CICS feature of OS/VIDEO/370 enables the online portion of the product to run as an application program under the control of CICS/OS-Standard V2 (5734-XX7) and CICS/OS/VS (5740-XX1).

HIGHLIGHTS

- Provides for data validation and error correction at the source.
- Maximum number of 3270 control units and terminals - limited by system's size and response time.
- Supports local and remote 3270 displays.
- Generalized design is application independent; the size and function of DOS/VIDEO/370 is tailorable to a particular installation's requirement.
- Functionally duplicates most of the 029, 059, 050, 129 and DATA/360 functions plus additional features.
- Increases system throughput.
- Improved turnaround time.
- Improves management control of key entry.
- Improves keystroke rate.
- Application dependent data formatting and prompting.
- Permits use of fill-in-the-blanks concept without increasing operator keystrokes.
- Requires no change to existing entry documents; entered records can be re-arranged by field under format control.
- Error fields are intensified for easy recognition.
- Each display station can optionally enter or verify data.
- Input data length is restricted only by screen size and VIDEO/370 control information.
- Format control on any number of fields (within display screen limit).
- Record lists of unresolved entry-verify errors maintained for fast access when correcting.
- Format change possible by use of program function key.
- Operator, format and production statistics.
- On output, fixed or variable length application records may be created.
- User exits in edit and extract operations to provide customized operation.
- Delete, Insert and Update record facility during entry, paging or verification.
- Simultaneous data entry and extraction (of different batches) to an application program.
- Keyboard upper shift under programmed format control.
- Paging of records by variable increments.
- Unlimited number of formats per batch.
- Multiple entry sets for flexibility and reliability.
- Extensive editing capability.
- Balance Totals - A summation for checking purposes of one or more designated fields of a batch.
- Ability to mark records in error for subsequent easy access and correction.
- Crossfooting - Addition of any number of numeric fields within a record for balancing or checking.
- Flexible security features.
- Message transmission from 3270 operator to system operator.
- Ability to tab from field to field both during normal entry and error correction procedures.
- Terminal flexibility when the CICS feature is used.
- Use of CICS Teleprocessing and File I/O facilities.

Use: The user of DOS/VIDEO/370 (OS/VIDEO) has the capability of entering data for typical applications that will run in a DOS (OS) environment. The data or source characters may be entered directly if they are contained within the standard 3270 system character set. A

capability is provided to allow the entry of characters not within this 64-character set through hexadecimal characters.

CUSTOMER RESPONSIBILITIES

A customer installing VIDEO/370 must meet the minimum machine configuration. He must also assure that appropriate DOS or OS training (including terminal and direct access storage education) be given to the systems analysts responsible for the installation of VIDEO/370. The customer must ensure that appropriate training is given the terminal operator in the use of VIDEO/370 commands and procedures. The customer must define the disk file allocation, terminal network and specify VIDEO/370 options desired.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS - DOS

VIDEO/370 operates under the Disk Operating System (DOS), DOS/VS, and DOS/VSE using BTAM (supporting 3270), DAM and SAM with: One IBM 3115 Processing Unit mdl FE or ... one IBM 2030 Processing Unit mdl F with the decimal arithmetic feature (#2327) and the interval timer feature (#4760) ... one Direct Access Storage Unit (IBM 2311, 2314, 2319, 3330, 3340 or 3350) ... one Line Printer (or equivalent) ... a selector channel, byte multiplexer channel or a block multiplexer channel

The minimum data communications configuration consists of one display device, a device controller and, for remote operation, a transmission controller.

Display Device: IBM 3277 (mdl 1 or 2), IBM 3278 (mdl 1, 2, 3 or 4) or the displays integrated in the IBM 3276 or 3275.

Device controller: IBM 3271 or 3275 (mdl 1 or 2), IBM 3274 (Model 1C or 1B) or the IBM 3276 (mdl 1, 2, 3 or 4).

Transmission controller: IBM 2701, 2703, 3704, 3705 or equivalent Integrated Communications Adapter configured for binary synchronous communication.

The IBM 3278 and integral display of the IBM 3276 are supported in 480 or 1920 character mode only.

HARDWARE REQUIREMENTS - OS

VIDEO/370 operates under the Operating System (OS) MFT, MVT, VS1, VS2, using BTAM supporting 3270, BDAM and BSAM with: one IBM 3135 Processing Unit mdl GD or ... one IBM 2040 Processing Unit mdl G with the decimal arithmetic feature (#3237) ... one Disk Storage Unit ... one Line Printer (or equivalent) ... a selector channel, byte multiplexer channel or a block multiplexer channel.

The minimum data communications configuration consists of one display device, a device controller and, for remote operation, a transmission controller.

Display Device: IBM 3277 (mdl 1 or 2), IBM 3278 (mdl 1, 2, 3 or 4), or the displays integrated in the IBM 3276 or 3275.

Device controller: IBM 3271 or 3275 (mdls 1 or 2), IBM 3274 (mdl 1C or 1B) or the IBM 3276 (mdl 1, 2, 3, or 4).

Transmission controller: IBM 2701, 2703, 3704, 3705 or equivalent Integrated Communications Adapter configured for binary synchronous communication.

The IBM 3278 and integral display of the IBM 3276 are supported in 480 or 1920 character mode only.

In addition, the following devices are required to install and maintain either system: one Card Read/Punch ... one 9-Track Tape Drive.

For the CICS feature, the processing unit requirements of CICS must be met.

DOCUMENTATION: (available from Mechanicsburg)

Specifications (OS GC27-6967, DOS GC27-6969) ... *Introduction to the IBM 3270 Information Display System* (GA27-2739) ... *Operator's Guide for IBM 3270 Information Display System* (GA27-2742).

VIDEO/370 CICS FEATURE

5736-RC3 ... Feature: #6038, 6039, 6040.
5734-RC5 ... Feature: #6085, 6086, 6087.

VIDEO/370 is a prerequisite for ordering this program feature.

PROGRAM PRODUCTS
**OS SORT/MERGE
 5734-SM1**
PURPOSE

The OS Sort/Merge (5734-SM1) satisfies the sorting and merging requirements of both tape-oriented and disk-oriented installations. The program will use different sorting and merging techniques depending on:

- The control information supplied by the user.
- The amount of main storage and secondary storage which is available to the program.

DESCRIPTION
Basic Features

- Sorting or merging can be accomplished on as many as 64 control data fields.
- The collating sequence as well as the data format can be specified separately for each control field.
- Device independent initial input and final output.
- With sufficient main or virtual storage, as many as 32 tape units or 17 work areas on either 3330/3333 or 2314 or 6 work areas on either 2301 or 2311 may be used for intermediate storage, as well as multiple input and output devices.
- Callable through COBOL, Assembler language and PL/I.
- All functions, facilities and options available in Type I 360S-SM-023 have been incorporated into the 5734-SM1 program product. There are no requirements for modifications to user written routines.

Features

- Support of 3330/3333 ... Extended Use of Exits ... Allows the use of all User Exits when sort is dynamically invoked ... Concatenation of SORTIN.
- The input data sets can be concatenated even if they reside on 'unlike' devices.

Modified CORE-parameter - In MFT and MVT, OS Sort/Merge OS-SM1 will use all available core if the user specifies MAX as the CORE-parameter value. This saves the user from recalculating the amount of core needed on different installations or in different regions or partitions.

- In VS1 and VS2, an appropriate nominal value of the CORE-parameter should be used. Maximum should not be used as a value.

Expanded Parameter List E61 - The parameter list passed to E61 previously contained only the number and the address of the extracted control field. It now also contains the length of the control field.

Expanded Standard for User Exit Names - A user library may contain several exit routines having unique names which may connect to the same exit point. In 360S-SM-023 all routines pointing at the same exit point had to have the same name as the exit point, even if they were not to be link-edited.

Checkpoints in Merge - Checkpoint/Restart is supported in Merge applications at End of Volume on SORTOUT.

Print Control Statement - The user will now have an option of printing his Sort/Merge control statements.

ASCII Formatted Files - It will be possible to read and write ASCII files and sort in ASCII Collating Sequence.

Note: 5734-SM1 or equivalent is a prerequisite for sorting on OS with the 3330/3333. 360S-SM-023 does not support the 3330.

SPECIFIED OPERATING ENVIRONMENT
HARDWARE REQUIREMENTS

For MFT and MVT, an OS system allowing a minimum of 15.5K bytes of main storage for the OS Sort/Merge program (inclusive of minimum data management). For VS1 and VS2, a minimum virtual partition of 64K bytes is required.

In addition to the standard system residence, the Sort/Merge requires at least one device for input/output and three intermediate storage areas on one of the following IBM devices:

- One 2311 Disk Storage Drive.
- One 2301 Drum Storage Drive.
- One drive of 3330/3333 Disk Storage.
- One drive of 2314 DASD.
- Three 2400/3400 series Magnetic Tape Units.

For planning purposes, the *IBM S/360 OS Sort/Merge Systems Information Manual* may be used to calculate disk storage requirements.

Any device supported by QSAM can be used as an input or output device.

The following table shows the tape configuration requirements:

Record Format	Input	Work	Object
Fixed or Variable	9-track	9-track	9-track
Fixed	7-track	7- or 9-track or mixed	7- or 9-track or mixed
Variable	7-track	9-track	7- or 9-track

Note: Distribution of OS-SM1 is on tape; therefore, access to at least one 2400 series Magnetic Tape Unit is required for installation.

SOFTWARE REQUIREMENTS

OS-SM1 is written in Assembler language and operates under the current OS/360 MVT, MFT or PCP systems.

DOCUMENTATION: (available from Mechanicsburg)

Timing Estimates (GC33-4008) ... *General Information Manual* (GC28-6754) ... *Specifications* (GC33-4006).

PROGRAM PRODUCTS

**TSO DATA UTILITIES: COPY, FORMAT, LIST, MERGE
5734-UT1****PURPOSE**

The OS TSO Data Utilities consists of the following terminal commands:

COPY
FORMAT
LIST
MERGE

This program provides OS Time Sharing Option users with the capabilities of copying, merging and controlled-format printing. The Data Utility commands are easy to use and are functionally complete. The design is consistent with the intent of TSO in that it addresses the professional programmer to the individual with no computer experience.

The Data Utility command processing programs provide full support of the TSO requirements and features. OS password protection is supported by the Data Utilities. The data set organizations supported are sequential and partitioned.

The FORMAT and MERGE commands also serve as EDIT subcommands. When invoked as subcommands, the FORMAT and MERGE operations are oriented specifically toward the data sets being processed by the EDIT command.

The HELP command provides assistance for the inexperienced user.

HIGHLIGHTS**COPY**

- Duplicates sequential or partitioned data sets.
- Adds members to a partitioned data set.
- Merges two partitioned data sets.
- Resequences records as they are copied.
- Changes record length, blocksize and record format on a copy to a physical sequential data set. On a copy to a partitioned data set, the above attributes become those of the partitioned data set.

MERGE

- Copies all or part of a data set. into a specified part of another data set.
- Resequences the resultant data set or members of a partitioned data set.

LIST

- Prints all or selected records of physical sequential data sets or members of partitioned data sets.
- Optionally prints specified columns of records.

FORMAT

- Prints data sets in a format determined by embedded control words.
- The control words enable the following capabilities:
 - Prints a heading on each page.
 - Centers lines between the margins.
 - Specifies the number of spaces in the top and bottom margins.
 - Causes right justification of lines.
 - Page numbering.
 - Stops printing.
 - Reprints pages.
 - Single and double line spacing.
 - Space insertion at the beginning of each line.
 - Line length variation.
 - Page length variation.
 - Paragraph indentation control.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Operation of the TSO Data Utilities under TSO requires the minimum TSO configuration.

PROGRAM PRODUCTS

**STAT/BASIC
5734-XA3****PURPOSE**

STAT/BASIC is an interactive program encompassing the most commonly used statistical techniques for the analysis of numerical data. It operates under ITF (DOS, OS, or TSO) or VS BASIC with VSPC, VM/370 CMS, or TSO.

STAT/BASIC is designed to meet the needs of the statistician, engineer, researcher or business analyst. It helps him to utilize the computer directly for statistical analyses. A statistically oriented user should have no difficulty in quickly learning the capabilities of the program. The interactive mode of the package allows a non data processing oriented user to use the program with ease, with a minimum of training.

Operation provides the user with fast results. Because of the interactive nature the user can sit at the keyboard and see the results of his analysis as they are developed. Delays and some of the sources of error familiar in batch processing are eliminated with STAT/BASIC.

DESCRIPTION

STAT/BASIC consists of 40 procedures, written in the BASIC language, providing a wide range of capabilities under the following categories --

Data Generation -- Read... Print... Edit ... Transformation.

Elementary Statistics -- Cross Tabulation ... Histogram ... Tally ... Moments ... T-test ... Chi-square.

Regression and Correlation Analysis -- Correlation ... Simple Regression ... Stepwise Regression ... Multiple Regression ... Polynomial Regression.

Multivariate Analysis -- Discriminant Analysis ... Canonical Correlation ... Factor Analysis Part 1 ... Factor Analysis Part 2.

Analysis of Variance -- One-way Analysis of Variance ... Factorial Design.

Nonparametric Statistics -- Kendall Rank Correlation ... Sign Test ... Wilcoxon's Matched-pairs Signed-ranks Test ... Cochran Q Test ... Friedman Two-way Analysis of Variance ... Mann-Whitney U Test ... Kendall Coefficient of Concordance ... Biserial Correlation ... Point-biserial Correlation ... Tetrachoric Correlation ... Phi Coefficient.

Time Series Analysis -- Moving Average ... Seasonal Analysis ... Cyclical Analysis ... Auto-covariance and Auto-correlation ... Cross-covariance and Cross-correlation ... Triple Exponential Smoothing.

Biostatistics ---Survival Rate ... Probit Analysis.

HIGHLIGHTS

- A comprehensive set of statistical procedures.
- A user with a knowledge of statistics can learn the program capabilities with a minimum of effort.
- Interactive mode simplifies usage.
- Calculations performed in short or long precision.
- Extensive error checking with correction facilities.
- Instructional messages clarify procedures or options available.

USE

The user may utilize any of the STAT/BASIC programs through any terminal supported by the host interactive environment. The user first types a few systems commands and the name of the desired statistical program. Following a Ready indication, STAT/BASIC guides the user through his problem by typing out procedural instructions. Alternate courses of action or options are usually in the form of questions, which the user answers by typing the appropriate replies.

CUSTOMER RESPONSIBILITIES

The STAT/BASIC programs are distributed in machine readable form for loading into the user system. Once stored, it is available to any member of the organization authorized to use the system.

If confidential information is to be stored in the library, the user must take appropriate steps to safeguard against unauthorized access.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The size of the user area required to run the STAT/BASIC procedures is a function of the number of statements in an individual procedure and the amount of data processed in short and long precision.

All procedures, with the exception of the transformation procedure, can be executed in short precision in a user area of 40,000 bytes with a symbol table size of 9000 bytes.

All procedures, with the exception of the transformation procedure, can be executed in long precision in a user area of 50,000 bytes with a symbol table size of 16,300 bytes. The transformation procedure cannot be executed in long precision; it can be executed in short precision in a user area of 50,000 bytes with a symbol table size of 10,800 bytes.

SOFTWARE REQUIREMENTS

STAT/BASIC is written in the BASIC language. It may be used with VS BASIC (5748-XX1) or ITF BASIC (OS: 5734-RC3; DOS: 5736-RC2; or TSO: 5734-RC4).

DOCUMENTATION: (available from Mechanicsburg)

General Information Manual (GH20-1027) ... *Promotional Flyer* (G520-2463).

PROGRAM PRODUCTS

**APPLICATION PROGRAM GENERATOR
OS - 5734-XC3; DOS - 5736-XC3****PURPOSE**

The System/7 Application Program Generator (APG/7) offers high-level program support for many different sensor-based applications found in the plant automation, process control, and data-acquisition applications. APG/7 reduces the programming effort required to install and maintain such applications. It allows the customer or IBM systems engineer to focus attention on application design, rather than machine-oriented programming details.

DESCRIPTION

APG/7 is made up of three major components: 'fill-in-the-blanks' facilities, a high-level language compiler, and a series of System/7 subroutines. The first two execute on a S/360 or S/370; the third consists of subroutines that execute on System/7, and are used to implement functions invoked by 'fill-in-the-blanks' specifications, or by language statements.

The 'fill-in-the-blanks' facilities provide question forms that guide the user in the selection and specification of programs from the library of Modular Systems Programs (MSP/7) or from the Application Module Library (5707-MLM1).

The APG/7 compiler provides the user a means for specification of operations that are more conveniently handled by language statements, rather than by specification of tables for library subroutines. The language contains a compatible subset of PL/I. The APG/7 language may be used to READ/WRITE files from/to a remote computing system, using the System/7 Binary Synchronous Communications Adapter (BSCA). Transmission of data to/from the remote computer will be in EBCDIC transparency mode in fixed record length.

The remote computing system may be an S/370, mdl 115 through mdl 195, an System/3, mdl 10 or mdl 15 Disk or another System/7 with the BSCA feature.

The APG/7 language contains special features oriented to System/7 applications. These features are peculiar to APG/7; they are not part of PL/I.

HIGHLIGHTS

- 'Fill-in-the-blanks' forms - guide users as they select and tailors library programs to be used, describes their data tables, and specifies the hardware configuration.
- Host file maintenance - S/360-S/370 host data files can be updated to reflect alterations to the System/7 program and data.
- Report generation - data from S/360-S/370 host files can be printed according to user-defined formats.
- Language compiler - provides users with high level method of describing their operating procedures using terminology familiar to them. The language contains a compatible subset of PL/I.

Applications: APG/7 is designed for cross-industry use in realtime sensor-based applications found in the plant automation, process control, and data acquisition applications.

The APG/7 language addresses a broad spectrum of sensor-based applications including manufacture, movement, test, and batch sequence control.

Use: To create a program for execution in System/7, the user answers questions about the application on 'fill-in-the-blanks' forms. These answers select and tailor the operating system facilities required from the MSP/7 library. If AML/7 is used, answers are also provided for the application data tables and facilities. Application operations are then described using the APG/7 procedural language. (Alternatively, subroutines may be written using the macro assembler language.) APG/7, working with the MSP/7 Host Program Preparation Facilities II, converts this information into a System/7 storage load module. The MSP/7 facilities are also used to format the storage load for transfer to the System/7 for execution.

Maintenance of such application programs is eased, since APG/7 provides facilities to generate reports that completely document the selections and the data provided on the forms. Additions to the APG/7 files can easily extend the use of the tailoring and documenting facilities to application subroutines that the user may personally write.

CUSTOMER RESPONSIBILITIES

- Create specification information for the application and complete the 'fill-in-the-blanks' forms for input to APG/7.
- Supply all program libraries necessary to the implementation of the application. This includes program products such as AML/7 if required.
- Provide, if necessary, appropriate application routines using the APG/7 procedural language.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

System Configuration for OS, OS/VS1, or OS/VS2: APG/7 requires a partition or region size of approximately 80K bytes. APG/7 requires storage space on a disk file for programs and files. The OS version uses approximately 418 tracks of an IBM 2316 Disk Pack or equivalent 3336 or 3348 Disk Pack Space. The sizes of some files are specified by the customer and may be smaller than the standard values. The use of tapes or cards for backup files can further reduce requirements.

System Configuration for DOS or DOS/VS: APG/7 requires a partition size of approximately 52K bytes. APG/7 requires storage space on a disk file for programs and files. The DOS version uses approximately 685 tracks of an IBM 2316 Disk Pack or equivalent 3336 or 3348 Disk Pack Space. The sizes of some files are specified by the customer and may be smaller than the standard values. The use of tapes or cards for backup files can further reduce requirements.

An APG/7 application program including only MSP/7 routines and not using the APG/7 language, the IBM 5022 Disk Storage Module, the IBM 3340 Disk Storage Module, an IBM 2790 Data Communication System, the BSCA support, or the Sequential Access Method requires a minimum System/7 configuration of 4K words of storage (an IBM 5010 Processor Module mdl A4 or B4) and an IBM 5028 Operator Station. Normally, at least a mdl A6 or B6 (6K words) is required if the APG/7 language is used. If other programs are included, such as AML/7 or PCP/7, the appropriate amount of storage must be added to the requirement.

The System/7 Processor mdls E16-E64 (16K words to 64K words) are supported.

SOFTWARE REQUIREMENTS

The portions of APG/7 that execute on the IBM S/360 or S/370 are written in macro assembler language. APG/7 operates under Release 26 and Release 27 of the Disk Operating System (DOS), and under Release 29 (DOS/VS), using the SAM and DAM access methods. When operating under the Operating System (OS), access methods used are QSAM, BSAM, and BDAM. APG/7 also operates under OS/VS1, and OS/VS2, in Real or Virtual Mode.

When using the IBM System/7 BSCA feature to communicate to a remote computing system, the remote system must use Teleprocessing access methods as follows:

For IBM S/370:

- DOS, DOS/VS - BTAM
- OS, OS/VS1, OS/VS2 - BTAM or TCAM
- DOS/VS, OS/VS1, OS/VS2 - VTAM

Refer to System/7 Facilities II Macro Library/Relocatable for System/7 specifications.

For IBM System/3:

- System/3 MLMP

For IBM System/7:

- MSP/7 Communications Access Method

The IBM System/7 subroutines are written in the System/7 macro assembler language. The Modular Systems Program (MSP/7), ASM/7 and LINK/7 are used in support of APG/7.

PROGRAM PRODUCTS

**BUSINESS ANALYSIS/BASIC
5734-XMB****PURPOSE**

This comprehensive set of interactive routines is used with VS BASIC under VSPC, VM/370 CMS, or TSO and with ITF under OS, DOS or TSO.

It consists of 30 routines written in the BASIC language, providing the problem-solver professional with procedures for data generation and maintenance, spread sheet analysis, investment analysis, break-even of cost-volume-profit analysis, depreciation analysis, and time series analysis. The program is designed so that a detailed knowledge of programming is not required.

DESCRIPTION

Business Analysis/BASIC includes 30 interactive routines for assisting the problem-solver in exercising the following functions:

- Spread Sheet Analysis:
 - Spread Sheet data file creation and update
 - Spread Sheet report formatting
- Investment Analysis:
 - Return-on-Investment computation
 - Discounted Cash Flow analysis
 - Loan analysis (multiple and single)
 - Lease vs Purchase analysis
 - Make vs Buy analysis
- Break-Even Analysis:
 - Break-even with definite assumptions
 - Break-even with probabilistic assumptions
- Depreciation Analysis:
 - Straight line depreciation
 - Sum-of-years digits depreciation
 - Declining balance depreciation
 - Equipment units depreciation
- Time Series Analysis:
 - Compound growth rate projection
 - Moving average
 - Seasonal analysis
 - Cyclical analysis
 - Autocovariance and Autocorrelation
 - Crosscovariance and Crosscorrelation
 - Exponential Smoothing
 - Simple Regression
- Graphic Presentation:
 - Histograms
 - Exponential Smoothing Plots
- Routine and File Indexing:
 - Business Analysis/BASIC routine index
 - User created data file log
- Data Generation and Maintenance:
 - Create and update data files
 - Select and rearrange records in data files and spread sheet data files
 - Resequence records in data files and spread sheet data files
 - Print data files

HIGHLIGHTS

- Comprehensive set of analytical routines to assist the user in examining investment alternatives and in preparing financial plans.
- Spread sheet analysis capability for report creation and update.
- Interactive features include instructional messages, flexible control of calculations, extensive error checking, and data editing.

Use: The professional analyst can utilize any of the Business Analysis/BASIC routines through a 2741 Data Communications Terminal or other terminals supported by ITF and VM/370-CMS.

The user first enters a few systems commands (LOGON, EDIT, etc.) and the name of the desired Business Analysis/BASIC routine. Following a READY indication, the Business Analysis/BASIC routine guides the user through his problem by typing out procedural instructions. Alternative courses of action or options are presented in the form of questions, which the user answers by entering the appropriate replies.

CUSTOMER RESPONSIBILITIES

The user must have the necessary computer configuration as described below. In the case of the S/360 or S/370, appropriate terminals and communication lines must be available. The user will also need the associated program product for his system as mentioned under "Programming Requirements".

Business Analysis/BASIC program is distributed in machine-readable form for loading into the user's system. Once stored, it is available to any member of the organization authorized to use the system.

If the user has confidential information to be stored in disk files, it will be his responsibility to take appropriate steps to safeguard against unauthorized access.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The requirements to run Business Analysis/BASIC are:

ITF (OS, DOS, TSO)

The Business Analysis/BASIC routines require a user area of 50,000 bytes and a symbol table of 10,800 bytes when the routines are run in short precision. Execution in long precision requires a user area of 60,000 bytes and a symbol table of 16,300 bytes. Business Analysis/BASIC supports all terminals supported by the most interactive environment.

SOFTWARE REQUIREMENTS

Business Analysis/BASIC is written in the BASIC language. To run the program requires the appropriate BASIC program product: DOS-ITF BASIC (5736-RC2), OS-ITF BASIC (5734-RC3), or TSO-ITF BASIC (5734-RC4), or VS BASIC (5748-XX1).

PROGRAM PRODUCTS

**MATRIX GENERATOR and REPORT WRITER (MGRW)
for the MATHEMATICAL PROGRAMMING SYSTEM
EXTENDED (MPSX) 5734-XMC****PURPOSE**

MGRW is a Matrix Generator and Report Writer for the Mathematical Programming System Extended (MPSX), Program Product 5734-XM4 and for the Mathematical Programming System Extended/370 OS/VS (MPSX/370 OS/VS), Program Product 5740-XM3.

Mathematical programming models are essentially arrays where the names of rows and columns have mnemonic significance. MGRW is an array-oriented system which simplifies the difficult task of generating mathematical models. Extensive facilities for name manipulation, pictorial report writing, table maintenance and analysis of linear programming solutions are available in this system. MGRW operates as a procedure under MPSX or MPSX/370 OS/VS.

HIGHLIGHTS

MGRW statements are self-descriptive and easy to understand ... pictorial format descriptors provide a visual representation of a report before it is produced ... communication with MPSX CR cells is possible via symbolic references at the MGRW program level ... MGRW is based on a list-driven concept which eliminates the constant search for names in order to locate data ... sets of table elements may be easily referenced by means of list subscripts ... scalar as well as table facilities are available for data storage ... extensive diagnostic facilities include tracing ... arithmetic, relational, boolean, and list operators and functions satisfy the most sophisticated model building requirements.

Use: In mathematical programming, the user first assembles the information required to build the linear programming model. MGRW is designed to carry out the actual generation of the model. It provides the user with a specialized language-type tool not only for reading the raw data but for assembling it in LP model form. Once the LP model has been optimized, MGRW provides the necessary language facilities for relating the original data to the solution to the LP model to produce a report for management.

CUSTOMER RESPONSIBILITIES

Users of MGRW are expected to have a background in mathematical programming and, more specifically, in the Mathematical Programming System Extended (MPSX) or the Mathematical Programming System Extended/370 OS/VS (MPSX/370 OS/VS). MGRW is designed for easy use, and the degree of learning effort required is similar to that of a higher-level programming language like FORTRAN. Data may be read in almost any format, from which tables, master files, etc., may then be generated.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

MGRW is subject to the system configuration requirements of whichever of the Mathematical Programming Systems it is operating under. For MPSX, these will be found in the *MPSX Operations Manual* (SH20-0924), while for MPSX/370, they are in the *MPSX/370 General Information Manual* (GH19-1090). Under MPSX, MGRW requires a partition or region with a minimum address space of 190K bytes which includes Version 1 of MPSX. Under MPSX/370 OS/VS, the minimum virtual address space required to run MGRW is less than that needed to run MPSX/370 alone. It requires one direct access storage device supplied by the Mathematical Programming System and also one 2400-series magnetic tape unit for installation and support, since the MGRW program and program change releases are distributed on magnetic tape.

MGRW uses the Universal Instruction Set, and, if the system output is a printer, it must have 132 print positions. In addition to the MPSX or MPSX/370 file requirements, MGRW requires the files described in Figure 1, and it optionally uses the files described in Figure 2.

Figure 1

FILE NAME	DESCRIPTION
PROGFILE	Contains the compiled MGRW program and the data associated with it. Must be a direct access device.
SORT1	Work file

Figure 2

FILE NAME	DESCRIPTION
EQVFILE	Contains system equivalences.
ERROR	Contains error messages and tracing information.
SORT2, SORT3, SORT4	These files are used by MGRW to speed up the sorting operations.

SOFTWARE REQUIREMENTS

MGRW may be assembled with the OS/360 F-level Assembler, and uses BSAM and QSAM data management facilities. MGRW runs under OS MFT and MVT on S/360 and S/370 and under OS/VS1 and

OS/VS2 on S/370 only. It can also be used with any of these systems running under VM/370 on a S/370. MGRW requires the OS/360 Utility Program IEHMOVE for system generation, and it runs as a procedure under MPSX, Program Product 5734-XM4, or MPSX/370 OS/VS. The F-level Linkage Editor is also required.

Program Services: Programming Service Classification C ... Testing Period 30 days

PROGRAM PRODUCTS

**PROCEDURE LIBRARY - MATHEMATICS
5734-XM3****PURPOSE**

This program product provides in the PL/I language powerful computational tools for the scientist and engineer.

DESCRIPTION

This library is a set of basic computational procedures intended to help the user develop his own PL/I procedure library. It evolved from the mathematics portion of the Scientific Subroutine Package - PL/I (SSP-PL/I), a Type II Program (360A-CM-07X).

The procedures included in the Procedure Library-Mathematics may be classified into three groups.

Procedures taken from SSP-PL/I and modified according to new conventions, but with functional capabilities and coding virtually unchanged.

Procedures with functional capabilities similar to those found in SSP-PL/I, but with coding revised to take advantage of current algorithmic technology.

New procedures representing new functional capabilities.

These categories contain approximately 40, 20, and 40 percent of the procedures in the Procedure Library-Mathematics, respectively.

Individual procedures or combinations of them can be used in the following general areas:

- Elementary array manipulations
- Solution of linear equations
- Eigenanalysis and related topics
- Polynomial operations
 - Orthogonal polynomials
 - Lanczos economization
 - Zeros of a polynomial
- Numerical quadrature
- Tabulated functions
- Nontabulated functions
- Numerical differentiation
- Tabulated functions
- Nontabulated functions
- Interpolation
- Approximation
- Smoothing
- Zeros and extrema of functions
- Linear programming
- Systems of ordinary differential equations with given initial values
- Convergence acceleration
- Transforms
- Special functions

With respect to SSP-PL/I, this library includes the following revisions and additions:

- Iterative refinement of the solution of systems of linear equations
- Solution of the general eigenanalysis problem
- Real and complex zeros of a polynomial
- Interpolation and approximation by cubic splines
- Interpolation by exponential sums
- Fast Fourier transforms
- Chebyshev approximations
- Extrema of functions
- Linear programming
- Solution of systems of ordinary differential equations
- Convergence acceleration
- Special mathematical functions

Features:

All procedures are free of input/output statements.

All procedures are written in OS PL/I F-level language (60-character set).

Many of the procedures provide a double-precision option. This option can be implemented at compile time using the compiler option SORMGIN.

The use of certain procedures (or groups of them) is illustrated in the program documentation by sample main programs with input/output.

All procedures are documented uniformly.

Certain classes of errors are detected and flagged. If these are ignored, the user is warned under the default option.

USE

The user may invoke any procedure from the Procedure Library-Mathematics by means of the standard PL/I CALL statement or FUNCTION reference, just as he does with his own procedures. Procedures of this program product are computational in nature and do not contain any references to input/output devices. The user must furnish, as part of his program, whatever input/output and other operations are necessary for the total solution of his problem.

CUSTOMER RESPONSIBILITIES

The customer should be familiar with the OS PL/I (F) language and the Operating System.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

A minimum requirement for compilation is a S/360 or S/370 suitable for the OS PL/I (F) compiler or the OS PL/I Optimizing Compiler (5734-PL1). The procedures are distributed on magnetic tape.

The storage requirements for any given problem depend upon the number of procedures used, the size of the compiled procedures, the size of the compiled main program, the size of the control program, and the data storage requirements.

SOFTWARE REQUIREMENTS

The procedures are written in the PL/I language, using the facilities provided by the OS PL/I (F) Compiler. They may also be compiled under the OS PL/I Optimizing Compiler (5734-PL1).

The 60-character symbol set is used.

PROGRAM PRODUCTS

**VEHICLE SCHEDULING PROGRAM - EXTENDED
VSPX OS (5734-XM5)
VSPX DOS (5736-XM3)****PURPOSE**

VSPX provides a comprehensive tool in the planning and operating of a distribution and delivery system. It computes near-optimal routes for the delivery of products or services by a fleet of vehicles. Since the program contains a wide range of options, it can be applied to most fleet routing and delivery situations. The advantages over manual methods are: Increased efficiency and speed of scheduling, improved routing and cost reductions through better fleet utilization.

DESCRIPTION

VSPX determines the routes a group of vehicles must travel to meet certain commitments in the delivery of services or products to customers at given locations. The program tends to optimize basic factors, such as travel time and number of vehicles. VSPX consists of two main sections, the Network Analysis Program and the Schedule Production Program. The first program analyzes a network representing the potential calling points by computing either actual or approximate distances between all points. The second program can repetitively produce schedules which meet various restrictions such as route time, speed, vehicle capacity and customer requirements.

VSPX can be used to solve many types of delivery problems. In addition to performing the daily routing function, VSPX can be applied to (a) redefine fixed routes, (b) aid in determining feasible locations of warehouses and depots to service customers, (c) plan for a new fleet and (d) provide statistical and cost data relative to the efficiency of a fleet.

Input to the Network Analysis Program may conform to one of two types: True-Distance or Coordinate Method. Both methods are based on zones rather than actual customers. A zone is defined as a delivery area (e.g., a shopping center, a postal zone or a section of a city), which can contain from 1 to 255 customers. The True-Distance Method considers actual distances over roads between all points, intersections and zones. An individual speed can be specified for each road in the network, if desired. This method, while more time-consuming to prepare, gives a higher degree of accuracy, because the output file represents the combined knowledge of a company's manual routing and dispatching departments. The True-Distance Method is best suited for networks in which customer locations can be determined in advance with relatively few changes so that the program needs to be executed only infrequently. Both methods produce a file representing all practical combinations of potential delivery zones.

The Schedule Production Program uses the output of the Network Analysis Program, together with a list of calls to be made. It then prepares feasible routes approaching optimum loads and minimum travel time, within the restrictions imposed by the user. The most valuable result is that fewer vehicles may be required. The output of the program consists of a printed list of the recommended routes. A summary of fleet utilization is also produced. All output is stored on disk in a format readable by PL/I programs and can be modified by the user to prepare a variety of specialized reports, including warehouse packing and loading lists, invoices in route sequence, special driver instructions and various analytical reports. The output can also be used as a re-entry medium into the user's existing data processing flow. Therefore, VSPX can be a link to a more fully integrated distribution system.

HIGHLIGHTS

The features of the Schedule Production Program listed below are of particular interest because they allow the schedules to be tailored to specific requirements of customer service and fleet utilization. These features are designed as options, which are used only when requested by the user and can then be combined in almost any manner.

- Limited calling times by stop.
- Average time at all stops in addition to loading/unloading.
- Special additional time for an individual stop.
- Vehicle limits by calling point.
- Up to 255 different vehicle types and capacities.
- Modification of average vehicle speed.
- Earliest possible starting and latest possible finishing time for the fleet.
- Maximum route time by vehicle type.
- Maximum number of calls per route.
- Multi-compartment vehicles (up to 15 compartments each).
- Variable assignment of trailers to vehicles.
- Average unloading time per unit.
- Dual specification of load (e.g., weight and volume.)
- Multiple trips in one scheduling period (up to three trips for each vehicle).
- Multiple-day journeys.
- Low-priority orders.
- Traveling time between calls within zones.
- Indicated orders.
- Average mileage between calling points within zones.
- Maximum route mileage.

- Consideration of route time between first and last customer on a route.
- Average reloading time per unit.
- Additional stop time at the depot.
- Predetermined start or end delivery for a route.

USE

VSPX consists of two basic parts, which can be thought of as separate programs and can be executed independently if desired. These are the Network Analysis and Schedule Production Programs.

After determining whether to use the True-Distance or the Coordinate Method of input, the user must prepare the appropriate network description cards for the Network Analysis Program. The output file from this phase is then used as partial input to the Schedule Production Program. In addition, for this second phase, the user must specify the various delivery requests and restrictions, fleet descriptions, and limits to be imposed.

The output from VSPX consists of a suggested schedule for each route and a summary of fleet utilization. All output is stored on disk. Although the user is not required to write additional programs, he may do so to create input for either phase or to expand the output from the Schedule Production Program.

CUSTOMER RESPONSIBILITIES

The user must be familiar with the options and features of both the Network Analysis and the Schedule Production Programs.

Capable user personnel must be assigned to choose between the True-Distance and the Coordinate Methods, and gather the appropriate data. Sufficient time should be devoted to data gathering prior to implementation of VSPX.

Overall work standards and special requirements for each delivery must be documented prior to producing the first usable schedule.

Some user programming may be required to tailor the input and output of the Schedule Production Program, as mentioned above.

A period of parallel operation should be planned when both VSPX and the manual system are used. This will allow time to try various combinations of the program features to produce the desired routings.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS - OS**

The execution of VSPX (OS) requires a 60K region in an IBM S/360 (with decimal feature) or S/370, one IBM 2311 Disk Storage Drive (in addition to OS System devices) or sufficient storage space on an IBM 2314 Direct Access Storage Facility, 2319 Disk Storage Facility, 3330/3333 or 3340 Disk Storage, one input device (card reader, magnetic tape drive or direct-access storage device), and one output device (printer, magnetic tape drive or direct-access storage device).

For the execution of VSPX using the PL/I Optimizing Compiler, a 100K region is required. For the generation of VSPX, one magnetic tape drive is required.

HARDWARE REQUIREMENTS - DOS

The execution of VSPX (DOS) requires a 24K partition in an IBM S/360 (with decimal feature) or S/370, an IBM 1052 Printer-Keyboard, one IBM 2311 Disk Storage Drive (in addition to DOS system devices) or sufficient storage space on an IBM 2314, 3330, 3340 Direct Access Storage Facility, one input device (card reader, magnetic tape drive or direct-access storage device); and one output device (printer, magnetic tape drive or direct-access storage device). For inclusion of VSPX in the core image and relocatable libraries, one magnetic tape drive is required.

For the execution of VSPX using the PL/I Optimizing Compiler, a partition of 60K is required.

SOFTWARE REQUIREMENTS - OS

VSPX (OS) is written in Assembler language and in PL/I. This program product is released to work with the IBM S/360 Operating System (MFT, MVT) Release 18.6 and all subsequent releases, unless so stated in a future revision of this document. Use is also made of the access methods QSAM, BSAM, BDAM. To install the program, the OS Utility Program IEHMOVE is required.

VSPX (OS) also executes on S/370 virtual storage configurations under control of OS/VS1 or OS/VS2 in virtual mode. It also operates under OS/MFT, OS/MVT, OS/VS1 and OS/VS2 running under VM/370 in virtual mode. The S/370 Virtual Storage configuration must be compatible with that of S/360 or S/370 described above.

SOFTWARE REQUIREMENTS - DOS

VSPX (DOS) is written in Assembler language and in PL/I (PL/I Optimizing Compiler is required). It operates under control of the IBM S/360 Disk Operating System. The utility programs Tape-Tape or

Do not reproduce without written permission

PP 5734-XM5.2

Jul 83

PROGRAM PRODUCTS

VSPX (cont'd)

Tape-Disk and Tape-Card are used to install the program. This program product is released to work with DOS Release 2.1 and all subsequent releases, unless so stated in a future revision of this document.

VSPX (DOS) also executes on S/370 Virtual Storage Configurations under the control of DOS/VS and under DOS and DOS/VS running under VM/370. The object code as distributed executes in virtual = real mode only. For execution in virtual mode, the source code - optional machine readable material - must be ordered and recompiled using the DOS/VS assembler. The S/370 Virtual Storage configuration must be compatible with that of S/360 or S/370 described above.

General Information Manual (GH19-2000).

PROGRAM PRODUCTS

**MATH/BASIC
5734-XM8**

PURPOSE

MATH/BASIC is a set of conversational routines for the solution of the most frequently encountered mathematical problems in science and industry. The library operates under VS BASIC with VSPC, VM/370 CMS or TSO.

MATH/BASIC is designed to meet the needs of the engineer and scientist. The conversational features of MATH/BASIC allow a non-data processing oriented user to use the programs with a minimum of training.

DESCRIPTION

MATH/BASIC consists of 44 routines providing computing capabilities in the following areas:

- Linear equations, matrix eigenvalue problem.
- Zeros of polynomials, zeros and minima of functions.
- Quadrature/differentiation.
- Interpolation, approximation and smoothing.
- Ordinary differential equations.
- Discrete Fourier transform.
- Special functions.
- Linear programming.

HIGHLIGHTS

- A comprehensive set of mathematical routines.
- Calculations in short and long precision.
- Control of operation in the case of ill-conditioned problems and error messages.
- Ease of use due to conversational mode.

Use: The user can utilize any of the MATH/BASIC routines through a 2741 Data Communications Terminal or other terminals supported by the host interactive environment.

The user first enters a few systems commands and the name of the desired MATH/BASIC routine. Following a READY indication, MATH/BASIC guides the user through his problem by printing procedural instructions. Alternate courses of action or options are described usually in the form of questions, which the user answers by entering the appropriate replies.

CUSTOMER RESPONSIBILITIES

The MATH/BASIC program is distributed in machine readable form for loading into the user's system. Once stored, it is available to any member of the organization authorized to use the system.

If confidential information is to be stored in the library, the user must take appropriate steps to safeguard against unauthorized access.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The MATH/BASIC routines require a user area of 50,000 bytes. When these routines are executed in short precision, a symbol table size of 9,000 bytes is required. Execution in long precision requires a symbol table of 16,300 bytes. In addition, the user must have sufficient space in the library to store the MATH/BASIC routines. MATH/BASIC supports all terminals supported by the host interactive environment.

SOFTWARE REQUIREMENTS

MATH/BASIC is written in the BASIC language. It may be used with VS BASIC (5748-XX1).

DOCUMENTATION: (available from Mechanicsburg).

General Information Manual, (GH20-1128) ... Promotional Flyer, (G520-2508).

PROGRAM PRODUCTS

MINIPERT (5734-XP3)**PURPOSE**

MINIPERT is an interactive Critical Path Method (CPM) program designed to help your customer meet the challenging managerial requirements of today's complex research, engineering and manufacturing projects. The value of CPM for project control has been proven in many applications such as construction, special products manufacture, maintenance and repair, research and development, etc. Effective project management requires good planning, control, and measurement of job status and financial performance with minimal delay. MINIPERT provides the management tool needed to meet these requirements and improve the productivity of your customer's valuable resources: men, machine, money and material.

DESCRIPTION

MINIPERT permits the interactive solution of project scheduling problems. The project schedule is described by a work-sequencing operation that treats a project as a series of interrelated activities, some of which can be done in parallel and others serially. When specified in this fashion, the activities form a network. The longest time path through this network determines the time required to complete the project. This path is called the critical path. All other paths through the network have some "slack" with respect to this critical path and represent non-critical work. The job of project management then becomes one of scheduling both critical and non-critical work to take best advantage of available resources while making the critical path as short as feasible.

HIGHLIGHTS

MINIPERT is an extremely versatile computer program for implementing CPM. Its features include variable size data fields ... flexible calendar capable of specifying holidays and vacation periods ... activities can be tagged for work on holidays ... optional use of master files ... networks may contain many subnets (a subnet consists of a number of related activities) ... ability to process either the whole network or an individual subnet ... ability to accept activity time durations in days, weeks, or months ... milestone summarization ... manpower loading ... conversational diagnostics and error correction ... a variety of reports including barcharts and project diagrams.

Note that the five APL workspaces contained in MINIPERT are a selected subset of the workspaces contained in SE Aid Programs - APL Library 835. Specifically, the five selected workspaces are:

- MINIPERT CPM network manipulation and calculation
- MINIREPORTS Basic CPM reporting facility
- DIAGRAM Graphic plot of MINIPERT plan
- NEWDIAGRAM Enhanced diagram report program
- MANPOWER CPM resource manipulation and reporting

These five workspaces are equivalent to those similarly named in the APL Library 835.

USE

MINIPERT will provide an interactive CPM system which can aid in planning a customer's projects.

CUSTOMER RESPONSIBILITIES

A prerequisite for MINIPERT is the installation of either APL/360-DOS (5736-XM6) or APL/360-OS (5734-XM6). MINIPERT will operate in either of these environments after being installed through the use of the APL utility.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

MINIPERT has no additional requirement over the APL/360 resident program product. Please see the appropriate pages for details.

SOFTWARE REQUIREMENTS

MINIPERT was written in the APL language provided by the APL/360 program products.

DOCUMENTATION: (available from Mechanicsburg)

Introduction to MINIPERT (GH20-0852) ... *Promotional Flyer* (G520-2368).

PROGRAM PRODUCTS

**PROJECT MANAGEMENT SYSTEM IV
5734-XP4**

PURPOSE

This program, an integrated collection of computer program modules, has been developed to meet the challenging managerial requirements of today's complex research, engineering and fabrication programs. Projects of all types in construction, special products manufacture, large-scale R & D, etc., have been growing increasingly complex. Effective management requires up-to-date knowledge of job status and financial performance. Even more important, management needs to determine the probable schedule and cost impact of contemplated changes in plan. PMS IV provides the scientific management tools needed for making better delivery promises, for spotting out-of-line conditions, for meeting schedules, and for controlling costs. PMS IV will help your customers plan and control the use of their valuable resources: men, machines, money and material.

DESCRIPTION

Incorporated within this system is a comprehensive set of data processing programs that make available to the user some of the most advanced management techniques utilized both by government and industry. The system provides critical path and general cost analyses, PERT and PERT COST capabilities, Precedence and Precedence/Cost capabilities, as well as Resource Allocation. A principal design objective provides a flexible add-on and substitution capability that allows for a growing library of management-oriented routines, and permits the user to tailor the program to the specific requirements of his installation.

HIGHLIGHTS

PMS IV is an enhancement of PMS/360 III (program product 5734-XP1) and offers a basic Report Processor with three optional features; an Extended Network Processor, a Cost Processor for cost accounting, and a Resource Allocation Processor for schedule adjustment based on resource availability. In addition to the above modular availability, the following significant enhancements are included.

- Improved performance by means of a BSAM search for description records.
- Ability to dynamically alter report sort, paging and format parameters at execution time.
- Ability to process Precedence Networks with percentage lags.
- Ability to process more subnets per network per master file (max 254 networks each with 255 subnets).
- Ability to optionally continue processing with hanging starts and ends.
- Ability to report activity progress in various forms.
- Ability to specify five types of schedule dates.
- Non-linear spreading of cost.
- User defined default values for rates.
- Larger OAT (Organization Analysis Table) and WBS (Work Breakdown Structure) tables (32,767 detail entries per summary item).
- Improved performance through in-core table look-ups instead of sort/merges.
- Deletion of data by charge number.
- Dynamic blocking of work files.
- Compatible with PMS/360 Versions 2 and 3.

The processor capabilities are:

Extended Network Processor: -- Highlights include variable size data fields ... variable ordering of input elements on data cards ... flexible calendar capable of specifying holidays and vacation periods ... activities can be tagged for work on holidays ... optional use of master files ... network may contain up to 255 subnets; subnet size ranges from 1,000 to 32,000 activities, depending on core memory, disk memory, the size of other data elements, operating systems, etc. ... ability to process either the network or the subnet approach to PERT ... ability to accept activity time durations in hours, days, weeks, or months ... nine levels of milestone summarization ... two methods of milestone summarization ... one level of activity summarization that allows the summary activities to be specified explicitly ... a description of up to 99 characters for activities and milestone events that may be subdivided and operated upon in the PMS-Report Processor ... output through the PMS Report Processor can be formatted and tailored to individual needs ... user control of program logic through modular design ... programmed for easy modification ... ability to specify progress data for activities ... five types of schedule dates, including no earlier than, no later than, and imposed dates ... percentage lag relationships in precedence notation ... different work-weeks per activity ... current actual only reportings ... expanded calendar features.

Resource Allocation Processor: -- The highlights of this processor include: Fixed Time or Fixed Resource Scheduling - Secondary levels - full compatibility with other PMS modules - serial-parallel allocation technique... allocation for one or more subnets, which may or may not be in the same network ... Wide variety of possible priority rules for choosing the most important of a set of activities competing for a resource ... alternative resources ... up to 25 resources per activity (or 18 if each has an alternative) ... activities may be split (stopped and restarted later) ... the time-now clock can be stepped up by any number of time-units, so that approximate schedules can be quickly obtained ... more than 32,000 different resources allowed ... scheduling cut-off at any user-defined date ... cyclic or dated changes in resource levels ... 'customized' reports possible through the PMS Report Processor ... regular checkpoint facility.

Cost Processor: -- Highlights include an accounting calendar for variable cost period reporting ... rate tables for budgets, actuals, estimates, commitments and obligations ... Charge Number rate tables for application of factors such as general and administrative expenses and special fees ... Nine-level Work Breakdown Structure for product-oriented cost reporting ... Nine-level Organization Analysis Table Breakdown for function-oriented cost reporting ... optional use of master file ... approximately 32,000 charge numbers and organization codes permitted for each summary item in non linear spreading of cost, both the Work Breakdown Structure and the Organization Analysis Table ... grouping factors for summary resource reporting ... variable card format ... variable field size for many data elements ... description field for use as a user option ... user control of program logic through the modular design ... programmed for easy modification ... additional "customized" reports possible through the PMS Report Processor.

Report Processor: -- Highlights include a set of PERT reports (similar to those produced by IBM PERT COST II, 7090-CP-02X) ... selected DOD/NASA PERT COST reports ... Resource Allocation reports ... statements that allow a user to define his own reports without the aid of a programmer ... ability to read a wide range of input tapes other than those prepared by other PMS modules ... programmed for easy modification ... arithmetic and logical procedures permit analysis of data to be reported ... selectivity of data for processing through request cards.

USE

Report Processor (Basic Package): - The Report Processor of PMS IV is designed for use in output report generation for the other PMS IV modules, or as an independent module within the framework of PMS.

Enhanced Network Processor (Optional feature): - This processor provides enhanced capability in the areas of Progress Reporting, Scheduled Dates and Precedence Networks for application areas which require this function.

Resource Allocation Processor (RAP) (Optional feature): - This processor is a dependent module of PMS IV. It must take its input from either Network Processor of PMS IV and can only produce printed output by means of the Report Processor. The input from the Network Processor gives the earliest and latest dates on which each activity can start (if the entire project is to be finished on time) together with the resources required for each activity and the resources available for the whole project. RAP schedules the start as soon as possible, commensurate with efficient utilization of specified resource availabilities. By means of the Report Processor the user can then output the scheduled start of any activity, and the utilization of any resource at any time during the project.

Cost Processor (Optional Feature): - This module is a collection of project-oriented manpower, material and cost planning and control subroutines. It can be used in conjunction with PERT, or in a completely separate "companion" application. When used with the other major modules of PMS to implement the DOD/NASA PERT COST technique, it can produce the reports required for internal control and the total management cycle.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

PMS IV with the Resource Allocation Processor will require a minimum of about 75K data bytes of main storage over and above the requirements of OS. PMS IV without Resource Allocation (an optional feature) will require a minimum of 44K bytes over and above the OS requirements. Larger core sizes will lead to faster program execution and in the case of the Network Processor, larger subnet capacity (see below).

At least one disk storage drive is required to hold the PMS system and work files. Other peripheral devices supported by PMS IV include all devices supported by OS where QSAM is an accepted access method. Two cost reports furnished by PMS, Management Summary Report (36) and Project Status Report (90) read a file named ORDFILE backwards for efficiency. If no 9-track tapes are available for this file, reports 37

PROGRAM PRODUCTS**PMS IV (cont'd)**

and 91 must be used. These have an additional sort module within them but read ORDFILE forwards.

PMS IV will run on a S/360 or a S/370. The Extended Network Processor operates on a S/370 only.

The Standard and Decimal Feature Instruction Sets are used. If the system's output device is a printer it must have 132 print positions.

The table below illustrates the core storage and peripheral storage byte requirements for a Network Processor and Report Processor run with one subnet for which a master file is created and detailed reports are produced. Input is through a card reader and output is directly on a printer.

No. of Activities in the Subnet*	Core	Peripheral
	Required by PMS/360	Storage Byte Requirements
1000	44K	700K
3560	108K	2,492K
8680	236K	6,076K
18920	492K	13,244K
32000	1004K	22,400K

* For Precedence, activities include both activities and lag relationships.

Essentially, this table is based on a peripheral storage byte requirement of 700 bytes per activity.

SOFTWARE REQUIREMENTS

The program is written in Assembler language and is assembled and can be executed under any of the IBM OS/VS or IBM OS systems. Note: Under VS, PMS IV is supported for V = R only. PMS IV uses QSAM, BDAM and BSAM access methods and makes use of the OS Sort/Merge program. The Sort/Merge used can be any of the OS supported programs, provided that the operating configuration conforms to the device constraints of that Sort/Merge program. IEHMOVE and IEBGENER are required to install the system.

DOCUMENTATION: (available from Mechanicsburg)

Application Description Manual (GH20-0855-1).

PROGRAM PRODUCTS

**GENERAL PURPOSE SIMULATION SYSTEM V
OS (5734-XS2) - DOS (5736-XS3)****PURPOSE**

GPSS V provides an easy-to-use and easy-to-understand tool for modeling and examining the behavior of systems in the engineering and management science areas. This system will accommodate varying model sizes in a modular fashion for S/360 and S/370 configurations with storage capacities ranging from 64K bytes upward for DOS or DOS/VS, and from 128K bytes upward for OS or OS/VS.

DESCRIPTION

GPSS V is a broad range general purpose tool for modeling and examining the behavior of systems in the management and engineering science areas. Many applications of a complex logical and procedure oriented nature which ordinarily defy mathematical description can be easily described and studied using GPSS. Varying environments are simply introduced, and the user can identify optimal conditions, isolate bottlenecks, and determine the effects of delays caused by capacity limitations. Both the particular environment and the activity processes are permitted to have statistical fluctuations as a function of time. Proposed changes to existing policies, methods and operations can be subjected to critical performance criteria and evaluated. The user may also investigate and judge the value of new proposals without costly capital investments and without disturbing existing operations. The application areas in which GPSS type simulations have been useful and profitable are many and varied -- general information system design, communication traffic flow and capacity studies, quality control procedure specification, advanced management planning, analysis of consumer behavior, inventory system design, job shop processing, studies of equipment availability, performance and reliability, transportation loading and scheduling, computer configuration evaluation, economic studies, capital investment and risk studies, analysis of alternative military strategies, analysis of plans for corporate growth and merger, among others.

FEATURES

GPSS V provides many significant advantages over GPSS/360 Version 1 (Type II programs) and GPSS/360 Version 2 (IBM Program Products). The major functions and capabilities of GPSS V are:

- Compatibility with GPSS/360 Version 1 and GPSS/360 Version 2.
- Entities on Auxiliary Storage.
- An interface capability between GPSS V and user written PL/I routines.
- Unavailable Equipment Entities (FACILITIES and STORAGES).
- Byte and single precision floating point savevalues.
- Byte and single precision floating point matrices.
- Every transaction may have as many as 1020 parameters. A maximum of 255 halfword, 255 fullword, 255 byte and 255 single precision floating point parameters in any combination.
- Extended indirect addressing capabilities.
- An automatic cross-reference dictionary of all symbolically addressed entities included with the assembly listing.
- Descriptive error messages to supplement numeric messages.
- Free-Form coding of GPSS statements.
- Unique data sets for the READ/SAVE feature.

USE

Programming experience is generally unnecessary for users of GPSS V. The user needs only to know the rules by which system models are constructed. The logical structure and statistical parameters of the system are first modeled in terms of a GPSS V block diagram. Information from each block of the diagram is keypunched into cards, control cards are added, and the input is then loaded for assembly and execution. No operator intervention is required, diagnostics are executed automatically as required. The operating system used provides GPSS V with input/output services.

CUSTOMER RESPONSIBILITIES

- A thorough understanding of the principles of system modeling.
- Complete definition of system to be modeled, including configuration and all decision logic.
- Collection of data to be used as input to the model.
- Model validation to assure that output is meaningful.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS - OS**

The minimum machine requirements for GPSS V-OS are similar to those for OS/360, OS/VS1, OS/VS2, or VM/370. No additional devices should be necessary. The minimum system required for the program product is an IBM S/360 mdl 40 for OS/360 or an IBM S/370 mdl 135 for OS or OS/VS1 which can support a partition of at least 62K for a model running with PARM=A. An IBM S/370 mdl 145 is needed to run GPSS V-OS under OS/VS2. The only additional requirement is enough direct access and/or sequential storage space for the GPSS V-OS data sets. The GPSS V-OS program will be distributed on magnetic tape only. An IBM 2400-series Tape Unit

(9-or 7-track with Data Conversion feature) must be available for program distribution and maintenance.

HARDWARE REQUIREMENTS - DOS

The minimum system requirements for GPSS V-DOS/VS are similar to those necessary to support either DOS/VS or DOS. For DOS/VS, the minimum system requirement is an IBM S/370 mdl 115. For DOS, the minimum system requirement is an IBM S/360 mdl 30 or an IBM S/370 mdl 135. Use of the Auxiliary Storage feature is not recommended under DOS/VS and is not supported because of its similarity in capability to DOS/VS paging. An IBM S/360 mdl 40 is required for DOS users wishing to use the Auxiliary Storage feature. GPSS Input device support includes IBM 2501, 2520 Card Readers, 2400- or 3400-series Tape Units, or 2311, 2314, 2319, 3330 or 3340 Direct Access Storage devices. Output devices, in addition to the Tape Units and Direct Access Storage devices previously mentioned, include the IBM 1403, 1443, 3211, 3262 and 4245 Printers as well as the IBM 3525 Card Punch. One or more IBM 2400- or 3400-series Tape Units are required when either the Update, Jobtape and/or Read/Save features are to be used. To use the GPSS Run Length feature under DOS, the Interval Timer is required. The sequential access method is used for reading and writing all data sets. For DOS users utilizing the Auxiliary Storage feature, the direct access method is used for the respective entity data sets.

GPSS program modules may reside in either the system Core Image Library or in a private Core Image library. For GPSS data sets, users may wish to either utilize space already allocated to the DOS/VS or DOS system units or allocate other available direct access space.

Main storage requirements vary according to the GPSS phase in progress. A minimum partition of at least 52K is required. The maximum amount of memory required at any one time is approximately 34K, excluding entities, and input/output buffers. DOS users require an additional 5K when using the Auxiliary Storage feature. DOS/VS users can reallocate their real partition size to OK, if desired. For best performance under DOS/VS, the virtual partition size should be approximately equal to the size of the GPSS partition required when running virtual = real.

SOFTWARE REQUIREMENTS

Both GPSS V program products are written entirely in Assembler language.

(available from Mechanicsburg)**

Application Description Manual (GH20-0826)

CONTINUOUS SYSTEM MODELING PROGRAM III and GRAPHIC FEATURE CSMP III (5734-XS9)

PURPOSE

CSMP III and the CSMP III Graphic Feature are designed for the simulation of continuous systems.

DESCRIPTION

Simulation is a well established tool for investigating phenomena ranging from information flow in business organizations to the dynamic behavior of complex electro-mechanical systems. The former often have been treated as discrete processes on digital computers through the use of such discrete system simulation programs as the General Purpose System Simulator (GPSS). By contrast, those continuous dynamic systems that are the usual concern of engineers and scientists have been traditionally simulated on analog computers. However, as the systems under investigation have become more complex and the need for accuracy and flexibility has increased, interest has grown in the application of digital computers for continuous system simulation. In addition, it is recognized that many working in these areas have no desire to learn digital computer programming. The need for a high level application language to facilitate the preparation of problems for solution on digital machines was clearly indicated. CSMP III satisfies the need.

CSMP III incorporates all the features of S/360 CSMP together with a number of enhancements and extensions.

CSMP III provides a basic set of functions with which the components of a continuous system may be represented, and accepts application-oriented statements for defining the relations between these components. This block modeling technique is common to engineering and scientific practices. CSMP III accepts FORTRAN statements, thereby allowing the user to readily handle non-linear and time-variant problems of considerable complexity. The CSMP III language consists of forty-two separate functions such as integrators, delays, function generators, Laplace transforms and limiter functions. This complement is further augmented by the FORTRAN library functions. In addition, special functions can be defined by the user, allowing CSMP III to take on the characteristics of a language oriented to any field of investigation. Input and output are facilitated by means of user-oriented control statements. Output routines are provided for tabular printing and print-plotting.

The Graphic Feature provides a powerful means for man-machine interaction at all stages of the simulation process. Communication with the machine is accomplished by means of a 2250 Display Unit equipped with a light pen and an alphameric keyboard. The program provides a set of display panels corresponding to the various stages of the simulation process. By means of these display panels, the user may review and modify his model. He may view a dynamic display of the simulation output while the computations are in progress. When the simulation is complete, he may analyze the output in more detail and he can choose which output curves he would like to have print-plotted. The program provides many diagnostic features and prompting messages to assure a successful simulation. Through these capabilities, CSMP III with the Graphic Feature permits the user to concentrate upon the phenomenon being studied rather than the mechanism for implementing the simulation.

HIGHLIGHTS of CSMP III

Powerful Standard Functions

The CSMP III language contains forty-two powerful simulation functions for integration, differentiation, signal and function generation, Laplace transformation, and switching and logical operations.

Capability to Develop Additional Functions

By combining standard CSMP III functions and/or FORTRAN statements, the user may build large functions specifically suited to his particular field of study. These functions become part of his CSMP III language and they may be used in a manner identical to the standard CSMP III functions.

Wide Selection of Integration Algorithms

The user has a wide range of integration algorithms from which to choose - both single and double precision; fixed and variable step, including one specifically designed for stiff equations.

Time, the independent variable, is always calculated in double-precision.

Numerous Output Options

- The values of 1 to 55 selected variables may be printed during the simulation run.
- The values of 1 to 220 selected variables may be stored during the simulation run for subsequent printing in tabular or print-plot format. Consequently, the user need not anticipate all of his output requirements prior to the simulation run. He stores all relevant

variables during the run and specifies those additional variables to be printed or print-plotted at a later time.

- Print-plots are automatically scaled, labeled, and may be in linear or logarithmic format.
- As many as five variables may be print-plotted simultaneously on a single grid, each variable to its own scale or, at the user's option, a selected group of those five variables may be printed to a common scale.
- The results of several simulation runs may be easily merged and print-plotted on the same grid.
- Contoured or shaded print-plots may be produced. Such plots are useful particularly in displaying functions of two variables or the results of merged runs.
- CSMP III provides a well-defined interface to user-developed X-Y plotter subroutines.

Extensive Function Generation Capability

- The user may incorporate arbitrary or experimental data into his model. Such data may be the function of one or two variables.
- Interpolation between data points, including interpolation of functions of two variables, is handled automatically. The degree of interpolation (first through fifth degree) is selected by the user.
- The slope of the data is obtained with a single CSMP III command.

Powerful Array Handling Capability

- The storage, manipulation and printing of arrays is easily performed.
- Integrator arrays are also easily specified and handled. This capability is particularly helpful when working with partial differential equations.

FORTRAN-Based System

- FORTRAN statements can be intermixed (with a few minor exceptions) with CSMP III statements thereby placing the logic and algebraic capability of the FORTRAN language at the user's disposal.
- FORTRAN functions (mathematical, trigonometric, logarithmic, etc.) can be incorporated in the user's model as well as FORTRAN routines such as those of SL-MATH program product (5736-XM7).

Extensive Library Facilities

- The library facilities of CSMP III allow the user to develop and maintain libraries of functions, sub-models, arbitrary or experimental data, tables and complete models. This greatly simplifies the model development process.
- Complete models can be retrieved from the library, or created from elements in the library.
- Models may also be stored as executable modules eliminating the necessity of translating, compiling and link-editing a completed model prior to each simulation run.

Improved Coding and Debugging Aids

- The CSMP III language - including FORTRAN when used in conjunction with CSMP III - is free-form.
- The user is provided with extensive diagnostics of both his CSMP III and his FORTRAN statements.
- Extensive debugging aids are available to the user to check out his CSMP III and his FORTRAN coding.
- Extensive documentation of the entire simulation process is automatically provided.

Flexible Installation

- CSMP III installation, maintenance, and operation may be conveniently tailored to the user's particular hardware configuration.
- The user has the options of specifying the FORTRAN compiler and the Linkage Editor for a particular run.

Comparison of CSMP III (5734-XS9) with CSMP (Type II for S/360, 360S-CS-16X)

New Output Capability

- As many as five variables may now be print-plotted on a single grid to permit easy analysis of model interrelationships.
- The results of several simulation runs may be automatically merged and print-plotted on a single grid.

CSMP III (cont'd)

- Contoured or shaded print-plots are not available for displaying functions of two variables or the results of merged runs.
- The number of variables which can be print-plotted from a single model have been increased from 50 to 220.
- The user may now specify the length and width of his printed page.
- CSMP III provides a well-defined interface to user-developed X-Y plotter subroutines.

Extensive Library Facilities

- The extensive source library facilities of CSMP III are unique to that program and are not included in previous version of CSMP.
- The storing of completed models as executable modules has been simplified.

Eight New Functions Provided

- A sampling function for use in collecting and processing data for a subsequent run or performing special I/O operations.
- An interpolation function in which the degree of interpolation may range from 1 through 5 and may be changed for different portions of the arbitrary data.
- An interpolation function that interpolates an arbitrary function of two variables.
- A function that computes the slope of an arbitrary function
- An array-to-scalar convertor function for accessing specific elements of an array.
- A scalar-to-array convertor function for collecting various scalar variables and combining them into a single array.
- A function for operating upon a variable with an easily-specified high-order polynomial Laplace transform.
- A variable-flow transport delay function for use in simulation models involving flow rates.

Usage of Arrays Simplified

- New array features simplify the modeling of distributed systems (systems represented by partial differential equations).
- Arrays of data and integrator arrays may be conveniently printed or print-plotted.
- Integrator array initial conditions may be entered as data tables in single or double precision.
- Arrays of data may be loaded directly into function generator storage.

Permissible Model Size Expanded

- A larger number of model variables are permissible.
- The maximum size of integrator arrays has been significantly increased.
- Previous limitations on the number of certain types of FORTRAN statements which could be included in a model have been eliminated.

Performance Improved

- Interpolation functions now use improved indexing and precomputed coefficients to improve execution speed.
- A new integration method which is significantly faster for stiff equations is now available.

Accuracy Improved

- A double precision integration method is now available.
- All integration methods now calculate TIME with double precision accuracy.
- Double precision constants now acceptable in model description.

Flexible Installation

- CSMP III installation, maintenance, and operation may be conveniently tailored to the user's particular hardware configuration.
- The user has options of specifying the FORTRAN compiler and the Linkage Editor for a particular run.

HIGHLIGHTS of the CSMP III GRAPHIC FEATURE

In addition to all the standard functions and capabilities of CSMP III, the Graphic Feature provides the following:

Interactive Model Development

- With its highly versatile set of editing features, the Graphic Feature makes it convenient for the user to develop simulation models, completely online.

- The user may conveniently store and retrieve data, sub-models, or entire models online using the CSMP III library. This assures continuity of model development, and helps the individual user to incorporate quickly commonly-used sub-models and data into his model.

- Both CSMP III and FORTRAN diagnostic messages are brought to the immediate attention of the user, dramatically reducing model development time.

- The Graphic Feature permits interactive graphical editing of arbitrary or experimental data that is to be incorporated in simulation models. The user may try various degrees of interpolation - from 1 through 5 - and immediately evaluate the resulting effect; data points may be added, moved, or deleted to quickly achieve the desired curve shape. Results of such interactive curve-fitting are automatically captured by CSMP III so that the model is immediately updated.

Interactive Simulation Run Control

- By dynamically displaying selected variables during a simulation run, the user can monitor the simulation and interrupt the run at will to change the model, model data, execution and control specifications or to vary the display itself.

- The number and length of simulation runs can be significantly reduced because the user can immediately halt simulation runs which produce unsatisfactory results.

- Parameter studies are completed in a fraction of the time; progress through the study is continually re-oriented as the user immediately sees the impact of his changes.

- Graphic plots are automatically scaled at the beginning of a run and rescaled during the run so that they are always of maximum size.

- The user may override graphic scaling as desired, zooming in on portions of the plot of particular interest simply by touching the scale with the light pen.

- Multiple-variable or multiple-run cross-plots are readily available.

Interactive Interrogation of Results

- Using the graphic device, the user may quickly display and analyze the results of the simulation run and select those variables which are to be printed or print-plotted for later reference and evaluation.

- One to four grids may be simultaneously displayed, with one to four variables plotted per grid.

- Graphic plots to logarithmic scales are readily available.

- The value of a plotted variable may be obtained merely by touching the display with the light pen at the appropriate point on the curve.

Online Reference Manual

- Whenever the user is in doubt about the use of a CSMP III statement, he can immediately obtain graphical display of instructional messages relating to rules and proper usage.

- The user may tailor this reference material to his own needs.

USE

The user can work from either a block diagram or a system of ordinary differential equations to prepare the language statements that are input to the CSMP III translator. The translator converts these application-oriented language statements into a FORTRAN subroutine which is automatically compiled and executed to accomplish the simulation and specified output of results.

CUSTOMER RESPONSIBILITIES

The user must represent the phenomenon to be simulated, by either a block diagram or a system of ordinary differential equations. Then the input language statements must be prepared and punched on cards for input to the CSMP III. A knowledge of basic FORTRAN is necessary for building more complex simulation models. Extensions to the language may be defined through a macro capability which permits the combination of standard CSMP III functions and FORTRAN algebraic and logic capability into larger more powerful functions.

The user is responsible for having or obtaining the knowledge of the Operating System required for installation and operation.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS for CSMP III

The minimum machine configuration for CSMP III, operating under the control of the Operating System with MFT or MVT option, is a S/360 mdl 40G (2040 Processing Unit) with Floating-Point Arithmetic (#4427) or a S/370 mdl 135GFO (3135 Processing Unit) with Floating-Point (#3900). The minimum partition or region size is 102K when using the FORTRAN IV (G) compiler and Linkage Editor F (88K).

The minimum machine configuration for CSMP III, operating under the control of the Operating System with Virtual Storage 1 option (OS/VS1)

PROGRAM PRODUCTS

CSMP III (cont'd)

is a S/370 mdl 135DHO (3135 Processing Unit) with Floating-Point (#3900). The minimum partition or region size is 104K in real mode or 128K in virtual mode when using the FORTRAN IV (G) compiler and the VS Linkage Editor.

The minimum machine configuration for CSMP III, operating under the control of the Operating System with Virtual Storage 2 option (OS/VS2), is a S/370 mdl 145I00 (3145 Processing Unit) with Floating-Point (#3910). The minimum partition or region size is 102K when using the FORTRAN IV (G) compiler and Linkage Editor F (88K).

One IBM 2314 Disk Storage Drive or the equivalent (in addition to the Operating System Disk Storage Requirement), is required to install and execute CSMP III, but this need not be dedicated disk storage. While not necessary for execution, one 2400 series tape drive is required for system installation.

The partition or region size required for the execution of CSMP III is determined by the largest of the following four phases: Translator, FORTRAN IV compiler, linkage editor or execution. The previously specified minimum partition or region size is due to the size of the linkage editor and very significant CSMP III models can be executed in this partition size.

CSMP III without the Graphic Feature will run under OS/MFT, OS/MVT, OS/VS1 or OS/VS2 in a VM/370 environment. The minimum configurations previously stated apply to the virtual machine operated in a VM/370 environment.

HARDWARE REQUIREMENTS for the CSMP III GRAPHIC FEATURE

The CSMP III Graphic Feature requires the CSMP III Program for its operation. The minimum machine configuration for the Graphic Feature is the following:

S/360 mdl 40GF (2040 Processing Unit) with Floating-Point Arithmetic (#4427) or a S/370 mdl 1 135DHO (3135 Processing Unit) with Floating-Point (#3900), when operating under the control of the Operating System with MFT or MVT option. The minimum partition or region size is 150K when using FORTRAN IV (G) compiler and Linkage Editor (88K). or S/370 mdl 145H00 (3145 Processing Unit) with Floating-Point (#3910), when operating under the control of the Operating System with Virtual Storage 1 option (OS/VS1). The minimum partition or region size is 154K in real mode or 192K in virtual mode when using the FORTRAN IV (G) compiler S/370 mdl 145I00 (3145 Processing Unit) with Floating-Point (#3910), when operating under the control of the Operating System with Virtual Storage 2 option (OS/VS2). The minimum partition or region size is 154K in real mode or 192K in virtual mode when using the FORTRAN IV (G) compiler and the VS Linkage Editor.

IBM 2250 Display Unit mdl 1 with the following features:

- 4K Buffer (#1498)
- Absolute Vectors and Control (#1002)
- Character Generator (#1880)
- Alphameric Keyboard (#1245)
- Light Pen (#4785)

or IBM 2250 Display Unit mdl 3 with the Alphameric Keyboard (#1245).

One IBM 2311 Disk Storage Drive or equivalent (in addition to the Operating System residence (DASD) is required to install and execute the Graphic Feature but this need not be dedicated disk storage. While not necessary for execution, one 2400 series tape drive is required for system installation.

The partition or region size for the execution of the Graphic Feature is determined by the longest of the following four phases: Translation, FORTRAN IV Compiler, Linkage Editor, or execution.

SOFTWARE REQUIREMENTS

CSMP III and the Graphic Feature are written in FORTRAN IV and Assembler languages and operate under control of the Operating System with MFT, MVT, VS1 or VS2 option. CSMP III without the Graphic Feature operates under the control of one of these Operating Systems running under VM/370 in virtual machine mode. CSMP III employs the following data management facilities and access methods: BPAM, BSAM, and QSAM. The Operating System must have the following programs available:

- FORTRAN IV (G or H) compiler and the FORTRAN IV Library.
- Assembler F for MFT and MVT or the respective Virtual Storage System Assembler for VS1 and VS2.
- Linkage Editor F for MFT and MVT of the respective Virtual Storage Linkage Editor for VS1 and VS2.
- The OS Utilities which are used to install CSMP III and maintain the CSMP III library data set.

The CSMP III Graphic Feature requires, in addition to the programming system requirements for CSMP III, the following:

- Graphic Access Method (GAM) for the 2250 display unit.

- Graphic Subroutine Package (GSP).
- Continuous System Modeling Program III.

This program product is released to work with Operating System Release 19 and all subsequent releases, versions, and modifications, unless so stated in a future revision of this document.

TERMS and CONDITIONS: See PP Index

**INFORMATION MANAGEMENT SYSTEM (IMS/360)
VERSION 2 (5734-XX6)****PURPOSE**

IMS/360 is an OS-based program product which supports user-written batch processing and teleprocessing applications. It provides extensive supervisory level services in two major categories.

- Data base management services which support the implementation of multiple applications in a common data base environment.
- Data communications management services which support the implementation of multiple applications in a shared terminal environment.

The data base management services are packaged as basic material in an orderable component called the Data Base (DB) System. The data communications management services are packaged as a special feature in a separately orderable component called the Data Communication (DC) Feature. The DB System is prerequisite to the DC Feature. When the basic DB System and the DC Feature are combined, the two form the Data Base/Data Communication (DB/DC) System.

Applications which operate within the environments supported by the DB or DB/DC Systems may be either batch-oriented or transaction-oriented. Batch-oriented and transaction-oriented applications may execute concurrently or separately.

In the DB System environment, applications are scheduled for execution through the operating system job stream in a process called batch-scheduling. The basic unit of work is assumed to be the operating system job step. The application itself may be transaction or batch-oriented.

In the DB/DC System environment, applications are scheduled for execution based upon the presence of transactions (input messages) in a process called transaction scheduling. The basic unit of work is the transaction. The DB/DC environment supports both batch-scheduling and transaction-scheduling of applications, either concurrently or separately. The internal logic of applications which are scheduled in the DB/DC environment is usually transaction-oriented. Evolutionary migration of applications from the Data Base System environment to the DB/DC System environment is facilitated.

The DB and DB/DC Systems of IMS/360 are designed to use the services of Operating System in its multiprogramming configurations, MFT and MVT, as well as the M65MP version of MVT and the program relocate features of OS/VS1 and OS/VS2.

DESCRIPTION

Application programs call upon the data base and data communications management services through Data Language/I (DL/I). DL/I provides the application program with a level of interface to the DB/DC management services which is independent of terminal and storage media programming considerations. Through installation management tools provided by IMS/360, terminal and storage media programming considerations may be manipulated independent of applications programs. Installation management can approach the problem of optimizing productivity for the total community of applications and users without affecting the functional capabilities of any of the members of that community. Existing IMS/360 application programs can be insensitive to the reorganization of stored data; the addition of new applications or data; changes in access methods, organization, or access strategy; and the introduction of new storage or terminal devices.

The data base management services of IMS/360 assist the user in:

- Description of data base structures.
- Creation of data bases.
- Access to and maintenance of data.
- Reorganization of data bases.
- Recovery and reconstruction of data.

Using utilities supplied with the system, the customer describes the structure of the data base from two viewpoints; the stored data structure as seen by the system and the logical data structure as seen by the application. Only one description of the stored data exists. However, multiple descriptions of the logical data may exist. These data base descriptions are external to application programs. They exist as stored data and are referenced by the system when it is processing access requests for application programs.

Data base descriptions define symbolic names for data-items (fields), segments, and data bases. They map collections of fields into segments and segments into data bases. To access or maintain stored data, the application program generates a functional GET/PUT level request for data base management services. As part of the functional request the application program supplies symbolic names which identify the data (segment type) to be processed. The names used are those defined in the logical data structure, not the stored data structure. Through data base descriptions the system maps the application-supplied logical data names to corresponding stored data names,

determines an access strategy and performs the requested function against the stored data.

The system description of stored data in data base descriptions contains information about organization, access strategy, the physical attributes of the data (length, format, etc.), the physical structure which exists among the stored data segments, and storage device characteristics.

A data base may be stored in two general organizations, Hierarchical Sequential (HS) or Hierarchical Direct (HD). For HS-organized data the access method and basic processing strategy may be sequential or index sequential. For HD-organized data it may be direct or index direct. Within a single data base, the system description defines a hierarchic relationship among segments within the stored data structure. In addition, relationships can be established between segments in different hierarchic structures stored within the same data base. Finally, relationships can be established between segments in different hierarchic structures stored in different data bases. The ability to interrelate hierarchic data structures assists in nonredundant data storage and permits data access through multiple retrieval paths.

Reorganization and recovery of stored data bases are supported by a set of utility programs supplied with the system.

The data communications management services of IMS/360 provide:

- Application-independent terminal management
- Input/output message traffic handling
- Terminal and program message switching
- Transaction initiated scheduling of application programs
- Conversational/interactive application support
- Terminal diagnostic aids
- System command and control language
- Resource security
- Checkpoint/restart for DB/DC environment

Application programs generate requests for message input/output operations through Data Language/I. Data is presented to the application programs in the same manner as data base requests. Data communications management services handle input and output traffic for the terminal network asynchronously to the processing performed by applications. In the characteristic response oriented interchange between terminal and application, the application is aware of the origin of the message it processes and the destination of the output it produces in a symbolic manner. It views the symbolic terminal as though it were a two level hierarchic data structure. The first level represents a segment type "First Message Segment". The second level represents a second segment type "Remaining Message Segments".

There is at least one symbolic name associated with each terminal managed by the system. Each transaction type known to the system also has a symbolic name. Messages entered by a terminal operator contain one of these two kinds of symbolic names. Based upon the characteristics of the name, an input message becomes either a message switch transaction or an application program transaction. Terminals may send messages to other terminals or to applications for processing. Applications may send messages to terminals or to other applications.

When the system receives a message for an application, it is entered into a selection queue based upon its priority relative to other messages in the system. The user specifies transaction selection priority when he generates the DB/DC System. Input transactions destined for application program processing are processed in message processing regions. When a message processing region or partition becomes available, the top transaction (message) type is selected from the queue of waiting transaction types and its associated application program identified. The application program is then scheduled for execution in the available region or partition where it will process under a unique protection key.

Some applications have the requirement to interface with a terminal operator in a conversational or interactive exchange of related input-response messages. The system will maintain data for the application between the interchanges of a conversation. A single conversation involves only one terminal operator but may take place with more than one application program.

A video terminal paging feature is provided to allow the application programmer to output multiple screens of information to a video device which may then be viewed by the terminal operator either in or out of sequence and as many times as he chooses. The capability is also provided for paging forward or backward within a series of screens, of skipping over one or more screens, and of returning later to view them. The only restriction IMS/360 imposes is that the operator may not return to a series of images after notifying IMS/360 that he has completed viewing them and has moved on to a new message or series of screens.

PROGRAM PRODUCTS

IMS/360 (cont'd)

Other applications might have the requirement for audio response support. Through the medium of a Touchtone® type telephone or a portable audio terminal (2721) in conjunction with the 7770-3 Audio Response Unit, the user can interface with application programs.

® AT&T

There is a system command and control language through which the customer can monitor and alter the operation of the DB/DC System. The commands provide dynamic display of the status of system resources such as communication lines, terminals, data bases, message queues, and programs. In addition, they permit the status of system resources to be changed dynamically. Terminal diagnostic aids can be invoked through the command language.

Provisions for system resource security are provided through a combination of password, terminal, data base, and program protection features. Through extensive checkpoint/restart capabilities, in combination with fail-soft and security provisions, a high degree of system resource integrity, reliability, and recoverability is provided.

HIGHLIGHTS

IMS/360 is a general-purpose system ... the user tailors the system to his environment ... data base support supplied through Data Language/1 ... application program independence from data management access methods and organization ... variable-length record support ... application programs may be written in COBOL, PL/I or Assembler language ... application-independent support on a multi-point or point-to-point basis for 1030, 1050, 2260, 2265, 2740, 2741, 2770 (multipoint only), 2780 and 3270 terminals (multipoint and local) ... switched communication line support for 2740 mdl 1, 2741 and 1050 terminals and the mdl 33/35 Teletypewriter (ARS) ... 7770-3 Audio Response support for the Touchtone® telephone (or equivalent equipment) and the 2721 Portable Audio Terminal ... single screen input, multiple screen output 2260 support ... a paging feature for video devices which allows output of multiple screens, viewing the screens as many times as is necessary, with the capability of forward or backward paging, or skipping over one or more screens, but being able to view any screen later ... interactive/conversational terminal application support ... teleprocessing or batch operations separately or concurrently ... transaction class selection priority scheduling ... security techniques available to user ... checkpoint/restart capability ... storage protection provided for each application program.

USE

The Customer defines the environment for applications, data bases, terminals, transactions, in a system generation process. Options and utilities enable him to tailor the generated system to his requirements. The Customer plans and implements application systems which use IMS/360 as a control program.

CUSTOMER RESPONSIBILITIES

A customer installing IMS/360 must meet the Minimum Machine Configuration (paragraph below) ... see to it that appropriate OS/360 and S/360 or S/370 training (including terminal and direct access storage education) be given to system analysts, application programmers, system programmers, and system operators ... have OS/360 successfully installed (no customer should attempt to implement IMS/360 until the installation has achieved proficiency in the use of OS/360) ... have personnel schooled in IMS/360 (a thorough knowledge and understanding of data base concepts and IMS/360 before installation are essential) ... provide adequate protection against the accidental loss or misuse of his data (functions exist within IMS/360 to assist in providing data security) ... plan for installation and operation of his remote terminals ... make sure personnel are trained in COBOL, PL/I, or Assembler language ... specify transactions for each application defined ... describe the structure of each data base for system and for application ... specify and implement application programs ... define the physical and logical communications network ... provide, if the 7770 mdl 3 Audio Response Unit is used, where required, the user-written input, output, and sign-on edit routines ... provide, if the 1030 Data Collection System is used, where required, the user-written output and sign-on edit routines ... if 3270 information Display System is used, message input and output descriptions must be created using the Format Language utility ... generate the IMS/360 control program by describing data bases, applications, transaction codes, message classes, communications lines and terminals, queues, system libraries, buffering requirements, storage devices, capacity, and programming system configuration to the IMS/360 System Definition Utility ... perform OS/360 maintenance associated with the installation of IMS/360.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

SYSTEM FUNCTION UNITS PERMITTED

Processing Unit S/360 mdls 40, 50, 65, 67 (65 mode), 75, 85, 91, 195, or S/370 Mdls 145, 155, 165 with main storage of:

M65MP	IMS/360	MFT	MVT
DB System	128K	256K	512K
DB/DC System	256K	512K	512K

If the S/360 mdl 40 is selected, the following features are required:

Selector Channel - first	#6980
Storage protection	#7520
Decimal arithmetic	#3237

Minimum Partition The practical minimum partition size is:

IMS/360	MFT	MVT	M65M
DB System	76K*	81K*	81K*
DB/DC System	175K	171K	171K

* Plus the size of the user's application program = the practical batch minimum partition size

In order to determine particular core requirements, complete either the DB or the DB/DC Storage Estimates Worksheet (Figure 6.1 or 6.9, respectively), in the IMS/360 System/Application Design Guide (SH20-0910), Chapter 6. Examples of minimum configuration storage estimates are also provided in that chapter. The 3270 planning storage estimates are in GI Manual (GH200765).

System Console See the appropriate operating system documentation.

Tape Units DB System: At least one 2400 7-track with data conversion feature or one 2400 9-track

DB/DC System: At least two 2400 9-track

Direct Access For system libraries and working storage space any devices supported by OS/360. Minimum space for system use and maintenance:

DB System - 115 cyl 2316 or equiv.
DB/DC System - 185 cyl 2316 or equiv.

For IMS/360 data base storage, within the capability and restrictions of OS/360 support by Indexed Sequential and Sequential Access Methods

- 2301 Drum Storage
- 2302 Disk Storage
- 2303 Drum Storage
- 2311 Disk Storage Drive
- 2314/2319 Direct Access Storage Facility
- 2321 Data Cell Drive
- 2305 Fixed Head Storage
- 3330/3333 Disk Storage

Telecommunications For the DB/DC system master terminal one of the following nonswitched devices is required:

- 2740 Mdl 1 Communication Terminal
- 1050 Data Communication System with
- 1052 Printer-KeyBoard

Complete description of the required and prohibited features for telecommunications control and terminal devices appears below.

Terminal Control Units

The 2701 Data Adapter Unit, 2702 Transmission Control or 2703 Transmission Control may be used. In addition, if 2260 terminals are to be installed, the 2848 Display Control is required; if 2265 terminals are to be installed, the 2845 Display control is required. If Audio Response support is desired, the 7770 Audio Response Unit mdl 3 is required. If 3277 local display stations or 3284/3286 local printers are desired, a 3272 Control Unit is required. In addition, if remote 3277 remote display stations are desired, a 3271 Control Unit is required. Line adapters and/or data sets must be added as required for the selected terminal control units and communication line facilities. The specifications shown here do not consider combinations of terminal types or lines attached to the same control unit. For a complete description of the prerequisites and limitations applicable to each control unit, see the "Machines" section of the sales manual. Programmable features or features which change the line or terminal control characteristics and

IMS/360 (cont'd)

which are not shown below are not supported. In addition, there are restrictions and dependencies on processor models and channels which are described in the "Machines" and "Systems" sections of the sales manual.

For use with 1050 Data Communication System, 1030 Data Collection System, 2740 and 2741 Communication Terminals, and 33/35 Teletypewriter (ASR)

2701 Data Adapter Unit mdl 1

For use with 1050 and 2770 Data Communication Systems, 1030 Data Collection System, Remote 2848 Display Controls with 2260 Display Stations, Remote 2845 Display Controls with 2265 Display Stations, 2740 Communication Terminal, 2780 Data Transmission Terminal, 2980 General Banking Terminal System, 3270 Information Display System and 33/35 Teletypewriter (ASR)

	Feature #
For 1050, 2740-1, 2740-2:	
IBM Terminal Control Type I appropriate selective speed Terminal Base	4815 9696
For 2741:	
Line groups for 2741 terminals with active interrupt feature (#8055) must be isolated from 1050/2740-1 and 2740-2 terminals and the appropriate selective special features.	
For 1030:	
IBM Terminal Control Type II Speed Extension (Selective speed 600 bpi - #9685) Terminal Base	4616 7387 9696
In addition for 1032 Digital Time Unit, 1032 Attachment	7918
For 33/35 Teletypewriter (ASR):	
Terminal Control Base Terminal Control Expansion	9697 7935
Additional features supported:	
Autopoll Two processor switch	1319 8110
2703 Transmission Control:	
For use with 1050 and 2770 Data Communication System, 1030 Data Collection System, 2740 and 2741 Communication Terminals, 2780 Data Transmission Terminal, 2980 General Banking Terminal System, 3270 Information Display System, and 33/35 Teletypewriter (ASR)	

	Feature #
For 1050, 2740-1, 2740-2:	
IBM Terminal Adapter Type 1 with appropriate speed selection	4660
For 1030:	
IBM Terminal Adapter Type II	4648

Terminal Control Units:

The 2701 Data Adapter Unit, 2702 Transmission Control, or 2703 Transmission Control may be used. In addition, if 2260 terminals are to be installed, the 2848 Display Control is required; if 2265 terminals are to be installed, the 2845 Display Control is required. If Audio Response support is desired, the 7770 Audio Response Unit mdl 3 is required. If 3277 local display stations or 3284/3286 local printers are desired, a 3272 Control Unit is required. In addition, if remote 3277 display stations are desired, a 3271 Control Unit is required. Line adapters and/or data sets must be added as required for the selected terminal control units and communication line facilities. The specifications shown here do not consider combinations of terminal types or lines attached to the same control unit. For a complete description of the prerequisites and limitations applicable to each control unit, see the 'Machines' section of the sales manual. Programmable features or features which change the line or terminal control characteristics and which are not shown below are not supported. In addition, there are restrictions and dependencies upon processor models and channels which are described in the 'Machines' and 'Systems' sections of the sales manual.

2701 Data Adapter Unit Model 1: For use with 1050 and 2770 Data Communication Systems, 1030 Data Collection System, Remote 2848 Display Controls with 2260 Display Stations, Remote 2845 Display Controls with 2265 Display Stations, 2740 Communication Terminal, 2780 Data Transmission Terminal, 2980 General Banking Terminal System, 3270 Information Display System, and 33/35 Teletypewriter (ASR)

	Feature #
For 1050, 2740-1, 2740-2:	
IBM Terminal Adapter Type 1 with appropriate speed selection	4660
For 1030:	
IBM Terminal Adapter Type II	4648
For remote 2848/2260 or 2845/2265:	
IBM Terminal Adapter Type III	4656 or 4657
For 2770 and 3270:	
Synchronous Data Adapter Type II Transmission code	7698 9060 or 9061
Features not permitted:	
Transparency	8029
For 2780:	
Synchronous Data Adapter Type II Transmission code:	7698 9060 or 9061 or 9062
Features not permitted:	
Transparency	8029
For 2980:	
Synchronous Data Adapter Type II Transmission code	7698 9060
Features not permitted:	
Transparency	8029
For 33/35 Teletypewriter (ASR):	
Telegraph Adapter Type II	7885

2702 Transmission Control:

	Feature #
For 1050, 2740-1:	
IBM Terminal Control Type I IBM Terminal Control Base Start Stop Base Type 1 Line Speed Option 134.5 bps	4696 4619 7505
For 2740-2:	
IBM Terminal Control Type I IBM Terminal Control Base Start Stop Base Type II Line Speed Option 600 bps	4696 4619 7506 4879
For 2741:	
Line groups for 2741 terminals with active Interrupt feature (#8055) must be isolated from 1050/2740-1 and 2740-2 terminals and the appropriate selective special features.	
For 1030:	
IBM Terminal Control Type II IBM Terminal Control Base Start Stop Base Type II Line Speed Option 600 bps	4697 4619 7506 4879
For 2770:	
Synchronous Attachment Synchronous Base Type 1A Base Expansion Synchronous Terminal Control	7702 7703 (7706) 1440 7715 or 7716
Features not permitted:	
Transparency	9100
For 2780:	
Synchronous Attachment Synchronous Base Type 1A or 1B Base Expansion Synchronous Terminal Control	7702 7703 or 7704 1440 7715 or 7716 or 7717
Features not permitted:	
Transparency	9100
For 2980:	
Synchronous Attachment Synchronous Base Type 1A, 2A, or 2B	7702 7703, 7704,

PROGRAM PRODUCTS

IMS/360 (cont'd)

	or 7706	
Base Expansion	1440	
Synchronous Terminal Control	7715	
Not Supported: Transparency	9100	
For 3270:		
Synchronous Attachment	7702	
Synchronous Base Type 1A, 2A	7703 or 7704	
Base Expansion	1440	
Synchronous Terminal Control	7715 or 7716	
Not supported: Transparency	9100	
For 33/35 Teletypewriter (ASR):		
Line Speed Option 110 bps	4877	
Telegraph Terminal Control Base	7905	
Optional features supported:		
Two processor switch	8110	
2712 Attachment	8043	
7770 mdl 3 Audio Response Unit		
For use with TOUCH-TONE telephone (or equivalent).		
	Feature #	
For TOUCH-TONE or equivalent operation:		
No special features required	-	
Features not permitted:		
EOI Disable	3540	
Terminal devices not supported:		
IBM 1001 Data Transmission Terminal		
Rotary dial telephones		
Rotary dial card dialer telephones		

Terminals

Programmable features which change the control or transmission characteristics and which are not shown are not supported. Line adapters and/or data sets must be added as required for the selected terminal control units and communication line facilities. The specifications shown here do not consider combinations of terminal types or lines attached to the same control unit. For a complete description of the prerequisites and limitations applicable to each control unit, see the "Machines" section of the sales manual.

Terminals which are equivalent to those explicitly supported may also function satisfactorily. The customer is responsible for the impact that any changes to the IBM-supplied products or programs may have on such terminals.

	Feature #
1030 Data Collection System - Nonswitched network:	
1031 Input Station - mdls A1 - A7:	None
1031 Input Station - mdls B1 - B7:	None
1032 Digital Time Unit:	None
1033 - 1 Printer:	
Mono Case Printing Element	9575
1035 - 1 Badge Reader:	None
1050 Data Communication System - Nonswitched and Switched Network:	
1051 mdl 1 or mdl 2 Control Unit:	
Keyboard Request (if a 1052 is attached)	4770
Automatic EOB (if a 1052 or 1056 is attached)	1313
Optional feature supported:	
First Printer attachment	4408
1052 mdl 1 or 2 Printer-Keyboard:	
Automatic EOB	1313
Dual Case Printing Element	9571 or 9591
Optional feature supported:	
Forms Feed Control	4452
1053 - 1 Printer:	
Dual Case Printing Element	9571 or 9591
Optional feature supported:	

Forms Feed Control	4452
1054 - 1 Paper Tape Reader:	None
1055 - 1 Paper Tape Punch:	None
1056 mdl 1 Card Reader:	
Optional feature supported:	
Extended Character Reading	3861
1057 - 1 Card Punch:	None
1058 - 1 Printing Card Punch:	
Optional feature supported for 1057 and 1058:	
Extended Character Punching	3860
2260 mdl 1 and mdl 2 Display Station - Nonswitched Network:	
Remote environment - See SRL GA27-2700	
2848 Display Control - mdls 1, 2, and 3:	
Display Adapter	3355 or 3356 or 3357
Optional features supported:	
Line Addressing	4787
Non-destructive Cursor	5340
Non-destructive Cursor Adapter	5341
1053-4 Adapter	7927 or 7928
2260 Display Station mdls 1 and 2:	
Alphameric Keyboard	4766
Optional hardware supported:	
1053 Printer:	None

2260/2848 Display Station and Control - Local Network:

See SRL GA27-2700. The same features specified for 2260 remote environment are required for local support. However, no data set adapters should be specified.

Hardware not supported:

1053 - 4 Printer

2265/2845 Display Station Control - Nonswitched Network, Remote Environment:

2845 Display Control mdl 1:

Data Set Adapter	9012 or 9013
Display Format	9101 or 9102
Tab Feature	7801

Optional features supported:

1053 Adapter	7927 or 7928
Line Addressing	4801
Destructive Cursor	3301

2265 Display Station mdl 1:

Alphameric Keyboard	4766
---------------------	------

2740 mdl 1 - Nonswitched Network:

Record Checking	6114
Terminal to Multiplexer	9700
Dual Case Printing Element	9571 or 9591
Automatic EOB	1313

Optional feature supported:

Station Control	7479
-----------------	------

2740 mdl 1 - Switched Network:

Record Checking	6114
Transit Control	8028
Terminal to Multiplexer	9700
Dual Case Printing Element	9571 or 9591
Automatic EOB	1313
Dial up	3255

2740 mdl 2 - Nonswitched Network:

Record Checking	6114
Buffer Receive	1499

PROGRAM PRODUCTS

IMS/360 (cont'd)

Dual Case Printing element	9571 or 9591	2502 Card Reader mdl A1 or A2:	
Optional features supported:		Optional features supported:	
Buffer Expansion positions 121-248	1495	Interchangeable Feed, 51/80 Column Card	4650
Buffer Expansion positions 249-440	1496	Interchangeable Feed, 66/80 Column Card	4651
Edit	3600	Optical Mark Read	5450
Header Control	4510	50 Magnetic Data Inscrber:	
Document Insertion	3401 or 3402	2772 Attachment	7850
2741 - Nonswitched Network:		1017 Paper Tape Reader:	
Optional feature supported:		Optional features supported:	
Receive Interrupt	4708	mdl 1 or mdl 2	9750
2770 Data Communications System - Nonswitched Network:		1018 Paper Tape Punch:	
2772 Multipurpose Control Unit		mdl 1 or mdl 2	9750
Feature required: Multipoint Data Link Control Inquiry Mode		2772 Attachment	8050
Operation of feature 5010 is supported. Feature supported (see sales manual for valid combinations)		Optional features supported:	
Buffer Expansion	1490	Takeup	7801
Buffer Expansion, Additional	1491	1053 Printer	
Display Format Control	3250	2772 Attachment	7850
Expanded I/O Capability	3830	Optional features supported:	
Expanded Print Line	3860	Accelerated Carriage Return	1006
050 Attachment - first (#5010 required)	3940	Forms Feed Control	4452
050 Attachment - second	3941	Forms Stand/Stacker	4462
545 Attachment	3950	Pin Feed Platen	9509
Keyboard Correction	4690	Pin Feed Platen with Forms Control	9510
Keylock	4695	1255 Magnetic Character Reader mdls 1, 2 or 3	
Optical Mark Read	5450	2772 Adapter	7850
Printer Horizontal Format Control	5890	Optional features supported:	
1017 Attachment (#5010 required)	7910	Balance list	1470
1018 Attachment (#5010 required)	7915	Dash Symbol transmission	3215
1053 mdl 1 Attachment	7920	51-Column Card Sorting	4380
1053 Ribbon Shift	7925	High Order Zero and Blank Selection	4520
1053 Vertical Forms Control	7930	Self-Checking Number	7060
Transmit-Receive Monitor Print	7950	2203 Printer mdls A1 or A2	
2203 mdl A1 Attachment	8000	Optional features supported:	
2203 mdl A2 Attachment	8001	Print Positions, 24 Additional	5558
2213 mdl 1 Attachment	8010	2780 Data Transmission Terminal - Nonswitched Network:	
2265 Attachment	8015	Mdls 1, 2, 3 and 4 are supported; on a multipoint communication line, if any terminal is a mdl 3, all 2780 terminals must be mdl 3.	
2502 mdl A1 Attachment	8020		Feature #
2502 mdl A2 Attachment	8021	Terminal Use (Communication with S/360 - point-to-point) or Multi-Point Line Control (multi-point)	9710 5020
2213 mdl 2 Attachment	8700	Optional features supported:	
15 Rows Screen (2265)	9101	Multiple Record Transmission	5010
12 Rows Screen (2265)	9102	Printer Horizontal Format Control	5800
1255 Attachment	9755	Print Line 120 Characters	5820
EBCDIC Transmission Code	9761	Print Line 140 Characters	5821
USASCII Transmission Code	9762	Features not permitted:	
Features not supported:		EBCDIC Transparency	8030
Data Set Attachment	9123	2972/2980 General Banking Terminal System - Nonswitched Network:	
Automatic Answering	1340	2980 mdls 1, 2 and 4 are supported in remote mode. The 2980-4 requires the Message Lights (RPQ 858156). The batch message input option is not supported. RV1 response to selection is required. (There are no numbers associated with these features. They are field-pluggable option furnished through Field Engineering. Refer to IBM SRL GL27-3020 Component Description: IBM 2972 mdls 8 and 11 General Banking Terminal System, to determine the appropriate RPQs for your installation (see the RPQ flowchart in Appendix A).	
Conversational Mode	1910	3270 Information Display System:	
EBCDIC Transparency	3650	3271 Control Unit, mdl 1 or (Remote Mode)	
Identification	4610	Optional features supported:	
Security Identification	6310	Copy	1550
Switched Network Attachment (WTC)	2981	ASCII Transmission Code	1087
Space Compression/Expansion	6555	Device Adapter (up to 7)	3250
5496 Data Recorder Attachment	3970	Transmission Speed	7820 or 7821
1545 Output Punch mdl 3 and 4:		Note: At least one 3277 with keyboard of an appropriate model must be attached to the 3271	
Optional features not supported:		3272 Control Unit, mdl 1 or 2 (Local Mode)	
Keyboard, 48 Character for Arrangement A	9651		
Keyboard, 64 Character for Arrangement USASCII	9671		
Keyboard, 64 Character for Arrangement EL	9677		
Acoustic Cover	9014		
Punch 81 Indication	5550		
2213 Printer mdl 1 or 2:			
Optional features supported:			
6-lines per inch	9435		
8-lines per inch	9436		
Roll Paper Feed	6200		
Pin Feed Platen	9509		
Forms Stand Stacker	4450		
2265 Display Station mdl 2:			
Optional features supported:			
Transmission Code for EBCDIC	9761		
Transmission Code for USASCII	9762		
15 Rows of 64 Characters	9101		
12 Rows of 80 Characters	9102		
Display Format Control	8015		

IMS/360 (cont'd)

Optional features supported:

Device Adapter (up to 7) 3250

Note: At least one 3277 with keyboard of an appropriate model must be attached to the 3271

3275 Display Station, mdl 1 or 2*:

Optional features supported:

ASCII Character Generator (A) 1085
 ASCII Character Generator (B) 1086
 ASCII Transmission Code 1087
 Audible Alarm 1090
 Operator Identification Card Reader 4600
 66-key EBCDIC Typewriter Keyboard 4630
 66-key EBCDIC Data Entry Keyboard 4631
 78-key Operator Console Keyboard 4632
 78-key EBCDIC Typewriter Keyboard 4633
 66-key ASCII Keyboard 4634
 78-key ASCII Typewriter Keyboard 4635
 Security Keylock 6340
 Transmission Speed 7820 or 7821
 Keyboard Numeric Lock 4690
 Printer Adapter 5550

3277 Display Station, mdl 1 or 2

Optional features supported:

ASCII Character Generator (A) 1085
 ASCII Character Generator (B) 1086
 Audible Alarm 1090
 Operator Identification Card Reader 4600
 66-key EBCDIC Typewriter Keyboard 4630
 66-key EBCDIC Data Entry Keyboard 4631
 78-key Operator Console Keyboard 4632
 78-key EBCDIC Typewriter Keyboard 4633
 66-key ASCII Keyboard 4634
 78-key ASCII Typewriter Keyboard 4635
 Keyboard Numeric Lock 4690
 Security Keylock 6340
 Selector Light Pen 6350

3284 Printer, mdl 1 or 2 (for Attachment to a 3271 or 3272):

Optional features supported:

ASCII Character Set (A) (3271 attach only) 1087
 ASCII Character Set (B) (3271 attach only) 1088
 Forms Stand 4450

3286 Printer, mdl 1 or 2 (for Attachment to a 3271 or 3272):

Optional features supported:

ASCII Character Set (A) (3271 attach only) 1087
 ASCII Character Set (B) (3271 attach only) 1088
 Forms Stand 4450

3284 Printer, mdl 3 (for Attachment to a 3275):

Optional features supported:

ASCII Character Set (A) 1087
 ASCII Character Set (B) 1088
 Forms Stand 4450

33/35 Teletypewriter (ASR):

Feature required:

Four row keyboard

Local Card Reader:

All local 80-column card readers supported by the operating system BSAM access method are supported by IMS/360 local card reader support.

Local Print:

Local print is supported for all printer, tapes, and sequential direct access data sets supported by BSAM.

If direct access data sets are provided, the option is available to switch data sets at EOV or through operator command and print the data set by means of SYSOUT writer while the alternate data set(s) is being filled by IMS/360.

TOUCHTONE telephone or equivalent operation - Switched Network:

This type of telephone is used with the 7770 mdl 3 Audio Response Unit.

SOFTWARE REQUIREMENTS

IMS/360 operates under Operating System (MFT, MVT, VS1 or VS2) and is written in Assembler language. Teleprocessing and batch processing application programs may be written in either Assembler language, COBOL or PL/I. For proper execution of IMS, system definition and system execution must be performed under the same OS release. A new IMS/360 system definition does not make it necessary to recompile user application programs.

If the programming system configuration is MFT, Storage Protection, Interval Timing, and Subtasking are required. The following features are recommended for better performance: PCI Fetch; Resident Access Methods and Resident Reentrant Code; Resident IDENTIFY, SPIE, STAE, and ATTACH functions.

For the Data Base System:

General Requirements

- Reserve one user channel end appendage suffix
- Reserve three user SVC numbers

Program Requirements

Name	Number
Multiprogramming with a Fixed Number of Tasks (MFT)	360S-CI-505
or	
Multiprogramming with a Variable Number of Tasks	CI-535
Assembler F	AS-037
Linkage Editor F	ED-521
OS/360 Utilities	UT-506
SERO, SER1, EREP	DN-527
Primary Data Management	DM-508
Indexed Sequential Access Method (ISAM)	IO-526
Recovery Management (as applicable to processor mdl)	DN-539

If the data base utilities log, accumulator utilities, or statistics utilities are to be used, a sort/merge program is required. Note that of the following only the program product 5734-SM1 supports the 3330 device type for intermediate data storage:

Sort/Merge	360S-SM-023
Sort/Merge Program Product	5734-SM1

If application programs are written in COBOL or PL/I, at least one of the following language translators and one of the associated libraries are needed:

ANS COBOL	360S-CB-545
ANS COBOL Library	360S-LB-546
COBOL F	360S-CB-524
COBOL F Library	360S-LB-525
COBOL E	360S-CB-503
COBOL E Library	360S-CB-504
PL/I F	360S-NL-511
PL/I F Subroutine Library	360S-NL-512

In addition to those shown above, application programs may be compiled by the following language translators:

Full ANS COBOL Version 3	5734-CB2
Assembler H	5734-AS1

For the Data Base/Data Communications System, in addition to the general and program requirements shown above:

Name	Number
Basic Telecommunications Access Method (BTAM) with communication serviceability features	360S-CQ-513
If 2260 local support is required, add:	
Graphic Programming Services	360S-IO-523
If 7770-3 Audio Response support required: Reserve a second user channel end appendage suffix.	
If 3270, 3270 BTAM	360S-OS-579

COMPATIBILITY

If a user is now operating IMS/360 Version 1, the mechanics of converting to IMS/360 Version 2 are:

1. Make an IMS/360 Version 2 System Definition to create an IMS/360 Version 2 System.
2. Regenerate existing program and data base descriptions and generate application control blocks (PSB, DBD, ACB) using the IMS/360 Version 2 macro-definition library.

No change is required to existing user application programs except as noted under 3270 support information.

Do not reproduce without written permission

**CICS/DOS - ENTRY (5736-XX6)
CICS/DOS - STANDARD (5736-XX7)
CICS/OS - STANDARD V2 (5734-XX7)**

PURPOSE

These systems form an upward compatible family of Data Base/Data Communications (DB/DC) systems providing a common application program interface. They simplify the implementation of terminal-oriented applications and provide an upward migration path. This compatibility exists at the source code level.

DESCRIPTION

The CICS System is a general purpose DB/DC interface between the operating system (OS or DOS) and user-written application programs (either ANS COBOL, PL/I or Assembler language). These systems provide the user with the facilities to generate a CICS system configuration applicable to his needs and to define the environment in which the system is to execute. User exits are provided for optional processing as required for specific system operation. Also provided is a macro facility to communicate application program service requests.

Functions necessary to support a DB/DC system and those required to support other standard terminal applications are provided by the CICS systems through the following management facilities.

Task Management -- Provides the dynamic multitasking* facilities necessary for effective, concurrent transaction processing. Functions associated with this facility include priority scheduling, transaction synchronization and control of serially reusable resources.

Storage Management -- Controls main storage allocated to CICS. Storage acquisition, disposition, initialization and request queuing are among the services and functions performed by this component of CICS.

Program Management -- Provides a multiprogramming capability through dynamic program management while offering a real-time program fetch capability.

Program Interrupt Management -- Provides for the interception of program interrupts by CICS to prevent total system termination. Individual transactions that program check are terminated by CICS with a dump (if Dump Management is used), thus preventing the entire CICS partition/region from terminating.

Time Management -- Provides control of various optional task functions (system stall detection, run-away task control, task synchronization, etc.) based on specified intervals of time or the time of day.

Dump Management -- Provides a facility to assist in analysis of programs and transactions undergoing development or modification. Specified areas of main storage are dumped onto a sequential data set, either tape or disk, for subsequent off-line formatting and printing using a CICS utility program.

Terminal Management -- Provides polling according to user specified line traffic control as well as user requested reading and writing. This facility supports automatic task initiation to process new transactions. The testing of application programs is accommodated by the simulation of terminals through sequential devices such as card readers, line printers, disk, tape, etc.

File Management -- Provides a data base facility using direct access and indexed sequential data management. This function supports updates, additions, random retrieval and selective retrieval (browsing) of logical data on the data base. CICS/OS provides single-thread access to the Data Language/I Facilities of the IBM Information Management System/360 Version 2 (IMS/360). For complete information on the capabilities of DL/I, refer to the appropriate IMS/360 manuals (GH20-0765, SH20-0910, SH20-0911, SH20-0912).

Transient Data Management -- Provides the optional queuing facility for the management of data in transit to and from user defined destinations. This function has been included to facilitate message switching, data collection and logging.

Temporary Storage Management -- Provides the optional general purpose "scratch pad" facility. This facility is intended for video display paging, broadcasting, data collection suspension, conservation of main storage, retention of control information, etc.

* CICS/DOS-Entry employs Quasi-multitasking, i.e., single thread processing using a roll-out/roll-in technique to facilitate conversational processing.

Additional management functions provided by CICS include the following:

Asynchronous Transaction Processing -- Provides the capability to read and queue (store) batched input from time-dependent devices and to dequeue and write back to a time-dependent device the output data created by the processing of batched input. Asynchronous transaction processing is performed concurrently with other terminal activity. (Not available for CICS/DOS-Entry.)

3270 Basic Mapping Support -- Provides Basic Mapping Support for use with the IBM 3270 Information Display System. The application programmer is provided access to both input and output 3270 data streams without being required to include (or be aware of) any 3270 device-dependent logic. The 3270 data streams are mapped into screen formats which are defined and assembled by use of CICS macro instructions.

2260 Compatibility -- Allows the user to run his currently operational 2260-based transactions from an IBM 3270 Information Display System. The Compatibility mode is specified by the user (by transaction and by terminal); operation can be intermixed with IBM 3270 Native mode. Two levels of compatibility are provided: a full screen operation or format mode. The latter is more efficient; however, not all 2260 operations are supportable within the format mode. The level of support can be selected by transaction. Four basic methods of 2260 screen and keyboard operation are supported. In most cases, the user is not required to make any changes to application programs.

In addition to the management functions described, CICS provides the following system service programs:

Sign On/Sign Off -- Provides terminal operator identification (security).

Master Terminal Function -- Provides dynamic user control of the system. The master terminal operator can change the status and values of parameters used by CICS and thereby alter the operation of the system.

Supervisory Terminal Function -- Performs a terminal-oriented subset of the services available to the master terminal. They are limited to the terminals under a given supervisor's jurisdiction.

System Statistics -- Provides the capability to dynamically log system statistics.

Abnormal Condition -- Intercepts abnormal conditions (except those associated with a terminal) not handled directly by the operating system.

Terminal Abnormal Condition -- Intercepts terminal abnormal conditions not handled directly by the operating system.

System Termination -- Allows the user to terminate operation of CICS by gathering summary statistics, closing data sets and returning control to the operating system.

Trace -- Provides a program debugging facility that reflects the execution of CICS macro instructions by CICS management programs and user-written application programs.

Dynamic Open/Close -- Allows the user to dynamically OPEN/CLOSE his data sets during the real-time execution of CICS.

Time of Day Control: Provides the capability for CICS to operate on a round-the-clock basis. CICS adjusts the expiration times it maintains in response to changes in the time of day maintained by the operating system, and then resets its date and time of day to the date and time of day maintained by the operating system.

Although the CICS/DOS-Entry system is functionally upward compatible, the throughput capabilities of this system would be significantly less than CICS/DOS-Standard or CICS/OS-Standard V2 in a moderate to large environment because of the technique utilized to function in a small main storage configuration.

USE

CICS is a modular program with system generation capabilities. The user selects those modules which meet his unique requirements during the system generation process. Each of the selected modules is resident in main storage during execution of the user's information system. Communication between the user-written application program and CICS is via CICS macro instructions.

Activity within the central processing system is initiated by data from a terminal on the system. All application program requests for terminal and file read-write are processed by the appropriate operating system through CICS. The operating system supervisor and data management services are used by CICS when they are functionally applicable. Features are incorporated which assist in the serviceability of components of the system to provide maximum system availability.

CUSTOMER RESPONSIBILITIES

To successfully install and use the CICS system, the customer must have the necessary minimum required machine configuration installed. In addition, he must have the appropriate operating system installed as required by the CICS system to be used ... have a thorough knowledge of the information system application ... train system analysts, programmers and operators in CICS ... design and create a data base ... design terminal formats ... design and implement application programs, using CICS macro instructions, to service his application

PROGRAM PRODUCTS

**CICS/DOS-Entry & Standard
CICS/OS-Standard V2 (cont'd)**

needs ... train operators for terminal-oriented application operation ... develop procedures to assure adequate security for data in the system ... develop appropriate back-up procedures for his application ... develop conversion procedures and schedules. If the TCAM option is selected, the user must write the required TCAM Message Control Program.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum partition/region size for CICS systems is as follows:

CICS/DOS-Entry (5736-XX6)	30K
CICS/DOS-Standard (5736-XX7)	44K
CICS/OS-Standard V2 (5734-XX7)	64K

See "Storage Considerations" for further storage requirements information.

Unless incorporated as standard features on the processing units, the Decimal Arithmetic (#3237) and Interval Timer (#4760) features are required. The configuration must include sufficient I/O devices to support the requirements for system output, system residence, and system data sets. Sufficient direct access storage must be provided to satisfy user information storage requirements and may consist of 2311 Disk Storage Drives and/or the 2314/2319 Direct Access Storage Facilities and/or the 2321 Data Cell Drives, and/or the 3330/3333 Disk Storage.

The appropriate line adapters and telecommunications control units must be included in the system configuration.

CICS/DOS is distributed on 9-track or 7-track tape or optionally on 2316 disk pack.

The following IBM terminals, terminal control units and programmable special features are supported by CICS. The user should be aware that many terminal and control unit special features are transparent to programming, and are therefore readily usable even though not specifically identified. Only those terminals and features supported by both CICS/OS Version 2 and TCAM are applicable for use by CICS application programs which are associated with terminals attached to TCAM.

Terminals Connected Via Nonswitched Lines

Start Stop Transmission

- 1030 Data Collection System with:
1031 Control Unit/Input Station and, optionally:
1033 Printer
1035 Badge Readers
- 1050 Data Communication System with:
1051 Control Unit mdl 1 or 2
1052 Printer Keyboard with, optionally:
1053 Printer mdl 1
1056 Card Reader
- 2260 Display Station mdl 1 or 2 with:
2848 Display Control mdl 1, 2, or 3 with, optionally:
Line Addressing (#4787), and/or
1053 Printer mdl 4
- 2265 Display Station mdl 1 or 2 with:
2845 Display Control with optionally:
Line Addressing (#4801), and/or
1053 Printer mdl 4, and/or Tab (#7801)
- 2740 Communication Terminal mdl 1 with, optionally:
Record Checking (#6114), and/or
Station Control (#7479)
- 2740 Communication Terminal mdl 2 with, optionally:
Record Checking (#6114), and/or
Buffer Receive (#1499)
- 2741 Communication Terminal
For the CICS/DOS systems, the Transmission Control Unit or ICA must be equipped with 2741 Break (#8055), or equivalent
- 2760 Optical Image Unit attached to a
2740 Communication Terminal mdl 1 with:
Record Checking (#6114)
- S/7
5010 mdls A2-A16 with Asynchronous Com Cntrl (#1610)

Binary Synchronous Communication

- S/360 or S/370 via:
Integrated Communications Attachment (mdls 25 and 135)
2701 Data Adapter Unit, or
2703 Transmission Control

- S/360 mdl 20 Processing Unit with:
Binary Synchronous Communications Adapter (#2074), and
EBCDIC Transmission Code (#9060), or
ASCII Transmission Code (#9061), and, optionally:
Station Selection (#7477)
- 2770 Data Communication System
2772 Multipurpose Control Unit variety:
EBCDIC Transmission Code (#9761), or
ASCII Transmission Code (#9762) and, optionally:
WACK Response (#9936), and/or
Buffer Expansion (#1490), and/or
Conversational Mode (#1910), and/or
Multi-point Data Link Control (#5010), and
545 Output Punch, and/or
1053 Printer, or
2213 Printer, and/or
2265 Display Station, and/or
2502 Card Reader
- 2780 Data Transmission Terminal with:
EBCDIC Code (#9762), or
ASCII Code (#9761), or
6-Bit Transcode (#9760) and, optionally:
Multi-point Line Control (#5020)
- 1130 Computer System with:
Synchronous Communications Adapter (#7690)
- 2980 General Banking System
2972 mdl 8 (RPQ 858160), and/or 2972 mdl 11 (RPQ 858231)
with optionally: 2980 mdl 1 (RPQ 835509) and/or 2980 mdl 1
(RPQ 835509) and/or 2980 mdl 2 (RPQ 835505), and/ or 2980
mdl 4 (RPQ 858147), Buffer Expansion (RPQ 858165) for mdls 1,
2 and 4, and/or Auditor Key (RPQ 858188) for 2980 mdl 2.
- S/3 mdls 6 and 10
5406 Processing Unit mdls B2-B4, or
5410 Processing Unit mdls A2-A16, with:
Binary Synchronous Communications Adapter (#2074) and,
optionally:
Station Selection (#7477)
- S/32 (supported as a S/3)
5320 System Unit (all models) with:
Binary Synchronous Communications Adapter (#2074)
- 3270 Information Display System
3271 Control Unit mdl 1 or 2 with, optionally:
ASCII Transmission Code (#1087)
3277 Display Station mdl 1 or 2, and/or
3284 Printer mdl 1 or 2, and/or
3286 Printer mdl 1 or 2, and/or
3287 Printer mdl 1 or 2
(as a 3284-1 or 2/3286-1 or 2 and/or
3275 Display Station mdl 1 or 2 with:
Printer Adapter (#5550) for 3284 Printer mdl 3
and, optionally:
ASCII Transmission Code (#1087)
Keyboard Numeric Lock (#4690)
Selector Pen (#6350)
Audible Alarm (#1090)
Security Keylock (#6340)
Copy (#1550) for 3271 Control Unit

Terminals Connected Via Switched Lines:

- 3270 Information Display System 3270 Control Unit mdl 1 or 2 with: 3277 Display Station mdl 1 or 2, and optionally: 3284 Printer mdl 1 or 2, and/or 3286 Printer mdl 1 or 2, and/or 3287 Printer mdl 1 or 2 (as a 3284-1 or -2 /3286-1 or -2) and, optionally: Keyboard Numeric Lock (#4690) Selector Pen (#6350) Audible Alarm (#1090) Security Keylock (#6340)
- 7770 Audio Response Unit mdl 3 TOUCH-TONE® type telephone, or equivalent equipment, and IBM 2721 Portable Audio Terminal are supported through the 7770 mdl 3 Audio Response Unit

SOFTWARE REQUIREMENTS

All CICS modules are coded using S/360 Assembly language. Communications to CICS occur via the CICS macro instructions and the coding which is included in the user-written programs. CICS operates as a single task within a partition (region) and may operate in a dedicated or multiprogramming environment. The selection of the environment is the user's responsibility, as is the selection of system options beyond those required for the operation of CICS.

CICS/DOS-Entry and CICS/DOS-Standard systems operate under the IBM Disk Operating System (DOS). The following components of DOS are required:

- Resident Supervisor:
2311/2314 360N-SV-474 (Main Storage S/360)
2311/2314/3330 370N-SV-495 (Main Storage S/370)
- System Control and Basic IOCS, 360N-CL-453/370N-CL-453
- Direct Access Method, 360N-IO-454/370N-IO-454
- Basic Telecommunications Access Method, 360N-CQ-469/370N-CQ-469
- Assembler, 360N-AS-465/370N-AS-465 (14K variant) or Assembler F, 360N-AS-466
- Utilities Group 1, 360N-UT-461
- Utilities Group 2, 360N-UT-462
- Magnetic Tape IOCS, 360N-IO-456/370N-IO-456, and/or Sequential Disk IOCS, 360N-IO-455/370N-IO-455

Note: To use the 3330 Direct Access Storage Device, the user must have a DOS System at least as recent as Release 27.

The Interval Timer Option, Decimal Arithmetic Feature and BTAM Teleprocessing feature must be included in the DOS system generation. The interval timer must be reserved for use by CICS during execution of the system.

In addition to the above DOS components, the user may require any of the following:

- Indexed Sequential File Management System, 360N-IO-457/370N-IO-457
- Full ANS COBOL V3 Compiler, 5736-CB2 and Full ANS COBOL Library**, 5736-LM2
- ANS COBOL Subset (DOS), 5736-CB1
- ANS COBOL, 360N-CB-482
- PL/I Optimizing Compiler, 5736-PL1
- PL/I Resident Library, 5736-LM4
- PL/I Transient Library, 5736-LM5
- 3735 Form Description Macros and Utility, 370N-CQ-493

** This does not include support for object code produced by the optimizing option.

Note: The user should be aware that ANS COBOL Compiler (360N-CB-482), Full ANS COBOL V3 Compiler (5736-CB2, PL/I Optimizing Compiler (5736-PL1) and Assembler F (360N-AS-466) require a main storage partition larger than the minimum required for operation of the CICS/DOS-Entry system. He should also be aware that if the ANS COBOL Compiler (360N-CB-482) or the Full ANS COBOL V3 Compiler (5736-CB2) is used with the minimum main storage size for the CICS/DOS-Standard system, there is only space for a 10K DOS nucleus.

The CICS/DOS user with ISAM must use the CICS ISAM logic module.

CICS may be assembled under Assembler, 360N-AS-465/370N-AS-465, with the following restrictions:

1. Stage 1 of SYSGEN may cause the following errors:
 - a. IJQ054 Local dictionary full
 - b. IJQ059 Undefined sequence symbol
 - c. Extraneous (irrelevant) MNOTEs between IJQ054 and IJQ059.

These errors may be ignored, and the output from Stage 1 will still be executable; however, some MNOTEs may be lost in final error checking and the results may not be as the user intended.

2. No more than twenty terminal types may be specified in Stage 1 of SYSGEN. This count of twenty terminal types includes terminals of the same type but with different features. (Example: BASIC 2741 and 2741 with checking are considered two terminal types). If this limit is exceeded the following error will occur:

IJQ096 Macro instruction or prototype operand exceeds 127 characters in length.

This error will produce unusable output from Stage 1.

3. The Destination Control Table will require 44K to assemble, therefore will not assemble in the CICS minimum configuration.
4. CICS will assemble under Assembler F, 360N-AS-466, with no errors.

To use Assembler F the installation must have a 2314, 2311 or 3 tape drives for assembler work files.

CICS/OS-Standard Version 2 operates under the IBM S/360 Operating System (OS/360). If access to the Data Language/I (DL/I) facility of the IMS/360 Version 2 Data Base system is provided by the CICS/OS-Standard Version 2 system, the CICS-DL/I interface operates as a separate task within the CICS partition/region. In this case, the user must have a multiprogramming environment. The following components of OS are required:

- Supervisor: MFT, 360S-CI-505, or MVT, 360S-CI-535
- Primary Data Management 360S-DM-508
- Direct Access Method (BDAM), 360S-DM-509
- Basic Telecommunications Access Method (BTAM), 360S-CO-513, and/or Graphic Programming Services, 360S-IO-523
- Assembler F, 360S-AS-037 and/or Assembler H, 5734-AS1
- Linkage Editor (E), 360S-ED-510 or Linkage Editor (F), 360S-ED-521
- Utilities, 360S-UT-506

The Multiple WAIT and Interval Timer options must be included in the OS system generation.

In addition to the above OS components, the user may require any of the following:

- Indexed Sequential Access Method (ISAM), 360S-IO-526
- Full ANS COBOL V3 Compiler and Library, 5734-CB1
- Full ANS COBOL V4 Compiler and Library, 5734-CB2, and Library only, 5734-LM2
- ANS COBOL, 360S-CB-545, and ANS COBOL Library, 360S-LM-546
- PL/I Optimizing Compiler and Libraries, 5734-PL3
- PL/I F, 360S-NL-511, and PL/I F Subroutine Library, 360S-LM-512
- Telecommunications Access Method (TCAM), 360S-CQ-548
- 3735 Form Description Macros and Utility, 360S-CQ-596
- A Type 4 SVC Number to be assigned to CICS for support of the 7770 Audio Response Unit

PROGRAM PRODUCTS

**CICS/DOS-Entry & Standard
CICS/OS-Standard V2 (cont'd)**

- IMS (Version 2, Modification Level 2 or later) Data Base System (5734-XX6) and OS system generation options required to handle an IMS Data Communication System.

Note: To use the optional "browsing" feature of CICS File Management, the CICS/OS user must have an operating system at least as current as Release 20.1 of OS.

To use the optional dynamic open/close function, the CICS/OS user must have an operating system at least as current as Release 20.0 of OS.

PROGRAM PRODUCTS

**SYSTEM/3 DOS/VS RPG II
CONVERSION PREPROCESSOR
5735-CV1****PURPOSE**

The S/3 DOS/VS Conversion Preprocessor is a set of programs designed to convert batch (*) application programs written for the S/3 mdl 10 Disk and mdls 8, 12, 15 RPG II Compilers (5702-RG1, 5704-RG1, 5704-RG2, 5705-RG1) to a form acceptable to the DOS/VS RPG II Compiler (5746-RG1).

* All programs not using communications support and/or assembler routines.

The Auto Report source programs and library members are also processed. The Conversion Preprocessor exists in two functionally equivalent programs.

- For use on S/3.
- For use under DOS/VS.

HIGHLIGHTS

For the conversion of S/3 RPG II source programs, which must have been previously successfully compiled by the S/3 RPG II Compiler, the user provides information about the new system environment by means of control statements. The user must specify:

- Whether all S/3 Disk file specifications are to be converted to VSAM or whether the File Description Specifications will be changed manually.
- The names of DOS/VS sublibraries for S/3 units (for Auto Report Programs only).
- The association of S/3 files and devices with DOS/VS devices and symbolic devices.

The control statements can be used globally for a whole stream of S/3 RPGII source programs and also locally for single programs within the stream.

The following conversions are performed automatically:

- File names of eight characters are reduced to seven characters and checked for non-uniqueness.
- Default values are inserted to avoid unnecessary manual intervention.
- For disk files translated to VSAM files, the file types are converted to corresponding VSAM files types.
- Information that is meaningless in a DOS/VS environment is deleted.
- A check is made for DOS/VS RPG II reserved words.
- Line counter specifications are changed to meet DOS/VS requirements

All conversion changes performed automatically are indicated in information messages. Where the user should check the conversion, warning messages are issued. In the few instances where automatic conversions cannot be performed, error messages are issued indicating that manual action must be taken.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The Conversion Preprocessor operates on any IBM S/370 supported by DOS/VS in a minimum virtual partition of 64K. It will also operate on a S/3 mdl 15 or a S/3 mdl 10, mdl 8 and mdl 12 if these latter systems have a minimum of 32K bytes of main storage. In any case, a disk oriented system is required.

SOFTWARE REQUIREMENTS

The S/3 DOS/VS RPG II Conversion Preprocessor source code is written in RPG II and can be installed on a system containing either DOS/VS RPG II (5746-RG1) running under DOS/VS Release 34, or DOS/VS Release 34 with the Advanced Functions - DOS/VS, 5746-XE2, program product installed, or S/3 RPG II (5702-RG1, 5704-RG1, 5704-RG2 or 5705-RG1) running under the current S/3 SCP.

PROGRAMMABLE STORE SYSTEM
SUBSYSTEM PROGRAM PREPARATION SUPPORT II
(SPPS II) Version 1 Release 3 Modification 0
5735-D16

PURPOSE

Subsystem Program Preparation Support II (SPPS II) supports the 3650 and 3680 Programmable Store Systems. It provides a general purpose programming facility for writing application programs to run in the Programmable Store System store controllers and the programmable terminals. These programs are prepared on the host processor, transmitted to the 3651 or 3684 store controller and executed at the store controller or the programmable terminal.

SPPS II provides support for all models of the 3683 Point of Sale Terminal and 3684 Point of Sale Control Unit, the 3685 Display Control Unit Models 1 and 2, 3286 Display Station Model 1, the 3651 Store Controller Models 25 and 75, the 3653 Model 1P and the 3663 Supermarket Terminal Models 1P and 3P.

HIGHLIGHTS

Subsystem Program Preparation Support II (SPPS II): SPPS II is the user program facility for the programmable store system. Programs written with SPPS II can support the hardware devices, communicate with the host computer and provide new applications that are not supplied by IBM. SPPS II provides the following additional services:

- SPPS II Assembler language
- SPPS II Macros
- Post Processor

SPPS II Assembler Language: SPPS II provides additional Assembler language instructions supported as macros. These instructions are assembled at the host processor and executed at the store controller or the programmable terminal or both. Arithmetic, logical and branching instructions are included in the set.

SPPS II Macros: SPPS II macros are executed in the 3651, 3684 or the programmable terminal, depending upon the macro type. The macros, along with assembler instructions, are assembled together at the host processor, then transmitted to the store controller.

- SPPS II supervisory macros are provided to define the message routing path between a terminal program and a controller program, to initialize a user program for execution and allocate system resources and control blocks.
- SPPS II controller to controller communications macros are provided to control the Auxiliary Communication Adapter. Available on the 3651 mdl 75.
- SPPS II Debug Macros are included to provide a diagnostic tool to the SPPS II programmer. The target application is the program to be debugged and the issuing application is the program performing the diagnostic.
- SPPS II macros are provided that execute in the programmable terminal, perform various terminal functions and control terminal operations.

Post Processor: SPPS II provides a Post Processor as a standalone program, executing in the host S/370 or 4300. It uses the SPPS II program assembly listing as input and produces a reformatted and edited assembly listing as output.

CUSTOMER RESPONSIBILITIES

The customer must create a unique macro library for SPPS II. The user must then install the macros supplied with SPPS II and the Post Processor.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

SPPS is designed to operate on the following IBM machines: System/370; 4300 Processors.

SOFTWARE REQUIREMENTS

SPPS II is designed to operate on any IBM System that will support the System/370 Assembler F operating under DOS/VSE, OS/VS1 or OS/VS2 (MVS). For the 3650 PSS user, the SPPS II SCP (5747-CJ2 for DOS or 5744-DA1 for OS) is a co-requisite for the SPPS II program product if the Terminal Display Language (TDL) is to be used.

COMPATIBILITY

Existing 3650 user programs assembled by Subsystem Program Preparation Support (SPPS) must be changed to gain the advantages of SPPS II. User programs written for the 3683 and/or the 3684 which perform I/O operations to devices unique to those machines (except LOOP I/O) will not operate in the 3685 and vice versa.

MVS SYSTEM INTEGRITY APPLIES: Yes

RPQs ACCEPTED: Yes

**3680 PROGRAMMABLE STORE SYSTEM/
SALES APPLICATION
RELEASE 2.0, MODIFICATION LEVEL 0
5735-D61**

PURPOSE

The 3680 Programmable Store System/Sales Application Program Product provides standard and extended sales transaction functions for a variety of store environments. The control unit and terminal segments programs are written in the Subsystem Program Preparation Support II (SPPS II) language allowing the user to modify them to suit his particular environment. Some of the types of stores for which these programs are intended include:

- Mass merchandisers
- Department stores
- Supermarkets and superettes
- Apparel
- Shoe
- Variety
- Drug
- Speciality
- Convenience

Functions may be added, deleted or changed to adapt the standard functions to the user's unique requirements. The extended functions may be used as described or serve as an example for other, user-designed alterations. These documented alterations, as well as those of the user's own design, are made using the programming capabilities of SPPS II.

DESCRIPTION

The programs are designed to be assembled on a S/370 or 4300 host processor operating under VSE/AF, OS/VS1 or OS/VS2 (MVS). A prerequisite is the SPPS II program product, 5735-D16, the language in which this program product is written.

The OS/VS version of Release 2 uses the System Modification Program (SMP) for distribution and service; the VSE/AF version uses the Maintain System History Program (MSHP). SMP and MSHP both provide improved installability and serviceability, and allow the user to better control the function and service level of his system.

The program product consists of two segments: A retail environment and a supermarket environment

The retail segment executes on the 3684 Point-of-Sale/Control Unit mdl 1 or 2 with 3683 Point-of-Sale Terminals, mdls 1, 2 or 3, and will primarily support retail-related point-of-sale environments.

The supermarket segment executes on the 3684 Point-of-Sale/Control Unit mdl 2 with 3683 Point-of-Sale Terminals mdls 1,2 or 3, and will primarily support supermarket-related point-of-sale environments.

Standard and extended sales functions provided for a retail operational environment by this program product are:

Standard Sales Functions

- Price Lookup
- Automatic Price Override
- Department Totals
- Item Movement
- Credit Authorization
- Transaction Logging

Store Level Options such as:

- Control Negative Entries
- Maximum Transaction Discount
- Default Transaction Discount
- Activating or Deactivating Functions and Changing Value or Threshold Limits

Sales Transaction Types

- Cash Take
- Cash Send
- COD (Cash On Delivery)
- Layaway
- Charge - Credit Plan A
- Charge - Credit Plan B
- Charge - Credit Plan C
- Charge - Credit Plan D

Other Capabilities During Sales Transactions

- Operator Guidance through Keying Sequence
- Journal Tape Recording of all Transactions
- Customer Receipt for a Cash Sale
- Sales Check for Charge or Other Transactions Requiring a Document
- Calculate Discounts
- Display Amount Due, Amount Tendered, Change Due, Refund
- Accept Keyboard and/or Wand Input
- Accumulate Transaction Total
- Accumulate Sales Period Totals by Terminal

- Fee Collection
- Modify Ticket Function
- Data Entry

Non-merchandise Function

- Allowance
- Discount
- Manual Tax Entry
- Payment
- No Sale Function
- Void Line item
- Void Transaction
- Force Operator to Void
- Multiple Pricing
- Clear Function
- Repeat Entry
- Check Out Mode
- Return-Credit
- Sales Period Totals
- Totals Readout/Reset (3 Types)
- Set Date and Time
- Sign On/Sign Off
- Journal Roll and Sales Check Indication Offline
- Department Totals Report
- Register Totals Report
- Item Price Change
- System Quiesce
- System Status Inquiry

Extended Sales Functions

- Cash Default Transaction
- Cashier Mode
- Quantity Keyed First
- Item Lookup Keying
- Department Keys
- Item Descriptor Lookup
- Check Endorsement
- Selective Record Code Logging
- Document Header Alignment by Transaction Type
- Positive Feedback from Wandering
- Cash Drawer Options
- Frank Cashlike Tender Option
- Enter and Record Multiple Cashlike Tender
- Enforce Amount Tendered Entry
- Alternate Cash Transaction Entry
- Transaction Type - Single Key
- Bypass Amount Tendered
- No Sale Key Control
- Prohibit Negative Entries and Operations by Transaction Type
- Wand Price Change Tickets
- Control Over Voiding a Preceding Item
- Automatic Tax Calculation
- Multiple Tax Tables
- Charge Balance Due on Cash Transaction
- Bypass Credit Authorization Offline
- Automatic Total at Sales Check End
- Display Minus Sign for Returns
- Line Item Discount
- Sales Period Totals Option
- Check Authorization
- Minimum Fees for COD, Layaway and Send Transactions
- Dept/Class Validation and Descriptor Lookup
- Bypass Entry of Stock Number
- No Tax of Fees
- Floor Limit Check Authorization Offline
- Floor Limit Credit Authorization Offline
- Multiple Tax Fees
- Modulo Check of Key Entry
- Mask Journal Rolls Totals Printout
- Define Transaction Type Prohibited
- Define Key Entry Sequence for Department/Class/Stock
- Salesperson from Keyboard or Wand
- Fractional Quantity
- Decimal Quantity Entry
- Terminal Security Code
- Bypass Prompt for Account Number

PROGRAM PRODUCTS

3680 Prog. Store System/Sales Application (cont'd)

Alphabetic Data Entry During Sales Transaction
 Additional Accounting Totals Recording
 Extended Layaway
 Bypass Amount Tendered
 Enforce Amount Tendered
 Class Validation
 Deposit Limit on C.O.D. and Layaway
 Enhanced Error Codes
 Item Movement Accumulation
 Magnetic Wand
 Optical Character Read Wand
 Unique Return Transaction
 Seven Digit Price Entry
 Totals Retention During Power Loss
 UPC/EAN (Bar) Wand
 Positive Feedback from Wanding
 Host Positive Credit

Permit Manual Handling of Tender
 Permit Use of Food Stamp Key
 Positive Wand Response Not Used
 Wand Override Number
 Wand Input of Customer ID Number
 Support Totals Retention Feature on Terminal
 Calculate Discounts and Tax Exemption
 Support Use of a non-IBM Coin Dispenser
 Change Store Coupon Effect on Taxability
 Exempt Food Stamp Items from Taxes
 Permit No Sale during a Transaction
 Process Trading Stamps
 Prevent Sales if Cash Drawer High Limit is Exceeded
 Specify Maximum Entry Limits by Department for Extended Price
 Specify Quantity Entry Limits
 Charge Check Fee
 Specify Negative Entry Limits
 Specify Void Transaction Maximum
 Defer Notification of Negative Entry Limit Errors
 Display Subtotals without Printing
 Print Non-summarized Messages
 Specify Validation Station Printing
 Specify Multiple Line Feeds
 Print Personalized Message before Store Name
 Print a Tax Paid Line
 Specify more than 5 Override Numbers
 Prevent Entry until Summary Journal Paper Roll is Replaced
 Support Management Override Key
 Print Grand Total Descriptors
 Support Backup Cassette Loading
 Provide Standalone Mode of Operation
 Provide Automatic Entry and Exit for Standalone Mode
 Use of Date, Time, Lane Number during Standalone Sign-on
 Accumulate Department Counts during Standalone Mode
 Accumulate Net Department Totals during Standalone Mode
 Permit Bypassing Check Verification
 Add Time-stamping for Transaction Log
 Accumulate Customer Count by Department
 Compute Taxes in Microcode
 Permit Reverse Key Sequences
 Display Alphabetic Characters as Keyed (now integrated into base code)
 Fast Process for Department/Price Entries
 Support EAN 13 Item Codes
 Transaction Log Wrap When Full
 Terminal Productivity Log Wrap When Full
 Storage Retention
 UPC/EAN Bar Code Wand
 Department Totals Accumulated in Terminal until End of Last Transaction
 Repeat Last Entry
 Print Transaction Number on Date/Time Line
 Terminal System Date Function
 Short Cashier Pickup in Checkout

Standard and Extended Functions Provided for a Supermarket Operational Environment by this Program Product are:

Standard Sales Functions

Customer Checkout
 Sign-on/sign-off for Authorized Operators
 Special Sign-on/sign-off
 Automatic Sign-off
 Item Sale by Quantity or Weight (non-IBM scale optional)
 Deposit
 Deposit Return
 Merchandise Refund
 Coupons
 Override Numbers
 Entry Limit Controls
 Quantity by Department
 Minimum/Maximum by Department
 Negative Entries by Department
 Maximum Cancel Limit in a Transaction
 Override Last Entry
 Repeat Last Entry
 Cancel and Cancel Last Entry
 Total Balance Due
 Food Stamp Balance Due
 Amount Tendered
 Correct Tender
 Tender Change Limits
 Tender Exchange
 Upper Limits on Checks Cashied
 Check Verification (negative)
 End of Transaction
 No Sale
 Void Transaction
 Exception Logging
 Price Lookup
 Item Movement - Quantity, Weight, Amount
 Department Totals

Non-Checkout Procedures
 Deactivate a Terminal
 Item Record Price Change
 Set Date and Time
 System Status Inquiry
 System Quiesce

Extended Sales Functions

Change the Edit Pattern for Amount Fields
 Change the Edit Pattern for Weight Fields
 System Date Format
 Check Date and Time Integrity Parameters
 Selective Transaction Logging
 Checkout Terminal Table Initialization
 Define the Check Verification Processing Options
 Alter Department Totals Records
 Rounding to Multiple Price Units
 Weight in Thousandths
 Specify Department Totals Main Storage Buffer
 Accumulate Net Department Totals in Main Storage
 Specify Item Movement Main Storage Buffer
 Prevent Item Movement Updates with Refund Key
 Alternate Item Record Descriptor Maximum Length
 Price Override Priority Selection
 Alternate Department Totals Storage Buffer Format
 Support Universal Product Code (UPC) System #2
 Accumulate Data for Checker Time Analysis
 Change Numeric Field Print Editing
 Add Department Keys
 Refund Key Invalid
 Store Coupon Key Invalid
 Eliminate Check Verification
 Eliminate Void Transaction Key Sequence
 Eliminate Food Stamp Processing
 Specify Tax Method

CUSTOMER RESPONSIBILITIES

Install the Programmable Store System Host Support to:

- Define and maintain the subsystem library (SLIB) and the data sets necessary to support the programmable store subsystem.
- Create the operational environment that will control the functions of control unit and terminal segments of the terminals in the store.
- Provide communications between the host and the store control unit to load the application programs and to recover application program dumps.

Install the Subsystem Program Preparation Support II (SPPS II) Program Product.

Place the 3680 Programmable Store System/Sales Application program release into a predefined data base.

Modify and customize the standard functions as desired.

- Insert and delete source code for IBM extended function and/or user-designed modules.

Note: Each extended function will be individually tested with the application base package of standard functions. Incorporating and testing multiple extended functions may require additional design and changes which are the user's responsibility.

Assemble and link edit the 3680 Programmable Store System/Sales Application Program.

Perform application definition.

- Use the Programmable Store System Host Support to:
 - Create Application Definition Record(s).
 - Create Application Load List(s).
- Assemble macro statements.

PROGRAM PRODUCTS

3680 Prog. Store System/Sales Application (cont'd)

Generate user data for files as required (examples):

- Item Record
- Check Verification
- Operator Authorization

RPQs ACCEPTED: Yes

TERMS and CONDITIONS: See PP Index

Load the 3684 diskette units.

- Via Programmable Store System Host Support
 - Application Definition Record
 - 3680 Programmable Store System/Sales Application Programs
- Via user-provided transmission program
 - Initialize user files

Note: The allocation, diskette location, size, creation, maintenance, transmission and content of all files are a user responsibility.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The 3680 Programmable Store System/Sales Application Program Product is designed to operate with the following minimum hardware configurations:

For the retail operational environment:

Control and terminal segments combined:

- 3684 mdl 1 with journal printer and 56K storage
- 3684 mdl 2 with 56K storage in the control unit segment and terminal segment with journal printer and 40K storage

Terminal segment only:

- 3683 mdl 1, 2 or 3 and journal printer with 40K storage.

For the supermarket operational environment:

Control and terminal segments combined:

- 3684 mdl 2 with 72K storage in the control unit segment and terminal segment with journal printer and 56K storage.

Terminal segment only:

- 3683 mdl 1, 2 or 3 with journal printer and 56K storage.

Additional storage capacity may be required depending on the extended functions and options selected, configurations and user code. Storage requirements must be evaluated at the systems assurance review.

SOFTWARE REQUIREMENTS

Host Requirement: This program product is designed to be assembled on a S/370 or 4300 host processor with storage sufficient to accommodate the VSE/AF, OS/VS1 or OS/VS2 (MVS) release required by Programmable Store System Host Support. This program product uses the Programmable Store System Host Support which utilizes VSAM and, for transmission of this program product to and from the 3680 Programmable Store System, BTAM for binary synchronous and VTAM or ACF VTAM for SDLC. All execution of this program product code will take place on the 3680 Programmable Store System. Specific release levels are detailed in the Product Availability Notices.

Programming Language: The 3680 Programmable Store System/Sales Application Program Product is written in the Subsystem Program Preparation Support II (SPPS II) Program Product language, a corequisite program product.

Store Environment: The 3680 Programmable Store System/Sales Application Program Product will support the 3684 and 3683 engineering change levels supported by the latest current level of the Programmable Store System Host Support and SPPS II programs.

**3680 PROGRAMMABLE STORE SYSTEM/
STORE ADMINISTRATION APPLICATION
RELEASE 2
5735-D62**

PURPOSE

The 3680 Programmable Store System/Store Administration Application Program Product provides functions to assist in a variety of administrative tasks and enhances operation of the point-of-sale system in the store. The programs, both control unit and terminal segments, are written in the IBM Subsystem Program Preparation Support II (SPPS II) language allowing the user to modify them to suit his particular environment. Some of the types of stores for which these programs are intended include:

- Mass merchandisers
- Department stores
- Supermarkets and superettes
- Apparel
- Shoe
- Variety
- Drug
- Specialty
- Convenience

Functions may be added, deleted or changed to adapt the standard functions to the user's unique requirements.

DESCRIPTION

The programs are designed to be assembled on a S/370 or 4300 host processor operating under VSE/AF, OS/VS1 or OS/VS2 (MVS). Prerequisites are the SPPS II program product, 5735-D16, the language in which this program product is written, and 3680 Programmable Store System/Sales Application program product, 5735-D61, which this program product works with and supports.

The OS/VS version of Release 2 uses the System Modification Program (SMP) for distribution and service; the VSE/AF version uses the Maintain History Program (MSHP). SMP and MSHP both provide improved installability and serviceability, and allow the user to better control the function and service level of his system.

The program product consists of two segments: A retail environment and a supermarket environment.

The retail segment executes on the 3684 Point-of-Sale/Control Unit mdl 1 or 2 with 3683 Point-of-Sale Terminals, mdls 1, 2 or 3, and will primarily support retail-related point-of-sale environments.

The supermarket segment executes on the 3684 Point-of-Sale/Control Unit mdl 2 with 3683 Point-of-Sale Terminals, mdls 1, 2 or 3, and will primarily support supermarket-related point-of-sale environments.

The programs provide the following functions for a retail operational environment:

- Obtain item movement and reset
- Loans and withdrawals
- Cash count data entry
- Change terminal and control unit options
- Data maintenance
- Wand data entry (extended function)
- Void previous transaction (summary form or by line item)
- Re-entry of offline transactions
- Operator training
- Set transaction number
- Specify maximum change options area
- Wandering in non-sales mode

The programs provide the following functions for a supermarket operational environment:

Base Store Administration Functions

Store Support Procedures

- Authorize transfer or signoff of another terminal
- Batched file maintenance
- Build standalone item records
- Carrying forward tender-on-hand
- Change options
- Close department totals
- Close reporting period
- Data maintenance
- Entering counted tender
- Obtain item movement
- Operator training
- Print manager's messages
- Recording cashier pickups
- Recording loans
- Recording miscellaneous account transactions
- Recording miscellaneous account transactions - privileged
- Shelf label preparation
- Transfer tender-on-hand
- Void previous transaction by line item

Store Reports

- Cash report
- Cash drawer position
- Department analysis
- Miscellaneous transaction recap
- Terminal productivity

Extended Store Administration Functions

- Standalone item record processing notification
- Long department totals during close reporting period (now integrated into base code)
- Check listing during recording cashier pickup
- Two copies for cashier pickup
- Calculate total to account for during miscellaneous transactions and enter counted tender
- Print option area during change options - change request
- Print option area during change options - execute request
- Print all options during change options
- Reverse key sequence for certain store support procedures
- Open cash drawer in training mode
- Process check listing file during close reporting period procedure
- Specify maximum change options area

Either retail or supermarket operational functions may be selected for any single control unit environment. Simultaneous selection of functions for both the retail and supermarket operational environments is not supported by this program product.

CUSTOMER RESPONSIBILITIES

Install the Programmable Store System Host Support to:

- Define and maintain the subsystem library (SLIB) and the data sets necessary to support the programmable store subsystems.
- Create the operational environment that will control the functions of control unit and terminal segments of the terminals in the store.
- Provide communications between the host and the store control unit to load the application programs and to recover application program dumps.

Install the Subsystem Program Preparation Support II (SPPS II) program product.

Install the 3680 Programmable Store System/Sales Application program product.

Place the 3680 Programmable Store System/Store Administration Application program product release into a predefined data base.

Modify and customize the standard functions as desired.

- Insert and delete source code for user designed modifications.

Assemble and link-edit the 3680 Programmable Store System/Store Administration Application program product along with the Sales Application licensed program.

Perform application definition.

- Use the Programmable Store System Host Support to:

- Create Application Definition Record(s).
- Create Application Load List(s).

- Assemble macro statements.

Generate user data for files as required (examples):

- Item Record
- Check Verification
- Operator Authorization

Load the 3684 diskette units.

- Via Programmable Store System Host Support

- Application Definition Record
- 3680 Programmable Store System/Sales Application programs
- 3680 Programmable Store System/Store Administration Application programs

- Via user provided transmission program

- Initialize user files

Note: The allocation, diskette location, size, creation, maintenance, transmission and content of all files are a user responsibility.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The 3680 Programmable Store System/Store Administration Application program product is designed to operate with the following minimum hardware configurations:

3680 PSS Store Administration Appl. (cont'd)

For the retail operational environment:

Control and terminal segments combined:

- 3684 mdl 1 with journal printer and 56K storage
- 3684 mdl 2 with 56K storage in the control unit segment and terminal segment with journal printer and 40K storage

Terminal segment only:

- 3683 mdl 1, 2 or 3 with journal printer and 40K storage

For the supermarket operational environment:

Control and terminal segments combined:

- 3684 mdl 2 with 72K storage in the control unit segment and terminal segment with journal printer and 56K storage

Terminal segment only:

- 3683 mdl 1, 2 or 3 with journal printer and 56K storage

Additional storage capacity may be required depending upon the extended functions options selected, configuration and user code.

SOFTWARE REQUIREMENTS

Host Requirement: This program product is designed to be assembled on a S/370 or 4300 host processor with storage sufficient to accommodate the VSE/AF, OS/VS1 or OS/VS2 (MVS) release required by Programmable Store System Host Support. This program product uses the Programmable Store System Host Support which utilizes VSAM and, for transmission of this program product to and from the 3680 Programmable Store System, BTAM for binary synchronous and VTAM or ACF/VTAM for SDLC. All execution of this program product code will take place on the 3680 Programmable Store System. Specific release levels are detailed in the Product Availability Notices.

Programming Language: The 3680 Programmable Store System/Store Administration Application program product is written in the Subsystem Program Preparation Support II (SPPS II) Program Product language, a corequisite program product.

Store Environment: The 3680 Programmable Store System/Store Administration Application program product will support the 3684 and 3683 engineering change levels supported by the latest current level of the Programmable Store System Host Support and SPPS II programs. The 3680 Programmable Store System/Sales Application program product, 5735-D61, is required.

PROGRAM PRODUCT

**EPIC: SOCRATES (5735-E91)
 EPIC: FAST (5735-E92)
 EPIC: BUDGET/FINANCE (5735-E93)**

[Program 5735-E92 is no longer available, effective June, 1983.]

PURPOSE

The EPIC licensed programs provide essential administrative and financial records for elementary and secondary schools, junior and community colleges, four year colleges, and universities. EPIC is written using the American National Standard COBOL subset language for user compilation on 1130, S/3 or on S/360/370 under DOS or OS. The system design of EPIC incorporates many significant features:

DESCRIPTION

- General -- System tailoring to the educational institutions' unique requirements for number of periods in a school day, number of semesters in a year, state reporting cycles, etc. All input specifications are described in terms familiar to school administrators and require no detailed knowledge of data processing techniques. Data Files are shared among applications to conserve space requirements.
- SOCRATES Student Scheduling -- A resource allocation facility for constructing an initial master schedule of class offerings, assignment of students to the initial or revised master schedule of classes, and post-scheduling maintenance of the schedule data files.
- FAST Test Scoring -- Contains the full content of widely used 1401-1440 FAST, plus significant improvements including stored conversion tables, scoring keys, and routines for teacher-made tests.
- Budget/Finance Accounting -- Computer-assisted construction of school budget, budgetary control of expenditures, encumbrance and general ledger accounting, vendor payments produced with comprehensive status reports for financial management.
- Student Records and Grade/Attendance Reporting -- Full range of academic achievement and progress reports including statistical analysis of marks. Attendance recording and reporting at the homeroom, school and district levels. The features in each program product are completely independent. Where more than one of the applications is installed by a user, files are shared for common data such as the master schedule and student identification files. A user whose needs are answered by any of the above facilities may readily implement only the function desired. Customers requiring the entire group of EPIC programs may schedule installation in sequence appropriate to their own needs.

EPIC:SOCRATES (5735-E91)

The EPIC:SOCRATES program product is used for student scheduling.

DESCRIPTION

The EPIC:SOCRATES program product is provided to the user in American National Standard COBOL source form, with a tailoring program used to produce a customized source program appropriate for direct compilation on the user's own system. In addition to adapting the programs to the user's machine configuration for improved performance, the programs are tailored to the unique educational requirements of the institution where appropriate.

HIGHLIGHTS

EPIC:SOCRATES accepts as input student course requests, course numbers and titles and a school master schedule of courses with meeting times, teachers and locations. Produced as output are:

- Prescheduling tallies, conflict matrices and verification listings.
- Student schedules.
- Analysis of scheduling effectiveness.
- Updated master schedule listing.
- Utilization analysis of teachers and rooms.
- Class lists and locator cards.
- Drop and add reports.

The main scheduling program capabilities are:

- Schedules classes in any of 99 periods per day, blocked or unblocked, consecutive or non-consecutive period sequences. (*)
- Schedules classes in any combination of eight user-defined days per cycle. (*)
- Schedules classes in any combination of five or less semesters per year. (*)
- Permits classes to be specified as meeting in differing locations for any combination of period, day, and semester meeting times.
- Permits classes to be specified as having differing teachers for any combination of period, day, and semester meeting times.
- Permits classes to be restricted to a single sex, or else will attempt to balance sexes in each class to the ratio observed in the overall requests for the course.

Permits classes to be restricted to an ethnic student group only, or else will attempt to balance between the majority and the minority ethnic groups in each class to the ratio observed in the overall requests for the course.

Permits classes to be restricted to a single ability group, or any range of consecutive ability groups, for students for which ability group codes are provided, or else will mix ability groups in a random manner. Individual students may be coded for random assignment, even though other students are grouped.

Permits students to request specific class sections, or instructors, along with their course requests.

Permits scheduling restrictions given above to be lifted optionally, if such restriction would otherwise result in a rejected course request. Each restriction is individually controllable in this respect.

(*) When the three features identified with the (*) symbol are each specified in combination near their maximum size, the total core requirements may exceed the minimum size specified in the system configurations.

CUSTOMER RESPONSIBILITIES

Establish required files for EPIC:SOCRATES.

Understand the options available and the data required to implement each.

Assign both an educator and a data processing systems person to implement the system.

Specify the tailoring information necessary to produce the COBOL source programs appropriate to the machine configuration and local requirements, and compile on the system. (Requires availability of suitable ANS COBOL program product compiler.)

Provide a person knowledgeable in COBOL programming to modify formats of input and output documents to meet local needs.

Provide a suitable system (360/370) to retrieve the EPIC programs from the DTR, run the Systems Tailoring Program and place the source modules on disk or cards for entry into the system.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This program product will function on a machine configuration of minimum size, as noted below, with the exception that when certain features modified by the system tailoring program are each specified in combination near their maximum size, the total main storage size may exceed the minimum size specified below. Examples of these specifications are: QS-101, QS-102, and QS-106. In larger installations, however, the program product can make use of the available main and secondary storage capabilities and some of the I/O facilities to promote faster throughput.

1130 Configuration

Minimum

- Processor 1131, mdl 2C
- Printer 120 or 132 print positions, any model (COBOL-supported)
- DASD Only the single drive in the CPU is required. A second drive in a 2310 is, however, very strongly recommended for all but the very smallest user.
- CRP Any configuration (COBOL-supported)
- Additional Support For:
 - Processor Additional storage
 - DASD Additional disks (COBOL-supported)

System/360-370 Configuration - DOS or OS

Minimum

- | | COBOL Compiler | Minimum Partition for Compilation and Execution |
|-----------|--|---|
| Processor | 5736-CB1
5736-CB2
5734-CB1 | 24K
Equal to compiler partition
Equal to compiler partition |
| DOS | | |
| OS | | |
| DASD | One disk drive beyond that required by the Supervisor, and any other programs operative concurrently | |
| CRP | Any configuration (COBOL-supported) | |
| Console | Printer-Keyboard | |

EPIC (cont'd)

Additional Support For:

Processor Additional storage
 DASD Additional disks (COBOL-supported)
 OMR IBM 3881 mdl 1 Optical Mark Reader (S/370 DOS/VS only).

Mag. Tape As preformatted input from an IBM 3881 mdl 2 only

System/3 Configuration

Minimum

Processor 5410, mdl A16 (32K bytes)
 Printer 120 or 132 print positions, any model (COBOL-supported)
 DASD One 5444 disk drive. Additional disk storage is recommended for all but the smallest user
 CRP Any configuration (COBOL-supported)
 Console Printer-Keyboard

Additional Support For:

Processor Additional storage
 DASD Additional 5444 or 5445 (COBOL-supported)
 Cd-Image IBM 1442 Card Read Punch
 OMR IBM 3881 mdl 1 Optical Mark Reader

Mag. Tape As preformatted input from an IBM 3881 mdl 2 only

Note: System/3 version is distributed on 2 5440 Disk cartridges. Tailoring and compilation procedures distributed with the program require 2 5444 disk drives (one mdl 2 and one mdl 2 or 3).

SOFTWARE REQUIREMENTS

The program product is distributed as a master source program written using the American National Standard COBOL subset language, plus certain IBM enhancements. In addition, some Assembler language modules are included.

A special systems tailoring program is used to convert the master source programs so they can produce logically equivalent programs adapted for compilation on the 1130, System/3 and on S/360 and S/370 under DOS or OS. During such conversion, user specifications are accepted to further modify the programs to use additional I/O devices and core size capabilities available on the user's system where required to improve performance.

The programming systems are 1130 Disk Monitor Version 2, Modification level 0; System/3 Model 10 Disk System, Release 7; S/360/370 DOS and S/360/370 OS.

The user is required to provide a suitable ANS COBOL program product compiler on his system, plus a suitable Assembler, to generate object code suitable for execution. These are 1130 ANS COBOL Subset Compiler (5711-CB1) and Assembler (1130-OS-005) ... System/360-370 32K DOS-ANS COBOL Subset Compiler V2M0 Release 2 (5736-CB1), 65K DOS-ANS COBOL Full Compiler V2M0 Release 2 (5736-CB2), Library for execution VMO Release 2 (5736-LM2) and Assembler Release 26 (360N-AS-466) ... S/360/370 OS-ANS COBOL Full Compiler V3M1 (5734-CB1) and Assembler Release 21 (360S-AS-037) ... System/3 ANS COBOL Subset Compiler Release 3.0 (5702-CB1), Overlay Linkage Editor (5702-SC1) and Checkpoint/Restart feature (#6026/#6027).

Other DOS considerations: SYSGEN -- Proper execution of the Systems Tailoring Program requires SYSFIL=XXXX, where XXXX is a disk device ... Access Method -- DAM ... Service Programs -- none.

Other OS considerations: Access Method -- BDAM ... Service Programs -- none.

Other System/3 considerations: SYSGEN -- Proper execution of the restart feature in RAF and 3881 bonus alignment routine requires \$DINQ=YES. This licensed program is designed to operate under the above stated programs and all subsequent releases, versions and modification levels unless stated otherwise in a future revision of this document.

DOCUMENTATION

General Information Manual (GH20-1129).

TERMS and CONDITIONS: See PP Index

EPIC:FAST (5735-E92)

EPIC:FAST produces timely test scoring results, handling of a wide variety of input, and provides extensive statistical analysis of test scores.

DESCRIPTION

EPIC:FAST is provided to the user in ANS COBOL source form with a tailoring program used to produce a customized source program appropriate for direct compilation on the user's own system. The programs are tailored to the user's machine configuration for improved performance.

HIGHLIGHTS

EPIC:FAST Test Scoring contains the full content of widely-used 1401-1440 FAST plus significant improvements including stored conversion tables and scoring keys. EPIC:FAST accepts responses punched in the 1401 FAST answer card and provides utilities to convert 1401 FAST conversion tables, Student ID, and raw score cards to EPIC:FAST format.

EPIC:FAST accepts as input raw scores from punched cards plus response input from optical mark readers in addition to 1401 FAST answer cards. Responses are scored according to correct responses provided in cataloged scoring keys. Raw scores are converted through the use of conversion tables cataloged into the systems.

Users of EPIC:SOCRATES or EPIC:Student have the capability of using the student data base created by these products to establish a test file. EPIC:FAST provides the capability of selecting students who were defined to EPIC:SOCRATES or EPIC:Student and transferring the pertinent information to the test files. Although EPIC:FAST does not provide a program to post the test results to EPIC:Student records, the data is available for the user to permanently record the results to his data base.

The capability for comparison of local norms at the group, school, region and district level for the current test period is provided. EPIC:FAST also provides the capability to accumulate the test results at the school, region and district level for comparison against the current test results. A student's local percentiles derived from the local norms are shared in his test record.

The user may define tests to be administered at any level and process the results to produce the same analysis and reports which can be achieved with standardized tests.

CUSTOMER RESPONSIBILITIES

- Establish required files for EPIC:FAST.
- Understand the options available and the data required to implement each.
- Assign both a test administrator and a data processing systems person to implement the system.
- Specify the tailoring information necessary to produce the COBOL source programs appropriate to the machine configuration and local requirements, and compile on the system. (Requires availability of suitable ANS COBOL program product compiler.)
- Provide a person knowledgeable in COBOL programming to modify formats of input and output documents to meet local needs.
- Provide a suitable system to retrieve the EPIC programs from the DTR, run the system tailoring program and place the source modules on disk or cards for entry into the system. Minimum configuration for tailoring on S/360 and S/370 is the minimum configuration plus one tape drive.
- Design and acquire preprinted forms for turnaround documents.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The program product functions on a machine configuration of minimum size as noted below. In larger installations, the program product can make use of the available main and secondary storage capabilities and some of the I/O facilities to promote faster throughput and to support all features at their maximum sizes.

1130 Configuration

Minimum

Processor 1131, mdl 2C (16K words)
 DASD Only the single drive in the CPU is required. A second drive in a 2310 is, however, very strongly recommended for all but the very small user.
 Printer 120 or 132 print positions, any model (COBOL-supported)
 CRP Any configuration (COBOL-supported)

Additional Support For:

Processor Additional storage
 DASD Additional disks (COBOL-supported)

EPIC (cont'd)

System/3 Configuration

Minimum

Processor 5410, mdl A16 (28.5K bytes)
 DASD One 5444 disk drive. Additional disk storage is recommended for all but the smallest user
 Printer 120 or 132 print positions, any model (COBOL-supported)
 CRP Any configuration (COBOL-supported)
 Console Printer-Keyboard
 Additional Support For:
 Processor Additional storage
 DASD Additional 5444 or 5445 (COBOL-supported)
 Cd-Image IBM 1442 Card Read Punch
 OMR IBM 3881 Model 1 Optical Mark Reader
 Mag. Tape As preformatted input from an IBM 3881 mdl 2 only
 System 360/370 Configuration - DOS or OS

Minimum

Processor	COBOL Compiler	Minimum Partition for Compilation and Execution
DOS	5736-CB1	24K
	5736-CB2	Equal to compiler partition.
OS	5734-CB1	Equal to compiler partition.
DASD	One disk drive beyond that required by the Supervisor, and any other programs operative concurrently.	
Printer	120 or 132 print positions, any model (COBOL-supported).	
CRP	Any configuration (COBOL-supported).	
Console	Any OS/DOS support console.	

Additional Support For:

Processor Additional storage.
 DASD Additional disk devices currently supported by COBOL.
 Tape Magnetic tape produced by 3881.

If attachable, the following devices and features:

OMR IBM 1231 Optical Mark Page Reader (360).
 IBM 2501 Optical Mark Reader Special Feature (370).
 IBM 3505 Optical Mark Reader Special Feature (370).
 IBM 3881 Optical Mark Reader (S/370 DOS/VS only).
 Col-Binary IBM 2540 (2821 Control Unit requires special feature #1990).
 Cd-Image IBM 2501 with Card Image Special Feature (360).
 IBM 3505 Card Image Standard Feature (370).
 Mag. Tape As preformatted input from 3881 mdl 2 only.

SOFTWARE REQUIREMENTS

The program product is distributed as a master source program written using the American National Standards COBOL subset language, plus certain IBM extensions. In addition, some Assembler language modules are included.

A special system tailoring program is used to convert the master source programs to produce logically equivalent programs adapted for compilation on the 1130, System/3 and on S/360 and S/370 under DOS or OS. During such conversion, user specifications are accepted to further modify the programs to use additional I/O devices and core size capabilities available on the user's system where required to improve performance.

The operating systems are:

1130: Disk Monitor Version 2, Modification 0
 System/3: Model 10 Disk System
 S/360 or S/370: DOS
 S/360 or S/370: OS

The user is required to provide a suitable ANS COBOL program product compiler on his system, plus a suitable Assembler in order to generate object code suitable for execution. These are:

1130: ANS COBOL Subset Compiler (5711-CB1) and Assembler (1130-OS-005)
 System/3: IBM System/3 Subset American Standard COBOL (5702-CB1), Release 3.0. Overlay Linkage Editor (5702-SC1, and Checkpoint/Restart feature (#6026/6027)
 S/360/370: DOS ANS COBOL Subset Compiler and Library (5736-CB1), Release 2 (V2M0)
 DOS ANS COBOL Full Compiler (5736-CB2), Release 2 (V2M0), and Library for execution (5736-LM2), Release 2 (V2M0)
 Assembler (360N-AS-466) or DOS/VS Assembler
 S/360/370: OS ANS COBOL Full Compiler (5734-CB1), V3M1.
 Assembler (360S-AS-037)

Other System/3 considerations:

SYSGEN Proper execution of forms alignment routines requires \$DINQ=YES.

Other DOS considerations:

SYSGEN: Proper execution of the Systems Tailoring Program requires SYSFIL=XXXX, where XXXX is a disk device.

Access Method: DAM access method is required.

Service Programs: None

Other OS considerations:

Access Method: BDAM access method is required.

Service Programs: None

This program product is designed to operate under the above stated programs and all subsequent releases, versions, and modification levels unless stated otherwise in a future revision of this document.

DOCUMENTATION

(available from Mechanicsburg)

General Information Manual (GH20-1131).

TERMS and CONDITIONS: See PP Index

EPIC:BUDGET/FINANCE (5735-E93)

The EPIC:Budget/Finance program product provides essential administrative and financial records for elementary and secondary schools, junior and community colleges, four-year colleges, and universities. EPIC:Budget/Finance was written using the ANS COBOL subset language for user compilation on the IBM 1130, System/360 and System/370 under OS or DOS, and on the System/3.

DESCRIPTION

EPIC:Budget/Finance is provided to the user in ANS COBOL source form with a tailoring program used to produce a customized source program appropriate for direct compilation on the user's own system. The programs are tailored to the user's machine configuration for improved performance.

Budget/Finance Accounting - Computer-assisted construction of school budget, budgetary control of expenditures, encumbrance and general ledger accounting, vendor payments produced with comprehensive status reports for financial management.

HIGHLIGHTS

EPIC:Budget/Finance is a series of interrelated programs designed to automate construction of the school budget and the accounting procedures in educational institutions. The program product includes procedures and programs to facilitate control of expenditures, starting with budgeted funds, including all types of accounting transactions, payment of amounts owed to vendors, and culminating with a range of status reports for financial management.

This program is designed to furnish control of expenditures. Compatibility with the United States Office of Education published financial guidelines in the area of Planning, Programming and Budgeting System (PPBS) is intrinsic in the program design. Each institution is given the prerogative of choosing its unique account code structure. Therefore, the program product is adaptable to the majority of educational organizations. Using the Budget/Finance package as the financial application hub, education administrators will be able to subsequently

EPIC (cont'd)

automate related procedures such as payroll and stores or supplies control.

USE

The system is used to control the educational institution's budget already in effect and to help prepare the next year's budget.

The programs also furnish the user with control over daily encumbrance accounting transactions.

CUSTOMER RESPONSIBILITIES

The customer must provide the necessary personnel with knowledge of their budgeting and accounting practices to structure the chart of accounts and establish the administrative and data processing procedure for data collection, posting and control.

He must also provide and implement a plan for conversion from his present system.

Provide a suitable system to retrieve the EPIC programs from the DTR, run the System Tailoring Program and place the source modules on disk or cards for entry into his system. Minimum configuration for tailoring on S/360 and S/370 is the minimum configuration plus one tape drive. System/3 tailoring requires two 5444 disk drives (one mdl 2 and one mdl 2 or 3). 1130 systems must use a S/360 or S/370 and punch out the tailored source programs.

Provide a person knowledgeable in COBOL programming to modify formats of input and output documents to meet local needs.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This program product will function on a machine configuration of minimum size as noted below. In larger installations, however, the program product can make use of the available main and secondary storage capabilities and some of the I/O facilities to promote faster throughput.

1130 Configuration

Minimum

- Processor 1131, mdl 2C (16K words)
- Printer 120 or 132 print positions, any model (COBOL-supported)
- DASD Only the single drive in the CPU is required. A second drive in a 2310 is, however, very strongly recommended for all but the very smallest user.
- CRP Any configuration (COBOL-supported)

Additional Support For:

- Processor Additional storage
- DASD Additional disks (COBOL-supported)

System/3 Configuration

Minimum

- Processor 5410, mdl A16 (32K bytes)
- Printer 120 or 132 print positions, any model (COBOL-supported)
- DASD One 5444 disk drive. Additional disk storage is recommended for all but the smallest user
- CRP Any configuration
- Console Printer-Keyboard

Additional Support For:

- Processor Additional storage
- DASD Additional 5444 or 5445 (COBOL-supported)

System/360 - 370 Configuration - OS or DOS

Minimum

- Processor Any 360/370 processor with a minimum core size required for the Supervisor, plus the COBOL compiler or 24K, whichever is greater.
- Printer 120 or 132 print positions, any model (COBOL-supported).
- DASD One disk drive beyond that required by the Supervisor, and any other programs operative concurrently.
- CRP Any configuration (COBOL-supported).
- Console Printer-Keyboard.

Additional Support For:

- Processor Additional storage.
- DASD Additional disks (COBOL-supported).

SOFTWARE REQUIREMENTS

The program product is distributed as a master source program written using the American National Standard COBOL subset language, plus certain IBM enhancements. In addition, some Assembler language modules are included.

A special systems tailoring program is used to convert the master source programs so they can produce logically equivalent programs adapted for compilation on the IBM 1130, System/3, and on S/360 and S/370 under OS or DOS. During such conversion, user specifications are accepted to further modify the programs to use additional I/O device and core size capabilities available on the user's system where required to improve performance.

The operating systems are 1130 Disk Monitor Version 2, Modification Level 11; System/3 Model 10 Disk System, Release 7; S/360/370 DOS and S/360/370 OS (MFT.MVT).

The user is required to provide a suitable ANS COBOL program product compiler on his system, plus a suitable Assembler, to generate object code suitable for execution. These are 1130 ANS COBOL Subset Compiler V1M1 (5711-CB1) and Assembler (V2M11 (1130-OS-005) ... System/360-370 DOS ANS Subset COBOL Compiler (5736-CB1), DOS Full ANS COBOL Version 3 Compiler (5736-CB2), Full ANS COBOL Library (5736-LM2) and Assembler Release 26 (360N-AS-466) ... S/360/370 OS Full ANS COBOL Version 3 Compiler and Library (5734-CB1) and Assembler Release 21 (360S-AS-037) ... System/3 ANS COBOL Subset Compiler Release 3.0 (5702-CB1), Overlay Linkage Editor (5702-SC1) and Checkpoint/Restart feature (#6026/#6027).

Other DOS considerations: SYSGEN -- Proper execution of the System Tailoring Program requires SYSFIL=XXXX, where XXXX is a disk device ... Access Method -- DAM ... Service Programs -- none.

Other OS considerations: Access Method--BDAM ... Service Programs--none.

Other System/3 Considerations: System/3 Version is distributed on one 5440 disk cartridge. Tailoring and compilation procedures distributed with the licensed program can make use of the available main and secondary storage capabilities and some of the I/O facilities to promote faster throughput.

PROGRAM PRODUCTS

**3650 PROGRAMMABLE STORE SYSTEM
PHARMACY APPLICATION/STORE ENVIRONMENT
Release 2, Modification Level 0
PASE (5735-H11)**

PURPOSE

The IBM 3650 Programmable Store System Pharmacy Application/Store Environment Program Product provides a base set of functions to support the operation of a pharmacy either with or without the POS Application/Retail Environment. The program modules are written in the IBM Subsystem Program Preparation Support II language, allowing the user to modify or add function as required to suit a particular operation.

The pharmacy application operates in an environment where responsibilities can be shared between pharmacy and headquarters personnel. The host system communicates with the pharmacy application through the store data base. The host sends control information, such as price changes, to the store(s) and retrieves operational information, such as the pharmacy log, for audit and host applications processing.

HIGHLIGHTS

The Pharmacy Application Program Product provides the following set of functions:

- Open pharmacy
- Prescription processing, which includes
 - Patient and family medical history maintenance and retrieval
 - Drug lookup through an access code or National Drug Code number
 - Expansion of coded SIGNA (usage instruction)
 - Patient prescription profiling
 - Prescription pricing, both retail and third party
 - Third party data collection
 - Automatic label generation
 - Automatic refill processing
- File inquiry, which includes
 - Display of patient records, including prescription profile
 - Display of prescription records
 - Drug price inquiries
- Cancel prescription, for return to stock
- Maintenance functions, which include
 - Add/alter drug files
 - Add/alter Doctor file
 - Add/alter SIGNA expansion file
 - Add/alter price exception file
 - Enter offline prescription data
 - Produce controlled substances report
 - Purge prescription records from files
- Logging of all pharmacy transactions, including prescription activity and file maintenance operations
- Shutdown pharmacy operations
- Report functions, which include:
 - Controlled substance report
 - Patient tax deduction listing

Additional Functions for the 3685/3686 Environment:

- Nursing home processing
- Daily prescription reporting

CUSTOMER RESPONSIBILITIES

- Install the Programmable Store System Host Support to:
 - Define and maintain the subsystem library (SLIB) and the data sets necessary to support the programmable store subsystem.
 - Create the "operational environment" that will control the functions of the controller and terminals in the Pharmacy.
 - Provide communications between the host and the pharmacy controller to load the application programs and to recover application program dumps.
- Install the Subsystem Program Preparation Support II (SPPS II) Program Product.
- Place the 3650 Programmable Store System Pharmacy Application/Store Environment program release into a predefined data base.
- Modify and customize the standard functions as desired.
 - Insert and delete source code and/or user designed modules.
- Assemble and link edit the 3650 Programmable Store System Pharmacy Application/Store Environment.
- Perform application definition.
 - Use the Programmable Store System Host Support to:
 - Create Application Definition Record(s).

- Generate user files as required (examples):
 - Drug File
 - Pharmacy File
 - SIGNA Expansion File
- Load the Pharmacy Controller File.
 - Via Programmable Store System Host Support
 - Application Definition Record
 - 3650 Programmable Store System Pharmacy Application/Store Environment programs
 - Via user provided transmission program
 - Initialize user files

Note: The allocation, file location, size, creation, maintenance, transmission and content of all files are a user responsibility.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The 3650 Programmable Store System Pharmacy Application/Store Environment Program Product is designed to operate with the following hardware configuration as a minimum:

- Controller: One of the following with 76K storage: 3651 mdl B25, B75, C25, C75 or D75.
- Terminals: One 3685 Display Control Unit mdl 2 with 88K bytes of storage and the label printer feature (#8726) and one 3686 Display Station mdl 1 or one 3275 mdl 3 display station, and the 3653 mdl 1P point of sale terminal with 36K storage and the Label Detect, RPQ Number 8Q0076.

Additional storage capacity may be required in the store controller depending on the options selected, the mix of concurrently running functions, and the number of other terminals attached to the controller.

SOFTWARE REQUIREMENTS

Host Requirement: This program product is designed to be assembled on a S/370 host processor with sufficient storage to accommodate DOS/VS, OS/VS1, or OS/VS2 releases required by the Programmable Store System Host Support, and subsequent releases and modification levels unless otherwise stated. The 3650 Programmable Store System Host Support (5744-D16 for OS/VS and 5747-D16 for DOS/VS), utilizes VSAM, and, for transmission of this program product to and from the store controller, BTAM for binary synchronous communications, and VTAM or ACF/VTAM for SDLC. All execution of this program product code will take place on the 3650 Programmable Store System.

Programming Language: The Pharmacy Application program modules are written in the Subsystem Program Preparation Support II programming language, a corequisite program product (5735-D16).

Store Environment: The 3650 Programmable Store System Pharmacy Application/Store Environment Program will support the 3651 engineering change level that is supported by the latest current level of the IBM 3650 Programmable Store System Host Support and SPPS II programs.

COMPATIBILITY

The Pharmacy Application is one of several Program Products which operate with the 3650 Programmable Store System. These program products together with user-written programs, make up a compatible family of applications that can be used to support a wide variety of store environments. Other Program Products in this application family include:

- Point of Sale Application/Retail Environment
- Point of Sale Application/Report Customizer
- Point of Sale Application/Store Data Management

DOCUMENTATION: (available from Mechanicburg)

The General Information Manual: 3650 Programmable Store System Pharmacy Application/Store Environment, GH20-2189 and the Licensed Program Design Objectives: 3650 Programmable Store System Pharmacy Application/Store Environment, GH20-4581, are available as unlicensed documentation at no charge. Availability of other licensed and unlicensed documentation will be announced prior to program availability.

TERMS and CONDITIONS: See PP Index

**INFORMATION/SYSTEM
5735-OZS**

PURPOSE

Information/System is an interactive retrieval program designed for use with its companion features and products. Information/System is the base for all Information/System features and products. The applications that the user wishes to perform determine which companion features and products he should select for use with Information/System.

The companion products to Information/System are:

1. Information/MVS (5665-955)

The Information/MVS product is a consolidated collection of IBM technical data of interest to data processing staffs responsible for planning, installing, supporting and tuning IBM systems, subsystems and components appropriate to the MVS, VM/370, VSE and VS1 environments.

2. Information/VM-VSE (5668-919)

The Information/VM-VSE product is a consolidated collection of IBM technical data of interest to data processing staffs responsible for planning, installing, supporting and tuning IBM systems, subsystems and components appropriate to the VM/370 and VSE environments.

The companion features to Information/System are:

1. Information/Management

Information/Management provides integrated problem management, change management and configuration management applications usable by data processing personnel of various skill levels.

2. Information/Access

Information/Access is used with Information/Management to assist system programmers at data processing installations in the resolution of suspected IBM software problems and in the planning of preventive service changes to IBM programs.

Operating Environments: Information/System operates in the following environments:

- MVS, with the Time Sharing Option (TSO), or with the Network Communications Control Facility (NCCF).
- VM/370, with the Conversational Monitor System (CMS).
- VSE, with the Interactive Computing and Control Facility (ICCF).

The current release of Information/System for the MVS environment is Release 2.1; Release 2.1 supports the Information/MVS and Information/VM-VSE products and the Information/Management and Information/Access features. The current release of Information/System for the VM/370 and VSE environments is Release 1.2. Release 1.2 supports the Information/VM-VSE and Information/MVS products.

INFORMATION/SYSTEM RELEASE 1.2

Information/System Release 1.2 for VM/370 and VSE is an interactive program product that provides data processing personnel, operating in the VM/CMS (Conversational Monitor System) environment or in the DOS/VSE ICCF (Interactive Computing and Control Facility) environment, with keyword access to a wide range of selected technical information regarding IBM products. The information is contained in optional data products.

The Information/VM-VSE product is a consolidated collection of IBM technical data of interest to data processing staffs responsible for planning, installing, supporting and tuning IBM systems, subsystems and components appropriate to the VM/370 and VSE environments.

The Information/MVS product is a consolidated collection of IBM technical data of interest to data processing staffs responsible for planning, installing, supporting and tuning IBM systems, subsystems and components appropriate to the MVS, VM/370, VSE and VS1 environments.

Either product may be installed with the Information/System Release 1.2 for VM/370 and VSE base product.

For purposes of simplicity, the Information/VM-VSE and the Information/MVS products will be referred to generically as Information/Data, and any references to Information/Data will imply references to both Information/VM-VSE and Information/MVS. Where individual references are required for purposes of clarification, the full product names, Information/VM-VSE and Information/MVS, will be used.

HIGHLIGHTS OF INFORMATION/SYSTEM RELEASE 1.2

- Interactive retrieval facility for keyword searches of the data.
- Designed for ease-of-use.

- Load program to load the Information/Data product into the user system.
- Capability to insert user data.
- Ability to optionally print selected screens or entries.

DESCRIPTION OF INFORMATION/SYSTEM RELEASE 1.2

INFORMATION/SYSTEM in conjunction with Information/Data is a productivity tool designed for use by data processing personnel supporting an MVS, VM/370, VSE or VS1 environment. It consists of an interactive information retrieval facility designed to provide access to the Information/Data files via previously assigned keywords, and of the appropriate programs for loading the data base.

Design objectives of Information/System and the companion information/Data products are to:

- Make the data available to the user online and on the user's system.
- Simplify and speed keyword searches of information.
- Integrate IBM technical information from many sources.
- Broaden the amount of technical information available to users.
- Keep the information up to date by addition of new data and by purging the out-of-date material.
- Enable users to add information to Information/Data.

The Information/System interactive retrieval facility provides the user with a set of commands to access the data provided by Information/Data through display terminals. The retrieval facility provides a keyword search function through which the user can search documents by specifying one or more previously assigned keywords connected by Boolean operators ('and', 'or', 'not'). The search can include all the document types or can be restricted only to selected types (e.g., EWS, PTF cover letters). The user can display the complete stored text of the documents or the titles only.

The user also has the option to search all of Information/Data or to limit the search only to any new entries added since the previous distribution tape.

Other Functions of Information/System include:

- Sequential display of contiguous data entries of Information/Data.
- A PRINT command to allow the user to print a section of a document or entire documents for later reference.
- A keyword glossary to expedite and facilitate the search process.
- A FIND command to locate specific words inside a pre-identified document.
- A HELP facility is built into Information/Data to describe error conditions and to suggest corrective actions.

HIGHLIGHTS OF INFORMATION/DATA

- Online, consolidated collection of technical information from many IBM sources.
- Periodic updates to the Information/Data products to provide current information.
- Self-instruction and usage assistance information.

DESCRIPTION OF INFORMATION/DATA

Technical information from a number of development, system and support locations worldwide is edited, structured and incorporated into Information/Data.

Types of information in Information/Data include:

- Selected IBM system support center flashes, memos, question and answer logs and technical articles produced by the support organization responsible for the subject element. Selected lengthy articles are abstracted and ordering information is included. (Occasionally, such documents are added as an additional file on the distribution tape.)
- Technical descriptions of recent IBM programming announcements.
- Service information on selected IBM software products including early warning system (EWS) data and systems engineering communications (SECOM).
- Status information on selected program products, installed user programs and field developed programs. Included is information on availability, feature numbers, optional features and documentation order numbers.
- A selection of Program Temporary Fix (PTF) cover letters and Program Level Change (PLC) information that may be used in

INFORMATION/SYSTEM (cont'd)

conjunction with the EWS file to locate appropriate fixes for identified problems.

- Brief descriptions of schedules for some of the education courses that IBM is conducting.
- An interactive HELP file designed to assist the user in making the most effective use of Information/System. A part of this file is a self-instruction tutorial for new users of the system.
- A keyword glossary giving alphabetical access to all keywords, whether abbreviated, hyphenated or misspelled by the author, which enhances the ability to find the required document.

The major products addressed by Information/Data include:

- Systems - S/370, 4300, 8100 Information System, industry and cross-industry terminal systems, storage and printing units.
- Programming - Operating systems, compilers and assemblers, access methods, DB/DC products, emulators, job entry subsystems, utilities and interactive products.

After the initial distribution to new users, a tape containing all updates to Information/VM-VSE or Information/MVS (depending on which product the user has chosen to use) since the last update will be distributed periodically to licensed users of Information/VM-VSE or Information/MVS to maintain a current level of technical information.

The updates of Information/Data are distributed by the standard IBM distribution centers. The distribution tapes are available in 9-track/1600 bpi and 9-track/6250 bpi. Utility programs in Information/System merge the updates into the existing data base for VM/370 and VSE users.

During the installation process, users have the option to:

- Insert their own data into Information/Data.
- Select only those types of data from Information/Data that are likely to be relevant to their environment.

All the IBM-provided Information/Data material must be regarded as working documents intended to assist the professional data processing personnel. The information does not provide formal IBM recommendations or documentation. The information provided is intended for use by data processing personnel who are sufficiently familiar with the necessary background material to understand the topics discussed and to use the information within the proper context and with the proper safeguards.

The technical material included in Information/Data addresses a wide variety of IBM products that are commonly used in an MVS, VM/370, VSE or VS1 installation. Although the main objective of Information/Data is to assist the user with useful, timely and up-to-date information, there is no commitment to provide exhaustive or complete information on any product addressed.

The customer may make printed copies of limited portions of the Information/Data products for use within the customer's organization, for purposes of maintenance and improvement of the customer's data processing installation.

CUSTOMER RESPONSIBILITIES

In order to use Information/System, the customer should have installed the minimum machine and software configuration as described in the "Specified Operating Environment".

If the Information/System user data insertion facility is used, the customer has the responsibility to ensure that the data inserted conforms to the specified format.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Information/System for VM/370 and VSE is designed to operate on any IBM processing unit that meets the minimum specifications of the supported operating system environments described under "Software Requirements".

An IBM 3270 display terminal or equivalent display device that supports a screen of at least 24 lines by 80 characters must be available. When a larger screen is used, Information/System runs in IBM 3277 mdl 2 compatibility mode. Devices supported by Information/System include the following IBM display stations:

- 3275 mdls 2 and 12
- 3276 mdls 2, 3, 4, 12, 13 and 14
- 3277 mdl 2
- 3278 mdls 2, 3, 4 or 5
- 3279 mdls 2A and 3A

SOFTWARE REQUIREMENTS

Information/System for VM/370 and VSE is the base product required by each of its products. This product is used in the VM/370 and VSE

environments. In the VM/370 environment, Information/System operates under the Conversational Monitor System (CMS). In the VSE environment, Information/System operates under the Interactive Computing and Control Facility (ICCF). The details of each environment are as follows:

- VM/370 Release 6 with BSEPP or SEPP, or with VM/SP.
 - VSE/VSAM
- DOS/VSE with VSE/Advanced Functions
 - VSE/VSAM
 - VSE/ICCF
- The IBM DOS/VS Sort/Merge program product (5746-SM2) or a compatible sort/merge product is required by the Information/System utilities to support user data insertion facilities for Information/MVS and Information/VM-VSE.

Storage Estimates: The amount of virtual storage required for Information/System code, work areas and VSAM areas is variable and depends on the function being performed.

In the VM/370 environment, a minimum CMS virtual machine size of 960K bytes (K=1,024) is required. Information/System requires no change to the nucleus. However, VSAM must be generated in the nucleus.

In the VSE environment, a minimum ICCF interactive partition size of 400K bytes is required. Information/System requires no change to the nucleus. However, since VSAM is reentrant, it may be included in the Shared Virtual Area (SVA).

Direct access storage requirements for the data products vary with the amount of data selected by the user. Information/VM-VSE requires approximately 80 to 100 megabytes of direct access storage for an untailored data base. Information/MVS requires approximately 180 to 200 megabytes of direct access storage for an untailored data base.

RPQs ACCEPTED: No

INFORMATION/SYSTEM RELEASE 2.1

DESCRIPTION

Information/System Release 2.1 operates in the MVS/TSO and MVS/NCCF environments and supports the Information/MVS and Information/VM-VSE products and the Information/Management and Information/Access features. Information/System Release 2.1 provides the base for the features and products. The applications that the user wishes to perform determine which features or products he should select for use with Information/System Release 2.1.

- Retrieval of selected IBM technical information requires Information/System and the Information/MVS or Information/VM-VSE product.
- Implementation of the problem management, change management and configuration management applications requires Information/System and the Information/Management feature.
- Information/Access is used with Information/System and Information/Management to assist system programmers at data processing installations in the resolution of suspected IBM software problems and in the planning of preventive service changes to IBM programs.

The following diagram illustrates the relationship of Information/System to the supported operating environments, and the interrelationships among the various Information/System Release 2.1 features and products.

INFORMATION/SYSTEM (cont'd)

The combinations of operating environments supported by Information/System Release 2.1 and its features and products are shown in the following table.

TSO NCCF	Information/System R2.1 Under MVS
Information/MVS	X
Information/VM-VSE	X
Information/Management	X
Information/Access	X

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Information/System operates on any IBM hardware configuration that supports MVS Release 3.8, MVS/SP Version 1, or MVS/SP Version 2 (operation is in 24-bit mode).

An IBM 3270 display terminal that supports a screen of at least 24 lines by 80 characters must be available. Devices supported by Information/System include the following IBM display stations:

- 3275 mdls 2 or 12
- 3276 mdls 2, 3, 4, 12, 13, or 14 in 3277 mdl 2 compatibility mode
- 3277 mdl 2
- 3278 mdls 2, 3, 4 or 5
- 3278 mdls 2A and 3A

To use the full capabilities of Information/System or any of its features and products, a printer such as an IBM 1403, 3211 or 3800 is required.

SOFTWARE REQUIREMENTS

Information/System executes as an interactive application under NCCF or TSO on OS/VS2 MVS Release 3.8, MVS/SP Version 1 or MVS/SP Version 2 (operation is in 24-bit mode). Two PTFs are required for VSAM to allow proper protocol for multiple users concurrently sharing the same VSAM data set. These PTFs are UZ22906 (PUT tape 7901) and UZ27104 (PUT tape 7909). A PTF is available for operating in the NCCF/TCAM environment.

Information/System is the base product required by each of its features and products.

Information/System operates directly under the Time Sharing Option (TSO) running on OS/VS2 MVS Release 3.8, MVS/SP Version 1 or MVS/SP Version 2 (operation is in 24-bit mode) with the current releases of the Virtual Telecommunications Access Method (VTAM) or the Telecommunications Access Method (TCAM). A TCAM MCP generation may be required by the installation to obtain full-screen mode in the TSO/TCAM environments.

In addition, Information/System runs as standard commands under the Network Communications Control Facility (NCCF) running on OS/VS2 MVS Release 3.8, MVS/SP Version 1 or MVS/SP Version 2 (operation is in 24-bit mode) with Advanced Communication Function/Virtual Telecommunications Access Method (ACF/VTAM Version 1 or ACF/VTAM Version 2) or Advanced Communication Function/Telecommunications Access Method (ACF/TCAM). Information/System can run under both TSO and NCCF concurrently.

The Information/System utilities used with Information/MVS or Information/VM-VSE require the IBM OS/VS Sort/Merge program product (5740-SM1) or a compatible Sort/Merge product.

PERFORMANCE CONSIDERATIONS

Information/System is an application that executes as a problem program. When Information/System is installed but not operational, there is no performance impact on the base system other than that caused by an increase in external storage requirements.

Information/System executes concurrently with other TSO or NCCF applications. The effect of Information/System is the same as similar terminal applications in these environments. The response time for any particular operation varies with the complexity of the function, the speed of the processor or other devices and the current system load. Base system supervisor facilities may be used to establish the amount of service that any particular user receives.

MVS SYSTEM INTEGRITY APPLIES: Yes

RPOs ACCEPTED: No

INFORMATION/SYSTEM RELEASE 2.1 with INFORMATION/MVS or INFORMATION/VM-VSE

Information/System Release 2.1 for MVS is an interactive program product that provides data processing personnel, operating in MVS/TSO or MVS/NCCF, with keyword access to a wide range of selected technical information regarding IBM products. The information is contained in the optional data products, Information/MVS or Information/VM-VSE.

The Information/MVS product is a consolidated collection of IBM technical data of interest to data processing staffs responsible for planning, installing, supporting and tuning IBM systems, subsystems and components appropriate to the MVS, VM/370, VSE and VS1 environments.

The Information/VM-VSE product is a consolidated collection of IBM technical data of interest to data processing staffs responsible for planning, installing, supporting and tuning IBM systems, subsystems, and components appropriate to the VM/370 and VSE environments.

Either product may be installed with the Information/System Release 2.1 base product.

For purposes of simplicity, the Information/MVS and Information/VM-VSE products will be referred to generically as Information/Data, and any references to Information/Data will imply references to both Information/MVS and Information/VM-VSE. Where individual references are required for purposes of clarification, the full product names, Information/MVS and Information/VM-VSE will be used.

HIGHLIGHTS OF INFORMATION/SYSTEM RELEASE 2.1

- Interactive retrieval facility for keyword searches of the data.
- Designed for ease-of-use.
- Load program to load the Information/Data product into the user system.
- Capability to insert user data.
- Ability to optionally print selected screens or entries.

DESCRIPTION OF INFORMATION/SYSTEM RELEASE 2.1

Information/System in conjunction with Information/Data is a productivity tool designed for use by data processing personnel supporting an MVS, VM/370, VSE or VS1 environment. It consists of an interactive information retrieval facility designed to provide access to the Information/Data files via previously assigned keywords, and of the appropriate programs for loading the data base.

Design objectives of Information/System and the companion Information/Data product are to:

- Make the data available to the user online and on the user's system.
- Simplify and speed keyword searches of information.
- Integrate IBM technical information from many sources.
- Broaden the amount of technical information available to users.
- Keep the information up to date by addition of new data and by purging the out-of-date material.
- Enable users to add information to Information/Data.

The Information/System interactive retrieval facility provides the user with a set of commands to access the data provided by Information/Data through display terminals. The retrieval facility provides a keyword search function through which the user can search documents by specifying one or more previously assigned keywords connected by Boolean operators ('and', 'or', 'not'). The search can include all the document types or can be restricted to selected types (e.g., EWS, PTF cover letters). The user can display the complete stored text of the documents or the titles only.

The user also has the option to search all of Information/Data or to limit the search only to any new entries added since the previous distribution tape.

Other functions of Information/System include:

- Sequential display of contiguous data entries of Information/Data.
- A PRINT command to allow the user to print a section of a document or entire documents for later reference.
- A keyword glossary to expedite and facilitate the search process.
- A FIND command to locate specific words inside a pre-identified document.
- A HELP facility is built into Information/MVS to describe error conditions and to suggest corrective action.

INFORMATION/SYSTEM (cont'd)**HIGHLIGHTS of INFORMATION/DATA**

- Online, consolidated collection of technical information from many IBM sources.
- Periodic updates of the Information/Data product to provide current information.
- Self-instruction and usage assistance information.

DESCRIPTION OF INFORMATION/DATA

Technical information from a number of development, system and support locations worldwide is edited, structured and incorporated into Information/Data.

Types of information in Information/Data include:

- Selected IBM system support center flashes, memos, question and answer logs and technical articles produced by the support organization responsible for the subject element. Selected lengthy articles are abstracted and ordering information is included. (Occasionally, such documents are added as an additional file on the distribution tape.)
- Technical descriptions of recent IBM programming announcements.
- Service information on selected IBM software products including early warning system (EWS) data and systems engineering communications (SECOM).
- Status information on selected program products, installed user programs and field developed programs. Included is information on availability, feature numbers, optional features and documentation order numbers.
- A selection of Program Temporary Fix (PTF) cover letters and Program Level Change (PLC) information that may be used in conjunction with the EWS file to locate appropriate fixes for identified problems.
- Brief description of schedules for some of the education courses that IBM is conducting.
- An interactive HELP file designed to assist the user in making the most effective use of Information/System. A part of this file is a self-instruction tutorial for new users of the system.
- A keyword glossary giving alphabetical access to all keywords, whether abbreviated, hyphenated or misspelled by the author, which enhances the ability to find the required document.

The major products addressed by Information/Data include:

- Systems - S/370, 4300, 8100 Information System, industry and cross industry terminal systems, storage and printing units.
- Programming - Operating systems, compilers and assemblers, access methods, DB/DC products, emulators, job entry subsystems, utilities and interactive products.

Information/Data will be distributed periodically to licensed users of Information/Data to provide an updated level of technical information.

The update of Information/Data is distributed by the standard IBM distribution centers. The distribution tapes are available in 9-track/1600 bpi and 9-track/6250 bpi. Utility programs in Information/System merge the updates into the existing data base.

During the installation process, users have the option to:

- Insert their own data into Information/Data.
- Select only those types of data from Information/Data that are likely to be relevant to their environment.

All the IBM-provided Information/Data material must be regarded as working documents intended to assist the professional data processing personnel. The information does not provide formal IBM recommendations or documentation. The information provided is intended for use by data processing personnel who are sufficiently familiar with the necessary background material to understand the topics discussed and to use the information within the proper context and with the proper safeguards.

The technical material included in Information/Data addresses a wide variety of IBM products that are commonly used in an MVS, VM/370, VSE or VS1 installation. Although the main objective of Information/Data is to assist the user with useful, timely and up-to-date information, there is no commitment to provide exhaustive or complete information on any product addressed.

The customer may make printed copies of limited portions of the Information/Data product for use within the customer's organization for purposes of maintenance and improvement of the customer's data processing installation.

CUSTOMER RESPONSIBILITIES

In order to use Information/System, the customer should have installed the minimum machine and software configuration as described in the "Specified Operating Environment".

If the Information/System user data insertion facility is used, the customer has the responsibility to ensure that the data inserted conforms to the specified format.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Information/System operates on any hardware configuration that supports MVS Release 3.8, MVS/SP Version 1 or MVS/SP Version 2 (operation is in 24-bit mode).

An IBM 3270 display terminal that supports a screen of at least 24 lines by 80 characters must be available. Devices supported by Information/System include the following IBM display stations:

- 3275 mdls 2 or 12
- 3276 mdls 2, 3, 4, 12, 13 or 14 in 3277 mdl 2 compatibility mode
- 3277 mdl 2
- 3278 mdls 2, 3, 4 or 5
- 3279 mdls 2A and 3A

To use the full capabilities of Information/System or any of its features and products, a printer such as an IBM 1403, 3211 or 3800 is required.

SOFTWARE REQUIREMENTS

Information/System executes as an interactive application under NCCF or TSO on OS/VS2 MVS Release 3.8, MVS/SP Version 1 or MVS/SP Version 2 (operation is in 24-bit mode). Two PTFs are required for VSAM to allow proper protocol for multiple users concurrently sharing the same VSAM data set. These PTFs are UZ22906 (PUT Tape 7901) and UZ27104 (PUT Tape 7909). A PTF is available for operating in the NCCF/TCAM environment.

Information/System is the base product required by each of its features and products.

Information/System operates directly under the Time Sharing Option (TSO) running on OS/VS2 MVS Release 3.8, MVS/SP Version 1 or MVS/SP Version 2 (operation is in 24-bit mode) with the current releases of the Virtual Telecommunications Access Method (VTAM) or the Telecommunications Access Method (TCAM). A TCAM MCP generation may be required by the installation to obtain full-screen mode in the TSO/TCAM environments.

In addition, Information/System runs as standard commands under the Network Communications Control Facility (NCCF) running on OS/VS2 MVS Release 3.8, MVS/SP Version 1 or MVS/SP Version 2 (operation is in 24-bit mode) with Advanced Communications Function/Virtual Telecommunications Access Method (ACF/VTAM Version 1 or ACF/VTAM Version 2) or Advanced Communication Function/Telecommunications Access Method (ACF/TCAM). Information/System can run under both TSO and NCCF concurrently.

The Information/System utilities used with Information/MVS or Information/VM-VSE require the IBM OS/VS Sort/Merge program product, 5740-SM1, or a compatible Sort/Merge product.

PERFORMANCE CONSIDERATIONS

Information/System is an application that executes as a problem program. When Information/System is installed but not operational, there is no performance impact on the base system other than that caused by an increase in external storage requirements.

Information/System executes concurrently with other TSO or NCCF applications. The effect of Information/System is the same as similar terminal applications in these environments. The response time for any particular operation varies with the complexity of the function, the speed of the processor or other devices, and the current system load. Base system supervisor facilities may be used to establish the amount of service that any particular user receives.

Storage Estimates: Direct access storage requirements for the data products vary with the amount of data selected by the user. Information/MVS requires approximately 180 to 200 megabytes of direct access storage for an untailed data base. Information/VM-VSE requires approximately 80 to 100 megabytes of direct access storage for an untailed data base.

INFORMATION/SYSTEM (cont'd)

**INFORMATION/SYSTEM RELEASE 2.1
with INFORMATION/MANAGEMENT**

Information/Management is a licensed feature of Information/System Release 2.1, and is used with Information/System Release 2.1 to support the system management processes of:

- Reporting, tracking and resolving problems detected at the data processing installation.
- Planning, coordinating and monitoring changes for the data processing installation.
- Maintaining information about the system inventory of hardware and software components which make up the data processing installation.

Through interactive applications for problem, change and configuration management, Information/System and Information/Management can help managers and data processing personnel to:

- Ensure that all problems receive proper attention until they are resolved.
- Define responsibility for problem resolution and change implementation within the organization and monitor problem and change status.
- Improve the management decision-making process by providing easy access to current information about problem and change status, priority, assignments, exception condition, etc.
- Organize and monitor the planning, scheduling and implementation of changes and thereby minimize their disruptive effect on the installation.
- Maintain a history of problems and changes and their impact on the installation, in order to improve the problem and change management process and to identify trends.
- Better utilize clerical personnel for performing standard problem, change and configuration management tasks.
- Consolidate configuration information, thereby eliminating problems caused by conflicting information and reduce the total effort required to maintain system and network component information.
- Obtain more rapid response to problems by maintaining central control of information on vendor maintenance.
- Improve the level of service provided to data processing users.

HIGHLIGHTS

- Full-screen prompting aids inexperienced and occasional users.
- Single-line input alternative saves time for experienced users.
- Extensive online tutorial and help facilities ease usage and data entry.
- Standardized stored response chains reduce training requirements.
- A powerful search facility enhances data base inquiry.
- Duplicate problem recognition aided by standard structured method of describing problem symptoms.
- Problem management application
 - Problem reporting, assignment and tracking are supported.
 - Selectable levels of function satisfies varying needs of individual installations.
 - Interactive inquiry makes desired information readily available.
 - Report capability provides management information.
- Change management application
 - Supports change request, planning and implementation.
 - Supports tracking of change approvals.
 - Interactive inquiry makes desired information readily available.
 - Report capability provides management information.
- Configuration management application
 - Supports a single source of current, accurate information about system components.
 - Supports interrelationships among hardware and software components.
 - Provides configuration management information (e.g., vendor and finance information) to assist many support activities at the installation.
 - Interactive inquiry makes desired information readily available.

- Report capability provides management information.
- Integrated applications relate problem, change and configuration management information.
- Input validation reduces data entry errors.
- Customized reporting facility satisfies additional reporting needs of individual installations.
- Journalling of data base changes provides audit trail.
- Authorization facility controls usage of data.
- Data base integrity and recovery facilities protect installation's investment in the data base.
- NPDA problem entry eliminates unnecessary keying of communication network problem data.

APPLICATION DESCRIPTION

Information/Management supports the creation, updating, inquiry and reporting of entries in the Information/Management data base that contains information about problems which occur in the data processing installation, changes which are planned for the installation and hardware and software components within the installation.

Ease of Use: Conversational data entry and extensive help and tutorial facilities allow Information/Management to be used easily and effectively by a variety of professional and nonprofessional data processing personnel including system and network operators, system and application programmers, managers, user help desk personnel, data control clerks and data entry personnel.

Inexperienced users can communicate with Information/Management through a conversational dialog. The user is asked what he wants to do through full-screen displays and responds by selecting one of the possible courses of action presented on the display, or by supplying requested data. Online tutorials are available to provide instruction on Information/Management facilities. These tutorials can be used to gain a general level of knowledge prior to using an unfamiliar facility of Information/Management or to answer specific questions which may arise during a dialog. In the latter case, the user can leave the dialog to browse the tutorial for the desired information and return to the point of departure.

Once the user has indicated what he wants to do, he is presented with data entry displays that ask for the data necessary for the operation he wishes to perform. Help screens are available. Thus, with the dialog, the user need know only what operation he wishes to perform and the data he wishes to enter.

While the dialog method provides ease-of-use for the unfamiliar user, a time-saving shortcut is provided for the experienced user. In a single line of input, he may chain responses for all the display screens he can anticipate, bypassing the dialog and reaching the desired screen directly. These two methods of input, dialog and response chaining, can be intermixed as needed by the individual user.

Another input shortcut helps users with low levels of training to use Information/Management effectively, and offers further time savings for experienced users. Standard operations that are frequently performed at the installation, such as opening certain types of problems, requesting certain types of changes and displaying or reporting certain types of information about problems, changes and system components, can be defined once by trained personnel and stored for subsequent use. The user then simply enters the name of the stored response chain for the operation he wishes to perform and Information/Management processes all the stored responses, filling in all the data that has been defined as being constant. Typically, the response chain would be built to take the user directly to a data entry screen, allow him to enter the variable data that changes by problem, change or component, then take him directly to the next data entry screen, and so on.

Inquiry into the Information/Management data base is easily accomplished. Any combination of entry characteristics (i.e., data field contents) can be selected to perform complex searches using Boolean (i.e., AND, OR, NOT) logic specifying combinations of field values, 'ignore' positions, and ranges. In a single command, a pre-stored response chain may be used, by-passing many screens, to directly access the desired data screen. Identification numbers and abstracts of criteria are displayed at the conclusion of the search. From these, the user selects either those entries for which he desires a more detailed display or requests a report of the entries found by the search.

Duplicate Problem Recognition: The ability to recognize a problem as being a duplicate of another is an important part of the problem resolution process. Information/Management facilitates the job of recognizing duplicate installation problems by its method of describing problem symptoms in a structured manner.

Network Problem Determination Application (NPDA) Problem Open: With the growing requirement to manage networks in addition to other activities throughout the system, integration of these two areas is essential. Our management solutions take advantage of the initial data

INFORMATION/SYSTEM (cont'd)

capture by NPDA and use Information/Management to track these problems to resolution. This integrates the areas of problem data capture with system administrative and management facilities.

Operating under NCCF, the interface to NPDA gives the user the option to automatically enter NPDA-detected problems into the Information/Management data base, thus reducing the need for reentering data for communication network management problems.

Problem Management Application: The problem management application assists in the management of hardware, software, facilities, procedures and documentation problems that arise at the data processing installation. After detection, new problems can be entered, automatically from NPDA, or through a series of data entry screens that accept a wide variety of administrative and symptom information, including problem description, open date and time, owner, priority, status, problem type, impact, failing component, location and, later, resolution data.

Installations initially implementing a basic level of function can make use of a single, comprehensive problem entry screen to capture the information they need. Installations requiring a higher level of function can make use of a series of problem entry screens to capture a greater amount of detail. As the problem progresses through the resolution cycle, it can be assigned to individuals or groups responsible for those phases of resolution; a record of these assignments is kept. The problem information can be updated as additional information becomes available.

The copy capability can be used to create a new entry similar to an existing one. Instead of having to reenter each item of input, a similar, existing entry can be copied and modified as appropriate.

The search capability displays all problem entries meeting selection criteria specified by the user. The selection criteria can range from straightforward to complex. This enables, for example, a system programmer to determine what new problems have been assigned to him; a problem analyst to determine what are the high priority problems he should be working on; or a manager to determine whether a vendor's repair response time is satisfactory.

In addition to displays of selected problem information, a variety of printed reports are available:

- Problem Management Calendar Report - Lists problems by date of occurrence.
- Periodic Problem Status Report - Lists problems opened, closed and priority 1 holdovers for this period as well as providing totals for the various kinds of problems.
- Problem Assignee Report - Lists problems by assignee in date entered sequence.
- Utilizing the powerful search capability, various other reports are available.
- Generalized report capability - Provides the user with a mechanism for creating customized reports from the Information/Management data base.

Change Management Application: The change management application assists in the management of changes planned for and being made to the hardware, software, facilities, procedures and documentation within the data processing installation. Change requests are entered through a series of data entry screens requesting description of the change, components affected, priority, reason for the change, identification of the change requestor, coordinator, implementor and other responsible parties, and fallback plans. As the change progresses through the implementation cycle, it can be assigned to individuals or groups responsible for those phases of implementation; a record of these assignments is kept. The entire change can be broken down into separate change activities that can be scheduled and tracked individually.

When the change request is entered, a list of individuals who must approve it is generated. Different individuals can be specified by the installation for different types of changes (e.g., hardware, new software installation, software service application, etc.). Each individual can enter his approval, or disapproval and reason.

The copy capability can be used to create a new entry similar to an existing entry. Instead of having to reenter each item of input, a similar, existing entry can be copied and modified as appropriate. This can be especially useful for such tasks as adding new terminals to the network and movement of spare terminals in and out of storage.

The search capability displays all change entries meeting selection criteria specified by the user. The selection criteria can range from straightforward to complex. This enables, for example, a change coordinator to determine whether a new GEN will be finished in time to support a new hardware installation; or a manager to determine whether schedule slippages for certain change activities expose the schedule for the entire change.

In addition to displays of selected change information, printed reports are available:

- Change Management Calendar Report - Lists problems by date required.
- Periodic Change Review Report - Lists changes targeted for completion last period, this period and next period.
- Change Approver Summary Report - Lists, by approver, summary information for each change requiring approval.
- Change Approver Detail Report - Lists, by approver, summary and detail information for each change requiring approval.
- Change and Activity Report - Lists changes or activities by planned start date.
- Changes with Related Activities Report - Lists each change and all the activities associated with that change.
- Utilizing the powerful search capability, various other reports are available.
- Generalized report capability - Provides the user with a mechanism for creating customized reports from the Information/Management data base.

Configuration Management Application: The configuration management application provides a means to maintain a single source of accurate, current, centralized and readily available information about the inventory of hardware and software system components. Component information can be entered through a series of data entry screens requesting component name, description, status, location, component vendor identification, service vendor identification, responsible party, financial data and connections to other components.

The copy capability can be used to create a new entry similar to an existing entry. Instead of having to reenter each item of input, a similar, existing entry can be copied and modified as appropriate. This can be especially useful for such tasks as making new data base entries for a large number of similar components.

The search capability displays all configuration management entries meeting a selection criteria specified by the user. The selection criteria can range from straightforward to complex. This ready source of configuration management information can assist:

- The problem analyst in the resolution of system and/or communication network problems by making available information such as location, on-site contact and service vendor identification.
- The change requestor, change coordinator and change implementor in the change planning process by making available information such as location, interconnections, current status and EC level.
- Hardware EC level management and software release and service level management by providing a readily accessible, current and centralized source of information about levels of all system components.
- The operations staff by providing a readily accessible, current list of off-site contacts for remote equipment.
- Management in coordinating system-wide service and repair activities by providing centralized, current information on component status and service vendor identification.
- Management in capacity planning and resource control by providing a current base of information about all system components.

In addition to displays of selected system inventory information, printed reports are available:

- Inventory by Location Report - Lists summary information for each component at that location.
- Configuration Map - Lists the connection interrelationship of all components.
- Utilizing the powerful search capability, various other reports are available.
- Generalized report capability - Provides the user with a mechanism for creating customized reports from the Information/Management data base.

Integrated Applications: Interrelationships among problems, changes and system inventory components can be described and subsequently retrieved through the integration of information in a single data base and the search capabilities of Information/Management. This enables, for example, problem analysts to determine whether recent changes have been made to a problem component, or determine the location and offsite contact for a suspected problem component; or change coordinators to plan changes necessary to resolve a certain problem or plan software upgrades based on current levels.

Input Validation: An optional capability of Information/Management allows for the definition of valid input for data entry fields. Up to nine unique user responses can be defined. Information/Management then monitors all data entered in these fields and rejects as invalid those not meeting the specification. Input validation cannot be used with certain problem symptom data entry fields. These fields must remain as

INFORMATION/SYSTEM (cont'd)

defined by IBM in order to preserve the integrity of the structured method of problem symptom description introduced to enhance duplicate problem recognition.

Customized Reports: Facilities are provided to create reports from user-specified selection criteria that identify data to be extracted from the Information/Management data base and placed in a separate data set. User-written programs can then perform any desired operations on this data and make the results available in any format.

Data Base Change Journaling: Changes made to certain fields in data base entries cause the previous contents of those fields to be journaled into history portions of the entry. This facility provides an audit trail, which can be displayed or printed, of changes made to key information.

Data Base Usage Authorization: Facilities are provided for a system administrator to identify create/update and delete authority. With this capability, Information/Management functions can be restricted to only those needing them to perform their job.

Data Base Integrity and Recovery Facilities: The Information/Management data base consists of one data set containing entries and a corresponding data set providing "quick-search" indices for these entries. The ability to recover from damage to the entry data set is also provided. Updates can optionally be journaled to a log. Should the entry data set become damaged, it can be updated from the log after being restored from the point where last saved. When an inconsistency is found between data sets, the index data set can be reconstructed from the entry data set, reestablishing consistency.

SPECIFIED OPERATING ENVIRONMENT

Information/Management operates in all environments supporting Information/System Release 2.1.

HARDWARE REQUIREMENTS

Information/Management operates on any IBM hardware configuration that supports MVS 3.8, MVS/SP Version 1 or MVS/SP Version 2 (operation is in 24-bit mode).

An IBM 3270 display terminal that supports a screen of at least 24 lines by 80 characters must be available. Devices supported by Information/Management include the following IBM display stations:

- 3275 mdls 2 or 12
- 3276 mdls 2, 3, 4, 12, 13 or 14 in 3277 mdl 2 compatibility mode
- 3277 mdl 2
- 3278 mdls 2, 3, 4 or 5
- 3279 mdls 2A and 3A

To use the full capabilities of Information/Management, a printer such as an IBM 1403, 3211 or 3800 is required.

SOFTWARE REQUIREMENTS

Information/System is the base product required by each of its features and products. Information/System must be installed before the Information/Management feature can be used. Information/Management executes as an interactive application under NCCF or TSO on OS/VS2 MVS Release 3.8, MVS/SP Version 1 or MVS/SP Version 2 (operation is in 24-bit mode). Two PTFs are required for VSAM to allow proper protocol for multiple users concurrently sharing the same VSAM data set. These PTFs are UZ22906 (PUT Tape 7901) and UZ27104 (PUT Tape 7909). A PTF is available for operating in the NCCF/TCAM environment.

Information/System operates directly under the Time Sharing Option (TSO) running on OS/VS2 MVS Release 3.8, MVS/SP Version 1 or MVS/SP Version 2 (operation is in 24-bit mode) with the current releases of the Virtual Telecommunications Access Method (VTAM) or the Telecommunications Access Method (TCAM). A TCAM MCP generation may be required by the installation to obtain full-screen mode in the TSO/TCAM environments.

In addition, Information/System runs as standard commands under the Network Communications Control Facility (NCCF) running on OS/VS2 MVS Release 3.8; MVS/SP Version 1 or MVS/SP Version 2 (operation is in 24-bit mode) with Advanced Communications Function/Virtual Telecommunications Access Method (ACF/VTAM Version 1 or ACF/VTAM Version 2) or Advanced Communications Function/Telecommunications Access Method (ACF/TCAM). Information/System can run under both TSO and NCCF concurrently.

COMPATIBILITY

The problem management application of Information/Management may be used in conjunction with the problem determination facilities of the Network Problem Determination Application (NPDA). When a network operator, problem analyst or other user of NPDA determines that a network communication problem exists, he can command NPDA to gather the key symptom and administrative information about that problem and transfer it to Information/Management. Information/Management then automatically opens a new entry in the problem data base using the information received from NPDA and

returns to the NPDA operator the Information/Management problem number. The facilities of Information/Management can then be used to manage that problem. A PTF for NPDA, Release 2, is available to support this function.

The problem management application of Information/Management may also be used in conjunction with the problem determination facilities of the MVS Interactive Problem Control System (MVS/IPCS). After using MVS/IPCS to gather information to be used in determining the source of a software problem, the problem analyst enters this information into the Information/Management problem data base. From then on, the facilities of Information/Management can be used to manage that problem.

MIGRATION

MVS installations using the Account Network Management Program (ANMP), Interactive Problem Control System (IPCS) problem management function, or other problem, change or configuration management applications should be encouraged to convert to Information/Management by beginning to use Information/Management for all new problems and changes occurring after a given start date. Migration aids will be available for installations using ANMP. MVS customers actively involved in planning for the installation of ANMP should evaluate going directly to Information/Management.

PERFORMANCE CONSIDERATIONS

Information/Management is an application that executes as a problem program. When Information/Management is installed but not operational, there is no performance impact on the base system other than that caused by an increase in external storage requirements.

Information/Management executes concurrently with other TSO or NCCF applications. The effect of Information/Management is the same as similar terminal applications in these environments. The response time for any particular operation varies with the complexity of the function and the data sets used, the speed of the processor or other devices and the current system load. Base system supervisor facilities may be used to establish the amount of service that any particular user receives.

The Information/Management data base has been designed so that entries that match the search argument can be quickly determined and retrieved. This is accomplished through the use of a separate index from the primary or entry data base. Even though every field in the data base can be used as a search argument, the search times are primarily dependent on the number of search arguments and the number of resulting matches and are not significantly affected by the size or number of entries in the data base.

INFORMATION/SYSTEM RELEASE 2.1

with INFORMATION/ACCESS

PURPOSE

Information/Access is a licensed feature of Information/System Release 2.1 that is used with Information/System and Information/Management to assist system programmers at data processing installations in the resolution of suspected IBM software problems and in the planning of preventive service changes to IBM programs.

- APAR Search
 - Enables installations to request a search of the CSSF data base for APAR information in order to assist in determining whether a new problem is already known to IBM.
- APAR and PTF Request
 - Enables establishments to:
 - Obtain APAR or PTF descriptive data needed to resolve a problem at the installation.
 - Obtain APAR fixes and selected PTFs prior to PUT Tape availability.
 - Submit a request to provide a corrective fix not currently available.
 - Obtain notification of subsequent changes to APAR or PTF status.
- Preventive Service Inquiry
 - Enables installations to obtain planning information about IBM software preventive service upgrades.

HIGHLIGHTS

Information/Access, in conjunction with Information/System and Information/Management, provides:

- Ease-of-Use
 - Full-screen prompting aids inexperienced and occasional users.

INFORMATION/SYSTEM (cont'd)

- Single-line input alternative saves time for experienced users.
- Extensive online tutorial and help facilities aid usage and data entry.
- Stored response facility reduces time required to perform repetitive operations.
- Ability to create complex boolean search arguments provides a powerful data base inquiry capability.
- **CSSF Access**
 - Installation can control scheduling of CSSF connection.
 - Single copy of duplicate results maintained to conserve disk space.
 - Customer access to CSSF improves installation productivity.
 - The user is allowed to select a BSC TP port in one of his 3705s.
- **APAR Search**
 - Search of CSSF APAR information enhances ability to recognize duplicate problems.
 - Duplicate problem recognition aided by new method of describing problem symptoms.
 - Duplicate problem recognition further aided with common search arguments for local and CSSF data base searches.
 - Multi-operating system establishments can obtain information about other IBM software systems.
- **APAR and PTF Request**
 - Temporary fixes or bypasses can be obtained.
 - Notification of changes in APAR and PTF status facilitates planning for problem resolution.
 - Installations can request pre-release APAR fixes and PTFs for field testing.
 - Multi-operating system establishments can obtain information about other IBM software systems.
 - Format of most MVS and VS1 PTFs and many APAR fixes are designed for direct application by SMP. For other IBM software systems such as VSE or VM, the format of most PTFs and APAR fixes are in the format required by those systems.
- **Preventive Service Inquiry**
 - Latest available planning information can be obtained.
 - Notification of APARs written against preventive service upgrades requested by the customer facilitates planning for application of preventive service.
- CSSF requests and results may be related to problems, changes or configuration data from Information/Management.
- Log of key Information/Access activities provides audit trail.
- Data base integrity and recovery facilities protect installation's investment in the data base.
- Telephone connection to Customer Software Support Facility (CSSF) is through a toll-free number.

DESCRIPTION

Ease-of-Use: Information/Access can be used easily and effectively by systems programmers through the variety of data input methods available and the help and tutorial facilities. With the facilities of Information/System and Information/Management, users unfamiliar with Information/Access can communicate with it through a conversational dialog. The user is asked what he wants to do through full-screen displays and responds by selecting one of the possible courses of action presented on the display. Online tutorials are available to provide instruction on Information/Access facilities. These tutorials can be used to gain a general level of knowledge prior to using an unfamiliar facility of Information/Access or to answer specific questions which may arise during a dialog. In the latter case, the user can leave the dialog to browse the tutorial for the desired information and return to the point of departure.

Once the user has indicated what he wants to do, he is presented with data entry displays that ask for the data necessary for the operation he wishes to perform. Help screens are available. Thus, with the dialog, the user need know only what operation he wishes to perform and the data he wishes to enter.

While the dialog method provides ease-of-use for the unfamiliar user, a time-saving shortcut is provided for the experienced user. In a single line of input, he can chain Information/Access responses for all the display screens he can anticipate, bypassing the dialog and reaching the desired screen directly. These two methods of input, dialog and response chaining, can be intermixed as needed by the individual user.

Another input shortcut allows Information/Access response chains to be built and stored for standard operations that are frequently performed at the installation. These operations include all three major Information/Access functions. Standard defaults are supplied automatically by the stored response chain, saving keystrokes and time.

The installation's Information/Access data base is actually an extension of the Information/Management data base. Inquiry into the Information/Access data base, for both CSSF requests and results, is accomplished using the Information/Management search and display capabilities. Search examines the data base and locates entries meeting the search selection criteria specified by the user. Any combination of entry characteristics (i.e., data field contents) can be selected and complex searches can be performed using Boolean (i.e., AND, OR, NOT) logic specifying combinations of field values, 'ignore' positions and ranges. Identification numbers and abstracts of the CSSF requests and results in the Information/Access data base entries that meet the selection criteria are displayed at the conclusion of the search. From these, the user selects those entries for which he desires a more detailed display. With these facilities, the user can perform such searches as looking for all of his outstanding CSSF requests and their status, for results newly returned from CSSF, for results available for a particular APAR, and for results available for a particular Information/Management problem or change.

CSSF Access: Access to CSSF by Information/Access is common for each of its three functions (APAR search, APAR and PTF request and preventive service inquiry), only the content of the CSSF request is different. Information/Access is entered by first entering Information/Management and then selecting Information/Access as the function desired. Information/Access is then used to construct a properly formatted CSSF request from user input and place it in a new entry in the Information/Access or local, data base and in the transmission queue data set.

Requests awaiting transmission to CSSF are assigned a weighting factor based on the priority and age of the request. These weighting factors are used to determine the need for making a connection to CSSF. The priority is used to determine the order of transmission to CSSF. When the 3705 autocal feature is not used to connect to CSSF, the connection is made by the system operator dialing the CSSF telephone number. The installation can develop its own criteria for connection scheduling based on these weighting factors. Information on how to obtain telephone numbers and CSSF usage authorization will be provided at availability. Access to CSSF is controlled by the use of security codes.

After the connection to CSSF has been made, all accumulated stored requests are transmitted to CSSF for processing. Results are transmitted back to Information/Access during that connection or a subsequent connection and stored as new entries in the Information/Access data base. The Information/System facilities for local data base search, display and print can then be used to view or print the results of the CSSF request. When the CSSF result is no longer needed by the requestor or other designated user, it can be purged.

To conserve disk space and reduce response time, Information/Access maintains only one copy of any APAR data, PTF or upgrade received from CSSF. Subsequent users requesting any CSSF information already requested by a previous user are given access to it. This master copy is kept by Information/Access until the last requestor has purged his request for the information.

Using Information/Access, the installation can obtain the information it needs directly from CSSF under the control of installation personnel and procedures. This can increase productivity of installation personnel involved in problem resolution and planning.

A user may select a 3705 for transmission to/from the Customer Software Support Facility (CSSF). For the 3705, support is provided for switched line (manual or autocal) communications using Binary Synchronous point-to-point contention protocol. The BTAM access method is required and the 3705 must be equipped with a lineset and a modem which provide 4800 bps and if desired, autocal.

The 3705 support provides the user with DIALING and LINE statistics in addition to those provided in the SYS1.LOGREC by BTAM ERP (Error Recording Program). Commands are also provided to display line status and control line activation/deactivation at the system operator's console.

APAR Search: Since the majority of software service work is involved in rediscoveries of known defects, the ability to recognize a problem as being a duplicate of another is an important part of the problem resolution process. Information/System, Information/Management and Information/Access facilitate the job of recognizing duplicates of suspected IBM software problems in two ways. First, they allow the same problem symptom selection criteria to be used in searching the installation's Information/Management problem data base and APAR information in CSSF through Information/Access.

Using Information/Management, a search argument can be constructed to determine whether a certain problem has already occurred at the installation by searching the Information/Management data base. If there is no match and if the problem is a suspected IBM software

INFORMATION/SYSTEM (cont'd)

problem, the user can use the Information/MVS search argument to search the Early Warning System (EWS) data in Information/MVS. If the problem is not found, he would utilize the same search argument used in Information/Management to search the more current information in the remote CSSF data base by invoking Information/Access.

Second, duplicate problem recognition is facilitated by the structured and consistent manner of describing problem symptoms used by Information/Management.

The Information/Access APAR Search facility enables the user to submit requests for CSSF APAR data on problems similar to the one he may be experiencing in order to determine whether this problem is known to have occurred elsewhere. Since CSSF contains the latest available IBM information about IBM software problems, APAR search can be of major importance to installations needing the latest information to help resolve problems.

With the availability of the IBM Support Center for MVS, a licensed user of Information/Access may use this program product to request a search of the CSSF data base. This search will then be considered equivalent to the Level 1 search. After completing 'problem source identification' and performing the search, if no resolution to the problem is found, the customer, having identified the failing component, may request access to the Level 2 queue, bypassing the Level 1 search and further reducing problem resolution time.

To request APAR data from CSSF, the Information/Access user simply enters the command for APAR search, responds to a data entry display screen similar to those used by Information/Management and enters administrative information about the request, such as identification of the CSSF library to be searched (e.g., MVS, VS1, VM, Program Products). The problem symptom search argument previously created using the facilities of Information/Management is used as the basis for the CSSF APAR search request. Through access to CSSF, the user will be provided with licensed program data for those programs for which the user is licensed by IBM.

If CSSF finds between one and ten APARs meeting the selection criteria, CSSF diagnostic information pertaining to each APAR is returned. This information may include the APAR description, status, closing code and temporary fix. If between eleven and twenty-five APARs have been found, an abstract of each APAR is returned. From this information the user can determine whether he wants more complete CSSF information on one or more APARs (which he can request using the APAR and PTF Request function) or whether he should refine his search argument and resubmit the request to CSSF. If more than twenty-five APARs have been found, no APAR information is returned. The user should refine his search argument and resubmit the request to CSSF.

APAR and PTF Request: APAR and PTF Request enables the user to:

- Obtain APAR or PTF descriptive data, APAR temporary fixes or PTFs needed to resolve a problem at the installation. PTFs and many APAR fixes are transmitted in machine readable format, ready for installation.
- Obtain notification of subsequent changes to APAR or PTF status. This information is useful for determining such things as when an open APAR is closed, when a PTF is available for a problem at the installation and whether a PTF has been found to be in error. When no longer needed, this CSSF status change notification can be discontinued.
- Submit a request to provide a corrective fix not currently planned to address the problem he is experiencing. Should this correction subsequently be determined unnecessary by either the customer or IBM, the request may be cancelled.
- Request APAR fixes and PTFs prior to their general availability by indicating that the installation is willing to field test them. IBM may select the installation as a field test site and will request a report on its experience with the preliminary fix. Information/Access provides the facilities for submitting these reports to CSSF.

To request APAR and PTF data from CSSF, the user simply enters the information needed to make up the CSSF request, using the input facilities described earlier.

When a machine-readable PTF is included in the CSSF results, it is automatically copied to a user-specified data set in order to be made available for further processing. Similarly, for those requests where CSSF has included an APAR fix with the CSSF results, the fix can be made machine-readable by using the facilities of Information/Access to copy it to a sequential data set. If the PTF or fix is in, for example, SMP format, it can then be installed by SMP. User-specified data sets can be named according to installation conventions. PTFs are no longer accessible from CSSF when generally available on a PUT Tape.

Corrective service is available for all IBM licensed programs for which FE provides support.

Preventive Service Inquiry: Preventive Service Inquiry enables the user to submit CSSF requests for information about IBM software changes (upgrades - e.g., PUT Tapes). The information accessible by the use of this facility includes:

- APAR text data including temporary fixes.
- Installation information and service related special hints and warnings.
- Service upgrade documentation clarification and corrections.
- Upgrade Modification Set (UMS) which defines modifications to be made to the upgrade.

A user requesting Preventive Service Inquiry data for an upgrade is also notified of any changes to that information occurring subsequent to the servicing of that request.

For those results which include a UMS, the UMS may be made machine-readable by using the facilities of Information/Access to copy it to a sequential data set. The application of the UMS is described in the cover letter for the upgrade.

Preventive Service Inquiry information is important in planning the application of upgrades in such a manner that the efficient operation of the installation is maintained.

Integrated Applications: Any CSSF request can be associated with a problem, change or configuration component described in the Information/Management data base. APAR Search information can be related to the problem being resolved. Fix and preventive service planning information can be related to the problem causing them, the change requiring them or to the software component being changed. This relational capability assists the installation in managing all problem, change and configuration management related activities.

Audit Trail: To provide an audit trail of CSSF usage, an optional facility is provided which allows the user to selectively log all system operator communications involving CSSF, all CSSF telephone connections and all hardware communication interface activity. The log can be selectively printed using an Information/Access utility.

DATA BASE INTEGRITY and RECOVERY FACILITIES

The Information/Access data base consists of one data set containing entries and a corresponding data set providing quick-search indices for these entries. To prevent loss of data base integrity due to inconsistency between these data sets (which could occur as a result of external system problems), consistency is checked each time an entry is retrieved. If an inconsistency is found, the index data set can be reconstructed from the entry data set reestablishing consistency.

The ability to recover from damage to the entry data set is also provided. Updates can optionally be journaled to a recovery log. Should the entry data set become damaged (by an external system problem), after being restored from the point where last saved, it can be updated from the recovery log.

SECURITY

Security controls should be considered for implementation by the customer. See Product Announcement for further details.

Response Time: The amount of time as seen by the user from entry of his CSSF request until receipt of his response depends upon such factors as the installation's CSSF connection scheduling procedure, the number and priority of CSSF requests awaiting transmission from the installation, the number of requests incoming and waiting at CSSF, and the amount of information transmitted by CSSF.

Access to the Customer Software Support Facility (CSSF) data base at any given time is dependent upon the Customer Software Support Facility (CSSF) system resources and is subject to the level of demand by all users.

The CSSF data base contains licensed information regarding IBM licensed programs and information regarding system control programming (SCP). (SCP as used here refers to system control programming function that is not licensed by IBM.) Information/Access licensees may retrieve data for programs for which they are licensed; SCP data is retrievable by all Information/Access licensees.

The CSSF data base is made available for access exclusively by the Information/Access licensee. The Information/Access licensee may not make or permit any manner of access to any form of the licensed CSSF data or parts thereof except to his employees or IBM employees, or to other persons acting for the licensee, as authorized in the Agreement for IBM Licensed Programs.

IBM reserves the right to limit access to the CSSF data base so as to optimize this capability for all users, and to define the contents and currency of the data contained in the SSF data base. IBM shall not be liable or deemed to be in default for any delays or failure in performance or interruption of service.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Information/Access operates on any IBM hardware configuration that supports MVS 3.8 or MVS/SP Version 1.

PROGRAM PRODUCTS

INFORMATION/SYSTEM (cont'd)

An IBM 3270 display terminal that supports a screen size of at least 24 lines by 80 characters must be available. Devices supported by Information/Access include the following IBM display stations:

- 3275 mdls 2, -12
- 3276 mdls 2, -3, -4, -12, -13, -14 in 3277 mdl 2 compatibility mode
- 3277 mdl 2
- 3278 mdls 2, -3, -4, -5
- 3279 mdls 2A, -3A

For Information/Access, a user may select an IBM 3705 Communications Controller for data transmission to and from CSSF.

3705 support is provided for switched line (manual or autocal) communications using Binary Synchronous point-to-point contention protocol. The 3705 must be equipped with a lineset and a modem which provide 4800 bps and, if desired, autocal.

For 3705 binary synchronous (BSC) support, Information/Access utilizes Basic Telecommunications Access Method (BTAM). With BTAM, Information/Access requires either the Partitioned Emulation Program (PEP) or the Emulation Program (EP).

An Information/Access implementation of System Network Architecture (SNA) using Network Control Program (NCP) support of switched lines is planned.

SOFTWARE REQUIREMENTS

Information/System is the base product required by each of its features and products. In addition, Information/Access requires Information/Management.

Information/Access operates in all environments supported by Information/System Release 2.1 except for MVS/SP Version 2.

Information/System operates directly under the Time Sharing Option (TSO) running on OS/VS2 (MVS) Release 3.8, MVS/SP Version 1 or MVS/SP Version 2 (operation is in 24-bit mode) with the current releases of the Virtual Telecommunications Access Method (VTAM) or the Telecommunications Access Method (TCAM). A TCAM MCP generation may be required by the installation to obtain full-screen mode in the TSO/TCAM environments.

In addition, Information/System runs as standard commands under the Network Communications Control Facility (NCCF) running on OS/VS2 MVS Release 3.8, MVS/SP Version 1 or MVS/SP Version 2 (operation is in 24-bit mode) with Advanced Communications Function/Virtual Telecommunications Access Method (ACF/VTAM Version 1 or ACF/VTAM Version 2) or Advanced Communications Function/Telecommunications Access Method (ACF/TCAM). Information/System can run under both TSO and NCCF concurrently.

For 3705 binary synchronous (BSC) support, Information/Access utilizes Basic Telecommunications Access Method (BTAM).

PERFORMANCE CONSIDERATIONS

Information/Access is an application that executes as a problem program. When Information/Access is installed but not operational, there is no performance impact on the base system other than that caused by an increase in external storage requirements.

Information/Access executes concurrently with other TSO or NCCF applications in the user's system. The effect of Information/Access is the same as similar terminal applications in these environments. The response time for any particular operation varies with the complexity of the function and the data sets used, the speed of the processor or other devices and the current system load. Base system supervisor facilities may be used to establish the amount of service that any particular user receives.

Information/Access queries to CSSF are batched and any delays in CSSF responses will not affect user system performance. Response times from CSSF are dependent upon such factors as the installation's CSSF connection scheduling procedure, the number and priority of CSSF requests awaiting transmission from the installation, the number and priority of requests incoming and waiting at CSSF and the amount of information transmitted by CSSF.

**ADVANCED COMMUNICATIONS FUNCTION
FOR TCAM (ACF/TCAM) VERSION 1
OS/VS (5735-RC1)**

PURPOSE

Advanced Communications Function for TCAM (ACF/TCAM) is a program product for users of OS/VS1 and OS/VS2 (SVS and MVS) that can provide capabilities for data communication in a network with a single S/370 or with multiple S/370s. MVS support includes support of the MVS/System Extensions program product.

HIGHLIGHTS

Support of SNA-SDLC devices attached to ACF/NCP/VS or NCP/VS via switched lines.

Support of a remote 3705-I or 3705-II Communications Controller with ACF/NCP/VS.

ACF/TCAM/TSO support of the 3790 system with 3270 data stream compatibility.

Support of 3705-I and 3705-II multiple channel attachment capabilities through ACF/NCP/VS.

Support of message traffic pacing inbound, through ACF/NCP/VS, from terminals that support inbound pacing.

Improved tuning capability through pageable control blocks.

Extended serviceability through support of the ACF/NCP/VS capability for concurrent trace of up to eight lines attached to a 3705.

Extended availability through improved switched network backup support for SNA-SDLC devices.

New capability for dynamic collection of tuning statistics.

Designed to run with the *latest current level** of NCP/VS as well as ACF/NCP/VS and the latest current versions of the Emulator Program (EP/VS) and Partitioned Emulator Programming (PEP).

* Latest current level means the SCP level of TCAM or VTAM, or SCP version of NCP/VS, PEP or EP/VS shipped most recently at the time of the initial availability of ACF/TCAM.

ADVANTAGES

Support of SNA-SDLC devices via switched lines: ACF/TCAM support of SNA-SDLC devices is extended to those attached to ACF/NCP/VS or NCP/VS via switched lines. Identification checking, telephone numbers and call scheduling are handled by ACF/TCAM. ACF/TCAM operator control permits specification of both the terminal to call and the line to use. In addition, several operator display enhancements are offered, including the capability to display:

The line, given a terminal name.

The terminal name, given a line.

The line status, plus the capability to indicate lines that are actually connected to a terminal and those that are available for calls.

Remote 3705 Support: Support of remote 3705-II with ACF/NCP/VS extends the communications network beyond the locally-attached 3705.

ACF/TCAM/TSO Support for Remote 3790: ACF/TCAM/TSO provides support for the remotely-attached 3790 Communication System with 3270 data stream compatibility, available on the 3790 system as **#9165** Configuration Support.

Multiple Channel Attachment: Support of the multiple channel attachment capability of ACF/NCP/VS expands the sharing capabilities of a 3705-I or a 3705-II. This may permit more economical use of one communications controller where a 3705-II can support a maximum of four ACF/TCAM host systems. (Some of the four may be ACF/VTAM or the latest current level of TCAM; one may be the latest current level of VTAM.) Also, this sharing capability allows one 3705-I to support a maximum of two ACF/TCAM host systems. (One may be ACF/VTAM or the latest current level of TCAM or VTAM.)

Inbound Pacing: Pacing of inbound message traffic can help avoid buffer overrun. ACF/TCAM provides this function as a user-selectable session establishment function.

Pageable Control Blocks: ACF/TCAM allows a choice of either fixed or pageable storage for certain tables and control blocks for NCP/VS or ACF/NCP/VS-attached stations. This gives the ACF/TCAM users considerable flexibility in managing their storage requirements and in tuning throughput and response time.

Multiple Line Trace: Multiple line trace support provides the capability to trace concurrently a maximum of eight lines attached to a 3705 with ACF/NCP/VS.

Improved Switched Network Backup: Improved switched network backup support for SNA-SDLC devices allows (a) control units associated with a failed or deactivated nonswitched line to be reactivated through an alternate, switched line, or (b) terminals associated with a failed or deactivated control unit (switched or nonswitched) to continue to receive communication support through reconfiguration to a backup, switched control unit.

Statistical Recording: Enhanced statistical recording provides the capability to collect traffic counts, error counts, unavailable network elements and ACF/TCAM resource pool utilization. This information is available to the user through operator control display.

MULTISYSTEM NETWORKING FACILITY

The ACF/TCAM Multisystem Networking Facility is a feature for the ACF/TCAM program product. It extends the capabilities of ACF/TCAM to support the implementation of intersystem communication among multiple S/370s operating with OS/VS1 and/or OS/VS2 (SVS and/or MVS). MVS support includes support of the MVS/System Extensions program product.

HIGHLIGHTS

The ACF/TCAM Multisystems Networking Facility supports cross-system message routing through which data may be transmitted across systems to its destination without host intervention, after initial session establishment.

The ACF/TCAM Multisystem Networking Facility can support cross-system communication for the following types of configurations:

Multiple S/370 configurations where each host processor has a network controlled by ACF/TCAM with the Multisystem Networking Facility and ACF/NCP/VS. Optionally, some of the host processors may have networks controlled by ACF/VTAM with the Multisystem Networking Facility and ACF/NCP/VS.

A network controlled by a single S/370 with two access methods, ACF/TCAM and ACF/VTAM, each with its own Multisystem Networking Facility in conjunction with ACF/NCP/VS.

Combinations of the above types of configurations.

The ACF/TCAM Multisystem Networking Facility, in conjunction with ACF/NCP/VS, enables the user to have cross-system communication, providing resource sharing, program sharing, distributed processing and increased resource availability through the facilities described below:

Support of communication, via ACF/NCP/VS, between an ACF/TCAM device message handler, sub-system or user-written application program on one host system and:

An SNA-SDLC device controlled by ACF/TCAM or ACF/VTAM on a different host system.

A BSC or start-stop device controlled by ACF/TCAM on a different host system.

A 3270 BSC device controlled by ACF/VTAM on a different host system.

A corresponding ACF/TCAM message handler or user-written application program or ACF/VTAM user-written application program on a different host system.

If the communication links which connect the host system configuration described above pass through one or more intermediate system configurations, message traffic can be routed through the local ACF/NCP/VS of each intermediate configuration, without involving the intermediate S/370 processor(s).

Support of the capability for one ACF/TCAM host system to assume control of a 3705 with ACF/NCP/VS that is channel-attached to a different ACF/TCAM (or ACF/VTAM) host that fails or is deactivated. This support applies to adjacent 3705s with ACF/NCP/VS. Appropriate system definitions and network operator procedures are required.

An active 3705 with ACF/NCP/VS and its resources can continue in an active state without re-IPL unless it also fails or is deactivated.

If the 3705-II with ACF/NCP/VS is to be re-IPLed while its channel-attached host is unavailable, it must be re-IPLed as a remote communications controller; however, as a remote communications controller, communication links to communications controllers other than its local are not supported.

Ability of a network operator to control the eligibility for communication between a message handler, application or terminal in the ACF/TCAM host system and message handlers, applications or terminals in a different ACF/TCAM or ACF/VTAM host system. The operator may determine which terminals and applications are currently eligible for such cross-system communication.

Ability for testing of links between local 3705s with ACF/NCP/VS.

Support of backup switched or nonswitched links between local 3705s with ACF/NCP/VS.

Support of a shared cross-system terminal table entry pool that provides improved storage management capability, and the capability to dynamically reconfigure an ACF/TCAM network.

PROGRAM PRODUCTS

ACF/TCAM Version 1 (cont'd)

Support of message traffic pacing between message handlers in different ACF/TCAM processors.

ADVANTAGES

Enhances application processing and access to information between multiple S/370 networks. For example, a user-written TCAM message handler may provide processing and data base access on one ACF/TCAM host on behalf of user-written message handlers, application programs or terminals on different ACF/TCAM or ACF/VTAM hosts.

Permits distributed processing and expands resource sharing capabilities between multiple S/370 networks as well as between a S/370 and a communications subsystem such as the 3790.

Permits a wide range of multiple S/370 configurations to support orderly applications growth with Systems Network Architecture.

Can minimize redundant network applications.

Permits interconnection of S/370 networks with the complete range of low end to high end processors and virtual operating systems that support ACF/TCAM or ACF/VTAM.

ACF/TCAM offers the multisystem user the capability to minimize control blocks by providing a shared terminal table entry pool. With this support, the multisystem user does not have to define a terminal table entry (TTE) and destination queue control block for every logical unit in every host system environment; those that are shared between operating systems need be defined only once. In addition, this shared TTE pool offers the user the capability to add, through operator control, cross-system logical units to the network without requiring system redefinition in other than the owning host. This shared pool is supported only for main storage queuing.

A communications management configuration permits certain communications management functions (such as terminal ownership, session establishment or loading of ACF/NCP/VS) to be consolidated in one of the processors that are connected by the multiple channel attachment capability of ACF/NCP/VS and the 3705 Communications Controller.

Other local processors are freed for applications processing.

The communications management processor can be backed-up by another local processor.

Excess capacity in the communications management processor can be used to run applications.

Functions, such as user-written ACF/TCAM transaction routing and message switching, can be accomplished in the communications management processor

SINGLE and MULTISYSTEM CONSIDERATIONS

Communications Controller Support: ACF/TCAM operates with the following communications controllers:

- 3704 Communications Controller
- 3705-I Communications Controller
- 3705-II Communications Controller

PLANNING CONSIDERATIONS

Machine and estimated storage requirements will be provided in an update to the *Advanced Communications Function for TCAM General Information* prior to the availability of ACF/TCAM for each operating system. TCAM/NCP/VS-Direct and ACF/TCAM require the following features in support of the Compare and Swap instruction: Conditional Swapping (#1051) on the 3135; Advanced Control Program Support (#1001) or Conditional Swapping (#1051) on the 3145.

ACF/TCAM operates in a VM/370 Virtual Machine which supports the required release of the operating system (OS/VS1, OS/VS2 (SVS or MVS)).

ACF/TCAM operation in a VM/370 environment is intended for use in program development and testing and other uses where performance is not critical. Operation of ACF/TCAM under VM/370 Release 3, even with the virtual machine assist feature, may add significant additional processor overhead. If your customer has specific throughput or terminal response requirements, you should plan to benchmark under VM/370 to ensure that any proposed configuration will meet the customer's performance needs.

Each OS/VS virtual machine in which ACF/TCAM resides requires a dedicated sub-channel address to a 3705-I or 3705-II with ACF/NCP/VS or the latest current level of NCP/VS.

Functions supported by the latest current level of TCAM/NCP/VS Direct and NCP/VS are also supported by ACF/TCAM and the latest current level of NCP/VS or ACF/NCP/VS.

The following functions are supported by ACF/TCAM in conjunction with the latest current level of NCP/VS or with ACF/NCP/VS:

- Support of SNA-SDLC devices via switched lines.

- TCAM/TSO support for remote 3790 with 3270 data stream compatibility.
- Pageable control blocks.
- Improved switched network backup.
- Statistical recording.

The following functions are supported by ACF/TCAM only in conjunction with ACF/NCP/VS:

- Remote 3705-II.
- Inbound pacing.
- Multiple channel attachment.
- Multiple line trace.
- Multisystem Networking Facility.

In a mixed ACF/TCAM - ACF/VTAM multisystem environment, ACF/VTAMs ability to access device characteristics of terminals controlled by ACF/TCAM is limited to those indicators defined and maintained by ACF/TCAM. In particular, the ability to determine the following 3270 device characteristics are not supported:

- Whether the device has the selector light-pen feature.
- Whether the device is a printer.
- The physical device address (used in the copy function).

Use of ACF/TCAM requires the concurrent installation of prerequisite TCAM system control programming (SCP). This prerequisite SCP should only be installed by ACF/TCAM users.

CUSTOMER RESPONSIBILITIES

To install and use ACF/TCAM, the customer must:

- Design the single system network.
- Order and install all required communications equipment.
- Have prerequisite TCAM SCP installed.
- Install ACF/TCAM.
- Define the network to ACF/TCAM.
- Install NCP/VS or ACF/NCP/VS (unless all terminals are local, i.e., channel-attached to the host).
- Define the network to NCP/VS or ACF/NCP/VS.

To install and use the Multisystem Networking Facility feature the customer must:

- Design the multisystem network.
- Order and install any additional communications equipment (e.g., intersystem links between interconnected 3705s).
- Have prerequisite TCAM SCP installed.
- Install ACF/TCAM.
- Install ACF/NCP/VS.
- Install the Multisystem Networking Facility.
- Define the multisystem network to ACF/TCAM and ACF/NCP/VS in each system.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The following functions supported by ACF/TCAM are supported with the latest current level of NCP/VS or with ACF/NCP/VS:

- Support of SNA-SDLC devices via switched lines.
- TCAM/TSO support for remote 3790.
- Pageable control blocks.
- Improved switched network backup.
- Statistical recording.

The following functions supported by ACF/TCAM also require support by ACF/NCP/VS:

- Remote 3705-II.
- Inbound pacing.
- Multiple line trace.
- Multiple Channel attachment.

SOFTWARE REQUIREMENTS

Use of the ACF/TCAM requires the concurrent installation of prerequisite system control programming (SCP). This prerequisite SCP should only be installed by ACF/TCAM users.

COMPATIBILITY

ACF/TCAM retains compatibility with the latest current level of TCAM. ACF/TCAM offers compatibility with the latest current level of NCP/VS as well as ACF/NCP/VS.

Where related IBM programs (for example, CICS/VS, TSO, SSS) operate with the latest current level of TCAM, compatibility is retained for the levels of those programs that are current at the availability of ACF/TCAM on the appropriate operating system release. Recompile of the related IBM programs is not required.

Compatibility is retained for existing user programs that utilize the latest current level of TCAM. However, such user programs may require

ACF/TCAM Version 1 (cont'd)

changes to take advantage of the multisystem networking capabilities offered by ACF/TCAM.

TCAM through VTAM is not provided with ACF/TCAM.

Program products which run under the control of CICS/OS/VS and/or CICS/DOS/VS and operate with VTAM and/or TCAM will operate with ACF/VTAM and/or ACF/TCAM (including the Multisystem Networking Facility). Program products which do not violate the CICS macro interfaces will require no modification to provide equivalent terminal function under ACF/VTAM and ACF/TCAM to that provided under VTAM and TCAM. Representative products which have been verified not to violate these interfaces are:

Advanced Text Management System II (ATMS II/OS/VS and ATMS II/DOS/VS)

Display Management System/VS (DMS OS/VS and DMS DOS/VS)

Planning Control and Decision Evaluation System/Interactive (PLANCODE/I OS/VS and PLANCODE/I DOS/VS)

Storage and Information Retrieval System (STAIRS/VS, STAIRS/DOS/VS, and STAIRS/VS - TLS)

Alpha Search Inquiry System

Life Inquiry/Data Entry

PERFORMANCE and STORAGE CONSIDERATIONS

An overall objective of ACF/TCAM is to have a positive effect on performance. Facilities to help accomplish this objective include:

Reduction of the fixed portion of the control block working storage from 122 bytes per logical unit to less than 20 bytes per logical unit.

The shared terminal table entry pool which allows for further control block storage reduction for logical units that are shared between operating systems.

The capability provided through the Multisystem Networking Facility to access any application from any supported terminal provides potential for storage savings by the elimination of duplicate application programs among multiple hosts.

In some cases, such as for cross-system session initiation and termination, the additional system function of multisystem networking will require increased ACF/TCAM resources.

The design objectives for ACF/TCAM path lengths for a single system environment are approximately equal to a TCAM/NCP/VS Direct environment for the same function and terminals. Specifically, the ACF/TCAM path lengths are estimated to be approximately 5% greater than TCAM/NCP/VS - Direct equivalents.

DOCUMENTATION (available from Mechanicsburg)

Introduction to Advanced Communications Function (GC30-3033) ... ACF/TCAM General Information Manual (GC30-2050).

TERMINALS SUPPORTED

ACF/TCAM supports the following terminals, programmable features, transmission control units and communications controllers. Programmable features which change the control of transmission characteristics and which are not shown are not supported. Attempts to use ACF/TCAM with unsupported features can cause unpredictable results.

The user should be aware that many terminal and control unit special features are transparent to programming and are therefore readily usable even though not specifically identified. Note that the appropriate line adapters and hardware attachment features must be included in the system configuration.

Terminals that are functionally equivalent to those specifically supported by ACF/TCAM may also function satisfactorily with ACF/TCAM; the customer is responsible for establishing equivalency. IBM assumes no responsibility for the impact that any changes to the IBM-supplied programs or products may have on such terminals.

5746-RC3 - ACF/VTAM R1 (DOS/VS)
ADVANCED COMMUNICATIONS FUNCTION
FOR VTAM RELEASE 1 (ACF/VTAM)**

PURPOSE

Advanced Communications Function for VTAM Version 1 (ACF/VTAM) is for users of DOS/VS, OS/VS1 and OS/VS2 (SVS and MVS) that can provide new capabilities for data communication in a network with a single S/370 or with multiple S/370s. These capabilities described below are added to VTAM functions as described in the pages for each SCP (DOS/VS, OS/VS1, and OS/VS2).

HIGHLIGHTS

Support of communication between two user-written ACF/VTAM application programs, through record Application Program Interface (API) extensions.

Support of message traffic pacing between application programs, or inbound from 3770, 3276, 3650, 3601/3602/3694 terminals operating in SNA/SDLC transmissions mode.

Support of a remote 3705-II Communications Controller with ACF/NCP/VS.

Support of 3705-I and 3705-II multiple channel attachment capabilities through ACF/NCP/VS.

Expansion of VTAM network operator DISPLAY command to provide more information about network resources and elements.

Dynamic buffer pool allocation capability.

Designed to run with the latest current level * of NCP/VS as well as ACF/NCP/VS.

Capability for dynamic collection of tuning statistics.

Extended serviceability through support of the ACF/NCP/VS capability for concurrent trace of up to eight lines attached to a 3705.

Extended availability through improved switched network backup support for SNA-SDLC devices.

For all operating systems, execution of ACF/VTAM in a problem program partition, region or address space, rather than as a system task.

Extended serviceability through improved tracing support under DOS/VS, equivalent to ACF/VTAM support under OS/VS1, MVS and SVS.

* Latest current level means that SCP level of VTAM or TCAM or SCP version of NCP/VS shipped most recently at the time of initial availability of ACF/VTAM.

DESCRIPTION

Advantages

Application-to-Application Communication: Communication between two user-written ACF/VTAM Version 1 applications offers users greater flexibility to design and implement more efficient application processing in a network. For example, a single user-written application may provide centralized processing for other user-written applications as well as terminal users. This may eliminate duplicate processing support, and optimize the use of system resources among multiple application programs.

Inbound Pacing: Pacing of inbound message traffic for a user application program can help avoid buffer overrun. ACF/VTAM provides this function as a user-selectable session establishment function.

Remote 3705-II: Support of remote 3705-II with ACF/NCP/VS offers the advantages of the new communications controller capabilities for 3705-II.

Multiple Channel Attachment: Support of the multiple channel attachment capability of ACF/NCP/VS expands the sharing capabilities of a 3705-I or a 3705-II. This may permit more economical use of one communications controller, where a 3705-II can support a maximum of four ACF/VTAM host systems, running under any combination of DOS/VS or OS/VS operating systems. (Some of the four may be ACF/TCAM or the latest current level of TCAM 10; one may be VTAM 2.0.) Also, this sharing capability allows one 3705-1 to support a maximum of two ACF/VTAM host systems. (One may be ACF/TCAM or VTAM 2.0 or TCAM 10.)

Operator DISPLAY Command: DISPLAY command capabilities permit a network operator (or programmed operator application) to obtain more information about the status of network resources; that is, nodes, lines terminals, logical units, physical units, application programs and buffers. Such information may be useful for status purposes, for performance analysis or to determine if an action is required for a failing element in the network.

Dynamic Buffer Allocation: Can dynamically allocate main storage for buffer pools according to message traffic loads and availability of main storage resources. This gives the user considerable flexibility to

optimize the use of main storage for buffer pools and determine buffer pool space requirements that are consistent with throughput and response time.

Tuning Statistics: A new tuning statistics function permits dynamic accumulation of data about the I/O interface to a channel-attached communications controller or a channel-attached 3790. Such data may aid a user in determining and selecting optimum values for start parameters and network definition.

Multiple Line Trace: Provides the capability to trace concurrently a maximum of eight lines with ACF/NCP/VS.

Improved Switched Network Backup: Improved switched network backup support for SNA-SDLC devices allows (a) control units associated with a failed or deactivated nonswitched line to be reactivated through an alternate, switched line, or (b) terminals associated with a failed or deactivated control unit (switched or nonswitched) to continue to receive communication support through reconfiguration to a backup, switched control unit.

VTAM as a User Task: Permits the operator to unconditionally terminate ACF/VTAM, without waiting for resources to be released. Upon termination, all system resources acquired by ACF/VTAM are released, and the partition, region or address space may be used for other purposes.

Improved Trace Support (DOS/VS): Permits activity trace records produced by ACF/VTAM (line, buffer, I/O and tuning statistics trace data) to be written to additional media.

TPRINT: Improvements include:

Device SYSLIST output to tape, disk or hardcopy.

TPRINT as a job step independent of ACF/VTAM, which may be active or inactive, as well as a subtask under ACF/VTAM.

Trace and TPRINT failures are isolated from ACF/VTAM, which continues to operate in the event of such failures.

MULTISYSTEM NETWORKING FACILITY

The ACF/VTAM Multisystem Networking Facility is a feature for the ACF/VTAM program product. It extends the capabilities of ACF/VTAM to support the implementation of intersystem communication among multiple S/370s operating with DOS/VS, OS/VS1 and/or OS/VS2 (SVS and/or MVS).

HIGHLIGHTS

The ACF/VTAM Version 1 Multisystem Networking Facility supports cross-system message routing, through which data may be transmitted across systems to its destination without host intervention after initial session establishment.

The ACF/VTAM Multisystem Networking Facility Version 1 can support cross-system communication for the following types of configurations:

Multiple S/370 configurations, operating with any combination of DOS/VS or OS/VS operating systems, where each host processor has a network controlled by ACF/VTAM with the Multisystem Networking Facility and ACF/NCP/VS. Optionally, some of the host processors may have networks controlled by ACF/TCAM with the Multisystem Networking Facility and ACF/NCP/VS.

A network controlled by a single S/370 with two access methods, ACF/VTAM and ACF/TCAM, each with its own Multisystem Networking Facility, in conjunction with ACF/NCP/VS.

Combinations of the above types of configurations.

The ACF/VTAM Multisystem Networking Facility, in conjunction with ACF/NCP/VS, enables the user to have cross-system communications providing resource sharing, distributed processing and increased resource availability through the facilities described below:

Support of communication, via ACF/NCP/VS, between an ACF/VTAM subsystem or user-written application program on one host system and:

An SNA-SDLC device controlled by ACF/VTAM Version 1 or ACF/VTAM Version 2 or ACF/TCAM on a different host system.

A 3270 BSC device controlled by ACF/VTAM or ACF/TCAM on a different host system. (Selected 3270 features are supported between ACF/VTAM and ACF/TCAM host systems, as discussed below under "Planning Considerations".)

Support of communications, via ACF/NCP/VS, between an ACF/VTAM user-written application program on one host system and a corresponding user-written ACF/VTAM application program, or an ACF/TCAM message handler or user-written application program on a different host system.

(ACF/VTAM) R1 (cont'd)

If the communication links which connect the host system configurations described above pass through one or more intermediate system configurations, message traffic can be routed through the local ACF/NCP/VS of each intermediate S/370 Processor.

Support of the capability for one ACF/VTAM host system to assume control of a 3705 with ACF/NCP/VS that is channel-attached to a different ACF/VTAM (or ACF/TCAM) host that fails or is deactivated. This support applies between adjacent 3705s with ACF/NCP/VS. Appropriate system definitions and network operator procedures are required.

An active 3705 with ACF/NCP/VS and its associated terminals can continue in an active state without re-IPL, unless it also fails or is deactivated.

If the 3705-II with ACF/NCP/VS is to be re-IPLed while its channel-attached host is unavailable, it must be re-IPLed as a remote communications controller; however, as a remote communications controller, communication links to communications controllers other than its local are not supported.

Ability of a network operator to control (using the VARY command) which applications and terminals controlled by the ACF/VTAM host are eligible to communicate with applications or terminals controlled by a different ACF/VTAM (or ACF/TCAM) host system. Also, the operator may determine (using a DISPLAY command) which terminals and applications are currently eligible for such cross-system communication.

Ability for testing of links between local 3705s with ACF/NCP/VS.

Support of backup switched or leased SDLC links between local 3705s with ACF/NCP/VS.

Advantages: Enhances application processing and screening of information between multiple S/370 networks. For example, a user-written VTAM application program may provide processing and data base access on one ACF/VTAM host on behalf of user-written application programs or terminals on different ACF/VTAM hosts.

Permits distributed processing and expands resource sharing capabilities between multiple S/370 networks as well as between a S/370 and a communications subsystem such as the 3790.

Permits a wide range of multiple S/370 configurations to support orderly applications growth with Systems Network Architecture.

Can minimize redundant network applications.

Permits interconnection of S/370 networks with the complete range of low end to high end processors and virtual operating systems that support ACF/VTAM or ACF/TCAM.

A communications management configuration permits certain communications management functions (such as terminal ownership, session establishment or loading of ACF/NCP/VS) to be consolidated in one of the processors that are connected by the multiple channel attachment capability of ACF/NCP/VS and the 3705 Communications Controller.

Other local processors are freed for applications processing.

The communications management processor can be backed up by another local processor.

Excess capacity in the communication management processor can be used to run applications.

Functions such as user-written transaction routing and message switching applications can be accomplished in the communications management processor.

Single and Multisystem Considerations

Communications Controller Support: ACF/VTAM operates with the following communications controllers:

3704 Communications Controller (as supported by the latest current level of NCP/VS that is available when ACF/VTAM becomes available).

3705-I Communications Controller (as supported by ACF/NCP/VS or the latest current level of NCP/VS that is available when ACF/VTAM becomes available).

3705-II Communications Controller (as supported by ACF/NCP/VS or the latest current level of NCP/VS that is available when ACF/VTAM becomes available).

Related IBM Programs: The following summarizes relationships in a networking environment:

host
system (See
Note).

Note: Refer to pages on individual systems for information on programming for specific SNA (and non-SNA) devices.

Planning Considerations: Machine and estimated storage requirements are provided in an update to the *Advanced Communications Function for VTAM General Information Manual*.

ACF/VTAM requires the following features in support of the Compare and Swap instruction: Conditional Swapping (#1051) on 3135; Advanced Control Program Support (#1001) or Conditional Swapping (#1051) on the 3145.

ACF/VTAM operates in a VM/370 virtual machine which supports the required release of the operating system (DOS/VS, OS/VS1, OS/VS2, SVS or MVS).

ACF/VTAM operation in a VM/370 environment is intended for use in program development and testing and other uses where performance is not critical. Operation of ACF/VTAM under VM/370 Release 3, even with the virtual machine assist feature, may add significant additional processor overhead. If your customer has specific throughput or terminal response requirements, you should plan to benchmark under VM/370 to ensure that any proposed configuration will meet the customer's performance needs.

Each DOS/VS or OS/VS virtual machine in which ACF/VTAM resides requires a dedicated subchannel address to a 3705-I or 3705-II with ACF/NCP/VS or the latest current level of NCP/VS.

Functions supported by the latest current levels of VTAM and NCP/VS are also supported by ACF/VTAM and NCP/VS Release 5.0 or ACF/NCP/VS.

The following functions are supported by ACF/VTAM in conjunction with NCP/VS Release 5.0 or with ACF/NCP/VS:

- Application-to-Application Communication.
- Inbound Pacing.
- Operator DISPLAY Command.
- Dynamic Buffer Allocation.
- Tuning Statistics.
- Improved Switched Network Backup.
- Improved Trace Support.

The following functions are supported by ACF/VTAM only in conjunction with ACF/NCP/VS:

- Remote 3705-II.
- Multiple Channel Attachment.
- Multiple Line Trace.
- Multisystem Networking Facility.

In a mixed ACF/VTAM - ACF/TCAM multisystem environment, ACF/VTAM's ability to access device characteristics of terminals controlled by ACF/TCAM is limited to those indicators defined and maintained by ACF/TCAM. In particular, the ability to determine the following 3270 SDLC device characteristics is not supported:

- Whether the device has the selector light-pen feature.
- Whether the device is a printer.
- The physical device address (used in the copy function).

Use of ACF/VTAM requires the concurrent installation of prerequisite VTAM system control programming (SCP) which will be available concurrent with ACF/VTAM. This prerequisite SCP should only be installed by ACF/VTAM users. ACF/VTAM requires the level of Virtual Storage Access Method (VSAM) that is current at the time ACF/VTAM is made available.

PROGRAM PRODUCTS

(ACF/VTAM) R1 (cont'd)

CUSTOMER RESPONSIBILITIES

To install and use ACF/VTAM, Version 1 the customer must:

- Design the single system network.
- Order and install all required communications equipment.
- Have prerequisite VTAM SCP installed.
- Install ACF/VTAM Version 1.
- Define the network to ACF/VTAM.
- Install NCP/VS or ACF/NCP/VS (unless all terminals are local, i.e., channel-attached to the host).
- Define the network to NCP/VS or ACF/NCP/VS.

To install and use the Multisystem Networking Facility feature, the customer must:

- Design the multisystem network.
- Order and install any additional communications equipment (e.g., intersystem links between interconnected 3705s).
- Have prerequisite VTAM SCP installed.
- Install ACF/VTAM.
- Install ACF/NCP/VS.
- Install the Multisystem Networking Facility.
- Define the multisystem network to ACF/VTAM and ACF/NCP/VS in each system.

COMPATIBILITY

ACF/VTAM Version 1 retains compatibility with ACF/VTAM Version 2 or VTAM Level 2. ACF/VTAM offers compatibility with NCP/VS Release 5.0 as well as with ACF/NCP/VS.

Where related IBM programs (for example, CICS/VS, IMS/VS, POWER/VS, JES1/RES, JES2/RJE, TSO, VSPC, BTP and SSS) operate with the latest current level of VTAM Level 2, compatibility is retained for the level(s) of those programs that are current at the availability of ACF/VTAM on the appropriate operating system release. Recompilation of the related IBM programs is not required.

Most user-written VTAM application programs that use the Application Program Interface (API) of VTAM Level 2 will continue to operate with ACF/VTAM without change and without recompilation when operating in a single domain environment. Possible exceptions to this and other considerations for moving from VTAM Level 2 to ACF/VTAM are in Appendix D of the *Advanced Communications Function for VTAM (ACF/VTAM) Conceptual Planning Manual (GC38-0282)*. To take advantage of the multisystem networking capabilities offered by ACF/VTAM, changes to user programs may be required.

Program products which run under the control of CICS/OS/VS and/or CICS/DOS/VS and operate with VTAM and/or TCAM will operate with ACF/VTAM and/or ACF/TCAM (including the Multisystem Networking Facility). Program products which do not violate the CICS Macro Interfaces as described in the sales pages will require no modification to provide equivalent terminal function under ACF/VTAM and ACF/TCAM to that provided under VTAM and TCAM. Representative products which have been verified not to violate these interfaces are:

- Advanced Text Management System II (ATMS II/OS/VS and ATMS II/DOS/VS).
- Display Management System/VS (DMS OS/VS and DMS DOS/VS).
- Planning Control and Decision Evaluation System/Interactive (PLANCODE/I OS/VS and PLANCODE/I DOS/VS).
- Storage and Information Retrieval System (STAIRS/VS, STAIRS/DOS/VS, and STAIRS/VS-TLS).
- Alpha Search Inquiry System.
- Life Inquiry/Data Entry.
- Interactive Training System (ITS).

PERFORMANCE and STORAGE CONSIDERATIONS

The design objective for ACF/VTAM record mode path lengths for a single system environment is approximately equal to that for a VTAM 2.0 environment for the same function. Response times in a multisystem environment will depend on the number of 3705s with ACF/NCP/VS traversed and other network load factors. The design objective for ACF/VTAM record mode for OS/VS and DOS/VS is to have the overall real storage requirement approximately equal to or less than that of VTAM 2.0. Specific user storage requirements will be dependent on the specific configuration.

The design objective is to reduce significantly the overall control block storage requirement per logical unit for OS/VS and DOS/VS. In addition, the objective is to reduce the fixed storage requirement for control blocks per logical unit for OS/VS from its current level (approximately 88 bytes), to a level approaching that currently available on DOS/VS systems (8 bytes).

The capability provided through the Multisystem Networking Facility to access any application from any supported terminal offers potential for storage savings by the elimination of duplicate application programs among multiple hosts.

Final information on path lengths and fixed storage requirements will be available when ACF/VTAM is available.

(available from Mechanicsburg)

Introduction to Advanced Communications Function (GC30-3033) ... ACF/VTAM General Information Manual (GC38-0254) ... ACF/VTAM Concepts and Planning (GC38-0282) ... Network Operation Support Program General Information Manual (GC38-0251)

Terminals Supported by ACF/VTAM and the Multisystem Networking Facility Feature: ACF/VTAM supports the following listed terminals. Programmable features which change the control of transmission characteristics and which are not shown are not supported. Attempts to use ACF/VTAM with unsupported features can cause unpredictable results.

The user should be aware that many terminal and control unit special features are transparent to programming and are therefore readily usable even though not specifically identified. Appropriate line adapters and hardware attachment features must be included in the system configuration.

Terminals that are functionally equivalent to those specifically supported by ACF/VTAM may also function satisfactorily with ACF/VTAM; the customer is responsible for establishing equivalency. IBM assumes no responsibility for the impact that any changes to the IBM-supplied programs or products may have on such terminals.

Notes: Support provided:

- The terminal type in parentheses designates the programming by ACF/VTAM, e.g., S/7 (2740-1) means the S/7 is supported as a 2740-1.
- S/370 mdls 115-168MP, whether DOS/VS, OS/VS1 or OS/VS2.

- All terminals not supported here, but supported on a single system can communicate across systems via a user-written application, using ACF/VTAM's application-to-application communication capability.
- Switched connection only.
- Nonswitched connection only.
- Buffer sizes of 960, 2560 and 3440 also supported.
- The 3776-3,-4 and 3777-3,-4 may be half duplex or duplex data communications. Duplex operation requires PTF 607 or higher for SSP for ACF/NCP/VS and also requires a PTF for ACF/VTAM. These PTFs will be incorporated in the following announced releases:
SSP for ACF/NCP/VS Release 2.
ACF/VTAM Release 2 on OS/VS1 Release 6.7.
ACF/VTAM Release 2 on OS/VS2 Release 3.8.
ACF/VTAM Release 2 on DOS/VSE.
- ACF/VTAM does not support the attachment of the 3644 or 8775 with Downstream Loadable Functions to the 4331 Loop Adapter Feature.
- 8775 base function only. ACF/VTAM does not support the 8775 with downstream Loadable Functions.

ACF/VTAM ENCRYPT/DECRYPT FEATURE

The ACF/VTAM Encrypt/Decrypt Feature is a feature for the ACF/VTAM program product. It extends the capabilities of ACF/VTAM to support cryptographic sessions in a single or multiple-domain network operating with OS/VS1 and/or OS/VS2 (MVS).

HIGHLIGHTS

- Operates with ACF/VTAM during sessions between a terminal and an application in a single or multiple system environment, and between applications in a multiple system environment.
- The ACF/VTAM Encrypt/Decrypt Feature allows the network operator or installation management to define a logical unit as requiring session level cryptography.
- Permits single-domain and multiple-domain cryptography.
- Permits encryption and decryption of messages during logical unit to logical unit sessions. All messages in a session or only selected messages in a session may be specified as requiring encryption.
- Applications can select encryption on a session basis.
- ACF/VTAM applications generally will not require alteration to run with the Encrypt/Decrypt Feature. Several new SNA sense codes dealing with unrecoverable errors associated with the Encrypt/Decrypt Feature have been introduced. Some application programs may have to be changed to properly handle these new sense codes.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Processor requirements are those specified for ACF/VTAM.

Applications can use the Encryption/Decryption function on sessions with the following terminals:

3276 Control Unit/Display Station mdls 11, 12, 13 and 14 with the Encrypt/Decrypt feature #3680 installed.

3776 Communication Terminal mdls 3 and 4 and 3777 Communication Terminal mdl 3 with the Encrypt/Decrypt Feature #3680 installed.

SOFTWARE REQUIREMENTS

- The ACF/VTAM Encrypt/Decrypt feature needs the Programmed Cryptographic Facility program product (5740-XY5).
- It can be used with OS/VS2 (MVS) Release 3.7 with the following prerequisite selectable units:

	Single Domain	Multiple Domain
ACF/VTAM Multisystem Networking Facility feature (SU34)		X
ACF/VTAM program product (SU35)	X	X
ACF/VTAM SCP (SU40)	X	X

PROGRAM PRODUCTS

(ACF/VTAM) R1 (cont'd)

- It can be used with OS/VS1 Release 6.0 with the following prerequisite selectable units:

	Single Domain	Multiple Domain
ACF/VTAM Program Product (SU7)	X	X
ACF/VTAM Multisystem Networking Facility feature (SU8)		X
ACF/VTAM SCP (SU15)	X	X

COMPATIBILITY

The ACF/VTAM Encrypt/Decrypt feature needs the Advanced Communications Function for VTAM (ACF/VTAM) (5735 RC2), feature #9001, for both single and multiple-domain operation. Multiple-domain operation also needs the ACF/VTAM Multisystem Networking Facility, feature #6009.

ACF/VTAM applications generally will not require alteration to run with the Encrypt/Decrypt feature. Several new SNA sense codes dealing with unrecoverable errors associated with the Encrypt/Decrypt feature have been introduced. Some application programs may have to be changed to properly handle these new sense codes.

**5735-RC2 - ACF/VTAM R2 (OS/VS)
5746-RC3 - ACF/VTAM R2 (DOS/VS)
ADVANCED COMMUNICATIONS FUNCTION
FOR VTAM RELEASE 2 (ACF/VTAM)**

PURPOSE

Advanced Communications Function for VTAM Version 1 Release 2 (ACF/VTAM R2) is for users of DOS/VSE, OS/VS1 and OS/VS2 (MVS) that can provide additional capabilities for problem determination, network operation and data communications in a network with a single host system or with multiple host systems. ACF/VTAM V1 R2 is designed to operate with ACF/NCP/VS Release 1 or with ACF/NCP/VS Release 2. Some of the additional capabilities provided by ACF/VTAM R2 are supported only in conjunction with ACF/NCP/VS R2. A summary of this support appears under the section entitled "Migration and Planning Considerations".

To support multiple S/370 networks, a user must install the ACF/VTAM R2 Multisystem Networking Facility feature.

HIGHLIGHTS

Problem Determination and Network Operation: Includes additional functions that can assist in optimizing management and control of a user's data communications installation.

- Enhanced SDLC data link test.
- Terminal connectivity test.
- Intensive mode recording of SDLC data link errors.
- Dynamic display of ACF/NCP/VS storage.
- Dynamic dump of ACF/NCP/VS storage.
- Dynamic reconfiguration of nonswitched SNA-SDLC devices under ACF/NCP/VS R2.
- Enhanced Network operator control for sessions termination.
- Support of the Network Communications Control Facility (NCCF) program product and its related Network Problem Determination Application (NPDA) program product.
- VARY command enhancements.
- Allow the LOGMODE, USS and INTERPRET tables to reside outside of the pageable link pack area (PLPA). (OS/VS2 MVS only).
- VTAM Internal Trace enhancements.
- DISPLAY command enhancements.

Additional Data Communication Capabilities: Include improved flexibility for sessions operations and enhanced device support.

- Negotiable session initialization parameters.
- Application-to-application parallel sessions.
- Support of selected Start/Stop devices through the Record Applications Program Interface (API) via the Network Terminal Option program product.
- Support of the channel-attached 3270 systems and 3790 systems in a multiple processor network, using the Multisystem Networking Facility feature.
- Usability enhancements associated with channel-attached device support.
- Usability enhancements to Unformatted Systems Services (USS).
- ACF/VTAM R1 and R2 supports the 3790 Communication System inbound message traffic pacing function. (Also supports 8100 and 3730 systems upon availability.)

VTAM 2.0 and ACF/VTAM V1 R1 Compatibility Considerations

- ACF/VTAM V1 R2 supports only record mode operations. It does not support basic mode operations including the SDLC/BSC path function of NCP/VS 5.0 and ACF/NCP/VS R1. Support for selected Start/Stop devices is provided on the Record API by the Network Terminal Option program product. Other Start/Stop and BSC devices (except BSC 3270) previously supported by basic mode operations are not directly supported by ACF/VTAM R2. ACF/NCP/VS R2 provides an interface through which these non-SNA devices can be supported via user-written NCP code.
- In a multisystem networking environment, message traffic from a terminal to a target host, or from a host to a terminal, or from one application program to another application program, can only be routed through intermediate ACF/NCP/VS systems, not through intermediate host processors.

Time Sharing Option (TSO) with ACF/VTAM V1 R2 (MVS only): Includes new support for the following products:

- Supports the 2741 Communications Terminal, the Western Union Teletypewriter Exchange Services (TWX mdl 33/35), and the

World Trade Teletypewriter Terminal (WTTY) through the Network Terminal Option program product.

SUMMARY and ADVANTAGES of ACF/VTAM V1 R2

Problem Determination and Network Operation Functions

Enhanced SDLC Data Link Test: Offers the capability to dedicate one station on an SDLC link to testing while allowing the remaining stations on that link to remain active. When a station comprises a cluster control unit and its attached devices, the control unit is dedicated to the test and its attached devices are deactivated.

Terminal Connectivity Test: Provides the capability of initiating an echo test from the terminal end of a session to determine that a terminal and its connection to ACF/VTAM R2 are functioning properly. The test does not interfere with other stations on the link or with other devices on the same control unit.

Intensive Mode Recording of SDLC Data Link Errors: A network operator can dynamically invoke and terminate recording of information about temporary errors that may be occurring on an SDLC data link. This capability supplements existing support that records permanent error information and permits a user to collect additional information on SDLC data link errors. This detailed information may preclude the need for more specific testing to re-create an error.

Dynamic Display of ACF/NCP/VS Storage: Allows a network operator to display any contiguous 256 bytes of ACF/NCP/VS storage without disrupting normal ACF/NCP/VS operation. This display capability, provided in hexadecimal representation on a network operator console, can be useful in dynamically evaluating network problem situations.

Dynamic Dump of ACF/NCP/VS Storage: A network operator can invoke a dump of ACF/NCP/VS R1 or R2 storage from a channel-attached or SDLC-attached 3705. Since ACF/NCP/VS continues to operate during the dump process, the dump will represent ACF/NCP/VS status over a period of time. The dump contents are recorded and printed via the facilities of the appropriate System Support Program (SSP) for the ACF/NCP/VS and can be useful in dynamically evaluating network problem situations.

Dynamic Reconfiguration of Nonswitched SNA-SDLC Devices under ACF/NCP/VS R2: Allows the network operator to selectively add or delete supported nonswitched SNA-SDLC devices, without disrupting other network functions. The capability supplements the ACF/NCP/VS generation process, and supports temporary configurations in a non-disruptive fashion until a permanent network control program generation can be done.

Increased Network Operational Flexibility and Control of Network Resources: Via the *VARY operator command, the operator can terminate a specific session between a network terminal and an ACF/VTAM R2 application program which may have other terminal sessions in operation at the same time. This permits a session to be cancelled without interfering with the remaining sessions or without termination of the application program. The application program sessions also may be connected to ACF/VTAM or ACF/TCAM application programs, as well as terminals, on the same host system or a different host system.

The VARY inactivate command has been enhanced to:

- Allow the specification of an individual application program. This will result in the automatic scheduling of termination processing for all network resources associated with the application program's existing sessions and will deactivate the application program.
- Allow the specification of an application program major node containing active application programs. This will result in the automatic scheduling of deactivations for all the active application programs defined in the major node.
- Allow the specification of an SDLC line which has active terminal cluster controllers, other than 3705s, attached to it. The terminal cluster controllers will be automatically scheduled for deactivation and upon completion, the SDLC line will be deactivated.

The VARY activate command has been enhanced to:

- Provide the Network Operator with a means of applying more consistent control over the scope of a resource's activation. Prior to ACF/VTAM R2 the activation of a resource's subordinate resources was based on their initial activation status. With ACF/VTAM R2 the network operator can specify either that the specific resource, the resource and all its subordinate resources regardless of initial activation status or the resource and all its subordinate resources with initial activation status are to be activated.
- Allow the specification of an individual application program within an application program major node. This facility enables the network operator to activate an individual application program that has been previously deactivated.

ACF/VTAM R2 (cont'd)

The LOGMODE, INTERPRET and DSS tables may now reside outside of the pageable link pack area (PLPA) (OS/VS2 MVS only): Moving these tables to SYS1.VTAMLIB could reduce the user's PLPA requirements and allows the user to modify the tables without requiring a re-IPL of the operating system.

VTAM internal trace enhancements: The following serviceability facilities have been added to the VTAM internal trace capability:

- The ability to terminate or initiate the VTAM Internal Trace facility at VTAM initialization time.
- The ability to have the VTAM Internal Trace records recorded on an external file in a DOS/VSE environment. This capability continues to be available in OS/VS1 and OS/VS2 MVS environments.
- The data formats and contents of certain VTAM Internal Trace records have been enhanced. For example, the user exit records now contain the resource names of the session partners.

Display Command Enhancements: With ACF/VTAM R2, when a network resource is displayed an indication of its status, as known by ACF/VTAM, is included in the display output. This information provides both detailed status to the network operator and serves also as an aid for problem determination. When appropriate, the resource's status will have an identifier appended to it indicating that it is either a virtual resource (i.e., a Network Terminal Option resource) or, has been reconfigured by the Dynamic Reconfiguration facility or, in the case of network backup, has been acquired from another host system's domain.

For increased network operator awareness, enhancements have also been made to the application program and cross domain resource displays. With ACF/VTAM R2, additional session and resource status information is included in the display output to aid the network operator in resource management.

Support of the Network Communications Control Facility (NCCF) Program Product: ACF/VTAM R2 provides an interface to support the problem determination and network operation facilities offered by this program product.

Additional Data Communication Capabilities: ACF/VTAM R2 can support additional functions and device options that significantly increase a users capability to transfer and access data in a single or multiple system environment.

Negotiable Session Initialization Parameters: Permits increased application program control of sessions between user-written application programs that reside within a single host system or across different host systems. During session initialization, two application programs (via the ACF/VTAM R2 application program macro interface) can dynamically exchange certain session parameters to establish and/or modify transmission control and integrity of session data. With this capability, it may be possible for a user to simplify the predefined installation of intercommunicating application programs.

Application-to-application parallel sessions: Adds the flexibility for multiple sessions to operate concurrently between two user-written application programs that reside within a single host system or across different host systems.

Network Terminal Option Program Product Support: Provides support to users that want to move to a SNA data communications environment while continuing to access the following non-SNA terminal devices:

- 2740 Communications Terminal mdl 1 (nonswitched and switched).
- 2741 Communications Terminal (nonswitched and switched).
- Western Union Teletypewriter Exchange Services (TWX mdl 33/35).

Access to these devices is now provided via the ACF/VTAM R2 record mode operations. ACF/VTAM R2 in conjunction with ACF/NCP/VS R2 permits these devices to participate in a multisystem as well as a single system environment.

TSO/VTAM supports the 2741, TWX mdl 33/35, and WTTY terminals via the Network Terminal Option program product concurrent with the availability of ACF/VTAM R2 for OS/VS2 (MVS).

VSPC R2 supports the IBM 2741 and TWX-33/35 protocols via the Network Terminal Option program product on OS/VS1 and OS/VS2 on the latest release of VSPC available.

Channel-attached 3270 System and 3790 System Networking: Permits all the channel-attached 3270 and 3790 systems supported by ACF/VTAM R2 to participate in multiple system networks.

Channel-attached device support enhancements have been made for both single and multiple host environments: Assignment of network addresses for channel-attached devices now comes from the host system's subarea. This removes the requirement that channel-attached devices be represented by their own unique subarea number. Channel-attached non-SNA 3270 devices may now make use of the USS facilities available to SNA devices. This will allow for common syntax of USS commands for SNA and non-SNA channel-attached devices.

Unformatted System Services (USS) Enhancements: It is now possible to supply to ACF/VTAM R2 a user defined USS message in excess of two hundred and fifty five (255) characters. This facility could be useful to an installation wishing to display a full screen (e.g., a company logo) on a 3270 display system prior to USS logon.

The syntax for some of the new ACF/VTAM R2 commands is provided within USS tables. This provides the capability to alter certain parameters and defaults by modifying the supplied USS tables. The new commands are: VARY terminate, the enhanced SDLC data link test, the terminal connectivity test, the intensive mode recording of SDLC data link errors and the dynamic display of ACF/NCP/VS storage. This allows an installation to customize these parameters and defaults to reflect the installation's requirements.

3790 Inbound Pacing Support: This facility is supported as a user-selectable session establishment function under ACF/VTAM R1 and R2. Pacing of inbound message traffic for a user application program can help avoid buffer overrun. (Also supports 8100 and 3730.)

CUSTOMER RESPONSIBILITIES

To install and use ACF/VTAM R2, the customer must:

- Design the single system network.
- Order and install all required communications equipment.
- Have prerequisite VTAM SCP for ACF/VTAM R2 installed.
- Install ACF/VTAM R2, or ACF/VTAM Version 2.
- Define the network to ACF/VTAM R2, or ACF/VTAM Version 2.
- Install ACF/NCP/VS R1 and/or ACF/NCP/VS R2. *
- Define the network to ACF/NCP/VS R1 and/or ACF/NCP/VS R2. *

To install and use the ACF/VTAM V1 R2 Multisystem Networking Facility feature, the customer must:

- Design the multisystem network.
- Order and install any additional communications equipment, for example, intersystem links between interconnected 3705s.
- Have prerequisite VTAM SCP for ACF/VTAM V1 R2 installed.
- Install ACF/VTAM R2 or ACF/VTAM Version 2.
- Install ACF/NCP/VS R1 and/or ACF/NCP/VS R2.
- Install the ACF/VTAM R2 Multisystem Networking Facility feature or ACF/VTAM Version 2.
- Define the multisystem network to ACF/VTAM R2 or ACF/VTAM Version 2 and to ACF/NCP/VS R1 and/or ACF/NCP/VS R2 in each host system.

* Unless all terminals defined to ACF/VTAM R2 are channel-attached to the host processor.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

ACF/VTAM V1 R2 runs in a virtual storage environment on one of the following CPUs with the relocation feature:

Under DOS/VSE: S/370 mdls 115, 125, 135, 135-3, 138 145, 145-3, 148, 155II, 158, and 3031.

Under OS/VS1: S/370 mdls 135, 135-3, 138, 145, 145-3, 148, 155II, 158, 158MP, 165II, 168, 168MP, 3031, 3032 and 3033.

SOFTWARE REQUIREMENTS

ACF/VTAM V1 R2 needs one of the following operating systems: DOS/VSE, OS/VS1, or OS/VS2 (MVS) and all subsequent releases and modifications unless otherwise stated. The licensed program ACF/VTAM R2 needs the concurrent installation of prerequisite VTAM SCP for ACF/VTAM R2 system control programming modules. These system control programming modules should be installed only by ACF/VTAM R2 users.

ACF/VTAM R2 requires a current level of the Virtual Storage Access Method (VSAM) if delayed configuration restart will be used.

The ACF/VTAM R2 Multisystem Networking Facility requires the installation of prerequisite ACF/VTAM R2 system control programming modules and the licensed program ACF/VTAM R2. The ACF/VTAM R2 Multisystem Networking Facility also requires the use of a 3705-I or 3705-II Communications Controller with the ACF/NCP/VS program product for cross-domain sessions.

In a mixed ACF/VTAM R2 - ACF/TCAM multisystem environment, ACF/VTAM R2 cannot get from ACF/TCAM the physical device address (used in the copy function) of an SDLC 3270 device controlled by ACF/VTAM. ACF/VTAM R2, therefore, cannot provide that physical device address to application programs.

ACF/VTAM R2 (cont'd)

The Time Sharing Option (TSO) of ACF/VTAM R2 only operates under OS/VS2 MVS.

COMPATIBILITY

ACF/VTAM R2 retains compatibility with ACF/VTAM Version 2 or ACF/VTAM R1, except as previously stated under "Migration and Planning Considerations". ACF/VTAM R2 offers compatibility with ACF/NCP/VS R1 and R2.

Where related IBM programs (for example, CICS/VS, IMS/VS, POWER/VS, JES1/RES, JES2/RJE, JES2/NJE, JES/RJP, TSO, IIS, VSPC, BTP, SSS and NOSP) operate with ACF/VTAM R1 Record Mode, compatibility is retained for the level(s) of those programs that are current at the availability of ACF/VTAM R2 on the appropriate operating system release. Recompilation of the related IBM programs is not required.

Compatibility of the ACF/VTAM R1 or ACF/VTAM Version 2 Record Mode Application Program Interface (Record API) is retained for existing user programs that utilize ACF/VTAM R2, except that the SIMLOGON CONALL function has been changed to operate compatibly with the OPNDST CONALL function. However, such user programs may require changes to take advantage of the single and multisystem capabilities offered by ACF/VTAM R2. TSO/VTAM data editing installation exits may require changes due to new exit interface parameters.

The ACF/VTAM R2 Multisystem Networking Facility in one domain of a multiple domain network will operate with another ACF/VTAM Multisystem Networking Facility or ACF/VTAM Version 2 or an ACF/TCAM Multisystem Networking Facility in another domain.

The capabilities provided by ACF/VTAM R2 operating in one domain are limited to the capabilities provided by ACF/VTAM R1, ACF/TCAM R1, and ACF/TCAM V2 R1 when operating in another domain(s). These capabilities are also limited to the capabilities of ACF/NCP/VS R1 when used in the same domain or a different domain.

MIGRATION and PLANNING CONSIDERATIONS

ACF/VTAM R2 with ACF/NCP/VS Considerations: When used only for local user applications (that is, data communication between two application programs in the same host system or between a channel-attached terminal and an application program on the same host system), ACF/VTAM R2 supports the following items without the need for ACF/NCP/VS or the ACF/VTAM R2 Multisystem Networking Facility feature:

- Enhanced Network Operator control for session termination.
- The NCCF program product.
- Application-to-application parallel sessions.
- Negotiable session initialization parameters.
- 3790 inbound pacing support.
- Terminal connectivity test.
- VARY command enhancements.
- Allow the LOGMODE, USS and INTERPRET tables to reside outside of the pageable link pack area (PLPA). (OS/VS2 MVS only)
- VTAM Internal Trace Commands.
- DISPLAY command enhancements.
- Usability enhancements associated with channel-attached device support.
- Usability enhancements to Unformatted Systems Services (USS).

When used for remote network user applications, ACF/VTAM R2 supports the following items in conjunction with ACF/NCP/VS R1 or with ACF/NCP/VS R2:

- Enhanced Network Operator control for session termination.
- Application-to-application parallel sessions. *
- Dynamic display of ACF/NCP/VS storage.
- Terminal connectivity test.
- Dynamic dump of ACF/NCP/VS storage.
- Channel-attached 3270 system and 3790 system networking. *
- VARY command enhancements.
- Allow the LOGMODE, USS and INTERPRET tables to reside outside of the pageable link pack area (PLPA). (OS/VS2 MVS only)
- VTAM Internal Trace Enhancements.
- DISPLAY command enhancements.
- Usability enhancements associated with channel-attached device support.
- Usability enhancements to Unformatted Systems Services (USS).

- The NCCF program product.
- Negotiable session initialization parameters (Application-to-application). *
- 3790 inbound pacing support.
- * Requires ACF/VTAM R2 Multisystem Networking Facility feature unless used for local user applications.

When used for remote network user applications, ACF/VTAM R2 supports the following items only in conjunction with ACF/NCP/VS R2:

- Enhanced SDLC data link test.
- Intensive mode recording of SDLC data link errors.
- Dynamic reconfiguration of nonswitched SNA-SDLC devices.
- The Network Terminal Option program product.

Communications Controller Support: ACF/VTAM R2 operates with the following communications controllers as supported by ACF/NCP/VS R1 and R2:

- 3705-I Communications Controller.
- 3705-II Communications Controller.

Multisystem Considerations: In a multiple host system environment, the ACF/VTAM V1 R2 enhancements are supported for each respective ACF/VTAM V1 R2 or ACF/VTAM Version 2 host system just as they are within a single host system environment.

ACF/VTAM R2 supports the following items between ACF/VTAM R2 host systems or between ACF/VTAM R2 or ACF/VTAM Version 2 or ACF/TCAM V2 host systems:

- Enhanced network operator control for session termination. *
- Negotiable session initialization parameters.
- Application-to-application parallel sessions. *
- The Network Terminal Option program product (except between ACF/VTAM R2 and ACF/TCAM V2).
- Channel-attached 3270 system and 3790 system networking.
- The NCCF program product. **
- 3790 inbound pacing support. **

ACF/VTAM R2 also supports the following items from an ACF/VTAM R2 host system when communicating with an ACF/VTAM R1 or ACF/TCAM V1 R1 host system:

- Enhanced Network operator control for session termination. *
- Channel-attached 3270 system and 3790 system networking.

In the above configurations, the appropriate access method features for multisystem networking must be installed.

* Not applicable to ACF/TCAM.

** Also supported between ACF/VTAM R2 and either ACF/VTAM R1 or ACF/TCAM V1 R1 host systems.

Migrating from VTAM 2.0 or ACF/VTAM V1 R1 to ACF/VTAM V1 R2: The following migration paths are available for the given levels of VTAM and ACF/VTAM:

VTAM 2.0 will operate with the following levels of NCP/VS and ACF/NCP/VS:

- NCP/VS 5.0.
- ACF/NCP/VS R1 (with appropriate VTAM 2.0 PTFs).
- ACF/NCP/VS R2 (OS/VS1 and OS/VS2 MVS only with appropriate VTAM 2.0 PTFs).

ACF/VTAM R1 and ACF/VTAM R2 will operate with the following levels of NCP/VS and ACF/NCP/VS:

- NCP/VS 5.0 (ACF/VTAM R1 only).
- ACF/NCP/VS R1.
- ACF/NCP/VS R2 (except ACF/VTAM R1 under OS/VS2 SVS and with appropriate ACF/VTAM R1 PTFs).

Functions supported by VTAM 2.0 or ACF/VTAM R1 with the appropriate level of NCP/VS or ACF/NCP/VS are also supported by ACF/VTAM R2 with the appropriate level of ACF/NCP/VS with the following exceptions:

- OS/VS2 (SVS) is not supported by ACF/VTAM R2 and consideration must be given to migrating a user's operating system support before or at the same time as migrating to ACF/VTAM R2.
- Alternatives (such as the Network Terminal Option program product) must be considered for users that have applications written for the VTAM 2.0 or ACF/VTAM R1 basic mode operations. ACF/VTAM R2 supports only record mode operations.
- In a multisystem networking environment, message traffic from a terminal to a target host, or from a host to a terminal or from one

PROGRAM PRODUCTS

ACF/VTAM R2 (cont'd)

application program to another application program can only be routed through intermediate ACF/NCP/VS systems, not through intermediate host processors. Alternatives (such as a 3705-to-3705 SDLC data link) should be considered for users who route message traffic through intermediate host processors under ACF/VTAM R1.

Other Considerations: ACF/VTAM V1 R2 requires the following features in support of the Compare and Swap instruction: Conditional Swapping (#1051) on the 3135; Advanced Control Program Support (#1001) or Conditional Swapping (#1051) on the 3145.

ACF/VTAM R2 will operate in a VM/370 virtual machine which supports the required release of the operating system (DOS/VSE, OS/VS1, OS/VS2 MVS).

ACF/VTAM R2 operation in a VM/370 environment is intended for use in program development and testing and other uses where performance is not critical. Operation of ACF/VTAM R2 under VM/370 Release 5, even with the virtual machine assist feature, may add significant additional processor overhead. If your customer has specific throughput or terminal response requirements, you should plan to benchmark under VM/370 to ensure that any proposed configuration will meet the customer's performance needs.

Each DOS/VSE, OS/VS1 or OS/VS2 (MVS) virtual machine in which ACF/VTAM R2 resides requires a dedicated sub-channel address to a 3705-I or 3705-II with ACF/NCP/VS R1 or ACF/NCP/VS R2.

In a mixed ACF/VTAM - ACF/TCAM multisystem environment, the ability of ACF/VTAM R2 to access device characteristics of terminals controlled by ACF/TCAM is limited to those indicators defined and maintained by ACF/TCAM. In particular, the ability to determine the following 3271-11, -12 and 3275-11, -12 device characteristic is not supported: The physical device address (used in the copy function).

Machine and storage requirements will be provided in an update to the *Advanced Communications Function for VTAM (ACF/VTAM) General Information: Introduction*, prior to availability of ACF/VTAM R2 on each supported operating system.

IBM will accept APARs describing any situation where the installation of ACF/VTAM R2 causes an exposure to the system integrity of OS/VS2 MVS.

CONVERSION

Initially, host computers that are to participate in a multiple-domain network can be installed separately as single-domain networks, and the networks can be interconnected later with links between local communications controllers. This permits an existing network to continue in operation while the multiple-domain network is being developed. VTAM and ACF/VTAM application programs that were originally designed to operate in a single-domain network will continue to operate within an ACF/VTAM R2 domain of a multiple-domain network, but may need modification if they are to have sessions with logical units in other domains.

ACF/VTAM R2 will support ACF/NCP/VS R1 in a 3705-I or 3705-II Communications Controller. This permits the concurrent or subsequent installation of ACF/NCP/VS R2 in a 3705-I or 3705-II Communications Controller.

PERFORMANCE and STORAGE CONSIDERATIONS

The design objective for ACF/VTAM R2 record mode path lengths for a single system environment is approximately equal to an ACF/VTAM R1 environment for the equivalent function. Response time in a multisystem environment will depend on the number of 3705s with ACF/NCP/VS traversed and other network load factors. The design objective for ACF/VTAM R2 record mode for OS/VS and DOS/VSE is to have the overall real storage requirement approximately equal to or less than that of ACF/VTAM R1 record mode. Specific user storage requirements will be dependent on the specific configuration.

In DOS/VSE, OS/VS1 and OS/VS2 (MVS), the design objective, compared to ACF/VTAM R1, is to reduce the:

- Overall ACF/VTAM R2 control block storage requirement due to elimination of the fixed storage requirement (currently 8 bytes) for control blocks per logical unit.
- Overall ACF/VTAM R2 storage requirement due to elimination of Basic mode support.

In OS/VS2 (MVS), the design objective, compared to ACF/VTAM R1, is to achieve reductions in ACF/VTAM R2 usage of OS/VS2 (MVS) common storage as follows:

- Reduce use of the Pageable Link Pack Area (PLPA) due to elimination of Basic mode support.
- Significantly reduce use of the Common Service Area (CSA) due to elimination of certain control blocks and/or movement of other control blocks from CSA to ACF/VTAM R2 private storage. (The movement from CSA to private storage may cause re-definition of the region size for ACF/VTAM R2). Due to Basic mode removal

and/or re-design of the ACF/VTAM R2 OPEN/CLOSE and VARY components, this design objective includes:

- 1) Movement of the symbol and resource definition tables to ACF/VTAM R2 private storage areas.
- 2) Elimination of the control blocks that represented active and inactive connections between application programs and between application programs and network devices.
- 3) Reduced usage of the large pageable pool during network activation.
- 4) Elimination of terminal related fixed storage control blocks that were used to route Basic mode input data.

- * 3791/3730 [Note 6]
- 3791/3760
- 4331 Display/Printer Adapter (3272-2)
- 4331 Loop Adapter (3274-1A) [Note 7]

† All of the above terminals have both single and multisystem support. The terminal type in parentheses designates the programming support provided by ACF/VTAM R2, e.g., S/32 (3770) means the S/32 is supported as a 3770.

* Also supported by TSO/VTAM.

Note 1: The Start/Stop Terminals shown are supported only via the Network Terminal Option program product.

Note 2: Nonswitched connection only.

Note 3: Switched connection only.

Note 4: Buffer sizes of 960, 1920, 2560, and 3440 are supported.

Note 5: With the SDLC/BSC switch feature set to SDLC.

Note 6: TSO support applies only with 3270 Data Stream Compatibility.

Note 7: ACF/VTAM does not support the attachment of the 3644 or 8775 with Downstream Loadable Functions to the 4331 Loop Adapter Feature.

Note 8: 8775 base function only. ACF/VTAM does not support the 8775 with Downstream Loadable Functions.

FOR VTAM RELEASE 3 (ACF/VTAM)**

PURPOSE

Advanced Communications Function for VTAM Version 1 Release 3 (ACF/VTAM R3) is for users of DOS/VSE, OS/VS1, and OS/VS2 (MVS) that offers expanded network configurability, network management capability and enhanced network recoverability. Multiple system networks require installation of the ACF/VTAM V1 R3 Multisystem Networking Facility (MSNF) feature.

HIGHLIGHTS OF ACF/VTAM R3

- **Parallel Links:** Multiple active SDLC data links between adjacent 3705s.
- **Transmission Groups:** Logical groupings of transmission links between adjacent network nodes.
- **Multiple Routes:** Multiple routes for SNA and non-SNA message transmission between nodes in a network.
- **Multiple Priority Levels:** Three levels of transmission priority selectable by session.
- **Extended NCP Interconnection:** New capabilities for interconnecting 3705s in single and multiple system networks.
- **Extended NCP Ownership.**
- **Flow Control:** Enhanced management of network traffic demands.
- **Reduced Cross-Domain Resource Definition Requirements. ***
- **Session Outage Notification:** Enhanced awareness of session outages.
- **Enhanced Recovery Capabilities. ***
- **Route Verification and Error Notification Facilities.**
- **Transmission Group Option for Line Trace.**
- **Support of Release 2 of the Network Terminal Option program product.**
- **Network Logical Data Manager (NLDLM):** For OS/VS2 MVS, support of the NLDLM program product.
- **Supports the CCITT X.21 switched interface when the 3705-II is attached to an X.21 Interface via the 3705-II**
- **Additional Problem Determination and Serviceability Enhancements.**
- **Additional Device Support Extensions and Network Operation Enhancements.**
- **Additional Reliability and Availability Enhancements for OS/VS2 (MVS).**
- * See the "Summary and Advantages" section for those capabilities requiring the Multisystem Network Facility (MSNF) feature.

ACF/VTAM R3 is designed to operate with ACF/NCP/VS Release 2, 2.1 or 3. Some of the capabilities provided by ACF/VTAM R3 are supported only in conjunction with ACF/NCP/VS R3. A summary of this support appears later in these pages.

SUMMARY AND ADVANTAGES OF ACF/VTAM R3

Parallel Links: Multiple active SDLC links between adjacent 3705s ... Parallel Links allow data traffic to flow simultaneously over two or more SDLC links between adjacent 3705s. All such links can be operational and in use at the same time, and each can be activated or deactivated independently of the others. This capability can provide increased message flow and improve the availability and reliability of transmissions between 3705s.

Transmission Groups: Logical groupings of transmission links between adjacent network nodes ... A user may define up to eight Transmission Groups, each with one or more SDLC links between adjacent 3705s. A Transmission Group permits multiple SDLC links to be defined as a single logical link. A single channel between a host and its channel-attached 3705 is also defined as a Transmission Group. If a link or links in a Transmission Group fails, session traffic will automatically be placed on remaining active links without loss of data. This enhances the reliability and availability of service between 3705s. Multiple Transmission Groups and appropriate route selection permit a user to specify message traffic for different applications to flow through a network via pre-assigned Transmission Groups. For example, interactive processing may be assigned one group and batch processing may be assigned a different group, each with its own physical link support.

Multiple Routes: Multiple routes for SNA and non-SNA message transmission between nodes in a network ... A user may define up to eight routes for message transmission between two host systems or between a host system and a 3705. When a session is initiated between two application programs or between a terminal and an

application program, one of the routes is automatically selected to transmit the session traffic. The user may limit the selection to a particular route or to one of an ordered sequence of routes. Thus, it is possible to distribute the traffic for different sessions to different routes, dividing the load among several routes. Parallel sessions between two applications can take advantage of multiple routes so that failure of one route does not disrupt all sessions.

The ordered sequence of routes, determined by the installation, defines the set of alternate routes available for session traffic. In the event a route becomes inoperative during a session, the application program or terminal may request that the session be re-initiated. This causes automatic selection of one of the alternate routes. The user can then resynchronize the session data traffic and continue data communications and application processing via network routes that remain in operation.

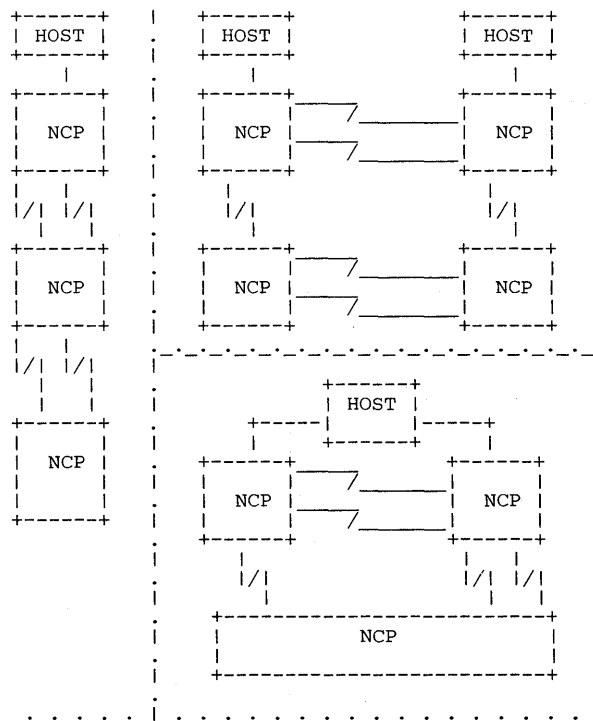

Multiple Priority Levels: Three levels of transmission priority selectable by session ... A user can specify one of three message traffic priorities for a session between two application programs or between a terminal and an application program. For example, this permits message traffic for a time dependent session to be transmitted through a network ahead of other message traffic. That is, interactive processing may be given top priority by a user while other network traffic, such as batch processing, is assigned to a lower priority by the user.

Extended NCP Interconnection: New capabilities for interconnecting 3705s in single and multiple system networks ... In ACF/VTAM V1 R2, a remote NCP could only be link-attached via a single link to a single channel-attached 3705. In ACF/VTAM V1 R3, a 3705 may now be link-attached via Transmission Groups to one or more channel-attached and/or link-attached 3705s.

These capabilities can significantly expand the installation's configurability options. Also, they can improve the overall efficiency of the network and improve the ability of a host processor to take over a 3705 whose current owner (or a link to that owner) has failed or has been deactivated.

See Figure 1 for some examples of interconnection flexibility.

FIGURE 1

ACF/VTAM R3 (cont'd)

Extended NCP Ownership: As many as eight host systems can share the ownership of an NCP in a 3705 that is channel-attached * and/or link-attached to another 3705(s). This extends the capability previously provided for sharing channel-attached 3705s. If one of the host systems fails or gives up control of the 3705, each of the remaining host systems is notified. This notification serves as a signal for using the enhanced take-over capability described below. All host systems that share ownership of an NCP in a 3705 can also share ownership of SDLC links that connect the 3705 to other 3705s. A shared SDLC link is not deactivated until all owning host systems give up control of the link. Each of the host systems is notified if a link that it owns fails, or if the adjacent 3705 becomes inoperative.

* The channel and SDLC link attachments cannot exceed the number of channels and SDLC links supported by the 3705-1 or the 3705-11 communications controllers.

Flow Control: Enhanced management of network traffic demands ... Via SNA protocols, the flow of message traffic is dynamically regulated between a host system and a 3705 and between two host systems. Continuous feedback is exchanged between network resources in order to regulate network traffic and reduce the possibility of network congestion. When necessary, the feedback triggers local flow control mechanisms in ACF/VTAM R3. Applications and local terminals may be temporarily prevented from introducing more data into a congested network.

Reduced Cross-domain Resource Definition Requirements ... Requires the MSNF feature. This enhancement is available for both terminal or application definitions and is requested when the user defines the host-to-host control session. A terminal in one domain can request a session with an application program in a different domain without prior definition of the terminal within the application program's host. Also, an application in one domain can request a session with an application program or terminal in a different domain without prior definition of the requesting application within the cross-domain application program's or cross-domain terminal's host.

This enhancement is designed to reduce the need for user-specified cross-domain resource definitions in a multisystem environment and also to reduce the storage required to support such definitions. It permits the addition of an application program or terminal to one host system without the need to redefine other host systems which the resource may want to enter an SNA session.

Session Outage Notification Enhanced awareness of session outages ... If the route supporting a session becomes inoperative, then, via SNA protocols, the session ends are made aware of the outage. Session re-initiation may be requested as described under "Multiple Routes".

Enhanced Recovery Capabilities

- **Enhanced restart of host-to-terminal control sessions ...** In recovering from a host failure or a route failure on the host-to-terminal control session, a host system can recover its control session for a 3770 MLU, 3271-11**, 3271-12**, 3275-11**, 3275-12**, 3274-1C/SNA*, 3684, 5285, 5288, S/32, S/34 or S/38 without disruption of existing sessions between the device and application programs. This permits user applications that are not affected by such a failure to continue processing during and after recovery of the control session. For other terminals, restart of the control session results in Session Outage Notification.

* This product must be at the appropriate EC level to provide this function.

** Support of these devices is provided by ACF/NCP/VS R3.

- **Enhanced takeover of a 3705 ...** In the event a host system fails or otherwise gives up control of a 3705, any host system that is sharing ownership of the same 3705 will have its network operator notified about the lost host. Any of the notified host systems can take over control of the devices mentioned above without disrupting their existing cross-domain sessions with application programs. It is no longer necessary to deactivate corresponding cross-domain resource definitions before acquiring resources attached to the 3705 that were controlled by the lost host system.

- **Enhanced multiple host system restart ...** Requires the MSNF feature. In recovering from a failure situation, two host systems can restart their control session without disruption of existing cross-domain sessions between two application programs or between a terminal and an application program. This permits user applications that are not affected by such a failure event to continue operations during and after recovery of the host systems' cross-domain control session.

Route verification and error notification facilities ... Via the DISPLAY Route command, a network operator can determine if a message route originating in his host is operative or inoperative. This permits a network operator to verify the availability of network routes and to take corrective action for routes that may have become inoperative. It also permits a network operator to verify that a route has been returned to service following a failure or deactivation. During the verification, appropriate resource owners are notified when an inactive or failed resource is encountered on a route.

In addition, if during network operation a route fails, an awareness message is issued at the host system end point(s), identifying the inoperative route to the network operator. This permits a network operator to take appropriate action to minimize the affects of an unusable message route on network applications.

Problem Determination and Serviceability Enhancements:

Trace Support Extensions:

- Prior to ACF/VTAM Release 3, the ACF/VTAM operator had to issue a separate command for each node for which a trace was to be initiated or terminated. With ACF/VTAM Release 3, the ACF/VTAM operator can initiate and terminate buffer and I/O traces for a node and all its subnodes with a single ACF/VTAM operator command. This capability could reduce the ACF/VTAM operator actions required to gather problem determination information.

- Provides VTAM Internal Trace (VIT) enhancements. The Path Information Unit (PIU) VIT entry has been enhanced to include traces of System Services Control Point (SSCP) SNA sessions. The sessions being traced are those between the SSCP and application programs, the ACF/VTAM operator services component, and the ACF/VTAM host physical unit services component. This additional problem determination information should be useful in diagnosing problems where the SSCP is believed to be in error.

All VIT entries containing the same problem determination data have been reformatted to have this data at a consistent location in each of the different entry types. These reformatted entries should improve the usability and readability of the entries and thus reduce the time necessary to analyze them.

The VIT SNAP entry type has been enhanced to allow for 64 bytes of problem determination data to be contained in the entry, thus allowing additional information to be collected. The current length of 32 bytes continues to be supported.

A new VIT option, CIO, has been added which provides trace entries of ACF/VTAM channel I/O operations. The entries contain information about start I/O conditions, channel interrupts and error recovery procedure events. These additional entries should be useful in isolating a problem to either an ACF/VTAM error or an error with a host processor's channel equipment.

- Provides the capability to initiate and terminate a Generalized Trace Facility (GTF) trace for individual ACF/VTAM user sessions (OS/VS2 (MVS) only).

- Transmission Group Trace extends the existing SDLC line trace capabilities to Transmission Groups. Via the ACF/VTAM operator MODIFY command, the SNA headers of message traffic over a Transmission Group between two IBM 3705 communications controllers can be traced as if it were a single SDLC line.

Message Support Extensions:

To aid in diagnosing network problems, ACF/VTAM Release 3 provides:

- The capability for the ACF/VTAM operator to specify a time interval after which notification will be given of ACF/VTAM operations that have been pending completion for longer than the specified time interval. The notification will identify the particular operation by its name and by the origin and destination network names or addresses. The internal ACF/VTAM event identifier will also be displayed. The ACF/VTAM operator also has the capability to modify the time interval.

- The capability to have the last five characters of the issuing ACF/VTAM module name appear in an ACF/VTAM operator message. If this option is specified, the module name information will be inserted between the message identification number and the first character of text of each ACF/VTAM operator message. Requesting this additional information may cause the ending text of some ACF/VTAM messages to be truncated and not displayed.

ACF/VTAM R3 (cont'd)

- Operator notification when, in a multisystem networking environment, a request for a cross-domain session fails because of one of the following:
 - The destination cross-domain resource manager (CDRM) is not defined.
 - A necessary CDRM-CDRM session is not active.
 - A required cross-domain resource (CDRSC) is not defined.
 - A required cross-domain resource is not active.

For each of these, the ACF/VTAM operator in the domain that detected the error receives a message containing the name of the resource (CDRM or CDRSC) that prevented successful session initiation and the names of the primary and secondary LUs for which the session setup failed.

- Notification to the system operator when an insufficient storage condition exists. The message will contain the buffer pool experiencing the problem or, as appropriate to the operating system, the operating system subpool from which the storage was requested.

TSO/VTAM Support Extension:

- TSO/VTAM is enhanced to allow installations to specify whether data is to be treated as 'confidential text' or not. Data not to be treated as confidential text remains unaltered in the ACF/VTAM buffers and may aid in problem determination.

Device Support Extensions and Network Operation Enhancements:

In OS/VS1, ACF/VTAM Release 3 extends device support for the Downstream Load Utility program product for IBM 3644 Automatic Data Units (ADU) and IBM 8775 Display Terminals.

- For OS/VS1, ACF/VTAM Release 3 provides support of the Downstream Load Utility program product to permit the operation of IBM 8775s with Advanced Functions when attached via an SDLC line to an IBM 3705 Communications Controller operating with ACF/NCP/VS. This support is available now.

ACF/VTAM has been enhanced to support SNA Notify:

- ACF/VTAM application programs that use the queuing facility of the ACF/VTAM SIMLOGON macro instruction may take advantage of SNA Notify to acquire terminals as they are powered on without operator intervention at the application program. This improved operational efficiency is supported by 3270 display stations and printers attached to the 3274 mdl 1A and mdls 1C and 51C when communicating with hosts via SDLC links. The 3274 support is contained in Configuration Support B (#9111) and Configuration Support C (#9112).

Device support extensions to permit dynamic exit and re-entry to the network:

- When devices are engaged primarily in tasks unrelated to communications, network communication is a small percentage of the device's use. ACF/VTAM Release 3 permits this type of device (e.g., the IBM System/34), operating on nonswitched SDLC lines, to disconnect and reconnect to the network without requiring ACF/VTAM operator intervention.

Ability to display a TSO/VTAM userid (OS/VS2 (MVS) only):

- Prior to ACF/VTAM Release 3, the ACF/VTAM operator had to enter multiple Display commands to associate a TSO user with a specific terminal. ACF/VTAM Release 3 provides the ACF/VTAM operator with a new Display command option which provides for the specification of a TSO user identification. The output of the display will contain:
 - An indication that this is a TSO userid display.
 - The application name (for example, TSO0005).
 - The terminal name (for example, SNA3270B) associated with the specified userid.
 - The status as known by ACF/VTAM of both the application and the terminal.
 - An indication as to whether the TSO/VTAM GTF trace is in effect for this TSO userid.

Ability to specify an Unformatted System Services (USS) table containing installation-customized ACF/VTAM commands:

- ACF/VTAM Release 2 and ACF/VTAM Release 3 contain newly implemented ACF/VTAM operator commands which can be customized via USS. Prior to ACF/VTAM Release 3, these customized commands had to be placed in the ACF/VTAM-defined default USS table. To improve the usability of this facility and allow migration of existing customized commands, ACF/VTAM Release 3 permits specification of an installation-defined USS table via the START command. ACF/VTAM searches this installation-defined table prior to searching the IBM-defined default table for ACF/VTAM operator commands. Thus, if during testing of

customized commands an error is detected, an installation need only restart ACF/VTAM and eliminate the specification of the USS table in error.

In OS/VS systems, the amount of private area storage ACF/VTAM may allocate from an application program can be limited:

- Prior to ACF/VTAM Release 3, if an application program had not requested to receive data from ACF/VTAM but data arrived for the application program, ACF/VTAM would allocate as much storage as needed from the application's private area to queue the data. This ACF/VTAM Release 3 facility allows an installation, when defining an application program, to limit the amount of private area storage ACF/VTAM may request to queue this data.

Reliability and Availability Enhancements for OS/VS2 (MVS)

Capability to have an application program span multiple address spaces:

- ACF/VTAM has been enhanced to permit application program interface (API) requests from a single application program to originate from different address spaces and to reference a single application program access method control block (ACB). This multiple address space facility can provide application programs with enhanced capabilities for error isolation and session protection. This capability will also allow application program design flexibility by permitting individual sessions to be assigned to their own address space while being allowed to reference a single ACB. Improved operation may also be achieved by grouping sessions with similar characteristics or functions to be performed in one address space.

New levels of error isolation:

- To minimize the disruption caused by an error detected while ACF/VTAM is processing, ACF/VTAM attempts to isolate the error to:
 - The failing API request.
 - The session issuing the API request.
 - The task containing the session.
 - The application program.

Also, if a task or address space is terminated while processing for other than ACF/VTAM, ACF/VTAM attempts to isolate the disruption to the task structure or address space involved.

Extensions to the OS/VS2 (MVS) authorized path mode of operation for additional ACF/VTAM application program interface (API) macro instructions and exit routines:

- Prior to ACF/VTAM Release 3, an authorized application program could use only a small subset of the ACF/VTAM API macro instructions and exit routines in the OS/VS2 (MVS) authorized path mode of operation (via the system request block (SRB) mode of operation). With ACF/VTAM Release 3, all API macro instructions (except for the OPEN, CLOSE, MODCB, TESTCB, GENCB and SHOWCB macro instructions) can be used in this mode of operation. Selection of authorized path mode is under control of the application program via API macro instruction operands.

All exit routines associated with an ACF/VTAM application program can make use of this authorized path mode of operation. The selection of authorized path mode is specified when the application program is defined.

Application programs selecting the authorized path mode of operation may realize improved ACF/VTAM performance.

Support of Release 2 of the Network Terminal Option (NTO) program product ... ACF/VTAM R3 will support the devices and capabilities of Release 2 of NTO.

NLDM Program Product ... The NLDM program product, which runs as an application on NCCF, is supported in OS/VS2 MVS environments. ACF/VTAM will accept requests from NLDM to capture session initiation/termination data from all resources it controls and to continuously trace data passing between selected network resources. The session data and trace data are sent to the NLDM application, where they are correlated to assist in performing session-level problem determination.

3274-1A and 3274-1C/SNA Inbound Pacing ... Inbound pacing is supported under ACF/VTAM R2 and R3 for the 3274-1A and 3274-1C/SNA. These products must be at the appropriate EC level to provide this function.

Serviceability Enhancements ... The following ACF/VTAM R2 serviceability enhancements continue to be supported by ACF/VTAM R3:

- The ability to terminate or initiate the VTAM Internal Trace facility at VTAM initialization time.
- The ability to have the VTAM Internal Trace records recorded on an external file in a DOS/VSE environment. This capability continues to be available in OS/VS1 and OS/VS2 MVS environments.

ACF/VTAM R3 (cont'd)

-The data format and contents of certain VTAM Internal Trace records have been enhanced. For example, the user exit records now contain the resource name instead of the address of the resource name.

ACF/VTAM R3 supports the following CCITT X.21 switched functions when attached to an X.21 Interface via the 3705-II:

- Address calling.
- Auto Answer.
- Call progress signal.
- Direct call.
- Closed User Groups.
- Abbreviated Address Calling.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Communications Controller support ... ACF/VTAM R3 operates with the following communications controllers as supported by the level or levels of ACF/NCP/VS that are current when ACF/VTAM R3 becomes available:

- 3705-I Communications Controller.
- 3705-II Communications Controller.

ACF/VTAM R3 requires the following features in support of the Compare and Swap instruction: Conditional Swapping (#1051) on the 3135; Advanced Control Program Support (#1001) or Conditional Swapping (#1051) on the 3145.

System Configuration: ACF/VTAM R3 runs in a virtual storage environment in any system configuration that supports a DOS/VSE, OS/VS1 or OS/VS2 (MVS) operating system as specified in the "Programming Systems" section.

SOFTWARE REQUIREMENTS

ACF/VTAM R3 needs one of the following operating systems: DOS/VSE with the VSE/AF licensed program, OS/VS1, OS/VS2 (MVS) and all subsequent releases and modifications unless otherwise stated. The licensed program ACF/VTAM R3 needs the concurrent installation of prerequisite VTAM SCP for ACF/VTAM R3 system control programming modules. These system control programming modules should be installed only by ACF/VTAM R3 users.

Software Configuration: ACF/VTAM R3 requires one of the following operating systems at the specified level or subsequent levels unless otherwise specified:

- DOS/VSE with the VSE/Advanced Function (VSE/AF) licensed product.
- OS/VS1 Release 7.0.
- OS/VS2 (MVS) Release 3.8.

If delayed configuration restart will be used, ACF/VTAM R3 requires a current level of Virtual Storage Access Method (VSAM).

ACF/VTAM R3 will operate in a VM/370 virtual machine which supports the required release of the operating system (DOS/VSE, OS/VS1, OS/VS2 (MVS)). VM/370 provides a means of supporting VTAM and TCAM systems in the same processor, each running in its own virtual machine. This facility can be helpful when changing VTAM releases and when testing the ACF/VTAM Multisystem Networking Facility feature.

Operation of ACF/VTAM R3 under VM/370, even with the virtual machine assist feature, may add additional processor overhead which should be considered in your review of the customer's performance needs.

Each DOS/VSE, OS/VS1 or OS/VS2 (MVS) virtual machine in which ACF/VTAM R3 resides requires a dedicated sub-channel address to a 3705-I or 3705-II with ACF/NCP/VS R1, ACF/NCP/VS R2 or ACF/NCP/VS R3.

Co-requisite: Use of ACF/VTAM R3 requires the concurrent installation of co-requisite VTAM system control programming (SCP) modules.

Other Considerations: In a mixed ACF/VTAM - ACF/TCAM multisystem environment, the ability of ACF/VTAM R3 to access device characteristics of terminals controlled by ACF/TCAM is limited to those indicators defined and maintained by ACF/TCAM. In particular, the ability to determine the physical device address of a 3271-11, -12 used in the copy function is not supported.

CICS/VS Intersystem Communication - Message Performance Option: The ISC Message Performance Option is designed for transaction switching between CICS/VS systems and is invoked by specifying a new parameter on the START command and by appropriately defining the terminal control table. Increased performance is achieved by eliminating certain CICS/VS generated control sequences that are normally exchanged between two CICS/VS systems. The application designer is given the option of increased performance as a trade-off against certain aspects of data integrity.

As is the case today, the START command is used to generate an asynchronous transaction. Recoverable resources are still protected

within each transaction, however, there is no communication at SYNCHPOINT time with the transaction.

ISC Message Performance option will be of particular value in those cases where the terminal operators are interested in making an inquiry-only (i.e., no resources are updated) and in getting an answer in the quickest possible time. If no answer is received after a certain time, the inquiry is considered lost and is retried. Thus, CICS/VS is not required to provide any recovery capability in the event of a failure, either of the line or the system; the operator provides all the recovery necessary, namely reissuing the original request.

Availability: CICS/DOS/VS and CICS/OS/VS support is available now.

CICS/VS VTAM Dynamic Close Support: The VTAM Dynamic Close Support being provided by CICS/VS is in response to the user requirements to have the ability to continue execution of CICS/VS even though the VTAM network is being shut down. This support is complementary to the CICS/VS V1 R4.0 support of Dynamic Open. Together, they allow CICS/VS and VTAM to be initialized, run and terminated independently of each other.

Dynamic close may be invoked either by issuing a CICS/VS Master Terminal command or a VTAM Halt command (normal, quick or cancel).

Dynamic close results in the termination of all CICS/VS sessions with VTAM. This may be achieved in two ways:

- Through an orderly Dynamic Close.
- Through a quick Dynamic Close.

An orderly close will wait for transaction termination on all CICS/VS sessions and then issue a CLSDST against each active session before issuing a VTAM CLOSE ACB macro. A quick close will abnormally terminate all transactions currently in session with VTAM before issuing a CLOSE ACB macro.

Parallel Sessions: CICS/VS will support the Parallel Session capability for communication between inter-connected CICS/VS systems. This can offer system throughput enhancements by permitting more than one transaction to concurrently access resources on a remote CICS/VS system. The maximum number of concurrent transactions is governed by the number of available parallel sessions.

This support will be available in the latest current release in 2Q80 for CICS/DOS/VS and 3Q80 for CICS/OS/VS.

COMPATIBILITY

Where related IBM programs (for example, CICS/VS, IMS/VS, POWER/VS, JES1/RES, JES2/RJE, JES2/NJE, JES3/RJP, TSO, IIS, VSPC, BTP, SSS, and NCCF) operate with the ACF/VTAM R2 Record Mode Interface, compatibility is retained for the level(s) of those programs that are current at the availability of ACF/VTAM R3 or ACF/VTAM Version 2 on the appropriate operating system release. Recompilation of the related IBM programs is not required.

Compatibility with the ACF/VTAM R2 Record Mode Application Program Interface (Record API) is retained for existing user programs that utilize ACF/VTAM R3. However, such user programs may require changes to take advantage of the single and multisystem capabilities offered by ACF/VTAM R3 or ACF/VTAM Version 2.

By the enhancements made in ACF/VTAM R3 in support of Parallel Links, Multiple Routes and Extended NCP Interconnection, minor operational differences do, however, exist with VTAM Level 2, ACF/VTAM R1 and ACF/VTAM R2.

MIGRATION and PLANNING CONSIDERATIONS

ACF/VTAM V1 R3 with ACF/NCP/VS Considerations

The following ACF/VTAM V1 R3 enhancements are supported only in conjunction with ACF/NCP/VS R3:

- Parallel Links.
- Transmission Groups.
- Multiple Routes.
- Multiple Priority Levels.
- Extended NCP Interconnection.
- Extended NCP Ownership.
- Flow Control.
- Session Outage Notification.
- Enhanced Recovery Capabilities. *
- Route Verification and Error Notification Facilities.
- Transmission Group Trace.
- Support of Release 2 of the Network Terminal Option program product.
- Support of the CCITT X.21 Switched Interface.

ACF/VTAM V1 R3 with ACF/NCP/VS Release 2 or 2.1 continues support of NTO Release 1.

In addition to being supported with ACF/NCP/VS Release 3, the following ACF/VTAM Version 1 Release 3 enhancements are supported with ACF/NCP/VS Release 2 or 2.1:

PROGRAM PRODUCTS

ACF/VTAM R3 (cont'd)

- Reduced cross-domain resource definition requirements. *
 - Problem determination and serviceability enhancements.
 - Device support extensions and network operation enhancements.
 - Reliability and availability enhancements.
- * See the "Summary and Advantages" section of the 1979 Program Product Announcement for those capabilities requiring the Multisystem Networking Facility (MSNF) facility

NCP/VS Version 5 and ACF/NCP/VS Release 1 are not supported with ACF/VTAM Release 3. All facilities provided by NOSP are now available with the Network Communications Control Facility (NCCF) program product, which operates on ACF/VTAM Release 3.

The VTAM-NCP support table that follows lists the releases of each product through which SSCP-PU, SSCP-LU, and LU-LU sessions are supported. It can be used to plan migration from previous releases of VTAM to ACF/VTAM V1R3.

NCPs	NCP5	V1	V1	V1	V1R3	V2	V2	V3	V3
		R1	R2	R2.1	(7)	(7)			
VTAMS						3705	3725	3705	3725
VTAM2	yes	yes	yes	yes	no	no	no	no	no
V1R1	yes	yes	yes	yes	yes	no	no	no	no
V1R2	no	yes	yes	yes	yes	no	no	no	no
V1R3	no	no	yes	yes	yes	yes	yes	yes	yes
		(1)	(2)	(2)	(6)				
		(3,4)	(3,4)	(3,4)	(6)				
		(5)	(5)	(5)	(8)	(8)	(9)	(8,9)	(10)

Notes:

- (1) With applicable VTAM Level 2 PTFs.
- (2) OS/VS only, with applicable VTAM Level 2 PTFs:
 - OS/VS1: UX14242.
 - OS/VS2 (MVS): UZ28810.
- (3) Not supported on VSE.
- (4) With applicable ACF/VTAM V1R1 PTFs:
 - DOS/VS Release 34: UD17664.
 - OS/VS1: UX14243.
 - OS/VS2 (MVS): UZ28811.
- (5) With applicable ACF/NCP/VS V1R2 or V1R2.1 PTFs when connected to ACF/NCP/VS V1R3 or later.
- (6) OS/VS only, with applicable ACF/VTAM V1R1 PTFs:
 - OS/VS1: UX14243.
 - OS/VS2 (MVS): UZ28811.
- (7) With EREP PTFs for Link Problem Determination Aid (LPDA) level maintenance data records.
- (8) OS/VS2 (MVS) only, with ACF/VTAM V1R3 PTFs UZ90205, UZ90206, UZ90207 and UZ90208. (ACF/VTAM V1R3 for OS/VS1 and DOS/VS does not support sessions with ACF/NCP for the 3725.)
- (9) With applicable ACF/VTAM V1R3 PTFs:
 - OS/VS2 (MVS): UZ62633.
 - OS/VS1: UX18990.
 - DOS/VS: UD26545.
- (10) With ACF/VTAM V1R3 PTF when the network contains any ACF/VTAM V2R2 or ACF/NCP/VS node(s):
 - OS/VS2 (MVS): UZ56422.
 - OS/VS1: UX17328.
 - DOS/VS: UD23966.

Note: The above matrix assumes that customers will be at current access method maintenance levels when migrating from one NCP release to another.

Refer to the "Compatibility" section which follows for the operational characteristic differences between ACF/VTAM R3 and VTAM Level 2, ACF/VTAM R1 and ACF/VTAM R2.

Multisystem Considerations: In a multiple host system environment:

- The ACF/VTAM R3 enhancements are supported for each respective ACF/VTAM Version 2 or ACF/VTAM R3 host system.
- An ACF/VTAM R3 host system can coexist with ACF/VTAM Version 2 or ACF/VTAM R1, ACF/VTAM R2, ACF/VTAME, ACF/TCAM V1 R1, ACF/TCAM V2 R1, ACF/TCAM V2 R2 and/or ACF/TCAM V2 R3 host systems at the level of function supported by these host systems and the intermediate NCPs.

DATA SECURITY, AUDITABILITY and CONTROL

Security features available with previous releases, such as Encrypt/Decrypt, continue to be supported by ACF/VTAM R3. User management is responsible for the selection, adequacy and implementation of these features and the appropriate application and administration control.

PERFORMANCE AND STORAGE CONSIDERATIONS

Machine and storage requirements will be provided in the *Advanced Communications Function for VTAM (ACF/VTAM) Installation* manual at the availability of ACF/VTAM R3 on each supported operating system. Optionally, additional storage must be allocated in OS/VS2 MVS environments when the NLDM program product is installed. This storage requirement is dependent on the number of size of NLDM trace buffers selected.

The planned design of ACF/VTAM Release 3 indicates that, due to the ACF/VTAM R3 enhancements, the ACF/VTAM R3 path lengths, real storage requirements, control block storage requirements, overall storage requirements and the OS/VS2 (MVS) Common Area storage requirements may increase compared to ACF/VTAM Release 2. The actual performance impact (if any) to a customer will vary depending upon his particular hardware and network configuration.

Note: Refer to sales pages for information on programming support for specific SNA (and non-SNA 3270) devices and other related IBM program capabilities. Non-SNA device support (other than 3270) is provided only through the Network Terminal Option program product, or through user-written code which uses the ACF/NCP/VS attachment facility.

PROGRAM CURRENCY

The levels of VTAM and ACF/VTAM currently supported on the various levels of the operating systems are listed below:

Programming support for OS/VS1 Release 6.7 and OS/VS2 (MVS) Release 3.7 operating system releases is being withdrawn effective December 31, 1980. The programming support for DOS/VS Release 34 is being withdrawn March 31, 1981.

Programming support for the current levels of VTAM and ACF/VTAM is being withdrawn on the following schedule:

VTAM 1.1

OS/VS2 (MVS) Release 3.7 December 31, 1980

Dec 83

PROGRAM PRODUCTS

ACF/VTAM R3 (cont'd)

Note 6: TSO support applies only with 3270 Data Stream compatibility.

Note 7: For OS/VS1, ACF/VTAM Release 3 supports the IBM 8775 with Downstream Loadable Functions. ACF/VTAM Release 3 on VSE and OS/VS2 (MVS) for the IBM 8775 is for base function only.

Note 8: Supported only via the Network Terminal Option Release 2 (NTO) program product.

MVS INTEGRITY

IBM will accept APARs describing any situation where the installation of ACF/VTAM R3 causes an exposure to the system integrity of OS/VS2 (MVS).

RPQs ACCEPTED: No

**5735-RC3 - ACF/TCAM V2 R1
ADVANCED COMMUNICATIONS FUNCTION for TCAM
VERSION 2 RELEASE 1**

PURPOSE

Advanced Communications Function for TCAM Version 2 Release 1 is for users of OS/VS1 and OS/VS2 (MVS) that can provide additional capabilities for improved installability and usability, problem determination, network operation and data communications in a network with a single S/370 or with multiple S/370s. To support multiple S/370 networks, a user must install the ACF/TCAM V2 Multisystem Networking Facility feature.

HIGHLIGHTS OF ACF/TCAM V2 R1

Problem determination and network operation ... Includes additional functions that can assist in optimizing management and control of a user's data communication installation.

- Enhanced SDLC data link test.
- SNA terminal connectivity test.
- Intensive mode recording of SDLC data link errors.
- Dynamic display of ACF/NCP/VS storage.
- Dynamic reconfiguration of nonswitched SNA-SDLC devices under ACF/NCP/VS Release 2.
- Support for the Network Communications Control Facility (NCCF) program product and its related Network Problem Determination Application program product.

Enhanced data communications capabilities ... Includes improved flexibility for session operation, data security and enhanced device support.

- Negotiable session initialization parameters.
- Support of the Programmed Cryptographic Facility program product (5740-XY5).
- Support of channel-attached 3790 and 3270 systems.
- Support of the channel-attached 3270 systems (SNA only) and 3790 systems (configuration support #9165 and #9169 only) in a multiple processor network, using the Multisystems Networking Facility feature.
- Support of the 3790 Communication System inbound message traffic pacing function. (Also supports 8100 and 3730 systems).

ACF/TCAM V2 R1 provides service programs and customer tailorabale facilities that enhance the installability and usability of ACF/TCAM in the following areas:

- System startup and restart.
- Session establishment and routing control.
- Statistics gathering.
- Exception and error control.
- Operator control.
- Message retrieval.
- Message routing.

In addition, the Multisystem Networking Facility feature has been enhanced by providing customer aids for implementing the following:

- Installation and management of ACF/TCAM host to host data flows in large networks with multiple application types, such as:
 - Interactive applications.
 - Message routing.
 - Data collection.
 - Data distribution.
- Extended device support for ACF/TCAM host to host networking.
- Automatic recovery of ACF/TCAM host to host message traffic.
- Other usability enhancements.

SUMMARY AND ADVANTAGES OF ACF/TCAM V2 R1

Problem Determination and Network Operation Functions

- Enhanced data link test offers the capability to dedicate one station on an SDLC to testing while allowing the remaining stations on that link to remain active. When a station comprises a cluster control unit and its attached devices, the control unit is dedicated to the test; its attached devices are deactivated.
- SNA terminal connectivity test provides the capability of initiating an echo test from the terminal end of a session to determine that an SNA terminal and its connection to ACF/TCAM V2 are functioning correctly. The test does not interfere with other stations on the link, or with other devices on the same control unit.
- Intensive mode error recording of SDLC data link errors allows a network operator to dynamically invoke and terminate recording of information about temporary errors that may be occurring on an SDLC data link. This capability supplements existing support that records permanent error information and permits a user to collect

additional information on SDLC data link errors. This detailed information could preclude the need for specific testing in order to recreate an error situation.

- Dynamic display of ACF/NCP/VS storage allows the network operator to display any contiguous 256 bytes without disrupting normal ACF/NCP/VS operation. This display capability, provided in hexadecimal representation, can be useful in dynamically evaluating network problem situations.
- Dynamic reconfiguration of nonswitched SNA-SDLC devices under ACF/NCP/VS R2 allows the user to selectively add or delete supported nonswitched SNA-SDLC devices, without disrupting other network functions. This capability supplements the ACF/NCP/VS R2 generation process, and supports temporary configuration in a non-disruptive fashion, until a permanent network control generation can be done.
- In support of the Network Communications Control Facility program, ACF/TCAM V2 R1 provides an interface to support the problem determination and operation facilities offered by this program product.

Additional Data Communications Capabilities

- Negotiable session initialization parameters allow a more flexible session initialization process. During session initialization, two user-written application programs or message handlers can dynamically exchange certain session parameters to establish and/or modify transmission control and integrity of session data. With this capability, it may be possible for a user to simplify the predefined installation of intercommunicating application programs.
- ACF/TCAM support of the Programmed Cryptographic Facility offers the user transmission security of data.
- Support of enhanced 3705-II (mdls J, K, & L) permits channel attachment and/or SDLC data link attachment of the enhanced 3705-II in an ACF/TCAM V2 R1 network with ACF/NCP/VS Release 2.
- Support of channel-attached 3270 and 3790 systems permits these systems to be included in the single system SNA environment supported by ACF/TCAM V2 R1.
- Channel-attached SNA 3270 system and 3790 system networking permits the channel-attached 3270 systems (SNA only) and 3790 systems (configuration support #9165 and #9169 only) supported by ACF/TCAM V2 R1 to participate in multiple system networking.
- 3790 inbound pacing is supported as a user-selectable session establishment function under ACF/TCAM V1 and V2 R1 with 3790 support. ACF/TCAM V2 R1 also supports 8100 and 3730 systems.

Enhanced Installability and Usability Capabilities: The following enhancements to ACF/TCAM V2 R1 consist of macros, system service programs, and message handler facilities that a customer can tailor to meet unique system configurations. Model message control programs are provided to aid the customer in implementing these new capabilities and minimize his coding requirements.

Enhancements to the Base ACF/TCAM V2 R1 Program Product

- An initiator program ... Functions as a master task for a customer's message control program. The initiator provides for automatic activation, monitoring and selective restart of the message control program and associated IBM or user supplied service programs. The initiator allows non-failed tasks in the MCP region to continue running when another task in the region fails. The initiator will optionally restart the failed task.
- A message generation facility for building variable content start-up and restart messages.
- Enhanced message handler facilities to provide ease of use and flexibility in:
 - ACF/TCAM session establishment.
 - Routing control.
 - Security checking.
 - Logon/logoff message handling.
 - Error handling.
- A system accounting facility that enables an installation to gather system utilization data for financial accounting and system control. Data such as line utilization, application program logons, number of messages processed by each terminal, etc., can be captured for either on-line or deferred processing.
- Enhanced exception and error control facilities are provided in the form of macro instructions that the installation can use to achieve a high degree of automation in exception handling procedures. To end users and operations people, these facilities can provide awareness of exception conditions, advise the operator of automatic actions taken and/or generate messages indicating

ACF/TCAM V2 R1 (cont'd)

required action and deliver the messages to the point where the action needs to be taken.

- Enhancements to operator control
 - A command for transferring, copying and purging unsent queued messages.
 - A facility for adding user written commands.
 - An on-line operator's guide that displays available commands and command format details.
 - Additional commands to facilitate large system management.
- A message retrieval system service program allows disk queued messages to be retrieved by command from specially designated stations. Retrieved messages may be sent to any station(s) and/or tape. This facility may be used in support of a message routing application, or to aid in investigation and analysis of user difficulties. The program can locate sent and unsent messages by specification of sending or receiving station, time of entry, sequence numbers or range of sequence numbers.
- A message queue system service program that at the time of system shutdown can search all, or selected, queues for unprocessed or unsent messages and place those messages on tape for introduction into a changed or altered system after a cold start. This facility allows the installation to redefine the network configuration and perform a cold restart without message loss and without having to wait for the system to drain. The latter could be difficult if traffic has been queued after hours to terminals that have been turned off for the night.

Enhancements to the ACF/TCAM V2 R1 Multisystem Networking Facility Feature: The enhancements to the networking feature of ACF/TCAM V2 R1 are oriented toward support of large networks with multiple application types. Two important elements of the enhanced support are:

Host to host data flows ... In which message traffic flowing on the network is always handled by both the originating host and the destination host. Depending upon the particular application, and user specified routing instructions, message traffic may also be handled by intermediate host nodes, in addition to the originating and destination hosts.

Host to host data flows can contribute to increased network usability by providing capabilities such as:

- An efficient mechanism for session establishment and message routing for interactive applications.
- A technique for re-routing of interactive data around failed network elements that is transparent to the terminal operator.
- A facility for staging the movement of non-interactive data across a network during periods of low interactive message traffic.
- Added capabilities for system accounting and control in large networks.

Transmission categories ... A customer may establish up to 16 transmission categories in his network. All messages in the same category are treated similarly with respect to queuing medium, message priority, sequence checking, error handling, data staging, routing alternatives, etc.

Use of host-to-host data flows and transmission categories is facilitated by enhanced message handler facilities and user specified networking tables. Within the structure provided by these enhancements, the ACF/TCAM V2 R1 user has the following capabilities:

Interactive Applications: Enhanced session establishment and message routing capabilities for interactive applications:

- Transaction routing on a message by message basis.
- Extended interchanges between a terminal and a single application.

Transaction input to different application programs residing in different hosts may be routed without requiring the terminal operator to establish separate SNA sessions for each transaction.

A terminal may access an application in another host, even if the terminal is not defined in the application's host.

Input for a conversational application that is not currently active can be rejected, with an appropriate message sent to the terminal sending the input.

Non-Interactive Applications

Message Routing

- Terminals need be defined to only their owning host nodes in order to gain access to the network via host-to-host message routing flows. New destinations may be added to the network, affecting only the owning host's ACF/TCAM terminal table.

- A single set of input and output sequence numbers can be defined and assigned to messages received from and sent to each terminal. Messages may be retrieved by input and output sequence numbers, thereby facilitating error recovery and problem determination.

Data Collection

- Input from a terminal to an application in a cross-domain host can be edited and accepted for processing by the terminal's host, even if the application host has not been brought up.
- Using host to host data flows, messages enter the terminal's host immediately, and are delivered to the application host at the system's convenience -- as determined by the priority and routing parameters specified by the customer.

Data Distribution

- Output for a terminal can be accepted for delivery by the terminal's host node even if the terminal is not up.
- Data may be moved in stages to other host(s) closer to the destination terminal, or directly from the source host to the destination host. The staging of data can be controlled by the system operator, contributing to a more manageable and efficient flow of data through the network.

In addition, the macros, system service programs and message handler facilities of the Multisystem Networking Facility feature provide the customer with the following capabilities:

- Host-to-Host networking support for:
 - Non-SNA Channel attached devices.
 - EP attached devices.
 - NCP attached start/stop, BSC and SNA-SDLC devices (in addition to the networking support already provided to these devices).
- In the event that the primary route to a destination host node is unavailable, messages in a particular transmission category can be re-routed through an intermediate host node(s) enroute to the destination host.
- The balancing of message traffic between two host nodes by the use of transmission categories.
- Automatic recovery of host-to-host message traffic.
- Automatic monitoring of the availability of cross-domain host nodes, terminals, and applications.
- Through the use of an expanded ACF/TCAM addressing structure, networking support can be extended to:
 - Non-SNA hosts.
 - SNA clusters as "hosts".
 - Non-SNA links.
 - Multiple SNA networks.

Model Message Control Programs: The base and networking capabilities previously described are utilized in *Model Message Control Programs*, which are shipped to the customer in machine readable form. The programs are Class A supported, and may be used exactly as is, or tailored to the user's installation requirements. The models include message handlers for 2740 EP start/stop, 3270 EP BSC, 3270 local, and 3767 SDLC devices, including TSO support.

The models will be documented in the publication, *ACF/TCAM Installation Sample Programs*.

MIGRATION and PLANNING CONSIDERATIONS

ACF/TCAM V2 R1 with ACF/NCP/VS: When used only for local user applications (that is, data communications between two application programs or message handlers in the same S/370 or between a channel-attached terminal and an application program or message handler on the same S/370) ACF/TCAM V2 R1 supports the following items without the need for ACF/NCP/VS:

- Support of channel-attached 3790 and 3270 systems.
- Support of IBM 3790 inbound pacing.
- Negotiable session initialization parameters.
- Support for the Network Communications Control Facility program product.

When used for remote network user applications, ACF/TCAM V2 R1 supports the following items in conjunction with NCP/VS 5.0, ACF/NCP/VS R1, or with ACF/NCP/VS R2:

- Dynamic display of ACF/NCP/VS storage.
- SNA terminal connectivity test.
- Multisystem networking feature support of channel-attached 3790 and 3270 systems.

PROGRAM PRODUCTS

ACF/TCAM V2 R1 (cont'd)

- Support for the Programmed Cryptographic Facility program product. **Notes:** (1) Single system support is provided through ACF/NCP/VS or NCP/VS. Multiple Systems Support is provided through ACF/NCP/VS.
 - Support for the NCCF program product. (2) Nonswitched support only.
 - Support for 3790 inbound pacing. (3) S/360 mdls 25, 30, 40, 50, 65, 65MP, 67 (65 Mode) 75, 85, 91, 195 with either BOS, BPS, DOS, OS; S/370 mdls 115-168MP with either BOS, BPS, DOS, OS, DOS/VS, OS/VS1 or OS/VS2.
 - Negotiable session initialization parameters (application-to-application). * (4) 3771-1,-2,-3; 3773-1,-2,-3; 3773-P1,-P2,-P3; 3774-1,-2; 3774-P1,-P2; 3775-P1; 3776-1,-2,-3,-4; 3771-1,-3,-4.
 - Enhanced installability and usability capabilities. (5) In 3767 compatibility mode.
- When used for remote network user applications, ACF/TCAM V2 R1 supports the following items only in conjunction with ACF/NCP/VS Release 2:
- Enhanced SDLC data link test. (6) TSO support applies only to 3790 with 3270 data stream compatibility.
 - Intensive mode recording of SDLC data link errors. (7) Configuration support #9165 and #9169 only.
- * Applicable only to ACP/NCP/VS R1 and R2

*Local devices, except for SNA 3270 and 3790 systems, are not supported by ACF/TCAM for cross-system communications with the ACF/TCAM Multisystem Networking Facility ... Unless such devices communicate via host-to-host data flows.

(7) Applies to 3276 mds 1, 2, 3, 4 with BSC/SDLC switch set to SDLC mode.

- Notes: (1) The terminal type in parenthesis designates the programming support provided by ACF/TCAM, e.g., System/38 (3770) means the System/38 is supported as a 3770.
- (2) Single System Support is provided through ACF/NCP/VS or NCP/VS. Multiple System Support is provided through ACF/NCP/VS.
- (3) Nonswitched support only.
- (4) Switched support only.
- (5) Supported as an interactive 3767 - applies to 3777-1,-2,-3; 3773-1,-2,-3; 3774-1,-2; and 3775-1,-3 only.
- (6) Buffer size of 960, 2560, and 3440 also supported.

- (2) Nonswitched connection only.
- (3) Switched connection only.
- (4) Connection only through NCP/VS or ACF/NCP/VS.
- (5) Applies to 3651 mds A25, B25, A75, B75, C75 and D75, with the appropriate SDLC communications features.

PROGRAM PRODUCTS

**5735-RC3 - ACF/TCAM V2 R2
ADVANCED COMMUNICATIONS FUNCTION for TCAM
VERSION 2 RELEASE 2**

PURPOSE

Advanced Communications Function for TCAM Version 2 Release 2 adds support for record mode operations and associated device products.

HIGHLIGHTS OF ACF/TCAM V2 R2

Record API support ... Provides a single telecommunications access method interface to subsystems for ACF/TCAM V2 R2, and VTAM and ACF/VTAM, and support for device products associated with record mode operations.

- Permits use of CICS, DSX, IMS, JES 2/3, and/or VSPC under ACF/TCAM at execution time without change to the existing subsystem/service program.
- Supports single-session inter-host subsystem communication.

ACF/TCAM V2 R2 WITH ACF/NCP/VS: The following ACF/TCAM V2 R2 enhancements are supported in conjunction with ACF/NCP/VS Release 1 or with ACF/NCP/VS Release 2:

- Record API support. *
- Single-session inter-host communication. **
 - * Supported also by NCP/VS 5.0.
 - ** Requires the ACF/TCAM V2 R2 Multisystem Networking Facility feature.

Communications Controller Support: ACF/TCAM Version 2 operates with the following communications controllers, as supported by NCP/VS 5.0, ACF/NCP/VS R1, and ACF/NCP/VS R2:

- 3705-I Communications Controller.
- 3705-II Communications Controller.

CUSTOMER RESPONSIBILITIES

To install and use ACF/TCAM V2, the customer must:

- Design the single system network.
- Order and install all required communications equipment.
- Have prerequisite TCAM SCP for ACF/TCAM V2 installed.
- Install ACF/TCAM V2.
- Define the network to ACF/TCAM V2.
- Install NCP/VS 5.0, ACF/NCP/VS R1, and/or ACF/NCP/VS R2 (unless all terminals defined to ACF/TCAM V2 are channel-attached to the host processor or are EP/VS-defined).
- Define the network to ACF/NCP/VS R1 and/or ACF/NCP/VS R2.

To install and use the ACF/TCAM V2 Multisystem Networking Facility feature, the customer must:

- Design the multisystem network.
- Order and install any additional communications equipment (for example, intersystem links between interconnected 3705 Communications Controllers).
- Have prerequisite TCAM SCP for ACF/TCAM V2 installed.
- Install ACF/TCAM V2.
- Install ACF/NCP/VS R1 and/or ACF/NCP/VS R2.
- Install the ACF/TCAM V2 Multisystem Networking Facility feature.
- Define the multisystem network to ACF/TCAM V2 and to ACF/NCP/VS R1 and/or ACF/NCP/VS R2 in each host system.

SOFTWARE REQUIREMENTS

ACF/TCAM V2 R1 and V2 R2 require one of the following operating systems at the specified level or subsequent levels unless otherwise specified:

- OS/VS1 Release 6.7.
- OS/VS2 (MVS) Release 3.8.

Multisystem Considerations: In a multiple host system environment, the ACF/TCAM V2 enhancements are supported for each respective ACF/TCAM V2 host system just as they are within a single host system environment.

ACF/TCAM V2 supports the following items between ACF/TCAM V2 host systems, or between ACF/TCAM V2 and ACF/VTAM R2 host systems:

- Negotiable session initialization parameters.
- Channel-attached SNA 3270 and 3790 systems.
- Single-session inter-host subsystem communication. **
- Support for the NCCF program product. *
- Support for the Programmed Cryptographic Facility program product.
- Support for 3790 inbound pacing. *
- * Also supported between ACF/TCAM V2 and ACF/TCAM V1 or between ACF/TCAM V2 and ACF/VTAM V1 R1 systems.
- ** Support provided in ACF/TCAM V2 R2 Record API.

The following ACF/TCAM V2 enhancement is also supported from an ACF/TCAM V2 host system when intercommunicating with an ACF/TCAM V1 or ACF/VTAM R1 host system:

- Channel-attached SNA 3270 system and 3790 system networking.
- In the above configuration, the appropriate access method features for multisystem networking must be installed.

ACF/TCAM V2 can co-exist with non-ACF/TCAM hosts and provide the structure for network-wide services such as message routing, data collection and data distribution. In addition, ACF/TCAM V2 enhanced installability and usability functions can be used to interface two separate networks that wish to communicate with one another.

MIGRATION

Migrating from TCAM 10 or ACF/TCAM V1 to ACF/TCAM V2: The following migration paths are available for the given levels of TCAM and ACF/TCAM:

TCAM 10 will operate with the following levels of NCP/VS and ACF/VS:

- NCP/VS 5.0.
- ACF/NCP/VS R1.
- ACF/NCP/VS R2 (with appropriate TCAM 10 PTFs).

ACF/TCAM V1 will operate with the following levels of NCP/VS and ACF/NCP/VS:

- NCP/VS 5.0.
- ACF/NCP/VS R1.
- ACF/NCP/VS R2 (with appropriate ACF/TCAM V1 PTFs).

ACF/TCAM V2 R1 and R2 will operate with the following levels of ACF/NCP/VS:

- NCP/VS 5.0.
- ACF/NCP/VS R1.
- ACF/NCP/VS R2.

Functions supported by TCAM 10 or ACF/TCAM V1 are also supported by ACF/TCAM V2 with the appropriate level of NCP/VS or ACF/NCP/VS with the following exceptions:

- OS/VS2 SVS is not supported by ACF/TCAM V2, and consideration must be given to migrating a user's operating system support before or at the same time as migrating to ACF/TCAM V2.
- The enhancements to ACF/TCAM V2 R1 include an initiator task that allows non-failed tasks in the MCP region to continue running when another task in the region fails. The initiator will optionally restart the failed task.

Both the MCP and TCAM operator control run as subtasks of the initiator. These subtasks, along with other initiator subtasks, are defined in a subtask table which contains information on each subtask running under the control of the initiator. A default subtask table, which may be changed by the user, is shipped with ACF/TCAM V2 R1.

The TCAM 10 or ACF/TCAM V1 user will need to do the following in order to execute his MCP as an ACF/TCAM V2 system:

- 1) Modify JCL to start the initiator rather than the MCP.
- 2) Update the subtask table to include his MCP name, or
- 3) Rename his MCP to the default name supplied in the subtask table, or
- 4) Override the default name via JCL.

If the user chooses to code his own subtask table rather than use the one supplied, he must code entries for his MCP and for the TCAM operator control program.

- In an ACF/TCAM V1 R1 multisystem networking environment, when one host had two or more 3705s with ACF/NCP/VS, cross-domain session traffic could be routed either through an ACF/TCAM host transit node or directly through the 3705s without host involvement. In ACF/TCAM V2, the host transit node capability has been removed. Therefore, cross-domain session traffic which does not use host to host data flows must be routed directly through the 3705s. The new 3705-II high speed local attachment feature for communication between 3705-II's offers an attractive means of off-loading this function.

Migrating from TCS-ACF to ACF/TCAM V2 R1: All TCS-ACF macros are supported by ACF/TCAM V2 R1. In addition, the functions of the following TCS-ACF macros have been incorporated into ACF/TCAM macros:

TCS-ACF	ACF/TCAM Macro/Operand
TCSRROUTE	FORWARD TTCIN =
HOLDNEXT	HOLDSYNCHLD =

PROGRAM PRODUCTS

ACF/TCAM V2 R2 (cont'd)

NEXTMSG
TCSINTRO

TOPTION
TCSPRIOR
SKIPFLD
MEROFF

IEDRELS SYNCHLD =, BRANCH =,
INTRO NETMON =, MANUAL =,
NEWLINE =, NODEID =,
LOOPCNT =, LOOPQ =
OPTION USE =
PRIORITY PRISAVE =
SETSCAN SKIPFLD =
TERRSET MASK =

To aid in migration, ACF/TCAM V2 R1 will also support the above TCS-ACF macros in their TCS-ACF form. However, it is recommended that customers use the new TCAM operands.

Users of TCS levels prior to TCS-ACF Version 1 Release 2 modification 2 should note that the format and size of two controls fields, the FHP and TCSOPTS option field, have been changed. Any absolute (rather than symbolic) references in user code to their content or size may to be changed.

Compatibility: Source code compatibility is retained for existing user programs that utilize current levels of TCS-ACF. However, such programs may require changes to take advantage of the additional capabilities offered through ACF/TCAM V2 R1.

Other Considerations: ACF/TCAM V2 requires the following features in support of the Compare and Swap instructions: Conditional Swapping (#1051) on the 3135; Advanced Control Program Support (#1001) or Conditional Swapping (#1051) on the 3145.

ACF/TCAM V2 will operate in a VM/370 virtual machine which supports the required release of the operating system (OS/VS1, OS/VS2 MVS). ACF/TCAM V2 operation in a VM/370 environment is intended for use in program development and testing and other uses where performance is not critical. Operation of ACF/TCAM V2 under VM/370 Release 5, even with the virtual machine assist feature, may add significant additional processor overhead. If your customer has specific throughput or terminal response requirements, you should plan to benchmark under VM/370 to ensure that any proposed configuration will meet the customer's performance needs.

Each OS/VS1 or OS/VS2 (MVS) virtual machine in which ACF/TCAM V2 resides requires a dedicated sub-channel address to a 3705-I or 3705-II with ACF/NCP/VS.

In a mixed ACF/TCAM - ACF/VTAM multisystem environment, the ability of ACF/VTAM to access device characteristics of terminals controlled by ACF/TCAM V1 or ACF/TCAM V2 is limited to those indicators defined and maintained by these versions of ACF/TCAM. In particular, the ability to determine the following SNA 3270 (3271-11,-12; 3275-11,-12) device characteristics is not supported:

- The physical device address (used on the copy function).

Machine and storage requirements will be provided in the *Advanced Communications Function for TCAM (ACF/TCAM) Version 2 Installation: Storage Estimates, Conversion Information, Sample Programs*, at the availability of ACF/TCAM V2 on each supported operating system.

IBM will accept APARs describing any situation where the installation of ACF/TCAM V2 causes an exposure to the system integrity of OS/VS2 MVS.

Related IBM Programs: The following table summarizes ACF/TCAM Version 2 relationships in a networking environment:

OS/VS1	OS/VS2 MVS	ACF/TCAM V2 R2			
		ACF/TCAM V2 R1		GET/PUT Interface*	Record API
		DB/DC	CICS/VS 1.4		
*	*	DB/DC	CICS/VS 1.4	*	*
*	*		IMS/VS 1.1.5		*

		Communication Network Mgt.	NCCF-NPDA	*	
		Programmed Cryptographic Facility		***	***

- * Includes programs utilizing TGET, TPUT, READ, WRITE, and native TCAM applications not written to Record API.
- ** Host support for 3650 Programmable Store System.
- *** Supported by ACF/VTAM V2 but independent of interface levels shown.

COMPATIBILITY

ACF/TCAM V2 R1 and R2 retain compatibility with ACF/TCAM V1, with the following exception:

- ACF/TCAM V2 does not support OS/VS2 SVS.

Consideration for this difference is described above under the section entitled "Migration and Planning Considerations".

ACF/TCAM V2 R1 and R2 offer compatibility with NCP/VS 5.0, ACF/NCP/VS R1, and ACF/NCP/VS R2.

Compatibility of related IBM programs (see previous chart) written to the Record Mode Application Program Interface (Record API) is retained in ACF/TCAM V2 R2, except for programs written to the Programmed Operator interface and user programs written directly to the Record API.

PROGRAM CURRENCY

ACF/TCAM V1 is currently supported under OS/VS1 release 6.0 and 6.7, OS/VS2 (SVS) release 1.7, OS/VS2 (MVS) release 3.7 and 3.8.

ACF/TCAM V2 R1 and V2 R2 is supported by OS/VS1 Release 6.7, and OS/VS2 (MVS) Release 3.8, and subsequent releases unless otherwise specified.

DOCUMENTATION:

(available from Mechanicsburg)

Publications currently available which describe ACF/NCP/VS V2 are the following:

Advanced Communications Function for TCAM (ACF/TCAM) Version 2 General Information: Introduction, ACF/TCAM Version 2 Program Library and Introduction to Advanced Communications Function.

**5735-RC3 - ACF/TCAM V2 R3
ADVANCED COMMUNICATIONS FUNCTION for TCAM
VERSION 2 RELEASE 3**

PURPOSE

Advanced Communications function for TCAM Version 2 Release 3 is for users of OS/VS1 and OS/VS2 (MVS) that offers expanded network configurability, network management capability and enhanced network recoverability. To support multiple S/370 networks, a user must install the ACF/TCAM V2 R3 Multisystem Networking Facility feature. To take advantage of some of the functions provided by the Multisystem Networking Facility, a user may install the feature in large, multi-node single system environments.

HIGHLIGHTS OF ACF/TCAM V2 R3

- **Parallel Links:** Multiple active SDLC links between adjacent 3705s.
 - **Transmission Groups:** Logical groupings of transmission links between adjacent network nodes. *
 - **Multiple Routes:** Multiple routes for SNA and non-SNA message transmission between nodes in a network. *
 - **Automatic Session Re-initiation Option:** Disrupted sessions can be automatically re-initiated to take advantage of multiple route availability. *
 - **Multiple Priority Levels:** Three levels of transmission priorities, selectable by session. *
 - **Extended NCP Interconnection:** New capabilities for interconnecting 3705s in single and multiple system networks.
 - **Extended NCP Ownership.**
 - **Flow Control:** Enhanced management of network traffic demands. *
 - **Reduced Cross-Domain Resource Definition Requirements**
 - **Session Outage Notification:** Enhanced awareness of session outages.
 - **Enhanced Recovery Capabilities. ***
 - **Route Verification and Error Notification Facilities. ***
 - **Route Availability Monitoring Option:** Notification to a session requestor that a previously unavailable route is now available. *
 - **Transmission Group Option for Line Trace.**
 - **Dynamic NCP Dump Facility.**
 - **Support of the Network Terminal Option (NTO) program product.**
 - **Supports the CCITT X.21 switched interface when the 3705-II is attached to an X.21 Interface via the 3705-II.**
- * Requires the Multisystem Networking Facility feature.

Note: The ACF/TCAM V2 R3 Base System provides the capability to define one Transmission Group between adjacent network nodes. The capability to define more than one Transmission Group requires the networking feature.

SUMMARY AND ADVANTAGES OF ACF/TCAM V2 R3

Parallel Links: Multiple active SDLC links between adjacent 3705s ... Parallel Links allows data traffic to flow simultaneously over two or more SDLC links between adjacent 3705s. All such links can be operational and in use at the same time, and each can be activated or deactivated independently of the others. This capability can provide increased message flow and improve the availability and reliability of transmissions between 3705s.

Transmission Groups: Logical groupings of transmission links between adjacent network nodes ... A user may define up to eight Transmission Groups, each with one or more SDLC links between adjacent 3705s with ACF/NCP/VS R3. A Transmission Group permits multiple SDLC links to be defined as a single logical link. A single channel between a host and its channel attached 3705 is also defined as a Transmission Group. If a link or links in a Transmission Group fails, session traffic will automatically be placed on remaining active links without loss of data. This enhances the reliability and availability of service between 3705s. Multiple Transmission Groups and appropriate route selection permit a user to specify message traffic for different applications to flow through a network via pre-assigned Transmission Groups. For example, interactive processing may be assigned one group and batch processing may be assigned a different group, each with its own physical link support.

Multiple Routes: Multiple routes for SNA and non-SNA message transmission between nodes in a network ... A user may define up to eight routes for message transmission between two host systems or between a host system and a 3705. When a session is initiated between two application programs or between a terminal and an application program, one of the routes is automatically selected to transmit the session traffic. The user may limit the selection to a particular route or to one of an ordered sequence of routes. Thus, it is

possible to distribute the traffic for different sessions to different routes, dividing the load among several routes.

The ordered sequence of routes, determined by the installation, defines the set of alternate routes available for session traffic. In the event a route becomes inoperative during a session, the application program or terminal may request that the session be re-initiated. This causes automatic selection of one of the alternate routes. The user can then resynchronize the session data traffic and continue data communications and application processing via network routes that remain in operation.

Automatic Session Re-Initiation Option: A user-provided exit routine gains control whenever a session is terminated. The routine may specify that automatic session re-initiation is to be provided for a given session. When this option is requested, TCAM will immediately request a new session with the same characteristics as the terminating session. The exit routine could be designed so that, for example, sessions terminating because of route failure will be automatically re-initiated. When a route fails, sessions using the route are terminated, the exit routine gains control for each session and new sessions are requested. If other routes are operational, a new session can be started immediately on one of the other routes, and data transmission can resume as soon as the new sessions are established.

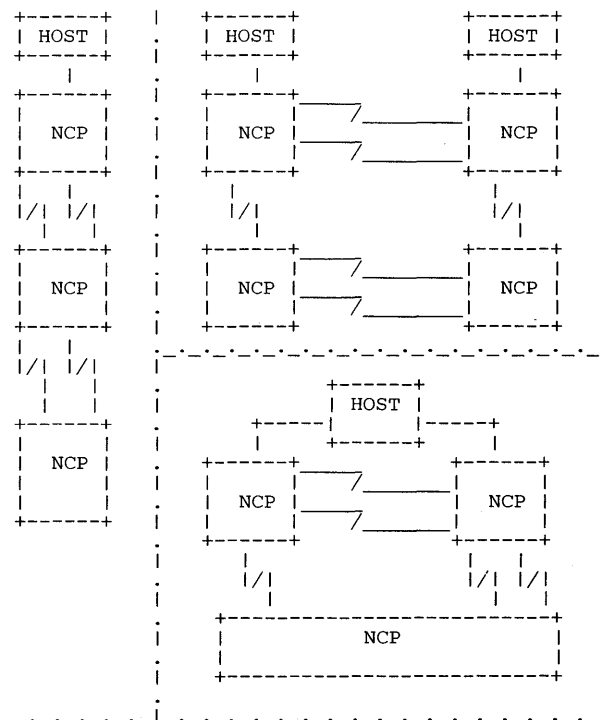

Multiple Priority Levels: Three levels of transmission priorities, selectable by session ... A user can specify one of three message traffic priorities for a session between two application programs or between a terminal and an application program. For example, this permits message traffic for a time dependent session to be transmitted through a network ahead of other message traffic. That is, interactive processing may be given top priority by a user while other network traffic, such as batch processing, is assigned to a lower priority by the user.

Extended NCP Interconnection: New capabilities for interconnecting 3705s in single and multiple system networks ... in ACF/TCAM V2 R2 a remote NCP could only be link-attached via a single link to a single channel-attached 3705. In ACF/TCAM V2 R3 a 3705 may now be link-attached via Transmission Groups to one or more channel-attached and/or link attached 3705s.

These capabilities can significantly expand the installation's configurability options. Also, they can improve the overall efficiency of the network and improve the ability of a host processor to take over a 3705 whose current owner (or a link to that owner) has failed or has been deactivated.

See Figure 1 for interconnection flexibility.

FIGURE 1

ACF/TCAM V2 R3 (cont'd)

Extended NCP Ownership: As many as eight host systems can share the ownership of a 3705 that is channel-attached * and/or link-attached to another 3705(s). Each of the owning host systems is notified in the event the 3705 becomes inoperative. This permits re-instatement of a failed or deactivated 3705 via any one of the host systems that shares in its ownership.

* The channel attachments cannot exceed the number of channels supported by the 3705-I or the 3705-II communications controllers.

Flow Control: Enhanced management of the network traffic demands ... Via SNA protocols, the flow of message traffic is dynamically regulated between a host system and a 3705 and between two host systems. Continuous feedback is exchanged between network resources in order to regulate network traffic and reduce the possibility of network congestion.

Reduced Cross-domain Resource Definition Requirements: An enhancement that is available for both SNA terminal or application definitions ... A SNA terminal in one domain can request a session with an application program in a different domain without prior definition of the terminal within the application program's host. Also, an application in one domain can request a session with an application program or SNA terminal in a different domain without prior definition of the requesting application within the cross-domain application program's or cross-domain terminal's host.

This enhancement is designed to reduce the need for user-specified cross-domain resource definitions in a multisystem environment and also to reduce the storage required to support such definitions. It permits the addition of an application program or SNA terminal to one host system without the need to re-define other host systems with which the resource may want to enter into a SNA session.

Session Outage Notification: If the route supporting a session becomes inoperative, the session ends and is made aware of the outage. Session reinitiation may be requested as described under "Multiple Routes".

Enhanced Recovery Capabilities:

• Enhanced restart or host-to-terminal control sessions: In recovering from a host failure situation, a host system can recover its control session for a 3271-11**, 3271-12**, 3274-10*, 3275-11**, 3275-12**, 3684, 3770 MLU, S/32, S/34 or S/38 without disruption of existing sessions between the device and application programs on other host systems. This permits user applications that are not affected by such a failure to continue processing during recovery of the control session. This capability is included in the base ACF/TCAM V2 R3 system.

* This product must be at an appropriate EC level for this function.

** Support for these devices is provided by ACF/NCP/VS R3.

• Enhanced takeover of a 3705: In the event a host system fails or otherwise gives up control of a 3705, any host system that is sharing ownership of the same 3705 will have its network operator notified about the lost host. Any of the notified host systems can take over control of the devices mentioned above without disrupting their existing cross-domain sessions with application programs. It is no longer necessary to deactivate corresponding cross-domain resource definitions before acquiring resources attached to the 3705 that were controlled by the lost host system.

• Enhanced multiple host system re-synchronization: In recovering from a failure situation, two host systems can re-synchronize their control session without disruption of existing cross-domain sessions between two application programs or between a terminal and an application program. This permits user applications that are not affected by such a failure event to continue operations during re-instatement of the host system's cross-domain control session.

Route Verification and Error Notification Facilities: Via the DISPLAY command, a network operator can determine if a message route originating in his host is operative or inoperative. This permits a network operator to verify the availability of network routes and to take corrective action for routes that may have become inoperative. It also

permits a network operator to verify that a route has been returned to service following a failure or deactivation. During the verification, appropriate resource owners are notified when an inactive or failed resource is encountered on a route.

In addition, if during network operation a route fails, an awareness message is issued at the host end point(s) identifying the inoperative route to the network operator. New display commands have been added which permit a network operator to take appropriate action to minimize the affects of an unusable message route on network applications.

Route Availability Monitoring Option: A user-provided exit routine gains control whenever a session initiation is attempted. The routine may specify that route availability monitoring is to be provided for a given session.

When a session initiation is attempted but there is no route available, the session attempt is rejected and the requestor is notified of the failure. It is the responsibility of the requestor to retry the session request later, requesting the same or a different route. When route availability monitoring is in effect for a session, however, the failure of the initiation attempt is remembered by TCAM and the requestor is notified of the availability of the route when it becomes available.

Transmission Group Option for Line Trace: Extends the existing SDLC line trace capabilities to Transmission Groups. Via the network operator MODIFY command, the message traffic over a Transmission Group between two 3705s can be traced as if it were a single SDLC link.

Dynamic NCP Dump Facility: A network operator can invoke a dump of NCP storage from a channel-attached or SDLC-attached 3705. Since NCP continues to operate during the dump process, the dump will represent NCP status over a period of time. The dump contents are recorded and printed via the facilities of the appropriate System Support Programs (SSP) for NCP, and can be useful in dynamically evaluating network problem situations.

Note: ACF/TCAM V2 R3 provides Multiple Active Routes and Session Outage Notification support to non-SNA, non-EP devices. EP device networking support continues as in ACF/TCAM V2 R2.

In addition to the existing TCAM support for non-SNA devices, ACF/TCAM V2 R3 supports the following devices as virtual SNA devices through its support of the Network Terminal Option (NTO) program product.

- 2740 mdl 1 Communications Terminal, switched and nonswitched.
- 2741 Communications Terminal, switched and nonswitched.
- Western Union Teletypewriter Exchange Service (TWX) M33/35, switched and nonswitched.
- World Trade Teletypewriter Terminal (WTTY), nonswitched only.

The support is provided for users of the DCB application interface and the TCAM subsystem interface. These devices can participate in a multiple system as well as a single system environment.

In addition to the existing support for non-SNA devices, TSO/TCAM supports the 2741 and TWX M33/35 via the NTO program product.

ACF/TCAM Version 2 Release 3 also supports the following CCITT X.21 switched function when attached to an X.21 Interface via the 3705-II:

- Address calling.
- Auto Answer.
- Call progress signal.
- Direct call.
- Closed User Groups.
- Abbreviated Address Calling.

CUSTOMER RESPONSIBILITIES

To install and use ACF/TCAM V2 R3, the customer must:

- Design the single system network.
- Order and install all required communications equipment.
- Have prerequisite TCAM SCP for ACF/TCAM V2 R3 installed.
- Install ACF/TCAM V2 R3.
- Define the network to ACF/TCAM V2 R3.
- Install NCP/VS 6.0, ACF/NCP/VS R1, ACF/NCP/VS R2, or ACF/NCP/VS R3 (unless all terminals defined to ACF/TCAM V2 R3 are channel-attached to the host processor or are EP/VS - defined).
- Define the network to NCP/VS 5.0, ACF/NCP/VS R1, ACF/NCP/VS R2 or ACF/NCP/VS R3.

To install and use the ACF/TCAM V2 R3 Multisystem Networking Facility feature, the customer must:

PROGRAM PRODUCTS

ACF/TCAM V2 R3 (cont'd)

- Design the single or multisystem network.
- Order and install any additional communications equipment (for example, intersystem links between interconnected 3705 Communications Controllers).
- Have prerequisite TCAM SCP for ACF/TCAM V2 R3 installed.
- Install ACF/TCAM V2 R3.
- Install ACF/NCP/VS R1, ACF/NCP/VS R2, or ACF/NCP/VS R3.
- Install the ACF/TCAM V2 R3 Multisystem Networking Facility feature.
- Define the network to ACF/TCAM V2 R3 and to ACF/NCP/VS R1, ACF/NCP/VS R2, or ACF/NCP/VS R3 in each host system.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Hardware Configurations: ACF/TCAM V2 R3 operates with the following communication controllers:

- 3705-I Communications Controller.
- 3705-II Communications Controller.

Hardware Features: ACF/TCAM V2 requires the following features in support of the Compare and Swap instruction: Conditional Swapping (#1051) on the 3135; Advanced Control Program Support (#1001) or Conditional Swapping (#1051) on the 3145.

System Configuration: ACF/TCAM V2 R3 runs in a virtual storage environment in any operating system configuration that supports the OS/VS1 or OS/VS2 MVS operating system as specified in the "Programming Requirements" section below.

SOFTWARE REQUIREMENTS

ACF/TCAM V2 R3 needs one of the following operating systems: OS/VS1 Release 7.0, or OS/VS2 MVS Release 3.8, and all subsequent releases and modifications unless otherwise stated.

Software Configuration: ACF/TCAM V2 R3 requires one of the following operating systems at the specified level, or subsequent levels, unless otherwise specified:

- OS/VS1 Release 7.0.
- OS/VS2 (MVS) Release 3.8.

ACF/TCAM V2 will operate in a VM/370 virtual machine which supports the required release of the operating system (OS/VS1, OS/VS2 MVS). VM/370 provides a means of supporting any combination of TCAM and VTAM systems in the same processor each running in its own virtual machine. This facility can be helpful when changing TCAM releases, and when testing the ACF/TCAM Multisystem Networking Facility. Further, one VTAM and one TCAM system can coexist in one virtual machine. Operation of ACF/TCAM V2 under VM/370, even with the virtual machine assist feature, may add additional processor overhead, which should be considered in your review of customer performance needs.

Each OS/VS1 or OS/VS2 (MVS) virtual machine in which ACF/TCAM V2 resides requires a dedicated sub-channel address to a 3705.

Prerequisite SCP: Use of ACF/TCAM requires the concurrent installation of prerequisite TCAM system control programming (SCP) modules.

Other Considerations: In a mixed ACF/TCAM - ACF/VTAM multisystem environment, the ability of ACF/VTAM to access device characteristics or terminals controlled by ACF/TCAM V1 or ACF/TCAM V2 is limited to those indicators defined and maintained by these versions of ACF/TCAM. In particular, the ability to determine the physical device address, used with the copy function of a 3271-11, -12, is not supported.

3274 mdl 1A and 3274 mdl 1C/SNA Inbound Pacing ... Is supported under ACF/TCAM V2 R2 and ACF/TCAM V2 R3. These products must be at the appropriate EC level for this function.

COMPATIBILITY

See "Migration and Planning Considerations" section for important compatibility exceptions.

Object code compatibility is retained in ACF/TCAM V2 R3 for related IBM programs (see *Related IBM program charts*) written to the VTAM Record Application Programs Interface (Record API). User programs written directly to the VTAM Record API are not supported by the ACF/TCAM V2 subsystem interface.

ACF/TCAM V2 R3 enhancements made in support of parallel links, multiple routes, and extended NCP interconnection result in minor operational differences from previous releases of TCAM. Users should

refer to the *ACF/TCAM V2 Installation and Migration Guide* available at first customer shipment.

MIGRATION AND PLANNING CONSIDERATIONS

ACF/TCAM V2 R3 with NCP/VS and ACF/NCP/VS: With the exception of the dynamic NCP Dump facility and Reduced Cross Domain Network Definition Requirements, the enhanced functions of ACF/TCAM V2 R3 are supported only in conjunction with ACF/NCP/VS R3.

The NCP Dump facility will operate with NCP/VS 5.0 (with appropriate PTFs), ACF/NCP VS R1, R2 or R3.

Reduced Cross Domain Network Definition Requirements will operate with ACF/NCP/VS R1, R2 or R3.

ACF/TCAM V2 R3 with EP/VS: ACF/TCAM R3 will continue to support the latest current level of the Emulator Program (EP/VS) and Partitioned Emulator Program (PEP). See the Terminal Support chart for specific device support.

Migrating from ACF/TCAM R1, ACF/TCAM V2 R1, or ACF/TCAM V2 R2 to ACF/TCAM V2 R3

The following support alternatives are provided to aid in migration planning:

	NCP/VS 5.0	ACF/NCP/VS R1	R2	R2.1 (1)	R3
TCAM 10	X	X	X*	X	No
ACF/TCAM V1	X	X	X*	X	X
ACF/TCAM V2 R1	X	X	X	X	X
ACF/TCAM V2 R2	X	X	X	X	X
ACF/TCAM V2 R3	X	No	X	X	X

- * Requires applicable access method PTFs.
- (1) Requires EREP PTFs for LPDA level maintenance data records.

Note: The above matrix assumes that customers will be at current access method maintenance levels when migrating from one NCP release to another.

The following significant differences between ACF/TCAM V2 and ACF/TCAM V1 may require special planning. All other functions supported by ACF/TCAM V1 are also supported by ACF/TCAM V2 R1, R2 and R3.

OS/VS2 (SVS) is not supported by ACF/TCAM V2, and consideration must be given to migrating a user's operating system support before or at the same time as migrating to ACF/TCAM V2.

In an ACF/TCAM V1 multisystem networking environment, when one host had two or more 3705s with ACF/NCP/VS, cross-domain session traffic could be routed either through an ACF/TCAM host transit node or directly through the 3705s without host involvement. In ACF/TCAM V2, the host transit node capability has been removed. Therefore, cross-domain session traffic which does not use host-to-host data flows must be routed directly through the 3705s. The new 3705-II high-speed local attachment feature for communication between 3705-II's offers an attractive means of off-loading this function.

Multisystem Considerations: In a multiple host system environment:

- The ACF/TCAM V2 R3 enhancements are supported for each respective ACF/TCAM V2 R3 host system.
- The ACF/TCAM V2 R3 host system can coexist with ACF/TCAM V2 R2, ACF/TCAM V2 R1, ACF/TCAM V1, ACF/VTAME, ACF/VTAM R3, ACF/VTAM R2, and/or ACF/VTAM R1 host systems at the level of function supported by these host systems.

PERFORMANCE and STORAGE CONSIDERATIONS

Machine and storage requirements will be provided in the *Advanced Communications Function for TCAM (ACF/TCAM) Version 2 Installation: Sample Programs*, at the availability of ACF/TCAM V2 R3 on each supported operating system.

The new functions provided by the ACF/TCAM V2 R3 Multisystem Networking Facility feature may increase storage requirements and path lengths over those in ACF/TCAM V2 R1 and R2. The actual performance impact (if any) to a customer will vary depending upon his particular hardware and network configuration.

DATA SECURITY, AUDITABILITY, and CONTROL

Previously announced security functions such as support for the Programmed Cryptographic Facility continue to be supported in ACF/TCAM V2 R3.

User management is responsible for the selection, adequacy, and implementation of these features and the appropriate application and administration control.

** Host Support for 3650 Programmable Store System.

Note: Supported by ACF/TCAM V2 R3 but independent of application program interface.

PROGRAM CURRENCY

TCAM and ACF/TCAM levels are currently supported on each operating system release as follows:

- TCAM Level 8 * OS/VS2 (MVS) - 3.7
- TCAM Level 9 * OS/VS1 - 6.0
OS/VS2 (MVS) - 3.7
- TCAM Level 10 * OS/VS1 - 6.0, 6.7, 7.0
OS/VS2 (SVS) - 1.7
OS/VS2 (MVS) - 3.7, 3.8
- ACF/TCAM V1 OS/VS1 - 6.0, 6.7
OS/VS2 (SVS) - 1.7
OS/VS2 (MVS) - 3.7, 3.8
- ACF/TCAM V2 R1, R2 OS/VS1 - 6.7, 7.0
OS/VS2 (MVS) - 3.8

* These releases will no longer be supported when currency terminates for the associated operating system. Currency is as follows:

- OS/VS1 6.0 - 12 months after availability of VS1 Release 6.7
- OS/VS2 (SVS) 1.7 - No longer current
- OS/VS2 (MVS) 3.7 - 21 months after availability of OS/VS2 (MVS) Release 3.8

Notes

- 1) Configuration support #9165 and #9169 only.
- 2) No multisystem support unless host to host data flows are utilized.
- 3) ACF/TCAM V2 R2 and subsequent releases only.
- 4) Switched support only.
- 5) Nonswitched support only.
- 6) Applies to 3651 mdls A25, B25, A75, B75, C75, and D75.
- 7) TSO support applies to 3276 mdls 1, 2, 3, and 4 with BSC/SDLC switch set to SDLC mode.
- 8) Applies to 3276 mdls 1, 2, 3 and 4 with BSC/SDLC switch set to SDLC mode.

**5735-RC3 - ACF/TCAM V2 R4
ADVANCED COMMUNICATIONS FUNCTION for TCAM
VERSION 2 RELEASE 4**

PURPOSE

ACF/TCAM Version 2 Release 4 offers significant extensions and enhancements to TCAM customers in a single and multiple networking environment. Advanced Communications Function for TCAM Version 2 Release 4 is a program product for users of OS/VS1 and OS/VS2 (MVS) that offers expanded network configurability, network management capability, enhanced queue recoverability, and improved migration. To support multiple S/370 networks, a user must install the ACF/TCAM V2 R4 Multisystem Networking Facility feature. With multiple TCAMs a user may network in the same CPU as well as run two or more copies of ACF/TCAM V2 R4.

HIGHLIGHTS OF ACF/TCAM V2 R4

- Multiple TCAMs: Capability of running multiple copies of ACF/TCAM V2 R4 concurrently in the same CPU. This function is not supported on an MVS/XA system.
- Reusable Queues Enhancement: Sequence of messages on a reusable queue will be maintained after queue reorganization is completed. Also most 045-2 ABEND conditions have been eliminated.
- Support Local Non-SNA 3270 Networking.
- Model MCP Supports Remote SNA 3270 Controllers.
- Support for 3274 Notify: Ability to sense power on/off status of LUs attached to 3274.
- Support for MVS/XA: The ability of ACF/TCAM to run on hardware supported by MVS/XA.
- Support for TAF (Terminal Access Facility) and HCF V2 (Host Command Facility)
- 3270 SNA Local REQMS/RECFMS Support: New options to retrieve messages.
- Tote Removal.

SUMMARY AND ADVANTAGES OF ACF/TCAM V2 R4

Multiple TCAM's: Multiple copies of ACF/TCAM V2 R4 may run concurrently in the same CPU. This capability is only supported in OS/VS2 MVS SP1.3.1. All copies of ACF/TCAM V2 R4 must be at the same maintenance level. Only one TSO/TCAM can run in a CPU.

Reusable Queue Enhancements: The possibility of overlaying a message during reusable queue reorganization has been greatly reduced. Also during reuse, sequence of messages is retained.

Local Non-SNA 3270 Networking: Local non-SNA 3270 terminals owned by ACF/TCAM may now participate in cross-domain sessions with either another ACF/TCAM or an ACF/VTAM.

Model MCP Supports Remote SNA 3270 Controllers: The Model MCPs are enhanced to support the remote 3270 SNA devices. Two additional SNA message handlers are included in the models. A message handler which supports displays (LU 2) and a message handler which supports printers (LU 1 and LU 3).

Retrieval Enhancements: New options have been provided to allow retrieval of very old messages, messages that have a higher sequence number than the current message number (rollover of sequence number) and other capabilities.

New Subsystem Support: Support of the Terminal Access Facility (TAF) feature of NCCF and Host Command Facility (HCF) V2.

Support for 3274 Notify: Support of the powered on/powered off feature on the model 1A control unit or model 1C or 51C control unit when BSC/SDLC switch is in SDLC mode.

3270 SNA Local REQMS/REQFMS Support: Allows 3274 model 1A maintenance statistics to be collected and transmitted to the host for processing by NPDA.

TOTE Removal: The Teleprocessing Online Test Executive (TOTE) is no longer supported.

OS/VS2 (MVS/SP Version 2): Support for expanded (3 byte) UCB in OS/VS2 (MVS/SP V2).

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

ACF/TCAM V2 R4 operates with the following communication controllers as supported by NCP/VS 5.0, ACF/NCP V1 R1, R2, R3 or ACF/NCP V2:

- 3705-I Communications Controller
- 3705-II Communications Controller
- 3705-80 Communications Controller
- 3725 Communications Controllers

ACF/TCAM V2 requires the following features in support of the Compare and Swap Instruction: Conditional Swapping (#1051) on the

3135; Advanced Control Program Support (#1001) or Conditional Swapping (#1051) on the 3145.

SOFTWARE REQUIREMENTS

ACF/TCAM V2 R4 requires one of the following operating systems at the specified level, or subsequent levels, unless otherwise specified:

- OS/VS1 7.0
- MVS/370
- MVS/XA

ACF/TCAM V2 will operate in a VM/370 virtual machine which supports the required release of the operating system (OS/VS1, OS/VS2 (MVS)). VM/370 provides a means of supporting any combination of TCAM and VTAM systems in the same CPU each running in its own virtual machine. This facility can be helpful when changing TCAM releases, and when testing the ACF/TCAM Multisystem Networking Facility. Further, one VTAM and one TCAM system can coexist in one virtual machine.

Prerequisite SCP: Use of ACF/TCAM requires the concurrent installation of prerequisite TCAM System Control Programming (SCP) modules.

Other Considerations: In a mixed ACF/TCAM - ACF/VTAM multisystem environment, the ability of ACF/VTAM to access device characteristics of terminals controlled by ACF/TCAM V1 or ACF/TCAM V2 is limited to those indicators defined and maintained by these versions of ACF/TCAM. In particular, the ability to determine the physical device address used with the copy function of a 3271-11, 12 is not supported.

COMPATIBILITY

See section on "Migration and Planning Considerations" for important compatibility exceptions.

Object code compatibility is retained in ACF/TCAM V2 R4 for related IBM programs (see "Related IBM Programs" chart) written to the VTAM Record Application Program Interface (Record API). User programs written directly to the VTAM Record API are not supported by the ACF/TCAM V2 subsystem interface.

RELATED IBM PROGRAMS: The following summarizes ACF/TCAM Version 2 Release 4 relationships:

		ACF/TCAM V2 R4				
OS/VS1	OS/VS2 MVS			GET/PUT Interface*	Subsystem Interface	
*	*	DB/DC	CICS/VS 1.4	*	*	
*	*		IMS/VS 1.1.6		*	
	*	Job Entry	JES2/RJE 4.1		*	
	*		JES2/NJE 3.0		*	
	*		JES3/R3.0		*	
	*	Interactive	TSO	*		
*	*		IIS	*		
*	*		IIPS	*		
*	*	Device Suppt.	SSS 5.0	*		
*	*		DSX	*	*	
*	*		HTF		*	
	*		IDWS		*	
*	*		Programmable Store System Host Support **			*
*	*		Host Command Facility ***		*	*
*	*	Communication Network Mgt.	NCCF-NPDA	*		
*	*		TAF			*
*	*	Programmed Cryptographic Facility		See Note	See Note	

* Includes programs utilizing TGET, TPUT, READ, WRITE, and native TCAM applications.
 ** Host Support for 3650 Programmable Store System.
 *** Host Command Facility (HCF) runs only on Get/Put interface and V2 runs only on subsystem interface.

PROGRAM PRODUCTS

ACF/TCAM V2 R4 (cont'd)

Note: Supported by ACF/TCAM V2 R3 but independent of application program interface.

PROGRAM CURRENCY

TCAM and ACF/TCAM Levels are currently supported on each operating system release as follows:

TCAM Level 10	OS/VS1 - 7.0*
	OS/VS2 (MVS) - 3.8*
ACF/TCAM V1	OS/VS2 (MVS) - 3.8*
ACF/TCAM V2 R2, R3	OS/VS1 - 7.0**
	OS/VS2 (MVS) - 3.8**

* Corrective service only.

** ACF/TCAM V2 R2 is no longer current.

MIGRATION AND PLANNING CONSIDERATIONS

ACF/TCAM V2 R4 with NCP/VS and ACF/NCP/VS: All functions that are supported by ACF/TCAM V2 R2 and R3 are also supported by this release.

ACF/TCAM V2 R4 with EP/VS: ACF/TCAM R4 will continue to support the latest current level of the Emulator Program (EP/VS) and Partitioned Emulator Program (PEP). See the Terminal Support Chart for specific device support.

Migrating from ACF/TCAM V1, ACF/TCAM V2 R1, R2, R3 to ACF/TCAM V2 R4: Migration plans can take advantage of the following support alternatives:

	NCP/VS 5.0	ACF/NCP V1 R1	ACF/NCP V1 R2, 2.1	ACF/NCP V1 R3	ACF/NCP V2
ACF/TCAM V1	X	X	X*	X*	
ACF/TCAM V2 R1	X	X	X	X	
ACF/TCAM V2 R2	X	X	X	X	
ACF/TCAM V2 R3	X	X	X	X	X
ACF/TCAM V2 R4	X	X	X	X	X

* Requires applicable TCAM PTFs.

The following significant differences between ACF/TCAM V2 and ACF/TCAM V1 may require special planning. All other functions supported by ACF/TCAM V1 are also supported by ACF/TCAM V2 R1, R2, R3 and R4.

OS/VS2 (SVS) is not supported by ACF/TCAM V2, and consideration must be given to migrating a user's operating system support before or at the same time as migrating to ACF/TCAM V2.

In an ACF/TCAM V1 multisystem networking environment, when one host had two or more 3705s with ACF/NCP/VS, cross-domain session traffic could be routed either through an ACF/TCAM host transit node or directly through the 3705s without host involvement. In ACF/TCAM V2, the host transit node capability has been removed. Therefore, cross-domain session traffic which does not use host to host data flows must be routed directly through the 3705s. The new 3705-II high-speed local attachment feature (see 278-95) for communication between 3705-II's offers an attractive means of off-loading this function.

Multisystem Considerations: In a multiple host system environment:

- The ACF/TCAM V2 R4 enhancements are supported for each respective ACF/TCAM V2 R4 host system.
- An ACF/TCAM V2 R4 host system can coexist with ACF/TCAM V2 R2, ACF/TCAM V2 R3, ACF/TCAM V1, ACF/VTAME, ACF/VTAM V2, ACF/VTAM R3, ACF/VTAM R2, and/or ACF/VTAM R1 host systems at the level of function supported by these host systems.

PERFORMANCE and STORAGE CONSIDERATIONS

Machine and storage requirements will be provided in the *Advanced Communications Function for TCAM (ACF/TCAM) Version 2 Installation: Sample Programs* at the availability of ACF/VTAM V2 R4 on each supported operating system.

The new functions provided by ACF/TCAM V2 R4 may increase storage requirements and path lengths over those in ACF/TCAM V2 R3. The actual performance impact (if any) to a customer will vary depending upon his particular hardware and network configuration.

Security, Auditability, and Control: Previously announced security functions such as support for the IBM Programmed Cryptographic Facility, continue to be supported in ACF/TCAM V2 R4.

User management is responsible for the selection, adequacy, and implementation of these features and for appropriate application and administration control.

DOCUMENTATION
(available from Mechanicsburg)

Advanced Communications Function for TCAM (ACF/TCAM) Version 2 General Information Manual: Introduction (GC30-3057) ... ACF/TCAM Version 2 Release 4 Program Summary (GC30-9526).

MVS INTEGRITY

IBM will accept APARs where the installation of ACF/TCAM V2 R4 introduces an exposure to the system integrity of OS/VS2 (MVS). This program is intended to run authorized.

ACF/TCAM V2 R4 enhancements made in support of multiple concurrent ACF/TCAMs, result in minor operational differences from previous releases of TCAM. Users should refer to the *ACF/TCAM V2 Installation and Sample Programs* manual available at first customer shipment.

RPOs ACCEPTED: No

Notes:

- 1) Configuration support #9165 and #9169 only.
- 2) No multisystem support unless host to host data flows are utilized.
- 3) ACF/TCAM V2 R2 and subsequent releases only.
- 4) Switched support only.
- 5) Nonswitched support only.
- 6) Applies to 3651 mdls A25, B25, A75, B75, C75, and D75 with the appropriate SDLC feature.
- 7) TSO support applies only with 3270 data stream compatibility.
- 8) Applies to 3276 mdls 1, 2, 3 and 4 with BSC/SDLC switch set to SDLC mode.
- 9) Supported via Network Terminal Option (NTO) program product.
- 10) These devices are not supported by MVS/XA.

The terminal types in parentheses designate the programming support provided by ACF/TCAM, e.g., System/32 (3770) means the System/32 is supported as a 3770.

**VIRTUAL MACHINE/VTAM
COMMUNICATIONS NETWORK APPLICATION
VM/VCNA (5735-RC5)**

PURPOSE

The Virtual Machine/VTAM Communications Network Application (VM/VCNA) program product provides the VM/System Product (VM/SP) user the capability of using an SNA, BSC, SS or local terminal as an operator console for a virtual machine. Support is included for Control Program/Conversational Monitor System (CP/CMS) command processing, CMS editor processing and VM full screen support. VM/VCNA is an application program that provides an interface between VM's console support and ACF/VTAM's or ACF/VTAME's application program interface in order to support SNA, BSC, SS or local devices as virtual machine consoles.

VM/VCNA, in conjunction with ACF/VTAM or ACF/VTAME, provides SNA, BSC, SS or local console support for virtual machines for VM/SP users and supports those S/370, 303X and 4300 processors announced as supported by VM/SP. All references to ACF/VTAM refer to ACF/VTAM Version 1 Release 2 or Release 3 or ACF/VTAM Version 2 (VSE or OS/VS1).

VM/VCNA, in conjunction with ACF/VTAM, ACF/VTAME, NTO and ACF/NCP/VS, provides VM users the advantages and capabilities of the multisystem networking facilities of the ACF products and allows the VM system to participate in an existing or planned multisystem ACF network based on Systems Network Architecture (SNA).

The SNA support for VM is located in what will be referred to as the VTAM (SNA) Service Machine (THE VSM, Figure 1) and provides SNA, BSC, SS or local terminal services to virtual machine consoles as well as providing ACF networking services. The VSM is a VM/SP Virtual Machine which consists of the following components:

- VSE and VSE/AF or OS/VS1 and OS/VS1 BPE
- ACF/VTAM or ACF/VTAME
- VM/VCNA

or

- SSX/VSE (which includes ACF/VTAM Version 2)
- VM/VCNA

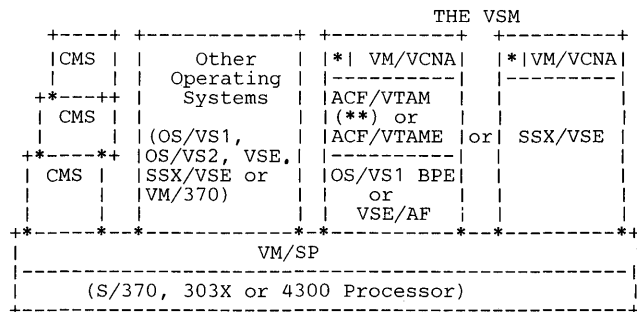

FIGURE 1

* Other application programs and subsystems; for example, CICS/VS or NCCF/NPDA.

** For ACF multisystem networking, ACF/VTAM Version 2 (VSE or OS/VS1) or the MSNF feature on ACF/VTAM Version 1 Release 2 or 3 is required.

The VSM owns and controls the network through ACF/VTAME or ACF/VTAM, including the SNA, BSC, SS or local terminals that will be used as VM Virtual Machine consoles. It is this ownership that permits terminals attached to the VM system, through ACF/VTAME (locally or through a Communications Adapter) or ACF/VTAM (locally or through ACF/NCP/VS), to gain access to the facilities of a multisystem (cross domain) ACF network.

Additional IBM and user application programs may also be present in the VSM (e.g., CICS/VS, NCCF/NPDA). VM/VCNA uses both the Console Communication Services and the Inter-User Communication Vehicle facilities available with the VM/System Product. The communication between the VSM and Console Communication Services of VM/SP is by the Inter-User Communication Vehicle available with VM/SP.

The terminals owned by the VSM may now be used by applications or subsystems in the VSM, such as CICS/VS, as well as virtual machine consoles for systems such as: CMS, OS/VS1, OS/VS2, SSX/VSE or VSE.

DESCRIPTION

VM/VCNA, in conjunction with ACF/VTAME, ACF/VTAM, NTO and ACF/NCP/VS, offers the following advantages to the VM user:

- Terminal sharing (assuming NTO support for SS devices) of the VSM across multiple ACF/VTAM or ACF/VTAME applications or subsystems, such as the Customer Information Control System/Virtual Storage (CICS/VS), the Information Management System/Virtual Storage (excluding NTO devices), user-written application programs and the CP/CMS system. This increases the usage of the terminal since it can now be located anywhere in a multisystem ACF network and may be used as a virtual machine console on VM systems in addition to having access to other systems that are not VM-based, (such as CICS/VS under ACF/VTAM or ACF/VTAME or TSU under ACF/VTAM or ACF/TCAM on an operating system running in native mode on another processor).

NTO Device Support by VM/VCNA: NTO is an IBM program product that extends the capabilities of ACF/NCP/VS in a 3705 Communications Controller to allow a select group of non-SNA devices to be supported as SNA devices. VM/VCNA's support of NTO allows VM installations with non-SNA devices to migrate to SNA. NTO support also allows an installation with S/S or asynchronous non-SNA devices to have the use of SNA services that:

- Provide a consistent and comprehensive structure for data communications growth.
- Minimize the effects of system changes.
- Distribute data communication functions throughout the SNA network.
- Allow for network sharing of asynchronous non-SNA devices.
- Extend data communication functions conveniently and effectively to the end-user in a distributed data processing (DDP) network.
- Minimize the end user's involvement in the details of data communications operations.

The support of NTO by VM/VCNA is transparent to both the NTO devices and the VM/SP control program. The NTO devices are supported by VM/VCNA through the application programming interface (API) of ACF/VTAM.

These supported NTO devices appear to ACF/VTAM as Physical Unit Type 1 (PU type 1), Logical Unit Type 1 (LU type 1) devices and support the same bind parameters as the SDLC 3767 Communications terminal. Therefore, the NTO support by VM/VCNA is an enhancement to the LU type 1 support provided by VM/VCNA. Thus the support provided for the 3101 display terminal is a line by line operation in character mode using the 64 graphic character set.

For a description of the facilities of related SNA products, see the following announcement letters:

PROGRAM PRODUCTS

VM/VCNA (cont'd)

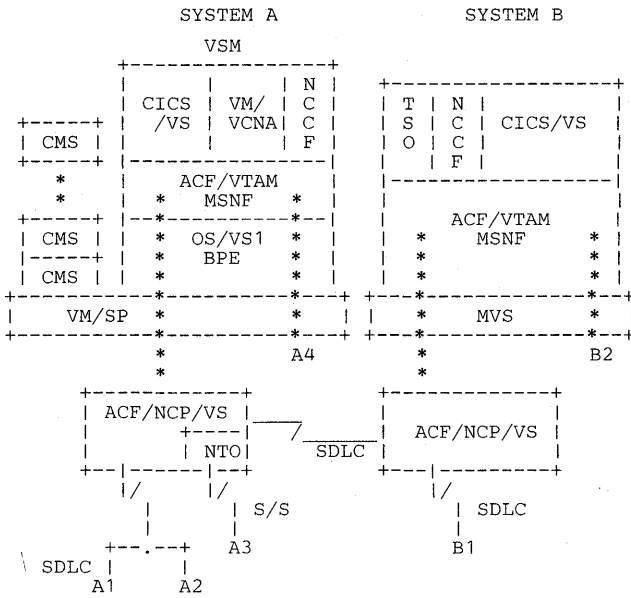

FIGURE 2

Figure 2 illustrates ACF/VTAM in the VSM and NTO support.

Resource Sharing between SNA and VM networks: Potential cost savings, and increased accessibility of applications to end-users, may be realized through the telecommunication resource sharing capabilities provided by ACF/VTAM. Type of link and terminal sharing which may be implemented are described below, in conjunction with FIGURE 2.

System A

- Terminals A1 and A2 are remote SNA devices on an SDLC link.
- Terminal A3 is a remote 3101 on an S/S link.
- Terminal A4 is a locally attached display.

System B

- Terminal B1 is a remote SNA device on an SDLC link.
- Terminal B2 is a locally attached display.
- Terminals A1, A2 and A4 are owned by ACF/VTAM in the VTAM Service Machine. Through the VM/VCNA support in the VSM, they may be used as operator consoles for virtual machines in the VM/SP system. For example, they may be used as CMS consoles. Support is included for CMS command processing, CMS editor processing and VM full screen support. Use of these terminals as virtual machine consoles does not require the MSNF feature of ACF/VTAM. Terminal A3 is also owned by ACF/VTAM in the VSM and may be used as an operator console for VM/SP virtual machines in a line operational mode.
- Because A1 to A4 are owned by ACF/VTAM, they also have access to ACF networking capabilities. In a single processor environment they may be used to access the CICS/VS applications running in the VSM. Other subsystems or applications running under ACF/VTAM could also be included in the VSM, and could then also share terminals A1 to A4 (A3 with NTO support). This sharing of terminals owned by the VSM among applications also running in the VSM does not require the MSNF feature of ACF/VTAM.
- With the addition of the MSNF feature to ACF/VTAM in the VSM, terminals A1 to A4 (A3 with NTO support) may now access remote applications or subsystems in other processors in an ACF network. For example, terminals A1 and A3 may access TSO or CICS/VS in System B, running under control of ACF/VTAM with the MSNF feature, while terminals A2 and A4 could be the operator consoles for CMS virtual machines in System A.
- Terminals B1 and B2, which are owned by ACF/VTAM in System B, also have access to SNA applications in System A, because of the MSNF feature in both systems. Through communication with VM/VCNA in the VSM in System A, terminals B1 and B2 may also be used as operator consoles for virtual machines, like CMS, in System A.
- In addition, if the NTO program product was present in ACF/NCP/VS on System B, then supported S/S device types attached to this NTO could also be used as virtual machine consoles through VM/VCNA.

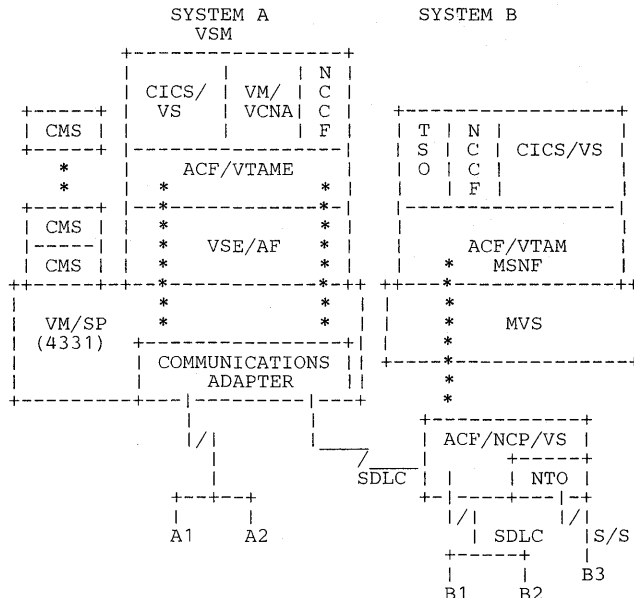

FIGURE 3

Figure 3 illustrates ACF/VTAME in the VSM and remote NTO Support when NTO and ACF/NCP/VS are attached to and owned by ACF/VTAM with the MSNF feature as shown in System B.

System A

- Terminals A1 and A2 are SNA devices on an SDLC link attached to the 4331 Communications Adapter.

System B

- Terminals B1 and B2 are SNA devices on a remote SDLC link.
- Terminal B3 is a remote 3101 on an S/S link.
- Terminals A1 and A2 are owned by ACF/VTAME in the VSM and may be used as operator consoles for virtual machines in the VM/SP System A, as well as having access to the ACF networking facilities of ACF/VTAME to access subsystems on ACF/VTAM in System B.
- Terminals B1, B2 and B3 are owned by ACF/VTAM in System B and may be used as operator consoles for virtual machines in the VM/SP System A, as well as having access to the ACF networking facilities of ACF/VTAM to access subsystems on ACF/VTAME in System A.
- VSM usability and human factors characteristics include:
 - The VSM can be initialized and controlled from the console of another virtual machine, or VM/SP system operator console.
 - Terminals can be initialized and logged on to VM/VCNA automatically by specifying required information in the ACF/VTAM or ACF/VTAME system definition.
 - The VSM terminal user's LOGON procedures may be made compatible with existing VM/370 LOGON procedures by providing the proper entries in the ACF/VTAM or ACF/VTAME system specifications.
 - Better communication line utilization resulting in improved user response time may be achieved with remote VSM controlled SNA terminals when compared with CP controlled remote BSC terminals.
 - A "saved system" can be IPLed with the operating system and ACF/VTAM or ACF/VTAME already active. This can be accomplished through the CMS EXEC facility and the CP "SAVESYS/IPL" function.
- The extended color and highlighting capability of the 3279 display is supported by VM/VCNA in virtual machine console mode and the write-structured-field facility of the 3279 display is supported by VM/VCNA in full screen mode.
- Potential for cost savings to the VM installation due to the teleprocessing resource sharing capabilities of ACF/VTAM or ACF/VTAME that the VSM brings to the VM customer's network. This resource sharing can result in consolidation and sharing of terminals, communication controllers and leased lines.

PROGRAM PRODUCTS

VM/VCNA (cont'd)

- The functions of the Network Communications Control Facility (NCCF) and the Network Problem Determination Application (NPDA) are supported in the VSM by ACF/VTAM and ACF/VTAME and are now available for virtual machine console operations supported by the VSM.
- The VSM enhances the communications capabilities of VM since current VM restrictions are removed, such as:
 - Allowing multiple SNA (or BSC) controller attachment to a single communications line (multi-drop).
 - Providing for more than 16 active (3705 attached) BSC and/or SDLC communications lines for remote VM communications service.
 - Providing support for a remote 3705 connected via an SDLC link to a local 3705, under control of ACF/NCP/VS, attached to a VM/SP system.
 - Terminal networking support for SNA, BSC, local and S/S terminals through VM/VCNA's use of ACF/VTAM, NTO and ACF/NCP/VS.
- Coexistence with existing VM telecommunication capabilities for binary synchronous (BSC) or start-stop terminal support through a Partitioned Emulation Program (PEP) in the 3705. The loading and management of the PEP in the 3705 is controlled by ACF/VTAM in the VSM.
- NTO support by VM/VCNA may eliminate the need for a "PEP" configuration in the 3705.
- The ability to use a SNA, BSC, S/S or local terminal, supported by VM/VCNA through ACF/VTAM or ACF/VTAME, as an operator console for virtual machines (such as CMS) on VM.

PLANNED AVAILABILITY: The VM/VCNA functions are available now.

SUMMARY OF VM/VCNA ADVANTAGES

Resource-sharing improvements may translate directly into real cost savings for the installation in the day-to-day operations of the teleprocessing network.

The savings may take many forms:

- Real cost savings in resource consolidation, such as terminals, lines, controllers.
- Increased end-user productivity for application development due to increased subsystem accessibility through terminal sharing and device independence for the user's application program.
- Intangible savings in the form of:
 - Decreased complexity in network maintenance and control through elimination of a 3705/EP 3270 network.
 - Teleprocessing services can be made available to a greater number of remote users due to economies in network resource sharing advantages and the full function multisystem networking facilities available through VM/VCNA's use of the ACF/VTAME or ACF/VTAM application program interface.
 - Increased VM user network configuration and application program flexibility since any VSM SNA, BSC, S/S or local terminal has access to any ACF/VTAM or ACF/VTAME-based subsystem when part of an ACF multisystem network, in addition to being used as a virtual machine console on VM.
 - Communication network management and network problem determination capabilities offered by NCCF/NPDA for VM/SP virtual machine operator consoles that are supported by VM/VCNA.

Advantages of SNA to VM/SP: VM/VCNA, in conjunction with ACF/VTAM, NTO, ACF/NCP/VS or ACF/VTAME, offers many improvements in resource sharing to the VM user's virtual machine environment. The following improvements are made possible by VM/VCNA's use of the application programming interface of ACF/VTAM or ACF/VTAME and the principles of Systems Network Architecture (SNA).

Terminal Sharing/Application Sharing: Any terminal supported by VM/VCNA through ACF/VTAM or ACF/VTAME, regardless of location in the ACF network, may gain access as an operator console to a virtual machine, such as CMS.

The same terminal that is used to access CMS may later be used to access applications in the VSM, such as CICS/VS. In addition, other subsystems (such as TSO or CICS/VS) may also be accessed by the VSM owned SNA, BSC, local and S/S (via NTO) terminals through the same multisystem networking feature (MSNF) or ACF/VTAM. These other subsystems may be in different virtual machines on the same VM processor as the VSM, in virtual machines on remote processors or remote processors not under control of VM/SP.

Controller Sharing (ACF/VTAM Only): In addition to the consolidation and sharing of terminals, SNA allows sharing of communications controllers through ACF/NCP's support of the 3705. SNA also allows transfer of many teleprocessing functions and responsibilities to ACF/NCP/VS. Prior to SNA, these functions were totally performed in the host processor and consumed processor cycles and system resources. Examples of such functions that the ACF/NCP/VS program has support responsibility for are:

- Terminal polling and addressing.
- Dial/Answer service.
- Character/Bit Service.
- Error recording/Diagnostics.
- Online terminal tests.
- Switched network backup.
- Transmission groups.
- Parallel links.
- Multiple active routes.
- Transmission priority.

In addition, the VSM provides for the remote attachment of 3705 controllers to 3705 controllers attached to the VM processor, in a tandem-like fashion, through ACF/NCP/VS Release 3.

Line Sharing: SNA allows multiple attachment of similar and dissimilar controller types (such as 3270 and 8100) on the same line. This may result in a decrease in the total number of leased lines the VM installation must have to provide remote teleprocessing services. This SNA multi-drop attribute can result in cost savings to the VM installation.

This capability is provided to VM only through the usage of VM/VCNA in conjunction with ACF/VTAME or ACF/VTAM Version 1 Release 2 or 3 or ACF/VTAM Version 2 (VSE or OS/VS1).

Function Sharing: SNA enhances application development for the VM user through the use of the logical unit concept. This concept provides device independence to the user's program for different classes of terminal devices. Therefore, a customer's application program design need not be sensitive to specific device types and unique device functions.

Non-disruptive Network Growth: SNA allows for growth to future technologies and functions without disrupting the customer's current SNA application programming investment. SNA provides for growth in:

- New network configurations for control and performance.
- Distributed data processing.

Communications Network Management (CNM): The VSM supports the program products (NCCF/NPDA) that provide a basis for communications network management for the resources owned and controlled by the VSM.

NCCF: The Network Communications Control Facility (NCCF) provides a network operator with convenient and efficient network control functions. In addition, NCCF provides communications and data base facilities for the collection, storage and retrieval of network error data in support of the Network Problem Determination Application (NPDA) program product. NCCF is also a program base, providing access method services, operating system services and an application interface for IBM or user-written network management programs.

NPDA: The Network Problem Determination Application (NPDA) runs under NCCF. NPDA collects, organizes and displays error statistics and data about communications controllers, lines, clusters, IBM micro-processor modems, control units and terminals. NPDA helps the NCCF operator to determine which communication subsystem may have caused a reported problem. In a VM/SP environment NPDA supports locally attached ACF/NCP 3705 controllers and remotely attached controllers/terminals.

CUSTOMER RESPONSIBILITIES

To install and use VM/VCNA, the user must:

- Design the single or multiple system ACF network configuration.
- Order and install all required communications equipment.
- Install VM/SP.
- Install the prerequisite operating system:
 - VSE and VSE/Advanced Functions Release 3.
 - OS/VS1 Rel. 7 and OS/VS1 Basic Programming Extensions.
- Install ACF/VTAM Version 2 (VSE or OS/VS1) or ACF/VTAM Version 1 Release 2 or 3 (with the MSNF feature if ACF networking is required) or ACF/VTAME.
- Define the single or multiple system ACF network to ACF/VTAM or ACF/VTAME (and to other remote ACF/VTAM or ACF/VTAME systems if ACF multisystem networking is required) in each host.
- Install ACF/NCP/VS if required.

VM/VCNA (cont'd)

- Install NTO if required.
- Install VM/VCNA.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

VM/VCNA, in its own partition, in conjunction with the ACF/VTAM or ACF/VTAME partition, provides SNA, BSC, S/S or local console support for virtual machines for VM/SP users and supports those IBM S/370, 303X and 4300 processors announced as supported by VM/SP. A 1024K processor storage size is the recommended minimum entry configuration for a VM/SP system running VM/VCNA.

SOFTWARE REQUIREMENTS

The VM/System Product is required for VM/VCNA. VM/VCNA executes in its own partition on VSE/AF or SSX/VSE or on OS/VS1 BPE systems and supports the following combinations:

- OS/VS1 Release 7 with OS/VS1 Basic Programming Extensions and ACF/VTAM Version 1 Release 2 or 3 or ACF/VTAM Version 2.
- VSE and VSE/Advanced Functions Release 3 with ACF/VTAM Version 1 Release 2 or 3, or ACF/VTAME or ACF/VTAM Version 2.
- SSX/VSE Release 3
- NTO Release 1 or 2.
- ACF/NCP/VS Release 2 or 3.

COMPATIBILITY

VM/VCNA operates with the ACF/VTAME or ACF/VTAM Release 2 or 3, application program interface. The Console Communication Services of VM/SP and VM/VCNA's support of the SIO and DIAGNOSE-58 interface for virtual machine console I/O is compatible with the existing virtual machine console I/O interface. Programs, like CMS, currently using these interfaces in VM/370, VM/Basic System Extensions program product or VM/System Extensions program product should run using a VM/VCNA supported terminal as a virtual machine operators console. The "VSM" can coexist with existing VM telecommunication capabilities for binary synchronous (BSC) or start/stop terminals with a partitioned emulation program.

MIGRATION and PLANNING CONSIDERATIONS

The following considerations should be evaluated in planning for the installation of VM/VCNA:

- ACF/VTAME or ACF/VTAM Version 2 (VSE or OS/VS1).
- ACF multisystem networking considerations.

For additional information on migration and planning considerations, consult the *VM/VCNA General Information* publication, (GC27-0501).

DATA SECURITY, AUDITABILITY AND CONTROL

In addition to existing VM/SP functions, the OS/VS1 ACF/VTAM Encrypt/Decrypt feature is supported for "VSM" owned terminals. User management is responsible for the selection, adequacy and implementation of these features and the appropriate application and administrative control.

RELIABILITY, AVAILABILITY and SERVICEABILITY (RAS)

RAS characteristics for VM are provided by VM/370 Release 6 and VM/SP. RAS characteristics for VSM owned and controlled resources are provided by the components of the VSM.

An internal trace capability is provided in VM/VCNA to correlate VM/SP Console Communication Services interface data to ACF/VTAM or ACF/VTAME API requests to the ACF network. Error recording in VM/VCNA is provided through storage dumps and error messages at the time the error is detected.

PERFORMANCE CONSIDERATIONS

Any individual system's performance may vary significantly depending on the number of terminals, types of terminals, transaction rates, the number of active batch operations and application subsystems and the system priority that is assigned to the batch and interactive subsystems. Performance options and tuning parameters are available in VM/SP, OS/VS1, VSE/AF, ACF/VTAM, ACF/VTAME and VM/VCNA to allow the user to tune and monitor system and network performance in the user's environment. Response time in a single-domain environment depends on a variety of host processor and data communication load factors, such as:

- Line speeds.
- Number, type and organization of terminals.
- Amount of processing performed by the application programs.

Response time in a multisystem environment depends on the factors noted above and, additionally, on various network load factors, such as the number of domains or nodes the interactive traffic must traverse.

User storage requirements depend on the specific configuration and upon user-supplied areas and functions as they relate to ACF/VTAME or ACF/VTAM Version 1 Release 2 or 3 or ACF/VTAM Version 2 (VSE or OS/VS1). Estimated storage requirements will be provided in *Virtual Machine/VTAM Communications Network Application (VM/VCNA) General Information* (GC27-0501).

The total storage requirements and path lengths to support the VSM are greater than for VM non-networking native support for non-SNA devices. This increase in path length may increase VM processor utilization and potentially reduce the total number of VM/CMS active users supported on a specific VM processor configuration. This increase in path length is due to the significant number of functions performed by the component parts of VM/SP and the VTAM (SNA) Service Machine (VSM) in order to:

- Provide a SNA, BSC, S/S and local interface to VM/SP.
- Provide single/cross domain ACF networking to VM users.
- Provide the network resource sharing/problem determination capabilities of SNA through ACF/VTAM or ACF/VTAME to VM/SP.

VM/VCNA DEVICE SUPPORT: VM/VCNA supports the following IBM devices as virtual consoles using ACF/VTAM or ACF/VTAME support in the VSM:

Control Units

- 3271 mdl 2 (BSC, Note 4).
- 3271 mdl 12 (SDLC, Note 1).
- 3272 mdl 2 (local).
- 3274 mdl 1A, 21A, 31A (local SNA).
- 3274 mdl 1B, 21B (local non-SNA).
- 3274 mdl 1C, 21C, 31C, 51C (SNA/BSC, Note 4).
- 3274 mdl 1D, 21D, 31D (local non-SNA).
- 3274 mdl 51C (SNA/BSC).
- 4331 Display Adapter (supported as a 3272-2).
- System/34 (as a 3271 mdl 2 BSC, Notes 4 and 6).
- System/36 (as a 3274 mdl 1C SNA, Note 6).
- 8100 Controller (Note 3).

Control Unit/Displays

- 3275 mdl 2 (BSC - 1,920 characters, Note 4).
- 3275 mdl 12 (SDLC - 1,920 characters, Note 1).
- 3276 mdl 1 (BSC - 960 characters, Notes 2, 4).
- 3276 mdl 2 (BSC - 1,920 characters, Note 4).
- 3276 mdl 3 (BSC - 2,560 characters, Note 4).
- 3276 mdl 4 (BSC - 3,440 characters, Note 4).
- 3276 mdl 11 (SNA - 960 characters, Note 2).
- 3276 mdl 12 (SNA - 1,920 characters).
- 3276 mdl 13 (SNA - 2,560 characters).
- 3276 mdl 14 (SNA - 3,440 characters).

Displays

- 3277 mdl 2 (1,920 characters).
- 3278 mdl 1 (960 characters, Note 2).
- 3278 mdl 2 (1,920 characters).
- 3278 mdl 3 (2,560 characters).
- 3278 mdl 4 (3,440 characters).
- 3278 mdl 5 (3,564 characters, 27 x 132).
- 3279 mdl 2A, 2B (1,920 characters).
- 3279 mdl 3A, 3B (2,560 characters).
- 8775 mdl 1 (960, 1,920, 2,560 characters, Notes 2, 3).
- 8775 mdl 2 (960, 1,920, 2,560, 3,440 characters, Notes 2, 3).

Printers

- 3268 mdl 2.
- 3284 mdls 2, 3.
- 3286 mdl 2.
- 3287 mdls 1, 1C, 2, 2C.
- 3288 mdl 2.
- 3289 mdl 1, 2.
- 3262 mdls 3, 13 (supported as 3289 mdls 1, 2).

Note: These printers are only supported, by VM/VCNA, for the VM program function key (PFK) COPY command.

Note 1: Supported by ACF/VTAM only.

Note 2: 960 character displays are supported on VM through VM/VCNA as virtual machine operator consoles. The new CMS editor available with VM/SP supports this display in full screen mode, while the current CMS editor supports this display in line mode through the NODISP option of the EDIT command.

Note 3: VM/VCNA supports 3790 (or 3730 as a 3790) attached 3270s or 8100 controller attached 3270s or 8775s in 3270 data stream compatibility mode only. The Distributed Processing Programming Executive 3270 Data Stream Compatibility (DPPX/DSC) licensed program provides this capability for the IBM 8100 Information System processor.

Note 4: Nonswitched connection only.

VM/VCNA (cont'd)

Note 6: Supported with the System/36 System Support program product (5727-SS1), the Communications feature (#6001), and the 3270 Device Emulation feature (#6003).

The following non-SNA start-stop terminals are supported by VM/VCNA through NTO and ACF/NCP/VS as 3767 line-by-line devices in console mode:

- IBM 2741 Communication Terminal
- IBM 3101 Display Terminal
- IBM 6733 Communication Module
- Western Union Teletypewriter Exchange Services (TWX) mdl 33/35

Keyboard/Printers

3232 Keyboard Printer Terminal mdl 1
3767 Communication Terminal mdls 1, 2, 3.

The following communication terminals are supported in the interactive mode of operation:

3771 mdls 1, 2, 3.
3773 mdls 1, 2, 3.
3774 mdls 1, 2.
3775.

DOCUMENTATION

PROGRAM PRODUCTS

HOST COMMAND FACILITY (5735-XR1)

PURPOSE

The Host Command Facility is a key program for distributed systems that includes S/370, 4300, and 8100 Information Systems processors. A host support program, the Host Command Facility gives a central S/370 or 4300 terminal operator the capability to:

- Operate and control SNA-connected 8100 Information Systems with DPPX or DPPX/SP as the operating system.
- Use nearly all operation and service functions that are available at an 8100 location. The exceptions are functions that require manual intervention, such as tape mounting and diskette insertion.
- Perform the operator-oriented tasks related to DPPX or DPPX/SP or DPCX problem determination and isolation.

HIGHLIGHTS

The Host Command Facility permits a S/370- or 4300-attached terminal to function in most requests, as if it were directly attached to an 8100/DPPX or DPPX/SP system, provided an SNA link exists between the S/370 or 4300 and 8100. This facility will provide the ability of the network control point 'Host' to have nearly complete control over the 8100 DPPX or DPPX/SP or DPCX system in the network. Some tasks will require manual intervention at the remote 8100 site (tape mounting, for example).

The Host Command Facility will allow the host terminal operator to perform all the standard system configuration, and problem determination and isolation procedures that can be accomplished from a terminal connected directly to the 8100/DPPX or DPPX/SP or 8100/DPCX system.

Host Command Facility/DPPX or DPPX/SP Functions: Functions provided by the Host Command Facility for DPPX or DPPX/SP include:

- Remote control and operation of a single 8100 system selected by the terminal operator.
 - Remote initiation and termination of work
 - Remote configuration control
- Remote examination of DPPX or DPPX/SP data sets, including dumps and logs, using the DPPX or DPPX/SP interactive editor.
- Remote problem determination and isolation
 - Examination of error logs and error log summaries
 - Examination of dumps, traces, etc.
 - Invocation of test programs, online tests, and diagnostics, and examination of their results.
 - Application of program patches via the DPPX or DPPX/SP interactive editor
- Remote program development, using the full set of DPPX or DPPX/SP tools for interactive program writing, compiler invocation, and problem determination.
- Submission of transactions and control commands to DPPX or DPPX/SP and the Data Base and Transaction Management (DPPX/DTMS) System or the DTMS component of DPPX/SP.

In general, the Host Command Facility allows the host terminal to access any function available to the command facility or DPPX/DTMS user or the DTMS component of DPPX/SP.

In addition, the Host Command Facility will provide the S/370-to-8100/DPPX or DPPX/SP or 4300-to-8100/DPPX or-DPPX/SP logical connection verification (LCV) function. This function verifies the logical connection path between the host S/370 or 4300 and the 8100/DPPX or DPPX/SP System. LCV can be initiated, through the Host Command Facility, by the host terminal operator. The test involves the transmission of a 'canned pattern', or operator-entered pattern from the corresponding DPPX or DPPX/SP LCV program to the initiating host terminal. The number of times the pattern is transmitted is controlled by the host terminal operator. When used in conjunction with the DPPX 3270 Data Stream Compatibility licensed program, the purpose of this facility is to verify the logical connection path (program-to-program, including links) between the S/370 or 4300 and 8100/DPPX or DPPX/SP.

Host Command Facility/DPCX Functions: Functions provided by the Host Command Facility for DPCX include:

- Remote control and operation of a single 8100/DPCX system
 - Setting IPL system parameters, operator passwords, time and date, and access codes to application programs
 - Activating and deactivating devices
 - Listing configurations and a summary of the application library contents
 - Initiating the packing of transactions, printing from queued printer support, and orderly shutdown of the system

- Remote problem determination and isolation
 - Initiating host link echo tests, host link, data link and loop traces
 - Listing the contents of the 8100/DPCX hardware incident log, the status of host communications sessions, applied PTFs and currently active tasks, terminals, and operators
 - Retrieval of unique system operation messages
 - Debugging an application program using the Program Execution Monitor
- Remote system performance control
 - Initiating the collection of system performance data
 - Listing the disk status

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The Host Command Facility requires 64K to 128K bytes of IBM S/370 or IBM 4300 virtual storage depending on the number of users allowed for the HCF and LCV functions. It will operate on a DOS/VS, DOS/VSE, OS/VS1 or OS/VS2 MVS system with sufficient real storage to satisfy the combined requirements of Host Command Facility, VTAM or TCAM, and other customer required programs.

The configuration must include an IBM S/370 or IBM 4300 attached (local or IBM 370X, BSC or SDLC) IBM 3276-1, 2, 3, 4, 11, 12, 13, 14 or IBM 3277-2 or IBM 3278-1, 2, 3, 4 displays using an IBM 3271-2, 12 or IBM 3272-2 or IBM 3274-1A, 1B, 1C, 1D, 21B, 21C, 21D, 31A, 31C, 31D or IBM 3275-2, 12 or IBM 3276-1, 2, 3, 4, 11, 12, 13, 14 as control units.

Note: Although Host Command Facility supports BSC, SDLC and local attachment for displays, it only supports SDLC links to the IBM 8100 systems.

SOFTWARE REQUIREMENTS

This licensed program is designed to work with the following:

- ACF/VTAM Version 2
- DOS/VS Release 34 with VTAM Version 1 Release 2 or ACF/VTAM Release 1.
- DOS/VSE with VSE Advanced Functions Releases 1 or 2 and ACF/VTAM Version 1 Release 2 or ACF/VTAME.
- OS/VS1 Releases 6, 6.7, and 7 with VTAM Release 2 or ACF/VTAM Version 1.
- OS/VS1 Releases 6, 6.7, and 7 with TCAM Release 10 or ACF/TCAM.
- OS/VS2 Releases 3.7 and 3.8 with TCAM Release 10 or ACF/TCAM
- OS/VS2 Releases 3.7 and 3.8 with VTAM Release 2 or ACF/VTAM Version 1.

For communication with IBM 8100/DPPX systems, Service Level 0200, which includes Functional Enhancement Package 1 (FEP 1), or later level of DPPX/BASE, is required. For communication with IBM 8100 DPPX/SP, the current service level of DPPX/SP is required.

Source code is available on tape and program listings on microfiche as related optional material.

MVS SYSTEM INTEGRITY

IBM will accept APARs describing any situation where installation of the Host Command Facility causes an exposure to the systems integrity of MVS.

RPOs ACCEPTED: No.

ADVANCED DATA COMMUNICATION for STORES RELEASE 5 (5735-XR2)

PURPOSE

The Advanced Data Communication for Stores is a host S/370 application which provides support for batch communications between the host system and individual controllers in: 3650 Programmable Store Systems ... 3650 Retail Store Systems ... 3660 Scanning and Key Entry Supermarket Systems ... 3660 Programmable Store System.

This program product's primary functions are to control and execute store data transmissions, both inbound to the central host and outbound to the store system controllers. Advanced Data Communication for Stores offers extensive facilities to help minimize the operational and administrative activities required for an expanding store communications network.

Advanced Data Communication for Stores provides a schedule command language that allows the user to create, alter and execute planned schedules for batch data transmissions. Extensive recovery and reconciliation facilities will either immediately handle exceptions or automatically retry them in subsequently scheduled transmissions. The capability to automatically expand user schedules for logical store and/or data groups reduces user input requirements. This can be significant in a complex network environment. Comprehensive offline support, including summary and exception reporting and data set maintenance utilities and subroutines, further simplifies the operational environment.

HIGHLIGHTS

Highlights of Advanced Data Communication for Stores program product are:

- BTAM/BSC switched line support is provided for the 3650 and 3680 Programmable Store Systems and the 3660 Scanning and Key Entry Supermarket Systems.
- BTAM/BSC nonswitched line support is provided for the IBM 3650 Programmable Store Systems.
- VTAM/SDLC and ACF/VTAM/SDLC lines (switched and/or nonswitched) are supported for the 3650 Retail Store System and the 3650 and 3680 Programmable Store Systems.
- The network may consist of a mixture of all supported controller and line types.
- Line Pooling allows controllers to be assigned to a group of switched lines.
- Concurrent multiple line communications capability is provided to help optimize network efficiency.
- A high level scheduling command language is used to ease communication schedule planning and execution by minimizing required user inputs.
- Logical communication groupings of stores can be defined by the user to accommodate unique customer factors, such as optimum store hours for communications, backup store assignments, distribution regions, sales districts, etc.
- Communications may be scheduled at a specific time with an individual controller, with a group of controllers or with all controllers in the network.
- Data to be transmitted by the host may be grouped for a single controller, for all controllers or for a variety of controller application/combinations (for example, price and tax zones, common check authorization areas, stores with special or common departments, etc.).
- User application data may dynamically drive communication schedules by the inclusion or exclusion of data and control information (such as passwords) in the outbound data set.
- The program product produces a comprehensive set of reports to display summary, exception and detail information about jobs (program runs) and pending and reconciled schedule requests. These reports can provide aid for problem solving, performance tuning and for the user auditing necessary to ensure the security and integrity of the data resources.
- An optional journal log may be created reflecting all data received and/or sent.
- A data audit trail is available for every batch of transmitted data.
- Utilities and subroutines are provided to assist the user in host data file maintenance.
- Shared access files can be created at the 3650 Programmable Store System.
- The program product can be used at the host to randomize (determine the sector locations of) records in the 3650 Retail System and the 3650 and 3680 Programmable Store System keyed files. This allows the transmission of complete sectors, instead of individual records, and can help to minimize file maintenance processing in the controller(s) and reduce overall transmission time.
- The program product can assign item movement indexes and build an image of the item movement file while randomizing the item record file.
- Host processing used in conjunction with the Programmable Store System POS Application/Store Data Management (SDM) program product (5748-D22) includes building/deleting the Program Request Blocks (PRBs) used by SDM and managing the SDM source files.

- The Console Operator may display current transmission status or quiesce transmission.
- Error recovery capabilities include:
 - Data batches saved for a subsequent warmstart if the communication link(s) fail.
 - Recovery from inbound and outbound request timeouts.
 - Recovery from line control errors (such as lost end-of-transmission characters, phone busy conditions, etc.).
 - Console interaction. For example, warmstart from the console is provided.
 - Physical and logical error recovery procedures span multiple connections to stores and multiple independent executions of this program product.
- An automatic warm start option is provided.

Additional Functions for the 3660 Scanning and Key Entry Systems

- Automatic retrieval is provided, whenever a controller is called, for all or certain controller output queues containing prepared data/response information. This is in conjunction with the automatic management of store input and output queues.
- Automatic reconciliation of each host initiated request is made to its corresponding controller response/report. This applies to both the immediate and the delayed types of controller maintenance.

SYSTEM DESCRIPTION

The major functional areas of this program product are Communications, Automatic Schedule Generation, Recovery and Reconciliation, Off-line Support and Report Routines. These functions interface with user data sets. They also interface with system data sets that contain user specified configuration, scheduling and status information.

Automatic Schedule Generation (ASG): ASG is based on a high level scheduling command language. ASG expands internal scheduling information from a single input statement that is propagated for all the designated stores in a user specified logical group. The same scheduling command language is used to create planned batch communications at system generation time and to revise and create special and one-time schedules as required. For the 3660 Supermarket Scanning and Key Entry Systems, ASG internally develops required request/retrieval information pairs, and appends all required information (such as output queues, passwords, etc.) from the Advanced Data Communication for Stores data base.

Recovery and Reconciliation: Recovery capabilities consist of restart functions for correctable error conditions. Recovery capability exists at three levels:

- Specific events.
- Store reconnections.
- Schedule restarts, (either operator-initiated or as a result of an abnormal termination).

Reconciliation, for the 3660 Supermarket Scanning and Key Entry System, consists of a programmed pairing of retrieved responses (and data) with their originating requests. The Advanced Data Communication for Stores data base contains the current status of the delayed and immediate execution store input queues, and the high and low priority store output queues for all the outstanding scheduled requests of all the 3660 stores in the network.

Off-line Support Routines and Off-Line Report Routines provide maintenance programs to generate the Advanced Data Communication for Stores system files and to initialize new and/or existing system values. Additionally, these routines provide exception status, detail statistics and summary reports. Reliability and serviceability features are implemented by maintaining a System Integrity Log to record all informational, statistical, diagnostic and error messages issued by this system.

CUSTOMER RESPONSIBILITIES

- Creating and loading private Advanced Data Communication for Stores macro and object libraries.
- Coding and assembling the Advanced Data Communication for Stores network configuration.
- Providing host programs to create and load user data files with store controller data, in formats specified for the 3650 and 3680 Programmable Store Systems and/or the 3650 Retail Store System and/or the 3660 Supermarket Systems. Data formats are cribed in the respective *Programmer's Guides* for each store system.
- Creation of batch communication transmission schedules using the scheduling command language.
- Providing host programs to process data retrieved from the store.
- Making effective use of system reports and logs to maintain integrity of data throughout the system.

PROGRAM PRODUCTS

Adv. Data Comm. for Stores R4 (cont'd)

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Advanced Data Communication for Stores may be used on any IBM S/370 Mdl 115 or larger or 4300 processor capable of operating with:

- VSE and VSAM and BTAM/BSC and/or VTAM/SDLC or ACF/VTAM/SDLC.
- OS/VS1 and VSAM and BTAM/BSC and/or VTAM/SDLC or ACF/VTAM/SDCL.
- OS/VS2 and VSAM and BTAM/BSC and/or VTAM/SDLC or ACF/VTAM/SDLC.

This product is announced for use with the following programs and subsequent releases unless otherwise identified:

- For DOS/VSE Operation: VSE Release 1 with VSAM and BTAM-ES and/or ACF/VTAME.
- For OS/VS Operation: OS/VS1 Release 7.0 or OS/VS2 Release 3.8 with VSAM and BTAM and/or VTAM and/or ACF/VTAM.

Minimum Virtual Storage Requirements:

Environment	Minimum Virtual
OS/VS	256K + VSAM and VTAM requirements
VSE using BTAM	306K + VSAM requirements
VSE using VTAM	292K + VSAM and VTAM requirements

The system must include S/370 or 4300 control units and features which are necessary for support of the 3650 and/or 3680 Programmable Store Systems and/or the 3650 Retail Store System and/or the 3660 Supermarket Systems.

SOFTWARE REQUIREMENTS

This program product is written in S/370 Assembler language and requires the S/370 Assembler for installation, modification and program error correction.

The OS/VS version of this program release uses the System Modification Program (SMP) for distribution and maintenance; the VSE/AF version uses the Maintain System History Program (MSHP). SMP and MSHP both provide improved installability and serviceability, and allow the user to better control the function and service level of his system.

COMPATIBILITY

The inbound and outbound data sets for the Supermarket controllers and the Supermarket schedule commands are compatible with 3660 Supermarket Batch Communication Subsystem/Advanced Scheduling Environment (FDP 5798-CJQ) and 3660 Advanced Scheduling Environment for CICS/VS (FDP 5798-CQC).

PROGRAM PRODUCTS

**5735-XR3 - HOST PREP for DPCX R 5.0, 6.0
HOST PREP LICENSED PROGRAM FOR SUPPORT of
DISTRIBUTED PROCESSOR CONTROL EXECUTIVE (DPCX)
RELEASES 5.0 and 6.0**

PURPOSE

Host Prep provides host support for 8100/DPCX to OS/VS1 Release 7.0, OS/VS2 (MVS) Release 3.8, and DOS/VSE users (and to users of all subsequent releases of these SCPs unless otherwise specified) on S/370, 30XX and 4300 Processors. Included are Instruction Support, Program Validation Services, Batch Data Exchange Services and Subsystem Information Retrieval Facility, for application programs using functions offered with DPCX Version 1 Releases 3 and 4 and DOSF Releases 3 and 4.

HIGHLIGHTS

Host Prep Release 5 is required to support the following DPCX Release 4 functions:

- Support of up to 191 user data areas.
- Support for Document Content Architecture, Revisable Form Text, Level 3 (L3DCA).
- Support of the 8140 model C.
- Up to 62 concurrently active user tasks.
- Set of programming statements enhancing data movement, editing, and index record update capabilities.
- Set of programming statements supporting 8775 and 3274-51C Enhanced Display Functions.
- Set of programming statements supporting distributed indexed access method (DPCX/DXAM/RSAM).
- Set of programming statements accessing the 32K byte virtual storage offered as part of the enhanced symbolic machines.
- Set of programming statements supporting large displays with 2560 and 3440 characters.
- Set of programming statements supporting the general spool file.
- Support for batch data exchange of the larger Relative Sequential Data Set (RSDS) data records.
- Support for receipt of the larger application program dump resulting from the enhanced symbolic machines, and its formatted printing.
- Text programming statements used with the 8775 loaded with the Interactive Display Text Facility (IDTF) program product.
- Translate and table lookup instructions.
- Modified instructions providing a capability to by-pass waiting after trying to access locked records or writing to a terminal.
- Support for transmission of user programs, panels, categories and subcategories, relative DSCBs, indexed DSCBs and RSDS DSCB key fields.
- Text programming statements used with a 327X/8775 terminal.
- A GOTO instruction which has forward and backward branches.
- Call/Return and Save/Restore facilities allowing an unlimited number of levels.
- Support for creation of subcategories for disk space allocation.
- Support for receipt of the 8100 standalone system dump, and its formatted printing.

If the above functions are not required, the SCP programs 5747-BQ1 (DOS/VS) and 5744-BZ3 (OS/VS) provide the required support.

Host Prep provides the following support:

- The Instruction Sets provide the ability to write 8100/DPCX, 3790, 3770 and 3730 programs, panels and data set control information.

This support includes:

- Assembly rules for S/370 OS/VS and DOS/VS assemblers.
- Assembly time error messages.
- High level macros.
- Program Validation Services (PVS) validates all 8100/DPCX, 3790, 3770, and 3730 programs and panels and creates data set control information. PVS provides the ability to test most of the functions of the above distributed processors, specifically:
 - Validates assembled programs.
 - Hardcopy of panels.
 - Simulates running of programs w/wo interactive interface.
 - Creates data set control information.
 - Formats and blocks programs, panel and data set control information for transmission to the distributed processors.

- The Subsystem Information Retrieval Facility (SYSINFOREF) provides centralized control of PTFs and REAs for 8100/DPCX, 3790 distributed processor networks. Also provided is access (from the S/370) to selected problem determination tools resident at the distributed processor. The SYSINFOREF provides:
 - Central control/monitoring of PTF/REA conditions of the network.
 - Ability to retrieve and monitor selected error indicators.
 - Retrieval of program and system dumps.
 - Transmission of user programs, panels, categories and subcategories, relative DSCBs, indexed DSCBs and RSDS DSCB key fields.

- Batch Data Exchange Services (BDES) is a substitute for the 8100/DPCX or 3790 to host teleprocessing link. BDES uses diskette and tape as its transmission media for:
 - Transmission of programs, panels and data set control blocks information.
 - Transmission of data records and messages.
 - Receipt of program dumps, completed transactions and messages.

- Batch Data Exchange Services (BDES) is a substitute for the 8100/DPCX or 3790 to host teleprocessing link. BDES uses diskette and tape as its transmission media for:

- Transmission of programs, panels and data set control blocks information.
- Transmission of data records and messages.
- Receipt of program dumps, completed transactions and messages.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

- Host Prep is designed to operate on IBM S/370, 30XX and 4300 processors with a minimum of 1M bytes above operating system requirements.

SOFTWARE REQUIREMENTS

PROGRAM PRODUCTS

**5735-XXA - ACF/SSP V2.1.1
ACF/SYSTEM SUPPORT PROGRAMS
VERSION 2 RELEASE 1.1****PURPOSE**

ACF/System Support Programs (ACF/SSP) Version 2 Release 1.1 provides generation and utility functions for users of ACF/NCP Version 2 and users of EP on 3705-II and 3705-80 Communication Controllers, plus ACF/NCP Version 2 for the 3725, and users of Emulation Program (EP) on the 3725 Communications Controllers.

HIGHLIGHTS

Supports the 3725 and 3705 Communication Controllers.

Provides the generation and utility functions offered by ACF/SSP Version 1 (Assembler, load utility, dump utility, dynamic dump utility, and ACF Trace Analysis program) plus:

- Configuration management, through a configuration report program which is a stand-alone utility by which the user may produce a report of his resource and line information, tailored to provide meaningful and representative information on his configuration.
- Reduced system generation time for ACF/NCP Version 2 for the 3725.

DESCRIPTION

- Supports the 3725 and 3705 Communication Controllers.
- A stand-alone configuration report program, which uses as input one or more stage 1 NCP, EP or PEP generation decks, provides the user a detailed report of resources and resource attributes of his network. The report, which separates SNA devices from non-SNA devices, can contain the following information:
 - Resource Level: Group, line, service (for SNA devices: PU, LU); (for non-SNA devices: Cluster, terminal, component).
 - Resource Name.
 - Network Address (actual).
 - Address (as specified on the appropriate macro).
 - Control Unit Type.
 - Physical Unit Type (SNA devices only).
 - Data Mode (duplex or half-duplex - SNA devices only).
 - Line Type (duplex or half-duplex).
 - Line Speed.
 - Resource Type (NCP, EP or PEP - non-SNA devices only).
 - Subarea Address (SNA devices only).
 - Clocking (internal and external).
 - Line Control (for SNA devices: User or SDLC; for non-SNA devices: BSC or S/S).
 - Dial (yes or no).
 - Dial number (non-SNA devices only).
 - For SNA Devices: Virtual or real status, NRZ or NRZI encoding, PUDRPOOL, LUDRPOOL, LUPOOL, NCPNAU, Service Order.

By optionally selecting only certain macros for processing, and by using comments, the user may tailor the report to provide meaningful and representative information on his configuration.

- The time required to generate a network control program for the 3725 Communication Controller has been reduced by the elimination of conditional assemblies. The resultant NCP will support both normal and character modes for the scanners, primary and secondary links, all terminal type parameters, all line controls, both local and remotely-loaded NCPs, panel test and online test. Although the controller storage required is now larger, the benefits of reduced complexity and generation time should outweigh the impact to storage. This impact will vary depending on configuration size; an NCP user who previously selected more options (representing a complex and varied configuration) will have a smaller increase in storage capacity than will the user who previously selected fewer options.
- Allows generation of ACF/NCP Version 2, its partitioned emulation programming (PEP) extension, and EP for the 3705, provided by Program Number 5747-CH2 with the EP/VS feature.
- Allows generation of ACF/NCP Version 2 for the 3725, its partitioned emulation programming (PEP) extension, and EP/3725.
- Loads the 3705 and 3725 Communication Controllers with a specified load module.
- Dumps the storage and register contents (in formatted or unformatted mode) of the 3705 and 3725 Communication Controllers.

- Formats the Maintenance Operator Subsystem (MOSS) and Communication Scanner Processor (CSP) dump data sets of the 3725.
- Allows the EP user to obtain a dynamic dump of emulation mode trace table entries, to activate or deactivate the character mode line trace function, to obtain a dump of 3705 or 3725 storage, or display portions of storage at the system console
- Assembler programs written in 3705 or 3725 Assembler language.
- Utilizes the ACF Trace Analysis Program (ACF/TAP) to provide a common trace facility for use with the appropriate release of ACF/TCAM Version 2 or ACF/VTAM and ACF/NCP Version 2 for the 3705 or Version 2 for the 3725 with SDLC, BSC, or start-stop line disciplines.

PLANNING CONSIDERATIONS

The Network Control Program user will require ACF/NCP Version 2 (5735-XX9) for the 3705 or 3725, ACF/SSP Version 2 Release 1.1 (5735-XXA), and the required access methods and operating systems.

The 3725 Partitioned Emulation Programming user will, in addition, require EP/3725.

The 3705 Partitioned Emulation Programming user will require Program Number 5747-CH2 for the EP feature, in order to generate and operate ACF/NCP Version 2 for the 3705 PEP.

The stand-alone Emulation Program user will require EP/3725 or 5747-CH2 with the EP feature and ACF/SSP Version 2 Release 1.1 in order to generate and operate EP on the 3725 or 3705.

CUSTOMER RESPONSIBILITIES

To install and use ACF/SSP Version 2, the customer must:

- Order ACF/System Support Programs Version 2 (5735-XXA).
- Design the single system network or multiple host communications system network.
- Meet the configuration and system requirements for the 3725 or 3705 and ACF/NCP Version 2 for the 3705 or Version 2 for the 3725, or EP for the customer environment.
- Install ACF/SSP Version 2 Release 1.1.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

ACF/SSP Version 2 is designed to operate with at least one locally-attached 3705-II or 3705-80 Communication Controller meeting the storage requirements of ACF/NCP Version 2 or EP for the 3705. ACF/SSP Version 2 Release 1.1 is designed to operate the same as Version 2, and, in addition, to operate with at least one locally-attached 3725 Communication Controller meeting the storage requirements of ACF/NCP Version 2 for the 3725 or EP/3725.

SOFTWARE REQUIREMENTS

ACF/SSP Version 2 is supported under VSE/AF Release 3, SSX/VSE Release 3, OS/VS1 Release 7, VM/SP Release 2.1, and OS/VS2 MVS Release 3.8 or MVS/SP Release 1.3.1. For reasons of compatibility and co-existence, ACF/SSP Version 2 will operate with the appropriate VTAM release in MVS Extended Architecture (MVS/XA) 24-bit addressing mode.

ACF/SSP Version 2 operates as a non-system task under DOS/VSE, SSX/VSE, OS/VS1, and OS/VS2 MVS. It is designed to operate with ACF/NCP Version 2 for the 3725, and Program Number 5747-CH2 with the EP/VS feature or EP/3725.

PROGRAM PRODUCTS

ACF/SSP V2R1.1 (cont'd)

RPOs ACCEPTED: No

**5735-XXA - ACF/SSP V2 R2
ACF/SYSTEM SUPPORT PROGRAMS
VERSION 2 RELEASE 2
MVS/370 and MVS/XA (Compatibility Mode)**

ACF/System Support Programs (ACF/SSP) Version 2 Release 2 is a licensed program which provides generation and utility functions for users of ACF/NCP Version 3 for the 3705 and the 3725 (5667-124) and Emulation Program for the IBM Communication Controllers (5735-XXB).

ACF/SSP Version 2 Release 1.1 will remain available for support of ACF/NCP Version 2, Emulation Program for the 3705, and EP/3725.

HIGHLIGHTS

- Supports 3725 and 3705 Communication Controllers
- Provides for ACF/NCP Version 3 the generation and utility functions offered by ACF/SSP Version 2 R1.1 (assembler, load utility, dump utility, dynamic dump utility, configuration report program, and ACF Trace Analysis Program) plus:
 - Reduced system generation time for ACF/NCP Version 3 for the 3705, previously incorporated in ACF/SSP Version 2 Release 1.1 for the 3725
- Usability enhancements to the ACF Trace Analysis Program
- Configuration Report Program enhancements

DESCRIPTION

- Supports the 3725 and 3705 Communication Controllers.
- For the 3705, allows generation of ACF/NCP Version 3, its partitioned emulation programming (PEP) extension, and EP for the 3705 provided by program product 5735-XXB.
- For the 3725, allows generation of ACF/NCP Version 3, its partitioned emulation programming (PEP) extension, and EP for the 3725 also provided by program product 5735-XXB.
- The stand-alone configuration report program is enhanced to provide extraction and printing of additional macros and their operands. Information concerning the 386X modems has also been added.
- The time required to generate a network control program for the 3705 has been reduced through elimination of conditional assemblies. The resultant NCP will support primary and secondary links, all terminal-type parameters, all line controls, both local and remotely-loaded NCPs, panel test, and online test. Although the controller storage required is now larger, the benefits of reduced complexity and generation time should outweigh the impact to storage. This impact will vary depending on configuration size; an NCP user who previously selected more options (representing a complex and varied configuration) will have a smaller increase in storage capacity than will the user who previously selected fewer options. This reduction in system generation time was previously included for the 3725 in ACF/SSP Version 2 Release 1.1 and ACF/NCP Version 2 for the 3725.
- Provides formatting for SNA Network Interconnection control blocks, direct addressable control blocks, and interrupt pointers.
- Enhances the ACF Trace Analysis Program (ACF/TAP) through increased selectivity to achieve data reduction and aid problem determination and problem source identification, and through printing of NTO and NRF traces.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

ACF/SSP Version 2 Release 2 is designed to operate with at least one IBM 3705-II, IBM 3705-80, or IBM 3725 Communication Controller meeting the storage requirements of ACF/NCP Version 3 or Emulation Program for the IBM Communication Controllers.

SOFTWARE REQUIREMENTS

ACF/SSP Version 2 Release 2 is supported under MVS Release 3.8 or MVS/SP Release 1 and MVS/XA in compatibility mode.

ACF/SSP Version 2 Release 2 operates as a non-system task under MVS. It is designed to operate with ACF/NCP Version 3 for the IBM 3705 and IBM 3725 (5667-124) and Emulation Program for the IBM Communication Controllers (5735-XXB).

PLANNING CONSIDERATIONS

The Network Control Program user will require ACF/NCP Version 3 for the IBM 3705 and the IBM 3725, ACF/SSP Version 2 Release 2, and the required access methods and operating systems.

The Partitioned Emulation Programming user will, in addition, require Emulation Program for the IBM Communication Controllers in order to generate and operate ACF/NCP Version 3.

ACF/SSP Version 2 Release 1.1 will continue to remain available in support of ACF/NCP Version 2 for the IBM 3705 and the IBM 3725,

Emulation Program for the IBM 3725 Release 1, and the Emulation Program (5747-CH2).

Education: ACF/SSP courses will be updated to include ACF/SSP Version 2 Release 2.

MVS INTEGRITY

IBM will accept APARs where the installation of ACF/SSP Version 2 Release 2 introduces an exposure to the system integrity of MVS. This program is intended to run unauthorized.

Licensed Program Material Availability: ACF/SSP Version 2 Release 2 source code and microfiche will be available as restricted materials.

**5735-XXB - EMULATION PGM for 3705-II, -80/3725
EMULATION PROGRAM for IBM COMMUNICATION
CONTROLLERS**

PURPOSE

The Emulation Program for IBM Communication Controllers allows a channel-attached 3705-80 or 3705-II Communications Controller with Channel Adapter Type 4 (CA-4), or a channel-attached 3725 Communication Controller, to perform most of the functions of a 2701 Data Adapter Unit and the 2702 or 2703 Transmission Control Units.

HIGHLIGHTS of EMULATION PROGRAM for the 3705

Offers users of 3705 Communications Controllers with Channel Adapter Type 4 (CA-4), operating in a MVS environment, function equivalent to that offered by existing releases of EP/VS, plus:

- Increased flexibility in storage utilization, which can be used for additional EP lines.
- Users of the Partitioned Emulation Programming (PEP) Extension of ACF/NCP V3 for the 3705, can have emulation mode capability only in conjunction with Emulation Program for the 3705.

HIGHLIGHTS of EMULATION PROGRAM for the 3725 RELEASE 1

Offers users of 3725 Communication Controllers operating in OS/VS1, MVS/370, VSE, or VM/SP environments function equivalent to that offered by existing releases of EP/VS, plus:

- Support of up to six channel adapters.
- Enhanced problem determination tools.
- Enhanced error recording and notification.
- Improved availability through continued operation and controlled shutdown in various failure situations.
- Incorporates the S.W.I.F.T. PRPQ (5799-AQT), which assists the EP or PEP user to directly link to the network of the Society for Worldwide Interbank Financial Telecommunication, S.C.
- Supports the 3101 Display Terminal at 1200 bps over switched and nonswitched lines.

HIGHLIGHTS of EMULATION PROGRAM for the 3725 RELEASE 2

Offers users of 3725 Communication Controllers, operating in an MVS environment, function equivalent to that offered by the Emulation Program for the 3725, Release 1, plus

- Support for the enhanced Start/Stop capability of the 3725.
- Support for the BSC tributary normal mode capability of the 3725.
- Users of the Partitioned Emulation Programming (PEP) Extension of ACF/NCP V3 for the 3725, can have emulation mode capability only in conjunction with Emulation Program for the 3725, Release 2.

DESCRIPTION

Emulation Program for the 3705:

- Emulation Program for the 3705 takes advantage of the capability of ACF/NCP V3 for the 3705 that allows key control blocks to be extended above the 64K boundary, and is therefore required for PEP operation in conjunction with ACF/NCP V3 for the 3705.
- Emulation Program for the 3705 supports Channel Adapters Type 4 (CA-4) only. The removal of CA-1 support, in combination with the extension of key control blocks above 64K as noted above, allows for increased flexibility in storage utilization, which can be used for the addition of EP lines.

Emulation Program for the 3725:

- The 3725 Communication Controller provides a keyboard/display that Emulation Program for the 3725 supports with problem determination tools, allowing the controller operator to:
 - Perform wrap test.
 - Activate line test in order to test the operation of lines, modems, and terminals.
- Emulation Program for the 3725 additionally offers problem determination tools that allow the system operator to:
 - Obtain a dump of controller's maintenance and diagnostic records, or of communications scanner processor storage.
 - Activate line trace for a given line in order to verify that the controller is sending and receiving correct data to and from a station.
 - Activate scanner interface trace for a given line in order to isolate problems to EP or communications scanner processor.
- Emulation Program for the 3725, in conjunction with the 3725 Maintenance and Operator Subsystem, maintains several types of error and statistical records that are helpful in problem determination:

- Channel adapter errors, communication scanner errors, program checks, and unresolved interrupts.
- The 100 most recent such error records may be accessed through the 3727.

- In addition to existing availability and recovery functions in the emulation program, Emulation Program for the 3725 and the 3725 Maintenance and Operator Subsystem offer improved availability through continued operation and controlled shutdown of the failing components in the following situations:

- Unrecoverable Level 1 error on a 3725 channel adapter.
- Unrecoverable Level 1 error on a single communications scanner.

- Emulation Program for the 3725 incorporates the S.W.I.F.T. PRPQ (5799-AQT), which is designed to assist the EP or PEP user to directly link to the network of the Society for Worldwide Interbank Financial Telecommunication, S.C.

- Emulation Program for the 3725 supports the 3101 Display Terminal at 1200 bps over switched and nonswitched lines.

- Emulation Program for the 3725, Release 2, supports the Start/Stop performance improvement and BSC Tributary Normal Mode capabilities of the 3725. Emulation Program for the 3725, Release 2, is required for PEP operation in conjunction with ACF/NCP V3 for the 3725.

PLANNING INFORMATION

Emulation-mode capability for the user of the Partitioned Emulation Programming (PEP) extension of ACF/NCP Versions 2 and 3, is provided according to the following support matrix:

	ACF/NCP Version 2		ACF/NCP Version 3	
	3705	3725	3705	3725
Emulation Pgm/3705	No	No	Yes	No
Emulation Pgm/3725, R1	No	Yes	No	No
Emulation Pgm/3725, R2	No	No	No	Yes

Emulation Program for the 3705 is designed to operate only in 3705 Communications Controllers with Channel Adapter Type 4 (CA-4). Channel Adapters Type 1 (CA-1) are not supported. In a PEP environment, ACF/NCP Version 3 for the 3705 is required. Coexistence of 270X, 370X, and 3725 in a common host environment is supported, as is co-existence of EP/VS and Emulation Program for the 3705.

Emulation Program for the 3725 is designed to operate only in the 3725 Communication Controller. Coexistence of 270X, 370X, and 3725 in a common host environment is supported.

Host access methods which currently support existing levels of EP/VS, within the specified operating environment of Emulation Program for IBM Communication Controllers, will support Emulation Program for IBM Communication Controllers without any host access method modifications.

Existing PRPQs, FDPs, and IUPs are not supported with Emulation Program for the 3705.

Changes will be required to the system generation deck to migrate to Emulation Program for the 3725. These modifications are not extensive and are relatively simple to implement. They include the addition and deletion of certain macros and macro operands. See *ACF/NCP and SSP, Installation and Resource Definition* (SC30-3167) for details.

For users of Emulation Program for the 3725, changes will be required to any user-written programs or online test programs using any of the following: ALC line support, the Host Wrap command, TTY Echo check detection, the host Dial command with more than 64 dial digits, the host Poll command with poll entries greater than 56 bytes used on a normal mode line (i.e., one providing Level-2 interrupts on a buffer, rather than a character, basis), or terminal support for 2703 (as a terminal), 2760, 2980, 3940, or 3980.

CUSTOMER RESPONSIBILITIES

To install and use Emulation Program for the 3705 in a Partitioned Emulation Programming (PEP) environment, the customer must:

- Design the network.
- Meet minimum 3705 configuration requirements to support Emulation Program for the 3705 and ACF/NCP V3 for the 3705 in the planned environment.
- Order and install all required communications equipment.
- Order and install Emulation Program for the 3705 (5735-XXB), ACF/NCP V3 for the 3705 (5667-124), and ACF/System Support Programs V2 R2 (5735-XXA).

PROGRAM PRODUCTS

Emulation Program for 3705-II, -80/3725 (cont'd)

- Generate Emulation Program for the 3705 and ACF/NCP V3 using the ACF/System Support Programs V2 R2 for the network configuration.
- Load the 3705 with the generated PEP load module, using, for example, the ACF/System Support Programs V2 R2.
- Meet the requirements of the host processor access method that is to communicate with the generated and loaded Emulation Program for the 3705 and ACF/NCP V3 PEP load module.

To install and use Emulation Program for the 3705 in a Stand-Alone Emulation Programming environment, the customer must:

- Design the network.
- Meet minimum 3705 configuration requirements to support Emulation Program for the 3705 in the planned environment.
- Order and install all required communications equipment.
- Order and install Emulation Program for the 3705 (5735-XXB), and ACF/System Support Programs V2 R2 (5735-XXA).
- Generate Emulation Program for the 3705 using the ACF/System Support Programs V2 R2 for the network configuration.
- Load the 3705 with the generated EP load module, using, for example, the ACF/System Support Programs V2 R2.
- Meet the requirements of the host processor access method that is to communicate with the generated and loaded Emulation Program for the 3705.

To install and use Emulation Program for the 3725, Release 1, in a Partitioned Emulation Programming (PEP) environment, the customer must:

- Design the network.
- Meet minimum 3725 configuration requirements to support Emulation Program for the 3725 Release 1, and ACF/NCP V2 for the 3725 in the planned environment.
- Order and install all required communications equipment.
- Order and install Emulation Program for the 3725 Release 1 (5735-XXB), ACF/NCP V2 for the 3725 (5735-XX9), and ACF/System Support Programs V2 R1.1 (5735-XXA).
- Generate Emulation Program for the 3725 and ACF/NCP V2 using the ACF/System Support Programs V2 R1.1 for the network configuration.
- Load the 3725 with the generated PEP load module, using, for example, the ACF/System Support Programs V2 R1.1.
- Meet the requirements of the host processor access method that is to communicate with the generated and loaded Emulation Program for the 3725 and ACF/NCP V2 PEP load module.

To install and use Emulation Program for the 3725 Release 1 in a Stand-Alone Emulation Programming environment, the customer must:

- Design the network.
- Meet minimum 3725 configuration requirements to support Emulation Program for the 3725 Release 1 in the planned environment.
- Order and install all required communications equipment.
- Order and install Emulation Program for the 3725 Release 1 (5735-XXB), and ACF/System Support Programs V2 R1.1 (5735-XXA).
- Generate Emulation Program for the 3725 using the ACF/System Support Programs V2 R1.1 for the network configuration.
- Load the 3725 with the generated EP load module, using, for example, the ACF/System Support Programs V2 R1.1.
- Meet the requirements of the host processor access method that is to communicate with the generated and loaded Emulation Program for the 3725.

To install and use Emulation Program for the 3725, Release 2, in a Partitioned Emulation Programming (PEP) environment, the customer must:

- Design the network.
- Meet minimum 3725 configuration requirements to support Emulation Program for the 3725 Release 2, and ACF/NCP V3 for the 3725 in the planned environment.
- Order and install all required communications equipment.
- Order and install Emulation Program for the 3725 Release 2 (5735-XXB), ACF/NCP V3 for the 3725 (5667-124), and ACF/System Support Programs V2 R2 (5735-XXA).

- Generate Emulation Program for the 3725 and ACF/NCP V3 using the ACF/System Support Programs V2 R2 for the network configuration.
- Load the 3725 with the generated PEP load module, using, for example, the ACF/System Support Programs V2 R2.
- Meet the requirements of the host processor access method that is to communicate with the generated and loaded Emulation Program for the 3725 and ACF/NCP V3 PEP load module.

To install and use Emulation Program for the 3725 Release 2 in a Stand-Alone Emulation Programming environment, the customer must:

- Design the network.
- Meet minimum 3725 configuration requirements to support Emulation Program for the 3725 Release 2 in the planned environment.
- Order and install all required communications equipment.
- Order and install Emulation Program for the 3725 Release 2 (5735-XXB), and ACF/System Support Programs V2 R2 (5735-XXA).
- Generate Emulation Program for the 3725 using the ACF/System Support Programs V2 R2 for the network configuration.
- Load the 3725 with the generated EP load module, using, for example, the ACF/System Support Programs V2 R2.
- Meet the requirements of the host processor access method that is to communicate with the generated and loaded Emulation Program for the 3725.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Emulation Program for the IBM 3705 is designed to operate only on channel-attached IBM 3705-80 and 3705-II with Channel Adapter Type 4. Channel Adapters Type 1 are not supported. Emulation Program for the IBM 3725, Releases 1 and 2 are designed to operate only on channel-attached IBM 3725 Communication Controllers.

SOFTWARE REQUIREMENTS

Emulation Program for the IBM 3725, Release 1, is generated using the ACF/System Support Programs (ACF/SSP) Version 2 Release 1.1 licensed program 5735-XXA, and operates with OS/VS1 Release 7, OS/VS2 MVS Release 3.8 or MVS/SP Release 1, VSE/AF Release 3, and VM/SP Release 2.1, and subsequent releases and modifications unless otherwise stated.

Emulation Program for the IBM 3705, and Emulation Program for the 3725, Release 2, are generated using the ACF/System Support Programs (ACF/SSP) Version 2 Release 2 licensed program 5735-XXA, and operate with OS/VS2 MVS Release 3.8 or MVS/SP Release 1, and MVS/XA in compatibility mode, and subsequent releases and modifications unless otherwise stated.

In a Partitioned Emulation Programming (PEP) environment, ACF/NCP Version 2 for the IBM 3725 (5735-XX9) is required for Release 1 of Emulation Program for the IBM 3725; ACF/NCP Version 3 (5667-124) is required for Emulation Program for the IBM 3705 and for Release 2 of Emulation Program for the IBM 3725.

Emulation Program for the IBM 3705 and 3725 supports the following access methods: BTAM, BTAM-SP, ACF/TCAM, RTAM.

Ordering Previous Releases of EP/VS and EP for the 3725: 3705 Communications Controller customers desiring CA-1 support, and/or not requiring PEP mode support in conjunction with ACF/NCP Version 3, can continue to order 5747-CH1 and 5747-CH2 with the EP/VS feature, after the availability of the Emulation Program for the 3705.

3725 Communication Controller customers not requiring PEP mode support in conjunction with ACF/NCP Version 3, or the additional capabilities of Emulation Program for the 3725, Release 2, can continue to order Release 1 of Emulation Program for the 3725, after the availability of Release 2 of the Emulation Program for the 3725.

PERFORMANCE and STORAGE CONSIDERATIONS

For users of Emulation Program for the 3705, the elimination of Channel Adapter Type 1 (CA-1) support, in combination with the ability for key control blocks to be extended above the 64K boundary can result in increased flexibility in storage utilization, which can be used for the addition of EP lines.

Path lengths for Emulation Program for the 3725 should closely approximate those for Emulation Program for the 3705. This, in combination with the performance improvements of the 3725 Communication Controller, should result in a substantial gain in performance.

For users of Emulation Program for the 3725, Release 2, the support of the start/stop performance improvement and BSC Tributary Normal Mode capabilities of the 3725 can result in increased performance in those areas.

**ADVANCED COMMUNICATIONS FUNCTION
FOR NCP/V5 (ACF/NCP/V5)
VERSION 1 RELEASE 2
5735-XX1**

PURPOSE

Advanced Communications Function for NCP/V5 Version 1 Release 2 is a program product for users of DOS/V5, OS/V51, and OS/V52 (MVS) that can provide additional capabilities for problem determination, network operation and data communications.

ACF/NCP/V5 R2 is designed to operate with ACF/TCAM Version 2 and ACF/VTAM Version 1 R2.

HIGHLIGHTS of ACF/NCP/V5 RELEASE 2

Problem determination and network operation ... Includes additional functions that can assist in optimizing management and control of a user's data communication installation.

- Enhanced SDLC data link test.
- SNA terminal connectivity test.
- Enhanced recording of SDLC data link error conditions.
- Dynamic reconfiguration of nonswitched SNA-SDLC devices.
- Expanded display, through ACF/TCAM Version 2 or ACF/VTAM Version 1 Release 2 of network control program storage in the 3705.
- Enhancements to line trace for Communications Scanner, Type 3.
- Supports the Network Communications Control Facility program product and its related Network Problem Determination Application program product.

Additional data communications capabilities ... Includes improved flexibility for session operations and enhanced device support.

- Negotiable session initialization parameters.
- Provides additional parameters that are used by the Network Terminal Option program product.
- Supports 3705-II Communications Controller enhancement.

SUMMARY and ADVANTAGES of ACF/NCP/V5 R2

Problem determination and network operation functions ...

- **Enhanced SDLC Data Link Test:** Offers the capability to dedicate one station on an SDLC link to testing while allowing the remaining stations on that link to remain active. When a station comprises a cluster controller and its attached devices, the control unit is dedicated to the test; its attached devices are deactivated.
- **SNA Terminal Connectivity Test:** Provides the capability of initiating an echo test from the terminal end of a session to determine that a SNA terminal and the connection to its owning SSCP are functioning correctly.
- **Enhanced Recording of SDLC Link Error Conditions:** Includes improved error statistics counters, as well as intensive mode error recording. Intensive mode error recording provides, through operator control, the capability of informing ACF/NCP/V5 Release 2 to record detailed error information about temporary SDLC data link errors. Such detailed information could preclude the need for specific testing in order to recreate an error situation.
- **Dynamic reconfiguration:** Allows the user to selectively alter the physical network definition for SNA-SDLC physical unit types 1 and 2 (i.e., SNA-SDLC devices excluding host processors and communications controllers), without stopping network operation. The result is greater network configuration flexibility for additional or relocated SDLC terminal support, supporting temporary or test configurations in a non-disruptive fashion, until a permanent network control program generation can be done.
- **Dynamic Display:** Allows the network operator, through ACF/TCAM Version 2 or ACF/VTAM Version 1 Release 2, to display any contiguous 256 bytes of ACF/NCP/V5 storage without disrupting normal ACF/NCP/V5 operation. ACF/VTAM Version 1 Release 2 takes advantage of this support to dynamically dump entire ACF/NCP/V5 storage excluding program and hardware registers, in 256 byte increments, without disrupting normal ACF/NCP/V5 operation.
- **Enhancements to Line Trace for Communications Scanner, Type 3:** Includes the address of the network control program routine that will handle the interrupt, the network control program I/O operation being performed and the condition of the data set leads.
- **Support for the Network Communication Control Facility Program Product:** Offers enhanced problem determination and network operation via programmed support.

Additional data communications capabilities ...

- **Negotiable Session Initialization Parameters:** Allow a more flexible session initialization process. Actual BIND parameter values can be

selected at session initiation; the receiver of the BIND image may alter the image and send it back to the issuer, who may accept or reject it.

- **Support for the Network Terminal Option and Related Capabilities:** Allows the inclusion of IBM-provided code that extends record mode operation to 2741, 2740 mdl 1, Western Union TWX mdl 33/35, and World Trade Teletypewriter (WTTY) terminals, and permits these terminals to participate in a multisystem as well as a single system environment.

When special user requirements make it necessary to add user-written code to the network control program, the support provided by ACF/NCP/V5 R2 allows the inclusion of user initialization routines to be executed during ACF/NCP/V5 R2 initialization, and the inclusion of user-written network addressable units which execute as part of ACF/NCP/V5 R2. These routines may be used to add programmed SNA resources, to support non-SNA devices through user-written code, or for the addition of line control support not supported by ACF/NCP/V5 but compatible with the 3705 communications scanner type 2 or type 3. This support should be used with the understanding that subsequent releases of ACF/NCP/V5 might precipitate changes to the user-written code.

- **3705-II enhancements (mdls J, K, & L) include**

- Support of additional memory up to 512K bytes of storage.
- A cycle utilization counter that allows ACF/NCP/V5 R2 to accumulate statistical data on 3705 cycle utilization for user access. This includes cycles taken for instruction execution and cycle steal operation, as well as operator panel maintenance cycles. From this data ACF/NCP/V5 R2 can provide information on the percentage of available cycles utilized. In a similar manner, ACF/NCP/V5 R2 can provide information on the percentage of buffers available.

CUSTOMER RESPONSIBILITIES

To install and use ACF/NCP/V5 R2 the customer must:

- Design the single system network or multiple host communications system network.
- Meet minimum 3705 configuration requirements to support ACF/NCP/V5 R2 in the planned environment.
- Order and install all required communications equipment.
- Order and install ACF/NCP/V5 R2 and the System Support Programs for ACF/NCP/V5 R2 program products and prerequisite system control programming.
- Generate ACF/NCP/V5 R2 using the System Support Programs for ACF/NCP/V5 R2, for the network configuration.
- Load the 3705-I or 3705-II with the generated ACF/NCP/V5 load module, using, for example, the System Support Programs for ACF/NCP/V5 R2.
- Meet the requirements of the host communications access method products to be operational with ACF/NCP/V5 R2.

MIGRATION and PLANNING CONSIDERATIONS

Migrating from NCP/V5 5.0 or ACF/NCP/V5 R1 to ACF/NCP/V5 R2: The following migration paths are available for the given levels of NCP/V5 and ACF/NCP/V5:

NCP/V5 5.0 will operate with the following access method levels:

- TCAM 10.0.
- ACF/TCAM V1.
- ACF/TCAM V2 R1 and R2.
- VTAM 2.0.
- ACF/VTAM V1 R1.

ACF/NCP/V5 R1 will operate with the following access method levels:

- TCAM 10.0.
- ACF/TCAM V1.
- ACF/TCAM V2 R1.
- ACF/TCAM V2 R2.
- VTAM 2.0.
- ACF/VTAM V1 R1.
- ACF/VTAM V1 R2.

ACF/NCP/V5 R2 will operate with:

- TCAM 10.0.
- ACF/TCAM V1.
- ACF/TCAM V2 R1.
- ACF/TCAM V2 R2.
- VTAM 2.0 (OS/V51 & OS/V52 MVS only).

PROGRAM PRODUCTS

ACF/NCP/VS V1R2 (cont'd)

- ACF/VTAM V1 R1.
- ACF/VTAM V1 R2.
- ACF/NCP/VS R1 (either local or remote).
- ACF/NCP/VS R2 (either local or remote).

Functions supported by NCP/VS 5.0 or ACF/NCP/VS R1 with the appropriate level of TCAM, ACF/TCAM, VTAM, or ACF/VTAM Version 1 are also supported by ACF/NCP/VS R2 with the appropriate access method and PTF levels.

Planning Considerations: Use of ACF/NCP/VS requires the concurrent installation of prerequisite NCP/VS System Control Programming (SCP).

ACF/NCP/VS R2 is generated using the System Support Programs for ACF/NCP/VS Release 2, program product 5735-XX3.

ACF/NCP/VS R2 operates with the following communications controllers:

- 3705-I Communications Controller with a minimum of 80K bytes of storage.
- 3705-II Communications Controller with a minimum of 96K bytes.

Although ACF/NCP/VS R2 will support existing levels of ACF/TCAM and ACF/VTAM Version 1, the support is at the functional level of the access method; full capability depends on coexistence with ACF/TCAM Version 2 and/or ACF/VTAM Version 1 Release 2.

COMPATIBILITY

ACF/NCP/VS R2 retains compatibility with ACF/NCP/VS R1 and offers compatibility with ACF/TCAM V1, ACF/TCAM V2, ACF/VTAM Version 1 Release 1, and ACF/VTAM Version 1 Release 2.

PROGRAM CURRENCY

ACF/NCP/VS R1 is currently supported under DOS/VS release 34, OS/VS1 releases 6.0 and 6.7, OS/VS2 (SVS) release 1.7, and OS/VS2 (MVS) releases 3.7 and 3.8.

ACF/NCP/VS R2 will be supported under DOS/VS release 34, OS/VS 1 releases 6.0 and 6.7, and OS/VS2 (MVS) releases 3.7 and 3.8, and subsequent releases unless otherwise specified.

(available from Mechanicsburg)

Advanced Communications Function for NCP/VS (ACF/NCP/VS) Release 2, Network Control Program ... System Support Programs General Information ... ACF/NCP/VS Release 2 Program Summary.

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**ADVANCED COMMUNICATIONS FUNCTION FOR
NCP/VS (ACF/NCP/VS)
VERSION 1 RELEASE 2 MODIFICATION LEVEL 1
5735-XX1**

ACF/NCP/VS Version 1 Release 2.1 supports the following new IBM product offerings:

- Link Problem Determination Aid (LPDA) for the new microprocessor-based modems.
- 230.4K bps line speed compatibility of the 3705-II.

Advanced Communications Function for NCP/VS Release 2.1 (ACF/NCP/VS R2.1) is a program product for users of DOS/VS, DOS/VSE, SSX/VSE Release 3, OS/VS1, and OS/VS2 (MVS), that provides support for LPDA and the 230.4K bps line speed capability of the 3705-II.

HIGHLIGHTS of ACF/NCP/VS RELEASE 2.1

- Support of LPDA for the new microprocessor based modems (3863, 3864, and 3865).
 - Generation of LPDA diagnostic test commands.
 - Automatically upon permanent station or link errors.
 - Automatically upon generation of Statistical Data Records.
 - On command from the Network Problem Determination Application (NPDA), Release 2.
 - Results of the LPDA tests are forwarded to NPDA for further processing.
- Support of the 230.4 KBPS line speed capability of the 3705-II.
 - Full Duplex SDLC or half duplex SDLC or BSC lines.
 - Line trace capability.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS:

ACF/NCP/VS R2.1 is designed to operate in the following communications controllers

- 3705-I Communications Controller with a minimum of 80K bytes of storage.
- 3705-II Communications Controller with a minimum of 96K bytes of storage.

SOFTWARE REQUIREMENTS

Co-requisite SCP: Use of ACF/NCP/VS requires the concurrent installation of Co-requisite NCP/VS system control programming (SCP).

Program Currency: ACF/NCP/VS R2 is currently supported under DOS/VS Release 34, DOS/VSE, SSX/VSE, OS/VS1 Releases 6.0, 6.7, and 7.0 and OS/VS2 (MVS) Releases 3.7 and 3.8.

ACF/NCP/VS R2.1 will be supported under DOS/VS Release 34, DOS/VSE, SSX/VSE, OS/VS1 Releases 6.7 and 7.0, and OS/VS2 (MVS) Release 3.8, and subsequent releases unless otherwise specified.

Customers can continue to order ACF/NCP/VS R2.1 after the availability of ACF/NCP/VS R3.

MIGRATION

Migrating to ACF/NCP/VS R 2.1: The following support alternatives are provided to aid in migration planning:

	NCP/VS 5.0	ACF/NCP/VS.....		R2.1 (2)	R3
		R1	R2		
TCAM 10.0	X	X	X*	X	NO
ACF/TCAM V1	X	X	X*	X	X
ACF/TCAM V2 R1	X	X	X	X	X
ACF/TCAM V2 R2	X	X	X	X	X
ACF/TCAM V2 R3	X	NO	X	X	X
VTAM 2	X	X*	X*(1)	X*(1)	NO
ACF/VTAM V1 R1	X	X	X*	X*	X
ACF/VTAM V1 R2	NO	X	X	X	X
ACF/VTAM V1 R3	NO	NO	X	X	X
ACF/VTAM V2	NO	NO	NO	X	X
NCP/VS V5	X	NO	NO	NO	NO
ACF/NCP/VS R1	NO	X	X	X	NO
ACF/NCP/VS R2	NO	X	X	X	X**
ACF/NCP/VS R2.1	NO	X	X	X	X**
ACF/NCP/VS R3	NO	NO	X**	X**	X

* Requires applicable access method PTFs.

** Requires applicable ACF/NCP/VS R2 and R2.1 PTF's.

1. OS/VS1 and OS/VS2 (MVS) only.

2. Requires EREP PTFs for LPDA level maintenance data records.

Note: The above matrix assumes that customers will be at current access method maintenance levels when migrating from one NCP release to another.

Planning Considerations: ACF/NCP/VS R3 is generated using the System Support Programs for ACF/NCP/VS Release 3, program product 5735-XX3.

Although ACF/NCP/VS R3 will support existing levels of ACF/TCAM and ACF/VTAM, the support is at the functional level of the access method; full capability depends on coexistence with ACF/TCAM V2 R3 and/or ACF/VTAM V1 R3 or ACF/VTAM V2.

COMPATIBILITY

ACF/NCP/VS R3 retains compatibility with ACF/NCP/VS R1 and R2 and offers compatibility with ACF/TCAM V1 and V2, and ACF/VTAM V1 R1, R2 and R3 with the exception of the SDLC/BSC Path Function.

Planning considerations: ACF/NCP/VS R2.1 is generated using the System Support Programs for ACF/NCP/VS Release 2.1, program product 5735-XX3.

Although ACF/NCP/VS R2.1 will support existing levels of ACF/TCAM and ACF/VTAM, the support is at the functional level of the access method; full capability depends on coexistence with ACF/TCAM V2 R2 and/or ACF/VTAM V1 R3 or ACF/VTAM V2.

Statement of Direction: It is IBM's direction to make available the LPDA and 230.4K bps line speed functions supported by ACF/NCP/VS R2.1 in ACF/NCP/VS R3. For planning purposes, we anticipate that availability dates for this support in ACF/NCP/VS R3 will be announced by the last quarter of 1979.

Compatibility: ACF/NCP/VS R2.1 retains compatibility with ACF/NCP/VS R1 and R2 and offers compatibility with ACF/TCAM V1 and V2, ACF/VTAM V1 R1, R2, R3 or ACF/VTAM V2 and ACF/NCP/VS R3.

PERFORMANCE and STORAGE CONSIDERATIONS

The functions provided by ACF/NCP/VS R2.1 will increase NCP storage requirements and path lengths over those of ACF/NCP/VS R2. The actual performance impact (if any) to a customer will vary depending upon his particular hardware and network configuration.

RPQs ACCEPTED: No

**ADVANCED COMMUNICATIONS FUNCTION
FOR NCP/VS (ACF/NCP/VS)
VERSION 1 RELEASE 3
5735-XX1**

Advanced Communications Function for NCP/VS Version 1 Release 3 is a program product for users of DOS/VS, DOS/VSE, OS/VS1 and OS/VS2 (MVS) that offers expanded network configurability, network management capability and enhanced network recoverability.

HIGHLIGHTS OF ACF/NCP/VS R3

- **Parallel Links:** Multiple active SDLC links between adjacent 3705s.
- **Transmission Groups:** Logical groupings of transmission links between adjacent network nodes.
- **Multiple Routes:** Multiple routes for SNA and non-SNA message transmission between nodes in a network.
- **Multiple Priority Levels:** Three levels of transmission priorities, selectable by session.
- **Extended NCP Interconnection:** New capabilities for interconnecting 3705s in single and multiple system networks.
- **Extended NCP Ownership.**
- **Flow Control:** Enhanced management of network traffic demands.
- **Session Outage Notification:** Enhanced awareness of session outages.
- **Enhanced Recovery Capabilities.**
- **Route Verification and Error Notification Facilities.**
- **Transmission Group Option for Line Trace.**
- **Support of Release 2 of the Network Terminal Option program product.**
- **Supports the CCITT X.21 switched interface when the 3705-II is attached to an X.21 Interface via the 3705-II feature (#5656).**

SUMMARY and ADVANTAGES of ACF/NCP/VS R3

Parallel Links: Multiple active SDLC links between adjacent 3705s: Parallel Links allows data traffic to flow simultaneously over two or more SDLC links between adjacent 3705s. All such links can be operational and in use at the same time, and each can be activated or deactivated independently of the others. This capability can provide increased message flow and improve the availability and reliability of transmissions between 3705s.

Transmission Groups: Logical groupings of transmission links between adjacent network nodes: A user may define up to eight Transmission Groups, each with one or more SDLC links between adjacent 3705s with ACF/NCP/VS R3. A Transmission Group permits multiple SDLC links to be defined as a single logical link. A single channel between a host and its channel attached 3705 is also defined as a Transmission Group. If a link or links in a Transmission Group fails, session traffic will automatically be placed on remaining active links without loss of data. This enhances the reliability and availability of service between 3705s. Multiple Transmission Groups and appropriate route selection permit a user to specify message traffic for different applications to flow through a network via pre-assigned Transmission Groups. For example, interactive processing may be assigned one group and batch processing may be assigned a different group, each with its own physical link support.

Multiple Routes: Multiple routes for SNA and non-SNA message transmission between nodes in a network: A user may define up to eight routes for message transmission between two host systems or between a host system and a 3705. When a session is initiated between two application programs or between a terminal and an application program, one of the routes is automatically selected to transmit the session traffic. The user may limit the selection to a particular route or to one of an ordered sequence of routes. Thus, it is possible to distribute the traffic for different sessions to different routes, dividing the load among several routes.

The ordered sequence of routes, determined by the installation, defines the set of alternate routes available for session traffic. In the event a route becomes inoperative during a session, the application program or terminal may request that the session be re-initiated. This causes automatic selection of one of the alternate routes. The user can then resynchronize the session data traffic and continue data communications and application processing via network routes that remain in operation.

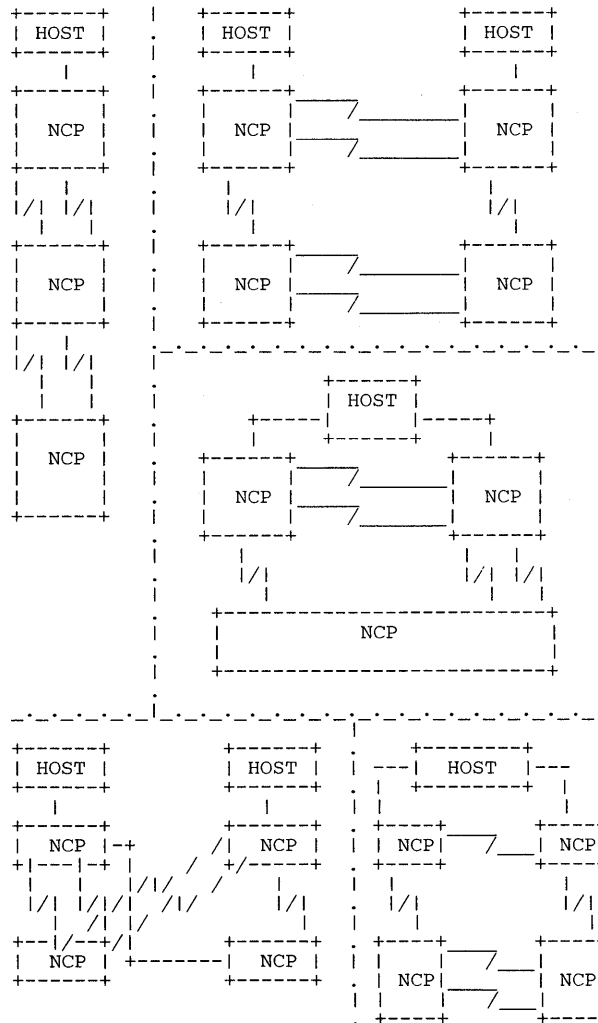

Multiple Priority Levels: Three levels of transmission priorities, selectable by session: A user can specify one of three message traffic priorities for a session between two application programs or between a terminal and an application program. For example, this permits message traffic for a time dependent session to be transmitted through a network ahead of other message traffic. That is, interactive processing may be given top priority by a user while other network traffic, such as batch processing, is assigned to a lower priority by the user.

Extended NCP Interconnection: New capabilities for interconnecting 3705s in single and multiple system networks: In ACF/NCP/VS R2, a remote NCP could only be link-attached via a single link to a single channel-attached 3705. In ACF/NCP/VS R3, a 3705 may now be link-attached via Transmission Groups to one or more channel-attached and/or link-attached 3705s.

These capabilities can significantly expand the installation's configurability options. Also, they can improve the overall efficiency of the network and improve the ability of a host processor to take over a 3705 whose current owner (or a link to that owner) has failed or has been deactivated.

See Figure 1 for interconnection flexibility.

FIGURE 1

Extended NCP Ownership: As many as eight host systems can share the ownership of a 3705 that is channel-attached * and/or link-attached to another 3705(s). Each of the owning host systems is notified in the event the 3705 becomes inoperative. This permits re-instatement of a failed or deactivated 3705 via any one of the host systems that shares in its ownership.

* The channel attachments cannot exceed the number of channels supported by the 3705-I or the 3705-II Communications Controllers.

Flow Control: Enhanced Management of network traffic demands: Via SNA protocols, the flow of message traffic is dynamically regulated between a host system and a 3705 and between two host systems. Continuous feedback is exchanged between network resources in order to regulate network traffic and reduce the possibility of network congestion.

ACF/NCP/VS R3 (cont'd)

Session Outage Notification: If a session message route becomes inoperative, the session ends are made aware of the outage (via SNA protocols). Session reinitiation may be requested as described under "Multiple Routes".

Enhanced Recovery Capabilities

- **Enhanced Restart of Host-to-terminal Control Sessions:** In recovering from a host failure situation, a host system can recover its control session for a 3271-11**, 3271-12**, 3274-1C*, 3275-11**, 3275-12**, 3684, 3770 MLU, 5285, 5288, S/32, S/34 or S/38 without disruption of existing sessions between the device and application programs on other host systems. This permits user applications that are not affected by such a failure to continue processing during recovery of the control session.

* This product must be at an appropriate EC level to function properly for this function.

** Support for these devices is provided by ACF/NCP/VS R3.

- **Enhanced Takeover of a 3705:** In the event a host system fails or otherwise gives up control of a 3705, any host system that is sharing ownership of the same 3705 will have its network operator notified about the lost host. Any of the notified host systems can take over control of the devices mentioned above without disrupting their existing cross-domain sessions with application programs. It is no longer necessary to deactivate corresponding cross-domain resource definitions before acquiring resources attached to the 3705 that were controlled by the lost host system.

- **Enhanced Multiple Host System Re-synchronization:** In recovering from a failure situation, two host systems can re-synchronize their control session without disruption of existing cross-domain sessions between two application programs or between a terminal and an application program. This permits user applications that are not affected by such a failure event to continue operations during re-instatement of the host systems' cross-domain control session.

- **Route Verification and Error Notification Facilities:** Via the DISPLAY command, a network operator can determine if a message route originating in his host is operative or inoperative. This permits a network operator to verify the availability of network routes and to take corrective action for routes that may have become inoperative. It also permits a network operator to verify that a route has been returned to service following a failure or deactivation. During the verification, appropriate resource owners are notified when an inactive or failed resource is encountered on a route.

In addition, if during network operation a route fails, an awareness message is issued at the host end point(s), identifying the inoperative route to the network operator. New display commands have been added which permit a network operator to take appropriate action to minimize the effects of an unusable message route on network applications.

- **Transmission Group Option for Line Trace:** Extends the existing SDLC line trace capabilities to Transmission Groups. Via the network operator MODIFY command, the message traffic over a Transmission Group between two 3705s can be traced as if it were a single SDLC link.
- **Support of Release 2 of the Network Terminal Option (NTO) program product:** ACF/NCP/VS R3 will support the devices and capabilities of Release 2 of NTO.

ACF/NCP/VS Release 3 supports the following CCITT X.21 switched functions when attached to an X.21 Interface via the 3705-II:

- Address calling.
- Auto Answer.
- Call progress signals.
- Direct call.
- Closed User Groups.
- Abbreviated Address Calling

CUSTOMER RESPONSIBILITIES

To install and use ACF/NCP/VS R3 the customer must:

- Design the single system network or multiple host communications system network.
- Meet minimum 3705 configuration requirements to support ACF/NCP/VS R3 in the planned environment.
- Order and install all required communications equipment.
- Order and install ACF/NCP/VS R3 and the System Support Programs for ACF/NCP/VS R3 program products and prerequisite system control programming.
- Generate ACF/NCP/VS R3 using the System Support programs for ACF/NCP/VS R3, for the network configuration.
- Load the 3705-I or 3705-II with the generated ACF/NCP/VS load module using, for example, the System Support Programs for ACF/NCP/VS R3.

- Meet the requirements of the host communications access method products to be operational with ACF/NCP/VS R3.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

ACF/NCP/VS R3 is designed to operate in the following communications controllers:

- 3705-I Communications Controller with a minimum of 144K bytes of storage.
- 3705-II Communications Controller with a minimum of 128K bytes of storage.

SOFTWARE REQUIREMENTS

Co-requisite SCP: Use of ACF/NCP/VS requires the concurrent installation of co-requisite NCP/VS system control programming (SCP).

PERFORMANCE and STORAGE CONSIDERATIONS

The new functions provided by ACF/NCP/VS R3 will increase NCP storage requirements and path lengths over those of ACF/NCP/VS R2. The actual performance impact (if any) to a customer will vary depending upon his particular hardware and network configuration.

PROGRAM CURRENCY

ACF/NCP/VS R2 is currently supported under DOS/VS Release 34, DOS/VSE, OS/VS1 Releases 6.0, 6.7 and 7.0 and OS/VS2 (MVS) Releases 3.7 and 3.8.

ACF/NCP/VS R3 will be supported under DOS/VSE, OS/VS1 Release 7.0, OS/VS2 (MVS) Release 3.8, and subsequent releases unless otherwise specified.

MIGRATION and PLANNING CONSIDERATIONS

Migrating to ACF/NCP/VS R3

The following support alternatives are provided to aid in migration planning:

	NCP/VS 5.0	ACF/NCP/VS..... R1	R2	R2.1 (2)	R3
TCAM 10.0	X	X	X*	X	NO
ACF/TCAM V1	X	X	X*	X	X
ACF/TCAM V2 R1	X	X	X	X	X
ACF/TCAM V2 R2	X	X	X	X	X
ACF/TCAM V2 R3	X	NO	X	X	X
VTAM 2	X	X*	X*(1)	X*(1)	NO
ACF/VTAM V1 R1	X	X	X*	X*	X
ACF/VTAM V1 R2	NO	X	X	X	X
ACF/VTAM V1 R3	NO	NO	X	X	X
ACF/VTAM V2	NO	NO	NO	X	X
NCP/VS V5	X	NO	NO	NO	NO
ACF/NCP/VS R1	NO	X	X	X	NO
ACF/NCP/VS R2	NO	X	X	X	X**
ACF/NCP/VS R2.1	NO	X	X	X	X**
ACF/NCP/VS R3	NO	NO	X**	X**	X

* Requires applicable access method PTFs.

** Requires applicable ACF/NCP/VS R2 and R2.1 PTF's.

1. OS/VS1 and OS/VS2 (MVS) only.
2. Requires EREP PTFs for LPDA level maintenance data records.

Note: The above matrix assumes that customers will be at current access method maintenance levels when migrating from one NCP release to another.

Functions supported by NCP/VS 5.0, ACF/NCP/VS R1 and R2 with the appropriate level of TCAM, ACF/TCAM, VTAM or ACF/VTAM Version 1 are also supported by ACF/NCP/VS R3, with the exception of the SDLC/BSC Path Function. In addition, ACF/NCP/VS R3 does not support Release 1 of the NTO program product (5735-XX7).

Planning Considerations: ACF/NCP/VS R3 is generated using the System Support Programs for ACF/NCP/VS Release 3, program product 5735-XX3.

Although ACF/NCP/VS R3 will support existing levels of ACF/TCAM and ACF/VTAM, the support is at the functional level of the access method; full capability depends on coexistence with ACF/TCAM V2 R3 and/or ACF/VTAM V1 R3 or ACF/VTAM V2.

COMPATIBILITY

ACF/NCP/VS R3 retains compatibility with ACF/NCP/VS R1 and R2 and offers compatibility with ACF/TCAM V1 and V2, and ACF/VTAM V1 R1, R2 and R3 with the exception of the SDLC/BSC Path Function. In addition, ACF/NCP/VS R3 does not support Release 1 of the NTO program product (5735-XX7).

PROGRAM PRODUCTS

**NETWORK OPERATION SUPPORT PROGRAM
5735-XX2 (DOS/VS, OS/VS)****PURPOSE**

The Network Operation Support Program is a program product which operates with ACF/VTAM Version 1 as an application program under the control of DOS/VS, OS/VS1 and OS/VS2 (SVS and MVS) and can support programmed operator functions for ACF/VTAM Version 1 networks.

HIGHLIGHTS

- Support of network operator functions in single or multiple ACF/VTAM Version 1 host system configurations.
- Support of operator to operator communications within the same host or between ACF/VTAM Version 1 host systems.
- Support of the 3270 Information Display System as a network operator station. See the following section on Supported Devices.
- Support of multiple network operators.
- Support of local and/or remote network operators.
- Capability for user-written exit routines to screen and edit operator message traffic.
- Capability for user-written command processors to support customized operator commands or operands.
- Support for logging of operator messages to a disk data set for offline printing, or to 3270 print devices for online printing.
- Capability for user-defined command lists stored in a disk file to be invoked by name for execution.
- Support of backup procedures for failing or deactivated operator stations.

DATA SECURITY/AUDITABILITY FEATURES:

- Ability through use of authorization facilities to limit each operator's control to specified portions of the network.
- Support of authorization checking based on operator and terminal identification in addition to that provided by ACF/VTAM logon procedures.
- Logging of operator messages which can provide a hard copy for audit of network operations.

ADVANTAGES:

- Enhances ACF/VTAM Version 1 network operation management.
- Permits network operation control at program execution speeds.
- Permits customized program control of an ACF/VTAM network so that a system console operator may be involved in critical situations only.
- Permits users to tailor their own commands to ACF/VTAM network operation.
- Enhances accuracy of ACF/VTAM network control via user-defined command sequences which can take the place of many human operator decisions and actions.
- Enhances network operation control via 3270 display devices with formatting and editing support.
- Permits operator to operator communication to supplement or replace usual verbal communication.
- Permits multiple network operators to share network control responsibility, where each may control a portion or all of an ACF/VTAM network.
- Permits network operator stations to be located anywhere in a physical network, as supported by ACF/VTAM.
- Supports backup procedures which can provide recovery for failing or deactivated network operator stations.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS:**

The Network Operation Support Program occupies a region (in OS/VS2 SVS, a partition in OS/VS1) or an address space (in OS/VS2 MVS). In DOS/VS the program operates as a single task in its own partition or as a subtask in the ACF/VTAM partition. The minimum estimated storage required is 200K bytes; however, this estimate may vary depending upon the device configuration chosen by the user and the size of the network being controlled. This storage is virtual with the exception of that storage which is required to be fixed by ACF/VTAM Version 1.

The terminals supported by the Network Operation Support Program are:

Controllers IBM 3272 mdl 2 (local)
IBM 3274 mdl 1A, 21A, 31A (local-SNA) as an IBM
3791
IBM 3274 mdl 1B, 21B (local) as an IBM 3272 mdl 2

IBM 3271 mdl 2 (BSC remote)
IBM 3274 mdl 1C, 21C, 31C, 51C (BSC remote) as an
IBM 3271 mdl 2 (Note 1)
IBM 3275 mdl 2 (BSC remote)
IBM 3276 mdls 1,2,3,4 (BSC remote) as an IBM 3271
mdl 2 (Note 1)
IBM 3271 mdl 12 (SDLC remote)
IBM 3274 mdl 1C, 21C, 31C, 51C (SDLC remote) as
an IBM 3791 (Note 1)
IBM 3275 mdl 12 (SDLC remote)
IBM 3276 mdls 11,12,13,14 (SDLC remote) as an IBM
3791 (Note 1)
IBM 3791

Display Unit IBM 3277 mdl 2
IBM 3278 mdls 1,2,3,4 as an IBM 3277 mdl 2 (Note 1)

Printers IBM 3262 mdls 3, 13 (as an IBM 3288 Mdl 2 (note 1))
IBM 3268 mdl 2 as an IBM 3284/3286 mdl 2 (Note 1)
IBM 3284 mdl 2
IBM 3286 mdl 2
IBM 3287 mdls 1,2,3 as an IBM 3284/3286 mdl 2
(Note 1)
IBM 3288 mdl 2
IBM 3289 mdls 1,2,3 as an IBM 3288 mdl 2 (Note 1)

Note 1: Buffer sizes of 960, 2560 and 3440 are also supported.

SOFTWARE REQUIREMENTS

The Network Operation Support Program runs as an application program on all S/370 processors that are capable of supporting DOS/VS, OS/VS1 or OS/VS2 (SVS or MVS). It supports the IBM 3270 Display System. The following support programs are required:

System assembler
Linkage editor
System utilities
System data set utilities
Independent utilities.

Planning Considerations: For VM/370 considerations, see the ACF/VTAM pages.

COMPATIBILITY

ACF/VTAM Version 1 commands issued at an operator station may have additional routing parameters added to them to accommodate multisystem command execution. These parameters are used by the Network Operation Support Program for routing purposes and are removed before the command is passed to the proper ACF/VTAM.

PROGRAM PRODUCTS

**SYSTEM SUPPORT PROGRAMS FOR
ACF/NCP/VS VERSION 1 RELEASE 2
5735-XX3****PURPOSE**

System Support Programs for ACF/NCP/VS Version 1 Release 2 is a program product for users of ACF/NCP/VS V1R2 under DOS/VS, OS/VS1, and OS/VS2 (MVS) that supports IBM 3705-II enhancements and provides enhanced generation and utility functions for single or multiple IBM S/370 networks.

HIGHLIGHTS of SYSTEM SUPPORT PROGRAMS for ACF/NCP/VS

Provides generation and utility functions in support of the following ACF/NCP/VS R2 enhancements.

- Enhanced SDLC data link test.
- SNA terminal connectivity test.
- Enhanced recording of SDLC data link error conditions.
- Dynamic reconfiguration of nonswitched SNA-SDLC devices.
- Expanded display of network control program storage in the 3705.
- Enhancements to line trace for Communications Scanner, Type 3.
- Negotiable session initialization parameters.
- Support for 3705-II Communications Controller enhancements.
- Support for the Network Communications Controller enhancements.
- Support for the Network Communications Control Facility program product and its related Network Problem Determination Application Processor program product.
- Support for the Network Terminal Option program product.

The following capabilities have been added to the NCP system generation program which is one of the programs comprising SSP for ACF/NCP/VS R2:

- The option to Process Multiple NCP Generations concurrently.
This option requires the user to specify a qualifier for the ACF/NCP/VS R2 conditional assemblies so that ACF/NCP/VS R2 generations with different names can be processed concurrently. This capability also eliminates having multiple object libraries for the ACF/NCP/VS R2 conditional assemblies.
- Additional Output Options (OS/VS Systems only).
This capability allows the user to replace the JCL normally generated with user specified cataloged procedures. The user may specify procedures for the assembly steps, post-assembly steps and linkage editor step. All of the assembly steps and/or the link edit step may be replaced by the invocation of a cataloged procedure. The assembly step procedure allows the user to direct his assembly output to a media other than print. The post assembly procedure allows the user to retrieve his assembly output based on the condition code setting of the assembly step. The linkage editor procedure allows the user to replace the normally generated link edit JCL with the invocation of a cataloged procedure.
- Print Suppression Option.
This option allows the user to suppress the printing of the macro expansion of NCP tables and NCP conditional assemblies.
- Print and Punch Output Reduction.
The most frequently used Stage 2 macro operands will now be structured in a contiguous multiple operand format instead of requiring one line or card per operand. This will reduce the number of print lines and punched cards required in the Stage 2 output.

Summary and Advantages: Refer to the sales pages for ACF/NCP/VS R2 for detailed information on the above ACF/NCP/VS R2 functions.

CUSTOMER RESPONSIBILITIES

To install and use SSP for ACF/NCP/VS R2, the customer must:

- Order System Support Programs for ACF/NCP/VS R2
- Design the single system network or multiple host communications system network
- Meet the configuration and system requirements for the 3705-I or 3705-II, ACF/NCP/VS R2, for the customer environment
- Install SSP for ACF/NCP/VS R2 and prerequisite system control programming

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

A supported host operating system (DOS/VS, OS/VS1 or OS/VS2 (MVS)), and at least one locally-attached 3705-I or 3705-II Communications Controller meeting the storage requirements of ACF/NCP/VS R2.

SOFTWARE REQUIREMENTS

System Support Programs for ACF/NCP/VS R2 operates as a non-system task under DOS/VS, OS/VS1 and OS/VS2 (MVS). It is designed to operate with ACF/NCP/VS R2.

COMPATIBILITY

System Support Programs for ACF/NCP/VS R2 retains compatibility with load modules produced by ACF/NCP/VS R1.

PROGRAM CURRENCY

System Support Programs for ACF/NCP/VS Release 1 is currently supported under DOS/VS Release 34, OS/VS1 Release 6.0 and 6.7, OS/VS2 (SVS) Release 1.7, and OS/VS2 (MVS) Release 3.7 and 3.8.

System Support Programs for ACF/NCP/VS Release 2 will be supported under DOS/VS Release 34, OS/VS1 Releases 6.0 and 6.7, OS/VS2 (MVS) Releases 3.7 and 3.8 and subsequent releases unless otherwise specified.

DOCUMENTATION

(available from Mechanicsburg)

Advanced Communications function for NCP/VS (ACF/NCP/VS) Network Control Program and System Support Programs, General Information ... Product Summary for System Support Programs for ACF/NCP/VS R2

**SYSTEM SUPPORT PROGRAMS FOR
ACF/NCP/VS VERSION 1 RELEASE 2
MODIFICATION LEVEL 1
5735-XX3****PURPOSE**

System Support Programs (SSP) for ACF/NCP/VS Version 1 Release 2.1 provides support for the following new ACF/NCP/VS V1R2.1 functions:

- Support of Link Problem Determination Aid (LPDA) for the new microprocessor-based modems (3863, 3864, and 3865).
- Support of the 230.4K bps line speed capability of the 3705-II.

System Support Programs (SSP) for ACF/NCP/VS Release 2.1 is a program product for users of DOS/VS, DOS/VSE, SSX/VSE, OS/VS1 and OS/VS2 (MVS) that supports ACF/NCP/VS Release 2.1.

CUSTOMER RESPONSIBILITIES

To install and use SSP for ACF/NCP/VS R2.1, the customer must:

- Order System Support Programs for ACF/NCP/VS R2.1.
- Design the single system network or multiple host communications system network.
- Meet the configuration and system requirements for the 3705-I or 3705-II, and ACF/NCP/VS R2.1 for the customer environment.
- Install SSP for ACF/NCP/VS R2.1 and prerequisite system control programming.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

At least one locally-attached 3705-I or 3705-II Communications Controller meeting the storage requirements of ACF/NCP/VS R2.1.

SOFTWARE REQUIREMENTS

A supported host operating system (DOS/VS, DOS/VSE, SSX/VSE, OS/VS1 or OS/VS2 (MVS)).

System Support Programs for ACF/NCP/VS R2.1 operate as a non-system task under DOS/VS, DOS/VSE, SSX/VSE, OS/VS1 and OS/VS2 (MVS). It is designed to operate with ACF/NCP/VS R2.1.

Program Currency: System Support Programs for ACF/NCP/VS Release 2 is currently supported under DOS/VS Release 34, DOS/VSE, SSX/VSE Release 3, OS/VS1 Releases 6.0, 6.7, and 7.0 and OS/VS2 (MVS) Releases 3.7 and 3.8.

System Support Programs for ACF/NCP/VS R2.1 will be supported under DOS/VS Release 34, DOS/VSE, SSX/VSE Release 3, OS/VS1 Releases 6.7 and 7.0 and OS/VS2 (MVS) Release 3.8 and subsequent releases unless otherwise specified.

Customers can continue to order SSP for ACF/NCP/VS R2.1 after the availability of SSP for ACF/NCP/VS R3.

COMPATIBILITY

System Support Programs for ACF/NCP/VS R2.1 retains compatibility with load modules produced by ACF/NCP/VS R2.

Statement of Direction: It is IBM's direction to make available the LPDA and 230.4K bps line speed functions supported by SSP for ACF/NCP/VS R2.1 in SSP for ACF/NCP/VS R3. For planning purposes, we anticipate that availability dates for this support in SSP for ACF/NCP/VS R3 will be announced by the last quarter of 1979.

DOCUMENTATION

(available from Mechanicsburg)

Advanced Communications Function for NCP/VS (ACF/NCP/VS) Network Control Program and System Support Programs, General Information (GC30-3058) ... Product Summary for System Support Programs for ACF/NCP/VS R2.1

IBM will accept APARs describing any situation where the installation of System Support Programs for ACF/NCP/VS R2.1 causes an exposure to the system integrity of OS/VS2 (MVS).

PROGRAM PRODUCTS

**SYSTEM SUPPORT PROGRAMS FOR ACF/NCP/VS
DOS/VS, DOS/VSE, OS/VS1, OS/VS2 (MVS)
VERSION 1 RELEASE 3
5735-XX3****PURPOSE**

System Support Programs for ACF/NCP/VS Version 1 Release 3 provides generation and utility functions for users of ACF/NCP/VS V1R3 under DOS/VS, DOS/VSE, OS/VS1 and OS/VS2 (MVS).

HIGHLIGHTS of RELEASE 3

Provides generation and utility functions in support of the following ACF/NCP/VS R3 enhancements:

- **Parallel Links:** Multiple active SDLC links between adjacent 3705s.
- **Transmission Groups:** Logical groupings of transmission links between adjacent network nodes.
- **Multiple Routes:** Multiple routes for SNA and non-SNA message transmission between nodes in a network.
- **Multiple Priority Levels:** Three levels of transmission priorities, selectable by session.
- **Extended NCP Interconnection:** New capabilities for interconnecting 3705s in single and multiple system networks.
- **Extended NCP Ownership.**
- **Flow Control:** Enhanced management of network traffic demands.
- **Session Outage Notification:** Enhanced awareness of session outages.
- **Route Verification and Error Notification Facility**
- **Transmission Group Option for Line Trace**
- **Support of Release 2 of the Network Terminal Option program product.**
- **Support of the CCITT X.21 switched interface.**

CUSTOMER RESPONSIBILITIES

To install and use SSP for ACF/NCP/VS R3, the customer must:

- Order System Support Programs for ACF/NCP/VS R3.
- Design the single system network or multiple host communications system network.
- Meet the configuration and system requirements for the 3705-I or 3705-II, and ACF/NCP/VS R3 for the customer environment.
- Install SSP for ACF/NCP/VS R3 and prerequisite system control programming.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

At least one locally-attached 3705-I or 3705-II Communications Controller meeting the storage requirements of ACF/NCP/VS R3.

SOFTWARE REQUIREMENTS

A supported host operating system (DOS/VS, DOS/VSE, OS/VS1 or OS/VS2 (MVS)).

System Support Programs for ACF/NCP/VS R3 operate as a non-system task under DOS/VS, DOS/VSE, OS/VS1 and OS/VS2 (MVS). It is designed to operate with ACF/NCP/VS R3.

Program Currency: System Support Programs for ACF/NCP/VS Release 2 is currently supported under DOS/VS Release 34, DOS/VSE, OS/VS1 Releases 6.0 and 6.7 and OS/VS2 (MVS) Releases 3.7 and 3.8

System Support Programs for ACF/NCP/VS Release 3 will be supported under DOS/VSE, OS/VS1 Release 7.0, OS/VS2 (MVS) Release 3.8 and subsequent releases unless otherwise specified.

COMPATIBILITY

System Support Programs for ACF/NCP/VS R3 retains compatibility with load modules produced by ACF/NCP/VS R2 except for the SDLC/BSC Path Function. In addition, Release 1 of the NTO program product (5735-XX7) is not supported.

NCCF (5735-XX6) (DOS/VSE, OS/VS)**

PURPOSE

The Network Communications Control Facility (NCCF) is a program product that operates with ACF/VTAM, ACF/VTAME or ACF/TCAM as an application program under the control of DOS/VSE, OS/VS1 or OS/VS2 MVS. NCCF provides a program base for communications network management (CNM) by providing telecommunications access method services and operating system services. With ACF/VTAM and ACF/VTAME, NCCF contains, and is compatible with, those access method operator control functions currently provided by the Network Operation Support Program (NOSP). NCCF extends telecommunications access method operator control to ACF/TCAM Version 2. NCCF provides communications network management application functions including: Network operations, data services for problem determination, and communications network management (CNM) operator data security and auditing. (A CNM operator is a person communicating with NCCF.) IBM-supplied or user-written programs may use NCCF services to provide additional functions of CNM beyond those provided by NCCF.

HIGHLIGHTS

- Support of the 3270 Information Display System (as listed in the System Configuration section) as a NCCF operator station.
- Support of multiple NCCF operators (see statement in "Programming Requirements" section).
- Support of local and/or remote NCCF operators.
- Routing of hardware error records to the appropriate command processor (for example, the Network Problem Determination Application (NPDA) and the Network Problem Determination Application Versions 2 and 3 (NPDA Version 2 and NPDA Version 3)).
- Routing of summary maintenance statistics.
- Capability for user-defined command lists stored in a disk file to be invoked by name for execution.
- Support of backup procedures for failing or deactivated CNM operator stations.
- Support of NCCF functions in single or multiple ACF/VTAM or ACF/TCAM host system configurations.
- Capability for the NCCF operator to enter ACF/VTAM or ACF/TCAM Version 2 operator control commands to be executed by the telecommunications access method.
- Support of operator-to-operator communications within the same host or between host systems.
- Cross-domain command and message routing.
- Capability for user-written command processors to support customized operator commands or program operator responses to network messages.
- Capability for user-written exit routines to screen and edit operator message traffic or data traffic.
- Data services for VSAM data sets used for hardware error or other CNM data collection and data access.
- Screen management functions for NCCF operator stations. Line by line and full screen formatting are supported.
- The ability, through use of authorization facilities, to limit each operator's capability to issue telecommunications access method operator control commands to specified portions of the network (ACF/VTAM or ACF/VTAME).
- Authorization checking based on operator and terminal identification.
- Logging of CNM operator activity to a VSAM disk data set that may be later used for offline printing.
- Logging of NCCF operator messages to a disk data set that may later be used for offline printing.
- Provides a conditional command list facility which allows the user to dynamically construct and modify commands, and to control the sequence of execution of the commands in a command list.
- The ability, through use of authorization facilities, to assign subsets of the total command set available to specific individual operators.
- Initiation of commands and command lists by timer events, either by time of day or repetitively after a specified interval.
- Initiation of command lists by the receipt of unsolicited messages from the access method.

Note: Cross-domain facilities provided with ACF/VTAM Version 1 and ACF/TCAM require access method features. (See ACF/VTAM Version 1 and ACF/TCAM pages for the additional features required).

DESCRIPTION

SUMMARY and ADVANTAGES of NCCF

- Enhances ACF/VTAM, ACF/VTAME and ACF/TCAM network operation management.
- Permits teleprocessing network operation control at program execution speeds.
- Supports the Network Problem Determination Application (NPDA), the Network Problem Determination Application Version 2 (NPDA Version 2) and the Network Problem Determination Application Version 3 (NPDA Version 3), and provides a program base upon which the user can build additional programs for the management of the teleprocessing network.
- Supports NPDA and NPDA Versions 2 and 3 access to error statistics in other domains allowing for a centralized problem determination station.
- Supports the Network Logical Data Manager (NLDM) product for the collection and presentation of access method path information unit and selected Network Control Program control data for software problem determination.
- Provides services that can insulate command processors from telecommunications access method and operating system differences.
- Provides telecommunications access method independent screen management and terminal input/output processing for command processors.
- Provides data services that allow command processors to request error data from the supporting products through the telecommunications access method and to store or retrieve error data from files.
- Provides operators with the ability to input telecommunications access method operator control commands (ACF/VTAM, ACF/VTAME or ACF/TCAM Version 2).
- Permits customized program control of a network through user-written command processors, so that a system console operator need be involved only in critical situations.
- Permits users to define their own commands for network operation.
- Allows an operator to initiate execution of command processors in domains other than his own.
- Enhances accuracy of network control via user-defined command sequences which can take the place of many human operator decisions and actions.
- Enhances network operation control via 3270 display devices with formatting and editing support. Line by line and full screen message formatting are provided.
- Permits multiple NCCF operators to share network control responsibility, where each may control a portion or all of an ACF/VTAM network.
- Improves operator efficiency through facilities for operator-to-operator communication.
- Permits NCCF operator stations to be located anywhere in a physical network, as supported by ACF/VTAM, ACF/VTAME and ACF/TCAM.
- Supports backup procedures which can provide recovery for failing or deactivated NCCF operator stations.
- Allows for the automation of various operator tasks (through the use of user-written exit routines, command lists, and command processors) to reduce the probability of human error.
- Supports the VSE/Operator Communications Control Facility (VSE/OCCF) program product that operates with DOS/VSE. VSE/OCCF and NCCF together allow a NCCF operator connected to one host system to control one or more remote DOS/VSE systems. This can minimize the need for operator attendance and DP skills at the remote sites.
- Supports Information/System Release 2 and the Information/Management feature for problem, change and systems configuration management.

In addition to the functions above, provided by NCCF, the Terminal Access Facility Feature of NCCF enhances the CNM operator's centralized control of components of the teleprocessing network and interactive capability with various CNM facilities.

PROGRAM PRODUCTS

NCCF (cont'd)

HIGHLIGHTS of TERMINAL ACCESS FACILITY FEATURE

Working with NCCF Release 2, the feature provides:

- Consolidated network operator control of CICS/VS, IMS/VS or 8100 DPPX or DPPX/SP systems via the Host Command Facility (HCF) Version 2.
- Centralized CNM Operator access to network management applications residing on CICS/VS, IMS/VS, TSO, Remote NCCF systems or, 8100 DPPX or DPPX/SP or DPCX systems via NCCF to HCF Version 2 Communication.

Summary of Terminal Access Facility Feature Functions:

- Concurrent access to system management facilities residing on local NCCF, CICS/VS Release 1.5 or subsequent releases, IMS/VS Version 1 Release 1.6 or subsequent releases, TSO, remote NCCF systems, or those on 8100 DPPX or DPPX/SP or DPCX systems accessible via HCF Version 2 is supported without requiring LOGON/LOGOFF procedures or separate terminals dedicated to each application.
- Operator access, using 3270 SNA conventions, to applications requiring full-screen display capability.
- Operator access to the facilities of local and remote TSO systems.
- Allows an NCCF operator to operate an NCCF system residing in another domain within the network.
- Ability to create a deferred session to an inactive IMS or CICS subsystem that allows the session to be completed automatically by the subsystem when it is activated.
- Concurrent session support for operator control capability and full-screen display transactions is provided. Network operator control messages may be queued for presentation upon completion of a full-screen display transaction, or the operator may elect to have the session interrupted.

PLANNING CONSIDERATIONS

NCCF executes in a VM environment on ACF/VTAM Release 2 and 3 or ACF/TCAM Version 2 Release 2 and 3; and on ACF/VTAME using a 4331 Processor in S/370 compatibility mode.

To assist conversion from NCCF Release 1 to NCCF Release 2; NCCF Release 1 is supported on ACF/VTAM Version 1 Release 3, ACF/TCAM Version 2 Release 2 and 3, and ACF/VTAME.

NCCF provides those functions currently provided for by NOSP. Existing user code written to NOSP Service Routine Interfaces (as described in the NOSP PIM) is source compatible with NCCF. A reassembly using NCCF macro libraries is required.

Cross-domain communication is not supported between NOSP and NCCF Release 2. Cross-domain communications between the following is supported:

- NOSP in both systems
- NCCF in both systems
- NOSP in one system and NCCF Release 1 in the other (ACF/VTAM Version 1 and ACF/VTAME only)

NOSP and NCCF can not reside in the same host processor. For systems with multiple teleprocessing access methods, a copy of NCCF is needed for each teleprocessing access method supported and both copies must be at the same release level.

CUSTOMER RESPONSIBILITIES

To use NCCF, the customer must:

- Define the NCCF, ACF/VTAM, ACF/VTAME and ACF/TCAM network environment.
- Determine the NCCF operators and CNM operator stations to be supported.
- Order and install any additional required communications equipment, e.g., 3270 terminals.
- Have the prerequisite ACF/VTAME, ACF/VTAM, or ACF/TCAM installed.
- Define all desired NCCF program definition parameters.
- Install NCCF.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The Network Communications Control Facility and the Terminal Access Facility feature are designed to operate on IBM 4300, S/370 and 30XX processors.

The Network Communications Control Facility occupies a partition (in VSE and OS/VS1), or an address space (in OS/VS2 MVS). In VSE the program operates as a single task in its own partition or as a subtask in the ACF/VTAM or ACF/VTAME partition.

The minimum estimated storage required is 300,000 bytes of virtual storage for NCCF Release 1, and 400,000 bytes of virtual storage for

NCCF Release 2. This estimate may vary depending upon the device configuration chosen by the user and the size of the network being controlled. This storage is virtual, it is a non-system area requirement. It comes from the NCCF private area for MVS or the NCCF partition of VSE and OS/VS1.

NCCF is an interactive program whose utilization is expected to vary widely between individual installations and within a given installation. NCCF is not expected to have a significant impact on the overall system performance. CNM operator response time will depend upon the complexity of the functions (commands) being executed.

The amount of virtual storage required by the Terminal Access Facility depends upon the number of concurrent user sessions and the type of functions being performed. Generally, the feature requires a minimum of 75K bytes of virtual user storage; actual storage requirements depend upon the number of sessions established. This storage requirement is in addition to the NCCF R2 storage requirements.

The terminals supported by NCCF as CNM stations are:

Controllers:

- IBM 3271 mdl 2 (BSC remote)
- IBM 3271 mdl 12 (SDLC remote)
- IBM 3272 mdl 2 (local)
- IBM 3274 mdl 1A, 21A, 31A (local SNA)
- IBM 3274 mdl 1B, 1D, 21B, 21D, 31D (local non-SNA)
- IBM 3274 mdl 1C, 21C, 31C (SDLC/SNA, BSC)
- IBM 3274 mdl 51C (SDLC/SNA, BSC)
- IBM 3791 (with 3270 data stream compatibility), (configuration support #9169).
- IBM 8100 (under DPCX or DPPX or DPPX/SP with 3270 data stream compatibility)

Controllers/Display Units:

- IBM 3275 mdl 2 (BSC remote)
- IBM 3275 mdl 12 (SDLC remote)
- IBM 3276 mdls 2, 3, 4 (BSC)
- IBM 3276 mdls 12, 13, 14 (SNA/SDLC)

Display Units:

- IBM 3277 mdl 2
- IBM 3278 mdls 2, 3, 4, 5 (mdl 5 supported as a mdl 2)
- IBM 3279 mdls 2A and 2B (supported as IBM 3278 mdl 2),
- IBM 3279 mdls 3A and 3B (supported as IBM 3278 mdl 3)
- IBM 8775 mdls 1, 2, 11, 12

The following printers are supported by NCCF as hardcopy log devices:

- IBM 3262 mdls 3, 13
- IBM 3268 mdl 2
- IBM 3284 mdl 2
- IBM 3286 mdl 2
- IBM 3287 mdls 1, 1C (supported as mdl 1), 2, and 2C (supported as mdl 2). All IBM 3287 models require the SCD Support feature #9660 when operating with SNA controllers.
- IBM 3288 mdl 2
- IBM 3289 mdls 1, 2

SOFTWARE REQUIREMENTS

The Network Communications Control Facility runs as an application program on all IBM host processors that support the following access methods:

NCCF Release 1	MVS	VS1	VSE
TCAM Level 10	X	X	
ACF/TCAM Version 1	X	X	
ACF/TCAM Version 2 Rel 1	X	X	
ACF/TCAM Version 2 Rel 2	X	X	
ACF/TCAM Version 2 Rel 3	X	X	
VTAM Level 2	X	X	
ACF/VTAM Version 1 Rel 1	X	X	
ACF/VTAM Version 1 Rel 2	X	X	X
ACF/VTAM Version 1 Rel 3	X	X	X
ACF/VTAME			X
NCCF Release 2			
ACF/TCAM Version 2 Rel 2	X	X	
ACF/TCAM Version 2 Rel 3	X	X	
ACF/TCAM Version 2 Rel 4	X	X	
ACF/VTAM Version 1 Rel 2	X	X	X
ACF/VTAM Version 1 Rel 3	X	X	X
ACF/VTAM Version 2	X	X	X
ACF/VTAME			X
Terminal Access Facility Feature			
ACF/VTAM Version 1 Rel 2	X	X	X
ACF/VTAM Version 1 Rel 3	X	X	X
ACF/VTAM Version 2			

PROGRAM PRODUCTS

NCCF (cont'd)

ACF/VTAME
ACF/TCAM Version 2 Rel 4 X X X

Operating system levels supported by NCCF are as required by the supported access methods, with the requirement that OS/VS2 MVS Release 3.8 and OS/VS1 Release 7.0 are the earliest levels of OS/VS supported by NCCF. NCCF will also support subsequent releases of OS/VS2, unless otherwise stated by IBM.

NCCF also runs on ACF/VTAM Release 2 or 3, and ACF/VTAME on VSE, with the VSE/Advanced Functions licensed program. If NCCF data services or NCCF Release 2 disk log are used, VSAM is needed.

NCCF executes in a VM environment on ACF/VTAM Release 2 or 3 and ACF/TCAM Version 2 Releases 1, 2, 3 and 4 and on ACF/VTAME using an IBM 4331 Processor in S/370 compatibility mode.

The Terminal Access Facility will support application programs running on CICS/VS Release 1.5 and subsequent releases, IMS/VS Version 1 Release 1.6 and subsequent releases, TSO, remote NCCF systems, or those accessible via HCF Version 2 which operate under IBM 3270 protocol.

The NLDM program product requires NCCF Release 2 with the appropriate PTF. NLDM is supported only on OS/VS2.

Use of the Terminal Access Facility capability to access a TSO system, or establish deferred session, in a cross-domain host containing IMS or CICS, requires the presence of NCCF and the Terminal Access Facility in the cross-domain host.

Terminal Access Facility capability to provide operator access to TSO and remote NCCF systems is not supported under ACF/TCAM.

SECURITY FEATURES

NCCF provides the following facilities to help prevent unauthorized access of information:

- Operator station security. Access to NCCF may be restricted to only those operator stations that have been defined by the user during program installation procedures.
- Operator logon security. NCCF logon facilities are provided that check an individual operator's authorization prior to allowing the operator to use NCCF. On OS/VS2 (MVS) Systems, NCCF provides an interface to RACF to allow usage of RACF logon authorization checking. (See RACF pages for the release level of RACF required.)
- Resource control authorization. On ACF/VTAM systems a capability is provided to restrict an individual operator to a subset of the network resources to which commands can be issued or from which messages can be received.
- Command authorization. A capability is provided to restrict an individual operator to a subset of the total command set available through NCCF.

These facilities provide security only in the context of NCCF. The Resource Access Control Facility (RACF) program product (5740-XXH) can be used to provide an integral foundation for security in MVS, complementing NCCF facilities by controlling access to system resources.

PERFORMANCE AND STORAGE CONSIDERATIONS

The minimum estimated storage required is 400K bytes with a single operator; however, this estimate may vary depending upon the device configuration chosen by the user and the size of the network being controlled. This storage is virtual.

NCCF is an interactive program whose utilization is expected to vary widely between individual installations and within a given installation. NCCF is not expected to have a significant impact on the overall system performance. CNM operator response time will depend upon the complexity of the functions (commands) being executed.

MVS SYSTEM INTEGRITY APPLIES: Yes

RPQs ACCEPTED: No

Productivity Aid: TPNS will provide terminal simulation in the networking environment.

5735-XX7 - NETWORK TERMINAL OPTION (NTO) R1**PURPOSE**

The Network Terminal Option extends the capabilities of ACF/NCP/VS V1R2 in 3705-I and 3705-II Communications Controllers to allow access of the following non-SNA terminals through the Record Mode Application program (SNA) interface in ACF/VTAM Version 1 Release 2 or ACF/VTAM Version 2: 2740 Communication Terminal mdl 1 - nonswitched and switched ... 3232 Keyboard Printer mdl 51 - switched and nonswitched ... 2741 Communication Terminal - nonswitched and switched ... 6733 Typewriter Communication Module - switched and nonswitched as a CPT-TWX 33/35 ... Western Union Teletypewriter Exchanges Services (TWX mdl 33/35) - nonswitched and switched ... World Trade Teletypewriter Terminal (WTTY) - nonswitched only. The Network Terminal Option is available to users of the operating systems as supported by ACF/VTAM R2.

HIGHLIGHTS

- Supports 2740 mdl 1, 2741, 3232-51, 6733 (as a CPT-TWX 33/35), TWX 33/35 and WTTY via the Record Mode Application program (SNA) interface of ACF/VTAM Version 1 Release 2 or ACF/VTAM Version 2.
- Preserves the non-SNA device data streams minimizing changes to existing application programs.
- Provides single and multiple system networking capabilities for the supported non-SNA terminals.
- Allows sharing of the supported non-SNA terminals in a SNA environment.
- Supports TSO for ACF/VTAM Version 1 Release 2 (MVS only) or ACF/VTAM Version 2.

ADVANTAGES

Provides SNA Interface for supported non-SNA terminals. From a program control point of view, the Network Terminal Option supported terminals appear like SDLC 3767 Communication Terminals to ACF/VTAM.

Preserves Non-SNA Data Streams which minimizes changes to existing application programs using Network Terminal Option supported terminals. Application program code that constructs or analyzes the non-SNA data streams may not require modification to run with the Network Terminal Option.

Provides Single and Multiple System Networking capabilities for the supported non-SNA terminals. ACF/VTAM R2 applications can access the terminals in a single or multiple system environment. A Network Terminal Option terminal controlled by ACF/VTAM in one host may communicate with a user-written ACF/VTAM application program in a different host system.

Provides TSO/ACF/VTAM R2 support of the 2741, TWX 33/35, and WTTY Terminals, using the facilities of ACF/VTAM R2 (MVS only).

PLANNING CONSIDERATIONS

Machine and estimated storage requirements will be provided in the *Network Terminal Option General Information Manual* prior to availability.

The Network Terminal Option requires ACF/VTAM R2 and ACF/NCP/VS V1R2. The program product runs in a 3705-I or 3705-II Communications Controller.

The Network Terminal Option is independent of the host operating system. The same program product runs with OS/VS or DOS/VS.

The Network Terminal Option runs in ACF/NCP/VS Interrupt Level 5.

CUSTOMER RESPONSIBILITIES

To install and use the Network Terminal Option, the customer must:

- Design the network.
- Order and install all the required communications equipment.
- Have the prerequisite ACF/VTAM Version 1 Release 2 or ACF/VTAM Version 2 and ACF/NCP/VS Version 1 Release 2 installed.
- Define the network to ACF/VTAM.
- Define the network to ACF/NCP/VS.
- Define supported devices to the Network Terminal Option.

COMPATIBILITY

The Network Terminal Option is a new program product which may be used in place of the Basic Mode interface contained in ACF/VTAM Version 1 Release 1 to provide specific device support to ACF/VTAM Version 1 Release 2 or ACF/VTAM Version 2. There are, however, some compatibility considerations.

First, terminal control is via the SDLC 3767 Communication Terminal protocols at the application program interface in ACF/VTAM. The data streams are not, however, compatible with the 3767 data streams.

The data streams are unmodified non-SNA data streams. These data streams are preserved to minimize changes to existing application programs.

PERFORMANCE and STORAGE CONSIDERATIONS

- The design objective for the Network Terminal Option is to provide an ACF/NCP/VS V1R2 path length which is approximately 10% greater than the ACF/NCP Version 1 Release 1 path length for the same terminals, excluding user-written code.
- The ACF/VTAM path length will be significantly reduced when moving from the BASIC MODE to the RECORD MODE application program interface. (This assumes that the terminal set remains the same, and that communications remain in the same domains.) The user will have more processor processing power to handle increased transaction rates or to run other jobs.
- The Network Terminal Option will require approximately 24K bytes of additional storage in ACF/NCP. In addition, each supported terminal will require:

86 bytes for each line
266 bytes for each terminal

in addition to the normal calculations for line and terminal in an NCP without the Network Terminal Option.

Network Terminal Option General Information (GC38-0297).

RPQs ACCEPTED: No

5735-XX7 - NETWORK TERMINAL OPTION R2 and 2.1**PURPOSE**

The Network Terminal Option Releases 2 and 2.1 (NTO 2 and NTO 2.1) extend support to ACF/VTAM Version 1 Release 3 and ACF/VTAM Version 2. For a description of ACF/VTAM Version 1 Release 3 and ACF/VTAM Version 2, see the program product pages. NTO 2 also supports the ACF/NCP/VS Version 1 Release 3 and ACF/NCP Version 2 function. NTO 2.1 supports ACF/NCP Version 3 only.

A description of ACF/NCP/VS V1R3 and ACF/NCP Versions 2 and 3 can be found in the program product pages.

DESCRIPTION

NTO 2 or NTO 2.1 with the corresponding level of ACF/NCP, and ACF/VTAM V1R3 or ACF/VTAM V2, allows Record Mode Application programs SNA access to the following terminals:

- 2740 Communication Terminal mdl 1 - nonswitched and switched.
- 2741 Communication Terminal - nonswitched and switched.
- Western Union Teletypewriter Exchanges Services (TWX mdl 33/35) - nonswitched and switched.
- World Trade Teletypewriter Terminal (WTTY) - nonswitched only.
- 3780 Data Communication Terminal - nonswitched

The Network Terminal Option will allow the SNA sessions to continue across the failure of the owning host (ACF/VTAM or ACF/TCAM) if the application program is not affected by the failure.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

NTO Releases 2 and 2.1 are designed to operate on the IBM 3705-II or 3725 Communication Controllers.

SOFTWARE REQUIREMENTS

NTO R2 with ACF/NCP/VS V1R3 operates with both ACF/VTAM V1R2 and ACF/VTAM V1R3. NTO 1 with ACF/NCP/VS V1R2 and ACF/NCP/VS V1R2.1 operates with both ACF/VTAM V1R2 and ACF/VTAM V1R3. On the IBM 3705, NTO R2 with ACF/NCP Version 2 operates with ACF/VTAM V1R3 and ACF/VTAM V2. On the IBM 3725, NTO R2 with ACF/NCP V2 operates with ACF/VTAM V1R3 (MVS only, with appropriate PTF) and ACF/VTAM V2. (Note: NTO 1 runs on ACF/NCP/VS V1R2 and ACF/NCP/VS V1R2.1; NTO 2 runs on ACF/NCP/VS V1R3 and ACF/NCP Version 2. NTO Release 2.1 operates with ACF/NCP Version 3 only, and any level of ACF/VTAM which operates with ACF/NCP Version 3.)

NTO Release 2 is independent of the host operating system. The same program product runs with OS/VS or DOS/VSE. NTO Release 2.1 runs on MVS/370 and MVS/XA (compatibility mode only).

The Network Terminal Option runs in ACF/NCP/VS Interrupt Level 5.

CICS/VS will support the Network Terminal Option (NTO) so that some terminals currently supported through BTAM can also be supported through ACF/VTAM and ACF/NCP/VS. Details for the physical attachment of these terminals is as specified by NTO. Support is specifically for the IBM 3232-51 and the IBM 6733 (as a CPT-TWX 33/35) and Western Union Teletypewriter Exchange Service (TWX Mdl 33/35) terminals and for World Trade Teletypewriter (WTTY) terminals. Existing applications for use with these terminals will run with NTO with minimal change.

Similar support is available with IMS/VS V1 R3. Note that IMS BTAM Dial Commands '/IAM' are not supported for NTO terminals.

COMPATIBILITY

Network Terminal Option/IBM Subsystems which run NTO with ACF/VTAM V1R2 will run on ACF/VTAM V1R3 or ACF/VTAM V2.

PERFORMANCE and STORAGE CONSIDERATIONS

The performance of NTO operating with the corresponding level of ACF/NCP is dependent upon particular hardware and network configuration. NTO Release 2 or Release 2.1 requires approximately 50K bytes of additional storage in ACF/NCP. For the NTO Release 2 user, the storage requirements of NTO Release 2.1 are approximately 15 additional bytes for each defined NTO terminal over the storage requirements of NTO Release 2.

Since the performance and storage requirements will vary depending upon particular hardware configuration, the 3705 Configurator (CF3705) or the 3725 Configurator (CP3725) should be used to assess individual customer performance capability and storage requirements.

Network Terminal Option General Information (GC38-0297).*

RPQs ACCEPTED: No

NETWORK PROBLEM DETERMINATION APPLICATION NPDA (5735-XX8)

PURPOSE

The Network Problem Determination Application (NPDA) assists users in performing communication network problem determination. NPDA collects records of errors detected by a communication network and, upon request, displays them at the user's terminal.

HIGHLIGHTS

The Network Problem Determination Application (NPDA) assists the user in locating hardware problems in a communications network by providing:

- Online, hierarchical, interactive viewing of error counts associated with communication controllers, BSC, S/S and SDLC lines, modems, cluster controllers, control units and terminals.
- Specific error data and a brief error description with suggested user action associated with each error event. The Network Problem Determination Application also allows the Display Exception Monitoring Facility (DEMF) to coexist within the same system environment.
- Permanent error records associated with:
 - 370X Communication Controllers.
 - SDLC, BSC and S/S lines attached to a 370X/NCP.
 - BSC and S/S lines connected to a 270X or a 370X/EP.
 - Inclusions and qualifications for ACF/VTAME support.
 - SDLC and BSC lines attached to the channel of a 4331.
 - 3232 Model 1
 - 3271 mdl 1 or 2 control units connected to a 370X/NCP, a 270X, a 370X/EP or a 4331 channel.
 - 3274 mdl 1C, 21C, 31C, 51C control units connected to a 370X/NCP, a 270X, 370X/EP or a 4331 channel.
 - 3274 mdl 1A, 21A, 31A (local SNA).
 - 3276 mdls 1, 2, 3, 4, 11, 12, 13 and 14.
 - 3275 mdls 1 and 2.
 - 3272 mdl 1 or 2 (local mode). *
 - 3274 mdl 1B, 1D, 21B, 21D or 31D (local non-SNA). *
 - 3770, MLU version models (3776 mdls 3 and 4, 3777 mdls 3 and 4).

Support in 3276 and 3274 SNA/SDLC mdls for the summary maintenance statistics function is required and will be available at first customer shipment of the NCCF and NPDA program products on ACF/VTAM Version 1 Release 2, ACF/TCAM Version 2 and ACF/VTAME.

 - 3863, 3864, 3865 Modems. *
 - 3867 Link Diagnostic Unit.
 - 8815 Scanmaster 1 mdls 1, 3 and 4.

* Except with ACF/VTAME

NPDA functions consist of:

- Link quality measurement and alerting for improved recognition and resolution of intermittent transmissions errors.
- A presentation services processor, which processes user requests and formats the return display to the user.
- A data services processor, which structures the request for recording and retrieving error statistics data to and from an NCP data base, and requests retrieval of error statistics from the communications network.
- A logging component, which executes as an NCCF subtask to route and record BSC and local error statistics on the EP data base.
- A communications network management interface simulator which formats NCP error records in the VTAM 2, ACF/VTAM Version 1 Release 1, TCAM 10, and ACF/TCAM Version 1 environments to be compatible with the ACF/VTAM Version 1 Release 2 or ACF/TCAM Version 2 architecture format.

In addition, NPDA is dependent on system functions provided by the Network Communications Control Facility (NCCF) for transparency to the operating system and the communications access methods.

MIGRATION

The Facility Error Recognition System (FERS) and the Display Exception Monitoring Facility (DEMF) coexist with NPDA. In a mixed EP and NCP environment, the Network Problem Determination Application constructs an EP data base which is organized identically to the DEMF data base. DEMF may be invoked independently from a DEMF terminal

and a user at an NPDA terminal is also able to request and display errors from the EP data base.

Enhancements to Release 2 of NPDA are supported on OS/VS1 Release 7 and higher releases and on the following access methods:

ACF/VTAM Release 2 and higher levels or ACF/VTAM Version 2
ACF/TCAM Version 2 and higher levels
ACF/VTAME

Communication between the FERS or DEMF facilities and the Network Problem Determination Application is not supported.

Dependencies: The Network Problem Determination Application (NPDA) program product is dependent upon the System Modification Program (SMP) for installation on OS/VS2 (MVS) and OS/VS1. The NCCF program product is a prerequisite for operation of NPDA.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This licensed program is designed to operate on the following IBM processors: 4300, S/370 and 303X.

NPDA logging and simulation components execute as subtasks under NCCF. Network Problem Determination Application user commands and display responses run as application programs.

Hardware: User access to problem determination data is supported with the following IBM 3270 Information Display Systems: IBM 3277 mdl 2 ... IBM 3275 mdl 2, 12 ... IBM 3276 mdls 2, 3, 4, 12, 13, 14 ... IBM 3278 mdls 2, 3, 4, 5 ... IBM 3279 mdls 2A, 2B, 3A, 3B (monochromatic). For effective operation, ECs for individual controllers may be necessary. See sales pages for details. SNA/SDLC models of 3274 and 3276 must be at the appropriate EC level to function properly with the summary maintenance statistics support in NCCF and NPDA.

Storage: The Network Problem Determination Application requires approximately 450K bytes for OS/VS, and 355K bytes for DOS/VS of virtual storage.

DASD: The Network Problem Determination Application requires any DASD device supported under VSAM for program storage and the SNA data base. It requires any DASD device supported by BDAM for the EP data base.

SOFTWARE REQUIREMENTS

The Network Problem Determination Application is provided as a program product on OS/VS2 (MVS) Release 3.8 or OS/VS1 Release 6.7 or 7 with TCAM Release 10, ACF/TCAM Version 1, ACF/TCAM Version 2, VTAM Release 2, ACF/VTAM Version 1 or ACF/VTAM Version 2. NPDA will run with ACF/VTAM Version 1 Release 2 and 3 and with ACF/VTAME on DOS/VSE environment. NPDA will operate with ACF/VTAM Release 2 and Release 3 and ACF/TCAM Version 2 as an application of NCCF which operates in a VM/370 environment. NPDA supports only remote controllers/terminals in this environment. Documentation shipped with the Network Problem Determination Application includes the program directory containing instructions for the installation of the package.

PROGRAM PRODUCTS

**ADVANCED COMMUNICATIONS FUNCTION for NCP
(ACF/NCP) VERSION 2 for the 3705
5735-XX9**

PURPOSE

Advanced Communications Function for the Network Control Program (ACF/NCP) Version 2 is a program product for users of OS/VS1, OS/VS2 MVS, SSX/VSE and DOS/VSE that offers the capabilities of ACF/NCP/VS Version 1, Release 3, plus improved diagnostic and performance tools for 3705 Communications Controllers.

ACF/NCP V2 is designed to operate in 3705-II and 3705-80 Communications Controllers, whether channel-attached to a host processor, or remotely connected to a host processor by an SDLC link to another controller. ACF/NCP V2 is generated using the ACF/System Support Programs (ACF/SSP) Version 2 (5735-XXA).

HIGHLIGHTS of ACF/NCP V2

Offers users of the 3705-II and 3705-80 function equivalent to that offered by ACF/NCP V1 R3, plus:

- A Generalized Path Information Unit Trace.
- Support for the session trace facility of the Network Logical Data Manager (NLDM) program product.
- Network Performance Analyzer function.
- Enhanced Address Trace.
- A Dispatcher Trace.
- Capability to load PEP load modules using data links.

SUMMARY and ADVANTAGES:

- A new trace for diagnosing and analyzing network operating data provides Path Information Unit (PIU) records for select resources in an SNA network. This Generalized PIU Trace is activated by the host access method and forwarded by ACF/NCP/VS to the host, where it can be recorded, formatted, and printed by a utility of ACF/SSP, the ACF Trace Analysis Program.
- The Session Trace function collects status information about NCP resources and identifies host and NCP session partners for session diagnosis and analysis. A host application program product, the Network Logical Data Manager (NLDM), activates the reporting of session trace data and solicits session trace data from ACF/NCP Version 2. The NLDM Session Trace is totally independent of other ACF/NCP trace facilities, including the Generalized PIU Trace.
- A performance tool, the Network Performance Analyzer, previously available as a field developed program (5798-CZT), is now provided as a part of ACF/NCP V2. The Network Performance Analyzer can highlight the causes of performance degradation, such as excessive traffic at certain periods, or insufficient line capacity. It may also aid in isolating performance problems induced by high line or cluster error rates caused by temporary errors or wide fluctuations in message rates. Data from this performance tool can be used to tune networks for greater efficiency and potentially improved response times. The Network Performance Analyzer host component, FDP number 5798-CZR, is a recommended co-requisite for this function.
- The Address Trace has been enhanced to permit tracing of either a register address or the address of a main storage location plus a displacement. The range of displacements that can be specified is 256 bytes. Multiple displacements may be specified following an address, and two-address or displacement combinations may be traced.
- The Dispatcher Trace is a service aid that is continuously active in the network control program, recording entries in the Dispatcher Trace Table for each QCB task that is dispatched by ACF/NCP/V2. The QCB regulates the sequential use of a programmer-defined facility among requesting tasks.
- The ACF/NCP Partitioned Emulation Programming (PEP) Extension load module can be loaded over a data link to a channel-attached 3705 Communications Controller.

MIGRATION and PLANNING CONSIDERATIONS

ACF/NCP Version 2 is designed to operate in the 3705-II and 3705-80 Communications Controllers. It supports and can communicate with:

Host-resident Programs:

- ACF/SSP V2
- ACF/TCAM V2 R3
- ACF/TCAM V2 R4
- ACF/VTAM V1 R3
- ACF/VTAM V2
- EREP
- NPA-Host, FDP Number 5798-CZR (Release 1.3)

- NPDA V2
- NLDM

Controller-resident Programs:

- ACF/NCP V2
- ACF/NCP V1 R2.1
- ACF/NCP V1 R3
- EP for the 3705 (SCP 5747-CH2 with EP/VS feature)
- Network Routing Facility (NRF)
- NTO R2
- X.25 NCP Packet Switching Interface (Release 3.1*)

* Support is provided at the X.25 NCP Packet Switching Interface (NPSI) Release 3 and ACF/NCP V1 R3 functional levels. The additional functions provided by ACF/NCP Version 2 are not supported. X.25 NPSI Release 3.1 support will be available July, 1983.

CUSTOMER RESPONSIBILITIES

To install and use ACF/NCP Version 2, the customer must:

- Design the single system network or multiple host communications system network.
- Meet the requirements of the host communications access method products to be operational with ACF/NCP Version 2.
- Meet minimum 3705-II or 3705-80 configuration requirements to support ACF/NCP V2 in the planned environment.
- Order and install all required communications equipment.
- Order and install ACF/NCP Version 2 (5735-XX9), and ACF/System Support Programs (ACF/SSP) Version 2 (5735-XXA).
- Generate ACF/NCP V2 using ACF/SSP Version 2 for the network configuration.
- Load the 3705 with the generated ACF/NCP V2 load module using, for example, the ACF/System Support Programs V2.

To install and use the PEP extension of ACF/NCP Version 2, the customer must:

- Design the network.
- Meet the requirements of the host processor access method that is to communicate with the generated and loaded PEP.
- Meet minimum 3705-II or 3705-80 configuration requirements to support ACF/NCP V2 and the PEP extension in the planned environment.
- Order and install all required communications equipment.
- Order and install ACF/NCP V2 (5735-XX9), ACF/SSP V2 (5735-XXA), and SCP Program (5747-CH2) with the EP/VS feature.
- Generate PEP using ACF/SSP V2 for the network configuration.
- Load the 3705 with the generated PEP load module using, for example, ACF/SSP V2.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This licensed program is designed to operate on the following IBM machines: IBM 3705-II or IBM 3705-80, either channel-attached to a host processor, or remotely connected to a host processor by an SDLC link to another controller.

SOFTWARE REQUIREMENTS

ACF/NCP Version 2 is generated using the ACF/System Support Programs (ACF/SSP) V2 (5735-XXA). ACF/NCP V2 operates with VSE/AF Release 3, SSX/VSE Release 3, OS/VS1 Release 7, and OS/VS2 MVS Release 3.8 or MVS/SP Release 1.3.1, and subsequent releases and modifications unless otherwise stated.

Use of the Partitioned Emulation Programming (PEP) extension of ACF/NCP V2 requires the additional installation of SCP, program number 5747-CH2, with the EP/VS feature.

ACF/NCP V2 supports the following releases of ACF/TCAM and ACF/VTAM, at the functional level of the access method:

Support For ACF/NCP V2 Generalized PIU Trace*	Support for NLDM*
--	----------------------

ACF/NCP V2 for the 3705 (cont'd)

ACF/TCAM V2 R3	No	No
ACF/TCAM V2 R4		
MVS	Yes	Yes
VS1	Yes	No
ACF/VTAM V1 R3		
MVS	Yes	Yes
VS1	No	No
VSE	No	No
ACF/VTAM Version 2		
MVS	Yes	Yes
VS1	Yes	No
VSE	Yes	No

Notes:

- (1) Generalized PIU Trace facility support provided only for MVS, with appropriate PTF.
- (2) Generalized PIU Trace support provided for MVS by PTF; PTF not required for Generalized PIU Trace support in VS1 and VSE environments.

ACF/NCP VERSION 1

IBM 3705 Communications Controller customers can continue to order ACF/NCP Version 1 Release 2.1 and 3, after the availability of ACF/NCP Version 2.

Program Currency: For program support purposes, ACF/NCP Version 1 Release 2 and its co-requisite programs will remain current until June 30, 1983.

DATA SECURITY, AUDITABILITY and CONTROL

ACF/NCP Version 2 enables the installation to establish and maintain integrity of the data communication network. The installation can control sessions between application programs and terminals.

Since sensitive data may be included in the Session Trace and Line Trace, user management may wish to control access to this information.

In OS/VS environments, the ACF/VTAM Encrypt/Decrypt Feature, and the Encrypt/Decrypt facility of ACF/TCAM can provide increased facilities to safeguard the information transmitted between logical units in the network.

User management is responsible for the selection, application, adequacy, and implementation of these facilities and for appropriate application and administrative controls.

PERFORMANCE and STORAGE CONSIDERATIONS

The functions provided by ACF/NCP V2 will increase NCP storage requirements and path lengths over those of ACF/NCP V1.

The actual performance impact (if any) to a customer will vary depending on particular hardware and network configuration.

**ADVANCED COMMUNICATIONS FUNCTION for NCP
(ACF/NCP) VERSION 2 for the 3725
5735-XX9**

PURPOSE

Advanced Communications Function for the Network Control Program (ACF/NCP) Version 2 for the 3725 is a program product for users of OS/VS1, OS/VS2 MVS and DOS/VSE that offers the capabilities of ACF/NCP Version 2 for the 3705 plus reduced system generation time, enhanced problem determination tools, error recording and availability. ACF/NCP Version 2 for the 3725 is designed to operate with the 3725 Communications Controllers, whether channel attached to a host processor, or remotely connected to a host processor by an SDLC link to another controller. ACF/NCP Version 2 for the 3725 is generated using the ACF/System Support Programs (ACF/SSP) Version 2 Release 1.1 (5735-XXA).

HIGHLIGHTS

ACF/NCP/VS Version 2 for the 3725 offers users of the 3725 Communication Controller function equivalent to that offered users of the 3705 by ACF/NCP Version 2, plus:

- Enhanced problem determination and performance evaluation tools.
- Enhanced error recording and notification.
- Improved availability through continued operation and controlled shutdown in various failure situations.
- Reduced time required for system generation and maintenance.
- Support for Release 4 of the X.25 NCP Packet Switching Interface program.
- Support for storage sizes up to 1 megabyte.

DESCRIPTION

The 3725 Communication Controller provides a display console that ACF/NCP Version 2 for the 3725 supports with problem determination tools, allowing the controller operator to:

- Perform wrap tests.
- Activate line test in order to test the operation of lines and modems.

ACF/NCP Version 2 for the 3725 additionally offers problem determination tools that allow the system operator to:

- Obtain a dump of controller's service processor records, or of communication scanner processor storage or Maintenance and Operator Subsystem (MOSS) storage.
- Users may specify the number of bytes of trace data (up to 254) to be included in the trace, in lieu of activating a full trace.
- Activate scanner interface trace for a given line in order to isolate problems to NCP or communication scanner processor.

ACF/NCP Version 2 for the 3725, in conjunction with the 3725 MOSS, maintains several types of error and statistical records that are helpful in problem determination. These are basically of two types: Those that are stored in the controller and sent to the host processor in response to host processor requests; and those (alert messages) that are sent automatically without being requested, notifying the host processor operator of serious and permanent errors in the 3725 controller.

- For those systems that include the Network Problem Determination Application (NPDA) program product for network management, the network operator is informed of an alert message through the NPDA display.
- For those systems that do not include NPDA, the host operator is informed of an alert message through the access method control.
- At the same time, in either case, a message lamp is activated on the 3725 control panel, and an alarm message (containing the same information as in the alert message sent to the access method console) is displayed at the controller operator console.

In addition to these error notification messages, the types of error statistics maintained by NCP and the 3725's MOSS are:

Internal, or box error records:

- Channel adapter errors, program checks and unresolved interrupts.
- Communication scanner and CCU software errors.

(The 100 most recent such records can be accessed through the 3727 Operator Console, or by the host processor through the dump utility of ACF/NCP V2 Release 1.1 or the corresponding access method facility.)

External, or network error records:

- BSC/SS station statistics and permanent BSC/SS line errors.
- Permanent SNA link and station errors.

- In addition to existing availability and recovery functions in the network control program, ACF/NCP Version 2 for the 3725 and the 3725 MOSS offer improved availability through continued operation and controlled shutdown of the failing components, in the following situations:

- Unrecoverable level 1 error on a 3725 channel adapter.
- Unrecoverable level 1 error on a single communication scanner.
- Failure of the 3725 maintenance and operator subsystem.

- The time required to generate and maintain an NCP has been reduced by the elimination of conditional assemblies. Refer to the Announcement Letter for ACF/System Support Programs Version 2 Release 1.1 (5735-XXA) for details.

- Support of Release 4 of the X.25 NCP Packet Switching Interface (5668-981) provides X.25 support for the 3725 only. X.25 functional support is at the same level as that provided by Release 3.1 of the X.25 NCP Packet Switching Interface program product, which supports ACF/NCP V2 for the 3705.

In addition, NPDA support unavailable with X.25 NPSI releases 1, 2, 3 and 3.1, is provided by X.25 NPSI Release 4 in conjunction with a later version or release of NPDA.

CUSTOMER RESPONSIBILITIES

To install and use ACF/NCP Version 2 for the 3725, the customer must:

- Design the single system network or multiple host communication system network.
- Meet the requirements of the host communication access method products to be operational with ACF/NCP Version 2 for the 3725.
- Meet minimum 3725 configuration requirements to support ACF/NCP Version 2 for the 3725 in the planned environment.
- Order and install all required communication equipment.
- Order and install ACF/NCP Version 2 for the 3725 (5735-XX9), and ACF/System Support Programs (ACF/SSP) Version 2 Release 1.1 (5735-XXA).
- Generate ACF/NCP Version 2 for the 3725 using ACF/SSP Version 2 Release 1.1 for the network configuration.
- Load the 3725 with the generated ACF/NCP Version 2 for the 3725 load module using the ACF/System Support Programs Version 2 Release 1.1.

To install and use the PEP extension of ACF/NCP Version 2 for the 3725, the customer must:

- Design the network.
- Meet the requirements of the host processor access method that is to communicate with the generated and loaded PEP.
- Meet minimum 3725 configuration requirements to support ACF/NCP Version 2 for the 3725, and the PEP extension in the planned environment.
- Order and install all communication equipment.
- Order and install ACF/NCP Version 2 for the 3725 (5735-XX9), ACF/SSP Version 2 Release 1.1 (5735-XXA), and EP for the 3725 (5735-XXB).
- Generate PEP using ACF/SSP Version 2 Release 1.1 for the network configuration.
- Load the 3725 with the generated PEP load module using ACF/SSP Version 2 Release 1.1.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This licensed program is designed to operate on the IBM 3725 Communication Controller, either channel attached to a host processor, or remotely connected to a host processor by an SDLC link to another controller.

SOFTWARE REQUIREMENTS

ACF/NCP Version 2 for the IBM 3725 is generated using the ACF/System Support Programs (ACF/SSP) Version 2 Release 1.1 licensed program (5735-XXA). ACF/NCP Version 2 for the IBM 3725 operates with VSE/AF Release 3, OS/VS1 Release 7, and OS/VS2 MVS Release 3.8 or MVS/SP Release 1.3.1. For reasons of compatibility and co-existence, ACF/SSP Version 2 will operate with the appropriate release of VTAM in MVS Extended Architecture (MVS/XA) 24-bit addressing mode.

Use of the Partitioned Emulation Programming (PEP) extension of ACF/NCP Version 2 for the IBM 3725 requires the additional installa-

PROGRAM PRODUCTS

ACF/NCP V2 for the 3725 (cont'd)

tion of the Emulation Program for the IBM 3725 (EP/3725) licensed program (5735-XXB).

ACF/NCP Version 2 for the IBM 3725 supports the following releases of ACF/TCAM and ACF/VTAM, at the functional level of the access method:

- ACF/TCAM Version 2 Release 4.
- ACF/VTAM Version 1 Release 3 (MVS only, with appropriate PTF).
- ACF/VTAM Version 2.

MIGRATION and PLANNING CONSIDERATIONS

ACF/NCP Version 2 for the 3725 is designed to operate in the 3725 Communication Controller. It supports and can communicate with:

Host-resident Programs:

- ACF/SSP Version 2 Release 1.1
- ACF/TCAM Version 2 Release 4
- ACF/VTAM V1 Release 3 (MVS only)
- ACF/VTAM Version 2
 - MVS
 - VS/1
 - VSE
- EREP 1.5
 - MVS/VS1
 - VSE/VM
- NPA-Host, FDP Number 5798-CZR
- NPDA Version 2
- NCCF Release 2
- NLDM

Controller-resident Programs:

- ACF/NCP Version 2 for the 3725
- EP for the 3725 (EP/3725) PEP
- NTO Release 2
- X.25 NPSI Release 4
- ACF/NCP for the 3705 (current releases)

Stage 1 program generation source decks for ACF/NCP Version 1 Release 3 and ACF/NCP Version 2 for the 3705 will generate ACF/NCP Version 2 for the 3725 with slight modifications. These modifications are not extensive and are relatively simple to implement. They include the addition and deletion of certain macros and macro operands. See *ACF/NCP and SSP, Installation and Resource Definition* (SC30-3167) for details.

ACF/NCP for the 3705: 3705 Communication Controller customers can continue to order ACF/NCP Version 2 for the 3705 after the availability of ACF/NCP Version 2 for the 3725. ACF/NCP Version 1 Release 3 and Release 2.1 can also be ordered for the 3705.

DATA SECURITY, AUDITABILITY and CONTROL

ACF/NCP Version 2 for the 3725 enables the installation to establish and maintain the integrity of the data communication network. The installation can control sessions between programs and terminals.

In OS/VS environments, the ACF/VTAM Encrypt/Decrypt feature, and the Encrypt/Decrypt facility of ACF/TCAM, can provide increased facilities to safeguard the information transmitted between logical units in the network.

User management is responsible for the selection, application, adequacy, and implementation of these facilities and for appropriate application and administrative controls.

PERFORMANCE and STORAGE CONSIDERATIONS

Path lengths for ACF/NCP Version 2 for the 3725 should closely approximate those for ACF/NCP V2 for the 3705. This, in combination with the performance improvements of the 3725 communication controller, should result in a substantial gain in performance. Storage requirements will increase over previous releases of ACF/NCP for the 3705 due to the elimination of conditional assemblies. The net increase in NCP storage will be smaller for the user who previously selected more options, than for the user who previously selected fewer options.

The actual performance impact (if any) to a customer will vary depending on particular hardware and network configuration.

PROGRAM PRODUCTS

**DOS PL/I RESIDENT LIBRARY
5736-LM4**

PURPOSE

This program product is used in conjunction with the *DOS PL/I Optimizing Compiler* (5736-PL1). For the complete compilation and execution of a PL/I program, the following additional program products are required:

- DOS PL/I Resident Library - 5736-LM4 (for link-editing)
- DOS PL/I Transient Library - 5736-LM5 (for execution)

DESCRIPTION

For a processor in which programs are compiled but not link-edited or executed, only the compiler is required. For a processor in which programs are link-edited but not compiled or executed, only the resident library is required. For a processor in which programs are executed but not compiled or link-edited, only the transient library is required.

The DOS PL/I Resident Library consists of those subroutines which, when link-edited under DOS with the object module produced by the DOS PL/I Optimizing Compiler, form a phase or object program for subsequent execution under DOS. To execute a phase the DOS PL/I Transient Library is required.

The functional areas serviced by subroutines of this library are as follows:

- Mathematical routines (e.g., SIN, COS).
- Data type conversion (e.g., Pictured Character to Float).
- Edit, List and Data-Directed I/O (Stream I/O).

Control program interfaces, including:

- Program Initialization.
- Storage Management.
- Display.
- Timer Facilities.
- Error Handling

but excluding those routines loaded during execution (see "Program Product Specifications" for DOS PL/I Transient Library).

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Link Edit: Direct access storage space is required for the Resident Library (approximately 700 blocks of 322 bytes each).

Execution: The main storage requirements of the object program are a function of the PL/I facilities used. The decimal and floating point instruction sets are required. The timer feature is required if use is made of the TIME built-in function or the DELAY statement.

The object program can utilize the following IBM input/output devices if they are supported by the release of the DOS or SSX/VSE system used:

Using SAM Support:

- Magnetic Tape Units - 2400, 3420, 3410, 3411
- Diskette Unit - 3540
- Card Units - 1442, 2501, 2520, 2540, 3504, 3505, 3525, 2560, 5425
- Optical Mark Reader - 3881
- Printers - 1403, 1404, 1443, 1445, 3203, 3211, 3262, 4245, 5203
- Direct Access Storage - Fixed block disk devices

Using SAM and DAM Support:

- Direct Access Storage - 2311, 2314, 2321, 3330-1, 3340, 3330-11, 3350

Using ISAM Support:

- Direct Access Storage - 2311, 2314, 2321, 3330-1, 3340, 3344, 3330-11, 3350 in 3330-1 compatibility mode

Using VSAM Support:

- Direct Access Storage - 2314, 3330-1, 3340, 3330-11, 3344, 3350 and fixed block disk devices

Under CMS, the object program can utilize those I/O devices which are supported by VM/370. For a list of the devices supported by VM/370, see the *IBM S/370: Planning and System Generation Guide* (GC20-1801).

SOFTWARE REQUIREMENTS

Release 5.1 of the resident library is supported on DOS Release 26 through DOS/VS Release 34, DOS/VSE with VSE/Advanced Functions Releases 1 and 2 and the CMS component of Releases 3 through 6 of VM/370, until March 31, 1982. After March 31, 1982, Release 5.1 of the resident library is no longer current.

Release 6.0 of the resident library is supported on DOS/VSE with VSE/Advanced Functions Release 2 or SSX/VSE, and on the CMS component of Release 6 of VM/370, and subsequent versions, releases and modifications, unless otherwise stated in a modification of the specifications.

Object programs must be executed under the Disk Operating System or SSX/VSE or under the Conversational Monitor System (CMS) component of VM/370. The timer system generation option is required if use is made of the TIME built-in function or the DELAY statement.

Object programs may also be executed as application programs in the CICS environment.

A subset of Library modules may, on installation option, be placed in CICS/NUCLEUS at PL/I installation time, with the intent of improving performance under a CICS/DOS/VS System.

COMPATIBILITY

A specific release of the DOS PL/I Resident Library can be used with any DOS PL/I Optimizing Compiler released prior to or on the same date as the Resident Library.

DOCUMENTATION

Title	Order Number
DOS/PL/I Resident Library Specifications	GC26-3996
DOS/PL/I Optimizing Compiler General Information Manual	GC33-0004

RPOs ACCEPTED: No

NOTE: The SSX/VSE version of the DOS/PL1 Compiler and Libraries is based on Release 5.1. For SSX/VSE, the DOS/PL1 resident library will only be available together with the DOS PL/I transient library and the DOS/PL1 Optimizing Compiler as one package with a specific order number.

PROGRAM PRODUCTS

**CONSOLIDATED FUNCTIONS ORDINARY II
CFO II (5736-N13)**

PURPOSE

The Consolidated Functions Ordinary II System represents a proven systems approach to maintaining, processing and servicing individual life insurance contracts. CFO II takes advantage of the experience and knowledge gained from the IBM '62 CFO system (1401-IL-02X). Although CFO II is a new system, the successfully-proven logic structure of the '62 CFO Daily Cycle and Periodic Update programs has been maintained and enhanced in this CFO II system.

DESCRIPTION

CFO II processes both scheduled and non-scheduled transactions, updates policies with cash values, dividends and other forms of participation and updates policies with renewable term premiums. Capabilities provide for policy status on loan, surrenders and mode premium values.

The CFO II system functions under the control of the Operating System, Disk Operating System, mdl 20 Tape Programming System, or mdl 20 Disk Programming System. It is programmed using a subset of the Assembler languages for these controlling programs. The insurance logic programming has been fully commented and documented to enable the user to better understand and modify the system. The CFO II system satisfies the major processing requirements for ordinary life insurance from the point in time immediately following policy issue through maturity, expiration or termination of the contract. The logic for certain accident and health processing is also contained in CFO II.

HIGHLIGHTS

Wide range of scheduled and non-scheduled transaction processing ... fully automatic APLs ... powerful status reporting, quoting or processing of cash surrenders, conversions, and loans ... handles standard billing forms ... contains insurance improvements developed through experience gained with '62 CFO. Examples are single line name and address processing ... loan processing contains cash value of term riders ... terminated policy master records remain on file for ease in reinstatement ... flexible policy master record allows for two user trailers ... available for small companies with 24K Model 20 systems with upward compatibility provided for DOS and OS users.

USE

The policy master record file and unscheduled transactions are input to the CFO II system and are processed by the 16 daily cycle programs. Scheduled transactions are initiated by information contained on the policy master record. In addition to the updated policy master records, output from the CFO II system daily cycle is in the form of policy and general accounting journals, transaction and error registers, and status reports.

Programs which update policy master records with cash values, dividends or other forms of participation and renewable term premiums are run periodically.

CUSTOMER RESPONSIBILITIES

Before the CFO II System may be successfully implemented, the user must --

- Acquire thorough knowledge and understanding of the Consolidated Functions Ordinary System.
- Design and implement procedures that will convert present policy master records to a form acceptable to the Consolidated Functions Ordinary II System.
- Generate participation, renewable term, cash value, rate files.
- Develop adequate procedures and programs to generate policy master records for all new business, exchange, conversion, and reinstatement contracts.
- Write programs to print all premium, anniversary, and loan activity notices.
- Write programs to prepare commission statements and agency accounting statements from system-generated output.
- Develop procedures to balance against external controls all assets and liabilities which are related to a specific policy.
- Develop procedures and programs to provide for Valuation and Policy Exhibit.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

CFO II is designed to operate in either a S/360 mdl 20 environment or on mdl 25 and larger systems. The minimum machine configuration is provided for the basic mdl 20 system and the mdl 25 system. In addition, the Decimal Arithmetic feature is required for mdl 30 and 40 systems.

Model 20 minimum configuration requires at least 20K bytes available for program, data and access method storage with the following devices:

Product	Model	Feature	Description
2020	DC5		Processing Unit
		4460	1442 mdl 5 Attachment
		8090	2501 Attachment
		8082	2203 mdl A1 Attachment
		4658	I/O Channel
1442	5		Card Punch
2501	A1		Card Reader
2203	A1		Printer
2415	2		(4) Magnetic Tape Units

Model 25 minimum configuration operating under DOS requires at least 22K bytes available for program, data and access method storage with the following devices:

Product	Model	Feature	Description
2025	E		Processing Unit
		4598	Integrated 2311 Attachment
		6960	Selector Channel
1052	7		Printer/Keyboard
1442	N1		Card Read Punch
1443	N1		Printer
2311	1		Disk Storage Drive
2415	2		(4) Magnetic Tape Units

For Operating System, in addition to the OS requirements, CFO II requires a region size of 30K for MFT and MVT along with space in auxiliary storage for the following data sets: System input and output (print and punch) -- selectable with Job Control Language ... up to four input and output sequential data sets used for such things as policy master records, external transactions, mortality tables, rate tables, activity records, and sort work files.

SOFTWARE REQUIREMENTS

CFO II operates under mdl 20 TPS or DPS, DOS, and OS and is written in a subset of the Assembler languages for these controlling systems. All file processing is sequential. The Sort/Merge programs for either TPS, DPS, DOS, or OS are also used with the CFO II System.

DOCUMENTATION (available from Mechanicsburg)

Application Description Manual (GH20-0883) ... *Promotional Flyer* (G520-2411).

PROGRAM PRODUCTS

**ALPHA SEARCH INQUIRY SYSTEM
5736-N14**

PURPOSE

Alpha Search Inquiry System is a terminal-oriented system for the retrieval of name records through phonetic techniques.

The Alpha Search Inquiry System consists of a set of routines that create, maintain, reorganize and provide terminal access to a file containing customer names and customer numbers which reference other user files. Depending on the environment in which the Alpha Search Inquiry System is used, customer numbers may be synonymous with one or more of the following terms: Account numbers ... policy numbers ... contract numbers ... certificate numbers ... subscriber numbers ... document numbers ... license numbers ... part numbers ... invoice numbers.

Phonetic encoding increases the user's ability to access the alpha search record even though the exact spelling is not known. Thus, the effects of transcription errors, partially illegible signatures on correspondence and sound-alike names can be reduced.

DESCRIPTION

Of the five routines that make up Alpha Search Inquiry System, four create and maintain the alpha search file, while the fifth (inquiry program) provides terminal access to the alpha search file. The alpha search file is intended to contain only one alpha search record per customer, pointing to one or more records on the user data file(s).

To create the file, the user extracts from his user file(s), name (which may be unformatted), secondary identifiers (1 to 9), user data (if applicable) and customer number(s). The Alpha Search Inquiry System then strips superfluous information from the name, generates a record key and formats the record for loading onto an ISAM or VSAM file. For personal names, the record key is generated through a phonetic encoding technique to reduce the problem of sound-alike and misspelled names. For commercial names, an alphameric technique is employed to generate the record key. If multiple records exist for a single customer, the customer numbers are combined into a single record.

The inquiry portion of this program product, which runs under control of CICS, retrieves one or more names from the alpha search file for display on the 3270 Display Station. The terminal operator may reduce the number of names displayed through secondary identification (for example, birth date, social security number, partial address) and a *degree of likeness* on name. All customer numbers pertaining to a name are displayed.

CICS/DOS/VS (5746-XX3), CICS/OS/VS (5740-XX1), CICS/DOS-Entry (5736-XX6), CICS/DOS-Standard (5736-XX7) or CICS/OS-Standard (5734-XX7) is a prerequisite. The inquiry portion of the program runs as an application program under CICS and is capable of being multi-tasked along with other CICS application programs. The 3270 Information Display System (local or remote) is supported. This program product is written in Assembler language using macros to tailor the system to user requirements and provide operating system compatibility. The program can be assembled and executed under either DOS/VS or OS/VS on a S/370 with virtual storage capabilities or under DOS/VS or OS/VS operating under VM/370.

HIGHLIGHTS

- A single Alpha Search file record can contain any number of customer numbers pointing to customer records in multiple files.
- Programs are provided to aid the user in creating and maintaining the alpha search file.
- The system provides for user-defined information in the alpha search record.
- Parameters are provided to tailor system and screen formats to user requirements.
- The system provides a file browse functions to allow partial input of last name.
- The system can search for a record with as many as nine secondary identifier fields (for example, birth date, social security number, partial address). The identifiers may be varied from transaction to transaction. Portions of each identifier may be entered when the terminal operator does not know all the information of the secondary identifier.
- Secondary identifiers and *degree of likeness* on the entered name reduce retrievals to common surnames.
- Separate encoding routines are provided to handle the differing characteristics of personal names and commercial names.
- A program exit in the alpha search inquiry program allows the user to pass control from the inquiry program to user application programs for referencing other customer files.
- The system utilizes features offered by the 3270 Information Display System; dual density screen, protected data fields, read

modified data only, selector light-pen, program tab and large 1920 character screen.

- The system utilizes the capabilities of CICS to provide: File management support ... multi-tasking environment ... terminal management ... storage management ... data management ... program management services ... time management (optional).
- The system is compatible between DOS/VS and OS/VS.

USE

The terminal operator enters a CICS transaction code, name and additional search information. The alpha search inquiry program queries the alpha search file and returns to the operator those names which are similar or identical to the name entered by the terminal operator along with their respective customer numbers.

CUSTOMER RESPONSIBILITIES

Before the Alpha Search Inquiry System may be successfully implemented, the user must:

- Acquire thorough knowledge and understanding of the Alpha Search Inquiry System, using the *Operations Guide* and *Program Reference Manual* written for the system.
- Prepare parameters for tailoring the input/output records and terminal formats to meet user requirements.
- Write programs to extract names, secondary identifiers, user data (if applicable) and customer numbers from existing files for use in establishing the alpha search file.
- Generate transactions for the update program (normally the user would modify his existing file maintenance programs to generate these transactions).
- Secure and generate the Customer Information Control System, and be knowledgeable in its operational and functional characteristics.
- Train terminal operators in the operation of the 3270 Display Station.
- Be knowledgeable in the characteristics of the applicable operating system environment and its data management facilities, including the Indexed Sequential Access Method or Virtual Storage Access Method.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum machine requirement is an IBM S/370 processor operating with OS/VS1, OS/VS2, DOS/VS or with these operating systems operating under VM/370. A virtual partition or region size of at least 64K bytes (excluding access methods) is required for the Alpha Search Inquiry System batch programs. The online (inquiry) program minimum requirement is a virtual partition or region which will contain 24.5K bytes. This does not include the CICS and access method requirements. The 24.5K byte requirement is divided as follows:

	Bytes
I/O areas and work areas	2.0K
Transaction work area (per terminal)	0.5K
Main application area	20.0K
Reserved for maintenance	1.0K
Reserved for customer modifications	1.0K
Total	24.5K

DASD space is required for the alpha search file, the program libraries and the system control program requirements. An 80-column card reader, 132 character/line printer and two sequential data sets (tape or DASD) are required for the batch programs.

For OS/VS, two sequential data sets (tape or DASD) are required for batch program execution.

For DOS/VS, two 9-track tape drives are required for batch program execution.

When operating in a Virtual = Real environment, the availability of 44K bytes of real core will ensure maximum performance of the batch programs. The inquiry program can operate in as little as 12K bytes, consisting of the two longest program phases.

Also required is the IBM 3270 Information Display System with appropriate control units (local or remote). The display stations must include a 1920 position display screen and one of the following Keyboards: 66-Key EBCDIC Typewriter Keyboard (#4630) ... 66-Key EBCDIC Data Entry Keyboard (#4631) ... 78-Key EBCDIC Typewriter Keyboard (#4633) ... 66-Key ASCII Typewriter Keyboard (#4634) ... 78 Key-ASCII Typewriter Keyboard (#4635). The Selector Light-Pen is optional.

PROGRAM PRODUCTS

Alpha Search Inquiry (cont'd)

SOFTWARE REQUIREMENTS

This program product runs under either a Disk Operating System (DOS/VS) or Operating System (OS/VS) environment on S/370 with virtual storage capabilities or under DOS/VS or OS/VS operating under VM/370. The program is written in S/370 Assembler language. Communication with the Customer Information Control System (CICS) is via CICS macro instructions.

The namecode, file load, update and reorg routines operate as single tasks within a partition. The inquiry portion operates as a single task under control of CICS.

The alpha search inquiry portion of the program product requires the following CICS management facilities: Task management ... storage management ... program management ... terminal management ... file management ... temporary storage management ... time management (optional).

In addition to DOS/VS components and options specified for CICS (see "Programming Systems" section in the *CICS General Information Manual*, GH20-1028), the following components are required:

ISAM or VSAM
Sort/Merge, 5743-SM1 or 5746-SM1

In addition to OS/VS components and options specified for CICS (see "Programming Systems section in the *CICS General Information Manual* , the following components are required:

ISAM or VSAM
Sort/Merge, 5734-SM1 or 5740-SM1

Sales Flyer	G520-2629

DOS PL/I OPTIMIZING COMPILER 5736-PL1

PURPOSE

The DOS PL/I Optimizing Compiler is designed specifically for generation of fast object programs. It provides a growth path for the users of Model 20 PL/I and the PL/I D (Version 4) compiler. Performance is achieved through the incorporation of the best design features of a number of well-proven compilers.

Subroutine Libraries: A subroutine library is required during link-editing of a compiler output module. A second library is required for execution of the object program. Each library is available as an IBM program product:

DOS PL/I Resident Library 5736-LM4 (for link-editing).

DOS PL/I Transient Library 5736-LM5 (for execution).

For a processor in which programs are compiled but not link-edited or executed, only the compiler is required. For a processor in which programs are link-edited but not compiled or executed, only the resident library is required. For a processor in which programs are executed but not compiled or link-edited, only the transient library is required. The three products are available packaged together (as program number 5736-PL3) or individually.

HIGHLIGHTS

- Extensive Optimization - Object code can be highly optimized so that programs generally require less execution time than those compiled by the PL/I D compiler.
- Advanced Level of PL/I - A powerful implementation of PL/I with language extensions and developments beyond the PL/I D (Version 4) level. Features include Compile-time Preprocessing, Arrays of Structures, DEFAULT Statement, File variables, Data-Directed Input/Output and Structured programming statements.
- VSAM Support - Support for the use of data sets created with or converted to VSAM. In most cases VSAM will be used directly; where this is not possible the ISAM interface will be used.
- Extensive Debugging Aids - The time and effort required for program checking are minimized by extensive implementation of on-units, support of the CHECK condition, facilities for dynamic dumping, data-directed input/output, a comprehensive range of options and clear and precise diagnostic messages at compilation and execution times.
- ASCII Support - ASCII data sets on magnetic tape can be created and accessed using SAM.
- Communication with FORTRAN, COBOL, RPG II and Assembler - This compiler facilitates communication between PL/I object modules and FORTRAN, COBOL, RPG II or Assembler object modules. (For details refer to *DOS PL/I Optimizing Compiler: Language Reference Manual* (GC33-0005) and *DOS PL/I Optimizing Compiler: Programmer's Guide* (GC33-0008).
- CMS Support - The compiler can be used with the CMS component of VM/370. The compiler can be invoked from a remote terminal.
- Extended Graphic Character Set Support - New functions (available on Release 6 only, not available under SSX/VSE), improve the usability of PL/I for applications requiring large character sets. This is accomplished by defining a new data set type, GRAPHIC, which defines two-byte string data (graphic string data). For detailed information see *OS and DOS PL/I Optimizing Compiler: Extended Graphic Character Set Support Supplement* (SC26-3971).

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Compilation: In DOS, the compiler itself requires at least 50K bytes of main storage, exclusive of the storage required for the operating system control program.

In DOS/VS, DOS/VSE and SSX/VSE the compiler will run in the minimum virtual partition, which is 64K exclusive of the storage required for the operating system control program. It is possible to compile with less real storage than the 50K design point of the compiler but performance will be degraded.

Additional storage, either real or virtual, can be used to reduce compilation time by reducing the use of auxiliary storage (SYS001 and SYS002) used by the compiler.

The IBM machine must include the floating-point and decimal instruction sets. The timer feature is required if the time taken for compilation or the time of compilation are to be recorded.

Direct-access storage space is required for Compiler residence - approximately 630 blocks of 1,728 bytes for 2311, 659 blocks of 1,688 bytes for 2314, 736 blocks of 1,504 bytes for 3330 or 736 blocks of 1,540 bytes for 3340. For Release 29 and later, the requirement is for approximately 1,200 blocks of 1,024 bytes, regardless of device.

Execution: The storage requirements of the object program are a function of the PL/I facilities used. The decimal and floating point instruction sets are required. The timer feature is required if use is made of the TIME built-in function or the DELAY statement.

The object program can utilize the following IBM input/output devices if they are supported by the release of the DOS or SSX/VSE system used:

Using SAM support:

Magnetic tape units	-	2400, 3420, 3410, 3411
Card units	-	1442, 2501, 2520, 2540, 3504, 3505, 3525, 2560, 5425
Optical Mark Reader	-	3881
Diskette Unit	-	3540
Printers	-	1403, 1404, 1443, 1445, 3203, 3211, 3262, 4245, 5203
Direct Access Storage	-	fixed block disk devices

Using SAM and DAM support:

Direct Access Storage	-	2311, 2314, 2321, 3330-1, 3330-11, 3340, 3344, 3350
-----------------------	---	---

Using ISAM Support:

Direct Access Storage	-	2311, 2314, 2321, 3330-1, 3340, 3344, 3350 in 3330-1 compatibility mode
-----------------------	---	---

Using VSAM Support:

Direct Access Storage	-	2314, 3330-1, 3330-11, 3340, 3344, 3350 and fixed block disk devices.
-----------------------	---	---

Compilation and Execution Under CMS: To operate the compiler under CMS, the minimum CMS virtual machine size of 320K bytes is required.

When executing a PL/I program under CMS, the same processor features are required as are used when executing under the IBM Disk Operating System. Under CMS, the PL/I Optimizing Compiler and library support those I/O devices which are supported under the IBM Disk Operating System provided they are supported by VM/370. For a list of the devices supported by VM/370, see the *IBM VM/370: Planning and System Generation Guide* (GC20-1801).

SOFTWARE REQUIREMENTS

Release 5.1 of the compiler is supported on DOS Release 26 through DOS/VS Release 34, DOS/VSE with VSE Advanced Functions Releases 1 and 2 and the CMS component of Releases 3 through 6 of VM/370, until March 31, 1982. After March 31, 1982, Release 5.1 of the compiler is no longer current.

Release 5.1 of the DOS/PL1 Optimizing Compiler together with the libraries is also available as Prompter-supported program product on SSX/VSE with a specific order number.

Release 6.0 of the compiler is supported on DOS/VSE with VSE/Advanced Functions Release 2, and on the CMS component of Release 6 of VM/370, and subsequent versions, releases and modifications, unless otherwise stated in a modification of the specifications.

Compilation: SAM is used directly by the compiler. The DOS or SSX/VSE system level which supports a specific device is required for the compiler to use that device. The timer system generation option is required if the time taken for compilation or the time of compilation are to be recorded.

Execution: Object programs must be executed under the Disk Operating System or SSX/VSE or the Conversational Monitor System (CMS) component of VM/370. All object programs require SAM modules in the generated operating system.

Programs using the PL/I ENVIRONMENT option INDEXED to access ISAM data sets require ISAM modules. Programs using the REGIONAL environment option to access DAM data sets require DAM modules. Programs using the INDEXED or VSAM ENVIRONMENT options to access VSAM data sets require VSAM modules. VSAM can be used directly if the VSAM ENVIRONMENT option is specified.

Object programs may also be executed as application programs in the CICS environment.

Compilation and Execution under CMS: There are no restrictions on the language accepted by the compiler under CMS. Programs compiled under CMS will execute under the IBM Disk Operating System but the following features are not available when executed under CMS:

- Multipartition.
- ENVIRONMENT attribute options ASSOCFLE and FUNC.
- REGIONAL files.
- INDEXED file support.
- PL/I Sort facilities.

DOS PL/I Optimizing Compiler (cont'd)

- PL/I Checkpoint/Restart facilities.
- ASCII data sets.
- BACKWARDS attribute with magnetic tapes.

For additional information about the object time restrictions under CMS, refer to the publication *DOS PL/I Optimizing Compiler: CMS Users Guide* (SC33-0051).

COMPATIBILITY

- (a) Compatibility between different releases of the DOS PL/I Optimizing Compiler and the DOS PL/I Resident and Transient Libraries.

For the successful link-editing of object modules, the resident library must be from a release corresponding to, or later than the Compiler used. Object modules from different releases of the Compiler can be link-edited together - provided that the release of the resident library is at least as recent as the latest compiler used.

- (b) Compatibility with the DOS PL/I D Compiler:

The compiler is compatible with the PL/I D (Version 4) compiler in the following respects:

Source language	Yes
Data sets	Yes
Compiler restrictions	Yes
Object code	No

Detailed information on the minor incompatibilities arising from implementation differences, and from language extensions and changes, is given in the *DOS PL/I Optimizing Compiler Programmer's Guide* (SC33-0008).

A source program written for compilation by the Disk Operating System PL/I D (Version 4) compiler, in general, produces identical results when compiled by this compiler. However, users of the PL/I D (Version 4) compiler should be aware of the differences in the language and implementation characteristics between these compilers.

- (c) Compatibility with the OS PL/I Optimizing Compiler.

The OS PL/I Optimizing Compiler implements a superset of the DOS language and the high degree of compatibility between these two compilers provides a convenient migration path from DOS, DOS/VS or DOS/VSE to OS or OS/VS.

Features

Extensive Optimization: Object code can be optimized to a much greater extent than has previously been possible with PL/I compilers. Optimization is optional, the options available to the programmer being:

OPT(TIME) Object code optimized to minimize the time required for execution of the object program. The secondary effect may be a reduction in object program size.

NOPT No optional optimization, permitting fastest compilation. This is the standard default setting.

Advanced Level of PL/I: The level of PL/I is considerably more extensive than the language level supported by the DOS PL/I D (Version 4) compiler. The features offered to DOS PL/I users include:

- **Compile-Time Preprocessing** - The full range of PL/I compile-time preprocessing facilities is supported, thus providing a convenient method of modifying and completing a PL/I source program at compile-time. Additional built-in functions, **COUNTER**, **COMPILETIME** and **PARMSET**, are available. Statements **%NOTE**, **%PRINT** and **%NOPRINT** are introduced. Arguments to preprocessor procedures may be specified by keyword reference as well as positionally.
- **Arrays of Structures** - Manipulation of data aggregates is improved by the facility for using arrays of structures. Arrays and arrays of structures may have bounds specified by expressions or, if they are parameters, by an asterisk.
- **DEFAULT Statement** - The Default statement provides the programmer with a method of overriding the standard language default attributes for all identifiers and descriptors. This statement can also be used for subsequent revision to the standard defaults.
- **Improved Record I/O** - The record oriented input/output facilities are more flexible than those of the PL/I D (Version 4) compiler. The implicit **OPEN** capability is provided for **RECORD I/O** statements, together with implementation of the **EVENT** option. This permits processing to overlap input/output operations when using direct access methods, thus reducing execution time for object programs.
- **File Variables** - File names may now be variables, thus permitting increased flexibility in file handling.
- **Dynamic Extents for Strings and Arrays** - Bit strings, character strings and arrays can have their lengths or bounds respectively specified by expressions or, if they are parameters, by an asterisk. String manipulation is also improved by the implementation of the **VARYING** attribute for bit and character strings.

- **LIKE Attribute** - The Like attribute can be used in the declaration of structures, thus simplifying the coding of large structure declarations.

- **Dynamic Variables in the ENVIRONMENT Option** - Expressions such as maximum record length, blocksize, etc., for record I/O may be specified by variables in the ENVIRONMENT option, which are accessed at the time the file is opened.

- **Structured Programming Statements** - The ease with which Structured Programming Techniques can be utilized is increased in Release 5 of the compiler by the addition of the **SELECT** group, and the **LEAVE**, **DO UNTIL** and **DO REPEAT** statements.

- **VSAM support** - Current **RECORD I/O** language in existing programs, written for use with ISAM data sets, automatically runs on VSAM. New environment options allow PL/I Support for more VSAM features in new programs, compiled on Release 5 of the compiler.

- **ASCII Support** - Support for the ASCII character set is provided for compiler object code by SAM. As a result the following rules apply:

Object time: Object programs can create or access data sets in ASCII provided the data sets are on magnetic tape with formats **U**, **F**, **FB**, **D** or **DB**. These data sets will be supported by **STREAM** files and by **RECORD SEQUENTIAL BUFFERED FILES** using the **CONSECUTIVE** environment option. Only character data may be written onto an ASCII data set. This feature is not available under CMS at object time.

- Numerous other additions or extensions to the PL/I language beyond that supported by the PL/I D (Version 4) compiler include the **COMPLEX** attribute for arithmetic, the use of scale factors for **FIXED BINARY** data, additional built-in functions (such as **POLY**, **ASIN** and **ACOS**) and pseudo variables, the **REFER** option, the **ENTRY** and **RETURNS** attributes in calling routines, the **ORDER** and **REORDER** options for optimization, use of expressions in format lists, the **CONTROLLED** attribute in storage allocation, use of **AREA**, **ALLOCATE**, and **ON AREA** in list processing, the **ISUB** facility in array definitions and the **GENERIC** attribute for automatic selection of entry points.

Extensive Debugging Aids: The time and effort required for program checking are minimized by the following debugging aids:

- **OnUnits** - Improvements in exceptional condition handling are provided by increased implementation of onunits. Onunits can be specified for conditions such as **SUBSCRIPTRANGE**, **STRINGRANGE**, **STRINGSIZE**, **ERROR**, **FINISH** and **CHECK**, in addition to those conditions implemented by the PL/I D (Version 4) compiler. Programmer-defined conditions may also be specified. Much greater flexibility in the contents of onunits is permitted. Built-in functions such as **ONSOURCE**, **ONCHAR**, **ONLOC** and **DATAFIELD** are also available to users.
- **Data-Directed Input/Output** - The implementation of data-directed input/output permits values to be placed in particular named variables on input and prints the names of variables on output.
- **Diagnostics** - Extensive diagnostics are provided at compilation and execution times. Where it is appropriate, the compiler will make an assumption as to the intended meaning of an erroneous statement. Diagnostic messages produced by the compiler will be in the categories of termination error, severe and other errors and warnings. Messages for each category will be listed in statement number order, each message indicating:
 - The number of the erroneous statement, and the portion of the statement involved.
 - The nature of the error.
 - Any assumptions made, or actions taken by the compiler.

Other aids to program debugging include:

- Control over interrupt and error handling. Error handling functions may be built-in or programmer-defined.
- Powerful flow-tracing (including statement number trace), statement counting facilities and dynamic dumping facilities.
- Communication with the program during execution by use of the **DISPLAY** statement.
- The compiler **SYNTAX** option to allow the programmer to check only the syntax of his programs. This avoids the burden of complete compilation when serious errors are found.

Compiler Options: In addition to the option for object code optimization, the wide range of options provides control over:

- Main storage allocation for compilation.
- Preprocessing and processing characteristics.
- Input/Output features including:

PROGRAM PRODUCTS

DOS PL/I Optimizing Compiler (cont'd)

- Source program listings.
- Attribute and cross-reference tables.
- Object program listings in Assembler code.
- Storage maps.
- Use of terminal for all compiler listings with CMS.
- Object program output on punched cards, magnetic tape or disk.

Additional Facilities: Provision is made for:

Accessing the system CHECKPOINT/RESTART facility, thus providing recovery facilities in the event of system or machine failure during long production runs.

Accessing the sort routines of the system Sort/Merge program directly from a PL/I object program.

PROGRAM PRODUCTS

DOS RPG II (5736-RG1)

PURPOSE

RPG II is a programming language that performs a wide variety of commercial data processing jobs. The RPG II language is an expanded version of the present RPG language operating under the Disk Operating System. Compared with the previous DOS RPG, RPG II offers performance improvement in two areas:

- Improved core efficiency for object programs.
- Improved throughput performance for process bound programs.

In addition to the performance improvements, many new functions have been added to the RPG II language. These functions make RPG II:

- Easier to use than the current DOS RPG.
- More flexible, so that the programmer can choose the method of coding which is most suited to his needs.
- More powerful, so that many programs can be coded using RPG II which in the past were difficult or impossible to code using RPG.

HIGHLIGHTS

These new functions include:

Edit Codes - provide the facility to format output fields by specifying a single character code rather than an edit mask.

Closed Subroutines - provide for executing closed subroutines within the RPG II program from any number of points within the calculations with an automatic return to the calculation line following the statement which asked for execution of the routine.

CHAIN Operation Code - provides user control of direct processing by key or record ID through the calculation specifications.

Spanned Record Format - permits processing of variable length logical records that can span multiple physical records.

EXCPT Operation Code - provides the ability to cause output to be written during either total or detail calculations. After the output is completed, calculations resume where interrupted.

Fetch Overflow - provides the ability to control when overflow processing is to occur.

DSPLY Operation Code - provides the ability to display messages on and accept data from a console device.

File Translation - provides character by character translation for specific files through the use of a translation table.

***PLACE** - provides the facility to print invoices or labels (of identical content) side-by-side (2 up, 3 up, etc.) without redefining the individual fields on the output specifications.

Look Ahead - provides the facility to look ahead at the contents of fields in other records awaiting processing for calculations, testing, comparison or for output.

Compile Time Tables - provides the ability to load tables at compile time.

Single Dimension Arrays - provides the ability to define, point to (index to) and look up fields within an array or like fields. An XFOOT operation is provided which sums the elements of an array.

SQRT Operation Code - provides a means of extracting the square root of the value in a given field.

FORCE - provides the ability to determine and control which file/record is to be processed during the next RPG II program cycle.

AND/OR Calculations - provides the ability to use AND/OR relationships on calculation specifications.

ASCII Support - allows the user to accept or create ASCII tape files.

Sign Control Option - provides the ability to suppress the forcing of signs on Input and/or Output to achieve performance improvements.

File Error Option - provides user options for the handling of file errors.

SPECIAL Device Support - provides linkage to Assembler language subroutines for unsupported devices.

Cylinder Index in Core - provides the capability to specify that all or part of the cylinder index of an ISAM file is to be in core during processing of the file.

Bit Operations - provides the ability to test and set bit switches in a one byte alphanumeric field.

***ERROR Byte** - provides the programmer with the ability to test a one byte field named *ERROR to determine why the HO ERROR indicator has been set on.

Alternate Sign Position - provides the ability to specify that the size of a numeric field is contained in a separate character either immediately to the left or right of the field.

Binary Fields - provides the ability to input or output external fields stored in binary format. The fields are converted to packed decimal for internal processing.

Console as an Output File - provides the ability to use the 1052 Console as an output device.

File Conditioning - provides the ability to conditionally specify whether a file is to be present in a program via use of a User Indicator. (U1-U8 corresponding to the bits in the UPSI byte.)

Unpacked Numeric Keys - provides the ability to randomly access an ISAM file using either packed or unpacked numeric keys.

READ/Demand Files - the READ operation is used to call for immediate input from a demand file during calculation time of the RPG II logic cycle. A demand file is a new file type that can be processed only by the READ operation code.

1P Forms Control - First page forms alignment allows an option to repetitively print the first output line conditioned by the first page (1P) indicator until the operator is satisfied that the forms are in alignment.

Header/Trailer Records - Header/Trailer support provides a means of processing a spread card record as though it were several records. A spread card contains a fixed portion (header), which applies to all records in the spread card, and groups of fields (trailers). Each trailer with the header is processed as one logical record.

Card Printing - provides the ability to print the contents of fields in a specified location on a card in the 64-print positions and 25 rows (lines) available on a card. Card printing is allowed only on the 3525 Card Punch.

***PRINT** - provides the ability to print the contents of punched fields, on the same card, in print positions that correspond to the punched positions of the field. *PRINT is allowed only on the 3525 Card Punch.

Dual I/O in ISAM - This extension allows the ability to specify two I/O areas for sequentially processed ISAM files in DOS RPG II. The use of this extension will allow the user of DOS RPG II to improve his performance.

MOVEA - This new operation code provides the ability to move a field to an array or an array to a field. The move is left-justified and can begin at any element of the array. This extension gives the DOS RPG II user the ability to process a byte within a field on a byte-by-byte basis.

For a complete list of these new functions along with a brief description of their use, see the *DOS RPG II General Information Manual (GC21-5021)*.

For additional information on the use of ASCII tape files, see the publication, *IBM S/360 Planning for the Use of Information Interchange Standards: OS, DOS, TSS (GC28-6756)*.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The DOS RPG II Compiler operates with a DOS system configuration which provides the RPG II compiler with a minimum 14K partition when disk work files are being used. If tape work files are required in addition to the disk files, a minimum 16K partition is required. In the minimum size partition, the source program being compiled may contain 20 files. For each additional 10 files, 2K of storage is required by the compiler. The maximum number of files allowed for any source program is 50. The RPG II compiler can operate in the background partition of the DOS Release 24 or subsequent release. The compiler can also operate in batched-job foreground partitions with DOS Release 25 or subsequent release. The Standard Instruction Set and the Decimal Arithmetic Feature (#3237) are required in order to use the RPG II compiler or generated programs.

For IBM S/370 devices, the DOS/VS system and hardware supporting them is required.

Device Support: Programs compiled using the RPG II compiler may interface with the following IBM devices:

- 2540 Card Read/Punch
- 1403 Printer
- 1404 Printer (continuous forms only)
- 1442 N1 and N2 Card Devices
- 1443, 1445, 3203, 3211, 3262, 4245, 5203 Printers
- 2501 Card Reader
- 2520 B1, B2 and B3 Card Devices
- 2400/3400 Tape
- 2311, 2314, 2319 Disks
- 2321 Data Cell
- 1052 Console
- (as an Output File)
- (Display and Accept with DSPLY operation code)
- 3330/3333 DASD
- 3340 Disk

DOS RPG II AUTO REPORT FEATURE
Feature #6017-#6020, #6035-#6036

DOS RPG II (cont'd)

3410 Tape
3411 Tape
3420 Tape
3504/3505 Card Reader
3525 Card Punch
3540 Diskette I/O Unit
2560 MFCM
5425 MFCU

SOFTWARE REQUIREMENTS

The compiler and its object programs execute under the Disk Operating System or DOS/VS. Object programs which have been compiled to process ISAM data files can process VSAM data files using VSAM Compatibility Interface.

Formatted Dump Facility: The RPG II formatted dump program performs an error analysis function and formats all important RPG II logic sections, relating them to the source program. There are three types of errors which the dump will handle - (1) RPG II recognized, (2) program checks and (3) device errors. The dump analyzes the error and isolates the pertinent data (the record being processed, the indicators, fields and I/O areas). Pertinent addresses are also labeled. The DOS system PDUMP may be requested instead of the formatted dump by making an entry in a column of the control card.

Program Testing Facilities: In addition to the core map provided with the listing and the write-up in the SRL on how to use a core dump, RPG II provides the DEBUG operation code to assist in testing programs. With the DEBUG operation code, fields and/or indicators can be displayed during the execution of the object program. By changing a column in the control card and recompiling, all code produced by the DEBUG operation codes may be deleted from the object program.

COMPATIBILITY

DOS RPG II is functionally compatible with DOS RPG. Some changes may be required in the source statements of a DOS RPG II program to produce results identical to the same program compiled by DOS RPG.

These differences result from an effort to provide a DOS compiler at the RPG II level, to obtain greater function and to make the language easier to learn. The *DOS RPG to DOS RPG II Conversion Reference Manual* (SC21-5033) should be reviewed for further details.

Transition from S/360 mdl 20 to DOS can be eased by DOS RPG II due to performance improvements and availability of new functions.

DOCUMENTATION
(available from Mechanicsburg)

Specifications (GC21-5028) ... *General Information Manual* (GC21-5021).

The **RPG II Auto Report Feature** enhances the RPG II language by providing functions which eliminate much of the preparation and coding work normally done by the user when producing an application program in RPG II. It is specifically designed to facilitate report preparation.

The Auto Report program executes as a preprocessor to the RPG II compiler (Version 1 Modification Level 2 or later), which is a prerequisite for this feature. The input to the program is RPG II source statements and new Auto Report statements. Auto Report produces a diagnostic listing, replaces the Auto Report statements with generated or copies RPG II source statements and calls for RPG II compiler for execution. If a Sort operation were requested, an object-time exit routine is produced which will interface with the DOS Tape and Disk Sort/Merge program (5736-SM1 or 360N-SM-483), the DOS Sort/Merge program (5743-SM1) or an equivalent Sort program.

Features: Coding of applications in RPG II is made easier by the following Auto Report functions:

Page Headings - The user need supply only the report title. Auto Report will generate skipping, spacing, horizontal alignment and date and page number constants. Page overflow is considered and the heading conditioned to print on the top of each page.

Simplified Output Specifications - A single output field specification can result in Auto Report generated statements to:

- Indicate printing with editing.
- Place column heading over the data fields.
- Control spacing.
- Control horizontal alignment of data.
- Define total fields and calculation specifications to accumulate totals by control levels (total rolling).
- Flag total lines with asterisk indication.

COPY - The COPY statement provides the ability to copy RPG II source statements from a disk library into the RPG II source program. Some values on the copied specifications may be modified for the resulting compilation.

Source Program - The Auto Report program will pass control directly to the RPG II compiler to cause compilation of the expanded source program. In addition, the user may elect to punch a card deck containing the source program so that he can make modifications which tailor the program more closely to his requirements.

Select/Sort - User may specify with RPG-II Source Program that:

- Only certain type records should be selected and processed, or
- All records should be sorted prior to processing, or
- Only certain records should be selected and then sorted prior to processing.

This function requires the RPG II compiler function Read Exit which is available with Version 1 Modification Level 2 (Release 3 or later), of the DOS RPG II compiler. The Sort function requires that the IBM DOS Tape and Disk Sort/Merge program (5736-SM1 or 360N-SM-483) or an equivalent program be available on the system at the time the object program is executed.

The Auto Report functions may be specified for one printer file in any RPG II program. Any RPG II specifications not related to the selected printer file and any RPG II statements for the printer file but not requesting Auto Report functions, are passed to the RPG II compiler as a part of the source program.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Core - The Auto Report programs require the same minimum core storage as does the DOS RPG II compiler.

Disk - Approximately 52K bytes are required in the system library for the Auto Report program.

Devices - Processor, Disk, Reader-Punch, Printer requirements are identical to the RPG II compiler requirements.

Other devices supported are also identical to those supported by RPG-II.

COMPATIBILITY

The DOS RPG II Auto Report Feature is functionally compatible with the S/3 RPG II Auto Report Feature, but contains the additional feature, Select/Sort.

PROGRAM PRODUCTS

**FARE QUOTE/TICKETING
5736-T11****PURPOSE**

The Fare Quote/Ticketing program is an enhancement in capability of the IBM Programmed Airline Reservation System (PARS). Operating in the PARS environment, it enables airlines to rapidly, accurately and automatically price and print, on demand, standard airline tickets based on Passenger Name Record (PNR) information.

DESCRIPTION

This program product increases the efficiency of airline passengers at ticket counters/desks by increasing the accuracy and speed with which the fare quote and ticketing functions are performed ... reduces ticket agent occupied time in performance of these functions ... reduces the general sales agent's average telephone call time by mechanizing the fare quote functions for inquiries.

The capability to quote/ticket any given percentage of itineraries is dictated primarily by the file space allotted for the necessary fare quote records. The types of fares that can be quoted are full fare, family plan and excursion. Connecting service is restricted to two segments allowing for any valid connecting point between the origin and destination. Fares are based on each specific connecting point and the carriers providing the connecting service.

Features: The FQ/TK system was specifically designed to require no modifications to any existing Passenger Name Record (PNR) data base. Minimal program changes to the input program (to accept the new FQ/TK primary action codes) are required to initiate the FQ/TK system. As the system for ticket issue uses preprinted ticketing stock, the automatic retry feature for transmission error must be suppressed only for output ticketing messages. The unique FQ/TK data record IDs must be added to the system utility program (e.g., FACE, RECOUP, etc.).

The special feature, Tariff Maintenance or its equivalent, is required to create and maintain the on-line tariff data base for the Fare Quote/Ticketing program. The Tariff Maintenance feature may be discontinued, separate from the Fare Quote/Ticketing program.

CUSTOMER RESPONSIBILITIES

It is the customer's responsibility to determine the extent of the fares he wishes to quote and to provide the input data required by the maintenance portion of the system to generate the necessary on-line data records to achieve this desired capability. The Tariff Maintenance feature or its equivalent, is required to create and maintain the on-line tariff data base. The customer must also provide (by core reallocation) the room for core resident programs and data records. A detailed definition may be found in (A1-09) Implementation Plan for FQ/TK.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Typical PARS configuration. The program supports the printing of standard tickets on the 1977 and 1980-24 typewriter terminals and the display of a ticket on the 2915 or the IBM 4505 CRT terminals.

SOFTWARE REQUIREMENTS

This program is written in Assembler language. It is compiled under DOS and executed under the Airlines Control Program (ACP).

DOCUMENTATION: (available from Mechanicsburg)

Application Description Manual (GH20-0873) ... Promotional Brochure.

DATA BASE ORGANIZATION and MAINTENANCE PROCESSOR (5736-XX4)

PURPOSE

The Data Base Organization and Maintenance Processor establishes the framework for implementation of a data based information system. This series of programs provides a flexibility of data organization that enables:

- Elimination of redundant data and implied redundant file update.
- Reduction in application implementation costs, storage costs, and processing costs.
- Improved accuracy through single manual recording of data at point of origin.
- Availability of centralized, consistent data to all organizational units on a timely, accurate basis.

The CICS Feature and the DBOMP-CICS/DASF Feature permit online access and update of the data base from programs using CICS or CICS/VS to control the data communications environment.

DESCRIPTION

The Data Base Organization and Maintenance Processor is based on a direct access, file-oriented concept that separates data into recurring and nonrecurring classes.

Master files contain nonrecurring data. The records of a master file are organized and kept in logical sequence, by record identifiers (keys). They can be accessed in logical sequence, by identifier through an index, by disk location, or by consecutive location sequence. Two physical organization alternatives are provided, one is especially suited to volatile files.

Chain files contain recurring data, organized in variable-length lists of related fixed-length records. Each list is associated with a record in a master file. A chain record may belong to more than one list, thereby constituting a list intersection which in effect cross-referenced master records. User data which are unique to the intersection are stored in the chain record.

HIGHLIGHTS

Content, format and logical relationship of data files are user-specified.

Data Base Organization and Maintenance Processor modules control the creation, update, reorganization, and access of data files on 2311, 2314, 2319, 3330 or 3340 (3348 - mdls 35, 70, and 70F) disk. *Note:* For 3348 mdls 70 and 70F, cylinders 1-511 of each module are supported for data file residence.

Cross-referencing of related data is managed by the system.

Modular in design, the system can be tailored to the requirements of the user in a systems generation procedure during which the user chooses only those options and features that apply. Multiple generations of various program modules may be generated to effect different options for different parts of the total data base.

Features: Functions include the addition, physical deletion, logical deletion, and change of master file records as well as the chain file functions of addition of a single record to an existing list, addition of a new list, physical deletion of a single record, physical deletion of an entire list, change to an existing record, replacement of one record by another within a list, the linking or unlinking of an existing record to or from an associated master record, list duplication (same-as-except), and replacement of one master record by another wherever the first is encountered in association with a chain file (mass replacement).

Disk file chaining is used to link logically related data ... related records are chained together to form lists ... any record may be incorporated in up to five lists, eliminating the need to keep the same information in multiple files or extract information by lengthy file scans ... variable-length lists of fixed length records approximate variable-length record capability and eliminate the need to reserve space in each record for the maximum of information that could exist ... disk file space resulting from record deletions is reusable ... program modules can be generated and combined so that multiple functions can be performed against multiple files during the same program run ... bi-directed chains greatly enhance the performance of chain file record deletion ... reverse chaining also makes certain record lists accessible in descending sequence ... a run activity control number aids failure recovery and facilitates special data retrieval functions ... record counts are kept for audit and control of direct access chains ... a macro is furnished to provide retrieval of a list of chain file records and their associated master records ... input/output modules are self-relocating.

The CICS Feature and the DBOMP-CICS/DASF Feature provide online retrieval of data and the following online functions: Addition, physical deletion, logical deletion, and change of master file records, as well as the chain file functions of addition, physical deletion, or change of a single record, and linking and unlinking of an existing record to or from an associated master record.

The DBOMP-CICS/DASF Feature includes all functions contained in the CICS Feature as well as support for the 3340 Direct Access Storage Facility and Rotational Position Sensing under DOS/VS. Use of the 3340 requires CICS/DOS/VS.

Neither of the CICS features requires file conversion ... a director module queues files and provides exclusive record control within the CICS partition ... the recovery function provides quick recovery of file integrity in certain instances.

USE

The Data Base Organization and Maintenance Processor is a set of programs designed for disk file organization and access to be used in conjunction with user-written application programs.

Online pointer and record updating are recommended only under one of the two CICS features. Updating should not be performed by more than one partition concurrently.

CUSTOMER RESPONSIBILITIES

The initial approach to an information system should include a broad view of the information processing requirements of all areas of the organization involved.

Design file structure.

Design external systems to cover activity beyond the boundaries of the data processing department.

Transform the file structure design into specific parameters for generating a custom-tailored Data Base Organization and Maintenance Processor system.

Generate a Data Base Organization and Maintenance Processor system.

Write and test application programs.

Firm operating procedures.

Prepare data for initial files.

Load files.

Cutover. (A conversion period where the new system is operating in parallel to the old system is recommended).

Operate.

Before installing one of the two CICS features, the customer must have fulfilled all the necessary responsibilities for installing CICS/DOS or CICS/DOS/VS and the basic Data Base Organization and Maintenance Processor. Use of the 3340 requires CICS/DOS/VS. To install either CICS feature the user must:

- Prepare parameters for the feature modules
- Generate a feature system
- Write and test application programs
- Develop open/close procedures
- Develop recovery procedures

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum machine requirements for the Data Base Organization and Maintenance Processor include a S/360 or a S/370 processing unit with printer, card read punch, console, and direct access storage devices (see notes 1 and 2).

Operating under DOS Version 4 or a previous version requires a partition size of at least 24K bytes. Operating under DOS/VS (Version 5) requires a virtual partition size of 64K bytes.

The CICS features require a S/360 or a S/370 processor with sufficient main storage to accommodate a CICS partition with CICS or CICS/VS, user programs and main storage required by either of the CICS features. In addition, the configuration must meet the minimum requirements of the Data Base Organization and Maintenance Processor and those of CICS or CICS/VS.

For either CICS feature operating under DOS/VS, the virtual partition size is 64K or more bytes as required to accommodate CICS or CICS/VS user programs and the CICS feature or DBOMP-CICS/DASF Feature.

When operating in virtual mode, the amount of actual core storage used by an application program is difficult to predict. Factors which affect the actual core storage requirements not only vary with the particular phase (set of modules) of the application program being executed, but with the mix and priorities of the other application programs concurrently operating in the multiprogramming environment.

If CICS/DOS-ENTRY is used, either CICS feature requires that the following be in subpool 0:

Data Base Organization and Maintenance Processor (cont'd)

	Approximate Size in K Bytes
File Directory	.1
File Description Modules	2.3 (see note 3)
File Maintenance List (if recovery function is specified)	.1
In addition to the user requirements, subpool 1 must be sufficient to accommodate the following feature requirements:	
Transaction Control Area Extension	.2
Dynamic Buffers	.9 (see note 4)
The greater of:	
Director - I/O Process (no file pointer update)	7.0
Fileorg (pointer update)	11.0
If CICS/DOS-STANDARD or CICS/DOS/VS is used, both CICS features require the following basic functions in the CICS partition:	
Director - I/O Process	7.0
File Description Modules	2.3 (see note 3)
File Directory	.2
Transaction Work Area Extension	1.3 (see note 6)
File Maintenance List (if recovery function is specified)	.1
At open/close time, the following are additional requirements to the basic functions:	
I/O Open/Close	2.0
Dynamic Buffer	.5 (see note 4)
If retrieval is being performed, the following is required in addition to the basic functions:	
Dynamic Buffer	4.5 (see note 4)
If pointer update is to be performed, the following requirement is added to the basic functions and the retrieval requirement:	
Fileorg	11.0

The above requirements are estimates provided for planning purposes only. They represent the core requirements for the CICS Feature or the DBOMP-CICS/DASF Feature of the Data Base Organization and Maintenance Processor. To arrive at the partition size required, the user must add the feature estimates to the core required by CICS or CICS/VS and by the user for his program modules (note 7).

Notes:

1. A card punch is required for system preparatory procedures. In an operational system, user application programs control unit record input/output where required. The application mainline program included in the package for the four specific manufacturing files provides options of 2540, 1442, or 2520 and 1403 or 1443. The sample problem is generated for a 1403 and 2540.
2. Direct access storage capacity is required to contain DOS system residence and user data files. Two drives are minimum. Chain file reorganization requires enough capacity for twice the size of the chain file itself plus one associated master file. To customize the system or to execute the sample problem on 2311, the Data Base Organization and Maintenance Processor requires one full pack exclusive of DOS system residence, DOS system work files, and private libraries. To customize the system or to execute the sample problem, the Data Base Organization and Maintenance Processor requires the first 103 cylinders of a 2314 or 2319, the first 65 cylinders of a 3330/3333, or the first 160 cylinders of a 3340, exclusive of DOS system residence, DOS system work files, and private libraries.
3. 2.3K bytes assumes two master files; one ISAM, one CSAM, and two chain files.
4. Dynamic buffers, consisting of mode to perform input/output functions, and space for input blocks are allocated to each task as required. The .9K estimates for CICS/DOS-ENTRY assumes a single task is accessing two files. The .5K estimate for open/close in CICS/DOS-STANDARD or CICS/DOS/VS assumes one buffer of .5K satisfies the largest block to be read. The 4.5K estimate for retrieval in CICS/DOS-STANDARD or CICS/DOS/VS assumes five active I/O buffers.
5. Fileorg is a program module containing the logic to perform file pointer update and addition or deletion of records. The 11K estimate assumes all functions are present for both master files and chain files. The user can reduce the 11K figure by excluding functions. Not included in the 11K estimate is the optional recovery function which requires an additional 1.2K.
6. The transaction control area extension estimate is approximately 250 bytes per task. The example assumes five tasks.
7. If the user programs are written in PL/1 or COBOL, each program that accesses a Data Base Organization and Maintenance Proc-

essor file must add approximately 600 bytes to its core requirement. Also, in CICS/DOS-STANDARD or CICS/DOS/VS, the user of PL/1 or COBOL must add 1K to his requirements if issuing requests to a Data Base Organization and Maintenance Processor file other than a CHASE request, and .6K if performing a CHASE.

SOFTWARE REQUIREMENTS

DOS or DOS/VS is used as the control system for the Data Base Organization and Maintenance Processor. The following components of DOS are used: System Control and Basic IOCS (360N-CL-453), Direct Access Method IOCS Macros (360N-IO-454), Assembler D (360N-AS-465) or Assembler F (360N-AS-466), Unit Record and Disk Utilities, Group 1 (360N-UT-461), and Disk/Tape Sort/Merge (360N-SM-483) or Sort/Merge - DOS (5743-SM1). Operating under DOS/VS, equivalent components of DOS/VS (5745-010) are used, and DOS/VS Sort Merge (5746-SM1) may be used. In addition, this program product also operates in a VM/370 environment under the control of DOS or DOS/VS.

In addition to the above DOS components, the following modules may be employed appropriate to the user's environment at the user's option: Full ANS COBOL V3 Compiler (5736-CB2), ANS Subset COBOL Compiler and Library (5736-CB1), COBOL (360N-CB-452 - for use with the basic system only), PL/1 Optimizing Compiler (5736-PL1), Basic PL/1 (360N-PL-464 - for use with the basic system only), and consecutive Tape Input/Output Control System Macros (360N-IO-456).

The Data Base Organization and Maintenance Processor itself is written in Assembler language. User application programs may be written in Assembler language, COBOL or PL/1.

The Data Base Organization and Maintenance Processor and the two CICS features are available for operation under DOS/VS both in the virtual and real modes. When running under CICS/DOS/VS, execution is in virtual mode.

DOCUMENTATION (available from Mechanicsburg)

Application Description Manual, (GH20-0771).

Reference Materials: See *Requirements Planning Interface* (5736-M13).

**MVS INFORMATION DISTRIBUTION
WORKSTATION SUPPORT
VERSION 1 RELEASE 1
5740-AMA**

PURPOSE

The MVS/Information Distribution Workstation Support program product provides batch-oriented remote communication functions for the 6670 Information Distributor with the systems network architecture (SNA) feature. The product provides transmission, routing, scheduling, command and message functions that are specifically tailored to the features and communication protocols of the 6670 and that support all data streams and media of the 6770.

HIGHLIGHTS

- Provides OS/VS2 MVS host support for the SNA version of the 6670 Information Distributor.
 - Allows 6670 users to access MVS application programs, such as the Document Composition Facility and the Document Library Facility for document processing and archiving.
 - Allows MVS application program users to utilize the 6670 for output.
 - Allows users to combine variable data from an MVS data base with a standard document on the 6670 to obtain personalized, repetitive letters in one operation.
- Extends MVS support to the 6670 by interfacing with JES2, NJE for JES2 or JES3.
 - Allows 6670 users to utilize MVS facilities for work entry (OS JOB) and output processing (SYSOUT).
 - Provides 6670 users with document distribution capabilities through the routing facilities of the job entry subsystems.
- Provides exits for customer-developed programming.

DESCRIPTION

Using the MVS/Information Distribution Workstation Support program, 6670 users can submit jobs and data to a S/370 OS/VS2 MVS host processor for formatting and processing. It may also be used to receive documents, letters, and variable data generated at the MVS host processor or extracted from MVS data bases for processing and output at the 6670. Access is provided over synchronous data link control (SDLC) communication lines connected to a 3705 Communications Controller containing a resident network control program (ACF/NCP). The MVS/Information Distribution Workstation Support program accesses the communications network via the Advanced Communications Function/Virtual Telecommunications Access Method (ACF/VTAM) and the Advanced Communications Function/ Telecommunications Access Method (ACF/TCAM). Systems network architecture (SNA) protocols are used. Other applications and terminals can use the same SDLC line simultaneously for SNA communications.

The MVS/Information Distribution Workstation Support program extends MVS remote job entry (RJE) support to the 6670 by interfacing with the MVS job entry subsystem for job input and output processing. The program can operate in any JES2 or NJE for JES2 processor and in a JES3 local processor or the JES3 global processor.

A session between the MVS/Information Distribution Workstation Support program and a 6670 can be established either manually or automatically. Manual session initiation and termination typically are controlled by the 6670 user through LOGON/LOGOFF commands. Automatic session initiation can occur when the MVS/Information Distribution Workstation Support program detects output to be transmitted to a 6670 not in session with it. Automatic session termination can occur when there is no more output to be transmitted. Terminal and data owner identifications are provided through LOGON passwords and a command associating specific owner keys with jobs. Keyed job output will not be transmitted to a 6670 until the owner is present to receive it. Thus, both data security and access can be controlled.

Users can enter data for transmission to the MVS/Information Distribution Workstation Support program through the 6670 magnetic card reader. Input can be an OS job, a command that causes the generation of an OS job, or a command to control or determine the status of the session or accumulated output. Also provided are commands to:

- Inquire about the status of output
- Expedite the delivery of output
- Hold, release, stop, or cancel output
- Control the session.

Output from jobs or commands submitted from a 6670 user usually will be routed back to that 6670, along with any logs. Using the MVS/Information Distribution Workstation Support and NJE for JES2 and/or ACF/VTAM or ACF/TCAM, ACF/NCP, and the Multi-System Networking Facility for ACF/VTAM or ACF/TCAM, the 6670 user can have the submitted job executed at another location or the output printed at another location or terminal. Further, through the use of

system output classes or destination names, application program jobs not submitted from a 6670 can route their output through the MVS/Information Distribution Workstation Support to a 6670. All output for transmission must be created as SYSOUT data sets.

Additional flexibility is provided with exits through which users may develop programming to access data other than job entry data, modify input and output data streams, or control the selection and disposition of documents in input and output queues.

Through the MVS/Information Distribution Workstation Support program, users with MVS applications such as the Document Composition Facility and the Document Library Facility can use 6670 as a remote communications printer, often without changes to existing application programs. Composed and formatted output that is currently produced on system printers can be transmitted to the 6670 for printing. In environments where events recorded in the data processing system also necessitate personalized correspondence, users can send data captured by their application program to be merged with a standard letter at the 6670.

The MVS/Information Distribution Workstation Support remote communication functions used in conjunction with the 6670 or MVS application program word processing functions provide 6670 users with an office device upon which they can receive letter-size output, bypassing several operations previously required. The 6670 offers:

- Text format printing -- Printing with the appearance of a typewritten page.
- Condensed format printing -- Printing that allows computer output typically printed on 279.40 x 335.60mm (11x14 inch) fanfold paper to be printed across the long side of 215.90 x 279.40mm (8-1/2 x 11 inch) paper, with up to 66 lines per page and 132 columns per line.
- High quality printing -- Characters formed by a dot pattern of up to 240 x 240 pel, depending on the type style and line spacing.
- Duplex printing -- Printing on both sides of a page.
- Choice of print media -- Plain or letterhead precut paper, offset masters and transparencies for overhead projection.
- Magnetic card recording -- Special word processing control codes can be recorded along with the text.

In addition, users can select the various word processing options of the 6670 for their output.

CUSTOMER RESPONSIBILITIES

To install the MVS/Information Distribution Workstation Support product, the customer must provide:

- Installation-unique JCL parameters for jobs generated internally by the product, such as JOB card accounting fields and job class.
- ACF/VTAM or ACF/TCAM, ACF/NCP, and JES Route Code definitions for the 6670 terminals.
- Terminal operator IDs and password and profile information in a protected VSAM data set.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The MVS/Information Distribution Workstation Support program product requires at least one IBM 6670 Information Distributor with the systems network architecture (SNA) feature. Configurations of up to 255 IBM 6670 Information Distributors can be supported.

Other machine-related requirements for the IBM S/370 Processor and the IBM 3705 Communications Controller are those imposed by the operating system, program products, and system control programs with which the MVS/Information Distribution Workstation Support program operates.

SOFTWARE REQUIREMENTS

The MVS/Information Distribution Workstation Support licensed program operates under OS/VS2 Release 3.8 and subsequent releases and modifications unless otherwise stated. The MVS/Information Distribution Workstation Support program executes with the following required programs and their subsequent releases and modifications unless otherwise stated:

- Advanced Communication Function for the Network Control Program/VS (ACF/NCP/VS) Release 1 (5735-XX1).
- One of the following:
 - Advanced Communications Function/Virtual Telecommunications Access Method (ACF/VTAM) Release 1 (5735-RC2).

PROGRAM PRODUCTS

MVS Information Distribution Workstation Supt. (cont'd)

- Advanced Communications Function/Telecommunications Access Method V2 R2 (ACF/TCAM) (5735-RC3).
- One of the following:
 - Job Entry subsystem 2 (JES2), Release 4.1
 - Network Job Entry Facility (NJE) for JES2, Release 3, program number (5740-XR8)
 - Job Entry Subsystem 3 (JES3), Release 3.
- System Modification Program (SMP) for installation.

The MVS/Information Distribution Workstation Support source code is in S/370 Assembler language and is distributed as optional licensed microfiche.

SECURITY/INTEGRITY

As part of an integral approach to security in the MVS/Information Distribution Workstation Support product, the Resource Access Control Facility (RACF, 5740-XXH), can be used to provide users access to RACF protected resources in an MVS environment. In addition, facilities are provided for controlling access to SYSOUT data sets destined for the supported devices. These facilities are effective only within the context of the MVS/Information Distribution Workstation Support program itself. IBM will accept APARs describing any situation where the installation of this program causes an exposure to the system integrity of MVS.

PERFORMANCE CONSIDERATIONS

MVS/Information Distribution Workstation Support performance is configuration-dependent and load-dependent. It is affected by the number of SYSOUT transmitters available to access SYSOUT data sets and by the number of job entry subsystem internal readers available to accept job stream data.

The MVS/Information Distribution Workstation Support program uses a pool of SYSOUT transmitter address spaces to access SYSOUT data sets concurrently. The number of SYSOUT transmitters available to it can be set by the MVS/Information Distribution Workstation Support SET XWTR command. This number should not exceed, but can be less than, the maximum number of 6670 Information Distributors in session with MVS/Information Distribution Workstation Support at any one time.

The MVS/Information Distribution Workstation Support program uses a pool of internal readers to submit jobs entered from the 6670 Information Distributors. The number of JES internal readers available to accept job stream data can be set by the MVS/Information Distribution Workstation Support SET INTRDR command. This number should not exceed, but can be less than, the maximum number of IBM 6670 Information Distributors in session with MVS/Information Distribution Workstation Support at any one time.

MVS/Information Distribution Workstation Support System Programming Library (SC23-0032) ... MVS/Information Distribution Workstation Support Commands and Messages (SC23-0033) ... MVS/Information Distribution Workstation Support Program Product Specifications (GC23-0035).

**SEQUENTIAL ACCESS METHOD-EXTENDED (SAM-E)
5740-AM3****PURPOSE**

Sequential Access Method-Extended (SAM-E) uses improved buffer scheduling for QSAM, and EXCPVR instead of EXCP for all BSAM and QSAM direct access and VIO operations, except BDAM WRITE/LOAD. In the exception case, the current implementation is used.

Measurements of MVS batch test environments have shown that SAM-E can increase batch throughput by up to 5% for either MVS or MVS/SE Systems. Users with batch workloads characterized by heavy QSAM DASD usage and DASD contention can achieve greater improvements. Measurements of such workloads have shown improvements in the range of 9 to 14%.

HIGHLIGHTS

SAM-E enables improved DASD data access performance by:

- Reducing channel program interpretation and translation.
- Reducing fixing and freeing of pages.
- Reducing the path length for the SAM I/O operations per block.
- Decreasing DASD contention.
- Increasing the number of QSAM buffers transferred per I/O operation.

CUSTOMER RESPONSIBILITIES

Customers installing SAM-E Release 1 on OS/VS2 Release 3.7 should begin once their system is at a 77-08 PUT Service Level or higher. This recommended Service Level is a higher Service Level than the MVS 3.7E Release. The MVS 3.7E Release is updated to a 77-06 service level. Additional service for a specific SU environment is required. See the SAM-E Release 1 Program Directory for additional information.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Each licensed program is designed to operate on one or more IBM machine types and, in most instances, in conjunction with other IBM equipment and programs.

System Configuration: SAM-E Release 1 is applicable to OS/VS2 Release 3.7 with the Supervisor 2 (SU 7) and Data Management (SU 8) Selectable Units, and as such has the same system constraints, executes on the same processors and supports the same configurations as the base operating system.

The amount of DASD storage required to use SAM-E is less than if the SCP direct access support for ESAM and QSAM is used. Exact savings figures are highly dependent on the type of DASD residence volume used, and upon individual installation parameters. One observed system (on a 3330-11) saved 30,000 bytes of DASD library storage, and 9,000 bytes of virtual storage (pageable LPA). For each DCB opened for BSAM, QSAM or BPAM DASD data sets, an additional 936 bytes of Fixed LSQA space is required over and above the space used on a system without SAM-E installed.

SOFTWARE REQUIREMENTS

SAM-E Release 1 is released to work with OS/VS2 Release 3.7 and subsequent releases of that system unless otherwise stated. Prerequisite for SAM-E on OS/VS2 Release 3.7 are the Supervisor 2 (SU 7) and Data Management (SU 8) Selectable Units applied. The SAM-E Release 1 source code is distributed in Assembler language as optional material.

SAM-E Release 1 is supported via the System Modification Program (SMP).

COMPATIBILITY

Existing OS/VS SAM data sets and programs which access them can be used with SAM-E Release 1 without conversion. The SAM data sets written using SAM-E Release 1 are compatible with existing OS/VS SAM.

PROGRAM PRODUCTS

**INTERACTIVE PERSONNEL SYSTEM
Release 1 Modification Level 2
IMS/VS and CICS/OS/VS (5740-AM4)**

DESCRIPTION

The IBM Interactive Personnel System is designed to assist personnel functions in performing their required tasks efficiently and competently. Online inquiry, online update, as well as batch processing capabilities are offered. The data organization methods of the IBM Information Management System/Virtual Storage (IMS/VS) are used for data storage and retrieval. The online capability is made possible through the use of either the Data Communication (DC) Feature of IMS/VS or the IBM Customer Information Control System/Virtual Storage (CICS/OS/VS).

The Interactive Personnel System maintains three data bases:

- The personnel data base, which contains data related to employees.
- The positions data base, which holds data reflecting the organizational structure of a company, including reporting paths.
- The jobs data base, which contains data describing the jobs to be performed in a company and the skills required for these jobs.

These data bases are designed to meet a variety of administration and information requirements of the personnel functions of a company. If additional or different data is needed, the data bases can be customized. Facilities are available in the Interactive Personnel System to add, change or delete fields, segments or data bases. Also new data base layouts can be defined.

A wide range of personnel administration and management is supported by the applications offered as part of the Interactive Personnel System. Some applications run in online mode and some in batch mode. The applications can be used without any modifications; however, they can be modified if necessary. Changes to the data bases or to the applications can be made easily using two system capabilities:

- Customizing of the data bases as mentioned above.
- Procedure definition language for the definition and modification of applications.

The procedure definition language is end-user-oriented and therefore easy to use. There are various procedure types, for example, a conversational inquiry or an online update, that define the skeleton of processing. A set of language keywords allows the specification of processing details such as input/output definitions, security specifications, editing options or user exit processing. This tool enables the user to define or modify applications with little effort. As part of the Interactive Personnel System, facilities for data security are offered in addition to the security facilities contained in the prerequisite data base/data communication systems. Security rules may be established for each user of the Interactive Personnel System. A hierarchy of security checks can be defined:

- Authorization to define or modify applications.
- Authorization to execute applications.
- Authorization to gain access to the application data bases.
- Authorization to use specific data within a record.
- Authorization to process the logging data base.

As part of the procedure definition language, editing features are included in the Interactive Personnel System to verify that the data entered into the data bases is correct. Editing can also be done on data that is to be displayed or printed. This includes, for example, code conversion.

Checking is done against user-defined tables that can be altered without program changes.

A set of government reporting and benefits tracking applications are offered as a separately-priced feature covering the following areas:

- Equal Employment Opportunity (EEO) Processing
- Occupational Safety and Health Act (OSHA) Processing
- Health Maintenance Organization (HMO) Tracking
- Benefits Tracking

These applications expand the personnel tracking capabilities of the Interactive Personnel System for private industry, providing the basis for the entry, update and processing of much of the information needed to comply with government reporting requirements.

The government reporting and benefits tracking applications use both online and batch mode processing. Sample data base segments are supplied for inclusion in the existing system data bases, and for the creation of an establishment data base to contain pertinent EEO data. Edit tables are also included for support of the establishment data base.

These applications use the data base customization and procedure definition language capabilities of the Interactive Personnel System, and require no additional resources, beyond the added data base segments, the establishment data base, and the table storage areas.

The system allows basic calculations. Complex calculations and complex data handling can be implemented in user exit routines supplied as Assembler, PL/I or COBOL programs.

HIGHLIGHTS

- A set of three data bases for personnel, positions and job data.
- Personnel applications are offered to support many tasks in personnel administration and management. The applications are written using the procedure definition language.
- The system supports both online and batch processing.
- The Interactive Personnel System procedure definition language allows easy implementation of additional applications and modification of existing applications by the user.
- Customizing facilities are provided to adapt the system to the user's environment. Data bases, segments and fields can be added or changed.
- Data security facilities and logging facilities are available.
- Data editing functions assist in data checking, data conversion and migration.
- Basic calculations are supported.
- User exit modules within the applications can be written in PL/I, COBOL or Assembler language.
- Provisions are made for the translation of messages, commands and screen data into the customer's desired terminology.
- An optional feature is the logging of data base updates in a logging data base. The contents of the logging data base can be processed using Interactive Personnel System applications.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the availability of the prerequisite machines and programming systems as listed in the "Specified Operating Environment".

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This licensed program is designed to operate on the following IBM machines: IBM S/370 mdl 148 to 168, IBM 303X and IBM 43XX. The following environment is required for execution of the program:

- Processors: One IBM processor supported by OS/VS and IMS/VS or CICS/OS/VS.
- Virtual address space requirements (figures do not include the partition-related parts of OS/VS, VSAM, IMS/VS or CICS/OS/VS):
 - 300K for programs running in a batch environment.
 - 275K for programs running under IMS/VS.
 - 240K for programs running under CICS/OS/VS, plus 35K for each active task.

The figures can increase if complex applications are executed, or if program functions such as security, edit or user exits are extensively used.

- Direct access storage devices: One IBM direct access storage device as supported by IMS/VS. In addition, optionally, one or more IBM direct access storage devices as supported by OS/VS for sequential input and output data sets.
- Unit-record devices: One card read/punch device and one print device as supported by OS/VS.
- Sequential access storage devices: One 9-track tape device for installation and support; and one or more 9-track tape device(s) for optional input and/or output.
- Telecommunication facilities: One IBM 3275 Display Station mdl 2 (with or without RPQ X81191: Arabic Left to Right) or mdl 12, or one IBM 3277 Display Station mdl 2 (with or without RPQ X81191).

The Interactive Personnel System can also be used with the IBM 3274/3276 subsystem in compatibility mode, with or without RPQ 7H0306 (Arabic Display Control).

The system is designed to support additional disk storage, tape units, processor storage and terminals.

SOFTWARE REQUIREMENTS

The Interactive Personnel System is designed to operate under the IBM Operating System/Virtual Storage (see Note 1).

It uses the data base facilities of the IBM Information Management System/Virtual Storage (see Note 2) and the data communication

PROGRAM PRODUCTS

**Interactive Personnel System
IMS/VS and CICS/OS/VS (cont'd)**

facilities of either the Data Communication (DC) feature of IMS/VS or the IBM Customer Information Control System/Virtual Storage (see Notes 2 and 3).

Notes:

1. OS/VS1 Release 6.7, OS/VS2 SVS Release 1.7 and OS/VS2 MVS Release 3.8 or subsequent releases unless otherwise identified.
2. IMS/VS Version 1, Program Number 5740-XX2, optionally including the Data Communication (DC) feature, Release 1.5 or subsequent releases unless otherwise identified.
3. CICS/VS Version 1, Program Number 5740-XX1, Release 4 or subsequent releases unless otherwise identified.

The IBM Interactive Personnel System is written in the IBM S/370 PL/I language and in the IBM S/370 Assembler language. Supplied user exit routines are written in the IBM S/370 PL/I language, the IBM S/370 Assembler language or IBM S/370 COBOL language.

Both source code and load modules are distributed. Normally, the user will run the load modules as distributed and, therefore, only require the OS PL/I Optimizing Compiler Transient Library, Program Number 5734-LM5, Release 3.0 or a subsequent release unless otherwise specified.

In addition, an OS/VS Sort/Merge program product is required.

Modifications to the source code including application of source fixes, require the use of either: PL/I Optimising Compiler and Libraries (5734-PL3) or, PL/I Optimising Compiler (5734-PL1) with PL/I Optimising Compiler Resident Library (5734-LM4).

**DATA FACILITY DEVICE SUPPORT (DFDS)
OS/VS1 (5740-AM6)
OS/VS2 MVS (5740-AM7)**

PURPOSE

Data Facility Device Support (DFDS) provides data management support for the 4245 Line Printer, the 3430 Magnetic Tape Subsystem, the 3380 and 3375 Direct Access Storage Devices, the 3880 Storage Control mdls 1, 2, 3, 11 and 13, the Data Streaming feature (#4850), The Speed Matching Buffer for 3380 feature (#6550), the Speed Matching Buffer for 3375 feature (#6560), and compatibility mode support for the 3800 Printing Subsystem mdl 3. Additionally, access to a DASD volume table of contents (VTOC) that contains a large number of entries is improved via an optional index to the VTOC. Installation management of DASD space is improved by providing installation exits in the direct access device space management (DADSM) routines.

HIGHLIGHTS

- Provides data management support for the 3430 Magnetic Tape Subsystem.
- Provides data management support for the 4245 Line Printer.
- Provides support for the 3800 mdl 3 for printing 3800 mdl 1 applications.
- Provides data management support for the 3380 Direct Access Storage and 3880 Storage Control mdls 2 and 3.
- Provides data management support for the 3375 Direct Access Storage.
- Improves VTOC access via an index to the VTOC.
- Improves installation management of DASD space by providing installation exits in the DADSM routines.
- Improves OS/VS2 MVS system availability by providing the capability to IPL using an alternate master catalog.
- Provides support for the 3880 Storage Control mdl 11 (MVS only) and mdl 13.
- Provides an installation exit when opening a data control block (DCB).
- Provides support for Extended Real Addressing (MVS only).
- Data Facility Device Support Release 1 Modification 1 for OS/VS1 provides the 4K PAGE support.

DESCRIPTION

3430 Magnetic Tape Subsystem: OS/VS1 data management support is provided by Release 1.2 for the 3430, enabling the device to be used as an input/output device for user data.

4245 Line Printer: OS/VS1 data management support is provided by Release 1.2 for the 4245, enabling the device to be used as a system or directly-attached printer, with program control of printing at either 6 or 8 lines-per-inch.

3380 Direct Access Storage Support: OS/VS2 MVS and OS/VS1 data management support is provided for the 3380, enabling the device to be used for user data sets, as a system residence device and as a system paging device.

3375 Direct Access Storage Support: Data management support is provided for the 3375, enabling the device to be used for user data sets, as a system residence device, and as a system paging device.

3880 Model 11 and Model 13 Support: OS/VS2 MVS support is provided by 5740-AM7 Release 1.5. This modification level is an optional enhancement for accounts installing the 3880 mdl 11 or 13. OS/VS1 support is provided by 5740-AM6 Release 1.2.

New Access Method Services Command (3880 mdl 11 and mdl 13)

LISTDATA The 3880 mdl 11 and mdl 13 keep data in subsystem counters for each device attached, recording the number of I/O operations that have been performed. They also keep status information for the cache, recording the amount of storage configured, available, unavailable and, for the 3880 mdl 13 only, the amount of storage bound for caching. The LISTDATA command provides a means to list the subsystem counters and subsystem status information.

3880 Model 11 Support Detail: DFDS 1.5 identifies to the system that a 3350 is attached via a 3880 mdl 11. This enables the multiple addressing capabilities of the 3880 mdl 11 to be utilized by supplying the 3350P device type at system generation (full SYSGEN or IOGEN). Specify unit = 3350P on the IODEVICE SYSGEN macro to provide four 3350 UCBs for each unit generated. A maximum of eight 3350P devices may be generated per IODEVICE invocation. The IODEVICE macro default value is two devices.

3880 Model 13 Support Detail: DFDS 1.5 also identifies to the system that a 3880 mdl 13 is attached to the system. The management of the cache is exploited by the following modes of operation:

- 'Sequential' allows the staging of data into the cache before access to that data is requested from the host.
- 'Normal' results in management of the data in the cache to be handled by the 3880 Storage Control mdl 13. This is the default mode of operation.

The following caching modes of operation are implemented:

- BDAM
 - 'Normal' for all functions
- ISAM
 - 'Sequential' for load mode
 - 'Normal' for all other functions
- QISAM
 - 'Normal' for overflow record accesses
 - 'Sequential' for all other functions
- PAM
 - 'Normal' for directory accesses
 - 'Sequential' for all other functions
- SAM
 - 'Sequential' for all functions
- VSAM
 - 'Sequential' format writes
 - 'Sequential' sequential accesses to ESDS
 - 'Normal' for all other functions
- Media Manager
 - 'Sequential' pre-format
 - 'Sequential' format writes
 - 'Normal' default for user read/write
 - 'Sequential' user-specified for sequential read/writes
- Utilities
 - 'Sequential' IEBCOPY
 - 'Normal' all other utilities

Provide Error Recovery procedures for error conditions and expected recovery actions associated with the 3880 mdl 13.

New Access Method Services Commands (3880 mdl 13 only)

BINDDATA For certain critical tracks, such as indexes, it may be necessary to specify that tracks are 'bound' to the cache. That is, the tracks are promoted to the cache and are not eligible for demotion. The BINDDATA command is used for that purpose. The tracks are specified by means of low and high cylinder and head addresses. Specified data will remain bound in the cache until released or a subsystem error occurs.

SETCACHE ON/OFF In certain cases it may be desirable to set a 3380 device offline for caching - for example, where a high proportion of writes are performed to the data sets on one device. The purpose of the SETCACHE command is to allow or inhibit caching for a 3380 device or for the entire 3880 mdl 13 subsystem. The default is SETCACHE ON for all attached 3380s.

Improved VTOC Access via an Index to the VTOC: The VTOC is composed of unblocked records with DASD keys and is accessed primarily in two ways: Via DADSM routines to perform global DASD space management functions such as allocating and scratching data sets, and via EXCP and the sequential access method (SAM) for reading and writing DSCBs, or portions of the VTOC.

Without Data Facility Device Support, VTOC access almost always involves a channel search for a specific DASD key. Therefore, channel time increases as the number of data sets on a volume increases (e.g., as the contents of the VTOC increases).

With Data Facility Device Support, VTOC access is improved by using an index structure for the current VTOC, and by providing a Common VTOC Access Facility (CVAF) to support the index structure. This new structure includes space maps which replace the Format 5 DSCBs of the current VTOC and are used to manage VTOC and VTOC index space.

Following are some key characteristics of volumes with a VTOC index:

- The VTOC index is optional on any DASD that is supported by the base operating system:
 1. It is not supported on any volume whose VTOC does not begin on record 1Z of a track.

Data Facility Device Support (cont'd)

2. It is not supported on the 2314.
- Volumes with and without the VTOC index can coexist on the same system and are supported by the DADSM routines in a manner transparent to the user.
- The Device Support Facilities may be used to create a VTOC with or without an index when a volume is initialized. Building of an index over existing volume VTOCs may be done.
- The VTOC can still be accessed via EXCP and SAM, except that data identifying a volume's available space has been moved from the Format 5 DSCB to space maps in the index. Programs which are dependent on the information in a Format 5 DSCB must use one of the new CVAF functions provided to obtain available space information from the index. However, users are encouraged to use CVAF for all access to the VTOC on volumes both with and without the VTOC index.
- If CVAF detects an error in the index structure, CVAF marks the index as invalid, and existing DADSM routines restore the VTOC to non-indexed format so that the volume can be used while the index error is being analyzed. Device Support Facilities can be used to rebuild the index as desired.

DADSM Installation Exits: Optional pre- and post-processing installation exits are provided for the allocate, extend, scratch, partial release and rename functions of DADSM. These exits provide an installation with the ability to reject, limit or simply monitor DADSM requests involving DASD space utilization.

OS/VS2 MVS Alternate Master Catalog IPL Capability: A message is added at IPL time prompting the system operator for the name of an alternate master catalog, enabling the system to be operated in the event that the regular, or default, master catalog is unavailable.

3800 Printing Subsystem Model 3 Support: For users of the 3800 mdl 3, support is provided as follows:

- 3800 mdl 1 applications can be printed on the 3800 mdl 3 in compatibility mode. Few if any changes to the application program or the JCL are required.
- An additional line spacing of 10 lines per inch.
- 3800 character sets and graphmods in the required 240 x 240 pel density.
- Character arrangement tables.
- Selected 6670 character sets converted for use with the 3800 mdl 3.
- IEBIMAGE Utility is enhanced to support 240 x 240 pel density and 10 lines per inch.
- Improved copy separation for single page data sets.
- Identifies to the host operating system that a 3800 mdl 3 is attached.
- Improved error recovery procedures.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

OS/VS1: OS/VS1 Data Facility Device Support (5740-AM6) is designed to operate on any IBM processor supported by OS/VS1 Basic Programming Extensions (5662-257).

OS/VS2: OS/VS2 Data Facility Device Support (5740-AM7) is designed to operate on any IBM processor supported by either MVS/System Product-JES2 Version 1 (5740-XYX) or MVS/System Product-JES3 Version 1 (5740-XYN).

SOFTWARE REQUIREMENTS

OS/VS1: OS/VS1 Data Facility Device Support Releases 1.0 and 1.1 require the functions provided by OS/VS1 Basic Programming Extensions Release 1 (5662-257) and subsequent releases and modifications unless otherwise stated by IBM.

OS/VS1 Data Facility Device Support Release 1.2 requires the functions provided by OS/VS1 Basic Programming Extensions Release 4 (5662-257) and subsequent releases and modifications unless otherwise stated by IBM.

OS/VS1 users of the following devices require the functions provided by OS/VS1 DFDS Release 1.2 and OS/VS1 Basic Programming Extensions Release 4 (5662-257) and subsequent releases and modifications unless otherwise stated by IBM:

- IBM 3380 Direct Access Storage
- IBM 3880 Storage Control mdls 2 and 3 with Speed Matching Buffer for 3380 feature
- IBM 3880 Storage Control mdl 13
- IBM 3430 Magnetic Tape Subsystem
- IBM 4245 Line Printer

To provide direct access storage device dump and restore functions, the user may need to order and install the latest release of Data Facility Data Set Services (DFDSS, 5740-UT3) or a functional equivalent. If the user is planning to install DFDSS, it is recommended that this be done well before OS/VS1 Data Facility Device Support is installed, to backup disk files to tape using the format acceptable to DFDSS for restoration.

OS/VS2 MVS: OS/VS2 Data Facility Device Support Release 1.4 requires the functions provided by one of the following:

1. MVS/System Product-JES2 Version 1 Release 1 (5740-XYX)
2. MVS/System Product-JES3 Version 1 Release 1 (5740-XYN)
3. MVS 3.8 3380/3375 PRPQ (5799-BFF)

Subsequent releases and modifications may be used unless otherwise stated.

OS/VS2 users of the IBM 3880 Storage Control mdls 11 and 13 require the functions provided by OS/VS2 DFDS R1.5, its prerequisite OS/VS2 DFDS R1.4, and either MVS/SystemProduct-JES2 Version 1 Release 3.1 (5740-XYX) or MVS/System Product-JES3 Version 1 Release 3.1 (5740-XYN) and subsequent releases and modifications, unless otherwise stated.

Users of the IBM 3800 Printing Subsystem mdl 3 require the functions provided by OS/VS2 DFDS R1.6, and its prerequisite OS/VS2 DFDS R1.4. OS/VS2 DFDS R1.6 does not require R1.5. However, either or both may be applied to R1.4. Neither OS/VS2 MVS DFDS R1.5 nor R1.6 may be installed with the MVS 3.8 3380/3375 PRPQ (5799-BFF).

OS/VS2 MVS DFDS R1.5 and R1.6 are separately orderable, will not be shipped automatically to current users of OS/VS2 MVS DFDS, and must be ordered by new users and current users of OS/VS2 MVS DFDS planning to install the devices.

The 3380 and 3375 must be initialized by the current release of the Device Support Facilities utility of either the applicable operating system or the stand-alone Device Support Facilities program (5747-DS1).

Storage Usage: The approximate real and virtual storage changes for Data Facility/Device Support Release 1 operating in an OS/VS2 MVS environment are:

Nucleus (Real)	22K
PLPA (Virtual)	120K

The specified operating environment may change and will be restated at availability.

COMPATIBILITY

Programs that currently access the VTOC through documented DADSM interfaces will continue to operate without change on volumes with a VTOC index. Programs that access the VTOC via EXCP or SAM will continue to operate without change on volumes with a VTOC index with one exception: Those programs that obtain information from the Format 5 DSCB(s) must be modified to use a new CVAF function to obtain the same information from the VTOC index. CVAF sets an indicator in the Format 4 DSCB, that is already defined for this purpose to indicate when the data in the Format 5 DSCB is invalid. CVAF sets a new indicator when a VTOC Index exists.

MIGRATION/CONVERSION

Coexistence with systems that do not support the VTOC index is a major feature of the VTOC index design.

- Any volume that is currently usable on OS/VS2 MVS, MVS/XA or OS/VS1 may be moved from another operating system and used as-is on a system with VTOC index support.
- Device Support Facilities can be used to initialize a VTOC index on these volumes whenever desired, with the exception of the 2314 and volumes whose VTOC does not begin on record 1 of a track (for example, a DOS 'stacked pack').
- A volume with a VTOC index can be moved to and from the following systems which do not support the VTOC index:
 - OS Release 21.8
 - OS/VS2 SVS
 - VSE/Advanced Functions
 - OS/VS1, without DFDS (5740-AM6) installed
 - OS/VS2 MVS, without either MVS/370 DFP (5665-295) or DFDS (5740-AM7) installed

In general, if the VTOC is modified on any of these systems, the VTOC index will be invalidated and the VTOC converted to the non-indexed format either via existing facilities on these systems or upon return to a system that supports the VTOC index. The user must then re-initialize the index with Device Support Facilities. Certain usage on OS Release 21.8 and OS/VS2 SVS may require that the VTOC index be converted to non-indexed format prior to use on these systems. See the *Data Facility/Device Support General Information* manual for a description of conditions which will require conversion.

Data Facility Device Support (cont'd)

In an environment where an Indexed VTOC is shared by multiple host systems, Data Facility Device Support, MVS/XA Data Facility Product, or MVS/370 Data Facility Product must be installed on all systems that can access the shared VTOC.

- Volumes with the VTOC index that must be used on systems other than those listed above should be converted to the non-indexed VTOC format via Device Support Facilities prior to use on the other system.
- The VTOC index is designed for easy user migration. User job streams, including JCL and IEHPRGM control cards, are fully compatible with indexed and non-indexed volumes. EXCP programs that are converted to use CVAF will operate on both types of volumes. Thus the installation may gradually convert volumes to the indexed format.

The Direct Access Storage Device Migration Aid licensed program is available to assist the user in moving data to the 3375 or the 3380.

3380 Model 11 (MVS only): 3350 devices formatted as paging volumes must be reformatted as the 3880 mdl 11 does not support track overflow. The format of swap data sets remains unchanged. Paging data sets created on 3350 prior to installation of the 3880 mdl 11 cannot be used.

3380 Model 13 (MVS only): User applications which currently use IBM-supported access methods will not need to be re-written or re-compiled.

Note: An application using the read back check command will not have the same data integrity check when used with the IBM Storage Control mdl 13. Due to the method of writing, data will be written first to the cache and then copied to the 3380. A subsequent read will be from the data in the cache and not the data on the 3880. For applications using read back check, consideration should be given to bypassing the cache using the access method services command SETCACHE OFF.

AVAILABILITY

In the event an error causes invalidation of the VTOC index, the next DADSM allocate or extend operation will restore the non-indexed format. The user's programs will not be aware of the error, and the volume continues to be available for use.

SECURITY

The VTOC index can be either RACF-protected (MVS only) or password-protected, in which case a user must be RACF authorized or must supply a password if the index is to be scratched, renamed or opened for output. The VTOC can be RACF-protected, in which case the user must be RACF-authorized to open the VTOC for output.

AUDITABILITY

The pre- and post-processing DADSM installation exits may be used by an installation for auditing DADSM requests.

PERFORMANCE CONSIDERATIONS

The indexed VTOC facility contained within Data Facility Device Support Release 1 offers performance improvements in data set allocation and the DADSM functions. This facility is optimized for large DASD volumes where the VTOC exceeds two tracks.

This is especially significant in a Time Sharing Option (TSO) environment, where a large number of data sets are typically found on a single DASD volume.

These improvements will be multiplied by the reduced channel interference in a multi-programming system. The existing VTOC access requires search commands which make a channel and control unit busy during the entire search. The Indexed VTOC will reduce channel and control unit busy time.

In multiple host, shared DASD configurations, the savings will be even more evident. The reduction in RESERVE/RELEASE interference will benefit all systems which need the shared volumes.

Improvements in allocation time were observed in the following environment:

Processor	3033
Main Storage	4.0 Megabytes
Operating System	OS/VS2 MVS
Device Type	3330-11

Observation 1: 500 data sets	
Elapsed time savings	62 percent
Observation 2: 1900 data sets	
Elapsed time savings	85 percent

The indexed VTOC support can save more than 700 microseconds per DSCB in the VTOC for an ALLOCATE. For 500 data sets, the savings may be more than .35 seconds, and for 1900 data sets, the savings may be more than 1.33 seconds for each allocation of a new data set. The larger the number of entries in the VTOC, the greater will be the overall improvement in DADSM performance.

Generally, 3800 mdl 1 jobs printed on the 3800 mdl 3 in compatibility mode using OS/VS2 MVS DFDS R1.6 will have equivalent throughput.

These observations are only examples. The actual improvement experienced by any user, or any specific environment, is dependent on many factors. IBM does not represent or warrant that all users will experience the same change in performance for all environments.

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**ACCESS METHOD SERVICES
CRYPTOGRAPHIC OPTION
RELEASE 1 MODIFICATION LEVEL 0
5740 - AM8**

PURPOSE

The Access Method Services Cryptographic Option for OS/VS2 MVS and OS/VS1 extends the Access Method Services REPRO function to give the user the ability to encrypt and decrypt data using a software or hardware version of the National Bureau of Standards Data Encryption Standard (DES). To encipher and decipher the data and provide "key" management functions, the access method services REPRO command uses the services of either the Programmed Cryptographic Facility licensed program (5740-XY5) using software for OS/VS2 MVS and OS/VS1, or the Cryptographic Unit Support licensed program (5740-XY6) using hardware for OS/VS2 MVS utilizing the 3848 Cryptographic Unit.

HIGHLIGHTS

- Enciphering and deciphering is based on a binary value, called a "key".
- Supports all data set organizations currently supported by Access Method Services REPRO command, (except VSAM and Integrated Catalog Facility catalogs).
- After encryption, the data set remains unintelligible until it is deciphered with the correct key.
- Provides users with an aid for securing data while offline for:
 - transportation to a different location.
 - long term storage at a different location.
 - or normal offline storage at the location where used.

CUSTOMER RESPONSIBILITIES

The customer responsibilities relating to use of the Access Method Services Cryptographic Option involve the system security and the physical security of keys, the cryptographic key data set and the encrypted data. The customer must realize that the loss of a key used to encrypt a data set means the loss of the encrypted data; that is, the encrypted data cannot be decrypted. Therefore, the customer must provide adequate measures for maintaining secure duplicate copies of keys used. For further information on this subject, see the Programmed Cryptographic Facility licensed program (5740-XY5) and the Cryptographic Unit Support licensed program (5740-XY6).

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Access Method Services Cryptographic Option is designed to have the same constraints, execute on the same processors and support the same configurations as the respective base operating system. This product increases the amount of storage required by Access Method Services. Approximately 14,000 additional bytes of virtual storage and 12,000 additional bytes of DASD library storage (SYS1.LINKLIB) are used.

SOFTWARE REQUIREMENTS

The Access Method Services Cryptographic Option is designed to operate with OS/VS2 Release 3.8 and OS/VS1 Release 7 and subsequent releases and modification levels unless otherwise stated. Additionally, the Programmed Cryptographic Facility licensed program (5740-XY5) is utilized by this option for software encryption/decryption on OS/VS2 MVS or OS/VS1, and Cryptographic Unit Support licensed program (5740-XY6) is utilized for hardware encryption/decryption on OS/VS2 MVS.

Access Method Services Cryptographic Option source code is distributed in assembler language as optional material and is supported via the System Modification Program (SMP).

COMPATIBILITY

All data set organizations supported for input by the Access Method Services REPRO command are supported as input for REPRO ENCIIPHER (with the exception of VSAM and Integrated Catalog Facility catalogs). All data set organizations supported for output by REPRO are supported for output from REPRO DECIPHER (except VSAM and Integrated Catalog Facility catalogs). Enciphered data sets are always sequentially organized, and are unintelligible to any system without either the Programmed Cryptographic Facility licensed program or the Cryptographic Unit Support licensed program installed, and without knowledge of the correct key. Enciphered data sets cannot be deciphered by DOS/VS systems. Therefore, customers should consider their cross system portability requirements in evaluating this OS/VS facility.

PERFORMANCE

No performance cost is incurred by an installation when the Access Method Services Cryptographic Option is not in use. When this option is in use, the performance cost depends directly upon the length of the

data records being encrypted or decrypted. At the user's option, performance may be improved by specifying the number of logical records (up to a maximum of 255) to be encrypted or decrypted as a unit.

DOCUMENTATION: (available from Mechanicsburg)

Title	Order Number
OS/VS1 and OS/VS2 MVS Programmed Cryptography Facility General Information Manual	GC28-0942
Licensed Program Design Objectives	GC26-3917
Data Security Through Cryptography	GC22-9062

SYSTEM INTEGRITY

IBM will accept APARs describing situations where the Access Method Services Cryptographic Option causes an exposure to the system integrity of OS/VS2 MVS.

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**OS/VS COBOL COMPILER AND LIBRARY (5740-CB1)
OS/VS COBOL LIBRARY ONLY (5740-LM1)**

DESCRIPTION

The OS/VS COBOL Compiler and Library operates in a virtual storage environment under control of OS/VS1, OS/VS2; OS/VS1, OS/VS2 under VM/370; or the Conversational Monitor System (CMS) of VM/370. The Library is required for execution of compiled programs. The compiler and library support American National Standard COBOL X3.23-1968* and X3.23-1974* and add several new features to those contained in previous IBM OS Full ANS COBOL Compilers.

OS/VS COBOL features are:

- VSAM Support** -- The high performance access method. ****
- Lister** -- A facility that produces a new source listing with standard indentation and alignment, embedded cross-references, footnotes, and other features.
- Verb Profiles** -- A facility to identify and locate verbs in a source program.
- Execution Statistics** -- A facility that counts executions of source verbs.
- WHEN-COMPILED Special Register** -- A means of associating a compilation with its execution.
- Merge** -- A facility for merging files. **
- Multiple Sort Inputs** -- An extension of the sort facility to permit specification of more than one data set as input. **
- Support of 3886 Optical Character Reader**. ***
- S/370 instructions generated automatically.**
- FIPS Flagger** -- An installation management tool which helps enforce conformance to the Federal Information Processing Standard for COBOL as defined by FIPS Pub. 21, March 15, 1972.

Source language, data set, and object program compatibility with previous versions of OS Full ANS COBOL.

HIGHLIGHTS

- VSAM (Virtual Storage Access Method) Support** ... VSAM is a high-performance access method, equally adapted to online and batch processing, with a high degree of data security. Through COBOL, access can be sequential, random through an index, or physical sequential.
- Lister** ... A facility for reformatted source listings with expanded, embedded cross-referencing information. Features of this new source listing include: Standard indentation for all DATA DIVISION level numbers to show group structure, and for all IFs, etc., in the PROCEDURE DIVISION to facilitate tracing program logic. Alignment of PICTURE and VALUE clauses to highlight OCCURS and REDEFINES. Two-way, embedded cross-references to eliminate indirect 'lookups' (via a separate SXREF listing in a conventional COBOL Compiler). Reference-letters to show type of reference indicate overall usage of a program item, and reduce the need to look up each reference. Footnotes on PROCEDURE pages to show the definition of referenced data items, eliminating more 'lookups'. Two-column PROCEDURE DIVISION pages to compact the listing and further reduce page-turning. Cross-reference summary to show how, and how much, FDs and PROCEDURE DIVISION SECTIONS reference each other. Optional reformatted and renumbered source deck for manual use or for updating the BASIS library.
- Verb Profiles** ... A facility which eases identification of verbs used in the source program, and of finding where the verbs are located. This facility is composed of two options: A verb summary feature and a verb cross-reference feature. Both the verb cross-reference and summary features use the format of the XREF and SXREF listings.
- Execution Statistics** ... A facility which is both a debugging and an optimization aid. It consists of a summary of how often each COBOL source program verb is executed; all statistics are for an individual program execution and are printed at a program termination. This is useful for knowing which sections of a program are heavily used and should be evaluated for efficient coding; it is of further use in monitoring whether all portions of a program have been executed during a debugging run.
- WHEN-COMPILED Special Register** ... The WHEN-COMPILED special register makes available to the object program the date-and-time-

* Formerly known as USA Standard COBOL, compatible with and identical to the international standard of the language, ISO Recommendation 1989-1972 -- Information Processing -- Programming Language COBOL.

** Not available under CMS at object time.

*** Not available under VM/370 at object time.

**** Available under CMS at object time as of VM/370 Release 3, except that no ISAM interface is provided.

compiled constant carried in the object module. WHEN-COMPILED provides a means of associating a compilation listing with both the object program and the output produced at execution time.

- Merge Facility** ... Allows the user to combine two or more identically sequenced files according to the ascending/descending order of embedded key(s) in each record. Use of this facility requires the OS/VS Sort/Merge program product (5740-SM1).
- Multiple Input Sort Data Sets** ... Allows the user to specify more than one data set as input to the sort facility.

3886 Optical Character Reader ... OS/VS COBOL supports the 3886 through appropriate statements to control and accept input from the device. A new library subroutine can be invoked through CALL statements. Functions include: Opening and closing the file; reading and checking the file; loading a new format record; and special control operations.

Automatic Generation of S/370 Instructions

FIPS Flagger ... This feature identifies non-standard COBOL statements in a source program. It ensures that COBOL source programs can be written to conform to specifications defined by the Federal Information Processing Standard for COBOL.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Operation of the IBM OS/VS COBOL Compiler with TSO requires the minimum TSO configuration. Information on OS/VS2 TSO system requirements can be found in the *IBM OS/VS2 TSO Guide* (GC28-0644).

When running under CMS, the minimum CMS configuration is required. Information about VM/370 and CMS can be found in *IBM VM/370: Planning and System Generation Guide, Release 2 PLC1* (GC20-1801).

For operation of the OS/VS COBOL Compiler without TSO or TCAM, an IBM S/370 and 108K bytes of virtual storage are required, as well as a configuration sufficient to run the selected IBM Operating System.

Executing object programs in a communications environment requires a minimum TCAM systems configuration and TCAM Modification Level 2. A description of TCAM is in the *Operating System: TCAM Concepts and Facilities* (GC30-2022) and in *Operating System: Telecommunications Access (TCAM) Programmer's Guide and Reference Manual* (GC30-2024).

Use of the FIPS Flagger requires an additional data set -- SYSUT6.

SOFTWARE REQUIREMENTS

The OS/VS COBOL Compiler and Library operates in a virtual storage environment under control of the following:

- OS/VS1
- OS/VS2, with or without the Time Sharing Option (TSO)
- The above VS Operating Systems under VM/370
- CMS of VM/370

OS/VS Release Requirements:

Object programs compiled from source programs that contain the language features listed below will require at least the following OS/VS releases for execution:

	OS/VS1	OS/VS2
Merge	2.6	1.6
VSAM Support	2.0	1.6
3886 Support	3.0	2.0

Operating with TSO, the OS/VS COBOL Compiler can be invoked most conveniently by the TSO COBOL Prompter (5734-CP1), which conversationally interacts with the terminal user to obtain the necessary compilation. The OS/VS COBOL Compiler requires at least Release 1 Modification 2 of the Prompter. The compiler can also be invoked in the Time Shared region by using the TSO 'CALL' command; however, it is necessary to allocate each data set required prior to compilation.

Under TSO, potentially significant gains in COBOL programmer productivity can be obtained by using OS/VS COBOL in conjunction with COBOL Interactive Debug (5734-CB4). The OS/VS COBOL Compiler requires at least Release 1 Modification 3 of COBOL Interactive Debug.

Under control of CMS of VM/370 the OS/VS COBOL Compiler may be invoked by the CMS command COBOL, and OS/VS COBOL object programs may be tested using COBOL Interactive Debug.

The separate program product IBM OS or OS/VS Sort/Merge programs are designed to be used with COBOL object programs that use the verb, or that sort ASCII or separately-signed numeric data. IBM OS/VS Sort/Merge (5740-SM1) is specifically designed to run under OS/VS, and is required if the Merge verb is used.

PROGRAM PRODUCTS

OS/VS COBOL Compiler/Library (cont'd)

COMPATIBILITY

ANS COBOL: This section addresses the compatibility between OS/VS COBOL (5740-CB1) and Release 1 and previous versions of the IBM OS Full American National Standard COBOL Compiler and Library: OS Version 2 COBOL (360S-CB-545, 360S-LM-546) ... OS Version 3 COBOL (5734-CB1) ... OS Version 4 COBOL (5734-CB2, 5734-LM2).

Source Level ... COBOL programs coded correctly for Versions 2, 3 or 4 are compatible and will compile without modification, provided that OS/VS COBOL reserved words were not used as user-specified names.

Object Module Level (Pre-Link Edit) ... At availability of the OS/VS COBOL Library, it will operate with object programs (a) compiled on Version 2, 3 or 4 and (b) operating with the most recent release-modification levels of their libraries that are then available. Present levels most recently available are:

Version 2; Release 21.X

Version 3; Release 3.1

Version 4; Release 1.2

Programs meeting the conditions of (a) and (b) above, must be re-link edited, but do not require compilation.

Load Module Level (Link-edited) ... No compatibility claimed; however, there may be instances in which load modules from earlier versions will run.

Data Set Compatibility ... Data sets created by programs compiled on any of the previous versions of ANS COBOL or by COBOL E or F programs can be processed by OS/VS COBOL programs.

COBOL, E, F: Source programs written for the COBOL E and F Compilers must be converted before compiling them on the OS/VS COBOL Compiler. The Language Conversion Program described in the *IBM System/360 Conversion Aids: COBOL-to-American National Standard COBOL Language Conversion Program (GC28-6400)* facilitates such conversions to the 1968 COBOL Standard.

CMS: Under CMS, the Compiler can accept and compile any COBOL source program that it can accept and compile under the control of OS/VS1 or OS/VS2. The object code generated by the OS/VS COBOL Compiler under CMS can be executed without restriction under the control of OS/VS1 or OS/VS2, with or without TSO. The object code generated under CMS can also be executed under CMS with the object time restrictions in the following areas:

ISAM, VSAM*

SORT

Segmentation (Removed by OS/VS COBOL Rel 2)

CALL ... on overflow

TCAM

Various I/O-related restrictions

* The restriction against VSAM is removed as of VM/370 Release 3.

For more detailed information about the above restrictions under CMS, refer to the *IBM OS/VS COBOL Compiler and Library General Information (GC28-6470)*.

As of VM/370 Release 3, VSAM data sets are compatible between CMS and OS/VS1 or OS/VS2. The disk formats of all other CMS files are not compatible with data sets of OS/VS, although CMS is able to read OS/VS BSAM, QSAM and BPAM data sets. Data sets are also transferrable through utilities or card and tape.

CICS: Programs written for use in a CICS environment that are to take advantage of the Object Code Optimizer feature must include a special compiler control statement at appropriate places within the source. New features other than the FIPS Flagger, Lister, Verb Profiles, and WHEN-COMPILED special register are not available for use in a CICS environment.

Note: The structure of object programs compiled with the OS/VS COBOL Compiler may differ from the structure of object programs compiled with previous versions of the ANS COBOL Compilers. Before installing the OS/VS COBOL Compiler, all application packages having dependencies on the structure of the object code must thus be updated to include support for the OS/VS COBOL Compiler.

PERFORMANCE

When run with the same options in a virtual environment, the OS/VS COBOL Compiler will compile the same program in approximately the same time as Version 4.

Compilation time may be increased slightly by selecting options for the Lister, Verb Profiles and FIPS Flagger.

DOCUMENTATION: (available from Mechanicsburg)

OS/VS COBOL Compiler and Library General Information (GC28-6470) ... Specifications (GC28-6472) ... OS Full American National Standard OS/VS COBOL Compiler and Library (GC28-6396) ... IBM VS COBOL for OS/VS (GC25-3857).

**3650 PROGRAMMABLE STORE SYSTEM
PSS COBOL COMPILER
DOS/VS (5746-CB2) OS/VS (5740-CB2)****PURPOSE**

The 3650 Programmable Store System COBOL Compiler program product is a derivation of the base S/370 DOS/VS and OS/VS COBOL compilers which is designed for use with the IBM 3650 Programmable Store Systems. It allows users of Programmable Store Systems to write batch type programs in COBOL. It executes in a S/370 and compiles the programs into SPPS II code. These SPPS II programs are then processed according to normal procedures for execution in the 3651 store controllers.

DOCUMENTATION

The *General Information Manual* (GC30-3059) and the *Licensed Program Design Objectives for PSS COBOL Compiler* are available from Mechanicsburg as unlicensed documentation at no charge. Availability of other licensed and unlicensed documentation will be announced prior to program availability.

HIGHLIGHTS

- This COBOL compiler program product consists of one component which replaces a single phase of the standard S/370 COBOL compilers. This phase normally generates the S/370 executable object deck. This replacement component will cause an SPPS II program deck to be punched. This SPPS II deck will then be processed according to standard user SPPS programming procedures.
- This COBOL is a proper subset of the American National Standards Institute (ANSI) COBOL as implemented by the S/370 COBOL compilers. The specifications are:
 - ANS/X3.23-1968 for DOS/VS
 - ANS/X3.23-1974 for OS/VS
- This COBOL compiler will allow the user to write programs in COBOL to do batch type processing in the 3650 Programmable Store System controllers. Since this COBOL is a subset of the S/370 COBOL, a program written for this compiler should also be able to compile under the standard S/370 compilers. Because of this, a user should be able to compile, to execute and to debug PSS application programs on the S/370 before transmission to the controller.

CUSTOMER RESPONSIBILITIES

The customer will be instructed to install the prerequisite COBOL/VS Compiler program product and its associated updates. After COBOL installation, the libraries which contain the various components of the base COBOL compiler are to be left intact. Instructions with this COBOL licensed program will then instruct the customer to execute the job control language (JCL) which is provided. This JCL will combine the proper components from the COBOL component libraries with the 3650 Programmable Store System COBOL component. The output will be the 3650 Programmable Store System COBOL Compiler. Hence, the customer will have on the host system both the standard COBOL compiler and the 3650 Programmable Store System COBOL Compiler. The compilers will be physically separate and distinct for ease in usage and maintenance.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The minimum system required is an IBM S/370 that will support the COBOL/VS compiler and the SPPS II program product under DOS/VS, OS/VS1 and OS/VS2 (MVS).

SOFTWARE REQUIREMENTS

This COBOL is designed to operate with DOS/VS, OS/VS1 and OS/VS2 (MVS). The prerequisite DOS/VS COBOL compiler program product or the OS/VS COBOL compiler program product and the SPPS II program product must also be installed. Specific release levels are detailed in the product availability notices.

COMPATIBILITY

Some language functions required by the ANS specifications for this product are not supported by 3650 Programmable Store System COBOL. The facilities required for support of these statements are not provided in the 3651 controller. These deviations will be detailed in the *Licensed Program Specifications*.

PERFORMANCE CONSIDERATIONS

Compile time performance factors for this COBOL compiler and the S/370 COBOL compilers are essentially the same. Compile time performance between the compilers may, therefore, be assumed to be equivalent. Execution time performance of the object code in the controller is, however, governed by how the COBOL program is coded. The three major influences in performance are:

- Arithmetic definition of data fields.
- Usage of bit flags.
- Program structure.

Maximum efficiency will be achieved by use of half-word, binary data fields, minimal usage of bit flags and minimal usage of PERFORMs and indexing.

**Change Management Tracking (CM/T) (5740-DC1)
Change Tracker (CT) (5740-DC4)
DP Accounting for IMS/VS (DPA) (5740-DC2)**

DESCRIPTION

Change Management/Tracking, Change Tracker, and DP Accounting for IMS/VS, together constitute an information system that covers three important aspects of data processing management:

- Change Management/Tracking (CM/T) keeps an orderly record of changes made to the installation's production libraries. Use of this record can reduce problem determination time and improve availability. The change tracking function of CM/T is also available as a separate program product – the Change Tracker (CT) – which can be licensed separately for each additional processor in a multiple-processor installation.
- DP Accounting for IMS/VS (DPA) provides IMS/VS DB/DC installations with an equitable and consistent charge-back system based on IMS transaction usage.

The above programs all use source information from the logs of the OS/VS System Management Facilities (SMF) and/or the Information Management System/VS (IMS/VS). Therefore, although they are available as separate program products, they are built on a common data base structure and share similar data base input, modification, and reporting functions.

The above program products run under OS/VS1 and OS/VS2 (SVS and MVS). On OS/VS2 systems, they can (with the exception of the Change Tracker) be executed online under TSO.

HIGHLIGHTS

Change Management/Tracking: CM/T provides the following functions:

- Tracks all changes made to user-specified libraries and stores information regarding the changes in a central data base for later use in problem and change management procedures. CM/T obtains this information from the SMF log where it is placed by the system SMF facilities and the Change Tracker subcomponent. Changes made to libraries by the following utility programs can be tracked at a member level by invoking of a tracker: Linkage Editor, IEBCOPY, IEBUGDTE, and IEHPROGM. Volume Dump/Restores made by IEHDASDR can be tracked. Data set changes that result in an SMF record type 15 can also be tracked.
- Takes backup copies of modules changed in user-specified libraries, ensuring the uniform backup of production libraries and reducing the frequency with which full backup must be taken.
- Permits reconstruction of a library when a system "crash" or some other crisis forces the use of a previous version of a library or application. CM/T produces a jobstream that, when executed and modified updates the last normal backup copy of a library with any changes that have been made between the backup and the "crash".
- Provides reports useful in determining unauthorized changes and in managing software problems and changes, particularly problem determination. If TSO is available, this information can be obtained online using a CM/T query command.

The error causing a software failure very frequently lies in a recently changed module. CM/T can help to reduce the time in locating such a module by providing a time-stamped history of changed modules – an important consideration when the module belongs to a critical application and end users are awaiting the resolution of the error.

The facilities of CM/T and the systematic use of CM/T provided information in problem and change management techniques offer an installation the opportunity for improvements in two different areas:

- *Systems availability* – reduced problem determination time and the rapid reconstruction of libraries can lessen the time an application is unavailable to the end user.
- *Programmer productivity* – improved documentation and faster problem determination can decrease the amount of time programmers devote to programming maintenance and release them to more productive work.

Both CM/T and CT are licensed for use on a per processor basis. However, in an installation with multiple processors, the full package of CM/T components need not be ordered for each processor to achieve the full capabilities of CM/T across all systems. Only the Change Tracker (5740-DC4) must be ordered for each additional processor. The tracker places linkage editor and system utility information onto the SMF log of each separate processor. The tracker also places backup copies of changed modules in a library on each processor. The SMF logs from the additional processors are processed later by the full CM/T (5740-DC1) on the processor to which it is licensed.

DP Accounting for IMS/VS: DPA functions permit a new method of accounting and planning for DP management responsible for IMS/VS DB/DC systems, and for users of IMS/VS featuring:

- *Transaction-based accounting* – billing information in terms of IMS/VS transactions – not in terms of processor seconds, EXCPs and SIOs – easing considerably the end user's task of estimating and justifying resource requirements for current and proposed applications.
- *Consistent billing* – DPA allows the billing of users at a fixed price by type of transaction over a given accounting period as opposed to other types of billings that often appear inconsistent and erratic to the end user.
- *Equitable billing* – DPA establishes a price for transaction types based on the average use of system resources.
- *Improved usage information* – using estimates from end users, DPA projects future workload trends, which can be used by DP management in calculating future resource requirements.

DPA has no impact on IMS/VS online performance; it can be run as a normal OS/VS batch job off prime shift or at any other time desired by the installation. To obtain complete information in DPA, IMS transactions should be defined with either INQ=NO or INQ=(YES, RECOVER).

DPA calculates from the IMS/VS system logs the average resource consumption per transaction type over a user-specified past period and establishes proportionate transaction weights. To determine a cost for each transaction type, DPA distributes the total IMS/VS cost (provided by the installation) over the estimated transaction volumes in proportion to the transaction weights. The installation can then determine equitable transaction prices based on the DPA-computed costs. At the end of each billing period, DPA produces a consolidated list of billings based on the transaction prices and number of transactions recorded in the IMS/VS logs over the period.

The data base system selects required data from the SMF and IMS/VS logs, summarizes it, and stores it in the data base. In an OS/VS installation with multiple processors, the logs from all systems can be used using TSO-like commands, the user can then access the data and obtain the Using TSO-like commands, the user can then access the data and obtain the reports he requires as tables, bar charts, or graphs through batch or TSO.

CUSTOMER RESPONSIBILITIES

Installation should be carried out by an experienced systems programmer with knowledge of SMF and/or IMS/VS (depending on the products to be installed).

Introductory education to the products is provided by supporting publications. For CM/T and CT, basic education in handling the product is needed by programmers updating production libraries, and by personnel responsible for problem determination and change coordination. For DPA, the person or persons responsible for billing of IMS/VS services need education in the product.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

CM/T, CT, and DPA will run on any machine configuration supported by the above system control programs and VSAM. If they are to be used under TSO, an IBM 3277 Display Station mdl 2 (or equivalent) must be available. Hardware floating-point capability is also needed.

CM/T and DPA, will each require a minimum virtual address space, or partition, of 512K bytes. CT will require a minimum of 256K bytes.

For installation, one IBM 2400- or 3400-series tape unit is required.

The disk space needed will vary with the amount of data processed.

SOFTWARE REQUIREMENTS

CM/T, CT, and DPA require the following system control programs:

- OS/VS1 Release 5.0, 6.0, 7.0, or
- OS/VS2 Release 1.7 or
- OS/VS2 Release 3.7, or 3.8.

The following must also be installed:

VSAM for data base access

An IBM sort/merge program (5740-SM1 or 5734-SM1) or equivalent (optional, if the SORT command is to be used).

TSO (optional, if reports are to be accessed from a terminal).

To achieve full value from CM/T and CT, the OS/VS system should have been generated in such a way that SMF records type 4, 5, 15, 17 and 18 are collected (a sample SMF program exit shipped with CM/T and CT allows records of these types not needed by the products to be eliminated from the SMF log).

PROGRAM PRODUCTS

Installation Management (cont'd)

DPA is released to work with:

IMS/VS Version 1 R0.1, or

IMS/VS Version 1 R1.3, R1.4, R1.5 and R1.6.

To obtain full information in DPA, IMS transactions should be defined with either INQ=NO or INQ=(YES, RECOVER).

PROGRAM PRODUCTS

**SERVICE LEVEL REPORTER (SLR)
RELEASE 2 (5740-DC3)**

PURPOSE

SLR provides DP management with information to help manage the DP installation. Many areas are covered by this single product - VS1, MVS, TSO, CICS/VS, IMS/VS. SLR is a post-processor of system log data, and information is collected in one data base and presented in readily understandable format. Graphics and color can be used to present information, thereby giving a versatile, easily-used, pictorial display capability for use by DP professionals at all levels. An SLR objective is to minimize the number of printed reports presented to management, by presenting the 'right' information in the 'right' format, and supplementing printed reports with online inquiries to the SLR data base when necessary.

DESCRIPTION

Items SLR addresses are:

Service Levels - SLR can be used to monitor the level of service provided to users of data processing. It enables the DP department to continuously monitor the service it provides, and thereby help ensure that commitments on the service to be provided can be given and adhered to. Deviations from commitments can be detected and their causes determined and rectified.

System Utilization - SLR can provide a comprehensive picture of system utilization, showing how the different system components are used, and relate this to the service levels described above. These two elements together help optimize the use of system resources.

Capacity Planning - SLR includes a capacity planning application which helps you measure the system load, categorize it into application areas, forecast the growth in each, and estimate hardware requirements for forthcoming years.

Accounting - SLR can provide the basis for DP accounting for batch, TSO, CICS/VS and IMS/VS systems. For online systems, SLR can base chargeout on a transaction basis, billing users in terms they understand and can influence.

SLR is easy to install and operate. Results are immediate. After installation, which in an MVS TSO environment normally takes less than one day, immediate access to several hundred SLR reports is available.

SLR has many powerful functions based on a data base containing historic data - online inquiry through CLIST menus under TSO, multi-processor and multi-system support, and an easy-to-use language to define additional reports, or customize the SLR data base. Two key considerations in developing SLR have been ease-of-use combined with flexibility.

SLR also supports the additional SMF records in MVS/SE Release 2 and MVS/SP.

RELEASE 2 HIGHLIGHTS

SLR Release 2 provides:

- Processing of the records from the CICS/VS Release 1.5 Monitoring Facility. CICS/VS 1.5 contains a new monitoring facility which produces records on a sequential file. Four log tables for CICS/VS have been added to SLR:
 - CICSACCTLOG which contains data for CICS/VS accounting.
 - CICSYSLOG which contains detailed transaction data for performance monitoring.
 - CICSTRANSLOG which contains further detailed transaction data complementing that in the CICSYSLOG.
 - CICSXLOG which contains data for CICS/VS exception reporting.
- Sample summary tables and reports are provided.
- SLR can process CICS/VS logs from both DOS/VS and OS/VS systems, although an OS/VS system is required to run SLR.
- Support of color/graphics on IBM 3279 Color Display Stations, graphics on IBM 3278 Display Stations and graphics/color on the IBM 3287 Printers, via the Presentation Graphics Feature (PGF, feature #6048) of the program product Graphical Data Display Manager (GDDM, 5748-XXH). This support is provided by a PGF/NOPGF option added to the PRINT GRAPH command, and through an additional command, PRINT CHART.
- The PRINT CHART command allows you to have any column as the X-coordinate in a graph, and also allows you to present data in 'pie-chart' form.
- The System Modification Program Release 4 (SMF4) is used to install and maintain SLR.
- A facility to route each output type from SLR (commands, reports, messages) to several different files. This permits:
 - Hardcopy of reports when running under TSO.
 - Suppress printing of commands between reports.

- Support of IMS/VS V1 Release 1.6 log data.
- Support for MVS/SP.
- Improved performance for IMS/VS Collect.
- The SLR log tape TAPELOG (based on SMF record type 21) is added.
- Additional data is provided in the IMSTLOG, JOBLOG, TSOSELOG, WACTLOG, PAGINGLOG, and DEVLOG log tables. For example, an additional third response time measurement is available in the IMSTLOG, giving transaction processing time (time between message arrival and placement on output queue).

CUSTOMER RESPONSIBILITIES

Installation of SLR, and tailoring, updating and maintenance of the SLR data base are customer responsibilities.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This licensed program is designed to operate on the following IBM machines: S/370 Mdl's 148, 155II, 158, 165II, 168, 30XX, 4341, 4361, or 4381 Processor.

If SLR is to be used under TSO without color or graphics, a suitable terminal must be available, either one of the following or equivalent:

- IBM 3276 Control Unit Display Station mdl's 2, 3, 4, 12, 13 or 14.
- IBM 3277 Display Station mdl 2.
- IBM 3278 Display Station mdl's 2, 3, 4 or 5.
- IBM 3279 Color Display Station mdl's 2A or 3A.

Graphics and/or color are available (via the program GDDM and its feature PGF) on the following display terminals and printers, or equivalent devices:

- IBM 3278 Display Station mdl's 2 or 3, with the ECSA, PS-2 and PS-4 features (monochrome)
- IBM 3279 Color Display Station mdl's 2B or 3B, with the PS-2 and PS-4 features (color).
- IBM 3287 Printer mdl's 1 or 2 (monochrome).
- IBM 3287 Printer mdl's 1C or 2C (color).

Features for Color or Graphics Devices: Features are required as follows:

Feature	D E V I C E			
	3278	3279	3287 1, 2	3287 1C, 2C
ECSA	3610		3610	3610
EPB			3680	3680
PS-2	5781	5781	5781	
PS-4	5782	5782	5782	
PS-4A				5782

The terminals for color or graphics must be attached to an IBM 3274 Control Unit mdl 1A, 1C, 1D or 51C.

SLR requires hardware floating-point capability.

SLR requires a minimum of 1M of virtual storage. When using the COLLECT command, it is advisable to request a large buffer pool and use up to 2M bytes of virtual storage.

Additional virtual storage is also required by Sort/Merge and GDDM/PGF.

SOFTWARE REQUIREMENTS

This licensed program requires the functions provided by the following IBM programs:

- OS/VS1 Release 6.7 and 7.0 and subsequent releases, unless otherwise identified.
- OS/VS2 (MVS) Release 3.8 and subsequent releases, unless otherwise identified.
- VSAM for data base access.
- IBM OS/VS Sort/Merge Program Product (5740-SM1), or equivalent (required if the SORT command is to be used).
- System Modification Program Release 4 (SMP4) for installation.
- TSO is required if the SLR data base is to be accessed from a TSO terminal.

PROGRAM PRODUCTS

Service Level Reporter (SLR) (cont'd)

- The Program Product OS/VS2 MVS TSO Command Package (5740-XT6) is required if SLR is to be run as a TSO Command Processor in *batch*.
- The Program Product Graphical Data Display Manager (GDDM, 5748-XXH) and its feature PGF (Presentation Graphics Feature, feature #6048) are required for the utilization of 3278/3279 color and graphics features with SLR. Hence, TSO ACF/TCAM Version 2 Release 1, or TSO ACF/VTAM Version 1 Release 2 is required to use color or graphics terminals.

Input Logs Supported: SLR will process log data sets produced by the following programs and subsequent releases and modifications unless otherwise stated:

- IMS/VS.
- IMS/VS Version 1 Release 1.3, 1.4, 1.5, 1.6 and 2.0.
IMS/VS Fast Path transaction records are not supported by SLR. Records from IMS/VS systems with the Multiple Systems Coupling feature are not supported for IMS/VS Version 1, Release 1.3 and 1.4. From Release 1.5 and following releases, SLR will process such records but without using the MSC information.
- SMF, RMF, MF/I.
SMF, RMF and MF/I records from OS/VS1 Release 5.0, 6.0, 6.7, 7.0 and OS/VS2 Release 1.7, 3.7 and 3.8, including the additional SMF records in MVS/SE Release 2, MVS/SP - JES2 Releases 1, 2 and 3 and MVS/SP - JES3 Releases 1, 2 and 3.
- CICS/VS.
CICS/VS Monitoring Facility records produced by CICS/VS Release 1.5. SLR accepts both native CICS/VS logs written under OS/VS or DOS/VS, or records written via the SMF writer under MVS/SE2 or MVS/SP.

CONVERSION

Users of SLR R1.3 can continue to use their existing data base after migrating their current data base to R2.0 format. This is achieved using conversion facilities available in both R1.3 and R2.0.

COMPATIBILITY

SLR can coexist in the same system with DP Accounting for IMS/VS (DPA) and Change Management Tracking (CM/T), but due to changes in the installation and maintenance procedures (with SMP4), SLR cannot share OS data sets, VSAM data base, or functions with these products. Separate collect runs will be required if two or more products are installed.

PROGRAM PRODUCTS

**PROGRAM CUSTOMIZER for the IBM
3600 FINANCE COMMUNICATION SYSTEM
(PC/3600)
DOS/VS (5746-F11)
OS/VS (5740-F11)**

DESCRIPTION

Program Customizer for the IBM Finance Communication System (PC/3600) generates a program for the IBM 3601 Financial Communication Controller from specifications prepared by users. Specification sheets from users request their requirements for the transactions to be executed in the IBM 3601. These specifications cover the key aspects of the program to be generated:

- The input which makes up the transactions.
- The processing to be done.
- The information to be retained in the IBM 3601 when the transactions are executed.
- The telecommunications desired between the IBM 3601 and an IBM System /370 computer.
- The output to be printed or displayed on terminal devices of the IBM 3600 Finance Communication System.

The specifications are entered into an IBM System/370 and processed by PC/3600 to create a Transaction Processor which resides in the 3601 communication controller. Master copies of the specification sheets will be provided by IBM in the PC/3600 Program Customizer Guide for duplication by the user.

The program produced by PC/3600 contains facilities for identification and sign-on of operators, for restriction in the use of transactions and terminals, and for recognition and support of trainees. PC/3600 also provides for continuous operation through user-specified processing of off-line transactions when telecommunications facilities are not available. Other facilities available are the capability to write on the controller diskette an electronic journal of transactions executed and the capability to perform desk calculator operations at the terminals.

HIGHLIGHTS

PC/3600 provides the user with the following advantages:

- Capability to utilize the flexibility of the 3600 Finance Communication System Features
- Simplified installation of the 3600 Finance Communication System
- Ease of handling processing variations within the institution
- Reduction of programmer time
- Capability to include off-line operations in case of a communication breakdown with the host computer
- Better customer service through improved transaction handling and inquiry facilities
- Relative ease of changing programs to meet changing requirements
- Personnel training capabilities
- File security control through sign-on identification
- Audit and control enhanced by an electronic and/or a printed journal
- Free-form sequence of data entry
- Operator identification card capability
- Cash box control
- Capability to obtain operator or station statistics
- Station-to-station message facility within a 3601 controller
- Provision for user-added code at specified exit points
- Telecommunication management for the IBM 3601 controller

CUSTOMER RESPONSIBILITIES

For successful installation of the IBM 3600 Finance Communication System through PC/3600, the user must:

- Understand the IBM 3600 Finance Communication System and its components, including the relationships of loops, devices and workstations.
- Study and understand the functions and architecture of PC/3600, and become familiar with the specification sheets for customizing PC/3600 to the user environment.
- Analyze the user environment to determine how the 3600 System work stations will be configured and used to satisfy transaction requirements.
- Document all transactions sufficiently to determine input specification requirements. Included here are the requirements for data input (field by field) and output printing for:

1. Validation of documents
2. Printing of receipts
3. Journal printing
4. Passbook or ledger card printing

- Determine and document off-line processing for each transaction specified.
- Determine how the IBM 3600 FCS will interface with the host S/370 for total system control.
- Prepare PC/3600 specifications to develop a unique user Transaction Processor.
- Identify and program special routines for user exits if required.
- Generate the Transaction Processor.
- Test the Transaction Processor for proper off-line operation in the user installation environment.
- Develop the host S/370 application programs.
- Test generated programs on-line with host applications.
- Verify system integrity, balancing and control techniques designed into the system.
- Optimize performance for the operating environment.
- Educate terminal users.
- Provide financial controls to ensure system integrity.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

DOS/VS requires no S/370 facilities other than those needed to support the programming systems listed above, with a virtual partition or region of 256K bytes. S/370 mdl 125 through 158 are supported.

OS/VS requires no S/370 facilities other than those needed to support the programming systems listed above. S/370 mdl 135 through 168 are supported.

Minimum configuration is one IBM 3601 Finance Communication Controller and one IBM 3604 Keyboard Display (any model).

Typical resources would be one or more IBM 3601 Finance Communication Controllers, one IBM 3604 Keyboard Display for each workstation, and optionally a printer for each station or pair of stations (the IBM 3610 Document Printer, the IBM 3611 mdl 1 Passbook Printer, the IBM 3612 Passbook and Document Printer or the IBM 3618 Administrative Line Printer, in any combination). One or more stations may have an IBM 3614 or 3624 Consumer Transaction Facility in place of the keyboard display.

PC/3600 supports the IBM 3614 or 3624 to the extent that messages can be transferred to and from the host processor without data being processed in the 3601. The IBM 3618 may be substituted for the 3610 for journal printing or for report printing under control of the host processor.

The controller will require one or more units of the Additional Storage Feature #1005 (Specify #9582) and may require the additional central storage for device attachment (Specify #9581) depending on the user configuration. To demonstrate the wide range of function available, the sample problem distributed with PC/3600 requires four units of additional user storage. The number of workstations which can be supported with a given amount of user programmable storage is highly variable, depending on the number and complexity of the transactions specified by the user.

SOFTWARE REQUIREMENTS

PC/3600 is written in S/370 and 3600 FCS Assembler Language. To create a program with PC/3600 and load the program into the IBM 3601, the user must have the Disk Operating System (DOS/VS) or the Operating System (OS/VS1) or the Operating System (OS/VS2) in a Virtual IBM S/370 computer as follows:

With DOS/VS, the user must have:

- DOS/VS Release 31 (5745-010) and subsequent releases
- DOS/VS Assembler (5745-SC-ASM)
- DOS/VS Sort/Merge (5746-SM1)
- 3704/3705 Network Control Program (5747-AJ2)
- Virtual Telecommunication Access Method (5745-SC-VTM)
- Virtual Storage Access Method (5745-SC-VSM)
- 3600 Host Support Independent Release (IR) 1 (5747-BR1)

PROGRAM PRODUCTS

PC/3600 (cont'd)

- Subsystem Support Services (5745-SC-SSS)
- Customer Information Control System (CICS/DOS/VS) (5746-XX3) or a user-provided equivalent interface to PC/3600

With OS/VS, the user must have:

- OS/VS1 Release 4.0 (5741-VS1) or OS/VS2 Release 3.0 (5752-VS2), and subsequent releases
- OS/VS Assembler (5741-SC1-03) for OS/VS1 or (5752-SC1-03) for OS/VS2
- OS/VS Sort/Merge (5740-SM1)
- 3704/3705 Network Control Program (5744-BA2)
- Virtual Telecommunications Access Method (5741-SC1-23 for OS/VS1 or 5752-SC1-23 for OS/VS2) or Telecommunication Access Method
- Virtual Storage Access Method (5741-SC1-DE for OS/VS1 or 5252-SC1-DE for OS/VS2) or Telecommunication Access Method
- 3600 Host Support Independent Release (IR) 1 (5744-CA2 for OS/VS1 or 5744-CA1 for OS/VS2)
- Subsystem Support Services (5741-SC1-SS for OS/VS1 or 5752-SC1-SS for OS/VS2)
- Customer Information Control System (CICS/OS/VS) (5740-XX1) or Information Management System (IMS/VS) (5740-XX2) or a user-provided equivalent interface to PC/3600

The user must prepare application programming for the Virtual IBM S/370 computer to interface with the program generated by PC/3600.

PROGRAM PRODUCTS

**DIRECT S.W.I.F.T. LINK (DSL)
RELEASE 2 Modification Level 0
CICS/DOS/VS (5746-F14)
CICS/OS/VS (5740-F15)
IMS/VS (5740-F16)**

PURPOSE

Direct S.W.I.F.T. Link is designed to assist the user of CICS/DOS/VS, CICS/OS/VS or IMS/VS, respectively, to directly link to the network of S.W.I.F.T. (Society for Worldwide Interbank Financial Telecommunication s.c.).

SPECIAL SALES INFORMATION:

Direct S.W.I.F.T. Link is designed to assist banks that are, or intend to become, members or users of S.W.I.F.T. (Society for Worldwide Interbank Financial Telecommunication s.c.), that is, banks that handle international payment transactions.

Large banks having foreign branches normally need several licenses. Small banks often constitute a pool for common accomplishment of their international activities.

IBM's licensed program Direct S.W.I.F.T. Link is a general application package to be integrated into an international banking environment.

Together with other banking applications that can automatically be initiated by the User Application Interface facility, IBM Direct S.W.I.F.T. Link allows for a full computer-assisted processing of international banking transactions.

VSAM full support is now provided for the 4300 processors, including the IBM support of the 3310 and 3370 disks. This is expected to be a performance improvement in comparison to the S/370 mode or 2314 emulation.

DESCRIPTION

The functional description of the subject programs is based on IBM's understanding of S.W.I.F.T.'s specifications including the S.W.I.F.T. message category 4 as of May 18, 1981 as stated in the S.W.I.F.T. User Handbook sections 3, 4 and 5.

Each program is divided into three major functional areas:

- S.W.I.F.T.-oriented functions, which comprise the communication with the S.W.I.F.T. regional processor, the checking, routing and queuing of incoming and outgoing messages, and program control.

The connection with the S.W.I.F.T. regional processor is established by entering the Direct S.W.I.F.T. Link operator command LOGIN. The actions necessary to enable the line are performed and the LOGIN message is sent. After log-in, IBM Direct S.W.I.F.T. Link behaves as a Computer Based Terminal (CBT) according to the S.W.I.F.T. definition.

- End-user-oriented functions, which support display and fetching of messages using terminals or sequential devices.

The terminal user contacts the Direct S.W.I.F.T. Link by typing in a transaction code. Then the user is prompted to enter his user identification and password. Next, the user is prompted to select the processing mode and desired functions.

The processing modes at the terminal are:

INPUT	To enter or display banking messages that are intended to be sent to another bank from the S.W.I.F.T. network.
OUTPUT	To request display and/or disposition of banking messages received from the S.W.I.F.T. network.
CONTROL	To enter or receive S.W.I.F.T. system messages, to receive, under certain, predefined circumstances, S.W.I.F.T. banking messages, or to issue Direct S.W.I.F.T. Link operator commands.

**AUTHENTICATOR
KEY FILE**

MAINTENANCE To update the authenticator key file online.

- Message formatting and routing services used to control the message flow from function to function within the IBM Direct S.W.I.F.T. Link and to gain access to individual fields within a S.W.I.F.T. message.

The IBM Direct S.W.I.F.T. Link Message Format Service (MFS) maps the various formats of S.W.I.F.T. messages into a common internal format or maps a message from the internal format into a format adequate to the device where it is to appear. MFS facilitates the access to each individual message field for inspection and further processing. The level of detail to which a S.W.I.F.T. message is segmented is determined during IBM Direct S.W.I.F.T. Link generation by facilities provided in the IBM Direct S.W.I.F.T. Link package. Ready-to-use panels for all S.W.I.F.T. message types, control blocks and other related items required to

process S.W.I.F.T. messages are contained in the distributed material.

Routing gives the bank the facility to control the movement of S.W.I.F.T. input and output messages from one IBM Direct S.W.I.F.T. Link function to the next. Routing criteria are either found in the message itself by inspecting the content of a particular message field, or are introduced by actions of the end user handling the message.

USER MODIFICATIONS:

The program will be implemented such that users can:

- Modify the layout and the language of the panels used to display a message and/or related data on screens, terminal printers and line printers.
- Modify the layout of a S.W.I.F.T. message and other related data in internal storage.
- Add individual code to the end user function program permitting user-specific message manipulation by use, for example, of information extracted from a data base not belonging to the IBM Direct S.W.I.F.T. Link.

RESTART/RECOVERY:

Restart/recovery assistance is supplied for:

- Device failures of IBM 3262 mdl 3 or 13, IBM 3277 and IBM 3284/3286/3288 mdl 2 and their equivalents.
- S.W.I.F.T. line problems.
- Failure of the IBM system covered by the recovery capabilities of CICS/DOS/VS, CICS/OS/VS, IMS/VS, DOS/VSE or OS/VS, respectively.

AUTHENTICATION:

Authentication of S.W.I.F.T. messages is normally done automatically using coded versions of the authenticator keys that have been agreed upon between a sending and a receiving bank. Optionally, the end-user can manually enter the authenticator key at the terminal.

The code for the authenticator algorithm is a feature of the IBM direct S.W.I.F.T. Link program package. This feature is available under the terms and conditions of the agreement for IBM licensed programs subject to special provisions which are contained in the new supplement to that agreement entitled "Supplement for IBM Direct S.W.I.F.T. Link Licensed Program". This supplement must be signed by the customer prior to ordering the authenticator module. The code will be distributed separately.

HIGHLIGHTS of RELEASE 2 MODIFICATION LEVEL 0

With respect to the current releases of IBM Direct S.W.I.F.T. Link, Release 2 Modification Level 0 provides the following new functions:

- VSAM support:** The user can generate IBM Direct S.W.I.F.T. Link such that VSAM is used as access method for the queue data set and for the authenticator key file.
- Manual addition of the PDE (Possibly Duplicated Emitted) trailer component:** A PDE trailer component can be entered manually.
- Extension of the automatically-inserted PDE trailer component:** The automatically inserted PDE trailer component contains the System Reference Number (SRN) and a time stamp.
- Access to ready queue:** An appropriately authorized end user can display messages stored in the ready queues and if required or appropriate, route them to another queue.
- De-authentication of retrieved output messages:** To satisfy the security requirements of corresponding banks, retrieved output messages will be de-authenticated.
- Improved processing of S.W.I.F.T. Message Type 950:** This allows the user to show several statement lines on one screen or printer panel.
- User application interface:** An interface is provided that allows the user to start a transaction each time a message is written to a queue for which a transaction has been defined.
- Alternate authenticator keys:** Alternate authenticator keys are used in the authentication and de-authentication process.

CUSTOMER RESPONSIBILITIES

If the customer is a new IBM Direct S.W.I.F.T. Link user, it is his responsibility:

- To ensure that the operating system is generated as required for the IBM Direct S.W.I.F.T. Link.

PROGRAM PRODUCTS**Direct S.W.I.F.T. Link R2 (cont'd)**

- To install CICS/DOS/VS (without ELS option), CICS/OS/VS or IMS/VS respectively.
- To install the prerequisite PRPQs for the control unit or the ICA, respectively.
- To perform the S.W.I.F.T. Bank Connection Procedure.
- To replace in the library the dummy authenticator module (contained in the basic material) by the separately ordered authenticator module.
- To define the end users, select and define the end user functions.
- To provide routing modules according to the bank's organizational requirements.

A customer having already installed the IBM Direct S.W.I.F.T. Link might need to consider the last two items.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The IBM Direct S.W.I.F.T. Link licensed programs are designed to operate on the following IBM machines:

5746-F14:

IBM S/370 mdls 115 to 158
IBM 3031
IBM 43XX

The size of the processor to handle IBM Direct S.W.I.F.T. Link depends on the operating system (DOS/VSE with VSE/Advanced Functions) and the data communication system (CICS/DOS/VS) used to control the operation of IBM Direct S.W.I.F.T. Link.

5740-F15, 5740-F16:

IBM S/370 mdls 135 to 168
IBM 303X
IBM 43XX

The size of the processor to handle IBM Direct S.W.I.F.T. Link depends on the operating system (OS/VS) and the data communication system (CICS/OS/VS or IMS/VS) used to control the operation of IBM Direct S.W.I.F.T. Link.

5746-F14, 5740-F15, 5740-F16:

The direct connection between the system concerned and the S.W.I.F.T. network requires one of the following control units in EP mode:

- IBM 3704, IBM 3705 (scanner 2 only).
- An Integrated Communication Adapter (ICA).

The connection between the ICA or the control unit and the S.W.I.F.T. regional processor is a point-to-point BSC line, switched or non-switched, using non-transparent EBCDIC code.

The system requirements of IBM Direct S.W.I.F.T. Link, in addition to those of the operating system used, are the following:

- At least one IBM 3277 Display Station mdl 2 or its equivalent.
- If printing services are desired, one IBM 3262 Printer mdl 3 or 13, or one 3284 Printer mdl 2, or one IBM 3286 Printer mdl 2, or one IBM 3288 Line Printer mdl 2, or one their equivalents.

Further machine requirements are:

- For IBM S/370 mdls 115 and 125, an ICA with RPQ XA1006. (5746-F14 only).
- For IBM S/370 mdls 135-3 and 138, an ICA with RPQ XA7464.
- For IBM 4331, a Communications Adapter with RPQ XD1603.

The following direct access devices are supported:

IBM 2314 Direct Access Storage Facility
IBM 3310 Direct Access Storage
IBM 3330 Disk Storage
IBM 3340 Direct Access Facility
IBM 3350 Direct Access Storage
IBM 3370 Direct Access Storage

SOFTWARE REQUIREMENTS

The programs that constitute the IBM Direct S.W.I.F.T. Link program are written in IBM S/370 Assembler language.

The programs are available for operation under the following operating systems and data communication systems:

5746-F14:

- IBM Disk Operating System/Virtual Storage Extended (DOS/VSE), Program Number 5745-020, Release 1.0, together with VSE/Advanced Functions, Program Number 5746-XE8, Release 1.0, or subsequent releases.

- Customer Information Control System/ Virtual Storage (CICS/DOS/VS) Version 1, Program Number 5746-XX3, Release 4.1 or 5.0, or subsequent releases.

5740-F15:

- IBM Operating System/Virtual Storage 1 (OS/VS1), Release 7.0 or subsequent releases, or
- IBM Operating System/Virtual Storage 2 (OS/VS2), Release 3.8 (MVS) or subsequent releases.
- Customer Information Control System/ Virtual Storage (CICS/OS/VS) Version 1, Program Number 5740-XX1, Release 4.0, 4.1 or 5.0, or subsequent releases.

5740-F16:

- IBM Operating System/Virtual Storage 1 (OS/VS1), Release 7.0 or subsequent releases, or
- IBM Operating System/Virtual Storage 2 (OS/VS2), Release 3.8 (MVS), or subsequent releases.
- Information Management System/Virtual Storage (IMS/VS) Version 1, Program Number 5740-XX2, Release 1.5 or 1.6, or subsequent releases.

5746-F14, 5740-F15, 5740-F16:

In order for the user to be able to communicate with the S.W.I.F.T. network, the S.W.I.F.T. BSC Procedure (PRPQ Y96612, Program Number 5799-AQT) must be installed on the IBM 3704 or IBM 3705.

If ACF/NCP/VS Release 2 (Program Number 5735-XX1), SSP (Program Number 5735-XX3), and SCP (Program Number 5747-CH1, with EP feature #6004) are installed, an IBM Direct S.W.I.F.T. Link installation requires the Compatibility for OS/VS or DOS/VSE EP Program (PRPQ Y96614), Program Number 5799-WRF.

Since the IBM Direct S.W.I.F.T. Link uses the Basic Telecommunications Access Method (BTAM) for the message traffic to and from the S.W.I.F.T. NETWORK, BTAM/ES, Program Number 5746-RC5, Release 1.0 must be available for DOS/VSE. For OS/VS, BTAM is a component of the OS/VS System Control Program.

If VSAM is selected as access method for the IBM Direct S.W.I.F.T. Line queue data set and the authenticator key file, VSE/VSAM, Program Number 5746-AM2, must be available for DOS/VSE. VSE/VSAM is part of DOS/VSE SIPO. For OS/VS VSAM is a component of the OS/VS System Control Program.

COMPATIBILITY

Release 2 Modification Level 0 of the IBM Direct S.W.I.F.T. Link programs is a compatible extension of the current releases of the respective programs.

However, a customer migrating from a current release of these programs to Release 2 Modification Level 0 of the IBM Direct S.W.I.F.T. Link must follow the same installation procedure as a customer who installs IBM Direct S.W.I.F.T. Link for the first time.

PROGRAM PRODUCTS**3614/3624 CONSUMER ONLINE
TRANSACTION SYSTEM
RELEASE 2, MOD. LEVEL 0
OS/VS (5740-F51) DOS/VS (5746-F57)****PURPOSE**

The 3614/3624 Consumer Online Transaction System (COLTS) provides a comprehensive level of support for the 3614/3624 Consumer Transaction Facility (CTF).

This program product consists of two major components: Host programs which are written in Assembler Language and a 3600 Finance Communication Controller (FCC) application program written in the Finance Communication Language. The host program is designed as a Virtual Telecommunications Access Method (VTAM) application testing vehicle. It is provided so that a user can perform a basic validation of the online capabilities of the COLTS 3600 controller application program. For 3602 customers, a batch program is provided to generate keys for customer account number entries which will comprise the 3602 disk-resident authorization file. The 3600 application program is designed to support CTFs attached to a 3600 Finance Communication controller during periods of host availability or unavailability.

HIGHLIGHTS

The 3600 application program will provide the following functions:

- Support the following 3624 standard functions:
 - Operator/host-system communication at the 3624 operator panel for such things as transmission of cartridge numbers when new cartridges are installed.
 - Consumer performance of multiple transactions with only one card insertion (transaction chaining).
 - Expansion of the Financial Institution Table in the 3624 to allow shared usage of the CTFs by more institutions and/or the acceptance of more consumer card types.
 - Use of special transaction, e.g., signon and signoff, codes of variable lengths.
 - Use of from/to other account numbers of variable lengths up to 19 digits.
 - The ability to display messages in multiple languages, thus giving the consumer the language of his choice.
 - The ability to suspend the operation of a CTF for a short period of time without having to close it.
- Provide a wide range of CTF operator network commands to:
 - Enter system control parameters
 - Perform 3600 disk or diskette authorization file service
 - Maintain the CTF network
 - Perform signon and CTF settlement.
- Support on one 3600 Finance Communication Controller the 3624 machine and the 3614 machine supporting Data Encryption Standard (DES) and the 3614 machine supporting the Alternate Encryption Technique (AET).
- Support for both single and dual denomination CTFs.
- Support CTF transaction chaining, journal printing and check cashing.
- Access a 3600 disk or diskette-resident authorization file during periods of offhost operations.
- Support for sharing CTFs between several financial institutions.
- Maintain a comprehensive cash total record at the 3600 Controller for each CTF.
- Support offhost transaction processing and accept or reject consumer cash requests based upon user-specified dollar and usage limits.
- Support a 3600 FCC polling workstation to be activated periodically to monitor the availability of the CTF network.
- Support the 3600 FCC Hard Error Recovery Facility.

The host testing application program is designed to provide the following functions:

- Host operator control of the CTF network.
- Transmission of an authorization file from the host to the 3600 application program.
- Maintenance of a journal to record all on host activity.

In addition to the support provided by the currently available release of this program product, Release 2 will provide the additional support required for the financial institution to implement:

- Six display lines of 40 characters each which will provide for more information and instructive messages than is possible with the present single line.
- User interactive functions which expand the means for communication between the consumer and the system.

- New transaction facility, such as fast cash (single key cash withdrawal) and split deposits (deposit with cash back).
- Expanded financial institution table (FIT) to allow the keys and processing options to be defined for individual institutions and/or card types in a sharing environment.
- Multiple transactions per statement when transactions are chained.
- Separate assemblies of sections of the 3600 application program.

A sample Personal Identification Number generation program will also be provided.

SECURITY FEATURES

Security controls help to protect against fraudulent attempts to obtain cash from the 3614/3624. The 3614/3624 Consumer Online Transaction System provides the following security features:

- Use of the IBM-provided encipher and decipher algorithm (DES and/or AET) during data transmission.
- Access of a 3600 disk or diskette-resident authorization file (positive or negative) during periods of offhost operations.
- Maintenance of a comprehensive cash total record for each 3614/3624 attached to a 3600 controller.
- Use of operator control commands to perform 3614/3624 signon, open, close, key reset and settlement.
- Support of a usage file by customer account number in which the user specifies dollar limits and card use limits over a specific time period.
- Support of transaction audit trails both at the 3600 controller and at the host.

CUSTOMER RESPONSIBILITIES

For installation of the 3600 Finance Communication System through the use of this program product, the user must:

- Understand the 3600 Finance Communication System and its components, including the relationships of loops, devices and workstations.
- Study and understand the functions and architecture of the provided application programs.
- Prepare input for the host authorization file transmission routine.
- Develop user-written application routines which will access the user's data base and provide authorization of customer disbursements.
- Review the program documentation to understand and to specify the criteria by which the 3600 application program will accept a 3614/3624 offhost entered transaction request.
- Generate Personal Identification Numbers (PINs).
- Define the terminal network for the VTAM application program.
- Test programs onhost with the host testing application program.
- Test programs for proper offhost operation.
- Implement appropriate security procedures through additional programming and physical control methods.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The program product is designed to work on the following host configurations:

- Any S/370, 3031, 3032, 3033 or 4300 processor with at least 512K bytes of virtual storage for DOS/VS or DOS/VSE or 768K bytes of virtual storage for OS/VS.
- Any Direct Access Storage Device supported by DOS/VS or OS/VS, Subsystem Support Services and the host support for 3600 Finance Communication System.
- Any card read/punch and printer supported by DOS/VS, DOS/VSE or OS/VS.
- One magnetic tape drive unit for installation of the program product and transaction logging.
- 3704 or 3705 Communications Controller with storage and features capable of supporting NCP/VS.

The minimum Finance Communication System consists of the following configuration:

- 3601 or 3602 Finance Communications Controller with a minimum of 40K bytes of user programmable storage.

PROGRAM PRODUCTS

3614/3624 Consumer Online Transaction System (cont'd)

- 3604 Keyboard Display, any model with a 240 or greater character display.
- 3610 Document Printer, 3615 Administrative Terminal Printer or 3618 Administrative Line Printer.
- 3614 or 3624 (mdl 1, 2, 11 or 12) Consumer Transaction Facility.

The following Consumer Transaction Facility features are supported by this program product:

- 3614 Custom Feature Group RPQ (#MG3758)
- 3614 Expanded Function Feature (#3895)
- 3614 Depository Feature (#3322)
- 3614 Transaction Statement Printer Feature (#7900)
- 3624 Additional Storage Feature (#1301)
- 3624 Transaction Statement Printer Feature (#8201)
- 3624 Depository Features (#3233 and #3234)
- 3624 Multiple Display Feature (#4750)
- 3624 Expansion Feature (#6501)

The 3600 application program is designed to support two 3614/3624 workstations in 40K of 3600 Controller user programmable storage in addition to the required 3604 workstation.

SOFTWARE REQUIREMENTS

The 3614/3624 Consumer Online Transaction System requires the programming systems specified below. To execute the host programs and to transmit the application program to the 3600 controller, the user should have installed a current release of one of the following operating systems:

- Disk Operating System (DOS/VS) (5745-010)
- Disk Operating System Extended (DOS/VSE) (5745-020)
- Operating System (OS/VS1) (5741-VS1)
- Operating System (OS/VS2 MVS) (5752-VS2)

In addition, the latest applicable releases of the following components at the time of availability are required.

DOS/VS or DOS/VSE

- Assembler (5745-SC-ASM)
- Network Control Program/VS (NCP/VS) (5747-AJ2) or (SCF/NCP/VS) (5735-XX1)
- Virtual Telecommunications Access Method (VTAM) (5745-SGVTM) or (ACF/VTAM) (5746-RC3) or (ACF/VTAME) (5746-RC7)
- Virtual Sequential Access Method (VSAM) (5745-SC-VSM) or (VSE/VSAM) (5746-AM2)
- Host Support for 3600 Finance Communications System (DOS/VS) (5747-BR1)
- Subsystem Support Services (SSS) (5747-CC6)
- Access Method Services (5745-SC-AMS)

OS/VS or OS/VS2

- Assembler XF (5741-SC1-03) or (5752-SC1-03)
- Linkage Editor (5741-SC1-04) or (5752-SC1-04)
- Network Control Program/VS (NCP/VS) (5744-BA2) or (ACF/NCP/VS) (5735-XX1)
- Virtual Telecommunications Access Method (VTAM) (5741-SC1-23) or (5752-SC1-23) or (ACF/VTAM) (5735-RC2) or Telecommunications Access Method (ACF/TCAM) (5735-RC3)
- Virtual Sequential Access Method (VSAM) (5741-SC1-DE)
- Host Support for 3600 Finance Communications System (OS/VS) (5744-CA3)
- Subsystem Support Services (SSS) (5741-VS1 or 5752-VS2)
- Access Method Services (5741-SC1-DK) or (5752-SC1-DK)

General Information Manual	GH20-2019

**CAPACITY PLANNING AND OPERATION SEQUENCING
SYSTEM - EXTENDED (CAPOSS E)
OS/VS RELEASE 1.0 (5740-M41)
DOS/VS RELEASE 1.0 and 1.1 (5746-M41)**

PURPOSE

The Capacity Planning and Operation Sequencing System-Extended (CAPOSS-E) is an extension of the Capacity Planning and Operation Sequencing System (CAPOSS), programming RPQ 5734-M41 (OS) and 5736-M41 (DOS). CAPOSS-E is designed to be used whenever a large number of activities must be allocated to limited capacity resources. Some frequently encountered problems when allocating resources include working within tight schedules, having some resources overloaded and some idle, having too much work in process planning and allocating activities at the shop level according to plans and priorities set at a higher level and integrating the capacity planning system into the existing data processing operations. These problems are interrelated, and any capacity planning system must achieve a compromise between the factors to find the optimum allocation of resources. CAPOSS-E brings computer assistance to capacity planning with processing based on a wide variety of factors defined by the user. Some areas of application for CAPOSS-E are in manufacturing (assembly and repair shops), in project planning for motor manufacturing and the aerospace industry, in process industries, including textile production, in the food industry and in public services.

HIGHLIGHTS

- Long-range project scheduling and determination of capacity requirements.
- Controlled release of orders to the shop floor.
- Scheduling controlled by user-specified priorities.
- Short-range simulation of most conditions in a real workshop:
 - Lot splitting with a part of the lot being sent ahead.
 - Grouping of operations, which require the same set up to save set-up time, on a device which processes several operations in parallel, for example a furnace.
 - Loading on alternate work centers or using alternate operations and routings to avoid delays or idle time on resources when a resource is not available.
 - Consideration of time conditions if two or more operations have to be performed within a specific time and involve processing the lot in charges (for example, heating/forging, lacquering/drying and certain chemical processes).
 - One operation requiring two or more facilities simultaneously (for example, a machine plus a special tool).
- Free format order file input and output specified by the user without reassembly.
- Up to nine different reports for order data can be printed with one file processing run.
- Most parameters for controlling the flow of execution are kept on file and changed by the user at execution time. Examples of parameters that can be stored are time ranges for scheduling, substitute values for missing input, priority weighting factors, etc.
- Output of prepunched feedback cards for the Planning System.
- Full compatibility between DOS/VS and OS/VS.
- DL/I data base for resource data.
- DL/I data base for project data with transaction extraction for the Planning System.

DESCRIPTION

The system consists of two parts: The CAPOSS-E Planning System and the CAPOSS-E Data Base System.

CAPOSS-E Planning System:

- The CAPOSS-E Planning System is a continuation of CAPOSS and contains many enhancements. The Planning System schedules activities (projects, orders and operations) for due dates based on priority rules controlled by the user and on capacity limitations. Work is scheduled for individual resources (work centers and machines) with different levels of detail for different time ranges.

In the long range, the program matches the entire forward load against the available capacity and highlights any resulting overloads (or underloads) in time for additional capacity or overtime to be planned.

In the medium range, based on actual capacity, the program controls the release of orders and determines delays of delivery dates caused by capacity bottlenecks.

In the short range (daily, if required), operations are sequenced taking into account recent operation completions and unplanned, urgent orders. The program considers special handling of

operations such as overlapping, splitting, grouping, forced time-dependent relationships and use of alternative resources and routings. The results are presented in work dispatch lists for every resource on the shop floor.

- New and improved general functions permit control of order and project status, facilitate the link to other planning systems (such as material requirements planning), and provide better control of priorities through the order priority analysis program.
- Fewer restrictions in feedback input allow insertion of partial-completion and completion data in the weekly cycle and actual finish dates for special features.
- Improved handling of input errors for order and work center data is provided.
- Better adaptation to virtual storage facilities through dynamic space allocation for work center tables and a revised link structure is provided.
- Customizing is made easier by improved documentation, fewer parameters, and parameters that do not require the reassembly of the whole system.
- Sample load modules are customized for a typical system rather than a minimum system, which includes the 3330 Disk Storage and is more useful for actual production runs.
- Improved documentation include an index for the *Program Reference Manual* and an additional manual, the *Implementation Guide*, for guidance in planning and installing the system.
- New and extended special functions (mainly for process industry applications) allow operation grouping according to user-specified characteristics, operation grouping with time-dependent relationships, alternate possibilities and related facilities, and long-range grouping on a statistical basis.

CAPOSS-E Data Base System:

- The Data Base System provides the user with two DL/I data bases. The project data base includes project and order data, operation data, material data, etc., maintained for the CAPOSS-E Planning System. The resource data base contains the work center file data of the Planning System. This includes references to the operation sequence list for each work center. Both data bases are updated after each scheduling cycle of the Planning System.
- The user may insert into the project data base, by means of user-written programs, feedback from orders in process and input for new orders. Before each scheduling cycle of the Planning System, the Data Base System extracts this data and resubmits it as input to the Planning System.
- The CAPOSS-E Data Base System is the basis for data communication within CAPOSS-E and the link between CAPOSS-E and other DP operations.
- DL/I data base for project data as a basis for online transactions feedback and retrieval is provided.
- DL/I data base for response data including the sequence of work on resources is provided.
- Extraction of feedback and input data from the project data base for use by the Planning System is provided.

CUSTOMER RESPONSIBILITIES

CAPOSS-E Planning System users must:

- Have the appropriate version of either DOS/VS or DOS/VSE or OS/VS successfully installed.
- Have personnel schooled in CAPOSS-E.
- Specify the program parameters to tailor CAPOSS-E to their needs. Since a large variety of substitute and default values exist, the required data is minimal.
- Describe the activities to be scheduled and the work centers performing them. A year of year-day shop calendar must be available to specify dates.

CAPOSS-E Data Base System users must have:

- The CAPOSS-E Planning System successfully installed.
- IMS/VS or DL/I DOS/VS and VSAM successfully installed.

**SPECIFIED OPERATING ENVIRONMENT
HARDWARE REQUIREMENTS (For 5740-M41)**

CAPOSS-E can be compiled, executed and maintained on:

- Any IBM S/370 suited for OS/VS.

PROGRAM PRODUCTS

CAPOSS-E (cont'd)

- An IBM 3031, 3032 or 3033 Processor
- An IBM 4300 Processor (OS/VS1 only).

CAPOSS-E also executes in an OS/VS environment controlled by the IBM Virtual Machine Facility/370 (VM/370).

Main Storage Requirements:

	Virtual address space required	Real address space proposed
CAPOSS-E Planning System	192K*	96K*
CAPOSS-E Data Base System	96K*	32K*

* These figures do not include the partition-related parts of the operating system, VSAM and IMS/VS.

Additional devices required:

- One IBM 2314/2319, 3330, 3340 or 3350 Direct Access Storage Facility.
- One IBM 2540 Card Reader or an equivalent device supported by the operating system.
- One IBM 1403-N1 Printer or an equivalent device supported by the operating system with at least 132 print positions.

HARDWARE REQUIREMENTS (For 5746-M41)

CAPOSS-E can be compiled, executed and maintained on:

- Any IBM S/370 suited to DOS/VS or DOS/VSE.
- An IBM 3031 Processor.
- An IBM 4300 Processor.

CAPOSS-E also executes in a DOS/VS or DOS/VSE environment controlled by the IBM Virtual Machine Facility (VM/370).

Main Storage Requirements:

	Virtual address space required	Real address space proposed
CAPOSS-E Planning System	192K*	96K*
CAPOSS-E Data Base System	96K*	32K*

* These figures do not include the partition related parts of the operating system, VSAM, DL/I DOS/VS or DL/I Entry DOS/VS.

Additional Devices required:

- One IBM 2314, IBM 2319, 3330, 3340, 3350, or 3370 Direct Access Storage Facility.
- One IBM 2540 Card Reader, or an equivalent device supported by the operating system.
- One IBM 1403-N1 Printer, or an equivalent device supported by the operating system, with at least 132 print positions.

SOFTWARE REQUIREMENTS

CAPOSS-E is written in the Assembler language and uses the Macro language facility. It operates under OS/VS1 Release 4 and MVS Release 3.0 or DOS/VS Release 34 or DOS/VSE Release 1.0 and subsequent releases, unless otherwise identified. CAPOSS-E uses the access methods SAM and DAM or SAM and VSAM, and is designed to operate with OS/VS Sort/Merge (5740-SM1) or DOS/VS Sort/Merge (5746-SM2).

In addition, the CAPOSS-E Data Base System (OS/VS) uses IMS/VS Version 1 Data Base System (5740-XX2) Release 1.3 and subsequent releases, unless otherwise identified, BDAM (optional), OSAM, VSAM and BPAM access methods and the access method services of VSAM.

or

The CAPOSS-E Data Base System (DOS/VS) uses DL/I DOS/VS (5746-XX1) Version 1 Release 1 and subsequent releases, unless otherwise identified, DAM (optional), SAM and VSAM access methods and the access method services for VSAM.

Note: CAPOSS-E executes on S/370 Virtual Storage configurations running under OS/VS1 or OS/VS2 or DOS/VS in virtual mode. It is also supported under VM/370 in virtual machine mode.

**S/370 AUTOMATICALLY PROGRAMMED TOOL
 INTERMEDIATE CONTOURING (5740-M52)
 ADVANCED CONTOURING (5740-M53)
 VERSION 1 MODIFICATION LEVEL 3**

PURPOSE

These program products form a modular, upward compatible family of Numerical Control Processors developed for machining operations from point-to-point through the full three-axis contouring.

DESCRIPTION

- APT-IC supports point-to-point and two-dimensional contour machining. A subset of its part-programming language capability is comparable with S/360 AUTOSPOT; however, APT-IC accepts its input in the APT language syntax. APT-IC extends the capabilities of and obsoletes AUTOSPOT with the addition of new processor functions. A subset of the APT-IC part programming language also compares with S/360 AD-APT/AUTOSPOT. APT-IC extends the capabilities of and obsoletes AD-APT/AUTOSPOT with the addition of new processor functions.
- APT-AC contains all of the functions found in APT-IC and extends the machining capability to three-dimensional surface operations. The APT-AC product is the most advanced of the products and is a superset of the internationally accepted S/360 APT. APT-AC extends the capabilities of S/360 APT with the addition of new processor functions.

Each of the program products will process, and has as its input, a numerical control language (part program) written in the APT syntax and will produce a Cutter Location Data Set (CLDATA). The CLDATA is then processed by an installation specified postprocessor.

APT-IC and APT-AC Capabilities in Version 1 Modification Level 2 over the Type II Programs

- Design Aid for Postprocessors (DAPP) - An expanded set of modules to facilitate the implementation of selected postprocessors to process the CLDATA.
- FILE and EDIT Functions - Allows the user to edit the part program files, geometric definition files and machinability files. These functions provide the ability to add, replace, delete and change Library entities. The Library functions, together with the PROC capability, permit a user to establish an N/C parts data base.
- Procedure (PROC) Capability - Enables the definition and subsequent repetitive execution of a series of logical instructions. These logical instructions use the N/C language to define a machining operation or event and the calculation algorithm(s) which support that operation or event. Through use of the Library Exit capability, a user may edit any PROC. When executed, PROCs may be part of the user's input program or retrieved from a library or both. A starter set of machinability and point-to-point PROCs are supplied with the processor.
- UNITS Specification - Allows the user to define the units of measurement (that is, inches, millimeters, etc.) for the part program parameter input.
- PRINT Capabilities - Provide options for printing (or the suppression of printing) user definitions, part program listings, symbol cross-reference lists, etc., via the expanded PRINT/OPTION statement.
- Synonym Print - Expands user defined synonyms to the equivalent vocabulary.
- Referencing - Provides the user with a cross-reference list of the user defined (and designated) symbols).
- Library Capability - Allows for the storage and retrieval of user-defined part programs, part program segments, PROCs, tool definitions, and canonical forms of geometric and non-geometric entities.
- User Input-oriented Diagnostics - Provides more comprehensive diagnostic messages from the translation and calculation phases. In addition, three levels of detailed diagnostic information are provided at user option.
- Diagnostic Output File - Optionally provided in addition to the normal output file. By exercising this option, diagnostic information may be more easily reviewed and appropriate corrections made more rapidly.
- Additional Methods of Definition for Geometric Entities.
- TRACUT (transformation of cutter location data) - A new option allows an additional level of TRACUT with and without the COPY feature.
- Flexible System Structure - Provides greater table capacity.
- Upward compatible part program input from APT-IC to APT-AC.
- Language compatibility with existing S/360 APT part programs, CLDATA and postprocessors. (For exceptions, see Appendix E of the *APT-AC Program Reference Manual* (SH20-1423) or the

APT-IC Program Reference Manual (SH20-1424) - Many current users of S/360 APT may take advantage of APT-IC.)

- Overall performance improvement for processor utilization can be expected over IBM Type II programs. For more detailed performance information, see the section entitled "Environmental Characteristics" either in the *APT-AC General Information Manual* (GH20-1423) or in the *APT-IC General Information Manual* (GH20-1424).
- Modular System Structure - Program functions are programmed into separate, modular, and easy-to-understand subroutines.
- Pagination and Line Length - Allows two line length formats (80 and 133 line lengths) to be supported under user control. Pagination of printed output now occurs - also, user control over the number of lines per page is available.
- Generic Definition Method - Allows the user to vary the syntax of the geometric definition by means of substitution.
- Extended Library Facilities - Allows macros and procs to be part of the canonical library.
- Syntax Option - Allows the user to execute the processor in the Syntax mode; that is, the part program is executed only by the translation section to check for syntax or geometric definition errors.
- VM/370 CMS Environment Supported - Allows the program products to execute in the VM/370 CMS operating system as well as the OS/VS operating environment.

Additional Capabilities for APT-IC and APT-AC in Version 1 Modification Level 3

- Link Feature - Allows user programs to be merged and executed with the N/C processor. N/C processor program functions are available to these programs as calculation or service aids.
- Relational Operators - Operators such as equal, not equal, greater than, etc., can be used to establish whether the relationship between scalar quantities is true or false.
- Logical IF Statements - If the relationship expressed in the logical IF statement is true, an appended APT statement is executed; otherwise, the next APT statement is executed.
- DO Statement - Allows a user-defined group of APT statements to be executed again and again; the extent of the loop and the number of repetitions are stated on the DO statement.
- Subscripted MACRO Names and Complex Macro Variables - Allows an array of macro definitions to be created; each macro is defined and referenced by using the subscript value of the array. A complex macro variable can be assigned an alphanumeric string of characters - when the macro is executed, the character string is translated and the translated value is substituted wherever the macro variable is used in the macro definition.
- Additional methods of definition for geometric entities.
- OMIT Specification in the PRINT or PUNCH Statements - Allows selected entities to be omitted when the ALL mode of printing or punching is specified.
- DATA Definition - Allows the user to define, store and retrieve an array of scalar quantities whose values can be used throughout the part program.
- Computing and Trigonometric Functions Added - Additional angle, distance and trigonometric functions are now available as computing functions.
- CLDATA Postprocessor Commands in Alphameric Format Added - Allows the user to have postprocessor commands output as class 20000 type of data as an option.

Functions Added to APT-AC in Version 1 Modification Level 2 beyond Type II Programs

- Formatted PRINT and PUNCH Capability - Allows the user to specify the format of the printed and punched output via a TEXT definition.
- Textual Synonym Facility - Allows the user to abbreviate commonly used part programming expressions.
- TORUS definition.
- Extended generic geometric definition processing.
- Canonical Extract - Allows the user to extract and use the canonical parameters of a previously defined geometric definition in a computing expression.
- Bell shape cutter specification.

Intermediate and Advanced Contouring (cont'd)

Functions Added to APT-AC in Version 1 Modification Level 3 beyond Type II Programs

- Formatted Alphameric Data for Postprocessor Commands - Allows the data for the PPRINT, PARTNO or INSERT statements to be formatted by conversion of canonical data via a format statement.

Functions Added to APT-IC in Version 1 Modification Level 3 beyond Type II Programs

- Special Program CALL - Allows user-defined special programs to be executed, via the CALL statement, in either the translation or the calculation section of the processor.

Other Functions Implemented in APT-IC (beyond those described above) that are similar to or in addition to those in S/360 AUTOSPOT are:

- Geometric definitions for points, lines, circles, planes, vectors, matrices and patterns. Also provided are new methods of definition for these entities.
- A reference system (REFSYS) capability.
- A synonym capability.
- A PRINT capability.
- Point-to-point motion commands.
- Contour motion commands for up to five geometric surfaces, including a plane part surface.
- A compute capability.
- A COPY-TRACUT capability.
- System options for CLPRNT, NOPOST, etc.
- A polygon pocket capability.
- Postprocessor commands.
- An auxiliary feed rate capability.

Other Functions Implemented in APT-IC that are similar to or in addition to those in S/360 AD-APT/AUTOSPOT are:

- Geometric definitions to include conics, hyperbola, ellipses and tabular cylinders.
- A RESERV and subscripting capability.
- A looping capability (LOOPST-LOOPNS).
- A MACRO capability.
- A READ-PUNCH capability for part programs and canonical forms.
- All motion commands to include new geometric entities and multiple check surface logic (TRANTO).

Other Functions Implemented in APT-AC (beyond those in APT-IC) that are similar to those in S/360 APT are:

- Geometric definitions extended to cones, spheres, quadrics, polyconics and ruled surfaces.
- PSTAN and TLAXIS statements.
- The WCORN-VTLAXS statements for four and five axis swarf cutting.
- Full 3-D and multi-axis machining.

CUSTOMER RESPONSIBILITIES

A customer using these new N/C processors must take the following steps to achieve the available results and performance:

- Train his part programmers in the use of the program products.
- Educate system programmers to correctly use the facilities and features of the processors and to update the program product with distributed maintenance releases.
- Make a special program run at installation time to initialize the necessary processor work files.
- If the machinability feature of the program product is used, supply the machinability data with respect to materials, machine tools and cutters that reflect the manufacturing environment.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The program products operate on any S/370 CPU model (with the Floating Point feature) where the OS/V5 or the VM/370 CMS operating systems can operate.

The processors are distributed on magnetic tape. If no tape devices are available, the user must make arrangements to have N/C Processor reloaded to a direct access device.

The minimum virtual storage partition or region required for APT-IC is 640K bytes; for APT-AC, 768K bytes.

The auxiliary storage requirement for the operating system is the sum of the system residence, work space requirements and input/output stream requirements. The computing system should have available approximately thirteen 3330 cylinders (or its equivalent) for the N/C processor and its execution requirements. (This number will vary with the amount of data referenced and produced by a particular part program.)

The auxiliary storage estimates for the N/C processors are:

	3330 Cylinders or Equivalent	
	APT-IC	APT-AC
Load Modules	6	7
Processor Diagnostics	2	2
Sample Part Program	3	3
Source Data Set	50	65
Object Data Set	12	12

The amount of space for work and Library files is a function of the part program and the number of entities placed in the Library files. If system entities are kept in the data set, the data set must be made permanent. With a small library, the storage requirements should range between three and eight 3330 cylinders (or equivalent).

The estimated number of input cards ranges from 200 cards to 3000 cards.

The cutter location file is estimated to range from one to three cylinders.

SOFTWARE REQUIREMENTS

The Numerical Control Processors are written in the Assembler and FORTRAN IV H-level languages. For maintenance in the OS/V5 environment, it requires the OS/V5 Assembler and Linkage Editor, the FORTRAN IV H-level compiler and their associated libraries, SYS1.MACLIB and SYS1.FORTLIB. For maintenance in the VM/370 CMS environment, the equivalent system functions: Assembler, Compiler and Linkage Editor operating in the CMS environment, are required. The processors are designed to reside on a direct access device in executable form and are scheduled as a job on S/370 under control of either OS/V5 or VM/370 CMS.

The processors make use of the BSAM, QSAM, BPAM and BDAM access methods for I/O and data management facilities.

These program products execute under the current releases of OS/V5, OS/V5 operating under VM/370 and VM/370 CMS.

COMPATIBILITY

The two APT program products represent an upward compatible family of Numerical Control Processors. APT-AC is the most advanced and is a superset of APT-IC.

DOCUMENTATION: (available from Mechanicsburg)

General Information Manuals (GH20-1423 for APT-AC and GH20-1424 for APT-IC).

OS/VS RPG II RELEASE 1 5740-RG1

PURPOSE

OS/VS RPG II is a programming language that can be used to create programs to perform a wide variety of commercial data processing jobs. OS/VS RPG II is based on the DOS/VS RPG II Release 3 compiler and is a powerful, easy-to-use programming language on OS/VS systems. OS/VS RPG II Release 1 runs under the control of OS/VS1 Release 7.0 and OS/VS2 Release 3.8 (MVS) with or without MVS/SP installed.

HIGHLIGHTS

The new licensed program provides:

- RPG II Compiler under OS/VS1 and OS/VS2 (MVS).
- DOS/VS RPG II Source Compatibility for batch functions.
- Autoreport Support.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The OS/VS RPG II compiler is designed to operate on any IBM S/370, 30XX or 43XX System supported by OS/VS1 or OS/VS2 (MVS). A minimum of 128K bytes of virtual storage must be available. For performance reasons, a minimum of 24K bytes of real storage is recommended.

Space must be available for two workfiles (minimum 40K bytes on a DASD) and for listing and punch output. The Autoreport and compilation do not require any OS/VS1 or OS/VS2 (MVS) features beyond the standard support. If the SORT Function of the Autoreport is used, the pertinent OS/VS Sort/Merge is required.

- **At COMPILE TIME:** The following IBM devices are supported:
 - Source input and object output
Any device supported by QSAM for device independent files, fixed length and input.
 - Listing output
Any device supported by QSAM for device independent files, output, control characters and record length equal to or greater than 121.
 - Copy books
Any device supported by BPAM.
- **At OBJECT TIME:** All devices supported by DOS/VS RPG II Release 3 are supported by OS/VS RPG II, with the following exceptions because of environmental differences:

IBM 2560	Multi-function Card Machine
IBM 3504	Card Reader
IBM 5203	Printer
IBM 5424/5	Multi-function Card Units
IBM 1442	Card Read Punch
IBM 2311	Direct Access Storage Device
IBM 3310/3370	Direct Access Storage Device

Note: The IBM 1442 Card Read Punch is only supported by OS/VS1.

The OS/VS RPG II Compiler supports the 3350 and 3375 direct access storage devices with the following restriction:

If the files, used by the OS/VS RPG II object program, are resident on a 3350 or 3375 DASD type, the device field (columns 40-46) of the file description specification has to contain the value of the 3330 DASD type ('DISK 30'): The relevant file characteristics are provided by the DD-card entries. Compiler workfiles can be resident on a 3350 or 3375 DASD without restrictions.

SOFTWARE REQUIREMENTS

The OS/VS RPG II compiler is designed to operate with the OS/VS1 and/or the OS/VS2 (MVS) Operating System and will run on OS/VS1 Release 7.0 and OS/VS2 Release 3.8 (MVS) with or without MVS/SP installed and all future releases unless otherwise stated. To use VSAM files, the appropriate support must be available.

COMPATIBILITY and CONVERSION

- **SOURCE PROGRAMS:** RPG II source programs written for DOS, DOS/VS and VSE are accepted by the OS/VS RPG II Compiler with no or minor changes.
Differences between DOS/VS and OS/VS will be addressed in the following way:
 - Language features required or optional under DOS/VS or VSE but whose statements have no meaning under OS/VS1 or OS/VS2 (MVS) will be ignored (for example, symbolic device on the file specifications).
 - Language features required under DOS/VS or VSE, but specifiable at object time under OS/VS, will be treated such that this specification is possible via job control language statements (for example, blocksize on the file specification).

- **OBJECT PROGRAMS:** All DOS or DOS/VS RPG II programs must be compiled from source code using the OS/VS RPG II compiler and the object code link-edited into a load library.
- **DIFFERENCES BETWEEN OS/VS RPG II and DOS/VS RPG II:** The following devices are not supported under OS/VS:

IBM 2560	Multi-function Card Machine
IBM 3504	Card Reader
IBM 5203	Printer
IBM 5424/5	Multi-function Card Units
IBM 1442	Card Read Punch (see Note)
IBM 2311	Direct Access Storage Device
IBM 3310/3370	Direct Access Storage Device

Note: The IBM 1442 Card Read Punch is only supported by OS/VS1.

The interfaces with CICS/DOS/VS and DL/I DOS/VS and the RPG II Source Entry Facility (RSEF) are not available under OS/VS. Combined files are not supported by OS/VS RPG II. ADDRROUT files can not be created because they are not supported by OS/VS Sort/Merge. Equivalent support can be provided by user written routines or VSAM files. The OS/VS RPG II compiler does not allow PL/I subprogramming. Stacker Select on Input is not possible under OS/VS RPG II.

PERFORMANCE CONSIDERATIONS

The process of adapting the DOS/VS RPG II compiler to OS/VS only minimally impacts the path length of the compiler and object programs. Any differences of compile time and object time between the DOS/VS and OS/VS version are the result of operating system characteristics.

DOCUMENTATION

TERMS and CONDITIONS: See PP Index

5740-SM1 - DATA FACILITY SORT (DFSORT) R6

PURPOSE

The DFSORT (5740-SM1) provides a high-performance disk and tape sort that runs under the OS/VS operating systems: MVS, MVS/XA and VS1. DFSORT also executes under VS/1 or MVS/370 when they are running as guests under VM/SP or VM/370.

SPECIAL SALES INFORMATION

Some prospects for the DFSORT (5740-SM1) are:

- Customers ordering the 3330/3333 mdl 11, the 3340/3344, 3350, 3380 and/or 3375 Direct Access Storage Facilities.
- Customers wanting to take advantage of the new reenterable high performance techniques for sorting applications with direct access intermediate storage.
- Customers wanting to have an in-main-storage sort capability
- Customers wanting to take advantage of dynamic allocation features.
- Customers wanting to use noncontiguous work files.
- Customers wanting to use secondary allocation capabilities for work files.
- Customers wanting to dynamically invoke merge only applications.
- Customers wanting to use alternative collating sequence capabilities.
- Customers wanting to preserve the order, from input to output, of records with equal control fields.
- Customers wanting to handle records with binary or character control fields with a length of more than 256 bytes.
- COBOL and PL/I users wanting to take better advantage of sort/merge features (such as alternative collating sequence).

HIGHLIGHTS

DFSORT Release 6 provides the user with:

- Significant performance improvements over OS/VS Sort/Merge Release 5.0 for most sorting applications:
 - Improved fixed-length record sort performance.
 - Improved variable-blocked spanned record (VBS) sort performance.
 - Sort performance optimized to larger region sizes.
 - Improved merge performance for both fixed- and variable-length records.
 - Removal of most restrictions that previously caused reversion to the older sorting techniques (Peerage or Vale).
 - Reductions in CPU seconds and EXCP counts when executing typical sort and/or merge applications.
- Usability and productivity enhancements including incorporation of some functions found in DOS/VS-VM/SP Sort/Merge Version 2 (5746-SM2).
 - INCLUDE/OMIT
 - INREC/OUTREC
 - SUM
- Improved message handling.
- New statistics messages.
- Improved installation/execution options.
- Extended parameter list support.
- Extended architecture (MVS/XA) user support, such as allowing user data and user exits to reside in virtual storage above 16 megabytes.

All device support previously provided via PTF to OS/VS Sort/Merge Release 5.0 has been incorporated in DFSORT Release 6.

DESCRIPTION

Improved Performance: Release 6.0 has been enhanced to provide the potential for significant improvements in CPU time and EXCP performance. A new sorting technique for use with fixed-length records may give users significant improvements for many sort applications. In addition, an improved merge-only technique should provide users with significant performance improvements for all supported file types.

Users of the 3380 should also realize substantial performance gains and improved throughput when executing sort/merge applications under DFSORT Release 6. More performance detail is contained in the "Technical Information" section below.

Usability and Productivity Enhancements: Several key control statements available with the current release of DOS/VS-VM/SP

Sort/Merge Version 2 (5746-SM2) have been added to DFSORT Release 6.0 to provide the OS/VS user with enhanced productivity and/or usability when compared to OS/VS Sort/Merge Release 5.0.

- **INCLUDE/OMIT** - Allows the user to select or omit certain records, based on data field contents, prior to execution of a sort or merge. Use of this function may improve sort performance by only sorting or merging records which are pertinent to the application.
- **INREC/OUTREC** - Provides the option of reformatting input records either before sorting or at output.
- **SUM** - Allows user-designated fields in records with equal control fields to be added together and placed in a single record containing the summarized data.

Support has also been enhanced with the availability of DFSORT Release 6 to remove restrictions that previously precluded utilization of the higher performing Blockset sorting technique. Among the enhancements are support for:

- BSAM input and output data sets.
- All control field formats.
- All statements in the SORTCNTL data set.

Further details on the specification/override of DFSORT options are available in *DFSORT Application Programming: Guide* (SC33-4035).

Message Handling: Message handling has been improved by:

- A macro (ICEMSGS) that allows an installation programmer to modify message text to conform to customer-specified requirements.
- Use of a single DD statement to request printing of diagnostic messages for all sort techniques.
- User-specified message/control statement printing hierarchy.
- Option-in-effect messages.

New Statistics Messages: Release 6.0 provides additional, more accurate statistics about sort execution. New messages will provide data on:

- Number of bytes sorted.
- Whether SORTWK files have been reallocated on cylinder boundaries.
- EXCP counts for SORTIN, SORTOUT, SORTWK.

More accurate information about intermediate storage space usage will also be provided.

Improved Installation/Execution Options: Options have been added to Release 6.0 to improve command utilization and ease of installation. Several of the key options include:

- Allowing specification of separate installation option defaults for JCL and dynamic invocation of DFSORT through changes to the ICEMAC macro.
- Allowing users the option to specify DFSORT STIMER macro usage.
- Allowing comment statements in SORTCNTL and SYSIN data sets.
- Allowing an invoking program to specify most option changes without recompilation.

Release 6.0 also provides for:

- Control card continuation in columns 2-71.
- Dynamic secondary allocation for SORTOUT.
- Option name consistency across source (ICEMAC installation macro, EXEC parm statement, and SYSIN, SORTCNTL and parameter list control statements).

Extended Parameter List: A superset of 24-bit parameter list functions is provided by the Release 6.0 extended parameter list. Highlights of this support include:

- All supported control statements may be passed to DFSORT.
- Callers using 31-bit addressing may pass 31-bit addresses to DFSORT and specify the addressing mode to be used when DFSORT enters a caller-loaded exit.

Extended Architecture User Support: In addition to the functions provided by the Extended Parameter List, DFSORT provides the following support to an MVS/XA user:

- Allows programs dynamically invoking DFSORT and/or user exits called by standard techniques (Blockset, Peerage, or Vale) to reside in virtual storage above or below 16 megabytes.
 - Execution may be done using 24-bit or 31-bit addressing.
 - Data residing in virtual storage above or below 16 megabytes may be passed to DFSORT.

DFSORT R6 (cont'd)

Features Retained from Earlier Releases:

The major features of OS/VS Sort/Merge Release 5 have been retained in DFSORT Release 6, including:

- VLR- BLOCKSET support
- OPTION control statement
- Suppression of record count checking
- Alternate collating sequence for character (CH) control fields
- SORT-related SMF statistics
- All device support previously provided to DFSORT Release 5.0

Other Features: OS/VS Sort/Merge (5740-SM1) includes the functions, facilities and options of the OS Sort/Merge (5734-SM1), among which are:

- Support of the 2314, 2319, 3330 and 3333 Direct Access Storage Facilities and the 2400- and 3400-series tape devices as intermediate storage in sorting applications.
- Ability to specify any units supported by QSAM as input and output devices.
- Ability to be dynamically invoked by COBOL, PL/I and Assembler language programs.
- Ability to specify as many as 64 control fields.
- Ability to utilize as many as 32 tape units as intermediate storage.
- Ability to concatenate input data sets on unlike devices.
- Ability to take checkpoints in both sort and merge applications.

CUSTOMER RESPONSIBILITIES

Installation of the OS/VS Sort/Merge program product is a customer responsibility. The user must install a sort program provided SVC, if using an operating system other than MVS.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

DFSORT is designed to operate with:

- All IBM processors supported by VS1, MVS or MVS/XA.
- Any IBM device supported by OS/VS for program residence.
- Any device used by QSAM for input and output.

As intermediate storage:

- In direct access applications - At least one IBM direct access storage device (3330/3333, 3340/3344, 3350, 3375, 3380 or 3850). It may be the same device as is used for the system residence device.
- In tape applications - At least three IBM magnetic tape units (2400- or 3400-series).

A minimum of 88K bytes virtual storage is required for the DFSORT product. (If VSAM data sets are used, the requirements will be greater.) Not all non-VSAM applications can run in as little as 88K bytes of storage; for example, restrictions apply to program residence, user exits, and input/output block sizes. For optimal DFSORT performance, 256K bytes to 1M bytes of virtual storage should be allocated, depending on file size. Further information on storage size definition may be found in *DFSORT Installation* (SC33-4034) and the *DFSORT Application Programming: Guide* (SC33-4035).

SOFTWARE REQUIREMENTS

DFSORT is MVS/370 operating system supported releases otherwise announced. DFSORT also executes under VS/1 or MVS/370 when they are running as guests under VM/SP or VM/370.

For operation under MVS, the IBM 3375 or 3380 products require:

- MVS/System Product-JES2 (5740-XYS) or MVS/System Product-JES3 (5740-XYN) and either of the following:
 - Data Facility Device Support (5740-AM7),
 - MVS/370 Data Facility Product (5665-295).

For MVS/XA operation, the IBM 3375 or 3380 products require:

- MVS/System Product-JES2 Version 2 (5740-XC6) or MVS/System Product-JES3 Version 2 Release 1 (5665-291).
- MVS/XA Data Facility Product (5665-284).

For VS1, the IBM 3375 or 3380 require:

- OS/VS1 Release 7.0.
- OS/VS1 Basic Programming Extensions (5662-257) Release 2.0 or later for 3375 support.

- OS/VS1 Basic Programming Extensions (5662-257) Release 4.0 or later for 3380 support.
- Data Facility Device Support (5740-AM6) Release 1.2 or later.

Either System Modification Program (SMP) Release 4 or System Modification Program Extended (SMP/E, 5668-949) is required for installation and subsequent maintenance of DFSORT.

COMPATIBILITY

With the exceptions noted below, user programs that use published external interfaces and which execute with OS/VS Sort/Merge Release 5.0 will perform the same function under the operating systems supported by DFSORT Release 6.

In order to enhance overall DFSORT performance, dynamic linking of user exits will no longer be allowed. Some users may have to execute a one-time job to linkedit the exits into a load library, altering their MODS cards to specify this library.

Additional compatibility considerations:

- DFSORT Release 6 will recognize but ignore Phase 2 user exits (E21, F25, F27, F28, E29).
- Temporary SORTWK data sets will be reallocated in cylinders to achieve better performance.
- If more than 32 SORTWK data sets are specified, only the first 32 will be used.

PERFORMANCE CONSIDERATIONS

Through incorporation of the functions found in the OS/VS Sort/Merge Performance Improvements Program Offering (5796-PQW), as well as additional functional enhancements, DFSORT Release 6 provides significant performance improvements over OS/VS Sort Merge Release 5.0.

- Improved fixed-length record sort performance.
- Improved variable-blocked spanned record (VBS) sort performance.
- Sort performance optimized to larger region sizes.
- Improved merge performance for both fixed- and variable-length records.
- Removal of most restrictions that previously caused reversion to the older sorting techniques (Peering or Vale).

DFSORT Release 6 continues to exploit the features of the new high-performance 3380 Direct Access Storage, resulting in improved elapsed time performance and faster execution of most sort applications when compared with the 3350.

A set of test cases, intended to be representative of many fixed-length record sort program user environments, was used to evaluate the performance improvement of DFSORT Release 6 as compared to OS/VS Sort/Merge Release 5.0.

The test cases were measured on a 3081 Processor having 16 megabytes of storage, with an MVS/XA system installed. SORTIN, SORTOUT, and SORTWK were on 3380 Direct Access Storage devices. The measurements were made using fixed-length records of 80 to 1,000 bytes and file sizes of 3M bytes to 150M bytes. Two cases were measured: One with composite results for region sizes of 128K, 256K, 512K and 768K; the other with improved results in a 1M region. The following performance improvements are provided by DFSORT Release 6 over OS/VS Sort/Merge Release 5.0:

- Case 1: 128K, 256K, 512K and 768K regions:
 - 14% average reduction in CPU seconds.
- Case 2: 1M region:
 - 40% average reduction in CPU seconds.
 - 75% average reduction in EXCP counts.

The performance improvements quoted above are the percent reductions in the sum of the times or counts of all of the test cases measured.

The actual improvements experienced by any specific user or for any specific file are dependent on many factors, including record length, file size and region size.

Elapsed time results for sorting in a multitasking environment are application profile- and workload-dependent, therefore the results may differ from user to user.

IBM does not represent or warrant that users will experience the same changes in performance as have been measured in the above examples.

PROGRAM PRODUCTS

**DIRECT ACCESS STORAGE DUMP RESTORE
DASDR (5740-UT1)**

DESCRIPTION

DASDR provides high speed dump and restore of data on direct-access devices by volume, selected data set, or track. Data can be dumped from and restored to the 3330/3333 mdls 1 and 11, 3340/3344 (except under OS/MVT), and the 3350 devices. †

The DASDR program product is composed of two programs: A system utility program (DRWDASDR) and a standalone program (DRUDMPRS).

DRWDASDR HIGHLIGHTS

- Selective DUMP operations to tape by set name (for most SAM, PAM, DAM and ISAM data sets) or by track.
- Selective RESTORE operations by data set name or by track from a full-volume dump tape or a selective data set dump tape created by the DASDR program product.
- Dynamic alternate track assignment during the RESTORE operation.
- Read multiple count, key, and data (full-track-read) command usage by the DUMP operation.
- Operator override on many data check errors.
- Support for an installation-supplied password checking routine.
- A new tape format which supports the selective data set DUMP or RESTORE operation, full-track-read command, and the handling of data checks.

The complete contents of a direct-access volume can be dumped to another compatible direct-access device, to a tape volume, or to a system output device. A selected data set can be dumped to a tape volume and restored from that volume. From a full-volume dump tape, either a selected data set, selected tracks, or all of the dumped data can be restored to a supported direct access device.

If a data check is encountered on DASD during the DUMP operation, the operator is given the option of bypassing the error and continuing the operation or terminating the job. During a RESTORE operation, if a data check is encountered on a track, an alternate track can be dynamically assigned at the operator's option. If a data check is encountered on tape during the RESTORE operation, the operator is given the option of bypassing the track in error and continuing or terminating the job.

DRWDASDR will utilize the full-track-read command, if available, which allows an entire track of data to be read in one disk revolution.

A new tape format has been implemented which supports the use of the full track read, selective data set DUMP or RESTORE operation, selective RESTORE by track, and the handling of data checks. Optionally, a tape format that is compatible with IEHDASDR can be utilized, which allows dump tapes to be created that can be restored by IEHDASDR and IBCDMPRS as well as by DRWDASDR, and which allows tapes created by IEHDASDR and IBCDMPRS to be restored by DRWDASDR.

SECURITY

DRWDASDR will support an optional installation-supplied password checking routine, which is given control when password protected data sets or VSAM data spaces are encountered. The installation routine returns codes which control further processing of the DUMP/RESTORE operations.

DASDR operating under MVS, will utilize capabilities of the Restore Access Control Facility (RACF, 5740-XXH, Release 1) if available. DASDR will also operate in a RACF Release 2 environment, but will only support RACF Release 1 function.

DRUDMPRS HIGHLIGHTS

Dumps and restores full volume direct-access devices, operating as a standalone utility.

Although not providing all of the features available with the system utility program (DRWDASDR), DRUDMPRS is provided to dump and restore full volume user data from and to the supported direct-access devices. A full direct-access volume can be dumped to tape volumes or other supported compatible direct-access devices in the IEHDASDR compatible format only. The data contents of these direct-access volumes can be restored from dump tapes created by IEHDASDR compatible format only. The data contents of these direct-access volumes can be restored from dump tapes created by IEHDASDR, IBCDMPRS and DRWDASDR (in either the IEHDASDR-compatible tape format or the new DASDR tape format) to a direct-access volume that resides on a compatible device.

Performance: DRWDASDR performance will be improved over that currently available with IEHDASDR by:

- Increased overlapping of I/O operations.
- Elimination of the channel program record for each track image record written to tape.

- Use of full-track-read command (if available).

Additionally, with the capability of dumping and restoring data selectively by data set name, operational efficiency may be improved by removing the necessity to perform the full-volume DUMP or RESTORE operation.

Customer Benefits

- Reduction in machine time required for dump/restore functions.
- Operational flexibility provided by selected data set dump/restore.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Storage Requirements: Minimum storage size required to execute DRWDASDR is 256K bytes.

SOFTWARE REQUIREMENTS

This program product will operate with OS/VS Release 5 and 6, SVS Release 1.7, MVS Release 3.7 and OS/MVT Release 21.8. This program product will also run under VM/370 Release 3 using one of the previously mentioned systems.

Note: The 3340/44 is not supported by OS/MVT.

Prerequisites: SVS Release 1.7 will require the 3350/3344 ICR (5742-017) if these devices are to be used.

DASDR is not supported by OS/MVT Release 21.8 when operating on a S/360.

OS/MVT Release 21.8 will require the 3350/3330 mdl 11 PRPQ 5799-ARG (EG4653) if these devices or the full-track-read command are to be used.

The full-track-read feature is available on the 3350 and 3344 direct-access devices. The full-track-read feature can be used by 3330 and 3340 devices attached to a 3830 Control Unit mdl 2, or a S/370 mdl 145, 148, 155II, 158, 165II or 168 and 3345 (mdls 3, 4 and 5) ISC, configured for 3350. The 3340 can also use the full track-read feature when attached to a 3830 or ISC configured for a 3344 or a 135 IFA configured for a 3344.

A type 4 user SVC (or a type 3 under MVS) will be required by DRWDASDR. Also, DRWDASDR must be an authorized program for VS1 and VS2.

DOCUMENTATION (available from Mechanicsburg)

DASDR Specification (GH20-9116) ... OS/MVT & OS/VS DASDR User's Guide (SH20-9111).

TERMS and CONDITIONS: See PP Index

Note: Distribution of DASDR is via tape. Therefore, access to at least one 2400/3400 Magnetic Tape Unit is required for installation.

† Note that support of these devices does not include their use as staging or virtual volume devices under control of a 3850.

DATA FACILITY DATA SET SERVICES RELEASE 2 (5740-UT3)

PURPOSE

The Data Facility Data Set Services (DFDSS) licensed program assists OS/VS users with protection and recovery of information on direct access storage devices, including the new 3380 and 3375 and 3850 Mass Storage System (MSS) virtual volumes and 3880 mdl 13, by providing full volume, partial volume and data set dump and restore facilities on a system basis and full and partial volume restore on a stand-alone basis.

HIGHLIGHTS

New with Release 2:

- Integrated Catalog Facility VSAM data set support for MVS.
- Usability enhancements.

Previously announced highlights of DFDSS are as follows:

- Multiple data set dump and restore.
- Volume defragmentation, with a minimum of data movement, to consolidate free space on the volume.
- Full or partial volume dump with the ability to restore some or all of the dumped data.
- Optional data set deletion after dumping.
- Devices supported include:
 - 2305-2
 - 3330 mdls 1 and 11
 - 3330V (MSS virtual volumes)
 - 3340/44
 - 3350
 - 3375
 - 3380
 - 3880 mdl 13
- Data Set Filter
- Stand-alone Restore
- User Installation Exit
- Enhanced performance capabilities.
 - User selectable performance options which allow the allocation of system resources to vary the performance of Data Facility Data Set Services.
 - Optional write check on restore.
 - Default option which dumps only the used portion of SAM and PAM allocated space.

DESCRIPTION

Data Facility Data Set Services is a utility with the following functions new for Release 2:

Integrated Catalog Facility VSAM data set support for MVS

- Dump and Restore. DFDSS supports Integrated Catalog Facility VSAM data sets at the cluster level. This means that all components belonging to a cluster on a single volume will be processed during dump and restore. However, DFDSS does not catalog or uncatalog any data sets, nor does it support key-range data sets or the DELETE function. Individual Integrated Catalog Facility VSAM data sets can now be restored from a full volume dump created by DFDSS Release 2.
- DEFRAG now supports Integrated Catalog Facility VSAM data sets.
- Integrated Catalog Facility data sets are supported by the usability enhancements in this release with the exception of the enhancements to RENAME.

Usability Enhancements

- A new WAIT parameter permits DFDSS to wait a specified time, then retry if a system resource needed for processing is unavailable.
- A new TOLERATE(ENQFAILURE) parameter permits DFDSS to dump, restore and print data sets without gaining control of the resource after retry of ENQ has failed.
