- One IBM 4245 Printer mdl 1, or an equivalent device supported by the operating system, with at least 132 print positions.
- One IBM tape unit, such as IBM 2400 or IBM 3400 or equivalent.
- One IBM 3277 Display Station mdl 2 or equivalent with data entry keyboard.

SOFTWARE REQUIREMENTS

IFS 4 is written in PL/I and Assembler language and is supplied in the form of object code and source code. It operates under OS/VS1 Release 7.0, program number 5741-VS1, MVS/SP-JES2, program number 5740-XY5, Release 1.0 or MVS/SP-JES3, program number 5740-XYN, Release 1.0 or subsequent releases, unless otherwise specified.

To recompile IFS 4 OS/VS, the OS PL/I Optimizing Compiler, program number 5734-PL1, and the OS/VS Assembler are required.

To link-edit and execute IFS 4 OS/VS the OS/VS PL/I Resident Library, program number 5734-LM4, the OS/VS PL/I Transient Library, program number 5734-LM5, and the OS/VS Sort/Merge, program number 5740-SM1, are required. IFS 4 uses the data management and access methods VSAM and SAM.

The online communication facility CICS/VS, program number 5740-XX1, Version 1 Release 5 or a subsequent release (unless otherwise indicated) is required.

For data base management, IMS/VS, program number 5740-XX2, Version 1 Release 1.6 or a subsequent release is required unless otherwise stated.

PERFORMANCE CONSIDERATIONS

The performance of the system can be influenced by VSAM specifications such as the buffer space, the control interval size and the record size. When the data base is distributed over more than one disk drive, or when the index data base resides on a separate disk drive or when additional real storage is allocated, this can result in an increase in performance.

RPOs ACCEPTED: No

PROGRAM PRODUCTS

**5668-971 - NLDM R1 and R2
NETWORK LOGICAL DATA MANAGER
RELEASES 1 and 2 for OS/VS2 MVS**

PURPOSE

Network Logical Data Manager (NLDM), a Network Communications Control Facility (NCCF) application program, develops and maintains an image of the active network configuration. The data describing the active configuration is used directly to aid session-oriented problem determination. NLDM is an interactive network management product which, because it can capture session data prior to an incident, is useful in identifying and isolating hardware and software problems.

NLDM Release 2, because of its interactions with ACF/VTAM Version 2 Release 2 and ACF/NCP Version 3, can present complete configuration data for the active network. NLDM R2 is effective in single and multiple-domain networks or in interconnected SNA networks

HIGHLIGHTS

- NLDM is an online, interactive facility which collects selected access method data and Network Control Program data and makes them available for display at an NCCF operator station.
- The collected data include recent path information unit headers from the access methods, PIU sequence numbers from NCP, and configuration information for the session including the primary and secondary logical unit names and addresses and the route description.
- The operator can commence NLDM R2 operations on an active network. With Release 2, synchronizing NLDM activity with network and session initialization is no longer required.
- The collected data is displayed in full-screen mode, utilizing seven-color support for highlighting and user prompting. NLDM also can be used with a monochrome display.
- NLDM provides useful data for doing problem determination when software problems occur, which otherwise may not produce problem-related information.
- The operator can select the session(s) to be traced.
- Data is maintained in virtual storage for active sessions. When the session is terminated, the data is transferred to a data base for later reference.
- NLDM Release 1 provides information for local or remote resources in the same SNA domain or in cross-domain sessions.
- NLDM Release 2 provides information for local or remote resources in the same SNA domain, in cross-domain sessions, or in cross-network sessions (i.e., within an SNA Network Interconnection environment).
- NLDM R2 can, automatically or under operator request, test the connectivity of a session up to the boundary node.
- In Release 2, the NLDMs, at the multiple hosts involved in a session, automatically cooperate in preparing a session description, for example, when presenting the configuration or trace data.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

NLDM Release 1 and NLDM Release 2 are designed to run in a virtual storage environment in any IBM system configuration that supports MVS as specified in the "Software Requirements". The estimated amount of virtual storage required by NLDM R1 is 280,000 bytes and by NLDM R2 is 330,000 bytes, plus (for both releases) a variable amount of storage depending upon the number of active sessions being monitored. NLDM executes in the same address space as NCCF. For additional information about storage requirements for NLDM:

- For Release 1, see the *NLDM General Information Manual* (GC30-8081).
- For Release 2, see the *Network Program Products Planning Manual* (SC27-0658).

Any terminal supported by NCCF as a communications network operator station can be used to operate NLDM. NLDM can use seven-color displays when appropriate.

SOFTWARE REQUIREMENTS

NLDM Release 1 and NCCF Release 2 (with the required PTF) operate with MVS/370*, and for reasons of compatibility and coexistence with MVS Extended Architecture (MVS/XA) in 24-bit addressing mode. The access method and NCP levels supported are:

- ACF/VTAM Version 1 Release 3** (with the required PTF)
- ACF/VTAM Version 2 (with the required PTF)
- ACF/TCAM Version 2 Release 4
- ACF/NCP Version 2 (IBM 3705)
- ACF/NCP Version 2 (IBM 3725)

NLDM Release 2 and the prerequisite NCCF Version 2 operate with MVS/370* and MVS/XA (compatibility mode). The access method and NCP levels necessary for full function of NLDM Release 2 are:

- ACF/VTAM Version 2 Release 2, and
- ACF/NCP Version 3 (for the IBM 3705 and 3725).

Other access methods and NCP levels are:

- ACF/VTAM Version 1 Release 3** (with the appropriate PTF) in single-domain networks
- ACF/VTAM Version 1 Release 1 (with the appropriate PTF)
- ACF/TCAM Version 2 Release 4 - in single-domain networks
- ACF/NCP Version 2 (IBM 3705)
- ACF/NCP Version 2 (IBM 3725)

* MVS/370 is a generic term used to refer to MVS operating systems which operate with S/370 architecture, i.e.:

- OS/VS2 (MVS) Release 3.8
- OS/VS2 (MVS) Release 3.8 with the MVS/SE program product
- OS/VS2 (MVS) Release 3.8 with the MVS/SP V1 program product

**ACF/VTAM Version 1 Release 3 is supported in MVS/370 mode only.

DATA SECURITY

NLDM uses the data security, auditability and control facilities of NCCF.

LICENSED PROGRAM MATERIAL AVAILABILITY

Restricted Material: No. This licensed program will be available without source licensed program materials. It will be available with object code.

QUERY MANAGEMENT FACILITY (QMF) RELEASE 1 5668-972

PURPOSE

Query Management Facility (QMF) is a program product designed to provide interactive data base facilities to users with little or no data processing background. It can also be highly useful to the data processing professional as a high productivity programming tool for use in application development and prototyping. Query Management Facility operates against IBM Database 2 (DB2) data in the MVS/XA and MVS/370 environments. Query Management Facility also operates against SQL/DS R2 data in the VM/SP environment. Query Management Facility also utilizes companion IBM program products: Interactive System Productivity Facility (ISPF) Dialog Manager and Graphical Data Display Manager (GDDM).

Query Management Facility provides an interface, designed principally for use by non-programmers, to enable users to access a relational (tabular) data base. The following are some specific characteristics:

- Both structured query language (SQL) style and query-by-example (QBE) style query and data manipulation capabilities.
- Data definition functions through the SQL language.
- An easy-to-specify interactive reports definition and generation capability.
- A simple set of commands that allows handling of queries, report forms, and procedures.

Users of QMF can produce meaningful results utilizing only a portion of the SQL or QBE language facility and/or QMF commands. To facilitate the use of QMF, a set of HELP panels and sample SQL queries are provided.

The functions available within QMF have been designed to support typical user tasks so that the performance of those tasks is easy for the non-data processing professional end user. At the same time, Query Management Facility offers flexibility regarding the order in which the steps of such tasks are performed.

Early Support Program: To assist IBM in introducing the significant new Query Management Facility product, QMF is currently being tested in a number of customer and IBM locations. Early experience with a limited number of users will assist IBM in evaluating the product in varied environments and in developing additional support material prior to general availability.

An Early Support Program (ESP) is being planned for QMF. This ESP will be conducted by the NAD Dallas Systems Center; nominations will be through the NAD regions and NMD areas.

HIGHLIGHTS

Typical functions which an end user might perform include:

- Ad-hoc query in SQL or QBE languages.
- Report preparation.
- Preparation of data for graphic presentation
- Definition and execution of a procedure consisting of a series of query/report functions.
- Definition of a data extract request in an interactive mode by dialogs which can invoke Data Extract (DXT), a companion IBM program product.

DESCRIPTION

Ad-Hoc Query - Either SQL or QBE may be used to retrieve selected information that is formatted and displayed at the user's terminal. Scrolling commands may be used to browse through the data. The user may then display the original query and modify it in order to obtain different results. Subsequently, the user may save the data, print it, save the request that produced the data, or simply go on to another task.

Report Preparation - The results of executing a query will be displayed to the user as a simple table. A form is generated which describes the default format for presentation of the result. Alternatively, a user-defined, pre-stored form may be specified at the time the query is run. The user can then describe the nature of the report (headings and other text, format and summarization required) by filling and changing the values in the form. With only a few specifications, the user can produce a variety of different report types including listing, summary or across-style reports. Once the form is satisfactory, the user merely requests the selected data be redisplayed. QMF will format and display the report at the user's terminal. Since preparing a report can often be an iterative process, QMF makes it easy for a user to move from one step to another. That is, display the report format, and redisplay the data using the updated form. These commonly performed command functions are available via program function (PF) keys as well. Once the user is satisfied with the report, he or she can print the report and also save the report description form.

Graphic Presentation Preparation - A sample program is provided with QMF which can invoke the Interactive Chart Utility (ICU) to present the data prepared using QMF. The ICU is a facility provided with the

Presentation Graphics feature of the licensed program GDDM (5748-XXH).

Procedures - For periodic reports, users can create a 'procedure' definition that allows the execution of a series of commands which can be invoked through a single command. The execution of both SQL- and QBE-style queries can be included in a single procedure.

Because QMF takes advantage of features of ISPF and GDDM, the creation and alteration of queries and procedures is easy for the user. As examples, corrections and insertions are simply typed over incorrect information or into blank spaces. Deletions can be made by simply blanking out the unnecessary data. Also, prompts and HELP panels are provided to guide the user as he or she performs a task.

Interactive DXT Requests - As a convenience, special ISPF dialogs are available in support of DXT. These dialogs are also part of the DXT program product (5668-973). This facility provides an easy, interactive way to specify extract requests for DXT. The user of these special dialogs is intended to be a technical person with data base knowledge sufficient to formulate an IMS/V5 V1 DL/I, virtual storage access method (VSAM), or physical sequential access method (SAM) request. These dialogs are the only part of QMF which requires some DP knowledge. QMF has otherwise been developed for the non-programmer.

The dialogs consist of ISPF menu-driven screen facilities which guide a user through the process of creating an extract request from a terminal. If DXT is not installed on the system where the extract request was constructed, the request can be sent to a system which contains DXT, and the requested data routed to its destination, via the appropriate operating system telecommunications facilities.

CUSTOMER RESPONSIBILITIES

A customer installing Query Management Facility must:

- Have installed the prerequisite products.
- Assure that appropriate MVS/XA, MVS/370, VM/SP and S/370 training (including terminal and direct access storage education) be given to system analysts, application programmers, system programmers, and system operators.
- Have MVS/XA, MVS/370 or VM/SP successfully installed.
- Have personnel educated in Query Management Facility.
- Provide adequate protection against the accidental loss or misuse of his data.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Query Management Facility will operate on any IBM Processor supported by MVS/SP V2 R1 and MVS/SP V1 R3, or VM System Product (VM/SP) Release 3 (5664-167). For the IBM 3033 Processor running MVS, it is recommended that hardware cross-memory extension feature (#6850) be used. The processors must have sufficient real storage to satisfy the combined requirements of IBM Database 2, MVS/XA or MVS/370, or SQL/Data System (SQL/DS) Release 2 and VM/SP, Query Management Facility, appropriate Data Facility Product, appropriate access methods, batch requirements, and other customer-required applications. The configuration must include sufficient I/O devices to support the requirements for system output, system residence, and system data sets. Sufficient direct access storage must be available to satisfy the user information storage requirements, and may consist of any direct access facility supported by the system configuration and the programming system.

DASD: Query Management Facility is independent of DASD device type. Any disk devices supported by either MVS/XA Data Facility Product or MVS/370 Data Facility Product in an MVS system, or by VM/SP Release 3 in a VM system, may be used. Query Management Facility uses disk devices for the following data sets:

- Spill file data set which holds the data for the report which a user is viewing (used only when the data does not fit in virtual storage)
- Data base data sets (managed by IBM Database 2 or SQL/Data System (SQL/DS) Release 2)
- Import/export data sets which hold queries, forms, and procedures which can be maintained outside of QMF control or which can be transferred between different QMF users (optionally, tape)

Tape: Query Management Facility is also independent of tape device type. Any tape device supported by either MVS/XA Data Facility Product or MVS/370 Data Facility Product in an MVS system, or by VM/SP Release 3 in a VM system, may be used. Query Management Facility uses tape devices for the following data sets:

- The print data set, and the debug (trace) data set

Data Communications Devices: Query Management Facility supports terminals supported by TSO, ISPF and GDDM in the MVS/SP environment, and by VM/SP, ISPF and GDDM in the VM/SP

PROGRAM PRODUCTS

QMF R1 (cont'd)

environment. See the appropriate TSO, VM/SP, ISPF, or GDDM pages.

SOFTWARE REQUIREMENTS

Operating System and Support Programs: In the MVS/TSO Environment, programs required are as follows:

- IBM Database 2 Release 1 (5740-XYR) and its prerequisites as stated for either the MVS/XA or MVS/370 environment
- Interactive System Productivity Facility, Release 1.1 (5668-960)
- Interactive System Productivity Facility/Program Development Facility-MVS, Release 1.1 (5665-268) (if DXT Dialogs are planned to be used)
- Graphical Data Display Manager, Release 3 (5748-XXH)
- System Modification Program, (SMP) Release 4

or alternatively,

In the VM/SP environment:

- SQL/Data System (SQL/DS) Release 2 (5748-XXJ) and its prerequisites
- Interactive System Productivity Facility Release 1.1 (5668-960)
- Interactive System Productivity Facility/Program Development Facility-VM, Release 1.1 (5664-172) (if DXT Dialogs are planned to be used)
- Graphical Data Display Manager Release 3 (5748-XXH)

COMPATIBILITY/CONVERSION

Query Management Facility, Data Extract, IBM Database 2, SQL/Data System (SQL/DS) Release 2 and Information Management System/Virtual Storage Version 1 are complementary products designed to provide solutions to end-user information needs. Data managed by IBM Database 2 or SQL/Data System (SQL/DS) Release 2 is available to end-users through the Query Management Facility (subject to appropriate authorization). Data managed by IMS/VS V1 DL/I or on VSAM or SAM files may first be extracted by the Data Extract program product and loaded into IBM Database 2 or SQL/Data System (SQL/DS) Release 2 tables. This 'snapshot' data is then accessible to end users using the Query Management Facility.

Virtual Storage Considerations: The design of the support for the MVS/XA 31-bit virtual storage addressing capability will allow most QMF modules to be resident in the extended pageable link pack area (EPLPA) or pageable link pack area (PLPA). In the MVS/XA environment, each Query Management Facility user requires at least a 2M byte region. If Query Management Facility modules are placed in the MVS/XA EPLPA/PLPA, up to 680K bytes may be located in the MVS/XA EPLPA and 20K bytes may be located in the MVS/XA PLPA; however, the size of the region is reduced accordingly. In the MVS/370 environment, each Query Management Facility user requires at least a 2M byte region. If Query Management Facility modules are placed in the MVS/370 pageable link pack area (PLPA), up to 700K bytes may be located in the MVS/370 PLPA; however, the size of the region is reduced accordingly.

In the VM/SP environment, each Query Management Facility user requires at least a 1.5M byte virtual machine. 700K bytes of storage is required in the discontinuous shared segment (DCSS).

DATA SECURITY and AUDITABILITY

In a QMF installation, facilities which will allow customer installation management to control its usage and impact are provided by the relational data base manager. Additionally, QMF itself controls the authorization for stored queries, forms, and procedures. Through the facilities of the data base manager, QMF users can specify security authorization for access to their data. Multiple levels of authorization make it possible to place restrictions on the different users' accessibility to data. For example, one user may be given unlimited access to the data for all types of operations. Another user may be allowed to read information, but not alter it. Still another user may be restricted to reading a subset of the information (for example, only information pertaining to a particular department within an organization).

PERFORMANCE CONSIDERATIONS

The primary objective of Query Management Facility is ease of use. The actual system resource requirements vary and depend on many factors such as number of records searched, complexity of the query, and availability of indexes. Response time and throughput depend on the allocated system resources, the priority of the executing task, and the nature of the transaction.

DOCUMENTATION
(available from Mechanicsburg)

The following task-oriented publications will be provided for QMF:
Query Management Facility: General Information ... Query Management Facility: Licensed Program Specifications ... Query Management Facility: Planning and Administration Guide for MVS ... Query Management Facility: Planning and Administration Guide for VM/SP ... Query Management Facility: Installation Guide for MVS ... Query Management Facility: Installation Guide for VM/SP ... Query Management Facility: Learner's Guide ... Introduction to Query Management Facility ... Query Management Facility: User's Guide and Reference ... Query Management Facility: Reference Summary ... Query Management Facility: Diagnosis Guide ... Query Management Facility: Diagnosis Reference.

MVS SYSTEM INTEGRITY

IBM will accept APARs describing situations where the installation of Query Management Facility introduces an exposure to the system integrity of MVS. This program is intended to run unauthorized. Refer to Programming Announcement dated October 21, 1981.

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**DATA EXTRACT (DXT) RELEASE 1
5668-973****PURPOSE**

Data Extract (DXT) is a program product which extracts data from files residing in Information Management System/Virtual Storage Version 1 data bases, virtual storage access method (VSAM) or sequential access method (SAM) data sets. DXT is designed for use in obtaining periodic 'snapshots' of subsets of existing data for use in end-user query and report writing. Data is extracted into a form suitable for loading using the IBM Database 2 (DB2) or SQL/Data System (SQL/DS) Release 2 load utilities. Extracted data can be sent to another processor by means of JES2 or JES3 networking. This data may then be loaded into DB2 tables or SQL/DS R2 tables. DXT operates in both MVS/XA and MVS/370 environments.

Data descriptions stored in the OS/VS DB/DC Data Dictionary may be used by DXT.

Dialogs, included with Data Extract and the Query Management Facility program products, will enable users to interactively construct extract requests through Interactive System Productivity Facility (ISPF) menu-driven screen facilities.

Early Support Program: To assist IBM in introducing the significant new Data Extract product, DXT is currently being tested in a number of customer and IBM locations. Early experience with a limited number of users will assist IBM in evaluating the product in varied environments and in developing additional support material prior to general availability.

An Early Support Program (ESP) is being planned for DXT. This ESP will be conducted by the NAD Dallas Systems Center; nominations will be through the NAD regions and NMD areas.

HIGHLIGHTS

- Extracts data using one or two views of an IMS/VS V1 data base or VSAM or SAM data sets in one request.
- Output data ready for loading into IBM Database 2 or SQL/Data System (SQL/DS) Release 2 tables.
- Optional use of OS/VS DB/DC Data Dictionary for stored IMS/VS V1 data base, VSAM or SAM data descriptions.
- Interactive dialogs for extract request construction and submission.

DESCRIPTION

DXT has three functions, independently executable, which collectively provide the DXT capabilities. These functions are:

- DXT dictionary access function
- DXT user input manager
- DXT data extract manager

Through the use of these three functions, a description of the data to be extracted is built, an Extract Request is submitted, validated and enqueued, and the data is extracted.

The data descriptions may be prepared manually or can be obtained by the DXT dictionary access function from the OS/VS DB/DC Data Dictionary. The descriptions are then input to the DXT user input manager for verification and subsequent storage in a data set called the file description table library (FDTLIB).

Extract requests are submitted to the DXT User Input Manager for verification, and, if valid, are then queued in a data set called the extract request library (EXTLIB). When the DXT data extract manager is scheduled and initiated, these requests cause data to be extracted from the data bases or files and made available to the requester. When finished, the extract requests are removed from the EXTLIB.

These activities may be independently executed. A typical execution sequence might be as follows:

- The DXT dictionary access function is executed in advance of anticipated extract requests to retrieve data descriptions.
- The DXT user input manager is then executed to store the descriptions in the FDTLIB.
- The DXT user input manager is then executed to verify and save incoming extract requests in EXTLIB.
- The DXT data extract manager is then executed to process Extract Requests awaiting execution in the EXTLIB.

The DXT data extract manager has the ability to restrict execution to those requests meeting pre-specified priority and volume criteria. For example, a copy of the DXT data extract manager might run continuously during prime shift to process extract requests with high priority and small output volumes. Then, one or more copies of the same program could run at night to process the other extract requests.

The DXT data extract manager also has the capability to batch extract requests, so that many requests can be fulfilled in one pass against the data. Typically, a copy of the DXT data extract manager might be dispatched nightly to process extract requests against certain large files.

For processing VSAM or SAM files, the DXT data extract manager runs as a job step under direct control of the operating system. For processing IMS/VS Version 1 DL/I data bases, the DXT data extract manager runs as an IMS application program, either as a BMP (batch message processing) job or as a batch application.

From the user's point of view, the DXT user input manager is the principal interface. The DXT data extract manager places a greater load on system resources than do the other two functions. Thus it can be run asynchronously to allow appropriate use of these resources.

DXT Dialogs: DXT dialogs provide an easy, interactive way for users to create and submit extract requests for DXT. The user is expected to be a technical person with data base knowledge sufficient to formulate an IMS/VS Version 1 DL/I, VSAM, or SAM extract request.

The dialogs consist of ISPF menu-driven panels which guide a user through the process of creating an extract request at a computer terminal. The dialogs feature:

- Panels that prompt the user for information needed to build an extract request
- Model extract statements that the user may tailor to his needs
- Panels that help the user with JCL, including sample JCL
- Request submission capability

Usage of the DXT dialogs requires both the ISPF and the ISPF/Program Development Facility program products.

The Data Extract dialogs provide four main functions:

- Building, maintaining and submitting DXT requests.
- Building and maintaining descriptions of the source data.
- Building and maintaining JCL files.
- Controlling processing options by updating variables in the user's profile.

An extract request prepared through DXT dialogs can be sent to a DXT system on another processor, and the resulting data can be routed back to the requesting system or another system using standard networking facilities.

The DXT dialogs will also be shipped with the Query Management Facility product (5668-972) so that extract requests can be prepared on the Query system.

CUSTOMER RESPONSIBILITIES

A customer installing Data Extract must:

- Have installed at least the minimum machine configuration.
- Have installed the prerequisite products.
- Assure that appropriate MVS/XA, MVS/370, and S/370 training (including terminal and direct access storage education) be given to system analysts, application programmers, system programmers, and system operators.
- Have MVS/XA, MVS/370, IMS/VS V1, VSAM or SAM files successfully installed.
- Apply necessary programming changes associated with the installation of Data Extract.
- Have personnel educated in Data Extract.
- Provide adequate protection against the accidental loss or misuse of his data (functions exist in Data Extract to assist in providing security).

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Data Extract will operate on any IBM processor supported by MVS/SP V2 R1 or MVS/SP V1 R3. The processors must have sufficient real storage to satisfy the combined requirements of MVS/XA or MVS/370, Data Extract, appropriate Data Facility Product, appropriate access methods, batch requirements, and other customer-required applications. The configuration must include sufficient I/O devices to support the requirements for system output, system residence, and system data sets. Sufficient direct access storage must be available to satisfy the user information storage requirements and may consist of any direct access facility supported by the system configuration and the programming system.

DASD: Data Extract is independent of DASD device type. Any disk devices supported by either MVS/XA Data Facility Product or MVS/370 Data Facility Product installed may be used. Data Extract uses disk devices for the following data sets:

- Request library
- File Description library
- Extracted output (optionally, tape, internal reader)

Tape: Data Extract is also independent of tape device type. Any tape devices supported by either MVS/XA Data Facility Product or

PROGRAM PRODUCTS

DXT R1 (cont'd)

MVS/370 Data Facility Product installed may be used. Tape or MSS may be used for extracted output.

Data Communications Devices: DXT operations can be controlled from the MVS console. DXT dialogs support terminals supported by TSO and ISPF. See the appropriate TSO or ISPF documentation.

SOFTWARE REQUIREMENTS

Operating System and Support Programs: Data Extract requires the following MVS/XA and MVS/370 configurations:

- For MVS/Extended Architecture (MVS/XA) environment (with the appropriate prerequisites for each product):
 - MVS System Product-JES2 (5740-XC6) or -JES3 (5665-291) Version 2 Release 1.1
 - MVS/XA Data Facility Product Release 1.1 (5665-284)
 - MVS TSO Extensions (TSO/E) Release 1 (5665-285)
 - Mass Storage System Extensions with MSSE MVS/XA Facility (5740-XYG) (for IBM 3850 Mass Storage System use only)
 - Interactive System Productivity Facility Release 1.1 (5668-960) (for Data Extract dialogs only)
 - Interactive System Productivity Facility/Program Development Facility-MVS Release 1.1 (5665-268) (for Data Extract dialogs only)
 - IMS/VS Version 1 (5740-XX2) (for customers extracting data from IMS/VS Version 1 DL/I data bases)
 - OS/VS DB/DC Data Dictionary, Release 4 (5740-XXF) (for customers obtaining data descriptions from this source)
 - System Modification Program (SMP) Release 4
 - Resource Access Control Facility (RACF) (5740-XXH) Release 5
- For MVS/370 environment (with the appropriate prerequisites for each product):
 - MVS/System Product-JES2 (5740-XY5) or -JES3 (5740-XYN) Version 1 Release 3
 - MVS/370 Data Facility Product Release 1 (5665-295)
 - MVS TSO Command Package Release 1.1 (5740-XT6) or MVS TSO Extensions (TSO/E) Release 1 (5665-285)
 - Interactive System Productivity Facility Release 1.1 (5668-960) (for Data Extract dialogs only)
 - Interactive System Productivity Facility/Program Development Facility-MVS Release 1.1 (5665-268) (for Data Extract dialogs only)
 - IMS/VS Version 1 (5740-XX2) (for customers extracting data from IMS/VS Version 1 DL/I data bases)
 - OS/VS DB/DC Data Dictionary Release 4 (5740-XXF) (for customers obtaining data descriptions from this source)
 - System Modification Program (SMP) Release 4
 - Resource Access Control Facility (RACF) (5740-XXH) Release 5

COMPATIBILITY/CONVERSION

Data Extract aids movement of data from IMS/VS Version 1 DL/I data bases, VSAM or SAM data sets into IBM Database 2 or SQL/Data System (SQL/DS) Release 2 tables to facilitate usage of these new products. It is not intended as a tool to migrate IMS/VS Version 1 DL/I users to IBM Database 2. DXT uses a language similar to the Structured Query Language (SQL) used by the IBM relational data base products. However, the languages are not identical and compatibility is neither implied nor required.

Virtual Storage Considerations: Storage used by the DXT set of functions will vary depending on the nature of the extract request. The minimum Data Extract virtual storage requirements are as follows:

- DXT Extract Dictionary Access function
 - 140K bytes to store the load module
 - 1,024K bytes to run in an IMS batch region (in addition to DB/DC Data Dictionary requirements)
- DXT User Input Manager
 - 380K bytes to store the load module
 - 800K-byte region size for a typical job
- DXT Data Extract Manager
 - 430K bytes to store the load module
 - 1,300K bytes to run an IMS batch job
 - 900K bytes to run a non-IMS job or an IMS BMP job
- DXT dialogs
 - 60K bytes to store the load module
 - ISPF/PDF-recommended region size to run a job

DATA SECURITY and AUDITABILITY

Protection of actual user data bases and files is provided by the appropriate system or program product, i.e., MVS, RACF, IMS/VS Version 1, DB2 or SQL/DS.

The Data Extract user input manager optionally uses RACF to control user access to data descriptions stored in the DXT data set FDTLIB.

The data descriptions constitute a new resource class independent of actual files and data bases.

PERFORMANCE CONSIDERATIONS

Data Extract is a set of three functions. Optimization of design is directed at minimizing the instruction path length and I/O requirements of the DXT search algorithm. The capability to execute more than one request at a time, that is, to scan a file once for several requests, is designed to reduce resource utilization and to enhance overall throughput. The actual system resource requirements vary and depend on many factors such as number of records searched, complexity of the extract request, and availability of indexes. Overall throughput depends on the allocated system resources, the priority of the executing task, and the nature of the request(s).

DOCUMENTATION

(available from Mechanicsburg)

The following task-oriented publications are planned for Data Extract: *Data Extract: General Information ... Data Extract: Licensed Program Specifications ... Data Extract: Planning and Administration Guide ... Data Extract: Administering and Using Dialogs ... Data Extract: Installation Guide ... Data Extract: Dialogs Installation Guide ... Data Extract: Operation ... Data Extract: User's Guide and Reference ... Data Extract: Diagnosis Guide ... Data Extract: Diagnosis Reference ... Data Extract: Dialogs Diagnosis ... Data Extract: Messages and Codes.*

MVS SYSTEM INTEGRITY

IBM will accept APARs describing situations where the installation of Data Extract introduces an exposure to the system integrity of MVS. This program is intended to run unauthorized. Refer to Programming Announcement dated October 21, 1981.

RPQs Accepted: No

**GRAPHICS ACCESS METHOD/SYSTEM PRODUCT
5668-978****PURPOSE**

The Graphics Access Method/System Product (GAM/SP) program product provides basic programming support for the IBM 3250 Graphics Display System and IBM 2250 Display Unit Model 3, and for application programs designed for those graphics systems and devices. GAM/SP extends to users of the CMS component of VM/System Product graphics support that previously has been available only under MVS and VS1 operating systems.

HIGHLIGHTS

- Supports IBM 3250 (and 2250 mdl 3) interactive vector-graphics display system in the user-oriented, highly interactive environment of VM/System Product.
- Enables migration to VM/SP of graphics applications previously usable only under MVS or VS1.

DESCRIPTION

GAM/SP is a program product required for the use of interactive, vector-graphics systems and application programs under VM/SP. It provides input/output control, attention handling and enqueueing facilities, graphical data management, and graphic-order management facilities necessary for the creation and use of graphics applications designed for the IBM 3250 Graphics Display System. By enabling the operation of IBM 3250 (and 2250 mdl 3) under VM/SP, it provides graphics users, such as designers, engineers and draftsmen, with access to a highly interactive and flexible operating system for support of their graphics display system.

Graphics application programs developed for support of IBM 3250 (and 2250 mdl 3) under MVS and VS1 will operate under VM/SP using GAM/SP with little or no change, except where the application program depends upon system features that are not supported by VM/SP (e.g., applications that rely on VS multitasking, or depend on asynchronous operation under an interrupt request block (IRB), may require modification). GAM/SP provides a macro interface for graphics application programs written in IBM S/370 Assembler language.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

GAM/SP is designed to operate in any IBM S/370, 303X, 3081 or 43XX Processor to which IBM 3250 Graphic Display System or IBM 2250 Display Unit mdl 3 can be attached, and in which the host control program can run. GAM/SP is designed to operate under control of VM/System Product (5664-167) only.

IBM 3250 Graphics Display System consists of the following devices:

- IBM 3258 Control Unit
- IBM 3255 Display Control
- IBM 3251 Display Station

GAM/SP will also support IBM 3250 with the Increased Capacity RPQ (7J0040-41) and the Additional Workstation RPQ (7J0042-43) applied.

An IBM 2840 Display Control mdl 2 is required for support of IBM 2250 Display Unit mdl 3.

GAM/SP will operate under control of VM/SP (5664-167). In addition to the machine and storage requirements of that host control program, GAM/SP requires the following storage:

- Auxiliary storage for product installation - 640 blocks of 800 bytes.
- Two discontinuous shared segments, to be allocated for the following purposes:
 - One shared segment for GAM/SP code.
 - One shared segment for device buffer tables. (Buffer table size is dependent upon graphics hardware system configuration, and typically requires 1K byte to support 8 display stations.)

SOFTWARE REQUIREMENTS

GAM/SP will operate under VM/System Product (5664-167). In particular, GAM/SP utilizes macros contained in the OSMACRO and OSMACRO1 macro libraries which are distributed with VM/System Product.

In order to use GAM/SP for support of the IBM 3250 or 2250 mdl 3, it will be necessary to apply PTF number UV90005 to VM/SP. This PTF was distributed with VM PUT 8107 in October, 1981.

GAM/SP provides macros and routines required for the creation and execution of graphics application programs written in S/370 Assembler language.

COMPATIBILITY

Many application programs designed for use with IBM 3250 and 2250 mdl 3 under control of OS/VS2 (MVS) and OS/VS1 should run unchanged with GAM/SP under VM/SP. This overall state of

compatibility is enabled by GAM/SP inclusion of all the functions performed by the Graphics Programming Services (GPS) component of the MVS and VS1 SCPs, except for those facilities provided by the Problem Oriented Routines (PORs) of GPS.

Incompatibilities may be apparent in application programs that depend upon functions in MVS and VS1 that are not supported by VM/SP CMS. Examples of known incompatibilities, necessitating changes to enable movement of application programs from MVS or VS1 to VM/SP CMS, are as follows:

- Applications dependent on OS/VS multitasking.
- Applications dependent on asynchronous processing under an IRB (interrupt request block).
- Applications relying on use of a DD statement to set the GNCP value in a graphics DCB. (Note that GAM/SP will assume a value of one (1) if GNCP is zero (0) in the DCB.)
- Applications which rely on specific timing or on performance characteristics of the system in which they operate, may execute differently in a CMS environment compared with their execution under MVS or VS1.

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**X.25 NCP PACKET SWITCHING INTERFACE
5668-981**

PURPOSE

The X.25 NCP Packet Switching Interface is a program product providing users of IBM's ACF/NCP program product with the capability to attach IBM's 3705-II, 3705-80, or 3725 Communication Controllers to data transmission services supporting interfaces complying with CCITT Recommendation X.25 (Geneva, 1980).

The X.25 NCP Packet Switching Interface is designed to operate with ACF/NCP Version 1 Release 2.1 or 3.0 and ACF/NCP Version 2 for the 3705 and 3725.

HIGHLIGHTS

Release 1

- Support of a subset of X.25 services conforming to CCITT Recommendation X.25 (Geneva, November 1980).
 - Permanent virtual circuit and virtual call management.
 - Modulo 8 packet sequence numbering.
 - Packet length selection (up to 4,096 characters).
- Support of selected user facilities:
 - One way logical channel.
 - Reverse charging.
 - Closed user group.
- Support of protocol conversion facilities for non-SNA equipment.
- Support of IBM cryptographic subsystem/access methods products.
- SNA communication via X.25 networks to selected SNA devices via Network Interface Adapter (RPQ 5973-LO2).
- IBM program product subsystem support, e.g., CICS/VS, IMS/VS, TSO, NCCF, VSPC.
- Coexistence with other 3705 program products, e.g., NTO (5735-XX7).
- Link speeds from 1,200 to 56,000 bps.

Release 2

- Integrated support of a subset of CCITT Recommendation X.29 allowing communication with terminals corresponding to CCITT Recommendation X.28, e.g., Start/Stop and TTY 33/35 terminals.
- Control facilities enabling the user to provide his own Packet Assembly/Disassembly (PAD) support at the application program level, e.g., for BSC.
- Capability allowing for a host application to manage X.25 control functions.
- Modulo 128 packet sequence number.
- Link Access Procedure Balanced (LAPB) only.
- Delivery Confirmation Bit (D-bit) and Qualified Data Packet (Q-bit) support for non-SNA equipment.
- Flow control negotiation at call set-up time.
- X.25 diagnostic packet support.
- Optional retries on clear/reset packets.
- Specific encoding of diagnostic and cause field in clear/reset packets through host application interface.

Release 3

- SNA Network Node Interconnection (ACF/NCP) through X.25 networks.
- X.21 Nonswitched Adapter.

Release 3.1

- Provides X.25 NPSI Release 3 level support for ACF/NCP V2 for the 3705. Release 3.1 has the same functions as Release 3, plus:
 - usage of the qualified bit for logical link control at the boundary network node
 - control facilities enabling the user to provide his own Packet Assembly/Disassembly (PAD) support at the application program level for HDLC connections.

Release 4

- Provides X.25 NPSI Release 3.1 level support for ACF/NCP V2 for the IBM 3725. Link access support in X.25 NPSI Release 4 is LAPB (Link Access Procedure Balanced) only. In addition, NPDA support, unavailable with X.25 NPSI Release 1, 2, 3, and 3.1, is provided by X.25 NPSI Release 4 in conjunction a later version or release of NPDA. For Release 4 prerequisites, refer to the "Program Service Considerations" section.
- X.21 Nonswitched Adapter.

SUMMARY and ADVANTAGES

Operating in conjunction with its prerequisite ACF/NCP program product, the X.25 Packet Switching Interface program product provides X.25 SNA boundary node function (initial release) and SNA Network Node Interconnection (follow-on release) through an X.25 network.

Release 1

Subsystem/Program Product Support: IBM program products (CICS/VS, IMS/VS, TSO, NCCF, and VSPC) which support SNA/SDLC communication with specific IBM controllers and devices via ACF/VTAM, ACF/TCAM and ACF/NCP can, without modifications, utilize this X.25 NCP Packet Switching Interface program product, in conjunction with the IBM 5973-LO2 Network Interface Adapter, and obtain the same SNA support for those controllers and devices via X.25 networks (reference M2700 pages for further information).

Expanded Networks: Offers in a single communications controller the capability for users to attach to multiple network offerings.

Single and Multiple System Networking: Allows ACF/NCP network nodes to be connected using X.25 NCP Packet Switching services in both single and multiple system environments.

Network Sharing: Permits a wide range of S/370 configurations supporting growth in both SNA and X.25 networks.

Standards: Conforms to worldwide CCITT Recommendation X.25 (Geneva, November 1980).

Protocol Conversion: The Protocol Converter for Non-SNA Equipment facility enabling support of non-SNA equipment attached to X.25 networks.

Release 2

Modulo 8, 128: Supports two levels of packet numbering.

Host Application Interface: Allows a host application to manage X.25 control functions such as those for call control (call request, incoming call connected and call accepted packets), and those during data transfer (interrupt, reset, and qualified data packets).

Packet Assembly/Disassembly: Provides support conforming to a subset of CCITT Recommendation X.29 allowing communication with terminals corresponding to CCITT Recommendation X.28, e.g., Start/Stop and TTY 33/35 terminals (TRANSPAC, including access through French telex) - control facilities enabling the user to provide his own PAD support at the application program level, e.g., for BSC.

Release 3

SNA Network Node Interconnection: Allows two IBM Communication Controllers (3705-II or 3705-80), each using the X.25 NCP Packet Switching Interface program product with ACF/NCP Release 3 to communicate via X.25 Packet Switching Networks using SNA Intermediate Network Node protocols.

X.21 Nonswitched Adapter: Allows the physical attachment to the X.25 network, using the X.21 Nonswitched Adapter.

Release 3.1

- Provides X.25 NPSI Release 3 level support for ACF/NCP V2 for the 3705. Release 3.1 has the same functions as Release 3, plus:
 - usage of the qualified bit for logical link control at the boundary network node
 - control facilities enabling the user to provide his own Packet Assembly/Disassembly (PAD) support at the application program level for HDLC connections.

Release 4

- Provides X.25 NPSI Release 3.1 level support for ACF/NCP V2 for the IBM 3725. Link access support in X.25 NPSI Release 4 is LAPB (Link Access Procedure Balanced) only. In addition, NPDA support, unavailable with X.25 NPSI Release 1, 2, 3, and 3.1, is provided by X.25 NPSI Release 4 in conjunction a later version or release of NPDA. For Release 4 prerequisites, refer to the "Program Service Considerations" section.

CUSTOMER RESPONSIBILITIES

To install and use the X.25 NCP Packet Switching Interface, the customer must:

- Insure that the X.25 network conforms to CCITT Recommendation X.25 (Geneva, November 1980).
- Order and install all required communications equipment.
- For the 3705: Order and install ACF/NCP Version 1 Release 2.1 or 3.0, of ACF/NCP Version 2; System Support Programs for ACF/NCP Version 1 Releases 2.1 or 3.0 and prerequisite System Control Programming, or ACF/SSP Version 2.
- For the 3725: Order and install ACF/NCP Version 2, and ACF/SSP Version 2 Release 1.1

X.25 NCP Packet Switching Interface (cont'd)

- Generate X.25 NCP Packet Switching Interface, using the System Support Programs for ACF/NCP Release 2.1 or 3.0 or ACF/SSP Version 2.
- Load the 3705-II, 3705-80, or 3725 with the generated X.25 NCP Packet Switching Interface load modules, using, for example, the System Support Programs for ACF/NCP Release 2.1 or 3.0 or ACF/SSP Version 2.
- Meet the requirements of the host access method products to be operational with ACF/NCP Release 2.1 or 3.0 or ACF/NCP Version 2.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The X.25 NCP Packet Switching Interface Release 1, 2, 3, and 3.1 are designed to operate on an IBM 3705-II or 3705-80 Communication Controller equipped with a CS2 or CS3 communications scanner with the appropriate FDX line set. When operating with one X.25 line at speeds above 20.4 kbps, a CS3 communication scanner is required.

X.25 NPSI Release 4 is designed to operate on an IBM 3725 Communication Controller with the appropriate FDX line interface card.

SOFTWARE REQUIREMENTS

The X.25 NCP Packet Switching Interface program product requires the installation of its prerequisite Advanced Communications Function for NCP/VS (ACF/NCP/VS) Program Product Release 2.1 or 3.0, or ACF/NCP Version 2.

Network Requirements: The X.25 NCP Packet Switching Interface program product is designed to operate with data transmission services having interfaces complying with CCITT Recommendation X.25 (Geneva, 1980) as delineated in the IBM SRL GA27-3345, *The X.25 Interface for Attaching IBM SNA Nodes to Packet-Switched Data Networks*. Announcement of support of X.25 networks will depend on network attachment availability and evaluation. Selection of X.25 networks for attachment will be based on IBM's technical and business judgment in addressing the requirements of its customers.

Program Service Considerations:

Program services for this licensed program used in other than the Specified Operating Environment are subject to limitation occasioned by the difference between the Specified Operating Environment and the customer's environment and by the extent of the local IBM representative's knowledge of the equipment, programs and networks involved. Users of Release 4 who desire program service support of the X.25 NCP Packet Switching Interface program product, or hardware maintenance service support for the lines controlled by the X.25 NPSI program product, must install the later version or release of NPDA.

COMPATIBILITY

IBM cryptographic subsystem/access method products compatible with this program product are:

- Programmed Cryptographic Facility, program product 5740-XY5, announced for OS/VS2 (MVS) Release 3.8 and OS/VS1 Release 7.0.
- Cryptographic Unit Support, program product 5740-XY6, announced for OS/VS2 (MVS) Release 3.8 and OS/VS1 Release 7.0.
- ACF/VTAM Encrypt/Decrypt Feature #6010, Program Number 5735-RC2, announced for OS/VS2 (MVS) Release 3.8 and OS/VS1 Release 7.0.
- ACF/TCAM Version 2 for OS/VS2 (MVS) Release 3.8 and OS/VS1 Release 7.0.

Note: IBM cryptographic line bracketing products (3845 and 3846 data encrypt devices) *cannot be used*.

RESTRICTIONS: The ACF/NCP dynamic reconfiguration capability is not supported for X.25 access links or virtual circuits controlled by the X.25 NCP Packet Switching Interface program product.

Fast select and Datagram facilities are not supported.

Remote loading and/or dumping of an ACF/NCP is not supported through the X.25 network. Should it be required, alternative (non-X.25) communication facilities may be used.

MIGRATION and PLANNING CONSIDERATIONS

Migration: This program product is compatible with the World Trade PRPQ 5799-BAK (ZA4239). Users of 5799-BAK may migrate to Release 1 of Program Product 5668-981 without changes to their network or host applications.

Planning:

Software: The following matrix defines the support alternatives available to OS/VS and DOS/VSE operating system environments.

**X.25 NCP Packet Switching Interface
(Program Product 5668-981)**

	Rel. 1.2	rel.3	Rel. 3.1*	Rel. 4**
ACF/VTAM V1R2	yes	no	no	no
ACF/VTAM V1R3	yes	yes	yes	yes ***
ACF/VTAM V2	yes	yes	yes	yes
ACF/TCAM V2R2	yes	no	no	no
ACF/TCAM V2R3	yes	yes	yes	no
ACF/TCAM V2R4	yes	yes	yes	yes
ACF/NCP V1R2.1	yes	no	no	no
ACF/NCP V1R3	no	yes	no	no
ACF/NCP V2	no	no	yes	yes

* Support available July, 1983

** Support available ... MVS/VS1: November, 1983 ... VSE: December, 1983

*** MVS only.

Hardware: SNA terminal support will be provided through the Network Interface Adapter RPQ 5973-LO2 (Y96635). Information on the supported terminals and other details can be obtained through normal RPQ information system procedures.

Other hardware support is provided through the X.25 NCP Packet Switching Interface program product's Protocol Conversion for Non-SNA Equipment facility and packet assembly/disassembly (PAD) support.

PERFORMANCE and STORAGE CONSIDERATIONS

The X.25 NCP Packet Switching Interface requires, in addition to its own storage requirement, the storage required by its own prerequisite ACF/NCP/VS program product. The functions provided by the X.25 NCP Packet Switching Interface program product will increase the ACF/NCP storage requirements and path lengths. The actual performance level will vary depending upon the user's particular hardware and software configuration.

3705 or 3725 configurator programs, IBM aids available via the HONE system, has been updated for X.25 and should be used to access individual customer performance capability and storage estimates.

DOCUMENTATION

TERMS and CONDITIONS: See PP Index

Program Service Considerations: Program services for this licensed program used in other than the Specified Operating Environment are subject to limitations occasioned by the difference between the Specified Operating Environment and the customer's environment and by the extent of the local IBM representative's knowledge of the equipment, programs and networks involved.

**5668-983 - NPDA VERSION 2
NETWORK PROBLEM DETERMINATION APPLICATION
VERSION 2 MVS, VS1, VSE**

PURPOSE

The Network Problem Determination Application Version 2 (NPDA Version 2) program assists users in performing problem determination. NPDA generates situation alerts to the appropriate personnel about potential problems. NPDA also collects and interprets records of detected events and statistical data originating in those hardware and software components that provide such information and recommends possible user activities to locate and relieve problems. NPDA Version 2 expands the function of the Network Problem Determination application (NPDA) program product (5735-XX8). NPDA Version 2, which runs as an application of the Network Communications Control Facility (NCCF), expands the alert support for resources of the 3600 and the 4700 Finance Communication Systems. NPDA Version 2 also expands the function of NPDA for OS/VS users by extending device error support to selected tape, DASD and 3800 printer devices attached to a network host processor and to the CPU (OS/VS2 MVS only) and channels of the network host processor, in addition to the previously supported communications network resources. The 3600 Threshold Analysis and Remote Access feature of NPDA is separately orderable for NPDA Version 2.

HIGHLIGHTS

The Network Problem Determination Application Version 2 (NPDA Version 2), which expands upon facilities available in NPDA, assists users in performing problem determination tasks by providing:

- Online, interactive viewing of recorded information that assists users in locating an unidentified hardware problem.
- An alert facility which will:
 - Dynamically display key events which warrant operator attention from both network and selected OS/VS tape and DASD devices.
 - Generate alerts based upon user specified thresholds.
 - Generate alerts for Network Routing Facility Licensed Program.
- A hierarchical view of event and statistical data for network problems occurring on lines, modems, cluster controllers, control units and terminals for OS/VS and VSE and for selected tape, DASD and network devices locally attached to the network host.
- Operator data on the following:
 - A description of alerts and events.
 - A probable cause description.
 - Recommended user action(s).
- Data base and display filters which permit user selection of which alerts/events are recorded and/or viewed:
- Permanent and/or temporary events/alerts associated with:

DESCRIPTION

Summary and Advantages of NPDA Version 2: The Network Problem Determination Application Version 2 (NPDA Version 2) program product assists users in performing the problem determination task by:

- Collecting records of detected error events from those hardware and software components that provide error information.
- Collecting and interpreting statistical data about permanent and temporary errors.
- Generating alerts to the appropriate personnel about potential problem situations.
- Recommending possible user activities to relieve detected problems.
- Transferring selected information to the data base of the Information/Management feature of Information/System program product (5735-OZS).

The NPDA Version 2 user has access, via a display terminal, to this accumulated information. This data is presented as:

- Identification of the component causing a specific event.
- Description of the event.
- Probable cause of the event based on an analysis of the recorded data.
- Recommended actions that the user may follow to correct or override any problems caused by the event.
- Accumulated statistics about temporary, or recoverable, errors. This data may be used to analyze performance degradation or unresolved intermittent failures.

The cross-domain capability of SNA communication subsystems is used by NPDA Version 2 to permit displays of event, alert and statistical data collected in remote network domains running NPDA Version 2.

NPDA Version 2 is logically composed of three entities:

- Data services command processors (DSCP) that select, analyze for alert service, and route to the NPDA Version 2 data base those records containing alert, event and statistical data from the components supported.

These command processors also serve to retrieve data from the NPDA Version 2 data base for user presentation and to perform maintenance services for that data base.

- Presentation services command processors (PSCP) that process user requests and format displays from the NPDA data base.
- A mapper which converts and routes non-SNA error data records to the data base (OS/VS only).

PROGRAM PRODUCTS

NPDA Version 2 (cont'd)

An important feature of NPDA Version 2 is the "filter" function. Filters are designed to screen out data before it is recorded in the NPDA Version 2 data base and are also used to screen out recorded data from each user's display.

Filters can be defined by the user to control the recording and viewing of:

- Specific event types.
- Specific resources.
- Specific resource type.
- Combinations of the above.
- Events based on the time of occurrence (viewing only).

Filters are supported in NPDA Version 2 by a number of status displays and explicit commands that are available to a user with proper authorization. For added convenience, the user can display the current status of recording and viewing filters that affect the data being viewed.

NPDA Version 2 has access to a single data base. The NPDA Version 2 data base records alerts, events and statistics occurring in an SNA controlled communications environment, a non-SNA controlled communications environment, and in a local environment.

NPDA Version 2 uses system functions provided by the Network Communications Control Facility (NCCF) Version 1 Release 2 or Version 2 program product for transparency to the operating system and the communications access methods.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

NPDA runs under NCCF on any IBM processors that meet the minimum requirements of the NCCF program product. These include the IBM S/370, 43XX, and the 30XX processors.

User Terminals: Among the display devices running under NCCF as user terminals are:

- 3275 mdls 2 and 12.
- 3276 mdls 2, 3, 4, 12, 13 and 14.
- 3277 mdl 2.
- 3278 mdls 2, 3, 4 and 5
- 3279 mdls 2A, 2B, 3A and 3B (monochrome and base color modes).
- 8775 mdls 1, 2, 11 and 12

Storage: The virtual storage requirement for NPDA Version 2 varies with the number of users, but is approximately 260K bytes. NPDA has no real storage or system area requirements.

DASD: The disk storage requirement for the NPDA data base is dependent upon the network configuration and user options, but is approximately 120 cylinders (3330), including program library space.

SOFTWARE REQUIREMENTS

NPDA is provided as a program product running with the Network Communications Control Facility (NCCF) Version 1 Release 2 or Version 2. NCCF Release 2 is provided as a program product on OS/VS2 (MVS) Release 3.8 and OS/VS1 Release 7 with the following access methods: ACF/VTAM Version 1 Releases 2 and 3, ACF/VTAM Version 2 and ACF/TCAM Version 2 Releases 2, 3 and 4 under any of their supported operating systems. NCCF Version 2 is provided as a program product on MVS with the following access methods: ACF/VTAM Version 1 Release 3, ACF/VTAM Version 2 and ACF/TCAM Version 2 Release 4.

NPDA Version 2 operates in a VM/370 environment under OS/VS2 (MVS) and OS/VS1 operating systems and supports remote resources only. The VM/370 environment requires VM/SP and VM/VCNA, while the OS/VS systems require: NCCF Version 1 Release 2 and ACF/VTAM Version 1 Releases 2 or 3, ACF/VTAM Version 2 Release 1, or ACF/TCAM Version 2 Releases 2, 3, or 4 under any of their supporting operating systems (OS/VS2 (MVS) and OS/VS1); NCCF Version 2 and ACF/VTAM Version 1 Release 3, ACF/VTAM Version 2 Releases 1 and 2, and ACF/TCAM Version 2 Release 4 under MVS.

NPDA Version 2 requires ACF/NCP Release 2.1 for 386X support of link quality monitoring.

Currency: For purposes of IBM providing program services, NPDA (5735-XX8) will be supported until discontinued by IBM upon at least twelve (12) months written notice.

MIGRATION

NPDA Version 2 is a replacement product for the Network Problem Determination Application (NPDA) program product. The functional extensions incorporated in NPDA Version 2 make the NPDA Version 2 data base incompatible with the NPDA data base. However, NPDA and NPDA Version 2 may coexist in the same system for viewing purposes.

The NPDA Version 2 terminal use procedures and commands are similar to those implemented in NPDA. NPDA Version 2 will not support DEMF coexistence.

Users of the IBM 3600 Threshold Analysis and Remote Access feature need to order feature #6008 for NPDA Version 2. The functions are the same as those in the NPDA Version 1 feature. The feature is supplied to provide compatibility with NPDA Version 2.

DEPENDENCIES

NPDA Version 2 is dependent upon the System Modification Program (SMP) for installation on OS/VS2 MVS and OS/VS1 and on MSHP for VSE. The NCCF Version 1 Release 2 or Version 2 program product is a prerequisite for operation of NPDA.

SECURITY

This program accesses hardware and software failure data, but not the customer data involved in the failure. The program acquires no customer data which is not directly supplied to the program by the customer and explicitly covered in customer documentation.

Customer management is responsible for the selection, application and adequacy of these controls for their environments.

DOCUMENTATION
(available from Mechanicsburg)

NPDA Version 2 will be supported by the following publications:

NPDA Version 2: Program Summary (GC34-2062) NC ... *NPDA Version 2: General Information Manual* (GC34-2061) ... *NPDA Version 2: Installation* (SC34-2066) ... *NPDA Version 2: Terminal Use* (SC34-2063) ... *NPDA Version 2: Recommended Action Guide* (SC34-2064) ... *NPDA Version 2: Messages and Codes* (SC34-2065) ... *NPDA Version 2: Logic* (LY25-0012).

MVS SYSTEM INTEGRITY

IBM will accept APARs where installation of NPDA Version 2 introduces an exposure to the integrity of OS/VS2 MVS. Refer to Programming Announcement of April 21, 1980. This program is intended to run authorized.

PROGRAM PRODUCTS

5668-985 - HOST COMMAND FACILITY VERSION 2

PURPOSE

Host Command Facility Version 2 (HCF V2) extends the capabilities of the first version in ACF/VTAM environments by allowing operation with the Terminal Access Facility, a feature of the Network Communication Control Facility (NCCF) Release 2 and an integrated function of NCCF Version 2. This capability, when used in a VTAM environment, will allow the central network operator to establish multiple concurrent sessions with 8100 Distributed Systems from a single NCCF terminal at the central-site S/370 or 4300. When communicating with 8100/DPPX or DPPX/SP systems, these sessions can be full-screen sessions or line-by-line sessions. Full-screen sessions require that the control terminal be dedicated to one session at a time. Line-by-line sessions provide for an interleaved display of messages from multiple 8100 systems, thereby allowing operational monitoring of multiple 8100 systems from a single terminal. Sessions with 8100/DPCX systems are limited to full-screen sessions. In addition to the operation with the Terminal Access Facility of NCCF, HCF V2, when used in DPPX or DPPX/SP environments, also allows use of the 3767 Communication Terminal for HCF functions.

SPECIAL SALES INFORMATION

Host Command Facility Version 2 is particularly useful to those 8100 users who are part of a S/370 or 4300 VTAM-based network and who want to manage that network from a central site through use of IBM-supplied network management tools such as NCCF. It is especially useful to those users who want to perform the operation, control and problem determination functions for multiple 8100 DPPX or DPPX/SP systems from a single host terminal, and to those users who want hardcopy capability for HCF functions.

HIGHLIGHTS

- Working in conjunction with the Terminal Access Facility of NCCF and ACF/VTAM, HCF V2 provides:
 - The management of multiple network nodes, both DPPX and DPCX, from a single NCCF terminal via a full-screen session temporarily dedicated to HCF V2. HCF commands are then utilized to establish and drop full-screen sessions to 8100 DPPX or DPPX/SP and 8100 DPCX applications in a serial manner.
 - The ability to operationally monitor multiple 8100/DPPX nodes from a single NCCF terminal. These sessions are line-by-line sessions which provide for an interleaved display of messages from multiple 8100 DPPX or DPPX/SP systems.
 - In DPPX environments, a dynamic switching capability between operator control environment (line-by-line) and the currently established full-screen session for HCF V2.
- Independent of the Terminal Access Facility feature of NCCF, HCF V2, when used in DPPX or DPPX/SP environments, allows use of the 3767 Communication Terminal for HCF functions. This provides a hard copy capability for installations requiring it, and also provides an alternative to those installations where display availability is a problem.
- In each of the above environments (i.e., with and without the Terminal Access Facility of NCCF, HCF V2 will provide a new operator facility which will enable graceful termination of HCF V2.

Other Features: When operating in DPPX or DPPX/SP VTAM environments, Host Command Facility Version 2 includes all of the functions of the first version among which are:

- Remote control and operation of one or more 8100 systems selected by the terminal operator.
 - Remote initiation and termination of work.
 - Remote configuration control.
- Remote examination of DPPX or DPPX/SP data sets, including dumps and logs, using the DPPX or DPPX/SP interactive editor.
- Remote problem determination and isolation.
 - Examination of error logs and error log summaries.
 - Examination of dumps, traces, etc.
 - Invocation of test programs, online tests and diagnostics, and examination of their results.
 - Application of program patches via the DPPX or DPPX/SP interactive editor.
- Remote program development, using the full set of DPPX or DPPX/SP tools for interactive program writing, compiler invocation and problem determination.
- Submission of transactions and control commands to DPPX or DPPX/SP and the Data Base and Transaction Management (DPPX or DPPX/SP DTMS) user.

In general, Host Command Facility Version 2 allows a host NCCF terminal operator access to any function available to the command facility or DPPX or DPPX/SP DTMS user.

In addition, Host Command Facility Version 2 will provide the S/370-to-8100/DPPX or -DPPX/SP or 4300-to-8100/DPPX or -DPPX/SP logical connection verification (LCV) function. This function verifies the logical connection path between the host S/370 or 4300 and the 8100/DPPX or DPPX/SP System. LCV can be initiated through HCF V2 by the host terminal operator. The test involves the transmission of a 'canned pattern' or operator-entered pattern from the corresponding DPPX or DPPX/SP LCV program to the initiating host terminal. The number of times the pattern is transmitted is controlled by the host terminal operator. When used in conjunction with the DPPX Data Stream Compatibility licensed program or the DPPX/SP Data Stream Compatibility component, the purpose of this facility is to verify the logical connection path (program-to-program, including links) between the S/370 or 4300 and 8100/DPPX or DPPX/SP.

When operating in DPCX VTAM environments, HCF V2 includes all of the functions of the first version among which are:

- Central control and operation of an 8100 System selected by the network operator, including:
 - Initiation of system services such as packing of transactions and printing data sets.
 - Access to user full-screen programs.
 - Enabling and disabling devices for reconfiguration control.
 - Ability to set IPL parameters and access to security controls in DPCX.
- Central problem diagnosis, including:
 - Initiation of tests and traces.
 - Display of distributed system status information, condition incident log, and attached devices error logs.
- Initiation and examination of traces and application program dumps.
- Retrieval of unique system information messages.
- Central access to the Program Execution Monitor for debugging DPCX application programs.
- Central system performance control, including system performance data collection.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

HCF V2 requires 64K to 128K bytes of IBM S/370 or IBM 4300 virtual storage depending on the number of users. It will operate on a DOS/VSE, OS/VS1 or OS/VS2 (MVS) system with sufficient real storage to satisfy the combined requirements of HCF V2, VTAM/VTAME, and other customer required programs.

The configuration must include an IBM S/370 or IBM 4300 attached (local or 370X, BSC or SDLC) IBM 3276-1,-2,-3,-4,-11,-12,-13,-14 or 3277-2 or 3278-1,-2,-3,-4 display, using a 3271-2, 12 or 3272-2 or 3274-1A,-1B,-1C,-1D or 3275-2,-12 or 3276-1,-2,-3,-4,-11,-12,-13,-14 as a control unit, or an IBM 3767 Communication Terminal.

Note: Although HCF V2 supports BSC, SDLC and local attachment for displays, it only supports SDLC links to the 8100 systems.

SOFTWARE REQUIREMENTS

HCF V2 is designed to run with:

DOS/VSE	VSE/Advanced Functions and ACF/VTAM Version 1 Releases 2 and 3, ACF/VTAM Version 2 Release 1, or ACF/VTAME.
OS/VS1	Release 7.0 with ACF/VTAM Version 1 Release 3 and ACF/VTAM Version 2 Releases 1 and 2.
OS/VS2	Release 3.8 with ACF/VTAM Version 1 Release 3 and ACF/VTAM Version 2 Releases 1 and 2.

In order to concurrently control multiple 8100 systems from a single terminal, HCF V2 must be used with the Terminal Access Facility, a feature of the Network Communications Control Facility (NCCF) Release 2 and an integrated function of NCCF Version 2.

COMPATIBILITY

Host Command Facility Version 2 is designed to work in VTAM environments in support of 8100 Information Systems with DPPX or DPPX/SP or DPCX as the Operating System. When used in these environments, HCF V2 includes all of the functions provided by the first version and is upwards compatible with it.

DATA SECURITY, AUDITABILITY and CONTROL

HCF V2 runs under OS/VS1, OS/VS2 (MVS) and DOS/VSE and is subject to the controls that they provide. User management is responsible for the selection, application, adequacy and implementation of these features and for appropriate application controls.

SYSTEM INTEGRITY APPLIES: Yes

RPQs ACCEPTED: No

**DISTRIBUTED SYSTEMS EXECUTIVE (DSX)
VERSION 2 RELEASE 1
5668-986**

PURPOSE

Distributed Systems Executive Version 2 Release 1.0 (DSX 2.1.0) is a network management tool designed to assist the user in achieving the controlled distribution of data and software in IBM 8100 and 3790 networks. DSX 2.1.0 includes: The host libraries, holding files and control files ... the transmission, formatting and reporting functions ... the flexible operator control capabilities that are needed for effective network management. This program is applicable to the 8100 and 3790 configuration #9431, #9165 or #9169 which have the ability to communicate with the host via SNA sessions.

DSX 2.1.0 consists of three major parts: Central library support ... automatic transmission control ... interactive operator control.

DESCRIPTION

The central library support supplies the functions and facilities needed at the host to maintain an inventory of network and processor resources (hardware, software and data), and to report on the status of these resources. One library contains a complete current set of 8100/DPPX or DPPX/SP programs, panels and CLISTS. Another library contains an equivalent set for the 3790 or 8100/DPCX (FSPs, FPs, DSCBs and DPCX category and category update data sets). The central files also include holding files for all the other data transmitted by DSX 2.1.0 (see below), a cluster master file for a complete inventory of network hardware and software, and a transmission control file of scheduled transmissions.

The automatic transmission control supplies function and service definitions needed by the host to start and control the exchange of data between the host and one or more processors. These include:

ACTION	DPPX	DPCX	3790
1. SENDING or DELETING			
Programs	yes	yes	yes
Panels	yes	yes	yes
DSCBs	no	yes	yes
CLISTS	yes	no	no
Data sets	yes	no	no
Category data sets	no	yes	no
Category updates	no	yes	no
2. SENDING			
Messages	yes	yes	yes
Print data	yes	yes	yes
File Update data	no	yes	yes
Power off command	no	yes	yes
PTF data sets	yes	no	no
Storage Dumps	yes	no	no
Category updates	no	yes	no
3. RETRIEVING			
Messages	no	yes	yes
Transactions	no	yes	yes
Programs	yes	no	no
Panels	yes	no	no
Data sets	yes	no	no
CLISTS	yes	no	no
Storage dumps	yes	yes	yes
PTF data sets	yes	no	no
Errorlog data	yes	no	no
4. INITIATE a FUNCTION	yes	yes	yes
5. CLEAR CATEGORY DATA SETS	no	yes	no

Variable length request units (RUs) are allowed for transmission to or from 8100/DPPX or DPPX/SP

The transmission control program sets up sessions and performs all requested functions according to session definitions previously entered by the user in the transmission control file. Messages to the operator are sent if any problems are encountered. Sessions will be executed according to the function sequence ordered by the user or by DSX. Defined sessions are initiated automatically by the transmission control program when the time conditions specified in session definition are met, or by an 8100/DPPX or DPPX/SP terminal request for a DSX initiation of a predefined session.

The transmission control program maintains complete records of the progress of scheduled transmissions. In the event of a failure in transmission, users are able to determine the exact point at which the failure occurred. For 8100/DPPX or DPPX/SP systems, failed transmissions are restarted at a logical block level, within a transmitted data set. Additionally, the DSX user may specify error conditions on which a session is to be terminated at subfunction level.

Through the Interactive Operator Facility, an operator at a 3270 Display Station can monitor the progress of transmissions and intervene as necessary. The 3270 Display Station used by the Interactive Operator Facility can be either native to DSX 2.1.0 or owned by Network Communications Control Facility (NCCF) and made accessible to DSX

2.1.0 via Terminal Access Facility. Users can choose the degree of control desired by selecting among three options:

- Operator control through the Interactive Operator Facility.
A sequence of displays on the 3270, with menu selection, fill-in-the-blank entry, and messages to prompt the correct data entry, gives the operator flexibility in monitoring and controlling transmissions.
- Simply replying to DSX messages requesting operator response (for example, RETRY or SKIP).

This option is available either on the 3270 Display Station or, for MVS systems, on the designated system console. In the latter case, the operator also has the ability to query session status and halt sessions if necessary. This capability is supported by commands entered in response to an outstanding write-to-operator reply (WTOR) maintained throughout the transmission run.

- Fully automatic operation with no operator intervention.

The degree of operator control is specified at DSX installation and may be overridden at each DSX invocation.

The Interactive Operator Facility is available for:

- MVS (ACF/VTAM or ACF/TCAM).
- VSE (ACF/VTAM or ACF/VTAME).
- OS/VS1 (ACF/VTAM or ACF/TCAM).

With TCAM, DSX 2.1.0 is available only through the Access Control Block (ACB) interface.

HIGHLIGHTS

- Central Library Support
Since modules and functions can be stored by version and modification level, the network administrator can recover earlier copies for backup, and store future versions before they are needed.
- Network Inventory
DSX 2.1.0 maintains complete, orderly records of cluster configurations and resource assignments.
- Problem Analysis
Host system retrieval of storage dumps, as well as of information on other user-noted problems, helps in problem analysis.
- Flexibility
 - Variable size request/response units (RUs) are allowed for 8100/DPPX or DPPX/SP systems to improve transmission performance.
 - Users are given many options in report writing; definition of user-noted problems, initiation of transmission by time, date, cluster, groups, or some combination.
 - Session planning and execution.
 - Ability for the DSX user to specify the sequence of execution of functions within a session.
 - Ability for the DSX user to have a session terminated at subfunction level if an error occurs.
 - Ability for the 8100/DPPX or DPPX/SP user to release an already-defined session for his node.
 - Transmission can be fully automatic, according to preset schedules, or, through the Interactive Operator Facility, a control operator can exercise extensive, flexible control:
 - Start transmission activity.
 - Display DSX transmission activity at subfunction level.
 - Quiesce/resume DSX transmission activity. The operator can choose if this command must become effective immediately or upon the completion of the subfunction in progress.
 - Hold/release a selected session. This command becomes effective upon the completion of the subfunction in progress.
 - Change session date and time.
 - Delete sessions.
 - Execute unscheduled but predefined sessions.
 - Terminate DSX transmission activity. The operator can choose if this command must become effective immediately or upon completion of all the sessions in progress.
 - Restart a session that did not complete.

PROGRAM PRODUCTS

DSX V2 R1 (cont'd)

- The Interactive Operator Facility allows operator communication through a 3270 Display Station, with full-screen data entry panels, menu selection, forward and backward paging, and messages to prompt the operator for the next appropriate entry.

- Means of Controlling Change

With the network equipment and data inventory maintained in the DSX 2.1.0 file, DSX 2.1.0 becomes a useful tool for keeping track of cluster configurations and modifications. Since DSX 2.1.0 checks the cluster master file before scheduling transmissions (to see if a program is assigned to a particular cluster, for example), users are prevented from making some time-consuming mistakes. Reports of cluster configurations, assigned programs, data sets, and so on, and of incidents occurring in the clusters may help to identify and correct problems resulting from incorrectly planned or implemented changes.

- Reporting

Users can obtain complete, current information on a specific cluster, data library contents, scheduled transmission sessions, abend dumps, or recorded problems. Reports can be current summaries or can show historical details and averages.

- Productivity

DSX 2.1.0 contributes to the productivity of everyone concerned with maintaining a distributed network by giving them:

- A common control statement language for maintenance functions.
- Syntax checking to minimize erroneous file updates; meaningful reports showing the status of files and transmission results; reusable session schedules.
- Operator commands to allow retry, restart and skipping of problem transmissions without terminating the session.
- Dynamic monitoring of transmission status and handling of emergencies by the operator through the Interactive Operator Facility.

- Auditability

- Programs, panels, command lists and data set control blocks are not sent to clusters unless they have been previously assigned to the cluster by a DSX 2.1.0 function.
- Time and date are stamped on all DSX 2.1.0 records in the system whenever the record is created or updated.
- A logging exit is provided for a user-written logging program or recovery system.
- DSX 2.1.0 archives the results of each session initiated.

- Security

DSX 2.1.0 has an extensive set of security functions in order to cover:

- Batch environment, to protect, by DSX passwords, utility runs.
- 8100/DPPX or DPPX/SP system access, via logon-ids and passwords to obtain authorization credentials whenever a session is initiated with the cluster.
- Online environment, to prevent unauthorized logons to Interactive Operator Facility via logon-ids and passwords.

Session logons and passwords for 8100/DPPX or DPPX/SP processors can be protected by DSX passwords. These controls only operate within the scope of DSX and depend on customer use of system protection options, e.g., RACF and MVS. Customer management is responsible for the selection, adequacy and use of these controls for their environment.

- Recovery

8100/DPPX or DPPX/SP can restart without retransmitting data in a partially transmitted data set. Attempts to format or send data sets only partially received are prevented and the DSX user is notified by message.

- Reliability, Availability and Serviceability

- Interference between transmission control program and the Interactive Operator Facility is minimal.
- User errors are detected as close to the source of input as possible. This is done for inputs to the batch utilities and for inputs to Interactive Operator Facility.
- The transmission control program can run without the Interactive Operator Facility.
- The Interactive Operator Facility can reconnect to a different terminal if terminal problems occur.
- In addition to the traces provided by the host environment, DSX maintains a trace table of TP I/O activities. The contents of the

DSX trace table will be part of the printed output provided by the operating system in case of a DSX abend.

- A tracking facility stores audit information concerning DSX file update operations in a reserved field of the updated records.

CUSTOMER RESPONSIBILITIES

For the cluster master file, the customer must collect and load the required data and set up a method to ensure that the information in this file is kept current and accurate.

DEPENDENCIES

In order to:

- Benefit from the transmission error recovery capability provided for 8100/DPPX or DPPX/SP systems
- Provide the capability for the 8100/DPPX or DPPX/SP user to release predefined held session for his node

8100/DPPX BASE enhancements or DPPX/SP is required and, at DSX 2.1.0 shipment time, the proper level of DPPX or DPPX/SP to be used will be documented.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

DSX 2.1.0 is designed to operate on any IBM S/370 mdl 125 or larger, or 30XX or 4300 processor capable of operating with software as shown below under "Software Requirements".

The host system must include IBM control units and features necessary for operation with the 8100 or 3790.

3790 Communication Systems must have one of the following feature codes:

- #9431 (at EC742305 or higher)
- #9165 (at EC 742042 or higher)
- #9169 (at EC 742051 or higher)

A full-screen display device must be available for the Interactive Operator Facility. This device must be one of the following IBM display stations:

- 3277 Display Station mdl 2 attached to one of the following controllers:
 - 3271 mdl 12
 - 3272 mdl 2
 - 3274 mdl 1B or 1C
- 3276 Display Station mdl 12 (or mdl 13 or 14 operating as a mdl 12)
- 3278 Display Station mdl 2 (or mdl 3 or 4 operating as a display station with 24 rows of 80 characters)
- 3279 Color Display Station (operating as a 3278 Display Station with 24 rows of 80 characters and default use of color)

In order to take advantage of the copy function provided with the Interactive Operator Facility, one of the printers attached to the 3270 Information Display System must be available. The copy function is supported in 3284/3286 mode.

The terminal support is provided through VTAM or through TCAM via the Access Control Block (ACB) interface.

SOFTWARE REQUIREMENTS

This licensed program is released to work with the specified minimum level of the following IBM system control programs (SCPs) and licensed products (LPs):

MVS		5752-VS2	Rel. 3.8
with	MVS/SP	5740-XYS	Rel. 1
or	MVS/SP	5740-XYN	Rel. 1
or	MVS/SP	5740-XC6	Ver. 2
			(when available)
or	MVS/SP	5665-291	Ver. 2
			(when available)
OS/VS1		5652-VS1	Rel.7
VSE		5745-030	
with	VSE/AF	5746-XE8	
ACF/VTAM		5735-RC2	Rel.2
with	VTAM SCP	5752-VS2	(MVS)
or	VTAM SCP	5652-VS1	(OS/VS1)
ACF/VTAM		5746-RC3	Rel. 2
with	VTAM SCP	5747-CF1	(VSE)
ACF/VTAME		5746-RC7	
with	VTAM SCP	5747-CG2	(VSE)

PROGRAM PRODUCTS

DSX V2 R1 (cont'd)

ACF/VTAM V2	5665-280	(MVS)
	5662-280	(OS/VS1)
	5666-280	(VSE)
ACF/TCAM	5735-RC3	Rel. 2 (MVS & VS1 only)
VSE/VSAM	5746-AM2	Rel. 2

The Interactive Operator Facility may also be accessed by an operator in session with the IBM Network Communication Control Facility (NCCF) through the Terminal Access Facility (5735-XX6, Feature #6001).

Program Validation Services (PVS) is required for preparing 3790 or 8100/DPCX programs, panels, and DSCBs for processing by DSX.

For DSX 2.1.0 used with 8100/DPPX or DPPX/SP, sequential data sets may originate at the host or at the 8100/DPPX or DPPX/SP processor. Programs and panels originate at the 8100/DPPX or DPPX/SP processor.

This licensed program is distributed in object code.

VIRTUAL STORAGE REQUIREMENTS: Minimum virtual storage requirements are:

- MVS: 800K private storage
- OS/VS1 and VSE: 800K partition size

plus VSAM and VTAM requirements.

CONVERSION from DSX VERSION 1 RELEASE 2.2

In the conversion from DSX Version 1 Release 2.2 to DSX 2.1.0, the DSX system files may be used without change.

The DSX cluster master file needs to be updated with the user IDs and passwords for the DSX control operators.

The transmission control file and the catalog work file must be redefined with IDCAMS, specifying variable-length instead of fixed-length records.

New VSAM Relative Sequential Data Sets (RSDS) files are needed for the Interactive Operator Facility.

COMPATIBILITY

Existing DSX Version 1 Release 2.2 input job streams will require minor modifications to run with DSX 2.1.0, as described in the DSX 2.1.0 *Installation Guide* (SH19-6233).

Coexistence of DSX Version 1 Release 2.2 and DSX 2.1.0 in the same host is not supported.

MVS SYSTEM INTEGRITY

IBM will accept APARS where installation of DSX 2.1.0 introduces an exposure to the system integrity of MVS. Refer to Programming Announcement dated October 21, 1981. This program is intended to run authorized.

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**DISTRIBUTED SYSTEMS EXECUTIVE (DSX)
VERSION 2 RELEASE 2
5668-986**

PURPOSE

Distributed Systems Executive Version 2 Release 2 (DSX-V2.2) is a S/370-based network management tool designed to give a central site user administrative and management control over the distribution of software and data across his distributed 8100, 3790, Series/1 network.

DSX-V2.2 consists of three major parts: Central repository support ... automatic transmission control ... operator control.

DESCRIPTION

The central repository provides the following services:

- Central libraries for permanent storage of copies of distributed user software resources (e.g., programs, panels, CLISTS for 8100/DPPX and Series/1, and FPs, FSPs, DSCBs, KEYS, Category Defines, Category Updates, CLISTS for 8100/DPCX). Associated maintenance functions allow the user to keep libraries complete and current.
- Holding files for temporary storage of transient transmission data such as user application data and maintenance data (e.g., storage dumps). Functions are provided to move data in and out of holding files, and to delete data which is no longer needed.
- A cluster master file for a complete and current inventory listing of hardware, software, and data resources at each distributed system in the network.
- Reporting facilities to allow the user to review the contents of the central repository.

The automatic transmission control supplies the facilities needed at the host to plan, automatically execute, track and report on the exchange of data between DSX and distributed systems. Figure 1 lists the automatic control capabilities provided for each type of distributed operating system.

The transmission control program is directed by session definitions, previously entered in the transmission control file, to set up sessions with the distributed systems, and to perform the requested functions (e.g., add program, retrieve data set, delete panel). Normally, sessions are started automatically by the time-directed schedule definitions. The functions requested in a session are executed either in the sequence defined or by a DSX-ordered sequence.

Sessions, which have been placed in a hold state, may be started by the central site DSX control operator, or by a remote site 8100/DPPX or Series/1 Control Program Support user. DSX allows user-definable transmission request-response units (RU) to be sent between DSX and distributed systems of up to 32K bytes in size.

The following is the current RU support provided by the various node types:

- 8100/DPPX: User-definable up to 4K bytes.
- 8100/DPCX and 3790: Fixed 256 bytes.
- Series/1: User-definable up to 16K bytes.

The transmission control program maintains complete records of the progress of scheduled transmissions. In the event of a transmission failure, users are able to determine the exact point at which the failure occurred. Failed transmissions are restarted at a more granular level than the data set being transmitted (e.g., at a logical block level for 8100/DPPX and Series/1 systems, and System Configuration data sets for 8100/DPCX). Additionally, the DSX user can specify error conditions under which a session is to be terminated at subfunction level. This protects the user from running into a compounded problem which may occur if subsequent session functions are conditionally dependent on the failing operation. During the running of the transmission control program, messages are sent to the DSX operator, if there are any DSX network transmission or service problems.

* Configuration data sets are supported only with DPCX Release 3.0.

+Including RSDS support.

-CLIST support of commands is available only with DPCX Release 3.0.

Figure 1. DSX-V2.2 Automatic Transmission control capabilities

Through the operator control capabilities, users can choose the degree of control desired by selecting among three options:

1. Operator control through the interactive operator facility.

An operator at a 3270 Display Station can monitor the progress of transmissions and intervene if necessary. A menu-ordered sequence of displays on a 3270 directs the user via prompting messages and fill-in-the-blanks entries to the various monitoring and controlling services. Transmission monitoring services are enhanced by a sorting and paging facility.

The monitoring and control capabilities which are available with the interactive operator facility are:

- Start transmission control program.
- Display DSX transmission sessions at subfunction level.
- Quiesce/resume DSX transmission to all distributed systems. The operator can request an immediate transmission stop or a subfunction completion stop. An immediate stop is at the current transmission block level. A subfunction completion stop brings the session to a halt as soon as the current subfunction is completed.
- Hold/release a selected session. This command becomes effective upon the completion of the subfunction in progress.
- Change session date and time of pending sessions.
- Delete pending or running session.
- Release sessions which have originally been defined as unscheduled.
- Restart a session that did not complete.
- Receive unsolicited messages generated by the transmission control program.
- Terminate DSX transmission control program. The operator can choose if this command must become effective immediately or upon completion of all the sessions in progress.

2. Limited operator control through the system console.

PROGRAM PRODUCTS

DSX V2 R2 (cont'd)

Unsolicited messages are displayed on the system console and, for system messages requiring a response (for example, RETRY or SKIP), the operator is prompted. For MVS and OS/VS1 systems, the operator also has the ability to query session status and halt sessions if necessary. This capability is supported by commands entered in response to an outstanding write-to-operator reply (WTOR) maintained throughout the transmission run.

3. Fully automatic operation with no operator intervention.

The degree of operator control is specified at DSX installation and may be overridden at each DSX invocation.

HIGHLIGHTS

• Central Library Support

Since copies of distributed software resources can be stored by version and modification level, the network administrator can recover earlier copies for backup, and store future versions before they are needed.

• Network Inventory

DSX-V2.2 maintains complete, orderly records of distributed system hardware configurations and software and data resource assignments.

• Problem Analysis

Host system retrieval of storage dumps, as well as of information on other user-noted problems, helps in problem analysis.

• Flexibility

- Mixed 8100, Series/1 and 3790 networks are supported in all combinations of distributed operating systems.

- User-definable RU sizes are allowed for 8100/DPPX and Series/1 systems to improve transmission performance.

- Users are given many options in:

- Report writing.
- Definition of user-noted problems.
- Initiation of transmission by time, date, group of distributed systems, or under a user request.

- Session planning and execution.

- Ability for the DSX user to specify the sequence of execution of functions within a session.

- Ability for the DSX user to have a session terminated at subfunction level if an error occurs.

- Ability for the 8100/DPPX and Series/1 Control Program Support user to release an already defined session for his node.

- Transmission can be fully automatic, according to preset schedules, or, through the interactive operator facility, a control operator can exercise extensive, flexible control:

• Means of Controlling Change

With the hardware, software and data resources inventory listings maintained in the cluster master file, DSX-V2.2 becomes a useful tool for keeping track of distributed system configurations and modifications. Since DSX-V2.2 checks the cluster master file before scheduling transmissions (to see if a program is assigned to a particular distributed system, for example), users are prevented from making mistakes that may introduce system and/or data integrity exposures. Reports of distributed system hardware configurations, assigned programs, data sets, and so on, and of incidents occurring in the distributed systems may help to identify and correct problems resulting from incorrectly planned or implemented changes.

• Reporting

Users can obtain complete, current information on a specific distributed system, holding file and library contents, scheduled transmission sessions, abend dumps, or recorded problems. Reports can be current summaries or can show historical details and averages.

• Productivity

DSX-V2.2 contributes to the productivity of everyone concerned with maintaining a distributed network by giving them:

- A common control statement language for maintenance functions.
- Syntax checking to minimize erroneous file updates.
- Meaningful reports showing the status of files and transmission results.
- Reusable session schedules.

- Operator commands to allow retry, restart and skipping of problem transmissions without terminating the session.

- Dynamic monitoring of transmission status and handling of emergencies by the operator through the interactive operator facility.

• Auditability

- Programs, panels, command lists and data set control blocks, keys, category data sets and category updates are not sent to distributed systems unless they have been previously assigned to the distributed system by a DSX-V2.2 function.

- Time and date are stamped on all DSX-V2.2 records in the system whenever the record is created or updated.

- A logging exit is provided for a user-written logging program or recovery system.

- DSX-V2.2 archives the results of each session initiated.

• Security

DSX-V2.2 has an extensive set of security functions in order to cover:

- Batch environment: To protect utility runs by DSX passwords.

- Online environment: To prevent unauthorized logons to the interactive operator facility via logon-ids and passwords.

- 8100/DPPX and Series/1 Control Program Support system access, via logon-ids and passwords to obtain authorization credentials whenever a session is initiated with the distributed system.

Session logon-ids and passwords for 8100/DPPX and Series/1 Control Program Support systems can be protected by DSX passwords. These controls only operate within the scope of DSX and depend on customer use of system protection options, e.g., RACF for MVS. Customer management is responsible for the selection, adequacy and use of these controls for their environment.

• Recovery

Transmissions can restart without resending the data of a partially transmitted data set. Attempts to format or send data sets only partially received are prevented and the DSX user is notified by message.

• Reliability, Availability and Serviceability

- Interference between transmission control program and the interactive operator facility is minimal.

- User errors are detected as close to the source of input as possible. This is done for inputs to the batch utilities and for inputs to interactive operator facility.

- The transmission control program can run without the interactive operator facility.

- The interactive operator facility can reconnect to a different terminal if terminal problems occur.

- In addition to the traces provided by the host environment, DSX maintains a trace table of TP I/O activities. The contents of the DSX trace table will be part of the printed output provided by the operating system in case of a DSX abend.

- A tracking facility stores audit information concerning DSX file update operations in a reserved field of the updated records.

TECHNICAL SALES INFORMATION

This program is applicable to 8100s, Series/1s and 3790s which have the ability to communicate with the host via SNA sessions.

CUSTOMER RESPONSIBILITIES

For the cluster master file, the customer must collect and load the required data and set up a method to ensure that the information in this file is kept current and accurate.

DEPENDENCIES

• 8100 systems must have one of the following licensed programs at the service level specified:

- DPPX: Base Level 0900 (FEP6), or subsequent service level.

- DPCX: Release 2.2 with feature #6001, or Release 3.0, or subsequent service level.

Note: Send/retrieve/delete data set functions and CLIST support of commands are available only with DPCX Release 3.0. If DPCX Release 2.1 is run with DSX-V2.2, the new DSX functions are not supported.

• 3790 systems must have one of the following feature codes:

- #9431 (at EC 742035 or higher)

PROGRAM PRODUCTS

DSX V2 R2 (cont'd)

- #9165 (at EC742042 or higher)
- #9169 (at EC 742051 or higher)
- Series/1 systems must have one of the following licensed programs at the service level specified:
 - Realtime Programming System: 5719-RM6 V1.0, upon availability, or subsequent service level.
 - Event Driven Executive: 5719-RM1 V1.0, upon availability, or subsequent service level.
 - Control Program Support: 5799-TFA SNA PRPQ.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

DSX-V2.2 is designed to operate on any IBM S/370 mdl 125 or larger, or IBM 30XX or 4300 Processor capable of operating with software as shown below under "Software Requirements".

The host system must include IBM control units and features necessary for operation with the IBM 8100, Series/1 or 3790.

A full-screen display device must be available for the interactive operator facility. This device must be one of the following IBM display stations:

- 3277 Display Station mdl 2 attached to one of the following controllers:
 - 3271 mdl 12
 - 3272 mdl 2
 - 3274 mdl 1B or 1C
- 3276 Display Station mdl 12 (or mdl 13 or 14 operating as a mdl 12)
- 3278 Display Station mdl 2 (or mdl 3 or 4 operating as a display station with 24 rows of 80 characters)
- 3279 Color Display Station (operating as a 3278 Display Station with 24 rows of 80 characters and default use of color)

In order to take advantage of the copy function provided with the interactive operator facility, one of the printers attached to the 3270 Information Display System must be available. The copy function is supported in 3284/3286 mode.

The terminal support is provided through VTAM or through TCAM via the Access Control Block (ACB) interface.

SOFTWARE REQUIREMENTS

This licensed program is released to work with release levels of the following IBM system control programs (SCPs) and licensed products (LPs) that are current at DSX-V2.2 availability time:

MVS		5752-VS2	
with	MVS/SP	5740-XYS	
or	MVS/SP	5740-XYN	
or	MVS/SP	5740-XC6	
or	MVS/SP	5665-291	
OS/VS1		5652-VS1	
VSE		5745-030	
with	VSE/AF	5746-XE8	
ACF/VTAM		5735-RC2	
with	VTAM SCP	5752-VS2	(MVS)
or	VTAM SCP	5652-VS1	(OS/VS1)
ACF/VTAM		5746-RC3	
with	VTAM SCP	5747-CF1	(VSE)
ACF/VTAME		5746-RC7	
with	VTAM SCP	5747-CG2	(VSE)
ACF/VTAM V2		5665-280	(MVS)
		5662-280	(OS/VS1)
		5666-280	(VSE)
ACF/TCAM		5735-RC3	(MVS and OS/VS1 only)
VSE/VSAM		5746-AM2	

With TCAM, DSX-V2.2 is available only through the Access Control Block (ACB) interface.

The interactive operator facility may also be accessed by an operator in session with the IBM Network Communication Control Facility (NCCF) through the Terminal Access Facility (5735-XX6, feature #6002).

Program Validation Services (PVS, 5735-XR3) is required for preparing IBM 3790 or 8100/DPCX programs, panels, DSCBs, 8100/DPCX Keys, Category Data Sets and Category Updates for processing by DSX. Minimum PVS releases are: Release 4.1 for DPCX Release 2.2 or Release 5.0 for DPCX Release 3.0.

This licensed program is distributed in object code.

VIRTUAL STORAGE REQUIREMENTS: Minimum virtual storage requirements are:

- MVS: 900K bytes private storage
 - OS/VS1 and VSE: 800K bytes partition size
- plus VSAM and VTAM requirements.

CONVERSION

- Conversion from DSX Version 1 Release 2.

The DSX system files may be used without change.

The DSX cluster master file needs to be updated with the user IDs and passwords for the DSX control operators and to reflect the acquisition of new distributed system and resource types, if required.

The transmission control file and the catalog work file must be redefined with IDCAMS, specifying variable-length instead of fixed-length records.

New VSAM Relative Sequential Data Sets (RSDS) files are needed for the interactive operator facility.

- Conversion from DSX Version 2 Release 1

All files are upward compatible.

Cluster master files must be updated to reflect the acquisition of new distributed system and resource types, if required.

COMPATIBILITY

Existing DSX Version 1 Release 2 input job streams will require minor modifications to run with DSX-V2.2, as described in the DSX-V2.2 Installation Guide (SH19-6233).

Existing DSX Version 2 Release 1 input job streams may be used with DSX-V2.2 without change.

DSX-V2.2 and previous DSX releases may coexist in the same host under the following restrictions:

- They should not deal with the same resources at the same distributed system.
- DSX files can be shared only if they do not run at the same time.

Logic Manual, Volume 2, Online Program and Diagnostic Aids (LY19-6216).

MVS SYSTEM INTEGRITY

IBM will accept APARS where installation of DSX-V2.2 introduces an exposure to the system integrity of MVS. Refer to Programming Announcement dated October 21, 1981. This program is intended to run unauthorized under MVS and authorized under OS/VS1.

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**4700 FINANCE COMMUNICATION SYSTEM
COBOL SUPPORT OS/VS (5668-987)**

PURPOSE

The 4700 Finance Communication System COBOL Support OS/VS, Program Number 5668-987, executes under OS/VS1 or OS/VS2 (MVS). Output of the compiler is object programs that will execute on the 4700 controllers.

The 4700 COBOL compilers should provide customers with a powerful, comprehensive, easy-to-use language for use in preparation and execution of finance application programs. The language offers a wide range of features, plus facilities for handling input/output, and debugging COBOL programs.

HIGHLIGHTS

- Language
 - Support of American National Standard (ANS) COBOL X3.23-1974 (except for the RERUN clause.)
- User Options
 - Source Listings.
 - Cross reference.
 - Storage map of variables.
 - Statement offset listing.
 - Object listing.
- Program Development and Productivity Aids
 - Symbolic debug.
 - Flow trace.
 - Extensive error checking.
 - Generalized CALL.

I/O Capabilities: 4700 Finance Communication System COBOL Support programs can work with SEQUENTIAL, RELATIVE and INDEXED files. The access methods supported are as follows:

- Sequential Organization
 - Sequential processing.
- Relative Organization
 - Sequential processing.
 - Random processing by relative record number.
- Indexed Organization

Table Handling: Define and process fixed length tables up to three dimensions.

Segmentation: The segmentation feature permits:

- Dividing the Procedure Division of a COBOL program into a series of segments.
- Specifying that some segments (fixed segments) must be resident in main storage while the program is running, and cannot be overlaid, while others (independent segments) are loaded into an overlay area when needed.
- Reducing main storage requirements during program execution.

Interprogram Communication: This facility allows transferring of control from one COBOL program to another. Control can also be transferred to an appropriate controller assembler language program. Programs can access the same or unique data.

Data Communications: Data Communications support for COBOL is via a CALL interface.

Industry Standards: Designed in accordance with the American National Standard (ANS) COBOL X3.23-1974 as understood and interpreted by IBM as of January, 1980, with the exception of the RERUN clause. ANS COBOL is identical to ISO 1989-COBOL approved February, 1978 by the International Organization for Standardization.

Processing Modules: The following processing modules are supported:

- 1 NUC 1, 2
- 1 TBL 1, 2
- 1 SEQ 1, 2 *
- 1 REL 0, 2 *
- 1 INX 0, 2
- 1 SEG 0, 2
- 1 LIB 0, 2
- 1 DEB 0, 2
- 1 IPC 0, 2

* RERUN clause is checked for syntactic correctness only.

The first digit above represents the level of the modules included in the compiler; the second digit represents the lowest level specified for the American National Standard COBOL (0 implies that the module may be completely missing from a standard compiler); the third digit represents the highest level specified in the Standard.

In addition to the above, the following NUCLEUS Level 2 features are also supported:

- COMPUTE statement.
- Qualification.
- Arithmetic operators.
- Complex conditions.
- CORRESPONDING phrase.
- ACCEPT and DISPLAY verbs.
- Multiple operand support for arithmetic statements.
- Nested IFs.
- PERFORM UNTIL.
- 01 through 49 level numbers.
- String/Unstring from level 2 of the ANS 1974 COBOL nucleus module.

Language Extensions:

- Support for Terminal I/O.
- Symbolic characters facility for defining and referencing hexadecimal values.
- Initial attribute to optionally cause program to be in its initial state each time it is called.
- Program access to the system global segments 13 and 15.

I/O File Support:

- EDAM file on diskette and disk via sequential, relative and indexed files I/O modules.
- CALL interface to handle unique 4700/3600 device characteristics.
- CALL interface to handle temporary files.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI Section, in the installation of IBM Licensed Programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation and day-to-day operation lies solely with the customer. Installation of IBM licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Compilation with the IBM 4700 COBOL-OS/VS Host Compiler and Library, Program Number 5668-987, requires at least 192K bytes of virtual storage as well as a configuration sufficient to run the selected operating system.

Object program execution can be on any 4700 system that has sufficient user storage and 4700 Controller Support including the optional zoned decimal support. The actual user storage requirements are a function of the COBOL source program.

CONVERSION/COMPATIBILITY

Some degree of upward compatibility does exist between the 4700 COBOL compiler and the OS/VS and DOS/VS compilers. However, differences do exist and some conversion will be necessary. The differences include I/O and communications support and language features introduced to support specific 4700 controller functions.

PROGRAM PRODUCTS

**5668-989 - 4700 FCS HOST SUPPORT
4700 FINANCE COMMUNICATION SYSTEM
HOST SUPPORT
SSX/VSE, DOS/VSE, OS/VS1, MVS and MVS/XA****PURPOSE**

The 4700 Finance Communication System Host Support will provide support for the following new and improved functions, over existing 3600 support: CPGEN enhancements for 4700 support ... Increased application program maximum size ... 4700 host transmission facility (enhanced diskette update capability, unattended diskette create/update capability, host transmission facility log file available, integrated SDLC and BSC3 image transmission facility) ... Host Diskette Image Create Facility (HDIC) Support ... Application Program/Diskette Dump Enhancements.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI Section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation and day-to-day operation lies solely with the customer. Installation of IBM Licensed Programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT**SOFTWARE REQUIREMENTS**

Support: The IBM Finance Communications System 4700 Host Support will support the current levels of the following operating systems: SSX/VSE, DOS/VSE, OS/VS1, MVS and MVS/XA.

All 4700 Host Support functions are also supported by the latest levels of BTAM, BTAM-ES, ACF/VTAM, ACF/TCAM R2 and VTAME. **Note:** ACF/TCAM V2 support for the 4700 host transmission facility is provided via the Subsystem Interface.

MIGRATION and COEXISTENCE

User application programs designed to be processed by current 3600/3624 host support will continue to be processed by 4700 host support with no source code changes required. However, the user programs will require reassembly and CPGENs will require minimum source code changes to take advantage of the new 4700 functions. The users of 3600/3624 and 4700 libraries may coexist on the same host system.

Action Required: 4700 Host Support must be ordered to match the operating system to which it will be applied. The orderable program number for 4700 Host Support is 5668-989.

4700 Host Support supports the 4700 controllers and terminals.

PROGRAM PRODUCTS

COMPOSED DOCUMENT PRINTING FACILITY (CDPF)

5668-997

PURPOSE

Composed Document Printing Facility (CDPF) program provides support for the 4250 Printer to produce high-quality master pages. CDPF processes the output from text programs such as Document Composition Facility Release 3 and graphics programs using Graphical Data Display Manager Release 3, and produces a format appropriate for printing on the 4250 Printer. CDPF operates under MVS/SP, MVS/XA, VM/SP CMS or DOS/VSE.

HIGHLIGHTS

- Provides an application program interface to the 4250 Printer.
- Provides high-quality printing at a resolution of 600 x 600 dots (pels) per square inch.
- Accepts hexadecimal-coded character output from text programs such as Document Composition Facility Release 3, and converts it into an appropriate image page layout using a font library designed for printing on the 4250 Printer.
- Accepts hexadecimal characters as input and converts them into an image pattern using a font library.
- Accepts non-coded dot patterns that have been generated by graphics programs using the Graphical Data Display Manager (GDDM) Release 3 licensed program or user-written routines.
- These text and graphics objects can be placed anywhere within a page by means of control information supplied to the CDPF program.
- Provides for merging of text and graphics data within a single page.
- CDPF can save its binary image output on disk, either as a complete document or as a single page segment for later processing.
- Page segments generated by CDPF or graphics programs can be merged with the text processed by text formatting programs.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation of the Composed Document Printing Facility licensed program.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Composed Document Printing Facility supports the IBM 4250 Printer on the following when supported by VSE, VM/SP or MVS/SP: All IBM S/370 mds 138 and above, the IBM 303X, 308X processors and the IBM 4321, 4331 and 4341 processors.

An IBM 4250 Printer must be attached to the system.

Processor Storage: Composed Document Printing Facility uses the paging facilities of the operating system. Therefore, it requires significantly less processor storage than the amount of virtual storage used. The system programmer responsible for the installation of the program determines the amount of real storage to be used.

Virtual Storage: The Composed Document Printing Facility program uses about 120K bytes of virtual storage. The amount of additional space for control blocks and various buffers is a function of the page width, the size of the largest font in the document, and the number of input files in use at any one time.

As an example, a job that files the output document and prints on 22cm (8-1/2 inch-wide) paper, using a maximum font size of 24 points and three parallel secondary input files, requires approximately 800K bytes of virtual storage.

Direct Access Storage: The Composed Document Printing Facility load module requires approximately 120K bytes of direct access storage. Composed Document Printing Facility does not require any temporary direct access storage.

The space required for input and output files depends on the content and complexity of the formatted document. An input file containing only text uses between 4K and 10K bytes per page. If this output is filed, it requires between 300K and 400K bytes per page on the DASD.

The font library requirements depend on the number of fonts, the number of characters in each font, and the size and shape of the character images.

The UNIVERS typeface family out of the IBM Typographic Fonts for the IBM 4250 Printer contains the greatest number of typefaces. It consists of eight typefaces and requires a maximum of 12MB of disk storage. The typical typeface family consists of four typefaces and requires approximately 6.2MB of disk storage.

Storage requirements for each typeface family are listed in the *IBM 4250 Printer Type Font Catalog* (G520-0004).

SOFTWARE REQUIREMENTS

Composed Document Printing Facility processes the composed output from text formatting programs such as Document Composition Facility and graphics programs such as Graphical Data Display Manager into a form suitable for printing on the IBM 4250 Printer.

The following are prerequisite programs for the Composed Document Printing Facility licensed program:

MVS Operating System

- MVS/370 (MVS/SP Version 1 Release 3 or later) and MVS/XA (MVS/SP Version 2 Release 1 or later).
- Either one of ACF/VTAM Release 3 or ACF/VTAM Version 2.
- Font library (see Note below).

VM Operating System

- VM/SP: Operation under VM/SP Releases 1 and 2 is possible by specifying the IBM 4250 as an unsupported device. Beginning with VM/SP Release 3, the IBM 4250 will be supported as a dedicated device.
- Font library (see Note below).

VSE Operating System

- VSE/Advanced Functions Release 3
- Either one of ACF/VTAM Release 3 or ACF/VTAM Version 2 or ACF/VTAME. In case of ACF/VTAME, the IBM 4250 Printer must be attached via an IBM 3274 mdl 1A, 31A or 41A.
- VSE/VSAM Release 2.
- VSE/VSAM Space Management for SAM feature.
- Font library (see Note below).

Input to Composed Document Printing Facility: The following program products or their equivalents furnish the input to Composed Document Printing Facility:

- Document Composition Facility (DCF) Release 3.
- Graphical Data Display Manager (GDDM) Release 3: GDDM provides input to CDPF under MVS and VM but not under VSE.
- One or more typeface families of the IBM Typographic Fonts for the IBM 4250 Printer.

Note: A font library is not required if the user runs only graphics applications (for example, via GDDM) without text applications.

PERFORMANCE

Composed Document Printing Facility has been designed to maximize the 4250 Printer speed. The actual time to print a document is dependent upon:

- Whether a document needs to be composed or not at printing time.
- Complexity of the system.
- Concurrent System activities (job mix, priorities assigned, etc.).
- Operating System used.
- Central Processor storage size.
- Central Processor speed.
- Type of devices used for paging.
- Type of 4250 Printer attachment (3274 Control Unit or Display/Printer Adapter on the 4321 or 4331 Processors).

RPQs ACCEPTED: Yes

**PARAMETER TABLE GENERATION FACILITY
For the IBM 3644 AUTOMATIC DATA UNIT
GEN3644 (5668-998)****PURPOSE**

The Parameter Table Generation Facility (GEN3644) provides a means for customizing the IBM 3644 Automatic Data Unit. This customization consists of selecting 3644 functions and specifying the initial values of stored data items. GEN3644 translates the customization data (developed on worksheets) into the format necessary for transmission to the 3644. Translation is performed by editing the source data created by the user and converting it into a parameter table format for loading into the 3644. The resulting parameter table works with the 3644 microcode provided by IBM.

GEN 3644 also produces a listing of the source data entered by the user. Edits are performed both on a record basis and on an overall table basis. In most cases, editing continues despite errors, but the parameter table is not usable if any errors are found. Errors noted on the 3644 program listings are corrected by changing the original input and resubmitting the job.

The output of GEN3644 is a sequential file containing the Parameter Table Load (PTL) data as required for transfer to the 3644. The records on the sequential file are 256 bytes long.

HIGHLIGHTS

Worksheets are used to guide the customer through the procedure of defining the 3644 PTL. The worksheets are distributed as a set of reproduction masters (GA24-3203) for use in a customer's office copier or similar equipment.

Messages identify errors encountered during the processing of the source statements.

Symbolic naming of 3644 channels and common data items is supported.

A program listing is produced in a format similar to the source worksheets.

Parameter Table Load (PTL) is produced that is usable with the IBM supplied Control Storage Load (CSL) to customize the operation of the 3644.

The PTL is placed in a sequential data set. The Downstream Load Utility (DSL) program product can be used to transfer both the CSL and PTL to the 3644 at required times. The DSLU is also used to handle CSLs and PTLs for library inclusion.

CUSTOMER RESPONSIBILITIES

The customer is responsible for installing the GEN3644 licensed program.

The customer is responsible for creating and managing the libraries of source statements and parameter tables for the 3644 through the use of DSLU and system utilities. The source statements must be sorted into ascending sequence based on columns 1 to 9.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

GEN3644 is designed to operate on the IBM 4331 processor. The minimum configuration must include a 4331 processor with a supported disk, tape and console. A printer is recommended.

SOFTWARE REQUIREMENTS

GEN3644 operates under control of DOS/VSE. 100K bytes of virtual storage is required. DASD space is required in the system library and the source statement library. Additional space is required for the PTL data.

COMPATIBILITY

The input source statements (from the worksheets) and the output PTL records of the DPPX/GEN3644 licensed program and the input and output of the 3630 Plant Communication System - 3644 Translation Services system control programming are compatible with the input and output of GEN3644.

AUTHORIZATION and AUDITABILITY

This licensed program supports and is subject to the isolation, authorization, auditability and integrity rules of the DOS/VSE Operating System.

DOCUMENTATION

(available from Mechanicsburg)

General Information Manual (GS31-0009)

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

**SYSTEM/3 UNIT INVENTORY TECHNIQUES
5701-D11****PURPOSE**

This IBM System/3 licensed program provides the retailer with meaningful reports on merchandising activity and inventory status to effect a more efficient and profitable operation. The system keeps management informed on the performance of all classes of merchandise and is designed to report exceptional performance of individual styles to the buyers.

HIGHLIGHTS

- Early recognition of fast and slow moving merchandise based on user-supplied standards.
- Early recognition of low stock levels based on user-supplied standards.
- Status inquiry at buyer's request.
- Variety of merchandise management reports.
- Automatic maintenance of file at the style level.
- Optional color/size reporting.

DESCRIPTION

This licensed program provides a comprehensive inventory control system for retailers, consisting of nine program elements. Four of these maintain a master file of sales and inventory information; five provide a comprehensive set of reports to assist retailers in managing the merchandising of their inventory. The file maintenance routines insure the validity of the transactions, update the master file, and identify exceptional sales and onhand conditions. The report routines produce reports with merchandise information at various levels: Color/size, style/store, vendor, price line, and age.

This system has been developed to assist retailers in installing a unit control system. It is intended as an entry level system for either new or current IBM users. The minimum configuration can handle up to nine store locations. With additional core storage, the system can be modified to handle more than nine stores. The initial efforts of this system should be to establish and maintain an accurate master file and provide basic operating reports. Installation of the system will give retailers mechanized record keeping and report preparation and will provide historical information. The experience and knowledge gained from installing this system will provide a base for expanding the retailers inventory application into more sophisticated areas.

On a daily basis, transaction cards are analyzed for correct format and valid field contents. The transactions may pertain to customer sales, order placements or receipts, customer or vendor returns, transfers between stores, reconciliation of inventory count, and so on.

On a weekly basis the master file is updated and styles are examined for fast or slow sales performance and low inventory levels. Style and color/size reports can be generated for buyer action. The reports can vary in detail from only the styles which are exceptional (fast, slow or low level) to styles which have been specifically requested to a complete stock report.

On a monthly, quarterly, or as required basis, the age, price line and/or vendor reports can be printed for evaluation and analysis.

CUSTOMER RESPONSIBILITIES

The users of this licensed program will need operating personnel who are knowledgeable in System/3 Card RPG II, Card Sort/Collate, and card system operating procedures. The buyers and/or merchandise managers must have a thorough understanding of the types and uses of transaction codes, the report contents, and the available reporting controls.

Prior to installation the user must be familiar with the functions and operation of the routines in this system. A disciplined procedure for data capture must be established and maintained.

Each user of this system must collect the required data and create the master card file. Due to the open-ended design of the system, the extent of the data which is considered to be required may be determined by the user.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

An IBM System/3 CPU (5410 model A3 - 12K) with the MFCU and printer attachments (#4100 or #4101 and #3970, #3971, or #3972), an IBM 5424 Multi-Function Card Unit (any model), and an IBM 5203 Printer (any model).

SOFTWARE REQUIREMENTS

This licensed program is written in Card RPG II. The file maintenance routine (update) has an IBM System/3 Basic Assembler subroutine incorporated into it.

IBM System/3 Card RPG II (5701-RG1) is required for compiling, modifying and maintaining the programs. IBM System/3 Basic Assembler (5702-AS1) and the use of an IBM Disk System/3 are required for the modification of the Basic Assembler subroutine in the update routine. The card sort/collate program, part of the IBM System/3 Card System Utilities (5701-UT1), can be used for sequencing the transaction file and merging the style/store master file with the color/size master file.

DOCUMENTATION
(available from Mechanicsburg)

Application Description Manual (GH20-0931)

TERMS and CONDITIONS: See PP Index

**SYSTEM/3 APPAREL BUSINESS CONTROL
(ABC) SYSTEM
5701-D12****PURPOSE**

The IBM System/3 Apparel Business Control (ABC) System provides the apparel industry with a low cost, easily installed order processing system designed to complement the capabilities of the IBM System/3.

HIGHLIGHTS

- Applications are self-sustaining; additional programs are not required.
- Programs are modular; all applications need not be installed.
- Programs can be tailored based on the application questionnaire; user programming is minimized.
- Tailored system is generated on the user's System/3; new versions can be generated if desired.
- All applications are order-oriented; basic system provides an excellent source of data for additional applications.

DESCRIPTION

The system provides a basic set of order-related functions. These functions are self-supporting; the system can be installed and operated without additional programming. The following functions are included:

- **Order Edit:** Consists of two programs, order edit and pricing. The order edit program checks new orders for valid codes, crossfoots the order detail cards, and balances the totals from the order detail cards against the totals in the order miscellaneous data cards. The pricing program validates the style and color numbers, and prices the order detail cards.
- **Order Writing:** The order writing program prepares printed orders for use as internal documents and as order acknowledgments. The order register program prints a register of the orders.
- **Bookings Reporting:** Prints a combined bookings and over/under report by style, color, dimension and size. The bookings report includes a summary of sales received prior to the last report, a detailed listing of key orders received since the last report, a summary of the remaining orders received since the last report, a summary of all outstanding or completed cuts, and an over under summary.
- **Fabric Requirements Reporting:** Consists of two programs, fabric requirements explosion and fabric requirements. The output shows seasonal fabric requirements based on actual or projected sales.
- **Finished Goods Requirements Reporting:** Produces a report showing finished goods requirements by time period, based on the start shipping and complete shipping dates specified on the orders.
- **Stock Allocation:** Matches outstanding orders against completed cuts. The results of the allocation are printed on an allocation report, and allocated order details are stacker-selected for review and shipment.
- **Invoicing:** Consists of three programs, invoice edit, invoicing and invoice register. The invoice edit program crossfoots the order detail cards and balances the order details against the invoice detail card. The invoicing program prepares extended and totaled invoices. The invoice register program prints an invoice register and punches invoice summary cards.

CUSTOMER RESPONSIBILITIES

Customer must accurately complete the application questionnaire, train operating personnel, generate the tailored system, organize support activities, test the tailored system, prepare input, operate the system, and analyze output.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum configuration for tailoring, compiling, and operating the system consists of an IBM System/3 5410 Processing Unit, mdl A2 (card; 8192 bytes), comprised of an IBM 5203 Printer, mdl 1 (100 lines-per-minute, 96 print positions, with attachment), an IBM 5424 and Multi-Function Card Unit, mdl A1 (read 250 cpm; punch 60 cpm, interpret 60 cpm, with attachment). In addition, the system must include an IBM 5496 Data Recorder, mdl 1, or a 5475 Data Entry Keyboard.

Availability of 120 or 132 print positions will allow greater flexibility in formatting reports. The programs use tables in storage during processing. The only table that can significantly affect storage requirements is the color code table. Under standard options the system can accommodate 150 color codes and their descriptive entries. Use of more codes may require additional storage.

SOFTWARE REQUIREMENTS

All ABC programs are written in IBM System/3 Card RPG II (5701-RG1). Online sorting or collating requires the use of System/3 Card Utilities (5701-UT1).

DOCUMENTATION

(available from Mechanicsburg)

Application Description Manual (GH20-0822).

TERMS and CONDITIONS: See PP Index

**SYSTEM/3 OPTIMUM BLENDING
5701-D51****PURPOSE**

IBM System/3 Optimum Blending is a small linear programming system specifically designed for blending applications in the agriculture and food processing industries.

HIGHLIGHTS

- Easy to install, no customer programming is required.
- Optimal solutions to most blending problems are obtained in 3 to 6 minutes; this time includes card reading and report printing.
- Cost justified; in many cases the cost of both the program and System/3 can be justified by direct savings from formula cost reductions alone.
- The linear programming algorithm used is the standard simplex method augmented by lower and fixed level bounding.

DESCRIPTION

The licensed program consists of a blend function that does linear programming and a batch report function that prints mixing instructions for various quantities of the optimal blend produced by the blend function. The blend function produces an optimal combination of raw material ingredients based on user-supplied product specifications and ingredient analysis information.

This licensed program has wide application among commercial feed manufacturers, cattle feedlots, fertilizer manufacturers, and sausage blenders. The programs are application oriented and do not require that the user have previous training in mathematics or data processing.

Optimum Blending is used to find a least cost combination of raw materials that will satisfy a set of user-supplied product specifications. The licensed program also creates printed mixing instructions for user-selected quantities of the least-cost combination of raw materials.

CUSTOMER RESPONSIBILITIES

Preparation of the punched card product specifications and ingredient analysis information and compilation of the batch report program are the only prerequisites to implement the licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

For program execution and batch report program compilation, the minimum configuration required is one IBM 5410 Processing Unit, mdl A2 (8,192 bytes), an IBM 5203 Printer mdl 1 (100 lpm, 96 print positions), and an IBM 5424 MFCU mdl A1 (read 250 cpm, punch 60 cpm, interpret 60 cpm).

For blend program assembly, the minimum configuration required is one IBM 5410 Processing Unit mdl A13 (12,288 bytes), an IBM 5203 Printer mdl 1 (100 lpm, 96 print positions) with Universal Character Set feature and a PN (60-character set) interchangeable chain cartridge, an IBM 5424 MFCU mdl A1 (read 250 cpm, punch 60 cpm, interpret 60 cpm), and an IBM 5444 Disk Storage Drive mdl 1 (2.45 million bytes).

Because of computer memory limitations, the size of the linear programming problems is limited to a certain number of ingredients, nutrients, and problem restrictions (constraints). Since there are many acceptable combinations of ingredients, nutrients, and constraints for any given memory capacity, a formula is provided below to determine the memory requirements for any given problem:

$$MR = 4320 + 30(N) + 40(I) + 3(I+R+1) + 5(I+1)(R+1)$$

where:

- R = computer memory requirement in bytes
- N = number of nutrients or raw material attributes
- I = number of ingredients or raw materials
- R = $R_1 + R_2 + R_3 + R_4 + R_5$
- R1 = number of nutrients with fixed limit (lower limit = upper limit)
- R2 = number of nutrients with lower limit other than zero
- R3 = number of nutrients with upper limit other than infinity
- R4 = number of ingredients with upper limit other than infinity
- R5 = number of nutrients with neither an upper nor lower limit specified

SOFTWARE REQUIREMENTS

System Control Program - the licensed program is dependent upon the system communication area established by the execution of the IBM System Initialization Program (5701-SC1), IBM System/3 Basic Assembler language (5702-AS1) and IBM System/3 Card RPG II language (5701-RG1).

PROGRAM PRODUCTS

**SYSTEM/3 LAW ENFORCEMENT SYSTEM
5701-G21**

PURPOSE

The IBM System/3 Law Enforcement System provides local government police departments with management, statistical, and investigative information. A complete set of Card RPG II and IBM System/3 Card Utility routines has been incorporated within six subsystems, each of which is significant to the law enforcement environment. The six subsystems are:

- Offense Reporting
- Arrest Reporting
- Accident Reporting
- Radio Dispatch Analysis
- Field Interview Reporting
- Police Personnel Reporting

Together, these subsystems can provide the local government police department with an extensive data processing capability for law enforcement purposes.

DESCRIPTION

Reports produced by the System/3 Law Enforcement System offer the local police administrator an opportunity to retrieve statistics on crime and traffic rapidly. Statistics may be accumulated on crime, traffic, radio dispatch, field interview, and personnel data. Data analysis, so vital in allocating police manpower, may be performed from recurring crime, arrest, traffic, and dispatch data. Investigative information and personnel information, covering days worked and leave of absence reporting, are readily available.

HIGHLIGHTS

The modular design of the System/3 Law Enforcement System encourages a step-by-step phased implementation of the six subsystems. Customer options have been incorporated to satisfy individual report generation and input processing requirements. Open fields are provided for unique data elements, if necessary. Special user-written reports may also be processed from the comprehensive data base provided by the System/3 Law Enforcement System.

Reports generated by the system provide a reservoir of information for the police department. Some of these reports are:

- Uniform Crime Reports (FBI) Offenses Known to Police - These reports provide the required information for the preparation of Return A - Monthly Return of Offenses Known to the Police, and Return B - Annual Return of Offenses Known to the Police. (Return A and Return B reports can assist the local police administrator in evaluating local conditions in relation to trends and activity in other local jurisdictions. They also can be used in determining the effectiveness of the police department in the clearing of crimes, recovery of property, and in follow-up investigations.)
- Uniform Crime Report (FBI) Return of Persons Charged - Uniform Crime Reports (arrests) provide the required information to prepare the Annual Return of Persons Charged, which is forwarded by local jurisdictions to the FBI. Persons Charged reports can also be produced on a monthly basis for use by the local police department.
- Uniform Crime Reports Age, Sex, and Race of Persons Arrested (18 Years and Over - Under 18 Years) - The Uniform Crime Reports - Age, Sex, and Race of Persons Arrested - provide the required FBI information. A local jurisdiction can also produce this report on a monthly basis.
- Accident Reports - Reports are generated in accordance with National Safety Council standards. Traffic accident statistics are provided for the police administrator to keep up with current trends and changing situations in specific areas. In addition to the National Safety Council Reports, a report on violations contributing to accidents by location is also produced.
- Dispatch Analysis - Dispatch Analysis provides information pertaining to events by geographic and time distribution. (This information is useful in allocating the police resources.)
- Field Interview Reports - This reporting function relates information on persons who have had field contact with police officers at unusual hours and in locations where they appeared to have no legitimate interest. This system is of value to police investigators in correlating field interviews against unsolved crimes.
- Police Personnel - The Police Personnel System provides a series of essential reports to modern police administration. Leave of Absence Reports and Daily Man Days Worked Reports are printed.

The primary potential customer for the System/3 Law Enforcement System is the local jurisdiction with a population of 25,000 to 250,000 inhabitants.

Each local government police department may choose to implement one or more of the six major subsystems in any desired order. Some

jurisdictions will implement all six subsystems. Others may only implement one or two from which the major local benefits are derived.

CUSTOMER RESPONSIBILITIES

To implement the System/3 Law Enforcement System, the customer must (1) capture the required source document information, (2) code the prescribed data from the source documents for the offense, arrest, and traffic programs, and (3) establish the required master files.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

An IBM 5410 Processing Unit mdl A2 (8K) with feature #4100 MFCU attachment, feature #3970 Printer Attachment, and feature #9496 Print Position Additions; an IBM 5424 Multi-Function Card Unit mdl A1; and an IBM 5203 Printer mdl 1 with feature #5560 (132 print positions).

SOFTWARE REQUIREMENTS

The IBM System/3 Law Enforcement System is coded in Card RPG II (5701-RG1) with feature #9011. Card System Utilities (5701-UT1) with feature #9011 are also utilized.

TERMS and CONDITIONS: See PP Index

SYSTEM/3 APPROPRIATION ACCOUNTING SYSTEM 5701-G22

PURPOSE

This IBM System/3 licensed program is an appropriation, revenue, and general ledger accounting system for public institutions.

HIGHLIGHTS

The comprehensive set of user options that is featured in the Appropriation Accounting System offers many advantages in effectively matching user requirements, including:

- Appropriation/Revenue/General Ledger processing
- Posting frequencies
- Reporting frequencies
- Variable account structures
- User-specified report sequences, controls, and content
- Prebatch/postbatch balancing
- Transaction audit trails
- Multiple account distributions
- Transaction code/General Ledger account relationships
- Allotment frequencies
- Open-ended architecture

DESCRIPTION

Appropriation, revenue, and general ledger accounting are vital administrative instruments that mirror public policy and the service commitments of cities, counties, states, school districts, hospitals, colleges, universities, and other public institutions. They help these institutions to conserve public property, and to plan, direct, and control revenues and dollar costs.

The Appropriation Accounting System records, accumulates, analyzes, and presents financial data by fund, source, organizational unit, project, function, activity, line item, object code, and/or any other user-determined classifications. This permits revenue and expenditure analyses to be accomplished by project and/or other categories as well as by traditional fund, departmental organization, and object code account structures. It enables public institutions to be more responsive to a citizen-oriented environment.

Computer processing facilitates rapid retrieval and effective presentation of vital data at frequent intervals and on a demand basis. In the appropriation accounting application, the Appropriation Accounting System automatically:

- Balances, edits, and posts appropriation, revenue, general ledger, allotment, encumbrance, and expenditure transactions.
- Controls project, organizational, and other commitments through constant checks to determine that encumbrances and expenditures do not exceed authorized allotment and appropriation limits.
- Maintains appropriation, revenue, general ledger, transaction, and purchase order files.
- Prepares control and audit registers, trial balances, status reports, and ledger cards.
- Constructs historical files of appropriation, revenue, and general ledger data.

Appropriation Accounting has three independent subsystems - the Appropriation Subsystem, the Revenue Subsystem, and the General Ledger Subsystem. Each user decides whether to process one, two, or all three subsystems. The user may elect to install one subsystem first and phase the other two in later.

Account files, the open purchase order file, and the transaction file may be posted or updated as frequently as an individual installation desires. One installation may choose to post the appropriation account file weekly, another may post biweekly, and a third may post daily. Appropriation accounts may be posted more frequently than revenue or general ledger accounts.

Reports may be printed on fixed schedules and/or upon demand. Other printing options include the decision to print or not to print updated account registers as individual appropriation, revenue, or general ledger accounts are being posted.

Any chart of accounts structure up to twenty characters in length may be accommodated. A given user's appropriation, revenue, and general ledger account structure may also vary. For example, the appropriation accounts could consist of twelve characters that have been subdivided into five categories, while at the same time, the revenue accounts contain eight characters subdivided into four categories, and the general ledger accounts have six characters with three categories.

One or more reports of a given type may be printed. Users specify the level of detail that is wanted to appear, up to five levels of summary

totals, and the page breaks. A separate report program is automatically generated for each variation the user specifies.

To provide positive controls and audit procedures:

- All transactions are edited and prebalanced to batch totals before they are posted to appropriation, revenue, general ledger, and other files.
- Asterisks are printed below data fields in error, and specific error messages are printed to the right of the transaction data on the Prebalance Transaction Register.
- Prebalanced batches are edited and balanced again as they are posted.

Multiple accounts may be debited and/or credited from a single source document. Two-digit suffixes are sequentially assigned and appended to the (preprinted) source document number to facilitate this option. This permits up to 99 accounts to be posted from a single source document.

The System/3 Appropriation Accounting System permits every institution to prescribe the specific general ledger account numbers to be debited and credited for each user-determined transaction code. Transaction code/general ledger account number assignments are established before the system is installed. They are recorded in a prepunched master deck which may be changed from time-to-time at the individual institution's discretion. Subsidiary account numbers are punched into the revenue and appropriation transaction cards themselves. Account numbers are also punched in the journal entry transaction cards that effect general ledger accounts.

Provisions have been made in the transaction cards, files, reports, and procedures for either quarterly or monthly allotments, or no allotments at all. This allows the system to be responsive to individual preferences and changing requirements.

All transactions, files, reports, and programs have been designed with an open-ended architecture. The defined structure will interface with all accounting applications including billing, accounts receivable, payroll and personnel, purchasing, accounts payable, inventory, and other applications. Transaction codes, files, and reports may be added or deleted without disturbing the effected programs. Historical data may be automatically accumulated for budget preparation and other purposes. Vendor Analysis Reports may be obtained by coding additional programs to process purchase order transactions.

The Appropriation Accounting System contains three independent subsystems—the Appropriation Subsystem, the Revenue Subsystem, and the General Ledger Subsystem. Each user may choose to process one, two, or all three subsystems. The user may elect to install one subsystem first and phase the other two in later. Files may be posted daily, biweekly, weekly, etc., to coincide with user requirements. Reports are printed on demand.

CUSTOMER RESPONSIBILITIES

Installation plans for the Appropriation Accounting System should include education, program evaluation, forms procurement, conversion, parallel operation, external procedure development, and final cutover.

Knowledgeable financial and data processing middle management personnel should study, evaluate, and plan for the installation. This middle management group should evaluate the programs in detail and prepare a preliminary implementation plan at least five months prior to the final program cutover date. The preliminary implementation plan should identify any program modifications, the options to be utilized, each task to be performed, the person or persons responsible for each task, and the schedules to be met.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration required is an IBM 5410 Processing Unit mdl A2 (8K) with (#4100) MFCU Attachment, (#3970) Printer Attachment, and (#9496) Print Position Additions; an IBM 5424 Multi-function Card Unit mdl A1; and an IBM 5203 Printer mdl 1 with (#5560) 132 Printer Positions.

SOFTWARE REQUIREMENTS

The program is coded in Card RPG II (5701-RG1) with feature #9011. Card System Utilities (5701-UT1) with feature #9011 are also utilized.

DOCUMENTATION (available from Mechanicsburg)

General Information Manual (GH20-1049).

PROGRAM PRODUCTS

**SYSTEM/3 CITATION PROCESSING SYSTEM
5701-G23****PURPOSE**

The IBM System/3 Citation Processing System is designed to handle the moving and parking citation accounting and control requirements of local governments. Reports and follow-up processing pertinent to this application are provided. This extremely flexible system recognizes that individual customer requirements vary from jurisdiction to jurisdiction.

A complete set of Card RPG II and System/3 Card Utility subprograms have been incorporated within four major subsystems, each of which pertains to a particular segment of this application area. The four subsystems are:

- Daily Parking and Follow-Up
- Daily Moving and Follow-Up
- Disposition Processing
- Monthly Statistical Reporting

Together, these subsystems can provide the local government with an extensive data processing capability for handling moving and parking citations.

The System/3 Citation Processing System is a low-cost, automated way to handle parking and moving citations for local governments. The system provides editing features and efficient follow-up procedures on delinquent parking and moving citations. Its violation and revenue accounting features allow for control of citations and efficient collection of fines and forfeitures.

As a traffic enforcement index and a significant source of revenue, citation processing has long been important to local governments. The system can expedite the handling of traffic citations and the collection of revenue. It can reduce manual operations and improve control.

The modular design of the system encourages step-by-step implementation. Options have been incorporated to satisfy individual processing requirements. Open fields in the data records are provided for individual users' unique data elements, if necessary.

HIGHLIGHTS

The primary market for this program is local jurisdictions with a population of 25,000 to 250,000 inhabitants. Provisions have been incorporated to allow the users to enter their unique statute descriptions and fines into the system through tables.

Delinquent notices and warrants are produced at user-defined time intervals (without program modification).

The system has been designed to fit a variety of situations through optional processing steps and program routines. Generally, any given operational system will be made up of something less than the total package. The user has the capability to handle moving and/or parking violations, partial payments, court dockets, juvenile violators, etc. In addition, the monthly statistical reports can be run at other than monthly intervals without program modification.

A user would be well advised to take a phased approach in implementing this program product. The recommended approach is to install:

- Parking violation processing without partial payment and court docket program functions
- Install partial payment processing, if needed
- Install parking court docket processing when the volume of parking cases going to court warrants it
- Install moving violation processing, if needed. Customers with less than 35 to 50 moving violation transactions per day should not be encouraged to use the moving violation processing functions.

The System/3 Citation Processing System offer customers:

- Editing and balancing of citations and revenue
- Precise audit trails
- Flexible reporting frequencies
- Traffic enforcement information by specific areas
- Automatic generation of court dockets
- Flexible user-defined tables relating statutes and fines
- Open-ended capability for implementing user-designed preprinted courtesy notices, partial payment notices, and warrants.
- Partial payment processing
- Selection of juvenile violators for separate processing
- Name and address lookup capability for parking violators
- Production of warrant indices
- Officer ticket book accounting
- State notification of guilty moving violators

CUSTOMER RESPONSIBILITIES

To implement, the customer must:

- Determine which programs will be used
- Create master files

- Create statute and fine tables
- Create city code table
- Design preprinted forms
- Determine codes for statutes and voided tickets
- Design audit control logs and journals
- Standardize recording and punching of violation data

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration is an IBM 5410 Processing Unit mdl A2 (8K) with feature #4100 MFCU attachment, feature #3970 Printer Attachment, and feature #9495 Print Position Attachment; an IBM 5424 Multi-Function Card Unit mdl A1, and an IBM 5203 Printer mdl 1 with feature #5558 (120 print positions).

SOFTWARE REQUIREMENTS

The program is coded in Card RPG II (5701-RG1) with feature #9011. IBM System/3 Card System Utilities (5701-UT1) with feature #9011 are also utilized.

DOCUMENTATION

(available from Mechanicsburg)

PROGRAM PRODUCTS

**SYSTEM/3 UTILITY BILLING SYSTEM
5701-G24****PURPOSE**

The IBM System/3 Utility Billing System is designed to handle the utility billing requirements of local governments and small utility companies. All reports and billing requirements that are associated with this application are processed on the basis of either flat rates and/or meter readings. This extremely flexible system recognizes that individual user requirements vary from jurisdiction to jurisdiction.

DESCRIPTION

The System/3 Utility Billing System is a low-cost, automated way to handle utility billing and receivables. A complete set of Card RPG II and System/3 Card Utility routines compute and/or print: Meter Reading Books, Consumption Proofs, Metered Service Charges, Utility Bills, Cash Proofs, Revenue Summaries, Meter Status Reports, Cutoff Listings, Cash Postings and Cycle Balances, Past Due Notices, New Account Listings, and Rate/Revenue Statistics.

Each customer utilizes only that portion of the program code that satisfies individual jurisdictional needs.

Utility services are a significant source of revenue for many municipalities and other local governmental units.

The System/3 Utility Billing System can expedite the receipt of utility revenues. It can reduce manual operations and improve customer service.

The primary potential customer for the System/3 Utility Billing System is the utility that supplies water, electric, and/or gas services to populations of 25,000 to 250,000 inhabitants. Provisions have been incorporated to bill for one or two flat rate services per account; one or two metered services per account; one electric demand metered service account; refuse services.

Although the System/3 Utility Billing System is intended to perform billing at monthly intervals, with fairly minor program modifications it can also accommodate intervals of other lengths. Cycle billing can be accomplished without program modification.

HIGHLIGHTS

A modular design permits selected options to be processed without necessitating program modifications. Routines are provided to:

- Print Meter Books.
- Adjust records for replaced meters during the billing period.
- Validate consumption and print Consumption Proof Lists.
- Perform table lookups to compute charges.
- Compute gross and net billings (with automatic late charge or discount disallowed).
- Print billing registers.
- Itemize detailed line items on the bills.
- Prepare optional return stubs or prepunched cash return cards to be sent with the bills.
- Summarize revenue entries for the general ledger system.
- Accumulate rate/revenue statistics.
- Produce daily cash proofs.
- Balance receivables against cycle totals.
- Print past due notices and cutoff lists.
- Record deposit receipts and refunds.
- Maintain inactive accounts.
- Print meter status reports on out-of-service meters.
- Sort and print an alphabetic index of accounts.

Customers may also modify or add routines.

CUSTOMER RESPONSIBILITIES

Customers must determine the type of billing service and the associated file requirements (for example, the metered service billing file is not required for flat rate billing). Rate tables must be created for each service to be billed. Codes and related alphabetic descriptions must be established for billing rates, meter locations, meter reading instructions, and cities. Code assignments include:

- Two digit code for each service to be billed.
- One character code for each meter location (optional).
- One character code for meter reading instructions (optional).
- One digit code for each city used in a service address.
- Unique number of up to 7 digits for each account.

The required master files must also be created.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration required is an IBM 5410 Processing Unit mdl A2 (8K) with feature #4100 MFCU attachment and feature #3970 Printer Attachment; an IBM 5424 Multi-Function Card Unit mdl A1; and an IBM 5203 Printer mdl 1.

SOFTWARE REQUIREMENTS

The IBM System/3 Utility Billing System is coded in Card RPG II (5701-RG1) with feature #9011. Card System Utilities (5701-UT1) with feature #9011 are also utilized.

DOCUMENTATION

(available from Mechanicsburg)

**SYSTEM/3 ORDER POINT TECHNIQUE for
INVENTORY MANAGEMENT
5701-M41****PURPOSE**

This IBM System/3 licensed program consists of a group of programs divided into inventory analysis, stock status transaction processing, and order action. It is especially designed for implementing order point inventory in manufacturing organizations.

Many aspects of these programs are discussed in the *Production Information and Control System Manual* (GE20-0280). This includes the use of the same symbolic labels for fields on the item master card for System/3 that are defined for the item master file in the appendix of the *Production Information and Control System Manual*.

The System/3 Order Point Technique for Inventory Management programs use a card item master file for recording status, averages, and other information required for order point control.

The inventory analysis program is designed to be used periodically to assist in selection of control parameters. The stock status program is normally run on a monthly basis.

Transaction processing and order action programs should be run frequently (for example, daily) to keep the inventory status current and provide order recommendations that are timely.

DESCRIPTION

Inventory Analysis: Programs that provide for detailed analysis of inventory items on the basis of usage and cost. The output is useful for determining how items are to be controlled.

Stock Status: In addition to preparing the stock status report, the program calculates average demand using exponential smoothing, computes the onhand value for each item and for the total inventory, and prepares a new item master card.

Transaction Processing: The program processes the day-to-day transactions that affect the inventory status of each item. Onhand, on-order, and exception requirements, as well as current sales and current usage, are updated.

Order Action: The current inventory status is checked by this program to determine if order action is recommended. Order point is calculated on the basis of lead time and safety stock stated in weeks, in conjunction with the current average demand calculated in the stock status program.

HIGHLIGHTS

- Easily understood techniques for inventory control.
- Analysis program for use in selecting order point and order quantity parameters.
- Calculation of new average demand each time period.
- Exponential smoothing that records average, trend, and forecast separately for ease-of-reference and use.
- Computation of safety stock on the basis of weeks of supply.
- Computation of Mean Absolute Deviation (MAD) for assistance in manually evaluating and setting safety stock level.
- The ability to have order quantity specified by the user automatically or calculated on the basis of weeks of supply.
- Updating of inventory on the basis of transactions.
- Order action notices prepared on the basis of the most recent status information.
- Follow-up notices for items that have an onhand balance below order point.
- Preparation of a periodic stock status report with inventory evaluation.

CUSTOMER RESPONSIBILITIES

The user must construct a master inventory file. An item master card must be prepared for each item to be controlled using these programs.

The customer must also determine how transaction processing is accomplished for the overall operation. That is, what source must be used to prepare the transaction cards that update inventory status.

The user must have an understanding of the inventory control concepts embodied in these programs, so the parameters for order quantity and order point and the alpha factor used in exponential smoothing can be selected.

The customer must write routines to perform tasks not covered by these programs. It is also the customer's responsibility to compile the program using the source statements provided.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

An IBM 5410 Processing Unit mdl A2 with appropriate attachments, IBM 5424 Multi-Function Card Unit mdl A1, and IBM 5203 Printer mdl 1, with attachment #5558 (120 print positions).

SOFTWARE REQUIREMENTS

The programs are written using Card RPG II, (5701-RG1). Source statements are provided with the licensed program, therefore, Card RPG II is required for compilation. The sort programs utilize Card System Utilities, (5701-UT1). The sort can also be performed offline.

DOCUMENTATION

PROGRAM PRODUCTS

**SYSTEM/3 CARD BILL-OF-MATERIAL and
REQUIREMENTS PLANNING
5701-M42****PURPOSE**

This IBM System/3 licensed program is designed to help manufacturing customers install their requirements planning applications.

DESCRIPTION

It consists of the following programs and Sort/Merge functions that use Card System Utilities (5701-UT1) with feature #9011.

Activity Audit and Bill-of-Material - These programs assist the customer in creating and maintaining bills-of-material. The activity audit program edits changes, deletions, and additions to the bill-of-material file and provides an audit listing and input to the next program. The bill-of-material program accepts the activity input and the bills-of-material and provides an updated bill-of-material card file and a listing of the bills-of-material.

Increase Level and Replace Level - These programs are used to develop the low-level code for all items. The programs are used initially when the product structure bill-of-material file is created and periodically, as required, to insure accuracy of the low-level code. The where-used file is a byproduct of low-level code generation.

Where-Used - This program prepares the where-used report. A separate where-used file may be maintained, or the bill-of-material file can be sorted (or reproduced and sorted) to provide input to the program.

Requirements Generation - This program accepts requirements for assemblies and bills-of-material and punches component gross requirements. The program is designed so it can be used with a product structure (single level) or product summary (quick deck) bill-of-material file.

Requirements Planning - This program combines inventory information with gross requirements to determine what has to be ordered. Orders can be lot sized (EOQ) or planned for net requirements by due date (discrete order planning). Provision is made to automatically include a forecast of spare (service) part usage that is netted with other requirements.

HIGHLIGHTS

Programs are used with Sort/Merge utilities to assist the customer in installing the requirements planning application.

Product structure (single level) or product summary (quick deck) bills-of-material.

Level-by-level time series planning or summarized requirements planning.

Net requirements for piece parts can be lot-sized (EOQ) in both techniques.

Many aspects of these programs are discussed in the *Production Information and Control System* (GE20-0280), including the use of the same symbolic labels for fields for the System/3 cards, which are defined for the disk-oriented files in the appendix of this manual.

System/3 Order Point Technique for Inventory Management (5701-M41) can be used to develop the forecast for spare (service) part usage and to update the item master card.

The System/3 Card Bill-of-Material and Requirements Planning programs are designed to create and maintain the bill-of-material files and for order planning.

The activity audit and bill-of-material programs are used, as required, to keep the bills-of-material up-to-date.

The low-level code programs are used initially when the file is created and in the maintenance of low-level codes as a result of changes to the bills-of-material.

The where-used program is run if the customer requires a new listing.

Requirements generation and requirements planning are used periodically (for example, monthly) to develop the overall plan for production.

Low-level code generation and where-used reports.

Automatic consideration of a forecast for spare (service) part usage.

Requirements for raw material developed on the basis of planning piece part orders.

CUSTOMER RESPONSIBILITIES

The customer must provide information to create and maintain bills-of-material. The bills-of-material must be accurate and up-to-date for requirements planning.

The customer must provide inventory information on the item master card for all items that are being planned.

The licensed program is designed to assist the user in the development of the overall production plan. Therefore, the user must develop

programs and procedures for the execution of the plan. This includes the release of planned orders, allocation of component inventory for assembly orders, recording issues and receipts for accurate up-to-date status information for subsequent planning runs.

Users must have an understanding of the concepts embodied in these programs to decide which items are to be planned, the type of planning to be used, the length of the planning horizon, and the size of time periods to be used, etc.

The customer must provide the forecast of spare (service) part usage if this option is selected.

The customer must write routines to perform tasks not covered by these programs.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

An IBM 5410 Processing Unit mdl A2 with correct attachments, IBM 5424 Multi-Function Card Unit mdl A1, and IBM 5203 Printer mdl 1 for product structure (single level) bills-of-material, attachment #5558 (120 positions) is required for product summary (quick deck) bills-of-material.

SOFTWARE REQUIREMENTS

The licensed program is written using Card RPG II (5701-RG1) with feature #9011. Source statements are provided with the licensed program; therefore, the customer requires RPG II.

The Sort/Merge programs utilize the Card System Utilities (5701-UT1).

DOCUMENTATION
(available from Mechanicsburg)

Application Description Manual (GH20-0770) ... *Production Information and Control System* (GE20-0280) ... *System/3 Order Point Technique for Inventory Management* (GH20-0741).

TERMS and CONDITIONS: See PP Index

**SYSTEM/3 CARD RPG II MODEL 10
5701-RG1**

PURPOSE

The IBM System/3 Model 10 program generator system is RPG II, a programming language and a processor program that is used to produce machine language object programs. These object programs are then used in performing a wide range of commercial data processing jobs.

DESCRIPTION

The 5424 MFCU is supported as an input/output device. The 5203 and 1403 Printers are supported as output devices. The 1442 mdl 6 (RPQ) is supported as an input/output device. Card RPG II permits punching the System/3 64-character set and packed decimal data on the 1442 (RPQ).

The RPG language has been extended to provide major functional capabilities while maintaining compatibility. These functions make RPG II:

- Easier to use
- More flexible, so the method of coding can be selected to best suit the programmer's needs
- More powerful, so that many programs can be coded using RPG II which in the past were difficult or impossible to code using RPG

The new functional capabilities include:

- Tables/arrays - provide the ability to define, point to (index to) and look up fields within a single dimension array of like fields. An XFOOT operation is provided which sums the elements of an array.
Tables or arrays can be loaded at compile time, object program load time, or object program execution time. A table or array may contain fewer than the total number of allowable entries; this facility allows for temporary expansion of execution time tables without modification of the source program.
- Closed subroutines - provide for executing closed subroutines within the RPG II program from any number of points within the calculations with an automatic return to the calculation line following the statement which asked for execution of the routine.
- EXCPT operation code - provides the ability to cause output to be written during calculations. After the output is completed, calculations resume where interrupted.
- DEBUG operation code - allows the user to debug programs at the RPG II source level. The DEBUG operation code is used to print the status of the indicators and, optionally, the contents of any field(s). A header card option allows the program to be compiled ignoring the DEBUG operation codes.
- Look Ahead - provides the facility to look ahead at, and to use, the contents of fields in other records awaiting processing.
- FORCE operation code - provides the ability to determine and control which file/record is to be processed during the next RPG II program cycle.
- Read/Demand Files - provide immediate input from a demand file during calculation time. A demand file is a file type that can be processed only by the READ operation code.
- Edit codes - provide the facility to format output fields by specifying a single character code rather than an edit mask. This includes placing slashes in date fields.
- UDATE - provides access to the system date that has been previously loaded during system initialization. This allows the entire date, or any of the three parts of the date, to be referenced by the reserved names UDATE, UMONTH, UDAY, or UYEAR. These fields may be referenced on the calculation specifications or on the output/format specifications.
- 1P Forms Control - allows an option to repetitively print the first output print line conditioned by the

first page (1P) indicator until the operator is satisfied that the forms are aligned.

- Dual I/O areas - provide optional buffered input and/or output performance improvement.
- Fetch overflow - provides the ability to control when overflow processing is to occur.
- File conditioning - provides the ability to use external indicators (U1-U8) to control calculations, input and output files, or specific output records.
- *PRINT - provides the facility to interpret, while punching, without redefining the output line.
- *PLACE - provides the facility to print identical information (invoices, labels, etc.) side-by-side (2-up, 3-up, etc.) without respecifying the individual fields on the output specifications.
- 9 match fields - provide flexibility in multi-file processing.
- Line counter specifications - provide a facility to specify page length and overflow line.
- File translation - provides character by character translation for specific files through the use of a translation table.
- Alternate collating sequence - provides the facility for altering the collating sequence if it is not the same as the System/3 collating sequence. This applies to match fields and to the comparison of alphameric fields during calculations.
- SPECIAL exit - provides linkage to assembler language subroutines for nonsupported devices during the RPG II cycle. This enables the user to insert program support for any input or output device capable of attachment to System/3. For example, this exit can be used to support RPQs and OEM devices.

Use of RPG II

Five different specification sheets are used to code the user's program requirements. One of these is used only when a table search or forms control is required by the object program. The headings on the specification sheet describe the particular usage of each form.

After the specifications have been written on the appropriate forms, cards are punched with the data from the forms. Each line of the form represents a card in the source deck.

The source deck, along with a control card and the RPG II processor, are read by the 5424 MFCU. On a system equipped with the 1442 mdl 6 (RPQ), the 1442 can be designated to read the source deck. At the end of this processing run, an object program is punched. This program contains all of the computer instructions necessary to run the desired job.

The punched object program deck may be loaded for immediate execution of the desired job. There are no control programs associated with the RPG II generated object program decks or with the RPG II processor program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/3 card RPG II processor program may be run on a minimum configuration IBM System/3 mdl 10 which includes an IBM 5410 Processing Unit mdl A2 (8K bytes), an IBM 5424 MFCU mdl A1 and an IBM 5203 Printer mdl 1 or an IBM 1403 Printer mdl 2. In addition, an IBM 1442 mdl 6 equipped with RPQ 841205 and an IBM 5410 Processing Unit equipped with Processing Unit Expansion #5732 and RPQ 843175, is required if 80 column cards are utilized as program data or RPG II source statements.

The RPG II generated object programs may take advantage of all capacities of the IBM 5410 Processing Unit up to and including 32,768 bytes of core storage, the IBM 5424 MFCU, and the IBM 5203 and 1403 Printers available on IBM System/3.

There is no restriction as to the number of input, output, or combined files which may be defined within a single RPG II job, other than those imposed by the number of physical devices attached to the system.

**SYSTEM/3 CARD RPG II TELECOMMUNICATIONS
FEATURE #6000 (5701-RG1)****PURPOSE**

The Card RPG II Telecommunications feature (#6000) provides the user with the capability of sending or receiving binary synchronous data over voice grade or high-speed communications lines. This support is achieved through the use of a new RPG II Telecommunications Specification Sheet, and the addition of BSCA (Binary Synchronous Communications Adapter) as a device entry on the RPG II File Description Specification. This RPG II support permits System/3 to function in one of the following communication modes:

- Receive only
- Receive with conversational reply
- Transmit only
- Transmit with conversational reply
- Alternate transmit and receive file.

The following RPG II language features are supported for communications:

- Input, Output and Combined Files
- Demand Files for Transmit and Receive
- Blocking and Deblocking of Records
- Dual I/O Area

These BSCA features, options, and capabilities are supported by the feature:

- Manual call
- Manual answer
- Auto-call
- Auto-answer
- Medium speed
- High-speed
- Station selection
- EBCDIC data transparency
- Intermediate block checking
- EBCDIC or ASCII data and data link control characters. File translation of ASCII data can be accomplished by proper use of the file translate extension of RPG II.

System/3 with a BSCA supported by the RPG II Telecommunications feature can communicate with the following systems:

Another System/3 with BSCA, program-supported by RPG II Telecommunications feature.

A System/32 with BSCA, program-supported by RPG II.

A System/34 equipped with a Communications Adapter, program-supported by RPG II and Assembler.

A System/360 Model 20 with BSCA, program-supported by BSCA IOCS.

System/360 mdl 22 or larger, System/370.

This program provides the support to use System/3 in the following telecommunications networks.

Point-to-Point switched or Point-to-Point nonswitched Multipoint (as a tributary station).

System/3 with BSCA is a compatible member of the IBM BSC family of terminals. It can be intermixed with other BSC terminals [System/32, System/34, System/360 mdl 20, 1130, 1800, 2770, 2780, 6670 (as a 2770), 2715 mdl 2 and 3780] on a multipoint line when operating as a tributary station with a central System/360 or System/370 computer* using DOS or OS BTAM. It can also share the same phone number at the central System/360 or System/370 computer* with other BSC terminals (System/360 or System/370 computers**, System/32, System/34, System/360 mdl 20, 1130, 1800, 2770, 2780, 2715 mdl 2 and 3780.)

* System/360 mdls 22, 25 and 30 with DOS/360; mdls 40, 50, 65, 67 (in 65 mode), and 75 with DOS/360 and OS/360 and mdls 85, 91, and 195 with OS/360. System/370 mdls 135, 145 and 155 with DOS and OS; and mdl 165 with OS when operating in Basic Compatibility Mode.

** System/360 mdl 22 with DOS, mdls 25 and 30 with BOS/BPS or DOS/360, mdls 40, 50, 65, 67 (in 65 mode), and 75 with BOS/BPS, DOS or OS/360 mdls 85, 91, and 195 with OS/360. System/370 mdls 135, 145 and 155 with DOS and OS; and mdl 165 with OS when operating in Basic Compatibility Mode.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/3 Card RPG II Telecommunications feature requires as a minimum for source program compilation an IBM System/3 mdl 10 which includes an IBM 5410 Processing unit A2 (8K bytes), an IBM 5424 MFCU mdl A1 and an IBM 5203 Printer mdl 1 or an IBM 1403 Printer mdl 2.

This support requires as a prerequisite the IBM System/3 Card RPG II licensed program (5701-RG1). In addition, an IBM 5410 Processing Unit with a BSCA feature #2074 is required for object program execution.

The Device Counter Logout Program, feature #6002 for System Control Program (5701-SC1) is required for concurrent installation with the BSCA feature #2074, and must be ordered separately.

SOFTWARE REQUIREMENTS

Programs 5701-RG1 and 5701-SC1 feature #6002.

PROGRAM PRODUCTS

**CARD RPG II BRAILLE
FEATURE #6003 (5701-RG1)**

PURPOSE

The IBM System/3 RPG II Card Compiler Braille feature (#6003) provides the user with the capability of having compilation listings and object program printouts in Braille. The user of a Card RPG II Compiler (5701-RG1) equipped with the Braille feature has the option at compile time to select either Braille or printed listings. An object program compiled with the Card RPG II compiler having the Braille feature and specifying Braille output has the option at execution time, to select either Braille or printed output.

The period in the user's printer print arrangement is used to form the Braille characters. A piece of elastic must be stretched in front of the type in order to make the proper impression. Description of the procedure to follow in installing the elastic is contained in the documentation *The Braille Feature for IBM System/3 Card RPG II Compiler* distributed by PID with the feature.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/3 Card RPG II Braille feature requires a card-oriented IBM System/3 mdl 10 which includes an IBM 5410 Processing Unit (8K bytes), an IBM 5424 MFCU (250 cpm read and 60 cpm punch and print), and an IBM 5203 Printer (96 print positions and 100 lpm) or 1403 Printer (132 print positions and 600 lpm).

SOFTWARE REQUIREMENTS

This support requires as a prerequisite Card RPG II (5701-RG1).

DOCUMENTATION

(available from Mechanicsburg)

All documentation for the Braille feature is distributed with the program from PID; it is not separately orderable.

PROGRAM PRODUCTS

**SYSTEM/3 CARD RPG II MAGNETIC TAPE
FEATURE #6004 (5701-RG1)**

PURPOSE

The IBM System/3 Card RPG II Magnetic Tape feature (#6004) provides the user with RPG II support to process data files on magnetic tape.

These features are supported:

- Consecutive input or output
- One to four tape units
- Fixed length, blocked or unblocked records
- Record size from 18 to 4,096 bytes
- Maximum block size 4,096 bytes
- Dual I/O areas
- ANSI labels or IBM Standard Labels
- Unlabeled tapes
- 9-track, 800 or 1600 bpi
- Multivolume files (up to 31 volumes)
- ASCII or EBCDIC mode of data or labels
- Program options for rewind or rewind/unload
- Magnetic Tape Error Counters
- Overlay of OPEN routines
- Pre-execution time tables (on tape)

In addition, two programs are provided that permit the Card RPG II compiler to be loaded on tape and executed from tape.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Same as for 5701-RG1, except that an IBM 12K Processing Unit and an IBM 3410/3411 Magnetic Tape Unit are required.

SOFTWARE REQUIREMENTS

5701-RG1 V1M8 or later; 5701-SC1, feature #6005.

PROGRAM PRODUCTS

**CARD-ORIENTED SYSTEM/3 MODEL 10
5701-SC1**

PURPOSE

These IBM System/3 programs perform the system control functions for the installation. They are supplied by IBM with the system at no additional charge, in two configurations of the IBM System/3 model 10; card and disk-oriented stored programs.

DESCRIPTION

Program Maintenance Program: Used by the customer to apply programming changes to card programming system decks. The 5424 MFCU is used to collate the changes.

The functions of this program include the inclusion of new cards, removal of deleted cards, and the replacement of cards in the customer's program deck, the automatic verification of sequence, verification of proper currency level, and updating card counts and currency level.

This program must be used to properly maintain the program decks to assure proper function, and to simplify the maintenance procedure.

System Initialization Program: Used to initialize the communication area with information obtained from control cards. Normally, the user initializes the communications area at the beginning of the day.

The user date and 'user switches' as well as other system information are stored in the communication area.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The Card System Control Programming operates on a minimum configuration IBM System/3 mdl 10 which includes an IBM 5410 Processing Unit (8K bytes), an IBM 5424 MFCU (250 cpm read and 60 cpm punch and print), an IBM 5203 Printer (96 print positions and 100 lpm) or an IBM 1403 Printer (132 print positions and 600 lpm). The Binary Synchronous Communications Adapter (#2074) with Text Transparency (#7850) is required for execution of the Remote Job Entry Work Station support. The Binary Synchronous Communications Adapter (#2074) is required for execution with the Device Counter Logout Program.

SOFTWARE REQUIREMENTS: None

**REMOTE JOB ENTRY WORKSTATION
FEATURE #6001 (5701-SC1)**

PURPOSE

Permits an IBM System/3 equipped with a Binary Synchronous Communications Adapter with EBCDIC Text Transparency feature to submit OS/360 jobs over communications facilities to a central System/360 (mdl 40 or above with a minimum of 256K of core), or System/370 (minimum of 256K of core) for execution, and to receive output from the central system upon completion of the job. Output may also be received at the workstation on a deferred basis if desired. A user at a workstation other than the sending station may also be designated as an alternate recipient of job output. Optionally, the user may choose to send and receive data in compressed form; the System/3 Workstation program will expand the data on receipt for printing or punching.

The System/3 Remote Job Entry (RJE) Workstation support operates with a central System/360 or System/370 supported by the OS/360 Remote Job Entry Program. Communication is in Binary Synchronous mode on a point-to-point switched, point-to-point nonswitched, or multipoint network.

In an RJE network, a System/3 with BSCA using the RJE program can be intermixed with other CPU workstations (System/360 computers, System/360 mdl 20 and 1130) on a switched network. It can operate as a workstation on a nonswitched multipoint line with System/360 mdl 20 and 1130 workstations.

Note: System/360 mdl 25, 30, 40, 50, 65, 67 (in 65 mode), 75, 85 and 195 using the BOS/BPS remote job entry workstation program.

When using the System/3 RJE support, OS object decks can be read or punched if the 1442 is attached; OS object decks cannot be read or punched on 96-column card devices. OS allows 80-position card input records; therefore, only card columns 1 through 80 of the System/3 96-column card are processed by the RJE support. Outputs of 120 or 132 characters from OS RJE are printed as two lines on a System/3 96-print position 5203 printer.

The installation of RJE on the Card-Oriented System/3 requires the concurrent installation of the Device Counter Logout feature for 5701-SC1, feature #6002. This feature must be ordered separately.

Program Prerequisites: 5701-SC1, feature #6002. *RJE Work Station Support Reference Manual* (GC21-7531).

**DEVICE COUNTER LOGOUT PROGRAM
FEATURE #6002 (5701-SC1)**

PURPOSE

This standalone IBM System/3 card program is designed to achieve maximum serviceability and an increased level of availability. It is designed to be executed immediately following the execution of any card system BSC object program which contains the updating of the device counter log. The program recovers the contents of counters accumulated in the preceding BSC execution. The contents of these counters serve as an aid in problem determination.

The program punches the contents of the counters using the MFCU. If selected by the user via the console data switches, the contents of the counters are also printed with appropriate headings.

The installation of the Binary Synchronous Communications Adapter (#2074) requires the concurrent installation of this System Control Program feature, 5701-SC1 (#6002).

Program Prerequisites: None.

**MAGNETIC TAPE UTILITY PROGRAMS
FEATURE #6005 (5701-SC1)**

PURPOSE

This feature contains four standalone, card-resident utility programs:

- **Magnetic Tape Error Logout Program** is executed immediately following the execution of any card system program that updates the magnetic tape error counters. The program punches the contents of counters accumulated during the execution of the preceding object program. The contents of these counters serve as an aid in problem determination.
- **Magnetic Tape Error Summary Program** is used to print a report of the error statistics using as input the cards punched by the Error Logout Program.
- **Tape Initialization Program** is used to create IBM Standard or ANSI tape column labels, to check for unexpired files, and to display existing volume and file labels.
- **Tape Dump Program** is used to list blocks of tape data on the printer in both hexadecimal and character representation until a tape mark is read. This program can also be used to backspace or forward space a tape block, and to rewind a tape to load point.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum system requirement is the same as for 5701-SC1, except that an IBM 12K Processing Unit and an IBM 3410/3411 Magnetic Tape Unit are required. The 7-track feature of the 3410/3411 is not supported by Card System Programming.

SOFTWARE REQUIREMENTS: None

PROGRAM PRODUCTS

**IBM SYSTEM/3 CARD-RESIDENT
MAGNETIC TAPE SORT PROGRAM
5701-SM1**

PURPOSE

The IBM System/3 Card Resident Magnetic Tape Sort Program supports: Three or four tape units, fixed length, blocked or unblocked records, record size from 18 to 9,999 bytes, maximum block size 9,999 bytes, labeled or unlabeled tapes, 9-track, 800 or 1600 bpi, multivolume input or output (work files are single volume only), ASCII or EBCDIC mode of data or labels (in one run, the mode cannot be mixed), and read backward.

DESCRIPTION

The sort program can select desired records from the input file to be included or excluded from the sort. Recognition of individual records can be based on:

- Record code
- Relation of a field to a constant
- Relation of two fields in a record
- Any relationship in a series (ORing)
- All relationships in a series (ANDing)
- Multiples of the above test in any combinations

Control fields may be in a different location in records within the file.

Output from the sort program is in the following format:

A file or records containing the sort control fields and the data fields the user has specified. The user need select only the data necessary from the input to be included in the output. By specifying the entire input record as a tagalong field, the user can, in effect, accomplish a record sort.

Specification of record selection, sort parameters and tagalong data fields is accomplished by simple, RPG-like coding sheets that are similar to those used by the Disk Sort Program, 5702-SM1. The addroit and summary sort capabilities of the Disk Sort are not supported in the Magnetic Tape Sort Programs.

Sort control card diagnostics and messages are printed on either the 5203 or 1403 Printer.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM System/3 Card Resident Magnetic Tape Program requires as a minimum an IBM System/3 mdl 10 which includes an IBM 5410 Processing Unit mdl A3 (12K bytes), an IBM 5424 MFCU mdl A1, an IBM 5203 Printer mdl 1 or an IBM 1403 Printer and three magnetic tape drives.

SOFTWARE REQUIREMENTS

5701-SC1; 5701-SC1 feature #6005 is recommended.

PROGRAM PRODUCTS

**CARD SYSTEM UTILITIES
5701-UT1**

PURPOSE

The Card System Utilities consist of six programs.

- System/3 Reproduce/Interpret Program

The Reproduce/Interpret program has the following options:

Reproduce
Interpret
Reproduce and Interpret
Reproduce with Reformatting
Reproduce and Interpret with Reformatting

The Data switch on the system console is used to select the desired option. Reformatting control cards follow the program deck in the primary hopper of the MFCU. Blank cards for reproduction are placed in the secondary hopper.

- System/3 96 Column List Program

The 96-Column List Program will list cards without reformatting. User options selected by the Data switch on the system console provide for single, double, or triple spacing. Automatic overflow on standard 11" forms is provided. After listing has been completed, a card count is printed by the program. The user can select an option to bypass the listing and receive only a card count as output.

- System/3 5424 MFCU Sort/Collate Program

This is a general purpose utility program designed to perform a wide variety of sorter and collator functions.

A specification sheet is used to describe the job to be performed. Cards are punched from this sheet. These cards are used by the program to perform the desired functions.

These functions are available:

- Sort
- Merge
- Match
- Select
- Sequence Check

Selection may be accomplished based upon a variety of logical tests including comparison of field contents to a constant or to other field contents. Several tests may be combined in series of *and/or* combinations to allow easy separation of cards meeting certain tests. Tests for zones, digits, or characters may be used during a run to select only those cards to be processed, leaving the remainder of the deck in its original sequence or to direct specific cards to a pocket during a match or select run.

Control fields for the various functions may be ascending or descending sequence and in combinations on numeric fields. Multiple and split control fields may be described provided they do not exceed an accumulated (total) length of 100 characters.

Alternate collating sequence facility is available. This allows the user to substitute a value table which changes the normal sequence values of the sort field contents.

It is also possible in this sort program to assign new values to existing punches in control fields for purposes of sequencing, sorting, and matching. Thus, an 'A' may be recoded to a 'B' so that 'As' and 'Bs' would be considered equal. Similarly, the A and B values could be reversed to provide a new sort pattern. Many variations are possible with this feature.

A control field for sorting or collating need not be in the same location in all cards in the deck. For example, part number might be in two different locations in two different identifiable card types being sorted together.

- System/3 Data Recording Program

This utility program allows a System/3 with an optional 5475 Data Entry Keyboard to be used for online data recording with punched cards created as output.

The 5424 MFCU is used as the punching device; the keyboard for entering the data.

Program control cards, a maximum of two, will be supported for use with this program to allow:

- Field Definition
- Field Skipping
- Field Duplication
- Upper and Lower Shift and Numeric Shift
- Modulus 11 Self-checking Number Verification

The use of a program control card is not mandatory. It is also possible to enter data under manual control.

Various switches and functional keys available of the 5475 Data Entry Keyboard are also supported as follows:

Auto Skip/Dup	Manual Duplication
Auto Record Release	Manual Skip
Program Control ON/OFF	Program Selection
Print ON/OFF	Release Key
Field Erase	Right Field Adjustment
Record Erase	Upper Shift/Lower Shift
Multiple Punch Key	

This program will allow for rekeying (correction) of data for an entire field or an entire record prior to the actual punching of the card by supporting a field erase/record erase facility. A column by column backspace is also supported for correction of data when operating in the manual mode.

- System/3 Data Verifying Program

This utility program allows a System/3 to be used to verify the accuracy of the recorded data. The 5424 MFCU is used to read the card deck which is to be verified and blank cards for immediate correction. The optional 5475 Data Entry Keyboard is required for rekeying source data for verification.

As each character is keyed, a comparison to the corresponding character in memory takes place. If the two are not identical, an error light is turned ON and the operator may re-key. After the third try, the character keyed is assumed correct. When the keying is complete (all data verified) and if there are any errors, a new card will be punched from the corrected information and will replace the original card in error. The incorrect card will be stacker selected. A verify 'OK' notation will be printed on the fourth print line of each correct card.

Two levels of program control will be supported to allow:

- Field Definition
- Field Skipping
- Field Duplication
- Right Field Adjust
- Upper and Lower Shift and Numeric Shift

The use of a program control card is not mandatory. It will also be possible to verify data under manual control.

Various switches and functional keys available on the 5475 Data Entry Keyboard will also be supported as follows:

Auto Skip/Dup	Manual Duplication
Auto Record Release	Manual Skip
Program Control ON/OFF	Program Selection
Print ON/OFF	Release Key
Field Erase	Right Field Adjustment
Record Erase	Upper Shift/Lower Shift
Multiple Punch Key	

This program allows the rekeying and reverification of fields or records by supporting a field/record erase facility.

- System/3 80-96 Conversion Program

The 80-96 Conversion program allows a System/3 equipped with a 1442 Card Read Punch and associated RPQ's to read 80-column cards, translate the information and punch out 96-column cards in the 5424 Multifunction Card Unit, with reformatting. Conversion options provided are:

- Standard character for character translation.
- Special translation for specific characters.
- Ability to translate any combination of 80 column card punches. Logical testing for the presence of punches in a column with AND, OR, and NOT conditions enables powerful and flexible translation.
- Ability to handle under punching. There is a translation code that says: accept only the highest value punch, where the ordering of the punches from lowest to highest is 12, 11, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9.
- Ability to flag and stacker select invalid or unwanted codes. This code flags and selects all punch combinations that are outside the System/3 64-character set. It also flags and selects all codes which meet a specified logical test for the presence of punches. Logical tests are AND, OR, and NOT.
- Ability to move a high order zone punch to a low order position.

Customers who desire to perform 96 to 80-column card conversion should be advised that a program must be written using RPG II. (Card RPG II permits punching the System/3 64-character set and packed decimal data into 80-column cards; Disk RPG II permits punching 256 characters and packed decimal data into 80-column cards.)

It is anticipated that many customers plan to complete the bulk of their 80-96 column card conversion work during their preinstallation test allowance.

Do not reproduce without written permission

PP 5701-UT1.2

**SYSTEM/3 BASIC ASSEMBLER
5702-AS1****PURPOSE**

The IBM System/3 Basic Assembler language is a symbolic programming language used to write programs for the IBM System/3 mdl 10. Source programs written in this language are processed by the Basic Assembler Program to produce executable object programs. (This program is applicable to the System/3 mdl 8).

The Basic Assembler can be used to create a standalone program. The object program is punched into cards. Program loading is performed with an initial program loader through the 5424 MFCU. Standalone programs are coded entirely by the user with no dependence on other programming support.

The Basic Assembler may also be used for assembly of relocatable subroutines for use with the Card or Disk System RPG II or with System/3 COBOL or FORTRAN. The subroutines, written in the Basic Assembler language, are coded by the user and separately assembled. The process of program linking is accomplished during compilation of the RPG II source program or by means of the Overlay Linkage Editor in the case of COBOL or FORTRAN.

DESCRIPTION

Some of the features provided by the Basic Assembler program and its language are:

- a) Mnemonic Operation Codes
- b) Symbolic Referencing of Storage Addresses
- c) Automatic Storage Assignment
- d) Address Displacement Calculation
- e) Convenient Data Representation
- f) Operand Field Expressions
- g) Source Identification - Sequence Fields
- h) Assembler Instructions
- i) Source Program Listings
- j) Cross Reference Listing
- k) Error Checking and Diagnostic Messages

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

For source program compilation - an IBM System/3 mdl 10 which includes an IBM 5410 Processing Unit mdl A13 (12K bytes), an IBM 5424 MFCU mdl A1 or an IBM 1442 Card Read Punch mdl 6, an IBM 5203 Printer mdl 1 or an IBM 1403 Printer mdl 2 with Universal Character Set feature and a PN (60-character set) interchangeable chain cartridge and an IBM 5444 Disk Storage Drive mdl 1.

Note: A 48-character set (for example, HN or LC arrangement) can be used with the Assembler; however, the user must be willing to accept substitute characters.

The Assembler requires 8K of main storage exclusive of control program requirements.

This program will support all increased capacity components of a disk-oriented System/3 mdl 10.

For use on System/3 Model 8 - An IBM 5408 Processing Unit mdl A14 (16K bytes), an IBM 5203 Printer, an IBM 5444 Disk Storage Drive mdl A1, and either an IBM 3741 Data Station directly attached or an IBM 5471 Printer-Keyboards.

SOFTWARE REQUIREMENTS

5702-SC1; 5702-SC1 feature #6026/#6027.

DOCUMENTATION

PROGRAM PRODUCTS

**SYSTEM/3 SUBSET ANS COBOL
COMPILER AND LIBRARY
5702-CB1****PURPOSE**

The IBM System/3 compiler, its library and object programs execute under control of the IBM S/3 model 10 Disk System Control Program (5702-SC1, Version 6 or later). It provides the user with the most widely accepted and used standard high-level procedural language in existence. In addition to the standard language, the following additional features are provided:

Certain language elements which are defined in higher levels of the American National Standard COBOL language.

Certain language elements defined by the CODASYL Programming Languages Committee but not yet incorporated into the COBOL language by the American National Standard Institute.

IBM extensions consistent with those supported by the System/360 OS and DOS ANS compilers and 1130 ANS compiler.

System/3 COBOL supports Grade 1 Braille for both compiler listings and object program printed output. The Braille option requires a 132-position printer (5203 or 1403) with 8 lines per inch spacing. A user-provided elastic strip is attached over the printer hammers to produce the Braille characters.

DESCRIPTION

Considerations: The American National Standards Institute approved the American National Standards Institute Standard COBOL (ANSI STANDARD X3.23-1968-COBOL) on August 23, 1968. The following functional processing modules of the American National Standards Institute standard are included in the System/3 Compiler:

- 1 Nucleus 1, 2
- 1 Sequential Access 1, 2
- 1 Random Access 0, 2
- 1 Library 0, 2
- 2 Table Handling 1, 3
- 1 Segmentation 0, 2

The first digit above represents the level of the modules included in the compiler; the second digit represents the lowest level in the American National Standards Institute Standard (0 implies that the module may be completely missing from some standard compilers); the third digit represents the highest level of the American National Standards Institute standard.

IBM implementation of the American National Standard COBOL complies with the first draft International Organization for Standards (ISO) recommendation for COBOL.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

For an IBM System/3 mdl 10 ... IBM 5410 Processing Unit mdl A14 (16K bytes), an IBM 5444 Disk Storage Drive mdl 1, either an IBM 5424 Multi-Function Card Unit or an IBM 1442 Card Read Punch and either an IBM 5203 Printer or 1403 Printer.

For a System/3 mdl 8 ... IBM 5408 Processing Unit mdl A14 (16K bytes), an IBM 5444 Disk Storage Drive mdl A1, an IBM 5203 Printer and either an IBM 3741 Data Station/Programmable Work Station directly attached or an IBM 5471 Printer-Keyboard.

For additional devices supported by the COBOL Object Programs, refer to the *System Generation Reference Manual*, GC21-5126.

Note: EC818676 is required for all 5410 Processing Units on which COBOL will be run. The HN print chain/train is recommended.

SOFTWARE REQUIREMENTS

5702-SC1; 5702-SC1 feature #6026/#6027. For 5445 support, 5702-SC1 feature #6022/#6023 is required. For 5448 support, 5702-SC1 Feature #6074 is required. For tape support, 5702-SC1 feature #6024/#6025 is required.

COMPATIBILITY

System/3 COBOL is upward compatible with the DOS and OS ANS COBOL compilers and is a superset of 1130 ANS COBOL; providing growth from 1130 through System/3 to Systems/360 and 370.

Migration to and from System/3 COBOL requires little source program conversion to effect the transition. Certain 1130 library routines are not included in the System/3 COBOL library, i.e., CALLED subprograms.

PERFORMANCE

The System/3 Disk COBOL operates in 12K bytes of main storage, exclusive of control program requirements. Object-time performance is dependent on program type, size, I/O functions performed and other factors pertinent to program execution speed. In the minimum configuration, the supervisor is limited to 4K for compilation. (See "Supervisor Sizes" in the pages for 5702-SC1.)

DOCUMENTATION

(available from Mechanicsburg)

COBOL Reference Manual (GC28-6452) ... *System/3 Bibliography* (GC20-8080).

TERMS and CONDITIONS: See PP Index

**SYSTEM/3 DISK FORTRAN IV
5702-FO1****PURPOSE**

IBM System/3 Disk FORTRAN IV processes programs written in the System/3 FORTRAN language, producing output suitable for execution with the System/3 Disk System Control Programming (5702-SC1).

DESCRIPTION

The System/3 FORTRAN language contains those features defined in American National Standard Basic FORTRAN, X3.10.1966; language extensions supported by IBM 1130 Basic FORTRAN; and additional features and capabilities previously available only with certain IBM Full FORTRAN compilers. These features include:

- The DEBUG facility, which enables the user to locate errors in a FORTRAN source program. By use of four basic statements, the debug facility provides for tracing flow within a program and between programs, and for checking the validity of subscripts.
- The IMPLICIT statement, which enables the user to specify the type (including length) of all variables, arrays, and user-supplied functions whose name begins with a particular letter.
- Length specification for INTEGER and REAL type statements, which allows the explicit specification of the INTEGER*2, INTEGER*4, REAL*4, and REAL*8 (double precision) data types.
- The relational IF statement, which is used to direct the transfer of control after the evaluation of relational expressions.
- List-directed input/output, which permits reading and writing of formatted data without a FORMAT statement.
- The GENERIC statement, which enables the user to specify a single name for a FORTRAN built-in or library function having several names. Depending on argument type, the correct function is selected by the compiler with each appearance of the name.
- IBM FORTRAN language extensions INVOKE, PROGRAM and GLOBAL, which allow FORTRAN main programs to be loaded successively into main storage and executed, while permitting these programs to share a common data area. These language extensions provide function equivalent to 1130 FORTRAN CALL LINK.
- Names of up to six characters for variables, arrays, functions, and subroutines.

The System/3 Disk FORTRAN IV library contains mathematical and service subprograms required during execution to perform arithmetic operations, input and output constant conversion and input/output control.

System/3 Disk FORTRAN IV is supplemented by a commercial subroutine package which is equivalent in function to the 1130 Commercial Subroutine Package insofar as is meaningful in terms of System/3 devices and data management.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

For an IBM System/3 mdl 10 ... an IBM 5410 Processing Unit mdl A13 (12K bytes), an IBM 5444 Disk Storage Drive mdl 1, either an IBM 5203 Printer or an IBM 1403 Printer, and an IBM 5424 MFCU or IBM 1442 Card Read Punch.

For an IBM System/3 mdl 8 ... an IBM 5408 Processing Unit mdl A14 (16K bytes), an IBM 5444 Disk Storage Drive mdl A1, an IBM 5203 Printer and either an IBM 3741 Data Station/Programmable Work Station directly attached or an IBM 5471 Printer-KeyBoard.

If running in a DPF environment, or supporting 5445/5448 Disk Storage or 3410/34 11 Magnetic Tape Subsystem, Disk FORTRAN IV requires a mdl 10 with 16K Processing Unit.

Note: EC 818676 is required for all 5410 Processing Units on which System/3 FORTRAN will be run. An HN print chain/train is recommended.

SOFTWARE REQUIREMENTS

5702-SC1, 5702-SC1 feature #6026/#6027 (Overlay Linkage Editor). For 5445 support, 5702-SC1 feature #6022/#6023 is required. For 5448 support, 5702-SC1 feature #6074 is required. For tape support, 5702-SC1 feature #6024/#6025 is required.

PROGRAM COMPATIBILITY

System/3 Disk FORTRAN IV source programs for the System/3 mdl 10 are compatible with System/3 Disk FORTRAN IV for System/3 mdl 6 except for changes required to accommodate differences in attached I/O. The System/3 Disk FORTRAN IV compiler accepts source programs written in the IBM System/360 Basic FORTRAN IV language, which encompasses American National Standard Basic FORTRAN as defined in X3.10.1966. The compiler also accepts source programs written in the IBM 1130 Basic FORTRAN language with minor modifications.

PERFORMANCE

The System/3 Disk FORTRAN will compile and execute in 9K bytes of main storage, exclusive of control program requirements. Object time performance is dependent on program type, size, I/O functions performed and other factors pertinent to program execution speed.

DOCUMENTATION

**SYSTEM/3 BILL-OF-MATERIAL PROCESSOR
5702-M41**

PURPOSE

This IBM System/3 program product is designed to establish, maintain and retrieve information from four basic manufacturing files.

The program product will load and maintain item master, product structure, work center master and standard routing records on disk files ... reorganize the four files ... perform six basic retrievals (single level, indented and summarized parts lists, and single level, indented and summarized where-used parts lists) ... perform two standard routing retrievals (manufacturing routings and work center where-used).

HIGHLIGHTS

Disk file chaining is used to organize product structure data in two sequences:

1. Assembly-component or bill-of-material sequence, thereby linking the components of an assembly in component item sequence. The product structure records are initially loaded and subsequently maintained in this sequence through the use of direct access file chaining techniques.
2. Where-used sequence, thereby associating item usages on higher level assemblies. This eliminates the need for either maintaining a separate file to indicate where each item is used, or periodically sorting the bill-of-material file into where-used sequence. Bi-directional where-used chains are used to facilitate faster processing during maintenance functions. (With bi-directional chaining, where record A points to record B, record B in turn points back to record A).

The same direct access capability makes the standard manufacturing operation records available in two sequences:

1. Routing operation sequence, which specifies the logical sequence of operations during the manufacturing process.
2. Work center (or machine) where-used sequence, which enables the user to retrieve information relative to all work performed by any given work center.

The structure of an assembly is recorded only once regardless of the number of times it is used on higher level assemblies or end products. The structure records are loaded and maintained on direct access files in the form of a series of single-level assemblies in component item sequence.

Users design their own record layouts by incorporating their information plus certain required data into item master, product structure, work center master and standard routine records.

For faster processing, some of the routines access the master files randomly by relative record number.

Raw material can be included in the product structure file to provide complete where-used cross-reference.

Low-level code is automatically maintained when adding records to the product structure file. Low-level code is used by the product structure file load and maintenance routine to verify assembly-to-subassembly continuity and by the product structure file retrieval routines.

All product structure retrieval functions can be performed in the same program run since the data recorded on direct access files is available either in assembly or where-used sequence. The same capability may be applied to routing information.

Product structure file reorganization punches out cards in a series of single-level bills-of-material in low-level code sequence, end items first, allowing the user to reload product structure assemblies in accordance with low-level codes. This speeds up processing in certain retrieval functions and eliminates unnecessary low-level code updating.

A complete assembly can be deleted from the product structure file with one multiple delete transaction card. The same facility is available for the deletion of an entire routing from the standard routing file.

Use: File Load and Maintenance - Users prepare their bills-of-material and routing operations in their predefined card formats. The program loads and maintains this information on disk in a logical structure consistent with the relationship of the data.

Retrieval - The user prepares an inquiry card to request one of the retrieval reports. The program retrieves the information from the disk files and prints the required document in user-defined format.

Reorganization - At the user's discretion, he or she can reorganize all files with the program supplied.

CUSTOMER RESPONSIBILITIES

A thorough knowledge of Bill-of-Material concepts, as explained in the *Application Description Manual*, is necessary. To implement the system, the following steps must be taken ... execute sample problem ... determine the format and content requirements of the records ... define card input format and transaction codes ... design print formats and write RPG II print routines to implement them ... write RPG II quantity extension routine (optional) and routines for changes to user

information ... tailor the RPG II source programs to fit individual requirements.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum configuration for IBM System/3 mdl 10 is an IBM 5410 mdl A14 Processing Unit (16K) with Multi-Function Card Unit Attachment (#4100) and Printer Attachment (#3970) ... IBM 5424 Multi-Function Card Unit mdl A1 ... IBM 5203 Printer mdl 1 ... IBM 5444 Disk Storage Drive mdl 1 (see note).

The minimum configuration for IBM System/3 mdl 15 is an IBM 5415 mdl A17 Processing Unit (48K), (mdl B17 with 3340 data module) with Multi-Function Card Unit Attachment (#4100) and Printer Control Unit 5421 ... IBM 5424 Multi-Function Card Unit mdl A1 ... IBM 1403 Printer ... IBM 5444 disk storage drive mdl A2.

The minimum configuration for IBM System/3 mdl 8 is an IBM 5409 mdl A14 Processing Unit (16K) ... IBM 8220, 3741 Data Station or 3741 programmable work station or IBM 4110, 5471 Printer-KeyBoard ... IBM 5203 Printer ... IBM 5444 disk storage drive ... plus appropriate attachment features for the I/O devices.

The minimum configuration for System/3 mdl 6 is an IBM 5412 mdl B16 Processing Unit (32K) ... IBM 5424 mdl A1 multi-function Card Unit and attachment ... IBM 3340 mdl C2 Disk Storage Drive ... IBM 5203 mdl 1 Printer.

The minimum configuration for IBM System/3 mdl 6 is an IBM 5406 mdl B4 Processing Unit (16K) with Printer Attachment (#3901) ... IBM 5213 Printer mdl 1 (85 CPS) ... IBM 5444 Disk Storage Drive mdl 1 (see note).

Note: Sufficient disk capacity is required to contain the system program and user data files. Consult the appropriate System/3 manuals to determine total file requirements.

For a one-drive system, consideration must be given to the fact that master file reorganization requires a new disk area plus an associated temporary disk output file.

SOFTWARE REQUIREMENTS

The IBM System/3 Disk System Control Program is used as the control system for the System/3 Bill-of-Material Processor. The following components are used:

	Model 8 & 10	Model 12	Model 6	Model 15
Disk System Control Program	5702-SC1	5705-SC1	5703-SC1	5704-SC1
Disk RPG II	5702-RG1	5705-RG1	5703-RG1	5704-RG1

The program product provides source code written in Disk RPG II.

The Disk Resident Card Utilities (5702-UT1) may be used for sorting the card input files and in reproducing card decks in the program modification process for Model 10.

DOCUMENTATION
(available from Mechanicsburg)

Application Description Manual (GH20-0965).

TERMS and CONDITIONS: See PP Index

SYSTEM/3 SHOP LOADING AND CONTROL 5702-M51

PURPOSE

This IBM System/3 program product consists of source programs and supporting documentation for use in the installation of an effective system which determines labor and machine requirements by work center, releases orders, creates and maintains open order files, produces status reports, and creates a work list. This program interfaces with System/3 Inventory and Requirements Planning, 5702-M52. It accepts planned orders generated by 5702-M52 and creates open orders which are used by 5702-M52.

DESCRIPTION

The program product consists of five phases - infinite loading, order release, open order status and update, open order maintenance, and work list preparation.

The infinite loading phase, using work center capacity information, determines the setup, labor and/or machine hours required for all open and planned orders, based on data extracted from the standard routing file. The setup, labor and/or machine hours are accumulated by time period and work center. The infinite load report is produced from this data to provide a representation of the load hours by time period for each work center.

The order release phase releases planned and unplanned orders to the shop after checking for the availability of all components. A material shortage report lists all planned and unplanned orders lacking sufficient component quantities to complete the order. When sufficient quantities of all components are available, the components are allocated and open order summary and open order detail records are created to maintain the status of each released order. Shop packet information is produced to accompany the order through the shop and provide the documents to update the open order files.

The open order status and update phase updates the files and provides reports on the status of orders in the shop. The open order files are updated by data cards which were provided as part of the shop packet. These data cards are the means of maintaining the current status of the orders in the open order files. The reports include the order status report and item report.

The open order maintenance phase provides for the deletion of cancelled or completed orders and changing current orders. Provision is made for changes to an order date and/or quantity, additions or deletions of open order detail records, and the splitting of open orders.

The work list preparation phase calculates a priority for the remaining operations of open orders, sorts the operations, and produces the work list report which lists the operations in priority sequence by work center. The work list can be used to specify the sequence of performing operations in the work center.

HIGHLIGHTS

- Calculates setup, labor and/or machine hours for each planned and open order and accumulates these hours by time period for each work center.
- Highlights overloaded and underloaded work centers with an easily read graphical output report.
- Provides for release of planned and unplanned orders.
- Checks component availability of orders prior to release.
- Allocates component requirements for released orders.
- Provides a material shortage report of orders that cannot be released due to insufficient availability of components.
- Creates an open order summary record and open order detail records for each released order.
- Provides detailed reports of released orders from data in the item master, open order summary and open order detail files.
- Prepares a shop packet for each released order.
- Maintains open order files reflecting completion, cancellation or changes to open orders.
- Updates the item master, open order summary and open order detail files with information from the shop floor.
- Provides three order priority calculations for preparation of a work list.
- Prepares a work list report to indicate priority of orders at each work center.

Use: System/3 Shop Loading and Control programs are direct access file-oriented and execute in conjunction with an item master file, product structure file, work center master file and standard routing file. These files are created and maintained by the System/3 Bill of Material Processor (5702-M41). The open order summary and open order detailed files are created and maintained by System/3 Shop Loading and Control. These files may be contained on either 5444 or 5445 or 3340 Disk Storage Drives.

Many aspects of this system are discussed in the *Production Information and Control System Manual* (GE20-0280).

System/3 Shop Loading and Control can be used by companies engaged in the fabrication and/or assembly of finished products. Modifications can be made to the programs to satisfy specific user requirements.

System/3 Shop Loading and Control accepts as input planned and/or unplanned order requirements. Planned order requirements must be stored in the item master file in the required format. System/3 Inventory and Requirements Planning (5702-M52) may be used to provide planned orders. Unplanned orders are not stored, but are processed from a card file. Users who do not require a formal system for generating planned orders may use System/3 Shop Loading and Control with only unplanned orders. In this situation, the planned order update program and planned order extract program in the order release phase are not used, and the infinite load report would reflect only open orders. The open order data stored in the item master file is used by System/3 Inventory and Requirements Planning in generating planned orders.

The infinite loading phase which is used for planning purposes is run as frequently as a material planning system, from which new order requirements are generated.

The order release phase is normally run weekly, although planned order changes and unplanned orders may be run on a daily basis, if required.

Feedback transactions are normally processed daily or more frequently if needed. Status reports are produced as frequently as new information is desired.

The open order maintenance phase should be run daily to process open order changes and weekly to process open order completions.

The work list preparation phase produces a work list report of unfinished operations in priority sequence by work center. It is recommended that it should be run daily to reflect the most current open order information.

CUSTOMER RESPONSIBILITIES

- Make modifications to the source programs to meet installation requirements.
- Create and maintain the item master, product structure, work center master and standard routing files.
- Define content and format of the above files.
- Install System/3 Bill of Material Processor (5702-M41)
- Provide planned order information. System/3 Inventory and Requirements Planning (5702-M52) may be used for the creation of this information.
- Establish procedures for handling the shop packet including the number of data cards to be produced and the collection of the data cards for updating of files.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum configuration for IBM System/3 mdl 10 is an IBM 5410 Processing Unit mdl A14 (16K) ... Multi-Function Card Unit Attachment #4100 ... Printer Attachment #3970 ... IBM 5424 Multi-Function Card Unit mdl A1 ... IBM 5203 Printer mdl 1 ... Printer Attachment #5558 ... IBM 5444 Disk Storage Drive mdl 1.

The minimum configuration for IBM System/3 mdl 6 is an IBM 5406 Processing Unit mdl B4 (16K) ... Printer Attachment #3901 ... Data Recorder Attachment #3210 ... IBM 5213 Printer mdl 1 (85 cps) ... IBM 5444 Disk Storage Drive mdl 1 ... IBM 5496 Data Recorder mdl 1 ... IBM System/3 mdl 6 Attachment #7501.

The minimum configuration for IBM System/3 mdl 12 is an IBM 5412 mdl B16 Processing Unit (32K) ... IBM 5424 mdl A1 Multi-Function Card Unit and attachment ... IBM 3340 mdl C2 Disk Storage Drive ... IBM 5203 mdl 1 Printer.

The minimum configuration for IBM System/3 mdl 15 is an IBM 5415 mdl A17 Processing Unit (48K), (mdl B17 with 3340 data module) with IBM Multi-Function Card Unit mdl A1 ... IBM 1403 Printer ... IBM 5444 disk storage drive mdl A2.

The minimum configuration for IBM System/3 mdl 8 is an IBM 5408 Processing Unit mdl A14 (16K) ... IBM 8220, 3741 Data Station or 3741 programmable work station or IBM 4110, 5471 Printer-Keyboard ... IBM 5203 Printer ... IBM 5444 disk storage drive ... plus appropriate attachment features for the I/O devices.

The program product supports the use of the IBM 5445 Disk Storage Drive. Sufficient disk capacity is required to contain the system program and user data files. Tables 1 through 4 in Appendix A of the *System/3 Shop Loading and Control General Information Manual* (GH20-1240) may be used to estimate disk capacity requirements for data files on the

PROGRAM PRODUCTS

S/3 Shop Loading and Control (cont'd)

IBM 5444, 5445 and 3340 Disk Storage Drives. In addition, consult the appropriate System/3 manuals to determine total file requirements.

For the Model 6 and 8, special consideration must be given to the user's input/output volume requirements, with respect to the equipment capabilities. The speed of the I/O devices (for example, the printer, data recorder, and 3741 Data Entry Station) has a significant effect on the overall throughput, and must be thoroughly examined and evaluated relative to the user's overall system requirements.

In addition to the System Control Program, a minimum of 13K bytes is required to compile and execute the programs.

For the Model 8, 10 and 15 user, improved performance will result with additional main storage capacity as the overlay requirements will be reduced or eliminated.

SOFTWARE REQUIREMENTS

IBM System/3 programs are required for compilation and execution—

	Model 8 & 10	Model 12	Model 6	Model 15
--	-----------------	----------	---------	----------

Disk System Control Program	5702-SC1	5705-SC1	5703-SC1	5704-SC1
Disk RPG II	5702-RG1	5705-RG1	5703-RG1	5704-RG1
Disk Sort	5702-SM1	5705-SM1	5703-SM1	5704-SM1

The program product provides source code written in RPG II. The System/3 Bill of Material Processor (5702-M41) is required for the creation and maintenance of the item master, product structure, standard routing and work center master files.

This program product is released to work with System/3 Disk Release 7 and all subsequent releases, versions, and modifications unless so stated in a future revision of this document.

SYSTEM/3 INVENTORY AND REQUIREMENTS PLANNING 5702-M52

PURPOSE

This program product is divided into four phases, inventory planning, projection, requirements planning, and execution. It is specifically designed to implement an inventory management and material planning system for manufacturing organizations.

Inventory Planning: Provides for the analysis of inventory items based on usage and cost. The output is useful for determining how the inventory items are to be controlled. Order point, safety stock and order quantity can be calculated using several techniques.

Projection: Analyses historical demand data and establishes estimates of demand for future time intervals. New forecasts are periodically projected and the item master records are updated.

Requirements Planning: Requirements are determined for component parts, subassemblies and raw materials utilizing forecasts, orders, bills of materials, production lead times and inventory levels. Individual assembly gross requirements may be altered between normal requirements generation runs. An output report provides detailed requirements information and an exception report highlights problem areas.

Execution: Input transactions, such as receipts and issues, are processed to update the item master record. Transaction listings highlight exceptions and order recommendations are produced. Inventory status reports are prepared for all or a portion of the item master file.

HIGHLIGHTS

- Classification of all inventory items.
- Selection of order point and order quantity calculation can be based on inventory classifications.
- Generation of order recommendation when available inventory is below calculated order point.
- Application of minimum, maximum and multiple values can be made during order quantity calculation.
- Maintenance of item averages, trends and forecasts performed using exponential smoothing.
- Planned orders established on basis of level by level explosion using offsetting of production (or procurement) lead times.
- Requirements exception report produced in sequence specified by user.
- Requirements alteration processing performed at option of user.
- Updating of inventory records based on input transactions.
- Order action or follow up notices produced as a result of transaction processing.
- Preparation of a periodic stock status report for management review.

Use: System/3 Inventory and Requirements Planning is direct access file-oriented utilizing data contained in the item master and product structure files. The records within these files may be created and maintained by System/3 Bill-of-Material Processor Program (5702-M41).

CUSTOMER RESPONSIBILITIES

A thorough knowledge and understanding of this program product before installation ... a thorough knowledge and understanding of the IBM System/3 Bill-of-Material Processor Program ... define contents and format of the item master and product structure files ... maintain accurate, up-to-date data ... provide open orders to the system ... provide file organization and maintenance of the item master and product structure files [the IBM System/3 Bill-of-Material Processor Program (5702-M41) may be used for this purpose].

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum configuration for IBM System/3 mdl 10 is an IBM 5410 Processing Unit mdl A14 (16K) ... Multi-Function Card Unit Attachment #4100 ... Printer Attachment #3970 ... IBM 5424 Multi-Function Card Unit mdl A1 ... IBM 5203 Printer mdl 1 ... Printer Attachment #5558 ... IBM 5444 Disk Storage Drive mdl 1.

The minimum configuration for IBM System/3 mdl 6 is an IBM 5406 Processing Unit mdl B4 (16K) ... Printer Attachment #3901 ... IBM 5213 Printer mdl 1 (85 cps) ... IBM 5444 Disk Storage Drive mdl 1.

For Card I/O on the IBM System/3 mdl 6, in addition to the minimum system, the IBM 5496 Data Recorder mdl 1 with attachment #7501 is required, and attachment #3210 is required for the IBM 5406 Processing Unit.

The minimum configuration for IBM System/3 mdl 15 is an IBM 5415 mdl A17 Processing Unit (48K), (mdl B17 with 3340 data module) with Multi-Function Card Unit Attachment #4100 and Printer Control Unit 5421 ... IBM 5424 Multi-Function Card Unit mdl A1 ... IBM 1403 Printer ... IBM 5444 disk storage drive mdl A2.

The minimum configuration for System/3 mdl 12 is an IBM 5412 mdl B16 Processing Unit (32K) ... IBM 5424 mdl A1 Multi-function Card

Unit and attachment ... IBM 3340 mdl C2 Disk Storage Drive ... IBM 5203 mdl 1 Printer.

The minimum configuration for IBM System/3 mdl 8 is an IBM 5408 mdl A14 Processing Unit (16K) ... IBM 8220, 3741 Data Station or 3741 programmable work station or IBM 4110, 5471 Printer Keyboard ... IBM 5203 Printer ... IBM 5444 disk storage drive ... plus appropriate attachment features for the I/O devices.

For card I/O on the IBM System/3 mdl 6, in addition to the minimum system, the IBM 5496 Data Recorder mdl 1 with attachment #7501 is required, and attachment #3210 is required for the IBM 5406 Processing Unit.

Sufficient disk capacity is required to contain the system program and user data files. Tables 1 and 2 of the *System/3 Inventory and Requirements Planning Application Description Manual* may be used. In addition, consult the appropriate System/3 manuals to determine total file requirements.

For the mdl 6 and 8, special consideration must be given to the user's input/output volume requirements, with respect to the equipment capabilities. The speed of the I/O devices (for example, the printer, data recorder and 3741 Data Entry Station) has a significant effect on the overall throughput, and must be thoroughly examined and evaluated relative to the user's overall system requirements.

In addition to the System Control Program, a minimum of 13K bytes is required to compile and execute the programs. Some programs use the Overlay Editor of RPG II.

For the mdl 8, 10 and 15 user, improved performance will result with additional core storage capacity as the overlay requirements will be reduced or eliminated.

SOFTWARE REQUIREMENTS

The programs required for the compilation and execution of the IBM System/3 Inventory and Requirements Planning are:

	Model 8 & 10	Model 12	Model 6	Model 15
Disk System Control Program	5702-SC1	5705-SC1	5703-SC1	5704-SC1
Disk RPG II	5702-RG1	5705-RG1	5703-RG1	5704-RG1
Disk Sort	5702-SM1	5705-SM1	5703-SM1	5704-SM1
Conversational Utilities*			5703-UT1	

The program product provides source code written in RPG II. The System/3 Bill-of-Material Processor (5702-M41) is required for the creation and maintenance of the item master and product structure files when all phases of the program product are implemented. If the user is only implementing the inventory control capability of the program, the programs of the requirements generation phase are not used and the product structure file is not required. The item master file may then be created and maintained using either the file creation and maintenance capability of System/3 Disk System RPG II or the System/3 Bill-of-Material Processor program product.

* The System/3 mdl 6 Conversational Utilities Programs are required for data file preparation for mdl 6 systems that do not have the IBM 5496 Data Recorder, mdl 1, with the System/3 mdl 6 online feature.

PROGRAM PRODUCTS

**SYSTEM/3 HEALTH, WELFARE and PENSION SYSTEM
5702-N11**

PURPOSE

The IBM System/3 Health, Welfare and Pension Fund System meets basic contribution accounting requirements for jointly administered health, welfare and pension funds. In addition, member, contribution, and claims information is maintained for improved management analysis and control.

The Health, Welfare and Pension Fund System program product provides a comprehensive, easily installed package which assumes minimum tailoring and no permanent user programming capability.

HIGHLIGHTS

- Contribution accounting including prelisting for both hourly and flat rate contribution funds.
- Notification of employer contribution shortage.
- Member contribution/history file.
- Claim history file.
- Employer contribution/history file including federal (D2) information requirements.
- Computer-prepared claim and pension checks.
- Inquiry facility for all primary files.
- Full maintenance of all system files.
- Data for typical eligibility determination.
- Control of all files, complete audit trail.

Use: The health, welfare and pension fund uses this system for contribution accounting, pension and claim check preparation, to provide data for eligibility determination and for analysis and control of its operation.

CUSTOMER RESPONSIBILITIES

A thorough knowledge and understanding of both current contribution accounting procedures and controls, and of the program product contribution accounting and controls ... any modification for unique requirements ... generation of system control program and program product ... coding and capture of required files and tables ... assignment of employer account numbers, claim codes, contract codes ... establishing individual audit requirements ... providing for manual supervision of controls and the integration of controls into the reporting framework used by the fund.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum Machine Configuration

Description	Type	M/SF
Processing Unit (12K)	5410	A13
Multi-Function Card Unit Attachment	5424	A1 4100
Printer	5203	1
Printer Attachment		3970
36 Additional Positions		5560
Additional Positions Attachment		9496
Disk Storage Drive (2.45 M bytes)	5444	1
Printer-Keyboard Attachment	5471	1 4110
Data Recorder	5496	1

The file storage requirements will vary greatly from fund to fund based upon such factors as number of members, collection cycle, and claim rate characteristics. Additional information can be found in the *General Information Manual*.

Reconstruction from machine-readable media will require the purchase of additional 5440 Disk Cartridges.

SOFTWARE REQUIREMENTS

The Health, Welfare and Pension Fund System is written in RPG II and operates under the control of the IBM System/3 model 10 Disk System Control Programming (5702-SC1).

All files are indexed disk.

Required Program Products

- System/3 Model 10 Disk RPG II (5702-RG1)
- System/3 Model 10 Disk Sort (5702-SM1)

DOCUMENTATION

(available from Mechanicsburg)

Information Manual (GH20-1189) .

TERMS and CONDITIONS: See PP Index

**SYSTEM/3 DISK RPG II
5702-RG1**
PURPOSE

IBM System/3 Disk RPG II is a program product that operates under control of the System Control Programming. It is disk resident on the IBM 5444 Disk Storage Drive, and in addition to the functions provided by the Card RPG II, the Disk RPG II facilitates reading and writing disk records and updating existing disk files using card and disk input/output. A directly attached IBM 3741 Data Station is supported for input or output at compile or execution time. Disk RPG II can be used on IBM System/3 mdl 8.

DESCRIPTION

The 1442 is supported as an I/O device, and for reading RPG II source statements or data. Disk RPG II permits punching 256 characters (see GX20-1703) and packed decimal on the 1442.

The recording techniques used by all disk file organizations permit multiple records to be read or written with a single I/O instruction. Unlike previous data management techniques, System/3 disk files can be written or read using different blocking factors in different programs. This facility allows the user to process single records when a program uses a large amount of storage or to use as much core as available in processing multiple records to increase throughput.

Any of the disk data files created by System/3 object programs can be processed by any program on the System/3 which uses disk system management to access the files and has compatible disk storage.

The access methods supported are as follows:

1. Sequential
 - a) Consecutive processing - including updating in place.
 - b) Random processing - by relative record number including updating but excluding file loading.
2. Indexed
 - a) Random processing - by key.
 - b) Consecutive processing - by key including file loading.

Unlike previous indexed file organizations, the keys and data may be in a different physical sequence; i.e., the most active records may be placed in the front of the file with the index in sequence by item number.
3. Direct
 - a) Random Processing - by relative record number, including updating and file loading. The open routine on the file load clears the data area on disk.
 - b) Consecutive processing.

Standard System/3 disk labels are mandatory on all disk files. Non-standard labels cannot be used except as data records within the file.

In addition to the extensions to RPG implemented in the System/3 Card RPG II, Disk RPG II has the following language extensions:

- a) Chain Operation Code - User control of direct processing by key or relative record number through the calculation specifications. This facility can be used for chaining from one record to another record in the same file and user generation of the key or relative record number through program logic.
- b) Automatic Overlay - When a program generates too much object code for the stated machine size, the Disk RPG II Compiler will generate overlays to fit. Not all programs - even with overlays - can fit into the stated machine size. In any event, programs cannot be compiled that would exceed 64K without overlays.
- c) AND/OR - Relationships on calculation specifications.
- d) Square root operation code in calculation specifications.
- e) Display Operation Code - The ability to display messages on and accept data from the 5471 Printer-Keyboard.
- f) Spread card processing is provided for within RPG II.
- g) Output from the Disk RPG II Compiler may be loaded into the object program library or punched into cards or written on diskette for subsequent loading.
- h) Support for nonstandard (RPQ and OEM) devices is included. The user must provide a suitable I/O routine (object program) to support the nonstandard device. The remainder of the program written in RPG II will be linked with the user's I/O routine during program compilation.
- i) MOVEA operation code - provides the ability to move a field to an array or an array to a field. The move is left-justified and can begin at any element of the array. This gives the user the ability to access a field on a byte-by-byte basis.
- j) SETLL operation code—allows the user to set limits during calculations for processing indexed files within limits.

SPECIFIED OPERATING ENVIRONMENT
HARDWARE REQUIREMENTS

Minimum System Requirement: For source program compilation - an IBM System/3 model 10 which includes an IBM 5410 Processing Unit mdl

A13 (12K bytes), an IBM 5424 MFCU mdl A1 or an IBM 1442 Card Read Punch mdl 6, an IBM 5203 Printer mdl 1 or an IBM 1403 Printer mdl 2 and an IBM 5444 Disk Storage Drive mdl 1.

The object program generated by the Disk RPG II Compiler supports, in addition, all capacities of the IBM 5203 and 1403 Printers, IBM 5424 MFCU, 1442 mdl 7, 3741 Data Station/Programmable Workstation directly attached, 5444 Disk Storage Drive, 5445/5448 Disk Storage (see Disk RPG II 5445 Disk Storage Drive feature), 3410/3411 Magnetic Tape Subsystem (see Disk RPG II Magnetic Tape Feature), and 5410 Processing Unit of 12K bytes and above.

For source program compilation on a model 8 - an IBM 5408 Processing Unit mdl A14 (16K bytes), an IBM 5203 Printer, an IBM 5444 Disk Storage Drive mdl A1, and either an IBM 3741 Data Station/Programmable Workstation directly attached or an IBM 5471 Printer-Keyboard.

The object program generated by the Disk RPG II Compiler on the mdl 8 supports, in addition, all the capabilities of the IBM 5203 Printer, 3741 Data Station/Programmable Work Station directly attached, 5444 Disk Storage Drives, 5448 Disk Storage (see "Disk RPG II 5445 Disk Storage Drive Feature"), 3410/3411 Magnetic Tape Subsystems (see "Disk RPG II Magnetic Tape Feature"), and 5408 Processing Unit of 16K bytes and above.

SOFTWARE REQUIREMENTS

5702-SC1. For 3741 support, 5702-SC1 feature #6066/#6067 is required.

**DISK RPG II TELECOMMUNICATIONS FEATURE
FEATURES #6000 and #6002**
PURPOSE

This feature is applicable to IBM System/3 mdl 8. The Disk RPG II Telecommunications feature provides the user with the capability of sending or receiving binary synchronous data over voice grade or high speed*** communications lines. This support is achieved through the use of an RPG II Telecommunications Specifications Sheet, and the addition of BSCA (Binary Synchronous Communications Adapter) as a device entry on the RPG II File Description Specification. This RPG II support permits System/3 to function in one of the following communication modes:

Receive only ... Receive with conversational reply*** ... Transmit only ... Transmit with conversational reply*** ... Alternate transmit and receive file.***

DESCRIPTION

The following RPG II language features are supported for communications:

Input, Output and Combined Files ... Demand Files for Transmit and Receive ... Blocking and Deblocking of Records ... Dual I/O Areas.

These BSCA features, options, and capabilities are supported by the feature:

Manual call ... Manual answer ... Auto-call ... Auto-answer ... Medium speed ... High speed ... Station selection ... EBCDIC data transparency ... Intermediate block checking ... EBCDIC or ASCII data and data link control characters. File translation of ASCII data can be accomplished by proper use of the file translate extension of RPG II.

System/3 with a BSCA supported by the RPG II Telecommunications feature can communicate with the following systems:

- Another System/3 with BSCA, program supported by RPG II Telecommunications feature.
- A System/32 with BSCA, program-supported by RPG II.
- A System/34 equipped with a Communications Adapter, program-supported by RPG II and Assembler.
- A System/360 mdl 20 with BSCA, program-supported by BSCA IOCS.
- S/360 mdl 22 or larger, S/370
- A 2770 Data Communication System.
- A 2780 Data Transmission Terminal.
- A 3741-2 Data Station/3741-4 Programmable Workstation.
- A 5110 Computer System supported as a 3741 mdl 2 or 4.
- A 5231 mdl 2 with BSCA (#2074). Receive mode only. Supported as a 3741 mdl 2 or 4.
- A 5280 Distributed Data System
- A Series/1 - Refer to Series/1 pages for appropriate features.

S/3 Disk RPG II (cont'd)

- A 6670 Information Distributor (as a 2770)
- A System/7 with BSCA (#2074)

This program provides the support to use System/3 in the following telecommunications networks:

Point-to-Point switched ... Point-to-Point nonswitched ...
Multipoint (as a tributary station).

System/3 with BSCA is a compatible member of the IBM BSC family of terminals. It can be intermixed with other BSC terminals (System/360 mdl 20, 1130, 1800, 5280, System/32, System/34, 2770, 2780, 3741-2, 3741-4, 3780 and 2715 mdl 2) on a multipoint line when operating as a tributary station with a central System/360 or System/370 computer* using DOS or OS BTAM. It can also share the same phone number at the central System/360 or System/370 computer* with other BSC terminals (System/360 or System/370 computers**, System/360 mdl 20, 1130, 1800, System/32, System/34, 2780, 2770, 3780, 3741-2, 3741-4 and 6670 (as a 2770), 2715 Model 2).

- * System/360 mdls 22, 25 and 30 DOS, mdls 40, 50, 65, 67 (in 65 mode), and 75 with DOS and OS, and mdls 85, 91 and 195 with OS; System/370 mdls 135, 145 and 155 using DOS or OS, and mdl 165 using OS when operating in Basic Compatibility Mode.
- ** System/360 mdl 22 with DOS, mdls 25 and 30 with BOS/BPS or DOS/360, mdls 40, 50, 65, 67 (in 65 mode), and 75 with BOS/BPS, DOS or OS/360 and mdls 85, 91 and 195 with OS/360, System/370 mdl 135, 145 and 155 with DOS and OS, and mdl 165 with OS when operating in Basic Compatibility Mode.
- *** Not supported in communication with System/32, System/34, 5280, 2770, 2780, 3741-2 or 3741-4.
- **** Transmit interspersed with Receive is not supported in communication with 2770, 2780, 3741-2 or 3741-4.
- † Operator Identification Card Reader feature (#5450) and the Expanded Communications/Multipoint Data Link Control feature (#1685) on 3741-2, -4 are not supported.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Requirement: For source compilation: same as Disk RPG II (5702-RG1).

For object program execution: Mdl 10 - an IBM 5410 Processing Unit with a BSCA (Feature #2074) ... Mdl 8 - an IBM 5408 Processing Unit with either the ICA (feature #4645) or the BSCA (feature #2074).

SOFTWARE REQUIREMENTS

5702-SC1; 5702-RG1.

DOCUMENTATION

(available from Mechanicsburg)

RPG II Telecommunications Reference Manual (SC21-7507) ... System/3 Bibliography (GC20-8080).

**DISK RPG II 5445 DISK STORAGE DRIVE FEATURE
FEATURE #6012, #6014**

PURPOSE

This feature supports the 5448 on both the mdl 8 and mdl 10, but supports the 5445 on the mdl 10 only. The feature allows RPG II users to process data files on the 5445/5448 Disk Storage Drive.

DESCRIPTION

The File Description Specifications define the control information and device entry of the 5445/5448 Disk Storage Drive to the RPG II compiler.

This feature supports the 5445/5448 Disk Storage Drive for data files only. The same capability for data file storage and retrieval is provided for the 5445/5448 as is provided for the 5444. The file organizations supported by Disk RPG II are: Sequential, Direct, and Indexed.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Requirements: For compilation on the mdl 8, the same requirements as Disk RPG II (5702-RG1). For object program execution, an IBM 5448 Disk Storage Drive is required.

For compilation on the mdl 10, the same requirements as Disk RPG II (5702-RG1). For object program execution, an IBM 5445 or 5448 Disk Storage Drive is required.

SOFTWARE REQUIREMENTS

5702-RG1; 5702-SC1; 5702-SC1 feature #6022/#6023 (5445 Support) or 5702-SC1 feature #6074 (5448 Support).

Note: For users of 5448 Disk Storage Drive, specify feature #6014 for 200-cylinder 5444 disk cartridge distribution.

**DISK RPG II MAGNETIC TAPE FEATURE
FEATURE #6016 or #6018**

PURPOSE

This feature is applicable to IBM System/3 mdl 8. The Disk RPG II Magnetic Tape Feature provides the user with RPG II support to process data or record address files on magnetic tape. Records may be fixed or variable length and may be either blocked or unblocked. Minimum record or block length is 18 bytes; the maximum is 9,999 bytes.

The File Description Specifications define the control information and device entry of Magnetic Tape to the RPG II compiler.

The feature supports consecutive input and output files. The files may be recorded in either EBCDIC or ASCII code.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Requirement: For source compilation: For both the mdl 8 and mdl 10 - the same requirements for compilation as Disk RPG II (5702-RG1). For object program execution: In addition to what is required for compilation, one or more units of the IBM 3410/3411 Magnetic Tape Subsystem are required.

SOFTWARE REQUIREMENTS

5702-RG1; 5702-SC1; 5702-SC1 feature #6024/#6025.

DOCUMENTATION

(available from Mechanicsburg)

IBM System/3 Magnetic Tape Planning Manual (GC21-5040) ... System/3 Bibliography (GC20-8080).

Note: For users of 5448 Disk Storage Drive, specify feature #6014 for 200-cylinder 5440 disk cartridge distribution.

**SYSTEM/3 MODEL 10 RPG II AUTO-REPORT FEATURE
FEATURE #6028, #6029**

PURPOSE

This feature is applicable to System/3 mdl 8. The RPG II Auto-Report feature enhances the RPG II language by providing functions which eliminate much of the preparation and coding work normally done by the user when producing an application program in RPG II. It is specifically designed to facilitate report preparation.

DESCRIPTION

The Auto-Report program executes as a preprocessor to the RPG II compiler which is a prerequisite for the feature. The input to the program is RPG II source statements and new Auto-Report statements. Auto-Report produces a diagnostic listing, replaces the Auto-Report statements with generated or copied RPG II source statements and calls the RPG II compiler for execution.

Features: Coding of applications in RPG II is made easier by the following Auto-Report functions.

- Page Headings - the user need supply only the report title. Auto-Report generates skipping, spacing, horizontal alignment and date and page number constants. Page overflow is considered and the heading conditioned to print on the top of each page.
- Simplified Output Specifications - A single output field specification can result in Auto Report generated statement to:
 - indicate printing with editing,
 - place column heading over the data fields,
 - control spacing,
 - control horizontal alignment of data,
 - define total fields and calculation specifications to accumulate totals by control levels (total rolling)
 - flag total lines with asterisk indication.
- COPY - The COPY statement provides the ability to copy RPG II source statements from a disk library into the RPG II source program. Some values on the copied specifications may be modified for the resulting compilation.
- Source Program - The Auto-Report program passes control directly to the RPG II compiler to cause compilation of the expanded source program. In addition, users may elect to punch the source program so that they can make modifications which tailor the program more closely to their requirements. They can also elect to catalog to the Source Library a copy of the source program for later compilation.

The Auto-Report functions may be specified for one printer file in any RPG II program. Any RPG II specifications not related to the selected printer file and any RPG II statements for the printer file but not

PROGRAM PRODUCTS

S/3 Disk RPG II (cont'd)

requesting Auto-Report functions, are passed to the RPG II compiler as a part of the source program.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Minimum System Requirements: Same as for RPG II.

This feature is applicable for the mdl 8 and has the same requirements as Disk RPG II.

SOFTWARE REQUIREMENTS

5702-RG1; 5702-SC1.

DOCUMENTATION

(available from Mechanicsburg)

Disk System RPG II Auto-Report Feature General Information Manual (GC21-7563) ... RPG II Auto-Report Reference Manual (SC21-5057) System/3 Bibliography (GC20-8080).

**RPG II 3270 DISPLAY CONTROL FEATURE
FEATURE #6070****PURPOSE**

The RPG II 3270 Display Control feature provides telecommunications services for local or remote 3270 devices. This program is automatically linked into the RPG II application program via the SPECIAL file exit capability on the RPG II File Description Specification Sheet. Neither the Assembler nor the RPG II Telecommunications feature is required.

DESCRIPTION

The following services are provided by the 3270 Display Control feature:

- RPG II access to 3270 Display System terminals attached via the Local Communications Adapter (mdl 10), the Local Display Adapter, or Integrated Communications Adapter (mdl 8) or BSCA (mdls 8 and 10).
- Automatic buffering and queuing of terminal data
- A display formatting interface which permits the support of 3270 devices with coding in RPG II.
- Complete line control procedures are provided.
- Up to 18 terminals may be controlled (up to 12 can be attached via the Local Display Adapter on the mdl 8).
- Two subroutines are provided. SUBR13 allows an RPG II program to support the 3270 Information Display System without using CCP. Using SUBR14, an existing program using the 3270 Display Control Feature may be converted to execute under control of CCP by replacing SUBR13 references with SUBR14 references in the RPG II source program. The user must then make any adjustments required by CCP and recompile the program.
- Provides the capability of coding one or more applications within one program. No task switching is provided.

Terminals Supported: The following terminals and communications facilities are supported under the RPG II 3270 Display Control feature:

With the Local Communications Adapter (mdl 10)

- One 3275 Display Station and Control
- One 3271 Display Control Unit (mdl 1 or 2) with:
 - 3277 Display Station (mdl 1 or 2)
 - 3284 Printer (mdl 1 or 2)
 - 3286 Printer (mdl 1 or 2)
 - 3288 Printer (mdl 2)

With the Local Display Adapter (mdl 8)

- 3277 Display Station (mdl 1 or 2)
- 3284 Printer (mdl 1 or 2)
- 3286 Printer (mdl 1 or 2)
- 3288 Printer (mdl 2)

Note: A maximum of 12 terminals may be attached via the Local Display Adapter.

With the Integrated Communications Adapter (mdl 8)

- One 3275 Display Station and Control, or
- One 3271 Display Control Unit (mdl 1 or 2), with:
 - 3277 Display Station (mdl 1 or 2)
 - 3284 Printer (mdl 1 or 2)
 - 3286 Printer (mdl 1 or 2)
 - 3288 Printer (mdl 2)

With the Binary Synchronous Communications Adapter (mdls 8 and 10)

- 3275 Display Station and Control, or
- 3271 Display Control Unit (mdl 1 or 2), with:

- 3277 Display Station (mdl 1 or 2)
- 3284 Printer (mdl 1 or 2)
- 3286 Printer (mdl 1 or 2)
- 3288 Printer (mdl 2)

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS****Minimum System Requirements**

Model 8...The RPG II 3270 Display Control feature requires an IBM System/3 mdl 8 which includes an IBM 5408 Processing Unit mdl A16 (32K bytes)...An IBM 5444 A02 Disk Storage Drive...An IBM 5203 Printer...An IBM 5471 Printer-Keyboard or 3741 Data Station directly attached...An Integrated Communications Adapter, Local Display Adapter, or Binary Synchronous Communications Adapter...and one of the devices listed under "Terminals Supported".

Model 10...The RPG II 3270 Display Control feature requires an IBM System/3 mdl 10 which includes an IBM 5410 Processing Unit mdl A16 (32K bytes)...An IBM 5444 mdl 2 Disk Storage Drive...An IBM 5203 or 1403 Printer...An IBM 5424 MFCU or 1442 Card Read Punch...A Local Communications Adapter or Binary Synchronous Communications Adapter...and one of the devices listed under "Terminals Supported".

Using SUBR13, approximately 10K-13.5K bytes is added to the size of the object program; using SUBR14, 4.25K-5.25K bytes is added. The actual amount of resident overhead is determined by the user options selected, and that size can be increased to approximately 15K if the trace options are additionally selected when using SUBR13.

SOFTWARE REQUIREMENTS

5702-SC1, 5702-SC1 feature #6021, 5702-SC1 feature #6031 and 5702-RG1.

COMPATIBILITY

The System/3 mdl 8/10 RPG II 3270 Display Control feature is functionally compatible with the System/3 mdl 12 and System/3 mdl 15 RPG II 3270 Display Control feature.

DOCUMENTATION

(available from Mechanicsburg)

IBM RPG II 3270 Display Control Feature Reference and Logic Manual (SC21-5161) ... System/3 Bibliography (GC20-8080).

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**SYSTEM/3 DISK SORT PROGRAM
5702-SM1**

PURPOSE

The IBM System/3 model 10 Disk Sort Program will sort any disk file organization supported by System/3 in ascending or descending sequence. This includes Indexed, Direct, and Sequential files.

DESCRIPTION

The files must be located on a 5444 Disk Storage Drive. The sort program will also accept fixed length records from magnetic tape files created by tape sequential access methods supported by System/3 data management. Output of the sort program may be created on either magnetic tape or disk. The sort program can select desired records from the input file to be included or excluded from the sort. Recognition of individual records can be based on:

- 1) Record code
- 2) Relation of a field to a constant
- 3) Relation of two fields in a record
- 4) Any relationship in a series (ORing)
- 5) All relationships in a series (ANDing)
- 6) Multiples of the above test in any combinations.

Control fields may be in a different location in records within the file.

Output from the sort program will be in three formats:

- 1) Tags - A file of three-byte binary relative record numbers in the sequence specified by the user.
- 2) Tagalong - A file of records containing the sort control fields and/or the data fields the user has specified. By using this option, the user can select only the data he needs from his input file to be included in the output. By specifying the entire input record as a tagalong field, the user can, in effect, accomplish a record sort.
- 3) Summary Tagalong - Records containing identical control fields are combined by summarizing (totaling) specified fields into one record.

Specification of record selection, sort parameters and tagalong data fields is accomplished by simple, RPG-like coding sheets that are similar to those used by the MFCU sort program.

Sort control card diagnostics and messages are printed on either the 5203 or 1403 Printers or the 5471 Printer-Keyboards, depending on which has been assigned to the system's logging function via the operator control language. If the logging function has been 'turned off,' the sort printed output will be suppressed.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Requirement: An IBM System/3 model 10 which includes an IBM 5410 Processing Unit model A13 (12K bytes), an IBM 5424 MFCU model A1 or an IBM 1442 Card Read Punch model 6, an IBM 5203 Printer model 1 or an IBM 1403 Printer model 2 and an IBM 5444 Disk Storage Drive model 1.

For use on IBM System/3 model 8 - an IBM 5408 Processing Unit model A14 (16K bytes), an IBM 5203 Printer, an IBM 5444 Disk Storage Drive model A1, and either an IBM 3741 Data Station directly attached or an IBM 5471 Printer-Keyboards.

SOFTWARE REQUIREMENTS

5702-SC1; for tape support, 5702-SC1 feature #6024/#6025 is also required.

DOCUMENTATION

(available from Mechanicsburg)

Disk Sort Reference Manual (SC21-7522) ... System/3 Bibliography (GC20-8080).

**DISK SORT 5445 DISK STORAGE DRIVE FEATURE
(Feature #6008/#6010)**

PURPOSE

This feature enables the user to sort all disk file organizations supported for System/3 in either ascending or descending sequence. This feature supports the 5448 on both the System/3 model 8 and model 10, but supports the 5445 on the model 10 only.

All functions available to the Disk System user through the Disk Sort Program (5702-SM1) are provided.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Requirement: For the IBM Model 8 - the same requirements as the Disk Sort Program (5702-SM1) for the model 8, plus the IBM 5448 Disk Storage Drive (the 5448 requires a 5444 model A2 as a prerequisite).

For the IBM Model 10 - the same requirements as the Disk Sort Program (5702-SM1) for the model 10, plus the IBM 5445 or 5448 Disk Storage Drive (the 5448 requires a 5444 model 2 or A2 as a prerequisite).

SOFTWARE REQUIREMENTS

5702-SM1; 5702-SC1; 5702-SC1 feature #6022/#6023 (5445 Support) or 5702-SC1 feature #6074 (5448 Support).

Note: For users of 5448 Disk Storage Drive, specify feature #6010 for 200-cylinder 5440 disk cartridge distribution.

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**SYSTEM/3 DISK RESIDENT MAGNETIC TAPE SORT
5702-SM2****PURPOSE**

The IBM System/3 Disk Resident Magnetic Tape Sort program sorts fixed length, blocked and unblocked files residing on Magnetic Tape. The sort requires a system with a minimum of 12K bytes of core and three magnetic tape drives. Up to four magnetic tape drives may be utilized by the sort program. The file may be recorded in either EBCDIC or ASCII code, and may reside on multiple tape reels. (This feature is applicable to System/3 model 8.)

DESCRIPTION

The sort program can select desired records from the input file to be included or excluded from the sort. Recognition of individual records can be based on:

- Record code
- Relation of a field to a constant
- Relation of two fields in a record
- Any relationship in a series (ORing)
- All relationships in a series (ANDing)
- Multiples of the above test in any combinations

Control fields may be in a different location in records within the file.

Output from the sort program is in the following format:

A file of records containing the sort control fields and the data fields the user has specified. The user need select only the data he needs from his input to be included in the output. By specifying the entire input record as a tagalong field, the user can, in effect, accomplish a record sort.

Specification of record selection, sort parameters and tagalong data fields is accomplished by simple, RPG-like coding sheets that are similar to those used by the Disk Sort program, 5702-SM1. The addroot and summary sort capabilities of the Disk Sort are not supported in the Magnetic Tape Sort programs.

Sort control card diagnostics and messages are printed on the system output device.

Checkpoint/Restart is supported but does not require the SCP feature (5702-SC1, feature #6026/#6027). The maximum block or record size for input or output is 9,999 bytes. Input and output files may be multi-volume, but work files for the sort can be single volume files only.

To utilize all of the functions of this program, at least three 9-track work tapes must be available. If one or more of the work tapes is 7-track, then only those sort functions that relate to the standard System/3 64-character set (EBCDIC) are supported. As a result, sorts of packed decimal data, of signed numeric data, or on zones are not allowed in these 7-track configurations.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Minimum System Requirements: In addition to the minimum system requirements for 5702-SM1, an IBM System/3 model 8 or model 10 requires three magnetic tape drives. (When operating using DPF, a minimum program level of 8K is required).

SOFTWARE REQUIREMENTS

5702-SC1; 5702-SC1, feature #6024/#6025.

DOCUMENTATION

(available from Mechanicsburg)

Tape Sort Program Reference Manual (SC21-7572). ... System/3 Bibliography (GC20-8080).

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**SYSTEM/3 DISK RESIDENT CARD UTILITIES
5702-UT1**

PURPOSE

The following IBM System/3 Card System Utilities may be ordered as disk resident on an IBM 5444 Disk Storage Drive. Their function is the same as their card system equivalents:

MFCU Sort/Collate
96-Column List
Reproduce/Interpret
Data Recording
Data Verifying
80-96 Conversion Program.

(This feature not applicable to IBM System/3 model 8.)

DESCRIPTION

The Model 10 Gangpunch program is available only for the disk system and provides the following capabilities:

- Interspersed master-card gangpunching: The master and detail cards are intermixed in the primary file.
- Count-controlled gangpunching: A fixed or variable counter may be used to punch a specified number of detail cards. The master card is in the secondary file and the detail cards are in the primary file.
- Match master cards and detail cards on a control field and punch into the detail card if a match occurs: The master card is in the secondary file and the detail card is in the primary file.
- The following functions may be performed with any of the major types of gangpunching described above: Offset gangpunching ... gangpunching consecutive numbers into detail cards ... gangpunching a constant into detail cards ... card interpretation (entire card or only what is punched) ... selection of a single type of master card from many master cards ... selection of a single type of detail card from many detail cards.
- For count-controlled and match fields processing, MFCU2 is used for input and MFCU1 is used for output. For interspersed processing, MFCU1 is used for both input and output.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Requirement: An IBM System/3 model 10 which includes an IBM 5410 Processing Unit model A13 (12K bytes), an IBM 5424 MFCU model A1, an IBM 5203 Printer model 1 or 1403 Printer model 2 and an IBM 5444 Disk Storage Drive model 1.

An IBM 5475 Data Entry Keyboard is required if the Data Recording and/or Data Verifying programs are utilized.

An IBM 1442 Card Read Punch model 6 is required, in addition to the IBM 5424 MFCU, if the 80-96 Conversion program is utilized.

SOFTWARE REQUIREMENTS: 5702-SC1.

DOCUMENTATION

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**SYSTEM/3 UTILITY PROGRAM FOR
1255 MAGNETIC CHARACTER READER
5702-UT2****PURPOSE**

This IBM System/3 utility program provides the disk oriented IBM System/3 model 10 user control of document processing on the IBM 1255 Magnetic Character Reader. It provides a means of reading MICR-encoded documents from the 1255, accumulating document totals and amount field totals for each pocket, and placing the data from the documents on output disk and printer files. The program is designed to fulfill the basic requirements of the "ON-US" data capture run required for all Demand Deposit Application programming. (This program is applicable to the IBM System/3 model 8.)

DESCRIPTION

The program reads fields from the documents as specified by the user and then, based on decisions indicated by the user, it will stacker select these documents into user-specified pockets. If requested, Modulus 10 and 11 checking will be performed. Then, after each document has been read and stacker selected, the utility will print user-specified fields from that document. Fixed-length records will also be created and placed on disk file (5444 or 5445 or 5448) or a tape file (3410 or 3411, 9-track only).

An additional facility provided by the program is the accumulation of document totals and amount field totals and then printing these at end of job. Subtotals may be printed at any time as indicated by the user during program execution.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Minimum System Configuration: Utility Program for the IBM 1255 Magnetic Character Reader will operate on a minimum configuration IBM System/3 model 10 which includes an IBM 5410 Processing Unit (12K bytes) with a Serial I/O Channel (#7081), an IBM 5424 MFCU (250 cpm read and 60 cpm punch and print), an IBM 5203 Printer (96 print positions and 100 lpm), or an IBM 1403 Printer (132 print positions and 600 lpm), an IBM 5444 Disk Storage Drive (2.45 million bytes) and an IBM 1255 Magnetic Character Reader. The minimum main storage required to support a system including an IBM 5445 or 5448 Disk Storage Drive or IBM 3410/3411 Magnetic Tape Subsystem is 16K bytes.

For use on IBM System/3 model 8 - an IBM 5408 Processing Unit model A14 (16K bytes), an IBM 5203 Printer, an IBM 5444 Disk Storage Drive model A1, and either an IBM 3741 Data Station directly attached or an IBM 5471 Printer-Keyboard. In addition, a Serial I/O Channel and an IBM 1255 Magnetic Character Reader is required.

SOFTWARE REQUIREMENTS

5702-SC1. For IBM 5445 support, 5702-SC1 feature #6022/#6023 is also required (model 10 only). For IBM 5448 support, 5702-SC1 feature #6074 (model 10 only - IBM 5448 mutually exclusive with SIOC on model 8). For tape support, 5702-SC1 feature #6024/#6025.

DOCUMENTATION

**JOB ANALYSIS SYSTEM/3 (JAS/3)
5702-XP1**

PURPOSE

IBM Job Analysis System/3 (JAS/3) provides a powerful tool to aid management in fulfilling its responsibilities in the planning, supervising, and controlling of project-oriented work by the critical path method. It is designed to be a high performance system with features which make it easily usable by non-technical personnel.

JAS/3 operates under the System/3 Disk System Control Programs 5702-SC1 or 5703-SC1, 5704-SC1, 5704-SC2, or 5705-SC1. Depending on core availability, JAS/3 has a processing capacity of from 180 to 736 activities or work items and relationships per subnet depending on core size.

HIGHLIGHTS

Front-to-back interfacing of up to 10 subnets to form a network with up to 7,000 activities ... multiple networks per master file ... multiple calendars (each subnet in a network can have its own calendar) ... every relationship can have a lag ... multiple starts and ends (explicit or implicit) ... reports easily modifiable via control cards ... progress reporting specifying actual start date and/or remaining duration ... three types of schedule dates ... nine levels of milestones ... Direct Access Master File ... free-form data input.

Use: To use JAS/3, the customer must describe the activities which constitute the project network. This data is punched into cards or diskettes, for entry into the System/3 or can be entered directly from the keyboard. Processing and report requests can also be entered in either fashion.

CUSTOMER RESPONSIBILITIES

All users should be familiar with the various features of this system before attempting to use it for actual project control. Users will need a knowledge of the fundamentals of the critical path technique before they can prepare input.

Note: JAS/3 Does Not Support Spooling.

SOFTWARE REQUIREMENTS

JAS/3 is written in System/3 Basic Assembler language and operates under the IBM System/3 Disk System Control Program. On a system with Dual Programming feature, JAS/3 must run in Program Level 1.

SYSTEM/3 DATA/3
5702-XX1, 5704-XX1, 5704-XX3, and 5705-XX1

PURPOSE

This program product provides users of IBM System/3 models 8, 10 Disk, 12 and 15 with a terminal-oriented data entry, inquiry, and file maintenance system. The specific functions it provides are data entry, data entry with master file input, inquiry, and inquiry with update.

HIGHLIGHTS

- Uses a program definition and a data definition form. Both are designed for ease-of-use with forms already familiar to the user.
- Easy to install and use via RPG-like forms and fill-in-the-blanks type prompting.
- DATA/3 generated programs do not require a dedicated system; that is, another program - batch or CCP - can be executed in the other program level or partition.
- DATA/3 generated programs can be executed under control of CCP.
- Places control and responsibility for data integrity at the data source.
- Offers up to four separate program security checks. Two are available in the DATA/3 generated programs; two additional checks are available when running under CCP.
- Requires no knowledge of programming languages by the terminal operator.
- Provides standard checking functions.

DESCRIPTION

Data Entry: Allows the operator to enter data on either a field or a record basis. It creates a single output file which can contain multiple record types depending on the application. Output files can be sequential, indexed, or direct. During data entry, the operator can page forward or backward through the entry screens. The definition of the output record format controls the program's flow by insuring that the proper input, edit, and output record display format operations are performed. If a field fails to pass a validity check, the field in error is intensified, indicating a correction must be made by the operator.

Data Entry with Master File Input: Allows the operator to extract information from up to eight existing master files and combine this information with data entered at the terminal. This combined data is displayed, verified or overridden by the operator, and incorporated into the output data file. Output files can be sequential or indexed, and, as above, the operator can page forward and backward through the entry screens during data entry.

Inquiry: This function allows access to records in a disk file by using a record key. When there are several inquiry screen format displays used by the program, the operator can switch from display to display. The program may also specify 'ease-of-reading' editing for numeric fields.

Inquiry with Update: This function provides file maintenance capability. When a record is accessed by key and displayed at the terminal, the operator can change the appropriate fields and direct the program to replace the record on disk with the new information. Data integrity is preserved by having user specify at program definition time which fields may be altered (unprotected) and which displayed fields may not be altered (protected). Records may also be added by the operator at the terminal.

Use: DATA/3 can be used in a wide variety of applications where a need exists for online data entry, data inquiry and file maintenance.

It is particularly suited for customer service ... order entry ... inventory and production control ... stockholder records ... credit control.

CUSTOMER RESPONSIBILITIES

Customizing DATA/3 to their specific needs. This will include the initial specification of the data files that DATA/3 generated programs will interface with. A data definition form is available.

Program definition forms are available for use when a program is to be generated using the DATA/3 facilities. These forms enable users to specify program name, security, data file interfaces, 3270 screen formats and field editing requirements of their various programs.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum configuration for IBM System/3 model 10 Disk System is IBM 5410 Processing Unit - 24K for Non-CCP or 32K for CCP ... IBM 5444 Disk Storage Drive model 2 ... IBM 5424 Multi-function Card Unit or 1442 Card Read Punch ... IBM 5203 Printer or 1403 Printer ... Local Communications Adapter (LCA) or Binary Synchronous Communications Adapter (BSCA) ... IBM 3270 Information Display System (minimum one display station). Programming Requirements include ... model 10 Disk System Control Programming (5702-SC1, Release 12 or later; or Release 13 if the Display Adapter is to be used) ... BSCA Multiline/Multipoint feature (5702-SC1, feature #6030/#6031), ...

Macros feature (5702-SC1, feature #6020/#6021) ... Overlay Linkage Editor and Checkpoint/Restart feature (5702-SC1 feature #6026/#6027) ... RPG II Compiler (5702-RG1).

The minimum configuration for the IBM System/3 model 8 is IBM 5408 Processing Unit model A16 (32K bytes) ... IBM 5444 Disk Storage Drive model A2 ... IBM 5203 Printer ... IBM 5471 Printer-KeyBoard or 3741 Data Station/Programmable Workstation directly attached ... Integrated Communications Adapter (ICA) or Binary Synchronous Communications Adapter (BSCA) or the Local Display Adapter ... IBM 3270 Information Display System (minimum one display station). Programming Requirements same as IBM System/3 model 10.

The minimum configuration for IBM System/3 model 12 is IBM 5412 Processing Unit B16 (32K) ... IBM 5424 MFCU or 1442 Card Read Punch or 3741 Data Station/Programmable Workstation directly attached ... IBM 5203 or 1403 Printer ... IBM 3340 DASF ... Integrated Communications Adapter (ICA) or Binary Synchronous Communications Adapter (BSCA) or Local Display Adapter ... IBM 3270 Information Display System (minimum one display station). Programming requirements include ... IBM model 12 System Control Programming (5705-SC1) ... RPG II Compiler (5705-RG1).

The minimum configuration for IBM System/3 model 15 is the same as for model 15 SCP, but in addition, the following are required: IBM 3270 Information Display System (minimum one display station) ... Local Communications Adapter (LCA) or BSCA or Display Adapter (FC4601); or the model 15D, the BSCC is supported by DATA/3, but only under CCP. Programming requirements for 5704-XX1 include the SCP (5704-SC1 Release 3 or later; or Release 4 if the Display Adapter is to be used) and RPG II Compiler (5704-RG1). Programming requirements for 5704-XX3 include the SCP (5704-SC2) and RPG II Compiler (5704-RG2).

Additional devices supported include additional 5444 or 5445 disks, 5448 disks, 3340 disks, 3344 disks, and multiple terminals (including printers) on the 3270 Information Display System. (Program Function Keys 1-5 are required on the 3270 terminals.) The Data Entry Keyboard is recommended on the 3270 terminals.

SOFTWARE REQUIREMENTS

DATA/3 generated programs are compiled and executed like any other RPG II program. The generated programs operate under control of the System/3 System Control Programming (SCP) as follows:

SYSTEM/3	DATA/3	SCP
Models 8 and 10	5702-XX1	5702-SC1
Model 12	5705-XX1	5705-SC1
Model 15	5704-XX1	5704-SC1
Model 15	5704-XX3	5704-SC2

DOCUMENTATION

TERMS and CONDITIONS: See PP Index

**SYSTEM/3 DISK FORTRAN IV
5703-FO1**

PURPOSE

IBM System/3 Disk FORTRAN IV processes programs written in the IBM System/3 FORTRAN language, producing output suitable for execution with the IBM System/3 model 6 System Control Programming (5703-SC1). (This program is not used with the model 4).

HIGHLIGHTS

The System/3 FORTRAN language contains those features defined in American National Standard Basic FORTRAN, X3.10.1966; language extensions supported by IBM 1130 Basic FORTRAN; and additional features and capabilities previously available only with certain IBM Full FORTRAN compilers. These features include:

- The DEBUG facility, which enables the user to locate errors in a FORTRAN source program. By use of four basic statements, the debug facility provides for tracing flow within a program and between programs, and for checking the validity of subscripts.
- The IMPLICIT statement, which enables the user to specify the type (including length) of all variables, arrays, and user-supplied functions whose name begins with a particular letter.
- Length specification for INTEGER and REAL type statements, which allows the explicit specification of the INTEGER*2, INTEGER*4, REAL*4, and REAL*8 (double precision) data types.
- The relational IF statement, which is used to direct the transfer of control after the evaluation of relational expressions.
- List-directed input/output, which permits reading and writing of formatted data without a FORMAT statement.
- The GENERIC statement, which enables the user to specify a single name for a FORTRAN built-in or library function having several names. Depending on argument type, the correct function is selected by the compiler with each appearance of the name.
- IBM FORTRAN language extensions INVOKE, PROGRAM and GLOBAL, which allow FORTRAN main programs to be loaded successively into main storage and executed, while permitting these programs to share a common data area. These language extensions provide function equivalent to 1130 FORTRAN CALL LINK.
- Names of up to six characters for variables, arrays, functions, and subroutines.

DESCRIPTION

The System/3 Disk FORTRAN IV library contains mathematical and service subprograms required during execution to perform arithmetic operations, input and output constant conversion and input/output control.

System/3 Disk FORTRAN IV is supplemented by a Commercial Subroutine Package which is equivalent in function to the 1130 Commercial Subroutine Package with the exception that I/O routines for the model 6 version are not provided. Therefore, FORTRAN I/O must be used for model 6 device support.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Configuration: For compilation and execution, a System/3 model 6 with a minimum of 12K bytes of main storage is required. Disk FORTRAN IV requires a minimum of 9K bytes of main storage for compilation - exclusive of control program requirements.

- 1 - IBM 5406 Central Processing Unit (model B03)
- 1 - IBM 5444 Disk Drive (model 1)
- 1 - IBM 5213 Printer (model 1) or 2222 Printer (model 1)

Additional Device Support

IBM 5406 Central Processing Unit (model B04) ... IBM 5213 Printer models 2 or 3 ... IBM 2222 Printer model 2 ... IBM 5444 Disk models 2 or 3 ... IBM 5496 Online Data Recorder with IBM System/3 model 6 attachment feature ... IBM 129 Online Data Recorder with card I/O attachment feature (supported as IBM 5496). FORTRAN supports the IBM 3741 directly attached as an input or output device for compilation only.

Prerequisite: EC 571595 is required for all IBM System/3 model 6 CPUs on which System/3 FORTRAN will be run.

SOFTWARE REQUIREMENTS

5703-SC1; 5703-SC1 feature #6010/#6011.

COMPATIBILITY

System/3 Disk FORTRAN IV source programs for System/3 model 6 are compatible with the System/3 Disk FORTRAN IV for System/3 model 10 except for changes required to accommodate differences in attached I/O. The System/3 Disk FORTRAN IV compiler accepts source programs written in the IBM System/360 Basic FORTRAN IV language, which encompasses American National Standard Basic FORTRAN as defined in X3.10.1966. The compiler also accepts source programs written in the IBM 1130 Basic FORTRAN language with minor modifications.

PERFORMANCE

The System/3 Disk FORTRAN IV will compile and execute approximately 100 source statements on a 12K system with increased capacity on a 16K system.

The System/3 Disk FORTRAN will compile and execute in 9K of main storage, exclusive of control program requirements. Object time performance is dependent on program type, size, I/O functions performed and other factors pertinent to program execution speed.

DOCUMENTATION

(available from Mechanicsburg)

FORTRAN Reference Manual (SC28-6874) ... FORTRAN Commercial Subroutines (SC28-6875). ... S/3 Bibliography (GC20-8080).

Multiple Program Requests: Program Products and System Control Programming type 5703 (System/3 model 4 or 6) which are ordered from PID for shipment at the same time will be shipped to the user stacked on a 5440 disk cartridge (or equivalent)* under the following conditions:

1. The scheduled ship date, seven-digit customer number and CPU number must be the same for all programs ordered.
2. All of the program feature orders must specify the same cylinder size (100 cyl or 200 cyl). (Note: Model 4 uses only 200-cylinder disks).
3. The total storage requirements of the programs ordered must not exceed the number of available cylinders indicated by the specify number (100 or 200 cylinders).*
4. The announcement of availability must indicate that the program can be stacked.

* More than one disk cartridge may be required.

Action Required: Sufficient lead time is necessary to facilitate the proper coordination of System Control Programming and program products shipped from PID, and the system installation date. The following procedures must be followed:

- System Control Programming and program products are shipped from PID on 5440 Disk Cartridge. A cartridge may either be supplied by the user or it may be ordered from IBM.
- Orders may be submitted directly to PID for 5440 disk cartridges to be used for program deliveries.
- Orders will be scheduled for shipment from PID the Friday of the second week following AAS order entry, unless a later scheduled ship date is requested. Customer disks must arrive at PID the Tuesday before the Friday scheduled date.
- The branch must verify that System Control Programming and program products are on order and scheduled for shipment from PID to ensure their arrival concurrent with systems delivery.
- When rescheduling a system, the branch must also ensure that associated System Control Programming, program products, and disks are also properly rescheduled.

Failure to adhere to the above procedures can result in late shipment of programs and late installations.

PROGRAM PRODUCTS

**SYSTEM/3 HEALTH, WELFARE AND PENSION FUND
SYSTEM (5703-N11)**

PURPOSE

The IBM System/3 Health, Welfare and Pension Fund System meets basic contribution accounting requirements for jointly administered Health, Welfare and Pension Funds. In addition, member, contribution, and claims information is maintained for improved management analysis and control. The program is designed for the System/3 model 6.

The compact System/3 model 6 offers for the first time all the benefits of a stored program system to a large number of smaller funds, while avoiding significant facility problems. The Health, Welfare and Pension Fund System program product provides a comprehensive, easily installed package which assumes minimum tailoring and no permanent user programming capability.

HIGHLIGHTS

- Contribution accounting including prelisting for both hourly and flat rate contribution funds
- Notification of employer contribution shortage
- Member contribution/history file
- Claim history file
- Historic employer contribution file
- Computer prepared claim and pension checks
- Inquiry facility for all primary files
- Full maintenance of all system files
- Data for typical eligibility determination
- Utilization of the low cost System/3 model 6
- Control of all files, complete audit trail

Use: The Health, Welfare and Pension Fund will use this system for contribution accounting, pension and claim check preparation, to provide data for eligibility determination and for analysis and control of its operation.

CUSTOMER RESPONSIBILITIES

A thorough knowledge and understanding of both current contribution accounting procedures and controls and of the program product contribution accounting and controls ... any modification for unique requirements ... generation of system control program and program product ... coding and capture of required files and tables ... assignment of employer account numbers, claim codes, contract codes ... establishing individual audit requirements ... providing for manual supervision of controls and the integration of controls into the reporting framework used by the fund.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum Machine Configuration

Description	Type	M/SF
Processing Unit (12K)	5406	B3
Printer Attachment		3902
Printer (132 positions)	5213	2
Disk Storage (2.45 M bytes)	5444	1

The file storage requirements will vary greatly from fund to fund based upon such factors as number of members, collection cycle, and claim rate characteristics. Additional information can be found in the *General Information Manual*. Please contact your Regional Insurance Industry Marketing representative or the Insurance System Center, Princeton, New Jersey, for further assistance.

Reconstruction from machine-readable media will require the purchase of additional 5440 Disk Cartridges.

SOFTWARE REQUIREMENTS

The Health, Welfare and Pension Fund system is written in RPG II and operates under the control of the IBM System/3 model 6 System Control Program (5703-SC1).

All files are indexed disk.

Required Program Products - System/3 Model 6

- RPG II (5703-RG1)
- Conversational Utilities (5703-UT1)
- Disk Sort (5703-SM1)

DOCUMENTATION

General Information Manual (GH20-1189).

TERMS and CONDITIONS: See PP Index

**SYSTEM/3 MODEL 6 RPG II
5703-RG1**

PURPOSE

IBM System/3 model 6 RPG II is a program product that operates under control of the System Control Programming. It is disk resident, and in addition to the functions provided by the S/3 Disk RPG II (5702-RG1), the S/3 model 6 RPG II supports operator keyboard console and other unique devices, as indicated below.

DESCRIPTION

The recording techniques used by all disk file organizations permit multiple records to be read or written with a single I/O instruction. Unlike previous data management techniques, System/3 disk files can be written or read using different blocking factors in different programs. This facility allows the user to process single records when a program uses a large amount of storage or to use as much core as available in processing multiple records to increase throughput.

System/3 Model 6 RPG II supports three types of file organization - Sequential, Indexed, and Direct. Direct files are addressed by relative record number; records may be loaded or retrieved by specifying the number of the record in the file.

The access methods supported are as follows:

1. Sequential
 - a) Consecutive processing - including updating in place.
 - b) Random processing - by relative record number including updating but excluding file loading.
2. Indexed
 - a) Random processing - by key.
 - b) Sequential processing - by key including file loading. Unlike previous indexed file organizations, the keys and data may be in a different physical sequence; i.e., the most active records may be placed in the front of the file with the index in sequence by item number.
3. Direct
 - a) Random processing - by relative record number, including updating and file loading. The open routine on the file load clears the data area on disk.
 - b) Consecutive processing.

Standard S/3 disk labels are mandatory on all disk files. Non-standard labels cannot be used except as data records within the file.

When a program generates too much object code for the specified size, the compiler will generate overlays. Not all programs - even with overlays - can fit into the stated machine size. In any event, programs cannot be compiled that would exceed 64K without overlays.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

System Configuration: An IBM System/3 model 4 workstation system includes: IBM 5404 Processing Unit model A18 (64K bytes) ... IBM 5447 Disk Storage and Control ... IBM 5213 Printer ... IBM 3277 Display Station model 1 ... at least one locally attached terminal. (Note: The 3277 is supported only by CCP; RPG II does not use the 3277.) A minimum IBM System/3 model 6 configuration includes: IBM 5406 Processing Unit model B2 (8K bytes) ... IBM 5444 Disk Storage Drive ... IBM 5213 or 2222 Printer.

Devices Supported: The following devices and features are supported by RPG II object programs:

Mdl 4	Mdl 6	Description
	X	129 Card Data Recorder mdl 1, 2 or 3
	X	2222 Printer mdl 1 or 2 (including Ledger Card Device and second tractor)
	X	2265 Display Station mdl 2 (5406-B3 or B4 is required)
	X	3741 Data Station mdl 1 or 2 directly attached
	X	3741 Programmable Workstation mdl 3 or 4 directly attached
	X	5213 Printer mdl 1, 2 or 3
X		5213 Printer mdl 3
X		5404 Processing Unit mdl A18
	X	5406 Processing Unit mdl B2, B3 or B4
	X	5444 Disk Storage Drive mdl 1, 2, 3
X		5447 Disk Storage and Control mdl A1 or A2
	X	5496 Data Recorder mdl 1

SOFTWARE REQUIREMENTS

5703-SC1 for IBM 3741 support, 5703-SC1 feature #6026/#6027 is required.

COMPATIBILITY

System/3 model 6 RPG II is source language compatible with RPG II for other System/3 models, except for differences due to different hardware.

Disk data files created by disk system management are compatible across System/3 models.

RPG II TELECOMMUNICATIONS FEATURE
(Feature #6000 or #6002)

PURPOSE

The RPG II Telecommunications feature provides the user with the capability of sending or receiving binary synchronous data over voice grade or high speed communications lines. This support is achieved through the use of an RPG II Telecommunications Specification Sheet, and the addition of BSCA (Binary Synchronous Communications Adapter) as a device entry on the RPG II File Description Specification. This RPG II support permits System/3 to function in one of the following communication modes:

- Receive only
- Receive with conversational reply***
- Transmit only
- Transmit with conversational reply***
- Alternate transmit and receive file****

DESCRIPTION

The RPG II language features supported for communications are:

Input, Output and Combined Files ... Demand Files for Transmit and Receive ... Blocking and Deblocking of Records ... Dual I/O Areas.

These BSCA features, options, and capabilities are supported by the feature:

Manual call ... Manual answer ... Auto-call ... Auto-answer ... Medium speed ... High speed ... Station selection ... EBCDIC data transparency ... Intermediate block checking ... EBCDIC or ASCII data and data link control characters. File translation of ASCII data can be accomplished by proper use of the file translate extension of RPG II.

System/3 with a BSCA supported by the RPG II Telecommunications feature can communicate with the following systems:

Another System/3 with BSCA, program-supported by RPG II Telecommunications feature.

A System/32 with BSCA (#2074), program-supported by RPG II.

A System/34 equipped with a Communications Adapter, program-supported by RPG II and Assembler.

A System/360 model 20 with BSCA, program-supported by BSCA IOCS.

A System/360 (or System/370 when operating in Basic Compatibility mode) program-supported by DOS BTAM, OS BTAM, or OS TCAM*.

A 2770 Data Communication System.

A 2780 Data Transmission Terminal.

A 3741-2 Data Station.†

A 3741-4 Programmable Work Station.†

A 5110 Computer System supported as a 3741 model 2 or 4.

A 5230 Data Collection System with BSCA (#2074). Receive mode only. Supported as a 3741 model 2 or 4.

A 5280 Distributed Data System with Communications Adapter (#2500).

A Series/1 - Refer to Series/1 pages for appropriate features.

A 6670 Information Distributor (as a 2770).

A System/7 with (#2074)

This program provides the support to use System/3 in the following telecommunications networks:

Point-to-Point switched ... Point-to-Point nonswitched ... Multipoint (as a tributary station).

System/3 with BSCA is a compatible member of the IBM BSC family of terminals. It can be intermixed with other BSC terminals (System/360 model 20, 5280, System/32, System/34, 1130, 1800, 2770, 2780 and 2715 model 2, 3780, 3741-2) on a multipoint line when operating as a tributary station with a central System/360 or System/370 computer* using DOS or OS BTAM. It can also share the

S/3 Mdl 6 RPG II (cont'd)

same phone number at the central System/360 or System/370 computer* with other BSC terminals (System/360 or System/370 computers**, System/360 model 20, System/32, System/34, 5280, 1130, 1800, 2780, 2770 and 2715 model 2, 6670 (as a 2770), 3780, 3741-2, -4).

* System/360 models 22, 25 and 30 with DOS/360, models 40, 50, 65, 67 (in 65 mode), and 75 with DOS/360 and OS/360 and models 85, 91 and 195 with OS/360. System/370 models 135, 145 and 155 with DOS and OS and model 165 with OS when operating in Basic Compatibility mode.

** System/360 models 22, 25 and 30 with BOS/BPS or DOS/360, models 40, 50, 65, 67 (in 65 mode), and 75 with BOS/BPS, DOS or OS/360 and models 85, 91 and 195 with OS/360. System/370 models 135, 145 and 155 with DOS and OS and model 165 with OS when operating in Basic Compatibility mode.

*** Not supported in communications with System/32, System/34, 2770, 2780 and 3741-2, -4.

**** Transmit interspersed with Receive is not supported in communication with 2770, 2780 or 3741-2, -4.

† Operator Identification Card Reader feature (#5450) and the Expanded Communications/Multipoint Data Link Control feature (#1685) on 3741-2, 4 are not supported.

The functions and specifications for the System/3 model 6 RPG II Telecommunications feature are identical to those of the System/3 model 10 Disk RPG II Telecommunications feature.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

This program can be used on the IBM System/3 model 4 or model 6. Minimum requirements are the same as for RPG II (5703-RG1).

For object program execution - the Binary Synchronous Communications Adapter (#2074) is required. For System/3 model 6, an IBM 5406 model B3 or B4 is required to support communications with an IBM 2770 or 2780.

SOFTWARE REQUIREMENTS

5703-RG1; 5703-SC1

DOCUMENTATION

(available from Mechanicsburg)

RPG II Telecommunications Programming Reference Manual (GC21-7507). ... System/3 Bibliography (GC20-8080).

**RPG II AUTO-REPORT FEATURES
(Features #6008, #6009)****PURPOSE**

The RPG II Auto-Report feature enhances the RPG II language by providing functions which eliminate much of the preparation and coding work normally done by the user when producing an application program in RPG II. It is specifically designed to facilitate report preparation.

The IBM System/3 Auto-Report program executes as a preprocessor to the RPG II compiler which is a prerequisite for this feature. The input to the program is RPG II source statements and Auto-Report statements. Auto-Report produces a diagnostic listing, replaces the Auto-Report statements with generated or copied RPG II source statements and calls the RPG II compiler for execution.

DESCRIPTION

Coding of applications in RPG II is made easier by the following Auto-Report functions.

- Page Headings - The user need supply only the report title. Auto-Report generates skipping, spacing, horizontal alignment and date and page number constants. Page overflow is considered and the heading conditioned to print on the top of each page.
- Simplified Output Specifications - A single output field specification can result in Auto-Report generated statements to:
 - Indicate printing with editing
 - Place column heading over the data fields
 - Control spacing
 - Control horizontal alignment of data
 - Define total fields and calculation specifications to accumulate totals by control levels (total rolling),
 - Flag total lines with asterisk indication.
- COPY - The COPY statement provides the ability to copy RPG II source statements from a disk library into the RPG II source program. Some values on the copies specifications may be modified for the resulting compilation.
- Source Program - The Auto Report program passes control directly to the RPG II compiler to cause compilation of the expanded source program. In addition, the user may elect to catalog to disk a copy

of the source program so that he can make modifications which tailor the program more closely to his requirements.

The Auto-Report functions may be specified for one printer file in any RPG II program. Any RPG II specifications not related to the selected printer file and any RPG II statements for the printer file but not requesting Auto-Report functions, are passed to the RPG II compiler as a part of the source program.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

System Configuration: This program can be used on the IBM System/3 model 4 or model 6. Minimum requirements are the same as for RPG II (5703-RG1).

SOFTWARE REQUIREMENTS

5703-RG1; 5703-SC1.

DOCUMENTATION

**RPG II 3270 DISPLAY CONTROL FEATURE
(Feature #6030 - Model 4 only)****PURPOSE**

The RPG II 3270 Display Control feature provides telecommunications services on the IBM model 4 for local or remote IBM 3270 devices. This program is automatically linked into the RPG II application program via the SPECIAL file exit capability on the RPG II File Description Specification Sheet. The RPG II Telecommunications feature is not required.

DESCRIPTION

The following services are provided by the RPG II 3270 Display Control feature:

- RPG II access to 3270 Display System terminals attached to the CPU or the Binary Synchronous Communications Adapter.
- Automatic buffering and queuing of terminal data.
- A display formatting interface which permits the support of 3270 devices with coding in RPG II.
- Complete line control procedures are provided.
- Up to 18 terminals may be controlled (up to 5 can be attached to the CPU).
- Two subroutines are provided. SUBR13 allows an RPG II program to support the 3270 Information Display System without using CCP. Using SUBR14, an existing program using the 3270 Display Control feature may be converted to execute under control of CCP by replacing SUBR13 references with SUBR14 references in the RPG II source program. The user must only then make any adjustments required by CCP and recompile the program.
- Provides the capability of coding one or more applications within one program. No task switching is provided.

Terminals Supported: The following terminals and Communication facilities are supported by the RPG II 3270 Display Control feature:

With the Binary Synchronous Communications Adapter

- 3275 Display Station and Control
- 3271 Display Control Unit (models 1 or 2) with:
 - 3277 Display Stations (models 1 or 2)
 - 3284 Printer (models 1 or 2)
 - 3286 Printer (models 1 or 2)
 - 3288 Printer (model 2)

Directly to CPU

- 3277 Display Stations (models 1 or 2)
- 3284 Printer (models 1 or 2)
- 3286 Printer (models 1 or 2)
- 3288 Printer (model 2)

Note: A maximum of 5 terminals may be attached to the CPU.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS****Minimum System Requirements**

The RPG II IBM 3270 Display Control feature requires an IBM System/3 model 4 which includes an IBM 5404 Processing Unit model A18 (64K bytes)...an IBM 5447 Disk Storage and Control ... an IBM 5213 model 3 Printer...and one of the devices listed under "Terminals Supported".

Using SUBR13, approximately 10.25K-13.75K bytes is added to the size of the object program; using SUBR14, 4.25K-5.25K bytes is

**SYSTEM/3 MODEL 6 DISK SORT PROGRAM
5703-SM1**

PURPOSE

This IBM System/3 model 6 disk sort program sorts any disk file organization supported by IBM System/3 disk systems management in ascending or descending sequence. This includes Indexed, Direct, and Sequential files. The sort program can select desired records from the input file to be included or excluded from the sort. Recognition of individual records can be based on:

- 1) Record code
- 2) Relation of a field to a constant
- 3) Relation of two fields in a record
- 4) Any relationship in a series (ORing)
- 5) All relationships in a series (ANDing)
- 6) Multiples of the above tests in any combinations.

DESCRIPTION

Control fields can be in a different location in records within the file.

Output from the sort program will be in one of three formats:

- 1) Tags - A file of 3-byte binary relative record numbers in the sequence specified by the user.
- 2) Tagalong - A file of records containing the sort control fields and/or the data fields the user has specified. By using this option, the user can select only the data he needs from his input file to be included in the output. By specifying the entire input record as a tagalong field, the user can, in effect, accomplish a record sort.
- 3) Summary Tagalong - Records containing identical control fields are combined by summarizing (totaling) specified fields into one record.

Specification of record selection, sort parameters and tagalong data fields is accomplished by simple, RPG-like coding sheets.

The functions and syntax of specification statements for the System/3 model 6 Disk Sort program are identical with those of the System/3 model 10 Disk Sort. An output data file created by the System/3 model 6 Disk Sort can be processed by any System/3 program which uses disk system management to access the file.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

An IBM System/3 model 4 workstation system includes: IBM 5404 Processing Unit model A18 (64K bytes) ... IBM 5447 Disk Storage and Control ... IBM 5213 Printer ... IBM 3277 Display Station model 1 ... at least one locally attached terminal. (Note: The IBM 3277 is supported only by CCP; the Disk Sort Program does not use the 3277.)

The minimum System/3 model 6 configuration includes: IBM 5406 Processing Unit model B2 (8K bytes) ... IBM 5444 Disk Storage Drive ... IBM 5213 or 2222 Printer.

Devices Supported

The following devices are supported by the Disk Sort program:

Model 4	Model 6	Description
	X	129 Card Data Recorder model 1, 2 or 3
	X	2222 Printer model 1 or 2
	X	2265 Display Station model 2 (5406 model B3 or B4 is required)
	X	3741 Data Station model 1 or 2 directly attached
	X	3741 Programmable Workstation model 3 or 4 directly attached
	X	5213 Printer model 1, 2 or 3
X		5213 Printer model 3
X		5404 Processing Unit model A18
	X	5406 Processing Unit model B2, B3 or B4
	X	5444 Disk Storage Drive model 1, 2 or 3
X		5447 Disk Storage and Control model A1 or A2
	X	5496 Data Recorder model 1

For Sort Specification input: IBM 129, 3741, 5444, 5447, 5496, or operator keyboard/console.

For input, work and output files: IBM 5444, 5447

For diagnostics and messages: IBM 2222, 2265, 5213

SOFTWARE REQUIREMENTS

5703-SC1. For IBM 3741 support, 5703-SC1 feature #6026/#6027 is required.

PROGRAM PRODUCTS

**CCP/DISK SORT PROGRAM (Model 4 Only)
5703-SM2**

PURPOSE

This program is functionally compatible with the IBM System/3 model 6 Disk Sort program (5703-SM1). With the CCP/Disk Sort program, however, the user can generate an object module which can be executed as a task under control of the Communications Control program (CCP) (5703-SC1 feature #6033), or as a program in batch (non-CCP) mode.

This program requires 12K bytes of main storage (exclusive of control program requirements) for both generation and execution, and automatic allocation of sort work files is not supported.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

An IBM System/3 model 4 workstation system includes: IBM 5404 Processing Unit model A18 (64K bytes) ... IBM 5447 Disk Storage and Control model A1 or A2 ... IBM 5213 Printer model 3 ... IBM 3277 Display Station model 1 ... at least one locally attached terminal. (Note: The IBM 3277 is supported only by CCP).

SOFTWARE REQUIREMENTS

5703-SC1; 5703-SC1 feature #6011. For execution under CCP: 5703-SC1 feature #6033.

PROGRAM PRODUCTS

**SYSTEM/3 MODEL 6 CONVERSATIONAL UTILITY PROGRAMS
5703-UT1**

PURPOSE

There are three IBM System/3 Conversational Utility programs that are disk resident and operate under control of the SCP:

The Keyboard Data Entry program allows the user to key data directly onto the disk. It will format records according to user specifications and output an indexed disk file which can later be processed by a user RPG II program or the Sort program. Additional functions of the program include the ability to correct records and take hash or control totals.

The Keyboard Source Entry program allows the user to key source statements (RPG II) or procedures directly from the keyboard to the source library on disk. The source statements may be in the form of RPG II source programs, format records for the Keyboard Data Entry program, Utility control statements, etc. The disk library is in a format which is acceptable to the system and to the RPG II compiler. Additional features include the ability to correct source statements.

The Data Interchange Utility allows the user to convert disk data files created by disk system management (such as RPG II - produced data files) into BASIC data files, and vice versa. The files are not converted in place; instead, a new file is created. The user must specify the format of his RPG II records and the fields to be converted. The final output will be acceptable to the new system.

(Note: The Data Interchange Utility is not used with the model 4). Data files created by the System/3 model 6 Conversational Utilities can be processed by any System/3 program which uses disk system management to access the files. The exception is that data files that are converted by the Data Interchange Utility (DIU) program to System/3 BASIC format are accessible only by System/3 BASIC and by DIU.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

An IBM System/3 model 4 workstation system includes: IBM 5404 Processing Unit model A18 (64K bytes) ... IBM 5447 Disk Storage and Control ... IBM 5213 Printer ... IBM 3277 Display Station model 1 ... at least one locally attached terminal. (Note: The IBM 3277 is supported only by CCP; the Conversational Utilities do not use the 3277.)

A minimum IBM System/3 model 6 configuration includes: IBM 5406 Processing Unit model B2 (8K bytes) ... IBM 5444 Disk Storage Drive ... IBM 5213 or 2222 Printer.

SOFTWARE REQUIREMENTS

5703-SC1.

PROGRAM PRODUCTS

**SYSTEM/3 UTILITY PROGRAM FOR
1255 MAGNETIC CHARACTER READER
5703-UT2**

PURPOSE

This utility program allows the IBM System/3 model 6 user to control document processing on the IBM 1255 Magnetic Character Reader. It provides a means of reading MICR-encoded documents from the 1255, accumulating document totals and amount field totals for each stacker, and placing the data from the documents on output disk and printer files. The program is designed to fulfill the basic requirements of the "ON-US" data capture run required for all Demand Deposit Application programming.

The program will read fields from the documents as specified by the user and then, based on decisions indicated by the user, it will stacker select these documents into user-specified stackers. If requested, Modulus 10 or 11 checking will be performed. Then after each document has been read and stacker selected, the utility will print user-specified fields from that document. Fixed-length disk records will also be created and placed on a disk file.

An additional facility provided by the program is the printing of document totals and amount field totals at end of job. Subtotals may be printed during program execution at times selected by the user.

The utility program is functionally compatible with System/3 model 10 Disk System Utility program for 1255 Magnetic Character Reader.

(This program is not used with the model 4.)

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This program requires an IBM 5406 Processing Unit model B3 or B4 with a Serial I/O Channel (#7081) ... IBM 5444 Disk Storage Drive model 1, 2 or 3 ... IBM 5213 Printer model 1, 2 or 3 or IBM 2222 Printer model 1 or 2 ... and IBM 1255 Magnetic Character Reader model 1, 2 or 3.

SOFTWARE REQUIREMENTS: 5703-SC1.

TERMS and CONDITIONS: See PP Index

**STAT/BASIC FOR SYSTEM/3 MODEL 6
5703-XA1****PURPOSE**

STAT/BASIC is an interactive program encompassing the most commonly used statistical techniques for the analysis of numerical data. The program operates on an IBM System/3 model 6.

STAT/BASIC is designed to meet the needs of the statistician, engineer, researcher or business analyst. It helps in using the computer directly for statistical analyses. A statistically-oriented user should have no difficulty in quickly learning the capabilities of the program. The interactive mode of the package allows a non-data processing-oriented user to use the program with ease, with a minimum of training.

Direct use on the System/3 model 6 provides the user with fast results. Because of the interactive nature of STAT/BASIC, the user can sit at the keyboard and see the results of his analyses as they are developed. Delays and some of the sources of error familiar in batch processing are eliminated with STAT/BASIC.

DESCRIPTION

STAT/BASIC consists of 40 procedures, written in the BASIC language, providing a wide range of capabilities under the following categories:

Data Generation - Read ... Print Edit ... Transformation.

Elementary Statistics - Cross Tabulation ... Histogram ... Tally ... Moments ... T-test ... Chi-square.

Regression and Correlation Analysis - Correlation ... Simple Regression ... Stepwise Regression ... Multiple Regression ... Polynomial Regression.

Multivariate Analysis - Discriminant Analysis ... Canonical Correlation ... Factor Analysis Part 1 ... Factor Analysis Part 2.

Analysis of Variance - One-way Analysis of Variance ... Factorial Design.

Nonparametric Statistics - Kendall Rank Correlation ... Sign Test ... Wilcoxon's Matched-pairs Signed-ranks Test ... Cochran Q Test ... Friedman Two-way Analysis of Variance ... Mann-Whitney U Test ... Kendall Coefficient of Concordance ... Biserial Correlation ... Point-biserial Correlation ... Tetrachoric Correlation ... Phi Coefficient.

Time Series Analysis - Moving Average ... Seasonal Analysis ... Cyclical Analysis ... Auto-covariance and Auto-correlation ... Cross-covariance and Cross-correlation ... Triple Exponential Smoothing.

Biostatistics - Survival Rate ... Probit Analysis.

On a System/3 model 6, the maximum size of a data matrix that can be processed is 300 rows (observations) by 30 columns (variables).

Exceptions are:

- For the edit and transformation programs, this limitation of 300 rows and 30 columns applies, but the number of rows (N) times the number of columns (M) must not exceed 3500 ($N \times M \leq 3500$).
- For the chi-square and Kendall coefficient of concordance programs, the maximum size of a data matrix is 100 rows by 30 columns.

HIGHLIGHTS

- A comprehensive set of statistical procedures.
- A user with a knowledge of statistics can learn the program capabilities with a minimum of effort.
- Interactive mode simplifies usage.
- Calculations performed in short or long precision.
- Extensive error checking with correction facilities.
- Instructional messages clarify procedures or options available.

Use: The user may utilize any of the STAT/BASIC programs through the console keyboard with System/3 model 6. The user first types a few systems commands and the name of the desired statistical program. Following a Ready indication, STAT/BASIC guides the user through his problem by typing out procedural instructions. Alternate courses of action or options are usually in the form of questions, which the user answers by typing the appropriate replies.

CUSTOMER RESPONSIBILITIES

The STAT/BASIC programs are distributed in machine-readable form for loading into the user system. Once stored, it is available to any member of the organization authorized to use the system.

If confidential information is to be stored in the library, the user must take appropriate steps to safeguard against unauthorized access.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The size of the user area required to run the STAT/BASIC procedures is a function of the number of statements in an individual procedure and the amount of data processed in short and long precision.

All procedures, with the exception of the transformation procedure, can be executed in short precision in a user area of 40,000 bytes with a symbol table size of 9,000 bytes.

All procedures, with the exception of the transformation procedure, can be executed in long precision in a user area of 50,000 bytes with a symbol table size of 16,300 bytes. The transformation procedure cannot be executed in long precision; it can be executed in short precision in a user area of 50,000 bytes with a symbol table size of 10,800 bytes.

IBM System/3 Model 6 ... The minimum system is the same as that required for System/3 BASIC, specifically IBM 5406 Processing Unit model B2 (8K) ... one IBM 5444 Disk Storage Drive model 1 ... one IBM 5213 Printer model 1.

SOFTWARE REQUIREMENTS

STAT/BASIC is written in BASIC. To run the program on an IBM System/3 model 6 requires the System/3 BASIC (5703-XM1) program product.

DOCUMENTATION

(available from Mechanicsburg)

General Information Manual (GH20-1027).

TERMS and CONDITIONS: See PP Index

**SYSTEM/3 BASIC
5703-XM1****PURPOSE**

IBM System/3 BASIC is a stand-alone, total facility interactive programming system. BASIC enables the user to enter BASIC statements, commands, utilities, BASIC data, and Desk Calculator (DCALC) instructions all in a completely interactive environment.

DESCRIPTION

System programs, source programs, and data files are stored on disk for direct accessibility. The system uses a virtual memory concept to allow the user to compile and execute large programs that otherwise would not fit into main storage.

System/3 BASIC, besides having a complete interactive interface to the user through the operator keyboard console, also provides the ability for continuous execution of stacked jobs without operator intervention.

Input to the System/3 BASIC is in the form of commands, data, or BASIC statements from either the keyboard console or from cards. Output is to the printer and/or to the 2265 model 2 Display Station. The disk is an input or output device as well as temporary and permanent storage for all forms of user data or programs.

DCALC (Desk Calculator) is a function of BASIC allowing the user to use the system as a large, highly sophisticated electronic desk calculator. No user knowledge of programming is necessary to put DCALC to its full use.

DCALC will give the user the ability to add, subtract, multiply, divide, and compute powers, roots, trigonometric functions, etc. Special procedures can be defined and stored into DCALC for future use. All of the functional routines (built-in functions) within BASIC are available to the DCALC user, except for the DET function.

The user has full control over his BASIC program with the command language. Commands are analyzed and result in the requested action being performed immediately upon the system. These commands allow the user intervention before, during, and after BASIC program execution.

A set of utilities are included in System/3 BASIC to allow for system generation and disk pack usage. The utilities give disk copy, file allocation, configuration, analysis, initialization, and track assignment capabilities to the user.

PERFORMANCE

The BASIC compiler can compile a 500-statement BASIC source program in 30 to 35 seconds. The BASIC program can be listed at a rate of approximately 60 statements-per-minute on the 5213 model 1 Printer (assuming the average statement is 40 characters long).

DCALC will respond to any user input within two seconds.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Minimum System Requirements: The minimum system configuration for System/3 BASIC, DCALC, and the utilities is: An IBM 5406 Processing Unit model B2 (8K bytes), an IBM 5213 Printer model 1 or an IBM 2222 Printer model 1 and an IBM 5444 Disk Storage Drive model 1.

Additional units and features supported are: IBM 5406 Processing Unit models B3 (12K bytes) and B4 (16K bytes), IBM 5213 Printer models 2 and 3, IBM 2222 Printer model 2, IBM 5496 Data Recorder with System/3 model 6 Attachment feature, IBM 129 Card Data Recorder with System/3 model 6 Card Input/Output feature, additional capacities of the IBM 5444 Disk Storage Drive, and the IBM 2265 model 2 Display Station. (Support of the 2265 requires a minimum of 12K bytes of main storage and the eight additional command keys.)

Note: A co-resident system requires a minimum of 4.90 million bytes of 5444 disk storage for operation.

System/3 BASIC is not supported on the model 4.

SOFTWARE REQUIREMENTS: None.

DOCUMENTATION

(available from Mechanicsburg)

BASIC Reference Manual (GC34-0001) ... BASIC Operator's Guide (GC34-0003) ... S/3 Bibliography (GC20-8080).

TERMS and CONDITIONS: See PP Index

**MATH/BASIC for SYSTEM/3 MODEL 6
5703-XM2****PURPOSE**

IBM System/3 MATH/BASIC is a set of conversational routines for the solution of the most frequently encountered mathematical problems in science and industry. The library operates on an IBM System/3 model 6.

MATH/BASIC is designed to meet the needs of the engineer and scientist. The conversational features of MATH/BASIC allow a non-data processing-oriented user to use the programs with a minimum of training.

HIGHLIGHTS

- A comprehensive set of mathematical routines.
- Calculations in short and long precision.
- Control of operation in the case of ill-conditioned problems and error messages.
- Ease-of-use due to conversational mode.

DESCRIPTION

MATH/BASIC consists of 44 routines providing computing capabilities in the following areas:

Linear equations, matrix eigenvalue problem.
Zeros of polynomials, zeros and minima of functions.
Quadrature/differentiation
Interpolation, approximation and smoothing.
Ordinary differential equations.
Discrete Fourier transform.
Special functions.
Linear programming.

Use: The user can utilize any of the MATH/BASIC routines through a System/3 model 6 console keyboard.

The user first enters a few systems commands and the name of the desired MATH/BASIC routine. Following a READY indication, MATH/BASIC guides the user through his problem by printing procedural instructions. Alternate courses of action or options are described usually in the form of questions, which the user answers by entering the appropriate replies.

CUSTOMER RESPONSIBILITIES

The MATH/BASIC program is distributed in machine-readable form for loading into the user's system. Once stored, it is available to any member of the organization authorized to use the system.

If confidential information is to be stored in the library, the user must take appropriate steps to safeguard against unauthorized access.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The minimum configuration for the IBM System/3 model 6 is the same as that required for System/3 BASIC, that is, one IBM 5406 Processing Unit model B2 (8K) ... one IBM 5444 Disk Storage Drive model 1 ... one IBM 5213 Printer model 1.

SOFTWARE REQUIREMENTS

MATH/BASIC is written in the BASIC language. To run the program on an IBM System/3 model 6 requires the System/3 BASIC (5703-XM1).

DOCUMENTATION

(available from Mechanicsburg)

General Information Manual (GH20-1128) .

TERMS and CONDITIONS: See PP Index

**BUSINESS ANALYSIS/BASIC FOR
SYSTEM/3 MODEL 6
5703-XM3****PURPOSE**

Business Analysis/BASIC is a comprehensive set of interactive routines for use on the IBM System/3 model 6.

It consists of 30 routines written in the BASIC language, providing the problem-solver professional with procedures for data generation and maintenance, spread sheet analysis, investment analysis, break-even or cost-volume-profit analysis, depreciation analysis, and time series analysis. The program is designed so that a detailed knowledge of programming is not required.

DESCRIPTION

Business Analysis/BASIC includes 30 interactive routines for assisting the problem-solver in exercising the following functions:

- Spread Sheet Analysis:
 - Spread Sheet data file creation and update
 - Spread Sheet report formatting
- Investment Analysis:
 - Return-on-Investment computation
 - Discounted Cash Flow analysis
 - Loan analysis (multiple and single)
 - Lease vs Purchase analysis
 - Make vs Buy analysis
- Break-Even Analysis:
 - Break-even with definite assumptions
 - Break-even with probabilistic assumptions
- Depreciation Analysis:
 - Straight line depreciation
 - Sum-of-years digits depreciation
 - Declining balance depreciation
 - Equipment units depreciation
- Time Series Analysis:
 - Compound growth rate projection
 - Moving average
 - Seasonal analysis
 - Cyclical analysis
 - Autocovariance and Autocorrelation
 - Crosscovariance and Crosscorrelation
 - Exponential Smoothing
 - Simple Regression
- Graphic Presentation:
 - Histograms
 - Exponential Smoothing Plots
- Routine and File Indexing:
 - Business Analysis/BASIC routine index
 - User-created data file log
- Data Generation and Maintenance:
 - Create and update data files
 - Select and rearrange records in data files and spread sheet data files
 - Resequence records in data files and spread sheet data files
 - Print data files

HIGHLIGHTS

- Comprehensive set of analytical routines to assist the user in examining investment alternatives and in preparing financial plans.
- Spread sheet analysis capability for report creation and update.
- Interactive features include instructional messages, flexible control of calculations, extensive error checking, and data editing.

Use: The professional analyst can utilize any of the Business Analysis/BASIC routines through the System/3 model 6 console keyboard.

The user first enters a few systems commands (LOGON, EDIT, etc.) and the name of the desired Business Analysis/BASIC routine. Following a READY indication, the Business Analysis/BASIC routine guides the user through his problem by typing out procedural instructions. Alternative courses of action or options are presented in the form of questions, which the user answers by entering the appropriate replies.

CUSTOMER RESPONSIBILITIES

The user must have the necessary computer configuration as described below. The user will also need the associated program product for his system as mentioned under "Programming Systems".

Business Analysis/BASIC program is distributed in machine-readable form for loading into the user's system. Once stored, it is available to any member of the organization authorized to use the system.

If the user has confidential information to be stored in disk files, it will be his responsibility to take appropriate steps to safeguard against unauthorized access.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The minimum configuration for the System/3 model 6 is the same as that required for IBM System/3 BASIC, that is, one IBM 5406 Processing Unit model B2 (8K), one IBM 5444 Storage Drive model 1, and one IBM 5213 Printer model 1.

SOFTWARE REQUIREMENTS

Business Analysis/BASIC is written in the BASIC language. To run the program on an IBM System/3 model 6 requires System/3 BASIC (5703-XM1).

PROGRAM PRODUCTS

SYSTEM/3 MODEL 15 BASIC ASSEMBLER
5704-AS1; 5704-AS2

PURPOSE

The IBM System/3 model 15 Basic Assembler program is a program product that processes source programs written in the Basic Assembler language, and produces executable object programs. The program is disk resident on an IBM 5444 Disk Storage Drive or 3340 Direct Access Storage Facility or 3344 Direct Access Storage (5704-AS2 only). 5704-AS1 is used with SCP 5704-SC1, and 5704-AS2 is used with SCP 5704-SC2.

DESCRIPTION

The Basic Assembler language is a symbolic programming language used to write programs. Some of the features provided by the program and its language are:

- Mnemonic Operation Codes
- Symbolic Referencing of Storage Addresses
- Automatic Storage Assignment
- Address Displacement Calculation
- Convenient Data Representation
- Operand Field Expressions
- Source Identification - Sequence Fields
- Assembler Instructions
- Source Program Listing
- Cross-Reference Listing
- Error Checking and Diagnostic Messages

The Basic Assembler may be used for assembly of relocatable subroutines for use with model 15 RPG II, COBOL, or FORTRAN. The subroutines, written in the Basic Assembler language, are coded by the user and separately assembled. The process of program linking is accomplished during compilation of the RPG II, COBOL, or FORTRAN source programs by means of the Overlay Linkage Editor.

Source input to the Assembler can be from the system input device (card reader, 3741 directly attached, or 3277 keyboard), from a source library, or from a source file generated by the macro processor. Work files for the Assembler can be on either a 5444 or 5445 Disk Storage Drive, or a 3340 Direct Access Storage Facility or 3344 Direct Access Storage. The Overlay Linkage Editor may be used to generate executable object programs.

Model 15 Basic Assembler Device Support

	Source Assembly	Object Execution
5444 Disk Storage Drive (5704-AS1 only)		
model A2 or A3	Yes	Yes
5445 Disk Storage (5704-AS1 only)		
model 1, 2 or 3	Yes	Yes
3340 Direct Access Storage Facility		
model A2, B1 or B2	Yes	Yes
3344 Direct Access Storage (5704-AS2 only)		
model B2	Yes	Yes
3410/3411 Magnetic Tape Unit		
model 1, 2, or 3	No	Yes
1403 Printer		
model 2, 5, or N1	Yes	Yes
3277 Display Station		
model 1	Yes**	Yes
5424 MFCU		
model A1 or A2	Yes	Yes
2560 MFCM		
model A1 or A2	Yes	Yes
1442 Card Read Punch		
model 6 or 7	Yes	Yes
2501 Card Reader		
model A1 or A2	Yes	Yes
3284 Printer model 1	Yes	Yes
1255 MCR model 1, 2 or 3	No	Yes
3881 OMR model 1	No	Yes
3741 (directly attached)		
model 1, 2, 3 or 4	Yes	Yes
BSCA, 1 or 2 lines, LCA, or DA	No	Yes
Main Storage Requirements		
5704-AS1	10-48K	up to 48K
5704-AS2	10-48K	up to 56K*

* Object program size can be up to 56K, depending on the CCP, spool and configuration options selected during system generation.
 ** Assembler and system halts are logged on the 3277. Source statements may be entered from the keyboard.

Stand-Alone Programs: The Basic Assembler can be used to create a stand-alone program. The object program is punched into cards. Program loading is performed with an initial program loader through the alternate IPL device (MFCU, MFCM, or 1442). Stand-alone programs are coded entirely by the user with no dependence on other programming support.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Requirements: The same as for SCP* (5704-SC1 for 5704-AS1; 5704-SC2 for 5704-AS2).

* **Note:** The IBM 1403 printer should be equipped with the Universal Character Set feature and a PN (60-character set) interchangeable train cartridge. A 48-character set (for example, HN or AN arrangement) can be used with the Assembler; however, the user must be willing to accept substitute characters.

SOFTWARE REQUIREMENTS

5704-SC1 for 5704-AS1; 5704-SC2 for 5704-AS2.

COMPATIBILITY

System/3 model 15 Basic Assembler is functionally equivalent to the Basic Assembler programs on other System/3 models. Four mnemonics are unique to model 15: Load CPU (LCP), Store CPU (SCP), Command CPU (CCP), and Supervisor Call (SVC). When converting from another System/3 model, there may be changes required in macro statements.

TERMS and CONDITIONS: See PP Index

**SYSTEM/3 MODEL 15
SUBSET ANS COBOL COMPILER AND LIBRARY
5704-CB1; 5704-CB2**

PURPOSE

Model 15 COBOL is a program product that operates under control of the IBM System/3 model 15 System Control Programming. 5704-CB1 is used with SCP 5704-SC1, and 5704-CB2 is used with SCP 5704-SC2. The compiler and library are disk resident on the IBM 5444 Disk Storage Drive or 3340 Direct Access Storage Facility or 3344 Direct Access Storage (5704-CB2 only). The compiler requires as input a COBOL source language program and produces as output, by means of the system's Overlay Linkage Editor, a System/3 machine language object program, either cataloged in an object library, punched into 80- or 96-column cards, or written onto a diskette.

System/3 COBOL supports Grade 1 Braille for both compiler listings and object program printed output. Minimum requirements include a 132-print position printer with 8 lines/inch spacing (1403 Printer); the compiler requires a 14K partition in order to produce Braille listings. A user-provided elastic strip is attached over the printer hammers to produce the Braille characters.

Source input to the compiler can be from the system input device (card reader, 3741 directly attached, or 3277 keyboard) or from a source library. Work files for the compiler can be on any 5444 or 5445 Disk Storage Drive or on a 3340 Direct Access Storage Facility or 3344 Direct Access Storage (5704-CB2 only). The Overlay Linkage Editor is used to generate object programs.

American National Standard COBOL Considerations

The U.S. Industry standard for COBOL is American National Standard (ANS) COBOL. ANS COBOL, X3.23-1968, was approved by the American National Standards Institute (ANSI) on August 23, 1968. The following functional processing modules of the ANSI standard are included in the System/3 model 15 Compiler.

1 Nucleus	1, 2
1 Sequential Access	1, 2
1 Random Access	0, 2
1 Library	0, 2
2 Table Handling	1, 3
1 Segmentation	0, 2

The first digit above represents the level of the modules included in the compiler; the second digit represents the lowest level in the American National Standards Institute Standard (0 implies that the module may be completely missing from the standard compilers). The third digit represents the highest level in the ANSI standard.

The international standard for COBOL is ISO Recommendation Number 1989, which was approved by ISO (International Organization for Standardization) in 1972. System/3 model 15 COBOL bears the same relation to the ISO standard as to the ANSI standard, inasmuch as the two standards are identical in technical content.

Additional: In addition to the standard language, the following additional features are provided:

- Extensions to the modules of American National Standard COBOL listed above, comprising:
 - Certain language elements which are defined in higher levels of the American National Standard COBOL than those listed.
 - Certain language elements defined by the CODASYL Programming Language Committee but not yet included by ANSI in American National Standard COBOL.
 - IBM-developed extensions consistent with those supported by the System/360 and 370 OS and DOS ANS COBOL compilers and 1130 ANS COBOL compiler.
- ROLLOUT/ROLLIN support allows a COBOL object program to be interrupted during execution. This is provided by invocation of a supplied program via a CALL statement (CALL "CBROLL"). ROLLOUT/ROLLIN is not supported in 5704-CB2.
- The interval timer is supported for time-of-day functions. This is provided by invocation of a supplied (SCP) subroutine via a CALL 'CFTOD' statement.

Support of 3277 Display Station: A model 15 COBOL object program supports the 3277 as a destination device for the DISPLAY and ACCEPT commands. Record lengths of 1 to 120 characters may be processed by ACCEPT, and records of 1 to 107 characters may be processed by DISPLAY. The 78-key Operator Console Keyboard is used for data input.

Disk File Support: The access methods supported for 5444, 5445, 3340 and 3344 are the same as those supported by other System/3 COBOL compilers, and are as follows:

Sequential Organization

- Consecutive Processing - including updating in place.
- Random Processing - by relative record number including updating but excluding file loading.

Indexed Organization

- Random Processing - by key.
- Sequential Processing - by key including file loading.

Direct Organization

- Random Processing - by relative recording number, including updating and file loading.
- Consecutive Processing.

Standard System/3 disk labels are mandatory for all disk files. Non-standard labels cannot be used except for data records within the file.

Record size can range from 1 byte to 32K bytes, and records may be processed as blocked or unblocked. Logical records may span physical disk sectors, tracks or cylinders.

Multi-volume indexed files are supported.

Tape File Support: The access methods supported for the 3410/3411 Magnetic Tape Subsystem are the same as those supported by other System/3 COBOL compilers. COBOL object programs can process data on magnetic tape; highlights include:

- Consecutive input or output files
- 1 - 4 tape drives
- Fixed length records, blocked or unblocked
- Variable length records, blocked or unblocked
- Record size from 18 to 32,768 bytes
- Block size from 18 to 32,768 bytes
- IBM Standard Labels, ANSI labels, no labels
- Option for two I/O areas
- 9-track, 800/1600 bpi
- 7-track, 200/556/800 bpi
- Single volume or multi-volume files
- Single file or multi-file volumes
- Recording format: EBCDIC (7- or 9-track) or ASCII (9-track only)

Printer Support: COBOL supports the 1403 as follows: Space 0, 1, 2, or 3 before or after printing a line; skip to line number before or after printing a line; overflow detection.

COBOL supports the 3284 Printer the same way it does the 1403, except that space 0 after print is not allowed.

Card I/O Support: Model 15 COBOL supports the MFCU, MFCM, 1442, and 2501 as follows:

	MFCU	MFCM*	1442	2501
Read	Yes	Yes	Yes	Yes
Punch	Yes	Yes	Yes	No
Card Print	Yes	Yes	No	No
Stacker Select (punch only)	Yes	Yes	Yes	No
Associated file	Yes	Yes	No	No
Character set (EBCDIC)	64	256	256	256

* MFCM support is similar to MFCU support; six lines of card printing is possible on the MFCM (optional feature on model A1 only).

Diskette Support: Data can be read from a diskette using ACCEPT verb. In addition, for 5704-CB2 only, a directly-attached 3741 can be specified as an input or output device in the ASSIGN clause of the SELECT statement.

PROGRAM PRODUCTS

Subset ANS COBOL Compiler and Library (cont'd)

Model 15 COBOL Device Support

	Compilation	Execution
5444 Disk Storage Drive (5704-CB1 only) model A2 or A3	Yes	Yes
5445 Disk Storage (5704-CB1 only) model 1, 2 or 3	Yes	Yes
3340 Direct Access Storage Facility model A2, B1, or B2	Yes	Yes
3344 Direct Access Storage (5704-CB2 only) model B2	Yes	Yes
3410/3411 Magnetic Tape Unit model 1, 2, or 3	No	Yes
1403 Printer model 2, 5, or N1	Yes	Yes
3277 Display Station model 1	Yes*	Yes
5424 MFCU model A1 or A2	Yes	Yes

1442 Card Read Punch model 6 or 7	Yes	Yes
2501 Card Reader model A1 or A2	Yes	Yes
3284 Printer model 1	Yes	Yes
1255 MCR model 1, 2 or 3	No	No
3881 OMR model 1	No	No
3741 (directly attached) model 1, 2, 3 or 4	Yes	Yes**
BSCA, 1 or 2 lines, LCA, or DA	No	No
Main Storage Requirements		
5704-CB1	12-48K	8-48K
5704-CB2	12-48K	8-56K***

* COBOL and system halts are logged on the 3277. Source statements may be entered from the keyboard.

** 5704-CB2 only. See "Diskette Support".

*** Object program size can be up to 56K, depending on the CCP, spool and configuration options selected during system generation.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Requirements: Same as for SCP (5704-SC1 for 5704-CB1; 5704-SC2 for 5704-CB2). For the IBM 1403 Printer, the HN print arrangement is recommended.

SOFTWARE REQUIREMENTS

5704-SC1 for 5704-CB1; 5704-SC2 for 5704-CB2.

COMPATIBILITY

- System/3 COBOL is upward compatible with the DOS and OS ANS COBOL compilers and is a superset of 1130 ANS COBOL providing growth from 1130 through System/3 to System/360 and 370. ROLLOUT support is unique to model 15 COBOL.
- Migration to and from System/3 COBOL requires little source program conversion to effect the transition. Certain 1130 library routines are not included in the System/3 COBOL library, i.e., CALLED subprograms.
- System/3 model 15 COBOL is source language compatible with COBOL on other System/3 models, except for differences due to different hardware. A COBOL source program can be recompiled by a model 15 COBOL compiler without changes to the source program (assuming the same I/O). The resulting object program can be executed under control of the appropriate model 15 SCP and will produce output identical to that on the previous system (assuming equivalent I/O devices and data).
- Any of the disk data files created by any System/3 program using disk system management (e.g., RPG II, Sort and COBOL) can be processed by any System/3 program which uses disk system management to access the file. Scratch files (RETAIN-S) created on other System/3 models are not accessible on the model 15. Files on magnetic tape are similarly compatible between the System/3 models, except only the model 15 supports multi-file tape volumes.

The directly-attached 3741 Data Station or Programmable Workstation is supported only in 5704-CB2.

**SYSTEM/3 MODEL 15 DISK FORTRAN IV
5704-FO1; 5704-FO2**

PURPOSE

Model 15 FORTRAN IV is a program product that operates under control of the IBM System/3 model 15 SCP. 5704-FO1 is used with SCP 5704-SC1; 5704-FO2 is used with SCP 5704-SC2. The compiler and library are disk resident on the IBM 5444 Disk Storage Drive or the IBM 3340 Direct Access Storage Facility or IBM 3344 Direct Access Storage (5704-FO2 only). The compiler requires as input a FORTRAN source language program and produces as output, by means of the system's Overlay Linkage Editor, a System/3 machine language object program, either cataloged in an object library or punched into 80- or 96-column cards or written onto a diskette. A source program listing, diagnostic messages and main storage map can be requested.

DESCRIPTION

Source input to the compiler can be from the system input device (card reader, 3741 directly attached, or 3277 keyboard) or from the source library. Work files for the compiler can be on any 5444 or 5445 Disk Storage Drive or on 3340 Direct Access Storage Facility or on the 3344 Direct Access Storage. The Overlay Linkage Editor is used to generate object programs.

The model 15 FORTRAN IV language is identical to the FORTRAN IV language for other System/3 models. It contains those features defined in American National Standard Basic FORTRAN, X3.10-1966 and additional language features and capabilities previously available only with certain IBM Full FORTRAN IV Compilers.

The model 15 FORTRAN IV Library contains mathematical and service subroutines required during execution to perform arithmetic operations, input and output conversion, and input and output control.

The model 15 FORTRAN IV Library also includes a Commercial Subroutine Package which is equivalent in function to the 1130 Commercial Subroutine Package insofar as is meaningful in terms of System/3 model 15 devices and data management.

The interval timer is supported for time-of-day functions. This is provided by a supplied SCP subroutine, CFTOD.

Support of 3277 Display Station: A model 15 FORTRAN object program can support the 3277 in either a split-screen or full-screen mode. Using a split-screen, an input file (up to 125 bytes) and/or an output file (up to 125 bytes) can be specified. In full-screen mode, 279 bytes can be read or written. The Operator Console Keyboard is used for data input.

Disk File Support: The access methods supported for 5444, 5445, 3340 and 3344 are the same as those supported by FORTRAN on other System/3 models, and are as follows:

Sequential I/O

Consecutive processing of formatted or unformatted records is supported. Record size of formatted records can range from 1 to 256 bytes. Record size of unformatted records can range from 1 to 32,767 bytes.

Direct Access I/O

Random processing is by relative record number; consecutive processing can also be performed. Record size can range from 1 to 32,767 bytes, formatted or unformatted.

Standard System/3 disk labels are mandatory for all disk files. Non-standard labels cannot be used except as data records within the file.

Indexed files are not supported.

Tape File Support: The access methods supported for the 3410/3411 Magnetic Tape Subsystem are the same as those supported by FORTRAN for other System/3 models. FORTRAN object programs can process data on magnetic tape; highlights include:

- Consecutive input or output files
- 1 - 4 tape drives
- Formatted or unformatted records
- Record size from 18 to 32,767 bytes
- Block size from 18 to 32,767 bytes
- IBM Standard Labels, ANSI Labels, no labels
- 9-track, 800/1600 bpi
- 7-track, 200/556/800 bpi
- Single volume or multi-volume files
- Single file or multi-file volumes
- Recording format: EBCDIC (7- or 9-track) or ASCII (9-track only)

Printer Support: The FORTRAN language supports the 1403 as follows: Space 0, 1, or 2 before or after printing a line ... skip to line 1 before or after printing a line ... overflow detection. Commercial Subroutines support the 1403 as follows: Space immediately 0, 1, 2, or 3 lines ... skip immediately to a specified line number.

FORTRAN supports the 3284 Printer the same way it does the 1403, except that space 0 after print is not allowed.

Card I/O Support: The model 15 FORTRAN supports the MFCU, MFCM, 1442, and 2501 as follows:

	MFCU	MFCM*	1442	2501
Read	Yes	Yes	Yes	Yes
Punch	Yes	Yes	Yes	No
Card Print	Yes	Yes	No	No
Stacker Select**	No	No	No	No
Combined File***	No	No	No	No
Character set (EBCDIC)	64	256	256	256

* MFCM support is similar to MFCU support; six lines of card printing is possible on the MFCM (optional feature on model A1 only).

** Commercial Subroutines support stacker selection of cards from the secondary hopper of the MFCU or MFCM.

*** When using the Commercial Subroutines, the MFCU2, MFCM2, or 1442 may be defined as both input and output.

Diskette Support: 5704-FO1 supports the 3741 directly attached as an input or output device for compilation only. 5704-FO2, in addition to compilation, supports the 3741 as an input/output device during object program execution.

Model 15 FORTRAN Device Support

	Compilation	Execution
5444 Disk Storage Drive (5704-FO1 only) model A2 or A3	Yes	Yes
5445 Disk Storage (5704-FO1 only) model 1, 2 or 3	Yes	Yes
3340 Direct Access Storage Facility model A2, B1, or B2	Yes	Yes
3344 Direct Access Storage (5704-FO2 only) model B2	Yes	Yes
3410/3411 Magnetic Tape Unit model 1, 2, or 3	No	Yes
1403 Printer model 2, 5, or N1	Yes	Yes
3277 Display Station model 1	Yes*	Yes
5424 MFCU model A1 or A2	Yes	Yes
2560 MFCM model A1 or A2	Yes	Yes
1442 Card Read Punch model 6 or 7	Yes	Yes
2501 Card Reader model A1 or A2	Yes	Yes
3284 Printer model 1	Yes	Yes
1255 MCR model 1, 2 or 3	No	No
3881 OMR model 1	No	No
3741 (directly attached) model 1, 2, 3, or 4	Yes	Yes***
BSCA, 1 or 2 lines, LCA or DA	No	No
Main Storage Requirements 5704-FO1	10-48K	8-48K
5704-FO2	10-48K	8-56K**

* FORTRAN and system halts are logged on the 3277. Source statements may be entered from the keyboard.

** Object program size can be up to 56K, depending on the CCP, spool and configuration options selected during system generation.

*** 5704-FO2 only; see "Diskette Support".

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Requirements: Same as for SCP (5704-SC1 for 5704-FO1; 5704-SC2 for 5704-FO2).

SOFTWARE REQUIREMENTS

5704-SC1 for 5704-FO1; 5704-SC2 for 5704-FO2.

COMPATIBILITY

System/3 Model 15 FORTRAN IV is source language compatible with FORTRAN IV on other System/3 models. A FORTRAN IV source program can be recompiled by a model 15 FORTRAN IV compiler without changes to the source program (assuming the same I/O). The resulting object program can be executed under control of the appropriate model 15 SCP and will produce output identical to that on the previous system (assuming equivalent I/O devices and data).

The FORTRAN IV compiler accepts source programs written in the IBM System/360 Basic FORTRAN IV language, which encompasses American National Standard Basic FORTRAN as defined in X3.10-1966. The compiler also accepts source programs written in the IBM 1130 Basic FORTRAN IV language with minor modifications.

**SYSTEM/3 MODEL 15 RPG II
5704-RG1; 5704-RG2**

PURPOSE

Model 15 RPG II is a program product that operates under control of the System/3 model 15 System Control Programming. 5704-RG1 is used with SCP 5704-SC1, and 5704-RG2 is used with SCP 5704-SC2. RPG II is disk resident on the 5444 Disk Storage Drive or 3340 Direct Access Storage Facility or 3344 Direct Access Storage (5704-RG2 only). It requires as input an RPG II source language program and produces as output a System/3 model 15 machine language object program, either cataloged in an object library or punched into 80- or 96-column cards, or written onto a diskette. A source program listing, diagnostic messages, and a main storage map can be requested.

DESCRIPTION

To use the RPG II compiler, the user supplies information about the job to be processed. The job can be described on specification sheets prior to entering the source statements into the system. The specification sheets are: Auto-Report, Control Card and File Description, Extension and Line Counter, Telecommunications, Input, Calculation and Output-Format.

Source Input to the compiler can be from the system input device (card reader, 3741 directly attached, or 3277 keyboard) or from a source library. Work files for the compiler can be on either a 5444 or 5445 Disk Storage Drive, or on a 3340 Direct Access Storage Facility or 3344 Direct Access Storage (5704-RG2 only). The Overlay Linkage Editor, invoked by the compiler, is used to generate overlays, executable object programs, etc. (On other System/3 models, RPG II uses its own linkage editor rather than the system's Overlay Linkage Editor.) The user can request non-link-edited output from the model 15 RPG II compiler, allowing modification of the control statements prior to the execution of the Overlay Linkage Editor.

In addition to the functions provided by S/3 model 10 Disk RPG II, model 15 RPG II provides the following capabilities:

- Model 15 RPG II includes the following support that is available as separate features in some of the other System/3 models: Telecommunications, Auto-Report, 5445 and Tape support.
- Support of 3340 Direct Access Storage Facility, 2560 MFCM, 2501 Card Reader, 3284 Printer, 1255 Magnetic Character Reader, and 3277 Display Station (with operator console keyboard).
- Support of 3344 Direct Access Storage (5704-RG2 only).
- Support of interval timer for time-of-day function.
- Device Independent Data Management - a sequential file is defined whose assignment to a device can be specified by an OCL FILE statement when the object program is executed. The sequential file can be input (2501, 1442, MFCU, MFCM, 3741 directly attached, 5444, 5445, 3340, 3344 or 3410/3411) or output (1403, 3284, 1442, MFCU, 3741 directly attached, MFCM, 5444, 5445, 3340, 3344 or 3410/3411) but not update, add or combined. Specifications unique to a particular device, such as space, skip, and stacker select are not allowed for this kind of file.
- Additional index space - for 5444, 5445, 3340 or 3344 indexed files, an optional File Description Specification entry, INDEX, permits additional main storage to be used to accommodate more sectors of file index. This is advantageous when sequentially processing indexed files.

Note: 5704-RG2 supports an 'external buffers' option and does not support B-type inquiry programs.

Auto-Report: RPG II Auto-Report enhances the RPG II language by providing functions which eliminate much of the preparation and coding work normally done by the user. It is specifically designed to facilitate report preparation.

Auto-Report executes as a preprocessor to the RPG II Compiler. The input is RPG II source statements and Auto-Report statements. Auto-Report produces a diagnostic listing, replaces the Auto-Report statements with generated or copied RPG II source statements and calls the RPG II compiler for execution.

Support of 3277 Display Station: The 3277 is an integral part of the system and is used as the system console. A model 15 RPG II object program can access the 3277 as an input file (up to 120 bytes), as an output file (up to 120 bytes), as an update file (up to 279 bytes), or as a display file (up to 35 bytes). The 78-key Operator Console Keyboard is used for data input. The program function keys 1-9 can be tested by means of a supplied subroutine, SUBR89.

Disk File Support: The access methods supported for 5444, 5445, 3340 and 3344 are the same as those supported by other System/3 RPG II compilers, and are as follows:

Sequential Organization

- Consecutive Processing - including updating in place.
- Random Processing - by relative record number including updating

but excluding file loading.

Indexed Organization

- Random processing - by key.
- Sequential processing - by key including file loading.

Direct Organization

- Random Processing - by relative record number, including updating and file loading.
- Consecutive Processing

Standard System/3 disk labels are mandatory for all disk files. Non-standard labels cannot be used except as data records within the file.

Record size can range from 1 to 9,999 bytes, and records can be processed as blocked or unblocked. Logical records may span physical disk sectors, tracks or cylinders.

Tape File Support: The access methods supported for the 3410/3411 Magnetic Tape Subsystem are the same as those supported by other System/3 RPG II compilers. RPG II object programs can process data or record address files on magnetic tape. Highlights of tape support include:

- Consecutive input or output files
- 1 - 4 tape drives
- Fixed length records, blocked or unblocked
- Variable length records, blocked or unblocked
- Record size from 18 to 9,999 bytes
- Block size from 18 to 9,999 bytes
- IBM Standard Labels, ANSI Labels, no labels
- Option for two I/O areas
- 9-track, 800/1600 bpi
- 7-track, 200/556/800 bpi
- Single volume or multi-volume files
- Single file or multi-file volumes
- Recording format: EBCDIC or ASCII
- Program options to Rewind or Rewind/Unload at end of job.

Printer Support: RPG II supports the 1403 Printer as follows: Space 0, 1, 2, or 3 before or after printing a line; skip to line number before or after printing a line; overflow detection; first page forms alignment.

RPG II supports the 3284 Printer the same way it does the 1403, except that space 0 after print is not allowed.

Card I/O Support: RPG II supports the MFCU, MFCM, 1442, and 2501 as follows:

	MFCU	MFCM	1442	2501
Read	Yes	Yes	Yes	Yes
Punch	Yes	Yes	Yes	No
Card Print	Yes	Yes	No	No
Stacker Select	Yes	Yes	Yes	No
Combined File	Yes	Yes	Yes	No
Character set (EBCDIC)	64	256	256	256

RPG II support of the MFCM is identical to the System/360 model 20 RPG support, except for certain situations involving stacker selection and combined files.

Card input or output files for which stacker selection is not specified may be double buffered.

Diskette Support: RPG II supports the 3741 directly attached as an input or output device through device independent data management or standard data management.

Telecommunications Support: The first and/or second Binary Synchronous Communications Adapter (BSCA) and the Local Communications Adapter are supported through the use of the RPG II Telecommunications Specifications and the addition of BSCA as a device entry on the RPG II File Description Specification. (The Display Adapter and the BSCC are not supported by the RPG II Telecommunications support.) The support is identical to that provided by other System/3 Telecommunications features, and it includes:

Modes: Receive only ... Receive with conversational reply*** ... Transmit only ... Transmit with conversational reply*** ... Alternate transmit and receive file.***

*** Not supported in communication with 2770 and 2780, 6670 (as a 2770).

RPG II language features supported: Input, Output and Combined files ... demand files for Transmit and Receive ... Blocking and deblocking of records ... Dual I/O areas.

BSCA features, options, and capabilities supported: Manual call ... manual answer ... Auto-call ... Auto-answer ... Medium Speed ... High Speed ... Station Selection ... EBCDIC data transparency ... intermediate block checking ... EBCDIC or ASCII data and data link control characters. File translation of ASCII data can be accomplished by proper use of the file translation facility of RPG II.

System/3 Model 15 RPG II (cont'd)

For additional information, see the description of the model 10 Disk RPG II Telecommunications feature (5702-RG1, feature #6000/#6002).

Communication with the 5231 model 2 is in Receive mode only. The 5231 model 2 is supported as a 3741 model 2 or 4.

System/3 Model 15 RPG II Device Support

	Compilation	Execution

1255 MCR model 1, 2 or 3	No	Yes****
3881 OMR model 1	No	Yes****
3741 (directly attached) model 1, 2, 3 or 4	Yes	Yes
BSCA, 1 or 2 lines, LCA, or DA	No	Yes**
Main Storage Requirements 5704-RG1	10-48K	8-48K***
5704-RG2	10-48K	8-56K*****

* RPG II and system halts are logged on the 3277. Source statements may be entered from the keyboard.

** For a list of terminals supported, see the model 5 SCP pages.

*** When a program generates object code that exceeds the partition size as specified, overlays will be generated to fit. Not all programs - even with overlays - can fit into the stated partition size.

**** Requires SCP subroutine; RPG II SPECIAL exit is used.

***** The discussion of overlays above (***) also applies to 5704-RG2. In addition, object program size can be up to 56K, depending on the CCP, spool and configuration options selected during system generation.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Requirements: Same as for model 15 SCP (5704-SC1 for 5704-RG1; 5704-SC2 for 5704-RG2).

SOFTWARE REQUIREMENTS

5704-SC1 for 5704-RG1; 5704-SC2 for 5704-RG2.

COMPATIBILITY

Programs: System/3 model 15 RPG II is source language compatible with RPG II on other System/3 models, except for differences due to different hardware. An RPG II source program can be recompiled by a model 15 RPG II compiler, without changes to the source program (assuming the same I/O). The resulting object program can be executed under control of the appropriate model 15 SCP and will produce output identical to that on the previous system (assuming equivalent I/O devices and data). The System/3 inline inquiry subroutine (SUBR95) is not supported by model 15 RPG II, but the program function keys 1-9 can be tested by using a different subroutine, SUBR89.

Data: Any of the disk data files created by any System/3 program using disk system management (e.g., RPG II, Sort, and COBOL) can be processed by any System/3 program which uses disk system management to access the file. Scratch files (RETAIN-S) created on other System/3 models are not accessible on the model 15. Files on magnetic tape are similarly compatible between System 3 models, except only the model 15 supports multifile tape volumes.

RPG II 3270 DISPLAY CONTROL FEATURE

Feature #6005/#6006

PURPOSE

The RPG II 3270 Display Control feature provides telecommunications services for local or remote 3270 devices. The program can be automatically linked into the RPG II application program via the SPECIAL file exit capability on the RPG II File Description Specification Sheet. Neither the Assembler nor the RPG II Telecommunications feature is required.

DESCRIPTION

The following services are provided by the 3270 Display Control Feature:

- RPG II access to 3270 Display System Terminals attached via the Display Adapter (DA), the Local Communications Adapter (LCA), or the Binary Synchronous Communications Adapter (BSCA).
- Automatic buffering and queuing of terminal data
- A display formatting interface which permits the support of 3270 devices with coding in RPG II
- Complete line control procedures are provided
- Up to 18 terminals may be supported
- Provides the capability of coding one or more applications within one program. No task switching is provided.
- Two subroutines are provided. SUBR13 allows an RPG II program to support 3270s without using CCP. SUBR14 provides upward compatibility with CCP, requiring only program recompilation, assuming the RPG II program meets the CCP requirements.

Terminals Supported

The following terminals and communications facilities are supported under the RPG II 3270 Display Control Feature:

With the Display Adapter

- 3277 Display Station (model 1 or 2)
- 3284 Printer (model 1 or 2)
- 3286 Printer (model 1 or 2)
- 3288 Line Printer (model 2)

With the Local Communications Adapter (LCA) or Binary Synchronous Communications Adapter (BSCA)

- 3275 Display Station and Control, or
- 3271 Display Control Unit (model 1 or 2), with:

- 3277 Display Station (model 1 or 2)
- 3284 Printer (model 1 or 2)
- 3286 Printer (model 1 or 2)
- 3288 Line Printer (model 2)

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Note: The RPG II 3270 Display Control feature is not supported under SCP 5704-SC2 (model 15D).

Minimum System Requirements: In addition to the minimum system requirements of the SCP (5704-SC1), the RPG II 3270 Display Control feature requires one of the following: Display Adapter (DA), the Local Communications Adapter (LCA), or the Binary Synchronous Communications Adapter (BSCA), plus one of the devices listed under "Terminals Supported".

Using SUBR13, approximately 10K-12K bytes are added to the size of the object program. Using SUBR14, approximately 4.3K bytes are added to the size of the object program.

SOFTWARE REQUIREMENTS

PROGRAM PRODUCTS

**SYSTEM/3 MODEL 15 DISK SORT
5704-SM1; 5704-SM9****PURPOSE**

The IBM System/3 model 15 Disk Sort program is a program product that sorts a file into ascending or descending sequence. It is resident on an IBM 5444 Disk Storage Drive or an IBM 3340 Direct Access Storage Facility or IBM 3344 Direct Access Storage (5704-SM9 only). 5704-SM1 is used with SCP 5704-SC1, and 5704-SM9 is used with SCP 5704-SC2.

DESCRIPTION

Input file: From 1 to 8 files may be input to the Disk Sort Program. These files may be on 5444 or 5445 Disk Storage drives, 3340 Direct Access Storage Facility, 3344 Direct Access Storage, 3410/3411 Magnetic Tape Subsystem, card reader, or 3741 directly attached. A disk input file can have sequential, indexed or direct organization. For a disk file, the input record size can be from 1 to 9,999 bytes. A tape input file can have fixed length records, either blocked or unblocked; variable length tape records are not supported. The maximum input tape record or block size is 9,999 bytes, and the minimum is 18 bytes. Input tape files can be 9-track 800/1600 bpi or 7-track 200/556/800 bpi. The tape file can be recorded in either EBCDIC or ASCII code. Input can be either a single volume file or a multi-volume file. For a diskette input file, the record size can be only 96 bytes.

Work file: A work file can be resident on a 5444 or 5445 Disk Storage Drive, or on a 3340 Direct Access Storage Facility or 3344 Direct Access Storage. Work space can be specified by the user or can be automatically allocated by the program. Directed auto-allocate references to units D3 or D4 on the 3344 Direct Access Storage is interpreted to mean any of the four logical volumes on the drive.

Output file: The output file can be resident on a 5444 or 5445 Disk Storage Drive, or on a 3340 Direct Access Storage Facility or on 3344 Direct Access Storage, or on a unit of the 3410/3411 Magnetic Tape Subsystem. A disk output file can have sequential organization only. Characteristics of tape output files are the same as for tape input files, described above. The maximum output record size for disk or tape is 4,096 bytes. Output of the program will be in one of three formats: Tag (ADDROUT), tag-along, or summary tag-along.

Features

- Records can be selected or omitted, and reformatted.
- Specified records may be forced ahead of others.
- An alternate collating sequence can be specified.
- Control fields can be in different locations in the records.
- The total length of the control fields can be from 1 to 256 bytes; there is no other limit on the number of control fields.
- Control fields can be sorted in ascending or descending sequence, or mixed (some ascending and some descending).
- Control fields can be sorted using only the digit or zone portion of the character. The fields can be packed or unpacked decimal, or character formats.
- Records containing identical control fields can be combined by summarizing specified fields into one record.

Use: Specifications are described on a simple, RPG-like coding sheet. These specifications are entered into the system using the system input device (card reader, 3741 directly attached, or 3277 keyboard), or they can be stored in the source library on disk. Sort control card diagnostics and messages may be displayed on the system logging device (CRT, 1403 or 3284). The program can be executed in a multi-programming environment and requires from 8K to 48K bytes of main storage, exclusive of SCP requirements.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Minimum System Requirements: Same as for SCP (5704-SC1 for 5704-SM1; 5704-SC2 for 5704-SM9).

SOFTWARE REQUIREMENTS

5704-SC1 for 5704-SM1; 5704-SC2 for 5704-SM9.

COMPATIBILITY

The System/3 model 15 Disk Sort program is compatible with the Disk Sort programs used on other System/3 models.

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**SYSTEM/3 MODEL 15 MAGNETIC TAPE SORT
5704-SM2; 5704-SM8****PURPOSE**

The IBM System/3 model 15 Magnetic Tape Sort Program is a program product that sorts a tape file into ascending or descending sequence. It is resident on an IBM 5444 Disk Storage Drive or an IBM 3340 Direct Access Storage Facility or IBM 3344 Direct Access Storage (5704-SM8 only). 5704-SM2 is used with SCP 5704-SC1, and 5704-SM8 is used with SCP 5704-SC2. A configuration that includes three or four tape units is required.

Input file: The input file resides on any unit of the 3410/3411 Magnetic Tape Subsystem. The input file can have fixed length records, either blocked or unblocked. (Variable length records are not supported). The maximum input record or block size is 9,999 bytes. The minimum input record or block size is 18 bytes. Input tape files can be 9-track 800/1600 bpi or 7-track 200/556/800 bpi. The file can be recorded in either EBCDIC (7- or 9-track) or ASCII (9-track only) code. Input can be either a single volume file or a multi-volume file.

Work files: Three work tapes are required: A fourth can be utilized, if available. Work tapes can be either 7- or 9-track (see restrictions below). Work tapes must be single volume only (not multi-volume).

Output file: The output file resides on any unit of the 3410/3411 Magnetic Tape Subsystem. Characteristics of tape output files are the same as for tape input files, described above. Output is a file of records containing the sort control fields and/or the data fields the user has specified. (The tag (ADDRROUT) and summary tag-along sort capabilities of the Disk Sort are not supported in the Tape Sort.)

Restrictions: To utilize all of the functions of this program, at least three 9-track work tapes must be available. If one or more of the work tapes is 7-track, then only those sort functions that relate to the standard System/3 64-character set (EBCDIC) are supported. As a result, sorts of binary data, packed or unpacked decimal data or sorts on zones are not allowed in these 7-track configurations.

Features

- Records can be selected or omitted, and reformatted.
- Specified records may be forced ahead of others.
- An alternate collating sequence can be specified.
- A checkpoint/restart facility is supported.
- Control fields can be in different locations in the records.
- The total length of the control fields can be from 1 to 256 bytes; there is no other limit on the number of control fields.
- Control fields can be sorted using only the digit or zone portion of the character. The fields can be packed or unpacked decimal, or character formats.
- Control fields can be sorted in ascending or descending sequence, or mixed (some ascending and some descending).

Use: Specifications are described on a simple, RPG-like coding sheet. These specifications are entered into the system using the system input device (card reader, 3741 directly attached, or 3277 keyboard), or they can be stored in the source library on disk. Sort control card diagnostics and messages may be displayed on the system logging device (CRT, 1403 or 3284). The program can be executed in a multiprogramming environment and requires 8K to 48K bytes of main storage, exclusive of SCP requirements.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Minimum System Requirements: Same as for SCP (5704-SC1 for 5704-SM2; 5704-SC2 for 5704-SM8). In addition, at least three tape drives of the 3410/3411 Magnetic Tape Subsystem are required.

SOFTWARE REQUIREMENTS

5704-SC1 for 5704-SM2; 5704-SC2 for 5704-SM8.

COMPATIBILITY

The model 15 Magnetic Tape Sort Program is functionally compatible with the Disk Resident Magnetic Sort Programs for other System/3 models.

DOCUMENTATION

Tape Sort Reference Manual (SC21-7572). ... S/3 Bibliography (GC20-8080).

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**SYSTEM/3 MODEL 15 CCP/DISK SORT
5704-SM7**

PURPOSE

The IBM System/3 model 15 CCP/Disk Sort program is a program product that is used to sort a file into ascending or descending sequence. It is resident on an IBM 3340 Direct Access Storage Facility or IBM 3344 Direct Access Storage. 5704-SM7 is used with SCP 5704-SC2.

With the CCP/Disk Sort program, the user can generate an object module which can be executed as a task under control of the Communications Control Program (CCP) (5704-SC2, feature #6011/#6012), or as a program under control of the SCP in a non-CCP partition.

All Disk Sort functions are available in the CCP/Disk Sort program, including tag, tag-along and summary tag-along sorts, with the following exceptions or requirements:

- For generation, only 12K bytes of main storage is used.
- For the size of the generated program, 12K to 48K can be However, CCP does not allow a program greater than 32K.
- Only disk input files can be specified. (From 1 to 8 input files may be used.)
- Deferred mount of the output file is not supported, and the output file cannot be written over the input file.
- Automatic work file allocation is not supported.
- Work record lengths cannot be less than 3 bytes.

Use: To use this program, two steps are necessary:

- Generation: Using information from OCL FILE statements (for input, work and output files) and sort specifications, this program generates an object module which is cataloged into the object library. Generation is done in a non-CCP partition.
- Execution: The CCP system or terminal operator calls the generated object program by entering the name of the program, similar to calling any other program under CCP control. A generated program can be loaded in a batch partition by the system operator.

SPECIFIED OPERATING ENVIRONMENT

PROGRAM PRODUCTS

**SYSTEM/3 MODEL 15
DISK RESIDENT CARD UTILITIES
5704-UT1; 5704-UT3**

PURPOSE

This IBM System/3 program product is resident on an IBM 5444 Disk Storage Drive or an IBM 3340 Direct Access Storage Facility or IBM 3344 Direct Access Storage (5704-UT3 only). 5704-UT1 is used with SCP 5704-SC1 and 5704-UT3 is used with SCP 5704-SC2. It provides the following programs that support 80- or 96-column card files: Sort/Collate, List, Reproduce/Interpret, and Gangpunch. (The following programs are not provided in 5704-UT1 or 5704-UT3 but are available in the model 10 Utilities, 5701-UT1 and 5702-UT1: Data Recording, Data Verifying and 80-96 Conversion Program.)

DESCRIPTION

Sort/Collate Program - Functionally identical to the model 10 Sort/Collate Program (see 5701-UT1), the model 15 program also supports the 2560 MFCM.

List Program - Functionally identical to the model 10 96-column List Program (see 5701-UT1), the model 15 program supports input from 5424 MFCU, 2560 MFCM, 1442 Card Read Punch, or 2501 Card Reader. Printed output is directed to the 1403 or 3284 Printer.

Reproduce/Interpret Program - Functionally identical to the model 10 Reproduce/Interpret Program (see 5701-UT1), the model 15 program supports:

- MFCU-1 input and MFCU-2 output, or
- MFCM-1 input and MFCM-2 output, or
- 2501 input and 1442 output.

Gangpunch Program - The model 15 Gangpunch Program provides the following capabilities:

- Interspersed master-card gangpunching: The master and detail cards are intermixed in the primary file.
- Count-controlled gangpunching: A fixed or variable counter may be used to punch a specified number of detail cards. The master card is in the secondary file and the detail cards are in the primary file.
- Match master cards and detail cards on a control field and punch into the detail card if a match occurs: The master card is in the secondary file and the detail card is in the primary file.
- The following functions may be performed with any of the major types of gangpunching described above: Offset gangpunching ... gangpunching consecutive numbers into detail cards ... gangpunching a constant into detail cards ... card interpretation (entire card or only what is punched) ... selection of a single type of master card from many master cards ... selection of a single type of detail card from many detail cards.

The Gangpunch Program supports the following devices:

- For count-controlled and match fields processing
 - MFCU2 input and MFCU1 output, or
 - MFCM2 input and MFCM1 output, or
 - 2501 input and 1442 output.
- For interspersed processing
 - MFCU1 input and output, or
 - MFCM1 input and output, or
 - 1442 input and output.

Use: The programs described above can be executed in a multiprogramming environment and require main storage, exclusive of SCP requirements, as follows: (Note: The minimum partition size is 8K.)

Sort/Collate	8K*
List Program	3K
Reproduce/Interpret	6K
Gangpunch	6K

* Additional main storage is used, if available.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Requirements: Same as for SCP (5704-SC1 for 5704-UT1; 5704-SC2 for 5704-UT3). The devices required for the particular program (described above) must be available.

SOFTWARE REQUIREMENTS

5704-SC1 for 5704-UT1; 5704-SC2 for 5704-UT3.

COMPATIBILITY

The model 15 Disk Resident Card Utilities that have model 10 equivalents are functionally compatible to the model 10 versions. Operation of the programs is different due to the model 15 system/operator interface.

DOCUMENTATION

(available from Mechanicsburg)

Sort/Collate and Card Utilities Reference Manual (SC21-7529) ... S/3 Bibliography (GC20-8080).

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

SYSTEM/3 MODEL 12 BASIC ASSEMBLER
5705-AS1

PURPOSE

The IBM System/3 model 12 Basic Assembler program is a program product that processes source programs written in the Basic Assembler language and produces executable object programs. The program is disk resident in a simulation area on the 3340 Direct Access Storage Facility (DASF) and operates under control of the model 12 SCP.

The Basic Assembler language is a symbolic programming language used to write programs. Some of the features provided by the program and its language are:

- Mnemonic Operation Codes
- Symbolic Referencing of Storage Addresses
- Automatic Storage Assignment
- Address Displacement Calculation
- Convenient Data Representation
- Operand Field Expressions
- Source Identification--Sequence Fields
- Assembler Instructions
- Source Program Listing
- Cross-Reference Listing
- Error Checking and Diagnostic Messages

The Basic Assembler can be used to create a stand-alone program. The object program is punched into cards. Program loading is performed with an initial program loader through the 5424 MFCU or the 1442 Card Read Punch. Stand-alone programs are coded entirely by the user with no dependence on other programming support.

The Basic Assembler may also be used for assembly of relocatable subroutines for use with model 12 RPG II, COBOL, or FORTRAN. The subroutines, written in the Basic Assembler language, are coded by the user and separately assembled. The process of program linking is accomplished during compilation of the RPG II source program or by means of the Overlay Linkage Editor, in the case of COBOL or FORTRAN.

Source input into the Assembler can be from the system input device (card reader, 3741 directly attached, or 5471 keyboard), from a source library, or from a source file generated by the Macro Processor. Work files for the Assembler are on the simulation area of a 3340. The Overlay Linkage Editor is used to generate executable object programs.

Model 12 Basic Assembler Device Support

	Source Assembly	Object Execution
3340 Direct Access Storage Facility model C2	Yes	Yes
3410/3411 Magnetic Tape Unit, model 1, 2 or 3	No	Yes
5203 Printer, model 1, 2 or 3	Yes	Yes
1403 Printer, model 2, 5 or N1	Yes	Yes
5424 MFCU, model A1 or A2	Yes	Yes
1442 Card Read Punch, model 6 or 7	Yes	Yes
5471 Printer-Keyboard, model 1	Yes	Yes
1255 MCR, model 1, 2 or 3	No	Yes
3881 OMR, model 1	No	Yes
3741 Data Station/Programmable Workstation, model 1, 2, 3 or 4 (directly attached)	Yes	Yes
BSCA, 1 or 2 lines, ICA, or Local Display Adapter	No	Yes
Main Storage Requirements (Program Level Size)	10-56K*	Up to 64K*

* The maximum program level is 64K less supervisor requirements.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Requirements: An IBM System/3 model 12 which includes an IBM 5412 Processing Unit model B16 (32K) ... and an IBM 5424 MFCU or an IBM 1442 Card Read Punch or an IBM directly-attached 3741 Data Station/Programmable Workstation ... and an IBM 5203 or 1403 Printer* ... and an IBM 3340 DASF.

* Note: The 5203 or 1403 printer should be equipped with the Universal Character Set feature and a PN (60-character set) print chain/train arrangement. A 48-character set (for example, HN or LC arrangement) can be used with the Assembler; however, the user must be willing to accept substitute characters.

SOFTWARE REQUIREMENTS

5705-SC1.

COMPATIBILITY

The model 12 Basic Assembler program is source language compatible with the model 10 Basic Assembler program. Macro instructions used in model 10 programs (model 10 Macros feature of the SCP) may have to be changed before re-assembling with the model 12 Assembler.

TERMS and CONDITIONS: See PP Index

**SYSTEM/3 MODEL 12 SUBSET
ANS COBOL COMPILER AND LIBRARY
5705-CB1)**

PURPOSE

IBM System/3 model 12 COBOL is a program product that operates under control of the System/3 model 12 System Control Programming. The compiler and library are disk resident in a simulation area on the 3340 Direct Access Storage Facility (DASF). The compiler requires as input a COBOL source language program and produces as output, by means of the System/3 Overlay Linkage Editor, a System/3 machine language object program, either cataloged in an object library, punched into 80- or 96-column cards, or written onto a diskette. A source program listing, diagnostic messages and a main storage map can be requested.

DESCRIPTION

System/3 COBOL supports Grade 1 Braille for both compiler listings and object program printed output. Minimum requirements include a 132-position printer (5203 or 1403) with 8 lines/inch spacing. A user-provided elastic strip is attached over the printer hammers to produce the Braille characters. The compiler requires a 14K program level in order to produce Braille listings.

Source input to the compiler can be from the system input device (card reader, 3741 directly attached, or 5471 keyboard) or from a source library. Work files for the compiler are in a simulation area of a 3340 Direct Access Storage Facility. The Overlay Linkage Editor is used to generate object programs.

American National Standard COBOL Considerations: The U.S. Industry standard for COBOL is American National Standard COBOL, X3.23-1968, which was approved by the American National Standards Institute (ANSI) on August 23, 1968. The following functional processing modules of the ANSI standard are included in the System/3 model 12 compiler.

1 Nucleus	1, 2
1 Sequential Access	1, 2
1 Random Access	0, 2
1 Library	0, 2
2 Table Handling	1, 3
1 Segmentation	0, 2

The first digit above represents the level of the modules included in the compiler; the second digit represents the lowest level in the American National Standards Institute Standard (0 implies that the module may be completely missing from the standard compilers).

The third digit represents the highest level in the ANSI standard.

The international standard for COBOL is ISO Recommendation Number 1989, which was approved by ISO (International Organization for Standardization) in 1972. System/3 model 12 COBOL bears the same relation to the ISO standard as to the ANSI standard, inasmuch as the two standards are identical in technical content.

Additions: In addition to the standard language, the following additional features are provided:

Extensions to the modules of American National Standard COBOL listed above, comprising

- Certain language elements which are defined in higher levels of the American National Standard COBOL than those listed.
- Certain language elements defined by the CODASYL Programming Language Committee but not yet included by ANSI in American National Standard COBOL.
- IBM-developed extensions consistent with those supported by the System/360 and 370 OS and DOS ANS COBOL compilers and 1130 ANS COBOL compiler.

Disk File Support: The access methods supported for the 3340 are the same as those supported by System/3 model 10 COBOL and are as follows:

Sequential

- Consecutive Processing - including updating in place.
- Random Processing - by relative record number including updating but excluding file loading.

Indexed (main data area only)

- Random Processing - by key.
- Sequential Processing - by key including file loading.

Direct

- Random Processing—by relative record number, including updating and file loading.
- Consecutive Processing.

Standard System/3 disk labels are mandatory for all disk files. Non-standard labels cannot be used except for data records within the file.

Record size can range from 1 to 32K bytes, and records may be processed as blocked or unblocked. Logical records may span physical disk sectors, tracks or cylinders.

Multi-volume sequential files are supported on the 3340 main data area. Offline multi-volume files are only supported on Drive 2 of the 3340. Neither multi-volume nor indexed files are supported on the simulation areas of the 3340.

Tape File Support: The access methods supported for the 3410/3411 Magnetic Tape Subsystem are the same as those supported by System/3 model 10 COBOL. COBOL object programs can process data on magnetic tape; highlights include:

- Consecutive input or output files
- 1-4 tape drives
- Fixed length records, blocked or unblocked
- Variable length records, blocked or unblocked
- Record size from 18 to 32,768 bytes
- Block size from 18 to 32,768 bytes
- IBM Standard Labels, ANSI labels, no labels
- Option for two I/O areas
- 9-track, 800/1600 bpi
- 7-track, 200/556/800 bpi
- Single volume or multivolume files
- Recording format: EBCDIC (7- or 9-track) or ASCII (9-track only)

Printer Support: COBOL supports the 5203 and 1403 as follows: Space 0, 1, 2, or 3 before or after printing a line; skip to line number before or after printing a line; overflow detection.

Card I/O Support: Model 12 COBOL supports the MFCU and 1442 as follows:

	MFCU	1442
Read	Yes	Yes
Punch	Yes	Yes
Card Print	Yes	No
Stacker Select (punch only)	Yes	Yes
Associated File	Yes	No
Character Set (EBCDIC)	64	256

Diskette Support: COBOL supports the 3741 directly attached as an input or output device for compilation. For object programs, the 3741 is supported only by using the ACCEPT statement.

Model 12 COBOL Device Support

	Compilation	Execution
3340 Direct Access Storage Facility model C2	Yes	Yes
3410/3411 Magnetic Tape Unit model 1, 2 or 3	No	Yes
5203 Printer, model 1, 2 or 3	Yes	Yes
1403 Printer, model 2, 5 or N1	Yes	Yes
5424 MFCU, model A1 or A2	Yes	Yes
1442 Card Read Punch model 6 or 7	Yes	Yes
5471 Printer-Keyboard, model 1	Yes	Yes*
1255 MCR, model 1, 2 or 3	No	No
3881 OMR, model 1	No	No
3741 Data Station/Programmable Workstation model 1, 2, 3 or 4 (directly attached)	Yes	Yes*
BSCA, 1 or 2 lines, ICA, or Local Display Adapter	No	No
Main Storage Requirements (Program Level Size)	12-56K	8-56K

* This device is supported only by using the DISPLAY or ACCEPT statement.

** The maximum program level is 64K less supervisor requirements.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Requirements: For source compilation - An IBM System/3 model 12 which includes an IBM 5412 Processing Unit model B16 (32K) ... and an IBM 5424 MFCU or an IBM 1442 Card Read Punch or a directly-attached IBM 3741 Data Station/Programmable Workstation ... and an IBM 5203 or 1403 Printer (the HN print arrangement is recommended) ... and a 3340 DASF.

PROGRAM PRODUCTS

**System/3 Mdl 12 Subset ANS COBOL
Compiler and Library (cont'd)**

COMPATIBILITY

- System/3 COBOL is upward compatible with the DOS and OS ANS COBOL compilers and is a superset of 1130 ANS COBOL providing growth from 1130 through System/3 to System/360 and 370.
- Migration to and from System/3 COBOL requires little source program conversion to effect the transition. Certain 1130 library routines are not included in the System/3 COBOL library, e.g., CALLED subprograms.
- System/3 model 12 COBOL is source language compatible with System/3 model 10 COBOL, with language differences due to differences in I/O. A System/3 model 10 COBOL source program can be re-compiled on System/3 model 12, without changes to the source, and be executed under control of System/3 model 12 SCP - assuming the same I/O. (Note: A 5444 is equivalent to a simulation area on the 3340; indexed and multi-volume files are supported in the main data areas only; split cylinder files are not supported.)

TERMS and CONDITIONS: See PP Index

**SYSTEM/3 MODEL 12 DISK FORTRAN IV
5705-FO1**

PURPOSE

System/3 model 12 FORTRAN IV is a program product that operates under control of the System/3 model 12 SCP. The compiler and library are disk resident in a simulation area on the 3340 Direct Access Storage Facility (DASF). The compiler requires as input a FORTRAN source language program and produces as output, by means of the system's Overlay Linkage Editor, a System/3 machine language object program, either cataloged in an object library, punched into 80- or 96-column cards, or written onto a diskette. A source program listing, diagnostic messages and a main storage map may be requested.

DESCRIPTION

Source input to the compiler can be from the system input device (card reader, 3741 directly attached, or 5471 keyboard) or from a source library. Work files for the compiler are in a simulation area of the 3340 Direct Access Storage Facility. The Overlay Linkage Editor is used to generate object programs.

The model 12 FORTRAN IV language is identical to the System/3 model 6 or 10 FORTRAN IV language. It contains those features defined in American National Standard Basic FORTRAN, X3.10-1966 and additional language features and capabilities previously available only with certain Full FORTRAN IV Compilers.

The model 12 FORTRAN IV Library contains mathematical and service subroutines required during execution to perform arithmetic operations, input and output conversion, and input and output control.

The model 12 FORTRAN IV Library also includes a Commercial Subroutine Package which is equivalent in function to the 1130 Commercial Subroutine Package insofar as is meaningful in terms of System/3 model 12 devices and data management.

Disk File Support: The access methods supported for the 3340 are the same as those supported by System/3 model 10 FORTRAN, and are as follows:

Sequential I/O

Consecutive processing of formatted or unformatted records is supported. Record size of formatted records can range from 1 to 256 bytes.

Record size of unformatted records can range from 1 to 32,767 bytes.

Direct Access I/O

Random processing is by relative record number; consecutive processing can also be performed. Record size can range from 1 to 32,767 bytes, formatted or unformatted.

Standard System/3 disk labels are mandatory for all disk files. Non-standard labels cannot be used except as data records within the file.

Indexed files are not supported.

Tape File Support: The access methods supported for the 3410/3411 Magnetic Tape Subsystem are the same as those supported by System/3 model 10 FORTRAN. FORTRAN object programs can process data on magnetic tape; highlights of tape support include:

- Consecutive input or output files
- 1-4 tape drives
- Formatted or unformatted records
- Record size from 18 to 32,767 bytes
- Block size from 18 to 32,767 bytes
- IBM Standard Labels, ANSI Labels, no labels
- 9-track, 800/1600 bpi
- 7-track, 200/556/800 bpi
- Single volume files
- Multivolume files
- Recording format: EBCDIC (7- or 9-track) or ASCII (9-track only)

Printer Support: The FORTRAN language supports the 5203 and 1403 as follows: Space 0, 1, or 2 before or after printing a line ... skip to line 1 before or after printing a line ... overflow detection. Commercial Subroutines support the 5203 and 1403 as follows: Space immediately 0, 1, 2 or 3 lines ... skip immediately to a specified line number.

Card I/O Support: The Model 12 FORTRAN supports the MFCU and 1442 as follows:

	MFCU	1442
Read	Yes	Yes
Punch	Yes	Yes
Card Print	Yes	No
Stacker Select*	No	No
Combined File**	No	No
Character set (EBCDIC)	64	256

* Commercial Subroutines support stacker selection of cards from the 1442 and from the secondary hopper of the MFCU.

** Through use of the Commercial Subroutines, the MFCU or 1442 can support a combined file.

Diskette Support: FORTRAN supports the 3741 directly attached as an input or output device for compilation only.

Model 12 FORTRAN Device Support

	Compilation	Execution
3340 Direct Access Storage Facility model C2	Yes	Yes
3410/3411 Magnetic Tape Unit model 1, 2 or 3	No	Yes
5203 Printer, model 1, 2 or 3	Yes	Yes
1403 Printer, model 2, 5 or N1	Yes	Yes
5424 MFCU, model A1 or A2	Yes	Yes
1442 Card Read Punch, model 6 or 7	Yes	Yes
5471 Printer-Keyboard, model 1	Yes	Yes
1255 MCR, model 1, 2 or 3	No	No
3881 OMR, model 1	No	No
3741 Data Station/Programmable Workstation model 1, 2, 3 or 4 (directly attached)	Yes	No

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Requirements: For source compilation - A System/3 model 12 which includes an IBM 5412 Processing Unit model B16 (32K) ... and an IBM 5424 MFCU or an IBM 1442 Card Read Punch or a directly-attached IBM 3741 Data Station/Programmable Workstation ... and an IBM 5203 or 1403 Printer ... and an IBM 3340 DASF.

SOFTWARE REQUIREMENTS

5705-SC1.

COMPATIBILITY

System/3 model 12 Disk FORTRAN IV source programs are compatible with System/3 Disk FORTRAN IV for System 3 model 6, 8 or 10 except for changes required to accommodate differences in attached I/O. The model 12 FORTRAN compiler accepts source programs written in the IBM System/360 Basic FORTRAN IV language, which encompasses American National Standard Basic FORTRAN as defined in X3.10-1966. The compiler also accepts source programs written in the IBM 1130 Basic FORTRAN IV language with minor modifications.

PROGRAM PRODUCTS

DATA COLLECTION SYSTEM SUPPORT FOR SYSTEM/3
5705-M31

PURPOSE

The IBM 5230 Data Collection System Support for System/3 program product provides the manufacturer with a convenient, practical means of preparing shop floor data for processing by a user-provided management accounting system. Data collected by the IBM 5230 Data Collection System is edited, consolidated, and formatted on the System/3 for such applications as payroll accounting, inventory management, and production control. By the customer making simple changes in the output formats of both program products, IBM 5230 Data Collections System Support for System/3 can provide input to and use turnaround documents from the System/3 Shop Loading and Control program product (5702-M51).

DESCRIPTION

The 5230 Data Collection System Support for System/3 program product provides two phases of operations: A 5230 personalization phase and a data conversion phase.

The 5230 personalization phase provides a menu of actions from which the user selects those that best fit the operation. Using the menu selections and loop definitions for up to three 5231 controllers with up to four loop each, this phase creates the personalization records required to personalize the 5230 Data Collection System.

The data conversion phase prepares the data received from the 5230 Data Collection System for processing by the user-provided applications. The data can be accepted through the data communications facilities, the 96-column cards, the 80-column cards, or the diskette offered as output options by the 5230 Data Collection System. (Input from 80-column cards or diskette requires minor changes to source).

Both material transactions and labor transactions are prepared by the program product. The material transactions are edited, listed, formatted and stored for later processing by the user-provided inventory management and production control applications. Labor transactions are expanded, edited, checked for accuracy and adjusted for break and lunch times and lunch and shift start-stop time variances. Time and attendance totals are checked against job time totals with warning messages printed for differences that exceed user-prescribed limits. The elapsed time for time and attendance and job time is calculated. Job time applied to overlapping jobs is apportioned to the jobs. A correction procedure is included to allow for changing incorrect labor records. The results of the labor transaction processing are stored for later processing by the user-provided payroll and production control applications.

Reports are printed, at the user's option, for material transactions and for labor transactions. The material transactions report is a single listing. Labor transactions reports provide labor-related information suitable for management review and checking by foremen for correctness.

A *Program Reference Manual* provides installation and planning information such as input and output formats, a description of the processing, control and audit information, and a discussion of the sample problem.

An *Operations Guide* specifies the procedures that must be followed to make any necessary modifications, to compile and include the program in the system library, and to prepare data for the program. A discussion of operating procedures and messages is also included.

HIGHLIGHTS

- Provides needed input to user-provided applications
 - Elapsed time calculation for payroll
 - Material receipt and issue data for inventory management
 - Job elapsed time and location data for production control
- Management reports generated as a byproduct of data entry
 - Jobs started checked against time and attendance record
 - Transaction records checked for complete and accurate entry
- Provides for automatic generation of machine-readable data
 - Uses punched-card turnaround documents from user-supplied applications
 - Reduces transcription errors
 - Eliminates timekeeper calculation of elapsed time

CUSTOMER RESPONSIBILITIES

IBM will provide assistance in many areas pertaining to the installation of IBM program products. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day to day operation lies solely with the customer. Activities, within these areas of customer responsibility, are defined to include, but not be limited to, the following:

Personnel selection and training ... the customer is responsible for selecting at least one person who will be responsible for supervising the installation and at least one person to assume the duties of an operator.

The customer is also responsible for the coordination and education of the various user departments affected by the installation.

Installation ... the customer is responsible for installation of the product. Installation activities include:

- Establishing an installation plan and schedule consistent with the requirements and availability of customer personnel
- Entering control data and compiling the program
- Copying the delivered disk cartridges for backup purposes
- Creation of the badge file and verification of the data
- Modification of existing programs to interface to the program product

Day-to-day system operation ... the customer is responsible for the day to day operation of the system and the results derived from its operation. The customer is also responsible for maintaining controls and audit trails consistent with good business practices and for the security and safekeeping of all machine-readable material and documents which are related to, and/or resulting from, the operation of the system.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM 5230 Data Collection System Support will execute on any model of the System/3 meeting the following minimum configuration:

System/3 Model 8

- IBM 5408 with 16K of primary storage
- IBM 3741 Data Station directly attached
- IBM 5444 model A1 Disk Storage Drive
- IBM 5203 Printer with 132 print positions and PN or GN print character arrangement

System/3 Model 10

- IBM 5410 with 16K of primary storage
- IBM 5444 model 1 or A1 Disk Storage Drive
- IBM 5424 Multifunction Card Unit
- IBM 5203 Printer with 132 print positions and PN or GN print character arrangement

System/3 Model 12

- IBM 5412 with 32K of primary storage
- IBM 3340 model C2 Direct Access Storage Facility
- IBM 5424 Multifunction Card Unit or IBM 3741 Data Station directly attached
- IBM 5203 Printer with 132 print positions and PN or GN print character arrangement

System/3 Model 15

- IBM 5415 with 48K of primary storage
- IBM 5444 model A2 Disk Storage drive
- IBM 5424 Multifunction Card Unit or IBM 3741 Data Station directly attached
- IBM 3277 Systems Console
- IBM 5421 Printer Control Unit
- IBM 1403 Printer with 132 print positions and PN or GN print character arrangement

If the data communications features of 5230 Data Collection System Support for the System/3 are to be used, the Binary Synchronous Communications Adapter, the Local Communications Adapter, or the Integrated Communications Adapter must be added to the minimum configuration. The processing unit must contain the appropriate expansion and attachments features if required.

SOFTWARE REQUIREMENTS

The IBM 5230 System Support for System/3 is written in RPG II programming language and executes under control of the System/3 System Control Program. The System/3 Disk Sort program is also required for execution of the program. The System/3 RPG II compiler is required for tailoring and compiling the Data Collection System Support for System/3. The program numbers applicable to the different system models are given below.

For System/3 Models 8 and 10

System Control Program	5702-SC1
Disk Sort Program	5702-SM1
RPG II Compiler	5702-RG1

If data communications is used, the RPG II Compiler must have either feature #6000 or feature #6002 installed.

For System/3 Model 12

System Control Program	5705-SC1
Disk Sort Program	5705-SM1
RPG II Compiler	5705-RG1

**SYSTEM/3 MODEL 12 RPG II
5705-RG1**

PURPOSE

IBM System/3 model 12 RPG II is a program product that operates under control of the System/3 model 12 System Control Programming. RPG II is disk resident in a simulation area on the 3340 Direct Access Storage Facility (DASF). It requires as input an RPG II source language program and produces as output a System/3 model 12 machine language object program, either cataloged in an object library or punched into 80- or 96-column cards, or written onto a diskette. A source program listing, diagnostic messages, and a main storage map can be requested.

To use the RPG II compiler, the user supplies information about the job to be processed. The job can be described on specification sheets prior to entering the source statements into the system. The specification sheets are: Auto Report, Control Card and File Description, Extension and Line Counter, Telecommunications, Input, Calculation and Output-Format.

Source Input to the compiler can be from the system input device (card reader, 3741 directly attached, or 5471 keyboard) or from a source library. Work files for the compiler are on a simulation area of a 3340 data module.

In addition to the functions provided by System/3 model 10 Disk RPG II, model 12 RPG II provides the following capabilities:

- Support of 3340 Direct Access Storage Facility.
- Included as standard functions of the model 12 RPG II, the following support that is available as separately priced features in model 6 and/or 10 RPG II: Telecommunications, Auto Report, and Magnetic Tape support.

Disk File Support: The access methods supported for the 3340 are the same as those supported by System/3 model 10 Disk RPG II and are as follows:

Sequential

- Consecutive Processing - including updating in place.
- Random Processing - by relative record number including updating but excluding file loading.

Indexed (main data area only)

- Random processing - by key.
- Sequential processing - by key including file loading.

Direct

- Random Processing - by relative record number, including updating and file loading.
- Consecutive Processing.

Standard System/3 disk labels are mandatory for all disk files. Non-standard labels cannot be used (except as data records within the file).

Record size can range from 1 to 9,999 bytes, and records can be processed as blocked or unblocked. Logical records may span physical disk sectors, tracks or cylinders.

Tape File Support: The access methods supported for the 3410/3411 Magnetic Tape Subsystem are the same as those supported by System/3 model 10 Disk RPG II. RPG II object programs can process data or record address files on magnetic tape. Highlights of tape support include:

- Consecutive input or output files
- 1-4 tape drives
- Fixed length records, blocked or unblocked
- Variable length records, blocked or unblocked
- Record size from 18 to 9,999 bytes
- Block size from 18 to 9,999 bytes
- IBM Standard Labels, ANSI Labels, no labels
- Option for two I/O areas
- 9-track, 800/1600 bpi
- 7-track, 200/556/800 bpi
- Single volume or multi-volume files
- Recording format: EBCDIC (7-or 9-track) or ASCII (9-track only)
- Program options to Rewind or Rewind/Unload at end of job

Printer Support: RPG II supports the 5203 and 1403 Printer as follows: Space 0, 1, 2 or 3 before or after printing a line; skip to line number before or after printing a line; overflow detection; first page forms alignment. The 5203 dual feed carriage is supported.

Card I/O Support: RPG II supports the MFCU and 1442 as follows:

	MFCU	1442
Read	Yes	Yes
Punch	Yes	Yes
Card Print	Yes	No
Stacker Select	Yes	Yes
Combined File	Yes	Yes
Character set (EBCDIC)	64	256

Diskette Support: A directly-attached 3741 is supported as a unit record input/output device for RPG II object programs.

Model 12 RPG II Device Support

	Compilation	Execution
3340 Direct Access Storage Facility, model C2	Yes	Yes
3410/3411 Magnetic Tape Unit, models 1, 2 or 3	No	Yes
5203 Printer, model 1, 2 or 3	Yes	Yes
1403 Printer, model 2, 5, or N1	Yes	Yes
5424 MFCU, model A1 or A2	Yes	Yes
1442 Card Read Punch, model 6 or 7	Yes	Yes
5471 Printer-Keyboard, model 1	Yes	Yes
1255 MCR, model 1, 2 or 3	No	Yes**
3881 OMR, model 1	No	Yes**
3741 Data Station/Programmable Workstation model 1, 2, 3 or 4 (directly attached)	Yes	Yes
BSCA, 1 or 2 lines, ICA, or Local Display Adapter	No	Yes
Main Storage Requirements (Program Level Size)	8-56K*	8-56K*

- * The maximum program level is 64K less supervisor requirements.
- ** Requires SCP subroutine; RPG II SPECIAL exit is used.

Auto Report: Model 12 RPG II Auto Report is functionally identical to the S/3 model 10 Disk RPG II Auto Report feature. Auto Report enhances the RPG II language by providing functions which eliminate much of the preparation and coding work normally done by the user. It is specifically designed to facilitate report preparation.

Auto Report executes as a preprocessor to the RPG II Compiler. The input is RPG II source statements and Auto Report statements. Auto Report produces a diagnostic listing, replaces the Auto Report statements with generated or copied RPG II source statements and calls the RPG II Compiler for execution.

Telecommunications Support: Support of the Binary Synchronous Communications Adapter (BSCA), and the Integrated Communications Adapter (ICA) is achieved through use of the RPG II Telecommunications Specifications Sheet and the addition of BSCA as a device entry on the RPG II File Description Specification. The support is identical to that provided by System/3 model 6 and 10 RPG II Telecommunications features, and includes:

Communication modes: Receive only ... Receive with conversational reply* ... Transmit only ... Transmit with conversational reply* ... Alternate transmit and receive file. (*Not supported in communication with System 32, System/34, 2770, 2780, 3741-2, and 3741-4 or a 5110 Computer System supported as a 3741 model 2 or 4.)

Communication with the 5231 model 2 is in Receive mode only. The 5231 model 2 is supported as a 3741 model 2 or 4.

RPG II language features supported: Input, Output, and Combined files ... Demand files for Transmit and Receive ... Blocking and deblocking of records ... Dual I/O areas.

BSCA and ICA features, options and capabilities supported: Manual Call ... Manual answer ... Auto-call (BSCA only) ... Auto-Answer ... Medium speed ... High speed (BSCA only) ... Station selection ... EBCDIC data transparency ... intermediate block checking ... EBCDIC or ASCII data and data link control characters. File translation of ASCII data can be accomplished by proper use of the file translation facility of RPG II.

For additional information, see the description of the model 10 Disk RPG II Telecommunications feature (5702-RG1, feature #6000/#6002).

COMPATIBILITY

System/3 model 12 RPG II is source language compatible with the System/3 model 10 Disk RPG II (5702-RG1) and System/3 model 6 RPG II (5703-RG1) except for differences due to different hardware. A System/3 model 6 or 10 Disk RPG II source program can be re-compiled on System/3 model 12, without changes to the source, and be executed under control of System/3 model 12 SCP - assuming the same I/O. (Note: 5444 is equivalent to a 5444 simulation area on the 3340; indexed and multi-volume files are supported in the main data areas only; split cylinder files are not supported; shared I/O areas are not supported.)

System/3 Model 12 RPG II (cont'd)**SPECIFIED OPERATING ENVIRONMENT****HARDWARE REQUIREMENTS**

Minimum System Requirements: For source program compilation - An IBM System/3 model 12 which includes an IBM 5412 Processing Unit model B16 (32K) ... and an IBM 5424 MFCU or an IBM 1442 Card Read Punch or directly-attached IBM 3741 Data Station/Programmable Workstation ... and an IBM 5203 or 1403 Printer ... and an IBM 3340 DASF.

RPG II 3270 DISPLAY CONTROL FEATURE**Feature #6003/#6004****PURPOSE**

The RPG II 3270 Display Control feature provides telecommunications services for local or remote 3270 devices. The program is automatically linked into the RPG II application program via the SPECIAL file exit capability on the RPG II File Description Specification Sheet. Neither the Assembler nor the RPG II Telecommunications feature is required.

DESCRIPTION

The following services are provided by the Display Control feature:

- RPG II access to 3270 Display System Terminals attached via the Local Display Adapter, the Integrated Communications Adapter (ICA), or the Binary Synchronous Communications Adapter (BSCA).
- Automatic buffering and queuing of terminal data
- A display formatting interface which permits the support of 3270 devices with coding in RPG II
- Complete line control procedures are provided
- Up to 18 terminals may be controlled (up to 12 can be attached via the Local Display Adapter)
- Provides the capability of coding one or more applications within one program. No task switching is provided.
- Two subroutines are provided. SUBR13 allows an RPG II program to support 3270s without using CCP. SUBR14 provides upward compatibility with CCP, requiring only program recompilation, assuming the RPG II program meets the CCP requirements.

Terminals Supported: The following terminals and communications facilities are supported under the RPG II 3270 Display Control feature:

With the Local Display Adapter

- 3277 Display Station (model 1 or 2)
- 3284 Printer (model 1 or 2)
- 3286 Printer (model 1 or 2)
- 3288 Printer (model 2)

Note: A maximum of 12 terminals may be attached via the Local Display Adapter.

With the Integrated Communications Adapter (ICA) or the Binary Synchronous Communications Adapter (BSCA).

- 3275 Display Station and Control, or
- 3271 Display Control Unit (model 1 or 2), with:
 - 3277 Display Station (model 1 or 2)
 - 3284 Printer (model 1 or 2)
 - 3286 Printer (model 1 or 2)
 - 3288 Printer (model 2)

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Minimum System Requirements: The RPG II 3270 Display Control feature requires an IBM System/3 model 12 which includes, as a minimum, an IBM 5412 Processing Unit model B16 (32K bytes) ... an IBM 3340 model C2 DASF ... an IBM 5203 or 1403 Printer ... an IBM 5424 MFCU or an IBM 1442 Card Read Punch or a directly-attached 3741 Data Station/Programmable Workstation ... a Local Display Adapter or an Integrated Communications Adapter or a Binary Synchronous Communications Adapter and one of the devices listed under "Terminals Supported".

Using SUBR13, approximately 10K-12K bytes are added to the size of the object program. Using SUB14, approximately 4.3K bytes are added to the size of the object program.

SOFTWARE REQUIREMENTS

5705-SC1, 5705-RG1.

COMPATIBILITY

The System/3 model 12 RPG II 3270 Display Control feature is functionally compatible with the System/3 model 8/10 and System/3 model 15 RPG II 3270 Display Control feature.

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**SYSTEM/3 MODEL 12 DISK SORT
5705-SM1****PURPOSE**

The IBM System/3 model 12 Disk Sort program is a program product that sorts a file into ascending or descending sequence. The program is resident in a simulation area on the 3340 Direct Access Storage Facility (DASF) and operates under control of the model 12 SCP.

DESCRIPTION

Input files - Multiple input files are supported - up to eight input files from disk and/or tape. An input file can be resident on a 3340 DASF or on a unit of the 3410/3411 Magnetic Tape subsystem. A disk file can have sequential, indexed or direct organization. For a disk file, the input record size can be from 1 to 9,999 bytes. A tape input file can have fixed length records, either blocked or unblocked; variable length tape records are not supported. The maximum input tape record or block size is 9,999 bytes, and the minimum is 18 bytes. Input tape files can be 9-track 800/1600 bpi or 7-track 200/556/800 bpi. The tape file can be recorded in either EBCDIC or ASCII code. Input can be either a single volume file or a multi-volume file.

Work file - A work file can be resident on a simulation area or main data area of a 3340 DASF. Work space can be specified by the user or can be automatically allocated by the program.

Output file - The output file can be resident on a 3340 DASF or on a unit of the 3410/3411 Magnetic Tape Subsystem. A disk output file can have sequential organization only. Characteristics of tape output files are the same as for tape input files, described above. The maximum output record size for disk or tape is 4,096 bytes. Output of the program will be one of three formats: Tag (ADDROUT), tag-along, or summary tag-along.

Features

- Records can be selected or omitted, and reformatted.
- Specified records may be forced ahead of others.
- An alternate collating sequence can be specified.
- Control fields can be in different locations in the records.
- The total length of the control fields can be from 1 to 256 bytes; there is no other limit on the number of control fields.
- Control fields can be sorted in ascending or descending sequence, or mixed (some ascending and some descending).
- Control fields can be sorted using only the digit or zone portion of the character. The fields can be packed or unpacked decimal, or character formats.
- Records containing identical control fields can be combined by summarizing specified fields into one record.

Use: Specifications are described on a simple, RPG-like coding sheet. These specifications are entered into the system using the system input device, or they can be stored in the source library on disk. Sort control statement diagnostics and messages may be displayed on the system logging device.

The program can be executed in a dual programming environment and uses from 8K to 56K bytes of main storage, exclusive of SCP requirements.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Minimum System Requirements: An IBM System/3 model 12 which includes an IBM 5412 Processing Unit model B16 (32K), and an IBM 5424 MFCU or an IBM 1442 Card Read Punch or a directly-attached IBM 3741 Data Station/Programmable Workstation, and an IBM 5203 or 1403 Printer and an IBM 3340 DASF.

SOFTWARE REQUIREMENTS

5705-SC1. (See SCP pages.)

COMPATIBILITY

The model 12 Disk Sort program is source language compatible with the Disk Sort programs for the System/3 models 6, 8 and 10.

DOCUMENTATION

(available from Mechanicsburg)

System/3 Disk Sort Reference Manual (SC21-7522) ... System/3 Disk Sort Program Product Specifications (GC21-5083) ... System/3 Bibliography (GC20-8080).

PROGRAM PRODUCTS

**SYSTEM/3 MODEL 12 MAGNETIC TAPE SORT
5705-SM2****PURPOSE**

The IBM System/3 model 12 Magnetic Tape Sort program is a program product that sorts a tape file into ascending or descending sequence. It is resident in a simulation area on the 3340 Direct Access Storage Facility (DASF) and operates under control of the model 12 SCP. A configuration that includes three or four tape units is required. The program is functionally identical to the System/3 model 10 Disk Resident Magnetic Tape Sort program (5702-SM2).

Input files - The input file resides on any unit of the 3410/3411 Magnetic Tape Subsystem. The input file can have fixed length records, either blocked or unblocked. (Variable length records are not supported.) The maximum input record or block size is 9,999 bytes. The minimum input record or block size is 18 bytes. Input tape files can be 9-track 800/1600 bpi or 7-track 200/556/800 bpi. The file can be recorded in either EBCDIC (7- or 9-track) or ASCII (9-track only) code. Input can be either a single volume file or a multivolume file.

Work files - Three work tapes are required; a fourth can be utilized, if available. Work tapes can be either 7- or 9-track (see restrictions below). Work tapes must be single volume only (not multivolume).

Output file - The output file resides on any unit of the 3410/3411 Magnetic Tape Subsystem. Characteristics of tape output files are the same as for tape input files, described above. Output is a file of records containing the sort control fields and/or the data fields the user has specified. (The tag [ADDROUT] and summary tag-along sort capabilities of the Disk Sort are not supported in the Tape Sort.)

Restrictions: To utilize all of the functions of this program, at least three 9-track work tapes must be available. If one or more of the work tapes is 7-track, then only those sort functions that relate to the standard System/3 64-character set (EBCDIC) are supported. As a result, sorts of binary data, packed or unpacked decimal data or sorts on zones are not allowed in these 7-track configurations.

Features

- Records can be selected or omitted, and reformatted.
- Specified records may be forced ahead of others
- An alternate collating sequence can be specified.
- A checkpoint/restart facility is supported.
- Control fields can be in different locations in the records.
- The total length of the control fields can be from 1 to 256 bytes; there is no other limit on the number of control fields.
- Control fields can be sorted using only the digit or zone portion of the character. The fields can be packed or unpacked decimal, or character formats.
- Control fields can be sorted in ascending or descending sequence or mixed (some ascending and some descending).

Use: Specifications are described on a simple, RPG-like coding sheet. These specifications are entered into the system using the system input device, or they can be stored in the source library on disk. Sort control statement diagnostics and messages may be displayed on the system logging device. The program can be executed in a dual programming environment and requires 8K to 55K bytes of main storage, exclusive of SCP requirements.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Minimum System Requirements: An IBM System/3 model 12 which includes an IBM 5412 Processing Unit model B16 (32K), and an IBM 5424 MFCU or an IBM 1442 Card Read Punch or a directly-attached IBM 3741 Data Station/Programmable Workstation, and an IBM 5203 or 1403 Printer, and an IBM 3340 DASF. At least three tape drives of the IBM 3410/3411 Magnetic Tape Subsystem are required.

SOFTWARE REQUIREMENTS

5705-SC1. (See SCP pages.)

COMPATIBILITY

The model 12 Magnetic Tape Sort program is functionally compatible with the Disk Resident Magnetic Tape Sort program for System/3 model 8 and System/3 model 10.

(available from Mechanicsburg)

System/3 Tape Sort Reference Manual (SC21-7572) ... System/3 Magnetic Tape Program Planning Manual (GC21-5040) ... System/3 Tape Sort Program Products Specifications (GC21-5138) ... System/3 Bibliography (GC20-8080).

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**SYSTEM/3 MODEL 12 DISK RESIDENT CARD UTILITIES
5705-UT1**

PURPOSE

This IBM System/3 program product is resident in a simulation area on the 3340 Direct Access Storage Facility (DASF) and operates under control of the model 12 SCP. The following programs are provided: Sort/Collate, List, Reproduce/Interpret, and Gangpunch. (The following programs, included in the model 10 Utilities, 5701-UT1 and 5702-UT1, are not available for the model 12: Data Recording, Data Verifying, and 80-96 Conversion program.)

DESCRIPTION

Sort/Collate Program - Functionally compatible with the model 10 Sort/Collate program (see 5701-UT1). The model 12 program supports the 5424 MFCU only.

List Program - Functionally compatible with the model 10 96-column List program (see 5701-UT1). The model 12 program supports input from 5424 MFCU, 1442 Card Read Punch, or the directly-attached 3741.

Reproduce/Interpret Program - Functionally compatible with the model 10 Reproduce/Interpret program (see 5701-UT1). The model 12 program supports the 5424 MFCU only.

Gangpunch Program - Functionally compatible with the model 10 Gangpunch program (see 5702-UT1). The model 12 program supports the 5424 MFCU.

Use: Each program described above can be executed in an 8K program level in a dual program environment.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Minimum System Requirements: An IBM System/3 model 12 which includes an IBM 5412 Processing Unit model B16 (32K), and an IBM 5203 or 1403 Printer, and an IBM 3340 DASF, and the device required for the particular program described above (IBM 5424 MFCU, 1442 Card Read Punch, or a directly-attached IBM 3741 Data Station/Programmable Workstation).

SOFTWARE REQUIREMENTS

5705-SC1. (See SCP pages.)

COMPATIBILITY

The model 12 Disk Resident Card Utilities that have model 10 equivalents are functionally compatible to the model 10 versions.

TERMS and CONDITIONS: See PP Index

**SYSTEM/3 UTILITY PROGRAM FOR
1255 MAGNETIC CHARACTER READER
5705-UT2****PURPOSE**

This utility program provides the System/3 model 12 user control of document processing on the IBM 1255 Magnetic Character Reader. It provides a means of reading MICR encoded documents from the 1255, accumulating document totals and amount field totals for each pocket, and placing the data from the documents on output disk or tape and printer files. The program is designed to fulfill the basic requirements of the "ON-US" data capture run required for all Demand Deposit Application Programming.

DESCRIPTION

The program reads fields from the documents as specified by the user and then, based on decisions indicated by the user, it will stacker select these documents into user-specified pockets. If requested, Modulus 10 or 11 checking will be performed. Then after each document has been read and stacker selected, the utility will print user-specified fields from that document. Fixed-length disk records will also be created and placed on a disk file or a tape file (3410 or 3411 9-track only).

An additional facility provided by the program is the accumulation of document totals and amount field totals and then printing these at end of job. Subtotals may be printed at any time as indicated by the user during program execution.

Use: The utility requires at least 10K bytes of main storage when disk output is requested and 12K bytes of main storage when tape output is requested (exclusive of SCP requirements). The program will operate in a dual program environment.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Minimum System Requirements: An IBM System/3 model 12 which includes an IBM 5412 Processing Unit model B16 (32K) with a Serial I/O Channel (#7081), and an IBM 5424 MFCU or a directly-attached IBM 3741 Data Station/Programmable Workstation, and an IBM 5203 or 1403 Printer, and an IBM 3340 DASF, and an IBM 1255 Magnetic Character Reader, model 1, 2 or 3.

SOFTWARE REQUIREMENTS

5705-SC1. (See SCP pages.)

COMPATIBILITY

The model 12 Utility Program for the 1255 MCR is functionally compatible to the model 10 version.

DOCUMENTATION

(available from Mechanicsburg)

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**SYSTEM/7 FORTRAN IV
STAND-ALONE COMPILER and LIBRARY
5707-FO1****PURPOSE**

Provides high-level FORTRAN language support for the System/7 user by offering the ease and speed of coding in the FORTRAN language. The Compiler and Library program product is installed on the System/7 and executes as a component under the System/7 Program Preparation Facilities, thereby significantly enhancing stand-alone program preparation capability on the System/7.

The System/7 FORTRAN IV program product is designed to provide users with convenient access to a powerful, easy-to-use higher-level language with which they may write scientific, sensor-based and other applications.

DESCRIPTION

Users will compile their programs with the System/7 FORTRAN IV compiler. The System/7 Linkage Editor under the S/7 Program Preparation Facilities will combine these programs with the FORTRAN library routines, sensor-based routines, and/or other MSP/7 routines to form an executable real-time application program. The FORTRAN programs which are connected to an interrupt on a priority level via MSP/7 facilities gain control whenever the appropriate device or software interrupt occurs.

The user also may utilize the batch DSS/7 nucleus provided as part of the System/7 Program Preparation Facilities. Thus, users need not build their own MSP/7 nucleus, thereby enhancing the installability and usability of FORTRAN. In this environment the user is offered batch compile-and-go facilities and sequential DP I/O device support for the 5028 Operator Station, 5022 Disk Storage Module, 129 Data Recorder and the 7431 Serial Printer.

Some of the features that FORTRAN offers include:

- ANS Basic FORTRAN with major extension
- Syntax checking mode, at substantial compile time savings
- Optimization during compilation for time, space and execution performance
- Sequential Access Method support of the 5028 Operator Station, 5022 Disk Storage Module, 129 Data Recorder, 7431 Serial Printer
- Direct support of the Binary Synchronous Communications Adapter through the Communications Access Method
- Extensive library containing mathematical subprograms, implicitly-called subprograms, service subprograms, and sensor-based subroutines. New sensor-based subroutines have been included conforming to the Instrument Society of America Standard S61.1 providing such functions as:
 - initiation, suspension and termination of user programs based upon time parameters
 - reading analog input points in random or sequential order
 - setting and resetting digital output at specified times
 - reading and writing input and output registers
 - bit manipulation through logical shift complement and inclusive and exclusive OR, AND functions.
- Compatibility with host FORTRAN IV Library and host FORTRAN IV source and object code.
- MSP/7 functions including sensor I/O available through CALL statements

CUSTOMER RESPONSIBILITIES

- Understand the application they wish to perform and provide the appropriate hardware and software design
- Install the System/7 Program Preparation Facilities
- Utilize the batch DSS/7 (8-12K) nucleus or generate the supporting system nucleus for servicing sensor-based devices
- Provide the required user-written programs and link-edit these programs with the MSP/7 nucleus
- Test the resulting object programs

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS****Minimum Hardware for Compilation:**

- IBM System/7 (5010 mdl A, B, or E) with at least 12K words of main storage
- IBM 5022 Disk Storage Module (mdl 1 or 2), with or without cycle steal feature
- IBM 5028 Operator Station

Minimum Hardware for Execution: For stand-alone execution, the minimum requirements are:

- An IBM System/7 (5010 mdl A, B, or E) with at least 6K words of main storage
- IBM 5028 Operator Station

Minimum Hardware for execution under control of the 8-12K version of DSS/7:

- IBM System/7 (5010 mdl A, B, or E) with at least 12K words of main storage
- IBM 5022 Disk Storage Module (mdl 1 or 2), with or without cycle steal feature
- IBM 5028 Operator Station

With this configuration, only the 5028 can be used for I/O.

Service programs for 5707-AA1 are provided on a separate 8-channel paper tape when #9056 is ordered.

SOFTWARE REQUIREMENTS

IBM System/7 FORTRAN IV runs under the control of the IBM System/7 Program Preparation Facilities. The object modules produced by FORTRAN must be link-edited and formatted prior to execution in the IBM System/7. Both the stand-alone Macro Assembler and the Macro Library/Relocatable are required for preparing the real-time nucleus (in lieu of using DSS/7 for non-real time applications) for those user applications utilizing sensor-based subprograms.

COMPATIBILITY

The compiler accepts source programs written in System/7 FORTRAN, which is an extension of ANS Basic FORTRAN, X3.10-1966 and produces object modules that are acceptable to LINK/7 for link-editing. The System/7 FORTRAN IV compiler will also accept source programs written in ANS Basic FORTRAN. The language level is similar with the host FORTRAN program product.

DOCUMENTATION

(available from Mechanicsburg)

Program Product Specifications: IBM System/7 FORTRAN IV (System/7 Compiler and Library) (GC34-0034) ... An Introduction to System/7 FORTRAN IV (GC28-6869).

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

**TREND ANALYSIS/370 - (5740-F12)
Color Graphics Support Feature (5707-F12)**

DESCRIPTION

Trend Analysis/370 is an easy-to-use, interactive, IMS/VS-based computer application designed to allow presentation of time series data in tabular report form on a 3270 Information Display System. Using the System/7 Color Graphics Support Feature, presentation can be done graphically on a color television monitor. Time series numerical data, either from an organization's internal systems or from the external environment, can be formatted and stored for use by the system.

Information stored for use by Trend Analysis/370 is logically organized by time period (daily, weekly, monthly, quarterly, semi-annually and annually), by organization (such as companies, divisions, departments, subsidiaries, competitors or part numbers) and by data element (such as assets, expenses, net/gross sales or unit price). It is the customer's responsibility to provide the source information, either by writing a simple format conversion program for machine-readable information, or by entering it manually through online data entry terminal facilities provided by Trend Analysis/370.

The Trend Analysis/370 program provides a framework within which time series information can be stored, retrieved, manipulated and presented as required during the process of executive or management decision-making. Users may customize their use of the system by stipulating, interactively, the information content and format of the reports they are creating, or by pre-defining the reports.

In either case, they interact with the system through the use of 'menus'. These are simply terminal displays (3277) of a list of options for users to select from in creating their reports. For a pre-defined report, a single menu suffices (i.e., 'give me standard report number 6') while for an interactively-created report, a series of menus would be required (i.e., to select from lists of available data, manipulation facilities, report formats, time periods of interest, etc.). Data selection menus are created by users themselves; report option menus are provided along with the program.

Trend Analysis/370 also provides for the presentation of decision-supporting information in whatever format the user decides is best suited to the information to be displayed. For example, a report of 'today's closing balances' could be shown in tabular form on a terminal display screen (and a printed copy may be requested). On the other hand, using the System/7 Color Graphics Support Feature, an analysis of the expenses incurred by six departments by month over the past 24 months could be displayed on a standard color television monitor as six lines, each line in a different color against a black background, with white axes and scales. In tabular form, this report might have required several pages from which trends or patterns would be more difficult to discover.

Trend Analysis/370, then, is a major support tool for executive management, providing for the storage, retrieval, manipulation and presentation of time series information to assist and augment the decision-making process.

HIGHLIGHTS

- Trend Analysis/370 provides time series data in tabular report form for comparison of multiple organizations and data elements at a point in time, for comparing the performance of multiple organizations over time and for analysis of the performance of a single organization over time.
- The Color Graphics Support Feature enables the compression of a large tabular report (hundreds of numbers over several pages) into a single color graphical display on a standard television monitor. Time series data is particularly suited to analysis when viewed in graphical form.
- An easy-to-use 'menu' approach permits users, with minimal training, to customize the information content and format of a desired report.

CUSTOMER RESPONSIBILITIES

For Trend Analysis/370 they include:

- Identify the source of required information.
- Assign unique numbers to each organization and data element.
- Assign up to eight-character acronyms and up to twenty-character descriptors to each data element and organization.
- Load the unique numbers, acronyms and descriptors into the description data base using a batch program supplied by Trend Analysis/370.
- Assign a general password, data access password and a data modification password to limit access to this sequence of menus, to limit the information that may be seen by personnel holding the general password, and to limit data modification capability to only authorized people.
- Write conversion programs to reformat existing machine-readable data to meet format requirements of the Trend Analysis/370 interface program for the time series data base. The online data

entry facility can be used to enter non-machine readable data values and subsequently modify them.

- Design menus to reflect the most logical sequencing of the source data and the Trend Analysis/370 facilities that will be used.

For the Color Graphics Support Feature they include:

- The customer must purchase, install and maintain all data interfaces, cabling and equipment not specifically provided and maintained by IBM, in accordance with published System/7 Physical Planning Specifications (see "System Requirements").
- The customer must write the System/7 code to interface with the video display generator or submit a PRPQ to IBM for System/7 interface code for the selected device.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Trend Analysis/370 operates under IMS/VS Version 1 Release 1.0 or later versions, using any version of OS/VS1 or OS/VS2 which supports IMS/VS. This requirement means that the minimum IBM S/370 which can be used, (and also process other transactions) is a mdl 145 with 1,024K bytes of main storage. The product uses 173K in main storage (real or virtual depending upon the customer's installation requirements) and requires a 260K Message Processing Region (real or virtual). Each of the two batch support programs requires 256K in main storage (real or virtual).

The IBM 3270 Information Display System is used to communicate with Trend Analysis/370 and can be attached locally or remotely.

The system and terminal requirements are the IMS/VS requirements (please refer to the IMS/VS pages). However, Trend Analysis/370 requires the large (1,920 characters) Display Station such as the IBM 3277 mdl 2. A Printer such as the IBM 3286 mdl 2 is optional.

The Color Graphics Support Feature operates under the Disk Support System/7 on an IBM System/7. It can operate in a local or a remote environment. In a remote environment, the required IBM System/7 components are:

Type	Feature Code	RPQ Reference Number	Quantity per Machine	Description
5010				Processor Module mdl E28 Minimum
	#1610		1	Asynchronous Communication Control
	#2165		1	Common Carrier Adapter
		D08001	1	Communication Asynchronous 1200 Adapter
5013				Digital I/O Module
	#3284		1	Digital Input Control
	#3289		2	Digital Input Group
	#3296		1	Digital Output Control
	#3422		2	Digital Output Medium Power Group
	#5710		1	Process Interrupt
		D08147	1	Common Attachment 129/5496/7431
		D08150	1	Data Recorder 129 Attachment
5022				Disk Storage Module
5026				Enclosure - 3 Position Minimum
5028				Operator Station
5029				Feature Attachment to System/7
	#3283		2	Digital Input Voltage Sense
	#3410		3	Digital Output Connector

PROGRAM PRODUCTS

Trend Analysis/370 (cont'd)

129			Card Data Recorder
	#3610	1	Expansion Feature
	8T0065	1	I/O Attachment for System/7

program product (5740-F12). The program logic manual for the feature contains the interface specifications and guidelines necessary to program the System/7 to utilize a video display generator. It is recommended that the System/7 Host Preparation Program Facility for OS/VS (5744-AF1) be used on the S/370 to compile the code. Alternatively, the S/7 Program Preparation Facilities (5707-AA1) can be used to do the compilations on the System/7.

DOCUMENTATION

(available from Mechanicsburg)

Design Objectives ... Promotional Brochure (G520-3064) ... Slide Set (GV20-0610) ... General Information Manual

RPQs ACCEPTED: Yes

TERMS and CONDITIONS: See PP Index

For all machine types other than the IBM 5010, the model for that machine type may be any that the customer desires. In a remote environment, an IBM 2701 Data Adapter Unit, 2702 Transmission Control, a 2703 Transmission Control, 3704 Communications Controller in 2701/2702/2703 Emulation Mode, or 3705 Communications Controller in 2701/2702/2703 Emulation Mode is required. Appropriate modems, such as the IBM 3872 Modem, are also required.

For a local attachment to a channel, the specifications for the IBM 5013, 5022, 5026, 5028, 5029 and 129 remain the same as that for a remote environment. The specifications for the IBM 5010 and a 2701 Data Adapter Unit are:

Type	Feature Code	RPQ Reference Number	Quantity per Machine	Description
5010				Processor Module mdl E28 Minimum
	#1610		1	Asynchronous Communication Control
		D08000		Communication Asynchronous 50KB Adapter
2701				Data Adapter Unit
		858450		Asynchronous Communication Adapter

The following are not required but recommended to increase the performance of the respective machine types:

Type	Feature Code	RPQ Reference Number	Quantity per Machine	Description
5010	#2662		1	Cycle Steal Basic
5022	#2664		1	Disk Cycle Steal
129		Z04771	1	Skip/Read Double SPD

Additionally, two Original Equipment Manufacturer (OEM) devices are required:

Video Display Generator.

Red/Green/Blue (RGB) Television Monitor.

The video display generator is a device whose function is to provide a 30-times-per-second refresh (signal regeneration) to an RGB television monitor or any other device which requires a similar signal regeneration. The OEM RGB television monitor, to meet United States standards, should have 525 scan lines of two interlaced fields, with a 30-times-per-second refresh rate. Of the 525 scan lines on the TV monitor, 480 are usable for display. With a display aperture ratio of four horizontal to three vertical, 640 bits of information can be displayed on each of the 480 lines. The Color Graphics Support Feature is based upon this coordinate display of 480 vertical elements by 640 horizontal elements.

The Color Graphics Support Feature has been tested with one of the commercially available video display generators and two of the commercially available television monitors.

SOFTWARE REQUIREMENTS

The IBM Trend Analysis/370 program product is written in Programming Language/1 (PL/1) and operates under the control of the Information Management System/Virtual Storage (IMS/VS) Version 1 Release 0 or later versions. The prerequisite program products are:

Information Management System/VS	5740-XX2
IMS/VS Data Communication Feature	5740-XX2
PL/1 OS Resident Library	5734-LM4
PL/1 OS Transient Library	5734-LM5

If user exit code is written, then the PL/1 OS Optimizing Compiler (5734-PL1) is required.

The Color Graphics Support Feature is written in MSP/7 and operates under the control of the Disk Support System/7 (5707-AG1) and should only be used in conjunction with the Trend Analysis/370

**MANUFACTURING MONITORING SYSTEM VERSION 2
5707-M33 (OS/VS)
5707-M34 (DOS/VS)****PURPOSE**

The IBM Manufacturing Monitoring System (abbreviated to MMS) is a program product designed for realtime monitoring of plant floor activities and resources.

DESCRIPTION

MMS consists of a base program, the Basic System/7 Code, which resides in a System/7, and a feature, the S/370 Data Feature, which resides in a S/370 and is required for MMS data set generation and teleprocessing capabilities. The System/7 communicates with the plant floor via 2790 terminals operated by plant personnel. User-provided sensors, attached to System/7 digital input and output points, sense status and production count of machines (optional).

MMS accepts, edits, and processes transactions entered by workers, foremen, dispatchers, stock-keepers, and other personnel who report via terminal on setup, operation start and completion, interruptions, delivery to stock, and so on.

Signals received from machine sensors - indicating machine status, failure conditions, and quantities produced - are used to calculate utilization data, report failure conditions, monitor idle times, and check consistency of machine status against job status reported via terminal.

Based on this data, MMS monitors the execution of shop orders, their correct sequence, and timely completion, and the utilization of machines. It also calls for immediate action whenever exceptional conditions are detected. The data collected on System/7 disk files can be transmitted periodically, for additional evaluation, to a S/370 via binary synchronous or asynchronous communication linkages, using the MMS S/370 Data Feature, or to an IBM System/3 via physical disk transfer. When using the binary synchronous communication linkage (BSC), MMS data logging and sensor input processing can be performed in parallel with the transmission of System/7 disk file data to a S/370 host. This function is important for plants with 3-shift operations.

HIGHLIGHTS

MMS assists the user in the following functions:

- Collection of plant activity data, such as reporting on job status and machine status changes, work and operator assignments, maintenance.
- Machine monitoring, by sensing machine status, failure conditions, and quantities produced.
- Realtime information, on workstations, job queues, shop orders, and machine operators.
- Plant communication, with message generation and distribution according to order progress and exceptional conditions detected.
- Feedback for planning and accounting, e.g., for scheduling systems, cost and payroll accounting, quality assurance, material planning.

CUSTOMER RESPONSIBILITIES

To tailor MMS according to the user's environment, the customer must provide specifications and parameters that describe the plant environment and select the MMS functions required.

If users install sensor hardware for machine monitoring and piece counting, a user-written System/7 interface program is required to connect the particular hardware equipment to MMS. An MMS sample problem will be provided as a guide for the user programming effort.

Prerequisite to successful implementation of MMS is an intensive education of the plant personnel operating terminals and using MMS functions.

SOFTWARE REQUIREMENTS

MMS Basic System/7 Code is written in IBM System/7 Assembler language.

The IBM System/7 MSP/7 Host Program Preparation Facilities II, Release (ASM/7, LINK/7, FORMAT/7, MACLIB/R: Group Order Number 5744-AF1 for OS/VS, 5747-AF1 for DOS/VS) are required to generate the MMS System/7.

System generation must be performed on an IBM S/370 processor operating under control of the IBM Operating System (OS/VS or OS/VS2) or the IBM Disk Operating System (DOS/VS).

The MMS System/7 batch programs use the direct-access method of MSP/7 Symbolic File Support for access to disk data sets. The MMS System/7 realtime programs use the Basic Access Support for disk file access.

For initialization of System/7 disks, for definition and deletion of data sets, and for program loading onto System/7 disk, the MSP/7 Disk Support System (5707-SC2 or 5707-AG1) is required.

MMS S/370 Data Feature is written in IBM OS/VS and DOS/VS Assembler language and operates on a host IBM S/370 Virtual Storage system under control of the IBM Operating System (OS/VS1 or OS/VS2) or the IBM Disk Operating System (DOS/VS). For data access and data management it uses QSAM, BSAM, BDAM, and BTAM (under OS/VS) or SAM, DAM, and BTAM (under DOS/VS).

Generation of the Basic System/7 code and compilation and execution of the S/370 Data Feature can also be performed on a S/370 operating under OS/VS1, OS/VS2 or DOS/VS running under the control of VM/370.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

For execution of the MMS Basic System/7 Code, the minimum machine requirements are as follows:

IBM System/7 with:

- 1 IBM 5010 A14 Processor Module with 14,336 words of storage (for MMS without machine monitoring function and without Binary Synchronous Communications Control - BSCA) or
- 1 IBM 5010 A16 or E16 Processor Module with 16,384 words of storage (for MMS with machine monitoring function but without BSCA) or
- 1 IBM 5010 E20 Processor Module with 20,480 words of storage (for MMS without machine monitoring function but with BSCA) or
- 1 IBM 5010 E20 Processor Module with 20,480 words of storage (for MMS with machine monitoring function and BSCA).

Users of the MMS Version 1 who change to Version 2 will experience a storage increase of approximately 1K words due to increased storage requirements of MSP/7 Release 7 even if no functional extensions are installed.

Data transmission between IBM System/7 and an IBM S/370 host can be performed either by the

- Binary Synchronous Communications Control (#2074) with 1,200 to 40,800 bps.

or the

- Asynchronous Communications Control (#1610) with 600 bits/sec.

- 1 IBM 5012 A01 Multifunction Module, or

- 1 IBM 5013 A01 Digital I/O Module

One or more digital input (DI) and output (DO) groups are required if the user installs direct machine monitoring and/or digital output-driven devices, such as lamp indicator boxes. The number of DI and DO groups depends on the hardware attached and the addressing technique applied.

- 1 IBM 5022 Disk Storage Module mdl 1 or 2, with one removable disk recommended for fast exchange of full disks. Up to three IBM 5022 modules can be supported with or without Cycle Steal features (#2662, #2664).

- 1 IBM 5026 C03 Enclosure or 1K with Storage Power Addition (#7401).

- 1 IBM 5028 001 Operator Station.

IBM 2790 Data Communication System with:

- 1 IBM 2791 and/or 2793 Area Station.

The following devices can be attached to area stations:

- IBM 2796/2797 Data Entry Unit,
- IBM 1053 Remote Printer, and
- IBM 1035 Badge Reader.

The number and type of devices depend on the user's plant organization, transaction load, and plant layout.

Refer to the System/7 and IBM 2790 documentation for restrictions regarding the number of terminals attachable to the 2790 loop of System/7.

Additional input/output devices, such as the IBM 129 Card Data Recorder and the IBM 7431 Serial Printer, can be supported by MMS if appropriate user-supplied interface programs are attached to MMS user exits.

For generation of the MMS Basic System/7 Code, and for compilation and execution of the S/370 Data Feature, the minimum machine requirements are as follows (in addition to those stated above):

An IBM S/370 Central Processing Unit supported by OS/VS1, OS/VS2, or DOS/VS. Address space requirements for the virtual region or partition are as follows:

MMS V2 (cont'd)

- For generation of the Basic System/7 Code:
128K bytes for the System/7 Host Macro Assembler, ASM/7.
- For compilation of the S/370 Data Feature:
256K bytes for the OS/VS Assembler
128K bytes for the DOS/VS Assembler
- For execution of the S/370 Data Feature:
48K bytes for data set generation and for data transmission.

Any IBM Direct-Access Storage Facility supported by the operating system, Assembler, and access methods used.

If the IBM System/7 is to be connected to the host system via a teleprocessing linkage, an IBM 2701 Data Adapter or equivalent transmission control unit and PTT (Post - Telephone - Telegraph: common carrier) or IBM modems are required.

MMS system generation can also be performed at an IBM Center.

Licensing 5707-M33, MMS with OS/VS Host System: MMS consists of System/7 code required for plant monitoring and communication and of S/370 code required for MMS data set generation and teleprocessing capabilities.

The basic System/7 code offered as MMS Basic Material is assembled on a host S/370, and used on a System/7.

The S/370 code offered as MMS S/370 Data Feature is assembled, and used on a S/370.

The Basic Material (System/7 code) and the S/370 Data Feature (S/370 code) each must be licensed on a designated central processing unit (Designated CPU).

The Basic Material must be licensed on a System/7. The S/370 Data Feature must be licensed on a S/370.

TERMS and CONDITIONS: See PP Index

SYSTEM/7 PROCESS CONTROL PROGRAM (PCP/7)

5707-XN3 (using HPPF-II/OS Systems)

5707-XN4 (using HPPF-II/DOS Systems)

5707-XN5 (using System/7 Program Preparation)

PURPOSE

System/7 Process Control Program (PCP/7) is designed to provide process monitoring, supervisory control, and direct digital control of continuous industrial processes. The program executes in a System/7 and is prepared on a S/360 or S/370 using the MSP/7 Host Program Preparation Facility-II (HPPF-II) or on a System/7 using the System/7 Program Preparation Facilities (System/7 PPF). Process operator communication with the program is supported through the RPQ 7414 Interactive Console or 5028 Operator Station used as a Process Operator Console (POC) attached to the System/7. In addition, support is provided for communications to a S/360, S/370, 1800, or 1130 System operating with the appropriate Distributed System Program (DSP).

The program is tailored to specific monitoring or control applications by means of user-specified information, which is stored in tabular form in the program. All of the information required to describe each process variable is specified in this table along with the program steps which must be executed to achieve the required control action. The table (Process Variable Record [PVR] Table) is scanned on a periodic basis and each variable is then processed in accordance with the information in the table. The table is generated by specifying the pertinent parameters of each process variable through a fill-in-the-blanks procedure. The parameters specified include the symbolic variable name, such as T100 to F005; type of measurement, analog or digital; range and units of measurement; and frequency of processing.

In addition, the macro permits the user to specify digital control processing steps for a variable and also the parameters for each step. Control processing options include:

- Two types of Digital Filtering
- Control algorithm selection
- Limits and limit violation action
- Selection of output type and disposition

HIGHLIGHTS

- **Measurement Processing** - Scanning of process variables, measurement conditioning, limit checking, and alarm annunciation. Measured variables are converted to engineering units for display and calculation.
- **Direct Digital Control Processing** - Several control algorithm options, including a five-mode controller and a ratio controller. The five-mode algorithm provides standard three-term (proportional, integral, derivative) control with two additional non-linear modes. The absolute form of the algorithm is used to produce absolute or incremental output on an individual PVR basis.
- **Supervisory Control** - PCP/7 solves a difference equation that computes the appropriate change in the target of a controlled variable based both on the deviation of the current value of a primary variable from its target and on the changes in other related variables. The change to the target of the controlled variable can be staged over a period of time.
- **Setpoint Adjustment** - The ability to adjust the setpoint of an external analog controller.
- **Operator Communication** - Support for up to two RPQ 7414 Interactive Consoles or one 5028 Operator Station when used as a Process Operator Console (POC). Two console-selectable modes of information access are provided. In the operator mode, the process operator is restricted to accessing only that information with which he must be concerned. In the engineer mode, nearly unlimited information access is possible.
- **Error Analysis and Control** - The ability to detect and take control on system errors. If the System/7 configuration includes the optional 5022 disk, the PCP/7 program and data can be stored on disk and used for restart purposes.
- **Multiple Utilities** - The ability to load and dump System/7 process data in the form of the PVR table via the 5028 Operator Station.
- **Process Data Preparation** - Users specify the characteristics of their process data to the system through fill-in-the-blanks forms. APG/7, if installed on the host preparation system, not only provides forms for specifying process data, but also for specifying system characteristics.

CUSTOMER RESPONSIBILITIES

To install PCP/7 on a System/7, the user must perform the following:

- **Define the Application** - Users must first determine the scope of the application and the control strategy to be used. Also, they must identify instrumentation and cabling, including sensors and computer output stations that will interface the process with the System/7.

- **Determine System/7 Configuration** - The computer system equipment necessary to satisfy the application scope must be identified.
- **Specify PCP/7 System Generation Options** - Depending on the specific System/7 configuration and scope of application, PCP/7 will require different modules and/or will take different action within the modules. Users tailor PCP/7 to meet the needs of their specific application by a user-oriented specification procedure that identifies the equipment they have and the program options they require. This requires extensive knowledge of the application but minimal knowledge of MSP/7 and programming.
- **Prepare Any User Additions** - Any processing routines added to PCP/7 must be prepared by the user. These routines may require MSP/7 specification macros in addition to those generated by PCP/7 as a result of the specification procedure. APG/7, if used, includes a high-level procedural language facility for coding user routines. PCP/7, in turn, provides an interface that allows APG/7 or System/7 FORTRAN IV to access and modify the PVR Table. User routines that compete with PCP/7 for such System/7 resources as the disk and the host communication adapter, require special consideration. In order to ensure maximum PCP/7 performance, users should be aware of the way in which PCP/7 uses these resources and organize their additions in the complementary manner. A good knowledge of programming and MSP/7 is required for any additions.
- **Generate PCP/7 Storage Load** - This may be done using either the MSP/7 Host Program Preparation Facility II on any S/370 that meets the minimum machine requirements, or the System/7 Program Preparation Facilities on a System/7 that meets the minimum machine requirements.
- **Generate Process Variable Record Table** - The user generates the PVR Table by using fill-in-the-blanks facilities to define each measured or controlled variable. The table, once loaded into System/7 storage, can be modified online using the POC in either operator or engineer mode.
- **Load Storage Module and PVR Table** - If PCP/7 is generated on a S/370 host and the System/7 is not host-connected, both the PCP/7 program and the PVR Table must be punched onto paper tape and loaded to System/7 using the 5028 Operator Station. If the System/7 is host-connected, the storage load and PVR Table can be loaded directly from the host system. In the case of a host 1800 or 1130 System, the appropriate DSP or Disk Monitor facility is used to load System/7 object code, generated on a S/360 or S/370, to 1800 or 1130 disk storage. DSP is subsequently used to transmit a storage load to the System/7.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum IBM System/7 configuration for PCP/7 program execution is:

- One IBM 5010 Processor, mdl A14 or B14 (14K words of storage).
- One 5012 Multifunction Module with sufficient sensor-based features to measure the variables and output control signals.
- One 5026 Enclosure
- One 5028 Operator Station.

The 5012 Multifunction Module provides the following:

- As many as 32 analog input points
- As many as 128 digital input points
- As many as 64 digital output points
- One or two analog output points

This system supports a useable group of digital control functions, including five-mode control of 50 process variables. (Storage requirements increase by approximately 25 words for each control variable added.) The complete set of input processing, control processing, and console functions, requires additional storage. Selection of certain user program options, disk support, or host communication support (DSP) also increases the storage requirement.

PCP/7 provides more user-selectable processing options than are likely to be used in a single process control system. The inclusion of the full range of these options, within any one application of PCP/7, together with the disk support and host communication functions, would result in a program exceeding 22K of System/7 storage. The detailed storage requirements for system options are available in the appendix of the *IBM Process Control Program (PCP/7) Operations Guide*.

The following components allow implementation of additional PCP/7 functions:

PROGRAM PRODUCTS

System/7 PCP/7 (cont'd)

- 5014 Analog Input Module, which handles up to 128 analog inputs.
- RPQ 7414 Interactive Consoles (without buffer of character set expansion), each of which includes a TV monitor (black and white display), alphameric keyboard (block style), function keyboard and 1053 Console Printer (optional). (7414 can be located up to 2,000 feet from the System/7).
- Asynchronous Communications Control Attachment (ACCA) for host communication (except for 1130 host).
- 1130 Host Attachment for 1130 host communication.
- 5022 Disk for checkpoint and restart.
- RPQ Bipolar Analog Output in a 5012 Multifunction Module.
- 5013 Digital I/O Module which provides up to 128 digital input and 64 digital output points. (PCP/7 does not support RPQ's housed in the 5013 Module).

Application Program Generator General Information Manual (GH20-1162) ... Application Program Generator Program Reference Manual (SH20-9502)

TERMS and CONDITIONS: See PP Index

See *IBM System/7 Functional Characteristics (GA34-0003)* and *IBM 7414 Model 1 Control Unit Custom Feature Description and Physical Planning Information (GA27-2743)* for details on these components.

The minimum configuration (S/360, S/370, or System/7) needed to assemble, format, and link-edit PCP/7 is satisfied by the configuration specified for MSP/7 Host Preparation Facilities II or System/7 Program Preparation Facilities, except that PCP/7 under DOS and DOS/VS requires an address space of 40K. The user requires enough direct access storage to support three work files, an MSP/7 library, and a PCP/7 library. 65 cylinders of 2314 space, or its equivalent will suffice. For the minimum configuration specified for stand-alone System/7 program preparation, the MSP/7 Source Library Editor must be used to minimize program listing requirements. The system configuration requirements for both host and stand-alone program preparation are specified in *IBM System/7 Macro Assemblers (GC34-0018)*.

For use with the System/7 Program Preparation Facilities, an additional 5022 Disk Storage Module (mdl 1, 2, 3, or 4) is recommended if the complete MSP/7, PCP/7, and FORTRAN IV Libraries are required to remain online at all times for the user's stand-alone System/7. In this case, the additional disk storage module will provide substantial additional storage for user source and object modules and application program data files.

Since support for the 129 Data Recorder and the 7431 Matrix Printer (see RPQ D08147) is included under the System/7 Program Preparation Facilities, it is strongly recommended that these devices be used for faster and easier PCP/7 preparation.

SOFTWARE REQUIREMENTS

The modules that comprise PCP/7 are written using MSP/7 system macros and ASM/7 Assembler Language instructions. PCP/7 can be prepared on an IBM S/360 or an IBM S/370 using the MSP/7 Host Program Preparation Facility II (HPPF II) operating under OS, OS/VS1, OS/VS2, DOS, or DOS/VS, or on an IBM System/7 using the System/7 Program Preparation Facilities (System/7 PPF). Users tailor their PCP/7 system according to the IBM System/7 configuration and the PCP/7 features desired by selecting the appropriate PCP/7 specification macro parameters. The application program preparation facility uses this information to prepare an object module. This nucleus module is then combined with other PCP/7 object modules and user-written modules in object form as input to LINK/7, to produce a link-edited load module. The load module will be processed by FORMAT/7 or \$UDFMT into final executable form.

The PCP/7 load module may be loaded into the IBM System/7 using the facilities of DSS/7 if prepared using the System/7 PPF. If prepared using HPPF-II, the module may be transmitted over a teleprocessing line to the IBM System/7, or it may be punched into 8-track paper tape for input through the operator station's paper tape reader.

IBM programs that can be used in support of PCP/7 are:

Host Program Preparation Facilities II (HPPF II)	
OS	360A-TX-020, 360A-TX-026
OS/VS1	5744-AF1
DOS	360A-TX-010, 360A-TX-016

PROGRAM PRODUCTS

SYSTEM TRANSACTION GENERATOR SYSTEM (TGS/7)

5707-XR1 - Stand-Alone

5740-XR3 - Host Preparation (OS, OS/VS1, OS/VS2)

PURPOSE

TGS/7 is a System/7 - 2790 program designed to increase the user's efficiency and productivity. It provides pre-coded transaction processing modules common to most data collection applications, and will support the 2790, disk and teleprocessing facilities available to the System/7. The data collection transaction modules provided include input checking, basic calculations, disk processing, message processing, and inquiry processing.

Users interface to TGS/7 through forms. The users fill in these forms to specify the particular data collection modules they want to employ and to provide parameters for tailoring them to their application environment. The actual selecting and tailoring of these application modules is performed by facilities provided by APG/7, a prerequisite to TGS/7.

TGS/7 first edits the TGS/7 forms data for correctness. The APG/7 program generation facilities then select and tailor the specified application modules and combine them with supervisory nucleus modules to produce an entire application system of System/7 programs. For the last step, the generated programs are assembled, linked, and formatted, and the object programs are ready for loading and execution.

HIGHLIGHTS

- TGS/7 can be a significant productivity aid in installing, supporting, and modifying System/7 - 2790 data collection applications.
- The TGS/7 application prototype file provides pre-coded and tested data collection transaction processing modules.
- TGS/7 forms enable the users to select and tailor the particular modules required for their specific data collection application.
- The user need not be an MSP/7 or APG/7 programmer to install a System/7 - 2790 data collection system using TGS/7.
- The *User's Guide* provides an easy to follow sequence of steps for APG/7 and MSP/7 use.
- TGS/7 edit facilities check the forms data for correctness and guide the user in correcting form data errors when they occur.
- APG/7 is a prerequisite to TGS/7 and provides program generation, compiler, and operating system facilities.
- TGS/7 supports the APG/7 Statement of Direction in emphasizing APG/7 as the major IBM application tool for the development and installation of System/7 programs.
- TGS/7 provides the user with a growth vehicle which is compatible with APG/7.

Use: The users fill in TGS/7 forms to specify the particular TGS/7 data collection processing modules they want to employ and to provide parameters for tailoring them to their application environment. TGS/7 edits the forms data for correctness and, when errors occur, generates messages to guide the users in correcting their forms input. The APG/7 program generation facilities then select and tailor the specified TGS/7 application procedures and combine them with supervisory nucleus modules to produce an entire application system of System/7 programs.

When using the TGS/7 BSCA and ACCA support to transmit to a remote computer system, receiving and processing transmitted data on the remote system is the user's responsibility.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

An IBM 5010 processor with 20K words of storage ... one IBM 5022 Disk Storage Module mdl 1 or 2 ... IBM 5028 Operator Station... one IBM 5026 Enclosure mdl C3 ... one IBM 5013 Digital Input/Output Module (with one 2790 Control #8195).

Notes:

1. For host preparation, an IBM S/370 is also required which will support System/7 HPPF and APG/7.
2. For stand-alone preparation, an IBM 129 and 7431 are recommended for entering specification forms input data and for printing intermediate output listings.
3. For generated program execution, at least one IBM 2790 Control feature and at least one 2790 data entry device are required.
4. To determine overall device, feature, and storage requirements for specific system configurations, see the *IBM System/7 Transaction Generator System (TGS/7) User's Guide* (SH20-9511).
5. For the inclusion of online batch program preparation, add an additional 12K words of storage for the batch partition and one more 5022 Mdl 1 or 2 disk storage module. (Also, the 5026 Enclosure mdl C3 will have to be changed to a Mdl C6.)

SOFTWARE REQUIREMENTS

For TGS/7 Stand-alone, the following program system is a prerequisite:

Stand-alone APG/7 - 5707-XC1

For TGS/7 Host Preparation (OS, OS/VS1, OS/VS2), the following programming system is a prerequisite:

Application Program Generator (APG/7) - 5734-XC3

Refer to APG/7 and Stand-alone APG/7 in the program product pages for subsequent prerequisite programming systems.

When using the System/7 BSCA feature to transmit to a remote computing system, the remote system must use the following teleprocessing access methods:

For System/370:
DOS/VS - BTAM
OS/VS1 - BTAM or TCAM
OS/VS2 - BTAM or TCAM

For System/3:
System/3 MLMP

For System/7:
MSP/7 Communications Access Method

When using the System/7 ACCA feature to transmit to a remote system (S/360 or S/370 only) the remote system must use teleprocessing access methods as specified in the programming section (see System/7 Macro Library/Relocatable).

PROGRAM PRODUCTS

**5280 ASSEMBLER LANGUAGE
5708-AS1****PURPOSE**

The 5280 Assembler language provides a symbolic programming language used to write programs for the 5280 system. This program consists of an assembler and the 3740 ACL Conversion Aid program.

DESCRIPTION

Source programs written in Assembler language are processed into 5280 machine language. Input to the assembler is a source program data set. If desired, this data set may be created by entering source statements through a user-written DE/RPG or Assembler language program, or the Key Entry Utility program [included in 5280 Utilities (5708-UT1)]. Output of the assembler is an object program written to a disk or diskette data set.

Some of the features provided by the 5280 Assembler Language are:

- Mnemonic Operation Codes
- Symbolic Referencing of Storage Addresses
- Automatic Storage Assignment
- Address Displacement Calculation
- Symbolic Data Representation
- Binary and Decimal Arithmetic
- Operand Expressions
- Source Program Listing
- Cross-Reference Listing
- Error Checking and Diagnostic Messages

3740 ACL Conversion Aid Program: Assists the user in converting existing 3740 ACL (Application Control Language) programs into 5280 Assembler language. The program will not convert CRDR, CRDP, EXEC A, COMM, IF CRD or CKPT instructions. Some converted instructions may not function as on the 3740*.

* For details, see *IBM 5280 Assembler Language Reference Manual* (SC21-7790).

Input to this program is a diskette data set with ACL source code. Output is a data set containing 5280 Assembler Language source code. Assembler source code requires the 5280 Assembler Language licensed program for assembly.

Program Use During Customer Pre-installation Testing: 5280 Assembler Language (5708-AS1) will be available to customers for pre-installation testing on IBM Test Center Systems.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM 5280 Assembler will run on any IBM 5280 system which has, as a minimum, either 2 diskette 1 drives, or 1 diskette 2D drive. The IBM 3740 ACL Conversion Aid Program will run on any IBM 5280 system. Minimum main storage partition size requirements are as follows: for the 5280 Assembler - 9K; for the 3740 ACL Conversion Aid Program - 16K.

SOFTWARE REQUIREMENTS

The Assembler, Assembler object programs, and the IBM 3740 ACL Conversion Aid Program require the IBM 5280 System Control Programming (5708-SC1).

PROGRAM PRODUCTS

**5280 COBOL-OS/V5 HOST COMPILER AND LIBRARY
5708-CB1****PURPOSE**

5280 COBOL-OS/V5 Host Compiler and Library compiles on a S/370, 30XX or 4300 under VM/SP, OS/V51 or OS/V52 (MVS). Output of the compiler is a 5280 machine-language object program that will execute on a 5285, 5286 or 5288. This object program may be copied to diskette (except for VM/SP) for transfer to a 5280 system or transmitted via communications directly to a 5280 system.

DESCRIPTION

5280 COBOL provides customers with a powerful, comprehensive, easy-to-use language for use in preparation and execution of commercial application programs. The language offers a wide range of commercial features, plus facilities for handling input and output, structuring the source programs and debugging COBOL programs. 5280 COBOL allows the development of interactive applications by supporting functions that enable users to accept data from and display data on a 5280 keyboard/display.

5280 COBOL is designed for an interactive commercial environment where users can perform transaction processing applications such as order entry, as well as applications that run in a background batch environment.

HIGHLIGHTS

- Language
 - Support of American National Standard (ANS) COBOL X3.23-1974.
 - Support of 1975 Federal Information Processing Standard for COBOL.
- Extensive User Options
 - Source listings
 - Cross-reference
 - Storage map of variables
 - Statement offset listing
 - Object listing
 - Object program record size of 80 or 128 bytes
- Program Development and Productivity Aids
 - Symbolic debug
 - Flow trace
 - Extensive error checking
 - FIPS Flagger
 - Generalized CALL
 - A job-to-job facility

DESCRIPTION**I/O Capabilities**

5280 COBOL programs can work with SEQUENTIAL, RELATIVE and INDEXED I/O files.

The access methods supported are as follows:

- Sequential Organization
 - Sequential processing
- Relative Organization
 - Sequential processing
 - Random processing by relative record number
- Indexed Organization
 - Sequential processing
 - Random processing by record key using index file or in-memory index

The new COBOL Transaction I/O extension by IBM provides a set of verbs and syntax for controlling a keyboard/display. Users can write interactive programs which allow an operator to perform functions such as entering data, performing inquiries and updating files. The capability is provided for defining display formats and operator-entered fields. Field editing functions, which are a subset of the DE/RPG functions, are also available. Formats are stored within members of a partitioned data set and copied into the source program as needed.

Table Handling

Define and process fixed length tables of up to three dimensions.

Segmentation

The Segmentation feature permits:

- Dividing the Procedure Division of a COBOL program into a series of segments.
- Specifying that some segments (fixed segments) must be resident in main storage while the program is running, and cannot be overlaid, while others (independent segments) are loaded into an overlay area when needed.

- Reducing main storage requirements during program execution.

Interprogram Communication

This facility allows transferring of control from one COBOL program to another within a partition. Programs can access the same data.

Data Communications

Data communications support for COBOL is via a CALL interface to the 5280 Communications Utilities licensed program (5708-DC1) access methods.

Industry Standards

5280 COBOL is designed in accordance with the following industry standards as understood and interpreted by IBM as of January 1980.

- American National Standard (ANS) COBOL, X3.23-1974. ANS COBOL is identical to ISO 1989-COBOL, approved February 1978 by the International Organization for Standardization. The following processing modules are supported:

1 NUC 1,2
1 TBL 1,2
1 SEQ 1,2*
1 REL 0,2*
1 INX 0,2*
1 SEG 0,2
1 LIB 0,2
1 DEB 0,2
1 IPC 0,2

* RERUN clause is checked for syntactic correctness only.

The first digit above represents the level of the modules included in the compiler; the second digit represents the lowest level specified for American National Standard COBOL (0 implies that the module may be completely missing from a standard compiler); the third digit represents the highest level specified in the Standard.

In addition to the above, the following Level 2 features are also supported:

- COMPUTE statement
- Qualification
- Arithmetic operators
- Complex conditions
- CORRESPONDING phrase
- ACCEPT and DISPLAY verbs
- Multiple operand support for arithmetic statements
- Nested IFs
- Nested REDEFINES
- PERFORM UNTIL
- 01 through 49 and 88 level numbers
- LINAGE
- START verb

- December, 1975 Federal Information Processing Standard (FIPS Pub 21-1), Low-Intermediate Level. The RERUN clause is checked for syntactic correctness only. Additional support is provided for many features of higher FIPS levels.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Compilation: The IBM 5280 COBOL-OS/V5 Host Compiler and Library (5708-CB1) executes on an IBM S/370, 30XX or 4300 with at least 192K bytes of virtual storage as well as a configuration sufficient to run the selected operating system.

Object Program Execution: COBOL object programs will run on any IBM 5280 system with a minimum of 48K bytes of main storage capacity. COBOL object programs require a minimum partition size of 16K bytes. Actual partition size requirements are a function of the COBOL source program. If data communications is used, a minimum of 64K bytes of main storage capacity is required.

SOFTWARE REQUIREMENTS

IBM 5280 System Control Programming (5708-SC1) is required. The IBM 5280 Communications Utilities licensed program (5708-DC1) is required when using data communications via COBOL and will require a communications partition.

CONVERSION/COMPATIBILITY

A high degree of upward compatibility does exist between the 5280 COBOL compiler and the OS/V5 COBOL Compiler and Library (5740-CB1). However, differences do exist and some conversion will be necessary. These differences include transaction I/O support and communications support. Also, computational data will be incompatible with System/370.

IBM 5280 COBOL-OS/VS Host Compiler and Library Licensed Program Specifications (GL23-0033) ... IBM 5280 COBOL Language Reference (GL23-0031) ... IBM 5280 COBOL Programmer's Guide (SL23-0032) ... IBM 5280 COBOL Host Compilers Problem Determination Manual (SL23-0043).

RPQs ACCEPTED: No

5708-CB2 - COBOL-DOS/VSE DOS/VSE HOST COMPILER AND LIBRARY

PURPOSE

5280 COBOL-DOS/VSE Host Compiler and Library compiles on a System/370, 30XX or 4300 under DOS/VSE. Output of the compiler is a 5280 machine-language object program that will execute on a 5285, 5286 or 5288. This object program may be copied to diskette for transfer to a 5280 system or transmitted via communications directly to a 5280 system.

DESCRIPTION

5280 COBOL provides customers with a powerful, comprehensive, easy-to-use language for use in preparation and execution of commercial application programs. The language offers a wide range of commercial features, plus facilities for handling input and output, structuring the source programs, and debugging COBOL programs. 5280 COBOL allows the development of interactive applications by supporting functions that enable users to accept data from and display data on a 5280 keyboard/display.

5280 COBOL is designed for an interactive commercial environment where users can perform transaction processing applications such as order entry, as well as applications that run in a background batch environment.

SPECIAL SALES INFORMATION

The method of transferring the 5280 object modules from the host compiler to the using 5280 must be considered. The 5280 object modules may be copied to diskette for transfer to a 5280. This transfer may be directly to a 5280 or by way of communications from a device capable of reading diskettes and transmitting to a 5280. Such a device could be a 3741, 3747 or another 5280. The object modules may also be transmitted directly by the host via communications to a 5280. The 5280 Communications Utilities may be used to receive these modules. Existing data transfer programs on the host may be used. These could include those written to communicate to a 3740 or similar device. The method chosen must be capable of handling either 80- or 128-byte records.

Any of these methods may require additional features, hardware and/or programming on the host.

5280 COBOL is designed for commercial applications. Although development of interactive applications is supported, the language provides only limited transcriptive (high keying rate) key entry capabilities. Therefore, the user should be encouraged to use DE/RPG (5708-DE1) for transcriptive key entry applications.

HIGHLIGHTS

- Language
 - Support of American National Standard (ANS) COBOL X3.23-1974.
 - Support of 1975 Federal Information Processing Standard for COBOL.
- Extensive User Options
 - Source listings
 - Cross-reference
 - Storage map of variables
 - Statement offset listing
 - Object listing
 - Object program record size of 80 or 128 bytes
- Program Development and Productivity Aids
 - Symbolic debug
 - Flow trace
 - Extensive error checking
 - FIPS Flagger
 - Generalized CALL
 - A job-to-job facility

DESCRIPTION

I/O Capabilities

5280 COBOL programs can work with SEQUENTIAL, RELATIVE and INDEXED I/O files.

The access methods supported are as follows:

- Sequential Organization
 - Sequential processing
- Relative Organization
 - Sequential processing
 - Random processing by relative record number using index file or in-memory index
- Indexed Organization
 - Sequential processing
 - Random processing by record key using index file or in-memory index

The COBOL Transaction I/O extension by IBM provides a set of verbs and syntax for controlling a keyboard/display. Users can write interactive programs which allow an operator to perform functions such as entering data, performing inquiries, and updating files. The capability is provided for defining display formats and operator-entered fields. Field editing functions, which are a subset of the DE/RPG functions, are also available. Formats are stored within books of the source statement library and are copied into the source program as needed.

Table Handling

Define and process fixed length tables of up to three dimensions.

Segmentation

The Segmentation feature permits:

- Dividing the Procedure Division of a COBOL program into a series of segments.
- Specifying that some segments (fixed segments) must be resident in main storage while the program is running and cannot be overlaid, while others (independent segments) are loaded into an overlay area when needed.
- Reducing main storage requirements during program execution.

Interprogram Communication

This facility allows transferring of control from one COBOL program to another within a partition. Programs can access the same data.

Data Communications

Data communications support for COBOL is via a CALL interface to the 5280 Communications Utilities licensed program (5708-DC1) access methods.

Industry Standards

IBM 5280 COBOL is designed in accordance with the following industry standards as understood and interpreted by IBM as of January 1980.

- American National Standard (ANS) COBOL, X3.23-1974. ANS COBOL is identical to ISO 1989-COBOL, approved February 1978 by the International Organization for Standardization. The following processing modules are supported:

```
1 NUC 1,2
1 TBL 1,2
1 SEQ 1,2*
1 REL 0,2*
1 INX 0,2*
1 SEG 0,2
1 LIB 0,2
1 DEB 0,2
1 IPC 0,2
```

* RERUN clause is checked for syntactic correctness only.

The first digit above represents the level of the modules included in the compiler; the second digit represents the lowest level specified for American National Standard COBOL (0 implies that the module may be completely missing from a standard compiler); the third digit represents the highest level specified in the Standard.

In addition to the above, the following Level 2 features are also supported:

- COMPUTE statement
- Qualification
- Arithmetic operators
- Complex conditions
- CORRESPONDING phrase
- ACCEPT and DISPLAY verbs
- Multiple operand support for arithmetic statements
- Nested IFs
- Nested REDEFINES
- PERFORM UNTIL
- 01 through 49 and 88 level numbers
- LINAGE
- START verb

- December 1975 Federal Information Processing Standard (FIPS Pub 21-1), Low-Intermediate Level. The RERUN clause is checked for syntactic correctness only. Additional support is provided for many features of higher FIPS levels.

5280 COBOL-DOS/VSE Host Compiler & Library (cont'd)**SPECIFIED OPERATING ENVIRONMENT**

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Compilation: The IBM 5280 COBOL-DOS/VSE Host Compiler and Library (5708-CB2) executes on an IBM S/370, 30XX or 4300 with at least a 168K byte partition plus the GETVIS space as well as a configuration sufficient to run the selected operating system.

Object Program Execution: COBOL object programs will run on any IBM 5280 system with a minimum of 48K bytes of main storage capacity. COBOL object programs require a minimum partition size of 16K bytes. Actual partition size requirements are a function of the COBOL source program. If data communications is used, a minimum of 64K bytes of main storage capacity is required.

SOFTWARE REQUIREMENTS

IBM 5280 System Control Programming (5708-SC1) is required. The 5280 Communications Utilities Licensed Program (5708-DC1) is required when using data communications via COBOL and will require a communications partition.

CONVERSION/COMPATIBILITY

Some compatibility does exist between the 5280 COBOL compiler and DOS/VS COBOL Compiler and Library (5746-CB1). Both compilers are designed in accordance with American National Standard COBOL. The 5280 COBOL supports the 1974 standard (X3.23-1974), while the DOS/VS COBOL supports the 1968 standard (X3.23-1968). Therefore, differences do exist and some conversion will be necessary.

In addition to the above, the following Level 2 features are also supported:

- Punctuation characters, arithmetic operators and expressions, the qualifier connectives OF and IN, and series connectives
- Complex conditions
- Plurals of figurative constants
- Comparison of nonnumeric operands of unequal length
- CORRESPONDING phrase
- ACCEPT, ADD, COMPUTE, DISPLAY, DIVIDE, IF, MOVE, MULTIPLY, PERFORM and SUBTRACT verbs
- Nested IFs
- Nested REDEFINES
- 01 through 49 and 88 level numbers
- LINAGE clause
- EXTEND clause for the Sequential I-O OPEN statement
- END-OF-PAGE clause for the Sequential I-O WRITE statement
- START verb for Relative I-O and Indexed I-O
- December, 1975 Federal Information Processing Standard (FIPS Pub 21-1), Low-Intermediate Level. The RERUN clause is checked for syntactic correctness only. Additional support is provided for many features of higher FIPS levels.

IBM Extensions

- Transaction I/O: The COBOL Transaction I/O extension by IBM provides a set of verbs and syntax for controlling a keyboard/display. Users can write interactive programs which allow an operator to perform functions such as entering data, performing inquiries and updating files. The capability is provided for defining display formats and operator-entered fields. Field editing functions, which are a subset of the DE/RPG functions, are also available. Formats are stored within library source members and copied into the source program as needed.

PROGRAM PRODUCTS

5280 COBOL-S/34 Host Compiler & Library (cont'd)

- Data Communications: Data communications support for COBOL is via a CALL interface to the 5280 Communications Utilities (5708-DC1) and 5280-3270 Emulation (5708-EM1) access methods.
- COMPUTATIONAL-3 option of the USAGE IS clause: This option is specified for internal decimal items. Such items appear in storage in packed decimal format.
- COMPUTATIONAL-4 option of the USAGE IS clause: This option is specified for binary items.

SPECIFIED OPERATING ENVIRONMENT

COMPILATION

The IBM 5280 COBOL-System/34 Host Compiler and Library (5708-CB3) compiles on a System/34.

HARDWARE REQUIREMENTS

The compiler requires a minimum of 64K bytes of main storage, and will run on any model of the System/34 which has a 64K region available (i.e., model DX or larger).

SOFTWARE REQUIREMENTS

This licensed program is designed to operate with System/34 System Support Program (5726-SS1) Release 8 Modification 0 and subsequent releases and modifications unless otherwise stated.

OBJECT PROGRAM EXECUTION

HARDWARE REQUIREMENTS

COBOL object programs will run on any 5280 system. COBOL object programs require a minimum partition size of 16K bytes. Actual partition size requirements are a function of the COBOL source program. If data communications is used, a minimum of 64K bytes of main storage capacity is required.

SOFTWARE REQUIREMENTS

COBOL object programs will execute with 5280 System Control Programming (5708-SC1) Release 6 and subsequent releases and modifications unless otherwise stated. The 5280 Communications Utilities licensed program (5708-DC1) is required when using data communications via COBOL and will require a communications partition.

CONVERSION/COMPATIBILITY

A degree of upward compatibility does exist between the 5280 COBOL compiler and the System/34 COBOL Compiler and Library (5726-CB1). However, differences do exist and conversion will be necessary. These differences include transaction I/O support and communications support.

Program Use During Customer Pre-installation Testing

IBM 5280 COBOL-System/34 Host Compiler and Library (5708-CB3) will be available to customers for pre-installation testing on IBM Test Center Systems.

- Punctuation characters, arithmetic operators and expressions, the qualifier connectives OF and IN, and series connectives
- Complex conditions
- Plurals of figurative constants
- Comparison of nonnumeric operands of unequal length
- CORRESPONDING phrase
- ACCEPT, ADD, COMPUTE, DISPLAY, DIVIDE, IF, MOVE, MULTIPLY, PERFORM and SUBTRACT verbs
- Nested IFs
- Nested REDEFINES
- 01 through 49 and 88 level numbers
- LINAGE clause
- EXTEND clause for the Sequential I-O OPEN statement
- END-OF-PAGE clause for the Sequential I-O WRITE statement
- START verb for Relative I-O and Indexed I-O
- December, 1975 Federal Information Processing Standard (FIPS Pub 21-1), Low-Intermediate Level. The RERUN clause is checked for syntactic correctness only. Additional support is provided for many features of higher FIPS levels.

IBM Extensions

- Transaction I/O: The COBOL Transaction I/O extension by IBM provides a set of verbs and syntax for controlling a keyboard/display. Users can write interactive programs which allow an operator to perform functions such as entering data, performing inquiries and updating files. The capability is provided for defining display formats and operator-entered fields. Field editing functions, which are a subset of the DE/RPG functions, are also available. Formats are stored within library source members and copied into the source program as needed.

PROGRAM PRODUCTS

5280 COBOL-S/38 Host Compiler & Library (cont'd)

- Data Communications: Data communications support for COBOL is via a CALL interface to the 5280 Communications Utilities (5708-DC1) and 5280-3270 Emulation (5708-EM1) access methods.
- COMPUTATIONAL-3 option of the USAGE IS clause: This option is specified for internal decimal items. Such items appear in storage in packed decimal format.
- COMPUTATIONAL-4 option of the USAGE IS clause: This option is specified for binary items.

SPECIFIED OPERATING ENVIRONMENT**COMPILATION**

The IBM 5280 COBOL-System/38 Host Compiler and Library (5708-CB4) compiles on a System/38.

HARDWARE REQUIREMENTS

The compiler will execute on any model of the System/38.

SOFTWARE REQUIREMENTS

This licensed program is designed to operate with System/38 Control Program Facility (5714-SS1) Release 4.1 and subsequent releases and modifications unless otherwise stated.

OBJECT PROGRAM EXECUTION**HARDWARE REQUIREMENTS**

COBOL object programs will run on any 5280 system. COBOL object programs require a minimum partition size of 16K bytes. Actual partition size requirements are a function of the COBOL source program. If data communications is used, a minimum of 64K bytes of main storage capacity is required.

SOFTWARE REQUIREMENTS

COBOL object programs will execute with 5280 System Control Programming (5708-SC1) Release 6 and subsequent releases and modifications unless otherwise stated. The 5280 Communications Utilities licensed program (5708-DC1) is required when using data communications via COBOL and will require a communications partition.

CONVERSION/COMPATIBILITY

A degree of upward compatibility does exist between the 5280 COBOL compiler and the System/38 COBOL Compiler and Library (5714-CB1). However, differences do exist and conversion will be necessary. These differences include SELECT statement, I/O and communications support and a limited support of the transaction file data description specifications.

Also, some forms of computational data will be incompatible with System/38. The System/38 Source Entry Utility may be used for source entry of COBOL statements, but the syntax checking option should not be used.

Program Use During Customer Pre-installation Testing: 5280 COBOL-System/38 Host Compiler and Library (5708-CB4) will be available to customers for pre-installation testing on IBM Test Center Systems.

PROGRAM PRODUCTS

**5280 PROCEDURE CONTROL LANGUAGE
5708-CL1**

PURPOSE

The 5280 Procedure Control language is a licensed program which provides 5280 users with job stream capability and the ability to execute a program with little or no operator intervention. The licensed program consists of a control program and supporting programs. Use of this licensed program is optional for 5280 users.

HIGHLIGHTS

Control Language: The control language consists of a set of statements which are used to identify a job and its processing requirements to the system. The language provides a method of describing a job stream, together with all associated prompts and program specifications. A series of related control language statements is referred to as a 'procedure'. A procedure is used to provide control for a job or series of jobs. Control language facilities include:

- Specification of the name of the program(s) to be compiled and/or executed.
- Specification of the device from which a program is to be loaded.
- Specification of the data sets to be processed and the location of the data sets.
- Control language statement and error logging. Control language statements can be logged in order to provide a history or to provide a diagnostic aid in the event of abnormal procedure termination.
- A logical IF statement, which provides for intelligence within procedures. It is possible to execute different jobs based on tests performed within a procedure.
- Specification of default responses with optional operator override capability. Responses can be made to specific user program generated prompts or to prompts from IBM-supplied programs, such as a utility or a sort.
- Ability to provide default responses or operator-keyed responses to error messages.
- Internal subroutines and variables.

DESCRIPTION

Procedure Data Sets: Control language statements required to control a specific job or sequence of jobs are stored on a source procedure data set. The source procedure data set can be created in two ways:

1. During standard (not controlled) execution of a job, the source procedure data set can be automatically created through use of the Procedure Build Initiator Program. The data set will contain all the information required to repeat that job sequence, including all program load specifications and prompt responses.
2. The data set can be created by directly entering each control language statement via a data entry program. The data entry program can be a user-written program or an IBM-supplied program such as the Key Entry utility (part of the 5280 Utilities licensed program).

The source procedure data set must be translated into object form in order to be utilized in a 'controlled' environment. The Procedure Preprocessor program converts the source data set into an object procedure data set. The object procedure data set is used by the Controller program to control execution of a specific program or series of programs.

Controlled Program Execution: Programs running in a controlled environment execute under control of the Controller program. The Controller program provides the link between controlled programs and object procedure data sets. It detects and services requests from controlled programs. An interface to the operator is available via a set of operator commands.

In a controlled environment, the Controller program supplies program load parameters and keyboard responses. A sequence of program prompts can be answered without operator intervention. The only time an operator is required to enter input to a controlled program is when an operator response is specifically requested by a control language statement, an error occurs that is not handled by the object procedure data set, or keyboard entry is required by a data entry program such as DE/RPG.

The Controller program resides in a background partition and must remain in main storage during execution of controlled programs. Standard, 'not controlled' 5280 programs can be concurrently executed in other partitions. These programs are functionally unaffected by and do not interface with the Controller Program.

Operator Commands: The keyboard operator can communicate with the Controller Program via a set of commands. The commands allow the operator to restart or terminate procedure execution and to update system parameters such as the system date or default Controller program prompt responses.

Controlled Programs: The following IBM programs can operate under control of the Controller Program:

- 5280 System Control Programming (5708-SC1)
- 5280 COBOL Host Compilers and Libraries (5708-CB1, 5708-CB2, 5708-CB3, 5708-CB4) (object programs)
- 5280 Communications Utilities (5708-DC1)
- 5280 DE/RPG (5708-DE1) (compiler and object programs)
- 5280-3270 Emulation (5708-EM1)
- 5280 Sort/Merge (5708-SM1)
- 5280 Utilities (5708-UT1)
- 5280 Assembler Language (5708-AS1) (Assembler and object programs*)
 - * Keyboard accesses in Assembler language programs will not be controlled.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM 5280 Procedure Control Language will run on any 5280 system which has, as a minimum, 48K bytes of main storage capacity and one diskette drive. Minimum main storage partition size requirements are as follows: 6K for the Procedure Build Initiator program; 12K* for the Controller Program; 14K for the Procedure Preprocessor program. The common functions area SYSJJCFA requires 22K.

- * 12K will control one partition, with the Controller program and object procedure data sets both residing on a diskette with formats 1, 2, 4, 5, or 7 or on disk. The Controller program partition size will vary between 12K and 23K depending up on the number of partitions controlled and the diskette format used. The Controller program diskette must remain resident while the Controller program is running. See the *IBM 5280 Procedure Control Language Reference Manual* for specific requirements for the Controller program partition size.

SOFTWARE REQUIREMENTS

IBM 5280 System Control Programming (5708-SC1) is required. A customer-created IPL data set containing common function area four (SYSJJCFA) is also required. SYSJJCFA is included in this licensed program.

IBM 5280 Procedure Control Language Licensed Program Specifications (GC23-0753) ... IBM 5280 Procedure Control Language Reference Manual (SC23-0706).

RPOs ACCEPTED: No

5708-DC1 - 5280 COMMUNICATIONS UTILITIES

PURPOSE

The 5280 Communications Utilities program, used with a communications adapter feature (#2500 or #3270) consists of Communications Access Method (CAM) support, a set of communications utility programs, and an interface to the access method for communications application programs written in 5280 COBOL, 5280 DE/RPG, or 5280 Assembler language.

HIGHLIGHTS

- MULTI-LEAVING Remote Job Entry (MRJE)
- SNA Remote Job Entry (SRJE)
- Batch Data Transfer and Inquiry
- Communications Configuration and Job Description
- General support includes:
 - Communications Access Methods (CAM)
 - Systems Network Architecture/Synchronous Data Link Control (SNA/SDLC)
 - Binary Synchronous Communications (BSC)
 - Application program interface to DE/RPG, COBOL and Assembler Language
 - BSC Multipoint Monitor
 - Direct Device Support
 - Diskette Data Management
 - Concurrent Program Operation
 - Diagnostics (BSC Online Test, Trace Capability, Communications Job Statistics)

DESCRIPTION

MULTI-LEAVING Remote Job Entry (MRJE): The 5280 Communications Utilities permit a 5280 system to function as a Remote Job Entry (RJE) workstation for submission of jobs to a S/370 under OS/VS1 RES, OS/VS2 JES2, OS/VS2 JES3 or VM/370 RSCS. The MRJE Utility communicates with the host system over a point-to-point (switched or nonswitched) communication line via the Binary Synchronous mode of the communications adapter. Host system RJE programming support should be generated specifying System/3 as the supported terminal with:

- One Console (input and output)
- One Reader
- One Printer
- One Punch

Highlights of the MRJE workstation are:

- MULTI-LEAVING support permits taking advantage of concurrent 5280 device operation.
- Card I/O operation is simulated by disk or diskette storage.
- Expansion of blanks and duplicate characters may be performed to increase host output line utilization.
- Job streams can originate at the 5280 disk or diskette or keyboard.
- Punch data streams are written to disk or diskette.
- Print data streams can be directed to disk or diskette or printer.
- Supports special printer forms
- Operates with detached keyboard/display.
- Supports transmission of multivolume data sets.
- Console data streams are used for sending and receiving commands and operator messages between the 5280 and the host.
- MRJE utility control statements can be entered from the keyboard or from a disk or diskette data set.
- Job statistics are maintained which are displayed at the end of the session.

SNA Remote Job Entry (SRJE): The 5280 Communications Utilities enable the 5280 system to submit RJE jobs to a host S/370 using SNA/SDLC link protocol. The utility supports a single LU-LU session with the following host subsystems using ACF/VTAM and ACF/NCP/VS:

- OS/VS1 Remote Entry Service (RES)
- OS/VS2 Job Entry Subsystem 2 (JES2)
- OS/VS2 Job Entry Subsystem 3 (JES3)
- DOS/VSE/POWER

SRJE has the following functions available to the host system:

- One Console (Input and Output)
- One Reader
- One Printer
- One Punch

Highlights of the SRJE workstation support are:

- Job streams can originate at the 5280 disk, diskette or keyboard.
- Card I/O operation is simulated by disk or diskette.
- Job output from the host is sent to the 5280 as a print or punch data stream.
- Punch data streams are written to disk or diskette.
- Print data streams can go to the disk, diskette or printer.
- Special printer forms are supported.
- Console data streams are used for sending and receiving commands and operator messages between the 5280 and the host system.
- SRJE Utility Control Statements can be entered from the keyboard or from a disk or diskette data set.
- Job statistics for each session are maintained which are displayed at the end of the session.

Batch/Inquiry Data Transfer: The capability to perform batch data transfer and interactive inquiries with various host systems using either BSC or SNA/SDLC protocol is supplied as part of the communications utilities. These batch data transfer and inquiry utilities use the information created/maintained by the preparation utilities for program execution.

The utilities permit the user to easily transfer information over the communications line with minimum operator involvement.

Binary Synchronous Communications (BSC)

These utilities provide the interface to support data communications with S/370 models 115 to 168 and 30XX, 4331 and 4341 processors operating under DOS/VSE, VSE/Advanced Function, OS/VS1 and MVS accordingly. Attachment is through 3704/3705 with Emulation Program (EP) or the Partition Emulation Program (PEP) extension to 3704/3705 ACF/NCP/VS or the Integrated Communications Adapter for S/370, 115, 125 and 138 or the Communications Adapter of the 4331.

Using the 5280 Communications Utilities, the 5280 system appears as a:

- 3741 to CICS/VS and IMS/VS
- 3780 to VSE/POWER

The preferred 5280 support to CICS/VS and IMS/VS is SNA LU1. The 3741 line protocol of the BSC Data Communications Utility (SYSBDCU) would normally be used when replacing a 3741.

SYSBDCU is also used to interface the 5280 to DOS/VSE/POWER using 3780 line protocol.

SYSBDCU should not be considered as providing 3741 or 3780 emulation capabilities.

The 5280 system also appears as a 3741 to:

- System/3 with CCP or RPG II
- System/32 with RPG II
- System/34 with RPG II or SSP-ICF
- System/38 with RPG III or COBOL
- Series/1 RPS Version 3/4
- 3741 models 2 and 4
- 3747
- 5265
- 5280

The 5280 communications configuration utility allows the user to describe certain communication characteristics, prior to program execution, such as terminal type, terminal address and timeouts.

5280 as a Terminal (LU TYPE1) to S/370 CICS/VS and IMS/VS Using SNA/SDLC Protocols

The 5280 communicates with IMS/VS applications under OS/VS1 or MVS or CICS/VS applications executing under DOS/VSE, VSE/Advanced Function, OS/VS1 or MVS in S/370 models 145 to 168 for IMS/VS, and models 138 to 168 for CICS/VS. The 5280 communicates with IMS/VS or CICS/VS applications in 30XX, 4331

PROGRAM PRODUCTS

5280 Communications Utilities (cont'd)

and 4341 processors. Multiple (up to 4) LU-LU sessions with ACF/VTAM are supported by IMS/VS or CICS/VS.

The 5280 communications configuration utility allows the user to describe certain communication characteristics, prior to program execution, such as station address, pacing counts and Logon.

Communications Configuration and Job Description: The primary functions of the communications configuration and job description utilities are to:

- Describe the communications environment.
- Describe the transmit, receive and/or inquiry functions that make up a job.

Users of the 5280 system describe the communications jobs for execution by running easy-to-use keyboard/display prompt/response preparation utilities. The responses to the prompts are saved on disk or diskette and identified by name. The information is then supplied to the appropriate utilities at execution time to control the communication session with the remote host or terminal system.

Multiple job records may be maintained to provide communications flexibility within the 5280 system.

Disk and Diskette Support: Disk and diskette support is an integral part of the 5280 Communications Utilities. It permits users to maintain and control a disk or diskette data set(s) in a variety of ways. Included in the support is the capability to transmit and receive single and multiple data sets from/to one or more physical disk or diskette drives; to support data sets spanning one or more disks or diskettes; to allocate and write received data to a new data set, add received data to the end of an existing data set and replace received data in an existing data set.

Direct Device Support: The 5280 Communications Utilities provide direct device support as to the origin and destination of the data transferred over the communications line.

To the Line	From the Line
Data Set(s)	Data Set(s)
Magnetic Stripe Reader (for BSC support only)	Printer
Keyboard	Display

In addition, certain combinations of multiple 5280 output devices are allowed.

Application Program User Interface: The 5280 Communications Utilities provide an interface to the Communication Access Methods (CAM) for a user to write DE/RPG, COBOL or 5280 Assembler language programs. As an example, this could provide 5280 users additional communications capabilities for those applications requiring random inquiries to remote host master files with the response data processed by the 5280 application.

BSC Multipoint Monitor: The BSC Multipoint Monitor provides, for the communicating 5285 Programmable Data Station and the 5288 Programmable Control Unit residing on a BSC multipoint network, the ability to respond to host polling and selection without the requirement to have a Communications Access Method (CAM) loaded into main storage. The Multipoint Monitor resides in the common functions area.

Use of the Multipoint Monitor prevents the host from removing the 5280 from polling lists, which would thereby require reactivation at the host when communications are desired.

Concurrent Program Operation: The 5280 Communications Utilities require a minimum of two partitions: one for a Communications Access Method (CAM) and one for an IBM-supplied 5280 Communications Utility or a user communications application program.

For concurrent program operation, the system may be running other application programs concurrent with a Communications Utility. The limitation is the amount of main storage available, number of partitions and possible performance considerations.

Diagnostics (BSC Online Test, Trace Capability, Communications Job Statistics): The Communications Utilities maintain information and provide statistics on the job just executed, such as the number of input/output records processed. Additional communications information such as status indicators, counters, error logs and communications trace table is available.

Program Use During Customer Pre-installation Testing: The 5280 Communications Utilities (5708-DC1) will be available to customers for pre-installation testing on IBM Test Center Systems.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration required to support communications in a BSC network is:

AN IBM 5285 with 32K bytes of main storage capacity, the Communications Adapter (#2500) and a display size of 960 characters. Because the SNA support requires either the Elapsed Time Counter (#3610) or the Magnetic Stripe Reader Adapter/Elapsed Time Counter (#4960), the customer should carefully evaluate his future requirements when installing a BSC system.

OR:

An IBM 5288 with 32K bytes of main storage capacity, the Communications Adapter (#2500), and an auxiliary data station (5281 or 5282) with a display size of 960 characters. Because the SNA support requires either the Elapsed Time Counter (#3610) or the Magnetic Stripe Reader Adapter/Elapsed Time Counter (#4955), the customer should carefully evaluate his future requirements when installing a BSC system.

The MRJE has the same requirements as above except that it requires 48K bytes of main storage capacity on the 5285 and 64K bytes of main storage on the 5288.

The minimum system configuration required to support communications in an SNA network, including the SRJE utility, is:

An IBM 5285 with 64K bytes of main storage capacity, the Communications Adapter (#2500), a display size(s) of 960 characters, and either the Elapsed Time Counter (#3610) or the Magnetic Stripe Reader Adapter/Elapsed Time Counter (#4960).

OR:

An IBM 5288 with 64K bytes of main storage capacity, the Communications Adapter (#2500), an auxiliary data station (5281 or 5282) with a display size(s) of 960 characters, and either the Elapsed Time Counter (#3610) or the Magnetic Stripe Reader Adapter/Elapsed Time Counter (#4955).

One communications line can be connected (via the appropriate line interface) to the adapter.

Optional hardware that is available for use with the Communications Utilities is:

- IBM 5217 Printer
- IBM 5222 Printer
- IBM 5224 Printer
- IBM 5225 Printer
- IBM 5242 Printer
- IBM 5256 Printer
- 3270 Emulation Communications Adapter
- Magnetic Stripe Reader

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**5280 DE/RPG
5708-DE1**

PURPOSE

DE/RPG provides advanced data entry and associated processing capability for the 5280 system. DE/RPG uses the Data Description Specifications (DDS) form, which is also supported on the System/38. An RPG subroutine capability is included which is a subset of RPG III calculation operation codes. DE/RPG program consists of a Compiler and a Source Entry Program.

DESCRIPTION

A broad range of capability is provided to allow the user to perform jobs ranging from simple, transcriptive key entry, to high-function data entry requiring extensive editing, data set access and user-defined processing. User-defined formats, presented on the display, constitute the framework for entering data, creating a record and writing that record to a disk or diskette data set. Extensive data editing is available to maximize productivity of the data entry process and reduce the need for expensive error correction procedures. Using General Utility Specification forms and Data Description Specification forms, the user can define a data entry program by simply specifying which edits and checks are required.

DE/RPG uses DDS forms for specification of data entry formats. A format or series of formats provide the framework for a data entry job. Sequence of execution of formats is determined by job definition, operator selection, or dynamically, based on analysis of current data.

Basic function is expanded through use of the RPG Calculation Specifications. This provides the user with the capability of defining specialized routines, such as complex arithmetic calculations, array handling, device I/O operations or initiate/terminate and read/write to communications. This RPG subroutine capability can also be used to create a stand-alone batch DE/RPG program.

HIGHLIGHTS

- Display Screen Design
 - Prompts and data fields can be positioned anywhere on the screen below the status line (Line 1 of the display).
 - Multiple formats can be displayed on a single screen.
 - Display attributes for prompts and data fields include highlight, blink, reverse image, underline, nondisplay and column separators.
- High-Function Editing

Provides the capability of checking and performing operations on data as it is entered. Edits can be performed on a character, field, or record basis, and include:

 - Character check - alpha, alpha only, numeric, numeric only, signed numeric, digits only, hexadecimal
 - Mandatory enter
 - Mandatory fill
 - Data required
 - Exit key required
 - Duplication - from previous record or named field
 - Right adjust with blank or zero fill
 - Self check/generate - Modulus 10/11 or user-defined
 - Counter arithmetic
 - Automatic field insert - constant, named field or results of an arithmetic expression
 - Comparison test - compare to constant, named field or arithmetic expression
 - Substitute table data for keyed data
 - Table lookup - test for matching table entry
 - Range test - compare to constants, named fields or table entries
 - Reformat field position - resequence fields for output record
 - Set indicators on/off
 - Exit to user subroutine
 - User-written error messages
 - Crosscheck - compare values of two fields against a table to ensure valid combination
 - Sequence check - compare current value of field with previous value
 - Picture check - multiple keyboard shifts in a single data field
- Production Statistics

All DE/RPG programs will maintain production statistics on a job basis and on a station basis. Statistics that can be maintained include: Keystrokes, records, elapsed time, marked records, verify correction keystrokes, number of jobs (on a station basis).
- User-Written Subroutines

Through use of the RPG Calculation Specifications, capability is provided to create subroutines for DE/RPG programs. In addition, this capability allows the user to write a non-interactive, stand-alone DE/RPG program that can run in any partition. The operation codes available are a subset of System/38 RPG III Calculation Specification operation codes. This capability can be used for such functions as complex edit routines, extensive arithmetic calcula-

tions, master data set access and report printing. Simple read/write statements provide access to communications via a direct interface to the 5280 Communications Utilities licensed program (5708-DC1) and the 3270 Emulation licensed program (5708-EM1). Sequence of instruction execution is user-defined - the RPG 'cycle' does not apply. The following operation codes are available:

- Arithmetic and data manipulation - ADD, Z-ADD, SUB, Z-SUB, MULT, DIV, MVR, LOKUP, MOVE, MOVEA, MOVEL, COMP
- Branching - CABxx, GOTO, TAG
- Indicator testing - SETON, SETOF, BITON, BITOF, TESTB
- Subroutine operations - EXSR, BEGSR, ENDSR
- Special I/O operations:
 - Diskette - OPEN, CLOSE, READ, READP, WRITE, CHAIN, SETLL, UPDAT, DELET
 - Printer - OPEN, CLOSE, WRITE
 - Keyboard/display - EXFMT, WRITE
 - Communications - OPEN, CLOSE, READ, WRITE
 - Assembler subroutine exit - CALL
- Disk/Diskette Data Set Support

The 5280 system supports the sequential data set organization. The access methods available are: Sequential, direct by relative record number and key indexed. Data sets can be shared by multiple programs on a read or write/update basis. Concurrent update of a record by multiple programs is prevented.
- Modes of Operation

The four basic modes of operation of a DE/RPG program are:

 - Enter: Initial data entry. The record created is written to a disk or diskette data set.
 - Update: Review and modification of selected records in an existing data set.
 - Verify: Verify data in an existing data set for accuracy.
 - Rerun: Sequential processing of an existing data set performing all field edits and checks without operator intervention (that is, normal key input is bypassed).
- Special Functions

During operation of a DE/RPG program, the operator can select from a number of available special functions. These special functions include:

 - Search Data Set - locate and retrieve a record in a data set by its position within the data set, or by record content.
 - Manual Format Selection - operator selection of a format within the current job.
 - Record Insert/Delete - insert a record into or delete a record from a data set.
 - Copy - transfer a record from a data set to the current transaction data set.
 - Print - an unformatted printing of the current record.
 - Mark Field - mark a field in error to facilitate later correction.
 - Edit Release - suspend editing of a field.
- Device Support

All devices available on the 5280 system are supported by DE/RPG:

 - Disk Storage Drive
 - Keyboard/display
 - Diskette 1 drive
 - Diskette 2D drive
 - Magnetic Stripe Reader (#4950)
 - 5217 Printer
 - 5222 Printer
 - 5224 Printer
 - 5225 Printer
 - 5242 Printer
 - 5256 Printer
- DE/RPG Source Entry Program

The DE/RPG Source Entry program is used to create a DE/RPG source statement data set, which becomes input to the DE/RPG compiler. Operating through the keyboard/display, the user selects the required statement type and is prompted to enter the parameters required to complete the statement. The parameters are entered via the keyboard, the program automatically formats the statement into the form required by the DE/RPG compiler, and the record is written to disk or diskette. Three modes of operation are normally used:

5280 DE/RPG (cont'd)

- Enter Mode - for the original entering of statements for a source program.
- Update Mode - for making corrections or additions to an existing DE/RPG source statement data set.
- Verify Mode - for verifying data in an existing source statement data set for accuracy.

- Program Use

Input to the compiler is a DE/RPG source statement data set. This data set may be created by the DE/RPG Source Entry Program, a DE/RPG user-defined data entry program or the 5280 Key Entry Utility program (part of the 5280 Utilities licensed program - 5708-UT1). During compilation, a source listing is optional, and if requested, can be directed to a printer, disk or diskette. Output of the compiler is an object program data set written to disk or diskette. For object program execution, when the requirement exists for multiple operators to perform the same job, each operator must have an individual copy of the program, executing in a separate partition.

Program Use During Customer Pre-installation Testing: 5280 DE/RPG (5708-DE1) will be available to customers for pre-installation testing on IBM Test Center Systems.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The DE/RPG compiler will run on any IBM 5280 system which has, as a minimum, either two diskette 1 drives or one diskette 2D drive. The DE/RPG Source Entry Program will run on any IBM 5280 system. Minimum main storage partition size requirements are as follows: 9K for the DE/RPG compiler; 13K for the DE/RPG Source Entry program. The compiler will take advantage of additional main storage capacity if it is available.

If the user desires to maintain the elapsed time production statistic, the Elapsed Time Counter or the Magnetic Stripe Reader Adapter/Elapsed Time Counter (special features) is required as follows: For the IBM 5285 - #3610, #4955 or #4960; for the IBM 5286 - #3610 or #4955; for the IBM 5288 - #3610 or #4955.

SOFTWARE REQUIREMENTS

The DE/RPG compiler, DE/RPG object programs and the DE/RPG Source Entry Program require the IBM 5280 System Control Programming (5708-SC1). In addition, DE/RPG object programs and the DE/RPG Source Entry program have, as a prerequisite, the IBM 5280 Utilities licensed program (5708-UT1). DE/RPG object programs and the DE/RPG Source Entry program require a customer-created IPL data set, containing the common functions area SYSCFA or SYSHELP (part of the 5280 Utilities).

RPOs ACCEPTED: No

PROGRAM PRODUCTS

**5280 - 3270 EMULATION
5708-EM1**

PURPOSE

5280 - 3270 Emulation allows the 5280 Distributed Data System to appear as selected 3270 control units and devices.

HIGHLIGHTS

The operating environments supported are:

- 3270 Device Emulation under System Network Architecture/ Synchronous Data Link Control (SNA/SDLC) and Binary Synchronous Communications (BSC). The 3270 Device Emulation Utility allows the 5280 to appear as selected 3270 control units and devices to existing host applications.
- 3270 Batch Transfer - BSC. Using this utility program, the 5280 user can transmit and receive batch data over a 3270 BSC network using 3270 line protocols. An appropriate user-written program is required at the host. Only graphic data (hex characters '40'-'FF') can be transmitted.
- 3270 Program Interface - BSC. This provides an interface for a user-written program in the 5280, written in DE/RPG or COBOL, to exchange records with a user-written program in a host system using 3270 BSC protocols. Only graphic data can be transmitted.

3270 Device Emulation

Control Unit:

- The 5280 appears to the host as a 3274 model 1C Control Unit under SNA/SDLC or as a 3271 model 2 Control Unit under BSC.

Display/Keyboard:

- The 1,920-character 5281 Data Station (attached to a 5288 Programmable Control Unit) and the 1,920-character 5285 Programmable Data Station appear to a host system as a 3277 model 2 Display Station with selected features.
- Typewriter, data entry, and data entry with proof arrangement keyboards are supported. 3270 Program Function keys are supported.
- The Local Print Key function is supported in SNA/SDLC and BSC.

Printer:

- The 3270 Printer Emulation Utility allows the 5217, 5222, 5224, 5225, 5242, and 5256 Printers to appear as the 3284 model 2, 3286 model 2, or 3288 model 2 Printer in BSC, or the 3287 model 1 and 2 Printer in SNA/SDLC.

3270 BSC Batch Transfer Utility Program

- Data on a 5280 disk or diskette can be sent to (or received from) an appropriately written host application program. Only graphic data can be transmitted.
- This utility is designed for batch transfer and limits the interference to other interactive sessions on the line. As a result, transfer of a data set can take more time than a normal batch transfer operation.
- The transmission and reception of multivolume disk and diskette data sets is supported.
- Unsolicited host operator messages are handled by the 5280 display while the utility program is in operation.
- Logon to an interactive host is allowed prior to starting Batch Transfer.
- The use of a user-provided record identifying character in the data stream permits distinguishing user data from system messages.
- Fixed length, blocked or unblocked records up to 1,918 bytes are supported.

3270 BSC Program Interface

- Read/write level of interface on a logical record basis is available in an interactive mode using DE/RPG and COBOL.
- The DE/RPG or COBOL application program provides a 1,920-character Device (Image) Buffer and 4,096-character, or less, Data Stream Buffer.
- User-written programs must be provided at both ends of the communications link with careful consideration given to the application design and the characteristics of the communications subsystem.

DESCRIPTION

The 5280 - 3270 Emulation licensed program consists of the following six basic parts:

- 3270 Device Emulation Program - BSC and SNA/SDLC
- 3270 Batch Transfer Utility - BSC
- 3270 Program Interface - BSC
- Communications Access Method - BSC

- Communications Access Method - SNA/SDLC
- Communications Access Method - 3270/SRJE

3270 Device Emulation Program - BSC and SNA/SDLC

Host system communication subsystems that are supported are: S/370 IMS/VS, CICS/VS, TSO, and System/3 model 15D CCP.

Control Unit:

The 3270 Device Emulation Program allows the 5280 to appear to a host system as a 3274 model 1C (SNA/SDLC) or a 3271 model 2 (BSC) Control Unit.

Device emulation of the 3270 allows the 5280 to reside on the same communications link that supports a 3274 model 1C or 3271 model 2 Control Unit. Since this program provides data stream translation, host application programs will generally require little or no changes to support the 5280 as a 3270. Performance, however, may be degraded.

Display/Keyboard:

The 1,920-character 5281 Data Station (attached to a 5288 Programmable Control Unit) and the 1,920-character 5285 Programmable Data Station appear to a host system as a 3277 model 2 Display Station with selected features. Features not supported include: ASCII, Magnetic Stripe Reader, Light-Pen, and the Copy Command (from the host).

Certain keys are in different locations on the 5280 keyboards. The EBCDIC typewriter, data entry, and data entry with proof arrangement keyboards and the EBCDIC transmission codes are supported. Function keys on the 3277 will be mapped onto the 5280 keyboard to provide for equivalent function: that is, Field Mark, Erase Input, PA, and PF keys. Up to 24 PF keys are supported. The host initiated local copy (print) is supported for SNA/SDLC. The local print key function is supported for SNA/SDLC and BSC. The magnetic stripe reader and the light-pen are not supported.

Printer:

The 3270 Printer Emulation utility provides to the 5280 user a method of using a 5280 printer as if it were a 3270 printer. The data to be printed is transmitted from the host system. The 3270 printers emulated are 3284 model 2, 3286 model 2, and 3288 model 2 in BSC. The 3287 Printer (models 1 and 2) is supported in SNA/SDLC. Special features available on these printers are not supported.

The 5280 printers supported are the 5217, 5222, 5224, 5225, 5242 and 5256. They will print characters that match 3270 printer characters where it is physically possible. Characters that do not match will print a standard default character. Users that must print all characters exactly as on a 3270 printer can do so by using a printer with the multinational character set. Upper and lower case printing is supported on all printers and vertical forms control is supported as on the 3287 and 3288 Printers.

The Printer Emulation Utility operates in either a foreground or background partition, and a maximum of five printer emulations may be active at one time.

The printers may operate in local mode, systems mode (entirely under host control) or shared mode.

3270 Batch Transfer - BSC

The 3270 Batch Transfer Emulation Utility will enable the user to transmit and receive batch data when communicating with a host system via 3270 BSC. Record lengths can be a maximum of 1,918 bytes. Transaction IDs and how they are to be used during transmission may be specified. It is possible to transmit and receive single or multiple volume data sets containing graphic text (hex characters '40'-'FF') only. Unsolicited messages and interactive logon/logoff can also be handled. The utility executes in a foreground partition. A user program is required at the host to send or receive batch data.

3270 Program Interface - BSC

This function provides the 5280 user with a program-to-program interface that uses 3270 BSC protocols. The 5280 application program that uses this function appears to the host system as a 3271 model 2 device. Up to seven concurrent sessions are supported. Each session represents a different 3270 device address.

The user application interface for this function is through DE/RPG and COBOL. The DE/RPG support for the 3270 program interface will provide a new parameter on the DEVICE keyword. The user will specify 'COMM3270' as the device type. A file defined with this device code may be accessed from the calculation specifications using READ, WRITE, OPEN, and CLOSE operations.

The COBOL support is implemented by use of the COBOL CALL routines. A COBOL program interfaces to the 3270 CAM through library routines. Communications are initiated by activating the CALL verbs that open and close data sets and read or write records.

PROGRAM PRODUCTS

5280 - 3270 Emulation (cont'd)

BSC Considerations: Primary operation is on nonswitched multipoint communications facilities. Switched network backup (SNBU) may be utilized if the associated modems and application programs support this capability.

The following BSC host system support is provided for 5280 - 3270 Device Emulation:

- IMS/VS with BTAM under OS/VS1 or MVS
- IMS/VS with ACF/VTAM under OS/VS1 or MVS
- IMS/VS with ACF/TCAM under OS/VS1 or MVS
- CICS/VS with BTAM under OS/VS1 or MVS
- CICS/VS with ACF/TCAM under OS/VS1 or MVS
- CICS/VS with BTAM-ES or ACF/VTAM or ACF/VTAME under DOS/VSE
- CICS/VS with ACF/VTAM under OS/VS1 or MVS
- TSO with ACF/VTAM under MVS*
- TSO with ACF/TCAM under MVS*
- RSCS with VM/370 (printer emulation)
- CMS with VM/370 (display emulation)
- System/3 model 15D under CCP

* TSO does not support printers.

Notes:

1. All of the above systems (except System/3) are also supported when under control of VM/370.
2. The 3270 Batch Transfer - BSC and the 3270 Program Interface - BSC functions are not supported by IMS or CICS/VS. Support for these functions is limited to those specific interfaces described in the *IBM 5280 - 3270 Emulation Reference Manual (SC34-0384)*.

SNA/SDLC Considerations: Operation is on point-to-point switched as well as nonswitched point-to-point or multipoint communications facilities. The point-to-point switched capability is a function of the 5280 - 3270 Emulation licensed program (not a function of the 3274).

The following SNA/SDLC host system support is provided for 5280 - 3270 Device Emulation:

- IMS/VS with ACF/VTAM under OS/VS1 or MVS
 - IMS/VS with ACF/TCAM under OS/VS1 or MVS
 - CICS/VS with ACF/VTAM under OS/VS1 or MVS
 - CICS/VS with ACF/TCAM under OS/VS1 or MVS
 - CICS/VS with ACF/VTAM or ACF/VTAME under DOS/VSE
 - TSO with ACF/VTAM under MVS*
 - TSO with ACF/TCAM under MVS*
 - VSPC (Version 2 of later) with ACF/VTAM under MVS
- * TSO does not support printers.

Note: All of the above systems are also supported when under control of VM/370.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum 5280 system configuration required to support the 5280 - 3270 Device Emulation capabilities is:

An IBM 5285 with 64K* bytes of main storage capacity, the 3270 Emulation Communications Adapter (#3270), and Optional 1,920-Character Display Size (#3505). SNA support requires, in addition, either the Elapsed Time Counter (#3610) or the Magnetic Stripe Reader Adapter/Elapsed Time Counter (#4960).

OR

An IBM 5288 with 64K* bytes of main storage capacity, the IBM 3270 Emulation Communications Adapter (#3270), and an IBM 5281 Data Station with a display size of 1,920 characters. SNA support requires, in addition, either the Elapsed Time Counter (#3610) or the Magnetic Stripe Reader Adapter/Elapsed Time Counter (#4955).

Refer to the *IBM 5280 - 3270 Emulation Reference Manual (SC34-0384)* for required main storage requirements of other functions.

SOFTWARE REQUIREMENTS

The current release of IBM 5280 System Control Programming (5708-SC1) and the current release of IBM 5280 Communications Utilities (5708-DC1)

- * 96K bytes if a printer is used in conjunction with the keyboard/display

96K bytes may be required depending upon the host system network parameters effect on the SNA CAM buffer size. Refer to the *IBM 5280 - 3270 Emulation Reference Manual (SC34-0384)*.

160K bytes is required if the 3270/SRJE CAM is to be run with two utilities, (96K with one utility), such as the IBM 3270 SNA Display Emulation program and the SNA Remote Job Entry Utility (part of the 5280 Communications Utilities licensed program), executing concurrently.

COMPATIBILITY

5280 Communications Support Compatibility: The 5280 - 3270 Emulation licensed program can co-exist on a 5280 system with other non-communicating programs. Running a 3270 Emulation program concurrently with Transcriptive (that is, high keying rate) Key Entry (TKE) may degrade TKE performance.

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**5280 SORT/MERGE
5708-SM1**

PURPOSE

The 5280 Sort/Merge consists of a Sort program and a Merge program. The Sort and Merge programs support any disk and diskette data set organization supported by the 5280 system. The 5280 Merge program supports multi-volume data sets.

DESCRIPTION

The 5280 Sort program sorts a single disk or diskette data set into ascending or descending sequence.

FEATURES

- Sort parameters are entered at the keyboard or read from a 'Command' data set which contains previously recorded parameters. Use of the 'Command' data set allows easier execution of most frequently desired sort functions.
- Records are sorted by a control field which can consist of from one to six subfields from different locations of the record.
- Control fields can be sorted in ascending or descending sequence or mixed (some ascending and some descending).
- Records can be selected, omitted, or reformatted.
- An alternate collating sequence can be specified.
- Records can be in EBCDIC or ASCII code.
- Work space and data sets are automatically allocated by the program.
- The order of records with identical control fields is preserved.
- Output from the sort program will be 1 of 4 formats:
 1. Full record
 2. Address Out - A data set of 4-byte relative record numbers.*
 3. Record Subset - A data set containing user-specified data fields.
 4. Index/Key - A data set with records consisting of a key and a relative record number.* The key is a user-specified input record data field.

* The relative record number corresponds to the position of the input record in the input data set.

MERGE PROGRAM: The 5280 Merge program will combine records from two sequentially-ordered disk or diskette data sets into another disk or diskette data set. The records can be in ascending or descending order. An alternate collating sequence can be specified. Multivolume data sets are supported for both input and output. Merge parameters are entered at the keyboard or read from a 'Command' data set which contains previously recorded parameters. Use of the 'Command' data set allows easier execution of most frequently desired merge functions.

Program Use During Customer Pre-installation Testing: The 5280 Sort/Merge (5708-SM1) will be available to customers for pre-installation testing on IBM Test Center Systems.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The Sort/Merge will run on any IBM 5280 system. Minimum main storage partition size requirements for the Sort and Merge Programs is 16K. The Sort and Merge Programs will take advantage of additional main storage capacity if it is available.

SOFTWARE REQUIREMENTS

IBM 5280 System Control Programming (5708-SC1).

PROGRAM PRODUCTS

**5280 UTILITIES
5708-UT1**
PURPOSE

The 5280 Utilities provides the following utilities for the 5280 user: Initialization Utility, Clear Utility, Label Maintenance Utility, Label List Utility, Copy Utility, Print Utility, SCS/BSC (3741) Print Utility, Resource Allocation Utility, 3740 Format Conversion Utility, Compress Utility, Key-Entry Utility, System Status Utility, Menu Configuration Utility, Menu Utility and Data Set Display Utility.

DESCRIPTION

Initialization Utility Formats the diskette according to user requirements. The program will initialize diskettes 1 and 2 with sector sizes of 128, 256 or 512 bytes, and diskette 2D with sector sizes of 256, 512 or 1,024 bytes. For disk, this utility clears the data set labels and allocates additional data set label space.

Clear Utility: Performs the following functions:

- **DROP:** Clears the data set(s) in preparation for the recording of new data.
- **FREE:** Deletes the data set(s) and its header label from the disk or diskette so that space is no longer assigned to that data set.

Label Maintenance Utility: Provides the user with the capability to allocate new data sets, delete old data sets, and to modify volume and data set labels.

The following capabilities are provided:

- **ALLOCATE:** Used to establish space for a new data set on a disk or diskette.
- **DELETE:** Offers capability to either drop or free a header label.
- **MODIFY VOLUME LABEL:** Can be used to alter the Volume ID, Owner ID and accessibility field.
- **MODIFY DATA SET LABEL:** Provides the user with the capability to modify header label fields.

Label List Utility: Provides the user with the capability to display, print, or write to disk or diskette: Disk or diskette volume labels, data set labels, data set names, and data set directories.

Copy Utility: Allows the user to copy all or a portion of a disk or diskette onto the same or another disk or diskette. Multivolume data sets are supported. The following functions are provided:

- **IMAGE COPY:** Copies the entire contents of an input disk to an output disk. Copies the entire contents of an input diskette onto an output diskette. Input and output diskettes must be the same type and format.
- **VOLUME COPY:** Copies a group of data sets or the entire contents of an input disk or diskette onto an output disk or diskette. Input and output diskettes can be different types and have different formats. Deleted data sets are not copied.
- **DATA SET COPY:** Copies the contents of up to four input data sets to an output data set.
- **SPECIFY RECORD COPY:** Copies the contents of a data set between 'from-to' relative record numbers to an output data set.
- **SPECIFY KEY COPY:** Allows the user to specify by key(s) which records are to be copied.
- **SINGLE DRIVE DATA SET COPY:** Copies a data set from one diskette to another using only one diskette drive.

Print Utility: Allows the user to print all or selected records on a disk or diskette. The program provides the following options:

- Print all records in a data set.
- Print all records from a group of data sets or all data sets.
- Print all records in a data set between user-specified relative record numbers.
- Print all records in a data set matching a user-specified key(s).
- Print hexadecimal values of selected records within a data set.

Records are printed exactly as recorded on disk or diskette without reformatting or editing.

The program also provides the capability to print a data set consisting of printer output previously directed to disk or diskette. The data set must have been created from printer output (such as a DE/RPG compiler output listing) directed to a disk or diskette, or from data transmitted over a communications line, and must be a valid Standard Character String (SCS) data set with appropriate printer format control.

SCS/BSC (3741) Print Utility: Provides the following print functions:

- **Print BSC (3741 protocol) data sets** that have not undergone the Standard Character String (SCS) mapping process. The utility will perform the SCS processing and provide a halt when an invalid escape sequence is encountered.

- Print a single SCS data set which contains valid printer format control characters.
- Print a group of SCS data sets having a common forms type identified. This capability supports data sets transmitted to a 5280 in the form 'PRINTsss' or 'Asssxxxx'.

Other features of this utility include:

- Printer format information for SCS processing may be supplied from the keyboard or from a printer format record on diskette.
- Printer forms alignment option. The first line of output may be reprinted multiple times.
- Print restart capability. For SCS data sets, the operator can halt printing and restart at any point in the data set.
- Multivolume input.

Resource Allocation Utility: Allows the user to display, alter, or delete the logical device identifier and physical address of an existing entry, or add an entry to the resource allocation table. The resource allocation table contains physical device addresses with corresponding logical identifiers, and is originally built using the System Configuration Program [part of 5280 System Control Programming (5708-SC1)].

3740 Format Conversion Utility: Allows the user to convert 3740 key entry program levels into source DE/RPG jobs. This utility converts basic field definitions such as right adjust, skip, dup, bypass, self check, field totals and their associated prompts. 3740 functions that are not converted by this utility can be implemented by adding appropriate DE/RPG statements to the DE/RPG program. Input to this utility is 3740 key entry string language from a diskette data set.

Compress Utility: Permits the user to rearrange data sets to make one contiguous space out of the unused space between data sets. Deleted data sets are removed from the disk or diskette.

Key Entry Utility: Provides the capability to create formats for basic key entry functions using the 3740 key entry string language. The key entry functions are functionally and operationally similar to the 3740 for enter, update, and verify operations.

This program takes advantage of 5280 ease-of-use characteristics to provide improvements in data set allocation, searches, and production statistics. Basic 3740 key entry functions are provided, except for self check, auxdup, 'numbers only' switch, online field totals, and non-key entry functions, such as printing and offline field totals.

The 3740 string language is entered at the keyboard and the resulting formats are immediately available or may be saved on disk or diskette for later use.

This utility is intended for simple key entry with little editing. It is not a 3740 emulator.

The Key Entry Utility requires an IPL data set containing the common functions area SYSCFA or SYSHELP (part of this licensed program).

System Status Utility: Provides the user with the capability to retrieve certain system status information. Current system status can be displayed, providing information on each main storage partition. This information includes partition number, name of program currently being executed (if any), partition size, and partition type (foreground or background).

System configuration parameters, stored on an IPL data set, can be retrieved and displayed or printed. These parameters define the configuration of the system for which the IPL data set was generated, and include: System size (main storage), common function area size, printer type(s) and address(es), partition definitions (number, type and size) and type and number of keyboards.

Menu Configuration Utility: Provides the programmer with the means to create and maintain a menu for a set of programs or procedures. A menu provides a displayed list of items (for example, job descriptions) from which an operator makes a selection. Menu selection allows the operator to start a job (or procedure) by simply selecting a menu item number. This utility creates a data set which contains the menu(s) and all information necessary to access, load, and initiate execution of the associated programs and/or procedures. The data set is stored on the disk or diskette which contains the programs and/or procedures associated with the menu(s).

Menu Utility: Provides the operator with the means to display and use menus. Initial execution of this utility provides a menu containing an entry for each online disk or diskette which contains a menu data set. The operator can then select a menu for a specific set of programs and choose a specific job to be executed. The program will automatically be loaded and executed in a pre-selected background partition, the smallest available background partition, or the partition in which the Menu Utility is executing.

Data Set Display Utility: Provides the user with an easy way to review the contents of a data set. The unformatted records are presented on the display, one line per record. For records with more than 80 characters,

PROGRAM PRODUCTS

5280 Utilities (cont'd)

the user can move the display right or left to view the entire record. Up to 22 lines of records (depending on display size) are displayed on each screen. The user can scroll forward and backward through the data set. Each successive display will index through the data set a user-specified number of records.

Program Use During Customer Pre-installation Testing: The 5280 Utilities (5708-UT1) will be available to customers for pre-installation testing on IBM Test Center Systems.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM 5280 Utilities (except Volume Copy, the write-to-diskette option of the Label List Utility, and the Menu Utility) will run on any IBM 5280 System. Volume Copy and the write-to-disk or diskette option of the Label List Utility will run on any IBM 5280 System which has, at a minimum, two diskette drives. The Menu Utility will run on any IBM 5280 system which has a display size of 960 or 1,920 characters.

Minimum main storage partition size requirements are as follows: 8K for the Key Entry Utility; 9K for the Data Set Clear, Label Maintenance, Label List, System Status*, Initialization, Copy, Print, Resource Allocation, Compress and 3740 Format Conversion Utilities; 12K for the Data Set Display Utility; 16K for the Menu Utility; 20K for the Menu Configuration Utility; and 22K for the SCS/BSC (3741) Print Utility. Each of the Utilities (except Initialization, Resource Allocation, Menu Configuration, and Menu) will take advantage of additional main storage capacity if it is available.

*16K for the IPL data set option

For the Key Entry Utility, if the user desires to maintain the elapsed time production statistic, the Elapsed Time Counter or the Magnetic Stripe Reader Adapter/Elapsed Time Counter (special features) is required as follows: For the 5285 - #3610, #4955, or #4960; for the 5286 - #3610 or #4955; for the 5288 - #3610 or #4955.

CUSTOMER RESPONSIBILITIES

The user of 1130 COBOL must train system analysts, programmers and operators and maintain a Source Library if one is desirable.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

A minimum installation for compilation and execution begins with an IBM 1131, model 2B or 4B Central Processing Unit having 8,192 words of main storage plus one disk as a 1B or 5B secondary storage facility. The disk can provide residence for the Disk Monitor System, the COBOL compiler, and user-written COBOL programs. The following components are essential supporting items:

One IBM 1442 Card Read Punch, model 6 or 7

or

One IBM 2501 Card Reader, model A1 or A2

One IBM 1132 Printer, model 1

or

One IBM 1403 Printer, model 6 or 7 with the 1133 adapter device

A console typewriter is an integral member of the IBM 1131 Central Processing Unit, serving the system operator.

Utilization of Extended Computing Facilities: Providing a larger-than-minimum-sized machine installation will increase the capacity of IBM 1130 COBOL in terms of program size or program complexity, or both. Similarly, the I/O devices or the faster CPU in more extensive installations may promote faster throughput. This improved operation of the licensed program will depend on the system having components that can augment or substitute for the devices specified as minimum, as follows:

Facilities At Compilation Time

CPU with faster core storage - (2.2 msec)

IBM 1442 Card Punch, model 5, if an IBM 2501 Card Reader is installed instead of a reader/punch

IBM 2310 Disk Drive Units - up to four drives or 2311 Disk Drives - up to two drives

Facilities At Execution Time: All compilation-time devices plus a second printer. Both an IBM 1403 Printer and an IBM 1132 Printer can be used for printed output, but two 1403s or two 1132s cannot be used. A 1403 with either 120 or 132 print positions can be used.

SOFTWARE REQUIREMENTS

The IBM 1130 COBOL Compiler is written in IBM 1130 Assembler language and operates under control of the IBM 1130 Disk Monitor system, Version 2, Modification Level 9 and subsequent releases (Program Number 1130-OS-005). 1130 COBOL can be incorporated in the Disk Monitor System, at Modification Level 9, or later. The COBOL Compiler requires that the COBOL Source Statements be in card form. The user should note that statements can be stored in the Source Library on disk and COPY'd into a program when required.

DOCUMENTATION

(available from Mechanicsburg)

General Information Manual (GH20-0799)

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCT

**LINEAR PROGRAMMING SYSTEM
5711-C01****PURPOSE**

The Linear Programming System/1130 (LPS/1130) provides IBM 1130 Disk Monitor Version 2 users with a simple, easy-to-use and easy-to-understand means of solving linear programming problems. It offers many significant advantages over LP-MOSS/1130. Performance is substantially better than LP-MOSS/1130 and, in addition, LPS/1130 will take advantage of additional core storage and input-output devices. Input data for LPS/1130 are compatible with those of LP-MOSS/1130 and LPS/360.

DESCRIPTION

Mathematical optimization is any mathematical technique for determining the optimum use of various resources to attain a particular objective (such as minimum cost or maximum profit) when there are alternate uses for resources. Linear programming is the most widely used of these techniques and has been used to allocate, assign, schedule, select, or evaluate the uses of limited resources for such jobs as blending, mixing, cutting, trimming, bidding, pricing, purchasing, planning, and the transportation and distribution of raw materials and finished products.

LPS/1130 has a logical processing capacity for 500 rows on an 8K 1130, and 1,500 rows on a 16K or larger 1130. Since problem capacity is limited by disk storage space available, more than the capacity of one 2315 disk may be required to process larger problems. For example, many 500-row problems will require the capacity of two such 2315 disk cartridges, and many 1,500-row problems will require the capacity of three such 2315 disk cartridges. 2310 models B1 and/or B2 Disk Storage Drives may be utilized, or 2311 models 11 or 12 to reach maximum problem size. Problem size is also limited by the arithmetic accuracy of the 1130.

Features: Large problem capacity (500 rows on an 8K 1130 and 1,500 rows on a 16K or larger 1130) ... flexible processing control (optional conditional control of processing sequence) ... simple problem definition (easy-to-use format and extensive data maintenance functions, specifications of starting solution basis, combination of problems to form master problems) ... advanced mathematical methods—automatic interactive input scaling for accuracy, revised simplex method (product form of inverse), bounded variable feature for range (\leq and \geq) constraints and bounded variables to simplify problem description and to increase problem capacity and solution speed ... multiple pricing ... efficient triangularization inversion method for accuracy ... extensive post optimal analysis options (discrete parametric analysis for all problem data and activity-cost-bound relationships for all variables) ... extensive checking (input check for duplicate entries, solution processing check to test for need of early inversion and automatic solution check).

Use: LPS/1130 is governed by procedure control cards which specify the solution sequence. Input data may originate on cards and be stored on disk for subsequent processing. Several problems may be stored on the disk and updated, rerun, or combined. For example, a corporate model can be formed from divisional models or a total production plan from the plans for individual products.

Reports may be on cards or printer. Output options include a full solution report, a solution analysis report, and parametric analysis reports.

CUSTOMER RESPONSIBILITIES

A working knowledge of the 1130 Disk Monitor System Version 2 is recommended for installation. Since the LPS documentation is written in a tutorial fashion, little mathematical background or linear programming experience is needed.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Execution of LPS/1130 requires at least an 8K disk 1130 system and one of the following:

- IBM 1442 Card Read Punch model 6 or 7
- IBM 2501 Card Reader
- IBM 1134 Paper Tape Reader

System generation and maintenance of LPS requires at least an 8K disk 1130 system and one of the following:

- IBM 1442 Card Read Punch model 6 or 7
- IBM 2501 Card Reader and IBM 1442 Card Punch model 5
- IBM 2501 Card Reader and IBM 1442 Card Read Punch model 6 or 7

The 1130 system used to generate LPS must have at least as much core storage and at least as many logical disk storage drives as the 1130 system on which LPS will be used.

A paper-tape-only configuration may not be used for system generation and maintenance. To run the sample problem on a paper-tape-

only LPS system, the cards must be put on paper tape. To do this a 1055 Paper Tape Punch is required in addition.

Compilation of LPS source decks requires at least an 8K 1130 system and one of the following:

- IBM 1442 Card Read Punch model 6 or 7
- IBM 2501 Card Reader

LPS can use up to 32,768 words of core storage and up to three 2310-type disk storage drives or one 2311-12 disk storage drive. LPS can also use an IBM 1132 Printer, 1403 Printer, 1442 Card Punch model 5, and a 1055 Paper Tape Punch.

The recommended IBM 1130 system for good performance and easy operation includes a model 2C (16,384 core storage and one disk storage device), a 2310 Disk Storage Device model B1, a 1442 Card Read Punch model 6 or 7 (or a 2501 Card Reader) and an IBM 1132 Printer (or an IBM 1403 Printer).

LPS versions can be generated for three core sizes: 8K, 16K and 32K (K=1, 024). When executing, LPS uses almost all of the core for which it was generated, except for approximately 530 words used by the 1130 Monitor. The programs for the 16K and 32K versions use the same amount of core as the programs for the 8K version (except for several programs which use locals on the 8K version). The extra core on the 16K and 32K versions is used for larger data storage.

SOFTWARE REQUIREMENTS

The source language of LPS/1130 is primarily FORTRAN with some Assembler language routines. LPS/1130 operates under the control of the IBM 1130 Disk Monitor System Version 2.

PROGRAM PRODUCT

ELECTRONIC CIRCUIT ANALYSIS PROGRAM II
1130 (5711-EE1) - System/360 (5734-EE1)

PURPOSE

Provides a flexible and powerful tool for investigating the behavior of electronic circuits.

DESCRIPTION

The Electronic Circuit Analysis Program (ECAP) II is an integrated system for performing direct current (DC) and transient analysis of both linear and non-linear electrical networks. ECAP II provides fast computation of results, large problem size capability, model library facilities, and the ability to handle a wide variety of non-linear problems.

The ECAP II language provides flexibility in specifying the network parameters and configuration and in selecting the output variables to be displayed. Both printed and plotted formats are provided. As an aid in preparing correctly formatted input statements, extensive user-oriented diagnostic messages are printed during the input phase. This feature greatly reduces the time required to prepare valid input data and begin productive computation. Other features, such as the choice of electrical units, accuracy checks, and automatic data storage and retrieval from disk, enhance the utility of the program.

For the 1130 System, ECAP II (5711-EE1) is provided, while ECAP II (5734-EE1) functions under the IBM Operating System. Both programs require the support of the respective IBM Problem Language Analyzer (PLAN) program (see "Software Requirements").

Features

- Integrated system of programs for DC and Transient Analysis; consistent standards and conventions; single specification of network for both DC and Transient Analyses.
- Convenient, flexible, simple, and expandable language for describing the problem.
- Efficient programming techniques and computational algorithms; accurate results.
- Fast turnaround and better utilization of both user time and computer time because of extensive, user-oriented diagnostics.
- Modification, rerun, and parameter-study capabilities, including modification of topology.
- Non-linear elements which can be described by arbitrary, user-defined functions.
- Storage and retrieval of device models and circuits in the Model Library, including hierarchical (nested) model definitions.
- Large problem size capability without program changes, when additional core storage is available.
- Increased speed, accuracy and problem size through sparse matrix techniques.
- Modular construction to permit subsequent addition of user-defined computation modules and/or algorithms.

Problem Size Limits: The core storage for a problem depends on the topology of the circuit and the type and amount of input specifications to describe the circuits. These circuit variables determine the matrix and table sizes and the corresponding core storage required. The table below shows ranges for a given core storage:

System/Machine	Problem Program Core Storage	Range of Problem Size Limits
DMS/1130	16K (words)	30-100 branches
DMS/1130	32K (words)	130-400 branches
OS/360-MFT	170K (bytes)	100-300 branches
OS/360-MVT	200K (bytes)	100-300 branches
OS/360-MFT	370K (bytes)	400-1200 branches
OS/360-MVT	400K (bytes)	400-1200 branches

Throughput Timings: Timing figures below are for a typical analysis, consisting of a 30-branch circuit resulting in 27 equations. The transient analysis continues for 100 time steps and the nonlinear DC solution requires six iterations to converge. For the IBM Operating System program, a five-fold replication of the 30-branch problems is assumed:

Problem	1130	S/360 Mdl 65 (MVT)
Number of branches	30	150
Number of Equations	27	135
Core Storage	16K words	200K bytes
Throughput Timing		
DC Analysis (6 iterations)	3 minutes	4 minutes
Transient Analysis (100 time steps)	25 minutes	6 minutes

Use: By means of a flexible, easy-to-use language, users can describe their circuit, indicate the analyses to be performed, and specify the output variables to be displayed in the tabular and/or plotted formats. To assist the user in quickly correcting input format error, diagnostic messages are printed immediately during the input phase and the processing is terminated if the errors are too serious to permit a valid analysis. In this way, the time required to prepare valid input data is greatly reduced and excessive wastage of machine time is avoided.

CUSTOMER RESPONSIBILITIES

Users must have a basic knowledge of circuit theory. They must learn the ECAP II language formats and the sign conventions for network elements. They must also learn to interpret the results. The user may supply equivalent circuits for the model library. A few device models will be supplied. A knowledge of FORTRAN is required if analytical functions are to be used for element non-linearities; otherwise, tables of values or supplied functions may suffice.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

- IBM 1131 Central Processing Unit model 2C (16K core storage)
 - IBM 1442 Card Read Punch model 6
 - IBM 2311-12 Disk Storage Drive
 - IBM 1133 Multiplex Control Enclosure with #1865 Channel multiplexer feature
 - Expanded IBM 1130 System Configuration: Additional core storage and faster I/O units such as the following will improve speed and throughput.
 - IBM 1131 Central Processing Unit model 2D (32K, 3.6 microsecond cycle time) or model 3D (32K, 2.2 microsecond cycle time)
 - IBM 1442 Card Read Punch model 7
 - IBM 1403 Printer
 - Minimum Operating System Configurations: The Operating System and the Problem Language Analyzer (PLAN) Program are required. In addition to core and auxiliary storage required for the IBM Operating System and the auxiliary storage required for PLAN, ECAP II requires two million bytes of auxiliary storage and minimum problem program core storage as follows:
 - 170K partition under OS MFT
 - 200K region under OS MVT
- The user may install additional core storage and disk drives and faster I/O units for improved operational efficiency.

SOFTWARE REQUIREMENTS: None

PROGRAM PRODUCTS

**1130 CONSTRUCTION ESTIMATING PROGRAM
5711-M61**

PURPOSE

This program provides the ability for a contractor in the construction industry to produce fast, accurate cost estimates for construction projects. Summaries of estimated costs may be produced for subdivisions of work for a project and for the entire project.

DESCRIPTION

Examples from three of the 16 divisions (concrete, masonry, and steel) set forward in the AGC Manual (Uniform System for Construction Specifications, Data Filing and Cost Accounting: Title One Buildings) have been provided with this package. Linkages are provided for the remaining 13 divisions. Within each division the program permits up to 846 categories, numbered 101 to 194, 201 to 294 ... 901 to 994.

For each category to be implemented, the user will assign a unit cost for labor, material, and equipment, as required. The user will then input the dimensions from the take-off taken from the building plans and specifications for each category. In the case where the given category has a pre-assigned formula for arriving at the estimated quantity, the user will input only the appropriate dimensions. In the case where it is a one-time formula or one which the user has not as yet added to the program coding, the formula may be provided on the input card.

The program then extends the dimensions into a quantity in the pre-assigned units of measure. These quantities are accumulated on the disk by category. At a command from the user, all of these accumulated quantities are extended by the appropriate unit costs and the summary for that particular division is produced.

CUSTOMER RESPONSIBILITIES

Users should be familiar with the theory and practice of construction estimating. No programming or classroom training is required unless customers decide to alter or extend the system. In these cases, they must be familiar with the 1130 Disk Monitor System, FORTRAN, and 1130 PLAN, as well as the practice of construction cost estimating.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

- 8K disk IBM 1131 Central Processing Unit
- IBM 1442 Card Read Punch model 6 or 7
- One IBM 1132 Printer
- One IBM 2315 Disk Cartridge

SOFTWARE REQUIREMENTS: None

**1130 CONSTRUCTION COST CONTROL SYSTEM
5711-M62****PURPOSE**

The IBM Construction Cost Control System is designed to assist a construction contractor in the monitoring and control of job construction costs.

DESCRIPTION

This system receives job cost information, completed work information, and payroll information. The program processes and stores this information by job number, for jobs currently being monitored. The cost data is categorized by labor, material, equipment, and/or sub-contractor.

The system prepares payroll information, prints checks, generates cost comparisons of estimated costs versus actual costs, and prints a wide range of reports at the option and request of the user.

The contractor using this system will receive the following benefits:

Reduction of costs

- Through automatic preparation of payroll and project cost reports.
- By generation of administrative reports.
- By establishing a cost system for a project directly from the 1130 Construction Estimating Program (5711-M61), if the contractor uses that licensed program for estimating activities.
- Through improved cash flow resulting from the knowledge of current status of cost data.

Improved Business Operations

- Because of the availability of job performance reports based upon current and timely cost and completion data.
- Because of the detailed breakdown of information to depth desired by the contractor.
- Through improved accuracy and completeness of operating reports which measure actual costs against estimated costs.
- Because of early warning of pending overruns.

HIGHLIGHTS

- Programs which operate under the 1130 Disk Monitor are stored on either the payroll disk or the cost control disk.
- The disk packs are interchanged as required to provide a multiple disk pack operation on a single disk drive.
- Data filing code organizations provide for control on a three digit job or project number - a five digit item code (for example, AGC code established by the Construction Estimating Program) - an employee identification code of up to 11 characters.
- Records are maintained on disk files to provide reporting for 500 employees - 50 government projects - 2,400 subcontractor work categories - 4,800 labor work categories - 4,800 material work categories - and/or 500 equipment work categories.
- Cost control data may be reported by units of work completed or percentage of work item completed. The user may choose either of these reporting methods.
- System outputs consist of payroll checks - a certified payroll for government project reporting - union reports of hours worked - a general ledger recap - a sub-contractor report - quarterly tax schedules - W-2 forms - 941A reports - a labor comparison report - a material comparison report - an equipment comparison report - a job summary report.
- Card input consists of employee time cards - employee deduction cards - sub-contractor billing data - sub-contractor disbursement data - sub-contractor completion data - work completion data - material order and receiving data - equipment usage and rate data - project estimate data - report heading data.
- Provision for user-written FORTRAN subroutines to accommodate city and state income tax processing and to provide for system extension for user-specified functions. The licensed program provides for one state tax and one city tax computation for any reporting period.
- Easy modification of payroll check format by FORTRAN subroutine modification.

Use: The required programs are selected from the disk by entry of the appropriate //XEQ monitor control card followed by the required input data. The programs, loaded from disk by monitor, read the input data from the card reader and provide output on the card punch and line printer.

CUSTOMER RESPONSIBILITIES

The user of the 1130 Construction Cost Control System must:

- Define the data filing code structures.

- Assign cost codes.
- Provide the project cost estimate (potentially through use of the 1130 Construction Estimating Program, 5711-M61).
- Develop employee data.
- Prepare necessary government project data.
- Select the cost reporting mode (percent or units).
- Prepare labor codes and descriptions.
- Design and implement state and local tax FORTRAN subroutines where required. This requires knowledge of 1130 FORTRAN.
- Modify the check writing subroutine if desired. This requires knowledge of 1130 FORTRAN.
- The entire system is designed on the basis of (1) many program modules capable of being independently executed and (2) separation of data into six files. This design permits easier user modification of files and operating programs or extended application through additional programming.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The minimum machine configuration required to compile, execute, and maintain the program is an IBM 1131 CPU-model 4B or 2B (8K with internal disk drive), two IBM 2315 disk cartridges, an IBM 1442 card read punch, and an IBM 1132 printer.

The user may install faster card and print devices to attain faster throughput. The card punch function is required. Additional core size and/or disk drives will improve performance. A card sorter is required to sort the input decks.

SOFTWARE REQUIREMENTS

The programs are coded principally in IBM 1130 Basic FORTRAN IV with lesser use of 1130 Assembler language.

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**1130 DISTILLATION PROGRAM
5711-P71****PURPOSE**

The Distillation Program is a fast, efficient, and versatile program that solves the steady state distillation problem for a multi-feed, multi-sidedraw, multi-heat exchange column by rigorous heat and material balances.

The program provides the user a distillation computation capability normally found only in programs written for large machines. The ability to solve complex distillation problems on the IBM 1130 meets a growing need of plant operating engineers, plant technical service engineers, process designers, consultants, and students.

DESCRIPTION

The 1130 Distillation Program consists of four major sections: Physical data preparation, distillation calculations, case study driver, and report writer.

The physical data preparation section is an integral part of the distillation code and may be used in one of three mutually exclusive modes.

In the first mode ("Name" option) for a selected number of components (primarily hydrocarbons), the specification of the component name suffices to determine the liquid and vapor enthalpies from the Yen-Alexander correlations and the equilibrium data from the Chao-Seader correlations.

In the second mode, the user specifies input data coefficients of polynomial approximations to the liquid and vapor enthalpy and equilibrium data curves.

In the third mode, the user supplies required liquid and vapor enthalpy and equilibrium data in tabular form.

The distillation calculations solve the steady-state distillation column problem by rigorous heat and material balances using the Thiele-Geddes method as presented by Holland and modified by Billingsley. The program is designed to handle a highly complex column with multiple feed streams, multiple side-draws, and multiple external heat exchangers (intercoolers and interheaters).

The Thiele-Geddes method, in contrast to the Lewis-Matheson technique, is essentially an "operating column" method rather than a design method. The Thiele-Geddes method is designed to answer how a distillation column operates given the number of stages, feed stage locations, component feed rates, feed thermal condition, reflux ratio, and total bottoms rate. With these specifications, the 1130 Distillation Program will compute overhead and bottoms component product rates, vapor or liquid composition at each stage, a phase flow at each stage, and stage temperatures.

The design problem to determine the number of stages needed to accomplish a specified separation from a given feed stock is solved using the case study driver capability. This capability permits the engineer to run a number of cases which are modifications to the initial design conditions. Solution times for cases using the driver are less for all cases except the first, since each case uses the preceding solutions as its initial conditions.

A report writer lists the computed output in a standard form. It also prints out diagnostics.

The program is very efficient in terms of core storage and time for solution. The program may be normally expected to solve distillation problems for a wide variety of feed stocks including crude oil. It may also be used for a limited class of strippers and absorbers.

HIGHLIGHTS

- Up to sixty-five stages
- Up to fifteen components
- Up to a total of eight feed streams and sidedraw streams
- Up to a total of eight interheaters and intercoolers
- Three options for specifying enthalpy and equilibrium data
- Option to make enthalpy and equilibrium data dependent on composition
- Option for users to create their own component file for physical data
- Option to employ case study capability

Use: Once the program and files have been stored on the disk, the user merely inserts the disk, places 1130 Monitor control cards and the data cards in the card reader and starts the execution of the program as described in the *Program Description and Operations Manual*.

CUSTOMER RESPONSIBILITIES

Users can create their own "Name" option compounds by following the instructions in the *Program Description and Operations Manual*. If users desire to enter their own physical data via mode two, they must curve fit their enthalpy and equilibrium data according to the polynomial approximations described in the *Program Description and Operations Manual*. The distillation program accepts the coefficients after they have been determined. For mode three, the user enters the enthalpy

and equilibrium data in tabular form. The program internally curve fits the data.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

- 1 IBM 8K Disk 1131 CPU
- 1 IBM 1442 Card Read Punch or 2501 Card Reader and IBM 1442 Card Punch
- 1 IBM 1132 Printer or 1403 Printer (option)
- 1 IBM 2315 Disk Cartridge

SOFTWARE REQUIREMENTS

- Language employed is 1130 Basic FORTRAN and 1130 Assembler
- Operating system is 1130 Disk Monitor System Version 2 and all subsequent releases unless so stated in a future revision.

DOCUMENTATION

(available from Mechanicsburg)

Application Description Manual (GH20-0889).

**SUBROUTINE LIBRARY-MATHEMATICS (SL-MATH)
1130 and 1800 (5711-XM2)
S/360 and S/370 (5736-XM7) §**

PURPOSE

SL-MATH provides FORTRAN users with powerful computational tools to solve their mathematical problems.

DESCRIPTION

SL-MATH is a collection of subroutines dealing with matrix algebra and numerical mathematics. The subroutines, computational building blocks written in FORTRAN IV, operate on data that resides in main storage.

This library is an enhancement of the mathematical portion of the Type II application program, S/360 Scientific Subroutine Package (SSP).

SL-MATH provides DOS and OS FORTRAN users with the functional capabilities of the program product PL-MATH (Procedure Library - Mathematics, written in PL/1).

The subroutines included in SL-MATH can be classified into three groups:

- Subroutines taken from S/360 SSP and adapted to new conventions, but with functional capabilities and coding virtually unchanged. (Approximately 40% of SL-MATH subroutines.)
- Subroutines replacing functional capabilities of IBM S/360 SSP, now using improved algorithms. (Approximately 15% of SL-MATH subroutines.)
- Subroutines presenting new functional capabilities. (Approximately 45% of SL-MATH subroutines.)

A major objective was to select and implement algorithms that represent the state of the art in numerical mathematics.

The subroutines in this library can be applied to the solution of many problems in industry, science, and engineering. Individual subroutines, or a combination of them, can be used in the following general areas:

- Elementary array operations
- Solution of linear equations
- Eigenanalysis*
- Optimization*
- Computation of extrema of functions
- Computation of roots of functions
- Polynomial operations
- Quadrature
- Differentiation
- Interpolation*
- Evaluation and computation of transforms*
- Approximation*
- Smoothing
- Convergence acceleration
- Solution of differential equations*
- Evaluation of special mathematical functions

* Sample programs that can be used for the solution of standard problems are provided for these areas.

HIGHLIGHTS (S/360/370)

With respect to SSP, S/360/370 SL-MATH includes these additions or major modifications:

- Pseudo-random number generator.
- Solution of linear equations with sparse coefficient matrices.
- Iterative refinement of the solution of systems of linear equations.
- Solution of the general eigenanalysis problem.
- Linear programming.
- Solution of capacitated network-flow problems.
- Computation of extrema of functions.
- Computation of the roots of a polynomial with real or complex coefficients.
- Interpolation and approximation by cubic splines.
- Interpolation by exponential sums.
- Chebyshev approximations.
- Solution of systems of ordinary differential equations.
- Evaluation of special mathematical functions.

HIGHLIGHTS (1130/1800)

Compared with 1130 SSP, IBM 1130-1800 SL-MATH includes the following:

- (1) New Areas –
- Optimization
 - Computing extrema of functions
 - Differentiation
 - Interpolation
 - Evaluation and computation of transforms
 - Approximation
 - Smoothing
 - Convergence acceleration

- (2) Additions and/or Modifications in the Areas –

- Elementary array operations
- Solution of linear equations
- Eigenanalysis
- Computing roots of functions
- Polynomial operations
- Quadrature
- Solution of differential equations
- Evaluation of special mathematical functions.

Use: The user can invoke any subroutine from SL-MATH by means of the standard (FORTRAN) CALL statement, just as he does with his own subroutines.

CUSTOMER RESPONSIBILITIES

Six source files for System/360/370 and four source files for 1130 and 1800, which are stored on one reel of magnetic tape, are shipped to the user. Utility programs for installation and updating are included. The user must be familiar with the FORTRAN language.

SL-MATH is distributed on one reel of magnetic tape. It is the 1130/1800 customer's responsibility to arrange for the conversion of the tape to cards for use on their system.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS (S/360/370)

The minimum machine requirements for the compilation of SL-MATH subroutines are an IBM S/360 or S/370 that meets the requirements of the operating systems listed above and of the appropriate (lowest level) FORTRAN IV compiler.

The storage requirements for a specific problem depend on the number of the subroutines used, the size of the compiled subroutines, the size of the compiled main program, the size of the control program, and the data storage requirements.

HARDWARE REQUIREMENTS (1130/1800)

The minimum machine requirement for the compilation of SL-MATH subroutines is an IBM 1130 or IBM 1800 system that meets the requirements of the 1130/1800 Basic FORTRAN IV compiler.

The storage requirements for a specific problem depend on the number of subroutines used, the size of the compiled subroutines, the size of the compiled main program, the size of the control program, and the data storage requirements.

SOFTWARE REQUIREMENTS

The SL-MATH subroutines, written in FORTRAN IV, can be used under the following programming systems:

IBM System/360/370

- Operating System (OS)
- Disk Operating System (DOS)

IBM 1130/1800

- IBM 1130 Disk Monitor System Version II
- IBM 1800 Time Sharing Executive System, and
- IBM 1800 Multiprogramming Executive System.

DOCUMENTATION

**PROJECT CONTROL SYSTEM II/1130
PCS II/1130 (5711-XP1)****PURPOSE**

IBM PCS II/1130 provides a basic tool to aid management in the planning, supervising and controlling of project-oriented work by the critical path method. In addition to critical path analysis, the system provides capability for summarizing externally prepared resource and cost information.

For critical path networks, PCS II/1130 processes 2,000 activities, either in the form of precedence lists or, alternatively, in IJ notation. Its design allows for a simple approach to networking, but also offers many of the features normally found only in programs designed for large computers.

HIGHLIGHTS

Up to 2,000 work items (or IJ/CPM activities) are allowed ... up to 4,500 precedence relationships are permitted ... each precedence relationship can be logged ... the number of days and the starting day of the work week can be specified for each item ... for in-progress work items, progress can be assigned to both the beginning and end of each work item ... basic resource and cost summarization capability is provided ... tabular and graphic charts are available ... card or disk master files may be used ... arbitrary non-work days, in addition to regular holidays, can be incorporated into the calendar.

Use: To use PCS II/1130, the customer must describe the work items and their relationships, which constitute the project network. This data is punched into cards for entry into the 1130. Optional data, including resource and cost information, may be entered initially or during a later network updating run. Requests for a variety of output reports can be made during any type of PCS II/1130 computer run.

CUSTOMER RESPONSIBILITIES

All users should be familiar with the various features of this system before attempting to use it for actual project control. New users will need a knowledge of the fundamentals of the critical path technique, including precedence list concepts, before they can prepare input. Networks generated under PCS II/1130 Version 2 can be reformatted and updated under PCS II/1130.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

- An IBM 8-disk 1131 with an IBM 2315 Disk Cartridge.
- An IBM 1442 Card Punch or an IBM 2501 Card Reader in conjunction with an IBM 1442 Card Punch.
- An IBM 1132 or 1403 Printer.

SOFTWARE REQUIREMENTS

PCS II/1130 is written in both 1130 FORTRAN and Assembler language and runs under the 1130 Disk Monitor System Version 2. While the program is designed to meet the needs of most users without modification, it is recognized that special individual requirements do arise. Therefore, the elements of the program written in FORTRAN include those that the user is most likely to modify to suit his own application.

DOCUMENTATION

Introduction to PCS II/1130 (GH20-0878).

TERMS and CONDITIONS: See PP Index

1130 CONTINUOUS SYSTEM MODELING PROGRAM II 5711-XS1

PURPOSE

The IBM 1130 Continuous System Modeling Program II (1130 CSMP II) provides a versatile means for digital simulation of continuous systems or processes. It uses a block-oriented input language familiar to engineers and scientists. By means of the console keyboard and output devices, 1130 CSMP II provides the user with an online interactive mode of operation while developing and testing continuous system models. The simplicity of the language statements and console procedures enables a user to become rapidly proficient with the program.

DESCRIPTION

The 1130 CSMP II is based upon the earlier PACTOLUS program for the IBM 1620 and its adaptation, 1130 CSMP, for the 1130 Computing System. 1130 CSMP II permits even larger models, faster runs, and greater ease-of-use. It also uniquely combines Interpretive and Compiler modes of operation (both completely interactive) to provide a balance favoring flexibility during model development and execution speed for parametric studies after the model is perfected.

For many types of investigation, 1130 CSMP II obviates any requirement for an analog computer facility. Indeed, both the design and implementation of a simulation study are considerably simpler with this system than with an analog computer. There is a corresponding significant savings in project time and expense.

1130 CSMP II requires limited knowledge of computer programming or operation and limited proficiency with machine operating procedures. A limited knowledge of FORTRAN is required for the definition of Special elements; such knowledge is not required to use an element once defined.

This program is classified as a "digital analog simulator". It provides a complement of functional elements similar to those of the analog computer and a block-oriented language to specify their interconnection. Included in its complements of functional elements are all those common to analog simulation. Additionally, it includes a group of special elements for which the user may define the functional relationships, thus adapting the language to specific needs. Users develop the block diagram showing the interconnections of the elements required to implement their model. 1130 CSMP II permits models consisting of up to 99 blocks and up to five function generators. Since its elements are generally more versatile than their analog computer counterparts, the problem-solving capacity of the program approximates that of a medium size analog computer facility.

Although 1130 CSMP II was developed specifically for continuous simulation, it has the capability of addressing a broad scope of mathematical problems involving initial value differential equations.

HIGHLIGHTS

- A block-oriented input language familiar to the engineering and scientific user.
- A library of 25 standard functional element types common to analog simulation.
- The ability to define special functional elements with characteristics pertinent to a particular field of study.
- Up to 99 functional elements including up to five function generators can be incorporated in each model.
- Input statements may be entered via punched cards as well as the console keyboard.
- Provisions for extensive online man-machine interaction during model development and model simulation, including the ability to interrupt a run, enter modifications and then proceed with the run from the point of interruption or initiate a new run.
- Instructional messages to guide user through model development and model simulation procedures in online mode.
- Diagnostic messages to facilitate online correction of errors.
- An Interpretive mode for flexibility during model development.
- A Compiler mode for faster runs after model configuration is perfected.
- Optional output of updated problem deck to facilitate simulation reruns.
- A print-plot of simulation results on console typewriter or high speed printer.
- A smooth-plot of simulation results on on-line plotter.

1130 CSMP II Compared to 1130 CSMP: 1130 CSMP II offers improved performance, extended capability, and simpler operation than its predecessor, 1130 CSMP. Specifically the new features include:

- Compiler mode for faster runs once the model configuration is completed. Runs are up to three times faster than in the Interpretive mode.

- 1130 CSMP II supports high speed line printers thereby significantly improving throughput speed over the console keyboard.
- The maximum number of functional elements which can be incorporated in a single model has been increased from 76 to 99, allowing the user to model larger problems.
- The maximum number of function generators which can be incorporated in a single model has been increased from three to five, thereby permitting the user to model more complex problems.
- The instructional and diagnostic messages have been significantly expanded and improved.
- 1130 CSMP II enables 1130 CSMP users to run existing models with little or no modification.

Use: Each functional element is identified by both a block diagram symbol and a language statement. After developing the block diagram, the user translates it into the corresponding set of 1130 CSMP II statements. A most important feature is the option of entering these language statements either by way of punched cards or directly from the console keyboard. When introducing a problem in the online mode, the users are provided with automatically typed instructions which guide them through the procedures.

During a run, users have the ability to interact with the model as directly and spontaneously as they would on an analog computer. This interaction is accomplished by means of the console switches and keyboard, again with the aid of typed instructions.

Model development is performed using 1130 CSMP II in its Interpretive mode. This permits flexibility in modifying the configuration of the model. When satisfied with the configuration, the user may elect to operate using the Compiler mode of 1130 CSMP II. In this mode all the previous options are available except that of further modification of configuration. Runs are up to three times faster, however, than in the Interpretive mode. This feature is of particular value with parameter studies requiring lengthy run sequences.

CUSTOMER RESPONSIBILITIES

- A thorough understanding of the principles of continuous system modeling.
- Complete definition of system model.
- Data to be used as input to the model.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

An 8K disk IBM 1131 Central Processing Unit ... IBM 1442 Card Read Punch or 2501 Card Reader and IBM 1442 Model 5, 6, or 7 ... IBM 1132 Printer or 1403 Printer model 6 or 7. The IBM 1627 Plotter is optional but highly desirable for this type of online experimentation.

SOFTWARE REQUIREMENTS

IBM 1130 CSMP II operates under Version 2 of 1130 Disk Monitor System and uses FORTRAN IV source language.

PROGRAM PRODUCTS

**CUSTOMER INFORMATION SYSTEM
APPLICATION DESIGN SERVICE
5712-AAA with feature #9096**

PURPOSE

Customer Information System Application Design Service (CIS ADS) is a special installation service to support the marketing and the installation of the Customer Information System concept to public utility customers. This service provides utility customers with a standardized solution for the CIS application along with planning assistance that helps utility customers understand this solution. The service includes a description and planning guide ... design specifications ... planning assistance.

DESCRIPTION

CIS Description and Planning Guide: The first component of the CIS is the description and planning guide. This guide is available at no charge and provides public utility customers with broad information about the CIS application with an overview of the standardized solution.

It includes a definition of the CIS application and its subsystems, a description of the application requirements and topics that address economic and implementation considerations. The guide is designed to encourage utilities to investigate and evaluate CIS and to provide the basic information required to carry out a study of the application.

CIS Design Specifications: The second component of CIS is the design specifications.

The specifications provide public utility customers with a standardized, specific design for the Customer Information System. The specifications expand the application solution previously outlined in the description and planning guide. The guide provides a basic set of requirements that must be addressed by the CIS application; the specifications offer a design that satisfies this set of requirements.

The specifications provide a complete design solution for the most important elements of the Customer Information System. In doing this, the design includes a detailed description of how CIS performs its functions and specifies the overall system architecture, subsystem design, terminal displays, data base, programming techniques and implementation considerations.

This standardized design solution is tailored by the individual utility company for its own requirements before the subsystems are programmed. This is directed at reducing the time and effort normally expended in the implementation of these systems.

CIS Planning Assistance (for base order only): As part of CIS, utility customers are provided with five contiguous days of on-site assistance from a person who is knowledgeable in the standardized CIS solution described in the CIS specifications. The assistance helps customers understand their standardized solution as presented. This includes assistance in understanding the application documentation and its organization, reviewing the fundamentals of the application design and suggestions for establishing an implementation plan for the development of CIS.

HIGHLIGHTS

- Access of customer account information by account identifiers (account number, service address, customer name or meter number).
- Inquiry paging to access additional customer information.
- Fill-in-the-blanks technique for service order entry with operator guidance for required fields.
- Generalized editing modules to validate and have corrected all orders as they are entered.
- A file maintained for pending service orders and other customer activity with the ability to indicate on terminal displays that these orders exist, and modify and enter completion information for these orders.
- Process all service outage, priority or trouble calls and enter them into the system.
- Trouble order crisis status maintained and design provided for printing trouble orders when they are entered.
- Schedule orders by date, considering customer requirements and available manpower.
- Efficient method of assigning and dispatching field orders provided, and display summary of workloads by day, area or order type.
- Batches of cash and meter readings accepted and balanced, and transmitted to central processing location.
- Data base design for VSAM.
- 3270 displays for all five subsystems using dual intensity screen, protected data fields, readmodified data only, selector light-pen, program tab and large 1920 character screen.
- The capabilities of CICS used to provide file management support ... multi-tasking environment ... terminal management ... storage

management ... data management ... program management services ... time management.

- The design compatible with DOS/VS and OS/VS.

Highlights of CIS ADS Feature: The CIS feature includes the services described above for the base product and is expanded and enhanced to include:

- Addition of all design specifications required for a customer to develop and implement CIS using DL/I data base control rather than native VSAM. Major additions include DL/I data base design, module specifications and input/output specifications. See section on Customer Responsibilities, pertaining to Customer Accounting System (CAS) processing.
- Conversion of all CIS modules from CICS macros to the new CICS High Level Programming Interface (HLPI) command language.
- Update of design information regarding recovery/restart and scratch pad usage to take advantage of CICS/VS Version 1 Release 4.0. Paging design to allow multiple pages within a generalized inquiry page (subpaging).
- Display design changes to improve content and format recommendations.
- Paging design to provide a subpaging capability and to speed processing time of a generalized inquiry.
- CIS activity file record key changes to allow use of the account number and the order control number rather than the account number and the order sequence number.
- Redesign of the trouble order subsystem so that the crisis status can be maintained for multiple service areas rather than for the whole system.

CUSTOMER RESPONSIBILITIES

To implement the Customer Information System successfully, users must:

- Acquire knowledge and understanding of the design solution in the CIS ADS from the documentation and the on-site planning assistance.
- Tailor the data base and terminal formats to meet their requirements.
- Standardize service addresses and customer names to satisfy index to customer master file requirements.
- Tailor the subsystem modules to meet their requirements.
- Program test, and debug modules.
- Develop operator training manual and train terminal operator in the operation of the 3270 Display Station.
- Secure and generate CICS/VS and be knowledgeable in its operation and functional characteristics.
- If the feature is being used, secure and generate applicable DL/I data base facility and be knowledgeable in its operation and functional characteristics.

This feature assumes implementation based on periodically loading the CIS DL/I customer master data base and daily updating of this data base with changes which reflect the processing of the sequential batch Customer Accounting System (CAS), which is non-DL/I based.

Before using the CIS DL/I data base for batch CAS processing, customers must determine the applicability in their own specific environment of updating a DL/I data base in place for CAS.

- Be knowledgeable in the characteristics of the applicable operating system environment and its data management facilities, including the applicable access methods.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum machine requirement is an IBM S/370 processor operating with OS/VS1, OS/VS2 or DOS/VS. The applicable S/370 and partition or region size will vary from customer to customer depending on the functions included and the size of the terminal network.

DASD space is required for the customer master file, indexes, support files, the program libraries and the system control program requirements.

Also required is the 3270 Information Display System with appropriate control units (local or remote). The design assumes the use of a 1920 position display screen and 12 program function keys. The field order dispatching subsystem assumes the use of the selector light-pen.

PROGRAM PRODUCTS

CIS/ADS (cont'd)

SOFTWARE REQUIREMENTS

The CIS ADS feature #9096 is designed to work with either CICS/DOS/VS or CICS/OS/VS, Version 1 release 4, and all subsequent releases and modification levels, unless otherwise stated. The DOS/VS or OS/VS requirements are the same as those for CICS/VS. The CIS ADS support of CIS DL/I data bases is designed to work with CICS/VS. CICS/OS/VS provides access to the DL/I facilities of IMS/VS. CICS/DOS/VS application programs can access DL/I data bases by using the interface to DL/I DOS/VS. The CIS ADS may be programmed in any of the programming languages supported by CICS/VS. (See CICS/VS pages for details.)

TERMS and CONDITIONS: See PP Index

**SYSTEM/38 BASIC
5714-BA1****PURPOSE**

System/38 BASIC, which includes both an interpreter and a compiler, is a high-level interactive programming language for use in problem solving and commercial application areas. The language provides the ease-of-use characteristics associated with BASIC, while providing System/38 functions, such as the use of externally described files in programs, and a CALL statement to access programs written in other languages on the System/38.

HIGHLIGHTS

- Compile commands provided (one each in BASIC and System/38 Control Language) to compile BASIC source.
- Ability to CALL another program, such as a compiled BASIC, RPG III, COBOL, or CL program, from any BASIC program or procedure.
- Externally described files (data base, display, and printer) can be used in BASIC programs.
- BASIC command provided to list variables in an externally described file.
- Binary floating-point with the representations for Positive Infinity, Negative Infinity and Not-a-Number provided.
- Integer data type support.
- SYSTEM command, which allows access to authorized System/38 CL commands from within the BASIC session.
- Function provided in SEU to enter and syntax-check BASIC source.
- Extensive HELP facility.
- System/38 Debug function provided for on compiled BASIC program.
- Support for 40-character variable and label names.
- Following matrix operations supported:
 - Assignment (scalar, array)
 - Addition
 - Subtraction
 - Multiplication
 - Scalar multiplication
 - Setting of all elements to zero
 - Ascending and descending array sort
 - Setting of all elements to a constant
 - Creation of an array of index elements that specifies ascending or descending sequence of the data associated with each index element
- Default BASIC source file provided at installation.
- Support for 7-dimension arrays.
- Parameter on LISTP command provides cross-reference source listings.
- Support for System/38 data areas and local data areas.

DESCRIPTION

System/38 BASIC consists of an interpreter for interactively entering, debugging, and running BASIC source programs or procedures. Each line of code is syntax-checked upon entry. In the interpreter mode, program execution can be interrupted, variables examined and changed, and execution resumed. A compiler is provided for those applications which need the performance advantages of compiled code. Source for programs and procedures may also be entered through SEU, with each statement syntax-checked and saved in a source file for later execution or compilation.

A CALL statement is provided, which allows a call to a compiled BASIC program or programs written in other System/38 supported languages such as CL, RPG III, or COBOL. The CALL statement may be issued in interpretive or compiled BASIC programs. A CALL command allows a call to a compiled program from a BASIC procedure or from the interactive session display when in immediate execution mode.

Externally described files may be accessed by BASIC programs (either data base files, display files, or printer files). The files, defined using System/38 Data Description Specifications, may be created specifically for use by the BASIC program or may be a file also used by other languages. BASIC automatically appends a \$ to all character-defined field names of externally defined files. This allows files previously described for existing programs to be used by BASIC programs. Two BASIC commands, LISTFMT and LISTFMTP, are provided to allow the user to display or print the variables in an externally described file.

To execute authorized System/38 CL commands without having to terminate the BASIC session and enter System/38 command mode, the user may use the SYSTEM command. The SYSTEM command may be used in a BASIC procedure or from the interactive session display when in immediate execution mode.

The BASIC HELP facility provides a brief description and guide to proper syntax for commands, statements, and intrinsic functions in BASIC. HELP may be accessed by pressing the HELP key, using the HELP command, or pressing Command Key 4 (CF4). Pressing the HELP key or using the HELP command with no parameters presents the user with the primary HELP menu. If the cursor is placed on a statement or command when CF4 is pressed, the HELP text for that statement or command will be presented to the user.

A sorted cross-reference listing may be printed by using an option on the LISTP command. The list cross-references the line numbers, labels and variable names used in the program. The variable names obtained from an externally described file will be included. The listing can assist in program documentation and debugging.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, selecting and training personnel, installing System/38 licensed programs, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The minimum configuration under which this program was designed to operate is:

- IBM 5381 System Unit (any model).
- One IBM 1920-character display from the IBM 5250 Information Display System.

SOFTWARE REQUIREMENTS

The IBM System/38 BASIC licensed program is designed to operate under the control of the IBM System/38 Control Program Facility (5714-SS1), Release 5.0.

Program Use During Customer Pre-installation Testing: IBM System/38 BASIC (5714-BA1) is available to customers for pre-installation testing on IBM Test Center Systems in accordance with IBM's Program Testing Policy.

DOCUMENTATION
(available from Mechanicsburg)

IBM System/38 BASIC Licensed Program Design Objectives (GC21-9044).

RPQs ACCEPTED: No

**SYSTEM/38 COBOL
5714-CB1**

PURPOSE

IBM System/38 COBOL, a licensed program, operates under the IBM System/38 Control Program Facility. The program consists of:

- Compiler
- Command for Invoking the Compiler
- Source File for COBOL Source Statements
- Compilation Message File
- Syntax Checker (for Source Entry Utility)

HIGHLIGHTS

System/38 COBOL provides high-level COBOL function, significant functional improvement beyond the System/3 COBOL, extensions for data base and workstation support, and enhanced programmer services.

High-Level Function

- ANS 74 Standard
- Functions in addition to those available with
 - System/3 COBOL
 - System/34 COBOL

Extensions for Data Base and Work Station Support

- Externally Defined Data and Display Device Definitions
- Data Base File Extensions
- Subfile Extensions
- Workstation Extensions
- Local/Remote Work Station Transparency

Programmer Services

- Enhanced Documentation
- Batch and Interactive Syntax Checking
- New Compiler Features

High-Level Function

- Industry Standards: IBM System/38 COBOL is designed according to the specifications of the following industry standards as understood and interpreted by IBM as of June 1980.
 - American National Standards (ANS) COBOL, X3.23-1974. ANS COBOL is identical to ISO 1989-COBOL, approved in February 1978 by the International Organization for Standardization. IBM System/38 provides the following ANS processing modules:

2 NUC 1,2	Nucleus
2 TBL 1,2	Table Handling Module
2 SEQ 1,2	Sequential I/O Module (Note 2)
2 REL 0,2	Relative I/O Module (Note 2)
2 INX 0,2	Indexed I/O Module (Notes 2 and 3)
2 SRT 0,2	Sort/Merge Module
2 SEG 0,2	Segmentation Module
2 LIB 0,2	Library Module
2 DEB 0,2	Debug Module
2 IPC 0,2	Interprogram Communication Module

Notes:

1. The first digit above represents the level of the modules included in the System/38 COBOL compiler; the second digit represents the lowest level specified for ANS COBOL (0 implies that the module may be completely missing from a standard compiler); the third digit represents the highest level specified in the Standard.
2. The RERUN clause is treated as a comment.
3. System/38 does not support the ALTERNATE RECORD KEY clause.
 - December 1975 Federal Information Processing Standards (FIPS PUB 21-1), Low-Intermediate.
- Additions: In addition to the standard language, the following additional features are provided:
 - Optional use of apostrophes instead of quotes.
 - Extended data types of computational-3 (packed) and computational-4 (binary).
 - SET condition name to TRUE.
 - SET mnemonic name to ON/OFF.

The System/38 COBOL compiler provides the user with significant increase in function beyond the System/3 COBOL and some functions in addition to those available with System/34 COBOL.

Enhancements beyond the System/3 COBOL include:

- COBOL SORT/MERGE verbs are supported for multiple input files. More than one sort/merge is allowed in the same program.
- Nested IF statements are supported.
- ADD, SUBTRACT, and MOVE CORRESPONDING are supported. These operations allow a reduction in the number of instructions required to edit group items for printing or data conversion of group items.
- Support for abbreviated combined relations will allow users to code implied subjects and operands such that the following statement will be valid:
IF A = B, OR C . . .
- Substring capability has been added so the user can use the verbs STRING and UNSTRING to combine or take apart fields respectively. These powerful instructions are useful in text processing.
- Table processing has been enhanced to support the ASCENDING/DSCENDING options and the SEARCH (sequential search) and the SEARCH ALL (binary search) functions.
- Variable length tables are also supported by the OCCURS DEPENDING ON option. This allows the user to restrict table searches to valid data only and thus save processing time.
- The INSPECT verb replaces the 1968 level EXAMINE. The function has been enhanced to allow use of multiple characters.
- File processing support has been expanded in the following areas:
 - Record DELETE option is supported.
 - Add to sequential files is supported via the OPEN EXTEND option.
 - START verb supports partial key values which will allow the user to do generic searches on indexed files.
 - Optional files allow the user to continue to run even if some of the files do not exist.
 - DYNAMIC ACCESS option allows a user to process the same file both sequentially and randomly without having to define the file more than once.
 - User can specify top and bottom margins for a printer file.
 - FILE STATUS function allows the user to interrogate the result of a file operation.
 - USE after STANDARD ERROR/EXCEPTION allows the user to combine error/exception logic in one section of the program.
- The level 88 value clause supports multiple values. The THROUGH option also allows users to do range checking easily.
- Multiple result fields in arithmetic statements are supported.
- The REMAINDER option of the DIVIDE is supported.
- The RENAME capability has been extended with:
 - Level 66 items
 - THROUGH option
- The edit character of '/' is allowed.
- The COPY function has been enhanced to support the REPLACING option. This will allow users to replace copied character strings, either entirely or partially, to fit the requirements of the source program.
- The 1974 debug module is supported. This gives the user a special group item called DEBUG-ITEM which can be processed at desired debug points in the program. This support also includes both compile and execution time switches for suppression of the debug function.

Functions in addition to those available with System/34 COBOL include:

- 96-column card support
- Diskette support
- Tape support
- Dynamic CALL and CANCEL function which permits improved flexibility in interprogram communication.
- USE FOR DEBUGGING on identifier or file name which extends the COBOL debugging capability.

System/38 COBOL is highly compatible with System/34 COBOL (5726-CB1, Release 5). For batch functions and most workstation functions, source changes are not necessary before compiling on the System/38.

System/38 COBOL permits a COBOL program to call or be called by a program written in System/38 CL, System/38 RPG III, or System/38 COBOL.

Extensions Supporting Data Base and Work Station Processing

PROGRAM PRODUCTS

S/38 COBOL (cont'd)

The System/38 COBOL programmer will be able to define data as done presently. Standard COBOL Environment and Data Division entries can be used to specify file identification, field definitions, and data structures. Clauses have been added to the Read, Write, Open, Rewrite, Delete, and Start verbs to support the System/38 data base and workstations.

The COBOL programmer is also provided with the following capabilities:

- Workstations may be programmed without regard to whether they are local or remote.
- System/38 COBOL provides the ability to utilize System DDS data base and display device definitions by translating them to COBOL source statements.
- The COBOL user may utilize previously announced System/38 SNA/SDLC or BSC files communications support by using CPF communication files.

Programmer Services: The following functions are available to the COBOL programmer:

- Enhanced documentation, including information such as data base relationship, file/field definitions, and program references (for example, data name cross-reference and verb usage list).
- Syntax checking of COBOL programs in either batch mode or interactively with the Source Entry Utility (SEU).
- FIPS (Federal Information Processing Standards) Flagger, which makes it possible to ensure that the level of COBOL language used in a particular programming department conforms to a particular 1975 FIPS level.

RELEASE 5 ENHANCEMENTS

System/38 COBOL is being enhanced in Release 5.0 to include support for CPF commitment control, local data area, and multiple devices in a file.

Highlights

- CPF Commit Support in COBOL
 - Additional verbs
 - Additional clause
- Multiple Device Support in COBOL
 - Additional verbs
 - Additional phrases
 - SPECIAL-NAMES addition
 - Extended file status
 - Supports mixed files
- CPF Local Data Area Support in COBOL
 - SPECIAL-NAMES addition
 - Additional phrases

Description: Definition of files under CPF commitment control and verbs to cause commitment or return to the prior commitment boundary are being added to COBOL to support CPF Commitment control. This support provides the programmer with greater flexibility in designing interactive applications and greater ease in backing out undesired changes.

Changes are being made to support multiple devices in a file. Provision is being made to ACQUIRE or DROP terminals or sessions, to ACCEPT attribute data of ACQUIRED terminals, and to add phrases to READ, WRITE and REWRITE statements when used with a TRANSACTION file. This support will provide functions similar to those provided by System/34. This multiple device support applies to CRT display and mixed files.

A local data area will be accessible from a COBOL program, by use of the ACCEPT and DISPLAY statements. This support will provide a function similar to that provided by System/34.

An extension is being implemented in System/38 COBOL which allows paragraphs in SORT/MERGE input and output sections to perform paragraphs in other sections and vice-versa. This is being implemented to provide additional compatibility with System/34 and System/370 COBOLs.

The COBOL user will benefit from a CPF improvement that will allow the use of elements of a table with CPF debug. The debug support will allow subscripted data names to be specified.

Planning Information

Customer Education: System/38 COBOL education is available as follows:

ANS '74 COBOL Language (self-study)	SBOF-0465
ANS '74 Programming (self-study)	SBOF-4526
ANS '74 Batch Workshop	D2085
S/38 COBOL Workshop	S2534

Conversion Requirements: Conversion requirements appear in the *S/38 Installation Manual - Conversion Planning* (GC21-7732).

CUSTOMER RESPONSIBILITIES

Installation of System/38 licensed programs is a customer responsibility. IBM may provide marketing assistance, in accordance with Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/38 COBOL runs on all models of IBM System/38.

SOFTWARE REQUIREMENTS

IBM System/38 COBOL is designed to operate with the IBM System/38 CPF (5714-SS1).

Program Use During Customer Preinstallation Testing: System/38 COBOL (5714-CB1) is available to customers for preinstallation testing on IBM test center systems in accordance with IBM's program testing policy.

DOCUMENTATION

(available from Mechanicsburg)

IBM System/38 COBOL Licensed Program Specifications (GC21-7764) ... *IBM System/38 Concepts for the COBOL User* (GC21-7855).

The following documents are scheduled to be updated for Release 5 and available in June 1983:

S/38 Guide to Publications, Glossary and Master Index (GC21-7726) ... *S/38 Installation Manual - Conversion Planning* (GC21-7732) ... *S/38 Concepts for the COBOL User* (GC21-7855) ... *S/38 COBOL Reference Manual and Programmer's Guide* (SC21-7718) ... *S/38 Messages Guide: COBOL* (SC21-7781) ... *S/38 COBOL Reference Summary* (SC21-7781).

PROGRAM PRODUCTS

**SYSTEM/38 CONVERSION REFORMAT UTILITY
5714-CV2****PURPOSE**

The IBM System/38 Conversion Reformat Utility licensed program is provided to assist the System/3 conversion by providing function similar to the System/3 Disk Sort Utility with the exception of summary sort. The Conversion Reformat Utility performs a variety of operations classified in the general categories of SORT, MERGE, and COPY. The utility is designed to operate upon data from either a data base or device file. Operations similar to SORT, MERGE, and COPY are also provided by the System/38 Data Base Data Management and COPY support.

HIGHLIGHTS

- The utility is capable of performing the following types of operations:
 - Sort a single physical data base file producing a record address file as output (similar to System/3 ADDRUT SORT).
 - Sort a single data base/device file producing a physical file as the output. In this case, the output file contains records and not record addresses (similar to System/3 tagalong sort).
 - Sort/Merge up two or more files producing a single data base physical file as output.
 - Copy, without sorting, records from one or more files producing a single data base physical file.
- The utility can be directed to accept all or selected records from the input file. Individual records to be included or omitted are recognized by:
 - Record code.
 - Relation of a field to a constant.
 - Relation of two fields within a record.
 - Any relationship in a series (ORing).
 - All relationships in a series (ANDing).
 - Multiples of the above tests in any combination.
- Control fields may be in different locations in records within the file, depending upon the function chosen.
- Specifications of record selection, parameters, and tagalong data fields is accomplished by filling in simple, RPG-like coding sheets.

The main difference between the System/38 Data Base and Copy support and the Conversion Reformat Utility is the manner in which file records are treated. Whereas, the data base and the copy support recognize the data descriptions associated with a file and operate upon the related data in accordance with that description; the conversion reformat utility does not. This utility recognizes file records strictly as a string of bytes (the length of which is determined by the file). This is true both of input to the utility and output from the utility. If a file has a detailed record format description associated with it, the Conversion Reformat Utility makes no attempt to assure requested operations are consistent with the description other than record length considerations. It is the user's responsibility to assure such consistency.

Any specific execution of the Reformat Utility is driven by a set of reformat specification statements. The reformat specification statements are similar to those used by the System/3 Disk Sort. The CL reformat specification statements are considered to be source statements and are treated accordingly by the System/38.

The set of statements to control a specific execution is identified to the utility via the Format Data (FMTDATA) CL command that is used to invoke the utility. Execution of the utility proceeds by interpreting the instructions given by the control statement set and performing the requested operations.

The output of the Reformat Utility is always a single data base physical file. In some cases, that file will contain nothing but record addresses and equates to a record address file. In other cases, the file will contain actual records. Which type of file is constructed by a specific execution of the utility is controlled by the utility statements used.

Program Use During Customer Preinstallation Testing: The System/38 Conversion Reformat Utility (5714-CV2) is available to customers for preinstallation testing on IBM Test Center Systems in accordance with IBM's Program Testing Policy.

CUSTOMER RESPONSIBILITIES

Installation of System/38 licensed programs is a customer responsibility. IBM may provide marketing assistance, in accordance with Marketing and Service Guidelines in the GI Section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

PROGRAM PRODUCTS

**SYSTEM/34 TO SYSTEM/38 CONVERSION AID
5714-CV5**

PURPOSE

The System/34 to System/38 Conversion Aid (5714-CV5) is designed to assist a System/34 customer in migrating to the System/38. Executing on a System/34 and a System 38, this aid converts System/34 RPG and Auto Report source code, OCL, displays, sorts, menus, and data files, which can then be processed on a System/38. In addition, programs that substitute for System/34 functions are provided for the System/38.

HIGHLIGHTS

- User menu prompting for ease-of-use.
- Prints converted code listings. Unconvertible statements found by the conversion aid are flagged, and error messages are listed.
- Prints conversion control log on demand for auditing purposes.
- Converts the following:

System/34		System/38
RPG II	-	RPG III
Auto Report	-	Auto Report
Operation Control Language	-	Control Language
Display Format Specifications	-	Data Description Specifications
Sorts	-	Reformat Utility
Menus	-	Data Description Specifications, Control Language
Message Member	-	Message File
Data Files	-	Data Files

- Generates the following System/34 functions on the System/38 through programming:
 - RPG II SUBR21 - Access to display station Local Data Area (LDA)
 - RPG II SUBR23 - Message Member Retrieval (Single Level)
- Unloads converted source code from the System/34 to diskette.
- Loads diskettes containing the converted source code to the System/38.
- Provides for parameter substitution into converted Sort Specifications on System/38.
- Provides menu for compiling on System/38.
- Generates field or record level data description specifications for converted files.
- Unloads data files to diskette and provides System/38 control language to load files on the System/38.

DESCRIPTION

The Conversion Aid (5714-CV5) is designed to help a System/34 customer in converting programming source code and data files to a System/38. Programs are provided for tasks to be done on the System/34 and on the System/38. These programs are menu oriented in that the user makes selections which then generate jobs to be executed in a batch mode. These functions are stated in the "Highlights" section.

Two System/34 functions accessing the Local Display Area (LDA) and Message Member retrieval, do not exist on the System/38 and are provided on the System/38 by Control Language procedures.

The product *Reference Guide/Runbook* will provide the detailed information necessary to use this conversion tool effectively. However, a comprehensive conversion plan for each customer is strongly recommended to assure a smooth transition from the System/34 to the System/38.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum configurations for IBM System/34 and System/38 are intended to define the licensing requirement necessary for the customer to obtain IBM Program Services for this product. Although there is nothing inherent in the design of this product that prevents the use of the minimum system configurations, the configuration for a particular customer must be able to accommodate the expected program libraries, data files and operating requirements. The amount of disk storage required is affected by:

- Amount of space used by the installed applications
- Amount of source code to be converted in each conversion session
- Amount of space required for the converted source code in each conversion session

System/34 minimum configuration for this conversion aid is:

- IBM 5340 System mdl B22 (48K, Diskette 2D Drive, 13.2MB disk)
- One IBM 5211 Line Printer, mdl 1 (160 lpm)
- One IBM 5251 mdl 11 Display Station (1920-character)

IBM System/38 minimum configuration required is the size needed to compile and execute the user's application. The conversion aid programs to replace IBM System/34 function execute on an IBM System/38 of the following configuration, (or larger):

- IBM 5381 Processing Unit mdl 322 (512K, diskette magazine drive, 128MB disk)
- One IBM 5211 Line Printer, mdl 2 (300 lpm)
- One IBM 5251 mdl 11 Display Station (1920-character)

SOFTWARE REQUIREMENTS

System/34: This product is written in IBM System/34 RPG II programming language and executes under control of the IBM System/34 System Support Program (5726-SS1), Release 9 or later. It requires 24K of user area, and spooling with user access support must be active.

The IBM System/34 Utilities (5726-UT1) must be available to use the sort program. IBM System/34 RPG II (5726-RG1) must be available. (It is recommended that SEU be installed for use in modifying the user converted source.)

System/38: This product is written in the IBM System/38 RPG III programming language and executes under control of the IBM System/38 Control Program Facility (5714-SS1) Release 5.0 or later. Spooling with user access support must be active. The IBM System/38 Conversion Rformat Utility (5714-CV2) must be ordered for use with the system. The IBM System/38 RPG III Compiler (5714-RG1) must also be available. Optionally, the IBM System/38 Interactive Data Base Utilities (IDU) (5714-UT1) with SEU should be installed if the user plans on making any online changes to source code.

DOCUMENTATION

(available from Mechanicsburg)

Design Objectives (GH30-0455)

RPQs ACCEPTED: No

**SYSTEM/3 CCP TO SYSTEM/38 CONVERSION AID
5714-CV7**

No longer available effective March, 1983.

PURPOSE

The IBM System/3 CCP to IBM System/38 Conversion Aid helps IBM System/3 models 8, 10 disk, 12, and 15 users convert their CCP programs to run on the IBM System/38. The Conversion Aid will reduce the time required to make a number of the repetitive and time consuming changes to the source code and to identify where user decisions and/or changes are necessary.

The IBM System/3 CCP to System/38 Conversion Aid assists the user in converting System/3 RPG II CCP programs to System/38 RPG III programs using native System/38 syntax. It assists in converting source Display Format Facility (DFF) statements to source Data Description Specifications (DDS) for display files. CCP Sort program specifications are converted to System/38 Reformat Utility specifications.

Separate RPG III programs, called 'driver' programs, are generated by the Conversion Aid. These 'driver' programs implement the CCP command screen and the CCP PRUF-like technique. The programs are converted one-for-one with each converted program performing the same function as its CCP counterpart. Thus, the converted CCP applications maintain the workstation user's view of the application.

The Conversion Aid programs are written in System/3 RPG II and distributed in source form. They may be compiled and executed on System/3 mdls 8, 10 disk, 12, and 15. The conversion functions handled by the Conversion Aid are:

- Analysis of the user's assignment set, DFF formats, RPG II CCP programs, and CCP Disk Sort programs.
- Listing of items that require additional information to allow conversion. Some items cannot be converted by the Aid and are flagged for action by the user.
- Conversion of DFF statements to Data Definition Specifications (DDS) for display files. Workstation printer formats are not converted.
- Conversion of RPG II CCP source programs to native System/38 RPG III source programs on a one-for-one basis.
- Generation of separate 'driver' programs to implement the CCP command screen and the PRUF-like environment on System/38.
- Conversion of System/3 CCP sort program specifications to System/38 Reformat Utility Specifications.
- Generation of record level DDS for data base files.

The Conversion Aid is executed in easy-to-manage procedures. These procedures are designed to provide breakpoints that allow the conversion process to be divided into logical portions. User involvement is required to control the conversion process and provide additional information to the Aid. The steps are:

1. The CCP Conversion Aid is loaded into a System/3 and the programs are compiled. Procedures are provided to tailor the programs to the user's environment prior to compilation.
2. Work files are sized and CCP Conversion Aid-provided OCL procedures are tailored to the user's environment.
3. Work files are created and initialized. The assignment set is scanned and analyzed. DFF, RPG II CCP programs, and CCP Disk Sort program specifications are copied into the work files.
4. The DFF is scanned and analyzed. 3270 display field/format information is consolidated to be used later in RPG II program scan and analysis.
5. RPG II CCP source programs are scanned and analyzed. The user is requested to supply additional information to the Aid for conversion.
6. CCP Disk Sort program specifications are scanned and analyzed. DFF source statements are converted to DDS Disk source statements, and RPG II source statements are converted to RPG III source statements. 'Driver' programs are generated.
7. CCP Disk Sort program specifications are converted and Control Language (CL) programs to execute the Reformat Utility are generated. Converted sorts are offloaded to offload media.
8. DDS, RPG III source, and Control Language job streams for compiling on the System/38, are offloaded to the offload media.

Some CCP programs converted by the Aid will require additional modifications to compile and execute on the System/38.

Corrections may be necessary during conversion, or the user may want to alter the conversion output. A comprehensive maintenance procedure is provided to allow the user to resolve and correct RPG II statements needing attention prior to moving to the System/38.

CUSTOMER RESPONSIBILITIES

Installation of IBM licensed programs is a customer responsibility. IBM may provide marketing assistance in accordance with Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/3 CCP to System/38 Conversion Aid runs in a 40K byte partition on IBM System/3 mdls 8, 10 disk, 12, or 15. A minimum of 5 million bytes of online disk storage is required for use by the Conversion Aid.

SOFTWARE REQUIREMENTS

The IBM System/3 CCP to System/38 Conversion Aid operates under the control of the current version of SCP for IBM System/3 mdls 8, 10 disk, 12, or 15. The Conversion Aid also requires the use of the IBM System/3 RPG II compiler and Disk Sort.

DOCUMENTATION

IBM System/3 Communications Control Program (CCP) to System/38 Conversion Aid Licensed Program Specification (GC21-7772).

TERMS and CONDITIONS: See PP Index

**SYSTEM/38 DISTRIBUTION MANAGEMENT SYSTEM
(DMS/38) CUSTOMER SERVICE
WITH PURCHASING APPLICATIONS**

BILLING ... 5714-D41
ACCOUNTS RECEIVABLE ... 5714-D42
INVENTORY CONTROL ... 5714-D43
SALES ANALYSIS ... 5714-D44
PURCHASING ... 5714-D45

PURPOSE

The IBM Distribution Management System for the System/38 (DMS/38) offers a practical approach to information processing for the distributor. The DMS/38 Customer Service and Purchasing licensed programs are functionally based on the programs of the IBM Distribution Management Accounting System (DMAS II) Release 2, which is designed to run on the IBM System/34. These applications have been enhanced to take advantage of the advanced capabilities of integrated data base of the IBM System/38.

DMS/38 consists of a workstation-oriented set of applications which access a data base designed especially for distribution activities, using up-to-date accounting practices and management controls.

The Distribution Management System for the System/38 includes the following applications:

- Customer Service Applications
 - Billing
 - Accounts Receivable
 - Inventory Control
 - Sales Analysis
 - Purchasing
- IMPROVE (Inventory Management, Product Replenishment, and Order Validity Evaluation)
- Financial Applications
 - General Ledger
 - Accounts Payable
 - Payroll

With DMS/38, the emphasis is on availability of up-to-the-minute information, accuracy of input data, and quick turnaround of processing results.

To accomplish these objectives, DMS/38 Customer Service and Purchasing programs use the advanced capabilities and integrated data base facilities of the System/38, to form an application system designed to provide information when and where it is needed.

HIGHLIGHTS

- DMS/38 Customer Service and Purchasing provides for data entry in an interactive mode from display stations. The screen displays guide the operators through data entry operations in a logical sequence.
- Workstation data entry is designed for simplicity and operator efficiency. All functions of the display screen are designed to help the operators perform their tasks as quickly, easily, and accurately as possible. System-detected errors are signalled, and descriptive data is displayed to aid in visual verification. Most errors are corrected interactively.
- Multiple interactive display stations may operate concurrently on different jobs. While customer order entry is being done on some workstations, others might be entering receipts against purchase orders, while still others can cash receipts to Accounts Receivable. During these operations, other jobs can be running in the background.
- Modifications are made easier by utilizing the System/38 programming productivity features. Use of the integrated data base facilities by the Customer Service and Purchasing application programs will ease the implementation of functional additions and cosmetic changes.
- DMS/38 Customer Service and Purchasing application programs use the System/38 Control Program Facility for data base, message handling, and SPOOL.
- Comprehensive search and inquiry facilities offer displays of key data for customers, items, and status of customer orders and purchase orders.
- Each application may be installed separately or in conjunction with the others.
- Auditability and control information is provided to help ensure system integrity.
- Application options may be selected at install time, run time, or by overriding standard data during data entry.
- To accommodate larger data requirements, certain field sizes have been increased from those in DMAS II.

- Comprehensive backup, recovery, and restart functions are provided to maximize system availability.
- An Online Information System is provided, which allows the operators to access operating instructions, data field descriptions, and additional information messages without leaving the application flow.

System Management

- Provides for phased activation of applications and application functions.
- Allows user to change default values used by the programs (such as tax rates) without reprogramming, in order to keep operations current with changing needs.

File Loading and Maintenance

- Accepts and edits master file information interactively from any workstation.
- Provides programs to add, update, or delete data base records.
- Can print lists of all customers, salespersons, vendors and items stored in the system.
- Helps protect against the deliberate or accidental alteration of any sensitive data stored in the system.
- Can load data from diskettes prepared offline.
- Provides audit documentation of changes made to the data base.
- Provides programs to convert DMAS II data files to DMS/38 files.

DESCRIPTION**DMS/38 BILLING (5714-D41)**

When other Customer Service applications are installed, DMS/38 Billing becomes the primary source of customer and inventory activity information.

Interactive order entry accommodates multiple operators working concurrently. Information can be entered for multiple companies with control and audit information maintained separately for each company. The workstation operator can enter order information, verify it on the display screen, and make corrections and changes to the order before it is used for further processing.

Billing

- Retrieves customer names, addresses and other information from the data base
- Selects prices
- Applies discounts, markups, and taxes
- Performs any necessary pricing conversions
- Calculates extensions
- Prints invoices that reflect all customer charges
- Prints an Invoice Register that shows summary information for all invoices printed during a given period

Features

- Multiple-company processing
- Alpha search and inquiry into customer information
- Choice of prebilling or postbilling methods
- Interactive entry, edit, and correction of customer orders
- Online allocation of item quantities (if Inventory Control is installed)
- Online addition of new customers
- Credit limit checking and credit hold procedures to help keep customers within assigned limits (if Accounts Receivable is installed)
- Price checking during order entry
- Flexible pricing structure
 - Contract prices selected by contract and item number
 - Prices automatically selected or manually keyed as overrides
 - Quantity-break discounts
 - Discount of markup prices calculated for any item with percentages automatically selected or manually keyed as overrides
- Item substitution under operator control
- Up to 99 taxing jurisdictions
- Multiple ship-to addresses for each customer

DMS/38 (cont'd)

- Accumulation of tax, discount and sales amounts for DMS/38 General Ledger
- Automatic backorder processing
- Order acknowledgments and picking lists
- Cash and C.O.D. sales tracking
- Order status inquiry
- Pricing inquiry by customer
- Cost and profit information calculated

DMS/38 ACCOUNTS RECEIVABLE (5714-D42)

DMS/38 Accounts Receivable accepts transactions from the Billing module and applies charges to customer accounts. It also provides credit limit status information to the Billing operation to help determine if credit should be extended. Transactions against customer accounts will immediately update an 'amount-in-process' value for each customer, providing current information as needed.

Invoice summary information (totals) can be entered directly into Accounts Receivable customer records, which is especially useful for invoices created outside of the DMS/38 Billing module. The invoice summary and payment information is accumulated and can be used as input to update DMS/38 General Ledger.

Features

- Multiple company processing
- Two Accounts Receivable aging cycles that can be user-established and selected for each customer
- Balance forward and open item accounting
- Four aging periods (plus current) and future aging
- Alpha search and inquiry into customer records
- Interactive entry, edit, and correction of customer payments, adjustments, and charges
- Immediate update of customer 'amounts-in-process' to support credit limit checking
- Late charges calculated automatically for all selected customers
- Inquiry into the Accounts Receivable detail data base
- Aged Receivables report on demand
- Delinquency notices printed on demand
- Multiple statements for multiple-location companies
- Data accessible by DMS/38 General Ledger

DMS/38 INVENTORY CONTROL (5714-D43)

Inventory Control keeps track of item quantities that are on hand, on order from vendors, and allocated to customer orders. As items are sold or received, and quantities are adjusted, their status is automatically updated so that the latest information is available to the Billing and Purchasing applications (if installed). Item costs are also updated, as well as the date of the last transaction.

The Inventory Control module maintains information about the inventory items, including many exception conditions that could exist, such as abnormally low stock levels, unusual item cost entries, and so forth. This information can assist with replenishment inventory ordering, helping to maximize sales and customer service, while at the same time minimizing unnecessary and special ordering and handling. This module also provides the controls and auditing features needed to monitor activity on a major asset ... inventory.

Features

- Multiple-company processing
- Multiple warehouse support within each company
- Alpha search and inquiry by item
- Interactive entry, edit, and correction of inventory transactions
- Online update of quantity available
- Item costing with average cost, last cost, and a user-defined cost
- With Billing, item demand information is accumulated for use by forecasting programs (such as DMS/38 IMPROVE)
- With Purchasing, on-order quantities and receipts will be automatically reflected in the item status
- Item price inquiry capability
- Handling of broken case quantities
- Automated group price maintenance
- Physical inventory aids

DMS/38 SALES ANALYSIS (5714-D44)

When integrated with other Customer Service applications, DMS/38 Sales Analysis provides sales, cost, profit amount, and profit percent information for management analysis. Using summaries of sales transactions, and customer and item information, the Sales Analysis reports help to assess profitability on goods sold. In addition, graphic comparative sales analysis displays are available that will show sales, profit, and quantity sold for items, and numbers of orders for customers. Graphs and tables showing percentage comparisons of these items for current month, previous month, this month last year, average of the last 12 months, and current and last year-to-date can be displayed.

Sales Analysis information is more easily obtained when the module is installed after the other DMS/38 Customer Service modules. When installed first, data entry facilities must be provided by the user.

Features

- Customer and item sales statistics
- Profit amount and percent (based on sales or cost); reported by customer, item, item within item class, item class within customer within salesperson, and salesperson
- Salesperson productivity measured
- Trend chart displays

DMS/38 PURCHASING (5714-D45)

Purchasing provides the major functions needed by most distributors to enter, generate and track purchase orders. When orders are received, Purchasing can speed the check-in and stock processes, making the new inventory received available to fill customer orders as soon as the receipt is entered into the system. Facilities are also provided to ease the reconciliation of vendor invoices for payment. Accounts Payable input information can then be generated as part of the approval cycle, reducing the keying activity related to that application.

When installed along with DMS/38 Inventory Control, Purchasing becomes part of an integrated set of application products that can significantly improve the efficiency and accuracy of purchasing and inventory operations. The Purchasing application can be installed without the DMS/38 Inventory Control module; however, some inquiry and stock status function, which requires the Inventory Control files, will not be available.

If installed with IMPROVE, Purchasing can use the IMPROVE suggested order output as input to the purchase order generation functions. Purchasing can also provide order lead time information needed by the lead time forecasting functions of IMPROVE.

Features

- User can browse through a vendor line, and mark items that need ordering, then produce a purchase order
- Purchase orders can also be entered interactively through multiple workstations
- Operator-entered messages can be associated with purchase orders and the items on order, and then directed to specific functional areas
- Multiple-company support
- Multiple-warehouse support
- Orders can be selected for printing either individually or in groups
- Inquiry facilities are provided to review individual purchase orders
- Item inquiry is provided that produces a summary of all active orders that contain a specific item
- Expected Receipts reports can help plan receiving and warehouse activities
- Interactive receiving of full and partial shipments against the purchase orders
- Interactive reconciliation of the vendor's invoice to the purchase order
- Accounts Payable input records can be automatically generated during the reconciliation and approval operation
- Operational reports: Purchase Orders, Expected Shipments Report, Receiving List, Vendor and Item Purchasing Report, and the closing reports
- Control reports: Daily Purchase Order Reconciliation and Alteration Report, Receiving Report, and the Items Ordered/Received Report

CUSTOMER RESPONSIBILITIES

Installation of System/38 application programs is a customer responsibility. IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI Section, in the installation of IBM licensed programs. However, the responsibility for providing

**DMS/38 (cont'd)**

accurate ordering information, personnel selection and training, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration for the DMS/38 Customer Service and Purchasing applications are:

- IBM System/38 with 768K bytes of main storage and 128 MB of disk storage.
- One IBM line printer.
- One IBM 5251 display station with 1920-character display screen.

Although there is nothing inherent in the design of DMS/38 to prevent use of the minimum system configuration stated above, the configuration for a particular customer must be able to accommodate the expected business volumes, data base size, and operating requirements ... including the mix and type of applications that will be used.

The amount of disk storage required is influenced by many things, including:

- The number of applications installed
- The volume of daily transactions
- The number of item, vendor item, customer, and ship-to and vendor records
- The number of open customer orders, vendor orders and unpaid invoices
- The number of contract items and items with quantity discounts

Additionally, a main storage capacity greater than the stated minimum will often provide improved performance. For example, performance can be affected by:

- The number of DMS/38 application tasks operating concurrently,
- The number of workstations operating concurrently on the same applications, and
- Any other applications operating concurrently.

SOFTWARE REQUIREMENTS

The application programs are written in IBM System/38 RPG III programming language and executed under control of the IBM System/38 Control Program Facility (5714-SS1). The IBM System/38 RPG III Compiler (5714-RG1) is required if modifications to the application programs are planned.

Education**Operators self-study**

An operator's self-study course will be provided to assist in preparing for the operation of the application. This course provides operator instruction online to the system using a data base and instructions supplied with the course.

**SYSTEM/38 DISTRIBUTION MANAGEMENT SYSTEM -
INVENTORY MANAGEMENT,
PRODUCT REPLENISHMENT,
AND ORDER VALIDITY EVALUATION
DMS/38 - IMPROVE (5714-D46)****PURPOSE**

Increasing costs, larger capital requirements, more demanding customers, and tougher competition are among the many challenges facing businesses today. If your customers have inventory to manage, they are probably facing problems which call for a set of proven techniques to help improve the management and control of this important investment.

IMPROVE is designed to help your customers meet these challenges. It provides a tool to assist them in ordering the right items, in the correct quantities, at the proper frequencies, and at the optimum time.

IMPROVE is an online, interactive, inventory management and purchasing tool for the customer who has an inventory that requires regular replenishment. It provides the user with the capabilities to measure, monitor and control the inventory and its financial performance, from a display station.

It has features that can help many areas of the business, including: Purchasing, warehousing, marketing, financial and top management. The benefits of enhanced inventory management can include:

- Lower inventory investment
- Reduced inventory operating costs
- Improved customer service
- More profitable inventory/purchasing strategies
- Improved buyer efficiency

HIGHLIGHTS

- Forecast demands and lead time for each item based on past performance and user anticipated conditions, such as: Seasonality, promotions, and trends.
- Analyzes various order frequencies to help determine the cost and overall policy for each vendor.
- Calculates order points and suggested order quantities in accordance with rules established by your customer's buyers and top management.
- Takes into account discounts, vendor order criteria, freight rate breaks, and other savings opportunities when calculating orders.
- Provides exception reporting according to your customer's rules for out-of-line conditions.
- Generates timely ranking reports to aid management in identifying potential profits and problems with both items and vendors.
- Provides an evaluation of the actual inventory performance compared with the optimum levels established by the user.
- Assists in evaluating special vendor offers and planned promotions for items by displaying key data such as cash flow, revenue, stock on hand, inventory cost, and expected profit.
- Provides the user the ability to simulate 'what if' conditions with the system, by allowing the temporary change of control, vendor, or item information, then run IMPROVE to test the effects of these changes.
- Online Information System (OLIS) provides HELPTTEXT when using IMPROVE. HELPTTEXT, relevant to the operation you are performing, can be obtained by pressing the HELP key. The system retrieves the associated HELPTTEXT. After reading the HELPTTEXT provided for the operation in progress, you can return to the interrupted operation immediately, or you can review any other HELPTTEXT for IMPROVE. IMPROVE HELPTTEXT contains operating information, command key descriptions and message expansions.
- Installation/Maintenance Support Facility (IMSF): An aid in installing and maintaining the IMPROVE.

CUSTOMER RESPONSIBILITIES

Installation of System/38 licensed programs is a customer responsibility. IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration for IMPROVE is an IBM System/38 with:

Mdl 332 Processor with:

768K Main Storage
128MB Disk Storage
System Printer
5251 mdl 11 Display Station

Although there is nothing inherent in the design of the IMPROVE application which prevents the use of the minimum system configuration stated above, the system configuration for a particular customer must be able to accommodate the expected business volumes, data base size, and operating requirements, including the mix and types of applications.

SOFTWARE REQUIREMENTS

The application program is written in System/38 RPG III (5714-RG1) programming language and executed under control of the System/38 Control Program Facility (CPF) program (5714-SS1). The System/38 RPG III Compiler is required if modifications to the source code are desired.

DOCUMENTATION
(available from Mechanicsburg)

User's Guide (SH30-0582)

Contains descriptions of all application operations typically performed by buyers. It also contains technical information and describes the data that the application uses.

Logic Manual (LH30-0583)

Provides the technical detail of the application. It contains such things as logic and flow, program descriptions, and data descriptions used primarily by programmers to maintain the system.

TERMS and CONDITIONS: See PP Index

**SYSTEM/38 DISTRIBUTION MANAGEMENT SYSTEM
FINANCIAL APPLICATIONS (DMS/38)**

GENERAL LEDGER ... 5714-D47
ACCOUNTS PAYABLE ... 5714-D48
PAYROLL ... 5714-D49

PURPOSE

The IBM System/38 Distribution Management System (DMS/38) Financial Applications provide an integrated and comprehensive workstation-oriented financial control system for the small-to-large size distributor. The Accounts Payable, General Ledger, and Payroll applications are part of the Distribution Management System, providing computer applications to key areas of the distribution process.

HIGHLIGHTS

- The System/38 hardware and software functions of the Control Program Facility are integral parts of the DMS/38 application design.
- Workstation data entry is designed for simplicity and ease-of-use. Screen displays provide guidance for mandatory input or fields that may be overridden. Error messages signal errors which are then corrected interactively by the operator.
- Provides interactive data entry, edit and correction for multiple applications concurrently, and multiple terminals for an application while batch programs may operate in the background.
- Inquiry into master files may be reviewed concurrently with data entry.
- Online file maintenance of all master files provided with optional file maintenance reports.
- Each application may be installed separately.
- System tailoring procedures permit the user to select optional functions and reports. Functions may be modified as the customer environment changes by re-executing the tailoring procedures.
- Source code, ready-to-execute procedures, and object code are provided. Although no additional system design, programming, or compiling is required, the system design incorporates features to assist the user in the modification of source code.
- File load programs for master files are provided.
- Password security deters unauthorized use of terminals, applications, and functions within applications. A second level of security protects selected master file data.
- Optional system procedures for master file backup and restart.
- Documentation for each application includes a *User's Guide* and a *Logic Manual*. From an overall DMS/38 Financial Applications perspective, a *User's Guide* and a *Logic Manual* are also provided. Self-study instructional materials are also available for operator education.
- Sample documents are provided for both data collection and data entry.
- Control features and documents are included to assist in establishing audit trails.
- File load programs for master files are provided as well as file conversion programs from System/34 DFAS II to System/38 format.

DESCRIPTION

The Distribution Management System Financial Applications offerings are three independent, yet interrelated, ready-to-execute applications for the small-to-medium distributor:

General Ledger
Accounts Payable
Payroll

These applications are designed for marketing in any combination and installation in any sequence.

Each application has certain required records within a cross-application control file which contain questionnaire responses. These records allow the application to select report formats and functions to suit each customer's needs. The questionnaire responses are keyed during initial installation and may be changed as needed. The System Tailoring Procedure allows these responses to be entered or modified. It provides the following:

- Tailors the application on-site at installation time.
- Allows the user to activate and deactivate provided functions as the user's business changes.
- All functions are included in the application programs, but only required functions are executed.

One systems-level *User's Guide* is provided for the DMS/38 Financial Applications covering all three applications. This *User's Guide* provides an explanation of the system to enable the user to understand the

application from a functional and operational standpoint. Installation guidance is included in this manual and provides detailed instructions on procedures to follow during installation. These instructions include sample numbering systems, sample input and maintenance of data forms, file loading sequences, and control forms with suggested procedures. This manual also gives guidance to the supervisor on managing and running the applications from a total systems viewpoint. For the system console operator, operation guidance is provided containing detailed instructions for the application procedures, an overview of the system and application flow, system considerations, hints for trouble shooting, and all of the error messages that can be generated by any of the applications.

Individual application *User's Guides* for each application provide reference information and instruct the user department manager on how to conduct day-to-day operations of the application. In addition, guidance for the workstation operator is provided and includes a summary of the application and workstation operations, application and screen flow, application messages, and a detailed description of how to run each procedure associated with the application.

Logic manuals are provided, as licensed material, for use by the self-sufficient customer and for the systems engineer. A system-level Logic Manual for maintaining and modifying DMS/38 - Payroll, Accounts Payable and General Ledger is available. Information on system architecture, naming conventions, system controls, system program functions and specifications, relationships among system files, and other information applicable to all applications is presented. In addition, logic manuals for maintaining and modifying each application are available. Information relevant only to the application, such as program descriptions, cross-reference lists, data dictionary, etc., is presented.

Two self-study instructional packages will be provided for the system and workstation operators. The objective of this material is to familiarize the operators with the tasks required to run the applications. They are designed around the operating guides and provide instructions and exercises in the use of the guides.

GENERAL LEDGER (5714-D47)

The DMS/38 - General Ledger application is the focal point of all accounting entries and integrates completely with DMS/38 - Accounts Payable and DMS/38 - Payroll. Though integrated, it can be installed apart from the other applications. Since a large number of ledger entries result from the distribution of expenses incurred through Accounts Payable, a majority of General Ledger users will likely install Accounts Payable.

Each transaction entered is assigned a journal number and a line number within that journal. This journal reference number is kept with the transaction until it is posted to the master record during period-end closing. Transactions coming from other interfacing applications also use this reference numbering scheme. This makes auditability easier throughout the application. Thorough editing of all data at entry time plus the fact that a double-entry bookkeeping system is used ensures that all credit entries are offset by an equal value of debit entries and provides for smooth period closings. Diskettes can be used for processing recurring entries. The application gives the user support for up to 20 companies and a choice of either a 12-month or 13-period fiscal year. The general ledger listing displays (by account number) transaction original journal reference number providing a clear and easily used audit trail of all transactions.

The balance sheet and income statement can be formatted to the user's particular requirements by use of a format file which permits special spacing, user-specified columnar printing, user-specified totaling, and up to 73 accounts to be totaled and printed with one line of description. By exploiting the capabilities of the format file, the user can produce departmentalized and/or combined (not consolidated) statements for multiple companies. Both the balance sheet and income statement can be comparative to last year and the income statement can also be comparative to budget figures.

ACCOUNTS PAYABLE (5714-D48)

The DMS/38 - Accounts Payable application keeps accurate and detailed records of vendor invoices and credit memos from the time they are entered into the system until they are paid and the check reconciled. Although it can be installed on a standalone basis, it will be frequently used with the DMS/38 - General Ledger to which it can distribute the dollar amounts spent against the proper account numbers while printing the purchase journal and the cash disbursements journal.

Transaction auditing is aided by a journal referencing scheme which causes every transaction affecting the DMS/38 - General Ledger to refer to a particular journal and line number within that journal. A double-entry bookkeeping method keeps transactions in balance.

Procedures for handling manual checks, petty cash, and check reversals are provided as well as online invoice entry and payment selection which includes partial payments, selection by date, and selection by vendor and invoice. Credit memos can be automatically generated,

PROGRAM PRODUCTS

DMS/38 Financial Applications (cont'd)

allowing the user to reverse a previously entered invoice without having to rekey all the invoice's indicative information and distribution.

Support is provided for up to 20 companies. Key reports include a new aged payables report, two vendor analysis reports, plus normal accounts payable audit trails such as purchase journal, cash requirements reports, and cash disbursement journal. When checks are printed, options are available to make the checks payable to 'assignees' (due to factoring by the vendor) and to print remittance advice 'overflow' data on a separate remittance advice form.

PAYROLL (5714-D49)

The DMS/38 - Payroll application starts with the basic employee time record as input and handles the calculation of wages, taxes, deductions, checkwriting and file updating for both salaried and hourly pay plans. The Payroll can interface with the DMS/38 - General Ledger application. Transactions may be passed to the DMS/38 - General Ledger during the printing of the payroll distribution journal.

Current payroll data is entered from time cards or job reports either daily or weekly and is edited to validate employee and job information. A user with an incentive payroll must manually calculate gross pay and then enter it into the system. In addition to calculating present Federal and FICA taxes, a standard tax algorithm is provided to calculate most present state taxes based upon customer-provided data. Local taxes may also fit the standard tax algorithm provided. The state disability insurance deductions also use a standard algorithm based upon customer-provided data. Wages subject to Federal Unemployment Insurance (FUI) and State Unemployment Insurance (SUI) are determined. Deduction programs compute voluntary deductions for a specific pay period as well as one-time and union deductions. All necessary reports are furnished including payroll register, deduction reports, checks, Federal 941-A reports, and W-2 reports.

Support for up to 20 companies, a manual payoff check procedure, and the ability to handle an employee working in multiple states, counties, cities, unions, jobs or shifts on the same day are provided to give the user wide flexibility. Labor distribution of payroll hours and dollars is done in the same detail as the basic employee time record, that is, department, work center, job number, operation.

Several other reports are printed:

- Vacation, holiday and sick pay register
- Year-to-date and quarter-to-date earnings register
- State and local tax register
- Workmen's compensation worksheets
- Check reconciliation register
- Union deduction register
- Paychecks (with option to print employee address)
- Federal Government reports, 941-A, W-2 (and associated registers)

CUSTOMER RESPONSIBILITIES

Installation of System/38 application programs is a customer responsibility.

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI Section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified environment:

HARDWARE REQUIREMENTS

Each of these licensed programs will execute on all models of the IBM System/38 with a minimum of:

- 768K of main storage
- 128 megabytes of auxiliary storage
- One line printer
- One IBM 5251 Display Station with a 1920-character display screen.

The DMS/38 financial applications are intended to be an independent yet interrelated set of applications. Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries. Design features have been incorporated into the applications to allow for co-residency of other applications and/or user-written programs with minimum restrictions. Consult the logic manual for further explanation of these restrictions.

SOFTWARE REQUIREMENTS

The IBM System/38 licensed programs are written in IBM System/38 RPG III Programming Language and executed under control of the IBM System/38 Control Program Facility (5714-SS1). The IBM System/38 Conversion Format Utility (5714-CV2) must be ordered for use with the system. The IBM System/38 RPG III Compiler (5714-RG1) is required if modifications to the source code are desired.

Manufacturing Applications
 Product Data Management
 Material Requirements Planning
 Production Control and Costing
 Capacity Requirements Planning

Data Collection
 Data Collection System Support

These applications are designed for marketing in any combination and installing in any sequence, with the following exceptions:

- Sales Analysis requires at least one of the other order processing and accounting applications.
- Material Requirements Planning requires both Inventory Management and Product Data Management.
- Production Control and Costing requires the Inventory Management application. (Although Product Data Management is not an absolute requirement, its use is highly recommended.)
- Capacity Requirements Planning requires the Inventory Management application and either Product Data Management or Production Control and Costing.

PURPOSE

The IBM System/38 Manufacturing Accounting and Production Information Control System (System/38 MAPICS) is based on System/34 MAPICS and is enhanced by utilizing the advanced systems and programming facilities of the System/38. It provides an integrated and comprehensive workstation-oriented accounting, financial, and manufacturing control system for the manufacturing industry and some of the like process industries. The Accounts Payable, General Ledger, and Payroll applications are designed to meet the needs of both the manufacturer and the distributor.

HIGHLIGHTS

- The System/38 hardware and system software functions of the Control Program Facility are integral parts of the System/38 MAPICS application design. System/38 MAPICS manufacturing applications also take advantage of the chain file processing techniques employed in System/34 MAPICS to provide for functional compatibility and ease-of-conversion.
- Workstation data entry is designed for simplicity and ease-of-use. Screen displays provide guidance for mandatory input and for fields that may be overridden. Error messages signal errors which can then be corrected interactively by the operator.
- Interactive data entry, concurrent edit and correction for multiple applications and multiple workstations is provided while batch programs operate in the background.
- Inquiry into master files concurrent with data entry.
- System tailoring procedures permit the user to select optional functions and reports. Selections may be modified as the customer environment changes by re-executing the tailoring procedures.
- Source code, ready-to-execute procedures, and object code are provided. Although no additional systems design, programming, or compiling is required, the system design incorporates features to assist the user in the modification of source code.
- Online file maintenance of most master files with file maintenance reports.
- Optional system procedures for master file backup and restart.
- Password security deters unauthorized use of applications, and functions within applications. A second level of security protects selected master file data.
- File load programs for master files are provided, as well as file conversion programs from IBM System/34 MAPICS, System/3 IPICS and System/3 DCSS files to System/38 format.
- Documentation for each application includes a reference manual, a run book and a logic manual. An overall System/38 MAPICS system reference manual, an installation guide, a run book and a logic manual are provided. Self-study instructional material is also available for operator education.
- Sample documents are provided for both data collection and data entry.
- Control features and documents are included to assist in establishing audit trails.

Each application has certain required records within a cross-application control file which contain questionnaire responses. These records allow the selection of report formats and functions to suit the user's needs. The questionnaire responses are entered during initial installation and may be changed as needed. The System Tailoring Procedures allow these responses to be entered or modified. It provides the following:

- Tailors the application on-site at installation time.
- Allows the user to activate and deactivate provided functions as the user's business changes.
- All functions are included in the application programs but only required functions are actually executed.

Reference manuals provide an explanation of the system to enable the user to understand the applications from a functional and operational standpoint. Installation guidance is included in this manual and provides detailed instructions on procedures to follow during installation. These instructions include sample numbering systems, sample input and maintenance data forms, file loading sequences, and control forms with suggested procedures. One reference manual is provided for System/38 MAPICS covering all twelve applications. This manual gives guidance to the supervisor on managing and running the applications from a total systems viewpoint. Individual reference manuals for each application instruct the user department manager on how to conduct day-to-day operations of the application.

Similarly, one operations guide is provided for the systems console operator and individual application operation guides for the workstation operators. The system operations guide contains detailed instructions for operating System/38 MAPICS at the console. Included are an overview of the system and application flow, system considerations, hints on troubleshooting, and all of the error messages that can be generated by any of the applications in the offering. The individual application operations guides provide a summary of the application and workstation operations, application and display flow, application messages, and a detailed description of how to run each procedure in the application.

The System/38 MAPICS logic manual is provided as licensed material for use by the self-sufficient customer, and for the Systems Engineer in maintaining and modifying System/38 MAPICS. Information on system architecture, naming conventions, system controls, system program functions and specifications, relationship among system files, and other information applicable to all applications is presented in this system manual. In addition, logic manuals for maintaining and modifying each application are available. Information relevant only to the subject application, such as program descriptions, cross-reference lists, and data dictionary, is presented.

Two self-study instructional packages will be provided for the console and workstation operators. The objective of this material is to familiarize the operators with the tasks required to run the applications. They are designed around the operations guides and provide instructions and exercises in the use of the guides.

Modular Application and Systems Training (MAST) is available to help identify and quantify benefits for top executives. MAST aids your customer in planning an effective implementation and includes techniques to assure top priority and the commitment of all the necessary resources. To assist in determining Management function and fit, there is a MAPICS features course for all MAPICS applications. In addition, for Inventory Management, Product Data Management, and Production Control and Costing, there will be concepts, implementation and 'using the system' courses to make the customer more self-sufficient and reduce the effort and time required to install these applications.

DESCRIPTION

System/38 MAPICS is a set of twelve independent, but interrelated, ready-to-execute applications for the small-to-large manufacturer consisting of:

- Order Processing and Accounting Applications
 - Order Entry and Invoicing
 - Inventory Management
 - Accounts Receivable
 - Sales Analysis
- Financial Applications
 - General Ledger
 - Accounts Payable
 - Payroll

S/38 MAPICS (cont'd)**PRODUCTION CONTROL AND COSTING (5714-M41)**

The Production Control and Costing application provides for shop packet creation and for the tracking and costing of an ordered item as it is manufactured; it also measures work center utilization and efficiency plus queue analysis and control functions, similar to the IPICS FDPs. The application also creates, maintains, and updates the operation and miscellaneous charge information associated with jobs within the user's shop. It requires the installation of Inventory Management and has optional interfaces with Accounts Payable, Payroll, and Product Data Management as well as accepting data from Data Collection System Support (Product Data Management is highly recommended). Open operation information may also be passed on to Capacity Requirements Planning.

This application uses information which Inventory Management creates and maintains in conjunction with its own information to produce all necessary reports to track and cost an order. In addition, it produces a prioritized worklist by work center to assist production control in moving work through the shop in the most efficient manner.

The capability of accepting transactions via the workstation and/or diskette is provided in order to support Data Collection System Support diskette output. The transactions passed via the Data Collection System Support interface are labor, moves, and machine times. The labor transaction depends on the user's request of a Payroll interface. If the Payroll interface has been requested, the labor transactions are passed through payroll to Production Control and Costing.

Additional functions include inquiry of order status, item status, and work center status, as well as report printing of order status and open order exceptions.

IBM System/38 MAPICS Production Control and Costing requires the use of the MAPICS Inventory Management (5714-M45) application.

PAYROLL (5714-M42)

The Payroll application starts with the basic employee time record as input, and handles the calculation of wages, taxes, deductions, checkwriting, and file updating for both salaried and hourly pay plans. Employee time data may be entered from a workstation or can be passed from the Data Collection System Support application. Payroll can interface with both the General Ledger and Production Control and Costing applications. Transactions may be passed to General Ledger on either a cash or accrual basis during printing of the payroll distribution journal. Relative to MMAS, the accrued procedures have been modified to precisely relate pay periods to accounting periods. Job-related data for both hourly and salaried employees can be passed to the Production Control and Costing application.

Current payroll data is entered from time cards or job reports either daily or weekly, and is edited to validate employee and job information. A user with an incentive payroll must manually calculate gross pay and then enter it into the system. In addition to calculating present Federal and FICA taxes, a standard tax algorithm is provided to calculate most present state taxes based upon customer-provided data. Local taxes may also fit the standard tax algorithm provided. The state disability insurance deductions also use a standard algorithm based upon customer-provided data. Wages subject to Federal Unemployment Insurance (FUI) and State Unemployment Insurance (SUI) are entered. Deduction programs compute voluntary deductions for a specific pay period as well as one-time and union deductions. All necessary reports are furnished including payroll register, deduction reports, checks, Federal 941-A reports, and W-2 reports.

Support for up to 20 companies, a manual payroll check procedure, and the ability to handle an employee working in multiple states, counties, cities, unions, jobs, or shifts on the same day are provided to give the user wide flexibility. Labor distribution of payroll hours and dollars is done in the same detail as the basic employee time record; that is, department, work center, job number, operation.

Several other reports are printed:

- Vacation, holiday, and sick pay register
- Year-to-date and quarter-to-date earnings register
- State and local tax register
- Check reconciliation register
- Workmen's compensation worksheet
- Union deduction register
- Paychecks (with option to print employee address)
- Federal Government reports 941-A, W-2 (and associated registers)

ACCOUNTS PAYABLE (5714-M43)

The Accounts Payable application keeps accurate and detailed records of vendor invoices and credit memos from the time they are entered into the system until they are paid and the check reconciled. Although Accounts Payable can be installed on a standalone basis, it is frequently used with the General Ledger application to which it can distribute the dollar amounts spent against the proper account numbers. There

also exists an interface to Production Control and Costing by which Accounts Payable can pass job-related purchase information.

Transaction auditing is aided by a journal referencing scheme which causes every transaction affecting General Ledger to refer to a particular journal and line number within that journal. A double-entry bookkeeping method keeps transactions in balance.

Procedures for handling manual checks, petty cash, and check reversals are provided as well as online selection of invoices for payment selection, including partial payments, selection by date, and selection by vendor and invoice. Credit memos can be automatically generated, allowing the user to reverse a previously entered invoice without having to rekey all the invoice's indicative information and distribution.

Support is provided for up to 20 companies. Key reports include an aged payables report, two vendor analysis reports, plus normal accounts payable audit trails such as purchase journal, cash requirements reports, and cash disbursements journal. When checks are printed, options are available to make the checks payable to 'assignees' (due to factoring by the vendor) and to print remittance advice 'overflow' data on a separate remittance advice form.

ACCOUNTS RECEIVABLE (5714-M44)

The Accounts Receivable application keeps detailed records of customer charges, cash payments, credit and debit memos, and other adjusting entries from the time they are entered into the system until they are paid or otherwise applied. The application allows for a combination of open item and balance forward handling of individual customer accounts. Interfaces with Order Entry and Invoicing, Sales Analysis, and General Ledger are provided.

Invoices and credit memos can be entered directly and/or received from the Order Entry and Invoicing application. Cash receipts and adjustments are entered into the system directly, update the accounts receivable immediately, and generate general ledger transactions. The application provides optional late charges by customer for both open items and balance forward accounting and support for up to 20 companies.

The user can generate account status reports as required, for a single customer or a group of customers as well as an aged trial balance in any of the following forms:

- Summary or detail
- Past due accounts only
- Delinquent accounts only
- Minimum balance
- Aging based on current status
- Aging based on date of next statement

Additionally, statements and delinquency notices can be printed at user-determined frequency. The following features are provided:

- Option to age unapplied cash/adjustment.
- Ability to identify credit memo by a unique number, but still relate the credit memo back to a specific invoice number.
- Ability to apply cash, without knowing specific invoice numbers.
- Ability for invoices to be considered current at a future time period (future aging).

INVENTORY MANAGEMENT (5714-M45)

The Inventory Management application processes all transactions affecting the status of the inventory balances. It is a central application which can interface with Order Entry and Invoicing, Sales Analysis, Product Data Management, and Data Collection System Support applications. Inventory Management is a prerequisite for installing Material Requirements Planning, Production Control and Costing, or Capacity Requirements Planning.

The basic functions of this application provide the 'in's and out's' of inventory accounting plus the ability to cycle count the physical inventory. The reporting functions include calculating current inventory investment and the annual inventory turns as well as valuation techniques for tax reporting. And finally, you have the ability to release purchase and manufacturing orders and track their progress until each order is closed out.

The application provides for inventory valuation based on average, last, or standard costs as well as LIFO and FIFO options. Physical inventory checklists can be generated for multiple or selected warehouses, with or without cycle count options. In addition to printing a stock transaction register for audit control, a stock status report can be printed for all items or on an exception basis, and a stock status review can be had by item or by item within vendor.

A component's 'availability check' is performed during the release phase, and items and orders with shortages are identified on special exception reports. At order release time, component allocation for manufacturing orders can be done to ensure that component inventory needs are accounted for between order release time and the actual withdrawal from stock.

S/38 MAPICS (cont'd)

Transactions can be entered from diskette or workstations. Transactions entered from diskette go through a batch edit and batch update. Transactions entered through a workstation are edited immediately, and can update balances either immediately, or later (based on a System Tailoring Option). In either case, an audit trail of all transactions is produced.

PRODUCT DATA MANAGEMENT (5714-M46)

The Product Data Management application maintains bills of material, product options, routing, and work center data bases and provides for costed retrievals and cost simulation. In interfacing with Inventory Management, Order Entry and Invoicing, Material Requirements Planning, Capacity Requirements Planning, and Production Control and Costing, this application is an information point for bills of material and routings.

The ability to perform inquiry into the product structure and routing files is provided. Application highlights include the capability for multiple screen displays, mass replace, mass delete, and same-as-except functions which facilitate maintenance to the product structure file. In addition to option handling techniques, use of engineering effectivity dates simplifies engineering change control procedures. Labor and overhead rate tables can be used for costing in lieu of routing and work center files.

Several reports can be printed:

- Listings of item master, products and their associated features and options and work center master
- Retrievals of product structures and routings
- Cost reports including management cost summary and cost variations

GENERAL LEDGER (5714-M47)

The General Ledger application is the terminal point of all accounting entries; it integrates completely with Accounts Payable and Payroll and accepts cash receipts and adjustment entries from Accounts Receivable. Though it can be installed apart from the other applications, a larger number of ledger entries result from the distribution of expenses incurred through Accounts Payable. Therefore, a majority of General Ledger users will likely install Accounts Payable and/or Payroll.

Each transaction entered is assigned a journal number and a unique line number within that journal. This journal reference number is kept with the transaction until it is posted to the master record during period-end closing. Transactions coming from other interfacing applications also use this reference numbering scheme. This makes auditability easier throughout the application. Thorough editing of all data at entry time plus the fact that a double-entry bookkeeping system is used ensures that all credit entries are offset by an equal value of debit entries, and provides for smooth period closings. Diskettes can be used for processing recurring entries. The application gives the user support for up to 20 companies and a choice of either a 12-month or 13-period fiscal year. The general ledger listing displays (by account number) the transaction original journal reference number, providing a clear and easily used audit trail of all transactions.

The balance sheet and income statement can be formatted to the user's particular requirements by use of a format file which permits special spacing, user-specified columnar printing, user-specified totaling, and up to 73 accounts to be totaled and printed with one line of description. By exploiting the capabilities of the format file, the user can produce departmentalized and/or combined (not consolidated) statements for multiple companies. Both the balance sheet and income statement can be comparative to last year and the income statement can also be comparative to budget figures.

SALES ANALYSIS (5714-M48)

The Sales Analysis application consolidates all sales and credit memo transactions affecting customers, salespersons, and items that have been entered into the system. Input can come from Order Entry and Invoicing, Inventory Management, or Accounts Receivable; at least one of these applications must be installed as a prerequisite.

Data is passed to Sales Analysis via interface files as shown:

Customer-related data can come from	Salesperson-related data can come from	Item-related data can come from
OE & I A/R	OE & I A/R	OE & I IM

In addition to these interfaces, Order Entry and Invoicing can provide customers order data for detailed analysis if the user desires. Either 12-month or 13-period reporting can be selected by the user. These transactions are posted to summary files which provide a historical data base for management reports. Summary files may also be corrected by file maintenance with an entry list providing an audit control.

The application provides multicompany support for up to 20 companies for customer summary analysis, for flagging specific items for inclusion in sales analysis, and for inquiry into the summary files from the

workstation. The reports included in the application are sales by customer, salesperson, and item, with the option to display comparative data as well.

The System/38 MAPICS Sales Analysis application requires the use of at least one of the following MAPICS applications:

- Order Entry and Invoicing (5714-M49)
- Accounts Receivable (5714-M44)
- Inventory Management (5714-M45)

ORDER ENTRY AND INVOICING (5714-M49)

The order entry function is a key starting point for activity in a manufacturing organization. For make-to-order products, this function describes the item to be manufactured and when the item is required. For products shipped from inventory, it streamlines the order processing so items can be shipped promptly. It interfaces with Inventory Management by directly updating quantity-on-hand data, with Accounts Receivable by providing invoice summary information, and with Sales Analysis by providing item, customer and salesperson data. The data stored in the open order files can also be analyzed by Material Requirements Planning and Capacity Requirements Planning.

As orders are entered, customer data is validated and a credit check is performed, initial ship dates may be established based on inventory availability or manufacturing orders, and item pricing data is checked for validity and completeness. A blanket order specifies a single item with multiple ship dates and specific quantities. Both order types may be entered in a similar manner. Invoicing may be accomplished by either direct entry or from orders previously entered into the system. Invoicing encompasses the computation of prices, taxes, and invoice totals. Pricing can be based on established contract prices, quantity breaks, markup from cost, or discounting from list price. Order acknowledgments, picking lists, invoices, and bills of lading, can be printed.

If Product Data Management is installed, orders can be entered for end items which have standard options associated with them. Since these options may be required, they are checked at entry time to make sure all required options are specified.

As soon as the Open Order files have been updated, the user has immediate access to current information such as:

- All orders for a particular item
- All orders for a particular customer
- Details for a particular order
- Blanket order status
- Customer status

The application also handles credit memo printing and the posting of back orders to the open order files. Support for up to 20 companies is provided as well as the generation of worksheets for general ledger input, commission accounting and taxing body reporting.

DATA COLLECTION SYSTEM SUPPORT (5714-M4A)

The Data Collection System Support application provides an interface between a 5230 Data Collection System and the Payroll, Inventory Management and Production Control and Costing applications. Inventory and labor transactions can be entered at conveniently located terminals, so information can be entered as it occurs, thereby eliminating many manual steps before this data can be processed on the System/38. Therefore, it provides a link between shop floor reporting and the System/38 MAPICS applications and an integrated labor reporting payroll production control system.

The Data Collection System Support application allows the definition of unique shop floor actions which are suited to individual customer requirements. The output from this definition phase is used by the 5231 Controller. Data from the 5230 is recorded on diskettes or cards which can be carried to the System/38. Elapsed time is then calculated (based on user options regarding shift start/stop times, lunch breaks, and other paid/unpaid breaks) and prepared for payroll processing as attendance records or job records. The application will also apportion the employee's time if that employee has worked on overlapping jobs.

The application produces attendance, absentee and labor reports, which provide a complete audit trail. Labor transactions may also be entered on the 5251 Display Station, as well as 5230 stations, to utilize the elapsed time calculations for payroll processing prior to installing a 5230 system.

MATERIAL REQUIREMENTS PLANNING (5714-M4B)

The Material Requirements Planning application is divided into three parts: Master Production Schedule Planning (MPSP), Material Requirements Planning (MRP), and Order Release Planning (ORP). This application interfaces with and requires installation of Inventory Management and Product Data Management. It also interfaces with Order Entry and Invoicing to the extent that it can compare a master production schedule against customer orders. Firm planned and planned orders can be passed to Capacity Requirements Planning.

S/38 MAPICS (cont'd)

MPSP determines the production schedule for master-level items (designated by a code in the item master record). Master level requirements can be compared to forecast and/or customer orders to evaluate the manufacturing plan. Typically, planning requirements for master level items is an interactive process. This process is simplified by various reports and workstation inquiries. The Material Requirements Planning reports include requirements planning, purchase planning, order recommendation, and cash analysis reports. A shortage report can be generated in the order release cycle if the user chooses to do an availability check. In addition, order release/review and requirements by item inquiries are supported.

Material Requirements Planning will take the approved output of MPSP and generate a total material plan to meet this schedule. This new plan can either be rebuilt (generation) or it can consist of differences from a previous plan (net change). Order recommendations produced from MRP become input to order release. The planner can review changes and approve orders scheduled for release.

System/38 MAPICS Material Requirements Planning requires the use of both the MAPICS Inventory Management (5714-M45) and MAPICS Product Data Management (5714-M46) applications.

CAPACITY REQUIREMENTS PLANNING (5714-M4G)

The Capacity Requirements Planning Application is designed to analyze a company's production plan in terms of its plant capacity. This is a very useful tool for a company that wishes to identify those work centers and time periods when over or underload conditions may be expected to develop. The application allows the production manager to meet the short term over or underload condition by entering a temporary increase or decrease in work center capacity for a specified time period in the future.

Medium term analysis using the capacity planning run can help a company distinguish between scheduling problems and capacity problems that require changes to the base capacity of a work center.

The production plan used by the application is based on capacity requirements from several sources: Open orders, firm planned orders, planned orders, and under some restrictions, customer orders. Accurate start dates and operation durations are imperative for each manufacturing operation whether these operations come from Production Control and Costing or from Product Data Management's standard routings.

When the production plan and plant capacity have both been defined, capacity planning is ready to schedule and accumulate the workload by user-defined time periods. This process will produce analysis files for workstation inquiry or report printing and may be repeated to help users tune their plant capacity to the current production plan.

Capacity Requirements Planning is a dependent application. It requires orders (customer, open, firm planned and/or planned) and specifications (routing and/or open operations). The minimum requirement to support Capacity Requirements Planning is:

Inventory Management (5714-M45) and Product Data Management (5714-M46)

or

Inventory Management (5714-M45) and Production Control and Costing (5714-M41).

CUSTOMER RESPONSIBILITIES

Installation of System/38 application programs is a customer responsibility. IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI Section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified environment:

HARDWARE REQUIREMENTS

Each of these licensed programs will execute on all models of the IBM System/38 with a minimum of:

- 768K bytes of main memory
- 128 megabytes of auxiliary storage
- One line printer
- One IBM 5251 display station with a 1920-character display screen

The minimum system configuration stated above is intended to define the licensing requirements for these licensed programs in order for the customer to obtain Program Services. The minimum configuration is intended to define the System/38 requirements for a single application customer environment.

Although there is nothing inherent in the design of the IBM System/38 MAPICS applications which prevents the use of the minimum system

configurations stated above, the system configuration for a particular customer must be able to accommodate the expected business volumes, data files, and operating requirements.

The amount of disk storage required is influenced by the:

- Number of applications installed
- Volume of daily transactions
- Number of records in the required master files

Additionally, a main storage capacity greater than the stated minimum required will often provide improved performance. For example, performance is affected by:

- Number of applications operating concurrently
- Number of workstations operating concurrently within the same or different applications

System/38 MAPICS is intended to be an independent yet interrelated set of applications. Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries. Design features have been incorporated into the IBM System/38 MAPICS applications to allow for co-residency of other applications and/or user-written programs with minimum restrictions. Consult the IBM System/38 MAPICS logic manual for further explanation of these restrictions.

SOFTWARE REQUIREMENTS

The IBM System/38 MAPICS application programs are written in System/38 RPG III programming language and executed under control of the IBM System/38 System Control Facility (5714-SS1). The IBM System/38 Conversion Format Utility (5714-CV2) must be ordered for use with the system. The IBM System/38 RPG III Compiler (5714-RG1) is required if modifications to the source code are desired.

The IBM System/38 MAPICS Material Requirements Planning, Capacity Requirements Planning, Production Control and Costing, and Sales Analysis applications require the use of other MAPICS applications as prerequisites. Refer to the descriptions of these four MAPICS applications for the specific requirements.

PURPOSE

The IBM System/38 Manufacturing Accounting and Production Information Control System (System/38 MAPICS) is based on System/34 MAPICS and is enhanced by utilizing the advanced systems and programming facilities of the System/38. It provides an integrated and comprehensive workstation-oriented manufacturing control system for the manufacturing industry and some of the like process industries.

Note: These programs have been written primarily to U.S. requirements, but in many cases they also satisfy AFE and EMEA country requirements.

HIGHLIGHTS

- The System/38 hardware and system software functions of the Control Program Facility are integral parts of the System/38 MAPICS application design.
- Workstation data entry is designed for simplicity and ease-of-use. Screen displays provide guidance for mandatory input and for fields that may be overridden. Error messages signal errors which can then be corrected interactively by the operator.
- Interactive data entry, concurrent edit and correction for multiple applications and multiple workstations is provided while batch programs operate in the background.
- Inquiry into master files concurrent with data entry.
- System tailoring procedures permit the user to select optional functions and reports. Selections may be modified as the customer environment changes by re-executing the tailoring procedures.
- Source code, ready-to-execute procedures, and object code are provided. Although no additional systems design, programming, or compiling is required, the systems design incorporates features to assist the user in the modification of source code.
- Online file maintenance of most master files with file maintenance reports.
- Optional system procedures for master file backup and restart.
- Password security deters unauthorized use of applications, and functions within applications. A second level of security protects selected master file data.
- File load programs for master files are provided.
- Documentation for each application includes a reference manual, an operations guide and a logic manual. An overall System/38 MAPICS system reference manual, an operations guide, and a logic manual are provided. Self-study instructional material is also available for operator education.
- Sample documents are provided for both data collection and data entry.
- Control features and documents are included to assist in establishing audit trails.

DESCRIPTION

System/38 MAPICS is a set of six independent, but interrelated, ready-to-execute applications for the small-to-medium manufacturer consisting of:

Order Processing and Accounting Applications
Order Entry and Invoicing
Inventory Management

Manufacturing Applications
Product Data Management
Material Requirements Planning
Production Control and Costing
Capacity Requirements Planning

These applications are designed for marketing in any combination and installing in any sequence, with the following exceptions:

- Material Requirements Planning requires both Inventory Management and Product Data Management.
- Production Control and Costing requires the Inventory Management application. (Although Product Data Management is not an absolute requirement, its use is highly recommended.)

- Capacity Requirements Planning requires the Inventory Management application and either Product Data Management or Production Control and Costing.

Each application has certain required records within a cross-application control file which contain questionnaire responses. These records allow the selection of report formats and functions to suit the user's needs. The questionnaire responses are entered during initial installation and may be changed as needed. The System Tailoring Procedures allow these responses to be entered or modified. It provides the following:

- Tailors the application on-site at installation time.
- Allows the user to activate and deactivate provided functions as the user's business changes.
- All functions are included in the application programs but only required functions are actually executed.

Reference manuals provide an explanation of the system to enable the user to understand the applications from a functional and operational standpoint. Installation guidance is included in this manual and provides detailed step-by-step instructions on procedures to follow during installation. These instructions include sample numbering systems, sample input and maintenance data forms, file loading sequences, and control forms with suggested procedures. Manuals are provided at two levels. A reference manual provided for System/38 MAPICS gives guidance to the installation supervisor on managing and running the applications from a total systems viewpoint. One management operations manual is provided for System/38 MAPICS operations covering all six applications. Individual application reference manuals for each application instruct the workstation manager on how to conduct day-to-day operations of the application.

Similarly, one operations guide is provided for the systems console operator and individual application operation guides for the workstation operators. The console operations guide contains detailed step-by-step instructions for operating System/38 MAPICS at the console. Included are an overview of the system and application flow, system considerations, hints on troubleshooting, and all of the error messages that can be generated by any of the applications in the offering. The individual application operation guides provide a summary of the application and workstation operations, application and screen flow, application messages, and a detailed description of how to run each procedure in the application.

The System/38 MAPICS logic manual is provided as licensed material for use by the self-sufficient customer, and for the Systems Engineer in maintaining and modifying System/38 MAPICS. Information on system architecture, naming conventions, system controls, system program functions and specifications, relationship among system files, and other information applicable to all applications is presented in this system manual. In addition, logic manuals for maintaining and modifying each application are available. Information relevant only to the subject application, such as program descriptions, cross-reference lists, and data dictionary, is presented.

Two self-study instructional packages will be provided for the system and workstation operators. The objective of this material is to familiarize the operators with the tasks required to run the applications. They are designed around the operations guides and provide instructions and exercises in the use of the guides.

Modular Application and Systems Training (MAST) is available to help identify and quantify benefits for top executives. MAST aids your customer in planning an effective implementation and includes techniques to assure top priority and the commitment of all the necessary resources. To assist in determining Management function and fit, there is a MAPICS features course for all MAPICS applications. In addition, for inventory control, product data management, and production control, there are concepts, implementation and 'using the system' courses to make the customer more self-sufficient and reduce the effort and time required to install these applications.

MATERIAL REQUIREMENTS PLANNING (5714-MSB)

The Material Requirements Planning application is divided into three parts: Master Production Schedule Planning (MPSP), Material Requirements Planning (MRP), and Order Release Planning (ORP). This application interfaces with and requires installation of Inventory Management and Product Data Management. It also interfaces with Order Entry and Invoicing to the extent that it can compare a master production schedule against customer orders. Firm and planned orders can be passed to Capacity Requirements Planning.

MPSP determines the production schedule for master-level items (designated by a code in the item master record). Master level requirements can be compared to forecast and/or customer orders to evaluate the manufacturing plan. Typically, planning requirements for master level items is an interactive process. This process is simplified by various reports and workstation inquiries. The Material Requirements Planning reports include requirements planning, purchase

S/38 MAPICS Spanish Language Version (cont'd)

planning, order recommendation, and cash analysis reports. A shortage report can be generated in the order release cycle if the user chooses to do an availability check. In addition, order release/review and requirements by item inquiries are supported.

Material Requirements Planning will take the approved output of MPSP and generate a total material plan to meet this schedule. This new plan can either be rebuilt (generation) or it can consist of differences from a previous plan (net change). Order recommendations produced from MRP become input to order release. The planner can review changes and approve orders scheduled for release.

CAPACITY REQUIREMENTS PLANNING (5714-MSG)

Capacity Requirements Planning is designed to analyze a company's production plan in terms of its plant capacity. This is a very useful tool for a company that wishes to identify those work centers and time periods when over or underload conditions may be expected to develop. The application allows the production manager to meet the short term over or underload condition by entering a temporary increase or decrease in work center capacity for a specified time period in the future.

Medium term analysis using the capacity planning run can help a company distinguish between scheduling problems and capacity problems that require changes to the base capacity of a work center.

The production plan used by the application is based on capacity requirements from several sources: Open orders, firm planned orders, and planned orders. Accurate start dates and operation durations are imperative for each manufacturing operation whether these operations come from Production Control and Costing or from Product Data Management's standard routings.

When the production plan and plant capacity have both been defined, capacity planning is ready to schedule and accumulate the workload by user-defined time periods. This process will produce analysis files for workstation inquiry or report printing and may be repeated to help users tune their plant capacity to the current production plan.

PRODUCTION CONTROL AND COSTING (5714-MS1)

The Production Control and Costing application provides for shop packet creation and for the tracking and costing of an ordered item as it is manufactured; it also measures work center utilization and efficiency plus queue analysis and control functions, similar to the IPICS FDPs. The application also creates, maintains, and updates the operation and miscellaneous charge information associated with jobs within the user's shop. It requires the installation of Inventory Management and has optional interfaces with Product Data Management. (Product Data Management is highly recommended.) Open operation information may also be passed on to Capacity Requirements Planning.

This application uses information which Inventory Management creates and maintains in conjunction with its own information to produce all necessary reports to track and cost an order. In addition, it produces a prioritized worklist by work center to assist production control in moving work through the shop in the most efficient manner.

Additional functions include inquiry of order status, item status, and work center status, as well as report printing of order status and open order exceptions.

INVENTORY MANAGEMENT (5714-MS5)

The Inventory Management application processes all transactions affecting the status of the inventory balances. It is a central application which can interface with Order Entry and Invoicing, Capacity Requirements Planning and Product Data Management applications. Inventory Management is a prerequisite for installing Material Requirements Planning or Production Control and Costing.

The basic functions of this application provide the 'in's and out's' of inventory accounting plus the ability to cycle count the physical inventory. The reporting functions include calculating current inventory investment and the annual inventory turns as well as valuation techniques for tax reporting. And finally, you have the ability to release purchase and manufacturing orders and track their progress until each order is closed out.

The application provides for inventory valuation based on average, last, or standard costs as well as LIFO and FIFO options. Physical inventory checklists can be generated for multiple or selected warehouses, with or without cycle count options. In addition to printing a stock transaction register for audit control, a stock status report can be printed for all items, or on an exception basis, and a stock status review can be had by item or by item within vendor.

A component's 'availability check' is performed during the release phase, and items and orders with shortages are identified on special exception reports. At order release time, component allocation for manufacturing orders can be done to ensure that component inventory needs are accounted for between order release time and the actual withdrawal from stock.

Transactions can be entered from diskette or workstations. Transactions entered from diskette go through a batch edit and batch update.

Transactions entered through a workstation are edited immediately, and can update balances either immediately, or later (based on a System Tailoring Option). In either case, an audit trail of all transactions is produced.

PRODUCT DATA MANAGEMENT (5714-MS6)

The Product Data Management application maintains bills of material, product options, routing, and work center data bases, and provides for costed retrievals and cost simulation. In interfacing with Inventory Management, Material Requirements Planning, Capacity Requirements Planning, and Production Control and Costing, this application is an information point for bills of material and routings.

The ability to perform inquiry into the product structure and routing files is provided. Application highlights include the capability for multiple screen displays, mass replace, mass delete, and same-as-except functions which facilitate maintenance to the product structure file. In addition to option handling techniques, use of engineering effectivity dates simplifies engineering change control procedures. Labor and overhead rate tables can be used for costing in lieu of routing and work center files.

Several reports can be printed:

- Listings of item master, feature/option table and work center master
- Retrievals of product structures and routings
- Cost reports including management cost summary and cost variations

ORDER ENTRY AND INVOICING (5714-MS9)

The order entry function is a key starting point for activity in a manufacturing organization. For make-to-order products, this function describes the item to be manufactured and when the item is required. For products shipped from inventory, it streamlines the order processing so items can be shipped promptly. It interfaces with Inventory Management by directly updating quantity-on-hand data. The data stored in the open order files can also be analyzed by Material Requirements Planning and Capacity Requirements Planning.

As orders are entered, customer data is validated and a credit check is performed, initial ship dates may be established based on inventory availability or manufacturing orders, and item pricing data is checked for validity and completeness. A blanket order specifies a single item with multiple ship dates and specific quantities. Both order types may be entered in a similar manner. Invoicing may be accomplished by either direct entry or from orders previously entered into the system. Invoicing encompasses the computation of prices, taxes, and invoice totals. Pricing can be based on established contract prices, quantity breaks, markup from cost, or discounting from list price. Order acknowledgments, picking lists, invoices, and bills of lading, can be printed.

If Product Data Management is installed, orders can be entered for end items which have standard options associated with them. Since these options may be required, they are checked at entry time to make sure all required options are specified.

As soon as the Open Order files have been updated, the user has immediate access to current information such as:

- All orders for a particular item
- All orders for a particular customer
- Details for a particular order
- Blanket order status
- Customer status

The application also handles credit memo printing and the posting of back orders to the open order files. Support for up to 20 companies is provided as well as the generation of worksheets for general ledger input, commission accounting and taxing body reporting.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI Section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support, as described under "Program Services", will be provided for these licensed programs when they are operated in the following specified environment:

HARDWARE REQUIREMENTS

Each of these licensed programs will execute on all models of the IBM System/38 with a minimum of:

- 768K bytes of main memory
- 129.5 megabytes of auxiliary storage
- One system printer with print speed of 160 lines-per-minute

S/38 MAPICS Spanish Language Version (cont'd)

- One 1920-character display station

The minimum system configuration stated above is intended to define the licensing requirements for these licensed programs in order for the customer to obtain Program Services. The minimum configuration is intended to define the System/38 requirements for a single application customer environment.

System/38 MAPICS is intended to be an independent yet interrelated set of applications. Many functions have been included to protect the integrity of the master files, programs, procedures and libraries. Design features have been incorporated into the System/38 MAPICS applications to allow for co-residency of other applications and/or user-written programs with minimum restrictions. Consult the System/38 MAPICS logic manual for further explanation of these restrictions.

SOFTWARE REQUIREMENTS

The IBM System/38 MAPICS application programs are written in System/38 RPG III programming language and executed under control of the IBM System/38 System Control Program Facility (5714-SS1). The IBM System/38 Conversion Format Utility (5714-CV2) must be ordered for use with the system. The IBM System/38 RPG III Compiler (5714-RG1) is required if modifications to the application programs are made.

TERMS and CONDITIONS

Program Services: Central Service and Local Service ... **Testing Period:** 30 days ... **Installation License Applies:** Yes ... **Warranted:** Yes

**SYSTEM/38 REMOTE JOB ENTRY FACILITY (RJEF)
5714-RC1**

PURPOSE

The IBM System/38 Remote Job Entry Facility (RJEF) licensed program provides support for the IBM System/38 to function as a remote job entry (RJE) workstation for submission of jobs to a host IBM System/370, 30XX, or 43XX using Binary Synchronous Communications (BSC) and/or Synchronous Data Link Control under Systems Network Architecture (SNA/SDLC).

HIGHLIGHTS

BSC Support

- Multi-leaving support concurrent with other System/38 programs and device operations.
- Up to seven readers operating concurrently.
- Up to seven printers operating concurrently.
- Up to seven punches operating concurrently.

The maximum number of readers, printers or punches is dictated by the host system.

Note: The total number of printers and punches operating concurrently cannot exceed eight.

SNA/SDLC Support

- Multi-session support concurrent with other SNA/SDLC activity on the line and with other System/38 program and device operations.
- Up to 15 readers operating concurrently.
- Up to 15 printers operating concurrently.
- Up to 15 punches operating concurrently.

The maximum number of readers, printers and punches is dictated by the host system.

General Support

- Reader input from data base.
- Reader input from workstation.
- Reader input from MFCU.
- Printer output to data base.
- Printer output to printer device file.
- Punch output to data base.
- Punch output to MFCU.
- Print or punch output directed to user program.
- Concurrent multiple RJE console interfaces to input host commands and view host and RJEF messages.
- Reader input may be queued for later transmission if RJE is not running.
- Standard System/38 command interface used for RJE commands except for READFILE and EOF control statements which are consistent with System/34.
- READFILE nesting supported.
- Capability of having operational messages sent to separate user message queues for:
 - Writer special forms handling.
 - Writer standard forms handling.
 - Reader READFILE processing.
- Forms control table supported to provide for special forms handling.
- Automatic creation/addition of new members to existing data base files.
- Automatic reblocking of user data for both reader data sent and writer (Printer/Punch) data received.
- Utility function to convert data written to data base in compressed format to decompressed data written to another data base file, a printer device file, or a card device file.
- RJEF data security operates under the system security mechanisms.
- RJEF SNA support allows RJEF operations concurrent with other SNA operations on the same line.

DESCRIPTION

RJEF communicates with the host system over a point-to-point (switched or nonswitched) communications line via BSC. Host system RJE programming support should be generated specifying System/3 with console support.

RJEF communicates with the host system over a point-to-point (switched or nonswitched) or multipoint (as a tributary) communications line via SNA/SDLC. Host system RJE programming support should be generated specifying LUTYPE1 (3770 with multiple logical attachment).

System/38 RJEF communicates with the currently available releases of host processing subsystems OS/VS1 RES, OS/VS2 JES2, and OS/VS2 JES3, or VM/370 Remote Spooling Communications Subsystem (RSCS) networking program product as a System/3 RJE workstation when using BSC line protocol. When using the SNA/SDLC protocol, RJEF communicates with the host processing subsystems OS/VS1 RES, OS/VS2 JES2, and OS/VS2 JES3, or DOS/VSE POWER/VSE as a 3770 RJE workstation. When support for more than three readers or writers is desired, the host system RJE programming support for BSC should be generated specifying the System/38 as a System/360 Model 25 or greater.

Input

Commands to submit a remote job stream may be entered from a workstation or a batch job. Multiple submit requests may be queued regardless of the active status of the RJE Facility. When RJEF is started, it will accept those queued requests and transmit the specified remote job stream files on a FIFO basis.

Output

Output from the host system can be directed optionally to:

- A printer device file (spooled or nonspooled).
- User pre-specified data base file members, based on data contained in the central system forms mount message.
- A data base file member optionally created by the RJEF communications process.
- A user program.

Default responses may be selected for messages issued by RJEF to permit unattended execution.

In addition to the immediate and controlled termination of the RJEF session, an IDLETIME termination is available to hold the communications line open for a user-defined time following the last transmission. This supports the unattended RJEF communications execution and also allows waiting to ensure all input or output has been processed.

CUSTOMER RESPONSIBILITIES

Installation of System/38 licensed programs is a customer responsibility. IBM may provide marketing assistance, in accordance with Marketing and Service Guidelines in the GI Section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

This licensed program runs on all models of IBM System/38.

SOFTWARE REQUIREMENTS

IBM System/38 RJEF licensed program is designed to operate under control of the IBM System/38 CPF (5714-SS1) Release 5.0.

DOCUMENTATION
(available from Mechanicsburg)

The following documents are scheduled to be updated and available in June 1983:

S/38 Remote Job Entry Facility (RJEF) Licensed Program Specifications (GC21-7916) ... S/38 Remote Job Entry Planning and Installation Guide (SC21-7924) ... S/38 Remote Job Entry Facility User's Guide (SC21-7914).

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

SYSTEM/38 RPG III 5714-RG1

PURPOSE

IBM System/38 RPG III is an upward compatible (with source changes) extension of the proven RPG II programming language available on IBM System/3, System/34, and other IBM Systems. New capabilities have been added to support System/38 Data Base Data Management, integrated work station support, user controlled logic flow, improved interprogram communications, and increased productivity.

Major features of RPG III are in the areas of program design flexibility, additional operation codes for increased function, and documentation.

HIGHLIGHTS

- The IBM RPG III licensed program includes:
 - Compiler
 - Command for Invoking the Compiler
 - Source File for RPG Source Statements
 - Message File
 - Syntax Checker (for Source Entry Utility)
 - Auto Report
 - Command for Invoking Auto Report
- Design Flexibility
 - Externally Described Files
 - Full Procedural File Capability
 - Programmer File Control
 - 'CALL' to Another Program with Parameter Passing
 - Data Structures
 - Multiple Occurrence Data Structures
 - Logic Flow Control
 - Optional User Error Handling
 - User-Defined Edit Codes
 - Dynamic Space/Skip Function
- Operation Code Enhancements
 - New File Processing Operation Codes
 - Direct Control of Workstation Files
 - Subfiles
 - Parameter Passing
 - DOWHILE, DOUNTIL, and IFTHENELSE
 - Compare and Branch
 - Short Form of Calculation Statement
 - Indicators as Data
 - Array Sorting
 - Composite Key Definition
- Documentation
 - Cross-Reference List
 - Text Description from DDS
 - SEU Sequence Number (if SEU used)
 - Source Diagnostic Error
 - Nested Level Indication

DESCRIPTION

Enhanced Design Flexibility: For design approach flexibility, System/38 RPG III permits traditional I/O coding, includes the Auto Report feature, and also allows the incorporation of externally-described files. The file description specification is used to indicate an externally described file. Descriptions of records and fields are stored with the file not in the source program.

System/38 RPG III allows the user to process the same file in both a random and sequential manner in the same program (full procedural file specification). It also permits the user to write a program without a 'primary' file (programmer I/O control).

System/38 allows any RPG III program to call any other program, including CL programs.

System/38 RPG III provides the capability to redefine (one or more times) fields (data structures) and the processing of either the entire field or any of the subfields.

- Data structure support lets the programmer:
 - Divide a field into subfields (without using MOVE and MOVEL).
 - Define a data structure with multiple occurrences.
 - Operate on a subfield and change the contents.
 - Redefine an internal area more than once using different data formats.
 - Define a data structure in the same manner as records are defined, using Input Specifications.
 - Process character fields with length up to 9999.

The user is permitted more logic flow control via support of 'DO', 'DO WHILE', 'DO UNTIL', and 'IFTHENELSE' functions.

- The DO WHILE (DOWXX) operation tests the relationship between FACTOR 1 and FACTOR 2, and if true, executes the instructions until the END operation code, and loops back to the DO WHILE instruction. The relationships tested are indicated in the last two digits of the operation code, such as LT (less than), GT (greater

than), and EQ (equal to). The DO UNTIL operation works in a similar manner.

- The IF/ELSE structure also provides user control of logic flow. The operation code IFXX tests the relationship between FACTOR 1 and FACTOR 2 in the same manner as DO WHILE and DO UNTIL. If the result of the test is true, the instructions between the IFXX operation and the associated END code are executed. If the test is false, the instruction following the END is executed.
- The COMPARE AND BRANCH (CABXX) operation relieves the programmer to a great extent, from indicator-conditioned logic in the calculations. The CABXX operation code indicates a relationship between FACTOR 1 and FACTOR 2 in the XX position (like DO WHILE, DO UNTIL, and IF/ELSE). If the relationship is true, control is passed to the TAG specified in the result field; otherwise, the program executes the next instruction immediately following the CABXX operation. Interaction with the system is permitted by allowing a program to receive feedback and error information from CPF (the system support program product). The programmer can provide subroutines to handle program and file exceptions/errors.

A program can also receive time, date, and shutdown requests from the system.

In addition to system-defined edit codes, five user-defined edit codes are supported as defined to CPF.

Additional space/skip function lets the user dynamically specify space/skip operations of the compiler listing.

Current line number is made available to the program for better control of overflow.

Increased Function: Enhancements for data base data files include new operation codes to allow data base record read, write, update, and delete, as well as file open and close capability.

- Subsequent to an indication on the file description specification, the following operation codes are valid:
 - WRITE - Creates new records in the file.
 - UPDAT - Modifies existing records.
 - DELET - Removes a record from a file.
- The READE (read equal) operation code determines if the next record read from the specified file has a key equal to a specified field or literal.
- The READP (read prior) operation is the same as the current RPG II READ operation, except that the prior record is read instead of the next record.
- The programmer can explicitly open or close a file with the following operations:
 - OPEN - The file named in FACTOR 2 is opened when the instruction is executed.
 - CLOSE - The file named in FACTOR 2 or *ALL files are closed when the instruction is executed. The file or device is disconnected from the program.
 - FEOD - Provides a logical end of data for the file named in FACTOR 2. The file or device is not disconnected from the program.

RPG III coding for display device files is greatly simplified so that it is now similar to that for other directly attached I/O devices. On the file description specification, the programmer specifies a file name that references a file containing formats created by DDS that describes the input or output, or both, for the display device.

The display screen formatting provided through DDS allows indicator usage for conditioning of display functions in conjunction with the associated RPG III program. DDS also permits definition of command keys. The programmer writes the program without being aware of whether workstation devices are local or remote, or the number of workstations that will call the program.

System/38 RPG III also provides easier coding for subfiles (multiple, like records processed in groups).

Operation codes exist to permit parameter (data) accessing among programs.

A conditional compare and branch operation code based on 'greater than', 'less than', etc., is provided.

Factor 1 is no longer required for ADD, SUB, MULT, and DIV operations. If blank, Factor 1 is assumed to be the same as the result field.

The RPG indicators (except 1P) can be referenced and manipulated as data.

A new operation code SORTA can be used to sort an array into the sequence specified on the Extension Specification for the array.

Description of a key field comprised of multiple fields is also supported. The composite key is defined by a KLIST operation code, followed by

S/38 RPG III (cont'd)

one or more KFLD operation codes to designate those fields comprising the composite key.

Documentation Aids: Documentation enhancements include a cross-reference allowing easy access to determine where fields, files, and indicators are used.

DDS text descriptions are available to source documentation.

The SEU (or source file) sequence number is used as the default number method for statements and diagnostics and is carried into the object code to assist in execution time debugging. In addition, for any statement found in error, Position 1 of the compiler listing will show an asterisk. Asterisks will also appear under each field in error in the listing of the source.

Nested level indication shows each statement level in a nest of DO loops and IF/ELSE processing.

RELEASE 5.0 ENHANCEMENTS

System/38 RPG III is being enhanced in Release 5.0 to include support for CPF commitment control, local data area, and for multiple devices in a display or mixed file. CPF commitment control is a mechanism for the user to code restart into interactive programs to assure the integrity of changes made to one or more files. Multiple device and local data area support provides functions similar to System/34.

HIGHLIGHTS

- New operation codes and commitment file designation are being added to support CPF commitment control.
- New operation codes and file specification continuation options have been added to provide multiple device support of display and mixed files.
- Access to the CPF Local Data Area provides function similar to that provided for the System/34.

DESCRIPTION

Definition of files under CPF commitment control and operation codes to cause commitment or return to the prior commitment boundary are being added to RPG III. This support provides the programmer with greater flexibility in designing interactive sessions and greater ease in backing out undesired transactions.

The operation codes (ACQ, REL, POST and NEXT) and file specification continuation options (NUM, IND, SAVDS and ID) are being added for display and mixed file support of multiple devices. These additions will provide functions similar to those provided by the System/34.

The CPF Local Data Area can be read in at the start of an RPG III program and written back at program termination. In addition, the IN and OUT operation codes can be used with other data areas. This support will provide a function similar to that provided by System/34.

CUSTOMER EDUCATION

System/38 RPG III Education is available as follows:

Title	Course	Code
Fundamentals of RPG II Programming	D2005*	
RPG II Programming Workshop	Q1005*	
RPG III Structured Programming Workshop	A2004	

* Not required for the experienced RPG II Programmer

COMPATIBILITY

Usually with minor source changes, batch System/32, System/34, and System/3 RPG II programs can be compiled and executed on System/38. The changes principally involve the Header (H) specification and File Description (F) specification.

CONVERSION REQUIREMENTS

Conversion requirements appear in the *S/38 Installation Manual - Conversion Planning* (GC21-7732).

PLANNING INFORMATION

For existing users, Release 4.1 must be installed prior to installing Release 5.0.

Program Use During Customer Preinstallation Testing: The System/38 RPG III licensed program (5714-RG1) is available to customers for preinstallation testing on IBM Test Center Systems in accordance with IBM's Program Testing Policy.

CUSTOMER RESPONSIBILITIES

Installation of System/38 licensed programs is a customer responsibility. IBM may provide marketing assistance, in accordance with Marketing and Service Guidelines in the GI Section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

IBM System/38 RPG III runs on all models of IBM System/38.

SOFTWARE REQUIREMENTS

IBM System/38 RPG III and/or System/38 COBOL is designed to operate with the IBM System/38 CPF (5714-SS1).

DOCUMENTATION

(available from Mechanicsburg)

IBM System/38 RPG III Licensed Program Design Objectives (GC21-7760).

The following documents are scheduled to be updated and available in June 1983:

S/38 Guide to Publications, Glossary and Master Index (GC21-7726)
... *S/38 RPG III Reference Manual and Programmer's Guide* (SC21-7725).

RPGs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

5714-SS1 - SYSTEM/38 CONTROL PROGRAM FACILITY

PURPOSE

The System/38 Control Program Facility (CPF) program, used with System/38 machine functions, provides these major capabilities: Work Management ... Data Management ... Control Language (CL) ... Security ... Message Facilities ... Spooling ... Communications ... Installation (System Specialization) ... System Services.

HIGHLIGHTS

- Work Management
- Data Management
 - Data Base Data Management (DBDM)
 - Device Support (DS)
 - Data Description Specifications (DDS)
- Control Language (CL)
 - Control Language Programming
 - Single Consistent Interface
- Security
- Message Facilities
- Spooling
- Communications
 - System/38 as a terminal to S/370 IMS/V5 or CICS/V5 (SNA/SDLC)
 - System/38 as a host for remote 5250 Information Display System devices
 - System/38 Binary Synchronous Communications (BSC) facilities
 - Point-to-point
 - Multipoint tributary
- System/38 as a Peer to CICS OS/V5 and CICS/DOS/V5 Version 1 Release 6 and another System/38 using New SNA (LU6.2 and PU2.1).
- Installation (System Specialization)
- System Services
 - Test and Debug Facilities
 - Library Facility
 - Journal Facility
 - Save/Restore Facility
 - Service Facilities
 - File Reference Facility
 - Copy Facility
 - Power Warning Feature

DESCRIPTION

Work Management: The primary functions of the System/38 CPF Work Management are to:

- Accept and process, concurrently, work from multiple users of the system.
- Support batch, interactive, and spooling functions.
- Allocate and control the usage of system resources in a multitasking environment.

Users from any 5250 System display device (or the system console) may initiate work, either interactive or batch. Work Management processes the job requests, acquires the system resources required for the jobs, executes, and terminates the jobs. Work Management supports transaction processing functions.

Work Management handles the contention resulting from multiple jobs competing concurrently for system resources. In order to accomplish this, it manages the scheduling and queuing necessary to share the system resources among all jobs. The user may control the job processing requirements and priorities through the Control Language.

All work is managed concurrently in subsystems (a defined operating environment such as batch, interactive, and spool), and jobs may be allocated to pools (a logical division of main storage) within a subsystem. These features permit the user to establish special operating environments, and control the execution of high priority jobs.

Data Management

- Data Management access methods support sequential, indexed, and direct (relative record number) file organization, and permit multiple user-defined indices per file.
- Data Management provides the support for disk data file handling such as create, add, delete, and traditional data I/O operations like read and write.
- Data Management provides the I/O management for all I/O devices. (Note that disk storage is not considered I/O on System/38.)
- Data Management provides support enabling the user to describe data and device files external to the application programs.

- Data Management includes support for:

- Data Base Data Management
- Device Support
- Data Description Specifications (DDS)

Data Base Data Management: Data Base Data Management support is integrated within the System/38. The relationship between physical data files is independent. Each file may be created, modified, or deleted without effect on other physical files.

The primary features of Data Base Data Management (DBDM) are:

- Data Independence
- Journal Facility
- Data Security
- Data Maintenance
- Data Sharing

System/38 Data Base Data Management is designed to simplify operations and increase user productivity. The user need only describe, create, and store the data once in a physical data file. System/38 Data Base Data Management provides the capability for multiple users to concurrently access that data logically in various organizations, sequences, and formats (logical file), regardless of the actual physical structure of that data. This provides a high degree of data independence to individual programs and users. Options are available to specify the type of maintenance to be performed to the sequencing of data including immediate, delayed, and rebuild.

A journal facility exists to allow for forward or backout recovery. Once a file is specified to be journaled, all changes are implicitly captured by the system. The journal may also be of benefit for such functions as faster daily backup, security, audit trail, activity reporting, and debugging. Commands are provided for recovery, display, and management of the journal objects.

Data security is provided by controlling ownership, authorization to use the data, and is actually a function of System/38 Security. (See "Security" for more information on Security features.)

With physical data only residing in one place and in one physical structure, it is easier to maintain. When data is altered in the physical file, the same program or any other program which subsequently retrieves that data, receives the updated version. Records added to the files are available to users when they are written to the file.

Data Base Data Management permits multiple users to access data. For updates, it will lock the record being updated until the update is done, to assure that all update requests are serially handled. It also provides the capability to lock data files for exclusive use until relinquished.

Device Support: System/38 Device Support will support the following devices:

- System Console
- 5250 Information Display System devices including local and remote displays and printers (5256/5224/5225)
- Diskette Magazine Drive
- 5424 MFCU
- 5211 mdl 2 Printer
- 5219, 5224, 5225 Printers
- 3262 Printer
- 3203 model 5 Printer
- 3370 Direct Access Storage Device
- 3410/3411 Magnetic Tape

System/38 Device Support is similar to data management and I/O supervisor routines for devices on other IBM systems, but with enhanced capability.

System/38 provides device independence by permitting the user to define device files (via DDS) external to the program. The user then has increased flexibility to direct and control device I/O through Control Language overrides independent of program instruction. For example, a program may have output coded for a workstation printer but selection of a specific printer could be made upon program execution. Also, devices may be dynamically allocated, or deallocated, to active processes. System/38 Device Support will support device file definitions whether coded in the program or defined to the device data management, and relieve the programmer of device attachment method (local or remote).

Subfile capability is provided for display devices. This reduces the programming effort for the user to group records of like format, for concurrent display, modification, or input. For example, a display device operator may enter an entire screen of order entry line items

System/38 Control Program Facility (CPF) (cont'd)

before submitting them to the system for processing by the program one record at a time.

Also extensive data manipulating functions such as screen formatting, editing, and validity checking are supported for display devices.

Data Description Specification: The Data Description support in System/38 Data Management is the user's means to describe files for the data base and devices independent of application programs.

The files may be described once external to the application program. The external description is automatically added to the program at compile time. This reduces redundant I/O coding for programs using the same data. It also gives a consistent view of the structure of the data to each using program, thus reducing transcription, and associated errors in repetitious I/O coding.

Display device formats for display I/O are entered via DDS. During format description, data base field definitions can be used, and editing and validity checking features are available. These capabilities greatly simplify the application programming.

The user enters source description information on a Data Description Specification Form, similar in approach to RPG coding. For syntax checking while entering the source description, the user may optionally use the Source Entry Utility on the System/38.

Data records are stored in online auxiliary disk devices in the order they are received by the system. These physical files may be accessed in arrival sequence or by field(s) defined to produce a composite key. All records in a physical file have the same format.

A logical file is the vehicle to allow the user to change the presentation of the data in a physical file. For example, with logical files the user may:

- Specify a different format than the physical file. These formats can specify field reordering, omission, concatenation, and different field attributes.
- Select or omit records from the physical file.
- Specify a different ordering (key) than the physical file.
- Specify records from multiple physical files sequenced together by a composite key (similar to RPG matching record logic).
- DDS supports SNA/SDLC LU-1, SNA/SDLC LU6.2 and BSC communications device file record formats similar to the method used for data base files. Functional control of communication operation is managed through use of communications-specific DDS keywords.

Control Language: To request system function, the user enters CL commands, which are abbreviations of words for each command. Parameters are also entered to tailor the functions performed by the command.

The System/38 Control Program Facility through the Control Language (CL) provides:

- An easy-to-learn and use, consistent interface for the user to request and control system and application function.
- Commands executable from console, workstation, or batch job stream.
- CL programs callable by RPG III, COBOL, or other CL programs.
- A tailorable interface, with user-created commands to meet varying requirements.
- Compilable control language capability.

Control Language for the System/38 is described in three sections:

- **Ease-of-Use Facilities**
 - User command selection from menus
 - Prompting by the system for parameters
 - Free form syntax
- **Control Language Programs**
 - Compiled commands
 - Manipulation of variables
 - Call command with parameter capability
 - User-defined logic flow
 - Access to DDS (for display formats)
 - System program testing support
 - Interprogram communication (via message queues and data areas)
- **User-Created Commands**
 - To fulfill special needs
 - To control parameter selection

Ease-of-Use Facilities: System/38 supports both the inexperienced and the experienced Control Language user. CL supports the inexperienced user in the learn-as-you-go mode. Authorized users unfamiliar with the Control Language can be guided through command

entry by the system. Commands may be selected from a menu and then displayed, along with the parameter options, from which the user can enter, select, or default.

The experienced user may learn and enter the commands to execute a job. There is ease-of-use for the experienced user also. Command statement structure is free form, no fixed position requirements for parameters. Parameters may be positional or keyword form, and most of the parameters have default values.

Special menus are provided for the system operator and the programmer. These menus are designed to simplify the typical requests and also allow the entry of any command.

Workstation users without data processing experience can work from application menu displays (user-coded). This means reduced need for them to have detailed knowledge of the Control Language or the system, and their access to the system can be easily limited and controlled.

Another aid permits the user to get additional description of an error message by depressing the 'HELP' key on the keyboard.

Control Language Programs: A CL program is a group of CL commands converted to an executable program by the CL compiler. CL programs allow the user to group CL commands and application programs together. CL programs permit the definition of data as variables (fields), and can pass data (parameters) to other programs. The 'IF' command allows conditional execution of commands based on the result of logical expressions. Branching is also supported.

The user can define screens (menus and prompts) and display them under control of a CL program.

Values for parameters for commands in CL programs can be supplied at execution time via a prompt to the user. Most commands are valid within CL programs.

The system's program debug support is available for CL programs.

User-Created Commands: The System/38 users can define their own commands to invoke system function or a user program. Associated parameters can be defined and validity checked during execution. This feature is useful for those users who need a specialized operating environment, or those who wish to reduce or restrict the parameter entry choices for users of the system.

The character set used for the Control Language is EBCDIC (Extended Binary Coded Decimal Interchange Code). All 256 EBCDIC characters can be used within comments and quoted character strings (literals), but only the following subset of EBCDIC characters can be used to code CL commands:

- 26 letters (A through Z)
- 10 numbers (0 through 9)
- 3 alphabetic extenders (\$, #, @)
- Special characters

(For the special characters and their function, see the *IBM System/38 CPF Reference Manual - Control Language*, SC21-7731.)

Message Facilities: Message facilities can be used to exchange information among users of the system or among programs (system and application) and users.

Message Handling on System/38 provides for creation, storage, queuing, routing, and authorizing messages for:

- Information
- Broadcast
- Reply

Message Handling provides support for establishing a message, providing a path for it to travel, controlling traffic on the path, and getting it to its destination. Messages can be displayed immediately or queued for display when requested.

Specific system level messages are placed in the system history file. All entries are logged with date and time, identify the source of the message, and have an identification number. The user may process the system history file.

Users of message facilities can create impromptu or predefined messages. Impromptu messages will usually be simple text strings created to handle specific situations, such as messages between workstation users. Predefined messages are created as message descriptions, with a unique identification number, and stored in a message file for subsequent retrieval. They will usually be error messages sent by programs encountering certain defined conditions.

SNA-ALERT Facility: The System/38 alert function notifies an SNA remote S/370, 30XX, or 43XX host network operator of conditions detected by the System/38. The alert support provides significant function to be used for centralized remote host problem determination. The following support includes:

System/38 Control Program Facility (CPF) (cont'd)

- Alert generation by the System/38 upon certain failing conditions.
- The alert and associated information are sent via SNA/SDLC to the remote host system.
- The companion host programs support processing of the alert data to enable the user to centralize network problem determination.

The required host programs that support the System/38 alert consist of the Network Communications Control Facility (NCCF) and Network Problem Determination Application (NPDA). Also required is one SNA communications line to the host system.

Spooling: Spooling enhances device I/O by controlling device contention, decreasing process execution time, and increasing user control of jobs in the system. Since programs get their input from, and direct their output to, spool queues (instead of directly interacting with the I/O device), multiple concurrently executing programs can appear to be using the same device. This also means that program execution time is not restricted to the speed of the I/O device.

The significant features of System/38 Spooling are:

- Multiple input/output queues
- Multiple output copies
- One program can output to multiple files
- Workstation control of queues
- Display of spooled output
- Output spool queues can be directed to any device

Input job streams from external devices (card, diskette) or from the data base can be processed by spool readers or entered directly onto an input queue. Output to printers, punches, and diskettes is processed by spool writers. Multiple spool queues can be established, and spooling provides the capability for the system or workstation operators to display or modify their spool queue attributes.

Spool support permits interleaving of output from multiple jobs to a spool queue, and from a single job to multiple spool files.

Communications

SNA/SDLC as a terminal: System/38 communicates as a terminal to System/370 CICS/VS and IMS/VS using Synchronous Data Link Control (SDLC) as a part of Systems Network Architecture (SNA).

System/38 communicates to IMS/VS applications executing under OS/VS1 or OS/VS2 (MVS), or CICS/VS applications executing under DOS/VSE, OS/VS1, or OS/VS2 (MVS) in S/370 mds 145 to 168 for IMS/VS, and models 135 to 168 for CICS/VS, and 3031, 3032, 3033, 4331, 4341, 4361 and 4381 Processors. Communication to any of these operating systems when running under VM/370 is also supported. Communication is via the levels of VTAM, ACF/VTAM, ACF/VTAME, TCAM or ACF/TCAM supported by IMS/VS or CICS/VS at the time of shipment. NCP/VS or ACF/NCP/VS will be required as appropriate.

Binary Synchronous Communications (BSC): System/38 Release 4 CPF Binary Synchronous Communications (BSC) support provides the facilities which allow the user to write application programs to communicate with other systems and devices which are compatible with 3780 BSC implementation.

For all devices listed below, it is the user's responsibility to provide the application program which uses the System/38 BSC support, and to ensure compatibility with supported protocols and/or unique data formats required by the attached devices.

System/38 Binary Synchronous Communications (BSC) program-to-program over point-to-point switched or point-to-point nonswitched facilities

Communications to the following systems and devices are supported:

System/3	3741
System/32	5110/5120
System/34	5230
System/38	5260
Series/1	5280
System/370, 30XX, 43XX	
DOS/VSE	BTAM-ES
OS/VS1	BTAM/TCAM
OS/VS2	BTAM/TCAM
CICS/VS (Version 1.5.0)	OS/VS or DOS/VSE BTAM

System/38 Binary Synchronous Communications (BSC) As A Multipoint Tributary are:

- Multipoint Tributary - The System/38 will act as one, or several, terminals (or tributaries) on a nonswitched multipoint BSC line. The BSC line is scheduled by a BSC control station or host. The host may be a System/3 with CCP, a Series/1, or a System/370, 30XX, or 43XX. The System/38 can recognize up to 32 poll and selection addresses for each line.

- Multiple Session Support - The System/38 will support up to 32 sessions per line when attached as a multipoint tributary station. This is accomplished by assigning one of the 32 polling and selection addresses to each session. The support will provide for multiple logical sessions to occur concurrently over a single link. A maximum of 256 logical sessions per system is allowed.

- Additional Systems/Devices Supported - The System/38 acting as a multipoint tributary supports BSC attachment of the following systems and devices:

- 3776/3777 Batch Terminals
- 5520 Administrative System
- 6240 Communicating Mag Card Typewriter
- 6580 Displaywriter System
- 6640 Document Printer
- 6670 Information Distributor
- OS/6 Office System
- CMCII Communicating Mag Card Typewriter II

Other BSC Features

- Component Selection - Some BSC terminals have several attached I/O devices or components. System/38 provides support through DDS and Function Management for the user to select the device or component to which the data is to be transmitted. This function is accomplished by inserting the component selection characters inside of the outbound text. The component selection function is a program-to-terminal protocol which operates only on point-to-point lines and only on WRITE operations.

- Compression/Decompression - This constitutes a technique for utilizing line time more efficiently.

- Compression: Sequence of three or more blanks, X'40', are replaced by a two-character sequence for transmission.

- Decompression: Data that has been received from the BSC line is scanned for controls in the data stream that define how to reconstruct the original data.

Note: Compression and Decompression are mutually exclusive with transparent data, user-blocked data, and ASCII.

- Trailing Blank Truncation - This permits the System/38 to utilize communications line time more efficiently. In some applications, the fixed length record has a variable amount of data at the beginning of each record and the end is filled with blanks. The trailing blank truncation facility removes the trailing blanks when creating a transmission block. The trailing blanks are replaced with a blocking character such as IRS or ITB or a BSC ending character, ETX or ETB, as appropriate.

Note: Trailing blank truncation is mutually exclusive with transparency, user-blocked data, and blocked data with *NOSEP.

System/38 as a 3270 Information Display System to a Remote Host: System/38 3270 Device Emulation support provided in CPF allows the System/38 to appear as a 3270 Information Display System to a remote host computer. The System/38 will appear to the host system as a 3274 (SNA/SDLC) or 3271 (BSC) Control Unit.

System/38 3270 Device Emulation consists of two offerings:

- The System/38 5250, 5291 and 5292 displays and printers will emulate the functions of a 3270. No System/38 user programming is required (SNA/SDLC and BSC).
- A 3270 program interface is provided which allows a System/38 application program to communicate with application programs operating on a remote host system (BSC only).

Note: See M5381 pages for hardware prerequisites.

System/38 as a Host for Remote 5250 Information Display System Devices: The System/38 CPF also provides remote communication support for the 5250 System family of terminals. (As described in the M5381 pages), the 5250 system is supported locally by the workstation controller.)

The 5250 System is supported as an SNA device. Although the remote communication attachment of the 5250 System devices may be by switched or leased line, the devices have the same capabilities as local directly-attached devices.

When featured for nonswitched multipoint communications facilities, the System/38 Communications Attachment feature provides hardware Autopoll for up to eight (8) control units (5251 mds 2 and 12) per TP line. Anytime a TP line has more than eight (8) control units varied online, polling is automatically transferred to system microcode. The system microcode supports a maximum of fifty (50) control units varied online (being polled) per line.

System/38 as a Peer to CICS/OS/VS and CICS/DOS/VS Version 1 Release 6 and to another System/38. The System/38 Peer support is based on new SNA definitions (SNA LU6.2 and PU2.1).

Attachment to a S/370 is as an SDLC secondary. Attachment to another System/38 requires SDLC primary on one System/38 and

System/38 Control Program Facility (CPF) (cont'd)

SDLC secondary on the other System/38(s). The link configuration can be either point-to-point nonswitched, point-to-point switched, or multipoint nonswitched. The link speeds supported are all of the standard speeds, up to 57.6K bps.

These SNA extensions are designed to provide common session protocols for both document interchange and distributed data processing. This provides the base by which users can establish a single network definition for distributed processing.

These new SNA extensions now allow System/38 to participate in a transaction processing environment as well as in the batch and interactive environment. Within a network, the System/38 can serve as either the front-end processor or the back-end processor.

System/38 display station pass-through when interconnecting multiple System/38s: Display station pass-through support allows interactive users at a System/38 (source) to request that their device be connected to another System/38 (target). The connection is made via an Advanced Program-to-Program Communications (APPC) link. The user signs on to the target systems as if the display station was directly attached to the target system. System request key options can be used to switch back to the source system and to switch jobs on the target system.

This support provides a convenient way for customers to increase System/38 processing capacity through horizontal growth, that is, by using multiple System/38s connected via APPC.

Communications Error Recovery Procedure (ERP): The enhanced ERP will enable users to recover from many communication errors with little or no operator intervention. When the recovery process begins after an error is encountered, jobs will not need to be canceled, nor will the communications objects need to be varied off. The application will need to either release the device or close the file. If communications are to be resumed, the applications will acquire the device (if it was released) or open the file (if it was closed). All communications (BSC and SDLC) devices, local workstations, and multidropping of 5250 and Advanced Program-to-Program Communications (APPC) devices on the same line will be supported.

Installation (System Specialization): The Installation facility of System/38 CPF provides the means for the user to install the Control Program Facility. This substitutes for the traditional system generation which is not required on the System/38.

To install, the user loads CPF through the diskette device or a tape device attached to the system. This establishes default libraries, user profile definitions, basic I/O definitions, etc. The system is ready to use, but the user may want to do some additional system specialization such as:

- Describe additional I/O devices.
- Define additional subsystems.
- Define additional user profiles.
- Modification of the supplied definitions.

System specialization can be done anytime and does not require a system generation function.

System Services

Test And Debug Facilities: The Test and Debug Facilities offer System/38 users significant productivity in the testing and training area.

The user can copy production files and programs to a 'test' library to create a test environment nearly identical to the production environment. The user still has the full range of system function and can observe and control operation of the program, but the user is prevented from updating production files. This also permits testing to occur concurrent to other operations.

For complete protection of the production environment, the security features of the system can be used to prevent any access of the production objects by the development planner.

This test environment is also useful for training operators because:

- It duplicates the real environment.
- It protects production files.

Debug support provides error diagnosis tools for the programmer. Debug requires no special statements in the source program. Through CL commands the user may:

- Halt execution at a specified statement number (source listing).
- Trace the sequence of statement execution.
- Display and modify program variables (fields).
- Obtain a printed copy of the interactive dialog with the system.

The CL command for program debug places programs in debug mode. In debug mode, breakpoints to halt execution (source program statement numbers) may be specified. For trace, ranges of statement

numbers may be entered to determine the sequence of statement execution. Commands for breakpoint or trace do not affect any other concurrent operation of that same program.

Library Facility: Library support on the System/38 provides the user the means to operationally group related objects. Objects are programs, file definitions, data files, etc. Libraries are used to logically (not physically) group objects in any division meaningful to the user, such as by application or by ownership. An object is an item of a library and no two objects of the same name and type may be a member of the same library. Although a system library is installed with the system, multiple user-defined libraries are permitted. The user controls object maintenance in the libraries.

Save/Restore Facility: The Save/Restore Facility on System/38 supports the 3410/3411 tape drive and the diskette magazine drive and the magnetic tape drives in the following functions:

- Back-up of user libraries and objects
- Keeping seldom used or sensitive information offline
- Data interchange between System/38s
- Back-up of the system library

The SAVE commands are used to write a copy of a library, all libraries, an object, or a group of objects in a library to the save device. The RESTORE commands are used to restore to the system saved objects and libraries. The system maintains a directory of saved objects and can identify the most recent copy of a saved object. The system can identify by date and time when an object was last changed. To provide for faster daily backup, a command is provided to save only those objects which have changed after a specific date.

Service Facilities: CPF supports servicing of CPF, the System/38, and workstations. Many service functions can be done concurrent to other system operations enhancing productivity for IBM and our customers. (Note: Concurrent servicing is accomplished through the Concurrent Service Monitor (CSM) which is a part of CPF.)

Some of the service facilities available, through Control Language commands, to support CPF and the System/38 are:

- For CPF
 - Problem analysis and diagnosis through dumps of internal job information and traces of processing flow.
 - Problem reporting by producing diagnostic documentation on a diskette for IBM service use.
 - Problem resolution by installing IBM-supplied program changes.
- For the System/38
 - Providing the machine error log for print or display.
 - Production of a trace of internal machine activities.

The CPF provides support through which workstation device operation can be checked and workstation printer operation can be verified.

File Reference Facility: The File Reference facility provides the user with information about the definition, organization and usage of the data base. It also provides information about the definition and usage of device files. It will provide significant aid in two areas:

- Documentation of the system.
- Supplying information to help determine the effect of planned changes.

Some functions providing information on file and field usage throughout the system can be output to a disk file for subsequent access and manipulation by the user. The following information is available:

- Files currently using a specified format.
- Files dependent on a specified file and type of dependency.
- File members dependent on a specified file member and type of dependency.
- Field descriptions by file.
- Data file usage by compiled program.

File Reference Facility functions can be invoked in interactive or batch mode. Output can be directed to a display or a printer, and in most cases to a data base file.

Copy Facility: The System/38 copy function provides some enhancements to the traditional file copying capabilities. The copy support can:

- Copy data from diskette, card, magnetic tape, or data base files to diskette, card, printer, magnetic tape, or data base files.
- Provide selection of records to be copied by the value of:
 - Fields within records
 - Characters within fields
 - Record formats
- Provide for adding records to an existing file member.
- Provide for the copying of an output spool file to a data base file to allow conversion of these files to microfiche applications, transmission to other systems, or processing of spooled output.

System/38 Control Program Facility (CPF) (cont'd)

- Provide for the selection of a record format when a multiformat (logical file) is being copied.
- Provide for reorganization of a data base file.
- Provide for a high speed copy of data base files which reads and writes disk sectors as opposed to individual records.

Power Warning Feature: CPF provides programming support for user-supplied Uninterruptable Power Supply devices. A system value will control which message queue will be sent a message if normal power is lost or restored. This allows user program logic to control termination/continuation of the System/38 operation.

Program Use During Customer Pre-installation Testing: The System/38 Control Program Facility (5714-SS1) is available to customers for pre-installation testing on IBM Test Center Systems in accordance with IBM's Program Testing Policy.

CUSTOMER RESPONSIBILITIES

Installation of System/38 licensed programs is a customer responsibility. IBM may provide marketing assistance, in accordance with Marketing and Service Guidelines in the GI Section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/38 CPF runs on all models of the IBM System/38.

All IBM licensed programs for System/38 are designed to operate in an environment that includes the System/38 CPF (5714-SS1) or its equivalent. The licensed program order should be entered via AAS at the same time as the system order. IBM's ability to provide concurrent hardware maintenance is dependent upon functions provided by the CPF or its full equivalent support.

SOFTWARE REQUIREMENTS: None

CPF Main Storage Usage: All Control Program Facility instructions are pageable, and therefore, invoked by the system as needed. The amount of main storage occupied at any given time is greatly dependent upon system functions concurrently and dynamically invoked by multiple system users.

SECURITY

Security on System/38 provides the user a selectable degree of protection of the system and data that can be increased by stages. Its major features are:

- User-controlled level of security
- Security Officer to provide security control
- Ownership/Authorization of objects (such as data files and programs) is user-controlled.

The degree of security exercised on the system can range from minimal security, to authorization for use to each individual data file, program, and device. The security officer 'owns' the system objects, has full rights of access across the system, and controls enrollment of users of the system. All users of the system are enrolled and have a user profile which controls their access to system and data resources. Security is based on ownership and authorization of objects in the system. Objects are data files, programs, formats, device descriptions, etc. All objects in the system have an owner. The owner has all rights to the object and may authorize various classes of access and usage of these objects to other enrolled users of the system.

Security support is divided into two types of functions - the definition and the enforcement of security procedures. Definition functions of Security are:

- The Security Officer - This person has full authority across the system and controls the installation security procedures.
- The User Profile - All users enrolled on the system have a user profile. It is a collection point for all security information related to each user.
- User Identification - All users of the system must identify themselves to the system.
- Object Authorization - Specifies the individual user's rights of use of the system resources.

Enforcement functions of Security are:

- User Verification - Verifies a user's identity to control access to the system.
- Object Verification - Assures user's right to access system devices, programs, and data objects.

- Security Information Displays - Provides security status displays to the security officer to aid controlling security.

Security may be controlled by library and/or the objects within a library. A special function exists to allow the owner of a program to allow authorized users of the program to use their authorizations. This can be used to minimize the number of detail specifications and ensure that certain functions and file accesses are performed only under the control of specific application programs. Data Base allows specific file formats to be created to provide a form of field level security.

PROGRAM PRODUCTS

**5714-SS1 - SYSTEM/38 CONTROL PROGRAM FACILITY
RELEASE 5.0 ENHANCEMENTS**

PURPOSE

System/38 CPF is enhanced in Release 5.0 to include: Support for additional devices, communication enhancements, a commitment control (recovery/restart) function and many other functional improvements.

Release 5.0 HIGHLIGHTS

- Communications Support
 - Advanced Program-to-Program Communications (APPC)
 - SNA-Alert Support
 - Mixed file and High-Level Language (HLL) Multiple Device Support
 - Error Recovery Procedure Enhancements
 - High-Speed Line Enhancements
 - 3270 Device Emulation
- Device Support
 - Existence check on media (diskette, tape)
 - Diskette command improvements
- Commitment Control
 - A commitment boundary restart aid, which assists in restarting following abnormal job or system termination.
- Spool Enhancements
 - DSPOUTQ identification of forms type and number of copies
 - Start a writer to a forms type
 - Support of change writer
- Save/Restore
 - Save/Restore of logical file access paths
 - Save/Restore of message, job and output queue descriptions
 - Option to prevent incomplete saves
 - Optional listing for restore objects
 - Improved allocation of source members
 - Improved tape error recovery
- Journal
 - Protection against deletion of unsaved journal receiver
 - New default for Apply Journal Change command
 - Retrieve Journal Entry command
 - Compare Journal Images command
 - Enhanced journal displays
- Work Management
 - Local data area
 - Change of a job's execution attributes
 - Option to control job log creation
 - DSPJOB enhancements
 - Job start/completion message enhancements
 - Display Active Job (DSPACTJOB) and Display System Status (DSPSYSSTS) enhancements
 - Job description parameter in user profile
 - Retaining once active batch jobs on job queues
- Security
 - Operations from the DSPOBJAUT display
 - Generic grant/revoke of authority
 - Revoke object authority feedback
 - Display user profile option for changes
 - Authority checking from system menus/displays
- Library Support
 - Add and remove from library list commands
 - Delete by generic name
 - Library display command enhancements
- CL/Prompter
 - Inquiry message capability on unmonitored messages
 - Send user message command
 - Data base sequential input in CL programs
 - Retrieve job attributes command enhancements
 - Selective prompting
 - Noninteractive commands used with the prompter
 - Return resulting command from prompter without executing
- Data Base
 - Rename member command
 - User notification of access path rebuild at open
 - Access path rebuild options at IMPL
 - Option to force access paths more frequently
 - Freeing of space with CLRPFM
- Other Enhancements
 - Conditional defaults for inquiry messages
 - Copy file enhancements and new copy commands

- Most create commands will use source text as a default
- Display file description command option for outfile
- Increase in number of values for the DDS VALUES keyword
- Messages used as constants in DDS
- Command selection menu enhancements
- Programmer and systems operator menu prompting for SBMJOB option
- Option to preserve edit codes and system values at install
- Multidimension array support in debug functions
- RPG auto report added to programmer menu
- Forty-eight character names in debug functions
- Ease of conversion from System/34
 - Several of the previously described native functions will provide a simpler conversion from System/34.

DESCRIPTION

Communications

- Advanced Program to Program Communications (APPC)

APPC is a CPF enhancement that provides a program-to-program protocol between two applications in different products. APPC is based on SNA architecture and provides a peer relationship between the interconnected products. This support allows System/38 to function as a departmental node with the ability to duplicate systems between departments. Additionally, it provides horizontal growth capability.
- SNA-Alert Support

This enhancement allows the remote host network operator to be notified of certain system conditions to assist in problem determination.
- Mixed File and High Level Language (HLL) Multiple Device Support

This enhancement provides new function and an improved interface for multiple device applications.
- Communications Error Recovery Procedures (ERP)

This function enables users to recover from many communication errors with little or no operator intervention.
- High-speed Lines Enhancement

Allows high-speed (57.6K bps) local attachment of System/38 to 3705.

Allows high-speed (56.0K bps) remote communication to 3705, 4331 Communications Adapter, and System/38.
- 3270 Device Emulation

This enhancement allows the System/38 and locally or remotely attached 5250 Information Display System devices to appear as a 3270 control unit and devices.

For more information on the Communications Enhancements for Release 5.0, see Programming Announcement Letter dated January 14, 1983.

DEVICE SUPPORT

- Existence Check on Media Commands

The new commands CHKDKT and CHKTAP are provided to allow the user to check for the existence of a specific volume (or file) label on a diskette or tape. For example, this allows a program to precheck the existence of the correct media before proceeding on a specific function using that media.
- Diskette Command Improvements

The SUFFIX parameter has been added to the CLRDKT, INZDKT, RNMDKT, and DLTDKTLBL commands. The RNMDKT command now supports a range of diskettes within a magazine thus allowing an entire magazine to be renamed.

Commitment Control

Commitment control is a function designed to assist the user in recovery/restart of applications. The most difficult aspect of restart in a complex transaction environment is ensuring that restart will occur when all files are at a specific point. Commitment control ensures that a job is at a specific point (called a commitment boundary) in the event of a system or job abnormal termination.

The user defines his commitment control environment in CL statements and specifies the files to be under commitment control in RPG or COBOL. New operations are supported in RPG, COBOL, and CL to allow the user to request a group of data base changes to be committed or rolled back. The rollback function allows the user to easily cancel a group of data base changes when the application program senses a need to cancel the effect of a transaction. Through commitment control, the system will implicitly roll back any uncommitted changes in case of a system or job failure.

System/38 CPF R5.0 (cont'd)

Restart can normally be provided by user coding which would access the last transaction record entered by an operator or by using a commitment control notify object. The notify object allows the program to store information about the last transaction before a failure in a data base file, a message queue, or a data area.

Data base files used in a commitment control environment must be journaled to the same journal.

All data base changes which are part of a commitment boundary will be locked until either a commit or rollback occurs. Optionally, records can also be locked in read-only files where the contents of a record should remain static until a commit or rollback occurs.

Commitment control functions will also allow the user to retain locks on multiple records in a single file.

Because the commitment control function will cause data base records to be locked until a commit or rollback occurs, the user must consider the frequency of issuing a commit or rollback. A commitment boundary which can span multiple enter keys can cause other users to wait until the commitment boundary is reached. In the event of a record lock timeout, the message which occurs will be enhanced to include the job name which has caused the record to be locked. The DSPJOB menu will provide an option to show the commitment control status.

SPOOL

- DSPORTQ support of Forms Types and Copies

The DSPORTQ display will add columns for forms type and number of copies. This information will be truncated if displayed at the 64-character console device.

- Start a Writer to a Forms Type

A new parameter will be added to STRPRTWTR to allow the user to control what form types in an output queue should be output. A CHGWTR command will also be available to allow formtype and output queue to be changed for an active printer writer without ending the writer. These functions should allow better control when dealing with special form types and help minimize the overhead associated with canceling and starting a writer multiple times to the same device.

- Support of Change Writer

A CHGWTR command will be available to allow form type and output queue to be changed for an active printer writer without ending the writer.

SAVE/RESTORE

- Save/Restore of Logical File Access Paths

An option on the save commands will allow associated logical file access paths to be saved. An access path will only be saved or restored when all related physical files are saved or restored. This option will cause an increase in the amount of save time and media usage, but will decrease the amount of time necessary to complete a restore operation since the associated access paths will not have to be rebuilt.

- Save/Restore of Message, Job and Output Queue Descriptions

The object types of *MSGQ, *JOBQ, and *OUTQ may be saved and restored. Only the description (not the contents) will be saved and restored. This facilitates the transfer and recovery of libraries. All object types are now supported by Save/Restore.

- Option to Prevent Incomplete Saves

An option will be added to the SAVOBJ/SAVCHGOBJ/SAVLIB commands to ensure that all objects can be saved prior to saving them. This precheck function will allow the user to easily determine that all objects requested to be saved are available before any media is written. This can eliminate situations where a file is bypassed by the save function because the file is open for update by another user.

- Optional Listing of Restored Objects

An option will be provided on the restore commands to list each object that is being restored and its associated security-related information. The existing low level messages for a successful restore of each object will be removed to improve the performance when a large number of objects are being restored. The listing should allow a better means of security control when new objects are restored to the system.

- Improved Allocation of Source Members

An internal option will be supported by SEU and Text Management to determine the exact number of records to be written to the member after creation or maintenance is performed. This will allow the system to tailor the allocation needed for the specific member instead of using a default allocation method. This should benefit save operations since each member will have only a single disk allocation.

- Improved Tape Error Recovery

Tape error recovery has been improved to allow the user to mount a new tape when media errors occur during a save operation. This will eliminate most situations where the save function must be aborted due to media errors, by allowing the user to continue on a new tape.

JOURNAL

- Delete Journal Receiver Protection

If an attempt is made to delete a journal receiver that has never been saved, an inquiry message will be sent to the user allowing the option to cancel or ignore. The message should assist in preventing the user from destroying his means of backup or audit trail.

- New Default for Apply Journal Change Command

The default for the TOENT parameter will be changed to *LASTRST. This will allow the defaults of the command to be used in a normal recovery environment where the user restores his last backup and reapplies the entries in the journal from the last save up to the restore.

- Retrieve Journal Entry Command

A RTVJRNE command will be provided to retrieve a specific journal entry and return the entry into CL variables. Similar selection criteria as with the current DSPJRN command may be used. This simplifies determining the journal sequence number of journal entries which may be used to automate certain recovery or backup functions.

- Compare Journal Images Command

A command will be available to compare the before and after images for record level changes recorded in a journal and highlight the differences. A listing form of output is provided. This can assist in problem determination.

- Enhanced Journal Displays

The journal displays will be enhanced to include such things as an explanation of the code and type of journal entries and the ability to switch from a character to hex display.

WORK MANAGEMENT

- Local Data Area

Each job will have an implicitly defined 512-byte character data area. This can be used for intrajob communication and it is also implicitly submitted to any batch jobs when SBMJOB is used. The local data area will have a name of *LDA and may be accessed by CHG/RTV/DSPDTAARA commands. The DSPDTAARA command is enhanced to support hex values. The local data area is an alternative means of passing variables within a job and can also be used to pass variables to batch jobs.

- Changing of a Job's Execution Attributes

New options on the CHGJOB command will allow a change to the execution attributes of EXCPTY, TIMESLICE, PURGE, and DFTWAIT. The user making the change may change any job on the system, but must have the special *JOBCTL authority defined in his user profile. This allows improved control over execution attributes.

- Option to Control Job Log Creations

A new job attribute will exist to control whether a job log should be produced if the job completes in a normal manner. This allows the user to eliminate the output of job logs except when a problem occurs.

- DSPJOB Enhancements

A new DSPJOB option will allow the display of the current library list. This output will also be supplied in the DSPJOB dump described later.

- Job Start/Completion Message Enhancements

The job start message (CPF 1124) will be enhanced to include the subsystem and the time the job entered the system (e.g., the submitted time for batch jobs). The job completion message (CPF 1164) will be enhanced to include such things as total response time, the number of interactions, the number of disk I/O operations and the type of job. Both of these messages appear in the job log and in the QHST log. This information can be useful in analyzing system workload, providing job analysis statistics, and problem determination data.

- Display Active Job (DSPACTJOB) and Display System Status (DSPSYSSTS) Enhancements

The DSPACTJOB display will provide an improved description of certain wait conditions and an indication of whether a job's

PROGRAM PRODUCTS

System/38 CPF R5.0 (cont'd)

execution priority has been downgraded because the time-slice has been exceeded. The DSPSYSSTS internal fields, which are used to calculate page fault rates, have been increased in size to greatly reduce wrapping.

- Job Description Parameter in User Profile

A job description parameter will be added to the user profile and *USRPRF may be specified on ADDWSE/CHGWSE to assign job attributes to communications jobs. This also allows job attributes to be specified for work station users (instead of the current approach, by device).

- Retaining Once Active Batch Jobs on Job Queues

A new command (similar to TFRJOB) will allow a currently executing batch job to be placed on a job queue. Unlike the TFRJOB command, the new command will allow the job to remain on the job queue in the event of an IMPL.

SECURITY

- Operations from the DSPOBJAUT Display

If the user has appropriate authority, a CF key option will appear on the DSPOBJAUT display to allow the user to redisplay the information as input capable fields. This allows the simple changing of authorization rights, as well as allowing new users to be added and existing users to be totally removed.

- Generic Grant and Revoke of Authority

The GRT/RVK commands will allow a generic function or will allow all objects in a library to be specified. This will simplify the specifying of security authorizations.

- Revoke Object Authority Feedback

The RVKOBJAUT command will provide a diagnostic message when the user whose authority is being revoked does not have the specific authority being revoked.

- Display User Profile Option for Changes

A CF key option will be added to the DSPUSRPRF command to allow the user to display the CHGUSRPRF prompt for the same user with the current values displayed. This simplifies changing the values for the various parameters.

- Authority Checking from System Menus/Displays

Authority checking will be performed on all command functions attempted from CPF menus/displays. This will allow better security control when utilizing system menus/displays.

LIBRARY SUPPORT

- Add and Remove from Library List Commands

ADDLIBL/RMVLIBLE commands will be provided to allow the user to add a library before or after the existing libraries on the user portion of the library list, or remove a library from the user portion of the library list. This will offer a simple means of adding specific user libraries to the existing library list without having to know what the current list is.

- Delete by Generic Name

Most of the DLT commands are enhanced to allow use of a generic name. This will simplify operations when generic object types must be deleted.

- Library Display Command Enhancements

When the DSPLIB command is used without specifying a library, the user will be presented with a list of library names to select from. Both the DSPLIB and DSPOBJD displays will provide an entry per object to allow access to the full or service attributes provided by the DETAIL parameter of the DSPOBJD command. The DSPLIBL command has been enhanced to include the text description of the libraries.

CL/PROMPTER

- Inquiry Message Capability on Unmonitored Messages

CL programs will now issue an inquiry message on an unmonitored escape and let the user request ignore and retry, in addition to the cancel and dump options already supported for the CPA 0701 message. CL programs can now report errors similar to RPG or COBOL programs where inquiry messages are sent to the interactive user or system operator (depending on the type of job) when an unexpected condition occurs.

- Send User Message Command

A command will be provided for use in communicating from CL programs to users or the system operator. This will provide for simple inquiry messages to be handled in one command. A pause function is also provided. A VALUES keyword is supported to allow checking of responses and a translate table option is provided to allow conversion from lowercase to uppercase. This command

should simplify the applications where a CL program needs a minimal amount of dialog with a user.

- Data Base Sequential Input in CL Programs

CL programs will support data base sequential input files. This simplifies working with files created by functions such as DSPOBJD. The support uses the existing DCLF and RCVF commands. MONMSG may be used for the end of file condition. Only one DCLF is allowed per CL program.

- Retrieve Job Attributes Command Enhancements

The RTVJOBA command will support new parameters to allow retrieval of additional job attributes such as EXCPTY, OUTQ, LOGLVL, and USRLIBL. This will simplify the changing of these job attributes and storing/ replacing them when a subprogram with unique requirements is called.

- Selective Prompting

Selective prompting allows a CL program to use the prompter facility at execution time to prompt for a command, and control:

- Which parameters are prompted
- Which defaults appear
- If the user is allowed to change specific parameters

This allows use of the prompter to directly invoke command functions, while allowing the programmer to control what is prompted and what may be changed by the user.

- Noninteractive Commands used with the Prompter

Noninteractive commands (e.g., JOB, ENDJOB, etc.) will be prompted when PF4 is pressed. A warning message will be sent, but the user will be allowed to see the prompts for these commands.

- Return Resulting Command from Prompter Without Executing

New Program QCACHEK (similar to QCAEXEC), may be called to either syntax check or prompt a command, and have the results returned without executing the command. This may be used in prompting for commands to be submitted or logged.

DATA BASE

- Rename Member Command

A RNMM command will be provided to simplify operations when a member must be renamed.

- User Notification of Access Path Rebuild At Open

When the user opens a file, causing an access path to be rebuilt, a message will be sent to the external message queue stating the cause for the delay in proceeding to the function. This should minimize the need for problem determination in this circumstance.

- Access Path Rebuild Options at IMPL

Following an abnormal IMPL in which access paths have been invalidated, a display will be available to the operator. This will describe each access path which must be rebuilt, show the number of records which must be read to rebuild the access path, and allow the operator to temporarily change the value of the RECOVER option that was specified for the file. The operator will have better control over whether the system should be brought up quickly or not brought up until certain access paths are rebuilt.

- Option to Force Access Paths More Frequently

An option will be provided on CRT/CHG data base file commands to cause the access paths and underlying data to be forced to disk on every access path update. This will minimize (but will not eliminate) the exposure to an access path rebuild in case of an abnormal termination. This function can be of value in certain large file/low activity environments, but performance should be carefully considered.

- Freeing of Space with CLRPFM

When the CLRPFM command is issued, any space associated with the physical access path is reset and the file allocation is reset to its initial value. This will help provide better allocation of storage on the system.

OTHER ENHANCEMENTS

- Conditional Defaults for Inquiry Messages

A job attribute will be added to the JOB, CHGJOB, and SBMJOB commands, and may be placed in a job description to determine automatic action when an inquiry message is sent by a program such as CL, RPG, or COBOL. The user may choose to:

- Send the inquiry message
- Send a default reply
- Use a new system-defined object for system reply values

PROGRAM PRODUCTS

System/38 CPF R5.0 (cont'd)

Commands exist to maintain the system reply list which allows entries for specific or generic messages. An option exists to allow a DSPJOB dump prior to replying to the message. This may be used for many functions such as:

- Automatically taking a DSPJOB dump and a program dump, and cancelling the program when an inquiry occurs. This can be used to eliminate operator intervention and ensure that problem determination information exists.
- Automatically responding to some messages which are sent to the system operator (messages relative to mounting the proper print belt, for example).

• Copy File Enhancements and New Copy Commands

Enhancements to the CPYF command support have been made to allow such functions as creating the TOMBR when it does not exist, copying zero records, better handling of packed keys, and generic FROMMBR support. A new CPYSRCF command is provided which is designed to work with source members and provide a formatted listing. Four new commands (CPYFRMDKT, CPYTODKT, CPYFRMTAP, and CPYTOTAP) are available to simplify use of copy functions using diskette or tape. These commands support most of the device parameters found on the corresponding OVRDKTF and OVRTAPF commands.

• Most Create Commands Which Use Source Will Default TEXT

Most of the CRT commands which use source members will change the default of the TEXT parameter to default to the text description of the source member. This will simplify the creation and retention of text descriptions on various objects.

• Display File Description Outfile Option

The DSPFD command will provide an OUTFILE option which will allow the attributes of the various file types to be placed in a data base file. A new parameter will control the subtype of file output. This output file option will allow many applications to take advantage of the attributes and statistics stored in the file descriptions to create reports and control various functions.

• Increase in Number of Values of DDS VALUES Keyword

The DDS keyword VALUES will accept up to 100 entries instead of the current limit of 20. This should simplify the validity checking of certain fields.

• Messages Used as Constants in DDS

A new DDS keyword (MSGCON) will allow the contents of a message description to be compiled into a device file. This can be used to simplify certain standard text functions used in multiple files.

• Command Selection Menu Enhancements

A new command will be supported and will be an option on the programmer and system operator's menus to allow the user direct access to an enhanced version of the command selection menu. This will allow the user who knows a verb (e.g., CNL), or an object (e.g., SBSDD), or a common abbreviation (e.g., JOB) to access all the commands with the same letter combinations. Over 175 additional menus will exist to simplify the process of selecting the proper command.

• Programmer and System Operator Menu Prompting for SMBJOB Option

The programmer and system operator menus will allow access to the prompter for the entry of RQSDTA when Option 6 is requested. In addition, the value in the RQSDTA field will be syntax checked as if it is a command. This will allow the full use of the prompter when submitting jobs from these menus.

• Install Options for Edit Codes and System Values

Additional options will appear on the install prompt to allow retention of installed edit codes or system values. This will simplify the installation of a new release.

• Multidimension Array Support in Debug Functions

The debug commands will allow changing and displaying of variables with up to three dimensions. This is specifically designed for COBOL support.

EASE-OF-CONVERSION From System/34

The release includes general enhancements which can make it easier to convert from System/34. This includes such functions previously discussed as:

- Messages used as constants in DDS.
- CHKDKT command to check for the existence of a volume ID or file label on diskette.
- Display output queue of a forms type.
- Start a writer to a forms type.
- Local data area.

- Delete by generic name.
- Inquiry messages on unmonitored escape messages in CL programs.
- Send user message command.
- Rename member command.
- Copy file enhancements and new commands.
- Mixed file and HLL multiple device support.

Customer Education: System/38 CPF education is available as follows:

Title	Course Code
System/38 Concepts	A2510
System/38 Application Analysis	A2003
System/38 Application Programming Workshop	A2004
System/38 Implementation I	A2001
System/38 Implementation II	A2501

These courses will be updated to reflect the Release 5.0 enhancements.

PLANNING INFORMATION

For existing users, Release 4.1 must be installed prior to installing Release 5.0.

CUSTOMER RESPONSIBILITIES

Installation of System/38 licensed programs is a customer responsibility. IBM may provide marketing assistance, in accordance with Marketing and Service Guidelines in the GI Section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/38 CPF runs on all models of the IBM System/38.

All IBM licensed programs for System/38 are designed to operate in an environment that includes the System/38 CPF (5714-SS1) or its equivalent. The licensed program order should be entered via AAS at the same time as the system order. IBM's ability to provide concurrent hardware maintenance is dependent upon functions provided by the CPF or its full equivalent support.

SOFTWARE REQUIREMENTS: None

DOCUMENTATION

(available from Mechanicsburg)

The following documents are scheduled to be updated and available in June 1983:

- S/38 Guide to Publications, Glossary and Master Index (GC21-7726)*

RPQs ACCEPTED: No

SYSTEM/38 INTERACTIVE DATA BASE UTILITIES (IDU) 5714-UT1

PURPOSE

The IBM System/38 Interactive Data Base Utilities (IDU) licensed program is a package of data handling utilities. The utilities can be invoked by multiple users, concurrent with other system operation.

HIGHLIGHTS

The following utilities are provided with the System/38 Interactive Data Base Utilities:

- Source Entry Utility (SEU)
- Screen Design Aid (SDA)
- Data File Utility (DFU)
- Query Utility

Source Entry Utility: Source Entry Utility (SEU) is the means by which the user enters and maintains source statements for Control Language (CL), RPG III, COBOL, Data Description Specifications (DDS), and Utility Definition Statements (UDS).

Predefined formats are provided for RPG III, COBOL, CL, DDS, Reformat Utility, and UDS entry and update. Syntax checking is provided for source entry and update of CL, RPG III (if RPG III compiler available), COBOL (if COBOL compiler available), DDS, and UDS. Syntax checking may be turned off or on and various formats may be selected during SEU execution. The System/38 CPF Prompter may be optionally invoked during entry and modification of CL source statements.

SEU can be used to:

- Create a new source file member and enter statements into it
- Add statements to an existing source member
- Modify statements in a source member
- Delete a single statement or a group of statements from a source member
- Move a single statement or a group of statements from one location to another within a source member
- Copy a single statement or a group of statements at another location within a source member
- Include a single statement or a group of statements into a source member from another member in the same or a different source file
- Locate a statement by scanning for a specified character or string of characters and, optionally, substitute another character or string of characters
- Scan and substitute forward or backward through a member
- Shift right or left a single statement or a group of statements a specified number of spaces
- Insert a record format line between statements as a keying aid
- Do user-controlled record positioning
- Slide displayed statements left or right (windowing) for viewing
- Do intermixed functions concurrently (adds, deletes, changes, move/copy, etc.)
- Insert (add) a specified number or an infinite number of statements
- Syntax check a limited portion or entire source member at any time
- Optionally change from one syntax checker to another without exiting from SEU
- Select any record format at any time
- Do user-controlled compress/expand substitution
- Optionally display member selection list on entry into SEU
- Delete members from a source file
- Optionally display member selection list for a browse file
- Display both the member being edited and the member being browsed on a split screen
- Browse a spooled output file
- Scan for errors in the member being browsed
- Locate a statement in a browse member by scanning for a specified character or string of characters
- Update the member being edited while browsing another member on the split screen
- Exit without updating the source member
- Create a new source member from the exit menu
- Optionally return to the member selection list from the exit menu

- Do optional recovery if abnormally terminated (the recovery option is automatically displayed the next time SEU (EDTSRC) is requested to edit the member)
- Display comprehensive HELP text available during SEU execution

DESCRIPTION

Screen Design Aid: The Screen Design Aid (SDA) is an interactive utility which is used by the programmer to design and maintain display formats, application menus, and the Control Language (CL) programs to execute the menus.

The following are some of the ways in which SDA assists the programmer in the design and maintenance of display formats and menus:

- Makes available the comprehensive display file description capabilities of DDS without the need to have detailed knowledge of the DDS coding form, keywords, or syntax.
- Provides a graphic representation of the display format being created or changed as it is being designed or changed, thus avoiding the tedious trial and error traditionally associated with designing an acceptable display format.
- Provides the capability to display and select fields from a field reference file.
- Provides the capability to create a new display format or menu based on an existing version.
- Facilitates extended field definition by presenting selectable keyword values in functional groups.
- Provides comprehensive testing of displays, allowing user selection of the data to be shown and the status of each conditioning indicator for each test.
- Provides the facility to create application menus and the CL programs required to drive them.
- Provides immediate diagnostic messages for most errors.
- Provides comprehensive online HELP text to assist in the selection and use of SDA and DDS function.

SDA can be executed on any model of the System/38 having at least one IBM 5251 Display Station mdl 11 or 12 attached. SDA cannot be executed from a 960-character screen display station or the system console. SDA can be used to design and maintain display formats which will be used on small display stations or the system console.

SDA can be executed concurrently with other system functions. Also, multiple users may be using SDA concurrently.

Data File Utility: DFU permits users to establish their own data entry application, optimized for their use, and unique to their requirements.

DFU operates on keyed data base files. Arrival sequence (nonkeyed) physical data base files can be operated upon in DFU through a keyed logical file based on the nonkeyed physical file.

The Data File Utility supports the following for externally described data base files:

- Data Entry
- Data Verify
- Inquiry (Display Data)
- File Maintenance

During DFU application definition, some of the major features of DFU permit the user to:

- Review Data Description Specifications for the file in order to select records and fields.
- Default to DDS-specified attributes.
- Define the displays to be presented during execution of the utility application.
- Define the validation to be done on any entered data.
- Specify automatic duplication of field values.
- Specify automatic field increments.
- Specify detection and correction of records containing invalid data.

During DFU application execution, some of the major capabilities of DFU permit the user to:

- Add, change, and/or delete data records.
- Print currently displayed record.
- Print totals accumulated during entry or change.
- Review descriptions of fields to aid in error correction and data entry.

S/38 Interactive Data Base Utilities (cont'd)

- Select Automatic Record Advance in add, verify, and change modes.
- Detect and correct records containing invalid data.
- Automatically duplicates data from a previous record.
- Search next on format allows the user to key all or part of a key on the key prompt, and request that the record with the next higher key be retrieved and displayed.

The application designer specifies an existing DDS-created data base file to begin. With that existing file format and field definitions, the application designer may:

- Default to the DDS field attributes and sequence.
- Reorder the sequence in which fields would be presented to the operator.
- Specify if record keys are to be generated by DFU.
- Specify validity checking.
- Specify verifying.
- Specify auditing.

During DFU application execution, users are presented with displays tailored to their job requirements. The user controls the interactive entry, modification, or deletion of records via DFU command keys and system function control keys.

Query Utility: The Query Utility enables the System/38 user to create a report from information in a data base file. This can be a logical file having up to 32 record formats based on up to 32 different physical files. Using the query file chaining facility, a second file can be associated with this file, allowing query to process two associated records as one logical record. The second file must be a keyed (physical or logical) data base file. The Query Utility provides significant capability for record selection, field selection, sequencing, summing, averaging, and tabulating, as well as major/minor table presentation.

A report of the results can be presented via a display or printer. (Note: Query supports both keyed and arrival sequenced DDS-defined data base files only.)

A series of display prompts are presented to the Query application designer. The responses to those prompts determine the report to be generated during application execution.

The application designer then, via a sequence of displays:

- Designates output format information. For printing, title and header information is specified, line width is specified, and whether the entire subset of data or just a sample is to be printed.
- Selects the record formats and fields to be used.
- Identifies the particular records to be selected. Record selection is determined by the relationship of a field in the record to a constant or to another field in the record.
- Selects the fields to be processed. Also designates for each field, its sequence for output, if it is a sort field, if it will be summed or averaged, and if it will be tabulated. The user may define result fields derived from computations on one or more fields in the same record and/or constant. A computed field can be used to add, select, sort, or build a table.

Throughout the definition process the user may:

- Review the status of the application development.
- Modify the application definition.
- Obtain a description of the prompt by depressing the Help key.

The resulting report can be detailed; summary only, or both. Tables either single or two-dimensional, allow class computation each time the field value changes. They also allow grouping of field values at specified intervals. Data printed for each table value may be a sum, accumulated sum, average, count, accumulated count, and rank.

When Query definition is complete, the user may save the definition for repeated use.

Data File Utility (DFU) and Query Utility

- DFU and Query Application menu interface: Both DFU and Query provide a series of menus and prompts through which the user can create, maintain, change, delete, and manage DFU and Query applications. The menu interface is an integral part of each utility. The menu interface will permit the user to easily perform the following tasks:
 - Define and create a new application.
 - Change and recreate an existing application.
 - Define and create a new application using an existing application as a base.

- Execute an existing application.
- Display the output from a query at the workstation.
- Inquire into the status of submitted queries.
- Delete an existing application.
- Change the descriptive text of an existing application.
- Rename an existing application.
- Move an existing application to another library.
- Grant/revoke the authority of other users to owned applications.
- Transfer the ownership of an owned application to another user.
- Review the names of and pertinent information about existing applications and data base files to which the user is explicitly authorized.

- The commands which invoke the DFU and Query Application Management Menus support an 'answer ahead' capability which will allow quick entry into a particular functional area of the menus or, when invoked from a CL program, can be used to restrict the activities of the user to a particular functional area, for example, execution only.

- Complete online HELP text for each prompt is provided.
- Command Function Key 1 (CF1) can be used on any prompt display to exit DFU or Query interactive definition, except the exit prompt (which requires the selection of an option and ENTER). Depression of CF1 while displaying a management menu prompt will return the user to the main menu.
- Command Function Key 2 (CF2) can be used while displaying a management menu prompt to back up to the previous display. This function is available for most displays in DFU and Query interactive definition.
- The cursor will be initially positioned in the input field most likely to be used on a prompt. This is not necessarily the first input field on the prompt.
- A fast path option is provided in the form of a question on the Output Specifications prompt in Query and the Application Control prompt in DFU.

Program Use During Customer Pre-installation Testing: The System/38 Interactive Data Base Utilities (5714-UT1) is available to customers for pre-installation testing on IBM Test Center Systems in accordance with IBM's Program Testing Policy.

RELEASE 5 ENHANCEMENTS

This release offers enhancements to: IDU commands, query file support, SEU source type support, and Screen Design Aid (SDA) support.

HIGHLIGHTS

- Concatenation expressions allowed for IDU commands.
- Query will offer a file chaining capability between a primary file and a secondary keyed access file.
- SEU will support a new source type.
- SDA will support a new keyword and mixed files.

DESCRIPTION

Concatenation expressions will now be allowed for parameter values on all IDU commands when used within a CL program.

Query will offer a file chaining capability to the query user. Query File Chaining will allow one or more fields from a primary file record to be used as a key to retrieve a corresponding secondary file record. This chained data can then be treated in the query application as one data record so that the query user can now print fields from it on the same line, do calculations between fields to create a result field, and specify all query functions (such as sort, select/omit, etc.) against any of the fields.

Source Entry Utility (SEU) will support a new source type for entering, editing and prompting of mixed file source statements. Syntax checking will be provided.

The Screen Design Aid (SDA) will support the INVITE keyword, the design of display record formats within mixed file source members, the creation of mixed files, and the testing of display record formats of a mixed file.

PROGRAM PRODUCTS

S/38 Interactive Data Base Utilities (cont'd)

CUSTOMER RESPONSIBILITIES

Installation of System/38 Licensed Programs is a customer responsibility.

IBM may provide marketing assistance, in accordance with Marketing and Service Guidelines in the GI Section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

IBM System/38 Interactive Data Base Utilities run on all models of the IBM System/38. SEU (EDTSRC) and SDA require an IBM 5251 mdl 11 or 12 for execution.

SOFTWARE REQUIREMENTS

IBM System/38 Interactive Data Base Utilities are designed to operate with the IBM System/38 CPF (5714-SS1).

DOCUMENTATION

(available from Mechanicsburg)

IBM System/38 Interactive Data Base Utilities Licensed Program Specifications (GC21-7761).

The following documents are scheduled to be updated for Release 5 and available in June 1983:

IBM System/38 Interactive Data Base Utilities Licensed Program Specifications (GC21-7761). ... S/38 Guide to Publications, Glossary and Master Index (GC21-7726) ... PROGRAM PRODUCTS

**SYSTEM/38 ADVANCED PRINTER FUNCTION UTILITY
5714-UT2****PURPOSE**

The System/38 Advanced Printer Function licensed program is a utility that provides users with a method of accessing the addressable matrix printing functions available on the 5224 Printer mdls 1 and 2 and the 5225 Printer mdls 1, 2, 3 and 4. With this utility, the user may design a form layout, design logos and special characters, and merge this data with a predefined form.

HIGHLIGHTS

The Advanced Printer Function Utility can be used separately or in conjunction with application programs to allow the user to:

- Design alternate character sets and symbols. These could include bold font styles, attractive character sets, special symbols, and foreign language characters.
- Design logos, emblems, signatures, and large characters.
- Design 'boxes' and boundaries on a form (i.e., organization charts and column separators on invoices).
- Design forms which could include previously defined symbols (i.e., logos).
- Print blank forms.
- Perform character highlighting and underlining.
- Merge spooled data with a forms description.
- Create simple bar charts.
- Print bar codes in various sizes and types - UPC (versions A & E), Code 39, EAN (8 and 13 digit), and modified Plessey (MSI) code.
- Print some fields at 10 characters per inch (cpi) and others at 15 cpi on the same line.

DESCRIPTION

The Advanced Printer Function Utility is an interactive tool designed to allow a user to create special characters and forms, and then print them using the dot matrix capability of the 5224/5225 Printers.

Menu and prompt displays guide the user through the functions. Comprehensive HELP text is available for messages and functions.

In creating special characters or symbols, the user can design the new character, using a blank area on the screen, or can modify an existing character or symbol. If a symbol or character is too large to view on the screen, a windowing option is available to allow a portion of the already created character to be displayed on the screen.

Two methods are available to facilitate the creation of large characters and symbols. One method extends the lines to the end of the display or to the end of the character by using command function keys and predefined characters. The other method requires the user to originally design the character or symbol on a small scale and then have the utility expand it by a certain factor.

To design a form and specify where the special characters, symbols, bar codes, bar charts, or boxes are located, the user is presented with a blank area on a screen to position the special features. Column numbers across the top and line numbers along the side serve as reference points for the user. Various windowing options are available to quickly display to the user any part of the form.

Highlighting and underlining of fields and different character-per-inch settings for fields on a line are included as options available with Advanced Printer Function to make certain items stand out on a form. Highlighting is done by automatically reprinting a field over itself twice. Underlining can either be specified for all data in a field or only nonblank data. Two character-per-inch options - 10 cpi or 15 cpi - are available.

Predefined bar codes and bar chart symbols are provided by the Advanced Printer Function. The bar codes are Code 39, UPC (versions A & E), EAN (8 and 13 digit), and modified Plessey (MSI) code. Six bar chart symbols are provided which can be used in various combinations on the same chart. The 5224 and 5225 Printers produce a representation of bar codes and machine-readable characters, as specified by national standards, industry standards, or manufacturer's specifications for wand and scanning mechanisms. Customers should test all bar codes or machine-readable characters printed by the 5224 and 5225 to ensure that their wand or scanning device will adequately read the printed information.

The ability to draw boxes or boundaries on a form is also provided. Boxes, for example, can be used as axes on a graph, to lay out the columns of an invoice, or provide a map of an office.

Copies of blank forms can be printed at any time via a menu option. This can be especially helpful during forms design.

Merging the user application spooled data with the form description can be done either interactively or from a batch job.

Three multinational character sets are available: One wide by one tall, one wide by two tall, and two wide by two tall characters.

CUSTOMER RESPONSIBILITIES

Installation of System/38 licensed programs is a customer responsibility. IBM may provide marketing assistance. However, the responsibility for providing accurate ordering information, selecting and training personnel, installing licensed programs, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment.

HARDWARE REQUIREMENTS

The minimum configuration for which this program has been designed to operate is an IBM System/38 with:

- IBM 5381 System Unit (any model).
- One 1920-character display from the IBM 5250 Information Display System.
- One IBM 5224 Printer mdl 1 or 2 or IBM 5225 Printer mdl 1, 2, 3 or 4.

SOFTWARE REQUIREMENTS

The IBM Advanced Printer Function Utility is designed to operate under control of the IBM System/38 Control Program Facility (5714-SS1) Release 5.0.

PROGRAM PRODUCTS

5714-WP1 -SYSTEM/38 ADMINISTRATIVE MANAGEMENT**PURPOSE**

The System/38 Administrative Management program consists of a set of applications designed to improve the productivity of an organization's personnel in the operation of some of their business, clerical and professional tasks. Any System/38 user familiar with the operation of the 5250 Administrative Display System (1,920-character displays) may use the Administrative Management program which consists of: Calendar Management ... Correspondence Control ... Message Facility ... Directory Management ... Link to Text Management.

HIGHLIGHTS

From a single display station, users may accomplish multiple tasks which will help them improve their productivity in meeting their business, clerical and professional responsibilities.

The Calendar Management application may be used to schedule and maintain appointments, meetings and conferences for individuals, and facilities such as conference rooms. The application provides for:

- ADD, CHANGE, DELETE, DISPLAY appointments and reminders.
- Security levels to control calendar access.
- Display calendar in 5-day weekly format.
- Display a listing of appointments.
- Display MORNING, BUSINESS DAY, EVENING calendar.
- Shift calendar LEFT or RIGHT a number of days.
- Schedule 'tentative' appointments on other calendars.
- Schedule 'personal' appointments which no one else can display.
- Schedule 'group' appointments with a single entry.
- Display group meeting status to check confirmed attendees.
- Schedule repeated meetings with one entry (for example, each Monday at 10:00 AM).
- Schedule repeated days with one entry.
- Display a 'composite' or group calendar to determine common available times.
- Menu-selected print options.

The Correspondence Control application may be used to:

- Log all daily incoming correspondence for ease in tracking.
- Inquire into correspondence files to assist in locating and tracking all logged correspondence.
- Directly browse online text documents.
- Provide information on ACTION items, through display station and printed reports.

The Message Facility may be used to enter and send brief, informal messages to other users, and request an answer. Messages may be 'broadcast' to more than one user or all users. Administrative Management allows users to review messages received at their display station as well.

Directory Management allows the user to define phone directory-like lists of information tailored to their needs. Support includes:

- Menu definition of directory fields.
- Tools for directory maintenance.
- Interactive retrieval by up to six search arguments.

Link to Text Management allows the Administrative Management main menu to provide a direct link to Text Management if the user is authorized to the EDTTXX command and Text Management is installed.

Administrative Management has been designed for ease-of-use by personnel in an organization who are familiar with the operation of the 5250 Information Display System. The applications are selected from a menu. Comprehensive 'HELP' text is available at the touch of a key. The Administrative Management publications contain many helpful examples and illustrations.

DESCRIPTION**CALENDAR MANAGEMENT**

Calendar Management is designed to easily maintain schedules with the application. Scheduled appointments may be entered, changed and deleted. Personal appointments (not displayable by others) may be entered. The users may view their personal calendars in either a weekly format, or a list format. Reminders and extensive notes are also available with the calendar.

When the calendar is displayed in list form, the user may 'roll' forward or backward through the list of appointments. When the calendar is displayed in weekly form, the user may 'roll' the display vertically through the 24 hours of the day, or 'roll' the display horizontally through the days of the year.

A user may view another calendar, and schedule tentative appointments on that calendar. Calendar users may be grouped in the system so that multiple calendars may be displayed concurrently by simply entering a group identification. Displaying multiple calendars provides an easy way to find 'common available times' for multiple users.

A group scheduling facility is available with which the user can schedule a meeting and invite all the individuals from a defined group. If no group is defined, the user can select people from a selection list. Once scheduled, the status of a group meeting can be checked on a consolidated status display to see who has confirmed their appointment or removed it from their calendar.

With the repetitive scheduling function, if an appointment is desired each week at the same time for several weeks, they can all be scheduled with one entry. If several continuous days have a repeated schedule (for example, vacation from August 1-10), all the days can be scheduled with one entry.

Multiple print formats are available to offer variety in the appearance of the printed calendar.

CORRESPONDENCE CONTROL

Many organizations have a requirement to log correspondence. This application facilitates this function by making online information available in the user environment. For ease in locating printed material, each item of incoming correspondence may be logged into the system and is given a unique identification. Special fields are provided to assist the user in routing a document through a department or organization.

Reports of items requiring action, their due dates and responsible individuals, may be procured.

With Correspondence Control, there is less likelihood of missing key file information, thus improving the quality of work. Inquiries may be made into the file, to assist with tracking and retrieving correspondence, by author, keyword, recipient, subject, date written or date due.

MESSAGE FACILITY

Message Facility may be used to send brief, informal messages to other users. A 'group' message capability allows one entry to send a message to a predefined group of individuals or broadcast it to all users. If the right 'group' has not been defined, message recipients can be selected from a list of enrolled users. Messages up to 132 characters in length may be sent and received at your display station. Information in excess of 132 characters may be handled by sending multiple messages.

DIRECTORY MANAGEMENT

The directory management facility gives the user the ability to create, maintain, and print personalized lists, such as phone directories. The directory information can then be retrieved in several ways. For example, an installation could create a directory of all its employees (or customers) with their name, phone number, and department. The typical use would be to enter a name and retrieve the other information. However, the directory could be defined so a department number would retrieve all department personnel, or a phone number will return the person's name. The Administrative Management directory support will allow up to nine fields, with up to six being 'retrieval' fields. The user can also specify how the directory is labeled and how long fields are.

LINK TO TEXT MANAGEMENT

The Administrative Management main menu provides a direct link to Text Management if the user is authorized to the EDTTXX command and Text Management is installed.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance and guidance. The responsibility for personnel training, installation and continued day-to-day operation lies solely with the customer. The customer is responsible for error detection and analysis, and submission of APARs.

SPECIFIED OPERATING ENVIRONMENT

Support is provided for this licensed program when it is operated in the following specified environments:

HARDWARE REQUIREMENTS

The minimum configuration is:

- IBM 5381 System Unit (any model).
- One Printer.
- One 1,920-character display from the IBM 5250 Information Display System.

SOFTWARE REQUIREMENTS

This program is written in IBM System/38 RPG III and CL programming languages, and executes under the control of the IBM System/38 Control Program Facility (5714-SS1), Release 5.0.

DOCUMENTATION

(available from Mechanicsburg)

IBM System/38 Administrative Management Licensed Program Design Objectives (GC21-7951) ... IBM System/38 OFFICE/38 -Administrative Management User's Guide and Reference.

PROGRAM PRODUCTS

**SYSTEM/38 TEXT MANAGEMENT
5714-WP2**

PURPOSE

The System/38 Office/38 Text Management licensed program provides the capability for System/38 users to create, store, retrieve, revise and print documents. The user may access the System/38 data base from the Text Management program interactively at edit time or at print time. This provides the capability to selectively include data base information within a text document. Forms may be created and filled-in on the display or stored in the system for later use.

The functions of Text Management are utilized interactively through a 1,920-character display of the 5250 Information Display System (including the following displays: 5251 mdls 11 and 999, 5291 mdl 001, and 5292), concurrent with data processing operations. The text program was designed with the same ease-of-installation and use as the other System/38 utilities. After installation, it is ready for use. Any user who has experience with the 5250 Information Display System on the System/38 should be able to perform the basic functions of the program with minimum learning time. Prompts and HELP text are available during program execution to assist the user, and examples of the basic functions are available in the program publications.

Documents are stored as members in files, allowing maximum flexibility for organization of documents. For example, a file can represent a folder in which all documents pertaining to a subject or job can be stored. In addition, each user can have one or more libraries for storage of document files.

Up to 21 lines of the display can be used to enter or revise text. Line commands, similar to the System/38 Source Entry Utility (SEU), as well as command keys and print controls, are used to invoke the function of the Text Management program.

HIGHLIGHTS

- Create text
 - File by user-provided document name
 - Key new text
 - Copy in from a stored document
- Revise text
 - Retrieve document by:
 - Keying document name
 - Selecting from a list of documents in a file
 - Searching document description for character string
 - Searching for creation date (from/to)
 - Searching for document name (including partial name)
 - Any combination of searches
 - Line commands to:
 - Move
 - Copy
 - Insert
 - Delete
 - Shift
 - Text string manipulation by command key and cursor to:
 - Insert text in a paragraph
 - Move text strings
 - Copy text strings
 - Delete text strings
 - Move columns
 - Copy in from a stored document
 - Scan for character string
 - Replace character string
- Print Documents with Formatting Options For:
 - Headers/footers per page
 - Number of copies
 - Length of printer form
 - Line spacing
 - Printing review copy with line numbers
 - Printing part of document (from/to page number)
 - Flagging changes
 - Capability to utilize the following advanced print functions of the 5219 Printer:
 - Type style support
 - Alternate cut sheet feed
 - Lines per inch
 - Ribbon saver under program control
 - Sending documents to Displaywriter for printing
 - Sending documents to 6670 Information Distributor for printing
 - Font (type style) downloading capability on 6670 model II with Font Storage feature installed
- Data base access
 - Form letters with data base field insertion at print time
 - Copy data base directly into document interactively
 - Simple conditional selection by field
- Create, store, retrieve forms
- Table of contents

- Column total for numeric data

DESCRIPTION

The user invokes the text program by entering the command or by selection from a user-created menu.

Text Management functions are selected from menus. For example, on the initial program menu, the user chooses to either create or revise, browse, print a document, or fill in a form. The user may key the document, file and library name, or key only the library name and select the file and document from displayed lists. From a document list, the user can: Select a document to revise, select a document to copy to a new document, remove a document from the file or print a list of documents. In the case of large document files, subsets of the document list can be presented as a result of user-specified searches of the list by document name or description (including partial description), and creation date (including from/to ranges).

During document creation or revision, the user can manipulate text by keying simple line commands. These line commands allow the user to:

- Insert one or more blank lines
- Copy one or more lines anywhere in the document
- Move one or more lines anywhere in the document
- Delete one or more lines
- Shift text right or left on a line

The user can manipulate text strings, such as sentences, by cursor placement (to frame the text string) and command keys to execute the function. There are command key functions for:

- Inserting text string in the document
- Moving a text string in the document
- Copying a text string in the document
- Deleting a text string
- Moving columns of text

For example, to insert text in the middle of a paragraph, the user would position the cursor at the point where the new text is to be inserted. Pressing the insert text command key would present a series of blank lines in which to key. The user would key the new text and, when finished, press the ENTER key. The paragraph would 'close up', adjusting line endings. While inserting text the user can also specify a new paragraph.

Text from another stored document can be copied into the document being created or revised. The document to be copied can be reviewed on the lower part of a split display while the document being edited remains displayed on the upper part of the screen.

The text program user can scan through a document to search for a specified character string and can also specify replacement of the character string.

The user may print interactively or utilize the batch print capability. The batch print capability will allow the user to perform other tasks while the text product is creating documents which have a large number of pages, or producing multiple copies of a document. This capability is designed to increase user productivity and enhance Text Management performance.

The user can store print format instructions with each document. Page header and footer information can be specified. Format options for: 1) line spacing, 2) positions to the left of margin, and 3) printing line numbers for review copies can be specified. The user can further indicate first and last print line, form length, number of copies, and partial document printing (from/to page number). Specification of character(s) to flag changes, when to print the flag, and whether or not to print the date of last modification can also be made.

The user can utilize some of the advanced functions of the 5219 Printer via Text Management. Supported functions include: Paper feed attachment support (which automatically feeds a cut sheet from one of two source drawers into the printer), type style selection capability, the support of lines-per-inch spacing, and the ribbon saver feature for printing draft copies of documents.

Text Management offers additional print capability via Binary Synchronous Communications (BSC) to the Displaywriter or 6670 Information Distributor. The user may direct documents to the 6670 Information Distributor or Displaywriter, for print only, using the software capability in Text Management. The System/38 is also supporting the font availability function of the 6670 model II with the Font Storage feature installed, to the extent of communicating fonts (font styles) from the System/38 to the 6670 RAM Font Storage. A corequisite for this capability is the 5799-BGN font diskette for the System/38.

The user may request that a document be produced on a 6670 Information Distributor or on a printer attached to the Displaywriter by using selections from the print options screens. On the 6670 Information Distributor, the user may utilize many of the advanced functions provided by that system, by means of System/38 Text Management prompting. No user programming is required.

System/38 Text Management (cont'd)

Forms can be created and stored in the system for later use. In forms mode, the user can define fields anywhere in the document which can be filled in later. There are options to define characteristics of fields defined in forms. The user can specify:

- Initial values
- Data base fields
- Numeric only
- Highlighting
- Underlining
- Centering
- Right adjust (with zero or blank fill)
- Decimal alignment

To fill in a form, the user simply retrieves it from storage and can then key into defined fields in the form. Pressing the field advance keys after keying into a form field will advance the cursor to the next field.

Text Management users can access the system data base in multiple ways. During editing of a document, the user can 'copy in' data base information in the same way that information is copied from other documents. The user can access a data base file (with options for field selection and ordering) that can be displayed on the lower portion of a split screen. Then, the data can be copied to the document being edited (displayed in the top portion of the screen).

Multiple copies of documents that require insertion of data base variables can be produced. Examples of these are: 'Past due' accounts receivable reminder to customers, order acknowledgments, and advertising to customers or categories of customers. The user creates a document and specifies the name of the data base field in the document at the location the variable is to print. Field and record selection options are supported to specify the total number of documents printed. Once the document is set up, normal print procedures are used.

A Table of Contents can be created for any document. The user specifies section headings and subheadings. As an option, the program will sequentially number the headings and subheadings and identify the page numbers. The Table of Contents can be printed anywhere in the document.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support is provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration for this program is an IBM System/38 with:

- IBM 5381 System Unit (any model).
- 1,920-character display of the IBM 5250 Information Display System.
- One IBM Printer.

SOFTWARE REQUIREMENTS

The IBM System/38 Text Management program is designed to operate under the control of the IBM System/38 Control Program Facility (CPF) (5714-SS1), Release 5.0.

Other Requirements:

- Appropriate Binary Synchronous Communications (BSC) support is necessary for the use of the IBM 6670 and Displaywriter printing capability.
- Font diskette (5799-BGN) is a System/38 prerequisite for the font availability function on the IBM 6670 model II.
- For use of the font function, the Font Storage feature is a prerequisite on the IBM 6670 model II.

Program Use During Customer Pre-installation Testing: System/38 Office/38 Text Management (5714-WP2) is available to customers for pre-installation testing on IBM test center systems in accordance with IBM's program testing policy.

RPQs ACCEPTED: No

SYSTEM/38 WORK STATION SEARCH FACILITY 5714-WS1

PURPOSE

The IBM System/38 Work Station Search Facility provides the workstation user with a powerful, yet easy-to-use tool to display records from disk files based on terminal user-selected search criteria. This IBM System/38 product is based on the proven IBM System/34 Work Station Search Facility. It includes enhancements that provide online assistance to the user during operation.

HIGHLIGHTS

- Ease-of-operation allows non-DP personnel within the organization to search their files for information.
- Reduces the need for alphabetically sorted master file listings.
- Keyword in Context (KWIC) technique for searching alphabetic fields without requiring data base changes by the user. Blanks and special characters (if preceded or followed by a blank position) are considered delimiters.
- User-defined literals are excluded during the index creation process (for example: the, and, co, Inc . . .)
- Use of up to an eight-character search argument with null characters anywhere within the argument. This facility may be used in those cases where the exact spelling of the search criteria is unknown.
- Use any combination of six logical search operators (equal, less than, less than or equal, greater than, greater than or equal, or not equal).
- AND/OR logic to define the relationship between the primary, secondary and tertiary searches.
- Supports both the 960 and 1920-character screen versions on the 5251 and 5252 Display Stations.
- Supports System/38 physical files in either keyed sequence or arrival sequence.
- Optional user-defined security passwords to prevent unauthorized use of searches. This is in addition to the System/38 integrated security.
- Creation of up to 13 cross-reference indices per master file for fast searching of high-use data fields.
- Supports all data field formats with the exception of binary fields.
- Displays up to 20 matches at a time.
- Allows forward and backward paging, termination of a search or start of a new search at any time.
- Second level display on a selected line provides additional data from the selected master record. This screen displays unformatted data directly from the record.
- User-oriented tailoring procedure that will allow the user to easily define the required searches, and then will generate the required RPG III source programs and Control Language (CL) and evoke the required creation and execution of the index-build program.
- Online Assistance:
 - Describes features of online assistance to user.
 - Gives user the capability to review prior tailoring options and make modifications.
 - Gives user additional information about error messages.
 - Provides clarification to user during data entry about the nature and description of a field.
 - Provides tailoring option information to workstation operator when using generated search program.

DESCRIPTION

This product (5714-WS1) is designed to process System/38 disk records. It is a cross-industry offering and will execute in conjunction with most licensed programs.

The operator will define through an interactive workstation session the search required, with up to 75 characters of information to be displayed on matching master records. Additionally, information about library and file name will be required. The *Application Installation Guide Reference Manual/Runbook* will provide the operator with an explanation of the required and optional fields to be entered during this session. Each response will be edited as the information is entered.

By displaying up to 20 records at a time that meet search criteria, the offering can reduce the need for referencing voluminous printed reports. If more than 20 records meet the criteria, the screen display can be paged forward or backward to allow a review of all matched records. Also, when the desired record is displayed, the entire contents of the record can be selected, as it appears on disk, to be further displayed.

The product application consists of four RPG programs: An interactive entry/edit program, a tailoring program, and two skeletal programs

which, when copied and modified by the tailoring program, provide user unique Index-build and Search programs.

The first segment consists of two programs. The first is an interactive entry/edit program in which unique tailoring answers to three or more displays are supplied. The second is a tailoring program that uses these answers to modify the two skeleton source programs in the other segments, and also creates operational procedures that are self-initiating. The first and second segments will be run sequentially as one session if the user does not want to modify the source prior to compilation. The sequential operations of this session would be:

1. Answers to displays are temporarily stored on disk.
2. Answers are used to tailor two skeleton RPG source programs and create tailored CL programs.
 - a. Index-build RPG program
 - b. Search RPG program
 - c. CL programs to run the Index-build and Search RPG programs
3. Creation of Index-build and Search programs.
4. Run the Index-build program which creates unique search pointer files.

If the user wants to modify the source code before compilation, only operation steps 1 and 2 will be performed. The user will need to be familiar with the source entry utility (SEU) to be able to modify either the Index-build or Search program source code. They will also need to know how to create the source programs because step 3 will not be executed.

The second segment consists of the tailored Index-build program. This program determines which data fields of a particular master file are to have pointer files created, as specified by the answers created during the running of the interactive entry/edit program. The Index-build program then creates one or more pointer records per master record for each search. If the user chooses not to modify the Index-build program before compiling, it will run automatically when both the interactive and tailoring programs are finished.

The index-build program can also run as a standalone program. The index files should be re-created after records are added or changed in the master file. The index-build program can be run any time.

The third segment of the application consists of the tailored search program. A workstation user initiates a particular search program by entering the name that was assigned during the running of the interactive entry/edit tailoring session. The search program returns a display allowing the user to key in the search request parameters. Records that match the search criteria are then displayed to the workstation user.

During the tailoring process, control logs are filled out that will aid the user in maintaining the search and index data base. Copies of these control logs, along with data entry forms, are provided to facilitate the actual entry during the tailoring process.

The *Application Installation Guide Reference Manual/Runbook* provides the user with the information necessary to install the product, execute tailoring of searches, and defines how the user would approach special situations. This document provides step-by-step instructions for operating the application.

Instructional information regarding the execution of the sample problem is provided in this manual. The sample problem will include a master file and tailoring instructions so that a user becomes self-educated on the tailoring and search programs and procedures.

The *Application Logic Manual* is provided as licensed documentation for use by the self-sufficient user and for the systems engineer in maintaining and modifying the product. Information on naming conventions, application program functions and specifications and other information pertaining to the application is presented in this manual.

CUSTOMER RESPONSIBILITIES

Installation of IBM licensed programs is a customer responsibility. IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum configuration for this application is an IBM System/38.

- IBM 5381 System Unit mdl 332 (128 megabytes of disk storage and 768K bytes of main storage)
- One IBM 5211 printer mdl 2 (300 lpm)

Do not reproduce without written permission

PP 5714-WS1.2

Nov 83

PROGRAM PRODUCTS

S/38 Workstation Search Facility (cont'd)

- One IBM 5251 or 5252 Display Station - all models

SOFTWARE REQUIREMENTS

The programs are written in IBM System/38 RPG III programming language and executed under control of the IBM System/38 Control Program Facility (5714-SS1). The IBM System/38 RPG III Compiler (5714-RG1) is also required.

PROGRAM PRODUCTS

**SYSTEM/38 DATA PREPARATION
5714-XA4****PURPOSE**

The IBM System/38 Data Preparation licensed program (5714-XA4) for the retail industry accepts transaction log data written on diskettes at IBM 5265 Point-of-Sale Terminals and hand-carried to the IBM System/38 host system. Data Preparation restructures IBM 5265 and 5266 Point-of-Sale Terminal transaction log records into logical records, routes them to appropriate files, and establishes initial transaction controls. The user is then able to access the logical records written by Data Preparation in the data base of the System/38.

HIGHLIGHTS

- Accepts point-of-sale terminal diskette transaction log records from the diskette reader.
- Restructures transaction log records into logical transaction records and writes them into the data base.
- Analyzes transaction log records to:
 - Eliminate true duplicate records.
 - Renumber different transactions having duplicate keys.
 - Recognize and automatically rectify out-of-sequence submission of diskettes.
 - Insert into logical transaction records personalization data required by subsequent processing.
- Validates store and register identification.
- Uses the Installation/Maintenance Support Facility (IMSF) as an aid in installing and maintaining the Data Preparation licensed program.

CUSTOMER RESPONSIBILITIES

Installation of the System/38 Data Preparation licensed program is a customer responsibility. IBM may provide marketing assistance in accordance with the Marketing and Service Guidelines in the GI section, in the installation of IBM licensed programs. However, the responsibility for personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration is an IBM System/38 consisting of:

- IBM 5381 System Unit, mdl 332 (768K bytes of main storage, 128MB of disk storage).
- One IBM printer.

Input will be accepted from the store-and-forward 5265 Point-of-Sale Terminals. This input may be either Diskette 1 (Basic Exchange format) or Diskette 2D (E-format only). The diskettes are read by the System/38 diskette magazine drive.

Although there is nothing inherent in the design of the application to prevent the use of the minimum system configuration stated above, the system configuration for a particular customer must be able to accommodate the expected business volumes, data base size and operating requirements.

The amount of disk storage is influenced by:

- The volume of daily transactions.
- The frequency of processing.
- Other applications installed.

SOFTWARE REQUIREMENTS

The IBM System/38 Data Preparation licensed program is written in IBM System/38 RPG III and System/38 Control Language, and executes under control of the IBM System/38 Control Program Facility (5714-SS1). The IBM System/38 RPG III Compiler (5714-RG1) is required if modification of the source code is desired. The IBM System/38 Interactive Data Base Utilities (5714-UT1) is required.

Publications: The *RMAS General Information Manual* contains a description of the system and its application features and functions as they may be used by a typical customer. It contains three sections. The first introduces IBM's retail offering, as it pertains to the IBM 5260 Retail System terminals, with special attention to the licensed programs, of which Data Preparation is the only one for System/38. The second provides more detailed information on the major functions and operations associated with the licensed programs. The last section reviews installation and planning tasks, and customer responsibilities.

A *User's Guide* provides the planning, reference, education, and operational information needed to understand, install, manage, and use Retail Data Preparation.

A *Logic Manual* is provided as licensed material, for use by the self-sufficient customer and for the systems engineer in maintaining and modifying Retail Data Preparation.

PROGRAM PRODUCTS

**SYSTEM/38 OFFICE/38 - APPLICATIONS MADE EASY
5714-XE1**

PURPOSE

The Applications Made Easy program is one of a series of programs within IBM System/38 OFFICE/38, all of which are designed to help improve the productivity of the professional and administrative employee in the modern office environment.

With Applications Made Easy from IBM, it's not necessary to understand computers to get productive work from someone. All that's needed is an understanding of the job to be done, and an understanding of English. Without learning computer languages, or memorizing complicated codes or abbreviations, the user may readily store and retrieve business information, and has the ability to use the System/38 to:

- Enter and change information
- Format new reports
- Do calculations
- Process daily transactions

HIGHLIGHTS

- One-day user training through the *Learning Guide* (SB30-3006) used in conjunction with computer-assisted training.
- Easy-to-use computer interface with menus, selections from lists, and the answering of questions posed in clear English.
- HELP text in cordial English
- Error messages in clear English.
- Both the control and storage of application and data files created while using Applications Made Easy is done automatically by the program.
- Automatic documentation of applications created by this program.
- Maintenance programs and screens, and a report program, are automatically generated for each data file created with the Applications Made Easy program.
- Ability to create a new application by using a previously created similar application. (Selection from a menu option copies the existing application's definitions, requests the name for the new application, and then allows the user to change the display answers and definitions to suit the new application, without disturbing the existing one.)
- Control of application and data file security can be by department and user names, rather than codes and abbreviations.
- Messages may be sent and received by user names, rather than workstation address.
- Physical and logical files may be defined and created without coding Data Description Specifications.
- Screens and reports may be obtained without coding RPG III or Control language, or using the Data File or Query Utilities.
- Capability to create screens and reports against an externally described data base:
 - Reports with:
 - Record selection (at execution time)
 - Calculations (add, subtract, multiply, divide)
 - Average, standard deviation, and variance calculation
 - Field totals and sub-totals
 - Screens with:
 - Record selection (at execution time)
 - Calculations (add, subtract, multiply, divide)
 - Record update capability
 - Transaction Processing with:
 - Field update via replacement
 - Field totals and sub-totals
- File creation by combining fields from records of one, two or three files.

DESCRIPTION

Applications Made Easy is designed with major emphasis on the interface to the non-programmer user. The program is intended to help these users create and execute custom-tailored applications fundamental to their job and department, without requiring that they have knowledge of the components of the System/38, RPG III, Control Language, Physical/Logical Files, etc.).

Application Creation: The non-programmer user creates data files, reports, and inquiries via menus, selections from lists, and by answering clear, English-like questions. Normally required naming conventions have been eliminated so that the user should not have to use codes or abbreviations.

- Application names can be up to twenty-five (25) characters.

- File names can be up to fifteen (15) characters.
- Field names can be up to fifteen (15) characters.

Example:

Application Name:	CREATE EXPENSE RECORDS	not	CRTEXPRECS
File Name:	EXPENSE RECORDS	not	EXPRECS
Field Names:	EMPLOYEE NUMBER	not	EMPNUM
	EMPLOYEE NAME	not	EMPNAM
	EXPENSE DATE	not	EXPDATE
	EXPENSE AMOUNT	not	EXPAMT

Applications Made Easy retains the user's selections and answers to questions and, upon completion of the application definition, all necessary programs are generated and compiled by the licensed program.

Generation and compilation is performed in a batch mode so that the workstation and the user can continue defining other applications or executing previously defined applications. For each application, a completion report is automatically generated which details:

- The name of the application
- The owner's name
- The file(s) used
- How the information is selected from the file (key fields)
- The sequence of the file (ascending/descending)
- Whether duplicate key field records are allowed
- A listing of the fields, and
- A listing of all departments and user names authorized to use the application.

After the application has completed compilation and is available for use, a message is placed in the user's personal message queue. The user is notified to review personal messages through an information message displayed on the Main Menu.

Installation Tasks: The *Applications Made Easy Installation Guide* (GB30-3077), details installation procedures and contains a pre-installation planning section. The user is instructed on how to create user profiles, libraries, etc. Examples of all required commands are also given in the guide.

SPECIFIED OPERATING ENVIRONMENT

These programs were written to execute on the IBM System/38.

HARDWARE REQUIREMENTS

The minimum system configuration for this program is:

- An IBM 5381 System Unit - any model*
 - One IBM 5251 mdl 11 or 12 Display Station (24 x 80-character screen)
 - One IBM System Printer - any model
- * The memory and disk storage requirements will be a function of the user's particular volumes and requirements.

SOFTWARE REQUIREMENTS

The following IBM System/38 program functions are required:

- IBM System/38 Control Program Facility (CPF) (5714-SS1), at least Release 4.0
- IBM System/38 RPG III (5714-RG1), at least Release 4.0

Program Services: This program is distributed on an *as is* basis, without warranty either expressed or implied. Successful implementation depends solely on the customer's ability to integrate each program into the total inventory of 'in-house'-produced programs, including the acceptance of full maintenance responsibility. While each offering has been reviewed by IBM for its transferability and maintainability, no assurance of successful installation can be given.

As a part of this licensed program offering, telephone assistance, only for program defects, is provided by the Distribution Industry Support Center until November 30, 1983.

IBM will, without additional charge, respond to a reported defect in the current unaltered release of the licensed program, which is operated in the Specified Operating Environment, by issuing known defect correction information to the customer reporting the problem, and/or issuing corrected code or notice of availability of corrected code. However, IBM does not guarantee service results or represent or warrant that all defects will be corrected.

The Distribution Industry Support Center can be contacted on the following toll-free numbers:

1-800-227-8222 Outside California

PROGRAM PRODUCTS

**SYSTEM/38 DISPLAY INFORMATION FACILITY
5714-XR1****PURPOSE**

The IBM System/38 Display Information Facility provides the System/38 user with a powerful tool to build online information applications consisting of combinations of alpha search, inquiry, update, add, delete, list, and user programs. This facility is designed to be used to generate programs that will give the user online access to data files. A high degree of tailoring capability permits the users to incorporate their unique data base file formats, display formats, and report formats. These formats could be created, for example, using the System/38 Data Description Specifications (DDS) or the System/38 Screen Design Aid (SDA). The result is a user-designed online information application.

Display Information Facility is applicable to most industry classifications. Distributors and manufacturers can use the facility to create online information applications consisting of interrelated searches, inquiries, and lists for customer and receivables files; contractors can do searches, inquiries, and lists for their employees and jobs; hospitals can build patient and guarantor searches, inquiries, enter patient information, and maintain hospital files.

HIGHLIGHTS

- Powerful inquiry and alpha search capabilities
 - File inquiry on a unique key
 - File inquiry on a non-unique key
 - One argument alpha search-in-context (scan) on one key field (for example, customer last name)
 - Delimited search-in-context (for example, customer last name for customers located in a specific city)
- Linkage to user-written programs (for example, to allow calculations to be made on data retrieved by inquiry, with the results displayed to the user).
- Generated source RPG III and object modules.
- Ability to list files between key limit values.
- Ability to add/delete records and write to an audit file.
- Forward and backward paging among display formats.
- Display of sequential records by browsing.
- Ability to write update changes to an audit file.
- Use of System/38 (CPF) security facilities.
- A sample problem that can be used for learning and referencing.
- Online Information System (OLIS) provides HELPTTEXT when using the Display Information Facility.
- Installation/Management Support Facility (IMSF) - an aid in installing and maintaining the Display Information Facility.

CUSTOMER RESPONSIBILITIES

Installation of IBM System/38 licensed programs is a customer responsibility. IBM may provide marketing assistance in the installation of IBM licensed programs, in accordance with the Marketing and Service Guidelines in the GI Section. However, the responsibility for providing accurate ordering information, personnel selection, and training, and continued day-to-day operation lies solely with the customer.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration for the Display Information Facility is an IBM System/38 with:

IBM mdl 332 Processor with 768K bytes of Main Storage, 128MB of Disk Storage

IBM System Printer

IBM 5251 mdl 11 Display Station

Although there is nothing inherent in the design of the IBM Display Information Facility which prevents the use of the minimum system configuration stated above, the system configuration for a particular customer must be able to accommodate the expected business volumes, data base size, and operating requirements, including the mix and types of applications.

SOFTWARE REQUIREMENTS

The IBM Display Information Facility licensed program is written in IBM System/38 RPG III (5714-RG1) programming language and executed under control of the IBM System/38 Control Program Facility (CPF) (5714-SS1). The IBM System/38 RPG III Compiler is required to compile the source programs generated by Display Information Facility.

PROGRAM PRODUCTS

**SYSTEM/23 ASYNCHRONOUS COMMUNICATIONS
5715-AC1****PURPOSE**

The System/23 Asynchronous Communications licensed program consists of communications access method support, a set of communications customer support functions, and a facility for user-written communications programs using the System/23 BASIC language. In conjunction with the communications access method, the Asynchronous Communications Terminal customer support function provides the user with an interactive interface to perform asynchronous communications.

HIGHLIGHTS

- Provides a data transfer function which gives the System/23 Datamaster functional characteristics commonly referred to as TTY-compatible. This function uses start/stop discipline and permits the user to transfer data using the American Standard Code for Information Interchange (ASCII) translate table and the Asynchronous Communications terminal function of the licensed program.
- A code translation table is provided to convert the Datamaster internal EBCDIC code to/from ASCII code. Other tables may be built by the user.
- Provides the operator with an ease-of-use interactive function that leads the user through a step-by-step procedure using prompts and responses for defining and establishing communications and for performing other TTY functions.
- The input/output devices supported are the keyboard/display and printer.
- Provides a facility for the execution of BASIC language user-written programs to perform data transfers.

DESCRIPTION**Communications Access Method**

A communications access method links a Datamaster communications program (either IBM-supplied or your own) with the communications network. It performs functions such as data handling, link protocol, and character set translations.

The line type can be point-to-point switched or point-to-point nonswitched on a full or half-duplex line. Only one asynchronous communications program can be executing in main storage at any given time.

Asynchronous Data Transfer Support

The System/23 Asynchronous Communications licensed program includes a data transfer function which gives the Datamaster characteristics commonly referred to as TTY-compatible. This function uses start/stop protocol and permits the user to transfer data using the American National Standard Code for Information Interchange (ASCII) translate table and the Asynchronous Communications Terminal function of the licensed program. This data transfer function performs batch data transfers in either manual or AUTO ANSWER mode.

This support can be used to communicate with the following IBM systems:

- S/370 mdls 135-168, 3031, 3032, 3033, 3081, 4331, 4341, 4361 and 4381 via 3704/3705-EP Release 3.0 to VM/370, using the American National Standard Code for Information Interchange (ASCII) translate table and the Asynchronous Communications Terminal function. The 3135 and 3138 attach via ICA to VM/370 and the 4331 attaches via CA to VM/370. Datamaster attachment to VM/370 is provided through VM/System Product, VM/Basic System Extensions and VM/System Extensions licensed programs with VM/370 Release 6 PLC 4 level or higher.
- Series/1 (Event Driven Executive, Realtime Programming System) (half-duplex, switched facilities).
- System/23 Datamaster (full and half duplex, switched and nonswitched).

For communications to VM/370, the facilities are full duplex, switched facilities up to 300 bps. Series/1 support is half duplex, switched facilities up to 300 bps. For communication to another Datamaster, the facilities are full or half duplex, switched or nonswitched, up to 1,200 bps.

This support uses the information created and maintained by the preparation function for program execution.

Communications Customer Support Functions

The communications support functions can be divided into three groups:

- A preparation function which is used to prepare for communications
- An execution function which transfers data over a communications line

- A diagnostic aid function.

The preparation function is interactive, requiring the user to respond to prompts using the keyboard/display. The prompts allow the user to describe a communications environment. Responses to the prompts are saved on diskette and are used each time the communications access method is loaded. The responses can also be updated.

The execution function transfers data to and from the Datamaster over the communications line.

The input/output devices supported by the execution function are the keyboard/display and printer.

A diagnostic aid function allows the user to list both communications statistics and trace information.

User-Written Communications Programs

The System/23 Asynchronous Communications licensed program provides a facility for user-written communications programs using the System/23 BASIC language. A user-written program can execute in conjunction with the communications access method to perform data transfers.

CUSTOMER RESPONSIBILITIES

IBM may provide normal marketing assistance and guidance. The responsibility for personnel selection and training, installation and continued day-to-day operation lies solely with the customer. The customer is responsible for error detection and analysis, and submission of APARs, but can obtain phone assistance from the Atlanta Customer Support Center (ACSC).

IBM Central Service develops and distributes program fixes, but the customer has the responsibility to apply fixes to the program. The customer can obtain phone assistance from the ACSC in applying PTFs to programs that are at the previous current levels.

IBM reserves the right to charge for any additional effort that results from providing program services for a licensed program that has been altered or is not at the proper program library release and program temporary fix level.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration required to support communications in an asynchronous network is:

- An IBM 5322 or 5324 Computer with minimum main storage size of 32K bytes.
- Communications Adapter feature #2550.
- One diskette drive or IBM 5247 Disk Storage Unit.

SOFTWARE REQUIREMENTS

The IBM System/23 Asynchronous Communications licensed program does not require any other system control program or licensed program for its execution.

The communications access method is distributed as machine language object code. The communications customer support functions are distributed as System/23 BASIC language BASIC format code.

DOCUMENTATION
(available from Mechanicsburg)

IBM System/23 Communications Guide (SA34-0111).

RPQs ACCEPTED: No

**SYSTEM/23
BINARY SYNCHRONOUS COMMUNICATIONS
5715-BC1**

PURPOSE

The IBM System/23 Binary Synchronous Communications licensed program consists of communications access method support, a set of communications customer support functions, and a facility for user-written communications programs using the System/23 BASIC language. In conjunction with the communications access method, the communications customer support functions can perform the following data transfer functions using Binary Synchronous Communications protocol:

- Transmit batch data
- Receive batch data
- Inquire into a host system and receive batch data

HIGHLIGHTS

- The System/23 Datamaster uses the line protocol of the 3741 to communicate with a variety of IBM systems.
- Includes a data transfer function which performs batch data transfers (both attended and unattended).
- The input/output devices supported are the keyboard/display, printers, and diskette.
- Provides a facility for BASIC language user-written programs to perform data transfers.
- Code translation tables are provided to convert to the Datamaster internal Multilingual Character Set to/from the National Language Version. Other tables may be built by the user.
- Provides an operator ease-of-use interactive function that leads the user through a step-by-step procedure using prompts and responses for defining and establishing communication and batch data transfer functions.

Communications Access Method

A communications access method links a Datamaster communications program (either IBM-supplied or customer-supplied) with the communications network. It performs functions such as data formatting, link protocol, and character set translation.

Binary Synchronous Communications Support

The Binary Synchronous Communications support on the Datamaster establishes the line connection, exchanges identification sequences, transmits and receives data, and executes the correct termination or disconnect procedures. The line type can be point-to-point switched or point-to-point nonswitched. Only one BSC program can be executing in main storage at any given time.

The Datamaster uses 3741 protocol to communicate with the following IBM systems at data transmission rates of up to 4,800 bps:

- System/3 mdl 15D
- System/23 Datamaster
- System/34
- System/38
- 5280 Distributed Data System
- 5265 Point-of-Sale Terminal
- 5110 Computing System
- 5120 Computing System
- Series/1 Event Driven Executive, Realtime Programming System

Datamaster is supported for attachment to System/370 mdls 115 through 168, 3031, 3032, 3033, 3081, 4331 and 4341 through CICS/VS using BTAM under VSE, VS1 or MVS. 3741 BSC protocol is provided for communications using point-to-point leased or switched facilities via ICA or CA (where applicable), or 3704/3705. In particular, support is provided for the following CICS/VS release/versions:

CICS/DOS/VS	Version 1.5	On VSE/AF	Release 2
CICS/OS/VS	Version 1.5	On VS/1	Release 7
CICS/OS/VS	Version 1.5	On MVS	Release 3.8

Communications Customer Support Functions

The communications customer support functions can be divided into three groups: Preparation functions which are used to prepare for communications, an execution function which transfers data over a communications line, and diagnostic aid functions.

The preparation functions are interactive, requiring the user to respond to prompts using the keyboard/display. The prompts allow the user to describe a communications environment or a communications job. A communications job is one or several data transfer functions (such as transmit, receive, or inquiry). Responses to the prompts are saved on

diskette and are used each time the job is executed. The responses can also be updated.

The execution functions transfer data to and from Datamaster over the communications line; they execute communications jobs.

The input/output devices supported by the execution functions are the diskette, keyboard/display, and printer.

Two diagnostic aid functions allow the user to run an online test of the communications link and also to list both statistics and trace information.

Batch Data Transfer

The System/23 Binary Synchronous Communications licensed program includes a data transfer function which performs batch data transfers in either MANUAL or AUTO ANSWER mode. This function uses Binary Synchronous Communications protocol and permits the user to transfer data with minimum operator involvement. Multiple transmit, receive, and inquiry operations, in varying combinations, can be chained together and executed as a single communications job. These functions use the information created and maintained by the preparation functions for program execution.

User-Written Communications Programs

The System/23 Binary Synchronous Communications licensed program provides a facility for user-written communications programs using the System/23 BASIC language. A user-written program can execute in conjunction with the communications access method to perform data transfers.

CUSTOMER RESPONSIBILITIES

IBM may provide normal marketing assistance and guidance. The responsibility for personnel selection and training, installation and continued day-to-day operation lies solely with the customer. The customer is responsible for error detection and analysis, and submission of APARs, but can obtain phone assistance from the Atlanta Customer Support Center (ACSC).

IBM Central Service develops and distributes program fixes, but the customer has the responsibility to apply fixes to the program. The customer can obtain phone assistance from the ACSC in applying PTFs to programs that are at the previous current levels.

IBM reserves the right to charge for any additional effort that results from providing program services for a licensed program that has been altered or is not at the proper program library release and program temporary fix level.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration required to support communications in a Binary Synchronous network is:

- IBM 5322 or 5324 Computer with minimum main storage size of 64K bytes
- Communications Adapter Feature #2550
- One diskette drive or 5247 Disk Storage Unit

SOFTWARE REQUIREMENTS

The IBM System/23 Binary Synchronous Communications licensed program does not require any other system control programs or licensed programs for its execution.

The communications access method is distributed as machine language code. The communications customer support functions are distributed as System/23 BASIC language BASIC format code.

RPOs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

SYSTEM/23 CLIENT ACCOUNTING 5715-CA1

PURPOSE

The IBM System/23 Client Accounting licensed program provides the accountant with powerful tools to perform client write-up activities in a more productive manner. The use of the computer for data entry, processing and report generation allows accountants to dedicate more time for the analysis and consulting functions of their profession.

The program design provides familiar accounting-based functions that are easy to implement and use. The application's functional richness and variety provide the accountant the ability to service a wide range of client businesses.

HIGHLIGHTS

- Built-in auditability and control characteristics through the use of familiar 5-column journals, intra-application data integrity, and sequential journal numbering.
- Application documentation is designed to promote customer self-sufficiency during installation and operation.
- Ease-of-use is enhanced through:
 - Application library design
 - Menu-driven task selection
 - Consistent data entry programs and procedures for all application functions
 - Consistent file maintenance techniques including user-defined field defaults
 - Use of generally accepted accounting terminology
- Application error handling facilities
- Installation time tailoring options allow the user to select key functions and perform file sizing
- An improved program update (PTF) procedure is provided to aid the operator in applying program fixes provided by the Atlanta Customer Support Center (ACSC) or the Program Information Department (PID)
- BRADS III file definitions are provided for selected master files
- Optional security code
- Multiple-client installs on separate diskette(s)
- File sharing capability supporting concurrent operations when two 5322s are connected via a Shared Diskette Unit (5246 mdl 22)

There are two major functions in the application: After-the-fact payroll accounting, and general ledger processing and reporting. The payroll accounting function is designed to accept keyboard entries of pay period information, post that information to the employee file, print journals, registers and reports, and pass summary payroll distributions to the general ledger.

The general ledger function accepts keyboard entries, automatic (recurring) entries, payroll distribution entries, and posts them to the general ledger. The Client Accounting application will not co-reside with the System/23 Business Management Accounting System applications. However, Client Accounting will accept transferred journals from the Business Management Accounting System applications (Accounts Receivable, Accounts Payable, Billing, Payroll). Once journals are posted, general ledger reports and statements can be printed.

DESCRIPTION

Features and Functions

- After-the-fact payroll recording
- Supports Earned Income Credit (EIC), non-taxable pay, and vacation/holiday pay and days
- FICA reporting for tips
- Up to three state and one local taxing bodies per client at any one time
- Up to four predefined deductions/benefits per client and one miscellaneous deduction per employee
- Automatic payroll distribution to general ledger
- Detailed journals, registers and reports for all earnings and deductions
- W-2s
- Calendar-driven general ledger - 1 to 13 user-defined accounting periods
- No 'hard close' - current and future year posting
- Automatic journal calculations and entry
- Up to five special journals
- Encumbrance and budget support

- Annual ledger capability
- Powerful and flexible statement formatting
- Quarterly spread statements
- Optional quality print for statements
- Whole dollar statement option
- Combined company general ledger capability
- Automatic year-end close
- History maintained for comparative reporting
- Default chart of accounts, statements and journals supplied
- Special file copy procedures for chart of accounts and statements

Auditability Features

- Balance control based on double-entry bookkeeping
- Execution control of logical posting sequence
- Audit trail fully documented in text and graphics
- Manual control logs supplied and fully documented
- Computer-numbered journals
- Posting additions list reports journals posted but not printed by the general ledger function
- Skeleton records added for posting to deleted accounts or employees

Program Documentation

The documentation provided is designed to help the user understand, install, and operate the application. The materials are consistent in size and format with the System/23 Datamaster publications and:

- Introduces new application users to automating typical accounting tasks in a way that invites use, reinforces efforts to learn and use, and builds confidence and willingness to re-use after learning.
- Are written in 'friendly', user-oriented language
- Are visually attractive with multicolor printing
- Are small in size to be usable in a work area with limited space
- Are presented in a step-by-step task fashion that guides the user through installation and operation
- Are designed to improve communication with the Atlanta Customer Support Center (ACSC)

The following materials are provided for this application:

Introducing: This book is intended for all users of the application. The owner executive, installer, operator, user department, programmer, and consultant can use this book as their first source of information about the application. The book is designed to be a general introduction to how the application fits within the user's business.

Learning: This learning package consists of a book, cassette, and a sample data files diskette. Separate exercises step the operator through application operations and are designed to be consistent with the system training.

Installing: This book details the steps to follow in installing and tailoring the application, collecting, preparing and entering the information, and scheduling operator training.

Running: This book contains information the operator needs in order to run the application. The learning package introduces and explains to the operator specific sections of the Running book. In addition to application training, the operator becomes familiar with the format of the Running book.

Using: This book is intended primarily for the user of the application information. It contains information the user needs to:

- Understand application concepts
- Prepare information for the application
- Analyze reports provided by the application
- Aid in using the reports for management of the business
- Understand alternative uses of the reports

The forms pack contains reproducible copies of all input forms needed to install and run the application as well as control logs for external (manual) controls.

Messages: Messages are printed as separate pages which are delivered with the application library. They are designed to be added as a section of the system message book so that the operator has one message book for the system and all installed applications.

S/23 Client Accounting (cont'd)

Application Logic Manual: A separate application program manual is available as optional material. It contains record formats, logic flows, and other technical information to be used primarily by the experienced BASIC programmer interested in understanding the detail design of the application.

Use of BRADS III (5715-RG2)

BRADS III provides the facility for a non-programmer to define files, create and maintain the files, build file inquiries and generate reports from the file data. The System/23 Client Accounting program will support that capability by providing selected BRADS III file definitions. Thus, the task of file definition, creation, and maintenance is accomplished as part of the application. A user who has BRADS III can build inquiries and develop additional reports for the defined files to help meet requirements unique to the user and not contained in the application.

CUSTOMER RESPONSIBILITIES

IBM may provide normal marketing assistance and guidance. The responsibility for personnel selection and training, installation and continued day-to-day operation lies solely with the customer. The customer is responsible for error detection and analysis, and submission of APARS, but can obtain assistance from the Atlanta Customer Support Center (ACSC).

IBM Central Service is responsible for the development and distribution of program fixes, but the customer has the responsibility to apply fixes to the program and can obtain assistance in doing so from the ACSC.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/23 Client Accounting program is written in BASIC and operates on an IBM System/23 Datamaster with the following minimum configuration:

1 - IBM 5322 Computer, mdl 124 (64K, 2 MB)

1 - IBM 5241 or 5242 Printer (any mdl)*

Diskette Sort feature (#6300)

For the user who desires dual workstation support, the minimum configuration is:

2 - IBM 5322 Computers mdl 123 (64K, 1 MB)

1 - IBM 5246 Diskette Unit mdl 21 (1 MB)

1 - IBM 5241 or 5242 Printer (any mdl)*

Diskette Sort feature #6300

(This configuration allows for sharing of *only* 1 MB of data files.)

A typical dual work station configuration would provide sharing of up to 2 MB of master file information, and dedicated usage of the printer from either IBM 5322 Computer.

A typical dual station system would be:

2 - IBM 5322 Computers mdl 123 (64K, 1 MB)

1 - IBM 5246 Diskette Unit mdl 22 (2 MB)

1 - IBM 5241 or 5242 Printer (any mdl)*

1 - feature #5600 printer switch cable assembly

Diskette Sort feature #6300

* Quality print capability requires a 5242 mdl 2 Printer

**5110/5120 BASIC TO SYSTEM/23
CONVERSION AID (5715-CV1)****PURPOSE**

The IBM 5110/5120 BASIC to System/23 Conversion Aid licensed program consists of programs designed to assist in converting 5110/5120 application programs written in the BASIC language to System/23 BASIC.

HIGHLIGHTS

- Converts many 5110/5120 BASIC statements to System/23 BASIC
- Identifies 5110/5120 BASIC statements that require evaluation or re-coding
- Provides listings of converted programs for documentation and debugging purposes
- Initial conversion performed on 5110/5120 prior to System/23 Datamaster installation
- Multiple program conversion during one unattended job step.

DESCRIPTION

Successful conversion of an application is dependent upon user knowledge of:

- The internal logic of the application program
- 5110/5120 BASIC language
- System/23 BASIC language and operations

Control and data files are not converted by the 5110/5120 Conversion Aid and must be converted or manually produced on Datamaster by the user. See the conversion aid publication for an example.

The conversion aid requires that the 5110 BASIC programs being converted contain valid 5110 BASIC language syntax and that they run successfully on the 5110 or 5120 Computing System.

Converted programs may need additional manual recoding in addition to that indicated by the conversion aid in order to produce the desired results on Datamaster.

Application Conversion

The conversion aid programs provide assistance in each of the following four phases of application conversion:

- Preparation Phase
- Statement Listing Phase
- Conversion Phase
- Installation Phase

A 5110/5120 system is required for the first three phases and a Datamaster is required for the fourth phase.

Preparation Phase

Inputs to the preparation phase are a diskette containing 5110/5120 BASIC language application programs in internal format and an initialized work diskette. The conversion aid marks files on the work diskette to hold the application programs. It saves the programs in source format and writes necessary control files to the work diskette.

Statement Listing Phase

The conversion aid lists, by BASIC keyword category, the statements that need to be evaluated or manually recoded. The user may choose to recode these statements into other 5110/5120 BASIC statements which the conversion aid can convert, or may wait until installation on Datamaster and make the needed code changes manually. If the 5110/5120 BASIC code is changed, the conversion aid includes a procedure to store the updated programs back on the work diskette.

Conversion Phase

The conversion aid operates in unattended mode to convert statements and write the programs in System/23 BASIC on the work diskette in BASIC exchange or H exchange format. During the conversion, a listing is produced for each converted program. It contains:

- All original 5110/5120 BASIC statements
- The converted statement System/23 BASIC for all original messages
- Warning and caution messages, as appropriate
- Summary of message information for the converted program

Installation Phase

The conversion aid provides a program to transfer the converted programs from exchange format files to Datamaster source files. The transfer program is placed on a Datamaster diskette by a small, user-entered program from the conversion aid publication. During the installation phase, the listings from the conversion phase are utilized to evaluate and/or convert statements that the conversion aid could not convert.

Successful conversion of an application is dependent upon user knowledge of:

- The internal logic of the application program
- 5110/5120 BASIC language
- System/23 BASIC language and operations

Procedures, sort control, and data files are not converted by the 5110/5120 Conversion Aid and must be converted or manually produced on Datamaster by the user. See *Conversion Aid for 5110/5120* (SA34-0114) for an example.

Converted programs may need manual recoding in addition to that indicated by the Conversion Aid in order to produce the desired results on Datamaster.

CUSTOMER RESPONSIBILITIES

IBM may provide normal marketing assistance and guidance. The responsibility for personnel selection and training, installing and continued day-to-day operation lies solely with the customer. The customer is responsible for error detection and analysis, and submission of APARs, but can obtain phone assistance from the Atlanta Customer Support Center (ACSC).

IBM Central Service develops and distributes program fixes, but the customer has the responsibility to apply fixes to the program. The customer can obtain phone assistance from the ACSC in applying PTFs to programs that are at the previous current levels.

IBM reserves the right to charge for any additional effort that results from providing program services for a licensed program that has been altered or is not at the proper program library release and program temporary fix level.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The conversion aid is designed to operate on an IBM 5110 or 5120 Computing System with the following minimum requirements:

5110	5120
5110 B22 Computer* (32K BASIC)	5110 B32 Computer* (32K BASIC)
5103 Printer	5103 Printer
5114 Diskette Unit Feature #3240 (Second Diskette Drive)	

* Or enough memory to load the largest program being converted.

The final steps of the conversion process require the minimum IBM System/23 Datamaster system configured to support the converted application's functions and requirements. Two diskette drives and enough memory to load the largest program converted are required.

SOFTWARE REQUIREMENTS

The conversion aid uses the IBM 5110/5120 BASIC language and system commands. The 5110/5120 Customer Support Functions diskette initialization utility (INITIAL) is required, and the diskette copy utility (DDCOPY or IMAGCOPY) is recommended. The Datamaster Customer Support Function prepare diskette function (PREPARE) is also required. Other Datamaster functions (for example, PRESORT, SORT, INDEX) may be required for total installation of the converted programs, depending on the particular application.

The conversion aid requires that the 5110/5120 BASIC programs being converted contain valid 5110/5120 BASIC language syntax and that they run successfully on the 5110 or 5120 computing system.

**SYSTEM/23 BUSINESS REPORT/
APPLICATION DEVELOPMENT SYSTEM III
BRADS III (5715-RG2)**

PURPOSE

The IBM System/23 Business Report/Application Development System III (BRADS III) brings data base power to users of the IBM System/23 Datamaster. Using BRADS III, users can productively develop and install system-justifying applications, most likely without becoming or hiring programmers.

Users can also expand the value of the IBM System/23 Business Management Accounting System applications and applications written by third parties by querying the data bases and by developing new reports.

BRADS II on the 5120 has proven that non-programmers such as management, professionals, and clerical persons can and will effectively utilize the system without having to write their own programs.

BRADS III brings new, more powerful function which is even easier to learn and use.

HIGHLIGHTS

The BRADS III program will be made available in two separate releases. The first release of BRADS III may be used to:

- Create, maintain and update data files.
- Create screen-driven data entry programs.
- Retrieve information from the files using a simple query.
- Create formatted reports using prompted report generation screens.
- Develop complete applications through use as a:
 - Highly productive development tool. The BRADS III facilities, by themselves or in conjunction with BASIC, can be used to create a program that executes with BRADS III.
 - BASIC program generator for screens and reports. The standalone programs generated by BRADS III can be added to other BASIC programs to create applications that execute independently of BRADS III.
- Create additional queries and reports for both the System/23 Business Management and Accounting System applications through use of the BRADS III file definitions provided, and for third-party developed applications by creating BRADS III file definitions.
- Obtain extensive documentation, maintained and provided by BRADS III, that removes much or all of the requirement that the users manually document their applications.

BRADS III may be used for developing new applications, or it may be applied to existing information in record files that have been created for other System/23 Datamaster applications simply by defining those files with BRADS III file definitions.

Files resident on the 5246 Diskette Unit may be shared for input between two 5322 Computers while executing QUERY, REPORT, or COPY commands.

The second release of BRADS III adds the spread sheet generator function and may be used to:

- Produce forecasts showing expected revenues, operating costs, capital expenditures, taxes, and other expenditures
- Try a variety of 'what if' adjustments on the original spread sheet data to investigate alternative plans.
- Produce reports that examine the differences (variances) between plans or between plans and actual performance.
- Produce reports showing percentage relationships between rows or between columns (for example, growth from month-to-month).
- Consolidate or deconsolidate plans and evaluate performance of separate operating entities (for example, department, companies, products).
- Combine historical and predictive data together to produce many more reports of this nature.

The spread sheet generator facility adds a powerful set of operations to the existing BRADS III capabilities to provide the user flexibility in addressing spread sheet type applications such as:

- Balance Sheets
- Budget Planning and Forecasting
- Cash Requirements and Forecasting
- Commercial Loan Evaluation
- Common Sizing Analysis

- Comparative Analysis
- Consolidation and Deconsolidation
- Investment Analysis
- Material and Labor Requirements
- Manpower Projection
- Merger and Acquisition Analysis
- Product Planning
- Profit and Loss Statements
- Real Estate Investment

As a result of experience gained with the 5120 Spread Sheet Generator, the user interface has been enhanced and the user can see results earlier and repeat them.

CUSTOMER RESPONSIBILITIES

IBM may provide normal marketing assistance and guidance. The responsibility of personnel selection and training, installation and continued day-to-day operation lies solely with the customer. The customer is responsible for error detection and analysis, and submission of APARS, but can obtain phone assistance from the Atlanta Customer Support Center.

IBM Central Service develops and distributes program fixes, but the customer has the responsibility to apply fixes to the program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/23 Business Report/Application Development System III (BRADS III) is designed to operate on an IBM System/23 Datamaster with the following minimum configuration:

- IBM 5322 mdl 123 (64K/1.0 MB)
- IBM 5241 Printer

IBM Type 2D Diskettes are required. An IBM 5322 mdl 124 (64K/2.0 MB) with an IBM 5242 Printer will significantly enhance usability and performance. Additional main storage may be required by users' programs generated by BRADS III.

SOFTWARE REQUIREMENTS

The BRADS III programs operate under the control of the IBM System/23 BASIC language processor. Datamaster customer support functions (specifically Diskette Prepare, Diskette Copy, Index File Generation, and SORT) are required.

Customer Education: First time BRADS III users should read self-study BRADS III manuals *Learning Books 1 and 2*. A similar publication, *BRADS III Learning-Spread*, should be read by those desiring to create spread sheet reports.

DOCUMENTATION

(available from Mechanicsburg)

Cross Industry Brochure (G580-0350) ... *Product Flyer* (G580-0353) ...

PROGRAM PRODUCTS

**SYSTEM/23 WORD PROCESSING
5715-WP1****PURPOSE**

The IBM System/23 Word Processing licensed program (5715-WP1) provides the functions necessary for text processing and DP/WP merge processing.

Functions are selected by the operator of the IBM System/23 Datamaster through control keys, abbreviations typed on the request line, and menus. For menu-supported tasks, the operator selects the proper menu, chooses the appropriate options from that menu, and then proceeds with the task. For control key supported functions, the operator presses the proper key and then proceeds with the task.

HIGHLIGHTS

- Task Initiation and Control
 - Menu approach
 - Defaults for the more commonly used procedures and standards
- Text Processing
 - Display scale line showing margins, tabs, paper edges, center point, and shadow cursor
 - Vertical scrolling and horizontal segmenting to review all parts of a stored page
 - Functions to create, revise, delete, duplicate, print, store, retrieve, and change profile of documents
 - Text manipulation facilitated by:
 - Block movement of text
 - Stored formats
 - Auto carrier return
 - Line adjust and paginate functions
 - Find function
 - Interactive keying of variable information in stored letters or documents (with prompts)
- Data Processing/Word Processing
 - Completed documents assembled from letter descriptions and data processing file data
 - Format functions for data processing data
 - Optional pagination after merge

Text Processing

Text processing functions can be divided into these basic activities:

- Create documents
- Review or revise documents
- Store documents
- Paginate documents
- Print documents
- Personalize standard letters
- Delete documents
- Copy documents

DP/WP Merge Processing

DP/WP merge processing provides the functions for tailoring documents with DP file data. Merge processing aids include:

- Producing completed documents, assembled from letter descriptions and file data
- Editing formats for file data
- Optional pagination after merge

CUSTOMER RESPONSIBILITIES

IBM may provide normal marketing assistance and guidance. The responsibility for personnel selection and training, installation and continued day-to-day operation lies solely with the customer. The customer is responsible for error detection and analysis, and submission of APARs, but can obtain phone assistance from the Atlanta Customer Support Center (ACSC).

IBM Central Service develops and distributes program fixes, but the customer has the responsibility to apply fixes to the program. The customer can obtain phone assistance from the ACSC in applying PTFs to programs that are at the previous current levels.

IBM reserves the right to charge for any additional effort that results from providing program services for a licensed program that has been altered or is not at the proper program library release and program temporary fix level.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/23 Word Processing Program requires an IBM 5322 Computer with a minimum of 64K of user storage and .6 MB of diskette storage (mdls 420 through 444).

Any of the printers available on the IBM 5322 Computer (mdls 420 through 444) may be used for hard copy output depending on the print speed and print quality desired.

Specify code #9850 must be ordered on the IBM 5322 or 5324 to receive the proper publications for 5715-WP1.

SOFTWARE REQUIREMENTS

Only this licensed program is required for IBM System/23 Word Processing.

Customer Education: (self study)

PROGRAM PRODUCTS

**IBM SYSTEM/23 WORD PROCESSING II
5715-WP2**

IBM System/23 Word Processing II (5715-WP2) has all of the functions of the previously announced IBM System/23 Word Processing (5715-WP1) and, in addition, the following functions have been added which enhance the capabilities for standalone Word Processing, combined Word Processing/Data Processing, and multi-page document preparation. In addition, many of these functions incorporate an additional operator ease-of-use capability.

HIGHLIGHTS

- Spelling verification and assistance with English language dictionary.
- Synonym assistance with English language thesaurus.
- Enriched Data Processing/Word Processing operations.
- Increased functional control of larger documents.
- Additional operator ease-of-use capabilities.

DESCRIPTION

Spelling Verification and Assistance: This function is used to check spelling and to assist in correcting words found to be in error. It can be applied to a single word or all of the words on a page or to a complete document. It uses an IBM-supplied dictionary comprised of approximately 130,000 English language words. The dictionary may be expanded by a user-supplied list of words. Approximately 7,500 characters are available for this addenda which will provide space for about 500 words. The actual number of words will depend upon the length of each word, the number of hyphenation points per word, and the number of control characters used.

When suspected spelling errors are detected, the word in question is highlighted and a list of possible correction words is displayed when the Assist function is utilized. Operators can either select one of the words on the list, key in their own correction, or indicate that the word is correct as entered.

Automatic Hyphenation: Automatic hyphenation can be specified by the user to insert hyphens in words that are found to cross the control zone at the right margins of the page. It starts at the top of the document and no operator interaction is required. Options are also available which permit hyphenation in interactive mode or manual mode.

This function employs the dictionary used for spelling verification and assistance. Standard dictionary hyphenation is used with the IBM-supplied dictionary. The user may also specify hyphenation for user-added words.

Synonym Assistance: The purpose of this function is to assist the operator in selecting alternate words with a meaning similar to the indicated word during document preparation. This function uses an IBM-supplied thesaurus* of English language words that are organized by their use (i.e., noun, verb, adjective, etc.) and displayed to the operator in lists.

The operator may initiate the synonyms function during document creation or editing. The indicated word will then be highlighted and synonyms for the word will be displayed in lists by usage on the text screen in a graphically outlined window. Operators can then select one of the words on the displayed list for automatic insertion in the text, key in their own selected alternate word, or cancel the Synonyms operation, leaving the original word in the text.

Enhanced WP Functions

Clear/set all tabs
Multiple save areas with append
Decimal/center/right tabs
Sub/superscript
Page number increments
Page GOTO
Overstrike
Phrase Glossary
Prompted hyphenation during exit

DP/WP Enhancements

WP execution from a procedure file
BASIC during Merge File/Text
- Ability to write BASIC expression
- Access to user-written BASIC function
- Pass character strings from BASIC function to document

DP file record selection
Get/include display file

Document Assembly

Get/include page
Page split

Paginate
Widow line control
Keep
Include page from document
Auto search
Auto replace

Document Control

Signon menu
Recover document
Operator profiles
Document owner specified access restrictions

CUSTOMER RESPONSIBILITIES

IBM may provide normal marketing assistance and guidance. The responsibility for personnel selection and training, installation and continued day-to-day operation lies solely with the customer. The customer is responsible for error detection and analysis, and submission of APARs, but can obtain phone assistance from the Atlanta National Support Center (ANSC).

IBM Central Service develops and distributes program fixes, but the customer has the responsibility to apply fixes to the program. The customer can obtain assistance from the ANSC in applying PTFs to programs that are at the previous levels.

IBM reserves the right to charge for any additional effort that results from providing program services for a licensed program that has been altered or is not at the proper library release and program temporary fix level.

For program support purposes, a licensed program is considered current if it is the current release of the program and all PID-distributed refreshes/PTFs have been applied.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The IBM System/23 Word Processing II program requires a Word Processing model of a 5322 or 5324 Computer with a minimum of 96K user storage (Models 430 through 444) and 1.1MB of diskette storage or a 5247 Disk Unit. Specify code #9851 must be ordered on the 5322 or 5324 to receive the proper publications for WP II.

Note: It is strongly recommended that a minimum of two diskette drives be configured for Word Processing II.

Any of the printers available on the 5322 or 5324 Computers may be used for hard copy output depending on the print speed and print quality desired.

SOFTWARE REQUIREMENTS

Only this licensed program is required for IBM System/23 Word Processing.

COMPATIBILITY

Any text previously processed by the IBM System/23 Word Processing (5715-WP1) licensed program and stored on diskette(s) may be utilized by the IBM System/23 Word Processing II (5715-WP2) licensed program for further processing or printing operations.

**SYSTEM/23 BUSINESS MANAGEMENT
ACCOUNTING SYSTEM for DATAMASTER (Diskette)**

GENERAL LEDGER for DATAMASTER (Diskette) ... 5715-XX2
ACCOUNTS PAYABLE for DATAMASTER (Diskette) ... 5715-XX3
ACCOUNTS RECEIVABLE for DATAMASTER (Diskette) ... 5715-XX4
PAYROLL for DATAMASTER (Diskette) ... 5715-XX5
INVENTORY ACCOUNTING for DATAMASTER (Diskette) ... 5715-XX6
BILLING for DATAMASTER (Diskette) ... 5715-XX7

PURPOSE

These multi-industry licensed programs for the IBM System/23 Datamaster (Diskette) provide the user with powerful tools to perform business accounting while providing additional management information. The programs contain functions applicable to a wide range of industry classifications.

The program design provides an accounting base of information and incorporates a flow of information in terms that are familiar to the user. This base of information is then available to improve user productivity through the managerial reporting provided by the programs.

HIGHLIGHTS

- Applications feature either standalone or co-resident installation with other System/23 Business Management Accounting System applications.
- Built-in auditability and control characteristics through the use of familiar 5-column journals, interapplication data integrity, and sequential journal numbering.
- Applications are interrelated through the passing of summarized transaction data between applications where appropriate and desired.
- Program documentation is designed to promote customer self-sufficiency during installation and operation.
- Ease-of-use is enhanced through:
 - Menu-driven task selection
 - Consistent data entry programs and procedures for all applications
 - Common file maintenance techniques including user-defined field defaults
 - Use of generally accepted accounting terminology
- Application error handling facilities
- Installation time tailoring options allow the user to select key functions and perform file sizing
- An improved program update (PTF) procedure is provided to aid the operator in applying program fixes provided by the Atlanta Customer Support Center (ACSC) or the Program Information Department (PID).
- BRADS III file definitions are provided with the applications for selected master files
- Optional security code by application
- Multiple-company installs on separate diskette(s)
- File sharing capability supporting concurrent operations when two 5322s are connected via a Shared Diskette Unit (5246 mdl 22)

DESCRIPTION**GENERAL LEDGER (5715-XX2)**

The System/23 General Ledger (Diskette) application is a multi-industry application designed to accomplish the basic accounting functions of posting journal entries to the General Ledger, generating financial statements, and producing special journals. The programs are based on double-entry accounting principles in accordance with generally accepted accounting practices. Transactions may be directly entered as general journal entries and also received as summary entries from the System/23 Billing, Accounts Receivable, Payroll, and Accounts Payable applications, if installed.

Features and Functions

- Calendar-driven 1 to 13-period support
- User-defined fiscal year
- Optionally combined financial statements for multiple companies
- User-defined statement formatting
- Special journal capabilities which allow the users to tailor their journal's format
- Previous year history maintained for comparative statements
- Budget and encumbrance support
- Annual ledger capability
- Page width option allowing statements on 8-1/2 x 11" inch paper

- Future fiscal year posting

ACCOUNTS PAYABLE (5715-XX3)

The System/23 Accounts Payable (Diskette) application is a multi-industry offering designed to assist the user in controlling the outflow of cash and maintaining accurate records of liabilities to trade and other vendors. Payable items are handled on an accrual basis and vendor analysis reporting allows the user to determine key purchase volumes and discounts taken or lost for the current and previous year. Summarized journal information can be passed to the System/23 General Ledger application, if installed.

Features and Functions

- Allows one-time vendor checks
- Cash discount by percent or amount on invoice total or line items
- Supports multiple distributions per invoice
- Payment selection by due date and/or by vendor/invoice
- Partial payment support
- User-defined excessive check amount warning
- Debit memos available
- Vendor open-item inquiry
- Manual checks
- User-tailorable 5-column purchase and cash disbursement journals
- Default General Ledger distribution by vendor
- Default vendor cash discount percent
- Check reversals

ACCOUNTS RECEIVABLE (5715-XX4)

The System/23 Accounts Receivable (Diskette) application is designed to assist the user in managing one of the most important assets of a business - the money owed by its customers. This multi-industry offering provides timely information to help improve cash flow and reduce bad debt losses through control of accounts receivable. Invoice transactions can be entered directly into the Accounts Receivable application and also received from the System/23 Billing application. Cash Receipts and Adjustment transactions are entered through the Accounts Receivable data entry menu option. Accounts Receivable can also pass summarized accounting information to the System/23 General Ledger application, if installed.

Features and Functions

- Supports entry of non-Accounts Receivable cash such as vending machine receipts
- Open-item or balance forward account type selection by customer
- Cash and COD sales support
- Partial and overpayment of invoices
- Statement selection by customer
- Supports invoices with future due dates
- Current plus 4 past due periods
- Optional late charges by customer
- Consolidated statements for companies with multiple branches
- Interactive cash entry for open-item customers
- User-tailorable 5-column sales and cash receipts and adjustment journals

PAYROLL (5715-XX5)

The System/23 Payroll (Diskette) application is a multi-industry solution that performs basic payroll computations and produces payroll checks with earnings statements and supporting reports. Both hourly and salaried payroll processing is supported. Individual earnings may be taxed for up to three taxing jurisdictions per time and adjustment transaction. Summarized accounting information can be transferred to the System/23 General Ledger application, if installed.

Features and Functions

- Weekly, biweekly, semimonthly and monthly pay frequency
- Shift differentials as a percent of employees hourly rate or a fixed dollar amount per hour
- Hourly, exempt, and non-exempt salaried employees
- Payroll calculations provided for:
 - Gross pay
 - Federal Income Tax (FIT)
 - Federal Insurance Contributions Act (FICA)

S/23 Business Management Accounting System (cont'd)

- State and Local Taxes
- State Disability Insurance (SDI)
- Federal Unemployment Tax Act (FUTA)
- Earned Income Credit (EIC)
- Net Pay
- Taxable and non-taxable adjustments
- Automatic deductions based on:
 - Percent of taxable gross
 - Rate per hour worked
 - Flat dollar amount per pay period
- Resetting deductions (that is, bonds)
- Automatic benefits (with optional maximums) can be calculated using the same algorithms used for automatic deductions
- Separate checks available for vacation and bonus payments
- Tip accounting with optional minimum hourly guarantee
- Workmen's compensation worksheet
- Detailed earnings and deductions shown on earnings statement

INVENTORY ACCOUNTING (5715-XX6)

The System/23 Inventory Accounting (Diskette) application offers management reports which aid the user in optimizing inventory levels. Up-to-date reports reflecting stock movement, on-hand positions, sales, and cost information enhance purchasing decisions. The Inventory Accounting application can receive summarized sales information from the System/23 Billing application.

Features and Functions

- Support for up to 3 warehouses per item
- Broken-case handling
- Pricing conversion
- Both returns and allowances supported
- Maintains both average and last cost for an item
- Both stock movement and financial information maintained
- Suggested reorder quantities based on user-supplied:
 - Minimum balance
 - Maximum balance
 - Lead time
 - Pack size
 - Vendor minimum
- Item inquiry including both item master and item balance information
- Inventory analysis based on sales, cost and profit amounts.

BILLING (5715-XX7)

The System/23 Billing (Diskette) application is a multi-industry billing application providing the user with the ability to create invoices for customer orders already picked and shipped. Customer and item names, prices, and tax information are automatically retrieved from the Billing Application master files during invoice entry. Summarized data is optionally available to the IBM System/23 Accounts Receivable, General Ledger, and Inventory Accounting applications, if installed.

Features and Functions

- Postbilling
- Selective printing of invoices
- 5 standard prices
- Pricing conversion
- Broken-case pricing
- Flexible terms and invoice discounts
- Federal Excise Tax (FET)
- Special charges and comments
- Credit memo support with returns and allowances
- Billing of non-inventory items
- Cash and COD sales
- Invoices for one-time customers
- Up to 3 sales taxes per invoice, maximum of 50 taxing bodies
- Optional profit tear strip on invoices
- User-tailorable 5-column sales journal
- Data entry overrides of master file data

Program Documentation

The documentation provided for each application is designed to help the user understand, install, and operate the application. The materials are consistent in size and format with the System/23 Datamaster publications and:

- Introduce new application users to automating typical business tasks in a way that invites use, reinforces efforts to learn and use, and builds confidence and willingness to reuse after learning
- Are written in "friendly", user-oriented language
- Are visually attractive with multicolor printing
- Are small in size to be usable in a work area with limited space
- Are presented in a step-by-step task fashion that guides the user through installation and operation
- Are designed to improve communication with the ACSC

The following materials are provided for each application:

Introducing: This book is intended for all users of the application. The owner/executive, installer, operator, user department, programmer, and consultant can use this book as their first source of information about the application. The book is designed to be a general introduction to how the application fits within the user's business.

Learning: This learning package consists of a book, cassette, and a sample data files diskette. Separate exercises step the operator through application operations and are designed to be consistent with the system training.

Installing: This package consists of a book and a forms pack. The book details the steps to follow in installing and tailoring the application, collecting, and recording the data, entering it, and scheduling operator training. The forms pack contains reproducible copies of all input forms needed to install and run the application as well as control logs pertinent to that application. Preprinted forms are documented in actual size for the user to provide to IBM SSD or to other forms vendors to minimize customer effort in forms layout.

Running: This book contains information the operator needs in order to run the application. The learning package introduces and explains to the operator specific sections of the Running book. In addition to application training, the operator becomes familiar with the format of the Running book.

Using: This book is intended primarily for the user of the application information. It contains information the user needs to:

- Understand application concepts
- Prepare input to the application
- Analyze reports provided by the application
- Aid in using the reports for management of the business
- Understand alternative uses of the reports

Messages: Messages for each application are printed as separate pages which are delivered with each application library. They are designed to be added as sections to the system message book so that the operator has one message book for the system and all installed accounting applications.

Application Program Manual: A separate application program manual is available as optional material (feature #7048). It contains record formats, logic flows, and other technical information to be used primarily by the experienced BASIC programmer interested in understanding the detail design of the application.

Use of BRADS III (5715-RG2)

BRADS III provides the facility for a non-programmer to define files, create and maintain the files, build file inquiries and generate reports from the file data. The System/23 Business Management Accounting System programs will support that capability by providing selected BRADS III file definitions with the applications. Thus, the task of definition, file creation, and maintenance is accomplished as part of the application. A user who has BRADS III can build inquiries and develop additional reports for the defined files to help meet requirements unique to the user, not contained in the applications.

CUSTOMER RESPONSIBILITIES

IBM may provide normal marketing assistance and guidance. The responsibility for personnel selection and training, installation and continued day-to-day operation lies solely with the customer.

The customer is responsible for error detection and analysis, and submission of APARS, but can obtain assistance from the ACSC.

IBM Central Service is responsible for the development and distribution of program fixes, but the customer has the responsibility to apply fixes to the program and can obtain assistance in doing so from the ACSC.

PROGRAM PRODUCTS

S/23 Business Management Accounting System (cont'd)

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM System/23 Business Management Accounting System programs (General Ledger, Accounts Payable, Accounts Receivable, Payroll, Inventory Accounting, and Billing) are written in BASIC and operate on an IBM System/23 Datamaster with the following minimum configurations:

- 1 - 5322 Computer, mdl 124 (64K, 2 MB)
1 - 5241 Printer (any mdl)
Diskette Sort feature (#6300)

For the user who desires dual work station support, the minimum configuration is:

- 2 - 5322 Computers mdl 123 (64K, 1 MB)
1 - 5246 Diskette Unit mdl 21 (1 MB)
1 - 5241 Printer (any mdl)
Diskette Sort feature #6300

This configuration allows for sharing of only 1 MB of data files.

A typical dual station system would be:

- 2 - 5322 Computers mdl 123 (64K, 1 MB)
1 - 5246 Diskette Unit mdl 22 (2 MB)
1 - 5241 Printer (any mdl)
1 - Feature #5600 printer switch cable assembly
Diskette Sort feature #6300

This configuration would provide dual station sharing of up to 2 MB of master file information, and dedicated usage of the printer from either 5322 Computer.

PURPOSE

These multi-industry licensed programs support the IBM System/23 with the IBM 5247 Disk Storage Unit attached. These programs are an extension of the IBM System/23 Business Management Accounting System for Datamaster (Diskette) in that both sets (Diskette and Disk) of licensed programs have identical accounting functions. These multi-workstation programs provide the user with powerful tools to perform business accounting while providing additional management information. The programs contain functions applicable to a wide range of industry classifications.

HIGHLIGHTS (all programs)

- Built-in auditability and control characteristics through the use of familiar 5-column journals, inter-application data integrity, and sequential journal numbering.
- Applications are interrelated through the passing of summarized transaction data between applications where appropriate and desired.
- Program documentation is designed to promote customer self-sufficiency during installation and operation.
- Ease-of-use is enhanced through:
 - Menu-driven task selection
 - Consistent data entry programs and procedures for all applications
 - Common file maintenance techniques including user-defined field defaults
 - Use of generally accepted accounting terminology
- Application error handling facilities
- Installation-time tailoring options allow the user to select key functions and perform file sizing
- A program update (PTF) procedure is provided to aid the operator in applying program fixes provided by the Atlanta National Market Support Center (ANMSC) or the Program Information Department (PID).
- BRADS III file definitions are provided with the applications for selected master files
- Optional security code by application within a company
- Online multi-company support
- File sharing capability supporting concurrent operations if more than one System/23 is attached to the 5247 disk storage unit
- Inquiry and data entry at any time except during file maintenance of the files being used
- A file load facility for loading selected large volume master files from multiple Datamaster workstations is provided
- During installation, support is provided for conversion of the System/23 Business Management Accounting System for Datamaster (Diskette) data files to disk
- An upgrade price for each application is available to all licensed users of the corresponding System/23 Business Management Accounting System application for Datamaster (Diskette)
- Accounting functions are identical to System/23 Business Management Accounting System for Datamaster (Diskette) licensed programs
- Master menu for user-installed applications
- All programs and data files reside on the disk (5247 Disk Storage Unit)

DESCRIPTION**SYSTEM/23 GENERAL LEDGER (5715-XZ2)**

The General Ledger for Datamaster (Disk) application is a multi-industry offering designed to accomplish the basic accounting functions of posting journal entries to the General Ledger, generating financial statements, and producing special journals. The programs are based on double-entry accounting practices. Transactions may be directly entered as general journal entries and also received as summary entries from the Billing, Accounts Receivable, Payroll, and Accounts Payable (Disk) applications, if installed.

Features and Functions

- Calendar-driven 1 to 13-period support

- User-defined fiscal year
- Optionally combined financial statements for multiple companies
- User-defined statement formatting
- Special journal capabilities which allow the users to tailor their journal's format
- Previous year history maintained for comparative statements
- Budget and encumbrance support
- Annual ledger capability
- Page width option allowing statements on 8-1/2" x 11" inch paper
- Future fiscal year posting
- Automatic year-end closing

SYSTEM/23 DISK ACCOUNTS PAYABLE (5715-XZ3)

The Accounts Payable for Datamaster (Disk) application is a multi-industry offering designed to assist the user in controlling the outflow of cash and maintaining accurate records of liabilities to trade and other vendors. Payable items are handled on an accrual basis and vendor analysis reporting allows the user to determine key purchase volumes and discounts taken or lost for the current and previous year. Summarized journal information can be passed to the General Ledger for Datamaster (Disk) application, if installed.

Features and Functions

- Allows one-time vendor checks
- Cash discount by percent or amount on invoice total or line items
- Supports multiple General Ledger distributions per invoice
- Payment selection by due date and/or by vendor/invoice
- Partial payment support
- User-defined excessive check amount warning
- Debit memos available
- Vendor open-item inquiry
- Manual checks
- User-tailorable 5-column purchase and cash disbursement journals
- Default General Ledger distribution by vendor
- Default vendor cash discount percent
- Check reversals

ACCOUNTS RECEIVABLE (5715-XZ4)

The System/23 Accounts Receivable (Diskette) application is designed to assist the user in managing one of the most important assets of a business - the money owed by its customers. This multi-industry offering provides timely information to help improve cash flow and reduce bad debt losses through control of accounts receivable. Invoice transactions can be entered directly into the Accounts Receivable application and also received from the System/23 Billing application. Cash Receipts and Adjustment transactions are entered through the Accounts Receivable data entry menu option. Accounts Receivable can also pass summarized accounting information to the System/23 General Ledger application, if installed.

Features and Functions

- Supports entry of non-Accounts Receivable cash such as vending machine receipts
- Open-item or balance forward account type selection by customer
- Cash and COD sales support
- Partial and overpayment of invoices
- Statement selection by customer
- Supports invoices with future due dates
- Current plus 4 past due periods
- Optional late charges by customer
- Consolidated statements for companies with multiple branches
- Interactive cash entry for open-item customers
- User-tailorable 5-column sales and cash receipts and adjustment journals

PAYROLL (5715-XZ5)

The System/23 Payroll (Diskette) application is a multi-industry solution that performs basic payroll computations and produces payroll checks with earnings statements and supporting reports. Both hourly and salaried payroll processing is supported. Individual earnings may

S/23 Business Management Accounting System (cont'd)

be taxed for up to three taxing jurisdictions per time and adjustment transaction. Summarized accounting information can be transferred to the System/23 General Ledger application, if installed.

Features and Functions

- Weekly, biweekly, semimonthly and monthly pay frequency
- Shift differentials as a percent of employees hourly rate or a fixed dollar amount per hour
- Hourly, exempt, and non-exempt salaried employees
- Payroll calculations provided for:
 - Gross pay
 - Federal Income Tax (FIT)
 - Federal Insurance Contributions Act (FICA)
 - State and Local Taxes
 - State Disability Insurance (SDI)
 - Federal Unemployment Tax Act (FUTA)
 - Earned Income Credit (EIC)
 - Net Pay
- Taxable and non-taxable adjustments
- Automatic deductions based on:
 - Percent of taxable gross
 - Rate per hour worked
 - Flat dollar amount per pay period
- Resetting deductions (that is, bonds)
- Automatic benefits (with optional maximums) can be calculated using the same algorithms used for automatic deductions
- Separate checks available for vacation and bonus payments
- Tip accounting with optional minimum hourly guarantee
- Workmen's compensation worksheet
- Detailed earnings and deductions shown on earnings statement

INVENTORY ACCOUNTING (5715-XZ6)

The System/23 Inventory Accounting (Diskette) application offers management reports which aid the user in optimizing inventory levels. Up-to-date reports reflecting stock movement, on-hand positions, sales, and cost information enhance purchasing decisions. The Inventory Accounting application can receive summarized sales information from the System/23 Billing application.

Features and Functions

- Support for up to 3 warehouses per item
- Broken-case handling
- Pricing conversion
- Both returns and allowances supported
- Maintains both average and last cost for an item
- Both stock movement and financial information maintained
- Suggested reorder quantities based on user-supplied:
 - Minimum balance
 - Maximum balance
 - Lead time
 - Pack size
 - Vendor minimum
- Item inquiry including both item master and item balance information
- Inventory analysis based on sales, cost and profit amounts.

BILLING (5715-XZ7)

The System/23 Billing (Diskette) application is a multi-industry billing application providing the user with the ability to create invoices for customer orders already picked and shipped. Customer and item names, prices, and tax information are automatically retrieved from the Billing Application master files during invoice entry. Summarized data is optionally available to the IBM System/23 Accounts Receivable, General Ledger, and Inventory Accounting applications, if installed.

Features and Functions

- Postbilling
- Selective printing of invoices
- 5 standard prices
- Pricing conversion
- Broken-case pricing
- Flexible terms and invoice discounts
- Federal Excise Tax (FET)

- Special charges and comments
- Credit memo support with returns and allowances
- Billing of non-inventory items
- Cash and COD sales
- Invoices for one-time customers
- Up to 3 sales taxes per invoice, maximum of 50 taxing bodies
- Optional profit tear strip on invoices
- User-tailorable 5-column sales journal
- Data entry overrides of master file data

Program Documentation

The documentation provided for each application is designed to help the user understand, install, and operate the application. The materials are consistent in size and format with the System/23 Datamaster publications and:

- Introduce new application users to automating typical business tasks in a way that invites use, reinforces efforts to learn and use, and builds confidence and willingness to reuse after learning
- Are written in "friendly", user-oriented language
- Are visually attractive with multicolor printing
- Are small in size to be usable in a work area with limited space
- Are presented in a step-by-step task fashion that guides the user through installation and operation
- Are designed to improve communication with the ANMSC.

The following materials are provided for each application:

Introducing: This book is intended for all users of the application. The owner/executive, installer, operator, user department, programmer, and consultant can use this book as their first source of information about the application. The book is designed to be a general introduction to how the application fits within the user's business.

Learning: This learning package consists of a book, cassette, and a sample data files diskette. Separate exercises step the operator through application operations and are designed to be consistent with the system training.

Installing: This package consists of a book and a forms pack. The book details the steps to follow in installing and tailoring the application, collecting, and recording the data, entering it, and scheduling operator training. The forms pack contains reproducible copies of all input forms needed to install and run the application as well as control logs pertinent to that application. Preprinted forms are documented in actual size for the user to provide to IBM SSD or to other forms vendors to minimize customer effort in forms layout.

Running: This book contains information the operator needs in order to run the application. The learning package introduces and explains to the operator specific sections of the Running book. In addition to application training, the operator becomes familiar with the format of the Running book.

Using: This book is intended primarily for the user of the application information. It contains information the user needs to:

- Understand application concepts
- Prepare input to the application
- Analyze reports provided by the application
- Aid in using the reports for management of the business
- Understand alternative uses of the reports

Messages: Messages for each application are printed as separate pages which are delivered with each application library. They are designed to be added as sections to the system message book so that the operator has one message book for the system and all installed accounting applications.

Application Program Manual: A separate application program manual is available as optional material (feature #7048). It contains record formats, logic flows, and other technical information to be used primarily by the experienced BASIC programmer interested in understanding the detail design of the application.

Use of BRADS III (5715-RG2)

BRADS III provides the facility for a non-programmer to define files, create and maintain the files, build file inquiries and generate reports from the file data. The System/23 Business Management Accounting System programs will support that capability by providing selected BRADS III file definitions with the applications. Thus, the task of definition, file creation, and maintenance is accomplished as part of the application. A user who has BRADS III can build inquiries and develop

S/23 Business Management Accounting System (cont'd)

additional reports for the defined files to help meet requirements unique to the user, not contained in the applications.

CUSTOMER RESPONSIBILITIES

IBM may provide normal marketing assistance and guidance. The responsibility for personnel selection and training, installation and continued day-to-day operation lies solely with the customer.

The customer is responsible for error detection and analysis, and submission of APARS, but can obtain assistance from the ANMSC.

IBM Central Service is responsible for the development and distribution of program fixes, but the customer has the responsibility to apply fixes to the program and can obtain assistance in doing so from the ANMSC.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

These licensed programs are written in BASIC and operate on the IBM System/23.

- Minimum Configuration
 - 1 - IBM 5322 Computer, mdl 123 (64K, 1 MB) or 1 - IBM 5324 Computer model 123 (64K, 1MB)
 - 1 - IBM 5217**, 5241 or 5242 Printer (any model)
 - 1 - IBM 5247 Disk Storage Unit (any model)
 - IBM System/23 Disk(ette) Sort feature (#6300)
- Maximum Configuration:
 - 4 - IBM 5322 or 5324 Computers (any 64K model)*
 - 4 - IBM 5217**, 5241 or 5242 Printers (any model)
 - 1 - IBM 5247 Disk Storage Unit (any model)
 - IBM System/23 Disk(ette) Sort feature #6300
- * At least one (1) of the 5322 or 5324 computers must have 1MB of diskette in any configuration. The Install, Learning and Backup/Restore functions require access to 1MB of diskette.
Any 5322 or 5324 computer within a particular configuration that will be used for any task besides Inquiry, must have access to a printer, either by direct cabling or through the special feature (#5600) Printer Switch and Cable Assembly.
- ** The 5217 printer must be equipped with the optional continuous forms tractor (#7850). The standard character type wheel supplied with the printer (ASCII courier 10 - part number 1439652) will handle the printing requirements for the Business Management Accounting System applications.
Each 5322 or 5324 computer which will utilize the 5217 printer must have the second printer attachment (#6350) installed.

SOFTWARE REQUIREMENTS: None

DATA ACQUISITION SYSTEM
5718-H11****PURPOSE**

The IBM 1800 Clinical Laboratory Data Acquisition System (CLDAS) provides a basic framework for satisfying the data acquisition and processing requirements which exist in clinical laboratories of modern hospitals. It is designed to help alleviate some of the more pressing problems being created by an ever increasing demand for more and better laboratory services. CLDAS is directed towards increasing the productivity of the laboratory technologist, reducing the likelihood of errors in the testing process, and improving responsiveness of the laboratory.

DESCRIPTION

CLDAS is an online data acquisition and analysis program designed for the IBM 1800 Data Acquisition and Control System. It provides for the monitoring and automatic acquisition of data from the continuous flow type single or multiple channel automatic analyzer commonly found in laboratories today. Data reduction and analysis are then performed to convert the raw instrument readings into final determinations which are listed for verification and reporting.

Features: Many instruments and channels can be monitored simultaneously. Regrouping of laboratory instruments into new batteries is facilitated by a Procedure File concept. Direct monitoring of instruments provides feedback on errors as they occur. All data reduction and analysis are automatic. Modular design of the program simplifies addition of instruments and procedures.

CLDAS utilizes two data files for this function. The first, a Procedure File, containing parameters uniquely describing each laboratory procedure to be automated, is loaded by the user when the system is initially installed. CLDAS then references the Procedure File and creates the second file, a Worklist File, whenever work requiring a specific procedure enters the laboratory.

The technologist loads the automatic analyzer tray with the available samples and activates the Clinical Laboratory Data Acquisition System. The program provides for monitoring the instrument output and placing the instrument readings into the newly generated Worklist File. Potential problems such as washouts, off scale readings, shoulders, noise spikes, etc., are reported via messages to the technologist as the run progresses. At the completion of the run, the results in the Worklist File are calibrated and printed for verification and final reporting.

CUSTOMER RESPONSIBILITIES

CLDAS is an online data acquisition and analysis program which may be tailored to fit a user's environment. A good understanding of this program and the TSX system is required for successful installation.

The user is responsible for the direct attachment of laboratory instruments to the IBM 1800 Data Acquisition and Control System. Acceptable voltage levels must be provided to the IBM 1800 from the instruments. Device support programs must be written if devices other than continuous flow automatic analyzers are to be attached.

The user must provide the data required to build the Procedure File and to establish program parameters which define the laboratory to CLDAS.

The user should generate and maintain a compilation listing, which should be available for all personnel servicing the program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The TSX system has minimum system requirements for System Generation as outlined in *IBM 1800 Time Sharing Executive System Concepts and Techniques* (SC26-3703). CLDAS has several additional requirements. The IBM 1801 Processor-Controller must have at least 16K core storage (a minimum of 6K of variable core is required in the TSX system). An IBM 1443 Printer is required in addition to the IBM 1816 Console-Typewriter. IBM 1800 Process I/O features appropriate for the user's laboratory instruments are required (at least one word of process interrupt must be included if plateau type devices are monitored).

SOFTWARE REQUIREMENTS

Both IBM 1800 FORTAN and IBM Assembler language are used in CLDAS. Programming additions may be written in either language as appropriate.

DOCUMENTATION

Application Description Manual (GH20-0715).

TERMS and CONDITIONS: See PP Index

**CLINICAL LABORATORY MANAGEMENT SYSTEM
5718-H12****PURPOSE**

The IBM 1800 Clinical Laboratory Management System (CLMS) is a system of files and procedures designed to satisfy the basic information processing requirements of clinical laboratories in modern hospitals. Using the Clinical Laboratory Data Acquisition System (CLDAS) program product (5718-H11) or its equivalent for the data acquisition function, CLMS provides a broad base for an information management system. CLMS, with its unique file approach, directs and controls the flow of information from receipt of the initial requisition for a test to final result reporting.

The MPX feature (#6000) to CLMS (5718-H12) facilitates the conversion of CLMS such that it can operate (exclusive of those programs designed to interface CLDAS) under the IBM 1800 MPX (Multiprogramming Executive System) Operating System. Those CLMS programs not converted are DIAGN, ERRRR, INTWV, PKINT, PLINT, SSSSS, SUWLG, SYMB, UPSET, and STATA.

HIGHLIGHTS

Creates and prints a master log of requested work for reference in the laboratory.

Organizes and generates worklists to be used at the work stations.

Prints a quality control listing for verification of numeric data from automatic analyzers.

Permits result verification and correction by the technologist using simple English language typewriter procedures.

Summarizes test results into patient reports.

Maintains a master file reflecting the status of laboratory requests for response to inquiry.

Collects and stores laboratory operating data for management and planning.

DESCRIPTION

CLMS processing revolves around a key file, the Master Log File, which maintains the status of each test as it progresses through the laboratory cycle. Initial entries in this file are created from test requisitions entering the laboratory. The system uses this file to generate the printed master log and the worklists for the various workstations. As the test runs at the workstations are completed, the system prints quality control listings to permit verification of final test results before they are made available for reporting. Upon verification, these results are placed by the system into the Master Log. Periodically, the Master Log can be reviewed and a patient report printed for completed tests. Entries into a charge file may be made at several points in the process.

The Master Log contains work status indicators which are maintained by the system. These indicators show when a specimen has physically entered the laboratory, when it has been placed on a worklist for a test run, and when a result has been obtained and is ready for reporting. These indicators are used by the system to direct the laboratory work flow. They are also available to the user for realtime response to inquiries on the status of tests.

The Master Log, in the normal course of processing, collects data on most aspects of the laboratory operation: The type and number of tests performed, the technologists performing them, the devices and procedures used, etc. This information is available to the user for the preparation of statistical and other special reports of value in managing the laboratory and planning for its future.

CLMS does not perform the data acquisition function for the laboratory. CLDAS or its equivalent must be used for this purpose. If customers intend to monitor instruments online to the computer, they should be cautioned that it requires a relatively complex programming effort.

Use: CLMS directs and controls the flow of information from receipt of the initial requisition for a test until the final result has been developed and is ready for reporting. It should provide a flexible base for both growth and customization of the user's clinical laboratory.

CUSTOMER RESPONSIBILITIES

CLMS may be tailored to fit a user's environment. A good understanding of the system is necessary for successful installation and operation.

For a description of the laboratory, CLMS uses a set of internal descriptive files. These files are created by the system from punched cards containing operational data specified by the user. By respecifying the operational data, users may at any time modify the system to reflect additions, deletions, or rearrangements in their test procedures.

CLMS uses the card reader, printer, and console typewriter as its principal means of communication with the user. However, all input and output functions of CLMS originate or terminate in a system file. These interfacing files simplify the incorporation of other input/output devices into the system. The user is responsible for any additional device support programs. A knowledge of the 1800 and its programming languages is required to write these additional device support programs.

CLMS uses an internal file, the Patient ID File, for patient data such as name, location, birthdate, and sex. The user is responsible for creating and maintaining this file.

CLMS is designed to operate concurrently with the data acquisition function. Users must provide CLDAS or its equivalent for the direct monitoring of their laboratory instruments.

If the user wishes to use CLDAS (5718-H11) with CLMS (5718-H12) and CLMS MPX feature (#6000), the user is responsible for converting DIAGN, ERRRR, INTWV, PKINT, PLINT, SSSSS, SUWLG, SYMB, UPSET, STATA and the CLDAS program to MPX.

The modification of the basic CLMS program product 5718-H12 by installing the MPX feature (#6000) conversion kit is also a customer responsibility if it is desired to operate CLMS under MPX. This entails the insertion of statements to some programs, the addition of new programs, and the replacement of some existing programs. These modifications are straight forward and step by step instructions are provided.

The user should generate and maintain a compilation listing which should be available for all personnel servicing the system.

When feature code #6000 (MPX feature) is added to CLMS (5718-H12), CLMS will operate under the 1800 MPX Operating System. This feature does not convert programs designed to interface CLDAS as noted above. The MPX Feature uses both IBM 1800 FORTRAN Language and the IBM 1800 Assembler language.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The TSX system has minimum system requirements for Systems Generation as outlined in "IBM 1800 Time Sharing Executive System Concepts and Techniques" (C26-3703). CLMS requires that the IBM 1801 Processor-Controller have at least 16K core storage (a minimum of 6,244 words of variable core is required in the TSX system). An IBM 1443 Printer, 1442 Card Read Punch, and an 1816 Console Typewriter are required. An IBM 1810 Disk Storage model A2 is also required. While the model A2 will normally provide adequate storage capacity, it is possible that laboratory volumes could be large enough to necessitate a model A3. Refer to the *Application Description Manual* (GH20-0772) for guidelines in determining disk storage requirements. The user's method of executing the data acquisition function will dictate the IBM 1800 Process I/O features required on the system.

The MPX system has minimum system requirements for System Generation as outlined in "IBM 1800 MPX System Introduction" (GC26-3718). CLMS with MPX feature (#6000) requirements are the same as for the TSX version with the following exceptions:

1. The IBM 1801 Processor-Controller must have at least 24K core storage.
2. A minimum of 6,850 words of variable core is required.
3. The FLET area required to hold the coreloads is increased to 1,125 sections (1,000 for TSX version).
4. Subroutine BUFFP (MPX Version) must be included in the system executive with at least two buffers specified; this requires 880 words.
5. Subroutine COIB2 (22 words) must also be included in the system executive.
6. 120 words of INSKEL COMMON must be reserved for core resident data. This does not include CLDAS INSKEL COMMON requirements.

SOFTWARE REQUIREMENTS

CLMS operates under the IBM 1800 Time-Sharing Executive System (TSX). Both the IBM FORTRAN Language and the IBM 1800 Assembler language are used in the system.

**PROSPRO II (TSX/1800)
PROCESS SYSTEMS PROGRAM
5718-P81**

PURPOSE

IBM 1800 PROSPRO II is a unique programming approach to industrial control computer applications which are mostly continuous operations. It offers simple, fill-in-the-blanks, tabular programming of the IBM 1800 Data Acquisition and Control System; enhancing and in no way obstructing user access to the TSX operating system. PROSPRO II substantially reduces the programming effort associated with the installation of process control systems. User coding is only necessary for special instruments, special logs, and special messages to operators.

Applications that are dedicated DDC (Direct Digital Control), supervisory control, operation sequencing, data acquisition, or combinations of these are efficiently served by using features of PROSPRO II that are applicable. In addition, process data management is provided.

DESCRIPTION

This program contains the following additions and improvements over PROSPRO/1800 (PROcess Supervisory PROgram):

- A Direct Digital Control (DDC) processor with its own General Block language for advanced control
- Extension of the supervisory General Action language
- Operator communication through the 1892 model 11 Process Operators Console (RPQ)
- Redesigned process I/O routines
- Improved bumpless transfer and system restart procedures
- An enhanced Preprocessor accommodates additional data forms
- Modification of the TSX error recovery procedures to better accommodate process control requirements

The 1892 model 11 Process Operators Console is an RPQ device attachable to the 1800. This console provides three rows of 10-character displays, 20 backlit pushbuttons, and a total of 104 interrupt generating pushbuttons in 10 groups.

All of these features are used by PROSPRO II to provide extensive and highly interactive operator communication with the 1800 for every defined process constant, process variable, closed loop and process unit.

PROSPRO II offers two levels of control. The upper supervisory control level provides minute-by-minute file updating and processing of variables against conditions that may call for actions, which are then executed, such as closed loop regulations, alternate procedures, messages, or transfer of objectives to the lower level. The lower control level provides second-by-second alarm scanning of measured variables and DDC. DDC processing provides fast closed loop regulation without the use of instrument controllers. PROSPRO II with DDC also offers rapid sequence control of industrial operations.

The user specifies the parameters of control strategy and/or data acquisition by filling in blanks on three to eleven special forms from which cards are punched and entered, online, into the 1800. Groups of data that pass logic consistency tests are preprocessed into data files and tables of pointers which cause the system to perform the defined actions. Minimal knowledge of computer programming is required to fill in the forms. Thus, PROSPRO II may be easily used by plant engineers. Initial functions and strategy can be created in a very short time. Changes in these functions and the strategy may be made quickly by entering new or different data cards online.

The completed PROSPRO II special data forms become the organized documentation of that installation.

PROSPRO II is designed for efficient execution with a complete file structure and prioritized file buffering. The design enables unique compiler preprocessing of the forms information to eliminate interpretive execution and inline code generation. A simple fill-in-the-blanks approach oriented toward industrial control with greater execution efficiency than normal Assembler/FORTRAN approaches is a significant advance.

PROSPRO II is extremely comprehensive. Data acquisition from standard instruments and essentially all process control and operator communication may be implemented by using only the system and filling in the forms. It may be used as an enhancement to the TSX operating system under which other associated functions are added as well as unassociated functions which may operate in the process or nonprocess mode. Buffered access to the files is provided by FORTRAN 'CALL' statements.

Features

- Special forms for data acquisition and control definition
- Lower installation costs
- Shorter implementation time

- Improved process control, operator communication, and data management
- Quick and safe online changes to strategy
- Efficient execution due to unique program design
- Thorough system documentation by the manuals
- Organized application documentation by the forms

CUSTOMER RESPONSIBILITIES

Customers must have a basic knowledge and understanding of the use of the system before implementation, and a TSX trained representative to generate it; know the instrumentation required; know the processes to be controlled and the desired data acquisition and control strategy; and describe that strategy on the standard forms.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

IBM 1801 or 1802 Processor - Controller model 1D or 2D, 1442 Adapter (#4430), three additional Data Channels (#3222), Analog Input Data Channel Adapter 1 (#1233), Analog Input Data Channel Adapter 2 (#1234), Analog-Digital Converter model 1 (#1231), Comparator (#2185), Multiplexer/R Control (#5256) ... IBM 1442 Card Read Punch model 6 or 7 ... IBM 1810 Disk Storage model A2 or B2 ... IBM 2315 Disk Cartridges ... IBM 1892 model 11 Process Operators Console (RPQ C08400 and prerequisites).

The number required, if any, of the following, depends on the application.

Digital Input Data Channel Adapter (#3291)*, Digital and Analog Output Data Channel Adapter (#3290)** (features 3290/1 may share a data channel), Process Interrupt Adapter (#5710), Process Interrupt-Contact (#5715), Digital Input Adapter (#3262), Digital Input Contact (#3285), Digital Output Control (#3296), Digital Output Adapter (#3295), Electronic "Contact" Operate (#3612), Pulse Output (#5863)** ... 1053 Printer ... 1828 Enclosure model 2 ... 1851 Multiplexer Terminal models 1 or 2, Multiplexer/R (#5252), Differential Amplifier (#3246), Signal Conditioning Element ... 1856 Analog Output Terminal model 1*, Digital to Analog Converter model 1, 2, 3 or 4 (#3251-#3254)*, Analog Driver Amplifier (#1227)*, Precision Voltage Reference (#5527 or 5528)*.

The following devices must not be ordered.

Buffer Register (#1507/8), Multiplexer Overlap (#5259).

Consideration should be given to an IBM 1810 Disk Storage model B2 and an IBM 1801 or 1802 model 2D for best performance.

PROSPRO II transmits pulse trains to setpoints of controllers (up-pulses and down-pulses), if any, and a gated analog drive to DDC stations or controllers, if any. For each output there must be a position feedback analog signal to the computer. The setpoint feedback must have the same signal range as the loop's measured input signal but may connect to any terminal address. The DDC feedback signal range must be 20-100 percent of the computer input range and must be connected to the next highest terminal number from the loop's measured input. For each DDC output, there must also be a digital input signal for the DDC/Local switch on the station or controller. The terminal number for this digital input and the terminal number for the analog drive signal gate (ECO or PO) must correspond.

Refer to the "Configuration" section of the *Application Description Manual* and the "Wiring Considerations" section of the *Program Description Manual* for further installation assistance.

Prior to completing the Process Interrupt Status Word Assignment Form and the Data Channel "Specify" codes, refer to the sections on Interrupt Level Assignments and 1801/1892 Interface Description in the *Operations Manual*.

SOFTWARE REQUIREMENTS

PROSPRO II operates under the IBM 1800 TSX operating system. The TSX Non-Reentrant Subroutines may be used. IBM 1800 FORTRAN and Assembler language are the source languages for PROSPRO II.

DOCUMENTATION
(available from Mechanicsburg)

Application Description Manual (GH20-0718).

TERMS and CONDITIONS: See PP Index

* Required for DDC.
** Required for setpoint control.

1800 REPORT PROGRAM GENERATOR (RPG) 5718-RG1

PURPOSE

The IBM 1800 Report Program Generator (RPG) significantly enhances the commercial data processing capability of the IBM 1800 Data Acquisition and Control System. The 1800 RPG operates under the IBM 1800 Multiprogramming Executive System (MPX), and provides a language which is easy to learn and specifically oriented to commercial applications such as accounts receivable, payroll, inventory accounting, and sales analysis. In addition, a file conversion utility (DFCNV) enables RPG to be used for generating operating reports from sensor-based disk data files created by FORTRAN-coded online programs.

DESCRIPTION

The 1800 RPG consists of a problem-oriented symbolic language, a compiler, and a library of subroutines. The user describes the problem by coding source statements, on RPG coding forms, that describe the input and output files, records and fields, and the data processing to be performed. The source statements are then punched into cards. The compiler converts the source statements to an object program with subroutine linkages, which in turn is executed to accomplish the problem solution.

The 1800 RPG uses the same coding forms as System/360 RPG and provides language specifications identical to 1130 RPG. Minor differences between the two systems exist in the job control language and input/output devices supported.

The 1800 RPG compiler can be executed in either the time-sharing mode under MPX or in the batch-processing mode under the MPX Basic Operating Monitor (BOM). At the user's option, an RPG object program can be executed as an area, main-line, or batch-object coreload, and can execute in any core partition except the Special Area (SPAR) or the System Executive.

The following operating restrictions apply:

- RPG can process disk files created only by an RPG program or the file conversion utility DFCNV.
- When processing an indexed sequential file, additions and updates to the file cannot both be made in the same program.
- A disk file must be contained in a contiguous area on one 2315 disk pack. Split extents and multi-volume files are not supported.
- The maximum key length in an indexed sequential file is 50 characters. The key must begin in the first position of the record.

Features: The 1800 RPG includes the following functions:

- Edit codes, to reduce the coding necessary to edit numeric printed data. With the use of a one-character edit code, the programmer can edit most numeric fields along with data fields. Where the edit codes are not sufficient, edit words are still supported.
- CHAIN operation code, to allow greater flexibility in random references to disk files. By using the CHAIN op code during calculations, the programmer may retrieve a record from an indexed sequential file and have it immediately ready for processing. With the use of CHAIN, the programmer can determine a record-not-found condition, and provide a routine to handle this instead of going to a halt condition. Multiple records can be retrieved from one file. A chained file may CHAIN to itself as well as CHAIN to other files. Through the use of CHAIN and relative record number, records may be randomly retrieved from sequential disk files.
- Subroutines, to avoid repeated coding of similar calculation routines. An often-used calculation routine may be coded as an RPG subroutine. The RPG subroutine must be compiled with the program that uses it. The use of Assembler language-coded subroutines is also supported.
- EXCPT operation code, to permit records to be output at other than fixed points in the RPG processing. With the use of the EXCPT op code the programmer can produce output at any time and as often as desired during both detail and total calculations.
- 1800 Input/Output Subroutines, to create and process sequential and indexed sequential files on the 1810 Disk Storage. These subroutines may also be used by 1800 Assembler language programs to create and process files. The subroutines accomplish these functions.
 - Create an indexed sequential file
 - Add records to an existing indexed sequential file
 - Sequentially process indexed sequential files, either within limits or the entire file
 - Randomly process individual records of indexed sequential files
 - Sequentially process input or output records of a sequential file
 - Randomly process input or update records of a sequential file

In addition, the following features can provide other benefits depending on the user's application:

- Cylinder Index in Core - One sector of the cylinder index remains in core during the processing of an indexed sequential file. Consequently, when randomly processing an indexed sequential file, greater throughput will normally be realized if the input is sorted first.
- Sequential Files - A sequential disk file may be retrieved either sequentially or randomly (by use of relative record number). Random retrieval of a sequential file replaces the direct access concept and allows for fast retrieval of files which make use of the relative record number technique.
- The LOCAL function - It is possible to overlay subroutines called by RPG. This function may reduce throughput to save on core.
- S/360 Appearance - Through the use of RPG, the programmer no longer need be aware of the fact that the 1800 is a fixed-word binary machine. The 1800 with the use of RPG appears to be a character-oriented system. Like S/360, both zoned decimal and packed decimal may be used.
- Dual I/O Areas - Dual I/O areas are supported for all card and printer devices. This allows the programmer to call for execution time options which afford, in most cases, increased throughput at the expense of core.

Use: The RPG compiler is a series of batch-process coreloads that operate under the Multiprogramming Executive System. Execution is initiated by entering a job in the card reader with an XEQ control card containing the coreload name RPG18. RPG source statements are read from the card reader, processed, and generated into a relocatable object program stored temporarily in disk working storage. The relocatable program can then be executed immediately, stored into the relocatable program library, punched into cards, or built into a coreload for later execution, all under control of the MPX Disk Management Program (DMP). Disk file areas can be reserved for the use of RPG applications by the *DFILE or *STOREDATA functions of DMP.

CUSTOMER RESPONSIBILITIES

The customer is responsible for:

- Developing application programs in the RPG language.
- Generating the MPX operating system.
- Loading the RPG compiler and subroutines to disk storage under MPX control.
- Compiling RPG application programs and building them into core loads for execution.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

- A. Compiler execution - IBM 1801/1802 Processor-Controller, model 1C or 2C (16K)
 - IBM 1810 Disk Storage, model A2 or B2
 - Two IBM 2315 Disk Cartridges
 - IBM 1816 Printer-Keyboard or 1053 Printer, model 3 or 1443 Printer, model 1 or 2
 - IBM 1442 Card Read Punch, model 6 or 7
- B. Object program execution - IBM 1801/1802 Processor-Controller, model 1C, or 2C (16K)
 - IBM 1810 Disk Storage, model A2 or B2
 - IBM 1442 Card Read Punch, model 6 or 7
 - Output devices as required by the application program
- C. Devices Supported by IBM 1801/1802 Processor-Controller (up to 32K)
 - Two IBM 1442 Card Read Punches, model 6 or 7
 - One IBM 1443 Printer, model 1 or 2
 - IBM 1810 Disk Storage, model A3 or B3
 - Two IBM 1816 Printer-Keyboards
 - Six IBM 1053 Printers, model 3

SOFTWARE REQUIREMENTS

The IBM 1800 RPG compiler is written in IBM 1800 Assembler language and operates under the IBM 1800 Multiprogramming Executive System (MPX). The Disk Management Program (DMP) of MPX provides utility functions to assist in RPG installation and

1800 RPG (cont'd)

operation, including loading programs to disk, creating of files, and building application program core loads.

The RPG compiler can execute under time-sharing within the 5,140-word variable core area required by MPX. The RPG compiler uses the LOCAL feature to execute within the 5,140-word area. The LOCAL feature is not necessary if the available variable core area exceeds 7,140 words. Additional available variable core area will be used automatically by the RPG compiler to increase throughput.

Approximately 30 cylinders of disk storage are required for the compiler and the supporting subroutine library.

Disk working storage is required for the generated object program and for temporary storage of source statements when they exceed the number which can be contained in available core storage.

SYSTEM/7 ASSEMBLER
5718-SC2 (Features #7027, #7029, #9005)**PURPOSE**

System/7 Assembler language is a symbolic programming language for use with the System/7. This language provides the programmer with a convenient means of writing machine instructions, designating registers, and specifying format and addresses of storage areas, data, and constants. All operational capabilities of the System/7 can be expressed in System/7 Assembler language programs.

DESCRIPTION

The System/7 Assembler is a paper tape-oriented, one pass, one-for-one Assembler program which translates source programs written in System/7 Assembler language into machine loadable object programs on paper tape.

The most significant features provided are briefly summarized in the following paragraphs:

- One-pass: By resolving forward referenced symbols as overlay patches, the assembly is completed in one pass.
- Forward Referencing: Symbolic names may be referenced prior to definition.
- Renaming Symbols: A symbolic name can be equated to another symbol so that both refer to the same storage location, register, etc.
- Convenient Data Representation: Constants can be specified as alphabetic characters, decimal digits, and storage addresses for ease of definition.
- Optional Program Listing: Program listings can be provided, at assembly time, of source and resulting object program. This is a programmer option.
- Error Checking: Source programs are examined by the assembler for possible errors arising from incorrect usage of the language. A message is printed on the printer describing the error discovered. This occurs even if the above program listing was not requested.
- Subroutine Entry: Subroutine names that are still undefined symbols at the end of assembly are printed on the keyboard printer. The source for these subroutines can then be entered and the assembly completed.
- Multiple Assemblies: Multiple assemblies may be done without reloading the assembler program.
- Minimum System Requirements: A System/7 with at least 4K words of storage and an Operator Station.

Although this assembler offers a subset of the resources that are available with the macro assemblers, a programmer can prepare an effective program to control an application. (The Functional Subroutines, with the exception of multiply and divide, are not available in Paper Tape Format.)

System/7 Utilities: Included with the System/7 Assembler are utility programs to provide the user with tested and maintained programs to assist in program maintenance and debugging on System/7. The following utilities require 128 words of storage and reside in the System/7 IPL area.

- Storage Dump: Output the contents of storage to the keyboard printer or paper tape punch.
- Storage Patch: Alter storage locations via the Operator Station keyboard.
- IPL Loader: Reads the storage load paper tape produced by the System/7 Assembler, Host Program Preparation Facilities, or storage dump. This loader will construct the necessary storage load in the System/7.
- Storage Initialization: Initializes both System/7 storage and registers. This function must be performed after power-on of the System/7.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Minimum System Configuration: System/7 Assembler requires a System/7 with a minimum of 4K of storage and an Operator Station. (Program preparation cannot be accomplished on a 2K system.)

PROGRAM PRODUCTS**1800 CHROMATOGRAPH MONITORING
5718-XX1****PURPOSE**

IBM 1800 Chromatograph Monitoring provides advanced data acquisition and fused peak analysis techniques for the simultaneous monitoring of multiple chromatographs in realtime. The program scans the signals from the chromatographs, analyzes the peak spectrum, and produces the reports. It is particularly well suited to the quality-control laboratory environment.

DESCRIPTION

The Chromatograph Monitoring Program operates either under the 1800 Time-Sharing Executive (TSX) or the 1800 Multiprogramming Executive (MPX). Time-sharing jobs may execute concurrently in the TSX version, and background jobs in the MPX version.

The advantages are reduced turn-around time on chromatograph runs, greater accuracy and better reproducibility than manual methods, better utilization of analyst time, and greater chromatograph utilization through automatic control.

The maximum number of chromatographs that can be monitored is a function of 1800 core size and speed, and the scanning frequency desired. Typical systems have 10 to 60 chromatographs wired, with 10 to 30 operating simultaneously.

Extensive digital filtering techniques are employed to minimize noise problems, including spike rejection of raw data. First and second curve derivatives are calculated using a least squares technique. Exponential smoothing is applied to raw data and curve derivatives. Dead bands and confirming counts are used to insure that only significant, persistent changes in the derivatives are considered. All filter parameters are adjustable and can be changed during a run.

Backflushing, and column-switching can be controlled by the program.

The rate of scanning each chromatograph can be varied individually, and can be changed during a run.

Analytical methods (for example, run parameters, peak decomposition method, type of run) can be defined and updated in real time by a series of data cards without interrupting the routine operation of the system.

Multiple reference peaks can be used to improve the estimation of expected peak times.

Peak areas can be calculated by several methods including a least squares curve fitting technique.

Use: The lab analyst initiates scanning of the chromatograph by entering information about the analytical method to be used, the chromatograph number, date and time of the sample, and other experimental parameters through a 1092 Keyboard, and then closing the start switch on the chromatograph. The chromatograph start light is turned on confirming computer monitoring. No further attention by the analyst is required to record the spectrum and produce the report. Offline or background jobs can be executed during the monitoring of the chromatographs.

CUSTOMER RESPONSIBILITIES

The customer is responsible for performing the following functions:

Installing start buttons and lights at each chromatograph with cabling to the 1800 PI and ECO terminals.

Providing low-noise, low-impedance chromatograph analog signals to the 1800.

Generating a suitable TSX or MPX operating system.

Defining system equates which specify the machine configuration addressing.

Executing the customizer program to modify the source programs for the particular installation.

Generating the required COMMON/INSKEL/cards using a utility program provided.

Compiling or assembling the package programs supplied in source form and building the core loads and data files.

Maintaining suitable listings and core maps for the use of system maintenance personnel.

As with other systems, customers are responsible for providing adequate protection against accidental loss or misuse of their data. This includes an adequate review of the system's security provisions by the user.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

- IBM 1801 Processor-Controller model 1C or 2C (16K) for TSX, model 1CB or 2CB (24K) for MPX
- IBM 1810 Disk Storage model A1 or B1
- One IBM 1442 Card Read/Punch model 6 or 7
- One IBM 1816 Printer Keyboard or 1053 Printer model 3
- IBM 1828 Enclosure model 2
- Analog-Digital Converter model 1 (#1231)
- Two IBM 1851 Multiplexer Terminals model 1
- Three Differential Amplifiers (#3246)
- One IBM 1092 Matrix Keyboard model 1 with 1051 Attachment (#7915) and RPQ C08735 (1800 attachment)
- IBM 1894 model 10 (RPQ C08056), 1092 Keyboard Attach Basic with #3612, ECO-one group, #5715, PIC-one group, and #3285, DIC-one group (Option A) or #5715, PIC-one group (Option B)
- IBM 1894 model 1, 1092 Keyboard Attach, Adapter (RPQ C08057).

The following is required for each chromatograph wired to the system: Four analog input MPX/R points; one on each of four input voltage levels (10 mv, 50 mv, 500 mv, 5 volt) (#5252) ... one point of Process Interrupt-Contact (#5715) ... one point of Electronic Contact Operate (#3612).

Additional devices that are supported and recommended are: A 1443 printer if much offline work is to be done. It is also helpful in system installation for online monitoring of the scan program ... additional 1810 Disk Drive if more than 472 sectors are required for data files in TSX or 571 sectors in MPX ... additional 1053 Printers if chromatographs are widely separated ... additional 1092 Keyboards if chromatographs are widely separated.

Note: The CNP programs may only use the 12 standard interrupt levels.

The TSX Version requires a Variable Core of 5,600 words, 1,880 words for skeleton programs, and 2,626 words of skeleton COMMON (20 chromatographs and one 1092). The MPX version requires a Variable Core of 5,186 words, a core load area of 2,192 words, 3,592 words of skeleton programs including system routines, and 1,918 words of skeleton COMMON (14 chromatographs and one 1092). The core load area may be eliminated by operating an interrupt core load in variable core, at some increase in system overhead.

To compile and build the program requires the above configuration without the Process I/O and 1092 Matrix Keyboard and its attachments.

SOFTWARE REQUIREMENTS

The IBM 1800 Chromatograph Monitoring Program is written in IBM 1800 Assembler language and 1800 FORTRAN. It operates under either the IBM 1800 Time-Sharing Executive (TSX) or the 1800 Multiprogramming Executive (MPX). The calculation routines, and the analysis report output programs, are written in FORTRAN to facilitate modification.

This program product is released to work with Version 3 of TSX, or Version 3 of MPX, and all subsequent versions and modifications unless so stated in a future revision of this document.

The Error Alert Control program (EAC) within the TSX operating system masks all interrupt levels during the processing of an error. Since EAC uses a series of overlays from the disk, the time involved can be as much as several seconds. The Chromatograph Monitoring program cannot operate under these conditions because data would be lost. A change is therefore made to EAC to allow the level(s) of the timers and analog input to remain unmasked during EAC operation. Any errors on the unmasked level(s) can result in a double entry into EAC with a resultant unrecoverable MLTP EAC message. The multiple EAC, however, is probably due to hardware problems on the unmasked level(s) and should not be considered a TSX problem. The Interval Timer Control program in TSX is also modified to allow timer A to continue running after a timer interrupt is processed. Customer Engineering involvement in these areas of code is potentially billable.

DOCUMENTATION

(available from Mechanicsburg)

Application Description Manual (GH20-0724).

TERMS and CONDITIONS: See PP Index

**REALTIME PROGRAMMING SYSTEM
INDEXED ACCESS METHOD
5719-AM1****PURPOSE**

The IBM Series/1 Indexed Access Method licensed program contains features of the Realtime Programming System Indexed Access Method PRPQs (5799-TBN, TCA, TCB). This licensed program provides improved usability and storage utilization. Additional function and the elimination of certain restrictions are also included. The product contains major enhancements such as: More efficient use of data file space to alleviate the problem of running out of space in a particular area of a file; a special online utility to define index data set organization; improved integrity via a write verify option; a macro to extract file attribute information from an index data set; key checking; termination clean-up and an immediate write option.

The Indexed Access Method licensed program will allow users of the COBOL (5719-CB1) licensed program to write application programs that directly access Indexed Access Method files. By using the new file definition utility to create the indexed file, a higher level language user need never use Series/1 Assembler language to create an indexed file.

In addition, users of the Sort/Merge (5719-SM1) licensed program will be able to specify Indexed Access Method data sets as input files. Users of COBOL and Sort/Merge will be able to use the Indexed Access Method licensed programs without having to write Assembler language programs as they did with the Indexed Access Method.

HIGHLIGHTS

This licensed program includes all Indexed Access Method PRPQ functions plus the following new functions:

- The requirement that the user always use the specified DSD name when referencing an Indexed Access Method file, and requiring the DSD to always be in the DSDT, has been removed. The user may now specify which task set the DSD should be associated with.
- The user may now specify a free pool area to be generated that contains reserved blocks. These blocks may be later allocated as data blocks or index blocks to expand a portion of a file due to heavy insert activity in that area.
- The access method will now verify that the key field of a data record has not been modified during an update operation.
- The user may select at file definition time whether or not the hardware write-verify option is to be used on file writes.
- Indexed files will automatically be closed and access method resources freed when a using task terminates either normally or abnormally. This is an option on Realtime Programming V4 which may be selected during SYSGEN.
- A macro is now provided which will allow the user to extract information about a file; for example, key length, key displacement, block size, record size and other more detailed data regarding the file structure.
- A utility program will be provided to create an indexed file. The utility executes as a user task set and it performs functions for the user that would otherwise require him to write an assembler language program. The utility has an interactive command language capability which makes it easy to use.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified environment.

HARDWARE REQUIREMENTS

This product operates on IBM Series/1 systems which use Realtime Programming System device support for the following input/output devices:

IBM 4962 Disk
IBM 4964 Diskette
IBM 4963 Disk
IBM 4966 Diskette Magazine Unit

SOFTWARE REQUIREMENTS

The minimum system for executing the product is specified in the IBM Series/1 Realtime Programming System, either Version 3 (5719-CP3) or Version 4 (5719-PC4). The Version 4.1 Command Language Facility INSTALL Command may be used to "Post-Install" Indexed Access Method licensed program, Version 1.1. In addition, the Indexed Access Method licensed program has the following relationships to other software products:

COBOL - User access to Indexed Access Method functions via standard COBOL verbs.

Sort/Merge - Accepts Indexed Access Method files as input.

The Realtime Programming System licensed program Version 3 or Version 4 and Program Preparation Subsystem Version 3 or Version 4 are prerequisite for the Indexed Access Method licensed program.

COMPATIBILITY

The following compatibilities/incompatibilities exist:

- User macro coding is a superset of the previous PRPQs. A program which operates under the Indexed Access Method PRPQ will operate with the same application results on the licensed program.
- Functional capabilities are a superset of the Indexed Access Method PRPQ functions.
- Application object code which invoked functions of the PRPQ on Version 3 or 4 of the Realtime Programming System need not be recompiled in order to execute with this product. Execution of this program provides identical results under the licensed program and under the PRPQ.
- Data files created by the PRPQ are capable of being processed by this licensed program, using the same level of function. To facilitate PRPQ to licensed program migration, a PRPQ file may be accessed via the licensed program and, as long as the file is not updated via the licensed program, the file may again be used with the PRPQ.

DOCUMENTATION

TERMS and CONDITIONS: See PP Index

**REALTIME PROGRAMMING SYSTEM
INDEXED ACCESS METHOD VERSION 2
5719-AM2****PURPOSE**

The IBM Series/1 Realtime Programming System Indexed Access Method Version 2 licensed program is an extension of Indexed Access Method (5719-AM1). The Indexed Access Method allows the user to build, access, and maintain user-defined records in indexed data sets via predetermined fields called keys. Version 2 of the Realtime Programming System Indexed Access Method, which operates under the IBM Series/1 Realtime Programming System Version 5.1 (5719-PC5), provides improvements for usability, capability for improved performance and enhanced flexible utility functions.

HIGHLIGHTS

The Series/1 Realtime Programming System Indexed Access Method Version 2 supports all the functions available in the previous version plus the following functions:

- Multiple secondary index support feature - every indexed data set contains a unique key field within a record called a primary key. It is used as a basis for the primary index. Keys other than the primary keys are called secondary keys which may be used to create separate secondary index files. Duplicate keys can exist in these files. This feature allows data retrieval and data manipulation using multiple keys for a specific record.
- A data paging function which utilizes unmapped storage can improve the performance of the Indexed Access Method. Data paging keeps the most frequently used indexed file pages (which consist of both data blocks and index blocks) in storage and operates in a manner similar to a cache, thereby reducing the number of file I/O accesses and improving response time.
- A set of enhanced Indexed Access Method Utilities which have a simpler interface and simplified procedures in the areas of file definition/creation (IDEF), load/unload and file reorganization.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system for executing this licensed program is specified in the IBM Realtime Programming System Version 5.1 (5719-PC5). The Series/1 Realtime Programming System Indexed Access Method requires at least 6K bytes of resident code. Control blocks, Indexed Access Method buffers (minimum 2 x block size), the secondary index update buffer (minimum 2 x record size), and unmapped storage for the paging area are additional.

The following devices are specifically supported:

- IBM 4952 Processors (models A & B)
- IBM 4952 model C Processor with Diskette Drive
- IBM 4955 Processors (all models)
- IBM 4962 Disk Storage Unit
- IBM 4963 Disk Storage Subsystem
- IBM 4964 Diskette Unit
- IBM 4965 Diskette Drive and I/O Expansion Unit
- IBM 4966 Diskette Magazine Unit
- IBM 4969 Magnetic Tape (Load, Unload Utility, Commands)

SOFTWARE REQUIREMENTS

The Realtime Programming System Version 5.1 (5719-PC5) is prerequisite for the Indexed Access Method Version 2 (5719-AM2). Sort/Merge (5719-SM1) is required only if the Indexed Access Method utility program is to be used to load a secondary index from an existing indexed file.

COMPATIBILITY

The Indexed Access Method licensed program has the following compatibilities:

- User macro coding is a superset of previous versions. A program which operates under Version 1 (5719-AM1) of the Indexed Access Method compiles and operates with the same application results on Version 2 of the Indexed Access Method.
- Functional capabilities are a superset of Indexed Access Method Version 1 functions.
- Application object code which invoked functions of Version 1 of the Indexed Access Method need not be recompiled in order to execute

with Version 2 of the Indexed Access Method Licensed Program. Execution of these programs provides identical results under Versions 1 and 2.

- Data sets created by Version 1 are capable of being processed by Version 2, using the same level of function.
- Indexed Access Method Version 2, like Version 1, will allow users of COBOL (5719-CB7 or 5719-CB1) and PL/I (5719-PL2) to write application programs that directly access Indexed Access Method data sets. In addition, users of Sort/Merge (5719-SM1) will be able to specify Access Method data sets as input files.

TERMS and CONDITIONS: See PP Index

**EVENT DRIVEN EXECUTIVE INDEXED ACCESS METHOD
5719-AM3****PURPOSE**

The IBM Series/1 Event Driven Executive Indexed Access Method licensed program (5719-AM3) provides data management facilities supporting indexed file operations for the IBM Series/1 Event Driven Executive system. This facility operates under the IBM Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS1). It allows the user to build, access, and maintain user-defined records in indexed data sets via a predetermined field called a key. The Indexed Access Method builds an index of keys which provides fast access to records in an Indexed Access Method data set. The access method supports a high degree of insert/delete activity providing both direct and sequential access to the data from multiple programs concurrently accessing the same or different indexed data sets. Applications that use the Indexed Access Method support can be programmed in the Event Driven Executive Language, PL/1 or COBOL. It is supported by the Series/1 Event Driven Executive Sort/Merge licensed program (5719-SM1) which will accept Indexed Access Method data sets as input files. Also provided is a utility to define and maintain indexed data sets. This utility can be used from a user terminal or program.

HIGHLIGHTS

- The Series/1 Event Driven Executive Indexed Access Method support provides keyed access to user data to support a wide variety of applications ranging from batch processing to multi-user interactive applications.
- The data set organization is designed to provide efficient direct and sequential processing of files. This is accomplished by using cascading index data blocks for sequential processing.
- The access method design supports data sets which have high add/delete activity (such as open order files) to minimize performance degradation. This is accomplished by distributing free space for additions throughout the file, by updating and inserting additions in place, and by dynamically reclaiming space after deletions.
- Indexed Access Method supports multiple programs and tasks sharing the same data sets. In a shared environment, data integrity is maintained by record and block level locking to prevent access to an indexed or data record while the record is being modified.

DESCRIPTION

The following functions are provided:

LOAD	Connects user to requested data set for initial load of file.
PROCESS	Connects user to requested data set for reading, updating, inserting and deleting records.
DISCONN	Terminates and disconnects user from requested data set. Forces buffer flush and releases any outstanding record locks.
GET	Directly retrieves a record from the data set which has a key equal (EQ), greater than (GT), or greater than or equal (GE) to the requested key. This operation can operate on a full or partial key. It moves the record to the user area. Both Update and Read-Only are supported.
GETSEQ	Sequentially retrieves the next record (in ascending key order) from the point of the last sequential access. A group of sequential retrievals may begin at the beginning of the indexed data set, or at a random record. Both Update and Read-Only are supported.
PUTUP	Replaces a record previously retrieved and releases the lock.
PUT	Loads or inserts a new record into the data set. The new key must be unique from those in the data set.
PUTDEL	Logically and physically deletes the record previously retrieved and releases the record lock.
DELETE	Logically and physically deletes a record, by key, from the data set.
RELEASE	Frees a previously obtained record lock. This eliminates the need for the user to replace unmodified records.
ENDSEQ	This is used with sequential option to terminate sequential processing.
EXTRACT	Returns data set information to user area.

Fixed length user data records are supported. The user records may be blocked in the data set.

User keys must be unique in each data set. The keys must be fixed length (254 byte maximum) and must be a single field within the data record.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system for execution of this licensed program is as specified for the IBM Series/1 Event Driven Executive Supervisor and Emulator (5719-XS1) Version 1. Storage requirements for the Series/1 Event Driven Executive Indexed Access Method requires a minimum of 14K bytes to be able to perform all of its functions. This minimum is in addition to the number of bytes required by the Event Driven Executive Supervisor for calling the Indexed Access Method or the size of any user error exit routines. There must be sufficient diskette or disk space for user data sets. The following devices are specifically supported:

- IBM 4962 Disk Storage Unit
- IBM 4963 Disk Subsystem
- IBM 4964 Diskette Unit
- IBM 4966 Diskette Magazine Unit

SOFTWARE REQUIREMENTS

Program Preparation for the Event Driven Executive (EDX) system which includes the Indexed Access Method requires the EDX Utilities Version 1.1 (5719-UT3), plus any combination of the following:

Event Driven Executive Program Preparation Facilities Version 1.1 (5719-XX2)

or

Event Driven Executive Macro Assembler Version 1 (5719-ASA)

Event Driven Executive Macro Library Version 1 (5719-LM5)

or

System/370 Program Preparation Facilities for Series/1 (5798-NNQ)

Event Driven Executive Macro Library/Host Version 1.1 (5740-LM2)

or

Event Driven Executive COBOL Compiler and Resident Library Version 1.1 (5719-CB3)

Event Driven Executive COBOL Transient Library Version 1.1 (5719-CB4)

COMPATIBILITY

Data sets created by the Series/1 Event Driven Executive Indexed Access Method are compatible with the Series/1 Realtime Programming System Indexed Access Method, provided the block size used is a multiple of 256 bytes.

TERMS and CONDITIONS: See PP Index

**EVENT DRIVEN EXECUTIVE
INDEXED ACCESS METHOD VERSION 2
5719-AM4****PURPOSE**

The IBM Series/1 Event Driven Executive (EDX) Indexed Access Method Version 2 is an extension of the Indexed Access Method (5719-AM3). The Indexed Access Method allows the user to build, access, and maintain user-defined records in indexed data sets via predetermined fields called keys. Version 2 of the EDX Indexed Access Method, which operates under the IBM Series/1 Event Driven Executive Version 3.1 (5719-XS3), provides improvements for usability, capability for improved performance, and enhanced flexible utility functions.

HIGHLIGHTS

The Series/1 EDX Indexed Access Method Version 2 supports all the functions available in the previous version plus the following functions:

- Multiple secondary index support feature. Every indexed data set contains a unique key field within a record called a primary key. It is used as a basis for the primary index. Keys other than the primary keys are called secondary keys, which may be used to create separate index files. Duplicate keys can exist in these files. This feature allows data retrieval and data manipulation using multiple keys for a specific record.
- A data paging function which utilizes the same or other partitions in storage can improve the performance of the Indexed Access Method. Data paging keeps the most frequently used indexed file pages (which consist of both data blocks and index blocks) in storage and operates in a manner similar to a cache, thereby reducing the number of file I/O accesses and improving response time.
- A set of enhanced Indexed Access Method Utilities which have a simpler interface and simplified procedures in the areas of file definition/creation, and improvements in load/unload and file reorganization processing.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system for executing this licensed program is specified in IBM EDX Version 3.1 (5719-XS3). The storage requirements range from approximately 15K to 27K bytes, depending on the package selected from the diskettes, for your function and performance needs. Control blocks, Indexed Access Method buffer (minimum 2 x block size), the secondary index update buffer (minimum 2 x record size) and the paging area are additional.

This minimum is in addition to the number of bytes required for calling the Indexed Access Method or the size of any user error exit routines. There must be sufficient diskette or disk space for user data files. The following devices are specifically supported:

- IBM 4952 Processors (models A & B)
- IBM 4952 model C Processor with Diskette Drive
- IBM 4955 Processors (all models)
- IBM 4962 Disk Storage Unit
- IBM 4963 Disk Storage Subsystem
- IBM 4964 Diskette Unit
- IBM 4965 Diskette Drive and I/O Expansion Unit
- IBM 4966 Diskette Magazine Unit
- IBM 4969 Magnetic Tape (Load, Unload Utility Commands)

SOFTWARE REQUIREMENTS

EDX Version 3.1 (5719-XS3) and Utilities (5719-UT5) are prerequisites for the Indexed Access Method Version 2 licensed program (5719-AM4). Sort/Merge (5719-SM2) is required if the Indexed Access Method Utility Program is to be used to build a secondary index for an existing primary indexed file.

To prepare a program which uses the Indexed Access Method, the user requires one of the following:

- IBM Series/1 Event Driven Executive Utilities (5719-UT5) and the IBM Series/1 Event Driven Executive Program Preparation Facility (5719-XX4)

or

- IBM Series/1 Event Driven Executive Macro Assembler (5719-ASA) and the IBM Series/1 Event Driven Executive Macro Library (5719-LM7)

or

- IBM Series/1 Event Driven Executive COBOL Compiler and Resident Library (5719-CB5 or 5719-CB3) and IBM Series/1 Event Driven Executive COBOL Transient Library (5719-CB6 or 5719-CB4)

or

- IBM System/370 Program Preparation Facilities for Series/1 (5798-NNQ) and IBM Series/1 Event Driven Executive Macro Library/Host (5740-LM4).

or

- IBM Series/1 Event Driven Executive PL/I Compiler and Resident Library (5719-PL5) and the IBM Series/1 Event Driven Executive PL/I Transient Library (5719-PL6)

COMPATIBILITY

The Indexed Access Method has the following compatibilities:

- Available functions are a superset of previous versions. A program which operates under Version 1 (5719-AM3) of the Indexed Access Method compiles and operates with the same application results on Version 2 of the Indexed Access Method.
- User macro coding is a superset of previous versions. A program which operates under Version 1 (5719-AM3) of the Indexed Access Method compiles and operates with the same application results on Version 2 of the Indexed Access Method.
- Functional capabilities are a superset of Indexed Access Method Version 1 functions.
- Application object code which invoked functions of Version 1 of the Indexed Access Method need not be recompiled but must be relinked in order to execute with Version 2. Execution of these programs provides identical results under Versions 1 and 2.
- Data sets created by Version 1 are capable of being processed by Version 2, using the same level of function.
- Indexed Access Method Version 2, like Version 1, will allow users of COBOL (5719-CB5 or 5719-CB3) and PL/I (5719-PL5) to write application programs that directly access Indexed Access Method data sets. In addition, users of Sort/Merge (5719-SM2) will be able to specify Indexed Access Method data sets as input files. New Indexed Access Method functions will be available through PL/I and COBOL.

Data sets created by the IBM Series/1 Event Driven Executive Indexed Access Method are compatible in indexed file structure with the Realtime Programming System Indexed Access Method file provided the block size used is a multiple of 256.

**EVENT DRIVEN EXECUTIVE MACRO ASSEMBLER
5719-ASA****PURPOSE**

The IBM Series/1 Event Driven Executive Macro Assembler (5719-ASA) is a licensed program which will allow the user to assemble application programs or program modules concurrent with the execution of other programs operating under the control of the IBM Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS1).

The Macro Assembler converts text data sets containing machine assembler and macro instructions that have been coded in the Series/1 instruction set, into object modules to be processed by the linkage editor that is included with the Assembler. In conjunction with the Series/1 Event Driven Executive Macro Library (5719-LM5), applications coded in the Series/1 Event Driven Executive language can also be processed by the Series/1 Event Driven Executive Macro Assembler, including the reconfiguring or customizing of the Series/1 Event Driven Executive supervisor. User-generated macros for commonly used routines can be incorporated into the macro library.

The Assembler also provides the user the facility to generate device support modules, specific routines in support of user exits, or customized supervisory functions. These routines can then be link edited with the user applications generated in the Series/1 Event Driven Executive language, FORTRAN IV, COBOL, and/or PL/I.

HIGHLIGHTS

- A function-oriented Assembler language for specifying machine instructions
- A macro language facility
- Conditional assembly capability within macros
- Sectional assembly capability
- Assembler options for listing control
- Relocatable object module output
- Support for the 4952 Processor instructions
- Listing output of the source program and object text, external symbol dictionary, relocation dictionary, cross reference table, error messages, and statistics
- Linkage editor

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following operating environment:

HARDWARE REQUIREMENTS

The Macro Assembler operates under the control of the IBM Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS1) and depends upon the operating system to be its interface to the hardware. The resultant object code is link edited with or without other programs and can be run as a program under control of the Event Driven Executive supervisor.

The minimum system required for assemblies is:

Processor	IBM 4952, 4953, or 4955 Processor
Storage	48K bytes (64K bytes for the IBM 4952), including 22K bytes for the Macro Assembler
Diskette Only (non-macro assemblies)	1 - IBM 4964 Diskette Unit or 1 - IBM 4966 Diskette Magazine Unit
Printer	1 - IBM 4973 Line Printer or 1 - IBM 4974 Printer
Operator Station	1 - IBM 4979 Display Station or 1 - IBM 4978 Display Station or 1 - Teletypewriter Adapter (#7850) with Teletype® Models ASR 33/35

In addition to the minimum configuration, one or more of the following disks are required for macro assemblies or are recommended for improved assembly performance:

Disk	1 - IBM 4962 model 2, 2F, or 4 Disk Storage Unit (combination disk/ diskette unit) or 1 - IBM 4962 model 1, 1F, or 3 Disk Storage Unit or
-------------	--

®Registered Trademark of Teletype Corporation

1 - IBM 4963 Disk Subsystem

SOFTWARE REQUIREMENTS

IBM Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS1)

IBM Series/1 Event Driven Executive Utilities (5719-UT3)

IBM Series/1 Event Driven Executive Macro Library (5719-LM5). (Required if Series/1 Event Driven Executive language is used or if supervisor customization is included in the assembly process.)

COMPATIBILITY

The Series/1 Event Driven Executive Macro Assembler is upward compatible from the Series/1 Base Program Preparation Facilities (5719-PA1) and source language compatible with the Series/1 Program Preparation Subsystem Version 4 (5719-AS4), with the exception of the GLOBL assembler instruction.

PROGRAM PRODUCTS

**PROGRAM PREPARATION SUBSYSTEM
5719-AS1**

PURPOSE

The IBM Series/1 Program Preparation Subsystem licensed program is a set of four programs that provide the user a batch processing environment, and aids for preparing programs for execution on the Series/1. The licensed program consists of these four components: Job Stream Processor, Text Editor, Macro Assembler, and the Application Builder. These programs will run in the batch partition as task sets under Series/1 Realtime Programming System (5719-PC1).

HIGHLIGHTS

- Provides program preparation and/or general purpose batch computing concurrently with realtime program execution.
- Aids the user in developing task sets for realtime or batch execution.
- Programs run in a Series/1 partition under control of the Realtime Programming System.

DESCRIPTION

Job Stream Processor

The Job Stream Processor provides the Series/1 user with a batch processing facility. This program provides a convenient and easily modified method of invoking programs, communicating with these programs, and defining or creating the data sets the programs will use. The facilities of this program are used to run (in the batch partition) the three program preparation aids that are included in this licensed program.

- Easy-to-use command language
- Multiple jobs and steps per job stream
- Data set creation and definition
- Predefined environments and job streams
- Also supports FORTRAN IV (5719-FO1) and PL/I (5719-PL1) compilers

Text Editor

The Text Editor Provides the user the capability to create and edit text modules. These text modules can be source programs for input to the Macro Assembler, FORTRAN IV compiler or the PL/I compiler or the PL/I compiler; job streams for batch processing; or data sets for user-written programs.

- Data can be entered from operator station, disk or diskette.
- Variety of command functions to aid user in Text Editing
- Create, display or modify text modules
- Search for, or change a field or character string
- Share display station with system console
- Flexible editing environment

Macro Assembler

The Assembler processes the user's source statements consisting of machine, assembler and macro instructions which were coded in the Series/1 Assembler language. This assembler program produces a machine language object module which will require address resolution prior to use.

- Source input from job stream or data set.
- Symbolic statements; mnemonic operation codes.
- Output modules on disk/diskettes along with information for address resolution, relocation and external symbol dictionary.
- Output to printer includes source program listing, symbol dictionaries, cross reference table and error messages.
- Control sections, common, and external references.

Application Builder

The Application Builder converts one or more object modules into an executable load module or a task set. The executable load module is intended for use with a user-provided operating system. The task set is intended for execution under control of the Realtime Programming System (5719-PC1) and will contain the various tables and control blocks required for this specific environment. In addition to this user task set, the Application Builder can also be used to create a special module (shared task set) consisting of programs and data areas that are shared by several user task sets.

- Processes object modules which are produced by the language translators
- Creates composite modules, assigns storage addresses, resolves external references

- Combines composite modules, tables and control blocks to form a task set
- Optional prebind capability for faster task set initiation
- Processes program overlay sections per composite modules
- Processes common/global sections
- Auto-Call facility automatically includes routines from program library
- Produces output listing of control statements, error messages, and task set map

FORTRAN IV and PL/I Compilers

The FORTRAN IV Compiler (5719-FO1) and the PL/I Compiler (5719-PL1) are not included as part of this Licensed Program. However, either of these compilers will run in the batch partition under control of the Job Stream Processor. These compilers produce object modules that are similar to those produced by the Macro Assembler. All these object modules require address resolution by the Application Builder program. The FORTRAN IV compiler will run in a 16KB batch partition. The PL/I compiler requires a 28KB batch partition.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system requirements for the Series/1 Program Preparation Subsystem are:

Processor	IBM 4953 or 4955 Processor
Storage	48K byte minimum system, with at least a 16K byte partition for the Program Preparation Subsystem
Disk/Diskette	1 - IBM 4962 model 2, 2F, or 4 Disk Storage Unit (Combination disk/diskette unit) or 1 - IBM 4962 model 1, 1F, or 4 Disk Storage Unit and 1 - IBM 4964 Diskette Unit
Printer	1 - IBM 4973 Line Printer or 1 - IBM 4974 Printer
Operator Station	1 - IBM 4979 Display Station or 1 - Teletypewriter Adapter #7850 with Teletype® Models ASR 33/35 or an ASCII equivalent device

SOFTWARE REQUIREMENTS

IBM Series/1 Realtime Programming System (5719-PC1).

PROGRAM PRODUCTS

PROGRAM PREPARATION SUBSYSTEM VERSION 2
5719-AS2

PURPOSE

The IBM Series/1 Program Preparation Subsystem Version 2 (5719-AS2) Licensed Program provides all the facilities of the IBM Series/1 Program Preparation Subsystem Version 1 (5719-AS1) plus support for the following additional features:

- Support for the 4962 Disk Storage Unit models 3 and 4 with a capacity of 13,962,240 bytes.
- New overlay manager controlling both disk and storage overlays.
- Job stream processor provides the following new functions:
 - Display jobs
 - Cancel jobs
 - Restart jobs
- Text editor for Version 2 offers eight additional editing commands

DF	Define, delete DSD statements, create volumes and data sets.
ED	Edit entire page of data from display station.
ID	Prints indexing line.
JS	Job stream creation.
LC	List and describe command syntax.
RE	Replace text with new text.
SU	Submit a job stream to job stream processor.

 (Command) Display syntax.
- Application Builder supports Program Preparation Facilities for Realtime Programming System Version 1 and 2.
- Application builder support for storage overlays.
- A packaged subsystem with prebuilt job stream processor, text editor, assembler, and application builder. Pre-defined DSDTs for the text editor, assembler, and application builder are also provided.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

**PROGRAM PREPARATION SUBSYSTEM VERSION 3
5719-AS3****DESCRIPTION**

The IBM Series/1 Program Preparation Subsystem Version 3 (5719-AS3) is a licensed program which provides all the facilities of the Program Preparation Subsystem Version 1 (5719-AS1) and Version 2 (5719-AS2) plus the following features:

Support for all functions being provided in Version 3 and Version 4 (except for Command Language Facility in 5719-PC4) of the IBM Series/1 Realtime Programming System.

Usability enhancements to the application builder:

- Automatic creation of data set definitions for data sets used by the application builder.
- Automatic deletion of an existing data set with same name as one being defined if data set is too small.
- Optional update of the System Data Set Definition Table for newly-built task sets.

The Program Preparation Subsystem Version 3 also has the ability to prepare applications to execute on the Realtime Programming System Versions 1, 2, 3, and 4.

Note: Version 3 does not provide assembler language instructions for the 4952 Clock/Comparator.

Features included in the Program Preparation Subsystem Version 3 are listed below.

The Application Builder provides the following additional function:

- Builds relocatable load modules.
- Builds relocatable task sets.
- Builds task sets that will execute under the Realtime Programming System Versions 1, 2, 3 and 4.
- Provides an option to add a DSD to the System DSDT for the task set being built.
- Creates DSDs automatically for the work data sets and various Phase 3 output data sets.
- Deletes and recreates Phase 3 output data sets if necessary.

The Job Stream Processor provides support for the following:

- Statement to invoke the COBOL compiler.
- COBOL compile, load, and execute statement.
- COBOL environment list DSD.

The Macro Assembler improvements include:

- Internal performance enhancements.
- Additional structured macros including SEARCH, EXITIF, ORELSE, ENDLOOP, and ENDSRCH.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system requirements to install the IBM Series/1 Program Preparation Subsystem Version 3 are:

IBM 4952, IBM 4953, or IBM 4955 Processors. Refer to the IBM Series/1 Realtime Programming System Version 3 (5719-PC3) or Version 4 (5719-PC4) for minimum system requirements. Storage requirements are: A 16K byte partition is required for the Program Preparation Subsystem if running under the Multiple Address Space Management environment of the IBM Series/1 Realtime Programming System Version 3 (5719-PC3) or Version 4 (5719-PC4); a 48K byte minimum system with at least an 18K byte partition is required if running under the Single Address Space Management environment of Version 4 (5719-PC4) of the IBM Series/1 Realtime Programming System.

SOFTWARE REQUIREMENTS

IBM Series/1 Realtime Programming System Version 3 (5719-PC3) or Version 4 (5719-PC4).

DOCUMENTATION

PROGRAM PRODUCTS

**PROGRAM PREPARATION SUBSYSTEM VERSION 4
5719-AS4****PURPOSE**

The Program Preparation Subsystem Version 4 (5719-AS4) is a licensed program which provides all the facilities of the Program Preparation Subsystem Version 1 (5719-AS1), Version 2 (5719-AS2), and Version 3 (5719-AS3). The Program Preparation Subsystem Version 4 also has the ability to prepare applications to execute on the Realtime Programming System Versions 1, 2, 3, and 4. Improvements in assembler performance have been made. Also, several usability enhancements are incorporated.

Note: If the Command Language Facility of Realtime Programming System Version 4 (5719-PC4) will be used, then 5719-AS4 is required.

HIGHLIGHTS

- Provides all the capabilities previously announced for Program Preparation Subsystem Versions 1, 2 and 3.
- Automatic creation of Assembler work DSDs if the user specifies either a "WORKVOL" or "WORK1" DSD.
- OBJOUT data set will be automatically created if it does not exist at assembler invocation.
- Multiple assembly capability for processing all members of a partitioned data set or all data sets in a volume with a single assembler invocation.
- Support for 4952 Processor instructions in the Assembler.
- A new component, the macro preprocessor, allows the user to develop preprocessed macro programs which will improve assembler performance.
- A new job stream processor statement provides a simple, easy-to-use interface to the new macro preprocessor.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system requirements to install the Series/1 Program Preparation Subsystem Version 4 are:

Processor	<p>For a Realtime Programming System Version 4 Multiple Address Space Management Environment</p> <p>1 - IBM 4955 model B or D Processor equipped with Storage Address Relocation Translator #6335, or 4955 model E, or 4952</p> <p>For a Realtime Programming System Version 4 Single Address Space Management Environment</p> <p>1 - IBM 4952 Processor or 1 - IBM 4953 Processor or 1 - IBM 4955 Processor</p>
Storage	64K byte minimum system with at least a 16K byte partition for the Program Preparation Subsystem to operate in a Version 4 Multiple Address Space Environment or at least 48K minimum system and an 18K byte partition to operate in a Version 4 Single Address Space Management Environment.
Disk	<p>1 - IBM 4962 model 2, 2F, or 4 Disk Storage Unit (Combination disk/diskette unit) or 1 - IBM 4962 model 1, 1F, or 3 Disk Storage Unit or 1 - IBM 4963 Disk Subsystem Unit may be used.</p>
Diskette	<p>1 - IBM 4964 Diskette Unit or 1 - IBM 4966 Diskette Magazine Unit</p>
Printer	<p>1 - IBM 4973 Line Printer or 1 - IBM 4974 Printer</p>
Operator	<p>1 - IBM 4979 Display Station or 1 - 4978 Display Station (RPQ P82572 Version 3, 5799-TCE)* or IBM 3101 Display Terminal (as Teletype® Models ASR 33/35 equivalent device) or</p>

1 - Teletypewriter Adapter #7850 with Teletype® Models ASR 33/35

* Requires separate licensed program

PROGRAM PRODUCTS

**PROGRAM PREPARATION SUBSYSTEM VERSION 5
5719-AS5****PURPOSE**

The IBM Series/1 Program Preparation Subsystem Version 5 licensed program contains changes to support functions offered in Version 5 of the IBM Series/1 Realtime Programming System, a Text Editor, and a repackaging to include facilities required for development use.

HIGHLIGHTS**New Text Editor**

For improved productivity, a new Text Editor is supplied as part of the Program Preparation Subsystem Version 5 replacing the old Text Editor. It is a general purpose text editor for the Series/1, running under Version 5 of the Realtime Programming System. It supports three editing modes:

- Full screen (or visual)
- Single-line
- Non-interactive

The commands in single-line and non-interactive modes are the same; only the source of editor input varies.

The new Text Editor is a user task set supporting one terminal per partition. It is designed to be invoked from a Command Language Facility environment although it can be started via a TSET STR operator command, by a QUETS macro, or via the Job Stream Processor.

In full screen mode, the Text Editor presents a user interface which is very similar to that of the SPF editor for TSO and CMS. In this mode, the following editing functions are supported:

- Direct alterations of data by overtyping.
- Line commands for:
 - Inserting or deleting one or more lines for data entry
 - Moving or copying one or more lines from place to place within the files
 - Repeating one or more lines, one or more times
 - Shifting data or block printing on one or more lines
 - Displaying an indicator line for columnar alignment
- Primary commands for:
 - Scrolling the data being edited in any direction and any amount
 - Finding or changing text strings
 - Saving the data being edited
 - Save in place
 - Cancelling the edit session without saving the data being edited
 - Copying another file into the current file
 - Controlling whether data in the file should be translated to upper case

There is also a menu interface for the selection of data to be edited; this interface is primarily designed for use when the editor is not invoked from the Command Language Facility.

In single-line and non-interactive modes, the new Text Editor presents an interface which is similar in appearance to that of the VM/370 CMS editor. This is not line number oriented. Commands are provided to:

- Change the current line pointer
- Find and change text strings
- Save the data being edited
- Save in place
- Cancel the edit session without saving the data being edited
- Copy another file into the current file
- Control whether data in the file should be translated to upper case
- Insert and delete one or more lines
- Move or copy one or more lines from place to place within the file
- Print feature

There are also commands to permit the selection of data to be edited; these commands are primarily intended for use when the editor is not invoked by the Command Language Facility.

File line numbers are provided on printed output for ease in updating.

Application Builder

Application Builder modifications to support specification of a new facility offered in Version 5 of the Realtime Programming System called "Secondary Storage Services".

Job Stream Processor

Job Stream Processor modifications to support Version 5 Realtime Programming System spooling parameters when building printer DSDs.

Improved Packaging

The Command Language Facility, SYSGEN, and the System User macros have been included into Version 5 of the Program Preparation Subsystem to separately provide the system functions required in a development environment and those required in a production environment.

The Job Stream Processor is also provided as a separate Programming RPQ (5799-TEC) so that "non-development" systems will not need the Program Preparation Subsystem in order to have access to a batch job stream capability.

SYSGEN

SYSGEN has been improved for the case where a customized system is required. The enhancements make SYSGEN easier, more accurate and faster through reduced questions, automatic answer verification, fewer assemblies, and by providing the user with the ability to restart the SYSGEN at various points.

Command Language Facility

New commands are provided to:

- Invoke the macro preprocessor (PREPM)
- Produce a formatted report of a system log (LLOG)

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system requirements for execution of the Series/1 Program Preparation Subsystem Version 5 in a Realtime Programming System Version 5 development environment are:

- | | |
|-----------------------|---|
| Processor | 1 - IBM 4955 |
| Storage | 192K byte minimum processor storage with at least 32K byte partition for the Program Preparation Subsystem. |
| Disk | 1-IBM 4962 model 4 Disk Storage Unit (combination disk/diskette unit)
or
1 - IBM 4962 model 3 Disk Storage Unit
or
1 - IBM 4963 Disk Subsystem unit may be used |
| Diskette | 1 - IBM 4964 Diskette Unit
or
1 - IBM 4965 Diskette Unit and I/O Expansion Unit
or
1 - IBM 4966 Diskette Magazine Unit |
| Printer | 1 - IBM 4973 Line Printer
or
1 - IBM 4974 Printer
or
1 - IBM 4975 Printer |
| System Console | 1 - IBM 4979 Display Station
or
1 - IBM 4978 Display Station
or
1 - IBM 5251 Display* models 1 or 2
or
1 - IBM 3101 Display Station attached via: <ul style="list-style-type: none"> • #1310 Multifunction Attachment (IBM 3101 models 10, 12, 13, 20, 22, or 23 on the first address, IBM 3101 models 13 or 23 on any address) • #1610 Asynchronous Communications Single-Line Control (IBM 3101 models 10, 12, 13, 20, 22, or 23) • #2091/#2092 Asynchronous Communication 8-Line Control and 4-Line Adapter (IBM 3101 models 10, 12, 13, 20, 22, or 23) • #2095/#2096 Feature Programmable 8-Line Multiline Communications Controller and 4-Line Attachment (IBM 3101 models 10, 12, 13, 20, 22, or 23)

PROGRAM PRODUCTS

Program Preparation Subsystem V5 (cont'd)

1 - Teletypewriter Adapter #7850 with a 3101 terminal or equivalent teletypewriter device

* Supported by separate licensed program

SOFTWARE REQUIREMENTS

IBM Series/1 Realtime Programming System Version 5 (5719-PC5) and IBM Series/1 5250 Information Display System (5719-TA1) if support is required.

COMPATIBILITY

Files

Text Editor Files generated with Version 4 (5719-AS4) are compatible with the Version 5 (5719-AS5) Text Editor.

Programs

Version 5 can prepare programs to execute on Versions 3, 4, and 5 of the Realtime Programming System (5719-PC3, PC4, PC5), respectively.

PROGRAM PRODUCTS

**SERIES/1 PROGRAM PREPARATION SUBSYSTEM
VERSION 6 (5719-AS6)****PURPOSE**

The Series/1 Program Preparation Subsystem Version 6 licensed program has been enhanced to support the functions offered in the Realtime Programming System, Version 6, and the Multiprocessing feature.

HIGHLIGHTS

Available July 29, 1983:

- Application Builder support of new function
- System Generation support for new function
- Text Editor Program Function Key tailoring
- High-Level Language tabs for the Text Editor

DESCRIPTION

Application Builder Support of New Function: The Application Builder will be updated to support the functions added to Realtime Programming System Version 6.

System Generation Support of New Function: New questions will be added to support the functions added to Realtime Programming System Version 6.

Text Editor Function Key Tailoring: The Text Editor now allows tailoring of Program Function Key definitions. Any or all of the Program Function Keys can be equated to any of the Full Screen Primary Commands so the specified command will be executed whenever the key is entered.

High-Level Language Tabs for the Text Editor: New Text Editor primary commands are defined to allow users entering source programs to set tabs at predefined column positions useful for source entry.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The following minimum configuration is required to operate the Program Preparation Subsystem, Version 6:

- The specified operating environment for the Realtime Programming System Version 6 (5719-PC6), or the Multiprocessing feature, for installation and customization.
- At least one 32K-byte partition for execution of Program Preparation Subsystem, Version 6.

SOFTWARE REQUIREMENTS

The following licensed program is compatible with the Program Preparation Subsystem, Version 6:

- IBM Series/1 Realtime Programming System, Version 6 (5719-PC6), or the Multiprocessing feature.

PROGRAM PRODUCTS

**SERIES/1-S/370 CHANNEL ATTACH
5719-CA1****PURPOSE**

The Series/1-S/370 Channel Attach program runs under the control of the Series/1 Realtime Programming System. This program, when used in conjunction with the 4993 mdl 1 Series/1-S/370 Termination Enclosure and the Series/1-S/370 Channel Attachment (feature #1200), provides the Series/1 user with the ability to communicate with a S/370 (mdls 135-168), and the 3031, 3032, 3033, 4331, 4341, 4361 and 4381 Processors over a selector or block multiplexer channel.

HIGHLIGHTS

This program provides the Series/1 user the ability of transferring data, under joint consent, between user application programs in his Series/1 and a S/370. The S/370 must be using DOS/VS, OS/VS1 or OS/VS2 (SVS or MVS) and BTAM, or DOS/VSE with BTAM-ES. The support:

- Establishes, controls and terminates access between Series/1 application programs and the channel attach device
- Manages input/output transfers between the Series/1 application programs and the channel attach device
- Performs error logging
- Handles interrupts from the channel attach device
- Performs error recovery at the physical (Read/Write) level of support

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

One IBM 4993 model 1 Series/1-S/370 Termination Enclosure and one IBM Series/1-S/370 Channel Attachment (#1200).

Realtime Programming Systems using this support with the IBM 4952 or the IBM 4953 should be carefully reviewed to see that performance objectives can be achieved.

SOFTWARE REQUIREMENTS

The minimum system required to install the IBM Series/1-S/370 Channel Attach program (5719-CA1) is specified for the IBM Series/1 Program Preparation System Version 3 (5719-AS3) or the IBM Series/1 Program Preparation System Version 4 (5719-AS4).

The minimum system required for program execution of the IBM Series/1-S/370 Channel Attach program is as specified for the IBM Series/1 Realtime Programming System Version 3 (5719-PC3) or the IBM Series/1 Realtime Programming System Version 4 (5719-PC4).

DOCUMENTATION

(available from Mechanicsburg)

IBM Series/1-System/370 Channel Attach Program General Information Manual (GC34-0217) ... IBM Series/1-System/370 Channel Attach Program Licensed Program Specifications (GC34-0214) ... IBM Series/1-System/370 Channel Attach Program Reference Summary (SX34-0029) ... IBM Series/1-System/370 Channel Attach Program Reference Manual (SC34-0215).

Note: Publications should be ordered via SLSS for customers. Customers on subscription for a current version of a licensed program will not automatically receive publications for a subsequent version; SLSS must be updated for each version of a licensed program.

**REALTIME PROGRAMMING SYSTEM
COBOL COMPILER AND RESIDENT LIBRARY (5719-CB1)
COBOL TRANSIENT LIBRARY (5719-CB2)**

PURPOSE

IBM Series/1 Realtime Programming System COBOL provides customers with a powerful, comprehensive, easy-to-use language for use in preparation and execution of commercial and online data entry application software. The language offers a wide range of commercial features, plus extensive facilities for handling input and output, sorting and merging data files, structuring the source and object programs, and debugging COBOL programs. The Series/1 product also supports local communication functions enabling users to accept data from and display data to Series/1 interactive devices.

COBOL programs can be used with the Realtime Programming System Multiple Terminal Manager PRPQ (5799-TCY). With these facilities, COBOL programs can execute in an interactive environment where one or more applications can run concurrently with one or more terminals. Users can write interactive terminal handling applications and develop screen-oriented programs to accept and display data from predefined fields on screens dedicated to multiple applications.

COBOL is suited to an interactive commercial environment where users can run transaction processing applications, such as order entry and data collection, as well as applications that run in a background batch environment.

DESCRIPTION

Series/1 Realtime Programming System COBOL is offered as two licensed programs:

- Realtime Programming System COBOL Compiler and Resident Library (5719-CB1) for compilation and building of user programs
- Realtime Programming System COBOL Transient Library (5719-CB2) for execution of user programs

The Realtime Programming System COBOL compiler executes under Version 3 or Version 4 (5719-PC3 or 5719-PC4) of the Realtime Programming System and Version 3 or Version 4 (5719-AS3 or 5719-AS4) of the Program Preparation Subsystem. COBOL applications can execute under the Realtime Programming System for the Program Preparation Subsystem batch environment.

COBOL Language

The 1974 American National Standard COBOL processing modules supported include all of Level 1 for the:

- Nucleus: Language elements needed for internal processing of data
 - Table Handling: Define and process fixed-length tables
 - Sequential I/O: Define and access sequential files*
 - Relative I/O: Define and access relative files*
 - Indexed I/O: Define and access indexed files*
 - Sort/Merge: Sorting of data files
 - Segmentation: Specify overlay of the Procedure Division at execution time
 - Library: Inclusion of pre-defined COBOL text into a COBOL source program
 - Debug: Convenient access for monitoring program execution
 - Interprogram Communication: Ability to transfer control from one object program to another within a task set
- * RERUN clause is checked for syntactic correctness only.

In addition to the above, the following features are also supported.

- Merge feature of Sort/Merge Level 2
- NUCLEUS Level 2 features:
 - COMPUTE statement
 - Qualification
 - Arithmetic operators
 - CORRESPONDING phrase
 - ACCEPT and DISPLAY statement
 - Multiple operand support for arithmetic statements
 - Nested IFs
 - PERFORM UNTIL
 - 01 through 49 level numbers

HIGHLIGHTS

- Language

Series/1 COBOL is designed according to the specifications for American National Standard (ANS) COBOL X3-23-1974 as understood and interpreted by IBM as of March 1979, with the exception of the RERUN clause.

Series/1 COBOL exceeds the Low Intermediate Level COBOL as defined by FIPS PUB 21-1.

- Extensive User Options
 - source listings
 - cross reference
 - storage map of variables
 - statement offset listing
 - reentrant object code generation
 - compile-load-go feature
 - object listing
 - MAP 370 option
- Program Development and Productivity Aids
 - Symbolic debug, which makes storage maps and snapshots of data available in COBOL format.
 - Flow trace, which identifies the last statement executed before an abnormal termination.
 - Extensive error checking and error messages at five severity levels, ranging from source program fix-up, to warning messages, to serious and critical errors.
 - FIPS Flagger enables quick and easy identification of COBOL source statements which exceed the specified FIPS language level.
 - Generalized CALL facility allows access to programs written in Assembler language, PL/I and FORTRAN.

I/O Capabilities in COBOL

Series/1 COBOL programs can work with SEQUENTIAL, RELATIVE and INDEX I/O files.

The data format for SEQUENTIAL files can be:

- fixed
- fixed blocked
- fixed blocked spanned
- variable
- variable blocked
- variable blocked spanned

RELATIVE files can be accessed sequentially or randomly by record number. INDEXED files can be accessed sequentially or directly by key associated with each record.

Table Handling

- Define and process fixed-length tables of up to three dimensions

Sort/Merge

- Sort one to eight data files
- Merge two to eight data files
- Sort/Merge files in ascending or descending order
- Facility to modify input and output records before or after sort processing

Segmentation

The Segmentation feature permits:

- Dividing the Procedure Division of a COBOL program into a series of segments.
- Specifying that some segments (fixed segments) must be resident in main storage while the program is running and cannot be overlaid, while others (independent segments) are loaded into an overlay area when needed.
- Reducing main storage requirements during program execution.

Source Program Library

This feature allows text (such as Configuration Section paragraphs, Input/Output Section paragraphs, FD and SD entries, record description entries, Procedure Division sections and paragraphs) to be copied into a source program from a library.

Interprogram Communication

This facility allows

- Transferring of control from one object program to another within a task set. Programs can access the same data.
- Use of the CALL verb to gain access to programs written in Assembler language, PL/I, and FORTRAN.

Resident Library

The Series/1 COBOL Resident Library consists of commonly used reentrant subroutines which are combined with a user's program through the Application Builder to form a task set for subsequent execution on Series/1. Resident Library routines can reside in a shared task set. The Resident Library consists of commonly used subroutines such as:

- Data conversion
- I/O routines
- ACCEPT/DISPLAY data to/from terminals

Realtime Programming System COBOL (cont'd)

- Arithmetic routines
- Sort/Merge interface
- Run-time error routines

Transient Library

The Series/1 COBOL Transient Library is used in conjunction with the execution of COBOL user programs. Routines in the transient library are loaded only when needed, thus allowing a more efficient utilization of primary storage. These routines are reentrant and can be executed from a shared task set. The principal functions in the Transient Library are:

- OPEN/CLOSE
- Program Termination/Initialization
- ACCEPT - Date/Time
- I/O Error Handling Routines
- Execution-Time Messages

Compilation

The Series/1 COBOL Compiler takes advantage of the features of the Realtime Programming System for computations. If the timer is supported on the user system, timer facilities are used to generate date and time-of-day information on compiler output and to provide elapsed time recording of a compilation.

COBOL is dependent on Application Builder facilities to build task sets for subsequent execution on the operating system. The SEGMENTATION feature of COBOL allows users to optimize storage requirements for their applications through use of overlays.

Execution

Object programs are executed under the Realtime Programming System. COBOL data sets can be declared SEQUENTIAL, RELATIVE or INDEXED and require the operating system data management facilities.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

In addition to the minimum requirement for IBM Series/1 Version 3 or 4 of the Realtime Programming System and Version 3 or 4 of the Program Preparation Subsystem, the storage requirements are:

- For compilation, a minimum 34K byte partition for the compiler.
- For execution, a minimum partition size of 8K bytes for small programs; actual partition size is a function of the COBOL source program.

Usage of shared task set in COBOL is optional. The shared task set can be used to reduce main and secondary storage requirements for application programs.

For details on system requirements for the IBM Series/1 Realtime Programming System Version 3 or 4 and the IBM Series/1 Program Preparation Subsystem Version 3, see the appropriate pages.

SOFTWARE REQUIREMENTS

The following licensed programs are required if the associated functions are used:

- IBM Series/1 Realtime Programming System Sort/Merge (5719-SM1): Required support for Sort and Merge verbs
- IBM Series/1 Indexed Access Method PRPQ (5799-TCB), or IBM Series/1 Indexed Access Method Licensed Program (5719-AM1) for Realtime Programming System Version 3 or 4: Required support for Indexed I/O
- IBM Series/1 Multiple Terminal Manager PRPQ (5799-TCY): For Application/terminal I/O and screen support
- IBM Series/1 4969 Magnetic Tape Subsystem Support Program (5719-TA4): Required support for IBM 4969 tape device

COMPATIBILITY

Series/1 COBOL at the source statement level is a compatible subset of the OS/VS COBOL Compiler and Library - Release 2. Programmers can develop COBOL programs on larger systems for use on Series/1 provided those programs do not use any language, implementation or hardware features the Series/1 product does not support.

**EVENT DRIVEN EXECUTIVE
COBOL COMPILER and RESIDENT LIBRARY (5719-CB3)
COBOL TRANSIENT LIBRARY (5719-CB4)**

PURPOSE

IBM offers COBOL under the Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS1). The compiler and library can be diskette- or disk-based as supported by the operating system. The compiler requires as input a COBOL source program and produces object modules which are combined by the Event Driven Executive linkage editor into a Series/1 executable machine language program.

The language offers a wide range of commercial features, plus extensive facilities for handling input and output, sorting and merging data files, index capability for faster and simpler access to data files, structuring the source and object programs, and trace facilities for debugging COBOL programs. The Series/1 COBOL product also supports local communication functions, enabling users to accept data from and display data to Series/1 interactive devices.

COBOL programs can be used with the Event Driven Executive Multiple Terminal Manager licensed program (5719-MS1). With these facilities COBOL programs can execute in an interactive environment where one or more applications can run concurrently with more than one terminal. Users can write interactive terminal handling applications and develop screen-oriented programs to accept and display data from predefined fields on screens.

COBOL is suited to an interactive commercial environment where users can develop transaction processing applications such as order entry, data collection, and file update, as well as applications that run in a batch environment.

DESCRIPTION

Series/1 Event Driven Executive COBOL is offered as two licensed programs:

- Event Driven Executive COBOL Compiler and Resident Library (5719-CB3) for compilation of user programs.
- Event Driven Executive COBOL Transient Library (5719-CB4) for execution of user programs.

COBOL Language

The 1974 American National Standard COBOL processing modules supported include all of Level 1 for the:

Nucleus	Language elements needed for internal processing of data
Table Handling	Define and process fixed-length tables
Sequential I/O	Define and access sequential files*
Relative I/O	Define and access relative files*
Indexed I/O	Access indexed files*
Sort/Merge	Sorting of data files
Segmentation	Specify overlay of the Procedure Division at execution time
Library	Inclusion of pre-defined COBOL text into a COBOL source program
Debug	Convenient access for monitoring program execution
Interprogram Communication	Ability to transfer control from one object program to another

* RERUN clause is checked for syntactic correctness only.

In addition to the above, the following features are also supported:

- MERGE feature of Sort/Merge Level 2
- NUCLEUS LEVEL 2 features:
 - COMPUTE statement
 - Qualification
 - Arithmetic operators
 - CORRESPONDING phrase
 - ACCEPT and DISPLAY statements
 - Multiple operand support for arithmetic statements
 - Nested IF statements
 - PERFORM UNTIL phrase
 - 01 through 49 level numbers

HIGHLIGHTS

- Language
 - Event Driven Executive COBOL is designed according to specifications for American National Standard (ANS) COBOL X3.23-1974 as understood and interpreted by IBM as of March, 1979, with the exception of the RERUN clause.

Event Driven Executive COBOL exceeds the Low Intermediate Level COBOL as defined by FIPS 21-1.

- Extensive User Options
 - Source listings
 - Cross reference
 - Storage map of variables
 - Statement offset listing
 - Object listing
 - MAP 370 option
- Program Development and Productivity Aids
 - Symbolic debug, which makes storage maps and snapshots of data areas available in COBOL format
 - Flow trace, which identifies the last statement executed before an abnormal termination
 - Extensive error checking and error messages at five severity levels, ranging from source program fix-up, to warning messages, to serious and fatal errors
 - FIPS flagger enables quick and easy identification of COBOL source statements which exceed the specified FIPS language level
 - Generalized CALL facility allows access to programs written in Assembler language or FORTRAN.

Resident Library

The Event Driven Executive COBOL Resident Library consists of commonly used subroutines which are combined with a user's program through the linkage editor to form an executable load module for subsequent execution under the Event Driven Executive Basic Supervisor and Emulator. The Resident Library includes subroutines such as:

- Data conversion
- I/O routines
- ACCEPT/DISPLAY data to/from terminals
- Arithmetic routines
- Sort/Merge interface
- Run-time error routines

Transient Library

The Event Driven Executive COBOL Transient Library is used in conjunction with the execution of COBOL user programs. Routines in the transient library are loaded only when needed, thus allowing a more efficient utilization of primary storage. The principal functions in the transient library are:

- OPEN/CLOSE
- Program Termination/Initialization
- ACCEPT - Date/Time
- I/O Error Handling Routines
- Execution time messages

Compilation

The Event Driven Executive COBOL Compiler operates in the environment of the Event Driven Executive Basic Supervisor and Emulator (5719-XS1). The COBOL-generated object code is combined with library routines by the Event Driven Executive linkage editor and can run as a program under the control of the Event Driven Executive system. The Event Driven Executive Utilities (5719-UT3) provide powerful program editing and program management capabilities for the COBOL development process.

Execution

Object programs are executed under the Event Driven Executive operating system. COBOL data sets can be declared SEQUENTIAL, RELATIVE or INDEXED, and require the operating system data management facilities. The SEGMENTATION feature of COBOL allows users to optimize storage requirements for their application through use of overlays.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

EDX COBOL (cont'd)**HARDWARE REQUIREMENTS**

In addition to the minimum requirement for the IBM Series/1 Event Driven Executive Basic Supervisor and Emulator, and the Event Driven Executive Program Preparation Facility, the storage requirements are:

- For compilation, a minimum 32K byte partition for the compiler.
- For execution, a minimum partition size is 8K to 10K bytes for small programs; partition size is a function of the COBOL source program.

For details on system requirements for the IBM Series/1 Event Driven Executive Basic Supervisor and Emulator and the IBM Series/1 Event Driven Executive Program Preparation Facility, see the respective pages.

SOFTWARE REQUIREMENTS

Licensed programs required for:

Compilation

- IBM Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS1)
- IBM Series/1 Event Driven Executive COBOL Compiler and Resident Library (5719-CB3)

Program Preparation

- IBM Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS1)
- IBM Series/1 Event Driven Executive Program Preparation Facility (5719-XX2)
- IBM Series/1 Event Driven Executive Utilities (5719-UT3)

Program Execution

- IBM Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS1)
- IBM Series/1 Event Driven Executive COBOL Transient Library (5719-CB4)

Additional Licensed Programs

The following licensed programs are required if the associated functions are used:

- IBM Series/1 Event Driven Executive Sort/Merge (5719-SM2): Required support for SORT and MERGE verbs
- IBM Series/1 Event Driven Executive Indexed Access Method (5719-AM3): Required support for indexed file I/O
- IBM Series/1 Event Driven Executive Multiple Terminal Manager (5719-MS1): Required support for interactive terminal I/O and screen support

COMPATIBILITY

- Series/1 Event Driven Executive COBOL at the source statement level is a compatible subset of OS/VS COBOL Compiler and Library Release 2. Programmers can develop COBOL programs on larger systems for use on Series/1, provided those programs do not use any language or hardware features the Series/1 product does not support.
- Series/1 COBOL programs are compatible at the Source level between the Realtime Programming System and the Event Driven Executive Basic Supervisor and Emulator (5719-XS1) except for the File Select statement.
- COBOL data files in fixed-block unspanned format are compatible between Event Driven Executive and the Realtime Programming System through the Basic Exchange data format.

**EVENT DRIVEN EXECUTIVE
COBOL COMPILER and RESIDENT LIBRARY VERSION 2
5719-CB5
COBOL TRANSIENT LIBRARY VERSION 2 (5719-CB6)**

PURPOSE

IBM offers COBOL Version 2 (see "Language" section below) operating in the environment provided by the Series/1 Event Driven Executive Basic Supervisor and Emulator Version 3.1 (5719-XS3). The compiler and library can be diskette- or disk-based as supported by the operating system. The compiler requires as input a COBOL source program and produces object modules which are combined by the Event Driven Executive linkage editor into a Series/1 program.

The language offers a wide range of commercial features, plus extensive facilities for handling input and output, sorting and merging data files, index capability for faster and simpler access to data files, structuring the source and object programs, and trace facilities for debugging COBOL programs. Series/1 COBOL also supports local communication functions, enabling users to accept data from and display data to Series/1 interactive devices.

COBOL programs can be used with the Event Driven Executive Multiple Terminal Manager Version 2 licensed program (5719-MS2). With these facilities, COBOL programs can execute in an interactive environment, where one or more applications can run concurrently with more than one terminal. Users can write interactive terminal handling applications and develop screen-oriented programs to accept and display data from predefined fields on screens dedicated to multiple applications.

COBOL is suited for an interactive commercial environment where users can develop transaction processing applications such as order entry, data collection, and file update, as well as applications that run in a background batch environment.

HIGHLIGHTS

The Series/1 Event Driven Executive COBOL Compiler is offered as two licensed programs:

- Event Driven Executive COBOL Compiler and Resident Library Version 2 (5719-CB5) for compiling and building of user programs.
- Event Driven Executive Transient Library Version 2 (5719-CB6) for execution of user programs.

The COBOL Version 2 licensed programs contain all of the functions currently available in the respective COBOL Version 1 programs and, in addition, contain the following language features and new I/O support:

- Logical connectives (AND, OR, NOT operators)
- START and READ NEXT verbs from relative or index I/O
- VALUE OF IS dataname clause
- COMP-3 data type (packed decimal) and COMP-4 data type (binary)
- Level 88
- OPEN EXTEND
- LINAGE clause
- Blocked Relative File Support

The Series/1 COBOL Compiler Version 2 executes in the operating environment provided by the Event Driven Executive Basic Supervisor and Emulator Version 3.1 (5719-XS3) and requires the Event Driven Executive Utilities Version 3.1 (5719-UT5).

COBOL Language

The 1974 American National Standard COBOL processing modules supported include all of Level 1 for the:

Nucleus	Language elements needed for internal processing of data
Table Handling	Define and process fixed-length tables
Sequential I/O	Define and access sequential files*
Relative I/O	Define and access relative files*
Indexed I/O	Access indexed files*
Sort/Merge	Sorting of data files
Segmentation	Specify overlay of the Procedure Division at execution time
Library	Inclusion of pre-defined COBOL text into a COBOL source program
Debug	Access for monitoring program execution
Interprogram Communication	Ability to transfer control from one object program to another

* RERUN clause is checked for syntactic correctness only.

In addition to the above, the following Level 2 features are also supported:

- NUCLEUS Level 2 features:
 - COMPUTE statement
 - Qualification
 - Arithmetic operators
 - CORRESPONDING phrase
 - ACCEPT and DISPLAY statement
 - Multiple operand support for arithmetic statements
 - Nested IF statements
 - PERFORM UNTIL phrase
 - 01 through 49 and 88 level numbers
 - Nested REDEFINES
 - Logical Operators
- Sequential I/O Level 2 features:
 - VALUE OF clause
 - OPEN EXTEND
 - LINAGE clause
- Relative I/O Level 2 features:
 - START and READ NEXT verbs
 - VALUE OF clause
 - DYNAMIC access mode
- INDEXED I/O Level 2 features:
 - START and READ NEXT verbs
 - VALUE OF clause
 - DYNAMIC access mode
- MERGE feature of SORT/MERGE

Resident Library: The Series/1 COBOL Resident Library Version 2 consists of commonly used reentrant subroutines which are combined with a user's program through the linkage editor for subsequent execution on Series/1. The Resident Library includes subroutines such as:

- Data conversion
- I/O routines
- ACCEPT/DISPLAY data to/from terminals
- Arithmetic routines
- Sort/Merge interface
- Run time error routines

Transient Library: The COBOL Transient Library Version 2 is used in conjunction with the execution of COBOL user programs. Routines in the transient library are reentrant and loaded only when needed, thus allowing a more efficient utilization of storage. The principal functions in the transient library are:

- OPEN/CLOSE
- Program Termination/Initialization
- ACCEPT Date/Time
- I/O Error Handling Routines
- Execution Time Messages

Compilation: The Series/1 COBOL Compiler Version 2 operates in the environment provided by the Event Driven Executive Basic Supervisor and Emulator Version 3.1 (5719-XS3). The COBOL-generated object code is combined with library routines by the Event Driven Executive linkage editor and can run as a program under the control of the Event Driven Executive. The Event Driven Executive Utilities Version 3.1 (5719-UT5) provide powerful program editing and program management capabilities for the COBOL development process.

Execution: Object programs are executed in the environment provided by the Event Driven Executive Basic Supervisor and Emulator Version 3.1 (5719-XS3). COBOL data sets can be declared SEQUENTIAL, RELATIVE or INDEXED, and require the operating system data management facilities. The SEGMENTATION feature of COBOL allows users to optimize storage requirements for their applications through use of overlays.

DESCRIPTION

- Language

Series/1 COBOL Version 2 is designed according to specifications for American National Standard (ANS) COBOL X3.23-1974 as understood and interpreted by IBM as of August, 1981. Series/1 COBOL Version 2 exceeds the Low Intermediate Level COBOL as defined by FIPS 21-1, with the exception of the RERUN Clause.

EDX COBOL V2 (cont'd)

- New COBOL Version 2 Language features:
 - 'AND' and 'OR' operators allows formation of complex conditionals by combining simple conditions
 - 'NOT' operator reverses the logical value (true or false) of an existing condition.
 - START and READ NEXT verbs allow easier file accessing of relative and index files; users can now specify a generic key to logically position to a record in the file and then proceed to read the file from that record to the end of the file.
 - COMP-3 data type is an extension beyond the ANS COBOL language support and enhances data interchange with System/370 applications which use this data type extensively. The COMP-3 data type is for arithmetic expressions in packed decimal format. With this data type, users can read and write in COMP-3 format, perform arithmetic calculations and convert COMP-3 to different data types. COMP-4 is treated as a synonym for COMP, which stores data in binary format.
 - Level 88 is used to identify entries for condition-names that will be used in conditional expressions.
 - OPEN EXTEND is part of sequential I/O for Level 2 ANS COBOL. This statement indicates the processing of a file will begin by writing the first record at the end-of-data marker. This increases usability so that records can be added to an existing file. This support is provided for files existing on disk or diskette.
 - LINAGE clause allows users to handle special forms from COBOL programs; this also gives users more dynamic capability to specify form layouts for different files. The LINAGE clause provides a means for specifying the depth of a logical page in terms of number of lines. It also provides for specifying the size of the top and bottom margins on the logical page and the line number, within the page body, at which the footing area begins.
 - Blocked Relative file support allows blocking of fixed length records. Block size must be an integer multiple of the record size.
 - VALUE OF IS data name clause which is a part of sequential, relative and indexed I/O and describes items in the label records associated with a file. In this implementation, the VALUE OF clause serves only as documentation.

• Extensive User Options

- Source listings
- Cross reference
- Storage map of variables
- Statement offset listing
- Object listing
- MAP 370 listing option

• Program Development and Productivity Aids

- Symbolic debug, which makes storage maps and snapshots of data areas available in COBOL format
- Flow trace, which identifies the last statement executed before an abnormal termination
- Extensive error checking and error messages at five severity levels, ranging from source program fix-up, to warning messages, to serious and fatal errors
- Generalized CALL facility allows access to programs written in Event Driven assembler language (EDL)
- FIPS Flagger enables quick and easy identification of COBOL source statements which exceed the specified FIPS language level

• Full Screen Support

Full screen facilities to support high level languages including COBOL are available in the Event Driven Executive Basic Supervisor and Emulator Version 3. These facilities are oriented towards the application programmer with minimal knowledge of the system. The screen functions can be accessed via direct CALL from COBOL to provide full screen control for the 4979, 4978 and 3101 models 20, 22, and 23 Display Stations. These functions include:

- Retrieve and display screen formats
- Display unprotected data
- Read all unprotected data
- Cursor positioning
- Tone control
- Erase display
- Wait on PF key interrupt

The screen formats can be built and stored on a disk(ette) data set using the \$IMAGE utility.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

In addition to the minimum requirement for the IBM Series/1 Event Driven Executive Basic Supervisor and Emulator Version 3.1 (5719-XS3), the storage requirements are:

- For compilation, a minimum 32K byte partition for the compiler.
- For execution, the minimum partition size is 8K to 10K bytes for small programs; partition size is a function of the COBOL source program.

For details on system requirements for the IBM Series/1 Event Driven Executive Basic Supervisor and Emulator Version 3.1 (5719-XS3) and the Event Driven Executive Utilities Version 3.1 (5719-UT5), see the respective pages.

SOFTWARE REQUIREMENTS

Licensed programs required for:

- Compilation
 - IBM Series/1 Event Driven Executive Basic Supervisor and Emulator Version 3.1 (5719-XS3)
 - IBM Series/1 Event Driven Executive COBOL Compiler and Resident Library (5719-CB5)
- Program Preparation
 - IBM Series/1 Event Driven Executive Basic Supervisor and Emulator Version 3.1 (5719-XS3)
 - IBM Series/1 Event Driven Executive Utilities Version 3.1 (5719-UT5)
 - IBM Series/1 Event Driven Executive COBOL Compiler and Resident Library (5719-CB5)
- Program Execution
 - IBM Series/1 Event Driven Executive Basic Supervisor and Emulator Version 3.1 (5719-XS3)
 - IBM Series/1 Event Driven Executive COBOL Transient Library (5719-CB6)

Additional Licensed Programs

The following licensed programs are required if the associated COBOL language and auxiliary function are used:

- Sort/Merge (5719-SM2): Required support for SORT and MERGE verbs
- Indexed Access Method Versions 1 (5719-AM3) or 2 (5719-AM4): Required for indexed I/O.
- Multiple Terminal Manager Version 2 (5719-MS2): Optional support for application/terminal I/O and screen support for IBM 4978, IBM 4979, and IBM 3101.

COMPATIBILITY

- Series/1 Event Driven Executive COBOL Version 2 source statement level is a compatible subset of OS/VS COBOL Compiler and Library Release 2. Programmers can develop COBOL programs on larger systems for use on Series/1 provided those programs do not use any language implementation or hardware features the Series/1 product does not support.
- Series/1 COBOL Version 2 offerings for the Realtime Programming System Version 5 and Event Driven Executive Basic Supervisor and Emulator Version 3 are compatible at the source level with possible changes to the ENVIRONMENT DIVISION. Programs are also compatible at the source level provided hardware features are supported by both operating systems.
- Series/1 COBOL Version 1 is a compatible subset of COBOL Version 2.

**REALTIME PROGRAMMING SYSTEM
COBOL COMPILER and RESIDENT LIBRARY VERSION 2
5719-CB7
COBOL TRANSIENT LIBRARY VERSION 2 (5719-CB8)**

PURPOSE

IBM Series/1 COBOL Version 2 operates in the environment provided by the Series/1 Realtime Programming System (5719-PC5). The compiler and library can be diskette- or disk-based as supported by the operating system. The compiler requires as input a COBOL source program and produces object modules which are combined by the Application Builder into a Series/1 executable machine language program.

The language offers a wide range of commercial features, plus extensive facilities for handling input and output, sorting and merging data files, index capability for faster and simpler access to data files, structuring the source and object programs, and trace facilities for debugging COBOL programs. Series/1 COBOL also supports local communication functions enabling users to accept data from and display data to Series/1 interactive devices.

COBOL programs can be used with the Realtime Programming System Multiple Terminal Manager Version 2. With these facilities, COBOL programs can execute in an interactive environment where one or more applications can run concurrently with more than one terminal. Users can write interactive terminal handling applications, and develop screen-oriented programs to accept and display data from predefined fields on screens dedicated to multiple applications.

COBOL is suited for an interactive commercial environment where users can develop transaction processing applications such as order entry, data collection, and file update, as well as applications that run in a background batch environment.

HIGHLIGHTS

The Realtime Programming System COBOL Compiler is offered as two licensed programs:

- Realtime Programming System COBOL Compiler and Resident Library Version 2 (5719-CB7) for compilation and building of user programs.
- Realtime Programming System COBOL Transient Library Version 2 (5719-CB8) for execution of user programs.

The COBOL Version 2 licensed programs contain all of the functions currently available in the respective COBOL Version 1 programs and, in addition, contain the following language features and new device support:

- Logical Connectives (AND, OR, NOT operators)
- START and READ NEXT verbs from Relative or Index I/O
- VALUE OF IS data name clause
- Computational-3 data type (packed decimal) and Computational-4 data type (binary)
- Level 88
- OPEN EXTEND
- LINAGE clause
- Fixed Block Relative Support
- Device Support for 4975 printer, models 1 and 2
- Capability for a COBOL program to send/receive messages through the Communication Monitor network for Series/1, using CALL subroutines provided by the Communication Monitor.

The Series/1 COBOL compiler Version 2 executes in the environment provided by the Realtime Programming System Version 5 and the Programming Preparation Subsystem Version 5.

COBOL Language

- Series/1 COBOL Version 2 is designed according to specifications for American National Standard (ANS) COBOL X3.23-1974 as understood and interpreted by IBM as of August, 1981. Series/1 COBOL Version 2 exceeds the Low Intermediate Level COBOL as defined by FIPS 21-1, with the exception of the RERUN Clause.

The 1974 American National Standard COBOL processing modules supported include all of Level 1 for the:

- Nucleus - Language elements needed for internal processing of data
- Table Handling - Define and process fixed length tables
- Sequential I/O - Define and access sequential files *
- Relative I/O - Define and access relative files *
- Indexed I/O - Access indexed files*
- Sort/Merge - Sorting of data files

- Segmentation - Specify overlay of the Procedure Division at execution time
- Library - Inclusion of predefined COBOL text into a COBOL source program
- Debug - Access for monitoring program execution
- Interprogram Communication - Ability to transfer control from one object program to another
 - * RERUN clause is checked for syntactic correctness only.

In addition to the above, the following Level 2 features are also supported:

- NUCLEUS Level 2 features:
 - COMPUTE statement
 - Qualification
 - Arithmetic operators
 - CORRESPONDING phrase
 - ACCEPT and DISPLAY statement
 - Multiple operand support for arithmetic statements
 - Nested IF statements
 - PERFORM UNTIL phrase
 - 01 through 49 and 88 level numbers
 - Nested REDEFINES
 - Logical Operators
- Sequential I/O Level 2 features:
 - VALUE OF clause
 - OPEN EXTEND
 - LINAGE clause
- Relative I/O Level 2 features:
 - START and READ NEXT verbs
 - VALUE OF clause
 - DYNAMIC access mode
- INDEXED I/O Level 2 features
 - START and READ NEXT verbs
 - VALUE OF clause
 - DYNAMIC access mode
- MERGE Level 2 feature (of SORT/MERGE)

Resident Library: The Series/1 COBOL Resident Library Version 2 consists of commonly used reentrant subroutines which are combined with a user's program through the Application Builder to form a task set for subsequent execution on Series/1. The Resident Library includes subroutines such as:

- Data conversion
- I/O routines
- ACCEPT/DISPLAY data to/from terminals
- Arithmetic routines
- Sort/Merge interface
- Run-time error routines

Transient Library: The Series/1 COBOL Transient Library Version 2 is used in conjunction with the execution of COBOL user programs. Routines in the transient library are loaded only when needed, thus allowing a more efficient utilization of primary storage. These routines are reentrant and can be executed from a shared task set. The principal functions in the transient library are:

- OPEN/CLOSE
- Program Termination/Initialization
- ACCEPT Date/Time
- I/O Error Handling Routines
- Execution Time Messages

Compilation: The Series/1 COBOL Compiler Version 2 operates in the environment provided by the Realtime Programming System Version 5 (5719-PC5). The COBOL-generated object code is combined with library routines by the Application Builder available with the Program Preparation Subsystem Version 5 (5719-AS5). The Program Preparation Facility provides a new text editor and program management capabilities for the COBOL development process.

Execution: Object programs are executed in the environment provided by the Realtime Programming System. COBOL data sets can be declared sequential, relative or indexed, and require the operating system data management facilities. The segmentation feature of COBOL allows users to optimize storage requirements for their applications through use of overlays.

Realtime Programming System COBOL V2 (cont'd)

DESCRIPTION

- Language
 - Series/1 COBOL Version 2 is designed according to specifications for American National Standard (ANS) COBOL X3.23-1974 as understood and interpreted by IBM as of August, 1981. Series/1 COBOL Version 2 exceeds the Low Intermediate Level COBOL as defined by FIPS 21-1, with the exception of the RERUN Clause.
- New COBOL Version 2 Language features:
 - 'AND' and 'OR' operators allows formation of complex conditionals by combining simple conditions.
 - 'NOT' operator reverses the logical value (true or false) of an existing condition.
 - START and READ NEXT verbs allow easier file accessing of relative and index files; users can now specify a generic key to logically position to a record in the file, and then proceed to read the file from that record to the end of the file.
 - COMP-3 data type is an extension beyond the ANS COBOL language support, and enhances data interchange with System/370 applications which use this data type extensively. The COMP-3 data type is for arithmetic expressions in packed decimal format. With this data type, users can read and write in COMP-3 format, perform arithmetic calculations and convert COMP-3 to different data types. COMP-4 is treated as a synonym for COMP which stores data in binary format.
 - Level 88 is used to identify entries for condition-names that will be used in conditional expressions.
 - OPEN EXTEND is part of sequential I/O for Level 2 ANS COBOL. This statement indicates the processing of a file will begin by writing the first record at the end-of-data marker. This increases usability so that records can be added to an existing file. This support is provided for files existing on disk or diskette.
 - LINAGE clause allows users to handle special forms from COBOL programs; this also gives users more dynamic capability to specify form layouts for different files. The LINAGE clause provides a means for specifying the depth of a logical page in terms of number of lines. It also provides a means for specifying the size of the top and bottom margins on the logical page, and the line number, within the page body, at which the footing area begins.
 - Blocked Relative file support allows blocking of fixed length records. Block size must be an integer multiple of the record size.
 - VALUE OF IS data name clause is part of sequential, relative and indexed I/O, and describes items in the label records associated with a file. In this implementation, the VALUE OF clause serves only as documentation.
- New Device Support:
 - 4975 Model 2 Printer Support

COBOL Version 2 provides support for the 4975 model 2 printer when attached to the Multifunction Attachment (#1310) as:

 - In the 4974 emulation mode (this is transparent to the COBOL user) and
 - New extended capability support that includes Text Mode selection with proportional spacing.
 - 4975 Model 1 Printer Support
 - COBOL Version 2 provides the user with the same support for the 4975 model 1 when attached to the Multifunction Attachment (#1310) similar to the model 2 with the exception that the model 1 does not use Text Mode.
 - COBOL programs can interface with the Communication Monitor (5719-CM1) through a CALL interface. This provides users with the ability to access, create and send messages to and from local and remote communication devices in a network.
- Extensive User Options
 - Source listings
 - Cross reference
 - Storage map of variables
 - Object listings
 - Statement offset listing
 - MAP 370 listing option
- Program Development and Productivity Aids
 - Symbolic debug, which makes storage maps and snapshots of data areas available in COBOL format
 - Flow trace, which identifies the last statement executed before an abnormal termination
 - Extensive error checking and error messages at five severity levels, ranging from source program fix-up, to warning messages, to serious and fatal errors

- Generalized CALL facility allows access to programs written in Assembler language
- FIPS flagger enables quick and easy identification of COBOL source statements which exceed the specified FIPS language level

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

In addition to the minimum requirement for the IBM Series/1 Realtime Programming System Version 5 and the Program Preparation Subsystem Version 5, the storage requirements are:

- For compilation, a minimum 32K byte partition for the compiler.
- For execution, a minimum partition size is 8K to 10K bytes for small programs; partition size is a function of the COBOL source program.

For details on system requirements for the IBM Series/1 Realtime Programming System Version 5 and the IBM Series/1 Program Preparation Subsystem Version 5, see the respective pages.

SOFTWARE REQUIREMENTS

Compilation and Application Build

- IBM Series/1 Realtime Programming System Version 5 (5719-PC5)
- IBM Series/1 Program Preparation Subsystem Version 5 (5719-AS5)
- IBM Series/1 COBOL Compiler and Resident Library Version 2 (5719-CB7)

Execution in a Foreground Environment

- IBM Series/1 Realtime Programming System Version 5 (5719-PC5)
- IBM Series/1 COBOL Transient Library Version 2 (5719-CB8)

Execution in a Batch Environment

- IBM Series/1 Realtime Programming System Version 5 (5719-PC5)
- IBM Series/1 Program Preparation Subsystem Version 5 (5719-AS5) or IBM Series/1 Job Stream Processor PRPQ (5799-TEC)
- IBM Series/1 COBOL Transient Library Version 2 (5719-CB8)

Additional Licensed Programs: The following licensed programs are required if the associated COBOL language and auxiliary functions are used:

- Sort/Merge (5719-SM1) - Required support for Sort and Merge verbs
- Indexed Access Method Versions 1 (5719-AM1) or 2 (5719-AM2) - Required for indexed I/O
- Multiple Terminal Manager Version 2 PRPQ (5799-TDX) - Optional support for application/terminal I/O and screen support for IBM 4978, IBM 4979, IBM 5251, and IBM 3101
- Communications Monitor for Series/1 (5719-CM1) - Optional support for sending data to remote communication devices

COMPATIBILITY

- Series/1 Realtime Programming System COBOL Version 2 source statement level is a compatible subset of OS/VS COBOL Compiler and Library Release 2. Programmers can develop COBOL programs on larger systems for use on Series/1 provided those programs do not use any language implementation or hardware features the Series/1 product does not support.
- Series/1 COBOL Version 2 offerings for the Realtime Programming System Version 5 and Event Driven Executive Basic Supervisor and Emulator Version 3 are compatible at the source level with possible changes to the ENVIRONMENT DIVISION.
- Series/1 COBOL Version 1 is a compatible subset of COBOL Version 2.

EVENT DRIVEN EXECUTIVE COMMUNICATIONS FACILITY 5719-CF1

PURPOSE

The IBM Series/1 Event Driven Executive Communications Facility Licensed Program is an enhancement to the existing Event Driven Executive Communications Facility - II FDP (5798-RDT), and contains all the functions provided by the FDP plus additional support.

The Communications Facility:

- Manages communication between Series/1s; between Series/1s and other computers; and between Series/1s and various input/output devices.
- Supports various devices and communication links, and accommodates user-written support for other devices.
- Manages user-supplied application programs.
- Includes various aids to assist programmers in writing interactive application programs.
- Includes various aids to assist the operator in defining and controlling an interconnected environment consisting of Series/1s, host computers, and devices.
- Provides various means of maintaining the entire network from a central site.

HIGHLIGHTS

Support for:

- Series/1 Local Communications Controller (LCC) (#1400). This support allows the attachment of multiple Series/1 (maximum 16) in a ring data link for peer-to-peer, high-speed data communication. Support for LCC will be provided via a Communications Facility Input/Output Control Program (IOCP) and a device handler. Remote IPL is supported.
- A message level interface capability between the Communications Facility and:
 - Systems supported by the Communications Monitor for the Series/1 (5719-CM1) when the systems are interconnected via the Series/1 Local Communications Controller (#1400). Also, the Communications Facility accepts the following Communications Monitor commands: START, STOP, HALT, and DISPLAY.
 - Application programs running under control of the Series/1 Event Driven Executive Multiple Terminal Manager (5719-MS2), which use the Multiple Terminal Manager capability for programs to send/receive Communications Facility messages.
- Series/1 Multifunction Attachment (#1310) with attached 3101 Display Terminals, 4975 Printers, and/or Binary Synchronous Communications.
- An Input/Output Control Program (IOCP) which provides an interface between the Communications Facility and the Event Driven Executive Systems Network Architecture Licensed Program (5719-SX1). This interface provides a Type 2 Logical Unit (LU2) as defined in IBM's Systems Network Architecture (SNA) for support of display devices, and a Type 3 Logical Unit (LU3) for support of printer devices. To users and devices controlled by the Communications Facility, it appears similar to the 3271 Emulation interface.
- Support for the Series/1 - System/370 Channel Attachment (4993 and feature #1200) is provided by a Communications Facility Input/Output Control Program (IOCP).
 - To the System/370, the Channel Attachment feature appears as a locally attached 3272 Control Unit with up to 32 devices. Multiple Channel Attachment features, to the same or different hosts, are supported. Attachment to either selector or block multiplexer channel is supported. To users and devices controlled by the Communications Facility, this support appears similar to that of the 3271 emulation support.
- Attachment to multipoint binary synchronous communications lines, emulating a 3271 Control Unit, using basic polling select addressing with standard 3270 protocol. This IOCP allows Series/1s to be interconnected in a multipoint hierarchy. Transparency is provided to allow the single BSC network to transmit/receive a mix of messages (standard 3270 screens, file data, program modules, and control/transactions).
- Control of multipoint 3271 model 2 Control Units, with attached 3277 model 2 Display Stations and 3284, 3286 model 2, 3287, and 3288 Printers.
- Control of the following (as 3271 model 2 Control Units):
 - 3274 Control Units models 1C and 51C, using BSC protocol, with attached 3278 model 2 Display Units, 3284, 3286, 3287 model 2, 3288, and 3289 Printers, and 3279 model 2A Color Displays.
 - 3276 Display Stations model 2 using BSC protocol, with attached 3278 model 2 Display Units, 3287 model 2, and 3289 Printers, and 3279 model 2A Color Display Stations.

- Simulation of a 3277 model 2 Display Station on a 4978 and all models of 3101 Display Terminals, in character mode.
- Support for the Series/1 4978 Data Stream Control Store Diskette (RPQ D02428). This RPQ for the 4978 can in certain application situations yield improved performance when doing 3270 emulation and passthru. Note: See RPQ D02428 for restrictions of this RPQ compared with the standard 4978 (RPQ D02056).
- Simulation of 3286 model 2 Printers on 4973/4974/4975 printers.
- Control over a 5280 Distributed Data System using 3270 device emulation over a multipoint BSC line.
- Series/1 to Series/1 communication over a point-to-point BSC line using a full conversational protocol.
- Connection with the 6640 Document Printer, the 6670 Information Distributor, the 5520 Administrative System, the Displaywriter System, and/or the Office System 6 Information Processor with its associated magnetic card reader or diskette reader over a point-to-point BSC line using 2770-like BSC protocol.
- Connection with the System/23 Datamaster and/or the 5280 Distributed Data System over a point-to-point BSC line using 3741-like BSC.
- Management and routing of messages between system facilities; that is, programs, terminals, lines.
- Extensive support utilities.
- Communications with multiple non-Series/1 host systems.
- Online interconnection configuration and modification.
- Automatic startup.
- Main storage and, optionally, disk queuing of messages.
- Ability to shut down and restart all or portions of the Communications Facility.
- Routing undeliverable messages to a disk file. Utilities provided can retrieve and resend these messages.
- Management and routing of transactions by a program dispatcher. Routes transaction messages anywhere in an interconnected Series/1 environment, including non-Series/1 host systems, for processing. Provides high speed loader facility for putting transaction programs into execution.
- Control and management of EDX terminals in conjunction with the program dispatcher so that transaction programs and terminals can communicate and interact across physical boundaries.
- Integration of the EDX Remote Management Utility with a Communications Facility Host Management Utility to provide within a single interconnected environment (either multipoint or point-to-point) the functions of reverse passthru, program execution, file transfers, etc., for maintaining the remote systems.
- Remote Initial Program Load (IPL) capability allows one Series/1 to IPL another Series/1 connected as a binary synchronous tributary. (Also note that remote IPL capability via the Local Communications Controller is mentioned above.)
- Screen design utility for laying out/formatting 3277 model 2 display screens.
- Remote disk support provides a means for a Series/1 in an interconnected system to have its data base volumes reside on a physical drive of another Series/1.

Basic Structure Of The Communications Facility

- The Communications Facility incorporates a modular design allowing a system configuration that contains only the programming modules required for the specific user application. The program design is open-ended to allow a user knowledgeable in communications protocol to write additional I/O modules. These modules can be written in the Event Driven Executive language.
- The Communications Facility is written primarily in the Event Driven Executive language and operates as a group of application programs using an Event Driven Executive supervisor. The advantage of using the Event Driven Executive language is that the code is self-documenting, easier to maintain and modify. The Communication System Extensions to the Event Driven Executive Supervisor represent a small part of the Communications Facility and are written in Series/1 Assembler language.
- The Communications Facility provides basic message routing and handling between stations, including the ability to communicate between programs across partition and physical boundaries. Stations represent origins and destinations of messages such as terminals, devices, communication lines and programs.

PROGRAM PRODUCTS

Event Driven Executive Communications Facility (cont'd)

- User application programs can operate concurrently with the Communications Facility.
- The Communication System Extensions provide a capability to write serially reusable programs which can manage messages from several stations. Only a single copy of the program is required in storage to handle multiple terminals, devices, or lines.

- Printers
 - One IBM 4973 Line Printer, or
 - One IBM 4974 Printer, or
 - One IBM 4975 Printer

SOFTWARE REQUIREMENTS

The following IBM licensed programs are prerequisites for the installation of the IBM Series/1 Event Driven Executive (EDX) Communications Facility Licensed Program (5719-CF1):

- IBM Series/1 EDX Basic Supervisor and Emulator Licensed Program Version 3 (5719-XS3)
- IBM Series/1 EDX Utilities Licensed Program Version 3 (5719-UT5)
- IBM Series/1 EDX Program Preparation Facility Licensed Program Version 3 (5719-XX4)
- IBM Series/1 EDX Macro Assembler (5719-ASA) is required if the installation of this product requires the assembling or reassembling of the communication system extensions.
- IBM Series/1 EDX Macro Library (5719-LM7) may be required to reassemble some of the Communication Facility Programs.
- The Event Driven Executive Systems Network Architecture Licensed Program (5719-SX1) is a prerequisite if the SNA IOCP is to be used.

Execution Systems

Potential applications for the Communication Facility include:

- Distributed Data Processing
- Data Concentration
- Terminal Controller
- 3270 Emulator

For further details pertaining to typical applications, see *IBM Series/1 Event Driven Executive Communications Facility: Introduction* (GL23-0070).

User Environment Considerations

The system requirements and the programming requirements needed to run communications programs depend on the customer installation. The following alternatives should be considered in planning the installation:

- The Series/1 Event Driven Executive Program Preparation Facility (5719-XX4) or optional program preparation products are required only on the user's development system(s) and are not required on the production systems.
- Most communication network applications can be implemented and supported centrally; therefore, the Series/1 Event Driven Executive Utility (5719-UT5) may not be required on the production systems.
- The Communications Facility can operate as a DASD-less system. Neither disk nor diskette is required in a production/user environment where no program preparation is required. Performance requirements should be carefully analyzed in a diskless and/or disketteless environment.
- It is recommended that a dedicated communications logging device be available on each Series/1. This could be a display, printer, or user program.
- It is recommended that a dedicated communications or systems operator's console (4978 or 4979) be available in the system for operator control. This can also be a logging device.
- The Communications Facility can coexist with all the Series/1 features supported by the Event Driven Executive, plus multiples of supported devices.
- The Communications Facility requires the Timer Adapter (#7840) on the 4955, or the integrated timer on the 4952, to operate.

CUSTOMER RESPONSIBILITIES

Installation of this licensed program, the prerequisite programming support, the data processing equipment that it requires and supports, and the required communications facilities, are the customer's responsibility. The environment in which the Communications Facility would be used are typically complex communications systems that must be carefully planned and managed.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The Series/1 Event Driven Executive Communications Facility requires the following hardware for Communications Facility installation and application development:

- Processors
 - Any IBM Series/1 Processor with at least 96K bytes of main storage
 - One Timer Adapter (#7840) is required on the IBM 4955
 - One Programmer's Console (#5650)
- Disk/Diskettes
 - One IBM 4962 model 1, 1F, or 3 Disk Storage Unit and one IBM 4964, 4965 or 4966 diskette unit, or
 - One IBM 4962 model 2, 2F, or 4 combined disk/diskette unit, or
 - One IBM 4963 Disk Storage Unit and one 4964, 4965 or 4966 diskette unit
- Display Stations
 - One IBM 4979 Display Station, or
 - One IBM 4978 Display Station (RPQ D02056)

PROGRAM PRODUCTS

**COMMUNICATIONS MONITOR FOR THE SERIES/1
5719-CM1****PURPOSE**

The Communications Monitor for the Series/1 licensed program manages communication between a Series/1 and other Series/1s; between a Series/1 and other computers; and between a Series/1 and various input/output devices. It supports various devices and communication links, and accommodates user-written support for other devices and computers. It also manages user-supplied application programs.

HIGHLIGHTS**A Message Management Program**

The Communications Monitor's function is to manage the flow of messages between computers, devices and application programs. A message can be any unit of information - from a record of a sales transaction to a large data set.

Series/1-to-Series/1 Communication

The Communications Monitor manages communication between Series/1s, at the same location or at geographically dispersed locations, that are connected by means of a point-to-point, binary synchronous communications (BSC) nonswitched line, a nonswitched High Level Data Link Control (HDLC) line (packet or frame level) or Local Communications Controller (#1400).

An interface for the connection of the Communications Monitor and the Event Driven Executive Communication Facility is supplied via the Series/1 Local Communications Controller. This interface allows messages to be exchanged from application to application.

Series/1-to-Host-Processor Communication

The Communications Monitor supports communication between a Series/1 and a host computer in four ways: BSC (transparent or nontransparent), 3271 emulation, Series/1-System/370 Channel Attachment, or SDLC/SNA. The SDLC/SNA support provides the ability to tie a Series/1 into an SNA network communicating with IMS/VS through the Type P Secondary Logical Unit (SLU-P) support and with CICS/VS using the 3790 Full Function Logical Unit. The BSC support has been verified to a System/3 by means of CCP on a nonswitched point-to-point or multipoint line. The Series/1 appears to the System/3 as a 3271 Control Unit.

Series/1-to-3270 Communication

The Communications Monitor manages communication between a Series/1 and 3277 displays and 3286 printers. The 3277s are attached to a 3271 control unit. The 3271 units communicate over multipoint BSC leased lines attached to the Series/1 4987 Programmable Communications Subsystem. Multiple control units can be attached to each line. This support may also be used with either:

- 3276 Control Unit Display Station models 1, 2, 3 and 4 with attached
 - 3278 Display Stations
 - 3279 Color Display Stations
 - 3287 Printers
 - 3289 Printers
- or
- 3274 Control Unit, models 1C and 51C with attached
 - 3277 Display Stations
 - 3278 Display Stations
 - 3279 Color Display Stations
 - 3284, 3286, 3287, 3288 and 3289 Printers.
- 5280 Distributed Data System, operating in BSC 3270 mode

Series/1-to-Other Systems Communications

The Communications Monitor supports the following as teletypewriters via the 4978 Programmable Communications Subsystem:

- Personal Computer
- System/23 Datamaster
- Displaywriter System

The Communications Monitor supports connection with the following systems using 2770-like BSC:

- Displaywriter
- 6670 Information Distributor
- 5520 Administrative System

The Communications Monitor supports connection with the following systems using 3741-like BSC:

- System/23 Datamaster
- 5280 Distributed Data System

Printers, Display Units, Teletypewriters, Disks, Diskettes and Magnetic Tape Units

Other devices the installation can make part of its Communications Monitor configuration are:

- 4955 Processor with minimum 128K bytes of storage
- 4962 and 4963 disk units
- 4964 diskette units and the diskette drives in 4962 model 2, 2F, and 4 disk units
- 4965 Diskette Drive and I/O Expansion Unit
- 4966 diskette units
- 4969 magnetic tape system
- 4973 line printers
- 4974 matrix printers
- 4975 matrix printers
- 4979 display stations, and 4978 display stations in 4979 mode with RPQ D02055
- Teletypewriter attachment (#7850) with Teletype® Models 33/35, or ASCII equivalent, or 3101 display terminal.
- 6733 Typewriter Communication Module (with attached IBM Electronic Typewriter 85) as a Teletype® Model 33/35.

Other Devices

The Communications Monitor makes it convenient to add support for devices such as specialized terminals to the product as supplied by IBM. The additional devices can be attached to the Series/1 through the Programmable Communications Subsystem or through native adapters.

A Base for Applications

The Communication Monitor manages the communication of messages to and from user-supplied application programs. Applications can take many forms:

- Data entry
- Message routing
- Distributed processing
- Store-and-forward
- Line concentration

Program Development

The Communications Monitor includes a set of assembler language macro instructions for the use of programmers writing Communications Monitor applications or message path programs.

The macro instructions allow programmers to:

- Create, send, receive, retrieve, and cancel messages
- Control the operation of stations (the device communications links and application programs that make up the communications configuration)
- Get and free blocks of storage
- Create new operator commands

The Communication Monitor applications may also be written in COBOL and PL/I and reside in any Realtime Programming System partition. Realtime Programming System Multiple Terminal Manager users can also send and receive messages using the Communications Monitor facilities.

Commands for Online Control

The Communications Monitor includes a set of operator commands to allow computer operators and terminal operators online control of the configuration.

A command log is available to allow all commands to be logged on a primary and/or secondary station to improve network awareness.

The Realtime Programming System Command Reader interface is supported to allow the sending of operating system commands to any node in the network with the responses returned to the originating station.

The commands allow operators to:

- Start and stop the Communications Monitor
- Define and delete stations and change their attributes

PROGRAM PRODUCTS

Communications Monitor for the S/1 (cont'd)

- Hold messages intended for a station, release held messages, and cancel messages pending for a station
- Display status information and error counts that pertain to a station
- Retrieve single or multiple messages for a station
- Warmstart the system
- IPL Remote Systems

Orderly System Definition

Each Series/1 in a Communications Monitor configuration is called a node. At each node, the installation does a system definition process that defines the Communications Monitor configuration as viewed by that node, all the other nodes it communicates with, and all the stations at other nodes (remote stations) that it is going to communicate with directly. Once the system definition has been done, users at a local node can treat remote stations as if they were local stations for most services.

A System Generation Answer File

The Communications Monitor is supplied to the installation with a system generation answer file. When used as input to the Realtime Programming System generation process, the answer file produces a Realtime Programming System with the Communications Monitor integrated. The resulting system supports:

- One BSC attachment
- One 4979 display
- One 4973 line printer
- One 4974 or 4975 matrix printer
- One teletypewriter adapter (#7850)
- Two 4962 or 4963 disk units
- Two 4964 or 4966 diskette drives or 4965 diskette drive and I/O expansion unit
- One timer attachment (#7840)

Aids for Operators

The Communications Monitor issues various error messages. The installation can designate a primary and a secondary station where those messages are to be logged.

For each station that sends or receives messages, the Communications Monitor maintains a count of messages and characters sent from and received by the station. Operator commands allow operators to display and reset the values of each message queue associated with a station.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

- A Series/1 4955 processor with at least 128K bytes of processor storage and the address translator
- A Realtime Programming System-supported disk unit
- A Realtime Programming System-supported diskette drive (required for installation only)
- An IBM 4973, and IBM 4974 or IBM 4975 printer
- An IBM 4979 display station, an IBM 4978 display station in 4979 mode with RPQ D02055, or a teletypewriter adapter (#7850) with Teletype® mdl 33/35 teletypewriter ASCII equivalent device attached or the 3101 display terminal.
- An IBM 6733 Typewriter Communication Module as a Teletype® mdl 33/35 (with attached IBM Electronic Typewriter 85)

SOFTWARE REQUIREMENTS

The Communications Monitor runs under control of the Realtime Programming System Version 5.1 (5719-PC5). For preparation of user-written programs, the Program Preparation Subsystem, Version 5.1 (5719-AS5) is required. If the installation is going to add unsupported devices attached through the Programmable Communications Subsystem or use the IBM-supplied device support that uses the Programmable Communications Subsystem, the Programmable Communications Subsystem Extended Execution Support (5719-CS2) is required.

To add unsupported devices through the Programmable Communications Subsystem, the Programmable Communications Subsystem Preparation Facility (5719-CS0) is required.

To use the SDLC/SNA support, Systems Network Architecture Extended (5719-SN1) is required. To use the IBM 4969 Magnetic Tape Subsystem support, the IBM 4969 Magnetic Tape Subsystem (5719-TA4) is required. To use the IBM Series/1-System/370 Channel Attachment support, Series/1-System/370 Channel Attachment (5719-CA1) is required. To use the HDLC support, the Packet Network Support (5799-TCP) is required.

COMPATIBILITY

This program is compatible with the licensed programs which are identified in the Software Requirements section.

PROGRAM PRODUCTS

**SERIES/1 REALTIME PROGRAMMING SYSTEM
 COMMUNICATIONS MANAGER
 VERSION 2 (5719-CM2)**
PURPOSE

The Series/1 Communications Manager (formerly named the Communications Monitor) significantly strengthens the communications capabilities of the Series/1 by addressing front end processing, distributing applications, and providing full networking functions with major enhancements. The Remote Manager for management of non-SNA networks from the SNA host using the host CNM products will also be available.

The Communications Manager supports the Realtime Programming System Version 6 Multiprocessing feature which provides horizontal growth, improved processing capability and system availability through multiple processor configurations.

Further enhancements are intended for the Communications Manager to strengthen the existing Series/1 SNA host affinity with new passthrough and host connections.

It is also intended that the Communications Manager will address the evolving International Standards by giving the ability to operate an in-house X.25 network consisting of several Series/1s. Additionally, this support will allow connecting to public X.25 packet switching networks to communicate Series/1-to-Series/1 or Series/1-to-host. X.25/HDLC Communications Support program product with DCE and DTE will also be available.

HIGHLIGHTS
Networking

- Peer-to-Peer
- Flexibility
- Variety of Protocols
- Alternate Routing
- Dynamic Online Configurability

Network Management

- Centralized SNA or Decentralized Series/1 Control
- Tie into NCCF, NPDA, DSX and HCF on SNA hosts
- Local/Remote Operator Transparency

Host Affinity (SNA and non-SNA)

- SNA/SDLC
- BSC and ASYNC
- S/370 Channel Attach

Device Support

- 3270 Controllers and Attached Devices
- Office Automation Equipment
- RJE Devices
- Personal Computer

OEM Attachment

- Access to all Communications Manager functions
- Easy Attachment of OEM Terminals and Hosts
- Protocol Conversion between Terminals and Hosts

Distributed Application Support

- Languages - COBOL, PL/I, Pascal, Assembler
- Multiprocessor Support through Realtime Programming System Version 6
- Transaction Processing through Terminal Managers

Local Area Networks

- Connection of up to 16 Series/1s on Each Ring
- Multiple Interconnected Establishment Rings
- Bridge to Event Driven Executive/Communications Facility Systems

DESCRIPTION

The Communications Manager Version 2 provides a wide range of functions and significant flexibility in addressing communication problems ranging from simple front end processing to supported distributed applications to a full networking facility.

Networking: The Communications Manager allows various types of networks to be implemented. As a peer-to-peer Series/1 network, it can attach to hosts (OEM and/or IBM), devices, terminals and applications, and make the data being sent or received by them transparent to network connections. Maximum flexibility and control is emphasized.

The network provides capabilities that allow online configuration so that terminals, devices or nodes can be added without stopping the network or affecting normal traffic. Message integrity is provided by allowing messages to be disk-queued as they traverse the network so none will be lost. Alternate routing allows a message to be delivered even though the primary path to the destination is broken.

Messages can have up to 255 different priorities to ensure that interactive or other critical response time activity flows ahead of long

batch-type data. Messages are assigned a significance that indicates what action occurs when the destination is unable to receive them. The Communications Manager automatically blocks and segments messages between nodes to maximize network throughput.

Network operator control is available from each node in the network, or only from a central site either on the Series/1 or on a host system. The operator controls the network definition, starting and stopping part or all of the network, checking on traffic and error statistics. The Communications Manager also provides application interfaces for all of these functions.

Network Management: The Communications Manager allows the user to control the network centrally from an SNA Host (when used in conjunction with the Remote Manager) or to distribute control throughout the Series/1 network. The Communications Manager allows the user to choose the network control points based on unique installation requirements.

The Communications Manager significantly strengthens and expands the SNA control facilities by extending network management to non-SNA networks. Network Management through an SNA Host is achieved with the standard SNA control and diagnostic products, namely NPDA, NCCF, HCF and DSX.

Alternatively, network management is achieved through unique, straightforward commands which can originate from any point(s) within the Series/1 network to control any other Series/1. Updates and reconfigurations to the Series/1 network occur dynamically and non-disruptively. A four-level security scheme limits the scope of control for any access point.

Host Affinity: The Communications Manager supports a variety of hosts and host protocols. The Series/1 emulates host devices (such as control units) and allows host applications to transparently communicate, through a Communications Manager network, with remote hosts, terminals, and applications. The Communications Manager attaches to host systems in these ways:

1. SNA/SDLC - As an SNA gateway, the Series/1 emulates a 3274 control unit conducting LU-2 and LU-3 sessions with Host applications such as CICS and IMS. Series/1 applications can also communicate with host applications over LU-0 sessions to CICS(LUP) or IMS(SLUP).
2. BSC - Three types of BSC connections are provided: 3271 emulation on a nonswitched multipoint line, Host BSC support in transparent or non-transparent modes on a point-to-point line, and BSC RJE passthrough where the Series/1 routes batch data between a host system and an RJE station over switched or leased lines.
3. S/370 Channel Attach - With this feature, the Series/1 appears as a control unit with up to 32 ports. The Series/1 can be used to route terminal traffic or serve as a high-speed pipeline for application data traffic.

Device Support: The Communications Manager supports a wide range of devices.

The 3270-family devices which are supported include 3271 and 3274 controllers on multipoint BSC leased lines with attached displays and printers.

The office automation equipment supported includes: System/23 Datamaster, Displaywriter, 6670 Information Distributor, 5280 Distributed Data System, and 5520 Administrative System using BSC protocol over nonswitched lines; Displaywriter and System/23 Datamaster using asynchronous ASCII communications over switched or nonswitched lines.

The IBM Personal Computer may be attached to a Communications Manager network using asynchronous ASCII protocol over switched or nonswitched lines. 3277 emulation on the IBM Personal Computer is provided by using the Communications Manager support for 3277 emulation on 3101 terminals in conjunction with the IBM Personal Computer Program (P/N 6024042) to emulate a 3101.

2780 and 3780 RJE devices may be attached to a Communications Manager network over switched or nonswitched lines to pass data through to a host.

OEM Attachment: Anticipating the need for OEM device attachment, the Communications Manager provides several options to the user. The user may attach OEM devices to the Series/1 using either native adapters or the Programmable Communications Subsystem (PCS). The OEM device support can be written as either a high-level language application for ease of development and test, or as an Assembler language program to gain the greatest performance and complete access to the Communications Manager's services.

Distributed Application Support: The Communications Manager provides a powerful base for message/transaction-oriented application programs. User-written applications can send, receive or interrupt

PROGRAM PRODUCTS

Series/1 RPS Communications Manager V2 (cont'd)

messages to accomplish functions such as input verification, transaction pre-processing and message switching. Applications can be written in COBOL, PL/I, Pascal and Series/1 Assembler language. They are dynamically loaded and controlled through a central SNA Host or through any Series/1 within the network. Through the Realtime Programming System Multiprocessor feature, applications can execute anywhere on the local area network transparent to the user.

Local Area Networks: Local area networks can be established with the Communications Manager using the Series/1 local Communications Controller. Up to 16 Series/1 systems may be connected in a ring configuration. Larger local area networks may be configured with multiple, interconnected rings. The ring also provides a bridge to pass messages to and from Event Driven Executive/Communications Facility networks.

HIGHLIGHTS of VERSION 2 ENHANCEMENTS

- Remote Manager Support
- 3274 SNA Emulation
- 3277 Emulation on 3101 Terminals
- Realtime Programming System Version 6 Multiprocessing Feature Support
- 2780/3780 Remote Job Entry Interface
- Enhanced Message Queuing
- Realtime Programming System Spooling Facility Support
- Pascal Support

In addition, the X.25 networking support and SDLC passthrough support are planned to be included in the Communications Manager Version 2 by 4Q83.

DESCRIPTION of VERSION 2 ENHANCEMENTS

Remote Manager Support: This support allows the Communications Manager's networks to be controlled from an SNA host using the host CNM products, NCCF, NPDA, DSX and HCF. Only the connection point node directly attached to the SNA host need have SNA support. All passthrough of alerts and commands are handled with normal Communications Manager support.

3274 SNA Emulation: The support allows a Series/1 to attach to a host system as a 3274 control unit using the SNA/SDLC protocol. This allows LU type 2 and 3 sessions to be established between the host and real or emulated 3270 devices attached to the Series/1.

3277 Emulation on 3101 Terminals: This support allows a 3101 display to be used as a 3277 device. All functions of a 3277 display station are supported except ITB and TEST REQUEST key. This can be used in conjunction with the 3274 SNA emulation, 3271 emulation, or S/370 channel attach for host 3270 applications.

Realtime Programming System Version 6 Multiprocessing Feature Support: This support allows the Communications Manager to use the Realtime Programming System multiprocessing support to communicate with other Communications Manager nodes in the multiprocessor system. This permits applications to be distributed across Series/1s, and the use of duplex volumes for high integrity, all transparent to the user.

2780/3780 Remote Job Entry Interface: This support provides a 2780 or 3780 RJE station with the ability to connect to a host system through a Series/1 network in passthrough mode. The connection to the network may be on a leased or switched line with auto-answer or manual call.

Enhanced Message Queuing: This support allows a Series/1 to make more effective use of the larger CPU sizes by having up to five partitions (previously limited to one) containing main storage messages and buffers.

Realtime Programming System Spooling Facility Support: This support allows the Communications Manager to use the Realtime Programming System Version 6 spooling facility.

Pascal Support: This gives additional language support for application programmer using the Communications Manager by providing subroutines which allow Pascal programs to invoke Communications Manager functions.

INSTALLATION AIDS: The Communications Manager is supplied to the installation with a system generation answer file. When used as input to the Realtime Programming System generation process, the answer file produces a Realtime Programming System with the Communications Manager integrated. The resulting system supports:

- One BSC attachment
- One 4979 display
- One 4973 line printer
- One 4974 matrix printer

- One teletypewriter adapter (#7850)
- Two 4962 or 4963 disk units
- Two 4964 or 4966 diskette drives
- One timer attachment

SERIES/1 to SERIES/1 CONNECTIONS: The following table describes the connections that may be established between Series/1 nodes in a Communications Manager network.

Protocol	Linespeed	Card	Software Requirements/Notes
LCC	2M bps	1400	Local Area Network,
LCC	2M bps	1400	Multiprocessor Feature
BSC	56K bps	2075	BSC Point-to-Point
BSC	19K bps	2095/6	Protocol, No additional
BSC	9.6K bps	2074	software is required.
BSC	9.6K bps	2093/4	

SERIES/1 to 3270 DEVICE CONNECTIONS: The following table describes the 3270 controllers and terminals that can be attached to a Series/1. All terminal attachments are through the Programmable Communications Subsystems.

Controller	Attached Device	Protocol	Notes
3271		BSC-MTP	Multipoint, Leased Line Display Printer Printer
	3277		
	3284		
	3286		
3276		BSC-MTP	Multipoint, Leased Line Display Display Printer Printer
	3278		
	3279		
	3287		
3274		BSC-MTP	Multipoint, Leased Line Display Display Display Printer Printer Printer Printer
	3277		
	3278		
	3279		
	3284		
	3286		
	3287		
	3288		
3289			

SERIES/1 to OTHER TERMINAL DEVICES: The following table describes the types of terminals, and other IBM devices that may attach to a Communications Manager network, excluding the Series/1 family of devices:

Device	PCS/Native	Protocol	Function/Notes
3101-1X,2X	PCS	ASC	3277 Emulation
	PCS	KSR 33/35	ASCII Terminal
	Native	ASC	Operator Station
5280	PCS	BSC-MTP	3271 Emulation
	Native	BSC-PTP	File Transfer
6670	Native	BSC-PTP	File Transfer
IBM PC	PCS	KSR 33/35	ASCII Terminal
	PCS	ASC	3101 Emulation Program
Display-writer	Native	BSC-PTP	File Transfer
	PCS	KSR 33/35	ASCII Terminal
S/23	Native	BSC-PTP	File Transfer
Data-master	PCS	KSR 33/35	ASCII Terminal
5520	Native	BSC-PTP	File Transfer

The Communications Manager has been verified using various Broadband modems (i.e., SYSTEK, 3M, Amdek) to connect asynchronous and bisynchronous terminals

PROGRAM PRODUCTS

Series/1 RPS Communications Manager V2 (cont'd)

SERIES/1 to HOST CONNECTIONS: This table shows the various host systems and subsystems which may attach to a Communications Manager network:

Host	Subsystem Access Methods	Protocol	Software Requirements/ Notes
S/370, 4300, 303X, 308X	VTAM, BTAM, VM, TCAM, TSO, CICS, IMS	SNA, BSC, Chann Att BSC	3274 EMUL (LU-2/3) LU-0 Point-to-Point with Native Card 5719-CA1 3271 Emul thru PCS
8100	DPCX/DPPX	SNA	3274 EMUL (LU-2/3)
S/34	SSP, ICF	BSC, BSC	Point-to-Point 3271 Control thru PCS
S/38	CPF, CPF	BSC, BSC	Point-to-Point 3271 Control thru PCS
S/3	CCP, CCP	BSC, BSC	Point-to-Point 3271 Control thru PCS

SERIES/1 DEVICE SUPPORT: This table shows the Series/1 devices which the Communications Manager supports.

Device	Description
4973	Line Printer
4974	Matrix Printer
4975	Matrix Printer
4979	Display Station as 4979 with RPQ D02038
4978	
TTY 33/35	ACSI Teletypewriter
4962	Disk
4963	Disk
4967	Disk
4969	Tape Unit
4964	Diskette
4962-2,2F,4	Diskette in Disk Drive Unit

SERIES/1 and PCS ATTACHMENT CARDS: This table shows the various Series/1 and PCS attachment cards which may be used for particular devices and protocols.

Protocol/Device	PCS/Native	Attachment Protocol	Function/Notes
BSC-PTP	Native	2074/5, 2093/4, 2095/6	BSC Point-to-Point, Leased Series/1-Series/1 Series/1-Host Series/1-2780 or 3780 RJE
BSC-MTP	PCS	4710, 4730/1, 4740, 4750/1/2/3	BSC Multipoint, Leased 3271 Emulation 3277 Control
SDLC	Native	2090, 2080	SNA 3274 Emulation LU-0
LCC	Native	1400	Local Area Network Multiprocessor Feature
Chan Att	Native	1200	S/370 Channel Attach (3272)
KSR 33/35	PCS	4730/1/9, 4746/7/8	ASCII Terminal
ASC	PCS	4730/1/9, 4746/7/8	3277 Emul on 3101, ASCII Terminal
	Native	1310, 1610, 7850, 2091/2, 2095/6	Operator Station

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum system requirement for program development or execution is an IBM 256K Series/1 processor, including IBM 4954, 4955 and 4956.

SOFTWARE REQUIREMENTS

The Communications Manager runs under control of the IBM Realtime Programming System, Version 6 (5719-PC6). For installation, the Program Preparation Subsystem, Version 6 (5719-AS6) is required.

If the installation is going to add unsupported devices attached through the Programmable Communications Subsystem, or use the IBM-supplied device support that uses the Programmable Communications Subsystem, the Programmable Communications Subsystem Extended Execution Support (5719-CS2) is required. To add unsupported devices through the Programmable Communications Subsystem, the Programmable Communications Subsystem Preparation Facility (5719-CS0) is required as well.

To use the IBM 3272 channel attach feature, the IBM Series/1-System/370 Channel Attach licensed program (5719-CA1) is required.

COMPATIBILITY

This program is compatible with the licensed programs which are identified in the "Software Requirements" section.

SECURITY/INTEGRITY

The Communications Manager utilizes the security and auditability features of the Realtime Programming System, as well as providing levels of security for operator control and terminal access. User management is responsible for evaluating, selecting, applying and implementing such features for the appropriate administrative and application controls.

For applications in which sensitive data is sent over external communication facilities, user management may wish to augment those facilities with the application of cryptography.

PROGRAM PRODUCTS

**STRUCTURED PROGRAM FACILITY (SPF)
MVS/VTAM APPLICATION (5719-CR1)****PURPOSE**

The IBM Series/1 Structured Program Facility (SPF) MVS/VTAM Application Program provides the software necessary to service requests from the Series/1 SPF licensed program (5719-ED1) to read and write messages, and to attach service tasks in the System/370.

HIGHLIGHTS

The SPF MVS/VTAM interface consists of three System/370-resident programs: Series/1 SPF MAIN, Series/1 SPF Service Program, and SPF Queue Service Program. SPF MAIN reads and writes messages, and attaches multiple Series/1 SPF service tasks.

The Series/1 SPF Service Program handles the following requests from the SPF program resident in the Series/1:

- Retrieve Data - From the System/370 direct access storage and send it to the Series/1. Retrievable information includes sequential, member of a partitioned data set, or directory information of a partitioned data set.
- Store Data - From the Series/1 to the System/370 direct access storage. The data from the Series/1 is sequential, and is stored in a System/370 partitioned data set or a sequential data set. The SPF Queue Service Program handles the enqueue and dequeue requests for all System/370 functions.
- Remote Job Entry - Request from the Series/1 will write JCL to JES2 or JES3 from the Series/1 or from an existing member of a partitioned data set or sequential data set.
- Retrieve Background Job Status - From JES2 by job name or by user ID. This program can handle up to ten (10) such requests at one time.

LIMITATIONS

This software offering is designed to operate in a System/370 OS MVS/VTAM environment. This program has been verified using MVS Release 3.7, VTAM 2 and NCP 5. The number of Series/1s which can be supported depends on the overall system activity, including number of terminals attached and active per Series/1, and overall request rate from the Series/1s.

If TSO is to be used in conjunction with Series/1 SPF, it must be defined as a shared application.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The hardware requirements for the use of this product on the System/370 are dependent on the overall system activity (see "Limitations"). In any event, the Series/1 is attached to the System/370 via a binary synchronous communications line as a 3271 terminal control unit. The System/370 must meet the configuration requirements of OS/VS2 (MVS) with VTAM.

SOFTWARE REQUIREMENTS

This licensed program operates under control of, and has a prerequisite, IBM System/370 OS/VS2 MVS, (5725-VS2) with VTAM2 (SU1).

The use of this product does not require the use of System/370 TSO/SPF as a prerequisite. However, the Series/1 SPF MVS/VTAM Application program does not provide any library control facilities. It is recommended that the user of this product make use of System/370 TSO/SPF or some similar product to perform library control functions. See "Limitations" for further information.

PROGRAM PRODUCTS

**STRUCTURED PROGRAM FACILITY (SPF)
MVS/TCAM APPLICATION (5719-CR2)****PURPOSE**

The IBM Series/1 Structured Program Facility (SPF) MVS/TCAM Application Program provides the software necessary to service requests from the Series/1 SPF licensed program (5719-ED1) to read and write messages, and to attach service tasks in the System/370.

HIGHLIGHTS

The SPF MVS/TCAM interface consists of three System/370-resident programs: Series/1 SPF MAIN, Series/1 SPF Service program, and SPF Queue Service program. In addition, new macros are provided for inclusion in the user's TCAM message control program. SPF MAIN reads and writes messages, and attaches multiple Series/1 SPF service tasks.

The Series/1 SPF Service program handles the following requests from the Series/1 SPF program resident in the Series/1:

- Retrieve Data - From the System/370 direct access storage and send it to the Series/1. Retrievable information includes sequential, member of a partitioned data set, or directory information of a partitioned data set.
- Store Data - From the Series/1 to the System/370 direct access storage. The data from the Series/1 is sequential, and is stored in a System/370 partitioned data set or a sequential data set. Series/1 SPF Queue Service program handles the enqueue and dequeue requests for all System/370 functions.
- Remote Job Submission - Request from the Series/1 will write JCL to JES2 or JES3 from the Series/1 or from an existing member of a partitioned data set or sequential data set.
- Retrieve Background Job Status - From JES2 or JES3 by job name or by user ID. This program can handle up to ten (10) such requests at one time.

LIMITATIONS

This software offering is designed to operate in a System/370 OS MVS/TCAM environment. This program has been verified using MVS Release 3.7 with TCAM 10 and NCP 5. The number of Series/1s which can be supported depends on the overall system activity, and number of terminals attached and active per Series/1, and overall request rate from the Series/1s.

If TSO is to be used in conjunction with Series/1 SPF, it must be defined as a shared application.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The hardware requirements for the use of this product on the System/370 are dependent on the application (see "Limitations"). In any event, the Series/1 is attached to the System/370 via a binary synchronous communications line through a 3270 terminal control unit.

SOFTWARE REQUIREMENTS

This licensed program operates under control of, and has as a prerequisite, IBM System/370 OS/VS2 MVS (5725-VS2), with TCAM 10 (SU36).

The use of this product does not require the use of System/370 TSO/SPF as a prerequisite. However, the Series/1 SPF MVS/TCAM Application program does not provide any library control facilities. It is recommended that the user of this product make use of System/370 TSO/SPF or some similar product to perform his library control functions. See "Limitations" for further information.

PROGRAM PRODUCTS

**4987 PROGRAMMABLE COMMUNICATIONS
SUBSYSTEM PREPARATION FACILITY
5719-CS0**

PURPOSE

The IBM Series/1 Programmable Communications Subsystem Preparation Facility licensed program is a macro library that is used to support the generation of controller storage image programs for the IBM Series/1 Programmable Communications Subsystem. This macro library is used with either the IBM Series/1 Base Program Preparation Facility (5719-PA1) or the IBM Series/1 Program Preparation Subsystem Versions 1, 2, 3, and 4 (5719-AS1, 5719-AS2, 5719-AS3, and 5719-AS4).

HIGHLIGHTS

- Provides the user with a protocol level instruction set for his subsystem.
- Provides the capability of customizing the subsystem to some line type, protocol, and functional level.
- Provides parameter build capability for management of the subsystem.

DESCRIPTION

The macro library provides the Series/1 user with the capability of defining and customizing the total protocol for his Subsystem. It provides communications instructions for implementing his communications applications. It accomplishes this with two basic macro types.

- Communications Macro Instructions
- Communications Definition Macros

The Communications Macro Instructions are the vehicle used to code the customized communications programs (called function strings) for each line of the Subsystem. They are a highly specialized instruction set designed solely for the function strings of the Programmable Communications Subsystem. These instructions assemble into the orders defined by the Programmable Communications Subsystem.

The Communications Definition Macros are the vehicle used to define the tables and parameters used by the orders. They are used to define the control characters for each line or line type, the function strings to be used for each line or line type, and all the pointers necessary to set up the controller storage. These macros are also assembled.

The output from these two macro types is linked together into a load module by the standard facilities of the Series/1 Base Program Preparation Facility or the Series/1 Program Preparation Subsystem and placed onto a disk or diskette. This load module is referred to as the controller storage image program.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system required to install the IBM Series/1 Programmable Preparation Facility (5719-CS0) is specified for the IBM Series/1 Base Program Preparation Facility or for the Version of the IBM Series/1 Program Preparation Subsystem selected.

PROGRAM PRODUCTS

**4987 PROGRAMMABLE COMMUNICATIONS SUBSYSTEM
EXECUTION SUPPORT (5719-CS1)**

The IBM Series/1 4987 Programmable Communications Subsystem Execution Support Licensed Program runs under the control of the Realtime Programming System Versions 2, 3 and 4, and provides support for the 4987 Programmable Communications Subsystem. The licensed program consists of a controller storage utility and macros that enhance the EXIO commands in Realtime Programming System, Versions 2, 3 and 4, for operating with a 4987.

DESCRIPTION

• Utility

The utility provides the user the capability to load his subsystem controller storage on line or dump his LCBs on line. The utility may be initiated from the system console or from the user's program, and executes in a user partition as a user task set.

The utility provides the following load functions:

- Verifies that the subsystem can be loaded by executing internal diagnostics.
- Reads the user's controller storage image program from disk or diskette.
- Loads the controller storage image program into the subsystem.
- Verifies the controller storage load.
- Notifies the user of any error via the operator console (if available).

Macros

The macros provide the user with an execution interface to EXIO commands in Realtime Programming System Versions 2, 3, and 4.

The macros and EXIO commands provide these functions:

- Provides the interface to and from the subsystem.
- Issues all physical I/O instructions to the subsystem.
- Fields the interrupts presented by the subsystem.
- Ensures that all subsystem errors and completion codes are returned to the user.
- Provides an interface to the Realtime Programming System trace facility for tracing all Programmable Communications Subsystem activity on the channel.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system required to install and to execute the IBM Series/1 4987 Programmable Communications Subsystem Execution Support is specified in the appropriate Version of the IBM Series/1 Realtime Programming System.

SOFTWARE REQUIREMENTS

IBM Series/1 Realtime Programming System Version 2 (5719-PC2)

or

IBM Series/1 Realtime Programming System Version 3 (5719-PC3)

or

IBM Series/1 Realtime Programming System Version 4 (5719-PC4)

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**4987 PROGRAMMABLE COMMUNICATIONS SUBSYSTEM
EXTENDED EXECUTION SUPPORT (5719-CS2)****PURPOSE**

The Series/1 4987 Programmable Communications Subsystem Extended Execution Support licensed program runs under the control of the Series/1 Realtime Programming System Version 4 and provides Read/Write level support as well as EXIO level support for the 4987.

HIGHLIGHTS

- Provides the user with a Read/Write level interface from the Realtime Programming System to the 4987 for supported terminals
- Provides the user with an EXIO level interface for supported and non-supported terminals
- Provides function strings for supported terminals
- Provides the user with 4987 Utility functions
- Provides the user with online RAS aids

DESCRIPTION**Function Strings**

These strings are in source and object format and are the interpretive instructions, which may be used in the 4987 to support a specific protocol for supported terminals.

Device Handler

This provides the user a Read/Write interface to the list of supported devices and also an EXIO interface for all supported and non-supported terminals.

Supported Terminals

- 3271 models 1 and 2 BSC nonswitched, as a multipoint tributary with 3277, 3284, and 3286.
- 3274 Control Unit (BSC), mdl 1C and 51C, with attached 3277 and 3278 Display Stations, 3279 Color Display Stations, and 3284, 3286, 3287, 3288 and 3289 Printers on a nonswitched point-to-point or multipoint line.
- 3275 mdl 1 or 2 BSC switched, or multipoint.
- 3276 Control Unit Display Station (BSC), mdl 1, 2, 3 and 4, with attached 3278 Display Stations, 3279 Color Display Stations, and 3287 and 3289 Printers on a nonswitched point-to-point or multipoint line.
- Series/1 to Series/1 BSC switched or nonswitched, multipoint control or tributary.
- 2740 mdl 1 Start/Stop switched, nonswitched, or multipoint
- 2740 mdl 2 Start/Stop multipoint
- 2741 Start/Stop switched or nonswitched
- Teletype® Models 33/35 switched or nonswitched
- 3101 Display Terminal, mdl 10, 11, 12, 13, 20, 21, 22, and 23 in EIA RS-232-C/CCITT V.24 mode operating on point-to-point switched or nonswitched lines, and mdl 12 and 22 on a current loop. Supported as a Teletype® mdl 33/35 equivalent device.
- 6733 Typewriter Communication Module (with attached IBM Electronic Typewriter 85) in EIA RS-232-C mode operating on point-to-point switched or nonswitched lines. Supported as a Teletype® mdl 33/35 equivalent device.

Macros

These macros aid the user in preparing and defining his controller image program, application programs, and in installing the program product.

Utility Functions

These functions give the user the capability to:

- Load the 4987 storage
- Interface to the 4987 trace and dump features
- Print 4987 trace and dump output in a formatted mode

Reliability, Availability and Serviceability (RAS) functions

In addition to the RAS features that Realtime Programming System provides, this support provides:

- Protocol level retry features in the function strings
- Communications I/O trace
- Error retry, those not handled at a protocol level by the function strings
- Statistical Data Collection
- Execution time error detection

- Online terminal tests for the supported terminals
- Error logging

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

SYSTEM REQUIREMENTS

The minimum system required to install the IBM Series/1 4987 Programmable Communications Subsystem Extended Execution Support (5719-CS2) is specified in the IBM Series/1 Realtime Programming System, Version 4 (5719-PC4).

Note: Realtime Programming System systems using this support in Series/1 with 64K of storage should be carefully reviewed to see that performance objectives can be achieved.

SOFTWARE REQUIREMENTS

IBM Series/1 Realtime Programming System Version 4 (5719-PC4) for execution. IBM Series/1 Program Preparation Subsystem Version 3 (5719-AS3) or Version 4 (5719-AS4) is required for installation and program preparation.

PROGRAM PRODUCTS

**EVENT DRIVEN EXECUTIVE
SYSTEM/370 CHANNEL ATTACH (5719-CX1)****PURPOSE**

The IBM Series/1 Event Driven Executive (EDX) System/370 Channel Attach Program is a licensed program that runs under the control of Version 3.0 of the EDX Basic Supervisor and Emulator. This program, when used in conjunction with the 4993 model 1 Series/1-System/370 Termination Enclosure and the Series/1-System/370 Channel Attachment (feature #1200), provides the Series/1 user the ability to communicate with a System/370 over a Selector or Block Multiplexer Channel. (Wherever System/370 is used, it refers to one of the following processors: System/370 (models 135-168), the 3031, 3032 and 3033 Processors, and the 4331 and 4341 Processors.)

HIGHLIGHTS

This program provides the Series/1 user the ability of transferring data, under joint consent, between user application programs in a Series/1 and a System/370. The System/370 must be using either DOS/VS, OS/VS1 or OS/VS2 (SVS or MVS) and BTAM, or DOS/VSE with BTAM-ES. The support:

- Establishes, controls and terminates access between Series/1 application programs and the channel attach device.
- Manages input/output transfers between the Series/1 application programs and the channel attach device.
- Communicates with the System/370 over 32 ports (device addresses).
- Performs error logging.
- Handles interrupts from the channel attach device.
- Performs error recovery.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

32K bytes of Series/1 storage is required for execution of the IBM Series/1 EDX System/370 Channel Attach Program in conjunction with the minimum requirements for Version 3.0 of the IBM Series/1 EDX Basic Supervisor and Emulator.

SOFTWARE REQUIREMENTS

Basic Supervisor and Emulator Version 3 (5719-XS3) is a prerequisite, and the Supervisor must have EXIO support included at SYSGEN. EDX System/370 Channel Attach application programs require the following licensed programs:

- Event Driven Executive Basic Supervisor and Emulator Version 3 (5719-XS3)
- Event Driven Executive Utilities Version 3 (5719-UT5)
- Event Driven Executive Program Preparation Facility Version 3 (5719-XX4)

The Utilities and Program Preparation Facility are required only for the preparation and installation of EDX System/370 Channel Attach application programs, and are not required for execution.

In addition to the previously listed programs, the following licensed programs are required to assemble EDX System/370 Channel Attach application programs on a host system:

- Series/1 Event Driven Executive Macro Library/Host Version 3 (5740-LM4)
- System/370 Program Preparation Facilities for Series/1 FDP (5798-NNQ)
- System/370 Event Driven Executive Host Communications Facility IUP (5796-PGH) [optional]

DOCUMENTATION

(available from Mechanicsburg)

IBM Series/1 Event Driven Executive System/370 Channel Attach Licensed Program Specification (SC34-1701) ... IBM Series/1 Event Driven Executive Communications and Terminal Application User's Guide (SC34-1705)

TERMS and CONDITIONS: See PP Index

**STRUCTURED PROGRAMMING FACILITY (SPF)
5719-ED1****PURPOSE**

The IBM Series/1 Structured Programming Facility licensed program provides a resident programming editor in a Series/1, which communicates with a companion application program in a System/370 MVS/VTAM or MVS/TCAM system.

HIGHLIGHTS

Series/1 Structured Programming Facility is a programming editor that resides in a Series/1 and communicates with a companion application program on a System/370 MVS/VTAM or MVS/TCAM system. The connection of the Series/1 to the System/370 consists of a binary synchronous communications line using 3271 protocol. Series/1 SPF performs the following functions:

- Initiates request for transfer of data to and from the System/370.
- Initiates request for job submission and job status to System/370.
- Submits background jobs to JES2 or JES3 from the Series/1 or a data set on the System/370 direct access storage.
- Performs local editing of source data.
- Provides 3271 emulation for passthru to TSO or other System/370 subsystems.

The Series/1 SPF editor provides most of the editing functions which are provided by System/370 TSO/SPF in a format and mode of operation consistent with System/370 SPF. Editing functions provided by Series/1 SPF include the following:

- Full screen, context editing which allows multiple lines to be modified in a single interaction.
- Forward, backward and sideways scrolling of data through use of program function keys.
- Inserting and deleting of a line or a block of lines.
- Moving or copying of a line or a block of lines.
- Shifting data on a line or lines.

LIMITATIONS

The Series/1 SPF licensed program provides a subset of the editing functions available with the TSO 3270 Display Support and Structured Programming Facility program product (5740-XT8). Although most command formats in the Series/1 SPF program are compatible with the System/370 product, there are a few commands whose format is different and a few commands which are not supported by the Series/1 SPF product.

Should the user require access to the functions of an installed TSO or SPF system on the System/370, this is available from the Series/1 terminal in passthru mode (3271 emulation).

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The use of this licensed program requires the following IBM Series/1 hardware:

- IBM 4955 Processor (model B, D, or E) with 96K bytes of storage
- Storage Address Relocation Translator feature (#6335) required except on IBM 4955 model E and 4952
- Binary Synchronous Communications Single-Line Control feature (#2074)
- Timer feature (#7840)
- Programmer Console (#5650)
- Disk/Diskette
 - One IBM 4962 model 1 Disk Storage Unit and one IBM 4964 model 1 Diskette Unit; or
 - One IBM 4962 model 2 combined Disk/diskette Unit (the fixed heads available with 4962 model 1F and 4962 model 2F are not supported)

Note: The diskette is required for installation and maintenance but optional when executing

- Up to ten IBM 4978 Display Stations
- IBM 4973 or 4974 Printer

A printer is not required to run Series/1 Structured Programming Facility. A printer is required for system maintenance (dumps for diagnosis and APAR submissions).

- System Console (one of the following)
 - IBM 4979 Display Station
 - or

- #7850 Teletypewriter Adapter Teletype® Models ASR 33/35 or equivalent device must be provided to complete this configuration if you choose to use #7850

SOFTWARE REQUIREMENTS

The use of Series/1 Structured Programming Facility does not require any prerequisite programs. The product is distributed as a completely self-contained load module.

PROGRAM PRODUCTS

**FORTRAN IV COMPILER AND
OBJECT SUPPORT LIBRARY (5719-FO1)
FORTRAN IV REALTIME SUBROUTINE LIBRARY
5719-FO3
FORTRAN IV REALTIME SUBROUTINE LIBRARY
VERSION 2 (5719-FO4)**

PURPOSE

The IBM Series/1 FORTRAN IV includes the compiler and execution time routines for the IBM Series/1 FORTRAN IV high-level language. Series/1 FORTRAN IV requires Mathematical Functional Subroutine Library, and also requires the floating-point emulator feature of the Realtime Programming System in those cases where the floating-point instructions are used and the floating-point hardware feature is not installed. The Realtime Subroutine Library is not a prerequisite of Series/1 FORTRAN IV, but may be used by FORTRAN IV users to facilitate access to sensor I/O and realtime functions. Source programs written in Series/1 FORTRAN IV can be used for plant and laboratory automation and process control application.

The prime purpose of the FORTRAN IV language is to aid in application programming productivity. For applications involving mathematical computations and other manipulation of numerical data, FORTRAN IV offers a major productivity enhancement over assembler coding, with the added benefit that its language is well known. In addition, FORTRAN IV is an established language, easily understood and easily learned. With FORTRAN IV, one can program applications without mastering the less familiar Assembler language. Thus, FORTRAN IV provides faster problem solution, since high-level languages require less coding than assemblers, macro-assemblers, etc.

DESCRIPTION

Series/1 FORTRAN IV with the prerequisite Mathematical and Functional Subroutine Library is a subset of American National Standard FORTRAN IV, X3.9-1966.

Series/1 FORTRAN IV provides interfaces to the Realtime Programming System to allow the user to control execution of tasks and manage resources. The Series/1 FORTRAN IV also meets the ISA S61.1 1976 standards for executive functions, process input/output, and time and date functions.

Series/1 FORTRAN IV Realtime extensions adapt FORTRAN IV to the Realtime Programming System environment. The FORTRAN IV statements, PROGRAM and GLOBAL, plus realtime extension routines, permit use of the realtime operating system environment. The PROGRAM statement allows a user to assign unique names to multiple main programs, thereby establishing multiple entry points for execution in response to interrupts.

The GLOBAL statement provides a data area which can be shared by main programs, thus establishing a vehicle for communication between main programs. The realtime extensions permit FORTRAN IV users to schedule execution of tasks and to delay further execution of tasks until a specified event has been completed.

Specification Statements:

DIMENSION (allowing arrays of up to 7 dimensions)

IMPLICIT

Explicit Specification Statements

COMMON, labeled, blank

GLOBAL, both blank and labeled

DATA

EXTERNAL

PROGRAM

INVOKE

Type statement, with or without length specification, and allowing data initialization and dimension information.

EQUIVALENCE

DOUBLE-PRECISION

Relational and Logical Operators:

EQ	equal to
NE	not equal to
LT	less than
GT	greater than
LE	less than or equal to
GE	greater than or equal to
OR	or
AND	and
NOT	not

Control Statements:

GO TO, unconditional

GO TO, computed

GO TO, assigned

DO

CONTINUE

ASSIGN

IF, arithmetic

IF, logical

PAUSE, with optional message or 5-digit identifying number

STOP, with optional 5-digit identifying number
END

Assignment Statements:

arithmetic assignment, allowing mixed-mode expression and multiple exponentiation
logic assignment

Input/Output Statements:

READ/WRITE, list directed

READ/WRITE, sequential - optional (END =) and (ERR =) parameters on **READ**; optional (ERR =) parameter on **WRITE**

READ/WRITE, direct access - both formatted and unformatted, with optional ERR = parameter on **READ** and **WRITE**

FIND

DEFINE FILE

BACKSPACE

REWIND

ENDFILE

FORMAT, with these codes: A, D, E, F, I, H, L, P, T, X, Z, "literal"

Subprograms and Statement Functions:

SUBROUTINE FUNCTION, allowing type specification of function name and redefinition or arguments

CALL, allowing subprogram name and literal constants as arguments
RETURN

ENTRY, allowing multiple entry points in one subroutine

BLOCK DATA

Constants:

INTEGER (INTEGER *4)

INTEGER (INTEGER *2)

LOGICAL

REAL *4

REAL *8

Additional Features:

Carriage control for printed output

Static and dynamic debugging capability

Symbolic names of up to 6 characters

Statement labels of up to 5 digits

Continuation up to 19 cards

Generalized subscripts

Flexible ordering of specification statements

Various service subroutines (such as **OVERFL**) to handle error conditions

Array declarators available in **COMMON**, **GLOBAL**, and type statements

Several mathematical and conversion functions are performed by inline generated code in Series/1 FORTRAN IV programs. When integer argument data type is specified, a subroutine is supplied for 16 bit integer and a subroutine is supplied for 32-bit integer. Real variables are 32 bits, double precision variables are 64 bits. The following functions provided by FORTRAN IV are:

1) Absolute Value: Four functions are provided -

Argument Type	Function Value Type
Single word integer (16)	Single word integer (16)
Double word integer (32)	Double word integer (32)
Single precision-real	Single precision-real
Double precision	Double precision

2) Integer-to-Real Conversion: Four functions provided -

Argument Type	Function Value Type
Single word integer (16)	Single precision-real
Single word integer (16)	Double precision
Double word integer (32)	Single precision-real
Double word integer (32)	Double precision

3) Real-to-Integer Conversion: Four functions provided -

Argument Type	Function Value Type
Single precision-real	Single word integer (16)
Double precision	Single word integer (16)
Single precision-real	Double word integer (32)
Double precision	Double word integer (32)

4) Precision Decrease: Single function to reduce precision from double precision to single precision.

5) Precision Increase: Single function to increase precision from single to double precision.

PROGRAM PRODUCTS

Realtime Programming System FORTRAN IV (cont'd)

- 6) Find Storage Address: This function produces a value of the location of the argument in main storage at execution time. The function returns an absolute address.
- 7) ERRXIT and CLOSE are meaningful only to a FORTRAN IV programmer and are supplied by the FORTRAN IV object library. The CALL ERRXIT subroutine permits an error exit to a user written subroutine to be given control if an error occurs during execution of an I/O statement. CALL CLOSE is used in FORTRAN IV to close a data set by specifying a logical unit number of the data set to be closed.

Product Content

FORTRAN IV is available to the user in two parts:

- a) Series/1 FORTRAN IV Compiler and Object Support Library (5719-FO1)
- b) Series/1 FORTRAN IV Realtime Subroutine Library (5719-FO3)
 - or
 - Series/1 FORTRAN IV Realtime Programming Subroutine Library Version 2 (5719-FO4)

Series/1 FORTRAN IV Realtime Subroutine Library is a licensed program used with FORTRAN programs requiring realtime function. This library includes Realtime System Interfaces, the ISA Executive Function routines, the ISA Process I/O routines, the ISA Time and Date Routines.

Object programs require the Mathematical and Functional Subroutine Library (5719-LM1), or Mathematical and Functional Subroutine Library Version 2 (5719-LM2) to execute, as well as floating-point emulator routines of the operating system, if floating-point execution is called for and the floating-point hardware feature is not installed.

Dynamic Debug Facilities

The debug facility is a programming aid that enables the user to locate errors in a FORTRAN IV source program. The debug facility provides for tracing the flow within a program and between programs at execution time.

The specification statement (DEBUG) sets the conditions for operation of the debug facility and designates debugging operations that apply to the entire program unit (such as subscript checking). The debug packet identification statement (AT) identifies the beginning of the debug packet, and the statement in the program at which tracing is to begin. The two executable statements (TRACE ON and TRACE OFF) designate actions to be taken at specific points in the program.

Execution Time Support Libraries

FORTRAN IV, through its object time support libraries, provides an execution environment for the object module.

MFSL is required for mathematical and conversion support.

The execution time support library includes support for direct and sequential I/O through FORTRAN IV READ/WRITE sequential/direct, object time trace facilities and the ISA bit manipulation routines. I/O is implemented through GET/PUT in the operating system, thereby ensuring device independence.

FORTRAN IV REALTIME SUBROUTINE LIBRARY VERSION 1

Series/1 Realtime Subroutine Library is a licensed program used with FORTRAN programs requiring realtime function. This subroutine library provides the FORTRAN IV user with a call interface to the Realtime Programming System functions needed for building multitask and multitask set applications.

Series/1 FORTRAN IV Realtime Subroutine Library includes system interfaces to the operating system realtime functions, ISA Executive Routines, ISA Process routines, and the ISA time and date routines.

Series/1 FORTRAN IV Realtime Subroutine Library allows the user to manage resources and control execution of applications in the multitasking environment. These realtime service functions supported by FORTRAN IV will include features for task and task set management, partition management, managing interrupts, queue management, synchronize the use of GLOBAL, and rollin/rollout support.

The ISA Executive Function routines allow a FORTRAN IV programmer to start execution of a task set after a time delay or at a particular time of day, and to be able to place a task in the WAIT state. The executive functions START, TRNON and WAIT, are accessible through CALLS and adhere to the ISA standard.

The ISA process routines allow a FORTRAN IV programmer to use sensor I/O devices. The routines allow reading and writing of data to and from analog and digital points.

The ISA time and date library routines will allow the FORTRAN IV programmer easy access to setting the date and TOD clock.

The specific functions provided by the Series/1 FORTRAN IV Realtime Subroutine Library are:

ISA Routines

FORTRAN IV

Routine	Function
START	- start a task set immediately or after a time delay
TRNON	- start a task set at a given time
WAIT	- delay a task for a specified interval
AISQW	- analog input sequential read
AIRDW	- analog input random read
AOW	- write analog output
DIW	- read digital input
DOLW	- set or reset digital output
DOMWV	- write digital output then reset
TIME	- read current time of day
DATE	- read the current date

Interface to the Series/1 Realtime Programming System Facilities

FORTRAN IV

Routine	Function
\$DFNEV	- define event
\$DLTEV	- delete event
\$AWAIT	- wait on event completion
\$POST	- post completion of an event
\$DFNQU	- define a storage queue
\$DLTQU	- delete a queue
\$ENQUE	- send an element to a queue
\$DEQUE	- receive an element from a queue
\$DFNRS	- define a resource
\$DLTRS	- delete a resource
\$REQRS	- synchronize (request) use of resource
\$RELRS	- release resource
\$CON	- connect task to process interrupt
\$DISCN	- disconnect task from process interrupt
\$ATACH	- start a new task
\$DTACH	- terminate task set execution
\$MDSTT	- modify system task set table
\$SERXT	- activate task error exit
\$RDTOD	- read time of day
\$SETRL	- set ROLLIN/ROLLOUT status
\$TSQUE	- queue task set for execution
\$TSTOP	- terminate task execution
\$WRTO	- write time of day

FORTRAN IV REALTIME SUBROUTINE LIBRARY VERSION 2

Series/1 FORTRAN IV Realtime Subroutine Library Version 2 (5719-FO4) includes all the functions in the Version 1 Realtime Subroutine Library (5719-FO3) plus enhancements to include new Instrument Society of America (ISA) subroutines and additional interfaces to the Realtime Programming System.

These routines, except \$RLOAD, are reentrant and can share the same data areas. The additional functions provided by the FORTRAN IV Realtime Subroutine Library Version 2 are:

ISA Routines

FORTRAN IV

Routine	Function
AORW	- read analog outputs in user-specified order
DOPW	- writes digital outputs pulsed
DORW	- reads digital outputs in user-specified order
DOW	- writes digital outputs in user-specified order

Interfaces to the IBM Series/1 Realtime Programming System facilities

FORTRAN IV

Routine	Function
\$CONVT	- convert an EBCDIC character string
\$DFNDQ	- define a disk queue
\$INTOD	- increment time of day
\$TRANS	- translate code format of strings
\$RLOAD	- load the restart supervisor

FORTRAN IV RAS

Syntax errors, errors of inconsistency, such as contradictory variable declarations, and detectable semantic errors occurring in the source program, are all diagnosed and reported in a meaningful form. The compiler optionally produces the following maps and listings:

- source statement listings
- statement label map
- cross-reference index for symbols and labels
- hexadecimal listing of the object deck

Realtime Programming System FORTRAN IV (cont'd)**CUSTOMER RESPONSIBILITIES**

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support is provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM Series/1 FORTRAN compiler operates in the batch environment of the IBM Series/1 Program Preparation Subsystem under the IBM Series/1 Realtime Programming System. FORTRAN-generated object code is combined with Library Routines by the Application Builder, and can run either as a batch task set or Realtime Task Set under control of the IBM Series/1 Realtime Programming System. The IBM Series/1 Program Preparation Subsystem must be used to prepare the source program.

The compiler operates on the IBM 4953 or IBM 4955 Processors in the batch environment of the IBM Series/1 Program Preparation Subsystem and can execute on a Series/1 configuration that does not have floating-point support.

IBM Series/1 FORTRAN IV object programs require the IBM Series/1 Mathematical and Functional Subroutine Library (MFSL). Floating-point support (either floating point emulator or floating-point hardware feature) is required if any REAL numbers are used in a FORTRAN program.

The IBM Series/1 FORTRAN IV uses other licensed programs to provide direct support of all Series/1 hardware. The compiler-generated object programs use Series/1 hardware through interfaces to the IBM Series/1 Realtime Programming System. They are able to use any DP I/O device supported at a logical I/O level by Series/1 operating system. They access sensor I/O and timers through the IBM Series/1 FORTRAN IV Realtime Subroutine Library.

The minimum system required for compilation and application build is specified in the pages for the version of IBM Series/1 Program Preparation Subsystem utilized.

The minimum system required to execute the compiler-generated object programs in a realtime or batch partition is specified in the pages for the version of the IBM Series/1 Realtime Programming System utilized.

Note: The system must be equipped with the Floating Point feature (#3920) or the Floating Point Software Emulator to execute a FORTRAN program when floating-point data is used in the program. Programs using floating-point arithmetic with the Floating-Point Emulator will experience performance degradation relative to the same program using the floating-point hardware feature (#3920).

Hardware Products Supported**Device Support Processors**

IBM 4952 models A or B
IBM 4953 models A, B, C, or D
IBM 4955 models A, B, C, D, or E

Disk

IBM 4962 models 1, 1F, 2, 2F, 3 or 4
IBM 4963 Disk Subsystem

Diskette

IBM 4964 Diskette Unit model 1
IBM 4966 Diskette Magazine Unit

Printer

IBM 4973 Line Printer models 1 or 2
IBM 4974 Matrix Printer model 1

Display Station

IBM 4979 model 1
IBM 4978 model 1

Magnetic Tape

Sensor I/O

IBM 4982

Features

#1560 - Native attach Sensor I/O
#7840 - Timer
#7850 - TTY Adapter (supported for use with Teletype® Models ASR 33/35)

#3920 - Floating Point Processor (transparent to FORTRAN)
#6335 - Storage Address Relocation Translator
(IBM 4955 models B or D)

All I/O devices are accessed through Realtime Programming System control program services, and all disks and diskettes supported by Versions 1, 2, 3, or 4 of Realtime Programming System are supported. Floating point is required, either by hardware feature or by emulation. For more detailed description of model types and options, refer to the pages for the operating system and processors being used.

SOFTWARE REQUIREMENTS

Licensed programs required for:

Compilation

- IBM Series/1 Realtime Programming System Version 1 (5719-PC1) and IBM Series/1 Program Preparation Subsystem Version 1 (5719-AS1)
or
- IBM Series/1 Realtime Programming System Version 2 (5719-PC2) and IBM Series/1 Program Preparation Subsystem Version 2 (5719-AS2)
or
- IBM Series/1 Realtime Programming System Version 3 (5719-PC3) and IBM Series/1 Program Preparation Subsystem Version 3 (5719-AS3)
or
- IBM Series/1 Realtime Programming System Version 4 (5719-PC4) and IBM Series/1 Program Preparation Subsystem Version 3 (5719-AS3) or Version 4 (5719-AS4)

Application Build

- IBM Series/1 Realtime Programming System Version 1 (5719-PC1) and IBM Series/1 Program Preparation Subsystem Version 1 (5719-AS1)
or
- IBM Series/1 Realtime Programming System Version 2 (5719-PC2) and IBM Series/1 Program Preparation Subsystem Version 2 (5719-AS2)
or
- IBM Series/1 Realtime Programming System Version 3 (5719-PC3) and IBM Series/1 Program Preparation Subsystem Version 3 (5719-AS3)
or
- IBM Series/1 Realtime Programming System Version 4 (5719-PC4) and IBM Series/1 Program Preparation Subsystem Version 3 (5719-AS3) or Version 4 (5719-AS4)
and
- IBM Series/1 Mathematical and Functional Subroutine Library (5719-LM1)
or
- IBM Series/1 Mathematical and Functional Subroutine Library Version 2 (5719-LM2)
and
- IBM Series/1 Realtime Subroutine Library (5719-FO3), only if called by FORTRAN user program
or
- IBM Series/1 FORTRAN IV Realtime Subroutine Library Version 2 (5719-FO4) only if called by the FORTRAN user program.

Execution on Realtime Partition

- IBM Series/1 Realtime Programming System Version 1 (5719-PC1)
or
- IBM Series/1 Realtime Programming System Version 2 (5719-PC2)
or

Realtime Programming System FORTRAN IV (cont'd)

Execution in a Batch Partition

- IBM Series/1 Realtime Programming System Version 1 (5719-PC1) and IBM Series/1 Program Preparation Subsystem Version 1 (5719-AS1)
or
- IBM Series/1 Realtime Programming System Version 2 (5719-PC2) and IBM Series/1 Program Preparation Subsystem Version 2 (5719-AS2)
or
- IBM Series/1 Realtime Programming System Version 3 (5719-PC3) and IBM Series/1 Program Preparation Subsystem Version 3 (5719-AS3)
or
- IBM Series/1 Realtime Programming System Version 4 (5719-PC4) and IBM Series/1 Program Preparation Subsystem Version 3 (5719-AS3) or Version 4 (5719-AS4)

Note 1: The 4969 Magnetic Tape Unit licensed program (5719-TA4) is required for 4969 support.

Note 2: The following FORTRAN language statements are not supported for tape control functions

REWIND, BACKSPACE, and END FILE.

COMPATIBILITY

Compatibility for Files, Programs and Preparation are specified in the pages for the Version of the IBM Series/1 Realtime Programming System and IBM Series/1 Program Preparation Subsystem utilized.

**FORTRAN IV COMPILER AND
OBJECT SUPPORT LIBRARY VERSION 2
5719-FO2**

PURPOSE

The IBM Series/1 FORTRAN IV Compiler and Object Support Library, Version 2 (5719-FO2) is for use with the IBM Series/1 Event Driven Executive (EDX) Base Supervisor and Emulator (5719-XS1) and the Realtime Programming System, Version 4 (5719-PC4). In addition, this product under the Realtime Programming System provides support for the 4969 Magnetic Tape Subsystem Support program.

The prime purpose of the FORTRAN IV language is to aid in application programming productivity. For applications involving mathematical computations and other manipulation of numerical data, FORTRAN IV offers a major productivity enhancement over assembler coding, with the added benefit that its language is easily understood and easily learned. With FORTRAN IV one can program applications without mastering the less familiar Assembler language. Thus, FORTRAN IV provides faster problem solution since high-level languages usually require less coding than assemblers, macro assemblers, etc.

Series/1 FORTRAN IV object modules can be combined either (1) by the Series/1 Event Driven Executive linkage editor into programs which are executed using the Event Driven Executive Basic Supervisor and Emulator (5719-XS1), or (2) by the Program Preparation Subsystem (5719-AS4), into task sets that run under the Realtime Programming System (5719-PC4).

The key advantages of using FORTRAN IV Version 2 (5719-FO2) over FORTRAN Version 1 (5719-FO1) are:

- Multivolume support for 4969 magnetic tape (Realtime Programming System only)
- Version 2 available on both Realtime Programming System and Event Driven Executive operating systems

Under the Realtime Programming System, programs written for FORTRAN (5719-FO1) can be recompiled with FORTRAN, Version 2, (5719-FO2) without any source changes.

DESCRIPTION

Language Level

Series/1 FORTRAN IV with the prerequisite Mathematical and Functional Subroutine Library (5719-LM3) conforms to the American National Standard FORTRAN IV, X3.10-1966, with some extensions from American National Standard FORTRAN X3.9-1966. The language also includes a significant number of IBM FORTRAN extensions common to other IBM FORTRANs, which are not part of the American National Standard.

Specification Statements:

DIMENSION (allowing arrays of up to 7 dimensions)
 IMPLICIT
 Explicit Specification Statements
 COMMON, labeled, blank
 DATA
 EXTERNAL
 PROGRAM
 GLOBAL (Realtime Programming System only)
 Type statement with or without length specification and allowing data initialization and dimension information.
 Equivalence

Double-Precision Relational and Logical Operators:

EQ equal to
 NE not equal to
 LT less than
 GT greater than
 LE less than or equal to
 GE greater than or equal to
 OR or
 AND and
 NOT not

Control Statements:

GO TO, unconditional
 GO TO, computed
 GO TO, assigned
 DO
 CONTINUE
 ASSIGN
 IF, arithmetic
 IF, logical
 INVOKE, (Realtime Programming System only)
 PAUSE, with optional message or 5-digit identifying number
 STOP, with optional 5-digit identifying number
 END

Assignment Statements:

Arithmetic assignment, allowing mixed-mode expression and multiple exponentiation
 Logic assignment

Input/Output Statements

READ/WRITE, list directed
 READ/WRITE, sequential-optional (END=) and (ERR=) parameters on READ; optional (ERR=) parameter on WRITE.
 READ/WRITE, direct-access, both formatted and unformatted, with optional (ERR=) parameter on READ and WRITE
 FIND
 DEFINE FILE
 BACKSPACE
 REWIND
 ENDFILE
 FORMAT, with these codes: A, D, B, E, H, I, P, T, X, Z, "literal"

Subprograms and Statement Functions

SUBROUTINE
 FUNCTION, allowing type specification of function name and redefinition of arguments
 CALL, allowing subprogram name and literal constants as arguments
 RETURN
 ENTRY, allowing multiple entry points in one subroutine
 BLOCK DATA

Constants

INTEGER (INTEGER *4)
 INTEGER (INTEGER *2)
 LOGICAL
 REAL *4
 REAL *8

Additional Features:

Carriage control for printed output
 Static and dynamic debugging capability
 Symbolic names of up to 6 characters
 Statement labels of up to 5 digits
 Continuation up to 19 cards
 Generalized subscripts
 Flexible ordering of specific statements
 Various subroutines (such as OVERFL) to handle error conditions
 Array declarators available in COMMON and type statements

Several mathematical and conversion functions are performed by inline-generated code in the Series/1 FORTRAN IV programs. When integer argument data type is specified, a subroutine is supplied for 16-bit integer and a subroutine is supplied for 32-bit integer. Read variables are 32 bits, double precision variables are 64 bits. The following functions provided by FORTRAN IV are:

- (1) Absolute Value: Four functions are provided

Argument Type	Function Value Type
Single word integer (16)	Single word integer (16)
Double word integer (32)	Double word integer (32)
Single precision-real	Single precision-real
Double precision	Double precision
- (2) Integer-to-Real Conversion: Four functions provided

Argument Type	Function Value Type
Single word integer (16)	Single precision-real
Single word integer (16)	Double precision
Double word integer (32)	Single precision-real
Double word integer (32)	Double precision
- (3) Real-to-Integer Conversion: Four functions provided

Argument Type	Function Value Type
Single precision-real	Single word integer (16)
Double precision	Single word integer (16)
Single precision-real	Double word integer (32)
Double precision	Double word integer (32)
- (4) Precision Decrease: Single function to reduce precision from double precision to single precision.
- (5) Precision Increase: Single function to increase precision from single to double precision.
- (6) Find Storage Address: This function produces a value of the location of the argument in main storage at execution time. The function returns an absolute address.

S/1 FORTRAN IV V2 (cont'd)

(7) The ERRXIT and CLOSE are meaningful only to a FORTRAN IV programmer and are supplied by the FORTRAN IV object library. The ERRXIT subroutine permits an error exit to a user-written subroutine to be given control if an error occurs during execution of an I/O statement. CALL CLOSE is used in FORTRAN IV to close a data set by specifying a logical unit number of the data set to be closed.

Dynamic Debug Facility

The debug facility is a programming aid that enables the user to locate errors in a FORTRAN IV source program. The debug facility provides for tracing the flow within a program and between programs at execution time.

The specification statement (DEBUG) sets the conditions for operation of the debug facility and designates debugging operations that apply to the entire program unit (such as subscript checking). The debug packet identification statement (AT) identifies the beginning of the debug packet and the statement in the program at which tracing is to begin. The two executable statements (TRACE ON and TRACE OFF) designate action to be taken at specific points in the program.

Object Support Libraries

FORTRAN IV, through its object time support libraries, provides an execution environment for the object module.

MFSL is required for mathematical and conversion support.

The execution time support library includes support for direct and sequential I/O through FORTRAN IV READ/WRITE sequential/direct, object time trace facilities, and the ISA bit manipulation routines. Available under the Realtime Programming System only is the Series/1 FORTRAN IV Realtime Subroutine Library Version 2 (5719-FO4), which is optional and offers process I/O, execution function, time, date, and realtime system service interface subroutines. These subroutines are accessed via the CALL statement.

FORTRAN IV RAS

Syntax errors, errors of inconsistency, such as contradictory variable declarations, and detectable semantic errors occurring in the source program are all diagnosed and reported in a meaningful form. The compiler optionally produces:

- source statements listings
- statement label map
- cross-reference index for symbols and labels
- hexadecimal listing of the object modules

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support is provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum FORTRAN IV, Version 2, storage requirements are:

- For compilation, a minimum 16K byte partition for the compiler; partition requirements depend on size of FORTRAN programs.
- For execution, a minimum partition size is 8K to 10K bytes for small programs; partition size is a function of the FORTRAN source program.

These storage requirements are in addition to the minimum requirements for the operating system environment.

For details on system requirements for the IBM Series/1 EDX Basic Supervisor and Emulator, the IBM Series/1 EDX Program Preparation Facility and the EDX Utilities, or the Realtime Programming System and Program Preparation Subsystem, see the respective pages for these licensed programs.

For EDX, the system must be equipped with the Floating Point feature (#3920) to execute a FORTRAN program that uses Floating Point numbers. Otherwise, FORTRAN will run on either a 4952 or 4955. For the Realtime Programming System, the system must be equipped with the floating point feature (#3920) or the Floating Point Software Emulator to execute a FORTRAN program.

SOFTWARE REQUIREMENTS

Licensed programs required for EDX

Compilation

- IBM Series/1 EDX Basic Supervisor and Emulator (5719-XS1)

Program Preparation

- IBM Series/1 EDX Basic Supervisor and Emulator (5719-XX2)
- IBM Series/1 EDX Utilities (5719-UT3)
- IBM Series/1 EDX Mathematical and Functional Subroutine Library (5719-LM3)

Program Execution

- IBM Series/1 EDX Basic Supervisor and Emulator (5719-XS1)

Licensed Programs required for Realtime Programming System**Compilation**

- IBM Series/1 Realtime Programming System Version 4 (5719-PC4)
- IBM Series/1 Program Preparation Subsystem Version 4 (5719-AS4)

Application Build

- IBM Series/1 Realtime Programming System Version 4 (5719-PC4)
- IBM Series/1 Program Preparation Subsystem Version 4 (5719-AS4)
- IBM Series/1 Mathematical and Functional Subroutine Library Version 2 (5719-LM2)
- IBM Series/1 FORTRAN IV Realtime Subroutine Library Version 2 (5719-FO4) (only if called by FORTRAN user program)

Execution in a Realtime Partition:

- IBM Series/1 Realtime Programming System Version 4 (5719-PC4)

Execution in a Batch Partition:

- IBM Series/1 Realtime Programming Subsystem Version 4 (5719-PC4)
- IBM Series/1 Program Preparation Subsystem Version 4 (5719-AS4)

COMPATIBILITY

FORTRAN IV programs written for the EDX Basic Supervisor and Emulator are upward compatible to FORTRAN IV programs written for the Realtime Programming System at the source language level. FORTRAN IV under the Realtime Programming System has the following features not available under EDX:

- GLOBAL statement
- INVOKE statement
- Resource reference (N-CON)
- REUS/NOREUS compiler option
- IOAREA compiler option

For more specific information concerning these differences see *FORTRAN Language Reference* (GC34-0133) and *Realtime Programming System FORTRAN IV User's Guide* (SC34-0134).

Program Currency

For program support purposes, a licensed program is considered current if it is the current release of the program and all PID-distributed refreshes/PTFs have been applied.

PROGRAM PRODUCTS

**7361 FASTDRAFT PROGRAM
RELEASE 1 (5719-GP1)**

PURPOSE

The 7361 Fastdraft Program supports the maximum 7361 Fastdraft System configuration. This program is intended to satisfy requirements for general purpose interactive drafting using 2D cartesian coordinates. It has been developed for use by non-computer-oriented drafters. The overall purpose of the 7361 system and the Fastdraft software is to provide an easy-to-learn and use system to enable drafters to improve drafting productivity.

HIGHLIGHTS

- Has capabilities for Isometric drawings and assemblies for clearer visualization of a part and an expanded range of drawing disciplines.
- Provides drafters with graphics systems equivalents for all the conventional tools (i.e., drawing instruments, templates, drafting board) required for general drafting tasks.
- Drafting functions are selected by a drafter using a light-pen, from menus displayed on the 3251 mdl 2 Display Station component of the 7361 system.
- Prompting messages on the 3251 mdl 2 guide the user through drafting functions requiring multiple steps.
- Drawings are saved on diskettes (one drawing per diskette) and can be restored to disk working storage for editing or plotting purposes at any time.
- Emphasis is on ease of learning and use. The *Fastdraft Training Guide* guides the drafter step-by-step through the use of prompting messages, from simple to more complex functions.
- Supports separate workstation areas on disk for each display station. Each action is written to disk. Therefore, minimal recovery is required in the event of a power outage.
- User can create his own templates (as pattern library symbols).
- Fastdraft software offers a choice of the level of detail for creating/editing drawings. The level selected is highlighted and changes are restricted to that level. The five hierarchical levels are:
 - Points
 - Lines
 - Shapes
 - Patterns
 - Views

DESCRIPTION

Three function menus are provided. The drafter selects a menu, and follows with the selection of the functions needed from the displayed menu, by use of the light-pen and the keyboard. The keyboard is primarily used to select the menu and to input measurement and other alphanumeric data.

Main Menu consists of four parts:

- Drawing and Diskette Options.
- Drawing Identification.
- Drawing Parameters.
- Notation Area.

Provides the capability to get and save drawings, erase drawing storage, identify jobs, format diskettes, plot, create notes, etc.

Customizing Menu is used to:

- Specify metric or inch units for the drawing.
- Set or change the values for drawing and dimensioning the work.
- Set up the Edit Menu screen and text formatting.
- Select line type and pens.
- Specify scrolling increment control.

The Fastdraft options from the Edit Menu use the specifications or attributes set up on the Customizing Menu.

Edit Menu has four areas:

- Display Window.
- Coordinate Readout Area.
- Instruction Area.
- Edit Menu Options.

Provides the capability to create, structure, copy, rotate, delete and modify drawings in working storage.

The 7361 Fastdraft System operates as a dedicated drafting system.

FUNCTIONAL CHARACTERISTICS

For initial construction of shapes:

- **Mathematical/Construction Options**
Edit Menu options provide for the construction of lines, circles, ellipses, boxes, etc.
- **Editing Options (for use on existing shapes)**
Menu options are provided for Window, Restore, Delete, Intersect, Rotate, Move, Scale, Measure, etc.
- **Drafting Options**
Isometrics, dimensioning, cross-hatching, filleting, etc.

Drafting Requirements of the following standards organizations are supported:

- International Standards Organization (ISO).
- American National Standards Institute (ANSI).

CUSTOMER RESPONSIBILITIES

To install and use the 7361 Fastdraft Licensed Program, the customer will:

- Order, as a minimum, the basic 7361 System shown under "Devices Supported".
- Order the Fastdraft Licensed Program (5719-GP1) from IBM.
- Follow site preparation guidelines found in the *IBM 7361 Fastdraft System Guide*.
- Read the following publications to acquire a knowledge of the graphics functions provided and the installation procedures:

IBM 7361 Fastdraft System Guide (SC34-0514) introduces the system and gives instructions for software installation, operation and maintenance. It also includes physical installation planning information.

IBM 7361 Fastdraft Training Guide (SC34-0515) is a self-study manual that explains how to use the functions offered, plot a drawing, create pattern libraries, etc. No knowledge of computers or programming is required.

After the user has become initially familiar with the system, a review of the *IBM Fastdraft Workstation Reference* (SC34-0516) will provide in depth information about each of the drafting functions available.

Security: Since the 7361 System is intended to operate in a non-secure environment, customer management should institute appropriate controls and procedures to safeguard the files in the system, and to limit access only to those who have been explicitly authorized.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Devices Supported: The IBM 7361 Fastdraft Licensed Program is specifically designed for use with the IBM 7361 Fastdraft System. Components of the 7361 System are:

Basic

- The IBM 7361 Graphics Processor Unit mdl 001.
- The IBM 3251 mdl 2 Display Station with two special features: Alphameric Keyboard (#4621) and Light-Pen (#4750).
- The IBM 3101 mdl 10 or mdl 23A Display Terminal (used as the system console for program installation and for DPCE Service Representative use in diagnostic testing).

Optional

- A second 3251 mdl 2 Display Station (with #4621 and #4750 features).
- An IBM 7374 Color Plotter mdl 001.

SOFTWARE REQUIREMENTS (None)

DOCUMENTATION
(available from Mechanicsburg)

IBM 7361 Fastdraft System Guide (SC34-0514) ... *IBM 7361 Fastdraft Training Guide* (SC34-0515) ... *IBM Fastdraft Workstation Reference* (SC34-0516) ... *IBM 7361 Licensed Program Specifications* (GC34-0513).*

* Describes the IBM 7361 Fastdraft licensed program and warrants that it conforms to its specifications (as contained in the document).

RPQs ACCEPTED: Yes

**7361 FASTDRAFT PROGRAM
RELEASE 1 Modification Level 1
5719-GP1**

PURPOSE

The 7361 Fastdraft Program Release 1.1 is a new release of the Fastdraft Program which contains all the functions available in the initial release, as well as new and enhanced capabilities.

The purpose of the program is to support the 7361 Fastdraft System which provides an easy-to-learn and use, 2D (two-dimensional) interactive drafting system enabling significant productivity improvements for drafters.

HIGHLIGHTS of RELEASE 1.0

The highlights of the initial release of the Fastdraft Program are:

- Has capabilities for Isometric drawings and assemblies for clearer visualization of a part and an expanded range of drawing disciplines.
- Provides drafters with graphics systems equivalents for all the conventional tools (i.e., drawing instruments, templates, drafting board) required for general drafting tasks.
- Drafting functions are selected by a drafter using a light-pen, from menus displayed on the 3251 mdl 2 Display Station component of the 7361 system.
- Prompting messages on the 3251 mdl 2 guide the user through drafting functions requiring multiple steps.
- Drawings are saved on diskettes (one drawing per diskette) and can be restored to disk working storage for editing or plotting purposes at any time.
- Emphasis is on ease of learning and use. The *Fastdraft Training Guide* guides the drafter step-by-step through the use of prompting messages, from simple to more complex functions.
- Supports separate workstation areas on disk for each display station. Each action is written to disk. Therefore, minimal recovery is required in the event of a power outage.
- User can create his own templates (as pattern library symbols).
- Fastdraft software offers a choice of the level of detail for creating/editing drawings. The level selected is highlighted and changes are restricted to that level. The five hierarchical levels are:
 - Points
 - Lines
 - Shapes
 - Patterns
 - Views

DESCRIPTION

Three function menus are provided. The drafter selects a menu, and follows with the selection of the functions needed from the displayed menu, by use of the light-pen and the keyboard. The keyboard is primarily used to select the menu and to input measurement and other alphanumeric data.

Main Menu consists of four parts:

- Drawing and Diskette Options.
- Drawing Identification.
- Drawing Parameters.
- Notation Area.

Provides the capability to get and save drawings, erase drawing storage, identify jobs, format diskettes, plot, create notes, etc.

Customizing Menu is used to:

- Specify units of measure for the drawing.
- Set or change the values for drawing and dimensioning the work.
- Set up the Edit Menu screen and text formatting.
- Select line type and plotter pens.
- Specify scrolling increment control.

The Fastdraft options from the Edit Menu use the specifications or attributes set up on the Customizing Menu.

Edit Menu has four areas:

- Display Window.
- Coordinate Readout Area.
- Instruction Area.
- Edit Menu Options.

Provides the capability to create, structure, copy, rotate, delete and modify drawings in working storage.

The 7361 Fastdraft system operates as a dedicated drafting system.

FUNCTIONAL CHARACTERISTICS

- Mathematical/Construction Options (for initial construction of shapes).
Edit Menu options provide for the construction of lines, circles, ellipses, boxes, etc.
- Editing Options (for use on existing shapes)
Menu options are provided for Window, Restore, Delete, Intersect, Rotate, Move, Scale, Measure, etc.
- Drafting Options
Isometrics, dimensioning, cross-hatching, filleting, etc.

Drafting Requirements of the following standards organizations are supported:

- American National Standards Institute (ANSI)
- International Standards Organization (ISO)

HIGHLIGHTS of RELEASE 1.1

The 7361 Fastdraft System Program Release 1.1 contains the following new or enhanced capabilities:

- Fastdraft drawing export/import capability.
- Concurrent plotting
- Feet/inch/fraction units to 1/64 inch.
- Drawing construction at user-defined scales.
- Plot/merge by view.
- Show/no show of text.
- Show/no show of dimensions.
- Main menu nomenclature change.
- Fillet function expansion.
- Chamfer.
- DX, DY value input.
- Expansion of cross-hatch option for 'Pouche'.
- First or third angle isometric projection.
- Automatic dimensioning of angles.
- Dimensioning with use of prefix/suffix.
- Additional line type and dimension terminators.

DESCRIPTION of RELEASE 1.1 ENHANCEMENTS

Fastdraft Drawing Export/Import Capability: Provides the ability to export graphic data for drawings created on a Fastdraft system to CADAM® or other CAD/CAM system. The export function may be used to migrate an entire drawing data base or allow the Fastdraft System to be used in conjunction with a CAD/CAM system. This capability is required by firms for specific workload management within their own organization or in conjunction with suppliers, contractors, etc.

To allow for the exporting of drawings created on Fastdraft to another system, Release 1.1 provides two main menu functions which allow the creation of Fastdraft drawing transport diskettes. These functions are:

- Format Export Diskette: Formats a type 1 diskette in Basic Exchange format and initializes it for use in exporting drawings.
- Export Drawing: Writes a drawing to one or more export diskettes.

To complete the transfer of graphic data for a Fastdraft drawing to a CAD/CAM system such as CADAM, three additional steps must be implemented by the customer which are external to the Fastdraft system:

- Conversion of the transport diskette to a S/370 file: The BASIC EXCHANGE formatted diskette(s) must be converted to a media which can be accepted by the S/370.
- Conversion of the Fastdraft graphic data to an IGES (Initial Graphics Exchange Specifications) file. This can be accomplished by invoking the Fastdraft to IGES Translator (5796-BEB). See Fastdraft to IGES Translator documentation for data format details.
- Conversion and passing of the IGES data file to CAD/CAM: Once the IGES file is created, it can be transferred to a receiving CAD/CAM system by the appropriate translator. The IGES Processor (5668-904) is used to complete the Fastdraft to CADAM path.

7361 Fastdraft Program R1.1 (cont'd)

Fastdraft also has the capability to read and accept graphic data input for drawings created on external systems when the data is in the proper Fastdraft format. It is the customer's responsibility to properly format such data, and the formatting has to be accomplished via customer-written software.

Concurrent Plotting: Provides the ability to take full advantage of both displays at the same time that the plotter is operating.

Concurrent plotting allows the system to accommodate the use of both terminal displays for graphic creation in parallel with the plotter. All three units can be in operation simultaneously and be independently working on three separate files or drawings on the same 7361 GPU.

Feet/Inch/Fraction Units to 1/64 Inch: Provides the ability to draw in units that are common to the construction industry.

The drafter has at his option the ability to select the units he will be working in for a particular drawing.

Example:

feet-inch-fractions (to 1/64")
feet-decimal feet (with scaling)
inches-decimal inches
System International (SI) metric

The unit of measurement selected will be consistent, at the drawing level, for coordinate display, measure, input and automatic dimensioning.

Drawing Construction at User-Defined Scales: This scaling ability will allow any scale to be used for the drawing construction, such as:

1/16" = 1'0"
1/4" = 1'0"
1 1/2" = 1'0"
1" = 40'
etc.

The view scale is specified on the customizing menu and will always be displayed on the edit menu.

The scale selection applies to the geometry at the view level to enable the drawing to contain detail drawings with views at different scales.

The text size is independent of the drawing scale and must be specified separately.

Plot Merge by View: Provides the ability to create drawings with a series of overlays of separate views or layers.

The drafter has the ability to merge and plot by view. View names are alphanumeric with a maximum length of four characters. The view name, in which geometry is presently being created or attached to, is always displayed on the edit menu.

Show/No Show of Text: Provides the ability to not display text, which will enhance the display quality by reducing flicker.

Selecting the Show option on the edit menu will query the drafter as to whether text should be displayed. The system will show the text unless otherwise instructed.

Show/No Show of Dimensions: Provides the ability to not display dimensions, including leaders, which enhances the display quality by reducing flicker.

Selecting the Show option on the edit menu will query the drafter as to whether the dimensions should be displayed. The system will show all dimensions unless otherwise instructed.

Main Menu Nomenclature Change: To make the main menu more global in meaning, two changes will be made: 'Part Number' will be changed to 'Drawing ID', and 'Detailer' will be changed to 'Drawn By'.

Fillet Function Expansion: Expands the fillet function to permit use between shapes.

Selecting the fillet function with the pattern level set will allow the routine to construct an arc tangent with two shapes.

Chamfer: Provides an additional function on the edit menu to automatically construct a chamfered corner.

The chamfer line for the shape selected will be constructed at any specified angle (45-degree default). Selection of the chamfer option will require the user to indicate the offset distance on the selected corner.

DX, DY Value Input: Provides the user with the ability to keyboard-input DX and/or DY values for construction options (e.g., circle, box).

For all construction routines, first entry is considered as absolute X,Y coordinates and all consecutive keyboard entries as DX, DY. Any light-pen entries will always be considered as absolute X,Y. This DX, DY ability would, for example, provide the user the ability to key in radius values in the circle/ellipse option, and height and width for box.

Expansion of Cross-Hatch Option for Pouche': Provides the ability to graphically fill shapes and patterns with a user-defined symbol from the symbol library.

This option fulfills the requirements of the construction industry for fill symbolization. The drafter is able to define several fill patterns in the symbol library that can be called and automatically replicated to graphically represent various construction materials. Pouche' will have a no-show option to improve display quality by reducing flicker.

First or Third Angle Isometric Projection: Provides capability for first or third angle isometric projection.

First or third angle isometric projection is constructed automatically based on the orientation of the orthographic views.

Automatic Dimensioning of Angles: Provides an automatic angular dimensioning routine.

Entry to this routine is invoked through the edit menu by selecting DIMEN and RADIAL, and then selecting a non-circular/arc shape. The angular dimension is created after selecting the first line, the second line, and locating the dimension line point. The dimension line is drawn to the form of a circular arc from the first extension or selected line to the second, and through the dimension point.

Dimensioning with Use of Prefix/Suffix: Provides the ability to insert custom prefix or suffix text with dimension text.

The Prefix/Suffix option is added to the Customizing menu as follows:

PREFIX = YES | NO

SUFFIX = YES | NO

If the Yes option has been selected, a prompt message will be displayed just before and/or after the 'ENTER DIMENSION TEXT' prompt appears.

Additional Line Type and Dimension Terminators: Provides greater versatility and accommodates the construction industry.

Additional dimension line terminators can be specified on the customizing menu:

- a) - (dot at one end point)
- b) (dots at both end points)
- c) /----- / (slash at both end points)

Additional line type:

-----/\--- - (break line)

CUSTOMER RESPONSIBILITIES

Licensed Program Installation: It is the customer's responsibility to install the 7361 Fastdraft Program Release 1.1. Release 1.1 will automatically be shipped to customers on multiple diskettes. Installation of the Release 1.1 software is accomplished by loading the diskettes in the proper sequence in the 7361 GPU Diskette Reader. Details for installation procedures are found in the Program Directory supplied with the program. The complete loading of the software will generally take less than one-half hour. There are no dependencies on external software for installation of the release.

Security: Since the 7361 System is intended to operate in a non-secure environment, customer management should institute appropriate controls and procedures to safeguard the files in the system, and to limit access only to those who have been explicitly authorized.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM 7361 Fastdraft licensed program runs only on an IBM Fastdraft System. Other than a minimum Fastdraft configuration, there are no hardware or software prerequisites.

The minimum Fastdraft Configuration consists of:

- An IBM 7361 Graphics Processor Unit.
- An IBM 3251 mdl 2 Display Station with its special drafting keyboard (#4621) and light-pen (#4750).
- An IBM 3101 Display Terminal Console.
- The IBM Fastdraft Licensed Program (5719-GP1).

Additional optional devices supported by the Fastdraft Program are:

- An IBM 7374 Color Plotter.
- A second IBM 3251 mdl 2 Display Station with its drafting keyboard and light-pen.

SOFTWARE REQUIREMENTS (None)

COMPATIBILITY

Drawings created on a Fastdraft System using the initial release (R1.0) of the Fastdraft Program can be processed on a system using Release 1.1.

7361 Fastdraft Program R1.1 (cont'd)**CONVERSION**

All Fastdraft customers will automatically receive Release 1.1 of the Fastdraft Program. It is recommended that all installed customers upgrade their program to Release 1.1. This is simply accomplished by reloading the system software as described under "Customer Responsibilities". Central Service of the initial release (R1.0) of the Fastdraft Program will be discontinued 90 days after the availability of Release 1.1.

DOCUMENTATION

(available from Mechanicsburg)

Shipped with the program: *IBM 7361 Licensed Program Specifications* (GC34-0513).

Updated to reflect Release 1.1 functions: *IBM 7361 Fastdraft System Guide* (SC34-0514) ... *IBM 7361 Fastdraft Training Guide* (SC34-0515) ... *IBM Fastdraft Workstation Reference* (SC34-0516).

Problem Determination: Customers will use the problem determination procedures specified in the *IBM Fastdraft System Guide*. The procedures lead the user through a series of steps which indicate the fastest probable path to problem resolution.

A key assumption in the design of the diagnostic procedures is that most users do not have computer or data processing experience. These procedures help to guide users simply and sequentially to the resolution of a problem, or to the source of the assistance necessary to resolve it.

Some fault conditions can be resolved by the customer without further assistance. If indications are that the problem is in the hardware, the customer calls his Local Customer Service Division. However, if the indications are that the problem is within the software, problem resolution is supported as follows:

Customer calls the Graphics Systems Program (GSP) Customer Assistance Center using the instructions provided with the Fastdraft Licensed Program. The center will respond, using the appropriate level of support, until the problem is resolved.

Education: The *IBM 7361 Fastdraft Training Guide*, a self-study guide, will be available. Formal classroom training is not required.

RPQs ACCEPTED: Yes

PROGRAM PRODUCTS

**SERIES/1 REALTIME PROGRAMMING SYSTEM
X.25/HDLC COMMUNICATIONS SUPPORT
VERSION 1 (5719-HD1)**

PURPOSE

The Series/1 Realtime Programming System X.25/HDLC Communications Support is a licensed program that extends the IBM Series/1 Realtime Programming System Version 6 to provide Read/Write level X.25/HDLC support for the DLC Adapter (RPQ 8T1067), the SDLC Single-Line Control (#2090), and the Synchronous Communications Single-Line Control/High Speed (#2080).

HIGHLIGHTS

This licensed program consists of a set of functional modules and provides the user with two levels of programmable interface:

1. HDLC Frame Level Interface. Supported protocols in this interface are:
 - a. Asynchronous Balanced Mode (ABM).
 - b. Normal Response Mode (NRM).
2. X.25 Packet Interface.

The interfaces 1 (a) and 2 correspond, respectively, to Level 2 and Level 3 of CCITT Recommendation X.25.

DESCRIPTION

The attachments and their operational modes supported by this licensed program are summarized in the following chart:

	X.25 Inter- face+	ABM Only FDX	NRM Primary/ HDX	Secondary/ FDX	Physi- cal Inter- face	Max. Speed (bps)
#2080	S	S	S	S	X.21 V.35	48000 56000
#2090	S **	S **	S	S **	V.24	19200
RPQ 8T1067	S *	S *	NS	S *	V.24	19200

Legend:

- HDX Half-duplex.
- FDX Full-duplex.
- S Supported.
- NS Not supported.
- * Requires quantity two in RPQ 8T1067.
- + Requires the selection of appropriate physical interfaces per individual network specifications.
- ** Requires quantity two on #2090 which must be equipped with EC 336758.

In addition, the X.25/HDLC Communications Support will be supported by the Series/1 Communications Manager (5719-CM2) via message path programs both at frame and at packet level.

Highlights of Each Programmable Interface:

- HDLC Communications Support
 - Supports ABM (as defined by CCITT Recommendation X.25 LAPB procedure).
 - Supports NRM for primary and secondary stations.
 - Supports multiple data links on a single Series/1 system.
 - Supports unextended (Modulo 8) control formats for commands and responses.
 - Supports data link control procedures for link initiation and termination, data transfer, link-state control and identification, and error recovery.
 - Supports HDLC ABM two-way simultaneous (duplex) point-to-point communications between 'combined' stations.
 - Supports HDLC NRM two-way simultaneous (duplex) and two-way alternate (half-duplex) communications on a point-to-point or multipoint link. The Series/1 can act as a primary or a secondary station.
 - Is supported by IBM Series/1 Communications Manager (5719-CM2) licensed program via message path program.
- X.25 Communications Support
 - Supports CCITT Recommendation X.25 (1980).
 - Supports DTE-to-DCE and DCE-to-DTE protocols.
 - Supports multiple permanent virtual circuits and virtual calls for concurrent access on an X.25 interface.

- Supports packet sizes of 32, 64, 128, 256, 512 and 1024 octets.
- Manages packet-level protocols including call establishment/clearing, data transfer and flow control.
- Performs data segmentation/concatenation and manages More Data ('M') bit.
- Allows user application to control the Qualifier ('Q') bit and the Delivery Confirmation ('D') bit.
- Allows application program access to carrier-supported optional facilities which are controlled by the application program. Examples of optional facilities are:

Throughput Class
Reverse Charging
Closed User Group
Priority Service

- Is supported by the IBM Series/1 Communications Manager licensed program (5719-CM2) via message path program.

Typical functions of user applications based on the Realtime Programming System X.25/HDLC Communications Support are:

- Protocol conversion: To enable non-packet mode terminals on a Series/1 to communicate with a packet switched data network.
- Networking: Where X.25 or HDLC are being used as the communication protocols between Series/1s.

CURRENT SUPPORT

This program is compatible with the 1980 version of the CCITT X.25 recommendation, and is intended to attach to packet switched networks conforming to this recommendation. If the network supplier requires certification, it is the responsibility of the customer or the network supplier to obtain the necessary certification.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified environment:

HARDWARE REQUIREMENTS

The basic system requirement is a minimum IBM Series/1 Realtime Programming System Version 6 system (5719-PC6) plus the following:

- One of the following communication adapters:

Adapter Feature	Description	Inter- face	Operating Mode
#2080	Synchronous Communication Single-Line Control/ High Speed	X.21 V.35	X.25, ABM, NRM (HDX & FDX)
#2090 -1 card -Pair	SDLC Single-Line Control	V.24	NRM, HDX X.25, ABM, NRM, FDX
RPQ 8T1067 Pair	DLC Adapter	V.24	X.25, ABM, NRM FDX

- One of the following cables appropriate to the communication adapter:

Cable Feature	Description	For Use With
#2067	X.21 DCE Cable	#2080
#2060	V.35 High Speed DDN Cable	#2080
#2057	EIA Data Set Cable	#2090-1 card
RPQ D02063	EIA Duplex Cable	RPQ 8T1067 Pair #2090 Pair

- One Timer feature #7840 dedicated for this licensed program.

SOFTWARE REQUIREMENTS

PROGRAM PRODUCTS

Series/1 RPS X.25/HDLC Communications Support (cont'd)

The Realtime Programming System X.25/HDLC Communications Support operates under control of the IBM Series/1 Realtime Programming System Version 6 (5719-PC6). For preparation of user-written programs and installation, the Program Preparation Subsystem Version 6 (5719-AS6) is required.

COMPATIBILITY

The Realtime Programming System X.25/HDLC Communications Support provides source and object code compatibility for user application programs already in use with Series/1 Realtime Programming System Packet Network Support (5799-TCP) (PRPQ P10008).

SECURITY, AUDITABILITY and CONTROL

User management is responsible for evaluating, applying and implementing any Security and Auditability features for the appropriate administrative and application controls.

For applications in which sensitive data is sent over external communication facilities, user management may wish to augment those facilities with the application of cryptography.

PERFORMANCE CONSIDERATIONS

Performance of this program is highly dependent on the user application as well as on the hardware and software used in the Series/1 system. Refer to *RPS X.25/HDLC Communications Support: Programming and Operating Reference Manual* (SC09-1029) for details.

DOCUMENTATION

PROGRAM PRODUCTS

**SERIES/1 EVENT DRIVEN EXECUTIVE
X.25/HDLC (HIGH-LEVEL DATA LINK CONTROL)
COMMUNICATIONS SUPPORT (5719-HD2)**

PURPOSE

The Series/1 Event Driven Executive X.25/HDLC Communications Support extends the Series/1 Event Driven Executive (EDX) Version 4 to provide Read/Write level X.25/HDLC support for the SDLC Single-Line Control (#2090), and the Synchronous Communications Single-Line Control/High-Speed (#2080).

HIGHLIGHTS

This licensed program consists of a set of functional modules and provides the user with two levels of EDL (Event-Driven Language) instructions:

1. HDLC Frame Interface. Supported protocols in this interface are:
 - a. Asynchronous Balanced Mode (ABM).
 - b. Normal Response Mode (NRM).
2. Packet Interface.

The interfaces 1 (a) and 2 correspond, respectively, to Level 2 and Level 3 of CCITT Recommendation X.25.

DESCRIPTION

The attachments and their operational modes supported by this licensed program are summarized in the following chart:

	X.25 Inter- face*	ABM Only FDX	NRM Primary HDX	Secondary FDX	Physi- cal Inter- face	Max. Speed (bps)
#2080	S	S	S	S	X.21 V.35	48,000 56,000
#2090	S **	S **	S	S **	V.24	19,200

Legend:

- HDX Half-duplex.
- FDX Full-duplex.
- S Supported.
- * Requires the selection of appropriate physical interfaces per individual network specifications.
- ** Requires a quantity of two on #2090 which must be equipped with EC 336758.

Highlights of Each Programmable Interface:

- HDLC Communications Support
 - Supports ABM (as defined by CCITT Recommendation X.25 LAPB procedure).
 - Supports NRM for primary and secondary stations.
 - Supports multiple data links on a single Series/1 system.
 - Supports unextended (Modulo 8) control formats for commands and responses.
 - Supports data link control procedures for link initiation and termination, data transfer, link-state control and identification, and error recovery.
 - Supports HDLC ABM 2-way simultaneous (duplex) point-to-point communications between 'combined' stations.
 - Supports HDLC NRM 2-way simultaneous (duplex) and two-way alternate (half-duplex) communications on a point-to-point or multipoint link. The Series/1 can act as a primary or a secondary station.
- X.25 Communications Support
 - Supports CCITT Recommendation X.25 (1980).
 - Supports DTE-to-DCE and DCE-to-DTE protocols.
 - Supports multiple permanent virtual circuits and virtual calls for concurrent access on an X.25 interface.
 - Supports packet sizes of 16, 32, 64, 128, 256, 512 and 1,024 octets.
 - Manages packet-level protocols including call establishment/clearing, data transfer and flow control.
 - Performs data segmentation/concatenation and manages More Data ('M') bit.
 - Allows user application to control the Qualifier ('Q') bit and the Delivery Confirmation ('D') bit.

- Allows application program access to carrier-supported optional facilities which are controlled by the application program. Examples of optional facilities are:

- Throughput Class
- Reverse Charging
- Closed User Group
- Priority Service

Typical functions of user applications based on the EDX X.25/HDLC Communications Support are:

- Protocol conversion: To enable non-packet mode terminals on a Series/1 to communicate with a packet-switched data network.
- Networking: Where X.25 or HDLC are being used as the communication protocols between Series/1s.

CURRENT SUPPORT

This program is compatible with the 1980 version of the CCITT X.25 recommendation, and is intended to attach to packet-switched networks conforming to this recommendation. If the network supplier requires certification, it is the responsibility of the customer or the network supplier to obtain the necessary certification.

Network Country

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The basic system requirement is a minimum IBM Event Driven Executive Version 4 system (5719-XS4), plus the following:

- One of the following communication adapters:

Adapter Feature	Description	Inter- face	Operating Mode
#2080	Synchronous Communication Single-Line Control/ High-Speed	X.21 V.35	X.25, ABM, NRM (HDX & FDX)
#2090 -1 card -Pair	SDLC Single-Line Control	V.24	NRM (HDX) X.25, ABM, NRM (FDX)

- One of the following cables appropriate to the communication adapter:

Cable Feature	Description	For Use With
#2067	X.21 DCE Cable	#2080
#2060	V.35 High-Speed DDN Cable	#2080
#2057	EIA Data Set Cable	#2090-1 card
#2062	EIA Duplex Cable	#2090 Pair

SOFTWARE REQUIREMENTS

The EDX X.25/HDLC Communications Support operates under control of the IBM Series/1 Event Driven Executive Version 4 (5719-XS4). For installation of this program and for preparation of user-written programs, EDX Program Preparation Facility (5719-XX5) will be required.

SECURITY, AUDITABILITY and CONTROL

User management is responsible for evaluating, applying and implementing any Security and Auditability features for the appropriate administrative and application controls.

For applications in which sensitive data is sent over external communication facilities, user management may wish to augment those facilities with the application of cryptography.

**MATHEMATICAL and FUNCTIONAL SUBROUTINE
LIBRARY (MFSL) (5719-LM1)**

Before ordering, refer to pages for MFSL Version 2. MFSL Version 2 provides commercial subroutines in addition to the subroutines provided by this licensed program.

PURPOSE

The IBM Series/1 Mathematical and Function Subroutine Library (MFSL) is a set of subroutines that aids in developing application programs. MFSL offers the user of Series/1 a library of subroutines that meets a wide range of requirements in the area of mathematical and data conversion functions. All routines are reentrant.

The MFSL subroutines are used with the Series/1 FORTRAN IV licensed program or the Macro Assembler language provided with the Program Preparation Subsystem licensed program. The operating environment required for MFSL, FORTRAN IV, and the Macro Assembler is provided by the Realtime Programming System licensed program. MFSL is compatible with any Series/1 hardware configuration that includes the floating-point feature or has the floating-point emulator feature on the Realtime Operating System.

DESCRIPTION

MFSL contains four types of subroutines: (1) mathematical functions such as SIN and SORT, (2) EBCDIC conversion subroutines such as EBCDIC-to-floating-point, (3) error-checking subroutines, and (4) subroutine library services.

The facilities provided by MFSL are mathematical functions, data conversion routines, error handling routines and service subroutines. The following sections describe the capabilities of these functions.

Mathematical Subroutines

Arc tangent, one or two arguments:

Given one argument, an arc tangent subroutine returns the angle that has the argument as its tangent. Given two arguments, an arc tangent subroutine returns the angle that has the quotient of two arguments as its tangent. All angles are in radians.

Cosine:

A sine-cosine subroutine returns the value of the cosine of the argument. All angles are in radians.

Exponential function:

An exponential subroutine returns the value of e raised to the power of the argument.

Exponentiation:

An exponentiation subroutine returns the value of any base raised to any power.

Hyperbolic tangent:

A hyperbolic tangent subroutine returns the value of the hyperbolic tangent for the argument.

Logarithms, common or natural:

Logarithmic subroutines return the value of the base 10 or base e logarithm of the argument.

Maximum value:

A maximum value subroutine returns the value of the largest argument in a set of arguments.

Minimum value:

A minimum value subroutine returns the value of the smallest argument in a set of arguments.

Modular arithmetic:

A modular arithmetic subroutine returns the remainder from the division of two arguments.

Positive difference:

A positive difference subroutine returns the positive difference between the first argument and the smaller of two arguments.

Sine:

A sine-cosine subroutine returns the value of the sine of the argument. All angles are in radians.

Square root:

A square root subroutine returns the value of the square root of the argument.

Transfer of sign:

A transfer-of-sign subroutine returns the value of the sign of the second argument concatenated to the absolute value of the first argument.

Doubleword integer multiplication:

This subroutine computes the product of a doubleword integer multiplier multiplied by a doubleword integer multiplicand.

Doubleword integer division:

This subroutine computes the quotient of a doubleword integer dividend divided by a doubleword integer divisor.

Conversion Subroutines

EBCDIC to floating-point:

A conversion subroutine converts an EBCDIC input into a floating-point number, single precision or double precision.

EBCDIC to integer:

A conversion subroutine converts an EBCDIC input into an integer value, either fullword or doubleword.

Floating-point to EBCDIC:

A conversion subroutine converts a floating-point number (single precision or double precision) into an EBCDIC output (with or without exponent).

Integer to EBCDIC:

A conversion subroutine converts an integer value (fullword or doubleword) into an EBCDIC output (with or without exponent).

Error Recovery Features

Error checking subroutine:

Error function subroutine to determine if an error was detected in any MFSL logarithmic, trigonometric, exponentiation, square root, or conversion subroutine since the last call to function test.

Floating-point divide exception:

A floating-point divide exception subroutine determines if an error in a floating-point divide operation has occurred since the last call to floating-point divide exception.

Floating-point overflow/underflow:

A floating-point overflow/underflow subroutine determines if an overflow or underflow condition has occurred since the last call to floating-point overflow/underflow.

Service Subroutines (Assembler Applications Only)

Library work area initialization/termination:

An initialization or termination subroutine creates or deletes a work area in storage for user communication (error flagging).

Abnormal termination routine specification:

An abnormal termination routine specification subroutine allows the user to specify a routine to receive control if a program interruption occurs or if an abnormal termination macro instruction (STOPTASK) is issued.

Additional Descriptions of MFSL Functions...

Library Interfaces

The library subroutines can be used in either a FORTRAN IV or Assembler language program. In FORTRAN IV, calls to the library are either at the programmer's request through explicit references to subroutine names or in response to the FORTRAN IV exponentiation notation. In Assembler language, all MFSL subroutines are invoked through explicit calls to subroutine names. The MFSL subroutines are added to the application load module by the application builder through automatic calls to the subroutine library.

MFSL RAS

Error conditions encountered in the mathematical subroutines (such as square root of a negative number, etc.) are recognized by the subroutines internally. The user program should interrogate for such errors.

Error conditions related to hardware operations (such as divide by zero) are recognized by the operating system.

MFSL is dependent upon the Realtime Programming System for programming RAS. It recognizes mathematical errors (such as log of a negative number) internally, expecting FORTRAN IV-coded user programs to check if such an error has an effect on program logic.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

MFSL (cont'd)**SYSTEM REQUIREMENTS**

MFSL runs under the control of the Realtime Programming System and depends upon the operating system to be its complete and only interface to hardware.

MFSL is compatible with any Series/1 hardware configuration that includes the primary and secondary storage required for the MFSL subroutines used. The configuration requires floating-point support only if the user application uses REAL numbers. MFSL functions operate on integer or fixed-point support. The MFSL subroutines are added by the Application Builder through automatic calls to the subroutine library.

HARDWARE REQUIREMENTS

The following are the hardware requirements for MFSL:

- IBM 4952, 4953, or 4955 Processors
- Floating-Point feature or emulation under Series/1 Realtime Programming System
- MFSL requires only a processor and storage to execute. The MFSL storage requirement is a function of the size of each subroutine used, the length of each call to those subroutines, plus the storage requirements of dependent subroutines and the size of any error exit routines. The minimum system is defined by the Realtime Programming System.

TERMS and CONDITIONS: See PP Index

MATHEMATICAL AND FUNCTIONAL SUBROUTINE LIBRARY (MFSL) VERSION 2 (5719-LM2)

PURPOSE

The IBM Series/1 Mathematical and Functional Subroutine Library (MFSL) Version 2 (5719-LM2) is a licensed program which provides all the facilities of the Mathematical and Functional Subroutine Library Version 1 (5719-LM1) plus commercial subroutines. The commercial subroutines offer the users of Series/1 a library of subroutines that will meet most requirements for decimal data handling. The commercial subroutines provide comprehensive facilities for editing, decimal arithmetic, data compaction, and conversion subroutines for data manipulation. These subroutines are similar to commercial subroutine packages offered on other IBM systems.

The commercial subroutines are callable through Series/1 FORTRAN IV or the Macro Assembler program provided with the Series/1 Program Preparation Subsystem. The operating environment required for MFSL Version 2, FORTRAN IV and Assembler is provided by the Series/1 Realtime Programming System.

DESCRIPTION

The commercial subroutines are intended to facilitate the use of FORTRAN and Macro Assembler for commercial programming. They are reentrant which results in efficient storage utilization.

The following subroutines are included:

- An editing subroutine, EDIT, for the preparation of output in special formats. The EDIT subroutine includes functions to insert commas, supply leading blanks, float dollar signs, and insert a CR symbol after negative numbers. EDIT functions are useful in the preparation of invoices, checks, and other commercial documents.
- Data compaction and conversion subroutines for data manipulation and data packing:

PACK	A1 Format to A2 Format
UNPACK	A2 Format to A1 Format
A1DEC	A1 to Decimal Format
DECA1	Decimal to A1 Format

- Variable-length decimal arithmetic subroutines for arithmetic operations with integer or decimal numbers, with field lengths specified by the user. Subroutines included are decimal add (ADD), subtract (SUB), multiply (MPY), divide (DIV), compare (ICOMP), and sign test (NSIGN).
- Utility subroutines for:

LCOMP, NCOMP	For comparing two variable-length, alphameric (A1) fields
MOVE	For moving data from one area to another
FILL	To fill an area with a specified value

In summary, the following are the provided functions:

Function Name	Function
MOVE	Moving data from one area to another
FILL	Fill an area with special character
EDIT	Edit data between arrays, with edit-mask
*NCOMP	Logical compare between data fields
*LCOMP	Logical compare between data fields
ICOMP	Algebraic compare between data fields for NOCOMPAT compiler option use KCOMP
ADD	Sums two arbitrary length data fields
SUB	Subtracts two arbitrary length data fields
DIV	Divides arbitrary length data fields
MPY	Multiplies arbitrary length data fields
NSIGN	Interrogates sign of decimal data field
PACK	Packs 2 characters per word into A2 format
UNPACK	Unpacks 2 characters into A1 format
A1DEC	Converts from A1 format to D1 format
DECA1	Converts from decimal format to A1 format

* NCOMP supports 1130 collating sequence; LCOMP supports Series/1 collating sequence.

Detailed information on the use of subroutines, data format requirements, and call parameters, is provided in the *IBM Series/1 Mathematical and Functional Subroutine Library User's Guide* (SC34-0139).

The Mathematical and Functional Subroutine Library Version 2 (5719-LM2) includes a set of commonly used subroutines that aid in developing application programs. All routines are reentrant.

For details on these subroutines see the pages for the Mathematical and Functional Subroutine Library (5719-LM1).

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

SYSTEM REQUIREMENTS

MFSL Version 2 runs under all versions of the Realtime Programming System.

MFSL Version 2 is compatible with any Series/1 hardware configuration that includes main and external storage required for the MFSL subroutines used. The Series/1 commercial subroutines which are part of MFSL Version 2 use no floating-point and have no requirements for floating-point support. The overall configuration may require floating-point support only if the user application uses REAL numbers. The MFSL subroutines are added by the Application Builder through automatic calls to the subroutine library.

HARDWARE REQUIREMENTS

The following are the hardware requirements for MFSL:

- IBM 4952, 4953 or 4955 Processors
- For Real numbers, Floating-Point feature or emulation under Series/1 Realtime Programming System for REAL numbers.
- MFSL Version 2 requires only a processor and storage to execute. The storage requirement is a function of the size of each subroutine used, the length of each call to those subroutines, plus the storage requirements of dependent subroutines and the size of any error exit routines. The minimum system is defined by the Realtime Programming System.

Hardware Products Supported

Device Support Processors

IBM 4952 models A or B
 IBM 4953 models A, B, C, or D
 IBM 4955 models A, B, C, D, or E

Disk

IBM 4962 models 1, 1F, 2, 2F, 3, or 4
 IBM 4963 Disk Subsystem

Diskette

IBM 4964 Diskette Unit model 1
 IBM 4966 Diskette Magazine Unit

Printer

IBM 4973 Line Printer models 1 or 2
 IBM 4974 Matrix Printer model 1

Display Station

IBM 4979 model 1
 IBM 4978 model 1

Magnetic Tape

IBM 4969

Sensor I/O

IBM 4982

Features

- #1560 - Native attach Sensor I/O
- #7840 - Timer
- #7850 - TTY Adapter (supported for use with Teletype® Models ASR 33/35 or IBM 3101 Display Terminal)
- #3920 - Floating-Point Processor (transparent to FORTRAN)
- #6335 - Storage Address Relocation Translator (IBM 4955 models B or D)

All I/O devices are accessed through Realtime Programming System control program services, and all disks and diskettes supported by Versions 1, 2, 3 or 4 of Realtime Programming System are supported. Floating-point is required, either by hardware feature or by emulation. For a more detailed description of model types and options, refer to the operating system and processors being used.

LIBRARY (MFSL)
5719-LM3**

A new licensed program, IBM Series/1 Event Drive Executive Mathematical and Functional Subroutine Library (5719-LM3), is available for the IBM Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS1).

The Event Driven Executive Mathematical and Functional Subroutine Library (MFSL) is a set of subroutines that aids in developing application programs. MFSL offers the user of Series/1 a library of subroutines that meets a wide range of requirements in the area of mathematical and data conversion functions. In addition, there are commercial subroutines which provide comprehensive facilities for editing, decimal arithmetic, data compaction and conversion subroutines for data manipulation.

The MFSL subroutines are used with the Series/1 FORTRAN IV licensed program (5719-FO2) on the Event Driven Executive Operating System. The operating environment required for MFSL, FORTRAN IV and Program Preparation Facility is provided by the Event Driven Executive Basic Supervisor and Emulator (5719-XS1).

DESCRIPTION

MFSL contains three types of subroutines: (1) mathematical functions such as SIN and SQRT, (2) EBCDIC conversion subroutines such as EBCDIC-to-floating-point, and (3) commercial subroutines.

Mathematical Subroutines

Arc tangent, one or two arguments:

Given one argument, an arc tangent subroutine returns the angle that has the argument as its tangent. Given two arguments, an arc tangent subroutine returns the angle that has the quotient of two arguments as its tangent. All angles are in radians.

Cosine:

A sine-cosine subroutine returns the value of the cosine of the argument. All angles are in radians.

Exponential function:

An exponential subroutine returns the value of any base raised to any power.

Exponentiation:

An exponentiation subroutine returns the value of any base raised to any power.

Hyperbolic tangent:

A hyperbolic tangent subroutine returns the value of the hyperbolic tangent for the argument.

Logarithms, common or natural:

Logarithmic subroutines return the value of the base 10 or base e logarithm of the argument.

Maximum value:

A maximum value subroutine returns the value of the largest argument in a set of arguments.

Minimum value:

A minimum value subroutine returns the value of the smallest argument in a set of arguments.

Modular arithmetic:

A modular arithmetic subroutine returns the remainder from the division of two arguments.

Positive difference:

A positive difference subroutine returns the positive difference between the first argument and the smaller of two arguments.

Sine:

A sine-cosine subroutine returns the value of the sine of the argument. All angles are in radians.

Square root:

A square root subroutine returns the value of the square root of the argument.

Transfer of sign:

A transfer-of-sign subroutine returns the value of the sign of the second argument concatenated to the absolute value of the first argument.

Doubleword integer multiplication:

This subroutine computes the product of a doubleword integer multiplier multiplied by a doubleword integer multiplicand.

Doubleword integer division:

This subroutine computes the quotient of a doubleword integer dividend divided by a doubleword integer divisor.

Conversion Subroutines

EBCDIC to floating-point:

A conversion subroutine converts an EBCDIC input into a floating-point number single precision or double precision.

EBCDIC to integer:

A conversion subroutine converts an EBCDIC input into an integer value either fullword or doubleword.

Floating-point to EBCDIC:

A conversion subroutine converts a floating-point number (single precision or double precision) into an EBCDIC output (with or without exponent).

Integer to EBCDIC:

A conversion subroutine converts an integer value (fullword or doubleword) into an EBCDIC output (with or without exponent).

Commercial Subroutines

- An editing subroutine, EDIT, for the preparation of output in special formats. The EDIT subroutine includes functions to insert commas, supply leading blanks, float dollar signs, and inset a CR symbol after negative numbers. EDIT functions are useful in the preparation of invoices, checks, and other commercial documents.

- Data compaction and conversion subroutines for data manipulation and data packing:

PACK	A1 Format to A2 Format
UNPACK	A2 Format to A1 Format
A1DEC	A1 to Decimal Format
DECA1	Decimal to A1 Format

- Variable-length decimal arithmetic subroutines for arithmetic operations with integer or decimal numbers, with field lengths specified by the user. Subroutines included are decimal add (ADD), subtract (SUB), multiply (MPY), divide (DIV), compare (ICOMP), and sign test (NSIGN).

- Utility Subroutines for:

LCOMP	For comparing two variable-length, alphanumeric (A1) fields.
NCOMP	
MOVE	For moving data from one area to another.
FILL	To fill an area with a specified value.

In summary, the following are the provided functions:

Function Name	Function
MOVE	Move data from one area to another
FILL	Fill an area with a special character
EDIT	Edit data between arrays, with edit-mask
NCOMP*	Logical compare between data fields
LCOMP*	Logical compare between data fields
ICOMP	Algebraic compare between data fields for NOCOMPAT compiler option use KCOMP
ADD	Sum two arbitrary length data fields
SUB	Subtract two arbitrary length data fields
DIV	Divide arbitrary length data fields
MPY	Multiply arbitrary length data fields
NSIGN	Interrogate sign of decimal data field
PACK	Pack 2 characters per word into A2 format
UNPACK	Unpack 2 characters into A1 format
A1DEC	Converts from A1 format to D1 format
DECA1	Converts from decimal format to A1 format

* NCOMP supports 1130 collating sequence; LCOMP supports Series/1 collating sequence.

Detailed information on the use of subroutines, data format requirements, and call parameters is provided in the *IBM Series/1 Mathematical and Functional Subroutine Library User's Guide* (SC34-0139).

EDX MFSL (cont'd)**CUSTOMER RESPONSIBILITIES**

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

- IBM 4952, 4953, or 4955 Processors.
- For floating-point numbers, the hardware floating-point feature (#3920) is required (available on IBM 4955 only).
- The storage requirement is a function of the size of each subroutine used, the length of each call to those subroutines, plus the storage requirements of dependent subroutines and the size of any error exit routines.

SOFTWARE REQUIREMENTS

IBM Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS1, 5719-XS2, 5719-XS3). MFSL runs under the IBM Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS1). MFSL is compatible with any Series/1 hardware configuration that includes main and external storage required for the MFSL subroutines used. The Series/1 Commercial Subroutines which are part of MFSL use no floating-point and have no requirements for floating-point support. The overall configuration will require floating-point support only if the user application uses REAL numbers. The MFSL subroutines are added by the Linkage Editor through automatic calls to the subroutine library.

Program Currency

For program support purposes, a licensed program is considered current if it is the current release of the program and all PID-distributed refreshes/PTFs have been applied.

**EVENT DRIVEN EXECUTIVE
LICENSED PROGRAMS VERSION 1**

MACRO LIBRARY -- (5719-LM5)
UTILITIES -- (5719-UT3)
BASIC SUPERVISOR AND EMULATOR -- (5719-XS1)
PROGRAM PREPARATION FACILITY -- (5719-XX2)
MACRO LIBRARY/HOST -- (5740-LM2)

Version 1.1 of the following licensed programs is available for the IBM Series/1 Event Driven Executive:

**EVENT DRIVEN EXECUTIVE MACRO LIBRARY
(5719-LM5)**

A set of macros which can be used to build a Basic Supervisor and Emulator and to assemble application programs written in the Event Driven Executive Language and/or Series/1 instruction set under the Event Driven Executive Macro Assembler (5719-ASA).

**EVENT DRIVEN EXECUTIVE UTILITIES
(5719-UT3)**

A set of utility programs that serve as productivity aids for application development and installation. These programs are independent load modules capable of running concurrently with other application programs under the Basic Supervisor and Emulator.

**EVENT DRIVEN EXECUTIVE BASIC SUPERVISOR AND EMULATOR
(5719-XS1)**

A multiprogramming system supervisor controlled by a user-oriented instruction set. This supervisor supports multiple, independent, time dependent, and/or event driven applications with minimum interaction. This support includes:

- The ability to initiate any application program from a terminal or another application program and to pass parameters to the new program
- Multitasking within each application program, with pre-emptive task switch
- Multiple terminal support so terminals may be dynamically assigned to each application requiring them
- A relocating loader so an application program may use any available main storage area at the time of invocation

**EVENT DRIVEN EXECUTIVE PROGRAM PREPARATION FACILITY
(5719-XX2)**

A group of programs to compile and link-edit application programs written in the Event Driven Executive language only. These programs may run concurrent with the execution of other programs, including other program preparation programs. The user can also reconfigure, compile and link-edit custom supervisors online.

**EVENT DRIVEN EXECUTIVE MACRO LIBRARY/HOST
(5740-LM2)**

A set of macros which provide the capability to assemble application programs written in the Event Driven Executive language and/or Series/1 instruction set on a host System/370 in conjunction with that system's program preparation facilities.

PURPOSE

Together, the above listed licensed programs form a set of productivity tools, enhancing the implementation of user application programs on the Series/1.

The Event Driven Executive is an entry level operating system on the Series/1 that can apply to a broad range of applications such as data entry, distributed processing, and other commercial applications; as well as typical sensor-based functions such as data acquisition, material and component testing, machine and process control, and shop floor control.

The Event Driven Executive and the Series/1 offer the user many benefits including:

- Multiprogramming diskette-based or disk-based capability
- User-oriented, simple and easy-to-learn
- Flexibility and ease-of-expansion
- Application development productivity that can aid in reducing the cost and time to put the user's application into service

HIGHLIGHTS**Multiprogramming multitasking supervisor**

- Up to 512 task priorities
- Multiple independent applications can run concurrently.
- In general, utility programs can run concurrently with application programs.
- Multiple copies of the same program can run concurrently.

Macro instructions high-level instruction set

- Emulator, table driven
- Simple, easy-to-learn and use
- Integer/Floating-Point calculations and logical functions [execution of floating point operations are limited to the 4955 Processor with the Floating-Point feature (#3920)]
- Structured program functions such as DO, IF THEN, ELSE, UNTIL
- Timing, realtime clock functions
- Realtime dynamic task control and synchronization with POST, WAIT, QUEUE, ATTACH
- Teleprocessing capability with BTAM-like BSC access method for multiple lines in point-to-point, switched, and/or multidrop configurations. In addition, direct read/write to System/360 or System/370 (Host) data sets and job submission to host batch processor is supported via the System/370 Event Driven Executive Host Communications Facility IUP (5796-PGH).
- Interactive terminal commands with forms and screen control
- Allows for the inclusion of basic Series/1 assembler instructions
- Generalized EXIO interface
- 128 byte/sector diskette interchange
- Data set management
- Distributed processing/communications control
- Source program entry, line and full screen editing
- Interactive program debugging
- Program library update
- Sensor I/O test functions
- Graphics display processor
- Screen format builder
- Session manager facilities
- Job stream processor
- Remote job entry (2780- and 3780-like work station)
- Terminal configurator
- Binary Synchronous Communications trace
- Message sending
- 4978 customizing for image and control store

Multiple device support

- Any mix of supported disk or diskette storage units including the 4963 Disk Subsystem and the 4966 Diskette Magazine Unit
- Any mix of terminal units as identified under DEVICE SUPPORT including the 3101 Display Terminal and other ASCII devices

Sensor input/output support

- Analog Input (AI), Analog Output (AO), Digital Input (DI), Digital Output (DO), Process Interrupt (PI)
- Sequential and random input/output
- External synchronization
- Relay/Solid State, Multi-Range Analog Input

Low storage requirements

- Supervisor sizes can range from 12K bytes to 32K bytes or more
- Event Driven Executive language instructions typically average six to eight bytes of storage

Flexible operating environment

- Multitasking, storage resident only
- Multiprogramming diskette- or disk-based
- Multiprogramming, multi-terminal, communication to host, disk/diskette-based distributed processing and/or program preparation capability
- Optional diagnostic and recovery facilities such as error recording and program exception trace

Distributed processing support

- Uses Binary Synchronous Communications Single- and Multiple-Line Controllers (#2074, #2075, #2093, #2094)
- Compatibility with System/370 Event Driven Executive Host Communications Facility IUP (5796-PGH) for direct read/write

EDX Licensed Programs (cont'd)

access to host data sets and batch job submission to host System/360 or 370.

- Remote Job Entry (2780- or 3780-like) work station support to Host RJE (HASP, HASP 4, RES, JES 2, JES 3, VM-RSCS).

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support is provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system requirement for program execution as a multitasking system is:

- IBM 4953 or 4955 Processor with 16K bytes or an IBM 4952 Processor with the minimum 32K bytes (IBM 4955 Processor with Floating-Point feature (#3920), if floating-point calculations are included).
- IBM 4964 Diskette Unit or 4966 Diskette Magazine Unit as an IPL source
- Application requirements may expand the system beyond this minimum system.

For native program preparation, assembly and installation:

- IBM 4953 or 4955 Processor with 48K bytes or IBM 4952 Processor with 64K bytes
- IBM 4962 Disk Storage Unit or 4963 Disk Subsystem
- IBM 4964 Diskette Unit or 4966 Diskette Magazine Unit
- IBM 4973 Line or 4974 Matrix Printer (optional)
- IBM 4979 Display station
or
IBM 4978 Display Station
or
Teletypewriter Adapter with IBM 3101 Display Terminal or Teletype® Models ASR 33/35

The configuration must have the following standard address assignments in order to satisfy the minimum system requirements. (The Starter System supports the minimum system requirements.)

Description	Decimal Address	Hexadecimal Address
IBM 4962 Disk Unit	03	03
IBM 4963 Disk Subsystem	72	48
IBM 4964 Diskette	02	02
IBM 4966 Diskette Magazine	34	22
IBM 4973 Line Printer	33	21
IBM 4974 Printer	01	01
IBM 4978 or 4979 Display Station	04	04
#7850 Teletypewriter Adapter	00	00

SOFTWARE REQUIREMENTS

None.

COMPATIBILITY

Application programs generated for the EDX FDP (5798-NRR) or the licensed program (5719-XS1) prior to the availability of Version 1.1 are source compatible with some exceptions and will require recompilation or reassembly to execute under Version 1.1. If the application programs make reference to the supervisor area or have dependencies on internal supervisor structures, source code modifications may be required. Storage requirements for the Version 1.1 supervisor can be expected to increase up to 10% to 15% depending on system configuration and functions required. (Refer to the *IBM Series/1 Event Driven Executive System Guide*, (SC34-0312) for storage estimates and the *IBM Series/1 Event Driven Executive Planning Guide*, (GC34-0328), for compatibility details).

The following Series/1 Licensed Programs are compatible and required for use with the Event Driven Executive Version 1.1:

- EDX Macro Assembler Version 1.1 (5719-ASA)
- EDX FORTRAN IV Compiler and Object Support Library Version 1.1 (5719-FO2)
- EDX Mathematical and Functional Subroutine Library Version 1.1 (5719-LM3)
- EDX COBOL Compiler and Resident Library Version 1.1 (5719-CB3)

®Registered trademark of Teletype Corporation.

- EDX Sort/Merge Version 1.1 (5719-XM2)
- EDX Multiple Terminal Manager (5719-MS1)
- EDX Indexed Access Method (5719-AM3)

These licensed programs are available concurrent with the availability of Version 1.1. For details on these licensed programs refer to the respective pages.

Files

Data files generated by the FDP (5798-NRR) or Version 1.0 (5719-XS1) can be processed without charge by Version 1.1.

Preparation

For application development and installation of PID-distributed service material, the Event Driven Executive (EDX) licensed programs are used in the following ways:

- For native program preparation and assembly, the following licensed programs are prerequisite:
 - IBM Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS1)
 - IBM Series/1 Event Driven Executive Utilities (5719-UT3)
 - IBM Series/1 Event Driven Executive Program Preparation Facility (5719-XX2)

If the Series/1 instruction set is used, the Macro Assembler (5719-ASA) is required and the Macro Library (5719-LM5) may be used in lieu of (5719-XX2).

- For host program preparation of application programs the following programs are required:

On the System/370

- IBM Series/1 Event Driven Executive Macro Library/Host (5740-LM2)
- System/370 Program Preparation Facilities for Series/1 FDP (5798-NNQ)
- System/370 Event Driven Executive Host Communications Facility IUP (5796-PGH) (optional)

On the Series/1

- IBM Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS1)
- IBM Series/1 Event Driven Executive Utilities (5719-UT3)

- For program execution, the Event Driven Executive Basic Supervisor and Emulator is a prerequisite. If any of the utility program functions are to be executed as a part of the user's application solution, the Event Driven Executive Utilities is a prerequisite.

- The System/370 Event Driven Executive Host Communications Facility IUP (5796-PGH) or equivalent may be used if data reduction, storage and reporting functions are to be supported on a host System/360 or 370. The Remote Job Entry capability of the Event Driven Executive Utilities may also be used.

DEVICE SUPPORT

The following Series/1 hardware products are supported:

Processor

- 4955 up to 256K bytes with Storage Address Translator (#6335) (standard on 4955E)
- 4953 up to 64K bytes.
- 4952 up to 128K bytes

I/O Devices (multiples supported)

- 3101 Display Terminal (character move only)
- 4962 Disk Storage Unit
- 4963 Disk Subsystem
- 4964 Diskette Unit
- 4966 Diskette Magazine Unit
- 4973 Line Printer
- 4974 Printer
- 4978 Display Station
- 4979 Display Station
- 4982 Sensor I/O Unit and related features

Features (multiples supported)

- #1560 Integrated Digital Input/Output
- #1610 Asynchronous Communications Single-Line Control
- #2074 Binary Synchronous Communications Single-Line Control to 9600 bps

PROGRAM PRODUCTS

EDX Licensed Programs (cont'd)

- #2075 Binary Synchronous Communications Single-Line Control – High Speed to 56K bps
- #2091 Asynchronous Communications 8-Line Control
- #2092 Asynchronous Communications 4-Line Adapter
- #2093 Binary Synchronous Communications 8-Line Control
- #2094 Binary Synchronous Communications 4-Line Adapter
- #2095 Feature – Programmable 8-Line Control
- #2096 Feature – Programmable 4-Line Adapter
- #3920 Floating-Point (4955 Processor only)
- #7840 Timers
- #7850 Teletypewriter Adapter

**EVENT DRIVEN EXECUTIVE
LICENSED PROGRAMS VERSION 2**

**MACRO LIBRARY -- (5719-LM6)
UTILITIES -- (5719-UT4)
BASIC SUPERVISOR AND EMULATOR -- (5719-XS2)
PROGRAM PREPARATION FACILITY -- (5719-XX3)
MACRO LIBRARY/HOST -- (5740-LM3)**

Version 2 of these programs provides all the facilities of the respective Version 1 licensed programs plus the following features:

- Support for the 4969 Magnetic Tape Subsystem
- Remote Management Utility

The 4969 Magnetic Tape Subsystem Attachment supporting one-half inch (1/2") nine (9) track tape transports at data densities of 800 BPI NRZI or 1600 BPI PE is now added to Event Driven Executive supported devices.

HIGHLIGHTS

Device Support

The Event Driven Executive language and Assembler users are provided a READ/WRITE interface or may use the EXIO interface in support of the 4969 Magnetic Tape Subsystem. This support, provided by the Supervisor and Utilities, consists of:

- READ/WRITE block of data, minimum of 18 to maximum 32,766 bytes
- REWIND Tape
- WRITE TAPE MARK
- FORWARD SPACE record or file
- BACK SPACE record or file
- NOTE/POINT
- REWIND and set tape transport offline
- Label processing includes:
 - IBM DOS standard tables
 - Non-labelled tape
 - Label bypass
- Multiple files per volume
- ONLINE UTILITIES
 - Save/Restore Disk volume or total disk contents to/from tape
 - Copy Tape to disk/diskette/tape
 - Initialize Tape
 - Online Tape Exerciser
 - Tape to Printer

Language Support

Event Driven Executive FORTRAN (5719-FO2), COBOL (5719-CB3 and 5719-CB4), and PL/I (5719-PL5 and 5719-PL6) support the 4969 Magnetic Tape Subsystem. Event Driven Executive Sort/Merge (5719-SM2) supports magnetic tape for sort input and output files. Review "Compatibility" section for applicable versions.

Remote Management Utility

The Remote Management Utility provides the capability to control a remote Series/1 from another CPU. The Remote Management Utility runs as a program under the Event Driven Executive on the Series/1 and provides an interface to any host system that provides support via Binary Synchronous Communications in transparent mode. It is the user's responsibility to provide the program in the host processor to interface with the Remote Management Utility. The support provided by the Remote Management Utility includes:

- SEND - Read a disk/diskette data set on the Series/1 and transmit it to the host
- RECEIVE - Receive data from the host and write it to an existing disk/diskette data set on the Series1
- DELETE - Delete a disk/diskette data set on the Series/1
- ALLOCATE - Allocate disk/diskette data set on the Series/1
- DUMP - Dump storage to a disk/diskette data set on the Series/1
- WRAP - Transmit a block of data just received back to the host
- IDCHECK - Verify identification between host and Remote Management Utility
- EXEC - Initiate execution of a program on the Series/1
- SHUTDOWN - Terminate the Remote Management Utility and free any allocated resources; may also initiate execution of another program
- PASSTHRU - Establish an interactive connection between the host and an application or utility on the remote Series/1

Device Support

The following Series/1 hardware products are supported.

Processor

- 4955 up to 256K bytes with Storage Address Translator (#6335) (standard on 4955E)
- 4953 up to 64K bytes
- 4952 up to 128K bytes

I/O Devices (multiples supported)

- 3101 Display Terminal (character mode only)
- 4962 Disk Storage Unit
- 4963 Disk Subsystem
- 4964 Diskette Unit
- 4966 Diskette Magazine Unit
- 4969 Magnetic Tape Subsystem
- 4973 Line Printer
- 4974 Printer
- 4978 Display Station
- 4979 Display Station
- 4982 Sensor I/O Unit and related features

Features (multiples supported)

- #1560 Integrated Digital Input/Output
- #1610 Asynchronous Communications Single-Line Control
- #2074 Binary Synchronous Communications Single-Line Control to 9600 bps
- #2075 Binary Synchronous Communications Single-Line Control - High Speed to 56K bps
- #2091 Asynchronous Communications 8-Line Control
- #2092 Asynchronous Communications 4-Line Adapter
- #2093 Binary Synchronous Communications 8-Line Control
- #2094 Binary Synchronous Communications 4-Line Adapter
- #2095 Feature - Programmable 8-Line Control
- #2096 Feature - Programmable 4-Line Adapter
- #3920 Floating-Point (4955 Processor only)
- #7840 Timers
- #7850 Teletypewriter Adapter

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support is provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system requirement for program execution as a multitasking system is:

- IBM 4953 or 4955 Processor with 16K bytes or an IBM 4952 Processor with the minimum 32K bytes (IBM 4955 Processor with Floating-Point feature (#3920), if floating-point calculations are included).
- IBM 4964 Diskette Unit or 4966 Diskette Magazine Unit as an IPL source.
- Application requirements may expand the system beyond this minimum system.

For native program preparation, assembly, and installation:

- IBM 4953 or 4955 Processor with 48K bytes or IBM 4952 Processor with 64K bytes.
- IBM 4962 Disk Storage Unit or 4963 Disk Subsystem.
- IBM 4964 Diskette Unit or 4966 Diskette Magazine Unit.
- IBM 4973 Line or 4974 Matrix Printer (optional).
- IBM 4979 Display Station.
- or
IBM 4978 Display Station.
- or

EDX Licensed Programs V2 (cont'd)

IBM 3101 Display Terminal.
or
Teletypewriter Adapter with Teletype® Models ASR 33/35.

The configuration must have the following standard address assignments in order to satisfy the minimum system requirements. (The Starter System supports the minimum system requirements.)

Description	Decimal Address	Hexadecimal Address
IBM 4962 Disk Unit	03	03
IBM 4963 Disk Subsystem	72	48
IBM 4964 Diskette	02	02
IBM 4966 Diskette Magazine	34	22
IBM 4973 Line Printer	33	21
IBM 4974 Printer	01	01
IBM 4979 Display Station	04	04
#7850 Teletypewriter Adapter	00	00

SOFTWARE REQUIREMENTS: None.

COMPATIBILITY

Files

Data files generated by previous versions of the Event Driven Executive system can be processed by this version without change.

Application Programs

Application programs generated for Version 1.1 are object compatible with Version 2. Programs generated on Version 1.0 are source compatible only and will require recompilation or re-assembly to execute in the Version 2 environment.

The following licensed programs are compatible with Version 2. For details on these licensed programs, refer to the respective pages:

- FORTRAN IV Compiler and Object Support Library Version 2.3 (5719-FO2)
- Mathematical and Functional Subroutine Library Version 1.1 (5719-LM3)
- Event Driven Executive Macro Assembler Version 1.1 (5719-ASA)
- Event Driven Executive COBOL Compiler and Resident Library Version 1.2 (5719-CB3)
- Event Driven Executive COBOL Transient Library Version 1.2 (5719-CB4)
- Event Driven Executive Indexed Access Method (5719-AM3)
- Event Driven Executive Sort/Merge Version 1.2 (5719-SM2)
- Event Driven Executive PL/I Compiler and Resident Library (5719-PL5)
- Event Driven Executive PL/I Transient Library (5719-PL6)
- Event Driven Executive Multiple Terminal Manager Version 1.1 (5719-MS1)
- Event Driven Executive Data Collection Interactive Programming RPQ P82600 (5799-TDE)

Preparation

For application development and installation of PID-distributed service material, the Event Driven Executive Program Products are used in the following ways:

- For native program preparation and assembly, the following licensed programs are prerequisite:
 - IBM Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS2)
 - IBM Series/1 Event Driven Executive Utilities (5719-UT4)
 - IBM Series/1 Event Driven Executive Program Preparation Facility (5719-XX3)

If the Series/1 instruction set is used, the Macro Assembler (5719-ASA) is required and the Macro Library (5719-LM6) may be used in lieu of 5719-XX3.

- For System/370 host program preparation of application programs the following programs are required:

On the host

- Event Driven Executive Macro Library/Host (5740-LM3)
- System/370 Program Preparation Facilities for Series/1 FDP (5798-NNQ)
- System/370 Event Driven Executive Host Communications Facility IUP (5796-PGH) (optional)

On the Series/1

- Event Driven Executive Basic Supervisor and Emulator (5719-XS2)
- Event Driven Executive Utilities (5719-UT4)
- For program execution, the Event Driven Executive Basic Supervisor and Emulator is a prerequisite. If any of the utility program functions are to be executed as a part of the user's application solution, the Event Driven Executive Utilities are a prerequisite.
- The System/370 Event Driven Executive Host Communications Facility IUP (5796-PGH) or equivalent may be used if data reduction, storage and reporting functions are to be supported on a host System/360 or 370. The Remote Job Entry capability of the Event Driven Executive Utilities may also be used.

PROGRAM PRODUCTS

EVENT DRIVEN EXECUTIVE (EDX) VERSION 3

MACRO LIBRARY (5719-LM7)

UTILITIES (5719-UT5)

BASIC SUPERVISOR AND EMULATOR (5719-XS3)

PROGRAM PREPARATION FACILITY (5719-XX4)

MACRO LIBRARY/HOST (5740-LM4)

These Series/1 licensed programs provide all the facilities of the respective Version 2 licensed programs plus support for the following:

- 4955 Processor, model F
- 4954 Processor
- 4952 Processor, model C
- 4965 Diskette Drive and I/O Expansion Unit
- 4975 Printer, models 1L, 1R, 2L, and 2R
- Multifunction Attachment Feature #1310
- 3101 Display Terminal Support Enhancements
- Data Management Enhancements
- New Spool Facility
- New Linkage Editor
- Support of GPIB and Series/1 to Series/1 Attachment
- Communication with other IBM products
- Functional Realignment

These new facilities expand EDX capabilities within the commercial application environment as well as provide new device support for terminal and OEM configurations.

HIGHLIGHTS

Series/1 4955 Processor Model F

EDX support of the 4955 Processors includes the larger storage capacity available in the model F. Storage management and processor feature support are unchanged in relation to the currently available support provided for the 4955.

Series/1 4954 Processor

EDX support of the 4954 Processors includes those facilities currently provided for equivalent models of the 4952. Support is extended to include floating point, eight address spaces, and the large capacity available with the 4954.

Series/1 4952 Processor Model C

Series/1 4965 Diskette Drive and I/O Expansion Unit

The diskette functions and data management of EDX for the 4964 and 4965 are extended to include support of the diskette drive(s) available within these Series/1 products.

Series/1 4975 Printer

EDX support for the 4974 Printer is extended to include the 4975 Printer in both local and remote mode attached to the Multifunction Attachment. Support is transparent to the using applications. The additional features available with the 4975 Printer such as quality print, selectable character-per-inch/lines-per-inch, and multiple character sets, are supported.

Support for Upper and Lower Case

EDX provides support for upper and lower case input for all terminals. In addition, ability to specify upper case conversion for output or input is provided.

Series/1 Multifunction Attachment

Support of this attachment is transparent to those applications utilizing the existing EDX functions for:

- Binary Synchronous Communications
- 3101 Display Terminal
- 4975 Printer

3101 Display Terminal Support

Current EDX Versions 1.1 and 2 support all models of the 3101 as a teletype device, or character mode, attached through the Teletypewriter Adapter (#7850) and the asynchronous communications attachments (#1610, #2091, #2092, and #2095/#2096). Version 3 introduces support for the 3101 models 20, 22, and 23 in block mode attached through the asynchronous communication attachments in point-to-point mode. The support functions are similar to those currently provided for the 4978 Display Station; however, specific functions will depend on the 3101 device characteristics. Briefly, 3101 support in block mode includes the following:

- Terminal I/O user interface
- Line-by-line (Roll) and Full Screen (Static) access
- 8 Program Function Key recognition. This support is also extended to the 3101 in character mode.
- Field control for protected, blinking, and highlighting
- Supporting utilities include screen formatter, screen-related subroutines and session manager

Data Management Enhancements

Significant enhancements to disk and diskette data management are:

- Disk volume or data set capacity is extended to the maximum capacity of the physical device capacity. This removes the previous limitation of 32,767 records.
- The volume table of contents for disk, formerly resident within the supervisor, is now contained on the physical device itself, thereby allowing mobility of supervisors from system to system.
- Diskette support, previously limited to 128 bytes per sector on diskette types 1 and 2, is now extended to 256 bytes per sector on types 1, 2, and 2D. 2D is not applicable for the 4964 Diskette Unit. Diskette capacity is increased to 958K bytes for type 2D.
- 2D diskettes formatted at 1024 bytes/sector will be supported on 4966, 4952 Processor model C and 4965.
- A utility is provided to allow a 2D diskette interchange for Type H data exchange.
- Diskette management is extended to include support of multiple volumes per diskette for all Series/1 diskette products.

New Spool Facility

Printer management allows one or more programs or tasks executing concurrently to be independent of the printer(s) resource. Spool intercepts and routes printer output to intermediate disk or diskette storage for later printing. This function is totally transparent to the application, with the exception of immediate device buffer control operations. Features are provided to allow:

- Program control of the number of copies, output disposition, forms type and report identification
- Operator control to display the print job(s) status, alter disposition, hold/delete, and alter target printer
- Restart capability

With Spool, application execution need not be delayed by printer availability nor intermixed with other application printer output.

Directory Utility

The \$DIRECT utility sorts disk/diskette volume directories alphabetical by size, or location. User may also place frequently used data sets at the beginning of the directory by user-defined list of data set names.

New Linkage Editor

Single level overlay segments can be defined at the linkage editor program development stage for applications generated in PL/I, FORTRAN, EDL, and/or the Series/1 instruction set. Existing EDL overlay programs and COBOL segmentation facilities are unaffected.

The EDX system common data area (\$SYSCOM) can be referenced directly from FORTRAN by utilizing the GLOBAL statement of the language.

Full screen support facilities are available to FORTRAN, COBOL, and PL/I via a direct CALL from the language. In addition to the field control, cursor positioning, etc., screen formats built by the \$IMAGE utility can be retrieved from disk(ette) data sets by the CALL interface.

GPIB and Series/1 to Series/1 Attachment Support

These RPQs are supported through the terminal I/O user interfaces of the EDX language. A utility is also provided for the operator to achieve interactive communications with the attachment. GPIB (RPQ D02118) provides for the attachment of instrumentation or other devices that adhere to the IEEE 488 Standard, thus extending the OEM interface capabilities of Series/1.

Series/1 to Series/1 Attachment RPQs D02241 and D02242 provide a high-speed intercommunication between the processors. With the Version 3 support, data transfers can be initiated between processors including an IPL request.

PROGRAM PRODUCTS

EDX V3 (cont'd)

Communication With Other IBM Products

It has been verified that user-written programs in the Series/1 can use the EDX asynchronous communications interface to communicate with the following products:

- IBM Personal Computer with the Asynchronous Communications Adapter and utilizing the Asynchronous Communications Support licensed program or appropriate user programming.
- System/23 Datamaster with the Communications Adapter Feature and utilizing the Asynchronous Communications licensed program.
- Displaywriter System with a Communications Adapter and utilizing the Asynchronous Communications licensed program.
- 6733 Typewriter Communication Module as a Teletype® Model 33/35 (with attached Electronic Typewriter 85).

The products attach to the Series/1 via asynchronous communication attachments #1610, #2091/#2092, or #2095/#2096. Switched and point-to-point nonswitched connections are supported.

It has been verified that user-written programs in the Series/1 can use the EDX binary synchronous communications interface to communicate with:

- System/23 Datamaster with the Communications Adapter Feature and utilizing the Binary Synchronous Communications licensed program.
- Displaywriter System with a Communications Adapter and utilizing the Binary Synchronous Communications licensed program.

The products attach to the Series/1 via binary synchronous communications attachments #2074 or #2093/#2094. The Displaywriter System can also attach via feature #1310. Switched and point-to-point nonswitched connections are supported.

With the Version 3 support, data transfers can be initiated between processors including an IPL request.

Functional Realignment

Version 3 of the Basic Supervisor and Emulator (5719-XS3) contains in addition to supervisory functions the following utilities:

- Allocation and deletion of data sets
- Copy functions
- Terminal initialization
- Error logging

For operating environments that do not require program preparation or do not utilize functions such as RJE or graphics, there will not be a requirement to license the processor for the Utilities program (5719-UT5).

The Utilities program will now contain the linkage editor function which was contained within the Program Preparation Facilities or Macro Assembler programs.

DEVICE SUPPORT

The following Series/1 hardware products are supported. Additional devices are supported by other licensed programs.

Processor

- 4955 up to 512K bytes with Storage Address Translator (#6335) (function included with 4955 models E and F)
- 4954 up to 256K bytes
- 4952 up to 128K bytes

I/O Devices (Multiples Supported)

- 3101 Display Terminal models 10, 12, 13, 20, 22, 23* – Teletypewriter Adapter and ACCA in Character mode
Models 20, 22, 23* – ACCA for Block mode
* EIA RS-422-A interface is not supported.
- 4962 Disk Storage Unit
- 4963 Disk Subsystem
- 4964 Diskette Unit
- 4965 Diskette Drive and I/O Expansion Unit
- 4966 Diskette Magazine Unit
- 4969 Magnetic Tape Subsystem
- 4973 Line Printer
- 4974 Printer
- 4975 Printer
- 4978 Display Station

- 4979 Display Station
- 4982 Sensor I/O Unit and related features

Features (Multiples Supported)

- #1310 Multifunction Attachment
- #1560 Integrated Digital Input/Output
- #1610 Asynchronous Communications Single-Line Control
- #2074 Binary Synchronous Communications Single-Line Control to 9600 bps
- #2075 Binary Synchronous Communications Single-Line Control/High Speed to 56K bps
- #2080 Synchronous Communications Single-Line Control/High Speed
- #2091 Asynchronous Communications 8-Line Control
- #2092 Asynchronous Communications 4-Line Adapter
- #2093 Binary Synchronous Communications 8-Line Control
- #2094 Binary Synchronous Communications 4-Line Adapter
- #2095 Feature—Programmable 8-Line Control
- #2096 Feature—Programmable 4-Line Adapter
- #3920 Floating Point (4955 only)
- #7840 Timers
- #7850 Teletypewriter Adapter

RPQs (Multiples Supported)

- D02118 GPIB Attachment
- D02241 and D02242 Series/1 to Series/1 Attachment
- D02350 3101 Direct Connect - 8-Line Adapter

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of these licensed programs. IBM services for these licensed programs are described elsewhere.

SPECIFIED OPERATING ENVIRONMENT

Support is provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system requirement for program execution as a multitasking system is:

- A Series/1 Processor with 32K bytes of storage
- 4964, 4965, or 4966 Diskette units or a 4952 Processor as an IPL source
- Application requirements may expand the system beyond this minimum configuration. Floating point calculations require the 4955 Processor with Floating Point (#3920).

For native program preparation, assembly, and installation:

- A Series/1 Processor with 64K bytes of storage
- 4962 Disk Storage Unit or 4963 Disk Subsystem
- 4964, 4965, or 4966 Diskette units or a 4952 model C Processor
- 4973, 4974, or 4975 Printer (optional)
- 4979 Display Station
or
4978 Display Station
or
3101 Display Terminal
or
Teletypewriter Adapter (#7850 with teletypewriters)

The configuration must have the following standard address assignments in order to satisfy the minimum system requirements. (The Starter System supports the minimum system requirements.)

PROGRAM PRODUCTS

EDX V3 (cont'd)

Description	Decimal Address	Hexadecimal Address
3101 Display Terminal (Reference *1,*2,*3)		
4962 Disk Unit	03	03
4963 Disk Subsystem	72	48

*1 Supports 3101 models 10, 12, 13, 20, 22, 23 in character mode		
*2 Supports 3101 models 20, 22, 23 in block mode (1200 bps for the Starter System only)		
*3 Multifunction Attachment (#1310) supports:		
• 3101 model 23 (EIA RS-422-A interface)	89	59
• 4975 model 1L	90	5A
• 4975 model 2L	91	5B

SOFTWARE REQUIREMENTS: None

COMPATIBILITY

Data

As a result of the data management enhancements for Version 3, previously generated data volumes and data sets will not be compatible. These files must be reinstalled prior to processing in the Version 3 environment. Conversion utilities (\$MIGRID and \$MIGRATE) are provided to facilitate the conversion of the data files.

Programs

Application programs generated for EDX Version 1.1 or 2 are source compatible only and will require recompilation or reassembly with the compatible program preparation programs to execute in the Version 3 environment. A *Planning Guide* (see "Documentation") is available to assist in understanding compatibility requirements and the new facilities provided.

Licensed Programs

The following Series/1 licensed programs are compatible to operate in EDX Version 3. Consult the sales manual for specific feature codes pertaining to compatibility:

- Indexed Access Method (5719-AM3)
- Indexed Access Method Version 2 (5719-AM4) (EDX Version 3.1)
- Macro Assembler (5719-ASA)
- COBOL Compiler and Resident Library (5719-CB3)
- COBOL Transient Library (5719-CB4)
- COBOL Compiler and Resident Library Version 2 (5719-CB5) (EDX Version 3.1)
- COBOL Transient Library Version 2 (5719-CB6) (EDX Version 3.1)
- System/370 Channel Attachment (5719-CX1)
- FORTRAN IV Compiler and Object Support Library (5719-FO2)
- Multiple Terminal Manager Version 2 (5719-MS2)
- Mathematical and Functional Subroutine Library (5719-LM3)
- PL/I Compiler and Resident Library (5719-PL5)
- PL/I Transient Library (5719-PL6)
- Sort/Merge (5719-SM2)
- Systems Network Architecture (5719-SX1)
- Systems Network Architecture RJE (5719-SX2)
- 523X Entry Station Direct Attachment Support (5799-TDE)
- Communications Facility (5719-CF1)

- Query (5719-XR1)

Preparation

For application development and installation of PID-distributed material, the Event Driven Executive licensed programs are used in the following ways:

- For native program preparation and assembly, three licensed programs (5719-XS3, 5719-UT5, 5719-XX4) are prerequisites. If the Series/1 instruction set is used, the Macro Assembler (5719-ASA) and the Macro Library (5719-LM7) are used in lieu of Program Preparation Facility (5719-XX4).

- For host program preparation of application programs, the following programs are required:

On the host

- Event Driven Executive Macro Library/Host Version 3 (5740-LM4)
- System/370 Program Preparation Facilities for Series/1 FDP (5798-NNQ)
- System/370 Event Driven Executive Host Communications Facility IUP (5796-PGH) (optional)

On the Series/1

- Event Driven Executive and Emulator Version 3 (5719-XS3)
- Event Driven Executive Utilities Version 3 (5719-UT5)

- For program execution, the Event Driven Executive Basic Supervisor and Emulator is a prerequisite. If certain utility program functions are to be executed as a part of the user's application solution, the Event Driven Executive Utilities are a prerequisite.

- To transfer programs generated on the host to the Series/1, the following are available:

- The IBM System/370 Host Communications Facility IUP (5796-PGH) and the host communications facilities of the IBM Series/1 Event Driven Executive Utilities (5719-UT5)

or

- The remote job entry capability of the System/370 and the remote job entry facilities of the IBM Series/1 Event Driven Executive Utilities (5719-UT5)

or

- The remote management utility of the Series/1 Event Driven Executive Utilities (5719-UT5) in conjunction with a System/370 user application that provides a binary synchronous communications interface.

or

- Physical media exchange utilizing magnetic tape between System/370 and the Series/1 4969 Magnetic Tape Subsystem.

PROGRAM PREPARATION FACILITY ... 5719-XX5
MACRO LIBRARY ... 5719-LM8
MACRO LIBRARY/HOST ... 5740-LM5

PURPOSE

The Event Driven Executive System (EDX) has been enhanced to provide the Series/1 users with improved performance, ease-of-use, and support for larger application environments.

The Event Driven Executive System improvements in management of unmapped storage may result in larger, faster application programs being implemented.

The restructuring of the supervisor of the Event Driven Executive System such that supervisor modules may be loaded in other partitions allows a large increase in the number of devices that EDX will support.

HIGHLIGHTS

Significant new functions are offered in the Event Driven Executive, Version 4 which provides a growth path for users of prior versions of EDX.

The significant functions provided are:

- Support for the 4956 Processor
- Support for the 4967 Disk Subsystem
- Support for the 4968 Autoload Tape Unit
- Support for the 5640 Printer Attachment for 5224 and 5225 Printers
- A Cross Partition Supervisor
- An Unmapped Storage Manager
- Unmapped Storage Overlay Support
- An Improved Text Editor
- Job Queue Processing
- A Message Data Set Facility
- Additional EDL Instructions
- Enhanced Timer Support Facilities
- ACCA and EXIO Trace Facilities
- Reduced Initialization Storage Requirements
- Selective Mapping of System Common Areas
- Redistribution of Production and Programming Development Utilities

DESCRIPTION

Support for the 4956 Processor: EDX support for the 4956 Processor allows up to 1,024K bytes of storage to be supported in the following manner; the first 512K bytes is supported as mapped storage with the remaining 512K bytes supported as unmapped storage by the Unmapped Storage Manager. EDX will also provide support for the floating-point feature and integrated clock/comparator.

Support for the 4967 Disk Subsystem: EDX supports the larger storage of the 4967 Disk Unit without change to existing EDX application programs. The cache facility on the 4967 attachment card is transparent to user applications.

Support for the 4968 Autoload Tape Unit: EDX supports the 4968 Tape Unit in a manner compatible with the 4969 Tape Unit support. In addition, support is provided to use the 4968 Tape Unit as a DUMP/RESTORE device. This can be accomplished in data streaming mode at 3200 bpi running at 50 inches per second or using standard 1600 bpi mode. The 4968 Tape support requires a processor with a minimum of 128K bytes of storage.

Support for the 5640 Printer Attachment for 5224 and 5225 Printers : EDX supports the 5224 and 5225 Printers in a manner compatible with the 4975 Printer. These printers are attached through the 5640 Attachment feature. Data stream mode of operation will be allowed from a user application.

Cross-Partition Supervisor: A Cross-Partition Supervisor architecture allows EDX supervisor modules to be assigned to any address space. Device control blocks continue to reside in partition 1 with their first level interrupt handlers.

This greatly increases the ability of EDX to support the attachment of more physical Input/Output devices such as terminals and printers. Initial functions supported by the cross partition supervisor are:

- Bisynchronous Access Method Support
- Floating-Point Services
- Queue I/O
- Sensor I/O

Terminal I/O
Printer Spooler

Unmapped Storage Manager: The Unmapped Storage Manager provides a technique to access unmapped storage. Unmapped storage is storage that the supervisor has not reserved for system common areas, or that the user has not reserved at system generation time. New EDL instructions will be available to the application programmer to manage the unmapped storage area.

- The GETSTG instruction is used to acquire exclusive use of a storage area
- The FREESTG instruction is used to release a previously acquired storage area
- The SWAP instruction is used to exchange addressability between storage areas
- The STORBLK is a non-executable statement that builds a storage management control block

Unmapped Storage Overlay Support: The EDX Linkage Editor is enhanced to support unmapped storage as a cache storage area for user-defined high performance overlay execution versus standard disk overlay management. With the exception of a new 'storage' command for the linkage editor overlay structure, the management of unmapped storage overlays is transparent to the user. A slightly larger overlay manager is used instead of the standard disk overlay manager.

Improved Text Editor: The \$FSEDIT Text Editor has been enhanced to provide the following additional functions:

- New line commands to manage data set access
- Set up to 10 tab stops (4978 only)
- Shift 2 spaces right/left
- Move command word 2 spaces right/left
- Masks for inserting lines
- Flagged changed lines
- Automatic COBOL line numbering

The improved text editor makes user of larger buffers to execute most functions with better performance than the previous \$FSEDIT Text Editor.

Job Queue Processing: The Job Queue Processor allows the submission of 'jobs' for future execution within an EDX system, while allowing the continuation of other processing. A 'job' is the execution of a \$JOBUTIL command stream. A job can be submitted from a terminal and that terminal used interactively for other work. Additionally, a program can submit a job and resume execution without further consideration for that job. Jobs are executed by the Job Queue Processor independently of the submission facility (interactive or program) chosen.

Message Data Set Facility: The Message Data Set support provides an interface for acquisition, formatting, and presentation of data set resident message text. This eliminates the static storage required for message text in executable programs.

A disk message utility is provided to format source messages into forms suitable for use with the system message handler. Optionally, the messages can be generated into a storage resident format which can be linked with an application program. This latter facility is implemented for most of the Event Driven Executive Utilities.

EDL Instructions: Some instructions in the EDL language are enhanced to extend logical decision processing. The 'IF' instruction now can do a logical compare on EQ, NE, GT, LT, GE, or LE.

Test bit operators have been added to the 'IF', 'DO-WHILE' and 'DO-UNTIL' instruction constructs to help the EDL application programmer perform bit manipulation. In addition, a companion 'SETBIT' instruction has been added to the EDL language.

Enhanced Timer Support Facilities: STIMER support is extended to provide a WAIT with timeout capability. This can be used with terminal input statements to provide more efficient management of system resources. A terminal no longer needs to be tied up indefinitely while waiting for a response. This facility can also be used to allow application programs a timeout facility while waiting for other resource events.

ACCA and EXIO Trace Facilities: New facilities have been added to EDX to support the analysis of communications messages to and from ACCA and EXIO devices attached to the system.

Reduced Initialization Storage Requirements: EDX Supervisors that are built using the overlay initialization feature require less than 7K bytes of storage for initialization for a reduction of approximately 1K bytes from EDX Version 3.

Selective Mapping of System Common Areas: The user can specify at system generation time which selected address spaces that the system common areas will be mapped across. The selected address spaces need not be contiguous.

PROGRAM PRODUCTS

Series/1 Event Driven Executive V4 (cont'd)

Redistribution of Production and Program Development Utilities: The utilities, previously packaged as a separate licensed program product have been distributed based on function (production versus program development) into the Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS4) or the IBM Event Driven Executive Program Preparation.

System Services: In addition to the above support, the Event Driven Executive provides operating system services and communications support for the following:

- Program Management
- Multi-Tasking Management
- Storage Management
- Queue Management
- Timer and Time/Date Management
- Data Management
- Error Logging and Recovery Management
- Operations Interface
- General Device Support

The Event Driven Executive supports the 4952, 4954, 4955, and 4956 Processors when the systems have at least 48K bytes of storage. The following options are also supported:

- #3920 Floating Point feature (4955 only)
- #3925 Floating Point feature (4954 and 4956)

In addition, multiples of the following devices and features are supported:

- 3101 Terminals
- 4978 and 4979 Display Stations
- 4962, 4963, or 4967 Disk Units
- 4964, 4965, 4966 Diskette Units
- 4973, 4974, 4975, 5224, 5225 Printers
- 4968 and 4969 Magnetic Tape Units
- 4982 Sensor I/O Units
- #1310 Multi-Function Attachment
- #1560 Integrated Digital I/O
- #1610 Asynchronous Communications Single-Line Control to 9600 bps
- #2074 Binary Synchronous Communications Single-Line Control to 9600 bps
- #2075 Binary Synchronous Communications Single-Line Control to 56K bps
- #2091/2092 Asynchronous Communications Multi-Line Control
- #2093/2094 Binary Synchronous Communications Multi-Line Control
- #2095/2096 feature Programmable Control
- #7840 Timers
- #7850 Teletypewriter Attachment
- RPOs (Multiples)
- DO2118 GPIB Attachment
- DO2241 and DO2242 Series/1-to-Series/1 Attachment

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of these licensed programs.

SPECIFIED OPERATING ENVIRONMENT

Support is provided for these licensed programs when it is operated in the following environments.

HARDWARE REQUIREMENTS

The minimum system requirement for program execution as a multitasking system is:

- IBM 4952, 4954, 4955, or 4956 Processor with 48K bytes of storage.
- IBM 4964, 4965, or 4966 Diskette Units as IPL source.
- Application requirements may expand the system beyond the minimum requirement. Floating-point calculations require floating-point feature #3925 on an IBM 4954 or 4956 Processor, #3920 on a 4955 Processor.

For native program preparation, assembly, and installation:

- IBM 4952, 4954, 4955, or 4956 Processor with 96K bytes of storage.
- IBM 4962, 4963, or 4967 Disk Unit
- IBM 4964, 4965, or 4966 Diskette Unit
- IBM 4973, 4974, 4975, 5224, or 5225 Printer (optional)
- IBM 3101, 4978, or 4979 Display Stations or
- Teletypewriter Adapter (#7850) with teletypewriter

Device Address Assignments: The EDX system as distributed from PID supports the minimum system configuration for installation and must have the following standard address assignments. Other address assignments or options are supported after completion of a system generation.

Description	Decimal Address	Hexadecimal Address
IBM 3101 Display Terminal (Reference *1, *2, *3)		
IBM 4962 Disk Unit	02	02
IBM 4963 Disk Subsystem	72	48
IBM 4967 Disk Subsystem	72	48
IBM diskette drive available in		
IBM 4964 Diskette Drive	02	02
IBM 4965 Diskette Drive and I/O Expansion Unit	68	44
IBM 4966 Diskette Magazine	34	22
IBM 4973 Printer	33	21
IBM 4974 Printer	01	01
IBM 4975 Printer (3)		
IBM 4978 Display Station	36	24
IBM 4979 Display Station	04	04
#1310 Multi-Function Attachment (3)	88	58
#1610 Async. Comm. Control (2)	08	08
#2091/92 Async. Comm. Multi-line Control (2)	104	68
#2095/96 Feature Programmable Comm. (2)	96	60
#7850 Teletypewriter Attachment (1)	00	00

- (1) Supports 3101 models 10, 12, 13, 20, 22, 23 in character mode
- (2) Supports 3101 models 20, 22, 23, in block mode (1200 bps for starter system only)
- (3) Multi-Function Attachment (#1310) supports:
 - 3101 model 23 (EIA RS-422A interface) 89 59
 - 4975 model 01L 90 5A
 - 4975 model 02L 91 5B

SOFTWARE REQUIREMENTS

Program Prerequisites: For application and installation of PID distributed material, the Event Driven Executive licensed programs are used in the following ways:

- For native program preparation and assembly, two licensed programs (5719-XS4 and 5719-XX5) are prerequisites. If the Series/1 instruction set is used, the Macro Assembler (5719-ASA) and the Macro Library (5719-LM8) are used in lieu of the Program Preparation Facility (5719-XX5).
- For host preparation of application programs the following programs are required:

On the host

- Event Driven Executive Macro Library/Host Version 4 (5740-LM5)
- System/370 Program Preparation Facility for Series/1 FDP (5799-NNQ)
- System/370 Event Driven Executive Host Communications Facility IUP (5799-PGH) (optional)

On the Series/1

- Event Driven Executive Supervisor and Emulator, Version 4 (5719-XS4)

- For program execution, the Event Driven Executive Supervisor and Emulator is a prerequisite.

COMPATIBILITY

Data volumes and data sets generated by Version 3 can be processed by Version 4 without change.

Data volumes and data sets generated prior to Version 3 are not compatible. These files must be re-installed prior to processing in the Version 4 environment. Conversion utilities (\$MIGRID, \$MIGCOPY, and \$MIGRATE) are provided to convert the data files.

Programs: Application programs generated to operate in the Version 3 environment are load module compatible with Version 4 provided they are coded with only the documented interfaces of the *Language Reference Manual*, *Installation and Systems Generation Guide*, and *Communications Guide*.

Application programs generated prior to Version 3 must be recompiled or re-assembled with Version 4 program preparation programs in order to execute in the Version 4 environment.

Licensed Programs: The following IBM Series/1 licensed programs are compatible to operate in the EDX Version 4 environment. Consult your

PROGRAM PRODUCTS

Series/1 Event Driven Executive V4 (cont'd)

ordering information for specific feature order codes pertaining to compatibility.

- Indexed Access Method Version 2 5719-AM4
- Macro Assembler 5719-ASA
- COBOL Compiler and Resident Library Version 2 5719-CB5
- COBOL Transient Library Version 2 5719-CB6
- System/370 Channel Attach 5719-CX1
- FORTRAN IV Compiler and Object Support Library 5719-FO2
- Multiple Terminal Manager Version 2 5719-MS2
- Mathematical and Functional Subroutine Library 5719-LM3
- PL/1 Compiler and Resident Library 5719-PL5

- Systems Network Architecture RJE 5719-SX2
- Query 5719-XR1
- Remote Manager 5719-RM1
- Advanced Remote Job Entry 5719-RJ1

In order to provide customers with planning information, IBM will include Communications Facility (CF) support under EDX Version 4 in a future release of CF. This support will be available by the fourth quarter of 1983.

SECURITY, AUDITABILITY, AND CONTROL

User management is responsible for evaluating, selecting, applying, and implementing any security and auditability features for the appropriate administration and application controls.

For applications in which sensitive data is sent over external communications facilities, user management may wish to augment those facilities with the application of cryptography.

PROGRAM PRODUCTS

**EVENT DRIVEN EXECUTIVE
MULTIPLE TERMINAL MANAGER (5719-MS1)**

PURPOSE

The IBM Series/1 Event Driven Executive Multiple Terminal Manager provides facilities designed to simplify the design and implementation of transaction-oriented application programs written in COBOL, FORTRAN, PL/I or Event Driven Language (EDL). These applications execute in an interactive environment, where one or more application programs run concurrently with one or more display devices. Programs using predefined screen formats may be used for such applications as order entry, inventory file update, and inquiry. Full screen support for the 4978, 4979 and 3101 (models 2X in block mode) includes:

- Write protected data
- Write variable data
- Read unprotected data from screen
- Cursor positioning
- Sound tone alarm (4978 and 3101 only)
- PF key support for invoking programs

Using the Event Driven Executive \$IMAGE utility, users can interactively design screen formats on a 4978 or 4979 and then store them into a disk data set which can be referenced by Multiple Terminal Manager application programs. Screen design for the 3101, using \$IMAGE, must be performed on a 4978 or 4979. No support for the execution of \$IMAGE on a 3101 is provided.

HIGHLIGHTS

- Productivity tool enhancing the implementation of transaction-oriented applications
- Applies to application-driven inquiry, file update, and data entry type applications
- Function available via call interface from COBOL, FORTRAN, PL/I or EDL
- Full screen formatted access
- Efficient storage usage
- Multiple terminals
- Access via call interface to:
 - Indexed data files
 - Direct data files
 - Retrieve screen
 - Write screen
 - Read screen
 - Link to named programs
 - Set cursor
 - Audible alarms (4978 and 3101 only)
 - Call menu
 - Describe input fields of current screen
- Operator interface support for:
 - Programs report
 - Screens report
 - Terminal activity report
 - Disconnect a terminal
 - Reconnect a terminal
 - Sign-on (optional)
 - Data entry (application driven)

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support is provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

- IBM 4952 or 4955 Processor with 96K bytes of storage
- IBM 4962 Disk Storage Unit or 4963 Disk Subsystem
- IBM 4964 Diskette Unit or 4966 Diskette Magazine Unit
- IBM 4973 Line Printer or 4974 Printer
- IBM 4978 or 4979 Display Station
 - or
 - IBM 3101 Display Terminal model 20, 22 or 23* in block mode
 - Attached by means of feature #1610, #2091/#2092 or #2095/#2096
 - * (Model 23 RS-422 attachment capability not supported.)
 - or
 - IBM 3101 Display Terminal in character mode (or an equivalent ASCII Device).

The Multiple Terminal Manager requires a minimum of 15K bytes to support four 4978/4979 Display Stations (19.5K bytes would be required to support four model 2X 3101 Display Terminals in block mode). This minimum is in addition to that storage required for the user's application programs, Indexed Access Method support, and the Event Driven Executive supervisor and its required device support programs and control blocks. There must also be sufficient disk space available for work areas and sufficient diskette or disk space available for user data sets.

SOFTWARE REQUIREMENTS

The Multiple Terminal Manager (5719-MS1) requires the current version/modification levels of the following licensed programs:

- Event Driven Executive Basic Supervisor and Emulator Version 1 or 2 (5719-XS1 or 5719-XS2)
- Event Driven Executive Utilities Version 1 or 2 (5719-UT3 or 5719-UT4)
- Event Driven Executive Program Preparation Facility Version 1 or 2 (5719-XX2 or 5719-XX3)

The Utilities and Program Preparation Facility are required only for preparation and installation of Multiple Terminal Manager application programs, and are not required for execution.

Additional Licensed Programs

The current version/modification levels of the following Series/1 Event Driven Executive licensed programs are compatible with the Multiple Terminal Manager (5719-MS1):

- Indexed Access Method (5719-AM3)
- Macro Assembler (5719-ASA)
- Macro Library Version 1 or 2 (5719-LM5 or LM6)
- COBOL Compiler and Resident Library (5719-CB3) and Transient Library (5719-CB4)
- FORTRAN IV Compiler and Object Support Library (5719-FO2)
- Mathematical and Functional Subroutine Library (5719-LM3)
- PL/I Compiler and Resident Library (5719-PL5) and Transient Library (5719-PL6)—requires Version 1.1 or later of the Multiple Terminal Manager

The following licensed programs are required to assemble Multiple Terminal Manager application programs on a host system:

- System/370 Program Preparation Facilities for Series/1 FDP (5798-NNQ)
- Series/1 Event Driven Executive Macro Library/Host Version 1 or 2 (5740-LM2 or 5740-LM3)

For compatibility statements between the Event Driven Executive versions and other licensed programs listed above, refer to the respective program.

TERMS and CONDITIONS: See PP Index

EVENT DRIVEN EXECUTIVE MULTIPLE TERMINAL MANAGER VERSION 2 5719-MS2

The IBM Series/1 Event Driven Executive (EDX) Multiple Terminal Manager Version 2 (5719-MS2) is a licensed program which operates under control of the Series/1 Event Driven Executive Basic Supervisor and Emulator Version 3.2 (5719-XS3). Version 2 includes all functions and facilities contained in Version 1 of the Multiple Terminal Manager (5719-MS1), and includes the following new and enhanced capabilities:

- 3101 Display Terminal Support
- Screen Support
- Utility Functions
- Additional IBM Products Supported
- Installation and Tailoring Aids
- Communications Facility Bridge
- 3101 Buffered Server
- Source Code Availability

HIGHLIGHTS

3101 Display Terminal Support

Current Multiple Terminal Manager support for 3101 models 20, 22 and 23 in block mode, is extended to utilize the block mode transmission and field control functions provided for the 3101 in EDX Version 3. This will allow specification of field control attributes for functions such as the highlighting or blinking of selected display fields when utilizing data stream formats built for the 3101.

Screen Support

New support routines provide the following functions, through a CALL interface:

- Blink cursor (4978 or block mode 3101 only)
- Return cursor position

Utility Functions

New utility functions to allow the user to:

- Dynamically add/update programs or screen formats without restarting the Multiple Terminal Manager.
- Reconnect a terminal not currently attached to the Multiple Terminal Manager from that same terminal.
- Alter the Multiple Terminal Manager log device to other than the \$SYSPRTR device.
- Execute EDX Utilities on Multiple Terminal Manager terminals.
- As development aids
 - Interactively request any FILEIO operation and display the results.
 - Determine at a display what interrupt codes are generated by each function key on a display.
 - Display a field definition table (FTAB) of any screen.

Additional IBM Products Supported

The Multiple Terminal Manager supports each of the following IBM products as a teletypewriter:

- IBM Personal Computer with the Asynchronous Communications Adapter and utilizing the Asynchronous Communications Support licensed program or appropriate user programming.
- System/23 Datamaster with the Communications Adapter Feature and utilizing the Asynchronous Communications licensed program.
- Displaywriter System with a Communications Adapter and utilizing the Asynchronous Communications licensed program.

The Multiple Terminal Manager supports these products via the asynchronous communications attachments #1610 and #2091/#2092 in point-to-point nonswitched connections.

Installation and Tailoring Aids

Version 2 includes new aids which will assist the user when installing and tailoring the Multiple Terminal Manager environment.

Communications Facility Bridge

This support allows Multiple Terminal Manager application programs to use the message routing capabilities of Communications Facility to send and receive messages.

3101 Buffered Server

An optional buffered terminal server is available for 3101 display terminals in block mode.

Source Code Availability

Source code in the form of machine-readable material is available.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specific operating environment:

HARDWARE REQUIREMENTS

The minimum system requirements for the IBM Series/1 Event Driven Executive Multiple Terminal Manager (5719-MS2) are as follows:

- Any IBM Series/1 Processor with 96K bytes of storage
- IBM 4962 Disk Storage Unit or IBM 4963 Disk Subsystem
- IBM 4964 Diskette Unit or IBM 4965 Diskette Drive and I/O Expansion Unit or IBM 4966 Diskette Magazine Unit
- IBM 4973 Line Printer or IBM 4974 Printer or 4975 Printer
- IBM 4978 Display Station
or
IBM 4979 Display Station
or
IBM 3101 Display Terminal*
or
Teletypewriter (or equivalent)

* See EDX Version 3 (5719-XS3) for attachment methods supported.

The Multiple Terminal Manager requires a minimum of 16.5K bytes to support four 4978/4979 Display Stations (19K bytes would be required to support four 3101 Display Terminals, model 20, 22, or 23, in block mode). This minimum is in addition to that storage required for the user's application programs and other licensed programs, and the Event Driven Executive supervisor and its required device support programs and control blocks.

SOFTWARE REQUIREMENTS

Version 2 of the Multiple Terminal Manager requires the following licensed programs:

- IBM Series/1 Event Driven Executive Basic Supervisor and Emulator Version 3.2 (5719-XS3)
- IBM Series/1 Event Driven Executive Utilities Version 3.2 (5719-UT5)
- IBM Series/1 Event Driven Executive Program Preparation Facility Version 3.2 (5719-XX4)

The Utilities and Program Preparation Facility are required only for the preparation and installation of Multiple Terminal Manager application programs. They are not required for execution.

Additional Licensed Programs

The following Series/1 Event Driven Executive licensed programs are compatible with this licensed program:

- IBM Series/1 Indexed Access Method (5719-AM3)
- IBM Series/1 Macro Assembler (5719-ASA)
- IBM Series/1 Macro Library Version 3 (5719-LM7)
- IBM Series/1 Communications Facility (5719-CF1)
- IBM Series/1 Query (5719-XR1)
- IBM Series/1 COBOL Compiler and Resident Library (5719-CB3, 5719-CB5) and COBOL Transient Library (5719-CB4, 5719-CB6)
- IBM Series/1 FORTRAN IV Compiler and Object Support Library (5719-F02)
- IBM Series/1 Mathematical and Functional Subroutine Library (5719-LM3)
- IBM Series/1 PL/I Compiler and Resident Library (5719-PL5) and PL/I Transient Library (5719-PL6)
- IBM Series/1 Event Driven Executive Macro Library/Host Version 3 (5740-LM4)
- IBM System/370 Program Preparation Facilities for Series/1 FDP (5798-NNQ)
- IBM System/370 Event Driven Executive Host Communications Facility IUP (5796-PGH) [optional]

**SERIES/1 REALTIME PROGRAMMING SYSTEM
MULTIPLE TERMINAL MANAGER VERSION 3
5719-MT1**

PURPOSE

The Series/1 Multiple Terminal Manager Version 3 licensed program contains changes to support the functions offered in the Series/1 Realtime Programming System Version 6.

HIGHLIGHTS

- Compatibility with the Realtime Programming System Version 6 Multiprocessing feature.
- 3101 dynamic terminal support extended.
- Increased Multiple Terminal Manager Version 3 partition space available to pass-through users.

DESCRIPTION

Compatibility with the Realtime Programming System Version 6 Multiprocessing Feature: This maintenance release is required for compatibility with the Multiprocessing feature.

3101 Dynamic Terminal Support Extended: The 3101 dynamic terminal support has been extended to allow switching between Series/1 subsystems (if the set-up switches are modified by the user), when connected via the #1310 Multifunction Attachment or the #2095/#2096 feature Programmable Attachment, or the D02350 RPQ Asynchronous Direct 8-line Adapter.

Increased Multiple Terminal Manager Version 3 Partition Space Available to Pass-Through Users: The Logical Unit Type 2 support which previously occupied Multiple Terminal Manager Version 3 partition space, has been moved to secondary storage. This leaves more space available in the Multiple Terminal Manager Version 3 partition for SNA users. This extra space makes support of larger application programs or more terminals possible.

Hardware Supported

- 4952, 4955 and 4956 Processor (192K bytes of storage minimum)
- 4962 Disk Storage Unit
- 4963 Disk Subsystem
- 4964 Diskette Unit
- 4965 Diskette Drive and I/O Expansion Unit
- 4966 Diskette Magazine Unit
- 4973 Line Printer
- 4974 Printer
- 4975 Printer
- Display Stations and Terminal Devices
 - Formatted:
 - 3101 Display Terminal (block and character mode)
 - 3270 Information Display System
 - 4978 Display Station
 - 4979 Display Station

Unformatted:

- 3101 Display Terminal (character mode) or equivalent ASCII device

- Communications
 - Binary Synchronous Communications Single-Line Control (#2074)
 - Binary Synchronous Communications Single-Line Control/High-Speed (#2075)
 - Binary Synchronous Communications 8-Line Control/4-Line Adapter (#2093/#2094)
 - Asynchronous Communications Single-Line Control (#1610)
 - Asynchronous Communications 8-Line Control/4-Line Adapter (#2091/#2092)
 - Multifunction Attachment (#1310)
 - Feature-Programmable 8-Line Communications Control/4-Line Communications Adapter (#2095/#2096)
 - Asynchronous Direct 8-Line RS-422-A Adapter (#2095/D02350)
 - SDLC Single-Line Control (#2090)
 - Teletypewriter Attachment (#7850)

- The Multiple Terminal Manager supports each of the following IBM products as a teletypewriter:

- IBM Personal Computer with the Asynchronous Communications Adapter and utilizing the Asynchronous Communications Support licensed program or appropriate user programming.
- System/23 Datamaster with the Communications Adapter feature and utilizing the Asynchronous Communications licensed program.
- 6580 Displaywriter with a Communications Adapter and utilizing the Asynchronous Communications licensed program.

Terminal and Performance Considerations

The number of terminals that can be supported by the Multiple Terminal Manager is dependent upon storage availability, terminal type(s) selected and performance requirements of the user's applications. Performance is dependent upon many factors; for example, the system hardware configuration, Realtime Programming System generation options selected, application program design, how often programs must access the terminals, etc. Analysis is required to evaluate expected performance.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified environment:

HARDWARE REQUIREMENTS

- IBM Series/1 Processor and I/O devices as required by the IBM Series/1 Realtime Programming System Version 5 (5719-PC5) or Version 6.

SOFTWARE REQUIREMENTS

Version 3 requires the current release of the following IBM Series/1 licensed programs:

- Realtime Programming System Version 5 (5719-PC5) or Version 6.
- Program Preparation Subsystem Version 5 (5719-AS5) or Version 6 (5719-PC6) is required for the preparation of user applications.

For certain environments and functions, the following Series/1 Realtime Programming System licensed programs may be required:

- Indexed Access Method Version 2 (5719-AM2)
- FORTRAN IV Compiler and Object Support Library (5719-FO2) and Realtime Subroutine Library (5719-FO4)
- Mathematical and Functional Subroutine Library Version 2 (5719-LM2)
- COBOL Compiler and Resident Library Version 2 (5719-CB7) and Transient Library Version 2 (5719-CB8)
- PL/I Compiler and Resident Library Version 2 (5719-PL2) and Transient Library Version 2 (5719-PL4)
- Realtime Programming System Query (5719-XR2)
- IBM Series/1 PASCAL Compiler and Object Library Programming RPQ P82659 (5799-TEQ).

See the terms and conditions which apply to the above licensed programs. Some are licensed on development machines only.

COMPATIBILITY

This licensed program is compatible with the licensed programs which are identified in the "Specified Operating Environment".

**BASE PROGRAM PREPARATION FACILITIES
5719-PA1**

PURPOSE

The IBM Series/1 Base Program Preparation Facilities licensed program is a set of standalone programs that aid in the preparation of programs for execution on the IBM Series/1. The licensed program consists of a Text Editor, a Macro Assembler, and a Linkage Editor. Each program is loaded separately and executes through prompts from the program with responses from the operator.

HIGHLIGHTS

- Provides the programming preparation facilities to develop and maintain specialized software systems and applications.
- Standalone program preparation on Series/1.
- Distributed from PID on Diskettes.

Text Editor

The Text Editor is a standalone program that creates and modifies source modules, which can then be used as input to the Macro Assembler. The Text Editor is used as an interactive tool for editing text modules. Commands are entered at the operator station with response by the Text Editor. Prompts from the Text Editor are responded to by the operator. Through this interactive process, assembler source modules or other text modules are created and modified. The output module is stored on a diskette.

- Source data is entered from the operator station.
- A variety of commands enable the user to create, display, and modify source modules.
- Source modules are retrieved from and stored on diskette.

Macro Assembler

The Macro Assembler is a standalone program that processes the machine, assembler, and macro instructions coded in Assembler language. Using the assembler language program, along with information entered at the operator station, the Macro Assembler produces a machine language object module, which is placed on disk. In addition, the Macro Assembler prepares listings and supplies information needed by the Linkage Editor.

Macros are coded in line or are in the users macro library stored on disk.

- Symbolic source statements entered from diskette.
- Mnemonic symbols for machine operations.
- Output modules are stored on disk along with information for linkage editing module relocation and external symbol resolution.
- Output to printer includes source program listing, external symbol dictionary, relocation dictionary, cross-reference table and error messages.

Linkage Editor

The Linkage Editor is a standalone program that processes one or more object modules produced by the Macro Assembler. Using these object modules, along with information entered at the operator station, the Linkage Editor (1) links the object modules, (2) resolves external references by searching the Object Module Library, (3) relocates all addresses to absolute addresses, and (4) prepares diagnostic and storage map listings. The result is an executable load module, which is placed on disk.

- Combines and links object modules into a single storage load.
- Prepares diagnostic and storage map listings.

Standalone Programs

The Series/1 Base Program Preparation Facilities are used to create standalone application programs. Program loading is performed with the IPL Bootstrap/Loader Disk Utility.

Standalone programs are coded entirely by the user with no dependence on other programming support.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Processor	IBM 4953 Processor (32K bytes minimum) or IBM 4955 Processor (32K bytes minimum)
Disk/ Diskette	1 - IBM 4962 model 2 or 2F Disk Storage Unit (Combination disk/diskette unit) or 1 - IBM 4962 model 1 or 1F Disk Storage Unit and 1 - IBM 4964 Diskette Unit. (Work files can optionally be assigned to a second or third disk if available to improve performance.)

Printer	1 - IBM 4974 Printer
Operator Station	1 - Teletypewriter Adapter #7850 with Teletype® Models ASR 33/35 or an ASCII equivalent device.

SOFTWARE REQUIREMENTS

Standalone Disk Utilities (5719-SC2).

PROGRAM PRODUCTS

**REALTIME PROGRAMMING SYSTEM VERSION 1
5719-PC1**

PURPOSE

The IBM Series/1 Realtime Programming System Licensed Program provides operating system functions for realtime operations with optional batch program preparation. Realtime Programming System allows the generation of a multi-partition system as well as smaller configurations in a consistent and compatible manner. Realtime Programming System includes multitasking facilities, storage management, data management, system operator station support, timer support and communications facilities.

The Realtime Programming System supervisor, when combined with the Program Preparation Subsystem, allows Series/1 to operate in a realtime online preparation environment or, if realtime is not required, in a simple batch environment.

The Series/1 Realtime Programming System provides an operating system that has been optimized for predictable response, and rich function. The Series/1 Realtime Programming System addresses the needs of users who require realtime control functions.

DESCRIPTION

- Supervisory Services
 - Task Management
 - Primary and Secondary Tasks
 - Dynamic Task Control Block Management
 - Prioritization by Hardware Level, Software Sublevel
 - Storage Management
 - Fixed Partitions
 - Overlays from Disk
 - Buffer Pooling
 - Task Set Management
 - Rollout/Rollin
 - Chaining of Task Sets
 - Queuing of Task Sets to Partitions
 - Optional Binding at Task Set Install Time
 - Scheduling Task Set Execution
 - Event Management
 - WAIT/POST (Simple, Iterative, Multiple)
 - Wait on Timer
 - Wait on I/O
 - Queue Management
 - Priority Queues in Storage
 - FIFO Queues on Disk and in Storage
 - Timer Management
 - Time-of-Day, Date
 - Time Delay
 - Asynchronous Timers
 - Serially Reusable Resource Management
 - REQUEST/RELEASE
 - Interrupt Management
 - I/O Interrupts
 - Class Interrupts
 - Error Management
 - Error Logging and Reporting
 - Task Error Exits
 - Storage Dump
 - System Reload and Restart
 - System Termination
 - Abnormal Termination of a Task
 - Operator Interface
 - Command Processing
 - Message Processing
 - Floating Point Emulator Support
- Data Management
 - Data Set Management
 - Basic I/O Access (EXIO)
 - Physical Access (READ/WRITE)
 - Logical Access (GET/PUT)
 - Sequential and Direct Access Methods
 - Consecutive, Direct, and Partitioned Organization
 - OPEN/CLOSE
 - CREATE/DELETE/RENAME
 - NOTE/POINT
 - DPIO Support
 - 4962 Disk Storage Unit
 - 4964 Diskette Unit
 - 4979 Display Station
 - 4973 Line Printer
 - 4974 Printer
 - Special Feature #7850, Teletypewriter Adapter
 - Message Buffering for User-selected Output Devices

Sensor I/O Support

- Analog I/O (single or multiple point)
- Digital I/O (single or multiple point)
- Process Interrupt

Communications Features Support

- Asynchronous Communications Single-Line Control (#1610)
- Asynchronous Communications 8-Line Control (#2091)
- Asynchronous Communications 4-Line Adapter (#2092)
- Binary Synchronous Communications Single-Line Control (#2074)
- Binary Synchronous Communications Single-Line Control/High Speed (#2075)
- Binary Synchronous Communications 8-Line Control (#2093)
- Binary Synchronous Communications 4-Line Adapter (#2094)

Communications Terminals and Systems Support

Via Start/Stop (asynchronous) Communications:

- 2740 Communications Terminal, model 1, in point-to-point switched and point-to-point nonswitched connections. Record Checking (#6114), Dial Up (#3255), and Transmit Control (#8028) special features are supported.
- Teletype® Models ASR 33/35 Data Terminals in point-to-point nonswitched connections.

Via Binary Synchronous Communications:

- IBM System/370 using OS/VS1 or OS/VS2 (SVS or MVS) BTAM in point-to-point switched and point-to-point non-switched connections (Series/1 as System/3).

• Utility Package

Standalone Utility Functions

- Disk Initialization
- System Build

System Utility Functions

- Compress (Partitioned Data Set or Volume)
- Copy
- Define (Create, Delete and Rename, Logical Volumes, Data Sets, Members)
- Initialize Diskette
- Prepare Diskette to IPL Standalone Dump
- Assign Realtime Programming System to be loaded by IPL Merge (PDS or Volumes)
- Patch
- Report (Print Disk/Diskette Directories, Disk/Diskette Data or Storage Dump)

• Service Aids

- I/O Trace
- Storage Patch and Dump
- SVC Trace

• Generation Facilities

• System Initialization

HIGHLIGHTS

• Storage Management and Task Set Management

Realtime Programming System supports multiple partitions. One partition (Number 0) is for the nucleus (System task set). Another partition may, at the user's option, contain a shared task set and be used as a shared partition containing data and other resources which may be used by programs in other partitions. The user may specify the number and sizes of the partitions at SYSGEN time and may alter his specifications at IPL time. Each partition must be a multiple of 2,048 bytes. Up to 12 user partitions (besides Partition 0) may be created until the total storage requirements reach the maximum 64K bytes. Programs executing in user partitions are organized into task sets. One task set at a time may occupy a user partition. One partition (selectable at SYSGEN or IPL time) may have a task set rolled out to disk to make way for a higher priority task set. A task set to be rolled out must have been specified to be rollutable at Application Build time. Only one task set at a time may be rolled out.

Task sets may use overlays from disk. Overlay areas may be shared between tasks only as serially reusable resources under user control.

A task set may chain to another task set which will replace it as the executing task set in the same partition. A partition GLOBAL area is maintained during this exchange, allowing several task sets to operate in sequence as a single logical operation using the same data. This facility supports the FORTRAN function "INVOKE" and the PL/I function "TRANSFER". Each task set has one primary task which executes following task set load. A buffer pooling

Realtime Programming System V1 (cont'd)

facility allows reservation of a pool of storage in a task set for dynamic allocation of buffers to tasks on request.

Supervisory Functions

• Task Management

Realtime Programming System is capable of supporting as many concurrent tasks as the user has processor storage (up to 64K) to execute the tasks. The user may have as many disk-resident programs as he can store on his disks. Tasks are dispatched in response to hardware interrupts, user requests from the system operator station, program requests, or timer services. Realtime Programming System supports the dispatching of independent tasks from other tasks.

Realtime Programming System provides up to 256 preemptive priority sub-levels within each of the four hardware levels. A task may be assigned to any level and sub-level. Multiple tasks may be assigned the same priority level. Several tasks can be simultaneously suspended on a level.

The programmer specifies whether a program is serially reusable, reentrant, refreshable, or non-reusable through the use of the program preparation facilities.

• Timer Services

Realtime Programming System manages all physical and logical timers. The system supports multiple logical timers per physical timer. Realtime Programming System requires a dedicated physical timer attachment for its own use in order to provide Time-of-Day and Date and logical timer services when required. No timers are required for batch-only systems running Program Preparation Subsystem. The other timers are available to the user as I/O devices through the READ/WRITE interface. The programmer is provided with a facility so that he may request his program to be suspended for a specified time interval or until a specified time.

The system provides a Time-of-Day Clock (TOD) and DATE. The DATE may be requested from the system in any of the following formats: Julian (YYDDD), MM DD YY and YY MM DD. The user is provided a facility for setting the DATE and TOD clock through the system operator station or from a program.

Scheduler services are provided the user so he may schedule a task set to execute on a periodic basis, at a particular time-of-day, or after a specified time interval. A facility is provided to add and delete task sets from the scheduler table on program request and from the system operator station.

• Interrupt Handler

An interrupt handler is provided for the initial handling of machine level interrupts and the dispatching of interrupt service routines. The programmer has the ability to assign task sets and events to specific bits within a process interrupt group through console or program request. Programs may dynamically connect and disconnect process interrupt bits. The programs dispatched may be storage-resident (a waiting task) or disk-resident (a task set to be queued). The user specifies the priority level at which the service task will execute.

The user is able to provide a program to be executed when the programmer console interrupt switch is depressed.

• Event Services

The programmer may define events and cause resumption of a suspended task upon the occurrence of an event. A Wait/Post facility is provided for the synchronization of tasks.

Events that are supported include I/O completion, timer, user-defined, and adding an element to a queue. The three event types supported are simple, iterative and multiple. A task may be suspended until a single event occurs or any of a list of events occurs.

• Floating Point Emulator

The Floating Point Emulator duplicates the execution of the floating point instructions when the Floating Point Processor is not attached to the system. The user specifies whether the emulator is to be resident or transient when the system is configured.

• Queuing Services

The user has the facility of defining storage and disk queues. These queues may be used for passing data from one task to another. The system provides for priority queues, while entries with the same priority are maintained on a FIFO basis. The user may add and remove entries from the queues. A copy queue entry facility is provided so entries may be added from a transient area. Provision is made for warm restart (queue elements retained) or cold restart (queue cleared) of disk queues after system shutdown. Queues may be "Public", that is, serviced by multiple tasks in a task set; or "Private", that is, serviced only by the task owning it.

• Resource Management

The system provides the user with a facility for management of serially reusable resources. Once the resource is freed from the current task, control is given to the highest priority task waiting on the resource.

• Command Language Processor

The functions supported through the system operator station using the command language are:

Execute a task set

Terminate a task set

Delete a task set from the partition queue(s)

Add and delete entries from the scheduler table, that is, task sets that will execute on TOD, on a periodic basis, after a time delay, etc.

Set and display TOD Clock and DATE

Put I/O devices online and offline

Devices may be reassigned by the operator in the event of a permanent I/O Error

Assign logical device numbers to physical device addresses

Define and Delete Error Logs

Mount and Demount 4964 Diskettes

Start and Stop the I/O Trace

Start and Stop the SVC Trace

Display up to 56 bytes of processor storage

Patch up to 20 bytes of processor storage

Make ABEND dump data set or member available for reuse

Set operating mode to Attended or Unattended

Reply to a WRITE-TO-CONSOLE message with an identifying number

Define partitions (as part of IPL sequence)

Activate support for physical devices (as part of IPL sequence)

A facility is provided so the user may select and add system operator station functions that he desires at SYSGEN

Data Management Functions

• DPIO Support

Realtime Programming System Data Management provides the user with services which are described below:

• Device Service Routines

Device Service Routines are provided for supported devices. Character data conversion between EBCDIC and TTY ASCII is provided.

The system performs all physical I/O upon request by the user program. Realtime Programming System provides optional I/O timeout for systems with hardware timers with times dependent on the device type. The programmer is able to read into his program the programmer console data buffer upon request. The programmer also has the ability to write to the programmer console lights. The DPIO user-interface is either GET/PUT or READ/WRITE. For Sensor I/O it is READ/WRITE. There is also a third level of access (EXIO) which is primarily for device manipulation such as diagnostic programs perform. Data files may exist on either fixed disk or removable diskette.

The data set organizations supported for sectorized devices are:

Consecutive
Random
Partitioned

The user may add and update records to a consecutive DASD file. The user may have multiple data sets per volume. Multivolume files (diskettes only) are supported only for Basic Exchange Format Files. When using random data sets, the user may also access the records by relative record number.

The partitioned data set support is provided for user and system libraries. Realtime Programming System provides facilities for the creation, deletion, and maintenance of the partitioned data sets.

Realtime Programming System supports the fixed heads option in the 4962 Disk Storage Unit file to the extent that the user may place data sets under the fixed heads at his discretion.

Data sets may be shared among tasks in the system. Management of sensor I/O is supported to the extent described under Sensor I/O. DPIO may be shared among any tasks in the system.

Realtime Programming System V1 (cont'd)

Management of shared I/O devices is the responsibility of the programmer. Management of disk message buffering is handled by Realtime Programming System.

The user has the option of accessing Series/1 I/O devices at the READ/WRITE, and GET/PUT level (sensor I/O at the READ/WRITE level only). The user is provided with device independence at the GET/PUT level. All hard copy devices logically support the ASA Control characters. This option allows the user to direct a print file to the disk or diskette for later printing. A write with read verify option may be a parameter on the OPEN macro only.

The record types supported are:

- Fixed
- Fixed Block
- Fixed Blocked Spanned
- Variable
- Variable Blocked
- Variable Blocked Spanned (Including Text Compression)

Data sets may be created and deleted via online system utility functions and from program requests (including the Program Preparation Subsystems).

Support of the 4964 diskettes:

- Provides users with a usable, removable programming medium
- Enhances data security, integrity, and privacy

The system user can copy via online system utility functions, a diskette volume to the fixed disk and utilize the stored data of the diskette as if it had always been on disk. When the user's operations are completed, a copy of the disk data may be transferred to diskette. The diskettes may contain multiple files, files may span multiple diskettes, and many diskettes/files may be copied to fixed disk at one time. The user will have the convenience and privacy that removable diskette modules provide him, while the system is able to utilize the speed and reliability offered by a fixed disk. The expiration date, which is a user option on diskettes, is honored by Realtime Programming System.

The user has the option to bind I/O devices and data sets during:

- A. Program Preparation
- B. Task Set Installation
- C. Execution (OPEN) Time

Options (A) and (B) provide the Realtime Programming System user with the ability to achieve higher performance by requiring a minimum number of disk reads to locate programs and data.

- **Sensor Input/Output**

Note: Multiple points (AI, AO, DI, DO) may be accessed via one supervisor request.

Process Interrupt

As defined under Interrupt Handler.

Analog Input

Realtime Programming System supports Analog Input including the programmable gain amplifier, and the automatic zero correction option. The user has a choice of either sequential or random access at the READ/WRITE level. A single point can be handled under either of the access forms by specifying a count of one.

Analog Output

Realtime Programming System supports analog output including maintaining the present output value of each point. The user has a choice of either sequential or random access at the READ/WRITE level. A single point can be handled under either of the access forms by specifying a count of one.

Digital Input

Realtime Programming System supports sequential and random access at the READ/WRITE level. Logical groups may be defined as contiguous DI points in a physical group composed of 16 points. This allows the user to place DI points among different devices and/or programs. A single point or group can be handled under either of the access forms by specifying a count of one.

Digital Output

Realtime Programming System supports sequential and random access at the READ/WRITE level. Digital Output points may be defined in a logical group as in Digital Input above.

- **Communications Support**

Communications support is an integral part of Realtime Programming System data management and is accessed via the Read/Write interface. The support directs the transfer of data between user programs and remote stations. A remote station may be either a supported start/stop terminal or another computer system via binary synchronous communications. Facilities are provided to:

- Establish, control, and terminate user program access to remote stations.
- Transfer data between user programs and remote stations on point-to-point lines (either switched or nonswitched).

The start/stop terminals supported are:

- 2740 Communications Terminal, model 1, in point-to-point switched and point-to-point nonswitched connections. Record checking, Dial Up, and Transmit Control Optional special features are supported.
- Teletype® Models ASR 33 and 35 Data Terminals or equivalent ASCII device in point-to-point nonswitched connections.

Binary Synchronous communications is supported to System/370s using OS/VS1 or OS/VS2 (SVS or MVS) BTAM in point-to-point switched and point-to-point nonswitched connections (Series/1 as System/3).

A function is provided (TRANSLTE macro) to facilitate code conversion between EBCDIC and commonly used line codes: ASCII, PTTC/EBCD, PTTC/BCD, PTTC/Correspondence, and 8-Level TWX Code.

For switched line processing, provision is made for connection via:

- Manual Call
- Manual Answer
- Auto Answer

ID exchange is supported for binary synchronous communications.

In normal operation with the 2740, or binary synchronous, the support will automatically include the proper line control (framing) characters. However, insertion and deletion of terminal control characters (carriage return, line feed, for example) are the responsibility of the user. Support for the Teletype® Models ASR 33 and 35 is limited to making and maintaining half-duplex line connection, transmitting user-furnished buffers on the line, receiving data from the line and filling user-furnished buffers, and recognizing user supplied change-of-direction character on receive as end of data. No Model ASR 33/35 features are supported. Features such as Echo Mode, Answer Back, Full-duplex, etc., must be supported through user programming.

- **Storage Protection**

Realtime Programming System protects the Realtime Programming System supervisor and, optionally, both the Control Module and Protected Dynamic Storage with user task sets from all application programs. Realtime Programming System uses the Series/1 hardware to achieve this protection. The 4953 processor does not have hardware storage protection. Realtime Programming System systems running in the 4953 are not storage protected.

- **Message Buffering**

Realtime Programming System provides a disk message buffering facility, supporting the following sequential output devices:

- Operator Station
- 4973 Line Printer
- 4974 Printer
- Communication Devices

Other devices may use the message buffering facility. The system will print a complete message before starting another message.

Initial Program Load (IPL)

A capability is provided to IPL from the following devices:

- 4964 Diskette (IPL Standalone Utilities)
- 4962 (IPL Realtime Programming System)

After Realtime Programming System is loaded in the system, Realtime Programming System processes a user specified command data set which may be used to start user task sets or perform any valid operator command.

Utilities

A set of utilities is provided for the proper installation and maintenance of application programs and data. Certain utilities may run concurrently with the user application programs and others run offline (that is, standalone - not concurrently with user programs or under Realtime Programming System).

Realtime Programming System V1 (cont'd)

The standalone utilities are loaded from a 4964 diskette.

The following standalone utilities are provided:

System Build

This utility prepares a disk device to IPL the Realtime Programming System starter system and execute Realtime Programming System online system utilities. System build is executed prior to system generation as part of the Realtime Programming System installation process and at other times to restore the Realtime Programming System starter system and Realtime Programming System online system utilities.

Disk Initialization

This utility initializes the fixed disks. It performs surface analysis and allows alternate sector assignments.

Storage-to-Diskette-Dump

This utility is used for APAR submission and dumps all of storage except for the area where the utility is loaded from the 4964 Diskette. This utility also dumps all the system's registers and status indicators. The online system REPORT utility may be used to obtain a printout of the dump on a hardcopy device. Additional dump diskettes may be created using the online system IPLMAINT utility.

Diskette Initialization

This utility provides online initialization of diskettes.

DEFINE/CREATE/BUILD/DELETE/RENAME Data Sets

These utilities perform the following functions:

- **DEFINE** - The function of defining a disk or diskette to be in Realtime Programming System format containing logical volumes.
- **CREATE** - The function of assigning space on sectorized devices including creation of logical volumes, partitioned data sets, consecutive or direct data sets, or members.
- **BUILD** - The function of building data set definitions in a task set library.
- **DELETE** - The function of deleting volumes, data sets, members, or data set definitions on sectorized devices including the management of TOCs and partitioned data set directories.
- **RENAME** - The function of renaming a volume, data set, or member, including the handling of TOCs and partitioned data set directories.

COMPRESS

This utility performs the function of copying partitioned data sets or volumes in place on sectorized devices to consolidate all available free space within one contiguous area.

PATCH DISK/DISKETTE

This utility provides the functions of applying permanent fixes to the DASD devices. Visual verification of the data to be replaced is provided before the user enters the new data.

REPORT

This utility provides the ability to print data from the diskette and disk files to any of the Series/1 hard copy output devices. The user has the ability to print the file (or data set), TOCs, and partitioned data set directories. This utility also provides the ability to print a formatted dump of storage. The dump was previously taken either standalone or online.

COPY

The COPY utility provides the function of doing either a selective or volume copy. The user has the ability to copy as follows:

From	To
Diskette, Disk	Diskette, Disk, Printer, Teletypewriter, Display

Selective copies allow the user to copy data sets, volumes, or members of data sets. Records may also be added to the end of a consecutive data set.

MERGE

This utility provides the function of combining two partitioned data sets or volumes into a third partitioned data set or volume.

IPLMAINT

This utility provides the functions to:

- Prepare a diskette to IPL the standalone storage-to-diskette dump utility, and
- Establish the system to be loaded from disk at IPL time.

REALTIME PROGRAMMING SYSTEM RAS CHARACTERISTICS

Realtime Programming System provides a set of RAS facilities which are always included in the Realtime Programming System system. Additional facilities may be optionally included which result in an extensive set of RAS functions.

Error Response

Detection of machine check or program check conditions, error logging and message generation are performed by supervisory functions in Realtime Programming System.

System Recovery

Error Recovery Procedures provide the system with capability to continue operation if at all possible, in the case of software, hardware, and power failures. Task set and system restart and reloading are provided. If the system cannot continue normal execution, the system user is able to specify execution of a program which utilizes minimum system resources and can notify and prepare the external environment for the imminent loss of the system.

Failure of the disk module that contains the System task set does not cause total system failure or initiate a reload of the supervisor. In the event of disk failure, programs that do not require that disk module are able to continue operation. Disk service to other disk modules continues. However, the next request for a system transient, with the exception of error logging, may cause an abnormal termination of the system.

Hardware Service Aids

Maintaining error logs is a means of assessing hardware and software reliability. By using hardware error recording to monitor the system, user personnel are made aware of marginally operating equipment. The type of intermittent failures of devices, channels, and CPU will be optionally recorded on a 4962 disk. The error logs are used by customer engineers and user personnel for diagnostic purposes. The user and the customer engineer are able to obtain dumps of disk recorded log areas.

Realtime Programming System provides the following functions:

- Routines to handle the occurrence of a machine check. These routines provide the option of returning control to a user routine after the check has been cleared and optionally logged. The system passes the pertinent error data to the user.
- Support of Automatic Restart after Power Failure. Upon power restoration, a user-specified load module is loaded.
- Support of Battery Backup Feature. Systems with the Battery Backup Feature and Timer Support notify the user of a power failure by dispatching a user-specified program. When the power is restored, Realtime Programming System dispatches a user-specified program and passes the duration of the power failure in minutes, seconds, and milliseconds. If the battery is exhausted, results will be the same as if the system does not have the Battery Backup Feature.
- In addition to the general purpose RAS aids, additional optional aids are provided for communications:
 - Communications Trace program which, when activated under user control, is designed to continuously record current communications activity in main storage. This facility works in conjunction with the general purpose I/O trace facility.
 - Communications Online Test is an optional facility which provides a means of testing attached 2740 model 1 terminals concurrent with user operation and determining proper operation of the communication link (lines and modems) as well as the terminal and system programming support.

Device Support

The Realtime Programming System supports the 4953 and 4955 Processors, all of the following Series/1 standard I/O devices and the following processor options:

- Floating Point Processor
- Programmer's Console

Multiples of the following devices and features are supported.

4962	model 1, 1F, 2, and 2F	Disk
4964	model 1	Diskette
4974	model 1	Printer
4973	models 1 and 2	Line Printer
4982	model 1	Sensor I/O
4979	model 1	Display Station
4999	models 1 and 2	Battery Backup
#7840	-	Timer
#7850	-	Teletypewriter adapter (supported for use with Teletype® Models ASR 33/35)
#1560	-	Integrated DI/DO
#1610	-	Asynchronous Communications Single-Line Control
#2091	-	Asynchronous Communications 8-line Control

PROGRAM PRODUCTS

Realtime Programming System V1 (cont'd)

- #2092 - Asynchronous Communications 4-line Adapter
- #2074 - Binary Synchronous Communications Single-Line Control
- #2075 - Binary Synchronous Communications Single-Line Control/High Speed
- #2093 - Binary Synchronous Communications 8-line Control
- #2094 - Binary Synchronous Communications 4-line Adapter

TERMS and CONDITIONS: See PP Index

Note: Device and feature performance is dependent upon hardware configuration, Series/1 Realtime Programming System generation options, and application program design.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system after initially loading the disk, and when the application program executes without hard copy output, system console operations, and data interchange, is:

- Processor** IBM 4953 or IBM 4955 Processor
- Storage** 48K bytes
- Disk** 1 - IBM 4962 model 1 or 1F Disk Storage Unit

The minimum hardware configuration to support System Generation is:

- Processor** IBM 4953 or 4955 Processor
- Storage** 48K bytes
- Disk/Diskette** 1 - IBM 4962 model 2 or 2F Disk Storage Unit (Combination disk/diskette unit)
or
1 - IBM 4962 model 1 or 1F Disk Storage Unit
and
1 - IBM 4964 Diskette Unit
- Printer** 1 - IBM 4973 Line Printer
or
1 - IBM 4974 Printer
- Operator Station** 1 - IBM 4979 Display Station
or
1 - Teletypewriter Adapter #7850 with Teletype® Models ASR 33/35

The actual configuration required by the user depends on his application needs. In addition to the above hardware, the Communications Indicator Panel (#2000) is recommended for configurations which contain communications features.

Note: The configuration must have the following standard address assignments in order to satisfy the minimum system requirements. (The starter system supports the minimum system requirements.)

Description	Decimal Address
IBM 4962 Disk Unit	03
IBM 4964 Diskette	02
IBM 4973 Line Printer	33
IBM 4974 Printer	01
IBM 4979 Display Station	04
#7850 Teletypewriter Adapter	00

SOFTWARE REQUIREMENTS: None

PROGRAM PRODUCTS

REALTIME PROGRAMMING SYSTEM VERSION 2
5719-PC2

PURPOSE

The IBM Series/1 Realtime Programming System Version 2 (5719-PC2) Licensed Program provides all the facilities of the IBM Series/1 Realtime Programming System Version 1 (5719-PC1) Licensed Program plus the following additional features:

- System support for the IBM 4962 Disk Storage Unit models 3 and 4 with a capacity of 13,962,240 bytes.
- Storage Overlays: Storage above 64K can be used to enhance the performance of user task sets by allowing more user-written program segments to be resident in storage at one time.
 - Uses Overlay Manager provided by 5719-AS2, or equivalent.
 - Invoked by CALL statement.
 - Faster than disk overlay.
 - Reduces DASD load, compared to using disk overlays.
- Secondary storage (above 64K) assigned to partitions at SYSGEN with optional IPL override.
- Supports up to 128K of physical storage.
- Storage Overlays loaded at task set load time.
- Fully compatible with rollout/rollin capability.

DESCRIPTION

Debug Package

The interactive debug package provides a set of functions to assist in program debugging. These functions are invoked and controlled from the system console. The following functions are provided:

- Display/Modify Storage
- Display/Modify Registers
- Display/Modify Floating Point Registers
- Display/Modify Segmentation Registers
- Print Control Blocks
- Print Storage
- Print Storage Overlays
- Hexadecimal Addition and Subtraction
- Decimal-Hexadecimal Conversion
- Set Break Point
- Display Break Points
- Reset Break Point
- Branch
- Execute
- Trace Storage Contents
- Display/Modify Disk
- Display/Modify Diskette
- Display/Modify Program
- Display/Modify Overlay
- Display/Modify Transient
- Load/Unload Transient

Automatic Device Backup

This facility provides automatic switching from a failing primary device to a secondary device. If an unrecoverable I/O error occurs on a device with device backup, data is redirected from that device to its backup. The following combinations are supported for automatic device backup:

- Teletypewriter primary to Teletypewriter backup (output only)
- Line Printer to line printer, matrix printer, or teletypewriter
- Matrix printer to matrix printer, line printer, or teletypewriter

Write with Read Verify Option

This facility allows Data Set Definitions (DSD) to contain the indication that all write operations to that data set (on disk or diskette) defined by the DSD are to be verified. This option may also be exercised by a parameter on the OPEN macro.

BSC Initial Program Load (IPL)

An IPL bootstrap program is provided, allowing a user program in a host Series/1 under the IBM Series/1 Realtime Programming System to transmit this bootstrap to a suitably configured remote Series/1 over a BSC line, causing the remote Series/1 to IPL from its own system residence device.

BSC Dump

This facility allows a remote Series/1, at the request of the host Series/1, to transmit the contents of its dump data set to the host Series/1 for subsequent printing.

Terminal and Systems Support

The IBM Series/1 Realtime Programming System Version 2 (5719-PC2) extends the communications support of Version 1 (5719-PC1) by adding:

- Start/Stop (Asynchronous) Communications support of:

- Teletype® Models ASR 33/35 Data Terminals or equivalent in point-to-point switched connections. Determination of equivalency is a user responsibility.

• Binary Synchronous Communications

- To another IBM Series/1 using IBM Series/1 Realtime Programming System Versions 2, 3, or 4 in point-to-point switched or nonswitched connections.
- To an IBM System/3 using CCP or RPG in point-to-point switched or nonswitched connections (Series/1 as System/3).
- To an IBM System/370 using DOS/VS BTAM or VTAM in point-to-point switched or nonswitched connections (Series/1 as System/3).

• EXIO Support for Communications

This facility allows the user to access the Binary Synchronous and Asynchronous communications features at a Basic level (EXIO). This basic access allows access to all facilities supported by the hardware features. The EXIO and the READ/WRITE support are mutually exclusive for an attachment.

Customers ordering the 4962 Disk Storage Unit models 3 and 4 should order the IBM Series/1 Realtime Programming System Version 2 (5719-PC2) and the IBM Series/1 Program Preparation Subsystem Version 2 (5719-AS2).

The Storage Overlay Feature can enhance performance of applications by permitting more program segments to be in storage at one time. These can be located in storage above 64K (secondary storage) and accessed by Supervisor control of the contents of segmentation registers provided by the Storage Address Relocation (#6335). Storage Overlay areas are loaded at task set load time, and the programs are executed when called.

Device Support

The Realtime Programming System Version 2 supports the 4953 and 4955 Processors and the following processor options:

- #3920 Floating Point Processor (4955 only)
- #5650 Programmer's Console
- #6335 Storage Address Relocation Translator (4955 only)

In addition, multiples of the following devices and features are supported:

- 4962 models 1, 1F, 2, 2F, 3 and 4
 - 4964 model 1
 - 4974 model 1
 - 4973 models 1 and 2
 - 4979 model 1
 - 4982 model 1
 - 4999 models 1 and 2*
- Disk
 - Diskette
 - Printer
 - Line Printer
 - Display Station
 - Sensor I/O
 - BatteryBackup

* Only one is supported.

Features

- #1560 - Integrated DI/DO
- #7840 - Timer
- #7850 - Teletypewriter Adapter, Supported for use with Teletype® Models ASR 33/35
- #1610 - Asynchronous Communications Single Line Control
- #2091 - Asynchronous Communications 8-Line Control
- #2092 - Asynchronous Communications 4-Line Adapter
- #2074 - Binary Synchronous Communications Single Line Control
- #2075 - Binary Synchronous Communications Single Line Control/High Speed
- #2093 - Binary Synchronous Communications 8-Line Control
- #2094 - Binary Synchronous Communications 4-Line Adapter

Note: Device and feature performance is dependent upon hardware configuration, Realtime Programming System generation options, and application program design.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

PROGRAM PRODUCTS

Realtime Programming System V2 (cont'd)

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system after initially loading the disk and when the application program executes without hard copy output, system console operations, and data interchange is:

Processor	IBM 4953 or IBM 4955 Processor
Storage	48K bytes
Disk	1 - IBM 4962 model 1, 1F, or 3 Disk Storage Unit

The minimum hardware configuration to support System Generation and System Installation is:

Processor	IBM 4953 or IBM 4955 Processor
Storage	48K bytes
Disk/ Diskette	1-IBM 4962 model 2, 2F or 4 Disk Storage Unit (Combination disk/diskette unit) or 1 - IBM 4962 model 1, 1F or 3 Disk Storage Unit and 1 - IBM 4964 Diskette Unit
Printer	1 - IBM 4973 Line Printer or 1 - IBM 4974 Printer
Operator Station	1 - IBM 4979 Display Station or 1 - Teletypewriter Adapter #7850 Supported for use with Teletype® Models ASR 33/35

To support BSC IPL and BSC DUMP, the host system must have any of the BSC communications features (#2074, #2075, #2093/#2094). The remote system must have one of the BSC single line features (#2074 or #2075).

The hardware requirement for the storage overlay capability includes the Storage Address Relocation Translator (#6335), and a minimum of 64K bytes of physical storage.

The Communications Indication Panel (#2000) is recommended for configurations which include communications features. The actual configuration required by the user depends on his application needs in addition to the above hardware.

Note: The configuration must have the following address assignments in order to satisfy the minimum system requirements. (The starter system supports the minimum system requirements.)

Description	Decimal Address
IBM 4962 Disk Unit	03
IBM 4964 Diskette	02
IBM 4973 Line Printer	33
IBM 4974 Printer	01
IBM 4979 Display Station	04
#7850 Teletypewriter Adapter	00

SOFTWARE REQUIREMENTS

None.

COMPATIBILITY

Files

Complete compatibility with files supported by the IBM Series/1 Realtime Programming System Version 1 (5719-PC1) is provided. Any data file written using either of these systems is directly usable by the other.

Compatibility with external (to Series/1) devices is maintained by using the diskette interchange architecture.

Programs

The IBM Series/1 Realtime Programming System Version 2 (5719-PC2) is functionally upward-compatible with the IBM Series/1 Realtime Programming System Version 1 (5719-PC1).

Problem state source programs that compile and execute on the IBM Series/1 Realtime Programming System Version 1 will compile and execute on the IBM Series/1 Realtime Programming System Version 2.

Customer-written programs included with the supervisor must be written in accordance with the internal supervisor programming

conventions and interfaces. In some areas these are different from those of the IBM Series/1 Realtime Programming System Version 1 (5719-PC1).

All task sets built to execute in the IBM Series/1 Realtime Programming System Version 1 (5719-PC1) environment must be rebuilt to execute in the IBM Series/1 Realtime Programming System Version 2 (5719-PC2) environment.

Preparation

The IBM Series/1 Program Preparation Subsystem Version 2 (5719-AS2) can prepare programs to execute with the IBM Series/1 Realtime Programming System Version 1 (5719-PC1) and Version 2 (5719-PC2). The IBM Series/1 Program Preparation Subsystem Version 1 (5719-AS1) can prepare programs to execute on the IBM Series/1 Realtime Programming System Version 1.

The following IBM Series/1 Licensed Programs can be used to prepare programs to execute with the IBM Series/1 Realtime Programming System Version 1 (5719-PC1) or the IBM Series/1 Realtime Programming System Version 2 (5719-PC2).

- IBM Series/1 FORTRAN IV Compiler and Object Support Library (5719-FO1)
- IBM Series/1 FORTRAN IV Realtime Subroutine Library (5719-FO3)
- IBM Series/1 Mathematical and Functional Subroutine Library (5719-LM1)
- IBM Series/1 Mathematical and Functional Subroutine Library Version 2 (5719-LM2)
- IBM Series/1 PL/I Compiler and Resident Library (5719-PL1)
- IBM Series/1 PL/I Transient Library (5719-PL3)

The IBM Series/1 Program Preparation Facilities (5719-PA1) cannot be used to prepare programs to run with the IBM Series/1 Realtime Programming System Version 2 (5719-PC2).

Required EC Levels

The required engineering change level for 5719-PC2 for the 4962 Disk Unit is EC 829868 and EC 578573. This applies to the IBM 4962 Disk Unit serial numbers 10001 through 10188.

REALTIME PROGRAMMING SYSTEM VERSION 3 5719-PC3

PURPOSE

The IBM Series/1 Realtime Programming System Version 3 (5719-PC3) is a licensed program which provides all the facilities of the Realtime Programming System Version 2 (5719-PC2) plus the additional function to manage up to 256K bytes of processor storage. Features of Version 3 are:

- Dynamic partitions which can be created upon demand.
- Relocatable task sets which can be executed in a partition other than the one for which the task set was built.
- Multiple address space management to provide isolation between task sets and the flexible use of up to 256K bytes.
- Multiple address space partitions which allow a shared task set to be shared system-wide.
- System-wide events and queues via the shared tasks set.
- Up to 15 user partitions.
- Up to 64K byte user partition size.
- Separation of system instructions and data to permit the system partition to occupy two address spaces and therefore exceed 64K bytes. (Instruction/Data Split System.) The new maximum size is 126K bytes (64K bytes maximum for data and 62K bytes maximum for instructions).

HIGHLIGHTS

This licensed program is a version of the Realtime Programming System, whose purpose is to provide an operating system which fully supports Series/1 configurations containing the Storage Address Relocation Translator feature. It allows the flexible use of physical storage greater than 64K. It also provides an increased degree of isolation of individual programs from other programs.

The option of splitting supervisory data and supervisor instructions into two address spaces (0 and 1) permits larger configurations and more capable systems than would be possible under a 64K size limitation. The new maximum size is 126K with a 64K maximum on data and on instructions including 2K mapped identically into each address space. The additional space may be variously used for such items as making more transients resident for improved performance, more control module space to support more user partitions and more complex task sets, support for more I/O, and more user-provided programming to be included in the supervisor.

DESCRIPTION

System-wide Objects

The Supervisor manages objects which are recognized across address space boundaries. These are:

- A. Events designated in a shared task set. (Other events are recognized within the task set in which they are defined.)
- B. Task sets which can be queued for execution by tasks executing in different address spaces from the one the requested task set will execute in.
- C. Queues in the shared task set whose elements may be either placed into a queue or removed from a queue by any task executing in a task set using the shared task set.

System-wide objects are referenced by name so that:

- User programs refer to them symbolically.
- Program preparation steps recognize them as shared objects.
- At execution time supervisory services perform the requested function across the address space boundaries.

There is a single shared task set. The purpose of the shared task set is to allow a single storage-resident copy of programs such as those in the Mathematical and Functional Subroutine Library (5719-LM1) routines to serve calling programs in all address spaces using the shared tasks set and to allow system-wide sharing of data and objects located in the shared task set.

System-wide Timer Services

The system maintains a single realtime clock. Other timer services are also consolidated for all tasks in the system.

Storage Management Functions

All of the storage management functions of Realtime Programming System Version 2 (5719-PC2) are available in this release.

Storage overlay is the capability of the supervisor to control the contents of the segmentation registers which are associated at task set load time with a storage overlay area in a task set (2K or a multiple of 2K in size). These registers may be pointed to different blocks of physical storage to provide a logical overlay with faster response than that obtainable from disk overlays and without performing any I/O

operation. The blocks of storage which compose the overlays are initialized at task set load time. The control operations are invoked by an SVC within the user program.

Disk overlays are available to each task set in the same manner as in Realtime Programming System Version 2 (5719-PC2).

The system will support up to 15 user partitions.

The relocatable task set feature allows task sets to execute in a partition (including a dynamic partition) or with an origin address other than the one it was built for. At task set load time, the loader will perform the relocation. A relocatable task set may do anything that any other task set may do with the following exceptions:

- a. It may not be pre-bound through task set installation unless it is being bound to the partition (number and origin) for which it was built; that is, a task set will not be relocated during task set installation.
- b. It may not be a shared task set. (It may, however, make use of a shared task set.)

The supervisor cannot be altered or referenced by user programs executing in problem state.

Programs and data residing in user-controlled sections of storage mapped exclusively to a single address space may not be altered or referenced by user programs residing in storage mapped to another address space because of addressability.

Task and Task Set Management

Task Management

Task management is the same as that provided in Realtime Programming System Version 2 (5719-PC2).

Each task will compete for execution by its numerical priority (level and sublevel) against all others in the system.

Task Set Management

A task set is what is loaded for execution into a partition, as in Realtime Programming System Version 2 (5719-PC2), with the extension that storage overlays can now be included in the task set.

The dynamic partition feature allows task sets to be executed without requiring that a pre-specified fixed partition be available. Task sets queued for execution without designating a partition number or specifying an undefined partition number will be brought into execution in a dynamic partition provided that:

- a. Sufficient unallocated storage is available (not necessarily contiguous).
- b. There is a partition number (1-15) which is not defined during IPL.
- c. There is an address key (2-7 in instruction/data split system) which did not have a partition defined in it at IPL time.

Task set queuing may be performed by either console request or program request.

Communications Support

All communications capabilities provided by Realtime Programming System Version 2 (5719-PC2) are also provided under this version.

In addition, under the Realtime Programming System Version 3 (5719-PC3), the support for the Binary Synchronous Communications features (#2074, #2093, #2094) has been verified for operation in the following environments:

- *System/32* using point-to-point BSC under RPG programming facilities as an IBM System/3.
- *System/34* using point-to-point BSC under RPG programming facilities and the recently announced BSCEL (BSC Equivalence Link) feature of the SSP-ICF (Interactive Communications Feature) as an IBM System/3.
- *5260 Retail System* via the 5265 models A12, A22, A42, B12, B22, B42 using point-to-point BSC discipline as an IBM System 3.
- *System/370 OS/VS1, OS/VS2 TCAM* using point-to-point BSC discipline as an IBM System/3. (Non-conversational mode only.)
- *System/370 OS/VS1, OS/VS2, DOS/VS CICS/VS* using point-to-point BSC discipline as an IBM System/3. (BTAM only.)
- *System/370 OS/VS1, OS/VS2 IMS/VS* using point-to-point BSC discipline. (BTAM only.) IMS/VS support is via IRSS (Independent Remote Subsystem Support), an IMS/VS protocol for the support of remote systems. A Series/1 user-written application program under the Realtime Programming System is required for the formatting and handling of messages in the proper IMS/IRSS formats.

PROGRAM PRODUCTS

S/1 Realtime Programming System V3 (cont'd)

Initial Program Load (IPL)

IPL will perform the same functions as IPL in Realtime Programming System Version 2 (5719-PC2). It will also allocate storage for the storage overlay function to partitions and assign partitions to address spaces as specified by the user.

Utilities

The utilities contain all the functions available in Realtime Programming System Version 2 (5719-PC2).

Message Buffering

Message Buffering capability is the same as that provided in Realtime Programming System Version 2 (5719-PC2).

Device Support

The Realtime Programming System Version 3 supports the 4955 Processor and the following processor options:

- #3920 Floating Point Processor
- #5650 Programmer's Console
- #6335 Storage Address Relocation Translator (4955 models B and D only)

In addition, multiples of the following devices and features are supported.

4962 models 1, 1F, 2, 2F, 3 and 4	Disk
4964 model 1	Diskette
4974 model 1	Printer
4973 models 1 and 2	Line Printer
4979 model 1	Display Station
4982 model 1	Sensor I/O
4999 models 1 and 2	Battery Backup

Features

- #1560 - Integrated DI/DO
- #7840 - Timer
- #7850 - Teletypewriter Adapter supported for use with Teletype® Models ASR 33/35
- #1610 - Asynchronous Communications Single Line Control
- #2091 - Asynchronous Communications 8-Line Control
- #2092 - Asynchronous Communications 4-Line Adapter
- #2074 - Binary Synchronous Communications Single Line Control
- #2075 - Binary Synchronous Communications Single Line Control/High Speed
- #2093 - Binary Synchronous Communications 8-Line Control
- #2094 - Binary Synchronous Communications 4-Line Adapter

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system after initially loading the disk and when the application program executes without hard copy input, system console operations, and data interchange is:

Processor	IBM 4955 Processor models B or D with Storage Address Relocation Translator #6335 or IBM 4955 model E or IBM 4952
Storage	64K bytes
Disk	1 - IBM 4962 model 1, 1F, or 3 Disk Storage Unit

The minimum hardware configuration to support System Generation and System Installation.

Processor	IBM 4955 Processor models B or D with Storage Address Relocation Translator #6335 or IBM 4955 model E or IBM 4952
Storage	64K bytes

Disk/ Diskette	1 - IBM 4962 model 2, 2F or 4 Disk Storage Unit (Combination disk/diskette unit) or 1 - IBM 4962 model 1, 1F or 3 Disk Storage Unit and 1 - IBM 4964 Diskette Unit
Printer	1 - IBM 4973 Line Printer or 1 - IBM 4974 Printer
Operator Station	1 - IBM 4979 Display Station or 1 - Teletypewriter Attachment #7850 with Teletype® Models ASR 33/35

The Communications Indication Panel (#2000) is recommended for configurations which include communications features. The actual configuration required by the user depends on his application needs in addition to the above hardware.

To support BSC IPL and BSC DUMP, the host system must have any of the BSC communications features (#2074, #2075, #2093/#2094). The remote system must have one of the BSC single line features (#2074, #2075).

The configuration must have the following standard address assignments in order to satisfy the minimum system requirements. (The starter system supports the minimum system requirements.)

Description	Decimal Address
IBM 4962 Disk Unit	03
IBM 4964 Diskette	02
IBM 4973 Line Printer	33
IBM 4974 Printer	01
IBM 4979 Display Station	04
#7850 Teletypewriter Attachment	00

SOFTWARE REQUIREMENTS

None

COMPATIBILITY

Files

Complete compatibility with files supported by the IBM Series/1 Realtime Programming System Version 1 (5719-PC1) or Version 2 (5719-PC2) is provided. Any data file written using any of these systems is directly usable by the others. Compatibility with external (to Series/1) devices is maintained by using Basic Data Exchange. See the *IBM Diskette General Information Manual (GA21-9182)*.

Programs

Problem state source programs which assemble or compile and execute on the IBM Series/1 Realtime Programming System Version 1 (5719-PC1) or Version 2 (5719-PC2) may require source modifications to assemble or compile and execute on the IBM Series/1 Realtime Programming System Version 3 (5719-PC3).

Customer-written programs included with the supervisor must be written in accordance with the internal supervisor programming conventions which are different from those of 5719-PC1 and 5719-PC2. The following IBM Series/1 licensed programs are compatible with the IBM Series/1 Realtime Programming System Version 3. For details on these licensed programs, refer to the respective sales manual pages.

- IBM Series/1 Program Preparation Subsystem Version 3 (5719-AS3)
- IBM Series/1 FORTRAN IV Compiler and Object Support Library (5719-FO1)
- IBM Series/1 FORTRAN IV Realtime Subroutine Library (5719-FO3)
- IBM Series/1 FORTRAN IV Realtime Subroutine Library Version 2 (5719-FO4)
- IBM Series/1 Mathematical and Functional Subroutine Library (5719-LM1)
- IBM Series/1 Mathematical and Functional Subroutine Library Version 2 (5719-LM2)
- IBM Series/1 PL/I Compiler and Resident Library (5719-PL1)
- IBM Series/1 PL/I Transient Library (5719-PL3)
- IBM Series/1 COBOL Compiler and Resident Library (5719-CB1)
- IBM Series/1 COBOL Transient Library (5719-CB2)
- IBM Series/1 Index Access Method (5719-AM1)
- IBM Series/1 Sort/Merge (5719-SM1)
- IBM Series/1 4987 Programmable Communications Subsystem Preparation Facility (5719-CS0)
- IBM Series/1 4987 Programmable Communications Subsystem Execution Support (5719-CS1)

PROGRAM PRODUCTS

S/1 Realtime Programming System V3 (cont'd)

- IBM Series/1-System/370 Channel Attach Program (5719-CA1)

The following IBM Series/1 Programming RPQs Licensed Programs are compatible with the IBM Series/1 Realtime Programming System Version 3. For details on these Programming RPQs, refer to the respective sales manual pages.

- IBM Series/1 Realtime Programming System Basic Sort Programming RPQ P82573 (5799-TBP)
- IBM Series/1 Remote Job Entry Programming RPQ P82575 (5799-TBK)
- IBM Series/1 Realtime Programming System Indexed Access Method Programming RPQ P82570 Version 3 (5799-TCB)
- IBM Series/1 Realtime Programming System IBM 4978 Display Station Support Programming RPQ P82572 Version 3 (5799-TCE)
- IBM Series/1 Realtime Programming System Disk Spooling Programming RPQ P82574 Version 3 (5799-TCH)
- IBM Series/1 Realtime Programming System Address Translator Transient Support Programming RPQ P82585 Version 3 (5799-TBY)

Preparation

The IBM Series/1 Program Preparation Subsystem Version 3 (5719-AS3) is required to prepare programs to execute on the IBM Series/1 Realtime Programming System Version 3 (5719-PC3).

The Base Program Preparation Facilities (5719-PA1) cannot be used to prepare programs to run with the Realtime Programming System.

Required EC Levels

The required engineering change levels for 5719-PC3 for the IBM 4962 Disk Unit are EC 829868 and EC 578573. This applies to the IBM 4962 Disk Unit serial numbers 10001 through 10188.

The required engineering change level for 5719-PC3 for all models of the 4955 is EC 375013. The 4955 model B must also have EC 578550.

**REALTIME PROGRAMMING SYSTEM
VERSION 4 (5719-PC4)**

PURPOSE

The IBM Series/1 Realtime Programming System Version 4 (5719-PC4) Licensed Program provides operating system functions for realtime operations with either multi-user online or batch program preparation. The Realtime Programming System allows the generation of a multipartition system as well as smaller configurations in a consistent and compatible manner. The Realtime Programming System includes multitasking facilities, storage management, data management, system operator station support, timer support and communications facilities.

The Realtime Programming System supervisor, when combined with the Program Preparation Subsystem, allows Series/1 to operate in a realtime online preparation environment or, if realtime is not required, in a simple batch environment.

DESCRIPTION

Realtime Programming System Function Summary

- Supervisory Services
 - Task Management
 - Primary and Secondary Tasks
 - Dynamic Control Block Management
 - Prioritization by Hardware Level, Software Sublevel
 - Storage Management
 - Fixed Partitions
 - Dynamic Partitions
 - Overlays from Disk
 - Buffer Pooling
 - Task Set Management
 - Rollout/Rollin of Task Sets
 - Chaining of Task Sets
 - Queuing of Task Sets to Partitions
 - Optional Binding at Task Set Install Time
 - Scheduling Task Set Execution
 - Shared Task Set
 - Relocatable Task Sets
 - Event Management
 - WAIT/POST (Simple, Iterative, Multiple)
 - Wait on Timer
 - Wait on I/O
 - Queue Management
 - Priority Queues in Storage
 - FIFO Queues on Disk and in Storage
 - Timer Management
 - Time-of-Day, Date
 - Time Delay
 - Asynchronous Timers
 - Serially Reusable Resource Management
 - REQUEST/RELEASE
 - Interrupt Management
 - I/O Interrupts
 - Class Interrupts
 - Error Management
 - Error Logging and Reporting
 - Task Error Exists
 - Storage Dump
 - System Reload and Restart
 - System Termination
 - Abnormal Termination of a Task
 - Command Language Facility
 - Series/1 EXEC Interpreter
 - Series/1 EXEC Language Terminal Handler Command (see "Highlights")
 - Operator Interface
 - Command Processing
 - Message Processing
 - Floating Point Emulator Support
- Data Management
 - Data Set Management
 - Basic I/O Access (EXIO)
 - Physical Access (READ/WRITE)
 - Logical Access (GET/PUT)
 - Sequential and Direct Access Methods
 - Consecutive, Direct, and Partitioned Organization
 - OPEN/CLOSE
 - CREATE/DELETE/RENAME
 - NOTE/POINT
 - Data Set Definition (DSD) support

DPIO Support

- 4962 and 4963
- 4978 (as a 4979)
- 4964 and 4966 Diskette Unit
- 4979 Display Station
- 4973 Line Printer
- 4974 Printer
- Special Feature #7850, Teletypewriter Adapter Message Buffering for User-selected Output Devices
- 3101 Display Terminal

Communications Support

- Binary Synchronous Communications Support
- Start/Stop Asynchronous Support
- Systems Network Architecture Support

Sensor I/O Support

- Analog I/O (Single or Multiple Point)

Digital Input/Digital Output

- Standalone Utility Functions
 - Storage Dump Diskette
 - Disk Initialization
 - System Build
- System Utility Functions
 - Compress (Partitioned Data Set or Volume)
 - Copy
 - Define (Create, Delete and Rename, Logical Volumes, Data Sets, Members)
 - Initialize Diskette
 - Prepare Diskette to IPL Standalone Dump
 - Assign Realtime Programming System to be loaded by IPL Merge (PDS or Volumes)
 - Patch
 - Report (Print Disk/Diskette Directories, Disk/Diskette Data or Storage Dump)
- Service Aids
 - I/O Trace
 - Storage Patch and Dump
 - SVC Trace
- Generation Facilities
- System Initialization

REALTIME PROGRAMMING SYSTEM FUNCTIONS

- Multiple Address Space Management

The Series/1 Realtime Programming System Licensed Program provides an operating system which fully supports Series/1 configurations containing the Storage Address Relocation Translator feature. It allows the flexible use of physical storage greater than 64K. It also provides an increased degree of isolation of individual programs from other programs.

The option of splitting supervisor data and supervisor instructions into two address spaces (0 and 1) permits larger configurations and more functions than would be possible under a 64K size limitation. The maximum supervisor size is 126K with a 64K maximum on data and 62K on instructions. The additional space may be used for such items as making more transients resident for improved performance, more control module space to support more user partitions, support for more I/O, and more user-provided programming to be included in the supervisor.
- Single Address Space Management

This licensed program also optionally supports a Single Address Space Management configuration, supporting up to 64K of storage. Storage above 64K can be used for overlays to enhance the performance of user task sets by allowing more user-written program segments to be resident in storage at one time.
- Storage Management and Task Set Management

Realtime Programming System supports multiple partitions. Partition 0 is for the system task set. Another partition may, at the user's option, contain a shared task set and be used as a shared partition containing data and other resources which may be used by programs in other partitions. The user may specify the number and sizes of the partitions at SYSGEN time and may alter his specifications at IPL time. Each partition must be a multiple of 2,048 bytes. Up to 15 user partitions (besides Partition 0) may be created until the total storage requirements reach the maximum 256K bytes. Programs executing in user partitions are organized into task sets. One task set at a time may occupy a user partition. One partition (selectable at SYSGEN or IPL time) may have a task set rolled out to disk to make way for a higher priority task set. A task set to be rolled out must have been specified to be rolloutable at Application Build time. Only one task set at a time may be rolled out.

Realtime Programming System V4 (cont'd)

Task sets may use overlays from disk. Overlay areas may be shared between tasks only as serially reusable resources under user control.

Storage overlays are loaded in unaddressable physical storage when the associated task set is started. When an overlay is called by an executing task set, the system accesses it through manipulation of the segmentation registers. Storage overlays are faster than disk overlays since no I/O operations are involved.

A task set may chain to another task set which will replace it as the executing task set in the same partition. A partition GLOBAL area is maintained during this exchange, allowing several task sets to operate in sequence as a single logical operation using the same data. This facility supports the FORTRAN function "INVOKE" and the PL/1 function "TRANSFER". Each task set has one primary task which executes following task set load. A buffer pooling facility allows reservation of a pool of storage in a task set for dynamic allocation of buffer to task on request.

SUPERVISORY FUNCTIONS

• Task Management

Realtime Programming System is capable of supporting as many concurrent tasks as the user has Processor Storage (up to 256K) to execute the tasks. The user may have as many disk-resident programs as he can store on his disks. Tasks are dispatched in response to hardware interrupts, user requests from the system operator station, program requests, or timer services. Realtime Programming System supports the dispatching of independent tasks from other tasks.

Realtime Programming System provides up to 256 preemptive priority sublevels within each of the four hardware levels. A task may be assigned to any level and sublevel. Multiple tasks may be assigned the same priority level. Several tasks can be simultaneously suspended on a level.

The programmer specifies whether a program is serially reusable, reentrant, refreshable, or non-reusable through the program macro.

• Timer Services

Realtime Programming System manages all physical and logical timers. The system supports multiple logical timers per physical timer. Realtime Programming System requires a dedicated physical timer attachment for its own use in order to provide time-of-day and date and logical timer services when required. No timers are required for batch-only systems running Program Preparation Subsystem. The other timers are available to the user as I/O devices through the READ/WRITE interface. The programmer is provided with a facility so that he may request his program to be suspended for a specified time interval or until a specified time is reached.

The system provides support for time-of-day (TOD) clock and date. The DATE may be requested from the system in any of the following formats: Julian (YYDDD), MM DD YY and YY MM DD. The user is provided a facility of setting the DATE and TOD through the system operator station or from a program.

Scheduler services are provided to the user so that he may schedule a task set to execute on a periodic basis, at a particular TOD, or after a specified time interval. A facility is provided to add and delete task sets from the scheduler table.

• Interrupt Handler

An interrupt handler is provided for the initial handling of machine level interrupts and the dispatching of interrupt service routines. The user specifies the priority level at which the interrupt service task will execute.

The user may provide a routine to be executed when the console interrupt button of the programmer's console is depressed.

• Event Services

The programmer may define events and cause resumption of a suspended task upon the occurrence of an event. A Wait/Post facility is provided for the synchronization of tasks.

Events that are supported include I/O completion, timer, user-defined, and adding an element to a queue. The three event types supported are simple, iterative and multiple. A task may be suspended until a single event occurs, or a list of events occurs.

• Floating Point Emulator

The Floating Point Emulator duplicates the execution of the floating point instructions when the Floating Point Processor is not attached to the system. The user specifies whether the emulator is to be resident or transient, when the system is configured.

• Queuing Services

The user has the facility of defining storage and disk queues. These queues may be used for passing data from one task to

another. The system provides for priority queues, while entries with the same priority are maintained on a FIFO basis. The user may add and remove entries from the queues. A copy queue entry facility is provided so entries may be added from a transient area. Provision is made for warm restart (queue elements retained) or cold restart (queue cleared) of disk queues after system shutdown. Queues may be "Public", that is, accessed by multiple tasks in a task set; or "Private", that is, accessed only by the task owning it.

• Resource Management

The system provides the user with a facility for management of serially reusable resources. Once the resource is freed from the current task, control is given to the highest priority task waiting on the resource.

• Operator Commands

The functions supported through the system operator station using the command language are:

- Execute a task set
- Terminate a task set
- Delete a task set from the partition queue(s)
- Add and delete entries from the scheduler table; that is, task sets that will execute on TOD, on a periodic basis, after a time delay, etc.
- Set and display TOD and DATE
- Put I/O devices on and offline
- Devices may be reassigned by the operator in the event of a permanent I/O Error
- Assign logical device numbers to physical device addresses
- Define and delete error logs
- Mount and demount diskettes
- Start and stop the I/O Trace
- Start and stop the SVC Trace
- Display up to 56 bytes of processor storage
- Patch up to 20 bytes of processor storage
- Make ABEND dump data set or member available for reuse
- Set operating mode to Attended or Unattended
- Reply to a WRITE-TO-CONSOLE message with an identifying number
- Define partitions (as part of IPL sequence)
- Activate support for physical devices (as part of IPL sequence)
- A facility is provided so the user may select and add system operator station functions at SYSGEN

DATA MANAGEMENT FUNCTIONS

Realtime Programming System Data Management provides the user with services which are described below:

• Device Service Routines

Device Service Routines are provided for supported devices. Character data conversion between EBCDIC and TTY ASCII is provided.

• Data Set Management

The system performs all physical I/O upon request by the user program. Realtime Programming System provides optional I/O timeout for systems having hardware timers which are time-dependent on specified device type times. The programmer is able to read the programmer console data buffer into a program upon request. The programmer also has the ability to write to the programmer console lights. The I/O user interface is either GET/PUT or READ/WRITE. For Sensor I/O it is READ/WRITE. There is also a third level of access (EXIO) which is primarily for device manipulation required in diagnostic programs. Data files may exist on either fixed disk or removable diskette.

The data set organizations supported for sectorized devices are:

Consecutive
Random
Partitioned

The user may add and update records to a consecutive DASD file. The user may have multiple data sets per volume. Multivolume files (diskettes only) are supported only for Basic Exchange Format Files. When using random data sets, the user may also access the records by relative record number.

The partitioned data set supported is provided for user and system libraries. Realtime Programming System provides facilities for the creation, deletion, and maintenance of the partitioned data sets.

Realtime Programming System supports the fixed heads option in the 4962 and 4963 Disk Storage Units.

Data sets may be shared among tasks in the system. Management of shared I/O devices is the responsibility of the programmer. Management of disk message buffering is handled by the Realtime Programming System.

The user has the option of accessing Series/1 I/O devices at the READ/WRITE, and GET/PUT level (sensor I/O at the READ/WRITE level only). The user is provided with device

Realtime Programming System V4 (cont'd)

independence at the GET/PUT level. All hard copy devices logically support the ASA Control characters. This option allows the user to direct a print file to the disk or diskette for later printing.

The record types supported are:

- Fixed
- Fixed Block
- Fixed Blocked Spanned
- Variable
- Variable Blocked
- Variable Blocked Spanned (including Data Compression)

Data sets may be created and deleted via online system utility functions and from program requests.

Write with Read Verify Option

This facility allows Data Set Definitions (DSDs) to contain the indication that all write operations to that data set (on disk or diskette) are to be verified. In Version 1, the Write Verify option may be exercised only by an option on the OPEN macro.

Support of the 4964 and 4966 diskette units:

- Provides users with a removable magnetic medium
- Enhances data security, integrity, and privacy

The system user can copy, via online system utility functions, a diskette to the fixed disk and utilize the stored data of the diskette as if it had always been on disk. When the user's operations are completed, a copy of the disk data may be transferred to diskette. The diskettes may contain multiple files, files may span multiple diskettes, and many diskettes/files may be copied to fixed disk at one time. The user will have the convenience and privacy that removable diskettes provide him, while the system is able to utilize the speed and reliability offered by a fixed disk. The expiration date, which is a user option on diskettes, is honored by Realtime Programming System.

The user has the option to bind I/O devices and data sets during:

- A. Program Preparation
- B. Task Set Installation
- C. Execution (OPEN) Time

Options (A) and (B) provide the Realtime Programming System user with the ability to achieve higher performance by requiring a minimum number of disk reads to locate programs and data.

- Sensor I/O

Analog Input

The Realtime Programming System supports Analog Input, including the programmable gain amplifier, and the automatic zero correction option. The user has a choice of either sequential or random access at the READ/WRITE level. A single point can be handled under either of the access forms by specifying a count of one.

Analog Output

The Realtime Programming System supports analog output, including maintaining the present output value of each point. The user has a choice of either sequential or random access at the READ/WRITE level. A single point can be handled under either of the access forms by specifying a count of one.

Digital Input

The Realtime Programming System supports sequential and random access at the READ/WRITE level. Logical groups may be defined as contiguous DI points in a physical group, composed of 16 points. This allows the user to place DI points among different devices and/or programs. A single point or group can be handled under either of the access forms by specifying a count of one.

Digital Output

Realtime Programming System supports sequential and random access at the READ/WRITE level. Digital Output points may be defined in a logical group as in Digital Input above.

- Storage Protection

The 4953 processor does not have hardware storage protection. Programming System systems running in the 4953 are not storage protected.

- Message Buffering

Realtime Programming System provides a disk message buffering facility, supporting the following sequential output devices:

- Operator Station
- 4973 Line Printer
- 4974 Printer
- Communication Devices

Other devices may use the message buffering facility. The system will print a complete message before starting another message.

Initial Program Load (IPL)

A capability is provided to IPL from the following devices:

- 4964 or 4966 Diskette (IPL Standalone Utilities)
- 4962 or 4963 (IPL Realtime Programming System)

After Realtime Programming System is loaded, it processes a user-specified command data set which may be used to start user task sets or perform any valid operator command.

Utilities

A set of utilities is provided for the proper installation and maintenance of application programs and data. Certain utilities may run concurrently with the user application programs and others that run offline (that is, standalone - not concurrently with user programs or under Realtime Programming System).

The standalone utilities are loaded from a 4964 diskette. The following stand-alone utilities are provided:

- System Build

This utility prepares a disk device to IPL the Realtime Programming System starter system and execute Realtime Programming System online system utilities. System build is executed prior to system generation as part of the Realtime Programming System installation process and at other times to restore the Realtime Programming System starter system and Realtime Programming System online system utilities.

- Disk Initialization

This utility initializes the 4962 fixed disks. It performs surface analysis and allows alternate sector assignments.

Storage-to-Diskette-Dump

This utility is used for APAR submission and dumps all of storage except for the area where the utility is loaded from the 4964 Diskette. This utility also dumps all the system's registers and status indicators. The online system REPORT utility may be used to obtain a printout of the dump on a hardcopy device. Additional dump diskettes may be created using the online system IPLMAINT utility.

- Display/Modify Storage
- Display/Modify Registers
- Display/Modify Floating Point Registers
- Display/Modify Segmentation Registers
- Print Control Blocks
- Print Storage
- Print Storage Overlays
- Hexadecimal Addition and Subtraction
- Decimal-Hexadecimal Conversion
- Set Break Point
- Display Break Points
- Reset Break Point
- Branch
- Execute
- Trace Storage Contents
- Display/Modify Disk
- Display/Modify Diskette
- Display/Modify Program
- Display/Modify Overlay
- Display/Modify Transient
- Load/Unload Transient

DEBUG PACKAGE

The interactive debug package provides a set of functions to assist in program debugging. These functions are invoked and controlled from the system console. The following online utilities are provided:

- Diskette Initialization

This utility provides online initialization of diskettes.

- Define/Create/Build/Delete/Rename Data Sets

These utilities perform the following functions:

- DEFINE - The function of defining a disk or diskette containing logical volumes must be in Realtime Programming System format.
- CREATE - The function of assigning space on sectorized devices, including creation of logical volumes, partitioned data sets, consecutive or direct data sets, or members.
- BUILD - The function of building data set definitions in a task set library.
- DELETE - The function of deleting volumes, data sets, members or data set definitions on sectorized devices including the management of TOCs and partitioned data set directories.
- RENAME - The function of renaming a volume, data set, or member, including the handling of TOCs and partitioned data set directories.

Realtime Programming System V4 (cont'd)

- COMPRESS - This utility performs the function of copying partitioned data sets of volumes in place on sectorized devices to consolidate all available free space within one contiguous area.
- PATCH DISK/DISKETTE - This utility provides the functions of applying permanent fixes to data sets on DASD devices. Visual verification of the data to be replaced is provided before the users enter the new data.
- REPORT - This utility provides the ability to print data from the diskette and disk files to any of the Series/1 hard copy output devices. The user has the ability to print the file (or data set), TOCs, and partitioned data set directories. This utility also provides the ability to print a formatted dump for storage. The dump was previously taken either standalone or online.
- COPY - The COPY utility provides the function of doing either a selective or volume copy. The user has the ability to copy as follows:

From	To
Diskette, Disk	Diskette, Disk, Printer, Teletypewriter, Display

Selective copies allow the user to copy data sets, volumes, or members of data sets. Records may also be added to the end of a consecutive data set.

- MERGE - This utility provides the function of combining two partitioned data sets or volumes into a third partitioned data set or volume.
- IPLMAINT - This utility provides the functions to:
 - Prepare a diskette to IPL the standalone storage-to-diskette dump utility, and establish the system to be loaded from disk at IPL time.

COMMUNICATIONS

• **Communications Support**

Communications support is an integral part of Realtime Programming System data management and is accessed via the READ/WRITE interface. The support directs the transfer of data between user programs and remote stations. A remote station may be either a supported terminal or another computer system via binary synchronous communication. Facilities are provided to:

- Establish, control, and terminate user program access to remote stations.
- Transfer data between user programs and remote stations on point-to-point lines (either switched or nonswitched) or multipoint lines.
- The multipoint control support (for 2740 and 3270) provides capabilities for autopoll and poll list modification.

• **EXIO Support for Communications**

This facility allows the user to access the Binary Synchronous and Asynchronous communications features at a Basic level (EXIO). This basic access allows access to all facilities supported by the hardware features. The EXIO and the READ/WRITE support are mutually exclusive for an attachment.

• **BSC Initial Program Load (IPL)**

An IPL bootstrap program is provided, allowing a user program in a host Series/1 under the IBM Series/1 Realtime Programming System to transmit this bootstrap to a suitably configured remote Series/1 over a BSC line, causing the remote Series/1 to IPL from its own system residence device.

• **BSC Dump**

This facility allows a remote Series/1 at the request of the host Series/1, to transmit the contents of its dump data set to the host Series/1 for subsequent printing.

• **SNA Support**

The Realtime Programming System SNA support for the Series/1 user controls the management of sessions and the flow of data in an SNA network between a user program in the System/370 Host and a user program in the Series/1 operating as a cluster controller. This support provides for:

- System definition services
- Network attachment, activation, or deactivation services
- Session and message exchange services
- Activation of a Series/1 task set from the host

The Realtime Programming System provides a Data Flow Control level interface for support of multiple physical units (cluster controller) with multiple logical units in an SNA network controlled by a System/370 using OS/VS2 (SVS or MVS) and ACF/VTAM or ACF/TCAM, or in a network controlled by a System/370 using OS/VS2 with IMS/VS Version 1 Advanced Function for Commu-

nications. This allows multiple Series/1 user programs to be in session with multiple System/370 user programs.

• **SNA Compatibility**

The Realtime Programming System SNA support provides the following functions, as defined by Systems Network Architecture:

- SNA Physical Unit Type Support
- SNA Function Management Profiles 3 and 4 Support
- SNA Transmission Subsystem Profiles and 4 Support
- SDLC Secondary Station Support

This set of functional support allows the Series/1 to be defined as a Cluster Controller on an SNA/SDLC network controlled by a System/370 using OS/VS2 (SVS or MVS) and ACF/VTAM or ACF/TCAM through a 3705 Communications Controller using the Network Control Program (ACF/NCP/VS). This support also allows operation in a network controlled by a System/370 using OS/VS2 with IMS/VS Version 1 Advanced Function for Communications.

The following start/stop (Asynchronous) terminals are supported via features #1610, or #2091 and #2092:

- 2740 Communications Terminal, model 1, in point-to-point switched, point-to-point nonswitched, multipoint connections.
- 2740 Communications Terminal, model 2, in multipoint connections.
- 2741 Communications Terminal in point-to-point switched and point-to-point nonswitched connections.
- Teletype® Models ASR 33/35 Data Terminals, or equivalent, in point-to-point switched or point-to-point nonswitched connections. Determination of equivalency is a user responsibility.

The following start/stop (asynchronous) terminals are supported via features #2095 and #2096.

- Teletype® Models ASR 33/35 Data Terminals, or equivalent, in point-to-point switched or point-to-point nonswitched connections. Determination of equivalency is a user responsibility.
- 3101 Display Terminal, models 10, 12, 13, 20, 22, and 23, in EIA RS-232-C/CCITT V.24 mode operating on point-to-point switched or nonswitched lines. Supported as a Teletype® Models 33/35 equivalent device.

The following Binary Synchronous Terminals are supported via features #2074 or #2093 and #2094.

- BSC support for 3271 Control Unit models 1 and 2 with attached 3277, 3284, 3286, and 3288 terminals on a multipoint line.

Note: 3270 support is limited to communications support and does not include mapping services

- BSC support for 3275 Display Station, models 1 and model 2, on a switched point-to-point or a multipoint line.
- BSC support for 3274 Control Unit, models 1C and 51C, with attached 3277 and 3278 Display Stations; 3279 Color Display Stations; and 3284, 3286, 3287, 3288, and 3289 Printers on a nonswitched point-to-point or multipoint line.
- BSC support for 3276 Control Unit Display Station, models 1, 2, 3, and 4, with attached 3278 Display Stations; 3279 Color Display Stations; and 3278 and 3289 Printers on a nonswitched point-to-point or multipoint line.
- 5260 Retail System via the 5265 models A12, A22, A42, B12, B22, B42, using point-to-point BSC discipline as a System/3.
- 5280 Distributed Data System via Communications Adapter (#2500).
- 6670 Information Distribution with BSC feature in a switched or nonswitched point-to-point line.
- 3684 Point-of-Sale Control Unit (model 1 or 2) with BSC Communications on a switched or nonswitched point-to-point or nonswitched multi-point facility (as a System/3). A user-written 3684 program or the Host Command Processor (HCP) facility in the Series/1 utilizing Realtime Programming System Read/Write communications support.

The following Binary Synchronous CPU-to-CPU communications is supported via features #2074, or #2075, (not System/32 or System/34) or #2093 and #2094 (Series/1 appears as a System/3).

- CPU-to-CPU point-to-point (switched or nonswitched)
 - Another Series/1 using the Series/1 Realtime Programming System Versions 2, 3 or 4.
 - System/370 BTAM OS/VS1, OS/VS2 (SVS or MVS), or DOS/VS.

Realtime Programming System V4 (cont'd)

- System/370 TCAM OS/VS1 or OS/VS2 (TCAM does not support conversational mode).
- System/370 VTAM, DOS/VS.
- System/370 CICS/VS, OS/VS1 or, OS/VS2 or DOS/VS (BTAM only).
- System/32 under RPG programming facilities.
- System/34 under RPG programming facilities and the BSCCL (BSC Equivalence Link) feature of the SSP-ICF (Interactive Communications Feature).
- System/3 using CCP or RPG.
- CPU-to-CPU, Series/1 as a multipoint tributary
- System/370 BTAM OS/VS1
- System/370 IMS/VS OS/VS1 or OS/VS2 (BTAM only). IMS/VS support is via IRSS (Intelligent Remote Station Support) an IMS/VS protocol for the support of remote systems. A Series/1 user-written application program is required for the formatting and handling of messages in the proper IMS/IRSS formats.

REALTIME PROGRAMMING SYSTEM RAS CHARACTERISTICS

The Realtime Programming System provides a set of RAS facilities which are always included. Additional facilities may be optionally included which result in an extensive set of RAS functions.

Error Response

Detection of machine check or program check conditions, error logging and message generation are performed by supervisory functions in the Realtime Programming System.

System Recovery

Error Recovery Procedures provide the system with the capability of continuing operation if at all possible, in the case of software, hardware, and power failures. Task set and system restart and reloading are provided. If the system cannot continue normal execution, the system user is able to specify execution of a program which utilizes minimum system resources and can notify and prepare the external environment for the imminent loss of the system.

Failure of the disk unit that contains the system task set does not cause total system failure or initiate a reload of the supervisor. In the event of disk failure, programs that do not require that disk unit are able to continue operation. Disk service to other disk units continues. However, the next request for a system transient, with the exception of error logging, may cause an abnormal termination of the system.

Automatic Device Backup

This facility provides automatic switching from a failing primary device to a secondary device. If an unrecoverable I/O error occurs on a device with device backup, data is redirected from that device to its backup. The following combinations are supported for automatic device backup:

Teletypewriter primary to Teletypewriter backup (output only)

Hardware Service Aids

Maintaining error logs is a means of assessing hardware and software reliability. By using hardware error recording to monitor the system, users are made aware of marginally operating equipment. The type of intermittent failures of devices, channels, and CPU will be optionally recorded on a 4962 and 4963 disk. The error logs are used by customer engineers and users for diagnostic purposes. The user and the customer engineer are able to obtain dumps of disk-recorded logs.

The Realtime Programming System provides the following functions:

- Routines to handle the occurrence of a machine check. These routines provide the option of returning control to a user routine after the check has been cleared and optionally logged. The system passes the pertinent error data to the user.
- Support of Automatic Restart after Power Failures. Upon power restoration, a user-specified module is loaded.
- Support of Battery Backup Feature. Systems with the Battery Backup Feature and Timer Support notify the user of a power failure by dispatching a user-specified program. When the power is restored, Realtime Programming System dispatches a user-specified program and passes the duration of the power failure in minutes, seconds, and milliseconds. If the battery is exhausted, results will be the same as if the system does not have the Battery Backup Feature.
- In addition to the general purpose RAS aids, additional optional aids are provided for communications:
 - Communications Trace program which, when activated under user control, is designed to continuously record current communications activity in main storage. This facility works in conjunction with the general purpose I/O trace facility.

- Communications Online Test is an optional facility which provides a means of testing attached 2740 Model 1 terminals concurrent with user operation and determining proper operation of the communication link (lines and modems) as well as the terminal and system programming support.

VERSION 4 ENHANCEMENTS

Version 4 of the Realtime Programming System provides all the function included in Version 1 (5719-PC1), Version 2 (5719-PC2) and Version 3 (5719-PC3) plus the following additional function:

- Support for the 4963 Disk Subsystem.
- Support for the 4966 Diskette Magazine Unit.
- Support for attachment of a Series/1 as a Cluster Controller to a System/370 SNA network.
- Enhancements to BSC and Start/Stop Communications which include support of multipoint lines.
- A Command Language Facility which provides multiple concurrent users at supported terminal devices with a simple, easy-to-use interface to system software services.
- System dynamic allocation of control blocks which removes the need for users to determine requirements and pre-allocate control block stacks at application build and SYSGEN time.
- A dynamic device configuration capability which allows users to add devices to an operational system without the requirement to re-SYSGEN.
- Support for either a single address space or multiple address space environment (selected at SYSGEN).
- A dynamic transient pool facility which greatly improves system performance through the automatic retention in unmapped storage of frequently used supervisor transient programs. (Optional at SYSGEN for a multiple address space management system only.)
- Expanded data management facilities which support increased diskette capacity and automatic sequencing of multi-volume diskette data sets.
- External DSD table support which allows multiple copies of a single task set on disk to be loaded and executed concurrently with each copy utilizing different data set definitions and devices.
- An INSTALL command, available with the Command Language Facility, which greatly simplifies the installation of certain related licensed programs by automatically performing the required install procedures for the user.
- A much simplified and improved SYSGEN facility which significantly reduces the number of procedural steps and decisions required to be made by the user.
- Support of a system global DSD table which provides users with a type of system catalog facility for data set definitions (DSDs).
- Support of a dummy DSD which provides users with an easy way to suppress unneeded application output such as a voluminous printout.
- Expanded and enhanced utilities which include the removal of the requirement for the user to specify PARM=() when taking utility function defaults.
- Support of a generic system residence device name which reduces the number of DSDs that must be updated by the user whenever the system residence device is changed.
- Distribution of a Single Address Space Management Starter System and a Multiple Address Space Management Starter System which should meet the initial needs of most users such that a SYSGEN will not be required to create a system on which to begin.

HIGHLIGHTS
• SNA Support

The Realtime Programming System SNA support provides management of sessions and the flow of data in the SNA network between a user program in the System/370 host and a user program in the Series/1. This support provides for:

- Systems definition services
- Network activation/deactivation services
- Session activation/deactivation and message exchange services
- Activation of a Series/1 task set from the host

The Realtime Programming System provides a Data Flow Control level interface for support as multiple Logical Unit Cluster Controller on an SNA network controlled by a System/370 using DOS/VS, OS/VS1 or OS/VS2 (SVS or MVS) and ACF/VTAM or ACF/TCAM with ACF/NCP/VS or VTAM 2.0 or TCAM 10 with NCP 5.0. This allows multiple user programs to be in session with multiple System/370 user programs. This support may also be used to interface with IMS/VS Version 1. Multiple physical units

Realtime Programming System V4 (cont'd)

may be active in the Series/1 at one time permitting simultaneous sessions with multiple System/370s.

SNA Compatibility

The Realtime Programming System SNA support provides the following functions, as defined by Systems Network Architecture:

- SDLC Secondary Station Support
- SNA Physical Unit Type 2 Support
- SNA Function Management Profiles 3 and 4 Support
- SNA Transmission Subsystem Profiles 3 and 4 Support

- Multiple Address Space and Single Address Space Support

Either a multiple address space system or a single address space system may be generated. A multiple address space system requires a Storage Address Relocation Translator. A single address space system is restricted to 48K and 64K of storage unless the Storage Address Relocation Translator is used.

- 4963 and 4966 Support

The 4963 Disk Subsystem is supported for all functions previously supported on the 4962 Disk and with expanded utility functions. Ability to provide backup for the disk is enhanced by the availability of the 4966 Diskette Magazine Unit and the new utility functions.

- Communications Enhancements

(For a complete list of communications support, see the "Communications Section" above.) Additional Communications support in Version 4 includes support for the following:

- Start/Stop (Asynchronous) Terminal Support

- 2740 Communications Terminal, models 1 and 2, in multipoint connections.
- 2741 Communications Terminal in point-to-point switched and nonswitched connections.
- Teletype® Models ASR 33/35 Data Terminal or equivalent, in point-to-point switched or nonswitched connections via the recently announced Series/1 Programmable Multi-Line Communications Attachment (#2095 and #2096). (Determination of equivalency is a user responsibility.)
- 3101 Display Terminal, models 10, 12, 13, 20, 22, and 23, in EIA RS-232-C/CCITT V.24 mode operating on point-to-point switched or nonswitched lines. Supported as a Teletype® Model 33/35 equivalent device.

- Binary Synchronous Support

- 3271 Control Unit, models 1 and 2, with attached 3277, 3284, 3286, and 3288 terminals on a multipoint line.
- IBM 3275 Display Station, models 1 and 2, on a switched point-to-point or multipoint line.
- BSC support for 3274 Control Unit, models 1C and 51C, with attached 3277 and 3278 Display Stations; 3279 Color Display Stations; and 3284, 3286, 3287, 3288, and 3289 Printers on a nonswitched point-to-point or multipoint line.
- BSC support for 3276 Control Unit Display Station, models 1, 2, 3, and 4, with attached 3278 Display Stations; 3279 Color Display Stations; and 3278 and 3289 Printers on a nonswitched point-to-point or multipoint line.

Note: 3270 support is limited to communications support and does not include mapping services.

- 5280 Distributed Data System via Communications Adapter (#2500).
- 6670 Information Distributor with BSC feature on a switched or nonswitched point-to-point line.
- System/370 OS/VS1, OS/VS2 IMS/VIS (BTAM only) in point-to-point switched and nonswitched connections. IMS/VIS support is via IRSS (Intelligent Remote Station Support) an IMS/VIS protocol for the support of remote systems. A Series/1 user-written application program is required for the formatting and handling of messages in the proper IMS/IRSS formats.
- System/370 OS/VS1 BTAM, Series/1 as a multipoint tributary.

- Dynamic Transient Pool Management

Dynamic Transient Pool Management maintains a pool of the most recently used system transients in unmaped storage. While in the pool, these transient programs will be executed with the performance advantage of a resident program. The dynamic transient pool handler will retain the most frequently used programs in storage thereby reducing the number of disk I/O refreshes required.

Note: The Dynamic Transient Pool Management facility is a SYSGEN selectable option for a multiple address space environment system only. This support is not available for a single address space environment system or for user transients.

- Expanded Diskette Data Management (for 4963/4966 SAVE/RESTORE)

Single density diskettes are supported and double density diskettes are supported on the 4966 diskette unit only.

A 512-byte physical sector size is also supported for non-system formatted diskette data sets at all levels of access. A 1,024-byte physical sector size is supported at the EXIO level only.

Volume sequencing support is now available for multivolume diskette data set processing.

- Command Language Facility

The new Series/1 Command Language Facility represents a significant enhancement to the Realtime Programming System's user interface.

The Command Language Facility provides online programming development and production system support to multiple users through a simplified command language interface.

Commands are processed in realtime by an interpretive compiler, which establishes the necessary execution environment prior to invoking requested services, such as the Series/1 Text Editor, PL/I, COBOL, FORTRAN compilers, macro assembler or Application Builder or user application programs. The ease of use of these commands reduces the amount of pre-planning and system knowledge required to use system services.

Programmer and operator productivity is significantly increased through minimization of keystrokes required for command entry. This is achieved by user-sensitive command syntax and effective default values within the logic of the commands. In addition, the multiterminal capability of this facility can increase productivity by supporting concurrent program development.

IBM provides a basic set of commands which may be modified or expanded through use of the Series/1 EXEC language, which is also provided. This permits users to write new commands, customized for their needs, not only for the purpose of aiding the program development process, but for generating commands that constitute production jobs and tasks. With the appropriate environmental setup, these commands can execute on production-oriented Series/1 systems.

The Command Language Facility executes with, and is part of, the Realtime Programming System Version 4 (5719-PC4) and requires the Program Preparation Subsystem Version 4 (5719-AS4) for some of its system facilities. It executes in a partition of the Realtime Programming System as a separate task set.

- External DSD Tables

An external DSD table is one that resides outside a task set library volume, on any direct access storage device, as any named data set or member of a partitioned data set. The use of an external DSD table may be optionally specified at task set execution time. This facility allows multiple copies of the same task set to be executed concurrently with each copy having a different DSD table active in order to access different data sets and devices.

- System Global DSD Table

The System Global DSD Table support allows the DSD table (DSDT) in the system task set to serve as a systemwide DSD table for all task sets. This provides a type of system catalog facility in that users can maintain all their Data Set Definitions (DSDs) in a single system data set which is automatically searched at execution time. The order of the system search for a given DSD is as follows:

1. The active DSDT of the appropriate executing task set.
2. The active DSDT of the currently active shared task set, if applicable.
3. The DSDT of the active System Task Set.

- DSD Dummy

With DSD DEV=DUMMY support, Data Set and Device Management services will provide successful return codes without actually performing the required I/O access functions if the generic device name DUMMY is specified in the corresponding DSD. This allows application programs to be tested without the need to patch out or remove I/O calls to the system for devices which may be unavailable or inoperative and provides an easy way to suppress application output such as unneeded voluminous printout.

Realtime Programming System V4 (cont'd)

- **Generic System Residence Device Name**
The device name DISK is a generic name for the device from which system IPL occurs and from which the system task set is loaded into storage. All DSD references to the device name DISK will automatically go to the system resident device regardless of the actual name assigned at system generation time.
- **Improved SYSGEN**
A greatly simplified SYSGEN is part of Version 4. This SYSGEN reduces considerably the number of procedure steps required prior to SYSGEN by automatically creating the work files, specification files, Systems Residence Volume, DSDs, control block requirements, rollin/rollout requirements and TPLIB size. New tuning options exist which reduce the number of lines displayed to the user and the number of decision points during the question and answer session. Also answers are checked for inconsistencies, duplicate names, addresses, omissions and proper combinations.
- **Utility Enhancements**
The online system utilities:
– Now provide facilities for obtaining a formatted report of the contents of a DSD table.
– No longer require the user to specify PARM=() when taking the utility function defaults.
– No longer automatically terminates a utility session for "data set or DSD not found" conditions which are detected while processing a "delete" command entered from a data set on a non-interactive device such as a disk or diskette.

Standalone disk/diskette SAVE/RESTORE facilities are available for the following device combinations:
– 4963 Disk Subsystem/4966 Diskette Magazine Unit.
– 4962 fixed Disk Storage Unit/4964 Diskette Unit.
- **Install Command**
A new INSTALL command, operating under the Command Language Facility, greatly facilitates the installation of certain licensed programs prior to or after SYSGEN. By issuing the command and specifying the program order number, the Command Language Facility and associated programs will automatically perform the install procedure.
- **Dynamic Device Configuration**
Additional Devices, of like type as those specified during SYSGEN, may dynamically be added "online" to an already operational system. This enhancement, applicable for most IBM supported devices, will eliminate the requirement to do a system generation to add devices of like type, thereby decreasing SYSGEN time and output. Start Device Commands for these devices may be placed into the "IPL Data Set" and processed at IPL time or may be issued later from the Operator Console. Thus, the user may increase the number of I/O devices in the system dynamically without the need to re-SYSGEN.
- **Dynamic Control Blocks**
The system will dynamically allocate control blocks required during execution of an application. The user (optionally) no longer needs to specify at Application Build, the number of control blocks required.

For a system task set, control blocks are allocated for dynamic storage of the system partition which is specified at installation time via the IPL MAINT utility command; for a user task set, control blocks are allocated from the Variable Control Block Area (VCBA) specified at application build time.
- **Pre-Package Systems**
A single address space management system is distributed to support users of 4952, 4953 and 4955 processors with 64K bytes of storage without the Storage Address Relocation Translator.

A multiple address space management system is distributed to support users of 4955 processors with at least 96K bytes of storage and equipped with the Storage Address Relocation Translator.

These pre-packed systems should meet most user's needs, thus removing the requirement for a customized SYSGEN. By taking advantage of the Dynamic Device Configuration and the Dynamic Transient Pool Management features, users can use these systems for both program development and production work.

Devices

The 4963 Disk Subsystem and 4966 Diskette Magazine Unit are functionally compatible with the 4962 Disk Storage Unit and the 4964 Diskette Unit, respectively. Therefore, any program using the 4962 and 4964 through the operating system GET/PUT or READ/WRITE support will run with the new devices in a similar fashion. This applies to the

Series/1 FORTRAN, PL/I and COBOL compilers which produce object programs that access the new devices through the operating system interfaces.

Note: EXIO access is by definition device dependent and is therefore not transparent to the user.

Device Support

The Realtime Programming System Version 4 supports the 4952, 4953 or 4955 Processors and the following processor options:

- #3920 Floating Point Processor (4955 only)
- #5650 Programmer's Console
- #6335 Storage Address Relocation Translator (4955 models B and D only)

In addition, multiples of the following devices and features are supported:

4962 models 1, 1F, 2, 2F, 3 and 4	Disk
4963 models 23A, 23B, 29A, 29B, 58A, 58B, 64A and 64B	Disk Subsystem
4964 model 1	Diskette
4966 model 1	Diskette Magazine Unit
4969	Magnetic Tape Drive**
4973 models 1 and 2	Line Printer
4974 model 1	Printer
4978	Display (as 4979) or Programming RQP
4979 model 1	Display Station
3101	Display Terminal (as Teletype® Model ASR33/35 equivalent device)
4982 model 1	Sensor I/O
4987	Programmable Communica- tions Subsystem**
4993	Channel Attach
4999 models 1 and 2	Battery Backup

Features

#1200	System/370 Channel Attachment **
#1210	5250 Information Display System Attachment**
#1560	Integrated DI/DO
#1565	Channel Repower
#1610	Asynchronous Communications Single-Line Control
#2091	Asynchronous Communications 8-Line Control
#2092	Asynchronous Communications 4-Line Adapter
#2074	Binary Synchronous Communications Single-Line Control
#2075	Binary Synchronous Communications Single-Line Control/High Speed
#2093	Binary Synchronous Communications 8-Line Control
#2094	Binary Synchronous Communications 4-Line Adapter
#2090	SDLC Single-Line Control
#2095	Feature-Programmable 8-Line Multi-Line Communi- cations Controller
#2096	Feature-Programmable 4-Line Multi-Line Communi- cations Attachment
#7840	Timer
#7850	Teletypewriter Attachment (supported for use with Teletype® Models ASR 33/35)

Note: Device and feature performance is dependent upon hardware configuration, Realtime Programming System generation options, and application program design.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

® Registered trademark of Teletype Corporation.
** Requires separate licensed program.

Realtime Programming System V4 (cont'd)

HARDWARE REQUIREMENTS

The minimum system after initially loading the disk and when the application program executes without hard copy output, system console operations, and data interchange is:

Processor	IBM 4952, 4953, 4955 for a single address space management environment system or IBM 4952 or 4955 (model B or D equipped with Storage Address Relocation Translator #6335 or model E) for a multiple address space management environment system.
Storage	48K bytes (64K bytes required for multiple address space environment).
Disk	1- IBM 4962 model 1, 1F or 3 or 4963 Disk Storage Unit.

The minimum hardware configurations to support System Generation and System Installation using the supplied Starter Systems is:

Processor	IBM 4952, 4953 or IBM 4955 for a single address space management environment system or an IBM 4955 (model B or D equipped with Storage Address Allocation Translator #6335 or model E) for a multiple address space management environment system.
Storage	64K bytes for single address space management environment or 96K for multiple address space management environment.
Disk/Diskette	1 each - diskette and disk drive in any combination, selected from supported models of IBM 4962 Disk Storage Unit, IBM 4963 Disk Subsystem, IBM 4964 Diskette Unit, and IBM 4966 Diskette Magazine Unit.
Printer	1 - IBM 4973 Line Printer or 1 - IBM 4974 Printer
Operator Station	1 - IBM 4979 Display Station or 1 - IBM 4978 Display Station (as 4979 only) or 1 - IBM 3101 Display Terminal (as Teletype® Models ASR33/35 equivalent device) or 1 - Teletypewriter Adapter #7850 with Teletype® Models ASR 33/35 or equivalent device

Attachment to an SNA network requires SDLC Single Line Control (#2090).

To support BSC IPL and BSC DUMP, the Series/1 host system must have any of the BSC communications features (#2074, #2075, #2093/#2094). The remote system must have one of the BSC single line features (#2074, #2075).

The hardware requirements for the storage overlay capability include the Storage Address Relocation Translator Feature #6335 in a 4955 model B or D or 4955 model E and a minimum of 64K bytes of physical storage.

SOFTWARE REQUIREMENTS

None

COMPATIBILITY

Files

Complete compatibility with files supported by the IBM Series/1 Realtime Programming System Version 1 (5719-PC1), Version 2 (5719-PC2) or Version 3 (5719-PC3) is provided. Any data file written using any of these systems is directly usable by the other. Compatibility with external (to Series/1) diskette devices is maintained by using Basic Exchange format. See the *IBM Diskette General Information Manual* (GA21-9187).

Programs

Problem state source programs which assemble or compile and execute on the Realtime Programming System Version 3 (5719-PC3) will also assemble or compile and execute on The Realtime Programming System Version 4 (5719-PC4).

Problem state source programs which assemble or compile and execute on the Realtime Programming System Version 1 (5719-PC1) or Version 2 (5719-PC2) may require source modifications to assemble or compile and execute on the Realtime Programming System Version 4 (5719-PC4).

In any case, Version 1 or Version 2 problem state programs require reassembly and rebuilding to prepare them to execute on Version 4.

In addition Version 3 problem state programs, with the exception of those programs using the BSC IPL bootstrap facilities, require no reassembly. Most Version 3 problem state programs need only be installed on a Version 4 system to execute. In some cases, VCBA space may need to be increased.

Results and output generated from selected Realtime Programming System-based programs invoked under the Command Language Facility are identical to that which would be experienced when invoking these programs and functions via alternate means (for example, Job Stream Processor).

Note: Only Version 4 of the Program Preparation Subsystem supports the Command Language Facility.

Customer-written programs included with the supervisor must be written in accordance with the internal supervisor programming conventions for 5719-PC4 which are different from those of 5719-PC1, 5719-PC2 and 5719-PC3.

The following Series/1 Licensed Programs are compatible with the Series/1 Realtime Programming System Version 4.

- Series/1 Program Preparation Subsystem Version 3 (5719-AS3)
- Series/1 Program Preparation Subsystem Version 4 (5719-AS4)
- Series/1 FORTRAN IV Compiler and Object Support Library (5719-FO1) Version 1.3
- Series/1 FORTRAN IV Realtime Subroutine Library (5719-FO3) Version 1.2
- Series/1 FORTRAN IV Realtime Subroutine Library (5719-FO4) Version 2.0
- Series/1 Mathematical and Functional Subroutine Library (5719-LM1) Version 1.2
- Series/1 Mathematical and Functional Subroutine Library (5719-LM2) Version 2.2
- Series/1 PL/I Compiler and Resident Library (5719-PL1) Version 1.2
- Series/1 PL/I Transient Library (5719-PL3) Version 1.2
- Series/1 COBOL Compiler and Resident Library (5719-CB1)
- Series/1 COBOL Transient Library (5719-CB2)
- Series/1 Sort/Merge (5719-SM1)
- Series/1 4987 Programmable Communications Subsystem Preparation Facility (5719-CS0)
- Series/1 4987 Programmable Communications Subsystem Execution Support (5719-CS1)
- Series/1 4987 Programmable Communications Subsystem Extended Execution Support (5719-CS2)
- Series/1 Indexed Access Method (5719-AM1)
- Series/1 5250 Information Display System (5719-TA1)
- Series/1-System/370 Channel Attach Program (5719-CA1)
- Series/1 4969 Magnetic Tape Drive (5719-TA4)

The following Series/1 Licensed Programs - PRPQs are compatible with the Series/1 Realtime Programming System Version 4 (5719-PC4). For details on these programming RPQs, refer to the respective programs.

- Series/1 Realtime Programming System Basic Sort Programming RPQ P82573 (5799-TBP) Version 1 Modification Level 1
- Series/1 Remote Job Entry Programming RPQ P82575 (5799-TBK)
- Series/1 Realtime Programming System Indexed Access Method Programming RPQ P82570 Version 3 (5799-TCB)
- Series/1 Realtime Programming System 4978 Display Station Support Programming RPQ P2572 (5799-TCE) Version 3
- Series/1 Realtime Programming System Disk Spooling Programming RPQ P82574 Version 3 (5799-TCH)
- Series/1 Realtime Programming System Transient Activity Tool Programming RPQ P82606 Version 1 (5799-TDG)
- Series/1 Realtime Programming System Multiple Terminal Manager RPQ P82596 (5799-TCY)

PROGRAM PRODUCTS

Realtime Programming System V4 (cont'd)**Program Preparation (5799-TCL)**

The IBM Series/1 Program Preparation Subsystem Version 3 (5719-AS3) or the IBM Series/1 Program Preparation Subsystem Version 4 (5719-AS4) is required to prepare programs to execute on the IBM Series/1 Realtime Programming System Version 4 (5719-PC4). If the Command Language Facility will be used, then 5719-AS4 is required as commands have been written to the Program Preparation Subsystem Version 4 function level.

The Base Program Preparation Facilities (5719-PA1) cannot be used to prepare programs to run with the Realtime Programming System.

Required EC Levels

The required engineering change level for all models of the 4955 is EC 375013. The 4955 model B must also have EC 578550.

The required engineering change levels for 5719-PC4 for the IBM 4962 Disk Unit are EC 829868 and EC 578573. This applies to the IBM 4962 Disk Unit Serial numbers 10001 through 10188.

Note: Implementation of engineering changes is handled by Field Engineering.

PROGRAM PRODUCTS

**REALTIME PROGRAMMING SYSTEM VERSION 5
5719-PC5**

PURPOSE

The IBM Series/1 Realtime Programming System (also referred to as the operating system) is a control system through which a user can install, operate, and maintain system programs, application programs, and data. It is a full function multiprogramming, multitasking, event-driven, disk/diskette-based system. The operating system manages physical resources - processor, storage, and devices. Its supervisor, data management, and communications services are a controlled interface between application programs and the Series/1 hardware. The operating system supports the terminal-transaction environment and supplies the environment for both realtime and batch applications.

DESCRIPTION

The Realtime Programming System Version 5 (5719-PC5) operates in a multiple address space environment only. Multiple address space management provides for isolation between task sets and the use of up to 512K bytes of processor storage.

• **Multiprogramming/Multitasking**

The operating system is a multiprogramming/multitasking system. It allows multiple programs within the system to be processed concurrently by interleaving their execution.

• **Event-driven**

Task sets are collections of programs, data, and control information which reside in partitions - one per partition.

Task sets are queued for execution in partitions based on the occurrence of the following events:

- External (process interrupt)
- Time of day
- Time interval, either single or repetitive
- Operator request
- Program request
- Host request for session establishment with an assigned logical unit (LU)

• **Disk/Diskette Based**

The control system consists of resident and transient programs. These programs reside in a system task set library on disk or diskette. User task set libraries can also reside on disk or diskette.

Diskette-based systems will have less capacity and performance than disk-based systems and must be custom-generated and tuned for specific application environments. Customers should contact their marketing representative for assistance in determining whether or not a diskette-based system can be generated to satisfactorily meet their requirements.

• **Supervisor Services**

The supervisor controls the allocation and distribution of the physical resources of the system: Storage, processor, and devices. It manages programs and their interaction through a set of system management services that manipulate resources and programs on a logical level. The supervisor performs services and functions such as:

- Primary and secondary storage management
- Partition and task set management
- Multiple dynamic partitions per address space
- Multiple concurrent shared task sets
- Task and program management
- Dynamic transient pool management for supervisor transients
- Event and queue management
- Global queue services (across partitions)
- Serially reusable resource management
- Timer management and services
 - Feature #7840
 - 4952 Native Clock/comparator
- Error management and logging
- Class interrupt management
- Operator interface management
- Management of the interface between subsystems and terminals

• **Data Management**

Data set management provides services such as:

- Three levels of access - basic, physical, and logical
- Two access methods - sequential and direct
- Three data set organizations - consecutive, random, and partitioned.

• **DPIO Support**

- 3101 Display Terminal
- 4962 and 4963 Disks
- 4964 and 4966 Diskette Unit
- 4965 Diskette Drive and I/O Expansion Unit (also 4952 model C Diskette Drive)

- 4969 Magnetic Tape**
- 4973 Line Printer
- 4974 Printer
- 4975 Printer
- 4978 Display
- 4979 Display Station
- 5225 Printer**
- 5251 models 1 and 2 Display Terminals**
- 5252 model 1 Display Terminal**
- 5256 models 1, 2, and 3 Printers**
- #7850 Teletypewriter Adapter
- 6733 Typewriter Communication Module*** (with Electronic Typewriter 85)

** Separate licensed program.
*** As a Teletype® Model 33/35.

• **Sensor I/O Support**

- Analog I/O (Single or Multiple Point)
- Digital I/O

• **Utilities**

The operating system has a set of utilities for the installation and maintenance of programs and data. Included are the Transient Activity and the Automatic Patch Application Tool.

• **Command Language Facility (Optional)**

The Realtime Programming System Version 5 command language facility consists of an initialization task set, the S1/EXEC interpreter with a language and a set of IBM-supplied commands written in the S1/EXEC language. The facility provides such functions as:

- Multiple concurrent user capability
- Commands processed by a realtime interpreter which invokes requested services
- Tutorial support
- A set of commands which may be supplemented by user-written commands
- Command capability to perform I/O to/from data sets or printers, as well as user terminals

• **Problem Determination**

The operating system has debugging aids that enable a user to find and correct errors in problem and supervisor programs. Through the interactive debug facility, a user can display and modify a register, processor storage, disk, and diskette, as well as set address stops to monitor the status of executing programs.

• **Service Aids**

- I/O Trace
- Storage Patch and Dump
- SVC Trace
- Online Error Log Report
- Patch Application Tool

• **System Initialization**

• **SNA Support**

The Realtime Programming System base SNA support provides the following functions, as defined by Systems Network Architecture:

- SNA Physical Unit Type 2 support
- SNA Function Management Profiles 3 and 4 Support
- SNA Transmission Subsystem Profiles 3 and 4 Support
- SDLC Secondary Station Support
- Data Flow Control Level Interface
- Multiple Physical and Logical Units
- System Definition Services
- Network Attachment, Activation, or Deactivation Services
- Session and Message Exchange Services
- Activation of a Series/1 Task Set from the Host

This set of functional support allows the Series/1 to be defined as a Cluster Controller on an SNA/SDLC network controlled by a System/370 using OS/VS2 (SVS or MVS) with one of the following access methods:

- ACF/VTAM
- ACF/TCAM
- VTAM Version 2
- TCAM Version 10 with NCP Version 5

through a 3705 Communications Controller using the appropriate version of the Network Control Program.

This support also allows operation in a network controlled by a System/370 using OS/VS2 with IMS/VS Version 1 Advanced Function for Communications and System/370 CICS/VS Version 1.5.

Realtime Programming System V5 (cont'd)

- Start/Stop Support

The following start/stop (asynchronous) terminals are supported via features #1610, or #2091 and #2092:

- 2740 Communications Terminal, model 1, in point-to-point switched, point-to-point nonswitched, multipoint connections.
- 2740 Communications Terminal, model 1 or 2, in multipoint connections.
- 2741 Communications Terminal in point-to-point switched and point-to-point nonswitched connections
- 3101 Display Terminal, models 10, 12, 13, 20, 22, and 23 (in character or block mode), or equivalent device, in point-to-point switched or nonswitched connections. Determination of equivalency is a user responsibility.

The following start/stop (asynchronous) terminals are supported via features #1310, #2095/#2096:

- 3101 Display Terminal, models 10, 12, 13, 20, 22, and 23 (in character or block mode), or equivalent devices in point-to-point switched or nonswitched connections. Determination of equivalency is a user responsibility.

The following systems are supported via features #1610, #2091/#2092, or #2095/#2096:

- IBM Personal Computer with the Asynchronous Communications Adapter, in switched and point-to-point nonswitched connections. The IBM Personal Computer licensed program - Asynchronous Communications Support, or a user-written IBM Personal Computer program can communicate with a user-written program in the Series/1 using Realtime Programming System Read/Write communications support.
- System/23 Datamaster with the Communications Adapter Feature and utilizing the Asynchronous Communications licensed program, in switched and point-to-point nonswitched connections.

The following system is supported via features #1310, #1610, #2091/#2092, or #2095/#2096:

- Displaywriter System with a Communications Adapter and utilizing the Asynchronous Communications licensed program, in switched and point-to-point nonswitched connections. The Displaywriter can operate in either of two asynchronous communications modes: 2741 (emulates the 2741 Communications Terminal), and TTY (emulates a teletypewriter).
- 6733 Typewriter Communication Module (with attached IBM Electronic Typewriter 85) in point-to-point switched or nonswitched connections as a Teletype® Model 33/35.

- BSC Support

The following Binary Synchronous Terminals are supported via features #1310, #2074, #2075, #2080 or #2093 and #2094:

- BSC support for 3271 Control Unit, models 1 and 2, with attached 3277, 3284, 3286, and 3288 terminals on a multipoint line. Note: 3270 support is limited to communications support and does not include mapping services.
- BSC support for 3275 Display Station, models 1 and 2, on a switched point-to-point or multipoint line.
- BSC support for 3274 Control Unit, models 1C and 51C, with attached 3277 and 3278 Display Stations, 3279 Color Display Stations, and 3284, 3286, 3287, 3288, and 3289 Printers on a nonswitched point-to-point or multipoint line.
- BSC support for 3276 Control Unit Display Station, models 1, 2, 3, and 4, with attached 3278 Display Stations; 3279 Color Display Stations; and 3287 and 3289 Printers on a nonswitched point-to-point or multipoint line.
- 3741 Data Station on a switched or nonswitched point-to-point line with the Expanded Communications Feature (#1685).
- 5260 Retail System via the 5265, models A12, A22, A42, B12, B22, B42, using point-to-point BSC discipline as a System/3.
- 5280 Distributed Data System via the 5285 or 5288 with Communications Adapter Feature (#2500) on a switched point-to-point or nonswitched point-to-point or multipoint line. (5280 appears as a 3741)
- 6670 Information Distributor with BSC feature on a switched or nonswitched point-to-point line. (See the *Programmer's Guide* for Communicating with the 6670 Information Distributor (BSC Environment) for details on the 6670.)
- 3684 Point-of-Sale Control Unit, models 1 or 2, with BSC Communications on a switched or nonswitched point-to-point or nonswitched multipoint facility (as a System/3). A user-written 3684 program or the Host Command Processor (HCP) facility in the 3684 can communicate with a user-written program in the Series/1 utilizing Realtime Programming System Read/Write communications support. (See the M3684 pages.)
- 4975, models 1R, 2R, via #1310 only.

The following system is supported via features #2074 or #2093/#2094:

- System/23 Datamaster with the Communications Adapter feature and utilizing the Binary Synchronous Communications licensed program, in switched and point-to-point nonswitched connections. The System/23 Datamaster supports the line protocol of the 3741 Data Station.

The following system is supported via features #1310, #2074, or #2093/#2094:

- Displaywriter System with a Communications Adapter and utilizing the Binary Synchronous Communications licensed program, in switched and point-to-point nonswitched connections. The Displaywriter System emulates 2770/3780 line protocol.

The following Binary Synchronous CPU-to-CPU communications are supported via features #1310, #2074, #2075, or #2080 (not System/32) or #2093 and #2094 (Series/1 appears as a System/3).

CPU-to-CPU point-to-point (switched or nonswitched)

- Another Series/1 using the Series/1 Realtime Programming System Versions 2, 3, 4, or 5.
- System/370 BTAM OS/VS1, OS/VS2 (SVS or MVS), or DOS/VS.
- System/370 TCAM OS/VS1 or OS/VS2 (TCAM does not support conversational mode).
- System/370 VTAM, DOS/VS.
- System/370 CICS/VS, OS/VS1, OS/VS2, or DOS/VS (BTAM only)
- System/32 under RPG programming facilities.
- System/34 under RPG programming facilities and the BSCCL (BSC Equivalence Link) feature of the SSP-ICF (Interactive Communications Feature).
- System/3 using CCP or RPG.
- System/38 via RPG III or COBOL application programs.

CPU-to-CPU, Series/1 as a multipoint tributary.

- System/370 BTAM OS/VS1.
- System/370 IMS/VS, OS/VS1, or OS/VS2 (BTAM only). IMS/VS support is via Intelligent Remote Station Support (IRSS), an IMS/VS protocol for the support of remote systems. A Series/1 user-written application program is required for the formatting and handling of messages in the proper IMS/IRSS formats.

VERSION 5 ENHANCEMENTS

Version 5 of the Realtime Programming System provides all the functions included in Version 1 (5719-PC1), Version 2 (5719-PC2), Version 3 (5719-PC3), and Version 4 (5719-PC4), excluding single address space management plus the following additional functions:

- Support for New Series/1 Large System Processor

- 4955 model F Support

Version 5 is designed to effectively support the larger 4955 model F processor.

This larger processor provides a maximum of 512K bytes of storage. The additional storage will allow room for more programs and data, multiple Shared Task Sets, larger and more applications, and increased number of Command Language Facility users in logically expanded D-Space.

- Logically Expanded D-Space

Supervisor Data Space (D-Space) has been logically extended beyond its current 64K byte limit by employing unmapped storage to hold user control modules. The effect of this is to provide a greater capacity for more devices and task sets.

- Secondary Storage Services

With the introduction of a new facility called "Secondary Storage Services", a partition size may be extended beyond 64K bytes by requesting that a pool of additional processor storage be allocated at Task Set load time.

- Multiple Shared Task Sets

More than one shared task set can be active at a time. This allows each shared task set to be tailored to the requirements of the applications which share it and avoids the need to combine all sharable data and programs into one large task set. This new capability can also result in more of the address space being available to the application program.

- More Effective Support of Small Processors

- 4952 model C Support

Realtime Programming System V5 (cont'd)

As a result of several enhancements, Version 5 more effectively supports the 4952 processor with a maximum of 128K bytes of storage. These enhancements are: Full support of the integrated clock/comparator, better storage utilization by making more functions SYSGENable and loadable Binary Synchronous/Asynchronous communications support.

• Improved SYSGEN and Installation

– Integrated Products

Version 5 has greatly improved in the area of SYSGEN and installation. The 4978, Spool and Transient Activity Tool support previously offered as separately licensed programs, have been fully integrated into Version 5. In addition, to fully provide what is needed for application development, the User Macro Library, SYSGEN programs, and the Command Language Facility are now packaged in Version 5 of the Series/1 Program Preparation Subsystem (5719-AS5). The Command Language Facility also remains as an option in Version 5 of the Realtime Programming System for production system use. Command Language Facility disk space requirements have been reduced for the non-development environments.

– Standard System

To reduce the need to SYSGEN, a standard (pre-built) system is provided. This system is quite comprehensive and will normally support a large number of different development configurations and uses, as well as having application to many production system environments. The minimum processor storage required by the standard system is 192K bytes. An installation system residing on diskette will also be provided and may be used to install a customized system on a processor with 128K bytes or more of storage.

– SYSGEN Improvements

If the need exists to generate a customized system, various improvements to SYSGEN have been made. A SYSGEN will be easier, more accurate, and faster through reduced questions, automatic answer verification, fewer assemblies, and the ability to restart SYSGEN at various points.

– Patch Application Tool Enhancements

To facilitate installing APAR fixes, the Patch Application Tool supports all Realtime Programming System-based products which have Central Service support and automatically allocates and maintains a single patch log. It will also automatically allocate a system patch backup volume if needed.

• Improved System Usability and Application Productivity

– SNA Enhancements

Improved usability and productivity is a key objective in Version 5. The segmentation of messages is now provided in the Systems Network Architecture (SNA) support. To provide increased connectivity to System/370 system facilities, Unbind/Hold and Full Duplex are also provided. In addition, the SNA buffer pool has been removed from supervisor data space (D-space) to reduce the SNA demands on this limited resource and to support more Logical Units (LUs).

– New Operator Commands

To improve usability and the operational characteristics of the system, additional system operator commands are supplied to display the System Scheduler Table, set the date in Gregorian format showing month, day, and year, and to IPL a Realtime Programming System. In addition, there are commands to display spooling jobs, delete, hold, expedite, or release a spool job, and define subsystem and terminals to the Terminal Controller.

– Common Terminal Controller

In view of the increased processor sizes now supported, several subsystems (IBM and User) may typically co-exist on a single processor. To facilitate users switching between subsystems, a Common Terminal Controller has been provided. The controller will dynamically connect a terminal to a specific subsystem when a user logs on (LOGON) and later disconnect and reconnect it to another subsystem. This support is SYSGENable. The Command Language Facility and the Multiple Terminal Manager PRPQ Version 2.1 support the Common Terminal Controller.

– Dynamic Partitions

Multiple dynamic partitions are now allowed in an address space.

– Interpartition Communication

Because larger applications will be possible, communication between portions of an application, specifically task sets, will become desirable. The new global queue facility provides cross partition communication without the need for a shared task set.

– Command Language Facility Enhancements

Additional commands and changed commands have been provided with the Command Language Facility to define a line or matrix printer, invoke a character FONT definition task set, invoke the Patch Application Tool, simplify dumping a 4969 Magnetic tape data set, print the formatted online error log report, and to queue a task set for execution. Also provided are the Series/1 EXEC System commands to read or write to the user's terminal, create a DSD and clear or query the console stack. There are also extended capabilities that can be used in writing commands, such as the ability to perform I/O from an EXEC command file. The latter will allow a user to write extremely powerful Series/1 EXEC command procedures. In addition, the Install command can be used to install all supported licensed programs.

– Improved Publications

Many of the existing publications have been split to improve usability. New publications have been introduced to better accelerate understanding of the Realtime Programming System Version 5 features and facilities.

– Debug

To improve usability, the Debug Facility has been enhanced to support multiple users, to provide commands for HELP and single instruction step, and to allow single command syntax and hardcopy output.

– Online Error Log Report Facility

This new facility will execute "online" under the operating system. This utility will format and print the system error logs without requiring the system operation to be terminated.

– Spool Enhancements

With the inclusion of the improved SPOOL function into Version 5, certain key enhancements have been made. They are as follows:

- Multiple Output Classes
- Forms Control
- Multiple Copies Control
- Improved Separator Page Support
- Spooling of System Messages
- Reduction of dynamic storage requirements in system data space

• New I/O Device Support

Support under Version 5 of the Realtime Programming System is provided for the following new I/O devices:

Model/Feature	Device
#1310	Multifunction Attachment
#1400	Local Communications Controller**
#2080	Synchronous Communications Single-Line Control/High Speed, BSC nonswitched (verified Series/1-to-Series/1 only) and SDLC non-switched to 9600 bps (verified Series/1-to-370 connection)
4975	Printer (all models)
4965	Diskette Drive and I/O Expansion Unit (also included in 4952 C)
3101 model 20, 22, 23	Display Terminal, models 20, 22 or 23 in full screen mode
5225 (as a 5256)	Printer** (via RPQ D02322)
6733 (as a TTY 33/35)	Typewriter Communication Module (with attached IBM Electronic Typewriter 85)

** Supported as a separately licensed program.

Devices

The 4975 Printer and the 4965 Diskette Drive and I/O Expansion Unit are functionally compatible with the 4974 Printer and the 4964 Diskette Unit, respectively. Any program using the 4974 or 4964 through the operating system GET/PUT or READ/WRITE support, will run with the new devices in a similar fashion. Use of the additional features provided by the 4975 printers will require appropriate program changes.

This applies to the Series/1 FORTRAN, PL/I, and COBOL compilers which produce object programs that access the new devices through the operating system interfaces.

Note: EXIO access is device dependent by definition and is therefore not transparent to the user.

** Supported by separate licensed programs

PROGRAM PRODUCTS

Realtime Programming System V5 (cont'd)

Device Support

The Realtime Programming System Version 5 supports the 4952 models A, B, and C and the 4955 models D, E, and F and the following processor options:

- #3920 Floating Point Processor (4955 only)
- #5650 Programmer's Console
- #6335 Storage Address Relocation Translator (4955 model D only)

In addition, multiples of the following devices and features are supported:

3101 models (10, 12, 13, 20, 22, 23)	Display Terminals
4962 models 1, 1F, 2, 2F, 3, and 4	Disk
4963 models 23A, 23B, 29A, 29B, 58A, 58B, 64A and 64B	Disk Subsystem
4964 model 1	Diskette
4965	Diskette Drive and I/O Expansion Unit
4966 model 1	Diskette Magazine Unit
4969 model 1	Magnetic Tape Drive**†
4973 models 1 and 2	Line Printer
4974 model 1	Printer
4975 models 1L, 2L, 1R, 2R	Printer
4978	Display
4979 model 1	Display Station
4982 model 1	Sensor I/O†
4987	Programmable Communications Subsystem**†
4993	Channel Attachment
4999 models 1 and 2	Battery Backup
5225 as a 5256 (via RPQ D02322)	Printer**†
5251 models 1 and 2	Information Display Stations**†
5252 model 1	Information Display Station**†
5256 models 1, 2, and 3	Printers**†
6733 (as a TTY 33/35)	Typewriter Communication Module

Features

#1200	System/370 Channel Attachment**
#1210	5250 Information Display System Attachment**†
#1310	Multifunction Attachment
#1400	Local Communications Controller**†
#1560	Integrated DI/DO†
#1565	Channel Repower
#1610	Asynchronous Communications Single-Line Control
#2000	Communications Indicator Panel
#2074	Binary Synchronous Communications Single-Line Control
#2075	Binary Synchronous Communications Single-Line Control/High Speed
#2080	Synchronous Communications Single-Line Control/ High Speed, BSC nonswitched (verified Series/1-to-Series/1 only) and SDLC nonswitched to 9600 bps (verified Series/1-to-370 connection)
#2090	SDLC Single-Line Control
#2091	Asynchronous Communications 8-Line Control

#2092	Asynchronous Communications 4-Line Adapter
#2093	Binary Synchronous Communications 8-Line Control
#2094	Binary Synchronous Communications 4-Line Adapter
#2095	Feature Programmable 8-Line Multiline Communications Controller
#2096	Feature-Programmable 4-Line Multiline Communications Attachment
#7840	Timer
#7850	Teletypewriter Adapter (supported for use with the 3101 model 1 or 2 Display Terminal or the Teletype® Models 33/35 as a 4979 or 3101 equivalent or 6733)
D02038	4978 Attachment (RPQ)
**	Available in separately licensed program.
†	Not within the prebuilt standard system; requires Custom SYSGEN to include support.
®	Registered Trademark of the Teletype Corporation.
	Note: Device and feature performance is dependent upon hardware configuration, Realtime Programming System generation options, and application program design.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system after installation of the system and when the application program executes without hard copy output, system console operations, and data interchange is:

Processor	IBM 4952 or 4955 (model D equipped with Storage Address Relocation Translator #6335 or models E or F)
Storage	128K bytes
Disk*	1 - IBM 4962 Disk Storage Unit (all models) or a 4963 Disk Subsystem (all models)

* See prior note regarding diskette-based system

The minimum hardware configurations to support System Generation, and supported by the supplied Standard System is:

Processor	IBM 4955 models E or F
Storage	192K bytes minimum
Disk/ Diskette	1 each - diskette and disk drive in any combination, selected from supported models of IBM 4962 models 3 or 4 Disk Storage Unit, IBM 4963 Disk Subsystem, IBM 4964 Diskette Drive or IBM 4965 Diskette Drive and I/O Expansion Unit and IBM 4966 Diskette Magazine Unit
Printer	1 - IBM 4973 Line Printer or 1 - IBM 4974 Printer or 1 - IBM 4975 Printer
System Console	1 - IBM 4979 Display Station or 1 - IBM 4978 Display Station or 1 - IBM 3101 Display Station attached via: <ul style="list-style-type: none"> • #1310 Multifunction Attachment (IBM 3101 models 10, 12, 13, 20, 22 or 23 on the first address, IBM 3101 models 13 or 23 on any address) • #1610 Asynchronous Communications Single-Line Control (IBM models 10, 12, 13, 20, 22 or 23) • #2091/#2092 Asynchronous Communication 8-line control and 4-line adapter (IBM 3101 models 10, 12, 13, 20, 22 or 23)

PROGRAM PRODUCTS

Realtime Programming System V5 (cont'd)

- #2095/#2096 Feature- Programmable 8-line multiline communications controller and 4-line attachment (IBM 3101 models 10, 12, 13, 20, 22 or 23) or
1 - Teletypewriter Adapter (#7850) with the IBM 3101 model 10, 12, 13, 20, 22, 23 Display or IBM 6733 Teletypewriter Communication Module (with attached Electronic Typewriter 85) or equivalent Teletypewriter device.

Attachment to an SNA network requires SDLC Single-Line Control (#2090) or Synchronous Communications Single-Line Control/High Speed (#2080).

To support BSC IPL and BSC DUMP, the Series/1 host system must have any of the BSC communications features (#1310, #2074, #2075, #2080, #2093/#2094). The remote system must have one of the BSC single-line features (#1310, #2074, #2075, #2080). BSC IPL and BSC DUMP are not supported on multipoint lines.

SOFTWARE REQUIREMENTS: None

COMPATIBILITY

Files

Complete compatibility with files supported by the Series/1 Realtime Programming System Version 1 (5719-PC1), Version 2 (5719-PC2), Version 3 (5719-PC3), or Version 4 (5719-PC4) is provided. Any data file written using any of these systems is directly usable by the other. Compatibility with external (to Series/1) diskette devices is maintained by using Basic Exchange format. See the *IBM Diskette General Information Manual* (GA21-9187).

Programs

Single Address Space Systems (64K bytes or less) are not supported by this Version of the Realtime Programming System.

Problem state source programs which assemble (or compile) and execute on the Realtime Programming System Version 3 (5719-PC3) or on a Version 4 (5719-PC4) Multiple Address Space Management (MASM) system, will also assemble (or compile) and execute on the Realtime Programming System Version 5 (5719-PC5).

In any case, Versions 1 or 2 problem state programs require reassembly and rebuilding to prepare them to execute on Version 5.

With the availability of logically expanded "D Space", Version 5 problem state programs may need to increase VCBA space.

In addition, Versions 3 and 4 problem state programs (with the exception of those programs using the BSC IPL bootstrap facilities) require no reassembly to execution Version 5. Most Version 3 and 4 problem state programs need only be installed on a Version 5 system to execute. In some cases, VCBA Space may need to be increased.

Customer-written programs included with the supervisor must be written in accordance with the internal supervisor programming conventions for 5719-PC5. These are different from those of 5719-PC1, 5719-PC2, 5719-PC3, and 5719-PC4, and may result in changes to existing user-written extensions.

Programs using the SVC interface to SPOOL commands will not operate on Version 5; using the TMON Macro of the Transient Activity Tool requires assembly and rebuilding with Version 5. Programs written to execute using the 4978 Programming RPQ may require code changes, reassembly, and rebuilding with Version 5 to emulate the Programming RPQ processing.

The following Series/1 Licensed Programs are compatible with the Series/1 Realtime Programming System Version 5:

- Series/1 Indexed Access Method (5719-AM1)*
- Series/1 Indexed Access Method Version 2 (5719-AM2)**
- Series/1 Program Preparation Subsystem Version 5 (5719-AS5)
- Series/1 System/370 Channel Attach Program (5719-CA1)*
- Series/1 COBOL Compiler and Resident Library (5719-CB1)
- Series/1 COBOL Transient Library (5719-CB2)
- Series/1 COBOL Compiler and Resident Library Version 2 (5719-CB7)**
- Series/1 COBOL Transient Library Version 2 (5719-CB8)**
- Series/1 Communications Monitor Version 1 (5719-CM1)*
- Series/1 4987 Programmable Communications Subsystem Preparation Facility (5719-CS 0)
- Series/1 4987 Programmable Communications Subsystem Extended Execution Support (5719-CS2)*
- Series/1 FORTRAN IV Compiler and Object Support Library Version 2.0 (5719-FO2)

Series/1 FORTRAN IV Realtime Subroutine Library Version 2 (5719-FO4)

Series/1 Mathematical and Functional Subroutine Library Version 2 (5719-LM2)

Series/1 PL/I Compiler and Resident Library Version 2 (5719-PL2)

Series/1 PL/I Transient Library Version 2 (5719-PL4)

Series/1 Realtime Programming System Screen Format Design Aid Utility (5719-SF1)

Series/1 Realtime Programming System Screen Format Presentation Support (5719-SF2)*

Series/1 Sort/Merge (5719-SM1)

Series/1 Realtime Programming System SNA Extended Support (5719-SN1)*

Series/1 5250 Information Display System (5719-TA1)*

Series/1 4969 Magnetic Tape Drive (5719-TA4)

The following Series/1 licensed programs - PRPQs are compatible with the Series/1 Realtime Programming System Version 5 (5719-PC5).

- Series/1 Remote Job Entry Programming RPQ P82575 (5799-TBK)
- Series/1 Packet Network Support Programming RPQ P10008 (5799-TCP)*
- Series/1 Remote Management Utility Programming RPQ P82597 (5799-TDH)
- Series/1 Realtime Programming System Multiple Terminal Manager Programming RPQ P82622 (5799-TDX) Version 2
- Series/1 Job Stream Processor Programming RPQ P82635 (5799-TEC)
- Series/1 SNA Remote Management Utility Programming RPQ P82639 (5799-TEF)*

Program Preparation

The Series/1 Program Preparation Subsystem Version 5 (5719-AS5) is required to prepare programs to execute on the Series/1 Realtime Programming System Version 5 (5719-PC5).

The Base Program Preparation Facilities (5719-PA1) cannot be used to prepare programs to run with the Realtime Programming System.

Device Address Assignment

The configuration must also have the following standard address assignments. The Standard System supports these minimum requirements:

Description	Decimal Address	Hexadecimal Address
4962 Disk Unit	03	03
4963 Disk Subsystem	72	48
IBM diskette drive available in		
4952 Processor, model C	68	44
4964 Diskette	02	02
4965 Diskette Drive and I/O Expansion Unit	68	44
4966 Diskette Magazine	34	22
4973 Line Printer	33	21
4974 Printer	01	01
4975 Printer (see #1310)		
4978 Display Station	36	24
4979 Display Station	04	04
#1310 Multifunction Attachment	88	58
• 3101 models 13 or 23 (EIA RS-422-A interface)	89	59
• 4975 model 1L	90	5A
• 4975 model 2L	91	5B
#1610 Asynchronous Communications Single Control	08	08

* Requires SYSGEN; not included in prebuilt standard system.
** Requires Realtime Programming System support.

PROGRAM PRODUCTS

**SERIES/1 REALTIME PROGRAMMING SYSTEM
VERSION 6 RELEASE 1 (5719-PC6)****PURPOSE**

The Series/1 Realtime Programming System has been enhanced to provide the Series/1 user with improved performance, ease-of-use, serviceability and data integrity.

The Realtime Programming System performance improvements may result in increased application throughput and an increase in the number of devices supported by a Series/1 application.

Ease-of-use enhancements such as full screen menus are provided that allow interactive users to conveniently access functions and applications from their terminals.

Serviceability extensions can result in increased availability of the Series/1 to the user by aiding in determining device condition and providing more information for problem determination.

Duplex volume support, which is available when utilizing at least two disks, provides automatic and transparent data integrity to the application program and the end user.

The Realtime Programming System Multiprocessing feature is announced to offer functions which provide improved processing capability and system availability through multiple processor configurations. A Multiprocessing feature system consists of multiple (2 to 16) Series/1 processors connected by the Local Communications Controller (#1400). In addition to the Realtime Programming System functions, the new feature supports interconnected multiple processors with a single system image, distribution of system operations and applications across processors and non-disruptive horizontal growth.

HIGHLIGHTS

- Duplex volumes
- Program segmentation services
- Command Language Facility enhancements
- Serviceability extensions
- Patch Application Tool
- I/O performance improvements
- 4969 Magnetic Tape support
- SNA-Extended support
- 4956 Processor 512K support
- Disk seek statistics
- Other enhancements:
 - All system messages contain node name, the date and the time of day
 - Operator commands display the system and the node status
 - Single or multiple system console control terminals
- New Integrated System Support

The following enhancements will be available August 26, 1983.

- 4956 Processor Support
- 4967 Disk Unit Support
- SNA Enhancements
- High-Level Language Support
- Virtual Device Interface Support
- X.21 Circuit Switched Support

HIGHLIGHTS OF THE MULTIPROCESSING FEATURE

- All Realtime Programming System functions
- Multiple processors with a single system image
- Distributed functions
- Non-disruptive growth
- Dynamic system configuration
- Two-channel switch support (#7900)

DESCRIPTION

Duplex Volumes: When at least two disks are available, any application volume can be declared to be duplexed (a disk can contain one or more volumes, a volume can contain one or more data sets). The Realtime Programming System and the Multiprocessing feature services automatically and transparently keep duplex copies of the volumes. In the event of a volume failure, the system automatically and transparently commences using the second copy of the volume. The terminal designated to receive system messages is notified of the change in volume use and the failure is recorded in the system log.

When any required repairs are completed, the unit can be returned to the system. At this point, a user-invoked system utility (RECOVER) will automatically make the down-level volume identical with the other copy. Application access to the volumes need not be suspended while the re-synchronization is being made. Once the re-synchronization is completed, normal duplex volume support functions are resumed.

The Indexed Access Method is compatible with this function. Refer to the Indexed Access Method (5719-AM2) pages for details.

Program Segmentation Services: The Realtime Programming System and the Multiprocessing feature support a new type of program segment and facilities for loading (LOADP) and unloading (UNLOADP) of these segments. These segments are referenced by external names (one to eight EBCDIC characters) and can be loaded and relocated anywhere within the storage previously acquired by the Assembler language application program.

This support provides the Assembler language application program with the capability of creating a dynamic set of storage-resident subroutines that are immediately available for execution.

Command Language Facility Enhancements: The Command Language Facility is included as a standard part of Realtime Programming System and the Multiprocessing feature. In addition to the previous command mode of operation, the Realtime Programming System and the Multiprocessing feature provide a new set of full screen menus that allow interactive users to conveniently access system functions and application programs from their terminals. Each user has a choice of command mode or menu mode of operation. In menu mode, the defaults are displayed on the menu; users need only enter the required parameters and if necessary, change the defaults.

Many menus also allow the user to enter a single line command. When the user knows the command format, time can be saved by directly entering the command. When the command function completes, the menu is again displayed.

When the menu names are known, the user can go directly from menu to menu without processing intervening menus. These time saving features can assist in improving end user productivity.

Serviceability Enhancements: The Realtime Programming System and the Multiprocessing feature provide two enhancements for serviceability:

- Additional error log record types
 - New log record types are written for changes in duplex volume status and errors in inter-node communication. These log entries improve the ability of the customer and the IBM Service Representative to perform problem determination and to determine system status.
- Online device tests
 - The Realtime Programming System and the Multiprocessing feature allow the system operator to use a set of simple commands to test (exercise) all the IBM disks, diskettes, printers, the floating-point and timer processor features, and most displays attached to the system. This permits the condition of the attached IBM devices to be judged by examining the results of the tests and the Realtime Programming System or the Multiprocessing feature error log.
 - This information is used to help determine when to call the IBM Service Representative to schedule repair or corrective actions.

Patch Application Tool: The patch application tool provides the mechanism to apply online patches to the supported products on the system. The patch is applied to the copy of the program on the disk, and therefore will be reflected the next time the program is loaded. Patches to programs loaded at system initialization will be reflected at the next system initialization.

I/O Performance Improvements: To more effectively support larger quantities of devices on a node and to provide more effective support of uniprocessor configurations, the Realtime Programming System and the Multiprocessing feature have new I/O support for the disks, diskettes, printers, 4978 Display, 4979 Display and the Asynchronous Attachment feature (#7850).

This implementation can provide better response time and throughput. The implementation is completely transparent to problem state programs.

4969 Magnetic Tape Support: The 4969 magnetic tape support is an integral part of Realtime Programming System and the Multiprocessing feature. It is possible to dump and restore disk (except the systems residence disk), while the system is operating.

SNA-Extended Support: SNA-Extended support is now provided as part of the base operating system support.

Disk Seek Statistics: The user may request that the accesses to physical disk locations be traced. The execution of a new command produces a report that can be used to determine if the volume or dataset placement

PROGRAM PRODUCTS

Series/1 Realtime Programming System V6 R1 (cont'd)

on the disk is optimal. By analyzing this report, a user can determine the distribution of the disk accesses between long and short disk arm movement. If there is a predominance of longer access times due to disk arm movements, the System Utilities can be used to reorganize volume or data set locations on the disk, which could result in improved response time and throughput.

Other Enhancements: The Realtime Programming System and the Multiprocessing feature provide system management functions, such as:

- Operator commands display the system and the node status
- All system messages contain the node name, the date, and the time of day
- Single or multiple operator console control terminals

Available in First Service Release:

4956 Processor Support: Realtime Programming System supports all of the features of the new processor including the floating-point feature, the integrated clock/comparator, and the one megabyte of storage. The system allows up to 512K bytes of storage to be mapped. The balance of the storage (if any) can be used by applications through secondary storage services.

The Multiple Terminal Manager (5719-MT1) and the Indexed Access Method (5719-AM2) products will also use additional storage to improve application response time and throughput.

4967 Disk Unit Support: Realtime Programming System supports the new large capacity 4967 Disk Unit. Support is consistent and compatible with support for existing disk products. All existing user applications will execute without modification. The cache facility support is transparent to user applications.

SNA Enhancements: Systems Network Architecture support is enhanced by:

- Dynamic Network Definition
- Dynamic Device Generation

Dynamic Network Definition: A network definition mechanism is provided to dynamically specify network parameters, function previously available only during the SYSGEN process. If at least one SNA network is defined during SYSGEN, additional networks can be defined and activated without requiring a new SYSGEN.

Dynamic Device Generation: An SDLC device definition mechanism is provided to dynamically start SDLC devices. If at least one SNA network is defined during SYSGEN, additional SDLC devices can be started without requiring another SYSGEN. Thus, additional devices can be added to the system without disrupting system operation.

High-Level Language Support: To enhance high-level language (COBOL, FORTRAN and PL/I) application use of the new larger 4956 Processor and to take advantage of certain Realtime Programming System services, high-level languages will be able to access:

- Secondary Storage Services (PL/I only)
- LOADP/UNLOADP Services
- Global Queue Services

This access will be provided through supplied, callable subroutines.

Virtual Device Interface Support: Virtual Device Interface Support provides a user with the capability to develop a system that supports a new terminal device, or a device emulator program, as the system console or display device.

Existing display applications using the READ/WRITE or GET/PUT level of support may use the new terminal device or device emulator as its input/output device with no changes.

X.21 Circuit-Switched Support: Operations on X.21 circuit-switched public data networks are supported in binary synchronous and SNA/SDLC modes in compliance with the CCITT X.21 recommendation. Functions provided are:

- Full Address Calling
- Call Establishment
- Call Acceptance
- Direct Call
- Abbreviated Address Calling
- Closed User Group (and with Outgoing Access)
- Calls Barred
- Multiple Lines at Same Address
- Charge Transfer
- Connect when Free
- Redirected Calls

- Dynamic Registration/Cancellation
- Dynamic Facility Request

The following network features are not supported:

- Multiple Addressing (broadcast)
- Charge Advice
- Delayed Delivery
- Selective Direct Call
- Calling Line ID
- Called Line ID

The X.21 Circuit-Switched Support contains:

- The external interfaces to enable the application program or system operator to connect to the X.21 network.
- Status for the X.21 Circuit-Switched network in the system error log.
- Interfaces to support binary synchronous and SNA/SDLC.

New Integrated System Support: Realtime Programming System Version 6 supports all of the features of the New Integrated System, models 4954-30D, 4956-30D and 4965-30D. The support is transparent to high-level language programs and Assembler language programs that use the READ/WRITE or GET/PUT interfaces. The Realtime Programming System Version 6 will also support the cache feature of the disk unit, transparent to the application programs.

DESCRIPTION OF THE REALTIME PROGRAMMING SYSTEM MULTIPROCESSING FEATURE

Each Series/1 processor can be dedicated to performing unique work, being a backup processor, or a combination of both. Each processor may have its own disks, printers, communications lines, etc., or it may share certain types of devices that are attached to other processors. Except when the execute I/O (EXIO) interface is used, the Realtime Programming System Multiprocessing feature manages the logical sharing of devices to enable applications to transparently use devices that are not attached to the processor in which they are executing.

Disks, diskettes, printers, and certain displays are the devices that do not have to be attached to the processor in which the application is executing. These devices can be attached to any processor in the system. The Realtime Programming System Multiprocessing feature transparently manages the flow of data to and from applications to these devices.

This distribution of system and application function has the potential for providing highly reliable and available operations through redundant resources. It also permits modular, incremental growth as application requirements expand.

A simple, straightforward command set is used to assign system functions and to support processors within the system. Applications can be assigned to processors using the same command set. Once these assignments have been made, they are repeated automatically any time the system is initialized for operation.

Multiple Processors with a Single System Image: The Realtime Programming System Multiprocessing feature supports from 2 to 16 processors with a single system image. Through the use of distributed function, most of the resources of each processor are available to the entire system. The entire system can be controlled from one system operator console. This reduces the complexity of system management and operation.

Distributed Function: The Realtime Programming System Multiprocessing feature is implemented to permit the distribution of system and application workload among the processors of the Realtime Programming System Multiprocessing feature. This option allows one or more processors to serve interactive displays and terminals, dedication of one or more processors to process disk input and output operations, and one or more processors to operations such as batch jobs and printer output spooling. This distribution of system function, applications, and resources can result in improved system throughput and availability.

The following devices and features can not be distributed:

- Sensor I/O
- Programmable Communications Subsystem
- 4969 Tape Magnetic Tape Unit
- 370 Channel Attach
- SNA/SDLC
- Binary Synchronous Communications
- Asynchronous Communications

Non-Disruptive Growth: The Realtime Programming System Multiprocessing feature allows the incremental addition of devices, features,

PROGRAM PRODUCTS

Series/1 Realtime Programming System V6 R1 (cont'd)

and other system options in a manner that does not require the entire system to be stopped.

Even processors and their attached I/O may be added in a manner that does not require the entire system to be stopped or quiesced.

Dynamic System Configuration: The system configurator program allows the user to examine and modify the configuration of the system.

The configurator program allows the user to:

- Display the configuration of each node in the system
- Name each node
- Designate whether each node is to be brought online at system initialization
- For each node:
 - Designate which task set is to be the system task set
 - Allocate storage
 - Display devices at the node
 - Name the devices
 - Designate if the Indexed Access Method (5719-AM2) is to run at that node and if it is to have a backup Indexed Access Method on another node
 - Assign devices to the Terminal Controller
 - Establish the System Network Architecture support at the node
 - Display and modify system parameters

Two-Channel Switch Support (#7900): Support will be provided to allow devices attached to the Two-Channel Switch to be switched to another processor. User-designated devices and applications can be restarted on a backup processor.

4968 Autoload Streaming Magnetic Tape Unit: In order to provide customers with planning information, IBM will include 4968 Autoload Streaming Magnetic Tape Unit support in the Realtime Programming System Version 6, in the first quarter of 1984.

SYSTEM SERVICES

In addition to the above support, the Realtime Programming System and the Multiprocessing feature provide operating system services and communications support for the following:

- Task Management
- Storage Management
- Task Set Management
- Event Management
- Queue Management
- Timer Management
- Serially Reusable Resource Management
- Interrupt Management
- Error Management
- Command Language Facility
- Operator Interface
- Data Set Management
- Support for the following devices:
 - 3101 Display Terminal
 - 4962 and 4963 Disks
 - 4964, 4965, and 4966 Diskette Units
 - 4965 Diskette Drive and I/O Expansion Unit
 - 4969 Magnetic Tape
 - 4973, 4974, 4975 Printers
 - 4978, 4979 Displays
 - (#7850) Teletypewriter Attachment
- 4967 Disk Unit
- Sensor I/O
- Stand-Alone Utility functions
- General Purpose Utility functions
- Service Aids
- System Initialization
- Asynchronous Communications support:
 - The following start/stop (asynchronous) terminals are supported via features #1610, or #2091/#2092:
 - 2740 Communications Terminal, mdl 1, in point-to-point switched, point-to-point nonswitched, multipoint connections

- 2740 Communications Terminal, mdl 1 or 2, in multipoint connections
- 2741 Communications Terminal in point-to-point switched and point-to-point nonswitched connections
- 3101 Display Terminal, mdls 10, 12, 13, 20, 22, and 23 (in character or block mode) or equivalent device, in point-to-point switched or nonswitched connections. Determination of equivalency is a user responsibility.
- The following start/stop (asynchronous) terminals are supported via features #1310, #2095/#2096:
 - 3101 Display Terminal, mdls 10, 12, 13, 20, 22, and 23 (in character or block mode) or equivalent device, in point-to-point switched or nonswitched connections. Determination of equivalency is a user responsibility.
- The following systems are supported via features #1610, #2091/#2092, or #2095/#2096:
 - IBM Personal Computer with the Asynchronous Communications Adapter in switched and point-to-point nonswitched connections. The IBM Personal Computer licensed program - Asynchronous Communications Support, or a user-written IBM Personal Computer program, can communicate with a user-written program in the Series/1 using Realtime Programming System READ/WRITE communications support.
 - System/23 Datamaster with the Communications Adapter feature and utilizing the Asynchronous Communications licensed program, in switched and point-to-point nonswitched connections.
- The following system is supported via features #1310, #1610, #2091/#2092, or #2095/#2096:
 - 6580 Displaywriter System with a Communications Adapter and utilizing the Asynchronous Communications licensed program, in switched and point-to-point nonswitched connections. The Displaywriter can operate in either of two asynchronous modes:
 - 2741 (emulates the 2741 Communications Terminal)
 - TTY (emulates a teletypewriter)
- Binary Synchronous Communications support:
 - The following Binary Synchronous Terminals are supported via features #1310, #2074, #2075, or #2093/#2094:
 - BSC support for the 3271 Control Unit mdls 1 and 2 with attached 3277 Terminal and 3284, 3286, 3287, and 3288 Printers on a multipoint line.

Note: 3270 support is limited to communications support and does not include mapping services.
 - BSC support for 3274 Control Unit, mdls 1C, 21C, 31C and 51C with attached 3277 and 3278 Display Stations, 3279 Color Display Stations, and 3230, 3262, 3268, 3284, 3286, 3287, 3288, and 3289 Printers on a nonswitched point-to-point or multipoint line.
 - BSC support for 3275 Display Station, mdls 1 and 2, on a switched point-to-point or multipoint line.
 - BSC support for 3276 Control Unit Display Station, mdls 1, 2, 3, and 4 with attached 3278 Display Stations, 3279 Color Display Stations, and 3230, 3262, 3268, 3287 and 3289 Printers on a nonswitched point-to-point or multipoint line.
 - 3684 Point-of-Sale Control Unit, mdls 1 or 2 with BSC Communications on a switched or nonswitched point-to-point or nonswitched multipoint facility (as a System/3). A user-written 3684 program or the Host Command Processor (HCP) facility in the 3684 can communicate with a user-written program in the Series/1 utilizing Realtime Programming System READ/WRITE communications support. (See the M3684 pages for details.)
 - 3741 Data Station on a switched or nonswitched point-to-point line or on a multipoint line with the Expanded Communications feature, #1685.
 - 4975 Printer, mdls 01R and 02R via the #1310 only.
 - 5260 Retail System via the 5265 mdls A12, A22, A42, B12, B22, B42 using point-to-point BSC discipline as a System/3.
 - 5280 Distributed Data System via the 5285 or 5288 with Communications Adapter feature (#2500) on a switched or nonswitched point-to-point or multipoint line. (5280 appears as a 3741.)
 - 6670 Information Distributor with BSC feature on a switched or nonswitched point-to-point line. (See the *Programmer's Guide for Communicating with the IBM 6670 Information Distributor (BSC Environment)* for details on the 6670).

PROGRAM PRODUCTS

Series/1 Realtime Programming System V6 R1 (cont'd)

- The following system is supported via features #2074 or #2093/#2094:
 - System/23 Datamaster with the Communications Adapter feature and utilizing the Binary Synchronous licensed program, in switched and point-to-point nonswitched connections. The System/23 Datamaster supports the line protocol of the 3741 Data Station.
- The following system is supported via features #1310, #2074, or #2093/#2094:
 - 6580 Displaywriter System with a Communications Adapter and utilizing the Binary Synchronous Communications licensed program, in switched and point-to-point nonswitched connections. The Displaywriter System emulates 2770/3780 line protocol.
- The following Binary Synchronous CPU-to-CPU communications are supported via features #1310, #2074, or #2075 (not System/32), or #2093/#2094. The Series/1 appears as a System/3.
 - CPU-to-CPU point-to-point, switched or nonswitched:
 - Another Series/1 using the Series/1 Realtime Programming System, Version 6
 - Another Series/1 using the Series/1 Realtime Programming System, Version 6 Multiprocessing feature
 - Another Series/1 using the Series/1 Realtime Programming System, Version 5, Version 4, Version 3, or Version 2
 - System/3 using CCP or RPG
 - System/32 under RPG programming facilities
 - System/34 under RPG programming facilities and the BSCEL (BSC Equivalence Link) feature of the SSP-ICF (Interactive Communications Feature).
 - System/38 via RPG III or COBOL Application Programs
 - S/370 BTAM OS/VS1, OS/VS2, (SVS or MVS), or DOS/VS
 - S/370 CICS/VS, OS/VS1, OS/VS2, or DOS/VS (BTAM only)
 - S/370 TCAM OS/VS1 or OS/VS2 (TCAM does not support conversational mode).
 - S/370 VTAM, DOS/VS
 - CPU-to-CPU, Series/1 as a multipoint tributary:
 - S/370 BTAM OS/VS1
 - S/370 IMS/VS, OS/VS1, or OS/VS2 (BTAM only). IMS/VS support is via Intelligent Remote Station Support (IRSS), an IMS/VS protocol for the support of remote systems. A Series/1 user-written application program is required for the formatting and handling of messages in the proper IMS/IRSS formats.
- SDLC and System Network Architecture support:
 - Data flow control level user interface
 - Presentation services level user interface (SNA-Extended interface)
 - Network activation and deactivation services
 - Session and message exchange services
 - Multiple physical and logical units
 - SNA Physical Unit Type 2
 - SNA Function Management Profiles three and four
 - SNA Transmission Subsystem Profiles three and four
 - SDLC secondary station
 - System definition services
 - Activation of a task set from the host

This functional support allows the Realtime Programming System to be defined as a Cluster Controller on an SNA/SDLC network controlled by a S/370 and ACF/VTAM or ACF/TCAM through a 3705 Communications Controller using the Network Control Program (ACF/NCP/VS). This support also allows operation in a network controlled by a S/370 with IMS/VS Version 1 Advanced Function for Communications and S/370 CICS/VS Version 1.5.

The data flow control level user interface consists of a set of macros which allow Series/1 user applications to communicate with host subsystems or applications. These macros are at a low level and provide a high degree of control over SNA formats and protocols.

The presentation services level user interface (SNA-Extended interface) also consists of a set of macros which allow program-to-program communications. These macros are at a higher level than those for the data flow control level user interface level and reduce the amount of programming required for message exchange. This interface allows Series/1 user applications to connect to host subsystem applications as any of the following logical units:

- IMS/VS Secondary Logical Unit Type P
- CICS/VS 3790 Full Function Logical Unit
- CICS/VS 3650 Pipeline Logical Unit

Device Support: The Realtime Programming System supports the 4954, 4955 and 4956 processors, when these systems have at least 192K bytes of storage attached. The following options are also supported:

- #3920 Floating-Point Processor (4955)
- #3925 Floating-Point Processor (4954, 4956)
- #5650 Programmer's Console (4955)
- #5655 Programmer's Console (4954, 4956)

In addition, multiples of the following devices and features are supported:

- 3101 Display Terminal, mdl's 10, 12, 13, 20, 22 and 23
- 3102 Printer (when attached to a 3101 auxiliary interface)
- 4962 and 4963 Disk Units
- 4964 and 4966 Diskette Units
- 4965 DASD Storage and Expansion Unit
- 4967 Disk Unit
- 4973, 4974 and 4975 Printers
- 4978 and 4979 Displays
- 4982 Sensor I/O (1)
- 4987 Programmable Communications Subsystem (1, 2)
- 4993 Channel Attachment (1, 2)
- 4999 Battery Backup

Notes:

1. Not required in Standard System; requires a system generation to include the support.
2. Available in separately licensed programs.

Features:

S/370 Channel Attachment	#1200
Multifunction Attachment	#1310
Local Communications Controller	#1400
Integrated DI/DO	#1560
Channel Repower	#1565
Asynchronous Communications	
Single-Line Control	#1610
Communication Indicator Panel	#2000
Binary Synchronous Communications	
Single-Line Control	#2074
Binary Synchronous Communications	
Single-Line Control/High Speed	#2075
Synchronous Communications	
Single-Line Control/High Speed	#2080
SDLC Single-Line Control	#2090
Asynchronous Communications	
8-Line Control	#2091
Asynchronous Communications	
4-Line Control	#2092
Binary Synchronous Communications	
8-Line Control	#2093
Binary Synchronous Communications	
4-Line Adapter	#2094
Feature Programmable 8-Line	
Multiline Communications Controller	#2095
Feature Programmable 4-Line	
Multiline Communications Attachment	#2096
Timer	#7840
Teletypewriter Attachment	#7850
Two-Channel Switch	#7900
Asynchronous Terminal 8-Line	
Adapter (RQP)	D02350

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Development: The minimum configuration required to install the system and to perform a system customization (if required) is:

- 192K-byte IBM 4954, 4955, or
- 256K-byte IBM 4956 processor
- Diskette
 - One IBM 4964 Diskette Unit, or
 - One IBM 4965 Diskette Drive and I/O Expansion Unit, or
 - One IBM 4966 Diskette Magazine Unit

PROGRAM PRODUCTS

Series/1 Realtime Programming System V6 R1 (cont'd)

- Disk
 - One IBM 4963 Disk Subsystem (any model)
 - One IBM 4967 Disk Unit
- Timer
 - An IBM 4955 Processor must have a #7840 timer feature
- Printer
 - One IBM 4973 Printer, or
 - One IBM 4974 Printer, or
 - One IBM 4975 Printer
- Operator Station
 - One IBM 4978 Display Station, or
 - One IBM 4979 Display Station, or
 - One #7850 Teletypewriter adapter with the IBM 3101 mdl 10, 12, 13, 20, 22, or 23 Display, or an equivalent device, or
 - One IBM 3101 Display Station, attached via:
 - #1310 Multifunction Attachment [IBM 3101 mdls 13 or 23 on the second address (MFA port 1)]
 - #1610 Asynchronous Communications Single-Line Control (IBM 3101 mdls 10, 12, 13, 20, 22, or 23)
 - #2091/#2092 Asynchronous Communication 8-Line Control and 4-Line Adapter (IBM 3101 mdls 10, 12, 13, 20, 22 or 23)
 - #2095/#2096 Feature Programmable 8-Line multiline communications controller and 4-Line Attachment (IBM 3101 mdls 10, 12, 13, 20, 22, or 23)
 - #2095/D02350 Asynchronous Direct 8-Line RS422A Adapter (IBM 3101 mdls 10, 12, 13, 20, 22 and 23)

Production: The minimum configuration after installation of the system and after completing any system customization is the same as for installation and customization with the following exceptions:

- Disk
 - One IBM 4962 Disk Storage Unit (any model)

Applications may require additional features, attachments, devices, and/or storage. Duplex volumes require two disk units.

SPECIFIED OPERATING ENVIRONMENT for the MULTIPROCESSING FEATURE**HARDWARE REQUIREMENTS**

The Multiprocessing feature has been designed to run with the Realtime Programming System, Version 6 minimum hardware configuration except:

- 256K-byte IBM 4954, 4955 or 4956 Processor
- One #1400 Local Communications Controller (two are recommended for redundancy, horizontal growth and continuous service).

Nodes 2 through 16 are the same as node 1 except the following:

- IBM 4962 Disk Storage Unit may be used
- Diskette is not required except to run stand-alone utilities or diagnostics.
- Printer is not required.

Application(s) may require additional features, attachments, devices and/or storage.

SOFTWARE REQUIREMENTS (None)**COMPATIBILITY**

IBM LICENSED PROGRAMS - NATIVE SUPPORT: The following Series/1 licensed programs are compatible with the Realtime Programming System and the Multiprocessing feature.

The asterisk (*) denotes the products that require a service release or special feature to operate in the Realtime Programming System and the Multiprocessing feature environment. The release or feature will be available at first customer ship of the Realtime Programming System, Version 6 and the Multiprocessing feature.

IBM Series/1 Program Preparation Subsystem, Version 6, 5719-AS6

IBM Series/1 Advanced Remote Job Entry, 5719-RJ6

IBM Series/1 COBOL Compiler and Resident Library, Version 2, 5719-CB7

IBM Series/1 COBOL Transient Library, Version 2, 5719-CB8

IBM Series/1 FORTRAN Compiler and Object Library, Version 2, 5719-FO2

IBM Series/1 FORTRAN Realtime Subroutine Library, Version 2, 5719-FO4

IBM Series/1 Mathematical and Functional Subroutine Library, Version 2, 5719-LM2

IBM Series/1 Communications Monitor, Version 2, 5719-CM2

IBM Series/1 Remote Manager, 5719-RM6

IBM Series/1 X.25/HDLC Communications Support, 5719-HD1

IBM Series/1 Indexed Access Method, Version 2, 5719-AM2 *

IBM Series/1 Job Stream Processor Programming RPQ P82635, 5799-TEC

IBM Series/1 Multiple Terminal Manager, Version 3, 5719-MT1 *

IBM Series/1 PASCAL Compiler and Object Library Programming RPQ P82659, 5799-TEQ

IBM Series/1 PL/I Compiler and Resident Library, 5719-PL2

IBM Series/1 PL/I Transient Library, 5719-PL4

IBM Series/1 Programmable Communications Subsystem Preparation Facility, 5719-CS0

IBM Series/1 Programmable Communications Subsystem Extended Execution Support, 5719-CS2 *

IBM Series/1 Query, 5719-XR2

IBM Series/1 SNA Remote Management Utility Programming RPQ P82639, 5799-TEF

IBM Series/1 Sort/Merge, 5719-SM1*

IBM Series/1 System/370 Channel Attach Program, 5719-CA1 *

IBM LICENSED PROGRAMS - HOST SUPPORT: The following licensed programs are compatible with the Realtime Programming System and the Multiprocessing feature. They support the Realtime Programming System and the Multiprocessing feature, by providing S/370 MVS support to develop applications that will execute on the Realtime Programming System and the Multiprocessing feature.

Host PL/I for Realtime Programming System, 5798-NZJ

Host COBOL for Realtime Programming System Programming RPQ P82648, 5799-TEP

IBM S/370 Host Program Preparation Facilities for the Series/1 Realtime Programming System Version 6 Programming RPQ P82725, 5799-BNA.

CONVERSION

The Realtime Programming System and the Multiprocessing feature contain all the function and device support provided by Realtime Programming System Version 5, except:

- Prebinding, including data sets, queues, and task sets is not supported.
- Rollout/Rollin is not supported.
- Message Buffering is not supported.
- Reusable task sets are not supported.
- Logging support is not optional.
- Full class interrupt support is not optional.
- Control module mapping support is not optional.
- Terminal controller support is not optional.
- Device level access (e.g., OPEN at the device level) requires new parameters if used with duplex volumes.
- The system error log is 256-byte records; in Realtime Programming System Version 5, the records were 128 bytes.
- Timers are required.
- The 4952 Processor is not supported.
- Only I/D split systems are supported.
- Series/1 5250 Information Display System (5719-TA1) is not supported.
- The following are system configuration options in the Realtime Programming System or the Multiprocessing feature:
 - Application program capability to request a system restart (IPL).
 - Application program capability to set the time of day.

DATA: Complete compatibility with volumes supported by Realtime Programming System, Version 5, is provided by Realtime Programming System and the Multiprocessing feature. Any data volume written by either Realtime Programming System, Version 5, Realtime Programming System, Version 6, or the Multiprocessing feature is directly usable by the other system. Duplexed volumes will not be maintained

PROGRAM PRODUCTS

Series/1 Realtime Programming System V6 R1 (cont'd)

by Realtime Programming System, Version 5. Realtime Programming System or Multiprocessing feature duplex volumes should be converted to simplex before they are used by Realtime Programming System, Version 5.

The error log data set created by one system cannot be used by the other system, because of the record size and format difference.

The Realtime Programming System or the Multiprocessing feature provide data exchange with other systems by means of diskettes and nine-track magnetic tape. The diskettes can be IBM standard Basic Exchange, Type E Exchange, or Type H format. The tapes must be DOS/VS compatible nine-track non-labeled or standard label tapes.

PROGRAMS: Subject to the compatibility constraints given above, user-written Realtime Programming System, Version 5 programs need only be installed on the Realtime Programming System Version 6 or the Multiprocessing feature to execute.

For programs executing on Realtime Programming System Versions 1 through 4, refer to the Realtime Programming System, Version 5, pages.

Customer-written programs included with the supervisor must be rewritten in accordance with the internal supervisor conventions for Realtime Programming System or the Multiprocessing feature. These are substantially different than Realtime Programming System, Version 5, and may result in changes to user-written extensions.

SECURITY/INTEGRITY

User management is responsible for evaluating, selecting, applying and implementing security and auditability features, and for the appropriate administrative and application controls.

For applications in which sensitive data is sent over external communication facilities, user management may wish to augment those facilities with the application of cryptography.

PERFORMANCE CONSIDERATIONS

The operating system has features which may help improve the performance of an application, such as:

- Dynamic transient pool management
- Secondary storage services
- Resident/transient module selection
- Logical expansion of supervisor data space

Actual performance is dependent upon many factors; for example, the system hardware configuration, Realtime Programming System generation options selected, application program design, how often programs must access devices, etc. Analysis is required to evaluate expected performance.

**REALTIME PROGRAMMING SYSTEM
PL/I COMPILER AND RESIDENT LIBRARY VERSION 1
(5719-PL1)
PL/I TRANSIENT LIBRARY VERSION 1 (5719-PL3)**

PURPOSE

The IBM Series/1 PL/I is a subset of American National Standard Programming Language PL/I (ANS X3.53 1976) plus additional language functions to support coding realtime applications. The PL/I compiler permits users to use the full capability of the hardware and operating system functions. The language has full function language capabilities that can be used for real time, scientific and commercial applications. Series/1 PL/I is extremely useful in writing applications for plant and laboratory automation, process control, report generation, problem solution and sensor-based application.

PL/I allows the programmer to express in a 'natural' syntax many functions of the Series/1 Realtime Programming System which would require CALLs in FORTRAN or require Assembler language usage. As a result, user application programs are easier to read, understand, debug, maintain and modify.

Series/1 PL/I consists of two licensed programs: a) compiler and resident subroutine library and b) transient subroutine library. The resident library contains frequently used routines used by user's application. These routines are included in the user's task set during execution of the Application Builder and, as a result, performance of a user's application is significantly enhanced by eliminating loading of these functions during execution time. The transient library contains less frequently used routines such as I/O transmission, error handling and conversion routines. These functions are dynamically loaded into a user's shared task set at execution time, thus permitting storage savings in a user's partition with minimal impact on performance.

HIGHLIGHTS

The Series/1 PL/I language is extensive in function aimed at allowing users to develop application programs that can be extended or changed. Highlights of the PL/I offering include:

- Language (realtime) Extensions
- Input/Output (I/O) Capability
- Message Buffering
- Multiple Data Types and Organizations
- Easy Data Manipulation Features
- Additional Features

DESCRIPTION

Realtime Extension

One of the key features of the Series/1 PL/I offering is the capability of allowing the user to develop a complete realtime application without the need to know Assembler language. The requirement has been expressed by the user for a language that offers realtime facilities as part of its syntax; that is, not through subroutine calls. To achieve this goal, a set of PL/I realtime language extensions were developed which allow starting of asynchronous tasks and programs and synchronization of their execution. Event handling and resource control statements allow you to easily code applications that invoke response to realtime events and resolution of resource contention. The following contains an explanation of these extensions.

Features

Multitasking Services

The statements associated with multitasking and their functions are:

RUN	Invokes a task or program.
STOP	Causes termination of a program or task.
UNSCHEDULE	Eliminates the scheduling of a task or program that has already been scheduled.
TRANSFERTO	Stops the current program, and activates another program in the same partition.

The PL/I coder is able to terminate a program or task when control for the task reaches a RETURN or END statement for the procedure invoked as a TASK or when control for any task reaches a STOP statement.

PL/I permits users to share data between tasks in a user partition: through the Application Builder facilities PL/I users can also take advantage of sharing data across partitions.

Timer Services

The programmer is provided with a facility to request a program to be suspended for a specified time interval. The user is provided a CALL facility for setting the DATE and TOD clock.

The PL/I coder may schedule a program or task to execute on a periodic basis, at a particular time-of-day, and after a specified timer

interval. A facility is provided to add and delete programs or tasks from the scheduler services on program request.

Resource Management

The programmer is provided a facility to synchronize tasks and programs by using locks. The language is extended to allow the user to control serially reusable resources and request/release resources for task synchronization. This provides users with a deadlock avoidance facility, and permits effective utilization of the system resources. In a multitasking environment, several tasks may want to update a file simultaneously. With this facility, a user may ensure that only one task could be executed at a time to ensure proper file update.

Event Facilities

The PL/I programmer may define events and start/resume execution of a particular program upon the occurrence of an event. Facilities are provided for the synchronization of task execution through WAIT/POST facilities. Thus, event handling facilities provide some predefined relationship between PL/I tasks running asynchronously.

Events that are supported are I/O completion, task completion, timer, and user-defined. The user is able to suspend a task until a single event occurs or any of a list of events occur.

Built-in Functions

The multitasking built-in functions are used during multitasking and during asynchronous I/O operations. They allow the user to investigate the current state of execution of a task or asynchronous I/O operation. The function names and definitions are:

COMPLETION	Returns the completion value of a given event. The event can be associated with completion of a task or completion of an I/O operation.
STATUS	Returns the status value of a given event.
PRIORITY	Returns the priority of a task.

PL/I Sensor I/O

PL/I permits the user to utilize current PL/I record I/O to access analog and digital data for both input and output. Sensor I/O records, which are described in the ENVIRONMENT attribute, may be either type S (sequential sampling) or type R (random sampling). PL/I access to records in an Analog or Digital I/O file can be SEQUENTIAL, KEYED SEQUENTIAL or DIRECT.

PL/I supports Series/1 sensor I/O, and also provides a GAIN option with a scaling factor (range code) that can override the standard representation.

I/O Capability

Realtime Programming System Data Management provides the PL/I user with I/O services. The PL/I user has facilities to access standard Series/1 I/O devices. PL/I uses both physical and logical I/O (that is, READ/WRITE or GET/PUT). The types supported include SEQUENTIAL, DIRECT, and TRANSIENT files, with data file record format FFB, FBS, FVB, and VBS being supported. Data files may exist on two types of magnetic media:

- 1) Fixed Disk
- 2) Removable Diskette

Series/1 PL/I includes both stream and record I/O capabilities. Stream I/O statements read and write data with a minimum programming effort because automatic formatting and conversion are provided. The following specific options are available:

- List-directed I/O. This facility allows you to input and output data with automatic formatting and conversion.
- Edit-directed I/O. A full range of format items, including picture qualifications and control, allows you to generate complex reports with a minimum of programming effort.

Record I/O statements allow you to have more control over your I/O. The following options are available:

- Consecutive I/O. This facility is available through the use of the READ, WRITE, and REWRITE statements. You can improve your execution-time performance by using the EVENT options for asynchronous I/O.
- Direct I/O. This facility is available through the use of the READ, WRITE, DELETE and REWRITE statements with the KEY option. Asynchronous direct I/O is also permitted.
- Sensor I/O. The facility for handling both sequential and random sampling of analog and digital I/O is available through the use of the READ and REWRITE statements.
- Transient Files. This form of file organization allows the user to communicate data with the Realtime Programming System data

Realtime Programming System PL/I V1 (cont'd)

queues using PL/I READ and WRITE statements. The PL/I program can detect and handle the empty queue situation by coding an ON-unit for the PENDING ON-condition.

The file types supported for sectorized devices (fixed disk and removable diskette) are:

- Sequential
- Direct
- Partitioned

The PL/I user has the ability to add and update records to a sequential DASD file. When using direct files, the user has the ability to access the record by relative record number. The user has the ability of supporting direct data files containing over 250,000 records.

The PL/I user has the option to bind I/O devices and data sets during a) program preparation and maintenance, that is, a compile, link-edit, library store, system generation, pre-execution utility, as well as, b) execution, that is, open time. Option (a) provides the user with the ability to achieve his higher performance requirements with a minimum storage penalty and minimum disk reads to find location of programs and data.

Message Buffering

The Realtime Programming System provides a disk message buffering facility to the following sequential output devices:

- TTY Operator Station
- 4973 Printer
- 4974 Printer

In addition, an interface is available to the message buffering function to allow the user to interface additional devices to the message buffering facility. The message buffering facility is handled logically as a priority queue. The system will complete outputting a message before another message is printed. Message buffering in the operating system is a transparent facility to PL/I and, as such, is available to the PL/I user.

Data Types and Organization

Series/1 PL/I supports arithmetic data, string data, arrays, structures and program control data. The wide variety of data types and array handling supported allow PL/I users to implement a large collection of programs such as system type applications, data base applications, manipulation of large collections of different types of data, scientific applications requiring arithmetic and floating point operation and commercial applications using PICTURE formatting and decimal arithmetic. In addition, the ability to organize data in a PL/I program through PL/I structures, for example, has an added benefit as a documentation aid. The different data types can be organized and structured much more easily than other languages.

Some of the different PL/I data types are:

- Arithmetic data can be represented in either binary or decimal radix and can be either fixed or floating-point.
- Fixed point binary word and double word precisions are supported. Decimal fixed point data can have up to 15 digit positions.
- String data can be either bit or character, with fixed or varying length attributes.
- Program control data can be label, event, activation, lock or pointer. Entry and file parameters are also supported.
- PL/I data may be organized into arrays of up to 15 dimensions, or in structures (hierarchical collections of data, not necessarily of the same type).

Data Manipulation Features

Series/1 PL/I supports major PL/I operators, data types, and statements. Of particular interest are:

- String operations, including substrings, concatenation, and general Boolean operations
- Full set of language built-in functions, including mathematical functions, string functions, and array functions.
- Structure assignment.
- Automatic data conversion in expressions.
- Generalized subscripting.
- Full support for internal and external procedures.
- Control structures including IF--THEN, IF--THEN--ELSE, DO, and DO--WHILE.

Other Series/1 PL/I capabilities that make it suitable as a general application development tool are:

- PL/I coded programs have the capability for entering a user-written error-handling block (entering an ON unit) when an execution error is detected. This can be for device or format errors in I/O, subscript range, and string size range, as well as a wide variety of other language-defined error conditions. The ON handling facility provides PL/I users with extensive run-time error-handling facilities. As a result, users are able to checkout program errors and install their application.
- PL/I supports both the 64-character set and the restricted 48-character set.
- The following features are supported in PL/I:
 - Conversion of mixed data types in expressions
 - Disk read and write
 - Repetitive specification of data items (GET and PUT)
 - General Condition names (ON, REVERT, and SIGNAL)
- Storage efficiency gained by the generation of reentrant code and support for automatic storage allocation.
- Program modularity and interface checking provided by the PL/I block structure and scope rules and the ENTRY attribute.
- The following user-oriented debug aids are provided:
 - Extensive compiler error messages
 - Extensive compiler listing aids
 - Snapshot trace
 - Subscript range checking at execution time
 - String range checking at execution time
 - Conversion condition checking and fix-up capability of execution data
- The user is not required to write Assembler language code in order to compile or execute PL/I-coded program(s). A user may choose, of course, to write assembler code, generally as CALLable subprograms, to achieve code secrecy, faster execution speed, tighter code or some non-PL/I supported function.

PL/I and PL/I coded programs use only the data set organizations and access methods defined by the operating system.

Communications with FORTRAN and Assembler

Subject to certain rules, the compiler allows communication between PL/I object modules and FORTRAN or Assembler object modules. Data may be passed as arguments and must conform to standard interface conventions.

PL/I RAS

Series/1 PL/I supplies compile-time error detection to analyze statement syntax and program structure errors.

The compiler provides debugging aids to decrease the time and effort required for program checkout. It permits efficient use of the language with respect to both compilation and execution. You can use options to request optional compiler facilities.

Syntax errors, errors of inconsistency, such as contradictory variable declarations, and detectable semantic errors occurring in the source program, are all diagnosed and reported in a meaningful form.

Series/1 PL/I supplies comprehensive object-time diagnostics at execution-time to test for and recognize I/O and arithmetic function errors and pass control to user-defined error routines. It also provides a calling trace facility, subscript and string range checking (option).

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The PL/I compiler operates in the batch environment of the IBM Series/1 Program Preparation Subsystem under the IBM Series/1 Realtime Programming System. The PL/I-generated object code, after processing by the Application Builder, runs as either a batch task set or as a realtime task set under control of the IBM Series/1 Realtime Programming System.

The compiler operates on the IBM 4952, IBM 4953 or IBM 4955 Processors in the batch environment of the IBM Series/1 Program Preparation Subsystem and uses the floating-point emulator of the IBM Series/1 Realtime Programming System when the floating-point feature is not installed and floating-point operations are required. Programs heavily using floating-point arithmetic and running with the Floating-Point Emulator will experience performance degradation relative to the same program using the floating-point hardware feature. Use of decimal arithmetic instead of floating-point is strongly

PROGRAM PRODUCTS

Realtime Programming System PL/I V1 (cont'd)

recommended when the floating point hardware feature (#3920) is not available.

Floating-point support is required at compilation time and execution time if the PL/I program contains either floating-point data or binary data of precision 16 or greater.

The minimum system required for compilation or Application Build is:

Processor	IBM 4952 (models A or B), IBM 4953 (models A, B, C, or D), or IBM 4955 Processor (models A, B, C, D, or E)
Storage	Compilation: 64K minimum system including at least a 28K partition for the Compiler Application Build: 48K minimum system including at least a 16K partition for the Application Builder
Disk/Diskette	1 - IBM 4962 model 2 or 2F or 4 Disk Storage Unit (combination disk/diskette unit) or 1 - IBM 4962 model 1 or 1F or 3 Disk Storage Unit or 1 - IBM 4963 Disk Subsystem may be used and 1 - IBM 4964 Diskette Unit or 1 - IBM 4966 Diskette Magazine Unit
Printer	1 - IBM 4974 Printer or 1 - IBM 4973 Line Printer
Operator Station	IBM 4979 Display Station or 1 - Teletypewriter Adapter #7850 supported for use with Teletype ® Models ASR 33/35

The minimum system required to execute in a realtime or batch partition is:

Processor	IBM 4952, IBM 4953 or IBM 4955 Processor
Storage	48K minimum system
Diskette	1 - IBM 4962 models 1 or 1F or 3 Disk Storage or 1 - IBM 4963 Disk Subsystem and 1 - IBM 4964 Diskette Unit or 1 - IBM 4966 Diskette Magazine Unit
Operator Station	IBM 4979 Display Station or 1 - Teletypewriter Adapter #7850 with Teletype® Models ASR 33/35 or an ASCII equivalent device

SOFTWARE REQUIREMENTS

Licensed programs required for compilation and application build:

- IBM Series/1 Realtime Programming System Version 1 Modification Level 1 (5719-PC1)
- or
- IBM Series/1 Realtime Programming System Version 2 (5719-PC2)
- or
- IBM Series/1 Realtime Programming System Version 3 (5719-PC3)
- or
- IBM Series/1 Realtime Programming System Version 4 (5719-PC4)
- IBM Series/1 Program Preparation Subsystem Version 1 Modification Level 1 (5719-AS1)
- or
- IBM Series/1 Program Preparation Subsystem Version 2 (5719-AS2)
- or
- IBM Series/1 Program Preparation Subsystem Version 3 (5719-AS3)
- or
- IBM Series/1 Program Preparation Subsystem Version 4 (5719-AS4)
- IBM Series/1 PL/I Compiler and Resident Library (5719-PL1)

Execution in a Realtime Partition

- IBM Series/1 Realtime Programming System Version 1 Modification Level 1 (5719-PC1)
- or
- IBM Series/1 Realtime Programming System Version 2 (5719-PC2)
- or
- IBM Series/1 Realtime Programming System Version 3 (5719-PC3)
- or
- IBM Series/1 Realtime Programming System Version 4 (5719-PC4)

IBM Series/1 PL/I Transient Library (5719-PL3)

Execution in a Batch Partition

- IBM Series/1 Realtime Programming System Version 1 Modification Level 1 (5719-PC1)
- or
- IBM Series/1 Realtime Programming System Version 2 (5719-PC2)
- or
- IBM Series/1 Realtime Programming System Version 3 (5719-PC3)
- or
- IBM Series/1 Realtime Programming System Version 4 (5719-PC4)
- IBM Series/1 Program Preparation Subsystem Version 1 Modification Level 1 (5719-AS1)
- or
- IBM Series/1 Program Preparation Subsystem Version 2 (5719-AS2)
- or
- IBM Series/1 Program Preparation Subsystem Version 3 (5719-AS3)
- or
- IBM Series/1 Program Preparation Subsystem Version 4 (5719-AS4)
- IBM Series/1 PL/I Transient Library (5719-PL3)

DATA SECURITY

PL/I object program structure and language provide controlled addressability to user data. Data with the internal attribute, for example, is not known outside the declaration block. This facility permits users to access data in a fashion which is consistent with declared data attributes and source language scope.

In addition, the PL/I STRINGRANGE and SUBSCRIPTRANGE error conditions restrict the application program from referencing data which lies beyond the declared extents and lengths of arrays and strings.

**REALTIME PROGRAMMING SYSTEM
PL/I COMPILER AND RESIDENT LIBRARY VERSION 2
(5719-PL2)
PL/I TRANSIENT LIBRARY VERSION 2 (5719-PL4)**

PURPOSE

The IBM Series/1 PL/I Version 2 is a subset of American National Standard Programming Language PL/I (ANSI X3.53 - 1976) plus additional language functions to support coding realtime applications. The PL/I compiler permits users to use the full capability of the hardware and operating system functions. The language has full function language capabilities that can be used for realtime, scientific and commercial applications. Series/1 PL/I is extremely useful in writing interactive applications for plant and laboratory automation, process control, report generation, problem solution and sensor-based applications.

Series/1 PL/I Version 2 represents a significant advantage for the Series/1 high-level language user. Users can write entire applications in a high-level language that provides interactive terminal handling facilities, communications via binary synchronous or START/STOP disciplines to other processors and to terminals, and index capability for data base management, all using highly optimized Series/1 code. The objective of this product is to allow Series/1 users with little knowledge of the actual hardware or operating system to develop highly sophisticated applications with easy-to-use, high productivity characteristics. In addition to the ANSI X3.53-1976 standard language facilities available in Version 1 of Series/1 PL/I, this product also provides more language capability which brings the product closer to the full ANSI X3.53 - 1976 standard as understood and interpreted by IBM as of September, 1979.

PL/I programs can be used with the Multiple Terminal Manager Programming RPQ (5799-TCY). These facilities offer another alternative to allow PL/I programs to execute in an interactive environment where one or more applications can run concurrently with more than one terminal.

PL/I allows the programmer to express in a 'natural' syntax many functions of the Realtime Programming System which would require CALLs in FORTRAN or require Assembler language usage. As a result, the user's application programs are easier to read, understand, debug, maintain and modify.

Series/1 PL/I Version 2 consists of two licensed programs: a) compiler and resident library, and b) transient library. The resident library contains frequently used routines used by an application. These routines are included in the user's task set during execution of the Application Builder, and as a result, performance of the application is significantly enhanced by eliminating the loading of these functions during execution time. The transient library contains less frequently used routines such as I/O transmission, error handling and conversion routines. These functions are dynamically loaded into a shared task set at execution time, thus permitting storage savings in a user's partition with minimal impact on performance.

These products provide all the facilities of and are extensions to the Series/1 PL/I products (5719-PL1 and 5719-PL3 respectively). Series/1 PL/I Version 2 compiler and application programs execute under Version 3 or Version 4 (5719-PC3 or 5719-PC4) of the Realtime Programming System and Version 3 (5719-AS3) or Version 4 (5719-AS4) of the Program Preparation Subsystem.

HIGHLIGHTS

Series/1 PL/I Version 2 language is extensive in function, aimed at allowing users to develop application programs that can be easily modified and maintained. Highlights of the PL/I Version 2 include:

- Full Screen Support
- Extended Coverage of ANS PL/I
- Code Optimization
- New Device Support (4969 Magnetic Tape Subsystem and 5250 Information Display System)
- Language (realtime) Extensions
- Input/Output (I/O) Capability
- Communications Support
- Indexed Access Method Support
- Multiple Data Types and Organizations
- Easy Data Manipulation Features
- Additional Language Features (not available in PL/I Version 1, 5719-PL1 and 5719-PL3)
- Sort/Merge Support

DESCRIPTION**Full Screen Support**

Full Screen Support under PL/I Version 2 is a subset of RECORD I/O and STREAM I/O, where the user can access terminal devices (4978, 4979 and 5251) that are accessible through the Realtime Programming System. Access to this I/O mode is controlled through the use of ENVIRONMENT options on a FILE declaration statement.

- Record I/O

This support significantly extends PL/I user control of these devices and permits REGIONAL data sets to be directed to the screen, in addition to CONSECUTIVE data sets. With this capability, users can deal with the whole screen, split the screen, control coordinate (X,Y) positions, write-protect selected fields to the screen, scatter write, sound the tone alarm and scroll, depending on device type. Program function keys may also be associated with PL/I event variables.

- Stream I/O

In stream I/O an INTERACTIVE mode is now provided. In this mode, GET and PUT statements may be directed to a single open stream file. Automatic buffer purging is provided when a GET statement follows a PUT to the same file. This allows user supplied prompting messages to appear in the proper sequence.

Additional Data Attributes

The additional data attributes being provided are:

- PICTURE
- DEFINED and POSITION
- AUTOMATIC with INITIAL
- FILE VARIABLE
- ENTRY VARIABLE
- PROGRAM VARIABLE

These are useful features required in commercial applications which are also common in PL/I products available on larger IBM systems. The inclusion of these facilities will also provide easier migration of a majority of existing PL/I programs from larger IBM data processing systems to Series/1.

Allocate/Free Statements

A new function is added to the compiler to allow the PL/I programmer to control the allocation and freeing of dynamic storage during execution. The statements supported are:

- ALLOCATE
- FREE

In the event that insufficient storage is available to fill a request for allocation, the STORAGE condition is raised and the user may decide how he wishes to proceed, as with other PL/I error conditions.

Fixed Block Regional

Fixed block (FB) is accepted as a valid environment option for a Regional file. This feature permits short length records to be blocked within 256-byte sector boundaries and thus allows users to optimize space on Series/1 direct access devices.

Built-In Functions (BIF's)

The new built-in functions expand the productivity of the PL/I programmer in handling arithmetic, string and array data.

- Arithmetic BIF's (built in functions)

- | | | |
|----------|------------|------------|
| - ADD | - FLOOR | - ROUND |
| - ATANH | - MAX | - SINH |
| - CEIL | - MIN | - SUBTRACT |
| - COSH | - MOD | - TANH |
| - DIVIDE | - MULTIPLY | - TRUNC |

- String BIF's

- TRANSLATE
- VALID
- VERIFY

- Array BIF

- SUM

- I/O BIF

- PAGENO

Realtime Programming System PL/I V2 (cont'd)

Pointer Qualification

Explicit pointer qualification is now available. This extension facilitates list processing applications.

Generated Code Optimization

The PL/I Version 2 compiler analyzes object-code logic and then eliminates most unnecessary instructions. This results in saving execution time and storage space. Code optimizations provided include:

- Improved register allocation
- Anchor pointing in compound IFs
- Use of byte immediate instructions in place of word immediate instructions where applicable
- Use of storage-to-storage operations
- Use of MVWS instruction where offsets and registers permit
- Use of Jump instruction for short Branch instructions
- Library call code improvements

PL/I Sort Capability

Sort/Merge functions available with the Series/1 Sort/Merge licensed program (5719-SM1) are now supported via the CALL PLISRT interface.

Realtime Extensions

One of the key features of the Series/1 PL/I offering is the capability of allowing the user to develop a complete realtime application without the need to know Assembler language. The requirement has been expressed by the user for a language that offers realtime facilities as part of its syntax; that is, not through subroutine calls. To achieve this goal, a set of PL/I realtime language extensions are provided which allow starting of asynchronous tasks and programs, and synchronization of their execution. Event handling and resource control statements allow users to easily code applications that invoke response to realtime events and resolution of resource contention. The following contains an explanation of these extensions.

Multitasking Services

The statements associated with multitasking and their functions are:

RUN	Invokes a task or program
STOP	Causes termination of a program or task
UNSCHEDULE	Eliminates the scheduling of a task or program that has already been scheduled by the RUN statement
TRANSFER TO	Stops the current program, and activates another program in the same partition

The PL/I programmer is able to terminate a program or task when control for the task reaches a RETURN or END statement for the procedure invoked as a TASK, or when control for any task reaches a STOP statement.

PL/I permits users to share data between tasks in a user partition through the Application Builder facilities. PL/I users can also take advantage of sharing data and subroutines across partitions through the shared task set.

Timer Services

The programmer is provided with a PL/I language facility to request a program to be suspended for a specified time interval. The user is provided a CALL facility for setting the DATE and TOD (time-of-day) clock.

The PL/I programmer may schedule a program or task to execute on a periodic basis, at a particular time-of-day, and after a specified time interval. A facility is provided to add and delete programs or tasks from the scheduler services on program request. Programs and tasks may also be scheduled to run on the occurrence of a process interruption.

Resource Management

The language is extended to allow the user to control serially reusable resources and request/release resources for task synchronization by the introduction of a LOCK variable. This provides users with a deadlock avoidance facility, and permits effective utilization of the system resources. For example, in a multitasking environment several tasks may want to update a file simultaneously; with this facility a user may ensure that only one task could execute the file update at one time.

Event Facilities

The PL/I programmer may define events and start/resume execution of a particular task upon the occurrence of an event. Facilities are provided for the synchronization of task execution through WAIT/POST facilities. Thus, event handling facilities can provide some predefined relationship between PL/I tasks running asynchronously.

Events that are supported are I/O completion, task completion, time of day, time interval, process control, display device function key and user-defined. The user is able to suspend a task until a single event occurs or any of a list of events occur.

Built-in Functions

The multitasking built-in functions are used during multitasking and during asynchronous I/O operations. They allow the user to investigate the current state of execution of a task or asynchronous I/O operation. The function names and definitions are:

COMPLETION	Returns the completion value of a given event. The event can be associated with completion of a task or completion of an I/O operation.
STATUS	Returns the status value of a given event.
PRIORITY	Returns the priority of a task.

PL/I Sensor I/O

PL/I permits the user to utilize current PL/I record I/O to access analog and digital data for both input and output. Sensor I/O records, which are described in the ENVIRONMENT attribute, may be either type S (sequential sampling) or type R (random sampling). PL/I access to records in an Analog or Digital I/O file can be SEQUENTIAL, KEYED SEQUENTIAL or DIRECT.

PL/I sensor I/O also provides a GAIN option with a scaling factor (range code) that can override the standard representation.

I/O Capability

The Realtime Programming System Data Management provides the PL/I user with I/O services. The PL/I user has facilities to access standard Series/1 I/O devices. PL/I uses both physical and logical I/O (that is, READ/WRITE or GET/PUT). The types supported include SEQUENTIAL, DIRECT, and TRANSIENT files with data file record format F, FB, FBS, V, VB, and VBS being supported. Data files may exist on three types of magnetic media:

1. Fixed Disk
2. Removable Diskette
3. Magnetic Tape (excludes spanned records)

Series/1 PL/I includes both stream and record I/O capabilities. Stream I/O statements read and write data with a minimum programming effort, because automatic formatting and conversion are provided. The following specific options are available:

- List-directed I/O. This facility allows you to input and output data with automatic formatting and conversion.
- Edit-directed I/O. A full range of format items, including picture formats and control formats, allows users to generate complex reports with a minimum of programming effort.

Record I/O statements allow more control over I/O. The following options are available:

- Sequential I/O. This facility is available through the use of READ, WRITE, DELETE and REWRITE statements. It is often possible to improve execution-time performance by using the EVENT options for asynchronous I/O.
- Direct I/O. This facility is available through the use of READ, WRITE, DELETE and REWRITE statements with the KEY option. Asynchronous direct I/O is also permitted.
- Sensor I/O. This facility for handling both sequential and random sampling of analog and digital I/O is available through the use of the READ and REWRITE statements.
- Transient Files. This form of file organization allows the user to communicate data with the Realtime Programming System data queues using PL/I READ and WRITE statements. The PL/I program can detect and handle the empty queue situation by coding an ON-unit for the PENDING ON-condition.
- Communications

Communications under PL/I gives the user capability to communicate with Binary Synchronous and START/STOP devices through the Realtime Programming System communications interfaces. All communications are a subset of RECORD I/O with no new language, only new ENVIRONMENT options. This facility is provided through a direct PL/I interface to normal operating system/subsystem functions.

These communications functions allows flexibility in developing terminal applications in PL/I and will permit:

- Communications between multiple Series/1 machines
- Series/1 to System/370
- Installation of PL/I programs in Binary Synchronous and Start/Stop environments

Realtime Programming System PL/I V2 (cont'd)

Indexed Access Method Support

The PL/I compiler now supports INDEXED (keyed) files in addition to CONSECUTIVE and REGIONAL files. This support includes new file environment options and support for non-numeric keys. Record types are fixed format, blocked or unblocked. Indexes associated with the data set are used by the Indexed Access Method to locate records when the key is supplied. Both the Indexed Access Method Licensed Program (5719-AM1) and Indexed Access Method PRPQ (5799-TCB) are supported. Both sequential and direct processing of indexed files is permitted.

The file types supported for sectorized devices (fixed disk and removable diskette) are:

- Sequential
- Direct
- Partitioned

The PL/I user has the ability to add and update records to a sequential DASD file. When using direct files, the user has the ability to access the record by relative record number. The user has the ability of supporting direct data files containing over 250,000 records.

The PL/I user has the option to bind I/O devices and data sets during a) program preparation, that is, a compile, application build and install, as well as, b) execution, that is, open time. Option (a) provides the user with the ability to achieve his higher performance requirements with a minimum storage penalty and minimum disk reads to find location of programs and data. Option b) allows flexibility in assigning different data sets to a file at execution time.

Data Types and Organization

Series/1 PL/I Version 2 supports arithmetic data, string data, arrays, structures and program control data. The wide variety of data types and array handling supported allow PL/I users to implement a large collection of programs such as system type applications, data base applications, manipulation of large collections of different types of data, scientific applications requiring arithmetic and floating point operation and commercial applications using PICTURE variables and formatting and decimal arithmetic. In addition the ability to organize data in a PL/I program through PL/I structures has an added benefit as a documentation aid. The different data types can be organized and structured much more easily than in other languages.

Some of the different PL/I Version 2 data types are:

- Arithmetic data can be represented in either binary or decimal radix and can be either fixed or floating-point.
- Fixed point binary word and double word precision are supported. Decimal fixed point data can have up to 15 digit positions.
- String data can be either bit or character, with fixed or varying length attributes.
- Program control data can be label, format, event, file, activation, program, lock, entry or pointer.
- PL/I data may be organized into arrays of up to 15 dimensions, or in structures (hierarchical collections of data, not necessarily of the same type).

Data Manipulation Features

Series/1 PL/I supports major PL/I operators, data types and statements. Of particular interest are:

- String operations, including substrings, concatenation, and general boolean operations.
- Full set of language built-in functions, including mathematical functions, string functions and array functions.
- Structure assignment.
- Automatic data conversion in expressions.
- Generalized subscripting.
- Full support for internal and external procedures.
- Control structures including IF--THEN, IF--THEN--ELSE, DO and DO--WHILE.

Other Series/1 PL/I Version 2 capabilities that make it suitable as a general application development tool are:

- PL/I-coded programs have the capability for entering a user-written error-handling block (entering an ON unit) when an execution error is detected. This can be for device or format errors in I/O, subscript range and string size range, as well as a wide variety of other language-defined error conditions. The ON handling facility provides PL/I users with extensive run-time error-handling facilities. As a result, users are able to checkout program errors and install their application.
- PL/I supports both the 64-character set and the restricted 48-character set.

The following features are supported in PL/I:

- Conversion of mixed data types in expressions
- Repetitive specification of data items (GET and PUT)
- General condition names (ON, REVERT, and SIGNAL)
- Storage efficiency gained by the generation of reentrant code and support for automatic storage allocation.
- Program modularity and interface checking provided by the PL/I block structure and scope rules and the ENTRY attribute.
- The following user-oriented debug aids are provided:
 - Extensive compiler error messages
 - Extensive compiler listing aids
 - SNAP on an ON statement
 - Subscript range checking at execution time
 - String range checking at execution time
 - Conversion condition checking and fix up capability of execution data
- The user is not required to write Assembler language code in order to compile or execute PL/I-coded program(s). A user may choose, of course, to write assembler code, generally as CALLable subprograms, to achieve code secrecy, faster execution speed, lower storage requirements or some non-PL/I supported function.

PL/I and PL/I-coded programs use only the data set organizations and access methods defined by the operating system.

Communications with FORTRAN, COBOL, and ASSEMBLER

Subject to certain rules, the compiler allows communication between PL/I object modules and FORTRAN, COBOL or Assembler object modules. Data may be passed as arguments and must conform to standard interface conventions. PL/I register conventions and error handling conventions must also be preserved.

PL/I RAS

IBM Series/1 PL/I Version 2 supplies compile-time error detection to analyze statement syntax and program structure errors.

The compiler provides debugging aids to decrease the time and effort required for program checkout. It permits efficient use of the language with respect to both compilation and execution. You can use options to request optional compiler facilities.

Syntax errors, errors of inconsistency, such as contradictory variable declarations, and detectable semantic errors occurring in the source program are all diagnosed and reported in a meaningful form.

IBM Series/1 PL/I Version 2 supplies comprehensive diagnostics at execution time to test for and recognize I/O and arithmetic function errors and pass control to user-defined error routines. It also provides a calling trace using ON-SNAP condition, subscript and string range checking (option).

Devices Supported

- The IBM products supported are the following:

– Processors	– 4952, 4953, 4955
– Diskette	– 4964, 4966
– Fixed Disk	– 4962, 4963
– Printer	– 4973, 4974, 5256
– CRT/Keyboard	– 4979, 4978, 5251, 5252
– Magnetic Tape	– 4969

Subsystem
– Sensor I/O – 4982

Features

- Floating Point Processor – #3920
- Storage Address Translator – #6335
- Teletypewriter Adapter – #7850
(supported for use with Teletype®
Models ASR 33/35 or equivalent device)
- Timer – #7840
- Native Attach Sensor I/O – #1560
- Binary Synchronous Communications – point
to point, switched and nonswitched
– Series/1 to System/370
– Series/1 to Series/1
- Start/Stop (asynchronous) Communications
Terminal Support
– 2740 model 1 communication terminals
– Teletype® Models ASR 33/35
or equivalent device.

®Trademark of Teletype Corporation.

All I/O devices are accessed through Realtime Programming System control program services, and all disks and diskettes supported by Versions 3 or 4 of Realtime Programming System are supported. Floating-point is required, either by hardware feature or by emulation (performance degradation may occur if emulation is used).

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

PROGRAM PRODUCTS

Realtime Programming System PL/I V2 (cont'd)**SPECIFIED OPERATING ENVIRONMENT**

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

In addition to the minimum requirement for IBM Series/1 Realtime Programming System Version 3 or 4, and Version 3 or Version 4 of the Program Preparation Subsystem, the storage requirements are:

- For compilation using Realtime Programming System Version 3 or 4 with Multiple Address Space Management: 64K system including at least a 26K partition for the compiler and 2K control module in the operating system partition.
- For compilation using Realtime Programming System Version 4 with Single Address Space Management: 64K system including at least a 28K partition for the compiler.

The minimum system required to execute a PL/I Version 2 object program in a realtime partition or batch partition is:

Processor	IBM 4952 or 4953 or 4955 Processor
Storage	48K (64K on 4952)
Disk	1 - IBM 4962 or 4963 Disk

For details on system requirements for the IBM Series/1 Realtime Programming System Version 3 or 4 and the IBM Series/1 Program Preparation Subsystem Version 3 or 4, see the respective pages.

SOFTWARE REQUIREMENTS

The following licensed programs are required if the associated PL/I language function is used:

- Sort/Merge (5719-SM1) required support for calling the Sort facility
- Indexed Access Method Programming RPQ (5799-TCB) either for Realtime Programming System Version 3 or Version 4
or
Indexed Access Method Licensed Program (5719-AM1) for Realtime Programming System Version 3 or Version 4 required support for indexed I/O.
- IBM 4978 Display Support Version 3 PRPQ (5799-TCE) for the extended features of screen support on the 4978
- IBM 5250 Information Display System Licensed Program (5719-TA1) for 5250 support
- IBM 4969 Magnetic Tape Subsystem (5719-TA4) for using magnetic tape

COMPATIBILITY

- PL/I Version 2 (5719-PL2 and 5719-PL4) is upward compatible with PL/I Version 1 (5719-PL1 and 5719-PL3) at the source program level.
- PL/I Version 2 is a compatible subset of ANS PL/I with realtime language extensions added.

DATA SECURITY

PL/I object program structure and language provide controlled addressability to user data. Data with the internal attribute, for example, is not known outside the declaration block. This facility permits users to access data in a fashion which is consistent with declared data attributes and source language scope.

In addition, the PL/I STRINGRANGE and SUBSCRIPTRANGE conditions can be used to restrict the application program from referencing data which lies beyond the declared extents and lengths of arrays and strings.

**EVENT DRIVEN EXECUTIVE
PL/I COMPILER and RESIDENT LIBRARY (5719-PL5)
PL/I TRANSIENT LIBRARY (5719-PL6)**

These products are licensed programs working under the Event Driven Executive Basic Supervisor and Emulator Versions 1.1 or 2.

PURPOSE

The IBM Series/1 Event Driven Executive PL/I is a subset of American National Standards Institute Programming Language PL/I (ANSI X3.53 1976), as understood and interpreted by IBM as of July 1979, plus additional language functions to support coding multitasking applications. The PL/I compiler permits users to use the functional capability of the operating system for commercial, scientific and interactive applications.

PL/I allows the programmer to express in a 'natural' syntax many functions of the Event Driven Executive operating system which would require CALLs in FORTRAN or require Assembler language or Event Driven Executive language usage. As a result, the user's application programs are easier to read, understand, debug, maintain and modify.

Event Driven Executive PL/I represents a significant advantage for the Series/1 high-level language user. Users can write entire applications in a high-level language that provides interactive terminal handling facilities, communications via binary synchronous or START/STOP disciplines to other processors and terminals, and indexed files for data base management. This product allows Series/1 users with little knowledge of the actual hardware or operating system to develop sophisticated applications with high programmer productivity.

PL/I programs can be used with the Event Driven Executive Multiple Terminal Manager licensed program (5719-MS1). This facility offers another alternative to allow PL/I programs to execute in an interactive environment where one or more applications can run concurrently.

Event Driven Executive PL/I consists of two licensed programs: a) compiler and resident library, and b) transient library. The resident library contains frequently used routines which are combined with the user's program through the linkage editor. As a result, performance of a user's application is significantly enhanced by eliminating loading of these functions during program execution. The transient library is required for program execution and contains less frequently used routines such as I/O transmission, error handling and conversion routines. These functions are dynamically loaded during program execution and remain in storage only as long as they are required by the program. This permits storage savings in a user's partition with minimal impact on performance.

HIGHLIGHTS

The Event Driven Executive PL/I language is extensive in function, aimed at allowing users to develop application programs that can be easily modified and maintained. Highlights include:

- Multitasking Extensions
- I/O Capability
 - Stream I/O
 - Record I/O
 - Communication Support
 - Indexed Access Method Support
 - Full Screen Support
 - Magnetic Tape Subsystem
- Data Types and Organization
- Data Manipulation Features
- Extensive Coverage of ANSI PL/I
- Code Optimization
- Language (realtime) Extensions

DESCRIPTION

Multitasking Extensions

One of the key features of Series/1 PL/I is the capability of allowing the user to develop a complete multitasking application without the need to know Assembler language. The requirement has been expressed by the user for a language that offers multitasking facilities as part of its syntax; that is, not through subroutine calls. To achieve this goal a set of PL/I multitasking language extensions is provided which allows starting of asynchronous tasks and programs, and synchronization of their execution. Event handling and resource control statements allow you to easily code applications that invoke response to events and resolution of resource contention. The following contains an explanation of these extensions.

- Multitasking Services

The statements associated with multitasking and their functions are:

- | | |
|------|--|
| RUN | Invokes a task or program |
| STOP | Causes termination of the issuing task |

The PL/I programmer is able to terminate a program or task when control for the task reaches a RETURN or END statement for the procedure invoked as a TASK or when control for any task reaches a STOP statement.

In addition, the CALL statement may be used to access subroutines written in Event Driven Language instructions.

- Resource Management

The language is extended to allow the user to control serially reusable resources and request/release resources for task synchronization by the introduction of a LOCK variable. This provides users with a deadlock avoidance facility and permits effective utilization of the system resources. In a multitasking environment several tasks may want to update a file simultaneously. With this facility a user may ensure that only one task could be executed at a time to ensure proper file update.

The statements associated with these functions are:

- | | |
|--------|-------------------------|
| LOCK | Request a LOCK variable |
| UNLOCK | Release a LOCK variable |

- Event Facilities

The PL/I programmer may define events and start/resume execution of a particular task upon the occurrence of an event. Facilities are provided for the synchronization of task execution through WAIT/POST facilities. Thus, event handling facilities provide some predefined relationship between PL/I tasks running asynchronously.

Events that are supported are I/O completion, task completion and user-defined. The user is able to suspend a task until an event occurs.

- Reentrant Programs

All programs produced by the compiler are reentrant. This allows common code to be shared among multiple tasks.

- Built-in Functions

The multitasking built-in functions are used during multitasking and during asynchronous I/O operations. They allow the user to investigate the current state of execution of a task or asynchronous I/O operation. The function names and definitions are:

- | | |
|------------|---|
| COMPLETION | Returns the completion value of a given event. The event can be associated with completion of a task or completion of an I/O operation. |
| STATUS | Returns the status value of a given event. |
| PRIORITY | Returns the priority of a task. |

I/O Capability

The Event Driven Executive Data Management provides the I/O services used by PL/I. The PL/I user has facilities to access standard Series/1 I/O devices through PL/I files. The file types supported include SEQUENTIAL and DIRECT files. Data files may exist on three types of magnetic media:

1. Fixed disk
2. Removable diskette
3. Magnetic tape (available with Event Driven Executive Version 2)

Series/1 PL/I includes both stream and record I/O capabilities. Stream I/O statements read and write data with a minimum programming effort, because automatic formatting and conversion are provided. The following specific options are available:

- List-directed I/O. This facility allows users to input and output data with automatic formatting and conversion.
- Edit-directed I/O. A full range of format items, including picture formats and control formats, allows users to generate complex reports with a minimum of programming effort.
- Stream I/O is to printers and terminals only.

Record I/O statements allow users to have more control over I/O. The following options are available:

- Consecutive I/O. This facility is available through the use of the READ, WRITE, and REWRITE statements. Often users can improve execution-time performance by using the EVENT options for asynchronous I/O.
- Regional I/O. This facility is available through the use of READ, WRITE, DELETE and REWRITE statements with the option of specifying the relative record number using the key option. Asynchronous direct I/O is also permitted.

EDX PL/I (cont'd)

- Blocking of Consecutive and Regional files is supported.
- Record I/O is to disk(ette) and tape only with the exception of Record I/O full screen support.
- Communications I/O. Communications under PL/I provide the capability to communicate with binary synchronous and Start/Stop devices through the Event Driven Executive communications interfaces. Communications support is a subset of RECORD I/O with no new language, only new ENVIRONMENT options. This facility is provided through a direct PL/I interface to the operating system/subsystem function.

These communication functions allow greater flexibility in developing terminal applications in PL/I and will permit:

- Communications between multiple Series/1s
- Series/1 to System/370
- Use of PL/I programs in other Binary Synchronous and Start/Stop environments

- Indexed Access Method I/O. The PL/I compiler supports INDEXED files in addition to CONSECUTIVE and REGIONAL files. This support includes file environment options to describe the length and location of character keys within the data records. Record types are fixed format, blocked or unblocked. Use of this support requires the Indexed Access Method licensed program (5719-AM3).

Full Screen Support

Full Screen Support is provided through RECORD I/O and STREAM I/O where the user can access the 4978 and 4979 Display Terminals. Access is controlled through the use of ENVIRONMENT options on a FILE declaration statement.

- Record I/O

This support significantly extends application control of these devices by permitting REGIONAL data sets to be directed to the display. With this capability, users can deal with the whole screen, control coordinate (X,Y) positions, write-protect selected fields on the screen, and scatter write. The program can also deal with program function keys using PL/I EVENT variables.

- Stream I/O

In stream I/O, an INTERACTIVE mode is now provided to simplify writing a prompt message to the display and reading the responses. In this mode, GET and PUT statements may be directed to a single open stream file, eliminating the requirement for two separate files - one for input and one for output. Automatic buffer purging is provided when a GET statement follows a PUT to the same file so the output data is written to the display before the read request is sent to the device.

Magnetic Tape Subsystem Support

The PL/I programmer can sequentially access data stored on the Magnetic Tape Subsystem using the Series/1 4969 Magnetic Tape support available with the Event Driven Executive Version 2 (5719-XS2).

Data Types and Organization

Series/1 PL/I supports arithmetic data, string data, arrays, structures and program control data. The wide variety of data types and array handling supported allows PL/I users to implement a large collection of programs such as system functions, data base applications, manipulation of large collections of different data types, scientific applications requiring arithmetic and floating-point operation, and commercial applications using PICTURE variables and formatting and decimal arithmetic. In addition, the ability to organize data in a PL/I program through PL/I structures has an added benefit as a documentation aid. The different data types can be organized and structured much more easily than in most other languages.

Some of the different PL/I data types are:

- Arithmetic data can be represented in either binary or decimal radix and can be either fixed or floating point.
- Fixed point binary word and double word precision are supported. Decimal fixed point data can have up to 15 digit positions.
- String data can be either bit or character, with fixed or varying length attributes.
- Program control data can be label, format, event, file, entry, activation, program, lock or pointer.
- PL/I data may be organized into arrays of up to 15 dimensions, or in structures (hierarchical collections of data, not necessarily of the same type).

Data Manipulation Features

Series/1 PL/I supports major PL/I operators, data types, and statements. Of particular interest are:

- String operations, including substrings, concatenation, and general boolean operations.

- A set of language built-in functions, including mathematical functions, string functions and array functions.
- Structure assignment.
- Automatic data conversion in expressions.
- Generalized subscripting.
- Control structures including IF-THEN, IF-THEN-ELSE, DO, and DO-WHILE.

Other Series/1 PL/I capabilities that make it suitable as a general application development tool are:

- PL/I-coded programs have the capability for entering a user-written error-handling block (entering an ON unit) when an execution error is detected. This can be for device or format errors in I/O, subscript range and string size range as well as a wide variety of other language-defined error conditions. The ON handling facility provides PL/I users with extensive run time error-handling facilities. As a result, users are able easily to check out program errors and install their application.
- PL/I supports both the 64-character set and the restricted 48-character set.
- The following features are supported:
 - Conversion of mixed data types in expressions
 - Repetitive specification of data items (GET and PUT)
 - General condition names (ON, REVERT, and SIGNAL)
- Storage efficiency gained by the generation of reentrant code and support for automatic storage allocation.
- Program modularity and interface checking provided by the PL/I block structure and scope rules and the ENTRY attribute.
- The following user-oriented debug aids are provided:
 - Extensive compiler error messages
 - Extensive compiler listing aids
 - Snap option on an ON-statement
 - Subscript range checking at execution time
 - String range checking at execution time
 - Conversion condition checking and fix up capability of execution data
- The user is not required to write Assembler language code in order to compile or execute PL/I-coded program(s). A user may choose, of course, to write Assembler code, generally as CALL'able subprograms, to achieve code secrecy, faster execution speed, lower storage requirements or some non-PL/I supported function.
- Extensive coverage of ANSI PL/I

Additional features of ANSI PL/I supported in Series/1 Event Driven Executive PL/I are:

The additional data attributes being provided are:

- PICTURE
- DEFINED and POSITION
- AUTOMATIC with INITIAL
- FILE VARIABLE
- PROGRAM VARIABLE
- ENTRY VARIABLE

These useful features, which are also common in PL/I products available on larger IBM systems, are required in most commercial applications. The inclusion of these facilities also provides easier conversion of some existing PL/I programs from larger IBM data processing systems to Series/1.

Allocate/Free Statements

A new function is added to the compiler to allow the PL/I programmer to dynamically control the allocation and freeing of storage during execution. The statements supported are:

ALLOCATE

FREE

In the event that insufficient storage is available to fill a request for allocation, the STORAGE condition is raised and the program may decide how to proceed, as with other PL/I error conditions.

Built-in Functions (BIFs)

The built-in functions expand the productivity of the PL/I programmer in handling arithmetic, string and array data.

- Arithmetic BIFs (built-in functions)

ADD	FLOOR	ROUND
ATANH	MAX	SINH
CEIL	MIN	SUBTRACT

PROGRAM PRODUCTS

EDX PL/I (cont'd)

	COSH DIVIDE	MOD MULTIPLE	TANH TRUNC
-	String BIFs		
	VERIFY TRANSLATE VALID		
-	Array BIF		
	SUM		
-	I/O BIF		
	PAGENO		

Pointer Qualification

The explicit pointer qualification operator is available. This extension facilitates list processing applications.

Code Optimization

The PL/I compiler analyzes program logic and then eliminates many unnecessary instructions. This results in saving execution time and storage space. Code optimization provided includes:

- Improved register allocation
- Anchor pointing in compound IFs
- Use of byte immediate instructions in place of word immediate instructions
- Use of storage-to-storage operations
- Use of MVWS instruction where offsets and registers permit
- Use of Jump instruction for short Branch instructions
- Library call code improvements

PL/I Sort Capability

Sort/Merge functions available on the Series/1 Sort/Merge Licensed Program (5719-SM2) are now supported via the CALL PLISRT interface.

Support for Event Driven Executive operating system services

Although PL/I supplies extensive coverage of operating system services through PL/I language, certain applications may require additional system services. The CALL statement may be used to access system services unique to a user's application by calling a user subroutine written in EDL.

PL/I RAS

Series/1 PL/I supplies compile-time error detection to analyze syntax of statements and program structure errors.

The compiler provides debugging aids to decrease the time and effort required for program checkout. It permits efficient use of the language with respect to both compilation and execution.

Syntax errors, errors of inconsistency, such as contradictory variable declarations, and detectable semantic errors occurring in the source program are all diagnosed and reported in a meaningful form.

Series/1 PL/I supplies comprehensive diagnostics at execution time such as I/O and arithmetic function errors and passes control to user-defined error routines. It also provides a calling trace using ON-SNAP feature, subscript and string range checking (option).

Communications with Other Languages

Subject to certain rules, the compiler allows communication between PL/I object modules and FORTRAN, COBOL, Macro Assembler, or Event Driven Executive Language programs. Data may be passed as arguments and must conform to standard interface conventions. PL/I register conventions and error handling conventions must be preserved.

All I/O devices are accessed through the Event Driven Executive control program services.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

In addition to the minimum requirement for the IBM Series/1 Event Driven Executive Basic Supervisor and Emulator Versions 1.1 or 2, the storage requirements are:

- For compilation using Event Driven Executive Versions 1.1 or 2: minimum system for native program preparation plus at least 28K of storage for the compiler.

The minimum system required to execute an Event Driven Executive PL/I object program is:

Processor IBM 4952 or 4953 or 4955 Processor

Storage	64K
Disk	1 - IBM 4962 or 4963 Disk
Diskette	IBM 4964, 4966
Printer	IBM 4973, 4974
Keyboard/CRT	IBM 4979, 4978
Magnetic Tape Subsystem	IBM 4969

Teletypewriter Adapter #7850 supported for use with Teletype® Models ASR 33/35 or equivalent device

Features

- Floating-Point feature - #3920 (4955 only)
- Storage Address Translator - #6335 (4955 B only)
- Timer - #7840
- Binary Synchronous Communication - Series/1 remote communication to Series/1 or System/370 via point-to-point (switched or nonswitched) binary synchronous line
- Asynchronous Communication (Start/Stop) Series/1 remote connection to 2741 or Teletypewriter Adapter #7850 via point-to-point (nonswitched) start/stop line

SOFTWARE REQUIREMENTS

Licensed programs required for:

Compilation

- IBM Series/1 Event Driven Executive Basic Supervisor and Emulator Version 1.1 (5719-XS1) or Version 2 (5719-XS2)
- IBM Series/1 Event Driven Executive PL/I Compiler and Resident Library (5719-PL5)
- IBM Series/1 Event Driven Executive Utilities Version 1.1 or 2 (5719-UT3 or 5719-UT4)

Program Preparation

- IBM Series/1 Event Driven Executive Basic Supervisor and Emulator Version 1.1 (5719-XS1) or Version 2 (5719-XS2)
- IBM Series/1 Event Driven Executive Program Preparation Facility (5719-XX2) or Event Driven Executive Macro Assembler (5719-ASA)
- IBM Series/1 Event Driven Executive PL/I Compiler and Resident Library (5719-PL5)
- IBM Series/1 Event Driven Executive Utilities (5719-UT3 or 5719-UT4)

Program Execution

- IBM Series/1 Event Driven Executive Basic Supervisor and Emulator Version 1.1 (5719-XS1) or Version 2 (5719-XS2)
- IBM Series/1 Event Driven Executive PL/I Transient Library (5719-PL6)
- IBM Series/1 Event Driven Executive Utilities Version 1.1 or 2 (5719-UT3 or 5719-UT4)

Additional Licensed Programs

The following licensed programs are required if the associated functions are used:

- Sort/Merge (5719-SM2)
Required support for CALL PLISRT
- Indexed Access Method (5719-AM3)
Required support for indexed I/O
- IBM 4969 Magnetic Tape Subsystem for using tape available with Event Driven Executive Version 2 (5719-XS2)
- IBM Series/1 Event Driven Executive Multiple Terminal Manager (5719-SM1)
Optional Support for terminal I/O and screen support handling

COMPATIBILITY

- Event Driven Executive PL/I (5719-PL5 and 5719-PL6) is a compatible subset of PL/I Version 2 (5719-PL2 and 5719-PL4) running on the Realtime Programming System at the source program level.
- Event Driven Executive PL/I is a compatible subset of ANSI PL/I if the Series/1 realtime extension features are not used.

PROGRAM PRODUCTS

**SERIES/1 EVENT DRIVEN EXECUTIVE
ADVANCED REMOTE JOB ENTRY
VERSION 1 (5719-RJ1)**

PURPOSE

The Series/1 Event Driven Executive Advanced Remote Job Entry (ARJE) licensed program provides remote job entry workstation support for the Series/1 user with RJE support in an SNA network or BSC environment.

HIGHLIGHTS

- **MRJE:** Multi-leaving Remote Job Entry support for Binary Synchronous Communications (BSC).
- **SNA RJE:** Multiple Logical Unit Systems Network Architecture (SNA) support for Synchronous Data Link Control (SDLC).
- **Unattended Operation:** ARJE allows unattended operation by having ARJE commands on disk/diskette, and support for dynamic punch file allocation and delayed activation.
- **Full Function RJE:** In addition to standard RJE capabilities, ARJE has console support with status reporting and journaling, data decompression, and printer form support.
- **ARJE Commands:** ARJE commands have been designed for ease-of-use, and are identical for MRJE or SNA RJE operation.
- **Host Remote Job Entry Subsystems:** ARJE supports the following:

BSC	SDLC
OS/VS2 JES2	OS/VS2 JES2
OS/VS2 JES3	OS/VS2 JES3
VM/370 RSCS	DOS/VSE VSE POWER

DESCRIPTION

The Series/1 Advanced RJE program supports both BSC and SNA/SDLC host connections, allowing the Series/1 installation to conform to the protocol required by the host system. The desired line protocol is selected when the Series/1 program is installed. User RJE commands are independent of line protocol.

The BSC option provides a multi-leaving RJE (MRJE) workstation over a point-to-point (switched or nonswitched) connection, appearing to the host as an IBM System/3 with console support.

The SDLC option provides an SNA RJE workstation over a point-to-point (switched or nonswitched) or multipoint connection. The Series/1 appears to the host as a PU-T2 with up to four LU type 1's.

The user can also place advanced RJE commands in a direct access data set, and the program will read these commands as if they were entered from a display terminal. If desired, the Series/1 program can be activated in a wait state, to begin execution when called by the host system.

The Advanced RJE program allows the Series/1 user to query the host system as to the status of previously submitted jobs. Standard inquiry commands are supported. Facilities are also provided to record the RJE console activity on a Series/1 data set for subsequent printing.

Output from a host can be printed directly or spooled to direct access data sets for later printing or other processing. Punched output received from the host is always placed in a dynamically allocated data set.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM Series/1 Event Driven Executive Advanced Remote Job Entry licensed program requires the following hardware for execution:

- **Processor**
 - IBM 4952, 4954, 4955 or 4956.
- **Storage (BSC Environment)**
 - 96K bytes minimum. This includes 30K for ARJE and 5.5K (in any partition) for the &DISKUT3 utility. The \$DISKUT3 utility is loaded when required for data management functions (Open, Seteod, Allocate, etc.) and unloaded when the function is complete.
- **Storage (SNA Environment)**
 - 128K bytes minimum. This includes 30K for ARJE, 5.5K (in any partition) for \$DISKUT3, and a minimum of 32K for the EDX SNA program. The \$DISKUT3 utility is loaded when required for data management functions (Open, Seteod, Allocate, etc.) and unloaded when the function is complete.
- **Disk/Diskette** - One each disk and diskette drive supported by EDX using the EDL READ/WRITE Instructions.
- **Printer** - Any printer supported by EDX using the EDL PRINTTEXT instruction.

- **System Console** - Any EDX-supported interactive terminal that allows use of the EDL READTEXT/WRITE/PRINTTEXT instructions, supports an attention key, and allows program loading (\$L command).
- **Communications** - One of the following communications adapters:
 - #1310 - Multi-function Attachment (BSC mode)
 - #2074 - BSC Single-Line Control
 - #2075 - BSC Single-Line Control
 - #2080 - X.21 Adapter (BSC/SDLC mode) under V.35 Interface
 - #2093/2094 - BSC 8-Line Control and 4-Line Adapter
 - #2090 - Synchronous Data Link Control - Single-Line Control

SOFTWARE REQUIREMENTS

The following IBM licensed programs are prerequisites for the execution of the IBM Event Driven Executive Advanced Remote Job Entry licensed program (5719-RJ1):

- IBM Series/1 Event Driven Executive Basic Supervisor and Emulator licensed program Version 3 (5719-XS3) or Version 4 (5719-XS4).
- IBM Series/1 Event Driven Executive Utilities licensed program Version 3 (5719-UT5) or Version 4 (5719-UT6).
- IBM Series/1 Event Driven Executive Systems Network Architecture licensed program (5719-SX1) for SNA operation.

PROGRAM PRODUCTS

**IBM SERIES/1 REALTIME PROGRAMMING SYSTEM
ADVANCED REMOTE JOB ENTRY
5719-RJ6**

DESCRIPTION

The IBM Series/1 Realtime Programming System Advanced Remote Job Entry (ARJE) Licensed Program executes as an application program on the Realtime Programming System (RPS). The ARJE Licensed Program supports the use of an IBM Series/1 as a remote job entry workstation using either Systems Network Architecture (SNA) or Multileaving Binary Synchronous Communications (BSC).

Advanced Remote Job Entry supports:

- **MRJE**
Multileaving Remote Job Entry (MRJE) support for Binary Synchronous Communications (BSC).
- **SNA RJE**
Multiple Logical Unit Systems Network Architecture (SNA) support for Synchronous Data Link Control (SDLC).
- **Unattended Operation**
ARJE allows unattended operation by having ARJE commands on disk/diskette, and support for dynamic punch file allocation, and auto answer.
- **Full Function RJE**
In addition to standard RJE capabilities, ARJE has full function console support with status reporting and journaling, data decompression, and printer form support.
- **ARJE Commands**
ARJE commands have been designed for ease of use and are identical for MRJE or SNA RJE operation.
- **Host Remote Job Entry Subsystems**
ARJE supports the following:

BSC	SDLC
OS/VS2 JES2	OS/VS2 JES2
OS/VS2 JES3	OS/VS2 JES3
VM/370 RSCS	DOS/VSE VSE/POWER

HIGHLIGHTS

The ARJE licensed program is an application program loaded by the terminal operator or another RPS application program. The purpose of the program is to provide the RPS user with the ability to participate in an SNA network or BSC environment as an RJE workstation. It will allow the user who has created a job stream via RPS edit facilities to transmit that job stream to a host job entry subsystem for processing. Upon completion, the output from the job stream(s) will normally be sent back to the workstation for punching (routed to an RPS data set) and/or printing.

- **MRJE**
The Binary Synchronous Support for point-to-point (switched or nonswitched) communication is with the ARJE Multileaving Remote Job Entry (MRJE) option. Multileaving is a term which describes a computer-to-computer communications technique developed for use by the HASP system. It has since been implemented by other IBM RJE programming systems. It permits the intermixing of input and output data streams on the communication lines. It is fully synchronized, two directional transmission of a variable number of data streams between the Series/1 and a host system. The Series/1 appears as a System/3 with console support to the host job entry subsystems.
- **SNA RJE**
The Systems Network Architecture (SNA) RJE option of ARJE supports (switched or nonswitched) point-to-point or multipoint Synchronous Data Link Control protocol. The Series/1 ARJE has Multiple Logical Unit support under a single workstation providing up to four LU to LU sessions. ARJE uses Logical Unit Type 1 protocols for session communication with the host job entry subsystems.
- **Unattended Operation**
Three ARJE capabilities, i.e., ARJE commands in a disk/diskette data set, dynamic punch file allocation, and auto answer, enable the workstation to operate without the user being physically present.
The ARJE user can place ARJE commands in a disk/diskette data set in addition to entering them at his workstation display terminal. These ARJE commands will be read in and processed just as if they were entered at the display.
The user can also activate ARJE in a "wait" state (auto answer), to establish the connection with the host job entry subsystem when a call is received from the host. Thus, Series/1 site personnel can perform other functions while ARJE is executing.
The punched output received by ARJE is always placed in a Realtime Programming System disk/diskette data set. This data set is allocated by ARJE (dynamic allocation).

- **Full Function RJE**

The workstation console function gives the user the ability to query the host system as to the status of a submitted job and/or query the host for any other normally allowed information (i.e., system status etc.). Facilities are also provided to allow a user to record ARJE console activity to an RPS data set for subsequent printing (called journaling).

The print output received by ARJE may be either printed directly on an available physical printer or, through the use of the RPS spool function, placed in a disk/diskette spool data set for printing at a later time. The use of the spool facility to store output on a diskette allows the user to transport that data to another RPS Series/1 for printing. Facilities exist in the RPS spool function to allow the user to control the printing of specific jobs from the spool processor output queue. ARJE supports 3211/3203-4 Forms Control Blocks for printed data. The FCB parameters are: Lines per inch, form end (page length), and page line to channel assignments (i.e., for each "select vertical channel" command received from the host, ARJE will skip to a specific line on the current printer page). A utility will be provided with ARJE to allow the user to define FCBs corresponding to the FCB/forms requests that may be sent by the host.

- **ARJE Commands**

The ARJE commands are single line commands with parameters that can be specified by the user. These commands are summarized below:

- Help -- Print a list of the commands
- Readfile -- Identify a command/data file to be processed
- Printer -- Alter current ARJE printer assignment
- Punch -- Modify punch specifications
- Library -- Change library environment
- Attend -- Change operational mode (attended/unattended)
- Status -- Report current ARJE status
- Journal -- Turn on/off journal activity
- Operator -- Transmit host operator command

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The Series/1 Realtime Programming System Advanced Remote Job Entry requires the following hardware for installation:

- A Series/1 4954 or 4955 processor.
- One of the following disk/diskette devices:
 - 4962 Disk Storage Unit (all models).
 - 4963 Disk Storage Unit (all models).
 - 4964 Diskette Storage Unit.
 - 4965 Diskette and I/O Expansion Unit.
 - 4966 Diskette Magazine Unit.
- One of the following interactive devices:
 - 4978 Display Station.
 - 4979 Display Station.
 - 3101 Display Terminal Model 1 or 2 or Typewriter Models ASR33/ASR35 or equivalent teletypewriter device attached by any of the following:
 - #7850 Teletypewriter Adapter (3101 or ASR33/35 or equivalent).
 - #2095/ #2096 Feature- Programmable Adapter D02350 (3101 only)
 - #1610 Asynchronous Single Line Adapter (3101 only).
 - #2091/ #2092 Asynchronous Multi-line Adapter (3101 only).
- One of the following adapters:
 - #1310 Multi-function Attachment (BSC mode).

PROGRAM PRODUCTS

Series/1 Advanced Remote Job Entry (cont'd)

- #2074 Binary Synchronous Communications Single Line Control.
- #2075 Binary Synchronous Communications Single Line Control.
- #2080 X.21 Adapter (BSC/SDLC mode) under V.35 Interface.
- #2093 Binary Synchronous Communications 8-Line Control
- #2094 Binary Synchronous Communications 4-Line Adapter
- #2090 Synchronous Data Link Control - Single Line Control

- Optionally, one of the following:

- 4973 Line Printer.
- 4974 Matrix Printer.
- 4975 Matrix Printer (via #1310 MFA).

SOFTWARE REQUIREMENTS

The following IBM licensed programs or functionally equivalent programs are prerequisites for the installation of the IBM Series/1 Realtime Programming System Advanced Remote Job Entry Licensed Program (5719-RJ6):

- IBM Series/1 Realtime Programming System Version 5 (5719-PC5).

For SNA RJE option only of ARJE:

- IBM Series/1 Realtime Programming System Systems Extended Network Architecture Support Licensed Program (5719-SN1).

The Series/1 Realtime Programming System Advanced Remote Job Entry Licensed Program requires an additional 26K bytes of storage.

PROGRAMMING RPQs

PRPQs will be accepted. Response time will depend upon complexity.

PROGRAM PRODUCTS

**SERIES/1 EVENT DRIVEN EXECUTIVE
REMOTE MANAGER
5719-RM1**

PURPOSE

The Series/1 Event Driven Executive Remote Manager enables the Series/1 to participate in the Communications Network Management (CNM) environment. The Remote Manager will interface to existing host IBM CNM programs to provide the Series/1 with central network management.

HIGHLIGHTS

The Remote Manager allows Series/1 networks to be managed and operated through the communication network management programs available on IBM host processors (S/370, 30XX, and 43XX). Effective network management is made possible with the Network Communications Control Facility (NCCF) licensed program and related communications network management (CNM) programs.

The Remote Manager is designed to communicate with the following host CNM programs:

- Network Communications Control Facility (NCCF)
- Network Problem Determination Application (NPDA)
- Host Command Facility (HCF)
- Distributed Systems Executive (DSX)

There are three major functions which are provided by the Remote Manager:

1. Host Operator Facility allows a host 3270 terminal operator to act as a local Series/1 operator. The host operator can issue commands, invoke system utilities, and run application programs. The host operator can communicate with any Event Driven Executive program which communicates with a local Series/1 terminal (4979) in line-by-line mode.

The host 3270 terminal operator, using the HCF licensed program and the Remote Manager, is able to:

- Display system status, examine error logs, run utilities, start and stop applications in an effort to effect problem determination.
 - Act as the console operator on an unattended Series/1.
2. Relay and Node Data Services: The facility to transmit data between a Series/1 and the host using the Distributed Systems Executive (DSX) as the transmission vehicle and the resource management and tracking vehicle. It is the direction of the Distributed Systems Executive (DSX) licensed program to support this facility in a subsequent release or version.
 3. Alert Processing: The facility to route Series/1 hardware and software error indications to the host to alert network operators of real or potential problems with Series/1 network operation. It is the direction of the Network Problem Determination Application (NPDA) licensed program to support this facility in the next available version or release.

DESCRIPTION

The IBM Series/1 Remote Manager will allow a Series/1 to be centrally managed and operated by host communication network management functions for IBM's System Network Architecture (SNA) with Advanced Communication Function.

Briefly these products are:

- Network Communications Control Facility (NCCF) is a licensed program designed to let you control, record, and automate various operator tasks. NCCF is the program base for many CNM functions. It is a VTAM or TCAM application program in OS/VS1, OS/VS2 (MVS), and VSE.
- Network Problem Determination Application (NPDA) is a licensed program that executes in conjunction with NCCF. NPDA allows an NCCF operator to display Series/1 network problem determination data.
- Host Command Facility (HCF) is a licensed program that allows an NCCF operator access to Series/1 console functions.
- Distributed Systems Executive (DSX) is a licensed program that provides Central Library Facilities for distributed library maintenance, software maintenance, and user data transfer with the Series/1.

The Remote Manager exchanges data and information with the host CNM products via SNA sessions.

There are three major functions which are provided by the Remote Manager:

ALERTS: The Remote Manager Alert function provides the Series/1 with the ability to notify a remote S/370, 30XX, or 43XX host of conditions detected by the Series/1. When the Series/1 detects certain hardware or software conditions, the system will send an alert message to the host system.

The Remote Manager permits a Series/1 to send alert messages for permanent errors recorded in the Series/1 system error log to the host.

The Series/1 error log records that generate alert records are: Device, and user program-determined errors.

Remote Manager provides support for Series/1 user-created alert records. The user must build a Series/1 error log record and send it to the Remote Manager.

User action codes have been allocated to Series/1 user-defined alert records.

HOST OPERATOR FACILITY: The Host Command Facility (HCF) licensed program and the Remote Manager Host Operator Facility function permit a host terminal to function as though it were directly connected to a Series/1 system. Maintenance, service, and control functions of a Series/1 system become available at the host control site for problem determination, problem isolation, and remote system control. Functions provided include the following:

- Central control and operation of a Series/1 system selected by the authorized host network operator:
 - Access to functions available through the Series/1 system console commands.
 - Initiation and termination of tasks at Series/1 system.
 - Dynamic reconfiguration control at the remote Series/1 system, e.g., activation and deactivation of hardware and programming components to adapt the Series/1 system to different optional environments or maintenance conditions.
 - Access to all nonphysical control facilities at the Series/1 system.
- Central access to Series/1 system data sets, including error log dumps, and system operator's log.
- Central problem determination and isolation.
 - Interactive examination of system error log summary and archive information
 - Invocation of the Series/1 system debug facility, as well as other test programs
 - Initiation and examination of dumps and traces
- Central program development using the Series/1 system debug facilities.

RELAY AND NODE DATA SERVICES: Remote Manager allows user and system data sets and programs to flow between a host system and a Series/1 in either direction. Thus new or changed data or programs may be sent to a Series/1 in a controlled way. Data or programs may be retrieved from a development or production Series/1. Data which originates at the host, or is destined to be processed at the host, may also be transmitted.

The Remote Manager provides the following capabilities:

1. Add or replace data sets or members
2. Delete data sets or members
3. Initiate procedures sent from the host
4. Inform operator of messages from host

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM Series/1 Event Driven Executive Remote Manager licensed program requires 32K bytes of processor storage over and above the requirements to support its appropriate Event Driven Executive environment.

The minimum storage requirements for Remote Manager execution is an IBM 256K Series/1 processor.

SOFTWARE REQUIREMENTS

The following IBM licensed programs are prerequisites for the execution of the IBM Series/1 Event Driven Executive Remote Manager (5719-RM6):

- IBM Series/1 Event Driven Executive Basic Supervisor and Emulator licensed program Version 4 (5719-XS4).
- IBM Series/1 Event Driven Executive Utilities licensed program Version 4 (5719-UT6).
- IBM Series/1 Event Driven Executive Systems Network Architecture licensed program (5719-SX1).

The following IBM licensed programs are required for Remote Manager communication to an SNA host:

Do not reproduce without written permission

PP 5719-RM1.2
May 83

PROGRAM PRODUCTS

Series/1 EDX Remote Manager (cont'd)

- A subsequent release or version of the Distributed Systems Executive (5668-986). The support will be specified in subsequent DSX documentation.
- Host Command Facility Version 2 (5668-985).
- Network Communications Control Facility Release 2 (5735-XX6) and the next available version or release of the Network Problem Determination Application.

PROGRAM PRODUCTS

**SERIES/1 REALTIME PROGRAMMING SYSTEM REMOTE
MANAGER
5719-RM6**

PURPOSE

The Series/1 Remote Manager enables the Series/1 to participate in the Communications Network Management (CNM) environment. The Remote Manager will interface to existing host IBM CNM programs to provide the Series/1 with central network management functions.

HIGHLIGHTS

The Remote Manager allows Series/1 networks to be managed and operated through the communication network management programs available on IBM host processors (S/370, 30XX, and 43XX). Effective network management is made possible with the Network Communications Control Facility (NCCF) licensed program and related communications network management (CNM) programs.

The Remote Manager is designed to communicate with the following host CNM programs:

- Network Communications Control Facility (NCCF)
- Network Problem Determination Application (NPDA)
- Host Command Facility (HCF)
- Distributed Systems Executive (DSX)

There are three components of the Remote Manager:

1. Host Operator Facility allows a host 3270 terminal operator to act as a local Series/1 operator. The host operator can issue commands, invoke system utilities, and run application programs. The host operator can communicate with any Realtime Programming System program which communicates with a local Series/1 terminal (4979) in line-by-line mode.

The host 3270 terminal operator, using the HCF licensed program and the Remote Manager is able to:

- Display system status, examine error logs, run utilities, start and stop applications in an effort to effect problem determination.
 - Act as the console operator on an unattended Series/1.
2. Relay and Node Data Services: The facility to transmit data between a Series/1 and the host using the Distributed Systems Executive (DSX) as the transmission vehicle and the resource management and tracking vehicle.
 3. Alert Processing: The facility to route Series/1 hardware and software error indications to the host to alert network operators of real or potential problems with Series/1 network operation.

DESCRIPTION

The IBM Series/1 Remote Manager will allow Series/1 networks to be centrally managed and operated by host communication network management functions for IBM's System Network Architecture (SNA) with Advanced Communication Function.

Briefly these products are:

- Network Communications Control Facility (NCCF) is a licensed program designed to let you control, record, and automate various operator tasks. NCCF is the program base for many CNM functions. It is a VTAM or TCAM application program in OS/VS1, OS/VS2 (MVS), and VSE.
- Network Problem Determination Application (NPDA) is a licensed program that executes in conjunction with NCCF. NPDA allows an NCCF operator to display Series/1 network problem determination data.
- Host Command Facility (HCF) is a licensed program that allows an NCCF operator access to Series/1 console functions.
- Distributed Systems Executive (DSX) is a licensed program that provides Central Library Facilities for distributed library maintenance, software maintenance, and user data transfer with the Series/1.

The Remote Manager exchanges data and information with the host CNM programs via SNA sessions. The Series/1 might be a single Series/1 processor or a member of a Series/1 network.

The following definitions are used in describing Remote Manager functions in a Series/1 network.

- An independent network contains two or more Series/1 processors (nodes) linked together via the Series/1 Realtime Programming System Communications Manager licensed program. An independent Series/1 network is a non-SNA network. To participate in communication network management, the independent network must have a connection point as one of its nodes.
- A connection point is a Series/1 processor in an independent network (or a single Series/1) which is connected to an IBM host system by an SDLC link. It serves as a relay for transmissions

between the host and the downstream Series/1 processors in the independent networks.

- Downstream Series/1 processors are not connection points but nodes in the independent network.
- Communications Manager is a requirement for Remote Manager Communication with downstream nodes. Remote Manager executes as a Communications Manager application program in downstream nodes to send alerts or send and receive data for the Host Operator Facility and Relay and Node Data Service functions.

There are three major functions which are provided by the Remote Manager:

ALERTS: The Remote Manager Alert function provides the Series/1 with the ability to notify a remote S/370, 30XX, or 43XX host of conditions detected by the Series/1. When the Series/1 detects certain hardware or software conditions, the system will send an alert message to the host system.

The Remote Manager permits a Series/1 to send alert messages for permanent errors recorded in the Series/1 system error log to the host.

The Series/1 error log records that generate alert records are: Device, and user-program-determined errors.

Remote Manager provides support for Series/1 user-created alert records. The user must build a Series/1 error log record and send it to the Remote Manager.

User action codes have been allocated to Series/1 user-defined alert records.

HOST OPERATOR FACILITY: The Host Command Facility (HCF) licensed program and the Remote Manager Host Operator Facility function permit a host terminal to function as though it were directly connected to a Series/1 system. Maintenance, service, and control functions of a Series/1 system become available at the host control site for problem determination, problem isolation, and remote system control. The Series/1 can be a connection point Series/1 or a downstream node in an independent Series/1 network. Functions provided include the following:

- Central control and operation of a Series/1 system selected by the authorized host network operator:
 - Access to functions available through the Series/1 system console commands.
 - Initiation and termination of tasks at Series/1 system.
 - Dynamic reconfiguration control at the remote Series/1 system, e.g., activation and deactivation of hardware and programming components to adapt the Series/1 system to different optional environments or maintenance conditions.
 - Access to all nonphysical control facilities at the Series/1 system.
- Central access to Series/1 system data sets, including error log dumps, and system operators log.
- Central problem determination and isolation.
 - Interactive examination of system error log summary and archive information.
 - Invocation of the Series/1 system debug facility, as well as other test programs.
 - Initiation and examination of dumps and traces.
- Central program development using the Series/1 system debug facilities.

The Series/1 can be a connection point Series/1 or a downstream node in an independent Series/1 network.

RELAY AND NODE DATA SERVICES: Remote Manager allows user and system data sets and programs to flow between a host system and a Series/1 in either direction. Thus, new or changed data or programs may be sent to a Series/1 in a controlled way. Data or programs may be retrieved from a development or production Series/1. Data which originates at the host, or is destined to be processed at the host, may also be transmitted.

The Remote Manager provides the following capabilities:

1. Add or replace datasets or members
2. Delete datasets or members
3. Initiate procedures sent from the host
4. Inform operator of messages from host

These facilities are initiated by DSX. If the request is intended for a downstream Series/1, Remote Manager forwards the request where a

Series/1 Remote Manager (cont'd)

Remote Manager is automatically started at the downstream Series/1 to process the request.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment.

HARDWARE REQUIREMENTS

The IBM Series/1 Remote Manager may execute on a Series/1 as follows:

- An IBM Series/1 attached to a host with no downstream Series/1s.
- An IBM Series/1 attached to a host with one or more downstream Series/1s.
- A downstream IBM Series/1.

Within each Series/1, the Remote Manager components can be used separately or in combination and with or without a Series/1 in 32K bytes of processor storage over and above the requirements to support its appropriate Realtime Programming System environment. To determine specific storage requirements for a given user installation, the user should reference the *Realtime Programming System Remote Manager Design and Installation Guide* (SL23-0094).

SOFTWARE REQUIREMENTS

The following IBM licensed program is a prerequisite for the execution of the IBM Series/1 Realtime Program System Remote Manager (5719-RM6):

- IBM Series/1 Realtime Programming System licensed program Version 6.1 (5719-PC6).

The following IBM licensed program is required for Remote Manager Independent Networks:

- IBM Series/1 Realtime Programming System Communications Manager Version 2 (5719-CM2).

The following IBM Licensed Programs are required for Remote Manager communication to an SNA host:

- Distributed Systems Executive (DSX) Version 2 (5668-986). The support will be specified in subsequent DSX documentation.
- Host Command Facility Version 2 (5668-985).
- Network Communication Control Facility Release 2 (5735-XX6).
- Network Problem Determination Application Version 3 (5668-920 for MVS/370, 5666-295 for DOS/VSE).

PROGRAM PRODUCTS

**STANDALONE DISK UTILITIES
5719-SC2**

HIGHLIGHTS

- Prompting messages issued through the operator station to facilitate use.
- Utilities can be loaded by name.
- Recoverable errors print message identifying error and reissue prompts.
- Unrecoverable errors print message identifying error and print termination message.
- Distributed from PID on a diskette.

DESCRIPTION

Diskette IPL Bootstrap

The Diskette IPL Bootstrap Utility loads the contents of cylinder 1, head 0, into the high end of storage.

DISK IPL Bootstrap/Loader

The IPL Bootstrap/Loader Disk Utility loads programs from the disk into main storage.

Diskette Initialization

The Diskette Initialization Utility initializes the diskette, writing ID records and checking for bad cylinders and assigns alternate cylinders. The program initializes for Basic Exchange Format and formats sectors to 128 bytes.

Disk Initialization

The Disk Initialization Utility initializes the disk, writing sector IDs and checking for defective sectors, and assigns alternate sectors. The program provides for user-specified alternate sector assignment.

Create Diskette HDR1

The Create Diskette HDR1 creates a HDR1 record on track 0 for a diskette, using information specified. The format of HDR1 maintains Basic Exchange Format.

Delete Diskette HDR1

The Delete Diskette HDR1 Utility deletes the HDR1 record for a specified diskette data file.

Diskette to Disk Copy

The Diskette to Disk Copy Utility copies data from a specified diskette file to a specified disk file.

Disk to Diskette Copy

The Disk to Diskette Copy Utility copies data from a specified disk file to a specified diskette file.

Diskette to Printer Dump

The Diskette to Printer Dump Utility dumps the contents of a specified area on the diskette to the printer.

Disk to Printer Dump

The Disk to Printer Dump Utility dumps the contents of a specified data area on the disk to the printer.

Operator Station to Diskette Patch

The Operator Station to Diskette Patch Utility applies a patch entered at the operator station to a specified location on the diskette.

Operator Station to Disk Patch

The Operator Station to Disk Patch Utility applies a patch entered at the operator station to a specified location on the disk.

Standalone Storage to Diskette Dump

Pressing the LOAD key on the console loads this utility into main storage from a dedicated prebuilt diskette. The utility then dumps the contents of the Instruction Address Register (IAR), the general purpose registers, and the Level Status Register (LSR) for each level, and the contents of storage to that same diskette.

Standalone Storage to Printer Dump

Pressing the LOAD key on the console loads this utility from a dedicated prebuilt diskette. The utility then dumps the contents of storage, the contents of the Instruction Address Register (IAR), the general purpose registers and the Level Status Register (LSR) for each level on the printer.

Automatic System Build

The Automatic System Build program copies to disk the diskettes shipped from PID. A copy of this program resides on each diskette shipped from PID. The diskettes can be loaded in any sequence.

System Verification

The System Verification program ensures that the system is built properly by cross-checking each module on the system disk against a table containing expected module names. If any are missing, a message is printed indicating which specific program is not at its expected disk address.

Error Logging Facilities

Error logging facilities are enhancements provided to log execution time errors. The facilities offer the user the ability to format a printable error record for processor errors, device I/O request errors, and device interrupt errors. The user provides the area in which the record will be built. The user must also provide his own I/O routine to display the record on a console or printer device or may write it to a disk or diskette device for intermediate storage. When the log is on disk or diskette, the Standalone Utilities provide facilities for printing the log on the console or printer device.

SPECIFIED OPERATING ENVIRONMENT

Support is provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Processor	IBM 4953 Processor (32K bytes minimum) or IBM 4955 Processor (32K bytes minimum)
Disk/ Diskettes	1 - IBM 4962 model 2 or 2F Disk Storage Unit (Combination disk/diskette unit) or 1 - IBM 4962 model 1 or 1F Disk Storage Unit and 1 - IBM 4964 Diskette Unit
Printer	1 - IBM 4974 Printer
Operator Station	1 - Teletypewriter Adapter #7850 with Teletype® Models ASR 33/35 or an ASCII equivalent device.

SOFTWARE REQUIREMENTS

None.

PROGRAM PRODUCTS

**REALTIME PROGRAMMING SYSTEM
SCREEN FORMAT DESIGN AID UTILITY (5719-SF1)
PRESENTATION SUPPORT (5719-SF2)****PURPOSE**

Used in conjunction with Version 4 of the IBM Series/1 Realtime Programming System (5719-PC4), the Screen Format Design Aid Utility (5719-SF1) and Presentation Support (5719-SF2) provide the user with definition and execution-time facilities for the creation, maintenance, and usage of screen formats for 4978, 4979, and 5250 Display Stations attached to the Series/1.

The Screen Format Design Aid Utility (5719-SF1) executes in a 16K partition. It is menu driven and interactive. It is used to create, change, test and save screen formats in libraries on disk or diskette, and requires the Presentation Support (5719-SF2) licensed program.

Presentation Support (5719-SF2) is used on production systems [Screen Format Design Aid Utility (5719-SF1) is not required] and operates as supervisor code. A CALL Interface is provided for Assembler and high-level languages (COBOL, PL/I, or FORTRAN). Application programs may use multiple display stations. Presentation Support provides the following functions:

- RETRIEVE format (from a predefined and created screen format library)
- PUT format (write format to display)
- PUT structure (write unprotected data on display device)
- GET structure (read unprotected data from display device)

HIGHLIGHTS**Screen Format Design Aid Utility (5719-SF1)**

- Interactive
- Option Driven
- Display device attribute characters are defined
- Hard copy of screen formats for reference and update

Presentation Support (5719-SF2)

- Supports multiple displays per application program
- Designed to improve user productivity
- Assembler and high-level language interface (COBOL, PL/I and FORTRAN)
- Display device independence to user application programs (except for editing attributes of the 5250)

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of these licensed programs.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system requirements are the same as for the IBM Series/1 Realtime Programming System Version 4 (5719-PC4). Additionally, an IBM 4978, 4979, or 5250 Display Station is required. The storage requirement for the Screen Format Design Aid Utility (5719-SF1) is 16K bytes. Presentation Support (5719-SF2) executes as supervisor transients, but may be specified as resident during SYSGEN (requires an additional 6K bytes of supervisor space).

SOFTWARE REQUIREMENTS

The Screen Format Design Aid Utility (5719-SF1) and Presentation Support (5719-SF2) require the following Series/1 licensed programs:

- Realtime Programming System Version 4 (5719-PC4)
- Program Preparation Subsystem Version 3 or 4 (5719-AS3 or 5719-AS4) - not required for execution of user applications.
- IBM 4978 Support Programming RPQ Version 3 (5799-TCE) - required if IBM 4978 is installed.
- IBM 5250 Information Display System Attachment Support (5719-TA1) - required if IBM 5250 installed.

The following Series/1 licensed programs are compatible with the Screen Format Design Aid Utility and the Presentation Support:

- FORTRAN IV Compiler and Object Support Library (5719-FO1 and 5719-FO2) and Realtime Subroutine Library (5719-FO3 and 5719-FO4)
- COBOL Compiler and Resident Library (5719-CB1) and Transient Library (5719-CB2)
- PL/I Compiler and Resident Library (5719-PL1) and Transient Library (5719-PL3)

- PL/I Compiler and Resident Library Version 2 (5719-PL2) and Transient Library Version 2 (5719-PL4)

REALTIME PROGRAMMING SYSTEM SORT/MERGE 5719-SM1

PURPOSE

The IBM Series/1 Realtime Programming System Sort/Merge licensed program handles the sorting and merging of records from up to eight input data sets into one output data set in either ascending or descending order. The user specifies one or more control fields in the records to be sorted; the program then compares the control fields to determine the relative sequence of the records.

Sort/Merge executes with the Realtime Programming System Version 3 or Version 4 (5719-PC3 or 5719-PC4) or under the Program Preparation Subsystem Version 3 or Version 4 (5719-AS3 or 5719-AS4). It can execute either as a batch job under the job stream processor or in a foreground partition under the Realtime Programming System.

Sort or merge records can have any of the data set organizations that are part of the Realtime Programming System Version 3 or Version 4; this includes consecutive, random or index, and partitioned data sets whose members have random or consecutive organizations. Data sets with other organizations such as indexed can be processed through user exit routines.

HIGHLIGHTS

- Accept multi-volume diskettes for input or output data sets in the basic exchange format.
- Accept variable or fixed length records in unblocked, blocked, or spanned blocked formats.
- Initiate program execution either as a batch job or from a user routine written in Series/1 Assembler or COBOL.
- Specify insertion of characters into the records to be sorted, either to control the sort or to appear in the sorted output as editorial characters or both.
- Permit user exit routines to handle I/O errors and process records during Sort/Merge execution.
- Specify either standard EBCDIC or ASCII collating sequence at program execution.
- Specify that the program deviate from either EBCDIC or ASCII, allowing the rearrangement of the collating sequences and addition of character not present in either code.
- Provide statistics on the number of records processed at different points in the program code and of error conditions arising during execution.
- Invoke multiple sorts from the same application.
- Route messages to the operator work station or printer.
- Select all or some of the input records to be selected from the input file by recognizing:
 - Record code
 - Relation of field to a constant
 - Relation of two fields within a record
 - Any relationship in a series (OR'ing)
 - All relationships in a series (AND'ing)
 - Multiple of the above conditions in any combination

Output from the Sort/Merge program can be one of four types:

- **Address Sort**
Address Sort supports one input data set and produces an output data set of four-byte binary numbers that can be used as an index to the input file. These relative record displacements reflect the sequence specified for the sort job and allow processing of the input data in an ordered manner after the sort job.
- **Record Sort**
The output from a Record Sort is a data set of sorted records in ascending or descending sequence. The format of the output records can be comprised of either the entire input record or one or more fields in the input record. This can be:
 - Control fields only
 - Data fields only
 - Control fields and data fields
- **Record Summary Sort**
The output from a Record Summary sort is a data set of sorted records and can contain summary records. The Record Summary Sort accumulates totals from one or more user-specified fields (called summary fields) in the input records, and provides one summary record for each set of input records having control fields with the same value (for example, in an inventory file, records with the same part number).
The summary records contain the total for each summary field specified; in addition, it can contain the same user-specified data as allowed for record sort.

- **Merge**

The Merge feature can combine up to eight previously sorted data sets into one sorted consecutive output data set.

Productivity Aids

The following programming aids are provided to assist the user in debugging:

- User specifications for Sort/Merge are edited to minimize generation of erroneous code and errors are noted in one pass.
- All errors may be routed to the system printer via a coded message which indicates the problem area.
- User exits are provided for I/O errors to permit accepting or bypassing of specific errors.
- Statistics are logged for input and output comparisons.

Output Listings

Under user option, Sort/Merge may produce as part of the output listing for a job, the following information:

- Specification lines
- Diagnostic messages
- Program status messages

In addition, processing statistics are always produced for the job. The statistics contain information regarding input/output files.

Invoking Mechanisms

The user may execute Sort/Merge via the following:

- CALL macro
- STARTASK macro
- QUETS macro
- LINKTS macro
- As a batch job using the Job Stream Processor (JSP) facilities

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system for executing this program as a batch job under the job stream processor of the IBM Series/1 Program Preparation Subsystem Version 3 or 4 for the selected version.

Sort/Merge requires a minimum of 16K bytes to be able to perform all of its functions. This minimum is in addition to the number of bytes required for calling the task, or the size of any error exit routines. The Sort/Merge program will utilize additional available storage for improved performance. There must be sufficient disk space available for work areas. There must be sufficient diskette or disk space for user data files.

SOFTWARE REQUIREMENTS

The minimum system for executing this program in a foreground partition for the version of the IBM Series/1 Realtime Programming System selected. The version selected must be Version 3 or Version 4.

DOCUMENTATION (available from Mechanicsburg)

The following manuals should be used for additional information on this licensed program.

IBM Series/1 Realtime Programming System Sort/Merge: Licensed Program Specifications (GL23-0010) ... IBM Series/1 Sort/Merge: Introduction (GC34-0239) ... IBM Series/1 Programming System Summary (GA34-0285) ... IBM Series/1 Realtime Programming System Sort/Merge: Programmer's Guide (SL23-0011) ... IBM Series/1 Sort/Merge Coding Form (GX03-0009)

TERMS and CONDITIONS: See PP Index

**EVENT DRIVEN EXECUTIVE SORT/MERGE
5719-SM2****PURPOSE**

The IBM Series/1 Event Driven Executive Sort/Merge (5719-SM2) licensed program handles the sorting and merging of records from up to eight input data sets into one output data set in either ascending or descending order. The user specifies one or more control fields in the records to be sorted. The program then compares the control fields to determine the relative sequence of the records.

The Event Driven Executive Sort/Merge program executes with the Event Driven Executive Basic Supervisor and Emulator (5719-XS1). It can be invoked by the user through the \$L command, the LOAD instruction, or the \$JOBUTIL utility of the Event Driven Executive Utilities (5719-UT3).

Sort or merge records can have any of the data set organizations that are part of the Series/1 Event Driven Executive Basic Supervisor and Emulator. This includes consecutive and indexed data set organizations.

HIGHLIGHTS

- Accept fixed length or variable length records in unblocked or blocked formats (variable length is only supported by the Event Driven Executive COBOL Compiler and associated libraries, 5719-CB3/CB4)
- Initiate program execution either as a batch job or from a user routine written in Series/1 Assembler language, Series/1 COBOL, or Event Driven language (EDL)
- Specify the insertion of characters into the records to be sorted, either to control the sort, or to appear in the sorted output as editorial characters, or both
- Permit user-written exit routines to handle I/O errors and process records during sort/merge execution
- Specify either standard EDCDIC or ASCII to be used in collating records at program execution
- Specify that the program deviate from either EBCDIC or ASCII, allowing the rearrangement of the collating sequences and addition of characters not present in either code
- Provide statistics on the number of records processed at different points in the program code and on error conditions arising during execution
- Invoke multiple sorts from the same application
- Route messages to the operator work station or printer
- Select all or some of the input records by recognizing:
 - Record code
 - Relation of field to a constant
 - Relation of two fields within a record
 - Any relationship in a series (OR 'ing)
 - All relationships in a series (AND 'ing)
 - Multiples of the above conditions in any combination

Output from the Event Driven Executive Sort/Merge program is limited only by output data set size and can be one of four types:

Address Sort

Address Sort for direct data sets supports one input data set and produces an output data set of four-byte binary numbers that can be used as an index to the input data set. These relative record displacements reflect the sequence specified for the sort job, and allow processing of the input data in an ordered manner after the sort job.

Record Sort

The output from a Record Sort is a data set of sorted records in ascending or descending sequence.

The user determines the format and content of the sorted output record. The output record can be comprised of either the entire input record or one or more fields in the input record.

Record Summary Sort

The output from a Record Summary Sort is a data set of sorted records and can contain summary records. The summary record accumulates totals from one or more user-specified fields (called summary fields) in the input records, and provides one summary record for each set of input records having control fields with the same value (for example, in an inventory file, records with the same part number).

The summary record contains the total for each summary field specified; in addition, it can contain the same user-specified data as allowed for record sort.

Merge

The Merge feature can combine up to eight previously sorted data sets into one sorted consecutive output data set.

The merged record is comprised of the entire input record and, at the option of the user, the control field specified for the merge.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support for this licensed program will be provided when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The Series/1 Event Driven Executive Sort/Merge program requires a minimum of 16K bytes to be able to perform all of its function.

This minimum is in addition to the number of bytes required for calling the task or the size of any error or processing exit routines. The Sort/Merge program will utilize additional available storage for improved performance. There must be sufficient diskette or disk space available for work areas. There must also be sufficient diskette or disk space for user data files.

SOFTWARE REQUIREMENTS

The minimum system for executing this program is specified in the pages for the Series/1 Event Driven Executive Basic Supervisor and Emulator (5719-XS1).

The following licensed programs are required if the associated functions are used.

- IBM Series/1 Event Driven Executive Utilities (5719-UT3) for \$JOBUTIL and Disk Utilities.
- IBM Series/1 Event Driven Executive Indexed Access Method (5719-AM3): Required support for indexed data sets.

DOCUMENTATION

**REALTIME PROGRAMMING SYSTEM VERSION 5
SNA EXTENDED SUPPORT (5719-SN1)****PURPOSE**

The IBM Series/1 Realtime Programming System Version 5 SNA Extended Support licensed program enhances the overall usability of the base operating system Systems Network Architecture (SNA) support.

Ordering Information
Contact IBM.

HIGHLIGHTS

A new user interface, the Realtime Programming System SNA Extended Support licensed program will mask the SNA protocols from the Series/1 user application program. The principal advantages of the new interface are:

- High-level macro instruction interface
- Easy to understand macro parameters
- Connection capability to CICS/VS application programs as an IBM 3790 Full Function Logical Unit
- Connection capability to IMS/VS application programs as a secondary Logical Unit Type P (SLU-P)
- Connection capability to the Network Routing Facility as a secondary Logical Unit (full-duplex pipeline)

The basic operation of the SNA Extended Support involves:

- Establishing communication with the host subsystem, including message recovery/resynchronization assistance
- Sending messages to and receiving messages from the host subsystem
- Terminating communication with the host subsystem.

The execution of these functions is shared among the elements that make up the network. The SNA Extended Support controls the communication path between the Series/1 and host, and handles the required SNA formats and protocols.

The SNA Extended Support licensed program provides an SNA presentation services level user interface to program-to-program communications with host data base/data communications subsystems in an SNA network. It is an enhancement to the data flow control (DFC) level user interface provided by the Realtime Programming System SNA base support.

This SNA Extended Support uses the SNA base support at its DFC level interface to gain access to the SNA network. The SNA base provides physical unit type 2 (cluster controller) support with multiple logical units (LU). The use of SNA Extended Support is selectable for any LU by the application programmer. Multiple LUs may be supported in the same physical unit.

The SNA Extended Support licensed program uses SNA commands to control the session with the host subsystem. The user requests services through the provided interface which allows a GET/PUT-like level of access for sending and receiving messages.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of these licensed programs.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specific operating environment:

HARDWARE REQUIREMENTS

The SNA Extended Support licensed program requires Synchronous Data Link Control Single-Line Control (SDLC) (#2090).

There are no additional hardware requirements to support the SNA Extended Interface Support, assuming all hardware requirements for the particular base Realtime Programming System SNA configuration have been satisfied.

SOFTWARE REQUIREMENTS

The minimum system for installation and program execution of this licensed program is specified in the IBM Series/1 Realtime Programming System Version 5 (5719-PC5).

COMPATIBILITY

This licensed program (5719-SN1) is compatible with the IBM Series/1 Realtime Programming System Version 5 (5719-PC5).

DOCUMENTATION

(available from Mechanicsburg)

IBM Series/1 Realtime Programming System Version 5 System Network Architecture Extended Support: Licensed Programming Specifications (GC34-0349) ... Programmer's Guide (SC34-0370).

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**EVENT DRIVEN EXECUTIVE
SYSTEMS NETWORK ARCHITECTURE (SNA)
5719-SX1****PURPOSE**

The IBM Series/1 Event Driven Executive (EDX) support for Systems Network Architecture (SNA) licensed program (5719-SX1) executes as a separate program within the Event Driven Executive system. A single copy of the SNA program will execute and coordinate all SNA session traffic from user application programs to a single host subsystem (IMS/VSE, CICS/VSE). The Event Driven Executive processing system will now be able to attach to existing SNA host system (System/370, 303X, 43XX) networks to permit Series/1 Event Driven Executive users to communicate with already existing host application subsystems such as the Customer Information Control System (CICS/VSE) and Information Management System (IMS/VSE). The Series/1 will attach to an SNA host system as a cluster controller node. The Series/1 node attaches to an adjacent 370X Network Control Program (NCP) Communications Controller that is either locally or remotely attached to the host system. The physical interconnection is linked by means of Synchronous Data Link Control (SDLC).

HIGHLIGHTS

The Event Driven Executive SNA interface will provide the Series/1 with an interface at the GET/PUT level. The principal advantages of the SNA interface are:

- Event Driven Language (EDL) interface
- Connection capability to CICS/VSE application programs as a 3790 Full Function Logical Unit
- Connection capability to IMS/VSE application programs as a secondary Logical Unit type P (SLU-P)
- Connection capability to the Network Routing Facility as a secondary Logical Unit (full-duplex pipeline).

The basic operation of the Event Driven Executive SNA support involves:

- Establishing communication with the host subsystem, including message recovery/resynchronization assistance
- Sending messages to and receiving messages from the host
- Terminating communication with the host

The execution of these functions is shared among the elements that make up the SNA network. The SNA support controls the communication path between the Series/1 and the host and handles the required SNA formats and protocols. The support provides an SNA presentation services level user interface to program-to-program communications with host data base/data communications subsystem in an SNA network.

The Event Driven Executive SNA support uses SNA commands to control the session with the host subsystem. The user requests services through the provided SNA interface which allows a GET/PUT level of access for sending and receiving messages.

This set of functional support allows the Series/1 to be defined as a Cluster Controller on an SNA/SDLC network controlled by a System/370 using OS/VSE, OS/VS1 or DOS/VSE and ACF/VTAM or ACF/TCAM through a 3705 Communications Controller using the Network Control Program (ACF/NCP/VSE). This support also allows operation in a network controlled by a System/370 with IMS/VSE Version 1 Advanced Function for Communications and System/370 CICS/VSE Version 1.5.

The Event Driven Executive SNA support is a subset of the total SNA architecture. The support provides services to establish, control, and terminate sessions between multiple Series/1 programs and an SNA host subsystem or user programs. The support also provides services to transfer data and control information between the programs.

- The Series/1 attaches to the SNA network as a cluster controller node, in SNA terminology a physical unit type 2.
- The Event Driven Executive SNA support allows multiple logical units in the Series/1.
- The Event Driven Executive SNA program supports transmission subsystem and function management profiles 3 or 4.
- The Event Driven Executive SNA program has a presentation services interface to allow Series/1 users to communicate across a network without being involved with protocols (for example, building request and transmission headers) and resources (for example, building control blocks, activating devices).
- The physical attachment to the SNA network is as a secondary SDLC station on a:
 - Nonswitched link
 - Point-to-point
 - Multipoint
 - Switched link

Auto-answer

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

32K bytes of additional Series/1 storage is required for execution of the IBM Series/1 Event Driven Executive SNA Program. The Event Driven Executive SNA licensed program support requires Synchronous Data Link Control Single-Line Control (#2090).

SOFTWARE REQUIREMENTS

Event Driven Executive SNA application programs require the following licensed programs:

- Event Driven Executive Basic Supervisor and Emulator Version 3 (5719-XS3)
- Event Driven Executive Utilities Version 3 (5719-UT5)
- Event Driven Executive Program Preparation Facility Version 3 (5719-XX4)

The Utilities and Program Preparation Facility are required only for the preparation and installation of SNA application programs, and are not required for execution.

In addition to the previously listed programs, the following licensed programs are required to assemble the Event Driven Executive SNA application programs on a host system:

- Series/1 Event Driven Executive Macro Library/Host Version 3 (5740-LM4)
- System/370 Program Preparation Facilities for Series/1 FDP (5798-NNQ)
- System/370 Event Driven Executive Host Communications Facility IUP (5796-PGH) (optional)

DOCUMENTATION

**EVENT DRIVEN EXECUTIVE
SYSTEMS NETWORK ARCHITECTURE RJE
5719-SX2****PURPOSE**

The IBM Series/1 Event Driven Executive (EDX) Systems Network Architecture RJE support (SNA RJE) licensed program has the commands and capabilities of the existing EDX RJE Utilities plus additional functions which accommodate SNA host job entry subsystems. The RJE program will execute as a separate program within the Event Driven Executive system.

HIGHLIGHTS

The SNA RJE product will allow the SNA RJE user who has created a job stream via the EDX edit facilities to transmit that job stream to a host system for processing. Upon completion, the output from the job stream will normally be sent back to the work station for printing and/or punching. The work station also gives the user the ability to query the host system for the status of the submitted job and/or query the host for any other normally allowed information; for example, system status.

- EDX SNA RJE supports the following host job entry subsystems:
 - DOS/VSE
 - OS/VS1
 - OS/VS2
 - VSE/POWER
 - RES
 - JES 2 and JES 3
- The print output received by SNA RJE may be either printed directly on an available physical printer or, through the use of the EDX spool processor, placed in a disk spool data set (an EDX logical printer) for printing at a later time.
- Full console support.
- Punched output received by SNA RJE is always placed in an EDX data set selected by the user.
- SNA RJE will have the capability to optionally have all SNA RJE console messages directed to a data set for subsequent printing.
- The commands listed below will be available in the EDX SNA RJE licensed program.

ABORT	Stops transmission to or from the host
COMMAND	Sends a command to the host
ENDRJE	Terminates execution of the utility
PRINTON	Defines the terminal name used for output
PUNCHO	Defines a disk or diskette file for punch output of object data
PUNCHS	Defines a disk or diskette file for punch output of source data
RESET	Reset function
SUBMIT	Sends a data stream to the host
SUBMITX	Sends a transparent data stream to the host
HRJE	Displays all SNA RJE commands and functions
JOURNAL	Directs SNA RJE messages to a data set

Since the SNA RJE spool functions will be handled by the EDX spool processor, the existing BSC RJE SPOOL and ENDSPOOL commands are not implemented in the SNA RJE licensed program.

The SNA RJE support has the following SNA requirements:

- 1 Logical Unit SNA RJE Work Station
- SNA Function Management Profile 3
- SNA Transmission Subsystem Profile 3

A display or console device will be required for each SNA RJE work station to start or interact with EDX SNA RJE.

To submit a job stream or receive punched output, the SNA RJE user will require a disk or diskette.

To receive printed output, the user will require a printer or disk space as specified for the use of the EDX Spool processor.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

64K bytes of additional Series/1 storage is required for execution of the IBM Series/1 Event Driven Executive RJE program. The hardware requirement for EDX SNA RJE support is feature #2090, Synchronous Data Link Control Single-Line Control (SDLC).

SOFTWARE REQUIREMENTS

Basic Supervisor and Emulator Version 3 (5719-XS3) is a prerequisite, and the Supervisor must have EXIO support included at SYSGEN. The Event Driven Executive SNA program (5719-SX1) is also a prerequisite for the RJE program.

DOCUMENTATION

IBM Series/1 Event Driven Executive Systems Network Architecture and Remote Job Entry (SC34-0402).

TERMS and CONDITIONS: See PP Index

5250 INFORMATION DISPLAY SYSTEM ATTACHMENT SUPPORT 5719-TA1

PURPOSE

The IBM Series/1 5250 Information Display System Attachment Support licensed program provides definition and execution time facilities to assist the user in the control of 5250 Information Display System work stations attached to the Series/1 5250 Information Display System Attachment.

HIGHLIGHTS

This licensed program provides the following support:

- Attachment Initialization
- Device Support
- Verification Test Facility
- Screen Formatting Assist and Data Stream Macros
- Alternate System Console Support
- Utility Functions
- High Level Language Support
- Print Function
- Operator Commands

DESCRIPTION

Attachment Initialization

The attachment initialization facility performs the following functions:

- Opens the data set referenced by the start device command or macro
- Reads the Controller Storage Image from disk or diskette
- Loads the Controller Storage Image into the attachment

Attachment initialization can be initiated from the operator station or the IPL (Initial Program Load) options data set using the Realtime Programming System Start Device operator command, or from a user application using the Realtime Programming System Start Device macro.

Device Support

The device support enables the user's applications to communicate with 5250 work stations attached to the Series/1. Communication is through user-generated data streams containing both data and control information. The device support provided is at a READ/WRITE macro level.

Verification Test Facility

The verification test facility enables the user to verify operational status during installation, normal operation, and servicing of the 5250 work stations attached to the Series/1. The following verification tests are provided:

Display Verification

- Display attributes
- Displayable characters
- Specified input fields
- Function keys
- Printer Verification
- Configuration Data
- Display 5250 Error Log Information

Screen Formatting Assist and Data Stream Macros

The screen formatting assist and Data Stream macros aid in constructing output data streams and screen formats for the 5250 work stations. Data streams are used to write data to a 5250 work station, and consist of data and control information which determine the placement and attributes of the data.

The following screen formatting assist macros are provided:

DEFERMSG	Defines error messages to be written.
FIELD	Assists in the detail definition of each field within the data stream
FTBLCLR	Defines the data stream to clear the format table
ROLL	Defines the data stream which will cause a given number of adjacent lines on the screen to be rolled upward or downward
SCREEN	Initiates the definition of the contents of a screen or any part of a screen
SCREEND	Builds a map of the fields defined within the data stream

STACLR Defines the data stream to clear the screen and the screen format table

Alternate System Console Support

The alternate system console support enables the user to define a 5250 work station as the alternate system console for operation after installation and initial system generation (SYSGEN). A 3101 Display Terminal, or other Teletype® ASR Models 33/35 compatible device, or 4979 Display Station must be used as the system console during initial SYSGEN, and for execution of the Realtime Programming System standalone utilities used for installation of the Realtime Programming System.

High Level Language Support

The high level language support allows access to 5250 work stations via the CALL interface from COBOL (5719-CB1), FORTRAN IV (5719-FO1 and 5719-FO2), or PL/I (5719-PL1 and 5719-PL2 applications).

Print Function

The print function allows the user to print the contents of a 5251 or 5252 Display Station or a 5256 Printer attached to the same 5250 Information Display System Attachment (#1210).

Utility Functions

The following functions are available to do the following:

- Build DSDs (Data Set Definitions) for 5250 work station DSDs
- Change 5250 work station DSDs

Operator Commands

Operator commands are provided to allow the user do the following:

- Stop a 5250 attachment and free the storage required to service that attachment
- Reset dates and counters in the 5250 error log data set

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum hardware requirements for the IBM Series/1 5250 Information Display System Attachment Support (5719-TA1) licensed program are the same as for the Series/1 Realtime Programming System Version 4 and Program Preparation Subsystems Versions 3 or 4 plus the 5250 Information Display System Attachment (#1210) and 5250 System Units. The addition of a 5250 support to the Realtime Programming System Version 4 requires at least 6K additional bytes of storage within the supervisor.

SOFTWARE REQUIREMENTS

The Series/1 5250 Information Display System Attachment Support (5719-TA1) requires the following licensed programs:

- Realtime Programming System Version 4, Modification Level 1 (5719-PC4)
- Program Preparation Subsystem Version 3 or 4 (5719-AS3 or 5719-AS4) – not required for execution of user applications
- FORTRAN IV Compiler and Object Support Library (5719-FO1 and 5719-FO2) and Realtime Subroutine Library (5719-FO3 and 5719-FO4)
- COBOL Compiler and Resident Library (5719-CB1) and Transient Library (5719-CB2)
- PL/I Compiler and Resident Library (5719-PL1) and Transient Library (5719-PL3)
- PL/I Compiler and Resident Library Version 2 (5719-PL2) and Transient Library Version 2 (5719-PL4)
- Multiple Terminal Manager Programming RPO P82596 (5799-TCY) Version 1, Modification Level 2.

PERFORMANCE

System performance is dependent upon processor selection, configuration, number of work stations attached, system generation options and application program design.

Do not reproduce without written permission

**4969 MAGNETIC TAPE SUBSYSTEM SUPPORT
5719-TA4****PURPOSE**

The IBM Series/1 4969 Magnetic Tape Subsystem Support licensed program (5719-TA4) provides support for the 4969 Magnetic Tape Subsystem when attached to the Series/1.

HIGHLIGHTS

The licensed program support consists of the following components: Device Management, Data Set Management and Online Utility Services.

Device Management

The device handler runs as part of the system task set and access is provided via Realtime Programming System access macros. The functions provided are:

- Activate and deactivate the device support
- Read a block of data from tape
- Write a block of data to tape
- Rewind tapes
- Set tape offline
- Rewind and set tape offline
- Write a tapemark
- Forward space a record or file
- Backward space a record or file
- Build a DIOCB, DDB, IOQE and DSD for tape

Data Set Management

The data set management routines run as part of the system task set and perform tape label, OPEN/CLOSE and GET/PUT processing and execute under the environment of the task issuing the request. These routines use the device handler functions for reading and writing tape labels and tape marks. The functions provided by the data set management routines are summarized as follows:

- Write header and trailer labels on output processing
- Verify header and trailer labels on input processing
- Write and verify the accompanying tapemarks that delineate label groups
- Allocate and deallocate a tape transport to a user program
- Receive logical records from a tape
- Send logical records to a tape
- Perform EOVS processing which includes volume switching and label processing for multi-volume tape files

Online Utility Services

- Copy unit w/backup (Dump Restore)
- Initialize a tape volume
- Copy tape to tape
- Build tape DSDs in a DSDT on disk
- Tape exerciser

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system requirements for the IBM Series/1 4969 Magnetic Tape Subsystem Support Program are the same for the IBM Series/1 Realtime Programming System Version 4 and IBM Program Preparation Subsystem Version 4 plus the IBM 4969 Magnetic Tape Subsystem Attachment feature (#1215) and an IBM 4969 Magnetic Tape Subsystem unit.

SOFTWARE REQUIREMENTS

The IBM Series/1 4969 Magnetic Tape Subsystem Support program (5719-TA4) requires the following licensed programs:

- Realtime Programming System Version 4, Modification Level 1 (5719-PC4)
- Program Preparation Subsystem Version 4, Modification Level 1 (5719-AS4) – not required for execution of user applications

The following Series/1 Realtime Programming System licensed programs are compatible with the 4969 Magnetic Tape Subsystem (5719-TA4):

- FORTRAN IV Compiler and Object Support Library (5719-FO1) and Realtime Subroutine Library (5719-FO3 or 5719-FO4)
- FORTRAN IV Compiler and Object Support Library (5719-FO2) Version 2, Modification Level 2 and Realtime Subroutine Library (5719-FO4)
- COBOL Compiler and Resident Library (5719-CB1) and Transient Library (5719-CB2) Version 1, Modification Level 1
- PL/I Compiler and Resident Library Version 2 (5719-PL2 and Transient Library Version 2 (5719-PL4)
- Sort/Merge (5719-SM1) Version 1, Modification Level 1

FACILITY CONTROL/POWER MANAGEMENT 1 FC/PM 1 (5719-U11)

PURPOSE

IBM Series/1 Facility Control/Power Management 1 licensed program is a standalone dedicated application providing control actions for reducing both electrical demand and consumption charges. It requires no local programming and is controlled through the entry of functional commands and appropriate parameters by the user.

HIGHLIGHTS

The Facility Control/Power Management 1 licensed program addresses electrical energy cost reduction in facilities with one demand meter, or that portion of facility on one demand meter, and up to 31 controllable device circuits. Savings are achievable providing there are sufficient controllable loads. Input points can also be monitored and, as specified by the user, can cause printing of operator messages, sounding of an alarm, and conditioning of control actions.

It may be operated in any one of six functional modes. This allows progressive installation from simple monitoring to full function energy management. The six modes are:

1. Electrical consumption monitoring.
2. Electrical consumption monitoring and alarm monitoring.
3. Electrical consumption monitoring, alarm monitoring, and time-of-day consumption limiting.
4. Electrical consumption monitoring, alarm monitoring, and time-of-day consumption limiting with cyclic start/stop.
5. Electrical consumption monitoring, alarm monitoring, and time-of-day consumption limiting with demand increment processing.
6. Electrical consumption monitoring, alarm monitoring, and time-of-day consumption limiting with cyclic start/stop and demand increment processing.

The application provides:

1. Power control functions:
 - Time-of-day strategies for up to three types of days for an entire year.
 - Device strategy specification includes up to 8 start/stop time control segments per day.
 - Devices may be selected for either demand control or cyclic on/off control by type of day.
 - Up to nine user-defined time segments per type of day.
 - 31 unique device off time strategies for each time segment.
 - Monitoring of demand meter (integrated or sliding window).
 - Demand increment processing to select and turn off demand control devices.
 - Optional inverted digital output logic for alternate control wiring.
 - Demand target for each time segment.
2. Status monitoring of up to 16 user alarm and condition points, with user defined duration times for validity checking.
3. Data logging and report generation, including the reporting of savings due to cyclic or demand control.
4. Operator interaction via keyboard of operator station:
 - Modify power, control, and device parameters.
 - Obtain reports.
 - Start or stop devices.
5. IPL and restart under user/operator control.
6. Startup/Shutdown:
 - Scheduled execution
 - Delay between device starts
7. Automatic restart after power failure with support of an optional external, battery-powered BCD clock.
8. Application personalization provides user capability of selecting options desired and entering parameters to define requirements:
 - Demand metering calculation requirements
 - Control strategies
 - Time-of-day segments for device operation and control
 - Time-of-day segments for applicable targets
 - Floating target specifications
 - Alarm and condition switch status points and message texts

9. Time-of-day update selects applicable control parameters based on time-of-day and Julian date.
10. Operator guidance provided by printed messages, status reports, and conversational prompts.
11. Condition switch function provides for external interaction with demand increment processing function.
12. Three types of targets:
 - Maximum – defined by user, and either
 - Standard – below maximum and defined by user, or
 - Floating – low maximum and dynamically adjusted to minimize demand.
13. Two basic strategies for demand control actions:
 - Priority selection of devices
 - Rotational selection of devices

CUSTOMER RESPONSIBILITIES

The user is responsible for physical planning; planning the control strategy; installing, personalizing, checking out and operating the licensed program; securing, installing, and maintaining the operator control station; and providing the instrumentation and control devices required to interface to the user's equipment being controlled.

The user will determine the energy control plan for the facility, determining which devices may be controlled, and how these devices may be controlled to reduce electrical energy consumption and demand.

In cooperation with the customer, the marketing representative must (a) request for inclusion in the order the RPQ D26024 Operator Station, or (b), alternatively, advise the customer of his responsibility to provide an equivalent operator station. The RPQ Operator Station consists of a Teletype® Model 43 Teletype. Reference should be made to the RPQ description for complete information and limitations on warranty and serviceability/service.

If time reset after automatic restart is to be implemented with an external, battery-powered BCD clock, the user is responsible for obtaining, installing, and maintaining such a clock.

After obtaining and installing the operator station, and a subsystem usually consisting of a Manual Control Panel, individual device controls, instrumentation and interconnecting wiring, and connecting them to the Series/1 processor by means of the Customer Access Panel, the user is responsible for the installation of the licensed program. To install the licensed program, the user loads the diskette received from IBM. After the FC/PM 1 programs on the diskette have been read into the processor, the user enters the control information, determined in the development of the energy control strategy, into the processor through the operator station. FC/PM 1 is then ready for checkout and operation by the user.

In order to assist the customer in the fulfillment of the subsystem responsibilities, design and installation services are available for a charge through IBM SBIS services.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Facility Control/Power Management 1 requires the following minimum configurations:

IBM Series/1 4952 model A Processor with 32K storage with the following features:

- Energy Conservation Application (#9023)
- Rack Mounting Fixture (#4540)
- Customer Access Panel (#1590) (recommended but optional)
- Customer Access Panel-Integrated DI/DO Cable (#1593) (recommended but optional)
- Timers (#7840)
- Teletypewriter Adapter (#7850)
- Teletypewriter-Customer Access Panel Cable (#2059) (recommended but the Teletypewriter Cable (#2055) may be substituted)
- Integrated Digital Input/Output Non-Isolated (#1560)
- 4964 Diskette Unit Attachment (#3581)
 - IBM 4964-1 Diskette Unit
 - IBM 4977-1A Rack Enclosure

®Registered trademark of Teletype Corporation.

Facility Control/Power Management 1 (cont'd)

- An Operator Station:
Any ASCII device usable as an operator station that meets the specification required by the Teletypewriter Adapter of the IBM Processor (see Customer Responsibilities)
- A Subsystem:
A Subsystem is required to attach controlled circuits or devices. This subsystem usually consists of:
 - The connecting wiring
 - The individual device controls
 - A Manual Control Panel—Description, availability, price and schedule information may be requested for a Manual Control Panel through an SBIS agreement.
 - Modification to the user's electrical consumption and demand meters needed to support the operating mode selected by the user.

SOFTWARE REQUIREMENTS

Facility Control/Power Management 1 is a standalone licensed program and requires no additional programming support. It is distributed as executable code in machine-loadable format.

FACILITY CONTROL/POWER MANAGEMENT 2 FC/PM 2 (5719-U12)

PURPOSE

IBM Series/1 Facility Control/Power Management 2 licensed program is a standalone dedicated application providing control actions for reducing both electrical demand and consumption charges. It requires no local programming in order to execute the included application functions, but permits user programming modification of those functions or development of additional functions if desired. The FC/PM 2 functions include the functions supplied in FC/PM 1 with extended support for up to 95 device circuits, plus utilities useful for function modification or new function addition. In addition, a number of new features such as the operations monitor and the Billing Period Report have been added. A special feature, Facility Control/Power Management 3, extends the range of IBM-provided application functions to include digital device addressing for up to 256 device circuits, enthalpy control of air dampers, temperature proportional control strategies, and extended condition switch function. Application functions of both FC/PM 2 and FC/PM 3 are controlled through the entry of functional commands and appropriate parameters by the user.

HIGHLIGHTS

The Facility Control/Power Management 2 licensed program addresses electrical energy cost reduction in facilities with one demand meter, or that portion of a facility on one demand meter, and up to 95 (94 if operations monitor is used) controllable device circuits. Savings are achievable providing there are sufficient controllable loads.

The application provides:

1. Power control functions:
 - Time-of-day strategies for up to four types of days for an entire year
 - Device strategy specification includes up to 8 start/stop time control segments per day
 - Devices may be selected for either demand control or cyclic on/off control by type of day
 - 95 unique device strategies within each of the above
 - Optional inverted digital output logic for alternate control logic
 - Demand increment processing
 - Monitoring of demand meter (integrated or sliding window)
 - Targets for up to nine user-defined time segments per type of day
 - Demand increment durations from 15 to 120 seconds and demand interval durations of 5 minutes to 2 hours for demand control
 - User-defined delay times from 2-30 seconds in increments of 2 seconds for turning on devices sequentially
2. Status monitoring of up to 95 (less if some of the FC/PM 3 functions and the automatic BCD clock is used) user alarm and condition switch points with user defined duration time for validity checking
3. Data logging and report generation including the reporting of savings due to demand and cyclic control
4. Operation interaction via keyboard of operator station:
 - Modify power, control, and device parameters
 - Obtain reports
 - Start or stop devices
5. IPL and restart under user/operator control
6. Startup/Shutdown:
 - Scheduled execution
 - Delay between device starts
7. Automatic restart after power failure with support of an optional external, battery-powered BCD clock
8. Operations monitor
9. Application personalization provides user capability of selecting options desired and entering parameters to define requirements:
 - Demand metering calculation requirements
 - Control strategies
 - Time-of-day segments for device operation and control
 - Time-of-day segments for applicable targets
 - Floating target specifications
 - Alarm and condition switch status points and message texts

10. Time-of-day update selects applicable control parameters based on time-of-day and calendar date
11. Operator guidance provided by printed message, status reports and conversational prompts
12. Condition switch function provides for external interaction with demand control, cyclic control, and time-of-day control of devices
13. Three types of targets:
 - Maximum – defined by user, and either
 - Standard – below maximum and defined by user, or
 - Floating – below maximum and dynamically adjusted to minimize demand
14. Two basic strategies for actions:
 - Priority selection of devices
 - Rotational selection of devices
15. Modifiability – The user can modify the application programs by requesting the optional source code and utilizing the Application Program Preparation Utilities which provide:
 - Source editing of records in members of the user source library
 - Source translation and execution of user-written application programs
 - User modification and replacement of Facility Control/Power Management 2 and 2M application code
 - Library service facilities for program libraries
 - Utility software error messages and diagnostics to aid the user during modification of programs

Note: Central and On-site Programming Services are provided by IBM on the current unaltered release of the licensed programs only.

CUSTOMER RESPONSIBILITIES

The user is responsible for physical planning; planning the control strategy; installing, personalizing, checking out, and operating the licensed program; securing, installing, and maintaining the operator control station; and providing the instrumentation and control devices required to interface to the user's equipment being controlled.

The user will determine the energy control plan for the facility, determining which devices may be controlled and how these devices may be controlled to reduce electrical energy consumption and demand.

In cooperation with the customer, the marketing representative must (a) request for inclusion in the order RPQ D26024 Operator Station or (b) alternatively, advise the customers of their responsibility to provide an equivalent operator station. The RPQ Operator Station consists of a Teletype® Model 43 Teleprinter. Reference should be made to the RPQ description for complete information and limitation on warranty and serviceability/service.

If automatic restart is to be implemented with an external, battery-powered BCD clock, the user is responsible for obtaining, installing and maintaining such a clock.

After obtaining and installing the operator station, and a subsystem usually consisting of a Manual Control Panel, individual device controls, instrumentation and interconnecting wiring, and connecting them to the Series/1 processor, by means of the Customer Access Panel, the user is responsible for the installation of the licensed program. To install the licensed program, the user loads the diskette received from IBM. After the FC/PM 2 programs on the diskette have been read into the processor, the user enters the control information, determined in the development of the energy control strategy, into the processor through the operator station. FC/PM 2 is then ready for checkout and operation by the user.

In order to modify the included application functions, or to add more functions (including those in Facility Control/Power Management 3), the user should order the optional material and become familiar with the source code of the function he wishes to modify. The PLM included in the optional material provides logic details of the functions. The user must then use the utilities provided to include the modification or additional function on his operating diskette. Assistance in design, coding, testing, and installing of new or modified application may be obtained from IBM under the terms and conditions of an IBM Systems Engineering Service Agreement.

In order to assist the customer in the fulfillment of the subsystem responsibilities, design and installation services are available for a charge through IBM SBIS services.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

®Registered trademark of Teletype Corporation.

Facility Control/Power Management 2 (cont'd)**HARDWARE REQUIREMENTS**

Facility Control/Power Management 2 requires the following minimum configurations:

- IBM Series/1 4952 model A Processor with 32K storage (for applications with 31 or less controllable load circuits)
- IBM Series/1 4952 model B Processor with 64K storage (for applications with 63 or less controllable load circuits)
- Series/1 4952 model B Processor with 64K byte storage (for applications with 64 or more controllable load circuits)

Plus the following features:

- Energy Conservation Application (#9023)
- Rack Mounting Fixture (#4540)
- Customer Access Panel (#1590) (recommended but optional)
- Customer Access Panel—Integrated DI/DO Cable (#1593) (recommended but optional)
- Timers (#7840)
- Teletypewriter Adapter (#7850)
- Teletypewriter Cable (#2055) (recommended but the Teletypewriter Customer Access Panel Cable (#2059) may be substituted)
- Integrated Digital Input/Output Non-Isolated (#1560)
- 4964 Diskette Unit Attachment (#3581)
- Storage Addition (#6306) as required
- Additional storage (up to 64K) and Integrated Digital I/O (#1560) (up to 5) and I/O cable (#1593) (one per #1560) may be required depending on customer modifications and number of I/O devices attached. The optional Programmer Console (#5650) may be useful for customer code modification, debug and maintenance.
- IBM 4964-1 Diskette Unit
- An additional Diskette Unit and 4964 Diskette Unit Attachment (#3581) are recommended and may be required if extensive modifications are made.
- IBM 4997-1A Rack Enclosure
- An Operator Station:
 - Any ASCII device usable as an operator station that meets the specification required by the Teletypewriter Adapter of the IBM Processor (see Customer Responsibilities).
- A Subsystem:
 - A Subsystem is required to attach controlled circuits or devices. This system usually consists of:
 - The connecting wiring
 - The individual device controls
 - A Manual Control Panel - Description, availability, price and schedule information may be requested for a Manual Control panel through an SBIS agreement.
 - Modification to the user's electrical consumption and demand meters needed to support the operating modes elected by the user.

Various other configurations are acceptable. Consult the "Machines" pages.

SOFTWARE REQUIREMENTS

Facility Control/Power Management 2 is a standalone licensed program and requires no additional programming support. It is distributed as executable code in machine loadable format. The application functions are also available as optional material in source code format.

**FACILITY CONTROL/POWER MANAGEMENT 3
PC/PM 3 FEATURES #6000, #6001
5719-U12****PURPOSE**

IBM Series/1 Facility Control/Power Management 3 is a special feature of IBM Facility Control/Power Management 2 and may be installed on Facility Control/Power Management 2M licensed programs operating on Series/1. It extends the range of functions supplied by IBM with the base product to include:

Digital Device Addressing
Enthalpy Control of Air Dampers
Temperature Proportional Control Strategies
Extended Condition Switch Action

This special feature provides the user with the opportunity to further capitalize on the potential of computerized energy control through additional manpower and energy savings.

HIGHLIGHTS

The IBM Facility Control/Power Management 3 Special Feature provides:

- Mapping of a particular device number on existing customer-owned manual control panels to a logical 3 digit ID code. This function aids in installing the IBM Facility Control/Power Management 2 and 2M licensed programs in facilities having compatible centralized control panels. Up to 256 electrical devices may be addressed for control by digitally addressing the attached devices with the easier-to-use matrix switchboard style of manual control panel. Addressing can be sequential or non-sequential. Ease and accuracy of use is a benefit plus the potential value of using installed digital control panels, separately or simultaneously with local control.
- Controlling the outside air inlet damper by comparing outside and inside air enthalpy (heat content) using temperature and humidity measurements. The enthalpy calculation includes the effect of the additional energy required to heat or cool moist air above that required for dry air. It is thus thermodynamically more efficient than is a calculation based on temperature alone and additional energy saving opportunities are thereby provided.
- Differing sets of demand control strategies are based on changes in outside air temperature to permit optimum comfort levels and energy savings. The proportional adjustment within specified limits of the control strategies as the outside temperature varies provides the effect of continuous monitoring and readjustment of control parameters. Additional energy savings are thus possible without the manpower cost and inconvenience of defining and reinstalling multiple strategies for changes in weather.
- Extended condition switch operates by permitting the user to specify logical combinations of 1 to 3 digital inputs for signaling the condition status of one or more devices. The logical combinations thus made possible include all possible combinations of up to 3 condition inputs. The user is provided with a means to construct and adjust complex logical energy savings strategies combining such events as time, temperature, day type, other operating decisions, manual actions, etc., simply and without the cost of programming. By inter-connecting controlled outputs as condition switch inputs, extremely rich combinations of logical decisions are available to the user who has opportunities for energy cost savings too complex for systems of lesser sophistication.

CUSTOMER RESPONSIBILITIES

See FC/PM 2 and 2M for basic responsibilities. In addition, the user must select and install required temperature and humidity instrumentation.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Same as FC/PM 2 and 2M, except 48K of storage is required and an IBM 4955 Processor is recommended. If an IBM 4952 Processor is used, 64K of storage is required. The subsystem will include temperature and humidity instrumentation and wiring, if these functions of FC/PM 3 are active for the unmodified FC/PM 2 or 2M and 3 functions.

Installation of FC/PM 3 into the user's prerequisite FC/PM 2 or 2M system requires the use of the utilities function obtained as part of FC/PM 2 basic material.

SOFTWARE REQUIREMENTS

Facility Control/Power Management 3 is a feature and operates under the control of the prerequisite Facility Control/Power Management 2 and may be installed on Facility Control/Power Management 2M licensed programs. It is distributed as executable code in machine readable format and is also available as optional material in source code format.

FACILITY CONTROL/POWER MANAGEMENT 4 FC/PM 4 (5719-U13)

PURPOSE

IBM Series/1 Facility Control/Power Management 4 licensed program is a stand-alone application providing control actions to help in reducing both electrical demand and consumption charges for facilities with multiple demand and consumption meters. It requires no local programming in order to execute the included application functions, but permits user programming of modifications of certain application functions, or development of additional functions if desired, for example, a user-written program to support a hardware communications subsystem which interfaces to the Series/1 through DI/DO (#1560). The included functions are equivalent to those provided in FC/PM 2 with extended support for up to 8 meter sites, up to 128 monitoring points, and up to 158 device circuits, plus utilities useful for function modification or new function addition. Application functions of FC/PM 4 are controlled through the entry of functional commands and appropriate parameters by the user. Application Program Preparation Utilities are included with FC/PM 4.

HIGHLIGHTS

The Facility Control/Power Management 4 licensed program addresses electrical energy cost reduction in facilities with multiple demand meters using a single Series/1 hardware configuration. It provides support for controlling up to 158 electrical devices and monitoring up to 128 status points distributed over up to eight meter sites, each having an independent demand meter. (A portion of a facility connected to a single meter is referred to as a meter site.) Savings are achievable providing there are sufficient controllable loads.

The application provides:

1. Power control functions for each meter site
 - Time-of-day strategies for up to four types of days for an entire year.
 - Device strategy specification includes up to eight start/stop time control segments per day.
 - Devices may be selected for either demand control or cyclic on/off control by type of day.
 - Unique strategies for each device within each of the above.
 - Demand increment processing for both electric and non-electric meters.
 - Monitoring of demand meter (integrated or sliding window).
 - Targets for up to nine user-defined time segments per type-of-day.
 - Demand increment durations from 15 to 120 seconds and demand interval durations of 5 minutes to 2 hours for demand control.
 - User-defined delay times from 2-30 seconds in increments of 2 seconds for turning on devices of a meter site sequentially.
- Note:** Non-electric meters, for example steam or gas, where the output can be made available to the Series/1 as a stream of electrical pulses similar to those provided from a watt hour or electrical demand meter are supported.
2. Status monitoring of up to 128 user alarm, condition switch, standby and dual action switch points, with user-defined duration times for validity checking. Each point is user specifiable for fast scan (2 second period) or slow scan (1 minute period) processing. Up to 128 scan points, of which no more than 96 can be fast scan points, distributed over 8 meter sites are supported.
3. Data logging and report generation
4. Operator interaction via keyboard of operator station:
 - Modify power, control, and device parameters
 - Obtain reports
 - Start or stop devices
5. IPL and restart under user/operator control
6. Startup/Shutdown:
 - Scheduled execution
 - Delay between device starts
7. 158 unique device strategies (control points).
8. Operations monitor support for a user-supplied alarm to signal if FC/PM or the Series/1 computer fails.
9. Automatic restart after power failure with support for an optional external battery-powered BCD clock.

10. Application personalization provides user capability of selecting options desired and entering parameters to define requirements for each meter site:
 - Demand metering calculation requirements
 - Control strategies
 - Time-of-day segments of device operation and control
 - Time-of-day segments for applicable targets
 - Floating target specifications
 - Alarm and condition switch and dual action switch, status points and message texts
11. Time-of-day update selects applicable control parameters based on time-of-day and calendar date and meter site.
12. Operator guidance provided by printed messages, status reports and conversational prompts.
13. Condition switch function provides for external interaction with demand control, cyclic control, and time-of-day control of devices.
14. Three types of targets for each meter site:
 - Maximum – defined by user, and either
 - Standard – below maximum and defined by user, or
 - Floating – automatically recalculated at the end of each demand interval as a user-specified alternative to standard target

Maximum and standard targets are user-specifiable for up to 9 time-of-day segments and 4 types of days independently for each meter site.
15. Two basic strategies for actions:
 - Priority selection of devices
 - Rotational selection of devices
16. Additional operator stations (up to 3) can be attached with an additional Teletypewriter Adapter (#7850) for user-written program functions.
17. Modifiability – The user can modify certain application programs by requesting the optional source code and using the Application Program Preparation Utilities to:
 - Edit source records in members of the user source library
 - Translate and execute user-written application programs
 - Modify and replace certain Facility Control/Power Management 4 application code
 - Allocate, delete, and rename members, and list directories and members using the library service facilities
 - Print utility software error messages and diagnostics to aid in modifying programs

The IBM Facility Control/Power Management 4M licensed program can operate each meter site in up to seven basic functional mode combinations. This allows progressive installation from a simple monitoring application for one meter site to full energy management controlling eight meter sites. The seven mode combinations are:

1. Consumption monitoring
2. Alarm monitoring
3. Consumption monitoring and alarm monitoring
4. Consumption monitoring, alarm monitoring and time-of-day consumption limiting
5. Consumption monitoring, alarm monitoring and time-of-day consumption limiting with cyclic start/stop
6. Consumption monitoring, alarm monitoring and time-of-day consumption limiting with demand increment processing
7. Consumption monitoring, alarm monitoring and time-of-day consumption limiting with cyclic start/stop and demand increment processing.

In addition, alarm monitoring is optional for mode combinations 4-7.

CUSTOMER RESPONSIBILITIES

The user is responsible for physical planning; planning the control strategy; installing, personalizing, checking out, and operating the licensed program; securing, installing, and maintaining the operator control station; and providing the instrumentation and control devices required to interface to the user's equipment being controlled.

FC/PM 4 programs support meters and devices attached directly to the Integrated Digital Input/Output Non-Isolated feature (#1560) of the Series/1 Processor. To support remote sites, the user must do one of

PROGRAM PRODUCTS

Facility Control/Power Management 4 (cont'd)

the following: a) the remote sites must be connected to the Series/1 such that it is transparent to the FC/PM 4 application programs, or b) write and install programs to interface the FC/PM 4 application program to the hardware communications subsystem which is connected to the Series/1 through Integrated DI/DO (#1560).

The user will determine the energy control plan for the facility, determining which devices may be controlled and how these devices may be controlled to help reduce electrical energy consumption and demand.

In cooperation with the customer, the marketing representative must (a) request for inclusion in the order the RPQ D26024 Operator Station, (b) alternatively, advise the customer of this responsibility to provide an equivalent operator station. The RPQ Operator Station consists of a Teletype® Model 43 Teleprinter. Reference should be made to the RPQ description for complete information and limitations on warranty and serviceability/service.

If auto restart is to be implemented with an external, battery-powered BCD clock, the user is responsible for obtaining, installing, and maintaining such a clock.

After obtaining and installing the operator station and a subsystem (usually consisting of a manual control panel, individual device controls, instrumentation, and interconnecting wiring), and connecting them to the Series/1, the user is responsible for the installation of the licensed program. To install the licensed program, the user loads the diskette received from IBM. After the FC/PM 4 programs on the diskette have been read into the processor, the user enters the control information, determined in the development of the energy control strategy, through the operator station. FC/PM 4 is then ready for checkout and operation by the user.

In order to change the modifiable application functions included or to add more functions, the user should order the optional material and become familiar with the source code of the function he wishes to modify. The PLM included in the optional material provides logic details of the functions.

The user must then use the Application Program Preparation Utilities provided to include the modification or additional function on the operating diskette. Assistance in design, coding, testing, and installing of new or modified applications may be obtained from IBM under the terms and conditions of an IBM Systems Engineering Service Agreement.

In order to assist the customer in the fulfillment of the subsystem responsibilities, design and installation services are available for a charge through IBM SBIS services.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Facility Control/Power Management 4 requires the following minimum configurations:

- IBM 4955 Processor model C with 64K storage [by Storage Addition (#6326 as required) attached] and the following features:
 - Energy Conversation Application (#9023)
 - Rack Mounting Fixture (#4540)
 - Customer Access Panel (#1590) (recommended but optional)
 - Customer Access Panel—Integrated DI/DO Cable (#1593) (recommended but optional)
 - Timers (#7840)
 - Teletypewriter Adapter (#7850)
 - Teletypewriter Cable (#2055), if TTY not attached through Customer Access Panel (#1590); (#2059), if TTY is attached through Customer Access Panel (#1590)
 - Integrated Digital Input/Output Non-Isolated (#1560)
 - 4964 Diskette Unit Attachment (#3581)
 - Communications Power Feature (#2010)
 - Additional Integrated Digital Input/Output Non-Isolated (#1560) (up to five can be attached) may be required depending on user requirements and number of input/output devices attached.
- IBM 4964 Diskette Unit model 1 (one required)
- An additional IBM 4964 Diskette Unit model 1 and Diskette Unit Attachment (#3581) are recommended and may be required if extensive user modifications are made via the Application Program Preparation Utilities.
- IBM 4997 Rack Enclosure model 1A
- An Operator Station: Any ASCII device that meets the specifications of the Teletypewriter Adapter of the IBM 4955 Processor (see "Customer Responsibilities") can be used as an operator station.

Note: Support for up to three additional Teletypewriter Adapters (#7850) is provided. They may be used by additional functions developed via the Application Program Preparation Utilities.

Operator communication to/from the FC/PM 4 application functions will be directed only to the first Teletypewriter Adapter (#7850).

- A Subsystem: A subsystem is required to attach controlled circuits or devices. This subsystem usually consists of:
 - connecting wiring
 - individual device controls.
 - manual control panel: Description, availability, price and schedule information may be required for a Manual Control Panel through an SBIS Agreement.
 - Modification to the user's electrical consumption and demand meters needed to support the operating modes elected by the user.

SOFTWARE REQUIREMENTS

Facility Control/Power Management 4 is a standalone licensed program and requires no additional programming support. It is distributed as executable code in machine loadable format. The modifiable application functions are also available as optional material in source code format.

Program Currency

For program support purposes, a licensed program is considered current if it is the current release of the program and all PID-distributed refreshes/PTFs have been installed.

PROGRAM PRODUCTS

**FACILITY CONTROL/POWER MANAGEMENT 2M
FC/FM 2M (5719-U14)****PURPOSE**

IBM Series/1 Facility Control/Power Management 2M licensed program operating on a Series/1 is a standalone dedicated application providing control actions to help in reducing both electrical demand and consumption charges. It requires no local programming in order to execute the included application functions, but permits user programming modification of those functions or development of additional functions if desired via the FC/PM 2 Application Program Preparation Utilities. The included functions are equivalent to those provided in FC/PM 2. Although the Application Program Preparation Utilities are not included with FC/PM 2M, optional source code will be available for function modification or new function addition. A special feature, Facility Control/Power Management 3, extends the range of IBM-provided application functions to include digital device addressing for up to 256 device circuits, enthalpy control of air dampers, temperature proportional control strategies, and extended condition switch function. Application functions of both FC/PM 2M and FC/PM 3 are controlled through the entry of functional commands and appropriate parameters by the user.

FC/PM 3, along with modifiability, opens a growth path for further savings not available to the FC/PM 1 user.

HIGHLIGHTS

The Facility Control/Power Management 2M licensed program addresses electrical energy cost reduction in facilities with one demand meter, or that portion of a facility on one demand meter, and up to 95 controllable device circuits. Savings are achievable providing there are sufficient controllable loads.

1. Power control functions:
 - Time-of-day strategies for up to four types of days for an entire year.
 - Device strategy specification includes up to eight start/stop time control segments per day.
 - Devices may be selected for either demand control or cyclic on/off control by type of day.
 - Ninety-five unique device strategies within each of the above.
 - Demand increment processing.
 - Monitoring of demand meter (integrated or sliding window).
 - Targets for up to nine user-defined time segments per type-of-day.
 - Demand increment durations from 15 to 120 seconds and demand interval durations of 5 minutes to 2 hours for demand control.
 - User-defined delay times from 2-30 seconds in increments of 2 seconds for turning on devices sequentially.
2. Status monitoring of up to 95 (less if some of the FC/PM3 functions and the automatic BCD clock are used) user alarm and condition switch points, with user-defined duration times for validity checking.
3. Data logging and report generation
4. Operator interaction via keyboard of operator station:
 - Modify power, control, and device parameters
 - Obtain reports
 - Start or stop devices
5. IPL and restart under user/operator control
6. Startup/Shutdown:
 - Scheduled execution
 - Delay between device starts
7. Automatic restart after power failure with support for an optional external, battery-powered, BCD clock.
8. Operations monitor
9. Application personalization provides user capability of selecting options desired and entering parameters to define requirements:
 - Demand metering calculation requirements
 - Control strategies
 - Time-of-day segments of device operation and control
 - Time-of-day segments for applicable targets
 - Floating target specifications
 - Alarm and condition switch status points and message tests

10. Time-of-day update selects applicable control parameters based on time-of-day and calendar date.
11. Operator guidance provided by printed messages, status reports, and conversational prompts.
12. Condition switch function provides for external interaction with demand control, cyclic control and time-of-day control of devices.
13. Three types of targets:
 - Maximum – defined by user, and either
 - Standard – below maximum and defined by user, or
 - Floating – below maximum and dynamically adjusted to minimize demand
14. Two basic strategies for actions:
 - Priority selection of devices
 - Rotational selection of devices
15. Modifiability – The user can modify the application programs by requesting the optional source code and utilizing the Application Program Preparation Utilities from FC/PM 2 which provide:
 - Source editing of records in members of the user source library
 - Source translation and execution of user-written application programs
 - User modification and replacement of Facility Control/Power Management 2, 2M, and 3 application code
 - Library service facilities for program libraries
 - Utility software error messages and diagnostics to aid the user during modification of programs

CUSTOMER RESPONSIBILITIES

The user is responsible for physical planning; planning the control strategy; installing, personalizing, checking out, and operating the licensed program; securing, installing, and maintaining the operator control station; and providing the instrumentation and control devices required to interface to the user's equipment being controlled.

The user will determine the energy control plan for the facility, determining which devices may be controlled, and how these devices may be controlled to help reduce electrical energy consumption and demand.

In cooperation with the customer, the marketing representative must (a) request for inclusion in the order the RPQ D26024 Operator Station, or (b) alternatively, advise the customer of his responsibility to provide an equivalent operator station. The RPQ Operator Station consists of a Teletype® Model 43 Teleprinter. Reference should be made to the RPQ description for complete information and limitations on warranty and serviceability/service.

If auto restart is to be implemented with an external, battery-powered BCD clock, the user is responsible for obtaining, installing and maintaining such a clock.

After obtaining and installing the operator station and a subsystem, usually consisting of a Manual Control Panel, individual device controls, instrumentation, and interconnecting wiring, and connecting them to the Series/1 by means of the Customer Access Panel, the user is responsible for the installation of the licensed program. To install the licensed program, the user loads the diskette received from IBM. After the FC/PM 2M programs on the diskette have been read into the processor, the user enters the control information, determined in the development of the energy control strategy, into the processor through the operator station. FC/PM 2M is then ready for checkout and operation by the user.

In order to modify the included application functions or to add more functions (including those in Facility Control/Power Management 3), the user should order the optional material and become familiar with the source code of the function he wishes to modify. The PLM included in the optional material provides logic details of the functions. The user must also have access to FC/PM2 in order to use the Application Program Preparation Utilities provided with FC/PM 2 to include the modification or additional function on the FC/PM 2M operating diskette. Assistance in design, coding, testing, and installing of new or modified applications may be obtained from IBM under the terms and conditions of an IBM Systems Engineering Service Agreement.

In order to assist the customer in the fulfillment of the subsystem responsibilities, design and installation services are available for a charge through IBM SBIS services.

Facility Control/Power Management 2M (cont'd)**SPECIFIED OPERATING ENVIRONMENT**

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Facility Control/Power Management 2M requires the following minimum configurations:

- IBM 4952 Processor model B with 32K storage (for applications with 63 or less device control circuits and 63 or less monitoring points)
 - or
- IBM 4952 model A Processor with 32K storage (for applications with 31 or less controllable load circuits)
 - or
- IBM Series/1 4952 model B Processor with 32K storage (for applications with 63 or less controllable load circuits)
 - or
- IBM 4952 model B Processor with 64K storage (for applications with 64 or more controllable load circuits)

Plus the following features:

- Energy Conservation Application (#9023)
- Rack Mounting Fixture (#4540)
- Customer Access Panel (#1590) (recommended but optional)
- Customer Access Panel—Integrated DI/DO Cable (#1593) (recommended but optional)
- Timers (#7840)
- Teletypewriter Adapter (#7850)
- Teletypewriter Customer Access Panel Cable (#2059) (recommended but the Teletypewriter Cable (#2055) may be substituted)
- Integrated Digital Input/Output Non-Isolated (#1560)
- 4964 Diskette Unit Attachment (#3581)
- Storage Addition (#6306) as required
- Additional storage (up to 64K) and Integrated Digital I/O (#1560) (up to five) and I/O cables (#1593) (one per #1560) may be required depending on customer modification, debug and maintenance.
- IBM 4964-1 Diskette Unit
 - An additional Diskette Unit and 4964 Diskette Unit Attachment (#3581) may be required if extensive modifications are made.
- IBM 4997-1A Rack Enclosure
- An Operator Station: Any ASCII device usable as an operator station that meets the specification required by the Teletypewriter Adapter of the IBM Processor (see "Customer Responsibilities").
- A Subsystem: A subsystem is required to attach controlled circuits or devices. This subsystem usually consists of:
 - The connecting wiring
 - The individual device controls.
 - A Manual Control Panel: Description, availability, price and schedule information may be requested for a Manual Control Panel through an SBIS Agreement.
 - Modification to the user's electrical consumption and demand meters needed to support the operating modes elected by the user.

Various other configurations are acceptable. Consult the "Machines" pages.

SOFTWARE REQUIREMENTS

Facility Control/Power Management 2M is a standalone licensed program and requires no additional programming support. It is distributed as executable code in machine loadable format. The application functions are also available as optional material in source code format.

PROGRAM PRODUCTS

**FACILITY CONTROL/POWER MANAGEMENT 3
PC/PM 3 SPECIAL FEATURES #6000, #6001
5719-U14**

PURPOSE

IBM Series/1 Facility Control/Power Management 3 is a special feature of IBM Facility Control/Power Management 2 and may be installed on Facility Control/Power Management 2M licensed programs operating on Series/1. It extends the range of functions supplied by IBM with the base product to include:

Digital Device Addressing
Enthalpy Control of Air Dampers
Temperature Proportional Control Strategies
Extended Condition Switch Action

This opportunity to further capitalize on the potential of computerized energy control through additional manpower and energy savings.

HIGHLIGHTS

The IBM Facility Control/Power Management 3 Special Feature provides:

- Mapping of a particular device number on existing customer owned manual control panels to a logical 3-digit ID code. This function aids in installing the IBM Facility Control/Power Management 2 and 2M licensed programs in facilities having compatible centralized control panels. Up to 256 electrical devices may be addressed for control by digitally addressing the attached devices with the easier to use matrix switchboard style of manual control panel. Addressing can be sequential or non-sequential. Ease and accuracy of use is a benefit plus the potential value of using installed digital control panels, separately or simultaneously with local control.
- Controlling the outside air inlet damper by comparing outside and inside air enthalpy (heat content) using temperature and humidity measurements. The enthalpy calculation includes the effect of the additional energy required to heat or cool moist air above that required for dry air. It is thus thermodynamically more efficient than is a calculation based on temperature alone and additional energy saving opportunities are thereby provided.
- Differing sets of demand control strategies are based on changes in outside air temperature to permit optimum comfort levels and energy savings. The proportional adjustment within specified limits of the control strategies, as the outside temperature varies, provides the effect of continuous monitoring and readjustment of control parameters. Additional energy savings are thus possible without the manpower cost and inconvenience of defining and reinstalling multiple strategies for changes in weather.
- Extended condition switch operates by permitting the user to specify logical combinations of 1 to 3 digital inputs for signaling the condition status of one or more devices. The logical combinations thus made possible include all possible combinations of up to 3 condition inputs. The user is provided with a means to construct and adjust complex logical energy savings strategies combining such events as time, temperature, day type, other operating decisions, manual actions, etc., simply and without the cost of programming. By inter-connecting controlled outputs as condition switch inputs, extremely rich combinations of logical decisions are available to the user who has opportunities for energy cost savings too complex for systems of lesser sophistication.

CUSTOMER RESPONSIBILITIES

See FC/PM 2 and 2M for basic responsibilities. In addition, the user must select and install required temperature and humidity instrumentation.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Same as FC/PM 2 and 2M except 48K of storage is required and an IBM 4955 Processor is recommended. If an IBM 4952 Processor is used, 64K of storage is required. The subsystem will include temperature and humidity instrumentation and wiring if these functions of FC/PM 3 are active for the unmodified FC/PM 2 or 2M and 3 functions.

Installation of FC/PM 3 into his prerequisite FC/PM 2 or 2M system requires the use of the utilities function obtained as part of FC/PM 2 basic material.

SOFTWARE REQUIREMENTS

Facility Control/Power Management 3 is a feature and operates under the control of the prerequisite Facility Control/Power Management 2 and may be installed on Facility Control/Power Management 2M licensed programs. It is distributed as executable code in machine-readable format and is also available as optional material in source code format.

PROGRAM PRODUCTS

**FACILITY CONTROL/POWER MANAGEMENT 4M
FC/PM 4M (5719-U15)**

PURPOSE

IBM Series/1 Facility Control/Power Management 4M licensed program is a standalone application providing control actions to help in reducing both electrical demand and consumption charges for facilities with multiple demand and consumption meters. It requires no local programming in order to execute the included application functions, but permits user programming of modifications of certain application functions, or development of additional functions if desired, via the FC/PM 4 Application Program Preparation Utilities, for example, a user-written program to support a hardware communications subsystem which interfaces to the Series/1 through DI/DO (#1560). The included functions are equivalent to those provided in FC/PM 4. Although the Application Program Preparation Utilities are not included with FC/PM 4M, optional source code will be available for function modification or new function addition. Application functions of FC/PM 4M are controlled through the entry of functional commands and appropriate parameters by the user.

HIGHLIGHTS

The Facility Control/Power Management 4M licensed program addresses electrical energy cost reduction in facilities with multiple demand meters using a single Series/1 hardware configuration. It provides support for controlling up to 158 electrical devices and monitoring up to 128 status points distributed over up to eight meter sites, each having an independent demand meter. (A portion of a facility connected to a single meter is referred to as a meter site.) Savings are achievable providing there are sufficient controllable loads.

The application provides:

1. Power control functions for each meter site
 - Time-of-day strategies for up to four types of days for an entire year.
 - Device strategy specification includes up to eight start/stop time control segments per day.
 - Devices may be selected for either demand control or cyclic on/off control by type of day.
 - Unique strategies for each device within each of the above.
 - Demand increment processing for both electric and non-electric meters.
 - Monitoring of demand meter (integrated or sliding window).
 - Targets for up to nine user-defined time segments per type-of-day
 - Demand increment durations from 15 to 120 seconds and demand interval durations of 5 minutes to 2 hours for demand control.
 - User-defined delay times from 2-30 seconds in increments of 2 seconds for turning on devices of a meter site sequentially.

Note: Non-electric meters, for example steam or gas, where the output can be made available to the Series/1 as a stream of electrical pulses similar to those provided from a watt hour or electrical demand meter, are supported.
2. Status monitoring of up to 128 user alarm, condition switch, standby and dual action switch points with user-defined duration times for validity checking. Each point is user specifiable for fast scan (2 second period) or slow scan (1 minute period) processing. Up to 128 scan points, of which no more than 96 can be fast scan points, distributed over 8 meter sites are supported.
3. Data logging and report generation
4. Operator interaction via keyboard of operator station:
 - Modify power, control, and device parameters
 - Obtain reports
 - Start or stop devices
5. IPL and restart under user/operator control
6. Startup/Shutdown:
 - Scheduled execution
 - Delay between device starts
7. 158 unique device strategies (control points).
8. Operations monitor support for a user-supplied alarm to signal if FC/PM or the Series/1 computer fails.
9. Automatic restart after power failure with support for an optional external battery-powered BCD clock.
10. Application personalization provides user capability of selecting options desired and entering parameters to define requirements for each meter site:

- Demand metering calculation requirements
 - Control strategies
 - Time-of-day segments of device operation and control
 - Time-of-day segments for applicable targets
 - Floating target specifications
 - Alarm and condition switch and dual action switch, status points and message texts
11. Time-of-day update selects applicable control parameters based on time-of-day and calendar date, and meter site.
 12. Operator guidance provided by printed messages, status reports, and conversational prompts.
 13. Condition switch or dual action switch function provides for external interaction with demand control and cyclic control.
 14. Three types of targets for each meter site:
 - Maximum – defined by user, and either
 - Standard – below maximum and defined by user, or
 - Floating – automatically recalculated at the end of each demand interval as a user-specified alternative to standard target

Maximum and standard targets are user-specifiable for up to 9 time-of-day segments and 4 types of days independently for each meter site.
 15. Two basic strategies for actions:
 - Priority selection of devices
 - Rotational selection of devices
 16. Additional operator stations (up to 3) can be attached with an additional Teletypewriter Adapter (#7850) for user-written program functions.
 17. Modifiability – The user can modify certain application programs by requesting the optional source code and using the Application Program Preparation Utilities from FC/PM 4 to:
 - Edit source records in members of the user source library
 - Translate and execute user-written application programs
 - Modify and replace certain Facility Control/Power Management 4 and 4M application code
 - Allocate, delete, rename members and list directories and members using the library service facilities
 - Print utility software error messages and diagnostics to aid in modifying programs

The IBM Facility Control/Power Management 4M licensed program can operate each meter site in up to seven basic functional mode combinations. This allows progressive installation from a simple monitoring application for one meter site to full energy management controlling eight meter sites. The seven mode combinations are:

1. Consumption monitoring
2. Alarm monitoring
3. Consumption monitoring and alarm monitoring
4. Consumption monitoring, alarm monitoring and time-of-day consumption limiting
5. Consumption monitoring, alarm monitoring and time-of-day consumption limiting with cyclic start/stop
6. Consumption monitoring, alarm monitoring and time-of-day consumption limiting with demand increment processing
7. Consumption monitoring, alarm monitoring and time-of-day consumption limiting with cyclic start/stop and demand increment processing.

In addition, alarm monitoring is optional for mode combinations 4-7.

CUSTOMER RESPONSIBILITIES

The user is responsible for physical planning; planning the control strategy; installing, personalizing, checking out, and operating the licensed program; securing, installing, and maintaining the operator control station; and providing the instrumentation and control devices required to interface to the user's equipment being controlled.

FC/PM 4M programs support meters and devices attached directly to the Integrated Digital Input/Output Non-Isolated feature (#1560) of the Series/1 Processor. To support remote sites, the user must do one of the following: a) the remote sites must be connected to the Series/1 such that it is transparent to the FC/PM 4M application programs, or b) write and install programs to interface the FC/PM 4M application

Facility Control/Power Management 4M (cont'd)

program to the hardware communications subsystem which is connected to the Series/1 through Integrated DI/DO (#1560).

The user will determine the energy control plan for the facility, determining which devices may be controlled and how these devices may be controlled to help reduce electrical energy consumption and demand.

In cooperation with the customer, the marketing representative must (a) request for inclusion in the order the RPQ D26024 Operator Station, or (b) alternatively, advise the customer of this responsibility to provide an equivalent operator station. The RPQ Operator Station consists of a Teletype® Model 43 Teleprinter. Reference should be made to the RPQ description for complete information and limitations on warranty and serviceability/service.

If auto restart is to be implemented with an external battery-powered BCD clock, the user is responsible for obtaining, installing, and maintaining such a clock.

After obtaining and installing the operator station and a subsystem (usually consisting of a manual control panel, individual device controls, instrumentation, and interconnecting wiring) and connecting them to the Series/1, by means of the Customer Access Panel, the user is responsible for the installation of the licensed program. To install the licensed program, the user loads the diskette received from IBM. After the FC/PM 4M programs on the diskette have been read into the processor, the user enters the control information, determined in the development of the energy control strategy, through the operator station. FC/PM 4M is then ready for checkout and operation by the user.

In order to change the modifiable application functions included, or to add more functions, the user should order the optional material and become familiar with the source code of the function he wishes to modify. The PLM included in the optional material provides logic details of the functions. The user must also have access to FC/PM 4 in order to use the Application Program Preparation Utilities provided with FC/PM 4 to include the modification or additional function on the FC/PM 4M operating diskette. Assistance in design, coding, testing, and installing of new or modified applications may be obtained from IBM under the terms and conditions of an IBM Systems Engineering Service Agreement.

In order to assist the customer in the fulfillment of the subsystem responsibilities, design and installation services are available for a charge through IBM SBIS services.

It is distributed as executable code in machine loadable format. The modifiable application functions are also available as optional material in source code format.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Facility Control/Power Management 4M requires the following minimum configurations:

- IBM 4955 Processor model C with 64K storage [by Storage Addition (#6326) as required] attached and the following features:
 - Energy Conservation Application (#9023)
 - Rack Mounting Fixture (#4540)
 - Customer Access Panel (#1590) (recommended but optional)
 - Customer Access Panel—Integrated DI/DO Cable (#1593) (recommended but optional)
 - Timers (#7840)
 - Teletypewriter Adapter (#7850)
 - Teletypewriter Cable (#2055), if TTY not attached through Customer Access Panel (#1590)
 - Teletypewriter Cable (#2059), if TTY is attached through Customer Access Panel (#1590)
 - Integrated Digital Input/Output Non-Isolated (#1560)
 - 4964 Diskette Unit Attachment (#3581)
 - Communications Power Feature (#2010)
 - Additional Integrated Digital Input/Output Non-Isolated (#1560) (up to five can be attached) may be required depending on user requirements and number of input/output devices attached.
- IBM 4964 Diskette Unit model 1 (one required)
 - An additional IBM 4964 Diskette Unit Model 1 and Diskette Unit Attachment (#3581) may be required if extensive user modifications are made via the Application Program Preparation Utilities from FC/PM 4.
- IBM 4997 Rack Enclosure Model 1A
- An Operator Station: Any ASCII device that meets the specifications of the Teletypewriter Adapter of the IBM 4955 Processor (see Customer Responsibilities) can be used as an operator station.

Note: Support for up to three additional Teletypewriter Adapters (#7850) is provided. They may be used by additional functions developed via the Application Program Preparation Utilities from FC/PM 4. Operator communication to/from the FC/PM 4 application functions will be directed only to the first Teletypewriter Adapter (#7850).

- A Subsystem: A subsystem is required to attach controlled circuits or devices. This subsystem usually consists of:
 - The connecting wiring
 - The individual device controls.
 - A Manual Control Panel: Description, availability, price and schedule information may be required for a Manual Control Panel through an SBIS Agreement

TERMS and CONDITIONS: See PP Index

**AUDIO DISTRIBUTION SYSTEM
VERSION 1
5719-U20**

PURPOSE

The IBM Series/1 Audio Distribution System licensed program (5719-U20), a Series/1-based voice store-and-forward message system, is intended for direct support of a network of business principals, such as managers, professionals, sales personnel, and other key operating personnel in their daily communications activities.

Users or subscribers interact with the IBM Audio Distribution System through conventional tone-generating telephones. Users access the primary functions Get (*G), Listen (*L), Record (*R), Transmit (*T) and Customize (*C) by means of the telephone keypad. The subscribers can record their own voice messages. These messages are digitized and stored on a disk for listening by one or more other subscribers as designated by the originating subscriber. A subscriber can listen to a message sent by another subscriber, and then either reply directly to the message, or send it to one or more additional subscribers. A HELP function may also be invoked at any time to assist the subscriber.

HIGHLIGHTS

- The Audio Distribution System is totally integrated and consists of a licensed program (5719-U20) operating in conjunction with dedicated Series/1 processor configurations.
- The configuration interfaces to either public or private telephone networks through high performance, telephone-oriented Series/1 I/O features: The Telephone Communications Controller (#7880), and the Telephone Communications Adapter (#7881). These features provide a variety of voice digitization and logical data control functions.
- The Audio Distribution System licensed program has been designed for installation by non-computer oriented users in non-computer oriented environments. Customers are not required to perform a system generation or make program changes. The program is loaded from diskettes provided by IBM which also contain the prerequisite licensed programs, the IBM Realtime Programming System (5719-PC5) and the PL/I Transient Library (5719-PL4).
- To provide the flexibility required by a variety of users, a set of user-definable parameters is available for customization. Should the user decide not to specify parameter values, the Audio Distribution System will use default values. These values may be changed at any time by the user.

DESCRIPTION

The Audio Distribution System allows users to voice communicate more quickly and on their own terms by utilizing a tone-generating telephone to:

- ***R (RECORD)**
 - Record while at home, at work or at another locations.
 - Edit what they record
 - Annotate messages received and forward to others
- ***L (LISTEN)**
 - Review what they or other users have created
 - Slow it down or speed it up as desired
 - Increase or decrease volume
 - Skip forward or backward within a message
- ***T (TRANSMIT)**
 - Distribute message to others on the system
 - Distribute via distribution list(s)
 - Specify time and date for delivery and classification
 - Send personal reminders to one's self for later delivery
- ***G (GET)**
 - Hear the names of other users who have sent new messages
 - Select a message to listen to
 - Select from a category of messages (new, old, pending outbound)
- ***C (CUSTOMIZE)**
 - Change or modify personal telephone numbers and passwords
 - Create distribution lists
 - Personalize status to let others know your location
 - Indicate version of system services and prompts desired (Prompted Basic, Basic, Complete)
- **# (HELP)**
 - Obtain instructional prompts to assist in starting or completing a function

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of the IBM Audio Distribution System licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support, as specified in the 'Program Services' section, will be provided for the Audio Distribution licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM Audio Distribution System licensed program must operate in a dedicated standalone environment. The minimum system requirements for execution of this licensed program with a single language is as follows. Please note, as the number of subscribers increase, so will the required number of ports and disks.

Unit	Mdl/FC	Description	Qty	
IBM 4955	F00	Processor 128K	1	
	3581	4964 Diskette Attach	1	
	3590	4963 Disk Attachment	2	
	3920	Floating-Point	1	
	5650	Programmer's Console	1	
IBM 4959	6328	128K Additional Storage	3	
	A00	I/O Expansion Unit	1	
	2070/2071	TCA Cable	4	
	5620	4974 Printer Attach	1	
	7840	Timer	1	
	7880	TCA Controller	2	
	7881	Telephone Comm. Adapter	4	
	RPQ D02038	4978 Display Attachment	1	
	IBM 4963	58A	58 Mb Disk Fixed Heads	2
	IBM 4964	001	Diskette Unit	1
IBM 4974	001	Matrix Printer	1	
IBM 4978	RPQ D02055	Display Station	1	
	RPQ D02056	4978 Keyboard	1	
	RPQ D02033	Attachment Cable	1	

* Predefined IBM Audio Distribution System configurations are available in AIDS under HONE.

@SS@

SOFTWARE REQUIREMENTS

Customers licensed for this licensed program must also be licensed for the following:

- IBM Series/1 Realtime Programming System (5719-PC5) Version 5.1 with the Command Language Facility.
- IBM Series/1 PL/I Transient Library (5719-PL4) licensed program.

Note 1: Machine-readable material (executable code) for the above licensed programs is included in the distribution (process) charge and diskettes for 5719-U20.

Note 2: Source code and related licensed material for this licensed program (5719-U20) will not be made available to customers and these items cannot be ordered.

DOCUMENTATION

(available from Mechanicsburg)

The following IBM Audio Distribution System publications are available via SLSS and should be used for additional information on the licensed program and Series/1 hardware features.

*Licensed Program Specifications (GC34-0401) ... Product Flyer (G580-0359) ... Executive Brochure (G580-0363) ... Administrator's Information Kit (SBOF-4535)** ... Subscriber's Information Kit (SBOF-4536)****

* IBM Internal Use Only

** (Consists of the following manuals which are also available separately

Administrator's Binder (SC34-0433) ... Administrator's Guide (SC34-0399) ... Telephone Template (SX34-0072) ... Wallet Card (SX34-0073) ... Subscriber's Guide (SC34-0400) ... Subscriber's Information Kit (SBOF-4536)

*** Consists of the following manuals which are also available separately:

Subscriber's Guide (SC34-0400) ... Telephone Template (SX34-0072) ... Wallet Card (SX34-0073).

Prerequisite Licenses: The IBM Audio Distribution System licensed program (5719-U20) requires the user to be licensed for the IBM Series/1 Realtime Programming System (5719-PC5) Version 5.1 and the IBM Series/1 Transient Library (5719-PC4). (See note under "Software Requirements" above.)

TERMS and CONDITIONS: See PP Index

EVENT DRIVEN EXECUTIVE QUERY 5719-XR1

PURPOSE

The IBM Series/1 Event Driven Executive Query licensed program provides an access to user's operating data stored in an Indexed Access Method file or a sequential file. This program is for use with Event Driven Executive Multiple Terminal Manager licensed program (5719-MS2). This licensed program can also be used as in a batch processing mode by an application program.

HIGHLIGHTS

- Query Definitions of a User's File: Query Definitions allow the user to select specific information in a file. This information may be used, for example, by a stock clerk, supervisor, accountant, or management. These query definitions refer to a file in terms of rows (representing records) and columns (representing data fields). These definitions are then used by Query to allow information retrieval from Indexed Access Method files and sequential files. File update, delete, and insert are also available using an Indexed Access Method file.
- Query Prompt Screen Interface: A user interface is provided to define file and query definitions. This interface utilizes prompt-response menu screens which guide users through creation of their definitions.
- Query Processing: The user can define different processes or tests to select specific information in a query definition.
- Query Maintenance Capabilities: Also provided are maintenance routines to perform the following functions for query definitions:
 - Copy
 - Update
 - Delete
 - Rename
- Provide global update of a field, that will update all occurrences of a field in all qualified records in an Indexed Access Method file, with a single query.
- Provide an interface to application programs written in COBOL or Series/1 Assembler language. To accomplish this, the Query object modules are linked with the user-written application programs which run as Multiple Terminal Manager applications or system application programs.
- Query Utility: Executes as a Multiple Terminal Manager application program. It operates in a prompt-response interactive mode, and its functions are not callable from any language. However, the Query Utility can be invoked by a user-written Multiple Terminal Manager application. This Query Utility program supports creation and maintenance of the following:
 - Define the fields in a file.
 - Define which field in a file to process.
 - Define how to select and process file information.
 - Define passwords.

CONSIDERATIONS

- Maximum supported block size is 1,024 bytes for input and output.
- Maximum size of a single field in a record is 250 bytes.
- Maximum number of fields in a file that can be defined is 100 with the shipped system, but can be increased to 250 with a customized system. This requires an additional 4,500 bytes in the Multiple Terminal Manager program area.
- Maximum number of Query fields that can be defined is 40. With customized installation into a Multiple Terminal Manager system that has a program area larger than 12K, this number can be increased. Approximately 80 bytes is required for each additional field over 40.
- Maximum number of fields that can specify record selection tests is 10.
- Maximum number of fields that can be sorted in an output file is 10.
- Maximum size of a binary numeric record field is 4 bytes, and 10 digits plus edit characters in display or print field.
- Maximum size of a numeric character record field is 10 digits and it cannot contain edit characters.
- Maximum number of records that can be sequenced for printed or displayed output is:
 - 500 for non-keyed sequence field.
 - Unlimited for keyed sequence field.
- Maximum number of bytes that can be used for sequencing a printed or displayed output is 50.
- Journaling will not be supported when Query is invoked by a high-level language or Assembler.
- A maximum of 20 characters, including qualifiers, can be used when defining record selection field tests in the Utility. This is a space restriction in the Process Definition file. While running the Query Processor in interactive mode, you can specify record select tests for more than 20 bytes in the field. If you request that the record select field data be saved, only the first 20 characters will be saved.

DESCRIPTION

This licensed program provides a facility to answer a simple query as well as a complex query with user-specified field test criteria. Specifically, the following features are supported:

- Manipulate data using a query definition.
 - Retrieve field information from a sequential file or Indexed Access Method file; the output of this retrieval can be displayed, printed or written to a sequential file.
 - Update or modify data fields within a record of an Indexed Access Method file.
 - Delete records from an Indexed Access Method file.
 - Insert or add new records to an Indexed Access Method file.
- Specify tests on data fields for selecting records to be processed, using comparison operators such as Equal to (=), Greater than (>), Less than (<), Not (\) and their logical combination. Up to ten fields may be qualified to control record selection. Three tests, logically ANDed or ORed, may be specified per field.
- Display or print sequenced output records.
- Store query definitions together with field test information in a file for later recall and processing
- Provide cancel function to stop processing the current request and allow a new request to be started.
- Produce a sorted output file.
- Edit binary and character numeric fields. Editing a numeric field is to display monetary symbols, unit of measure symbols, positioning of a decimal point and commas, and to suppress leading zeroes.
- Perform a logical connection of two Indexed Access Method files. This function supports the need to select all records from two Indexed Access Method files based on a common field within those records.
- Provide data security through Query by the use of passwords and calls to user-written security routines.
- Provide optional journaling of all updates, deletes and inserts to Indexed Access Method file when processing under the Query Multiple Terminal Manager interface. These maintenance type requests for records in a file are written to a journal file. This feature provides an audit trail.
- Provide count function to count the number of records which meets the user-defined field test criteria.
- Support generic processing for character data fields. Generic processing is performed by specifying some leading character sequence for a field and all fields which contain that leading character sequence. For example, select all names that begin with character(s) S_, SM_, etc.
- Calculate subtotals and totals for a particular field.

HARDWARE PRODUCTS SUPPORTED

This Series/1 Query program executes on Series/1 with Event Driven Executive Version 3.2. This program will support the following I/O devices:

Disk/Diskettes and Magnetic Tape

- 4962 Disk Storage Unit
- 4963 Disk Subsystem
- 4964 Diskette
- 4965 Diskette Drive and I/O Expansion Unit
- 4966 Diskette Magazine Unit
- 4969 Magnetic Tape Subsystem (may be used for journal and output files only)

Printers

- 4973 Line Printer
- 4974 Printer
- 4975 Printer

PROGRAM PRODUCTS

Event Driven Executive Query (cont'd)

Terminals

- 3101 Display Terminal (models 1 and 2)
- 4978 Display Station
- 4979 Display Station

Only those hardware products supported by the Multiple Terminal Manager are supported by this Query program. Terminal devices must be 24 line full screen displays.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system for executing this licensed program is as specified for the Series/1 Event Driven Executive Version 3.2 (5719-XS3) and the Multiple Terminal Manager Version 2.1 (5719-MS2). Query requires at least 12K bytes of the transaction/program area of the Multiple Terminal Manager. A requirement for batch processing mode is an additional 20K bytes to be used with the user's application program.

SOFTWARE REQUIREMENTS

- Event Driven Executive Version 3.2 (5719-XS3)
- Indexed Access Method Version 2.0 (5719-AM4)
- Sort/Merge Version 1.3 (5719-SM2)
- Multiple Terminal Manager Version 2.1 (5719-MS2)

COMPATIBILITY

This licensed program is also compatible with the following IBM Series/1 licensed programs:

- COBOL Compiler and Resident Library Version 2 (5719-CB5)
- COBOL Transient Library Version 2 (5719-CB6)
- Macro Assembler Version 1.2 (5719-ASA)
- Macro Library Version 3.2 (5719-LM7)

DOCUMENTATION

REALTIME PROGRAMMING SYSTEM QUERY 5719-XR2

PURPOSE

The IBM Series/1 Realtime Programming System Query licensed program provides an access to user's operating data stored in an Indexed Access Method file or a sequential file. This program is for use with Realtime Programming System Multiple Terminal Manager licensed program (5719-MT1). This licensed program can also be used in a batch processing mode by an application program.

HIGHLIGHTS

- Query Definitions of a User's File: Query Definitions allow the user to select specific information in a file. This information may be used, for example, by a stock clerk, supervisor, accountant, or management. These query definitions refer to a file in terms of rows (representing records) and columns (representing data fields). These definitions are then used by Query to allow information retrieval from Indexed Access Method files and sequential files. File update, delete and insert are also available using an Indexed Access Method file.
- Query Prompt Screen Interface: A user interface is provided to define file and query definitions. This interface utilizes prompt-response menu screens which guide users through creation of their definitions.
- Query Processing: The user can define different processes or tests to select specific information in a query definition.
- Query Maintenance Capabilities: Also provided are maintenance routines to perform the following functions for query definitions:
 - Copy
 - Update
 - Delete
 - Rename
- Provide global update of a field that will update all occurrences of a field in all qualified records in an Indexed Access Method file, with a single query.
- Provide an interface to application programs written in COBOL or Series/1 Assembler language. To accomplish this, the Query object modules are linked with the user-written application programs, which run as Multiple Terminal Manager applications or system application programs.
- Query Utility: Executes as a Multiple Terminal Manager application program. It operates in a prompt-response interactive mode, and its functions are not callable from any language. However, the Query Utility can be invoked by a user-written Multiple Terminal Manager application. This Query Utility program supports creation and maintenance of the following:
 - Define the fields in a file.
 - Define which field in a file to process.
 - Define how to select and process file information.
 - Define passwords.

CONSIDERATIONS

- Maximum supported block size is 1,024 bytes for input and output.
 - Maximum size of a single field in a record is 250 bytes.
 - Maximum number of fields in a file that can be defined is 100 with the shipped system, but can be increased to 250 with a customized system by the user. This requires an additional 4,500 bytes in the Multiple Terminal Manager program area.
 - Maximum number of Query fields that can be defined is 40. With customized installation into a Multiple Terminal Manager system that has a program area larger than 12K, this number can be increased. Approximately 80 bytes is required for each additional field over 40.
 - Maximum number of fields that can specify record selection tests is 10.
 - Maximum number of fields that can be sorted in an output file is 10.
 - Maximum size of a binary numeric record field is 4 bytes, and 10 digits plus edit characters in a display or print field.
 - Maximum size of a numeric character record field is 10 digits and it cannot contain edit characters.
 - Maximum number of records that can be sequenced for printed or displayed output is:
 - 500 for non-keyed sequence field.
 - Unlimited for keyed sequence field.
 - Maximum number of bytes that can be used for sequencing a printed or displayed output is 50.
 - Journaling will not be supported when Query is invoked by a high-level language or Assembler.
 - A maximum of 20 characters including qualifiers can be used when defining record selection field tests in the Utility. This is a space restriction in the Process Definition file. While running the Query Processor in interactive mode, you can specify record select tests for more than 20 bytes in the field. If you request that the record select data be saved, only the first 20 characters will be saved.
 - Up to 512 byte support on 4965 Diskette Drive and I/O Expansion Unit.
- DESCRIPTION**
- This licensed program provides a facility to answer a simple query as well as a complex query with user-specified field test criteria. Specifically the following features are supported:
- Manipulate data using a query definition.
 - Retrieve field information from a sequential or Indexed Access Method file; the output of this retrieval can be displayed, printed or written to a sequential file.
 - Update or modify data fields within a record of an Indexed Access Method file.
 - Delete records from an Indexed Access Method file.
 - Insert or add new records to an Indexed Access Method file.
 - Specify tests on data fields for selecting records to be processed using comparison operators such as Equal to (=), Greater than (>), Less than (<), Not (\) and their logical combination.  - Provide data security through Query by the use of passwords and calls to user-written security routines.
 - Provide optional journaling of all updates, deletes and inserts to Indexed Access Method file when processing under the Query Multiple Terminal Manager interface. These maintenance type requests for records in a file are written to a journal file. This feature provides an audit trail.
 - Provide count function to count the number of records which meet the user-defined field test criteria.
 - Support generic processing for character data fields. Generic processing is performed by specifying some leading character sequence for a field and all fields which contain that leading character sequence. For example; select all names that begin with character(s) S_, SM_, etc.
 - Calculate subtotals and totals for a particular field.
- HARDWARE PRODUCTS SUPPORTED**
- This Series/1 Query program executes on IBM Series/1 systems with the Realtime Programming System Version 5.2. This program will support the following I/O devices:
- Disk/Diskettes and Magnetic Tape**
- 4962 Disk Storage Unit
 - 4963 Disk Subsystem
 - 4964 Diskette
 - 4965 Diskette Drive and I/O Expansion Unit
 - 4966 Diskette Magazine Unit
 - 4969 Magnetic Tape Subsystem (may be used for journal and output files only)
- Note:** Licensed program 5719-TA4 is required to support magnetic tape.

PROGRAM PRODUCTS

Realtime Programming System Query (cont'd)

Printers

- 4973 Line Printer
- 4974 Printer
- 4975 Printer

Terminals

- 3101 Display Terminal (models 1 and 2)
- 4978 Display Station
- 4979 Display Station
- 5251 Display Station (model 11)

Note: Licensed program 5719-TA1 is required to support the 5251 Display Station.

Only those hardware products, supported by the Multiple Terminal Manager, are supported by this Query program. Terminal devices must be 24-line full screen displays.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this licensed program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system for executing this licensed program is as specified for the IBM Series/1 Realtime Programming System Version 5.2 (5719-PC5) and the Multiple Terminal Manager Version 3 (5719-MT1). Query requires at least 12K bytes of the transaction/program area of the Multiple Terminal Manager. A requirement for batch processing mode is an additional 20K bytes to be used with the user's application program.

SOFTWARE REQUIREMENTS

- IBM Realtime Programming System Version 5.2 (5719-PC5)
- IBM Indexed Access Method Version 2.0 (5719-AM2)
- IBM Sort/Merge Version 1.1 (5719-SM1)
- IBM Multiple Terminal Manager Version 3.0 (5719-MT1)

COMPATIBILITY

This licensed program is also compatible with the following IBM Series/1 licensed programs:

- COBOL Compiler and Resident Library Version 2 (5719-CB7)
- COBOL Transient Library Version 2 (5719-CB8)
- Program Preparation Subsystem Version 5.2 (5719-AS5)
- 4969 Magnetic Tape Subsystem Version 1.2 (5719-TA4)
- IBM 5250 Information System Attachment Support Version 1.2 (5719-TA1)

Note: The Programming Preparation Subsystem Version 5.2 (5719-AS5) and the Realtime Programming System Version 5.2 (5719-PC5) will be available prior to or concurrent with first customer shipment of the Letter Writer program.

PROGRAM PRODUCTS

**5110 PRINT PLOT/PROBLEM SOLVER LIBRARY
5721-DC3 (BASIC) and 5721-DC4 (APL)****PURPOSE**

IBM 5110 Print Plot/Problem Solver Library is an interactive program. When used in conjunction with the printer control function support provided (also available via RPQ S40161), it allows the IBM 5110 to plot data generated by BASIC or APL programs, or to plot data entered from the keyboard onto an IBM 5103 Printer. (Note: All further references to the Print Plot/Problem Solver Library assume the printer control function support is that provided with the Print Plot program and not the RPQ.) In addition, the Print Plot/Problem Solver Library, through the use of the Serial I/O Adapter, can be used with these types of peripheral devices:

- Absolute Vector Plotters
- Storage Display Terminals

The present implementation will be compatible only with certain peripheral devices of the above generic device types. Peripheral device support programs are the user's responsibility. See *User's Manual* for more detail.

Print Plot/Problem Solver Library will provide the capability for generating the most used types of graphs such as line graphs, bar charts, histograms, point plotting, etc. The user may write a program to generate the data or enter the data directly from the keyboard.

HIGHLIGHTS

Print Plot/Problem Solver Library supports the following functions:

- Plot of horizontal and vertical lines given starting point and length.
- Automatic plotting of axes.
- Automatic plotting of grid.
- Automatic plotting of scale numbers and tick marks including logarithmic.
- Connect two points with straight line or connect more than two points with straight lines between points in the order given.
- Automatic plotting of histogram.
- Automatic plotting of bar charts.
- Plot of curve identifying characters (from standard character set).
- Built-in routine for scaling to compensate for dot density differences horizontally and vertically so that a square will be square and a circle will be round.
- Variable density of plot.
- Reversible platen so that the paper can move backward as well as forward.
- Standard 5103 character set printed horizontally for chart identification or title.
- Calculate and plot curve fits for given points.

DESCRIPTION

Print Plot/Problem Solver Library consists of a series of modules, that when loaded into the system, will provide a wide range of plotting capabilities. In generating a graph using Print Plot, the user would generally invoke processing as follows:

- Specify, interactively, metric or inch plotting.
- Specify the size and location of graph within the plot limits.
- Specify the location of the origin within the graph, the user X value and Y value at the origin, and the horizontal and vertical scaling factors. The scaling factors can be either linear or logarithmic.
- If axes are to be plotted, either specify automatic plotting of axes, or use Print Plot commands to plot axes to user specifications.
- If grids are to be plotted, invoke the grid plotting functions.
- Specify horizontal and vertical dot density.
- Specify a symbol to be printed at all user-defined points.
- Input user coordinates for all points to be plotted indicating whether each individual point should or should not be connected to the last point provided. In addition to keyboard entered and user program-generated points, the data for plotting points may be provided via a data file.

When generating special types of graphs (bar charts or histograms), the user may utilize the Print Plot routines which are tailored to these specific applications.

CUSTOMER RESPONSIBILITIES

The Print Plot/Problem Solver Library is distributed on cartridge or diskette for loading into the user's system. A *User's Guide* is also provided. The customer should use the test data supplied in the *User's*

Guide to test the system and 5103 Printer, and to make sure the programs work properly.

It is the customer's responsibility to provide sufficient backup cartridges or diskettes (see license agreement for limitations) to ensure continued operation in case of a failure. It is the customer's responsibility to provide sufficient security for these licensed programs.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Print Plot/APL requires a minimum of 32K of processor storage (IBM 5110 models A12 or C12 [tape], A22 or C22 [diskette]).

Print Plot/BASIC also requires a minimum of 32K of processor storage (IBM 5110 models B12, C12, B22 or C22).

The printer control function support will be automatically provided with any Print Plot/Problem Solver Library ordered. The printer control function support is separately available via RPQ S40161.

SOFTWARE REQUIREMENTS None

TERMS and CONDITIONS: See PP Index

**5110 BUSINESS ANALYSIS/PROBLEM SOLVER LIBRARY
5721-DC5****PURPOSE**

This IBM 5110 program contains a comprehensive set of interactive routines for use on the system. It consists of 30 routines written in the BASIC language. It provides the problem solver with procedures for data generation and maintenance, spread sheet analysis, investment analysis, break-even or cost-volume profit analysis, depreciation analysis and time series analysis. The program is designed so that a detailed knowledge of programming is not required.

HIGHLIGHTS

- Comprehensive set of analytical routines to assist the user in examining investment alternatives and in preparing financial plans.
- Spread sheet analysis capability for report creation and update.
- Time Series Analysis for business forecasting and analysis.
- Interactive features include instructional messages, flexible control of calculations, error checking, and data editing.

DESCRIPTION

The Business Analysis/BASIC Problem Solver Library includes 30 routines for helping the financial analyst in exercising the following functions:

- Spread Sheet Analysis:
 - Spread sheet data file creation and update
 - Spread sheet report formatting
- Investment Analysis:
 - Return on Investment Computation
 - Discounted Cash Flow Analysis
 - Loan Analysis (multiple and single)
 - Lease vs. Purchase Analysis
 - Make vs. Buy Analysis
- Break-Even Analysis:
 - Break-even with Definite Assumptions
 - Break-even with Probabalistic Assumptions
- Depreciation Analysis:
 - Straight Line Depreciation
 - Sum-of-years Digit Depreciation
 - Declining Balance Depreciation
 - Equipment Units Depreciation
- Time Series Analysis:
 - Compound Growth Rate Projection
 - Moving Average
 - Seasonal Analysis
 - Cyclical Analysis
 - Auto-covariance and Auto-correlation
 - Cross-covariance and Cross-correlation
 - Exponential Smoothing
 - Simple Regression
- Graphic Presentation:
 - Histograms
 - Exponential Smoothing Plots
- Routine and File Indexing:
 - Business Analysis/Problem Solver Library Routine Menu
 - User-Created Data File
- Data Generation and Maintenance:
 - Create and Update Data Files
 - Select and Rearrange Records in Data Files and Spread Sheet Files
 - Resequence Records in Data Files and Spread Sheet Files
 - Print Data Files

CUSTOMER RESPONSIBILITIES

The Business Analysis/BASIC Problem Solver Library is distributed in machine-readable form (diskette for the 5110) and with a *User's Guide*. Customers should use the procedures outlined in the *User's Guide* with their own data to test the machine-readable code and to make sure that the programs are working properly.

It is the customer's responsibility to provide sufficient backup cartridges or diskettes (no more than 5 copies are permitted under the license agreement) to ensure continued operation in case of a failure. It is the customer's responsibility to provide sufficient security for these licensed programs.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The Business Analysis/BASIC Problem Solver Library will operate on IBM 5110 models B12, C12 (tape), B22 or C22 (diskette). The spread sheet routines require a 132-position printout or display. The IBM 5103 printer is recommended when these routines are used. Larger storage can be utilized by the Business Analysis/Problem Solver Library. This is accomplished automatically during the initialization phase of the Menu program.

SOFTWARE REQUIREMENTS: None

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**5110 MATH/PROBLEM SOLVER LIBRARY (Basic)
5721-DC6****PURPOSE**

IBM 5110 MATH/Problem Solver Library is a set of interactive programs for the solution of frequently encountered mathematical problems in science and industry. The library is available in BASIC only for the IBM 5110. The conversational mode of operation of MATH/Problem Solver Library allows a non-data processing-oriented user to use the library with a minimum of effort.

HIGHLIGHTS

- A comprehensive set of numerical analysis routines
- Control of operation in the case of ill-conditioned problems and error messages
- Ease-of-use due to conversational mode.

DESCRIPTION

MATH/Problem Solver Library consists of a series of routines providing computing capabilities in the following areas:

- Solution of a Linear Equation
- Linear Equation with a Symmetric Positive Definite Matrix
- Linear Equation with a Symmetric Position Definite Band Matrix
- Linear Equation General Band Matrix
- Least Squares Solution of an Over-determined Linear System*
- Complex Matrix Eigenproblem*
- Real Matrix Eigenproblem Part 1 Eigenvalues*
- Real Matrix Eigenproblem Part 2 Eigenvectors*
- Symmetric Matrix Eigenproblem*
- Complete Symmetric Eigenproblem
- Generalized Symmetric Eigenproblem*
- Integration of a Tabulated Function (Trapezoidal Rule)
- Integration of a Tabulated Function (Simpson's Rule)
- Integral of a Tabulated Function (Trapezoidal Rule)
- Integral of a Tabulated Function (Simpson's Rule)
- Derivative of a Tabulated Function
- Integral of a Function (Romberg)
- Integral of a Function (Gaussian Formulas)
- Aitken-Lagrange Interpolation
- Least Squares Approximation (Chebyshev Polynomials)*
- Evaluation of a Polynomial Expanded in Terms of Chebyshev Polynomials
- Least Squares Approximation (User-Supplied Basis)
- Min-Max Approximation Part 1: Data Preparation*
- Min-Max Approximation Part 2: Calculation*
- Local Least Squares Smoothing
- Real Zero of a Real Valued Function
- Local Minimum of a Function of Several Variables
- Zeros of a Polynomial with Real Coefficients
- Zeros of a Polynomial with Complex Coefficients
- First Order Differential Equations
- Inverse Discrete Fourier Transform
- Orthogonal Polynomials
- Elliptic Integrals and Functions
- Gamma Function and its Logarithm
- Fresnel Integrals
- Sine and Cosine Integrals
- Exponential Integral
- Bessel Functions of Integer Order*
- Bessel Functions of the First Kind and Fractional Order
- Modified Bessel Functions of Integer Order*
- Modified Bessel Functions of the First Kind and Fractional Order
- Linear Programming*

* These BASIC routines require a minimum of 32K for the 5110.

CUSTOMER RESPONSIBILITIES

The MATH/Problem Solver Library is distributed in machine-readable form for loading into the user's system. A *User's Guide* is also provided. Customers should use their own test data and the procedures in the user's guide to test machine-readable code to make sure the programs are working properly.

It is the customer's responsibility to provide sufficient backup cartridges/diskettes (no more than 5 copies are permitted under the license agreement) to ensure continued operation in case of a failure. It is the customer's responsibility to provide sufficient security for these licensed programs.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

Math/Basic will operate 30 routines on an IBM 16K 5110. The remaining routines require a minimum 32K machine to operate. The library can be adjusted to reflect the amount of storage available. This is done through the initializing portion of the Menu routine.

SOFTWARE REQUIREMENTS: None

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**5110 STAT/PROBLEM SOLVER LIBRARY (BASIC)
5721-DC7****PURPOSE**

The IBM 5110 STAT/Problem Solver Library is an interactive program encompassing commonly used statistical techniques for the analysis of numerical data. The library is available in BASIC only for the IBM 5110.

STAT/Problem Solver Library helps the problem solver to utilize the computer directly for statistical analysis. A statistically-oriented user should have no difficulty in quickly learning the capabilities of the programs. The interactive mode of the package allows a non-data processing-oriented professional to readily utilize the programs.

Because of the interactive nature of the STAT/Problem Solver Library the user can sit at the keyboard and see the result of the analysis as it is developed. Delays and some of the sources of error associated with batch processing and time sharing usage are eliminated.

HIGHLIGHTS

- A comprehensive set of statistical procedures.
- A user with a knowledge of statistics can learn the program with a minimum of effort.
- Interactive mode simplifies usage.
- Error checking with correction facilities.
- Instructional messages clarify procedures or options available.

DESCRIPTION

STAT/Problem Solver Library consists of a series of routines covering a wide range of capabilities under the following categories:

- **Data Generation** - Read, Print, Edit, Transform
- **Elementary Statistics** - Cross Tabulation, Histogram, Tally, Moments, T-Test, Chi-Square
- **Regression and Correlation Analysis** - Correlation, Simple Regression, Stepwise Regression, Multiple Regression, Polynomial Regression
- **Multivariate Analysis** - Discriminant Analysis, Canonical Correlation, Factor Analysis
- **Analysis of Variance** - One-way Analysis of Variance, Factorial Design
- **Non-Parametric Statistics** - Kendall Ranks Correlation, Sign Test, Wilcoxon's Matched-pairs Signed Ranks Test, Cochran Q-Test, Freedman Two-way Analysis of Variance, Mann-Whitney U-Test, Kendall Coefficient of Concordance Biserial Correlation, Point Biserial Correlation, Tetrachoric Correlation, Phi-Coefficient.
- **Time Series Analysis** - Moving Average, Seasonal Analysis, Cyclical Analysis, Auto-Covariance and Auto-correlation, Cross-Covariance and Correlation, Triple Exponential Smoothing.
- **Biostatistics** - Survival Rate, Probit Analysis

CUSTOMER RESPONSIBILITIES

The STAT/Problem Solver Library is distributed in machine-readable form for loading into the user's system. A *User's Guide* is also provided. Customers should use the procedures outlined in the *User's Guide* with their own data to test the machine-readable code to make sure the programs are working properly.

It is the customer's responsibility to provide sufficient backup cartridges or diskettes (no more than 5 are permitted under the license agreement) to ensure continued operation in case of a failure. It is the customer's responsibility to provide sufficient security for these licensed programs.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

STAT/BASIC will operate on an IBM 16K 5110 system. The library is able to automatically adjust the minimum-maximum entries to fit various storage sizes and input/output options.

SOFTWARE REQUIREMENTS: None

TERMS and CONDITIONS: See PP Index

ACCOUNTING APPLICATIONS For The 5120 COMPUTING SYSTEM

5120 BILLING ... (5721-XB1)
 IBM 5120 PAYROLL ... (5721-XB2)
 IBM 5120 ACCOUNTS PAYABLE ... (5721-XB3)
 IBM 5120 ACCOUNTS RECEIVABLE ... (5721-XB4)
 IBM 5120 INVENTORY REPORTING ... (5721-XB5)
 IBM 5120 GENERAL LEDGER ... (5721-XB6)

PURPOSE

The IBM 5120 Computing System licensed programs for accounting applications are cross-industry programs, applicable to many different business types, which provide the user with powerful tools for running and managing a business.

The levels of support provided for these programs include: Documentation designed to increase ease-of-use and productivity; an Installation Support Center (ISC) Hotline available to all customers for assistance; Responsive Program Temporary Fix (PTF) - an enhancement to the distribution and applying of program fixes.

HIGHLIGHTS

- Interrelated applications through generation and passing of transaction data on diskettes for direct input, as appropriate.
- New approach to program documentation designed to significantly increase ease-of-use and customer self-sufficiency during installation and operation.
- Installation Support Center (ISC), with a direct customer hotline for questions related to the installation and operation of these applications.
- Central Service from the Application Development Center for error correction, including rapid distribution of PTFs and the capability for users to automatically apply the fixes through Responsive PTF facility.
- Enhanced ease-of-use through appropriate use of menu-driven procedure selection and/or screen prompting.
- Built-in auditability and control through such techniques as zero balancing and control totals.
- Installation-time tailoring to select key options and user specific control and report data.
- BRADS II (5798-NXT) file definitions provided with the programs for selected portions of the application files.

DESCRIPTION

BILLING (5721-XB1)

IBM 5120 Billing is a post-billing application providing the user the ability to create invoices for customer orders already shipped. The customer name and address, item descriptions and prices are automatically obtained from the customer and item files if the 5120 Accounts Receivable and Inventory Reporting programs are installed. If these programs are not installed, the data can be keyed in directly for each invoice. Extensions and discounts are automatically applied and transaction records created for direct input to 5120 Accounts Receivable and Inventory Reporting programs.

Functions and Features

- Post-billing.
- Automatic price extensions.
- Broken Case pricing.
- Discounts optionally applied based on invoice total.
- Availability of four customer class prices per item controlled by a price code in the Customer Master File.
- Up to 2 sales taxes (State, local) plus Federal Excise tax.
- Up to 3 classes of special charges (packing, freight, etc.).
- Handles cash sales.
- Billing of non-inventoried items.
- Optional handling of back order, back order shown on invoice.
- Invoice by single order, specified orders, or batch orders.
- Credit memos for returns and adjustments.
- Daily sales information from Billing is summarized in the order file and available to user as input to a user sales history file.
- Auditability and control through edit lists and control totals for Invoice Register, Accounts Receivable and Inventory transaction files.
- Interactive data entry and edit of customer orders.
- Can override any fixed data during data entry (that is, price, discounts, cost, etc.)

- Creates transaction data on diskette for direct input to the 5120 Accounts Receivable and Inventory Reporting.
- Installation-time tailoring including selection of Accounts Receivable/Inventory interface, back order, general ledger account numbers for use with accounts receivable input and automatic invoice numbering.

PAYROLL (5721-XB2)

5120 Payroll provides an application that performs basic payroll computations and produces payroll checks with earnings statements and deduction reports. It accommodates both hourly and salaried payrolls. Additional program flexibility and options are provided to satisfy many special customer needs.

Functions and Features

- Weekly, biweekly, semimonthly or monthly pay periods.
- Provides payroll register, payroll checks with Earnings Statements, Deduction Report (with exceptions) and Distribution Journal.
- Preparation of the 1979 W-2 forms with subtotals and 941-A showing excess wages for SUI.
- Vacation, holiday and sick time processing and reporting.
- Pay for regular employees on hourly basis, with additional capability for
 - Payment of special wages only (for example, piecework).
 - Two overtime rates set by user.
 - A shift differential premium handled as percent of hourly rate or flat amount per hour, set at user option. Shifts 2 and 3 may differ.
 - Pay rates based on "skill" codes.
- Pay for salaried employees, with additional capability for
 - Payment of commission only.
 - Recording overtime hours, with or without pay.
- Provides for processing special payments such as awards and bonuses.
- Allows additional Federal Income Tax withholding at employee's request.
- Provides user a specified tax table for Federal and State/Local tax computation with one state and one local tax deduction per pay period per employee. Up to four state/local changes allowed per year per employee.
- Non-statutory deductions allowed, with capability for:
 - Up to eight per employee, with a total system capacity of 40 non-statutory types.
 - Specifying deduction frequency, and continuing until stopped or predefined limit is reached.
 - Deduction amount may be percent of gross, amount per period, or amount per hour.
 - Stock/bond deduction with a certificate value and balance forward.
- Inquiry to any employee record.
- Security provisions with user pre-set passwords.
- Interactive data entry for file creation/maintenance and transactions.
- Auditability and control through payroll data batch proof and zero balancing general ledger distribution.
- Creation of summary job/department cost distribution data for input to the 5120 General Ledger program.
- Installation-time tailoring, including company name/address, security password and various processing options such as pay rates based on skill, interface to the 5120 General Ledger, job costing and distribution.

ACCOUNTS PAYABLE (5721-XB3)

The 5120 Accounts Payable is an interactive solution designed to assist the user in controlling cash outflow, while maintaining accurate and detailed records of vendor invoices and credits.

Information is provided to help management take advantage of vendor discounts. Accounting controls, audit trails, a menu facility and operator prompting can assist the user in maximizing productivity. Data validity is provided through zero balancing of debits and credits by voucher number at entry time.

Functions and Features

- Multicompany support.
- Payment options by "due date", "on demand", or "within date".

5120 Accounting Applications (cont'd)

- Allows for expedited payments when necessary to deviate from regular payment cycles.
- Optionally allows generated standard recurring payable items for several payment cycles.
- Handles partially prepaid vendor invoices, adjustments, transfer, reversals, and vendor debit and credit memos on an accrual basis.
- Credit memo tracking through key reports.
- Use of up to nine specified cash bank account numbers for cash disbursements.
- Allows accounting for and deduction of cash discounts.
- Supports open payables and cash disbursements.
- Auditability and control functions including zero balancing by voucher and control totals for batch input and update.
- Provides for vendor master file inquiry through file maintenance facility.
- Interactive data entry and correction capability with fast response screen for efficient data entry.
- Use of specified general ledger accounts for payables, discounts earned, cash and expense distributions.
- Creation of journal entry data to be used for input to general ledger or optionally create journal entry on diskette for input to the 5120 General Ledger.
- Installation-time tailoring includes selection and definition of report titles, payment options, interface to 5120 General Ledger and use of security feature.
- Handling of broken-case quantities
- On-demand stock status reporting with flagging of exception items (for example, out of stock, below reorder level, etc.) which may optionally be restricted to selected vendors, item classes, or inventory items
- Comprehensive inventory analysis report
- Perpetual inventory maintenance
- Item costing - both average cost and last cost
- Maintenance of month-to-date and year-to-date sales and cost of items sold for all items
- Displayed inquiry of the contents of Inventory Master File records using the File Maintenance process
- Physical inventory list - in sequence by warehouse and location
- Auditability and control functions including Master File update sequence numbering and dating, and control totals for transaction entry
- Installation-time tailoring

GENERAL LEDGER (5721-XB6)

The 5120 General Ledger System is an application designed to accomplish the basic bookkeeping functions of posting journal entries to general ledger and creating financial statements. The programs are based on double-entry bookkeeping principles in accordance with established professional standards. The system has been designed for easy implementation and installation, allowing a user to be productively operational in a short time.

Functions and Features

- Accommodate up to eleven major divisions of accounts.
- Account structure within each division can be tailored by the user to meet their specific requirements.
- Produces General Ledger, General Ledger Trial Balance, Chart of Accounts and Transaction Listings.
- Produces Balance Sheet and Income Statement on 8 1/2" x 11" format.
- Auditability and control through edit of data input formats, entry of debit and credit transactions under systems guidance, batch total control and zero balancing for input transactions.
- Use of master menu screen, with optional return after each procedure.
- Accepts transactions, direct from diskette, generated by the 5120 Payroll, Accounts Payable and Accounts Receivable programs.

Program Documentation: A documentation approach is provided to help customers install these IBM accounting applications. The materials offer significant improvements in the following areas:

- They are written in user-oriented language.
- The material within each book is presented in an easy-to-follow, step-by-step structure that guides the customer through the installation of the application.
- Hands-on operator training is provided. This training is self-paced and can be used with or without accompanying audio cassettes, depending upon the experience level of the user.
- The materials are designed to interface with the 5120 Operator Training providing a coordinated prerequisite for the specific operator training.
- They are designed to work in conjunction with the ISC customer hotline.
- The books are visually attractive.

The following materials are available for each application.

Getting Ready: This book steps the customer through the implementation process. It spells out, in simple terms, what has to be done to get the application up and running.

Operator Training: Complete instructional materials are provided for training the operator. This training program uses both audio and workbook to bring operators up to speed quickly. After training, the operator workbook and a *Ready Reference Guide* are used as needed.

Reports and Information: This book helps management take full advantage of the reports and information provided by the application. It describes, in detail, the reports produced and how they are used.

In addition, a separate program detail manual will be optionally available for each application.

ACCOUNTS RECEIVABLE (5721-XB4)

The 5120 Accounts Receivable is an application designed to provide the user with timely information to help improve cash flow, and reduce bad debt losses by control of the accounts receivable. The accounts receivable transactions are summarized into debits and credits to the general ledger accounts. The system provides a summarized journal report and optionally creates a general ledger transaction file on diskette, summarized by account, for entry to the user's general ledger.

Functions and Features

- Open-item accounting or balance forward accounting selectable by customer.
- Accounts receivable aging including three aged, one current, and one future period, with aged Trial Balance on demand.
- Customer account information may be selectively printed for credit checking and cash application.
- Automatic creation of late charge transactions which may be reviewed and edited before posting. Late charge rate and first late period can be specified.
- Deferred statement printing.
- Suppression of statements and/or late charges on an individual customer basis, as required.
- Credit limit reporting.
- Past due reporting.
- "Sundry" entries for which general ledger account numbers may be specified at transaction entry time.
- Auditability function including control totals for batch input and update.
- Interactive entry and correction capability for invoice, debit memo, credit memo, payment, adjustment data and late charge data. Fast response screen for efficient data entry.
- Creation of journal summary transactions for input to general ledger, with optional diskette output for input to the 5120 General Ledger program.
- Installation-time tailoring includes user company name and report titles, general ledger account numbers, interface to the IBM 5120 General Ledger and Billing programs, choice by customer of balance forward or open item accounting, and others.

INVENTORY REPORTING (5721-XB5)

The 5120 Inventory Reporting offers small enterprises the management reports to help appropriate optimization of inventory levels. The user is assisted in purchasing decisions by up-to-date reports reflecting stock movement, on-hand and on-order quantities, as well as sales and cost data.

Functions and Features

- Quantity on-hand and warehouse location kept separately for up to three warehouses

5120 Accounting Applications (cont'd)

Installation Support:

Atlanta National Market Support Center
Customer telephone service to the Atlanta National Market Support Center, formerly the ACSC, is available only for selected 5120 licensed programs as follows:

- IBM will provide 90 days of no-charge telephone service to 5120 customers who are installing their first 5120 licensed program. These programs are:
 - Billing (5721-XB1)
 - Payroll (5721-XB2)
 - Accounts Payable (5721-XB3)
 - Accounts Receivable (5721-XB4)
 - Inventory (5721-XB5)
 - General Ledger (5721-XB6)
 - BRADS II (5796-NXT)
- Customers may purchase 12 months of continuing telephone service for all of the above licensed programs.
- Telephone service for the 5100, 5110, and 5120 BASIC programing languages is no longer available.

Responsive Program Temporary Fix (PTF): Responsive PTF is a diskette system designed to have customers automatically install program fixes for the 5120 Accounting Applications and BRADS II.

It consists of a single diskette containing program fixes and a program which prompts the customer to apply the required fix or fixes. The diskette will contain all known fixes to the supported applications. Central Service, at the West Coast Application Development Center, is responsible for developing fixes, maintaining the Responsive diskette, and shipping it to a customer at the request of the ISC. The customer will also receive information on how to initiate the system to the point where screen prompts are provided for further guidance.

Responsive PTF does not replace the normal methods of periodic update releases, as required, through PID. It is meant to serve as an enhanced level of support for use between releases.

Use of Accounting Applications with BRADS II (5796-NXT): BRADS II provides the facility for a non-programmer to define files, create and maintain the files, build file inquiries and generate reports from the file data. The 5120 Accounting Applications (except General Ledger) will further support that capability by providing selective BRADS II file definitions with the applications. Thus, the task of definition, file creation, and maintenance is accomplished as part of the application. A user who has BRADS II can then build inquiries and develop additional reports for the defined files. This facility can help meet user unique inquiry and report requirements not contained in the applications.

In addition, with BRADS II, the user can extend the usefulness and value of the 5120 by developing additional simple applications (that is, asset inventory, company phone book, price lists, mailing lists, bills of material, etc.), without requiring a knowledge of BASIC programming.

BRADS II is also a highly productive application development tool. Thus the user, who also has BASIC language programming experience, can productively develop additional applications of varying complexities.

CUSTOMER RESPONSIBILITIES

IBM may provide normal marketing assistance and guidance. The responsibility for personnel selection and training, installation and continued day-to-day operation lies solely with the customer.

The customer is responsible for error detection and analysis and submission of APARs, but can obtain hotline assistance from the ISC.

IBM Central Service is responsible for the development and distribution of program fixes, but the customer has the responsibility to apply fixes to the program and can obtain hotline assistance from the ISC and use of the Responsive PTF diskette and program.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for these licensed programs when they are operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The IBM 5120 Accounting Applications (General Ledger, Accounts Payable, Payroll, Billing, Inventory Reporting, Accounts Receivable) are designed to operate on an IBM 5120 Computing System or a 5110 Computer with the following minimum configurations:

5110	5120
5110 B22 Computer (32K BASIC) Feature #3200 Diskette Sort (except Payroll)	5110 B32 Computer (32K BASIC) Feature#3200 Diskette Sort (except Payroll)
5103 mdl 11 Printer	5103 mdl 11 Printer
5114 Diskette Unit Feature #3240 (Second Diskette Drive)	

Each of the applications operates individually, with its own diskettes, on a dedicated 5120 or 5110. Though there is data-passing, via diskette, between selective applications, there is no system or file co-residency.

SOFTWARE REQUIREMENTS

The IBM 5110 Accounting FDPs [General Ledger (5798-NPH), Accounts Payable (5798-NPK), Payroll (5798-NPJ), Inventory Reporting (5798-NXK), Accounts Receivable (5798-NPN)] were used as a base for development of the 5120 Accounting Applications. Enhancements, extensive changes to the interfaces, the addition of Billing with an interface to the enhanced Accounts Receivable and Inventory, and the development of a new documentation approach have resulted in major changes. Because of these changes operational problems can occur if the 5110 and 5120 programs are used together. Therefore, IBM cannot support the intermixing of the 5110 and the 5120 applications.

DOCUMENTATION (available from Mechanicsburg)

Marketing Publications

The following program documentation is provided as part of the Basic Material shipped with the programs from PID. It is also available from Mechanicsburg, and includes the following:

IBM 5120 Billing (5721-XB1)
Getting Ready Binder (SB30-0438) contains: ... *Getting Ready Manual* (SB30-0439) ... *Getting Ready Planner Form* (SB30-0441) ... *Reports and Information Manual* (SB30-0440) ... *Operator Training Binder* (SB30-0442) contains: ... *Operator Training Manual* (SB30-0443) ... *Operator Training Cassette* (SV30-0236) ... *Ready Reference Manual* (SB30-0444) ... *Program Detail Manual* (LB30-2519) ... *Application Extension Booklet* (LB30-2527).

IBM 5120 Payroll (5721-XB2)
Getting Ready Binder (SB30-0403) contains: ... *Getting Ready Manual* (SB30-0404) ... *Getting Ready Planner Form* (SB30-0406) ... *Reports and Information Manual* (SB30-0405) ... *Operator Training Binder* (SB30-0407) contains: ... *Operator Training Manual* (SB30-0408) ... *Operator Training Cassette* (SV30-0231) ... *Ready Reference Manual* (SB30-0409) ... *Program Detail Manual* (LB30-2516) ... *Application Extension Booklet* (LB30-2524).

IBM 5120 Accounts Payable (5721-XB3)
Getting Ready Binder (SB30-0424) contains: ... *Getting Ready Manual* (SB30-0425) ... *Getting Ready Planner Form* (SB30-0427) ... *Reports and Information Manual* (SB30-0426) ... *Operator Training Binder* (SB30-0428) contains: ... *Operator Training Manual* (SB30-0429) ... *Operator Training Cassette* (SV30-0234) ... *Ready Reference Manual* (SB30-0430) ... *Program Detail Manual* (LB30-2518) ... *Application Extension Booklet* (LB30-2525).

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**SYSTEM/32 BASIC ASSEMBLER LANGUAGE
and MACRO PROCESSOR
5725-AS1****PURPOSE**

The Basic Assembler language is a symbolic programming language used to write programs for the System/32. Source programs written in this language are processed by the Basic Assembler licensed program to produce relocatable object programs which are converted to executable format by the System/32 System Control Programming-Overlay Linkage Editor facility. The Basic Assembler can be used to create a stand-alone program. The object programs are stored in the System/32 Library. Program loading is performed through System/32 OCL.

Programs may be coded entirely by the user with no dependence on any other programming other than System/32 System Control Programming (5725-SC1).

Basic Assembler may also be used for assembly of relocatable subroutines for use with System/32 RPG II. The subroutines written in the Basic Assembler language are coded by the user and separately assembled. The process of program linking is accomplished during compilation of the RPG II source program.

HIGHLIGHTS

Some of the features provided by the Basic Assembler licensed program and its language are:

- Mnemonic Operation Codes
- Symbolic Referencing of Storage Addresses
- Automatic Storage Assignment
- Address Displacement Calculation
- Convenient Data Representation
- Operand Field Expressions
- Source Identification - Sequence Fields
- Assembler Instructions
- Cross-Reference Listings
- Error Checking and Diagnostic Messages

System/32 macros provide support to the Assembler user through the Macro Processor for the following System Control Program facilities: Disk functions, printer operations, keyboard and display screen access and binary synchronous communications.

The macros are supplied to provide an interface to existing SCP support. Additional macros may be written by the user using the macro definition language provided.

By referring to macro definitions, the Macro Processor expands macro instructions coded by the user. The macro definitions are coded in a macro language. The macro definitions may be supplied by either the user or IBM. See the related System/32 SCP macros. All macro instructions are expanded into assembler source language statements that in turn can be processed by the Basic Assembler.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

IBM System/32 Basic Assembler language and Macro Processor licensed program supports all models and features of the IBM 5320.

SOFTWARE REQUIREMENTS

A concurrent version of IBM System/32 System Control Programming (5725-SC1) is required to support IBM System/32 Basic Assembler language and Macro Processor licensed program.

TERMS and CONDITIONS: See PP Index

**SYSTEM/32 CLIENT ACCOUNTING and
FINANCIAL REPORTING SYSTEM (CAFRS)
5725-C21**

PURPOSE

The System/32 Client Accounting and Financial Reporting System (CAFRS) offers the public accounting profession a comprehensive aid to solving the problems of client accounting. It assists the Certified Public Accountant, Public Accountant, or bookkeeper in operating a more profitable and productive practice.

HIGHLIGHTS

CAFRS can be installed without in-house programming capability:

- File sizes may be changed, within limits, as needed, by the system tailoring procedure to allow additional clients to be serviced or to offer optional processing features to more clients
- File load and maintenance procedures provided
- System-controlled master and transaction file backup procedures
- Easy-to-use runbook is available
- Step-by-step installation activity plan and detail user's information supplied by *Application Reference Manuals*

CAFRS provides ease-of-use options to the user

- Designed to fit industry requirements
- OCL procedures, Sort specifications, and processing programs are packaged into logical work units which simplify system operation
- Monitoring of procedures prevents execution of a program until preceding programs have been completely and successfully executed
- Compatible online/offline file maintenance and transaction data entry via the System/32 keyboard or diskettes created on the 3740 Data Entry System
- Dynamic Backup and Recovery System forces periodic backup of master files and edited transactions and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files
- Reprint options are possible because file updating is separated from report writing functions
- Selective printing options are available for many report functions

CAFRS uses recognized accounting techniques and terminology to provide a solid accounting system:

- Sample user-oriented forms for data preparation, file creation, audit and control are provided
- Clear audit trails and control techniques are provided
- Standard types of accounting reports, such as journals, ledger, trial balance, and financial statements plus special supporting analyses and lists, are provided

DESCRIPTION

The Client Accounting and Financial Reporting System is a ready-to-execute application for the small accounting firm.

It combines two data entry approaches - operator-oriented and batch-oriented. Support is provided for transaction entry through the System/32 keyboard or through a diskette created on a 3740 Data Entry System.

The application has certain records within a control file which contain questionnaire responses. These records allow the application to select file sizes and functions to suit each firm's needs. The questionnaire responses are keyed during initial installation and may be changed as needed. The System Tailoring Procedure allows these responses to be entered.

The System Tailoring Procedure utilizes the answers to a series of questions regarding the firm's requirements. It provides the following:

- Tailoring the application on-site at installation time.
- Allows users to activate and deactivate provided functions as their requirements change.
- All provided functions are included in the programs but only required functions are executed.
- File sizes may be expanded or contracted, as needed, by rerunning the System Tailoring Procedure.

An *Application Reference Manual* provides a step-by-step installation activity plan including sample numbering systems, sample input and maintenance data forms, file loading sequences, control forms with suggested procedures. Volume II of the *Application Reference Manual* provides information on the day-to-day use of the application.

The *Runbook* provides the operator with a detailed and easy-to-use set of instructions showing all the activities necessary to run the programs

on a System/32. The Operator Reference Summary Card is provided for the operator as a reminder of the major operational functions of each procedure. It is intended to be used once the operator is thoroughly trained in the particular application.

Instructional material in the form of a self-study course is provided for the operator for training in the use of the runbook.

An *Application Logic Manual* is provided, as optional licensed material, for use by the self-sufficient customer and for systems engineering continuing support. It describes the architecture of programs, procedures, data base cross-references, data dictionary, and detailed descriptions of each program.

Application Description: The Client Accounting and Financial Reporting System is a full-function ready-to-execute application. It includes application reference manuals, a runbook, source code, object code, execution procedures, and an application logic manual, if ordered as optional base material.

It is designed to allow flexibility in the options included to meet an individual client's special needs:

- Up to 13 periods per fiscal year
- Automatically calculated journal entries based upon algorithms previously defined by the accountant
- Multiple special-purpose journals with source code, related accounts, and headings specified by client
- Ability to correct prior periods
- Extensive chart of account flexibility to provide desired heading and account description information, up to 9 levels of subtotals for combining accounts, spacing and paging control
- Optional titles and formats for financial statements

Support is provided for the optional consolidation of multiple clients. Maintenance is provided for eliminating entries. Controls are included to force fiscal period alignment of clients being consolidated. The same processing capabilities are available for the consolidated client as for others.

Optional features and reports are available for any client, such as:

- Last year comparative data on financial statements
- Print-suppression of zero-balance accounts on financial statements
- Balance sheet
- Income and expense statement
- Combined department income and expense reporting
- Income and expense comparison to budget
- Income and expense account balance comparison to a specified account balance, by department
- Income and expense account balance comparison to a client-specified base, such as number of rooms, square feet, or miles driven
- Supporting schedules
- Statement of Changes in Financial Position with related worksheet and ability to process adjustments
- Reporting of financial ratios, defined by client with comparison to industrial averages
- Employee payroll register
- Printing of presently formatted 941a and W-2 forms
- Accountant's transmittal letter
- Notes to the financial statements
- Annual General Ledger

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day to day operation lies solely with the customer.

Installation of System/32 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This IBM System/32 program will execute on all models of the IBM System/32. The programs are compiled assuming a 16K minimum system. Because of volume and time constraints, there may be a requirement for providing offline keying on an IBM 3740 Data Entry System. If an IBM 3742 is to be used, it must have the 128-character record features (128-character - #5455, and feature group A - #4004).

For presentation purposes on the reports, left and right parentheses have been included to indicate a dollar amount opposite an account's normal balance. The 64-character set feature is required for the System/32 to print the parentheses.

PROGRAM PRODUCTS

System/32 CAFRS (cont'd)

Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries. Because of this, no other user-written program may co-reside with this application unless stringent coding requirements for these programs are met to insure compatibility with the Client Accounting and Financial Reporting System. The *Application Logic Manual* discusses in detail the coding conventions used for the development of CAFRS.

SOFTWARE REQUIREMENTS

These programs are written in IBM System/32 RPG II Programming language and execute under control of the IBM System/32 System Control Program (5725-SC1). IBM System/32 Utilities licensed program (5725-UT1), which includes Sort, Data File Utility, and Source Entry Utility, is required for execution of the programs. The IBM System/32 RPG II Compiler (5725-RG1) is required if modifications to the source code are necessary.

TERMS and CONDITIONS: See PP Index

**SYSTEM/32 LUMBER DEALERS
MANAGEMENT ACCOUNTING SYSTEM**

BILLING ... 5725-D4F
ACCOUNTS RECEIVABLE ... 5725-D4B
INVENTORY CONTROL ... 5725-D4D
SALES ANALYSIS ... 5725-D49

PURPOSE

These modular applications are available for either a 16K or 24K System/32. The application function and data base are exactly the same. Performance improvements in the larger memory size versions for each system come from the reduction of overlays, incorporation of larger blocking factors, and use of dual I/O areas.

When all four applications are installed they constitute an interrelated application set with an integrated data base. They can help users manage their two largest business assets, accounts receivable and inventory, and give them profit performance data on their products, customers, and salesmen. They can also help the user increase operational efficiency and customer service.

The Payroll, Accounts Payable, and General Ledger licensed programs of the Distribution Financial Accounting System (DFAS) can co-reside with the Lumber Dealers Management Accounting System.

DESCRIPTION**BILLING (5725-D4F)**

A post-billing system with data entry from the System/32 keyboard and/or diskettes keyed on a 3740 Data Entry System. Editing, invoice printing, invoice register, and sales summary. Features include:

- Ship-to address file
- Variable price selection methods
 - Operator entry of price
 - Contract price file
 - Customer code selects either the list price, or, one of six prices, discounts from list price, or markups from cost
- Price conversion, with computations for square foot, lineal foot, and board foot items
- Estimate preparation
- Price list printing - six prices in addition to list price
- State sales tax and one local sales tax
- Customer code selects 1 of 6 payment terms

ACCOUNTS RECEIVABLE (5725-D4B)

A combined balance forward and open item method, with data editing, monthly statements, and delinquency notices. Features include:

- Balance forward or open item selectable by account
- Lien expiration date checking
- Late charge capability for both open item and balance forward accounts
- Credit limit checked during order edit if Billing is installed
- Variable statement format - two options
- Aged trial balance monthly or on-demand
- Statement by job for contractors or by branch for multi-location wholesalers

INVENTORY CONTROL (5725-D4D)

A system which allows management to obtain the information needed for purchasing and profitability analysis, including reports to assist in taking inventory. Features include:

- Stock Status Review - on demand, selectable for
 - All items, item within limits, active items only
 - Sequence by vendor (optional), item class, or item
 - Exceptions only: Below minimum or cost deviation
 - Current stock position: On hand, on order, and available
 - Sales and cost information: This month and year-to-date
- Stock Status Report - monthly
 - Current stock position
 - Activity during the month
 - Year-to-date drop shipped quantities
- Inventory Analysis Report - on demand in sequence by
 - Item number
 - Date of last use or sale
 - Months supply on hand
 - Extended cost on hand
 - Vendor number
 - Item class
 - Vendor/item class

- Alternate cost on hand
- Year-to-date sales
- Basic Unit Cost - Standard cost method
- Alternate Cost - average cost
- Multiple Warehouses

SALES ANALYSIS (5725-D49)

Sales and profitability figures by salesman, customer, item, and item class. Availability of the information in the following reports is dependent upon the applications selected and their installation sequence.

- Daily sales recap by salesman (Data from Billing or Accounts Receivable)
- Monthly salesman sales analysis (Data from Billing or Accounts Receivable)
- Monthly customer within salesman sales analysis (Data from Billing or Accounts Receivable)
- Monthly customer sales analysis (Data from Billing or Accounts Receivable)
- Monthly item and item within item class sales analysis (Data from Billing or Inventory)
- Monthly item class within customer sales analysis (Data from Billing)
- The ability to report sales information for groups of items which do not have inventory records on file
- If Sales Analysis is the first or only Lumber Dealers application installed, the customer must provide data entry and edit programs.

System Functions

- Integrated data base which simplifies file maintenance and provides for more efficient disk utilization
- User-maintained constants file is used in most programs which allows operator to modify data subject to change, such as late charges rate, tax rates, terms, or aging dates, without the need to change and recompile programs
- Specific file load and maintenance programs are included for each master file
- Easy-to-use printed *Runbook* for each application
- Contains additional space in item and customer master records for customer use
- OCL procedures, sort specifications, and processing programs are cataloged into logical work units which optimize system utilization
- Automatic monitoring of execution sequence prevents execution of a program until preceding required programs have been completely and successfully executed.
- Dynamic backup and recovery system provides for periodic backup of master files and edited transactions and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files.
- Reprint options are possible because file updating is separated from report printing functions.
- Selective printing allows the operator to control the printing mode for reports.
- Inquiry programs
- Offline 3741 data entry diskette formats

File Size and Application Function Tailoring Capability

Programs and procedures for file allocation are included. The customer can allocate file space during installation and change file space allocations as business volumes change. Also, customers may control the operation of some application functions by file maintenance and by operator-controlled run-time options.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/32 programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The 16K options of these IAPs will execute on all models of the IBM System/32. The 24K option will execute on all models of the IBM

PROGRAM PRODUCTS

**System/32 Lumber Dealers Management Accounting
System (cont'd)**

System/32 except the 16K model. There may be a requirement for providing offline keying on an IBM 3740 Data Entry System.

SOFTWARE REQUIREMENTS

The LDMAS programs are written in IBM System/32 RPG II programming language.

The 16K and 24K IBM System/32 options are executed under control of the IBM System/32 System Control Program (5725-SC1 Version 5 and above). IBM System/32 Utilities licensed program (5725-UT1), which includes Sort, Data File Utility, and Source Entry Utility, is required for execution of the system. The RPG II Compiler (5725-RG1) is required if modifications are anticipated.

Instructional Materials

Operator Introduction and Exercises

These materials, consisting of a *Student Guide*, audio cassettes, and System/32 diskettes, will help the operator learn and practice operations without using the customer data files. One copy will be provided at no charge to the customer.

One copy of the following material is supplied via SLSS when program number and initial library are specified. Additional copies may be obtained by ordering them individually from Mechanicsburg.

Audio Cassettes (2) (SV30-0002) ... System/32 Diskettes (3) (SV30-0003) ... *Student Guide* (SR30-0171) ... *Advisor Guide* (SR30-0169) ... *Runbook* (SR30-0170) ... Binder (SV30-0024).

SYSTEM/32 FOOD DISTRIBUTORS MANAGEMENT ACCOUNTING SYSTEM

BILLING ... 5725-D6A
ACCOUNTS RECEIVABLE ... 5725-D66
INVENTORY CONTROL ... 5725-D68
SALES ANALYSIS ... 5725-D6C

PURPOSE

These modular applications are available for either a 16K or 24K System/32. The application function and data base are exactly the same. Performance improvements in the larger memory size versions for each system come from the reduction of overlays, incorporation of larger blocking factors, and use of dual I/O area.

When all four applications are installed, they constitute an interrelated application set with an integrated data base. They can help users manage their two largest business assets, accounts receivable and inventory, and give them profit performance data on their products, customers, and salesmen. They can also help the user increase operational efficiency and customer service.

The open order file, slot sequenced picking lists and automated pricing and discounting methods can help improve order processing speed and accuracy. Inventory Control provides information to the buyer that will help optimize inventory investment through identification of the obsolete, slow moving, and unprofitable items; and help increase inventory turns and service levels. Automatic credit limit checking, variable credit terms, late charges on open item and balance forward accounts, delinquency notices, and aged receivables reports provide tools for reducing bad debt losses and increasing cash flow. Daily, monthly, and on-demand sales reports help monitor the attainment of the distributor's sales objectives.

The Payroll, Accounts Payable, and General Ledger licensed programs of the Distribution Financial Accounting System (DFAS) can co-reside with Food Distributors Management Accounting System. If Billing is used in the prebilling mode, a compatible inventory control system must be installed before or with Billing.

DESCRIPTION

BILLING (5725-D6A)

A prebilling system (when used with a compatible inventory control system) with postbilling capability, with data entry from the System/32 keyboard and/or from diskettes keyed on a 3740 Data Entry System, with editing, invoicing, invoice register, and a salesman's recap. Features include:

- Open orders file with listing by customer and/or item that allows either case labels or picking list in warehouse (slot) sequence
- Ship-to address file
- Variable pricing methods, including:
 - Contract pricing
 - Customer class pricing (six classes)
 - Cost plus pricing
 - Catchweight pricing
 - Broken case pricing and surcharge
 - Special charges and allowances
 - Case label charges
 - Cash and trade discounts
- Sales and tobacco tax
- Credit limit checking
- Automatic invoice numbering
- Special deals
- Automatic substitution
- Suggested retail price on invoice and case labels

ACCOUNTS RECEIVABLE (5725-D66)

Accounts Receivable provides for the recording, controlling, and reporting of money owed for merchandise sold or services rendered. Recognizing that a major portion of a wholesale food distributor's assets may be tied up in accounts receivable, the procedures are designed to provide timely information that helps your customer:

- Maximize profit and return on investment through tight control over all accounts due
- Minimize losses from bad debts through appropriate attention to slow-paying accounts
- Maintain customer goodwill through prompt, accurate record keeping

The major features of Accounts Receivable include:

- Balance forward or open item selectable by account
- Late charges for both open item and balance forward accounts on monthly statements
- Credit limit checked during order edit if Billing installed

- Monthly or weekly statements and delinquency notices
- Aged trial balance monthly or on demand - Summary or detail
- Aging into four aging periods

INVENTORY CONTROL (5725-D68)

Inventory control involves the recording of items received, sold, and on hand, the updating of item costs and the recording of activity dates.

Inventory Control can provide accurate, periodic reviews of the status of each item, while identifying any exception conditions, to assist management in deciding what to buy, how much to buy and how often to buy.

Inventory Control provides information that helps:

- Maintain records of all items physically in stock as well as on order, providing control and auditing for this major investment
- Arrange for timely, economical ordering of stock
- Minimize investment required to meet a specific service level, by highlighting overstocked or slow-moving items.

The major features of Inventory Control include:

- Two cost figures - last cost and burdened cost
- Maintenance of broken case quantities
- Warehouse location (slot)
- Physical inventory aids
- An array of reports to assist in:
 - Buyer ordering
 - Inventory Management
 - Transaction recording and control
 - Inventory Accounting

SALES ANALYSIS (5725-D6C)

Sales Analysis offers sales and profitability figures by salesman, customer, item, and item class. Availability of the information in the reports is dependent upon the applications selected and their installation sequence. Major Sales Analysis Reports include:

- Daily sales recap by salesman (data from Billing or Accounts Receivable).
- Monthly salesman sales analysis - current and year-to-date (Data from Billing or Accounts Receivable).
- Monthly customer sales analysis - current and year-to-date (Data from Billing or Accounts Receivable).
- Monthly salesman/customer sales analysis - current and year-to-date (Data from Billing or Accounts Receivable).
- Monthly item and item within item class sales analysis - current and year-to-date (Data from Billing or Inventory).
- Monthly item class, within customer, within salesman sales analysis - current and year-to-date (data from Billing).

If Sales Analysis is the first or only application installed, the customer must provide data entry and edit programs.

Functions

- Integrated data base which simplifies file maintenance and provides for more efficient disk utilization.
- User-maintained constants file is used in most programs which allows operator to modify data subject to change, such as late charge rate, tax rates, terms, or aging dates, without the need to change and recompile programs.
- Specific file load and maintenance programs are included for each master file.
- Easy-to-use printed *Runbook* for each application.
- Contains additional space in item and customer master records for customer use.
- OCL procedures, sort specifications, and processing programs are cataloged into logical work units which optimize system utilization.
- Automatic monitoring of execution sequence prevents execution of a program until preceding required programs have been completely and successfully executed.
- Dynamic backup and recovery system provides for periodic backup of master files and edited transactions and keeps track of what procedures need to be rerun from the last backup point to re-create up-to-date master files.
- Reprint options are possible because file updating is separated from report printing functions.

**System/32 Food Distributors
Management Accounting System (cont'd)**

- Selective printing allows the operator to control the printing mode for reports.
- Inquiry programs, with data retrieval options selectable at program run time, provide current information from the customer and item master files.
- Offline 3741 data entry diskette formats.

File Size and Application Function Tailoring Capability: Programs and procedures for file allocation are included. Customers can allocate file space during installation and change file space allocations as business volumes change. They may control the operation of some application functions by file maintenance and by operator controlled run-time options.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/32 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The 16K option of these IAPs will execute on all models of the IBM System/32. The 24K option will execute on all models of the IBM System/32 except the 16K mdl. There may be a requirement for providing offline keying on an IBM 3740 Data Entry System.

SOFTWARE REQUIREMENTS

The FDMAS IAPs are written in IBM System/32 RPG II programming language.

The 16K and 24K IBM System/32 options are system-executed under control of the IBM System/32 Control Program (5725-SC1 Version 5 and above). IBM System/32 Utilities licensed program (5725-UT1), which includes Sort, Data File Utility, and Source Entry Utility, is required for execution of the system. The RPG II Compiler (5725-RG1) is required if modifications are anticipated.

Instructional Materials**Operator Introduction and Exercises**

These materials, consisting of a *Student Guide*, audio cassettes, and System/32 diskettes, will help the operator learn and practice operations without using the customer data files. One copy will be provided at no charge to the customer.

One copy of the following material is supplied via SLSS when program number and initial library are specified. Additional copies may be obtained by ordering them individually from Mechanicsburg.

Automatic credit limit checking, variable credit terms, late charges on open item and balance forward accounts, delinquency notices, and aged receivables reports provide tools for reducing bad debt losses and increasing cash flow. Daily, monthly, and on-demand sales reports help monitor the attainment of the distributor's sales objectives.

The Payroll, Accounts Payable, and General Ledger licensed programs of the Distribution Financial Accounting System (DFAS) can co-reside with the DMAS licensed programs.

DESCRIPTION

BILLING (5725-D41)

A postbilling system with data entry from the System/32 keyboard and/or from diskettes keyed on a 3740 Data Entry System, with editing, invoicing, invoice register, and salesman's recap. Features include:

- Open orders file allows printing of either order acknowledgements or packing lists
- Ship-to address file
- Variable price selection methods
- Variable item discount or markup flexibility
- Variable payment terms and cash discounts
- Broken case pricing with surcharge
- Pricing unit conversion - when inventory unit differs from selling unit
- Container charges automatically applied
- Price list
- Daily backorder slips
- Federal Excise tax calculated
- State sales tax (standard) plus two local sales taxes
- Monthly tax totals report

ACCOUNTS RECEIVABLE (5725-D43)

A combined balance forward and open item method, with data editing, monthly statements, and delinquency notices. Features include:

- Balance forward or open item selectable by account
- Late charges for both open item and balance forward accounts
- Future dating
- Credit limit checked during order edit if Billing is installed
- Monthly statements and delinquency notices
- Aged trial balance monthly or on demand - summary or detail
- Statements by job or branch location
- Aging of customer invoices with three past due periods

INVENTORY CONTROL (5725-D45)

A system which allows management to obtain the information needed for purchasing and profitability analysis, including a perpetual inventory system and a physical inventory system. Features include:

- Stock Status Review - on demand
- Stock Status Report - monthly

- Inventory Analysis Report - on demand
- Basic Unit Cost - average cost method
- Alternate Cost - last cost method
- Multiple Warehouses

SALES ANALYSIS (5725-D47)

Sales profitability figures by salesman, customer, item, and item class. Availability of the information in the following reports is dependent upon the applications selected and their installation sequence.

- Daily sales recap by salesman (data from Billing or Accounts Receivable)
- Monthly salesman sales analysis - current and year-to-date (data from Billing or Accounts Receivable)
- Monthly customer sales analysis - current and year-to-date (data from Billing or Accounts Receivable)
- Monthly salesman/customer sales analysis - current and year-to-date (data from Billing or Accounts Receivable)
- Monthly salesman/customer/item class sales analysis - current and year-to-date (data from Billing)
- Monthly item and item within item class sales analysis - current and year-to-date (data from Billing or Inventory)

If Sales Analysis is the first or only DMAS application installed, the customer must provide Data Entry and Edit Programs.

System functions

- Integrated data base which simplifies file maintenance and provides for more efficient disk utilization.
- User-maintained constants file is used in most programs which allows operator to modify data subject to change, such as late charge rate, tax rates, terms, or aging dates, without the need to change and recompile programs.
- Specific file load and maintenance programs are included for each master file.
- Easy-to-use printed RUNBOOK for each application
- Contains additional space in item and customer master records for customer use.
- OCL procedures, sort specifications, and processing programs are cataloged into logical work units which optimize system utilization.
- Automatic monitoring of execution sequence prevents execution of a program until preceding required programs have been completely and successfully executed.
- Offline 3741 data entry diskette formats.
- Dynamic backup and recovery system provides for periodic backup of master files and edited transactions and keeps track of what procedures need to be rerun from the last backup point to re-create up-to-date master files.
- Reprint options are possible because file updating is separated from report printing functions.
- Selective printing allows the operator to control the printing mode for reports.
- Inquiry programs provide current information from the customer and item master files.

File Size and Application Function Tailoring Capability: All necessary programs and procedures for file allocation are included with the DMAS programs. The customer can allocate file space during installation and change file space allocations as business volumes change. Also, the customer may control the operation of some application functions by file maintenance and by operator-controlled run-time options.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/32 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The 16K option will execute on all models of the IBM System/32. The 24K option will execute on all models of the IBM System/32 except the 16K model. There may be a requirement for providing offline keying on an IBM 3740 Data Entry System.

SOFTWARE REQUIREMENTS

System/32 DMAS (cont'd)

The DMAS licensed programs are written in IBM System/32 RPG II programming language.

The 16K and 24K System/32 options are executed under control of the IBM System/32 System Control Program (5725-SC1 Version 5 and above). IBM System/32 Utilities licensed program (5725-UT1), which includes Sort, Data File Utility, and Source Entry Utility, is required for execution of the system. The RPG II Compiler (5725-RG1) is required if modifications to the IAPs are anticipated.

Instructional Materials

Operator Introduction and Exercises

These materials, consisting of a *Student Guide*, audio cassettes, and System/32 diskettes, will help the operator learn and practice operations without using the customer data files. One copy will be provided at no charge to the customer.

SYSTEM/32 DISTRIBUTION FINANCIAL ACCOUNTING SYSTEM (DFAS)

GENERAL LEDGER ... 5725-D61
ACCOUNTS PAYABLE ... 5725-D62
PAYROLL ... 5725-D63

PURPOSE

These three applications provide distributors with a powerful aid in managing their business.

HIGHLIGHTS

- Independent or Interrelated application approach:
 - Modular design facilitates sequential application installation
 - Single data entry results in multiple application updates
 - Modular design allows users to choose the applications that address their problem areas
- Wide variety of reports and report options included:
 - Management reporting is a byproduct of normal data entry
 - The 941-As and W-2s are saved on diskette and may be printed later
 - Detail or summary listings within a range of keys is supported in many reports
- Uses recognized accounting techniques and terminology to provide a solid accounting system:
 - Clear audit trails and control techniques are provided
 - Sample user-oriented forms for data preparation, file creation, audit and control are provided
 - Security code deters unauthorized execution of key programs in each application
 - A journal reference numbering system supplies an audit trail for any application that generates transactions into the General Ledger
- The System/32 product may co-reside, but not interact, with the System/32 Distribution IAPs written up elsewhere in this section.
- Can be installed without customer programming capability:
 - System tailoring procedure facilitates account growth by allowing on-site changes to file sizes and determination of functions used
 - File maintenance and audit procedures provided
 - Easy-to-use runbook
 - Operator self-study course is available
 - Step-by-step installation activity plan provided by the *Application Reference Manuals*
 - User's information supplied to the supervisor by the *Application Reference Manuals*

SPECIAL SALES INFORMATION

Each application offers opportunities for growing installed System/32s. Each is primarily intended for the distributor with 20-250 employees.

Key accounting and management reports are provided to allow selling and installing without a requirement for Systems Engineering Services or customer programming capabilities.

Each application is a customer requirements-oriented system, and caution should be used in changing the system design, function, or data base layout. Exercise care in proposing these applications to large distributors. Make an extensive study of the large distributor's needs to determine the applicability, throughput, and the extent of any needed modification to the programs, procedures, or file sizes.

DESCRIPTION

These three applications are independent yet interrelated, ready-to-execute applications for the small distributor:

- General Ledger
- Accounts Payable
- Payroll

The system combines two data entry approaches - Operator-Oriented and Batch-Oriented. Support is provided for transaction entry through the System/32 keyboard or through a diskette keyed offline on a 3740 Data Entry System. The three easy-to-operate applications can be installed in separate stages at different times and still be an interrelated system.

Each application has certain requirements for records within a cross-application Constants File which contains questionnaire responses. These records allow the application to select certain fields for editing, file sizes, and functions to suit each customer's needs. The questionnaire responses are keyed during initial installation and may be changed as needed. The System Tailoring Procedure allows these responses to be entered.

The System Tailoring Procedure utilizes the answers to a series of questions regarding a distributor's requirements. It provides the following:

- Tailoring the application on site at installation time.
- Allows users to change the selection of provided functions as their business changes.
- All provided functions are included in the programs but only required functions are executed.
- File sizes may be expanded or contracted as needed by rerunning the System Tailoring Procedure.

An *Application Reference Manual* Volume 1 provides a step-by-step installation activity plan including sample numbering systems, sample input and maintenance data forms, file loading sequences, and control forms with suggested procedures. Volume 2 of the *Application Reference Manual* provides information on the day-to-day use of the application.

The *Runbook* provides the operator with a detailed and easy-to-use set of instructions showing all the activities necessary to run the programs on a System/32. The Operator Reference Summary Card is provided for the operator as a reminder of the major operational functions of each procedure. It is intended to be used once the operator is thoroughly trained in the particular application.

Instructional material, with exercises, is provided for operator training in the use of the *Runbook*. The course is not application-dependent. Therefore, only one copy of the course is needed per customer no matter how many DFAS applications are installed.

An *Application Logic Manual* is provided, as optional licensed material, for use by the self-sufficient customer and for systems engineering continuing support. It describes the architecture of programs, procedures, data base cross-references, data dictionary, and detailed descriptions of each program.

Applications Description: The three applications are ready-to-execute applications. Each includes samples of all input forms and control forms. Also included are the *Application Reference Manuals*, a *Runbook*, Source Code, Object Code, execution procedures, and the *Application Logic Manual*, if it is ordered as optional basic material.

These are some general features which all three applications have:

- Designed to fit industry requirements
- Security codes to deter unauthorized use of master files
- In-house inclusion/exclusion of functions to be executed
- OCL procedures, Sort specifications, and processing programs are packaged into logical work units which simplify system operation
- Monitoring of execution sequence prevents execution of a program until preceding required programs have been completely and successfully executed
- Compatible online/offline file maintenance and transaction data entry via the System/32 keyboard or diskettes created on the 3740 Data Entry System
- Dynamic Backup and Recovery System forces periodic backup of master files and edited transactions, and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files
- Reprint options are possible because file updating is separated from report writing functions
- Some report printing can be deferred to a more convenient time
- Selective printing options are available for many report functions

GENERAL LEDGER (5725-D61)

This application combines all the transactions affecting the financial status of the company during the period. They may be entered directly as a General Journal Entry or may have been previously entered through interface with Accounts Payable or Payroll. Support is provided for either a 13-period or 12-month fiscal year. At period-end closing time, audit listings and the Financial Statement Worksheet are provided to help verify that the user is still in balance before proceeding into the actual closing. The reports will also aid in generation of any necessary closing entries.

An Income Statement and Balance Sheet are standard report outputs. The user can design the format of these reports with an easy-to-use format description procedure. The financial reports can illustrate current financial data as compared to historical information, also to budget information on the Income Statement. The capability is provided to format Income Statements by subdivisions of a company, such as department. Several companies' financial information may be combined into one Balance Sheet and Income Statement. A Statement of Changes in Financial Position Worksheet is provided.

Users may define their own Chart of Accounts or use a suggested account structure provided with the application. The fiscal year start period or month is user-defined. Multiple company support for up to ten companies is included. Any transactions passed from Payroll are applied to company number one only.

System/23 DFAS (cont'd)**ACCOUNTS PAYABLE (5725-D62)**

The Accounts Payable application provides an Open Payables and Cash Disbursements function on either an accrual or cash basis. Invoices and credit memos entered may be multi-lined and distributed by General Ledger account number. Entries may be for standard or one-time vendors and may be open or pre-paid. Credit memos may be entered manually or initiated automatically by referencing a prior entered invoice. Invoice payments may be assigned to a vendor other than the original vendor. Invoices may be controlled through the application based upon a voucher number entered with the invoice.

A Purchase Journal provides the audit trail for cost transactions entering into the General Ledger system and into the Open Payables File. An Open Payables Report is provided in due date or vendor sequence. This turnaround document provides a way to select for payment by date, vendor, or invoice, including partial payments, for Cash Disbursements. Invoices may be entered or placed in hold status to prevent inadvertent payment. A Cash Requirements Report is used to assist in insuring sufficient funds are available and proper invoice selection was made before the checkwriting procedure begins. The Cash Disbursements Journal provides an audit trail for its transactions entering the General Ledger application and acts as the Check Register. Checkwriting and reconciliation are also provided.

A Vendor Analysis Report indicates key business volumes and discounts lost and taken by previous year and current year. An additional analysis report by business volume per vendor is also provided. Multiple company support for up to 10 companies is provided.

PAYROLL (5725-D63)

This hourly/salary/executive payroll provides for regular, overtime, premium, vacation, and sick pay. It may be run weekly, biweekly, semimonthly, monthly. Hours may be entered daily or by pay period. Exception hours provide time and one-half, double-time, double-time and one-half, and triple time capabilities. Rates may be selected from the Employee Master Record or keyed in as an override. Shift differential capabilities are provided for second and third shift. The differential may be defined as a percentage of the rate or cents to be added to the rate.

Vacation/Holiday pay may be part of a regular pay check or on a separate check. A bonus payment is paid on a separate check with a flat percentage of income tax deducted. Sick pay may be fully non-taxable or only liable for income tax. Wages subject to Federal Unemployment Insurance (FUI) and State Unemployment Insurance (SUI) are determined.

The ability to handle taxable or non-taxable adjustments, pay advances, and employer-paid union benefits (taxable and non-taxable) is also provided. Once the gross earnings is calculated, deductions will be taken to reach net pay. In addition to calculating present Federal and FICA taxes, a standard tax algorithm is provided to calculate most present state taxes based upon customer-provided data. Local taxes may also fit the standard tax algorithm provided. The state disability insurance deductions also use a standard algorithm based upon customer-provided data. Miscellaneous deductions may be taken by percent, fixed amount, hourly rate, upper limit, or cyclic within a user-specified frequency. Union deductions may be taken by percent, hourly rate, or fixed amount within a user-specified frequency.

Handwritten paychecks and paychecks never cashed (reversals) are also supported by the application. Once the payroll register and checks are printed, many analysis reports are produced: Labor Distribution, Miscellaneous Deductions, Union Deductions, YTD/QTQ Earnings, Workmen's Compensation Worksheet, and Payroll Journal. The presently formatted W-2 and 941A reports are also provided.

The capability is provided to pass transactions to the General Ledger application, if installed. These transactions will be applied towards company one only. Payroll may be on either a cash or accrual basis. If the cash basis is selected, no transactions are passed to the General Ledger.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/32 programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

The three applications are intended to be independent yet interrelated. Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries.

Each application may co-reside, but will not interact, with the Distribution IAPs but may also operate as stand-alone applications.

The Distribution IAP must have a Constants File with a record length of 64 characters. The original shipments of the Food and Paper IAPs for 24K machines had 59-character records. The customers that received

these original shipments will have to update their IAPs to the larger record size before they will co-reside with DFAS.

HARDWARE REQUIREMENTS

Each of these IBM System/32 Industry Application Programs will execute on all models of the IBM System/32. The programs are compiled assuming a 16K system. Because of volumes and time constraints, there may be a requirement for providing offline keying on an IBM 3740 Data Entry System. If an IBM 3742 is to be used, it must have the 128-character record features (128-character - #5455 and feature group A - #4004).

SOFTWARE REQUIREMENTS

The application programs for the IBM System/32 are written in IBM System/32 RPG II Programming language and execute under control of the IBM System/32 System Control Programming (5725-SC1 Version 3). The IBM System/32 Utilities licensed program (5725-U11), which includes Sort, Data File Utility, and Source Entry Utility, is required for execution of the programs. The IBM System/32 RPG II Compiler (5725-RG1) is required if modifications to the source code are necessary.

Instructional Materials

DFAS Operator Instructions (SBOF-3584).

One copy is supplied via SLSS when program number and initial library are specified. Additional copies can be obtained by specifying SBOF-3584 which includes the following:

Binder (SR30-0120) ... *Study Guide* (SR30-0117) ... *Sample Run Book* (SR30-0118) ... *Advisor Guide* (SR30-0119) ... *Cassette* (SV30-0073) ... *Diskette* (SV30-0074) ... *Plastic Insert* (SR30-0166)

RPOs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

**SYSTEM/ 32 STUDENT RECORDS (5725-E31),
STUDENT ACCOUNTING (5725-E32),
STUDENT SCHEDULING (5725-E33)**

PURPOSE

Each program offers opportunities for new name and first systems account sales in small school districts. These applications are primarily intended for small school districts, or large secondary schools.

The Student Records IAP, which provides the data base and file maintenance functions, is a prerequisite for either or both of the other packages.

These three applications provide the school with a powerful aid in managing its student record keeping functions.

The system design of these packages incorporates many significant features:

- General - System tailoring to the schools' unique requirements for number of periods in a school day, number of terms (or semesters) in a year, state reporting cycles, etc. All input specifications are described in terms familiar to school administrators and require no detailed knowledge of data processing techniques. Data files are shared among applications.
- Student Records - provides common data base and file maintenance functions for the other applications. Basic record keeping and reporting functions essential for secondary schools are also included.
- Student Accounting - consists of an Attendance Accounting Application and a Mark Reporting Application.
- Student Scheduling - supports both machine scheduling and "arena" scheduling of students to classes. Provides many reports to assist the principal and counselor in the scheduling process.

HIGHLIGHTS

- Interrelated applications approach:
 - Modular design allows users to choose applications that address their problem areas
 - Modular design facilitates sequential application installation
 - Single data entry results in multiple application updates
- Wide variety of reports and report options included:
 - Management reporting is a byproduct of normal data entry
 - Optional sequences and selection within a range is supported in many reports
- Uses recognized accounting techniques and terminology to provide a solid student accounting system:
 - Clear audit trails and control techniques are provided
 - Sample user-oriented forms for data preparation, file creation, audit and control are provided
 - Security codes deter unauthorized execution of key programs in each application
- Can be installed without customer programming capability:
 - Designed to fit industry requirements
 - System tailoring procedure facilitates account growth by allowing on-site changes to file sizes and determination of functions used
 - File maintenance and auditability provided
 - Easy-to-use runbook
 - Operator self-study course
 - Step-by-step installation activity plan and detailed user information provided by the *Application Reference Manual*

DESCRIPTION

These three applications are an interrelated and ready-to-execute set of applications for the small school district or large secondary school:

- Student Records
 - Data Base and Maintenance
- Student Accounting
 - Attendance Accounting and Mark Reporting
- Student Scheduling
 - Assignment of Students to Classes

The system combines two data entry approaches - operator-oriented and batch-oriented. Support is provided for transaction entry through the System/32 keyboard or through a diskette keyed offline on a 3740 Data Entry System. Student Records is a prerequisite to the other applications which can be installed at different times.

Each application has certain requirements records within a cross-application Constants File which contain questionnaire responses. These records allow the application to select certain fields for editing, file sizes, and functions to suit each customer's needs. The questionnaire responses are keyed during initial installation and may be changed

as needed. The System Tailoring Procedure allows these responses to be entered and maintained.

The System Tailoring Procedure utilizes the answers to a series of questions regarding a school's requirements. It provides the following:

- Tailoring of the application at installation time.
- Allows users to change the selection of provided functions as the environment changes.
- All provided functions are included in the programs but only required functions are executed.
- Files may be resized as needed by rerunning the System Tailoring Procedure.

Application Reference Manual Volume 1 provides a step-by-step installation activity plan including sample input and maintenance data forms and file loading sequences. *Application Reference Manual* Volume 1 is delivered with the Student Records application. It contains information pertinent to all three applications. Each Volume 2 of the *Application Reference Manual* provides information on the day-to-day use of the application.

The *Runbook* provides the operator with a detailed and easy-to-use set of instructions showing all the activities necessary to run the programs on a System/32. The *Procedure Reference Summary* is provided for the operator as a reminder of the major operational functions of each procedure. It is intended to be used as a quick reference once the operator is thoroughly trained in the particular application.

Instructional material with exercises is provided for System/32 operator training in the use of the *Runbook*. The course is not application dependent. Therefore, only one copy of the course is needed per customer no matter which of the student applications is installed.

An *Application Logic Manual* is provided, as optional licensed material, for use by the self-sufficient customer and for systems engineering continuing support. It describes the architecture of programs, procedures, data base cross-references, data dictionary, and detailed descriptions of each program.

Applications Description: The three applications are ready-to-execute. Each includes source code, object code, execution procedures, and the *Application Logic Manual*, if it is ordered as optional basic material.

These are some general features which all three applications have:

- Designed to fit industry requirements
- Security codes to deter unauthorized use of master files
- In-house inclusion/exclusion of functions to be executed
- OCL procedures, Sort specifications, and processing programs are packaged into logical work units which simplify system operation
- Monitoring of execution sequence prevents execution of a program until preceding required programs have been completely and successfully executed
- Compatible online/offline file maintenance and transaction data entry via the System/32 keyboard or diskettes created on a 3740 Data Entry System
- Dynamic Backup and Recovery System forces periodic backup of master files and edited transactions and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files
- Reprint options are possible because file updating is separated from report writing
- Selective printing options are available for many reports

STUDENT RECORDS (5725-E31)

The Student Records area represents a systems solution to the problems of recording, retrieving, manipulating, and reporting student data. The student record is the key to the school's student accounting system. It is a vital source of information necessary to the implementation of the other applications. In addition to providing data to and collecting data from the scheduling, mark reporting, and attendance accounting applications, it contains student personal data for counseling. This data includes the student's name, school code, year of graduation, current grade level, sex, birth date, address, and a number of other data elements. It also contains student attendance information, the student's current schedule and mark reporting information, and the school's curriculum for the current school year. From these files, many reports can be provided for the school administration, teacher, counselors and parents.

As the Student Records system is designed to be an ongoing system, it is not necessary to recreate all of the basic files at the beginning of each school year. Programs are provided to accomplish a year-to-year

Student Records, Accounting, Scheduling (cont'd)

transition by indicating the promotion of qualified students to the next grade level, and their new school, if that is indicated at promotion time. An important aspect of the student records application is the file maintenance functions. Programs are provided to update information in each of the files in the student records application as well as performing the year-end transition functions (student transfers between schools, promotions of students from one grade level to the next, etc.).

The integrity of the data in the files is maintained through the use of extensive editing of the data when it is entered into the system and through complete backup and recovery procedures which are an integral part of the package.

Output reports include:

- Student Listings
- Name and Address Labels
- Ethnic Distribution Report
- Student Profiles
- Student Schedules
- Room Schedules
- Instructor Schedules
- Class Rosters

STUDENT ACCOUNTING (5725-E32)

The Student Accounting package consists of two applications, Attendance Accounting and Mark Reporting. The Student Records package, which provides the data base and file maintenance functions, is a prerequisite to this package.

A. Attendance Application

The maintenance of attendance records is an important aspect of Student Accounting. In many states the amount of state aid for public education is based on average student attendance. Under manual methods, a considerable amount of time is expended by teachers and staff personnel in keeping records and accumulating data for state reports. The Attendance Accounting application simplifies such tasks by collecting original data at the source through the use of attendance data gathering documents, enabling reports to be prepared accurately and rapidly, and reducing clerical transcriptions.

Output reports include:

- Daily Absence Phone List
- Daily Absence Report
- Unresolved Absence Report
- Student Attendance Register
- Student Category Register
- School Category Register

B. Mark Reporting Application

The Mark Reporting application provides a means of recording student progress data for reports to parents and to school personnel. The prime data processed by this application are the student marks, which may be either numeric marks or alphabetic marks with optional plus or minus signs. In addition, up to two comments may be selected from a list of 99 user-defined comments and associated with each student's graded course. The Mark Reporting application is designed to fit the needs of many schools by providing a selection of reports and processing methods from which to choose. Output reports include:

- Report Card
- Labels for Permanent Records
- GPA Listings
- Mark Analysis
- Exception Reports

STUDENT SCHEDULING (5725-E33)

The Student Scheduling package (Student Records (5725-E31) is a prerequisite) processes student course requests against a manually prepared master schedule of classes to produce a schedule of classes for each student. To assist the school administrator in preparing this master schedule of classes, the following reports are produced from the student course requests: Student Verification Report, Course Verification Report, Course Request Tally Report, and Potential Conflict Matrix.

Once the master schedule of classes has been prepared, student requests are processed by the Main Scheduler programs, or schools may wish to use the arena scheduling option. Whether the class assignments are accomplished through machine scheduling or arena scheduling, the results are the same: A data base reflecting each

student's class assignments. For those students who could not be completely scheduled because of a conflict in their course requests, a Student Conflict report can be printed to assist the school administrator in resolving that student's conflict. Once a final scheduling run has been processed, the school may optionally run the study hall scheduler which will assign the student to study halls during any unassigned time in the school day.

Output reports include:

- Student Request Verification
- Course Request Verification
- Course Request Tally Report
- Potential Conflict Matrix
- Student Conflict Report
- Student Schedules

Programs are provided to pass basic student identifying information from the Student Records package to the Scheduling package and then, once scheduling is completed and the scheduled term is about to begin, the student data records will be updated to reflect the student's current schedule of classes. One of the primary objectives of the Student Scheduling package is to provide for the variety of scheduling philosophies present in today's secondary school environment. This flexibility is accomplished by offering a number of basic scheduling features and options which include:

- Scheduling of up to 4 terms, or semesters
- Up to 24 periods in a school day
- Up to 20 requests per student
- Flexibility in course requests - section requests, instructor requests, term requests, free time requests, and alternates
- Add-on scheduling
- Study hall scheduling option
- Arena scheduling option

Student scheduling is far more than a clerical chore. The basic educational philosophy of an institution is reflected in the manner in which students are assigned to a class section. For example, many school systems permit varying degrees of student-elected alternates and teacher preferences. This example illustrates the need for flexibility in a student scheduling system to accommodate a wide spectrum of educational policies. The student scheduling package provides the administrator with a large variety of optional system features which can be used to tailor the scheduling system to coincide with the policies of the school.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/32 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum system configuration requirements are an IBM System/32 with:

- 24K bytes of main storage
- 5.0 MB of disk storage
- Character or line print capability with 132 print positions and the 48-character set.

The IAPs are designed to process data recorded on the IBM System/32 keyboard, or data from a diskette recorded by the IBM 3740 Data Entry System. Because of volumes and time constraints, there may be a requirement for providing offline key entry on an IBM 3740 Data Entry System. If an IBM 3742 is to be used, it must have the 128-character record features (#5455) and Feature Group A (#4004).

The three applications are interrelated. Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries. Because of this, no other IAP or user-written programs may co-reside unless stringent coding requirements for these programs are met to insure compatibility with the Student Administration System. The *Application Logic Manual* discusses in detail the coding conventions used for the development of the Student Administration System.

Because of the printing volumes and timing constraints involved in the Mark Reporting applications, an 80 cps printer is recommended as a practical minimum.

Do not reproduce without written permission

Major Revision

PROGRAM PRODUCTS

Student Records, Accounting, Scheduling (cont'd)

SOFTWARE REQUIREMENTS

The application programs are written in IBM System/32 RPG II Programming language and execute under control of the IBM System/32 System Control Programming (5725-SC1) Version 5. The IBM System/32 Utilities licensed program (5725-UT1), which includes Sort, Data File Utility, and Source Entry Utility, is required for execution of the programs. The IBM System/32 RPG II Compiler (5725-RG1) is required if modifications to the source code are necessary.

**SYSTEM/32 FORTRAN IV
5725-FO1****PURPOSE**

System/32 FORTRAN IV processes programs written in the System/32 FORTRAN IV language, producing output suitable for execution with the System/32 System Control Programming (5725-SC1).

DESCRIPTION

The System/32 FORTRAN IV language contains those features defined in American National Standard Basic FORTRAN, X3.10.1966; language extensions supported by IBM 1130 Basic FORTRAN; and additional features and capabilities previously available only with certain IBM Full FORTRAN compilers. These features include:

- Logical data, logical expressions, and logical IF are supported.
 - Logical elements (that is, constants, variables, and arrays) contain true or false values.
 - Operation symbols are used in logical and relational expressions

.NOT. (negative)	.LT. (less than)
.AND. (conjunction)	.LE. (less or equal to)
.OR. (union)	.EQ. (equal)
	.GT. (greater than)
	.NE. (notequal)
	.GE. (greater or equal to)
 - Logical expressions evaluate elements to obtain true or false values.
 - Logical assignment statements define a relationship - placing the value of a logical expression in a variable or array element.
 - The logical IF statement evaluates an expression and executes or skips an associated statement, depending upon whether the value of the expression is true or false, respectively.
 - Logical variables and arrays can be initialized to true or false using the DATA statements.
 - Logical elements can be used as arguments of a CALL statement.
- Integer 2-byte constants are provided to facilitate IBM 1130 to System/32 FORTRAN IV conversion.
- Source Entry Utility [Utilities licensed program (5725-UT1)], although not a part of the FORTRAN licensed program, may be used to enter and maintain FORTRAN source programs.
- IBM FORTRAN IV language extensions INVOKE, PROGRAM and GLOBAL allow FORTRAN main programs to be loaded successfully into main storage and executed, while permitting these programs to share a common data area. These language extensions provide function equivalent to 1130 FORTRAN CALL LINK.
- The Overlay Linkage Editor will automatically create overlays which reduces the amount of storage required to run System/32 FORTRAN IV programs but may increase the execution time.
- The DEBUG facility enables the user to locate errors in a FORTRAN source program. By use of four basic statements, the DEBUG facility provides for tracing flow within a program and between programs and for checking the validity of subscripts.
- List directed input/output permits reading and writing of formatted data without a FORMAT statement.
- The GENERIC statement enables the user to specify a single name for a FORTRAN built-in or library function having several names. Depending on argument type, the correct function is selected by the compiler with each appearance of the name.

The System/32 FORTRAN IV library contains mathematical and service subprograms required during execution to perform arithmetic operations, input and output constant conversions and input/output control.

System/32 FORTRAN IV is supplemented by a commercial subroutine package which is equivalent in function to the 1130 Commercial Subroutine Package insofar as is meaningful in terms of System/32 devices and data management.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

FORTRAN IV compiler and its generated programs will execute on any model of IBM System/32. Object programs will support Additional Support (#1005) and Data Recorder Attachment (#3200). Control Storage Increment (#1500) is required on the IBM 5320 for execution of object programs. It is not required for compilation. On IBM 5320 B and C models, FORTRAN graphics are provided by a 64-character EBCDIC print belt or a 48-character FORTRAN print belt.

SOFTWARE REQUIREMENTS

A current version of IBM System/32 System Control Programming (5725-SC1) is required to execute the FORTRAN IV compiler and its generated programs.

TERMS and CONDITIONS: See PP Index

**SYSTEM/32 FINANCIAL INSTITUTIONS
CUSTOMER ACCOUNTING SYSTEM**

**CUSTOMER INFORMATION FILE ... 5725-F11
DEMAND DEPOSIT ACCOUNTING ... 5725-F12
SAVINGS ACCOUNTING ... 5725-F13
INSTALLMENT LOAN ACCOUNTING ... 5725-F14**

PURPOSE

The Customer Information File IAP (CIF) includes the data base, the application conversion procedures, and the file maintenance procedures for the system. It is a prerequisite for the Demand Deposit Accounting, Savings Accounting and Installment Loan Accounting IAPs, which may be installed independently of each other.

The applications provide broad application support for the small commercial bank. The Customer Information File IAP enables the bank to associate all of a customer's checking, savings, and installment loan accounts with a single record that contains common information about the customer and the customer's relationship to the bank. This enables the bank to make decisions based on a broader knowledge of the status of the customer's accounts. Account and customer information is accessed by account number for daily transaction processing, and by customer name for management reports, inquiries, etc. The Demand Deposit Accounting, Savings Accounting and Installment Loan Accounting IAPs support the three most important data processing applications in a commercial bank. Each of these IAPs contains a variety of functional options, enabling the bank to tailor the application to its own requirements.

These applications offer an opportunity for new name and first system account sales to small commercial banks. While the applications are primarily intended for commercial banks with deposits of \$5 to 25 million, the size of the bank deposits is not by itself an accurate indicator of proper IAP fit at any given bank.

HIGHLIGHTS

- Can be Installed without Customer Programming Capability:
 - Step-by-step installation activity plan and detailed user guidance is provided in the *Application Reference Manual*
 - System Tailoring Procedure accommodates account growth by allowing on-site changes to file sizes and functions used.
 - Application conversion procedures are provided.
 - Conversion aids are provided to assist in consolidating the master data from a customer's account records into a single CIF record.
 - Strict DP controls are enforced during conversion.
 - File maintenance is provided.
 - Operator self-study course is provided.
- Accounting and Control Techniques
 - Two levels of security codes help deter unauthorized access to programs and data.
 - Sample audit trail and control techniques are documented.
 - Sample user-oriented forms for data preparation, file creation, audit and control are provided.
- Interrelated Application Design
 - Data base design reduces file space requirements.
 - Common procedures add new accounts and provide file maintenance for all installed applications.
 - Access to all application accounts through the CIF Master Record.

DESCRIPTION

These four applications are an interrelated and ready-to-execute set of applications for the small commercial bank:

- Customer Information File
 - Data Base, File Maintenance, Application Conversion and Customer-oriented reports.
- Demand Deposit Accounting
 - Processing of checking accounts with optional functions of Overdraft Banking, Automatic Funds Transfer, and Combined Statements.
- Savings Accounting
 - Processing of savings accounts, both regular savings accounts and time deposit open accounts.
- Installment Loan Accounting
 - Processing of installment loan accounts, including simple interest, add-on, and discount loans.

The system provides transaction and file maintenance data entry through the System/32 keyboard or through a diskette keyed offline on a 3740 Data Entry System. The bank may optionally elect to use the 1255 Magnetic Character Reader (MICR) to capture transactions for Demand Deposit Accounting, Savings Accounting, and Installment Loan Accounting. An installation questionnaire and data capture programs are provided to support the 1255 MICR.

At installation time the options provided in the systems are selected through a System Tailoring Procedure which allows the user to:

- Tailor the application to use only the functions wanted.
- Change selection of functions to be executed as the environment changes.
- Resize files as the bank's business expands, or if the bank wishes to revise its original estimates.

There is only one *Application Reference Manual, Volume 1*, provided with the System/32 Financial Institutions Customer Accounting System. It is shipped with CIF and provides instructions for installing and converting all of the Financial Institutions Customer Accounting System IAPs. It contains guidance on installation planning, data gathering, and the use of the installation and conversion procedures. Samples of all required input data and control forms are included. A separate Volume 2 of the *Application Reference Manual* is provided for each of the four IAPs. These manuals contain information on the daily operations of the application. Included is information on procedure scheduling, the operating of each procedure and the implementation of sound operational controls.

A runbook and a procedure reference summary is provided for each application. The *Runbook* provides the operator with an easy-to-use set of instructions showing all the activities necessary to run the procedures on a System/32. The *Procedure Reference Summary* is provided for the operator as a reminder of the functions and use of each procedure. It is intended to be used as a quick reference once the operator is thoroughly trained in the particular application.

An *Operator Instruction Manual* with exercises is provided for operator training in the use of the runbook. The course is not oriented specifically to financial applications. Therefore, only one copy of the course is needed per customer regardless of which of the IAPs are installed.

An *Application Logic Manual* is provided for each application as licensed material. It is mainly useful for the self-sufficient customer and for systems engineering support. The manual describes the architecture of the Financial Institutions Customer Accounting System, and the logic of the programs and procedures. Data base cross references and a data dictionary are also included.

The four applications are ready-to-execute. Each includes the source code, object code, execution procedures and the *Application Logic Manual*. Some general features common to all four applications are:

- Two levels of security codes help deter unauthorized access to programs and data.
- Customer tailors application processing by including or excluding functions to be executed.
- OCL procedures, Sort specifications, and processing programs are packaged into logical work units which simplify system operation.
- Monitoring of execution sequence prevents execution of a program until the required preceding programs have been successfully executed.
- File maintenance and monetary transactions may be entered via the System/32 keyboard or diskettes created on a 3740 Data Entry System.
- Monetary transactions may be entered via the 1255 Magnetic Character Reader.
- A single set of CIF procedures enters and edits application conversion data for all IAPs and creates the master files.
- A single set of CIF procedures establishes new accounts and performs master file maintenance for all IAPs.
- The Backup and Recovery design forces periodic backup of master files and transactions. This provides for tracking of what procedures need to be rerun in recovery to re-create the master files. Three generations of backup diskettes can be maintained, each containing a complete set of master files and transactions.
- Reprint options permit printing multiple copies of reports.

CUSTOMER INFORMATION FILE (5725-F11)

The Customer Information File IAP supports three general functions of the System/32 Financial Institutions Customer Accounting System:

- Application Conversion
- Master File Maintenance
- Cross-Application Reports

Customer Information File is a prerequisite for Demand Deposit Accounting, Savings Accounting, and Installment Loan Accounting, and is installed in conjunction with the installation and conversion of each of those IAPs. The conversion process creates a CIF Master File, (which contains customer-related data for each of the bank's customers) and separate Account Master Files for DDA, Savings, and Installment

**System/32 Financial Institutions
Customer Accounting System (cont'd)**

Loans. The Account Master Files contain account-related data for each account in the three applications. The system maintains linkage from each customer's Customer Information File record to the account master record for each account - checking, savings, and installment loan accounts. In addition a cross-reference file provides an access path from each account master record to all of the customers associated with the account, based on the account number.

HIGHLIGHTS

Application Conversion: Separate programs are provided to enter and edit the customer and account data and to build the data base during application conversion. A two-phase conversion procedure is established for each application. During the first phase the data that is less subject to change (such as customer name and address, account type, etc.) is entered. The master data from each customer's account records is consolidated into a single Customer Information File record. A unique access key is developed for each customer and all master records are created. At this stage the records can be maintained, but monetary transactions cannot be processed. This phase may take place over several weeks or months.

During the second phase the remaining data, such as account balances are entered, edited and loaded into the master records created in the first phase. The records are placed in active status and the application is ready for daily processing.

Strict batch controls are implemented for both phases of conversion. The controls will not permit either phase to proceed if edit errors exist in any records or if the monetary controls do not balance.

File Maintenance: All maintenance of inter-application master files is performed by Customer Information File programs. A single operator procedure is provided to add new customers or new accounts to any converted application. Another procedure is used to change the data in these master files - including status, etc. Monetary data can only be changed through application transaction processing. A separate procedure is provided to change the operator and supervisor security codes.

Cross-Application Reports: A basic set of cross-application reports is provided. The advanced customer may wish to extend the use of the Customer Information File data base through additional user-written report programs. (If these programs are to co-reside with the Financial Institutions Customer Accounting System IAPs, they must, however, meet stringent coding requirements to insure complete compatibility.)

The following items are provided:

- A Customer Services Report, summarizing the number of customers using installed applications or combinations of applications.
- Mailing labels, to assist the bank in selective marketing of its services, may be printed according to customer selection criteria established by the execution of the Customer Services Report.
- A Customer Profile showing information for an individual customer, and the account status.
- A customer inquiry, display on the console CRT, and containing a subset of the information printed for a Customer Profile. Inquiry may be by full or partial customer name, customer key, or an account number.
- A Spread Report showing the distribution of accounts and the total deposits for up to five user-supplied ranges of DDA and Savings account balances.
- A Master File List, in customer key sequence, to assist in the maintenance of customer and account data.

DEMAND DEPOSIT ACCOUNTING (5725-F12)

The Demand Deposit Accounting (DDA) IAP provides daily transaction processing and reporting for checking accounts for a commercial bank. The IAP includes broad support for the standard processing functions and for two major optional functions - Overdraft Banking and Automatic Funds Transfer (AFT).

The Customer Information File (5725-F11), which provides the data base and file maintenance functions, is a prerequisite for this IAP.

Standard DDA Functions: Transactions can be entered from the operator console, a diskette created on a 3740 Data Entry System, or a 1255 Magnetic Character Reader.

Transactions can be posted against the current, available or collected balance in the account. The bank must select one of these options at installation time to apply to all DDA accounts.

Either one or two classes of float may be used for deposits to calculate the collected balance for accounts. The bank specifies the number of days it requires to collect each class.

The bank must assign one of the supported service charge options to each DDA account. In addition, if the Savings Accounting Application (5725-F13) is installed, the service charge may be waived based on

either a minimum or average balance maintained in the customer's savings account. The supported service charge options are:

- Free Checking
 - No service charge.
- Single Plan
 - A fixed monthly service charge.
- Special or Thrift
 - A fixed monthly charge plus an extra charge for each item designated by the bank as "service chargeable".
- Minimum Balance and Charge Per Item
 - The same as the Special or Thrift Option except that provision is made for a charge for each item in a deposit; and the service charge is zero if a bank-specified minimum or average current balance is maintained in the account during the statement period.
- Three-Two-One
 - The service charge for the account will be one of three fixed monthly charges, or will be zero, depending on the relationship of the minimum current balance for the period to three ascending balance levels designated by the bank. The account will be charged amount 1 if the minimum current balance is below level 1, amount 2 if it is between level 1 and level 2, amount 3 if it is between level 2 and level 3, and no charge if it is above level 3.
- Volume Earnings
 - The service charge is determined by calculating the cost of servicing the account, subtracting from this amount a credit for the amount the bank earned on the average collected balance, and charging the account the difference. The bank may include a fixed monthly cost, a cost per service-chargeable item, and a cost per item deposited in the cost computation. The earnings credit is a specified percentage of the average collected balance for the statement period. If the earnings credit exceeds the cost, the service charge is zero

Stop payment actions may be ordered against a check, based on check amount or serial number. In addition a "stop all" action may be initiated to prevent the posting of any checks to the account.

A hold for a specific amount may be specified against an account, or the account may be frozen - in which case all transactions against it are rejected.

The bank may specify a short list factor which applies to all accounts. When the daily number of checks for an account reaches the specified level, the checks are added together to form a single item for account posting and statement printing. A list of the checks that were combined to produce this single item is printed for filing in the customer's account folder. The short list factor may be overridden to always short list or never short list an account regardless of the number of checks.

The bank must select one of two procedures for determining how to handle an account when there are not sufficient funds to post all checks that are presented. They may choose to, (1) post each item individually until the balance is insufficient and then reject those items that cannot be posted; or, (2) add all checks together and either post them or reject them.

Overdraft Banking: The overdraft banking function may be invoked for any specific account. If a check would normally cause the posting balance to fall below zero, a loan sufficient to cover the check is automatically advanced. Loans are always advanced in user-defined increments, with a credit limit specified for each account. The loan balance is maintained separate from the checking account balance, and deposits do not reduce the loan balance. Finance charges are accrued daily and added to the loan balance when the monthly statement is printed. A user-defined minimum payment is also calculated at statement time and automatically deducted from the DDA account balance. The overdraft banking format of the standard statement shows the running balance of the overdraft loan, its associated transactions, and the loan status.

Automatic Funds Transfer (AFT): The AFT function provides periodic transfers of funds from a checking account to another account - such as a savings or installment loan account. If the Savings Accounting IAP (5725-F13), or the Installment Loan Accounting IAP (5725-F14) is installed, the deposit or payment is automatically credited. If the credit is to some other account, it is listed on a report and must be credited offline. The account holder may designate a frequency of weekly, biweekly, monthly or quarterly for the transfer. A number of transfers may be established against a single account.

Customer-Oriented Reports: These reports are all produced on pre-printed forms. The sample forms shown in the documentation may be ordered from the Systems Supplies Division.

**System/32 Financial Institutions
Customer Accounting System (cont'd)**

Account statements are printed monthly. One of the five service charge options, or free checking, must be assigned to each account. The bank may offer each customer either the standard statement or a "combined" statement. The combined statement includes the balances of selected customer savings and installment loan accounts, if they exist on an installed Savings Accounting IAP, (5725-F13) or Installment Loan Accounting IAP (5725-F14).

The NSF Notice is a combination form which is used to notify the customer either of checks drawn on insufficient funds, or of an overdraft loan advance.

Auditor Confirmation Notices are generated on request, based on a multiple start point systematic sample technique. The random start points are selected by the auditor.

Internal Reports: The reports produced for use within the bank include:

- Transaction entry and edit reports
- Trial balance and Activity Journal
- Unposted Items Report
- Service Charge Journal
- Overdrawn and Drawing Against Uncollected Funds Report
- Significant Balance Change Report
- Inactive and Dormant Accounts List
- Inactive and Dormant Accounts Activity Report
- Account Status Change Report
- Stopped Items List
- Closed and Zero Balance Accounts List
- Short Lists
- Overdraft Banking Trial Balance Report
- AFT Debits List and AFT Credits List
- AFT Journal
- Stop/Hold Journal

SAVINGS ACCOUNTING (5725-F13)

The Savings Accounting IAP provides daily transaction processing and reporting for regular savings accounts and time deposit open accounts.

The Customer Information File (5725-F11), which provides the data base and file maintenance functions, is a prerequisite for this IAP.

Standard Functions: Transactions may be entered from the operator console, a diskette created on a 3740 Data Entry System, or a 1255 Magnetic Character Reader. If the Demand Deposit Accounting IAP (5725-F12) is installed, Automatic Funds Transfer (AFT) to savings accounts will be merged by the system into the daily transactions and automatically credited to the designated accounts.

A hold for any amount may be specified against an account, all withdrawals may be stopped, or the account may be frozen - in which case all transactions against it will be rejected.

Up to eight different account plans, based on combinations of the interest calculation techniques, and the compounding and crediting options discussed below, may be offered at one time.

Interest Calculation Techniques: The IAP supports both regular saving deposits and time deposit open accounts. The Low Reference Balance and Day of Deposit to Day of Withdrawal (DOD-DOW) interest calculation techniques may be selected for savings deposit account plans. Time deposit open account plans may be based on either, (1) a requirement that the funds be on deposit for at least one complete calendar quarter, or, (2) a requirement that they be on deposit for at least ninety consecutive calendar days.

For Low Reference Balance accounts, interest is calculated and compounded either quarterly or semi-annually. Grace periods at the beginning of each month and end of the period may be defined, and either the LIFO or FIFO posting option must be selected for each plan.

For all except Low Reference Balance accounts, interest is accrued daily, and the bank may elect to compound interest continuously, daily, quarterly or semi-annually.

The bank may elect to credit interest to the account (add it to the account balance) either quarterly or semiannually.

Customer-Oriented Reports: For both regular savings deposit and time deposit open accounts, the bank may choose to provide pass-books, periodic statements, or may do both. The system records and reports "no-book" transactions against a passbook account.

Interest earned during the preceding year may be reported to the customer each January on 1099 forms.

Auditor Confirmation Notices are generated on request, based on a multiple start point systematic sample technique. The random start points are selected by the auditor.

Internal Reports: The reports produced for internal use within the bank include:

- Transaction entry and edit reports.
- Trial Balance
- Activity Journal
- Unposted Items Report
- Special Activity Report
- Earnings Journal
- Inactive and Dormant Accounts
- Closed Accounts
- No-Book Transactions List
- Transaction History Report
- Accrual Report
- Account Status Change Report
- Stop/Hold Journal

INSTALLMENT LOAN ACCOUNTING (5725-F14)

The Installment Loan Accounting IAP provides daily transaction processing for installment loan accounts for a commercial bank. The IAP includes broad support for the handling of the common interest calculation types, accrual and refund methods, and provides a variety of other features.

The Customer Information File (5725-F11), which provides the data base and file maintenance functions, is a prerequisite for this IAP.

Standard Functions: Transactions may be entered from the operator console, a diskette created on a 3740 Data Entry System, or a 1255 Magnetic Character Reader. If the Demand Deposit Accounting IAP (5725-F12) is installed, AFT payments to installment loan accounts will be merged by the system into the daily transactions and automatically applied to the designated accounts.

For simple interest loans, interest is accrued daily. For precomputed (add-on and discount) loans, interest is accrued monthly on the loan's anniversary day (the day of the month on which payment is scheduled) by either the rule of 78s or straight-line accrual methods or on a cash basis.

Early payoff calculations for precomputed loans use either the rule of 78s or straight-line method. They are performed monthly on, or up to 15 days after, the anniversary day. These calculations are performed monthly for all loans including those on a quarterly payment schedule. A loan paid off prior to the first regular monthly accrual will earn either one full month's interest or interest computed at a daily rate for the number of days outstanding.

Credit life and accident and health insurance are supported. Earnings and collections on each type of insurance are maintained and reported separately. Early payoff calculations include insurance earnings.

Dealers can be associated with a loan and earn a portion of the interest. Dealers will earn by the same schedule and method that the bank earns. Banks earnings and dealers earnings are reported separately on a daily and monthly basis. The bank's recourse to dealer is identified.

The bank may choose to print reminder notices and late notices and to assess late charges for accounts missing a payment. A percentage of the payment may be allowed to fulfill the payment obligation and prevent late charges from being assessed.

Payments may be applied first to either past due amounts or to the current payment, based on a bank-selected option. Late charges are assessed only if the current payment has not been paid. The bank has the option to permit automatic deduction of late charges from a payment. The late charges will only be deducted after the current month's payment obligation is fulfilled, past due amount is satisfied, and full payments are applied to the loan balance. A separate late charge payment is also accepted.

Loan extensions may be granted, thereby deferring payments for some number of months. The bank may require a fee for extensions.

Notices of Interest can be produced on request for all or selected accounts. These notices are also produced automatically at the end of each month for accounts closed during the month.

Payment notices can be printed for simple interest loans, advising customers of payments due.

Auditor confirmation notices are generated on request based on a multiple start point systematic sample technique. The random start points are selected by the auditor.

**System/32 Financial Institutions
Customer Accounting System (cont'd)**

Internal Reports: The reports produced for use within the bank include:

- Transaction entry and Edit reports
- Trial Balance
- Update Totals
- Earnings Update Summary
- Transaction Journal
- Unposted Items Report
- Suspected Closed Report
- Special Activity Report
- Exception Report
- New Loans Report
- Late Charge Assessments Report
- Collection Report
- History Merge
- Monthly Earnings Report
- Dealers Monthly Earnings Report
- Monthly Insurance Company Report
- Closed Loans Report
- Transaction History Report
- Aged Delinquency Report
- Dealers Trial Balance
- Loan Class Report
- Loan Plan Report
- Collateral Insurance Expiration Report

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/32 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Each of these IBM System/32 Industry Application Programs is compiled assuming a 24K (#9041) or 32K (#9141) system and will execute on all models of the IBM System/32 equipped with a minimum of 24K or 32K of memory. Because of volumes and time constraints, there may be a requirement for offline keying on an IBM 3740 Data Entry System and/or transaction entry IBM 1255 Magnetic Character Reader. If an IBM 3741 is to be used, it must have Feature Group A - #4002. If an IBM 3742 is to be used, it must have 128-Character feature - #5455 and Feature Group A - #4004. In addition, the Proof Keyboard feature (#5901 or #5902) is desirable but is not required.

All models of the IBM 1255 Magnetic Character Reader (MCR) that can be attached to the IBM System/32 are supported by these IAPs. The Dash Symbol Transmission feature (#3215) cannot, however, be installed if the customer wishes to use the MICR data capture programs supplied with the IAPs. Consult the appropriate pages for ordering instructions and any restrictions that pertain to attachment of the IBM 1255 MCR to the IBM System/32.

The four applications are closely interrelated. Many functions have been included to protect the integrity of the master files, programs, procedures, and libraries. Because of this, no other IAP or user-written programs may co-reside unless stringent coding requirements for these programs are met to insure compatibility with the Financial Institutions Customer Accounting System. The *Application Logic Manual* discusses in detail the coding conventions used.

SOFTWARE REQUIREMENTS

- IBM System/32 System Control Program (5725-SC1) (Version 6 or above)
- IBM System/32 Utilities Licensed Program (5725-UT1)
- RPG II Compiler (5725-RG1) is required if modifications to the RPG programs are required.
- Customer Information File (5725-F11) is a prerequisite for Demand Deposit Accounting (5725-F12), Savings Accounting (5725-F13), and Installment Loan Accounting (5725-F14).

PROGRAM PRODUCTS

**SYSTEM/32 HOSPITAL FINANCIAL
MANAGEMENT SYSTEM (HFMS)****PATIENT BILLING ... 5725-H11
ACCOUNTS RECEIVABLE ... 5725-H12
PAYROLL ... 5725-H13****GENERAL LEDGER/ACCOUNTS PAYABLE ... 5725-H14****PURPOSE**

The Hospital Financial Management System offers the small hospital a disk data-based system comprised of a series of programs and procedures that perform the accounting, management reporting and statistical functions for patient billing, accounts receivable, payroll and general ledger/accounts payable.

Presentation of timely information enables management to observe trends and deviations from the hospital's planned financial position. This enables Hospital Management to quickly spot problems and initiate corrective action. More important, it provides a basis upon which to institute plans to improve the financial position. The accuracy of the accounting information is mandatory because of reporting requirements placed upon the hospital by regulatory agencies.

Completeness of hospital operating information provides the basis for review, analysis, and cause-and-effect relation studies of such things as rate setting, reimbursement analysis, patient mix, and services performed. A comprehensive information base provides the justification for decisions regarding future operations and services.

Four applications are supported in HFMS. They are Patient Billing, Accounts Receivable, Payroll, and General Ledger/Accounts Payable. General Ledger and Accounts Payable are marketed together as one offering. Each of the other applications is a separate offering. Each application may be installed and operated independently or as an integrated system.

A description of the four offerings follows the general highlights of the system.

HMS is designed for the small hospital, in general 50 to 150 beds.

HIGHLIGHTS

- An integrated series of offerings that can be installed in any sequence for stand-alone or integrated operation.
- The HFMS offering consists of:
 - Source Code and Object Code
 - Ready-To-Execute Procedures
 - Predefined File Sizes
 - Installation Guides
 - Operator Runbooks
 - Installation Supervision Self-Study Instructions
 - Operator Self-Study Courses With Machine Exercises
 - Hospital Application-Oriented Specifications for Data Entry and Control Forms
 - Technical Documentation for problem determination
- Simplicity of operation characterized by application-oriented commands, prompting, responses, and messages
- Complete hospital disk data base
- Complete file load and maintenance programs
- Backup/recovery procedures imbedded in the application flow
- Comprehensive data entry editing with errors explained to facilitate correction
- Inquiry facility for Patient Billing and Accounts Receivable
- Optional entry of batch transaction input through diskettes prepared on the 3740 Data Entry System
- Comprehensive accounting controls through a defined audit trail
- User-defined system control file entries for adapting HFMS to customer requirements

DESCRIPTION**PATIENT BILLING (5725-H11)**

The system provides for accurate and timely posting of inpatient and outpatient charges to produce patient bills and provides the basis for the revenue statistics needed for third-party reporting, cost reimbursement, internal rate setting and revenue analysis. The offering has five logical subsystems: Census, posting, billing, and revenue usage, and statistics.

The census subsystem tracks the location of inpatients and processes all outpatient activity. Census reports are produced in various sequences which serve the needs of different users in the hospital. The census reports and the daily recap are used to verify the accuracy of the reported day's activity. The generation of the final census triggers the automatic generation of room charges to the posting subsystem.

The posting subsystem enters all routine and ancillary charges (including room charges from the census subsystem) into the inpatient and outpatient billing files. Charges can be automatically priced by the

system or overridden by keyboard entry. It produces reports necessary to verify the accuracy of the information, automatically prepares the daily revenue entries for General Ledger (5725-H14), and updates the detail revenue file records.

All detail posted charges are saved by the system on an accumulated charges file, which is used by the billing subsystem to prepare detail patient bills. Accounts Receivable (5725-H12) will post payments against accounts not yet final billed into the accumulated charges file.

The billing subsystem uses the information in the inpatient and outpatient billing files and the accumulated charges file to print patient bills. The detail bills for both inpatients and outpatients include a complete chronological detail of charges and a summary of charges at the end of the bill. Inpatients' final detail bills are automatically produced after discharge. Outpatient emergency (one-time visit) detail final bills are automatically produced after the patient visit, while recurring outpatient final detail bills are produced when requested by the hospital. After the detail final bill is produced, the billing file record is deleted. Prior to this deletion, it is transferred to the accounts receivable file if HFMS Accounts Receivable (5725-H12) is installed.

Detail cycle bills can also be requested for any current inpatient account. This bill shows the balance as of the last cycle bill and a detailed summary of current charges. Requesting cycle bills does not alter the processing or format of the detail final bill which will eventually be produced.

Summary bills can be printed on demand (inquiry) for any inpatient or outpatient account not yet final billed. The bill is in summary format containing all charges as of the last posting period.

The revenue usage subsystem is driven by the inpatient and outpatient charges from the posting subsystem. Daily and monthly revenue reports are produced in detail or in summary by departments showing usage of individual services within the current period and year-to-date.

The statistics subsystem maintains and reports patient statistics by medical service and patient category for both inpatients and outpatients, ancillary utilization statistics by department for all inpatients and for five outpatient categories, and departmental revenue by six financial classes.

ACCOUNTS RECEIVABLE (5725-H12)

Managing the Hospital's Accounts Receivable has become an increasingly complex task. Required interaction with patients and many third parties (including private and public insurance companies and various governmental agencies) has created an explosion in clerical tasks. This has resulted in a difficult control problem in the hospital business office. The offering has three logical subsystems to aid in the collection of accounts receivable and in controlling the large volume of data involved. They are daily posting, statement writing, and reporting.

The posting subsystem creates receivable accounts either through keyboard entry or by accepting transferred inpatient and outpatient accounts which have been final billed from the HFMS - Patient Billing offering (5725-H11). The subsystem accepts a full range of transactions such as payments, adjustments, late charges, and bad debt recoveries. If HFMS - Patient Billing (5725-H11) is installed, payments can be accepted against active billing accounts and posted as credit charges. Controls, procedures, edit and audit reports assist the accounts receivable department in making sure transactions are posted to the correct accounts. This automated posting procedure eliminates many clerical tasks and frees business office personnel to concentrate the majority of their time analyzing and pursuing collection of open accounts.

The posting subsystem maintains a separate account for each patient for each hospital visit. However, the ability to assign a guarantor number (family number) is provided. The facility enables the system to group all accounts for one family together for statement writing and accounts receivable reporting. The system has further facilities to handle both active and bad debt accounts with separate controls, to transfer from patient to insurance and from insurance to patient, and to generate entries for the General Ledger (5725-H14).

The Statement Writing Subsystem generates balance-forward statements and includes a number of options that allow the user to operate the system to meet unique requirements. Statements can be written on a weekly, biweekly, or monthly cycle to smooth the business office workload. Statements can be written for all financial classes or only selected financial classes (financial class denotes primary method of payment, such as self-pay, Medicare, Blue Cross, Welfare, etc.). Finance charges can be assessed at the option of the user. Statements can be either family statements or individual account statements.

The Reporting Subsystem provides the user with a flexible information system to be used in handling the unique patient and third-party collection problems encountered in a hospital receivables system. Aged receivables reports can be produced in varying sequences or as various exception reports to help hospital personnel zero-in on specific collection problems or to satisfy specific information needs. The age of accounts can be calculated based on discharge date, date of last

System/32 HFMS (cont'd)

payment, or date insurance was filed. Reports can be produced for all open accounts or selected accounts based on financial class, range of dollar balances, and age since discharge date, last payment date, or date insurance was filed. If patient number is assigned to all accounts, the aging reports can be printed for all accounts for a patient alphabetically by patient name.

A selective Detail Status Report facility is provided in the system for the user to retrieve reports showing all detail transactions for any specific account or group of accounts, based on financial class or patient number.

The system handles the processing for both Active and Bad Debt Accounts. A report showing all accounts that have been transferred to bad debt can be run at any time.

Account Balance Inquiry can be requested at any time to be displayed on the System/32 Display Unit or printed or both. This allows the business office to retrieve the most current information regarding any account when it is required.

The Patient Account record and all Detail Transactions for an account are maintained in the system until a user-specified number of days after the account zero balances or until the account is deleted from the system as an uncollectable bad debt. At the time an account is deleted from the system, a one page report is printed showing all the detailed information for the account. This report is then filed for reference purposes.

PAYROLL (5725-H13)

Within the hospital, personnel represents the most valuable and most expensive resource. While an efficient mechanism for prompt employee payment and bookkeeping is essential, the emphasis today is necessarily on astute management - planning, scheduling, and monitoring - to ensure the most productive use of this valuable and costly resource. This application addresses these needs through four logical subsystems: Payroll Processing, Labor Distribution, Benefits Analysis, and Personnel Reporting.

The biweekly Payroll Processing subsystem calculates hourly and salaried employee earnings, calculates statutory and voluntary deductions, accrues vacation and sick leave, accumulates quarter and year-to-date totals needed for 941-A and W-2 reports, and prints the employee's check. It also provides necessary reports to show a complete audit trail of each payroll run and to perform check reconciliation. The system calculates and deducts tax sheltered annuities, federal withholding taxes, and Federal Insurance Compensation Act (FICA) withholding. Rates are supplied to the programs from a system control file to avoid program recompilation as rates change. The data fields needed to calculate existing state, county, or city withholding taxes are included in the data base and an exit point is provided in the program for the inclusion of a user-written subroutine to calculate these taxes. However, the earnings statement and reports have provisions to print only one non-federal withholding tax.

Vacation and sick-leave hours are accrued based on actual hours worked and a hospital-defined accrual rate that can vary by employee.

The system will handle up to 10 types of voluntary deductions that can vary among employees regarding the frequency and method of calculation. These hospital-defined voluntary deductions are calculated, deducted, and reported each pay period on both a current period and year-to-date basis.

The labor distribution subsystem produces current and year-to-date reports each pay period by using the extended employee time records and budgeted and year-to-date balances from the position control file. These reports show hours and dollars (actual, budget, and variance) categorized by productive and non-productive time. This subsystem produces the departmental expense entries for General Ledger (5725-H14).

The benefits analysis subsystem produces reports for both included and contributory benefits each pay period. Included benefits are generally those that are completely paid by the hospital, such as vacation, sick leave and holidays. Contributory benefits are generally those that are partly paid by the hospital and partly by the employee, such as life insurance and health insurance.

The Included Benefits Report shows vacation and sick leave hours carried over, accrued, taken and remaining for each employee and department. Holidays taken are also noted on this report. The Contributory Benefits Report provides an analysis of the amount paid by the hospital for life and health insurance on a total cost basis and cost per hours basis for each employee, position classification, and department.

The personnel reporting subsystem provides reports to assist the personnel department in effectively using the people resource of the hospital.

An up-to-date Employee Status Report for each employee in the hospital is produced by the system whenever a change is made on an employee's record. All additions, changes, or deletions of employee information are thoroughly edited by the system and printed on Maintenance Reports. An Employee Personnel Profile is produced for

employee verification of pertinent data. It serves as a turnaround document for entering changes into the system.

Employee listings by name and number are printed for reference purposes. An Annual Employee Benefits Report is produced for each employee showing total earnings, included benefits, and contributory benefits. The Turnover Report provides an analysis of employee terminations by department showing the reason for each termination. Union Listings by employee within union can be produced when required.

GENERAL LEDGER/ACCOUNTS PAYABLE (5725-H14)

In order to provide increased patient care, hospitals must work from a sound financial base. In order to develop that base, the hospital executive must have detailed hospital operating information that is accurate, timely, and complete. The hospital must establish a plan, and since they are controlled to cost-dependent prices, they must work within that plan. The general ledger application provides the information that is key to more effective management through three logical subsystems: Daily processing, accounting period-end updating, and accounting period-end financial reporting.

The daily processing subsystem produces a journal of the day's valid transactions and adds them to the accumulated transaction file. Transaction validity is established through the use of the batch proof report. All transactions can be entered as miscellaneous journal entries. However, other offerings of the Hospital Financial Management System automatically provide journal entries from Patient Billing (5725-H11), Accounts Receivable (5725-H12), Payroll (5725-H13), and General Ledger/Accounts Payable (5725-H14) which will substantially reduce keying time. All transactions from whatever source are thoroughly edited by the system.

The accounting period-end updating subsystem provides the detail and summary trial balances. They are produced at the close of each accounting period. The system is designed to handle either 12 or 13 accounting periods per fiscal year. The trial balances can be run as many times as necessary to insure that all closing and correcting entries for that accounting period have been processed and the ledger is in balance. The system then updates the General Ledger Accounts file by extracting all entries for the accounting period (from the Accumulated Transaction File and summing these entries with the balance as the end of the last accounting period) to obtain the new year-to-date balance of each account in the General Ledger Accounts File. The updated General Ledger Accounts File is then used to produce the Financial and Management reports by the accounting period-end reporting subsystem.

Comparative schedules of Patient Revenue, Miscellaneous Revenue, Deductions from Revenue, and Expenses are produced showing variances on a current month and year-to-date basis for either this year versus last year or this year versus budget or both.

The format of the Balance Sheet, Income Statement, Pre-Cost Allocation Schedule, Per Diem Revenue Report, and Per Diem Expense Report can be tailored to the user's requirements through the use of the Report Description Master file. This file contains a record for each physical line that appears on each of the reports. By adding, changing or deleting records in this file, characteristics of the reports such as the number of lines, levels of total, and line and total descriptions, can be changed to meet the needs of the user. This feature, along with the ability to define the chart of accounts desired, provides a flexible financial information system that can be defined by the user to produce financial reports for assistance in creating and maintaining financial stability for the hospital.

Accounts Payable: Inflation has caused a rapid increase in the cost of supplies in all departments of the hospital. An accurate, efficient Accounts Payable system has become a requirement. It is one of the basic tools needed by hospital management to assist in reducing and controlling the cost of providing health care because most of the hospital's supplies expense originates through Accounts Payable. Approved vendor invoices must be accurately recorded, efficiently analyzed, and accurately distributed to affected cost centers.

The key element of expense control can only be obtained if the proper departments are given the information they need. For example, the purchasing agent requires information regarding standard vendor terms and volume of the business. The financial officer needs timely information regarding open Accounts Payable to analyze cash requirements. Available cash must be used effectively to take advantage of all discounts through prompt payment. The business office needs an efficient method of recording items, reporting to management, and accurately distributing supplies expense to appropriate cost centers.

The Accounts Payable application meets these objectives and satisfies these needs through four logical subsystems: Transaction entry, check writing, expense distribution, and reporting.

The transaction entry subsystem performs an extensive edit on all approved invoices and credit memos. The required information is keyed into the system and a Proof Report is printed to balance to controls. Any errors are corrected prior to further processing. These transactions

PROGRAM PRODUCTS

System/32 HFMS (cont'd)

are accumulated with any prior unpaid items and a Cash Requirements Report is printed to provide a current listing of all unpaid items listed by invoice within vendor. The items to be paid are noted on the Cash Requirements report and control totals are developed. Items to be paid can be selected in either of two ways: All invoices for a vendor or only certain invoices within a vendor can be selected. The computer operator uses this report to enter a notification of items to be paid into the system. A Payment Journal is printed by the system showing all transactions selected to be paid. This report is used to balance to the control totals and any keying errors are corrected prior to the writing of checks.

Further flexibility is provided by the system because a check for any items may be typed at any time and entered into the system with a different code to designate a demand check. The transactions for these demand checks flow through to the expense distribution, but no computer checks are prepared. This facility provides the hospital maximum flexibility for taking advantage of discounts and creating of special checks such as travel advances.

The check writing subsystem produces the Check Registers, Checks, and Remittance Advices for those items checked on the cash requirements report. The system allows for multiple check-writing runs during the month which, in conjunction with the ability to handle demand checks, provides the flexibility needed to control the payment of outstanding accounts payable items. Check reconciliation reports are included to allow the user to control the reconciling of checks and produce an Aged Outstanding Check Register.

Once each accounting period, the Accumulated Transaction file is sorted by General Ledger number and the expense distribution subsystem is run. An Accounts Payable Distribution Report is produced and summary expense entries are created for entry into the General Ledger System.

The reporting subsystem provides analysis of year-to-date purchases and discounts taken based on information in the Vendor Master file. This file contains one record for each permanent or temporary vendor used by the system to obtain vendor name, address, and discount terms information. The amount of purchases, credit memos and discounts for each vendor are also maintained in this file and Vendor Analysis Reports can be printed whenever desired.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/32 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

These IBM System/32 Industry Application Programs will execute on all models of the IBM System/32.

Information regarding disk allocation and usage (master and transaction files) and recommended backup levels and diskette requirements are available in the *HFMS Installation Guide*.

The OCL and file sizes, as distributed, will be fixed at the maximum capacity, assuming all five applications are to be installed on a 5 megabyte file.

Any changes to file sizes other than those shown above should be carefully reviewed by the customer and IBM System Engineering to determine the necessity for more storage, estimate time required to convert OCL procedures, and estimate throughput performance.

SOFTWARE REQUIREMENTS

The IBM HFMS System/32 program is written in IBM System/32 RPG II and operates under control of IBM System/32 System Control Program (5725-SC1). In addition, the IBM System/32 Utilities licensed program (5725-UT1) must be available for sorting of data (SORT), entering transactions with the Data File Utilities (DFU) and for making source program corrections with Source Entry Utility (SEU). If compilation of the RPG HFMS source programs is required, the IBM System/32 RPG II Compiler (5725-RG1) and Source Entry Utility (SEU), for making RPG II program corrections, must be available.

SYSTEM/32 MEDICAL GROUP MANAGEMENT SYSTEM 5725-H15

PURPOSE

The application provides the medical group with a powerful aid in managing its business.

The Medical Group Management system is primarily intended for a group of up to 20 doctors using a single accounting system.

Key accounting and management reports are provided to allow selling and installing without a requirement for services or customer programming capabilities.

HIGHLIGHTS

- Wide variety of reports and report options included:
 - Management reporting is a byproduct of normal data entry
 - Detail or summary listings within a range of options is supported in many reports
- Uses recognized accounting techniques and terminology to provide a solid accounting system:
 - Clear audit trails and control techniques are provided
 - Sample user-oriented forms for data preparation, file creation, audit and control are provided
 - Security code deters unauthorized execution of all programs in the application
 - A Reference Number may be used to supply an audit trail for any transaction entered into the system
- Designed to be installed without customer programming capability:
 - System tailoring procedure facilitates account growth by allowing on-site changes to file sizes and determination of functions used
 - File maintenance and audit procedures
 - Easy-to-use runbook
 - Operator self-study course is available
 - Step-by-step installation activity plan provided by the *Application Reference Manual*
 - User's installation and daily operating information supplied to the supervisor by the *Application Reference Manual*

DESCRIPTION

The system combines two data entry approaches: Operator-oriented and batch-oriented. Support is provided for transaction entry through the System/32 keyboard or through a diskette created on a 3740 Data Entry System.

The application has requirements records which contain Questionnaire responses stored in a Constants File. These records allow the system to select certain fields for editing, report formats, file sizes, and functions to suit each customer's needs. The Questionnaire responses are typed in during initial installation and may be changed as needed. The System Tailoring Procedure allows these responses to be entered.

The System Tailoring Procedure uses the answers to a series of questions regarding a medical group's requirements to build the system. It provides the following:

- Tailoring the application and Operational Control Language (OCL) on site at installation time.
- All provided functions are included in the programs but only required functions are executed.
- Allows the user to activate and deactivate provided functions as the user's business changes.
- File sizes may be increased or decreased as needed by rerunning the System Tailoring Procedure.

Application Reference Manual Volume I provides a step-by-step installation activity plan including sample numbering systems, sample input and maintenance data forms, file loading sequences, and control forms with suggested procedures. Volume II of the *Application Reference Manual* provides information on the day-to-day use of the application.

The *Runbook* provides the operator with a detailed and easy-to-use set of instructions stating all the activities necessary to run the programs on a System/32. The *Procedure Reference Summary* is provided for the operator as a reminder of the major operational instructions for each procedure. It is intended to be used once the operator is thoroughly trained in the application.

Instructional material in the form of a self-study guide is provided to train the System/32 operator in the use of the *Runbook*.

An *Application Logic Manual* is provided, as optional licensed material, for use by the self-sufficient customer and for systems engineering continuing support. It describes the architecture of programs, procedures, data base cross-references, data dictionary, and detailed descriptions of each program.

DESCRIPTION

The application is ready-to-execute. It includes source code, object code, and execution procedures as basic material. The *Application Logic Manual* is included if it is ordered as optional licensed material.

There are some general features included in the application:

- Designed to fit business requirements
- Security codes to deter unauthorized use of master files
- In-house inclusion/exclusion of functions to be executed
- OCL procedures, Sort specifications, and processing programs are packaged into logical work units which simplify system operation
- Monitoring of execution sequence prevents execution of a program until preceding required programs have been completely and successfully executed
- Compatible online/offline data entry through the System/32 keyboard or by means of diskettes created on a 3740 Data Entry System
- Dynamic Backup and Recovery System forces periodic backup of master files and edited transactions and keeps track of what procedures need to be rerun from the last backup point to recreate up-to-date master files.
- Reprint options are possible because file updating is separated from report writing functions
- Some report printing can be deferred to a more convenient time
- Selective printing options are available for many report functions

The Medical Group Management System IAP is intended to provide a balance forward accounts receivable system for a group of up to 20 doctors using a single accounting system.

The IAP provides the ability to bill patients on a monthly basis. Third parties (insurance companies) can be billed as required. It provides accounts receivable information including status reports and aged trial balances in order to control accounts receivable.

An optional Daily Charge Slip system is provided to print an appointment list showing patient appointment information and patient charge slips for recording patient charges, diagnoses and procedures. The charge slips can then be used as turnaround documents for input into A/R.

A practice analysis system is also optional and provides statistical reports for each doctor on a calendar year basis.

Inquiry is provided allowing the user to locate a guarantor record by keying either the guarantor's last name and first initial or the guarantor's account number.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance in the installation of IBM licensed programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation, and continued day-to-day operation lies solely with the customer.

Installation of System/32 licensed programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Each of these IBM System/32 Industry Application Programs will execute on all models of the IBM System/32. The programs are compiled assuming a 16K system. Because of volume and time constraints, there may be a requirement for providing offline key entry on an IBM 3740 Data Entry System. If an IBM 3742 is to be used, it must have the 128-character record feature (#5455) and Feature Group A (#4004).

Many functions have been included to protect the integrity of the master files, programs, procedures and libraries. Because of this, no other IAP or user-written programs may co-reside unless stringent coding requirements for these programs are met to insure compatibility with the Medical Group Management System. The *Application Logic Manual* discusses in detail the coding conventions used for the development of the Medical Group Management System.

SOFTWARE REQUIREMENTS

The application programs for the IBM System/32 are written in IBM System/32 RPG II Programming language and execute under control of the IBM System/32 System Control Program (5725-SC1 Version 3. IBM System/32 Utilities licensed program (5725-UT1), which includes Sort, Data File Utility, and Source Entry Utility, is required for execution of the programs. The IBM System/32 RPG II Compiler (5725-RG1) is required if modifications to the source code are necessary.

SYSTEM/32 MEMBERSHIP and MAILING LIST SYSTEM 5725-K11

PURPOSE

Associations are constituted to serve their memberships. Their prime functions are information retrieval and dissemination, establishment of standards and ethics, research, and representing their members to external agencies. Items of general interest are disseminated through association publications sent through the postal service. However, the need often exists to make specialized mailings to selected members with specific characteristics. Information exchange also takes place at events sponsored by associations. Associations, then, have data processing needs characterized by large data bases which must be processed in total but with the ability to process individual records or groups of records on a selective or exception basis.

The Membership and Mailing List System is designed for associations of up to approximately 15,000 members if optional files are not used.

HIGHLIGHTS

The Membership and Mailing List System provides an economical approach for the needs of business and professional associations. It addresses the following areas:

Data Base Management

- Interrelates up to 10 master files into a single data base
- Non-redundant data base (duplicate records eliminated)
- Can be installed as:
 - Single-file system (members are individuals)
 - Dual-file system (members are companies with mailing sent to and events attended by individuals). Usage of other master files is optional as needed.
- Full maintenance procedures

Cash Accounting

- Invoices generated for dues and publications
- Balance forward accounts maintained for dues
- Cash application through file maintenance runs

Mailing Labels

- One-up or four-up
- Names and addresses vertically and horizontally aligned
- Produced from the data base on user-defined selection criteria
- Zip code changes noted and count shown
- Includes zip codes and circulation reporting

Membership and Association Services

- Membership cards
- 3 x 5 information cards
- Membership rosters, dynamic listings, and profiles
- Data file inquiry

Analyze Procedure

- Provides a means to select and sequence subsets from the data base
- Used for statistical profiles; input to all of the above runs; input to a preformatted dynamic listing program - for management review and analysis.

The Membership and Mailing List System also includes the following features:

- Installation through a System Control File which allows implementation of user options and printed descriptions without recompilation
- Inquiry capability to display or print individual member's records

DESCRIPTION

The Membership and Mailing List System organizes the vital records of an association into a comprehensive data base. The data base is modular in design so that only those portions which are required for user-desired functions need to be implemented. For example, if the association does not maintain its membership in a chapter structure, the chapter file is not used. Similarly, if it has no interest in knowing who sponsored a member for membership, the sponsor file is not used. The basic decision to be reached regarding the optionality of files, however, concerns the manner in which the association structures its membership and what dues functions are required. A typical difference between business associations and professional organizations is that business associations tend to have companies as members while professional organizations tend to have individuals as members. The Membership and Mailing List System accounts for this difference by separating the dues function from the mail function. Data required to

implement these two functions is separated into two discrete files: the dues file and the mail file.

If your customer has company members with individuals within the company receiving mail, both files would be used (dual-file system). If, however, the members of the association are individuals, either the dues file or the mail file, or both, may be used. If partial payments are to be accepted and the association has only one publication that it distributes, the dues file should be implemented. If the association has multiple publications with different payment rates and accepts full payment only, the mail file should be implemented. However, whichever file is implemented, the basic cash accounting and mailing function are provided. The optional nature of the data base files is implemented through a Systems Control File without need for recompilation. Consult the Membership and Mailing List System *Installation Guide* for further information.

The following sections describe system highlights in three important functional areas: Accounting, mailing, and service.

Accounting Functions

Invoicing: Invoices are generated for both dues and publications. The dues invoice shows the balance brought forward, the current dues amount, and a new total owed. An optional special charge amount (such as an initiation fee) can also be included. First dues billing for new members can be pro-rated. Publication invoices can handle amounts for two separate publications (mail file). Both types of invoices as well as follow-up notices are prepared on user-defined billing cycles and frequencies.

Cash Application: Cash can be applied to dues on a partial payment basis (dues file only) or on a full-payment required basis. Payments for publication subscription can be applied in even increments of the base subscription rate with automatic calculation of the "paid to" date. Cash receipts can also be applied for registration fees for association-sponsored events.

Mailing Functions

Mailing Labels: Mailing labels are prepared for user-defined subsets of the data base. The selection is dynamic. User-defined parameters for inclusion/exclusion and sequencing are keyed prior to the label run. The labels can be printed one-up or four-up with names and addresses horizontally and vertically aligned. Changes in zip code (if the labels are sequenced by zip code) can be highlighted to facilitate mailing bundling. Mailing type is noted, that is, sample publications.

Circulation Reports: This report recaps totals by state, zip code, or type of mailing for each mailing. It can be used for advertising rate setting by showing circulation demographics.

Membership/Association Service Functions

Membership Cards: Membership identification cards can be prepared showing member's name and current membership period.

3 x 5 Information Cards: These cards can be prepared with user-defined inclusion/exclusion and sequencing criteria. They are useful for such functions as convention registration, direct sales follow-up, etc.

Rosters: Periodic alphabetic listings of the membership, mailing lists, or event participation can be prepared for reference.

Membership Profile: A profile of all information regarding a member can be printed that can be sent for review and correction. Therefore, it can serve as a turnaround document to maintain the accuracy of the data base.
