

PROGRAM PRODUCTS

**3270-PC CONTROL PROGRAM
P/N 1837434, Feature #1505**

PURPOSE

The 3270-PC Control Program provides the 3270 Personal Computer with the controls necessary for the user to select screen configurations, manipulate and interact with the displayed data, and manage screen presentations. The screen presentation may consist of up to four host interactive sessions, two local notepad sessions and one IBM Personal Computer DOS 2.0 session.

HIGHLIGHTS

- Concurrent operation of up to four host interactive sessions, up to two local notepad sessions, and one IBM Personal Computer DOS 2.0 session.
- Base 3270 (four color) or 3270 Extended Data Stream (eight color, Distributed Function Terminal mode only) support.
- Two host-interactive modes, set during 3270-PC and 3274 customization:
 - Distributed Function Terminal mode: One to four sessions (or LUs) emulating any mdl 3178, 3278 (except mdls 2A and 5), or 3279 (except mdl 2C) via a 3274 with configuration support T or D.
 - Control Unit Terminal mode: One session (or LU) emulating a 3178, 3278 mdl 2, or 3279 mdl S2A via either:
 - 1) 3274, any mdl and configuration support
 - 2) 4321, 4331, or 4361 Display/Printer adapter
- Advanced screen management, including the ability for the user to:
 - View through a window on the display screen the portion of an application's presentation space defined by the window in the presentation space. A window is a user-controlled display area (up to 2,000 characters) to allow viewing all or part of a presentation space. A presentation space is a logical representation of a host (up to 3,440 characters) or local (2,000 characters) session.
 - Move the window to any location on the display screen.
 - Move the window to any location within the presentation space.
 - Share the display screen with multiple applications windows.
 - Alter the size of a window, permitting various combinations of concurrent applications to be seen.
 - Window Enlarge to dedicate the display screen to one presentation space.
 - Define combinations of windows in up to ten logical screens.
 - Define the foreground and background color for host sessions not using Extended Data Stream attributes.
 - Define the background color for the screens.
 - Select base-color (3279 4-color) mode.
- Copy a block of data within or between any presentation space, except to the IBM Personal Computer DOS 2.0 presentation space.
- Keystroke Record/Play function to capture often used keystroke entries for later storage and playback.
- Save and restore (using IBM Personal Computer DOS 2.0) the current 5271 and 3270-PC Control Program environment, including screen profiles, keystroke recordings, and notepad presentation spaces.
- File transfer (host to and from a 3270-PC file) in ASCII, binary, or EBCDIC data format.
- One IBM Personal Computer DOS 2.0 session permitting the operation of non-APA graphics IBM Personal Computer applications that use or observe IBM Personal Computer DOS 2.0 and BIOS protocols and conventions.
- One or two local notepad sessions for copy or save of data from other sessions, personal notes, or general scratch-pad use.
- 5150/5160 Personal Computer function in native mode, except APA graphics.
- Use of other 5150/5160 Personal Computer options with IBM Personal Computer DOS 2.0 applications.
- Print to the 3270-PC attached printer of 3274 attached printer.
 - Screen copy to the 3270-PC attached printer.
 - 5150/5160 Personal Computer full screen (presentation space) to the 3270-PC attached printer.
 - Host full screen (presentation space) to 3274 attached printer or 4321, 4331, or 4361 Display/Printer adapter attached terminal printer.

- Ease-of-use functions:
 - Operator Information Area (OIA).
 - Message line: User prompt area.
 - Help function: Displays active workstation control functions and sessions.
 - On Line Tutorial: Explains the capabilities and functions of the 3270-PC and simulates workstation functions. (The tutorial can be run in a standard 5150/5160 Personal Computer with a Dual-Sided Diskette and IBM Personal Computer DOS 2.0).
- Alert function (host sessions only).
- Response Time Monitor (Control Unit Terminal mode only).
- Maintenance utilities:
 - INDPATCH
 - Hardware diagnostics
 - Trace
 - Error handler service
 - Dump facility

CUSTOMER RESPONSIBILITIES

- Customizing the 3270-PC and 3274. Spare blank diskettes must be ordered by the customer as required.
- Producing a backup copy of the 3270-PC Control Program.
- Protection of data from unintended modification, destruction, or disclosure, and for the accuracy and integrity of the results.
- Testing other IBM Personal Computer programs not included with the 3270-PC to assure viability. IBM does not accept any responsibility for them.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM 3270 PC Control Program requires a 5271 System Unit, a 5151 Monochrome or 5272 Color Display, and a 5271 keyboard.

The following table identifies the storage increments required for the several 3270-PC Control Program functions:

Function	Storage Increment Total
Choose one:	
Control Unit Terminal mode	94,116 bytes
Distributed Function Terminal:	
Non-SNA mode	145,828 bytes
SNA mode	156,708 bytes
Add for each session, (maximum of four)	
1,920 characters, base (4-color)	1,968 bytes
1,920 characters, EDS (8-color)	3,888 bytes
2,560 characters, base (4-color)	2,624 bytes
2,560 characters, EDS (8-color)	5,184 bytes
3,440 characters, base (4-color)	3,526 bytes
3,440 characters, EDS (8-color)	6,966 bytes
Add for each notepad session, (maximum of two)	3,840 bytes
Configuration Total:	
For local applications, add:	
5150/5160 Personal Computer session (maximum of one)	2,000 bytes
IBM PC DOS 2.0	24,000 bytes

The balance of the storage capacity is available for local application use. 3270-PC applications that run under IBM PC DOS 2.0 have the following application storage requirements:

Save Restore	8,320 bytes
File Transfer	15,870 bytes
Patch	6,656 bytes
Tutorial	25,088 bytes

Note: Local applications may require additional storage.

Do not reproduce without written permission

PROGRAM PRODUCTS

3270-PC Control Program (cont'd)

SOFTWARE REQUIREMENTS

IBM Personal Computer DOS 2.0 (P/N 6024061)

PACKAGING

The 3270-PC Control Program resides on two IBM Personal Computer diskettes that are packaged with the *3270-PC Control Program User's Guide and Reference*.

ORDERING and SCHEDULING

The 3270-PC Control Program must be ordered as a feature (#1505) against the 5271-YYY. IBM PC DOS 2.0 and all other IBM Personal Computer programs must be ordered as a feature against the 5271-XXX mdl. The appropriate QDA number should be entered at order entry time or prior to shipment from the IBM FE Distribution Center in Raleigh.

When the 3270-PC Control Program is ordered, the 3270-PC Control Program Online Tutorial (Helper) is automatically included. The Tutorial provides a user-involved description of how to operate the 3270-PC. The Tutorial may be ordered separately and it runs in a standard 5150/5160 Personal Computer (64KB, Dual-Sided Diskette, and IBM PC DOS 2.0 minimum).

In addition, IBM PC DOS 2.0 (4061, P/N 6024061) must be available for customization of the 3270-PC Control Program.

IBM Personal Computer programs marketed by NAD or NMD may be ordered with the 3270-PC and receive the same QDA discount as the 3270-PC Control Program when ordered at the same time.

PROGRAM PRODUCTS

**IMPLEMENTATION PACKAGES for the
6580 DISPLAYWRITER SYSTEM**

ADMINISTRATIVE SUPPORT ... 5608-AX1

APPLICANT PROCESSING ... 5608-AX2

PERSONNEL REPORTING ... 5608-AX3

PURPOSE

These IBM 6580 Implementation Packages assist IBM 6580 Displaywriter System users in setting up specific applications using IBM 6580 Displaywriter System Textpack 4 (5608-TR4) or Textpack 6 (5608-TR6). Each package consists of three components: A procedure guide for the operator, a prerecorded diskette and a catalog of reports for principals. The prerecorded diskette can be used to establish files with unique data for each application. The *Operator's Guide* can be used to step through all the functions necessary to implement and maintain specific files and produce the identified application reports or letters.

HIGHLIGHTS

- Customer-installable.
- Adaptable to specific application requirements.
- Provides pre-designed files and shell documents.
- Provides stored set-ups for report generation.
- Provides a variety of sample documents.

DESCRIPTION

- Administrative Support Implementation Package 5608-AX1

The Administrative Support Implementation Package is designed to assist in performing many routine administrative tasks required to support management-level professionals. Some of the tasks addressed by this package are:

- Correspondence tracking by author, subject and date.
- Calendar of meetings, action items and maintenance items.
- Directories of personnel.
- Inventory by contract number, serial number and department.
- Travel expenses (detail and summary), travel itinerary.
- Library of printed material by author, topic, publication.
- Customer inquiry tracking by location, inquiry, code.
- Time card reports (detail and summary); absence, overtime, expenses.
- Office expenses by department and vendor.

- Applicant Processing Implementation Package 5608-AX2

The Applicant Processing Implementation Package is designed to support the administrative tasks associated with the recruiting and/or employment of personnel. Included in this Implementation Package are:

- Applicant and Requisition files.
- Interview invitation letters.
- Applicant rejection letters.
- Employment offers.
- Applicant activity reports.
- Job requirements report.
- Affirmative action reports.

- Personnel Reporting Implementation Package 5608-AX3

The Personnel Reporting Implementation Package is designed to streamline the personnel function and provide management with timely employee information. This implementation package includes:

- Active employee file.
- History file.
- Salary analysis reports.
- Affirmative action reports.
- Hiring and promotion reports.
- Various employee directories.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of Displaywriter licensed programs, as well as certain problem determination activities.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The Implementation Package licensed programs are designed to operate on the following IBM 6580 Displaywriter System:

- IBM 6580 Display Station model A04, A06, B04 or B06.
- IBM Dual Diskette Unit.
- IBM Printwheel Printer.
- 12- and 15-Pitch Printwheels.

- 25-line or Large Display.
- Sheetfeed Paper Handler and 2D Diskettes are recommended but not required.

SOFTWARE REQUIREMENTS

Each Implementation Package licensed program is designed to operate with IBM 6580 Displaywriter System Textpack 4 (5608-TR4) or Textpack 6 (5608-TR6) and Reportpack (5608-SR5) licensed programs.

DATA SECURITY, AUDITABILITY and CONTROL

Customers are encouraged to use backup storage when processing their data. IBM has no responsibility for protecting customer data and no facility for recovery of lost data.

DOCUMENTATION

(available from Mechanicsburg)

- Administrative Support Implementation Package (5608-AX1) consists of:
 - Administrative Support Principal's Catalog
 - Administrative Support Operator's Guide
 - Administrative Support Licensed machine-readable Material on a prerecorded diskette 1
- Applicant Processing Implementation Package (5608-AX2) consists of:
 - Applicant Processing Principal's Catalog
 - Applicant Processing Operator's Guide
 - Applicant Processing licensed machine-readable material on a prerecorded diskette 1
- Personnel Reporting Implementation Package (5608-AX3) consists of:
 - Personnel Reporting Principal's Catalog
 - Personnel Reporting Operator's Guide
 - Personnel Reporting licensed machine-readable material on a prerecorded diskette 1

Note: Form numbers will be announced at availability.

TERMS and CONDITIONS: See PP Index

**6580 DISPLAYWRITER SYSTEM
CHARTPACK
5608-SRA****PURPOSE**

Chartpack, a licensed program for the Displaywriter System, provides the capability to produce various types of business charts. Charts that can be created are bar charts, line charts, pie charts, and free-form charts (such as organization charts). All of these charts can be displayed and revised using either 25-line or large display models of the 6580 Displaywriter equipped with a Chartpack display adapter card (feature #6955). Charts can be stored on diskette, merged to print with text documents, and printed on 5218 and 5228 Printwheel Printers with printwheels designed for use with Chartpack.

HIGHLIGHTS

- Create and revise a variety of business charts: Bar, line, pie, and free-form
- Display and print charts during or after the creation process
- View the same information in different chart formats
- Merge charts to print with text documents
- Add text and legend notation to any chart
- Draw vertical and horizontal connecting lines on charts

DESCRIPTION

Chartpack is a Displaywriter licensed program that operates with either Textpack 4 or Textpack 6. This program provides the capability to produce various types of business charts such as bar charts, pie charts, line charts, and free-form charts (e.g., organization charts). These charts can be viewed on the display, stored on diskette, revised, and printed.

With the Chartpack program, the operator selects menu items and chooses the appropriate options to describe the chart, enters the label information and data values needed to draw the chart, and then types any extra text and legend notation to enhance the chart.

Based on menu responses and data input by the operator, the Chartpack program automatically determines the size and position of the chart on a page.

The spacing of all axis labels, the height and width of bars, and the relative percentages of pie chart sections are also computed by the program. For operator assistance in creating line and bar charts, 'help' screens are available which show examples of possible formats.

At any time during the creation or revision of a chart, the operator can display or print as much of the chart as has been defined up to that point. In this way, the operator can view the chart as it is being defined. The entire chart and notation area (60 lines by 80 characters) can be displayed on the large display. With a 25-line display, 20 lines of the chart area are displayed, with the remainder of the chart available for viewing by using the cursor control keys.

A line drawing capability permits the operator to draw vertical and horizontal lines using the cursor control keys. These lines can be used to enhance charts or to create diagrams and forms.

Information can be viewed in different chart formats to see which kind of chart the operator can choose to display or print the same information in a line or bar chart format. Also, chart values can be printed separately in columnar format.

Charts can be printed individually on a page or merged with text documents when printing. The charts are designed to print in 12-pitch and, if previously stored on diskette, may be printed by either Textpack 4, Textpack 6, or Chartpack.

When using the Chartpack program with Textpack 6, the operator may utilize the stored keystroke procedure to store, recall, and execute a series of up to 500 keystrokes which are to be used repetitively. This function can be used, for example, to help draw predefined boxes for an organization chart.

Charts created and stored on diskette using the Chartpack program can be communicated in media image between Displaywriters using the Displaywriter Binary Synchronous Communications program (5608-SR2). The receiving Displaywriter must use a Chartpack program to display and revise charts that are transmitted. However, the charts may be printed by Textpack 4 or Textpack 6 without using the Chartpack program, provided a Chartpack printwheel is available.

Two specially designed 12-pitch printwheels, Letter Gothic (P/N 1439992) and Prestige Elite (P/N 1439994), are available to support the Chartpack licensed program. These 96-character printwheels, for use on the 5218 and 5228 Printwheel Printers, contain special graphic characters used to print charts. Numerals, upper-case alphabetic characters, and special characters are contained on these printwheels. Characters and symbols are also included on these two printwheels in order to support creating charts for languages other than U.S. English. Printwheels are available separately as supply items and can be obtained through normal IBM supplies ordering procedures.

A brief description of each type of chart supported by the Chartpack program is given below:

Bar Chart - The bar chart is particularly appropriate for comparing the magnitude, or size, of items or parts of the total. Chartpack allows for either a single component, a side-by-side, or a stacked bar chart, with the bars arranged either vertically or horizontally. Bar charts can have a maximum of 24 bars and corresponding labels, with up to four data items per bar in a stacked bar chart. The number of bars and label positions in a side-by-side bar chart depends on the number of bars (maximum of four) per label. The length of the individual bars is determined by the chart values.

Line Chart - The line chart is very useful when showing the change in a value over time. Up to four lines may be plotted on a single chart. A maximum of 24 labels for the horizontal axis can be entered along with the corresponding data values for each line. The labels will be equally spaced on the horizontal axis. The scaling for the vertical axis is determined by the information entered by the operator in response to menu options.

Pie Chart - The pie chart is used to portray the relative sizes of the component parts of a total. The operator enters data values (maximum of 24) and the section labels. The Chartpack program calculates and displays the relative percentages for each section of a three-inch diameter circle.

Free-form Chart - The free-form chart does not have a predefined format. The user can construct charts using the cursor keys to draw horizontal and vertical lines of any length. Special characters and shading can also be utilized when making free-form charts. Examples of free-form charts are organization charts, forms, and certain diagrams. The stored keystroke procedure in Textpack 6 can be used when constructing these charts.

Symbols and upper-case character notation can be added to any of the chart formats, within the chart or above and below the chart. Notation added to a displayed chart can overlay information created by the Chartpack program. Where an overlay appears, the added notation will be the information that is printed.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The Chartpack licensed program is designed to operate with IBM 6580 Displaywriter System configurations with the following components:

- IBM 6580 Display Station with at least 256K memory (when used with Textpack 4) or at least 320K memory (when used with Textpack 6). The Display Station must include a Chartpack Display Adapter (feature #6955).
- IBM 6360 Diskette Unit
- IBM 5218 or IBM 5228 Printwheel Printer
- A special Letter Gothic (P/N 1439992) or Prestige Elite (P/N 1439994) printwheel (required for printing charts)

SOFTWARE REQUIREMENTS

The Chartpack licensed program has been designed to operate with the IBM Displaywriter System Textpack 4 (5608-TR4) or Textpack 6 (5608-TR6).

DOCUMENTATION

(available from Mechanicsburg)

PROGRAM PRODUCTS

**6580 DISPLAYWRITER SYSTEM
EXTENDED SPELLING DICTIONARY - LEGAL
5608-SRB**

PURPOSE

The 6580 Displaywriter System Extended Spelling Dictionary - Legal program adds approximately 16,000 legal terms to the IBM-supplied general usage dictionary of approximately 100,000 words for use with the spelling verification, hyphenation and correction aid tasks of the Displaywriter Textpack 6 program (5608-TR6).

HIGHLIGHTS

The Extended Spelling Dictionary - Legal program is specifically tailored to the needs of law firms, legal departments, and other frequent users of legal vocabulary. The primary sources for the spelling and hyphenation of the legal terms included in the Extended Spelling Dictionary - Legal are *Black's Law Dictionary*, Fifth Edition, and *Webster's Legal Speller*, 1978.

The Extended Spelling Dictionary - Legal adds approximately 16,000 legal terms to the approximately 100,000 general usage words in the extended spelling dictionary of Textpack 6. The Extended Spelling Dictionary - Legal program diskette is used in place of the Textpack 6, Volume 4 diskette when performing spelling verification. The diskette containing the dictionary must be resident in the diskette unit during the spelling verification process. The Extended Spelling Dictionary - Legal diskette can be combined with Textpack 6 diskettes volumes 1, 2 and 3 onto a single Diskette 2D for ease of handling.

The Extended Spelling Dictionary - Legal program is only available in English US and English UK versions.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this program, as well as the applicable problem determination activities.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The Extended Spelling Dictionary - Legal program is designed to operate on the following IBM 6580 Displaywriter System components:

- An IBM 6580 Display Station with at least 320K bytes of memory.
- An IBM 6360 Single or Dual Diskette Unit. (If a single diskette unit is used, it must support the IBM Diskette 2D.)
- An IBM 5215 Selectric Element Printer or IBM 5218 or 5228 Printwheel Printer. (A printer is recommended but not required.)

SOFTWARE REQUIREMENTS

The use of the enhanced Textpack 6 program (5608-TR6) is a prerequisite to the use of the Extended Spelling Dictionary - Legal licensed program (5608-SRB).

DOCUMENTATION

(available from Mechanicsburg)

Licensed Program Specification for Extended Spelling Dictionary - Legal (G544-2366).

PROGRAM PRODUCTS

**6580 DISPLAYWRITER SYSTEM
ASYNCHRONOUS COMMUNICATIONS
5608-SR1****PURPOSE**

The IBM 6580 Displaywriter System Asynchronous Communications program (5608-SR1) provides the functions necessary to send information to and receive information from other IBM Displaywriter Systems or other compatible communicating equipment.

HIGHLIGHTS

Information can be sent either from the keyboard or from diskette. Received information can be recorded on diskette for subsequent revision and/or printing.

All personalization of the communication facility is done through menus provided by the Displaywriter System Asynchronous Communications program (5608-SR1). The operator selects the proper menu, chooses the appropriate options from that menu, and then proceeds with the task. These choices can be stored as communication setups which can be used without the need for the operator to respecify the options for each communication session.

Displaywriter System Asynchronous Communications has three operating modes:

- IBM CMC, which emulates the IBM Communicating Mag Card Selectric® Typewriter, with line speeds of 134.5, and 1,200 bits per second
- IBM 2741, which emulates the IBM 2741 Communications Terminal, with line speeds of 134.5, 300, and 1,200 bits per second.
- TTY, which emulates Teletype® KSR models 33, 35, and 45, with line speeds of 110, 150, 200, 300, and 1,200 bits per second.

A Displaywriter System using Asynchronous Communications program (5608-SR1) also can communicate with a suitably programmed host computer.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this program, as well as applicable problem determination activities.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The IBM Displaywriter System Asynchronous Communications program (5608-SR1) requires the following IBM components or equivalents:

- An IBM Electronics Module with 192K or above memory, a Keyboard Module and a Display Module.
- An IBM 6360 Single or Dual Diskette Unit.
- An IBM 6580 Displaywriter System Communication feature (#3704, #3705, or #3707).
- A modem.
- A communication line.

An IBM 5215 Selectric ® Element Printer, an IBM 5218 Printwheel Printer, or equivalent device is recommended but not required. (A Printer Sharing prerequisite, a logic card placed in a display station to designate printer control in a shared configuration, is necessary for any IBM 6580 Displaywriter System with a shared printwheel printer.)

SOFTWARE REQUIREMENTS

Use of an IBM 6580 Displaywriter System Textpack 2, 4 or 6 program (6508-TR2, 5608-TR4 or 5608-TR6, respectively) is a prerequisite to use of Asynchronous Communications program (5608-SR1).

RPOs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**6580 DISPLAYWRITER SYSTEM
BINARY SYNCHRONOUS COMMUNICATIONS
5608-SR2****PURPOSE**

The IBM 6580 Displaywriter System Binary Synchronous Communications program (5608-SR2) provides the functions necessary to send documents to and receive documents from other 6580 Displaywriter Systems or other compatible communicating equipment. (Documents received by other compatible communications equipment may need additional editing or reformatting if revisions are necessary.)

HIGHLIGHTS

All personalization of the communication facility is done through menus provided by the Displaywriter System Binary Synchronous Communications program (5608-SR2). The operator selects the proper menu, chooses the appropriate options from that menu, and then proceeds with the communication. These choices can be stored as communication setups which can be used without the need for the operator to respecify the options for each communication session.

Displaywriter System Binary Synchronous Communications has 2770/3780 and 2780 emulation. Line speeds of 1,200, 2,000, 2,400, and 4,800 bits per second are available. Both emulation and line speeds are chosen in menus.

A Displaywriter System equipped with Binary Synchronous Communications can communicate with another Displaywriter System or with the following compatible communicating equipment:

- Mag Card II Typewriter - Communicating
- 6240 Mag Card Typewriter - Communicating
- 6640 Document Printer - Communicating
- Office System 6 - Communicating
- 6670 Information Distributor
- 5520 Administrative System

A Displaywriter System using Binary Synchronous Communications can communicate with a suitably programmed host computer.

The sending and receiving of IBM Level 3 Document Content Architecture (L3DCA) between Displaywriter Systems and appropriately programmed IBM host computer systems is supported.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this program, as well as applicable problem determination activities.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The IBM 6580 Displaywriter System Binary Synchronous Communications program (5608-SR2) requires the following IBM components or equivalents:

- An IBM Electronics Module with 256K or above memory, a Keyboard Module, and a Display Module.
- An IBM 6360 Single or Dual Diskette Unit.
- An IBM 6580 Displaywriter System Communication feature (#3704, #3705, #3707, or #1630).
- A modem.
- A communication line.

An IBM 5215 Selectric® Element Printer, an IBM 5218 Printwheel Printer, or equivalent device is recommended but not required. (A Printer Sharing prerequisite, a logic card placed in a display station to designate printer control in a shared configuration, is necessary for any IBM 6580 Displaywriter System with a shared printwheel printer.)

SOFTWARE REQUIREMENTS

Use of an IBM 6580 Displaywriter System Textpack 2, 3 or 4 program (5608-TR2, 5608-TR4, or 5608-TR6, respectively) is a prerequisite to use of Binary Synchronous Communications program (5608-SR2).

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**6580 DISPLAYWRITER SYSTEM
MAGNETIC CARD CONVERSION
5608-SR3****PURPOSE**

The IBM 6580 Displaywriter System Magnetic Card Conversion program (5608-SR3) provides the functions necessary to support the interaction between magnetic cards read or recorded in the 6580 Displaywriter 6361 Mag Card Unit and the 6580 Displaywriter System.

HIGHLIGHTS

Using the conversion functions, magnetic cards created on compatible mag card office equipment can be read and stored on a Displaywriter System diskette for revision, printing, or storage. Information created on the Displaywriter System can be recorded on mag card office equipment.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The IBM 6580 Displaywriter System Magnetic Card Conversion program (5608-SR3) requires the following IBM components or equivalents:

- An IBM Electronics Module with 192K or above memory, a Keyboard Module and a Display Module.
- An IBM 6360 Single or Dual Diskette Unit.
- An IBM 6361 Mag Card Unit.

An IBM 5215 Selectric® Element Printer, an IBM Printwheel Printer, or equivalent device is recommended but not required. (A Printer Sharing prerequisite, a logic card placed in a display station to designate printer control in a shared configuration, is necessary for any IBM 6580 Displaywriter System with a shared printwheel printer.)

SOFTWARE REQUIREMENTS

Use of an IBM 6580 Displaywriter System Textpack 2, 4 or 6 program (5608-TR2, 5608-TR4 or 5608-TR6, respectively) is a prerequisite to use of the IBM 6580 Displaywriter System Magnetic Card Conversion program (5608-SR3).

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**6580 DISPLAYWRITER SYSTEM LANGUAGEPACK
5608-SR4**

PURPOSE

The IBM 6580 Displaywriter System Languagepack program (5608-SR4) contains spelling dictionaries in eight languages for use with the spelling verification aid contained in the 6580 Displaywriter System Textpack 2 program (5608-TR2) and Textpack 3 program (5608-TR3).

HIGHLIGHTS

The Displaywriter System Languagepack program (5608-SR4) contains a spelling dictionary in each of the following languages:

- Danish
- Dutch
- English UK
- English US
- French Canadian
- German
- Italian
- National French
- Norwegian
- Spanish
- Swedish

After a document is typed or revised, the spelling verification aid helps check for possible spelling errors. The spelling verification aid compares the words in a document to:

- An IBM provided dictionary
Each English US and English UK spelling dictionary is capable of checking approximately 50,000 words. Each dictionary for the other languages listed above is capable of checking in excess of 150,000 words.
- A customer-created supplemental dictionary unique to the customer's environment containing up to 4,500 words, for example 450 ten-character words or 900 five-character words.
Eight supplemental dictionaries (one with each language) can be stored on the Languagepack program diskettes.

Any word not found in either dictionary is highlighted on the display. The operator can then correct the misspelled words and cancel the highlighting on unrecognized but correct words (a proper name, for example).

Only one dictionary and one supplemental dictionary can be used for spelling verification aid at one time.

Note: The spelling verification aid may occasionally verify a misspelled word which is formed from inappropriate combinations of root words, prefixes, and/or suffixes. For example, "destate", a combination of the prefix "de" and the root word "state", will not be highlighted.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this program, as well as applicable problem determination activities.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM 6580 Displaywriter System Languagepack program (5608-SR4) requires the following IBM components or equivalents.

- An IBM 6580-A02 or 6580-A03 Electronics Module with a Keyboard Module and a Display Module.
- An IBM 6360 Single or Dual Diskette Unit.

An IBM 5215 Selectric® Element Printer, an IBM Printwheel Printer, or equivalent device is recommended but not required. (A Printer Sharing prerequisite, a logic card placed in a display station to designate printer control in a shared configuration, is necessary for any IBM 6580 Displaywriter System with a shared printwheel printer).

SOFTWARE REQUIREMENTS

Use of the IBM 6580 Displaywriter System Textpack 2 program (5608-TR2) or Textpack 3 program (5608-TR3) is a prerequisite to the IBM 6580 Displaywriter System Languagepack program (5608-SR4).

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**6580 DISPLAYWRITER SYSTEM REPORTPACK
5608-SR5****PURPOSE**

The IBM 6580 Displaywriter System Reportpack program (5608-SR5) provides for the creation, maintenance, and printing of files.

HIGHLIGHTS**File Creation And Maintenance**

The Reportpack Program allows the user to enter and revise the records that make up a file. The file functions are selected at the workstation through menus and control keys. For menu-supported tasks, the operator selects the proper menu, chooses and enters the appropriate options from that menu, and then proceeds with the task. For control key-supported tasks, the operator presses the proper key and then proceeds with the task.

File creation and maintenance activities supported by the Reportpack program include these activities:

- Records can be added to a file:
 - As the file is initially input, or
 - Any time after the file is created.
- The file can be revised by:
 - Adding or deleting entire records, and
 - Adding, revising, or deleting fields of information in a record.
- Records can be selected according to operator-specified parameters for revision or for viewing.
- Fields of information within a record can be temporarily rearranged to allow for easier access to certain fields during revisions.
- A file can be duplicated so that all the records or only selected records are duplicated. These duplicated records may be used to create a new file or be added to an existing file.

File Output

The information in the file can be printed from the file or it can be merged with a text document.

The file information can be printed:

- With the fields printing in a different order than they appear in the field.
- With some fields not printed.
- With all or some records printed.
- With the records sorted (placed in alphabetical or numerical order and in either ascending or descending order) according to operator-specified parameters.

The file can be merged with a shell document created using the Displaywriter System Textpack 4 program (5608-TR4) or Textpack 6 (5608-TR6). Record instructions in the shell document control what information from the file is merged into the shell document and the placement of that information.

Files can be merged with shell documents to produce:

- Repetitive letters, with one letter produced for each record or for selected records in the file.
- Printed lists of records with headings.
- Printed multi-column lists.
- Printed reports that incorporate groups of records.
- Information about groups of records, such as the total number of records in a group.

In addition to controlling the output format in the merge process, the operator can also select and sort the records to be merged.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this program, as well as applicable problem determination activities.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The IBM 6580 Displaywriter System Reportpack program (5608-SR5) requires the following IBM components or equivalents:

- An IBM 6580 Electronics Module with 256K or above memory, a Keyboard Module, and a Display Module (memory requirement dependent on Textpack program used).
- An IBM 6360 Single or Dual Diskette Unit.

An IBM 5215 Selectric® Element Printer, an IBM 5218 or 5228 Printwheel Printer, or equivalent is recommended but not required. (A Printer Sharing prerequisite, a logic card placed in a display station to

designate printer control in a shared configuration, is necessary for any IBM 6580 Displaywriter System with a shared printwheel printer.)

SOFTWARE REQUIREMENTS

Use of the IBM 6580 Displaywriter System Textpack 4 program (5608-TR4) or Textpack 6 (5608-TR6) is a prerequisite to use of the IBM 6580 Displaywriter System Reportpack program (5608-SR5).

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**6580 DISPLAYWRITER SYSTEM
DATA STREAM COMPATIBILITY
5608-SR6****PURPOSE**

The 6580 Displaywriter 3270 Data Stream Compatibility enables a properly configured 6580 Displaywriter System to appear as a specific configuration of a 3274 Control Unit to supported host systems. Those host systems currently supported are the S/370, 4331, 4341, 4361, 4381, 3031, 3032, 3033, 3081, and 8100. The 3274 configuration supported is the mdl 51C (with Configuration Support C), with a single 3278 mdl 2 or mdl 4 Display (with an 87-key EBCDIC typewriter keyboard).

SNA/SDLC communications may be by switched network at up to 4800 bps, or by nonswitched, point-to-point or multi-point at up to 9600 bps.

HIGHLIGHTS**Transition To 3270 Mode**

Transition to 3270 mode is by feature overlay load from diskette followed by operator execution of normal 3270 SNA sign-on procedures. While in the 3270 mode, the operator can save 3270 display screens on diskette in the Displaywriter document format. Displaywriter background printing is also supported while in the 3270 mode.

Native Textpack Mode

Return to native textpack mode is by operator execution of normal 3270 SNA sign-off procedures. After returning to the text mode, all portions of the saved 3270 screens are available for use as Displaywriter text documents.

Alternate Task

By installing 128K bytes of memory in addition to that required for normal Textpack operation, the operator can alternate between Displaywriter Textpack applications and host system applications without terminating either operation. The operator receives messages and prompts about both modes while performing either operation.

Enhancements

- Support for 3287 mdls 1 and 2 printer emulation requires a 5218 or 5228 Printwheel Printer.
- Print operations may be either direct print to the printwheel printer or deferred print. In deferred print, the 6360 Diskette Unit can be selected as the destination for host print and host-initiated copy for subsequent operator editing and printing. Both the diskette unit and printer can be selected as destinations. Diskette cannot be selected as the destination for operator-initiated copy (SAVE is used for that function).

Unsupported Features

Displaywriter 3270 Data Stream Compatibility supports most commonly used 3270 features except for:

- Binary Synchronous Communications
- 3270 Cluster Emulation (multiple displays attached)
- Local Channel attachment
- Loop attachment to local or remote R-Loop
- 3270 Extended Data Stream
 - Extended Highlighting
 - Programmable Symbol Sets
 - Color
- Magnetic Card Reader
- Selector Light-Pen
- Character sets other than U.S. EBCDIC
- Keyboards other than 87-key EBCDIC typewriter
- Printing of English UK
- Certain 3270 keys
 - Alternate cursor
 - Click
 - Cursor blink
 - Extended function keys
 - Indent
 - Overbar
 - Print
- Dual Case/Mono Switch
- Up to 4 characters may not be available from the keyboard if the 92-character keyboard is selected
- Security Keylock

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this program, as well as applicable problem determination activities.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The minimum IBM 6580 Displaywriter system configuration required to support the IBM 6580 Displaywriter 3270 Data Stream Compatibility program product feature is:

- An IBM Electronics Module with at least 256K memory, a Keyboard Module, and a Display Module.
- An IBM 6360 Single or Dual Diskette Unit.
- Communications adapter (#3705 or #3707).
- Customer-supplied modems.
- Customer-supplied communications.

The support for the IBM 3278 mdl 4 Display requires an IBM 6580 Display Station mdl B04 or B06 with a large display.

Emulation of the IBM 3287 mdl 1 or 2 Printer requires a Displaywriter mdl 5218 or 5228 Printer. The 5215 Printer may be used with the Displaywriter background printing but will not support the host printer capability. Also, no single element for the 5215 Printer contains all of the characters which may appear in the saved 3270 screens.

Activating the Alternate Task function requires 128K bytes of memory in addition to that of the Textpack program used.

SOFTWARE REQUIREMENTS

Minimum requirement is IBM 6580 Displaywriter System Textpack 4 (5608-TR4). If screen save is used extensively, use of Textpack 6 (5608-TR6) may be preferred. Textpack 6 provides an enhanced keystroke store and recall capability which can simplify the process of converting the saved 3270 screens to the desired format.

COMPATIBILITY

Programming which operates on the S/370, 4331, 4341, 4361, 4381, 3031, 3032, 3033, or 3081 processors using a 3270 System function subset within that described above, will operate without modification in conjunction with Displaywriter 3270 Data Stream Compatibility.

Operation is on point-to-point switched, and nonswitched point-to-point SNA/SDLC communications facilities.

The most current version of the following SNA/SDLC host system environments will support Displaywriter 3270 Data Stream Compatibility.

- DPPX (for the IBM 8100 Distributed Office System only)
- IMS/VS with ACF/TCAM under OS/VS1 or OS/VS2 (MVS)
- IMS/VS with ACF/VTAM under OS/VS1 or OS/VS2 (MVS)
- CICS/VS with ACF/VTAM under OS/VS1 or OS/VS2 (MVS)
- CICS/VS with ACF/TCAM under OS/VS1 or OS/VS2 (MVS)
- CICS/VS with ACF/VTAM under DOS/VS or DOS/VSE**
- CICS/VS with ACFVTAM E under DOS/VSE**
- TSO* with ACF/VTAM under OS/VS2 (MVS) TSO* with ACT/TCAM under OS/VS2 (MVS)

* TSO does not support printers.

** On a 4331 with integrated communications adapter.

Most existing application programs written to the 3274 SDLC interface of the above listed host programming environment will run unchanged when using the Displaywriter 3270 Data Stream

RPOs ACCEPTED: No

PROGRAM PRODUCTS

**6580 DISPLAYWRITER SYSTEM LANGUAGEPACK 2
5608-SR7****PURPOSE**

The IBM 6580 Displaywriter System Languagepack 2 program (5608-SR7) contains spelling dictionaries in eleven languages for use primarily with the spelling aid contained in 6580 Displaywriter System Textpack 4 program (5608-TR4) and Textpack 6 program (5608-TR6) to support the automatic hyphenation of these programs. Languagepack 2 will also support a level of spelling verification aid in Textpack 2 and Textpack 3.

HIGHLIGHTS

The Displaywriter System Languagepack 2 program (5608-SR7) contains a spelling dictionary in each of the following languages:

- Danish
- Dutch
- English UK
- English US
- French Canadian
- German
- Italian
- National French
- Norwegian
- Spanish
- Swedish

After a document is typed or revised, the spelling verification aid helps check for possible spelling errors. The spelling verification aid compares the words in a document to:

- An IBM provided dictionary.

Each English US and English UK spelling dictionary is capable of checking approximately 50,000 words. Each dictionary for the other languages listed above is capable of checking in excess of 150,000 words.

- A customer-created supplemental dictionary unique to the customer's environment containing up to 4,500 characters, for example, 450 ten-character words or 900 five-character words.

Eleven supplemental dictionaries (one with each language) can be stored on the Languagepack 2 program diskettes. (Only one dictionary and one supplemental dictionary can be used for spelling verification aid at one time.)

The function provided by the Displaywriter System Languagepack 2 program depends on the supporting Textpack program that is used.

Languagepack 2 Used with Textpack 2 or Textpack 3

When Languagepack 2 is used with Textpack 2 or Textpack 3, the spelling verification aid functions, which are described below, are the same as the spelling verification aid functions contained in Textpack 2 and Textpack 3.

After typing or revising the document, the operator can use spelling verification aid to help check for possible errors. After using the spelling verification aid, the operator returns to the revision mode. Any word not found in either dictionary is highlighted on the display. The operator can then correct the misspelled words and cancel the highlighting on unrecognized but correct words (a proper name, for example). If the operator wants to check the spelling corrections, the spelling verification aid must be used to check the entire document again.

Languagepack 2 Used with Textpack 4 or Textpack 6

When Languagepack 2 is used with Textpack 4 or Textpack 6, the spelling verification aid functions, which are described below, are the same as the spelling verification aid functions contained in Textpack 4 or Textpack 6. They include a prompted spelling check and either prompted or automatic hyphenation.

After creating or revising a document, the operator can choose to do a spelling check, make hyphenation decisions, and have the document paginated and printed in one operation. As a part of this task, the operator can choose to do:

- A prompted spelling check.
- Either prompted or automatic hyphenation.

If the operator chooses to use the spelling verification aid in this task, the spelling check will be prompted. Any word not found in either dictionary is highlighted on the screen. Some of the text surrounding the word is also shown. The operator can either indicate that the word is acceptable, or correct the misspelled word by typing it correctly on the prompt line on the display. The newly typed word is checked immediately. If it is spelled correctly, it replaces the misspelled word in the text. If it also is incorrect, the operator is alerted to try another possible spelling.

As a part of the pagination of the document, the lines of text are adjusted to fit within the margins. If there is a word that crosses the right margin, a hyphenation decision is necessary. There are two methods of making the hyphenation decision:

1. The operator can choose to have the system prompt when a hyphenation decision is necessary. Then the operator is shown the word to be hyphenated. Some of the text surrounding the word is also shown. The operator can hyphenate the word, move the entire word to the next line, or leave the entire word on the line it is on.
2. The operator can also choose automatic hyphenation. In this mode, the Displaywriter System will automatically hyphenate any word that crosses the right margin. It uses information from the spelling dictionary to determine the hyphenation points within a word.

During the spelling check, hyphenate, and paginate operation, the document can be trail printed.

Note: The spelling verification aid may occasionally verify a misspelled word which is formed from inappropriate combinations of root words, prefixes, and/or suffixes. For example, "destate", a combination of the prefix "de" and the root word "state", will not be highlighted.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The IBM 6580 Displaywriter System Languagepack 2 program (5608-SR7) requires the following IBM components or equivalents:

- An IBM Electronics Module with at least 192K memory, a Keyboard Module, and a 25-line Display Module. (The memory size used depends on the memory size required for the supporting Textpack.)
- An IBM 6360 Single or Dual Diskette Unit.

An IBM 5215 Selectric® Element Printer, an IBM 5218 Printwheel Printer, or equivalent device is recommended but not required. (A Printer Sharing prerequisite, a logic card placed in a display station to designate printer control in a shared configuration, is necessary for any IBM 6580 Displaywriter System with a shared printwheel printer.)

SOFTWARE REQUIREMENTS

Use of the 6580 Displaywriter System Textpack 2 program (5608-TR2) (or a higher numbered Textpack program) is a prerequisite to the IBM 6580 Displaywriter System Languagepack 2 program (5608-SR7).

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**6580 DISPLAYWRITER SYSTEM
ELECTRONIC DOCUMENT DISTRIBUTION
5608-SR8**

PURPOSE

The IBM 6580 Electronic Document Distribution licensed program provides the IBM Displaywriter System with the functions required to perform the following in an IBM SNA/SDLC communications environment:

- Document distribution with remote Displaywriters and certain other IBM office systems within a communication network through the facilities of IBM Distributed Office Support System/370 (DISOSS/370) Version 3.
- Access to the IBM DISOSS/370 Version 3 document library services.
- Direct exchange of documents with another Displaywriter via SNA telecommunications without the need for host assistance.

HIGHLIGHTS

- SNA/SDLC transmission at up to 9,600 bps.
- Use of Document Interchange and Document Content architectures.
- Interaction with IBM DISOSS/370 Version 3 Document Distribution and Library Services functions.
- Direct document exchange with other similarly configured Displaywriters.
- Final form document interchange with certain other IBM office systems in an IBM DISOSS/370 network.

DESCRIPTION

The Electronic Document Distribution licensed program allows the IBM Displaywriter System to attach to document distribution networks and provides the following functions:

- Distributing and receiving text and records documents through DISOSS/370 (Document Distribution).
- Filing and retrieving text and records documents in DISOSS/370 Host Document Library (Library Services).
- Exchanging text and records documents directly with other IBM Displaywriter Systems (Document Exchange).

Document Distribution: Document Distribution allows the IBM Displaywriter operator to perform a wide range of distribution activities within a DISOSS/370 Version 3 host-based document distribution network. With Document Distribution, the Displaywriter becomes a terminal for distributing documents to and obtaining documents from other terminals via the document distribution network. These document distribution capabilities offer significant advantages over the traditional mail system.

In a document distribution network, each user or department is assigned a local address (user ID) which can be up to eight characters long and serve as the address to which documents can be sent. In addition to the address, each user can be assigned his own unique password for security.

Either before or during the actual communication session, the Displaywriter operator can create a queue of commands for distributing and obtaining documents via an IBM host computer with DISOSS/370 Version 3. When the Communication session is initiated, these commands are sent to DISOSS/370 to be processed. Documents destined for other network users are queued for distribution to their address destinations, and incoming documents are sent to the local Displaywriter.

Some of the Document Distribution capabilities are:

- Distributing documents to one or more specific addresses; to a previously stored distribution list containing one or more address; or to a combination of addresses and lists.
- Requesting DISOSS/370 to return confirmation that a document has been distributed.
- Including messages with distributed documents to provide additional information to the recipient(s). These messages can be used to describe any special printing or formatting requirements and for other comment.
- Changing the operator password maintained by DISOSS/370.
- Requesting delivery to the Displaywriter of all documents or specific documents queued in DISOSS/370 for selected users. In addition, the user can display a detailed or summarized list of the documents awaiting delivery from IBM DISOSS/370.
- Deleting documents in the DISOSS/370 distribution queue.

Library Services: Library Services allows the Displaywriter user to file documents electronically in the IBM DISOSS/370 Version 3 Host Document Library, and to search the library to locate and retrieve previously stored documents. Parametric searches are performed based on criteria the operator selects, and can include documents

stored by other library users. The additional capabilities provided by the Library Services function are:

- Filing a document and/or document profile (a description of the document that includes information about the document but not the document itself) in the Host Document Library.
- Searching the Host Document Library for documents meeting user-selectable criteria. The user-selectable criteria are: Author, document date, document name, document class, recipients, and keywords.
- Retrieving documents from the Host Document Library.
- Distributing documents stored in the Host Document Library to certain other IBM office systems in the network.
- Deleting documents from the Host Document Library.

Note: The Displaywriter does not support the application processing functions of Document Interchange Architecture. Examples of these functions are the DISOSS support for adding search terms and printing on host printers.

Document Exchange: Document Exchange provides the IBM Displaywriter with capabilities for sending and receiving directly to and from other configured IBM Displaywriters. Both Displaywriters must have the Electronic Document Distribution licensed program installed.

In the Document Exchange function, each Displaywriter System can optionally be assigned a name (up to 8 characters long). These optional names, called Session IDs, serve as the addresses of the remote Displaywriter. When a Document is being distributed, the operator selects the Session IDs designated to receive the document. During the actual communication session, only the designated remote devices will receive the document. Any documents queued to other Session IDs will be sent only when the communication session is established with the correct remote Displaywriter. If a session ID is not specified for a document, then all locations will receive the document.

The capabilities offered by the Document Exchange function are:

- Sending documents to operator-selectable recipients(s).
- Sending an up to 80-character message to the remote Displaywriter. This message displays on the remote Displaywriter's display station when the communication session is active and can provide a form of interactive communication between operators.
- Receiving documents and messages sent from other Displaywriters.
- Providing backup capability for DISOSS/370 Network distribution.

Architecture: The Displaywriter System, using the Electronic Document Distribution licensed program, utilizes Systems Network Architecture and Office System Architectures.

Systems Network Architecture - The Displaywriter System, using the Electronic Document Distribution licensed program conforms to the Advanced Program-to-Program Communication (APPC) protocol of SNA.

Office Systems Architectures - The Office Systems Architectures supported by Displaywriter are:

- **Document Interchange Architecture (DIA)** - Document Interchange Architecture provides the framework for communicating commands in a document distribution network. The Document Distribution and Library Services functional subsets of DIA are supported between DISOSS/370 and Displaywriter. The Document Exchange function set of DIA is supported between Displaywriters.
- **Document Content Architecture (DIA)** - Displaywriter supports sending and receiving the Final Form and Revisable Form data streams. The Final Form (L2DCA) data stream is intended to insure print image fidelity and integrity in a document distribution network. With this data stream many commands characteristic of word processing systems (e.g., margin text, footnote and auto-outline instructions) are resolved prior to transmission. The Revisable Form (L3DCA) data stream contains text formatting commands and can be revised at a compatible recipient device.

Refer to the Marketing Announcement Letter, Systems and Architectures, and IBM publication *Information Interchange Architecture Concepts* (GC23-0765, planned availability February 28, 1983) for further information on Office Systems Architectures.

Personalization: The tailoring of the Electronic Document Distribution licensed program to meet specific communication needs is called personalization. All personalization is performed through menus. The modem and line options selected are stored as a part of the program diskette and will not require future operator intervention unless the modem or line option is changed. In addition, the various operating options available to conform to a remote communication device are also defined through menu selection and retained on the program diskette.

PROGRAM PRODUCTS

6580 Electronic Document Distribution (cont'd)

Specifying operating options (personalization) is a one-time task. Therefore, subsequent communication sessions simply require recalling the stored profiles. These profiles are a key to the simplicity of operation of Displaywriter System communication. Up to eight operational profiles can be defined for Electronic Document Distribution. These profiles are used to define the functions required (Document Distribution, Library Services, Document Exchange), as well as other specific tailoring requirements.

Communication Characteristics: The Displaywriter System, with the Electronic Document Distribution licensed program, provides the ability to communicate at a range of speeds depending on the facility and modem. Either point-to-point, switched communication at speeds from 1200 to 4800 bps or multipoint, nonswitched communication at speeds from 1200 to 9600 bps can be utilized.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM Displaywriter Electronic Document Distribution licensed program is designed to operate with the following configurations of IBM Displaywriter System components:

- An IBM 6580 Display Station with a least 320K memory.
- An IBM 6360 Diskette Unit
- Communications adapter (feature code #3704, #3705, or #3707)
- IBM 5218 or IBM 5228 Printwheel Printers, or the IBM 5215 SELECTRIC® Element Printer. (Use of a printer is optional).

The customer is responsible for providing modems (such as the IBM 3863, 3864, 3865, or equivalent) and other communications facilities.

SOFTWARE REQUIREMENTS

IBM Displaywriter System Textpack 4 (5608-TR4) or Textpack 6 (5608-TR6) is required to operate the Electronic Document Distribution licensed program on the Displaywriter.

The Electronic Document Distribution program diskette can be combined onto a single 2D diskette with the Textpack 4 Program diskettes. However, with Textpack 6, it may be necessary to omit the Electronic Spelling Dictionary diskette (textpack 6, volume 4) in order to combine the Electronic Document Distribution and the other three Textpack 6 Program diskettes onto a single 2D diskette.

NETWORK REQUIREMENTS

A suitably configured and programmed IBM System/370 computer with IBM DISOSS/370 Version 3 provides support for the Displaywriter Electronic Document Distribution licensed program. Refer to Programming Announcement Letter for details of the IBM DISOSS/370 Version 3 operating environment.

The following IBM office systems can attach to IBM DISOSS/370 Version 3:

- IBM Displaywriter with Electronic Document Distribution licensed program.
- IBM 8100 Information System with Distributed Office Support Function (DOSF) Release 3 and DISOSS/8100.
- IBM Scanmaster I.
- IBM 5520 Administrative System with the Administrative Processing Program Release 2.

Network Interchange Considerations: The following describes the potential relationship of the Displaywriter System with the above systems through DISOSS/370 Version 3. The *Displaywriter System Electronic Document Distribution Compatibility Guide* (G544-2185, planned availability April, 1983) will provide a detailed description of Displaywriter compatibility with other devices through DISOSS/370.

IBM Displaywriter - The Displaywriter System, using the Electronic Document Distribution licensed program, can send and receive Final Form (L2DCA), Revisable Form (L3DCA), and records documents through DISOSS/370 Library Services and Distribution Services.

Displaywriter will receive the Final Form documents and store them on diskette. Subsequently, the documents can be printed or viewed on the display. In addition, if minor revisions are required, Final Form documents can be converted to Displaywriter internal editable form. Because many of the work processing commands, such as margin text, are resolved in Final Form documents, repagination of a converted document may not have satisfactory results and other revisions may be cumbersome.

Revisable Form documents are converted to Displaywriter internal editable form and stored on diskette when received by Displaywriter. Subsequently, the documents can be viewed on the display, edited with similar ease and facility to that possessed by the originator, and repaginated.

Records documents transferred between Displaywriters through DISOSS/370 can be processed by the Reportpack licensed program at the receiving Displaywriter.

IBM 8100/DOSF - Both 8100/DOSF and Displaywriter Systems have the ability to utilize both the Distribution Services and Library Services functions of DISOSS/370 Version 3. When the 8100/DOSF system files or distributes a document through IBM DISOSS/370, the 8100/DOSF internal data stream is sent. If the document is subsequently routed to a Displaywriter, DISOSS/370 will transform the document to the Final Form (L2DCA) data stream. The document can then be printed, viewed, or converted for limited editing on the Displaywriter. The Displaywriter can file or distribute Final Form documents through DISOSS/370 for subsequent printing on an 8100/DOSF Release 3 System with the 5210 models E1 or E2 printers (with EC996869). Thus, through DISOSS/370 Version 3, the Displaywriter can interchange Final Form documents with IBM 8100/DOSF systems having 5210 printers.

IBM Scanmaster I - A Scanmaster I has the ability to print a subset of the Final Form (L2DCA) data stream. Thus, Displaywriter Systems can distribute Final Form documents through DISOSS/370 Version 3 for subsequent printing on a Scanmaster I. In addition, Scanmaster I can file Image documents in the DISOSS/370 Host Document Library. The Displaywriter attached to the DISOSS/370 network can direct the distribution of these Image documents from the Host Document Library to locations with the Scanmaster I.

IBM 5520 - The 5520 Administrative System, using the 5520 Administrative Processing Program (5611-SS2) Release 2 can file but not retrieve Final Form (L2DCA) documents in the DISOSS/370 Host Document Library. Final Form documents can be transferred one-way (5520 to Displaywriter) through the DISOSS/370 Host Document Library. In addition, both Displaywriter and the 5520 can file or retrieve records document in the DISOSS/370 Host Document Library, providing a two-way interchange. IBM has announced its intent to enhance this data interchange capability to include both Final Form and Revisable Form text interchange between the 5520 and Displaywriter.

PROGRAM PRODUCTS

**6580 DISPLAYWRITER SYSTEM
3270 ATTACHED WORKSTATION
5608-SR9**

PURPOSE

The IBM 6580 Displaywriter System 3270 Attached Workstation licensed program provides the user the convenience of both Displaywriter and 3270 host system functions in a single workstation. This program allows the Displaywriter to emulate functions of the 3278 Display and the 3287 Printer when the Displaywriter workstation is attached through coaxial cables to a 3274 Control Unit or 3276 Control Unit Display Station.

Displaywriters may also attach to the 4321 and 4331 Processors and the 4701 Finance Communication Controller through the integrated adapters supporting the 3278 Display mdl 2 and the 3287 Printer mdls 1 and 2.

In addition to providing 3270 emulation, documents can be transferred in either direction between the Displaywriter diskette and an appropriately programmed host system. Also, with a simple keystroke operation, the user can alternate between Displaywriter text functions and 3270 applications.

HIGHLIGHTS

- Coaxial cable attachment of Displaywriter to:
 - 3274 Control Units
 - 3276 Control Unit Display Stations
 - 4321 Processors
 - 4331 Processors
 - 4701 Finance Communication Controller with Device Cluster Adapter
- Emulation of 3278 Display mdls 2 or 4
- Emulation of 3287 Printer mdls 1 or 2
- Similar user interface and functions as the Displaywriter 3270 Data Stream Compatibility program, including screen save, deferred print, and compress print
- Alternate task capability between 3270 applications and Textpack or Reportpack applications (except program diskette tasks)
- Document transfer capability with the Host Displaywriter Document Interchange Program (PRPQ #P09054, 5799-BKE)

DESCRIPTION

The Displaywriter System 3270 Attached Workstation licensed program supports the direct coaxial cable attachment of Displaywriter workstations to 3274 Control Units, 3276 Control Unit Display Stations, 4321 Processors, 4331 Processors, and 4701 Finance Communication Controllers. With the 3270 Attached Workstation program, an appropriately configured Displaywriter can emulate a subset of the functions of the 3278 Display mdls 2 or 4 and the 3287 Printer mdls 1 and 2.

Expanded Information Handling: The 3270 functions emulated by Displaywriter are expanded with the following information handling capabilities:

- **Screen save:** Transferring of individual 3270 screens to Displaywriter diskette. Local screen print using the print key is also available using a Displaywriter printwheel printer.

Deferred print: Routing host session print and host-initiated screen print output to the Displaywriter diskette unit, printwheel printer, or both.

Compress print: Reformatting host system printer output by changing the pitch (to 12 or 15 characters-per-inch) and by reducing the interline spacing for the printout on the Displaywriter printwheel printer.

Alternate Task: Two modes of operation can be maintained concurrently using the alternate task capability of the 3270 Attached Workstation program. An operator may alternate between Displaywriter Textpack/Reportpack applications (except program diskette tasks) and host system applications without terminating either operation. The operator receives message prompts about both modes while performing either operation. The use of this alternating capability for concurrent operations requires 128K bytes of memory in addition to that required for the Textpack program used. Without this additional memory, either Textpack or 3270 applications may be performed in a nonconcurrent mode by loading the appropriate program diskettes and performing normal start-up and termination procedures.

Document Transfer: In addition to the emulated 3278 and 3287 functions, the 3270 Attached Workstation program provides document transfer capability. Documents can be transferred in either direction between the Displaywriter diskette and an appropriately programmed host system. The Host Displaywriter Document Interchange program (PRPQ P09054, 5799-BKE), announced on November 18, 1982, is a host system program designed to support document transfer using the

Document Content Architecture, revisable form text, level three (L3DCA) data stream.

The following application scenarios depict possible uses of the document transfer capability:

- A Displaywriter user can take advantage of the power of the Professional Office System (PROFS) to view, edit, store, retrieve, mail, and print a document.
- Documents pre-recorded on diskette can be transmitted through the host network to other similarly attached Displaywriters, where the documents may be recorded on diskette, viewed, edited, and printed.
- Documents from Displaywriter diskette can be transferred to a suitably programmed host where they may be viewed and edited on 3270 displays.
- Documents created at the host can be transferred to the Displaywriter diskette for subsequent viewing, editing, or printing.
- The host data base may be utilized for archiving documents, thus reducing the need for diskette storage at the Displaywriter.

Customers requiring the document transfer function within their own host programming environment should refer to the following documents:

- *Document Content Architecture, Revisable Form Text, Level Three (L3DCA)* (SC23-0758), planned availability June 1983 - specifies the elements in a text data stream for interchange of revisable form documents.
- *Displaywriter 3277 Device Emulation/Document Transfer Host Programming Guide* (SC09-1038), planned availability August 1983 - describes the document transfer programming interface.

Displaywriter 3270 Emulation Options: Displaywriter Systems can now be used to participate in all 3270 networks. With the appropriate programs installed, the Displaywriter can support 3270 emulation with a host system and provide additional text/data functions. Either communication lines (e.g., from a remote location) or direct cable attachment to a control unit or host system may be used. The following chart provides a comparison of the four Displaywriter 3270 emulation programs:

	3270 DSC (5608-SR6)	3270 AW (5608-SR9)	3277 DE (5799-BHT) and 3277 DE/DT (5799-BKG)
Characteristics/Support			
3270 Display Emulation	3278-2/4	3278-2/4	3277-2
3270 Printer Emulation	3287-1/2	3287-1/2	N/A
3270 Control Unit Emulation	3274-51C	N/A	N/A
Control Unit Attachment	N/A	3276 3274 (A adapter)	3271/3272 3274 (B adapter)
Direct System Attachment	N/A	4701/4321/ 4331	N/A N/A
Document Transfer with Host	No	Yes	Yes (3277 DE/DT only)
Alternate Task Capability	Yes	Yes	Yes
Text/Data Functions:			
Screen Save	Yes	Yes	No
Direct Print	Yes	Yes	No
Deferred Print	Yes	Yes	No
Compress Print	Yes	Yes	No
Modem Dependent (SNA/SDLC)	Yes	No	No
Control Unit Dependent (SNA/SDLC, BSC, NON-SNA)	No	Yes	Yes
Memory Required (Textpack 4)			
Alternate Task NOT Active	256K	256K	256K
Alternate Task Active	384K	384K	320K
Memory Required (Textpack 6)			
Alternate Task NOT Active	320K	320K	320K
Alternate Task Active	448K	448K	384K

PROGRAM PRODUCTS

3270 Attached Workstation Program (cont'd)

3270 Features: The 3270 Attached Workstation program supports most commonly used 3270 features and capabilities except for the following:

- Emulation of 3278 Display mdl 5
- Magnetic Stripe Readers
- Mono/Dual Case Switch
- Selector Pen
- 3274 Entry Assist Capability
- Certain 3278 keys:
 - Alternate Cursor
 - Click
 - Cursor Blink
 - Attribute select keys: Color, programmed symbols, extended highlighting
- Display of color, programmed symbols, and extended highlighting
- Certain 3287 Printer capabilities:
 - Mono/Dual case printer switches and indicators
 - Programmed symbols
 - SCS support for structured fields or attribute processing
 - X print error indication
 - Attribute-specified underscores
 - Test, Setup, and Index switches
 - Test, and CU signal lights

The 3270 Attached Workstation program supports only 3278 87-key EBCDIC Typewriter Keyboards. The Text, Data Entry, and APL keyboards and the following language-related keyboards are not supported:

- Brazilian/Portuguese
- Portuguese
- Finnish
- World Trade EBCDIC
- International
- Japan (English and Katakana)

Coaxial cable attachment to Port 0 on a 3274 Control Unit is not supported.

Refer to the *Displaywriter 3270 Emulation General Information Manual* (G544-2049), for additional information on the 3270 features supported, restrictions, and the 3270 features supported differently when using the Displaywriter 3270 Attached Workstation program.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM 6580 Displaywriter 3270 Attached Workstation licensed program is designed to operate with IBM Displaywriter System configurations with the following components:

- IBM 6580 Display Station with the 3275/3276 Attached Workstation Adapter (feature #8332), with a minimum memory size as indicated below:

Memory Requirement/Program:	Textpack 4	Textpack 6
- Alternate Task NOT Active	256K bytes	320K bytes
- Alternate Task Active	384K bytes	448K bytes

Emulation of the IBM 3278 Display mdl 4 requires an IBM 6580 Display Station model with a Large Display.

- IBM 6360 Diskette Unit
- IBM 5218 or 5228 Printwheel Printer (required for IBM 3287 Printer emulation).

Additional Hardware Considerations: In a shared printer environment, the 3274/3276 Attached Workstation adapter may be installed in secondary workstations. The 3270 Attached Workstation program can execute local screen print and host system print by requesting the shared printer. The adapter can not be installed in the workstation(s) containing the printer sharing prerequisite (feature #7997).

The 3274/3276 Attached Workstation adapter may be installed in Displaywriter workstations (either 25-Line Display or Large Display models) with communications features (e.g., #3705 and #3707), but can not coexist with the 3277 Device Emulation RPQ (#8D0098).

Cables and/or associated parts to attach the Displaywriter to the 3274 Control Unit and the 3276 Control Unit/Display Station may be purchased from IBM or from customer-selected source. For proper identification, installation, and application of these cables and parts, see *IBM 3270 Installation Manual - Physical Planning* (GA27-2787). The customer is responsible for installation and maintenance of these cables and their associated parts.

For 3270 emulation of both the display and the printer, two coaxial cables must connect the Displaywriter to the terminal type A adapter of the selected control unit. Only one coaxial cable is needed if printer emulation is not required. When attaching Displaywriter to the IBM 4321/4331 Processors, the specify code #9842 must be ordered for the 4321/4331.

The following printwheels are available as supply items and will support the 3270 character set for use with the Displaywriter 3270 emulation programs:

	Courier 10	Artisan 10	Letter Gothic 12	Courier 15
--	------------	------------	------------------	------------

US EBCDIC (ID 101)	1439900	1439932	1439916	1314671
Spanish (ID 309)	1439915	1439947	1439931	1353357

See your IBM marketing representative for information regarding printwheels available to support the 3270 character set in other languages.

SOFTWARE REQUIREMENTS

The IBM 6580 Displaywriter 3270 Attached Workstation licensed program is designed to operate with IBM Displaywriter System Textpack 4 (5608-TR4) or Textpack 6 (5608-TR6).

The 3270 Attached Workstation licensed program can not be operated concurrently with any other Displaywriter communication programs.

PERFORMANCE CONSIDERATIONS

Since the capability to send pre-recorded information with Displaywriter permits a greater rate of information transmission than normal 3270 applications, operations involving document transfer applications may affect the performance of other devices attached to the same 3270 Control Unit. In addition, deferred print allows a higher transmission rate of host printout to the Displaywriter than to a 3287 Printer. This may also affect the performance of other devices attached to the same control unit. Contact your IBM Marketing Representative for additional details on performance implications concerning document transfer and deferred print.

Alternate Task provides concurrent text and 3270 emulation operations. Concurrent batch types of operations, such as pagination (a text operation), and document transfer (a 3270 operation), will increase the individual elapse time for each operation.

PROGRAM PRODUCTS

**6580 DISPLAYWRITER SYSTEM TEXTPACK E
5608-TRE**

PURPOSE

The IBM 6580 Displaywriter System Textpack E program (5608-TRE) provides the functions for text processing and operator assistance.

HIGHLIGHTS

Text Processing

The Textpack E program provides for entry and revision of text. Printed output is also controlled by this program. The text processing functions are selected by the operator at a workstation through menus and control keys. For menu-supported tasks, the operator selects the proper menu, chooses the appropriate options from that menu, and then proceeds with the task. For control key-supported tasks, the operator presses the proper key and then proceeds with the task.

Text processing functions for a document can be divided into these basic activities:

- Creating
- Paginating
- Printing
- Revising or reviewing
- Duplicating a document onto another diskette or onto the same diskette
- Deleting a document
- Incidental typing using key-to-print.

Operator Assistance

The operator assistance functions control many repetitive actions and tasks of the Displaywriter System. Some areas of operator assistance are:

- Display aids that provide the workstation operator with helpful reference information such as menus and messages.
- Personalization that allows standard information, such as document formats, to be entered in the system one time for repetitive use by the operator.
- Work diskette tasks that allow the operator to:
 - Delete a document from a diskette.
 - Duplicate a document.
 - Change a document name or a diskette name.
 - Duplicate an entire diskette.
 - Print an index of a diskette's contents.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this program, as well as applicable problem determination activities.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM 6580 Displaywriter System Textpack E program (5608-TRE) requires the following IBM components or equivalents:

- An IBM 6580 (25-line) Display Station or an IBM 6580 (66-line) Display Station including at least 128K memory, and a keyboard.
- An IBM 6360 Single or Dual Diskette Unit.
- An IBM 5215 Selectric® Element Printer or an IBM 5218 or 5228 Printwheel Printer or equivalent is recommended, but not required.

SOFTWARE REQUIREMENTS

Only this licensed program is required for the IBM 6580 Displaywriter System.

DOCUMENTATION

(available from Mechanicsburg)

General Information Manual for the IBM 6580 Displaywriter System (G544-0851).

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**6580 DISPLAYWRITER SYSTEM TEXTPACK 1
5608-TR1**

No longer available.

PURPOSE

The IBM 6580 Displaywriter System Textpack 1 program (5608-TR1) is designed to operate on the IBM Displaywriter System. The Textpack 1 program provides for text entry, revision and a Spelling Verification Aid (English version programs only) through the use of a workstation. Printed output is also controlled by this program.

HIGHLIGHTS

Menus on the screen list operator choices to simplify task selection. The operator chooses a task and is presented with a menu from which to select options.

Examples of text processing tasks supported by the Displaywriter System Textpack 1 program are:

- Create a document
- Revise or review a document
- Print a document
- Paginate a document
- Delete a document
- Store documents on diskette
- Copy a document or a diskette

Spelling Verification Aid For English Version Programs Only

In addition to these tasks, a Spelling Verification Aid helps identify possible errors. The Spelling Verification Aid compares the words in a document to an IBM-provided dictionary containing approximately 50,000 words and to a customer-created supplemental dictionary unique to the customer's environment containing up to 4,500 words, for example, 450 ten-character words or 900 five-character words. Any word not found in either dictionary is highlighted on the display.

Note: The Spelling Verification Aid may occasionally verify a misspelled word which is formed from inappropriate combinations of root words, prefixes, and/or suffixes. For example, "destate", a combination of the prefix "de" and the root word "state", will not be highlighted.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of the Displaywriter System Textpack 1 program, as well as applicable problem determination activities.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM 6580 Displaywriter System Textpack 1 program (5608-TR1) requires the following IBM components or equivalents:

- An IBM 6508-A01, 6508-A02, or 6508-A03 Electronics Module with a Keyboard Module and a Display Module
- An IBM 6360-010 or 6360-011 Diskette Unit

An IBM 5215 Selectric® Element Printer, an IBM 5218 Printwheel Printer, or equivalent device is recommended, but not required.

SOFTWARE REQUIREMENTS

No other program besides this licensed program is required to perform the listed text management and system operations on the IBM 6580 Displaywriter System.

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**6580 DISPLAYWRITER SYSTEM TEXTPACK 2
5608-TR2****PURPOSE**

The IBM 6580 Displaywriter System Textpack 2 program is designed to operate on the IBM 6580 Displaywriter System. The Textpack 2 Program provides for text entry, revision, and a Spelling Verification Aid. Printed output is also controlled by this program.

HIGHLIGHTS

This program can be used on the display stations in any Displaywriter System that has one or more workstations (up to a maximum of three) sharing an IBM 5218 or 5228 Printwheel Printer. This program can also be used to support feature programs such as the Displaywriter System Asynchronous Communications program (5608-SR1), the Displaywriter System Binary Synchronous Communications program (5608-SR2), the Displaywriter System Magnetic Card Conversion program (5608-SR3), and the Displaywriter System Languagepack program (5608-SR4).

Menus on the screen list operator choices to help simplify task selection. The operator chooses a task and is presented with a menu from which to select options.

Examples of text processing tasks supported by the Displaywriter System Textpack 2 program:

- Create a document
- Revise or review a document
- Print a document
- Paginate a document
- Delete a document
- Store documents on diskette
- Copy a document or a diskette
- Display codes
- Key-to print

Spelling Verification Aid

In addition to these tasks, a Spelling Verification Aid helps identify possible spelling errors. The Spelling Verification Aid compares the words in a document to an IBM-provided dictionary containing approximately 50,000 words (English language version) and to a customer-created supplemental dictionary unique to the customer containing up to 4,500 characters, for example, 450 ten-character words or 900 five-character words. Any word not found in either dictionary is highlighted on the display.

Note: The Spelling Verification Aid may occasionally verify a misspelled word which is formed from inappropriate combinations of root words, prefixes, and/or suffixes. For example, "destate", a combination of the prefix "de" and the root word "state", will not be highlighted.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of Displaywriter programs, as well as applicable problem determination activities.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The IBM 6580 Displaywriter System Textpack 2 program (5608-TR2) requires the following IBM components or equivalents:

- An IBM 6580 Electronics Module with at least 192K or above memory, 2 Keyboard Modules and a 25-line Display Module.
- An IBM 6360-010, 6360-011, 6360-020, or 6360-022 Diskette Unit.
- A Printer Sharing Prerequisite (a logic card placed in one display station in a shared environment to designate printer control) is necessary for any IBM 6580 Displaywriter System with a shared printwheel printer.

An IBM 5215 Selectric® Element Printer, an IBM 5218 Printwheel Printer, or equivalent device is recommended, but not required.

SOFTWARE REQUIREMENTS

No other program besides this licensed program is required in order to perform the listed text management and system operations on the IBM 6580 Displaywriter System.

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

**6580 DISPLAYWRITER SYSTEM TEXTPACK 3
5608-TR3**

No longer available.

PURPOSE

The IBM 6580 Displaywriter Textpack 3 program (5608-TR3) provides for text processing, a spelling function verification aid, and statistical typing.

HIGHLIGHTS

This program can be used on an IBM 6580 Displaywriter System that has one to three workstations sharing an IBM 5218 Printwheel Printer, as well as on an IBM Displaywriter System with an IBM Selectric® Element Printer. This program can support the following Displaywriter System licensed programs:

- Asynchronous Communications program (5608-SR1)
- Binary Synchronous Communications program (5608-SR2)
- Magnetic Card Conversion program (5608-SR3)
- Languagepack program (5608-SR4)

Text Processing

The Textpack 3 program supports the entry, revision, and printing of text. The text processing functions are selected at the workstation through menus and control keys. For menu-supported tasks, the operator selects the proper menu, chooses and enters the appropriate options from that menu, and then proceeds with the task. For control key-supported tasks, the operator presses the proper key and then proceeds with the task.

Text processing functions supported by the Textpack 3 program include:

- Creating, paginating, and printing documents, including
 - Merge processing for the preparation of repetitive documents
 - Alternating headers and footers
- Revising or reviewing a document, including
 - Global replace/delete
 - Block overstrike
- Duplicating a document or a diskette
- Deleting a document

Spelling Verification Aid

After a document is typed or revised, the spelling verification aid helps check for possible spelling errors. The spelling verification aid compares the words in a document to:

- An IBM-provided dictionary capable of checking approximately 50,000 words.
- A customer-created supplemental dictionary unique to the customer's environment containing up to 4,500 characters, for example, 450 ten-character words or 900 five-character words.

Any word not found in either dictionary is highlighted on the display. The operator can then correct the misspelled words and cancel the highlighting on unrecognized but correct words (a proper name, for example).

Note: The spelling verification aid may occasionally verify a misspelled word which is formed from inappropriate combinations of root words, prefixes, and/or suffixes. For example, "destate", a combination of the prefix "de" and the root word "state", will not be highlighted.

Statistical Typing

In addition to the text functions, Textpack 3 offers statistical typing functions. These include:

- Column processing functions, which include column layout, column revision, column delete, column move, and column copy
- Four-function math, which allows the operator to add or subtract rows or columns of numbers or constants that have been typed on the Displaywriter System. The result can be displayed or inserted in the text.
- Four-function math, which allows the operator to multiply or divide numbers or constants that have been typed on the Displaywriter System. The results can be displayed or inserted in the text.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of Displaywriter programs, as well as applicable problem determination activities.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The IBM 6580 Displaywriter System Textpack 3 Program (5608-TR3) requires the following IBM components or equivalents:

- An IBM Electronics Module with a 224K or above memory, a Keyboard Module, and a Display Module.
- An IBM 6360 Single or Dual Diskette Unit.

An IBM 5215 Selectric® Element Printer, an IBM 5218 Printwheel Printer, or equivalent device is recommended but not required. (A Printer Sharing prerequisite, a logic card placed in a display station to designate printer control in a shared configuration, is necessary for any IBM 6580 Displaywriter System with a shared printwheel printer.)

PROGRAM PRODUCTS

**6580 DISPLAYWRITER SYSTEM TEXTPACK 4
5608-TR4****PURPOSE**

The IBM 6580 Displaywriter System Textpack 4 program (5608-TR4) provides functions for text processing, a spelling verification aid, statistical typing, and records instructions [used with the IBM Displaywriter Reportpack program (5608-SR5)].

HIGHLIGHTS

This program can be used on a Displaywriter System that has one to three workstations sharing an IBM Printwheel Printer, as well as on a Displaywriter System with an IBM Selectric® Element Printer. This program can support the following Displaywriter System licensed programs:

- Asynchronous Communications program (5608-SR1)
- Binary Synchronous Communications program (5608-SR2)
- Magnetic Card Conversion program (5608-SR3)
- Reportpack program (5608-SR5)
- 3270 Data Stream Compatibility program (5608-SR6)
- Languagepack 2 program (5608-SR7)

Text Processing

The Textpack 4 program supports the entry, revision, and printing of text. The text processing functions are selected at the workstations through menus and control keys. For menu-supported tasks, the operator selects the proper menu, chooses and enters the appropriate options from that menu, and then proceeds with the task. For control key-supported tasks, the operator presses the proper key and then proceeds with the task.

Text processing functions supported by the Textpack 4 program include:

- Creating, paginating, and printing documents, including
 - Merge processing for the preparation of repetitive documents
 - Merging files/text for the preparation of documents that include information from a file (created using Reportpack)
 - Alternating headers and footers
- Revising or reviewing a document, including
 - Global replace/delete
 - Block overstrike
- Duplicating a document or a diskette
- Deleting a document

Spelling Verification Aid

After a document is typed or revised, the spelling verification aid helps check for possible spelling errors. The spelling verification aid compares the words in a document to:

- An IBM-provided dictionary capable of checking approximately 50,000 words.
- A customer-created supplemental dictionary unique to the customer's environment containing up to 4,500 characters, for example, 450 ten-character or 900 five-character words.

After creating or revising a document, the operator can choose to do a spelling check, make hyphenation decisions, and have the document paginated and printed in one operation. As part of this task, the operator can choose to do a prompted spelling check. Any word not found in either dictionary is highlighted on the display. Some of the text surrounding it is also shown. The operator can either indicate that the word is acceptable or correct the misspelled word by typing it correctly on the prompt line on the display. The newly typed word is checked immediately. If it is found in either dictionary, the newly typed word replaces the highlighted word in the text. If it also is not found in either dictionary, the operator is alerted to try another possible spelling.

As a part of the pagination of a document, the lines of text are adjusted to fit within the right margin. If there is a word that crosses the right margin, a hyphenation decision is necessary. There are two methods of making a hyphenation decision:

1. The operator can choose to have the system prompt when a hyphenation decision is necessary. Then the operator is shown the word to be hyphenated. Some of the text surrounding that word is also shown. The operator can then hyphenate the word, move the entire word to the next line, or leave the entire word on the line it is on.
2. The operator can also choose automatic hyphenation. In this mode, the Displaywriter System will automatically hyphenate a word that crosses the right margin or will move the entire word to the next line. It uses information from the spelling dictionary to determine the hyphenation points within a word.

During the spelling check, hyphenate, and paginate operation, the document can be trail printed.

Note: The spelling verification aid may occasionally verify a misspelled word such as one formed from inappropriate combinations or root words, prefixes, and/or suffixes. For example, "destate", a combination of the prefix "de" and the root word "state", will not be highlighted.

Statistical Typing

In addition to the text function, Textpack 4 offers statistical typing functions. These include:

- Column processing functions, which are column layout, column revision, column delete, column move, and column copy.
- Four-function math, which allows the operator to add or subtract rows or columns of numbers or constants that have been typed on the Displaywriter System. The results can be displayed or inserted in the text.
- The operator can add a row or column of numbers by simply pressing a typamatic row add key or column add key.
- Four-function math, which allows the operator to multiply or divide numbers or constants that have been typed on the Displaywriter System. The results can be displayed or inserted in the text.
- The number or items added or subtracted in a row or column is displayed for the operator, as is the total of the math calculations. If an average is needed, the operator can use the system to automatically compute the average by dividing the number in the total by the number of items.
- The math function can also be used to automatically calculate percentages and to add, subtract, multiply, or divide a percentage of a number from that number.

Records Instructions

Records instructions support the Merge File/Text capability of the Displaywriter System Reportpack Program (5608-SR5). The records instructions are used in shell documents created using Textpack 4. The records instructions, which are selected by the operator, are:

- Control what information from a file, created using Reportpack, is merged into a shell document.
- Allow the operator to set up arithmetic calculations using numbers from a file and/or constant numbers. The results can be inserted into the text or used as a part of a group total or average.

Combined Program Diskette

Textpack 4 includes the ability for the operator to create a combined program diskette. This capability permits the operator to combine the Textpack 4 program diskettes and at least one feature program diskette, or one of the eleven languages from Languagepack 2, onto a 2D diskette. The feature programs are:

- Reportpack
- Asynchronous Communications
- Binary Synchronous Communications
- Mag Card Conversion
- 3270 Data Stream Compatibility

Any remaining space on the combined program diskette can be used for customer data. The amount of space remaining may be reduced or eliminated by software maintenance updates.

Use of this facility requires either an IBM 6360-020 or 6360-022 Diskette Unit (both use IBM Displaywriter diskettes 1 and 2D).

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this program, as well as applicable problem determination activities.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The IBM 6580 Displaywriter System Textpack 4 program (5608-TR4) requires the following IBM components or equivalents:

- An IBM 6580 Electronics Module with 256K or above memory, a Keyboard Module, and a 25-line Display Module.
- An IBM 6360 Single or Dual Diskette Unit.

An IBM 5215 Selectric® Element Printer, an IBM 5218 or IBM 5228 Printwheel Printer, or equivalent is recommended, but not required. (A Printer Sharing prerequisite, a logic card placed in a display station to designate printer control in a shared configuration, is necessary for any IBM 6580 Displaywriter System with a shared printwheel printer.)

Textpack 4 (cont'd)**SOFTWARE REQUIREMENTS**

No other licensed program is required as a prerequisite for using Textpack 4 program (5608-TR4) with the IBM 6580 Displaywriter System.

The IBM 6580 Displaywriter System Reportpack program (5608-SR5) is required to enter and revise the files used with records instructions.

5608-TR6**

PURPOSE

The 6580 Displaywriter System Textpack 6 program provides functions for text processing, operator assistance, a spelling verification aid, statistical typing, automatic footnote processing, automatic outlining, automatic column reference/column heading display, key-to-print, menu bypass enhancement, keystroke storage, recall, editing, an extended spelling dictionary and records instructions.

HIGHLIGHTS

This program can be used on a Displaywriter System that has one to three workstations sharing a 5218 or 5228 Printwheel Printer, as well as a standalone Displaywriter System with a Selectric® Element Printer. This program supports the following Displaywriter System licensed programs:

- Asynchronous Communications program (5608-SR1)
- Binary Synchronous Communications program (5608-SR2)
- Magnetic Card Conversion program (5608-SR3)
- Reportpack program (5608-SR5)
- 3270 Data Stream Compatibility program (5608-SR6)
- Languagepack 2 program (5608-SR7)
- Electronic Document Distribution program (5608-SR8)
- 3270 Attached Workstation program (5608-SR9)
- Chartpack (5608-SRA)
- Extended Spelling Dictionary - Legal (5608-SRB)

Text Processing

The Textpack 6 program supports the entry, revision, and printing of text. The text processing functions are selected at the workstation through menus and control keys. For menu-supported tasks, the operator selects the proper menu, chooses and enters the appropriate options from that menu, and then proceeds with the task. For control key-supported tasks, the operator presses the proper key and then proceeds with the task.

Text processing functions supported by the Textpack 6 Program include:

- Creating, paginating, and printing documents, including
 - Merge processing for the preparation of repetitive documents
 - Alternating headers and footers
 - Delete a document from a diskette
 - Duplicate a document
 - Change a document name or a diskette name
 - Duplicate an entire diskette
 - Erase or initialize (name a diskette)
 - Print an index of a diskette's contents
- Revising or reviewing a document, including
 - Global replace/delete
 - Block overstrike
- Duplicating a document or diskette
- Deleting a document
- Incidental typing using key-to-print

Operator Assistance

The operator assistance functions control many repetitive actions and tasks of the Displaywriter System. Some areas of operator assistance are:

- Display aids that provide the workstation operator with helpful reference information such as menus and messages.
- Personalization that allows standard information, such as document formats, to be entered in the system one time for repetitive use by the operator.

Spelling Verification Aid

After a document is typed or revised, the spelling verification aid, using either the standard or the extended dictionary, helps check for possible errors. The spelling verification aid compares the words in a document to:

- An IBM-supplied standard dictionary consisting of approximately 50,000 words or, if selected by the user, an IBM-supplied extended dictionary of approximately 100,000 words.
- A user-created supplemental dictionary unique to the user's environment. Maximum size of supplement is: 4,500 characters if the standard dictionary is used and 16,000 characters if the extended dictionary is used.

After creating or revising a document, the operator can choose to do a spelling check, make hyphenation decisions, and have the document paginated and printed in one operation. As part of this task, the operator can choose to do:

- A prompted spelling check. Any word not found in either dictionary is highlighted on the display. Some of the text surrounding it is also shown. The operator can either indicate that the word is acceptable or correct the misspelled word by typing it correctly on the prompt line on the display. The newly typed word is checked immediately. If it is spelled correctly, it replaces the highlighted word in the text. If it also is incorrect, the operator is alerted to try another possible spelling.
- As a part of the pagination of a document, the lines of text are adjusted to fit within the right margin. When a word crosses the right margin, a hyphenation decision is necessary. There are two ways to make this decision:

1. The operator can choose to have the system prompt when a hyphenation decision is necessary. Then the operator is shown the word to be hyphenated. Some of the text surrounding that word is also shown. The operator can then hyphenate the word, move the entire word to the next line, or leave the entire word on the line it is on.
2. The operator can also choose automatic hyphenation. In this mode, the Displaywriter System automatically hyphenates any word that crosses the right margin. It uses information from the spelling dictionary to determine the hyphenation points within a word.

During the spelling check, hyphenate, and paginate operation, the document can be trail printed.

Note: If the standard dictionary is selected by the user, the spelling verification aid may occasionally verify a misspelled word formed from inappropriate combinations of root words, prefixes, and/or suffixes. For example, 'destate', a combination of the prefix 'de' and the root word 'state', will not be highlighted. The Extended Spelling Dictionary will only verify as correct those words that are included in the IBM-supplied dictionary or the user-created dictionary.

Extended Spelling Dictionary

Extended Spelling Dictionary helps the Displaywriter operator correct misspelled words. Specialized dictionary and search techniques are used to present on the display a list of likely candidate words. The operator may select a word from the list to replace a misspelled word when found by the Spelling Verification Aid. This capability is available in the Check Document Task when the promoted spelling option has been selected. Extended Spelling Dictionary will be available in English US and English UK languages only. Both the IBM-supplied extended dictionary and the user-created supplemental dictionary are used to provide candidate words.

Statistical Typing

In addition to the text function, Textpack 6 offers statistical typing functions. These include:

- Column processing functions, which are column layout, column revision, column delete, column insert, column move, and column copy.
- Four-function math, which allows the operator to add or subtract rows or columns of numbers or constants that have been typed on the Displaywriter System. The operator also can multiply or divide numbers or constants that have been typed on the Displaywriter System. The results can be displayed or inserted in the text.
- The operator can add a row or column of numbers by simply pressing a typematic row add key or column add key. The system continues to add the numbers in a row or column until the key is released.
- The number of items added or subtracted in a row or column is displayed for the operator, as is the total of the math calculation. If an average is needed, the system automatically computes the average by dividing the number in the total by the number of items.

Textpack 6 (cont'd)

- The math function can also be used to calculate percentages automatically and to add, subtract, multiply, or divide a percentage of a number from that number.

Automatic Footnote Processing

Textpack 6 offers the ability to type footnotes. The process includes:

- Automatic renumber
- Automatic tie-in
- Automatic placement/repagination
- Spill across pages

The final results will be a formatted and paginated document which can be printed by any other Textpack program.

Automatic Outline/Section Numbering

The feature allows sections of a document to be numbered/renumbered automatically in several different ways, including:

- Upper and lowercase Roman Numerals
- Upper and lowercase alphabetic
- Integer and decimal numerals

Each section level may be indented as desired. The leading and trailing text may be automatically supplied with the outline or section number. The final results will be a formatted and paginated document which can be printed by any other Textpack program.

Automatic Column Reference And Heading Display

Textpack 6 supports this feature as a means of enhancing the creation and revision capability for statistical applications. When an operator wishes to revise or type a table containing multiple columns, the Displaywriter System can automatically display a single column with that column's heading and the first column of the table for reference purposes.

Keystroke Store, Recall, and Editing

This enhancement provides the ability to store on diskette a series of keystrokes (characters, controls, commands, etc.) known to be used repetitively, to recall them, and to have the keystrokes executed by pressing a single key. The program is captured as the keystrokes are executed and may be altered in a single step mode.

Key-to-Print

Key-to-print is an operator-selectable task which provides for incidental typing and interactive forms fill-in support, like using a typewriter. This task can be invoked from the Task Selection menu and interrupts the printer at a page boundary if the job is being printed when key-to-print is requested. The suspended print job is resumed when key-to-print is ended. The keyed text is neither displayed nor stored on a diskette while in key-to-print mode.

Records Instructions

Records instructions support the Merge File/Text capability of 6580 Displaywriter System Reportpack program (5608-SR5). The records instructions are used in shell documents created using Textpack 6. The records instructions:

- Control what information from a file, created using Reportpack, is merged into a shell document.
- Allow the operator to set up arithmetic calculations using numbers from a file and/or constant numbers. The results can be inserted into the text or used as a part of a group total or average.

Combined Program Diskette

Textpack 4 includes the ability for the operator to create a combined program diskette. This capability permits the operator to combine the Textpack 4 program diskettes and at least one feature program diskette, one of the eleven languages from Languagepack 2, onto a 2D diskette. The feature programs are:

- Reportpack
- Asynchronous Communications
- Binary Synchronous Communications
- Mag Card Conversion
- 3270 Data Stream Compatibility

Any remaining space on the combined program diskette can be used for customer data. The amount of space remaining may be reduced or eliminated by software maintenance updates.

Use of this facility requires either an IBM 6360-020 or 6360-022 Diskette Unit (both use IBM Displaywriter diskettes 1 and 2D).

Multipass Equation Printing

Multipass equation printing on the 5218/5228 Printers provides an optional procedure for printing documents which require multiple printwheel changes. The document can be printed in multiple passes using a different printwheel on each pass. A list of the specified printwheels (up to twelve) for any document and the range of pages on which each printwheel is used can also be printed.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation and use of this program, as well as the applicable problem determination activities.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The IBM 6580 Displaywriter System Textpack 6 program (5608-TR6) requires the following IBM components or equivalents:

- An IBM Electronics Module with 320K or above memory, a Keyboard Module, and a Display Module (25-line or 66-line).
- An IBM 6360 Single or Dual Diskette Unit.

An IBM 5215 Selectric® Element Printer, an IBM 5218 or 5228 Printwheel Printer, or its equivalent is recommended, but not required. (A printer-sharing prerequisite, a logic card placed in a display station to designate printer control in a shared configuration, is necessary for any IBM Displaywriter System with a shared printwheel printer.)

SOFTWARE REQUIREMENTS

Only this IBM licensed program, Textpack 6 (5608-TR6), is required for the IBM 6580 Displaywriter System. The IBM 6580 Displaywriter System Reportpack program (5608-SR5) is required to enter and revise the files used with records instructions.

RPQs ACCEPTED: No

5520 ADMINISTRATIVE PROCESSING PROGRAM 5611-SS1

PURPOSE

The 5520 Administrative Processing Program provides support to relieve the user of any programming requirement on the 5525 mdls 20, 30, 40 and 50.

HIGHLIGHTS

- Text processing
- Electronic document distribution
- Files processing** and stored procedures**
- System Services (including system management)

DESCRIPTION

Text processing

- Display scale line showing margins, tabs, columns, paper edge and shadow cursor
- Vertical scrolling and horizontal segmenting to review all parts of a stored page
- Functions to create, revise, delete, duplicate, print, store, archive, retrieve, and change profile of documents
- Text manipulation facilitated by:
 - Block movement of text and/or columns with nine save areas per operator
 - Stored formats
 - Auto carrier return
 - Inclusion of margin text (headers and footers)
 - Date, document name and page symbols (margin text)
 - Paragraph adjust
 - Background or interactive paginate functions
 - Background or interactive global functions
- Statistical typing facilitated via:
 - Automatic column alignment (decimal, right, left, center)
 - Column exceptions
 - Column manipulation
 - 'Keep' function (to avoid splitting over page boundary)
 - 'Skip' lines (to reserve space for drawings, etc.)
 - 'Skip to' (for forms fill-in)
- Repetitive document preparation (standard letters, etc.) facilitated via:
 - Document sharing (read or revise)
 - Use of 'instruction symbols' (for later expansion into phrases or long names)
 - Assembly of letters from stored paragraphs
 - Interactive keying of variables with personalized prompts to stored letters or documents
 - Background merging of stored paragraphs and variables
- Scientific report writing facilitated by the support of Greek alphabet and other symbols***
- Access to documents in a System/370 data base (requires user programming and appropriate IBM licensed programming support)
- Security Support
 - Operator ID plus selective password check on sign-on
 - Selective designations of 'private' or 'shared-read' for documents

Files Processing**

In the descriptions that follow, files should be regarded as groups of like records, each record containing user-described 'fields' of information such as the name, department, and telephone number entries in an internal phone directory. From the user's standpoint, a file is a special (structured) form of a document on which the files processing functions may act.

Some of these functions act either on all records within a file or, at the user's option, on selected records only; that is, on only those qualifying records meeting user-defined criteria.

The files themselves are stored on the 5525 and all files processing functions are invoked by the operator at a 5253 or 5254 Display Station.

File Characteristics

Record length may be up to 1000 characters to include:

- Character fields: 1-80 alpha, numeric or special characters
- Arithmetic fields: 1-15 digits plus sign and decimal indicator

** Denotes availability of the function(s) with 5611-SS1 Release 3 only.

*** See Note 5 following "Service Aids".

† See Note 1 following "Service Aids".

- Up to two text field identifiers (of 16 characters each) that link to associated text fields, each text field containing up to 500 characters (including control characters)

A file is a special form of a document that can be:

- Protected by allowing private, shared-read, shared-revise access
- Archived to/retrieved from diskette
- Distributed (as a document)

File sequence is defined by up to six fields, up to 100 characters maximum (ascending or descending) and may provide direct access to the file by optional unique index field

Record selection (where indicated) may also be based on up to 12 qualifiers. Each qualifier compares field content (or its arithmetic/character derivation) to a constant, a list, a range, or another field/expression

File Organization

Files can be:

- Created directly by keying through a 5253/5254 Display Station
- Acquired from a host System/370 (with appropriate programming support)
- Obtained as a document from any remote device on a 5520 Administrative System document distribution network (see "Electronic Document Distribution Communications Support" later in this text)

A convert function is also provided to change the format of many list documents into the 5520 file format for further processing. These lists may have been created locally in a 5520 System or remotely in the document distribution network.

File Creation (on the 5253/5254 Display Station)

- Tabular format designed for straightforward list entry
- Field prompting format designed for more comprehensive checking or operator training on more involved files.

- Prompts and/or field names
- Designation of fields as text, character, or arithmetic
- Field level edit-checking which includes minimum length, maximum length, range check, list check, character compare mask, and unique entry
- Field entry may be required, optional, or conditioned by a prior field in the record

- File maintained in sequence (by sequence field content) irrespective of sequence of creation
- Compatible records may be merged in from another file on the system

Delete Records (by qualifiers)

- Selected records eliminated (after optional operator verification) to free up storage space

Query File

- Display of individual record content on 5253/5254 screen
- Direct access via sequence field or via optional unique index field
- Repeated query to ascending/descending records via sequence field
- Optional file 'lock' (to prevent alteration) during query operation

Display/List File (directly or by qualifiers)

- Sequential search for one or multiple records meeting described selection criteria
- Qualifying records may be displayed or stored in the 5525 as a document for further processing such as printing

Update File

- Records added, changed, or deleted (directly or by qualifiers)
- Optional printout of proof list for all types of alterations
- Added records automatically inserted in correct position within the sequence
- Same checks and messages on fields/characters as for File Creation

Copy Records (directly or by qualifiers)

- Reproduce file; with user choice of new index if desired
- Resequencing of entire file or of selected records
- Merge an entire file (or selected subset) with a second file
- Create a subset file of selected records

Duplicate File

- Reproduce file (for temporary use)

List File (directly or by qualifiers)

- Background search of file for multiple records meeting selection criteria
- Creates a text document for later viewing, printing, etc.

5520 Administrative Processing Program (cont'd)

- Counts the number of records selected
- Merge File/Text
 - User-specified document 'template' controls repetitive variable inserts from records
 - User-specified report 'template' controls summarized input from records
 - Document and report templates can be used at the same time
 - Information can be:
 - Extracted from single file or
 - Additionally, at user choice, extracted from a parallel file linked by a common field (two files processed concurrently)
 - Record information can be extracted from:
 - All records or
 - Selected records (by qualifiers)
 - Record information can be included:
 - As is, or
 - After arithmetic operations on single or multiple fields and/or
 - After editing with decimals/currency/sign indicators, etc.
 - Embedded instructions available to the operator are designed to enable such operations as:
 - Conditional insertion of variables and paragraphs
 - Accumulating multi-level totals
 - Skipping to a given line number (for example, for forms fill-in)
 - File/text output can be:
 - Printed and/or
 - Stored (for display or later use)
 - File update (where permitted)

Stored Procedures**

- Operator-created by linking and storing file processing functions via menu-selection
- May contain:
 - Open parameters to be completed by operator
 - Closed parameters completed beforehand and used for each execution of this procedure
- Executed as a single task in the prescribed sequence of steps while file(s) employed are locked for procedure duration

Electronic Document Distribution

Functions

- Distribution addressing:
 - Multiple individual destinations
 - Distribution list
 - Combination of the two
- Scheduling of delivery (transmission):
 - Priority (by sender)
 - On request (by receiving system operator)
 - Normal (automatic batching) based on:
 - Time of day (up to 3 times per day)
 - Number of documents (economic quantity)
 - Combination of the two
- Document receipt alternatives
 - Print (with deletion from storage)
 - Copy to online library (for further use)
 - Print and copy to library (for example, further copies required)
 - Cancel (after viewing at display, implies receipt)
- Addressee options
 - Destination group (for example, a secretary is authorized to receive documents for members of a department)
 - Addressee only (personal); may be combined with password
- Delivery advice
 - List of documents waiting, on request
 - Message if 'personal' documents waiting
- Confirmation of receipt at final destination if requested by sender
- Security Support
 - Device ID interchange (both BSC and SDLC)
 - Selective operator password sign-on check
 - 'Personal' documents may be restricted by addressee password

Communications Support: (in conjunction with the 5520 Administrative System with requisite hardware features)

- Distribute/Receive documents between 5520s (SNA/SDLC)
- Distribute documents to or receive documents from the following devices (with appropriate features)
 - An Office System 6 (BSC)††
 - A Displaywriter System (BSC)††
 - A Mag Card II Typewriter (BSC)††
 - A 6240 Communicating Mag Card Typewriter (BSC)††
 - A 6640 Document Printer (BSC)††
 - A 6670 Information Distributor (BSC)††
 - A System/32 with Word Processing Feature #6002 plus appropriate hardware and programming
 - A System/370 (with user programming and ACF/VTAM or ACF/TCAM) (SNA/SDLC)†
 - A System/370 (with user programming and ACF/TCAM) (BSC)†**
- Use of the System/370 as a store-and-forward node in a 5520 distribution network (requires user programming and ACF/VTAM or ACF/TCAM Version 2 Release 1 or 2††† (SNA/SDLC)†
- Option for auto-call (auto-answer is standard choice)
- Call-in device list (for control of traffic on switched line)
- Call-out line list (for optimum use of available lines)
- Retry option with number of times and intervals

Production Statistics (when selected by the user)

- Automatic recording of statistics as they occur by:
 - Text document access and type
 - Distribution connect time and volume
- Reports printable on request by:
 - Document charge number
 - Operator charge number
 - Document distribution
 - Destination
- Report convertible to a file for subsequent processing

System Services (including systems management) via:

- User-created profiles (descriptions), changeable as needs develop
 - System components (configuration)
 - Operators (type, authority, etc.)
 - Documents (including files**)
- System resource sharing and usage measurements
- Error checking, retry, and recording
- Program maintenance facilities

The following facilities are also provided:

Task initiation and control

- Menu approach to initiate tasks (with menu bypass)
- Online interactive HELP facilities to guide and assist the operator in many areas on request
- Display/List job status available at all times
- Automatic facilities for print queue management (via set-ups)
- Print queue management override for exceptional situations
- Print, archive/retrieve in background
- Operator messages, immediate or queued as appropriate
- Special 'Device Service' messages to alert the operator to required actions (for example, the replenishment of a printer with paper)
- Broadcast messages to all or selected operators
- Defaults at system, operator, and document level for the more common user-defined procedures and standards

Installation Aids: To install the licensed program, the user (with guidance via a display station) establishes the system program library, describes required I/O device definitions and authorized users, and starts the

** Denotes availability of the function(s) with 5611-SS1 Release 3 only.
 † See Note 1.
 †† See Notes 2 and 3 for limitations.
 ††† or later releases. This does not imply that such later releases will occur.

5520 Administrative Processing Program (cont'd)

program. The system is ready for use at this point but the user may wish to do some additional system personalization such as:

- Describing additional I/O devices
- Defining additional authorized users
- Modifying the supplied default parameters

This additional system personalization can be done any time.

System Resource Management: Under control of the licensed program, the system processes the job requests, acquires system resources for the jobs, executes the jobs and terminates the jobs. The system manages disk space allocation and controls the contention resulting from multiple jobs competing concurrently for system resources. In order to accomplish this, it manages the scheduling and queuing necessary to share the system resources among all jobs.

Archive and Retrieve Facility: The archive and retrieve facility provides the following functions via the system compact diskette drive supporting Diskette 2D:

- Archive/retrieve repetitive documents (including files**)
- Provide backup for the document library (including files**)
- Keep seldom used or sensitive information offline
- Provide authorized data exchange between 5520 Administrative Systems including documents and profiles so that, for example, one 5520 system may be personalized on another (with equal or higher model number or the 5525).

I/O Management: The program supports the following locally attached devices:

- 5253 Display Station
- 5254 Dual Display Station
- 5258 Printer
- 6670 Information Distributor (SDLC) (see note 6)
- 5321 Mag Card Unit (see note 4)
- 5219 Printer

Service Aids: This program contains system level diagnostic function designed to assist with concurrent maintenance of a 5253, 5254, and 5257, 5219 or a 5258 attached to the 5525, while the customer continues to use other parts of the system. Absence of these diagnostic functions (or their full equivalent) will result in reduced system availability to the user.

Note 1: In communicating with a System/370 the following interface rules apply:

- The 5525 System Unit (with SNA/SDLC) is supported by ACF/VTAM or ACF/TCAM Version 2, Release 1 or Release 2†††, as an LU Type 1.
- The 5525 System Unit (with BSC)** is supported by ACF/TCAM Version 2, Release 1 or Release 2††† as a 2770-like device.
- Access to CICS/VS 1.4 Subsystem (SNA/SDLC) is via the supported levels of ACF/VTAM and ACF/TCAM LU-to-LU facilities. The 5525 will be supported as a 3790 full function LU, Type O.
- Access to CICS/VS 1.4 Subsystem (BSC)** is via the supported levels of ACF/TCAM, BTAM, or BTAM-ES, where the 5525 is supported as a 2770-like device.
- Access to IMS V1 R1.5††† Subsystem (SNA/SDLC) is via the supported levels of ACF/VTAM and ACF/TCAM LU-to-LU facilities. The 5525 will be supported as an LU, Type P.

Note 2: For communications with remote devices and also the reading or writing of mag cards in the 5321, the following U.S. and country keyboard I.D.s are supported: 1, 2, 3, 4, 5, 6, 7, 8, 17, 19, 24, 25, 26, 28, 29, 31, 32, 33, 36, 37, 38, 39, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 66, 67, 80, 100, 101, 103, 251, 252, 253, and 254. In the same environment, format feature protocols (as optionally used on the Mag Card II typewriter and also other IBM devices) are supported.

Note 3: Documents prepared on BSC-supported devices, such as members of the OS/6 family, may contain formatting and other control codes (OCL). These are not recognized by the 5520 Administrative Processing Program. Where Document Distribution is between like devices, document content including OCL (formatting and other control codes) is transmitted transparently. However, for distribution with one of these devices, to or from a 5253 or 5254 Display Station, additional operator intervention may be necessary and special procedures implemented.

Note 4: The 5321 Mag Card Unit is used for reading and/or recording of Mag Cards, with limitations. These limitations relate to the use of Operator Control Language Statements which, when read, are treated as text by the 5520 Administrative Processing Program. Also, if OCL statements are required on mag cards prepared on the 5321, they must be inserted by the operator. Writing to mag card is in 'page image' format. This is suitable for printing on mag card devices only and not for further editing.

Note 5: Symbol character support is only available in conjunction with SNA/SDLC protocols. Documents containing symbols may be distributed within a single 5525, or to or from another 5525, for printing on a 5258, a 6670 used as an output printer, or possibly 5219 or 5257 Printers as appropriate; or to or from a host System/370 (appropriately programmed) using SNA/SDLC communications.

Note 6: 6670 Information Distributor may be used as a printer locally attached by an LDC line. Printer support is also provided for a remotely located 6670 Information Distributor (SDLC) attached by a nonswitched SDLC communications line. Similar support for locally or remotely attached 6670 Mdl IIs will also be provided. Contact IBM for hardware schedules.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with Marketing and Service Guidelines in the GI section of the sales manual, in the installation of IBM licensed programs. However, the responsibility of providing accurate ordering information, personnel selection and training, and continued day-to-day operations lies solely with the customer. Installation of the IBM 5520 Administration Processing Program, all subsequent releases and Program Temporary Fixes (PTFs) are the customer's responsibility.

Customers should be reminded that they are responsible for conforming the use of the system to applicable statutes or regulations relating to the distribution of information both in their own country and also to, from or between other countries.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration is:

- IBM 5525 mdl 20, 30, 40, or 50
- 1 - IBM 5253 or 5254 Display Station located in the same room as, and within 6.1 cable meters (20 cable feet) of, the 5525 System Unit.

SOFTWARE REQUIREMENTS: None.

DOCUMENTATION

(available from Mechanicsburg)

Licensed Program Design Objectives (GC23-0734).

RPOs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

5611-SS2 - 5520 ADMINISTRATIVE PROCESSING V2

PURPOSE

The 5520 Administrative Processing Program Release 2 and Release 3 provides support for the 5525 mds 21, 31, 32, and 51, without the requirement of any user programming on the 5525.

HIGHLIGHTS

- Text processing
- Files processing and stored procedures
- Electronic document distribution and interchange
- Electronic message distribution
- 3270 Emulation
- DISOSS/370 user interfaces
- System Services (including system management)

DESCRIPTION

Text Processing

- Display scale line showing margins, tabs, columns, paper edge, and shadow cursor
- Vertical scrolling and horizontal segmenting to review all parts of a stored page
- Functions to create, display, revise, delete, duplicate, print, store, archive, retrieve, and change profile of documents
- Text manipulation facilitated by:
 - Block movement of text and/or columns with nine save areas per operator
 - Stored formats
 - Auto-carrier return
 - Directional and contextual cursor movement
 - Replace and/or insert mode
 - Inclusion of margin text (headers and footers)
 - Date, document name and page symbols (margin text)
 - Line numbering
 - Paragraph adjust and join/split page functions
 - Background or interactive paginate functions
 - Background or interactive global functions
- Dictionary Services:
 - System-supplied English, Medical and Legal Dictionaries
 - Users may add supplemental lists for special words
 - Automatic hyphenation in pagination or merge file/text
 - Spelling check and aid with correctly spelled possibilities
 - Synonym aid gives lists of words with similar meaning
- Notes and References*
 - Supports footnotes, references and inline notes
 - Reference may be numeric, alphabetic or special characters
 - Text-like flexibility in creation and pagination of notes
 - Automatic placement and renumbering after editing
 - Support for note overflow and text/note distinguishing characteristics
- Technical Writing Support** facilitated via:
 - Extensive symbols set includes math functions and operators, Greek characters, scientific symbols and business and advanced text signs
 - Flexible display screen cursor control (5253 and attached IBM PC)
 - Multi half-line visualization technique
 - Printing via auto font change printers such as 5258
- Statistical typing facilitated via:
 - Automatic column alignment (decimal, right, left, center)
 - Column exceptions
 - Column manipulation
 - 'Keep' function (to avoid splitting over page boundary)
 - 'Skip' lines (to reserve space for drawings, etc.)
 - 'Skip to' (for forms fill in)
 - Long line entry with 17-inch wide print
 - Advanced math in text through shell document instructions
- Repetitive document preparation (standard letters, etc.) facilitated via:
 - Document sharing (read or revise)
 - Use of 'instruction symbols' (for later expansion into phrases or long names)
 - Assembly of letters from stored paragraphs
 - Interactive keying of variables with personalized prompts to stored letters or documents
 - Background merging of stored paragraphs and variables
 - Conditional insertion of text through file processing functions
- Access to documents in a S/370 data base (requires user programming and appropriate IBM licensed programming support

• Security Support

- Operator ID plus selective password check on sign-on
- Selective designations of 'private', 'shared-revise' or 'shared-read' for documents
- User access lists to separate groups of users*

Files Processing

In the descriptions that follow, files should be regarded as groups of like records, each record containing user-described 'fields' of information such as the name, department, and telephone number entries in an internal phone directory. From the user's standpoint, a file is a special (structured) form of a document on which the files processing functions may act.

Some of these functions act either on all records within a file or, at the user's option, on selected records only - that is on only those qualifying records meeting user-defined criteria.

The files themselves are stored on the 5525 and all files processing functions are invoked by the operator at a 5253 or 5254 Display Station.

• File Characteristics

Record length may be up to 1000 characters to include:

- Character fields: 1-80 alpha, numeric or special characters
- Arithmetic fields: 1-15 digits plus sign and decimal indicator
- Up to two text field identifiers of 16 characters each that link to associated text fields. Each text field contains up to 500 characters (including control characters)

A file is a special form of a document that can be:

- Protected by allowing private, shared-read, shared-revise access
- Archived to/retrieved from diskette
- Distributed (as a document)

File sequence is defined by up to six fields, up to 100 characters maximum (ascending or descending) and may provide direct access to the file by optional unique index field

Record selection (where indicated) may be based on up to 12 qualifiers. Each qualifier compares field content (or its arithmetic/character derivation) to a constant, a list, a range or another field/derivation.

• File Organization

Files can be:

- Created directly by keying through a 5253/5254 Display Station
- Acquired from a host S/370 (with appropriate programming support)
- Obtained as a document from any remote device on a 5520 Administrative System document distribution network [see "Electronic Document Distribution" (Communications Support) later in this text]

A Convert Function is also provided to change the format of many list documents into the 5520 file format for further processing. These lists may have been created locally in a 5520 system or remotely in the document distribution network.

• File Creation (on the 5253/5254 Display Station)

- Tabular format designed for straightforward list entry
- Field prompting format designed for more comprehensive checking or operator training on more involved files.
 - Prompts and/or field names
 - Designation of fields as text, character, or arithmetic
 - Field level edit-checking which includes minimum length, maximum length, range check, list check, character compare mask, and unique entry
 - Field entry may be required, optional, or conditioned by a prior field in the record
- File maintained in sequence (by sequence field content) irrespective of sequence of creation
- Compatible records may be merged in from another file on the system

• File Description Editing

• Delete Records (by qualifiers)

- Selected records eliminated (after optional operator verification) to free up storage space

• Query File

- Display of individual record content on 5253/5254 screen
- Direct access via sequence field or via optional unique index field
- Repeated query to ascending/descending records via sequence field

* With Release 3 of the program only.

** See Note 5 following "Service Aids".

† See Note 1 following "Service Aids".

PROGRAM PRODUCTS

5520 Administrative Processing Program (cont'd)

- Optional file 'lock' (to prevent alteration) during query operation
- Display/List File (directly or by qualifiers)
 - Sequential search for one or multiple records meeting described selection criteria
 - Qualifying records may be displayed or stored in the 5525 as a document for further processing such as printing
- Update File
 - Records added, changed or deleted (directly or by qualifiers)
 - Optional printout of proof list for all types of alterations
 - Added records automatically inserted in correct position within the sequence
 - Same checks and messages on fields/characters as for File Creation
- Copy Records (directly or by qualifiers)
 - Resequencing of entire file or of selected records
 - Merge an entire file (or selected subset) with a second file
 - Create a subset file of selected records
- Duplicate File
 - Reproduce file (for temporary use)
- Duplicate File Description (FD)
 - Newly duplicated FD is fully editable
 - Allows changes to FDs that have been used to create a file
- List File (directly or by qualifiers)
 - Background search of file for multiple records meeting selection criteria
 - Creates a text document for later viewing, printing, etc.
 - Counts the number of records selected
- Merge File/Text
 - User-specified document 'template' controls repetitive variable inserts from records
 - User-specified report "template" controls summarized input from records
 - Document and report templates can be used at the same time
 - Information can be:
 - Extracted from single file or
 - Additionally, at user choice, extracted from a parallel file linked by a common field (two files processed concurrently)
 - Fast path option when pagination at output document is not required
 - Record information can be extracted from:
 - All records or
 - Selected records (by qualifiers) or
 - Designation of 'start' and 'stop' record range
 - Record information can be included:
 - As is, or
 - After arithmetic operations on single or multiple fields and/or
 - After editing with decimals/currency/sign indicators, etc.
 - Embedded instructions available to the operator are designed to enable such operations as: (some of these instructions preclude the use of the fast path option)
 - Conditional insertion of variables and paragraphs
 - Accumulating multi-level totals
 - Skipping to a given line number (for example, for forms fill-in)
 - Records can be optionally resequenced (up to 6 fields on output)
 - File/text output can be:
 - Printed and/or
 - Stored (for display or later use)
 - File update (where permitted)

Stored Procedures

- Operator-created by linking and storing file processing functions via menu-selection
- May contain:
 - Open parameters to be completed by operator
 - Closed parameters completed beforehand and used for each execution of this procedure
- Executed as a single task in the prescribed sequence of steps while file(s) employed are locked for procedure duration

Electronic Document Distribution and Interchange

With Release 3 of the program, the 5520 has implemented the SNA Distribution Services (SNADS) architecture which describes the SNA store-and-forward function. In conjunction with the DISOSS/370 V3.2 implementation of the same architecture, the two systems may co-exist in the same SNA store-and-forward network and perform as end and intermediate nodes for purposes of distribution of documents through the network.

Functions

- Distribution to and from any DISOSS/370 V3.2 node and 5520 node in a network of the two systems.
- Distribution addressing
 - Multiple individual destinations
 - Distribution list
 - Combination of the two
- Scheduling of delivery (transmission)
 - Priority (by sender)
 - On request (by receiving system operator)
 - Normal (automatic batching) based on
 - Time of day (up to 3 times per day)
 - Number of documents (economic quantity)
 - Combination of the two
- Document receipt alternatives
 - Print (with deletion from storage)
 - Copy to online library (for further use)
 - Print and copy to library (for example, further copies required)
 - Cancel (after viewing at display; implies receipt)
- Addressee options
 - Destination group (for example, a secretary is authorized to receive documents for members of a department)
 - Addressee only (personal); may be combined with password
- Delivery advice
 - List of documents waiting, on request
 - Message if 'personal' documents waiting
- Confirmation of receipt at final destination if requested by sender
- Security Support
 - Device ID interchange (both BSC and SDLC)
 - Selective operator password sign-on check
 - 'Personal' documents may be restricted by addressee password

Communications Support (in conjunction with the 5520 Administrative System with requisite hardware features)

- Distribute/Receive revisable and final form documents between 5520s (SNA/SDLC) and also 6580 Displaywriter (SNA/SDLC) and other devices and subsystems supported by DISOSS/370 Version 3 Release 2.
- Distribute documents to or receive documents from the following devices (with appropriate features)
 - An Office System 6 (BSC)††
 - A Displaywriter System (BSC)††
 - A Mag Card II Typewriter (BSC)††
 - A 6240 Communicating Mag Card Typewriter (BSC)††
 - A 6640 Document Printer (BSC)††
 - A 6670 Information Distributor (BSC)††
 - A System/32 with Word Processing feature #6002 plus appropriate hardware and programming
 - A System/34 with appropriate hardware and programming
 - A System/36 with appropriate hardware and programming
 - An S/370 (with user programming and ACF/VTAM or ACF/TCAM) (SNA/SDLC)†
 - An S/370 (with user programming and ACF/TCAM) (BSC)
- Use of the S/370 as a store-and-forward node in a 5520 distribution network (requires user programming and ACF/VTAM or ACF/TCAM Version 2 Release 1 or 2††) (SNA/SDLC)† or using DISOSS/370 V3.2 and other appropriate programming
- Option for auto-call (auto-answer is standard choice)
- Call-in device list (for control of traffic on switched line)
- Call-out line list (for optimum use of available lines)
- Retry option with number of times and intervals

Electronic Message Distribution: * Messages (up to 256 characters long) may be distributed across a 5520 SNA network using the same communications facilities as document distribution:

- To one or many recipients
- Locally or across the network
- By themselves or attached to accompanying document
- Using priority or other forms of scheduling

†† See Notes 2 and 3 for limitations.

* With Release 3 of the program. See Note 1 following "Service Aids".

† See Notes 2 and 3 for limitations.

††† or later releases. This does not imply that such later releases will occur.

5520 Administrative Processing Program (cont'd)

3270 Emulation

3270 Emulation is a 5520 function that is accomplished by means of a hardware emulation feature on supported 5253 Display Stations or appropriately configured attached IBM PCs* in 5253 emulation mode, and the Administrative Processing Program Release 2 or 3 (5611-SS2) on the 5525 (mdls 21, 31, 32, and 51) System Unit.

3270 Emulation supports a subset of the functions and keys of the 3278 mdl 2 Display Station with the 87-key EBCDIC typewriter keyboard as it would appear when communicating through a 3274 mdl 1C or 51C Control Unit (using a subset of the functions and options available) to an appropriately programmed S/370 or 4300 Processor in half-duplex mode using Synchronous Data Link Control (SDLC) over duplex or half-duplex communications facilities. Direct attach and/or loop attach to host processors is not supported.

Alternatively, BSC lines* may be used which must be nonswitched, multi-drop with the 5525 (emulating a 3274) acting as a tributary station, and operating in control mode, text mode or transparency mode (for monitoring purposes only). A single BSC line is supported for 5525 mdls 21, 31 and 32, and two lines for mdl 51 (with two distribution controllers).

Highlights

- A single-featured 5253 Display Station or appropriately configured attached IBM PCs* in 5253 emulation mode can now support both 5520 functions and, via SNA/SDLC or BSC* communications, a subset of 3270 functions
- 5520 operators initiate 3270 mode, selecting host and applications through menu selections
- Data displayed in 3270 mode may be selectively copied and saved for use in 5520 text functions
- 5520 operators may suspend 3270 mode, perform 5520 functions, then return to 3270 mode without re-initiating the communication session; the 3270 screen information is saved and redisplayed.
- 5520 operators may update the host data base using host applications support
- Multiple appropriately featured 5253 Display Stations or attached IBM PCs* in 5253 mode on a 5520 System may use 3270 Emulation concurrently, with the same or different hosts

Basic Features: The 3270 Copy function support is emulated through use of a 5520 system-generated full screen block copy operation for both the print key and host-initiated requests. This data may then be printed as a 5520 function.

Functions selectable during the 3274 customization process are not supported.

Limitations/Restrictions

- **Display Station and Keyboard:** The 5520 Administrative System 3270 Emulation function utilizing the 5253 Display Station with the Function Extension feature (#3270) supports a subset of the functions and keys of the 3278 mdl 2 Display Station with the 87-key EBCDIC Typewriter Keyboard (#4627) and Audible Alarm (#1090). The following limitations should be noted:
 - The 5253 Keylock feature (#4655) may be used for the same purposes as the Security Keylock feature (#6340) of the 3278 mdl 2 Display Station
 - The 3278 capability to display indicator symbols is not supported.
- In 3270 emulation mode, all keyboard characters are printable on the 5219, 5229, and 5257 and 5229 impact printers with the following print wheels:
 - For 5257 - #1257613 supporting EBCDIC keyboard 101
 - For 5219 and 5229 - #1439653 supporting EBCDIC keyboard 101
 - No other special features or options of the 3278 mdl 2 Display Station are supported
 - The following 87-key EBCDIC typewriter keyboard (#4627) keys and/or functions are not supported: IDENT, TEST, Device Cancel, Alternate Cursor, Cursor Blink, Double Speed Cursor, Click
 - Additionally, the location of some control keys are in different positions on the 5253 keyboard. A keyboard overlay is provided for aid in identifying the key locations.
- **Configuration Support:** The 5520 Administrative System 3270 Emulation Support provides support equivalent to a subset of a 3274 mdl 1C or 51C Control Unit for the following functions:
 - Pacing of inbound message traffic
 - Automatic session recovery in both single and multi-domain networks
 - Host notification of changes in power-on/off status at attached terminals

- Support for solicitation of summary maintenance statistics through the use of Network Problem Determination Application (NPDA) is provided with the following exception:
 - RECFMS Type 5 is supported as a 5525 not a 3274.

- **Host Support:** To use the 3270 Emulation with a 5520 communicating with an S/370 or 4300 host, the user must provide appropriate programming for that host.

Host software support may require certain 3270 functions in order to operate properly. Customers must refer to the description of their host programs to determine if this emulation support meets the requirements.

- **Host Support Limitations:**

- The 3274 mdl 1C or 51C Control Unit functions that are selectable during the 3274 customization process are not supported by the 5520 Administrative System 3270 Emulation Support

- **Special Features:** No other special features or options are supported.

Communications Support (in conjunction with the 5520 Administrative System with requisite hardware features)

- **Communications:** The 5520 Administrative System 3270 Emulation Support provides communication capability with an appropriately programmed host S/370 or 4300 Processor in half-duplex mode using Synchronous Data Link Control (SDLC) or BSC over duplex or half-duplex communications facilities using:
 - IMS/VS with ACF/VTAM or ACF/TCAM under OS/VS1 or OS/VS2 (MVS)
 - CICS/VS with ACF/VTAM or ACF/TCAM under OS/VS1 or OS/VS2 (MVS)
 - CICS/VS with ACF/VTAM-E under DOS/VSE on a 4331 with a communications adapter
 - CICS/VS with ACF/VTAM under DOS/VSE
 - TSO with ACF/VTAM or ACF/TCAM under OS/VS2 (MVS)
 - PROFS or CMS under VM (BSC only)
 - Direct attach and/or loop attach to host processors is not supported

- **Communications Facilities:** In 3270 Emulation mode, the 5520 Administrative System operates in half-duplex point-to-point or multipoint mode over half-duplex or duplex facilities using SDLC or multi-drop nonswitched using BSC at transmission speeds of 2400 or 4800 bps on switched (point-to-point only) or 2400, 4800, or 9600 bps on nonswitched facilities.

- **Limitations/Restrictions:**

BSC:
- The 5525 controller must be the byte type

SNA:
- Only teleprocessing, non-loop, SNA/SDLC communications is supported by the 5520 Administrative System 3270 Emulation function
- The 5253 Display Station should be defined to the host as an LU Type 2, and the 5525 System Unit should be defined to the host as a PU Type 2.

DISOSS/370 V2.1.1, V3.1 and V3.2*

The 5520 user interface is to the IBM Distributed Office Support System (DISOSS) licensed programs, Version 2 Release 1 and Version 3 Releases 1 and 2.

HIGHLIGHTS: This licensed program function support provides the capability of the 5520 to communicate with the DISOSS/370 Host Document Library for:

- Increased online document storage space. Permits archiving, retrieving, searching (with a subset of search arguments), and deleting a 5520 document in the IBM DISOSS/370 Host Document Library.
- Sharing 5520 revisable form and final form* documents with other 5520 or other compatible DISOSS/370 Host Document Library users connected to the same S/370 host.
- Printing via the host system. Printable (final form) text documents may be printed on a host printer via DISOSS/370 and the host operating system. Printable documents may also be transformed into a STAIRS format and stored in a STAIRS document library, assuming STAIRS is properly installed on the same S/370 host.
- Requesting a program to be scheduled by the host operating system facilities with output at the host.

* With Release 3 only.

5520 Administrative Processing Program (cont'd)

- Image Document Printing via DISOSS/370 (Version 3.1 and 3.2* only).

The 5520 user can search for and print an image document from the Host Document Library on a host-attached Scanmaster I.

- These functions are available only in the hardware, software and communications environment described in the "Specified Operating Environment" section.

DESCRIPTION: The 5520 user interface to DISOSS/370 Version 2 Release 1 and Version 3 Releases 1 and 2* is through 5520 menus. These menus provide the 5520 operator with access to the following DISOSS/370 services at the host: Application Processing Services, Document Library Services and the Host Document Library.

Application Processing Services available include the capability to:

- Request programs at the DISOSS/370 host to be scheduled for execution by, and with output at, the host.
- Print a Printable (final-form) document, via the DISOSS/370 host operating system, on a host printer.
- Transform a 5520 document stored in the DISOSS/370 Host Document Library to STAIRS Format, when STAIRS is operational at the host.
- Store the transformed document in a STAIRS data base at that host.

Document Library Services available include the capability to search 5520 documents in the Host Document Library by:

- 5520 document name
- 5520 document date
- 5520 document originator
- 5520/DISOSS document owner
- Out-of-context keywords
- Combinations of the above

Search arguments not supported by the 5520 include:

Document class
Document recipient
Document subject

Filing, retrieving and deleting: The user can file revisable form or final form* documents created at or stored in the 5520 into the host DISOSS/370 Host Document Library via the 5520 archiving function. When filing a document, the user can specify filing information that indexes the document for later use in search. This filing information consists of search arguments, such as the document name, author, date, or keywords describing the contents of the document. In addition, access codes can be added to help control the document-access authorization.

The DISOSS/370 Host Document Library will permit a 5520 operator to file multiple documents having the same 5520 document name, as DISOSS/370 will assign a unique name to each document archived in the library. This Library-Assigned Document Name (LADN) is returned to the 5520 operator for subsequent access to the document.

A 5520 operator may retrieve a document directly by specifying the LADN, or indirectly by specifying a document list, such as a DISOSS/370 Search Descriptor Document or a 5520 Status Log.

A 5520 user may wish to search the DISOSS/370 Host Document Library for all documents which match a specified combination of search arguments; the resultant DISOSS/370 search descriptor document includes the LADNs of those documents which met the search criteria and may be used as a retrieval list document, or may be edited at the 5520 for use in requesting retrieval of selected documents. Once a document has been identified by its LADN, it can be retrieved from the DISOSS/370 Host Document Library, restored in the 5520 Document Library, displayed at the 5520, shared with other operators on the same 5520 system, distributed or deleted from the 5520 Document Library. A 5520 operator may delete a document from the DISOSS/370 Host Document Library by requesting Erase Archived Document and specifying the Library-Assigned Document Name (LADN), or a list containing multiple LADNs.

Printing at the S/370 Host: This facility allows final form 5520 documents that are stored in the DISOSS/370 Host Document Library by a 5520 operator to be printed on a host-attached printer. For DISOSS/370 Version 3 only: The 5520 user can search for and print an image document from the Host Document Library on a host-attached Scanmaster I.

STAIRS input formatting: Using the 5520 interface to DISOSS/370 Version 2 Release 1 and Version 3, the 5520 operator can cause a final form 5520 document stored in the DISOSS/370 Host Document Library to be transformed to STAIRS format. The transformed document may be used by a S/370 host application to update a STAIRS data base.

* With Release 3 only.

Job submission: The job-submission capability allows the 5520 operator to request the S/370 host to schedule programs resident at the host system for batch execution, with output at the host.

This capability can also be used to submit a document from the 5520 to the host along with the job-submission request. A user-written program, at the host, can place this document into a data set for subsequent host-application processing.

Document Security: The 5520 user interfaces to DISOSS/370 Version 2 Release 1 and Version 3 Releases 1 and 2 are designed to help provide data security based on the interaction of:

- Document ownership
- Level of document privacy through access codes

Access codes are assigned to users centrally at the host and to documents during filing. To access a filed document, a user must be assigned an access code that matches one access code of the document to be retrieved. The 5520 user interfaces to DISOSS/370 Version 2 Release 1 and Version 3 Releases 1 and 2 provide the capability to assign document access codes in the following manner for security assistance purposes:

- Private - Only the document owner's authorization can be used to access the document.
- Shared Private - Only the authorization codes of predefined user groups can be used to access the document.
- Public - All valid DISOSS/370 users authorization codes can be used to access the document.

The facilities for controlling access to protected resources are effective only within the context of DISOSS/370 itself. Access control within VSE or OS/VS1 outside the scope of DISOSS/370 is not provided. For IMS/VS or CICS/VS systems under MVS, the Resource Access Control Facility (5740-XXH) can be used to help control access to DISOSS/370 or user-written DLS/APS libraries. For applications in which sensitive data is sent over external communication facilities, user management may augment these facilities with external line modems which support cryptography. User management is responsible for the selection, implementation, and adequacy of these security features for their environment.

System Services (including systems management) via:

- User-created profiles (descriptions), changeable as needs develop
 - System components (configuration)
 - Operators (type, authority, etc.)
 - Documents (including files)
- System resource sharing and usage measurements
- Error checking, retry, and recording
- Program maintenance facilities

The following facilities are also provided:

Task initiation and control

- Menu approach to initiate tasks (with menu bypass)
- Online interactive HELP facilities to guide and assist the operator in many areas on request
- Display/List job status available at all times
- Automatic facilities for print queue management (via set-ups)
- Print queue management override for exceptional situations
- Print, archive/retrieve in background
- Pagination, global search/replace, merge file/text, and Files jobs in background
- Background job priority queue
- Operator messages, immediate or queued as appropriate
- Special 'Device Service' messages to alert the operator to required actions (for example, the replenishment of a printer with paper)
- Broadcast messages to all or selected operators
- Defaults at system, operator, and document level for the more common user-defined procedures and standards

Production Statistics (when selected by the user)

- Automatic recording of statistics as they occur by:
 - Text document access and type
 - Distribution connect time and volume
- Reports printable on request by:
 - Document charge number
 - Operator charge number
 - Document distribution
 - Destination

5520 Administrative Processing Program (cont'd)

- Report convertible to a file for subsequent processing

Installation Aids: To install the licensed program, the user (with guidance via a display station) establishes the system program library, describes required I/O device definitions and authorized users, and starts the program. The system is ready for use at this point but the user may wish to do some additional system personalization such as:

- Describing additional I/O devices
- Defining additional authorized users
- Modifying the supplied default parameters

This additional system personalization can be done any time.

System Resource Management: Under control of the licensed program the system processes the job requests, acquires system resources for the jobs, executes the jobs and terminates the jobs. The system manages disk space allocation and controls the contention resulting from multiple jobs competing concurrently for system resources. In order to accomplish this, it manages the scheduling and queuing necessary to share the system resources among all jobs.

Archive and Retrieve Facility: The archive and retrieve facility provides the following functions via the system compact diskette drive supporting Diskette 2D:

- Archive/retrieve repetitive documents (including files)
- Optional automatic delete after archive
- Provide backup for the document library (including files)
- Keep seldom used or sensitive information offline
- Provide authorized data exchange between 5520 Administrative Systems including documents and profiles so that, for example, one 5520 system may be personalized on another (with equal or higher model number or the 5525).

I/O Management: The program supports the following locally attached devices:

- 5253 Display Station
- 5254 Dual Display Station
- 5257 Printer
- 5258 Printer
- 6670 and 6670 mdl II Information Distributors (SDLC) (see note 6)
- 5321 Mag Card Unit (see note 4)
- 5219 Printer
- 5229 Wide Carriage Printer
- IBM Personal Computer (see note 7)

Service Aids

This program contains system level diagnostic function designed to assist with concurrent maintenance of a 5253, 5254, and 5257, 5219, 5229 or a 5258 attached to the 5525, while the customer continues to use other parts of the system. Absence of these diagnostic functions (or their full equivalent) will result in reduced system availability to the user.

Note 1: In communicating with an IBM S/370 the following interface rules apply:

- The 5525 System Unit (with SNA/SDLC) is supported by ACF/VTAM or ACF/TCAM Version 2, Release 1 or Release 2†††, as an LU Type 1.
- The 5525 System Unit (with BSC) is supported by ACF/TCAM Version 2, Release 1 or Release 2††† as a 2770-like device.
- Access to CICS/VS 1.4 Subsystem (SNA/SDLC) is via the supported levels of ACF/VTAM and ACF/TCAM LU-to-LU facilities. The 5525 will be supported as a 3790 full function LU, Type O.
- Access to CICS/VS 1.4 Subsystem (BSC) is via the supported levels of ACF/TCAM, BTAM, or BTAM-ES where the 5525 is supported as a 2770-like device.
- Access to IMS V1 R1.5††† Subsystem (SNA/SDLC) is via the supported levels of ACF/VTAM and ACF/TCAM LU-to-LU facilities. The 5525 will be supported as an LU, Type P.

Note 2: For communications with remote devices and also the reading or writing of mag cards in the 5321, the following U.S. and country keyboard IDs are supported: 1, 2, 3, 4, 5, 6, 7, 8, 17, 19, 25, 26, 28, 29, 31, 32, 33, 36, 37, 38, 39, 41, 42, 43, 44, 45, 46, 47, 48, 49, 51, 52, 53, 54, 55, 56, 57, 66, 67, 80, 100, 101, 103, 251, 252, 253, and 254. In the same environment,

format feature protocols (as optionally used on the Mag Card II typewriter and also other IBM devices) are supported.

Note 3: Documents prepared on BSC-supported devices such as members of the OS/6 family may contain formatting and other control codes (OCL). These are not recognized by the 5520 Advanced Administrative Processing Program. Where Document Distribution is between like devices, document content including OCL (formatting and other control codes) is transmitted transparently. However, for distribution with one of these devices, to or from a 5253 or 5254 Display Station, additional operator intervention may be necessary and special procedures implemented.

Note 4: The 5321 Mag Card Unit is used for reading and/or recording of Mag Cards, with limitations. These limitations relate to the use of Operator Control Language Statements which when read are treated as text by the 5520 Advanced Administrative Processing Program. Also, if OCL statements are required on mag cards prepared on the 5321, they must be inserted by the operator.

Note 5: Symbol character support is only available in conjunction with SNA/SDLC protocols. Documents containing symbols may be distributed within a single 5525, or to or from another 5525, for printing on a 5258 or possibly 5219, 5229 or 5257 Printers as appropriate; or to or from a host S/370 (appropriately programmed) using SNA/SDLC communications.

Note 6: Printer support is also provided for a remotely located 6670 Information Distribution (SDLC) attached via a nonswitched SDLC communications line***. Similar support for locally or remotely attached 6670 mdl IIs will also be provided.

Note 7: If IBM Personal Computers are connected to the 5525 System Unit, Program Code #2888, IBM 5520/Personal Computer Attachment Program, must be provided to the Personal Computer user.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with Marketing and Service Guidelines in the GI section of the sales manual, in the installation of IBM licensed programs. However, the responsibility of providing accurate ordering information, personnel selection and training, and continued day-to-day operations lies solely with the customer.

Installation of the 5520 Administrative Processing licensed program Release 2 (5611-SS2), all subsequent releases, and Program Temporary Fixes (PTFs) are the customer's responsibility.

Customers should be reminded that they are responsible for conforming the use of the system to applicable statutes or regulations relating to the distribution of information both in their own country and also to, from, through, or between other countries.

SPECIFIED OPERATING ENVIRONMENT

Support will be provided for this licensed program when it is operated in the following specified operating environment:

HARDWARE REQUIREMENTS

The minimum system configuration is:

- 1 - IBM 5525 mdl 21, 31, 32 or 51
- 1 - IBM 5253 or 5254 Display Station (must be located in the same room as, and within 6.1 meters (20 feet) of the 5525).

3270 Emulation requires:

- IBM S/370 or IBM 4300 Processor host attached via teleprocessing, non-loop, SNA/SDLC communications
- Function Extension feature (#3270) for each supported IBM 5253 Display Station

SOFTWARE REQUIREMENTS: None.

DISSO USER INTERFACE SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This function is supported by the IBM 5525 models 21, 31, 32 and 51, in conjunction with the licensed program, IBM 5520 Administrative Processing Program (5611-SS2). The IBM 5520 Administrative System used for this function must be equipped with the appropriate SNA communications facilities.

*** Contact IBM for hardware schedules.

††† or later releases. This does not imply that such later releases will occur.

PROGRAM PRODUCTS

5520 Administrative Processing Program (cont'd)**SOFTWARE REQUIREMENTS**

The IBM 5520 user interface to DISOSS Version 2.0 is provided by means of licensed programs executing in either an OS/VS or DOS/VSE (DISOSS/370 Version 3 only) IBM host system environment.

- IBM Distributed Office Support S/370 Version 2 Release 1.
- IBM Distributed Office Support S/370 Version 3 Releases 1 and 2.

COMMUNICATIONS REQUIREMENTS

Communications must be with an IBM S/370 running DISOSS/370 Version 2 Release 1 or Version 3 and their pre-requisite and co-requisite access methods and operating system programs. Communication is via SNA/SDLC teleprocessing using switched or nonswitched half-duplex lines at speeds of 2400/4800 bps for switched or 2400/4800/7200/9600 bps for nonswitched lines. Direct attach and/or loop attach to the host processor is not supported.

DATA SECURITY, AUDITABILITY and CONTROL

Data security aids are provided through the interaction of document ownership, level of document privacy and document access codes assigned by the 5520 operator when filing documents in the DISOSS/370 Host Document Library. The 5520 Administrative Processing Program (5611-SS2) utilizes the same security and auditability assistance features of the 5520 Administrative Processing Program (5611-SS1). In addition, when the 5520 is communicating with DISOSS/370, the security features of DISOSS/370 are also utilized. User management is responsible for evaluating, selecting, applying, and implementing such features, and is also responsible for the appropriate administrative and application controls.

VERSION 1, DPPX/DPS V1 (5760-XR1)
VERSION 2, DPPX/DPS V2 (5660-264)**

PURPOSE

These program products form an upward compatible family of ease-of-use aids for programmers of the 8100 Information System with Distributed Processing Programming Executive Base (DPPX/BASE) which provide a set of device and format independent application functions. These functions simplify the programming of a wide range of I/O devices available on the 8100: Displays and their associated keyboards, line printers and, for output only, keyboard printers. All aspects of programming can benefit - design, implementation, testing and maintenance.

DESCRIPTION

The description of DPPX/DPS that follows is oriented towards the most recent offerings of DPPX/DPS Version 1.

DPPX/DPS V1 is used as an abbreviation for DPPX/DPS Version 1.

DPPX/DPS V2 is used as an abbreviation for DPPX/DPS Version 2.

DPPX/DPS is used as a generic term applying to both versions unless explicitly stated.

DPPX/DPS Format Management (FM), the run time component, can be invoked from applications written in DPPX COBOL, DPPX assembler language or Distributed Processing Development System (DPDS) - Programming Language for Distributed Systems (PL/DS), including those running under Data Base and Transaction Management System (DPPX/DTMS). The application passes a destination identifier and the address of control and application data areas in the application. The structure of the control area is supplied by IBM with the DPPX/DPS code. The structure for the application data area is generated by IMD (see below). The functions required by the application are defined partly by previously defined maps and partly dynamically by the control and application data areas.

DPPX/DPS provides as an optional feature Interactive Map Definition (IMD), the program development time component. This feature is an online programming aid, enabling the application programmer to create and update a library of maps containing panel formats for display devices. IMD provides a full screen context editing capability, compatible with the DPPX/BASE interactive editor command syntax and semantics, and uses DPPX/DPS FM as well as standard DPPX I/O facilities. Following the creation or modification of a map by IMD, before it can be used by an application program and FM, a special IMD generate process must be invoked, the result of which is:

- An application data structure for the appropriate application language (DPPX COBOL, DPPX assembler language or PL/DS) placed on a "source copy library".
- One or more object map load modules placed on a "map module library".

The key to the transfer of data between application and display device is the map which FM loads and which contains the following information:

- The structure of the input and/or output logical record as viewed by the application.
- A definition of the constant data in the panel.
- The size and position (row, column or floating), within the partition, of the panel.
- The relative position and length of fields within the panel.
- Device attributes to be associated with the defined fields.
- Device control information (e.g., alarm, free keyboard).

Maps are grouped together into a map group, containing information required for several I/O requests and panels. The map group includes device dependent information including screen size. At any instant during run time, several panels may appear in a screen layout.

DPPX/DPS provides support for advanced functions:

Multiple partitions with or without scrolling.

Scrolling.

Field validation in maps.

- Trigger field.
- Mandatory fill.
- Mandatory field.

Extended field attributes, via maps or dynamically via the application program interface (API).

- Highlighting.
- Programmed symbols.
- Extended color.

Character attributes, dynamically via character attributes embedded in data.

- Highlighting.
- Programmed symbols.
- Extended color.

DPPX/DPS code is reentrant and reusable; at the installation's option it may be transient.

DPPX/DPS INTERACTIVE MAP DEFINITION SUMMARY: At program development time or during maintenance, the application programmer invokes the DPPX/DPS IMD feature to describe a run time panel format including constant data, variable data to be presented to or by the end user, partition identification, some editing characteristics of the data presented by the end user and detectable fields. IMD uses FM to control interactions with the screen during definition.

IMD aids the application programmer in describing the DPPX display device interface with the end user. It facilitates map specification by virtue of the following programmer oriented interactive design concepts:

- Full screen context editing capability for entry of display and printer panel formats.
- Horizontal and vertical software driven scrolling capability.
- Menu driven processes.
- Help facility.
- Compatibility with DPPX/BASE interactive editor commands and SDF/CICS editor commands.
- Restart capability - changes can be automatically recovered.
- Default values for map characteristics.
- The ability for existing DPPX/DPS IMD map specifications to be copied as initial specifications for a new map.
- Library management utilities.
- Generate process, providing a structure for application data and reducing need for recompilation.
- Print utility.

The DPPX/DPS IMD Feature Allows an Application Programmer to Describe Online DPPX Display Device Interfaces With The End User

When IMD is invoked, or on completion of a process, the Initial Selection Menu is displayed. The user may select one of the following processes or terminate IMD. Each process is also menu driven.

Map Editor Process: Defines the device types supported by the map, the size and position of the panel in the partition, the programming language and whether there are to be user mapping exits and device control functions such as alarm and keyboard lock. A flexible interactive technique for defining the panel format is provided, and then field attributes are added (for devices which support field attributes); a field qualification step is used to identify variable fields which are to appear in the application data area.

At any time during the process, the programmer may terminate the process, and the changes made will be saved in a map specification library (MSL). Only one terminal can use a given map specification library at one time, but there may be several such libraries.

The entire map editor process is highly interactive. The test command enables the panel, as so far defined, to be viewed.

Map Group Process: Interactively defines the grouping of maps for several I/O requests and panels. Includes specification of output only displays, floating area and partition definition.

A partition in the IBM 8775 is defined as a rectangular viewport on the screen together with a buffer called a presentation space. Up to eight partitions may be defined. In general, a partition looks to the application like a display device whose characteristics may be defined or modified by IMD. The size of the partition and the origin of the viewport on the screen are defined.

Library Management Process: Provides utility functions for managing the map specification library; list directory, copy, rename, and delete. An audit trail is kept of map modifications, and when the generate process was last invoked.

DPPX/DPS (cont'd)

Generate Process: Before maps can be used by an application program, the map specifications have to pass through the generate process. There are two types of output from this process:

- Each map generates an application data structure (for the specified application language) which is cataloged on a source copy library.
- Each map group generates one object map module per device type supported which is cataloged on a map module library.

A report is also produced. When the application data structure is not changed, recompilation of the application program is not necessary as a result of the generate process (e.g., change of panel format or addition of an extra device type for the map).

Utility Process: Used to print, import and export members of the map specification library.

Tutorial Process: Online documentation of DPPX/DPS IMD. This facility is modeled on the TSO/SPF tutorial mode.

The *HELP Facility* allows the user to obtain additional information about any error message displayed, or general information about a subcommand or options, by entering the Tutorial process at the appropriate chapter.

IMD commands are compatible with DPPX/BASE interactive editor commands with respect to syntax and semantics.

In the event of a system failure, IMD will automatically save any changes that have been made and optionally recover (providing the map specification index is still usable - IMD will not attempt recovery of the index).

Horizontal and vertical software driven scrolling is provided by program function key; other program function keys and commands may result in automatic scrolling.

The *Multiple Device Map* allows the same map to be defined to support a selection of devices, including various models and features, which are supported by DPPX/DPS FM. The panel format on these different devices does not have to be the same. The major requirement for a multiple device map is that the application data area has the same structure for each device panel:

MAP

Application Data Structure	Panel Format for Device Type 1	Panel Format for Device Type 2
----------------------------	--------------------------------	--------------------------------

The device list may be modified at will. Inapplicable device dependent features (e.g., blink when the device does not support extended highlighting) will be ignored. In this manner, the programmer need have little concern for device dependent features. An existing DPPX/DPS IMD map on a library can be used in the knowledge that it will give reasonable results - the application can thus be format as well as device independent. Nor need there be concern with device configuration - a particular device is invoked by name from the application program interface at application run time.

A multiple device map may:

- Have different panel positions on the various devices.
- Have a panel of different width and depth, and have a differing number of displayed characters for the various devices.
- Contain different constant data in different device panels.
- Have different default attributes.
- Have fields in a different order in different device panels. The same set of fields do not have to be specified for all devices (data destined for a field not specified for a particular device will be suppressed).
- Have different field lengths in different device panels.

Application program development is completed by:

1. Compilation/assembly of the source program with a copy from the source copy library of
 - a. The-IBM supplied control structure and
 - b. IMD generated application data structure and
2. Compilation/assembly of any user mapping exit code.

The map group corresponding to the device type in use is loaded by DPPX/DPS FM at application run time.

DPPX/DPS FORMAT MANAGEMENT SUMMARY:

DPPX/DPS FM Provides the Application Run-Time Support and Interacts with the End User at a Terminal

Functions provided by DPPX/DPS FM are: Basic mapping (selector fields ... adjunct fields ... menu selection ... floating panels ... device control ... feedback information ... printer support ... output only support ... browsing), built-in procedures, user mapping exits.

Basic Mapping function of FM allows the application to send and receive data in a device independent manner, using maps previously generated by IMD. The map contains device dependent information required for the manipulation of the data stream. Extensive alterations of a map (panel format or devices supported) can be made without change to the application data structure, and hence without the need to recompile the application program and copy a new data structure.

A selector field can optionally be associated with a data field. On output, the application can set the selector fields to indicate which of the associated data fields are to be transmitted. On input, FM sets the selector to indicate which associated data fields were modified on the screen.

Adjunct fields can optionally be associated with a data field. At run time, the application can override map defined field attributes by attributes set in the adjunct.

Menu selection panels for cursor or light pen selection can be defined.

Floating panels permit multiple instances of the same panel to be displayed or read; thus reports containing repetitive, or identical format, may be more readily defined.

The device control function provides support for device characteristics and field attributes specified either in the map or dynamically in the application data area:

- Protected/unprotected fields.
- Freeing keyboard.
- Constant field in panel.
- Modified data tag.
- Field selector tag.
- Program access and attention keys.
- Program function keys.
- Alarm.
- Multiple partitions.
- Intensity.
- Extended highlighting.
- Character highlighting.
- Field validation.
- Light pen selection.
- Cursor positioning.
- Programmed symbols.
- Extended color.

Feedback information is provided through the control area, indicating a class of error and details within that class.

Printer support is provided for line printers and keyboard printers as output only devices:

- DPPX/DPS will allow sharing of printers between applications (using the SNA bracket protocol), but does not use the DPPX/BASE printer sharing function.
- DPPX/DPS supports printer forms control either through the current (DPPX/DPS IMD-defined) mapgroup, or by an installation specified - at device connect time - table, or by using defaults. Printer forms control includes margin setting, page depth and line density.
- The same maps may be written to a printer as were written to a screen (but there are limitations in appearance since, for example, panels which appear side-by-side on a screen will appear sequentially on a printer because the printer cannot backspace having printed the first panel). This support should not be confused with the hardware copy function. It is invoked by the application program passing to FM the same data as it passed to the display but specifying the destination as a printer. The application may choose to use different maps to reformat the data.

Output only support is for applications where there is no terminal operator or no terminal keyboard. The end user views a display which might:

- Show timetable and status of transportation
- Display status of an operation or process, and highlight abnormal situations or sound an alarm.
- Repeat broadcast instructions.
- Show production status and schedules.

End user browsing is provided, output only, forward only, a page at a time. FM paginates the output according to the partition size.

DPPX/BASE Interactive Debug can be used to monitor an application which is using DPPX/DPS FM to drive screens; this requires a separate screen. The interactive debug screen may need to be physically located beside the application screen.

PROGRAM PRODUCTS

DPPX/DPS (cont'd)

Built-in procedures are functions provided in addition to Basic Mapping functions for users who need a high degree of device control. They enable dynamic screen field manipulation and cursor positioning without the use of maps through the application program interface (e.g., change of an attribute). Built-in procedures also enable the application to obtain device and map characteristics; for example, a user paging application may need to know screen and panel size.

User Mapping Exits provide a capability for the user to write his own programs in DPPX COBOL, DPPX assembler language or PL/DS. These programs will use a subset of program language facilities. Typical uses on output are conversion and editing of encoded fields and provision of device specific control information to the application. On input, the user program can interact with the display operator, handling IBM 8775 trigger fields, validating the data at source, and requesting reentry of erroneous data (e.g., by issuing error messages and highlighting errors). Following validation, the user may wish to convert character values to encoded values, translate attention definition bytes (e.g., IBM 3643 function keys), classify the input, etc.

RELATIONSHIP BETWEEN DPPX/DPS IMD AND DPPX/DPS FM

Programmer at terminal (program development time)

- Uses – IMD (which utilizes FM)
 - to create – Map specifications
 - to generate – Application data structures on source copy libraries
 - and – Maps on map module libraries
- Uses – DPPX/BASE interactive editor
 - to create – Source program
 - User mapping exit code
- Uses – DPPX/COBOL, DPPX Assembler (DPPX/ASM) or PL/DS
 - a) with – Source program input and copies
 - Control and application data structures
 - to create – Program modules
 - b) with – User mapping exit code
 - to create – User mapping exit load module

End user at terminal (application run time)

- invokes– Application (program modules) which in turn invokes
 - FM, passing
 - The destination
 - Address of the application data area
 - Address of the control area
- interacts– with Application through FM panels and User Mapping Exit code.

The Application Program Interface (API) is the Means of Invoking DPPX/DPS FM at Application Run-Time

The functions required by the application are defined partly by previously defined maps and partly dynamically at the API by setting fields in the control and application data areas. DPPX/DPS FM can be invoked from applications.

- The destination (a file name representing a device).
- (The address of) the control area.
- (The address of) the application data area.

The control area is used to indicate the type of request (built-in procedure or basic mapping, new or modified record), names (map, map group, built-in procedure), feedback, and other control information.

HIGHLIGHTS OF VERSION 2

- Improved programmer productivity, particularly in handling programmed symbols, editing maps and simplified application programming for data arrays.
- Distributed processing support through outboard formatting for CICS/VS basic mapping support (BMS) applications on SNA/SDLC connections can reduce telecommunications line loading.
 - The constant portion of maps is held outboard in the IBM 8100 and merged with the variable portion received from the (now smaller) BMS generated data stream. The host application does not need to be changed. The BMS map must have a flag set to indicate outboard formatting is required, and the CICS TCT

(terminal control table) must be changed to specify that the terminal accepts outboard maps.

- Validation can be added locally on the IBM 8100 (by coding user exit routines) thereby reducing line traffic to the host. The user exit routines can be coded in COBOL, ASM or PL/DS at the DPS logical record application program interface (API).
 - In user validation routines, advantage can be taken of the advanced features of IBM 8775 displays, e.g., highlighting, mandatory enter and mandatory fill.
 - Some CICS-to-operator dialog could be moved to a DPPX/DPS V2-to-operator dialog.
- Aid for moving BMS maps outboard is provided through Release 2 of the Screen Definition Facility (SDF/CICS) licensed program. Alternatively, the BMS map can be reproduced by the programmer using DPPX/DPS IMD.
- New application functions in user exits may now become economically feasible with minimal impact on line and host, e.g., use of programmed symbols.
- Additional support for existing devices and LU 1 printer extensions.
 - 3268-1 condensed print via data stream control.
 - 3287 extended highlighting (underscore), programmed symbols and color.
 - Enhanced magnetics feature support for displays at the DPS built-in procedure level is documented.
 - Enhanced support for devices with programmed symbols (PS).
 - Interactive PS definition and generation enables the application programmer to create and edit an enlarged representation of a symbol within a named set, while comparing it side by side with a reference symbol ... color is supported ... on suitable devices a life size test can be carried out ... some characteristics can be changed for all symbols in a set, e.g., color ... PS sets can be manipulated as any object ... device-dependent PS set modules are generated for run-time use.
 - PS set load and management facilities provide run-time loading of PS sets as required by the map.
 - Improvements to operational characteristics.
 - Directory-driven IMD processing reduces the amount of keying required in selecting objects and menus during editing. The displayed map specification library (MSL) directory is itself used as a menu to invoke directly most IMD function.
 - Improvements to Application Prn Identifier (AID) byte in the input stream may now be translated into a character string, typically a DPPX/DTMS transaction code.
 - Folding (to uppercase), and justification (left or right) with a user defined pad character.
 - Validation adjunct fields permit run-time change of the IBM 8775 field validation attributes (mandatory enter, mandatory fill and trigger fields).
 - Improvements to performance support for line printers.
 - DPPX/DPS V2 will allow line printers to run closer to rated speeds.
 - Serviceability and error handling.
 - DPPX/DPS FM V2 has optional error trace facility.
 - Improvements to System Library and Service Library Publications. In particular, at DPPX/DPS V2 availability time, the *User's Guide* will be split into:
 - Application Development Guide.
 - Application Programming Reference.
 - Map Definition Reference.
 - System Programming Guide.
- Together with a Reference Card, this will significantly enhance DPPX/DPS V2 usability.

CUSTOMER RESPONSIBILITIES

To install and use DPPX/DPS the user must: Acquire a knowledge of the functions provided through reading the *DPPX/DPS User's Guide* and be familiar with DPPX/BASE ... Understand the use of the application program interface in DPPX COBOL, DPPX assembler language or PL/DS to invoke DPPX/DPS FM ... Understand the DPPX initialization and customization processes described in *DPPX Installation: Guide* (SC27-0401) and *DPPX/BASE Administration* (SC27-0403) as they relate to DPPX/DPS, and *DPPX/DPS User's Guide* (SC33-0092) ... Carry out approved problem determination procedures described in *DPPX/DPS Diagnosis and Logic Overviews* (LY33-6031 and LY33-6036) before contacting IBM for program service ... Install fix packages

PROGRAM PRODUCTS

DPPX/DPS (cont'd)

and service level updates as appropriate ... Provide environments for user mapping exits if they are to be used.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

DPPX/DPS hardware system configuration requirements (except for storage) are consistent with those of the DPPX/BASE licensed program.

The storage requirements of DPPX/DPS FM are dependent upon various configuration and workload parameters, including - device type, map size, message rates, number of resident maps, requested function, and the number of processing environments.

Note that DPPX/DPS IMD necessitates the use of DPPX/DPX FM, DPPX/BASE distributed indexed access method and relative sequential access method services and therefore additional storage is required for these services.

Sufficient direct access storage must be available to satisfy the user information storage requirements and may consist of any direct access facility supported by the DPPX/BASE distributed indexed access method unless otherwise stated.

Use of DPPX/DPS IMD requires a DPPX/DPS FM supported display with a screen width of at least 80 characters, depth of at least 24 lines and with a keyboard which has 12 or more program function keys.

Device Support: Table 1 below gives devices supported by DPPX/DPS V1 FM, including physical attachment. Terminals that are functionally equivalent to those specifically supported by DPPX/DPS V1 may also function satisfactorily; the customer is responsible for establishing equivalency. Table 2 below gives additional DPPX/DPS V2 FM device support.

TABLE 1

DPPX/DPS FM supports the following devices:

IBM Display Devices	Attachments
3104-B1,B2 3276-1,2,3,4	Display Terminal Control Unit Display Station
3276-11,12 13,14	Control Unit Display Station
3277-1,2	Keyboard Display
3278-1,2,3,4	Display Station
3278-1,2,3,4,5	Display Station
3279-2A,2B,3A, 3B	Color Display Station
3643-2,3,4	Keyboard Display
8775-1,2	Display Terminal
8775-11,12	Display Terminal

These displays are supported by DPPX/DPS using an LU2 protocol and 3270 or 3270 extended data stream as appropriate.

IBM Printer Devices	Attachments
3230-1 3230-2	Printer Printer
3232-1 3232-11 3262-2,12 3262-3 3262-13	Keyboard Printer Keyboard Printer Line Printer Line Printer Line Printer
3268-1 3268-2	Printer Printer
3284-1,2 3286-1,2 3287-1,1C, 2,2C 3287-11,12 3288-2 3289-1,2	Printer Printer Printer Printer Line Printer Line Printer
3289-3 3645 3767-1,2,3	Line Printer Printer Communication Terminal

These printers are supported for output only using the DPPX LU1/SNA character string interface to DPPX/BASE Communication Services.

TABLE 2

IBM Printer Devices	Attachment
3268-1 3287-1C,2C	Printer Printer
	Loop 3274-51C

These printers are supported for output only using the DPPX LU1/SNA character string interface to DPPX/BASE Communication Services.

SOFTWARE REQUIREMENTS

This licensed program is designed to work with the DPPX/BASE licensed program.

DPPX/DPS is written in Programming Language for Distributed Systems (PL/DS). When optional source code is ordered, it is distributed in DPPX assembler language with most of the original PL/DS statements shown as comments. DPPX/DPS source code is available on magnetic tape and program listings on microfiche as related optional material.

The following licensed programs are required depending on application programming language used:

DPPX/BASE	5760-010
DPPX/COBOL Compiler	5760-CB1
DPPX/COBOL Run-Time Library	5760-LM1
DPPX/ASM	5760-AS1
DPDS (for PL/DS) (PRPQ P88016)	5799-AZL

The following licensed programs are required if the outboard formatting function of DPPX/DPS V2 is to be used:

DPPX/DSC	5760-RC1
CICS/OS/VS Version 1 Release 5	5740-XX1 (VS1, MVS)
CICS/DOS/VS Version 1 Release 5	5746-XX3 or (VSE)

The following licensed programs may optionally be used to assist moving CICS Basic Mapping Support maps outboard:

Screen Definition Facility/CICS (SDF/CICS) Release 2	5740-XXF (OS/VS) 5746-XXT (DOS/VSE)
Distributed Systems Executive (DSX) Release 2	5748-XXG (VSE, OS/VS)

DPPX/DPS FM is a prerequisite for DPPX/DPS IMD, which uses DPPX/DPS FM to control interactions with the programmer.

DPPX/DPS FM is a prerequisite for the DPPX/BASE interactive editor in full screen mode. DPPX/DPS IMD is a prerequisite for DMS/DPPX (Development Management System, 5760-XC2) application generation; DPPX/DPS FM is required to execute applications which use maps under DMS/DPPX Execution Facility (5660-265) or which use maps under DCMS/DPPX (5760-XR6) in execution mode. DPPX/DPS IMD is a prerequisite for DPPX/PS3640 (5660-267) Interactive Transaction Generator.

Some customers may need to transmit maps, object programs, etc., from the IBM 8100 where they were developed, to a destination IBM 8100 for execution. This can be done as follows:

- By the use of a S/370 or 4300 and the DSX (Distributed System Executive) Release 2 licensed program, 5748-XXG. The maps etc., are transmitted from an 8100 to a S/370 or 4300 DSX library and then DSX will retransmit to the destination 8100.
- The customer may write an application program in the originating (development) 8100 which connects to the DPPX/BASE command facility in the destination 8100; the program transmits a job stream which includes the commands necessary to catalog the map, as well as the object map module.
- A diskette may be produced with the desired maps, etc., to be loaded at the destination 8100.

DPPX/DPS is a part of the DPPX System IPO, 5750-BA1.

COMPATIBILITY

DPPX/DPS V2 is upward-compatible with the first version of DPPX/DPS, i.e., DPPX/DPS V2 will provide compatible DPPX/DPS V1 function as follows:

- Source and object programs.
- Source and object maps.
- Version 1 source maps are accepted by DPPX/DPS V2 IMD and converted irreversibly to Version 2 specifications to the map specification library. Customers should consider saving a back-up copy of a Version 1 source map before processing it by DPPX/DPS V2 IMD.
- Version 1 object maps are accepted by DPPX/DPS V2 FM.
- Syntax and semantics of the application program interface (API).
- Mapping function provided.
- Application data structures.
- Application control structures.

PROGRAM PRODUCTS

DPPX/DPS (cont'd)

PERFORMANCE CONSIDERATIONS

A systems programmer will be able to make trade offs of DPPX/DPS FM response time against storage. For details of response time characteristics see *DPPX System Design and Performance Guide* and *DPPX/DPS User's Guide*.

PROGRAM PRODUCTS

**IBM 8100 INFORMATION SYSTEM
DEVELOPMENT MANAGEMENT SYSTEM
DISTRIBUTED PROCESSING PROGRAMMING EXECUTIVE
DMS/DPPX FEP1
DEFINITION (5760-XC2) - EXECUTION FACILITY (5660-265)**

PURPOSE

Development Management System/Distributed Processing Programming Executive provides an interactive interface for developing, testing, generating and executing application programs in an IBM DPPX environment. It is highly compatible with the DMS Cross-System Product for SSX/VSE, and for CICS/VS, TSO and VM/CMS.

- DMS/DPPX Definition includes the facilities for developing, testing and generating DMS/DPPX applications.
- DMS/DPPX Execution Facility provides for production execution of DMS/DPPX applications.

HIGHLIGHTS

- Interactive definition, test and execution of application programs.
- Trace/debug facility at development time.
- Direct execution of generated applications.
- Call and transfer linkage to other applications.
- Definition and execution in a DPPX environment.
- Portability of application definitions (within published restrictions) between DMS/DPPX, DMS/CSP, and DMS/DPCX.

DESCRIPTION

Data Definition - Allows the definition of data structures and the characteristics associated with that data. Single elements of data are defined as data items. Each data item name is unique within a library called the Member Specification Library (MSL). Data items are components of a record, table, map or working storage. After a data item has been defined once, it may be used in other records, tables, maps or working storage by entering the data item name. The associated characteristics of the data item, collected from the MSL, need not be reentered.

Map Definition - Allows the definition of a map for a terminal display or printer. Each map is given a unique name within a map-group (a group of maps for use in an application) and device. The variable fields defined on a map are named and characteristics are defined for each. Characteristics may be collected from data definitions on the MSL if an already defined data item name is used.

Application Definition - Provides for the definition of an application as a group of related processes. Processing statements can be used to define arithmetic operations, movement of data, use of tables, access to map fields and record data items, and logical testing and branching.

Application Test - Allows the user to verify the syntax and logic design of any DMS-defined application as well as to view the logical sequence of map displays as the user will see them in the production environment.

List Processor - Provides the capability to list all members of an MSL, or select subsets to be listed, and then invoke other DMS/DPPX functions against them. These functions are: Copy, rename, delete, print, change, where used, edit, view, export. Most utilities and editors can be invoked directly from the list processor.

Utilities

- **EXPORT** - Allows an MSL member to be moved out of an MSL.
- **IMPORT** - Allows a previously exported member to be moved into an MSL.
- **Member Maintenance** - Allows members in an MSL to be copied, deleted, renamed, or printed.
- **File Maintenance** - Allows the user to view or change data that is stored in a file that has been previously created and defined. If the change option is selected, the user may display, replace, delete, add or copy records to the file. File maintenance replaces the previously available File Inquiry facility.
- **Tutorial** - Can be used to learn about DMS/DPPX by reading it as a manual or by direct selection of certain sections. It can be accessed at any point in DMS/DPPX by pressing the HELP program function key.

Modes of Operation: DMS/DPPX operates in either of two modes during application development:

- **TUTOR** - An instructional or teaching mode for use by a new or learning DMS/DPPX user.
- **PROMPT** - An input assistance mode for the experienced DMS/DPPX user.

A change from TUTOR to PROMPT, or vice versa, can be made at any time by entering the subcommand MODE.

If a user requires assistance during the execution of DMS, the HELP function key may be pressed.

Application Generation: This process translates the defined application into a set of tables which may be executed in the DPPX environment. These execution tables may be distributed to a production system by tape, diskette, or communications facilities. Normal DPPX/BASE library services are used to enter the module (execution tables) into the program library of the production system. Once there, the application can be executed without reference to the MSL.

Application Execution: Once an application has been generated, it may be executed under the control of the DMS/DPPX Execution Facility product. DMS/DPPX Execution Facility retrieves the application definition from the DPPX library, initializes it to the run-time environment and manages the execution of the application.

CUSTOMER RESPONSIBILITIES

INSTALLATION: The DMS/DPPX installation procedure consists of loading programs and data files from the distribution diskettes to disk. All DMS programs are distributed in object module form and program assembly is not required.

The DMS/DPPX FEP1 installation package contains a complete set of replacement modules for DMS/DPPX and may be installed as a FEP or as a Service Level Update. Installation of the FEP rather than the Service Level Update is recommended for systems that have DMS already installed.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum configuration for DMS/DPPX is:

- One IBM 8100 Information System with 384K bytes of storage.
- One display terminal with a 1,920-character screen and 12 program function keys.
- One operator terminal (Execution Facility).

For system libraries, any appropriate storage devices supported by DPPX/BASE are allowed.

For user data storage and system data sets, at least one disk storage unit is required, which may be the same as required for DPPX/BASE system operation.

SOFTWARE REQUIREMENTS

DMS/DPPX (Definition) and DMS/DPPX Execution Facility require the following product:

Program Name	Program Number
DPPX/BASE	5760-010

DMS/DPPX (Definition) also requires:

Program Name	Program Number
DPPX/DPS (FM) V1 or DPPX/DPS (FM) V2	5760-XR1 5760-264
DPPX/DPS IMD V1 or DPPX/DPS IMD V2	5760-XR1 FC #6000 or 6001 5760-264 A, B or C

DMS/DPPX Execution Facility may use the following products:

Program Name	Program Number
DPPX/DTMS (interactive applications and if DTMS data bases are accessed)	5760-TD1
DPPX/DPS FM (if maps are used)	5760-XR1
DMS/DPPX (Definition) (if application modification is required)	5760-XC2

Storage Requirements: DMS/DPPX (Definition) requires a minimum of 48K real storage. Additional storage is required for multiple concurrent users.

DMS/DPPX Execution Facility requires a minimum of 38K bytes of real storage plus the size of the run-time application. DMS applications vary in size from 4K for a small application to 20K bytes or more for larger applications.

These storage requirements do not include data storage, or storage for other licensed programs or the concurrently resident application programs.

PROGRAM PRODUCTS

DMS/DPPX FEP1 (cont'd)**COMPATIBILITY and PORTABILITY**

COMPATIBILITY with EARLIER RELEASES: DMS/DPPX Execution Facility FEP 1 will execute applications generated with DMS/DPPX Fix Package 204 or later.

Applications generated with DMS/DPPX FEP1 will require FEP1 of the DMS/DPPX Execution Facility for execution.

COMPATIBILITY with DMS/CSP: DMS/DPPX and DMS/CSP provide a means for defining applications which, with little or no change, can be migrated between S/370, 30XX, 4300 and 8100 systems. This is achieved as follows:

The definition facilities, by which a user describes his application, maps, and data, are identical in DMS/DPPX and DMS/CSP. These definitions are stored in a Member Specification Library which can be moved from one DMS system to another. DMS/DPPX and DMS/CSP each include utilities for moving definitions between them.

The generation and execution facilities recognize differences between environments and allow use of certain facilities unique to the environment. While use of these facilities does not preclude portability, the user should be cautious in taking advantage of them during definition as they may introduce some extra effort into migrating between DMS-supported environments.

Additional information on application portability is included in the *DMS/DPPX General Information Manual* (GH20-2154).

COMPATIBILITY with DMS/DPCX: DMS/DPPX, DMS/DPCX and DMS/CSP are conceptually the same in the definition phase, however, DMS/DPPX and DMS/CSP offer functions that are not available with DMS/DPCX. Applications developed on DMS/DPPX or DMS/CSP which use these unique capabilities may require redesign or redefinition if the application is also to be generated for a DPCX system.

Applications defined using DMS/DPCX are portable to DMS/DPPX or DMS/CSP environments within previously published restrictions. For more information about DMS portability, see the *DMS/CSP General Information Manual*.

COMPATIBILITY with DMS/3790: An objective of DMS/DPPX is to provide user interface compatibility where functional properties are similar. A conversion aid program that executes under DPPX is provided to convert Display Management System/3790 (DMS/3790) panel (map) files into a format which is compatible with DMS/DPPX and DMS/DPCX. IBM 3790 function programs (FPs) that use these map definitions must be manually converted by the user. However, the user can use the DMS/DPPX or DMS/DPCX definition facilities to redefine his programs.

CONVERSION: Not applicable.

**8100 INFORMATION SYSTEM
DISTRIBUTED PROCESSING PROGRAMMING EXECUTIVE
PRESENTATION SERVICES for 3640 TERMINALS
DPPX/PS3640 (5660-267)**

PURPOSE

This licensed program is an ease-of-use aid for users of the 8100 Information System with Distributed Processing Programming Executive Base (DPPX/BASE) or the Distributed Processing Programming Executive/System Product (DPPX/SP) which provides presentation services support, including transaction invocation, formatting, editing, message assembly, message buffering and time-of-day broadcasting, for selected 3640 terminals. These functions simplify the programming on the 8100 of the 3640 terminals, specifically the 3641, 3642, 3644, 3646 and the 3647. All aspects of programming can benefit - design, implementation, testing and maintenance.

SPECIAL SALES INFORMATION

8100 customers can benefit from the device-independent support provided by DPPX/PS3640 EM at application run time. DPPX/PS3640 ITG is of benefit where the 8100 is being used to write applications - this may be at a central 8100 in the DP center or a remote 8100 where programs to be run locally are developed.

DESCRIPTION

The DPPX/PS3640 Execution Manager (EM), the runtime component which uses the DPPX/BASE and DPPX/SP 3640 exit facility, can be invoked from applications written in DPPX COBOL, DPPX Assembler language or Distributed Processing Development System (DPDS) - Programming Language for Distributed Systems (PL/DS), including those running under Data Base and Transaction Management System (DPPX/DTMS). To utilize DPPX/PS3640, the application program passes the address of the application control header and the application data area when issuing a COBOL WRITE (or the equivalent macro instructions for Assembler language and PL/DS). Included in the application header are the transaction group name and the transaction step map name which is specified by the application program. The structure of the control area is supplied by IBM with the DPPX/PS3640 code. The application data structure area is generated by the Interactive Transaction Generator (ITG) feature of DPPX/PS3640. Transaction functions required by the application are defined in maps previously created through ITG.

DPPX/PS3640 provides, as an optional feature, the Interactive Transaction Generator (ITG) which is the program development time component. This feature is an online programming aid, enabling the application programmer to create and update a library of maps and tables. These maps, which are called transaction step maps, contain parameters which specify the type of media, variable fields and their attributes, prompt messages (if applicable), indicator controls (lights and buzzer), and edit tables if required. ITG uses the standard DPPX and DPPX/SP I/O facilities. In DPPX/SP environments, it also uses the Distributed Presentation Services (DPPX/DPS) components, Interactive Map Definition (IMD) feature and Format Management (FM), during its execution. In DPPX/SP environments, it also uses the FM component of DPPX/SP and DPPX/SP IMD licensed program. These components must therefore be available on the machine where ITG transaction definition takes place.

A transaction is created by the user defining or copying (previously defined) transaction step maps into a transaction group. Following the creation or modification of this transaction group by ITG, before it can be used by an application program and EM, a special ITG generate process must be invoked, the result of which is:

- An application data structure for the appropriate application language (DPPX COBOL, DPPX assembler language or PL/DS) placed on a source copy library.
- A transaction group object module which is placed on a map module library.

The key to the transfer of data between application and the 3640 terminal is the map which EM loads and which contains the following information:

- The structure of the input/output data when passed to/from the application program.
- A definition of the constant data and/or prompt message(s).
- The edit checks to be performed on the variables entered.
- Tables to provide functions such as range checking and variable flow control.
- Error control including operator guidance lights.
- Device control information (e.g., buzzer, enable keyboard).
- Message buffering.
- Time of day (TOD) formatting for the 3641 and 3647 terminals along with TOD broadcasting to 3641 terminals and synchronization with the 3647 terminals.

Transaction step maps are grouped together into a transaction group which basically links together the several steps required for a transaction. These usually are prompts followed by the terminal operator entering data via a fixed media such as a magnetic stripe or via a keyboard entry from a 3641.

DPPX/PS3640 code is reentrant and reusable; at the installation's option selected modules may be transient.

DPPX/PS3640 INTERACTIVE TRANSACTION GENERATOR SUMMARY:
At program development time or during maintenance, the application programmer invokes the DPPX/PS3640 ITG feature to describe a run-time 3640 transaction including constant data, variable data to be presented to or by the end user, and edit characteristics and tables.

ITG aids the application programmer in describing the 3640 device interface with the end user. It facilitates transaction specification by virtue of the following programmer oriented interactive design concepts:

- Full screen context editing capability for entry of 3641 display and 3642 printer formats.
- Horizontal and vertical software driven scrolling capability.
- Menu driven processes.
- HELP facility.
- Restart capability - changes can be automatically recovered.
- Default values for map characteristics.
- The ability for existing DPPX/PS3640 ITG map specifications to be copied as initial specification for a new map.
- Library management utilities.
- Generate process to provide a structure for application data and to reduce the need for recompilation.
- Print utility.

The DPPX/PS3640 ITG Feature Allows an Application Programmer to Describe Online Transactions for the 3640 Terminals

When ITG is invoked, or on completion of a process, the initial selection menu is displayed. The user may select one of the following processes or terminate ITG. Each process is also menu driven.

Map Editor Process

The Map Editor allows the user to create new transaction step maps and to edit existing ones. The user may specify the map layout, field attributes and application data structure details. This process consists of a series of screens which ask the user to specify such items as:

- Type of media.
- Map exit program name (if desired).
- Error map flow.
- Light control.
- Map flow variable control.
- Buzzer control.
- Magnetic stripe creation specifications.
- Display layout including prompt messages (constants) and variable fields including edit attributes.
- Control map characteristics - Includes special device specifications for the 3641 and 3647 terminals.

Library Management Process

Provides utility functions for managing the map specification library: List Directory - Copy - Rename - Delete. An audit trail is kept of map modifications, and when the generate process was last invoked.

Generate Process

Before maps can be used by an application program, the map specifications have to pass through the generate process. There are two types of output from this process.

- a. Each transaction group generates an application data structure (for the specified application language) which is cataloged on a source copy library.
- b. Each transaction group generates one object map module which is cataloged on a map module library.

DPPX/PS3640 (cont'd)

A report is also produced. When the application data structure is not changed, recompilation of the application program is not necessary as a result of the generate process.

Utility Process

Used to print, import and export members of the map specification library.

Transaction Group Editor

Allows the user to review the application data structure that is defined for a transaction group and modify it if necessary. The user can delete, insert or reorder variables; their names and characteristics may be changed; and variables may be designated as subfields of other variables. In addition this process allows the user to review and modify the map flow control in a transaction group.

Table Editor

Table editor functions are used to create and modify the tables that control the transaction ID translation and direct map flow based on a transaction ID or function Key. It is also used for generating edit tables for input variable verification (such as range check) and specifying map flow.

Time of Day Specification

The time of day specification frames allow the user to create a new time of day table and to edit an existing one. The user may specify the type of clock to be displayed (12 or 24 hour), how often it is to be updated, the frequency of synchronization of the 3647's clocks with the 3641, and if the time to be displayed should be different from the 8100 timer value.

Tutorial Process

Online documentation of DPPX/PS3640 ITG. This facility is modeled on the TSO/SPF tutorial mode.

The HELP facility allows the user to obtain additional information about any error message displayed, or general information about a subcommand or options, by entering the tutorial process at the appropriate chapter.

In the event of a system failure, ITG will automatically save any changes that have been made and optionally recover (providing the map specification index is still usable - ITG will not attempt recovery of the index).

Application programs development is completed by

1. Compilation/assembly of the source program with a copy from the source copy library of
 - a. The IBM-supplied control structure and
 - b. ITG generated application data structure
 and
2. Compilation/assembly of any user exit code.

The transaction group/transaction step map specified in the control header is loaded by DPPX/PS3640 EM at application run time.

DPPX/PS3640 EXECUTION MANAGER SUMMARY: DPPX/PS3640-EM is designed to work under DPPX/BASE or DPPX/SP using the 3640 exit facility.

IBM 3640 Devices Supported BY DPPX/PS3640 EM

Device	Type
3641	Reporting Terminal
3642	Encoder Printer
3644	Automatic Data Unit
3646	Scanner Control Unit
3647	Time and Attendance Terminal

Note: Support for the 3643 and 3645 terminals is included in DPPX Distributed Presentation Services (DPPX/DPS) and DPPX/SP.

DPPX/PS3640 EM Provides the Application Run-Time Support and Interacts with the End User at a 3640 Terminal

Functions provided by DPPX/PS3640 EM are:

Basic mapping (media definition ... map characteristics ... variable field definition and edit characteristics ... table creation and modification ... feedback information) and user exits.

The *Basic Mapping* function of EM allows the application to send and receive data in a device independent manner, using maps previously generated by ITG. The map contains device dependent information required for the manipulation of the data stream. Changes to maps (using ITG) which do not change the application data structure can be made without the need to recompile the application program and copy a new data structure.

Media definition identifies the type of media the map will define: Display, magnetics, punched card, punched badge, print, DI, DO, 3644 or control.

Map characteristics defines various characteristics of the map and include: Map exit name, map flow, lights, buzzer, time of day and type of magnetic encoding.

Variable fields can be defined and associated with an application data structure. Edit characteristics can be specified to be performed upon data entry. These edit characteristics include: Literal check, range check, table check, field assembly (combining numeric fields entered one at a time via a "menu" card into a single field), folding, alphabetic/numeric check, length check and right/left justification.

Table creation/modification allows the user to define and change tables used for range checks, function key translation to a transaction ID, and variable map flow control.

Feedback information is provided through the control header, indicating a class of error and details within that class.

User Exits provide a capability for the user to write programs in DPPX COBOL, DPPX assembler language or PL/DS. These programs will use a subset of program language facilities. Typical uses on output are special conversion and editing and provision of device specific control information to the application on input.

Relationship Between DPPX/PS3640 ITG and DPPX/PS3640 EM

Programmer at terminal (program development time)

- Uses - ITG (which utilizes DPPX/DPS IMD and FM) or the FM component of DPPX/SP and DPPX/SP licensed programs
 - to create - Transaction step maps
 - to generate - Application data structures on source copy libraries
 - and - Transaction group maps on Map Module Libraries

Uses - DPPX/BASE or DPPX/SP interactive editor

- to create - Source program
- User exit code

Uses - DPPX COBOL, DPPX assembler (DPPX/ASM) or PL/DS

- a) with - Source program input and
- copies - Control header and application data structure
- to create - Program modules
- b) with - User mapping exit code
- to create - User mapping exit load module

End user at IBM 3640 terminal (application run-time)

- invokes - Transaction which in turn
 - Invokes the appropriate group of maps passing data both to and from the application data structure if required
- interacts - With application program and the user exit code via the application data structure and control header

The Application Program Interface (API) is the Means of Invoking DPPX/PS3640 EM at Application Run-Time

The functions required in a transaction are defined in maps which have been previously created using ITG. A transaction can be invoked by DPPX/PS3640 EM from applications written in DPPX/COBOL, DPPX assembler language or PL/DS which pass:

- The transaction group name and the transaction step map name (in the control header).
- (The address of) the control header and application data area.

The control header is used to indicate transaction group and step-names, feedback and other control information.

DPPX/PS3640 (cont'd)

CUSTOMER RESPONSIBILITIES

To install and use DPPX/PS3640 the user must:

Acquire a knowledge of the functions provided through reading *DPPX/PS3640 User's Guide*, and be familiar with DPPX/BASE and DPPX/DPS or DPPX/SP and DPPX/SP IMD ... understand the use of the application program interface in DPPX/COBOL, DPPX Assembler language or PL/DS to invoke DPPX/PS3640 EM ... understand the DPPX or DPPX/SP initialization and customization processes described in *DPPX or DPPX/SP Installation: Guide (SC27-0401)* as they relate to DPPX/PS3640 ... carry out approved problem determination procedures before contacting IBM for program service ... install fix packages and service level updates as appropriate.

SPECIFIED OPERATING ENVIRONMENT

DPPX/PS3640 INTERACTIVE TRANSACTION GENERATOR

HARDWARE REQUIREMENTS

The minimum configuration is:

IBM 8100 Information System with 512K bytes of processor storage.

IBM operator console or terminal.

IBM display terminal with 1920-character screen and at least 12 program function keys (can be operator console).

Direct access: For system libraries, any appropriate devices supported by DPPX/BASE or DPPX/SP are allowed. For DPPX/PS3640 user data storage and DPPX/PS3640 Interactive Transaction Generator system data sets, at least one disk storage unit is required, which can be the same device as required for DPPX/BASE system operation.

SOFTWARE REQUIREMENTS

DPPX/PS3640 ITG requires the following products:

DPPX/SP	5660-281
	or
DPPX/BASE	5760-010
DPPX/DPS V1	5760-XR1
	or
DPPX/DPS V2	5660-264

DPPX/PS3640 ITG is designed to work with the above products and subsequent modifications unless otherwise stated in a future program announcement.

DPPX/PS3640 EXECUTION MANAGER

HARDWARE REQUIREMENTS

The minimum configuration for application execution under EM is:

IBM 8100 Information System with 512K bytes of processor storage.

IBM operator terminal.

Selected IBM 3640 terminal (3641, 3642, 3644, 3646, 3647).

Direct access: For system libraries, any appropriate devices supported by DPPX/BASE or DPPX/SP are allowed.

For DPPX/PS3640 Execution Manager user data storage and DPPX/PS3640 Execution Manager system data sets, at least one disk storage unit is required, which may be the same device as required by DPPX/BASE or DPPX/SP system operation.

SOFTWARE REQUIREMENTS

The Execution Manager operates under the control of DPPX/BASE or DPPX/SP with the 3640 exit facility.

PLANNING CONSIDERATIONS

Machine: The storage requirements of DPPX/PS3640 Execution Manager are dependent upon various configuration and workload parameters including the number of devices, device types, number of resident transaction group maps and the amount of resident Execution Manager code. The following data does not include the resident DPPX or DPPX/SP exit manager storage requirement; neither does it include the exit environment work area because this is not used by the Execution Manager.

In a production, response oriented, environment of 20 terminals (consisting of a mixture of 3641s, 3642s, 3644s, 3646s and 3647s) supporting 25 different transactions, including time of day to 3641/3647s, the storage requirement for DPPX/PS3640 Execution Manager would be approximately 126K bytes. This figure includes DPPX/PS3640 Execution Manager code (80K bytes), control blocks and dynamic storage (33.8K bytes), and transaction group map storage (12.2K bytes).

The minimum storage requirement for a single 3641 terminal system supporting 10 transactions is approximately 6.2K bytes. This figure includes 3K bytes for DPPX/PS3640 Execution Manager code, 2.4K

bytes for control blocks and dynamic storage, and 750 bytes for transaction group map storage. Note that with DPPX/PS3640 Execution Manager, system programmers are able to make trade-offs of response time against storage consumption.

In an application development environment, where a single user is creating typical transaction step maps using DPPX/PS3640 Interactive Transaction Generator, approximately 39.5K bytes of storage is required. This consists of 18K bytes for permanently resident DPPX/PS3640 Interactive Transaction Generator code, 4.5K bytes for dynamically loaded DPPX/PS3640 Interactive Transaction Generator process code and 17K bytes for control blocks and dynamic storage. Note that in DPPX environments, DPPX/PS3640 Interactive Transaction Generator necessitates the installation of DPPX/DPS - Distributed Presentation Services - both the Interactive Map Definition and Format Management components, DPPX/BASE indexed access method and relative sequential access method services, and therefore additional storage is required these services. In DPPX/SP environments, it also uses the FM component of DPPX/SP and DPPX/SP IMD licensed program. The storage for control blocks and buffers for these services is included in the total of 39.5K bytes. Each additional user requires approximately 21.5K bytes for the DPPX/PS3640 Interactive Transaction Generator process code, control blocks and dynamic storage.

The configuration must include sufficient I/O devices to support the requirements for system residence and system data sets. Sufficient direct access storage must be available to satisfy the user information storage requirements and can consist of any direct access facility supported by the DPPX/BASE or DPPX/SP indexed access method, unless otherwise stated. DPPX/PS3640 Execution Manager object code requires approximately 225K bytes (900 256-byte blocks) of disk storage, DPPX/PS3640 Interactive Transaction Generator object code requires approximately 875K bytes (3,500 256-byte blocks) of disk storage plus 775K bytes (3,100 256-byte blocks) of disk storage for DPPX/PS3640 Interactive Transaction Generator online documentation.

Use of DPPX/PS3640 Interactive Transaction Generator requires a DPPX/DPS or DPPX/SP FM Format Management supported display with a screen width of 80 characters, depth of at least 24 lines and with a keyboard that has 12 or more program function keys.

DPPX/PS3640 EM supports the following IBM 3640 devices:

Device	Type
3641	Reporting Terminal
3642	Encoder Printer
3644	Automatic Data Unit
3646	Scanner Control Unit
3647	Time and Attendance Terminal

Note: Support for the 3643 and 3645 terminals is included in DPPX/DPS and in the FM component of DPPX/SP and DPPX/SP IMD.

These terminals may be attached either by a data link through a 3842 or 3843 Loop Control Unit or by the directly attached IBM Multiuse Communications Loop.

Programming: This licensed program is designed to work with the DPPX/BASE or DPPX/SP licensed program using the 3640 exit facility. DPPX/PS3640 also requires the DPPX/DPS licensed program on the system on which ITG is installed in DPPX environments. ITG uses the IMD and FM components of DPPX/DPS to control interactions with the display. In DPPX/SP environments, it also uses the FM component of DPPX/SP and DPPX/SP IMD licensed program.

The following programs are required depending on application programming language used:

DPPX/COBOL Compiler	5760-CB1
DPPX/COBOL Runtime Library	5760-LM1
DPPX/ASM	5760-AS1
DPDS (for PL/DS)	5799-AZL
	(Programming RQP
	P88016)

DPPX/DTMS or the DTMS component of DPPX/SP can be used optionally with DPPX/PS3640 to provide a more simple I/O interface between application programs and the 3640 terminals.

Some customers may need to transmit information, such as maps and object programs, from the 8100 where they were developed to a destination 8100 for execution. This can be done by:

1. Use of a S/370 or 4300 and the DSX (Distributed System Executive) Release 2 licensed program product, 5748-XXG. The maps etc. are transmitted from the 8100 to a S/370 or 4300 DSX library and then DSX will retransmit to the destination 8100.
2. A user written application program.
3. Use of diskette or other portable medium.

Do not reproduce without written permission

PROGRAM PRODUCTS

**DISTRIBUTED PROCESSING PROGRAMMING
EXECUTIVE/
INTERACTIVE PRODUCTIVITY FACILITY
5660-271**

PURPOSE

The DPPX/Interactive Productivity Facility provides a simplified, full-screen, interactive interface to the DPPX command facility. It is designed to enhance the usability and productivity of 8100/DPPX systems by both central and remote site users.

HIGHLIGHTS

The DPPX/Interactive Productivity Facility supports three major functional areas, as well as tutorial information that clarifies each function.

- **System use**
The system use dialogs are designed primarily for application developers and system analysts. They address data set, catalog and volume management and the submission of COBOL programs for background batch processing.
The system use dialogs provide the capability to:
 - Define, delete and rename data sets.
 - Edit data sets.
 - Browse data sets.
 - Browse catalogs and display, edit and delete data sets.
 - Define, delete and display catalogs.
 - Initialize, activate and display data about volumes.
 - Copy or move data sets or catalogs.
 - Compile COBOL programs, link-edit programs and submit programs for execution in the background batch environment.
- **System operations**
The system operations dialogs are designed primarily for remote site users who do not have a high level of data processing skills. They assist the user with the daily operation of the 8100.
The system operation dialogs provide the capability to:
 - Display system status.
 - Use printer sharing.
 - Use batch processing.
 - Use remote job entry services.
 - Add, remove or initialize diskettes or tapes.
 - Set and verify the date and time stored in the system.
 - Maintain an operator log.
- **System management**
The system management dialogs are primarily designed for system administrators and, in some instances, remote site operators. These dialogs are grouped under administrative services and an analyze function.
The administrative services dialogs provide the capability to define and maintain:
 - DPPX user profiles.
 - DPPX environment profiles.
 - Printer sharing options.
 - DPPX/Interactive Productivity Facility user session options.
 - DPPX/Interactive Productivity Facility tables.
 The analyze dialogs assist with the problem determination process. These dialogs may be useful to operations or "help desk" personnel at the central site when used in conjunction with the Host Command Facility licensed program, or, in some instances, remote site operators. The analyze dialogs provide the capability to:
 - Print dump data sets.
 - Examine and print the error log.
 - Start, stop and display a system trace.
 - Test device operation.
- **Tutorials**
The tutorial function is essentially an online user's manual. Tutorials can be invoked from the initial menu, any other menu, or data entry panel by pressing Program Function Key 1 (PF1) or entering "explain" on the command input line. The "First Use Tutorial" may be selected from the initial menu. This tutorial

describes the DPPX/Interactive Productivity Facility and how to use it. Inexperienced users should browse this tutorial before attempting any other activity.

When a tutorial is invoked by the PF1 key, an explain panel is displayed. These panels are structured so they reflect, panel for panel, the functions provided. Those at the highest level of the structure describe DPPX/Interactive Productivity Facility concepts and objectives. Tutorials for the function selection panels discuss the objectives and rationale of the particular function. Those that correspond to data entry panels offer considerations for the data to be entered, instructions for modifying an entry, and references to documents providing more detailed information. To leave any tutorial panel, the user presses the END key (PF3).

CUSTOMER RESPONSIBILITIES

To install and use the DPPX/Interactive Productivity Facility, it is the customer's responsibility to:

- Acquire sufficient knowledge of DPPX/BASE concepts and facilities necessary to utilize the DPPX/Interactive Productivity Facility.
- Use the installation process as described in the DPPX/Interactive Productivity Facility program directory.
- Acquire a knowledge of DPPX/Interactive Productivity Facility function by reading the *DPPX/Interactive Productivity Facility General Information* manual and the tutorials included in DPPX/Interactive Productivity Facility.
- Carry out the problem determination procedures described in the *DPPX/Command Facility Extensions Feature Diagnosis* guide before contacting IBM for program service.
- Install fix packages and service level updates.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This licensed program is designed to operate on an IBM 8130 or 8140 Processor with 512K bytes of processor storage, with a diskette drive and with 58MB of disk storage capacity. Also required is a display supported by DPPX/DPS Format Management with a screen width of at least 80 characters and a depth of at least 24 lines. Up to 24 program function keys are supported if available on the display keyboard. Specific devices supported are:

Device Number	Device Name	Attachment
3276-12,13,14	Control Unit	
	Display Station	Loop or Data Link
3277-2	Display Station	Display/Printer Attachment
3278-2,3,4	Display Station	via 3276
3278-2,3,4,5	Display Station	via 3274-51C
3279-2A,2B,3A,3B	Color Display Station	via 3274-51C or 3276
8775-1,2	Display Terminal	Loop
8775-11,12	Display Terminal	Data Link
3104-B1, B2	Display Terminal	Loop

Storage Requirements: The storage requirements of this licensed program are dependent upon the various configuration and workload parameters. The parameters include: Device type, map size, message rates, number of resident maps, and the number of processing environments.

The DPPX/BASE Command Facility Extensions Feature (required for DPPX/Interactive Productivity Facility) executes in a standard DPPX interactive command facility environment (approximately 48K bytes of processor storage). Within the command facility address space, the approximate processor storage estimates for the DPPX/Command Facility Extensions Feature are:

Resident Programs (shared)	11,000 bytes
Control Blocks and Work Areas	8,000 bytes
Dynamic Variables	1,000 bytes
Total	20,000 bytes

DPPX/Interactive Productivity Facility and non-resident DPPX/BASE Command Facility Extension Feature programs are invoked as required on a temporary basis and deleted when no longer needed. They will operate within a standard command facility address space.

PROGRAM PRODUCTS

DPPX/Interactive Productivity Facility (cont'd)

The DPPX/Interactive Productivity Feature requires 256-byte blocks of disk storage space in the System Program Catalog (SYSPGM) as follows:

Object Code	1500
Field Descriptor Tables	1100
Display Panel Maps	*

* 1100 blocks of space are required for each of up to 14 selected device groups. See the *DPPX/Interactive Productivity Facility General Information* manual for further information.

The DPPX/Interactive Productivity Facility also requires 256-byte blocks of disk storage space in three catalogs for dialog scripts, tutorials, and tables.

SOFTWARE REQUIREMENTS

This licensed program is designed to work with the DPPX/BASE (5760-010) service level 0501, DPPX/BASE Command Facility Extensions Feature (5760-010, feature #6005, #6006 or #6007) service level 0100, and DPPX/DPS FM (5760-XR1) service level 0103. All subsequent service levels are supported unless otherwise stated.

The code portion of the licensed program is written in Programming Language for Distributed Systems (PL/DS). When optional source code is ordered, it is distributed in DPPX Assembler language with most of the original PL/DS statements shown as comments. Source code on magnetic tape and program listings on microfiche are available as optional material.

DATA SECURITY, AUDITABILITY and CONTROL

The DPPX/Command Facility Extensions Feature utilizes the system services of DPPX/BASE and therefore is governed by the security and auditability features within that environment. Customer management is responsible for the selection, implementation, and adequacy of these features.

PERFORMANCE CONSIDERATIONS

Performance of DPPX with the DPPX/Command Facility Extensions Feature and DPPX/Interactive Productivity Facility depends on a number of factors such as the system configuration, the available system resources, the number of concurrent user programs and their associated workloads and relative priorities, user data set characteristics and access methods.

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**DISTRIBUTED PROCESSING PROGRAMMING
EXECUTIVE/
INTERACTIVE PRODUCTIVITY FACILITY
RELEASE 2
5660-271**

PURPOSE

The DPPX/Interactive Productivity Facility (IPF) provides a simplified, full-screen, interactive interface to the DPPX command facility. It is designed to enhance the usability and productivity of 8100/DPPX systems by both central and remote site users.

Release 2 is an enhancement to the current release of DPPX/Interactive Productivity Facility. Enhancements have been made to System Operations dialogs in the area of Printer Sharing and Diskette Volume utilities; System Use dialogs in the area of Browse, Edit, Dataset utilities, Catalog utilities and Copy utilities. A new dialog has been included to allow execution of DPPX Commands and CLISTs directly from DPPX/Interactive Productivity Facility.

The following paragraphs contain general information pertaining to DPPX/IPF Release 2. A subsequent section covers follow-on Functional Enhancement Package (FEP) Highlights to Release 2.

HIGHLIGHTS

The DPPX/Interactive Productivity Facility supports the functional areas of System Use, System Operations and System Management, as well as help information that clarifies each function.

- System use

The system use dialogs are designed primarily for application developers and system analysts. They address data set, catalog and volume management and the submission of COBOL programs for background batch processing.

The system use dialogs provide the capability to:

- Define, delete and rename data sets.
- Edit data sets.
- Browse data sets.
- Browse catalogs and display, edit and delete data sets.
- Define, delete and display catalogs.
- Initialize, activate and display data about volumes.
- Copy or move data sets or catalogs.
- Compile COBOL programs, link-edit programs and submit programs for execution in the background batch environment.

RELEASE 2 ENHANCEMENTS

Browse data set provides a new FIND command to search for a character string bounded by blanks (WORD), preceded by a blank (PREFIX) or followed by a blank (SUFFIX). The search can be started or ended at a specific column number. A new MARKER command will display column markers at the top and bottom of the display area. The capability has been added to set the SCROLL field to a specific number of lines instead of a half or full page.

Edit data set allows an initial CLIST to be specified that contains EDIT subcommand defaults.

Data set utilities support the building of index datasets, recovery of a data set and defining and deleting aliases. The copy/move function is now supported as part of data set utilities. A data set can now be defined by specifying a model data set.

Catalog utilities support copy/move function and copying of non-uniform catalogs.

System Operations

The system operations dialogs are designed primarily for remote site users who do not have a high level of data processing skills. They assist the user with the daily operation of the 8100.

The system operation dialogs provide the capability to:

- Display system status.
- Use printer sharing.
- Use batch processing.
- Use remote job entry services.
- Add or remove diskette or tape volumes to or from the system.
- Set and verify the date and time stored in the system.
- Maintain an operator log.

Release 2 Enhancements

- Submit Data Set for Printing supports the additional printer sharing options of hold, headers, FCB name, train, form and type.
- Print Data Set Selection supports the additional options of forms, hold and type.
- Data Sets Awaiting Printing supports hold and release of a data set display and changing print request characteristics.
- Change Print Request Options supports new printer sharing function which allows the user to change printer sharing submit options for a data set on the printer sharing queue. The options which can be changed are class, copies, delete, hold, job name, headers, suppression, FCB name, train name and form name.
- Override Printer Job Selection allows the redefinition of the job selection criteria for a printer.
- Printer Start Options allows additional start options RULOGMODE, wait, restart mode, restart scope and entry of a symbolic printer name.

Volume Utilities

- Diskette volume utility has been enhanced to reduce the amount of data entry required. The adapter and device name are the only data required. The dialog verifies if the adapter is active and activates it if required. The Volume ID and Volume Catalog name of the diskette is read from the diskette and if the volume catalog is not defined to DPPX, the Define Catalog command is issued. The activate volume command is issued and a message displayed identifying the volume ID and VOLCAT mounted.

Command/CLIST Execution

- This new function allows the user to enter a list of DPPX commands and CLIST, and selectively execute them. The list is retained across sessions. This reduces the times a user must use Suspend/Resume to execute DPPX commands and CLISTS.

System Management

The system management dialogs are primarily designed for system administrators and, in some instances, remote site operators. These dialogs are grouped under administrative services and an analyze function.

The administrative services dialogs provide the capability to define and maintain:

- DPPX user profiles.
- DPPX environment profiles.
- Printer sharing options.
- DPPX/Interactive Productivity Facility user session options.

The analyze dialogs assist with the problem determination process. These dialogs may be useful to operations or "help desk" personnel at the central site when used in conjunction with the Host Command Facility licensed program, or, in some instances, remote site operators. The analyze dialogs provide the capability to:

- Print dump data sets.
- Examine and print the error log.
- Start, stop and display a system trace.
- Test device operation.

Help Facilities

The help function is essentially an online user's manual. The help function can be invoked from the initial menu, any other menu, or data entry panel by pressing Program Function Key 1 (PF1) or entering "help" on the command input line.

The "First Use Tutorial" may be selected from the initial menu. This tutorial describes the DPPX/Interactive Productivity Facility and how to use it. Inexperienced users should browse this tutorial before attempting any other activity.

When a help function is invoked by the PF1 key, a help panel is displayed. These panels are structured so they reflect, panel for panel, the functions provided. Those at the highest level of the structure describe DPPX/Interactive Productivity Facility concepts and objectives. Help panels for the function selection panels discuss the objectives and rationale of the particular function. Those that correspond to data entry panels offer considerations for the data to be entered, instructions for modifying an entry, and references to documents providing more detailed information. To leave any help panel, the user presses the END key (PF3).

DPPX/Interactive Productivity Facility R2 (cont'd)

CUSTOMER RESPONSIBILITIES

To install and use the DPPX/Interactive Productivity Facility, it is the customer's responsibility to:

- Acquire sufficient knowledge of DPPX/BASE concepts and facilities necessary to utilize the DPPX/Interactive Productivity Facility.
- Use the installation process as described in the DPPX/Interactive Productivity Facility program directory.
- Acquire a knowledge of DPPX/Interactive Productivity Facility function by reading the *DPPX/Interactive Productivity Facility General Information* manual and the tutorials included in DPPX/Interactive Productivity Facility.
- Carry out the problem determination procedures described in the *DPPX/Command Facility Extensions Feature Diagnosis* guide before contacting IBM for program service.
- Install fix packages and service level updates.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This licensed program is designed to operate on an IBM 8130 or 8140 Processor with 512K bytes of processor storage, with a diskette drive and with 58MB of disk storage capacity. Also required is a display supported by DPPX/DPS Format Management with a screen width of at least 80 characters and a depth of at least 24 lines. DPPX/Interactive Productivity Facility commands can be executed via program function keys if available on the display. All displays with an 80 character by 24 line screen supported by DPPX Version 1 and 2 are supported by DPPX/Interactive Productivity Facility.

Storage Requirements: The storage requirements of this licensed program are dependent upon the various configuration and workload parameters. The parameters include: Device type, map size, message rates, number of resident maps, and the number of processing environments.

The DPPX/BASE Command Facility Extensions Feature Level 2 (required for DPPX/Interactive Productivity Facility Release 2) executes in a standard DPPX interactive command facility environment. Within the command facility address space, the approximate processor storage estimates for the DPPX/Command Facility Extensions Feature are:

Resident Programs (shared address space)	11,000 bytes
Control Blocks and Work Areas (user address space)	8,000 bytes
Dynamic Variables (user address space)	1,000 bytes
Total	20,000 bytes

DPPX/Interactive Productivity Facility and non-resident DPPX/BASE Command Facility Extension Feature programs are invoked as required on a temporary basis and deleted when no longer needed. They will operate within a standard command facility address space.

DPPX/Base Command Facility Extensions Feature Release 2 and DPPX/Interactive Productivity Facility Release 2 requires the following 256-byte blocks of disk storage space in the System Program Catalog (SYSPGM):

	Programs and Messages	Display Panel Maps *
DPPX/Base Command Facility Extensions Release 2	2,500	60
DPPX/Interactive Productivity Facility Release 2	1,000	8
TOTAL	3,500	

* Blocks of disk storage space for display panel maps are required for each one of up to 14 selected device groups using DPPX/DPS Version 1 or DPPX/DPS Version 2.

The DPPX/Base Command Facility Extensions Feature and DPPX/Interactive Productivity Facility also require disk storage in three DPPX/Base Command Facility Extensions Feature Release 2 user catalogs for dialog scripts, help panels and tables; 2,600 256-byte blocks are required for DPPX/Base Command Facility Extensions Feature Release 2 and 5,200 256-byte blocks are required for DPPX/Interactive Productivity Facility Release 2.

SOFTWARE REQUIREMENTS

This licensed program is designed to work with the DPPX/BASE (5760-010) FEP5 level, DPPX/BASE Command Facility Extensions Feature Level 2 (5760-010, feature #6005, #6006 or #6007), and DPPX/DPS Format Management (5760-XR1) or DPS Format Management Version 2 (5660-264).

The code portion of the licensed program is written in Programming Language for Distributed Systems (PL/DS). When optional source code is ordered, it is distributed in DPPX Assembler language with most of the original PL/DS statements shown as comments. Source code on magnetic tape and program listings on microfiche are available as optional material.

DATA SECURITY, AUDITABILITY and CONTROL

The DPPX/Base Command Facility Extensions Feature utilizes the system services of DPPX/BASE and therefore is governed by the security and auditability features within that environment. Customer management is responsible for the selection, implementation, and adequacy of these features.

PERFORMANCE CONSIDERATIONS

Performance of DPPX with the DPPX/Command Facility Extensions Feature and DPPX/Interactive Productivity Facility depends on a number of factors such as the system configuration, the available system resources, the number of concurrent user programs and their associated workloads and relative priorities, user data set characteristics and access methods. DPPX/Interactive Productivity Facility Release 2 performance will be equal to that of Release 1.

FUNCTIONAL ENHANCEMENT PACKAGE to IPF RELEASE 2

HIGHLIGHTS

The DPPX/Interactive Productivity Facility supports the major functional areas of system use, system operation, and system management, as well as help information that clarifies each function.

System Use

- The system use dialogs are designed primarily for application developers and system administrators. They address data set catalog, catalog, and volume management, and the submission of COBOL programs for background batch processing.
- Release 2 user catalogs for dialog scripts, help panels, and tables.

SOFTWARE REQUIREMENTS

IPF Release 2 is designed to operate with the DPPX/BASE (5760-010) FEP 6 level, DPPX/BASE Command Facility Extensions feature Release 2 (5760-010, feature #6005, #6006 or #6007), and DPPX/DPS Format Management (5760-XR1) or DPPX/DPS Format Management Version 2 (5660-264).

DOCUMENTATION

(available from Mechanicsburg)

DPPX/Interactive Productivity Facility Licensed Program Specifications (GH20-5307) ... *DPPX General Information* (GC27-0400) ... *DPPX/Interactive Productivity Facility Summary* (GX20-2380).

Users of this licensed program are encouraged to order the licensed document, *DPPX/Interactive Productivity Facility Diagnosis* (LY20-2511). This document is available as an optional feature to the basic license.

DPPX/BASE INTEGRITY

IBM will accept APARS where the installation of DPPX/Interactive Productivity Facility introduces an exposure to the system integrity of DPPX/BASE.

RPOs ACCEPTED: No

APAR Processing: All APARs will be processed throughout the period during which central service is provided, regardless of the service level of DPPX/Interactive Productivity Facility Release 2 in use by the customer. Preventive service fixes, however, will only be developed for the latest available service level and may not be applicable to previous service levels, unless otherwise announced.

Corrective service will be developed for the last service level preceding DPPX/Interactive Productivity Facility Release 2 for 6 months from availability of DPPX/Interactive Productivity Facility Release 2. Customers remaining on the service level preceding Release 2 will receive this corrective service on request.

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**5660-272 - DPPX/PDA
8100 INFORMATION SYSTEM
DISTRIBUTED PROCESSING PROGRAMMING EXECUTIVE
PROBLEM DETERMINATION APPLICATION****PURPOSE**

DPPX/PDA program provides improved central network management for 8100 Information Systems. DPPX/PDA will reside in the 8100 and will work in conjunction with the Network Problem Determination Application Version 2 (NPDA V2) and the Network Communications Control Facility (NCCF) Release 2 or Version 2 in a host S/370 or 4300. DPPX/PDA will interface with the DPPX error log, analyze errors that have occurred, and notify the host NPDA V2 which in turn will notify the central network operator who can take appropriate action. DPPX/PDA will also accept alerts originated by devices attached to the 8100 as well as alerts generated by DPPX applications, and pass them through to the host NPDA V2.

SPECIAL SALES INFORMATION

The DPPX/PDA licensed program is particularly useful to those DPPX users who are part of an S/370 or 4300-based network and who want to manage that network from a central site through use of IBM-supplied network management tools such as NCCF Release 2 or Version 2 and NPDA Version 2, and especially to those who want the central-site control operator to be automatically informed about problem areas and potential problem areas in his network nodes.

HIGHLIGHTS

- Detects alert conditions by analyzing DPPX error log entries and sends unsolicited alerts (REFM5 type 00) to the host.
- Transmits to the host alerts received from user applications and from devices attached to the 8100, e.g., the 3600 Finance Communication System.

DESCRIPTION

Functional Capabilities: The DPPX/PDA licensed program acts as a sensor for central network management by scanning all error log records and reacting to those which require network management action. Additionally, DPPX/PDA forwards to the host alerts received from devices attached downstream. The specific functions provided by DPPX/PDA are:

- System alert processing. This function generates an alert RECFMS (type 00) for unsolicited transmittal to the host system (S/370 or 4300). The alerts are received by the Network Problem Determination Application Version 2 (NPDA V2). Alerts are produced from DPPX error log entries which indicate that:
 - An unrecoverable device or adapter error has occurred.
 - An SDLC primary adapter transmission counter threshold has been exceeded.
 - A program, either IBM-provided or user-written, which was running in a critical environment, has failed.
 - A user application or an authorized terminal operator has issued an alert command indicating that he wishes to notify the host of a condition in the 8100 system.

Alerts are also transmitted to the host when they are received from devices attached to the 8100, e.g., the 3600 Finance Communication System.

CUSTOMER RESPONSIBILITIES

The customer must install the Distributed Processing Programming Executive Base (DPPX/BASE) licensed program and provide sufficient real storage for DPPX/PDA.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

DPPX/PDA will operate on an IBM 8100 Information System with DPPX/BASE. All DPPX/PDA modules are transient and therefore do not require permanent allocation of main storage.

No unique input/output devices are required for DPPX/PDA to operate.

SOFTWARE REQUIREMENTS

DPPX/PDA is designed to run under control of the DPPX/BASE licensed program (5760-010), which provides facilities for its operation.

DPPX/PDA is written in Programming Language for Distributed Systems (PL/DS). When optional source code is ordered, it is distributed in DPPX Assembler language with most of the original PL/DS statements shown as comments.

DPPX/PDA operates with Network Problem Determination Application Version 2, which runs with the Network Communications Control Facility (NCCF) Release 2 or Version 2 on IBM S/370 or 4300.

DATA SECURITY

DPPX/PDA runs under DPPX/BASE and is subject to the controls that it provides. Customer management is responsible for the selection, application and adequacy of these controls for their environments. DPPX/PDA accesses hardware and software failure data but not customer data (or any sampling) involved in the failure. DPPX/PDA acquires no customer data which is not directly supplied to it by the customer.

DOCUMENTATION

(available from Mechanicsburg)

DPPX General Information Manual (GC27-0400) ... DPPX/PDA Licensed Program Summary (GC27-0631) ... DPPX/PDA Licensed Program Specification

Other DPPX/BASE publications will be updated as appropriate to reflect DPPX/PDA.

DPPX/BASE SYSTEM INTEGRITY APPLIES: Yes

RPOs ACCEPTED: No

PROGRAM PRODUCTS

**IBM 8100 INFORMATION SYSTEM
DISTRIBUTED PROCESSING PROGRAMMING EXECUTIVE
PROGRAMMED OPERATOR FACILITY
5660-273****PURPOSE**

The DPPX/Programmed Operator Facility provides the ability to service messages directed to the system operator with programmed responses. It is designed to reduce the skills and effort required to operate an IBM 8100 Information System with DPPX/BASE at a remote site.

DESCRIPTION

The DPPX/Programmed Operator Facility will give the user of an IBM 8100 Information System the ability to intercept messages directed to the system operator and service them with pre-established program logic. Each message may have a unique programmed response associated with it, or it may be grouped with messages that have a common response. The programmed response can be specified by the user. An initial action statement file will be shipped with the licensed program. These defaults can be modified as the users determine the way in which they plan to customize the systems for their mode of operation.

Optionally, the DPPX Programmed Operator Facility may be used to intercept and handle RJE messages. It is recommended that this option be employed only when running RJE queued output.

An installation can select from the following actions to be taken by the Programmed Operator Facility when a message is received:

- Ignore the message.
 - Send a message to a DPPX/DTMS or Command Facility user who has been designated "lead operator".
 - Send a message to a user who has been designated "host operator" and who is logged on at the central host system through the Host Command Facility (HCF).
 - Broadcast a message to all logged on Command Facility and DTMS users.
 - Initiate the execution of a specific command list (CLIST).
 - Call a program.
 - Reply to a prompt from the system.
 - Solicit a response from a lead or host operator (System Prompt).
- In addition, the Programmed Operator Facility provides the user with the ability to:
- Build an indexed file of action statements that defines the desired response to messages.
 - Define and set timer event request.
 - Perform actions when a specified timer event occurs.
 - Monitor at a local or host terminal the messages and responses being received and sent by the Programmed Operator.

Messages and responses will be logged in the system operator session log.

Through the use of the Programmed Operator Facility, the requirement for a system operator attendant at a remote system may be minimized.

CUSTOMER RESPONSIBILITIES

To install and use the Programmed Operator Facility, the customer must be familiar with the operation and concepts of DPPX/BASE. This includes being knowledgeable in problem determination, installing fix packages, and other normal servicing functions for the operating system. In addition, the user must determine those messages that he wishes to handle in a way other than that defined in the initial action statement file, define his unique action statements, and prepare the corresponding programs, CLISTS, or messages.

EDUCATION: The current 8100 Information System education will be updated to reflect the new facilities of the DPPX/Programmed Operator Facility. See the *Customer Education Catalog and Schedule G320-1244* for information on 8100 Information System courses.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The DPPX/Programmed Operator Facility requires a hardware configuration capable of supporting the DPPX/BASE program product, with a minimum storage size of 512K bytes.

Most of the Programmed Operator Facility code will be transient. Storage of 12K bytes will be required for the duration of the Programmed Operator environment.

The DPPX/Programmed Operator Facility requires approximately 200K bytes (800 256-byte blocks) of disk storage in the System Program Catalog (SYSPGM). In addition, the message action statement data set and the timer event data set will each require 256 bytes per entry and indices.

SOFTWARE REQUIREMENTS

This program product is designed to operate with the DPPX/BASE (5760-010) service level that is current at the time of shipment, and subsequent service levels and versions unless otherwise announced. If the customer is using DPPX/Data Base and Transaction Management System (DPPX/DTMS) and/or DPPX/Distributed Presentation Services Version 2 (DPPX/DPS - V2), they also must be at the current service level at the time of shipment of DPPX/Programmed Operator Facility.

This program product is written in Programming Language for Distributed Systems (PL/DS). When optional source code is ordered, it is distributed in DPPX Assembler language with most of the original PL/DS statements shown as comments. Source code on magnetic tape and program listings on microfiche are available as optional material.

DATA SECURITY, AUDITABILITY, and CONTROL

The DPPX/Programmed Operator Facility utilizes the system services of the DPPX/BASE and is therefore governed by the security and auditability features within that environment. Customer management must be sensitive to system integrity considerations and is responsible for the selection, implementation and adequacy of these features.

SYSTEM INTEGRITY

IBM will accept APARS where the installation of the DPPX/Programmed Operator Facility introduces an exposure to the system integrity of DPPX/BASE. This program is intended to run authorized.

RPQs ACCEPTED: No

**5660-281 - DPPX/SP R1
8100 INFORMATION SYSTEM
DISTRIBUTED PROCESSING PROGRAMMING EXECUTIVE
SYSTEM PRODUCT RELEASE 1**

PURPOSE

8100 Information System Distributed Processing Programming Executive/System Product (DPPX/SP) is a licensed program designed for distributed data processing applications running on 8100 Information Systems. It provides multi-programming, multi-user and multi-level system support for concurrent application environments. Interactive, batch, and plant floor applications are supported. DPPX/SP provides a variety of functions to communicate with S/370, 30XX, 4300, other 8100 systems, and terminals. There are facilities to simplify installation, application design, program development and system operation. DPPX/SP provides general usage system support which may be tailored or modified to suit unique requirements. DPPX/SP includes a Migration Aid feature to assist users in migrating from DPPX/BASE.

SPECIAL SALES INFORMATION

All IBM customers with distributed system applications are candidates for DPPX/SP. DPPX/SP is an advanced programming system designed to span a wide variety of distributed data processing environments, providing extensive function to simplify development, installation and operation of distributed systems. The 8100/DPPX/SP customer has a wide range of choices in how data processing capability is to be distributed.

DESCRIPTION

DPPX/SP may operate alone or with the following related licensed programs (described separately):

DPPX Licensed Programs

Presentation Services for 3640 Terminals (DPPX/PS3640)
COBOL Compiler (DPPX/COBOL Compiler)
FORTRAN Compiler (DPPX/FORTRAN Compiler)
FORTRAN Library (DPPX/FORTRAN Library)
Assembler (DPPX/ASM)
Parameter Table Generation Facility for 3644 Automatic Data Unit (DPPX/GEN3644)
Development Management System (DMS/DPPX)
Data Capture and Management System (DCMS/DPPX)
Performance Tool (DPPX/PT)
APL (DPPX/APL)
PL/I Compiler (DPPX/PL/I)
PL/I Library (DPPX/PL/I Library)

DPPX/SP Licensed Programs

DPPX/SP Interactive Map Definition (DPPX/SP IMD)

S/370, 30XX and 4300 Licensed Programs

Distributed Systems Executive (DSX) Version 2
Host Command Facility (HCF)

The DPPX/System Product (DPPX/SP) is a licensed program which extends the proven DDP capabilities of the DPPX/BASE operating system to provide improved usability and additional functional and connectivity enhancements. It combines and enhances the functional benefits of DPPX/BASE FEP6 (Functional Enhancement Package 6), plus ten additional DPPX licensed programs, into a single transaction-oriented product which has been system tested for use together. Menu-driven dialogs provide the primary means by which system functions are managed. Online user guidance eases the customer effort to install, customize and maintain the DPPX/SP system.

DPPX/SP comprises the following components:

DPPX/BASE
CFE feature
Interactive Productivity Facility
Data Stream Compatibility
Data Base and Transaction Management System
Sort
Router
COBOL Library
Programmed Operator Facility
Problem Determination Application
Remote Job Entry
Format Management

DPPX/SP provides support for a range of 8130 and 8140 configurations including new input/output devices (i.e., the 3290 and the 3178), new performance options (i.e., DASD Cache, self-tuning buffers, Save/Restore IPL, etc.), new network/system management facilities (i.e., Link Problem Determination Application, new tract options, etc.) and improved application development and execution flexibility (i.e., Format Management, Router, etc.).

DPPX/SP is provided for both new and existing 8100 distributed data processing customers. New customers will find DPPX/SP particularly easy to install and use, allowing them to get their 8100 systems into production easier. DPPX/SP allows this activity to be accomplished

with less effort than the current DPPX licensed product. Migration aid support for installed DPPX users is provided. New and enhanced functions, enhanced usability characteristics, application-to-application communication flexibility as well as performance benefits make DPPX/SP an attractive solution to those customers desiring to upgrade their 8100 DDP capabilities.

MIGRATION AID FEATURE: The Migration Aid feature is provided to assist users in migrating from DPPX/BASE to DPPX/SP. This feature installs on DPPX/BASE in the same manner as any other DPPX licensed program, and includes the following functions:

- A new command, REDEFINE.CATALOG, that can be used for clearing space and expanding system catalogs. It operates similar to COMPRESS.CATALOG function in DPPX.
- A new command, ANALYZE.SPACE, that analyzes the space available in your system catalogs and tells you how much additional space is required.
- A new command, IPL.DISKETTE, which allows a central site operator to perform an IPL of the diskette created by REDEFINE.CATALOG at a distributed site.
- CLISTS are provided which delete obsolete material on the System Residence file.

DESCRIPTION OF DPPX/SP COMPONENTS

BASE -- Based on DPPX/BASE (5760-010): The base component of DPPX/SP provides a variety of functions to communicate with S/370, 303X, 4300, other 8100 systems and terminals. The base component provides multi-programming, multi-user and multi-level system support for concurrent application environments. Interactive, batch, and plant floor applications are supported.

Refer to 5760-010 for a detailed description of the functions provided. In addition to the functions described for 5760-010, the base component of DPPX/SP provides the following.

Highlights of the Base Component of DPPX/SP

- New and Enhanced function
 - Support for the new 8130 mdls B23 and B24
 - Connectivity with special subsystems
 - Printer sharing enhancements
 - New device support
- Improved performance
 - DASD Cache
 - Self-tuning buffers
 - Save/Restore IPL
 - RJE larger maximum RU (request unit) size
 - I/O reductions for loading application programs and maps
 - User library improvements
 - Programmed Communications feature (high performance bisynchronous communications)
 - HDT (Host Data Transfer) larger maximum RU size
- Enhanced Network/System Management Support
 - Link Problem Determination Application (LPDA)
 - System trace enhancements
 - Formatted Dump
 - Error Recovery Management enhancements
 - Clear Error Log capability
 - Enhanced Problem Determination Application naming capability
 - Error Log Summary and Archive (ELSA) enhancements

Description

- Support for new 8130 mdls B23 and B24
DPPX/SP supports the new 8130 mdls B23 and B24. These new models employ state-of-the-art technology and provide a new 32-bit processing element. The 8130 mdls B23 and B24 will achieve up to 50% more interactive throughput over 8130 for equivalent response times. The new models will provide up to two megabytes of real memory with eight megabytes of logical address space.
The 8130 mdls B23 and B24 are also supported on DPPX/BASE FEP6.
- Connectivity with special subsystems
DPCX-DPPX/SP Interconnect Extensions
- DPCX device access to DPPX/SP
The DPCX-DPPX/SP interconnect facilities are extended with support of DPCX device access to DPPX/SP. Most 3270-compatible devices that are supported by both DPPX/SP and DPCX can be attached to DPCX and have access to all DPPX/SP

DPPX/SP R1 (cont'd)

functional capabilities. This includes support for other intelligent workstations attached to DPCX, including the Displaywriter and Personal Computer via their emulation functions. The DPCX system appears as a 3274 Control Unit to the DPPX/SP system; the DPPX system appears as a host to the DPCX system.

With this capability, devices attached to DPCX can, via the DPCX data stream compatibility function, access any application in a DPPX/SP system. This includes DTMS, ICF and DSC (to function as a 3270 device on a S/370, 30XX, or 4300 host system).

DPCX attached printers can be used as local copy devices for DPCX attached displays that are logged on to either DPPX/SP or DPCX applications. Printers attached to DPPX/SP cannot be used for local copy by DPCX attached displays.

The following DPCX attached devices are supported:

Attachment	Device
SDLC Loop	3104 Display
	8775 Display
	3262 Printer
	3268 Printer
	3287 Printer
SDLC Loop or DLA (3274/3276)	3178 Display
	3278 Display
	3279 Display
	3290 Display
	3262 Printer
	3268 Printer
	3287 Printer
	3289 Printer
SDLC DLA	6580 Displaywriter
	5150 Personal Computer
	8775 Display
SDLC Loop or DLA (7426 TIU)	5150 Personal Computer 3101 Display

DPCX attaches directly or through a nonswitched line to an SDLC adapter on the DPPX/SP system. Communications speeds up to 56K bps between DPCX and DPPX/SP are supported. The number of DPCX attached devices that can be supported in this environment is limited only by performance considerations and DPCX active task and configuration restrictions.

It is now possible for both a DPCX system and DPPX/SP system to have access to all the functional capabilities in the other system. This is done by having two communication links between the two systems, with each system defined as a host to the other.

A prompt facility is provided in DPPX/SP for DPCX users who log on to the DTMS or Command Facility functions of DPPX/SP.

DPPX/SP-DPCX Application-to-Application Support

When DPPX/SP is defined as a host to an attached DPCX system, transfer of records, programs, messages and documents can take place in both directions on the same communication link between the two systems. Using the SNA LU Type 0 protocol, applications can perform this function in either of the following ways:

- 1.A DPPX/SP application with Resource Independent Interface (RII) and a Type 2 host communication application in DPCX.
- 2.A DPPX/SP application with an RII interface that conforms to the Document Transmission Facility (DTF) interface in DPCX, and a Type 2 host communication application in DPCX.

DPPX/SP-8775-IDTF Local Copy Support

A DPPX/SP attached 8775 with the Interactive Display Text Facility (IDTF) license program loaded, can now perform local copy operations when accessing DPPX/SP applications, or when accessing the non-text functions of DPCX. The original announcement of DPPX/8775-IDTF to DPCX/DOSF listed the local copy function as a restriction.

Displaywriter Attached Printer Support: Support is provided for 3287 Printer emulation for printwheel printers attached to Displaywriters with 3270 Data Stream Compatibility licensed program (5608-SR6). This support augments the previously announced DPPX support of the 3278 Display emulation of Displaywriter through this same program. Through the Displaywriter, the Displaywriter printwheel printer emulates the operation of, and appears to DPPX/SP, as a communication port attached 3274 Control Unit supporting a 3287 mdl 1 or 2 printer.

This support is also available with DPPX/BASE FEP6.

Support for this capability requires the Displaywriter 3270 Data Stream Compatibility licensed program (5608-SR6) and a 5218-A01, A02 or 5228-A12 Printer.

- Printer Sharing Enhancements

- Previously, all printers used by Printer Sharing were controlled by the System Operator. With DPPX/SP, each printer used by Printer Sharing can be controlled independently by a separate operator, or each operator can control more than one printer, as specified by system setup. Printer Sharing messages necessary for control of the printers are sent to the operator defined as controlling that printer.

- Jobs can be submitted to a particular print queue, and a printer can be started using a particular print queue. Two or more printers may share the same print queue, with each printer servicing different print classes or the same print classes of that queue. Up to 255 classes per print queue are supported. Additionally, the Display Printer Status command (DISPLAY.PSTATUS) has been enhanced to display more status information.

- Authorization capability is provided to protect printers and print queues from unauthorized operators.

- Printer Sharing will support up to 36 printers. Depending upon configuration and system workload, all printers may not print at rated speed.

- New Device Support

- 5210 Printer mdls E01, E02, G01, G02

The 5210 Printer is a bidirectional printwheel printer combining letter quality printing and paper handling flexibility in a single desktop unit. The mdls E01, E02 attach directly to the loop, the mdls G01, G02 attach to the 3274 Control Unit and 3276 Control Unit. On data link attached loops, the 5210 mdls E01 and E02 will operate only at 9600 bps.

The DPPX/SP support for this printer is the same as that currently provided for the 3287 and 3268 printers operating under SNA LU Type 3 (3270 data stream) and LU Type 1 (SCS data stream) protocols.

5210 mdls E01 and E02 feature #9001 for attachment to the 8100 will be available in January, 1984.

The 5210 mdls E01 and E02 must be at EC Level 996869 or higher in order to assure correct operation with DPPX/SP.

- 3290 Information Panel *

Support is provided for the Information Panel Display Station, a new member of the 3270 Information Display System. The 3290 utilizes a flat plasma panel as its display medium to provide a large capacity display of alphanumeric data and graphic images. It attaches to the 8100 via the 3274 mdl 61C Control Unit.

The 3290 is data stream compatible with all models of the 3270 Displays in alphanumeric application environments, and also provides new functions. Highlights of the new functions supported by DPPX/SP include:

- Concurrent multiple screen-capability: The viewing area can be configured to display up to four 3278 mdl 2 screens, two 3278 mdls 3, 4, or 5 screens, a full page of computer output in printer format (62 rows x 132 columns), two horizontal screens of up to 31 rows x 160 columns or two vertical screens of up to 62 rows x 80 columns.

- Multiple screen-copy capability: One or more screens are interactive and the remaining configured screens can be used for copying of the interactive screen(s).

- Multiple interactive screens: The user may logon to one application, multiple applications, or multiple systems. Each configured screen acts like a separate display station (referred to as a logical terminal). Up to four logical terminals may be operable simultaneously in one physical 3290 terminal.

- Multiple partitions: A screen can be divided into up to 16 separately managed partitions via application program control with vertical scrolling capability in the 3290 Display Station.

The 3290 also provides the DPPX/SP user with new screen management capabilities. These include:

- Control of 3290 Information Panel's screen configuration from the keyboard.

- Coexistence of multiple copy screens with multiple interactive screens.

- A horizontal rule line provided to assist in eye positioning and location of the displayed data.

- A Zoom capability provided to enlarge the character size of either a partition or a displayed screen to proportionally occupy the full viewing area.

3178 Display Station: Support is provided for the 3178 Display Station, a new, lower priced member of the 3270 Information Display System. It is a compact, lightweight display station with a

PROGRAM PRODUCTS

DPPX/SP R1 (cont'd)

1,920-character 12-inch CRT, a low profile keyboard, and significant human factors enhancements.

The 3178 attaches to the 8100 via the 3274 Control Unit, or via the 3276 Control Unit Display and provides functions equivalent to the base functions of the 3278 mdl 2.

- 3274-41C Control Unit *

Support is provided for the new 3274-41C Control Unit. This new control unit provides increased functional capability by including 192K control storage, double-sided diskette capability and a full complement of terminal ports at a lower price than the currently supported 3274-31C configured with similar capabilities. The 3274-41C supports up to 32 attached devices and can be connected to the 8100 system via a data link.

- 3274-61C Control Unit *

Support is provided for the new 3274-61C Control Unit. This new control unit provides increased functional capability by including 192K control storage, double-sided diskette capability, and a full complement of terminal ports at a lower price than the currently supported 3274-51C configured with similar capabilities. The 3274-61C supports up to 16 attached devices and can be connected to the 8100 system through a directly-attached loop, a data link-attached loop or a data link.

- Entry Assist Capability on 3274 Control Units *

Support is provided for the entry assist capability on the 3274 for 3178, 3278, and 3279 Displays attached via the 3274 Control Unit. The entry assist for 3274, operating in concert with the DPPX/SP editor program, provides capabilities that facilitate operator entry and editing of textual material such as letters, memos, reports, source programs, and other text documents. These capabilities can provide improved operator convenience and productivity for text-related tasks.

- 3270 Personal Computer Attachment *

Support is provided for the 3270 Personal Computer attachment for the 3278 Display Station. This capability enables the IBM Personal Computer, 5150, to be attached to the 3278 Display Station. The display stations and the associated keyboard become common to both the Host processor and to the IBM Personal Computer, thus expanding the use of the display station and the applications available at the display station.

* Note: These devices are also supported on DPPX/BASE FEP6 with the following limitation:

- The 3290 Information Panel support is through DPS Version 2 and is equivalent to that provided for the 3278 and the 8775. The new capabilities of the 3290 are not supported on FEP6.

• Host Transaction Facility (HTF) enhancements

- An option is provided that allows a user to bypass the scheduling of a Host Request Complete transaction when there are no errors or reply messages. This capability provides for savings in system resource utilization by allowing for suppression of unnecessary transactions.

- An option is provided that allows Host Request Complete transactions to be run on a session different from the one that initiated the transmission to the host.

IMPROVED PERFORMANCE

• DASD Cache

The DASD Cache function can add to the performance improvement of DPPX/SP over DPPX/BASE FEP6. DASD Cache is designed to reduce physical disk I/O activity by keeping frequently used disk blocks in the main memory buffer. The performance improvement depends upon three key factors:

- Application Dependent Factors

The actual reduction in physical disk I/Os depends upon the application type, data set type, and the data set's access pattern. Depending on these factors, a 20% - 80% reduction in disk I/Os can be achieved with DASD Cache.

- Available Real Storage

Additional real storage is required in order to use the DASD Cache function. The amount of real storage required depends upon the application. Simulation and measurement have shown that 64K to 512K bytes of storage is generally required to achieve significant reduction (20% - 80%) in physical disk I/Os.

- Available Processing Power

Although DASD Cache can significantly reduce disk I/Os, an application may not experience significant response time or throughput improvement if it is relatively CPU or communication bound.

DASD Cache is expected to provide performance improvement for 8140C users.

DASD Cache may provide users of the 8130 mdls B23 and B24 with a performance improvement if the application is not CPU bound.

DASD Cache may not provide 8130A and 8140B users with significant performance improvement due to real storage and processing power limitations.

• Self-Tuning Buffers

DPPX/SP is able to dynamically adjust the levels of its buffer pools in response to changing demands on the system. DPPX/SP will expand and contract the number of buffer pools to achieve optimum performance while avoiding retention of excessive amounts of storage. Users will not need to monitor and adjust the number of buffer pools based upon system activity. This will be performed automatically.

• Save/Restore IPL

This capability provides improvement in the time it takes to restart DPPX/SP (i.e., IPL, activate auto logged terminals, environments, TSEs, etc.). DPPX/SP uses a saved image of the system to re-IPL DPPX/SP, consequently requiring less initialization time.

For example, 8140B DPPX/SP SAVE/RESTORE IPL time for a specific test configuration of 30 DTMS terminals (all autologged), 5 data bases, and 4 TSEs, is 3 minutes. This is less than half the time of a DPPX/BASE FEP6 system which required 8 minutes of IPL time.

Since the IPL time depends upon configuration, number of data bases and other variations, etc., the actual IPL time will not be the same for every system.

• RJE Larger Maximum RU Size

The maximum request unit (RU) size for the RJE component is increased from 512 bytes to a maximum of 3,840 bytes in order to provide improved throughput.

• I/O Reductions Loading Application Programs and Maps

DPPX/SP reduces the number of disk accesses required to load application programs and maps. DPPX/SP will typically reduce program load requirements from three to two I/Os compared with DPPX/BASE. Heavy program fetch environments will experience improved response times.

• User Library Improvements

Users may now have duplicate names in the user library and system library. Performance of user libraries is improved by maintaining information in main storage for each userlib module location on disk. This performance improvement will enhance the use of user libraries in an application development and production environment.

• Programmed Communications Feature (bisynchronous communications)

DPPX/SP supports the Programmed Communications feature. Use of the PCF instead of the current BSC Communications Adapter will reduce processor utilization for bisynchronous operation. This reduction depends upon the data rate to the processor. The reduction is more significant if the data rate is higher.

Using the Programmed Communications feature, bisynchronous communication is now supported in the 8140 mdl C processor in dual mode as well as single mode.

• HDT Larger Maximum RU size

The maximum request unit (RU) size for the DPPX/SP Host Data Transfer (HDT) component is increased from 4,096 bytes to 32,768 bytes. This capability, with DSX Version 2 Release 2, will provide improved throughput performance. This improvement is particularly significant for transmissions utilizing satellite communications links.

IMPROVED NETWORK/SYSTEM MANAGEMENT SUPPORT

• Link Problem Determination Application (LPDA)

LPDA, as part of DPPX/SP, will offer those customers who have installed 3863, 3864, and 3865 Modems, the ability to obtain problem determination information from their downstream data link networks. This information will be collected from the modems by an SDLC LPDA request and an SDLC LPDA response containing problem determination data regarding local-remote modem status, modem conditions, and data link status.

Data is collected both on reaching a traffic threshold and by DPPX/SP error recovery routines. The data is placed in the DPPX/SP error log. The user can access this data using the LPDA option of the Display.Error Log command and can initiate additional LPDA tests as desired.

DPPX/SP R1 (cont'd)

These facilities are available both at the 8100 System and at the central site host through use of the Host Command Facility.

Note: 8100 units installed prior to September 1983 require the customer to contact the local Field Engineering Branch Office to set up the adapter external test line which is required before invoking the LPDA function.

• **System Trace Enhancements**

- Trace performance is improved by tracing certain events (Dispatch and Service Request) logically inline in the system dispatcher.

- System trace now provides the ability to specify which call types will be traced for events 1 and 2 (Dispatch and Service Request). Fewer trace entries will be built, recorded, and spooled. The user of system trace will be able to build a trace table with fewer unwanted entries, making the desired data easier to find.

- System trace has been expanded to include the DTMS and Router components of DPPX/SP, as well as additional communications line trace capabilities.

• **Formatted Dump**

- A new DISPLAY.DUMP subcommand (FORMAT) has been provided in DPPX/SP to enable a customer, working with the support center, in problem source identification mode, to dump selected control block information as formatted output. This capability will enhance DPPX/SP serviceability by eliminating a significant amount of hexadecimal dump reading.

• **Error Recovery Management (ERM) Enhancements**

ERM dump output will be improved by formatting existing information in a more usable fashion, and by dumping additional information. Formatting of PSV, register and control block information will be done similar to that provided by DISPLAY.ERRORLOG.

• **Clear Error Log Capability**

A Clear Error Log function will improve the problem determination characteristics of DPPX/SP by enabling users to reset the DPPX/SP Error Log.

• **Enhanced Problem Determination Application Naming Capability**

The Problem Determination Application component is enhanced to allow the specification of an eight-byte node identifier (currently limited to four bytes). This will enable a DPPX/SP user to name the 8100 resource more meaningfully for identification in an ALERT. Users who want to utilize an existing identifier (typically, link name) that is already understood at the host to represent a particular 8100 node in the network can now do so. This function will improve the NPDA operator's capability to recognize a particular failing 8100 node and thus enable the operator to enter problem determination mode more rapidly.

• **Error Log Summary and Archive (ELSA) Enhancements**

The SUMMARIZE.ERRORLOG command has been improved to assist DPPX/SP 8100 users in more effectively diagnosing error conditions. The command has been rewritten to take less storage, run faster and provide error reports which are easier to read.

Command Facility Extensions: Based on Command Facility Extensions (CFE) Feature - Level 2 of DPPX/BASE (5760-010)

This component provides services for logic control, accessing and displaying pre-defined menu, data entry, and tutorial panels of the Interactive Productivity Facility component. It invokes DPPX/SP commands and programs based on the logic of IPF scripts. It manages the retrieval, modification and display of internal IPF tables.

Refer to PP 5760-010 for a more detailed description.

Interactive Productivity Facility: Based on DPPX Interactive Productivity Facility (5660-271)

This component provides a simplified full screen interface to the facilities of DPPX/SP. It consists of a series of panels, dialog scripts and programs whose execution sequence is controlled by the Command Facilities Extension component. Functions requiring specific command sequences and coordination of parameters are supplied by the dialog scripts. The user, interfacing with a full screen panel, selects the functions to be performed. The dialog script issues the necessary DPPX/SP commands to complete the requested function.

Refer to PP 5660-271 for a more detailed description of the functions provided. In addition to the functions described in PP 5660-271, the Interactive Productivity Facility component of DPPX/SP provides the following.

• **Menu-Driven System Functions**

The IPF component of DPPX/SP is used for most everyday tasks for the DPPX/SP user. Step-by-step interactive guidance through a menu hierarchy is provided for common system function. This interface is organized so that the steps necessary to accomplish a task are logically grouped together.

- The IPF panel interface to catalog and data set services has been expanded and restructured.

- New IPF services (for example, Router Definition and Printer Sharing) are also available.

• **Menu-Driven Hardware Definition, Activation and Testing**

DPPX/SP provides simplified hardware (terminals, disks, tapes, etc.) definition for most device types attachable to the 8100. This support is through an IPF menu-driven interface. This support can be used only after an initial IPL to customize the system. At a later time this support can be used to reconfigure the system. The tasks supported are:

- **Definition**

Definition is simplified in these ways:

- A full screen interface is implemented to do definition.
- The number of SNA terms necessary to define devices has been reduced.
- Many SNA logical devices are defined automatically.

- **Activation**

The definition process automatically updates appropriate activation CLISTS so that the device will be activated automatically at IPL.

- **Testing**

A verify process may be invoked optionally for each terminal device defined. This will provide assurance immediately after definition that the terminal was defined properly. If the verify process fails, there are additional IPF panels provided to assist problem determination.

Data Stream Compatibility: Based on DPPX Data Stream Compatibility (DPPX/DSC, 5760-RC1)

This component allows certain keyboard displays, printers and selected controllers and communications systems attached to the 8100 system with DPPX/SP to communicate with S/370, 303X, 4300 hosts as though they were directly attached by data link to the host processor.

Refer to PP 5760-RC1 for a more detailed description of function provided and devices supported. In addition to the function described in PP 5760-RC1, the Data Stream Compatibility component of DPPX/SP includes support for devices attached via the new programmed communications adapter.

Data Base and Transaction Management: Based on DPPX Data Base and Transaction Management System (DPPX/DTMS, 5760-TD1)

This component is the data management and transaction management system that provides ease-of-use facilities for DPPX/SP application programmers and system programmers in the online transaction-oriented environment. The facilities provided by this component are designed to enable the programmers to concentrate on application program development rather than on data and transaction management.

Refer to PP 5760-TD1 for a more detailed description of functions provided. In addition to those functions described in PP 5760-TD1, the DTMS component of DPPX/SP provides the following:

• **The DTMS component of DPPX/SP provides 8100 users with the following additional functional improvements over the current DPPX DTMS licensed product:**

- **Session Control** - Users are provided with the capability to control certain session parameters which are determined at logon time and previously could not be altered. This includes the capability to execute a final transaction before session termination.

- **Trace** - Users are provided with the capability to trace logic flows of the DTMS component, thus enhancing the problem determination facility of the system.

- **Non-indexed data base support** - The DTMS component provides full data base support for relative sequential data sets (non-indexed) processed in direct mode.

- **Final Program Name (FPN) Support** - A routine may be provided by the user to take control when a DTMS user exits the system. The FPN routine is similar to the DTMS Initial Program Name (IPN) routine (which may be invoked between transactions), except that the FPN is invoked at logoff and cannot access a terminal. FPN may be used to release storage, resources and disconnect data sets prior to the completion of the logoff.

DPPX/SP R1 (cont'd)

- Logon With Prompts - When a DPCX terminal user attempts to logon, the system will prompt for the ID (and a password, if used).

Sort/Merge: Based on DPPX Sort/Merge (5760-SM1)

This component provides a sort capability for DPPX/SP which provides users with facilities for extracting data from their data sets and sequencing it. It is designed to address the user's needs not only for straightforward sorting and merging of records of a single type, but also for related tasks such as selecting certain records from one or more files and handling multiple record types as well as ordering according to user-specified collating sequences.

Refer to PP 5760-SM1 for a more detailed description of the function provided.

COBOL Runtime Library: Based on DPPX COBOL Runtime Library (5760-LB1)

COBOL is a high-level programming language suited to developing application programs. It is especially efficient for coding programs that manipulate files of formatted data.

The runtime library component provides certain subroutines that provide services at execution time to run a COBOL application.

Refer to PP 5760-LB1 for a more detailed description of functions provided.

Programmed Operator Facility: Based on DPPX Programmed Operator Facility (5660-273)

This component provides the ability to service messages directed to the system operator with programmed responses. It is designed to reduce the skills and effort required to operate an 8100 system with DPPX/SP, especially at a remote site.

Refer to PP 5660-273 for a more detailed description of function provided.

Problem Determination Application: Based on DPPX Problem Determination Application (DPPX/PDA, 5660-272)

This component supports central network management of 8100 systems. It interfaces with the DPPX/SP error log, analyzing errors that have occurred, and notifies the host NPDA V2, which in turn will notify the central network operator who can take the appropriate action.

Refer to PP 5660-272 for a more detailed description of functions provided. In addition to the function described in PP 5660-272, the PDA component of DPPX/SP provides the following:

- The specification of an 8-byte node identifier. This will enable a DPPX/SP user to more meaningfully name the 8100 resource for identification in an ALERT. Users who want to utilize an existing identifier that is already understood at the host to represent a particular 8100 node in the network can now do so. This function will improve an NPDA operator's capability to recognize a particular failing 8100 node and thus enable the operator to more rapidly enter problem determination mode.

Remote Job Entry: Based on DPPX Remote Job Entry (DPPX/RJE, 5760-XC1)

This component permits the 8100 Information System executing with DPPX/SP to function as an SNA or BSC remote job entry workstation for submitting jobs to a host S/370, 303X or 4300 processor with an OS/VS, DOS/VSE, or VM/370 operating system and a job entry subsystem installed.

Refer to PP 5760-XC1 for a detailed description of the functions provided. In addition to the functions described in PP 5760-XC1, the RJE component of DPPX/SP provides the following:

- A workstation can function independently of a logged-on RJE operator, thereby fully supporting unattended workstation operation. New commands are provided to acquire or relinquish the role of operator of a workstation.
- The maximum request unit (RU) size for the RJE component is increased from 512 bytes to a maximum of 3,840 bytes.
- Support is provided for the new programmed communications adapter.

Format Management: Based on DPPX Distributed Presentation Services Format Management Version 2 (DPPX/DPS V2 FM, 5660-264)

This component provides the application runtime support for interaction with input/output devices. The basic mapping function of Format Management, using maps created by the DPPX/SP Interactive Map Definition licensed program (DPPX/SP IMD) allows the application to send and receive data in a device-independent manner.

Refer to PP 5660-264 for a more detailed description of the functions provided. In addition to the functions provided in PP 5660-264, the Format Management component of DPPX/SP provides the following:

- Execution Debug Monitor Improvements

A specified printer or display connection may be debugged on a display, including monitoring of exits, while output to the device is unaffected by the monitor.

- Device Size Independence

The rules for matching the map definition and runtime device sizes have been relaxed. Format Management will adjust the presentation area size of a mapgroup to that of the runtime display device.

- Stored Logical Messages

Format Management will optionally retain in storage the data structure from each output request. This information may be used to provide, on user option, the facility to:

- Merge inbound data, returning a complete data structure to the application, not just the modified field.

- Give full page out-of-paper recovery for non-batch printers.

- Enable automatic recovery from use of the clear key.

- Improved Magnetic Stripe Reader (MSR) Support

Special processing of MSR input to locate and map the MSR data as if it were normal input data.

- Auto-Logon for Keylocked Devices

Format Management will allow the DTMS component to proceed with auto-logon connections without hanging or excluding a terminal which has the security keylock turned off. When subsequently turned on, Format Management will complete the connection.

Router: The router is new to DPPX/SP. It provides the following functions.

- Display operators may communicate with multiple applications in different nodes in the network without extra logons and logoffs. Applications may reside in a local or remote DPPX/SP environment or in a host system. The Binary Synchronous Communications to Systems Network Architecture (BIAS) portion of Data Stream Compatibility (DSC) is not supported by the Router. When operating in full routing mode, the user's terminal must be a display with a screen size of at least 80 characters wide with a total screen size not greater than 4,096 characters (rows x columns).

The Router can also operate in a passthrough mode which is functionally equivalent to Data Stream Compatibility Co-Domain Pass-Through (DSC/CDP). When operating in this mode, the Router supports all of the devices supported by DSC/CDP. This support simplifies the user's installation and configuration requirements by eliminating the need for DSC/CDP when the Router function is used.

The Distributed Processing Connection Facility (DPCF) program offering (5798-DKX) provides a similar capability to the DPPX/SP Router function. DPCF is supported on DPPX/SP and operates in the same manner as on DPPX/BASE. Although DPCF and the Router can exist on the same DPPX/SP system, users will want to take advantage of the Router's enhancements which have been designed to increase operator ease and flexibility to access applications anywhere in the network.

- This support provides easy-to-use menu driven operator interface for switching between applications.
- Extended recovery from application session outage is provided.
- The Router supports autolog on/off for both display and non-display devices.

CUSTOMER RESPONSIBILITIES

To successfully install and use DPPX/SP, the customer must:

Attend education courses as necessary ... Acquire a knowledge of the functions documented in DPPX/SP customer publications ... Understand the management and control of the design, installation and control of DPPX/SP as described in *DPPX/SP Administration* ... Install DPPX/SP on an 8100 System ... Become familiar with the operating procedures as described in *DPPX/SP Operation* ... Design and implement user applications ... Carry out approved problem determination procedures before contacting IBM for program service ... Install service-level updates and fixes as appropriate.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This licensed program is designed to operate on an IBM 8130 or 8140 Processor with a minimum of 512K bytes of processor storage, a diskette drive, and at least 58MB of disk storage capacity.

- Terminal requirements are one IBM 3104, one IBM 3276 or one IBM 8775 Display Terminal, or an IBM 3274 Control Unit with an attached Display Station connected via a directly-attached loop or

PROGRAM PRODUCTS

DPPX/SP R1 (cont'd)

a directly-attached IBM 3277.

- Users who implement DPPX/SP utilizing the same functional capabilities as DPPX/BASE FEP6 require a minimum processor storage of 512K for production configurations.
- Users who implement some of the new functional improvements of DPPX/SP such as the Router, DASD Cache, HDT larger RU size, etc., will require a minimum processor storage of 768K for production configurations.

SOFTWARE REQUIREMENTS

DPPX/SP is a self-contained executable system. For application development, users are required to separately order the desired programming language capability. The following licensed programs are supported by DPPX/SP:

Application Programming Languages and Tools

DMS/DPPX (only with DPS V1 IMD or DPS V2 IMD)	5760-XC2
DMS/DPPX Execution Facility	5660-265
DPPX COBOL Compiler	5760-CB1
DPPX FORTRAN Compiler	5760-FO1
DPPX FORTRAN Library	5760-LM1
DPPX PL/I Compiler	5760-PL1
DPPX PL/I Library	5760-LM2
DPPX Assembler	5760-AS1
DPPX APL	5760-XR2

Application Support

DCMS/DPPX	5760-XR6
DPPX/SP IMD	5660-282
DPPX GEN 3644	5760-ED1
DPPX PT	5760-XR5
DPPX/PS3640	5660-267
DPS Version 1 IMD Feature (for migration purposes only)	5760-XR1
DPS Version 2 IMD Feature (for migration purposes only)	5660-264

Network Management

(The following program products run in a S/370, 30XX, or 4300 host):

Distributed Systems Executive (DSX) Version 1.2.2	5748-XXG
Distributed Systems Executive (DSX) Version 2	5668-986
Host Command Facility (HCF) Version 1	5735-XR1
Host Command Facility (HCF) Version 2	5668-985

The following PRPQs, FDPs, IUPs and IFPs are supported on DPPX/SP:

PRPQs

SDLC Auto-Answer	5799-BDE
3277 Graphics Attachment	5799-BAQ

FDPs, IUPs, IFPs

COBOL Appl X-Reference (FDP)	5798-DDJ
COBOL Appl Integrity Monitor (FDP)	5798-DGZ

COPICS Plant Monitor (FDP)	5798-DFT
Data Compression - Host (FDP)	5798-DJL
Data Compression - Controller (FDP)	5798-DJN
Distributed Document Formatting Facility (IFP)	5785-RAA
Distributed Plant Maintenance (FDP)	5787-GAA
Distributed Processing Connection Facility (FDP)	5798-DKX
DMS Management Aid (FDP)	5798-DHH
DTMS Segmented Access Method (IUP)	5796-DCG
DTMS Transaction Simulation (FDP)	5798-DDP
Extended Debug Facility (FDP)	5785-ECA
File Print Utility (FDP)	5798-DGG
Interactive Data Base Transaction Program (IUP)	5796-PNR
Interactive Processing of Data and Text (IFP)	5785-DDK
Mortgage Banking System (FDP)	5798-DDN
Order Entry Using DMS (FDP)	5798-DEZ
Pattern Letter Generator (FDP)	5798-DHP
Payroll Management System (FDP)	5798-DDD
Peer Data Transfer (FDP)	5798-DWJ
Power Plant Maintenance (FDP)	5798-DED
Retail Merchandise Ticketing (IUP)	5796-BCA
Spoiled Output Transcription Program (FDP)	5798-DHW
Virtual Terminal Access Facility (FDP)	5798-DFF
3640 Device Support Programs (FDP)	5798-DEJ
3640 Data Collection/Lot Tracking (FDP)	5798-DFG
3640 Shop Floor Control (IUP)	5796-BBR

COMPATIBILITY

Upward compatibility for the earlier licensed programs now contained in DPPX/SP is maintained. Printer Sharing and RJE operator responses have been changed. Users of the Programmed Operator Facility may be

required to make changes to their message action files. This will be documented in the Informal Documentation which accompanies the DPPX/SP shipment and also in other publications.

Users of the DPPX/Performance Tool must install the latest level which will be available at the time of the first shipment of DPPX/SP. Usability changes have been made in this new service level in the print and monitor files. Customers with programs that access these files may have to make modifications to their programs.

MIGRATION AND PLANNING

To assist customers in migrating to DPPX/SP, these functions or performance improvement items are provided.

- Improved Service Level Update (SLU) Processing Time

DPPX/SP can be installed as a Service Level Update (SLU). SLU performance has been improved significantly. The amount of time to install one diskette will change from 25 minutes to approximately 3 minutes.

- Migration Aid Feature

The Migration Aid feature is a set of routines and programs which assist in migrating to DPPX/SP. The Migration Aid contains the following new commands:

- ANALYZE.SPACE Command

When the ANALYZE.SPACE command is invoked, it will analyze the current amount of space available in the system catalogs and the amount of space required by DPPX/SP. It will present, via a full screen interface, the results of that analysis, identifying the catalogs that need expansion.

- REDEFINE.CATALOG Command

This new command allows DPPX/SP to change the characteristics of an existing catalog. The catalog may be increased or decreased in size, or the number of data sets it can potentially contain can be changed. The input for changing a catalog is specified interactively while DPPX is running. When the actual redefinition of the catalog takes place, it is necessary to IPL a stand-alone utility that has been created on a diskette. If the IPL.DISKETTE command was used to invoke the standalone utility, DPPX will automatically be IPLed and restored to an operational state when the stand-alone utility is complete.

- IPL.DISKETTE Command

This new command requests DPPX to IPL the diskette prepared by the Redefine Catalog process. The terminal operation requesting the IPL could be connected via the Host Command Facility (HCF) from a central site.

- DPPX/SP Distribution via DSX

For DPPX/SP customers who have an existing DPPX network and wish to install DPPX/SP at their remote sites, an alternative to a Service Level Update installation is available. DPPX/SP supports a network installation option which is similar in nature to the Remote Service Distribution Option (RSDO), a DPPX network maintenance procedure.

The network installation option approach uses the Distributed Systems Executive (DSX) to perform network installation of DPPX/SP. It includes the retrieving from the DPPX/SP base license site and sending to the remote sites, the necessary DPPX/SP data sets to upgrade a DPPX remote site (at a prerequisite service level, FEP6) to DPPX/SP.

Planning information for existing DPPX users will be available in the publication, *DPPX/SP Migration Guide*, (GC23-0601).

SYSTEM INTEGRITY

The system integrity features of the earlier licensed programs now contained in DPPX/SP are unchanged.

DATA SECURITY, AUDITABILITY AND CONTROL

The data security, auditability, and control features of earlier licensed programs that run under DPPX/SP are unchanged. User management is responsible for the selection, implementation, and adequacy of these security features.

PERFORMANCE

Generally, DPPX/SP with storage available to accommodate additional functions, will run with performance equivalent to DPPX/BASE FEP6. However, some systems will experience improved performance with DPPX/SP due to DASD Cache, Save/Restore IPL, self-tuning buffers, dynamic resident program fetches disk I/O reduction, user library improvements, and increased RJE and DSX/HDT maximum RU size.

The performance impact of using the Router depends upon the message rate from the terminals configured to use the router and the size of the message. If the message rate is 1,800 messages-per-hour and the inbound/outbound message size is less than one RU (Request Unit), each, then the 8140B Processor utilization is increased by 4%

PROGRAM PRODUCTS

DPPX/SP R1 (cont'd)

absolute. The impact on user's response time due to the increase in processor utilization depends upon the user's application and the total processor utilization.

When the router is used instead of Co Domain Passthrough (CDP) for host sessions, performance is equivalent to CDP.

In general, the 8130 mdls B23 and B24 will achieve up to 50% more interactive throughput over 8130 A models for equivalent response times. For an 8130 application which is CPU and storage constrained, the 8130 mdls B23 and B24 may provide more than a 50% throughput improvement if the application can take advantage of additional storage (e.g., DASD Cache.)

Real Storage Requirements

- Migration to DPPX/SP from DPPX/BASE FEP6 with DTMS FEP1, and DPS 2.1 results in an additional 20K bytes.
- In cases where more storage than necessary was allocated in DPPX/ BASE FEP6 and earlier releases buffer pools, the self-tuning buffer pool feature of DPPX/SP may result in a reduction in processor storage utilization.
- Optionally, up to one-fourth of real storage on any 8100 Processor can be allocated for the DASD Cache function. With allocation of additional storage, DASD Cache may provide additional throughput.
- The following product storage requirements are in addition to 20K-byte base storage increases.
 - Installation of a Programmed Communications feature replacing all existing BSC Communications Adapters will not require more real storage. Addition of a Programmed Communications feature to a system that did not contain any BSC Communications Adapters will require 14.5K bytes more real storage plus the real storage to support the user's applications.
 - User library performance improvement requires 20 bytes of real storage for each module in an active user library. This additional storage is required only if the facility is utilized.
 - 40K bytes of additional storage may be required for systems which previously had DPPX/DPS FM modules non-resident.
 - The host communication performance improvements for RJE and HDT require the following increase in storage: For host to 8100, the increase is [(2 X Pacing) - 1] X RU size increase; For 8100 to host the increase is 2 X Pacing X RU size increase.
- The basic storage requirements for the Router, if utilized, are as follows:
 - 8K bytes of fixed storage
 - 3.5K bytes of storage for every user of the router with two sessions, e.g., DTMS and Host.
 - 1.0K bytes of storage per user for every additional session above two sessions.
 - If the user saves the screen for a suspended session, then enough storage for the terminal screen size (i.e., 1,920, 2,560, etc.) for each suspended session is required. This is in addition to the basic router storage requirements.

Disk Storage Requirements: DPPX/SP system catalogs require 30 megabytes on a system residence volume. An additional 12 megabytes of catalog space has been preallocated for customer usage.

INSTALLATION

DPPX/SP will be shipped in two forms: Dump/restore tapes and SYSRES initialization diskettes. The dump/restore tapes are intended for new users with tape drives. The contents of the tape will completely overlay whatever is on the disk.

The SYSRES initialization diskettes provide two installation modes:

1. A complete disk initialization process for new DPPX/SP users. If this mode is selected, any data existing on the disk will be overlaid.
2. An update option for existing DPPX/BASE users. The selection of this mode will result in the replacement of IBM data on the disk as well as adding new IBM data. Customer programs and data sets will not be affected.

5660-281 - DPPX/SP R2
8100 INFORMATION SYSTEM
DISTRIBUTED PROCESSING PROGRAMMING EXECUTIVE
SYSTEM PRODUCT RELEASE 2

PURPOSE

DPPX/System Product (DPPX/SP) Release 2 provides significant functional enhancements which extend the previously announced DPPX/SP (now referred to as DPPX/SP Release 1) capabilities to ease the implementation and management of 8100 Information Systems in a distributed data processing (DDP) environment.

DPPX/SP Release 2 provides full support for the 8150 Processor as well as the current 8130 and 8140 Processors. DPPX/SP Release 2 also contains enhancements which provide better storage management facilities, higher availability capabilities and improved DXAM file management support.

Also provided is the capability to run DPPX/SP Release 1 on the new 8150 Processors, but without the full function of the 8150.

HIGHLIGHTS

Additional Hardware Support:

- Support of 8150 Systems:
 - Main storage support of up to 6MB real storage and 16MB logical storage, plus reduced mode operation of the 8150 mdl B. The 8150 mdl B is capable of being operated in several reduced modes, occurring either automatically as a result of a component failure during IPL, or as specified by the operator during an IPL. Reduced modes may occur with either Processing Control Element (PCE) running in single mode, with full memory or with half memory.
 - An optional Keys and Locks approach to storage management allows for a wider variety of user area sizes with access to storage areas via keys and locks. The Common Address Storage Section (CASS) is no longer duplicated throughout logical storage; only one copy exists when using the Keys and Locks option. Also, CASS can be from 148K bytes to 14M bytes in size in multiples of 32K bytes. In addition to less logical storage space used by CASS, this addressing structure provides the capability for more user areas and the potential for more separation of users.
 - Dual PCE (Processing Control Element) I/O Connection. I/O Devices, such as display terminals, printers, communications devices, may be attached to either PCE in the 8150 mdl B Processor. This support allows the customer to continue operations in the event of a single PCE failure. Following a failure, a re-IPL is required to run with one PCE.
- Devices attached through 8150 mdl B communications ports have paths to each PCE and are therefore available to either PCE. 8101 units can each be connected to both PCEs through the 8101 File/Tape Switch RPQ (mdls A20, A23, A25 only). Attached in this way, if a PCE fails, the switch will allow the 8101 to be automatically activated by the working PCE.
- This means that the customer, through proper configuration and use of the above mentioned switches, can potentially recover and use all I/O in the event of a single PCE failure. Customers who desire to restrict their use of I/O or memory in the event of a PCE or memory failure can use the new Alternate System Parameters capability. The Alternate System Parameters will be automatically used during IPLs that occur when the PCEs or memory have been reconfigured into a reduced mode of operation.
- Enhanced 5210 Printer Support:
 - Additional support for the 5210 Printer via Printer Sharing. Alternate sheet feed and data processing printwheel changes for varying typesets will now be supported on the 5210 mdls E1 and E2 (installed with EC 996869) quality printers via Printer Sharing.

Enhanced Functions:

- Multiple environments in batch mode. DPPX/SP Release 2 provides users with the option to run up to 16 environments in batch mode. Batch jobs are processed concurrently, thereby providing higher utilization of 8100 Processors and improved batch throughput. This support, combined with the faster 8150 Processor, provides the application developer with a powerful environment which can speed up application development efforts and get applications installed more quickly.
- Additionally, dialog support is provided to ease the setup and management of the multiple batch environments.
- Shadow File Facility. Provides a simple-to-use alternative to data base recreation for the protection of critical data from physical damage of loss due to hardware related causes. This facility gives the customer the ability to maintain an exact copy of a non-SYSRES disk volume on a separate disk enclosure. Each update to a volume (source) is automatically applied to the other volume

(shadow) as well. The optional use of the Shadow File facility is transparent to applications and licensed programs.

Should one disk fail, processing can automatically continue with the other disk. After repair of the failing device, a command is issued to resynchronize and process with both the source and the shadow volumes.

The Shadow File facility reduces the need for customers to maintain and dump backup and audit files or to recreate a data base when a problem occurs. Customers may also combine this facility with the 8101 Manual File/Tape Switch feature (RPQ 8K0958) to provide the capability to resume control of a disk device from another 8100 processor in the event of an unrecoverable processor failure. This will achieve higher availability and shorter recovery time from hardware failures.

The DXAM automatic index reorganization enhancement and the Shadow File facility will provide the ability for customers to approach continuous operation of 8100 Systems.

- Enhanced DXAM File Management. DPPX/SP Release 2 provides the 8100 user with improved system availability through DXAM index reorganization support. Release 2 will automatically perform a partial reorganization of DXAM indexes on 'out of space' conditions. Also, a command is provided to fully reorganize DXAM indexes. This enhancement represents a significant time saving over previous methods which required deactivation of files for reorganization.
- Also, the ability to access and update data is maintained during either reorganization process.
- Router Enhancements:
 - The Router of DPPX/SP Release 2 will now support the 6580 Displaywriter and 8815 Scanmaster in passthrough mode. These devices may now be connected to an 8100 System for pass-through only to a host system. The Displaywriter, connected in this way, may now utilize its full function, for example, Document Transfer. Since the Scanmaster transmits up to 256K bytes per image, consideration should be given to the resulting communications load before attaching the device.
 - Resolution of different Request Unit (RU) sizes. Previously, if an RU size specified from an application to the Router did not match the RU size specified from the Router to a terminal, the system administrator had to redefine the RU size parameters to match before processing could continue. DPPX/SP Release 2 will automatically resolve such differences in RU size so that intervention is not required.

Also, the binary synchronous communication to systems network architecture (BIAS) portion of data stream compatibility (DSC) is now supported by the Router component in DPPX/SP Release 2.

- Host Transaction Facility (HTF) Improvements:
 - Host Transaction Facility (HTF) Direct. This facility decreases the path length required to process a message to a host subsystem such as IMS or CICS. The facility uses fewer services of the data base and transaction management capability (including message error recovery services) of DPPX/SP. Therefore, for a single transmission request, it is faster than normal HTF processing.
- When using HTF Direct, application programs need not be designed with a separate Host Request Complete Transaction to process the host reply message. Also, a COMMIT is not required before transmitting information to a host transaction program. 8100 data base updates can be committed after the reply from the host is received.
- HTF Direct is used for synchronous, non-batch, non-recoverable messages to a host.
- HTF Display/Delete Messages. HTF messages, or input for host transactions, are submitted to the HTF Batch Message Data Set (BMDS) for periodic transmission to a host subsystem such as CICS or IMS. DPPX/SP Release 2 provides the user with the ability to display the messages in the BMDS and to selectively delete messages within the data set. This will allow customers to review and delete messages before they are sent to the host.
- Enhanced DPPX/SP LPDA (Link Problem Determination Aid) Function:
 - An alert to a host system will be generated from the 8100 when LPDA data is logged in the 8100 system error log. The alert can result from error solicitation by the 8100, error threshold exceeded, or error-to-traffic ratio exceeded.

Education Support: 8100 technical education for NAD and NMD is provided by the NAD Washington System Advanced Education Center. Customers should consult the latest customer education catalogs.

PROGRAM PRODUCTS

DPPX/SP R2 (cont'd)

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This licensed program is designed to operate on an IBM 8130, 8140, or 8150 Processor with a minimum of 768K bytes of processor storage, a diskette drive, and at least 58MB of disk storage capacity.

- Terminal requirements are one directly-attached IBM 3277 or one IBM 3104, 3276 or 8775 Display Terminal, or an IBM 3274 Control Unit with an attached Display Station connected via a directly-attached loop.

SOFTWARE REQUIREMENTS

DPPX/SP Release 2 is a self-contained executable system. For application development, users are required to separately order the desired programming language capability. The following licensed programs are supported by DPPX/SP Release 2:

Application Programming Languages and Tools

Cross SystemProduct/AD (only with DPPX/SP IMD, 5660-282)	5660-284
Cross System Product/AE	5660-285
DMS/DPPX Execution Facility (for migration purposes only)	5660-265
DMS/DPPX Development Facility (only with DPS/IMD Versions 1 and 2, for migration purposes only)	5760-XC2
DPPX COBOL Compiler	5760-CB1
DPPX FORTRAN Compiler	5760-FO1
DPPX FORTRAN Library	5760-LM1
DPPX PL/I Compiler	5760-PL1
DPPX PL/I Library	5760-LM2
DPPX Assembler	5760-AS1
DPPX APL	5760-XR2

Application Support

DCMS/DPPX	5760-XR6
DPPX/SP IMD	5660-282
DPPX GEN3644	5760-ED1
DPPX PT Version2	5660-286
DPPX/PS3640	5660-267
DPS Version 1 IMD Feature (for migration purposes only)	5760-XR1
DPS Version 2 IMD Feature (for migration purposes only)	5660-264

Network Management

(The following program products run in an S/370, 30XX, or 4300 host):

Distributed Systems Executive (DSX) Version 1	5748-XXG
Distributed Systems Executive (DSX) Version 2 Releases 1 and 2	5668-986
Host Command Facility (HCF) Version 1	5735-XR1
Host Command Facility (HCF) Version 2	5668-985

The following PRPQs and Program Offerings are supported on DPPX/SP:

PRPQs

Line Switching Attachment	5799-BBT
SDLC Auto-Answer	5799-BDE
X.21 Host Switched Short Hold Mode	5799-BBG

Program Offerings

COBOL Appl X-Reference	5798-DDJ
COBOL Appl Integrity Monitor	5798-DGZ
Communication Design Aid	5796-PNL
COPICS Host Interface	5798-DFR
COPICS Plant Monitor	5798-DFT
Data Compression - Host	5798-DJL
Data Compression - Controller	5798-DJN
Distributed Document Formatting Facility	5785-RAA
Distributed Plant Maintenance	5787-GAA
Distributed Processing Connection Facility	5798-DKX
DMS Management Aid	5798-DHH
DTMS Segmented Access Method	5796-DCG
DTMS Transaction Simulation	5798-DDP
Extended Debug Facility	5785-ECA
File Print Utility	5798-DGG
Interactive Data Base Transaction Program	5796-PNR
Interactive Processing of Data and Text	5785-DDK
Mortgage Banking System	5798-DDN
Order Entry Using DMS	5798-DEZ
Pattern Letter Generator	5798-DHP
Payroll Management System	5798-DDD
Peer Data Transfer	5798-DWJ
Power Plant Maintenance	5798-DED
Retail Merchandise Ticketing	5796-BCA
Spooled Output Transcription Program	5798-DHW

Virtual Terminal Access Facility	5798-DFF
3640 Device Support Programs	5798-DEJ
3640 Data Collection/Lot Tracking	5798-DFG
3640 Shop Floor Control	5796-BBR

DPPX/SP Release 2 Real Storage Requirements: DPPX/SP Release 2 will require up to 30K bytes of additional main storage over DPPX/SP Release 1.

The following product storage requirements are in addition to the 30K bytes base storage increase:

- Use of the Shadow File facility will require additional processor storage as shown below:
 - Normal Operation: 16K bytes for a source and target pair (a disk volume and its shadow volume) and 2K bytes for each additional pair.
 - During Activation and Resynchronization (COPY): 46K bytes for a source and target pair and 26K bytes for each additional pair activated concurrently.
- Use of the Multiple Environments in batch mode support will require additional real storage for each batch environment started. The total storage required is dependent upon the size and number of environments.

INSTALLATION

DPPX/SP Release 2 will be shipped in three forms: Dump/restore tapes, SYSRES initialization diskettes, and a DPPS/SP Release 1 to DPPX/SP Release 2 Revision Package.

The dump/restore tapes are intended for new users with tape drives. The contents of the tape will completely overlay whatever is on the disk.

The SYSRES initialization diskettes provide two installation modes:

- A complete disk initialization process for new DPPX/SP users. This is intended for an initial install. If this mode is selected, any data existing on the disk will be overlaid.
- DPPX/BASE FEP6 users may install an SLU (Service Level Update) to migrate their system to DPPX/SP Release 2. An SLU results in replacement of IBM data on the disk as well as adding new IBM data. Customer programs and data sets are not affected.

The Revision Package is provided for DPPX/SP Release 1 users to migrate to Release 2. The Revision Package will upgrade the existing DPPX/SP Release 1 system to Release 2 by applying the coding differences interactively.

COMPATIBILITY

DPPX/SP Release 2 maintains compatibility with Release 1 components and those licensed programs now combined in DPPX/SP. User application programs which run under DPPX/BASE or DPPX/SP Release 1 will run under DPPX/SP Release 2. DPPX/BASE users should be aware that Printer Sharing and RJE responses were changed in DPPX/SP Release 1, and that changes may have to be made to the Programmed Operator Facility message action files. This will be documented in the informal documentation that accompanies the DPPX/SP shipment and also in other publications.

DPPX/PT Version 2 supports DPPX/System Product Releases 1 and 2. DPPX/PT Version 1 supports DPPX/BASE FEP6 and DPPX/System Product Release 1 only, with no enhancements.

The DPPX/Performance Tool Version 2 program product consists of the Monitor, the Reporter and a new Accounting Collector that provides job resource usage information for capacity planning and billing purposes. For more information, please see the DPPX/PT Version 2 Announcement Letter, dated October 18, 1983.

MIGRATION and PLANNING

To assist customers in migrating to DPPX/SP Release 2, these functions are provided:

- DPPX/SP Revision Package for DPPX/SP Release 1 Users: For customers currently using Release 1 of DPPX/SP, the DPPX/SP Revision Package will enable them to migrate to Release 2. The Remote Service Distribution Option (RSDO) may be used to distribute the Revision Package to other Release 1 systems in a network.
- Service Level Update (SLU): If migrating from DPPX/BASE FEP6, DPPX/SP Release 2 can be installed as a Service Level Update (SLU). SLU performance has been improved significantly. The amount of time to install one DPPX/SP SLU diskette is approximately three minutes.
- Migration Aid Feature: The Migration Aid Feature is a set of routines and programs which will assist the DPPX/BASE FEP6 user migrating to DPPX/SP Release 2. The Migration Aid Feature can be installed and run on a DPPX/BASE system. The Migration Aid Feature function and commands have been incorporated into DPPX/SP Release 1 and may be used when migrating from Release 1 to Release 2.

PROGRAM PRODUCTS

DPPX/SP R2 (cont'd)

The Migration Aid contains the following commands:

- ANALYZE.SPACE Command
- REDEFINE.CATALOG Command
- IPL.DISKETTE Command

RPOs ACCEPTED: Yes

Planning information for existing DPPX/BASE users is available in the publication *DPPX/SP Migration Guide* (GC23-0601).

PERFORMANCE

DPPX/SP Release 2, with processor storage available to accommodate the 30K byte increase, will run with throughput performance equivalent to DPPX/SP Release 1.

Keys/Locks on 8150 Processor: The potential for increased CASS size and more address spaces can improve DPPX/SP Release 2 performance over Release 1.

Users with large (i.e., more than 404K bytes total) and frequently used application programs can reduce physical disk I/O activity and processor utilization by making these programs resident in CASS storage.

HTF Direct: HTF Direct will reduce the path length and disk utilization required by HTF. This improvement is achieved by:

- a. Eliminating CREATX processing that is required to send or receive host messages, and
- b. Eliminating the need to issue a COMMIT before sending a message to the host system from the 8100.

Multiple Environments in Batch Mode: Batch throughput (often, COBOL compiles) can be improved on the 8140 mdl C and the 8150 mdl B with the use of the Multiple Environments in batch mode support of DPPX/SP Release 2.

Disk Storage Requirements: DPPX/SP Release 2 requires 32 megabytes of system catalog space on a system residence volume. An additional 12 megabytes of catalog space has been preallocated for customer usage.

DATA SECURITY, AUDITABILITY and CONTROL

The data security, auditability and control features of earlier licensed programs that run under DPPX/SP are unchanged. User management is responsible for the selection, implementation and adequacy of these security features. If sensitive data is sent over external communications facilities, user management may wish to pursue the application of cryptography.

DOCUMENTATION
(available from Mechanicsburg)

The documentation for DPPX/SP is contained in the manuals shown below. These manuals should minimize the need to refer to multiple manuals and may be placed in separately orderable binders. The DPPX/SP manuals include information on all components. The DPPX/SP manuals are:

3-Ring Binder Volume & Title	Binder Order #	Manual Title	Manual Order #
1 Installation and Operation	SX23-0233	DPPX/SP Installation DPPX/SP Operation	SC23-0603 SC23-0604
2 Administration	SX23-0234	DPPX/SP Administration	SC23-0605
3 Application Programming	SX23-0235	DPPX/SP Application Programming	SC23-0606
4 Commands	SX23-0236	DPPX/SP Commands	SC23-0607
5 Messages & Codes	SX23-0237	DPPX/SP Messages and Codes	SC23-0608
6 Problem Mgmt	SX23-0238	DPPX/SP Problem Management	SC23-0609
7 Diagnosis Guide	SX23-0239	DPPX/SP Diagnosis Guide	SC23-0610.

The entire set of publications and binders may be obtained by ordering SBOF-1044.

DPPX/SP General Information (GC23-0600) ... *DPPX/SP Migration Guide* (GC23-0601) ... *DPPX/SP (8150) Migration Guide* ... *DPPX/SP Installation Card for Tape* (SC23-0611) ... *DPPX/SP Installation Card for Diskette* (SC23-0612) ... *DPPX/SP Interactive Productivity Facility Reference Card* (SC23-0613) ... *DPPX/SP System Services and Reference* (SC23-0614) ... *DPPX/SP Dialog Development Facility Panel Design Forms* (SX23-0242) ... *DPPX/SP Supplemental Binder* (SX23-0240) ... *DPPX/SP Supplemental Spine and Cover Inserts* (SX23-0241).

SYSTEM INTEGRITY

The system integrity features of the earlier licensed programs now contained in DPPX/SP Releases 1 and 2 are unchanged. See statement of DPPX System Integrity dated April 3, 1980.

LICENSED PROGRAM MATERIALS AVAILABILITY

Restricted Materials: No. This licensed program will be available without source licensed program materials. It will be available with object code.

PROGRAM PRODUCTS

**8100 INFORMATION SYSTEM
 DISTRIBUTED PROCESSING PROGRAMMING
 EXECUTIVE/SYSTEMS PRODUCT
 INTERACTIVE MAP DEFINITION (DPPX/SP IMD)
 5660-282**

PURPOSE

The Interactive Map Definition program is a new licensed program, designed to run with DPPX/SP. It generates maps which exploit the enhanced functions provided by the DPPX/SP Format Management component. These maps form the basis of easy-to-use, device and format independent, full-screen device support for DPPX/SP.

DPPX/SP IMD is upwards compatible with the DPS Version 2 Interactive Map Definition feature and creates source maps to extended DPS V2 map specifications.

HIGHLIGHTS

The new functions provided in the DPPX/SP IMD licensed program beyond that available in existing releases of the DPPX/DPS Interactive Map Definition feature are:

- Greater Device Size Independence
- Improved Mapgroup Test
- MSL Concatenation and Sharing
- Mapgroup Generator Improvements
- Support for Improved Mapgroup Load Module
- Support for 3290 Information Panel

DESCRIPTION

DPPX/SP IMD enables the DPPX/SP application programmer to create and update screen and printer panel layouts online at program development time.

The application programmer uses a display to describe how data will appear in a panel to an end-user of a display device or a printer. Interactive Map Definition captures this description in a map and imparts it both to the application program at compile-time and to a run-time library via generation. At application run-time, the Format Management component of DPPX/SP loads the generated run-time map from the library and uses it to format the panel, to control the transfer of data between the application and the device, and for device-dependent information.

The DPPX/SP IMD licensed program provides online facilities for the DPPX/SP application programmer to create and update a map specification library (MSL) containing source maps. The user can also share MSLs (read-only) with other concurrent developers and generate compile-time (application data structure) and run-time maps.

Program development is normally completed by compilation/assembly of the source program. At this time, a copy of the IBM-supplied control structure and DPPX/SP IMD generated application data structure from the source copy library are included.

- Greater Device Size Independence

The Format Management (FM) component of DPPX/SP has enhanced the procedure for matching the device (both size and function level) at run-time with that for which the mapgroup was defined. DPPX/SP IMD supports this facility at generation. DPPX/SP IMD also uses this new facility to reduce the number of versions of each IMD menu map from four (DPS/IMD Version 2) to just one, with a consequent reduction in disk storage requirements.
- Improved Mapgroup Test

This enhancement permits the user, without leaving IMD, to send maps to the screen by invoking the FM component of DPPX/SP just as an application would. This permits additional map facilities to be tested. This testing includes any combination of maps from a map group. The testing can demonstrate any of the following facilities: Programmed symbol sets, partitioning, and user exits.
- MSL Concatenation and Sharing

DPPX/SP IMD allows a user to access up to six MSLs. The first MSL is read/write and is exclusive for the user. Subsequent MSLs are read-only and may be referenced as read-only by other concurrent users.
- Mapgroup Generator Improvements
 - Mapgroup Generator Invocation.

All the information to initiate map generation is now contained within a single frame.

 - Mapgroup Generator Errors

Additional checking and diagnosis occurs during Mapgroup and Application Data Structure generation.
- Support for Improved Mapgroup Load Module

DPPX/SP IMD generates the improved mapgroup load module accepted by the FM component of DPPX/SP. Improvements include:

- Reduced path length at run-time for maps of average complexity.
- An interface at the built-in procedure level for an application to obtain a descriptor of the data structure corresponding to a map.
- Support for 3290 Information Panel

The 3290 Information Panel allows large screen capacity, variable character size, extended highlighting, Programmable Symbol sets, and multiple partitions. DPPX/SP IMD allows a user to take advantage of all of these facilities.

SPECIFIED OPERATING ENVIRONMENT
HARDWARE REQUIREMENTS

This licensed program is designed to operate on all models of the IBM 8100 Information System.

Use of DPPX/SP IMD requires a display supported by the FM component of DPPX/SP with a screen width of at least 80 characters, depth of at least 24 lines and with a keyboard which has 12 or more program function keys.

SOFTWARE REQUIREMENTS

This licensed program is designed to work under DPPX/SP licensed program, 5660-281.

One of the following licensed programs will be required to create applications to utilize DPPX/SP IMD maps via the FM component of DPPX/SP, depending on the application programming language used:

DPPX/COBOL Compiler	5760-CB1
DPPX/PL/I Compiler*	5760-PL1
DPPX/PL/I Library*	5760-LM2
DPPX/ASM	5760-AS1
DPPX/APL	5760-XR2

* PL/I Library is a prerequisite for PL/I Compiler

COMPATIBILITY

The DPPX/SP IMD licensed program is upwards compatible with the Interactive Map Definition feature of DPS Version 2. All of the DPS IMD V1 and V2 function is provided, together with significant usability, performance, and functional enhancements. Source maps and MSLs created by either DPS V1 IMD feature or DPS V2 IMD feature can be processed by DPPX/SP IMD.

Conversion of source map formats from those used by DPS IMD V1 and V2 may be made either explicitly, by user request, or implicitly (automatically) on reference. Saving an edited map results in the DPPX/SP IMD level being saved. Read-only access to the source map, for example, for generation or editing of related objects, causes temporary conversion, but the new level is not saved. Therefore, explicit conversion offers better performance during map editing.

Map conversion back to DPS V2 IMD format is provided by explicit user request. Map conversion back to DPS V1 IMD format is not provided.

DOCUMENTATION

DPPX/SP General Information Manual (GC23-0600).

MVS SYSTEM INTEGRITY APPLIES: Yes

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**CROSS SYSTEM PRODUCT/APPLICATION
DEVELOPMENT (AD) for DPPX/SYSTEM PRODUCT
5660-284**

**CROSS SYSTEM PRODUCT/APPLICATION
EXECUTION (AE) for DPPX/SYSTEM PRODUCT
5660-285**

PURPOSE

Cross System Product/Application Development provides an interactive interface for developing, testing and generating application programs for execution in a DPPX/System Product (DPPX/SP) environment. It is highly compatible with Cross System Product/AD for CICS/VS, SSX/VSE, MVS/TSO and VM/SP CMS. Cross System Product/Application Development includes the facilities for developing, testing and generating applications. Cross System Product/Application Execution provides for production execution of Cross System Product/AD applications.

SPECIAL SALES INFORMATION

Cross System Product/AD and Cross System Product/AE are members of the Cross System Product set of programs which also contains DMS/DPPX, DMS/DPCX, and Cross System Product/AD and AE for CICS/VS, SSX/VSE, MVS/TSO and VM/SP CMS. Each of these programs shares a common, proven architecture and all are highly compatible in their implementation. The Cross System Product set provides the IBM customer with a highly productive capability for producing applications which, with little or no change, may be used in the DPPX/SP, SSX/VSE, CICS/VS, MVS/TSO and VM/SP CMS environments. Applications developed in the DMS/DPPX or DMS/DPCX environments may be moved to the Cross System Product/AD environment, regenerated and executed in the Cross System Product/AE environment, subject to published restrictions.

Generation of applications for DPPX/SP execution is now a capability of Cross System Product/AD on the 4300 and 3000-series. This capability will provide 8100 customers with large DPPX/SP application development projects an additional avenue of application development with their 4300 or 3000-series processor.

Cross System Product/AD and AE provide a powerful tool for the customer who is planning distributed applications for the 8100.

HIGHLIGHTS

- Interactive definition, test and execution of application programs.
- Trace/debug facility at development time.
- Direct execution of generated applications.
- Call and transfer linkage to other applications.
- Definition and execution in a DPPX/SP environment.
- Portability of application definitions (within published restrictions) between members of the Cross System Product set.

DESCRIPTION

Data Definition - Allows the definition of data structures and the characteristics associated with that data. Single elements of data are defined as data items. Each data item name is unique within a development library called the Member Specification Library (MSL). Data items are components of a record, table, map or working storage. After a data item has been defined once, it may be used in other records, tables, maps or working storage by entering the data item name. The associated characteristics of the data item, collected from the MSL, need not be reentered.

Map Definition - Allows the definition of a map for a terminal display or printer. Each map is given a unique name within a map-group (a group of maps for use in an application) and device. The variable fields defined on a map are named and characteristics are defined for each. Characteristics may be collected from data definitions on the MSL if an already-defined data item name is used.

Application Definition - Provides for the definition of an application as a group of related processes. Processing statements can be used to define arithmetic operations, movement of data, use of tables, access to map fields and record data items, and logical testing and and branching.

Application Test - Allows the user to verify the syntax and logic design of any Cross System Product/AD-defined application, as well as to view the logical sequence of map displays as the user will see them in the production environment.

List Processor - Provides the capability to list all members of an MSL, or select subsets to be listed, and then invoke other Cross System Product/AD functions against them. These functions are: Copy, rename, delete, print, change, where used, edit view, export. Most utilities and editors can be invoked directly from the list processor.

Tutorial - Can be used to learn about Cross System Product/AD by reading it as a manual or by direct selection of certain sections. It can be accessed at any point in Cross System Product/AD by pressing the HELP program function key.

Utilities:

EXPORT - Allows an MSL member to be moved out of an MSL.

IMPORT - Allows a previously-exported member to be moved into an MSL.

Member Maintenance - Allows members in an MSL to be copied, deleted, renamed or printed.

File Maintenance - Allows the user to view or change data that is stored in a file that has been previously created and defined. If the change option is selected, the user may display, replace, delete, add or copy records to the file.

Application Generation: This process translates the defined application into a set of tables which may be executed in the DPPX/SP environment. These execution tables may be distributed to a production system by tape, diskette, or communication facilities. Normal DPPX/SP library services are used to enter the module (execution tables) into the program library of the production system.

Application Execution: Once an application has been generated, it may be executed under the control of Cross System Product/AE. Cross System Product/AE retrieves the application definition from the DPPX/SP library, initializes it to the run-time environment, and manages the execution of the application.

CUSTOMER RESPONSIBILITIES

Installation: Cross System Product/AD and AE are installed using the DPPS/SP Program Product Installation procedure as described in the *DPPX/SP Installation Manual*. The Cross System Product/AD installation procedure consists of loading programs and data files from the distribution diskettes to disk. All Cross System Product/AD programs are distributed in object module form, and program assembly is not required.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Cross System Product/AE has been designed to operate on an IBM 8130 or 8140 Processor with a minimum of 512K bytes of memory. Cross System Product/AD has been designed to operate on an IBM 8130 or 8140 Processor with a minimum of 768K bytes of memory.

Terminal requirements are:

- One display terminal with 1,920-character screen and 12 program function keys.
- One operator terminal (execution).

For system libraries, any appropriate storage devices supported by DPPX/SP are allowed.

For user data storage and system data sets, at least one disk storage unit is required, which may be the same as required for DPPX/SP system operation.

SOFTWARE REQUIREMENTS

Cross System Product/AD and Cross System Product/AE require the following product:

- DPPX/SP (5660-281).

Cross System Product/AD also requires:

- DPPX/SP Interactive Map Definition (5660-282).

Cross System Product/AD and DMS/DPPX may not be installed concurrently on the same DPPX/SP system. In like manner, Cross System Product/AE and DMS/DPPX Execution Facility may not be concurrently installed on the same system.

Storage Estimates: Cross System Product/AD requires a minimum of 256K bytes of real storage. Additional storage is required for multiple concurrent users.

Cross System Product/AE requires a minimum of 64K bytes of real storage, plus the size of the run-time application. Applications vary in size from 8K bytes for a small application to 64K bytes or more for large applications.

These storage requirements do not include data storage, or storage for other licensed programs or the concurrently-resident application programs.

COMPATIBILITY and PORTABILITY

Compatibility with Cross System Product/AD (5668-944): Cross System Product/AD provides a means for defining applications which, with little or no change, can be migrated between S/370, 4300, 3000-series, and 8100 systems. This is achieved as follows:

Cross System Product/AD and AE for DPPX/SP (cont'd)

The definition facilities, by which a user defines his application, maps, and data, are identical in Cross System Product/AD for DPPX/SP (5660-284) and Cross System Product/AD for CICS/VS, SSX/VSE, MVS/TSO and VM/SP CMS (5668-944). These definitions are stored in a Member Specification Library which can be moved from one system to another. Each product includes utilities to assist in moving definitions between them.

Cross System Product/AD and Cross System Product/AE recognize differences between environments and allow use of certain facilities unique to the environment. While use of these facilities does not preclude portability, the user should be cautious in taking advantage of them during definition as they may introduce some extra effort into migrating between supported environments.

Additional information on application portability is included in the *Operation-Development Manual*.

Compatibility with DMS/DPPX and DMS/DPCX: DMS/DPPX, DMS/DPCX and Cross System Product/AD are conceptually the same in the definition phase, however, Cross System Product/AD offers functions that are not available with DMS/DPPX and DMX/DPCX. Applications developed on Cross System Product/AD will execute only on Cross System Product/AE.

Applications defined using DMS/DPPX or DMS/DPCX are portable to Cross System Product/AD within published restrictions. For more information, see the *Operation-Development Manual*.

CONVERSION

The DMS/DPPX Execution Facility will execute in the DPPX/SP environment. Therefore, DMS/DPPX applications can migrate from DPPX to DPPX/SP without a regeneration if DMS/DPPX Execution Facility is used.

Applications that were generated by the DMS/DPPX Definition product will execute in the DPPX/SP environment under Cross System Product/AE without regeneration.

Applications that are generated using Cross System Product/AD will not execute under the DMS/DPPX Execution Facility.

DMS/DPPX FEP1 definition will run on DPPX/SP only with DPS V1 IMD or DPS V2 IMD. This capability is provided for migration purposes only, and DMS/DPPX will not co-reside on DPPX/SP with Cross System Product/AD.

DOCUMENTATION

(available from Mechanicsburg)

The publications for Cross System Product/AD and Cross System Product/AE have been restructured into a common, task-oriented library utilizing loose-leaf binders, tabs and inserts. They may be ordered at product availability.

All of the publications, binders and binder inserts may be obtained by ordering *Cross System Product/AD* (SBOF-1023) and *Cross System Product/AE* (SBOF-1024).

Individual form numbers for publications are: *General Information* (GH20-0940) ... *Application Development Guide* (SH20-0942) ... *How-to-Use Cross System Product/Application Development* (SH20-0941) ... *Operation - Development* (SH20-0943) ... *Operation - System Considerations* (SH20-0944) ... *Operation - Execution* (SH20-0945) ... *Problem Determination Guide* (SH20-0947) ... *Messages and Codes* (SH20-0946) ... *Program Specifications - Development* (GH20-0951) ... *Program Specifications - Execution* (GH20-0952) ... *Reference Summary* (GX20-0950).

PROGRAM PRODUCTS

**DISTRIBUTED PROCESSING PROGRAMMING EXECUTIVE
PERFORMANCE TOOL VERSION 2
DPPX/PT (5660-286)**

PURPOSE

The DPPX/PT Version 2 program consists of a Monitor, a Reporter and an Accounting Collector that monitors and reports on the activity of the DPPX/System Product, as well as provides system resource usage information for each user.

Regular use of DPPX/PT Version 2 can assist the customers to measure and evaluate the performance of their current 8100/DPPX systems. In addition, it enables them to plan for additional 8100/DPPX capacity to meet their distributed processing needs.

Both general and detailed information are available, such as:

- The 8100 Processor utilization.
- Real storage utilization.
- DASD device utilization.
- Environment statistics.
- Transient module utilization.
- DASD data set utilization.
- DTMS transaction statistics.
- Dynamic resident module utilization
- CPU and I/O resource utilization for each user.

HIGHLIGHTS

- Supports DPPX/SP Release 1 and Release 2.
- Combines the Monitor, the Reporter and the new Accounting Collector into a single program product.
- Provides an enhanced Environment Report with comprehensive resource utilization information.
- Adds a new Accounting Collector for capacity planning and billing applications.
- Makes available a sample COBOL source program to print accounting data.
- Improves the Monitor's I/O performance.
- Provides a one-time charge with Volume License Amendment discounts.

DESCRIPTION

DPPX/PT Version 2 supports the 8100 DPPX/System Product Releases 1 and 2. A fix package (FP) will be shipped to all DPPX/PT Version 2 users of record at general availability of DPPX/SP Release 2.

DPPX/PT Version 2 combines into a single program product the previously separate Monitor program and Reporter feature of Version 1, and a new Accounting Collector.

The Monitor uses a sampling technique to scan and record the current DPPX system status. It also captures and records information from event trace points in the DPPX system. DTMS transaction statistics are obtained by capturing transaction events at appropriate points in the DTMS modules. At requested intervals, the DPPX/PT Monitor will write its collected data to a disk data set. The Monitor output data may then be entered into the Reporter Program which produces formatted reports from the captured performance data.

The Reporter contains information on processor, real storage and device utilizations, environment and DTMS statistics, transient module and dynamic resident module utilizations. Bar graphs are produced for both processor and DASD device utilization.

The new Environment Report provides comprehensive information about DPPX system performance, such as: CPU utilizations by level within environment or transaction, and read/write statistics by data set and adapter type within environment or transaction.

The new Accounting Collector provides CPU and I/O resource usage data for each 8100/DPPX user. In addition, the CPU utilization may be monitored at the end of each user-defined interval through messages sent to the system operator by this program.

Three types of records are written:

- Interval Record: One summary record for each interval.
- User Record: One record for each user active during the interval.
- Device Record: One record for each device accessed by each user.

This data provides basic information necessary to implement capacity planning or user billing applications.

A sample COBOL source program is provided to print each accounting record. This COBOL source program may be used as the basis for a more comprehensive accounting report developed by the user.

Improvements in I/O performance for the Monitor have been implemented in DPPX/PT Version 2. These performance improvements are achieved by writing multiple blocks of records with a single SEND macro.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This program product is designed to operate on any IBM 8100 system on which DPPX/SP will operate. The minimum real storage and disk requirements for each of the functions are show below:

Function Name	Real Storage	Disk Space
Monitor	16K	7 logical blocks
Reporter	14K	34 logical blocks
Accounting Collector	11K	10 logical blocks

For details, refer to the *DPPX/PT Version 2 User's Guide* (SC34-2147).

SOFTWARE REQUIREMENTS

DPPX/PT Version 2 requires the functions provided in the following program products that are components of the DPPX/System Product (DPPX/SP, 5660-281):

- DPPX/BASE (5760-010)
- DPPX/DTMS (5760-TD1) for the DTMS transaction statistics.
- The COBOL Compiler (5760-CB1) for the sample COBOL source program.

PLANNING INFORMATION

Planning information is provided in the *DPPX/PT Version 2 General Information Manual* (GC34-2145).

INSTALLATION

Installation procedures are described in the *DPPX/PT Version 2 User's Guide* (SC34-2147).

EDUCATION

IBM 8100 technical education is provided by the Washington Advanced Education Center. Courses in the 8100 curriculum will be updated to include discussion of the DPPX/PT Version 2 functions and features.

DATA SECURITY, AUDITABILITY and CONTROL

DPPX/PT Version 2 provides no security or data integrity functions beyond those provided by the environments in which it operates. User management is responsible for the selection, implementation and adequacy of these security features. If sensitive data is sent over external communication facilities, user management may wish to pursue the application of cryptography.

DOCUMENTATION

(available from Mechanicsburg)

DPPX/PT Version 2 User's Guide (SC34-2147) ... *DPPX/PT Version 2 General Information Manual* (GC34-2145) ... *DPPX/PT Version 2 Licensed Program Specifications* (GC34-2146).

5662-257 - OS/VS1 BASIC PROGRAMMING EXTENSIONS

PURPOSE

The OS/VS1 Basic Programming Extensions program is supported on S/370, the 3031, 3032, 3033, and 4300 Processors in S/370 mode. It can also run on the 308X Processors under VM. It provides support for the 4331 Model Group 2 Processor, the 3262 Printer mdls 1 and 11, the 3848 Cryptographic Unit, the 3375 Direct Access Storage, the 4341 Model Group 10 and 11 Processors and enhanced dump facilities.

DESCRIPTION

RELEASE 1

- Support for the 4331 Model Group 2 Processor.
 - Allows optimization of I/O Load Balancing algorithms.
- Support for the 3262 Printer mdls 1 and 11: The 3262 Printer mdl 1 is a 650 line-per-minute printer (nominal speed) using a 48-character-set print belt. The 3262 Printer mdl 11 is a 325 line-per-minute printer (nominal speed) using a 48-character-set print belt. Both printer models attach to the 4331 Processor. The OS/VS1 support allows the 3262 Printer to be used as a system printer, data management printer and as the output portion of a composite console.
- Enhanced Dump Facility I: The dump enhancements are:
 - Provide machine-readable abend dumps via a user SYSMDUMP data definition (DD). A SYSMDUMP will include the fixed nucleus, the partition and the pageable supervisor above the JES partition.
 - Allows multiple system dump data sets. This enhancement allows up to 99 system dump data sets which are installation-allocated and maintained.
 - Allows OS/VS1 handshaking with VM to have OS/VS system dumps taken via the VMDUMP command. This facility can be provided by initializing the VMDUMP parameter on the NIP member of SYS1.PARMLIB or at 'SPECIFY SYSTEM PARAMETERS' time or by using the VMDUMP keyword on the SET command.
 - Provides an in-storage console trace. The number of kilobytes to be reserved for a console trace area and the initial status of the trace can be specified on the NIP member of SYS1.PARMLIB or at 'SPECIFY SYSTEM PARAMETERS' time. The trace can be suspended and resumed (provided space was reserved) via the CNTRACE keyword on the SET command.
- Virtual Machine/VTAM Communications Network Application (VM/VCNA) support: VM/VCNA uses the IUCV (Inter-user Communication Vehicle) support provided by OS/VS1 Basic Programming Extensions to communicate with the VM/SP (Virtual Machine/System Product) control program. The IUCV support may be used by other privileged programs running on OS/VS1 Basic Programming Extensions.
- IOS Serviceability Enhancement: Prior to abending, a problem determination area is reserved and pertinent IOS data is stored to diagnose IOS abends.
- Support for 3848 Cryptographic Unit: The 3848 Cryptographic Unit is a channel-attached unit that enciphers and decipheres data. A new program product, the Cryptographic Unit program product (5740-XY6) can provide generation and management control functions for cryptographic keys.

RELEASE 2

- Support for the 4341 Model Group 2 Processor.
 - Allows optimization of I/O Load Balancing algorithms.
- Enhanced Dump Facility II: The dump enhancements are:
 - A dump management facility for system dumps.
 - Allows user machine-readable dumps to be taken via the DMDUMP command of VM/370.
 - Allows system dumps and user dumps to specify a VM userid for dumps taken via the VMDUMP command of VM/370.
- Provides support for the 3375 Direct Access Storage along with the program product Data Facility Device Support (5740-AM6).

RELEASE 3

- Support for the 4341 Model Group 10 and Model Group 11 Processors.
 - Allows optimization of I/O Load Balancing algorithms.
- Enhanced Dump Facility III.
 - Symptom strings will be provided for all system dump data sets except those being taken via the VMDUMP command of VM/370.
- Enhancements for the 3880 Control Unit Buffer.

- Support for the 3880 Storage Control Speed Matching Buffer feature for the 3375 (#6560).
- Support for the 3880 Storage Control Speed Matching Buffer feature for the 3380 (#6550)
- Provide support for the 3380 Direct Access Storage.
- Support for 4K Page Sizes.
 - Makes possible the execution of VS1 under VM on processors with 4K key-in-storage domains.

RELEASE 4

- Support for the 4341 Model Group 9 and 12, 4361 Model Group 4 and 5, and 4381 Model Group 1 and 2 Processors, which allows the OS/VS1 I/O load balancing algorithm to be optimized to the individual processor performance characteristics.
- Support for the 3380 Direct Access Storage and the 3380 Speed Matching Buffer of the 3880 (#6550). The channel commands for Dynamic Pathing are not supported. (The 3380 mdl AA4 can be used without this support.)
- Support for the 3880 Storage Controller, mdl 13.
- Support for the 4245 Printer including changes to SYSGEN for device recognition, and changes to allow their use as a DSO writer and JES writer.
- Support for the 3430 Magnetic Tape Subsystem.
- Addition of the System Authorization Facility Security Router, providing a standard interface common to MVS and VS1 for modules requesting security services and installation-written security processing routines.
- A repackaging of the Stand-Alone Dump program removing prior space limitations for several modules.

CUSTOMER RESPONSIBILITIES

The customer is responsible for ordering and installing OS/VS1 Release 7 prior to installing the OS/VS1 Basic Programming Extensions program product.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The OS/VS1 Basic Programming Extensions program product is supported on any IBM S/370, 3031, 3032, 3033, or 4300 Processors in S/370 mode. It can also run on the 308X Processors under VM.

SOFTWARE REQUIREMENTS

The OS/VS1 Basic Programming Extensions program product requires OS/VS1 Release 7 as a base. Also, Data Facility Device Support Release 1 Modification Level 1 is co-requisite with Release 3 of the Basic Programming Extensions and Data Facility Device Support Release 1 Modification Level 2 is co-requisite with Release 4 of Basic Programming Extensions.

Starter System: The starter system provided is a special OS/VS1 system ordered separately.

The starter systems provided have been updated from OS/VS1 Release 7 to include the OS/VS1 Basic Programming Extensions program product and require a minimum of 192K bytes of real storage. This starter system is only available to licensed users of the OS/VS1 Basic Programming Extensions program product.

A 3380-resident starter system with the OS/VS1 Basic Programming Extensions Release 4 program product applied will be available to licensed users of record of this program product. This starter system will be necessary for users with 3380 DASD as the only DASD attached to their processor. In addition to OS/VS1 Basic Programming Extensions Release 4, the user will require a license for OS/VS1 Data Facility Device Support Release 1.2 (5740-AM6). To install this starter system, the user will need the functions provided by the Data Facility Data Set Services (5740-UT3) program product, or its equivalent. The user may order the 3380 starter system with the Data Facility Data Set Services program product included in the starter system.

Starter systems residing on 2314, 3330, 3340 and 3350 DASD with the OS/VS1 Basic Programming Extensions Release 2 program product applied will still be available. These starter systems do not contain the OS/VS1 Data Facility Device Support program product, and therefore, do not support 3375 DASD.

Also still available is a 3375 starter system with Basic Programming Extensions Release 3 and Data Facility Device Support Release 1.1 applied.

The starter system has the basic elements necessary for system generation in a form that is directly usable by a majority of customers. The starter system functions with a variety of different I/O units at 'standard' addresses. Customers may use the starter system to perform system generation if there are appropriate matching units and addresses in their own configuration.

PROGRAM PRODUCTS

OS/VS1 Basic Programming Extensions (cont'd)

Dedicated Data Set Support is used in SYSGEN for the utility data sets in assemblies, link edits and data set copies.

The starter system runs on any IBM Processor supported by OS/VS1 which meets the minimum system requirements. RMS (Recovery Management System) routines for all S/370, 303X, 4300, 4361 and 4381 Processors are included in the system libraries, thus allowing processor independence of the Starter System.

Customers should be encouraged to match unit addresses with those of the starter system to the greatest degree practical. Unit addresses are established as part of the normal physical planning and cable order process; therefore, physical installation plans should be reviewed where appropriate. The following chart shows the devices supported by the starter system, the system functions for which they may be used, and the three character address assigned to each unit. The OS/VS1 starter system supports all the devices at the address specified.

RPQs ACCEPTED: No

Notes: The following notes are applicable to the "Starter System Requirements Chart":

1. DASD 3330/3333 mdl 1 and 11, 3340, 3375, 3380 and 3350 are generated on channel 1 and accessed on channel 1, with channels 2 through 4 as optional channels. (Some 3340 DASD are generated on channel 2 and accessed on channel 2, with channels 3 and 4 as optional.)
2. The three system generation utility data sets and the three object program data sets do not require additional direct access devices if sufficient space is available on the volumes that contain the new system and the starter system.
3. The 3138 and 3148 consoles use the 3158 console support (Display Mode).
4. 3286 mdl 2 optional printer for S/370 mdl 138/148.
5. 3138 and 3148 Console when IMPLIED in Printer/Keyboard mode.
6. 3420 Tapes are generated on channel 2 and accessed on channel 2, with channels 3 through 5 as optional.
7. The DLIB Installation and Build process requires space equal and additional to the distribution library space. The spindle(s) available after DLIB installation and build may be used for the new system being generated.
8. For 4300 Processors.
9. For 4331 Processors only.
10. 3375 and 3380 Starter Systems only.
11. 3775 requires OS/VS1 Data Facility Device Support program product.
12. 3375 and 3380 Starter Systems have addresses 180 and 181 only.
13. 3380 Starter System only.

PROGRAM PRODUCTS

**TELEPROCESSING NETWORK SIMULATOR
VERSION 2 RELEASE 2
TPNS (5662-262)****PURPOSE**

Teleprocessing Network Simulator (TPNS) is a telecommunications testing package that enables a user to test and evaluate application programs, communications access methods, and communication control programs without the use of actual terminals. The purpose of TPNS is to provide controlled generation of message traffic into a telecommunications subsystem or application through the use of processing rather than by large amounts of terminal hardware and terminal operator time. TPNS provides the ability to simulate a specified network of terminals and their associated messages, allowing the user to alter network conditions and message loads during a run. Thus, TPNS can be used to stress-test telecommunications application programs with volume messages to evaluate the reliability and approximate performance characteristics under expected operating conditions.

HIGHLIGHTS

- Supports Start/Stop, Airlines Line Control (ALC), BSC, SDLC, and X.25 terminals as indicated below.
 - Provides simulation support for X.25 packet switching networks.
 - Simulates entire subareas in an MSNF environment.
 - Runs under any current release of OS/VS1, OS/VS2 (MVS), MVS/System Product Version 1 (MVS/SP V1), and MVS/Extended Architecture (MVS/XA) or subsequent releases of these SCPs unless otherwise specified.
 - Executes in 31-bit addressing mode under MVS/XA.
 - Automatically handles line protocols using a TPNS Control Program that executes in a 3705 or 3725 Communications Controller.
 - Utilizes flexible, easy-to-use script language.
 - Provides a script generator program.
 - Provides enhanced communication among terminal scripts based on user-defined events.
 - Provides a message generation trace facility to aid in the debugging of scripts, including logic tests.
 - Allows for comprehensive operator intervention and modification during the test run, either manually or automatically through the inclusion of operator commands in the message decks.
 - Variable message mix and traffic rate.
 - Paging of message scripts to reduce virtual storage requirements.
 - Message logging and time stamping for offline analysis.
 - Pre processor for checking syntax prior to run.
 - Online and offline reports.
 - Multiple networks may be simulated simultaneously and independently to multiple subsystems on one or more processors.
 - Logic tests on both input and output to allow dynamic changes in message mix during the test run.
 - Random generation of test data.
 - Multiple console support to allow remote console support of the simulator.
 - High-level message generation by having the TPNS Control Program automatically add necessary line control and terminal framing characters.
 - Line and SIT trace capabilities for access method debugging.
 - Drives application programs running under IBM data communication programs such as IMS, CICS, VSPC, TSO, TCAM, VTAM, BTAM, ACF/VTAM and ACF/TCAM.
 - Simulates parallel sessions.
 - Supports negotiable bind.
 - Supports data encryption.
 - Supports parallel links and multiple routing.
 - Supports Class of Service.
 - Supports Transmission Priority and Network Flow Control.
 - Supports configurable station, channel contact and FID4 Transmission Header.
 - Supports Session Outage Notification.
- Operates within the same S/370 as the application program under test (Simplex Mode) or with TPNS driving application programs in one or more processors (Duplex Mode).
 - Exercises the interfaces between the terminal control unit, communication lines and the application program as used in the operational system.
 - The ability to simulate S/S terminals up to 1200 bps.
 - Support for the extended color capability of the 3279 Color Display Station and 3287 Printer.
 - Support for the programmed symbols feature of the 3279 Color Display Station, the 3278 Display Station, the 3278 Printer and the 8775 Display Terminal.
 - Support for terminals utilizing a 230KB line attached to a TPNS 3705 or 3725 or a 256KB line attached to a TPNS 3725.
 - The ability to use application messages/data to generate TPNS messages. Data received in response to a previous message can be used in a succeeding message.
 - Condensed interval reports.
 - Enhanced logic testing - logic check can be performed at message generation time.
 - Console commands to alter the message sequence dynamically.
 - Line/terminal device status on interval reports.
 - Readable interpretation of SNA command codes and headers and X.25 packet headers on the log data set formatted output.
 - Message rates routed to the console in addition to the printer.
 - Ability to observe traffic of individual devices while executing via a monitor.
 - The capability to write messages to the console operator from the TPNS script or a user exit routine.

DESCRIPTION

TPNS Version 2 may be used to drive the online telecommunications system in the following manner:

- Simulate Start/Stop (S/S), Airlines Line Control (ALC), Binary Synchronous (BSC), Synchronous Data Link Control (SDLC) or X.25 terminals and the networks to which they would be attached.
- Simulate an X.25 packet switching network.
- Simulate entire subareas in a Multisystem Networking Facility (MSNF) environment.
- Generate data from descriptions of application messages and transmit those real messages to a running teleprocessing application program.
- Vary the frequency of message transmission within desired limits.
- Time-stamp and log all messages sent from and received by the simulated terminals.
- The user may analyze the message contents for accuracy of data transmitted. The user may also analyze the sending and receiving times to approximate application performance in response times and message rates.

Utilizing a 3705 or 3725 Communications Controller, TPNS supports a broad range of terminal types and provides flexible, generalized message generation facilities that can be used to simulate a wide variety of telecommunications operations. The following terminal and device types are simulated by TPNS:

- Start/Stop communication terminals on leased communications facilities:
 - 1050 Data Communications System
 - 2740 Communication Terminal mdl 1 (with Station Control and Record Checking)
 - 2740 Communication Terminal mdl 2 (with Station Control, Record Checking and Buffered Receive).
 - 2741 Communication Terminal

PROGRAM PRODUCTS

TPNS V2 (cont'd)

3101 Display Terminal (block mode, half-duplex mode, send break only)

6580 Displaywriter (communicating as a 2741 or mdl 33/35 TWX)

AT&T 83B3 Selective Calling System (supported in 3705 only)

Western Union Plan 115A Outstation (supported in 3705 only)

Western Union mdl 33/35 TWX (half-duplex mode, send break only)

- Start/Stop Communication terminals on switched communications facilities:

3101 Display Terminal (block mode, half-duplex mode, send break only)

Western Union mdl 33/35 TWX (half-duplex mode, send break only)

- Airlines Line Control (ALC) support is provided in the 3705 only for those remote terminals that communicate via the 6-bit line code known as Airlines Line Control. Specific features include full duplex line operation, support of direct polling, and the capability to specify the end-of-message character to be appended to messages transmitted by the simulated terminals.

- Binary Synchronous Communication Terminals:

3270 Information Display System mdls 1 and 2 (3271 mdls 1 and 2, 3274 mdl 1C, 3276 mdls 1, 2, 3 and 4, 3277, 3278, 3284, 3286, 3287, 3288, 3289) remote only, EBCDIC or ASCII

In addition, the following IBM BSC disciplines are supported:

BSC1 (Point-to-point leased BSC)

BSC2 (Point-to-point dial BSC (terminal answer only))

BSC3 (Multipoint BSC)

The types of BSC terminals which may be simulated using the above BSC 1, 2 and 3 line disciplines include the following:

1130

1800 Data Acquisition and Control System

S/3

S/7

S/34

S/36

S/360 mdl 20

S/360 mdl 25

S/360

S/370

2770 Data Communication System

2780 Data Transmission Terminal

3780 Data Communications Terminal

6670 Information Distributor

8100 DPPX Information System

6580 Displaywriter (communicating as a 2770, 2780 or 3780)

Note: TPNS provides no support for special features on these BSC 1, 2, and 3 devices. Multileaving (mdl 20 workstation) is supported (transparent mode only).

- Synchronous Data Link Control (SDLC) line discipline for Systems Network Architecture (SNA) terminals on leased half-duplex, leased full-duplex, or dial communication facilities. These terminals are also supported in an X.25 packet switching environment on leased full-duplex communication lines.

3270 Information Display System (SNA) (3271 mdls 11 and 12, 3274 mdl 1C, 3276 mdls 1, 2, 3, 4, 11, 12, 13 and 14, 3277, 3278, 3284, 3286, 3287, 3288, 3289)

3600 Finance Communication System

3650 Retail Store System (supported as 3600-Compatible Device)

3660 Supermarket System (supported as 3600-Compatible Device)

3614 Consumer Transaction Facility

3624 Consumer Transaction Facility

3730 Distributed Office Communication System

3767 Communication Terminal

3770 Data Communication System

3790 Communication System

4700 Finance Communication System (supported as 3600-compatible device)

5250 Information Display System (5251 Display Station and 5256 Printer)

S/34

S/36

8100 DPPX Information System

8100 DPPX/SP Information System

8100 DPCX Information System

8775 Display Terminal

General support for physical unit type 2 terminal controllers

General support for physical unit type 1 terminal nodes

General support for SNA subareas in an ACF 2 or ACF 3 MSNF environment

Note 1: In order to execute SNA Dial Communications, the application program must run under an OS/VS operating system which also supports SNA Dial.

Note 2: TPNS SNA simulation is not intended to simulate code residing in the logical control unit other than that code required to transmit and receive message traffic.

TPNS also provides support for devices attached to the 8100 systems via teleprocessing links or remote loop. The level of support for a remote loop is from the 3842 remote loop controller downward; i.e., TPNS simulates the entire remote loop with its attached devices.

Specific device support for 8100 systems includes functions of the 3276 and 3278 Displays, the 3287, 3289 and 3645 Printers, and the 8775 Display. TPNS also simulates a certain class of devices that use 'device headers' rather than the standard SNA headers. These devices include the 3641, 3642, 3643, 3646, 3647, and the 3289 mdl 3 with its attached devices. The 3644 is supported by allowing the user to specify the device header in the scripting statements.

Another level of simulation provided by TPNS is the simulation of an entire system in a Multisystem Networking Facility (MSNF) environment. In simulating such a system, TPNS performs the functions of the System Services Control Point (SSCP), the Network Control Program (NCP), and the physical and logical units in the system. The logical units in a simulated system generate messages in the same way that same-domain terminals simulated by TPNS generate messages. Subareas in the simulated system are supported independently by TPNS. A simulated NCP subarea may have the following attachments: Real link attachments to one or more communications controllers executing ACF/NCP/VS, simulated link attachments to other simulated NCP subareas, and simulated channel attachments to simulated host subareas. A simulated host subarea may have the following attachments: Real channel attachments to one or more communications controllers executing ACF/NCP/VS and simulated channel attachments to simulated NCP subareas.

In addition to simulating terminals and subareas on remote links, TPNS provides simulation support for an X.25 packet switching network. The specific X.25 facilities supported are consistent with the IBM interpretation of the CCITT Recommendation X.25. TPNS provides three different types of X.25 interfaces:

- TPNS appears as one or more data circuit-terminating equipment (DCE) interfaces to the system under test; i.e., TPNS simulates an entire packet switching network including the data terminal equipment (DTE) devices.
- TPNS appears as multiple DCE interfaces to the system under test, simulating a packet switching network between real DTEs. This form of simulation is called 'passthrough' and is independent of end-to-end protocols (such as SNA) and the types of DTEs involved.
- TPNS appears as one or more DTEs to the system under test which may be a real packet switching network

Each X.25 interface simulated by TPNS can support multiple permanent and/or switched virtual circuits. TPNS will simulate a variety of DTEs including SNA terminals using PSH or QLLC protocols for logical link control, SNA subareas using QLLC protocols, and X.25 native equipment.

PROGRAM PRODUCTS

TPNS V2 (cont'd)

Scripting facilities are provided by the TPNS language. The script describes the terminals, network configuration, and message rates desired by the user. In addition, the script defines telecommunications messages meaningful to the online application programs under test. Individual segments of information in the messages may be generated by different methods including random selection, table lookup, and constant insertion. TPNS provides a logic test capability of comparing for certain data or text received or sent by TPNS. Thus, scripts can vary message data from the simulated terminals based on the content of a prior response from the application program.

Preparation of scripts is simplified by providing common default values for the keyword parameters used in the scripting language. Messages may be generated from a single script for multiple terminals.

A message generation trace facility is available to aid in script debugging by providing a listing of the steps through message generation for a simulated terminal. A device level option specifies that trace records are to be written to the log data set. This facility also traces the execution of logic tests. The ITPLL postprocessor program will format the trace records from the log data set.

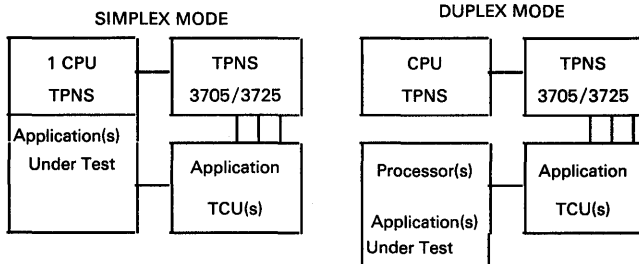

Multiple networks may be simulated within a single TPNS job to provide messages to drive multiple telecommunications applications or multiple CPUs.

A script generator program is provided as a part of TPNS Version 2. This program allows the user to generate automatically TPNS MSGTXT texts from data captured during running of an online application. The user needs to specify only the network configuration statements and provide these, along with the captured data, as input to the script generator. The network configuration statements may be updated by the script generator program to reflect the MSGTXT decks generated.

Several formats for the captured data can be used as input to the script generator:

- Data captured in the format of the TPNS Script Generator Field Developed Program.
- VTAM buffer trace.
- VTAM/PARS II trace.
- CCWTRACE option of GTF.
- Subsystem data capture. TPNS provides some sample IMS and CICS capture routines for 3270 terminals.

TPNS can operate in either simplex or duplex mode. In simplex mode, TPNS and the subsystem (the driven telecommunication application) under test reside in a single processor and execute in separate regions under OS/VS. In duplex mode, two or more processors are required. TPNS resides in one and drives various telecommunication applications in the other(s). Neither simplex nor duplex operation requires that either processor be dedicated to the test run. Dedicated duplex processors would be used primarily for critical application performance approximations. In either mode, TPNS requires a dedicated 3705 or 3725 Communications Controller (see exception below), and the application under test requires another transmission control unit (TCU) of the appropriate type required by the application programs.

For subarea simulation only, TPNS can share an ACF/NCP/VS communications controller with ACF access methods in a multi-tail environment, i.e., neither a dedicated communications controller nor a TPNS Control Program is necessary. When simulating terminals controlled by the system under test, such as non-SNA terminals, TPNS will continue to require a dedicated communications controller executing a TPNS Control Program.

TPNS can drive various application programs running under IBM data communication products such as IMS, CICS, VSPC, VTAM, TSO, TCAM, BTAM, ACF/VTAM and ACF/TCAM.

A pre-processor program is provided to syntax check network and message configuration script statements. Two post-processor programs are provided: One to list out the TPNS log tape in a formatted report, and one to selectively calculate a response time analysis by network communication line. The response time calculated by the post-processor is the time required for the application to respond to an input message. The user has, as his option, the ability to write his own response time analysis program using the various TPNS

time stamps. TPNS also provides functions for graphing the results of the analysis program.

The log tape formatting program has the capability to analyze the message traffic on the log tape for display terminals and construct formatted screen images to be printed. A device level option is available when executing TPNS Version 2 to specify that special display records are to be written to the log tape, and these special records will be used in producing the screen image outputs. The screen formatting feature is available for all terminals in the 3270 Information Display System, the 8775 Display Terminal, and the 5250 Information Display System.

Properly used, TPNS may reduce testing time and required testing resources while improving the thoroughness of testing for telecommunication applications.

TPNS can provide repeatability for functional testing, a collection of comprehensive transaction messages for regression testing, and message rate statistics for approximating application performance, response times and evaluation of telecommunication network design.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the following functions to install TPNS:

- Providing an appropriate OS/VS SCP including arranging OS/VS2 system authorizations to include necessary references to TPNS modules and placing the provided source, object and macro statements into appropriate OS/VS libraries.
- Generating a functional 3705 or 3725 Control Program for TPNS. Preparing high-level macro statements to describe type(s) of network(s) whose simulation is desired, and compiling the TPNS 3705 Control Program from provided libraries.
- Ordering and installing the necessary communications equipment to support the application and TPNS environment.
- Providing communication line connections between the TPNS communications controller and the application TCU with appropriate line adapters.

The *TPNS Program Reference Manual* provides information on how to connect the application TCU to the TPNS communications controller using modems, modem eliminators, or direct-attach cables.

If use of common carrier lines is planned, the customer is responsible for contacting the local common carrier and arranging for the necessary communication services.

- Arranging for appropriate engineering changes required by TPNS. The TPNS 3705 requires engineering change levels to include EC 311283 or REA 23-13007 if SDLC lines are to be used. This engineering change level must also be installed on the application 3705 if NCP Release 3.1 or later is used. If data set eliminators are being used for SDLC simulation, the application 3705 must have the previously mentioned EC or REA and the NCP must be level 3.1 or later. A TPNS 3725 requires an updated MIOC card (P/N 6089020) to provide accurate timestamping information.

The customer is responsible for the following functions to use TPNS in simulation tests:

- Determining and specifying significant network configuration, operational and timing alternatives to test.
- Developing the appropriate test data for meaningful transaction messages and application conditions.
- Executing the provided programs for transaction rate tables, or developing unique rate tables to characterize the application activity.
- Preparing TPNS scripts or message files to define the messages and operating parameters.
- Executing report programs to analyze message data transfers and performance approximations.
- Interpreting output results and modifying application programs and test parameters for subsequent runs.
- Developing specialized analysis programs to examine message data or time stamps for the TPNS log tape.

In connection with suggested customer use of TPNS, whether by formal proposal or not, the customer must be furnished, in writing, with the following statement as well as the other pertinent customer responsibilities as set forth above.

"The terminal network simulations provided by TPNS are believed to be sound, but IBM does not warrant or guarantee that users can or will achieve similar results on networks with actual terminals attached. Other IBM terminal devices announced as compatible with the IBM devices specifically simulated by TPNS may be supported in compatibility mode. The simulations will be equivalent only to the extent that the compatible devices function identically. It is the user's responsibility to determine and validate input data and

PROGRAM PRODUCTS

TPNS V2 (cont'd)

determine the extent to which these simulation results are relevant to the user's application and system environment."

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

TPNS is designed to run in an IBM S/370 Processor.

One tape drive is required if message logging to tape is desired. In addition, multiple drives may be specified for alternating tape reels of log messages.

For TPNS simulation runs, DASD storage space is required for the following partitioned data sets:

- User network/message definition records
- TPNS CPU and Control Program load modules
- Rate tables (optional)

For a TPNS Control Program system generation run, 800 tracks of IBM 3330 DASD storage (or equivalent space on IBM 3340, 3350 or 3380 DASD) is required for TPNS and TPNS Control Program macro libraries, object libraries and tables.

At least two communications controllers are required when executing TPNS (see exception above). One communications controller must be dedicated to TPNS during the simulation run, and must be either a 3705 Communications Controller (Mdl I or Mdl II) or a 3725 Communications Controller. TPNS can support multiple communications controllers if larger line configurations are required. The other required communications controller is the one used by the system under test.

A TPNS 3705 requires a type 1, type 2, type 3 or type 4 channel adapter, a type 2 or type 3 communications scanner, a minimum of 80K bytes of storage, and sufficient line adapters to simulate the line configuration required. If the 3705 has the 'N ROS' feature (#9566) installed, the loader and dump utilities must be those supplied in the System Support Programs for ACF/NCP/VS (SSP) program product (5735-XX3). If the 3705 has more than 256K bytes of storage, then SSP Version 1 Release 2 or later is required.

A TPNS 3725 requires a 3725 channel adapter, a 3725 communications scanner, and sufficient line adapters to simulate the line configuration required. The loader and dump utilities used must be those supplied in the SSP Version 2 Release 1.1 program product (5735-XXA).

The *TPNS Program Reference Manual* contains information for estimating TPNS communications controller storage requirements.

SOFTWARE REQUIREMENTS

TPNS executes in the virtual mode (V=V) or real storage (V=R) under any current release of OS/VS1, OS/VS2 (MVS), MVS/System Product Version 1 (MVS/SP V1) and MVS/Extended Architecture (MVS/XA) or subsequent releases of these SCPs unless otherwise specified.

The TPNS virtual region size required for a minimum network of up to five lines and five terminals is 704K bytes. The *TPNS Program Reference Manual* contains additional information necessary for calculating individual region requirements. The TPNS preprocessor will report the control block size required for a TPNS network for each run.

A TPNS Control Program is supplied to execute in the communications controller allocated to TPNS, and to provide line scheduling and I/O operations. This control program can be used only with TPNS, and it must be generated by the user according to the required line configuration.

The 3705 or 3725 Communications Controller and Network, when used by TPNS, will be serviced by Field Engineering.

ADVANCED TELECOMMUNICATIONS FUNCTION
for VTAM VERSION 2 RELEASE 1

PURPOSE

Advanced Communications Function for VTAM (ACF/VTAM) Version 2 extends subsystem support, offers new and enhanced capabilities, and adds support of the communications adapter on the 4321 and 4331 processors (VSE only). Advanced Communications Function for VTAM Version 2 Release 1 (ACF/VTAM V2 R1) is a program product for users of OS/VS2 (MVS), OS/VS1 and VSE that offers additional capabilities for networks with single or multiple S/370, 30XX and 4300 processors in the areas of data communications, problem determination, ease-of-use, and network configuration, operation, management and control. ACF/VTAM Version 2 incorporates multisystem networking capabilities. Also included is support of the communications adapter for VSE systems, and channel-to-channel connections for OS/VS systems.

OVERVIEW

ACF/VTAM V2 provides telecommunications support for channel-attached and SDLC link-attached communication controllers* in network control mode, for SDLC devices and BSC 3270 devices attached to a communications adapter (VSE only), and for locally attached devices. In addition, ACF/VTAM V2 controls the sharing of telecommunication resources between application programs, and supports the concurrent execution of multiple teleprocessing applications.

* The term communication controller is used in these pages to refer to the IBM 3705 Communications Controller.

Using the communication controller or the OS/VS host system's channel-to-channel adapter, ACF/VTAM V2 provides for the direct transmission of messages between application programs and terminals. An application program need only be responsible for device control characters in data streams.

The types of devices supported are:

- SNA-SDLC devices.
- BSC 3270 devices.
- SNA and certain non-SNA channel-attached devices (including support of the 4331/4321 Loop Adapter feature on VSE and OS/VS1).
- Various Asynchronous (Start/Stop) and BSC devices through the Network Terminal Option (NTO) program product with ACF/NCP/VS.

The interface for application programs allows the user to control connections between application programs and other application programs or terminals, as well as to request data transfer. A single request for connection or input can be directed simultaneously to more than one terminal.

The ACF/VTAM V2 application program interface is upward compatible for the three virtual storage operating systems (VSE, OS/VS1 and OS/VS2 (MVS)). It is designed for long-term stability and to aid user teleprocessing growth.

The program operator facility of the application program interface allows an authorized application program to enter ACF/VTAM V2 operator commands and receive ACF/VTAM V2 operator messages.

Network operator control facilities are provided, enabling users to monitor and reconfigure their network to meet fluctuating requirements.

In OS/VS2 (MVS), ACF/VTAM V2 provides time sharing support through its integrated time sharing option (TSO/VTAM). TSO/VTAM extends the line and terminal sharing benefits of ACF/VTAM V2 to TSO users. TSO is a standard feature in OS/VS2 (MVS) that provides conversational time sharing facilities.

ACF/VTAM V2 enables the user to have cross-system communications providing resource sharing, distributed processing and increased resource availability.

Configuration Restart Facilities allow the ACF/VTAM V2 network to be reinstated after a failure or a normal deactivation occurs. Manual switching support to a backup processor or communication controller is provided.

Encrypt/Decrypt Feature: The ACF/VTAM Encrypt/Decrypt Feature (Feature #6000 for OS/VS only) for ACF/VTAM Version 2, in combination with the Programmed Cryptographic Facility program product (5740-XY5) or the Cryptographic Unit Support program product (5740-XY6) permits encryption and decryption of messages.

When supporting a communications controller, ACF/VTAM V2 is designed to operate with ACF/NCP/VS Release 2.1 or 3. Some of the capabilities provided by ACF/VTAM V2 are supported only in conjunction with ACF/NCP/VS Release 3. A summary of this support appears later in these pages.

HIGHLIGHTS

ACF/VTAM V2 R1 is a data communication access method based on Systems Network Architecture (SNA) that controls communication between elements in an SNA communication network. It uses the facilities of the operating system and of virtual storage to provide the following services:

- Device support:
 - SNA SDLC devices.
 - BSC 3270 devices.
 - SNA and certain non-SNA channel-attached devices (including support of the 4331/4321 Loop Adapter feature on VSE and OS/VS1).
 - Various Asynchronous (Start/Stop) and BSC devices through the Network Terminal Option (NTO) program product with ACF/NCP/VS.
- Support of SDLC devices and BSC 3270 devices attached to a communications adapter.
- Support of channel-attached and SDLC-link-attached communication controllers with ACF/NCP/VS, including multiple channel attachment and extended NCP ownership and interconnection.
- Support for channel-to-channel adapters for multisystem communication in OS/VS2 (MVS) and OS/VS1.
- ACF/VTAM V2 R1 hosts can function as intermediate nodes in the network, for example, when connected to each other via channel-to-channel adapters.
- Support for downstream load of devices via the Downstream Load Utility program product.
- Switched network backup support for SNA-SDLC devices for extended availability.
- Support of CICS/VS, IMS/VS, TSO, JES, VSE/POWER, VM/VCNA, NCCF, and many other related IBM subsystems and program products.
- Support of the Communications Network Management program products:
 - Network Communications Control Facility (NCCF)
 - Network Problem Determination Application (NPDA)
 - Information/System
 - Network Logical Data Manager (NLDM)
- Integrated multisystem networking capabilities.
- Simplified single-tape installation and ordering procedures (including multisystem networking capabilities).
- Ability to easily modify, replace or suppress ACF/VTAM messages to suit installation needs or preferences.
- Enhanced processing to improve network performance and reliability of large SNA messages sent from ACF/VTAM application programs.
- An interface for application programs to control connections between application programs and other application programs or terminals, as well as to request data transfer.
- Provides an application program interface (API) compatible with the ACF/VTAME and ACF/VTAM Version 1 Release 3 Record API on OS/VS2 (MVS), OS/VS1 and VSE, to facilitate migration.
- Application program interface (API) enhancement to allow programs to determine, at assembly and at execution time, what particular functions are supported with the given level of ACF/VTAM being used.
- Allows communication between two IBM subsystems or two user-written ACF/VTAM application programs, including parallel sessions.
- Permits flexibility in initiating sessions by allowing the two ends of a session to negotiate the session initialization parameters.
- Provides parallel links and transmission groups for increased bandwidth, multiple routes for communication route backup, and multiple priority levels for improved traffic control.
- Time Sharing Option (TSO) (OS/VS2 MVS) includes support for SNA/SDLC interactive terminals, non-SNA 3270 systems and, via the Network Terminal Option program product, the following selected Start/Stop terminals:

The 2741 Communications Terminal ... the 3101 Display Terminal (TWX Model 33/35) ... the 3767 Communications Terminal ... the 6733 Communication Module (CPT-TWX Model 33/35) ... the Western Union Teletypewriter Exchange Services (TWX

PROGRAM PRODUCTS

ACF/VTAM V2 R1 (cont'd)

Model 33/35) ... and the World Trade Teletypewriter Terminal (WTTY).

- Extensive capabilities to enhance the reliability, availability and serviceability of ACF/VTAM networks.
- Allows control of (a) communication controller(s) of one host processor to be transferred to another host processor. It also permits control of the terminals of a communication controller to be divided among multiple host processors.
- Dynamic buffer pool allocation to optimize the use of main storage.
- Session pacing to help avoid buffer overruns.
- Execution of ACF/VTAM V2 in a problem program partition, region, or address space, rather than as a system task or as part of the application.
- Dynamic display and dump of ACF/NCP/VS storage.
- SDLC data link test, terminal connectivity test, route test, Transmission Group trace, and intensive mode recording of SDLC data link errors, to assist in network problem determination.
- Dynamic collection of tuning statistics.
- Provides network operation and control facilities that allows users to monitor, control and reconfigure the network to meet fluctuating requirements. The network configuration may be changed while the network is being used.
- Capability to concurrently trace up to eight lines with ACF/NCP/VS.
- Ability to trace events that are occurring internally between ACF/VTAM V2 modules.
- Session outage notification to both ends of a session if the supporting route becomes inoperative.
- Provides flow control capability for enhanced management of network traffic demands.
- Dynamic reconfiguration of nonswitched SNA-SDLC devices.
- Reliability and Availability Enhancements for OS/VS2 (MVS).
- Supports the CCITT X.21 switched protocols when the communication controller is natively attached to an X.21 network.
- Consolidated task-oriented reference library, including a Master Index.

ACF/VTAM Version 2 is intended as a complete replacement for ACF/VTAM (Releases 1, 2 and 3) and the Multisystem Networking Facility feature, as well as for ACF/VTAME.

ACF/VTAM V2 R1 is designed to operate with ACF/NCP/VS Releases 2.1 and 3. Some of the capabilities provided by ACF/VTAM V2 R1 are supported only in conjunction with ACF/NCP/VS Release 3. A summary of this support appears in "Migration and Planning Considerations". ACF/VTAM Version 2 operates without ACF/NCP/VS when used with a communications adapter.

SPECIAL FEATURES: The ACF/VTAM Version 2 Encrypt/Decrypt Feature (OS/VS only), in combination with the Programmed Cryptographic Facility program product, provides the following functions:

- Permits encryption and decryption of messages in single and multiple domain networks (when used in a multiple domain network, the Encrypt/Decrypt Feature is required in each domain that uses cryptography).
- Permits ACF/VTAM application programs generally to run unaltered with the Encrypt/Decrypt Feature and allows them to select encryption for particular sessions or for particular messages within sessions.

DESCRIPTION

SUMMARY and ADVANTAGES

ACF/VTAM V2 R1 is an SNA (Systems Network Architecture) access method with which users can build a wide variety of data communication networks. Using SNA within the network:

- Provides a consistent and comprehensive structure for communication system growth.
- Minimizes the effects of system changes.
- Distributes network functions away from host processors.
- Allows sharing of network resources.
- Supports many different kinds of communication devices.
- Extends system functions conveniently and effectively to users.
- Minimizes users' involvement in details of system operation.

ACF/VTAM V2 R1 supports a wide variety of related IBM programs, as well as user-written application programs, all of which can share the

network resources. This provides for a more efficient use of lines, terminals, communication controllers, channel-to-channel adapters, and other network resources, because they are not dedicated to a single application program.

Provides an Interface for Application Programs:

- Provides an application program interface (API) compatible with the ACF/VTAM Releases 1, 2 and 3 API on OS/VS2 (MVS), OS/VS1 and VSE. This facilitates migration. It is also compatible with the ACF/VTAME and VTAM Level 2 API.
- Provides for the direct transmission of messages between application programs and terminals, making the network communication elements, such as the communication links and the communication controllers, transparent to the application program. It permits use of resources without specifying knowledge of their location.
- The program operator facility of the application program interface allows an authorized user-written application program to enter ACF/VTAM V2 operator commands and receive ACF/VTAM V2 operator messages.

Single and Multiple Host Environments Supported:

- Can be used in a single-system environment, as well as in a multiple-system environment (with its integrated multisystem networking capability).
- In a multiple-system environment, ACF/VTAM V2 R1 can be connected* to other processors that have installed one of the following IBM program products:
 - ACF/VTAM Version 2.
 - ACF/VTAM Releases 1, 2 and 3 with the Multisystem Networking Facility feature.
 - ACF/VTAME.
 - ACF/TCAM with the Multisystem Networking Facility feature.
- * The connection can be through an SDLC cross-domain link, or through a channel-to-channel adapter (OS/VS systems only, including OS/VS guest operating systems on VM/370), or through a communication controller with the multiple channel attachment capability supported by ACF/NCP/VS (not applicable to ACF/VTAME), depending on the cross-domain connections supported by the other SNA hosts in the multisystem network.

This allows application programs and terminals that are controlled by ACF/VTAM V2 R1 to communicate with application programs in another domain of the multiple-system network. It also allows application programs and terminals controlled by another domain in the network to communicate with ACF/VTAM V2 R1 application programs.

Through adequate planning and network design, multisystem networking can be used to make IBM program products and user-written application programs, installed in one SNA host, available to users of other SNA hosts in the SNA network. In some cases, this may provide for:

- Significant extension of the services available to the end users of the various connected SNA hosts, without unnecessary duplication of resources.
- Backup services to the end users of the SNA network, when a failure occurs in certain elements of the network.
- Balancing of the load in the various hosts in the network.

Extended NCP Interconnection: Capabilities for interconnecting communication controllers in single and multiple system networks ... In ACF/VTAM V2, a communication controller may be link-attached via Transmission Groups to one or more channel-attached and/or link-attached communication controllers.

These capabilities can significantly expand the installation's configuration options. Also, they can improve the overall efficiency of the network and improve the ability of a host processor to take over a communication controller whose current owner (or a link to that owner) has failed or has been deactivated.

Extended NCP Ownership: As many as eight host systems can share the ownership of an NCP in a communication controller that is channel-attached* and/or link-attached to another communication controller(s). If one of the host systems fails or gives up control of the communication controller, each of the remaining host systems is notified. This notification serves as a signal for using the enhanced take-over capability described below. All host systems that share ownership of an NCP in a communication controller can also share ownership of SDLC links that connect the communication controller to other communication controllers. A shared SDLC link is not deactivated until all owning host systems give up control of the link. Each of the host systems is notified if a link that it owns fails, or if the adjacent communication controller becomes inoperative.

PROGRAM PRODUCTS

ACF/VTAM V2 R1 (cont'd)

* The channel and SDLC link attachments cannot exceed the number of channels and SDLC links supported by the communication controllers.

Support of the Downstream Load Utility Program Product: In OS/VS1 and VSE, ACF/VTAM V2 supports the Downstream Load Utility program product for IBM 3644 Automatic Data Units (ADU) and IBM 8775 Display Terminals. Downstream load support in ACF/VTAM permits the operation of:

- 8775s with Advanced Functions, when attached via either the 4331/4321 Loop Adapter feature or an SDLC line to a communication controller operating with ACF/NCP/VS, or an SDLC line to a communications adapter.
- 3644 ADUs when attached via the 4331/4321 Loop Adapter feature.

In MVS, ACF/VTAM supports Downstream Load Utility program product for 8775s with Advanced Functions and/or equivalent products such as the 7426 Terminal Interface Unit when attached via an SDLC line to a communications controller operating with ACF/NCP/VS.

Switched Network Backup: Switched network backup support for SNA-SDLC devices allows (a) control unit(s) associated with a failed or deactivated nonswitched line to be reactivated through an alternate, switched line, or (b) terminals associated with a failed or deactivated control unit (switched or nonswitched) to continue to receive communication support through reconfiguration to a backup, switched control unit.

Support of the Network Communications Control Facility (NCCF) Program Product: ACF/VTAM V2 provides an interface to support the problem determination and network operation facilities offered by NCCF.

Network Terminal Option Program Product Support: Provides support to users that want to move to an SNA data communications environment while continuing to access the following non-SNA terminal devices:

- 2740 Communications Terminal mdl 1.
- 2741 Communications Terminal.
- 3101 Display Terminal (TWX mdl 33/35).
- 3780 Data Communications Terminal (BSC).
- 6733 Typewriter Communication Module (TWX mdl 33/35).
- Western Union Teletypewriter Exchange Services (TWX mdl 33/35).
- World Trade Teletypewriter Terminal (WTTY) (nonswitched only).

NLDM Program Product Support: The NLDM program product, which runs as an application on NCCF, is supported in OS/VS2 (MVS) environments. ACF/VTAM will accept requests from NLDM to capture session initiation/termination data for all resources it controls and to continuously trace all data passing between selected network resources. The session data and trace data are sent to the NLDM application, where they are correlated to assist in performing session-level problem determination.

Application-to-Application Communication: Communication between two ACF/VTAM V2 applications offers users greater flexibility to design and implement more efficient application processing in a network. For example, a single application may provide centralized processing for other applications as well as terminal users. This may eliminate duplicate processing support, and optimize the use of system resources among multiple application programs. This facility also adds the flexibility for multiple sessions to operate concurrently between two application programs that reside within a single host system or across different host systems.

Negotiable Session Initialization Parameters: Permits increased application program control of sessions between user-written application programs that reside within a single host system or across different host systems. During session initialization, two application programs (via the ACF/VTAM V2 application program macro interface) can dynamically exchange certain session parameters to establish and/or modify transmission control and integrity of session data. With this capability, it may be possible for a user to simplify the predefined installation of intercommunicating application programs.

Parallel Links: Multiple active SDLC links between adjacent communication controllers ... Parallel links allow data traffic to flow simultaneously over two or more SDLC links between adjacent communication controllers. All such links can be operational and in use at the same time, and each can be activated or deactivated independently of the others. This capability can provide increased message flow and improve the availability and reliability of transmissions between communication controllers.

Transmission Groups: Logical groupings of transmission links between adjacent network nodes ... A user may define up to eight Transmission Groups, each with one or more SDLC links between adjacent communication controllers. A Transmission Group permits multiple SDLC links to be defined as a single logical link. Only a single TG containing a

single link is supported between adjacent subareas connected through a communications adapter. A single channel between a host and its channel-attached communication controller is also defined as a Transmission Group. If a link or links in a Transmission Group fails, session traffic will automatically be placed on remaining active links without loss of data. This enhances the reliability and availability of service between communication controllers. Multiple Transmission Groups and appropriate route selection permit a user to specify message traffic for different applications to flow through a network via pre-assigned Transmission Groups. For example, interactive processing may be assigned one group and batch processing may be assigned a different group, each with its own physical link support.

Multiple Routes: Multiple routes for SNA and non-SNA message transmission between nodes in a network ... A user may define up to eight routes for message transmission between two host systems or between a host system and a communication controller. When a session is initiated between two application programs or between a terminal and an application program, one of the routes is automatically selected to transmit the session traffic. The user may limit the selection to a particular route or to one of an ordered sequence of routes. Thus, it is possible to distribute the traffic for different sessions to different routes, dividing the load among several routes. Parallel sessions between two applications can take advantage of multiple routes so that failure of one route does not disrupt all sessions.

The ordered sequence of routes, determined by the installation, defines the set of alternate routes available for session traffic. In the event a route becomes inoperative during a session, the application program or terminal may request that the session be re-initiated. This causes automatic selection of one of the alternate routes. The user can then resynchronize the session data traffic and continue data communications and application processing via network routes that remain in operation.

Multiple Priority Levels: Three levels of transmission priority selectable by session ... A user can specify one of three message traffic priorities for a session between two application programs or between a terminal and an application program. For example, this permits message traffic for a time dependent session to be transmitted through a network ahead of other message traffic. That is, interactive processing may be given top priority by users while other network traffic, such as batch processing, is assigned to a lower priority by users.

TSO/VTAM Support: In OS/VS2 (MVS), ACF/VTAM V2 provides time sharing support through its integrated time sharing option (TSO/VTAM). TSO/VTAM extends the line and terminal sharing benefits of ACF/VTAM V2 to TSO users. TSO is a standard feature in OS/VS2 (MVS) that provides conversational time sharing facilities.

- TSO/VTAM allows installations to specify whether data is to be treated as 'confidential text' or not. Data not to be treated as confidential text remains unaltered in the ACF/VTAM V2 buffers and may aid in problem determination.
- Provides the capability to initiate and terminate a Generalized Trace Facility (GTF) trace for individual TSO/VTAM user sessions.
- ACF/VTAM V2 provides the ACF/VTAM V2 operator with a Display command option which provides for the specification of a TSO user identification. The output of the display will contain:
 - An indication that this is a TSO userid display.
 - The application name (for example, TSO0005).
 - The terminal name (for example, SNA3270B) associated with the specified userid.
 - The status as known by ACF/VTAM V2 of both the application and the terminal.
 - An indication as to whether the TSO/VTAM GTF trace is in effect for this TSO userid.

Enhanced Restart of Host-to-Terminal Control Sessions: In recovering from a host failure or a route failure on the host-to-terminal control session, a host system can recover its control session for a 3770 MLU, 3271-11, 12**, 3275-11, 12**, 3274-1C, 21C, 31C, 51C/SNA*, 3684, 5285, 5288, S/32, S/34 or S/38 without disruption of existing sessions between the device and application programs. This permits user applications that are not affected by such a failure to continue processing during and after recovery of the control session. For other terminals, restart of the control session results in Session Outage Notification.

* These products must be at the appropriate EC microcode level to provide this function.

** Support of these devices is provided by ACF/NCP/VS R3.

Enhanced Takeover of a Communication Controller: In the event a host system fails or otherwise gives up control of a communication controller, any host system that is sharing ownership of the same communication controller will have its network operator notified about the lost host. Any of the notified host systems can take over control of

ACF/VTAM V2 R1 (cont'd)

the devices mentioned above without disrupting their existing cross-domain sessions with application programs. It is unnecessary to deactivate corresponding cross-domain resource definitions before acquiring resources attached to the communication controller that were controlled by the lost host system.

Enhanced Multiple Host System Restart: In recovering from a failure situation, two host systems can restart their control session without disruption of existing cross-domain sessions between two application programs or between a terminal and an application program. This permits user applications that are not affected by such a failure event to continue operations during and after recovery of the host systems' cross-domain control session.

Dynamic Buffer Allocation: ACF/VTAM V2 can dynamically allocate main storage for buffer pools according to message traffic loads and availability of main storage resources. This gives users considerable flexibility to optimize the use of main storage for buffer pools and determine buffer pool space requirements that are consistent with throughput and response time.

Inbound Pacing Support for 3270, 3730, 3790 and 8100: This facility is supported as a user-selectable session establishment function under ACF/VTAM V2. Pacing of inbound message traffic for a user application program can help avoid buffer overrun.

VTAM as a User Task: Permits the operator to unconditionally terminate ACF/VTAM V2, without waiting for resources to be released. Upon termination, all system resources acquired by ACF/VTAM V2 are released, and the partition, region or address space may be used for other purposes.

Dynamic Display of ACF/NCP/VS Storage: Allows a network operator to display any contiguous 256 bytes of ACF/NCP/VS storage without disrupting normal ACF/NCP/VS operation. This display capability, provided in hexadecimal representation on a network operator console, can be useful in dynamically evaluating network problem situations.

Dynamic Dump of ACF/NCP/VS Storage: A network operator can invoke a dump of ACF/NCP/VS storage from a channel-attached or SDLC-attached communication controller. Since ACF/NCP/VS continues to operate during the dump process, the dump will represent ACF/NCP/VS status over a period of time. The dump contents are recorded and printed via the facilities of the appropriate System Support Program (SSP) for ACF/NCP/VS and can be useful in dynamically evaluating network problem situations.

SDLC Data Link Test: Offers the capability to dedicate one station on an SDLC link to testing while allowing the remaining stations on that link to remain active. When a station comprises a cluster control unit and its attached devices, the control unit is dedicated to the test and its attached devices are deactivated.

Terminal Connectivity Test: Provides the capability of initiating an echo test from the terminal end of a session to determine that a terminal and its connection to ACF/VTAM V2 are functioning properly. The test does not interfere with other stations on the link or with other devices on the same control unit.

Route Verification and Error Notification Facilities: A network operator can determine if a message route originating in his host is operative or inoperative. This permits a network operator to verify the availability of network routes and to take corrective action for routes that may have become inoperative. It also permits a network operator to verify that a route has been returned to service following a failure or deactivation. During the verification, appropriate resource owners are notified when an inactive or failed resource is encountered on a route.

In addition, if during network operation a route fails, an awareness message is issued at the host system end point(s), identifying the inoperative route to the network operator. This permits a network operator to take appropriate action to minimize the effects of an unusable message on network applications.

Transmission Group Trace: The SNA headers of message traffic over a Transmission Group between two communication controllers can be traced as if it were a single SDLC line. This allows for the collection of transmission control information without tracing the entire message.

Intensive Mode Recording of SDLC Data Link Errors: A network operator can dynamically invoke and terminate recording of information about temporary errors that may be occurring on an SDLC data link. This capability supplements support that records permanent error information and permits a user to collect additional information on SDLC data link errors. This detailed information may preclude the need for more specific testing to re-create an error.

Tuning Statistics: A tuning statistics function permits dynamic accumulation of data about the I/O interface to a channel-attached communication controller, a channel-attached 3790 or channel-attached host processor. Such data may aid a user in determining and selecting optimum values for start parameters and network definition.

Operator DISPLAY Command: DISPLAY command capabilities permit a network operator (or programmed operator application) to obtain information about the status of network resources; that is, nodes, lines,

terminals, logical units, physical units, application programs and buffers. Such information may be useful for status purposes, for performance analysis or to determine if an action is required for a failing element in the network.

This information provides both detailed status to the network operator and serves also as an aid for problem determination. When appropriate, the resource's status will have an identifier appended to it indicating that it is either a virtual resource (i.e., a Network Terminal Option resource) or, has been reconfigured by the Dynamic Reconfiguration facility or, in the case of network backup, has been acquired from another host system's domain. Session and resource status information is included in the display output to aid the network operator in resource management.

Multiple Line Trace: Provides the capability to trace concurrently a maximum of eight lines with ACF/NCP/VS. The trace data is recorded on a file and may be printed using the ACF/TAP (Trace Analysis Program) System Support Program (SSP) of ACF/NCP/VS.

VTAM Internal Trace: ACF/VTAM provides:

- The ability to trace events that are occurring between ACF/VTAM V2 modules.
- The ability to terminate or initiate the VTAM Internal Trace Facility at VTAM initialization time.
- The ability to have the VTAM Internal Trace records recorded on an external file.

Session Outage Notification Enhanced Awareness of Session Outages: If the route supporting a session becomes inoperative, then, via SNA protocols, the session ends are made aware of the outage. Session re-initiation may be requested as described under "Multiple Routes".

Flow Control Management of Network Traffic Demands: Via SNA protocols, the flow of message traffic is dynamically regulated between a host system and a communication controller and between two host systems. Continuous feedback is exchanged between network resources in order to regulate network traffic and reduce the possibility of network congestion. When necessary, the feedback triggers local flow control mechanisms in ACF/VTAM V2. Applications and local terminals may be temporarily prevented from introducing more data into a congested network.

Dynamic Reconfiguration of Nonswitched SNA-SDLC Devices: Allows the network operator to selectively add or delete supported nonswitched SNA-SDLC devices, without disrupting other network functions. This capability supplements the ACF/NCP/VS generation process, and supports temporary configurations in a non-disruptive fashion until a permanent network control program generation can be done.

In OS/VS, ACF/VTAM V2 Usage of Application Program Private Area Can Be Limited: ACF/VTAM V2 allows an installation, when defining an application program, to limit the amount of private area storage ACF/VTAM V2 may request to queue data arriving for the application program.

Reliability and Availability for OS/VS2 (MVS):

- Capability to have the application program span multiple address spaces:

ACF/VTAM V2 permits application program interface (API) requests from a single application program to originate from different address spaces and to reference a single application program access method control block (ACB). This multiple address space facility can provide application programs with enhanced capabilities for error isolation and session protection. This capability will also allow application program design flexibility by permitting individual sessions to be assigned to their own address space while being allowed to reference a single ACB. Improved operation may also be achieved by grouping sessions with similar characteristics or functions to be performed in one address space.

- Levels of error isolation:

To minimize the disruption caused by an error detected while ACF/VTAM V2 is processing, ACF/VTAM V2 attempts to isolate the error to:

- The failing API request.
- The session issuing the API request.
- The task containing the session.
- The application program.

Also, if a task or address space is terminated while processing for other than ACF/VTAM V2, ACF/VTAM V2 attempts to isolate the disruption to the task structure or address space involved.

PROGRAM PRODUCTS

ACF/VTAM V2 R1 (cont'd)

- OS/VS2 (MVS) authorized path mode of operation for ACF/VTAM V2 application program interface (API) macro instructions and exit routines:

An ACF/VTAM V2 authorized application program may use the ACF/VTAM V2 API macro instructions and exit routines in the OS/VS2 (MVS) authorized path mode of operation (via the system request block (SRB) mode of operation). All API macro instructions (except for the OPEN, CLOSE, MODCB, TESTCB, GENCB and SHOWCB macro instructions) can be used in this mode of operation. Selection of authorized path mode is under control of the application program via API macro instruction operands.

All exit routines associated with an ACF/VTAM V2 application program can make use of this authorized path mode of operation. The selection of authorized path mode is specified when the application program is defined.

Application programs selecting the authorized path mode of operation may realize improved ACF/VTAM V2 performance.

CCITT X.21 Support: ACF/VTAM V2 supports the following CCITT X.21 switched functions when attached to an X.21 network through a communication controller:

- Address calling.
- Auto answer.
- Call progress signal.
- Direct call.
- Closed User Groups.
- Abbreviated Address Calling.

RELATED IBM PROGRAMS

The following related IBM programs and program products are supported by ACF/VTAM V2 R1:

TYPE	PROGRAMS	MVS	VS1	VSE
DB/DC	CICS/VS	*	*	*
	IMS/VS	*	*	
Job Entry	FTP	*	*	*

¹ Supported through CICS/VS.
² Supported through TSO/VTAM.
³ Supported through VSPC.
⁴ Supported through NCCF.
⁵ Supported through IMS/VS.
⁶ Supported through VSE/ICCF.
⁷ For VSE, Release 2 supports NPDA Release 2.
⁸ VTAM PTF required.

Note: Refer to the appropriate product documentation for information on programming support for specific devices supported and other related IBM program capabilities.

User programs properly coded to use the ACF/VTAM Version 1 application program interface (API) will also be supported by ACF/VTAM Version 2. Refer to "Compatibility" for further information.

CUSTOMER RESPONSIBILITIES

To install and use ACF/VTAM Version 2, the customer must:

- Design the single system network.
- Order and install all required communications equipment.
- Install ACF/VTAM V2 R1.

ACF/VTAM V2 R1 (cont'd)

- Define the network to ACF/VTAM.

When ACF/VTAM Version 2 supports a communications controller, the customer also must:

- Install ACF/NCP/VSE (unless all terminals are local, i.e., channel-attached to the host).
- Define the network to ACF/NCP/VSE (if applicable).

To use the ACF/VTAM V2 R1 multisystem networking functions, the customer must:

- Design the multiple-system network.
- Order and install any additional communications equipment (e.g., intersystem links between interconnected communication controllers) or channel-to-channel adapters required.
- Install ACF/VTAM V2 R1.
- Install ACF/NCP/VSE (if required).
- Define the multisystem network to ACF/VTAM and ACF/NCP/VSE (if required) in each system.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

ACF/VTAM Version 2 Release 1 is designed to run in a virtual storage environment in any IBM system configuration that supports the OS/VS2 (MVS), OS/VS1 or VSE operating system as specified in "Programming Requirements".

The host processor instruction set must include the Compare and Swap and the Compare Double and Swap instructions.

For remote or cross-domain communications, ACF/VTAM V2 R1 requires a communications adapter feature (standard on the IBM 4321 processors and optional on the IBM 4331 processors), a 3705-1, 3705-II or 3705-80 Communications Controller, with the appropriate level of ACF/NCP/VSE, or a channel-to-channel adapter connecting it to another ACF/VTAM V2 R1 host (OS/VS only).

Storage Considerations: Requirements for host processor storage and for disk storage for ACF/VTAM data sets can be calculated by using the *ACF/VTAM Planning and Installation Reference* manual. Requirements for disk storage for NCP data sets can be calculated by using the *ACF/NCP/VSE Installation* manual. Storage requirements for communication controllers can be calculated by using the *ACF/NCP/VSE Installation* manual.

SOFTWARE REQUIREMENTS

ACF/VTAM Version 2 is designed to run with the following operating system releases:

- OS/VS2 (MVS) Release 3.8
- OS/VS1 Release 7.0
- VSE/AF Release 3

ACF/VTAM Version 2 will also run on subsequent releases or modifications of these operating systems, unless otherwise stated in the announcement documentation of future releases or modifications of these operating systems or for ACF/VTAM Version 2. ACF/VTAM Version 2 does not support prior releases of these operating systems.

ACF/VTAM V2 R1 will run in a VM/370 environment using VSE, OS/VS1 or OS/VS2 (MVS) in a guest virtual machine.

The Time Sharing Option of ACF/VTAM (TSO/VTAM) operates only under OS/VS2 (MVS).

The use of certain ACF/VTAM facilities (such as delayed configuration restart of the ACF/VTAM Encrypt/Decrypt Feature) requires the Programmed Cryptographic Facility program product (5740-XY5) or the Cryptographic Unit Support program product (5740-XY6).

For remote communication when supporting a communications controller, ACF/VTAM requires the ACF/NCP/VSE program product Releases 2.1 or 3, running in the communication controller.

Communication between ACF/VTAM Version 2 domains can also be established for OS/VS hosts without a communication controller by connecting these hosts via channel-to-channel adapters.

COMPATIBILITY

The ACF/VTAM V2 R1 application program interface (API) is upward compatible with the ACF/VTAM Version 1, ACF/VTAME, and VTAM level 2 API. Where related IBM programs (for example, CICS/VS, IMS/VS, VSE/POWER, JES1/RES, JES2/RJE, JES2/NJE, JES3/RJP, TSO, VSPC, NCCF, etc.) operate with ACF/VTAM Version 1, ACF/VTAME or VTAM level 2, compatibility is retained for the level(s) of those programs that are current at the availability of ACF/VTAM V2 R1 on the appropriate operating system release, except for the cases where support for specific release level(s) of these products has been indicated elsewhere in these pages. Recompilation of the related IBM programs is not required.

Application programs that use the macro language and control block record mode interface of ACF/VTAM Version 1, ACF/VTAME, or VTAM level 2, should continue to operate without recompilation on the same operating system with ACF/VTAM V2 R1, provided that these programs do not depend on the internal processing characteristics of these access methods.

For ACF/VTAM Version 2, the length of the access method control block (ACB) has increased. Application programs that have been properly coded using the *ACF/VTAM Programming* manual to run on ACF/VTAM Version 1 or ACF/VTAME will run without reassembly on ACF/VTAM V2 R1.

Program operator application programs that have been properly coded using the *ACF/VTAM Programming* manual to run on ACF/VTAM Version 1 or ACF/VTAME will also run on ACF/VTAM V2 R1.

Application programs written for ACF/VTAM Version 1, ACF/VTAME, or VTAM level 2 may require changes to take advantage of the additional functions offered by ACF/VTAM V2 R1.

MIGRATION and PLANNING CONSIDERATIONS

A checklist of migration considerations for current users of ACF/VTAM Version 1 Releases 1, 2 and 3, ACF/VTAME, VTAM level 2, and BTAM-ES is included in the *ACF/VTAM Version 2 General Information* manual. Additional information on migration will be included in the *ACF/VTAM Version 2 Programming* and the *ACF/VTAM Version 2 Planning and Installation Reference* manuals.

MULTISYSTEM CONSIDERATIONS

Initially, host processors that are to participate in a multiple-domain network can install ACF/VTAM with single-domain networks and then the domains can be connected later. This permits an existing domain to continue operating while the multiple-domain network is being developed.

In a multiple-domain environment:

- The ACF/VTAM V2 R1 functions are supported for each respective ACF/VTAM V2 R1 host system.
- An ACF/VTAM V2 R1 host system can coexist in the network with ACF/VTAM Version 1 Releases 1, 2, and 3, ACF/VTAME, ACF/TCAM Version 1 Release 1 and ACF/TCAM Version 2 Releases 1, 2 and 3 host systems, at the level of function supported by these host systems and the intermediate NCPs.
- Cross-domain connections through a communications adapter to a communications controller require ACF/NCP/VSE Release 2.1 or Release 3 in the controller.

ACF/NCP/VSE CONSIDERATIONS

When supporting a communications controller, the following ACF/VTAM V2 enhancements are supported only in conjunction with ACF/NCP/VSE R3:

- Parallel Links.
- Transmission Groups.
- Multiple Routes.
- Multiple Priority Levels.
- Extended NCP Connectivity.
- Extended NCP Ownership.
- Network Flow Control.
- Session Outage Notification.
- Enhanced Restart of Host-to-Terminal Control Sessions.
- Enhanced Takeover of a Communication Controller.
- Enhanced Multiple Host System Restart.
- Route Verification and Error Notification Facilities.
- Transmission Group Trace.
- Support of Release 2 of the Network Terminal Option Program Product.
- Support of the CCITT X.21 Switched Interface.
- Support of intermediate routing nodes for NCPs.

ACF/VTAM V2 with ACF/NCP/VSE Release 2.1 continues support of NTO Release 1.

PROGRAM PRODUCTS

ACF/VTAM V2 R1 (cont'd)

The VTAM-NCP support table that follows lists the releases of each product through which SSCP-PU, SSCP-LU, and LU-LU sessions are supported. It can be used to plan migration from previous releases of VTAM to ACF/VTAM V2R1.

NCPs	NCP5	V1 R1	V1 R2	V1 R2.1	V1R3 (7)	V2	V2	V3	V3
VTAMs						3705	3725	3705	3725
VTAM2	yes	yes	yes	yes	no	no	no	no	no
		(1)	(2)	(2)					
V1R1	yes	yes	yes	yes	yes	no	no	no	no
			3,4	3,4	(6)				
V1R2	no	yes	yes	yes	yes	no	no	no	no
V1R3	no	no	yes	yes	yes	yes	yes	yes	yes
(12)			(5)	(5)		(8)	(9)	(8,9)	
V2R1	no	no	no	yes	yes	yes	yes	yes	yes
(13)				(5)		(10)	(11)	10, 11	

Notes:

- (1) With applicable VTAM Level 2 PTFs.
- (2) OS/VS only, with applicable VTAM Level 2 PTFs:
- OS/VS1: UX14242.
- OS/VS2 (MVS): UZ28810.
- (3) Not supported on VSE.
- (4) With applicable ACF/VTAM V1R1 PTFs:
- DOS/VS Release 34: UD17664.
- OS/VS1: UX14243.
- OS/VS2 (MVS): UZ28811.
- (5) With applicable ACF/NCP/VS V1R2 or V1R2.1 PTFs when connected to ACF/NCP/VS V1R3 or later.
- (6) OS/VS only, with applicable ACF/VTAM V1R1 PTFs:
- OS/VS1: UX14243.
- OS/VS2 (MVS): UZ28811.
- (7) With EREP PTFs for Link Problem Determination Aid (LPDA) level maintenance data records.
- (8) OS/VS2 (MVS) only, with ACF/VTAM V1R3 PTFs UZ90205, UZ90206, UZ90207 and UZ90208. (ACF/VTAM V1R3 for OS/VS1 and DOS/VS does not support sessions with ACF/NCP for the 3725.)
- (9) With applicable ACF/VTAM V1R3 PTFs:
- OS/VS2 (MVS): UZ62633.
- OS/VS1: UX18990.
- DOS/VS: UD26545.
- (10) With ACF/VTAM V2R1 OS/VS2 (MVS) PTF UZ59682. (PTFs not required for OS/VS1 and DOS/VS systems.)
- (11) With ACF/VTAM V2R1 OS/VS2 (MVS) PTF UZ90186. (PTFs not required for OS/VS1 and DOS/VS systems.)
- (12) With applicable ACF/VTAM V1R3 PTF when the network contains any ACF/VTAM V2R2 or ACF/NCP V3 node(s):
- OS/VS2 (MVS): UZ56422.
- OS/VS1: UX17328.
- DOS/VS: UD23966.
- (13) With ACF/VTAM V2R1 OS/VS2 (MVS) PTF UZ56421 when the network contains any ACF/VTAM V2R2 or ACF/NCP V3 node(s). (PTFs not required for OS/VS1 or DOS/VS systems.)

PTFs may be required in addition to those stated above. Contact your IBM support center for updated install information and recommended service before installing these products.

OTHER CONSIDERATIONS

As a result of some of the new capabilities in ACF/VTAM V2 R1, minor network operational differences may exist with ACF/VTAM Version 1.

ACF/VTAM application programs generally will not need to be changed to operate with the Encrypt/Decrypt feature. However, there exist several SNA sense codes that deal only with unrecoverable errors associated with the Encrypt/Decrypt feature, and existing application programs that are not now using the Encrypt/Decrypt feature may need to be changed to handle these sense codes properly. Application programs that already operate properly with the Encrypt/Decrypt feature on ACF/VTAM Version 1 require no further modification to work properly with the ACF/VTAM Version 2 Encrypt/Decrypt feature.

In a mixed ACF/VTAM-ACF/TCAM multisystem environment, the ability of ACF/VTAM to access device characteristics of terminals controlled by ACF/TCAM is limited to those indicators defined and maintained by ACF/TCAM. In particular, the ability to determine the physical device address of a 3271-11, 12 used in the copy function is not supported.

When using the ACF/VTAM V2 R1 capability to modify, replace, or suppress ACF/VTAM messages, it should be noted that user modification of information required for problem diagnosis, such as IBM-supplied command syntax and defaults, might impair the standard serviceability characteristics of the product and may increase the documentation requirements for reporting a problem to IBM. The

IBM-supplied command CSECT should be retained for problem re-creation.

CONVERSION

CONVERTING from BTAM or BTAM-ES to ACF/VTAM V2 R1: Conversion to ACF/VTAM from applications that use BTAM through CICS/VS, IMS/VS, or other IBM subsystems or programs that also support ACF/VTAM, will, in most cases, involve little or no reprogramming. ACF/VTAM V2 supports concurrent use of BTAM-ES and ACF/VTAM V2 in the VSE host. The use of ACF/NCP/VS in the Partitioned Emulation Programming (PEP) mode will ease the transition from BTAM to ACF/VTAM V2 R1 since it allows concurrent use of BTAM and ACF/VTAM by the IBM subsystem or program and permits gradual conversion of communication links and terminals from BTAM/ES to ACF/VTAM with ACF/NCP/VS. This will help to avoid or minimize disruption of the services provided by the application to its users.

Conversion to ACF/VTAM from application programs that use the BTAM macros directly involves reprogramming those applications. The recommended approach is to redesign those applications to use the IBM subsystems (such as CICS/VS or IMS/VS) and obtain multiple benefits, besides ACF/VTAM support, including:

- The intrinsic advantages of using the various data management, multi-tasking, device support, and other functions in the IBM subsystems that exploit and expand the capabilities offered by the operating system.
- Support for a wide variety of existing IBM terminals and other devices.
- Continued updating of support for new IBM terminals and other devices.
- Intersystem communication capabilities (on CICS/VS and IMS/VS).
- Little or no effect on the applications as new releases of the operating system and access methods become available.
- High level interface for application programmers that masks many of the complexities of communications programming.
- Relief to the application programmers from many of the tedious tasks involved in writing communication programs, thus providing more time for the development of the actual applications and capabilities requested by the end users.
- Availability of many programming tools and techniques that extend the capabilities of the IBM subsystems and increase the productivity of the application programmers through IBM program products that operate on the IBM subsystems (such as DL/I, DMS, GDDM, etc.).

As an alternative, the existing BTAM or BTAM-ES applications could be recoded to use the ACF/VTAM macros directly.

MIGRATING from ACF/VTAME to ACF/VTAM V2 R1

On VSE systems, ACF/VTAME application programs will run without recompilation on ACF/VTAM V2 R1, if they have been coded to use the ACF/VTAM API correctly (see the "Compatibility" section).

Recompilation of ACF/VTAME application programs is required for them to run with ACF/VTAM V2 R1 on OS/VS1 or OS/VS2 (MVS). Changes may be required to the portions of the application programs that are dependent on VSE functions and facilities.

The main considerations for applications and networks in a migration from ACF/VTAME to ACF/VTAM V2-VSE are the same as for migration from ACF/VTAM Version 1 Release 2 to Version 2. They are documented in the *ACF/VTAM Version 2 Programming* and the *ACF/VTAM Version 2 Planning Installation Reference* manuals. Following are some additional considerations for network definitions and operation related to communications adapter support:

- ACF/VTAM V2 has no line type default in the GROUP statement; SDLC must be explicitly coded.
- The INBFRS operand of the LINE definition statement for SDLC and BSC lines in the communications adapter must be changed to MAXBFRU.
- The syntax of the MODIFY command is slightly different in ACF/VTAM V2. The ACF/VTAME syntax is also accepted to ease migration.
- Some messages will differ from the corresponding message in ACF/VTAME (message-ID, additional information, terminology).
- Files for configuration restart have to be defined, if specified. Configuration restart is not supported in ACF/VTAME.

In addition to the above, for multi-domain networks, the following considerations also apply:

- PATH statements must be coded for cross-domain routes where the destination subarea is the adjacent subarea.

ACF/VTAM V2 R1 (cont'd)

- Configurations containing ACF/VTAME nodes that are providing an 'IRN' routing function must be migrated to ACF/VTAM in a specific order. See the *ACF/VTAM Version 2 Planning and Installation Reference* manual for a description of this order.

Note that ACF/VTAME and ACF/VTAM cannot be run concurrently on the same host processor, except when using VM/370.

DATA SECURITY, AUDITABILITY and CONTROL

ACF/VTAM V2 R1 enables the installation to establish and maintain the integrity of the data communication network. The installation can control sessions between application programs and terminals.

In particular, auditors will find the following functions to be of interest:

Control

- Application-to-application communication
- Negotiable sessions initialization parameters
- Transmission group
- Multiple priority levels
- Application program interface

Integrity/Recovery

- NCCF/NPDA
- Error isolation
- Multiple routes
- Parallel links
- Switched network backup
- Route verification
- Trace facilities

ACF/VTAM V2 R1 also provides a confidential text capability. The data on sessions defined by the user to contain confidential text is not included in buffer traces. Moreover, buffers containing confidential text are cleared before being returned to the buffer pool.

In OS/VS systems, the ACF/VTAM Encrypt/Decrypt Feature can provide increased facilities to safeguard the information transmitted between logical units in the network.

User management is responsible for the selection, application, adequacy, and implementation of these features and for appropriate application and administrative control.

PERFORMANCE and STORAGE CONSIDERATIONS

Machine requirements are included in the Specified Operating Environment section of these pages. Estimated storage requirements will be included in the *ACF/VTAM Version 2 Planning and Installation* manual.

The design objectives for ACF/VTAM V2 R1 are to have total storage requirements and path lengths approximately the same as for an equivalent ACF/VTAM Version 1 Release 3, and a minimal increase over an equivalent ACF/VTAME system.

Specific user storage requirements will be dependent on the specific configuration and upon the following user-specified areas and functions:

- I/O buffer areas.
- Number and organization of terminals.
- Number and type of macro instructions used.
- Number and size of NLDM program product trace buffers selected (Optional).

Response time in a single system environment depends on a variety of processor and data communication load factors, such as:

- Line speeds.
- Number, type and organization of terminals.
- Number and type of ACF/VTAM commands and exits used.
- Amount of processing done by the application programs.

Response time in a multiple-system environment depends on the factors above and on various network load factors, including the number of nodes traversed.

The actual performance impact (if any) to a customer will vary depending upon his particular hardware and network configuration.

Notes:

- 1 All of these terminals have both single and multiple-system support.
- 2 PU TYPE.
- 3 Switched line support.
- 4 Nonswitched line support.
- 5 Capable of supporting cryptographic sessions.
- 6 Supported as a PU Type 1 3270.
- 7 Supported as a 3272-1,-2.
- 8 Supported as a 3271-1,-2.
- 9 Supported through the Network Terminal Option (NTO) program product with ACF/NCP/VS.
- 10 With the SDLC/BSC switch set to SDLC.
- 11 Supported as a 3275-1,-2.
- 12 Supported as a TWX Model 33/35.
- 13 OS/VS only.

The user should be aware that many terminal and control unit special features are transparent to programming and are therefore readily usable even though not specifically identified. Appropriate line adapters and hardware attachment features must be included in the system configuration.

Terminals that are functionally equivalent to those specifically supported by ACF/VTAM Version 2 may also function satisfactorily with ACF/VTAM Version 2; the customer is responsible for establishing equivalency. IBM assumes no responsibility for the impact that any changes to the IBM-supplied programs or products may have on such terminals.

Notes:

- 1 3278-5 does not attach to 3274-1B or 3274-21B.
- 2 Supported in Data Stream Compatibility mode only.
- 3 Supported with the DPPX 3270 Data Stream Compatibility program product and DPPX/SP Data Stream Compatibility program product.

- 4 Supported through the Network Terminal Option (NTO) program product with ACF/NCP/VS.
- 5 Supported with the System/34 3270 Device Emulation program product (5726-EM1).

PROGRAM PRODUCTS

ACF/VTAM V2 R1 (cont'd)

- 6 Supported with the System/36 System Support program product (5727-SS1), the Communications feature (#6001) and the 3270 Device Emulation feature (#6003).
- 7 Supported with the System/38 Control Program Facility program product (5714-SS1) and the appropriate communications features with 3270 device emulation.

RPOs ACCEPTED: No

MVS SYSTEM INTEGRITY APPLIES: Yes

**VIRTUAL MACHINE/SYSTEM PRODUCT
VM/SP (5664-167)**

PURPOSE

The VM/System Product provides usability and performance extensions to VM/370; it is recommended for users running DOS/VS, VSE, VS1, SVS and MVS under VM/370 on processors supported by those SCPs, or users with high-speed paging devices, and CMS intensive users. The VM/System Product is designed to run on S/370 mdls 135, 135-3, 138, 145, 145-3, 155II, 158, 158-3, 158AP, 158MP, 165II, 168, 168-3, 168AP, 168MP and on 4321, 4331, 4341, 4361, 4381, 3031, 3031AP, 3032, 3033 Model Group N, 3033, 3033S, 3033AP, 3033AP-2, 3033MP, and the 2K storage protect key version of the 3081-D16 Processor Complex in S/370 mode.

SPECIAL SALES INFORMATION

Note: Information on the availability of the VM/SP High Performance Option Licensed Program (5664-173) for VM/SP Release 3 will be available prior to the availability of VM/SP Release 3.

SQL/DS on VM/SP Release 3 will be supported on AP/MP, the 3081-D16 Processor, and the VM/SP High Performance Option concurrent with the above stated availability.

The VM/System Product Release 3 contains all the function previously available in the VM/370 Release 6 SCP, its priced extensions program products (VM/BSE and VM/SE), VM/SP Release 1, and VM/SP Release 2. Refer to the appropriate pages for an overview of the functions provided in each of these products.

DESCRIPTION

Multiprocessor Support: The VM/System Product will offer to users of VM/370 the reliability and availability characteristics of a full multiprocessor environment. The VM/SP will support the 158MP, 168MP and 3033MP configurations with up to 16 channels per processor and a maximum of 32 channels per MP configuration.

3042 Attached Processor Model 2 Support: The VM/System Product, when generated in multiprocessor mode, will support I/O on both sides of a 3033 Attached Processor complex when the complex includes a 3042 Attached Processor mdl 2.

The 3042 mdl 2 offers a standard group of 6 channels, and an optional feature adds another group of 6, for configurations of 18, 22, 24 or 28 channels in a 3033 Attached Processor complex.

3081 Processor in MP Mode: When the 3081 is structured so that a channel set is available to each of the two integral central processors, the multiprocessor mode of VM/SP should be specified. This permits up to 16 channels per central processor and up to an aggregate capability of 24 channels. The 3081 Processor may be structured to limit a single channel set to one of the two central processors inherent in 3081 (AP mode).

Note: VM/SP does not simulate multi-processing for virtual machines other than under Single Processor Mode. A virtual machine will be dispatched by VM/SP on only one of the two processors in an MP configuration unless the Single Processor Mode of the VM/SP is in effect.

Enhanced Attached Processor Support: Several significant enhancements to the VM/370 AP environment are available in the VM/System Product, notably:

- Improved locking logic that may result in a reduction in contention on the global system lock.
- Extended channel error recovery.

In addition, for both the AP and MP environments, several CP commands have been improved to extend the system status and processor activity data available to the system operator.

Improvements in Resource Management

Throughput Improvements: May be achieved in the following environments:

- Systems with real storage bottlenecks.
When a real storage bottleneck is indicated, the resource manager may reduce the effect and increase the level of multiprogramming. This is achieved through the use of improved scheduling and paging algorithms, which give rise to smaller working set size estimates and higher page steal ratios. The net result is that a given real storage size appears more able to contain the given load with improved throughput.
The resource manager also migrates swap tables of interactive users and frees up real storage for other purposes. This may increase the level of multiprogramming and improve throughput.
- Storage bound systems with long running non-interactive users and high multiprogramming levels.
Such systems devote a large part of their paging activity to swapping the long running users in and out of storage as each is given a timeslice. The resource manager reduces this paging overhead by swapping the longest running users into real storage

less frequently but keeping them there for longer periods. This may lower the overall level of paging activity with accompanying reduction in supervisor overhead and some increased throughput.

- Systems that need more paging space than is available on preferred paging devices.

The resource manager maintains active user pages on the high speed or primary paging devices using a page migration scheme. Page wait due to slow access times of secondary devices is reduced and improved processor utilization and throughput may result.

Improved Response to Trivial Interactions: May be achieved in the following environments:

- Where terminal interactions occur for both single trivial commands and nontrivial transactions during terminal I/O.

The resource manager distinguishes between the two types of transactions by tracking the resource consumption rate and giving higher priority to the smallest consumer.

- Where transactions are characterized by a wide range of resource requirements.

The fair share algorithms of the resource manager, which are effective in both compute-bound and paging-bound environments, distinguish between the different resource requirements of the users. Consequently, a better interactive/non-interactive split is achieved with improved responsiveness to trivial transactions.

Improved Installation Management: Over the services provided in the following environments:

- Where multiple users require a specific percentage of the processor.

The SET FAVOR command with percentage option may now be specified for more than one user.

- Where CMS batch facilities run non-interactively.

Directory priority controls may now be utilized to make CMS batch facilities either fully non-interactive to minimize impact on the system, or fully interactive to encourage its use.

CP Performance Improvements

The storage management algorithm for returning free storage to the dynamic area was modified. A check is made every hour and also upon a user logging off, to determine if any dynamic area pages obtained for free storage purposes can be returned to the dynamic area.

The set favored command accepts a percentage specification of 100. This specification is handled as a special case by the scheduler where the designated user will be kept at the top of the run list.

CMS disk I/O (Diagnose 18) takes advantage of ECPS:VM/370 for CCW translation. The improvement is available with the existing ECPS:VM/370 assist on the 3135-3, 3138, 3145-3 and 3148 Processors. The improvement is also available with the ECPS:VM/370 assist on the 4341 Processor.

Addition to ECPS: ECPS for VM/370 on S/370 mdls 135-3, 138, 145-3 and 148, and on the 4321, 4331, 4341 and 4361 Processors has been enhanced to accelerate the processing of the DIAGNOSE Interface between a virtual machine and CP. Because CMS is a heavy user of DIAGNOSE, the CMS user may receive improved performance.

Operation of VM/SP on a 4321 processor is recommended in a VM/CMS-only environment.

Small CP Option: Small CP option reduces real memory requirements for CP which makes more pageable storage available to virtual machines.

Shadow Page and Segment Table Maintenance: VM/SP reduces overhead associated with maintaining shadow tables used to run virtual systems.

Multiple shadow tables will be maintained to reduce the overhead associated with building shadow tables when a different address space within a virtual machine is dispatched.

Shadow table entries will be selectively invalidated when VM/SP (extended by the VM/SP) steals a page from a virtual machine.

Shadow tables can be eliminated for V=R users running a production system.

Shadow table maintenance will be reduced for areas in a virtual system where the virtual address is equal to the real address.

Extended Support: VM/SP will support operating systems that utilize the S/370 Extended Facility of the 3031, 3032, 3033 and 3081 Processors, and the S/370 Extended Feature of the S/370 mdls 158 and 168, provided the S/370 Extended Feature is installed on the hardware. Thus, MVS/Systems Extensions and MVS/System Product can be run under the VM/System Product on these processors.

VM/SP (cont'd)

MVS Guest Environment: Release 1 of the MVS/System Product (JES2, program number 5740-XYS, and JES3, program number 5740-XYN) will be supported as guest operating systems under the VM/System Product.

The cross-memory services of Release 2 of the MVS/System Product (JES2 and JES3) will be supported in the guest operating system environment under the level of VM/System Product which is most current at the time of availability, or Release 2 of MVS/System Product. However, cross-memory services will use the hardware microcode implementation of the 3033 Extension Feature (Feature #6850) only when executing under VM/SP High Performance Option (5664-173).

RELEASE 3 ENHANCEMENTS

- **SQL/DS Support**
SQL/DS is a Relational data base Licensed Program (5748-XXJ). CP and CMS enhancements have been included to allow SQL/DS Release 2 to operate on VM/SP Release 3 without a guest VSE operating system and without VSE/VSAM. These extensions have been provided in a generalized fashion so that other applications may take advantage of them. The CP/CMS Extensions for Application Programs sections below describe this support.
- **System Product Interpreter**
The System Product Interpreter is a new command and macro processor. It can be used for interpreted applications, command processing and generation, for macros such as those used by the System Product Editor, as a desk calculator, mathematical problem solver, or for any other purpose for which an interpreted simple-to-use language is suitable. Syntax is in a high level form which is easy to learn.
- **Highlights of the System Product Interpreter include:**
 - Extended Control Structure:
 - If-Then-Else
 - Select-When-Otherwise-End
 - Do-Interactive-End
 - Iterate and Leave
 - Full set of arithmetic, character, and logical operators
 - Selection of Standard functions
 - Free Format, Mixed Case
 - Interactive Debug
 - In line Function and Subroutine calls
 - Decimal and Scientific arithmetic capability
 - Built-in string parsing instructions
- The System Product Interpreter will be the primary interpretive command and macro processor for VM/SP in the future. It is intended that all future enhancements will be applied to the System Product Interpreter. EXEC and EXEC2 will remain supported and will coexist with the more powerful System Product Interpreter.
- **Programmable Operator Enhancements**
Several enhancements to the Programmable Operator Facility have been added. Among them are:
 - Message routing with nicknames - allow messages to be routed to other than the logical operator or to multiple operators via CMS "TELL". This enhances the ability to have SPOOL and/or TAPE operators at the remote site in addition to a system operator at the host.
 - Remote Node Availability - ability for periodic signaling between a host and remote system and alerting the host operator of the inability to communicate with a remote system. Improved availability is also provided with the capability to recover from Programmable Operator Facility ABENDs.
 - Enhanced text comparison - allows multiple text comparison strings in a routing table entry with logical operations on the strings.
 - EXEC Action Routines - ability for action routines to be written in all EXEC languages supported by CMS, including the new System Product Interpreter.
 - LOG recording and error handling enhancements.
- **Enhanced Serviceability**
 - Symptom Records - A new record will be created that will assist in problem identification. Information from this record can be useful in communicating problems to the IBM support center. The VM Interactive Problem Control Program System Extension (VM IPCS/E 5748-SA1) Release 2 at the then current service level is required to implement this enhancement.
 - S/370 Program Event Recording (PER) support - This enhancement provides CP command support to facilitate debugging in a virtual machine. It uses the S/370 hardware program event recording (PER) feature to monitor successful branches, instructions fetched within an address range, alteration of storage within an address range, and alteration of a specific general purpose register. In addition, the support provides the ability to trace within multiple ranges, compare altered storage and registers to specific values and execute CP commands on specific events.

- **CP Extensions for Application Programs**
Several extensions to CP have been made to support Application programs:
 - A DASD Block I/O System Service allowing a virtual machine fast, device independent asynchronous access to fixed size blocks on CMS formatted virtual DASD I/O devices.
 - Inter-User Communication Vehicle (IUCV) extensions to provide:
 1. Fast communications through data specification in the parameter list and related protocol extensions.
 2. Extended mask capability for individual IUCV control interrupts
 3. Expanded trace capability
 4. Support for the DASD Block I/O System Service
 - Diagnose Zero support of time zone differential from Greenwich Mean Time
- **CMS Extensions for Application Programs**
A number of enhancements to CMS have been included to support applications written to run on CMS:
 - CMS File System Extensions - The CMS File System Extensions include:
 - 512-byte length physical DASD blocks - A new block size of 512 bytes is supported and is available through a new option on the CMS FORMAT command.
 - DASD Block I/O Support - New and extended CMS commands and functions are provided to initialize CMS disks for use with the CP DASD Block I/O system service.
 - Update-in-Place
The update-in-place facility allows you to write blocks back to their previous location on disk rather than in a new slot. The filemode number 6 differentiates CMS files with the update-in-place attribute from regular CMS files.
 - CMS IUCV Support
Support for IUCV communication has been introduced into CMS. This support will allow multiple programs within a virtual machine to use IUCV functions. Included is the ability to initialize a CMS machine for IUCV communication and to invoke IUCV functions via new CMS macros. These macros will also allow the user to specify path-specific exits for IUCV external interrupts. CMS IUCV support can be used to access a CP DASD Block I/O system service.
 - CMS Wait on ECB - The ability to wait on an ECB or a list of ECBs will be supported via a new CMS macro. This macro will provide the capability to wait on OS and VSE format ECBs.
 - CMS ABEND Exit - A general CMS abnormal exit capability will be provided so that user programs may specify the address of a routine to get control before CMS ABEND recovery begins. An exit is established and cleared through a new CMS macro.
 - RDTERM Direct - A new option on the RDTERM macro will allow a program to read an input line directly from the console. Lines already stacked in the program or console stack will not read. This function will enable a program to prompt a terminal user for a response without disturbing the contents of the program or console stack.
 - Immediate Command Extensions - The immediate command capability of CMS will be extended by allowing users to define their own immediate commands.
 - Enhancements to GLOBALV
The GLOBALV command has been enhanced to use the EXECCOMM interface available in EXEC2 and the System Product Interpreter. This makes it possible to set and retrieve global variables by specifying the name of the variable on the GLOBALV command call.
 - Removal of the CMSSEG Segment
The discontinuous saved segment CMSSEG has been removed by merging modules from the CMSSEG segment into the CMS shared nucleus.
 - Enhancements to TELL EXEC, DEFAULTS EXEC
The TELL EXEC has been enhanced to allow the use of the MSGNOH command instead of the default of MSG command for local messages. The DEFAULTS EXEC has been changed to support the enhancement made to the TELL EXEC.
 - EXECOS Command
EXECOS is a new CMS command that resets the OS environment under CMS without returning to the interactive environment. It is intended for use in an EXEC2 or System Product Interpreter EXEC that either invokes several OS programs sequentially or invokes the same OS program repetitively. If VSAM is running, VSAM cleanup is also accomplished.
- **CMS Performance Enhancements**

PROGRAM PRODUCTS

VM/SP (cont'd)

- LISTFILE and RENAME
The LISTFILE and RENAME functions, formerly executed in the transient area, are now reentrant, and have been moved to the CMS shared nucleus.
 - XEDIT Interface
Applications can have access to files in storage. They can read and write specific records without the overhead of using the disk or the program stack to transfer data to or from XEDIT.
 - Enhanced VSAM Support
 - VSE/VSAM Release 3 Support
CMS will support VSE/VSAM Release 3 which includes significant enhancements designed to improve catalog reliability and integrity while providing additional serviceability and usability. VSE/VSAM Release 2 is not supported.
 - 3380 DASD Support
VM/SP Release 3 will support the use of 3380 DASD by VSE/VSAM through the OS/VSAM environment display.
 - Assembler Language VSAM Support
All of the VSE/VSAM macros and their options and a subset of the OS/VSAM macros are supported by CMS. The OS/VSAM Assembler language macros supported for use in CMS are contained in the OSVSAM MACLIB that is distributed with VM/SP.
 - VSEVSAM Command
VSEVSAM is a new CMS command which allows VSAM users to obtain the VSE/VSAM Assembler language macros from the Optional Source Statement Library tape. The VSEVSAM command creates the VSEVSAM MACLIB containing all of the VSE/VSAM Assembler language macros and some VSE MACROS.
 - CATCHCHECK Command
CATCHCHECK is a new CMS command which allows CMS VSAM users to invoke the VSE/VSAM Catalog Check Service Aid to verify a complete catalog structure.
 - New and Improved System Product Editor (XEDIT) Functions
Enhancements to the System Product Editor (XEDIT) to provide new or improved support in the following areas:
 - Prefix macro support
 - Selective line editing
 - Screen Control
 - Additional SET RESERVED capabilities
 - Extended data stream (color)
 - Vertical screen split
 - Several new functions intended to provide additional data manipulating capabilities
 - Modifications to miscellaneous existing XEDIT functions to improve flexibility and/or consistency between related subcommands

XEDIT provides all of the major capabilities available in EDIT. It is IBM's intent to provide all future VM/SP editing enhancements to XEDIT. XEDIT has attempted to provide the most useful capabilities available in various editors. A compatibility function for Display Editing System 5796-PJP (EDGAR) was provided in VM/System Product Release 1 to assist EDGAR users in the transition to XEDIT. Its primary purpose was for migration only.

A subset of the EDGAR functions was provided to aid in migration. Not all EDGAR commands or functions are supported in the same manner as in EDGAR. There will not be any changes or enhancements to this migration support. It is recommended that all those using this migration support should complete the migration to XEDIT when VM/SP Release 3 is installed. New XEDIT users should not use the EDGAR migration functions.
 - Enhanced Publications
The following publications have been revised and restructured to provide increased usability. The books have a new cover design, with a graphic that is printed in various colors according to the major task associated with a particular book. New binders are available for storing the manuals. Labels for the binders are also available.
 - VM/SP General Information, GC20-1838
The content of this manual has been generalized to provide an executive level description of VM/SP. It also provides customer management and staff with information needed to evaluate the applicability of VM/SP to their installations.
 - VM/SP Introduction, GC19-6200
This manual has been completely rewritten to provide basic information about VM/SP. It describes what VM/SP is and what it can do for the general user.
 - VM/SP Release 3 Guide, SC24-5240
This manual is specifically intended to provide current users of VM/SP with a synopsis of the functional enhancements offered by the new release. It will improve customer productivity by describing new functional enhancements, defining the related user interfaces, and giving examples of their use. It includes details for migrating from VM/SP Release 2 to VM/SP Release 3 and identifies new and changed modules.
 - VM/SP Installation Guide, SC24-5237
This manual provides procedural information about the VM/SP install process. It is published expressly to satisfy the requirements associated with the installation and service tasks.
 - VM/SP Planning Guide and Reference, SC19-6201
This manual, previously titled *VM/SP Planning and System Generation Guide*, has been revised to better meet the requirements of the planning task. This book identifies the hardware and software planning considerations for a VM/SP system, and the system definition files that must be prepared for a system generation.
 - VM/SP Terminal Reference, GC19-6206
This manual, previously titled *VM/SP Terminal User's Guide*, is completely reorganized and revised for ease-of-use. It discusses the characteristics of terminals in general, and the physical characteristics of different terminals and consoles. It contains a typical session that gives working examples from logon to logoff.
 - VM/SP System Product Interpreter User's Guide, SC24-5238
This manual is a step-by-step guide to using the System Product Interpreter for new users.
 - VM/SP System Product Interpreter Reference, SC24-5239
This manual is a complete compilation of reference information for using the System Product Interpreter.
 - VM/SP System Product Interpreter Reference Summary, SX24-5126
This publication provides quick synoptic reference information about System Product Interpreter statements and their use.
- Additionally, two previously announced functions will be available in VM/SP Release 3. They are:
- The Missing Interrupt support announced July 6, 1982. This function will monitor system I/O activity for interrupts not completing within a certain time period and attempt to correct the condition. See Programming Announcement 282-116 for additional information.
 - Support for the Speed Matching Buffer for the IBM 3375 announced July 30, 1982. This support provides the capability to use the hardware when connected to a 1.5 megabyte channel. This includes paging, spooling, and/or mini disks.
- RELEASE 2 ENHANCEMENTS**
- Programmable Operator Support
The Programmable Operator facility can be used in a VM/SP system to reduce or eliminate system operator messages. This facility provides the capability to log messages, suppress messages, redirect messages, execute commands, and pre-program message responses, all under the control of an editable message routing table in a CMS file.

The Programmable Operator facility can be used by a stand-alone VM/SP system or can allow the operation of a remote VM/SP system to be controlled by an operator at a host VM/SP system. Remote operation of a VM/SP system requires Release 2 or Release 3 of the RSCS Networking program product on both VM/SP systems. Installation of the RSCS Networking Release 3 program product will provide enhanced display utilization.
 - New CMS End-user Functions
Numerous end-user functions are being provided to assist the non-professional user as well as the professional user in utilizing the system. These functions are provided to enhance the system usability and to improve user productivity. These functions provide:
 - The new VM/SP SENDFILE and RECEIVE commands may be used in conjunction with the TSO/E Interactive Data Transmission Facility TRANSMIT and RECEIVE commands to exchange files between VM/SP Release 2 and MVS/TSO systems connected through an NJE/NJI network.
 - Enhanced full screen capability to display information about Reader Spool files. Allows the ability to review/browse through files, to discard files, or initiate other actions such as copy, or forward the file to other media/users.
 - A full screen capability to display file information (information presented is similar to what LISTFILE provides today) and issue CMS commands that perform some type(s) of action on the file(s) being displayed. Program function keys are also assigned to useful functions like EDIT, SORT or HELP.
 - Enhanced command capability such as:
 - a. Header Option on Print.

PROGRAM PRODUCTS

VM/SP (cont'd)

- b. DISK LOAD extended to allow sequence identification and the ability to load a file and retain its original date/time.
- c. Ability to specify '=' for any file identifier in the fileid2 operand of the COMPARE command.
- d. LISTFILE enhanced to allow 'STACK', 'ARGS', 'BLOCK', 'TRACE', 'FIFO', 'LIFO' and extended pattern matching options.
- e. UPDATE extended to keep a record of missing PTF files.
- f. A new command to display environmental status such as userid, nodeid, date, time, zone.
- New CMS Productivity Aids for the DP Professional CMS has been enhanced to provide the DP professional user with several productivity enhancements to make their system implementation easier. These productivity enhancements provide:
 - A CMS facility to allow I/O between a device and an EXEC program.
 - The ability to dynamically extend the CMS nucleus.
 - A routine to display at the console or stack virtual reader file characteristics.
 - An enhanced CMS QUERY command to display CMSLEVEL information such as product name, release identification, service level and information regarding virtual disks that are accessed. In addition, QUERY command results can be stacked.
 - A GLOBALV command which allows a user to maintain a collection of named values whose lifetime is either within a single IPL, within a session or across sessions.
 - The ability to specify that portions of a line should be displayed, highlighted, protected, and/or masked using the VM/SP editor.
 - The ability to directly access EXEC 2 variables. Variables may then be inspected and/or set from a program.
- DIAL Command support for remote BSC 3270 users. This support provides the ability for remote BSC 3270 users to issue the DIAL command. The remote 3270 will appear to be a locally attached terminal to the dialed virtual machine.

In addition, this support removes the previous restriction of 16 remote communication lines. The maximum number of remote communication lines is now 256.
- CMS Nucleus Restructured. The CMS nucleus has been restructure to provide a CMS system which is more flexible and extendible for development, serviceability and maintenance purposes.
- CMS Tokenization. The eight-byte tokenization restriction has been eliminated for parameter passing.
- Starter System Full Screen Support. The ability to operate the new CMS editor in full screen mode has been extended to the VM/SP Starter System running second-level. Previously, the new CMS editor would only run in single line mode.
- HELP Files. The HELP files can now be placed on disks other than the S-DISK.
- CMS/DOS Upgrade. CMS/DOS support has been upgraded to VSE/Advanced Functions Release 3 and VSE/VSAM Release 2 including support for the 3375 DASD.
- Command Retrieve Capability. The CP SET Program Function command is enhanced to include the option "RETRIEVE". When specified, the system will save input lines. When the specified program function key is pressed, the saved input lines are redisplayed in the reverse sequence of entry. The number of saved lines depends upon buffer size and input line length.
- QUERY Command Enhanced. The QUERY command is enhanced to allow the user to specify the operands "USERID" or "CPLLEVEL". The Query USERID command responds with the userid and with the system identifier of the system that the user is logged on to.

The query CPLLEVEL provides information relative to the software product's name (e.g., VM/SP), release number, service level number, Nucleus Creation Date and time, along with the IPL date and time.
- Enhanced ASCII Support. ASCII support has been enhanced to support the 3101 user with the following:
 - Screen Management - Controlled scrolling of output.
 - Prompting - Linefeed prompting can be selected to allow data to be entered starting in column 1.

- Read operations can be command-chained to write operations.
- Linesize Control option has been added.
- Enhanced 3800 Support. This enhancement allows the RSCS Networking Release 3 program product to pass to CP the 3800 attributes defined in an NJI header created by a system using the NJI protocol. This will also allow files created in these systems to print properly on a 3800 controlled by VM/SP Release 2. Copy group and burst attributes remain unsupported.
- Support for 3375 DASD. VM/SP Release 2 will support the 3375 Direct Access Storage Device with the 3800 Storage Control Models 1 or 2.

The new DASD will be supported as a paging, spooling, system residence, T-disk, mini-disk and as a dedicated device to a virtual machine operating system that supports the 3375 DASD.
- Support for 3380 DASD. VM/SP Release 2 will support the use of 3380 DASD by VSE/VSAM through the OS/VSAM environment of CMS only.
- Support for the new Speed-Matching Buffer (Feature #6550). The 3880 Speed-Matching Buffer Feature support allows attachment of the new high speed 3380 DASD to processors with channel speeds slower than those normally required by the new devices. Refer to Announcement Letter 280-61 for details regarding the hardware support.

VM/SP support for the Speed-Matching Buffer is provided for use of CMS, via Diagnose 18, as well as by the CP component of the operating system.
- Trace Table Recording Facility. A new serviceability enhancement is provided to record a history of system operations on spool. This facility is controlled by a new Class C command. Selective recording of CP trace entries by type, VMBLOK address, interrupt code and device type is provided. In addition, user generated information from a virtual machine and CP information can be included.

A utility program is also provided. This utility provides the user with the capability to print the collected information or display it on a terminal.

As a customer convenience, the Class 2 SCP Stand-alone Device Support Facility is being shipped in conjunction with VM/System Product. Device Support Facility is a utility used to initialize DASD volumes or mini disks and performs data analysis and recovery either stand-alone or in a virtual machine under VM/SP.

RELEASE 1 ENHANCEMENTS

Dynamic SCP Transition To and From Native Mode: An installation can have the ability to run another SCP in native mode on the same system used for running VM/SP with a minimum of disruption to the system's operation; it is possible to switch from VM/SP to another SCP, run that SCP in native mode and then switch back to VM/SP without IPLing the system. The guest SCP must run in a V=R area. It can be MVS, SVS or VS1 in non-handshaking mode.

When the transition is made to native mode, the OS/VS SCP is operating without VM/SP. The performance of the OS/VS system will be equivalent to that OS/VS system running native with the same amount of storage and the same I/O configuration it was using in the VM/SP V=R area. When the installation again requires VM/SP services, the operator returns control to VM/SP and the installation again has all the advantages that result from using VM/SP.

This gives an installation operational flexibility that it did not have before. It is possible to run both VM/SP and OS/VS in native mode on the same system, without the disruption of an IPL when a switch is made between VM/SP and OS/VS. This capability is particularly valuable when running an application that cannot be shut down, such as DB/DC.

Note: This function is not supported for MVS on the 4300 processors.

Single Processor Mode: It is possible to run VM/SP in Single Processor Mode (SPM). SPM will allow an installation to restrict VM/SP to a single processor of an AP or MP system, leaving the other processor for the exclusive use of a virtual machine running MVS. In SPM, MVS must be IPLed in a V=R area. MVS will then initialize the other processor and run in AP or MP mode.

IPL Command Enhancement: This enhancement allows a user to activate an OS/VS1 system without any operator intervention. It is similar to the capability provided by the DOS/VSE Automatic System Initialization (ASI) Facility.

Virtual Machine Storage Preservation: In VM/SP, during a warm start or an abnormal termination by VM/SP, the virtual storage of specified virtual machines will be preserved. Specifically, virtual machine IPL was changed so that it no longer uses a page of the user's virtual storage, and the V=R area under VM/SP will be preserved during warm start. In addition, specific virtual machines can be

PROGRAM PRODUCTS

VM/SP (cont'd)

identified such that at VM/SP abend, or when that virtual machine is abnormally terminated by VM/SP, the registers and main storage for that virtual machine will be saved.

The improved integrity of virtual storage is particularly beneficial to IMS/VS users running in a virtual machine who need to have storage preserved so that they can run a stand-alone program to recover IMS/VS Log Buffers. In addition, stand-alone dumps that are IPL'd from an external storage device will now accurately reflect the user's virtual storage, because VM/SP will no longer use a page of that storage.

Single Console Image Facility: This support enables the operator of a virtual machine to control multiple virtual machines from one physical terminal. Availability is improved in cases where there is a console failure because control can be automatically passed to the virtual console of another user. This capability is available for use by any guest machine.

Functions that enhance the reliability, availability and serviceability characteristics of the VM/SP system include:

- An enhancement that will detect missing I/O interrupts and notify a system operator of the problem.
- Enhancements to allow an installation to dynamically allocate space for a dump after an IPL and to reserve sufficient contiguous DASD space for one or more system dumps.
- Expansion of the checkpoint limit for spool files from the current limit of 2,048 to a new limit of 9,900, the maximum allowable number of spool files in the system.

New functions that enhance the integrity and security of the VM/SP system include:

- A system option that will automatically clear allocated T-Disk DASD space and prevent access to residual data.
- A function to prevent the system operator from being automatically logged on during an automatic system restart if the operator was not logged on the primary system console when the system ABEND occurred.
- An enhancement to the SPTAPE command to support the DUMP and LOAD functions for CP DUMP reader files.

Full Screen Console Support Via SIO Interface: Full screen console support will enable a guest machine (for example, VSE DOC or OS/VS DIDOCS) and CP to share a locally-attached display terminal controlled by CP. The guest machine can use a display terminal as a graphics device in full screen mode while CP shares the terminal and uses it as a line device. A Start I/O (SIO) instruction is the interface for this support. A guest machine can use either the existing DIAGNOSE interface or the SIO interface, but not both simultaneously.

Systems Network Architecture (SNA) Support: Full VM/370 operator console capabilities are provided to the SNA terminal users. These console functions include full CP/CMS command processing capabilities, CMS editor processing mode and full screen support for 3270 display terminal devices. This support requires that the Virtual Machine/VTAM Communications Network Application (VM/VCNA) program product and its prerequisites be installed.

Inter-User Communication Capability: The inter-user communication vehicle (IUCV) facilitates the transfer of messages among virtual machines and between a virtual machine and CP.

- All IUCV interfaces are provided to the user at a macro level.
- A user can selectively establish and terminate communications paths.
- Two users can establish multiple paths between themselves.
- A virtual machine can receive messages and reply either synchronously without an interrupt or asynchronously via an external interrupt.
- An installation can restrict the number of messages outstanding on each communication path.
- A receiver can selectively reject messages.
- IUCV coexists with VMCF and provides extended inter-user communication capabilities.

CP Spooling Enhancements

- Association of a form number with each spool file and spool device. Features of form number support are:
 - An eight character alphameric form number.
 - Optional automatic prompting of the spool operator for forms changes.
 - Optional "setup mode" to allow the spool operator to align forms.

- Ability to order, change, purge, transfer, spool-to-tape and query spool files by form number.
- Default form numbers that are installation specified.
- Optional installation specified translation from user form numbers to operator form numbers.
- Ability to transfer spool files between the reader and printer queues, or the reader and punch queues.
- Capturing of the Load FCB, Fold and Unfold CCWs in a virtual printer spool file, and their subsequent execution on the real printer.
- Ability to select spool files for the QUERY command based on their hold status.
- An enhanced header page and a new trailer page for printed output. A file sequence number helps the spool operator distribute output correctly.
- Additional spool operator information:
 - A "waiting" message when a real spool device finishes work.
 - Ability to display the number of records left to print or punch in the currently active spool file.
 - Display of the distribution code and the new file sequence number for each file printed or punched.
- Ability for the installation to specify classification titles for selected spool file classes. The title will be printed on the separator page, and optionally on each page of output.
- Ability to specify the distribution code on SPOOL command.
- Increase in the allowable copy count to 255.

Spool Files to Tape: This support provides Class D commands which enable the spooling operator to store to tape, or retrieve from tape, those unit record output files which he or she wishes to schedule for real output at some later time on the VM/SP system. The restored files will retain the same characteristics as the original files, but will be assigned new spool-ids to avoid duplicate identification within the spooling system. The spooling operator can store or retrieve spool files selectively (by class or spool-id) or completely. An option is provided to allow the operator to scan the tape.

Spooling of Accounting Records: This support provides the installation with the ability to spool accounting data to a designated virtual machine with a designated class. The data can be spooled to provide punched output or spooled to a virtual machine's reader for additional processing. This eliminates the need to have a real card punch online at all times to get accounting records.

CMS File System Enhancements: The file system enhancements will provide the user with a more efficient and flexible file system. Specifically, the enhancements are:

- Removal of the limitations on the size of CMS disks and the number of files per CMS disk.
- Support for physical block sizes of 800, 1024, 2048 and 4096 bytes.
- Efficient handling of variable length files.
- Selective directory updating.
- Fixed Block Mode (FBM) device type support.
- Concurrent open for read and write of CMS files.
- CMS access to one system disk and up to 25 minidisks concurrently.

Interactive Help Facility Under CMS: The help facility is an informational, online display service available at the CMS terminal to guide the user in using CP and CMS commands and reacting to CP and CMS messages. As a result, the user can, in most cases, avoid referencing manuals during CMS sessions.

With the enhanced HELP Facility of VM/SP, the user will be able to issue CMS (including editor) and CP commands directly from the screen on which a HELP file is displayed. Because HELP files will be viewed via the new CMS editor, scrolling and locate facilities will be improved.

The New CMS EXEC Interpreter: VM/SP CMS will provide the user with more advanced EXEC processing capabilities and improved performance. The new EXEC interpreter:

- Accepts words of up to 255 characters each.
- Allows commands to be issued either to CMS or to specified subcommand environments; for example, to an editor.
- Provides new string manipulation functions.
- Provides arithmetic functions for multiplication and division.
- Provides debugging facilities.

VM/SP (cont'd)

- Supports user-defined functions and subroutines.
- Improves execution time.
- Coexists with the current CMS EXEC interpreter.

The New CMS Editor: The new CMS editor provides:

- Full screen support for 3270 display stations, including: multiple views of the same file or of different files, selective column viewing and automatic wrapping of lines larger than the screen.
- Ability to extend and tailor editor commands with a powerful macro mechanism which uses the new CMS EXEC interpreter.
- Extended string search facilities to improve text processing.
- Enhanced functions to handle program development including automatic update generation.
- Ability to define the screen format according to individual preferences.
- Data import and export facilities.
- Coexistence with the CMS editor.
- 3278-5 and 3279 terminal support.

CMS OS Loader Capability: The CMS OS Loader will enable OS relocatable load modules to be used under CMS. The load modules may be loaded from an OS partitioned data set or a CMS load library. This support also provides a facility to list, copy or compress members of a CMS load library and to merge CMS load libraries.

This support further allows use of the OS/VS Linkage Editor to create a CMS LOADLIB or a LOADLIB member. This is accomplished using the existing LKED command. The supported Linkage Editor options are defined in the *CMS Command and Macro Reference* (SC19-6209).

CMS Use of CP Page Management Interfaces: CMS now takes advantage of the existing page control interfaces to better communicate the true working set of pages to CP, thus better utilizing the page frame resources of the real machine.

CMS Tape Command Performance Improvement: To decrease overhead, a large block-size (4K) is supported for tape dump.

CMS Support of Labeled Tapes: CMS processes labelled tapes as follows:

- VOL 1 Labels
 - Processed by DOS or OS OPEN simulation routines.
 - Processed by CMS TAPPDS of TAPEMAC commands.
 - Displayed or written by CMS TAPE command.
- HDR Labels
 - Processed by DOS or OS OPEN simulation routines; exits are provided to allow access to user-written routines to process standard user (UHL) labels.
 - Processed by CMS TAPPDS or TAPEMAC commands.
 - Processed by a CMS macro designed for use in assembly language programs in conjunction with other CMS tape macros.
- EOF/EOV Labels
 - Processed by DOS or OS CLOSE simulation routines; exits are provided to allow access to user-written routines to process standard user (UTL) labels.
 - Processed by a CMS macro designed for use in assembly language programs in conjunction with other CMS tape macros.
- Non-Standard Labels
 - User exits are provided in DOS or OS OPEN and CLOSE simulation routines and in TAPPDS or TAPEMAC commands to allow access to user-written routines to process non-standard labels.

Note: The following are supported:

 - Label processing for tapes which are read backwards.
 - Multi-volume files.
 - ASCII labels.

CMS Support of Unlabeled Tapes: CMS will process unlabeled tapes.

Enhanced Support for the 3270 Information Display System Which Includes:

APL Text Feature: The 3270 APL-TEXT feature provides the 3270 user with access to the full APL, TEXT and EBCDIC character sets. This makes it possible for the user to interact with the VS APL program product as well as text processing applications which run under CMS. This support extends the APL-TEXT function to users with 3274 Controllers/3278 Display Stations.

Intensified Display: VM/System Product takes advantage of the intensified display feature of the 3270 Information Display System as follows:

- The "Current Line" of the CMS Editor will be intensified.
- All CMS Edit messages will be intensified.
- An application program may supply a 3270 Start Field order and an attribute byte in a DIAGNOSE 58, CCW Code 19 (Virtual Console Interface) data stream. This provides an application program with the ability to define a field as normal intensity, intensified or non-display.
- Messages from the system operator or other users will be intensified.
- The re-display of user input is intensified so that it may be distinguished from output. The SET command will activate or deactivate intensification of input re-display.

Support for the Enhanced Display Terminals: The following terminals and associated printers are supported:

- 2250 mdl 3 Display Unit
- 2840 Display Control mdl 2
- 3250 Graphics Display System
- 3251 Display Station
- 3255 Display Control Unit
- 3258 Channel Control Unit
- 3262 Printer mdls 3 and 13
- 3274 Control Unit mdl 1B, 21B (3272 compatible)
- 3274 Control Unit mdl 1C, 21C, 31C, 51C (TP - BSC only)
- 3274 Control Unit mdl 1D, 21D, 31D (3272 compatible)
- 3276 Control Unit/Display Station mdl 2 (1920 character screen)
- 3276 Control Unit/Display Station mdl 3 (2560 character screen)
- 3276 Control Unit/Display Station mdl 4 (3440 character screen)
- 3278 Display Station mdl 2 (1920 character screen)
- 3278 Display Station mdl 3 (2560 character screen)
- 3278 Display Station mdl 4 (3440 character screen)
- 3278 Display Station mdl 5 (3564 character screen)
- 3279 Display Station (Multi-color display screen)
- 3268/3287/3289 Printer (Copy command support only)

This includes support for the 96-character set (94 characters plus space and null), and PF keys 13 through 24.

The VM/SP support for the 3279 provides a new data stream for communicating between the device and the host, multiple colors for data display, programmable symbol-set capability and extended highlighting attributes; extended highlight functions are character underscore, reverse video and blinking character. These attributes can be set and reset for the different areas of the display screen. VM/SP support for color enables the user to select colors for CP messages, virtual machine output, redisplay of user input, user input area and the CP status area.

Support for the 3880 Storage Control Models 1, 2 and 3

Support for the 3800 Printing Subsystem as a Virtual Spooling Device: The VM/SP will allow extended use of the font, image and copy capabilities of the 3800 Printing Subsystem. A user is able to print a file on a real 3800 or on any real spooling device supported by CP Spooling running in conjunction with the VM/SP.

Dedication of Remote 328X Printers: Remote bisynchronous 328X printers can now be dedicated to guest machines. This support further allows the Remote Spooling Communication Subsystem (RSCS) program product to spool and print VM/370 files on the 328X printers. (For further information, see the RSCS documentation.)

Support for the 3289 Printer Model 4: The 3289 mdl 4 is a 400 line-per-minute printer, functionally compatible with the 3203 Printer mdl 4 except in the area of UCS buffer load.

Support for the 3262 Printer Models 1 and 11: The 3262 mdls 1 and 11 are, respectively, 650 and 325 line-per minute printers.

Support for the 3262 Printer Model 5: The 3262 mdl 5 is a channel-attached 650 lines-per-minute printer functionally compatible with the 3262 mdl 1.

Support for the 4245 Printer Model 1: The 4245 Printer mdl 1 is a channel-attached, 2,000 line-per-minute printer.

Support for the 8809 Tape: The 8809 is a two-speed tape drive (12.5 ips and 100 ips). It is supported at 12.5 ips in VM/370. The stand-alone dump-restore utility (DDR) supports the device at 100 ips to provide high-speed backup capability when executing on a stand-alone processor and 3310/3370 DASD.

Support for the 3310/3370 Direct Access Devices: The 3310/3370 are direct access devices that use Fixed Block Architecture. The Direct Access Storage Compatibility Feature (#7901) of the 4331 Processor for emulation of 2314, 3330 or 3340 format data on the 3310 or 3370 is supported. VM/SP supports 3310 or 3370 volumes containing emulated data which are dedicated to a guest operating system other than VM/SP or CMS.

PROGRAM PRODUCTS
VM/SP (cont'd)

3380 DASD Support: VM/SP supports the 3380 Direct Access Storage with the 3880 Storage Control mdls 2 and 3, using the Data Streaming Feature on the 3031, 3032 and 3033 Processors, or attached to a 3MB channel on the 4341 and 4381.

The 3380 DASD is supported by VM/SP as a paging, spooling, SYSRES, T-disk or mini-disk device and as a device dedicated to a virtual machine operating system that supports the 3380 DASD.

The 3380 DASD offers a new level of reliability and performance, with increased capacity for online data storage.

Note: VM/SP does not support the dynamic path selection capability of the 3380 DASD mdl A4.

Missing Interrupt Handler: System I/O activity is monitored to detect interrupts not occurring within an installation specified period of time. An attempt at corrective action is made and a message is sent to the system operator to advise of the results.

Note: Missing Interrupt Handler support for Release 2 of VM/System Product is available 4Q 1982.

CUSTOMER RESPONSIBILITIES

- Ordering and installing all of the required communications facilities.
- Generating the appropriate 3704/3705 Communications Controller programs.
- Allocating and formatting direct access storage space for the VM/SP control program, the CMS system residence area and user work areas.
- Generating and updating user directory and virtual machine descriptions.
- Making the final evaluation as to which programs should be run under VM/SP in his environment.
- Training personnel to operate the VM/SP system.
- Teaching users VM/SP commands and how to operate the remote terminals.

Note: To run SVS under the VM/System Product, PTF UY77568 must have been applied to the SVS system.

SPECIFIED OPERATING ENVIRONMENT
HARDWARE REQUIREMENTS

VM/System Product is designed to run on IBM S/370 mdls 135, 135-3, 138, 145, 145-3, 148, 155II, 158, 158-3, 158AP, 158MP, 165II, 168, 168-3, 168AP, 168MP and on the 4321, 4331, 4341, 4361, 4381, 3031, 3031AP, 3032, 3033 Model Group N, 3033, 3033S, 3033AP, 3033AP-2, 3033MP and the 2K storage protect version of the 3081 Model D16 Processor Complex. **Note:** Support of the VM/System Product High Performance Option licensed program (5664-173) for VM/System Product Release 3 will be available in first quarter 1984.

VM/SP Release 3 support of AP/MP and the 3081-D16 Processors will be available in first quarter 1984. **Note:** The VM/SP requires as a prerequisite the application of EC #274276 (shipped in June 1980) to the 3031 uniprocessor and 3031 attached processor.

Real Storage Requirement: The VM/System Product requires a minimum user accessible storage of 512K.

Minimum machine requirements are listed for information only. Depending upon the number of terminals used, the total workload of the system, and the desired response time, all users should consider increasing real storage size as appropriate.

Display Terminal Support: The IBM 3278 mdl 5 and 3279 display terminals are supported.

Notes

1. VM/System Product supports a cardless environment. By using the facility to spool accounting records and altering the system generation procedures to use tape devices, the requirement for a card reader/punch can be eliminated. Specific details are contained in the *VM/SP Planning and System Generation Guide*.
2. Specific details relevant to the minimum configuration required for hardware maintenance should be directed to the Field Engineering Division.

ECPS:VM/370 Support

Model No.	VM/370	Availability
135-3	Level 18	EC #149136 and later
138	Level 18	EC #149136 and later
145-3	Level 18	EC #356901 and later
148	Level 18	EC #147710 and later
3031	Level 19	EC#274276 and later
3131AP	Level 19	EC#274276/388860 and later
4321	Level 19	At shipment of processor
4331MG1	Level 19	EC 364290 and later

4331MG2	Level 19	EC 364415 and later
4341MG1	Level 19	EC 154315 and later
4341MG2	Level 19	EC 856093 and later
4361	Level 20	at shipment of processor
4381	Level 21	EC 866902 and later

Notes

1. The VM/System Product will execute on the 135-3, 138, 145-3 and 148 processors at earlier EC levels, but the hardware assist will not be used.
2. The 3031, 4321, 4331, 4361 and 3031AP Processors support only a subset of ECPS:VM/370 function.
3. If users running the VM/SP on S/370 mdls 135-3, 138, 145-3 or 148 with ECPS for VM/370 also choose to use the shadow table maintenance functions of the VM/SP, they will not realize the full benefit of ECPS. This is because the shadow table maintenance algorithms will be used in preference to some ECPS algorithms.
4. CMS disk I/O (Diagnose 18) has been modified to take advantage of ECPS:VM/370 for CCW translation. The improvement is available with the existing ECPS:VM/370 assist on the S/370 135-3, 138, 145-3 and 148 Processors. The improvement is also available with the ECPS:VM/370 assist on the 4341 and 4381 Processors.
5. The ECPS:VM/370 and ECPS:MVS options on the 4341 Model Group 1 are mutually exclusive. The 4341 Model Group 1 Processor MVS users who have specific throughput or terminal response requirements and who plan to run the MVS/System Products in conjunction with the VM/SP should carefully review their configurations to ensure that executed performance needs are met.
6. The ECPS:VM/370 and ECPS:MVS options may be concurrently utilized on the 4381 and 4341 Model Group 2 Processor, whenever ECPS:VM/370 and ECPS:MVS are both selected at IML time. With this joint selection, functions of the shadow table bypass assist defined in *Virtual Machine Assist and Shadow Table Bypass Assist* (GA22-7074) are included. These functions are designed to enhance the performance of MVS running under VM/370 in a V=R environment with the VM/System Product.

Shadow Table Bypass Support: On the 3031 and 3031 AP processors, an engineering change (EC #276271 and later) is available to improve the performance gains of the shadow table function of the VM/SP. Because system performance is dependent on a number of variables, IBM will not warrant that improvement in performance will be realized in all cases where the VM/SP shadow table function is activated.

SOFTWARE REQUIREMENTS

VSE/VSAM Release 3 program product support and CMS/DOS services for VSE/Advanced Function Release 3 are supported by VM/SP Release 3.

COMPATIBILITY

Application programs that currently execute under the VM/Basic System Extensions program product or the VM/System Extensions program product or the VM/System Product Release 1 and are not dependent on internal CD or CMS structure and/or control blocks, should also run on the VM/System Product Release 2.

For ease of migration, the existing CMS editor continues to be supported in the VM/SP. However, the existing CMS editor EV Migration macros. If he or she desires, the user can invoke the existing CMS editor.

The new VM/SP editor includes among its enhancements some of the functions contained in the Display Editing System (DES) IUP, order number 5796-PJP. Macros are provided to aid users in migrating from DES to the new editor by providing a DES display format for command input. The Macros provide a SYGSET of the EDGAR functions. Not all functions will work exactly as EDGAR native mode.

CONVERSION

SPOOL file information has been changed in Release 3. A conversion aid will be available via the SPTAPE function to allow those users who currently have VM/SP Release 1 or Release 2 installed and do not want to perform a COLD start the ability to migrate their SPOOL files to VM/SP Release 3.

VM/SP Release 2 Programmable Operator Routing Tables must be converted to the VM/SP Release 3 routing table format. A CMS EXEC will be provided to aid in this conversion.

Other than the optional compatibility macros announced in VM/SP Release 1, and the above items, no conversion aids are required to move from VM/Basic System Extensions Release 2, VM/System Extensions Release 2, or VM/SP Releases 1 or 2 to Release 3 of VM/SP.

5664-169 - VM/XA MIGRATION AID RELEASE 1 and 2

PURPOSE

The VM/XA Migration Aid is provided for the MVS user who will be migrating to MVS/XA. It is designed to operate on any 4381 Group 1 and Group 2 Processors, 4381, 3081, 3083 or partitioned 3084 Processor. Its purpose is to support, concurrently, one MVS/SP production virtual machine and one or more MVS/XA test machines. VM/System Product CMS will be supported for VM/XA Migration Aid installation and service, and for MVS/XA conversion requirements. The objectives of the VM/XA Migration Aid are: Maximize performance and provide high availability and recoverability of the MVS/SP production machine ... support one or more MVS/XA test machines with extended test facilities.

RELEASE 2 ENHANCEMENTS

- Support of additional production and test environments (VSE/AF and OS/VS1):
Support is provided to allow VSE/AF (Release 3 at Service Level 8205 and beyond) and OS/VS1 (Release 7 with Basic Programming Extensions Release 3) to run in non-paging mode either in the V=V area, or to run as a preferred guest in the V=R area. This will extend the capability of the VM/XA Migration Aid to those VSE/AF and OS/VS1 customers who have the need to migrate to MVS/XA.
- Full support for the 3203 mdl 5 Printer:
Provides full support of the 3203 mdl 5 Printer including error recovery, device simulation, and the printing of SPOOL files.
- Full support for the 3380 and 3375 DASD:
Provides full support for the 3375 and 3380 for minidisks, utilities (format, directory, dumping and restoring), and for all system data (paging, spooling, tdisk, directory and nucleus) and error recovery.
- Support for the 3088 as a dedicated channel-to-channel adapter:
Allows use of the 3088 as a dedicated channel-to-channel adapter for the inter-connection of processors.

DESCRIPTION

THE VIRTUAL MACHINE

A virtual machine control program manages the resources of 4381 Group 1 and Group 2 Processors, 3081, 3083 or partitioned 3084 Processor to provide virtual processor, I/O, and storage support through the implementation of virtual machines.

A virtual machine user appears to have the functional capabilities of a dedicated system available (either S/370 or extended architecture). The terminal acts as the virtual systems console for the virtual machine. Other users may be running batch, or testing jobs concurrently, and also having the functional characteristics of dedicated system.

Each user can specify the configuration required; the number, type and I/O addresses of all devices to be used; and from 64K bytes to 999 million bytes of storage, provided sufficient resources are available with the real machine's configuration.

Each user's virtual system comprises an operator's console (the user's terminal), a virtual processor, a virtual storage size ranging from 64K bytes to 999 megabytes, and virtual I/O channels and I/O devices. Virtual machine configurations may also include dedicated transmission control units and channel-to-channel adapters. Virtual I/O devices are controlled by the virtual machine's operating system and not by the VM/XA Migration Aid with the exception of those virtual unit record devices that are spooled by the VM/XA Migration Aid to/from disk. The basic device support for the proper number and type of I/O devices must be generated into the virtual machine's supervisor or nucleus.

- Processor or timing dependencies may not exist. For example there is no reliance on a certain action or activity being completed within a fixed interval of time.
- The Diagnose instruction may not be used for machine control by an operating system running in a virtual machine.
- Limited dynamic modification of channel programs is permitted.

Note: See the *General Information Manual* for further clarification.

THE CONTROL PROGRAM

The control program of the VM/XA Migration Aid creates and controls virtual machines, multiprogramming the resources of the real computer to offer concurrent execution of multiple virtual machines.

All virtual machines execute under Start Interpretive Execution, providing the basic mechanism for control by permitting either the control program or Start Interpretive Execution hardware feature to trap and process all interrupts and privileged instructions.

Execution under the VM/XA Migration Aid does not require communication between the control program and the virtual machine operating system since, subject to the restrictions listed above, the virtual machine interface is that of the real machine. Communication is

available between the virtual machine and the control program through use of the Diagnose interface: The CMS provided utilizes the DIAGNOSE instruction for many operations including I/O operations.

TIME MANAGEMENT: The control program periodically gives each virtual machine access to the real processor for a small amount of time, called a "time-slice". Since the primary focus is the preferred virtual machine and since one entire processor is being dedicated to that virtual machine, the scheduling of that virtual machine is straightforward. "Round Robin" scheduling will be used by the 'master' processor which runs all other virtual machines so that each V=V virtual machine will get a share of the processor resource.

STORAGE MANAGEMENT: Each virtual machine's storage is created and controlled by the control program as virtual storage and is organized into 4K blocks called pages and 1M blocks called segments. For each virtual machine, the control program creates and maintains a set of segment and page tables to describe the virtual storage and to reflect the allocation in real storage. The active pages from all virtual machines and from the pageable routines of the control program compete for available page frames. When the number of page frames available for allocation falls below a threshold value, the control program determines which virtual storage pages currently allocated to real storage are relatively inactive and initiates suitable page-out operations.

VIRTUAL I/O MANAGEMENT: Because virtual machines execute in emulation mode, the control program gains control whenever an I/O instruction is issued by a virtual machine operating system. If necessary the control program copies into its own work area the channel command list, and pages into real storage all virtual storage locations required for data transfer. If a virtual device is a minidisk, any cylinder numbers specified are modified to reflect the true location of the data; the virtual device address number is mapped to the real device address. The virtual machine is given a condition code to indicate the status of the START I/O operation, and the control program reflects the interrupts caused by the I/O operation to the virtual machine.

SPOOLING: The control program spooling facilities allow multiple virtual machines to share unit record devices by intercepting and modifying the Start I/O operations to those virtual unit record devices designated as spooled in the virtual machine configuration. The control program uses its paging I/O mechanism to create the disk records which act as intermediate storage between the real unit record devices and the virtual machines.

The spooling facilities allow data files to be transferred between virtual machines or between different operating systems executing at different times in the same virtual machine. In addition, virtual machine console input/output data may be spooled to disk for later printing.

CONTROL PROGRAM COMMANDS: The control program commands allow control of the real computing system and the VM/XA Migration Aid and provide user control of virtual machines and associated control program facilities. The control program commands can be used at any time without regard to which operating system is executing in the virtual machine. A user's privilege class(es), defined as part of the virtual machine configuration, define the allowable subset of the control program commands.

EXTENDED ARCHITECTURE SUPPORT

The VM/XA Migration Aid will exploit the extended architecture by providing support for extended real storage, extended virtual storage, hardware assisted emulation for S/370 and extended architecture virtual machines, and the new extended architecture channels.

LARGE REAL STORAGE: The VM/XA Migration Aid will support all real storage configurations allowed by the extended architecture (extended architecture provides for offerings of real main storage up to two gigabytes).

LARGE VIRTUAL STORAGE: Extended architecture includes a new mode which allows the use of 31-bit storage addresses and one-megabyte storage segments. Extended architecture virtual machines can define storage sizes up to 999 megabytes of storage. The System/370 Extended Architecture virtual machine can use CCWs in either S/370 format (format 0) or extended architecture format (format 1) for its I/O operations. Translated channel programs are always in extended architecture format.

The VM/XA Migration Aid will allow MVS/370 virtual machines to define storage sizes up to 32 megabytes.

START INTERPRETIVE EXECUTION: A new instruction, Start Interpretive Execution, is associated with the extended architecture emulation facility. The emulation facility is used by the VM/XA Migration Aid to provide hardware support for several areas of virtual machine operation, such as: Interval timer, prefixing, address translation, and privileged instruction handling.

The VM/XA Migration Aid will dispatch all virtual machines by executing the Start Interpretive Execution instruction. The virtual machine receives control in emulation mode and will continue to

VM/XA Migration Aid (cont'd)

execute in this mode until an interruption or interception condition occurs.

The VM/XA Migration Aid also simulates the Start Interpretive Execution instruction to allow the VM/XA Migration Aid to be tested and serviced in a virtual machine.

NEW CHANNEL SUPPORT: The VM/XA Migration Aid will support the new extended architecture channel interface. At the control unit interface, 3081/3083/3084/4381 channels are similar to S/370 channels. However, at the programming interface, 3081/3083/3084/4381 channels permit the offloading of some function from the SCP to the channels. Many of the S/370 channel functions have been replaced with new ones that are MP and performance oriented. The hardware now handles the alternate path and I/O queuing management.

The I/O supervisor of the VM/XA Migration Aid will use new extended architecture I/O instructions in order to communicate with the channels. In the extended architecture, interrupts are recognized by class instead of by channel. There is no software association of devices to control units or channels. Subchannels are the addressable units in extended architecture and represent individual devices. The new extended channels use new CCW formats allowing addressing up to two gigabytes.

PRODUCTION MVS/SP VIRTUAL MACHINE

PREFERRED VIRTUAL MACHINE: Preferred virtual machine means that the preferred virtual machine executes with minimum interpretive execution. The preferred virtual machine derives performance benefits from a one to one virtual to real storage addressing. The size of this preferred area is specified in megabyte increments and physically begins at absolute zero of real storage.

Note: Only MVS/SP version 1 (release 1 with enhancement and release 3) is supported as the preferred virtual machine.

SET ADDRESS LIMIT: The integrity of the preferred virtual machine is enhanced by the VM/XA Migration Aid use of the Set Address Limit instruction. Using the Set Address Limit instruction will cause the System/370 Extended Architecture channel hardware to restrict I/O operations for dedicated devices for the preferred virtual machine below its boundary, and restrict for all other I/O above the boundary.

VIRTUAL S/370 I/O: The VM/XA Migration Aid supports S/370 architecture virtual machines, with all S/370 I/O operations being automatically intercepted out of Start Interpretive Execution. The virtual I/O simulation routines will recognize an S/370 virtual machine and convert all of its I/O from S/370 to S/370 Extended Architecture I/O operations. The S/370 virtual machine will have no knowledge of the extended architecture processor on which it is running as the virtual I/O simulator will maintain the S/370 interfaces. Virtual S/370 I/O will be simulated as if each virtual device is on a non-shared S/370 subchannel.

MASTER/DEDICATED MULTIPROCESSING SUPPORT: Master/Dedicated MP support provides a multiprocessing environment where the 'master' processor performs most VM/XA Migration Aid control program (CP) work, and then runs virtual machines when all control program work is completed. The 'dedicated' processor is used to run only the MVS/SP V1 preferred virtual machine.

DEDICATED PROCESSOR: With Dedicated Processor support, the MVS/SP preferred virtual machine is run in the 'dedicated' processor and all other virtual machines are run in the 'master' processor. Dedicated Processor support therefore eliminates all contention from the other virtual machines for that processor's compute power. If the 'dedicated' processor is not used to run an MVS/SP preferred virtual machine, that processor will be placed in an enabled wait state.

DEDICATED PROCESSOR I/O: The preferred virtual machine will have a 'fast path IOS' to handle most S/370 SIOF initiation and I/O interrupts without having to go to the 'master' processor.

This is done in a Master/Dedicated MP system by devoting an interrupt subclass to the dedicated devices of the preferred virtual machine. By running the preferred virtual machine on the dedicated CPU enabled only for the dedicated interrupt subclass, the operating system can eliminate the overhead of stacking and unstacking I/O interrupts for other virtual machines and can avoid CPU switching.

PREFERRED VIRTUAL MACHINE RECOVERY: The facility attempts to resume execution of the preferred virtual machine after the VM/XA Migration Aid has terminated with an abend and initiated and automatic restart.

SYSTEM PROGRAMMER TEST FACILITIES

VIRTUAL MP: The Virtual Multiprocessor facility will provide functional simulation of a S/370 Extended Architecture multiprocessing computing system. The virtual MP facility is provided through extensions to virtual machine definition, dispatching, and command processing. Console commands are provided to create and destroy, stop, start and query virtual processors.

Note: Virtual MP will only be supported for extended architecture virtual machines.

VIRTUAL MACHINE DEBUGGING: The debugging facilities of VM/XA Migration Aid will provide a significant tool to aid in debugging a virtual machine or virtual MP in the extended architecture environment. For example:

- A BEGIN command starts execution of the virtual machine's processor (or the virtual extended architecture MP).
- To look at a virtual machine's storage, the DISPLAY facility displays storage at the user's terminal, and the DUMP facility prints storage to the user's virtual printer.
- A STORE command can be used to alter storage and certain architected areas of the virtual machine (such as general registers, control registers, and PSW).

TRACE FACILITY: The trace function provides the ability to trace the following events in a virtual machine:

- Any activity against an I/O device or against a range of devices.
- Any storage alteration or alteration within a range of storage. A value may be specified such that the event traced is signaled when that value is set.
- Any general register alteration may be traced with an optional value to be set.
- Selected mnemonics and special instructions can be traced.

ACCOUNTING: Accounting records are created when:

- A virtual machine logs off.
- A minidisk, t-disk, or a dedicated device is detached.
- A user application issues a diagnose instruction.
- The operator enters a CP ACNT command.

These records are used to measure the usage of system resources. This information can be used to account for virtual machine resource utilization.

SYSTEM LOADER: The VM/XA Migration Aid Loader provides the facility to perform system generation directly under CMS or build a load tape or card deck for system generation as a standalone operation in a S/370 or 370-XA real or virtual machine. System generation directly under CMS is limited to systems which, including their preferred region, will fit within the free storage available within the CMS virtual machine.

ADDITIONAL FUNCTION: The following functions, available in the VM/System Product, will be available in this migration aid:

- Channel Check Reflection - for MVS/SP RAS.
- Machine Check Reflection - for MVS/SP RAS.
- Vary Processor - for VM/XA Migration Aid RAS.
- VMCF - for the VM/XA Migration Aid recording and accounting.
- VMSERV - for the VM/XA Migration Aid service.

VM/XA MIGRATION AID DEVICE SUPPORT LIST

Supported DASD:

- 2305 mdl 2
- 3330 mdl 1, 11
- 3333 mdl 1, 11
- 3340
- 3344
- 3350 mdl A2, B2, C2
- 3375 (Dedicated Only)
- 3380 (Dedicated Only)
- 3850 (Dedicated Only)

Supported DASD Control Unit:

- 2835 mdl 2
- 3830 mdl 2, 3
- 3851 (Dedicated Only)
- 3880 mdl 1
- 3880 mdl 2, 3, 11, 13 (Dedicated Only)
- 3880 Speed Matching Buffer (Dedicated Only)

Tapes Supported:

- 3420 mdl 3, 4, 5, 6, 7, 8

Tape Control Unit Supported:

- 3803

Printers Supported:

- 1403 mdl 2, 3, 5, N1
- 3211 mdl 1
- 3262 mdl 1, 5, 11

PROGRAM PRODUCTS

VM/XA Migration Aid (cont'd)

3800 (Dedicated Only)
4245 mdl 1

Readers/Punches Supported:

3525 mdl P1, P2, P3
3505 mdl B1, B2
2540 mdl 1
2501 mdl B1, B2

Unit Record Control Unit Supported:

3811
3505
2821

Display Printers Supported:

(Key operator initiated copy only)

3287 mdl 1, 1C, 2, 2C
3286
3284
3288
3289 mdl 1, 2

Terminals/Consoles Supported:

3277 mdl 2
3278 mdl 2, 3, 4
3279 mdl 2A, 2B, 3A, 3B (4 Color Only)

Terminal Control Unit Supported:

3274 mdl 1B, 1D
3274 mdl 21B, 21D, 31D
3272 mdl 2

Transmission Control Unit Supported:

3704 (Dedicated Only)
3705 (Dedicated Only)

Miscellaneous Supported:

CTCA (Dedicated Only)

ALTERNATE PATH SUPPORT: The control required for alternate path management is provided by the extended architecture channels.

DEDICATED DEVICES: Dedicated devices can be accessed through multiple paths by a virtual machine if there are multiple paths to the real device. Minidisks and simulated devices however will be accessible only through the first path. The Channel Path Identifiers will be the same for the dedicated device as for the real device which supports it.

Note: Support for 3340 and 3344 alternate tracks is only provided in dedicated mode by the virtual machine.

CUSTOMER RESPONSIBILITIES

- Allocating and formatting direct access storage space for the control program and the CMS system residence area.
- Generating and updating user directory and virtual machine descriptions.
- Making the final evaluation as to which operating systems should be run under the VM/XA Migration Aid in the customer's environment.
- Generating the VM/XA Migration Aid system.
- Training personnel to operate the system.
- Teaching users VM/XA Migration Aid commands.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The VM/XA Migration Aid is supported on all models of the 4381 and 308X Processors operating in 370/XA mode to provide multiple MVS/XA testing environments.

STORAGE ESTIMATES: The resident nucleus for the VM/XA Migration Aid will be approximately 1M, and the minimum supported storage size will be 4M.

SOFTWARE REQUIREMENTS

Assembler H Version 2 Release 1 (5668-962) is required for system generation of the VM/XA Migration Aid and for the service of this product.

PROGRAM INTERFACES: The VM/XA Migration Aid Release 1 will support only the following systems:

- MVS/System Product Version 1 (JES2 or JES3) in a V=R preferred area in UP mode.
- MVS/XA in a V=R preferred area in UP mode.
- VM/SP in a V=R preferred area in UP mode.

- VM/SP High-Performance Option in a V=R preferred area in UP mode.
- MVS/System Product Version 1 (JES2 or JES3) in a V=V area in UP mode.
- VM/SP in a V=V preferred area in UP mode.
- VM/SP High-Performance Option in a V=V area in UP mode.
- MVS/XA in a V=V area in UP or virtual MP mode.
- VM/XA Migration Aid in a V=V area in UP or virtual MP mode.
- CMS in a V=V area.

Note: MVS System Product means either MVS/SP Release 1 enhancement or Release 3 and later releases.

The VM/XA Migration Aid Release 2 is designed to support the following operating systems as virtual machines:

- All of the Release 1 environments plus:
 - OS/VS1 in a V=V or a V=R preferred area in UP mode.
 - VSE/AF in a V=V or a V=R preferred area in UP mode.

PACKAGING: The VM/XA Migration Aid will be shipped with the combined components of:

1. VM/XA Migration Aid Control Program
2. VM/XA Migration Aid CMS
3. Dump Viewing Facility

COMPATIBILITY

While the VM/XA Migration Aid is a Virtual Machine Facility, its functions will not be equivalent to any of IBM's VM/370 Products. For example, VM/XA Migration Aid does not support:

1. The following devices (except when used in a dedicated mode by an MVS Virtual Machine)
 - 3375
 - 3380
 - 3800
 - 3850
 - 3705
2. Interactive Networking
3. Program products (excluding RSCS, Pass-Thru Virtual Machine, Remote 3270 Display Option and Assembler H Version 2)
4. Remote terminals (other than through Pass-Thru Virtual Machine program product with the Remote 3270 Display Option program product)
5. Monitoring facilities
6. CMS use other than for installation and service of the VM/XA Migration Aid, and migration from MVS/SP to MVS/XA

The VM/XA Migration Aid user is an MVS customer who is ready to migrate to MVS/XA and would like to continue MVS/SP production work while testing MVS/XA and associated subsystems. On a 3081 Processor, MVS/SP, MVS/XA, VM/SP or VM/SP High Performance Option may run as the preferred virtual machine on one processor of the complex, and cannot be run in virtual AP or MP mode. The test virtual machines and CMS activity will run on the other processor of the complex.

FIELD ENGINEERING CONSIDERATIONS

IMPROVED RAS: This product uses some of the 4381 Group 1 and Group 2 Processor or 308X hardware RAS features to provide system availability enhancements and to put emphasis on recovery. The following will have a positive effect on RAS:

- Reflection of machine checks to S/370 virtual machines.
- Preferred Virtual Machine Recovery.
- Extended Architecture channel processor.
- Set Address Limit.
- CP trace table entries.

RELIABILITY

MACHINE CHECK REFLECTION: This function reflects machine checks to the MVS/SP preferred virtual machine to improve the reliability and availability of the preferred virtual machine.

ERROR RECORDING: EREP records are created when I/O and machine errors occur. These error records are built by the CP modules that handle error recovery. An analysis of these records can provide valuable information concerning current and potential hardware problems.

VM/XA Migration Aid (cont'd)

AVAILABILITY

SCHEDULER: The objective for the scheduler in the VM/XA Migration Aid is the support of a specific environment: The migration of MVS/SP to MVS/XA. There will be no external controls in the VM/XA Migration Aid since the environment is very specific. Since the primary focus for performance is the preferred virtual machine and one entire processor is being dedicated to that virtual machine, the scheduling of that virtual machine is straightforward. "Round Robin" scheduling will be used on the 'master' processor which runs all other virtual machines so that each virtual machine will get a share of the processor.

VIRTUAL MACHINE TERMINATION (SOFT ABEND FUNCTION): In order to reduce the number of system terminations, every attempt will be made to isolate an error to a virtual machine. That virtual machine will be reset or the error will be reflected to the virtual machine via machine check or I/O error. In some instances, diagnostic information will be taken and the system will continue operation.

MISSING INTERRUPT DETECTOR: The VM/XA Migration Aid will have a missing interrupt detector. The MVS missing interrupt handler will be able to take appropriate actions for any of its missing interrupts. The time intervals will be based on the device type. Upon detection of a missing interrupt, the operator will be notified.

HOLD AND FREE COMMAND: A LOGON option can be used to prevent a user from logging on to the VM/XA Migration Aid. If an installation has a user that repeatedly causes system abends, that user can be denied access to the VM/XA Migration Aid by using the HOLD LOGON command, until the problem is solved. When the problem is solved, access can be restored via the FREE LOGON command.

PREFERRED VIRTUAL MACHINE RECOVERY: This facility attempts to resume execution of the preferred virtual machine after the VM/XA Migration Aid has terminated with an abend and initiated an automatic restart.

SERVICEABILITY

MAINTENANCE AND SUPPORT SYSTEM FACILITY (MSSF): MSSF support will be included in this product. In addition, limited support is provided for handling the MSSF commands when they are issued by a virtual machine. Some MSSF commands will be fully handled by the VM/XA Migration Aid product for a virtual machine. Other MSSF commands may be issued by the virtual machine but will have an error response indicated.

ABNORMAL TERMINATION DUMPS: Abnormal termination (ABEND) dumps may be taken when the control program (CP) detects internal errors. There are two types of ABENDS, hard and soft. A hard ABEND is taken when an error condition is detected that cannot be isolated to a single virtual machine or system integrity is endangered. A soft ABEND is taken when an error can be isolated to a single virtual machine or when system integrity is not endangered. When a hard ABEND is taken, optionally all control program storage may be written onto the dump device, and then the system is optionally warm started. When a soft ABEND is taken, only selected pages of control program storage are written into a spool file and the affected virtual machine is given a system reset. The affected virtual machine is notified, if possible.

STAND-ALONE DUMPS: A stand-alone dump utility (S/A DUMP) will be provided with the VM/XA Migration Aid. There will be versions of the S/A DUMP utility that can be IPLed from any supported TAPE device or control program formatted DASD device that is not a control program SYSRES device. The VM/XA Migration Aid stand-alone utility will support the use of the IPL device as the dump device for tapes. The output devices supported by the S/A DUMP utility will be tape and printer (except advanced function printers such as the 3800).

VM/XA MIGRATION AID CMS: VM/XA Migration Aid CMS will be supported only for the service, installation and conversion requirements of the VM/XA Migration Aid. No program products, IUPs, or FDPs that run under CMS, except RSCS, PVM, the Remote 3270 Display Option and the Assembler H program product, will be supported.

SERVICE: The VM/XA Migration Aid will use the PLC type modification concept, and there will be no versioned modules in the control program.

CP TRACE: The CP TRACE facility maintains a history of system activity by recording events in a trace table. Two types of events are tracked:

1. Control Program Events - Significant activities within control program. Examples are resource allocation/deallocation and privileged operation simulation.
2. I/O Events - I/O device activities. Examples are I/O operation initiation and I/O interrupts.

Each event is recorded as a trace table entry using the extended architecture TRACE instruction. A trace table entry contains a trace table entry code, a time stamp and up to 20 bytes of event-unique information. The trace table entry code defines the event being traced, and the time stamp reflects the time-of-day when the entry was made. Each trace table entry will have a CPU identifier.

EXECUTION CHARACTERISTICS

START INTERPRETIVE EXECUTION: Start Interpretive Execution will provide many benefits to the virtual machine environment such as privileged instruction handling, prefixing, and timer handling. (Start Interpretive Execution will also take care of the function provided by shadow tables.) Once a virtual machine is dispatched under Start Interpretive Execution, the control program need not get involved unless there is an I/O interrupt, an external interrupt, or an intercept condition.

EXTENDED ARCHITECTURE CHANNEL GROUP: The System/370 Extended Architecture channel group allows much of the function in the I/O Supervisor to be done by the floating channel group microcode. In addition, since any device can be accessed by any processor, the control program overhead for path selection and processor affinity will be deleted.

LARGE REAL STORAGE: Extended architecture allows up to 2 gigabytes of real storage.

SERVICE PROGRAMS

DIRECTORY PROGRAM: The VM/XA Migration Aid directory program will run only under CMS.

LOADER: The VM/XA Migration Aid loader can be run in S/370 mode or System/370 Extended Architecture mode.

FORMAT/ALLOCATE: The VM/XA Migration Aid format program can only be invoked as a CP command.

DASD DUMP RESTORE: This service routine has two versions, one that runs stand-alone on a S/370 mode machine, and one that runs under CMS.

SECURITY

The VM/XA Migration Aid will include several facilities to ensure the security and integrity of the system. Minidisk security will be provided by a password facility to control both read-only and read-write access. The VM/XA Migration Aid will examine channel programs to determine if the access mode is being violated by the channel program.

The password will not be shown on the command lines for LOGON and AUTOLOG. For the LOGON command, the password must be entered where the area is print inhibited. For the AUTOLOG command, there is no password. The directory entry for the autologged virtual machine will indicate that the virtual machine can be autologged on and the userid of the virtual machine that can autolog it on.

DOCUMENTATION

(available from Mechanicsburg)

VM/XA Migration Aid General Information (GC19-6213), is available. Additional publications will be available at general availability.

PROGRAM PRODUCTS

**VM/SYSTEM PRODUCT HIGH-PERFORMANCE OPTION
5664-173**

PURPOSE

VM/SP High-Performance Option is a performance-oriented extension to VM/System Product for the high-end user. It is recommended for users who can utilize the capability of the 308X Processor Complex; users who can benefit from performance and RAS enhancements to MVS guest machine environments; and users who can benefit from performance enhancements in the CMS intensive environment.

DESCRIPTION

RELEASE 1

- Support for the Segment Protection Extension to VMA on the IBM 308X Processor Complex.

This enhancement utilizes the Segment Protection Extension to VMA on the IBM 308X Processor Complex to reduce overhead incurred in managing segments shared among users.

Shared segments are defined as read-only sections of data and executable code. In previous VM/SP systems and on processors without this VMA extension, segment protection is provided by a software scan to check if a segment was modified by the last user of the segment. By utilizing the new microcode assist on the 308X, the VM Control Program scan for a changed page has been eliminated. In addition, duplication of shared pages, page tables, and swap tables that would otherwise have been required for a dyadic processor has been eliminated, making more real storage available for user applications in the CMS environment.

This reduction in overhead is expected to improve performance in CMS environments when protected shared segments are in use.

Note: VM/SP High-Performance Option Release 1 runs only on the 2K storage protect key version of the model D16 of the IBM 3081 Processor Complex. All other models of the 3081 are supported by Release 2 of the High-Performance Option.

RELEASE 2

- 308X Processor Complex Support

The VM/System Product High-Performance Option supports all models of the 3081, 3083 or partitioned 3084 Processor Complex operating in S/370 mode.

Support is accomplished by providing 4K Storage Protection Key support for VM/SP High-Performance Option and guest operating systems. On these processors, only 4K storage protection can be invoked. The appropriate level of the guest SCP which supports the 4K storage protection keys is required (e.g., MVS/SP Version 1 Release 1 Enhancement, MVS/SP Version 1 Release 3, or VM/SP Release 2 as a guest under VM/SP High-Performance Option).

VM/SP (with or without VM/SP High-Performance Option) continues to provide 2K Storage Protection Key support for the 2K storage protect key version of the 3081 model D16 (as well as other 2K key processors), allowing operation of guest systems that use 2K storage protection (for example, DOS/VSE, VS1, MVS 3.8, etc.).

Note: It is IBM's direction to support VSE/AF and VS1/BPE as guests under VM/SP High-Performance Option on machines with 4K storage protection keys.

- Preferred Machine Assist Support

In conjunction with hardware and microcode, the Preferred Machine Assist support offers a new mode of operation on the 3033 and 308X Processor Complexes. In this mode of operation the preferred MVS/SP guest (MVS/System Product Version 1 Release 1 Enhancement and subsequent releases) is in direct control of the processor, dedicated channels, and I/O devices if VM/SP services are not required.

The preferred MVS/SP guest operates in supervisor state. It can start and retry I/O operations, process I/O interrupts and initiate error recovery operations directly. The direct control of hardware resources eliminates the VM/SP overhead associated with instruction simulation and indirect I/O operations.

The Preferred Machine Assist further permits the MVS/SP V=R preferred guest (MVS/System Product Version 1 Release 3 and subsequent releases) to use storage in excess of 16 MB on the 3033 and 308X Processor Complexes. This allows additional performance potential for storage constrained MVS/SP preferred guests.

Since Preferred Machine Assist allows an MVS/SP V=R virtual machine to operate in supervisor state and utilize the 3033 Extension Feature, previous restrictions to using Single Processor Mode (SPM) or Non-Disruptive Transition (NDT) functions while running MVS/SP Version 1 Release 3 are eliminated.

- Support for the 3033 Extension Feature Enhancement to VMA

VM/SP High-Performance Option allows those 3033 users having the 3033 Extension Feature (#6850) to increase performance of an MVS/SP guest machine (MVS/System Product Version 1 Release 3 and subsequent releases). This also removes existing restrictions to use of Single Processor Mode (SPM) or Non-Disruptive Transition (NDT) for customers installing MVS/SP Version 1 Release 3 on a 3033 with the 3033 Extension Feature. 3033 Extension Feature Enhancement to VMA is required for this capability.

VM/System Product High-Performance Option also supports the newly announced ECPS:MVS enhancement for the 4341 Model Group 2 and 4381 Processors.

- Additional Support for the 3033 Models U24 and A24

The 4K Storage Protection Key support in VM/SP High-Performance Option allows all 24 MB of storage on 3033 models U24 or A24 to be configured online. This support allows the VM/SP installation to dynamically reconfigure storage to meet workload and maintenance requirements.

Previously VM/SP would not IPL if any of the storage physically beyond the first 16 MB were configured online. This restriction held even if the storage above the physical 16 MB line were assigned to logical addresses under 16 MB via a configuration panel (for example, to temporarily replace damaged storage).

VM/SP High-Performance Option removes this restriction and also allows a model 2 Attached Processor Complex (a 3033 A24 and a 3042 model 2) to be split into two uniprocessors with VM/SP on either or both sides and utilize all of storage.

As with the 308X, this support is provided only for guest operating systems using 4K storage protection. Guest operating systems using 2K storage protection continue to be supported on the 3033 models U24 and A24 by configuring the storage above 16 MB offline.

- Enhanced Availability in the MVS/SP V=R Environment

This addition to VM/SP increases the availability of MVS/System Product (MVS/SP) by preserving the V=R virtual machine environment in the event of a Control Program (CP) failure. If CP terminates with an ABEND, an attempt is made to save the MVS/SP V=R virtual machine status, to automatically re-IPL VM/SP, and to resume execution of the MVS/SP V=R guest.

When the MVS/SP V=R virtual machine is operating in Preferred Machine Assist mode, additional recovery capability is available. In most cases where CP enters a disabled wait state, an attempt is made to pass control to the preferred guest. The preferred guest can then continue in native state until the operator re-IPL's VM/SP.

Information about operational considerations will be available in *Operating Systems in a Virtual Machine* with the availability of VM/SP High-Performance Option Release 2.

- Operational Enhancements to Single Processor Mode

These operational enhancements facilitate transition to and from Single Processor Mode. They allow an installation to vary use of the second processor in an AP, MP, or dyadic complex between the Control Program (CP) and the MVS/SP V=R virtual machine without a re-IPL of MVS/SP.

RELEASE 3

- Support for up-to-32 MB by CP

VM/SP High-Performance Option allows use of up-to-32 MB of real storage by the Control Program (CP). This will give CP additional storage to augment the dynamic paging area for guest machines and will provide relief for installations which are currently constrained by storage capacity. The Extended Addressing Enhancement to VMA RPO is required on the 3033.

- Support for the 3880 model 11

VM/SP High-Performance Option will provide support for the new IBM 3880 Storage Control model 11.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The VM/System Product High-Performance Option is designed to run on the IBM S/370 models 1551I, 158, 158-3, 158AP, 158MP, 1651I, 168, 168-3, 168AP and 168MP; on the IBM 4341, 4381, 3031, 3031AP, 3032, 3033U, 3033N, 3033S, 3033AP, 3033AP-2 and 3033MP Processors; and the IBM 3081, 3083 or partitioned 3084 Processor Complex in S/370 mode.

Real Storage Requirements: For a VM/SP system that is running VM/SP High-Performance Option, a minimum of 1 MB real storage is required.

Do not reproduce without written permission

PP 5664-173.2
Nov 83

PROGRAM PRODUCTS

VM/SP High-Performance Option (cont'd)

SOFTWARE REQUIREMENTS

Prerequisites: VM/System Product Release 1 is a prerequisite for VM/SP High-Performance Option Release 1 and 2. VM/SP Release 2 is a prerequisite for VM/SP High-Performance Option Release 3. (Note: VM/SP High-Performance Option does not support the Small CP option for VM/System Product).

COMPATIBILITY

Application programs that currently execute under the VM/System Product and are not dependent on Internal CP or CMS structure and/or control blocks, should continue to run on the VM/System Product with VM/SP High-Performance Option.

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**PROFESSIONAL OFFICE SYSTEMS (PROFS)
5664-176**

PURPOSE

The Professional Office System is designed to provide a comprehensive and easy-to-use set of office system and principal support functions for non-DP and DP users. Operating as a VM/SP application program, PROFS offers a wide range of automated office functions for the executive, professional, and secretary. Electronic preparation, storage, retrieval, and dissemination of office correspondence within a single system or across multiple VM/SP systems can contribute to increased productivity and improved communications.

HIGHLIGHTS

The PROFS licensed program is based on and extends the functions of the PROFS Programming RPQ. IBM will withdraw from marketing the PROFS RPQ, 5799-BEX (P09033), at the availability of the PROFS licensed program, 5664-176. The PROFS licensed program can produce major benefits for users including the potential for:

- Improved productivity because of enhanced communications among PROFS users via the PROFS document library, as well as communications with VM/CMS users via the VM/SP R2 SEND-FILE and RECEIVE functions, and message facilities.
- Increased principal, secretarial, and clerical productivity by using the PROFS document filing, search, and retrieval capabilities.
- Increased principal, secretarial, and clerical communications and productivity by using the scheduling services in PROFS.
- Improved text production with PROFS through simplified use of the VM/SP editor and the Document Composition Facility (DCF) together with proofreading facilities.

Significant capabilities of PROFS include:

- Easy-to-use 3270 display interface
- Support for line-mode devices
- Message exchange among users
- People and facilities scheduling
- Facilities for informal notes or formal documents
- Document preparation aids
- Document formatting and printing
- Online information filing, search, and retrieval
- Electronic document distribution
- Electronic routing slips
- Online help information
- A follow-up/action function
- A remind function
- Spelling verification and word usage aid

Enhanced capabilities of the licensed program are:

- Improved 3270 menus, screens, messages and HELP text
- Improved calendar and scheduling facility
- Spelling, linguistic and composition aids
- Additional problem determination aids
- Restructured publications for ease-of-use
- Customer '800' telephone line to report program defects

DESCRIPTION

3270 User Interface: PROFS offers a broad range of office and personal services functions. Selection and invocation of these functions is simplified through a set of menu and information entry/display screens, and the 'help' facility. The screens are designed to guide the inexperienced user through PROFS and to also provide fast access to the desired function for the more advanced user.

Many screens are used to present a list of choices for user selection. For example, the first screen in PROFS shows a selection list of major functions. The user selects the desired program function key corresponding to the desired function. An alternate method of selection through commands can be used by more experienced users to go directly to a desired function without the aid of menu screens.

Additional information about PROFS functions is available to the user through messages and the 'help' facility. Messages are used to advise about the status of a requested function and to alert about entry errors. The user can also invoke the 'help' facility to obtain 'how to' information about PROFS functions.

Line-Mode Device Support: There are commands available to PROFS users with line-mode devices. These commands, a subset of the PROFS commands available to 3270 users, will help the user create, send, and process memos, notes and messages, as well as help the user maintain the in-basket, mail log, and note log.

Document Preparation: PROFS provides facilities which simplify the entry, change, and correction process for documents with simple format requirements. The PROFS document preparation facility uses IBM-supplied or customer-tailored formats to prompt the person creating a document for standard information such as addressee, subject, reference, copy, list, etc. Author information such as name, title, and department can be automatically inserted via the PROFS author profile facility.

Formatting controls may be entered by the user, although most format controls for basic documents (memos and letters) are provided automatically.

On completion of the document, PROFS lets the user print, mail, file, delete, set aside temporarily, distribute drafts for review, or further update the document.

Proofreading: PROFS also provides a comprehensive set of proofreading services to help correct spelling errors and improve usage of words. It can be used to improve user documentation in several ways:

- Spelling verifications and spelling aid
- Synonyms
- Confusable word usage aid
- Phrase checking
- Dictionaries

The spelling verification and spelling aid facilities can be invoked for any document. Once invoked, spelling verification will cause any misspelled words to be highlighted. The user can correct the misspelled word or invoke the spelling aid that shows the most probable correct spelling for the word. The correctly spelled word will replace the misspelled word when selected by the user.

The synonym facility is based on the American Heritage Dictionaries published by Houghton Mifflin Company. It can be used for any word in a document and will display a list of synonyms if available. Any of the synonyms can be selected to replace the word in the document. PROFS uses Roget's II The New Thesaurus, copyright 1982 by Houghton Mifflin Company, for its list of synonyms.

The confusable word usage aid is used to determine if homonyms (words that sound the same or similar, but are spelled differently), have been used correctly by the author. Incorrect or suspicious usage is highlighted.

The phrase checking facility highlights phrases in the document which are awkwardly worded.

The dictionary facility contains medical, legal, American English and United Kingdom English dictionaries. One or more personal user dictionaries can also be created and maintained through the facility. These personal dictionaries can contain as many words as the user wishes to have recognized by the spelling verification facility.

Document Storage, Distribution, and Receipt: PROFS library services provide a central storage point for documents. Library services allow documents of different types, different access controls, and distribution controls to be placed in and retrieved from the PROFS library. Documents are kept in the library and need only be present temporarily on a user's personal storage for such things as viewing, printing, or updating. PROFS manages the task of document storage and flow control.

PROFS distribution functions allow PROFS users to send documents to other PROFS users. System and RSCS printers can be used to print documents for delivery through normal mail services outside of PROFS. PROFS uses RSCS and the VM/SP services to distribute and receive information from other PROFS systems.

Documents which require the attention of another person may be forwarded with an appropriate routing slip attached. Documents may also be restricted from further distribution.

The document receipt function lets recipients view, print, file, or forward the document to another user, as well as hold it for review at a later time.

The acknowledgement of mail receipt is provided for mail that flows between PROFS users. A person's mail may be forwarded to another user, to himself or another system, or to a printer to be printed and delivered.

File, Search, and Retrieval: Documents in the PROFS library are indexed so that they can be located using a variety of search terms. Information about the document such as author, date, subject, and addressee, is extracted for indexing when a document is created. Other identifying information, such as searchable key-words, can be provided as needed by the document originators and recipients.

Documents that meet the user-specified search criteria may be viewed at the terminal, printed, forwarded, or retrieved to the user's personal storage. Draft documents can be retrieved, changed, and refiled in the PROFS library.

Index records can also be maintained for documents that are not created by PROFS. The physical location of externally stored documents may be determined by utilizing the search facility. The index record can be mailed by PROFS and have a routing slip associated with it.

Formatting and Printing: Actual document formatting is performed by DCF. PROFS helps the user by using predefined formatting controls and printing options. For some applications, formatting will be controlled by customer pre-defined formats. Special formats will

PROFS (cont'd)

require end-user specification of DCF format controls and/or GML tags.

Documents can be printed on VM/SP system and RSCS-supported printers. An interface is provided for adapting output for final printing on 6670 and 6640 devices. Printing specifications, such as number of copies and printer type, can either be selected from screen menu options or can be preset for each printer.

People and Facilities Scheduling: PROFS users can establish a personal calendar for scheduling appointments and meetings, recording daily diary items, planning vacations, or setting up 'to do's'.

Appointments may be added, changed, and deleted at any time. Users, through the System Administrator, can specify who can view or update their individual calendars. Appointments can be made confidential or personal so they are not viewable by others. Calendar entry descriptions may be updated and used as a diary.

The display function provides the capability to view the calendar for a day or a month at a time, and to page forward or backward to a desired day or month. Daily or monthly schedules may be printed.

PROFS calendar provides a powerful function which helps the user schedule meetings involving groups of PROFS users. Date range for the meeting as well as duration and meeting attendees may be specified. PROFS then searches for available time slots on all attendees' schedules. When the user selects from these possible times, a notice is sent to each attendee, showing time, purpose and location of the meeting, and who scheduled it. The user can also search for open times within a date range, based on the amount of open time required.

End-User Services: Besides providing the support functions noted above, PROFS has several 'service' functions that help people do other administrative tasks. One such function is the PROFS scheduling facility, described above. Following are other services:

Notes and Message Facilities: Short, informal communications can be routed between users when there isn't a need for a memo or letter.

Notes can be saved, responded to as they are read and forwarded to others. Both messages and notes may be sent to a list of people. PROFS nicknames may be used in the addressing of this electronic correspondence.

With the message facility, a user can have an interactive 'conversation' with other active users.

Online Help Facility: Many of the menus in the system have several levels of information to help the user understand what can and cannot be done.

Follow-up File: As part of the mail handling facility, PROFS lets users assign due dates to documents for follow-up. These dates can also be used as search arguments.

Remind Function: A reminder function is available to display a message on the user's terminal at a preselected time. The message is accompanied by an audible tone, if available. The message may optionally be repeated at a specified interval up to nine times.

Security of Documents and Calendars: PROFS runs in its own virtual machines and the library contents are owned by PROFS. Therefore, both PROFS and its libraries receive the normal protection of the virtual machine environment. The functions of PROF, as used in inter-virtual machine communications and PROFS, qualifies general users requesting access to members of the library as follows:

When a document is stored, the author can specify that it may be retrieved and viewed only by the author or the person(s) to whom it was sent. Calendars may be viewed and/or changed only by those individuals specifically authorized.

User management is responsible for the selection of all security features and for appropriate application, adequacy and administrative controls. Where natural-language text and/or data is to be transmitted via public communications facilities, management may wish to consider the use of encryption.

CUSTOMER RESPONSIBILITIES

Installation of PROFS will require system programmer and system administrator resources. There should also be a knowledgeable individual available for user guidance in text creation and administration. In addition, the establishment of competency groups (e.g., administration centers, word processing centers, help centers) may be required for specialization and user assistance.

Installation: Installation of a licensed program is the customer's responsibility.

PROFS is a set of load modules, CMS EXECs, text decks, and supporting files. A VM/SP nucleus generation is required to install PROFS.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

PROFS is designed to operate on any currently supported VM/SP IBM S/370, 4331, 4341, 4361, 4381, 303X, 308X in S/370 mode only, 3084 in partitioned processing mode only or 4321 Mdl J11 or larger Processor with a minimum main storage size of one megabyte. A DASD device which is supported by VM/SP is also required. One 9-track tape drive is required to install PROFS.

Device support under PROFS is provided through the VM/SP and RSCS Networking program products. This support consists of the following:

- 3270 Display Stations

PROFS supports IBM 3270-type display terminals with at least 24 lines.

PROFS supports the following IBM display stations:

- 3275 mdl 2
- 3276 mdls 2, 3, and 4
- 3277 mdl 2 (local and remote attachment)
- 3278 mdls 2, 3, and 4
- 3279 mdls 2A and 3A
- 3279 mdls 2B and 3B in 4-color compatibility mode

The following keyboards are supported:

For 3275 or 3277 Display Stations

- 78-key Operator Console (feature #4632)
- 78-key EBCDIC Typewriter (feature #4633)
- 78-key EBCDIC Typewriter/APL (feature #4638), when operated with APL switch off

For 3276, 3278, or 3279 Display Stations

- 75-key EBCDIC Typewriter (feature #4621)
- 87-key EBCDIC Typewriter (feature #4627)
- 87-key EBCDIC Typewriter/APL (feature #4626), when operated with APL switch off
- 87-key EBCDIC Typewriter/TEXT (feature #4629), when operated with TEXT switch off

The standard character set (94 graphics plus blank and null) is supported on 3276 and 3278 Display Stations.

The following are supported, but not required:

- Audible alarm (feature #1090)
- 3277 dual-case character set (RPQ #8K0366)

- 2741 Communication Terminal
- 3101 Display Terminal (e.g., Teletype Mdl ASR 33/35)
- 328X Printers through RSCS
- 7436 Printer (Supported as a 3287)
- VM/SP System Printer (e.g., 1403, 3211, 3800)
- Communicating Mag Card Selectric Typewriter as a 2741
- An interface for adapting printer output for final printing on the 6670 Information Distributor and the 6640 Document Printer, connected through RSCS.

SOFTWARE REQUIREMENTS

PROFS is written in IBM S/370 Assembler language, EXEC2 and XEDIT Command Language. PROFS is designed to operate in a VM/CMS environment and is dependent on the following licensed programs which are available separately:

- VM/System Product (5664-167) Release 1.2 at Service Level 118 (PUT 8209/8210) or subsequent release.
- VM/High-Performance Option (5664-173) Release 2.5 or subsequent release.
- Remote Spooling Communications Subsystem/Networking (5748-XP1) Release 3 or later. (Required for either of the following: (1) exchange of 'mail' between PROFS systems or (2) support for remotely attached output devices such as the 6670 Information Distributor).
- Document Composition Facility (5748-XX9) Release 2 or later with the CMS Foreground Environment features (#6076, #6077, #6407, #6408).

SECURITY/INTEGRITY

PROFS runs in its own virtual machine and the library contents are owned by PROFS. Therefore, both PROFS and its libraries receive the normal protection of the virtual machine. Additional security measures exist within PROFS itself. General users, requesting access to members of the libraries are checked for specific authorization.

When a document is stored, the author can specify that it may be retrieved and viewed only by the author or the person(s) to whom it was sent. Calendars may be viewed and/or changed only by those individuals specifically authorized. User management is responsible for the selection, application, adequacy, and implementation of all security

PROGRAM PRODUCTS

PROFS (cont'd)

features and for appropriate application and administrative controls. Where natural-language text and/or data is to be transmitted via public communications facilities, management may wish to consider the use of encryption.

CMS RELEASE 1.0 (5664-178)
OS/VSE RELEASE 4.0 (5740-XYF)
DOS/VSE RELEASE 4.0 (5746-XXT)**

PURPOSE

Screen Definition Facility/Customer Information Control System (SDF/CICS) is an online application development tool for the CICS/VS application programmer who wants to define or edit maps, map sets, and partition sets for the CICS/VS Basic Mapping Support (BMS). The online operation and the ease-of-use-oriented functions of the tool enhance productivity in development and maintenance. This tool is provided as three functionally equivalent program products which are designed for use in the following environments:

SDF/CICS OS/VS: Online functions can be used either under CICS/VS or, alternatively and new with Release 4.0, under TSO. Batch functions of SDF/CICS can be executed under any batch partition or region; under TSO they can also be invoked for foreground execution.

SDF/CICS VSE: Online functions can be used either under CICS/VS or, alternatively and new with Release 4.0, under ICCF. Batch functions of SDF/CICS can be executed under any batch partition or region; under ICCF they can also be invoked for foreground execution.

SDF/CICS CMS: Online functions of SDF/CICS and SDF/CICS utilities can be invoked under CMS. SDF/CICS libraries are implemented as VSAM clusters. VM/Interactive File Sharing (5748-XXC) is used for accessing these libraries, and is thus a prerequisite for using this product. The CMS batch facility cannot be used for SDF/CICS CMS because of a VM/IFS restriction.

The maps, map sets and partition sets generated by any of the above products can be used for CICS/VS applications executing in the OS/VS, VSE/Advanced Functions, and SSX/VSE environments. All maps and map sets can be generated for CICS/VS Version 1, Release 5 or Release 6. Partition sets generated by SDF/CICS can be used with applications using CICS/VS Version 1, Release 6.

Release 4.0 of SDF/CICS OS/VS, Release 4.0 of SDF/CICS VSE and Release 1.0 of SDF/CICS CMS support all functions of Release 3.0 of SDF/CICS OS/VS and SDF/CICS DOS/VSE. In addition, these products provide functional and usability enhancements, and support for features new in CICS/VS Version 1, Release 6.

HIGHLIGHTS

Functions available in Release 3 (OS/VS and VSE):

- Online definition and editing of maps and map sets.
- Support of device independence for maps and map sets.
- CICS/VS-BMS map generation.
- Multiple libraries support for online operation.
- Library directory support.
- Page simulation.
- Demo session support.
- User hierarchy and authorization.
- User profiles and environments.
- Online help and tutorial.
- Batch utilities.
- Conversion of CICS/VS-BMS defined maps and map sets.
- Conversion of data dictionary segment definitions to SDF/CICS maps.

Highlights of New Functions:

- CICS/VS Release 1.6 Specific Functions
 - Partition set definition and generation.
 - Empty graphic maps (for use by GDDM).
 - Trigger fields.
 - Aligned/unaligned maps.
 - Unsequenced input maps.
 - Large screen support.
- Usability Enhancements
 - Full command assignment to PF keys.
 - Full screen query and definition of PF keys.
 - Full screen query and definition of equate characters.
 - User concept for batch functions.
 - Multiple MSL support for batch functions.
 - Optional, integrated job logging.
 - Simplified product installation.
 - SDF/CICS automatically enabled during CICS/VS start-up via PLT.
- Other System Environments
 - Online functions of SDF/CICS OS/VS can alternatively be invoked under MVS/TSO.
 - Online functions of SDF/CICS VSE can alternatively be invoked under VSE/ICCF.
 - SDF/CICS CMS provides equivalent functional support under VM/SP CMS.

INSTALLATION: SDF/CICS is installed using the installation procedures of the respective operating system. SDF/CICS VSAM clusters can be installed and/or migrated using an SDF/CICS-provided installation program. The installation process is documented in the respective *SDF/CICS Operations Guide* and in the SDF/CICS Program Directory.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

SDF/CICS is designed to operate on the following IBM machines:

All IBM S/370, 303X and 308X processing units and IBM 4300 processors capable of supporting CICS/VS Version 1, Release 5 or 6, MVS/TSO, VSE/ICCF or VM/SP.

The online part of SDF/CICS, when running as a CICS/VS transaction, requires the same specified operating environment as announced for the respective CICS/VS version and release. Alternatively, the online part of SDF/CICS can be invoked under MVS/TSO, VSE/ICCF or CMS without additional requirements for the system configuration.

SDF/CICS utilities are run in a single partition in VSE/Advanced Functions or OS/VS1, or in a single address space in OS/VS2 (MVS). This does not generate additional requirements for the system configuration. Under CMS, The SDF/CICS utilities must be executed in the user's environment.

The configuration must provide sufficient direct access space to contain the VSAM files used by both SDF/CICS online functions and utilities.

The terminals supported by SDF/CICS as target devices are the same as those supported for the definition of maps by the Basic Mapping Support of CICS/VS Version 1, Release 5 or 6.

The IBM SDF/CICS terminals, that is, those devices on which the SDF/CICS user enters or receives information, are:

3275 Control Unit	mdl 2	BSC - remote
Display Station	mdl 12	SDLC - remote
3276 Control Unit	mdls 2,3,4	BSC - remote
Display Station	mdls 12,13,14	SDLC - remote
3277 Display Station	mdl 2	local and remote
3278 Display Station	mdls 2,3,4,5	local and remote
3279 Display Station	mdls 2A,2B,3A,3B	local and remote
3290 Display Station		local and remote
8775 Display Station	mdls 1,2	local and remote
	mdls 11,12	SDLC - remote

For the restrictions on specific devices and their local or remote support in a specific release of CICS/VS and/or interactive environment, the corresponding manuals for the release must be consulted.

Note that display devices with a width of 80 characters and a depth of 12 lines only are not supported since SDF/CICS Release 3.0. A minimum of 5 PF keys is required for operating SDF/CICS (12 PF keys are recommended for ease-of-use, 24 PF keys are supported).

SOFTWARE REQUIREMENTS

SDF/CICS runs as a CICS/VS application program on all IBM S/370, 303X and 308X processing units and IBM 4300 processors capable of supporting CICS/VS Version 1 Release 5 and 6.

CICS/VS is available as 5740-XX1 for OS/VS and 5746-XX3 for VSE/Advanced Functions.

SDF/CICS can, alternatively, also be run in the following interactive environments or in their compatible successors:

MVS/TSO (5752-VS2) Release 3.8.

MVS/XA (5740-XC6 or 5665-291) under TSO in MVS/370 compatibility mode only.

VSE/ICCF (5746-TS1) with VSE/Advanced Functions (5746-XE8) Release 3.0.

VSE/SP CMS (5664-167) Release 1.0.

SDF/CICS supports application programming in S/370 Assembler language, PL/I, COBOL and RPG II. For each language required, the appropriate compiler and library must be installed if application programs are compiled or assembled on the system.

SDF/CICS uses the Virtual Storage Access Method (VSAM). For VSE and CMS, the VSE/VSAM licensed program must be installed. For CMS, the VM/IFS licensed program (5748-XXC) must be installed (and the required segments must have been generated; see the *VM/SP Planning and System Generation Guide* (SC19-6201) for details). The VSAM functions used by SDF/CICS in OS/VS1 and OS/VS2 are basic and thus contained in the operating system. When running under MVS/TSO, the Data Facility Extended Functions program product (5740-XYQ) must be installed.

PROGRAM PRODUCTS

SDF/CICS OS/VS & VSE R4, CMS R1 (cont'd)

SDF/CICS requires for its installation and/or operation the following support programs:

Assembler

System utilities

VSE: MAINT, Linkage Editor

OS/VS: IEBUPDTE, IEBCOPY, Linkage Editor

VSAM:

VSE: VSE/VSAM licensed program (5746-AM2)

MVS/TSO: Data Facility Extended Functions (5740-XYQ)

OS/VS: VSAM Access Method Services

CMS: VSE/VSAM (5746-AM2) and VM/IFS Virtual Machine/
 Interactive File Sharing (5748-XXC)

SMP (System Modification Program) Release 4 in OS/VS

MSHP (Maintain System History Program) in VSE/Advanced Functions

VMSEVR in VM/SP CMS.

SDF/CICS can convert data dictionary segments, containing logically related data fields, from the following licensed programs into SDF/CICS maps:

DB/DC Data Dictionary licensed program

OS/VS (5740-XXF) from Release 3.0 on

VSE (5746-XXC) from Release 3.0 on.

SDF/CICS provides a skeleton map for the use of the ELIAS-I program products:

ELIAS-I (5746-XXV)

ELIAS-I/VM (5748-XXK)

SDF/CICS-defined maps can be exported to DPPX/Distributed Presentation Services of the IBM 8100 Information System.

DPPX/DPS (5760-XR1)

DPPX/DPS Version 2 (5660-264)

The distributed Basic Material consists of object modules, source for CICS/VS dependent modules, CICS/VS table entries, and input data to create the VSAM clusters necessary to run SDF/CICS. Furthermore, all SDF/CICS macros required to assemble the SDF/CICS source modules, SDF/CICS system generation table, and device characteristics table are part of the Basic Material.

Virtual Storage Requirements: The online part of SDF/CICS works either as a CICS/VS transaction or can, alternatively, be invoked in the supported interactive environments. Estimated virtual storage requirements are as follows:

CICS/VS 100K for the first user, 70K for each additional user. (CICS/VS and VSAM requirements must be added to that. A CICS/VS partition will accommodate at least three SDF/CICS users.)

VSE/ICCF 768K

MVS/TSO 512K

CMS 1024K

SDF/CICS utilities require a partition or region of 256K virtual storage. Under CMS, the 1024K of virtual storage required for running online SDF/CICS is sufficient for running SDF/CICS utilities.

COMPATIBILITY/CONVERSION/MIGRATION

SDF/CICS can be used to define and generate maps, map sets and partition sets for all the CICS/VS environments that are supported by SDF/CICS Release 4.0. The physical maps and partition sets generated by SDF/CICS are fully compatible with equivalent maps and partition sets generated by the map, map set, and partition set definition macros of the CICS/VS Basic Mapping Support.

The symbolic description maps generated by SDF/CICS are a compatible superset of maps that can be generated by the CICS/VS Basic Mapping Support. In particular, in extension to BMS macros, longer field names and arrays of structures can be defined and corresponding symbolic descriptions of maps can be generated.

CICS/VS maps and map sets in their BMS macro source format can be imported into SDF/CICS. Such maps and map sets can be converted by a batch utility of the program into SDF/CICS card formats, which can then be loaded into the SDF/CICS map specification libraries.

No import facility for BMS macro-defined partitions and partition sets is provided. The corresponding new parameters on the map and map set definition macros are ignored when converting to SDF/CICS format.

Education: The SDF/CICS online tutorial serves as built-in education material. SDF/CICS also contains two online demo sessions that demonstrate a simple map and the modification of an existing map to extended color field attributes.

5664-179 - VMPPF VM PERFORMANCE PLANNING FACILITY

PURPOSE

The VM Performance Planning Facility (VMPPF) is a performance and capacity management product for VM/SP and VM/SP High-Performance Option (VM/SP HPO) systems, operated as an application program under the VM system.

The VMPPF program product performs these major functions: Data reduction of VM/Monitor data ... model building to create a representation of the measured or projected system environments ... model execution to estimate: Average throughput, average transaction response time, hardware component utilization, e.g., CPU or channel. Model inputs representing workload and system configuration may be modified to estimate the performance of projected systems. These estimates can help the performance analyst or capacity planner evaluate alternative solutions to anticipated installation or user requirements.

HIGHLIGHTS

Marketing Highlights

- VMPPF can be used for capacity planning and performance management in the VM environment.
- To effectively use the product, the user needs to understand the system installation, application requirements and business growth as well as VM and guest operating systems. Performance analysis expertise is also required.
- It can help an installation to optimize the performance of its current system by identifying system bottlenecks.
- VMPPF estimates can help answer 'what if' questions on performance of various projected system configurations and workloads.
- The modeling process can be iterated to evaluate a variety of alternative solutions to meet performance objectives.

Technical Highlights:

- VMPPF runs as a CMS application in the virtual machine environment.
- VMPPF contains a model to estimate the performance of VM systems under a variety of system configurations and user workloads.
- VMPPF operation is based on the VM/Monitor measurements of an existing system which may be automatically input to the model.
- VMPPF provides full-screen user interfaces for all VMPPF functions.
- VMPPF provides color/graphics display capabilities for enhanced usability.
- Calibration of the model against measured performance of an existing system is required.
- Guest operating systems and subsystems can be represented as special user classes.

DESCRIPTION

VMPPF consists of five distinct parts:

1. The model estimates VM performance from user-specified system configurations and workload characteristics, of the following:
 - Average throughput
 - Average transaction response time
 - Hardware component utilizations, e.g., CPU or channel
2. The data reduction program extracts and analyzes the VM/Monitor data for performance of an existing installation and provides input to the model.
3. The user interfaces provide full-screen panels to control data input and model run iterations.
4. The compare program allows the user to compare the output of multiple data reduction and model runs.
5. The color/graphics display output provides graphical representation of output data in specified chart formats.

Hardware Modeled

- IBM CPUs, storage sizes, and DASD devices supported by current releases of VM/SP and VM/SP HPO:
 - UP, AP and MP CPU configurations
 - Up to 48 megabytes of storage
- Multiple VM systems.
- Tape I/O can be partially modeled if a channel is dedicated to tapes.
- The 3340 emulation on the 4331 Mdl Group 1 CPU.
- The 3880 Storage Control mdl 11.

Software Modeled: In the system environments of all currently supported releases of VM/SP Releases 1-3, and VM/SP HPO Releases 1-3, VMPPF provides modeling capability for:

- Single-threaded virtual machines such as CMS
- Multi-threaded virtual machines, such as the S/370 mode operating systems (these models employ simplifying assumptions)
- Dedicated resources, in which a portion of the VM system's hardware resources are assigned to a particular virtual machine, such as a Dedicated Batch facility

Changes That Can Be Modeled: The output data from VMPPF helps the analyst answer 'what if' questions, such as how is performance affected by a variety of system configuration and workload changes.

Analysts may represent these changes by modifying the input to the model. By running the model with the changes and generating the comparison reports, the analyst can evaluate the impact of changes on system performance.

Changes that can be modeled include:

- Growth of system workloads.
- Movement of workloads across processors.
- Changes in IBM processor type or processor model.
- Changes in processor storage size.

Model Limitations: VMPPF can only be used to model VM operations on those IBM CPUs specifically supported. The internal architecture of other CPUs may vary significantly, and attempts to model or extrapolate to other CPUs may result in unpredictable results.

The measured and modeled response times are represented as seen by the internal scheduler, and do not include transmission delays. For guest operating systems, the VMPPF data reduction program captures only aggregate throughput and response time data.

In order to model a guest operating system or subsystem at an end-user transaction level, a measure of the transaction rate is required from the guest operating system itself. Such data may be obtained from other available monitoring programs, such as RMF and SMF. The data can be entered through the full-screen interface provided with VMPPF.

The distribution of DASD read and write access over channel and control units reflect optimal access allocation rather than actual path utilization. In addition, delays for channel and control unit protocol are included in data transfer delays and are not modeled explicitly.

The queuing analytic model for the I/O subsystem employs some simplifying assumptions that may result in optimistic statements for DASD device response times. Response times for DASD devices and data sets reported by the model should be treated with caution, particularly at higher device utilizations. These outputs should be used primarily as relative indicators of the I/O configuration efficiency and performance.

Model Accuracy: VMPPF is a high-level analytic model which estimates 'average' values. Individual response times for particular transactions and short term utilizations of hardware components will vary from these average values.

Model results are sensitive to a variety of factors; these are described in the *VMPPF Guide and Reference* (SC34-2128). Examples of such factors include:

- Adequacy of base model calibration.
- Approximations employed by the I/O subsystem model.
- Consistency of workloads.
- Amount of change from base to projected environment.
- Degree to which measured system has been tuned.

Such factors must be applied to the interpretation of model results by a knowledgeable analyst. Attendance at one of the recommended IBM courses is key to the understanding, interpretation and application of model estimates. Further, the user should develop his own 'sensitivity awareness' of model results, based on continuing experience at his installation.

A key advantage of VMPPF is the ability to generate many projections quickly and easily from a given base. Hence, model results should primarily be used to identify trends and patterns based on a methodically developed body of accumulated information. Significant decisions should be confirmed by multiple runs across a varied range of base measurements.

CUSTOMER RESPONSIBILITIES

Successful use of this product as a planning aid within a specific customer environment is dependent upon:

- A properly configured system with the prerequisite programs.
- A reasonably tuned base system for initial measurement.
- User-provided data that accurately describe the environment.
- Validity of the modeled hardware configuration (e.g., that it is installable).
- A realistic assessment of anticipated system growth.

VMPPF (cont'd)

The interpretation of the output results is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

VMPPF operates on any IBM central processing unit (CPU) that meets the minimum specifications of the operating system environment described under "Software Requirements".

It is necessary to have the APL/Data Analysis feature #1066 installed in 3271 or 3272 Terminal Control Units. The APL/Text Control Function feature (#1067) is required for 3274 or 3276 Control Units.

The ISPF and APL panels are designed for an IBM 327X-2 Display, but will run on any 3270-compatible terminal with at least 24 lines and 80 characters.

Use of the IBM 3279 mdl 3 Color Display is required for the graphics feature, and is recommended for emphasizing the input/output fields on the ISPF and APL panels. An IBM 3287-2 Printer is required if color hardcopy of graphical data is desired.

SOFTWARE REQUIREMENTS

The programs listed below are required to create the VMPPF operating environment:

- Any currently supported release of Virtual Machine/System Product (5664-167), or Virtual Machine/High Performance Option (5664-173), including VM/SP HPO 3.2 and 3.4 when available
- VS APL Release 4 (5748-AP1) which includes the APL full-screen auxiliary processor AP126 and GRAPHPAK
- VS FORTRAN Library Version 1 Release 1 or later, 5748-LM3
- Graphical Data Display Manager (GDDM) Version 1 Release 1 or later (5748-XXH)
- Interactive System Productivity Facility (ISPF) Version 1 Release 1 (5668-960)

Storage Estimates: VMPPF runs under VM/SP Releases 1 to 3, or VM/SP HPO Releases 1 to 3.4, in a CMS virtual machine with at least 2.0 megabytes of virtual storage.

VMPPF requires about 2.2 megabytes of disk storage, exclusive of data files. Graphics installation requires an additional 0.5 megabytes, which is included in the cylinder allocations below.

The following table shows the storage requirements for VMPPF, in cylinders. It is recommended that 3 to 5 additional cylinders initially be allowed for user listing output. This number of cylinders will vary, depending on VMPPF usage and the amount of output saved.

Device Type	Cylinders of Storage for VMPPF (2.2 Megabytes)
3310	13
3330	10
3350	6
3375	6
3340	22
3380	6
3370	7

Note: For additional descriptions, see *VMPPF General Information* (GC34-2126) for details.

PLANNING INFORMATION

Because VMPPF provides a queuing analytic modeling function for the representation of VM systems, hardware and software, the user should be familiar with:

- The installation, application workload requirements and the projected data processing growth for the installation.
- Performance characteristics of the measured VM system, including any guest operating systems or subsystems.
- Performance characteristics of measured workloads and classes of users.
- The use of VM/Monitor data collection, including selection of appropriate collection intervals.
- VMPPF should be used in the context of a structured, methodical approach to performance management and capacity planning. VMPPF methodology, and the simplifying assumptions made by the queuing model, will affect the estimates generated for any projected system configuration or workload.

Customer Education: The following education courses are recommended for understanding VMPPF:

- New York Advanced Education Center (call IBM DIRECT 800-631-5582)
 - VM/Performance: Course S3613
 - VMPPF Implementation: Course S3618

All analysts and capacity planners using VMPPF should complete the Independent Study Program:

- Capacity Planning - Basic Models: ISP IO100

All customer management and those responsible for implementing capacity and performance management projects should attend:

- Capacity Planning for Management: Course W9936

Other educational offerings of interest to the analyst and planner are:

- Information Systems Management Institute (ISMI)
 - Capacity Planning and Performance: Course W9911
 - Capacity Planning for Managers: Course E3353
- Capacity Planning Overview:
 - Video disk, Item GV20-1308
 - Video tape, Item GV20-1309

For further information on these IBM courses and education offerings, see your IBM service representative.

Installation: Installation procedures are described in the *VM Performance Planning Facility Guide And Reference Manual* (SC34-2128).

Planning information is provided in the *VMPPF General Information Manual* (GC34-2126).

DATA SECURITY, AUDITABILITY and CONTROL

VMPPF provides no security control in the function of this product. It depends on, and is controlled by the security controls of VM. The data handled by this program is obtained from the VM/Monitor and is restricted to data on CP and their timings. No data is processed which originates in another virtual machine (e.g., another user's data). Customer management is responsible for the selection, adequacy, and implementation of these controls for the protection of their data.

DOCUMENTATION
(available from Mechanicsburg)

Available at FCS:

VM Performance Planning Facility General Information Manual (GC34-2126) ... *VM Performance Planning Facility Licensed Program Specifications* (GC34-2127) ... *VM Performance Planning Facility Guide And Reference* (SC34-2128) ... *VM Performance Planning Facility Template for 3270 Display Terminals* (GX23-0013) ... *VM Performance Planning Facility Program Summary* (GC34-2131) ... *VM Performance Planning Facility Supplemental Information* (SC34-2153).

SYSTEM INTEGRITY

IBM will accept APARs where installation of VMPPF introduces an exposure to the system integrity of the VM system. This program is intended to run unauthorized.

LICENSED PROGRAM MATERIAL AVAILABILITY

Restricted: No. This licensed program contains APL interpretive language materials and FORTRAN modules. Some APL materials are not accessible by the user. The FORTRAN modules will be available without source licensed program materials. These modules will be available in object code.

PROGRAM PRODUCTS

**HIGH-ACCURACY ARITHMETIC
SUBROUTINE LIBRARY (ACRITH)
5664-185**

PURPOSE

The ACRITH subroutine library provides a set of subroutines (VS FORTRAN and Assembler) for solving problems of numerical analysis with algorithmically verified accuracy for execution under VM/SP. It takes advantage of the High-Accuracy Arithmetic Facility which consists of new floating-point instructions for computations with maximum accuracy. An ISPF-based training component operating under VM/SP can be used for familiarization with the numerical properties of the algorithms in an interactive environment, and to solve smaller problems in conversational mode.

SPECIAL SALES INFORMATION

Today's commercial and engineering/scientific computing environments are often plagued by inaccurate solutions of difficult problems. The particular danger lies in the inability of the computer to give indication of an incorrect result.

The ACRITH subroutine library provides the user with a beneficial and unique feature: The ability to obtain the numerical results with algorithmically verified and maximum accuracy. This will be especially productive for the user who is not a sophisticated numerical analyst, and who cannot do the error analysis for her/his problem, and also for those users who do not want to spend the effort of going through such a person- and machine-time consuming error analysis.

A key element of the ACRITH concept is the use of the High-Accuracy Arithmetic Facility, which employs a long accumulator, thus solving hidden and known accuracy problems in numerical computations. These problems are generally expressed as exponent range or mantissa length limitations of a particular computer architecture.

HIGHLIGHTS

- Optimal floating-point arithmetic newly developed by:
 - Prof. U. Kulisch, Karlsruhe University (Germany) and
 - W. Miranker, IBM Research, Yorktown Heights (USA).
- Algorithms for linear algebra provide:
 - Numerical results with verified accuracy.
 - Solutions with verified existence, uniqueness and validity.
 - User notification, if a verified solution cannot be found.
- Based on High-Accuracy Arithmetic Facility:
 - New floating-point instructions with directed results.
 - For computational results with maximum accuracy.
- Online training component with capability to solve smaller problems in conversational mode.
- Application areas:
 - Professional personal computing.
 - Education in numerical mathematics.
 - Research in numerical methods.
 - Cross-industry mathematical problem solving (structural analysis, optimization, nuclear energy, power net distribution, forecasting, robotics, etc.).

DESCRIPTION

The ACRITH subroutine library provides a set of subroutines (VS FORTRAN and Assembler) for the solution of problems in most cases, and are automatically verified by the mathematical algorithms.

The subroutines are available for S/370 hexadecimal short and/or long floating-point formats for the following numerical problems:

- Evaluation of arithmetic expressions.
- Polynomial evaluations and zeros of polynomials.*
- Linear equations.
- Matrix inversion.
- Linear optimization.*
- Eigenvalues and eigenvectors.*
- Vector operations.
- Scalar product.
- Matrix multiplication

* Note: Long format only.

Also included are format conversion routines from decimal to hexadecimal, and from hexadecimal to decimal, both available with directed rounding.

The subroutines use the High-Accuracy Arithmetic Facility according to the Kulisch/Miranker theory (K.-M.: *Computer Arithmetic in Theory and Practice*, Academic Press 1981). These new instructions compute the basic arithmetic functions (+, -, x, /) and the scalar product (dot product) with maximum accuracy, and provide directed rounding (upwards, downwards, to the nearest number, towards zero) for the hexadecimal short and long floating-point formats. The scalar product instructions use a long accumulator with the internal size of 328

hexadecimal digits. Maximum accuracy is defined such that between the computed floating-point result and the exact result (infinite precision) there is no floating-point number.

The subroutines for linear equations and for eigenvalues/eigenvectors accept as input (coefficients, right-hand side) point or interval data. The output is usually provided in form of intervals, within which the results are verified to exist and to be unique. The vector operations also support point and interval data with the option of directed rounding.

It is a property of the algorithms that all subroutines deliver their results with verified bounds, and if the condition of the problem allows, also with maximum accuracy. The existence, uniqueness and validity of the solution are also verified within these bounds. If for an extremely ill-conditioned problem a verified solution cannot be achieved, an appropriate return code will be issued.

The Online Training Component can be used to familiarize the user with the functions of the ACRITH subroutines. It is based on ISPF, and offers similar panel layout and menu techniques. In the course of execution of an option, random input data can be generated or actual values from a mathematical problem can be entered, thus providing a very comfortable way to solve smaller problems in conversational mode. A tutorial is included that can give an introduction to the Online Training Component, to ISPF and to editing functions.

CUSTOMER RESPONSIBILITIES

The customer is responsible for the installation of the ACRITH subroutine library.

Installation: The ACRITH subroutine library, including the Online Training Component, requires six megabytes of disk storage. The virtual storage required is application dependent. For a typical problem to solve, e.g., a system of linear equations for a 50 x 50 matrix, 125K bytes for the program and 225K bytes for the data including the workspace are required.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The ACRITH subroutine library has been designed to operate under VM/SP in all IBM S/370 mdl 135 and above, the IBM 303X and 308X Processors, and the IBM 4300 Processors. On IBM 4361 Processors, microcode support is provided for the new floating-point instructions.

SOFTWARE REQUIREMENTS

The ACRITH subroutine library is designed to operate with the following program products:

Program	Ver.	Rel.	Modif.	Program No.
VM/SP	1	2 or 3	0	5664-167
VS FORTRAN Comp. & Lib	1	2 or 3	0	5748-F03 (1)
VS FORTRAN (Lib. only)	1	2 or 3	0	5748-LM3 (1)
ISPF Dialog Manager	1	1	0	5668-960 (2)

Notes:

- (1) For execution of the ACRITH subroutines, either VS FORTRAN library is required.
- (2) Required for the Online Training Component only.

COMPATIBILITY

The ACRITH subroutines adhere to two interface levels:

- The FORTRAN call interface: All ACRITH subroutines that can be called in user main programs obey the specifications of the CALL statement as described in the *VS FORTRAN Reference Manual*. Assembler routines called by the ACRITH subroutines follow the respective VS FORTRAN linkage conventions from the *VS FORTRAN Application Program Guide*.
- The High-Accuracy Arithmetic Facility: All ACRITH subroutines adhere to the specifications of the High-Accuracy Arithmetic Facility.

CONVERSION

VS FORTRAN programs which use the ACRITH subroutine library can be executed on all supported S/370 processors without the need for recompilation.

Programs using the new simulated instructions assembled for execution on processors without the ACRITH microcode support must be reassembled with the appropriate ACRITH macro library in order to gain from the performance benefits when executed on processors with the ACRITH microcode support.

Existing VS FORTRAN programs which want to utilize the power of the ACRITH program product must be rewritten for the arithmetic portions and the problem solving routines.

PROGRAM PRODUCTS

ACRITH (cont'd)

PERFORMANCE CONSIDERATIONS

The ACRITH subroutines are different from conventional subroutines both with respect to the algorithms used and to the results provided. Therefore, any simple comparison of run times can be misleading. In addition to the run time required, the algorithmically verified accuracy of the results must be considered. Because of the verified existence, uniqueness and validity of the solution, it is not required to conduct time consuming forward and/or backward error analysis.

For many problems that previously computed in long or extended hexadecimal floating-point format for accuracy reasons, the High-Accuracy Arithmetic subroutine library now delivers accurate results in short floating-point format.

On the 4361 Processors, microcode support is provided for the new ACRITH instructions for improved instruction execution times. Measurements show an average acceleration factor of approximately 2.0 (ranging from 1.1 to 4.5).

**5664-187 - CVIEW V1
THE COOPERATIVE VIEWING FACILITY
VERSION 1****PURPOSE**

The Cooperative Viewing Facility (CVIEW), Version 1, is a program product that allows two users, at separate display stations, to share a single interactive terminal session. It provides the capability for centralization of DP support and services, thereby increasing productivity in the use of Data Processing Systems. It is useful for remote consultation, education, problem management, program maintenance and demonstrations.

HIGHLIGHTS

- Simple and expedient setup procedure
- Dual keyboard control
- Session security consideration
- Log file facility
- Multiple session capability

DESCRIPTION

Setup Procedure: All option selections are made via menus, rather than commands. At every point in the setup procedure, one of the options is the HELP panel. These design considerations have allowed the product to be usable to a wide range of users, including those without any knowledge of VM or CMS.

Dual keyboard control: Both terminal keyboards are active during a session. This allows either user to make entries with the resultant screen displayed on both terminals.

Session security: Each user is informed, periodically, through a security panel, that they are operating under the CVIEW system. The time period is set, at user option, during installation.

Log file facility: A log file is maintained and updated for each session with the following information:

- Name of consultant
- Start and stop date and time
- Device addresses

Multiple sessions: Up to 15 two-party sessions can be handled simultaneously.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

CVIEW operates on any IBM central processing unit (CPU) that meets the minimum hardware requirements for VM/SP.

At least two display terminals are required. Devices that may be used include the following IBM display stations:

- 3277 mdl 2
- 3278 mdls 2, 3 and 4
- 3279 all models when operated in 4-color compatibility mode.

SOFTWARE REQUIREMENTS

CVIEW operates under VM/SP Release 2 or 3 and CMS. It operates with or without the VM/High-Performance Option. It consists of 14 programs written in Assembler language and 14 execs written in EXEC2.

In the case of remote terminals from another system linking to CVIEW, VM/Pass-Through Facility (PVM) program product, Release 2, must be used. Once a remote session is taking place no other sessions can be started until the remote session is terminated.

CVIEW requires four cylinders of 3330 (or equivalent) and two megabytes of virtual storage.

Installation: CVIEW was designed for ease of installation.

Installation procedures are described in the *CVIEW Installation, Messages and Diagnosis Manual*.

Education: The time required for a person to become familiar with the process of establishing a session is relatively short since the system panels lead the user through the process.

DATA SECURITY

The security of a session is achieved by synchronizing on a password which can be communicated over the telephone. The password is not retained by CVIEW after session termination.

Additionally, each user receives, at a particular time interval, a warning that they are operating under CVIEW and are therefore sharing the session with another party.

DOCUMENTATION

(available from Mechanicsburg)

CVIEW User's Guide (SC34-2144) ... CVIEW General Information Manual (GC34-2149) ... CVIEW Licensed Program Specification (GC34-2150) ... CVIEW Installation, Messages and Diagnosis Manual (SC34-2151).

SYSTEM INTEGRITY

IBM will accept APARS when installation of CVIEW introduces an exposure to the system integrity of VM. This program is intended to run unauthorized when operating in VM/SP Release 3.

PROGRAM PRODUCTS

**3270-PC FILE TRANSFER PROGRAM
5664-281**

PURPOSE

The 3270-PC File Transfer Program provides a 5150/5160 Personal Computer 3278/79 Emulation Adapter-featured computer, or a 3270 Personal Computer with the capability to transfer files to or from the host system to the workstation. This program product may be installed in VM/SP 2.1.

HIGHLIGHTS

The 3270-PC File Transfer Program allows files to be transferred from the host to the workstation for off-line data manipulation, updating, or correction or for the transfer and storage of local data in the host system.

CUSTOMER RESPONSIBILITIES

The customer is responsible for installing the proper program in the host system.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE/SOFTWARE REQUIREMENTS

Either:

- IBM 3270 Personal Computer, 3270-PC Control Program, and IBM PC DOS 2.0 or,
- IBM Personal Computer 3278/79 Emulation Adapter in a 5150/5160 Personal Computer, Personal Computer 3278/79 Emulation Control Program, and IBM PC DOS 2.0.

PACKAGING

Each program product resides on a mini-reel.

ORDERING INSTRUCTIONS:

When ordering PP 5664-281 for VM/SP 2.1, #9001 must also be ordered for Asset Assignment. In addition, specify either #5242 for 9-track 1600 bpi Magnetic Tape or #5243 for 9-track 6250 bpi Magnetic Tape.

PROGRAM PRODUCTS

5665-274 - RMF V3 R2.1
RESOURCE MEASUREMENT FACILITY (RMF)
VERSION 3 RELEASE 2 Modification Level 1

PURPOSE

The Resource Measurement Facility (RMF) Version 3 Release 2 Modification Level 1 program incorporates all the functions of RMF Version 3 Release 1 and, in addition, offers a workload delay monitor and a virtual storage activity report.

HIGHLIGHTS

RMF Version 3 Release 2 Modification Level 1 provides support for the 438X Processors and incorporates the functions of RMF Version 3 Release 2 as follows:

- New and improved measurements are provided to help the installation manage the larger workloads and increased resources that the S/370 Extended Architecture can support.
- Measurement data from channel hardware can be used for more accurate measurement of I/O data.
- The Workload Delay Monitor (Monitor III) provides realtime exception capability and analysis to identify performance problems and resource contentions as they occur. Exceptions to predefined thresholds are highlighted for rapid identification.
- The backward reference capability will allow the analysis of recent performance problems. The development of a current performance problem can be tracked through the recent history data.
- Panels for online display allow contention analysis from both a job and resource perspective.
- A Virtual Storage Activity Report will provide information about the usage of virtual storage.
- Takes advantage of the S/370 Extended Architecture by relocating most RMF data areas and some RMF code to the extended area of virtual storage.

DESCRIPTION

I/O ARCHITECTURE: SUPPORT AND USE: The S/370-XA channel subsystem architecture and the MVS/SP Version 2 support for it, allow the channel subsystem to perform some of the I/O processing formerly done by programming. It presents a logical view of an I/O configuration to the software. All devices are accessible to each processor of the Processor Complex, and channel path selection and queuing of requests are performed by the hardware. The MVS/SP Version 2 I/O Supervisor (IOS) supports this new architecture by removing path selection and queuing for channel or control unit busy conditions. I/O requests are made to the channel such that there is one I/O request initiated per device. This is an enhancement over MVS/SP Version 1, in which the software remains sensitive to channel busy conditions and to control unit and device busy conditions of sufficient duration.

Since the queuing techniques are different in S/370/XA, the data that RMF reports is different. RMF preserves and reports data that the channel maintains about the I/O requests it handles. Several items of RMF data are measured by the channel instead of sampled by RMF, thus providing improved accuracy. Other items are presented in different terms to improve their usability.

One of the items of channel-measured data that RMF uses extensively is device connect time, the time the channel is transferring data to or from the device. This item is a measure of 'device busy' accumulated by channel hardware which reflects the amount of data actually transferred.

RMF and SMF both provide a common unit of measure for I/O activity; i.e., connect time. It is therefore not necessary to try to relate SIOs to EXCPs.

Among the significant changes made to reports in support of MVS Extended Architecture are:

- **I/O Device Activity Report:**
Version 3.2 presents the average I/O response time for each device and then breaks this down into its parts. The parts are:
 - Software queuing time.
 - The time the channel took to find a path to a device.
 - The time the device spent searching and transferring data.
 - The time the device spent positioning and reconnecting.

All except software queuing time are measured by the channel and passed to RMF for recording and reporting.

- **Channel Activity Report:**
This report provides utilization data about each physical channel.

- **I/O Queuing Activity Report:**

This report presents data that the hardware has collected about its management of path contention. The report also provides valuable I/O configuration information; it identifies channel paths and the control units they serviced during the measurement interval, along with a logical index into the I/O Device Activity report to allow easy association to the related set of devices.

MONITOR for CONTENTION ANALYSIS: Other enhancements will provide for improved performance and resource monitoring capabilities that will help the installation maintain performance criteria and manage large MVS system workloads with the increased resources that are supported by the S/370 Extended Architecture.

Previous performance monitoring techniques have relied upon resource utilization as an indicator of interactive response time. These methods are only valid in a system environment that has no resource constraints. The MVS operating system is designed to allow the installation to determine batch and interactive priorities in the distribution of various system resources. Because of this prioritization, some jobs or interactive users will have faster response time than others due to the delay caused by higher priority tasks.

By monitoring job or system delay time (in conjunction with 'busy' or active time) a better picture of overall system operation can be seen.

In a response time oriented interactive system, RMF Monitor III provides a contention- (or delay) oriented approach which identifies problems as they are occurring, via realtime exceptions. This puts a focus on the current performance problem.

Workload delay reasons are provided to help identify the area which is the probable cause of the performance problem. Additional delay information such as tasks being delayed, resources involved, tasks holding those resources and magnitude of delay time, provide the performance analyst with data on the impact of current system delays.

Through the use of the backward reference capability, the performance analyst may retrieve necessary measurement data to analyze performance problems of the recent past or trace the development of a current problem.

The workflow screen provides a pictorial representation of the speed at which work units are progressing and system resources are servicing requests. The use of workflow as a measure of performance allows instantaneous performance evaluation by workload (TSO, batch, started tasks, performance groups, domains or specific job), and system resources.

The RMF Workload Delay Monitor will improve system performance analyst effectiveness through an easier method of identifying and diagnosing system performance problems.

ADDRESSING ARCHITECTURE: SUPPORT AND USE: Most RMF data areas and some RMF code have been relocated to the extended areas (virtual storage above 16 megabytes). A substantial portion of the private area modules and data areas have been relocated to the extended area.

The Virtual Storage Activity Report provides information about the usage of virtual storage in the major system areas within the first 16 megabytes, as well as the extended area of virtual storage. Additional information may also be selected about the usage of virtual storage in the private areas of installation-selected jobs.

Using this new virtual storage information, an installation can plan for and monitor changes that will relieve virtual storage constraints below 16 megabytes.

Virtual storage utilization data can now be collected along with other long term measurement data that is used in capacity planning.

System programmers or capacity planners can easily assess their current situation with respect to a potential or actual virtual storage resource constraint problem. RMF data on paging activity and real storage utilization includes counts (or activity) from both above and below 16 megabytes. A count of fixed frames below 16 megabytes is provided.

RESTRUCTURED SMF RECORDS: RMF Version 3 provides a flexible structure for all SMF records produced by RMF. The Version 3 post processor converts records produced by RMF Version 2 (Release 2 MVS/System Extensions Support and later) to a format acceptable to the rest of Version 3.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The RMF Version 3 Release 2 Modification Level 1 licensed program is designed to operate on any IBM processor that is supported by MVS/SP 2.1.1 with the PTFs for 4381 support installed.

PROGRAM PRODUCTS

RMF V3R2.1 (cont'd)

SOFTWARE REQUIREMENTS

RMF Version 3 Release 2 Modification Level 1 licensed program requires that MVS/SP 2.1.1 be installed along with the PTFs for 4381 support and RMF Version 3 Release 2. If Monitor II or Monitor III local display sessions are used, the BTAM/SP must be installed.

Storage Considerations: Fixed storage requirements for RMF include temporarily fixed storage in the extended PLPA, temporarily fixed storage in the private area, and fixed storage in the extended SOA. The amount of storage RMF uses depends on the set of options the installation selects for RMF processing.

PROGRAM PRODUCTS

**5665-274 - RMF V3 R1
RESOURCE MEASUREMENT FACILITY (RMF)
VERSION 3 RELEASE 1**

PURPOSE

The Resource Measurement Facility (RMF) Version 3 program provides measurements that will help the installation to monitor the workload and use of resources in a 4381 Processor and 3081 Processor Complex running MVS/System Product Version 2.

HIGHLIGHTS

RMF Version 3 does the following:

- Provides new and improved measurements that will help the installation manage the larger workloads and increased resources the S/370 Extended Architecture can support.
- Changes measurements or the way in which they are accumulated, where necessary to support the S/370 Extended Architecture.
- Takes advantage of the S/370 Extended Architecture by relocating most RMF data areas and some RMF code to the extended area of virtual storage.
- Incorporates the functions of RMF Version 2 Release 4 Enhancement.

DESCRIPTION

I/O ARCHITECTURE: SUPPORT AND USE: The S/370-XA channel subsystem architecture and the MVS/SP V2 support for it, allow the channel subsystem to perform some of the I/O processing formerly done by programming. It presents a logical view of an I/O configuration to the software. All devices are accessible to the 4381 and each processor of the 3081 Processor Complex, and channel path selection and queuing of requests are performed by the 3081 or 4381 hardware. The MVS/SP V2 I/O Supervisor (IOS) supports this new architecture by removing path selection and queuing for channel or control unit busy conditions. I/O requests are made to the channel such that there is one I/O request initiated per device. This is an enhancement over MVS/SP Version 1, in which the software remains sensitive to channel busy conditions and to control unit and device busy conditions of sufficient duration.

Since the queuing techniques are different, the data RMF reports is different. RMF preserves and reports data the channel maintains about the I/O requests it handles. Several items of RMF data are now measured by the channel instead of sampled by RMF, thus providing improved accuracy. Other items are presented in different terms to improve their usability.

One of the new items of channel-measured data that RMF now uses extensively is device connect time, the time the channel is transferring data to or from the device.

- As a percentage of elapsed time, it is a measure of "device busy". Since it is measured rather than sampled, it is more accurate than the device busy reported by RMF Version 2.
- As a measure of load on a device, it is better than activity rate, because it reflects the amount of data transferred.
- SMF reports device connect time in the same way that it reports EXCP count; by DD statement and the total for job step. Now that SMF and RMF use the same unit to report I/O, it is not necessary to try to relate SIOs to EXCPs.

The new I/O architecture has led to changes in several RMF reports.

- I/O Device Activity Report:

RMF Version 2 presented data about path contention in terms of percents, times, and queue lengths. Version 3 presents most of its data in units of time. It gives an overall Average I/O response time for each device and then breaks this down into its parts. The parts are:

- Software queuing time.
- The time the channel took to find a path to the device.
- The time the device spent searching and transferring data.
- The time the device spent seeking and reconnecting.

All except software queuing time are measured by the channel and passed to RMF for recording and reporting.

% device busy is replaced by two values, % device connect and % device utilization. The % device connect, explained above, is measured by the channel. The % device utilization is both the time the device was in use and the time the device was reserved. It is a measure of the time the device was unavailable to service a request from another system.

- Channel Activity Report:

The physical channel portion of the Channel Activity report has been renamed Channel Path Activity. It provides utilization data about each channel path. The logical channel portion of the 370 Channel Activity report provided data on software management of

path contention. This is being dropped and a new, separately requested, report called I/O Queuing Activity presents data the hardware has collected about its management of path contention. The I/O Queuing Activity report also provides valuable I/O configuration information. It identifies channel paths and the control units they serviced during the measurement interval, along with a logical index into the I/O Device Activity report to allow easy association to the related set of devices.

- Address Space Resource Data Report:

The device connect time is provided for each job. It is analogous to the total EXCP count provided in 370, except it is hardware-measured and is a different unit.

ADDRESSING ARCHITECTURE: SUPPORT AND USE: Most RMF common area data areas and modules have been relocated to the extended areas (virtual storage above 16 megabytes). A substantial portion of the private area modules and data areas have been relocated to the extended area.

RMF data on paging activity and real storage utilization appears the same but includes counts (or activity) from both above and below 16 meg. A new count of fixed frames below 16 meg is provided.

RESTRUCTURED SMF RECORDS: The new and changed data RMF provides has resulted in a new structure for all SMF records produced by RMF. To allow the installation to process existing records with the new Version 3 post processor, the post processor converts records produced by RMF Version 2 (Release 2 MVS/System Extensions Support and later) to a format acceptable to the rest of Version 3.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The RMF Version 3 Licensed Program operates on any IBM processor supported by MVS/System Product Version 2.

SOFTWARE REQUIREMENTS

The RMF Version 3 Licensed Program requires that MVS/System Product Version 2 be installed. If Monitor II local display sessions are used, the BTAM/SP must be installed.

Storage Considerations: Fixed storage requirements for RMF include temporarily fixed storage in the extended PLPA, temporarily fixed storage in the private area, and fixed storage in the extended SQA. The amount of storage RMF uses depends on the set of options the installation selects for RMF processing.

PROGRAM PRODUCTS

**INFORMATION/LIBRARY
RELEASE 1
5665-277****PURPOSE**

Information/Library is a dialog-oriented program providing search and retrieval functions for a companion data base Library/MVS, Program Number 5665-294. The data base contains MVS system reference and program logic information. This information reflects the structure of the publications and consists of titles, abstracts, tables of contents, headings, indexes and full text for selected manuals (such as *OS/VS System Message Library: VS2 System Messages*).

Information/Library provides an online-accessible, complete and IBM-maintained master index of the OS/VS2 MVS documentation.

The fill-in-panels of the Information/Library dialog provide a convenient and easy way to 'formulate' search queries. Matching information is found accurately and displayed in a clearly arranged form. Moreover, the user can print the displayed information or parts thereof.

Information/Library operates under the Time Sharing Option (TSO) and/or under the licensed program Network Communications Control Facility (NCCF) of OS/VS2 MVS. The Virtual Storage Access Method (VSAM) is used for the Library/MVS data base organization.

HIGHLIGHTS

- Online master index for OS/VS2 documentation.
 - Quick and direct access to specific manuals or parts thereof.
 - Decrease in the OS/VS2 MVS library complexity.
 - Increase in the OS/VS2 MVS library usability.
- Context search based on manual-like structure.
 - Search on title (including order number).
 - Search on abstract.
 - Search on heading.
 - Search on index.
 - Search on heading and index.
 - Search on various combinations of the above.
- Structured index.
 - Search on complete master index.
 - Search on index terms to specific titles.
 - Search on index terms to specific headings.
- Dialog capabilities for finely-tuned, efficient inquiries.
 - Small number of comprehensive, yet easy-to-use functions.
 - User guidance by fill-in panels.
 - No need to learn command syntax.
 - Extended search terms: Phrases and word fragments.
 - Search operations based on previously obtained results.
- Structured result display.
 - Display titles (order number included).
 - Display abstracts (title included).
 - Display headings (title included).
 - Display index terms (title and headings included).
 - Display full text (title and headings included).
 - Display additional information for a specific result:
 - Heading hierarchy above a lower heading.
 - All index terms for a heading, not only the matching ones.
- Offline printing.
 - Parts to be printed are user-selectable.
 - User comments can be put on top of print information.
 - Print information can be directed to specific SYSOUT data sets.
- Online tutorial and help facilities.
 - Educational panels.
 - Help panels, available at any dialog step.
 - User never gets lost throughout the entire dialog.
- Increased productivity.
 - Easy information retrieval.
 - Greatly reduced search time.
 - Reduction of false starts and program runs due to missing information.
 - Better performance of OS/VS2 MVS-associated tasks.
 - More frequent and more efficient usage of the OS/VS2 MVS documentation.

CUSTOMER RESPONSIBILITIES

This section briefly discusses the activities the user has to perform to make Information/Library operational. It gives a rough guide for assessing the total installation effort. The assumption is that a system running under OS/VS2 MVS with TSO and/or NCCF has already been installed.

The major implementation steps are:

- Installation of the Information/Library dialog program according to the distribution tape and installation description. The System Modification Program (SMP) is used for installation.
- Definition of VSAM space and VSAM clusters for the Library/MVS data base and importing the Information/Library data base from the distribution tape.
- Execution of the sample dialog to verify the installation.

No modifications or adaptation of the Information/Library dialog program or the Library/MVS data base are required.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Information/Library is designed to operate on any IBM processor configured to run OS/VS2 MVS with TSO or NCCF.

For installation and operation of the program, the following minimum equipment is required:

- One 9-track IBM magnetic tape unit, 6250 bpi, or equivalent, for the installation of the distribution tapes.
- DASD space for the Library/MVS data base on any device supported by VSAM.
- One IBM 3270 Display Station with at least 24 lines by 80 characters, or equivalent, attached to the appropriate control unit.

SOFTWARE REQUIREMENTS

Information/Library requires the functions required by OS/VS2 MVS Release 3.8 and subsequent releases, unless otherwise identified, with the following:

MVS/SE Release 2
MVS/SP Version 1
MVS/SP Version 2

Information/Library operates under the Time Sharing Option (TSO) of the OS/VS2 MVS System Control Program Release 3.8, with the current releases of the Virtual Telecommunications Access Method (VTAM) or the Telecommunications Access Method (TCAM).

In addition, Information/Library operates under the licensed program Network Communications Control Facility (NCCF) Release 2 of OS/VS2 MVS Release 3.8 with the latest releases of Advanced Communications Function/Virtual Telecommunications Access Method (ACF/VTAM) or Advanced Communications Function/Telecommunications Access Method (ACF/TCAM). Subsequent releases of ACF/VTAM and ACF/TCAM are also supported unless otherwise stated by IBM. Information/Library can run under both TSO and NCCF concurrently.

The Virtual Storage Access Method (VSAM) is used for the Library/MVS data base organization.

Information/Library is a prerequisite for the use of Library/MVS.

MVS SYSTEM INTEGRITY APPLIES: Yes

RPQs ACCEPTED: No

PROGRAM PRODUCTS

INFORMATION/LIBRARY
RELEASE 2 Modification Level 0
5665-277

PURPOSE

Information/Library is a dialog-oriented program providing search and retrieval functions for the companion data base product Library/MVS. Installations can also use Information/Library with a data base consisting of user documentation, or with a concatenated data base containing both information from Library/MVS and user documentation.

Library/MVS contains MVS and MVS/XA system reference and program logic information. This information reflects the structure of the publications and consists of titles, abstracts, table of contents headings, indexes, and, for certain manuals (such as *Messages and Codes* manuals), full text. It provides an online, accessible master index to MVS documentation.

Information/Library and Library/MVS improve the productivity of MVS users by helping them to quickly locate the information they require for any given task from the MVS library. They can save not only search time in using the hardcopy library but also time spent as the result of errors from failing to find all the pertinent information for a given task. For full text documentation (such as *Messages and Codes*), users can access up-to-date information without referencing the hardcopy library.

DESCRIPTION

Information/Library operates under the Time Sharing Option (TSO), the licensed program TSO/Extensions (TSO/E), and/or the licensed program Network Communications Control Facility (NCCF) of MVS/370 or MVS/XA. The virtual storage access method (VSAM) is used for the Library/MVS data base organization.

Release 2 of Information/Library and Library/MVS contains all the search and retrieval functions of Release 1 plus the following enhancements:

- Selection of manuals from Library/MVS according to the user's specification.
- Support for user publications/documentation as a separate data base or concatenated with the selected manuals from Library/MVS.
- Support for multiple versions of the same publication or abstract.

SELECTION OF INFORMATION IN THE DATA BASE: Release 2 of Library/MVS allows the user to select the contents of the data base. As a result, the user can:

- Maintain product information at the level of the installed products.
- Reduce the size of the data base by eliminating inapplicable or unwanted product documentation, thereby requiring less DASD space for the data base and improving search time.
- Supplement information in the Library/MVS data base with user documentation.
- Maintain multiple versions of the same publication or abstract.

Release 2 includes the following programs to support the creation of an installation-tailored data base:

- A selection program that allows the installation to exclude individual publications or groups of publications (such as publications for a specific product or product level).
- A conversion program that converts user documentation input to Information/Library data base format.
- A load program that operates in batch mode and that builds the data base from the complete Library/MVS data base, from the output of the selection program, from the output of the conversion program, or from a combination of the preceding.

Updates to Library/MVS will be shipped as update tapes, containing only the updated documentation, documentation for additional products, or additional full text documentation. The user can use the selection and load programs to incorporate updates into the data base, replacing existing information in the current data base as applicable to the particular installation.

Periodically, update tapes will be incorporated into a new base tape.

CONTENTS OF THE LIBRARY/MVS DATA BASE: Release 2 of Library/MVS includes the information provided in Release 1.3, plus additional full text. The base tape for Release 2 supports MVS/370 systems: MVS/System Product Version 1 and related products (including data management products, ACF/VTAM, ACF/TCAM, IMS, CICS, and high-level languages). Updates to Release 2 will support:

- MVS/XA (MVS/System Product Version 2 (JES2 and JES3), Data Facility Product, and related products).
- Additional updates for MVS/370 (new releases of MVS/System Product Version 1 and related products).
- Additional products not yet included in the data base.
- Additional full text.

Updates will be distributed three to four times a year.

SEARCH AND RETRIEVAL FUNCTIONS: The search and retrieval functions and the structure of the data base are designed specifically for rapid and easy retrieval of applicable information from a large library of books such as the MVS library:

- Context search based on manual-like structure
 - Search on title (including order number)
 - Search on abstract
 - Search on headings (table of contents)
 - Search on index
 - Search on various combinations of the preceding
- Structured index
 - Search on complete master index
 - Search on index terms in a subset of titles
 - Search on index terms in specific headings
- Dialog capabilities for finely tuned, efficient inquiries
 - Small number of comprehensive yet easy-to-use functions
 - User guidance by fill-in panels
 - No need to learn any command syntax
 - Extended search terms: Phrases and word fragments
 - Search operations based on previously obtained results
- Structured display of results
 - Display titles (order number included)
 - Display abstracts (title included)
 - Display headings (title included)
 - Display index terms (title and headings included)
 - Display full text (title and headings included)
 - Display additional information for a specific result
 - Heading hierarchy above a lower-level heading
 - All index terms for a heading, not only the matching index terms
- Offline printing
 - All or parts of search results
 - Addition of user comments
 - Output directed to specific sysout data sets
- Online tutorial and help facilities
 - Educational panels
 - Help panels available at any dialog step

CUSTOMER RESPONSIBILITIES

This section outlines the activities the user does to make Information/Library operational. It gives a rough guide for assessing the total installation effort. The following steps assume that a system running MVS/370 or MVS/XA with TSO, TSO/E, and/or NCCF has already been installed.

The major implementation steps are:

1. Installation of the Information/Library dialog program according to the distribution tape and installation description. The system modification program (SMP) is used for installation.
2. Optional use of the selection program to exclude information on the Library/MVS tape from the data base. The selection program uses a selection table included on the Library/MVS tape to determine the contents of the data base. To load all information from the Library/MVS tape, omit the selection step.
3. Optional use of the conversion program to convert user documentation input into Information/Library data base format.
4. Use of the load program to build the VSAM-organized data base from one or more of the following sequential data sets:
 - The complete Library/MVS tape
 - Output from the selection program
 - Output from the conversion program
 The load program operates in batch mode.
5. Execution of the sample dialog to verify the installation.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This licensed program is designed to operate on any IBM processor configured to run MVS/370 or MVS/XA with TSO, TSO/E, or NCCF.

For installation and operation of the program, the following minimum equipment is required:

- Three 9-track, 6250 bpi IBM magnetic tape units, or equivalent, for the installation of the distribution tapes.
- DASD space for the data base on any device supported by VSAM.

Information/Library R2 (cont'd)

- One IBM 3270 Display Station with at least 24 lines by 80 characters, or equivalent, attached to the appropriate control unit.

SOFTWARE REQUIREMENTS

Information/Library operates under the Time Sharing Option (TSO) of the MVS/370 system control program (Release 3.8, MVS/System Extensions, or MVS/System Product Version 1) and the MVS/XA system control program (MVS/System Product Version 2), with the applicable releases of the Virtual Telecommunications Access Method (VTAM) or the Telecommunications Access Method (TCAM). Information/Library is also designed to operate under the licensed program TSO Extensions running under MVS/System Product Version 1 or MVS/System Product Version 2. Subsequent releases of MVS/370, MVS/XA, and TSO/E are also supported unless otherwise stated by IBM.

In addition, Information/Library operates under the licensed program Network Communications Control Facility (NCCF) Release 2 of the MVS/370 system control program (Release 3.8, MVS/System Extensions, or MVS/System Product Version 1) and the MVS/XA system control program (MVS/System Product Version 2), with the applicable releases of the Virtual Telecommunications Access Method (VTAM) or the Telecommunications Access Method (TCAM). Subsequent releases are also supported unless otherwise stated by IBM.

Information/Library can run under both TSO (or TSO/E) and NCCF concurrently.

Information/Library Release 2 is a prerequisite for the use of Library/MVS Release 2. Any combination of the Release 1 products with the Release 2 products is not supported. The licensed program Sort/Merge is a prerequisite for Information/Library.

General Information Manual (GH12-5136-1) ... Information Retrieval Guide (SH12-5362-0) ... Installation and Data Base Administration Guide (SH12-5361-0) ... Licensed Program Specifications (GH12-5254-1) ... Program Logic Manual (LY12-5041-1).

MVS SYSTEM INTEGRITY APPLIES: Yes

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**BASIC TELECOMMUNICATIONS ACCESS METHOD/
SYSTEM PRODUCT
5665-279**

PURPOSE

The facilities of the Basic Telecommunications Access Method/System Product (BTAM/SP) provide the basic tools required to write a telecommunications program. These include facilities for creating terminal lists and for performing the following operations: Initiating and answering calls to and from terminals on switched networks ... Polling and addressing terminals on nonswitched multipoint lines ... Changing the status of terminal lists ... Transmitting and receiving messages ... Code translation ... Retransmitting messages which are received with detected errors ... Providing online terminal test facilities ... Keeping error statistics.

HIGHLIGHTS

BTAM/SP supports Binary Synchronous Communications and start/stop low, medium and high speed devices.

BTAM/SP supports Binary Synchronous Communication over nonswitched (leased or private direct communication) and switched (dial) networks in MVS/370 to MVS/Extended Architecture (MVS/XA), MVS/370 to terminal, and MVS/XA to terminal communications.

All terminals (except Binary Synchronous Communication) on a multipoint nonswitched line must be the same type. Terminals may be mixed within the same problem program.

Further information on terminal support is provided in the "BTAM/SP Terminal Support Chart".

Optional communication serviceability facilities are available in BTAM/SP including error recovery procedures, diagnostic error information, error counts and online terminal tests. It is strongly recommended that these facilities be included since they increase system availability.

BTAM/SP supports the same functions as OS/VS BTAM and, therefore, requires no additional programming training. The user is cautioned regarding any internal changes that he may have made to OS/VS BTAM.

CUSTOMER RESPONSIBILITIES

Prior to operation of IBM subsystems or user programs with BTAM/SP, any modules using the BTAM RESETPL macro must be reassembled against the changed RESETPL macro in BTAM/SP. After this reassembly, the using programs or subsystems will operate with BTAM/SP and MVS/370* or MVS/XA. The reassembly programs and subsystems will no longer operate with OS/VS BTAM.

Note: MVS/370 is a generic term used to refer to MVS operating systems which operate with S/370 architecture, i.e.,

- OS/VS2 MVS 3.8
- OS/VS2 MVS 3.8 with the MVS SE program product
- OS/VS2 MVS 3.8 with the MVS SP V1 program product

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

BTAM/SP will operate on any hardware configuration supported by MVS/370 or MVS/XA.

BTAM/SP TERMINALS SUPPORTED

BTAM/SP supports the following terminals, programmable features, transmission control units, and communication controllers. Programmable features which change the control or transmission characteristics and which are not shown are not supported. Attempts to use BTAM/SP with unsupported features can cause unpredictable results. The user should be aware that many terminals and control unit special features are transparent to programming, and therefore readily usable even though not specifically identified. Note that the appropriate line adapters and hardware attachment features must be included in the system configuration. Terminals that are functionally equivalent to those specifically supported by BTAM/SP may also function satisfactorily with BTAM/SP; the customer is responsible for establishing equivalency. IBM assumes no responsibility for the impact that any changes to the IBM-supplied programs or products may have on such terminals.

REMOTE ATTACHMENT

Terminals and Terminal Features

SS LINES:

IBM TERMINALS

- 1030 Data Collection System on nonswitched lines:
 - 1031 Input Station (mdls A1, A2, A3, A4, A5, A6, A7):
 - Supported: Attachment of 1031, 1033, 1034, 1035
 - 1031 Input Station (mdls B1, B2, B3, B4, B5, B6, B7):
 - Supported: Attachment of 1035
 - 1035 Badge Reader
 - 1033 Printer
 - 1034 Card Punch
- 1050 Data Communication System on switched or nonswitched lines:
 - 1051 Control Unit (mdls 1,2):
 - Supported: Attachment of 1052, 1053, 1054, 1055, 1056, 1057, 1058, 1092, 1093
 - #1313 - Automatic EOB
 - #4795 - Line Correction
 - #4796 - Line Correction Release
 - #5465 - Open Line Detection
 - #6100 - Receive Interrupt
 - #9698 - Text Time-Out Suppression
 - #9700 - Transmit Interrupt
 - 1052 Printer-Keyboard (mdls 1, 2):
 - Supported: #1313 - Automatic EOB
 - #9567, #9597 - PTTC/BCD Code
 - #9571, #9591 - PTTC/EBCD Code
 - 1053 Printer (mdl 1):
 - Supported: #9567, #9597 - PTTC/BCD Code
 - #9571, #9591 - PTTC/EBCD Code
 - 1054 Paper Tape Reader (mdl 1)
 - 1055 Paper Tape Punch (mdl 1)
 - 1056 Card Reader (mdls 1, 3)
 - 1057 Card Punch (mdl 1)
 - 1058 Printing Card Punch (mdls 1, 2)
- 1060 Data Communications System (MVS/370 only)
- 2848 Display Control (mdls 1, 2, 3) on nonswitched lines: (MVS/370 only)
 - Supported: Attachment of 2260, 1053
 - #3901 - Extended Cursor Control
 - #4787 - Line Addressing
 - #5340 - Non-Destructive Cursor
 - #5341 - Non-Destructive Cursor Adapter
 - Not Supported: Attachment of 1053
- 2260 Display Station (mdls 1, 2):
 - Supported: #3606 - Extended Cursor Control
 - Alphameric Keyboard
 - #4766 - Alphameric Keyboard Tab feature of 3606
 - Not Supported:
- 1053 Printer (mdl 4):
 - Supported: #9567, #9597 - PTTC/BCD Code
 - #9571, #9591 - PTTC/EBCD Code
- 2845 Display Control (mdl 1) on nonswitched lines (MVS/370 only):
 - Supported: Attachment of 2265, 1053
 - #3301 - Destructive Cursor
 - #4801 - Line Addressing
- 2265 Display Station (mdl 1):
 - Supported: #4766 - Alphameric Keyboard
- 1053 Printer (mdl 4):
 - Supported: #9567, #9597 - PTTC/BCD Code
 - #9571, #9591 - PTTC/EBCD Code
- 2740 Communication Terminal (mdl 1) on switched or nonswitched lines:
 - Supported: #3255 - Dial Up
 - #6114 - Record Checking
 - #7479 - Station Control
 - #8028 - Transmit Control
 - #8301 - 2760 Attachment
 - #9567, #9597 - PTTC/BCD Code
 - #9571, #9591 - PTTC/EBCD Code
 - Correspondence Code
- 2740 Communication Terminal (mdl 2) on nonswitched lines:
 - Supported: #1495, 1496 - Buffer Expansion
 - #1499 - Buffer Receive
 - #6114 - Record Checking
 - #9571, #9591 - PTTC/EBCD Code
- 2741 Communication Terminal (mdl 1) on switched or nonswitched lines:

PROGRAM PRODUCTS

BTAM/SP (cont'd)

Supported: #3255 - Dial Up
 #4708 - Receive Interrupt
 #9567, #9597 - PTTC/BCD Code
 #9571, #9591 - PTTC/EBCD Code
 Correspondence Code

2760 Optical Image Unit (mdl 1) on switched or nonswitched lines
 Required: In the 2740-1: #6114 Record
 Checking and 8301 - 2760 Attach-
 ment

3100 Display Terminal (mdls 10, 12, 13, 20, 23) (supported as
 CPT-TWX mdl 33/35 Line Control) on switched lines:

3767 Communication Terminal (mdls 1, 2) (supported as a 2740-1) on
 switched or nonswitched lines:
 Required: #7111 - 2740-1 Start/Stop
 Supported: #9560 - Station Control

3767 Communication Terminal (mdls 1, 2, 3) (supported as a 2740-2)
 on nonswitched lines:
 Required: #7112 - 2740-2 Start/Stop

3767 Communication Terminal (mdls 1, 2) (supported as a 2741) on
 switched or nonswitched lines:
 Required: #7113 - 2741 Start/Stop

5100/5110 Computer Systems (supported as a 2741) on switched or
 nonswitched lines:
 Required: #1525 - Communications Adapter

6733 Typewriter Communication Module on switched lines supported
 as CPT-TWX 33/35.

CMCST (Communicating Magnetic Card Selectric® Typewriter)
 (supported as a 2741 with Correspondence Code) on switched lines:
 Supported: The CMCST is functionally equivalent
 to a 2741 with Dial UP, & Receive
 Interrupt

IBM PROCESSORS AS TERMINALS

(For details of programming support provided within the Processor
when acting as a terminal, see appropriate Programming pages)

S/7 (supported as a 2740-1 with checking) on switched or non-
switched lines:
Required: #1610 - Asynchronous Communica-
tion Control

NON-IBM TERMINALS

AT&T 83B3 Line Control Type on nonswitched lines
CPT-TWX (mdl 33/35) Line Control Type on switched lines
World Trade Telegraph on nonswitched lines
WU 115A Line Control Type on nonswitched lines

BSC LINES:

IBM TERMINALS

2770 Data Communication System on switched or nonswitched lines:
 2772 Multipurpose Control Unit:
 Required: #5010 - Multipoint Data Link Control
 Supported: Attachment of 0050, 0545, 1017,
 1018, 1053, 1255, 2203 2213,
 2265, 2502, 5496
 #1340 - Automatic Answering
 #1490 - Buffer Expansion (256 bytes)
 #1491 - Buffer Expansion Additional
 (512 bytes)
 #1910 - Conversational Mode
 #3250 - Display Format Control
 #3650 - EBCDIC Transparency
 #3860 - 144 Character Print Line
 #4610 - Identification
 #4690 - Keyboard Correction
 #5010 - Multipoint Data Link Control
 #5890 - Horizontal Format Control
 #6555 - Space Compression/
 Expansion
 #7705 - Synchronous Clock
 #7950 - Transmit-Receive-Monitor
 Print
 #9140 - Extended Re-Entry
 #9402 - Line Termination - 2-wire
 #9761 - Transmission Code EBCDIC
 #9762 - Transmission Code ASCII
 #9936 - Immediate WACK

0050 Magnetic Data Inscrber
0545 Output Punch (mdls 3, 4)
1017 Paper Tape Reader (mdls 1, 2)
1018 Paper Tape Punch (mdl 1)
1053 Printer (mdl 1)

1255 Magnetic Character Reader
 2203 Printer (mdls A1, A2):
 Supported: #5558 - Print Positions, 24 Additional

2213 Printer (mdls 1, 2)
 2265 Display Station (mdl 2)
 2502 Card Reader (mdls A1, A2)
 5496 Data Recorder

2780 Data Transmission Terminal on switched or nonswitched lines:
 Supported: #1340 - Automatic Answering
 #1350 - Automatic Turnaround
 #3401 - Dual Communication
 Interface
 #5010 - Multiple Record Transmission
 #5020 - Multipoint Line Control
 #5820 - 120 Character Print Line
 #5821 - 144 Character Print Line
 #6400 - Selective Character Set
 #7850 - Terminal Identification
 #8030 - EBCDIC Transparency
 #9150 - Extended Retry Transmission
 #9761 - ASCII Transmission Code
 #9762 - EBCDIC Transmission Code

2790 Data Communication System on switched or nonswitched lines:
 2715 Transmission Control Unit (mdl 1 and 2):
 Required: 2740
 Supported: Attachment of 2798, 1035, 1053,
 2740
 #3801 - Expanded Capability
 #4850 - Local 2740 Adapter
 #9401 - Point-to-point Nonswitched
 #9402 - Point-to-point Switched
 #9403 - Multipoint Nonswitched

2740 Communication Terminal (mdl 1)
 2798 Guidance Display Unit (mdl 1)
 1035 Badge Reader (mdl 1)
 1053 Printer (mdl 1)

2980 General Banking System on nonswitched lines:
 2972 Station Control Unit (mdl 8 - RPO 858160, mdl 11 - RPO
 858231)
 Supported: Attachment of 2980, 2971
 RPO 835503 - Buffer Expansion
 RPO 858165, 858182 - 96-Character
 Buffer

2980 Teller Station (mdl 1 - RPO 835504, mdl 4 - RPO 858147)
 2980 Administrative Station (mdl 2 - RPO 835505)
 2971 Remote Control Unit (mdl 3 - RPO 858144)

3270 Information Display System on nonswitched lines:
 3271 Control Unit (mdls 1, 2):
 Supported: Attachment of 3277, 3284, 3286,
 3287, 3288
 #1550 - Copy
 #9761 - EBCDIC Code

3274 Control Unit (mdl 1C, 21C, 31C, 51C) (Supported as a 3271)
 Supported: Attachment of 3277, 3278, 3284,
 3286, 3287, 3288, 3289

3276 Control Unit Display Station (mdls 1, 2, 3, 4) (Supported as a
 3271)
 Supported: Attachment of 3278, 3287
 #6350 - Selector Light-pen
 #9082 - EBCDIC Character Set

3277 Display Station (mdls 1, 2):
 Supported: #6350 - Selector Light-pen
 #9089 - EBCDIC Character Set

3278 Display Station (mdls 1, 2, 3, 4, 5) (Supported as a 3277)
 Supported: #6350 Selector Light-pen
 #9082 - EBCDIC Character Set

3279 Display Station (mdl 1A, 1B, 2A, 2B)
 3284 Printer (mdls 1, 2):
 Supported: #9089 - EBCDIC Character Set

3286 Printer (mdls 1, 2):
 Supported: #9089 - EBCDIC Character Set

3287 Printer (mdls 1, 2) (Supported as a 3284 or 3286 attached to a
 3271-1 or -2)
 Supported: #9082 - EBCDIC Character Set

3288 Printer (mdl 2) (supported as a 3286-2):
 Supported: #9089 - EBCDIC Character Set

3289 Printer (mdls 1, 2) (Supported as 3286-2)

3270 Information Display System on switched lines
 or nonswitched lines:
 3275 Display Station (mdls 1, 2):
 Supported: Attachment of 3284
 #6350 - Selector Light-pen
 #9089 - EBCDIC Character Set
 #9761 - EBCDIC Code

3284 Printer (mdl 3):
 Supported: #9089 - EBCDIC Character Set

PROGRAM PRODUCTS

BTAM/SP (cont'd)

3624 Consumer Transaction Facility (mdls 1, 2, 11, 12) (supported as a 2772)

Supported: Attached to a 3704/3705 via nonswitched lines only

3650 Programmable Store System (Supported as a S/3) on switched lines:

3651 Store Controller (mdls A25, B25, A75, B75, C75, D75)
Supported: Attachment of 3275, 3653, 3657, 3659, 3663, 3669, 3683, 3784

3653 Point of Sale Terminal (mdl 1 and 1P)
3683 Point of Sale Terminal (all models)
3657 Ticker Unit (Not available on 3651 mdl A25 and B25)
3663 Supermarket Terminal (mdls 1P, 2 and 3P)
3275 Display Station (mdl 3)

Supported: Attachment of 3284

3284 Printer (mdl 3)

3659 Remote Communication Unit (mdl 1)

Required: 2400 BPS nonswitched line (Not available on 3651 mdls A25 and B25)

3784 Printer (mdl 1) Not Available on 3651 mdls A25 and B25

3660 Supermarket Scanning System (supported as a S/3) on switched lines:

3651 Store Controller (mdls A60, B60):
Supported: Attachment of 3663, 3669

3663 Supermarket Terminal (mdls 1, 2):
Supported: Attachment of 3666

3666 Checkout Scanner (mdl 1)
3669 Store Communications Unit (mdl 1)

3660 Supermarket Key-Entry System (supported as a S/3) on switched lines:

3661 Store Controller:
Supported: Attachment of 3663

3663 Supermarket Terminal (mdls 1, 2)

3680 Programmable Store System supported on switched and nonswitched lines:

3683 Point of Sale Terminal
3684 Point of Sale - Control Unit (mdls 1, 2)
Supported: 3684 mdl 2: Attachment of 3683 Point of Sale Terminal

3735 Programmable Buffered Terminal (mdl 1) on switched or nonswitched lines:

Supported: Attachment of 5496, 3286
#5010 - Multipoint Data Link Control
#9761 - EBCDIC Code
#9762 - ASCII Code

5496 Data Recorder (mdl 1)
3286 Printer (mdl 3)

3741 Data Station (mdl 2) on switched or nonswitched lines:

Supported: Attachment of 0129, 3713, 3715, 3717
#1680 - Expanded Communications
#1685 - Expanded Communications/
Multipoint Data Link Control
#5450 - Operator Identification Card
Reader
#7850 - Terminal Identification

0129 Card Data Recorder (mdl 2)
3713 Printer (mdl 1)
3715 Printer (mdls 1, 2)
3717 Printer (mdl 1)

3741 Programmable Work Station (mdl 4) on switched or nonswitched lines:

Supported: Attachment of 0129, 3713, 3715
#1680 - Expanded Communications
#1685 - Expanded Communications/
Multipoint Data Link Control
#5450 - Operator Identification Card
Reader
#7850 - Terminal Identification

0129 Card Data Recorder (mdl 2)
3713 Printer (mdl 1)
3715 Printer (mdls 1, 2)

3747 Data Converter (mdl 1) on switched or nonswitched lines:

Supported: #1660 - Communications Adapter

3750 Switching System

3770 Data Communication System (supported as a 2770) on switched or nonswitched lines:

3771 Communication Terminal (mdls 1, 2, 3):
Required: #1460 - SDLC/BSC, Switch Control, or
#1461 - BSC Point-to-point, or
#1462 - BSC Multipoint
Supported: #1201 - ASCII Code

3773 Communication Terminal (mdls 1, 2, 3, P1, P2, P3):

Required: #1460 - SDLC/BSC, Switch Control, or
#1461 - BSC Point-to-point, or
#1462 - BSC Multipoint
Supported: #1201 - ASCII Code

3774 Communication Terminal (mdls 1, 2, P1, P2):

Required: #1460 - SDLC/BSC, Switch Control, or
#1461 - BSC Point-to-point, or
#1462 - BSC Multipoint

Supported: #1201 - ASCII Code

3775 Communication Terminal (mdls 1, P1):

Required: #1460 - SDLC/BSC, Switch Control, or
#1461 - BSC Point-to-point, or
#1462 - BSC Multipoint

Supported: #1201 - ASCII Code

3776 Communication Terminal (mdls 1, 2) (supported as a 2772/3780):

Required: #1460 - SDLC/BSC, Switch Control, or
#1461 - BSC Point-to-point, or
#1462 - BSC Multipoint

Supported: #1201 - ASCII Code

3777 Communication Terminal (mdl 1) (supported as a 2772/3780):

Supported: #1201 - ASCII Code

3777 Communication Terminal (mdl 2) (supported as a S/360-20 MULTI-LEAVING Workstation):

Required: #3701 - EIA Interface

3780 Data Communications Terminal (mdl 1) (supported as a 2772 without component select) on switched or nonswitched lines:

Supported: #3601 - EBCDIC Transparency
#5010 - Multipoint Data Link Control
#5701 - Print-Positions, Additional
#9761 - EBCDIC Code
#9762 - ASCII Code

5110 Computer (supported as a 2772) on switched or nonswitched lines:

Required: 2074 BSCA
Supported: Attachment of a 5103 Printer, 5106 Tape Cartridge and 5114 Diskette Unit.

The 5110 emulates the following 2772 features:

Auto Answer, Buffer expansion additional (512), EBCDIC transparency, 144 character print line, identification, Multipoint Data Link Control, Horizontal Format Control, Space Compression/ expansion, Synchronous clock, Transmission code EBCDIC.

5265 Retail Communicating mdl (supported as 3741) point-to-point operation.

Required: #5500 - 1200 BPS Integrated Non-switched Modem or
#5501 - 1200 BPS Integrated Switched Modem or
#3701 - EIA/CCITT Interface

5275 Direct Numerical Control Station (MVS/370 only) (supported as a 3275 with EBCDIC code and EBCDIC Character Set) on switched lines and as a 3277 on nonswitched lines

IBM PROCESSORS AS TERMINALS

(For details of programming support provided within the Processor when acting as a terminal, see appropriate Programming pages.

1130 Computing System on switched or nonswitched lines:

1131 Central Processing Unit:
Required: #7690 - Synchronous Communications Adapter

1800 Data Acquisition and Control System on switched or nonswitched lines: (TCAM, BTAM)

1826 Data Adapter Unit:
Required: #7550 - Communication Adapter

5280 Distributed Data System (supported as a 3271-2) on a non-switched line:

5285 and 5288 controllers:
Required: Refer to GSD sales manual for required features and related programming

5280 Distributed Data System (supported as a 3741 or S/3 MRJE) on switched or nonswitched line:

5285 and 5288 Processor Units:
Required: #2500 Communications Adapter

Series/1 (Supported as a S/3 on switched or nonswitched lines:)

PROGRAM PRODUCTS

BTAM/SP (cont'd)

4953 or 4955 Processor
Required: #2074, 2075 or 2094 Binary Synchronous Communications Adapter

S/3 on switched or nonswitched lines:
5404, 5406, 5408, 5410, 5412 or 5415 Processing Unit:
Required: #2074 - Binary Synchronous Communications Adapter

S/7 (supported as a S/3) on switched or nonswitched lines:
5010 Processor Module:
Required: #2074 - Binary Synchronous Communications Adapter

S/32 (supported as a S/3) on switched or nonswitched lines:
5320 System Unit:
Required: #2074 - Binary Synchronous Communications Adapter

S/34 (supported as a S/3) on switched or nonswitched lines:
5340 System Unit:
Required: #2500, 3500 or 4500 Communications Adapter Feature

S/34 (supported as a 3271 mdl 2) on a nonswitched line:
5340 System Unit:
Required: #2500, 3500, 4500 Communications Adapter Feature
#4900 or 4901 Work Station Control Expansion A or B

S/36 (supported as a System/3) on switched or nonswitched lines:
5360 System Unit:
Required: #2500 or #4500 Communications Adapter feature

S/36 (supported as a S/360 mdls 25 & up) on switched or non-switched lines:
5360 System Unit:
Required: #2500 or #4500 Communications Adapter feature

S/36 (supported as a S/3271 on mdl 2) on nonswitched lines:
5360 System Unit:
Required: #2500 or #4500 Communications Adapter feature
#4900 Workstation Control feature

S/360 mdl 20 on switched or nonswitched lines:
2020 Processing Unit:
Required: #2074 - Binary Synchronous Communications Adapter

S/38 (supported as a S/3 on switched and nonswitched line):
5381 System Unit:
Required: #1501 or #1502 Communications Attachment Feature
#2001 or #2003 Communications Control Feature
#3200 Line Base Feature

S/38 (supported as a 3271 mdl 2) on a nonswitched line (BTAM, TCAM VTAM):
5381 System Unit
Required: #1501, 1502 Communications Attachment
#2001, 2003 Communications Control Feature

S/360 mdls 25, 30, 40, 50, 65, 65MP, 67(65 mode), 75, 85, 91, 195 on switched or nonswitched lines:
Processing Unit:
Required: #4580 - Integrated Communications Attachment, or
2701 Data Adapter Unit, or
2703 Transmission Control, (S/370 only), or
3704 Communications Controller in emulation mode, or
3705-I Communications Controller in emulation mode, or
3705-II Communications Controller in emulation mode

All virtual storage S/370 Processors on switched or nonswitched lines:
Processing Unit:
Required: 2701 Data Adapter Unit, or
2703 Transmission Control, (S/370 only) or
3704 Communications Controller in network control or emulation mode, or
3705-I Communications Controller in network control or emulation mode, or

3705-II Communications Controller in network control or emulation mode

8100 with DPPX on nonswitched lines:
Required: Refer to 8100 pages for required features and for licensed programs supported.

8100 with DPPX/SP on nonswitched lines:
Required: Refer to 8100 pages for required features and for licensed programs supported.

LOCAL ATTACHMENT

Transmission Control Units and Communications Controllers

2701 Data Adapter Unit on local channel:
Supported: #1302, 1303, 1314 - Autocall
#3455 - Dual Code
#3463-3465 - Dual Communication Interface
#8029 - Transparency
#9060 - EBCDIC Code
#9061 - ASCII Code
#9062 - 6-bit Transcode

2702 Transmission Control Unit* on local channel:
Supported: #1290 - Autocall
#1319 - Autopoll
#8055 - 2741 Break

2703 Transmission Control Unit* on local channel:
Supported: #1340, 1341 - Autocall
#7715 - EBCDIC Code
#7716 - ASCII Code
#7717 - 6-bit Transcode
#8055 - 2741 Break
#9100 - Transparency for ASCII

2715 Transmission Control Unit* (mdl 1) on local channel:
Supported: See "2790" under *Local Terminals*

3704/3705-I/3705-II/3705-80 Communications Controller on local channel:
Supported: EBCDIC Code, ASCII Code, Autopoll and EBCDIC Transparency do not have special feature codes in the 3704/3705 EP/VS

* These control units are supported on MVS/370 only

LOCAL TERMINALS

3270 Information Display System on local channel - Non-SNA:
3272 Control Unit (mdls 1, 2):
Supported: Attachment of 3277, 3284, 3286, 3287, 3288

3277 Display Station (mdls 1, 2):
Supported: #6350 - Selector Light-pen
#9089 - EBCDIC Character Set

3284 Printer (mdls 1, 2):
Supported: #9089 - EBCDIC Character Set

3286 Printer (mdls 1, 2):
Supported: #9089 - EBCDIC Character Set

3287 Printer (mdls 1, 2) (Supported as a 3284 or 3286 attached to 3272-1 or -2)
Supported: #9082 - EBCDIC Character Set

3288 Printer (mdl 2) (supported as a 3286-2):
Supported: #9089 - EBCDIC Character Set

3270 Information Display System on Local Channel: (Supported as a 3272)

3274 Control Unit (mdl 1B, 1D, 21B, 21D, 31D)
Supported: Attachment of 3277, 3278, 3284, 3286, 3287, 3288, 3289

3277 Display Station (mdls 1, 2)
Supported: #6350 - Selector Light-pen
#9089 - EBCDIC Character Set

3278 Display Station (mdls 1, 2, 3, 4, 5) (Supported as a 3277)
Supported: #6350 - Selector Light-pen
#9082 - EBCDIC Character Set

3279 (mdls 1A, 1B, 2A, 2B)
3284 Printer (mdls 1, 2)
Supported: #9089 - EBCDIC Character Set

3286 Printer (mdls 1, 2)
Supported: #9089 - EBCDIC Character Set

3287 Printer (mdls 1, 2) (Supported as a 3284 or 3286)
Supported: #9082 - EBCDIC Character Set

3288 Printer (mdl 2) (Supported as a 3286-2)
Supported: #9089 - EBCDIC Character Set

3289 Printer (mdls 1, 2) (Supported as a 3286-2)

- M = Group of terminals which can operate on same BSC MP and same line speed.
- S = Group of terminals which can share the same phone number(s).

Notes:

- (a) If shown, the terminal type in parenthesis designates the programming support provided, e.g., "S/7 (2740-1)" means "the S/7 is supported as a 2740-1".
- (b) S/360 mdls 25, 30, 40, 50, 65, 65MP, 67 (65 mode), 75, 85, 91, 195 with either BOS, BPS, DOS or OS. All virtual storage S/370 Processors with either BOS, BPS, DOS, OS, DOS/VS, OS/VS1 or OS/VS2.
- (c) The 3741/3747 can use the same switched network hardware at the 3704/3705 as other BSC terminals.
- (d) IPL of S/7 is not supported in this network configuration.

SOFTWARE REQUIREMENTS

Applications or subsystems using BTAM/SP must be recompiled against BTAM/SP (because of changes to the RESETPL macro). After recompilation, the subsystems/applications, with BTAM/SP will run on either MVS/370 or MVS/XA. PTF UZ29156 (MVS 3.8) must have been applied prior to installation of BTAM/SP.

COMPATIBILITY and MIGRATION

User applications or subsystems require recompilation with BTAM/SP because of changes to the RESETPL macro. After recompilation, BTAM/SP, with the recompiled applications or subsystems, runs with MVS/370 or MVS/XA.

BTAM/SP consists of interface modifications that allow BTAM/SP to operate with MVS/XA. No other enhancements were made to the product. Application environments that operate successfully on MVS/370 will continue to operate successfully on MVS/XA. Extensions of BTAM/SP into new networking environments require evaluation. The innate design limitations of BTAM, i.e., internally defined time delays, retry limits and recovery procedures that were appropriate in the 1960s and early 1970s have not been changed.

MVS SYSTEM INTEGRITY APPLIES

IBM will accept APARS where the installation of BTAM/SP introduces an exposure to the system integrity of MVS/370 or MVS/XA. Refer to Programming Announcement Letter. This program is intended to run authorized.

RPQs ACCEPTED: No.

**5665-280 - ACF/VTAM V2.2 (OS/VS2 MVS)
ADVANCED TELECOMMUNICATIONS FUNCTION
for VTAM VERSION 2 RELEASE 2**

PURPOSE

Advanced Communications Function for VTAM Version 2 Release 2 (ACF/VTAM V2R2) is a Systems Network Architecture (SNA) access method program product for users of OS/VS2 (MVS) Release 3.8, optionally including MVS/SP Version 1 for S/370 and MVS/SP Version 2 for extended architecture (XA) processors operating in S/370 compatibility mode. It continues to support the functions provided in previous releases of ACF/VTAM (except as indicated in the "Compatibility"), and has been enhanced in the areas of data communications, device support, problem determination, ease of use, and network configuration, management and control.

OVERVIEW

ACF/VTAM V2R2 provides telecommunications support for channel-attached and SDLC link-attached communication controllers* in NCP mode and for locally-attached devices. In addition, ACF/VTAM V2R2 controls the sharing of telecommunication resources between application programs, and supports the concurrent execution of multiple teleprocessing applications.

* The term 'communication controller' is used in these pages to refer to both the 3705 and 3725 Communication Controllers.

ACF/VTAM controls communication between application programs and terminals by establishing and managing SNA sessions. Sessions can be established between resources in single or multiple host networks, or between resources in independent, interconnected networks. Application programs need only be responsible for device control characters in data streams.

The types of devices supported are:

- SNA-SDLC devices.
- BSC 3270 devices.
- SNA channel-attached devices.
- Non-SNA channel-attached devices.
- Certain asynchronous (Start/Stop) and BSC devices through the Network Terminal Option (NTO) program product with ACF/NCP.

The interface for application programs allows the user to control connections between application programs and other application programs or terminals, as well as to request data transfer. A single request for connection or input can be directed simultaneously to more than one terminal. The ACF/VTAM V2R2 application program interface is designed to provide long-term stability and to aid user teleprocessing growth.

The program operator facility of the ACF/VTAM V2R2 application program interface allows an authorized application program to enter ACF/VTAM operator commands and receive ACF/VTAM operator messages.

Network operator control facilities are provided, enable users to monitor and reconfigure their networks to meet fluctuating requirements.

ACF/VTAM V2R2 provides interactive time sharing support through its integrated time sharing option (TSO/VTAM). TSO/VTAM extends the line and terminal sharing benefits of ACF/VTAM to TSO users. TSO is a standard feature in OS/VS2 (MVS) that provides conversational time sharing facilities.

ACF/VTAM V2R2 enables the user to have cross-system and cross-network communication, thus providing resource sharing, distributed processing and increased resource availability.

Configuration restart facilities allow an ACF/VTAM network to be reinstated after a failure or a normal deactivation. Manual or programmed operator switching to a backup processor or communication controller is also supported.

Encrypt/Decrypt Feature: The ACF/VTAM Encrypt/Decrypt optional feature, in combination with the Cryptographic Facility program product (5740-XY5) or the Cryptographic Unit Support program product (5740-XY6), allows users to encrypt and decrypt messages during sessions between logical units.

ACF/VTAM V2R2 operates with ACF/NCP Version 1 Release 3, Version 2 or Version 3. Some of the capabilities provided by ACF/VTAM V2R2 are supported only in conjunction with specific releases of ACF/NCP. A summary of this support appears later in these pages.

SPECIAL SALES INFORMATION

ACF/VTAM V2R2 will be attractive to current users of ACF and to new users installing SNA for the first time because of its improved subsystem support, additional capabilities and device support, and its enhancements in the area of software problem determination, documentation, and ease of use.

Specifically, the following ACF/VTAM V2R2 capabilities exceed those of ACF/VTAM Version 2 Release 1:

- SNA network interconnection.

- Gateway System Services Control Point (SSCP).
- Adjacent SSCP routing.
- Multiple gateways.

- Default SSCP selection.
- Integrated support for Network Logical Data Manager Release 1.
- Support for Network Logical Data Manager Release 2.
- Data host communication with a channel-attached NCP without having to activate the NCP.
- Support for subsystem use of ASCII-8.
- Session management exit routine for authorization and accounting.
- TSO/VTAM enhancements:
 - 3290 Information Panel support.
 - ASCII-8 support.
 - Screen-size support for type-1 logical units.
- Usability enhancements:
 - Improved methods of specifying virtual route pacing parameters.
 - Default Communication Network Management (CNM) routing information for IBM CNM applications.
- Serviceability enhancements:
 - Forced deactivation of an NCP link.
 - Trace enhancements.
- Removal of TOLTEP.

HIGHLIGHTS

ACF/VTAM V2R2 is a data communication access method based on Systems Network Architecture (SNA). It controls communication between elements within one or more SNA networks. It also uses the facilities of the operating system and of virtual storage to support:

- Devices:
 - SNA SDLC devices.
 - BSC 3270 devices.
 - SNA channel-attached devices.
 - Non-SNA channel-attached 3270 devices.
 - Certain asynchronous (Start/Stop) and BSC devices through the Network Terminal Option (NTO) program product with ACF/NCP.
- Channel-attached and SDLC-link-attached communication controllers with ACF/NCP, including multiple channel attachment and extended NCP ownership and connectivity.
- Multisystem networking.
- Interconnection of two or more independent SNA networks through gateway ACF/NCP nodes, including:
 - Gateway System Service Control Point (SSCP) for cross-network name and address translation.
 - Adjacent SSCP routing table to determine the next SSCP on a session path.
 - Multiple gateways for SSCP-SSCP and LU-LU sessions.
- Default selection of the SSCP that owns an undefined network resource or provides a path to the owning SSCP.
- Channel-to-channel adapters for multisystem communication.
- ACF/VTAM V2R2 hosts as intermediate routing nodes in the network, for example, when connected to each other through channel-to-channel adapters.
- Downstream loading of devices through the Downstream Load Utility program product.
- Switched network backup support for SNA-SDLC devices for extended availability.
- CICS/VS, IMS/VS, TSO, JES, NCCF, and many other related IBM subsystems and program products.
- Subsystem or application program usage of the ASCII-8 code set defined in ANSI X3.41-1974, as well as ASCII-7.
- The Communications Network Management (CNM) program products:
 - Network Communications Control Facility (NCCF)
 - Network Problem Determination Application (NPDA)
 - Information/System
 - Network Logical Data Manager (NLDM)
- Default routing of CNM RUs to the appropriate IBM CNM application program.

ACF/VTAM V2 R2 (cont'd)

- Single-tape installation (including multisystem networking and interconnected network capabilities).
- Ability to easily modify, replace or suppress ACF/VTAM messages to suit installation needs or preferences.
- Processing to improve network performance and reliability of large SNA messages sent from ACF/VTAM application programs.
- An interface for application programs to control connections between application programs and other application programs or terminals, as well as to request data transfer.
- An application program interface (API) compatible with previous releases of ACF/VTAM to facilitate migration.
- Ability for application programs to determine, at assembly and at execution time, what particular functions are supported with the given level of ACF/VTAM being used.
- Session management exit routine for authorization, accounting and gateway node path selection.
- Communication between two IBM subsystems or user-written ACF/VTAM application programs, through single or parallel sessions.
- Flexibility in initiating sessions by allowing the two ends of a session to negotiate the session initialization parameters.
- Parallel links and transmission groups for increased bandwidth, multiple routes for communication route backup, and multiple priority levels for improved traffic control.
- Time Sharing Option (TSO) for SNA/SDLC interactive terminals, non-SNA 3270 systems and, through the Network Terminal Option program product, selected Start/Stop terminals.
- TSO/VTAM Device Support Enhancements:
 - Support for the 3290 Information Panel large-screen, plasma Display Station.
 - Screen-size support for type-1 logical units.
 - Support for the use of the ASCII-8 code set.
- Extensive reliability, availability and serviceability facilities for ACF/VTAM networks.
- Transfer control of one host processor's communication controller(s) to another host processor. It also permits control of the terminals of a communication controller to be divided among multiple host processors.
- Data host communication with a locally-attached ACF/NCP without the need to establish an SNA session (contact without ACTPU).
- ACF/NCP Version 3 capability to unconditionally force the deactivation of an ACF/NCP link and all its attached submodes.
- Dynamic buffer pool allocation to optimize the use of main storage.
- Session pacing to help avoid buffer overruns.
- Specifying on the PATH macro or an exit routine, the maximum and minimum pacing window size to be used on a route.
- Dynamic display and dump of ACF/NCP storage.
- SDLC data link test, terminal connectivity test, route test, transmission group trace, and intensive mode recording of SDLC data link errors in single-system networks, multiple-system networks, and interconnected-system networks to assist in network problem determination.
- Dynamic collection of tuning statistics.
- Network operation and control facilities that allow users to monitor, control and reconfigure the network to meet fluctuating requirements. The network configuration may be changed while the network is being used.
- Concurrent tracing of up to eight ACF/NCP lines.
- Ability to trace events that are occurring internally between ACF/VTAM modules.
- Session outage notification to both ends of a session if the supporting route becomes inoperative.
- Flow control to manage networks during periods of peak demand.
- Dynamic reconfiguration of nonswitched SNA-SDLC devices.
- CCITT X.21 switched protocols when the communication controller is natively attached to an X.21 network.
- Task-oriented reference library, including a master index.

ACF/VTAM Version 2 Release 2 is a complete replacement for previous releases of ACF/VTAM, including those that use the Multisystem Networking Facility.

Note: Refer to "Special Sales Information" for a list of the ACF/VTAM V2R2 capabilities not included in previous releases of ACF/VTAM.

SPECIAL FEATURES: The ACF/VTAM Version 2 Release 2 Encrypt/Decrypt optional feature, in combination with the Programmed Cryptographic Facility program product, provides the following functions:

- Permits encryption and decryption of messages between logical units in single, multiple-domain and interconnected networks.
 - Multiple-domain networks require the Encrypt/Decrypt feature to be installed in each domain that uses cryptography.
 - Interconnected networks require the Encrypt/Decrypt feature to be installed in each ACF/VTAM (SSCP) in the session route in order to support cryptographic sessions.
- Permits ACF/VTAM application programs generally to run unaltered with the Encrypt/Decrypt feature and allows them to select encryption for particular sessions or for particular messages within sessions.

DESCRIPTION

SUMMARY and ADVANTAGES

ACF/VTAM V2R2 is an SNA (Systems Network Architecture) access method with which users can build and interconnect data communication networks. Using SNA within or between networks:

- Provides a consistent and comprehensive structure for communication system growth.
- Minimizes the effects of system changes.
- Distributes network functions away from host processors.
- Allows sharing of network resources.
- Supports many different kinds of communication devices.
- Extends system functions conveniently and effectively to users.
- Minimizes users' involvement in details of system operation.

ACF/VTAM V2R2 supports several related IBM programs, as well as user-written application programs, all of which can share the network resources. This provides for a more efficient use of lines, terminals, communication controllers, channel-to-channel adapters, and other network resources, because they are not dedicated to a single application program.

Interface for Application Programs

- Provides an application program interface (API) compatible with previous releases of ACF/VTAM on OS/VS2 (MVS).
- Provides for the direct transmission of messages between application programs and terminals, making the network communication elements, such as the communication links and the communication controllers, transparent to the application program. It permits the use of resources without specifying knowledge of their location.
- The program operator facility of the application program interface allows an authorized user-written application program to enter ACF/VTAM operator commands and receive ACF/VTAM operator messages.

Single and Multiple Host Support

- Can be used in a single-system, multiple-system, or interconnected-system environment (with its integrated multisystem networking and SNA network interconnection capabilities).
- In a multiple-system environment or interconnected-system environment, ACF/VTAM V2R2 can be connected* to other processors that have installed one of the following IBM program products:
 - ACF/VTAM Version 2 Release 1 or 2.
 - ACF/VTAM Version 1 Release 3 with the Multisystem Networking Facility feature.
 - ACF/VTAME.
 - ACF/TCAM V2R4 with the Multisystem Networking Facility feature.

* A cross-domain connection can be through an SDLC cross-domain link or through a channel-to-channel adapter (not applicable to VSE) including MVS guest operating systems on VM/370, or through a communication controller with the multiple channel attachment capability supported by ACF/NCP (not applicable to ACF/VTAME), depending on the cross-domain connections supported by the other SNA hosts in the multisystem network. A cross-network connection must be through an SDLC link-attached or channel-attached communication controller operating with ACF/NCP Version 3.

Multi-system and interconnected-system connection capability allows application programs and terminals that are controlled by ACF/VTAM

ACF/VTAM V2 R2 (cont'd)

V2R2 to communicate with application programs in another domain or network. It also allows application programs and terminals controlled by another domain or network to communicate with ACF/VTAM V2R2 application programs.

Through adequate planning and network design, multisystem networking and SNA networking interconnection may provide:

- Significant extension of the services available to the end-users of the various connected SNA hosts, regardless of the domain or network in which the resources reside.
- Backup services to the end-users, when a failure occurs in certain elements of the network.
- Balancing of the processing load in the various hosts.

Interconnected SNA Network Support: Allows two or more distinct SNA networks to be interconnected. Connections occur without redefining subarea addresses, logical unit (LU) names, class or service names, or logon mode table names. End-user-initiated sessions can be established between LUs in any two interconnected networks using the same session initiation procedures currently used in those networks. Thus, the operation of interconnected networks is transparent to the end-users. The major SNA network interconnection facilities provided in ACF/VTAM Version 2 Release 2 include:

- Gateway Systems Services Control Point (SSCP) - Using the gateway node facilities provided by ACF/NCP Version 3, sets up the name translations and network address translations needed to support cross-network sessions in interconnected SNA networks.
- Multiple Gateways - Allow the gateway SSCP to select a gateway node for cross-network LU-LU sessions independently of the gateway node used to set up the session with the adjacent SSCP.
- Adjacent SSCP Routing - Allows the gateway SSCP to use a list of adjacent SSCPs to determine the next SSCP on the session-initiation path to a destination network or destination SSCP for an LU-LU session. One or more multiple adjacent SSCP definitions can be filed and activated individually.

Default SSCP Selection: Allows one or more default SSCPs to be defined to each ACF/VTAM host. A session setup request for a logical unit is sent to each of the default SSCPs in turn until the setup succeeds, or until all the SSCPs have been tried without finding the SSCP that owns the logical unit. In a single network, this list of default SSCPs is used when the owner of the destination logical unit is not defined to ACF/VTAM, and thus the owning cross-domain resource manager (CDRM) is not identified. In an interconnected environment, this list is used when neither the destination network nor the destination SSCP is known to ACF/VTAM or when ACF/VTAM is not in session with the destination SSCP. It is also used when there is no list of adjacent SSCPs for the destination network.

Extended NCP Interconnection: Capabilities for interconnecting communication controllers in single and multiple-system networks. A communication controller may be link-attached through transmission groups to one or more channel-attached and/or link-attached communication controllers.

These capabilities can significantly expand the installation's configuration options. They can also improve the overall efficiency of the network, and improve the ability of a host system to take over a communication controller whose current owner (or a link to that owner) has failed or has been deactivated.

Extended NCP Ownership: In single system and multisystem networking networks, as many as eight host systems can share the ownership of an NCP in a communication controller that is channel-attached* and/or link-attached to another communication controller(s). If one of the host systems fails or gives up control of the communication controller, each of the remaining host systems is notified. This notification serves as a signal for using the take-over capability described below. Extended NCP ownership does not apply across network boundaries. Host systems that share ownership of an NCP in a communication controller can also share ownership of SDLC links that connect the communication controller to other communication controllers. When the force deactivate facility of ACF/VTAM V2R2 is used to deactivate a shared NCP link, the link is unconditionally deactivated, and each of the sharing owners is notified. Each of the host systems is also notified if a link that it owns fails, or if the adjacent communication controller becomes inoperative.

* The channel and SDLC link attachments cannot exceed the number of channels and SDLC links supported by the communication controllers.

Channel-Attached NCP Communication without NCP Activation: Allows an ACF/VTAM Version 2 Release 2 data host to establish contact with a channel-attached ACF/NCP that has been activated by another ACF/VTAM. Data can then be transferred between the data host and the communication controller without the need for an NCP definition in the data host. The makeup of the network is transparent to the data host. This facility also prevents the data host from issuing requests on the SSCP session that could affect the configuration of the communication controller or of other nodes.

Forced Deactivation of an NCP Link: Supports the ACF/NCP Version 3 capability to unconditionally reset a 'hung' NCP link without requiring the user to re-IPL the NCP. Previously, the FORCE operand of the VARY INACT command deactivated the link's subnodes, then it deactivated the link. This processing required ACF/VTAM to send I/O for each PU on the link, then send I/O for the link itself. The new support requires only one I/O to reset the link and all attached subnodes.

Downstream Load Utility Program Product Support: Via an SDLC link-attached communication controller operating with ACF/NCP, ACF/VTAM V2R2 supports the Downstream Load Utility licensed program's ability to load data into the 8775 Display Terminal or equivalent devices such as the 7426 Terminal Interface Unit.

Switched Network Backup: Switched network backup support for SNA-SDLC devices allows (a) control unit(s) associated with a failed or deactivated nonswitched line to be reactivated through an alternate, switched line, or (b) terminals associated with a failed or deactivated control unit (switched or nonswitched) to continue to receive communication support through reconfiguration to a backup, switched control unit.

Network Communications Control Facility (NCCF) Program Product Support: ACF/VTAM V2R2 provides an interface to support the problem determination and network operation facilities offered by NCCF.

Network Terminal Option (NTO) Program Product Support: Provides support to users who environment while continuing to access the following non-SNA terminal devices:

- 2740 Communications Terminal mdl 1.
- 2741 Communications Terminal.
- 3101 Display Terminal (TWX mdl 33/35).
- 3780 Data Communications Terminal (BSC).
- 6733 Typewriter Communication Module (TWX mdl 33/35).
- Western Union Teletypewriter Exchange Services (TWX mdl 33/35).
- World Trade Teletypewriter Terminal (WTTY) (nonswitched only).

NLDM Program Product Support: ACF/VTAM V2R2 supports the Network Logical Data Manager (NLDM) program product that runs as an application program on NCCF.

- Integrated support for the Network Logical Data Manager (NLDM) Release 1 program product. (This support was available for MVS systems in ACF/VTAM Version 1 Release 3 and Version 2 Release 1 through PTFs.) ACF/VTAM supplies path information unit (PIU) trace data and session notification data to NLDM. ACF/VTAM accepts requests from NLDM to:
 - Activate or deactivate the PIU data capture function within ACF/VTAM.
 - Initiate or terminate tracing of PIUs that flow within ACF/VTAM to or from a specified network resource or resource type.
 - Initiate or terminate session notification processing.
- Support for the Network Logical Data Manager (NLDM) Release 2 program product. ACF/VTAM supplies NLDM Release 2 with the information it needs to perform route tests and enhanced problem determination in single and interconnected networks.
 - Information about cross-network sessions as they appear to the ACF/VTAM network, and as they appear to an adjacent network through which the session path flows. ACF/VTAM also supplies information about which networks contain the session endpoints, and each resource's network name in the network where it resides.
 - Information about the route being used by a session that has a session endpoint within the domain of the SSCP.
 - Information about the route used by a cross-network session within the network where an SSCP resides, and within adjacent networks, when the SSCP is acting as a gateway SSCP for the session.
 - The ability to test the connectivity of a route within its network or an adjacent network.
 - Time-stamped session start and session end notification data, thus allowing session awareness processing to begin after sessions have been established.

Application-to-Application Communication: Communication between two ACF/VTAM application programs offers users greater flexibility to design and implement more efficient application program processing in a network. For example, a single application may provide centralized processing for other application programs as well as terminal users. This may eliminate duplicate processing support, and optimize the use of system resources among multiple application programs. This facility also adds the flexibility for multiple sessions to operate concurrently

ACF/VTAM V2 R2 (cont'd)

between two application programs that reside within a single host system or across different host systems.

Negotiable Session Initialization Parameters: Permits increased application program control of sessions between user-written application programs that reside within a single host system or across different host systems or networks. During session initialization, two application programs (through the ACF/VTAM application program interface) can dynamically exchange certain session parameters to establish and/or modify transmission control and integrity of session data. With this capability, it may be possible for a user to simplify the predefined installation of intercommunicating application programs.

Parallel Links: Multiple active SDLC links between adjacent communication controller links allow data traffic to flow simultaneously over two or more SDLC links between adjacent communication controllers. All such links can be operational and in use at the same time, and each can be activated or deactivated independently of the others. This capability can provide increased message flow and improve the availability and reliability of transmissions between communication controllers.

Transmission Groups: Logical groupings of transmission links between adjacent network nodes allow a user to define up to eight transmission groups, each with one or more SDLC links between adjacent communication controllers. A transmission group permits multiple SDLC links to be defined as a single logical link. Only a single transmission group containing a single link is supported between adjacent subareas connected through a communications adapter. A single channel between a host and its channel-attached communication controller is also defined as a transmission group. If a link or links in a transmission group fails, session traffic will automatically be placed on remaining active links without loss of data. This ensures the reliability and availability of service between communication controllers. Multiple transmission groups and appropriate route selection permit a user to specify message traffic for different application programs to flow through a network over pre-assigned transmission groups. For example, interactive processing may be assigned one group and batch processing may be assigned a different group, each with its own physical link support.

Multiple Routes: A user may define up to eight routes for SNA or non-SNA message transmission between two host systems or between a host system and a communication controller. When a session is initiated between two application programs or between a terminal and an application program, one of the routes is automatically selected to transmit the session traffic. The user may limit the selection to a particular route or to one of an ordered sequence of routes. Thus, it is possible to distribute the traffic for different sessions to different routes, dividing the load among several routes. Parallel sessions between two application programs can take advantage of multiple routes so that failure of route does not disrupt all sessions.

The ordered sequence of routes, determined by the installation, defines the set of alternate routes available for session traffic. In the event a route becomes inoperative during a session, the application program or terminal may request that the session be re-initiated. This causes automatic selection of one of the alternate routes. The user can then resynchronize the session data traffic and continue data communication and application program processing over the network routes that remain in operation.

Multiple Priority Levels: A user can specify one of three message traffic priorities for a session between two application programs or between a terminal and an application program. For example, this permits message traffic for a time-dependent session to be transmitted through a network ahead of other message traffic. That is, interactive processing may be given top priority by users while other network traffic, such as batch processing, is assigned to a lower priority by users.

TSO/VTAM Support: ACF/VTAM provides time sharing support through its integrated time sharing option (TSO/VTAM). TSO/VTAM extends the line and terminal sharing benefits of ACF/VTAM V2R2 to TSO users. TSO is a standard feature in OS/VS2 (MVS) that provides conversational time sharing facilities.

- TSO/VTAM allows installations to specify whether data is to be treated as 'confidential text' or not. Data not to be treated as confidential text remains unaltered in the ACF/VTAM buffers and may aid in problem determination.
- Provides the capability to initiate and terminate a generalized trace facility (GTF) trace for individual TSO/VTAM user sessions.
- ACF/VTAM allows the ACF/VTAM operator to specify a TSO user identification on a Display command. The output of the display will contain:
 - An indication that this is a TSO userid display.
 - The application program name (for example, TSO0005).
 - The terminal name (for example, SNA3270B) associated with the specified userid.
 - The status as known by ACF/VTAM of both the application program and the terminal.

- An indication as to whether the TSO/VTAM GTF trace is in effect for this TSO userid.

- Screen-size support for type-1 logical units. TSO/VTAM now supports the TSO TERMINAL SCRSIZE command for type-1 logical unit devices, as well as for type-0 and type-2 logical unit devices supported already. The TERMINAL SCRSIZE command sets the number of characters per line and the number of lines on a screen. The TERMINAL SCRSIZE command will now be valid for any type-1 logical unit display or printer. (This support was available, through PTFs, in ACF/VTAM V1R3 and V2R1.)
- ASCII-8 support for users. TSO/VTAM users can now use the ASCII-8 code set defined in ANSI X3.41. TSO/VTAM translates I/O to and from ASCII-8 devices that are defined as such in the logon mode table. The appropriate ASCII-7 or ASCII-8 alternate code indicator is set in the attributes area specified by the GETTERM ATTRIB operand.
- Support for the 3290 Information Panel. The 3270-compatible functions of the 3290 are supported in SNA and non-SNA networks, and the enhanced functions of the 3290 are supported in SNA networks. This support, which was also provided in ACF/VTAM Version 2 Release 1 through PTFs, includes:
 - A logon mode table entry for the 3290.
 - Ability to use any bit string in the address bytes of data streams destined for the 3290, thus allowing access to device buffer positions beyond 4,096.
 - Using only one SEND for request/response units (RUs) destined to type-2 logical unit devices, regardless of the outbound RU size, thus improving performance. (ACF/VTAM builds chains as required.)

Multiple Host System Restart: In recovering from a failure situation, two host systems can restart their SSCP-SSCP session without disrupting existing cross-domain or cross-network LU-LU sessions. This permits user application programs that are not affected by such a failure to continue operations during and after recovery of the host systems' SSCP-SSCP session.

Communication Controller Session Takeover: In the event a host system fails or otherwise gives up control of a communication controller, any host system that is sharing ownership of the same communication controller will have its network operator notified about the lost host. Any of the notified host systems can take over control of the devices mentioned above without disrupting their existing cross-domain sessions with application programs. It is unnecessary to deactivate corresponding cross-domain resource definitions before acquiring resources attached to the communication controller that were controlled by the lost host system.

Host-Terminal Control Session Restart: In recovering from a host failure or a route failure on the host-to-terminal control session, a host system can recover its control session for most IBM devices that are SDLC link-attached to PU type 2 control units without disrupting the existing sessions between the devices and application programs. This permits user application programs that are not affected by such a failure to continue processing during and after recovery of the control session. For other terminals, restart of the control session results in session outage notification.

Note: Some devices or control units may require a specific EC level of hardware or microcode to support this function. The appropriate documentation for the various SNA terminal products should be reviewed.

Dynamic Buffer Allocation: ACF/VTAM can dynamically allocate main storage for buffer pools according to message traffic loads and availability of main storage resources. This gives users considerable flexibility to optimize the use of main storage for buffer pools and determine buffer pool space requirements that are consistent with throughput and response time.

Inbound Pacing Support for 3270, 3730, 3790 and 8100: This facility is supported as a user-selectable session establishment function under ACF/VTAM V2. Pacing of inbound message traffic for a user application program can help avoid buffer overrun.

VTAM as a User Task: Permits the operator to unconditionally terminate ACF/VTAM V2, without waiting for resources to be released. Upon termination, all system resources acquired by ACF/VTAM are released, and the address space may be used for other purposes.

Session Management Exit Routine: Provides a single exit through which an installation can combine the session-related functions of authorization, accounting and gateway node path selection.

Although designed with special considerations for cross-network sessions, this exit may also be used for single-network sessions. In this case, at the option of the installation, the session management exit routine can replace the existing authorization and accounting routines.

When used with cross-network sessions for gateway path selection, the exit is passed a list of alternate gateway paths and LU names of the

ACF/VTAM V2 R2 (cont'd)

session partners. The routine can modify the order of the list or shorten it, thus changing the way in which the gateway paths are considered for use in setting up a particular session. This gives the installation an opportunity to distribute LU-LU sessions across gateway NCPs according to an installation's particular requirements.

Dynamic Display of ACF/NCP Storage: Allows a network operator to display any contiguous 256 bytes of ACF/NCP storage without disrupting normal ACF/NCP operation. This display capability, provided in hexadecimal representation on a network operator console, can be useful in dynamically evaluating network problem situations.

Dynamic Dump of ACF/NCP Storage: A network operator can invoke a dump of ACF/NCP storage from a channel-attached or SDLC-attached communication controller. Since ACF/NCP continues to operate during the dump process, the dump will represent ACF/NCP status over a period of time. The dump contents are recorded and printed via the facilities of the appropriate System Support Program (SSP) for ACF/NCP and can be useful in dynamically evaluating network problem situations.

Dump for the 3725: The 3725 operator can dump the microcode for the communication scanner processor (CSP) and maintenance and operator subsystem (MOSS). ACF/VTAM writes the dumps on specified files.

SDLC Data Link Test: Offers the capability to dedicate one station on an SDLC link to testing while allowing the remaining stations on that link to remain active. When a station comprises a cluster control unit and its attached devices, the control unit is dedicated to the test and its attached devices are deactivated.

Terminal Connectivity Test: Provides the capability of initiating an echo test from the terminal end of a session to determine that a terminal and its connection to ACF/VTAM V2 are functioning properly. The test does not interfere with other stations on the link or with other devices on the same control unit.

Route Verification and Error Notification Facilities: A network operator can determine if a cross-domain or cross-network message route originating in that, or an adjacent host, is operative or inoperative. This permits the operator to verify the availability of routes and to take corrective action for routes that may have become inoperative. It also permits the operator to verify that a route has been returned to service following a failure or deactivation. During the verification, appropriate resource owners are notified when an inactive or failed resource is encountered on a route.

In addition, if during network operation a route fails, an awareness message is issued at the host system end point(s), identifying the inoperative route to the operators. This enables an operator to take appropriate action to minimize the effects of an unusable message on application programs.

Transmission Group Trace: The SNA headers of message traffic over a transmission group between two communication controllers can be traced as if it were a single SDLC line. This allows for the collection of transmission control information without tracing the entire message.

Intensive Mode Recording of SDLC Data Link Errors: A network operator can dynamically invoke and terminate recording of information about temporary errors that may be occurring on an SDLC data link. This capability supplements support that records permanent error information and permits a user to collect additional information on SDLC data link errors. This detailed information may preclude the need for more specific testing to re-create an error.

Tuning Statistics: A tuning statistics function permits dynamic accumulation of data about the I/O interface to a channel-attached communication controller, a channel-attached 3790 or channel-attached host processor. Such data may aid a user in determining and selecting optimum values for start parameters and network definition.

Operator DISPLAY Command: ACF/VTAM DISPLAY commands permit a network operator (or programmed operator application) to obtain information about the status of network resources; that is, nodes, lines, terminals, logical units, physical units, application programs and buffers. Such information may be useful for status purposes, for performance analysis or to determine if an action is required for a failing element in the network.

This information provides both detailed status to the network operator and serves also as an aid for problem determination. When appropriate, the resource's status will have an identifier appended to it indicating that it is either a virtual resource (i.e., a Network Terminal Option resource) or, has been reconfigured by the Dynamic Reconfiguration facility or, in the case of network backup, has been acquired from another host system's domain. Session and resource status information is included in the display output to aid the network operator in resource management.

Multiple Line Trace: Provides the capability to trace concurrently a maximum of eight lines with ACF/NCP. The trace data is recorded on a file and may be printed using the ACF/TAP (Trace Analysis Program) System Support Program (SSP) of ACF/NCP.

VTAM Internal Trace: ACF/VTAM provides:

- The ability to trace events that occur between ACF/VTAM modules.
- The ability to terminate or initiate the VTAM Internal Trace Facility at ACF/VTAM initialization time.
- The ability to have the VTAM Internal Trace records recorded on an external file.
- The ability to trace session setup, session takedown, and BIND failures.
- The ability to trace ACF/VTAM I/O activity.

3725 Scanner Interface Trace: ACF/NCP for a 3725 Communication Controller forwards data collected by the CSP line scanner to ACF/VTAM, which writes it on a specified file.

Session Outage Notification: If the route supporting a session becomes inoperative, then, via SNA protocols, the session ends are made aware of the outage. Session re-initiation may be requested as described under "Multiple Routes".

Flow Control Management of Network Traffic Demands: SNA protocols dynamically regulate the message traffic flow between a host system and a communication controller and between two host systems. Continuous feedback is exchanged between network resources in order to regulate network traffic and reduce the possibility of network congestion. When necessary, the feedback triggers local flow control mechanisms in ACF/VTAM. Application programs and local terminals may be temporarily prevented from introducing more data into a congested network.

Dynamic Reconfiguration of Nonswitched SNA-SDLC Devices: Allows the network operator to selectively add or delete supported nonswitched SNA-SDLC devices, without disrupting other network functions. This capability supplements the ACF/NCP generation process, and supports temporary configurations in a non-disruptive fashion until a permanent network control program generation can be done.

Limited Usage of Application Program Private Area: ACF/VTAM allows an installation, when defining an application program, to limit the amount of private area storage ACF/VTAM may request to queue data arriving for the application program.

Reliability and Availability

- Capability to have the application program span multiple address spaces:

ACF/VTAM V2R2 permits application program interface (API) requests from a single application program to originate from different address spaces and to reference a single application program access method control block (ACB). This multiple address space facility provides application programs with capabilities for error isolation and session protection. This capability will also allow application program design flexibility by permitting individual sessions to be assigned to their own address space while being allowed to reference a single ACB. Improved operation may also be achieved by grouping sessions with similar characteristics or functions to be performed in one address space.

- Levels of error isolation:

To minimize the disruption caused by an error detected while ACF/VTAM is processing, ACF/VTAM attempts to isolate the error to:

- The failing API request.
- The session issuing the API request.
- The task containing the session.
- The application program.

Also, if a task or address space is terminated while processing for other than ACF/VTAM, ACF/VTAM attempts to isolate the disruption to the task structure or address space involved.

- OS/VS2 (MVS) authorized path mode of operation for ACF/VTAM application program interface (API) macro instructions and exit routines:

– An ACF/VTAM V2R2 authorized application program may use the ACF/VTAM API macro instructions and exit routines in the OS/VS2 (MVS) authorized path mode of operation (using the system request block (SRB) mode of operation). All API macro instructions (except for the OPEN, CLOSE, MODCB, TESTCB, GENCB and SHOWCB macro instructions) can be used in this mode of operation. Selection of authorized path mode is under control of the application program through API macro instruction operands.

– All exit routines associated with an ACF/VTAM V2R2 application program can make use of this authorized path mode of operation. The selection of authorized path mode is specified when the application program is defined.

PROGRAM PRODUCTS

ACF/VTAM V2 R2 (cont'd)

- Application programs selecting the authorized path mode of operation may realize improved ACF/VTAM performance.

CCITT X.21 Support: ACF/VTAM V2R2 supports the following CCITT X.21 switched functions when attached to an X.21 network through a communication controller:

- Address calling.
- Auto answer.
- Call progress signal.
- Direct call.
- Closed User Groups.
- Abbreviated Address Calling.

RELATED IBM PROGRAMS

The following related IBM programs and program products are supported by ACF/VTAM V2 R1:

TYPE	PROGRAMS
Data Base/ Data Communication	CICS/VS
	IMS/VS
Job Entry	FTP
	JES2/RJE
	JES2/NJE
	JES3/RJP
Interactive	IIPS/IIAS
	IIS
Device Support	TSO (2)
	TSO/E (2)
	VSPC
	VS APL (1, 2, 3)
	BTP Version 4
	DSLU
	DSX Release 2
	GDDM (1,2,3,5)
	Host Command Facility
	Host Prep (8100/DPCX Support)
	MVS/IDWS
	Network Routing Facility
	NTO Release 2
	Programmable Store System Host Support
SSS Release 5	
Systems and Communications Network Management	3600/4700 Finance Com'ctn. System Host Support
	Information/System Version 1 (2,4)
	Information/System Version 2 (2)
	NCCF Version 1 Release 2
	NCCF Version 2
	NLDM Releases 1 (4), 2 (4)
Distributed Data Processing	NPDA Versions 2, 3
	DISOSS/370 (1, 5)
	MVS/OCCF (4)

Notes:

- (1) Supported through CICS/VS.
- (2) Supported through TSO/VTAM.
- (3) Supported through VSPC.
- (4) Supported through NCCF.
- (5) Supported through IMS/VS

ACF/VTAM Version 2 Release 2 will support subsequent releases of the above programs and products unless otherwise stated in the announcement documentation for the future releases or modifications for ACF/VTAM.

Refer to the appropriate product documentation or to your IBM marketing representative for information on programming support for specific devices supported and other related IBM program capabilities.

ACF/VTAM V2R2 also will support user programs written to use the ACF/VTAM record application program interface (Record API).

CUSTOMER RESPONSIBILITIES

To install and use ACF/VTAM Version 2 Release 2, the customer must:

- Design the single system network.
- Order and install all required communication equipment.
- Install ACF/VTAM V2R2.
- Define the network to ACF/VTAM.
- Install a compatible release of ACF/NCP (unless all terminals are channel-attached to the host).
- Define the network to ACF/NCP (if applicable).

To use the ACF/VTAM V2R2 multisystem networking functions, the customer must:

- Design the multiple-system network.
- Order and install any additional communication equipment (e.g., intersystem links between communication controllers) or channel-to-channel adapters that may be required.
- Install ACF/VTAM V2R2.
- Install a compatible release of ACF/NCP (if required).
- Define the multisystem network to ACF/VTAM and ACF/NCP (if required) in each system.

To use the ACF/VTAM V2R2 functions for interconnected SNA networks, the customer must:

- Design the interconnected network.
- Install, or upgrade to, a compatible release of ACF/NCP.
- Order and install any additional communication equipment (e.g., inter-network links between communication controllers).
- Define to each ACF/VTAM V2R2 all networks that will interconnect.
- Define to each ACF/NCP Version 3 (V3) all networks that will be interconnected, including COS entries and VR lists.
- Install ACF/VTAM V2R2 in the gateway hosts.
- Install ACF/NCP V3 in the gateway nodes.
- Install NCCF Version 2 (if required for resource name translation).*
- Specify the alias/real name equivalencies if the NCCF name translation facility is used.
- Install NLDM Release 2 (optional).*

* For an SNA network interconnection environment, IBM recommends that NLDM Release 2 and NCCF Version 2 be present at every VTAM host that serves as a gateway node to support the problem determination effort for cross-network sessions. With these products installed, the network operator will have access to data used for network problem determination and problem source identification.

Certain tasks, such as installing links, updating path tables in non-gateway NCPs and hosts, and updating CDRM and CDRSC statements in back-level hosts can be done before ACF/VTAM V2R2 is installed.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

ACF/VTAM Version 2 Release 2 is designed to run in a virtual storage environment in any IBM system configuration that supports OS/VS2 (MVS) as specified in "Software Requirements".

The host processor instruction set must include the Compare and Swap, the Compare Double and Swap and the Set PSW Key from Address (SPKA) instructions.

For remote or cross-domain communication, ACF/VTAM V2R2 requires an IBM 3705 or 3725 Communication Controller, with the

ACF/VTAM V2 R2 (cont'd)

appropriate level of ACF/NCP or a channel-to-channel adapter connecting it to another ACF/VTAM Version 2 host.

For cross-network communication, ACF/VTAM V2R2 requires an IBM 3705 or 3725 Communication Controller with the appropriate level of ACF/NCP.

Storage Considerations: Preliminary requirements for host processor storage and for disk storage for ACF/VTAM data sets can be calculated by using the *Network Program Products Planning* manual (SC27-0658). Requirements for disk storage for ACF/NCP data sets and for communication controllers can be calculated by using information in the same manual.

SOFTWARE REQUIREMENTS

ACF/VTAM Version 2 Release 2 is designed to run with the following operating system releases:

- OS/VS2 (MVS) Release 3.8, optionally with:
 - MVS/SP Version 1 for S/370.
 - MVS/SP Version 2 for Extended Architecture (XA) processors (ACF/VTAM with MVS/XA operates in 24-bit mode).

ACF/VTAM Version 2 Release 2 will also run on subsequent releases or modifications of OS/VS2 (MVS), unless otherwise stated in the announcement documentation of the future releases or modifications for it or for ACF/VTAM.

ACF/VTAM V2R2 will run in a VM/370 environment in a guest virtual machine.

The optional ACF/VTAM Encrypt/Decrypt feature requires the Programmed Cryptographic Facility program product (5740-XY5) or the Cryptographic Unit Support program product (5740-XY6).

For remote communication, ACF/VTAM V2R2 requires ACF/NCP Version 1 Release 3, Version 2 or Version 3 running in an IBM 3705 or 3725 Communication Controller.

For cross-network communication, ACF/VTAM V2R2 requires ACF/NCP Version 3 running in a communication controller.

For cross-network communication with networks that have identically named resources, an alias name translation facility is required to provide name translations between the interconnected networks. NCCF Version 2 provides this function.

To provide NLDM Release 2 with complete session route data, ACF/NCP Version 3 is required at all the subarea nodes along the session route.

COMPATIBILITY

The ACF/VTAM V2R2 application program interface (API) is upward compatible with the ACF/VTAM Version 1, ACF/VTAM V2R1 and VTAM level 2 API. Where related IBM programs (for example, CICS/VS, IMS/VS, JES2/RJE, JES2/NJE, JES3/RJP, TSO, VSPC, NCCF, etc.) operate with ACF/VTAM Version 1 or VTAM level 2, compatibility is retained for the level(s) of those programs that are current at the availability of ACF/VTAM V2R2 on OS/VS2 (MVS), except for the cases where support for specific release level(s) of these products has been indicated elsewhere in these pages. Recompilation of the related IBM programs is not required.

Application programs that use the macro language and control block record mode interface of ACF/VTAM Version 1 or VTAM level 2, should continue to operate without recompilation on the same operating system with ACF/VTAM V2R2, provided that these programs do not depend on the internal processing characteristics of these access methods.

Beginning with ACF/VTAM Version 2 Release 1, the length of the access method control block (ACB) was increased. Application programs that have been properly coded using the *ACF/VTAM Programming* manual to run on ACF/VTAM Version 1 and ACF/Version 2 Release 1 will run without reassembly on ACF/VTAM V2R2.

Program operator application programs that have been properly coded using the *ACF/VTAM Programming* manual to run on ACF/VTAM Version 1 or ACF/VTAM Version 2 Release 1 will also run on ACF/VTAM V2R2.

ACF/VTAM Versions 1 and 2 for OS/VS1, ACF/VTAM Version 1 for VSE, and ACF/VTAME have the following restrictions in the use of the automatic logon function (VARY LOGON or LOGAPPL):

- Controlling PLU relationships cannot be established between the above VTAMs and ACF/VTAM V2R2.
- Cross-network controlling PLU relationships cannot be established to or from the above VTAMs in an SNA network interconnection environment.

The restrictions above also exist for ACF/VTAM V2R1 and V1R3 for MVS, and for ACF/VTAM V2R1 for VSE. For these levels of

ACF/VTAM only, however, the restrictions may be removed by applying a compatibility PTF that will be available.

The possibility that a user could logon cross-domain to an application program using the application program's ACB name has been eliminated in ACF/VTAM V2R2. While this use of the ACB name is not documented or recommended, it was possible in previous releases of ACF/VTAM. With ACF/VTAM V2R2, a user can logon to a cross-domain application program only by using the application program's network name, as documented in the ACF/VTAM publications.

Application programs written for previous releases of ACF/VTAM or VTAM Level 2 may require changes to take advantage of the additional functions offered by ACF/VTAM V2R2.

MIGRATION and PLANNING CONSIDERATIONS

The recommended bases for migration to ACF/VTAM Version 2 Release 2 are ACF/VTAM Version 1 Release 3 and ACF/VTAM Version 2 Release 1.

A checklist of conversion/migration planning considerations for current users of BTAM, BTAM/SP and previous releases of ACF/VTAM is included in the *Network Program Products Planning* manual (SC27-0658).

When migrating to ACF/VTAM Version 2 Release 2 from a prior release of ACF/VTAM, the following should be considered:

- ACF/VTAM support of associated IBM program products.
- Choosing the migration path.
- Upgrading to ACF/VTAM V2 R2.
- Upgrading NCPs.
- Functional compatibility with networks having various supported levels of ACF/VTAM and ACF/NCP.

An ACF/VTAM V2R2 host does not support an ACF/NCP V1 R2.1 in its domain. A V1 R2.1 NCP cannot be channel attached to, or controlled by a V2R2 VTAM host. However, an ACF/VTAM V2R2 does support LU-LU sessions with ACF/NCP V1 R2.1 for cross-domain and cross-network communications.

ACF/NCP CONSIDERATIONS

The following ACF/VTAM V2R2 enhancements are supported only in conjunction with ACF/NCP V3:

- SNA Network Interconnection.
- Forced deactivation of an NCP link.
- NLDM Release 2 Route Test Data.

The VTAM-NCP support table that follows lists the releases of each product through which SSCP-PU, SSCP-LU, and LU-LU sessions are supported. It can be used to plan migration from previous releases of VTAM to ACF/VTAM V2R2.

NCPs	NCP5	V1 R1	V1 R2	V1 R2.1 (7)	V1R3 (7)	V2	V2	V3	V3
VTAMs						3705	3725	3705	3725
VTAM2	yes	yes (1)	yes (2)	yes (2)	no	no	no	no	no
V1R1	yes	yes	yes (3,4)	yes (3,4)	yes (6)	no	no	no	no
V1R2	no	yes	yes	yes	yes	no	no	no	no
V1R3 (12)	no	no	yes (5)	yes (5)	yes	yes	yes (8)	yes (9)	yes (8,9)
V2R1 (13)	no	no	no	yes (5)	yes	yes	yes (10)	yes (11)	yes (10,11)
V2R2	no	no	no	no	yes (14)	yes	yes	yes	yes

Notes:

- (1) With applicable VTAM Level 2 PTFs.
- (2) OS/VS only, with applicable VTAM level 2 PTFs:
 - OS/VS1: UX14242.
 - OS/VS2 (MVS): UZ28810.
- (3) Not supported on VSE.
- (4) With applicable ACF/VTAM V1R1 PTFs:
 - DOS/VS Release 34: UD17664.
 - OS/VS1: UX14243.
 - OS/VS2 (MVS): UZ28811.

ACF/VTAM V2 R2 (cont'd)

- (5) With applicable ACF/NCP/VS V1R2 or V1R2.1 PTFs when connected to ACF/NCP/VS V1R3 or later.
- (6) OS/VS only, with applicable ACF/VTAM V1R1 PTFs:
 - OS/VS1: UX14243.
 - OS/VS2 (MVS): UZ28811.
- (7) With EREP PTFs for Link Problem Determination Aid (LPDA) level maintenance data records.
- (8) OS/VS2 (MVS) only, with ACF/VTAM V1R3 PTFs UZ90205, UZ90206, UZ90207 and UZ90208. (ACF/VTAM V1R3 for OS/VS1 and DOS/VS does not support sessions with ACF/NCP for the 3725.)
- (9) With applicable ACF/VTAM V1R3 PTFs:
 - OS/VS2 (MVS): UZ62633.
 - OS/VS1: UX18990.
 - DOS/VS: UD26545.
- (10) With ACF/VTAM V2R1 OS/VS2 (MVS) PTF UZ59682. (PTFs not required for OS/VS1 and DOS/VS systems.)
- (11) With ACF/VTAM V2R1 OS/VS2 (MVS) PTF UZ90186. (PTFs not required for OS/VS1 and DOS/VS systems.)
- (12) With applicable ACF/VTAM V1R3 PTF when the network contains any ACF/VTAM V2R2 or ACF/NCP V3 node(s):
 - OS/VS2 (MVS): UZ56422.
 - OS/VS1: UX17328.
 - DOS/VS: UD23966.
- (13) With ACF/VTAM V2R1 OS/VS2 (MVS) PTF UZ56421 when the network contains any ACF/VTAM V2R2 or ACF/NCP V3 node(s). (PTFs not required for OS/VS1 or DOS/VS systems.)
- (14) Supported for LU-LU sessions only. The 1.2.1 NCP cannot be channel attached to, or controlled by the V2R2 VTAM.

PTFs may be required in addition to those stated above. Contact your IBM support center for updated install information and recommended service before installing these products.

OTHER CONSIDERATIONS

As a result of some of the new capabilities in ACF/VTAM V2R2, minor network operational differences may exist with prior releases of ACF/VTAM.

A controlling PLU session set request (CDINIT) is always deferred (queued) when the PLU or SLU is owned by an adjacent SSCP and the single required SSCP-SSCP session is not active. Session setup in a single network involves only two SSCPs, therefore the session setup request is always deferred when the SSCP-SSCP session is not active. When networks are interconnected, the path between the controlling PLU and its associated SLU can be through several SSCPs. In this case, the setup request is not deferred if one or more of the required SSCP-SSCP sessions is not active, unless the PLU and SLU are owned by adjacent SSCPs. All deferred session setup requests are established automatically when the required SSCP-SSCP session becomes active. Cross-network session requests that are not deferred can be established by the operator issuing the VARY LOGON after all the required SSCP-SSCP sessions become active.

ACF/VTAM application programs generally will not need to be changed to operate with the Encrypt/Decrypt feature. However, there exist several SNA sense codes that deal only with unrecoverable errors associated with the Encrypt/Decrypt feature, and existing application programs that are not now using the Encrypt/Decrypt feature may need to be changed to handle these sense codes properly. Application programs that already operate properly with the Encrypt/Decrypt feature require no further modification to work properly with the ACF/VTAM Version 2 Release 2 Encrypt/Decrypt feature.

In a mixed ACF/VTAM-ACF/TCAM multisystem environment, the ability of ACF/VTAM to access device characteristics of terminals controlled by ACF/TCAM is limited to those indicators defined and maintained by ACF/TCAM. In particular, the ability to determine the physical device address of a 3271-11, 12 used in the copy function is not supported.

When using the ACF/VTAM capability to modify, replace, or suppress ACF/VTAM messages, it should be noted that user modification of information required for problem diagnosis, such as IBM-supplied command syntax and defaults, might impair the standard serviceability characteristics of the product and may increase the documentation requirements for reporting a problem to IBM. The IBM-supplied command CSECT should be retained for problem re-creation.

CONVERSION

Converting from BTAM or BTAM/SP to ACF/VTAM V2R2: Conversion to ACF/VTAM from application programs that use BTAM through CICS/VS, IMS/VS, or other IBM subsystems or programs that also support ACF/VTAM, will, in most cases, involve little or no reprogramming. The use of ACF/NCP in the Partitioned Emulation Programming (PEP) mode will ease the transition from BTAM to ACF/VTAM V2R2 since it allows concurrent use of BTAM and ACF/VTAM by the IBM subsystem or program and permits gradual conversion of communication links and terminals from BTAM to ACF/VTAM with ACF/NCP. This will help to avoid or minimize disruption of the services provided by the application program to its users.

Conversion to ACF/VTAM from application programs that use the BTAM macros directly involves reprogramming those application programs. The recommended approach is to redesign those application programs to use the IBM subsystems (such as CICS/VS or IMS/VS) and obtain multiple benefits, besides ACF/VTAM support, including:

- The intrinsic advantages of using the various data management, multi-tasking, device support, and other functions in the IBM subsystems that exploit and expand the capabilities offered by the operating system.
- Support for a wide variety of existing IBM terminals and other devices.
- Continued updating of support for new IBM terminals and other devices.
- Intersystem communication capabilities (on CICS/VS and IMS/VS).
- Little or no effect on the application programs as new releases of the operating system and access methods become available.
- High-level interface for application programmers that masks many of the complexities of communications programming.
- Relief to the application programmers from many of the tedious tasks involved in writing communication programs, thus providing more time for the development of the actual application programs and capabilities requested by the end-users.
- Availability of many programming tools and techniques that extend the capabilities of the IBM subsystems and increase the productivity of the application programmers through IBM program products that operate on the IBM subsystems (such as DL/I, DMS, GDDM, etc.).

As an alternative, the existing BTAM or BTAM/SP applications could be recoded to use the ACF/VTAM macros directly.

DATA SECURITY, AUDITABILITY and CONTROL

ACF/VTAM gives customer management the ability to:

- Establish and maintain the integrity of the data communication network.
- Control the connection of applications to terminals and other applications in the network.
- Elect a confidential text capability. Sessions may be defined as confidential text. This ensures that the data is not included in buffer traces, and buffers are cleared prior to being returned to the buffer pool.
- Encrypt communications. The ACF/VTAM Encrypt/Decrypt feature can be used to protect data transmitted within a network or across networks.
- Configure networks for security. Nodes sharing similar security requirements may be placed in an isolated (e.g., secure) network. SNA Network Interconnection allows communication between these nodes and less secure nodes in other networks. However, Network Management Operations originating from nodes in other (less secure) networks can not affect the isolated network.

In particular, auditors will find the following functions to be of interest:

- Control
 - Application-to-application communication
 - Negotiable session initialization parameters
 - Transmission group
 - Multiple priority levels
 - Application program interface
 - Optional user exits for authorization and accounting
- Integrity/Recovery
 - NCCF/NPDA
 - Error isolation
 - Multiple routes
 - Parallel links
 - Switched network backup
 - Route verification
 - Trace facilities

Customer management is responsible for the selection, application, adequacy, and implementation of these features in the protection of their data.

PERFORMANCE and STORAGE CONSIDERATIONS

ACF/VTAM V2R2 mainline path storage and common storage requirements are approximately the same as for equivalent functions using ACF/VTAM V2R1. ACF/VTAM V2R2 private virtual storage requirements have increased. Information on this increase will be available during First Quarter, 1984 via the HONE aids STORMVS and STORVTAM. Preliminary estimates of host processor storage and disk

ACF/VTAM V2 R2 (cont'd)

storage requirements are in the *Network Program Products Planning* manual (SC27-0658).

Response time in a single system environment depends on a variety of processor and data communication load factors, such as:

- Line speeds.
- Number, type and organization of terminals.
- Number and type of ACF/VTAM commands and exits used.
- Amount of processing done by the application program.

Response times in a multiple-system and interconnected-system environments depend on the factors above and on various network load factors, including the number of nodes traversed.

Hardware requirements are included in the "Specified Operating Environment" above.

Specific user storage requirements will be dependent on the specific configuration and upon the following user-specified areas and functions:

- I/O buffer areas.
- Number and organization of terminals.
- Number and type of macro instructions used.
- Number and size of NLDM program product trace buffers selected (optional).

The actual performance impact (if any) to a customer will vary depending upon his particular hardware and network configuration. IBM aids such as SNAP/SHOT should be used to assess individual customer performance capability and storage requirements.

MVS SYSTEM INTEGRITY APPLIES: Yes

LICENSED PROGRAM MATERIALS AVAILABILITY

Restricted Materials: Yes

This licensed program will be available with some licensed program materials designated as "RESTRICTED MATERIALS OF IBM".

In addition, some modules will be available without source licensed program materials. These modules will be available in object code.

PROGRAM PRODUCTS

**VIRTUAL STORAGE PERSONAL COMPUTING (VSPC)
OS/VS2 VSPC (MVS) V2 R1 (5665-283)**

Programs 5740-XR5, 5740-XR6 and 5746-XR3 are no longer available.

PURPOSE

IBM Virtual Storage Personal Computing (VSPC) is a set of program products that provides DOS/VS, OS/VS1 and OS/VS2 (MVS) users at terminals a choice of responsive tools, in an interactive environment, to help support their personal computing and problem solving activities.

VSPC was designed to offer a comprehensive set of functions for data and source program manipulation that are tailored for end users without extensive data processing knowledge. VSPC also offers the ability to submit jobs for batch processing and to retrieve job output at the user's terminal.

HIGHLIGHTS

General purpose personal computing and problem solving capabilities are provided that can operate concurrently with DOS/VS, OS/VS1 or OS/VS2 (MVS) background operation.

VSAM is used exclusively as the device-independent access method for VSPC library support.

VTAM is used exclusively as the terminal access method. Use of VTAM and its associated network independence allows the same terminals to be used for VSPC and other VTAM applications such as CICS or IMS, etc.

For VSPC job submission, cancellation, status and output functions VSPC under DOS/VS uses POWER/VS ... under OS/VS1 the Job Entry Subsystem (JES) ... under OS/VS2 (MVS) the Job Entry Subsystem (JES2 or JES3).

VSPC functions are complemented by a set of other program products that operate in the environment created by the VSPC foreground processor interface. These complementary program products provide the VSPC user with a selection of programming languages, such as APL, BASIC and FORTRAN, for problem solving. Further information on these complementary program products can be found in the appropriate sections of these pages.

Commands are provided by VSPC for the customer's operations staff for interactive control of system resources, user enrollment and user profile maintenance. VSPC AID, a prompting facility, assists the user in constructing commands.

The personal computing users of VSPC will have at their disposal a set of simple-to-use commands to help support their problem solving needs; they are provided with a workspace, editing and data management commands, as well as library support.

A set of conversational remote job entry commands is also provided which will allow the VSPC user to submit jobs to the batch for execution; output can be retrieved at the terminal or routed elsewhere.

VSPC provides a responsive, interactive editor for program and data manipulation.

The foreground processor interface provides facilities for VSPC foreground processors (VS APL, VS BASIC and installation written) to access sequential and direct files in the VSPC library, as well as VSAM key sequenced, entry sequenced and relative record data sets external to the VSPC library.

The VSPC Library provides a set of facilities both to share data files and to keep them secure, as required.

The Full Screen Management facility allows installation written foreground processors to format, read, write and erase two-dimensional fields of data on a 3270 display device. These processors can also read program function and attention keys and light-pen operations.

A function, called Shared Storage Management, is also available with VSPC. By means of the shared variable concept, Shared Storage Management provides a means of communication between programs, both in the VSPC foreground and in the batch background.

DESCRIPTION**VERSION 1 RELEASE 2 CAPABILITIES**

In addition to the functions provided by Version 1 Release 1, Version 1 Release 2 provides numerous enhancements to VSPC in the OS/VS1 and OS/VS2 (MVS) operating environments.

Full screen editing for display terminals; the user can edit multiple data lines through the terminal facilities (INS MODE, DEL key, etc.).

Program Function (PF) key setting lets the display terminal user specify the interpretation of PF keys.

New and improved editing commands give added capabilities for editing and line entry. Data lines can now be copied, joined together or split apart. Global changes to data must now be

explicitly requested. A current line pointer is provided as a convenient reference point for the terminal user.

General usability improvements are also included. Command entry is simplified. Empty editable files of any content attribute can be defined. The screen display on a terminal can be held as long as the user wishes.

Job entry improvements allow omission of the JECODE from jobnames in job entry commands and the ability to query status of all submitted jobs.

Improved application capabilities include:

VSAM alternate index support for record processing of external VSAM files.

Shared file updating by transfer of ownership of shared files from one user to another.

Foreground interface enhancements: Foreground processors can now issue immediately executed commands, make use of in-storage command lists and control password prompting to the terminal user.

Subsystem management improvements include:

Additional display terminal support. Advanced 3270 terminals with added function can be used. The 3791 Controller is also supported.

Additional resource control through enhancements to the VSPC operator SET command.

Composite accounting units: The separate VSPC counts may be combined and weighted by the installation. This gives a more direct relationship between VSPC accounting counts and the installation accounting/billing methods. The composite units are included in all SMF records and in messages to terminal users.

Service program enhancements: Incremental backups are now provided; for an incremental backup only, files updated since the last full backup are copied. Files designated as shared by their owners can be exported and copied by authorized other users. Alphabetic characters in the line-number field of an imported file are allowed. With appropriate authority, files and users can be deleted from the VSPC output library.

General usability improvements: Terminal and system problem messages are much improved. A sample logon interpreter is provided; an installation can use it unchanged or can modify it as needed. AID messages are no longer resident in virtual storage and can be easily modified. Extensions to SMF records are provided for more complete recording of VSPC activity.

VERSION 2 RELEASE 1 CAPABILITIES

In addition to the functions provided by the previous releases, Version 2 Release 1 provides the following enhancements to VSPC in the OS/VS2 (MVS) environment:

Large screen models of the IBM 3270 display terminal family are supported in large screen mode. This includes the VIEW mode full screen editor as well as the VSPC command mode screen format. The new screen sizes are: 32 rows by 80 columns (mdl 3 terminals), 43 rows by 80 columns (mdl 4 terminals), and 27 rows by 132 columns (mdl 5 terminals).

Improved support for IBM 328X printers, including forms control and printing up to 132 characters per line. In addition, VSPC Version 2 Release 1 supports cross-domain access to printers in an ACF/VTAM multi-system network, as well as sharing of these hardcopy devices between VSPC and other cooperating VTAM applications.

Terminal output can be directed to a file, while output to the terminal itself can be suppressed.

Scheduled execution of a VSPC session without a terminal (also known as disconnected operation), including the ability to query the status of the scheduled sessions.

MSS support for external VSAM files is improved to provide better resource balancing when external VSAM files have been defined to be staged in "cylinder fault" mode.

The ability to reuse an existing VSPC library when doing a reorganization or recovery operation (without the overhead of reformatting every track that occurs when a new VSPC Library is created), and the ability to EXPORT directly from a VSPC backup tape.

A full-function CLIST processor, including support for symbolic parameter substitution, conditional execution (with run-time logic for error processing), and non-command data embedded in the CLIST stack.

A time limit for program execution, which may be specified by the VSPC user in the RUN command.

PROGRAM PRODUCTS

VSPC (cont'd)

Foreground interface extensions allow installation-written foreground processors to read detailed directory records from the VSPC library, to obtain information about the current user load, and to perform a confidential read from the terminal.

Shared Storage Manager (SSM) extensions allow installation-written processors to find out whether or not a potential partner has signed on the the SSM and allow installation-written auxiliary processors to be posted when a partner has become interlocked.

Improved installation control options including the ability to restrict the use of the SEND command and the ability to restrict certain users to be able to run only specified applications without being able to directly utilize the general programming facilities of VSPC.

Support for GDDM and PGF running under the VSPC supervisor. A new foreground interface service request is provided to allow processor and application access to all GDDM and PGF functions and utilities. This support requires GDDM and PGF Release 2 or later.

CUSTOMER RESPONSIBILITIES

Each customer installing, operating or supporting VSPC must have a working knowledge of DOS/VS, OS/VS1 or OS/VS2 (MVS). No customer should attempt to install VSPC until the installation has achieved proficiency in the use of the operating system.

With VSPC, as with other products, considerable attention should be given to pre-installation systems design and analysis, and to communications requirements.

The customer is responsible for providing adequate protection against accidental loss or misuse of his data. This includes an adequate review of the system's security provisions by the user.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

DOS/VS:
VSPC Release 1 operates under DOS/VS on IBM S/370 mdls *115 (3115-2 only) *125, 135, 138, 145, 148, 155 II and 158, with at least 256K bytes of real storage to support three terminals. VSPC requires the following features in addition to those features required by DOS/VS:

- CPU timer and clock comparator (#2001).
- Floating point (#3900 or #3910).
- Conditional swapping (#1051) or advanced control program support (#1001).

* VSPC operation on the mdls 115 (3115-2 only) and 125 is suitable for test operation only. In most cases, performance is not expected to be suitable for a production environment.

OS/VS1:
VSPC Version 1 Release 2 operates on all IBM processors supported by OS/VS1, with at least 384K bytes of real storage to support three terminals. VSPC requires the following features, in addition to those features required by OS/VS1:

- CPU timer and clock comparator (#2001).
- Floating point (#3900 or #3910).
- Conditional swapping (#1051) or advanced control program support (#1001).

OS/VS2 (MVS):
VSPC Version 1 Release 2 and VSPC Version 2 Release 1 operate on all IBM processors supported by OS/VS2 (MVS), with at least 2,048K bytes of real storage to support three terminals. VSPC requires the following feature, in addition to those features required by OS/VS2 (MVS):

- Floating point (#3900 or #3910).

VIRTUAL STORAGE REQUIREMENTS

DOS/VS, OS/VS1:
The size of the VSPC interactive partition is dependent on the number and type of active terminals, the sum of the active users' workspaces, the VSAM external file requirements and the initialization options selected. Additional virtual storage is required for any user-installed foreground processors.

OS/VS2:
The VSPC interactive environment virtual storage requirement is dependent on the number and type of active terminals, the sum of the active users' workspaces, VSAM external file requirements and the initialization options selected. Additional virtual storage is required for any user-installed foreground processors. Note: VSPC under OS/VS2 (MVS) utilizes multiple address spaces to extend the total amount of virtual storage available to interactive VSPC.

Real Storage Requirements: The real storage requirement for VSPC is dependent on the number and type of terminals, the functions selected, the installation's other processing (if any), expected traffic and the desired response time characteristics.

Direct Access Storage Requirements: Additional DASD space is required, beyond the minimal operating system requirements, for system libraries, system paging data sets, VSPC library data sets and VSPC accounting data sets.

TERMINALS SUPPORTED

VSPC uses VTAM for all terminal operations. VTAM requires NCP/VS for remote terminals.

Operating with ACF/VTAM Version 1 Release 2 or later or ACF/VTAM Version 2 (which does not support the Basic Applications Program Interface) on OS/VS1 or OS/VS2 (MVS), VSPC continues to provide access to the IBM 2741 and TWX-33/35 protocols via the ACF/VTAM V1 R2 or ACF/VTAM Version 2 Record Application Program Interface and the Network Terminal Option program product (5735-XX7) installed with ACF/NCP/VS Release 2 or later.

The user should be aware that many terminal and communications controller features are transparent to programming, and therefore readily usable even though not specifically identified. Note that the appropriate line adapters and hardware features must be included in the system configuration. Note that VSPC also requires an attention interrupt capability on all terminals with the exception of the 3270. See the appropriate pages for specific terminal configurations.

Existing keyboards can be modified for use with APL by utilizing APL overlays on the keys (order APL Characters, GX20-1783).

The terminals and communications controllers supported are listed below.

Terminals that are functionally equivalent to those specifically supported by VSPC may also function satisfactorily with VSPC; the customer is responsible for establishing equivalency. IBM assumes no responsibility for the impact that any changes to the IBM-supplied programs or products may have on such terminals.

The following terminals and communications controllers are supported:

COMMUNICATIONS CONTROLLERS

3704/3705 Communications Controller on local channel:

Note: EBCDIC Code, ASCII Code, Autopoll and EBCDIC Transparency do not have special feature codes in the 3704/3705, but the equivalent functions are program supported as capabilities of the 3704/3705 NCP/VS.

Supported: NCP/VS
PEP (NCP/VS only)

START/STOP TERMINALS

The following start/stop terminals are supported via the VTAM Basic Application Program Interface (API).

1050 Data Communication System on switched or leased lines:

- 1051 Control Unit (mdls 1,2)
 - Required: Attachment of 1052
 - #6100 - Receive Interrupt
 - #1313 - Automatic EOB (or RPQ E28235)
 - #9698 - Text Time-Out Suppression
- 1052 Printer-Keyboard (mdls 1,2)
 - Recommended: #1006 - Accelerated Carrier Return
 - Supported:
 - Print. Elements: #9567 - PTTC/BCD (P/N 1167938)
 - #9571 - PTTC/EBCD (P/N 1167963)
 - RPQ F24235 - APL (P/N 1167988)

2741 Communication Terminal on switched or leased lines:

- Required: #4708 - Receive Interrupt
- Supported:
- Print. Elements: #9567 - PTTC/BCD (P/N 1167938)
- #9571 - PTTC/EBCD (P/N 1167963)
- #9812 - Correspondence (P/N 1167043)
- RPQ F24235 - APL, Base Machine is PTTC/BCD or PTTC/EBCD (P/N 1167988)
- RPQ E62267 - APL, Base machine is Standard Selectric (P/N 1167987)
- Keyboards: RPQ M40174 - APL, Base machine is PTTC/BCD or PTTC/EBCD (P/N 5195500)
- RPQ M40174 - APL, Base machine is Standard Selectric (P/N 5156576)
- Recommended: #8341 - Typamatic Keys

Note: With ACF/VTAM V1 R2 or ACT/VTAM Version 2, supported via the Record Applications Program Interface and with the Network Terminal Option program product installed with ACF/NCP/VS R2. OS/VS1 and OS/VS2 MVS only.

3232 (Mdl 51) on switched or leased lines:

PROGRAM PRODUCTS

VSPC (cont'd)

Note: With ACF/VTAM R2, supported via the Record Application Program Interface and with the Network Terminal Option program product installed with ACF/NCP/VS R2. (OS/VS1 and OS/VS2 MVS only).

3767 Communication Terminal (mdls 1,2) on switched or leased lines supported as a 2741. The NCP MTA facility, a feature for switched line devices, supports the start/stop mode of this device on ACF/NCP only. The 3767 has an optional feature which permits one keyboard and an alternate character set.

Required: #7113 - 2741 start/stop (which provides PTTC/EBCD and Correspondence Codes)
#5505, 5506 or 3719 - Interrupt Capability for the modem

Supported: Keyboards: #9381 - Correspondence and #9382 - Alternate EBCDIC Character Set or, #9383 - Alternate APL Character Set #9391 - EBCDIC and #9392 - Alternate Correspondence Character Set or #9393 - Alternate APL Character Set #2950, #2955 - EBCDIC #1291 - APL Character Set

Note: Alternate Character Set requires feature #1291 as a prerequisite.

Note: With ACF/VTAM V1 R2 or ACF/VTAM Version 2, supported via the Record Applications Program Interface and with the Network Terminal Option program product installed with ACF/NCP/VS R2. (OS/VS1 and OS/VS2 MVS only.)

6733 Typewriter Communication Module on switched or nonswitched lines as a CPT-TWX 33/35:

Note: With ACF/VTAM (R2), supported as a CPT-TWX 33/35 via the Record Application Program Interface and with the Network Terminal Option program product installed with ACF/NCP/VS (R2). (OS/VS1 and OS/VS2 (MVS) only.

CPT-TWX (mdl 33/35) Line Control Type on switched lines or leased lines:

Supported: KSR and ASR.

Note: Use of paper tape reader requires the Reader Control arrangement (XON and XOFF).

Note: With ACF/VTAM V1 R2 or ACF/VTAM Version 2, supported via the Record Applications Program Interface and with the Network Terminal Option program product installed with ACF/NCP/VS R2. (OS/VS1 and OS/VS2 MVS only.)

3101 Display Terminal (mdls 10, 11, 12, 20, 21, 22) 110-1200 bps on switched or leased lines. The MTA facility, a feature for switched line devices, supports only 110 bps on NCP and 110 and 300 bps on ACF/NCP.

Note: With ACF/VTAM V1 R2 or ACF/VTAM Version 2, supported via the Record Applications Program Interface and with the Network Terminal Operation program product installed with ACF/NCP/VS R2. (OS/VS1 and OS/VS2 MVS only.)

TERMINALS SUPPORTED VIA VTAM RECORD API

Also refer to the START/STOP TERMINALS section, above, for selected Start/Stop terminals supported via the ACF/VTAM V1 R2 or ACF/VTAM Version 2 Record API. (OS/VS1 and OS/VS2 MVS only.)

3232 Keyboard Printer Terminal (mdl 1) on switched or leased lines for SDLC.

Support of a 3232 Keyboard Printer Terminal (mdl 11 attached via an 8100 Information System is provided by DPPX/Base using DPPX/DSC (Data Stream Compatibility).

3270 Information Display System. LOCAL, BSC and SDLC are supported through the Record API of VTAM. The 3270 Data Analysis - APL Feature (#1066) or the APL/Text feature (#1120) is required if APL or text characters are to be entered/displayed. This

feature is not available for all 3270 devices. See the appropriate pages for applicability.

Support of 3270 devices attached via a 3791 controller or 8100 Information System is provided by Version 1 Release 2 or later using DSC (Data Stream Compatibility).

Supported: Control Units:

3271 mdl 2 - Remote Cluster on leased line only.
3271 mdl 12 - Remote Cluster on leased line only. (Not supported: ASCII)
3272 mdl 2 - Local Cluster (Not supported: ASCII)
3274 mdl 1A, 21A, 31A (Version 1 Release 2 or later only)
3274 mdls 1B, 1C, 1D, 21B, 21C, 21D, 31C, 31D, 51C
3791 mdls 1C, 2A, 2B (Version 1 Release 2 or later only)
8100 Information System (Version 1 Release 2 or later only)

Displays:

3275 mdl 2 - Standalone Display Station on leased line only.
3275 mdl 12 - Standalone Display Station on leased line only (Not supported: ASCII)
3276 mdls 2, 3 or 4
3276 mdls 12, 13, 14 (Version 1 Release 2 or later only)
3277 mdl 2 - Display Station
3278 mdls 2, 3, 4, 5
3279 mdls 2A, 2B, 3A, 3B
8775 (Version 1 Release 2 or later only)
Notes: Extended Data Stream not supported. Prior to Version 2 Release 1, the above displays are supported in 1920 character mode only. In addition to supporting all of the models supported by the previous releases, Version 2 Release 1 supports the large screen models in large screen mode.

Printers:

3262 mdls 3, 13 (supported as a 3289 mdls 1, 2)
3268 mdl 2 printer 3284 mdls 2, 3
3286 mdl 2
3287 mdls 1, 1C, 2, 2C (Features #9660 and #3610 not supported; #9550 not supported prior to Version 2 Release 1)

Trans. Codes:

3288 mdl 2
3289 mdls 1 and 2
Note: Printers require a 1920 character or larger buffer

Char. Sets:

#9761 - EBCDIC
#9762 - ASCII
#9089 - EBCDIC
#9082 - EBCDIC
#9084 - ASCII Character Set (B) (3287 mdls 1 and 2)

Keyboards:

#9091 - ASCII Character Set (A)
#9092 - ASCII Character Set (B)
#4621 - 75-Key EBCDIC Typewriter
#4622 - 75-Key EBCDIC Data Entry
#4623 - 75-Key EBCDIC Data Entry
#4624 - 75-Key ASCII Typewriter
#4627 - 87-Key EBCDIC Typewriter
#4628 - 87-Key ASCII Typewriter
#4630 - 66-Key EBCDIC Typewriter
#4631 - 66-Key EBCDIC Data Entry
#4632 - 78-Key Operator Console
#4633 - 78-Key EBCDIC Typewriter
#4634 - 66-Key ASCII Typewriter
#4635 - 78-Key ASCII Typewriter
#4637 - 66-Key APL Typewriter
#4638 - 78-Key APL Typewriter
#4639 - 78-Key Text

3767 Communication Terminal (mdls 1,2,3) on switched or leased line for SDLC:

Supported: Keyboards:

#9381 - Correspondence and #9382 - Alternate EBCDIC Character Set or, #9383 - Alternate APL Character Set #9391 - EBCDIC and #9392 - Alternate Correspondence Character Set or, #9393 - Alternate APL Character Set #2950, #2955 - EBCDIC #1291 - APL Character Set

PROGRAM PRODUCTS

VSPC (cont'd)

Note: Alternate Character Sets require feature #1291 as a prerequisite.

3770 Data Communication System on switched or leased line:

Supported: Interactive mode only
 Models: 3771 mdls 1, 2, 3 - Communication Terminal
 3774 mdls P1, P2 - Communication Terminal (Required: #9141 Emulator)
 3775 mdl P1 - Communication Terminal (Required: #9141 Emulator)
 Trans. Codes: #1460 - SDLC/BSC
 #1470 - SDLC

5280 Distributed Data System on switched or leased lines. These devices are supported as selected 3270 control units and devices.

Supported as:
 Control Unit: 3274 mdl 1C - switched or leased line (SNA/SDLC)
 Display: 3277 mdl 2 - selected features only
 Printer: 3287 mdl 1 and 2 (SNA/SDLC)

System/34 on switched or nonswitched lines. These devices are supported as selected 3270 control units and devices.

Supported as:
 Control Unit: 3274-mdl 1C - SNA/SDLC
 Display: 3277 mdl 2 - selected features only
 Printer: 3288 mdl 2
 3287 mdl 2 (in 3288 mode)

System/36 on switched or nonswitched lines. These devices are supported as selected 3270 control units and devices.

Supported as:
 Control Unit: 3274-mdl 1C - SNA/SDLC
 Display: 3277 mdl 2 - selected features only
 Printer: 3288 mdl 2
 3287 mdl 2 (in 3288 mode)

SOFTWARE REQUIREMENTS

VSPC which is distributed in Assembler language, operates under OS/VS1 and OS/VS2 (MVS). OS/VS1 Release 5 or later, or OS/VS2 (MVS) Release 3.7 or later is required for VSPC Version 1 Release 2. OS/VS2 (MVS) Release 3.8 or later is required for VSPC Version 2 Release 1.

Under DOS/VS, VSPC requires VTAM, VSAM and SAM. POWER/VS is required for VSPC conversational remote job entry. NCP Release 4.1 or later is required for remote terminals.

Under OS/VS1 VSPC requires VTAM and VSAM. NCP is required for remote terminals.

Under OS/VS2 (MVS), VSPC requires VTAM Release 2.0, or ACF/VTAM Version 1 or ACF/VTAM Version 2. For remote terminals, NCP Release 5.0 or ACF/NCP/VS is required with either of the above levels of VTAM. The latest current level of VSAM Release 2 must be installed. VSPC under OS/VS2 (MVS) also requires JES2 or JES3, Supervisor 1 and Supervisor 2 selectable units. VSPC also operates with the MVS/System Extensions and MVS/System Product program products.

PROGRAM PRODUCTS

**MVS/XA DATA FACILITY PRODUCT
RELEASE 1
MVS/XA DFP (5665-284)**

PURPOSE

The MVS/XA Data Facility Product (MVS/XA DFP) program provides the MVS/Extended Architecture (MVS/XA) operating system environment with data management, device support, program library management, and utility functions for IBM processors operating in Extended Architecture mode. Previous to MVS/XA these functions were provided in OS/VS2 MVS Release 3.8 for S/370 users.

SPECIAL SALES INFORMATION

This support includes re-packaging the above functions together with the functional extensions that are available to OS/VS2 MVS Release 3.8 users via the following licensed programs:

- Data Facility Device Support Release 1 Modification Level 4 (DFDS) (5740-AM7).
- Sequential Access Method - Extended Release 1 (SAM-E) (5740-AM3).
- Data Facility Extended Function Release 1 (DFEF) (5740-XYQ).
- Offline IBM 3800 Utility program product (5748-UT2).
- Access Method Services Cryptographic Option (5740-AM8).

MVS/XA DFP Release 1.0 includes prerequisite maintenance and 3800 Enhancements.

RELEASE 1.0 HIGHLIGHTS

The Data Facility Product licensed program support provided for IBM 4381 Processors and 3081 Processors operating in Extended Architecture mode consists of the following:

- Support for 31-bit real storage addressing. Examples include:
 - Access methods, when acquiring buffer(s), indicate to storage management that the pages will not require real locations below 16 megabytes (when the pages are fixed in preparation for I/O operations).
 - Device error recovery procedures support the full range of real addresses.
- Support for 31-bit virtual storage addressing. Examples include:
 - Program fetch.
 - Loader.
 - Linkage editor.
 - IEBCOPY.
 - AMBLIST.
 - Checkpoint/restart.
 - TSO LINK/LOADGO prompter.
 - Virtual I/O.
 - Device error recovery procedures.
- Support of the new maximum number of Unit Control Blocks (UCBs) providing for up to 4,096 unique device addresses. The actual number of devices is dependent on the particular processor model and I/O configuration.
- Support of up to 256 channel paths with up to 8 paths per device, with the actual number of paths and paths per device dependent upon the particular configuration.

DFP Release 1.0, does not require any pre-requisite maintenance.

RELEASE 1.1 HIGHLIGHTS

MVS/XA DFP Release 1.1 provides support for the 3880 Storage Control mdl 11 and the 3880 Storage Control mdl 13, virtual storage constraint relief and the following functions.

- VSAM global resource serialization.
- Virtual I/O 31-bit virtual indirect addressing words.
- System generation has been modified to increase the number of 2840 Display Control mdl 2s which can be identified (4,095).
- Additional VSAM local shared resource (LSR) pools per address space.

DESCRIPTION

ADDRESSING and RESIDENCE MODE (AMODE/RMODE): The architecture for 31-bit virtual addressing introduces a new control bit in the program status word (PSW) to define the addressing mode of the executing instruction as 24- or 31-bit mode. When in 31-bit mode both instruction and data addresses are treated as 31-bit addresses. In 24-bit mode they are treated as 24-bit addresses and most operations are performed with 370 addressing architecture applied.

MVS/XA provides support for execution in either addressing mode and allows programs to switch from one mode to another during execution. The majority of MVS/370 programs can execute in 24-bit mode without change. New or modified programs can be written to take advantage of 31-bit addressing. The default mode of execution is 24-bit. MVS/370 is a generic term used in reference to the supported releases of OS/VS2 MVS operating with S/370 architecture.

To manage this dual environment, addressing mode (AMODE) and residence mode (RMODE) attributes are supported. AMODE is the attribute of the entry points into a load module that specifies the addressing mode that is expected by the entry point. RMODE is the attribute of a load module that specifies the residence mode when loaded into virtual storage for execution.

The Assembler H Version 2 licensed program marks output object modules with AMODE/RMODE attributes which the linkage editor available with DFP uses to mark load modules in the directory entry. See the Assembler H Version 2 pages (5668-962) for further information regarding the Assembler. The control program then ensures that the program is loaded in the correct addressing range, and is invoked in the appropriate addressing mode. The original AMODE/RMODE attributes are retained in the composite external symbol dictionary and will be utilized in the event the module is again link edited. The AMODE/RMODE attributes can be overridden at link edit time with new control statements or linkage editor input parameters.

PROGRAM DEVELOPMENT CONSIDERATIONS

24-bit Program Development Considerations: As stated earlier, the majority of MVS/370 programs continue to execute correctly utilizing upward compatible MVS/XA DFP interfaces. (See the "Compatibility" section below.) As long as AMODE-24 is selected or defaulted to (i.e., AMODE not specified), this level of compatibility applies to new and changed programs.

31-bit Program Development Considerations: New programs or changed programs expecting to execute in 31-bit addressing mode need to be aware of the following situations when calling MVS/XA DFP services:

- In all cases identified below, the user must ensure that only 24-bit virtual addresses are passed. Parameter lists, control blocks, buffers, and user exit routines must reside within the 24-bit addressing range.
- VSAM services have been modified to accept calls from 31-bit users. Users must be executing in 24-bit mode when directly calling the services of MVS/XA DFP access methods other than VSAM.
- When calling the MVS/XA DFP services via SVC, the system performs the necessary mode switching.

For Release 1.1, VSAM allows programs running in 31-bit mode to create and access buffers in virtual storage above 16 megabytes. VSAM user exits are also supported above 16 megabytes.

OPEN, CLOSE, BLDVRP, DLVRP, and the control block manipulation macros (CBMM) must have their parameter lists in virtual storage below 16 megabytes. Other VSAM macros (GET, PUT, etc.) can have their parameter list above 16 megabytes. The user needs to specify the intent to use 31-bit buffers in the access method control block (ACB) at OPEN time. The ACB is to be kept below 16 megabytes while the request parameter list (RPL) may be placed above 16 megabytes. The RPL and EXLST must be below 16 megabytes if referenced by the MODCB, GENCB, TESTCB or SHOWCB macros.

Note: MVS/XA DFP R1.1 uses the entire 4-byte address field. Programs that use an address field for other than addressing purposes (for example, flags in high order bits) may produce unexpected results.

PERFORMANCE and VIRTUAL STORAGE USAGE OBJECTIVE

It is IBM's objective that Data Facility Product will not show a significant change in performance or virtual storage usage when compared to an OS/VS2 MVS Release 3.8 environment with DFDS Release 1 Modification Level 4, DFEF Release 1, SAM-E, Offline IBM 3800 Utility and Access Method Services Cryptographic Option installed, providing load libraries have been prepared by the user to include optimum block size and relocation dictionary (RLD) record and relocation dictionary/control (RLD/CTL) record block counts in the program library members.

For information concerning overall MVS/XA performance, see MVS/System Product Version 2 (5665-291).

DATA MANAGEMENT

Data management controls operations associated with input/output devices, such as allocation of space on volumes, storing, naming, and cataloging data sets, and movement of data between real and auxiliary storage.

IMPROVED VTOC ACCESS via an INDEX to the VTOC: Indexed VTOCs are supported by DFP. The support is functionally equivalent to the support introduced to S/370 users with the Data Facility Device Support (DFDS) licensed program, and is available in MVS/370 Data Facility Product licensed program (5665-295).

The VTOC is composed of unblocked records with DASD keys and is accessed primarily in two ways: Via DADSM routines to perform global DASD space management functions such as allocating and scratching

MVS/XA Data Facility Product (cont'd)

data sets, and via EXCP and the sequential access method (SAM) for reading and writing DSCBs, or portions of the VTOC.

VTOC access is improved by using an index structure for the VTOC, and by providing a common VTOC access facility (CVAF) to support the index structure. This structure includes space maps which replace the Format 5 DSCBs of the OS/VS2 MVS VTOC and are used to manage VTOC and VTOC index space. Following are some key characteristics of volumes with a VTOC index:

- The VTOC index is optional on any DASD that is supported by MVS/XA. For additional information, see "Migration".
- Volumes with and without the VTOC index can coexist on the same system and are supported by the DADSM routines in a manner transparent to the user.
- The VTOC can still be accessed via EXCP and SAM, except that data identifying a volume's available space has been moved from the Format 5 DSCB to space maps in the index. Users are encouraged to use CVAF for all access to the VTOC on volumes both with and without the VTOC index. See "Indexed VTOC Compatibility".
- If CVAF detects an error in the index structure, CVAF marks the index as invalid, and existing DADSM routines restore the VTOC to non-indexed format so that the volume can be used while the index error is being analyzed. The user's programs will not be aware of the error, the volume continues to be available for use, and the operator is notified.
- The Device Support Facility, a Class 2 System Control Program, may be used:
 - To create a VTOC with or without an index when a volume is initialized.
 - To build an index over an existing volume's VTOC.
 - To rebuild the index as desired.
- To convert the VTOC to non-indexed for running on certain systems, see "Migration".

The VTOC index can be either RACF- or password-protected, in which case a user must be RACF-authorized or must supply a password if the index is to be scratched, renamed, or opened for output. The VTOC can be RACF-protected, in which case the user must be RACF-authorized to open the VTOC for output.

DADSM INSTALLATION EXITS: Optional pre- and post-processing installation exits are provided for the allocate, extend, scratch, partial release, and rename functions of DADSM. These exits allow an installation to reject, limit, audit, or simply monitor DADSM requests involving DASD space utilization.

INTEGRATED CATALOG FACILITY: The integrated catalog facility program included in MVS/XA DFP is a functional replacement for VSAM master catalogs, VSAM user catalogs, and OS control volumes. It was introduced to the OS/VS2 MVS Release 3.8 users with the Data Facility Extended Function licensed program, and is available in MVS/370 Data Facility licensed program (5665-295).

The integrated catalog facility defines two catalog data sets: The basic catalog structure data set and the VSAM volume data set. These data sets replace the VSAM or CVOL catalog data sets.

The basic catalog structure contains volume information for both VSAM and non-VSAM data sets. The basic catalog structure may be located on any volume and multiple basic catalog structure data sets may be defined on a single volume. A VSAM volume data set contains the data set characteristics for VSAM format data that resides on a given volume. There is one VSAM volume data set on each volume that contains VSAM format data controlled by the integrated catalog facility.

The integrated catalog facility program is designed to reduce the potential of damaging the catalog and limits the scope of damage in the event of system failure during catalog processing.

The integrated catalog facility program also validity checks critical data during catalog processing.

VSAM catalog ownership of volumes is eliminated for data sets cataloged by the integrated catalog facility. Data sets on any volume may be cataloged in any basic catalog structure and multiple basic catalog structure data sets may be defined on a single volume.

Users of the Resource Access Control Facility (RACF) are restricted from protecting identically-named VSAM data sets which are cataloged in separate basic catalog structures residing on the same volume.

Backup and Recovery Facilities: The catalog backup and recovery facilities allow the user to define simple and consistent recovery procedures. The integrated catalog facility supports catalog recovery without the RECOVERABLE attribute of VSAM catalogs. The attributes of a VSAM data set, including its physical location on direct access storage, are maintained in a VSAM volume data set on the same volume as the VSAM data set. This allows periodic EXPORTs of the basic catalog structure, and a subsequent IMPORT in the event of

failure of a basic catalog structure without concern for catalog and VSAM data set synchronization.

VSAM Space Management: All direct access storage space management for VSAM data sets cataloged by the integrated catalog facility is performed by the system direct access device space management (DADSM) function. Integrated catalog facility does not perform sub-allocation; hence, no data spaces are associated with an integrated catalog facility catalog and all VSAM data sets under its domain will appear as UNIQUE-like VSAM data sets. Functional equivalency to the VSAM catalog is maintained by removing the restrictions associated with the current UNIQUE data sets.

All integrated catalog facility catalog records are VSAM logical records. This allows a considerable savings in the amount of direct access storage space required. For most non-VSAM data sets, only 20 percent of the space required by the current VSAM catalog will be used by the integrated catalog facility.

System Catalog: Either the integrated catalog facility master catalog or the VSAM master catalog may be the system catalog. In addition to optionally containing pointers to integrated catalog facility and/or VSAM user catalogs, it may also contain pointers to OS control volume catalogs. JCL may be used to designate specific catalogs to be used for a job or job step.

A message at IPL time prompts the system operator for the name of an alternate system catalog, enabling the system to be IPLed in the event that the regular, or default, system catalog is unavailable.

ACCESS METHODS

LARGE REAL SUPPORT: MVS/XA DFP Release 1.0 support of large real storage allows the data buffers to be allocated at any location in the real storage installed on the processor (including locations whose real addresses are above the 24-bit addressing range). This support is designed to reduce contention for real storage locations in the 24-bit addressing range and will benefit those programs which require real storage in that range.

Any available real storage in the 31-bit addressing range is used to back virtual storage in either the 24-bit or 31-bit addressing ranges. When areas of virtual storage in the 24-bit addressing range are page fixed, they are normally page fixed in 24-bit addressable real storage. The new "LOC" parameter of GETMAIN may be used to indicate that an area in 24-bit addressable virtual storage may be backed by 31-bit addressable real storage when page fixed. For example,

```
GETMAIN...LOC=(BELOW,ANY)...
```

would result in virtual storage being obtained within the 24-bit virtual addressing range. The real storage backing the virtual storage may be anywhere within the 31-bit real addressing range (up to the capacity of the particular processor model), even when page fixed.

The following access methods, included in MVS/XA DFP Release 1.0, have implemented this support.

BDAM, BISAM, BPAM, QSAM, BSAM, VSAM, QISAM

VIRTUAL STORAGE ACCESS METHOD - VSAM: DFP VSAM is an access method designed to operate with direct access storage devices and to support both direct and sequential processing by means of either an index key (keyed accessing) or relative byte address (addressed accessing). (Relative byte address refers to the displacement of a stored record or control interval, from the beginning of the storage space allocated to the data set to which it belongs.)

Three types of data sets are provided:

1. Key-sequenced data sets, which are ordered by a key field in the data record.
2. Entry-sequenced data sets, which are ordered by the sequence in which the records were loaded.
3. Relative record data sets, which are ordered by record number.

Keyed accessing is used to access key-sequenced or relative record data sets, and addressed accessing is used to access both key-sequenced and entry-sequenced data sets. Key-sequenced and entry-sequenced data sets may be either fixed- or variable-length records; relative record data sets contain fixed-length records only.

VSAM is composed of two major elements: A data organization which minimizes data movement and which is suitable for data base applications; and routines for creating data sets in the VSAM organization, adding and deleting records, and performing other data management functions.

The data management functions supplied by VSAM include:

- Opening data sets.
- Processing records by index key.
- Processing records by address.
- Closing data sets.
- End of volume processing.
- Cataloging VSAM data sets.
- Data set password protection.

MVS/XA Data Facility Product (cont'd)

- Data set encryption/decryption.
- Allocating space.
- Checkpoint/restart processing.

In OS/VS2 MVS the channel command word (CCW) contains a 24-bit address. MVS/XA supports this CCW and calls it a format 0 channel command word (CCW or CCW0). MVS/XA introduces a new format 1 CCW (CCW1) that contains a 31-bit address. VSAM will utilize the Format 1 CCWs in its support of real main storage above the 16 megabyte line, and will provide new MVS/System Product Version 2 system management facilities (SMF) statistics.

Encryption/Decryption Support:

The access method services REPRO function gives the user the ability to encrypt and decrypt data using a software version of the National Bureau of Standards Data Encryption Standard (DES). This function was introduced to the OS/VS2 MVS user with the Access Method Services Cryptographic Option licensed program (5740-AM8).

All data sets supported for copying by REPRO (any VSAM or ISAM data set, or any other data set that can be accessed sequentially except VSAM and integrated catalog facility catalogs) are supported as input for enciphering via REPRO ENCPHER. The user can decrypt the sequential cipher text data set using REPRO DECIPHER.

This function of the REPRO command may use the services of the Programmed Cryptographic Facility (5740-XY5) licensed program to encipher/decipher the data by a program and provide facilities for controlling the cryptographic key.

Alternatively, this function of the REPRO command may use the services of the Cryptographic Unit Support (5740-XY6) licensed program to provide facilities for controlling the cryptographic key and provide an interface to the 3848 Cryptographic Unit to encipher/decipher the data.

Implicit VERIFY:

When VSAM OPEN detects a condition requiring a VERIFY, it will automatically initiate VERIFY processing, unless the user specifies otherwise. A warning message will be issued.

Activity Indicators:

The last-accessed date field and change data set indicators in the VTOC Format 1 data set control block (DSCB) are now maintained under control of a user exit for VSAM data sets cataloged by the integrated catalog facility.

VSAM Data Sharing Facilities:

The following VSAM data sharing facilities introduced by DFEF and available in MVS/370 DFP are supported to provide the VSAM application more control of shared data:

- Exclusive control feedback. When an exclusive control conflict occurs, the address of the RPL which owns the resource, and the RBA of the control interval will be returned to the user.
- A control block update facility is available to allow an application to perform cross-system and cross-region VSAM data sharing under share option 3.
- The OS/VS2 MVS restriction which prohibits control area splits under cross-region share option 4 has been eliminated. The restriction still applies to cross-system share option 4 data sets.
- VSAM supports facilities which allow the user to invalidate VSAM data and index buffers (MRKBFR) or to cause VSAM to write a modified buffer to DASD storage (WRTBFR).
- Extensions to the JRNAD exit allow the application to maintain control over data and index control intervals.

VSAM SRB/Cross-Memory Mode Processing:

In order to minimize the need for a VSAM application to switch execution modes, VSAM record management allows SRB and limited cross-memory mode processing. This support includes:

- An additional user processing exit (UPAD) for request resumption (POST) when the user is operating in SRB/cross-memory mode.
- The elimination of SVC calls where possible, and RPL codes to indicate to the VSAM application that the request must be reissued in TCB mode.

RELEASE 1.1 VSAM HIGHLIGHTS

The relocation of VSAM record management code to the extended pageable link pack area (EPLPA) provides virtual storage savings below 16 megabytes of approximately 158K bytes in the pageable link pack area (PLPA). VSAM I/O buffers may optionally reside in virtual storage above 16 megabytes. Programs running in 31-bit addressing mode may create and access these VSAM buffers. VSAM user exits are supported above 16 megabytes.

Up to 16 VSAM local shared resource (LSR) pools per address space may be specified, and the LSR pools may optionally reside in virtual storage above or below 16 megabytes.

VSAM Global Resource Serialization: VSAM has been enhanced for users of global resource serialization. Provisions are available which allow

cross-system sharing of VSAM data sets using a subset of the cross-region share option. This cross-system support provides:

1. Consistent RNAME for the enqueues issued by open, close, and end-of-volume, and
2. Enqueues to cross-system enqueues where appropriate.

SEQUENTIAL ACCESS METHODS: Data Facility Product uses the buffer scheduling introduced to OS/VS2 MVS with SAM-E for queued sequential access method (QSAM) processing. MVS/XA DFP, SAM-E and MVS/370 DFP use EXCPVR instead of EXCP for all basic sequential access method (BSAM) and QSAM direct access and virtual I/O operations, except basic direct access method (BDAM) WRITE/LOAD. In the exception case, the S/370 implementation is used. The buffer handling program modules made obsolete by this new implementation are not in DFP. For the OS/VS2 Release 3.8 user with SAM-E or MVS/370 DFP installed, these changes enable improved DASD data access performance by:

- Reducing channel program interpretation and translation.
- Reducing the frequency of fixing and freeing of pages.
- Reducing the path length for the SAM I/O operations per block.
- Decreasing DASD contention.
- Increasing the number of QSAM buffers transferred per I/O operation.

Under BSAM, data is sequentially organized and physical blocks of data are stored or retrieved. The READ/WRITE macro instruction causes the initiation of an input/output operation. The completion of these operations is tested by using synchronization macro instructions. Automatic translation between EBCDIC and ASCII codes is provided for magnetic tape labels and record formats.

Under QSAM, logical records are retrieved or stored as requested. The access method anticipates the need for records based on their sequential order, and normally transfers the desired records to virtual storage, ready for use, before the request for retrieval occurs. When writing data, the program normally will continue as if the record had been written immediately, although the access method routines may block it with other logical records and defer the actual writing until the output buffer has been filled. For direct access storage devices, the actual writing may be deferred until multiple buffers are filled. As with BSAM, automatic translation between EBCDIC and ASCII codes is provided for magnetic tape labels and record formats.

BASIC PARTITIONED ACCESS METHOD - BPAM: This access method, when used in conjunction with BSAM, is designed for efficient storage and retrieval of discrete sequences of data (members) belonging to the same data set on a direct access storage device. The data set includes a directory that relates the member name with the address where the sequence of data begins. Each member has a simple name. Members may be added to a partitioned data set as long as space is available in the directory and the data set. Other than directory manipulation, all I/O is performed by BSAM.

BASIC DIRECT ACCESS METHOD - BDAM: Under BDAM, records within a data set are organized on direct access volumes in any manner chosen by the programmer. Storage and retrieval of a record is by actual or relative address within the data set. This address can be that of the desired record or a starting point within the data set where a search for the record, based on a key furnished by the programmer, begins. Addresses are also used by BDAM as a starting point for searching for available space for new records.

INDEXED SEQUENTIAL ACCESS METHODS: Sequential and direct processing are provided by the indexed sequential access methods (ISAM). Records are maintained in control field sequence by key. A multilevel index structure is system maintained, allowing retrieval of any record by its key. Additions can be made to an existing ISAM data set without rewriting the data set.

The basic indexed sequential access method (BISAM) stores and retrieves records randomly from an indexed sequential data set. Selective reading is performed using the READ macro instruction, and specifying the key of the logical record to be retrieved. Individual records can be replaced or new records added randomly.

The queued indexed sequential access method (QISAM) is used to create an indexed sequential data set or to retrieve and update records sequentially from a data set. Synchronization of the program with the completion of input/output transfer and record blocking/deblocking are automatic. QISAM is also used to reorganize an existing data set.

VIRTUAL I/O: The system paging mechanism can be used to perform data set access. This is known as virtual I/O. It uses the system paging mechanism to transfer data set blocks between external page storage and real storage. The user can specify virtual I/O processing for system-named temporary data sets accessed through BDAM, BPAM, BSAM, QSAM, EXCP, and XDAP interfaces. Virtual I/O processing for system-named temporary data sets is established at system generation time.

MVS/XA Data Facility Product (cont'd)

Page-size (4K bytes) physical blocks are dynamically allocated in external page storage as a virtual I/O data set is created. These blocks are not necessarily contiguous and the virtual I/O data set may span several volumes of external page storage. The blocks are released when the data set is deleted and the space is immediately made available for other paging needs.

In Release 1.1, virtual I/O data set buffers which reside in virtual storage above 16 megabytes are supported via 31-bit virtual indirect data address words (IDAW). Virtual IDAW support applies to all CCWs currently supported by virtual I/O except:

- Transfer in channel.
- Control no-operation.
- Read and sense with skip flag on.

This support is equivalent to that provided by the EXCP processor.

Implementation of virtual I/O processing is compatible with the BDAM, BPAM, BSAM, QSAM, EXCP, and XDAP macro interfaces to a DASD data set. When a request is made for accessing a virtual I/O data set, the channel programs are intercepted and interpreted and the page table entries are manipulated if necessary, so that the desired data will be paged in or out of real storage as requested. For example, the control program reads a virtual I/O data set record into a virtual address space by modifying page table entries so that the 4K byte block(s) containing the record are identified as part of the virtual address space from which the request was made. Most SAM data access is performed without channel program construction or interpretation.

Restart processing currently available for temporary data sets is provided for virtual I/O data sets. Checkpoint and automatic step restart are provided for job failures. Checkpoint, and step and job restart are provided through the applicable Job Entry Subsystem and automatic step restart is provided for system restart processing.

Some of the advantages of virtual I/O are:

- Centralized direct access storage device management.
- Elimination of channel program translation and page fixing requirements.
- Use of the I/O balancing of the paging mechanism.
- Elimination of normal I/O device allocation and DADSM overhead for temporary data sets.
- Compatibility at the object code and JCL level.

Shared DASD: A pool of direct access storage devices may be shared by IBM processors in either 370 mode or Extended Architecture mode. Devices supported are 3330/3333, 3340, 3344, 3350, 3375, and 3380; two processors may share a pool of 2305 mdl 2 direct access storage devices. The catalog, user program libraries, and user data sets may be accessed by any processor. Advantages are: Reduced file maintenance, improved operational flexibility, and reduced disk space requirements.

VSAM user catalogs may be shared among OS/VS1, SVS, OS/VS2 MVS Release 3.8, MVS/370 DFP, or MVS/XA DFP. OS control volume catalogs may be shared among the above plus the OS/MFT and OS/MVT systems. While VSAM user catalogs may be shared, reference to specific entry types (e.g., GDG) created by OS/VS2 MVS Release 3.8, MVS/370 DFP, or MVS/XA DFP may be accessed only by those systems. The master catalog cannot be shared.

In an environment where an integrated catalog facility catalog is shared by multiple host systems, either the Data Facility Extended Function licensed program, MVS/370 Data Facility Product, or MVS/XA Data Facility Product must be installed on all systems that can access the shared catalog.

In an environment where an indexed VTOC is shared by multiple host systems, either the Data Facility Device Support licensed program, MVS/370 Data Facility Product or MVS/XA Data Facility Product must be installed on each system that can access the shared VTOC.

Program libraries and other system or user data sets may be shared on a read-only basis. The system does not automatically provide exclusive control of records, or prevent concurrent update or extensions to these data sets. Such data sets should be shared on a read-only basis until safeguards are instituted by each installation. Exclusive access for all other data sets can be controlled by using the RESERVE and DEQ macro instructions.

VSAM GLOBAL RESOURCE SERIALIZATION: In order for the changes in the VSAM components of MVS/XA DFP Release 1.1 to allow the sharing of data sets in a global resource serialization complex (ring), each system in the global resource serialization complex must contain the VSAM global resource serialization support.

If data sets are being shared by processors that are not in the same global resource serialization complex, or that do not have VSAM global resource serialization installed, the RESERVE/DEQ functions must be used by all application programs in all systems to ensure the integrity of the data set. Should a system drop out of the global resource

serialization complex and continue to access a VSAM data set which is in use, both the applications within the system in the global resource serialization complex and the application programs in the system(s) outside the global resource serialization complex must use RESERVE/DEQ.

All users must examine their current use of global resource serialization resource name lists (RNLs). If these lists have been used to convert RESERVEs to ENQs for catalogs, then the user must update these lists (i.e., the RESERVEs for catalogs must not be converted). These changes must be accomplished prior to using the MVS/XA DFP VSAM global resource serialization support. For specific details, see the *OS/VS2 MVS Planning for Global Resource Serialization (GC28-1062)*.

CHECKPOINT/RESTART: If a job step is terminated before successful completion, checkpoint/restart can make it possible to resume execution from the beginning of the step or from a place within the step. Either way, the restart can be made to occur automatically when the failure occurs.

The CHKPT macro instruction is coded in the user's program at a checkpoint to be taken. A checkpoint is the point at which information about the status of a job step is recorded so that the job step can be restarted later at that point if necessary.

Checkpoint/restart includes a checkpoint routine and several restart routines.

The checkpoint routine gathers and records on a checkpoint data set enough information about the status of the job step and its related control blocks to allow a restart from the place where the checkpoint is taken.

The restart routines can be invoked when a job step is resubmitted for restart, or they can be invoked automatically when a failure occurs. The functions performed by restart routines depend upon the type of restart requested.

If the restart is to be made from the beginning of a job step, for deferred restart only, the RESTART parameter of the JOB statement must contain the name of the step to be restarted, and routines of the initiating task simply bypass preceding steps and begin processing with the named step.

If a step is to be restarted from the beginning automatically, the RD parameter may be used; then restart processing begins during step termination. If RD is not used and the checkpoint DD statement is in the JOB, the job starts automatically at the last checkpoint taken. The step termination routine of job management invokes routines to verify that a restart can be performed and requests the operator to authorize the restart.

If a step is to be restarted from a place where a checkpoint was taken and the job is resubmitted, the RESTART parameter of the JOB statement must identify the step and checkpoint identifier and a SYSCHK DD statement must describe the checkpoint data set.

If a step is to be restarted automatically from a place where a checkpoint was taken, the step termination routine invokes routines to ensure that all data sets for the step are kept.

Checkpoint/restart supports 31-bit callers of it's services.

In MVS/System Product-JES2 Version 2 (5740-XC6) or MVS/System Product-JES3 Version 2 (5665-291), restarted jobs are processed by the job entry subsystem, JES, which returns them to its job execution queue for subsequent initiation based upon priority and resource availability.

SYSTEM SUPPORT PROGRAMS

LINKAGE EDITOR: The linkage editor available with DFP combines separately compiled or assembled object modules into one or more load modules in a format suitable for loading by the control program and for subsequent execution. It also combines previously edited load modules with each other or with object modules. The linkage editor available with DFP does not execute in overlay. This increases the virtual storage requirements by 32K bytes. The linkage editor will run in 24-bit mode.

Although linking or combining of program modules is its primary function, the linkage editor also:

- Supports the specification of 24- and 31-bit addressing modes and residency modes, which may be specified in source programs submitted to Assembler H Version 2, or the linkage editor JCL and control statements. Object and load modules which were acceptable to the OS/VS2 MVS linkage editor are also acceptable to the linkage editor available in DFP which assigns default values of 24 to AMODE/RMODE.
- Inserts relocation dictionary (RLD) record and relocation dictionary/control (RLD/CTL) record block counts into program library members.
- Provides CSECT ordering and page boundary alignment facilities to allow the user to improve paging characteristics of his programs.

PROGRAM PRODUCTS
MVS/XA Data Facility Product (cont'd)

- Incorporates modules from data sets other than those in its primary input, either automatically or upon request.
- Aids program modification by replacing and deleting control sections as directed by linkage editor control statements.
- Defines the storage requirements for the common control sections generated by the assembler and by FORTRAN compilers, and the static external areas generated by PL/I compilers.
- Provides processing options and logs diagnostic error messages.
- Maintains an audit trail of compilation, linkage editing dates, and levels and modifications on a CSECT basis within a load module via the identification record.
- Provides a service aid feature to allow for expansion of modules to provide maintenance space.
- Processes a control card and parameter permitting the user to supply his authorization level for the authorized program facility (APF).

PROGRAM FETCH: Modules that were placed in a load library by the linkage editor can be read into virtual storage throughout the 31-bit addressing range.

Program fetch modifications for MVS/XA DFP:

- Utilizes the RLD and RLD/CNTL block counts in the MVS/XA PDS directory entry to build channel programs.
- Program fetch evaluates RMODE program attributes, then reads the load module into storage within the 31-bit virtual addressing range or the 24-bit virtual addressing range as specified.
- Uses the new Format 1 CCW to read a module into virtual storage within the 31-bit addressing range
- Fetch is a part of the nucleus and runs in 31-bit address mode and resides anywhere in virtual storage.

LOADER: The MVS/XA DFP loader combines the basic editing and loading functions of the linkage editor and program fetch in one job step. It loads object modules provided by the compilers and load modules produced by the linkage editor directly into virtual storage throughout the 31-bit addressing range for program execution. The loader executes in 31-bit addressing mode and resides within the 24-bit addressing mode range.

SYSTEM UTILITIES

These programs are used to maintain system control data at an organizational or system level to operate in pageable storage. The following functions are performed by the system utility programs:

IEHPROGM: Modifies system control data and maintains data sets at an organization level, via scratch, rename, catalog data, etc. IEHPROGM supports the increased number of device addresses.

IEHMOVE: Moves or copies logical collections of data. IEHMOVE supports the increased number of UCBs.

IEHLIST: Lists system control data such as directory entries of partitioned data sets and VTOC entries. IEHLIST supports the increased number of UCBs and prints the 24- and 31-bit addressing mode and residency mode indicators in a partitioned data set directory. RLD counts for load modules are shown.

IEHINITT: Writes volume label sets in EBCDIC, BCD, or ASCII code on magnetic tapes.

IEHATLAS: Locates and assigns an alternate track to replace a defective track and copies usage records from the defective track to an alternate track.

IFHSTATR: Selects, formats, and writes information from Type 21 (error statistics by volume) SMF records. In MVS/XA DFP, IFHSTATR is run against the output of MVS/System Product's IFASMFDP or MVS/370 DFP.

Offline 3800: The offline 3800 Printing Subsystem mdl 1 user is provided with the same functional capability as is available to the online 3800 mdl 1 user. The program executes in an online MVS/XA environment to create control information and place it on magnetic tape. The magnetic tape can then be used to set up the 3800 mdl 1 for the printing of user data.

DATA SET UTILITIES

These programs reorganize, change, or compare data at the data set and/or record level, and are required for the proper generation and maintenance of MVS/XA. The following general functions are performed by these utilities for non-VSAM data sets:

IEBCOPY: Copies, compresses, merges, loads, reblocks load modules, inserts the count of relocation dictionary records and/or control records, and unloads partitioned data sets.

IEBGENER: Copies a sequential data set or members of a partitioned data set, or converts a data set from sequential to partitioned organization.

IEBPTPCH: Prints or punches records residing in a sequential or partitioned data set.

IEBUPDTE: Updates a symbolic library.

IEBEDIT: Produces an edited input job-stream data set from a master input job-stream data set.

IEBDG: Can create output data sets with either internally generated test data or externally supplied input. These data sets can be sequential, indexed sequential, or partitioned.

IEBCOMPR: Compares two identically organized sequential or partitioned data sets at the logical record level.

IEBISAM: Can copy, print, reorganize, load, or unload an indexed sequential data set.

IEBIMAGE: Provides means for the user to create or modify and to store in SYS1.IMAGELIB forms control buffer records, copy modification records, graphic character modification records, library character sets, and character arrangement tables. Input to the utility consists of simple control statements. Users can specify for FCB records, forms sizes, number of lines at each vertical spacing, and line positions for simulated channel control punches. For copy modification, control statements include the text and its position within each copy of the pages of a data set. Existing copy modification records can also be modified. Control statements for graphic character modification modules and library character sets provide means for combining and naming groups of graphic characters, including any characters already in SYS1.IMAGELIB, and to assist in storing in the system new graphic characters of the user's own design. Character arrangement tables can be created or modified to print using different character sets, to include graphic character modifications and library character sets, and to assign data codes to graphics or to change existing assignments.

INDEPENDENT UTILITY: The independent utility ICAPRTBL does not operate with the MVS/XA control program, but supports MVS/XA by performing stand-alone buffer loading for the 3211 or 3203 mdl 5 printer. ICAPRTBL will not operate in IBM processors operating in Extended Architecture mode.

SERVICE PROGRAM

The access method services multi-function service program is used with VSAM data sets for the following:

- Define a VSAM data set or catalog.
- Delete a VSAM data set or catalog.
- Define an integrated catalog facility catalog.
- Delete an integrated catalog facility catalog.
- Convert a sequential or an indexed sequential data set to VSAM format.
- List VSAM or integrated catalog facility catalog entries or records of a data set.
- Copy a data set for reorganization.
- Create a backup copy of a data set.
- Make a data set portable from one operating system to another.
- Define and delete aliases for catalog names and non-VSAM data set names.
- Support generation data groups (GDGs) in non-VSAM data sets.
- Define and format paging data sets.
- Convert OS (CVOL) catalog or VSAM catalog to an integrated catalog facility catalog.
- Move or copy a VSAM catalog or integrated catalog facility catalog.
- Create pointers in the master catalog to the OS control volume catalogs.
- Reorganize catalogs:
 - Move catalogs to different device types.
 - Merge two integrated catalog facility catalogs into a single integrated catalog facility catalog.
 - Split a single integrated catalog facility catalog into two or more integrated catalog facility catalogs.
- Validate the content, format, and consistency of the integrated catalog facility catalogs and data sets.

Access method services is also used to:

- List the counters and status of the 3880 Storage Control mdl 11 and mdl 13.
- Cause data to be read into cache of the 3880-13.

MVS/XA Data Facility Product (cont'd)

- Allow or inhibit caching for the 3880-13 or attached device.

It can be invoked through an input job stream containing an access method services command, by a processing program that passes it a command statement, or from a time-sharing terminal.

SERVICE AID

AMBLIST: This linkage editor service aid program produces various formatted listings which may be used for system serviceability and diagnostic purposes. Depending on options specified on AMBLIST control statements, the following listings may be produced:

- Formatted load module listings.
- Formatted object module listings.
- Maps of:
 - Modified link pack area (MLPA)
 - Extended modified link pack area (EMLPA)
 - Fixed link pack area (FLPA)
 - Extended fixed link pack area (EFLPA)
 - Pageable link pack area (PLPA)
 - Extended pageable link pack area (EPLPA)
- Map and cross-reference listings of the DAT-on nucleus.
- Listings of the data stored in the CSECT Identification records of load modules.
- Load module map and cross-reference listing showing addresses relocated relative to a user-supplied address.
- Load module summary data including entry point address, APF access code, module attributes, and the contents of the module's system status Index.
- Program modifications to a load module library.

The minimum virtual storage requirement for AMBLIST is 64K bytes. AMBLIST supports both 24- and 31-bit addressing and residency mode specifications by indicating so on output listings.

For Release 1.1, VSAM allows programs running in 31-bit mode to create and access buffers in virtual storage above 16 megabytes. VSAM user exits are also supported above 16 megabytes.

OPEN, CLOSE, BLDVRP, DLVRP, and the control block manipulation macros (CBMM) must have their parameter lists in virtual storage below 16 megabytes. Other VSAM macros (GET, PUT, etc.) can have their parameter list above 16 megabytes. The user needs to specify the intent to use 31-bit buffers in the access method control block (ACB) at OPEN time. The ACB is to be kept below 16 megabytes while the request parameter list (RPL) may be placed above 16 megabytes. The RPL and EXLST must be below 16 megabytes if referenced by the MODCB, GENCB, TESTCB, or SHOWCB macros.

Note: MVS/XA DFP Release 1.1 uses the entire 4-byte address field. Programs that use an address field for other than addressing purposes (for example, flags in high order bits) may produce unexpected results.

SYSTEM GENERATION

System generation is the process of preparing a specially tailored operating system to match the machine configuration and operating system options selected by the user. This process requires an operational system, either OS/VS2 MVS Release 3.8 or MVS/XA, and requires the program products specified in the "Specified Operating Environment".

MVS/XA DFP DEVICE SUPPORT CHART

I/O Unit Support: The following units, up to a maximum of 4096 devices, are supported by MVS/XA for the indicated function:

PROGRAM PRODUCTS

MVS/XA Data Facility Product (cont'd)

MVS/XA DFP DEVICE SUPPORT CHART

Input/Output Units	Input Job Stream	In/Out Work Queue	System Output	Primary SYSRES	Program Libraries	C	G	S	I,P,D,A
1403 Printer mdls 2,-7,-N1			X1			X2		X1	
2250-3 Display Station						X3	X		
2305-2 Fixed Head Storage (Notes 4, 5)	X	X7		X	X			X	X
2501 Card Reader	X					X2		X	
2540 Card Read Punch	X12		X11,12			X2		X	
3203-5 Printer			X			X2		X	
3211 Printer			X			X2		X	
3251 Display Station (Note 9)						X3	X		
3262-5			X			X2		X	
3277 Display Station	X					X2			
3278 (Supported as a 3277)	X					X2			
3279 Color Display Station	X					X2			
3284 Printer						X2			
3286 Printer						X2			
3330 Disk Storage (Notes 5, 8)	X	X		X	X			X	X
3333 Disk Storage and Control (Notes 5, 8)	X	X		X	X			X	X
3340 Direct Access Storage Facility (Notes 5, 6, 8)	X	X		X	X			X	X
3344 Direct Access Storage (Notes 5, 8)	X	X		X	X			X	X
3350 Direct Access Storage (Notes 5, 8, 18, 19)	X	X		X	X			X	X
3375 Direct Access Storage (Notes 5, 8)	X	X		X	X			X	X

3890 Document Processor								X13	

MVS/XA DFP Device Support: The MVS/XA DFP device support chart shows all devices supported by MVS/XA for systems functions and/or non-TP access methods. The chart shows for each device the relevant functions supported. For telecommunications devices see:

- ACF/VTAM Version 2 Release 1 licensed program (5665-280)
- ACF/TCAM Version 2 Release 4 licensed program (5735-RC3)
- BTAM/SP licensed program (5665-279)

Devices that are not shown in this chart have no specific programming support under MVS/XA and their existence is not recognized by the programs.

Notes:

1. The Selective Tape Listing feature is not supported.
2. A console must consist of a printer-keyboard, or a card reader and printer to simulate the actions of a printer-keyboard (composite console). See the pages for MVS/System Product-JES2 Version 2 (5740-XC6) or MVS/System Product-JES3 Version 2 (5665-291) licensed program for a further description of this support.
3. DIDOCS supported by MVS/System Product-JES2 Version 2 (5740-XC6) or MVS/System Product-JES3 Version 2 (5665-291) licensed program.
4. Multiple requesting supported.
5. File scan not supported.
6. Rotational position sensing support is an optional feature on 3340.
7. Not supported by MVS/System Product-JES3 Version 2 (5665-291) licensed program.
8. For message queues under TCAM, requires ACF/TCAM Version 2 Release 4 licensed program (5735-RC3).

9. Must be SYSGENed as 2250-3.
10. Supported for read or punch, but not simultaneously.
11. For use with the MVS/XA output writer; not for system messages.
12. Punch-feed-read feature is not supported.
13. QSAM (device-dependent only).
14. Support shown is for 3330s or 3333s as staging devices. If real 3330/3333s are included as part of 3851, see note 15.
15. With 3330/3333 as staging device, rotational position sensing is supported.
16. User program libraries only.
17. 3851 support will require Mass Storage Systems Extensions (5740-XYG) licensed program.
18. 3330 emulation is not supported when the 3350 is attached via the 3880 mdl 11.
19. The 3350 is required to utilize the 3880 mdl 11.
20. The 3380 is required to utilize the 3880 mdl 13.

Legend:

- C = Console
- G = Graphic programming support
- S = Sequential access method
- I = Indexed sequential access method
- P = Basic partitioned access method
- D = Basic direct access method
- A = Virtual storage access method
- X = Function supported

MVS/XA Data Facility Product (cont'd)

CUSTOMER RESPONSIBILITIES

MVS/XA DFP users of record will automatically receive distribution of Modification Level 1.

The user needs to order and install Device Support Facilities Release 6 (a Class 2 System Control Program) for MVS/XA (5665-257).

Users of either OS/VS2 MVS IEHDASDR or the Direct Access Storage Dump Restore licensed program must order and install Data Facility Data Set Services (DFDSS) (5740-UT3) or a functional equivalent to provide direct access storage device dump and restore functions. If the customer is planning to install DFDSS, it is recommended that this be done well before MVS/XA DFP is installed, in order to back up disk files to tape using the format acceptable to DFDSS for restoration.

Users that have DFDSS installed at the time of MVS/XA DFP installation must re-install, prior to execution in Extended Architecture mode, DFDSS Release 1.2 or later release or modification.

Additionally, current S/370 users and new installations must order and install MVS/XA Data Facility Product and one of the co-requisites: MVS/System Product-JES2 Version 2 (5740-XC6) or MVS/System Product-JES3 Version 2 (5665-291). The linkage editor available with DFP must be used during system generation and subsequent maintenance.

Assembler H Version 2 licensed program (5668-962) must be used to perform the assemblies required for system generation (SYSGEN) and subsequent maintenance of the MVS/XA operating system.

Users intending to use the access method services REPRO encryption/decryption function must order and install one of the following or a functional equivalent:

- Programmed Cryptographic Facility licensed program (5740-XY5).
- Cryptographic Unit Support licensed program (5740-XY6) and its pre-requisites.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

MVS/XA Data Facility Product is designed to operate on the IBM processors operating in Extended Architecture mode.

SOFTWARE REQUIREMENTS

MVS/XA Data Facility Product Release 1 requires OS/VS2 MVS Release 3.8 as an installation base, and the functions provided by either MVS/System Product-JES2 Version 2 Release 1.0 (5740-XC6) or MVS/System Product-JES3 Version 2 Release 1.0 (5665-291) for execution and their program distribution libraries for the assemblies required for system generation (SYSGEN).

MVS/XA DFP Release 1.1 requires MVS/XA DFP Release 1.0 and its prerequisites as an installation base, and the functions provided by either MVS/System Product - JES2 Version 2 Release 1 Modification Level 1 (5740-XC6) or MVS/System Product - JES3 Version 2 Release 1 Modification Level 1 (5665-291) and their prerequisites for the assemblies required for system generation.

Assembler H Version 2 licensed program (5668-962) performs the assemblies required for SYSGEN and subsequent maintenance of the MVS/XA operating system.

MVS/XA DFP may be installed via either the System Modification Program Extended (SMF/E) or System Modification Program Release 4.27.

Users of the access method services REPRO encryption/decryption function will require the functions provided by one of the following or a functional equivalent:

- Programmed Cryptographic Facility licensed program (5740-XY5)
- Cryptographic Unit Support licensed program (5740-XY6) and its pre-requisites

COMPATIBILITY

Upward Compatibility of User Programs: This refers to the capability of user programs that use published external interfaces, do not run authorized, and which execute with MVS/370 to perform the same function in the MVS/XA environment. Although this level of compatibility is true in most cases, the user should review this section in its entirety.

MVS/370 Data Facility Product: User programs that take advantage of the new devices and functions introduced by MVS/370 Data Facility Product will not operate with MVS/XA DFP.

Note: The reader may wish to review the "Compatibility" sections of the Program Product pages for the following licensed programs:

- MVS/System Product Version 2 (5665-291)
- ACF/VTAM Version 2 Release 1 (5665-280)
- ACF/TCAM Version 2 Release 4 (5735-RC3)
- BTAM/System Product (5665-279)

Indexed VTOC Compatibility: Both indexed and non-indexed VTOCs are supported by MVS/XA DFP. The support is functionally equivalent to the support introduced to S/370 users with the Data Facility Device Support (DFDS) licensed program. Programs that currently access the VTOC through documented DADSM interfaces will continue to operate without change on volumes with a VTOC index. Programs that access the VTOC via EXCP or SAM will continue to operate without change on volumes with a VTOC index with one exception: Programs that are dependent on the information in the Format 5 DSCB(s) must be modified to use the common VTOC access facility (CVAF) function to obtain the same information from the VTOC index.

MVS/XA Program Management Compatibility:

Linkage Editor: Object and load modules acceptable to the OS/VS2 MVS Release 3.8 or MVS/370 DFP linkage editor are also acceptable to the linkage editor available in MVS/XA DFP. The linkage editor available with MVS/XA DFP will require 32K more storage than was used by the OS/VS2 MVS Release 3.8 linkage editor.

Loader: Object modules acceptable as input to the OS/VS2 MVS or MVS/370 DFP loader are also acceptable to the loader available in MVS/XA DFP.

Checkpoint/Restart: User application programs that successfully take checkpoints on MVS/370 may do so on MVS/XA.

OS/VS2 MVS programs not available with MVS/XA: Four OS/VS MVS Release 3.8 programs will not be available in the MVS/XA environment upon the installation of MVS/XA DFP. The programs and suggested alternatives for specified functions are listed below:

IBCDASDI: Disk initialization functions are currently available in Device Support Facilities.

IBCDMPRS: The standalone disk *restore* functions are currently available in the Data Facility Data Set Services (DFDSS) licensed program. The stand-alone disk restore functions will not operate in IBM processors operating in Extended Architecture mode. The stand-alone disk *dump* functions are no longer available or supported in MVS/XA.

IEHDASDR:

- Disk initialization functions are currently available in Device Support Facilities.
- Dump/restore functions are currently available in DFDSS.

However, DFDSS does not support the dump format produced by IEHDASDR. S/370 users may order and install Data Facility Data Set Services to create backup tapes in an acceptable format. Dumps taken by DFDSS in an MVS/370 environment may be restored by DFDSS in an MVS/XA environment.

Analysis Program-1 (AP-1): The functions to aid in the analysis of DASD error situations are available in Device Support Facilities.

Note: The Direct Access Storage Dump Restore (5740-UT1) licensed program creates tape in two formats, neither of which is accepted by DFDSS. Any tape created by these two IBM programs that must be used to restore data, may be restored by the originating IBM programs operating in S/370 mode.

INSTALLATION CONSIDERATIONS

MVS/XA DFP Release 1.0 is based upon the DM, DS, ST, PM, and UT FMIDs provided with OS/VS2 MVS System Control Program Release 3.8 and of the five licensed programs whose functions have been incorporated in MVS/XA DFP Release 1.0. During installation, these FMIDs are replaced with a single FMID HDP1102. Since not all functions are replaced, the user should review the "Compatibility" section. The stated corequisite licensed program must also be installed prior to execution.

The installation of MVS/XA DFP Release 1.0 via System Modification Program Extended (SMP/E) or System Modification Program Release 4.27 requires a full system generation.

MVS/XA DFP Release 1.1 is an update to MVS/XA DFP Release 1.0.

An IOGEN will be required for:

- The attachment of the 3350 Direct Access Storage to the 3880 Storage Control mdl 11.
- Any change in the value specified in the PCU parameter of the system generation IO-DEVICE macro.

Following the installation of MVS/XA DFP and MVS/System Product Version 2, the user can no longer use the resulting MVS/XA libraries for building or maintaining a non-MVS/XA system.

The following programs support the MVS/XA environment and will enhance the usage of MVS/XA Data Facility Product:

Device Support Facilities Release 6 (5665-257), a Class 2 System Control Program, by providing such functions as direct access storage device initialization and indexed VTOC creation.

The Direct Access Storage Device Migration Aid licensed program (5668-002) provides assistance to the user in moving data from

PROGRAM PRODUCTS

MVS/XA Data Facility Product (cont'd)

other supported direct access storage devices to the IBM 3375 or the IBM 3380 Direct Access Storage device.

The MVS/XA Data Facility Product includes the functions in the following licensed programs and no attempt should be made to apply them to an MVS/XA system:

- Data Facility Device Support (DFDS) (5740-AM7)
- Sequential Access Method - Extended (SAM-E) (5740-AM3)
- Data Facility Extended Function (DFEF) (5740-XYQ)
- Offline IBM 3800 Utility program product (5748-UT2)
- Access Method Services Cryptographic Option (5740-AM8)

MIGRATION

Page data sets on existing 3350 Direct Access Storage volumes must be reformatted prior to attachment to the 3880 Storage Control mdl 11.

VSAM GLOBAL RESOURCE SERIALIZATION: In order for the changes in the VSAM component of MVS/XA DFP Release 1.1 to allow the sharing of data sets in a global resource serialization complex (ring), each system in the global resource serialization complex must contain the VSAM global resource serialization support.

If data sets are being shared by processors that are not in the same global resource serialization complex, or that do not have VSAM global resource serialization installed, the RESERVE/DEQ functions must be used by all application programs in all systems to ensure the integrity of the data set. Should a system drop out of the global resource serialization complex and continue to access a VSAM data set which is in use, both the applications within the system in the global resource serialization complex and the application programs in the system(s) outside of the global resource serialization complex must use RESERVE/DEQ.

All installations must examine their current use of global resource serialization resource name lists (RNLs). If these lists have been used to convert RESERVEs to ENQs for catalogs, then the installation must update these lists for the duration of the migration to VSAM and global resource serialization on all processors (i.e., the RESERVEs for catalogs must not be converted). These changes must be accomplished prior to using the MVS/XA DFP VSAM global resource serialization support. For specific details, see the *OS/VS2 Planning for Global Resource Serialization* (GC28-1062).

Indexed VTOC Migration: Coexistence with systems that do not support the VTOC index is a major feature of the VTOC index design.

- Any volume with or without a VTOC index that is currently usable on OS/VS2 MVS or OS/VS1 may be moved to the MVS/XA environment and used as-is.
- Device Support Facilities may be used to initialize a VTOC index on these volumes whenever desired, except on volumes whose VTOC does not begin on record 1 of a track (for example, a DOS 'stacked pack').
- A volume with a VTOC index can be moved to and from the following systems which do not support the VTOC index:
 - OS Release 21.8
 - OS/VS2 SVS
 - VSE Advanced Functions
 - OS/VS1, without DFDS (5740-AM6) installed.
 - OS/VS2 MVS, without either MVS/370 DFP (5665-295) or DFDS (5740-AM7) installed.

In general, if the VTOC is modified on any of these systems, the VTOC index will be invalidated and the VTOC converted to the non-indexed format either via existing facilities on these systems or upon return to a system that supports the VTOC index. The user must then re-initialize the index with Device Support Facilities.

- Volumes with the VTOC index that must be used on systems other than those listed above should be converted to the non-indexed VTOC format via Device Support Facilities prior to use on the other system.
- The VTOC index is designed for easy user migration. User job streams, including JCL and IEHPRGM control statements, are fully compatible with indexed and non-indexed volumes. EXCP programs that are converted to use CVAF will operate on both types of volumes. Thus, the installation may gradually convert volumes to the indexed format.

INTEGRATED CATALOG FACILITY MIGRATION: The MVS/XA DFP integrated catalog facility program and catalog may be used to replace and will coexist with all currently available catalog functions and facilities. Access method services CVNTCAT function will convert an existing VSAM user catalog or OS (CVOL) catalog to an integrated catalog facility catalog. Individual catalogs may be converted without requiring the conversion of any other catalog. DFEF users that have previously converted, or are in the process of converting, to integrated catalog facility catalogs will not need to repeat that conversion when migrating to DFP.

The MVS/XA Data Facility Program Directory contains information to enable the user to modify the contents of the PLPA following migration to the integrated catalog facility catalogs for the purpose of removal of modules no longer required to support current VSAM catalogs. Users who have previously removed these modules should consider doing so again on completion of the installation of MVS/XA DFP and any subsequent system generation. The application of maintenance may also reinstall these modules resulting in additional removal decisions. The user should also take into account that additional virtual storage constraint relief has been provided through extended pageable link pack area residence of VSAM record management in MVS/XA DFP and such relief as is provided by one or the other of the corequisites: MVS/System Product - JES2 Version 2 (5740-XC6) or MVS/System Product - JES3 Version 2 (5665-291).

DATA SECURITY, AUDITABILITY and CONTROL

The Resource Access Control Facility (RACF) program product (5740-XXH) Release 4 and Release 5 will execute in an MVS/XA environment, providing security and protection of data resources for those installations requiring it.

MVS/XA DFP provides:

- For non-VSAM data sets to be protected against unauthorized access or alteration via the password parameter on the DD statement.
- For VSAM data sets, passwords that may be defined to control access to the data set, limit alteration of the data set, or limit access to the integrated catalog facility catalog of VSAM catalog.

For transportation or storage of data, security is implemented by encrypting the data, using the facilities of the access method services REPRO encryption/decryption function, and either the Cryptographic Unit Support program product or the Programmed Cryptographic Facility program product.

User management is responsible for the selection, adequacy, and implementation of these features, and the appropriate application and administrative control.

RPO's ACCEPTED: No

MVS/XA SYSTEM INTEGRITY APPLIES: Yes

PRODUCT CLASSIFICATION

This product contains restricted availability material. On receipt of the product material marked "Restricted Materials IBM", it must be kept in accordance with the Terms and Conditions outlined in either the supplement to the *Agreement for IBM Licensed Programs* (Z125-3359) of the *Agreement for IBM Licensed Programs* (Z125-3358).

PROGRAM PRODUCTS

TSO EXTENSIONS (TSO/E)

RELEASE 1

MVS/370 (5665-285)

MVS/XA (5665-293)

PURPOSE

The TSO Extensions (TSO/E) Licensed Program incorporates all the functions of the TSO Command Package (5740-XT6) and in addition provides the TSO user with new function, improved usability, and performance improvements. It will benefit centralized as well as distributed interactive systems. Non-DP professional end users as well as programming professionals will benefit from use of the TSO/E program product. This product is intended to complement full screen System Productivity Facility (SPF) environments as well as enhancing line command terminal environments. The TSO/E Licensed Program is designed to operate in either an MVS/370 or MVS/XA environment. The TSO/E, for MVS/XA systems (5665-293), provides the TEST command function in the MVS/XA environment. It therefore is required if TEST is to be used on an MVS/XA system.

HIGHLIGHTS of ENHANCEMENTS AVAILABLE in an MVS/370 or MVS/XA ENVIRONMENT

NEW FUNCTION

- A new function, the Interactive Data Transmission Facility, provides the capability to establish and operate a transmission facility for programs and data between any two processing centers on a network.

Applications such as an online, user-to-user message facility and distributed data processing may be developed and supported using the Interactive Data Transmission Facility.

PERFORMANCE

- Reductions have been made in the number of I/O operations required to process the data set which contains user mail and notices. These reductions give significant savings in the LISTBC path length which itself is a significant portion of the LOGON path length.
- The normal process of EDITing a model data set before submitting it has been eliminated by extending the function of SUBMIT, thus improving performance of SUBMIT in a commonly used environment.

USABILITY

- A full screen LOGON panel is provided which simplifies LOGON. It eliminates the terminal user's need to know command syntax and provides default operands (saved from the previous session) and also provides online help information for each entry field. The user can also specify the first command to be executed after LOGON, which may also be saved from session to session.
- The use of the ALLOCATE command has been simplified by providing the capability to create a data set modeled on the attributes of an existing data set.
- The SUBMIT command has been enhanced to allow more flexibility in the job stream source.
- The "???" PROMPT HELP facility provides additional, more descriptive information for command operands than is available today. In addition, productivity is improved by eliminating the need to re-key information entered prior to the request for help.

The following is a summary of functions in the TSO/E that were in the TSO Command Package:

- Execution of TSO commands and subcommands in the background:

The Terminal Monitor Program (TMP) allows command execution in the background. The commands are executable if submitted from a terminal, or through a batch, internal, or remote reader facility of the Job Entry Subsystem (JES).
- TSO Command Accounting allows an installation to keep track of individual TSO commands entered during a TSO session.
- Recoverability of workfiles (utility data sets):

The EDIT Command Processor allows a user to recover a modified workfile if a system, line, or edit failure occurs.

The CKPOINT subcommand of EDIT is available to eliminate the need for a user to execute SAVE to prevent loss of data. This subcommand is used in conjunction with the EDIT recovery feature.
- The SUBMIT command supports the RACF USER and PASSWORD keyword operands for the generated job statement.
- The ATTRIB and FREE commands are executable as subcommands of EDIT.
- The DOWN subcommand of EDIT has an abbreviation of D.
- The FREE command and subcommand of EDIT provides the ALL keyword for freeing all dynamically allocated data sets.

- The PROFILE command supports keywords which allow the user to decide whether the EDIT recovery option is to be used.
- The ACCOUNT command has keywords which indicate the installation's decision to allow a particular user the ability to use the EDIT recovery option.
- The maximum length of the DEST keyword of ALLOCATE, FREE, and OUTPUT is eight characters, making it compatible with the job control language (JCL).
- MSGCLASS, JOBCLASS, SYSOUT, and HOLD MSGCLASS defaults can be supplied in the user's UADS entry.

DESCRIPTION

ENHANCEMENTS AVAILABLE IN AN MVS/370 or MVS/XA ENVIRONMENT:

Interactive Data Transmission Facility: Two new commands, TRANSMIT and RECEIVE, simplify the process of sending data among nodes in a network. Previously, one could send data as in-stream data in a job, but the process required an in-depth knowledge of JCL and of accounting conventions at the receiving location and any intermediate locations. Now, one need know only the name of the receiving node and the userid of the person to whom one is sending the data.

The Interactive Data Transmission Facility "TRANSMIT" and "RECEIVE" commands may be used in conjunction with the VM/System Product Release 2 SEND FILE and RECEIVE commands. With these two products installed you may exchange data in a compatible format between MVS/TSO and VM systems. For additional information see the VM/System Product Release 2 Licensed Program Announcement.

A typical transmission sequence follows: When a sender enters the TRANSMIT command, TSO gets the data to be sent, converts the data to transmittable format, and writes the data to a SYSOUT file. The data is then routed to the receiving location by JES. When the data arrives at the destination node, a message is sent to the receiving userid via the SEND command announcing the availability of transmitted data. When the receiver issues the RECEIVE command, a message indicates a data set has arrived and the receiver is given the data set name, the name of the sender and the name of the sending node. The receiver is then prompted for a data set name for the data. TSO restores the data to original format and places it in the named data set.

If the AMS Cryptographic Option (5740-AM8) is installed on an MVS/370 system (or DFP on an MVS/XA system) and encryption requested, TSO will use the AMS REPRO command to encrypt data sets before transmitting them. Private key management or system key management may be selected. With private key management, both the sender and receiver must enter an encryption key. With system key management, AMS will select a key and encypher the data.

"Nicknames" can be substituted for node-userid identifiers and thereby simplify what must be entered in order to transmit data. A *names data set* is first built. TSO will use it to translate "nicknames" into node names and userids. The following may be placed in the *names data set*:

- Text to be inserted at the beginning or end of data being transmitted.
- Filename for alternative names data set.
- Log data set name (for information about transmission activity).

A number of user exits will give installation management a means of monitoring transmission activity or altering the way TSO performs some operations. Information from the PARM keyword of the TRANSMIT and RECEIVE commands is passed to all exit routines of the TRANSMIT and RECEIVE command processor routines.

- For *authorization checking*, there are two exits (a transmit startup exit and a receive data set preprocessing exit) for controlling who can transmit and/or receive data, and who can use a particular network path. Also, with the receive exit, the installation can identify persons who are to receive messages not directed to their own userids. The RACF authorization checking macro, RACHECK, could be used for these functions.
- For *unsupported data set types*, the two exits mentioned above can be used in combination with a third, the receive data set post-processing exit. Supported data set types are format F (fixed), V (variable) and U (undefined) length, in sequential or partitioned data sets. Unsupported data set types are ISAM and VSAM data sets, or data sets with user labels or keys. (VSAM data can be unloaded by standard AMS facilities and transmitted in unloaded format).
- For *accounting*, a transmit termination exit is supplied to be used with the receive data set post-processing exit. At each of these, information is available about volume and direction of data traffic.

TSO Extensions R1 (cont'd)

- For encryption and decryption, exits are available to provide local support for the encryption process.

The TRANSMIT and RECEIVE commands require APF authorization to perform their intended functions.

FULL SCREEN LOGON: This new capability, for 3270 terminal users, provides a LOGON panel with a menu of all the LOGON variables. If the userid matches one in the user attribute data set, attributes from the last session will be displayed and the user will be prompted for a password. The user may obtain help for any variable by entering a "?" by the appropriate variable or for all the variables by depressing a Program Function Key. During LOGON if a syntax error is made the following will happen:

- An audible alarm will sound (if terminal is equipped with one).
- An asterisk will appear next to incorrect entries and they will be highlighted.
- A message will appear on the menu.
- The cursor will move to the first incorrect entry.

In addition, the user may specify the next command to be executed after the LOGON process. For example, if the user normally executes SPF and this was specified, SPF will be the next command executed. (Note that this command will be executed after any command entered in the PARM field on the EXEC card of the LOGON procedure.) As with all other LOGON attributes, this field will be initialized to the value specified in the last session.

ALLOCATE COMMAND ENHANCEMENT: The ALLOCATE command processor will allow the creation of a new data set based on the attributes of an existing model data set. This function will be implemented using the LIKE(dsn) keyword.

The keyword operands of the ATTRIB command can now be specified with the ALLOCATE command so that:

1. Command language users will no longer have to issue the ATTRIB command to specify DCB operands. This allows the user to allocate a data set by using a single TSO command.
2. Command language users will be able to override any attribute of an existing data set specified on the LIKE Keyword.

The ALLOCATE command is extended to provide for the RACF protection of DASD data sets and tape volumes. When a RACF-defined user is allocating a permanent tape data set on a private volume as the first file on the first volume in a volume sequence, that tape volume can be RACF-protected by using the new PROTECT keyword operand on ALLOCATE. Since ADSP (Automatic Data Set Protection) is not supported for tape, the user today must issue a separate RACF command to protect the tape volume. Furthermore, when the RACF user does not have the ADSP attribute, a separate RACF command must be issued to protect DASD data sets. With this new PROTECT operand, the tape volume or DASD data set will automatically be protected at the time the specified data set is OPENed for OUTPUT.

New keyword operands will be provided on the ALLOCATE command in support of allocation of SYSOUT data sets.

The limit of concatenating up to 16 partitioned data sets will be increased to 255, the same as for sequential data sets.

SUBMIT COMMAND ENHANCEMENT: SUBMIT * is an enhancement to the SUBMIT command processor that provides a significant performance improvement when the input job stream is to be entered from a terminal or is contained in a command list (i.e., CLIST).

This function is more efficient than the previous function available via the SUBMIT command processor, since the requirement to EDIT a skeleton or model data set prior to submitting a job is eliminated. Installations may now incorporate the JCL within the CLIST and issue the SUBMIT * command.

The other card functions of this command are unchanged.

The existing SUBMIT * function of EDIT will continue to select the current EDIT data set as the input job stream.

PROMPT HELP ENHANCEMENT: This enhancement provides assistance when requested by the terminal user.

When prompting is being done for most command operands any information in the SYS1.HELP data set pertinent to the operand will be displayed when the user enters a "?". Refer to the *General Information Manual* (GC28-1061) for more specific information. This capability now also makes it possible for an installation to more easily tailor the information about an operand without modifying command processors.

Previously, in order to obtain help a user might have terminated the command, obtained the HELP information, and re-entered the command. "? PROMPT HELP" improves productivity by eliminating the need to terminate the command (before obtaining help) and to re-key previously entered information.

LISTBC/SEND COMMAND ENHANCEMENTS:

- **LISTBC I/O Reduction**
This enhancement significantly reduces the number of I/O operations required to process a LISTBC mail request. LISTBC now performs a direct read of the user's mail directory record rather than requiring a sequential directory search.
- **SEND I/O Reduction**
A new algorithm has been implemented which significantly reduces search time to locate a free record within the BRODCAST data set when the SEND command is invoked.
This enhancement will reduce the channel, control unit, and device busy time by keeping a pointer in SYS1.BRODCAST which either points to the first free record or points to some record before the first free record. This pointer will be used to determine where the sequential search should begin.
Whenever SEND uses a free record it will increment the pointer to point to the next record which may or may not be a free record. Whenever LISTBC creates a new free record which is the first free record in SYS1.BRODCAST, it will update the pointer to point to this new free record.

ENHANCEMENTS AVAILABLE ONLY WITH TSO EXTENSIONS FOR MVS/XA (5665-293)

TSO TEST SUPPORT

- Support for testing a program above 16 megabytes (M): Programs to be tested may reside above 16M and use virtual storage above 16M.
Through the use of TEST subcommands, the user can:
 - Obtain additional virtual storage above 16M.
 - Change the addressing mode of the program being tested.
 - List and alter virtual storage above 16M.
- Cross Memory environments. LIST subcommand will support all Cross Memory op codes. AT subcommand supports most Cross Memory op codes. At an ABEND, information will be displayed which specifies Address Space IDs (this will also occur for TSO programs not under TEST).
- A selected group of TSO commands can now be executed as subcommands of TSO TEST.
- Testing of programs that invoke other user programs has been simplified.

TSO SERVICES: Several important service routines (listed below) have been modified to enable them to process data in virtual storage above 16M whenever they are invoked by programs executing in 31-bit addressing mode. Several other important TSO service routines can be invoked in 31-bit addressing mode even though their input must be below 16M. In addition, the number of messages displayed at the operator's console has been reduced by eliminating the monitoring of the TSO Operator Command at the operators console. Only hard copy will be produced.

The following TSO service routines have been modified to enable them to be invoked by programs executing in 31-bit addressing mode:

- These service routines will process data above 16M:
 - PARSE
 - TSO message issuer
 - DAIRFAIL
 - GNRLFAIL
- These service routines will process only data in virtual storage below 16M:
 - PUTGET
 - PUTLINE
 - GETLINE
 - STACK

Refer to the *OS/VS2 MVS TSO Extensions General Information Manual* for additional detail on enhancements to TSO TEST and services.

SPECIFIED OPERATING ENVIRONMENT - MVS/370

HARDWARE REQUIREMENTS

The TSO Extensions Licensed Program (5665-285) operates on:

- Any IBM processor that is supported by OS/VS2 (MVS) Release 3.8 with the MVS/System Product Version 1.

PROGRAM PRODUCTS

TSO Extensions R1 (cont'd)

- Any terminal currently supported by MVS TSO. In addition, the new Full Screen LOGON and the Interactive Data Transmission Facility supports the following:

- 3270 Information Display System Terminals
 - 3275 mdls 2, 12
 - 3276 mdls 2, 3, 4, 12, 13, 14
 - 3277 mdl 2
 - 3278 mdls 2, 3, 4, 5
 - 3279 mdls 2A, 2B, 3A, 3B (base color mode)

The screen sizes supported are:

- 24 rows by 80 columns - mdls 2, 2A, 2B, and 12
- 32 rows by 80 columns - mdls 3, 3A, 3B, and 13
- 43 rows by 80 columns - mdls 4 and 14
- 27 rows by 132 columns - mdl 5

- 8275 Display Terminals, mdls 11 and 12

STORAGE CONSIDERATIONS - MVS/370:

The approximate increase in virtual storage requirements are:

Pageable Link Pack Area: 55K bytes.

Private Area: The new TRANSMIT and RECEIVE commands can be used within a TSO user region size of 128K bytes. The virtual storage requirement for the new SUBMIT * function depends upon the size of the job stream being submitted. The other functions of this product will result in a small increase in virtual storage requirements and also can be used within a TSO user region size of 128K bytes.

The approximate space requirement increases for system libraries (based on an IBM 3330 Disk Storage with a track size of 13,030 bytes) are:

Library	Bytes	Tracks
SYS1.COMDLIB	75K	6
SYS1.MACLIB	10K	1
SYS1.HELP	400K	30
SYS1.LINKLIB	70K	6
SYS1.LPALIB	60K	5
SYS1.UADS	160 per user	1 per 80 users

SOFTWARE REQUIREMENTS

The TSO Extensions Licensed Program (5665-285) is designed to execute with OS/VS2 (MVS) Release 3.8 with the MVS/System Product Version 1. The Interactive Data Transmission Facility function requires that the appropriate level of SP-JES2 or SP-JES3 be installed: For the JES2 environment the MVS/System Product - JES2 Release 3 and for the JES3 environment the MVS/System Product - JES3 Release 3.1. If the Interactive Data Transmission Facility is to be used to send or receive data from a VM System, the MVS/System Product - Release 3.1 is required.

SPECIFIED OPERATING ENVIRONMENT - MVS/XA

HARDWARE REQUIREMENTS

The TSO Extensions Program for the MVS/XA environment is designed to operate on:

- Any IBM processor that is supported by MVS/System Product Version 2
- Any terminal currently supported by MVS TSO. In addition, the new Full Screen LOGON and the Interactive Data Transmission Facility supports the following:

- 3270 Information Display System Terminals
 - 3275 mdls 2, 12
 - 3276 mdls 2, 3, 4, 12, 13, 14
 - 3277 mdl 2
 - 3278 mdls 2, 3, 4, 5
 - 3279 mdls 2A, 2B, 3A, 3B (base color mode)

The screen sizes supported are:

- 24 rows by 80 columns - mdls 2, 2A, 2B, and 12
- 32 rows by 80 columns - mdls 3, 3A, 3B, and 13
- 43 rows by 80 columns - mdls 4 and 14
- 27 rows by 132 columns - mdl 5

- 8275 Display Terminals, mdls 11 and 12

STORAGE CONSIDERATIONS - MVS/XA:

The approximate increase in virtual storage requirements are:

Pageable Link Pack Area: 75K bytes

Private Area: The new TRANSMIT and RECEIVE commands can be used within a TSO user region size of 128K bytes. The virtual storage requirement for the new SUBMIT * function depends upon the size of the jobstream being submitted. The virtual storage requirements for the TEST command depend upon the characteristics of the program being tested. For example, a TSO user region size of 128K may be sufficient

to TEST a simple program that does not itself use large amounts of virtual storage. The other functions of this product will result in a small increase in virtual storage requirements and also can be used within a TSO user region size of 128K bytes. The approximate space requirement increases for system libraries (based on an IBM 3330 Disk Storage with a track size of 13,030 bytes) are:

Library	Bytes	Tracks
SYS1.COMDLIB	175K	14
SYS1.MACLIB	10K	1
SYS1.HELP	570K	44
SYS1.LINKLIB	70K	6
SYS1.LPALIB	80K	7
SYS1.UADS	160 per user	1 per 80 users

SOFTWARE REQUIREMENTS

The TSO Extensions Licensed Program (5665-293) is designed to execute with the MVS/System Product Version 2. It is not installable on MVS/System Product Version 1.

DOCUMENTATION

(available from Mechanicsburg)

TSO Extensions General Information Manual (GC28-1061).

MVS SYSTEM INTEGRITY APPLIES: Yes

RPOs ACCEPTED: No

**TSO EXTENSIONS (TSO/E)
RELEASE 2
MVS/370 or MVS/XA
5665-285**

PURPOSE

The TSO Extensions (TSO/E) Release 1 licensed program incorporates all the functions of the TSO Command Package (5740-XT6) and in addition provides the TSO user with new function, improved usability, and performance improvements. It will benefit centralized as well as distributed interactive systems. Non-DP professional end users as well as programming professionals will benefit from use of the TSO/E program product. This product is intended to complement full screen System Productivity Facility (SPF) environments as well as enhancing line command terminal environments. The TSO/E licensed program is designed to operate in either an MVS/370 or MVS/XA environment. The desired operating environment is selected by ordering the appropriate feature. The TSO/E feature for MVS/XA systems provides the TEST command function in the MVS/XA environment. It therefore is required if TEST is to be used on an MVS/XA system.

TSO/E Release 2 replaces TSO/E Release 1, incorporating all Release 1 function and performance improvements. TSO/E Release 2 extends the information center concept to the MVS/TSO environment through a new TSO/E Information Center Facility. Significant new performance and functional capabilities are also part of this release. Additionally, the Session Manager program product (5740-XE2) is integrated into TSO/E Release 2 with new device support and ease-of-use features.

HIGHLIGHTS of ENHANCEMENTS AVAILABLE in an MVS/370 or MVS/XA ENVIRONMENT - TSO/E RELEASE 1

NEW FUNCTION

- A new function, the Interactive Data Transmission Facility, provides the capability to establish and operate a transmission facility for programs and data between any two processing centers on a network.

Applications such as an online, user-to-user message facility and distributed data processing may be developed and supported using the Interactive Data Transmission Facility.

PERFORMANCE

- Reductions have been made in the number of I/O operations required to process the data set which contains user mail and notices. These reductions give significant savings in the LISTBC path length which itself is a significant portion of the LOGON path length.
- The normal process of EDITing a model data set before submitting it has been eliminated by extending the function of SUBMIT, thus improving performance of SUBMIT in a commonly used environment.

USABILITY

- A full screen LOGON panel is provided which simplifies LOGON. It eliminates the terminal user's need to know command syntax and provides default operands (saved from the previous session) and also provides online help information for each entry field. The user can also specify the first command to be executed after LOGON, which may also be saved from session to session.
- The use of the ALLOCATE command has been simplified by providing the capability to create a data set modeled on the attributes of an existing data set.
- The SUBMIT command has been enhanced to allow more flexibility in the job stream source.
- The '?' PROMPT HELP facility provides additional, more descriptive information for command operands than is available today. In addition, productivity is improved by eliminating the need to re-key information entered prior to the request for help.

The following is a summary of functions in TSO/E that were in the TSO Command Package:

- Execution of TSO commands and subcommands in the background:

The Terminal Monitor Program (TMP) allows command execution in the background. The commands are executable if submitted from a terminal, or through a batch, internal, or remote reader facility of the Job Entry Subsystem (JES).

- TSO Command Accounting allows an installation to keep track of individual TSO commands entered during a TSO session.

- Recoverability of workfiles (utility data sets):

The EDIT Command Processor allows a user to recover a modified workfile if a system, line, or edit failure occurs.

The CKPOINT subcommand of EDIT is available to eliminate the need for a user to execute SAVE to prevent loss of data. This subcommand is used in conjunction with the EDIT recovery feature.

- The SUBMIT command supports the RACF USER and PASSWORD keyword operands for the generated job statement.
- The ATTRIB and FREE commands are executable as subcommands of EDIT.
- The DOWN subcommand of EDIT has an abbreviation of D.
- The FREE command and subcommand of EDIT provides the ALL keyword for freeing all dynamically allocated data sets.
- The PROFILE command supports keywords which allow the user to decide whether the EDIT recovery option is to be used.
- The ACCOUNT command has keywords which indicate the installation's decision to allow a particular user the ability to use the EDIT recovery option.
- The maximum length of the DEST keyword of ALLOCATE, FREE, and OUTPUT is eight characters, making it compatible with the job control language (JCL).
- MSGCLASS, JOBCLASS, SYSOUT, and HOLD MSGCLASS defaults can be supplied in the user's UADS entry.

DESCRIPTION - TSO/E RELEASE 1

ENHANCEMENTS AVAILABLE in an MVS/370 or MVS/XA ENVIRONMENT

Interactive Data Transmission Facility: Two new commands, TRANSMIT and RECEIVE, simplify the process of sending data among nodes in a network. Previously, one could send data as in-stream data in a job, but the process required an in-depth knowledge of JCL and of accounting conventions at the receiving location and any intermediate locations. Now, one need know only the name of the receiving node and the userid of the person to whom one is sending the data.

The Interactive Data Transmission Facility 'TRANSMIT' and 'RECEIVE' commands may be used in conjunction with the VM/System Product Release 2 SEND FILE and RECEIVE commands. With these two products installed you may exchange data in a compatible format between MVS/TSO and VM systems. For additional information see the VM/System Product Release 2 Licensed Program Announcement.

A typical transmission sequence follows: When a sender enters the TRANSMIT command, TSO gets the data to be sent, converts the data to transmittable format, and writes the data to a SYSOUT file. The data is then routed to the receiving location by JES. When the data arrives at the destination node, a message is sent to the receiving userid via the SEND command announcing the availability of transmitted data. When the receiver issues the RECEIVE command, a message indicates a data set has arrived and the receiver is given the data set name, the name of the sender and the name of the sending node. The receiver is then prompted for a data set name for the data. TSO restores the data to original format and places it in the named data set.

If the AMS Cryptographic Option (5740-AM8) is installed on an MVS/370 system (or DFP on an MVS/XA system) and encryption requested, TSO will use the AMS REPRO command to encrypt data sets before transmitting them. Private key management or system key management may be selected. With private key management, both the sender and receiver must enter an encryption key. With system key management, AMS will select a key and encypher the data.

'Nicknames' can be substituted for node-userid identifiers and thereby simplify what must be entered in order to transmit data. A 'names data set' is first built. TSO will use it to translate 'nicknames' into node names and userids. The following may be placed in the 'names data set':

- Text to be inserted at the beginning or end of data being transmitted.
- Filename for alternative names data set.
- Log data set name (for information about transmission activity).

A number of user exits will give installation management a means of monitoring transmission activity or altering the way TSO performs some operations. Information from the PARM keyword of the TRANSMIT and RECEIVE commands is passed to all exit routines of the TRANSMIT and RECEIVE command processor routines.

- For authorization checking, there are two exits (a transmit startup exit and a receive data set preprocessing exit) for controlling who can transmit and/or receive data, and who can use a particular network path. Also, with the receive exit, the installation can identify persons who are to receive messages not directed to their own userids. The RACF authorization checking macro, RACHECK, could be used for these functions.
- For unsupported data set types, the two exits mentioned above can be used in combination with a third, the receive data set post-processing exit. Supported data set types are format F (fixed), V

TSO Extensions R2 (cont'd)

(variable) and U (undefined) length, in sequential or partitioned data sets. Unsupported data set types are ISAM and VSAM data sets, or data sets with user labels or keys. (VSAM data can be unloaded by standard AMS facilities and transmitted in unloaded format.)

- For accounting, a transmit termination exit is supplied to be used with the receive data set post-processing exit. At each of these, information is available about volume and direction of data traffic.
- For encryption and decryption, exits are available to provide local support for the encryption process.

The TRANSMIT and RECEIVE commands require APF authorization to perform their intended functions.

FULL SCREEN LOGON: This new capability, for 3270 terminal users, provides a LOGON panel with a menu of all the LOGON variables. If the userid matches one in the user attribute data set, attributes from the last session will be displayed and the user will be prompted for a password. The user may obtain help for any variable by entering a '?' by the appropriate variable or for all the variables by depressing a Program Function Key. During LOGON, if a syntax error is made, the following will happen:

- An audible alarm will sound (if terminal is equipped with one).
- An asterisk will appear next to incorrect entries and they will be highlighted.
- A message will appear on the menu.
- The cursor will move to the first incorrect entry.

In addition, the user may specify the next command to be executed after the LOGON process. For example, if the user normally executes SPF and this was specified, SPF will be the next command executed. (Note that this command will be executed after any command entered in the PARM field on the EXEC card of the LOGON procedure.) As with all other LOGON attributes, this field will be initialized to the value specified in the last session.

ALLOCATE COMMAND ENHANCEMENT: The ALLOCATE command processor will allow the creation of a new data set based on the attributes of an existing model data set. This function will be implemented using the LIKE(dsn) keyword.

The keyword operands of the ATTRIB command can now be specified with the ALLOCATE command so that:

1. Command language users will no longer have to issue the ATTRIB command to specify DCB operands. This allows the user to allocate a data set by using a single TSO command.
2. Command language users will be able to override any attribute of an existing data set specified on the LIKE Keyword.

The ALLOCATE command is extended to provide for the RACF protection of DASD data sets and tape volumes. When a RACF-defined user is allocating a permanent tape data set on a private volume as the first file on the first volume in a volume sequence, that tape volume can be RACF-protected by using the new PROTECT keyword operand on ALLOCATE. Since ADSP (Automatic Data Set Protection) is not supported for tape, the user today must issue a separate RACF command to protect the tape volume. Furthermore, when the RACF user does not have the ADSP attribute, a separate RACF command must be issued to protect DASD data sets. With this new PROTECT operand, the tape volume or DASD data set will automatically be protected at the time the specified data set is OPENed for OUTPUT.

New keyword operands will be provided on the ALLOCATE command in support of allocation of SYSOUT data sets.

The limit of concatenating up to 16 partitioned data sets will be increased to 255, the same as for sequential data sets.

SUBMIT COMMAND ENHANCEMENT: SUBMIT * is an enhancement to the SUBMIT command processor that provides a significant performance improvement when the input job stream is to be entered from a terminal or is contained in a command list (i.e., CLIST).

This function is more efficient than the previous function available via the SUBMIT command processor, since the requirement to EDIT a skeleton or model data set prior to submitting a job is eliminated. Installations may now incorporate the JCL within the CLIST and issue the SUBMIT * command.

The other card functions of this command are unchanged.

The existing SUBMIT * function of EDIT will continue to select the current EDIT data set as the input job stream.

PROMPT HELP ENHANCEMENT: This enhancement provides assistance when requested by the terminal user.

When prompting is being done for most command operands any information in the SYS1.HELP data set pertinent to the operand will be displayed when the user enters a '?'. Refer to the *General Information Manual* (GC28-1061) for more specific information. This capability now also makes it possible for an installation to more easily tailor the information about an operand without modifying command processors.

Previously, in order to obtain help a user might have terminated the command, obtained the HELP information, and re-entered the command. '? PROMPT HELP' improves productivity by eliminating the need to terminate the command (before obtaining help) and to re-key previously entered information.

LISTBC/SEND COMMAND ENHANCEMENTS:

- LISTBC I/O Reduction

This enhancement significantly reduces the number of I/O operations required to process a LISTBC mail request. LISTBC now performs a direct read of the user's mail directory record rather than requiring a sequential directory search.

- SEND I/O Reduction

A new algorithm has been implemented which significantly reduces search time to locate a free record within the BRODCAST data set when the SEND command is invoked.

This enhancement will reduce the channel, control unit, and device busy time by keeping a pointer in SYS1.BRODCAST which either points to the first free record or points to some record before the first free record. This pointer will be used to determine where the sequential search should begin.

Whenever SEND uses a free record it will increment the pointer to point to the next record which may or may not be a free record. Whenever LISTBC creates a new free record which is the first free record in SYS1.BRODCAST, it will update the pointer to point to this new free record.

ENHANCEMENTS AVAILABLE only with TSO EXTENSIONS with the MVS/XA FEATURE

TSO TEST SUPPORT

- Support for testing a program above 16 megabytes: Programs to be tested may reside above 16MB and use virtual storage above 16MB.

Through the use of TEST subcommands, the user can:

- Obtain additional virtual storage above 16MB.
- Change the addressing mode of the program being tested.
- List and alter virtual storage above 16MB.
- Cross-Memory environments. LIST subcommand will support all Cross-Memory operation codes. AT subcommand supports most Cross-Memory operation codes. At an ABEND, information will be displayed which specifies Address Space IDs (this will also occur for TSO programs not under TEST).
- A selected group of TSO commands can now be executed as subcommands of TSO TEST.
- Testing of programs that invoke other user programs has been simplified.

TSO SERVICES: Several important service routines (listed below) have been modified to enable them to process data in virtual storage above 16MB whenever they are invoked by programs executing in 31-bit addressing mode. Several other important TSO service routines can be invoked in 31-bit addressing mode even though their input must be below 16MB. In addition, the number of messages displayed at the operator's console has been reduced by eliminating the monitoring of the TSO Operator Command at the operators console. Only hard copy will be produced.

The following TSO service routines have been modified to enable them to be invoked by programs executing in 31-bit addressing mode:

- These service routines will process data above 16MB:

- PARSE
- TSO message issuer
- DAIRFAIL
- GNRLFAIL

- These service routines will process only data in virtual storage below 16MB:

- PUTGET
- PUTLINE
- GETLINE
- STACK

Refer to the *OS/VS2 MVS TSO Extensions General Information Manual* for additional detail on enhancements to TSO TEST and services.

TSO Extensions R2 (cont'd)

HIGHLIGHTS for TSO/E RELEASE 2 - MVS/370 or MVS/XA

- **TSO/E Information Center Facility**
The TSO/E Information Center Facility allows an MVS installation to easily install and maintain an information center (IC). It permits the information center end user to access supported licensed programs or installation-developed applications via a set of easy-to-use panels. Special IC administration dialogs are provided as well. The Information Center Facility will have HELP panels for most selection panels and online descriptions of all the licensed programs supported.
- **CLIST Enhancements**
The power and ease-of-use of the CLIST language have been enhanced by the addition of new CLIST functions, and by substantial performance improvements. With these enhancements, end users familiar with languages like BASIC and PASCAL, and ISPF dialog developers can use the CLIST language to easily create new applications. New CLIST function includes:
 - Command output management.
 - New built-in functions and control variables.
 - Text handling support.
 - Program access to variables.
- **TSO Service Facility**
ISPF dialogs, CLISTs and locally-written TSO application programs gain two distinct new services:
 - Program interface to TSO commands.
 - Authorized service facility.
 Exploitation of these services can allow a richer set of end-user applications under TSO and a reduction in the time and effort to implement those applications.
- **Session Manager**
The TSO Session Manager provides extended display support for the 3270 Display Terminal and the 3290 Information Panel. The Session Manager enhances the terminal user's productivity when operating in a line-mode environment.
The Session Manager licensed program (5740-XE2) has been integrated into TSO/E Release 2.
Enhancements to the integrated Session Manager include support for larger screen sizes and improved usability and flexibility of screen layout for different terminal types. Many other functions have also been improved.
- **ALLOCATE**
The ALLOCATE and ATTRIB commands have been extended for the 3800 Printer.
- **Resident Notices**
LOGON performance has been improved by reducing contention for the broadcast data set. The notices displayed at logon time will be kept in an in-storage table to reduce access to the broadcast data set.

DESCRIPTION for TSO-E RELEASE 2 - MVS/370 or MVS/XS

TSO/E Information Center Facility: The TSO/E Release 2 Information Center Facility is an important element in implementing an MVS-based information center. TSO/E Information Center Facility is a system of selection panels, documentation, and dialogs to help users access a set of IBM licensed programs. Functions for both end users and IC administration personnel are provided. Information Center Facility permits easy access to services via a uniform set of interactive panels. In a user-friendly way, the Information Center Facility helps the user select the appropriate product and prepare for its use by providing a series of prompting panels, help panels, and a first-use tutorial.

An overview of how the Information Center Facility works and what it does from the end user's vantage point follows. The items highlighted represent functions provided by the Information Center Facility.

- First a user is registered (user enrollment) to use the Information Center Facility and the requested programs by the IC administrator.
- Before starting, a user consults a beginner's guide that describes the terminal, how to log on to the system, and the mechanics of using the Information Center Facility, including how to access the tutorial information given in the panels. This guide provides an overview of the services and functions available in the Information Center Facility. In short, it provides what the new Information Center Facility user needs to know in order to get started.
- When the Primary Selection Panel is presented, the user may select additional panels to perform a work-related task, to display

installation news (NEWS), or to obtain first use information (First Use Tutorial).

- The First Use Tutorial interactively explains the services and functions available to the end-user.
- News allows the user to access information the installation wishes to distribute to all Information Center Facility users.
- If the end user chooses a work-related task (such as report preparation or data manipulation), the underlying licensed program is invoked via Conduit Dialogs. These dialogs shield the user from data-processing jargon by requesting setup information in a familiar language.
- The user may also select the computer-based training function available in the Information Center Facility. This offers a simple dialog that lets the user identify a course, browse a course description, browse the course itself, or take the course as a student.
- When the user finishes a selection, another task may be chosen, or use of the Information Center Facility may be terminated. The Information Center Facility is designed so that end users are not left at the terminal without guidance.

The functions provided with the Information Center Facility are:

- **Information on getting started**
The information for getting started is contained in a hard-copy users' guide. This manual describes the terminal and basic logon procedures from the end user's point of view. It describes the mechanics of using the Information Center Facility, and provides an overview of the services and facilities available for the end user. No prior knowledge of data processing is assumed. This manual directs the user to the first use tutorial panel for additional information.
- **First Use Tutorial Information**
The first use tutorial is an online tutorial that contains a list of all the functions or services available on the system for Information Center Facility users.
Together, the guide and the first use tutorial cover the following information:
 - The display terminal.
 - Selection and data entry panels.
 - Help panels.
 - Special keyboard functions (e.g., APL).
 - Overview of Information Center Facility functions and services.
 - Task mapping to the TSO/E publications library.
- **Primary selection panel.**
The primary selection panel lists the highest level of services available to an individual using Information Center Facility. Different panels will be provided for IC administrators and end users. The panel presented will depend on the user type assigned to the individual at enrollment.
- **Conduit Dialogs**
The conduit dialogs provide an interactive process for the user to access one of the supported licensed programs installed in the IC. These dialogs mask the underlying system operations that are required to access the requested service. The conduit dialogs will perform the following tasks:
 - Ensure that required resources (data set, etc.) are available.
 - Invoke the requested licensed program.
- **Computer-Based Training Function**
Computer-based training has been shown to be an efficient means of providing education. Information Center Facility support for this training will allow all users of the information center to benefit from this effective education technique. Full use of this function requires that both the Interactive Instructional Presentation System (5668-012) and the Interactive Instructional Authoring System (5668-011) be installed. If neither of these is installed, descriptions of all available IBM courses may still be viewed.
Information Center Facility computer-based training lets users:
 - View a list of course names and information on whether or not the courses are installed in the installation.
 - Request the display of detailed descriptions about any course (whether or not it is installed).
 - Browse a course.
 - Initiate a request to be formally enrolled in a particular course.

PROGRAM PRODUCTS

TSO Extensions R2 (cont'd)

- Access a course as an enrolled student or as an author.
- Modify the course descriptions distributed with the Information Center Facility.
- Add additional course descriptions.
- Change the course status as displayed to the user.
- Review enrollment requests, select and enroll students, and send enrollment notifications.

Several courses are available from IBM and these must be ordered separately. (See the IBM education catalog for a list and descriptions.) The installation may also create and offer its own courses.

• User Enrollment

This function assists the IC Administrator in enrolling users. Data entry panels are used to collect information about the user and customize profiles. Information Center Facility adds the user to the names directory, identifies the user to TSO and RACF (if installed), creates a catalog alias, and updates default ISPF profiles. The required underlying commands are issued automatically.

The administrator is given an extensive facility for defining multiple Information Center Facility user categories or types. This allows the administrator to access sets of defaults for TSO, ISPF and RACF with only user-specific information being altered. An administrator facility also allows setting ISPF defaults for the system.

• News

The NEWS function allows the IC administrator to maintain and distribute online information (NEWS) to all TSO/E Information Center Facility users. The administrator can add, update and delete news items which users may then browse. When the administrator adds or updates a news item, users will be notified when logging on to the system that there has been a change.

By entering selection criteria in the appropriate panel, an IC user may:

- Indicate whether or not any NEWS is to be viewed.
- Request a specific NEWS item by name.
- View all NEWS items identified by a specific category.
- View all NEWS items entered in a specific date.
- View a complete list of all current NEWS items.

• Supported Licensed Programs in TSO/E Release 2 Information Center Facility.

The licensed programs listed below are supported in this release with selection panels, help panels, tutorials, and conduit dialogs. Each product to be used with the Information Center Facility must be ordered separately in addition to TSO/E Release 2.

- A Departmental Reporting System II (5796-PLN)*
- APL Data Interface II (5796-PNJ)*
- Financial Planning System (5798-CPX)*
- Graphical Data Display Manager Presentation Graphics Feature (GDDM/PGF Release 2 or Release 3) (5748-XXH)
- Interactive Instructional Presentation System (5668-012)
- Interactive Instructional Authoring System (5668-011)

* These APL-based products require that VS/APL (5748-AP1) be installed.

Note: The Information Center Facility support of these products with conduit dialogs, help panels and tutorials is external to each of these products. Any interactive assistance provided, once a particular product is entered, is that provided by the product itself.

CLIST Enhancements: Functional enhancements in conjunction with significant performance improvements in CLIST statement processing make CLIST a powerful interpretive language candidate for end users familiar with languages such as BASIC and PASCAL. Used with ISPF panels and dialogs, CLIST provides an excellent facility for implementation of new end user services.

• Performance

The CLIST processor has been restructured. Significant performance improvements have been achieved in statement parsing, variable access, and file I/O. The use of MVS services by CLIST processing has been substantially reduced.

A sampling of the ratios of old to new average execution (CPU) times of four commonly used statements follows:

Statement Type	Ratio Old : New
SET	3.5 : 1
PUTFILE	2.7 : 1
GETFILE	2.6 : 1
IF	1.9 : 1

Note: To accurately access the CLIST performance improvements, these development laboratory measurements were performed using CLISTs containing CLIST statements only. No TSO commands are included. Actual performance improvements obtained by any particular user are dependent on many factors. The overall performance for a given CLIST can range from 2% to over 50% improvement in average execution (CPU) time, dependent on the type and mix of CLIST statements, TSO commands, or ISPF services within. These measurements show the comparative improvement between TSO/E Release 1 (old) and TSO/E Release 2 (new).

• Function

- Text Support

Text support has been enhanced by two new built-in functions and a new operand on the CONTROL statement allowing CLISTs to deal with lowercase text. This will allow office systems applications requiring upper/lower case data to be developed.

- Command Output Management

New CLIST variables control the routing of command or CLIST output to the terminal, or to CLIST variables. This allows a CLIST to interpret, reformat, or modify this output. As an example, output of the TSO LIST series of commands could be captured, modified and presented in ISPF panels.

- Additional Built-In Functions

New built-in functions return information about the current environment to CLIST. This allows CLISTs to present data in formats more suitable to the terminal being used, to be aware of the security environment, and to access meaningful data on resource consumption.

- Program Access to CLIST Variables

This new TSO service will allow application programs to examine and manipulate CLIST variables. User-written programs may now fully interact with CLIST and/or ISPF.

- National Symbol Support

In order to move toward compatibility with higher-level language syntax, CLIST will allow national characters as part of a symbol name.

Other CLIST changes have been made to improve usability. See the TSO/E General Information Manual for details.

TSO Service Facility

ISPF dialogs, CLISTs, and locally-written TSO application programs gain two distinct new services:

• Program interface to TSO commands

This new interface, designed with high-level languages under TSO in mind, can be used to execute any primary TSO command as a system service. The design is such that if the command invoked runs AUTHORIZED, it will function normally without comprising MVS system integrity.

As an example, using this interface, a PL/I program could be written which accomplishes dynamic allocation of data sets via the TSO ALLOCATE command and, after completing file processing, issues the RACF PERMIT command to ensure correct data set security.

• Authorized service facility

This function allows CLISTs (and therefore ISPF dialogs), running unauthorized, to execute TSO commands that run AUTHORIZED with no MVS integrity exposures. A new TSO command, issued within a CLIST, with an argument of the target (desired) command and its parameters, provides this new service.

Session Manager - Integrated and Enhanced

The MVS TSO 3270 Session Manager licensed program (5740-XE2) has been integrated into TSO/E Release 2.

The integrated session manager provides extended display support for the 3270 Display Terminal and the 3290 Information Panel. The session manager enhances the terminal user's productivity when operating in a line mode environment.

PROGRAM PRODUCTS

TSO Extensions R2 (cont'd)

The Session Manager provides the following functions:

- Journaling of TSO sessions
A journal of line-oriented terminal input and output is kept in virtual storage. It can be used to review prior input/output, construct new input from existing journal contents, or save portions of the session by printing, or copying journal contents to a data set.
- Customization of the 3270 Display Terminal and 3290 Information Panel screen layouts.
Users can dynamically tailor screen layouts and program function key definitions to suit the unique needs of their individual TSO sessions.
- Full-screen support for all line-oriented TSO functions
The session manager supports existing IBM and user-written commands and applications. Included are such execution processors as TSO TEST, the PL/I Checkout Compiler and the COBOL or FORTRAN Interactive debugging environments.
- Terminal support*
Session Manager will now use large screen terminals by dynamically adjusting the screen layout to match the dimensions of the terminal. With the session manager utilizing the maximum screen size, a user's productivity can be increased by allowing more data to be displayed at the terminal. Refer to "Hardware Requirements" for additional detail.
- Numerous other improvements and usability enhancements have been made*.
* These items are new or enhanced in the TSO/E Release 2 Session Manager. See the *General Information Manual* for a more detailed description.

ALLOCATE Enhancements

The ALLOCATE and ATTRIB commands have been extended to support the 3800 Printer. This support provides improved performance and usability for the 3800.

The COPIES, CHARS, FLASH, MODIFY, BURST and OPTCD(J) JCL keyword parameters are now supported for the ALLOCATE command. OPTCD(J) is also supported on the ATTRIB command.

These enhancements allow a reduction in system resources used and a more convenient user interface for the 3800. Background jobs are no longer necessary to use the 3800 Printing Subsystem effectively.

Resident Notices

As the capacity of systems increase, they support larger and larger numbers of users. Contention for resources between these users may cause bottlenecks in the system. The SYS1.BROADCAST data set, which is accessed by users as they log on, is an example.

TSO/E Release 2 avoids most of the I/Os required for LOGON notice processing by keeping an in-storage copy of the notices.

This enhancement is achieved without changing the format or sharability of the SYS1.BROADCAST data set.

**SPECIFIED OPERATING ENVIRONMENT
TSO/E WITH THE MVS/370 FEATURE**

HARDWARE REQUIREMENTS

- TSO/E with the MVS/370 feature is designed to operate on any IBM processor that is supported by OS/VS2 (MVS) Release 3.8 with MVS/System Product Version 1.
- TSO/E will operate on any terminal currently supported by MVS TSO.
The Full-Screen LOGON, the Interactive Data Transmission Facility, the Session Manager, and the new Information Center Facility (see notes) support:
 - IBM 3270 Information Display System Terminals
 - 3178 mdls C1, C2
 - 3275 mdls 2, 12
 - 3276 mdls 2, 3, 4, 12, 13, 14
 - 3277 mdl 2
 - 3278 mdls 2, 3, 4, 5
 - 3279 mdls 2A, 2B, 3A, 3B (base color mode)
 - IBM 8775 Display Terminal, mdls 11 and 12
 - IBM 3290 Information Panel
 - IBM 3290 support is TSO/E Release 2 only
 - The IBM Personal Computer (with 3270 compatibility)
 - The IBM 6580 Displaywriter (with 3277 RPQ)

Notes:

A minimum screen size of 24 by 80 is required.

Support for the IBM 3278 mdls 3, 4 or 5 and the IBM 3290 is dependent on the maintenance or release level of the underlying teleprocessing access method (TCAM or VTAM). Contact your IBM representative for specific requirements.

TSO/E Release 2 Information Center Facility uses the Interactive Productivity Facility (ISPF) Dialog Manager. ISPF Release 1.1 supports the IBM 3290 Information Panel in compatibility mode as an IBM 3278 mdl 2, 3, 4 or 5.

The following Information Center Facility supported licensed programs have special terminal considerations. See the specific product descriptions for detail.

- Graphical Data Display Manager (GDDM) (5748-XXH) and its Presentation Graphics Feature (PGF)
- The Information Center Facility APL-based products

STORAGE CONSIDERATIONS - MVS/370 Feature:

TSO/E Release 1 and 2 Pageable Link Pack Area: 55K bytes.

TSO/E Release 1 and 2 Private Area: The new TRANSMIT and RECEIVE commands can be used within a TSO user region size of 128K bytes. The virtual storage requirement for the new SUBMIT * function depends upon the size of the job stream being submitted.

The TSO/E release Information Center Facility will result in a small increase over the virtual storage requirements of its prerequisite product ISPF.

The other functions of this product will result in a small increase in virtual storage requirements and also can be used within a TSO user region size of 128K bytes.

The approximate increase in space requirements for the system libraries (based on the IBM 3330 Disk Storage with a track size of 13,030 bytes) for TSO/E with the MVS/370 feature are:

Library	Tracks	
	Rel. 1	Rel. 2
SYS1.CMDLIB	6	8
SYS1.MACLIB	1	3
SYS1.HELP	30	32
SYS1.LINKLIB	6	6
SYS1.LPALIB	5	18
SYS1.UADS	1 per 80 users	1 per 80 users
SYS1.SMLIB	None	13
SYS1.SAMPLIB	None	6

For the TSO/E Information Center Facility, the following additional libraries:

ISPF panels	None	115
ISPF messages	None	40
CLISTS	None	30
CLIST prologs	None	15

SOFTWARE REQUIREMENTS - MVS/370 FEATURE

- TSO/E with the MVS/370 feature: Requires OS/VS2 (MVS) Release 3.8 with the MVS/System Product Version 1 Release 1, or subsequent releases.
- The Interactive Data Transmission Facility function of TSO/E, when used in the MVS/370 environment, requires that the appropriate level of MVS/SP-JES2 or MVS/SP-JES3 be installed:

For the JES2 environment the MVS/System Product-JES2 Release 3, and for the JES3 environment the MVS/System Product-JES3 Release 3.1 will be required.

If the Interactive Data Transmission Facility is to be used to send or receive data between an MVS/System Product Version 1 system and a VM/SP system, MVS/System Product Version 1 at Release 3.1 or higher and VM/System Product Release 2 or higher are required.

The following items are for TSO/E Release 2 only:

- TSO/E Information Center Facility: If the Information Center Facility is used, the Interactive System Productivity Facility/Dialog Manager (5668-960) and the Interactive System Productivity Facility/Program Development Facility (5665-268) are required.
If an IBM 3284, 3286, 3287, 3288 or 3289 Printer is to be used for ISPF or TSO/E Information Center Facility output, the appropriate DSPRINT command processor or the JES/328X Print Facility must be installed on the system.
 - TSO/TCAM Command Processor 'DSPRINT' (5798-AYF)
 - TSO/VTAM Data Set Print 'DSPRINT' (5798-CPF)
 - JES/328X Print Facility (5785-BAB)

PROGRAM PRODUCTS

TSO Extensions R2 (cont'd)

- ALLOCATE and ATTRIB Commands: If the new operands in the ALLOCATE or ATTRIB commands are used, MVS/System Product Version 1 Release 3.2 or subsequent releases are required.

**SPECIFIED OPERATING ENVIRONMENT
TSO/E WITH THE MVS/XA FEATURE**

HARDWARE REQUIREMENTS

- TSO/E with the MVS/XA feature is designed to operate on any IBM processor that is supported by the MVS/System Product Version 2.
- TSO/E will operate on any terminal currently supported by MVS TSO.

The Full Screen LOGON, the Interactive Data Transmission Facility, the Session Manager, and the new Information Center Facility (see notes) support:

- IBM 3270 Information Display System Terminals
 - 3178 mdls C1, C2
 - 3275 mdls 2, 12
 - 3276 mdls 2, 3, 4, 12, 13, 14
 - 3277 mdl 2
 - 3278 mdls 2, 3, 4, 5
 - 3279 mdls 2A, 2B, 3A, 3B (base color mode)
- IBM 8775 Display Terminal, mdls 11, 12
- IBM 3290 Information Panel
 - IBM 3290 support is TSO/E Release 2 only
- The IBM Personal Computer (with 3270 compatibility)
- The IBM 6580 Displaywriter (with 3277 RPQ)

Notes:

A minimum screen size of 24 by 80 is required.

Support for the IBM 3278 mdls 3, 4 or 5 and the IBM 3290 is dependent on the maintenance or release level of the underlying teleprocessing access method (TCAM or VTAM). Contact your IBM representative for specific requirements.

TSO/E Release 2 Information Center Facility uses the Interactive Productivity Facility (ISPF) Dialog Manager, ISPF Release 1.1 supports the IBM 3290 Information Panel in compatibility mode as an IBM 3278 mdl 2, 3, 4 or 5.

The following Information Center Facility supported licensed programs have special terminal considerations. See the specific product descriptions for detail.

- Graphical Data Display Manager (GDDM) (5748-XXH) and its Presentation Graphics Feature (PGF)
- The Information Center Facility APL-based products

STORAGE CONSIDERATIONS - MVS/XA Feature:

TSO/E Release 1 and 2 Pageable Link Pack Area: 75K bytes.

TSO/E Release 1 and 2 Private Area: The new TRANSMIT and RECEIVE commands can be used within a TSO user region size of 128K bytes. The virtual storage requirement for the new SUBMIT * function depends upon the size of the job stream being submitted.

The TSO/E Release 2 Information Center Facility will result in a small increase over the virtual storage requirements of its prerequisite product ISPF.

The virtual storage requirements for the TEST command depend on the characteristics of the program being tested. For example, a TSO region size of 128K may be sufficient to TEST a simple program that does not itself use large amounts of virtual storage.

The other functions of this product will result in a small increase in virtual storage requirements, and can also be used within a TSO user region size of 128K bytes.

The approximate increase in space requirements for the system libraries (based on the IBM 3330 Disk Storage with a track size of 13,030 bytes) for TSO/E Release 2 with the MVS/370 feature are:

Library	Tracks Rel. 1	Tracks Rel. 2
SYS1.CMDLIB	14	20
SYS1.MACLIB	1	11
SYS1.HELP	44	45
SYS1.LINKLIB	6	6
SYS1.LPALIB	7	18
SYS1.UADS	1 per 80 users	1 per 80 users
SYS1.SMLIB	None	13
SYS1.SAMPLIB	None	8

For the TSO/E Information Center Facility, the following additional libraries:

ISPF panels	None	115
ISPF messages	None	40
CLISTs	None	30
CLIST prologs	None	15

SOFTWARE REQUIREMENTS - MVS/XA FEATURE

- TSO/E with the MVS/XA feature: Requires MVS/System Product Version 2 Release 1 and its corequisite MVS/XA Data Facility Product Release 1 or subsequent releases.
- If the Interactive Data Transmission Facility is to be used to send or receive data between an MVS/System Product Version 1 system and a VM/SP system, MVS/System Product Version 1 at Release 3.1 or higher and VM/System Product Release 2 or higher are required.

The following items are for TSO/E Release 2 only:

- TSO/E Information Center Facility: If the Information Center Facility is used, the Interactive System Productivity Facility/Dialog Manager (5668-960) and the Interactive System Productivity Facility/Program Development Facility (5665-268) are required.

If an IBM 3284, 3286, 3287, 3288 or 3289 Printer is to be used for ISPF or TSO/E Information Center Facility output, the appropriate DSPRINT command processor or the JES/328X Print Facility must be installed on the system.

- TSO/TCAM Command Processor 'DSPRINT' (5798-AYF)
- TSO/VTAM Data Set Print 'DSPRINT' (5798-CPF)
- JES/328X Print Facility (5785-BAB)

- ALLOCATE and ATTRIB Commands: If the new operands in the ALLOCATE or ATTRIB commands are used, MVS/System Product Version 2 Release 1.1 is required.

COMPATIBILITY

TSO/E Release 2 supersedes and includes all the functions of TSO/E Release 1 and TSO Session Manager. Users migrating to TSO/E Release 2 should be aware of the following:

- Resident NOTICES: In a multi-CPU installation, when the broadcast data set is shared among TSO/E Release 2 and non-TSO/E Release 2 systems, all notices should be added on a TSO/E Release 2 system. This ensures that the TSO/E Release 2 systems will keep their in-storage list of notices up to date.

DATA SECURITY, AUDITABILITY and CONTROL

Security features available with the previous release of TSO/E continue to be available with Release 2. User management is responsible for the selection, adequacy and implementation of these features, and the appropriate application and administrative control.

DOCUMENTATION
(available from Mechanicsburg)

TSO/E General Information Manual (GC28-1061-2).

SYSTEM INTEGRITY

IBM will accept APARs where the installation of TSO/E Release 2 introduces an exposure to the system integrity of MVS. Refer to IBM Programming Announcement, "Statement of MVS System Integrity". This program is intended to run authorized.

RPQs ACCEPTED: No

PROGRAM PRODUCTS

5665-288 - MVS/OCCF
MVS/OPERATOR COMMUNICATION CONTROL FACILITY

PURPOSE

MVS/OCCF is a program which allows one or more remote MVS systems to be operated from a host MVS system. It will reside in the remote system(s) and optionally in the host.

DESCRIPTION

The specific functions provided to accomplish this are the ability to:

- Send commands issued at the host to the remote for execution.
- Intercept messages at the remote and route them to the host for reply or information.
- Have predefined replies for Write to Operator with Replies (WTOs).
- Generate a series of commands through a command list (CLIST) capability.

A related function, the suppression of unwanted messages, is provided in OS/MVS/SP-JES 2, Release 3, by the Message Processing Facility of MVS Multiple Console Support.

In addition, MVS/OCCF will include 3275 data stream emulation support for the Remote Operator Console Facility (ROCF) of the 4300 processors.

MVS/OCCF will address two major requirement areas of the Interconnected System (IS) environment support for MVS/SP-JES2.

- (1) Remote operator support.
- (2) Programmed operator facility.

Within these two major areas, MVS/OCCF (in conjunction with its prerequisite products) provides support for the Host and Remote requirements as follows:

HOST REQUIREMENTS:

- The ability for the host to receive messages from the remote and act on them as required.
- The ability for the host to submit operating system commands to the remote.
- The ability to change the designation of the host operator control point for the remote as required.
- The ability for the host operator control point to receive messages from multiple remote nodes concurrently.
- The ability to switch control from the host to the remote at the discretion of the host.
- A facility to define preprogrammed replies for messages at the remote.
- Utilization of SNA/SDLC protocols to provide line sharing.

REMOTE REQUIREMENTS:

- The ability to issue preprogrammed replies to messages.
- The ability to transfer messages to the central host for action/information.
- Notification to the local operator when the host/remote connection fails.
- A command list capability to simplify operator actions.

In addition to the above, MVS/OCCF 3275 data stream emulation support of the 4300 Remote Operator Console Facility will allow an IPL/IML of a remote 4341, 4361 or 4381 MVS or 4300 DOS/VSE system (with ROCF installed) from an MVS host system with MVS/OCCF installed.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

MVS/OCCF is designed to operate on any IBM processor supporting the then most current level of MVS/System Product-JES 2 Release 3.

Remote IPL/IML of a 4341 MVS System: For this function, MVS/OCCF must be installed in the host and the remote processor must be an MVS 4341, 4361 or 4381 with the Remote Operator Console Facility (ROCF) installed (see Product Announcement Letter).

Remote IPL/IML of a 4300, 4361 or 4381 DOS/VSE System: MVS/OCCF, residing in a host, will IPL/IML a remote 4331, 4341, 4361 or 4381 DOS/VSE Processor. For this function, MVS/OCCF must be installed in the host and the remote processor must be a DOS/VSE 4331, 4341, 4361, or 4381 with the Remote Operator Console Facility (ROCF) installed. See Product Announcement Letters for the 4331, 4341, 4361 and 4381.

SOFTWARE REQUIREMENTS

The following programs are required by MVS/OCCF for local operations:

OS/MVS Release 3.8 (BCP) with Processor Support 2
OS/MVS/SP-JES2 Release 3 (at the then current level)

Additional Programming Requirements for Remote Operations

NCCF Version 1 Release 2 or Version 2 (MVS)
ACF/VTAM Release 2 or 3
(with the Multi-System Networking Facility, MSNF)
ACF/VTAM Version 2
or
ACF/TCAM Version 2, Release 2 or 3 (with MSNF)

COMPATIBILITY

Since MVS/OCCF attaches NCCF, provisions have been made to address those users of the version of NPDA which also attaches NCCF. The user who desires to use NPDA (Network Problem Determination Application) in this environment will be required to indicate this to MVS/OCCF through an MVS/OCCF initialization parameter.

Because NCCF is used for presentation services by MVS/OCCF, the operators' screens will differ from those presented by the Multiple Console Support of MVS.

INSTALLATION: MVS/OCCF will be installed using the System Modification Program (SMP).

SECURITY

Facilities of NCCF can be used to control access of host operators to MVS/OCCF. At MVS/OCCF initialization, the management of the remote system may specify which MVS commands will be available via MVS/OCCF (i.e., to host operators). Where common-carrier provided communications facilities are employed, management may wish to consider the use of encryption. Management is responsible for the selection, implementation and adequacy of these features.

DOCUMENTATION (available from Mechanicsburg)
MVS/OCCF General Information Manual (GC24-5225) is available. An *MVS/OCCF Installation Guide and Reference Manual* and a *Program Logic Manual* will be available by First Customer Shipment date.

MVS SYSTEM INTEGRITY APPLIES: Yes

RPOs ACCEPTED: No

PROGRAM PRODUCTS

**5665-290 - DISOSS/370 V3R2 (OS/VS2)
5666-270 - DISOSS/370 V3R2 (VSE)
DISTRIBUTED OFFICE SUPPORT SYSTEM/370
VERSION 3 RELEASE 2**

PURPOSE

DISOSS/370, an office systems host program providing host document library and distribution functions, has been enhanced to support distribution among multiple DISOSS/370 Version 3 Release 2 systems and between 5520 Administrative Systems and DISOSS/370 Version 3 Release 2 systems. The 5520 Administrative Processing Program has been enhanced to allow distribution between the 5520 and DISOSS/370 Version 3 Release 2 systems, and to allow the interchange of revisable and final form documents between the 5520 and the 6580 Displaywriter System, the interchange of revisable form text documents between the 5520 and 8100/DOSF Release 4, and the distribution of final form text documents created on a 5520 to an 8100/DOSF. Support continues for the functions provided by DISOSS/370 Version 3 Release 1 for users of the 6580 Displaywriter System, the Distributed Office Support System/8100/DOSF, the Scanmaster I, and the 5520 Administrative System. DISOSS/370 Version 3 Release 2 is designed to operate under the control of OS/VS2 (MVS/370 or MVS/XA) or VSE, and CICS/VS.

HIGHLIGHTS

- DISOSS/370 Version 3 Release 2 users are able to submit document distribution requests at their convenience through the support of SNA Distribution Services. This support provides for the transmission of documents to other systems as connections become available.
 - Distribution among multiple DISOSS/370 Version 3 Release 2 systems, including support for personal and priority distribution requests.
 - Distribution between 5520 Administrative Systems with 5611-SS2 Release 3 and DISOSS/370 Version 3 Release 2 systems, including support for personal and priority distribution requests.
- Communication with the 6580 Displaywriter.
 - Provides a host document library for Displaywriter users with file, search, retrieve and delete support.
 - Provides document distribution, including support for personal and priority distribution requests, for Displaywriter users.
- Communication with the IBM Scanmaster I
 - Extends DISOSS/370 Version 3 document distribution and library services support to include image documents.
 - Allows document distribution, including support for personal and priority distribution requests, and filing in the host document library using the Scanmaster I coversheet or numeric keypad.
 - Allows document transmission at the convenience of the sender, without requiring an immediate connection with the receiving Scanmaster I.
 - Allows document delivery either automatically at the Scanmaster I, or allows documents to be temporarily queued in DISOSS/370 until requested by the recipient.
 - In addition to image documents, final form text documents can be printed on the Scanmaster I.
- Communication with the 5520
 - Provides a host document library for 5520 users with file, search, retrieve and delete support.
 - Allows a 5520 user to print a final form text document on a host printer, or format it for input to STAIRS/VS.
 - Allows 5520 users to initiate a S/370 batch job.
- Document Interchange among Workstations
 - Using Document Interchange Architecture (DIA) and Document Content Architecture (DCA), DISOSS/370 can interchange final form text documents among Displaywriter, 8100/DOSF, 5520, and Scanmaster I devices. (See the "Document Distribution and Library Services Interchange" charts for specific interchange capabilities.)
 - Interchange of revisable and final form text documents is supported between the 5520 Administrative System and the 6580 Displaywriter System via a DISOSS/370 System, as well as interchange of revisable and final form text documents between 8100/DOSF and the Displaywriter System. Interchange of revisable form documents is also supported between 8100/DOSF and 5520 through DISOSS/370, as well as the distribution of final form text documents created on a 5520 to an 8100/DOSF. (See the "Document Distribution and Library Services Interchange" charts for specific interchange capabilities.)

- Installation Assist
 - Simplifies the DISOSS/370 installation process by providing a pretested set of editable definition statements.
 - Is compatible with the CICS/VS Starter System and provides the required DISOSS/370, CICS/VS, ACF/VTAM, ACF/NCP and VSAM statements required to add a model DISOSS/370 system to an existing system.
- Application Program Interface
 - Allows user-written application programs to use the DISOSS/370 library and distribution functions.
 - Allows these programs to store data in, or extract it from, their own data bases, and to send this information as a document to DISOSS/370 for storage in the host document library or for distribution to other applications and DISOSS/370 users.
- Online Directory Sample Program
 - Provides a running program in source form to illustrate the use of the DISOSS/370 application program interface.
 - Provides a directory so that users can look up and update user addressing information, such as system name, location, and telephone number.
- User Affinity Support
 - Allows authorized users to work on behalf of others.
 - Provides group mail handling capability for environments where multiple users share a single workstation, such as mail rooms and secretarial workstations.
 - Allows Displaywriter and Scanmaster I recipient groups to be defined so that all documents for the group can be obtained with a single command.
- Improved Structure and Management of Document Library
 - Provides enhanced library integrity using CICS/VS VSAM data base recovery capabilities.
 - Provides online recovery of document space after all authorized users have deleted their access to a document.
- Interactive Service Aids
 - Query routing information used for document distribution.
 - Locate distributed documents.
 - Isolate delays in multi-host distributions.
 - Display distribution queues.
 - Delete records from the queues.

DESCRIPTION

Summary of Functions and Device Support Provided by DISOSS/370 Version 3

- DISOSS/370 Version 3 Release 2 users are able to submit distribution requests at their convenience through the support of SNA Distribution Services. This support provides for the transmission of documents to other systems as connections become available. DISOSS/370 Version 3 Release 2 will temporarily store documents awaiting route availability to other nodes and then deliver them to subsequent nodes when the routes become available.

Distribution among multiple DISOSS/370 systems:

- Users on different DISOSS/370 systems can interchange documents without knowing on which DISOSS/370 system the users are located.

Distribution between the 5520 Administrative System and DISOSS/370 Systems:

- 5520 users can now distribute documents to and receive them from DISOSS/370 users, in addition to other 5520 users.

DISOSS/8100 and Scanmaster I addressing enhancements:

- DISOSS/370 Version 3 Release 2 allows installations to optionally define DISOSS/8100 users and Scanmaster I users only at the DISOSS/370 system to which they are directly attached.

• 6580 Displaywriter

Distributing Documents: Displaywriter users can distribute documents to other DISOSS/370 users. A document can be accompanied by a message if the sender desires. The sender can

DISOSS/370 V3 R2 (cont'd)

request a confirmation of delivery message so that he can be informed when documents have been delivered.

DISOSS/370 Version 3 Release 2 allows Displaywriter users to request priority and personal distribution of documents. DISOSS/370 assigns priority distributions to a separate SNA Distribution Services service level which allows priority routing throughout the SNA Distribution Services network. DISOSS/370 uses the service level to allow selection of a unique SNA session for priority requests. Even if the priority service level is not configured to select a separate SNA session, a priority distribution request will be placed ahead of non-priority requests within a given queue. A document that is distributed with the personal designation can be obtained only by the named recipient. A member of an affinity group can obtain a personal distribution for another group member only by supplying the member's user id and password.

Refer to the Document Distribution Interchange chart for specific information on distribution interchange capabilities among workstations.

Receiving Documents: Documents distributed to a Displaywriter user are held in a DISOSS/370 queue. A Displaywriter user can request that all documents in the queue be delivered to the workstation or he can request a list of all of the documents in the queue. He can then select a specific document for delivery.

Filing, Retrieving and Deleting Documents: Documents created at a 6580 Displaywriter can be filed in the host document library. When the user files a document, he can specify information that can be used to locate the document in subsequent searches. This information consists of search arguments such as the document name, author, document class, date, recipients and keywords describing the contents of the document. In addition, access codes can be included to control access to the document.

To retrieve or delete a filed document, a user first searches the host document library index using any of the search arguments specified when the document was filed. In a search request, search arguments can be truncated, and one or more alternative search arguments can be specified. Once a document has been identified, the user can retrieve it from the host library and store it at the Displaywriter workstation. A document can also be retrieved or deleted by specifying the unique document name assigned by DISOSS/370 when it is filed.

Scanmaster I

Filing Documents: Image documents can now be filed in the DISOSS/370 library and handled like text documents by users of 8100/DOSF, Displaywriter, or 5520 workstations. Scanmaster I documents are handled by a two step process. The user first enters a document identifier on a special file coversheet, together with the document to be filed. As an alternative, the document identifier and file command can be entered through the Scanmaster I keypad.

After filing the document, the user can then go to his workstation for additional handling. 8100/DOSF users can search, add search terms and access codes, distribute and redistribute, print and delete an image document using their normal menus. Displaywriter users can search for, distribute and delete image documents and 5520 users can search for, print and delete them, both using their normal end-user interface.

Distributing Documents: As an alternative to distributing Scanmaster I documents that have been filed in the DISOSS/370 library, users can distribute them directly. They supply addressing information by marking their user identifier and the recipient identifiers on a distribution coversheet, or by keying them in using the numeric keypad. Users can send documents to one or more individual recipients or distribution lists. When multiple recipients are specified, only one copy is sent to DISOSS/370 which in turn sends the requested copies to the receiving Scanmaster I(s).

DISOSS/370 Version 3 Release 2 allows users to request personal and/or priority distribution of documents using the Scanmaster I coversheet or numeric keypad. DISOSS/370 assigns priority distributions to a separate SNA Distribution Services service level which allows priority routing throughout the SNA Distribution Services network. DISOSS/370 uses the service level to allow selection of a unique SNA session for priority requests. Even if the priority service level is not configured to select a separate SNA session, a priority distribution request will be placed ahead of non-priority requests within a given queue. A document that is distributed with the personal designation can be obtained only by the named recipient and not by other users, even though they have affinity with the named recipient. Delivery of personal distributions may be requested only using the keypad, not via automatic delivery.

Printing Documents: Distributed documents can be automatically delivered to recipients or they may be saved in the host until they have been requested by the recipient. A Displaywriter user can request a list of all documents in his queue. He can then request printing of image documents, using the Scanmaster I keypad. The

8100/DOSF maillog display contains entries representing image as well as text documents. An 8100/DOSF user can request printing of image documents displayed in his maillog on a host-attached Scanmaster I.

The Scanmaster I can also be used as a draft printer for final form text documents. Final form documents filed in the host document library or distributed from a Displaywriter or 8100/DOSF can be printed on a Scanmaster I.

5520

Filing, Retrieving, and Deleting Documents: Documents created at a 5520 can be filed in the host document library. When the user files a document, he can specify information that can be used to locate the document in subsequent searches. This information consists of search arguments such as the author, date, and keywords describing the contents of the document. In addition, access codes can be included to control access to the document.

To retrieve or delete a filed document, a user first searches the host document library using any of the search arguments specified when the document was filed. Once a document has been identified, he can retrieve it from the host library and store it at the 5520 workstation. Alternatively, a document can be retrieved or deleted by specifying the unique document name assigned by DISOSS/370 to each document when it is filed.

Distributing Documents: 5520 users can distribute documents and messages to other DISOSS/370 Version 3 Release 2 users.

Refer to the "Document Distribution Interchange" chart for specific information on distribution interchange capabilities among workstations.

Printing Documents at the S/370 Host: A 5520 user can print a 5520 final form text document stored in the host document library on a S/370 attached 1403-compatible system printer.

STAIRS/VS Input Formatting: Using this function, documents created at the 5520 can be prepared for batch input to a STAIRS/VS data base.

DISOSS/8100/DOSF

Distribution and Mail Processing: DISOSS/8100/DOSF users can distribute documents or messages to other DISOSS/370 users. Optionally, confirmation of receipt can be requested.

DISOSS/370 collects and retains distribution information in the recipient's mail log. This distribution information consists of the date of receipt, the sender, and either the subject of the received document or, in the case of a received message, the message itself. The user can view the mail log in total or view it selectively by specifying criteria such as a date or a date span.

Once a particular mail log entry has been selected, the user can display, print, or redistribute the received document, send a response message to the sender, suspend the mail log entry through the assignment of an action date, delete the entry, or insert a personal note.

Filing, Retrieving and Deleting: The user can file documents created at the 8100/DOSF subsystem in the DISOSS/370 host document library. While filing a document, the user can specify filing information that indexes the document and can be used for later retrieval of the document. This filing information consists of search arguments, such as the document name, the author, recipients and keywords describing the contents of the document. In addition, access codes can be added to help control document access.

To retrieve or delete a filed document, a user first searches the host document library using any of the search arguments specified when the document was filed. In a search request, search arguments can be truncated, and one or more alternative search arguments can be specified. Once a document has been identified, it can be retrieved to the subsystem, displayed at the subsystem, printed on the host or the subsystem, transferred to other DISOSS/370 users, or deleted.

Filing and retrieval of documents can be performed interactively or in deferred mode. Deferred processing is particularly applicable for large documents because the operation is executed in parallel to other tasks performed at the terminal.

Host Printing: This facility allows the user to request printing of a document filed in the host document library on a host-attached printer. The 6670 is supported as a host line printer.

STAIRS Input Formatting: Using this function, documents created at the 8100/DOSF subsystem can be prepared for batch input to a STAIRS/VS data base.

Job Submission: The job submission capability allows the user to send predefined jobs to the host system for batch execution.

This capability can also be used to submit a document from the subsystem to the host along with a job. A user-written program

PROGRAM PRODUCTS

DISOSS/370 V3 R2 (cont'd)

can place this document into a data set for subsequent host application processing.

The following chart summarizes the functions available to users at each of the workstations through DISOSS/370:

• Functional Support Summary

Functions Available through DISOSS/370 Version 3							
Workstation	Document Distribution			Library Services	Host Services		
	Send	View	Print	Redistribute from Maillog	File Search Retrieve Delete	Host Print (Note 1)	Format for STAIRS/VS (Note 2)
8100/DOSF	X	Note 3	X	X	X	X	X
5520	X	X	X	-	X	X	X
Displaywriter	X	X	X	-	X	-	-
Scanmaster I	X	-	X	-	File only	Note 5	-
Application Interface	X	Note 4	Note 4	-	X	X	X

Legend:

- X = Function can be performed.
- = Function cannot be performed.
- Note 1 = The user can request printing of a document on a host-attached 1403-compatible printer or Scanmaster I. (This is in addition to the local printing support provided by the devices.)
- Note 2 = Storage and Retrieval System/Virtual Storage (5740-XR1 OS/VS, 5740-XR4 DOS/VS).
- Note 3 = In addition to viewing documents created on the 8100/DOSF, the user can also view and browse documents filed in the host document library without first retrieving them.
- Note 4 = A user-written application program can receive distributed documents.
- Note 5 = The Scanmaster I can be used as a host printer for both final form text and image documents.

• Document Interchange among Workstations

The workstations supported by DISOSS/370 Version 3 use a variety of data streams available with document content architecture (DCA). The following summarizes the data streams used by each workstation:

8100/DOSF: The 8100/DOSF system can use both the Distribution Services and Library Services functions provided by DISOSS/370. Documents can be sent from the 8100/DOSF to DISOSS/370 in either the 8100 internal or the revisable form text data streams. Documents can be received at the 8100 in the 8100 internal, revisable or final form text data streams. (When an 8100 internal or revisable form document is received at the 8100 as a result of distribution, it is automatically formatted by the receiving 8100, and is not available for editing. Document Library Services can be used to retrieve a revisable copy of the document from the host document library.) DOSF Release 4 or a subsequent release is required for support of the revisable form text data stream, and viewing of final form text data stream at an 8100/DOSF.

6580 Displaywriter: The 6580 Displaywriter can use both the Distribution Services and Library Services of DISOSS/370 Version 3. The Displaywriter can send and receive revisable and final form text documents and word processing records.

5520: The 5520 can use both the Distribution Services and Library Services of DISOSS/370. The 5520 can send and receive documents in the revisable and final form text data streams, the 5520 internal data stream, word processing files, and WP/EBCDIC data stream. Note: 5520 internal refers to file descriptors, profile recovery documents, stored procedures, and 5520 revisable documents created by 5520 Systems with 5611-SS2 Release 2. 5611-SS2 Release 3 does not generate the 5520 internal data stream but will pass it through from attached systems.

Scanmaster I: In addition to sending and receiving image documents, a Scanmaster I can also print a subset of the final form text data stream. Image and text documents can be distributed for printing on a Scanmaster I. In addition, an image document, filed in the host document library, can subsequently be directed to a Scanmaster I, by a Displaywriter, 5520, or 8100/DOSF for printing.

The DISOSS/370 approach to document interchange is to store a document as it was entered; it is not converted to a standard data stream. Then, when DISOSS/370 receives a distribution or retrieve request, if the target workstation can accept the document data stream, the document is delivered without change. If the target workstation cannot accept the document data stream, DISOSS/370 will attempt to perform a data stream transformation. Using this approach, the following interchanges are possible:

- Document Interchange Using Document Distribution Services
 - 8100/Displaywriter Interchange:**
 - If an 8100 internal document is sent from an 8100 to a Displaywriter, DISOSS/370 transforms it to the final form text data stream. The document can then be viewed, printed, or converted to a revisable form at the Displaywriter, for minor revisions.
 - If a revisable form text document is sent from an 8100, using DOSF Release 4, to a Displaywriter, DISOSS/370 sends it to the Displaywriter in the revisable form text data stream. The document can then be revised, viewed or printed at the Displaywriter.
 - The Displaywriter can send both revisable and final form text documents to the 8100/DOSF through DISOSS/370. Final form text documents can be viewed using direct document view facility, or using the 8100/DOSF Release 4 Browse facility, or can be printed using DOSF Release 3 or later on a 5210 Printer mdl E01/E02 with EC 996869.
 - When a revisable form text document is sent from a Displaywriter to an 8100, the receiving 8100 automatically transforms it to final form text. It can then be viewed using the 8100/DOSF Browse facility on a 5210 printer.
- Because these documents were created in different environments, they can contain concepts not understood by the 8100 transformation. Therefore, the fidelity of the document transformation is necessarily limited. However, many typical documents can be converted while retaining their external appearance. A revisable form copy of the document can be retrieved from the DISOSS/370 host document library. For more information, see "Document Interchange Using Library Services".
- 8100/5520 Interchange:**
 - 8100/DOSF and 5520 can interchange revisable form documents using 8100/DOSF Release 4 and 5520 with 5611-SS2 Release 3. A revisable form document created on any single standard U.S. 5520 keyboard (keyboard IDs 001, 002, 003, 004, 005, 006, 007, 008) can be sent to an 8100, where it is automatically transformed to final form text. There it can be viewed using the 8100/DOSF browse facility, or printed on a 5210 Printer mdl E01/E02 with EC 996869. To revise the document, the user can retrieve it from the host document library and transform it to 8100 internal format. See "Document Interchange Using Library Services" for more information.
 - A final form document created on a 5520 can be viewed using the direct document view facility or the 8100/DOSF browse facility, and can be printed on a 5210 Printer.
 - A revisable form document sent from 8100/DOSF to a 5520 can be revised, viewed, or printed at the receiving 5520.

PROGRAM PRODUCTS

DISOSS/370 V3 R2 (cont'd)

8100/Scanmaster I Interchange: If an 8100/DOSF document is routed to a Scanmaster I, DISOSS/370 transforms it to the final form text data stream for printing at the Scanmaster I. In addition, the Scanmaster I can file image documents in the DISOSS/370 host document library. The 8100/DOSF system can subsequently print or redistribute these image documents from the host document library to a Scanmaster I.

Displaywriter/Scanmaster I Interchange: Displaywriter systems can distribute final form documents for printing on a Scanmaster I. In addition, Scanmaster I can file image documents in the DISOSS/370 host document library. The Displaywriter system can direct the distribution of these image documents from the host document library to a Scanmaster I.

5520/Displaywriter Interchange: Revisable and final form text and word processing records (files) can be interchanged between the Displaywriter and 5520 through DISOSS/370 Version 3 Release 2 using both distribution and library services.

5520/Scanmaster I Interchange: The 5520 can direct a final form text or an image document stored in the host document library to a Scanmaster I for printing.

Document Distribution Interchange Matrix: The following chart shows which combinations of workstations can participate in DISOSS/370 document distribution and the level of document interchange at which they can participate. The level of interchange shown is that provided by the latest release levels of each of the products. Refer to the previous description of "Document Interchange Using Distribution Services" for a more detailed explanation of the interchange capabilities.

Source Workstation (Data stream)	Destination Workstation			
	8100/DOSF	Displaywriter	5520 (7)	Scanmaster
8100/DOSF				
8100 Internal Revisable Form	P/V (1)	P/V/C	No	P
Displaywriter Revisable Form	P/V (1)	P/V/R	P/V/R	No
Final Form Records/Files	P/V	P/V/C	P	P
5520				
Revisable Form	P/V (1)	P/V/R	P/V/R	No
Final Form Records/Files	P/V	P/V/C	P	P
5520 Internal WP/EBCDIC	No	No	P/V/R	No
Scanmaster Image (2)	No	No	No	P

Legend:

- P = Printable
- V = Viewable
- R = Revisable
- C = Convertible from final form text to Displaywriter internal revisable format for minor revision.

Notes:

Note 1: When receiving an 8100 internal or revisable form document as a result of distribution, the receiving 8100 automatically formats it. When a revisable copy of the document is desired, DISOSS/370 library services may be used.

Note 2: An image document that has been filed in the host document library can be printed on a Scanmaster I using the print command at an 8100/DOSF, the run application program menu at a 5520, or the distribute command at an 8100/DOSF or Displaywriter.

Document Interchange Using Library Services

8100/Displaywriter Interchange:

- When an 8100 internal document, filed in the host document library, is retrieved by a Displaywriter, it is automatically transformed to final form text by DISOSS/370. The document can then be viewed, printed or converted to Displaywriter internal revisable form at the Displaywriter.
- A revisable form text document, filed in the host document library by an 8100/DOSF Release 4, can be retrieved by a Displaywriter where it can be viewed, printed, or revised.
- A revisable form document, filed in the host document library by a Displaywriter, can be retrieved by an 8100/DOSF Release 4

where it can be viewed or printed on a 5210 Printer mdl E01/E02. To revise the document, the user can transform it to 8100 internal form.

- A final form text document, filed in the host document library by a Displaywriter, can be viewed at an 8100 using the direct document view facility only.

8100/5520 Interchange:

- An 8100 internal document, stored in the host document library and retrieved by a 5520, is transformed to final form text by DISOSS/370 before being sent to a 5520. Once retrieved, it can be printed at the 5520.
- A revisable form document filed by an 8100/DOSF Release 4 can be retrieved by a 5520, where it can be revised, viewed or printed.
- A revisable form document filed by a 5520 can be retrieved by an 8100/DOSF Release 4 where it can be viewed or printed on a 5210 Printer mdl E01/E02. The document can be revised by transforming it to 8100 internal format.
- A final form document filed by a 5520 can be viewed at an 8100 using direct document view facility only.

Displaywriter/5520 Interchange: The Displaywriter and 5520 can interchange revisable and final form text documents and word processing records (files) using library services.

- A 5520 can revise, view, and print revisable form documents, and can print final form documents created on a Displaywriter.
- A Displaywriter can revise, view, and print revisable form documents created on a 5520. Final form documents created on a 5520 can be viewed, printed, and converted to Displaywriter internal revisable format for minor revision.

Library Services Interchange: The following chart shows which workstation combinations can participate in DISOSS/370 library services and the level of document interchange at which these workstations can participate. The level of interchange shown is that provided by the latest release levels of each of the products. Refer to the previous description of "Document Interchange Using Library Services" for a more detailed explanation of the interchange capabilities.

Filing Workstation (Data stream)	Retrieving Workstation		
	8100/DOSF	Displaywriter	5520
8100/DOSF			
8100 Internal Revisable Form	P/V/R	P/V/C	P
Displaywriter Revisable Form	P/V/T	P/V/R	P/V/R
Final Form Records/Files	V	P/V/C	P
5520			
Revisable Form	P/V/T	P/V/R	P/V/R
Final Form Records/Files	No	P/V/R	P
5520 Internal WP/EBCDIC	No	No	P/V/R
Scanmaster Image (1)	No	No	No

Legend:

- P = Printable
- V = Viewable
- R = Revisable
- C = Convertible from final form text to Displaywriter internal revisable format for minor revision.
- T = Transform from revisable form to 8100 internal for revision. If the document is to be revised on a Displaywriter attached to the 8100, then no transformation is required.

Notes:

Note 1: An image document that has been filed in the host document library can be printed on a Scanmaster I either using the print command at an 8100/DOSF or 5520, or the distribute command at an 8100/DOSF or Displaywriter.

Note for Displaywriter document conversion from final to revisable form: Because many of the word processing commands, such as margin spacing, are resolved in final form documents, repagination of a converted document may not have satisfactory results, and other revisions may be cumbersome. Refer to the *IBM Displaywriter System*

PROGRAM PRODUCTS

DISOSS/370 V3 R2 (cont'd)

Electronic Document Distribution Compatibility Guide (G544-2185) for more information.

Note for interchange of revisable documents: When they are created in different environments, revisable documents sometimes express common concepts in different ways. Each has concepts that the other cannot express at all. Therefore, the transformation between any two forms of revisable documents will necessarily be limited. However, many typical documents can be converted while retaining their external format.

- **Installation Assist**

To simplify the installation process, DISOSS/370 Version 3 provides an installation assist package. This package works with the CICS/VS Starter System and consists of editable sample definition statements for installing DISOSS/370 Version 3. The package includes statements for DISOSS/370 itself as well as matching CICS/VS, ACF/VTAM, VSAM, and ACF/NCP statements. The package supports a multi-host DISOSS/370 system configured with two Displaywriters, two 8100s, two Scanmasters, and two 5520s.

The package contains the CICS/VS table entries required to include DISOSS/370 in the CICS/VS subsystem. These definitions can be combined with the CICS/VS Starter System definitions to generate a pretested CICS/VS DISOSS/370 system.

In addition, matching ACF/VTAM and ACF/NCP definitions that are required to add the Displaywriter, 5520, 8100, and Scanmaster I devices to existing network definitions are provided. Unloaded DISOSS/370 Version 3 data sets and VSAM access method services jobs required to define an initial DISOSS host document library and user profile data set are also included.

Using the installation assist package can reduce the time required to install DISOSS/370 Version 3. By following the steps in the *Distributed Office Support System/370 Version 3 Installation Guide*, the user can modify the supplied definitions to create the appropriate production configuration.

- **Application Program Interface**

The application program interface (API) allows user-written programs executing on the same CICS/VS subsystem as DISOSS/370 to use DISOSS functions. These applications can file, search for, retrieve, and delete documents from the host document library. They can also modify the document description (for example, add search terms), print documents on a host-attached printer, and distribute documents to other DISOSS users and application programs.

DISOSS/370 provides these functions by accepting, over the API, a set of Document Interchange Architecture (DIA) commands.

The application interface also serves as a replacement for the Host Text Library User Exit routine provided by previous DISOSS/370 versions.

- **Online Directory Sample Program**

A sample program is provided with DISOSS/370 Version 3 to illustrate the use of the DISOSS/370 application program interface (API) and to provide an online directory. This program is provided in PL/1 source form to facilitate development of customer applications using the DISOSS/370 API.

The directory is intended to be used in the following way. With the aid of a DISOSS-supplied skeleton document, 8100/DOSF and Displaywriter users fill the following information for each directory entry: User name, user system identifier, Scanmaster I numeric identifier, location and telephone number. Optional fields, such as address, and job title can also be added. Using standard distribution panels, users send the directory document to the host directory program which maintains a directory file. Users can add, change, or remove directory entries.

Users can find the directory entry for an individual, or all the entries for a location, by sending a request to the directory program. Truncated names can be used if a user is uncertain of the correct spelling of a name. The directory program returns a document containing the entries that meet the criteria. Users can then display the document or print it for manual use.

- **User Affinity Support**

DISOSS/370 Version 3 extends user affinity support to include Displaywriter and Scanmaster I users. 8100/DOSF, Displaywriter, 5520 and Scanmaster I users can be defined so that they can work on their own behalf or on behalf of others. In addition, Displaywriter and Scanmaster I users can be defined as part of recipient groups so that they can either obtain their own mail or that of the entire group.

- **Improved Management of Document Library Space**

The organization of the host document library has been improved to provide online reclamation of document space. Document space

will be reclaimed after all authorized users have deleted their access to a document. With DISOSS/370 Version 3, it is no longer necessary to execute an offline library reorganization utility to reclaim available space. The library reorganization utility need only be executed to archive documents or to restore archived documents.

The host library uses VSAM keyed sequential data sets (KSDS) which provide enhanced document library integrity by enabling DISOSS/370 to take full advantage of the CICS/VS VSAM data base recovery capabilities.

CUSTOMER RESPONSIBILITIES

Installation of DISOSS/370 requires systems programming and systems administration resources. Customers must install DISOSS/370, CICS/VS and the associated prerequisite programs specified under "Software Requirements". In addition, customers must define the operating environment to DISOSS, initialize the document library, create the user profile information data base, and initialize other data sets used internally by DISOSS. The installation assist package is provided to facilitate this process.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

DISOSS/370 Version 3 Release 1 is designed to run on any IBM S/370, 4331, 4341, 4361, 4381, 303X, or 308X Processor having a minimum of 2 megabytes of real storage that meets the minimum requirements for either of the prerequisite operating system programs, OS/VS2 (MVS) or VSE, and CICS/VS.

DISOSS/370 requires 1.2 megabytes of virtual storage in addition to that required for the appropriate release of CICS/OS/VS or CICS/DOS/VS. Additional storage requirements will vary depending on user configuration and workload.

It is estimated that a minimum of 55.5 megabytes of DASD storage will be required for the IBM-supplied DISOSS modules and the files required to operate DISOSS/370 Version 3 Release 2. Additional DASD storage will be required to contain the document library, library indexes, user profiles, and other DISOSS files. The sizes of these files will depend on user-controlled variables.

SOFTWARE REQUIREMENTS

IBM DISOSS/370 is written in a proprietary language.

DISOSS/370 Version 3 is designed to operate in the following environment:

- CICS/OS/VS (5740-XX1) Version 1 Release 6
- ACF/VTAM OS/VS2 Version 2 (5665-280)
- MVS/System Product 1 or System Product 2
 - JES 2 MVS/SP-JES2 Version 1 Release 3 (5740-XYN)
 - JES 3 MVS/SP-JES3 Version 1 Release 3 (5740-XYN)
 - JES 2 MVS/SP-JES2 Version 2 (5740-XC6) (MVS/370 compatibility mode only)
 - JES 3 MVS/SP-JES3 Version 2 (5665-291) (MVS/370 compatibility mode only)
- ACF/NCP/VS
 - Version 1 Release 3 (5735-XX1)
 - Version 2 Release 1 (5735-XX9)
- CICS/DOS/VS Version 1 Release 6 (5746-XX3)
- ACF/VTAM VSE Version 2 Release 1 (5666-280)
- DOS/VSE Release 3 with VSE/Advanced Functions (5745-030)
- VSE/VSAM Release 2 (5746-AM2)
- VSE/POWER Release 2 (5746-XE3)

Notes:

- DISOSS/370 requires the use of the Virtual Storage Access Method (VSAM).
- In an MVS environment, MVS Information Distribution Workstation Support (5740-AMA) is required if the SNA version of the IBM 6670 is used as a host line printer.
- DISOSS/370 Version 3 supports the 5520 Administrative Processing Program (5611-SS2) Release 2 and Release 3 for Library Services.
- DISOSS/370 Version 3 Release 2 supports the 5520 Administrative Processing Program (5611-SS2) Release 3 for Document Distribution.
- DISOSS/370 Version 3 operates with the Displaywriter Electronic Document Distribution (EDD) licensed program (5608-SR8) which requires either Textpack 4 (5608-TR4) or Textpack 6 (5608-TR6).
- In the IBM 8100, the following are required:
 - IBM Distributed Processing Control Executive (DPCX) (5761-DS1) Release 2.2, with feature #6001, and subsequent releases unless otherwise specified.

PROGRAM PRODUCTS

DISOSS/370 V3 R2 (cont'd)

- IBM Distributed Office Support Facility (DOSF) (5761-XR1), Release 2.1 together with IBM Host Prep (5735-XR3) Release 4.1, and subsequent releases unless otherwise specified.
- DPCX Release 3, DOSF Release 3, and Host Prep Release 5, and subsequent releases are required for printing final form text documents on a 5210 Printer with EC 996869 and for handling image documents.
- DOSF Release 4 or a subsequent release, along with required prerequisite programs, is required for support of the revisable form text data stream.
- IBM Distributed Office Support System/8100/DOSF (DISOSS/8100/DOSF) Release 1 (5668-955) and subsequent releases unless otherwise specified.

COMPATIBILITY

DISOSS/370 Version 3 will not operate on OS/VS1, ACF/TCAM, ACF/VTAME, or IMS/VS. Customers using these programs should consider migrating to a supported environment. Refer to the "Specified Operating Environment" section for details.

MIGRATION

DISOSS/370 Version 3 is designed as an extension of DISOSS/370 Versions 1 and 2 and DISOSS/VSE Releases 1 and 2. Users who wish to take advantage of the extended functions provided by DISOSS/370 Version 3 can migrate from DISOSS/370 Versions 1 or 2 to DISOSS/370 Version 3. DISOSS/370 Version 3 provides utilities to assist in converting the host document libraries and the host user profile data base from Version 1 or 2 format to the Version 3 format. Some manual editing of control statements will be required to change the host user profile from Version 1 to Version 3. DISOSS/VSE Release 1 and 2 users can migrate in a similar fashion.

DISOSS/370 Version 3 Release 1 users migrating to DISOSS/370 Version 3 Release 2 must create a new host user profile. This can be done with the same definitions used to create the DISOSS/370 Version 3 Release 1 host user profile. In order to take advantage of DISOSS/370 Version 3 Release 2 enhancements for document distribution among multiple hosts and naming conventions to reduce network maintenance, changes must be made to the host user profile creation definitions.

IMS/VS users who wish to migrate to DISOSS/370 Version 3 on the CICS/VS subsystem can use these utilities as an aid in migrating and in converting from DL/1 to the VSAM access method. Some manual editing of control statements will be required to change the user information profile data set.

PERFORMANCE CONSIDERATIONS

Capacity planning for each individual DISOSS/370 Version 3 Release 2 host in a customer's environment can be accomplished by using the DISOSS/370 Version 3 Release 1 *Capacity Planning Guides* for both MVS and VSE. The IBM aid SNAP/SHOT will be available at first customer shipment to model inter-DISSOSS/370 host load in a Version 3 Release 2 environment and to evaluate individual customer performance capability.

INSTALLATION

DISOSS/370 provides the following utilities and techniques to simplify the installation process and maintenance of its data sets:

- Model operating environment definition statements, provided by the easy install package, which may be customized to meet the needs of each installation. (These statements replace the generation facilities provided by previous DISOSS versions.)
- Default values for installation parameters, which provide a guideline and reduce installation time and effort whenever these values are acceptable.
- Definition statements for use in creating the jobstream required to load an 8100/DOSF controller with the DISOSS/8100/DOSF program product.
- A utility that supports the creation and maintenance of user profile information, such as the user's name, password, and access codes.
- A utility that supports the creation and maintenance of distribution lists for use with Scanmaster I.
- Utilities that support the migration of DISOSS/370 Versions 1 and 2 or DISOSS/VSE Releases 1 and 2 host document libraries and user profile data bases to the DISOSS/370 Version 3 environment.
- Utilities that allow users to delete, backup and restore selected documents from the library, transfer ownership of all documents from the owner to another user, and print the search arguments for documents stored in the library.

DATA SECURITY

Installations can protect their DISOSS resources from unauthorized access by assigning user passwords that are maintained as a part of the user profile information.

DISOSS/370 is designed to provide document security based on the interaction of access codes and document ownership:

• Access Codes

Access codes can be assigned to users centrally, at the host, and to documents, during filing. To access a filed document, a user must be assigned an access code that matches one access code of the document to be retrieved.

• Document Ownership

DISOSS/370 provides two types of document ownership:

- Primary document ownership which is assigned to the filing or original distribution requestor. Only primary owners of a document are authorized to assign access codes to the document or delete existing access codes.

- Secondary document ownership which is assigned to the recipients of distributed or redistributed documents. These recipients are not authorized to assign or change access codes.

Document deletion requests can be issued only by the document owners and will result in deletion of that person's ownership. Deletion by all owners causes the document to be physically deleted from the host document library.

The combination of access codes and document ownership characteristics determine the privacy characteristics of a document. There are three levels of document privacy:

- Private - These documents are those that are accessible only to the primary owner. Private documents have not been assigned any access codes and have not been distributed to any secondary owners.
- Shared - These documents are accessible only to users authorized either through access codes or primary or secondary ownership.
- Public - These documents are accessible to all authorized DISOSS/370 users. They carry an access code of zero.

In an OS/VS2 (MVS) environment, a DISOSS/370 customer can choose to use the Resource Access Control Facility (5740-XXH) to provide additional protection for the Document Library and User Information Profile data sets.

For applications in which sensitive data is sent over external communication facilities, users may augment these facilities with cryptography.

SYSTEM INTEGRITY

IBM will accept APARS where the installation of DISOSS/370 Version 3 Release 2 introduces an exposure to the system integrity of OS/VS2 (MVS). Refer to Programming Announcement dated October 21, 1981. DISOSS/370 Version 3 is intended to run unauthorized.

RPOs ACCEPTED: No

PROGRAM PRODUCTS

5740-XC6 - MVS/SP-JES2 V2.1.1
5665-291 - MVS/SP-JES3 V2.1.1
MVS/SYSTEM PRODUCT-JES2
VERSION 2 RELEASE 1 Modification Level 1
MVS/SYSTEM PRODUCT-JES3
VERSION 2 RELEASE 1 Modification Level 1

PURPOSE

MVS/SP 2.1.1 is an enhancement to the first release of MVS/System Product Version 2 (which will be identified as MVS/SP 2.1.0 in this document). MVS/SP 2.1.1 contains additional virtual storage constraint relief over the prior release, additional serviceability items for large system complexes, and additional operational improvements and device support. MVS/SP 2.1.1 incorporates most of the new functions announced for MVS/SP Version 1 Release 3.0, MVS/SP Version 1 Release 3.1, MVS/SP Version 1 Release 3.2, and MVS/SP Version 1 Release 3.3.

INTRODUCTION

MVS/SP 2.1.1 will be used as a generic term to refer to both: MVS/System Product-JES2 Version 2 Release 1 Modification Level 1 ... MVS/System Product-JES3 Version 2 Release 1 Modification Level 1.

MVS/SP 2.1.0 is the base on which subsequent releases are to be installed, and is a prerequisite to MVS/SP 2.1.1.

DESCRIPTION

Items included are listed below:

- Identification of the releases of the licensed programs.
- Highlights of each release of the licensed programs.
- A description of the Base Control Program.
- A description of the JES2 support.
- A description of the JES3 support.
- The identification of pre-requisite and co-requisite items.
- Information concerning configuration requirements, system generation and maintenance requirements.
- Information concerning related products which will probably be used in this environment.

IDENTIFICATION OF THE MVS/SP VERSION 2 RELEASES

MVS/SP 2.1.1: There are two licensed programs offered in this release. The Base Control Program is the same in both licensed programs. The licensed programs are:

- MVS/System Product-JES2 Version 2 Release 1 Modification Level 1.
 This licensed program consists of a Base Control Program and Job Entry Subsystem 2 (JES2). This release has the following characteristics:
 - The JES2 component of this release is functionally equivalent to the JES2 component of MVS/SP 1.3.3.
 - MVS/SP-JES2 2.1.0 is a pre-requisite.
 - Data Facility Product (DFP) Release 1.1 is a co-requisite.
- MVS/System Product-JES3 Version 2 Release 1 Modification Level 1.
 This licensed program consists of a Base Control Program and Job Entry Subsystem 3 (JES3). This release has the following characteristics:
 - The JES3 component of this release is functionally equivalent to the JES3 component of MVS/SP 1.3.1. This JES3 component is also functionally equivalent to the JES3 component of MVS/SP 2.1.0.
 - MVS/SP-JES3 2.1.0 is a pre-requisite.
 - Data Facility Product (DFP) Release 1.1 is a co-requisite.

MVS/SP 2.1.0: Two licensed programs were announced on October 21, 1981. The Base Control Program is the same in both licensed programs. The licensed programs are:

1. MVS/System Product-JES2 Version 2 Release 1 Modification Level 0.
 This consists of a Base Control Program and Job Entry Subsystem 2 (JES2). This release has the following characteristics:
 - The JES2 component of this release is functionally equivalent to the JES2 component of MVS/SP 1.3.0.
 - MVS/SP 2.1.0 must be installed on OS/VS2 MVS Release 3.8.
 - Data Facility Product (DFP) Release 1.0 is a corequisite.
 - A SYSGEN is required.
2. MVS/System Product-JES3 Version 2 Release 1 Modification Level 0.
 This consists of a Base Control Program and Job Entry Subsystem 3 (JES3). This release has the following characteristics:
 - The JES3 component of this release is functionally equivalent to the JES3 component of MVS/SP 1.3.1.

- MVS/SP 2.1.0 must be installed on OS/VS2 MVS Release 3.8.
- Data Facility Product (DFP) Release 1.0 is a corequisite.
- A SYSGEN is required.

TERMINOLOGY

The following terms will be used throughout:

- **MVS/System Product Version 2 (MVS/SP V2)**
 This term will be used to identify topics which are common to all releases and all modification levels of MVS/System Product Version 2.
- **Data Facility Product (DFP)**
 DFP is a licensed program which contains data management support, device support, program library management support, and utility functions.
- **MVS/XA**

MVS/System Product-JES2 V2 or MVS/System Product-JES3 V2 is a required part of MVS/XA. MVS/SP V2, the co-requisite Data Facility Product (DFP) (5665-284) licensed program, plus selected modules and macro instructions from OS/VS2 MVS Release 3.8 comprise MVS/XA.

MVS/XA supports the following systems when they are operating in S/370 Extended Architecture mode:

- 3081 Processor Complex
- 3083 Processor Unit
- 3084 Processor Complex

MVS/XA provides many enhancements, particularly in areas that address constraints connected with programming. Examples of the enhancements are: Additional virtual storage and an additional number of I/O devices. These and other enhancements will be described in the following topics.

INSTALLATION AND MAINTENANCE REQUIREMENTS

SYSGEN Requirements

- MVS/SP 2.1.0 requires a SYSGEN.
- If MVS/SP 2.1.0 was previously installed, a SYSGEN is not required for MVS/SP 2.1.1 (MVS/SP 2.1.1 may be applied directly to the users' system libraries using an appropriate level of the system maintenance program).

See the section "Installation Considerations" for additional information.

Optional Program Products: For installations desiring to use the following programs, the specific releases stated below are required to function with MVS/SP V2:

- For users of Resource Measurement Facility (RMF), the RMF Version 3 licensed program is required. This is a new version of RMF and is a total replacement for existing RMF support.
- For users of TSO TEST, TSO Command Package, or TSO/E for MVS/370, the TSO/E for MVS/XA licensed program or equivalent is required.

MVS/SP 2.1.1 - HIGHLIGHTS

The major items in this release are:

- Support for the 3880 model 11 and model 13.
- Virtual Storage Constraint Relief of approximately 400K bytes, providing additional capacity for large subsystems and applications. The virtual storage constraint relief in MVS/SP 2.1.1 is in addition to that in MVS/SP 2.1.0. It was obtained by moving system modules and data areas from the virtual storage area below 16 megabytes to the area above the first 16 megabytes. Further information is contained in the section "Virtual Storage Considerations".
- Improvements in the processing of the system link library concatenation, to eliminate the need to tune the LNKLIST libraries for performance and to reduce the complexity of system maintenance for many large systems.
- Automated dump analysis and suppression of duplicate dumps by selected components along with many other serviceability enhancements, to improve system programmer productivity.
- Numerous RAS enhancements, including the ability to restart SMF after a failure without an IPL and the movement of SMF to a private address space.

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

The changes to SMF combine to make SMF more reliable and provide improved availability of SMF, which is particularly important with the continued growth in processor capacity and the resultant dependence on SMF data to monitor and report on the workload of the system.

- Improved operation and control for multi-system environments by allowing the SYS1.LOGREC data set to reside on a volume other than SYSRES, by allowing multiple PAKLST parmlib members, and concatenated LPALIBs. (Each of these items is described below).

- Support of Separate SYS1.LOGREC data sets.

The LOGREC change allows an installation to share SYSRES for multiple systems and to keep a separate SYS1.LOGREC data set for each system. The separate LOGREC data sets will be located through the Master Catalog. The SYSRES volume will remain the default.

- Support for multiple PAKLSTs.

Multiple PAKLST parmlib members allow an installation to define separate parmlib members (IEAPAKxx) for each system which must be maintained rather than having separate copies of SYS1.PARMLIB. The PAKLST parmlib members are specified via a new system parameter keyword, 'PAK'. If the keyword is not specified, the default will be 'PAK=00', thus maintaining compatibility for current installation procedures.

- Support for Concatenated LPALIBs:

This allows an installation to have separate data sets for the individual systems that must be maintained rather than alternate copies of the entire SYS1.LPALIB. The data sets are specified in a set of LPALSTxx members in SYS1.PARMLIB, and they will be concatenated to SYS1.LPALIB in order to form the list of data sets to be used when constructing the Pageable Link Pack Area (PLPA). The LPALST parmlib members are specified via a new system parameter keyword 'LPA'. If the keyword is not specified, SYS1.LPALIB will be used.

In addition, MVS/SP 2.1.1 contains support for the program function recently announced for MVS/System Product Version 1. These items include:

- Support to allow multiple copies of ACF/TCAM Version 2 Release 4 (5735-RC3) program product to operate concurrently in the same processor.
- ISAM space recovery (previously available in MVT and SVS).
- Deferred mounting of volumes supported by dynamic allocation.
- 3800 Printing Subsystem keywords supported by dynamic allocation.
- Support for the MVS/Operator Communication Control Facility (MVS/OCCF) in the JES2 environment. MVS/OCCF is a program which allows one or more remote MVS Systems to be operated from a host MVS System. The following support is provided for MVS/OCCF:

- The MVS/OCCF user can acquire or alter the use of a console. This support allows MVS/OCCF to obtain and release a console, change the routing/destination codes of a console, or request whether messages are to be broadcast to all subsystems.

- Commands can be issued at a console on the remote system with the result displayed on the host MVS/OCCF console, with the converse capability being available.

- Multiple console Support (MCS) consoles can be initialized at IPL via the command PARMLIB facility. After IPL, the master console operator or an operator at an MVS/OCCF console may direct commands to other consoles to correct systems problems related to MCS consoles.

- Eleven additional JES2 user exits

- Exit 0 - Pre-Initialization Exit.

Allows an installation to change the initialization options, alter JES2 control blocks, and initialize installation-defined control blocks. It can also instruct JES2 to bypass the initialization options or to terminate initialization processing.

- Exit 14 - Job Queue Work Select Exit.

Allows the algorithm in the user exit routine to search the JOB Queue and return a JOB Queue Element or allow normal JES2 searching.

- Exit 15 - Output Data Set/Copy Select Exit.

Allows the user to create separation pages for each data set or copy of a data set, instead of creating separation pages only at the start and end of a job.

- Exit 16 - Notify Exit.

Allows the user to examine or modify the message text before the \$WTO for the notify message is sent.

- Exit 17 - BSC RJE Signon/Signoff.

Allows the user in a BSC RJE environment to implement additional security checks over the standard password check, limit the number and types of remote devices that can be on a system at any one time, and at Signoff to gather statistics of terminal usage.

- Exit 18 - SNA RJE Logon/Logoff.

Allows the user in an SNA RJE environment to implement additional security checks over the standard password, check, limit the number and types of remote devices that can be on a system at any one time, and at signoff to gather statistics of terminal usage.

- Exit 19 - Initialization Statement Exit.

Allows the user to implement additional checking of the initialization statement, make alterations to the values supplied or to implement installation initialization statements.

- Exit 20 - End of Job Input.

Gives the user the opportunity to specify or override the System Affinity (SYSAFF), the execution mode and priority of the job.

- Exit 21 - SMF Record Exit.

Makes available the JES2 control blocks which are required by the SMF exit (IEFU83). This exit will be taken whenever a JES2 processor submits an SMF record (for processing by the JES2 subtask which actually issues the SMF WTM's).

- Exit 22 - Cancel/Status Exit.

Allows the users to define their own criteria for job selection and job ownership to the Subsystem Interface's Cancel/Status Interface.

- Exit 24 - Post Initialization Exit.

Gives the user the ability to make modifications to JES2 control blocks prior to the end of initialization. The exit may also initialize and process installation-defined control blocks.

- User Control of JES2 Sysout Data Set Grouping.

JES2 Improvements to the usability and operational characteristics of output processing and its associated command processing.

- New Output JCL statements which allow the user to specify which data sets are to be contained in an output work unit. The user can also specify the setup characteristics and the priority for the output group.

- Operational enhancements provide improved procedures for limiting the formation of demand setup groups, limiting which output device will process demand setup groups, limiting the use of user-specified priorities for output and reducing operator intervention. Overall these enhancements will assure that the efficient processing of the user's output will not be disrupted by the increase in the amount of demand setup work.

- Dynamic Add/Delete of Spool Data Sets

A new JES2 facility which gives an installation the capability to dynamically add and delete spool data sets (without warm starts) with minimal impact to the normal processing of work.

- Capability for the operator to dynamically add or delete spool data sets eliminating the need to resort to a warm start which impacts the normal processing of work.

- A number of operator commands will be enhanced to display the jobs on a volume or the volumes used by a job.

MVS/SP 2.1.0 - HIGHLIGHTS

The major items in this release are:

- 31-bit Virtual Addressing: The memory map allows the full range of 31-bit virtual addressing to be utilized by system and user programs executing in 31-bit addressing mode. The new memory map provides complementary extended areas above 16 megabytes for most of the areas that exist below 16 megabytes (e.g., Private and Extended Private, Nucleus and Extended Nucleus, PLPA and Extended PLPA, SQA and Extended SQA).

MVS/SP V2 allows programs to execute in 24-bit addressing mode or in 31-bit addressing mode. The 24-bit addressing mode is provided for programs that were designed for execution in MVS/370 and for programs that do not require greater than the 24-bit addressing range (16 megabytes). Extensive support has been provided to insure that programs prepared for 24-bit environments (i.e., 24-bit addressing mode) will execute correctly.

PROGRAM PRODUCTS

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

Insertions, deletions and changes which have been made to system interfaces, and to system control block structures will be identified.

In 31-bit addressing mode, programs may utilize the entire 31-bit (two gigabyte) virtual addressing range. In this release, the user can begin to take advantage of the 31-bit virtual addressing support provided by system services. Many Base Control Program services fully support 31-bit virtual addressing while others support a 31-bit interface (but still require parameters and data to be below 16 megabytes virtual). Other interfaces only support the MVS/370 level of interface.

The EXCP Processor provides a new interface to support 31-bit virtual addresses for data transfer operations (e.g., address of the I/O area specified in read or write requests). In this support, the user supplies the 31-bit virtual address in an Indirect Data Address Word (IDAW) associated with the CCW.

- Virtual Storage Constraint Relief (VSCR): Programs that were designed for 24-bit virtual addressing will continue to execute and use storage below 16 megabytes. These programs will benefit from MVS/SP V2's use of the two gigabyte address range. Many system data areas have been moved to extended system areas and many system programs have been modified to execute in the address range above 16 megabytes, thus making available increased virtual storage below 16 megabytes for those programs that require it. Specific changes include:
 - Most of the storage management control blocks have been moved to locations above 16 megabytes virtual.
 - Most programs which support the Generalized Trace Facility (GTF), recovery/termination, print dump, Region Control Task (RCT), and dumping services have been moved to Extended Pageable Link Pack Area (i.e., above 16 megabytes Virtual).
 - Selected control blocks that currently reside in SQA have been moved to Extended SQA.
 - The system trace table has been moved from SQA to a private address space.
 - Portions of the nucleus have been moved to an extended nucleus which resides above 16 megabytes virtual.

In S/370 Extended Architecture, the segment boundaries occur at one megabyte intervals. Since MVS/SP V2 uses segment entries to provide isolation, the effect of rounding must be considered in all assessments of virtual storage requirements.

The 31-bit virtual addressing capabilities provide a base whereby programs can be designed to take full advantage of the large address range.

- Nucleus changes: The Nucleus of MVS/XA has been relocated so that it resides partially below and partially above the 16 megabyte virtual address boundary. The requirement for contiguous error free real storage has been reduced. Sections of the nucleus are protected from accidental destruction by erroneous stores or modification to these areas.

Those portions of the nucleus that execute DAT-off have been placed in a new nucleus module IEAVEDAT and it is referred to as the DAT-off nucleus. This module is loaded in contiguous high real storage and is not virtually addressable in any address space. The remainder of the nucleus continues to be named IEANUC0x and is referred to as the DAT-on nucleus.

- Increased number of I/O devices: The new maximum number of devices is 4,096.
- Enhanced support for real addresses above 16 megabytes: The locations above 16 megabytes real are supported for I/O operations as well as space for backing virtual pages, system data areas and programs. I/O support for these locations is provided by Indirect Data Address Words (IDAWs) with the existing Channel Command Word format (Format 0 CCW), and with a new Channel Command Word format (Format 1 CCW).

Most user programs have no dependencies on real addresses. Thus, this extended real storage support will be transparent to most user programs. Some programs, however, depend on real addresses. For example, programs that execute Virtual=Real (V=R) or existing programs that use EXCPVR require real storage below 16 megabytes. For these programs, MVS/SP V2 will automatically supply real frames below 16 megabytes when a page fix is requested. Users may also request virtual storage which is backed below 16 megabytes. To make more real storage below 16 megabytes available for those programs that require it, MVS/SP V2 has relocated portions of major system areas (such as the Nucleus, LSQA and SQA) to frames above 16 megabytes.

Interactive environments such as TSO can use additional real storage for working set pages, thereby reducing demand paging and increasing capacity and responsiveness.

- Support of the S/370 Extended Architecture Channel: The I/O Supervisor and related areas support the increased flexibility and

improved RAS characteristics of the S/370 Extended Architecture Channel.

Operating under MVS/SP V2, the dynamic reconnection facility of the dynamic path selection function of the 3380 Direct Access Storage (model AA4) allows the device to reconnect to any channel path identified by the originating system. By improving the probability of finding an available path from a device, this function may increase the effective throughput or it may improve response time. In addition to changes in the I/O Supervisor (IOS), the Systems Resources Manager (SRM) component has been modified to allow higher thresholds of channel utilization in support of this function.

- S/370 Extended Architecture Trace: The S/370 Extended Architecture includes additional trace capability. A queue of trace buffers is provided for each processor. System trace, which supports the S/370 Extended Architecture, provides branch tracing, address space ID tracing and explicit software-initiated tracing. Provisions are made for the system operator to control the new trace facilities through extensions to the TRACE operator command.

The system trace now operates concurrently with GTF.

- RAS Enhancements

RAS Overview: As IBM products and systems play a more important role in the operation of our customers' business, there is increased dependence on the reliability, availability, and serviceability of products and systems.

MVS/SP V2 includes new and improved reliability, availability, and serviceability (RAS) features. These features provide significant improvements in error detection and recovery, error data capture, operations, and dumping and dump formatting options. These features are designed to improve system reliability and availability, to enhance operator and installation control of MVS/XA, and to decrease the problem determination and debug time for both system and user dumps.

These new and improved RAS features are an indication of the on-going focus on large systems RAS.

- RAS Highlights

- Error Detection and Recovery Improvements

Improvements in error detection improve the ability of MVS/XA to protect itself from errors. New capabilities improve the ability to detect and correct error conditions.

- A new hardware protection mechanism is used to protect selected key system areas from overlays. This protection is applied to individual 4K pages.
- The S/370 Extended Architecture Channel is used to provide improved access to all I/O devices in the event of a processor failure.
- The Missing Interrupt Handler (MIH) is initialized as part of every IPL.
- Additional FRRs were added to IOS, VSM, RSM.
- Allocation detects and recovers from I/O errors on devices being allocated.

- Error Data Capture Improvements

Problem determination and debugging are simplified by the collection of additional error data.

- On system mode errors, RTM captures key debugging information before it can be changed by recovery processes.
- Tracing enhancements include support of the new hardware trace mechanism, operator control of dynamic trace options, new trace table entries, and improvements in trace entry content and formatting. Also, the trace buffers have been placed in a separate address space.
- GTF improvements include extended support for user trace entries, new I/O architecture support, and concurrent tracing with the system trace.
- A new SLIP-SVCDUMP interface has been created to improve the content of dumps requested by SLIP.
- Changes to the I/O Supervisor (IOS) storage manager permit better tracking of the use of IOS storage areas.

- Dumping and Dump Formatting Improvements

Some new dumping and formatting options have been provided to assist the collection and presentation of the information needed for debugging but to eliminate that which is not needed.

- New SNAP/ABDUMP options allow the dumping of selected portions of subtask data, and of user selected subpools.

PROGRAM PRODUCTS

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

- Subtask data will automatically be supplied on dumps resulting from x22 ABENDs (cancels).
- Output of the SNAP/ABDUMP subpool (SPLS) option will be in ascending address order.
- Support is provided for exit routines that receive control when SNAP/ABDUMPs are requested and before the dump is taken.
- New SVCDUMP options allow the selection of areas by subpool number and storage key.
- SNAP/ABDUMP and SVCDUMP provide options to reduce the amount of nucleus data dumped.
- SVCDUMP will dump storage around the location (i.e., PSW instruction address) at which an error was detected.
- Support is provided for exit routines to receive control after SVCDUMPs have been taken.
- New formatters for IOS, Virtual Storage Manager (VSM), Real Storage Manager (RSM) and Auxiliary Storage Manager (ASM) are provided for use with PRINT DUMP.
- A new PRINT DUMP formatter is provided to format the System Trace table.
- The PRINT DUMP SUMMARY, FORMAT, and LPAMAP verbs are enhanced.
- Improvements have been made to the PRINT DUMP user exit interface to improve its usefulness.
- IPCS Support
IPCS will provide interactive dump viewing and problem analysis capabilities for MVS/XA. IPCS will also provide usability improvements.
- Miscellaneous Enhancements
Additional improvements have been made to assist problem identification.
 - New operands on the ABEND, CALLRTM, and SETRP macros permit the specification of the abend reason code.
- Operational Improvements:
Operational improvements aid the operator and the installation to control the MVS/XA system. In addition, operational improvements are provided that permit simplified and improved problem determination.
 - Authorized programs may add, modify, or delete entries in the SVC Table through use of the new SVCUPDTE macro instruction.
 - IOS Recovery attempts to move RESERVEs so as to avoid the requirement to stop systems which are sharing the device(s).
 - IOS Recovery avoids stopping other tightly coupled processors when communicating with the operator.
 - HOT I/O (i.e., an invalid repeated interruption condition caused by a hardware malfunction) recovery actions can be defaulted, thus bypassing the need for operator intervention.
 - The system trace table size and tracing options may be changed dynamically by the system operator.
 - The CANCEL and FORCE commands have been enhanced to terminate address spaces that are not cancellable today. Address spaces are also cancellable by Address Space Identifier (ASID).
 - Dumps that are normally not needed for problem determination will be suppressed. The SLIP NODUMP function has been extended to consider dump type as selection criteria.
 - A new operator command, DUMPDS, permits the dynamic connection, disconnection, or clearing of SYS1.DUMP data sets.
 - Extensions to the SYS1.DUMP data set support permits use of the DUMP option of the IEASYSxx member of SYS1.PARMLIB for selection of the SYS1.DUMP data sets. Up to 100 SYS1.DUMP data sets may be connected to SVCDUMP at one time. Suffixes to the SYS1.DUMP data set name may be numbers from 00 to 99.
 - Enhancements have been made to the DISPLAY DUMP command to assist problem determination for dumps in the SYS1.DUMP data sets.
 - Improvements have been made to Stand-Alone Dump to improve its usability and to provide additional control. Stand-alone dump will support 'shared (non-dedicated) paths' to output tapes and DASD devices.
 - New operator console support permits the installation to control the use of up to seven colors, underscoring, blinking, and reverse image display through specifications in SYS1.PARMLIB.

- When AMDPRDMP is used to offload a SYS1.DUMP data set, it will provide a brief description of important information about the dump. This information will be helpful for both dump management and problem determination.

- JES2: The JES2 component supplied with MVS/SP 2.1.0 is functionally equivalent to the JES2 component supplied with MVS/SP 1.3.0. (See "Installation Considerations".)

In loosely-coupled (multiaccess spool) JES2 environments, co-existence can occur only between processors using the same level of JES2.

- JES3: The JES3 component supplied with MVS/SP 2.1.0 is functionally equivalent to the JES3 component supplied with MVS/SP 1.3.1. (See "Installation Considerations".)

In loosely-coupled JES3 environments, co-existence can occur only between processors using the same level of JES3 components.

DESCRIPTION OF MVS/SP V2

MVS/SP V2 BASE CONTROL PROGRAM (BCP): The MVS/SP V2 BCP is composed of routines which assist in the:

- Entering and scheduling of work.
- Supervising the execution of work.
- Managing of system resources.
- Satisfying of I/O Requests.
- Recovering from errors.
- Support of Multiprocessing.
- Monitoring of system activity.

Each of these areas is described in the following sections.

ENTERING AND SCHEDULING OF WORK

JOB MANAGEMENT: Job Management controls the processing of jobs. It performs a variety of functions that include processing commands, reading and interpreting job and step definitions, allocating data sets and I/O devices, scheduling jobs, and writing system messages and job output.

Job management functions are performed by the master scheduler, the job entry subsystem (JES2 or JES3), and the job scheduler.

The master scheduler initializes the system and responds to operator commands by initiating the requested actions. The job entry subsystem reads job definitions, schedules the jobs for processing, and records job output data. The job scheduler builds control blocks in the scheduler work area (SWA) and initiates and terminates the processing of jobs and job steps.

MASTER SCHEDULER: The master scheduler is a system-initiated task that is established when the system is loaded. Its functions can be divided into two categories: Initialization and command processing.

Master scheduler initialization includes:

- Initiating the console communications address space (COMTASK) to handle all communication with the operator consoles.
- Initializing the subsystem interface.
- Initiating the allocation address space.
- Initialization will diagnose invalid entries in the current Eligible Device Table (EDT).
- Initializing the event notification facility.
- Establishing an ESTAE environment to handle system task failures during initialization.
- Initializing the system management facilities (SMF).
- Initializing the missing interruption handler.

Command processing includes the reading, scheduling, and executing of operator commands issued through a console device, an input job stream or a remote workstation.

The scheduling of a command consists of preserving the command and readying a task to continue processing the command. A command scheduling routine operates under either the console communications task (when the command was issued from a console device), or the reader task (when the command was issued through an input job stream).

The executing of a command is the performance of the function specified by the command. The functions are performed either as new tasks (established by the master scheduler or COMTASK) or as parts of existing system tasks.

JOB ENTRY SUBSYSTEMS: The Job Entry Subsystem is assigned the responsibility of readying of jobs and removal of job output (while the supervision of job execution is assigned to MVS/SP V2 BCP components).

There are two job entry subsystems available for use with MVS/XA: Job Entry Subsystem 2 (JES2), and Job Entry Subsystem 3 (JES3). A

PROGRAM PRODUCTS

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

fundamental difference between the two subsystems is the manner in which they manage multiple processor complexes.

The JES2 concept is one of decentralized control and a common job queue -- each JES2 processor operates independently of the others, but each may add jobs to or select jobs from the common job queue.

JES3 exercises centralized control over all processors. JES3 also uses a common job queue, but all jobs reach the queue only through one central JES3 component that selects and distributes work to the processors. This permits centralized resource control for devices, volumes, and data sets and gives the opportunity for fuller resource utilization.

JOB MANAGEMENT FACILITIES

Some of the major facilities provided for job management are multiple console support, system log, hardcopy log, and system management facilities.

MULTIPLE CONSOLE SUPPORT - MCS: Multiple console support (MCS) allows one operating system to use many operator consoles. Each console in a multiple console configuration is defined by specifying the operator commands the system will accept from that console, a console to act as an alternate if a failure occurs, and the types of messages the console will receive.

In a system with MCS, one console acts as the master console and the rest (up to ninety-eight) are secondary consoles. The master console is the basic console required for operator-system communication; it alone can accept all possible operator commands, change the status of the hardcopy log and the messages to be recorded on it, switch to a different master console, and receive all messages not specifically assigned to any other console. A secondary console is any console other than the master console; it handles one or more functions assigned to it (for example, it might handle tape activity).

The following list identifies the types of consoles supported by MVS/SP V2. MVS/SP V2 requires a minimum of one full-capability console. Note: The MVS/SP V2 minimum console requirement is in addition to the consoles required by the IBM processor operating in S/370 Extended Architecture mode.

Devices supported by Multiple Console Support (MCS)

MVS/SP V2 supports the following as consoles:

Input/Output Console (3)	Control Unit
2250 mdl 3	2848
3251 (when SYSGENED as 2250M3)	3258
3277 mdl 2 (2)	3272, 3274-1B, 1D, 21B, 21D, 31D
3278 mdls 2, -2A, -3, -4	3274-1B, 1D, 21B, 21D, 31D
3279 mdls 2A, -2B, -3A, -3B (4)	3274-1D, 21D, 31D
Output only Console (1) (3)	
3277 mdl 1 (2)	3272, 3274-1B, 1D, 21B, 21D, 31D
3278 mdl 1	3274-1B, 1D, 21B, 21D, 31D
3284 mdls 1 and 2 (2)	3272, 3274-1B, 1D, 21B, 21D, 31D
3286 mdls 1 and 2 (2)	3272, 3274-1B, 1D, 21B, 21D, 31D
Composite Console	
Combination Card Reader/Printer (1)	
Card Readers:	
2501	
2540	2821
3505	
Printers:	
1403	2821
3211	3811
3203-5	
4245	
Remote Console	
2740	

Notes:

- (1) A composite console must consist of a printer-keyboard or a card reader and printer to simulate the actions of a printer-keyboard. MCS allows output only consoles as secondary consoles.
- (2) The 3277 mdl 1, 3284 mdl 1 and 3286 mdl 1 attach via a 3272 mdl 1 or 2. The 3277 mdl 2, 3284 mdl 2, and 3286 mdl 2 attach via a 3272 mdl 2 only.
- (3) DIDOCS supported.
- (4) Use of seven colors and extended highlighting are supported on the 3279-2B and the 3279-3B. Specification of their use is governed by the Message Processing Facility (MPF) members of SYS1.PARMLIB.

DEVICE INDEPENDENT DISPLAY OPERATOR CONSOLE SUPPORT (DIDOCS): Device independent display operator console support (DIDOCS) is a facility that enables graphic display devices to be used as

operator consoles. Its use can result in faster communication between the system and the operator than can be achieved with standard printer-keyboard or composite console devices.

DIDOCS provides the following advantages to the operator:

- Ability to respond to a message or enter a command while messages are being written to the screen.
- Ability to see action messages to be answered and to delete any no longer needed.
- Ability to use the cursor, or selector light-pen when available, to delete messages and perform other display-oriented functions.
- Ability to initiate automatic command entry either with the selector light-pen or with the program function keyboard by an operator command.

STATUS DISPLAY SUPPORT (SDS): SDS provides a clear and understandable presentation of information to a system operator. It provides the following advantages to the operator: Ability to obtain a contiguous out-of-line display within specified display screen areas ... ability to obtain a dynamic status display from an operator command.

SYSTEM LOG: The system log is recorded in a SPOOL data set. It contains communications between problem programs, operators, and the system. It may contain the following kinds of information: Operating data entered by problem programs using a write-to-log (WTL) macro instruction ... Descriptions of unusual events that occurred during a shift ... Write-to-operator (WTO) and write-to-operator with reply (WTOR) messages ... Accepted replies to WTOR messages ... Commands issued through operator's consoles and the input stream, and commands issued by the operating system.

HARDCOPY LOG: The hardcopy log is a permanent record of system activity that is mandatory for systems with an active display console or multiple active consoles; for other systems, the primary console device serves as the hardcopy log. The hardcopy log is kept on another, non-display, console device or can also be kept on the system log.

Since multiple console support allows more than one console in a system, an installation should find it helpful to record all the messages issued by and to a system. The hardcopy log is a place to collect these messages, and therefore, an installation can review system activity by reviewing message activity.

SUPERVISING the EXECUTION of WORK

MVS/SP V2 SUPERVISOR: The Supervisor provides global functions for all work being done in the system. The Supervisor, in general, automatically controls the use of the Processor, I/O, real storage, and virtual storage. It provides a variety of services such as program loading, storage allocation, serialization services, timer services, work dispatching and interruption handling. To perform its function, the supervisor receives control following an I/O, external, or program interruption or through a program-requested supervisor call (SVC) interruption.

SUPERVISOR FUNCTIONS: Supervisor functions include:

- Managing system resources.
- Managing the content of virtual storage (Contents Supervision).
- Satisfying I/O requests.
- Recovering from errors.
- Supporting Multiprocessing.
- Monitoring system activity.
- Supporting Cross Memory Services.

Areas involved include:

INTERRUPTION PROCESSING: When an interruption occurs, the supervisor receives control, saves the status of the interrupted routine, analyzes the interruption, and passes control to the appropriate routine to process the interruption.

CREATING DISPATCHABLE UNITS OF WORK: Units of work are represented by control blocks in order to identify and keep track of all work in the system. The two types of control blocks which represent units of work are Task Control Blocks (TCBs) and Service Request Blocks (SRBs).

SERVICE MANAGEMENT (SRB SUPPORT): The service management function consists of dispatching and queuing techniques allowing system components to provide services that execute enabled, serialized, and in parallel. The basic control structure used by the service manager incorporates two levels of system priority, global and local. Service requests (SRBs) queued at the global level are given a higher priority than that of any address space, regardless of the address space in which they will be dispatched. SRBs queued at the local level are given a priority equal to that of the address space in which they will be dispatched, but higher than any task within that address space.

DISPATCHING WORK: After supervisor routines process interruptions, the dispatcher determines the unit of work which has the highest priority and passes control to that unit of work.

SERIALIZING THE USE OF PROCESSORS: In a multiprogramming system, instruction sequences can be interrupted, to be resumed later. The supervisor offers services that can be used to prevent other

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

programs from using resources owned by the interrupted routine. This support includes the management of locks, support of local requests to enqueue (ENQ) resources, and Global Resource Serialization (GRS).

MANAGING SYSTEM RESOURCES

The System Resource Manager (SRM) has two objectives:

- To distribute the system's resources among address spaces according to the installation's performance objectives.
- To achieve the optimal use of those resources from the viewpoint of system throughput.

An installation specifies its requirements for the first objective in a member of SYS1.PARMLIB called the Installation Performance Specification (IPS).

The system programmer can also influence many of the decisions of SRM by means of information stored in another member of the SYS1.PARMLIB data set.

RESOURCE MANAGEMENT: The control program can dynamically regulate the utilization of most system resources. A central set of system resource management routines coordinates the scheduling of various system resources attempting to both maintain efficient resource utilization and also to satisfy installation specified performance objectives.

With this support each job/user will belong to one of several installation-defined performance groups. The scheduling of system resources will then be controlled so that each job/user receives resources at a rate prescribed for the associated performance group by the installation. Jobs or TSO transactions can be associated with different resource consumption objectives as a function of the resource demand of the job or transaction. This is specified by having multiple performance group periods for a performance group.

The load on various system resources is monitored and resource scheduling decisions are made which will attempt to correct detected imbalances and overloads. For example, SRM monitors I/O interrupt activity and adjusts the number of processor(s) available for handling I/O interrupts.

The number of address spaces resident in real storage and eligible to use system resources (the multiprogramming level) is dynamically controlled based on contention for system resources. This is accomplished by swapping address spaces in and out of real storage.

The ability of address spaces resident in real storage to use the processor(s) can be controlled and dynamically changed as necessary to meet the installations' responsiveness and throughput goals.

Real storage is distributed among address spaces by the Real Storage Manager (RSM) under the direction of the SRM.

Real storage can be allocated to address spaces based on their demand relative to other address spaces for maximum throughput. Real storage can be allocated to address spaces with specific response time goals in mind and the amount can be dynamically adjusted to control the paging rate of the address spaces within acceptable limits. The SRM will use real storage, if available, to contain address spaces that are not demanding system resources, such as TSO address spaces waiting for the terminal user to enter a command.

The allocation of data sets for which no specific device has been explicitly or implicitly requested is controlled by the SRM. The selection of a device is based on the contention on the paths to devices and contention on the devices themselves.

STORAGE MANAGEMENT: Multiple address space supervision is provided by system resource management routines, real storage management routines, auxiliary storage management routines, and virtual storage management routines.

- The virtual storage manager (VSM): VSM's main function is to control the allocation and deallocation of virtual storage within each address space as directed by requesting GETMAIN and FREEMAIN macro instructions. See Figure 1 for a presentation of the MVS/XA Virtual Storage Map. In addition, VSM is comprised of routines that perform the following functions:

Address Space Creation and Deletion:

Creates and deletes the VSM control blocks necessary to describe new address spaces.

Task Initialization and Termination - initializes the VSM control blocks necessary to describe storage that is related to individual tasks.

Obtain/Free User Regions - creates and deletes the VSM control blocks necessary to describe the portion of the user's private area that is used for the user's problem programs.

Support the following VSM services:

- VSMLIST - Provides information about the allocation of virtual storage within an address space.

- VSMLOC - Verifies that a given storage area is getmained.
- VSMREGN - Provides the starting address and size of the non-extended and extended private area.
- CPOOL- Provides a high performance, general purpose cell management service.

VSM has been restructured to:

- Support a full two-gigabyte virtual address space. This support allows for movement of code and data to the extended virtual area and can provide relief to users currently constrained by the 16-megabyte virtual storage address limit.
- Provide functionally oriented routines and remove inter-component dependencies for easier serviceability.
- Enhance recovery for a higher degree of availability.

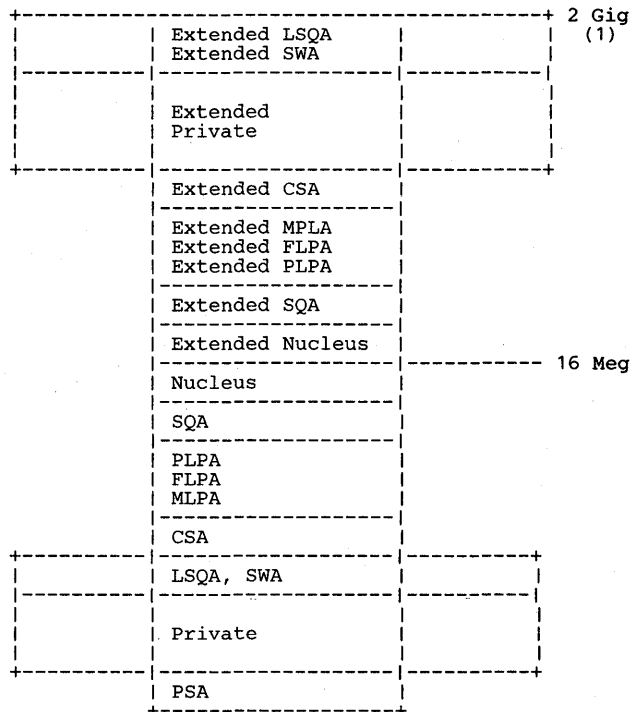

Figure 1. MVS/XA Virtual Storage Map²

Note 1: 'GiG.' = gigabytes = 2³⁰

Note 2: Figure not drawn to scale

- The real storage manager (RSM): RSM provides backing of virtual pages and directs the movement of virtual pages between real storage and auxiliary storage. RSM has been restructured to:
 - Support extended real addressing.
 - Handle virtual page requests for Page Fix, Page Free, Page Load, Page Out, Page Release, and Page Anywhere.
 - Create segment and page tables for each virtual address space.
 - Direct address space swapping.
- Provide service for the VIO facility.
- The auxiliary storage manager (ASM): ASM initiates the paging I/O necessary to transfer pages in and out of real storage (both individual page requests and block paging requests, such as swapping). ASM performs space management for all external page storage data sets. ASM also maintains and retrieves copies of the temporary virtual I/O (VIO) data set pages.

ASM has three types of direct access data sets. These types are: Page data sets, swap data sets, and SYS1.STGINDEX (ASM's journaling data set).

- Page data sets are VSAM data sets that make up the page space portion of auxiliary storage. ASM uses this page space to store the paged-out portions of all virtual storage address spaces and VIO data set pages. Each data set is formatted in 4096-byte records called slots.

To page efficiently, ASM divides the pages of the system into classes, namely PLPA, common, and local. A fourth class (duplex), is optional and provides system recoverability. The four types of page data sets and their usage are:

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

1. PLPA (pageable link pack area) page data set -- contains pageable LPA pages of the system plus ASM control information (including the quick start record). This page data set is filled during a cold start IPL and becomes effectively a read-only data set once PLPA has been constructed. The only exception occurs when overflow from the common page data set is written to this area.
2. Common page data set -- contains the non-PLPA virtual pages in the system common area.
3. Duplex page data set (optional) -- used for a secondary copy of the PLPA and common page data sets to provide system recoverability for a permanent I/O error on either of these data sets.
4. Local page data sets -- contain private address space unique pages, VIO data sets, and LSQA pages if there were no swap data sets available.

Local page data sets are placed on one of two circular queues to optimize performance.

- Swap data sets are VSAM data sets that are used to store and retrieve the set of LSQA (local system queue area) pages and working set pages belonging to an address space. Working set pages are private area pages that are swapped in with the address space.

Each data set is formatted in 4,096-byte slots, but ASM utilizes them in groups of twelve slots called swap sets. The contiguous slots of a swap set allow ASM to process the critical LSQA pages more quickly in groups instead of as individual pages.

- SYS1.STGINDEX data set is a key-sequenced VSAM data set used to store journal information. For example, ASM maintains a copy of the last checkpointed association between VIO pages and auxiliary storage on this data set. This provides recoverability in a step restart situation or warm start IPL.

ASM will assign paging and swapping devices to a higher Interruption Subclass (ISC) than other I/O devices in the system. This will allow paging completions to be presented to the system with a higher priority than other I/O interruptions that are pending.

**MANAGING THE CONTENT OF VIRTUAL STORAGE
(CONTENTS SUPERVISION)**

CONTENTS SUPERVISION: This support provides the facilities that respond to both system and user application requests which identify a requirement for a specific program (i.e., load module). The external interfaces to this function include: ATTACH, LINK, XCTL and LOAD.

LNKLST Processing: When Contents Supervision detects the need to search for a load module in LNKLST (i.e., SYS1.LINKLIB and any program libraries concatenated to it), it will employ a mechanism which eliminates channel and device contention caused by directory searches.

This support also:

- Eliminates the need to tune the LNKLST library directories for performance.
This improves system programmer productivity, particularly in a large multi-system environment.
- Improves dynamic update of modules in these program libraries.
- Raises the maximum number of data sets that can be concatenated in LNKLST.
- Allows non-APF authorized libraries to be included with APF authorized libraries in the LNKLST concatenation.

Channel and device contention caused by LNKLST directory searches are removed by providing an in-storage, hashed directory for the LNKLST concatenation. After the hashed directory is created at system initialization, there is no I/O issued to the actual LNKLST data set directories, thus reducing contention on the channel and LNKLST devices. The hashed directory is created from the concatenated list of data sets specified in the LNKLSTxx PARMLIB members. The directory is kept in a separate LNKLST Lookaside (LLA) address space and the function is invoked directly from BLDL, so there is no customer intervention required to activate it. The resident BLDL table is eliminated.

The need to tune the LNKLST library directories for performance has been eliminated. The search for a module in the LNKLST concatenation is now performed against the hashed directory, thus performance is not dependent on the order of data sets in the concatenation. With this performance dependency eliminated, the requirement for tuning the order of data sets in the LNKLST concatenation or moving modules between data sets has been eliminated. The occurrence of multiple copies of the same module in multiple data sets continues to be supported by the LNKLST Lookaside (LLA) function. The processing performed in this case is the same as with the previous mechanism, that is, the first occurrence of the module in the concatenation will be used.

Two other restrictions on LNKLST concatenation processing have been removed in MVS/SP 2.1.1. First, if specified by the operator, non-APF authorized libraries included in the LNKLST concatenation will remain non-APF authorized and only those LNKLST libraries named in the APF table will be APF authorized. This new function allows the installation to include non-authorized, user libraries in the LNKLST concatenation, thus avoiding the need for separate JOBLIBs or STEPLIBs for each user. Secondly, the restriction of 16 data sets in the LNKLST concatenation has been removed. (The limit of data sets is now governed by similar restrictions to the data management restrictions.)

The LLA function provides a new mechanism to control updates to modules accessed through the LNKLST concatenation. An operator command is provided to refresh the hashed directory. When it is invoked by the operator, a new hashed directory is built by the LLA function. In this manner, any modules in the LNKLST concatenation which have been changed or added since the last creation of the hashed directory will be included in the new directory. After the new directory is created, the old directory is deleted, and any subsequent searches will use the new directory. The LLA function serializes access to and update of the directory by a locking mechanism. The operator can issue a command to stop the LLA function. This command provides a mechanism to synchronize use of the LLA directories across multi-system complexes.

The use of a separate address space for the LLA function can provide a high degree of availability because it lessens the chance of an unintentional modification which might cause a system outage or error. In addition, the use of the separate address space allows the customer to influence the performance of the LLA function by putting it in a separate SRM performance group. The separate performance group allows the customer to monitor and influence the working set size for the LLA function and thus the amount of paging done for the LNKLST directory.

The combination of these changes provides greatly simplified system tuning and library maintenance (particularly for multi-system complexes) and has reduced the channel and device constraints caused by the heavy utilization of the LNKLST libraries.

SATISFYING I/O REQUESTS

IOS: The Input Output Supervisor (IOS) provides a central facility to control and conduct I/O activity through MVS/XA. IOS has been restructured to:

- Support and utilize the S/370 Extended Architecture Channel.
- Provide functionally oriented routines to handle the many differing types of events connected with the initiation of I/O, the completion of I/O, and unsolicited I/O events.

Included in the functionally oriented design of IOS are:

- A routine to perform I/O initiation (including the handling of the subchannel, device control, I/O initiation and subchannel redrive).
- Disabled I/O interrupt handler. This routine performs the initial processing of solicited or unsolicited I/O interrupts, including the analysis of the Interruption Response Block (IRB) and the invocation of the caller's Disabled Interrupt Exit Routine (DIE), if one was specified.
- I/O Completion Enabled Handling routines which complete the processing of I/O interrupt events. These routines interface with I/O Driver exit routines and with Error Recovery Procedures (ERPs), when required.
- Channel Recovery routines which handle channel errors reported through Machine Check Interrupts.
- Missing Interrupt routines which monitor and report missing I/O interrupt conditions, and mount requests.
- Routine handling the Purging and Restoring of I/O requests.

In support of the S/370 Extended Architecture Channel, IOS utilizes the extended capabilities of the Channel Subsystem. In this environment, the following aspects are significant:

- The program (i.e., IOS) view is independent of the physical structure of the channel, the configuration of channel paths, and the addressability of control units and devices.
- Any processor can access the channel to execute any I/O instruction.
- Access to channel facilities is independent of the physical structure of the channel and the current channel, control unit, or device state.
- The channel can request an I/O interruption on any processor.

In this environment, there is a dedicated subchannel for each device. I/O operations are initiated by issuing the START SUBCHANNEL instruction. The channel will accept (and either initiate or hold for later initiation) one I/O request per subchannel (i.e., per device). To a large degree, the channel has assumed the responsibility of scheduling the I/O requests. IOS is no longer responsible for attempting to locate alternate paths to a device (if the initial path to the device is busy at the time an I/O request is initiated).

I/O operations can be initiated on any processor. Initially, only the processor that executed the IPL process is enabled for I/O interrupts.

PROGRAM PRODUCTS

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

SRM will monitor the I/O operations and optionally will adjust the number of processor(s) currently handling I/O interrupts.

The S/370 Extended Architecture Channel establishes several formally defined interfaces connected with the I/O events. One of these is the Operation-Request Block (ORB). This control block is the required parameter to the START SUBCHANNEL Instruction. Additional architected interfaces have been established in connection with I/O Interruption processing (e.g., Interruption Response Block (IRB), and Extended Status Word (ESW)).

RECOVERY ROUTINES ASSOCIATED WITH IOS

THE SUBCHANNEL LOGOUT HANDLER (SLH): SLH handles interrupt status which contain logout data. The main functions provided are:

- Processing of the Extended Status Word (ESW) upon detection of situations where the subchannel logs out this information.
- Record the error on the SYS1.LOGREC data set.
- Build an Error Recovery Procedure Information Block for subsequent use by the Error Recovery Procedure (ERP).
- Issue message to the operator to inform him of the event.
- The Subchannel Logout Handler processes situations where the sub-channel has logout data to be presented to the system. These situations include:
- Storage or key errors which may have occurred on the data buffer, the CCWs or the IDAWs.
- Inability to present measurement data. This has no effect on the I/O operation itself, but does affect the statistics normally presented concerning I/O operations.
- Interface Control Checks.
- Channel Control Checks.

The SLH presents status to the Real Storage Manager (for storage or key checks) or to the Monitoring Facility (for measurement checks).

CHANNEL RECOVERY: The Channel Recovery functions within IOS handle channel anomalies which are reported through Channel Report Words.

The goal is to report any/all abnormal situations and to initiate recovery operations where possible or appropriate. The S/370 Extended Channel Architecture provides for the ability to localize error reporting to the specific area of failure (e.g., sub-channel, channel path, etc.).

ALTERNATE PATH RETRY (APR): APR ensures that an alternate path to a device is tried (whenever possible) when a failing path is detected.

The operator may vary paths to a device online or offline by means of the VARY PATH command. He can vary offline all paths except those to shared direct access storage devices which have an outstanding RESERVE.

UNCONDITIONAL RESERVE SUPPORT (Alternate Path Recovery): The Unconditional Reserve Support determines the need (and applicability) of invoking the Unconditional Reserve Error Recovery Procedure. Factors involved in the analysis include:

- Type of condition which triggered the event.
- Type of device (support limited to DASD).
- Type of control unit.

When Unconditional Reserve is issued, the 3770-2 or 3880 Storage Control will:

- Clear the indicators in the control unit that indicate that the addressed device is reserved to a particular path.
- Set indicators in the control unit indicating that the addressed device is reserved to the current path.

Additional actions are taken in cases where a string switch feature is present.

When the command is accepted, all of the above operations are executed unconditionally and without regard for the current status of the control unit or the string switch.

THE MISSING INTERRUPTION HANDLER (MIH): MIH is a standard facility that notifies the operator if a device-end, channel-end, or mount interruption is not received within a specified period of time. (MIH also detects 'start pending' and 'request queued plus device idle' situations). A SYS1.PARMLIB member can be used to establish the time interval for each device or for groups of devices. The absence of such interruptions may mean that a mount message has not been satisfied or that a device has malfunctioned. Specific actions an operator may have to take depend upon the conditions he encounters. He may be required to ready a device on which a volume has been mounted, examine indicator lights on the device for abnormal signs, or terminate the job. In the case of channel end interruptions, MIH will invoke I/O restart to attempt to retry. Additionally, MIH will record via recovery management when device-end or channel-end interruptions are not received.

INPUT/OUTPUT CONFIGURATION PROGRAM (IOCP)

The channel operations of the IBM processor operating in S/370 Extended Architecture mode are controlled by the External Data Controller (EXDC). The EXDC requires specific data about the

hardware I/O configuration so that channel operations can be performed. In order to define the input/output configuration, the IOCP is executed with the following input data:

- Channel paths on the processor complex.
- Control units attached to the channel paths.
- I/O devices assigned to the control units.

The MVS/XA system generation process is modified to allow MVS/XA users, in most cases, to create a single set of statements which can be used as input to both the MVS/XA system generation process and to the IOCP.

To meet changing I/O requirements, IOCP can be used to define a new I/O configuration.

IOCP is available in two versions:

- An MVS/XA version which can be executed as an MVS/XA job via JCL statements; and,
- A stand-alone version which can be executed from the system or service support console.

The I/O configuration data is stored in two I/O configuration data sets which reside on the integrated processor controller file in the IBM processor operating in S/370 Extended Architecture mode. Two levels of the data are provided to allow the definition and testing of a new configuration without affecting an existing configuration. At power-on reset, either of the two definitions can be utilized to control I/O operations.

IOCP can read from both levels of the configuration data in order to produce reports which describe the I/O configuration.

EXCP PROCESSOR

The EXCP Processor provides services for direct use by application programs and for many of the data management access methods (which issue the EXCP request on behalf of the application program).

Areas of support include:

- Construction of a copy of the channel program that was supplied with the request. The new copy of the channel program is constructed utilizing real main storage addresses (as opposed to the virtual main storage addresses supplied in the original copy).
- Page Fixing the required areas involved in the I/O operation.
- Notifying the requestor on the completion of the request. This includes notification of successful or unsuccessful termination of the operation.
- For authorized users, the EXCPVR interface is supported. At this interface, the user provides his own real channel program and is responsible for Page Fixing all areas involved in the request.

The EXCP Processor supports the Format 0 Channel Command Word.

The EXCP Processor supports the Indirect Data Address Word (IDAW) when specified in the user's channel program for data transfer operations. This support is provided to permit the user to supply 31-bit virtual addresses in an IDAW. When EXCP is issued, the channel program may contain CCWs with the IDAW flag on. The EXCP Processor will support this indicator by referencing the addressed IDAW and will use its content as the basis for building the executable channel program.

RECOVERING FROM ERRORS

RECOVERY MANAGEMENT: Recovery management monitors the flow of control through recovery processing for system, address space, and task failures, and performs normal and abnormal task and address space termination processing. It provides to system functions, and optionally to problem programs, the means necessary to intercept, attempt recovery, and record unexpected or expected error situations. The recovery processing is designed to operate at different levels of control. If a recovery routine for a process operating at one level of control is unable to recover from an error, the error is passed to a recovery routine at a previous (higher) level of control.

In addition to the recovery routines described below, the I/O Supervisor (IOS) contains specialized error recovery routines. These routines were described under 'Satisfying I/O Requests' earlier in this section.

THE MACHINE CHECK HANDLER (MCH): MCH records, via recovery management, all machine checks and determines if recovery from a malfunction was made by the Instruction Retry or Error Correction Code facilities of the IBM processor operating in S/370 Extended Architecture Mode. If the malfunction is not corrected by the machine facilities, MCH performs certain analyses and provides a record of the analysis to the Recovery Termination Manager. The appropriate software recovery routines are then invoked. In a tightly-coupled multiprocessing (MP) environment, MCH may initiate ACR on a non-failing processor (as described later in this section).

DYNAMIC DEVICE RECONFIGURATION (DDR): DDR allows a demountable volume not marked permanently resident to be moved

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

from one device to another. The request to move a volume may be initiated by the system or by the operator. The system will initiate a DDR request to the operator upon detection of a permanent error.

ALTERNATE CPU RECOVERY (ACR): ACR processing is invoked when a Processor in a tightly-coupled multiprocessing (MP) environment can no longer function. ACR processing is invoked by a signal that is sent by the failing Processor before it enters a permanent wait or stopped state. This signal is either a hardware-generated malfunction alert (MFA) or a software-generated emergency signal (EMS). When ACR processing is invoked on a non-failing Processor, it monitors the recovery processing of tasks from the failing Processor in an attempt to recover those activities which were on the failing Processor and continue system operations.

In S/370 Extended Architecture, I/O operations need not be monitored (by ACR) since all processors have access to all devices.

DUPLICATION OF SYSTEM DATA AREAS: Any common pageable system areas (e.g., Link Pack Area) will optionally be written to two separate paging data sets which may be on two separate devices. The additional copy will be utilized if on the first attempt to access the information, an I/O failure occurs.

SUPPORTING MULTIPROCESSING

Multiprocessing (MP) is a capability of the control program that supports tightly-coupled processors with shared real storage. MP is an integral part of MVS/System Product V2. The Processors are treated as system resources and are assigned by the supervisor to process any dispatchable unit of work. Multiprocessing is designed to provide more efficient and more flexible allocation of execution time and main storage for a single job stream than uniprocessing with separate processors. Availability on multiprocessors is supported by:

- Any processor can access the channel to execute any I/O operation. Hence, any processor can take over the I/O responsibility for the complex.
- Commands which allow the logical and physical reconfiguration of hardware resources.
- Recovery management support that reduces the impact of software and solid hardware failures.
- Alternate Processor Recovery processing that allows a non-failing Processor to attempt recovery of tasks in progress on a failing processor.

A locking structure providing a number of locks in the control program allows more parallelism over previous systems. With the use of separate address spaces for jobs and subsystems, queues and control blocks associated with only one virtual address space can be manipulated without preventing another Processor from performing similar control program functions in other address spaces.

MONITORING SYSTEM ACTIVITY

SYSTEM MANAGEMENT FACILITIES - (SMF): SMF collects and records system information. The information obtained can be used in management information reports that describe system efficiency, performance, and usage. The SMF records contain such data as: System configuration ... Job and job step identification ... Processor and input/output device usage ... Device Connect Time ... Temporary and non-temporary data set usage and status ... Virtual and real storage usage ... Status of removable direct access volumes ... Paging statistics.

The SMF component is critical to MVS accounting, performance analysis and capacity planning. The SMF component has been modified to execute in a separate address space. This improves the reliability of SMF by isolating it from unintentional modification. It also improves overall system availability since SMF is now restartable after a failure. The installation no longer has to re-IPL the system in order to resume SMF recording after a failure. To protect the reliability of SMF, repeated abends in user exits will no longer cause SMF to terminate. Instead, SMF will mark the failing exit inactive.

Processing for the SMF data set has also been improved. The data set will be preformatted with dummy records rather than binary zeroes. In this way, the SMF dump program will not have to read to physical end of file when processing a partially full data set. Instead, it will recognize the dummy record as the end of the data set. Data sets that have been preformatted for the previous level of SMF (i.e., with binary zeroes) can also be processed by this new level of SMF.

The use of an SMF address space has also allowed an increase in the number of buffers for SMF use. The buffers are no longer kept in common storage, thus the number of buffers is limited only by the amount of private area virtual storage available.

SMF provides exits to installation-supplied routines that can monitor the operation of a job or job step and generate the installation's own SMF records. The exit routines can cancel jobs, write records to the SMF data set, open and close user-defined data sets, suppress the writing of certain SMF records, and enforce installation standards (such as identification of users). The IEFUSI (User Step Initiation) exit can be employed to monitor (or change) the region size parameter. Dummy routines are automatically provided for all unused exits. SMF records

contain additional accounting information to reflect new system environmental characteristics ... SMF provides an exit from the system control program, which receives control each time an SMF record has been formatted and is ready to be written out; this exit can prevent the record from being written ... an exit is provided whenever a job is ready to be purged from the system ... SMF recording data sets must reside on a direct access device ... OUTLIM is supported.

SUPPORTING CROSS MEMORY SERVICES

Cross memory services increase the efficiency of communication between address spaces by reducing the requirement for communicating through the common area. Cross memory services allow programs to pass control to programs in other address spaces and allow direct data movement between two defined address spaces. When cross memory services are utilized by areas of the control program (see list below), the use of these services is transparent to the user.

Cross memory services, together with auxiliary address spaces for some system components and subsystems, reduces the system virtual storage (nucleus, PLPA, SQA, CSA) requirements for specific environments. Additionally this storage is protected by being isolated in a separate private address space. Examples of functions that use cross memory services are:

- Global resource serialization

The use of cross memory services permits global resource serialization to place ENQ/DEQ control blocks in the private area of a separate address space. This reduces common storage usage and provides RAS benefits.

- JES3

JES3 allows an installation to significantly reduce its use of common storage for buffers and staging areas by storing some of this data in the private area of a JES3 auxiliary address space and using cross memory services to access the data.

- PROGRAM MANAGER

A program manager extension, virtual fetch, tailored for IMS/VS, uses cross memory services and provides a performance potential for IMS installations. This enhancement reduces execution time and channel contention for program fetching during application scheduling.

- CONSOLE COMMUNICATIONS TASK

This use of cross memory provides virtual storage savings by having the communications task execute in its own address space and use cross memory services to communicate with user address spaces and the master address space. The communications task control blocks for console support, write-to-operator messages, and console message queuing, previously located in the common service area (CSA), are now in the private area of the communications task address space.

MVS/SP V2 RAS CHARACTERISTICS/IMPROVEMENTS

Improvements have been made in the system RAS characteristics. These include:

- Support of page protection which will detect and prevent any erroneous attempts to change the contents of selected portions of the nucleus, PLPA (including the Extended PLPA), MLPA (including the extended MLPA), and the FLPA (including the Extended FLPA). The MLPA and FLPA may be optionally unprotected.

The protection is on the basis of a 4K page (where previously protection was for a segment).

- MVS/SP V2 trace facilities enhancements:

- The IBM processor operating in S/370 Extended Architecture mode provides new hardware support for tracing certain branch instructions and address space tracing. A new TRACE instruction is provided to record significant software events. The MVS/SP V2 System Trace supports these new hardware tracing mechanisms.

- The system trace options and trace table size may be changed dynamically. In MVS/SP V2, the System Trace tables are constructed in a new (separate) address space.

- New trace table formatting options are provided.

- Both GTF and the new S/370 Extended Architecture trace can be executed concurrently.

- GTF has been enhanced to trace additional events.

- GTF support for CCW Trace is integrated into MVS/SP V2.

- New dumping and formatting options have been provided to assist the collection and presentation of the information needed for debugging, eliminating that which is not needed.

At the time a dump is taken, any WTO type messages which were issued by disabled or locked routines and which still remain in the in-storage buffer, will contain a timestamp (time of day clock). This will permit the coordination of such messages with entries in the System Trace Table and the headers for LOGREC entries.

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

These buffered messages can be key to quick problem resolution and (with the addition of the timestamp) pertinent messages can be distinguished from those that are irrelevant. During normal operation, the timestamp will not appear when the message is sent to the operator.

Improvements to SVCDUMP will improve system availability and assist the management of SYS1.DUMP data sets. Enhancements have been made to stand-alone dump to improve its usability.

- Printdump has been enhanced through these improvements:
 - MVS/SP V2 printdump will execute on MVS/SP V2 or MVS/SP V1 to format MVS/SP V2 dumps.
 - ASM, VSM, RSM and IOS Control Block Formatters are provided.
 - A new formatter for the system trace table is provided. The system trace entries will be formatted in first-in, first-out order, so as to resemble a hardcopy log of events. This new format should improve system programmer productivity since it eliminates the need to search for and decode the trace buffer in the hexadecimal portion of the dump. This function is invoked through a new Print Dump verb, TRACE.
 - The title page is expanded to include parts of the dump header information which may be helpful in performing problem determination and problem management.
 - New options on the FORMAT verb permit selection of the address spaces to be formatted. The default is to format only the address spaces for which error indicators are set or were current at the time of the dump.
 - The output of the SUMMARY formatter is restructured for ease-of-use.
 - A dump index will be provided to indicate the starting pages in the dump of the output of each of the print dump formatters, plus additional data depending upon the formatter. An INDEX DD statement may be used to cause the index to appear at the front of the dump.
 - LPAMAP will list all the modules in the link pack area. A new operand is used to indicate whether the module list is to be sorted by entry point address or by module name.
 - The interface provided to user exits (formatters) is enhanced. Exits can now obtain up to 4K bytes of dump data at a time. Exits can now access real storage, processor status records, or the dump header record.
- SNAP/ABDUMP provides the following new support:
 - The SUBTASKS option causes the inclusion of subtask data in a dump. This subtask data is always automatically included in x22 ABEND dumps.
 - The SYMPTOM option provides concise information about the error (ABDUMP only).
 - The SUM option provides information about the areas being used by the program at the time of error plus user selected control blocks (ABDUMP only).
 - The SUBPLST option dumps the data in the selected subpools.
 - The ALLNUC option dumps the complete DAT-on nucleus. The existing NUC option will dump only the non-protected parts of the DAT-on nucleus.
 - The dump index will be expanded to identify the page number in the dump of the job's active load module(s).
 - User subpool areas (requested by the SPLS option) will be printed in ascending address order.
 - New pre-ABDUMP exit support will allow an installation to tailor or suppress abend dumps.
- SVCDUMP provides the following new support:
 - The SUBPLST option causes the dumping of the data in the specified subpools.
 - The KEYLIST option causes the dumping of the data in the specified keys within the subpools specified by the SUBPLST option.
 - The ALLNUC option causes the dumping of the complete nucleus (DAT-on and DAT-off). The NUC option will dump only the non-protected parts of the virtual nucleus.
 - New information is put into software error (SYS1.LOGREC) records to identify the results of an unsuccessful attempt to take an SVCDUMP.
 - SVCDUMP-SLIP interface is used to allow the dumping of the areas in use at the time of the SLIP event. This improves the usefulness of dumps requested by SLIP.
 - SVCDUMP insures that the area around the point of error is included in the dump regardless of the options selected.
 - A new task termination resource manager will attempt to protect the system from SVCDUMP errors by freeing resources and resetting the system dispatchable before task termination completes.
 - A new command, DUMPDS, is provided to connect, disconnect, or clear SYS1.DUMP data sets.
 - An extension to the DUMP option of the IEASYSxx SYS1.PARMLIB member can be used to identify the SYS1.DUMP data sets to be initialized for use at IPL time.

Thus, many SYS1.DUMP data sets may be cataloged in the system master catalog, but only the selected ones are used by MVS/SP V2.

- MVS/SP V2 will support up to 100 SYS1.DUMP data sets.
- New post-SVCDUMP exit support will allow an installation to provide exit routines to automate the offloading of SYS1.DUMP data sets, to perform some automated dump screening, or to take other actions that the installation desires.
- Enhancements have been made to Stand-Alone Dump.
 - SADMP now supports devices (tape, DASD, console) attached on 'shared (non-dedicated) paths'.
 - The console address list has been expanded from 1 to 21, and SADMP will only consider the listed devices to be consoles. This will avoid having SADMP respond to any device that presents the first attention interrupt.
 - SADMP previously required the residence volume, output device, and console to be attached to the same processor (Channel set). This restriction is removed.
 - A means to specify additional storage to be dumped has been added to both the residence volume initialization process (to allow local defaults) and to operator prompting (to allow dynamic additions). This can be used, for example, to dump selected areas of private storage.
 - SADMP will prompt the operator when a labeled tape is mounted instead of unloading it. SADMP will display the volume serial number and request permission to erase the label. This removes the requirement that non-labelled tapes be kept available for SADMP.
 - The user may now choose where SADMP will load itself (instead of having a fixed location). With knowledge of the local configuration, this can be used to avoid storage areas with defective locations.
 - Residence volume initialization has been simplified from a SYSGEN-like two stage process to a single step batch job.
 - Informational messages, which slow stand-alone dump, may optionally be suppressed.
- Enhancements have been made to SLIP.
 - SLIP dumps now contain registers and related data areas, some control registers from time of interrupt.
 - SLIP dump suppression may be tailored by type of dump (i.e. SYSABEND, SYSUDUMP, SYSDUMP, or SVCDUMP).
 - SLIP supports the keyword, REASON=x which filters non-PER traps based on the reason code of the ABEND or CALLRTM macro. The syntax rules for the REASON keyword are the same as those for the COMP (completion) keyword, and can only be used in a SLIP trap where the COMP keyword has been specified.
 - SLIP users may perform logical AND and OR functions on any number of DATA triplets.
 - The user may specify the name of a nucleus module when defining a PER or non-PER trap. This is done through the keyword NUCMOD=x.
 - A parameter on the ACTION keyword (ACTION=NOSUP) will prevent DAE and other dumping services from suppressing the dump for a particular error.
- The S/370 Extended Architecture Channel provides RAS improvements.
 - The channel selects and controls the paths to I/O devices.
 - Because I/O devices are not associated with a processor, I/O recovery in the event of a processor failure is no longer necessary.
- Additional Functional Recovery Routines
 - Additional FRRs have been added to IOS, VSM and RSM.
- Operational improvements are provided.
 - New SYS1.PARMLIB support allows the installation to control the display output at the MVS/XA Operator Console. Seven colors, reverse image, underscore and blinking may be selected.
 - The CANCEL command will be executed to support termination of tasks which are:
 - Not initialized to the point where a job name has been assigned.
 - Not unique (i.e., two started tasks with the same name).
 - The FORCE command will be extended to support termination of address spaces which are:
 - Non-cancellable.
 - Not initialized to the point where a job name has been assigned.
 - SLIP commands are automatically set to suppress dumps that are normally valueless. These SLIP commands are maintained in a new SYS1.PARMLIB member (IEACMD00) that can be modified by the installation.
 - Improvements have been made to the DISPLAY DUMP command to provide information which may be useful for problem determination.

PROGRAM PRODUCTS

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

- Enhancements have been made to the MIH, including support for installation options via PARMLIB specification. A SYS1.PARMLIB member can be used to establish the time interval for each device or for groups of devices.
- Usability Enhancements: At the installation's option, the SYS1.PARMLIB data set may be blocked and multi-extent.
- A restartable wait state is loaded to inform the operator that IPLs may not succeed since the nucleus is in more than one extent.

TIMESHARING OPTION - TSO

TSO provides users a general purpose timesharing capability. Terminal users share remote access to the facilities of the system for conversational interaction -- preparation, syntax checking, execution, updating of programs and data -- concurrently with normal background operations. TSO provides conversational remote access to the system environment for both the experienced professional programmer and the individual with little or no experience with computers.

TIMESHARING: Each timesharing user has a private virtual address space.

The edit and scheduling functions of timesharing are integrated in the Base Control Program.

The data set handling commands allow allocation of multi-volume and multi-unit data sets, non-direct access data sets, and VSAM and virtual I/O data sets. Terminal users can allocate and unallocate concatenated data sets (other than VSAM and ISAM). Timesharing users may be selectively authorized by the installation to allocate data sets requiring volume mounting. Under installation control, timesharing users can direct SYSOUT data sets to remote stations defined to either Job Entry Subsystem.

The installation may specify a time interval which establishes a period that will permit a timesharing user to reconnect to the system in the event of a line disconnect. Should the interval lapse prior to the user reconnecting to the system, then the system will automatically save any data set which the user was in the process of editing.

Remote Entry Subsystem workstations are identified to the system in the same manner as TSO terminal users.

FEATURES

- General purpose time sharing capability operating concurrently with background operation within one operating system.
- Each timesharing user is assigned to an individual virtual address space.
- Data sets can be dynamically allocated by programs executing in the time sharing address space. Devices can also be dynamically allocated.
- Real storage utilization reflects the actual requirements to execute the program in the time shared address space.
- Time sharing provides an environment for creating and executing conversational programs. A device-independent BSAM/QSAM interface to terminals is provided for ease of development and installation of terminal-oriented application programs.
- Programming languages and data management are compatible between conventional (batch) programs and programs developed at the terminal. Batch or terminal-developed programs can be stored, retrieved and executed locally (at the computer center) or from the remote terminal allowing the use of data sets by time shared or other address spaces.
- Use of ACF/TCAM or ACF/VTAM to handle timesharing terminal types allows the same terminal and/or communications lines to be used for timesharing or other applications.
- The ACCOUNT facility may be executed in a background environment. It enables a batch-entry or remote user to update the user attribute data set (UADS) and the broadcast data set (BROADCAST) in a background environment.

The TEST facility of TSO is supported by TSO Extensions for MVS/XA licensed program. See the appropriate pages for a description of the support.

TSO offers language support for online development, debugging and execution of programs in COBOL, FORTRAN, PL/I, BASIC, APL, PASCAL and Assembler. For more detailed descriptions of the language products designed for use under TSO, see the Program Products section. As previously stated, the TEST facility is supported through the TSO Extensions for MVS/XA licensed program.

Language facilities available to the terminal user include: Compilation, usually invoked with a single command ... Linkage editing or loading ... Program execution with terminal I/O capabilities for interactive application.

Command Procedure allows the user to specify compiler-type functions to control execution of his CLISTS, with control options to handle error exiting, including nesting of CLISTS, If/Then/Else and Do While/End

Syntax, Read/Write to/from CLIST, local and global options, external file - I/O and symbolic substitution.

The use of ACF/VTAM or ACF/TCAM allows the use of many SNA terminal types.

TSO users may wish to consider using the Time Sharing Option 3270 Display Support and Structured Programming Facility licensed program. See the appropriate section for further information.

JOB ENTRY SUBSYSTEMS

JES2 COMPONENT DESCRIPTION: JES2 is a specialized component of MVS/SP-JES2 which operates in the same processor with MVS/XA to perform the peripheral functions associated with batch job processing. JES2 is started as a job entry subsystem. Control of designated unit-record devices is assumed, the specified intermediate storage direct access device(s) are initialized, and job processing begins. JES2 has four major processing stages which relate to its four major external functions. These are:

1. **INPUT STAGE** - This stage reads jobs simultaneously from a variable number of various types of online card readers and remote terminals. These jobs are then entered into a priority queue to await processing by the next stage.
2. **CONVERTER STAGE** - This stage passes the Job Control Language (JCL) to the MVS/SP V2 Converter which merges the specified procedures from the appropriate Procedure Library, performs a basic syntactical scan, and converts the JCL statements into an 'internal text' format which JES2 SPOOLS for later use by the MVS/SP V2 Interpreter. The jobs are then queued by job class to await processing by the next stage.
3. **EXECUTION STAGE** - This stage removes jobs based upon priority and class from the queue established by the Converter Stage and passes those jobs to MVS/SP V2 for processing. Input cards are supplied as required to the executing program and print and punch records are received and written onto JES2 intermediate storage. At the completion of a job, it is placed in a queue to await processing by the next stage.
4. **OUTPUT STAGE** - This stage transcribes the print and punch output generated by jobs in the previous stage to printers and punches. A variable number of various types of printers, punches and remote terminals can be operated simultaneously.

JES2 STANDARD FEATURES: The standard features of JES2 include:

- **JOB INPUT SERVICE** provides for low-overhead reading of job streams and storing of data on SPOOLing volumes for later high-speed retrieval for up to 99 concurrently active local card readers in any combination of devices as follows: 2540 reader ... 2501 reader ... 3505 reader (80-column punched cards only) ... 3525 punch (with read feature).
- **CONVERTER SERVICE** provides for the merging of the submitted JCL with user-selected or installation-selected procedure libraries and for an early scan of this combined JCL for syntactical errors.
- **EXECUTION SERVICE** provides for selection of jobs and execution monitoring for up to 99 concurrently executing jobs as follows: Selection of jobs based upon job class and initiator priority class list of up to 36 classes for each initiator ... automatic delaying of jobs with duplicate OS jobnames ... automatic deblocking and blocking of user SYSIN/SYSOUT data ... counting of lines, cards, and execution duration with optional operator notification and/or cancellation ... interface for SMF counting of SYSIN data.
- **MULTIPLE SPOOLING VOLUME SUPPORT** provides for balanced utilization of up to 36 volumes for any combination of any models of the following devices (one required): 3330 ... 2305 mdl 2 ... 3340 ... 3350 ... 3375 ... 3380. Warm start capability provides for checkpointing critical JES2 information sufficient for: Optionally restarting jobs which were executing ... restarting print and punch at the last checkpoint.
- **JOB OUTPUT PRINT SERVICE** provides for low overhead printing of job streams, system message, and user data print output for up to 99 concurrently active local printers in any combination of devices as follows: 1403 Printer mdl 2, 7, N1 ... 3211 Printer ... 3800 Printing Subsystem ... 3203 mdl 4 and 5. Note: Only the 3203 mdl 5 can be attached to IBM processors operating in S/370 Extended Architecture mode.
- **SPECIAL FORMS SUPPORT** provides for the routing of print (on a job or data set basis) and punch data (on a data set basis) to special forms output queued for output as directed by the operator.
- **INTERNAL READER FACILITY** provides the ability for any task within the system to submit jobs to JES2 for batch execution as though entered from a JES2 card reader.
- **CONSOLE SUPPORT** provides for direct entry for JES2 commands and JES2 abbreviated replies to WTORs through MVS/SP V2 operator consoles.

PROGRAM PRODUCTS

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

- JES2 interfaces directly with the MVS/SP V2 SMF writer to produce seven SMF records (types 6, 26, 43, 45, 47, 48 and 49). JES2 also provides two user SMF exits (IEFUSO and IEFUJP).
- JOB OUTPUT PUNCH SERVICE provides for low overhead punching of job stream user punch output for up to 99 concurrently active local punches in any combination of devices as follows: 2540 punch ... 3525 punch.
- EXECUTION BATCHING provides the facility for passing jobs directly to a processing program such as a 'one-step' monitor, reducing the overhead of OS scheduling and allocation for short running jobs requiring limited system facilities.
- PRIORITY AGING provides for automatically increasing the JES2 scheduling priority of jobs which have been in the system for extended periods of time.
- REMOTE JOB ENTRY provides for high speed communications with binary synchronous and SNA batch workstations which may be used for job stream input and output as well as operator control of the devices and jobs associated with the remote (see 'JES2 RJE Features').

USER EXIT FACILITIES

- The JES2 User Exit facilities enable installations to individually tailor the JES2 component of MVS/System Product-JES2 to the requirements of their own operating environment.
- Specific IBM-defined exit points are provided at strategic points in JES2 code. The installation-supplied exit routines are 'logical extensions' of the JES2 environment. The exit code is assumed to be authorized.
- The installation is also provided with the general facility to specify its own exit points by coding the exit macros in the source code of JES2.
- Individual exit points can be controlled by initialization parameters and by system operator commands.

SPOOL OFFLOAD FACILITY

- A facility is provided to give the installation the capability to dump and later restore the data from the JES2 spool. This facility will function using either tape, DASD or MSS virtual volumes as the offload media.
- Release and spool device-independent data formats allow customers to use the spool offload facility as a future JES2 cold start circumvention mechanism when migrating from release to release or changing spool devices. At present, a cold start can cause loss of jobs and sysout data; this facility would permit a cold start to be performed without such losses or the need to drain the system.

SPOOL PARTITIONING FACILITY

- Spool Partitioning provides a means of reducing the impact of the failure of a single storage device on the total spool space. The total number of volumes eligible for spool space allocation for each job can be limited. Through the use of this facility, the probability of a job's data becoming inaccessible due to a device failure can be reduced. Exit points are provided to enable the installation to control the allocation of spool space: The installation will also have the option of doing a warm start without all previously mounted volumes available.

USER CONTROL OF SYSOUT DATA SET GROUPING

- The SYSOUT Data Set Grouping support provides new Output JCL statements which allow the user to specify which data sets are to be contained in an output work unit. The user can also specify the setup characteristics and the priority for the output group.
- Operational enhancements provide improved procedures for limiting the formation of demand setup groups, limiting which output device will process demand setup groups, limiting the use of user-specified priorities for output and reducing operator intervention. Overall, these enhancements will assure that the efficient processing of user's output will not be disrupted by the increase in the amount of demand setup work.

DYNAMIC ADD/DELETE OF SPOOL DATA SETS

- Dynamic Add/Delete of Spool Data Sets provides a capability for the operator to dynamically add or delete spool data sets. This eliminates the need to resort to a warm start which impacts the normal processing of work.
- A number of operator commands will be enhanced to display the jobs on a volume or the volumes used by a job.

ERROR RECOVERY FACILITY

- This facility, similar in structure to the operating system's ESTAE/FRR recovery scheme, allows internal JES2 'processors' to deal with programming errors which previously caused JES2

termination. SYS1.LOGREC recording of all JES2 errors, regardless of whether recovery is successful, is also provided.

JES2 MULTI-ACCESS SPOOL FEATURE (MAS): JES2 allows from two to seven MVS/370 and MVS/XA Systems to share the JES2 input, job and output queues through the use of Shared DASD. This feature may be used to share the workload or a pool of JES2-controlled devices among processors. Jobs may be routed to any specific system or all systems in this multi-access spool complex. Furthermore, JES2-controlled unit record and remote devices need not, but may, be attached to each processor.

Each processor operates asynchronously within the multi-access spool complex, i.e., there is no master-slave relationship. Because of this operating design, any system in the complex can recover the workload accepted into the complex by any other system. Another system in the complex can have the RJE, TSO and unique unit record devices of the failing system physically switched to it and continue processing those jobs previously entered into the spool queue.

Another function supplied by the JES2 multi-access spool feature is the ability to isolate a processor for testing purposes. A processor may be designated as operating in independent mode, and in so doing, will only process jobs that are both routed to it and are themselves designated to be executed on that processor in independent mode.

JES2 RJE FEATURES: Those features common to all JES2 RJE configurations are as follows:

- JES2 RJE supports up to 1,000 remote workstations communicating over nonswitched (point-to-point) or switched lines.
- JES2 RJE provides for concurrent operations over as many as 1,000 lines assigned to unique communication line adapter addresses of the following types: SDA Type II on a 2701 for Binary Synchronous ... 3704 providing 270X emulation ... 3705 providing 270X emulation ... 3704/3705 SNA.
- Output routing control provides for print and punch output to be directed to the devices attached to the remote, to the central system, or to other remotes as designated by JES2 initialization parameters, by control cards submitted with the job, or by operator command.
- Remote operator control provides a subset of the JES2 operator commands for display of information and control of jobs and devices associated with the remote.
- Operator message output provides for transmission of messages and responses to remote operators with online MULTI-LEAVING workstations with consoles immediately, and optional saving of messages for all other remotes until the remote is online and has a printer available.
- Workstation programs, when required, are supplied as extensions of JES2 and are contained on the MVS/SP V2 distribution libraries in source form.
- Terminal support on the central system provides for communication with: 2772 (Binary Synchronous) ... 2780 (Binary Synchronous) ... 3780 (Binary Synchronous) ... 5110 Computer (as a 2772 BSC) ... S/360 mdl's 20, 25, 30, 40, 50, 65, 65MP, 67 (in 65 mode), 75, 85, and 195 (MULTI-LEAVING) ... All virtual storage S/370 processors (MULTI-LEAVING) ... IBM processor (operating in S/370 or S/370 Extended Architecture mode) (MULTI-LEAVING) ... 1131 (MULTI-LEAVING) ... System/3 (MULTI-LEAVING) ... System/32 or System/34 (MULTI-LEAVING as a System/3) and System/32 or System/34 (SNA as a 3770) (MULTI-LEAVING as a System/3 or MULTI-LEAVING as a S/360 or S/370) and System/36 (SDLC as a 3770 or multiple logical units) ... 8100/DPPX (multiple logical unit SNA) ... 8100/DPPX/SP (multiple logical unit SNA).

To achieve this flexibility of terminal-sharing, JES2 uses the VTAM application program interface for the support of the SNA terminals which are attached to a 3704/3705 in network control mode.

SNA terminals supported by JES2 in MVS/SP V2 are the non-programmable models of the 3771, 3773, 3774, 3775, 3776 and 3777 Communication Terminals, the System/32 (as a 3770), the System/34 (as a 3770), the System/34 (as a 3770 with multiple logical units), the System/36 (as a 3770 with multiple logical units), the 6670 Information Distributor (through the program product MVS/Information Distribution Workstation Support, 5740-AMA), the 3790 Communication System and the 8100/DPCX Information System. Support for the 3770 family of devices includes the the 3262 Line Printer mdl's 2 and 12, the 3784 Line Printer, the 3521 Card Punch, the 3501 Card Reader and the 2502 Card Reader.

- The signon feature provides for remote identification and line security through remote and line passwords.
- Remote characteristics support utilizes the unique features on each remote as follows: Full text transparency (required for object decks) ... text compression ... print line width truncation ... outer size and blocking capabilities. Note: Multipoint or multidrop line features are prohibited.

PROGRAM PRODUCTS

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

- Remote job priority adjustment provides for favoring or limiting the JES2 scheduling priority of jobs submitted from each remote workstation.
- Line restart feature provides for warm starting of print output after remote workstation or line failures.

NJE FEATURES: The Network Job Entry (NJE) facility provides for the transmission of selected jobs and in-stream data sets, system output (SYSOUT) data sets, operator commands and messages, and job accounting information from one computer system to another across a communication link.

A job entry network consists of one or more interconnected computer systems (called nodes), running under MVS/XA, OS/VS2 MVS, VM/370, or DOS/VSE. These nodes have the capability of communicating with one another and passing the information indicated above from one node to the next. The number of JES2 nodes which can exist within a job entry network ranges from one to 1,000.

The JES2 nodes can be single processors (UP/AP), tightly coupled multiprocessing processors, dyadic processors, or multi-access spool systems.

In a JES2 node, a job may enter the network via any local or remote input device and will be queued for transmission to another node if the node of entry is not the execution node. A job designated for execution at another node is either transmitted directly to that node or is transmitted through intermediate nodes located along a path to the execution node. Transmission of jobs along BSC communications links is handled on a store-and-forward basis; that is, a job must be completely received by a node before any action will be taken to either execute the job or transmit the job to another node. Once a job has been completely received by a node, the transmitting node frees the resources that were allocated to the transmitted job. Transmission of jobs through ACF/VTAM links is logically direct to the execution node.

At each JES2 node, appropriate accounting information is collected and produced for local accounting. In addition, network accounting number support is provided by JES2 NJE. This permits accounting numbers to be assigned across the network and provides initialization parameters, conversion tables and routines and user exits to convert local accounting numbers to network accounting numbers and vice versa. All accounting information is produced through standard System Management Facilities (SMF) in JES2 nodes.

NETWORK PATH MANAGER: A network path manager running in each JES2 processor in the job network interfaces with JES2 and the multi-access spool facility to communicate with all other network path managers. The network path managers control the routing of data through the network by providing best-path and alternate-path information to other NJE components. No single node is designated as a network manager; any subset of an NJE network can function entirely on its own.

JES3 COMPONENT DESCRIPTION

JOB ENTRY SUBSYSTEM 3 - JES3: The JES3 component of MVS/SP-JES3 is designed to improve the operational environment of the computer installation by aiding many of the operator functions. JES3 can improve installation workload scheduling, increase the workload capacity, and reduce turnaround time. JES3 provides a single system image for the execution of many jobs concurrently on the connected processors.

JES3 can support up to eight JES3 processors, any of which can be a tightly coupled multiprocessor, operating under the control of MVS/SP-JES3. A JES3 configuration consists of a global processor that controls all job input and output, and the scheduling of time sharing users, batch jobs and, optionally, devices. One to seven additional JES3 processors, called JES3 local processors, can be connected to the JES3 global processor. Each processor is attached to the JES3 global processor by a channel-to-channel (CTC) adapter which is used to communicate control information. The JES3 global processor handles all SYSIN and SYSOUT data to and from peripheral devices.

JES3 design and the shared spool concept help to improve the overall complex availability by permitting any JES3 local processor, if properly configured, to assume JES3 global functions. Should the JES3 global processor fail in a loosely coupled configuration, the operator can move the JES3 global function to any properly configured JES3 local processor. The degree of this availability depends on the presence of appropriate alternate CTC paths and switchable peripheral devices.

As the installation workload grows, capacity can be increased by increasing the size of processors, by using multiprocessor configurations, and/or by adding additional JES3 local processors, operating under the control of MVS/SP-JES3. JES3 enables such expansion with minimal disruption to the operational environment. Jobs are distributed to available processors depending on job priority, device requirements, user specification, and processor dependencies. (A processor dependency is an attribute of a job that requires it to execute on a specific JES3 processor. For example, if a job uses a device that is attached to only one processor, then the job has a processor

dependency and must execute on the processor that can access the device.)

Remote job processing from binary synchronous communications (BSC) and systems network architecture (SNA) terminals is supported. JES3 also provides multiprogrammed background utilities which the operator can invoke.

SOME OF THE FEATURES OF JES3 ARE:

- Single operator interface to the entire system.
- Complex-wide data set integrity.
- Job Networking (BSC).
- Automatic scheduling of interdependent jobs (dependent job control).
- Optional auxiliary address space to reduce CSA requirements.
- Generalized peripheral scheduling and improved output service that includes related INQUIRY/MODIFY processing.
- Performance features, for example:
 - Ordered seek I/O queuing
 - SIO drivers for RJP, CTCs, spool and printers
 - Unserialized path for allocation
 - VTAM authorized path
 - Main store resident control blocks
- Optional invocation of JES3 writer processing as a separate JES3 task in the JES3 address space. This provides more utilization of IBM's tightly coupled processors.
- Extensive RAS capability, for example:
 - Functional recovery routines
 - ESTAE recovery routines
 - Alternate Path Channel-to-channel (ACTC)
 - Dynamic system interchange
 - Spool I/O error recovery, partitioning and RAS support
 - HOTSTART of JES3 address space with or without an IPL WARMSTART of JES3 system
- Facilities to help prevent and recover from JES3 out of storage conditions.
- Automatic scheduling of up to seven attached local processors (including multiprocessors).
- Centralized console service with message suppression.
- Logical device grouping with consoles defined for the group.
- Installation-specified, operator-controlled job selection algorithms for scheduling local processors.
- Numerous user exits.
- Deadline scheduling.
- Simulated console support for non-programmable remote terminals (2770, 2780, 3780).
- Multitasking of the Converter/Interpreter and locates.
- Checkpoint/Restart support for jobs.
- SMF support.
- Early JCL diagnosis through JES3's use of the VS2 Converter and Interpreter.
- Support of TSO Foreground Initiated Background functions.

JOB NETWORKING: This facility provides for the transmission of selected jobs, in-stream data sets, operator commands and messages, system output data sets and job accounting information from one computer complex to another across binary synchronous telecommunications facilities or channel-to-channel adapters. The use of standard interface protocols enables communication among similar and dissimilar operating systems such as MVS/SP-JES3, MVS/SP-JES2 and VM/SP and the RSCS Networking licensed program. Routing from the originating network node to the destination node is controlled by a routing table at each node in the path. Strings of duplicated characters are compressed into shorter representations, reducing data flow between nodes. Operator commands permit manual intervention to control the network. JES3 Networking utilizes the security functions normally in effect at each node.

REMOTE JOB PROCESSING (RJP)

BINARY SYNCHRONOUS COMMUNICATION (BSC): JES3 Remote Job Processing (RJP) permits the input, processing and output of jobs to and from terminals remote from the installation. This function is achieved through the use of the 3704 or 3705 Communications Controller (emulator mode), or the 2701 Data Adapter interface with binary synchronous communication (BSC) terminals. BSC remote terminals are used as remote card readers, printers and card punches, with job output routed optionally to any remote terminal or local output device.

For more detailed information related to JES3 BSC RJP, see *Introduction to JES3* (GC28-0607).

SYNCHRONOUS DATA LINK CONTROL (SDLC): JES3 SNA RJP provides JES3 remote job processing support for SNA terminals in a terminal-sharing environment where multiple applications may establish logical connections with the terminal on a per-session basis. To achieve this flexibility of terminal-sharing, JES3 uses the VTAM application program interface for the support of the SDLC terminals which are attached to a 3704/3705 in network control mode.

SDLC job entry stations supported by JES3 are the 8100 Information System under DPPX or DPPX/SP, the 8100/DPCX Information System, the 5280 Distributed Data System, the 3790 Communication

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

System and the 3770 Data Communication System (except for the 3773 mdls P1, P2 and P3, all SDLC models are supported). Multiple Logical Unit (MLU) 3776 mdls 3, 4 and 3777 mdls 3, 4 with up to six independent and concurrent sessions are supported. Also supported are the 3262 Line Printer mdls 2, 12, the 3784 Line Printer, the 3203 Printer mdl 3, the 3521 Card Punch, the 3501 Card Reader, and the 2502 Card Reader when attached to a 3770. In addition, JES3 supports the 6670 Information Distributor (SNA version) through the MVS/Information Distribution Workstation Support licensed program (5740-AMA). The 3790 Communication System and 8100/DPCX Information System support a single RJE workstation which can handle up to five logical concurrent processing sessions with JES3.

Functional characteristics of the JES3 SNA RJP support for SDLC terminals are as follows:

- Half duplex session flow.
- Multidrop operation.
- 3770 diskette, 8100/DPPX or 8100/DPPX/SP disk operations, 8100/DPCX disk operations, and 3790 disk operations are transparent to JES3.
- Data stream provides compression of repeated characters outbound to the 8100 Information System under DPPX with DPPX/RJE or under DPPX/SP with DPPX/SP/RJE, the 3790 Communication System, the 8100/DPCX Information System, and to the 3770 Data Communication System.
- Data compaction is supported outbound to the 8100 Information System under DPPX with DPPX/RJE or under DPPX/SP with DPPX/SP/RJE, the 3790 Communication System, the 3776 mdls 3 and 4, the 3777 mdls 1, 3 and 4 of the 3770 Data Communication System, and the 8100/DPCX Information System.
- Single or multiple LUs (allowing multiple sessions) in a job entry station.
- Provides device setup for the 3790, the 8100 Information System under DPPX with DPPX/RJE or under DPPX/SP with DPPX/SP/RJE, and 8100/DPCX by use of the Peripheral Data Stream Information Record (PDIR).

JES3 JOB MANAGEMENT

INPUT SERVICE: Input Service consists of two phases, each consisting of several non-resident modules:

- **READER PHASE:** Jobs are read from an input device and placed on a spool in batches.
- **CONTROL STATEMENT PROCESSING PHASE:** Jobs are read from the spool and processed.

INTERPRETER SERVICE: Interpreter service converts JCL statements to scheduler control blocks (SCBs) for use by the scheduler component. It also determines resource requirements and creates control blocks for use by JES3 main device scheduler (MDS) function. Every job must pass through the interpreter service before it can be scheduled for execution. This service comprises primarily the converter/interpreter (CI) dynamic support programs (DSPs).

The critical option in creating MDS control blocks is choosing the type of setup for JES3-managed devices. The setup options available with JES3 are:

1. **JOB SETUP:** The interpreter assigns each unique volume used throughout the job to a separate device, except where JCL explicitly indicates otherwise. This type of setup generally improves job turnaround at the expense of efficient device usage.
2. **HIGH WATERMARK SETUP:** The interpreter assigns a number of mountable devices (discounting permanently resident or reserved volumes) of each device type equal to the maximum number of volumes required in any single job step, unless the JCL explicitly indicates otherwise. This type of setup makes efficient use of devices, but may slow job turnaround due to dismounting and mounting of volumes.
3. **EXPLICIT SETUP:** The programmer specifies in a JES3 control statement which DD statements are (and which are not) to be setup.

The entire MDS function is optional, and additionally, the automatic setup options (job and high watermark) are separately selectable for DASD, tape and MSS virtual devices. These options are supplied as an installation default and can be overridden by JES3 control statements.

DATA RESOURCE MANAGEMENT: The main device scheduler (MDS) is a JES3 facility that controls the setup of resources (devices, volumes and data sets) associated with job execution on a processor. MDS services consist of volume fetching, allocation of data resources, volume mounting and verification, and deallocation of data resources. MDS services are part of the main scheduler element in normal job processing. Once a job is in execution, MDS services can also be invoked to process dynamic allocation requests.

VOLUME FETCHING: MDS determines a job's requirements for mountable volumes and issues operator messages to a tape or DASD library, requesting that the required volumes be 'fetched' to the computer area. As an installation option, after the issuing of these messages, MDS will either make the job immediately eligible for data

resource allocation, or will wait for operator 'go ahead' that the required volumes are available.

DATA RESOURCE ALLOCATION: Data resource allocation facilities fall into three overlapping categories: (1) Selection of a job relative to other jobs competing for resources; (2) selection of an eligible processor on which to attempt allocation; (3) assignment of devices, volumes and data sets to the selected job.

SELECTING A JOB: In general, jobs are considered for data resource allocation in priority order. The first job that can acquire data resources on an eligible processor will be granted those resources.

SELECTING A PROCESSOR: This choice of a 'setup' processor does not restrict the eligibility of that job to run on only that processor. In allocating devices, preference is given to devices that are shared by other processors eligible to execute the job. If all devices allocated to the job are shared by another processor, that processor also remains eligible to run the job.

ALLOCATING DATA SETS, VOLUMES AND DEVICES: JES3 provides data set integrity protection across processors in the JES3 complex in accordance with the JCL-specified data set disposition and dynamic allocation. This means that a job which holds exclusive access to a data set will prevent other jobs from allocating successfully.

MDS keeps track of the volume currently mounted on each device to minimize volume movement and attempts to satisfy further requests for the volume on the device where it is already mounted. MDS supports dynamic device reconfiguration (DDR) through the subsystem interface for JES3-managed tape and disk drives.

VOLUME MOUNTING AND VERIFICATION: Once all required resources have been assigned to a job, MDS issues 'mount' messages, requesting that the operator mount the first required volume on a specified device. MDS then verifies that each volume has been correctly mounted by reading its volume label.

Once all required volumes for a job have been mounted and verified, the job is passed to the generalized main scheduler (GMS) for execution processing selection.

JES3 3850 MSS FEATURES INCLUDE: Allocation to mounted volumes for non-specific requests for new, non-VSAM data sets.

Access to Mass Storage Volumes can be shared by all JES3 system processors physically connected to the same 3850.

Virtual units may be partitioned (fenced) for use by specific job class groups or dependent job networks.

Data reuse is encouraged (without access to 3850 controller tables).

JES3 algorithms attempt to equalize the amount of staging/destaging activity across Staging Drive Groups.

Multiple 3850s can be supported in a JES3 loosely coupled processor configuration, where each 3850 is attached to a separate host (as previously announced, one operating system can only be attached to one MSS).

DEALLOCATION OF DATA RESOURCES: During job execution, MDS or DYNAL is notified, as each step completes, to deallocate resources that are not required by subsequent steps of the job (early resource release). Data resources may also be returned in the midst of job step execution via the dynamic deallocation subsystem interface. Tape volumes used by a job can be optionally made available to other jobs at the end of volume. Finally, any resources still held at job end are released at that time. In all cases, returned resources immediately become available for assignment to other jobs.

JOB SCHEDULING: JES3 functions as a resource manager and job scheduler. The scheduling and selection of jobs for execution are major functions of the job entry subsystem. JES3 provides a unique set of these functions that are especially designed for a loosely coupled environment. These functions are generalized main scheduling, which determines which jobs should be scheduled to execute on a processor; deadline scheduling, increasing the priority of a job when it has been scheduled to make the best use of the available resources; and dependent job control which allows jobs to be executed in a specified order.

Selection of a job for a processor is based on the capacity of that processor to provide sufficient resources. JES3 supports pooled devices among processors to further control job/processor selection.

GENERALIZED MAIN SCHEDULING: Jobs are selected for execution by the generalized main scheduling (GMS) facility of JES3. Initialization parameters define the characteristics of each processor, job-selection mode criteria, and jobs categorized by class.

GMS uses the priority parameters specified at initialization to help select jobs for execution. The hierarchy of priorities is:

1. Processor priority (dynamic)
2. Job Class priority.

PROGRAM PRODUCTS

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

The priority aging feature allows JES3 to increase the priority of a job after it has been passed over for selection by JES3 an installation-specified number of times, because of a low priority relative to that of other jobs in the system. At an installation-specified priority barrier, JES3 will attempt to prevent lower priority jobs from capturing idle resources if they are known to be needed by a job at or above the barrier priority.

DEADLINE SCHEDULING: Deadline scheduling provides job scheduling algorithms that increase the probability of a job being scheduled by a specific time. The job's selection priority may be dynamically incremented as the job approaches its deadline for entering execution.

The deadline scheduling feature allows the installation to specify a time of day by which the job should be scheduled. If the job is not scheduled by this time, JES3 will increase the priority of the job at user-defined intervals until it is scheduled.

DEPENDENT JOB CONTROL: Dependent Job Control (DJC) allows jobs to be executed in a specific order. DJC is a function within the JES3 system that manages jobs that are dependent upon each other. Job dependencies may occur because of data dependencies; they may be defined so as to achieve better device utilization; or they may be defined so as to manage job streams.

CONSOLES SUPPORTED - JES3 IN MVS/XA ENVIRONMENT: The following consoles are supported by JES3 in an MVS/XA environment:

Input/Output Consoles

2250 mdl 3
 3277 mdl 2
 3278 mdls 2, -2A, -3, -4, -5
 3279 mdls 2A, -2B, -3A, -3B

Output only Consoles

1403
 3203 mdl 5
 3211
 3284 mdls 1, -2, -3
 3286 mdls 1, -2
 3287 (Supported as a 3284 mdl 3)
 3288 mdl 2
 3289 mdls 1, -2
 4245 Printer mdl 1

Remote Console

2740

RAS TOOLS - SERVICE AIDS

GENERALIZED TRACE FACILITY (GTF): GTF is a component of MVS/SP V2. It is a service aid program that assists users in performing problem determination and diagnosis by tracing system events, user events, or both.

GTF is a system service that can be optionally started from an operator console. It executes as a system task in its own address space. When GTF is started, the user has the option of tracing internally in the GTF region or externally to a data set on an auxiliary device. The GTF output is trace records of any combination of:

- System events
- Specific incidences of one type of system event
- Defined events

The EDIT control statement of the AMDPRDMP service aid program provides the user with a selective data reduction capability for the trace data set and formats GTF trace records from a storage dump produced by STAND ALONE DUMP or the SYS1.DUMP data set. It runs as a problem program and can be invoked via JCL.

SYSTEM TRACE: The System Trace supported in MVS/SP V2 assists in the determination of system problems by providing an on-going record in main storage of significant software events. This trace replaces the System Trace available in earlier systems. The new trace utilizes the trace facilities available on the IBM processors operating in S/370 Extended Architecture mode. There are three types of entries in the trace table:

- Branch tracing (e.g., successful BALR, BASR, and BASSM instructions).
- Address Space ID tracing (execution of PROGRAM CALL, PROGRAM TRANSFER and SET SECONDARY ASID).
- Explicit software-initiated tracing of significant software events such as normal system interrupt and dispatch events (through execution of the TRACE instruction which creates an entry in the trace table).

The new system trace table consists of a queue of trace buffers per processor. These queues of trace buffers are maintained in a separate address space.

The MVS/SP V2 support consists of routines to initialize, manage and format the trace table. Support is also provided for the new tracing instruction to place explicit entries in the trace table. The TRACE ST operator command provides operational control of tracing. Through

this command, the operator can start or stop tracing, specify trace table size, and activate the branch tracing option.

Turning the tracing on or off activates or deactivates explicit and ASID tracing. Branch tracing can be activated only if tracing is already on.

New facilities are provided to merge and format the trace table entries during dump formatting. The TRACE control statement of the AMDPRDMP service aid program provides the user with a selective data reduction capability.

AMASPZAP: This service aid program assists authorized personnel to:

- Inspect and modify instructions and data in any load module that exists as a member of a partitioned data set.
- Inspect and modify data in a specific data record that exists in a direct access data set.
- Dump an entire data set, a specific member of a partitioned data set, or any portion of a data set residing on a direct access device.

AMDSADMP: This service aid is a macro instruction that allows the user to generate a stand-alone dump program that is specifically tailored to his needs. AMDSADMP can generate two types of dump programs: One high-speed, the other low-speed. The high-speed version can write the control registers, contents of real storage, and selected portions of paged out storage onto a tape volume in machine readable format. The low-speed version can write the control registers and the contents of real storage to a printer or tape volume in unblocked, printable format.

AMDPRDMP: This service aid program formats and prints dump data sets produced by AMDSADMP and other system programs. The dump data sets may contain dumped real or virtual storage.

Selective printing and formatting of the dump data sets is completely controlled by the user of AMDPRDMP via control statements.

The FORMAT control statement (with no operands) will now format only the control blocks for the current address spaces and those address spaces that are in error. The readability of the output from the SUMMARY control statement has been enhanced.

The user may use this information to determine what further formatting is required and proceed to get the required formatting by selecting the proper AMDPRDMP control statements.

An interface is provided whereby the user may write formatting modules to do additional (user-tailored) formatting during AMDPRDMP execution.

ONLINE TEST EXECUTIVE PROGRAM - (OLTEP)

Note: OLTEP is Class 2 System Control Program (SCP). A brief introduction is included with the RAS TOOLS - SERVICE AIDS information because it is expected that OLTEP will be utilized in an MVS/XA environment. A copy of this program will be supplied with MVS/SP V2.

The Online Test Executive Program (OLTEP) is a function designed to direct the selection, loading, and execution of the Online Test sections (OLTs) within the MVS/System Product V2 environment.

OLTEP with the related OLTs is designed to allow the testing of Input/Output Hardware components of a system, concurrent with the running of customer jobs.

The OLTEP/OLT system is designed for: Providing an interface with RETAIN/370 ... Diagnosing I/O errors ... Verifying I/O hardware repairs and Engineering Changes ... Exercising a device requiring dynamic adjustments ... Checking I/O hardware ... Preserving integrity of customer data while testing.

As a job under MVS/SP V2, it is called by standard Job Control Language and is under the control of the operating system at all times. It uses the facilities of MVS/SP V2 to accomplish the testing and competes with other jobs in the system for use of these facilities when running in a multiprogramming environment.

Definition of test to be run can be entered via console or non-console devices. FieldEngineering supplies the OLTs and device configuration information to the customer on magnetic tape or cards. The Field Engineer reformats and link edits the OLTs into a partitioned data set so that they can be used under the operating system. Device configuration information is required for each device to be tested by OLTEP/OLTs.

The OLTEP interface to RETAIN/370 provides the ability to transfer Diagnostic Test results to the RETAIN/370 center and allows the RETAIN/370 center to modify Diagnostic Test requests and options. The RETAIN/370 interface is provided in OLTEP via the console.

OLTEP must normally be executed as a V=R job. The Logout Analysis program operates in virtual storage. Since use of OLTEP is now restricted by APF, all OLTEP programs must be online in protected system libraries.

OLTEP must normally be executed in a minimum of 76K bytes. The logout analysis program will operate in the paged virtual storage.

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

MVS/System Product Version 2 Release 1.1 is designed to operate on IBM processors operating in IBM S/370 Extended Architecture mode.

SOFTWARE REQUIREMENTS

MVS/System Product Version 2 Release 1.1 is designed to be installed on an MVS Release 3.8-based system. MVS/System Product Version 2 Release 1.0 is a prerequisite and the Data Facility Product (DFP) (5665-284) Release 1.1 is a co-requisite. (DFP Release 1.0 is a prerequisite for DFP Release 1.1.)

See the section "Installation Considerations" for additional information.

PLANNING INFORMATION

MIGRATION

In order to facilitate the migration to MVS/XA, IBM has authorized the use of the components and macros (migration aids) listed below on a processor running MVS/370 in a location* where MVS/SP Version 2 and DFP are licensed. Use of these migration aids is permitted on another processor running MVS/SP Version 1 Releases 3.0, 3.1, 3.2, or 3.3 in the location for a period of 18 months after shipment from IBM of the first MVS/SP Version 2 and DFP program products for that location.

- Linkage editor provided with DFP
- MVS/SP Version 2 IPCS
- MVS/SP Version 2 AMDPRDMP
- MVS/XA SYS1.MACLIB

Procedures for adding this linkage editor to an MVS/370 system will be provided in the DFP program directory. A jobstream will be provided with MVS/SP Version 2 Release 1.0 to create a library with IPCS and AMDPRDMP modules for use with MVS/370 systems.

These procedures will also update the MVS/SP Version 2 control data set and ensure that service applied by SMP to the MVS/SP Version 2 libraries will be applied to the libraries created for use with the MVS/370 system. Therefore, maintenance will be synchronized.

PRODUCT CLASSIFICATION

This product contains "restricted availability" material. On receipt of the product, material marked "Restricted information of IBM" must be kept in accordance with the terms and conditions outlined in the IBM Program Product license agreement.

COMPATIBILITY AND CO-EXISTENCE

Compatibility has been maintained between MVS/SP V2 and MVS/SP V1 R3 for user-written programs. With minor exceptions, programs that use published external interfaces¹ will continue to execute on MVS/SP V2. Details are included in the section titled "Source/Object Compatibility".

JCL and user data set formats are completely compatible between MVS/SP V2 and MVS/SP V1 R3. In addition, most of the operator messages and commands are unchanged.

MVS/SP V1 R3 SYSGEN decks and I/O Configuration Program (IOCP) decks can be used unchanged with MVS/SP V2. To take advantage of new functions in MVS/SP V2 however, some changes may be desirable.

Any installation performance specification (IPS) that is compatible with MVS/SP V1 R3 can also be used unchanged with MVS/SP V2. As always, the IPS should be reviewed to ensure that optimum tuning is achieved. Some changes to take advantage of new functions in MVS/SP V2 may be desirable.

Programs that use system-generated records (e.g., LOGREC, GTF, SMF records) should be evaluated for compatibility. New record types have been defined for LOGREC, GTF and SMF, and in some cases record formats have changed.

If the installation chooses to use new SMF data for accounting, the installation may have to change accounting procedures after MVS/SP V2 is installed. Installation procedures that account for virtual storage usage may need to be changed; some system control blocks that reside in the private area have been moved to extended virtual storage, and therefore, most programs will reflect a corresponding change in private area, virtual storage size. SMF collects additional information on virtual

Note 1: In the context of this information, published external interfaces refers to information in the following IBM SRLs:

OS/VS2 MVS JCL (GC28-0692) OS/VS2 Supervisor Services and Macros (GC28-1114) ... OS/VS2 TSO Command Language Reference (GC28-0646) ... OS/VS2 Guide to Writing a Command Processor or Terminal Monitor Program (GC28-0648) ... OS/VS2 Data Management Macro Instructions (GC26-3873) ... OS/VS2 Access Method Services (GC26-3841) ... OS/VS Virtual Storage Access Method (VSAM) Programmers Guide (GC26-3838).

storage usage both above and below 16 megabytes. Installations may want to take this information into account as users begin to implement programs that use storage above 16 megabytes.

PROGRAM COMPATIBILITY USING 24-BIT ADDRESSING MODE AND 31-BIT ADDRESSING MODE: Compatibility for MVS/370 problem programs is maintained in MVS/SP V2 by using the dual addressing mode capability of the S/370 Extended Architecture, which allows programs to run in either 24-bit addressing mode or 31-bit addressing mode. In 24-bit addressing mode, S/370 addressing architecture is applied. Only the low-order 24 bits of a word are used to address storage; the high-order eight bits are ignored. In 31-bit addressing mode, all but the high order bit of a word are used to address storage. For some instructions the high order bit of a word is used to indicate and save addressing mode.

In the absence of any address mode specification, MVS/SP V2 will default programs to 24-bit addressing mode. Programs will be loaded into the assigned address space in the area that is addressable with 24-bit addresses.

SOURCE/OBJECT COMPATIBILITY

PROBLEM-STATE PROGRAMS that execute on MVS/SP V1 R3 will continue to execute on MVS/SP V2 with the following exceptions:

- The SVC 33 interface has been modified for MVS/SP V2. PTFs are available on MVS/SP V1 and OS/VS2 MVS Release 3.8 for the IOHALT macro which generates the SVC 33 interface. With this PTF, the SVC 33 interface for MVS/SP V1 and OS/V2 MVS Release 3.8 is made compatible with MVS/SP V2, and programs may be re-assembled prior to migration to MVS/SP V2.
- The STOP,SYNCH option of the STATUS macro is no longer supported.
- With MVS/SP V2, when a program completes, any SPIE environments created by the program are deleted. This may create an incompatibility for MVS/SP V1 R3 programs which depend on the SPIE environment remaining in effect. Details will be supplied at general availability.

Programs that interrogate system control blocks or depend on internal system structure may require modifications. Detailed information concerning changes can be found in the *MVS/Extended Architecture Conversion Notebook (GC28-1143)*.

SOURCE CODE COMPATIBILITY is maintained between MVS/SP V1 R3 and MVS/SP V2 for published external interfaces. There are a set of macros which have two levels of expansion, an MVS/SP V1 R3 level and an MVS/SP V2 level. Detailed information concerning this can be found in the *MVS/Extended Architecture Conversion Notebook (GC28-1143)*.

DEVICE SUPPORT: The devices supported by MVS/SP V2 are the same as those supported by MVS/SP V1 R3.0 with the exception that MVS/SP V2 does not support the following devices. For completeness, the following list includes devices not supported because they cannot be attached to the IBM processors operating in S/370 Extended Architecture mode.

Device	Control Unit
• Disk, Fixed Head Storage Module: 2305 model I Fixed Head Storage Module 2314 Disk Storage 2319 Disk Storage	2775 2314, 2844 2314
• Magnetic Tape: 2401 Magnetic Tape 2402 Magnetic Tape 2403 Magnetic Tape 2404 Magnetic Tape 2420 Magnetic Tape 3410/3411 Magnetic Tape	2803, 2804 2803, 2804 2803, 2804 2803, 2804 2803
• Card I/O and Printers: 1053 mdl 4 1443 N01 Printer 2520 Card Reader/Punch	2848
• Cartridge Readers: 2495 Magnetic Tape Cartridge Reader	
• Transmission Controllers: 2702 Transmission Control 2703 Transmission Control 2715 Transmission Control	
• OCR/MICR: 1287 Optical Reader 1288 Optical Page Reader 1419 MICR Reader/Sorter 3886 Optical Character Reader 3895 Document Reader/Inscriber	

PROGRAM PRODUCTS

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

- **Consoles:**
 - 1052-7 Console-Printer/Keyboard (2150 Control Unit)
 - 2150 Console
 - 2250 mdl 1
 - 3210 Console-Printer/Keyboard
 - 3213 Console-Printer
 - 3215 Console-Printer/Keyboard
- **Systems:**
 - 1060 Data Communications System 1061
 - 2790 Data Communications System (local) 2715
 - 3670 Brokerage Branch Office System
- **Other:**
 - 2816 Tape Switch Unit 2803
 - 3540 Diskette Input/Output unit
 - 7770 Audio Response Unit

**CO-EXISTENCE OF MVS/SP V2 AND MVS/SP V1
IN MULTI-SYSTEM ENVIRONMENTS**

IBM anticipates that many customers will have both MVS/370 and MVS/XA systems in the same data center. Therefore, co-existence in a loosely coupled environment between these systems is important. The following considerations apply.

- **JES2**

Coexistence in a Multi-Access Spool environment can only occur between processors using the same level of the JES2 component. The level of JES2 shipped in MVS/SP-JES2 1.3.0, 1.3.1, and 1.3.2 and MVS/SP-JES2 2.1.0 is the same level, and will work in both an MVS/370 and an MVS/XA environment. Also, the level of JES2 shipped with MVS/SP-JES2 1.3.3 and MVS/SP-JES2 2.1.1 is the same level, and will work in both an MVS/370 and an MVS/XA environment.
- **JES3**

Coexistence in a loosely-coupled JES3 complex can only occur between processors using the same level of the JES3 component. The level of JES3 shipped in MVS/SP-JES3 1.3.1, 1.3.2, 1.3.3, and MVS/SP-JES3 2.1.0 and 2.1.1 is the same level and will work in both an MVS/370 and MVS/XA environment.
- **Data sharing with Global Resource Serialization**

The Global Resource Serialization component of MVS/SP 2.1.1 is both upward and downward compatible with respect to data sharing. That is, data may be shared between systems running MVS/SP 2.1.1 and systems running either MVS/SP 2.1.0, or MVS/SP Version 1 Release 3 at all Modification Levels.

The Reserve/DEQ (dequeue) functions may also be used between MVS/370 and MVS/XA systems.

- **MSS**

The MSS may be shared between MVS/370 and MVS/XA. MSSE with the MVS/XA Facility is required on the MVS/XA system.

VIRTUAL STORAGE CONSIDERATIONS

MVS/SP V2 provides a base for eliminating virtual storage constraint. By moving system programs and data areas above 16 megabytes MVS/SP V2 makes more system or private area virtual storage below 16 megabytes available to other subsystems and new applications, or for current application growth. System programs and data areas have been moved from the nucleus, PLPA, SQA and LSQA. In addition, as users start to implement programs which utilize 31-bit virtual addresses, those programs will not be constrained by the 16 megabyte virtual storage limit.

With MVS/SP 2.1.0, the base control program (BCP) is providing the following reductions in the use of virtual storage below 16 megabytes:

- A significant amount of nucleus code and portions of PLPA are moved above 16 megabytes, yielding a projected savings of approximately 1.3-1.6 megabytes.
- Additional savings of 4K bytes per megabyte of configured real storage are realized by relocating the page frame table above the first 16 megabytes of virtual storage. For example, on a 32 megabyte system, 128K bytes of virtual storage savings will be realized.
- Further savings are achieved by moving many control blocks and data areas residing in SQA and LSQA to areas above 16 megabytes. The amount of savings realized in this area is heavily dependent on the installation's environment and is therefore variable.

MVS/SP 2.1.1 Approximately 400K bytes of system modules and data areas have been moved from the virtual storage area below 16 megabytes, to the area above the first 16 megabytes.

This constraint relief was achieved by modifying the Allocation component and portions of the Scheduler Work Area manager to

execute in the address range above 16 megabytes. In addition, the creation of a new SMF address space has allowed removal of the SMF buffers from common storage making additional virtual storage below 16 megabytes available to system and user applications. For each SMF buffer defined by the installation, 4,096 bytes are removed from Common storage and reside in the private area of the new SMF address space.

The virtual storage constraint relief in MVS/SP 2.1.1 is in addition to that in MVS/SP 2.1.0.

The total amount of virtual storage savings below 16 megabytes that an installation may realize is dependent upon many environmental factors, such as hardware configuration, type of workload, and other software products installed. Therefore, no assurance can be given that an individual installation will achieve the projected savings or a specified minimum amount of savings.

The segment boundary between the common area and the private area is a megabyte boundary on MVS/XA. This causes a 'rounding' of the common area to a full megabyte. For example, if the nucleus, LPA, SQA, and CSA areas require 8.5 megabytes below 16 megabytes, MVS/SP V2 will set aside an additional half-megabyte in the common area in order to 'round-up' this area to a full megabyte boundary, (i.e., 9 megabytes). It is therefore important that the installation take care when selecting sizes for LPA, SQA, and CSA at system initialization, so as to optimize the use of virtual storage. The virtual storage savings enumerated above do not take this common area rounding into consideration.

INSTALLATION CONSIDERATIONS

MVS/SP 2.1.1

MVS/SP 2.1.1 must be installed, with its co-requisite licensed program, Data Facility Product (DFP) Release 1.1 (5665-284), on distribution libraries which are at MVS/SP 2.1.0 level.

The following items are required for installation and maintenance:

- System Maintenance Program (SMP) -- either:
 - System Maintenance Program (SMP) Release 4. The maintenance level of this program which is current at the time of availability must be installed, or,
 - System Maintenance Program/Extended (SMP/E) (5668-949) licensed program.
- Assembler H Version 2 licensed program.
- The Linkage Editor which is available with the Data Facility Product licensed program must be used to perform SYSGEN and to apply maintenance.

A SYSGEN is not required for MVS/SP 2.1.1. Review the description of the co-requisite licensed program (MVS/XA DFP 1.1) for cases where a SYSGEN is required.

MVS/SP 2.1.1 - JES2 Installation Considerations: The JES2 component of MVS/SP-JES2 2.1.1 is functionally equivalent to the JES2 component of MVS/SP-JES2 1.3.3. Customers currently at that level of JES2 need not re-install it. However, if the customer wishes to remain at that level of JES2 in an MVS/XA environment, the MVS/SP 2.1.1 level of the Base Control Program must be installed.

MVS/SP-JES2 2.1.1 requires a JES2 cold start.

The Base Control Program in MVS/SP 2.1.1 is compatible with the level of JES2 which was shipped with MVS/SP-JES2 2.1.0 and MVS/SP-JES2 1.3.0. Thus, customers at that level of JES2 may install the new function in the Base Control Program of MVS/SP 2.1.1, without changing their JES2 component.

MVS/SP 2.1.1 - JES3 Installation Considerations: The JES3 component of MVS/SP-JES3 2.1.1 is functionally equivalent to the JES3 component of MVS/SP-JES3 2.1.0. (The same level of JES3 was also shipped with MVS/SP-JES3 1.3.1, 1.3.2, and 1.3.3). Customers currently at that level of JES3 need not re-install it. Thus, customers may install the new function in the Base Control Program of MVS/SP 2.1.1, without changing their JES3 component. This level of JES3 component is the only level which operates in an MVS/SP V2 environment.

MVS/SP 2.1.0

MVS/SP V2 must be installed, with its co-requisite product Data Facility Product (DFP) Release 1.0 (5665-284) licensed program on distribution libraries which are at a minimum at OS/VS2 MVS Release 3.8 level.

The Input/Output Configuration Program (IOCP) must be executed and a SYSGEN must be performed to obtain an operational MVS/XA system.

The distribution libraries on which the installation is performed may be the user's current OS/VS2 MVS Release 3.8 distribution libraries, or the latest version of OS/VS2 MVS Release 3.8 obtainable from PID.

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

Installation, SYSGEN, and subsequent maintenance may be performed under the control of a supported MVS/370 Release or MVS/SP V2 System.

Assembler H Version 2 must be installed on the operational system that will control the installation, SYSGEN and subsequent maintenance of MVS/SP V2. See information above concerning programs required for installation and maintenance.

In addition, if installation, SYSGEN and maintenance are performed under the control of MVS/370, the SYSGEN must be performed by a system with the linkage editor available with DFP installed.

MVS/SP V2 replaces and, therefore, completely deletes the BCP portion of OS/VS2 MVS Release 3.8. The CDS and ACDS for the BCP is zeroed and therefore any of the following offerings that were installed will also be deleted from the installation's distribution libraries.

- MVS Processor Support 2 selectable unit (5752-VS2)
- MVS/System Extensions program product (5740-XE1)
- MVS/System Product Version 1 (5740-XYX and 5740-XYN) (BCP Component)
- TSO Command Package (Selectable Unit 11) (5740-XT6)
- TSO Extensions for MVS/370 (5665-285)
- Measurement Facility 1 (MF1)
- Display Exception Monitoring Facility (DEMF)

MVS/SP V2 contains all of the TSO functions available in OS/VS2 MVS Release 3.8 with the exception of TSO TEST. The TSO Extensions for MVS/XA must be installed to obtain TSO TEST functions. Significant modifications have been made to TSO TEST to allow the testing of problem state programs which execute and reference data areas using 31-bit addresses.

MVS/SP 2.1.0 - JES2 Installation Considerations: The JES2 component supplied with MVS/SP 2.1.0 is functionally equivalent to the JES2 component supplied with MVS/SP 1.3.0.

MVS/SP 2.1.0 - JES3 Installation Considerations: The JES3 component supplied with MVS/SP 2.1.0 is functionally equivalent to the JES3 component supplied with MVS/SP 1.3.1.

SYSTEM CONFIGURATION CONSIDERATIONS

MVS/SP V2 executes in environments which provide:

- IBM processor operating in S/370 Extended Architecture mode.
- Main storage requirement - the following areas of main storage are required (each item is a separate (additional) requirement):
 - A 256K block of contiguous error free area so that NIP can be loaded (and complete its execution).
 - 8K contiguous error free area for the DAT-off Nucleus.
 - Two contiguous error free frames (4K each) for each segment table.
 - I/O measurements require a block containing 32 bytes for each generated tape and DASD device and for each additional device being measured by RMF. The optional Channel Measurement Block (CMB) system parameter specifies which device classes, in addition to tape and DASD, RMF is to measure. Execution may continue with possibly degraded system performance if the space is not available for at least the tape and DASD entries.
- Software configuration: Data Facility Product (DFP) is a corequisite.
- Minimum I/O configuration: In addition to requirements for operational maintainability of the IBM processors operating in S/370 Extended Architecture mode (see below) and sufficient I/O to satisfy user application requirements, the following is required:
 - Consoles - A full-capability console device (in addition to the system console) is needed to satisfy the requirements of the control program. Supported console device(s) are identified in the Multiple Console Support description earlier in this section.
 - DASD - Six 3330/3333 DASD spindles. This requirement may be satisfied by substituting 3340, 3350, 3375, or 3380 spindles where appropriate.
 - A SYSIN device (card reader or tape).
 - A SYSOUT printer (printer or tape).
 - A SYSOUT punch (punch or tape).
 - A 9-track 1600 bpi or 6250 bpi tape drive. Distribution of MVS/SP V2, component releases, and PTFs are made on a 9-track 1600 bpi tape or 6250 bpi tape; therefore, a 9-track tape on the system (or access to another system meeting the minimum configuration requirements and having a 9-track tape at the customer installation is required for system generation and maintenance).
- If ACF/TCAM, ACF/VTAM, or BTAM/SP is specified, at least one transmission control unit or communications controller is required

for operation of remote terminals (ACF/VTAM requires a 3704/3705-1/3705-II in network control mode).

FEATURE SUPPORT

FEATURES SUPPORTED, IBM PROCESSORS OPERATING IN SYSTEM/370 EXTENDED ARCHITECTURE MODE: The following features are supported. Other features, not listed, have no specific programming support; their existence is ignored by the control program. Attempts to use the system with unsupported features may cause unpredictable results. For brevity this list does not include those basic features or control units which are required to connect a supported device.

Features supported (may be model dependent):

- Real storage:
 - 8,388,608 bytes
 - 16,777,216 bytes
 - 25,165,824 bytes
 - 33,554,432 bytes
 - 50,331,648 bytes
 - 67,108,864 bytes
- Channels:
 - 6, 8, 12, 16, 24 or 48 channels
 - Channel-to-Channel Adapter (on 3082 and 4381)
 - First, feature #1850
 - Second (#1850 required), feature #1851
 - Third, feature #1852
 - Fourth (#1852 required), feature #1853
- Required Consoles:
 - Integrated Service Support Console. (The integrated Service Support Console is a part of the IBM processors operating in S/370 Extended Architecture mode.
 - 3278 Display Console mdl 2A as a system console.
 - 3279 Display Console mdl 2C as a system console.
 - A full-capability console device (in addition to the system console) is needed to satisfy the requirements of the control program. Supported console device(s) are identified in the Multiple Console Support description earlier in this section.
- Requirements for Operational Maintainability of the IBM processors operating in S/370 Extended Architecture mode. See the Machine pages for a complete statement of the requirements.

Features Supported, I/O Devices: The following I/O Device Features are supported when these devices are attached locally:

- 1052 Printer - Keyboard (Note 1)
- 1403 Printer (mdls 2, 7, N1):
 - Supported: #8640 - Universal Character Set
#8641 - Universal Character Set
- 2250 Display Unit (mdl 3)
 - Required: #2840 Display Control (mdl 2)
- 2305 Fixed Head Storage (mdl 2):
 - Required: #2835 Storage Control
- 2501 Card Reader (mdls B1, B2):
 - Supported: #1531 - Card Image
- 2540 Card Read Punch (mdl 1):
 - Supported: #1531 - Card Image
- 2821 Control Unit (mdls 1, 2, 3, 5, 6):
 - Supported: #1990 - Column Binary (for problem program use only)
#8637-8639 - Universal Character Set Adapter
- 3203 Printer (mdl 5)
- 3211 Printer (mdl 1):
 - Required: 3811 Printer Control Unit
 - Supported: #5554 - 18 Additional Print Positions
- 3251 Display Station
 - Required: IBM 3255 Display Control
IBM 3258 Control Unit
- 3275 Display Station (mdls 1, 2) (Note 1)
- 3276 Display Station (mdls 1, 2) (Note 1)
- 3277 Display Station (mdls 1, 2) (Note 2)
 - Supported: #6350 - Selector Light-Pen
Program Function Keys (Dependent on specified keyboard)
#1090 - Audible Alarm
#4999 - Operator Identification Card Reader
#4690 - Keyboard Numeric Lock

PROGRAM PRODUCTS

MVS/SP-JES2 V2.1, MVS/SP-JES3 V2.1 (cont'd)

3278 Display Station (mdls 1, 2, 2A, 3, 4, 5) (Note 2)
Supported: Features equivalent to 3277. (See above).
#5781, 5782 - Programmed Symbols (mdls 1, 2, 3, 4, 5).

3279 Display Station (mdls 2A, 2B, 3A, 3B) (Note 2)
Supported: Features equivalent to 3277. (See above).
#5781, 5782 - Programmed Symbols (mdls 2B, 3B).

3284 Printer (mdls 1, 2)

3286 Printer (mdls 1, 2)

3288 Printer (mdl 2) (supported as a 3286-2)

3330 Disk Storage (mdls 1, 2, 11):
Required: 3333 Disk Storage and Control, or 3830 Storage Control, or 3880 Storage Control (mdls 1, 2 or D11)

3333 Disk Storage and Control (mdls 1, 11):
Required: 3830 Storage Control, or 3880 Storage Control (mdl 1, 2 or D11)
Supported: #8150 - String Switch

3340 Direct Access Storage (mdls A2, B1, B2):
Required: 3340 mdl A2 and 3830 Storage Control, or 3880 Storage Control (mdl 1 or 2)
Supported: #6201, 6202 - Rotational Position Sensing
#8150 - String Switch

3344 Direct Access Storage (mdls B2, B2F)
Required: 3340 mdl A2

3350 Direct Access Storage Facility (mdls A2, A2F, B2, B2F, C2, C2F):
Required: 3830 Storage Control, or 3880 Storage Control (mdls 1, 2 or D11)
Supported: #8150 - String Switch

3375 Direct Access Storage (mdls A1, B1, D1)
Supported: #8150 - String Switch
Required: 3880 Storage Control mdl 1 or 2

3380 Direct Access Storage (mdls A4, AA4, and B4):
Required: 3880 Storage Control mdl 2, 3, B13 or D13

3420 Magnetic Tape Unit (mdls 3, 5, 7):
Supported: #3550 - Dual Density
#6407 - 7-track
#6631 - Single Density

3420 Magnetic Tape Unit (mdls 4, 6, 8):
Supported: #6420 - 6250 Density
#6425 - 6250/1600 Density

3505 Card Reader (mdls B1, B2):
Supported: #5450 - Optical Mark Read
#6555 - Selective Stacker

3525 Card Punch (mdls P1, P2, P3):
Supported: #1533 - Card Read
#5272 - Multiple Card Print
#8338 - Two-Line Card Print

3800 Printing Subsystem (mdl 1):
Supported: #1490 - Burster-Trimmed-Stacker
#5401 - 127 Character Generation Storage Positions
#8170 - Two-Channel Switch

3803 Tape Control (mdl 1):
Supported: #1792 - Two-Control Switch
#1793 - Three-Control Switch
#1794 - Four-Control Switch
#3551 - Dual Density
#6408 - Seven-Track
#9071 - Communicator 1-2
#9073 - Communicator 3-4

3803 Tape Control (mdl 2):
Supported: #1792 - Two-Control Switch
#1793 - Three-Control Switch
#1794 - Four-Control Switch
#5310 - Nine-Track NRZI
#6320 - Seven-Track NRZI
#8100 - Two-Channel Switch
#9071 - Communicator 1-2
#9073 - Communicator 3-4

3811 Printer Control Unit (mdls 1, 2):
Supported: #5553 - Additional (18) Print Positions

3830 Storage Control (mdl 2):
Supported: #8170 - Two-Channel Switch
#8171 - Two-Channel Switch
Additional

3830 Storage Control (mdl 3):
Supported: #8170 - Two-Channel Switch
#8171 - Two-Channel Switch,
Additional

3851 Mass Storage Facility (mdls A1, A2, A3, A4, B1, B2, B3, B4) (Note 3)
Supported: #8171, 8172 - Two-Channel switch, additional
#4901, 4902 - MSC Port

3880 Storage Control (mdls 1, 2, 3)
Supported: #8170 - Two-Channel Switch Pair
#8171 - Two-Channel Switch Pair, Additional
#8172 - Eight-Channel Switch feature (requires #8170 and #8171)
#6550 - Speed Matching Buffer for 3380
#6560 - Speed Matching Buffer for 3375

3880 Storage Control (mdls B13, D13)
Supported: #8170 - Two-Channel Switch Pair
#8171 - Two-Channel Switch Pair, Additional

3880 Storage Control (mdl D11)
Supported: #8170 - Two-Channel Switch Pair
#8171 - Two-Channel Switch Pair, Additional

3890 Document Processor (mdls A1, A2, A3, A4, A5, A6, B1, B2, B3, B4, B6):
Supported: #5111 - Microfilming
#4666 - Item Number/Endorsing

3890 Document Processor (mdls E3, E4, E5, E6, F3, F4, F5, F6):
Supported: #4667 - Item Number/Endorsing

Note 1: These devices are supported by one or more of the following licensed programs:

ACF/VTAM, ACF/TCAM, BTAM/SP

(Refer to description of those licensed programs to determine the features supported).

Note 2: These devices are supported as operator consoles and by one or more of the following licensed programs:

ACF/VTAM, ACF/TCAM, BTAM/SP

(Refer to description of those licensed programs to determine the features supported).

Note 3: The Licensed Program Mass Storage Systems Extension (MSSE) with the MVS/XA Facility is a prerequisite for the attachment of the 3850 Mass Storage System to an IBM 3081 Processor operating in S/370 Extended Architecture mode.

DATA MANAGEMENT CONSIDERATIONS

In MVS/XA, most data management functions are provided by licensed programs which are not part of MVS/SP V2. Examples of data management support include:

- Data Facility Product (DFP) (5665-284) licensed program.
- Advanced Communication Function/Virtual Telecommunications Access Method (ACF/VTAM) Version 2 (5662-280) licensed program.
- Advanced Communication Function/Telecommunications Access Method (ACF/TCAM) Version 1 Release 4 (5735-RC3) licensed program.
- Basic Telecommunications Access Method/System Product (BTAM/SP) (5665-279) licensed program.
- Execute Channel Program (EXCP) support which is contained within MVS/SP V2.
- Specialized access methods which are user-supplied or provided with a licensed program.

For those items mentioned above which are licensed programs, the Program Products section should be reviewed for additional information.

MVS/370 DATA FACILITY PRODUCT

RELEASE 1

5665-295

PURPOSE

MVS/370 Data Facility Product (DFP), a program product similar to the Data Facility Product previously announced for the MVS/XA environment, is now announced for MVS/370. MVS/370 DFP is a new program product containing new functions along with data management, device support, program library management, and utility functions for the OS/VS2 MVS Release 3.8 environment with MVS/System Product Version 1 Release 3 installed.

In addition to new functions, MVS/370 DFP incorporates the functions previously available to OS/VS2 MVS users via the following program products:

- Data Facility Device Support (DFDS) Release 1 Modification Levels 1 through 6 (5740-AM7).
- Sequential Access Method - Extended (SAM-E) Release 1 (5740-AM3).
- Data Facility Extended Function (DFEF) Release 1 (5740-XYQ).
- Offline IBM 3800 Utility program product (5748-UT2).
- Access Method Services Cryptographic Option (5740-AM8).

MVS/370 DFP will also include prerequisite program service and 3800 mdl 1 enhancements.

MVS/370 DFP program product includes the following new functions:

- Tape labels and tape file structure support for ISO 1001-1979, ANSI X3.27-1978 and Federal Information Processing Standard (FIPS) 79.
- VSAM global resource serialization.
- Tape OPEN/EOV installation exits.
- Aids for migration to MVS/XA:
 - Linkage editor.
 - AMBLIST.

DESCRIPTION

Tape Support for ISO/ANSI/FIPS Version 3: This support includes the organization, format and processing of labels designed according to the specifications of the following industry standards as understood by IBM as of March 1983:

- ISO 1001-1979, level 4.
- ANSI X3.27-1978, level 4.
- Federal Information Processing Standard (FIPS) 79.

Extended Access Control: If RACF is not active for tape, volume and data set access control is available for ISO/ANSI/FIPS Version 3 tape volumes, as provided for in ISO/ANSI/FIPS Version 3. When RACF is active for tape, RACF volume access control prevails. Authorization for ISO/ANSI/FIPS tape accessibility is controlled by the volume/file installation exits or by RACF installation exits.

Label Validation: ISO/ANSI/FIPS Version 3 tape labels will be validated. User-controlled validation may be accomplished through the provisions of an installation exit.

Generation Data Groups: A generation data set will be accommodated on an ISO/ANSI/FIPS Version 3 volume.

Spanned Record Format: Spanned Records will be supported on an ISO/ANSI/FIPS Version 3 volume.

Extended Logical Record Interface: The logical record interface (LRI) for spanned records has been extended to accommodate up to a 16 megabyte logical record for ISO/ANSI/FIPS Version 3 labeled files. The actual length of logical records to be processed is dependent on the amount of virtual storage that can be acquired.

Volume Initialization: The IEHINITT utility will create a Version 3 volume header label (VOL1) for ISO/ANSI/FIPS volume initialization.

Tape Open/EOV Installation Exit: When extending to another tape volume, a DCB exit allows a user program to indicate that a specific volume is to be mounted instead of a scratch volume. If a specific volume is to be mounted, the user program returns the volume serial number. Another DCB exit allows an authorized user program to indicate acceptance or rejection of the tape.

Performance: With identical hardware and software configurations and MVS/SP Version 1 Release 3.0 environment, MVS/370 DFP does not show a significant change in performance when compared to the same environment with DFDS Release 1 Modification Levels 1 through 6, DFEF Release 1, SAM-E, Offline IBM 3800 Utility and Access Method Services Cryptographic Option installed.

DATA MANAGEMENT

Data management controls operations associated with input/output devices, such as allocation of space on volumes, storing, naming, and cataloging data sets, and movement of data between real and auxiliary storage.

IMPROVED VTOC ACCESS via an INDEX to the VTOC: Indexed VTOCs are supported by MVS/370 DFP. The support is functionally equivalent to the support introduced to OS/VS2 MVS Release 3.8 users with the Data Facility Device Support (DFDS) program product, and is available in MVS/XA Data Facility Product program product (5665-284) (MVS/XA DFP).

The VTOC is composed of unblocked records with DASD keys and is accessed primarily in two ways: Via DADSM routines to perform global DASD space management functions such as allocating and scratching data sets, and via EXCP and the sequential access method (SAM) for reading and writing DSCBs, or portions of the VTOC.

VTOC access is improved by using an index structure for the VTOC, and by providing a common VTOC access facility (CVAF) to support the index structure. This structure includes space maps which replace the Format 5 DSCBs of the OS/VS2 MVS VTOC and are used to manage VTOC and VTOC index space.

Following are some key characteristics of volumes with a VTOC index:

- The VTOC index is optional on any MVS/370 DFP-supported DASD. For additional information, see "Migration".
- Volumes with and without the VTOC index can coexist on the same system and are supported by the DADSM routines in a manner transparent to the user.
- The VTOC can still be accessed via EXCP and SAM, except that data identifying a volume's available space has been moved from the Format 5 DSCB to space maps in the index. Users are encouraged to use CVAF for all access to the VTOC on volumes both with and without the VTOC index. See "Indexed VTOC Compatibility".
- If CVAF detects an error in the index structure, CVAF marks the index as invalid, and existing DADSM routines restore the VTOC to non-indexed format so that the volume can be used while the index error is being analyzed. The user's programs will not be aware of the error, the volume continues to be available for use, and the operator is notified.
- The Device Support Facility, a Class 2 System Control Program, may be used:
 - To create a VTOC with or without an index when a volume is initialized.
 - To build an index over an existing volume's VTOC.
 - To rebuild the index as desired.
 - To convert the VTOC to non-indexed for running on certain systems, see "Migration".
- The VTOC index can be either RACF- or password-protected, in which case a user must be RACF-authorized or must supply a password if the index is to be scratched, renamed, or opened for output. The VTOC can be RACF-protected, in which case the user must be RACF-authorized to open the VTOC for output.

INTEGRATED CATALOG FACILITY: The integrated catalog facility program included in MVS/370 DFP is a functional replacement for VSAM master catalogs, VSAM user catalogs, and OS control volumes. It was introduced to the OS/VS2 MVS Release 3.8 users with the Data Facility Extended Function program product, and is available in MVS/XA Data Facility Product.

The integrated catalog facility defines two catalog data sets: The basic catalog structure data set and the VSAM volume data set. These data sets replace the VSAM or CVOL catalog data sets.

The basic catalog structure contains volume information for both VSAM and non-VSAM data sets. The basic catalog structure may be located on any volume and multiple basic catalog structure data sets may be defined on a single volume.

A VSAM volume data set contains the data set characteristics for VSAM format data that resides on a given volume. There is one VSAM volume data set on each volume that contains VSAM format data controlled by the integrated catalog facility.

The integrated catalog facility program is designed to reduce the potential of damaging the catalog and limits the scope of damage in the event of system failure during catalog processing.

The integrated catalog facility program also validity checks critical data during catalog processing.

VSAM catalog ownership of volumes is eliminated for data sets cataloged by the integrated catalog facility. Data sets on any volume may be cataloged in any basic catalog structure and multiple basic catalog structure data sets may be defined on a single volume.

Users of the Resource Access Control Facility (RACF) are restricted from protecting identically-named VSAM data sets which are cataloged in separate basic catalog structures residing on the same volume.

MVS/370 DFP R1 (cont'd)

Backup and Recovery Facilities: The catalog backup and recovery facilities allow the user to define simple and consistent recovery procedures. The integrated catalog facility supports catalog recovery without the RECOVERABLE attribute of VSAM catalogs. The attributes of a VSAM data set, including its physical location on direct access storage, are maintained in a VSAM volume data set on the same volume as the VSAM data set. This allows periodic EXPORTs of the basic catalog structure, and a subsequent IMPORT in the event of failure of a basic catalog structure without concern for catalog and VSAM data set synchronization.

VSAM Space Management: All direct access storage space management for VSAM data sets cataloged by the integrated catalog facility is performed by the system direct access device space management (DADSM) function. Integrated catalog facility does not perform sub-allocation; hence, no data spaces are associated with an integrated catalog facility catalog and all VSAM data sets under its domain will appear as UNIQUE-like VSAM data sets. Functional equivalency to the VSAM catalog is maintained by removing the restrictions associated with the current UNIQUE data sets.

All integrated catalog facility catalog records are VSAM logical records. This allows a considerable savings of direct access storage space. For most non-VSAM data sets, only 20 percent of the space required by the current VSAM catalog will be used by the integrated catalog facility.

DADSM Installation Exits: Optional pre- and post-processing installation exits are provided for the allocate, extend, scratch, partial release, and rename functions of DADSM. These exits allow an installation to reject, limit, audit, or simply monitor DADSM requests involving DASD space utilization.

System Catalog: Either the integrated catalog facility master catalog or the VSAM master catalog may be the system catalog. Besides optionally containing pointers to integrated catalog facility and/or VSAM user catalogs, it may also contain pointers to OS control volume catalogs. JCL may be used to designate specific catalogs to be used for a job or job step.

A message at IPL time prompts the system operator for the name of an alternate system catalog, enabling the system to be IPLed in the event that the regular, or default, system catalog is unavailable.

ACCESS METHODS

VIRTUAL STORAGE ACCESS METHOD - VSAM: DFP VSAM is an access method designed to operate with direct access storage devices and to support both direct and sequential processing by means of either an index key (keyed accessing) or relative byte address (addressed accessing). (Relative byte address refers to the displacement of a stored record or control interval, from the beginning of the storage space allocated to the data set to which it belongs.)

Three types of data sets are provided:

1. Key-sequenced data sets, which are ordered by a key field in the data record.
2. Entry-sequenced data sets, which are ordered by the sequence in which the records were loaded.
3. Relative record data sets, which are ordered by record number.

Keyed accessing is used to access key-sequenced or relative record data sets, and addressed accessing is used to access both key-sequenced and entry-sequenced data sets. Key-sequenced and entry-sequenced data sets may be either fixed- or variable-length records; relative record data sets contain fixed-length records only.

VSAM is composed of two major elements: A data organization which minimizes data movement and which is suitable for data base applications; and routines for creating data sets in the VSAM organization, adding and deleting records, and performing other data management functions.

The data management functions supplied by VSAM include:

- Opening data sets.
- Processing records by index key.
- Processing records by address.
- Closing data sets.
- End of volume processing.
- Cataloging VSAM data sets.
- Data set password protection.
- Data set encryption/decryption.
- Allocating space.
- Checkpoint/restart processing.

VSAM Global Resource Serialization: VSAM has been enhanced for users of global resource serialization. Provisions are available which allow cross-system sharing of VSAM data sets using a subset of the cross-region share option. This cross-system support provides:

1. Consistent RNAME for the enqueues issued by open, close, and end-of-volume, and
2. Enqueues to cross-system enqueues where appropriate.

Encryption/Decryption Support: The access method services REPRO function gives the user the ability to encrypt and decrypt data using a software version of the National Bureau of Standards Data Encryption Standard (DES). This function was introduced to the OS/VS2 MVS user with the Access Method Services Cryptographic Option licensed program (5740-AM8) and is also available in MVS/XA DFP program product (5665-284).

All data sets supported for copying by REPRO (any VSAM or ISAM data set, or any other data set that can be accessed sequentially except VSAM and integrated catalog facility catalogs) are supported as input for enciphering via REPRO ENCIPHER. The user can decrypt the sequential cipher text data set using REPRO DECIPHER.

This function of the REPRO command may use the services of the Programmed Cryptographic Facility licensed program (5740-XY5) or a functional equivalent to encipher/decipher the data by a program and provide facilities for controlling the cryptographic key.

Alternatively, this function of the REPRO command may use the services of the Cryptographic Unit Support (5740-XY6) program product to provide facilities for controlling the cryptographic key and provide an interface to the 3848 Cryptographic Unit to encipher/decipher the data.

Implicit VERIFY: When VSAM OPEN detects a condition requiring a VERIFY, it will automatically initiate VERIFY processing, unless the user specifies otherwise. A warning message will be issued.

Activity Indicators: The last-accessed date field and change data set indicators in the VTOC Format 1 data set control block (DSCB) are now maintained under control of a user exit for VSAM data sets cataloged by the integrated catalog facility.

VSAM Data Sharing Facilities: The following VSAM data sharing facilities introduced by DFEF, and available in MVS/XA DFP, are supported to provide the VSAM application more control of shared data:

- Exclusive control feedback. When an exclusive control conflict occurs, the address of the RPL which owns the resource, and the RBA of the control interval will be returned to the user.
- A control block update facility is available to allow an application to perform cross-system and cross-region VSAM data sharing under share option 3.
- The OS/VS2 MVS restriction which prohibits control area splits under cross-region share option 4 has been eliminated. The restriction still applies to cross-system share option 4 data sets.
- VSAM supports facilities which allow the user to invalidate VSAM data and index buffers (MRKBFR) or to cause VSAM to write a modified buffer to DASD storage (WRTBFR).
- Extensions to the JRNAD exit allow the application to maintain control over data and index control intervals.

VSAM SRB/Cross-Memory Mode Processing: To minimize the need for a VSAM application to switch execution modes, VSAM record management allows SRB and limited cross-memory mode processing. This support includes:

- An additional user processing exit (UPAD) for request resumption (POST) when the user is operating in SRB/Cross-Memory mode.
- The elimination of SVC calls where possible, and RPL codes to indicate to the VSAM application that the request must be reissued in TCB mode.

SEQUENTIAL ACCESS METHODS: MVS/370 Data Facility Product uses the buffer scheduling introduced to OS/VS2 MVS with SAM-E for queued sequential access method (QSAM) processing. MVS/370 DFP, SAM-E and MVS/XA DFP use EXCPVR instead of EXCP for all basic sequential access method (BSAM) and queued sequential access method (QSAM) direct access and virtual I/O operations, except basic direct access method (BDAM) WRITE/LOAD. In the exception case, the OS/VS2 MVS Release 3.8 implementation is used. The buffer handling program modules made obsolete by this new implementation are not in MVS/370 DFP. For the OS/VS2 Release 3.8 user without SAM-E or MVS/370 DFP installed, these changes enable improved DASD data access performance by:

- Reducing channel program interpretation and translation.
- Reducing the frequency of fixing and freeing of pages.
- Reducing the path length for the SAM I/O operations per block.
- Decreasing DASD contention.
- Increasing the number of QSAM buffers transferred per I/O operation.

Under BSAM, data is sequentially organized and physical blocks of data are stored or retrieved. The READ/WRITE macro instruction causes the initiation of an input/output operation. The completion of these operations is tested by using synchronization macro instructions. Automatic translation between EBCDIC and ASCII codes is provided for magnetic tape labels and record formats.

MVS/370 DFP R1 (cont'd)

Under QSAM, logical records are retrieved or stored as requested. The access method anticipates the need for records based on their sequential order, and normally transfers the desired records to virtual storage, ready for use, before the request for retrieval occurs. When writing data, the program normally will continue as if the record had been written immediately, although the access method routines may block it with other logical records and defer the actual writing until the output buffer has been filled. For direct access storage devices, the actual writing may be deferred until multiple buffers are filled. As with BSAM, automatic translation between EBCDIC and ASCII codes is provided for magnetic tape labels and record formats.

BASIC PARTITIONED ACCESS METHOD - BPAM: This access method, when used in conjunction with BSAM, is designed for efficient storage and retrieval of discrete sequences of data (members) belonging to the same data set on a direct access storage device. The data set includes a directory that relates the member name with the address where the sequence of data begins. Each member has a simple name. Members may be added to a partitioned data set as long as space is available in the directory and the data set. Other than directory manipulation, all I/O is performed by BSAM.

BASIC DIRECT ACCESS METHOD - BDAM: Under BDAM, records within a data set are organized on direct access volumes in any manner chosen by the programmer. Storage and retrieval of a record is by actual or relative address within the data set. This address can be that of the desired record or a starting point within the data set where a search for the record, based on a key furnished by the programmer, begins. Addresses are also used by BDAM as a starting point for searching for available space for new records.

INDEXED SEQUENTIAL ACCESS METHODS: Sequential and direct processing are provided by the indexed sequential access methods (ISAM). Records are maintained in control field sequence by key. A multilevel index structure is system maintained, allowing retrieval of any record by its key. Additions can be made to an existing ISAM data set without rewriting the data set.

The basic indexed sequential access method (BISAM) stores and retrieves records randomly from an indexed sequential data set. Selective reading is performed using the READ macro instruction, and specifying the key of the logical record to be retrieved. Individual records can be replaced or new records added randomly.

The queued indexed sequential access method (QISAM) is used to create an indexed sequential data set or to retrieve and update records sequentially from a data set. Synchronization of the program with the completion of input/output transfer and record blocking/deblocking are automatic. QISAM is also used to reorganize an existing data set.

VIRTUAL I/O: The system paging mechanism can be used to perform data set access. This is known as virtual I/O. It uses the system paging mechanism to transfer data set blocks between external page storage and real storage. The user can specify virtual I/O processing for system-named temporary data sets accessed through BDAM, BPAM, BSAM, QSAM, EXCP, and XDAP interfaces. Virtual I/O processing for system-named temporary data sets is established at system generation time.

Page-size (4K bytes) physical blocks are dynamically allocated in external page storage as a virtual I/O data set is created. These blocks are not necessarily contiguous and the virtual I/O data set may span several volumes of external page storage. The blocks are released when the data set is deleted and the space is immediately made available for other paging needs.

Implementation of virtual I/O processing is compatible with the BDAM, BPAM, BSAM, QSAM, EXCP, and XDAP macro interfaces to a DASD data set. When a request is made for accessing a virtual I/O data set, the channel programs are intercepted and interpreted and the page table entries are manipulated if necessary, so that the desired data will be paged in or out of real storage as requested. For example, the control program reads a virtual I/O data set record into a virtual address space by modifying page table entries so that the 4K byte block(s) containing the record are identified as part of the virtual address space from which the request was made. Most SAM data access is performed without channel program construction or interpretation.

Restart processing currently available for temporary data sets is provided for virtual I/O data sets. Checkpoint and automatic step restart are provided for job failures. Checkpoint, and step and job restart are provided through the applicable Job Entry Subsystem and automatic step restart is provided for system restart processing.

Some of the advantages of virtual I/O are:

- Centralized direct access storage device management.
- Elimination of channel program translation and page fixing requirements.
- Use of the I/O balancing of the paging mechanism.
- Elimination of normal I/O device allocation and DADSM overhead for temporary data sets.

- Compatibility at the object code and JCL level.

Shared DASD: A pool of direct access storage devices may be shared by IBM processors in either 370 mode or Extended Architecture mode. Devices supported are 2314/2319, 3330/3333, 3340, 3344, 3350, 3375, and 3380; two processors may share a pool of 2305 fixed head storage devices. Direct access storage devices and fixed head storage devices supported are subject to their attachability to any specific IBM processor. The catalog, user program libraries, and user data sets may be accessed by any processor. Advantages are: Reduced file maintenance, improved operational flexibility, and reduced disk space requirements.

VSAM user catalogs may be shared among OS/VS1, SVS, OS/VS2 MVS Release 3.8, MVS/370 DFP, and MVS/XA DFP. OS control volume catalogs may be shared among the above plus the OS/MFT and OS/MVT systems. While VSAM user catalogs may be shared, reference to specific entry types (e.g., GDG) created by OS/VS2 MVS Release 3.8, MVS/370 DFP, or MVS/XA DFP may be accessed only by those three systems. The master catalog cannot be shared.

In an environment where an integrated catalog facility catalog is shared by multiple host systems, DFEF, MVS/XA DFP, or MVS/370 DFP must be installed on all systems that can access the shared catalog.

In an environment where an indexed VTOC is shared by multiple host systems, the Data Facility Device Support (DFDS), MVS/XA DFP or MVS/370 DFP must be installed on each system that can access the shared VTOC.

Program libraries and other system or user data sets may be shared on a read-only basis. The system does not automatically provide exclusive control of records, or prevent concurrent update or extensions to these data sets. Such data sets should be shared on a read-only basis until safeguards are instituted by each installation. Exclusive access for all other data sets can be controlled by using the RESERVE and DEQ macro instructions.

CHECKPOINT/RESTART

If a job step is terminated before successful completion, checkpoint/restart can make it possible to resume execution from the beginning of the step or from a place within the step. Either way, the restart can be made to occur automatically when the failure occurs.

The CHKPT macro instruction is coded in the user's program at a checkpoint to be taken. A checkpoint is the point at which information about the status of a job step is recorded so that the job step can be restarted later at that point if necessary.

Checkpoint/restart includes a checkpoint routine and several restart routines.

The checkpoint routine gathers and records on a checkpoint data set enough information about the status of the job step and its related control blocks to allow a restart from the place where the checkpoint is taken.

The restart routines can be invoked when a job step is resubmitted for restart, or they can be invoked automatically when a failure occurs. The functions performed by restart routines depend upon the type of restart requested.

If the restart is to be made from the beginning of a job step, for deferred restart only, the RESTART parameter of the JOB statement must contain the name of the step to be restarted, and routines of the initiating task simply bypass preceding steps and start processing with the named step.

If a step is to be restarted from the beginning automatically, the RD parameter may be used; then restart processing begins during step termination. If RD is not used and the checkpoint DD statement is in the JOB, the job starts automatically at the last checkpoint taken. The step termination routine of job management invokes routines to verify that a restart can be performed and requests the operator to authorize the restart.

If a step is to be restarted from a place where a checkpoint was taken and the job is resubmitted, the RESTART parameter of the JOB statement must identify the step and checkpoint identifier and a SYSCHK DD statement must describe the checkpoint data set.

If a step is to be restarted automatically from a place where a checkpoint was taken, the step termination routine invokes routines to ensure that all data sets for the step are kept.

In MVS/System Product-JES2 Version 1 Release 3 (5740-XYS) or MVS/System Product-JES3 Version 1 Release 3 (5740-XYN), restarted jobs are processed by the job entry subsystem, JES, which returns them to its job execution queue for subsequent initiation based upon priority and resource availability.

SYSTEM SUPPORT PROGRAMS

LINKAGE EDITOR: The linkage editor available with MVS/370 DFP combines separately compiled or assembled object modules into one or more load modules in a format suitable for loading by the control program and for subsequent execution. It also combines previously

PROGRAM PRODUCTS

MVS/370 DFP R1 (cont'd)

edited load modules with each other or with object modules. The linkage editor available with MVS/370 DFP does not execute in overlay. This increases the virtual storage requirements by 32K bytes.

Although linking or combining of program modules is its primary function, the linkage editor also:

- Provides CSECT ordering and page boundary alignment facilities to allow the users to improve paging characteristics of their programs.
- Incorporates modules from data sets other than those in its primary input, either automatically or upon request.
- Aids program modification by replacing and deleting control sections as directed by linkage editor control statements.
- Defines the storage requirements for the common control sections generated by the assembler and by FORTRAN compilers, and the static external areas generated by PL/I compilers.
- Provides processing options and logs diagnostic error messages.
- Maintains an audit trail of compilation, linkage editing dates, and levels and modifications on a CSECT basis within a load module via the identification record.
- Provides a service aid feature to allow for expansion of modules to provide maintenance space.
- Processes a control card and parameter permitting the user to supply his authorization level for the authorized program facility (APF).

The linkage editor has a facility which will provide the user a means to prepare the installation's load and object modules for migration to MVS/XA:

- Inserts relocation dictionary (RLD) record and relocation dictionary/control (RLD/CTL) record block counts into program library members.
- AMODE/RMODE information is preserved.

PROGRAM FETCH: Modules that were placed in a load library by the linkage editor may be read into virtual storage.

LOADER: The loader combines the basic editing and loading functions of the linkage editor and program fetch in one job step. It loads object modules provided by the compilers and load modules produced by the linkage editor directly into virtual storage.

SYSTEM UTILITIES

These programs are used to maintain system control data at an organizational or system level to operate in pageable storage. The following functions are performed by the system utility programs:

IEHPROGM: Modifies system control data and maintains data sets at an organization level, via scratch, rename, catalog data, etc.

IEHMOVE: Moves or copies logical collections of data.

IEHLIST: Lists system control data such as directory entries of partitioned data sets and VTOC entries.

IEHINITT: Writes volume label sets in EBCDIC, BCD, or ASCII code on magnetic tapes. The IEHINITT included in MVS/370 DFP will initialize volume labels to conform to the ANSI X3.27-1978 standard.

IEHATLAS: Locates and assigns an alternate track to replace a defective track and copies usage records from the defective track to an alternate track.

IFHSTATR: Selects, formats, and writes information from Type 21 (error statistics by volume) SMF records. In MVS/370 DFP, IFHSTATR is run against the output of the IFASMFDP currently available in MVS/System Product - JES2 Version 1 Release 3 (5740-XYS) or MVS/System Product - JES3 Version 1 Release 3 (5740-XYN).

Offline 3800: The offline 3800 Printing Subsystem mdl 1 user is provided with the same functional capability as is available to the online 3800 mdl 1 user. The program executes in an online environment to create control information and place it on magnetic tape. The magnetic tape can then be used to set up the 3800 mdl 1 for the printing of user data.

DATA SET UTILITIES

These programs reorganize, change, or compare data at the data set and/or record level, and are required for the proper generation and maintenance of OS/VS2 MVS Release 3.8 and MVS/370 Data Facility Product. The following general functions are performed by these utilities for non-VSAM data sets:

IEBCOPY: Copies, compresses, merges, loads, and unloads partitioned data sets.

IEBGENER: Copies a sequential data set or members of a partitioned data set, or converts a data set from sequential to partitioned organization.

IEBTPCH: Prints or punches records residing in a sequential or partitioned data set.

IEBUPDTE: Updates a symbolic library.

IEBEDIT: Produces an edited input job stream data set from a master input job stream data set.

IEBDG: Can create output data sets with either internally generated test data or externally supplied input. These data sets can be sequential, indexed sequential, or partitioned.

IEBCOMPR: Compares two identically organized sequential or partitioned data sets at the logical record level.

IEBISAM: Can copy, print, reorganize, load, or unload an indexed sequential data set.

IEBIMAGE: Provides means for the 3800 user to create or modify and to store in SYS1.IMAGELIB forms control buffer records, copy modification records, graphic character modification modules, library character sets, and character arrangement tables. Input to the utility consists of simple control statements. Users can specify for FCB records, forms sizes, number of lines at each vertical spacing, and line positions for simulated channel control punches. For copy modification, control statements include the text and its position within each copy of the pages of a data set. Existing copy modification records can also be modified. Control statements for graphic character modification modules and library character sets provide means for combining and naming groups of graphic characters, including any characters already in SYS1.IMAGELIB, and to assist in storing in the system new graphic characters of the user's own design. Character arrangement tables can be created or modified to print using different character sets, to include graphic character modifications and library character sets, and to assign data codes to graphics or to change existing assignments.

INDEPENDENT UTILITY: The independent utility ICAPRTBL does not operate with the OS/VS2 MVS system control program or MVS/370 DFP program product, but supports those programs by performing stand-alone buffer loading for the 3211 or 3203 mdl 5 Printer. This independent utility does not support the 3066 Console.

SERVICE PROGRAM

ACCESS METHOD SERVICES: The access method services multi-function service program is used with VSAM data sets for the following:

- Define a VSAM data set or catalog.
- Delete a VSAM data set or catalog.
- Define an integrated catalog facility catalog.
- Delete an integrated catalog facility catalog.
- Convert a sequential or an indexed sequential data set to VSAM format.
- List VSAM or integrated catalog facility catalog entries or records of a data set.
- Copy a data set for reorganization.
- Create a backup copy of a data set.
- Make a data set portable from one operating system to another.
- Define and delete aliases for catalog names and non-VSAM data set names.
- Support generation data groups (GDGs) in non-VSAM data sets.
- Define and format paging data sets.
- Convert OS (CVOL) catalog or VSAM catalog to an integrated catalog facility catalog.
- Move or copy a VSAM catalog or integrated catalog facility catalog.
- Create pointers in the master catalog to the OS control volume catalogs.
- Reorganize catalogs:
 - Move catalogs to different device types.
 - Merge two integrated catalog facility catalogs into a single integrated catalog facility catalog.
 - Split a single integrated catalog facility catalog into two or more integrated catalog facility catalogs.
- Validate the content, format, and consistency of the integrated catalog facility catalogs and data sets.

Access method services is also used to:

- List the counters and status of the 3880 Storage Control mdl 11 and mdl 13.
- Cause data to be read into cache of the 3880-13.
- Allow or inhibit caching for the 3880-13 or attached device.

PROGRAM PRODUCTS

MVS/370 DFP R1 (cont'd)

It can be invoked through an input job stream containing an access method services command, by a processing program that passes it a command statement, or from a time-sharing terminal.

SERVICE AID

AMBLIST: This linkage editor service aid program produces various formatted listings which may be used for system serviceability and diagnostic purposes. Depending on options specified on AMBLIST control statements, the following listings may be produced:

- Formatted load module listings.
- Formatted object module listings.
- Maps and cross-reference listings of the system nucleus for the S/370 users and the DAT-on nucleus for the MVS/XA users.
- Listings of the data stored in the CSECT Identification records of load modules.
- Load module map and cross-reference listing showing addresses relocated relative to a user-supplied address.
- Load module summary data including entry point address, APF access code, module attributes, and the contents of the module's system status Index.
- Program modifications to a load module library.

The minimum virtual storage requirement for AMBLIST is 64K bytes.

SYSTEM GENERATION

System generation is the process of preparing a specially tailored operating system to match the machine configuration and operating system options selected by the user. This process employs the user's current operational operating system, either OS/VS2 MVS Release 3.8 with or without MVS/System Product Version 1 Release 3 and MVS/370 DFP and requires the program products specified in the "Specified Operating Environment".

PROGRAM PRODUCTS

MVS/370 DFP Device Support: The MVS/370 DFP device support chart shows all devices supported by MVS/370 DFP for systems functions and/or non-TP access methods. The chart shows for each device the relevant functions supported.

For telecommunications devices see:

- VTAM
 - OS/VS2 MVS VTAM 2.0
 - ACF/VTAM Version 1 licensed program (5735-RC2)
 - ACF/VTAM Version 2 licensed program (5665-280)
- TCAM
 - ACF/TCAM Version 1 licensed program (5735-RC1)
 - ACF/TCAM Version 2 licensed program (5735-RC3)
- BTAM
 - OS/VS2 MVS BTAM
 - BTAM/SP licensed program (5665-279)

Devices that are not shown in this chart have no specific programming support under MVS/370 DFP.

Notes:

1. The Selective Tape Listing feature is not supported.
2. A console must consist of a printer-keyboard, or a card reader and printer to simulate the actions of a printer-keyboard (composite console).
3. DIDOCS supported by MVS/System Product-JES2 Version 1 Release 3 (5740-XYS) or MVS/System Product-JES3 Version 1 Release 3 (5740-XYN) licensed program.
4. Multiple requesting supported.
5. File scan not supported.
6. Rotational position sensing support is an optional feature on 3340.

7. Not supported by MVS/System Product-JES3 Version 1 Release 3 (5740-XYN) licensed program.
8. For message queues under OS/VS2 MVS TCAM.
9. For message queues under TCAM, requires ACF/TCAM Version 2 Release 3 licensed program (5735-RC3).
10. Supported for read or punch, but not simultaneously.
11. For use with the OS/VS2 MVS output writer; not for system messages.
12. Punch-feed-read feature is not supported.
13. QSAM (device-dependent only).
14. Support shown is for 3330s or 3333s as staging devices. If real 3330/3333s are included as part of 3851, see Note 15.
15. With 3330/3333 as staging device, rotational position sensing is supported.
16. User program libraries only.
17. The 3851 is supported by OS/VS2 MVS Release 3.8 or Mass Storage Systems Extensions (5740-XYG) licensed program.
18. BSAM (device-dependent only).
19. QSAM (device-dependent only) for journal tapes; BSAM (device-dependent only) for cut-form documents.
20. Supported on mdls 165II, 168, and the 3033 Processors only.
21. The 3540 is supported by the diskette copy programming support of OS/VS2 MVS Release 3.8. SYSIN/SYSOUT support is provided by the diskette reader program and diskette writer program of either MVS/System Product - JES2 Version 1 Release 3 (5740-XYS) or MVS/System Product - JES3 Version 1 Release 3 (5740-XYN) licensed program.
22. ANSI/ISO tape labeling not supported.
23. A utility (IEBTCRIN) is provided by MVS/370 DFP to read data from the 2495 and create a sequentially organized data set.

PROGRAM PRODUCTS

MVS/370 DFP R1 (cont'd)

- 24. DIDOCS support of up to four colors by MVS/System Product - JES2 Version 1 Release 3.1 (5740-XYS) or MVS/System Product - JES3 Version 1 Release 3.1 (5740-XYN) licensed program.
- 25. Rotational position sensing is not supported.
- 26. Must be SYSGENed as a 2250-3.
- 27. Supported in compatibility mode only.
- 28. Requires Vector Processor Subsystem (VPSS) (5744-CK1).

Legend:

- C = Console
- G = Graphic programming support
- S = Sequential access method
- I = Indexed sequential access method
- P = Basic partitioned access method
- D = Basic direct access method
- A = Virtual storage access method
- X = Function supported

CUSTOMER RESPONSIBILITIES

Users need to order and install MVS/370 DFP and one of the prerequisites: MVS/System Product - JES2 Version 1 Release 3.0 (5740-XYS) or MVS/System Product - JES3 Version 1 Release 3.0 (5740-XYN) for execution, and their program distribution libraries for the assemblies required for system generation (SYSGEN).

Installations may need to order and install later levels or releases of either of the two prerequisites for specific device support or function desired.

Additionally, users of either OS/VS2 MVS IEHDASDR or the Direct Access Storage Dump Restore licensed program need to order and install Data Facility Data Set Services (DFDSS) (5740-UT3) or a functional equivalent to provide direct access storage device dump and restore functions. If the customer is planning to install DFDSS, it is recommended that this be done well before MVS/370 DFP is installed, to back up disk files to tape using the format acceptable to DFDSS for restoration.

For further details, see "Software Requirements".

INSTALLATION CONSIDERATIONS

MVS/370 DFP is based on the modules and macros contained in OS/VS2 MVS Release 3.8 identified by the System Modification Program (SMP) indices DM, DS, ST, PM, and UT, which were provided with OS/VS2 MVS System Control Program Release 3.8 and with the five program products whose functions have been incorporated in MVS/370 DFP. During installation, these modules, macros and their System Modification Program (SMP) Control Data Set (CDS) entries are replaced by MVS/370 DFP and identified as FMID HDQ1102. Since not all functions are replaced, the user should review the "Compatibility" section.

Installation of MVS/370 DFP requires System Modification Program (SMP) Release 4 with PTF URO3129 applied.

MVS/370 DFP includes the functions in the following program products and no attempt should be made to apply them to an OS/VS2 MVS system once MVS/370 has been installed:

- Data Facility Device Support (DFDS) (5740-AM7).
- Sequential Access Method - Extended (SAM-E) (5740-AM3).
- Data Facility Extended Function (DFEF) (5740-XYQ).
- Offline 3800 Utility program product (5748-UT2).
- Access Method Services Cryptographic Option (5740-AM8).

The following programs will enhance the usage of MVS/370 Data Facility Product:

Device Support Facilities (5752-VS2 or 5747-DS1), a Class 2 System Control Program, provides such functions as direct access storage device initialization and indexed VTOC creation. Note that if Device Support Facilities is used, Release 6 is required with MVS/370 DFP.

The Direct Access Storage Device Migration Aid licensed program (5668-002) provides assistance to the user in moving data from other supported direct access storage devices to the 3375 or the 3380 Direct Access Storage device.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

MVS/370 Data Facility Product is designed to operate on any IBM processors supported by OS/VS2 MVS Release 3.8 with MVS/SP Version 1 Release 3 installed.

SOFTWARE REQUIREMENTS

MVS/370 Data Facility Product Release 1 requires OS/VS2 MVS Release 3.8 as an installation base, and the functions provided by either MVS/System Product-JES2 Version 1 Release 3.0 (5740-XYS) or MVS/System Product-JES3 Version 1 Release 3.0 (5740-XYN) for execution, and their program distribution libraries for the assemblies required for system generation (SYSGEN). Some functions supported by MVS/370 DFP require functions contained in later releases of MVS/System Product as described below.

The IBM 3880 Storage Control mdl 11 requires the functions provided by either MVS/System Product - JES2 Version 1 Release 3.1 (5740-XYS) or MVS/System Product - JES3 Version 1 Release 3.1 (5740-XYN).

The tape labels and tape file structure support for ISO 1001-1979, ANSI X3.27-1978 and FIPS-1979 requires the functions provided by either MVS/System Product - JES2 Version 1 Release 3.2 (5740-XYS) or MVS/System Product - JES3 Version 1 Release 3.2 (5740-XYN) with the JES3 ANSI Tape Support feature (FMID JJS2351) installed.

The access method services REPRO encryption/decryption function requires the functions provided by one of the following:

- Programmed Cryptographic Facility licensed program (5740-XY5)
- Cryptographic Unit Support licensed program (5740-XY6) and its prerequisites

Either System Modification Program Release 4 (with PTF URO3129) or System Modification Program Extended (SMP/E) program product (5668-949) is required for installation and subsequent maintenance of MVS/370 DFP.

COMPATIBILITY

Upward Compatibility of User Programs: This refers to the capability of user programs that use published external interfaces, do not run authorized, and which execute with OS/VS2 MVS Release 3.8 to perform the same function in the MVS/370 environment. Although this level of compatibility is true in most cases, the user should review this section in its entirety.

Indexed VTOC Compatibility: Both indexed and non-indexed VTOCs are supported by MVS/370 DFP. The support is functionally equivalent to the support introduced to OS/VS2 MVS users with the Data Facility Device Support (DFDS) licensed program.

Programs that currently access the VTOC through documented DADSM interfaces will continue to operate without change on volumes with a VTOC index. Programs that access the VTOC via EXCP or SAM will continue to operate without change on volumes with a VTOC index with one exception: Programs that are dependent on the information in the Format 4 or 5 DSCB(s) must be modified to use the common VTOC access facility (CVAF) function to obtain the same information from the VTOC index.

OS/VS2 Program Management Compatibility: Object and load modules acceptable to the OS/VS2 MVS Release 3.8 DFP linkage editor are also acceptable to the linkage editor available with MVS/370 DFP. The linkage editor available with MVS/370 DFP will require 32K more virtual storage than is used by the OS/VS2 MVS Release 3.8 linkage editor.

OS/VS2 MVS programs not available with MVS/370 DFP: Four OS/VS2 MVS Release 3.8 programs will not be available on installation of MVS/370 DFP. The programs and suggested alternatives for specified functions are listed below:

IBCDASDI: Disk initialization functions are currently available in Device Support Facilities.

IBCDMPRS: The stand-alone disk restore functions are currently available in the Data Facility Data Set Services (DFDSS) licensed program. The stand-alone disk dump functions are no longer available or supported.

IEHDASDR:

- Disk initialization functions are currently available in Device Support Facilities.
- Dump/restore functions are currently available in DFDSS.

However, DFDSS does not support the dump format produced by IEHDASDR. Users may order and install Data Facility Data Set Services to create backup tapes in an acceptable format.

Analysis Program-1 (AP-1): The functions to aid in the analysis of DASD error situations are available in Device Support Facilities.

Note: The Direct Access Storage Dump Restore (5740-UT1) licensed program creates tape in two formats, neither of which is accepted by DFDSS. Any tape created by the Direct Access Storage Dump Restore program product or IEHDASDR, that must be used to restore data, may be restored by the originating IBM program.

MVS/370 DFP R1 (cont'd)**MIGRATION**

Indexed VTOC Migration: Coexistence with systems that do not support the VTOC index is a major feature of the VTOC index design.

- Any volume with or without a VTOC index that is currently usable on OS/VS2 MVS Release 3.8, MVS/XA, or OS/VS1 may be moved to the MVS/370 DFP environment and used as-is.
- Device Support Facilities may be used to initialize a VTOC index on these volumes whenever desired, except on volumes whose VTOC does not begin on record 1 of a track (for example, a DOS 'stacked pack').
- A volume with a VTOC index can be moved to and from the following systems which do not support the VTOC index:
 - OS Release 21.8
 - OS/VS2 SVS
 - VSE Advanced Functions
 - OS/VS1, without DFDS (5740-AM6) installed.
 - OS/VS2 MVS, without either MVS/370 DFP (5665-295) or DFDS (5740-AM7) installed.

In general, if the VTOC is modified on any of these systems, the VTOC index will be invalidated and the VTOC converted to the non-indexed format, either via existing facilities on these systems, or upon return to a system that supports the VTOC index. The user must then re-initialize the index with Device Support Facilities. However, to ensure in all cases that the VTOC index is valid, it is recommended that the user re-initialize the index with Device Support Facilities upon return to a system that supports the VTOC index.

- Volumes with the VTOC index that must be used on systems other than those listed above should be converted to the non-indexed VTOC format via Device Support Facilities prior to use on the other system.
- The VTOC index is designed for easy user migration. User job streams, including JCL and IEHPRGM control statements, are fully compatible with indexed and non-indexed volumes. EXCP programs that are converted to use CVAF will operate on both types of volumes. Thus, the installation may gradually convert volumes to the indexed format.

INTEGRATED CATALOG FACILITY MIGRATION: The MVS/370 DFP integrated catalog facility program and catalog may be used to replace and will coexist with all currently available catalog functions and facilities. Access method services CVNTCAT function will convert an existing VSAM user catalog or OS (CVOL) catalog to an integrated catalog facility catalog. Individual catalogs may be converted without requiring the conversion of any other catalog. DFEF users that have previously converted, or are in the process of converting, to integrated catalog facility catalogs will not need to repeat that conversion when migrating to MVS/370 DFP.

ISO/ANSI/FIPS VERSION 3 RESTRICTIONS and MIGRATION CONSIDERATIONS: The following restrictions may be over-ridden by manipulation in the installation exits provided by ISO/ANSI/FIPS Version 3 tapes, but such action will be the responsibility of the user:

- ISO/ANSI/FIPS Version 1 volumes are supported for input only.
- Record format 'U' (undefined) is not supported for ISO/ANSI/FIPS Version 3.
- The block size on an ISO/ANSI/FIPS Version 3 volume cannot exceed 2,048 bytes.
- Open for MOD (Output), EXTEND, OUTINX or INOUT is not allowed for ISO/ANSI/FIPS Version 3 tapes.
- Only one generation of a Generation Data Group may exist on a volume.

The MVS/370 DFP system utility IEHINITT must be used to initialize tapes to be used with ISO/ANSI/FIPS Version 3 support.

Checkpoints cannot be taken within a job step that has an ISO/ANSI/FIPS Version 3 tape that is open.

VSAM GLOBAL RESOURCE SERIALIZATION: In order for the changes in the VSAM component of MVS/370 DFP Release 1 to allow the sharing of data sets in a global resource serialization complex (ring), each system in the global resource serialization complex must contain the VSAM global resource serialization support.

The installation must not use global resource serialization to convert RESERVEs to ENQs for catalogs until VSAM global resource serialization support has been installed on all processors in the complex. Since the VSAM global resource serialization support in MVS/370 DFP is functionally equivalent to that provided in MVS/XA DFP Release 1.1 program product (5665-284), processors in the global resource serialization complex may use either program product. For specific details, see *OS/VS2 MVS Planning: Global Resource Serialization* (GC28-1062).

RPQ's ACCEPTED: No

MVS SYSTEM INTEGRITY APPLIES: Yes

CHARACTER CONVERSION AID
5665-299**PURPOSE**

The Character Conversion Aid program product provides support for the IBM 3800 model 3 Printing Subsystem. This conversion aid is designed to reduce the effort required to convert graphic characters designed for the IBM 3800 model 1 to the new pel density (240 x 240 pels per square inch) required for the 3800 model 3. The primary use is for converting graphic characters created by customers, since all IBM-supplied 3800 model 1 character sets will be provided by IBM in the new print density.

DESCRIPTION

The Character Conversion Aid is an interactive program operating under MVS/TSO. VS/APL and GDDM (Graphical Data Display Manager) are required to execute the conversion program. The program is menu-driven from a 3277, 3278 or 3279 Display which is supported by GDDM.

This conversion aid is used in conjunction with the 3800 model 3 support provided in Data Facility Device Support Release 1.6 to provide graphic characters in the format required by the 3800 model 3 for printing in Compatibility mode.

The conversion aid provides the following functions:

- Retrieval and storage of 3800 model 1 library character sets (LCS), and graphic modification modules (GRAPHMOD) data sets in an internal library as a character group.
- Ability to convert character groups to the 3800 model 3 pel density, and the ability to edit, create, copy, rename and delete characters and character groups.
- Ability to produce input for the IEBIMAGE utility to create characters in the new pel density.
- Library services to import objects into a user-defined library, route output to user-defined destinations, and print the online help screens.
- Online help screens to assist users in the proper use of the program.

The conversion process produces 'new' characters which may require further refinement. These corrections can be done interactively at the display using the Character Conversion Aid.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

An IBM 3277, 3278 or 3279 Display and appropriate Control Unit.

SOFTWARE REQUIREMENTS

The Character Conversion Aid is available only on MVS/TSO systems and requires MVS Release 3.8. Also required are the following program products:

- VS/APL Release 4 (5748-AP1).
- Graphical Data Display Manager (GDDM), Release 2 (5748-XXH).

Planning Information: Users planning to install the Character Conversion Aid program product must also install or have installed the VS/APL Release 4 and GDDM Release 2 program products. The output of the conversion aid must be processed by the enhanced IEBIMAGE utility which is part of the Data Facility Device Support Release 1.6.

The Character Conversion Aid program product will install on an OS/VS2 (MVS) Release 3.8 system by using the System Modification Program (SMP4).

DOCUMENTATION

(available from Mechanicsburg)

Character Conversion Aid Tent Card (S320-8025) ... Character Conversion Aid Diagnosis Guide and Reference (SY35-0052).

MVS SYSTEM INTEGRITY

IBM will accept APARs where the installation of this licensed program causes an exposure to the system integrity of MVS. This licensed program is intended to run authorized. Refer to Programming Announcement Statement of MVS Integrity dated October 21, 1981 for additional information.

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**MVS/BULK DATA TRANSFER
5665-302**

PURPOSE

MVS/Bulk Data Transfer (MVS/BDT) is a program product that enables an installation that is part of a Systems Network Architecture (SNA) network to copy data sets to or from another installation in the network. Data is transferred directly from system to system without having to copy it to an intermediate spool.

HIGHLIGHTS

MVS/BDT has the following features:

- Provides the ability to copy data sets from one MVS node in an SNA network to another.
- Data Transfer types include sequential and partitioned data sets. PDSs may be whole data sets, single members, multiple members, or all of a PDS excluding selected members.
- Data transfer checkpointing which allows an interrupted transfer to be rescheduled and resumed from the most recent checkpoint.
- MVS/BDT executes in its own address space which provides isolation for better overall system availability.
- MVS/BDT uses MVS multi-tasking to exploit MP, AP, and dyadic machines. Since each file transfer request is a separate task, each runs independent of the others.
- Data transfer requests can be initiated from TSO terminals, MVS MCS consoles, JES3 consoles or from batch jobs.
- Users are kept informed of the progress of their transfer requests through status messages and through command inquiry.
- Assignment of scheduling priorities to data transfer requests allows user control over the order in which data transfers are executed.
- A command set which allows system operators to monitor and manage the flow of work to and from their nodes.
- Frequently used data transfer requests may be stored in a library and reused as needed. This feature eliminates the need to recode these requests each time they are used.
- Users may specify that some requests are dependent on other requests completing before they may be scheduled for execution. This function is called MVS/BDT Dependent Job Control and is useful for production work scheduling.
- Protection against loss of data transfer requests is provided by saving the request in a direct access storage queue from which it can be automatically recovered.
- Data set disposition, record attributes, and blocking are all under user control.
- The Teleprocessing support is via ACF/VTAM SNA and features the following:
 - Concurrent file transfers, so that between two nodes, a number of file transfer requests run simultaneously. A fencing facility permits allocation of one portion of the session for sending and another for receiving.
 - Negotiable bind, a feature that can resolve minor differences in communication parameters between nodes so as not to prevent SNA sessions from being established.
 - Password Validation, which requires nodes to exchange passwords before a SNA session may be established.
 - An automatic session restart option which enables MVS/BDT to restart abnormally terminated sessions automatically.
 - Data compression options optimized for text and for numeric data.
 - Full-duplex protocols exploit the full bandwidth of the communications channel.
 - Buffer pooling reduces the usage of private virtual storage.
 - Through SNA VTAM Class of Service, data may be routed over crypto teleprocessing links.
 - Any physical links supported by VTAM are supported by MVS/BDT.
- Installations are provided with extensive management tools in addition to the operator commands, such as:
 - SMF accounting records are provided for each file transfer. Additionally, an exit to allow monitoring or tailoring of the information is provided.
 - A BDT subsystem log records all messages.
 - Authorization exits to control usage of MVS/BDT.
 - User exits for tailoring MVS/BDT.
 - Initialization parameters for tuning MVS/BDT.

- MVS/BDT includes features to enhance its availability and serviceability, such as:

- Executing in its own address space which provides isolation for better overall system availability.
- Having extensive ESTAE routines which reinstate failing tasks when possible.
- Providing formatted ABEND dumps.
- Being able to provide, in main storage, a trace of BDT internal events.
- Providing a diagnostic log of problems encountered during initialization processing.

DESCRIPTION

MVS/Bulk Data Transfer (MVS/BDT) is an authorized program which runs on MVS/SP Version 1 Release 3.1 and Version 2 Release 1 in its own address space. MVS/BDT transmits and receives data sets to and from other MVS/BDT nodes. The data transmitted by MVS/BDT may be either sequential data sets or partitioned data sets, in addition to commands and messages.

Data is transmitted directly from the sending data set to the receiving data set without any intervening spooling. This characteristic is very important in that it allows large data files to be transmitted without using the JES spool.

The transmission uses a full-duplex SNA protocol which allows a checkpoint/restart capability for large files. The protocol also provides a 'pacing window' so that the receiving BDT can provide a delayed response to the sending BDT for each message buffer. The checkpoint feature and the pacing capability are designed to take advantage of full-duplex, wideband and satellite capacities.

Transaction requests may be entered by the MVS operator (MCS Console), the JES2 operator (MCS Console), the JES3 Operator (JES3 Console), a TSO user or by a batch job. The unit of work submitted by the operator or end-user is called a 'transaction'. A transaction defines a 'from' and a 'to' data set at a 'from' and 'to' MVS/BDT node. The transactions are stored on a BDT work queue and are scheduled by one of the two MVS/BDT nodes involved.

MVS/BDT nodes are assumed to have 'any-to-any' connectivity to each other. No Store-and-Forward is provided.

MVS/BDT is designed to be as JES-independent as possible. For example, all MVS/BDT input commands, transaction requests, and the resulting system responses are identical, regardless of the type of JES in use at any node involved in processing the request.

CUSTOMER RESPONSIBILITIES

The customer must order and install MVS/BDT and must also have installed one of the MVS/System Product releases specified in the "Software Requirements" section.

Installation Requirements: MVS/BDT is installed using System Modification Program Release 4 (SMP4) or System Modification Program Extended (SMP/E).

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

MVS/BDT Release 1 is designed to operate on any IBM Processor that is supported by MVS/System Product Version 1 Release 3.1 or MVS/System Product Version 2 Release 1.1.

SOFTWARE REQUIREMENTS

Base Control Program Considerations:

- MVS/BDT requires the Base Control Program component of MVS/SP Version 1 to be at Release 3.1 level or later, and Version 2 to be at Release 1.1 level.
- Additional required support for MVS/BDT in the Base Control Program is provided by the MVS/System Product TCB Expansion feature (FMID JBB1337, JIP2337) and by Program Temporary Fixes (PTFs) to MVS/SP Version 1 Release 3.1, 3.2 and 3.3, and by PTFs to MVS/SP Version 2 Release 1.1.

JES2 Considerations:

- MVS/BDT requires the JES2 component of MVS/SP Version 1 or Version 2 to be at Release 3.0 or later.

JES3 Considerations:

- MVS/BDT requires the JES3 component of MVS/SP Version 1 or Version 2 to be at Release level 3.1 with the JES3 MVS/BDT Support feature (FMID JJS2350) installed.

PROGRAM PRODUCTS**MVS/Bulk Data Transfer (cont'd)****VTAM Considerations:**

- MVS/BDT requires either ACF/VTAM Version 1 Release 3 with the Multisystem Networking feature (MSNF) or ACF/VTAM Version 2 Release 1.

CONVERSION (not applicable)**DATA SECURITY**

MVS/BDT provides support for external security management through transaction and command authorization exits, session passwords, and logging facilities. User management is responsible for evaluating, selecting, applying and implementing such features and for the appropriate administrative and application controls.

DOCUMENTATION
(available from Mechanicsburg)*General Information Manual (GC28-1313).***MVS SYSTEM INTEGRITY**

IBM will accept APARs describing any situation where the installation of MVS/Bulk Data Transfer (5665-302) causes an exposure to the system integrity of MVS.

RPQs ACCEPTED: No

5665-309 - MVS FINANCIAL MANAGEMENT SYSTEM R1

PURPOSE

MVS Financial Management System offers a framework for creating financial systems to be used in various accounting applications such as general ledger, cost control, budgeting, reporting and consolidation.

HIGHLIGHTS

MVS Financial Accounting System provides facilities for creation of accounting systems in the following application areas:

- Financial Accounting and Reporting
- General Ledger
- Management and Responsibility Accounting
- Budgeting
- Cost Accounting
- Project Accounting
- Consolidation Reporting

DESCRIPTION

Introduction: The licensed program offerings in the finance and accounting area can be divided into three major groups:

- **OPERATIONAL**, which cover applications such as order entry, invoicing, accounts payable and accounts receivable.
- **TACTICAL**, covering general ledger, budgeting, cost and project accounting and consolidation
- **STRATEGIC**, which includes various tools for planning and decision evaluation.

Application Areas: MVS Financial Management System is designed to provide a framework for creating financial systems to be used in the following application areas:

- **FINANCIAL ACCOUNTING and REPORTING**, incorporating **GENERAL LEDGER** (nominal ledger), profit and loss statement, balance sheet, financial adjustment, reserves, provisions, control accounts, and journals.
- **MANAGEMENT and RESPONSIBILITY ACCOUNTING**, incorporating revenue as well as costs, and profitability analysis by various cost centers and product types.
- **BUDGETING** with a distribution function to allocate a department budget to single accounts and with seasonal curve functions to distribute the budget over periods in the year within the account.
- **COST ACCOUNTING**, incorporating productivity analysis, determination of fixed and variable costs, variance analysis, and costing by product types and market place. It is within its application area complementary to IBM **COSTING**.
- **PROJECT ACCOUNTING**, incorporating project costs to date, as well as accruals and repayments allocated over future periods, budgets and budget revisions.
- **CONSOLIDATION REPORTS**, incorporating the structuring and merging of information over several divisions or companies within a group, very often from the base of completely different charts of accounts.
- In addition to the areas mentioned in the points above, various forms of statistical analysis, multilevel reporting, daily, weekly, and to-date, by product type, region, market location, etc. are also included. (That is, information which is already present in base accounts, but needs to be restructured and presented in a different format.)

These application areas are supported by an integrated system that:

- Gathers, processes, and consolidates financial data; ensures data integrity, audit trails, and data retention for analysis
- Maintains ledgers and prepares financial statements.
- Can provide cost accounting and reporting for products and/or responsibility centers.
- Assists in the creation of long- and short-range budgets, and stores current year budgets for performance comparisons.
- Prepares and maintains accounting, financial, statistical, and management data over many years.
- Supports auditing facilities and security functions.
- Provides controlled access to and display of data.
- Can be modified and can grow with the organization.
- In line with the above introduction, the MVS Financial Management System provides published interfaces to and complements the IBM program products **Interactive Financial System 1 (IFS 1 - 5668-967)**, and **Planning, Control and Decision Evaluation System (PLANCODE/S - 5740-XX9 and PLANCODE/I - 5840-XX8)**.

System Overview: MVS Financial Management System consists of three main components:

- The **Multiple Ledger System (MLS)**, which is a batch component, used for building up and maintaining a set of data bases containing financial information.
- The **Financial Management Display System (FDS)**, which provides functions for requesting and displaying reports and for creating input transactions via a display terminal. It also allows for graphic display of certain reports using the **Interactive Chart Utility (ICU)** component of **GDDM**.
- The **Business Output/Tailoring System (BOS)**, which is used for creating reports, and tailoring the standard functions where user-defined enhancements are required. The **Business Output/Tailoring System** is a tool that requires programmers' assistance.

Specific Functions: Within each of these application areas, MVS Financial Management System provides specific functions such as the following:

- **OVERHEAD RECOVERY**, being the reallocation of fixed and indirect costs, possibly several times in the course of absorption. MVS Financial Management System provides a **Calculation, Pricing, and Redistribution** function to handle just this problem.
- **FOREIGN CURRENCY** requires that certain accounts be expressed in different currencies. MVS Financial Management System enables the user to define a special table containing conversion factors which may be used for converting values from one currency to another for presentation in printed output.
- Different **CHARTS of ACCOUNTS** can be handled by MVS Financial Management System, which enables the user to achieve faster corporate consolidation because all divisions and subsidiaries can be handled by the same system, even if their chart of accounts' structure is different. There are several facilities in MVS Financial Management System that simplify the restructuring of any specific chart of accounts that may arise due to changes of company or government accounting policy.
- **VARIABLE ACCOUNTING PERIODS** are often required, depending on the type of application. MVS Financial Management System is designed to operate with a 12- or 13-period fiscal year (representing monthly periods made up according to calendar months, four- and five-weekly accounting months, or even periods, split across different days of the week). However, weekly or quarterly periods may be accommodated.
- Generating **MULTIPLE TRANSACTIONS** from certain selected transactions simplifies data entry, such that copies of each individual transaction may be modified and directed to different accounts.
- **AUDIT CHECKS and BALANCES** are provided by Financial Management System through a comprehensive series of standard reports, which enable the user to trace postings right through from source to incorporation in the final account.
- Timely reports for decision making may be generated by the user and displayed on a terminal screen or printed on paper. The user can structure and group data for meaningful management analysis.

As well as the facilities mentioned above, MVS Financial Management System can accommodate those specific problems users might encounter in such areas as accounting for fixed assets and depreciation, changes in government policy regarding accounting for profit and loss, and handling various forms of accruals and repayments. The keyword that applies to MVS Financial Management System is the flexibility it provides to users for tailoring and enhancing the accounting system to meet their specific requirements when and as they arise. For example, customization facilities are provided including audit trails to enable the enhancement of standard functions, such as:

- Transforming input from other data processing systems into transactions for MVS Financial Management System.
- Generating output, including reports and records for other data processing applications.
- Processing user-defined information for inclusion into data bases.

CUSTOMER RESPONSIBILITIES

The following list provides an overview of major tasks necessary to accomplish a smooth product implementation for the MVS Financial Management System.

Planning

1. Define suitable initial application (pilot application).
2. Select members of the project group.
3. Accounting personnel, project leader, and systems analyst attend the Functions workshop.
4. Draw up preliminary project plan (time and resources).

PROGRAM PRODUCTS

MVS Financial Management System (cont'd)

5. Install Financial Management System and get acquainted with the sample problem.
6. Project leader, systems analyst and application programmer attend the BOS workshop.

Design

7. Specify requirements for printed reports.
8. Decide on chart of accounts structure (account number layouts).
9. Outline format of input data and relationships to feeder systems.
10. Determine segment layouts and space requirements for data bases.
11. Plan test environment and procedures.
12. System analyst and application programmer attend the BOS Advanced workshop.

Implementation

13. Start documenting the application design.
14. Draw up detailed project plan (time and resources).
15. Set up control information, chart of accounts.
16. Plan production environment and procedures (MLS and FDS).
17. Use BOS to:
 - Program/tailor output reports.
 - Convert data from existing feeder systems.
 - Modify standard functions, add new functions.
 - Tailor error handling routines.
18. Establish data entry procedures (including PREVDATA panels).
19. Develop framework for FDS and hoc report requests (PREVREQ panels).
20. Complete testing and plan switch-over to normal operation.
21. Educate users and complete system documentation.

**SPECIFIED OPERATING ENVIRONMENT
HARDWARE REQUIREMENTS**

This IBM program product is designed to operate on the following IBM machines: IBM S/370 mdls 148, 158, 168, 303X, 308X and on 4300 Processors if operating in an MVS environment.

For the MVS Financial Management System sample problem, the F program (which is the largest), can be run in 1,000K bytes. A typical installation, however, might require 1,200K bytes of virtual storage. MVS Financial Management System itself does not require any fixed real storage.

The Display System (FDS) can use any of the following (or equivalent) terminals if equipped with at least 12 Program Function Keys:

- IBM 3276 Control Unit Display Station mdls 2, 3, 4, 12, 13, or 14.
- IBM 3277 Display Station mdl 2.
- IBM 3278 Display Station mdls 2, 3, 4 or 5.
- IBM 3279 Color Display Station mdls 2A, 2B, 3A or 3B.
- IBM 3178 Display Station.
- IBM 3290 Information Panel.

SOFTWARE REQUIREMENTS

MVS Financial Management System executes under:

- MVS/SP-JES2 Version 1 Release 3 (5740-XY5).
- MVS/SP-JES3 Version 1 Release 3 (5740-XYN).

MVS Financial Management System also executes under MVS/XA:

- MVS/SP-JES2 Version 2 (5740-XC6).
- MVS/SP-JES3 Version 2 (5665-291).

As prerequisites for above MVS/SP products, MVS Release 3.8 with Processor Support 2 must be installed.

The following products or necessary upgrades as specified by MVS/XA are required:

- IMS/VS-DB Version 1 Release 2 (5740-XX2).
- OS/VS Sort/Merge Release 5 (5740-SM1).
- OS/VS COBOL Library Release 2 (5740-LM1).

- If FDS is to be used, then one of the following alternatives is required:

- The TSO function of MVS, or
- CICS/OS/VS Version 1 Release 6 (5740-XX1) and MVS/370 Data Facility Product Release 1 (5665-295). When interfacing with CICS/OS/VS, the Command Level Interface is used.

- If the graphic display capability of FDS is to be used, the Graphical Data Display Manager Release 3 (5748-XXH) with the Presentation Graphic Feature with Interactive Chart Utility must be installed. In an MVS/XA environment, GDDM Release 3 requires MVS/SP Version 2 Release 1.1.

- System Modification Program Release 4 (SMP4) is needed for the installation of MVS Financial Management System.

Subsequent releases and modification levels are supported unless otherwise stated.

CONVERSION

Migrating from the IFP/FDP Version of Financial Management System (5785-NAC): Migrating from the IFP version of Financial Management System to the program product MVS Financial Management System (still using TSO for the display system FDS) will be a small effort as the main design is kept consistent within the two products.

The migration activities are:

- Recompile BOS tailoring programs.
- Use a utility if saved report requests (PREVREQ) or data entry panels (PREVDATA) need to be brought over to the new system.

Migrating from VSE/Financial Management System (5666-263): Migrating from the VSE Financial Management System is of interest for customers who are moving all their activities from VSE to MVS. These customers are assumed to continue using CICS for the display system (FDS).

Also, these customers will benefit from the fact that the main design is kept consistent within the two products. Examples of this are described in the previous section.

In addition to normal migration activities when going from VSE to MVS, the only identified special migration activity is to recompile BOS tailoring programs.

SECURITY/INTEGRITY

General data security is provided by the use of DL/I data bases. This can be further extended if RACF (5740-XXH) is installed. In addition, specific functions are provided by MVS Financial Management System in the area of Security and Integrity:

- To get access to information about a company in the data bases from an online terminal, the user must be authorized for that company.
- Functions exist for input data validation, and tools are provided so the customer can extend these functions.

**DOCUMENTATION
(available from Mechanicsburg)**

General Information Manual (GH19-6274).

The following documents will be available at program availability:

Multiple Ledger System User's Guide (GH19-6276) ... *Licensed Program Specifications* (GH19-6275) ... *Financial Management Display System User's Guide* (SH19-6277) ... *The Business Output/Tailoring System Programmer's Guide* (SH19-6278)

SYSTEM INTEGRITY

IBM will accept APARs where the installation of MVS Financial Management System introduces an exposure to the system integrity of OS/VS2 (MVS). MVS Financial Management System is intended to run unauthorized. Refer to Programming Announcement dated October 27, 1981.

RPOs ACCEPTED: No

PROGRAM PRODUCTS

**REPORT MANAGEMENT AND DISTRIBUTION SYSTEM
RELEASE 1.0 (5665-310)**

PURPOSE

The Report Management and Distribution System is a series of programs which provide the MVS user with a system to store, protect, view and print system output on demand. This system gives the user the potential for reducing operational costs, decreasing report turnaround time and increasing report handling productivity.

HIGHLIGHTS

- Stores user-designated SYSOUT datasets
- Controls user access to stored datasets
- Provides terminal viewing of stored datasets through IMS, TSO or CICS
- Permits demand printing of a stored dataset
- Provides indexing or decollate capability
- Provides report owner review of output prior to release
- Provides Extended Support for the 6670 Information Distributor
- Supports the 3290 Information Panel

DESCRIPTION

STORES SYSOUT DATASETS: User-designated SYSOUT datasets are stored by an MVS external writer. Unique report identifiers are established and used in managing data retrieval.

CONTROLS USER ACCESS: RACF or VSAM cluster passwords can be used to control access to a report or group of reports. When RACF is used, users are not aware of the existence of reports they are not authorized to view. SMF records are generated to provide a detailed audit trail of report creation and deletion, viewing and printing. A user exit is provided for an interface to a user-supplied security system.

PROVIDES TERMINAL ACCESS: Access to the stored report images is provided via TSO, CICS and/or IMS to the IBM 3270-type display terminals including the 3178 model C2 and the 3290 Information Panel. The following panels are currently available: Signon panel (IMS and CICS only), primary option panel, index panel, versions panel, display panel, and print panels. Predefined PF keys are available to aid the user in the manipulation of data being viewed. These viewing functions include paging forward and backward, scanning, and reformatting. (Actual stored data is never reformatted.) Help panels are also provided.

At initial availability, the 3290 Information Panel will be supported by the Report Management and Distribution System under TSO. CICS support will be available during the third quarter of 1983 and IMS support during the fourth quarter of 1983.

PERMITS DEMAND PRINTING: Viewers of a report can request printing of a report or portions of a report on a 328X network printer, system printer or the 6670 Information Distributor. Restrictions can be placed on a report to limit the capability of a user printing the report. These restrictions include the control of page ranges to be printed and other print parameters.

INDEXING: Reports may be logically subdivided into control levels based on user-defined fields. Utilizing this concept the archiver dynamically supplies an index indicating, like a table of contents, where the control fields change. The index is stored as additional pages at the end of the report. The user may then view this index to facilitate access to a desired portion of the report.

DECOLLATING: Another use of the control level concept allows selective access to logical portions of a report. The report continues to exist in its entirety, controlled by a designated owner. Other users only have access to their portions of the report for viewing and printing.

REPORT REVIEW/RELEASE: This feature provides the capability for the owner of a report to review the report prior to releasing it for printing or viewing by other users.

EXTENDED SUPPORT FOR THE 6670 INFORMATION DISTRIBUTOR: This support provides:

- The capability on the Report Management and Distribution System Viewer's 6670 Print Panel to select options by 'filling in the blanks.'
- The capability to request the printing to the 6670 of a report or reports, or a list of stored reports, or a list of the stored versions of a report.
- The capability to signon to the system directly from an SNA 6670.
- The capability to request distribution to the SNA 6670 of all reports not yet transmitted which the user is authorized to access or to request a single available report be transmitted to multiple SNA 6670s.

SUPPORT FOR THE 3290 INFORMATION PANEL: The productivity of report viewing on the Report Management and Distribution System and report readability is increased with the use of the 3290 Information Panel. The capabilities of the 3290 Information Panel work with the functions of the Report Management and Distribution System to:

- Display a report page up to 160 columns across and 59 lines in depth, eliminating the need to scroll the report page.

- Provide help information in a scrollable partition along side of the report page being viewed if the report is 132 columns or less.
- Use the 3290 Multiple Interactive Screens Function to display reports on one half of the screen while using the other half of the screen to view another report, or logon to a different application or system.
- Use the 3290 Multiple Copy Function to save portions of the report on another part of the screen while continuing to view the report.

CUSTOMER RESPONSIBILITIES

INSTALLATION: The customer is responsible for installation. The process of installation and verification is estimated to take no more than two days. The basic steps involved are installing the libraries from the distribution tape, updating the installation's VTAM Definition Libraries to recognize the system's online application program, updating the MVS program properties table and archiving the sample reports. Additionally, for IMS, an IMS system generation and MFS generation are required and for CICS, a CICS generation is required.

EXITS: To allow flexibility for an installation to tailor the Report Management and Distribution System the following exit points have been supplied: initialization, termination, security, SMF logging, archive page GET/PUT, and print. Exit code is provided at the RACF security and SMF logging exit points and may be used or overridden as desired. The customer must supply any code necessary to make use of the other exit points.

AUDITABILITY AND CONTROL: An IBM-supplied user exit is available in the Report Management and Distribution System to provide the capability to do SMF logging. SMF records can be generated to provide a detailed audit trail of report archiving, viewing, and printing.

SPECIFIED OPERATING ENVIRONMENT

The operating environment for the Report Management and Distribution System is described in terms of a host processor, user terminals, printers and programming systems.

HARDWARE REQUIREMENTS

The Report Management and Distribution System is designed to operate with an IBM host processor that supports MVS. The IBM 3270 terminals (3277 model 2; 3278 models 2, 3, 4, and 5; and 3279 models 2 and 3) with Program Function keys, an IBM 3178 model C2 or an IBM 3290 Information Panel are required for online viewing of a report. VTAM network 328X or system JES printers(s) or the IBM 6670 Information Distributor are required to print a report. The 6670 is supported via JES as a point-to-point BSC Nonprogrammable Workstation RJE terminal or via IDWS as multipoint SNA.

SOFTWARE REQUIREMENTS

The Report Management and Distribution System operates with the following IBM products: MVS 3.7 or later (including MVS/XA 24-bit addressing mode) with SU 32 (System Security Support) if desired; JES2 or JES3; ACF/VTAM (5735-RC2) Version 1, Release 3, or ACF/VTAM (5665-280) Version 2; OS/VS VSAM; SP/VS (5668-009) or ISPF (5668-960); IMS/DC (5740-XX2) or CICS (5740-XX1); VTAM DSPRINT (5798-CPF) if printing to a VTAM cluster printer in the TSO environment is used, and IDWS (5740-AMA) for distribution to the SNA 6670.

CONVERSION

If an installation is currently using FCO (File Cabinet Option) (5798-CPY and DCG), an FCO to Report Management and Distribution System utility is available to convert the FCO directory to a Report Management and Distribution System directory. The utility can also move FCO archived reports onto the Report Management and Distribution System. Current FCO users may take the option to convert only their directories and view new versions of reports under the Report Management and Distribution System.

SECURITY/INTEGRITY

Customer management is responsible for the selection, application, and adequacy of security controls for their environment. RACF security or VSAM password protection for the reports is available.

PERFORMANCE and PHYSICAL RESOURCE CONSIDERATIONS

Actual performance of the Report Management and Distribution System Viewer may vary due to many factors such as system size and load, available storage and TSO, IMS, or CICS tuning. Data Streams used for display of the Report Management and Distribution System report data are blank compressed to keep the transmission time to a minimum.

The system can move varying large quantities of report data to and from storage. It is possible only to estimate the system load by monitoring activity. In an MVS/SP environment, the Hierarchical Storage Manager program product (5740-XRB) can be used to automate much of the storage management. If archived reports are to be defined to virtual (MSS) DASD, it is recommended for performance reasons that the directory be placed on real DASD.

PROGRAM PRODUCTS

Report Management and Distribution System R1 (cont'd)

DOCUMENTATION
(available from Mechanicsburg)

Licensed Program Specifications (GC30-9562) ... General Information Manual (GC30-3191).

Available at time of general availability of the Program Product:

User's Guide (SC30-3192) ... User's Reference Summary (SC30-3197) ... Template for 3270 Display Terminals (SX27-3547) ... Archive Administrator's Guide (SC30-3196) ... Archive Administrator's Reference Summary (SC30-3176) ... Installation and Operations Guide (SC30-3193) ... 3290 Information Panel Support (SC30-3195) ... Two Inch-Three Ring Binder (SX27-3541).

MVS SYSTEM INTEGRITY

IBM will accept APARs where the installation of the Report Management and Distribution System introduces an exposure to the system integrity of MVS. Refer to Programming Announcement dated October 21, 1981. Certain Components of this system are intended to run authorized.

RPQs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**3270-PC FILE TRANSFER PROGRAM
5665-311**

PURPOSE

The 3270-PC File Transfer Program provides a 5150/5160 Personal Computer 3278/79 Emulation Adapter-featured computer, or a 3270-Personal Computer with the capability to transfer files to or from the host system to the workstation. This program product may be installed in MVS/TSO.

HIGHLIGHTS

The 3270-PC File Transfer Program allows files to be transferred from the host to the workstation for off-line data manipulation, updating, or correction or for the transfer and storage of local data in the host system.

CUSTOMER RESPONSIBILITIES

The customer is responsible for installing the proper program in the host system.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE/SOFTWARE REQUIREMENTS

Either:

- IBM 3270 Personal Computer, 3270-PC Control Program, and IBM PC DOS 2.0 or,
- IBM Personal Computer 3278/79 Emulation Adapter in a 5150/5160 Personal Computer, Personal Computer 3278/79 Emulation Control Program, and IBM PC DOS 2.0.

PACKAGING

Each program product resides on a mini-reel.

ORDERING INSTRUCTIONS:

When ordering PP 5665-311 for MVS/TSO, specify either **#9029** for 9-track 1600 bpi Magnetic Tape or **#9031** for 9-track 6250 bpi Magnetic Tape.

PROGRAM PRODUCTS

**5665-948 - IBM BASIC (MVS/SP V1 and MVS/XA)
5668-996 - IBM BASIC (VM/SP CMS)**

PURPOSE

IBM BASIC provides a problem-solving capability under VM/SP-CMS and under MVS/SP in both the interactive and batch environment. The BASIC language is easy to learn and easy to use. Its simplicity has broad appeal to non-computer professionals (business analysts, engineers, scientists, students, etc.), as well as to the professional programmer. The language is widely used as a problem solving tool across a broad range of business and scientific-oriented applications.

SPECIAL SALES INFORMATION

IBM BASIC is designed for new as well as existing users of BASIC. Such users of other BASIC products (including the VS BASIC program product 5748-XX1) will find that IBM BASIC offers advantages as an alternative to their current products.

HIGHLIGHTS

- Interactive source program development and debugging with line-by-line syntax checking.
- Extensive online HELP facilities.
- Object program execution in either batch mode or interactive mode.
- Variables can be given descriptive names which may be up to 40 characters long.
- The number of statements in a program is limited only by available storage.
- Control of the display screen is available for use in applications.

DESCRIPTION

BASIC LANGUAGE STANDARDS: IBM BASIC is designed according to the specifications of the following industry standards, as understood and interpreted by IBM in July 1982:

- American National Standard (ANS) Minimal BASIC, ANSI X3.60-1978.
- European Computer Manufacturers Association Standard for Minimal BASIC ECMA-55 Minimal BASIC, January 1978.
- International Organization for Standardization proposed standard ISO Minimal BASIC DP ISO-6373.

These standards are technically equivalent. ANSI and ECMA have recently completed the specification of an enhanced BASIC. IBM BASIC contains a number of the proposed enhancements. In addition, IBM BASIC has many features from other BASIC products of IBM which are not contained in the above standard.

FEATURES of IBM BASIC

- The easy-to-use interactive facilities permit the user to interactively edit and dynamically debug a program at the terminal. Each statement is checked for syntax as it is entered.
- A comprehensive CALL statement is included:
 - Can call other BASIC source programs contained within the same workspace.
 - Can call precompiled subroutines.
 - Can call programs written in other languages (COBOL, VS FORTRAN and PL/I) are explicitly supported.
 - Can call the Graphical Data Display Manager (GDDM) Release 2 or later with its Presentation Graphics feature to provide access to a whole host of Graphics and full screen control functions.
 - Can call the host system to execute its subset commands.
- The HELP command gives users interactive assistance in learning or using IBM BASIC.
- Use of the Discontiguous Shared Segment feature of VM/SP, so that a single copy of IBM BASIC (or a single copy of a compiled IBM BASIC program) can be shared by many users.
- Screen scrolling.
- An application program in BASIC can fully control a display screen, in order to improve end-user communication.
- An extensive range of intrinsic functions is included for arithmetic and character operations.
- Structured programming aids.
- User-defined functions.
- VSAM support through the BASIC language for:
 - Sequential Data Sets (ESDS)
 - Relative Record Data Sets (RRDS)
 - Indexed Data Sets (KSDS)

- Saving and loading of source programs using either VSAM data sets (ESDS) or host system files.
- Input/output facilities that provide great flexibility in accessing input data and in formatting output data.
- Alternate collating sequence support (ASCII or EBCDIC).
- Extensive data manipulation capabilities, including arithmetic operations on variables and arrays with high precision.
- Immediate execution of BASIC commands and certain BASIC statements.
- Support for host system sequential and direct files.
- Symbolic alphanumeric statement labels are permitted.
- Identifiers and labels may be up to 40 characters long.
- Versatile character string handling, enabling the user to define character variables of different lengths, to concatenate groups of character data items, and to locate and extract substrings.
- Comprehensive array handling operations for both numeric and character arrays of up to seven dimensions.
- Implicit data typing.
- No arbitrary limit to the number of statements in a program. It is only limited by the size of the virtual address space.
- Many unusual conditions and errors can be handled specifically by an application using IBM BASIC statements.
- IBM BASIC and all generated code (except for one 'root' module in the VM/SP CMS product) is reentrant and can reside in shared storage.
- A Federal Information Processing Standard (FIPS) flagger will indicate the use of BASIC extensions that are not within the standard.

CUSTOMER RESPONSIBILITIES and INSTALLATION

To install IBM BASIC, the user:

- Chooses the options and system parameters as described in *IBM BASIC/MVS: Installation and Customization (SC26-4105)* and in *IBM BASIC/VM: Installation and Customization (SC26-4025)*.
- Executes the defined procedures provided for installation.
- Uses the installation verification procedures to test for successful installation.

Each customer installation, operating with or maintaining IBM BASIC, must have a working knowledge of the MVS/SP or VM/CMS systems.

It is the customer's responsibility to make the changes in the customer's existing BASIC programs necessary to run under IBM BASIC. It is also the customer's responsibility to ensure type compatibility when exchanging data with programs written in other languages while using IBM BASIC.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

By IBM BASIC/MVS: IBM BASIC/MVS Release 1 operates on all IBM processors supported by MVS/SP Version 1 Release 3 or by MVS/XA, or by subsequent releases unless otherwise announced.

For IBM BASIC/MVS, a minimum of approximately 372K bytes of virtual storage is required if the 'space' installation option is chosen, or 552K bytes if the 'speed' installation option is chosen, in order to operate BASIC/MVS. This required virtual storage may be provided in shared storage (LPA). In addition, for each user, the virtual storage required to compose and execute a normal 200-line BASIC program is approximately 40K bytes. In addition, MVS/SP needs space within the user's virtual address space.

The direct-access storage space required for IBM BASIC/MVS is independent of the device type. It ranges from 4,380 to 6,800 blocks of 1,000 bytes each, depending on which installation alternatives are chosen.

By IBM BASIC/VM: IBM BASIC/VM Release 1 operates on all IBM processors supported by VM/SP Release 1 or by subsequent releases, unless otherwise announced. A minimum of approximately 365K bytes of virtual storage is required if the 'space' option is chosen, or 545K bytes if the 'speed' option is chosen to operate IBM BASIC/VM. This required virtual storage may be provided in shared storage. In addition, for each user, the virtual storage required to compose and execute a normal 200-line BASIC program will be approximately 40K bytes. In addition, VM/SP-CMS needs space within the user's virtual machine.

The direct access storage space required for IBM BASIC/VM residence is independent of the device type. It ranges from 2,080 to 4,500 blocks of 1,000 bytes each, depending on which installation alternatives are chosen.

PROGRAM PRODUCTS

IBM BASIC (cont'd)

The processor must include the decimal and floating-point instruction sets.

By **IBM BASIC Object Program Execution**: Storage requirements are dependent upon the facilities and functions used in the source program. The decimal and floating-point instruction sets are required. The timer feature is required if the **TIME** built-in function is used, or if the time for processing is required, or if the **RANDOMIZE** keyword is used to alter the random number sequence.

User programs utilize IBM input/output devices as supported by the host systems.

SOFTWARE REQUIREMENTS

General: IBM BASIC/MVS operates under MVS/SP Version 1 Release 3 and MVS/SP Version 2 Release 1, and under subsequent releases unless otherwise announced.

IBM BASIC/VM operates under the CMS component of VM/SP Release 1 and under subsequent releases unless otherwise announced. If VSAM files are used, the licensed program VSE/VSAM Release 2 (5746-AM2) is required.

Execution: A copy of IBM BASIC must be installed on each machine where the IBM BASIC object programs are to be executed.

COMPATIBILITY

There are incompatibilities between the language and data supported by VS BASIC (5748-XX1) and IBM BASIC. These incompatibilities are significant differences in both syntax and semantics.

However, IBM BASIC is in the same syntactic family with the System/23, System/34, System/36 and the RM BASIC (5797-BCX) BASIC language.

CONVERSION and MIGRATION

IBM BASIC is designed to translate and run successfully all valid BASIC source programs conforming to the ANS Minimal BASIC Standard.

A Federal Information Processing Standard (FIPS) flagger is provided to verify conformance to FIPS Publication 68, and to indicate the use of BASIC extensions that are not within the standard.

DATA SECURITY

IBM BASIC is intended to run under MVS/SP or VM/SP-CMS and is subject to their controls. Customers must employ these controls to provide for user-to-user and user-to-system isolation, and to control data sharing among users. Customers are responsible for the selection, implementation, and adequacy of these controls. In establishing controls, it should be recognized that end-users can issue host system commands.

PERFORMANCE

Because the environment in which IBM BASIC Release 1 operates can be virtual, real storage requirements are largely a function of performance desired.

MVS SYSTEM INTEGRITY

IBM will accept APARs where the installation of the IBM BASIC/MVS licensed program introduces an exposure to the system integrity of MVS.

Refer to Programming Announcement dated October 21, 1981. This program is intended to run 'unauthorized'.

RPOs ACCEPTED: No

PROGRAM PRODUCTS

**INFORMATION/SYSTEM VERSION 2
MVS/TSO (5665-952)**

PURPOSE

Information/System Version 2 is a licensed program that assists a user in managing a data processing installation by providing an online, interactive facility for collecting, managing, displaying and reporting information frequently needed. Information/System is the base product that provides the mechanism for loading, searching, reviewing and reporting user data. Its functions and utilities are used by the optional companion licensed programs Information/Management Version 2 and Information/MVS or Information/VM-VSE.

Information/System Version 2 is intended to replace Information/System Version 1 (5735-OZS) for the MVS environment. Additional function and usability enhancements have been included in Version 2.

HIGHLIGHTS

- Information/System runs with the Interactive System Productivity Facility (ISPF) and utilizes many of its functions, such as split-screen and PF key tailoring. In addition, the Information/System user interface has been enhanced to resemble the ISPF user interface. In most cases, Information/System operation is identical to or closely resembles that of ISPF, e.g., command function and format, selection and deletion of items on a list, and screen scrolling.
- A new report tailoring facility makes it possible to modify, add, and delete data fields on standard and new user-developed reports to satisfy the unique data reporting requirements of a data processing installation. Complex reporting requirements may be addressed by user exits and the ability to make all Information/System and Information/Management data available to external reporting programs.
Reports, previously a part of Information/Management, are now available with Information/System. The Version 1 customized report facility will continue to be supported so that current customized reports will run under Version 2. Any further customization of reports should be done through the new report tailoring facility. Restrictions in the Version 1 customized report (e.g., freeform text) have been removed in the new report tailoring facility.
- The report tailoring facility has also been enhanced:
 - To allow reports to be initiated by batch jobs.
 - To allow the data base to be updated while reports are being generated.
 - To allow data from records not contained in the user's search results list to be included in reports.
- Performance enhancements have been made. See details in the "Performance" section.
- The response chaining facility has been enhanced:
 - To allow some commands, such as Report, to be imbedded within stored response chains (SRCs).
 - To store SRCs in the Information/System data base, thereby making SRC records available to Information/System facilities such as searching, reporting, deleting, and authorization (see below).
 - To simplify the changing of existing SRCs within Information/System.
 - To allow immediate response chain (IRC) execution with the Information/System invocation.
 - To remove the Version 1 restriction on SRC resumption after returning from freeform text selection.
The response chaining facility, including SRCs, was previously a part of Information/Management. It is now a part of Information/System, and is available to all its companion products.
- The privileged class facility has been enhanced:
 - To authorize the display of Information/System records.
 - To separate authorization for record create and update.
 - To provide authorization for SRC records.
The privilege class facility, previously a part of Information/Management, is now a part of Information/System and is available to all its companion products.
- Variable-length panels, such as search results list and freeform text are enhanced to automatically expand to fill the number of lines available on the physical screen.
- Version 1 currently 'date stamps' entries made to the freeform text and history portions of a record. With Version 2, this function is expanded to include a 'time stamp' and 'userid stamp' as well.

This facility, previously a part of Information/Management, is now a part of Information/System and is available to all its companion products.

- A listing of prefix words (known to the Information/System Version 1 - Information/MVS user as keywords) and corresponding data fields is available online.
- Read/write access to Information/System data sets by multiple systems is provided by the global resource serialization facility of MVS/SP Version 1 Release 2 or later.
- Profiles, controlled by Information/System, enable users to personalize various default values, change them within a session, and preserve them across sessions. These values include such categories as print and report output destinations, scroll amounts, uppercase and lowercase data display, and positioning of command line at top or bottom of screen.
- The 'products' load modules have been restructured so that there will no longer be a need to reinstall Information/System for a later installation of Information/Management.
- The consistency between the Information/System - Information/Management and Information System - Information/MVS or Information/VM-VSE user interfaces has been enhanced by making product selection, commands, and data set allocation and deallocation procedures common across the Information/System companion products.
- Separate data bases may be created to store installation-specific information in an Information/MVS or Information/VM-VSE format. All or selected parts of the user data generated with Information/System Version 1 may be copied to the Version 2 user data format.
- New Information/System utilities are used with the Information/MVS or Information/VM-VSE product for the loading and tailoring of the data base. These new utilities allow the user to better address any potential tradeoffs he may wish to make between amount of data desired and amount of DASD space required through the following:
 - Data base tailoring is both enhanced and simplified.
 - The statistics function is revised and streamlined to provide a more meaningful set of information about the amount of data selected.
 - The tailoring and merge step of the load utility generates a VSAM space requirements report without performing an actual load function, thus allowing for more accurate allocation of DASD space.
- An installation may designate one of several alternative formats provided for expressing data fields on panels and reports.

DESCRIPTION

Information/System assists a user in managing a data processing installation by providing an online, interactive facility for collecting, managing, displaying and reporting information frequently needed.

Information/System without its related companion products provides a mechanism for loading, searching, reviewing and reporting user data in a manner similar to that described below for Information/MVS or Information/VM-VSE.

Its functions and utilities are also used by the optional companion licensed programs, Information/Management and Information/MVS or Information/VM-VSE.

INFORMATION/SYSTEM with INFORMATION MANAGEMENT

Information/System, in conjunction with Information/Management is a set of conversational applications used to help manage information about problems, changes, and component configuration information. With Information/System and Information/Management, the user may create, display, update, print and delete records that document the installation's data processing problems, changes and configuration information. These records are stored in the Information/System data base and can be searched according to the user's criteria. For example, the user may search for open problems that have been recorded for a particular location, changes scheduled for a specific date, changes for which the user is responsible, the names of personnel responsible for servicing a component, or the relationships between certain problems, changes or system components. Upon user request, a variety of standard and installation-created reports may be produced.

INFORMATION/SYSTEM with INFORMATION/MVS or INFORMATION/VM-VSE

Information/System, in conjunction with Information/MVS or

Information/System V2 (cont'd)

Information/VM-VSE, provides user access to a wide range of technical information that may be used to assist in effective management of MVS, VM/370, VSE, and VS1 (with Information/MVS) or VM/370 and VSE (with Information/VM-VSE) data processing systems.

The user employs Information/System capabilities to search the data base, to browse retrieved records, and to print selected data. The information covers many aspects of the operating systems and related subsystems, licensed programs, components and documentation. A tape containing updated information is sent to the installation periodically.

Types of information in Information/MVS or Information/VM-VSE include:

- Technical newsletters, flashes, and corrective information (such as found in System Engineering Communications (SECOM)), and additional support information not generally found in other published documents. This information is provided by Support Centers.
- Corrective information in Program Temporary Fixes (PTFs), Program Level Changes (PLCs), and additional material such as that found in the Early Warning System (EWS). This information is provided by Field Engineering locations.
- A range of technical information varying from overview material found in product announcement notices to detailed documentation found in publications. This information is prepared by product development groups.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Information/System Version 2 operates on any IBM Processor that meets the minimum specifications of the supported operating system environments described under "Software Requirements". Information/System has no dependencies on any new hardware equipment or changes.

An IBM 3270 display terminal that supports a screen of at least 24 lines by 80 characters must be available. Devices that may be used with Information/System include the following IBM display stations:

- 3275 mdls 2 and 12
- 3276 mdls 2, 3, 4, 12, 13 and 14
- 3277 mdl 2
- 3278 mdls 2, 3, 4 and 5
- 3279 all models when operated in compatibility mode

SOFTWARE REQUIREMENTS

Information/System Version 2 functions as an application under the Interactive System Productivity Facility (ISPF) program product with PTF numbers UZ63880 and UZ61801 installed. ISPF operates as a TSO command processor under the Time Sharing Option of OS/VS2 Release 3.8 (MVS), MVS/SP Version 1 Release 1.1, or MVS/SP Version 2 Release 1 with its corequisite Data Facility Product, and subsequent releases unless otherwise notified by IBM. The Basic Partitioned Access Method (BPAM) and the Basic Sequential Access Method (BSAM) of either OS/VS2 MVS Release 3.8, or of the Data Facility Product are required by ISPF for reading and writing data sets, and the Telecommunications Access Method (TCAM) or the Virtual Telecommunications Access Method (VTAM) is required for terminal communication. The telecommunication access methods supported are:

- TCAM 10 (available with MVS)
- ACF/TCAM Version 2 Release 2 or later (5735-RC3)
- VTAM 2 (available with MVS)
- ACF/VTAM Version 1 Release 2 or later (5735-RC2)

In the TSO/TCAM environment, if the full-screen option is not included in the message control program (MCP), a TCAM MCP generation with the full-screen option is required.

The Information/System utilities, used to load the Information/MVS or Information/VM-VSE data base, and used in the Information/System data base index rebuild procedures, require the IBM OS/VS Sort/Merge program product (5740-SM1) or a compatible sort/merge product.

For shared DASD support for Information/System Version 2, the global resource serialization facility of MVS/SP Version 1 Release 2 is required.

Information/System requires no changes to OS/VS2 MVS system storage requirements. For planning purposes, the virtual storage

required for Information/System is approximately 1,000K bytes (K equals 1,024) per user. Information/System also requires approximately 15 cylinders in SYS1.LINKLIB (3330 mdl 2-formatted tracks). In addition, approximately 5 cylinders are required for the Information/System VSAM dictionary data set, VSAM panel data set and report format table data set.

DASD storage for the data sets that constitute the Information/System data base varies with the amount of data the user enters. A data base of 1,000 entries (as might be used with Information/System only) requires approximately 20 cylinders; a data base of 10,000 entries (as might be used with Information/System and Information/Management) requires approximately 145 cylinders.

For additional information concerning storage and DASD requirements and tailoring options, refer to the *Information/System Installation* manual.

PLANNING INFORMATION

ISPF, and therefore Version 2 of Information/System, does not run on NCCF. To obtain a level of function similar to that available with Version 1 under NCCF, Version 2 users can access Information/System Version 2 under TSO through the NCCF Terminal Access feature.

INSTALLATION

The installation of Information/System Version 2 via SMP or SMP/E deletes Information/System Version 1. You may want to take the necessary steps to have both products available during a transition state. This can be accomplished by maintaining Information/System Version 1 on a completely separate set of backup packs, or in a set of libraries that do not interfere with the execution of Information/System Version 2. Installation procedures to run both Information/System Version 1 and Information/System Version 2 concurrently are described in the *Information/System Installation* manual.

COMPATIBILITY

Existing functions in Information/System Version 1 for the MVS environment are available in Version 2, although the usage of some have changed; additionally, many of the functions have been enhanced. Differences between Version 1 and Version 2 are highlighted in the Version 2 publications.

Privilege class records must be recreated for Version 2 because of the enhanced authorization capability available with Version 2.

With the exception of privilege class records, users with existing Version 1 data bases can run Version 2 of Information/System without needing to make any changes to the data base. However, after using the data base with Information/System Version 2, the user can no longer use the data base with Version 1. For further information, refer to the *Information/System Installation* manual.

No SRCs are shipped with Version 2, as was done for Version 1. Version 1 SRCs will not run with Version 2.

The Information/Access feature of Information/System Version 1 Release 2 will not run with Information/System Version 2. However, it is our intent to enhance Information/Access to run with Information/System Version 2.

MIGRATION

Migration considerations from Version 1 to Version 2 are documented in the *General Information* manual.

DATA SECURITY

Information/System data set access can be controlled by RACF. Customers are responsible for the selection, adequacy and implementation of the necessary controls for the protection of their data.

PERFORMANCE

Information/System is an application that executes as a problem program under ISPF. Information/System does not require any permanently assigned pages of real and virtual storage. No changes to the base system code path lengths are required. When Information/System is installed but not operational, there is no performance impact on the base system.

Information/System operates concurrently with other applications. The effect is the same as similar terminal applications in these environments. The response time for any particular operation varies with the complexity of the function, the speed of the processor or other devices, the current system load, and the data sets required to perform the function. As with other terminal applications, base system supervisor facilities may be used to establish the amount of service that any particular user receives.

Performance Highlights: Performance enhancements have been made in the following areas:

- The Version 1 PTF reducing the SDIDS-rebuild utility (BLGUT1) run time has been incorporated into Version 2.

PROGRAM PRODUCTS

Information/System V2 (cont'd)

- The Version 1 PTFs improving response times for record file operations have been incorporated into Version 2; further improvements in response time for record file operations have been made.
With Information/Management Version 2, the installation can specify which data entry fields are to be included in the SDIDS. With this ability, the installation can further reduce file response time if it is determined that not all fields need to be searchable.
- In addition to the Non-Shared Resource (NSR) VSAM option supported in Version 1, Version 2 supports the VSAM Local Shared Resource (LSR) option. This allows for better tuning of performance through control of both the size and number of VSAM buffers.
- With Version 2, response time for activities that update the data base can be reduced if the user selects the option that will free the data base periodically during report processing.
- The time from search until the appearance of the standard search results list, for a large number of records found, has been reduced. This response time will generally be constant and independent of the size of the data base or number of records found by the search.
- Virtual storage requirements for load modules have been segmented by product function and virtual storage is allocated only at the first use of each function. This means, for example, that virtual storage needed to support the report function will not be allocated for the user who only opens problems. In addition, an installation can specify the maximum amount of virtual storage which should be allocated by Information/System for load modules.
- Information/System supports GTF hooks which can be activated to provide an installation with a trace of performance-related information.
- Panels, stored in a partitioned data set in Version 1, are stored in a VSAM data set in Version 2. This reduces response time due to panel retrieval.

SYSTEM INTEGRITY

IBM will accept APARs where the installation of Information/System introduces an exposure to the system integrity of OS/VS2 (MVS). Refer to Programming Announcement dated October 21, 1981. Information/System is intended to run authorized.

RPQs ACCEPTED: Yes

PROGRAM PRODUCTS

5665-953 - INFORMATION/MANAGEMENT V2 (MVS/TSO)

PURPOSE

Information/Management Version 2 program is used in conjunction with Information/System Version 2 to help manage information about problems, changes and component configurations. With Information/Management, the user may create, display, update, print and delete records that document the installation's data processing problems, changes and configuration information. These records are stored in the Information/System data base and can be searched according to the user's criteria. Information/Management Version 2 is intended to replace the Information/Management feature of Information/System Version 1 (5735-OZS). Additional function and usability enhancements have been included in Version 2.

HIGHLIGHTS

- A new panel modification facility (PMF) makes it possible to modify, add and delete data fields and panels to satisfy the unique data collection requirements of a data processing installation. PMF replaces the less versatile panel edit facility of the Information/Management feature of Information/System Version 1. See details in the "Panel Modification" section below.
- Performance enhancements have been made. See details in the "Performance" section.
- The privilege class facility has been enhanced:
 - To authorize the display, assignment and close of records.
 - To provide separate authorization for financial records and for PMF.
- The products' load modules have been restructured so that there will no longer be a need to reinstall Information/System for a later installation of Information/Management.
- The consistency between Information/System - Information/Management and Information/System - Information/MVS or Information/VM-VSE user interfaces has been enhanced by making product selection, commands, and data set allocation and deallocation procedures common across the Information/System companion products.

In addition to the above, the following additional enhancements, while a part of Information/System Version 2, are available to users of Information/Management Version 2:

- Information/System runs with the Interactive System Productivity Facility (ISPF) and utilizes many of its functions, such as split-screen and PF key tailoring. In addition, the Information/System user interface has been enhanced to resemble the ISPF user interface. In most cases, Information/System operation is identical to or closely resembles that of ISPF, e.g., command function and format, selection and deletion of items on a list, and screen scrolling.
 - A new report tailoring facility makes it possible to modify, add and delete data fields on standard and new user-developed reports to satisfy the unique data reporting requirements of a data processing installation. Complex reporting requirements may be addressed by user exits, and the ability to make all Information/System and Information/Management data available to external reporting programs.
- The Version 1 customized report facility will continue to be supported so that current customized reports will run under Version 2. Any further customization of reports should be done through the new report tailoring facility. Restrictions on the Version 1 customized report facility on what types of data can be included on a customized report (e.g., freeform text) have been removed in the new report tailoring facility.
- The report facility in Version 2 has also been enhanced:
 - To allow reports to be initiated by batch jobs.
 - To allow the data base to be updated while reports are being generated.
 - To allow data from records not contained in the user's search results list to be included in reports.
 - The response chaining facility has been enhanced:
 - To allow some commands, such as Report, to be imbedded within stored response chains (SRCs).
 - To store SRCs in the Information/System data base, thereby making SRC records available to Information/System facilities such as searching, reporting, deleting and authorization (see below).
 - To simplify the changing of existing SRCs within Information/System.
 - To allow immediate response chain (IRC) execution with the Information/System invocation.

- To remove the Version 1 restriction of SRC resumption after returning from freeform text selection.

- Variable-length panels, such as search results list and freeform text are enhanced to automatically expand to fill the number of lines available on the physical screen.
- Version 1 currently 'date stamps' entries made to the freeform text and history portions of a record. With Version 2, this function is expanded to include a 'time stamp' with 'userid stamp' as well.
- A listing of prefix words (known to the Information/System Version 1 - Information/MVS user as keywords) and corresponding data fields is available online.
- Read/write access to Information/System data sets by multiple systems is provided by the global resource serialization facility of MVS/SP Version 1 Release 2 or later.
- Profiles, controlled by Information/System, enable users to personalize various default values, change them within a session, and preserve them across sessions. These values include such categories as print and report output destinations, scroll amounts, uppercase or lowercase data display, and positioning of command lines at top or bottom of screen.
- An installation may designate one of several alternative formats provided for expressing data fields on panels and reports.

DESCRIPTION

Information/Management is a licensed program that is used in conjunction with Information/System to assist the user in managing problem, change, and configuration information within a data processing installation.

Information/Management users can be system administrators, clerks, managers, internal auditors, operators, and system and application programmers, or other system or operational personnel. This diverse group uses Information/Management by means of a dialog called the prompting sequence that allows each user to apply techniques (such as response chaining) applicable to his level of expertise, his familiarity with the product, and the task he wishes to perform.

The Information/System data base retains the data that the user enters during this dialog. Upon user request, Information/Management extracts user-specified information from the data base and displays it on panels or prints it in a report.

Information/Management provides:

- An online means for recording, managing, displaying and reporting information about problems, changes and configuration data.
- An online panel modification facility, called PMF, that allows the user to satisfy the installation's requirements to tailor the collection of data by modifying, adding, and deleting data fields and panels.

Each of the facilities includes functions that help the user describe, access, and manage information about his installation.

Problem Management: The problem management portion of Information/Management provides information necessary to assist in efficient resolution of data processing problems. It can also provide information about the causes of problems and their effects. By using problem management to track, coordinate and report on problems, the management of an installation may obtain information that could influence decisions that would minimize the number and severity of future problems.

With Information/Management's capabilities, a user can:

- Enter initial problem information into the Information/System data base.
- Assign a problem to appropriate personnel for resolution.
- Update the problem description as additional information becomes known.
- Identify problems that have exceeded their target resolution date.
- Search for and display selected information related to a problem.
- Determine if a new problem is a duplicate of a known problem.
- Report on problems with specific characteristics.
- Close a problem and record resolution information.
- Relate problems, changes and system components.
- Maintain the history of a problem (e.g., who is working on it, actions taken, current status).
- Summarize and categorize the major causes of problems and the effects.

Change Management: The change management portion of Information/Management can help the user coordinate enhancements and fixes to software and hardware components, data processing procedures, application programs and other facilities of the data

Information/Management V2 (cont'd)

processing installation. The purpose is to provide data processing management with the information that will enable them to make better decisions about the frequency, timing and types of changes planned for the systems environment, in order to minimize disruption of service. It can also assist in the consistent preparation and screening of all proposed changes, which may minimize the number and severity of faulty changes that would result in service disruptions.

With Information/Management's capabilities, a user can:

- Request a change.
- Define related activities.
- Record information about implementation plans for changes and related activities.
- Update a change description as additional information becomes known.
- Search for and display selected information related to a change request.
- Register approval or disapproval of a change.
- Report on changes with specific characteristics.
- Record a change as complete.
- Relate changes, problems, and system components.
- Maintain the history of a change (e.g., success, failure, timeliness).
- Produce a comprehensive picture of all planned changes for a specified period, date, component or location.

Using these capabilities, data processing personnel can monitor individual or collective change status and ascertain whether changes are being approved, rejected, and implemented on schedule. Also, it may be easier to identify potential conflicts when multiple changes are scheduled for the same time period. The improvement of overall change administration through the use of change management can contribute to a more stable data processing environment.

Configuration Management: The configuration management portion of Information/Management helps the user maintain a single, up-to-date inventory of system and network components.

With Information/Management capabilities, a user can:

- Maintain information about the inventory of hardware and software components.
- Maintain financial information pertaining to these components.
- Identify the connections between these components.
- Record the assignment of components to responsible contacts.
- Update configuration data as changes are implemented.
- Search for and display selected configuration data.
- Display paths between two components in a system to assist, for example, in network problem determination.
- Report on specified configuration information.

When a failing component has been identified, configuration information can be of value in efforts to institute bypass and recovery procedures and, thus, quickly restore service to the user. System configuration information is also valuable in determining the source of problems, monitoring system status, and allocating system resources.

Panel Modification: The panel modification facility (PMF) makes it possible to adapt Information/Management panels to the unique data collection needs of a data processing installation. Through PMF, the user is given the ability to:

- Modify field names.
- Rearrange field sequence.
- Add new fields.
- Delete unused fields.
- Condense needed fields onto a minimum number of panels.
- Modify menu selection panels to reflect data entry panels used.
- Specify field validation criteria.
- Specify required and journalled fields.
- Specify fields to be displayed on the search results list panel.
- Specify the field on which the search results list is to be sorted.
- Specify fields to be extracted from referenced records, as records are created and updated.
- Specify authorization at the field and panel levels.
- Expand the number of users which can be assigned to a privilege class.

- Tailor the width of certain panels (such as text panels, search results panels, and data entry panels).
- Personalize help and tutorial panels.

Panels tailored with PMF can more fully satisfy the unique requirements of the data processing installation in the areas of data content, screen format, and terminology.

As with other Information/Management user-system interactions, the person modifying the panels is prompted step-by-step, panel-by-panel, and responds to a sequence of instructions by selecting options and inserting information. The user creates and updates panels by using a combination of direct entries, cursor movements, and screen commands.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Information/Management Version 2 operates on any IBM Processor that meets the minimum specifications of the supported operating system environments described under "Software Requirements". Information/Management has no dependencies on any new hardware equipment or changes.

An IBM 3270 display terminal that supports a screen of at least 24 lines by 80 characters must be available. Devices that may be used with Information/Management include the following IBM display stations:

- 3275 mdls 2 or 12
- 3276 mdls 2, 3, 4, 12, 13 and 14
- 3277 mdl 2
- 3278 mdls 2, 3, 4 and 5
- 3279 all models when operated in compatibility mode

SOFTWARE REQUIREMENTS

Information/System Version 2 is the base product required by Information/Management Version 2. Information/Management Version 2 functions as an application under the Interactive System Productivity Facility (ISPF) program product with PTF numbers UZ63880 and UZ61801 installed. ISPF operates as a TSO command processor under the Time Sharing Option of OS/VS2 (MVS) Release 3.8, MVS/SP Version 1 Release 1.1, or MVS/SP Version 2 Release 1 with its corequisite Data Facility Product, and subsequent releases unless otherwise notified by IBM. The Basic Partitioned Access Method (BPAM) and the Basic Sequential Access Method (BSAM) of either OS/VS2 (MVS) Release 3.8 or of the Data Facility Product are required by ISPF for reading and writing data sets, and the Telecommunications Access Method (TCAM) or the Virtual Telecommunications Access Method (VTAM) is required for terminal communications. The telecommunications access methods supported are:

- TCAM 10 (available with MVS)
- ACF/TCAM Version 2 Release 2 or later (5735-RC3)
- VTAM 2 (available with MVS)
- ACF/VTAM Version 1 Release 2 or later (5735-RC2)

In the TSO/TCAM environment, if the full-screen option is not included in the message control program (MCP), a TCAM MCP generation with the full-screen option is required.

Information/System and Information/Management require no changes to OS/VS2 MVS system storage requirements. For planning purposes, the virtual storage required for Information/System is approximately 1,000K bytes (K equals 1,024) per user. Information/System also requires approximately 15 cylinders in SYS1.LINKLIB (3330 mdl 2 formatted tracks). In addition, approximately 5 cylinders are required for the Information/System VSAM dictionary data set, VSAM panel data set and report format table data set.

In addition to that required by Information/System, the virtual storage required for Information/Management is approximately 50K bytes per user for problem, change and configuration functions, and an additional 450K bytes per user for PMF functions. The additional DASD storage required by Information/Management libraries is approximately 4 cylinders in SYS1.LINKLIB, and an additional 23 cylinders for the VSAM dictionary data set, VSAM panel data set and report format table data set.

DASD storage for the data sets that constitute the Information/System data base varies with the amount of data the user enters. A data base of 1,000 entries (as might be used with Information/System only) requires approximately 20 cylinders; a data base of 10,000 entries (as might be used with Information/System and Information/Management) requires approximately 145 cylinders.

For additional information concerning storage and DASD requirements and tailoring options, refer to the *Information/System Installation manual*.

PROGRAM PRODUCTS

Information/Management V2 (cont'd)

PLANNING INFORMATION

Version 2 of Information/Management does not run on NCCF. To obtain a level of function similar to that available with Version 1 under NCCF, (including the transfer of data from NPDA to Information/Management), Version 2 users can access Information/Management Version 2 under TSO through the NCCF Terminal Access feature.

The transfer of NPDA data to Information/Management will continue to operate as it does in the Information/Management feature of Information/System Version 1. NPDA will continue to invoke, in the NCCF address space, a small subset of Information/Management modules whose only function is to enter NPDA information into the Information/System data base.

INSTALLATION

The installation of Information/Management Version 2 via SMP or SMP/E deletes the Information/Management feature of Information/System Version 1. You may want to take the necessary steps to have both products available during a transition stage. This can be accomplished by maintaining the Information/Management feature of Information/System Version 1 on a completely separate set of backup packs, or in a set of libraries that do not interfere with the execution of Information/Management Version 2. Installation procedures to run both the Information/Management feature of Information/System Version 1 and Information/Management Version 2 concurrently are described in the *Information/System Installation* manual.

COMPATIBILITY

Existing functions in the Information/Management feature of Information/System Version 1 are available in Version 2, although the usage of some have changed; additionally, many of the functions have been enhanced. Differences between Version 1 and Version 2 are highlighted in the Version 2 publications.

Privilege class records must be recreated for Version 2 because of the enhanced authorization capability available with Version 2.

With the exception of privilege class records, users with existing Version 1 data bases can run Version 2 of Information/System without needing to make any changes to the data base. However, after using the data base with Information/System Version 2, the user can no longer use the data base with Version 1. For further information, refer to the *Information/System Installation* manual.

MIGRATION

Migration considerations from the Information/Management feature of Information/System Version 1 to Information/Management Version 2 are documented in the *General Information* manual.

AUDITABILITY

Information/System and Information/Management, when used with an adequate set of management controls and standards, will assist the user in establishing problem management, change control, and configuration management procedures. Internal auditors will find these features to be of particular interest.

DATA SECURITY

Access to Information/System data sets used by Information/Management can be controlled by RACF. Customers are responsible for the selection, adequacy and implementation of the necessary controls for the protection of their data.

PERFORMANCE

Information/Management is an application that executes as a problem program under ISPF. Information/Management does not require any permanently assigned pages of real or virtual storage. No changes to the base system code path lengths are required. When Information/Management is installed but not operational, there is no performance impact on the base system.

Information/Management executes concurrently with other applications. The effect is the same as similar terminal applications in these environments. The response time for any particular operation varies with the complexity of the function, the speed of the processor or other devices, the current system load, and the data sets required to perform the function. As with other terminal applications, base system supervisor facilities may be used to establish the amount of service that any particular user receives.

Performance Highlights: Performance enhancements have been made in the following areas:

- The Version 1 PTF reducing the SDIDS-rebuild utility (BLGUT1) run time has been incorporated into Version 2.
- The Version 1 PTFs improving response times for record file operations have been incorporated into Version 2; further improvements in response time for record file operations have been made.

With Information/Management Version 2, the installation can specify which data entry fields are to be included in the SDIDS.

With this ability, the installation can further reduce file response time if it is determined that not all fields need to be searchable.

- In addition to the Non-Shared Resource (NSR) VSAM option supported in Version 1, Version 2 supports the VSAM Local Shared Response (LSR) option. This allows for better tuning of performance through control of both the size and number of VSAM buffers.
- With Version 2, response time for activities that update the data base can be reduced if the user selects the option that will free the data base periodically during report processing.
- CPU utilization and run time have been reduced for certain reports.
- The time from search until the appearance of the standard search results list, for a large number of records found, has been reduced. This response time will generally be constant and independent of the size of the data base or number of records found by the search.
- Virtual storage requirements for load modules have been segmented by product function, and virtual storage is allocated only at the first use of each function. This means, for example, that virtual storage needed to support the report function will not be allocated for the user who only opens problems. In addition, an installation can specify the maximum amount of virtual storage which should be allocated by Information/System for load modules.
- Information/System supports GTF hooks which can be activated to provide an installation with a trace of performance-related information.
- Panels, stored in a partitioned data set in Version 1, are stored in a VSAM data set in Version 2. This reduces response time due to panel retrieval.

SYSTEM INTEGRITY

IBM will accept APARs where the installation of Information/System introduces an exposure to the system integrity of OS/VS2 (MVS). Refer to Programming Announcement dated October 21, 1981. Information/System is intended to run authorized.

PROGRAM PRODUCTS

**INFORMATION/MVS
5665-955**

PURPOSE

The Information/MVS program is a consolidated collection of IBM technical data of interest to data processing staffs responsible for planning, installing, supporting and tuning IBM systems, subsystems and components appropriate to the MVS, VM/370, VSE and VS1 environments. When used in conjunction with Information/System (5665-952), it provides processing personnel with keyword access to a wide range of selected technical information regarding IBM products.

SPECIAL SALES INFORMATION

See the pages for Information/System (5735-OZS).

HIGHLIGHTS OF INFORMATION/SYSTEM with INFORMATION/MVS

- Interactive retrieval facility for keyword searches of the data.
- Designed for ease-of-use.
- Load program to load the Information/MVS product into the user system.
- Capability to insert user data.
- Ability to optionally print selected screens or entries.

DESCRIPTION OF INFORMATION/SYSTEM

Information/System in conjunction with Information/MVS is a productivity tool designed for use by data processing personnel supporting an MVS, VM/370, VSE or VS1 environment. It consists of an interactive information retrieval facility designed to provide access to the Information/MVS files via previously assigned keywords, and of the appropriate programs for loading the data base.

Design objectives of Information/System and the companion Information/MVS product are to:

- Make the data available to the user online and on the user's system.
- Simplify and speed keyword searches of information.
- Integrate IBM technical information from many sources.
- Broaden the amount of technical information available to users.
- Keep the information up to date by addition of new data and by purging the out-of-date material.
- Enable users to add information to Information/MVS.

The Information/System interactive retrieval facility provides the user with a set of commands to access the data provided by Information/MVS through display terminals. The retrieval facility provides a keyword search function through which the user can search documents by specifying one or more previously assigned keywords connected by Boolean operators ("and", "or", "not"). The search can include all the document types or can be restricted to selected types (e.g., EWS, PTF cover letters). The user can display the complete stored text of the documents or the titles only.

The user also has the option to search all of Information/MVS or to limit the search only to any new entries added since the previous distribution tape.

Other functions of Information/System include:

- Sequential display of contiguous data entries of Information/MVS.
- A PRINT command to allow the user to print a section of a document or entire documents for later reference.
- A keyword glossary to expedite and facilitate the search process.
- A FIND command to locate specific words inside a pre-identified document.
- A HELP facility is built into Information/MVS to describe error conditions and to suggest corrective action.

HIGHLIGHTS of INFORMATION/MVS

- Online, consolidated collection of technical information from many IBM sources.
- Periodic (10 - 12 times a year) updates of the Information/MVS product to provide current information.
- Self-instruction and usage assistance information.

DESCRIPTION OF INFORMATION/MVS

Technical information from a number of development, system and support locations worldwide is edited, structured and incorporated into Information/MVS.

Types of information in Information/MVS include:

- Selected IBM system support center flashes, memos, question and answer logs and technical articles produced by the support organization responsible for the subject element. Selected lengthy

articles are abstracted and ordering information is included. (Occasionally, such documents are added as an additional file on the distribution tape.)

- Technical descriptions of recent IBM programming announcements.
- Service information on selected IBM software products including early warning system (EWS) data and systems engineering communications (SECOM).
- Status information on selected program products, installed user programs and field developed programs. Included is information on availability, feature numbers, optional features and documentation order numbers.
- A selection of Program Temporary Fix (PTF) cover letters and Program Level Change (PLC) information that may be used in conjunction with the EWS file to locate appropriate fixes for identified problems.
- Brief description of schedules for some of the education courses that IBM is conducting.
- An interactive HELP file designed to assist the user in making the most effective use of Information/System. A part of this file is a self-instruction tutorial for new users of the system.
- A keyword glossary giving alphabetical access to all keywords, whether abbreviated, hyphenated or misspelled by the author, which enhances the ability to find the required document.

The major products addressed by Information/MVS include:

- Systems - S/370, 4300, 8100 Information System, industry and cross-industry terminal systems, storage and printing units.
- Programming - Operating systems, compilers and assemblers, access methods, DB/DC products, emulators, job entry subsystems, utilities and interactive products.

The update of Information/MVS is distributed by the standard IBM distribution centers. The distribution tapes are available in 9-track/1600 bpi and 9-track/6250 bpi. Utility programs in Information/System merge the updates into the existing data base.

During the installation process, users have the option to:

- Insert their own data into Information/MVS.
- Select only those types of data from Information/MVS that are likely to be relevant to their environment.

All the IBM-provided Information/MVS material must be regarded as working documents intended to assist the professional data processing personnel. The information does not provide formal IBM recommendations or documentation. The information provided is intended for use by data processing personnel who are sufficiently familiar with the necessary background material to understand the topics discussed and to use the information within the proper context and with the proper safeguards.

The technical material included in Information/MVS addresses a wide variety of IBM products that are commonly used in an MVS, VM/370, VSE or VS1 installation. Although the main objective of Information/MVS is to assist the user with useful, timely and up-to-date information, there is no commitment to provide exhaustive or complete information on any product addressed.

The customer may make printed copies of limited portions of the Information/MVS product for use within the customer's organization for purposes of maintenance and improvement of the customer's data processing installation.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Storage Estimates: Direct Access Storage Requirements for the data product varies with the amount of data selected by the user. Information/MVS requires approximately 180 to 200 megabytes of direct access storage for an untailored data base.

MVS SYSTEM INTEGRITY APPLIES: Yes

RPOs ACCEPTED: No

PROGRAM PRODUCTS

**DISTRIBUTED OFFICE SUPPORT SYSTEM/370/VSE
RELEASE 1
DISOSS/VSE (5666-264)****PURPOSE**

Distributed Office Support System/VSE (DISOSS/VSE) program provides document-handling extensions to subsystems like the 3730 Distributed Office Communication System or the 8100 Information System available with the Distributed Office Support Facility (DOSF). It operates on a host computer, such as the S/370, 3031 Processor or the 4300 Processors, under VSE and the Customer Information Control System/Virtual Storage (CICS/DOS/VS) program product. It offers both interactive and deferred communication with the Distributed Office Support System (5740-XYK), operating in an 3730 System or an 8100 System under DOSF.

DESCRIPTION

Significant capabilities of the Distributed Office Support System include:

- Host document filing with indexing.
- Filed document search and retrieval.
- Filed document access protection.
- Message switching between users of the same or different IBM 3730 Systems, and between users of the same or different DOSF Systems.
- Submission of batch jobs to the host system from an IBM 3732 Text Display Station.

These functions are achieved by means of programs in the host and in each attached subsystem.

In the Distributed Office Support System, users are persons who use the IBM 3732 Text Display Station in a similar way to ordinary office equipment. They can be secretaries, typists, office clerks, editorial assistants, managers, or others who need not have knowledge of data processing.

Filing and Retrieving: The user can file documents created at, and stored in, the subsystem in a document library maintained by the host system. While filing a document, the user can specify filing information that indexes the document and can be used for later retrieval of the document. This filing information consists of search arguments, such as the document name, the author, recipients, and keywords describing the contents of the document. In addition, access codes can be added to help protect the document against unauthorized access.

To retrieve a filed document, users first identify it by a search request using the search arguments specified when the document was filed. Once a document has been identified, it can be restored in the subsystem, displayed on the screen of the IBM 3732, printed on the host or the subsystem, or deleted.

Filing and retrieval of documents can be performed interactively or in deferred mode. Deferred processing is particularly applicable for large documents because the operation is executed in parallel to other tasks performed at the terminal.

Message Switching: The message-switching capability allows the user to send messages to other users in the system, for example, to inform them that a document has been filed and is available for retrieval.

Job Submission: The job submission capability allows the user to send predefined VSE jobs to the host system for batch execution.

This capability can also be used to submit a document from the subsystem to the host along with the job. A user-written program can place this document into a data set for subsequent host-application processing.

Additionally, with some user-written conversion, this document can be imported into the Document Library Facility, Program Number 5748-XXE, and then processed by the Document Composition Facility, Program Number 5748-XX9. This approach can be used to provide advanced composition functions, such as multiple columns, footnote placement, automatic hyphenation, and spelling verification of the document.

Installation: The Distributed Office Support System provides convenient techniques to ease the installation of the system and the maintenance of its data sets.

Document Security: In a multiple-user document processing system, data security is of great interest to its users. The Distributed Office Support System is designed to provide data security based on the interaction of the following:

- Access codes
- Document ownership
- Level of document privacy

Access codes are assigned to users centrally at the host and to documents during filing. A user who needs to gain access to a filed

document must be assigned one access code that matches one access code of the document to be retrieved. The profiles of eligible users can only be changed under central control.

The owner of a document is defined as the user who issued the initial request to file this document in the host document library. The deletion of a document, for example, can only be initiated by the document owner.

The Distributed Office Support System distinguishes between two types of documents: Private documents and public documents. Private documents are accessible to their owners alone and are, therefore, not assigned any access codes. Public documents, which are recognized by the presence of access codes, can be retrieved by all authorized users.

In the Distributed Office Support System, passwords can be assigned to users to control access to the central file from any IBM 3732 Text Display Station on the same network.

These facilities for controlling access to protected resources are effective only within the context of the IBM Distributed Office Support System itself.

Access control within VSE outside the scope of the IBM Distributed Office Support System is not provided.

For applications in which sensitive data is sent over external communication facilities, user management may wish to augment these facilities with the application of cryptography. User management is responsible for the selection, implementation, and adequacy of these security features for their environment.

Additional Functions: The following additional functions are available with the Distributed Office Support System:

- Host Print Facility

By means of this function, documents filed in the host library can be printed on a host-attached printer upon request from the IBM 3732 Text Display Station.

The IBM 6670 is supported as a Host Line Printer, and VSE/POWER Remote Job Entry, Program Number 5746-XE3, Feature #6066-6071 is a prerequisite.

- STAIRS Input Format Facility

Using this function, documents created at the IBM 3732 can be prepared for batch input to a STAIRS data base.

Optional Feature: The following optional feature is available with the Distributed Office Support System/3730, Program Number 5740-XYK, (for details refer to the Announcement Letter).

- Direct Document Viewing Facility

This feature allows users to have documents in the host library displayed on their terminal screens without the need to copy the documents from the host document library to the associated subsystem permanent storage. This speeds up the process of displaying documents. This feature is to be installed with the Distributed Office Support System/3730 and is supported by the host system.

Restrictions with IBM 8100/DOSF: If documents are created on an IBM 8100 Information System under the Distributed Office Support Facility (DOSF), these DISOSS facilities do not support processing of document control functions which are not contained in the IBM 3730 System.

DOSF text commands which cannot be processed are the following:

- Blind Text
- Block Overstrike
- Block Underscore and Remove Underscore
- Bold Face Printing
- Line Number on Output
- Revision Indicators
- Command List Processing
- Begin Execution
- End Execution
- Intermediate Execution
- Begin Scalar Execution
- End Scalar Execution
- Execution Format
- Imbed Text File
- Start and End Imbed List

DOSOSS/VSE ignores these functions.

HIGHLIGHTS**Functions**

- Filing of IBM 3730 or 8100/DOSF documents in host document library.

PROGRAM PRODUCTS

DISOSS/VSE R1 (cont'd)

- Searching of documents in the host document library by specification of search arguments, such as document name or search terms, authors, recipients.
 - System-controlled indexing of external (hard-copy) documents.
 - Retrieval of filed documents from host document library.
 - Message switching between users.
 - Submission of batch jobs to the host system from an IBM 3732 Text Display Station.
 - Document access protection.
 - Support of IBM 3730 or IBM 8100/DOSF archive retrieve/delete commands.
 - Printing of documents on a host-attached printer using the Host Print Facility.
 - Preparation of documents for batch input to a STAIRS data base using the STAIRS Input Format Facility.
- System Support Programs for ACF/NCP/VS, Program Number 5735-XX3.
 - Advanced Communications Function for NCP/VS (ACF/NCP/VS), Program Number 5735-XX1.
- The IBM 3705 is not necessary if ACF/VTAME is used on an IBM 4331 Processor equipped with a Communications Adapter (CA).
- Subsystem:** The IBM Distributed Office Support System/370/VSE communicates with the IBM Distributed Office Support System/3730, Program Number 5740-XYK. This program executes in either an IBM 8100 with DOSF and DPCX Release 2 and/or IBM 3730. It was announced in April, 1979 and is available from PID.
- For details on the Distributed Office Support System/3730, refer to the corresponding pages.

DOCUMENTATION
(available from Mechanicsburg)

Licensed Program Design Objectives (GH12-5056) ... *General Information Manual* (GH12-5137).

Optional Feature:

- Display of documents using the Direct Document Viewing Facility.

RPQs ACCEPTED: No

CUSTOMER RESPONSIBILITIES

Customers generate the Distributed Office Support System by means of a set of specification statements. These statements provide options that may be selected to tailor the system to each company's individual needs.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM Distributed Office Support System/370/VSE is designed to operate on the following IBM machines:

One IBM S/370 Model 138 or larger, or one IBM 3031, or one IBM 4331 or larger with main and external storage capacity and peripheral equipment as required for, and supported by, VSE and CICS/DOS/VS.

SOFTWARE REQUIREMENTS

The Distributed Office Support System/370/VSE is written in the IBM S/370 Assembler language. It is designed to operate in the following environment on the host system:

Host System: VSE Release 2 or subsequent releases unless otherwise specified, together with:

- VSE/Advanced Functions, Program Number 5746-XE8, Release 2 or 3 or a subsequent release unless otherwise specified.
- VSE/VSAM, Program Number 5746-AM2, Release 2 or a subsequent release unless otherwise specified.
- IBM S/370 Customer Information Control System/Virtual Storage (CICS/DOS/VS) Version 1, Program Number 5746-XX3, Release 5, together with its required associated programs, or a subsequent release unless otherwise specified.

In CICS/DOS/VS, data management is performed by the Virtual Storage Access Method (VSE/VSAM). Communication with the Distributed Office Support System/3730 uses the Full Function Logical Unit (SNA LU0 protocol). However, communication with the Document Transmission Function of the IBM 3730 (refer to the IBM 3730 documentation for details), is via the CICS/VS Data Interchange Program (DIP) and uses the Batch Data Interchange Logical Unit (SNA LU1 protocol). To identify the appropriate required and optional licensed programs for CICS/DOS/VS, refer to *CICS/VS General Information* (GC33-0066).

In addition, the following programming support must be available:

- Virtual Telecommunication Access Method (VTAM/SCP), Program Number 5747-CF1 or 5747-CG2.
- Either the Advanced Communications Function for VTAM (ACF/VTAM), Program Number 5746-RC3, or the Advanced Communications Function for VTAM Entry (ACF/VTAME), Program Number 5746-RC7. ACF/VTAM supports the IBM 3705 Communications Controller; ACF/VTAME supports the Communications Adapter (CA) in the IBM 4331 Processor.
- VSE/POWER, Program Number 5746-XE3, Release 2 or a subsequent release unless otherwise specified, including VSE/POWER Remote Job Entry, Program Number 5746-XE3, Feature #6066-6071 (required if the IBM 6670 is used as a host line printer).
- An IBM VSE Sort/Merge program product.

IBM 3705: One of the following is required for remotely attached subsystems:

- Advanced Communications Function for NCP/VS (ACF/NCP/VS), SCP, Program Number 5747-CH1.

SMALL SYSTEM EXECUTIVE/VSE RELEASE 1 (SSX/VSE) 5666-265

PURPOSE

The licensed program Small System Executive/Virtual Storage Extended (SSX/VSE) is a VSE based pregenerated operating system which runs within a range of predefined 4321 and 4331 configurations. SSX/VSE supports batch and interactive applications. It can be used in standalone environments supporting locally and remotely attached terminals and in distributed data processing environments, i.e., interconnected to other processors in an SNA network. SSX/VSE is designed for quick installation and enhanced ease of use compared to DOS/VSE. SSX/VSE will be delivered on one tape and serviced as one product. The functional capabilities of the VSE components included in SSX/VSE are restricted to the generation parameters selected and represent as such a subset of the respective VSE components. The concept of pregeneration with a fixed set of external functions will increase the level of system stability. SSX/VSE RPG II, SSX/VSE PL/I and DL/I SSX/VSE are prompter-supported program product versions of DOS/VSE program products in an SSX/VSE environment, which have been tested under and adapted to SSX/VSE. They can be ordered with unique SSX/VSE related program product numbers, different from their DOS/VSE versions.

SSX/VSE will be especially attractive for standalone environments which do not have the skills required for VSE, namely new name accounts and establishments/departments in existing DP accounts.

Use of SSX/VSE in a networking environment requires understanding of networking procedures and considerations, which preferably should be managed at the customers central installation.

HIGHLIGHTS

SSX/VSE includes the following basic functions:

- Online transaction processing.
- Two batch partitions for batch production work and testing.
- Spooling for job input and output.
- Data communication support for locally and remotely (SNA) attached 3278/3279 display stations and 3287 terminal printers.
- 377X remote job entry workstation support.
- Interactive program development and system control capabilities.
- VSAM-based data management routines including automatic space management. Capability to install DL/I SSX/VSE in addition.
- A set of file handling utilities including Sort and DITTO.
- High level language support through COBOL. Capability to install SSX/VSE PL/I and SSX/VSE RPG II in addition.
- SSX/VSE operator console functions supported on ICCF terminals.
- SNA cross-domain application usage from any authorized terminal in a multi-CPU network environment.
- Remote job execution and file exchange between interconnected SNA systems.

SSX/VSE provides the following usability characteristics:

- Quick installation, reconfiguration and update of the pregenerated SSX/VSE system.
- Predefined procedures and prompts for simple installation of prompter-supported program products SSX/VSE RPG II, SSX/VSE PL/I and DL/I SSX/VSE.
- User-oriented interactive communication with the system through full screen prompters, procedures and help screens for operation and system administration tasks.
- Enhanced interactive problem analysis and problem reporting facilities.
- New task-oriented documentation with "how to" description for systems administration, operation and application development tasks.
- Creation of job control statements via prompters and dialogs SSX/VSE supports (within physical limitations) the following 4321 and 4331 hardware functions and I/O devices :
 - ECPS:VSE mode.
 - 1MB to 4MB of processor storage.
 - Up to 16 3310 drives or 4 3370 drives (2 addresses each), minimum is 2 3310 or 1 3370 (2 addresses).
 - Up to 6 8809 tape drives and/or up to 8 channel-attached 3410 and/or 3420 tape drives; minimum is 1 tape drive.
 - Integrated 3540 compatible diskette drive and up to 6 channel-attached 3540 diskettes.

- 3262 and/or 3289 printers attached to the display/printer adapter and/or up to 6 channel-attached 3203 printers; minimum is 1 system printer.
- Local 3278, 3279 and 3287 terminals attached to the display/printer adapter; minimum is one display unit with keyboard. Up to 32 additional 3278, 3279 and 3287 terminals can be channel-attached via 3274 control units.
- Up to 32 remote 3278, 3279 and 3287 terminals in SNA mode attached via 3274 or 3276 control units and SDLC lines to the communication adapter (one control unit per line).
- Up to 6 377X remote job entry workstations attached via SDLC lines to the communication adapter (one control unit per line).

Note: See Specified Operating Environment for hardware support details.

DESCRIPTION

SSX/VSE PRODUCT DESCRIPTION

Summary: SSX/VSE is an operating system designed for the IBM 4321 and IBM 4331 processors, which is:

- **Pregenerated:** SSX/VSE consists of a predefined set of software components that have been tested for combined use. Because SSX/VSE is pregenerated, it simplifies a number of tasks (such as system planning) that are associated with data processing systems.
- **Preconfigured:** SSX/VSE is designed to work with specific hardware devices in a specific range of configurations. Because SSX/VSE is preconfigured, the time spent in selecting and coordinating hardware devices is minimized.
- **Flexible:** Within SSX/VSE's predefined range of supported configurations and program products, users can:
 - Alter their system's hardware configuration by adding or replacing supported devices.
 - Install prompter supported IBM program products (SSX/VSE PL/I, SSX/VSE RPG II, and DL/I SSX/VSE) for use with the SSX/VSE system.
 - Develop their own application programs using SSX/VSE components.
 - Operate their system in either a local or a telecommunications environment.

The functional capabilities of the VSE components included in SSX/VSE are restricted to the generation parameters and are a subset of the respective VSE components. The level of functions provided in SSX/VSE will be described in *Pregeneration Specifications*, SC33-6152.

SSX/VSE has been designed for system ease of use. Besides extensive online user aids for the daily operation and system administration, support is provided for installation, application programming and problem determination. An integrated set of task oriented documentation covering the administration, operation and application development functions of SSX/VSE with "how to" descriptions is also provided.

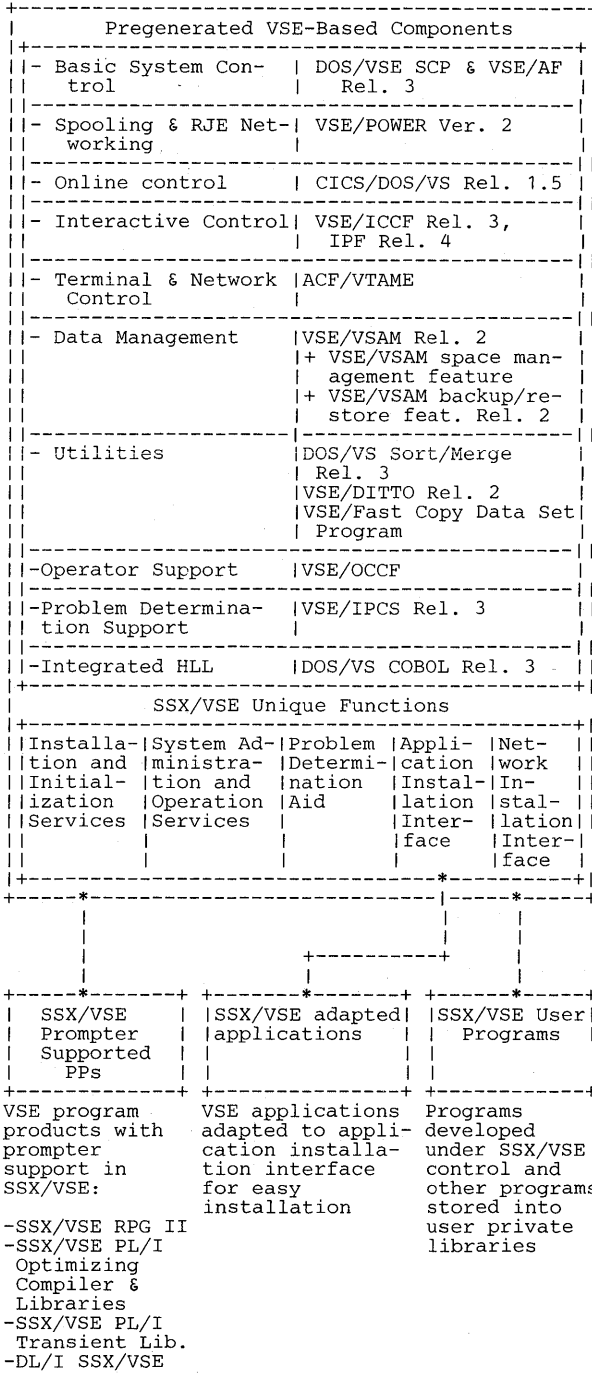

Refresh of the complete SSX/VSE system will be provided on an as-required basis. The customer can order the refresh system from a distribution center.

PROGRAM PRODUCTS

Small System Executive/VSE (cont'd)

The following graphic illustrates the SSX/VSE structure:

SSX/VSE Licensed Program

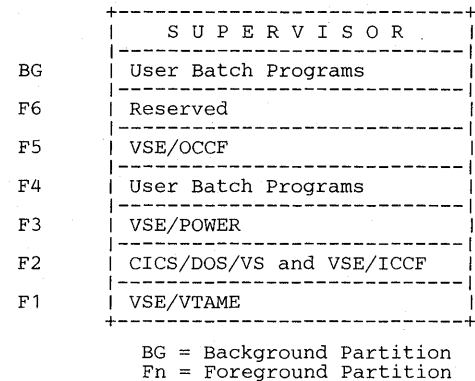

DESCRIPTION of VSE-BASED COMPONENTS:
The following describes the SSX/VSE components. Application owners adapting an existing VSE application to SSX/VSE will find a description of the SSX/VSE functions and restrictions compared to the respective VSE components in the *SSX/VSE Pregeneration Specifications*, SC33-6152.

System Control: DOS/VSE SCP and VSE/AF-based

The SSX/VSE supervisor has been pregenerated for ECPS/VSE mode with 12MB of virtual storage. The processor storage not occupied by the supervisor is divided into partitions as shown below:

SSX/VSE main memory layout:

Two batch partitions are available for production and testing. One partition is available for online transaction programs (F2).

SSX/VSE provides the following predefined libraries utilizing the VSE/AF and VSE/ICCF library concepts:

- System libraries contain the SSX/VSE programs and procedures.
- User private libraries contain user programs and procedures developed under SSX/VSE or other VSE programs installed and tested under SSX/VSE. If more space is required, a second set of user libraries can be created.
- ICCF libraries contain batch jobs to be submitted for execution, all programs in development and data entered from a display station under ICCF control.
- Program Product libraries contain prompter supported program products (SSX/VSE RPG II, SSX/VSE PL/I and DL/I SSX/VSE).
- Application libraries contain programs which are adapted to SSX/VSE using the application installation interface. An SSX/VSE adapted application provides its own application library. The installation of more than one adapted application requires evaluation and coordination of possible usage of dynamic system parameters and therefore requires additional system skill and knowledge of the SSX/VSE system structure.

Note: Program Product Libraries and Application Libraries are established on demand only and require additional DASD space (see Specified Operating Environment).

Spooling and RJE Networking: VSE/POWER Version 2-Based

This component provides spooling for job input and output. All batch programs run under control of the spooler. The user submits a job interactively from the VSE/ICCF library. The job is queued on DASD in the reader queue for execution. After execution, the job output is queued on DASD in the list queue to be either printed on a printer or displayed on the interactive terminal.

VSE/POWER Version 2 (in conjunction with ACF/VTAME) also provides support for:

- 377X remote job entry workstations attached to SDLC lines.
- Remote job exchange and output routing with SNA Interconnected MVS JES2, VSE POWER V2, and SSX/VSE systems (POWER Networking).

File transfer capability on interconnected systems is provided in SSX/VSE in addition to the POWER networking capability. ICCF members and VSAM ESDS or KSDS files can be transferred with a block length up to 32K bytes.

Online Control: CICS/DOS/VS-based

This component provides a transaction-oriented, multi-application data base/data communication interface between SSX/VSE and user applications. It uses ACF/VTAME for communication with terminals. Functions provided include:

- Access to data stored in central files.
- Protection of data from double updating and access to data by unauthorised persons.
- Movement of data from terminals to the processor.
- Flow of multiple tasks (units of work) at a time.

PROGRAM PRODUCTS

Small System Executive/VSE (cont'd)

- Display of status of terminals, data and programs.
- Journaling and recover/restart capability.

Interactive Control: VSE/ICCF and IPF-Based

This component provides:

- Interactive program development
- Batch job creation and,
- Interactive control of the SSX/VSE system

using facilities of VSE/ICCF in conjunction with the Interactive Productivity Facility (IPF) via locally and remotely attached terminals.

Programs can be written at a terminal and saved in VSE/ICCF libraries. One can view these programs and change them as necessary. Later the program can be compiled and the results of the compilation displayed. User jobs executed under SSX/VSE can be initialized interactively via control of VSE/ICCF from the ICCF libraries. Five interactive partitions are available for job creation and other system services.

System administration tasks are performed interactively by simple responses to a series of prompts provided in the form of screen panels that the user fills in. More details about interactive control of the SSX/VSE system are provided in the section 'SSX/VSE Unique Functions'.

An SSX/VSE extension allows the utilization of the following operator console functions from a display station by an authorized ICCF user.

- 1) Display the actual system activity.
- 2) Display a mirror image of the operator console.
- 3) Scrolling through the console hard copy file.
- 4) Input of most operator commands and responses to messages (reserved for system administrator only). Functions like IPL and CICS shutdown are not possible.

In conjunction with the SNA multisystem networking capability this function allows local SSX/VSE operator from a remote location (one SSX/VSE system at a time).

Data Management: VSE/VSAM-based including space management and backup/restore features.

The data management component allows creating, maintaining and processing of files on DASD. Furthermore, it manages the data set space automatically. Data sets defined under SSX/VSE may either have a keyed (KSDS), sequential (ESDS) or relative record number (RRDS) VSAM format. The Data Set Administration Prompts provide the functions to define, delete, print, backup and restore such data sets.

DL/I SSX/VSE can be installed on top of VSAM with the help of SSX/VSE installation prompts to allow DB/DC applications to run under control of SSX/VSE.

Terminal and Network Control: ACF/VTAME-based

This component controls the operation of the terminals and handles the transfer of data between the terminals and the processor. It also provides cross domain communication. It supports:

- 3278, 3279 and 3287 terminals locally-attached to the display/printer adapter.
- 3278, 3279 and 3287 terminals attached via 3274 control units (3272 version) to a byte or block multiplexer channel.
- 3278, 3279 and 3287 terminals attached to the communication adapter via SDLC lines and 3274 or 3276 control units (one control unit per line).
- 377X remote job entry terminals attached to the communication adapter via SDLC lines (one control unit per line).
- Cross domain communication to other SNA systems via SDLC lines.

Utilities: Based on:
DOS/VS Sort/Merge
VSE/DITTO
VSE/Fast Copy Data Set Program

The SSX/VSE utilities are used to provide the basic file manipulation functions like sort, copy to DASD or tape or printer.

Operator Support: VSE/OCCF-based

This component has been preprogrammed in SSX/VSE to reduce and simplify the operator communication at the system console by answering certain messages automatically or suppressing messages when appropriate. It may also be used as the base for message translation.

Problem Determination Support: VSE/IPCS-based

This component in conjunction with specific SSX/VSE problem determination services assists in problem analysis and problem report preparation.

Integrated High Level Language: DOS/VS COBOL

COBOL/VS is the standard high level language provided in SSX/VSE to be used for application development from an interactive ICCF workstation. SSX/VSE RPG II and SSX/VSE PL/I can be installed on top of SSX/VSE as supported program products. SSX/VSE provides prompts for installation and execution of these program products.

DESCRIPTION OF SSX/VSE UNIQUE FUNCTIONS: SSX/VSE provides interactive user services for:

- System installation and initialization.
- System administration and operation.
- Problem determination.

SSX/VSE provides predefined interfaces and procedures for:

- Application installation.
- Network installation.

The interactive services are provided by prompts, procedures, and programs. The prompts direct the user through system activities in user terms and submit requests to the system in system language (e.g., job control language, access method services, control cards), dialogs begin with a master menu panel which allows selecting an environment. Menu panels are organized as a hierarchy. At the lowest menu level, the user selects the function to be performed by the system.

SSX/VSE prompts are based on the IPF dialog manager. Two users can work concurrently with SSX/VSE prompts. The job stream and control procedures created during a prompter session can be saved into the ICCF libraries for repeated use.

SYSTEM INSTALLATION and INITIALIZATION SERVICES

SSX/VSE system installation. The time required to install SSX/VSE in a standalone environment depends on the hardware configuration. One or two hours are typically required. The SSX/VSE licensed program is distributed on a single magnetic tape. The first installation task is to transfer the contents of the tape to DASD. Once SSX/VSE is on DASD, prompts at the operator console guide the user in providing information regarding:

- Hardware configuration
- Type of print belt or train on the system printer
- Format of the date.

SSX/VSE automatically recognizes the standard hardware attached to the system (see "Specified Operating Environment"). Only configurations that are larger than the standard configurations need to be defined further by hardware configuration prompts.

Based on this information the installation prompter builds a job stream for system initialization which is executed automatically upon the next initial program load (IPL).

Hardware reconfiguration support is provided through prompts which are designed to update the current SSX/VSE system for a new hardware configuration (e.g., second printer, new terminals) with minimum effort.

Follow-on system updates can easily be applied by replacing a phase, module, macro, procedure, ICCF member or even the whole system library or by fixing a problem directly with a change to a phase (called ZAP). It is planned to provide refresh tapes of SSX/VSE on an as-required basis.

SYSTEM ADMINISTRATION and OPERATION SERVICES

Daily operation begins with automatic start up of the SSX/VSE system after:

- Power on of the processor and I/O devices.
- and
- Date and time specification at IPL time.

After initialization is complete, control is given to the Data Communications component and SSX is displayed at terminals (signaling that SSX/VSE is online). The user can then begin to use the system by pressing the Enter key at his display terminal. This initiates the display of the initial selection menu from which the user can select one of the displayed options.

The following SSX/VSE system administration and operation tasks are supported through selection menus and execution procedures:

- Library Maintenance Support

Prompted parameters are:

- Function to be performed (e.g., display, catalog, etc.)
- Library type.
- Program name.

Knowledge of DOS/VSE job control or library control statements is not required.

Small System Executive/VSE (cont'd)

- Program Development Support

A procedure is provided allowing COBOL/VS compilations to be submitted for execution in one of the two batch partitions.
- Data Set Management Support

Data administration prompters allow defining, using and deleting VSAM entry sequenced (ESDS), relative record number (RRDS) and key sequenced data sets (KSDS) with or without alternate indexes. The following functions are possible without the need to know VSAM/AMS macros:

 - Define files.
 - Delete files.
 - Print files (or portions of a file).
 - List catalog entries.
 - Verify file integrity.
 - Backup files.
 - Restore files.
 - Define new VSAM space.
- CICS/VS Table Maintenance

Procedures are provided to extend or modify CICS tables and basic mapping support definitions to adapt them to the user needs, e.g., if a new application is added to run under SSX/VSE.
- System Operation Support
 - Initiation and termination.
 - Job creation and submission (knowledge of the VSE Job Control Language is not required).
 - System utilities like disk dump, Display Volume Table of Contents (VTOC), diskette copy, Assign Alternate Block, Backup/Restore of user libraries.
 - Back up and restore of the complete system, volumes or of individual data sets.

Problem Determination Aid:

To aid the SSX/VSE user, a licensed service program is provided in SSX/VSE as an extension to the Interactive Problem Communication System (IPCS) function. It assists the user in the analysis of dump related problems and collects data for problem reporting. The service program creates an error analysis report which serves as a guide for user application problems, as a base for communication between the SSX/VSE user and IBM.

Application Installation Interface

SSX/VSE provides a predefined application installation interface to allow adaptation and easy installation of programs on top of SSX/VSE.

The key characteristics of the interface are:

- Programs installed on top of SSX/VSE via this interface must adhere to a specific distribution tape layout (SSX/VSE format), which has to be prepared by the program owner.
- On the distribution tape the program owner provides installation and generation jobs to:
 - Define and restore the necessary libraries.
 - Define, initiate and load all needed data sets.
- The program owner also provides the necessary adaptations for the SSX/VSE start-up procedure and CICS tables and submits them to the SSX/VSE application activation job.

After above prerequisites are met, the program fits on SSX/VSE, and can be installed on SSX/VSE in four steps:

1. Read installation jobs into POWER queue from tape.
2. Execute installation and generation jobs.
3. Submit application activation job (which is part of SSX/VSE).
4. IPL to activate application.

The SSX/VSE application installation interface is designed to support one application on an SSX/VSE system.

The installation of more than one adapted application possibly requires coordination of system variables and therefore additional system skill and knowledge.

A complete description of the SSX/VSE functions and the application installation interface is provided in *SSX/VSE Pregeneration Specifications*, SC33-6152.

Network Installation Interface:

SSX/VSE provides a network installation interface to allow integration of SSX/VSE into a given SNA cross domain environment.

Installing SSX/VSE in this multiple processor environment requires network definitions for the SSX/VSE node.

The SSX/VSE distribution tape contains a pre-formatted file for these network definitions. Experienced central site personnel can put this file on a disk and use an editor to specify the necessary network information. A network definition tape can then be created and given to the administrator of the SSX/VSE system.

Once the SSX/VSE system is up and running, the administrator can install the network definition tape. SSX/VSE prompters help the administrator create the appropriate job. The job is processed automatically after CICS/DOS/VS and VSE/ICCF are shut down.

The next time the system is brought up, it is automatically established as a network node.

PROGRAMS RUNNING UNDER SSX/VSE CONTROL

SSX/VSE Prompter Supported Program Products

SSX/VSE prompter-supported program products are SSX/VSE versions of VSE licensed programs which have been tested under and adapted to SSX/VSE. They can be ordered with a unique program number, different from their DOS/VSE versions, and installed on SSX/VSE following the instructions in *SSX/VSE System Administration*, SC33-6145. Program service will be equivalent to SSX/VSE. Prompter-supported program products are supported by dialogs for easy installation and operation.

SSX/VSE has prompter support for the following program products:

- SSX/VSE PL/I Optimizer Compiler & Libraries (Original program number 5736-PL3 Rel. 5.1)
- SSX/VSE PL/I Transient Library (Original program number 5736-LM5 Rel. 5.1)
- SSX/VSE RPG II (Original program number 5746-RG1 Rel. 3.0)
- DL/I SSX/VSE (Original program number 5746-XX1 Rel. 1.5.5) (installation prompter support only)

For the installation of one or more SSX/VSE prompter-supported program products, a separate set of private libraries, the SSX/VSE program product libraries, must be utilized. In the case of 3310, a complete DASD drive is needed; in case of 3370, the remaining space is available for user data or private libraries.

SSX/VSE Adapted Applications

SSX/VSE Adapted Applications are IBM or non-IBM programs adapted to the SSX/VSE application installation interface. An 4321 or 4331 system in conjunction with SSX/VSE and an appropriately adapted application can thus be a turn-key application system, which can be used immediately after installation.

Before an adapted application program is installed, additional DASD space must be made available for it. This space is needed to store the application libraries and to allocate its data files. It resides outside of the DASD addresses reserved for the SSX/VSE system, and the predefined user and ICCF libraries.

The installation of more than one adapted application possibly requires coordination of the system variables and therefore additional system skill and knowledge.

SSX/VSE User Programs: SSX/VSE User Programs are:

- programs developed under SSX/VSE and
- other VSE programs stored into the SSX/VSE user private libraries (see Note).

SSX/VSE provides COBOL as the primary language for application programming. *SSX/VSE Application Development*, SC33-6148, describes how the programmer can create and activate batch and online COBOL programs. Besides COBOL, SSX/VSE PL/I (for batch and online programs) and SSX/VSE RPG II (for batch programs) can be used for application development, if the respective SSX/VSE version of the compiler has been installed into the program product library.

Program development under SSX/VSE is done interactively. The compiled programs are stored into the SSX/VSE user private libraries. After having provided the necessary updates to the CICS tables (in case of online programs), these programs can be used from CICS terminals. Files supported are VSAM entry sequential (ESDS), key sequential (KSDS) and relative record number (RRDS) files.

VSE programs other than SSX/VSE prompter supported PPs and SSX/VSE adapted applications will run on SSX/VSE if they are stored into the SSX/VSE user private libraries and if:

- Their specified operating environment matches the predefined SSX/VSE hardware and software functions.
- Any additional prerequisite software product is made available with the program.
- Installation jobs for the program and the required data are provided.
- The program has been tested successfully in conjunction with concurrently running programs.

PROGRAM PRODUCTS

Small System Executive/VSE (cont'd)

Note: In case of IBM program products (PP, FDP, IUP, etc.) an IBM support notice must be available. For technical information, please contact your IBM representative.

The following table summarizes the key characteristics of the programs running under SSX/VSE control:

SSX/VSE PROGRAM TYPES

PROGRAM CHARACTERISTICS	SSX/VSE PROMPTER SUPP. PP	SSX/VSE ADAPTED APPLICATIONS	USER PROGRAMS
What kind of programs?	IBM Program Products?	IBM, 3rd Party and customer programs, mainly application programs	Customer Program developed under SSX/VSE and other existing VSE programs
Who provides SSX/VSE support? (Incl. service)	IBM	Program owner (IBM in case of IBM Program)	Customer; Program owner
Where is program stored?	Program Product Libraries	Application Libraries or User Private Libraries	User private Libraries

CUSTOMER RESPONSIBILITIES

To successfully install and use SSX/VSE the customer must:

- Have installed a hardware configuration which is supported by SSX/VSE.
- Ensure the appropriate training of the system administrator and application programmer (when application development is done by the customer).
- Plan for installation and operation of any remote terminals.
- Plan for proper network layout in the case of multisystem networking.
- Design his application programs to satisfy his performance requirements.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

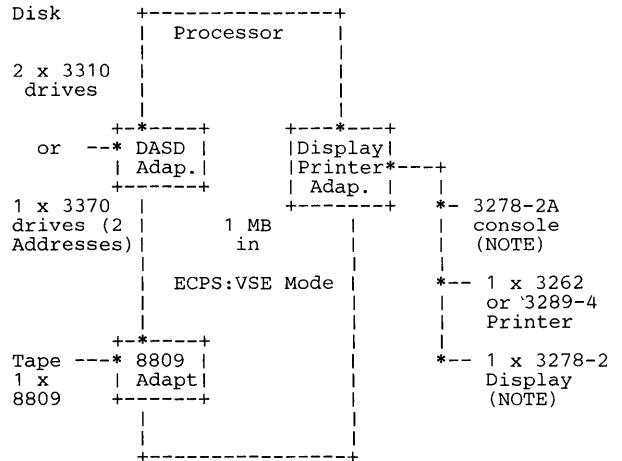

SSX/VSE is designed to operate on IBM 4321 and 4331 processors in ECPS:VSE mode and on all storage sizes offered with these processors starting with a minimum of 1MB. It supports DASD, tape, terminal, printer and diskette attachments. Card readers and card punches are not supported. A microcode modification must be installed on the processors to enable the user to select 12 megabytes of virtual storage in ECPS:VSE mode. This modification will be standard on IBM 4321 and IBM 4331 model 11. The IBM 4331 model 1 and 2 processors must have the following minimum EC levels installed:

Model 1: EC 364303 and REA 6420718

Model 2: EC 364418 and REA 6420627

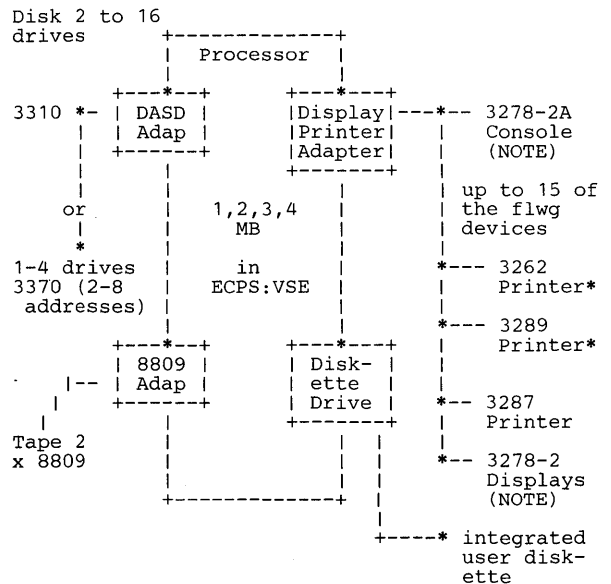

Note: Hardware devices not indicated are not supported by SSX/VSE.

Minimum Configuration: This configuration is required for installation of SSX/VSE as operational system (see also under General Configuration Considerations).

NOTE: See hardware Support Details regarding support of 3279 color display stations and color console.

Standard Configuration: This range of configurations is assumed by SSX/VSE as default hardware configuration, so that all prompts at installation time which relate to hardware configurations will be bypassed (see also General Configuration Considerations).

* = Maximum 2

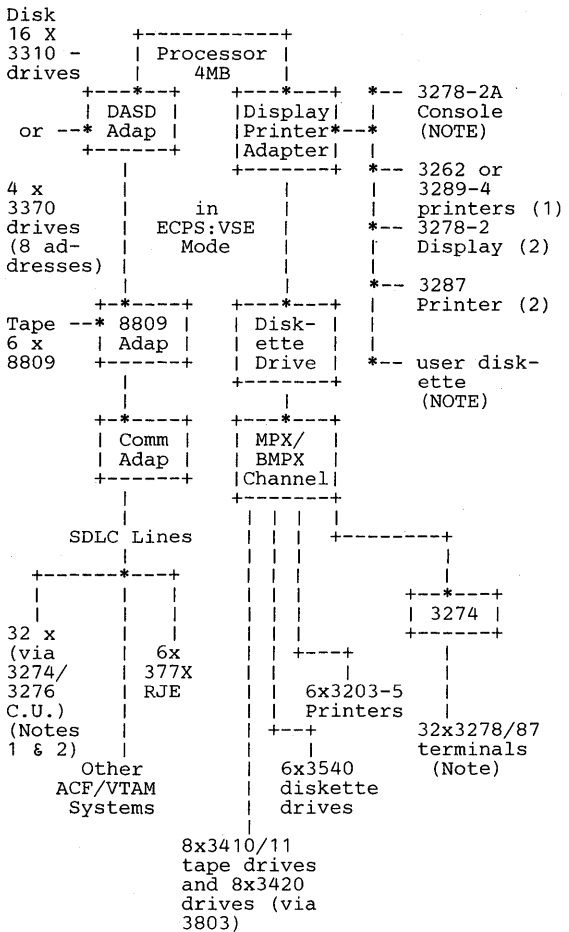

NOTE: See hardware Support Details regarding support of 3279 color display stations and color console.

Maximum Configuration: The following maximum number of I/O devices, terminals and lines are supported in SSX/VSE.

The numbers in front of the device type specify the maximum number of attachable units that SSX/VSE supports. (See also General Configuration Considerations).

PROGRAM PRODUCTS

Small System Executive/VSE (cont'd)

(1) = Maximum 2
(2) = Maximum 15

Notes:

1. See Hardware Support Details regarding support of 3279 color display stations and color console.
2. Only a single terminal control unit (3274, 3276 or 377X) can be attached to one SDLC line.

GENERAL CONFIGURATION CONSIDERATIONS

For any SSX/VSE configuration:

- Either 3310s or 3370s are supported but not both on the same system. The IBM 3370 disk drive does not attach to the IBM 4321 processor.
- One 3370 drive (2 addresses) or two 3310 drives (one address each) are required to store SSX/VSE and the predefined user and ICCF libraries. The 3310s and the 3370s have the following approximate capacities:

Device	Megabytes per Two Addresses
3310	129
3370	570

When 3310s are used, SSX/VSE allocates approximately 5.9 MB for VSAM data space. When a 3370 is used, SSX/VSE allocates approximately 220MB for VSAM data space.

If one or more supported program products (SSX/VS PL/I, SSX/VSE RPG II, or DL/I SSX/VSE) are used with SSX/VSE, above DASD storage capacity must be increased by one 3310 address or one 3370 address. For the IBM 3370, the remaining space is available for user files or user private library extensions.

The installation of an SSX/VSE adapted application also requires additional DASD space to store the application program and to allocate its data files. This space resides outside the DASD addresses reserved for the SSX/VSE system, and the predefined SSX/VSE user and ICCF libraries.

The total amount of required DASD space depends on the size of programs and data files. SSX/VSE supports a maximum of eight 3370 DASD addresses and sixteen 3310 DASD addresses.

If the system uses 3370s, and frequent full backup is required, it is recommended to have at least one 3420 tape unit that supports 6520 bytes per inch.

SSX/VSE recognizes specific addresses or address ranges for the devices that it supports. These are shown in the following table:

Operator Console	3278-2A	01F
Display Stations	3278-2	010-01E
Printers	3279	
	3203-5	02A-02F
	3262	
	3287	010-01E
	3289-4	
DASDs	3310	240-243, 250-253 260-263 270-273 220-227
Magnetic Tape Units	3370	1B0*-1B7
	3410/11	1A0*-1A7
	3420	300*-305
	8809	009
Diskette Unit	Integrated	024-029
	3540	

Note: * = address used for installation

Hardware Support Details

Processor Features Supported:

- DASD adapter #3201 for IBM 3310 and IBM 3370
- 8809 Magnetic tape unit adapter #4910
- Bytes Multiplexer Channel #5248
- Block Multiplexer Channel #1421
- Diskette Drive #3401
- Display/Printer Adapter Expansion #2001
- Communication Adapter #1601 and associated features.

Processor Features Not Supported:

- 14XX compatibility #3950
- Printer-Keyboard mode #5550
- Direct Access Storage Compatibility #7901
- 5424 Adapter #3901
- ECPS: VM/Adapter #8701
- Loop Adapter features #4830, #4831, #4840
- 3340/3344 Direct Attachment #7851
- High Speed Block Multiplexer Channel #1431
- External Signals #3898
- Second DASD Adapter #3202

Device Support

Disk Drives: IBM 3310 (mdls A1, A2, B1, B2) or IBM 3370 DASD (mdls A1, B1) are supported. Minimum disks required are two IBM 3310 drives (two addresses) or one IBM 3370 drive (two addresses). The maximum number of disk drives is either sixteen IBM 3310 drives (16 addresses) or four IBM 3370 drives (8 addresses). A mixture of IBM 3310 and IBM 3370 strings is not possible.

Tape Drives: The maximum number of tape drives supported is six IBM 8809 attached to the 8809 tape unit adapter, eight IBM 3410/11 models 1 - 3 channel-attached, and eight IBM 3420 models 3 - 8 channel-attached via a 3803 tape control unit. The 7-track feature is not supported. As a minimum, one tape drive is required.

Diskette Drives: SSX/VSE supports the integrated diskette drive as an IBM 3540. Up to six additional IBM 3540 diskette drives (six 3540 B01 or three 3540 B02) attached to a channel are supported.

Printers: SSX/VSE supports the printer IBM 3262 models 1 and 11, IBM 3289-4 and IBM 3203-5. All 3 printer types are supported as system printers (SYSLST). At least 1 printer is required. The maximum number of supported printers attached to the display/printer adapter is two.

In addition up to six IBM 3203-5s can be attached to a channel.

Terminals: SSX/VSE supports local and remote display stations and hard copy printer to the:

- Display/Printer Adapter (local)
Up to 15 devices are allowed in addition to the operator console IBM 3278-2A or IBM 3279-C (see note below). The devices can be of the following types:
 - Display station IBM 3278-2
 - Color Display Station IBM 3279-2A, 2B (see note)
 - Terminal Printer IBM 3287-1, 2
 - Line Printer IBM 3289-4, maximum 2
 - Line Printer IBM 3262-1, 11, maximum 2

PROGRAM PRODUCTS

Small System Executive/VSE (cont'd)

- Byte or Block Multiplexer Channel (local): Up to 32 devices of the following types attached to appropriate IBM 3274 (IBM 3272 version) terminal control units are supported:
 - Display Station IBM 3278-2
 - Color Display Station 3279-2A, 2B (see note)
 - Terminal Printer IBM 3287-1, 2
- Communication Adapter (remote) via SDLC lines and appropriate IBM 3274-XXC and/or 3276-12 terminal control units (one control unit per line). Up to 32 devices of the following types are supported:
 - Display Station IBM 3278-2
 - Color Display Station IBM 3279-2A, 2B (see note)
 - Terminal Printer IBM 3287-1, 2
- Communication Adapter via SDLC lines (one control unit per line): Up to eight IBM 377X remote job entry terminals of the following types and models:

DEVICE	MODEL	ATTACHABLE DEVICES			
		Reader	Punch	Printer	Storage Devices
3771	1,2,3	3501	3521	None	None
3773	1,2,3	None	None	None	One integr. device
3774	1P,2P	2502	3521	3784	1 or 2 (diskette)
3775	1P	3501 2502	3521	None	1 or 2 (diskette)
3776	1/2	3501 2502	3521	None	1 or 2 (diskette)
3777	1	3501 2502 2502	3521 3521 3521	3203-3 3262-2 /12	1 or 2 (diskette)

As a minimum, the operator console IBM 3278-2A and one locally attached display station IBM 3278-2 or IBM 3279-2A, 2B are required.

Note: SSX/VSE supports the IBM 3279 color display console (model 2C) as a 3278-2A with no specific color support. The IBM 3279 display station (mdls 2A and 2B) is supported in 3278 compatibility mode, i.e., SSX/VSE has not been programmed to exploit color capabilities for prompts, helps and messages.

Applications running under SSX/VSE control which use the color display station or the color terminal printer will however be able to utilize the color capabilities according to the application program coding.

SOFTWARE REQUIREMENTS

Small Systems Executive/VSE is a self-contained operating system with no prerequisite software requirements.

Communication from a processor running SSX/VSE with another processor can be established via SDLC lines if the other processor has the following software products installed:

- Another SSX/VSE program product (5666-265)
- or
- ACF/VTAM with ACF/NCP and the Multisystem Networking Facility
- or
- ACF/VTAME (DOS/VSE only)

RJE connections to other SNA processors are possible via SDLC lines if the other processor has the following software products installed:

- Another SSX/VSE program product
- VSE/Advanced Functions release 3 with VSE/POWER version 2 and ACF/VTAME or ACF/VTAM release 2 with MSNF
- MVS/SP and ACF/VTAM release 2 with MSNF and JES2 SPE 1.2

SSX/VSE is shipped mainly as object code. Source code is only provided for macros whose parameters must be defined by the user in the application programs. Prompts and helps are provided as ICCF library members. A number of procedures and relocatable library members are provided for system operation.

COMPATIBILITY and MIGRATION

With the exception of SSX/VSE unique functions, like the file transfer function and the ICCF operator console functions, SSX/VSE is upward compatible to a DOS/VSE System which includes the VSE based products contained in SSX/VSE on the appropriate release level. No major problems are expected when migration to an extended environment is desired, since only VSAM files and (if installed) DL/I data base are supported by SSX/VSE. Jobs created by SSX/VSE prompts can be saved if ICCF libraries and executed on VSE systems.

A user moving from SSX/VSE to a full-function DOS/VSE IPO/E system and related products will require additional education regarding the base interfaces of DOS/VSE job control language and the various new options available to him, as the SSX/VSE unique prompts and helps are not available in DOS/VSE.

SECURITY

SSX/VSE, via ICCF and CICS/DOS/VS, provides the same level of security as provided by these products in VSE.

Customer Management is responsible for the selection, implementation and adequacy of security procedures for their applications.

PERFORMANCE AND STORAGE CONSIDERATIONS

PERFORMANCE: Generally SSX/VSE will have the same batch and interactive performance as a DOS/VSE system generated with the same program products and generation parameters on equivalent 4321 and 4331 program configurations.

MAIN MEMORY: SSX/VSE requires a system with a minimum of 1 megabyte of processor storage. The amount of processor storage needed for a specific customer installation depends on the number of terminals in use and the mix of concurrent work. Such a mix may contain:

- Batch program execution
- Online program development
- Simple or complex online program use
- DL/I use in batch or online programs
- Telecommunication operations

Multi-application environments (e.g., concurrent use of online processing, application development and cross domain communication) can be expected to need additional storage.

Please contact the IBM Representative for support in calculating the required processor storage for a specific SSX/VSE system.

DASD SPACE: SSX/VSE requires a minimum of two IBM 3310 DASD drives or 1 IBM 3370 DASD drive (2 addresses). The approximate DASD space reserved for the user (private libraries, ICCF user space and VSAM data space) in a minimum DASD configuration is as shown in the following table:

Available user space on minimum DASD configurations (approximate figures):

	2 x 3310 Drives	1 x 3370 Drives
User private libraries		
Core Image	4.3 MB	28.0 MB
Relocatable	4.3 MB	28.0 MB
Source	3.5 MB	12.5 MB
Free VSAM space (for data files)	5.0 MB	220.0 MB
ICCF user space	7.5 MB	75.0 MB

In case of IBM 3310 DASDs it is recommended to offer at least a system with three IBM 3310 DASD drives to allow for sufficient VSAM space for user data files.

DOCUMENTATION
(available from Mechanicsburg)

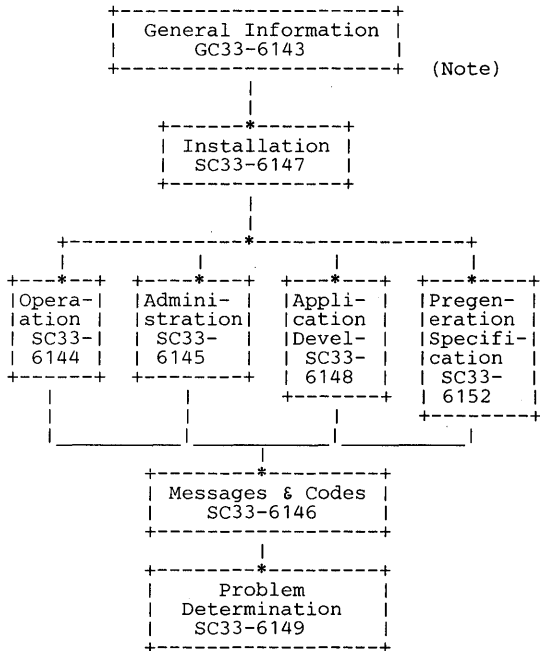

A set of eight manuals is provided to describe the functions and interfaces available to the SSX/VSE users.

The manuals provide "how to use" information for all tasks which can be performed by the user with the SSX/VSE system. Conceptual information is kept to a minimum.

Small System Executive/VSE (cont'd)

The following shows the names and order numbers of the manuals:

SSX/VSE LIBRARY

Note: The *General Information Manual* is planned to be available at announcement time.

VSE often allows the same tasks to be performed in different ways. The SSX/VSE documentation describes only one way to perform a given task. Example: The *Application Development Guide* only describes the high level programming (command level) interface to CICS/DOS/VS. The macro level interface is excluded.

The *SSX/VSE Pregeneration Specifications, SC33-6152*, lists the internal functions of SSX/VSE (like to CICS macro level interface) that are not documented elsewhere. It also describes how to adapt application programs to run under SSX/VSE. Its primary purpose is to inform system programmers who are familiar with VSE and CICS/DOS/VS about the capabilities of SSX/VSE to run existing VSE programs.

**SMALL SYSTEM EXECUTIVE/VSE
RELEASE 2 (SSX/VSE)
5666-265**

PURPOSE

The licensed program Small System Executive/Virtual Storage Extended (SSX/VSE) is a pregenerated VSE operating system which runs within a range of predefined IBM 4321, 4331 and 4341 configurations. SSX/VSE supports batch and interactive applications. It can be used in standalone environments supporting locally and remotely attached terminals and in distributed data processing environments, i.e., interconnected to other processors in an SNA network. SSX/VSE is designed for quick installation and enhanced ease-of-use compared to DOS/VSE. SSX/VSE Release 2 will be delivered on one tape and serviced as one product.

SSX/VSE is designed for easy installation and easy operation in standalone environments or distributed data processing environments.

Use of SSX/VSE in a networking environment requires understanding of networking procedures and considerations, which are recommended to be managed at the customer's central installation.

HIGHLIGHTS

SSX/VSE includes the following basic functions:

- Online transaction processing.
- Batch partitions for batch production work and testing.
- Spooling for job input and output.
- Data communication support for locally and remotely attached terminals.
- Remote job entry workstation support.
- Interactive program development and system control capabilities.
- VSAM-based data management routines including automatic space management. Capability to install DL/I SSX/VSE and SQL/DS in addition.
- A set of file handling utilities including Sort and DITTO.
- High-level language support through COBOL. Capability to install DOS PL/I, DOS/VS RPG II, VS/FORTRAN and RM BASIC.
- SSX/VSE operator console functions supported on local and remote ICCF terminals.
- SNA cross-domain application usage from any authorized terminal in a multi-CPU network environment.
- Remote job execution and file exchange between interconnected SNA systems; capability to also use BSC lines.
- SSX/VSE Release 2 can run as a guest system under VM/370 on processors supporting the 3310 or 3370.

SSX/VSE provides the following usability characteristics:

- Quick installation, reconfiguration and update of the pregenerated SSX/VSE system.
- Predefined procedures and prompts for simple installation of optional programs.
- User-oriented interactive communication with the system through full screen prompts, procedures and help screens for operation and system administration tasks.
- Enhanced interactive problem analysis and problem reporting facilities.
- New task-oriented documentation with 'how to' description for systems administration, operation and application development tasks.
- Creation of job control statements via prompts and dialogs.

SSX/VSE supports (within physical limitations) the following 4300 hardware functions and I/O devices:

- ECPS:VSE mode.
- Minimum of 1 megabyte processor storage.
- Up to 16 3310 drives or 8 3370 drives (2 addresses each), minimum is 2 3310 or 1 3370 (2 addresses).
- Up to 6 8809 tape drives and/or up to 8 channel-attached 3410 and/or 3420 tape drives; minimum is 1 tape drive.
- Integrated 3540 compatible diskette drive and up to 6 channel-attached 3540 diskettes.
- 3262 and/or 3289 Printers attached to the display/printer adapter and/or up to 6 channel-attached 3203, 3211, or 4245 Printers; minimum is 1 system printer.

- Capability to use Magnetic Character Reader and Optical Character (MCR/OCR) Reader devices.
- Local 3278, 3279 and 3287 terminals attached to the display/printer adapter. Additional 3278, 3279 and 3287 terminals can be channel-attached via 3274 control units. Minimum is one display unit with keyboard.
- 8775 display station attached to the local loop adapter.
- Remote 3278, 3279 and 3287 terminals in SNA mode attached via 3274 or 3276 control units and nonswitched SDLC lines to the communication adapter.
- Support of 3601, 3602 and 4701 finance communication controllers and associated devices.
- Up to 8 377X remote job entry workstations attached via switched SDLC lines and up to 8 attached via nonswitched SDLC lines to the communication adapter.
- Up to 8 terminal control units (327X, 377X, 360X, 4701) can be attached to one communication line (multipoint).
- Capability to use BSC line control for Remote Job Entry (RJE), Job Networking, File Transfer and BSC 3270 terminal support via the VTAME and POWER component.

DESCRIPTION

SSX/VSE PRODUCT DESCRIPTION

Summary: SSX/VSE is an operating system designed for the 4321 and 4331 processors.

SSX/VSE Release 2 also supports local configurations (without communication lines) of the 4341.

As an operating system that has no prerequisite software, SSX/VSE is:

- **Pregenerated:** SSX/VSE consists of a predefined set of software components that have been tested for combined use. Because SSX/VSE is pregenerated, it simplifies a number of tasks (such as system planning) that are associated with data processing systems.
- **Preconfigured:** SSX/VSE is designed to work with specific hardware devices in a specific range of configurations. Because SSX/VSE is preconfigured, the time spent in selecting and coordinating hardware devices is minimized.
- **Flexible:** Within SSX/VSE's predefined range of supported configurations and program products, users can:
 - Define how the processor uses storage. This includes:
 - Specifying whether the processor works with 12 or 16 megabytes of virtual storage.
 - Increasing the number of system partitions. SSX/VSE supports a maximum of 12 partitions.
 - Alter system's hardware configuration by adding or replacing supported devices.
 - Install one or more of the optional programs supported by SSX/VSE.
 - Install application programs that have been adapted for use on an SSX/VSE system. SSX/VSE provides an interface for adapting applications to run under it.
 - Develop own application programs for use on the SSX/VSE system.
 - Operate the system in either a local or a remotely controlled environment.

As an operating system SSX/VSE controls the:

- Data processing done by the systems application programs.
- Flow of data to and from the systems input and output devices.

To do this, SSX/VSE includes functions from a number of VSE program products. The level of functions provided in SSX/VSE is described in *Pregeneration Specifications* (SC33-6152).

SSX/VSE has been designed for system ease-of-use. Besides extensive online user aids for the daily operation and system administration, support is provided for installation, application programming and problem determination. A set of task-oriented documentation covering the administration, operation and application development functions of SSX/VSE with 'how to' descriptions is also provided.

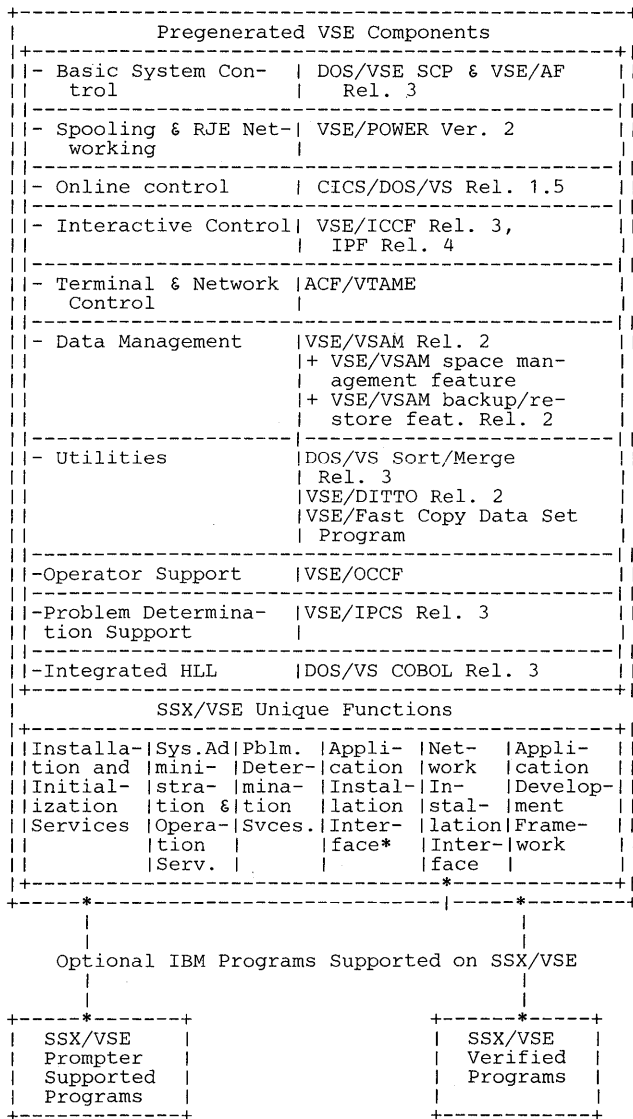

Refresh of the complete SSX/VSE system will be provided on an as-required basis. The customer can order the refresh system from a distribution center.

PROGRAM PRODUCTS

Small System Executive/VSE (cont'd)

The following graphic illustrates the SSX/VSE structure:

SSX/VSE Licensed Program

* For standardized installation of adapted applications.

DESCRIPTION of VSE COMPONENTS:

The following describes the SSX/VSE components. Application owners adapting an existing VSE application to SSX/VSE will find a description of how to do this, as well as the SSX/VSE functions and restrictions compared to the respective VSE components in the *SSX/VSE Pregeneration Specifications* (SC33-6152).

Basic System Control: DOS/VSE SCP and VSE/AF

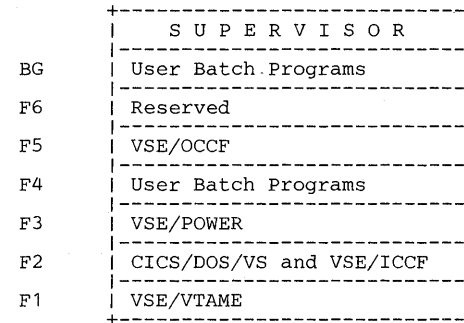

The SSX/VSE supervisor has been pregenerated for ECPS/VSE mode with 12MB of virtual storage. If required, the virtual storage size can be changed to 16MB at initial installation or later. The virtual storage not occupied by the supervisor and the shared virtual area is divided into partitions as shown below:

SSX/VSE is pregenerated with seven partitions:

- Four partitions contain SSX/VSE components. This includes partition F2 which is available for online transaction programs.
- Two partitions are available for running user batch programs.
- One partition (F6) is not active when SSX/VSE operates with 12 megabytes of virtual addressable storage. In SSX/VSE Release 2 systems that use 16 megabytes of virtual addressable storage, F6 is also available for running batch programs.

- SSX/VSE Release 2 supports a maximum of 12 partitions. *SSX/VSE Pregeneration Specifications* describes the procedure for defining the additional five partitions.

SSX/VSE partitions and their use:

BG = Background Partition
Fn = Foreground Partition

SSX/VSE provides the following predefined libraries utilizing the VSE/AF and VSE/ICCF library concepts:

- System libraries contain the SSX/VSE programs and procedures.
- User private libraries contain user programs and procedures developed under SSX/VSE or other VSE programs installed and tested under SSX/VSE. If more space is required, a second set of user libraries can be created.
- ICCF libraries contain batch jobs to be submitted for execution, all programs in development and data entered from a display station under ICCF control.
- Feature libraries (called Program Product libraries in Release 1) contain optional programs supported on SSX/VSE.
- Application libraries contain programs which are adapted to SSX/VSE using the application installation interface. An SSX/VSE adapted application provides its own application library.

Note: Feature Libraries and Application Libraries are established on demand only and require additional DASD space.

Spooling and RJE Networking: VSE/POWER Version 2

This component provides spooling for job input and output. All batch programs run under control of the spooler. The user submits a job interactively from the VSE/ICCF library. The job is queued on DASD in the reader queue for execution. After execution, the job output is queued on DASD in the list queue to be either printed on a printer or displayed on an interactive terminal.

VSE/POWER Version 2 (in conjunction with ACF/VTAME) also provides support for:

- 377X remote job entry workstations attached to SDLC lines.
- Remote job exchange and output routing with SNA Interconnected MVS JES2, VSE POWER V2, and SSX/VSE systems (POWER Networking).

SSX/VSE Release 2 provides the capability to generate support for BSC line control for:

- 2770, 2780, 3741, 3770 (in 2770/3780 compatibility mode), 3780, remote job entry workstations.
- Remote job exchange and output routing with BSC interconnected MVS JES2, VSE POWER V2 or other VM/370 RSCS systems and other SSX/VSE systems generated for BSC RJE support.

File transfer capability on interconnected systems is provided in SSX/VSE in addition to the POWER networking capability. ICCF members and VSAM ESDS or KSDS files can be transferred.

Online Control: CICS/DOS/VS

This component provides a transaction-oriented, multi-application data base/data communication interface between the SSX/VSE system and user applications. It uses ACF/VTAME for communication with terminals. Functions provided include:

- Access to data stored in central files.
- Protection of data from double updating and access to data by unauthorized persons.
- Movement of data from terminals to the processor.
- Flow of multiple tasks (units of work) at a time.
- Display of status of terminals, data and programs.

Small System Executive/VSE (cont'd)

- Journaling and recovery/restart capability.*
- Capability to use CICS intersystem communication (ISC) functions.*

* Requires respective CICS/VSE knowledge.

All macros required to compile command level and most macro level programs are provided. An optional macro tape (no charge) containing CICS/DOS/VS macros not shipped with the base SSX/VSE system can be ordered.

Interactive Control: VSE/ICCF and IPF

This component provides:

- Interactive program development,
- Batch job creation and,
- Interactive control of the SSX/VSE system

using facilities of VSE/ICCF in conjunction with the Interactive Productivity Facility (IPF) via locally and remotely attached terminals.

Programs can be written at a terminal and saved in VSE/ICCF libraries. One can view these programs and change them as necessary. Later the programs can be compiled and the results of the compilation displayed. User jobs executed under SSX/VSE can be initialized interactively via control of VSE/ICCF from the ICCF libraries. Five interactive partitions are available for job creation and other system services.

System administration tasks are performed interactively by simple responses to a series of prompts provided in the form of screen panels that the user fills in. More details about interactive control of the SSX/VSE system are provided in the section 'SSX/VSE Unique Functions'.

An SSX/VSE extension allows the utilization of the following operator console functions from an authorized ICCF terminal when SSX/VSE is up and running:

- 1) Display the actual system activity.
- 2) Display a mirror image of the operator console.
- 3) Scrolling through the console hard copy file.
- 4) Input of most operator commands and responses to messages (for authorized user only). Functions like IPL and CICS shutdown are not possible.

In conjunction with the SNA multisystem networking capability, this function allows SSX/VSE operation support from a terminal attached to a system in a remote location.

Data Management: VSE/VSAM, including space management and backup/restore features.

The data management component allows creating, maintaining and processing files on DASD. Furthermore, it manages the data set space automatically. Data sets defined under SSX/VSE may either have a keyed (KSDS), sequential (ESDS) or relative record number (RRDS) VSAM format. The Data Set Administration Prompters provide the functions to define, delete, print, backup and restore such data sets.

DL/I SSX/VSE can be installed on top of VSAM with the help of SSX/VSE installation prompters to allow DB/DC applications to run under control of SSX/VSE.

If a relational data base is required, SQL/DS can be installed on top of SSX/VSE with the help of SSX/VSE prompters.

Terminal and Network Control: ACF/VTAME

This component controls the operation of the terminals and handles the transfer of data between the terminals and the processor. It also provides cross-domain communication. It supports:

- 3278, 3279 and 3287 terminals locally-attached to the display/printer adapter of the 4321 and 4331.
- 3278, 3279 and 3287 terminals attached via 3274 control units (3272 version) to a byte or block multiplexer channel.
- 3278, 3279 and 3287 terminals attached to the communication adapter via SDLC lines and 3274 or 3276 control units.
- 8775 terminals attached to the local loop adapter.
- Finance Communication Controllers 3601, 3602 and 4701 and associated devices.
- 3278, 3279 and 3287 terminals attached to the communication adapter via BSC lines and appropriate 3274 control units (no prompter support).
- 377X remote job entry terminals attached to the communication adapter via SDLC lines.
- Cross-domain communication to other SNA systems via SDLC lines.
- Multipoint support (multidropping) of up to 8 terminal controllers of the following types to SDLC or BSC lines:

- 3274

- 3276
- 377X (multipoint via SDLC lines only)
- 3601, 3602, 4701

Utilities:

- DOS/VS Sort/Merge
- VSE/DITTO
- VSE/Fast Copy Data Set Program

The SSX/VSE utilities are used to provide the basic file manipulation functions like sort, and copy to DASD, tape or printer.

Operator Support: VSE/OCCF

This component has been preprogrammed in SSX/VSE to reduce and simplify the operator communication at the system console by answering certain messages automatically or suppressing messages when appropriate. It may also be used as the base for message translation.

If the optional program product NCCF is installed on SSX/VSE Release 2, the remote operator console function of OCCF can be used to control multiple SSX/VSE systems simultaneously from one remote terminal.

Problem Determination Support: VSE/IPCS

This component, in conjunction with specific SSX/VSE problem determination services, assists in problem analysis and problem report preparation.

Integrated High-Level Language: DOS/VS COBOL

COBOL/VS is the standard high-level language provided in SSX/VSE to be used for application development from an interactive ICCF workstation. DOS/VS RPG II, DOS PL/I, VS/FORTRAN and RM BASIC can be installed on SSX/VSE Release 2 as optional program products. SSX/VSE provides prompters for installation and execution of these optional high-level languages.

DESCRIPTION OF SSX/VSE UNIQUE FUNCTIONS: SSX/VSE provides interactive user services for:

- System installation and initialization.
- System administration and operation.
- Problem determination.

The interactive user services are provided by prompters, procedures, and programs. The prompters direct the user through system activities in user terms and submit requests to the system in system language (e.g., job control language, access method services, control cards). Dialogs begin with a master menu panel which allows selection of an environment. Menu panels are organized as a hierarchy. At the lowest menu level, the user selects the function to be performed by the system.

SSX/VSE prompters are based on the IPF dialog manager. Two users can work concurrently with SSX/VSE prompters. The job stream and control procedures created during a prompter session can be saved into the ICCF libraries for repeated use.

SSX/VSE also provides predefined interfaces and procedures for:

- Application installation
- Network installation
- Application development

Following is a short description of the SSX/VSE unique functions:

SYSTEM INSTALLATION and INITIALIZATION SERVICES

SSX/VSE system installation. The time required to install SSX/VSE in a standalone environment depends on the hardware configuration. One to two hours are typically required. The SSX/VSE licensed program is distributed on a single magnetic tape. The first installation task is to transfer the contents of the tape to DASD. Once SSX/VSE is on a DASD, prompters at the operator console guide the user in providing information regarding:

- Hardware configuration
- Type of print belt or train on the system printer
- Format of the date.

SSX/VSE automatically recognizes the standard hardware attached to the system (see "Specified Operating Environment"). Configurations that are larger than standard configurations need to be defined further using hardware configuration prompters.

Based on this information, the installation prompter builds a job stream for system initialization which is executed automatically upon the next initial program load (IPL).

There is no prompter support for:

- Installation of BSC lines and terminals
- Installation of MCR/OCR devices
- Invocation of up to 12 partitions
- Allocation of storage to partitions
- Extension of 3600/4700 standard generation

Small System Executive/VSE (cont'd)

- Completing network definition skeleton
- Adding VTAM applications other than NCCF

Hardware reconfiguration support is provided for most hardware devices through prompters which are designed to update the current SSX/VSE system for a new hardware configuration (e.g., second printer, new terminals) with minimum effort.

Follow-on system updates of the SSX/VSE base system and most prompter-supported optional programs are also supported by a prompter. Thus, changes can be easily applied by replacing a phase, module, macro, procedure, ICCF member or even the whole system library, or by fixing a problem directly with a change to a phase (called ZAP). It is planned to provide refresh tapes of SSX/VSE on an as-required basis.

SYSTEM ADMINISTRATION and OPERATION SERVICES

Daily operation begins with automatic start up of the SSX/VSE system after:

- Power on of the processor and I/O devices.
- and
- Date and time specification at IPL time.

After initialization is complete, control is given to the Data Communication component and SSX is displayed at terminals (signaling that SSX/VSE is online). The user can then begin to use the system by entering userid and password and pressing the Enter key at the display terminal. This initiates the display of the initial selection menu from which the user can select one of the displayed options.

The following SSX/VSE system administration and operation tasks are supported through selection menus and execution procedures:

- Library Maintenance Support

Prompted parameters are:

- Function to be performed (e.g., display, catalog, etc.)
- Library type.
- Program name.

Knowledge of DOS/VSE job control or library control statements is not required.

- Data Set Management Support

Data administration prompters are provided for defining, using and deleting VSAM entry sequenced (ESDS), relative record number (RRDS) or key sequenced data sets (KSDS) with or without alternate indexes. The following functions are possible without the need to know VSAM/AMS macros:

- Define files.
- Delete files.
- Print files (or portions of a file).
- List catalog entries.
- Verify file integrity.
- Backup files.
- Restore files.
- Define new VSAM space.

- CICS/VS Table Maintenance

Procedures are provided to extend or modify most frequently used CICS tables.

- System Operation Support

- Initiation and termination.
- Job creation and submission (knowledge of the VSE Job Control Language is not required).
- System utilities like Disk Dump, Display Volume Table of Contents (VTOC), Diskette Copy, Assign Alternate Block, Backup/Restore of user libraries.
- Back up and restore of the complete system, volumes or individual data sets.

Problem Determination Services

To aid the SSX/VSE user, a service program is provided in SSX/VSE as an extension to the Interactive Problem Communication System (IPCS) function. It assists the user in the analysis of dump related problems and collects data for problem reporting. The service program creates an error analysis report which serves as a guide for user application problems, as a base for communication between the SSX/VSE user and IBM.

Network Installation Interface

SSX/VSE provides a network installation interface to allow integration of SSX/VSE into a given SNA cross-domain environment.

Installing SSX/VSE in this multiple processor environment requires network definitions for the SSX/VSE node. The SSX/VSE distribution tape contains a pre-formatted file for these network definitions.

SSX/VSE Release 2 also provides installation skeletons for the optional products NCCF and NPDA. Experienced central-site personnel can put this file on a disk and use an editor to specify the necessary network information. Network definition tapes can then be created and given to the administrators of the SSX/VSE nodes.

Once the SSX/VSE system is up and running, the administrator can install the network definition tape. SSX/VSE prompters help the administrator create the appropriate job. The job is processed automatically after CICS/DOS/VS and VSE/ICCF are shut down.

The next time the system is brought up, it is automatically established as a network node.

Application Installation Interface

SSX/VSE provides a predefined Application Installation Interface.

This interface can be used to adapt and install an existing application on top of SSX/VSE. Applications using this interface are sometimes referred to as SSX/VSE adapted applications.

Characteristics:

- Programs packaged using this interface adhere to a specific installation tape layout.
- On this installation tape, the application owner provides jobs and information to:
 - Define and restore necessary libraries.
 - Define and load necessary application files.
 - Modify SSX/VSE startup procedures and CICS/VS tables.

With this format, the application type can be installed in four easy steps:

1. Read installation jobs into POWER queue from tape.
2. Execute installation and generation jobs.
3. Submit application activation job (which is part of SSX/VSE).
4. IPL to activate application.

The SSX/VSE application installation interface is designed to support one application on an SSX/VSE system.

The installation of more than one adapted application possibly requires coordination of system variables and therefore additional system skill and knowledge.

Before an application is installed, additional DASD space must be made available in order to store the application libraries and to allocate the required data files. This space resides outside of the DASD addresses reserved for the SSX/VSE system and the predefined user and ICCF libraries.

A complete description of the SSX/VSE functions and the application installation interface is provided in *SSX/VSE Pregeneration Specifications* (SC33-6152).

Application Development Framework

COBOL is the primary language for application programming in SSX/VSE. Based on COBOL, an application framework including a sample application is provided. The application framework consists of partially or completely preprogrammed building blocks for online CICS programs. Specializing the function of each building block simplifies application program development. Design and development of each program is made even easier by the sample program included in SSX/VSE. *SSX/VSE Application Development* describes the use of the application framework for COBOL programming in detail.

Other high-level languages (PL/I, RPG II, FORTRAN, BASIC) and program development productivity tools (ELIAS, DMS/CSP, SDF) can be installed on top of SSX/VSE (see optional IBM programs). These tools are described in their own documentation.

Program development under SSX/VSE is done interactively. The compilation of COBOL, PL/I, RPG II and FORTRAN programs is prompter-initiated. The compiled programs are stored into the SSX/VSE user private libraries. After having provided the necessary updates to the CICS tables (in case of online programs), these programs can be used from CICS terminals. Files supported are VSAM entry sequential (ESDS), key sequential (KSDS) and relative record number (RRDS) files.

SSX/VSE user programs are programs developed by the user under SSX/VSE control using the SSX/VSE-provided tools and procedures.

OPTIONAL IBM PROGRAMS SUPPORTED ON SSX/VSE

There are two categories of optional IBM programs supported on SSX/VSE:

SSX/VSE Prompter-Supported Programs

SSX/VSE prompter-supported programs are defined as follows:

- IBM-supplied DOS/VSE programs
- Verified by IBM to run under SSX/VSE and, as far as required, adapted to SSX/VSE

PROGRAM PRODUCTS

Small System Executive/VSE (cont'd)

- Ease-of use prompter-supported in the SSX/VSE base system for easy installation and maintenance
- When appropriate, ease-of-use prompters are also included to aid in the use of these programs.

SSX/VSE Verified Programs

SSX/VSE Verified Programs are defined as follows:

- IBM-supplied DOS/VSE programs
- Verified by IBM to run under SSX/VSE
- Installed on SSX/VSE according to the documented installation procedures of the individual program, i.e., no aids have been included in SSX/VSE for these programs.

SSX/VSE Release 2 supports the following optional programs:

- High-level languages
 - * DOS PL/I Optimizer Compiler & Libraries, Release 6.0 5736-PL3 (p)
 - DOS PL/I Resident Library 5736-LM4 (v)
 - * DOS PL/I Transient Library 5736-LM5 (p)
 - DOS PL/I Compiler, Release 6 5736-PL1 (v)
 - * DOS/VS RPG II, Release 3 5746-RG1 (p)
 - VS/FORTRAN, Release 2 Compiler & Libraries 5748-FO3 (p)
 - VS/FORTRAN Libraries 5748-LM3 (p)
 - RM-BASIC (IUP) 5796-BCX (p)
- Program Development Productivity Aids
 - DMS/CSP SSX/VSE Development and Test Execution 5668-282 (p)
5666-283 (p)
 - ELIAS SSX/VSE 5666-291 (p)
 - SDF/CICS SSX/VSE 5666-288 (p)
- Hierarchical and Relational Data Base Support
 - DL/I SSX/VSE 5666-275 (p)
 - SQL/DS 5748-XXJ (p)
- Enhanced Central Management Capabilities
 - NCCF, Release 2 5735-XX6 (p)
 - NPDA, Version 2 5668-983 (p)
- Enhanced Security Support
 - VSE Access Control-Logging and Reporting 5746-XE7 (p)
- Finance Communication System Support
 - Subsystem Support Services Release 4 5747-CC6 (v)
 - 3600 Host Support IR, Release 7 5747-BR1 (v)
 - 4700 Host Support Program 5668-989 (v)
 - 4700 COBOL 5666-266 (v)
- Other Device Support
 - Downstream Load Utility Rel. 1.2 5668-006 (p)
- Applications for text processing
 - DCF, Release 2 5748-XX9 (v)
 - DLF 5748-XXE (v)
 - IPDT Version 1 Release 1 5785-DDD (v)
- Cross-Industry Applications
 - Financial Management System 5666-263 (v)
 - Interactive Personnel System 5746-AM1 (v)
 - Interactive Financial System
 - IFS1 Postings and General Ledger 5746-F52 (v)
 - IFS2 Profit & Loss, Balance Sheet.. 5746-F53 (v)
 - IFS3 Open Item Accounting 5746-F54 (v)
 - IFS4 Payment Processing 5746-F55 (v)
- Communications-Oriented Product Information and Control (COPICS) Products
 - COPICS Inventory Accounting II 5785-GBE (v)
 - COPICS Advanced Function Material Requirements Planning II 5785-GBF (v)

COPICS Product Cost Calculation II 5785-GBD (v)
COPICS Bill of Material Online II 5785-GBA (v)

- (p) SSX/VSE prompter-supported
- (v) SSX/VSE verified program

* Available on SSX/VSE Release 1 with a specific SSX/VSE program number. On SSX/VSE Release 2, these programs are ordered with their VSE program number.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

SSX/VSE is designed to operate on IBM 4300 processors in ECPS:VSE mode and on all storage sizes offered with these processors starting with a minimum of 1MB. It supports DASD, tape, terminals, printers, diskettes, MCR/OCR devices and a range of terminals and communication subsystems. It can be installed with 12 megabytes or 16 megabytes of virtual storage.

Note: Hardware devices not indicated are not supported by SSX/VSE.

MINIMUM CONFIGURATION: This is the minimum configuration needed to run SSX/VSE. The number in front of the device type indicates the minimum quantity of devices required.

Direct Access Storage Drives	Processor	(1) Console
4321 (1MB)	4321 (1MB)	3278 or
4331 (1MB)	4331 (1MB)	3279
(2) 3310 *--+	4341 (1MB)	(1) Line
or	12 Megabyte	Printer
(1) 3370	virtual storage	*---* 3262 or
(1) Mag Tape Unit	**	3289-4 or
8809 or	**	3203 or
3410/11 *--+	**	3211 or
or	**	4245
3420	**	3278
	**	or *
	**	3279

- (*) Locally attached via the display/printer adapter or via a channel-attached terminal control unit.
- (**) 16MB virtual storage in case of IBM 4341.

STANDARD CONFIGURATION: This range of configurations is assumed by SSX/VSE as default hardware configuration, so that all prompts at installation time which relate to hardware configurations will be bypassed (see also "General Configuration Considerations").

There is no standard configuration for a 4341 processor. This is because a 4341 does not have the device adapters shown in the following figure.

DASD 2 to 16 drives	Processor	3278-2A Console (NOTE)
3310 *--	4321	
	4331	
	DASD	up to 15 of
	Adap	the following
		devices
		*---3262)
or-----		Printer)
*		*---3289)
1-8 drives	ECPS:VSE	Printer)
3370 (2-16	mode	*---3287

NOTE: See hardware Support Details regarding support of 3279 color display stations and color console.

PROGRAM PRODUCTS

Small System Executive/VSE (cont'd)

MAXIMUM CONFIGURATION: The following I/O devices, terminals and lines are supported in SSX/VSE. The numbers (e.g., 8x) indicate for each device type the maximum number of device addresses supported by SSX/VSE when installed as an independent operating system.

Note: The device adapters shown in the following figure are not available on the 4341 processor. Because of this, devices must be attached to a 4341 via a channel and a control unit.

- Notes:**
- * Only SDLC lines are pregenerated in SSX/VSE.
 - ** See Configuration considerations point 5.
 - *** On IBM 4341 systems, the following restrictions apply:
 - No support of remote communication (3705-type devices).
 - No support of IBM 3310 DASD, 8809 tapes, integrated diskette and devices attached to the Display/Printer adapter.
 - IBM 3370 DASD attached via channels.
 - 16 megabytes virtual storage only.

CONFIGURATION CONSIDERATIONS

For any SSX/VSE configuration:

1. SSX/VSE recognizes specific device addresses. The addresses are described in the *SSX/VSE General Information* manual.
2. Either 3310s or 3370s are supported but not both on the same system.
3. In case of IBM 3310 DASDs, a system with at least three IBM 3310 DASD drives is recommended to allow for sufficient VSAM space for user data files. The amount of user VSAM data space available on the first two IBM 3310 DASD addresses is approximately 0.5 million bytes, and on the first two IBM 3370 DASD addresses is approximately 200 million bytes. Installation of one or

more of the optional programs requires the reservation of space on an IBM 3310/3370 DASD drive.

The total amount of DASD space required depends on the size of the data files. SSX/VSE supports a maximum of 16 DASD addresses of either IBM 3310 or 3370.

4. If the system uses IBM 3370 drives and frequent full backup is required, it is recommended to have at least one IBM 3420 tape unit that supports 6,250 bytes-per-inch tape density.
5. Maximum number of terminals - Each SSX/VSE Release 2 system allows the definition of up to 250 local and remote display stations as shown in the following table. This includes any terminals physically attached to other systems which can access a given SSX/VSE system (cross-domain terminals).

Device Type	Attachment	Maximum
3278/3279 display stations and 3287 terminal printers	Local; via a display/printer adapter or via channel-attached 3274	64*
8775 display terminals	Local; via an integrated loop adapter	32
3278/79 display stations and 3287 terminal printers	Remote; via 3274/76 control units on nonswitched BSC or SDLC lines	250**
3600/4700 logical units accessed by CICS	Remote; via 3600/4700 control units on switched or nonsw. SDLC lines	

- * Maximum number of terminals attachable to the display/printer adapter is 15.
- ** Minus all locally-attached terminals.

Hardware Support Details

4321/31 Processor Features Supported:

- DASD Adapter #3201 for IBM 3310 and IBM 3370
- 8809 Magnetic Tape Unit Adapter #4910
- Byte Multiplexer Channel #5248
- Block Multiplexer Channel #1421
- Diskette Drive #3401
- Display/Printer Adapter Expansion #2001
- Communication Adapter #1601 and associated features.
- Loop Adapter features #4830, 4831
- High Speed Block Multiplexer Channel #1431 (4331-2 only)
- External Signals #3898
- Second DASD Adapter #3202 (only if SSX/VSE is used under VM)

4321/31 Processor Features Not Supported:

- 14XX compatibility #3950
- Printer-Keyboard mode #5550
- Direct Access Storage Compatibility #7901
- 5424 Adapter #3901
- 3340/3344 Direct Attachment #7851
- Data Link Adapter #4840

4341 Processor Features Not Supported:

- Channel-to-Channel Adapter #1870

Device Support

Disk Drives: IBM 3310 (mdls A1, A2, B1, B2) or IBM 3370 DASD (mdls A1, B1) are supported. Minimum disks required are two IBM 3310 drives or one IBM 3370 drive (two addresses). The maximum number of disk drives is either sixteen IBM 3310 drives (16 addresses) or eight IBM 3370 drives (16 addresses). A mixture of IBM 3310 and IBM 3370 strings is not possible. The IBM 3370 string switch feature is not supported.

Tape Drives: The maximum number of tape drives supported is six IBM 8809 attached to the 8809 tape unit adapter, eight IBM 3410/11 models 1 - 3 channel-attached, and eight IBM 3420 models 3 - 8 channel-attached via a 3803 tape control unit. The 7-track feature is not supported. As a minimum, one tape drive is required.

Diskette Drives: SSX/VSE supports the integrated diskette drive as an IBM 3540. Up to six additional IBM 3540 diskette drives (six 3540 B01 or three 3540 B02) attached to a channel are supported.

PROGRAM PRODUCTS

Small System Executive/VSE (cont'd)

Printers: SSX/VSE supports the Printers IBM 3262 models 1 and 11, 3289-4, 3203-5, 3211, and 4245. All 5 printer types are supported as system printers (SYSLST). At least 1 printer is required. The maximum number of IBM 3262 or IBM 3289 Printers attachable to the display/printer adapter is two. In addition, up to six IBM 3203-5s, 3211s, or 4245s can be attached to a channel.

OCR/MCR: The following Magnetic and Optical Character Readers are supported:

Magnetic Ink Character Readers	Optical Character Readers	Document Processor
1255	1270 1275*	3890
1259	1287 1288	
1419*	3881 3886	

* Dual Address Adapters are supported.

If SSX/VSE is used as a guest under VM, only the IBM 3886/3890 are supported.

Terminals Supported: (see configuration considerations for maximum number of terminals allowed)

- Locally attached to the Display/Printer Adapter (available on IBM 4321 and 4331):
 - Operator Console IBM 3278-2A or IBM 3278-2C (see note 1 below)
 - Display station IBM 3278-2
 - Color Display Station IBM 3279-2A, S2A, O2X
 - Terminal Printer IBM 3287-1, 2, 1C, 2C
 - Line Printer IBM 3289-4
 - Line Printer IBM 3262-1, 11
- Locally attached to the Byte or Block Multiplexer Channel via appropriate IBM 3274 (IBM 3272 version) terminal control units:
 - Display Station IBM 3278-2, 3, 4
 - Color Display Station IBM 3279-2A, 2B, S2A, S2B, 3A, 3B, S3G, O2X, O3X
 - Terminal Printer IBM 3287-1, 2, 1C, 2C
- Attached to the Local Loop Adapter
 - IBM 8775 mdls 1, 2
 - Extended functions (RPQ SU0183 and SU0184) are supported. 960-character screens are not supported.
- Attached to the Communication Adapter via nonswitched SDLC lines and appropriate IBM 3274 and/or 3276 terminal control units:
 - Display Station IBM 3278-2
 - Color Display Stations IBM 3279-2A, 2B, S2A, S2B, 3A, 3B, S3G, O2X, O3X
 - Terminal Printer IBM 3287-1, 2, 1C, 2C
- Attached to the Communication adapter via nonswitched BSC lines and appropriate IBM 3274 or 3276 terminal control units:
 - IBM 3278 mdls 2, 3, 4
 - IBM 3279 mdls S2A, S2, S3G
 - IBM 3287 mdls 1, 2, 1C, 2C
- Attached to the Communication adapter via switched or non-switched BSC lines
 - IBM 2770, 2780, 3770 (in 2770/3780 compatibility mode), 3741, 3780 line protocols
- Attached to the Communication adapter via switched or non-switched SDLC Lines IBM Finance Communication Controllers
 - IBM 3601 mdls 1, 2A, 2B, 3A, 3B
 - IBM 3602 mdls 1A, 1B
 - IBM 4701 mdls 1, 2, 5

Subconfigurations under 3601/02 or 4701 Controllers are supported by the Controller Programs as announced for Finance Communication Systems IBM 3600 and IBM 4700.
- Attached to the Communication Adapter via SDLC lines:

DEVICE	MODEL	ATTACHABLE DEVICES			
		Reader	Punch	Printer	Storage Devices
3771	1, 2, 3	3501	3521	None	None
3773	1, 2, 3	None	None	None	One integr. device
3774	1P, 2P	2502	3521	3784	1 or 2 (diskette)
3775	1P	3501 2502	3521	None	1 or 2 (diskette)
3776	1/2	3501 2502	3521	None	1 or 2 (diskette)
3777	1	3501 2502 2502	3521 3521 3521	3203-3 3262-2 /12	1 or 2 (diskette)

Notes:

1. SSX/VSE supports the IBM 3279 color display console (model 2C) as a 3278-2A with no specific color support, i.e., three colors are supported by default.
2. Applications running under SSX/VSE which use the IBM display stations 3278 and 3279 will be able to utilize the extended data stream capabilities including all colors according to the application program coding.

The SSX/VSE components have not been programmed to exploit the extended data stream capabilities of IBM 3278 display stations for prompts, helps and messages. The IBM 3279 color display station is used by SSX/VSE components in 3278 compatibility mode.

SOFTWARE REQUIREMENTS

SSX/VSE Release 2 is a complete operating system with no prerequisite software requirements. It is ready for use immediately after installation. It is shipped mainly in object code format.

Cross-domain application communication from a processor running SSX/VSE with another processor can be established via SDLC lines, if the other processor has one of the following software packages installed:

- Another SSX/VSE program product.
- ACF/VTAM with Multisystem Network Facility and ACF/NCP.
- ACF/VTAME (DOS/VSE only).

RJE connections for job networking and file transfer to other SNA processors are possible via SDLC lines if the other processor has one of the following software packages installed:

- Another SSX/VSE licensed program.
- VSE/Advanced Functions Release 3 with VSE/POWER Version 2 and ACF/VTAME or ACF/VTAM Release 2 or later with MSNF and ACF/NCP.
- MVS/SP-JES2 (Version 1, Release 3 or later) unless otherwise specified, and ACF/VTAM (Release 2 or later) with MSNF and ACF/NCP.

Job networking via BSC lines is possible if the other processor has the following software installed:

- Another SSX/VSE licensed program.
- VM/370 Remote Spooling Communications Subsystem (RSCS), Release 2.
- DOS/VSE with VSE/POWER Version 2.
- MVS/SP-JES2 (Version 1, Release 3 or later, unless otherwise specified).

Note: SSX/VSE is pregenerated to communicate with other systems using SDLC line control. SSX/VSE Pregeneration Specifications describe how BSC line control can be used for host-to-host connections under control of the POWER component.

COMPATIBILITY

Compatibility to DOS/VSE: SSX/VSE Release 2 is upward compatible to a DOS/VSE system with the exception of the SSX/VSE unique function, the file transfer function, and the ICCF operator console function. To be upward compatible, the DOS/VSE system must include program products at the appropriate release level which are contained in SSX/VSE. SSX/VSE users can functionally enhance their systems in the future by moving to a SIPO/E full function DOS/VSE system and related products. Additional education will be required for the user to learn the base interfaces such as job control language and the various user options available.

In general, existing DOS/VSE programs can be executed on SSX/VSE if they:

- Meet SSX/VSE requirements for

PROGRAM PRODUCTS

Small System Executive/VSE (cont'd)

- Hardware configuration
- Pregenerated software components
- System layout
- Library definitions.

• Do not require:

- Direct or indexed sequential access method (DAM or ISAM)
- ISAM interface program (IIP)

To perform direct access I/O, the FORTRAN user will be required to change the source program. The data set must be defined as a VSAM Relative Record Data Set (RRDS). See the VS/FORTRAN publications on requirements for VSAM processing.

The majority of existing VSE programs are not affected by above restrictions and will, therefore, run on SSX/VSE as on any other generated VSE system. The *Pregeneration Specification Manual* should be consulted for further information.

IBM-supplied VSE program products with local service (class A equivalent) are supported on SSX/VSE if they are announced as being supported on SSX/VSE.

To SSX/VSE Release 1: All applications which work with SSX/VSE Release 1 will also work with SSX/VSE Release 2. Only jobs created by means other than SSX/VSE-supplied prompters and procedures (e.g., including their own job control statements) may need changes. Users already familiar with SSX/VSE Release 1 will notice little difference in the appearance of Release 2 at the display station.

DATA SECURITY, AUDITABILITY AND CONTROL

SSX/VSE, via its ICCF and CICS/DOS/VS components and the optional program product VSE/Access Control-Logging and Reporting, provides the same security, auditability and control facilities as provided by these products in DOS/VSE. Customers are responsible for the selection, implementation and adequacy of security procedures for their applications.

RELIABILITY, AVAILABILITY, SERVICEABILITY (RAS)

SSX/VSE RAS support for IBM 4300 is equivalent to that of DOS/VSE.

The SSX/VSE specific Problem Determination Facility introduced in SSX/VSE Release 1 will be continued in SSX/VSE Release 2. This facility produces an analysis of dumped data for both batch and online programs. It helps the user to identify and overcome errors.

PROGRAM CURRENCY

SSX/VSE Release 2 replaces SSX/VSE Release 1. With the availability of SSX/VSE Release 2, SSX/VSE Release 1 will be withdrawn from marketing. IBM will provide Program Service for SSX/VSE Release 1 until December 31, 1983.

With the availability of SSX/VSE Release 2, the following program products available on SSX/VSE Release 1 will be withdrawn from marketing:

- SSX/VSE RPG II (5666-274)
- SSX/VSE PL/I Optimizer & Library (5666-276)
- SSX/VSE PL/I Transient Library (5666-277)

Refer to the optional IBM programs section for information on replacements. For purposes of IBM providing Program Services, these program products will be considered current until December 31, 1983.

PERFORMANCE AND STORAGE CONSIDERATIONS

PERFORMANCE: Generally SSX/VSE Release 2 and the optional IBM programs supported on it will have the same batch and interactive performance as a DOS/VSE system generated with the same program products and generation parameters on equivalent 4300 configurations.

The performance of SSX/VSE Release 2 functions already available in Release 1 will be about the same as in SSX/VSE Release 1.

MAIN MEMORY: SSX/VSE requires a system with a minimum of 1 megabyte of processor storage. The amount of processor storage needed for a specific customer installation depends on the number of terminals in use and the mix of concurrent work. Such a mix may contain:

- Batch program execution
- Online program development
- Simple or complex online program use
- DL/I use in batch or online programs
- Telecommunication operations
- Job networking and cross-domain management
- Central Network Management

Multi-application environments (e.g., concurrent use of online processing, application development and cross-domain communication) can be expected to require additional storage.

DASD SPACE: SSX/VSE requires a minimum of two DASD addresses for system residence (i.e., 2 3310 DASD drives or 1 3370 DASD drive).

Included on these disks is some space available for the user as shown in the table below (in approximate figures):

DASD Area	3310 Megabytes	3370 Megabytes
VSAM Master Catalogs	2.0	2.0
VSAM User Space	0.5	200.0
ICCF Library	10.0	95.0
POWER Files	4.5	27.0
User Private Library (core image, relocateable, source)	10.0	78.0

On additional DASD volumes space may be allocated for:

- VSAM data files
- A second set of private libraries
- A Feature library for optional IBM programs
- Extension of the ICCF library and POWER files
- Adapted application libraries and data

DOCUMENTATION
(available from Mechanicsburg)

The documentation for SSX/VSE is contained in 8 manuals. This library will be updated to include the SSX/VSE Release 2 enhancements. These manuals are:

Overview/Evaluation:

SSX/VSE General Information GC33-6143-2
Available since October, 1982.

Manuals for Specific Tasks: These manuals provide 'how to use' information for all tasks which can be performed by the user of the SSX/VSE system. Conceptual information is kept to a minimum.

SSX/VSE Installation SC33-6147-1
 SSX/VSE Operation SC33-6144-1
 SSX/VSE Administration SC33-6145-1
 SSX/VSE Application Development SC33-6148-1
 SSX/VSE Problem Determination SC33-6149-1
 These manuals will be available in January, 1983.

Reference Type Manuals:

SSX/VSE Messages and Codes SC33-6146-1
 SSX/VSE Pregeneration Specifications SC33-6152-1
 These manuals will be available in January, 1983.

Note: Tasks which require VSE, CICS, VTAM or other DP skills are documented only in the *SSX/VSE Pregeneration Specification Manual*.

RPQs

Should a customer wish to use SSX/VSE without the full complement of components, an RPQ can be submitted which allows the customer to delete selected components from the tape distributed by PID. Prices will be adjusted to reflect the deletion of components. for details.

Note: The terms and conditions for the licensed programs optionally available on SSX/VSE Release 2 remain as announced for the individual products.

PROGRAM PRODUCTS

**4700 FINANCE COMMUNICATION SYSTEM
COBOL SUPPORT - DOS/VSE (5666-266)**

PURPOSE

The 4700 Finance Communication System COBOL Support - DOS/VSE (5666-266), executes under DOS/VSE. Output of the compiler is object programs that will execute on the 4700 controllers.

The 4700 COBOL compilers should provide customers with a powerful, comprehensive, easy-to-use language for use in preparation and execution of finance application programs. The language offers a wide range of features, plus facilities for handling input/output, and debugging COBOL programs.

SPECIAL MARKETING CONSIDERATIONS

Since applications developed using 4700 Finance Communication System COBOL Support are developed at a higher level user interface than those developed with controller assembler language, they may require additional features and/or hardware to provide for equivalent transaction loads.

HIGHLIGHTS

- Language
 - Support of American National Standard (ANS) COBOL X3.23-1974 (except for the RERUN clause).
- User Options
 - Source Listings.
 - Cross reference.
 - Storage map of variables.
 - Statement offset listing.
 - Object listing.
- Program Development and Productivity Aids
 - Symbolic debug.
 - Flow trace.
 - Extensive error checking.
 - Generalized CALL.

I/O Capabilities: 4700 Finance Communication System COBOL Support programs can work with SEQUENTIAL, RELATIVE, and INDEXED files. The access methods supported are as follows:

- Sequential Organization
 - Sequential processing.
- Relative Organization
 - Sequential processing.
 - Random processing by relative record number.
- Indexed Organization

Table Handling: Define and process fixed length tables up to three dimensions.

Segmentation: The segmentation feature permits:

- Dividing the Procedure Division of a COBOL program into a series of segments.
- Specifying that some segments (fixed segments) must be resident in main storage while the program is running, and cannot be overlaid, while others (independent segments) are loaded into an overlay area when needed.
- Reducing main storage requirements during program execution.

Interprogram Communication: This facility allows transferring of control from one COBOL program to another. Control can also be transferred to an appropriate controller assembler language program. Programs can access the same or unique data.

Data Communications: Data communications support for COBOL is via a CALL interface.

Industry Standards: Designed in accordance with the American National Standard (ANS) COBOL X3.23-1974 as understood and interpreted by IBM as of January, 1980, with the exception of the RERUN clause. ANS COBOL is identical to ISO 1989-COBOL approved February, 1978, by the International Organization for Standardization.

Processing Modules: The following processing modules are supported:

- 1 NUC 1, 2
- 1 TBL 1, 2
- 1 SEQ 1, 2 *
- 1 REL 0, 2 *
- 1 INX 0, 2
- 1 SEG 0, 2
- 1 LIB 0, 2
- 1 DEB 0, 2
- 1 IPC 0, 2

* RERUN clause is checked for syntactic correctness only.

The first digit above represents the level of the modules included in the compiler; the second digit represents the lowest level specified for the American National Standard COBOL (0 implies that the module may be completely missing from a standard compiler); the third digit represents the highest level specified in the Standard.

In addition to the above, the following NUCLEUS Level 2 features are also supported:

- COMPUTE statement
- Qualification
- Arithmetic operators
- Complex conditions
- CORRESPONDING phrase
- ACCEPT and DISPLAY verbs
- Multiple operand support for arithmetic statements
- Nested IFs
- PERFORM UNTIL
- 01 through 49 level numbers
- String/Unstring from level 2 of the ANS 1974 COBOL nucleus module.

Language Extensions:

- Support for terminal I/O.
- Symbolic characters facility for defining and referencing hexadecimal values.
- Initial Attribute to optionally cause program to be in its initial state each time it is called.
- Program access to the system global segments 13 and 15.

I/O File Support:

- EDAM file on diskette and disk via sequential, relative and indexed files I/O modules.
- CALL interface to handle unique 4700/3600 device characteristics.
- CALL interface to handle temporary files.

CUSTOMER RESPONSIBILITIES

IBM may provide marketing assistance, in accordance with the Marketing and Service Guidelines in the installation of IBM Licensed Programs. However, the responsibility for providing accurate ordering information, personnel selection and training, installation and day-to-day operation lies solely with the customer. Installation of IBM Licensed Programs is a customer responsibility.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM 4700 Finance Communication System COBOL Support - DOS/VSE requires at least a 192K byte partition as well as a configuration sufficient to run the selected operating system.

Object program execution can be on any 4700 system that has sufficient user storage and 4700 controller support, including the zoned decimal support. The actual user storage requirements are a function of the COBOL source program.

CONVERSION/COMPATIBILITY

Some degree of upward compatibility does exist between the 4700 COBOL compilers and the OS/VS and DOS/VS compilers. However, differences do exist and some conversion will be necessary. The differences include I/O and communications support and language features introduced to support specific 4700 controller functions.

**DIRECT MULTINETWORK LINK (DMNL) for CICS/DOS/VS
VERSION 1 RELEASE 1
5666-269**

PURPOSE

Direct Multinetwork Link (DMNL) is an application program product that enables the preparation and processing of messages related to banking transactions.

HIGHLIGHTS

As a generalized communication monitor, Multinetwork Link is a base product and provides the following end-user oriented services for the banking environment.

- Message Processing
 - Online message processing
 - Batch message processing
 - User application program support
 - Operator control of the system
- Message Definition Facility
- General Services
 - Routing
 - Message format service
 - Queue management
 - Journaling

DESCRIPTION

DMNL is a message processing facility that allows the end-user to work with a display terminal or sequential devices. With DMNL, a user can prepare messages based on user-specified or S.W.I.F.T. formats. These messages can be transmitted to the network interface for any public or private network including the S.W.I.F.T. network. Communication network interface functions provide a base to establish and operate the connection to any network including the S.W.I.F.T. network, and allow the concurrent operation of multiple network links within one DMNL installation.

DMNL provides message formatting and routing services to control the message flow from function to function, and to gain access to individual fields within a message. The Message Format Service (MFS) maps the various formats of the messages to a common internal format or maps a message from the internal format to a format compatible with the device where it is to appear. MFS simplifies the access to each individual message field for inspection and further processing. The level of detail to which a message is segmented is determined during DMNL generation by the facilities provided.

Routing services control the movement of input and output messages from one DMNL function to the next. Routing criteria are either found in the message itself or are introduced by the end user handling the message. All messages are stored in queues. The queues of all message processing functions are collected in one data set. Queue management dynamically utilizes this data set. The journal saves information on events that occur during the operation of DMNL. This information can be used for security and reliability purpose.

As a general application package, DMNL is integrable into a banking application environment. Together with other banking applications that can automatically be initiated by the user application interface facility, Direct Multinetwork Link allows a full computer-assisted processing of banking transactions.

Reference Information: Direct Multinetwork Link is available for the following environments:

- DMNL-CICS/DOS/VS (5662-269)
- DMNL-CICS/OS/VS (5668-965)
- DMNL-IMS/VS (5668-964)

To communicate with the S.W.I.F.T. network, the user of Direct Multinetwork Link has to install Direct S.W.I.F.T. Network Link (DSNL) (5668-926).

DMNL/DSNL are internally restructured, functional extensions of the program product Direct S.W.I.F.T. Link (DSL), Program Numbers 5746-F14 (DSL-CICS/DOS/VS), 5740-F15 (DSL-CICS/OS/VS) and 5740-F16 (DSL-IMS/VS).

CUSTOMER RESPONSIBILITIES

Users are responsible for the following prerequisites:

- The operating system and data communication system must be generated and installed as required for Direct Multinetwork Link.
- The required library space must be provided.
- Customization and installation must be performed for DMNL.
- End users must be defined and end-use functions must be selected and defined.
- Routing modules that reflect the bank's organizational requirements must be provided.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The Direct Multinetwork Link program product is designed to operate on the following IBM machines.

IBM S/370 mds 135-3 through 158
IBM 3031, 3033
IBM 43XX

The size of the processor for DMNL depends on the operating system (DOS/VSE with VSE/Advanced Functions) and the data communication system (CICS/DOS/VS) used to control the operation of DMNL.

The system requirements of DMNL/DSNL, in addition to those of the operating system used, are the following:

- At least one IBM 327X display station (i.e., 3278-2, 3279-2).
- If printing services are desired, one IBM 328X Printer (i.e., 3287-2, 3288-2) or equivalent.
- A direct access storage device for DMNL data sets and library. DMNL batch programs under DOS/VSE support all direct access storage devices supported by DTFSD, as well as DTFMT devices for no label and standard label.

SOFTWARE REQUIREMENTS

The programs that constitute the Direct Multinetwork Link program product are written in IBM S/370 Assembler language.

The operational requirements are:

- IBM Disk Operating System/Virtual Storage Extended (DOS/VSE) (5745-030) Release 3.0, together with VSE/Advanced Functions (5746-XE8) Release 3.0 or subsequent releases.
- Customer Information Control System/Virtual Storage (CICS/DOS/VS) Version 1 (5746-XX3), Release 5.0, or subsequent releases.
- The DMNL/DSNL queue, user table, journal and the authenticator-key file are VSAM data sets. VSE/VSAM (5746-AM2) must be available for DOS/VSE. VSE/VSAM is part of the DOS/VSE System IPO.

Restart/Recovery: Restart/Recovery assistance is supplied for:

- DMNL restart based on queues.
- Device failures of IBM 3278-2 and 3287-2 and their equivalents.
- Failure of the IBM system covered by the recovery capabilities of the operating and data communication system.

COMPATIBILITY and MIGRATION

Direct Multinetwork Link together with the separate program product Direct S.W.I.F.T. Network Link support all S.W.I.F.T. specific services. Direct S.W.I.F.T. Network Link is the interface between Direct Multinetwork Link and the S.W.I.F.T. network. The program products DMNL/DSNL Release 1.0 are internally restructured, functional extensions of the program product Direct S.W.I.F.T. Link DSL (5746-F14 - DSL-CICS/DOS/VS), (5740-F15 - DSL-CICS/OS/VS), and (5740-F16 - DSL-IMS/VS). With respect to DSL Release 2.0, DMNL/DSNL Release 1.0 provides the following new functions:

- Direct Multinetwork Link (DMNL)
 - NOPROMPT mode in addition to normal screen processing in PROMPT mode.
 - Compressed printer layout.
 - Dynamic queue-key table.
 - Separated signon processing.
 - Improved console operator message.
 - Improved Message Format Service error diagnostics.
 - Extended panel command availability.
 - CICS command level interface.
 - 3375 and 3380 support.
 - Online maintenance of the user-table (passwords, users).
 - Support of customer-added applications, including record formats other than S.W.I.F.T.
- Direct S.W.I.F.T. Network Link (DSNL)
 - Support of all S.W.I.F.T. message types, including message category 7 (documentary credits).
 - Optional automatic retry of LOGIN processing.

To ease migration, DMNL/DSNL are designed to be functionally upward compatible with DSL. However, a customer migrating from DSL to DMNL/DSNL must follow the same installation procedure as a new customer.

The generalization of the facility to define user-specific messages has implied modifications of the message format service, queue manage-

PROGRAM PRODUCTS

DMNL for CICS/DOS/VS (cont'd)

ment and routing in DSL. User-written application programs that use these services may have to be rewritten.

User Modifications: During DMNL installation, each user can determine the customizing options that best meet his requirements. For additional, individual changes, the programs are designed so that users can:

- Modify the layout and the language of the panels used to display a message or related data on screens, terminal printers, and line printers.
- Modify the layout of a S.W.I.F.T. message and other related data in internal storage.
- Add individual code of user-specific message processing steps.

PROGRAM PRODUCTS

**DOS/VS RPG II Release 3 (5746-RG1)
SSX/VSE RPG II (5666-274)**

PURPOSE

DOS/VS RPG II is a programming language that can be used to create programs to perform a wide variety of commercial data processing jobs. Release 3 of DOS/VS RPG II is an enhancement of the current DOS/VS RPG II Release 2 compiler mainly for interactive usage. DOS/VS RPG II Releases 2 and 3 run under the control of DOS/VSE with VSE/Advanced Functions or CMS in VM/370 Release 6 with VM/BSE program products or VM/SE. RPG II Release 3 also runs under control of SSX/VSE. A minimum of 64K bytes of virtual storage is required for the compilation of batch applications and 128K bytes for the CICS/DOS/VS Command Language Translator. For the batch DL/I DOS/VS Translator, a minimum of 96K bytes of storage in a virtual partition is required. An interactive partition of 140K bytes of virtual storage is required for the RPG II Source Entry Facility under VSE/ICCF or CMS. The DOS/VS RPG II compiler executes on any configuration supported by DOS/VSE, SSX/VSE or CMS in VM/370 Release 6 with VM/BSE or VM/SE program products.

HIGHLIGHTS

FBM Support

The DOS/VS RPG II compiler supports all fixed blocked mode devices which are supported by the data management of DOS/VSE on 4331, 4341, 4361 and 4381; and SSX/VSE on the 4331, 4341 or 4361 Processors.

Adaptation of the Compiler for Conversational Monitor System (CMS) in VM/370: The adaptation of the compiler for running under CMS/DOS provides the interactive user with the capability to:

- a) Catalog the compiler object deck into the user's CMS library.
- b) Catalog the compiler SYSLST output into the user's CMS library.
- c) Write all compiler error messages to the user's terminal.

These facilities enable the interactive user to invoke the compiler from his terminal via a CMS EXEC procedure which will:

- Ensure that the CMS/DOS environment is active.
- Establish the requisite device assignments and labels for the compiler workfiles and input/output files.
- Provide environmental checks (e.g., R/W access, file names etc.)
- Fetch the RPG II compiler for execution.
- Release all workfiles and reset all labels.
- Provide the user with a return code when errors are detected in the environment for the control of further steps.

This EXEC procedure is available to the user for modification, thereby providing a convenient method of satisfying any special user requirements.

The "error messages on user terminal" feature allows the interactive user to receive the compiler error messages on his terminal so that he can modify his source immediately and resubmit his compilation without the need to interrogate his output listings.

Adaptation of the Compiler for VSE/Interactive Computing and Control Facility: The adaptation of the compiler for running under VSE/ICCF provides the interactive user with the capability to:

- a) Catalog the compiler object deck onto the user's VSE/ICCF library.
- b) Write all compiler error messages to the user's terminal.

The "error messages on user terminal" feature allows the interactive user to receive the compiler error messages on his terminal so that he can modify his source immediately and resubmit his compilation without the need to interrogate his output listings.

A VSE/ICCF CLIST procedure is provided for compiling RPG II programs under VSE/ICCF. This CLIST procedure is similar to those available for other high level languages under VSE/ICCF. The parameters passed to this procedure define the compiler input and output.

RPG II Source Entry Facility (RSEF) for Conversational Monitor System (CMS) and VSE/Interactive Computing and Control Facility: RPG II Source Entry Facility (RSEF) provides an easy-to-use, interactive facility for entry and/or modification of RPG II source language in a format that eliminates the need for column counting on the screen, and at the same time provides line-by-line syntax checking.

The RPG II source being entered or modified is checked for correct syntax, as far as possible on a line-by-line basis, after a source line entry or modification. The user is informed when syntactical errors are detected in the input, so that corrective action can be taken immediately, before the source is submitted to the compiler.

Native Language Text Capability: All RSEF screen texts, messages and prompting texts are modularized which means that World Trade countries wishing to provide native language texts for the various

countries have only to generate these modules in the required language, and then link the RSEF anew.

DMS/CMS Call Interface Support (Conversational Monitor System): The Display Management System for CMS (DMS/CMS) is available to RPG II programs in the CMS/DOS environment with the DMS/CMS product installed. DMS/CMS allows the programmer to define terminal panels, and to use previously defined panels in RPG II programs: He can move data from data fields in the panel to data fields in the program, and vice versa; he can control display intensities, position the cursor, sound the audible alarm and he can add comments to the bottom line of the panel before it is displayed.

The RPG II programmer invokes the DMS/CMS panel manager interface routine using the DOS/VS RPG II HLL interface, i.e., the CALL, PLIST and PARM calculation specification. A calculation specification with the operation code CALL provides the ability to link to another program. Parameter passing is specified by PLIST (parameter list) and PARM (parameter) Calculation Specifications.

IFS/CMS CALL Interface Support (Conversational Monitor System): The VM/Interactive File Sharing (IFS) is available to RPG II programs in the CMS/DOS environment with the IFS product installed. IFS provides an easy to use, interactive interface for creating shared /VSAM/ files and for multiple CMS applications to access those shared files. Sequential and keyed access is provided. An RPG II application invokes the IFS data access interface using the DOS/VS RPG II HLL interface in the same manner as described for DMS/CMS.

Error Cross-Reference List: This additional support of error messages fulfills the special requirement for debugging programs in an interactive terminal environment.

This cross reference list includes the following information:

- a) Text of error message (identical to current compiler messages).
- b) Sequence number of statement or statements where the error occurred (new function).

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

DOS/VS RPG II operates on any IBM S/370 or 4300 processors supported by DOS/VSE or SSX/VSE. A minimum of 64K bytes of storage in a virtual partition must be available for batch applications. For performance reasons, a minimum of 24K bytes of real storage is recommended. For the CICS/DOS/VS Command Language Translator, a minimum of 128K bytes of storage in a virtual partition is required. For the batch DL/I DOS/VS Translator, a minimum of 96K bytes of storage in a virtual partition is required. An interactive partition of 140K bytes of virtual storage is required for the RPG II Source Entry Facility under VSE/ICCF or CMS. If the RPG II Source Entry Facility of DOS/VS RPG II Release 3 is to be used, either VSE/Interactive Computing and Control Facility under DOS/VSE or VM/BSEPP 1.2/CMS must be installed.

For the Compiler, two work files are necessary; if Auto Report is used after the CICS/DOS/VS Command Language Translator or the batch DL/I DOS/VS Translator, three workfiles are preferable but only two are necessary. The maximum number of files for any source program is 50. The Standard Instruction Set and the Decimal Arithmetic Feature (#3237) are required in order to use the DOS/VS RPG II Compiler.

SOFTWARE REQUIREMENTS

The DOS/VS RPG II Release 3 Compiler and its object programs are designed to operate under control of DOS/VSE with VSE/Advanced Functions or SSX/VSE or VM/BSEPP 1.2/CMS with a DOSLIB.

At system generation of DOS/VSE "SYSFIL=YES" (if DASD or diskette is used with device independence) of the FOPT supervisor generation macro must be specified.

DOS/VS RPG II DC and/or DB requests require the IBM CICS/DOS/VS program product (5746-XX3) Version 1 Release 4 and/or the IBM DL/I DOS/VS program product (5746-XX1) Version 1 Release 4.

SSX/VSE supports only DOS/VS RPG II batch programs through compilation promptors.

If ADDRROUT is used for nonRRDS files, the IBM DOS/VS Sort/Merge II program product (5746-SM2), or an equivalent sort/merge program is required.

If ADDRROUT is used for RRDS files, the IBM DOS/VS Sort/Merge II program product (5746-SM2) or an equivalent sort/merge program is required.

Under VM/BSEPP 1.2/CMS the Auto Report Feature can only be used if a DOS/VSE SYSRES is installed.

For installation of DOS/VS RPG II the use of the DOS/VSE Restore Utility program and the DOS/VSE Maintain System History Utility program is required. For installation of DOS/VS RPG II under

PROGRAM PRODUCTS

RPG II - DOS/VS R3 & SSX/VSE (cont'd)

VM/BSEPP 1.2/CMS, an installation EXEC is provided as part of the distribution package.

Release 3 of DOS RPG II is also available as Promptor-supported program product on SSX/VSE with a specific order number.

COMPATIBILITY

- Source Programs.
Source programs written for the DOS RPG II Compiler and the DOS/VS RPG II Compiler Releases 1 and 2 will be accepted, without modification, by the DOS/VS RPG II Compiler Release 3.
- Object Programs.
If the Formatted Dump facility is to be used, the core image library must contain the appropriate transient routines:
 - DOS/VS RPG II Release 1 object programs require the DOS/VS RPG II Release 1 Formatted Dump routines.
 - DOS/VS RPG II Release 2 object programs require the DOS/VS RPG II Release 2 Formatted Dump routines.
 - DOS/VS RPG II Release 3 object programs require the DOS/VS RPG II Release 3 Formatted Dump routines.

The Formatted Dump facilities of RPG II cannot be used with programs running under CICS/DOS/VS.

PERFORMANCE CONSIDERATIONS

Compile Time: There will be no change in the compile time compared to the DOS/VS RPG II Release 2 compiler on an equivalent system, if the compilation is without compile error messages.

Object Time: There will be no change in the performance of the execution of object code compared to the object code produced by the DOS/VS RPG II Release 2 compiler on an equivalent system.

RPG II Source Entry Facility: The response time when operating under CMS or VSE/ICCF is determined by the chosen interactive system.

PROGRAM PRODUCTS

**DATA LANGUAGE/I DISK OPERATING SYSTEM/
VIRTUAL STORAGE
DL/I DOS/VS (5746-XX1) - DL/I SSX/VSE (5666-275)**

PURPOSE

DL/I DOS/VS is a data base management control system developed to help improve the user's ability to implement data base processing applications. It provides data organization methods that are useful in the creation, interrelation and maintenance of large common data bases. DL/I DOS/VS executes as an application program in a virtual storage environment under DOS/VS or DOS/VSE.

DL/I DOS/VS has been designed to permit the concurrent scheduling of multiple programs requesting DL/I DOS/VS services, thereby allowing access by more than one user to the same or different data bases at the same time. Application programs may utilize this design concept in conjunction with the Customer Information Control System/DOS/VS (CICS/DOS/VS), program product 5746-XX3, to access DL/I DOS/VS data bases in either an online environment or batch environment.

DESCRIPTION

Application programs call upon the data base management services through DL/I DOS/VS. DL/I DOS/VS provides the application program with access to the data base management services which is independent of storage media programming considerations. Through installation management tools provided by DL/I DOS/VS, storage media programming considerations may be manipulated independent of application programs. Existing DL/I DOS/VS application programs can be insensitive to the reorganization of stored data, the addition of new applications or data, changes in access methods, organization or access strategy, and the introduction of new storage devices.

The data base management services of DL/I DOS/VS help the user:

- Describe data base structures
- Create data bases
- Reorganize data bases
- Recover and reconstruct data

Using DL/I DOS/VS utilities supplied with the system, the user describes the structure of the data base from two viewpoints: The stored data structure as seen by the system and the logical data structure as seen by the application. Only one description of the stored data exists. However, multiple logical descriptions may exist. These data base descriptions are external to application programs. They exist as physical data themselves and are referenced by the system when it is processing access requests for application programs.

Data base descriptions define symbolic names for data items (fields), segments and data bases. Within a single data base, the system description defines a hierarchic relationship among segments of the stored data structure. It also contains information about organization, access strategy, the physical attributes of the data (length, format, etc.), the physical structure of the stored data segments and storage device characteristics.

To access or maintain stored data, the application program issues a CALL or an EXEC command for data base management services. As part of the functional request, the application program supplies symbolic names which identify the data (segment type) to be processed. Through data base descriptions, the system relates the application-supplied logical data names to corresponding stored data names, and performs the requested function against the stored data.

A data base may be stored in two general organizations: Hierarchical Sequential (HS) or Hierarchical Direct (HD). For HS-organized data, the access method and basic processing strategy may be sequential or indexed sequential. For HD-organized data, it may be direct or indexed direct.

Application programs may process data bases independent of physical organization or storage device used. Data management services are provided by the DOS/VS Virtual Storage Access Method (VSAM) or VSE Virtual Storage Access Method (VSE/VSAM) for data bases of the Hierarchical Direct (HD) organization and indexed sequential data bases of the Hierarchical Sequential (HS) organization. Sequential Access Method (SAM) provides data management services for SHSAM and HSAM data bases.

Data bases may be shared between DL/I subsystems in one host or across hosts; one system having update capability concurrent with multiple read-only subsystems. DL/I's use of the CICS/DOS/VS Intercommunication Facility, or equivalent, permits access to both local and remote DL/I data bases within the same CICS/VS logical unit of work.

Interactive Macro Facility (IMF) is a tool that helps reduce the complex task of defining and generating DL/I Data Base Definition (DBD), Program Specification Block (PSB) and online program, its view and authorization. It provides formatted displays on a 3270-type terminal and prompts the user, who can then choose either the appropriate activity and enter the required information in interactive mode, or accept defaults.

Reorganization and recovery of stored data bases are supported by a set of DL/I DOS/VS utilities supplied with the system.

HIGHLIGHTS

Application Programming: High-Level Programming Interface (HLPI) provides a high-level source language interface for the programmer using DL/I DOS/VS in a COBOL or PL/I (Optimizing Compiler) application program. This consists of a set of commands which enable the application programmer to access DL/I function. These commands are translated by a translator into call statements. DL/I and CICS/VS HLPI commands may be used in the same application program.

Boolean Qualifications Statements in Segment Search Arguments (SSAs) or HLPI commands can decrease the application program logic necessary for complex data retrieval by permitting multiple Boolean logic tests within a single DL/I CALL. The qualification statements are logically related by the Boolean AND and OR operators.

Segment expansion/compression exits are provided for HD-organized data bases, permitting user-written encode/decode routines to improve utilization of direct access storage space or to strengthen security of stored confidential data.

Generation and support of low-level codes along with continuity check are functions provided in application support programs for the manufacturing industry user. These are techniques that permit the user to specify hierarchical levels within a data structure and to ensure that a structure is not dependent upon itself. Although primarily provided for manufacturing industry applications, they can also be utilized in other environments.

Application Environments: There are three application environments:

- Batch
- Multiple partition support
- Online

Batch: Under CMS/DOS, batch DL/I application programs can be coded, compiled and tested to load, retrieve and update data bases.

Multiple Partition Support: Multiple Partition Support (MPS) can execute in several DOS/VS or SSX/VSE partitions and/or VSE/ICCF pseudo partitions and may access the same data base concurrently with online users. For example, one or more online applications can retrieve information from a data base while a batch program updates that same data base. MPS, following DL/I conventions, uses DL/I resources and the multitasking facilities of DL/I and CICS/VS. (CICS/VS, therefore, is a prerequisite for running MPS.)

Online: DL/I uses CICS/VS facilities for multitasking and terminal control.

DL/I DOS/VS users may move to the Information Management System/VS (IMS/VS, 5740-XX1), which accesses the DL/I data bases of IMS/VS.

Alternate Accessing: Secondary indexing provides an alternate path to the data. It provides indexed access to root or dependent segments within an HD-organized data base. Fields within most segments of a data base may be indexed.

The ACCESS Macro is designed to help the data base administrator more easily define data base indexes. It is an alternative to the index definition supplied by the LCHILD and XDFLD macros and the /SX and /CK named types of the FIELD statements.

HD-organized data bases may be defined such that relationships are established between segments of different hierarchical structures stored within the same or different data bases. This support is called 'Logical Relations'.

Extended Logical Relations for HDAM or HIDAM data bases include the ability to switch directions from an inverted sequence to a normal sequence (up to down).

Data Security: Data base integrity and security is provided through the concept of sensitivity, a description of a program's intended access to a data base.

Field Level Sensitivity gives the user the ability to have different views of a physical segment on an application basis. The basic support allows a user to specify those fields from the physical definition to be included in his view of the segment, including the location in the new view. DL/I will map the fields from the physical segment into the user's view.

DL/I (DOS/VS & SSSX/VSE) (cont'd)

The following items are also supported under Field Level Sensitivity:

- Virtual Fields - The ability to identify a field in the application's view of a segment that doesn't exist in the physical view.
- Automatic Data Format Conversion - The ability to change the format of the physical data without re-compiling the application programs.
- User Field Exit Routine - The ability to specify a routine to get control any time a field is retrieved or stored.
- Dynamic Segment Expansion - The ability to add fields to a segment without reloading the data base or re-compiling the application programs.
- No Sequence Field Order Restrictions - Sequence fields need no longer be the first fields defined by field statements, allowing the user to define his fields in the order in which they appear in his segment. Scheduling of multiple online application programs for concurrent execution is based on their sensitivity.

Logging Capabilities: Data base recovery is facilitated through the use of data base activity logging. Disk logging is an option to allow the disk-only user to take advantage of data integrity features of DL/I DOS/VS; these features are primarily BACKOUT, RECOVERY, and CHANGE ACCUMULATION. In an online environment, the Shared Log option eliminates the need for separate tape drives to be assigned to CICS/DOS/VS Journal and DL/I DOS/VS Log by optionally directing all DL/I DOS/VS log information to the CICS/DOS/VS tape journal. Module identifiers and a system log print utility enhance serviceability. For debugging purposes, the Log Print Utility will selectively print log records by:

- DBD name
- CICS task ID
- VSAM relative block number (RBM)

Support is provided for multiple logs on a single tape, as well as a multiple volume log file. Unload sequence checking is provided.

Reorganization Utilities: Reload Restart enables the user to restart the reloading of an HD-organized data base that failed before completion. The data base can be reloaded without rerunning the entire job by resubmitting the job with an additional JCL statement identifying the job as a restart of the Reload Utility. The system operator needs only to supply a checkpoint identification number obtained from a console message as a restart point.

The HD Reorganization utility permits specification of the number of data base records to be unloaded between each DL/I checkpoint.

- Partial Data Base Reorganization Utility
The Partial Data Base Reorganization Utility allows the customer to reorganize only that portion of his data which needs it.
- Separate Index Reorganization
Separate Index Reorganization permits reorganization of an index without requiring concurrent reorganization of the associated data base.
- Selective Unload
The user can reformat a data base through the use of the HD Unload Utility and program (PSB) views of the original data. This allows the Data Base Administrator to, for example, delete or rearrange fields within a segment, and produce a revised physical data base.
- Rewind Option - Reorganization Utilities
A Tape Rewind Option is available for HISAM and HD Reorganization Utilities. Several unload data bases may be stacked on a single tape reel when these utilities are used.

Performance Considerations: Through optional parameters, the tuning facility allows DL/I DOS/VS to be adapted to specific environments and/or application characteristics. The tuning facility provides flexible control mechanisms for buffer and main storage allocation. Two facilities used to capture tuning data are CMF and RUN and Buffer Statistics.

- CICS/VS Monitoring Facility (CMF) Hooks
DL/I performance statistics may be optionally gathered in an online (including MFS) environment using CMF for data capture and recording.

Run and Buffer Statistics

This facility captures DL/I system statistics pertaining to the online environment, and writes them to a CICS/VS data set. This data can then be printed by CICS/VS during its shutdown.

Users may reserve Free Space in the Hierarchical Direct-organized data bases (HDAM and HIDAM) at load or reload time in order to reduce instances of extensive processing during space management search, and also to reduce access time for retrieving related segments.

A processing option (PROCOPT=0) is also supported on the PCB statement that provides a performance improvement by inhibiting any locking (enqueueing) by the program isolation function during retrievals of the same segments type in a data base.

Debugging Aids: VSE IDUMP Support provides a mechanism for obtaining standardized IDUMP-format dumps instead of DL/I dumps on a DL/I-initiated abnormal termination of an application program. These dumps can be used to assist the system user with problem determination. These dumps are captured on disk storage devices using a logical unit called SYSDMP.

DL/I provides a trace facility for both batch and online environments.

A PL/I user may use the PL/I diagnostic information to 'debug' an error condition, before the error is returned to DL/I DOS/VS.

A sample problem utilizing more advanced function to demonstrate the capability of DL/I DOS/VS for broader application usage is included. The examples are discussed in the *Guide for New Users* (SH24-5001). The sample problem shows examples of variable-length segments.

The HLPI user can use CICS Execution Diagnostic Facility in online DL/I applications to trap and study DL/I and CICS HLPI commands during execution.

HIGHLIGHTS of VERSION 1 RELEASE 7

Interactive Generation of Utility Job Streams: Interactive dialogs have been added to support all DL/I utilities. These dialogs are designed to make it easier to generate DL/I utility job streams. Utilities will be automatically generated in their correct execution order with all required parameters.

Easy-to-use menus will assist users in generating utility jobs. Information such as data base names will be saved when entered for an early step in the generating process, and automatically used in later steps. Future job stream generations will also use this saved information, eliminating the need for the user to re-enter data. Data base information can also be entered by choosing the menu option for this function. This makes it unnecessary to enter detailed data base information when generating a utility job stream.

Defaults are used extensively for many specifications such as size, number of records and utility parameters. What was entered previously will be the default value the next time a similar job stream is created. This will reduce the amount of data the user must actually enter.

VSE job control statements will be generated, including JOB, EXEC, ASSGN, DLBL, EXTENT and TLBL. The VSE/VSAM 'Space Management for SAM Feature' will be used whenever possible for SAM disk files. This reduces the amount of data required because specific track locations need not be specified. Also, because VSAM supports secondary allocation, jobs are less likely to abnormally end from lack of sufficient space.

HLPI Support for Boolean Operators: The DL/I High-Level Programming Interface (HLPI) is an easy-to-use method for processing DL/I data bases. It provides commands similar in syntax to those in CICS/VS command language.

Boolean operators 'AND' and 'OR' provide HLPI users with logic capability in segment selection through the WHERE clause. Application program logic necessary for complex data retrieval is easier with this added function.

HLPI Key Feedback: Segment keys and key length may optionally be made available in an area provided by the application program using HLPI to retrieve data.

Variable-Length Index Source Segments: Dynamic segment expansion provides the ability to add fields to a segment in the application program's view without recompiling other programs that access the segment. This feature requires variable-length segments.

Index source segments were previously restricted to fixed-length. Index source segments may now be defined in the DBD as variable-length. This provides customers with more flexibility in data base design, especially those who use dynamic segment expansion.

Recovery/Restart Guide: This new document consolidates the information necessary to plan for and conduct data base recovery in a data systems environment.

The Recovery/Restart information is presented for the batch, MPS batch, and the online environments. Also included, therefore, is information about CICS/VS as it applies to the user's DL/I DOS/VS recovery/restart procedures.

PROGRAM PRODUCTS

DL/I (DOS/VS & SSX/VSE) (cont'd)

Utilities Operational Improvements: Control statements are added to several utilities to eliminate, in many cases, manual intervention. For example, multi-file tape capability is added to the Change Accumulation, Forward Recovery, Log Print, Backout and Image Copy utilities.

DL/I Documentation Aid: The DL/I Documentation Aid is intended to provide an ease-of-use facility in documenting DL/I definitions that can be accessed by ISQL, the interactive facility of SQL/Data Systems (5748-XXJ).

The DL/I Application Control Blocks Creation and Maintenance utility (ACBGEN) is intended to create and store, at the user's request, the DBD and PSB definitions into predefined SQL/DS tables. These tables can then be accessed and displayed in various views using ISQL. Sample ISQL query routines will be provided with this function.

This function furthers the complementary relationship between DL/I and SQL/DS.

Automatic Extract Definitions: This is a utility that provides an automatic creation of an ISQL routine of EXTRACT DEFINE commands that identifies a DL/I data base to the ISQL EXTRACT facility.

It uses the SQL/DS tables created by the DL/I Documentation Aid.

Low-Level Code/Continuity Checking Improvement: Low-level code/continuity checking is used extensively in a manufacturing product structure.

The algorithm to generate the low-level codes and do the continuity checking is changed to increase efficiency.

MPS Restart: DL/I is extended so that its checkpoint capability can be used in conjunction with the VSE checkpoint/restart facility in a Multiple Partition Support (MPS) batch environment. Through this extension, the application programmer will be able to checkpoint an MPS batch job and subsequently restart it if it fails.

IMF Adaptation to ISPF: The Interactive Macro Facility (IMF) has been changed to run with Interactive System Productivity Facility (ISPF).

An option to convert existing IMF tables from Interactive Productivity Facility to ISPF is provided.

USE

The DL/I DOS/VS program is distributed in a RESTORE format and must be restored to a scratch pack using the DOS/VS or DOS/VSE library restore program. The restored DL/I DOS/VS libraries may then optionally be merged with user libraries.

CUSTOMER RESPONSIBILITIES

A customer installing DL/I DOS/VS must:

- Meet the minimum configuration (see "Specified Operating Environment").
- See to it that appropriate hardware training (especially direct access storage device education) be given to system analysts, system programmers and system operators.
- Have DOS/VS or DOS/VSE successfully installed (no customer should attempt to implement DL/I DOS/VS until the installation has achieved proficiency in the use of DOS/VS or DOS/VSE).
- Have personnel schooled in DL/I DOS/VS (a thorough knowledge and understanding of data base concepts and DL/I DOS/VS before installation is essential).
- Provide adequate protection against the accidental loss or misuse of his data (functions exist within DL/I DOS/VS to assist him in providing data security.).
- Have DOS/VS or DOS/VSE personnel trained in COBOL, PL/I, RPG II or Assembler language.
- Design the structure of each data base and its program views.
- Specify and implement application programs.

In addition to the above, additional time considerations should be given if the user wishes to process in an online environment in conjunction with CICS/DOS/VS.

If DL/I DOS/VS is to be used under CMS/DOS, refer to pages on VM/370 and VM/BSE or VM/SP as appropriate for additional considerations.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum machine requirements for DL/I DOS/VS are the same as those needed for conventional operation of DOS/VS, DOS/VSE or SSX/VSE. Because of virtual storage support, the minimum machine configuration is dependent on application characteristics and performance requirements. Central processing unit performance may be traded off against main storage size. DL/I DOS/VS will operate on any IBM machine currently supported by DOS/VS, DOS/VSE, or SSX/VSE that has sufficient real storage to meet the combined requirements of

DL/I DOS/VS, DOS/VS, DOS/VSE or SSX/VSE and other customer-required applications. Batch DL/I DOS/VS has a recommended real storage requirement of 256K bytes (including VSE/VSAM). Online DL/I DOS/VS, using CICS/DOS/VS, for example, has a recommended minimum real storage requirement of 512K bytes (including VSE/VSAM and CICS/DOS/VS). See the *General Information Manuals* for DL/I DOS/VS (GH20-1246) and CICS/VS (GC33-0066) when configuring these systems. VM/370 storage requirements must be considered if CMS/DOS is to be used.

When using DL/I DOS/VS in conjunction with CICS/DOS/VS in a VM/370 virtual machine, (under control of DOS/VS or DOS/VSE), the following considerations apply:

1. CICS/VS operating in a virtual machine has the same requirements as CICS/VS operating in a real machine. Other software components (e.g., access methods, compilers and the release of DOS/VS, or DOS/VS under which CICS/VS runs) must be valid for that release of CICS/VS).
2. The minimum hardware requirements of CICS operating in a VM/370 virtual machine are the same as those for CICS/VS running in a real machine, and should be considered as additional to the minimum requirements for VM/370 itself, and any other virtual machines within the VM/370 environment.
3. Processor utilization and possibly terminal response times will be greater when CICS/VS is running under VM/370 than when it is running in a real machine. The effect on performance will be most noticeable when VM/370 is introduced into an installation where processor and main storage resources are already substantially committed to existing CICS/VS and other work. General guidance on the performance considerations associated with the running of CICS/VS under VM/370 is contained in the *CICS/VS System Programmer's Reference Manual*.

Data base storage files may be on any of the following:

- 2314 Direct Access Storage Facilities
- 2319 Disk Storage
- 3330-1/3330-11 Disk Storage
- 3340/3344 Direct Access Storage Facilities
- 3310 Direct Access Storage
- 3350 Direct Access Storage
- 3370 Direct Access Storage
- 3375 Direct Access Storage

If DL/I is used in conjunction with SSX/VSE, the data base storage files must be either on 3310 Direct Access Storage or on 3370 Direct Access Storage.

In addition, at least two 9-track 2400, 3400 or 8809 series tape units and control are required, if tape logging is to be utilized or HSAM or SHSAM files are on tape.

Any terminal device supported by CICS/DOS/VS, or equivalent product, may be used for online DL/I DOS/VS. IMF requires an IBM 3270-type terminal.

PROGRAM PRODUCTS

DL/I (DOS/VS & SSX/VSE) (cont'd)

SOFTWARE REQUIREMENTS

DL/I DOS/VS will operate on DOS/VS (Release 34) or VSE with Advanced Functions (VSE/AF) program product. The following chart cross-references DL/I releases to various operating system releases and CICS/VS:

DL/I Release	DOS/VS Rel 34	VSE ADVANCED FUNCTIONS				
		Rel 1	Rel 2	Rel 3	Rel 3.5	
1.5.0	CICS/VS 1.4.1	CICS/VS 1.4.1	CICS/VS 1.4.1	No	No	
1.5.1 (1)	No	CICS/VS 1.4.1	CICS/VS 1.4.1	No	No	
1.5.5 (2,3)	No	No	CICS/VS 1.5	CICS/VS 1.5	No	
1.6	No	No	No	CICS/VS 1.5, 1.6	CICS/VS 1.6	
1.7	No	No	No	No	CICS/VS 1.6	

Notes:

- DL/I 1.5 ICR (1) or DL/I 1.5.1 contains Interactive Macro Facility (IMF) support.
- DL/I 1.5 ICR (2) or DL/I 1.5.5 contains High-Level Programming Interface (HLPI) and Intercommunication Checkpoint support.
- DL/I Release 1.5.5 is a separately-orderable prompter-supported program to be used with SSX/VSE Releases 1 and 2. No other releases of DL/I are supported by SSX/VSE Releases 1 and 2.

DL/I DOS/VS will also operate in batch mode, with certain exceptions, on the level of Virtual Machine/370 (VM/370) Conversational Monitor System DOS/VS simulator (CMS/DOS) which supports the equivalent DOS/VS or VSE/AF release.

DL/I DOS/VS is designed to work with DOS/VSE (5745-020 and 5745-030) and the following licensed programs (or their equivalents, e.g., in SSX/VSE):

- VSE/Advanced Functions, 5746-XE8
- CICS/DOS/VS Version 1 Release 5, 5746-XX3
- VSE/VSAM, 5746-AM2
- DOS/VS Sort/Merge Version 2 Release 2.0, 5746-SM2
- VSE POWER, 5746-XE3
- Interactive Productivity Facility Release 1, 5748-MS1
- VSE/ICCF (VSE/Interactive Computing and Control Facility), 5746-TS1

VM/370 SCP (5749-010) supports IMF through CMS and the following Licensed Programs (or their equivalents):

- Interactive Productivity Facility (5748-MS1)
- VM/Basic Systems Extensions (5748-XX8)
- VM/Systems Extensions (5748-XE1)
- VM/System Product (5664-167)

DL/I DOS/VS is supported for use with:

- DOS/VS COBOL compiler (5746-CB1) or Library Only (5746-LM4)
- Full ANS COBOL V3 Compiler (5736-CB2) and Full ANS COBOL Library (5736-LM2)
- ANS Subset COBOL (5736-CB1)
- PL/I Optimizing Compiler and Libraries (5736-PL3)
- PL/I Optimizing Compiler (5736-PL1)
- PL/I Resident Library (5736-LM4)
- PL/I Transient Library (5736-LM5)
- RPG II - DOS/VS (5746-RG1)
- VM/370 SCP (5749-010)
- VM/Basic Systems Extensions (5748-XX8)
- VM/Systems Extensions (5748-XE1)
- VM/System Product (5664-167)

DL/I DOS/VS is designed to run in batch or Multiple Partition Support (MPS) mode in VSE/Interactive Computing and Control Facility (VSE/ICCF), 5746-TS1, pseudo partitions. VSE/ICCF can also be the host environment for the Interactive Productivity Facility (IPF), 5748-MS1, under which the DL/I DOS/VS Interactive Macro Facility runs.

DL/I DOS/VS uses the Virtual Storage Access Method (VSAM), Sequential Disk IOCS, and Magnetic Tape IOCS data management facilities.

DB/DC Data Dictionary DOS/VS (5746-XXC) enhances DL/I DOS/VS by helping to simplify and manage the creation, maintenance and reporting definitions of the data in the system and its use by the application programs.

Development Management System/CICS/VS (5746-XC4) provides DL/I DOS/VS support for inquiry, insertion, update and deletion of data base records. Access into the data base may be via primary or secondary indexes.

Entry Level Interactive Application System (ELIAS, 5746-XXV) will assist new data base/data communications (DB/DC) users in implementing their early DB/DC applications and the more experienced DB/DC users in increasing their programming productivity. ELIAS provides an interactive interface for the definition of DL/I DOS/VS data bases.

DL/I DOS/VS Space Management Utilities IUP (5746-PKF) is designed to help improve system performance and programmer productivity. They are designed to detect and report DL/I hierarchical direct (HD) pointer discrepancies, to provide statistics and information for HD tuning, and to assist with segment restructuring and reloading during data base reorganization.

COMPATIBILITY

- The following facilities in DL/I DOS/VS are not supported by IMS/VS:
 - Interactive Generation of Utility Job Streams.
 - MPS Restart.
 - Variable-Length Index Source Statements.
 - DL/I Documentation Aid.
 - Automatic Extract Definitions.
 - Field Level Sensitivity Extensions.
 - Fixed Block Architecture (FBA) DASD Devices.
 - Interactive Macro Facility.
 - High Level Programming Interface (HLPI).
 - Application programs written in RPG.
 - The concept and implementation of Extended Remote PSB.
 - ACCESS Macro.
- The following facilities in DL/I DOS/VS are supported in IMS/VS in a different manner:
 - Checkpoint.
 - Operational aspects of certain DL/I DOS/VS utilities.
- Certain utility-generated files may only be processed by the system under which they were created.

Data set portability and alternate access between DL/I DOS/VS and IMS/VS are provided by the IMS Compatibility Support facility in DL/I.

DL/I DOS/VS Version 1 Release 7 is upward compatible from DL/I DOS/VS Version 1 Release 6.

No application programming changes are required.

For program support purposes, DL/I DOS/VS Version 1 Release 5 (and its ICRs) will remain current with Central and Local Service until January 31, 1982.

DOCUMENTATION
(available from Mechanicsburg)

Licensed Program Specifications (GH24-5025)

RPOs ACCEPTED: No

NOTE: Please note that the SSX/VSE version of DL/I DOS/VS is based on Release 5 ICR (2).

PROGRAM PRODUCTS

**DOS PL/I TRANSIENT LIBRARY (5736-LM5)
SSX/VSE TRANSIENT LIBRARY (5666-277)**

PURPOSE

This Program Product is used in conjunction with the DOS PL/I Optimizing Compiler (5736-PL1). For the complete compilation and execution of a PL/I program using this compiler, the following additional program products are required: DOS PL/I Resident Library - 5736-LM4 (for link-edit) ... DOS PL/I Transient Library - 5736-LM5 (for execution).

SPECIAL SALES INFORMATION

For a Processor in which programs are compiled but not link-edited or executed, only the compiler is required. For a Processor in which programs are link-edited but not compiled or executed, only the resident library is required. For a Processor in which programs are executed but not compiled or link-edited, only the transient library is required.

DESCRIPTION

The DOS PL/I Transient Library consists of those phases loaded dynamically during object program execution, thus minimizing the space occupied by the object program. These phases reside in the core image library; they are transient and are loaded when required, by the system macro LOAD.

The principal functions of the PL/I Transient Library modules are:

- Error and interrupt handling.
- Opening and closing the files.
- Record-oriented and stream-oriented input/output transmission.

The transient library module remains in core for as long as it is required by the problem program being executed.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Direct access storage space is required for the Transient Library subroutine (approximately 101 blocks of 1,728 bytes for 2311, 103 blocks of 1,688 bytes for 2314, 115 blocks of 1,504 bytes for 3330/3333 or 115 blocks of 1,540 bytes for 3340). For Release 29 and subsequent releases, the requirement is approximately 167 blocks of 1,024 bytes, regardless of device type.

The main storage requirements of the object program are a function of the PL/I facilities used. The decimal and floating point instruction sets are required.

The object program can utilize the following IBM input/output devices if they are supported by the release of the DOS or SSX/VSE system used:

Using SAM support:

- Magnetic Tape Units - 2400, 3420, 3410/3411
- Card Units - 1442, 2501, 2520, 2540, 3504, 3505, 3525, 2560, 5425
- Optical Mark Reader - 3881
- Diskette Unit - 3540
- Printers - 1403, 1404, 1443, 1445, 3203, 3211, 3262, 4245, 5203
- Direct Access Storage - Fixed block disk devices

Using SAM, and DAM support:

- Direct Access Storage - 2311, 2314, 2321, 3330-1, 3330-11, 3340, 3344, 3350

Using ISAM Support:

- Direct Access Storage - 2311, 2314, 2321, 3330-1, 3340, 3344, 3350 in 3330-1 compatibility mode

Using VSAM support:

- Direct Access Storage - 2314, 3330-1, 3330-11, 3340, 3344, 3350 and fixed block disk devices

Under CMS, the object program can utilize those I/O devices which are supported under the IBM Disk Operating System provided they are supported by VM/370. For a list of the devices supported by VM/370, see the *IBM VM/370: Planning and System Generation Guide* (GC20-1801).

SOFTWARE REQUIREMENTS

Release 5.1 of the transient library is supported on DOS Release 26 through DOS/VS Release 34, DOS/VSE with VSE/Advanced Functions Releases 1 and 2 and the CMS component of Releases 3 through 6 of VM/370, until March 31, 1982. After March 31, 1982, Release 5.1 of the transient library is no longer current.

Release 6.0 of the transient library is supported on DOS/VSE with VSE/Advanced Functions Release 2, on SSX/VSE and on the CMS component of Release 6 of VM/370, and subsequent versions, releases and modifications, unless otherwise stated in a modification of the specifications.

Object programs must be executed under the Disk Operating System or SSX/VSE or under the Conversational Monitor System (CMS) component of VM/370. All object programs require SAM modules in the generated operating system. Object programs may also be executed as application programs in the CICS environment.

Support for the ASCII character set is provided for object programs by SAM. Object programs can create or access data sets in ASCII provided the data sets are on magnetic tape with formats U, F, FB, D or DB. These data sets will be supported by STREAM files and RECORD SEQUENTIAL BUFFERED FILES using the CONSECUTIVE ENVIRONMENT option. Only character data may be written onto an ASCII data set.

Programs using the PL/I ENVIRONMENT option INDEXED to access ISAM data sets require ISAM modules. Programs using the REGIONAL ENVIRONMENT option to access DAM data sets require DAM modules. Programs using the INDEXED or VSAM ENVIRONMENT option to access VSAM data sets require VSAM modules. VSAM can be used directly if the VSAM ENVIRONMENT option is specified.

Execution Under CMS: Execution of a PL/I program under CMS is subject to restrictions in the following areas: INDEXED file support, REGIONAL FILE support, PL/I Checkpoint/Restart Facilities, ASCII data sets and other miscellaneous functions. For additional information refer to *DOS PL/I Optimizing Compiler: CMS User's Guide* (SC33-0051).

Compatibility: For successful execution, the DOS PL/I Transient Library must be from the release corresponding or subsequent to that of the DOS PL/I Resident Library used.

DOCUMENTATION
(available from Mechanicsburg)

Title	Order Number
DOS PL/I Transient Library Specifications	GC26-3995
DOS PL/I Optimizing Compiler General Information Manual	GC33-0004

RPQs ACCEPTED: No

Note: The SSX/VSE version of the DOS/PL1 Optimizing Compiler and Libraries is based on Release 5.1. The DOS PL/1 resident library will be available as a separate Prompter Supported program product under SSX/VSE with a specific order number.

**INTERACTIVE SYSTEM PRODUCTIVITY FACILITY/
PROGRAM DEVELOPMENT FACILITY FOR VSE
ISPF/PDF VSE (5666-281)**

PURPOSE

The Interactive System Productivity Facility/Program Development Facility for VSE (ISPF/PDF VSE) is a program product that aids in the development of various types of applications, including dialogs. It uses display terminals in an interactive environment to assist with many programming tasks. The Interactive System Productivity Facility (ISPF) and ISPF/PDF VSE are related IBM program products. Together they are designed to increase user productivity in the development of applications by taking advantage of the features of display terminals. They contain special functions for the development and use of interactive applications (dialogs). ISPF/PDF VSE requires the use of ISPF.

HIGHLIGHTS

- ISPF/PDF VSE is an interactive facility that aids in the development of various types of applications including dialogs. It may be used with both conventional and structured programming techniques and provides simplified procedures for development of dialog applications.
- ISPF/PDF VSE is a dialog that runs under the ISPF program product.
- Multilevel programming library support that allows maintenance and tracking of program segments at different versions or levels. **Note:** The VSE user must use normal VSE library naming conventions to provide this function.
- Full-screen, context editing that allows multiple additions and changes to information on a screen with one interaction with the host system. The most frequently used editing functions are invoked using simple, 1-character commands.
- Models that help a user develop dialog panels, messages, function routines, file skeletons and tables.
- Scrolling (in any direction) of source data and listings, with location of data provided by character string or line number.
- Utilities to specify and maintain libraries and data.
- Interface to standard language processors (compilers, assemblers, and linkage editors or loaders). These processors may be invoked as batch jobs.
- Dialog test facilities that help a user test ISPF dialog applications.
- Online tutorial for instruction or reference. This feature is especially valuable for the new or occasional user.

DESCRIPTION

- An ISPF PARMs option allowing the user to display and change a variety of ISPF parameters at any time during the session. Changes remain in effect until the user changes the parameter again, and are retained across sessions.

The ISPF PARMs option allows the user to specify:

- Command delimiters.
- Terminal characteristics.
- Program function (PF) key assignments.
- A BROWSE option allowing the user to display source data or output listings. Browse is primarily intended for viewing large files (data sets) such as compiler listings or dumps.
- A full-screen EDIT that allows the user to create, display and change source data, such as program code, test data, or documentation.
 - Edit reads the selected member (or entire sequential file) into virtual storage, and retains it there during edit operations.
- A UTILITIES option which provides a variety of functions or processes library members of VSE/POWER queues.
- The BATCH Option provides an interface with standard language processors for:
 - Background compilation and assembly of programs stored in VSE and ICCF libraries.
 - Linkage editing using control statements stored in VSE source statement library members.
 - User can customize batch options to match his compilers and pre-processors, and to combine job steps for compile/link-and-go.
- A COMMAND option allows the user to enter ICCF commands during execution of PDF. Typically, the command and any resulting output is displayed to the user as though the command had been issued in the ICCF environment.
- A DIALOG TEST option provides users with aids for testing ISPF dialog parts (functions, panels, messages, tables, skeletons) and complete ISPF applications. The dialog test option provides for:

- Tracing of application or function calls and variable usage and browsing of trace output during test.
- Specification of breakpoints at which execution can be suspended to use test facilities.
- Display of all ISPF variables.
- Table display and row manipulation.
- A TUTORIAL Option allows the user to obtain immediate online instruction in the use of PDF. The tutorial may be viewed sequentially from beginning to end, or randomly by selecting topics from the table of contents or index. The tutorial may also be entered from other PDF options by using the HELP command or PF key.

CUSTOMER RESPONSIBILITIES

The installation of ISPF/PDF requires a properly configured system, with appropriate terminals and other devices, as required for the desired operating system. A user of ISPF/PDF must be familiar with the base operating system and should review the *ISPF/PDF Reference Manual*.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

PDF operates on any IBM processor that meets the minimum requirements for its prerequisite program product (ISPF).

Storage: The following table lists the:

- Approximate disk storage space required to contain the PDF libraries.
- Size of the shared virtual area (SVA) required for PDF program residency on VSE systems. The first value shown is the minimum required area. The second value is the size needed for all components of the product. The use of SVA beyond the minimum requirement is recommended for performance reasons but not required. Most of the performance benefits may be achieved by using the asterisked (*) value shown in this entry in the table.

	VSE
Cylinders of disk storage (3330)	10
Pseudo Partition (K bytes)	198
SVA size required (K bytes)	0
(* = recommended)	360
	260*

Terminals: PDF runs on any IBM 3270 Display Terminal supported by its prerequisite program product (ISPF).

SOFTWARE REQUIREMENTS

The ISPF program product is a prerequisite for the operation of PDF. PDF itself has no additional system requirements over those required for its prerequisite program product.

ISPF/PDF VSE provides interfaces to the following IBM processing programs and object code generated by them in batch execution:

- System Assembler (available with VSE)
- Linkage Editor (available with VSE)
- Full ANS COBOL Compiler and Libraries (5746-CB1)
- VS/FORTRAN Compiler Release 2 (5748-FO3)
- PL/I Optimizing Compiler and Libraries (5736-PL3)
- RPG II Compiler (5746-RG1)

The appropriate processing programs must be installed to use the batch option. All the program products listed above can be ordered separately under IBM licensing agreements.

Installation: Installation procedures are described in the *ISPF Installation and Customization* publication.

Dependencies: ISPF/PDF VSE is dependent upon the Maintain System History Program (MSHP) for installation on VSE/ICCF. ISPF/PDF under VSE operates with ICCF. ISPF (5668-960) is a prerequisite program product.

DATA SECURITY

ISPF/PDF VSE provides no security or data integrity functions beyond those provided by the environments in which it operates. It is the responsibility of customer management to use existing programs to provide this support.

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**DEVELOPMENT MANAGEMENT SYSTEM/
CROSS-SYSTEM PRODUCT
FOR the SSX/VSE ENVIRONMENT
DEFINITION (5666-282) - EXECUTION (5666-283)**

PURPOSE

The Development Management System/Cross-System Product (DMS/CSP) provides an interactive interface for developing, testing, generating and executing application programs in an SSX/VSE environment. It is fully compatible with the DMS Cross-System Product for CICS/VS, TSO or VM/CMS. DMS/CSP Definition includes the facilities for developing, testing and generating DMS/CSP applications. DMS/CSP Execution provides for production execution of DMS/CSP applications.

HIGHLIGHTS

- Interactive definition, test and execution of application programs.
- Trace/debug facility at development time.
- Direct execution of generated CICS applications.
- Call and transfer linkage to other applications.
- Access to user-defined VSAM files.
- Portability of application definitions (within published restrictions) between DMS/CSP, DMS/DPPX, and DMS/DPCX.

DESCRIPTION

Data Definition - Allows the definition of data structures and the characteristics associated with that data. Single elements of data are defined as data items. Each data item name is unique within a library called the Member Specification Library (MSL). Data items are components of a record, table, map or working storage. After a data item has been defined once, it may be used in other records, tables, maps or working storage by entering the data item name. The associated characteristics of the data item, collected from the MSL, need not be reentered.

Map Definition - Allows the definition of a map for a terminal display or printer. Each map is given a unique name within a map-group (a group of maps for use in an application) and device. The variable fields defined on a map are named and characteristics are defined for each. Characteristics may be collected from data definitions on the MSL if an already defined data item name is used.

Application Definition - Provides for the definition of an application as a group of related processes. Processing statements can be used to define arithmetic operations, movement of data, use of tables, access to map fields and record data items, and logical testing and branching.

Application Test - Allows the user to verify the syntax and logic design of any DMS-defined application as well as to view the logical sequence of map displays as the user will see them in the production environment.

List Processor - Provides the capability to list all members of an MSL, or select subsets to be listed, and then invoke other DMS/CSP functions against them. These functions are: Copy, rename, delete, print, change, where used, edit, view, export. Most utilities and editors can be invoked directly from the list processor.

Utilities

- **EXPORT** - Allows an MSL member to be moved out of an MSL.
- **IMPORT** - Allows a previously exported member to be moved into an MSL.
- **Member Maintenance** - Allows members in an MSL to be copied, deleted, renamed, or printed.
- **File Maintenance** - Allows the user to view or change data that is stored in a file that has been previously created and defined. If the change option is selected, the user may display, replace, delete, add or copy records to the file. File maintenance replaces the previously available File Inquiry facility.
- **Tutorial** - Can be used to learn about DMS/CSP by reading it as a manual or by direct selection of certain sections. It can be accessed at any point in DMS/CSP by pressing the HELP program function key.

Modes of Operation: DMS/CSP operates in either of two modes during application development:

- **TUTOR** - An instructional or teaching mode for use by a new or learning DMS/CSP user.
- **PROMPT** - An input assistance mode for the experienced DMS/CSP user.

A change from TUTOR to PROMPT, or vice versa, can be made at any time by entering the subcommand MODE.

If a user requires assistance during the execution of DMS, the HELP function key may be pressed.

Application Generation: This process translates the defined application into a set of tables which may be executed using DMS/CSP Execution. These tables are placed in an execution library called the Application Load File (ALF). Once there, the application can be executed without reference to the MSL.

Application Execution: Once an application has been generated, it may be executed under the control of the DMS/CSP Execution product. DMS/CSP Execution retrieves the application definition from the Application Load File, initializes it to the run-time environment and manages the execution of the application.

CUSTOMER RESPONSIBILITIES

INSTALLATION: The DMS/CSP installation procedure consists of loading programs and data files from the distribution tape to disk. All DMS/CSP programs are distributed in object module form and program assembly is not required. DMS/CSP Execution is required for DMS/CSP Definition and should be installed first.

The DMS/CSP installation is prompter-supported under SSX/VSE. This means that the installation is assisted by IBM-supplied prompting programs. These prompters reduce the system knowledge and user intervention required and shorten the install time. DMS/CSP installation supports the Maintain System History Program (MSHP) for system and change management.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

DMS/CSP is designed to operate on the following systems configuration:

- An IBM 4300 processor with enough real storage to meet the operating requirements of SSX/VSE.
- Any magnetic tape drive supported by SSX/VSE (required only for installation).
- A minimum of one IBM 3270 1,920-character display station or other compatible device with 12 program function keys.

SOFTWARE REQUIREMENTS

IBM DMS/CSP requires IBM SSX/VSE, program number 5666-265.

Both DMS/CSP Definition and Execution must be installed for application development and test. DMS/CSP Execution may be used separately when only application execution is planned.

Storage Requirements: DMS/CSP Definition requires 280K of virtual storage shared by all definition users; of this, 136K is shared with DMS/CSP Execution. Each concurrently-used definition terminal requires an additional 50K to 150K of virtual storage. However, this storage will be reduced if the users are invoking the same function within Definition.

DMS/CSP Execution requires 210K of virtual storage which is shared by all executing applications. Additional storage requirements vary by application.

COMPATIBILITY and PORTABILITY

COMPATIBILITY with DMS/CSP for CICS/VS, TSO and VM/CMS: DMS/CSP for SSX/VSE and DMS/CSP for CICS/VS, TSO and VM/CMS are fully compatible. Application definitions are fully compatible and portable between products. In addition, application definitions generated for SSX/VSE or for CICS/VS are fully compatible in Application Load File (ALF) form.

COMPATIBILITY with DMS/DPPX: The DMS/Cross-System Product and DMS/DPPX provide a means for defining applications which, with little or no change, can be migrated between S/370, 3000-Series, 4300 and 8100 systems. This is achieved as follows:

The definition facilities, by which a user describes his application and data, are identical in DMS/DPPX and DMS/Cross-System Product. These definitions are stored in a Member Specification Library which can be moved from one system to another. The DMS/Cross-System Product and DMS/DPPX each include utilities for moving definitions between them.

The generation and execution recognize differences between environments and allow use of certain facilities unique to the environment. While use of these facilities does not preclude portability, the user should be cautious in taking advantage of them during definition as they may introduce some extra effort into migrating between supported environments.

Additional information on application portability is included in the *DMS/CSP General Information Manual*.

COMPATIBILITY with DMS/DPCX: DMS/DPPX, DMS/DPCX and DMS/CSP are conceptually the same in the definition phase. However,

PROGRAM PRODUCTS

DMS/CSP (cont'd)

DMS/DPPX and DMS/CSP offer functions that are not available with DMS/DPCX. Applications developed on DMS/DPPX or DMS/CSP which use these unique capabilities may require redesign or redefinition if the application is also to be generated for a DPCX system.

Applications defined using DMS/DPCX are portable to DMS/DPPX or DMS/CSP environments within previously published restrictions. For more information about DMS portability, see the *DMS/CSP General Information Manual*.

COMPATIBILITY with DMS/CICS/VS: There is no compatibility or portability between DMS Cross-System Product and DMS/CICS/VS.

CONVERSION: Not applicable.

PERFORMANCE GUIDELINES

DMS/CSP will support a limited number of concurrent users in application definition and/or execution within a 4321 or 4331 with one million bytes of main storage. Customers who plan to use DMS/CSP for application development and concurrent application execution will normally require two million bytes of storage. Applications designed for volume workloads will likely require two million bytes or more of storage.

PROGRAM PRODUCTS

**SCREEN DEFINITION FACILITY/
CUSTOMER INFORMATION CONTROL SYSTEM
SMALL SYSTEMS EXECUTIVE/VIRTUAL STORAGE
EXTENDED - RELEASE 1 (5666-288)**

PURPOSE

Screen Definition Facility/Customer Information Control System - Small Systems Executive/Virtual Storage Extended (SDF/SSX) is an online application development tool for the CICS/VS application programmer who wants to define or edit maps and map sets for the CICS/VS Basic Mapping Support (BMS). The online operation and the ease-of-use oriented functions of the program enhance productivity in map and map set development and maintenance.

SPECIAL SALES INFORMATION

All established or new SSX/VSE installations which use or plan to use the Basic Mapping Support of CICS/VS can utilize SDF/SSX.

SDF/SSX is designed to run in the environment provided by the Small Systems Executive/Virtual Storage Extended (SSX/VSE, 5666-265). SSX/VSE provides an Installation Prompter to assist the user in installing SDF/SSX.

SDF/SSX is functionally equivalent to SDF/CICS Release 3 (program numbers 5740-XYF for OS/VS, 5746-XXT for VSE/AF). The maps generated by SDF/SSX can be used in the SSX/VSE, VSE/AF and OS/VS environments.

HIGHLIGHTS

- Online development productivity
 - Online definition of new maps and map sets.
 - Online editing of maps and map sets.
 - Ease-of-use in operation and maintenance.
- Support of device independence for maps and map sets.
 - Multiple-device support, including color displays.
- Management of map and map set inventory in installation
 - Libraries for maps and map sets.
 - Library directory support.
- Hierarchy of users
- Session profiles of defaults
- Generation of physical and symbolic map descriptions
- CICS/VS - BMS map generation
- Page definition and simulation
 - Early test of maps and pages.
 - Immediate end user review of maps, pages and sessions.
- Online demo session capability
- Online testing of maps during definition
- Smooth migration from BMS macro-defined maps and map sets to SDF/SSX
- Online education
 - Tutorial and help functions.
 - Tutorial sample and built-in demo.
- Batch utilities

CUSTOMER RESPONSIBILITIES

The customer should ensure that the functions of SDF/SSX match their application requirements and that the hardware configuration is sufficient to allow realization of the benefits of an online programming environment.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

SDF/SSX is designed to operate in the same hardware environments as SSX/VSE.

The configuration must provide sufficient direct access space to contain the VSAM files used by both online and batch SDF functions.

The terminals supported by SDF/SSX as target devices are the same as those supported for the definition of maps by the Basic Mapping Support of CICS/VS Version 1, Release 5.0.

The SDF/SSX development terminals, that is, those devices on which the SDF/SSX programmer enters or receives information are:

- IBM 3276 Control Unit Display Station, model 12, (SDL C - remote).
- IBM 3278 Display Station, model 2 (local and remote).
- IBM 3279 Display Station, models A2, B2 (local and remote).

SOFTWARE REQUIREMENTS

SDF/SSX requires for its installation and operation the following programs, all of which are provided in the pre-generated SSX/VSE product:

- VSE/AF SCP
- VSE/Advanced Functions Release 3
- VSE/VSAM Release 2
- VSE/POWER Version 2
- MSHP

If the SDF/SSX user specifies a programmed symbol set attribute, it is his responsibility to ascertain that the specified symbol set is loaded into the device.

Whenever SDF/SSX is used with a device in base color mode, the fields on SDF/SSX screens are displayed in base colors according to the attributes associated with the screens.

SDF/SSX supports application programming in:

- System/370 Assembler language
- PL/I
- COBOL
- RPG II

COBOL is included in the pre-generated SSX/VSE system. PL/I and RPG II are available as prompter-supported program products if application programs are to be compiled or assembled on the system.

SDF/CICS provides a skeleton map for use of the ELIAS-I prompter-supported program product:

ELIAS/SSX (5666-291)

The distributed Basic Material consists of pre-generated object modules, CICS/VS table entries, and a job stream to create ICCF members which update the CICS/VS tables, and to create the VSAM clusters necessary to run SDF/SSX.

Virtual and Real Storage Requirements: The online part of SDF/SSX works as a CICS/VS transaction, the batch part of SDF/SSX occupies a single partition in SSX/VSE. Partition sizes as established by SSX/VSE are adequate for SDF/SSX.

Installation: SDF/SSX is installed using the SSX/VSE Installation Prompter which is included in the SSX/VSE product. Instructions for invoking the Installation Prompter are provided in the SDF/SSX Program Directory.

COMPATIBILITY/CONVERSION/MIGRATION

SDF/SSX can be used to define and generate maps for all the CICS/VS environments that are supported by SDF/CICS Release 3.0. The physical maps generated by SDF/SSX are fully compatible with equivalent maps generated by the map and map set definition macros of the CICS/VS Basic Mapping Support.

The symbolic description maps generated by SDF/SSX are a compatible superset of maps that can be generated by the CICS/VS Basic Mapping Support. In particular, longer field names and arrays of structures can be defined and corresponding symbolic description maps can be generated.

CICS/VS maps and map sets in their BMS macro source format can be imported into SDF/SSX from non-SSX/VSE environments. Such maps and map sets can be converted by a batch utility into SDF/CICS card formats, which then can be loaded into the SDF/SSX map libraries.

Education: The SDF/SSX online tutorial serves as computer-based education material. SDF/SSX also contains two online demo sessions that demonstrate the definition of a simple map and the conversion of an old map to extended color field attributes.

**ENTRY LEVEL INTERACTIVE APPLICATION SYSTEM -
SMALL SYSTEMS EXECUTIVE/
VIRTUAL STORAGE EXTENDED
ELIAS SSX/VSE (5666-291)**

PURPOSE

ELIAS SSX/VSE is an interactive program which runs under the control of the Interactive Productivity Facility that is included in the Small System Executive/Virtual Storage Extended (SSX/VSE, 5666-265). When correctly installed in its Specified Operating Environment (SOE), ELIAS SSX/VSE is designed to provide a system intended to facilitate the design, development and implementation of VSAM, DB, DC, and/or DB/DC programs. These programs may be written in COBOL or PL/I. Through the facilities of ELIAS SSX/VSE, they may invoke the functions provided by the CICS and VSAM components of SSX/VSE and DL/I SSX/VSE in a manner which is simpler than the direct interface to these program products. This interactive approach can also reduce the amount of time spent in searching documentation and also for data entry, thus improving productivity.

ELIAS SSX/VSE is a major functional subset of ELIAS I/VSE (5746-XXV). It has been modified to operate in the environment provided by SSX/VSE. Many CICS and VSAM functions are included in the SSX/VSE program product. The facilities of DL/I are available in DL/I SSX/VSE (5666-275) and PL/I is available via PL/I SSX/VSE Optimizing Compiler and Libraries (5666-276) and PL/I SSX/VSE Transient Library (5666-277).

SSX/VSE provides an Installation Prompter specifically designed for ELIAS SSX/VSE which simplifies the installation and maintenance of this product.

The ELIAS SSX/VSE program product and its supporting documentation is designed to provide an approach to batch and DB/DC application creation tailored to the inexperienced user. It is thus well suited to the needs of many users of SSX/VSE. Straightforward interactive dialogs are provided which prompt for the information necessary to create, access and maintain data bases and screens. A standardized program framework, for COBOL and PL/I programs, is provided and filled in, where possible, with information provided in previous dialogs. Pre-defined sequences of code (called bricks) to perform frequently used system functions are available. These may be easily included in the program using Program Function keys. HELP functions are provided in all the dialogs.

DESCRIPTION

Dialogs (called Procedures) and bricks are provided in the following main functional areas:

- Assistance with data base definition. Screens request input used by the procedures to generate DBDs, PSBs, SSAs and the associated VSAM files, together with associated COBOL and PL/I structures. The screens are designed to reduce the level of experience necessary to provide the required parameters. The output of these procedures is standard source code which can then be passed to the SSX job submission facility.
- Assistance with PSB importing. A procedure to make available to the ELIAS SSX/VSE program generation procedure PSBs which have been defined externally to ELIAS SSX/VSE. This function can be useful in an environment where DL/I data bases already exist.
- Assistance with DL/I data base maintenance. A procedure is provided to generate the utility JCLs required for loading, reorganization and backup/recovery of DL/I data bases.
- Assistance with screen map generation using Basic Mapping Support for the CICS-based component of SSX/VSE. An interactive procedure allows easier definition of application screens to ELIAS SSX/VSE design standards. These maps can be defined for use either with COBOL or PL/I application programs.
- Programs generated by ELIAS SSX/VSE may specify the use of screen maps generated and maintained by SDF/SSX (5666-288). The use of these two program products together, while not required, is recommended to further simplify the task of screen definition and maintenance.
- Assistance with batch and online program creation and maintenance in COBOL and PL/I. ELIAS SSX/VSE provides skeleton programs with data areas, screen maps, as well as linkage and error recovery code for DL/I (CALL or High-Level Programming Interface), and the SSX/VSE components based on VSE/VSAM and CICS/DOS/VS. Wherever possible, data available from other procedures is automatically entered in the skeletons. The services of a full screen editor are employed to create a user statements file.
- 'Fetch a Brick' capability. Easy inclusion of pre-defined sequences of code (bricks) to request system services related to DL/I, VSAM and CICS. A program function key fetches the brick and simple use of the full screen editor allows whatever tailoring is necessary.
- Direct interface to SSX/VSE job submission facilities. ELIAS SSX/VSE allows the user to submit the source code created to the SSX/VSE job submission facilities for compilation and link editing.

Additional Features:

- Prompter-supported installation and maintenance. SSX/VSE contains a prompter specifically designed for ELIAS SSX/VSE. It leads the user through the installation and maintenance processes by providing step-by-step instructions on the screen. It either detects when the user has compiled or accepts simple responses.
- Upward Compatibility with ELIAS I. Since ELIAS SSX/VSE is a major functional subset of ELIAS I/VSE Release 2, the user will have a consistent interface when running in either the SSX/VSE or VSE environments.
- Transportability of the Generated Code. ELIAS SSX/VSE generates source code that is valid for compilation and execution in both SSX/VSE and VSE environments. To transport an application, the user need only submit this code for compilation in the appropriate VSE environment. In addition, where feasible, ELIAS SSX/VSE allows user selection of options for the VSE environment that are not valid in SSX/VSE. In this way, source code can be produced which is designed for execution under VSE. The transportability feature is especially useful for both migration, and where the SSX/VSE system is being used for development. Warnings are provided to help prevent specification of input that is invalid when the application is to execute under SSX/VSE.
- Code may also be generated in the VSE environment using ELIAS I/VSE that can then be transported to an SSX system. In this case, care should be taken not to violate the software/hardware constraints of the target system. If ELIAS SSX/VSE is installed on the SSX system, it may be used to make modifications to the transported elements once they have been reloaded to the appropriate SSX libraries. The use of SSX system facilities to accomplish this reloading may require somewhat greater user experience than normal SSX operation. However, once this is done, the full functions of ELIAS SSX/VSE are available to make changes and submit the application components to SSX job submission.
- Support for High-Level Programming Interface (HLPI). ELIAS SSX/VSE supports the use of the HLPI feature of DL/I. This allows both the user and the ELIAS SSX/VSE-supplied bricks to directly invoke DL/I services from COBOL and PL/I programs.
- ELIAS SSX/VSE supports all types of VSAM files supported by SSX/VSE, for COBOL and PL/I programs (batch and online). This support includes error handling in program frameworks and coding of VSAM file access statements through the use of specific bricks.
- Default Options. When ELIAS SSX/VSE is invoked for the first time, the user can specify installation standard default options. These may be modified, if necessary, at subsequent invocations using a supplied procedure. In addition, ELIAS SSX/VSE supplies certain default options which represent acceptable solutions and relieve the user of the necessity of determining them himself.
- Input Checking. User input is checked for validity at input time. This significantly reduces the amount of rerun time caused by incorrect data or keying errors. In addition, ELIAS SSX/VSE requires much less input than would be necessary to produce an equivalent amount of source code by direct preparation of the macros and program statements. This can result in initial resource savings and reduced effort in correcting errors identified at compile and test time.
- Documentation is straightforward and 'how to' oriented. The format and content is designed to be compatible with that supplied with SSX/VSE.

The ELIAS SSX/VSE program product should be of interest to users of SSX/VSE who do not have experience in batch and/or DB/DC applications. Together with the associated documentation and available education, it provides a simplified methodology for application design and implementation that can provide a significant improvement in DP productivity.

ELIAS SSX/VSE offers advantages to the experienced user as well. Skilled personnel can concentrate on the more complex aspects of applications while using ELIAS SSX/VSE to more easily generate base application elements. It can also be an effective vehicle for training new people who work under the direction of the advanced designer/programmer.

ELIAS SSX/VSE may also be of significant value where SSX is specifically installed as a development system (see "Customer Responsibilities").

PROGRAM PRODUCTS

ELIAS SSX/VSE (cont'd)

CUSTOMER RESPONSIBILITIES

The customer should ensure that the functions of ELIAS SSX/VSE match their application requirements and the hardware configuration is sufficient to allow realization of the benefits of an online programming environment.

When generating source code for compilation and execution in the VSE environment, it is the user's responsibility to transport and submit the output of ELIAS SSX/VSE to the target system. It is also the user's responsibility to provide the required software/hardware configuration for the VSE system necessary for compilation, link editing and execution.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

ELIAS SSX/VSE is designed to operate in the same hardware environments as SSX/VSE.

When generating code for submission to SSX/VSE, only fixed block architecture (FBA) DASD devices may be specified to ELIAS SSX/VSE procedures. Specifically, these are the IBM 3310 and 3370. For compilation and execution in the VSE environment, ELIAS SSX/VSE will generate code supporting IBM 3310, 3330, 3340, 3350 and 3370 disk storage devices.

The estimated library space requirements, according to library type, are shown below:

Library Type	Directory Entries	Library Space
Core Image Library	24	950 blocks
VSE/ICCF Library	455	14,000 records

ELIAS SSX/VSE can be installed and executed in the minimum SSX/VSE hardware configuration with the exception that one additional DASD spindle is required for the program libraries.

SOFTWARE REQUIREMENTS

All programming requirements necessary for the execution of ELIAS SSX/VSE are provided by SSX/VSE. In addition, an ELIAS SSX/VSE installation prompter is supplied as part of SSX/VSE.

The set of macros and application programs generated by ELIAS SSX/VSE may interface with the following programs:

- CICS/DOS/VS Release 1.5 or the CICS-based component of SSX/VSE.
- VSE/VSAM Release 2 or the VSE/VSAM-based component of SSX/VSE.
- DOS/VS COBOL Release 3 or the COBOL component of SSX/VSE.

The following SSX Installation Prompter-Supported program products are also supported by ELIAS SSX/VSE:

- DL/I SSX/VSE (5666-275)
- PL/I SSX/VSE Optimizing Compiler and Libraries (5666-276)
- PL/I SSX/VSE Transient Library (5666-277)

Virtual and Real Storage Requirements: ELIAS SSX/VSE operates in the same partition as CICS. Within this partition, ELIAS SSX/VSE procedures operate in an ICCF batch pseudo-partition under the control of IPF. The ELIAS SSX/VSE editors execute in the ICCF foreground pseudo-partition. Partition sizes as established by SSX/VSE are adequate for ELIAS SSX/VSE.

COMPATIBILITY/CONVERSION/MIGRATION

Application elements (programs, file definitions, etc.) generated with ELIAS SSX/VSE may be transported to a VSE environment for compilation, link-editing, and execution. It is the user's responsibility to extract these elements from the SSX libraries and move them to the appropriate VSE libraries. If ELIAS I/VSE is present in the VSE environment, it will recognize these elements, construct the necessary job stream, and submit the job. If ELIAS I/VSE is not present, the user must perform these tasks.

When migrating from SSX/VSE to VSE, the user may move all ELIAS-generated application elements to the new environment. Changes may be required to exploit the differences in hardware/software configurations. ELIAS I/VSE may be used to make these alterations. The user will find few procedural differences in interfacing to either product.

DOCUMENTATION

(available from Mechanicsburg)

The following ELIAS I/VSE Release 2 manuals will be provided, without change, with ELIAS SSX/VSE:

Application Design Guide (SH19-6220) ... *System Administrator's Guide* (SH19-6221) ... *COBOL Application Programmer's Guide* (SH19-6222) ... *PL/I Application Programmer's Guide* (SH19-6223).

The following manuals are either entirely new or are updates of relevant ELIAS I/VSE Release 2 publications:

General Information Manual (GH19-6269) (*) ... *Reference Card* (GX11-6072) ... *Using ELIAS SSX/VSE under SSX/VSE* (SH19-6271)

(*) available at announcement.

Ordering Instructions: ELIAS-SSX/VSE is ordered separately from SSX/VSE.

PROGRAM PRODUCTS

QUERY MANAGEMENT FACILITY for VSE
QMF/VSE VERSION 1 RELEASE 1
5666-292
PURPOSE

QMF/VSE is a new program product that extends query and report writing facilities within the VSE Advanced Function Release 3 environment. It is designed to complement SQL/Data System (SQL/DS) Release 2 by providing interactive facilities to retrieve and modify, display, or print relational data. It expands the ease-of-use characteristics and enhances the report writing capabilities of the interactive SQL (ISQL) function of SQL/DS. The QMF/VSE user may select his query language between the structured query language (SQL) and the query-by-example (QBE) style language.

SPECIAL SALES INFORMATION

Query Management Facility for VSE is a key part of IBM's data systems and Information Center offerings extending data access to end-users.

HIGHLIGHTS

Report Writer Capabilities: QMF/VSE reports can be either a displayed or printed version of relational data. These reports are formatted via user-defined or default form specification. Using the form, a variety of different reports types including listing, summary, or across-summary reports can be generated. In addition, column headings, subtotal descriptors, page headings, and page footings can be changed or added by the user simply by updating the form specification.

Ease-of-Use Considerations: QMF/VSE extends the query and report writing capabilities to the end-user by providing functions designed to support typical user tasks. The performance of those tasks is easy for the end-user with little or no data processing related skills. It can also be useful as a high productivity programming tool in application development, and in prototyping for the data processing professional. At the same time, it offers flexibility regarding the order in which the steps of such tasks are performed by the user.

User Aid Facilities: Model queries, sample tables, prompting, and comprehensive online HELP facilities are also provided to assist the end-user. In addition, the user may define parameters in queries and procedures that may be specified at execution time.

Query Language Selection: The user may optionally select his preferred query language since QMF/VSE supports both the structured query language (SQL) and the query-by-example (QBE) style language.

Command-Driven Display Screens (called panels): QMF/VSE provides a simple set of commands in conjunction with the panels which guide the end-user in the creation or alteration of queries, reports, or procedures. Users of QMF/VSE can produce meaningful results utilizing only a portion of the SQL or QBE language facility and/or QMF commands, and utilizes Program Function (PF) Keys as well. QMF/VSE also provides the capability to share saved queries, report forms, and procedures.

Migration of ISQL Users: Facilities are provided to assist in the migration of ISQL users to QMF/VSE.

Relational Data Base Manipulation: Data definition, retrieval, update, insert, delete, and authorization control operations are supported by the structured query language (SQL) of SQL/DS. Access to these facilities is provided through the command languages of QMF/VSE.

DESCRIPTION

Typical functions which an end-user might perform include:

- Ad-hoc query in SQL or QBE languages.
- Report preparation.
- Preparation of data for graphic presentation.
- Definition and execution of a procedure consisting of a series of query/report functions.

Ad-Hoc Query - Either SQL or QBE may be used to retrieve selected information that is formatted and displayed at the user's terminal. Scrolling commands may be used to browse through the data. The user may then display the original query and modify it in order to obtain different results. Subsequently, the user may save the data, print it, save the request that produced the data, or simply go on to another task.

Report Preparation - The results of executing a query will be displayed to the user as a simple table. A form is generated which describes the default format for presentation of the result. Alternatively, a user-defined, pre-stored form may be specified at the time the query is run. The user can then describe the nature of the report (headings and other text, format and summarization required) by filling and changing the values in the form. With only a few specifications, the user can produce a variety of different report types including listing, summary or across-style reports. Once the form is satisfactory, the user merely requests the selected data be redisplayed. QMF will format and display the report at the user's terminal. Since preparing a report can often be an iterative process, QMF make it easy for a user to move from one step to another. That is, display the report format, and redisplay the

data using the updated form. These commonly performed command functions are offered as Program Function (PF) Keys as well. Once the user is satisfied with the report, he can print the report and also save the report description form.

Graphic Presentation Preparation - A sample program is provided with QMF/VSE which can invoke the Interactive Chart Utility (ICU) to present the data prepared using QMF/VSE. The ICU is a facility provided with the Presentation Graphics feature of the licensed program GDDM (5748-XXH).

Procedures - For periodic reports, users can create a 'procedure' definition that allows the execution of a series of commands which can be invoked through a single command. The execution of both SQL- and QBE-style queries can be included in a single procedure.

Because QMF takes advantage of the features of CICS/DOS/VS and GDDM, the creation and alteration of queries and procedures is easy for the user. As examples, corrections and insertions are simply typed over incorrect information or into blank spaces. Deletions can be made by simply blanking out the unnecessary data. Also, prompts and HELP panels are provided (if called upon) to guide the user as he performs his tasks.

CUSTOMER RESPONSIBILITIES

A customer installing QMF/VSE must:

- Have installed at least the minimum machine configuration.
- Have installed the prerequisite products.
- Assure that appropriate VSE/Advanced Functions and S/370 training (including terminal and direct access storage education) be given to system analysts, application programmers, system programmers, and system operators.
- Have VSE/Advanced Functions successfully installed.
- Have personnel educated in QMF/VSE.
- Provide adequate protection against the accidental loss or misuse of his data.

SPECIFIED OPERATING ENVIRONMENT
HARDWARE REQUIREMENTS

QMF/VSE is designed to operate on those processors supported by VSE with Advanced Functions Release 3 (or later). The minimum real storage requirement is two megabytes, although four megabytes is recommended.

The processors must have sufficient real storage to satisfy the combined requirements of VSE with Advanced Functions Release 3, SQL/Data System (SQL/DS) Release 2, QMF/VSE, GDDM, CICS/DOS/VS, appropriate access methods, batch requirements, and other customer-required applications. The configuration must include sufficient I/O devices to support the requirements for system output, system residence, and system data sets. Sufficient direct access storage must be available to satisfy the user information storage requirements, and may consist of any direct access facility supported by the system configuration and the programming system.

DASD: Query Management Facility is independent of DASD device type. Any disk devices supported by VSE with Advanced Functions may be used. Query Management Facility uses disk devices for the following data sets:

- Spill file data set which holds the data for the report which a user is viewing (used only when the data does not fit into virtual storage)
- Data base data sets managed by SQL/Data System (SQL/DS) Release 2

Data Communications Devices: Query Management Facility operations can be controlled from the CICS/DOS/VS terminal.

Query Management Facility supports the following IBM display stations:

- 3277 mdl 2
- 3278 mdls 2, 3, 4, and 5
- 3279 all mdls (in 4-color compatibility mode)
- 3178 mdl C1 and C2
- 3290 mdl 1

See the appropriate (CICS/DOS/VS or GDDM) documentation.

SOFTWARE REQUIREMENTS

QMF/VSE is designed to operate with and requires VSE with Advanced Functions Release 3 or later. The following related (or equivalent) licensed products are also required:

QMF/VSE (cont'd)

- SQL/Data System (SQL/DS) Release 2 (5748-XXJ) and its prerequisites.

The SQL/Data System (SQL/DS) Release 2 licensed product provides relational data base capabilities to users in the VSE with Advanced Functions operating system environment, and the base upon which query entries using Query Management Facility can operate to satisfy customer information demands.

- Customer Information Control System (CICS/DOS/VS, 5746-XX3) Release 1.5 or later.

The Customer Information Control System (CICS/DOS/VS) licensed product controls online DB/DC applications serving a network consisting of a wide variety of terminals and subsystems. CICS/DOS/VS is used to invoke QMF/VSE as CICS transaction, to control terminal displays, and provides the Basic Mapping Services (BMS) for QMF/VSE operational, prompt, and HELP panels.

- Graphical Data Display Manager (GDDM), Release 2 or later (5748-XXH)

- The Graphical Data Display Manager licensed product provides the QMF user with a comprehensive formatting, displaying, and printing capability that coexists with current applications. GDDM is used by Query Management Facility for device support for displays involving dynamically changing data fields. GDDM Release 3 and CICS/DOS/VS Release 1.6 are required for support of the 3290 mdl 1 in large-screen mode.

COMPATIBILITY/CONVERSION

Query Management Facility and SQL/Data System (SQL/DS) Release 2 are complementary products designed to provide solutions to end-user information needs. Data managed by SQL/DS is available to end-users through the Query Management Facility (subject to appropriate authorization). Data managed by DL/I DOS/VS can be retrieved by the extract facility of SQL/DS which loads the data into an SQL/DS table. In addition, the SQL/DS Data Base Services Utility (DBSU) can be used to load the data into an SQL/DS table. This data is then accessible to end-users using QMF/VSE.

MIGRATION CONSIDERATIONS

Facilities are provided to assist in the migration of ISQL users to QMF/VSE. Additional information on migration to QMF/VSE will be supplied with the publications when the product is available.

DATA SECURITY and AUDITABILITY

In a QMF installation, facilities which will allow customer installation management to control its usage and impact are provided by the relational data base manager. Additionally, QMF itself controls the authorization for stored queries, forms, and procedures. Through the facilities of the data base manager, QMF users can specify security authorization for access to their data. Multiple levels of authorization make it possible to place restrictions on the different users' accessibility to data. For example, one user may be given unlimited access to the data for all types of operations. Another user may only be allowed to read information, not alter it. Still another user may be restricted to reading a subset of the information (for example, only information pertaining to a particular department within an organization).

PERFORMANCE CONSIDERATIONS

The primary objective of Query Management Facility is ease-of-use. The actual system resource requirements vary and depend on many factors such as number of records searched, complexity of the query, and availability of indexes. Response time and throughput depend on the allocated system resources, the priority of the executing task, and the nature of the transaction.

**5666-294 - PARIS/BASE
PLANNING AID for
RETAIL INFORMATION SYSTEM/BASE****PURPOSE**

Planning Aid for Retail Information System/Base (PARIS/Base) is a set of 16 data bases designed to support retail merchandise processing and merchandise information applications. PARIS/Base uses the DOS/VSE Operating System in conjunction with CICS/VS, DMS/CICS/VS, and DL/I.

SPECIAL SALES INFORMATION

PARIS/Base provides a retail establishment with the data bases and associated online maintenance routines needed to insert, delete and create data to support retail applications. These applications include purchase order preparation, merchandise information, merchandise planning, receiving, checking, merchandise distribution, operational planning, vendor invoice matching, and big ticket or warehouse subsystems. PARIS/Base is a set of data bases to support an integrated retail information system.

This product is intended for retail firms that order merchandise from vendors, process the receipt of the merchandise from a receiving dock to the sales floor, and process the vendor invoice. The retailer can utilize items on order and sales information as input to merchandise and operational planning systems.

HIGHLIGHTS

- PARIS/Base contains the Data Base Descriptions (DBDs) and Program Specification Blocks (PSBs) in support of 16 data bases. Application Control Blocks (ACBs) are supplied for the maintenance routines.

The 16 data bases are:

Charge Back	Department/Class/Store
Freight Payment	Manifest
Purchase Order	Reservation/Order
Security	Transfer
Control/SKU Number	Distribution Center
Invoice	Overage
Receipts	Route Guide Delivery
Stock Keeping Unit	Vendor

- The online maintenance routines utilize CICS/VS, DMS/CICS/VS and COBOL support routines.
- Control and audit features are included in PARIS/Base through the security data base. Controlled access to secured files is via user-defined passwords.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The PARIS/Base licensed program is designed to operate on IBM S/370, 303X or 43XX processors supported by DOS/VSE that meet the minimum processor storage requirements described below. The processor should be selected based on the user's projected transaction load along with other CPU workload.

For batch or online processing, PARIS/Base requires 64K bytes of real storage and 3,600K bytes of virtual storage, in addition to the storage required for the VSE operating system, CICS/DOS/VS, DMS/CICS/VS, DL/I DOS/VS and the application program. Optimum real storage and processor requirements may vary. Users are responsible for determining optimum real storage and processor requirements. The minimum machine requirements for PARIS/Base are:

- One IBM 4300 processor with 1MB of storage.
- Two IBM direct access storage devices supported by DOS/VSE. To install PARIS/Base, approximately 200 cylinders for the source library and 182 cylinders for the core image library on the IBM 3340 or equivalent storage on other direct access devices are required.
- One IBM 3278 or 3279 Display Station mdl 2 or equivalent supported by DOS/VSE.
- One IBM console display device supported by DOS/VSE.
- One IBM 3262 Printer with 132 print positions or equivalent supported by DOS/VSE.
- One IBM card reader punch supported by DOS/VSE.
- One tape drive supported by DOS/VSE.

SOFTWARE REQUIREMENTS

PARIS/Base is written using DL/I DOS/VS, CICS/DOS/VS and DMS/CICS/VS, COBOL and Assembler language. It is supplied in the form of source statement books for the data bases and core image phases, and source statement books for the maintenance routines. It is designed to operate with the following prerequisite products:

- DOS/VSE System Control Program (5745-030) Release 3.
- COBOL/VS Compiler (5746-CB1) Release 3.

- CICS/DOS/VS (5746-XX3) Release 1.5.
- DMS/CICS/VS (5746-XC4) Release 3.
- DL/I DOS/VS (5746-XX1) Release 1.6.
- VSE/Advanced Functions (5746-XE8) Release 3.1.
- VSE ICCF (5746-TS1) Release 3.
- VSAM (5746-AM2) Release 2.

**5666-295 - NPDA V3 (DOS/VSE, SSX/VSE)
5668-920 - NPDA V3 (MVS/370, MVS/XA)
NETWORK PROBLEM DETERMINATION APPLICATION
VERSION 3**

PURPOSE

Network Problem Determination Application (NPDA) Version 3 provides functional and usability enhancements, new device support, and support for host and 37X5/EP attached resources in an MVS/XA environment.

NPDA Version 3 licensed program is designed to enhance the network operators' capability to detect and resolve problem situations. NPDA provides an alert management facility which monitors alert messages and automatically notifies the network operator of error situations or threshold conditions previously defined by the user. The alerts can be dynamically displayed on selected operator stations. NPDA collects and interprets information about detected errors or events and maintains statistical data originated by hardware and software components that provide such information. NPDA also recommends possible user activities to locate and relieve problems.

HIGHLIGHTS

In addition to the previously announced NPDA functions, NPDA Version 3 offers enhanced support as follows:

- Additional product support:
 - 3725 Communications Controller. NPDA Version 3 integrates support for the 3725 Communication Controller with its attached links and resources that is similar to that provided for the 3705. In addition, NPDA provides support for 3725 solicited and unsolicited RECFMS records. The 3725 support for NPDA requires ACF/NCP Version 2.
 - X.25 Networks (X.25 NCP Packet Switching Interface licensed program). NPDA provides storage, analysis, and display support for the X.25 NCP Packet Switching Interface licensed program Release 4.
 - Series/1. NPDA supports event/alert records from the Series/1 Realtime Programming System (RPS) Version 6.1 Remote Manager licensed program and the Event Driven Executive (EDX) Version 4 Remote Manager licensed program.
 - 3274 Control Unit. NPDA Version 3 provides support for event/alert records generated by 3274 Control Unit (Configuration Support C and D). This support is in addition to the presently available SNA summary data (RECFMS 01, 02, 03, and 05 records).
 - System/38. NPDA supports event/alert records from the System/38 Control Program Facility (CPF) Release 5.
 - 3650 Programmable Store System. Alerts generated by the 3650 Programmable Store System Release 4.1, including user alerts, are recorded and made available for display.
 - 6580 Displaywriter System. NPDA supports event/alert data received for the communication adapter from the 6580 Displaywriter Electronic Documentation Distribution (EDD) feature program.
 - MVS/Extended Architecture (MVS/XA) System. NPDA Version 3 extends its support to resources attached to the host and attached to a 37X5/EP communication controller or 270X communication control unit in an MVS/XA environment.
 - 4700 Finance Communication System. NPDA Version 3 integrates support for the 4700 Finance Communication System.
 - Network Routing Facility licensed program. NPDA Version 3 integrates support for the Network Routing Facility program product.
 - Functional/Usability Enhancements:
 - Improved CLIST capability. NPDA Version 3 permits the inclusion of any NPDA command in a CLIST initiated by an NPDA operator.
 - Filtering based on alert/event descriptions. The NPDA Version 3 filtering capability has been extended to permit the selection of records based on alert/event descriptions.
 - New event types. NPDA Version 3 supports 16 event types. Event types are used in the selection of records to be recorded and/or viewed.
 - Expanded data transfer for problem recording with Information Management Version 2. The number of fields transferred as problem information by NPDA to Information/Management has been expanded to include the data presented by NPDA on its Event Detail and Recommended Action displays.
- Additional capability is provided in NPDA Version 3 over previous versions by allowing previously created Information Management

problem records existing in the Information/System Version 2 data base to be updated by NPDA Version 3.

DESCRIPTION

NPDA Version 3 assists operators in performing the problem determination task by:

- Collecting records of detected errors and events from hardware and software components.
- Collecting and interpreting statistical data about permanent and temporary errors.
- Generating alerts to the appropriate personnel about potential problem situations.
- Recommending possible user actions to relieve detected problems.
- Transferring problem information to the data base of the Information/Management Version 1 (a feature of the Information/System program product Version 1 (5735-OZS) or Version 2 (5665-953)).

NPDA Version 3 uses system functions provided by the Network Communications Control Facility (NCCF) Version 1 Release 2 or Version 2 licensed program for access to this accumulated information. This data is presented as:

- Identification of the component causing a specific event.
- Description of the event.
- Probable cause of the event based on an analysis of the record data.
- Recommended actions that the user may follow to correct or override any problems caused by the event.
- Accumulated statistics about temporary or recoverable errors. This data may be used to analyze performance degradation or unrecovered intermittent failures.

The cross-domain capability of SNA communication subsystems is used by NPDA Version 3 to permit displays of event, alert, and statistical data collected in remote network domains running NPDA Version 3.

An important feature of NPDA Version 3 is the filter function. Filters are designed to screen out data before it is recorded in the NPDA Version 3 data base and are also used to screen out recorded data from each user's display.

Filters can be defined by the user to control the recording and viewing of:

- Specific event or alert description (recording only)
- Specific event types
- Specific resources
- Specific resource types
- Combinations of the above
- Events based on the time of occurrence (viewing only)

PRODUCTS SUPPORTED: NPDA Version 3 collects alert, event, and statistical data associated with various IBM products.

3725 Communications Controllers
3790 Communications System (as an SNA Controller)
380C Printer Subsystem mdl 1

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

NPDA Version 3 and its IBM 3600 (4700) Threshold Analysis and Remote Access feature are designed to operate on IBM 4300, S/370 and 30XX processors.

NPDA Version 3 storage requirements vary with the number of users and their demand for program storage. NPDA has no fixed real storage or system area requirements. The virtual storage requirement for NPDA varies depending on use but is approximately 300K bytes.

NPDA Version 3 requires space on any DASD device supported under VSAM for the NPDA Version 3 data base. Disk storage requirements for the NPDA data base are dependent on the network configuration and user options. Program library space is estimated at 20 cylinders on 3330 DASD plus 420 directory blocks.

User access to NPDA is supported with any display station/unit supported by NCCF.

SOFTWARE REQUIREMENTS

NPDA Version 3 logging and display components execute as subtasks under NCCF Version 1 Release 2 or Version 2.

NPDA Version 3 is designed to operate with any of the following combinations of operating system and communications access methods:

- MVS/XA
 - ACF/VTAM Version 2
 - ACF/TCAM Version 2 Release 4
- MVS/370
 - ACF/VTAM Version 1 Release 3
 - ACF/VTAM Version 2
 - ACF/TCAM Version 2 Release 4
- DOS/VSE
 - ACF/TCAM Version 1 Releases 2 and 3
 - ACF/VTAM Version 1
 - ACF/VTAME
- SSX/VSE
 - ACF/VTAME

In a VM/370 environment with VM/SP and VM/VCNA, NPDA Version 3 is designed to operate with communications access methods as listed above. NPDA Version 3 supports only remotely-attached controllers and terminals in the VM/370 environment.

Information/Management Version 2 must be installed to take advantage of the additional data fields that NPDA Version 3 will transfer when the problem management link is invoked. If Information/Management Version 1 is installed the additional data fields will be ignored by Information/Management.

MIGRATION

The NPDA Version 2 data base is upward compatible with the NPDA Version 3 data base. NPDA Version 2 should not be used to view Version 3 data. The NPDA Version 3 data base like that of NPDA Version 2 is incompatible with the NPDA Version 1 data base. However, NPDA Version 1 and NPDA Version 3 may coexist in the same system for data display purposes.

Coexistence of NPDA Version 2 with Version 3 on the same host should only be of value during a transition stage when Version 2 might be required to execute commands in a cross-domain environment with a second NPDA Version 2 product.

Users of 3600 (4700) Threshold Analysis and Remote Access feature must reorder the feature for NPDA Version 3. The functions are the same but the feature provides the necessary control statements to install with NPDA Version 3.

DEPENDENCIES

The System Modification Program (SMP) or the System Modification Program Extended (SMP/E) is required for installation on MVS/370 and MVS/XA. Maintain System History Program (MSHP) is required for installation on DOS/VSE and SSX/VSE systems. The function provided by NCCF Version 1 Release 2 or Version 2 program product is a prerequisite for operation of NPDA Version 3.

DATA SECURITY

This program accesses hardware and software failure data. Normally, customer data is not included in the failure data (in some instances a user or user application has the capability to create NPDA records with the user-specified data). Customer management is responsible for the selection, application, and adequacy of these controls for their environment.

CURRENCY STATEMENT

NPDA Version 1 (5735-XX8) is withdrawn from marketing.

Programming Services previously announced for Version 1 of NPDA will be available until June 1984.

MVS SYSTEM INTEGRITY

IBM will accept APARs where the installation of NPDA Version 3 introduces an exposure to the system integrity of MVS. Refer to Programming Announcement, "Statement of MVS System Integrity", dated October 21, 1981. This program is intended to run authorized during initialization only.

RPQs ACCEPTED: No

5666-296 - VSE/SP 1.1.0 PRODUCTION
5666-297 - VSE/SP 1.1.0 GENERATION
5750-AAP - VSE SYSTEM IPO/E 1.4.0 VERSION 1.1.0

PURPOSE

VSE/System IPO/E 1.4.0 is an important enhancement and extension of the well-accepted VSE System System IPO/E. VSE System IPO/E 1.4.0 is restructured and enhanced to further reduce time and skill level required to install and service VSE.

The primary design emphasis for VSE System IPO/E 1.4.0 is the following:

- Improved system stability and quality by system testing all of the programs as a single package.
- Reduced installation time and complexity through pre-generated and pre-tailored VSE System IPO/E 1.4.0 programs and libraries. In many cases, the process to install the system can be completed in approximately two hours.
- A new and simplified service procedure. Customers can choose the PRODUCTION format, which significantly reduces service time and complexity.
- A new and simplified ordering procedure.

OVERVIEW

VSE System IPO/E 1.4.0 consists of SCPs, VSE/SP 1.1.0, Optional and Documented support products which are tested as a system to provide high system quality. Previously, VSE System IPO/E consisted of several bases. These bases have been combined and enhanced into a single base for VSE System IPO/E 1.4.0, called VSE/SYSTEM PACKAGE 1.1.0 (VSE/SP 1.1.0). The VSE Interactive Productivity Facility has been incorporated into the VSE/SP 1.1.0. The performance of Interactive Productivity Facility has been improved by approximately 50% for key dialogs. New programs have been added and release levels of other VSE System IPO/E programs have been upgraded in VSE System IPO/E 1.4.0.

VSE/SP 1.1.0: This licensed program, with its prerequisite System Control Programs (SCPs), is an operational, interactive, data communication operating system. The prerequisite SCPs are not a part of the VSE/SP 1.1.0 licensed program, but are merged into the pre-generated VSE/SP 1.1.0. All references to VSE/SP 1.1.0 include both the licensed program and its prerequisite SCPs unless specifically indicated otherwise. VSE/SP 1.1.0 is comparable to the previous VSE System IPO/E Data Communications (DC) base. It is built and tested as a pre-generated package of VSE programs and delivered as a single licensed entity. It is part of VSE System IPO/E 1.4.0 and is ordered via the VSE System IPO/E 1.4.0 order process.

VSE System IPO/E 1.4.0 introduces a new and improved delivery process and a new service process for the PRODUCTION format.

All programs within VSE System IPO/E 1.4.0 are available in PRODUCTION and in GENERATION format. Both formats provide full function, are pre-generated and ready to use. The pre-generated options are selected to meet a very high degree of existing VSE installations. The GENERATION format, which also includes the PRODUCTION libraries, is provided for those users who want to modify the system.

Customers who order the VSE System IPO/E 1.4.0 in PRODUCTION format will benefit from a new service process, which reduces the service time and complexity. For the GENERATION format, service is similar to that of VSE System IPO/E 3.1.

The VSE/SP 1.1.0 PRODUCTION system is offered at a lower price than the GENERATION system.

VSE/SP 1.1.0 is offered with a new One-Time-Charge (OTC) Option as an alternative to the Monthly License Charge (MLC).

VSE/SP 1.1.0, in addition to the above, provides hardware support for the 3430 Tape Unit, the 4245 and 3262-5 Printers, and the 4341 Model Groups 9 - 12 Processors.

HIGHLIGHTS

VSE

- Is delivered and installed as a pre-generated SYSTEM via VSE System IPO/E 1.4.0 with VSE/SYSTEM PACKAGE 1.1.0 as its base.
- VSE/SP 1.1.0 is offered with a new One-Time-Charge (OTC) Option as an alternative to the Monthly License Charge (MLC).

VSE/SP 1.1.0

- Is a pre-generated package of VSE programs.
- Is an operational, interactive, data communications operating system without any other prerequisite software
- Is delivered as one entity under a single license.
- Is ordered as the base for VSE System IPO/E 1.4.0.

VSE System IPO/E 1.4.0

- Is available in only one version comparable to the Data Communication (DC) version of the previous VSE System IPO/E.
 - The DB/DC version of the previous VSE System IPO/E can be obtained by installing VSE/SP 1.1.0 plus the Optional Product DL/I DOS/VS.
 - A Batch/Interactive version will not be available as a standard offering with VSE System IPO/E 1.4.0.
- All programs within VSE System IPO/E 1.4.0 are available in:
 - PRODUCTION format to significantly reduce service time and complexity, and in
 - GENERATION format for users who want to modify the system.

Ordering/Shipping

- Improved order process and physical packaging for VSE System IPO/E 1.4.0.
- In order to simplify the packaging, only VSE System IPO/E 1.4.0 documentation will be included in the shipment. Documentation for individual VSE System IPO/E products is now only ordered through SLSS.
- VSE/SP 1.1.0 is available as part of the VSE System IPO/E 1.4.0 and is ordered via the VSE System IPO/E 1.4.0 order process. The prerequisite SCPs are shipped together with VSE/SP 1.1.0.
- Optional and Documented Support Products are ordered individually as part of the VSE System IPO/E 1.4.0 order.
- The number of distribution tapes is reduced from 13 to 2 when ordering VSE System IPO/E with Optional Products in PRODUCTION format. Ordering ACF/NCP, VM/VSE feature, or Documented Support Products increases the number of tapes.
- Customized libraries are shipped to VSE System IPO/E 1.4.0 users.

Installation

- The installation of VSE System IPO/E 1.4.0 including Optional and Documented Support Products can be done in approximately two hours.
- The installation process for VSE/SP 1.1.0 Optional and Documented Support Products is simplified via pre-tailored library packaging and a simplified customization process.
- The usage of a single DASD type for system files further reduces installation complexity.
- System file sizes have been established to meet the needs of most users, reducing the necessity to expand, regenerate, and reload these files.
- The Interactive Productivity Facility dialogs are easier to understand by using fewer DP terms.
- Performance of Interactive Productivity Facility has been improved by approximately 50% for key dialogs.
- Online information is available in the form of 'Explain facilities' and a 'First Use Tutorial' to improve ease-of-use.
- The number of user responses during installation of VSE System IPO/E 1.4.0 is reduced to about 25% compared with previous System IPO/E releases.
- Recovery and restart procedures have been added for operator errors, system failures or uncontrolled system shutdown during the installation process.

Quality

- System quality, stability and availability is improved via more comprehensive tests of VSE System IPO/E 1.4.0.
- Optional and Documented Support Products are system verification-tested within VSE System IPO/E 1.4.0 based on VSE/SP 1.1.0.

New Service Process

- Customers who order VSE System IPO/E 1.4.0 products in PRODUCTION format will benefit from a new service process.
- This process will ensure that cross-component module dependencies have been included, resolved and tested on a VSE System IPO/E 1.4.0 level for all VSE/SP 1.1.0 Optional and Documented Support Products.
- The IBM service organization now has the capability of testing and verifying corrections to a greater degree than before, because they have the same set of modules and executable phases as the customer.

PROGRAM PRODUCTS

VSE System IPO/E V1.4.0 & VSE/SP 1.1.0 (cont'd)

- This new service eliminates the time consuming process of recompilation and/or link-editing.
- Service for executable phases of products ordered in PRODUCTION format are supplied pre-link edited, ready to be merged to production libraries.
- Service for relocatable/source members is applied directly to production libraries.
- Service libraries are not provided for a PRODUCTION system.
- For VSE System IPO/E 1.4.0 products ordered in GENERATION format, the service process is similar to that in the previous VSE System IPO/E 1.3.1.

New Hardware Support

- 3430 Tape
- 4225 Printer
- 3262-5 Printer
- 4351 Processors Model Group 9 - 12
- 3290 Information Panel in 3278 mdl 2-5 compatibility

In S/370 mode

- Support of FBA DASD
- Virtual Storage Address extension to 16MB independent of the real storage size (max. 8MB real memory in S/370 mode)

DESCRIPTION

VSE SYSTEM IPO/E 1.4.0

Product Content

Note: Program numbers listed in the tables that follow denote the individual program numbers outside the VSE System IPO/E 1.4.0.

VSE/SP 1.1.0

VSE/SP 1.1.0 (5666-296 and 5666-297)		
COMPONENT NAME	NUMBER	V. R. M.
VSE/Advanced Functions	5746-XE8	1.3.5
VSE/ICCF	5746-TS1	1.3.5
VSE/POWER	5666-273	2.1.0
VSE/VSAM	5746-AM2	1.3.0
VSE/VSAM Space Management	5746-AM2	---
VSE/VSAM Backup/Restore	5746-AM2	1.2.0
VSE/INTERACTIVE PRODUCTIVITY FACILITY	N/A	N/A
CICS/DOS/VS	5746-XX3	1.6.0
VSE/FAST COPY	5746-AM4	1.2.0
DITTO FOR VSE AND VM	5668-917	1.1.0
BTAM-ES	5746-RC5	1.1.0
ACF/VTAM	5666-280	2.1.0
VSE/POWER SHARED SPOOLING VM/VSE Feature	5666-273	2.1.0
DOS/VSE SCP	5745-030	1.3.5
BTAM SCP	5747-CG1	1.1.0
EREP	5656-093	2.2.0
OLTEP	5656-092	1.1.0
Device Support Facility	5747-DS2	1.6.0

Notes:

1. The ACF/VTAME Communication Adapter support is incorporated into ACF/VTAM 2.1.0.
2. The VM/VSE feature provides support for the VM/VSE environment of Interactive Productivity Facility and needs to be ordered as a separate feature of VSE/SP 1.1.0.
VM/SP 2.1.0 is required when the VM/VSE feature is used.
3. The VSE Interactive Productivity Facility is included in the VSE/SP 1.1.0, but is separately available upon request.

Optional Products: Optional Products are installed and tested within the VSE System IPO/E 1.4.0 environment. Inter-product/component dependencies are resolved for the VSE System IPO/E user. Dialog support for key functions of these products is provided by Interactive Productivity Facility. Support for Optional Products has already been generated in VSE/SP. Library space for Optional Products is pre-assigned. The set of Optional Products available with the VSE System IPO/E 1.4.0 is shown in the following table, which also compares the release levels with the previous VSE System IPO/E Release 3.1 components.

OPTIONAL PRODUCTS			
	LICENSED PROGRAM NUMBER	VSE SYSTEM IPO/E	VSE SYSTEM IPO/E
PRODUCT NAME		R 3.1	1.4.0
VSE/IPCS	5746-SA1	1.3.0	1.3.0
VSE/OCCF	5746-XC5	1.1.0	1.1.0
Sort/Merge II	5746-SM2	2.4.0	2.5.0
DL/I DOS/VS	5746-XX1	1.6.0	1.6.0
EP/VS - DOS/VS	5747-AG1	1.3.0	1.3.0
VSE/Access Control Logging & Reporting	5746-XE7	1.1.0	1.1.0
ACF/NCP/VS (which includes) ACF/NCP/VS	5735-XX1	1.2.1	1.2.1
SSP for ACF/NCP/VS	5735-XX3	1.2.1	1.2.1
NCP/SSP SCP	5747-CH1	1.2.1	1.2.1
NCP/SSP SCP with EP Support feat. #6004	5747-CH1	1.3.0	1.3.0
NCCF	5735-XX6	1.2.0	1.2.0
NPDA	5668-983	1.2.1	2.1.0
DOS/VS COBOL	5746-CB1	1.3.0	1.3.0
DOS/VS RPG II	5746-RG1	1.3.0	1.3.0
PL/I COMP/LIB	5736-PL3	1.6.0	1.6.0
PL/I OPT. COMP	5736-PL1	1.6.0	1.6.0
PL/I RES. LIB	5736-LM4	1.6.0	1.6.0
PL/I TRANS LIB	5736-LM5	1.6.0	1.6.0

Notes:

1. The Optional Products ordered with VSE System IPO/E 1.4.0 are shipped as pre-tailored libraries that are restored within the VSE System IPO/E 1.4.0 install process.
2. The Optional Products are available with the same installation and servicing attributes as VSE/SP 1.1.0.

Documented Support Products: Documented Support Products are installed and tested with the VSE System IPO/E 1.4.0. The set of Documented Support Products in the VSE System IPO/E 1.4.0 are listed in the following table.

DOCUMENTED SUPPORT PRODUCTS			
	LICENSED PROGRAM NUMBER	VSE SYSTEM IPO/E	VSE SYSTEM IPO/E
PRODUCT NAME		R 3.1	1.4.0
DMS/CICS/VS-DOS	5746-XC4	1.3.0	1.4.0
DMS/CICS/VS IAG	5746-XC4	1.3.0	1.4.0
DMS/CSP DEFINITION	5668-944	N/A	1.1.0
DMS/CSP EXECUTION	5668-945	N/A	1.1.0
ELIAS-I	5746-XXV	1.2.0	1.2.0
DB/DC Data Dictionary	5746-XXC	1.4.0	1.4.0
ISPF	5668-960	N/A	1.1.0
ISPF/PDF	5666-281	N/A	1.1.0
INFO SYSTEM	5735-OZS	N/A	1.1.2
SQL/DS	5748-XXJ	1.1.0	1.2.0

Notes:

1. The DASD space required to install Documented Support Products is additional to minimum DASD requirements.
2. Documented Support Products are shipped as pre-tailored libraries that are restored using jobs created by Interactive Productivity Facility dialogs.
3. Documented Support Products are available with the same packaging and servicing attributes as VSE/SP 1.1.0.
4. SQL/DS 1.2.0 will be available in 1/84.
5. VSE/Performance Tool (VSE/PT) Release 2 Modification Level 1 has been tested with VSE System IPO/E 1.4.0 and is available at PID for installation as a non-SIPO program. The Technical Newsletter (TNL) (N20-0602) describes the installation and activation tasks.
6. It is IBM's direction to extend the ISPF dialog manager to the future VSE System IPO/E.

Installation of VSE System IPO/E 1.4.0 products ordered after the initial installation: VSE System IPO/E 1.4.0 Optional and Documented Support Products that are ordered after the initial order are installed into the pre-allocated libraries using jobs created by Interactive Productivity Facility dialogs.

VSE System IPO/E V1.4.0 & VSE/SP 1.1.0 (cont'd)

PRODUCTION and GENERATION Definition of VSE System IPO/E 1.4.0 Products

PRODUCTION Definition: PRODUCTION is generally defined as providing full product function but not providing for user modifications of this function. The products are pre-generated and shipped primarily in object code (library restore format) to simplify installation and service and to enhance usability. Flexibility for system environment adjustments is still maintained. Source code required for program development and program execution is included. These pre-generated options are selected to meet the requirements of most existing VSE installations. Service libraries are not provided. A user who orders VSE System IPO/E 1.4.0 products in PRODUCTION format will benefit from the new service process, which significantly reduces time and complexity of service application.

VSE/SP PRODUCTION is the pre-generated VSE/SYSTEM PACKAGE 1.1.0. It contains several pre-assembled supervisors to cover various 4300 and S/370 VSE and VM/VSE environments. CICS/DOS/VS 1.6.0 is pre-generated, but allows for environmental adaptations of the Terminal Control Tables, Program Control Tables, Transient Data Table, Basic Mapping Support, etc. These adaptations can either be done at initial installation or at a later time when needed, as described in the CICS/DOS/VS 1.6.0 documentation.

GENERATION Definition: VSE System IPO/E 1.4.0 products shipped in GENERATION format include the PRODUCTION format as well as all library members available with the Basic Machine-Readable Material of stand-alone products.

GENERATION allows the user to modify and to re-assemble certain programs. The GENERATION format is provided for users who:

- Require unique system or subsystem generation parameters that are not provided in the PRODUCTION format of VSE/SP 1.1.0 or other VSE System IPO/E 1.4.0 products.
- Modify IBM-provided code/generation options to support additional hardware or software.

The service process for programs ordered in GENERATION format is similar to that of the VSE System IPO/E 3.1.

Note: Details about the characteristics and considerations of System IPO/E 1.4.0 products shipped in PRODUCTION format versus GENERATION format can be found in the *VSE System IPO/E 1.4.0 Planning Guide* (GC20-2003). This document will be shipped after the VSE System IPO/E 1.4.0 announcement to all SLSS users with VSE/AF in their SLSS profiles.

VSE/System Package 1.1.0 Characteristics: The VSE System IPO/E 1.4.0 with VSE/SP 1.1.0 is a significant step to address VSE as a total system

VSE/SP 1.1.0 is an operational, interactive, and data communication operating system. It is built as a package of VSE programs and delivered as a single licensed entity as the base for VSE System IPO/E 1.4.0. The optional VM/VSE feature of VSE/SP 1.1.0 can be ordered for execution of Interactive Productivity Facility under CMS.

The components within VSE/SP 1.1.0 have been serviced to a service update level concurrent with all VSE System IPO/E 1.4.0 products.

Functions of VSE/SYSTEM PACKAGE 1.1.0 by Program: (Detailed functional descriptions can be found in the documentation associated and available with each program.)

VSE/Advanced Functions (VSE/AF) 1.3.5: VSE/AF is extended to provide the following new support:

- **New I/O devices:**
 - 2,000 lpm 4245 Printer attached via channel
 - 5,650 lpm 3262 Printer attached via channel
 - 3430 Tape device with recording densities of 1,600 and 6,250 bpi attached via channel
- **New functions:**
 - **Support of FBA DASD in S/370-mode**
Any supervisor mode now supports FBA Direct Access Storage Device (FBA DASD).
 - **More Virtual Storage in S/370-mode**
With VSE/AF 1.3.5 up to 16MB of virtual storage size can now be specified also in S/370 supervisor mode regardless of the real memory size. However, the 16MB of virtual storage space is reduced by the supervisor size and the sum of the real partition sizes specified.
For ease-of-use, VSIZE can be specified in units of M-Bytes in addition to units of K-Bytes.
 - **SIOF (START IO FAST) Support**
The SIOF instruction will be used in the VSE/AF supervisor.

Along with the support of the SIOF instruction, the extended I/O architecture for improved I/O busy handling (SIO Queued) will be supported. The supervisor will process 'delayed I/O interrupts'. This support will be used by processors which can exploit this SIOF instruction. It can improve performance in environments with heavy I/O activity. The use of SIOF allows VM a better guest system dispatching in case of I/O operations.

- **Ease-of-Use, Availability, Reliability**
 - **ISPF Support**
This support allows use of the Documented Support Product ISPF as dialog and panel manager in a VSE system with dialog and panel compatibility of other systems running ISPF. ISPF executes in an ICCF interactive partition.
 - **Integrity Improvements**
The ABEND exit routine has been extended to be invoked for any type of termination (normal and abnormal). Thus, the task which is abended can keep control. This allows the user to program controlled termination actions like invocation of VSAM automatic close, completion of all pending I/O requests, free all locks etc. Using this function will more often leave a functioning system after an BEND, and thus make recovery/restart much easier or avoid recovery at all.
 - **Extended IPL support**
Allows specification of volume serial number instead of device address in the IPL commands DEF, DLA, DLF and DPD. These enhancements further simplify IPL and give more flexibility in DASD usage.

Device Support Facility 1.6.0

- Provides functions like Initialize Disk, Assign Alternate Block etc. for the DASD devices.

VSE/ICCF 1.3.5

- **Multilevel Program Function Keys**
The extension of the PF-key setting will be used to define and work with four different sets of PF-keys: One individual set for each, Command mode, LIST/SPOOL-mode, EDIT-mode and EXECUTION/READ-mode. Each set can be up to 24 PF-Keys and thus fully utilize the extended PF-Key keyboards. This facility is used to substitute PF-Keys for commands etc., for ease-of-use and productivity purposes.
- **@Exit Macro Order in the ICCF Macro Language**
The new macro order will be used to exit a macro without reaching the physical end of a macro. This provides controlled flexibility in macro processing comparable to procedures.
- **Removal of @-Prefix for Macro Invocations**
Macros may now be invoked in command mode by specifying the macro name without the @-prefix. Thus, a terminal user can invoke macros like he can invoke procedures. This functional extension improves ease-of-use and simplifies the human machine interface in VSE.
- **VSE/ICCF Notify Support**
A communication link will be established between VSE/ICCF and VSE/POWER (via NOTIFY) so that e.g., batch job ending messages can be routed to the terminal user who submitted the job. This function notifies the terminal user about the job events automatically rather than have him query the system to get the information, thus providing a better level of information. This function complements the NOTIFY support in VSE/POWER.
- **/Include Job Entry Statement Resolved by DTSUTIL**
The new parameter SDI will be introduced for the DTSUTIL-commands PRINT, PUNCH and PRTPCH to allow printing or punching of included members. This function provides ease-of-use in ICCF library handling. It relieves the user of analyzing library members to create extra punch or print cards for each INCLUDE statement within members. The INCLUDE statement will be automatically resolved by DTSUTIL.
- **Skip Recovery (via DTSANALS) if Library is Correct**
DTSANALS will have the capability through the optional parameter OPT on the commands ANALYZE, RECOVER, and REORG, to decide whether the Analyze-, Recover- or Reorg-command should run or not depending on the current status of the ICCF library. This should reduce and improve restart/recovery time because unnecessary recovery runs can be eliminated
- **3290 Information Panel support**
The 3290 Information Panel is supported as a 3278 mdl 2 -5 compatible display.

VSE System IPO/E V1.4.0 & VSE/SP 1.1.0 (cont'd)

VSE/POWER 2.1.0

- **New Device Support**
VSE/POWER has been extended to support the new hardware devices which are supported in VSE/AF 1.3.5.
- **NOTIFY Support to a VSE/ICCF User**
This support enables a message to be sent to a VSE/ICCF user when a job has executed locally or remotely, output has been received from another system for that user, or a job or output has been transmitted by the network. This complements the NOTIFY support in VSE/ICCF.
- **Network connectivity to MVS/JES3**
The VSE/POWER networking function can now be used to connect with an MVS/JES3 Release 1.3.1 node via BSC lines (PTF UZ64973 has to be installed in MVS/JES3 1.3.1).

VSE/Interactive Productivity Facility

- **Restructured Menu Hierarchy**
Interactive Productivity Facility provides a structured menu hierarchy, which is more task-oriented.
- **Additional Hardware Support**
VSE/Interactive Productivity Facility supports all new hardware devices which are supported in VSE System IPO/E 1.4.0.
- **Support of new Software Products/Components**
VSE/Interactive Productivity Facility supports all new software components which are included in VSE System IPO/E 1.4.0.
- **Dialog Improvements**
Performance for key Interactive Productivity Facility dialogs has been improved by approximately 50%.
- **VM/VSE Feature Enhancements**
The VM/VSE feature will contain its own dialog manager in Interactive Productivity Facility and will no longer be dependent on VM Interactive Productivity Facility. The system interfaces in the Interactive Productivity Facility dialog manager are adapted to the new standard interfaces provided in VM/SP 2.1. Thus, VM/SP 2.1 is a prerequisite if the VM/VSE feature is used in a VM/VSE environment.

CICS/DOS/VS 1.6.0 (For detailed information, see P-Letter 282-268)

- Application Programming Enhancements
- Guidance on CICS/VS Master Terminal and User Exits
- Security Enhancements
- Journal Management and Restart Enhancements
- CICS Resource Definition Online
- System Availability Enhancements
- Performance and Tuning Improvements
- Intercommunication Enhancements
- Device Support Enhancements
- Problem Diagnosis/Serviceability Aids
- New User Exit Facilities
- Serviceability Improvements

VSE/Fast Copy 1.2.0

- Performance improvements for 8809 via a new Multiple Buffering concept developed in order to guarantee the streaming for the 8809 tape device in most cases of alternate block assignments.

BTAM-ES 1.1.0: BTAM-ES provides support for Bisynchronous and Start/Stop communication terminals and also supports local terminal attachment.

ACF/VTAM/VSE 2.1.0

- **Full VTAM/NCP Environment**
ACF/VTAM/VSE 2.1.0 provides the following enhancements over ACF/VTAM 1.3.0 in a VSE environment:
 - Integrated multisystem networking capabilities.
 - ACF/VTAM/VSE 2.1.0 hosts can function as intermediate routing nodes in the network
 - Ability to easily modify, replace, or suppress ACF/VTAM messages to suit installation needs or preferences.

- Enhanced processing of large SNA messages sent from ACF/VTAM application programs to potentially improve network performance and reliability.
- Allows programs to determine, at assembly and at execution time, what particular functions are supported with the given level of ACF/VTAM being used.
- Support for downstream load of devices with the Downstream Load Utility program on VSE.
- Reliability, availability, and serviceability (RAS) enhancements of ACF/VTAM networks.
- Dynamic collection of tuning statistics.

• Communications Adapter Support

Integration of communication adapter and communications controller support in ACF/VTAM/VSE 2.1.0 provides VSE users with simplified growth paths for IBM communication products and enhanced data communication capability. ACF/VTAM/VSE 2.1.0 replaces ACF/VTAME in VSE System IPO/E.

With these enhancements, ACF/VTAM 2.1.0 VSE now provides support for:

- Customers installing their first teleprocessing system
- Non-SNA customers desiring to utilize:
 - Economies of SNA line sharing and terminal sharing
 - Communication network management licensed programs for centralized control and problem determination
 - Loop adapter support
- CICS/DOS/VS customers with terminals supported by BTAM who wish to migrate to terminals supported by SNA.
- ACF/VTAME customers wishing to utilize facilities previously available only in ACF/VTAM Release 3.

VSE/VSAM 1.3.0

- VSE/VSAM is an access method designed to operate with direct access devices and to support both direct and sequential processing.
- Three types of data sets are provided: Key-sequenced, entry-sequenced and relative record data.
- VSE/VSAM offers multiple levels of password protection.
- Alternate Indexes permit application programs to access records of a VSAM entry or key-sequenced data set on the basis of keys other than the prime key.
- VSE/VSAM SPACE MANAGEMENT FOR SAM provides the capability to define and process a SAM file within VSE/VSAM data space giving automatic space management of the file.
- VSE/VSAM BACKUP/RESTORE of VSE/VSAM provides backup onto tape and restore from tape with high performance and low processor utilization. The VSE/VSAM feature is especially geared to the streaming mode of the 8809 tape drive.
- VSE/VSAM delivered in VSE/SP 1.1.0 can also be used for execution in a VM/CMS/DOS environment.

VSE/OLTEP 1.1.0

- **Extended Hardware Support**
VSE/OLTEP supports all hardware devices supported by VSE. In addition, it now supports FBA only and cardless systems.

VSE/EREP 2.2.0: EREP 2.2.0 availability for VSE environments is announced through this announcement. It will be available concurrent with VSE/AF 1.3.5 and VSE/SP 1.1.0.

• Extended Hardware Support

EREP is extended to handle the new hardware devices which are supported in VSE/AF 1.3.5.

• New Function - System Exception Report

This function of EREP 2.2.0 strengthens and extends the analytic/diagnostic capabilities of EREP in VSE environments, enabling a more rapid identification of significant component failures within a system and each of its major hardware subsystems.

DITTO for VSE and VM 1.1.0: DITTO for VSE and VM Release 1.1.0 provides the following new functions and improvements to existing functions:

- Full screen display mode for record display and alteration functions.
- A tape-to-tape compare function (TTC) to compare the contents of two different files. If a mismatch is found, the input and output records will be printed out.

VSE System IPO/E V1.4.0 & VSE/SP 1.1.0 (cont'd)

- A VSAM Record Load (VRL) function to allow direct alteration of VSAM file records.
- Further SET function extensions are provided to allow the user to specify:
 - Dump formats of UPDOWN or ACROSS (new horizontal format)
 - Print length of 80 or 132. The shorter length is especially useful on VSE/ICCE screens to avoid overlapped output lines.
- Significant ease-of-use improvements, for example:
 - SET function defaults can be changed via a profile.
 - Horizontal Dump format for printouts and full-screen displays.
 - The Display VTOC function (DVT) is extended to provide additional information about the files on the disk and is presented in a more compact format.
 - The Disk Record Scan function is extended to also show the offset of the data found in the record and to provide printouts of each record where a hit is found.
- DITTO for VSE and VM delivered in VSE/SP 1.1.0 can also be used for execution in a VM/CMS/DOS environment.

Deleting VSE/SP 1.1.0 Components: The option of taking VSE/SP 1.1.0 without the full complement of components is available. In this case, one of the following PRPQ versions of VSE/SP 1.1.0 has to be ordered, licensed and installed instead of VSE/SP 1.1.0 (5666-296/5666-297):

- VSE/SP 1.1.0 PRPQ - Partial Function PRODUCTION (5799-BNB)
- VSE/SP 1.1.0 PRPQ - Partial Function GENERATION (5799-BNC)

Licensing Instructions: To simplify the customers order process, the VSE/SYSTEM PACKAGE may be ordered and licensed as a single licensed program.

Customers who do not wish to use all of the components of the VSE/SYSTEM PACKAGE in their operational VSE system will be given permission via a VSE/SYSTEM PACKAGE memo-to-users, to use all of the components of the VSE/SYSTEM PACKAGE solely for the purpose of installing the VSE System IPO/E 1.4.0. The customer is then required to delete those components which the customer does not plan to use in his operational system. At time of general availability, an ordering check list will be provided on which the customer can select those components of VSE/SP 1.1.0 which the customer wants to use in his operational system.

See the Announcement Letter for Sample Order Checklists to be used for ordering VSE System IPO/E 1.4.0 and VSE/SP 1.1.0. The availability letter for VSE System IPO/E 1.4.0 will include an updated VSE System IPO/E 1.4.0 order checklist.

CUSTOMER RESPONSIBILITIES

Customer Management is responsible for the ultimate evaluation of the adequacy of this offering to address individual customer requirements and or the selection, implementation and adequacy of security procedures for their application.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Systems: VSE System IPO/E 1.4.0 supports the same IBM 4300, S/370, and 30XX hardware as the VSE System IPO/E 3.1. (Processors: IBM 4321, IBM 4331 - all model groups with a minimum of 1MB of real memory, IBM 4341 Model Groups 9 - 12, IBM 4361 Processor, IBM S/370 mdls 138 - 158 with a minimum of 1MB of real memory, IBM 3031, 3032, 3033. Support for the IBM 3083 requires VM. Hardware feature requirements are the same as for VSE/AF.) New hardware is supported as described under the individual programs (see "Highlights of VSE/SP 1.1.0 by product").

VSE System IPO/E 1.4.0 requires a processor with a minimum of 1MB of real storage. Therefore, S/370 mdl 115 and 125 Processors can not utilize VSE System IPO/E 1.4.0

Storage Requirements: The minimum processor storage requirements for the VSE System IPO/E 1.4.0 are shown below.

VSE Environment	VM/VSE Environment
1.0MB	2.0MB

Note: Depending on the products used in a customer environment, the minimum processor storage requirement may be higher (e.g., due to SQL/DS, which requires a system containing at least 2.0MB of real memory).

Those customers who have processors with minimum real storage and who are now fully exploiting their memory should consider the increased memory needs of VTAM and CICS.

DASD Requirements: The number of Direct Access Storage Device (DASD) volumes required for the installation of VSE System IPO/E is dependent upon the DASD type and the product set being installed.

The minimum addressable DASD volumes required are shown below in Figure 1 for a VSE System IPO/E 1.4.0 system with VSE/SP 1.1.0 and Optional Products shipped only in PRODUCTION format. Figure 2 shows the minimum addressable DASD volumes required for the same system if any product is shipped in GENERATION format (Figure 2).

- All DASD volumes required for VSE System IPO/E installation and service must be of the same device type.
- The minimum volumes listed below do not include space for the Documented Support Product production-library sets.
- The VM/VSE feature requires 28,000 1K blocks of VM CMS mini-disk space for all DASD environments.

IBM DASD TYPE	MINIMUM VOLUMES PRODUCTION	NOTES
3310	5	
3330	5	1
3340	5	2, 3
3350	2	
3370	2	
3375	2	

Figure 1: Minimum VSE/System Package and Optional Product DASD Requirements with only PRODUCTION Products

Notes:

1. IBM 3330 mdl 1. 3330 mdl 11s are treated as 3330 mdl 1s.
2. IBM 3340 mdl 70 or 70F or 3344 (1-3344 = 4-3340s).
3. One additional 3340 volume is required for ACF/NCP/VS.

IBM DASD TYPE	MINIMUM VOLUMES GENERATION	NOTES
3310	6	4
3330	6	1, 4
3340	6	2, 3, 4
3350	2	4
3370	2	4
3375	2	4

Figure 2: Minimum VSE/System Package and Optional Product DASD Requirements if any GENERATION Products

Notes:

1. IBM 3330 mdl 1. 3330 mdl 11s are treated as 3330 mdl 1s.
2. IBM 3340 mdl 70 or 70F or 3344 (1-3344 = 4-3340s).
3. No additional 3340 volume is required for ACF/NCP/VS.
4. No data-secured file may be placed in the DASD space required for a generation library.

Library/File Size Comparison: The size of the minimum DASD layout in VSE System IPO/E 1.4.0 is larger than the layout for the VSE System IPO/E 3.1. This is due to two factors:

- All phases, modules, and macros necessary for normal use of each product are included in the production libraries. In the VSE System IPO/E 3.1, some of the parts of products needed for normal use were contained in the service libraries.
- The size of the user's POWER files, ICCF libraries, and ICCF files are increased substantially. This will minimize the need to expand these files during or after the installation of VSE System IPO/E 1.4.0.

Other Hardware: The following minimum hardware is required for the VSE System IPO/E 1.4.0. The VM/VSE feature has the same hardware requirements as the VM/SP System IPO/E, plus at least the virtual equivalent of the devices listed below:

- A VSE-supported console.
- A local terminal which supports a 24x80-character screen format. This terminal must be supported by VSE, CICS/VS, VSE/ICCF, and the telecommunications access method selected by the user.

VSE System IPO/E V1.4.0 & VSE/SP 1.1.0 (cont'd)

- A VSE-supported tape drive.
- A VSE-supported printer.

SOFTWARE REQUIREMENTS

VSE/SP 1.1.0 is a complete operating system with no prerequisite software. VSE System IPO/E 1.4.0 PRODUCTION and GENERATION products are ready for immediate use after installation. Products ordered in GENERATION format can be modified according to customer needs like in VSE System IPO/E 3.1.

VM/SP 2.1 is required if the VM/VSE feature is used in a VM/VSE System IPO/E 1.4.0 environment.

COMPATIBILITY

Migration to VSE System IPO/E 1.4.0: (Details are described in the *VSE System IPO/E 1.4.0 Planning Guide*, GC20-2003).

The migration to VSE System IPO/E 1.4.0 is considered as a release transition.

Migration assistance will be provided through Interactive Productivity Facility dialogs to migrate from VSE System IPO/E 2.1, VSE System IPO/E 3.0, and VSE System IPO/E 3.1 to VSE System IPO/E 1.4.0.

Non-VSE System IPO/E products with Interactive Productivity Facility dependent dialogs will run without modification on VSE System IPO/E 1.4.0 with the following exceptions: Explicit references to menu names in Interactive Productivity Facility may cause an error message due to the restructured menu hierarchy. Depressing a function key can be used to recover from this situation.

VSE/POWER provides support to migrate POWER punch, list and reader files via the POWER Offload (Poffload) facility.

Users of VSE/ICCF can migrate their VSE/ICCF user libraries using the facilities provided by the VSE/ICCF DTSUTIL program.

VSE/VSAM 1.3.0 provides compatibility and portability for VSAM data sets of previous releases as documented in chapter 10 of the *VSAM Programmer's Reference* (SC24-5145-2).

VSE System IPO/E 1.4.0 will coexist in networks with VSE/System IPO/E 3.1, 2.1 and other VSE releases and with SSX/VSE 1.2.

Interactive Productivity Facility provides dialog facilities to support the backup and restore of user program libraries.

VSE/Performance Tool (VSE/PT) Release 2 Modification Level 1 has been tested with VSE System IPO/E 1.4.0 and is available at PID for installation as a stand-alone program. The Technical Newsletter (TNL) (N20-0602) describes the installation and activation tasks.

PERFORMANCE CONSIDERATIONS

VSE System IPO/E 1.4.0 provides improved performance in the areas of system installation and service.

Response time and system performance is a function of the application and system configuration. Refer to individual product or component documentation for further details on the performance of the individual products.

**5667-124 - ACF/NCP V3 for 3705 and 3725
ADVANCED COMMUNICATIONS FUNCTION for
NETWORK CONTROL PROGRAM VERSION 3
for the 3705 and 3725 COMMUNICATION CONTROLLERS**

PURPOSE

Advanced Communications Function for the Network Control Program (ACF/NCP) Version 3 for the 3705 and the 3725 is a program product for users of MVS/370 and MVS/XA (Compatibility Mode) that offers the capabilities of ACF/NCP Version 2 for the 3705 and the 3725, plus SNA network interconnection capability, enhanced recovery of lost resources, enhanced problem determination tools, error recording, and availability. Additionally, for the 3705, ACF/NCP Version 3 contains improved sysgen times previously incorporated for the 3725 in ACF/NCP Version 2.

Additional enhancements support functional enhancements for the 3725. ACF/NCP Version 3 is designed to operate in the 3705 and 3725 Communication Controllers, whether channel-attached to a host processor, or remotely connected to a host processor by an SDLC link to another controller. ACF/NCP Version 3 is generated using the ACF/System Support Programs (ACF/SSP) Version 2 Release 2 (5735-XXA).

HIGHLIGHTS

- Provides the capability for independent SNA networks to communicate via SNA network interconnection in conjunction with ACF/VTAM Version 2 Release 2.
- Allows forced deactivation of SNA resources and non-SNA lines.
- Extends support when applicable for 3863, 3864, 3865, and 3868 modems to reporting of received signal level and execution of LPDA commands on data multiplexed links and tail circuit attached links.
- Provides improved problem determination capabilities via the ability to trace the path of a session and to map physical addresses to logical names, in conjunction with the Network Logical Data Management (NLDM) licensed program, Release 2.
- For the 3705, enhancements are included which were previously supported for the 3725 in Version 2:
 - Reduced sysgen time due to removal of conditional assemblies.
 - Key control blocks may be extended above 64K boundary, which may allow additional devices to be included, if adequate storage is available.
- For the 3725 only, ACF/NCP Version 3 supports functional hardware improvements:
 - Additional storage protect support is implemented.
 - Up to 2 megabytes of storage is supported.
 - Links across an Intermediate Routing Node (IRN) may send up to 127 blocks of data in one direction before requiring a response, resulting in more efficient usage of high-speed links and satellite transmissions.
 - The Port Swapping function of the 3725 is supported.
 - The enhanced start/stop support announced October 4, 1983 for the 3725 is supported.

DESCRIPTION

- ACF/NCP Version 3 provides SNA network interconnection, the capability of connecting two or more networks through a gateway NCP node. With ACF/NCP Version 3 operating in conjunction with ACF/VTAM Version 2 Release 2, two end-points (LUs) in different networks can then be logically interconnected through the gateway NCP. Highlights of SNA network interconnection include:
 - Each network still preserves its own character, in terms of network elements, naming, control, evolution, and security.
 - Interconnected networks may have different partitioning of the 16-bit network address. Thus, a network of 16 subareas may be interconnected with a network of 64 subareas, for example.
 - All currently supported cross-domain LU-LU sessions are also supported in cross-network sessions. Ownership is within a network.
 - Addresses in one network are transformed into corresponding addresses of the other network. Through the use of the alias name translation function of the Network Communications Control Facility (NCCF) Version 2, each interconnected network may (optionally) have its own name structure.
 - BSC 3270 terminals may participate in cross-network sessions.
 - Networks may be interconnected by more than one gateway NCP.
 - One gateway NCP may be used for attaching up to 255 networks. The gateway NCP is capable of supporting sessions spanning any pair of networks connected to it.
 - Any number of networks may be connected together via interconnection. A cross-network session may go through a number of networks.
 - In addition to SNI functions, a gateway NCP may perform additional NCP functions consistent with available storage and performance capabilities.

- One gateway NCP may have up to eight SSCP owners at one time, each of which may or may not be gateway SSCPs.
- ACF/NCP V3 also provides end-to-end visibility of the configuration from one end of the session to another within a network in conjunction with NLDM.
- ACF/NCP V3 provides forced deactivation to operationally force the deactivation of a line. For some cases where 'hung' resources would previously require re-IPLing, the NCP to recover, the resources may be recoverable via command. ACF/TCAM supports both SNA and non-SNA forced deactivation of lines via PTF on Version 2 Release 4; ACF/VTAM Version 2 Release 2 supports forced deactivation of SNA links, BSC 3270 lines, and, in conjunction with Network Terminal Option Release 2.1, non-SNA Lines.
- ACF/NCP V3, in conjunction with the Network Problem Determination Application (NPDA) Version 3, provides additional support for 3863, 3864, 3865 and 3868 modems:
 - Extension of Link Problem Determination Aid (LPDA) capability to support 3865 modems with the data multiplexer feature and 3863 and 3864 modems attached by the tail circuit accessory.
 - Inclusion of the received signal-level measurement with LPDA data sent to NPDA V3.
 - Inclusion of support for remote modem self-test, with LPDA data sent to NPDA V3.
- For the 3725, ACF/NCP extends the functional support:
 - Storage Protection enhancements will offer more protection against inadvertent overlays of storage.
 - Storage support will be increased from one megabyte up to two megabytes of allowable storage.
 - Up to 127 blocks of data may be sent across an IRN link before a response is required, which will provide significantly improved performance for NCP-to-NCP traffic on 19.2K bps and higher-speed links. Previous IRN to IRN traffic required a response after only seven blocks.
 - The enhanced start/stop support announced October 4, 1983 for the 3725 is supported.
 - Support is included for Port Swapping. Port Swapping allows an operator to logically swap a defined port to an undefined port, improving recovery capability.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This licensed program is designed to operate on the IBM 3705-II, the IBM 3705-80, and the IBM 3725 Communication Controllers, either channel-attached to a host processor, or remotely connected to a host processor by an SDLC link to another controller.

SOFTWARE REQUIREMENTS

ACF/NCP Version 3 for the IBM 3705 and 3725 is generated using the ACF/System Support Program (ACF/SSP) Version 2 Release 2 licensed program (5735-XXA). ACF/NCP Version 3 for the IBM 3705 and IBM 3725 operates with MVS Release 3.8, MVS 3.8 with the System Extension licensed program, MVS 3.8 with the SP Version 1 licensed program, and MVS/SP Version 2 for Extended Architecture (XA) processors (24-bit mode).

Use of the Partitioned Emulation Programming (PEP) extension of ACF/NCP Version 3 for the IBM 3705 requires the Emulation Program for the IBM Communication Controllers.

Use of the Partitioned Emulation Programming (PEP) extension of ACF/NCP Version 3 for the IBM 3725 requires the Emulation Program for the IBM Communication Controllers.

ACF/NCP Version 3 supports the following releases of ACF/TCAM and ACF/VTAM, at the functional level of the access method:

- ACF/TCAM Version 2 Release 4
- ACF/VTAM Version 1 Release 3 (MVS only)
- ACF/VTAM Version 2 Release 1 (MVS only)
- ACF/VTAM Version 2 Release 2

COMPATIBILITY

ACF/NCP Version 3 for the 3705 and 3725 Communication Controllers supports and can communicate with:

Host-resident programs	3705	3725
• ACF/SSP V2 R2	X	X
• ACF/TCAM V2 R4	Note 5, 6	
• ACF/VTAM V1 R3	Note 1, 5	
• ACF/VTAM V2 R1	Note 1, 5	
• ACF/VTAM V2 R2 MVS	X	X
• EREP MVS	X	X

PROGRAM PRODUCTS

ACF/NCP V3 for 3705 and 3725 (cont'd)

• NPA-Host FDP (5798-CZR)	X	X
• NPDA V2	Note 2, 5	
• NPDA V3	X	X
• NCCF R2	Note 5	
• NCCF V2	X	X
• NLDM R1	Note 5	
• NLDM R2	X	X

Controller-resident programs: Operation of the following programs is supported with NCP Version 3 in the specified machine:

	3705	3725
• EP for the IBM Communication Controllers	X	X
• NTO Release 2.1	Note 3	
• NRF Release 1.5	Note 3	
• X.25 NPSI	Note 4	
• Non-SNA Interconnection	Note 7	

Notes:

1. MVS only, with appropriate PTF.
2. NPDA Version 2 support for the 3725 is provided via PTF.
3. NTO Release 2.1 and NRF Release 1.5 for ACF/NCP Version 3 will be ordered by new feature numbers for the 3705 and 3725. Feature numbers will be available at general availability.
4. Ability for the X.25 NCP Packet-Switching Interface (5668-981), to operate with ACF/NCP Version 3 is scheduled for 4Q84 for the 3705 and 4Q84 for the 3725.
5. Supported only at the identified product's functional level.
6. A TCAM PTF will be provided 2Q84 to support cross-network sessions and forced deactivation for SNA and non-SNA lines.
7. The Non-SNA Interconnection licensed program (5668-951) will be available for operation with ACF/NCP Version 3 for the 3725 1Q85.

The following levels of ACF/NCP may communicate with ACF/NCP Version 3:

- ACF/NCP V1 R2.1
- ACF/NCP V1 R3
- ACF/NCP V2 (3705 and 3725)
- ACF/NCP V3

In addition, ACF/NCP Version 3 can communicate with ACF/VTAME and ACF/VTAM V2R1 supporting an ICA under VSE.

Stage 1 program generation source decks for ACF/NCP Version 1 Release 3 and ACF/NCP Version 2 for the IBM 3705 or IBM 3725 with no or slight modifications may be used to generate ACF/NCP Version 3 for the corresponding Communication Controller. Modifications, if required, are not extensive and are relatively simple to implement. They include the addition and deletion of certain macros and macro operands. Details for Version 3 for the IBM 3705 are in the *ACF/NCP and SSP Installation and Resource Definition Guide (SC30-3224)*; details for Version 3 for the IBM 3725 are in the *ACF/NCP and SSP Installation and Resource Definition Guide (SC30-3226)*.

PLANNING CONSIDERATIONS:

The Network Control Program user will require ACF/NCP Version 3 for the 3705 and the 3725 (5667-124), ACF/SSP Version 2 Release 2 (5735-XXA), and the required access methods and operating systems to generate and operate ACF/NCP Version 3.

The 3705 or 3725 Partitioned Emulation Programming user will require, in addition, Emulation Program for the IBM Communication Controllers (5735-XXB).

For a SNA network interconnection environment, IBM recommends that NLDM Release 2 and NCCF Version 2 be present at every VTAM host that serves as a gateway node to assist problem determination for cross-network sessions. With these products installed, the network operator will have access to data used for network problem determination and problem source identification.

VM/370 support for BSC or start-stop terminals may coexist with the SNA terminal support provided by the partitioned emulation program (PEP) extension of ACF/NCP Version 3 with the Emulation Program for the IBM Communication Controllers under MVS. The loading and the management of the PEP is controlled by ACF/VTAM, ACF/TCAM, or the independent loader utility program in the guest MVS machine.

When deactivating or reloading the Communication Controller, the guest machine must be aware of the potential impact to users of EP lines if these lines are used by the VM/370 control program. The dynamic dump utility is usable under VM/370 provided the utility is run under a guest machine and the utility was installed using SMP.

Performance and Storage Considerations: Path lengths for ACF/NCP Version 3 for the 3705 and the 3725 should closely approximate those for ACF/NCP Version 2 when using the same

functions. Use of the SNA Network Interconnection support will result in increased path lengths for messages traversing the gateway.

For the 3705, storage requirements will increase over previous releases of ACF/NCP due to the elimination of conditional assemblies. The net increase in NCP storage will be less for the user who previously selected more options, than for the user who previously selected fewer options. Customers with 256K or less of storage should carefully review storage requirements before installation.

For the 3725, the elimination of conditional assemblies was included in Version 2.

The actual performance and storage impact (if any) to a customer will vary depending on particular hardware and network configuration and options selected.

DATA SECURITY, AUDITABILITY and CONTROL

ACF/NCP Version 3 enables the installation to establish and maintain the integrity of the data communication network. SNA network interconnection provides additional potential for network separation, which may increase security.

An enterprise may, for security reasons, wish to protect some nodes and their data flows from inadvertent or intentional access by other nodes. SNA network interconnection allows customers to configure nodes sharing similar security requirements into an isolated network, allowing cross-network communications through a defined interface, but preventing network management control from nodes outside that network.

In OS/VS environments, the ACF/VTAM Encrypt/Decrypt feature, and the Encrypt/Decrypt facility of ACF/TCAM can provide increased facilities to safeguard the information transmitted between logical units in the network.

The user is responsible for the selection, application, adequacy, and implementation of these facilities and for appropriate application and administrative controls.

Education: ACF/NCP courses will be updated to include ACF/NCP Version 3 for the 3705 and 3725. Also available is an SNA Network Interconnection Planning and Implementation Class, Course Number G3643.

Ordering Information: Customers may continue to order ACF/NCP Version 2 for the 3705 and ACF/NCP Version 2 for the 3725 after the availability of ACF/NCP Version 3. ACF/NCP Version 1 Release 3 and Release 2.1 may also be ordered for the 3705.

PROGRAM PRODUCTS

5668-002 - DASD MIGRATION AID RELEASE 1.1

PURPOSE

The Direct Access Storage Device (DASD) Migration Aid program provides support for the new 3380 and 3375 Direct Access Storage, new high-speed, large capacity direct access disk storage devices. The Migration Aid is designed to help reduce the effort required to perform DASD migration.

The Migration Aid is designed to capture all required data set attributes from the devices' Volume Tables of Contents (VTOC). Furthermore, by identifying the amount of space currently allocated and the original secondary space allocation, internal space calculation routines can help project the data sets' space requirements on the new device.

HIGHLIGHTS

- Data Set Characteristics report with target device space calculations.
- Identification of data sets that do not meet user specified space utilization goals on the current and/or target device.
- Independent Space Calculation routines (TSO or batch). A one-step approach provides information to help determine the best data set blocking factors and total space requirements on the target device.
- Creation of customized JCL and utility statements to allocate space, copy data sets to the target device, and update the catalog.
- Mass conversion support:
 - Full volume Data Set Characteristics report.
 - Creation of customized JCL and utility statements for all supported data sets in current volumes.
- Procedure Library tools to:
 - Identify all affected data set JCL statements.
 - Generate a jobstream to update all affected JCL statements.
- All JCL and utility statements generated by the migration aid are placed under user control for review, modification and execution.

New with Release 1.1:

- Preservation of Resource Access Control Facility (RACF) discrete protection for certain types of data sets.
- Reblocking of migrated load modules, in the MVS/XA Data Facility Product (DFP) environment.
- Handling of special data sets (unsupported data set organization, unknown record format or a blocksize of zero).
- User specification of multiple compatible catalogs (virtual storage access method, VSAM, and integrated catalog facility catalogs) for migration selection criteria (filters).
- User specification of multiple output volumes and corresponding space thresholds.

The Migration Aid is composed of four parts:

- Presentation of current data set information and generation of JCL statements to place data on the target devices.
- Independent Space Calculation routines.
- Procedure Library Search and Update functions.
- Procedure Library utilities.

DEVICES SUPPORTED

The Migration Aid provides support for the following device type migrations:

FROM	3350		TO		3340		3380	
	3380	3375	Native	Compat	3330-1	3330-11	3344	3850

2314/2319	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
2305 mdl 2	Yes	Yes	Yes	C	C	C	C	C

C - Caution: Data sets with blocking factors larger than the target device track size are not supported by the Migration Aid.

CUSTOMER RESPONSIBILITIES

New customers are responsible for ordering and installing DASD Migration Aid Release 1.1 and any prerequisite programs.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The DASD Migration Aid can be utilized on IBM processors with the minimum configuration required to support the host operating system. Main Storage of 200K bytes is usually required for execution.

SOFTWARE REQUIREMENTS

The DASD Migration Aid is designed to operate with OS/VS1 Release 7.0, OS/VS1 Basic Programming Extensions (BPE, 5662-257), OS/VS2 MVS Release 3.8 and all subsequent releases including System Extensions and System Product, and MVS/XA unless otherwise stated. The 3380 and 3375 require the MVS/System Product-JES3 Release 1 (5740-XYN), or MVS/System Product-JES2 Release 1 (5740-XYS), MVS 3.8 3380/3375 PRPQ (5799-BFF) with Data Facilities Device Support (5740-AM7), MVS/370 Data Facility Product (5665-295), or MVS/XA Data Facility Product (5665-284). OS/VS1 users of the 3375 require Data Facilities Device Support (5740-AM6) with OS/VS1 Basic Programming Extensions (5662-257).

Prerequisites for the 3380 and 3375 need be present in the system only at the time when an actual or test migration of data sets to it is attempted; all other functions may be used without the device and its supporting software being installed. Sort, OS/VS Sort/Merge (5740-SM1) or equivalent, must be installed. The following IBM utility programs, supplied with the host operating system, must be installed on the system.

- IEHMOVE
- IEBUPDTE
- IEHPROGM
- IEBISAM
- IDCAMS
- IEBTPCH
- IEBCOPY

The following programs are required to install and maintain the Migration Aid:

- OS/VS Assembler and macro library
- OS/VS Assembler H Version 2 (5668-962) is required in the MVS/XA environment.
- IEBGENER
- System Modification Program Extended (SMP/E, 5668-949) or SMP/4 (with PTF UR03129).

Data sets, that have not been allocated as unmovable, using the following access methods are supported:

- BDAM
- BSAM/QSAM
- ISAM
- OSAM
- PAM
- VSAM

Multi-volume data sets must be cataloged.

COMPATIBILITY

DASD Migration Aid Release 1.1 is a functional update to the current release of the DASD Migration Aid and is upward compatible for all prior functions.

SECURITY

DASD Migration Aid Release 1.1 complies with and conforms to the data security and auditability controls of the systems it supports. The target of source data may be either RACF or password protected, which would require a user to be RACF-authorized or to supply the password. User management is responsible for evaluating, selecting, applying and implementing such features and for the appropriate administrative and application controls.

PROGRAM PRODUCTS

**DOCUMENT INTERCHANGE FACILITY/CENTRAL
VERSION 1 RELEASE 1 (5668-003)
DOCUMENT INTERCHANGE FACILITY/DISTRIBUTED
VERSION 1 RELEASE 1 (5668-004)**

PURPOSE

IBM offers a variety of products associated with word and text processing activities. Among these are:

- 8100 Information System with the DOSF/8100 (Distributed Office Support Facility) program product
- 3730 Distributed Office Communication System
- Document Library Facility
- Document Composition Facility (SCRIPT/VS)
- Advanced Text Management System-III (ATMS-III)
- Storage and Information Retrieval System (STAIRS/VS)
- Distributed Office Support System.

Individually, these products provide facilities for the creation, storage, revision and production of a wide variety of documentation items.

DESCRIPTION

Acting as a functional link, the Document Interchange Facility allows an enterprise to take advantage of these products within the same installation. Using the communications capabilities of the Customer Information Control System/VS (CICS/OS/VS or CICS/DOS/VS), the Document Interchange Facility/Central executes as a CICS/VS application, invoking the Document Library Facility through a supplied batch program. Documents created on an 8100 System with DOSF or a 3730 Distributed Office Communication System can be stored in a library of the Document Library Facility and formatted using the SCRIPT/VS formatter of the Document Composition Facility. Formatted documents may be printed on a system printer, saved in a library or returned to the DOSF/8100 or 3730 for local printing.

The Document Interchange Facility consists of two complementary program products:

Document Interchange Facility/Central - Operates as a transaction-initiated CICS/VS application in a host computer. It processes user requests from 8100 or 3730 controllers to 'IMPORT' documents to the Document Library Facility, to format documents using the SCRIPT/VS formatter of the Document Composition Facility and to retrieve documents from the Document Library Facility.

Document Interchange Facility/Distributed - Operates in the DOSF/8100 or 3730 controller and provides easy to use panels to prompt for information needed to submit requests to the Document Interchange Facility/Central.

HIGHLIGHTS

- Documents are created on the 8100 system with DOSF or the 3730 system using the 3732 Text Display Station.
- Documents may be filed in a library of the Document Library Facility.
- Documents sent to the Document Library Facility may optionally be translated into a form suitable for the SCRIPT/VS formatter of the Document Composition Facility.
- A user-provided translate routine can be used in place of the IBM-supplied routine. For example, a user-provided routine could convert controls to a set of Generalized Markup Language tags.
- Documents formatted by SCRIPT/VS can be directed to a system printer, stored in a library of the Document Library Facility or returned to the DOSF/8100 or 3730 for local printing.
- Advanced SCRIPT/VS functions, such as multiple-column formatting or footnote management, can be used by embedding appropriate SCRIPT/VS Generalized Markup Language tags or control words within the text of the documents created on the DOSF/8100 or 3730.
- Documents may be retrieved from a library of the Document Library Facility by document name (with or without translation) and placed in the appropriate DOSF/8100 or 3730 operator's permanent storage.
- Retrieved documents can be those previously transferred by the Document Interchange Facility to the Document Library Facility or those placed there by other applications.
- A list of documents stored in the Document Library Facility may be obtained for local printing.
- Documents may be deleted by name from a library of the Document Library Facility by any authorized text operator.

An added advantage of having documents filed in a library of the Document Library Facility is accessibility by other text-oriented applications, such as the use of ATMS-III for continual revision and production, user-provided data extraction and search routines, and for repetitive batch printing for quantity output.

CUSTOMER RESPONSIBILITIES

The customer must provide the proper operating environment by installing the required operating system, CICS/VS program product, Document Library Facility, DOSF/8100, 8100 or 3730 system, and supporting machine configuration.

Customer personnel must be trained and knowledgeable on the above products, as well as on any other products to be used in conjunction with the Document Interchange Facility.

The customer will develop procedures to insure data security, develop backup procedures, determine the overall tasks to be accomplished and install and operate the Document Interchange Facility. If necessary, the customer may wish to add special translate routines for documents being transferred between the DOSF/8100 or 3730 and the Document Library Facility.

SPECIFIED OPERATING ENVIRONMENT FOR DOCUMENT INTERCHANGE FACILITY/CENTRAL

HARDWARE REQUIREMENTS

The minimum requirement to execute the Document Interchange Facility/Central is an IBM S/370 mdl 125 or higher or other IBM processor with a main and external storage capacity and peripheral equipment as required for, and supported by, CICS/OS/VS or CICS/DOS/VS. Floating-point hardware is required for the Document Library Facility. A 3704 or 3705 Communications Controller is also required for a 3730 controller attached using telecommunications facilities rather than a channel. With a 4331 processor, the Integrated Communications Adapter may be used in place of a 3704 or 3705.

SOFTWARE REQUIREMENTS

The source code language for the Document Interchange Facility/Central is Assembler. It runs under control of CICS/OS/VS (5740-XX1) or CICS/DOS/VS (5746-XX3) Version 1 Release 5 and subsequent releases unless otherwise indicated.

Operation in an OS/VS environment requires OS/VS1 Release 7.0 or OS/VS2 MVS Release 3.8 together with VSAM and JES2 or JES3. A user SVC is supplied for installation in an OS/VS1 environment. Operation in a DOS/VSE environment requires DOS/VSE with VSE/Advanced Functions Release 2 (5746-XE8), VSE/VSAM (5746-AM2) and VSE/POWER (5746-XE3).

In addition, the release of ACF/VTAM Version 1 or ACF/VTAM Version 2 or ACF/VTAME (5746-RC7), as required by CICS/VS Release 1.5, is required. ACF/NCP/VS (5748-XX1) is required for the 3704 or 3705.

The Document Library Facility (5748-XXE) Release 2 is required. If document formatting at the host is to be done by the SCRIPT/VS formatter, the Document Composition Facility (5748-XX9) Release 2 is also required.

SPECIFIED OPERATING ENVIRONMENT FOR DOCUMENT INTERCHANGE FACILITY/DISTRIBUTED

HARDWARE REQUIREMENTS

- One IBM 8100 Information System as required to support the DOSF/8100 program product, and at least one IBM 3732 Text Display Station with keyboard, and at least one IBM 3736 Printer, -or-
- One IBM 3730 Distributed Office Communication System with Configuration Support #9171 and feature codes #9275 and #9285 with at least one IBM 3732 Text Display Station with keyboard and at least one print device which can be an IBM 3736 Printer or the IBM 3791 Line Printer Feature. The host attachment is by either the IBM 3791 Local Channel Attachment Feature (#1515) to a byte or block multiplexer channel or the IBM 3791 SDLC Communications Feature (#6301, 6302, or 6303) to an IBM 3704 or 3705 Communications Controller or a 4331 processor Integrated Communications Adapter.

SOFTWARE REQUIREMENTS

Document Interchange Facility/Distributed is written in IBM 3790 and IBM 3730 programming statements. If executed on an IBM 8100, the DOSF/8100 (5761-XR1) program product is required. The Program Validation Services (PVS) Release 11 or later, and Subsystem Support Services (SSS) programming support must be available.

DATA SECURITY

Control of access to Document Interchange Facility/Central is provided by CICS/VS. Authorized users of the DOSF/8100 or 3730 will have access to Document Interchange Facility/Distributed. Document security is provided by using those facilities already available in the Document Library Facility, the DOSF/8100 program product and the 3730. Access to libraries, or to the documents stored therein, may be protected by passwords. Documents stored in DOSF/8100 or 3730

Do not reproduce without written permission

PP 5668-003.2
Nov 83

PROGRAM PRODUCTS

Document Interchange Facility (cont'd)

permanent storage may also be protected by get and/or delete codes. Customer management is responsible for the implementation, application and adequacy of these controls.

In MVS, the Resource Access Control Facility (RACF) program product (5740-XXH) can be utilized to control authorized access to the libraries of the Document Library Facility, as well as to control access to CICS/VS transactions and address space.

PROGRAM PRODUCTS

**DOWNSTREAM LOAD UTILITY
RELEASE 1 (5668-006)****PURPOSE**

The Downstream Load Utility program product provides the function needed to load data into the 3644 Automatic Data Unit and/or the 8775 Display Terminal and/or equivalent devices such as the 7426 Terminal Interface Unit. The 3644 and the 8775 mdls 1 and 2 can be attached to the 4331 processor via the Loop Adapter Feature. The 8775 mdls 11 and 12 can be attached to the 4331 processor via the Communication Adapter (Feature #1601) or to the 4300 and S/370 processors via the 3704 or 3705 Communications Controller.

These devices require transmission of load data from the processor for the 3644 Automatic Data Unit (not supported by OS/VS1, MVS/370 or MVS/XA) and the downstream loadable function microcode for Enhanced Function, Enhanced Function with Magnetics or Multiple Partitions and Scrolling for the 8775 Display Terminal. They also require a mechanism to install distributed load data in system libraries. Downstream Load Utility supports both the receipt of load data for inclusion into the system or private library, and the transfer of the data to the device via ACF/VTAME with VSE, or via ACF/VTAM Version 1 Release 3 with OS/VS1 or ACF/VTAM Version 2 (VSE, OS/VS1, MVS/370 or MVS/XA) on demand. The use of existing system libraries, procedures and services allows the user to manage his configuration and application in a familiar fashion.

HIGHLIGHTS

Downstream Load Utility provides for the following functions to support the load requirements for the 3644 and IBM 8775:

- Two types of load data will be applied by Downstream Load Utility to the system libraries prior to its transmission to the device.
 - Distributed control storage load for the CSL Load (3644) and Enhanced Function Load (8775).
 - User defined data (3644 only) for the PTL load.
- 3644 Control Storage Load (CSL): The purpose of CSL is to provide the 3644 with its required Control Storage microcode. The loading takes place automatically upon unit power-on or after a power line disturbance (PLD).
- 3644 Parameter Table Load (PTL): The purpose of PTL is to provide the 3644 with user defined operational characteristics. After a successful CSL load the 3644 contains a default PTL and is operational. A user-generated PTL is constructed by the 3644 Parameter Table Generation Facility based upon user defined inputs and is required to personalize the 3644.
- 8775 Microcode Load: The 8775 requests the load of the downstream loadable microcode as part of its power on sequence. The load if required occurs at physical unit activation (for example, shortly after power on) of the 8775 display.
- Load Data Distribution: Both 3644 CSL and 8775 downstream loadable microcode are distributed in DTR format. 3644 PTL is created at the host processor through user defined input to the 3644 Parameter Table Generation Facility.

CUSTOMER RESPONSIBILITIES

Downstream Load Utility requires the VSE/Advanced Functions or OS/VS1, MVS/370 or MVS/XA release most current at the time of first customer shipment of Downstream Load Utility, and ACF/VTAME or ACF/VTAM as shown in the DSLU Support Summary Table under "Software Requirements". At least one tape unit must be available for program distribution and maintenance. Any system-supported tapes or DASD may be used with Downstream Load Utility. Sufficient I/O devices must be available to support the requirements for system input, system output, system residence and system data sets.

DASD space required for the program product is less than two cylinders of 3340 space in both the core image library and the source statement library. Additional DASD space is required in the program libraries for both IBM distributed device microcode and "Parameter Table Load" data from the IBM 3644 Parameter Table Generation Facility program (GEN3644).

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The Downstream Load Utility operates on the IBM 4300 or S/370 processors with either of the following:

- The IBM Loop Adapter feature (4331/21) to support the load requirements of:
 - The IBM 3644 Automatic Data Unit.
 - The IBM 8775 Display Terminal mdls 1 and 2, with the downstream loadable functions.

The IBM 3644 and the IBM 8775, mdls 1 and 2, attach either via the directly attached loop or via the data link attached loop to the IBM 4331 Processor.

- The Communication Adapter (feature #1601) (4331/21) or
- The IBM 3705 Communication Controller (4300 or S/370) to support the load requirements of the IBM 8775 mdls 11 and 12 with downstream loadable functions.
- At least one tape unit supported by VSE/Advanced Functions.
- Sufficient DASD space.

SOFTWARE REQUIREMENTS

DSLU requires:

- Either the VSE/Advanced Functions release most current at the time of first customer shipment of DSLU and ACF/VTAME, upgraded by a PTF to support DSLU, or ACF/VTAM Version 2.
- Or the OS/VS1 release most current at the time of first customer shipment of DSLU and ACF/VTAM Version 1 Release 3 or ACF/VTAM Version 2.

For the IBM 3644, the program product IBM 3644 Parameter Table Generation Facility (GEN 3644), 5668-998, is required.

PROGRAM PRODUCTS

**COMMUNICATION ORIENTED MESSAGE SYSTEM
OS/VS (CORMES) REL.1.0
5668-007**

PURPOSE

The Communication Oriented Message System OS/VS (CORMES) is designed to build the central "paperless" message exchange system in an organization connecting terminal users and application programs of different functions. It provides communication links:

- For the exchange of information between terminal users (action messages).
- For the interaction between application programs and terminal users (action messages).
- For triggering the execution of online application programs based on the occurrence of prespecified events (trigger messages).

CORMES operates under the Operating Systems OS/VS1 Release 6.7/7.0 and OS/VS2 MVS Release 3.7 (collectively referred to as OS/VS) or subsequent releases unless otherwise identified.

For data base management, the system uses the data base facilities of the Information Management System/Virtual Storage (IMS/VS) Version 1, Program Number 5740-XX2, Release 1.5 or subsequent releases unless otherwise identified.

For data communication, CORMES uses the facilities of the S/370 Customer Information Control System/Virtual Storage (CICS/VS) Version 1, Program Number 5740-XX1, Release 4 or subsequent releases unless otherwise identified.

HIGHLIGHTS

Terminal User Services

- Easy-to-use terminal functions to create, display, modify and distribute action messages.
- Routing of action messages from one user to another.
- Linkage to online application programs to process a user-selected action message.

Application Program Services:

- User macros to simplify the creation of action and trigger messages in user-written programs and their transfer to the central message file.
- Triggering of online application program execution according to prespecified events: A point in time, a time interval, a queue length or a combination of these.
- CORMES as a framework for the implementation of interactive application programs.

System Services

- Monitoring of the individual message queue of each terminal user by due date or by the number of received messages.

CUSTOMER RESPONSIBILITIES

This section briefly discusses the activities the user has to perform to make CORMES operational. It gives a rough guide for assessing the total installation effort. The assumption is that a system running under OS/VS with IMS/VS and CICS/VS has already been installed.

The installation procedure allows an easy installation of CORMES, including the sample, by use of object code facility. The distributed source code will be used for the final adaptation to the existing system environment, if necessary.

The major implementation steps are:

- Installation of CORMES according to the distribution tape and installation description.
- Execution of the supplied sample to verify the installation. This sample can also be used as a tool for training terminal users.
- Optionally, assembly of all CORMES online programs to include customer requirements.
- Modification and reassembly of existing programs for CORMES communication (according to the rules defined by CORMES) by use of macros and examples provided.
- Exchange of the sample data sets and tables by data sets and tables that describe the customer system.

The required changes within existing user programs have been reduced to a minimum. In addition, macros are provided to simplify the program interactions. Support is provided for Assembler, PL/I and COBOL programs.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

For compilation and/or execution of CORMES, an IBM S/370, a 3031, 3032 or 3033 Processor or a 4300 Processor (OS/VS1 only) with a main storage capacity large enough to run IMS/VS and CICS/VS is required.

For CORMES, additional storage is required: For the first terminal 16,500 bytes and for each additional terminal 3,000 bytes; for the first application program 11,800 bytes and for each additional program 1,200 bytes.

For the data bases and data sets, the same devices are used as supported by the basic software of OS/VS, CICS/VS, and IMS/VS.

One magnetic tape device is required for the installation.

At least one 1920-character or larger 3270 Display Station, attached to the appropriate control unit, must be available.

The online address space requirements for CORMES may vary widely, according to the number of active terminals. A minimum installation might require address space for a combined CICS/VS and IMS/VS user-task partition.

SOFTWARE REQUIREMENTS

CORMES is written in Assembler language and uses the macro language facility. Application programs that interact with CORMES can also be written in command-level languages.

CORMES is designed for an online OS/VS environment and requires the following programs:

- OS/VS1 Release 6.7/7.0 or OS/VS2 MVS Release 3.7
- CICS/VS Version 1, Program Number 5740-XX1, Release 4
- IMS/VS Version 1, Program Number 5740-XX2, Release 1.5

Subsequent releases of the above are also supported unless otherwise provided by IBM.

PROGRAM PRODUCTS

**SYSTEM PRODUCTIVITY FACILITY
SPF (5668-009)**

No longer available, effective September 30, 1982.

PURPOSE

The System Productivity Facility (SPF) is a program product which assists in program development. SPF is designed to take advantage of the characteristics of IBM 3270 display terminals and increases productivity in an interactive environment for users of both structured and conventional programming techniques.

The System Productivity Facility replaces the Structured Programming Facility program products (5740-XT8, 5748-XT3). The name has been changed to reflect the expansion of the product capabilities beyond structured programming. SPF includes significant new functions that simplify the development of interactive applications. New services are provided to display predefined screen images, build and maintain permanent tables of user information and generate output files for job submittal or other processing.

HIGHLIGHTS

- SPF consists of a comprehensive set of dialog management services and the program development facility.
- The dialog manager includes a new panel display service with enhanced function and improved usability over the previous Structured Programming Facility display capability.
- New functions added to SPF will simplify the development of interactive applications. These applications can execute in online environments. These SPF services provide the ability to:
 - Define and control symbolic variables.
 - Display predefined screen images and messages.
 - Build and maintain permanent tables of user information.
 - Generate output files for job submittal or other processing.
 - Interface to edit and browse, and log hardcopy output.
- Conversion utilities are provided in the program development facility to convert old format selection menus, tutorials and messages to the new panel and message formats.
- SPF consists of two major components: The dialog manager and the program development facility. The dialog manager provides control and services for running interactive applications.
- The dialog manager allows totally new applications to be developed, each with its own primary option menu. Applications may be independent, entered via separate command procedures or linked via menu options that transfer from one application to another.
- The SPF dialog manager provides control facilities to:
 - Traverse a hierarchy of selection menus and invoke the appropriate dialog functions.
 - Transfer in and out of the tutorial and control the sequence of tutorial pages based on user inputs.
 - Manage the physical display image in single screen or split screen mode.
 - Interpret program function (PF) key usage for system defined functions.
- Online tutorial can be entered in either of two ways:
 - As a selectable option from a menu or
 - Indirectly from any non-tutorial panel when the user presses the 'Help' PF key.
- Advantages of the new panel and message formats include:
 - Communication of user inputs (from panels) and substitution of parameters (in messages) via symbolic variables rather than positional calling sequence parameters.
 - Ability to verify user inputs in panel definitions.
 - Ability to test and set variables in panel definitions.
 - Improved control over field attributes, including specification of padding characters and justification.
 - Replacement of LIST/RETURN keywords with TRANS keyword in which the source and translated values are paired.
 - Simplification of selection menu and tutorial panel formats.
- The significant program development facilities include:
 - Support for multi-level programming libraries. Facilities maintenance and tracking of program segments under development at varying version and modification levels.
 - Full screen, context editing. Allows additions and changes to multiple lines in a single interaction. Simple one-character edit

commands are used for inserting, deleting, duplicating or rearranging lines of source data.

- Forward, backward and sideways scrolling of source data or listings, plus the ability to locate information by character string or line number.
- Interface to utilities for specification and maintenance of libraries, files and data sets.
- Interface to standard language processors for execution in the foreground or batch.
- Document preparation support, including text editing features and a menu interface to the SCRIPT/VS Document Composition Facility.
- Online tutorial for instruction and reference which is especially valuable for the occasional or novice user.
- The program development facility supports both structured and conventional programming techniques. Features which are especially oriented toward structured programming include:
 - Ease of segmentation changes. One segment (member) can easily be split into multiple segments or multiple segments can be merged into one.
 - Ease of indentation changes. Single statements or blocks of statements can easily be shifted left or right by a specified number of column positions.
 - Insert in context. A 'DO-END' pair, for example, may be coded on two consecutive lines and then space can be opened between the two lines to allow insertion of a block of code.
 - Visual verification aids. A block of code may be temporarily excluded from display so that the space which it occupies on the screen is closed up. This facilitates visual verification of the control structure, particularly when the length of a segment exceeds the screen size.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The System Productivity Facility is designed to operate on the following IBM machines: 303X, 4300 and S/370.

MVS

The machine requirements are the same as those for MVS with the Time Sharing Option (TSO).

Approximately 512K bytes of the pageable link pack area (PLPA) are required for SPF program occupancy. The virtual storage requirements for each user's region will vary depending upon the application being executed, the size of tables and data sets and the use of "split-screen". The minimum region size is 512K bytes, but a larger region (at least 1024K bytes) is recommended.

Approximately 20 cylinders of direct access storage are required for the panel, message and skeleton libraries distributed with SPF. This number assumes IBM 3330 disk storage. An equivalent amount of space is required for other types of devices.

VM

The machine requirements are the same as those for VM/370 with the Conversational Monitor System (CMS).

Approximately 512K bytes (8 segments) of a discontinuous shared segment (DCSS) area are required for SPF program occupancy. The virtual storage requirements for each user's virtual machine will vary depending upon the application being executed, the size of tables and files and the use of "split-screen". The minimum virtual machine size is 512K bytes, but a larger virtual machine (at least 1024K bytes) is recommended.

Approximately 20 cylinders of direct access storage are required for the panel, message and skeleton libraries and EXECs distributed with SPF. This number assumes IBM 3330 disk storage. An equivalent amount of space is required for other types of devices.

Execution of SPF also requires a disconnected virtual machine which communicates with each user's machine via the VM Communication Facility (VMCF).

TERMINALS**MVS**

SPF requires an IBM 3270 type display terminal with at least 24 lines and 12 PF Keys.

SPF supports the following IBM display stations:

3275 mdls 2 and 12
3276 mdls 2, 3, 4, 12, 13 and 14

PROGRAM PRODUCTS

SPF (cont'd)

- 3277 mdl 2 (local or remote attachment)
- 3278 mdls 2, 3, 4 and 5 (local or remote attachment)
- 3279 All mdls (local or remote attachment), when operated in 4-color compatibility mode

The following IBM keyboards are supported:

For 3275 or 3277 Display Stations:

- 78-Key Operator Console (feature #4632)
- 78-Key EBCDIC Typewriter (feature #4633)
- 78-Key ASCII Typewriter (feature #4635)
- 78-Key EBCDIC Typewriter/APL (feature #4638), when operated with APL switch off.

For 3276, 3278 or 3279 Display Stations:

- 75-Key EBCDIC Typewriter (feature #4621)
- 75-Key ASCII Typewriter (feature #4624)
- 87-Key EBCDIC Typewriter (feature #4627)
- 87-Key ASCII Typewriter (feature #4628)
- 87-Key EBCDIC Typewriter/APL (feature #4626), when operated with APL switch off.
- 87-Key EBCDIC Typewriter/Text (feature #4629), when operated with TEXT switch off.

The standard character set (94 graphics plus blank and null) is supported on 3276, 3278 and 3279 Display Stations.

The following are supported, but not required:

- Audible alarm (feature #1090)
- IBM 3268, 3284, 3286, 3287, 3288 and 3289 printers
- 3277 dual-case character set (RPO #8K0366)

Installation of the audible alarm feature is strongly recommended to enhance usability. The alarm is sounded whenever a warning or error message is displayed.

The IBM 3268, 3284, 3286, 3287, 3288 and 3289 printers, if used, are supported via the "DSPRINT" TSO command processor, which must be installed if output is directed to one of these printers.

VM

SPF requires an IBM 3270 type display terminal with at least 24 lines and 12 PF Keys.

SPF supports the following IBM display stations:

- 3275 mdl 2
- 3275 mdl 12 (via VM/VCNA)
- 3276 mdls 2, 3, and 4
- 3276 mdls 12, 13 and 14 (via VM/VCNA)
- 3277 mdl 2 (local or remote attachment)
- 3278 mdls 2, 3, 4 and 5 (local or remote attachment)
- 3279 All mdls (local or remote attachment), when operated in 4-color compatibility mode

The following keyboards are supported:

For 3275 or 3277 Display Stations:

- 78-Key Operator Console (feature #4632)
- 78-Key EBCDIC Typewriter (feature #4633)
- 78-Key EBCDIC Typewriter/APL (feature #4638), when operated with APL switch off.

For 3276, 3278 or 3279 Display Stations:

- 75-Key EBCDIC Typewriter (feature #4621)
- 87-Key EBCDIC Typewriter (feature #4627)
- 87-Key EBCDIC Typewriter/APL (feature #4626), when operated with APL switch off.
- 87-Key EBCDIC Typewriter/Text (feature #4629), when operated with TEXT switch off.

The standard character set (94 graphics plus blank and null) is supported on 3276 and 3278 Display Stations.

The following are supported, but not required:

- Audible alarm (feature #1090)
- 3277 dual-case character set (RPO #8K0366)

Installation of the audible alarm feature is strongly recommended to enhance usability. The alarm is sounded whenever a warning or error message is displayed.

SOFTWARE REQUIREMENTS

The System Productivity Facility is designed for use on the OS/VS2 (MVS) operating system with TSO environment, and on the VM/370 operating system with CMS and VM/SP. The program operates with the current releases of MVS and the VM operating systems.

MVS

SPF operates as a TSO command processor under the Time Sharing Option of VS2 Release 3.8 (MVS). The BPAM and BSAM access methods are required by SPF for reading and writing data sets, and TSO/TCAM or TSO/VTAM are required for terminal communication.

The following teleprocessing access methods are supported:

- TCAM 10 (available with MVS)
- ACF/TCAM Version 2, Releases 2 and 3 5735-RC3
- VTAM 2 (available with MVS)
- ACF/VTAM Version 1 Releases 2 and 3 5735-RC2
- ACF/VTAM Version 2 5665-280

The SPF program development facility provides interfaces to the following IBM processing programs for foreground and background execution:

- VS2 Assembler (available with MVS)
- TSO Assembler Prompter (foreground only) 5734-CP2
- COBOL Compiler and Library 5740-CB1
- TSO COBOL Prompter (foreground only) 5734-CP1
- COBOL Interface Debug (foreground only) 5734-CB4
- FORTRAN IV G1 Compiler 5734-FO2
- TSO FORTRAN Prompter (foreground only) 5734-CP3
- FORTRAN Interactive Debug (foreground only) 5734-FO5
- PL/I Checkout Compiler 5734-PL2
- PL/I Optimizing Compiler 5734-PL1
- PASCAL Compiler 5796-PNQ
- Linkage Editor (available with MVS)

The appropriate processing programs and TSO prompters must be installed to use the foreground and background options.

An interface to SCRIPT/VS is also provided to allow formatting, display and printing of text maintained in SPF libraries or other data sets. Use of this feature requires installation of the following IBM program product:

- Document Composition Facility (SCRIPT/VS) with the Foreground Environment Feature 5748-XX9

Internal interfaces are provided to the following IBM programs. These programs are not required to operate SPF. However, if an IBM 3268, 3284, 3286, 3287, 3288 or 3289 printer is used for SPF output, the appropriate DSPRINT command processor must be installed on the system.

- OS/VS2 MVS 3270 Extended Display Support - Session Manager, Release 2 5740-XE2
- TSO/TCAM Command Processor "DSPRINT" 5798-AYF
- TSO/VTAM Data Set Print (DSPRINT) 5798-CPF
- TSO/VS2 Programming Control Facility (PCF) 5798-BBJ
- TSO Programming Control Facility - II (PCF2) 5798-CLW

All the program-numbered products listed above can be ordered separately under IBM licensing agreements.

VM

SPF operates as a CMS command under VM/370 Release 6. It uses the VM Communication Facility for inter-machine communication and uses the full-screen display support of the following program product which must be installed:

- VM/System Product (VM/SP) 5664-167

If SPF is to be used with SNA 3270 Displays, the following program product must be installed:

- VM/VCNA 5735-RC5

VM/VCNA requires a VS1/BPE guest system with ACF/VTAM or a VSE system with VTAME or ACF/VTAM.

The SPF program development facility provides interfaces to the following IBM processing programs for foreground and batch execution:

- VM/370 Assembler (available with VM)
- COBOL Compiler and Library 5740-CB1
- COBOL Interactive Debug (foreground only) 5734-CB4
- FORTRAN IV G1 Compiler 5734-FO2
- FORTRAN Interactive Debug (foreground only) 5734-FO5
- PL/I Checkout Compiler 5734-PL2
- PL/I Optimizing Compiler 5734-PL1
- PASCAL Compiler 5796-PNQ

The appropriate processing programs must be installed to use the foreground and batch options.

An interface to SCRIPT/VS is also provided to allow formatting, display and printing of text maintained in SPF libraries or CMS files. Use of this feature requires installation of the following IBM program product:

SPF (cont'd)

Document Composition Facility
(SCRIPT/VS) with the
Foreground Environment Feature 5748-XX9

Guide	SC34-2036	SC43-2049
Licensed Program		
Specifications	SC34-2035	GC34-2050
Program Logic Manual	LY25-0006	LY25-0010

Internal interfaces are provided to the following IBM program. This program is not required to operate SPF, but must be installed if spool output is to be sent to another node on the network.

RSCS Networking 5748-XP1

All the program-numbered products listed above can be ordered separately under IBM licensing agreements.

COMPATIBILITY

All existing function in the Structured Programming Facility TSO (5740-XT8) and CMS (5748-XT3) will be carried forward in SPF.

INSTALLATION RESPONSIBILITIES

MVS

The installation of SPF requires a properly configured IBM S/370 or 303X, appropriate terminals and other required devices and MVS with the Time Sharing Option (TSO). Also, appropriate processing programs and TSO prompters must be installed to use the SPF foreground and background options, and the Document Composition Facility must be installed to use the SCRIPT/VS utility.

To install SPF, operations personnel must be knowledgeable in OS/VS JCL, TSO and the System Modification Program (SMP). Installation procedures are described in the *SPF Installation and Customization Guide*.

If SPF is to be used with TSO/TCAM, a TCAM MCP generation is required to obtain full-screen support in the TSO/TCAM environment. This MCP generation is required to eliminate interference between the full screen I/O operations used by SPF and the line-oriented I/O operations used by TSO. No other changes are required to TSO or TCAM.

A dialog developer must be familiar with MVS, TSO and appropriate programming languages, and should review the *SPF Dialog Development Guide*. A user of the SPF Program Development Facility must be familiar with MVS and TSO, and should review the *SPF Program Reference Manual*.

Special SPF training or courses are not required for programming personnel familiar with the IBM 3270, the programming and machine systems and the language processors in use.

VM

The installation of SPF requires a properly configured IBM S/370, 303X or 4300 processor, appropriate terminals and other required devices and VM/370 with the Conversational Monitor System (CMS) and the VM/SP program product. Also, appropriate processing programs must be installed to use the SPF foreground and batch functions, and the Document Composition Facility must be installed to use the SCRIPT/VS utility.

To install SPF, operations personnel must be knowledgeable in VM/CMS and the computer system. Installation procedures are described in the *SPF Installation and Customization Guide*.

A dialog developer must be familiar with VM/CMS and appropriate programming languages, and should review the *SPF Program Development Guide*. A user of the SPF Program Development Facility must be familiar with VM/CMS and should review the *SPF Program Reference Manual*.

Special SPF training or courses are not required for programming personnel familiar with the IBM 3270, the programming and machine systems and the language processors in use.

DATA SECURITY

SPF runs in the environments produced by TSO in MVS and by CMS in VM/370 and is subject to the controls provided by these environments. SPF runs as a TSO Command Processor with or without the Resource Access Control Facility (RACF). SPF also provides an interface to the standard MVS TSO Password Protection mechanism. Customer management is responsible for the selection, implementation and adequacy of these facilities.

PROGRAM PRODUCTS

**INTERACTIVE INSTRUCTIONAL
AUTHORING SYSTEM
5668-011****PURPOSE**

The Interactive Instructional Authoring System is an IBM Program Product that provides the capability to create (author) and maintain computer based training courses. These courses will run under Interactive Instructional Presentation System (5668-012), a companion product which is a prerequisite.

DESCRIPTION

For the course author, three methods of creating course materials are available:

- Course Structuring Facility
- Simulation Exercise Facility
- Coursewriter Language

The Course Structuring Facility provides simplified course development and course organization facilities for both the new and the experienced author.

Specific fill-in-the-blanks worksheets allow for entering, analyzing, and structuring the following:

- TEXT - Tutorial information.
- QUESTIONS - True/false, matching, multiple choice, single or multiple constructed answers.
- SCREEN FORMATS - Enables author to use special terminal screen displays to simulate other terminal applications as part of a training course.

The Simulation Exercise Facility provides a means of creating a series of computer based training exercises which students can access through topic menus. Facilities to simulate online applications are included.

Using the Coursewriter language, the author is free to decide on the instructional strategies to be implemented. Language codes allow the author to enter lines of text, ask questions, evaluate responses, and provide remedial text for incorrect student responses. Experienced authors may write their own macros (frequently used course statements in skeletal form).

The system also includes commands for author use in storing, moving, and deleting course material as well as inserting new material into already existing text.

The entry of course material can be accomplished in either batch processing mode or at the terminal, interactively.

Computer Based Training courses on advanced authoring support facilities are provided as a part of the Authoring System.

An interactive method of creating full screen formats for subsequent use in courses is provided.

CUSTOMER RESPONSIBILITIES

Before installation of the Interactive Instructional Authoring System the customer must install the prerequisite product, Interactive Instructional Presentation System (5668-012). Then the customer must install Interactive Instructional Authoring System and:

- Register authors and courses for development as required.
- Administer course creation and maintenance.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The Interactive Instructional Authoring System is designed to operate on all processors capable of supporting the prerequisite product - Interactive Instructional Presentation System (5668-012). Machine requirements vary depending on operating environment. The Interactive Instructional Authoring System requires a properly configured IBM S/370, 303X or 4300 processor. Storage requirements given below are estimates for planning purposes. (Note, K = 1024).

VTAM, TCAM

The versions of the Interactive Instructional Authoring System that support the VTAM and TCAM environments will be pre-generated for each environment. The pre-generated version will utilize 456K bytes of virtual storage for VS1 and VS2, in addition to the storage requirements of the host system, and will include provision for:

20 Course Files
200 Courses
7 WorkFiles
100 Users

These parameters can be changed by the customer at execution time through the use of control cards. Working storage (real storage) for the default system with all 100 users on the system simultaneously (assuming 85% of the users are students) is estimated to be less than 200K bytes in addition to that required by the teleprocessing access

method and other components of the host system. Utilization of system resources, and therefore working storage, will increase as the number of active authors increases.

IMS/VS, CICS/VS, TSO, CMS

The Interactive Instructional Authoring System under IMS/VS, TSO or CMS will require the following S/370 virtual storage for the duration of each transaction:

280K Administrator
280K Author
280K Student

Under CICS/VS, a shared program storage area of 260K bytes is required. Each transaction requires an additional 20K bytes for the duration of that transaction.

Input/Output Devices: Sufficient direct access storage must be provided to satisfy the requirements of the online data sets. This will be approximately 35 cylinders of 3330 space for all host environments except IMS/VS. Approximately 60 cylinders of 3330 space are required under IMS/VS. Additional space for course materials will be required.

Approximately 45 cylinders of 3330 DASD space will be required for the storage of courses delivered with the Interactive Instructional Authoring System.

DOS based installations of this product do not support 23XX DASD.

Distribution and Maintenance: Installation and maintenance of the instructional system requires the availability of one tape drive.

Terminals Supported: The Interactive Instructional Authoring System provides support for IBM 3277, IBM 3275, IBM 3276, IBM 3278 and IBM 3279 terminals. Screen sizes of 24x80, 32x80 and 43x80 are supported in those environments supporting and identifying the appropriate models. Typewriter, data entry, APL and text keyboards are supported in those environments that permit identification of the keyboard type. SDLC, BSC and local IBM protocols are supported as permitted by each environment. Support for IBM 3279 terminals is for IBM 3278 functions. Color support is provided only via the 4-color default mode of the 3279. Support for IBM 3278 mdl 5 is in default mode (24x80). Programmable Symbol Set is not supported.

The Interactive Instructional Authoring System provides support for non-3270 type terminals only in line-at-a-time mode. The IBM 2741 mdl 1 is supported in those environments with appropriate support. CPT-TWX (mdl 33/35) Line Control Type is supported in those environments with appropriate support.

It is the user responsibility to assure the equivalence at the software interface of other terminals as well as the suitability of non-hardcopy terminals using hardcopy interfaces.

Since update transactions are employed under IMS, non-checking terminals are not supported.

SOFTWARE REQUIREMENTS

The Interactive Instructional Presentation System, a prerequisite product, runs in a variety of teleprocessing environments. That product in turn provides the operating environment for Interactive Instructional Authoring System. See the pages for Interactive Instructional Presentation System for a description of appropriate operating environments.

COMPATIBILITY

Courses running under the predecessor product, Interactive Instructional System (5748-XX6), will run without change.

Users planning simultaneous operation of this product and its predecessor should carefully review the pertinent operations guides for information on special installation and operational restrictions when using this mode of operation.

Courses using 3270 dynamic formatting operation codes are not supported by the instructional system in the IMS/VS environment.

PERFORMANCE CONSIDERATIONS

The performance of the instructional system in a virtual storage environment is dependent on the system resources available, the programs that operate concurrently and their relative priorities, system and application data set placement, and system timing. Performance also depends on the paging characteristics and storage reference patterns of the system and its courses, the allocation of data sets to particular devices, and the particular data being processed.

For specific online performance and response time requirements, attention must be given to ensuring that adequate real resources (main storage, processor computing capability, channels, direct access devices, etc.) are available. To verify specific performance (particularly on systems with a large number of concurrent terminal users), benchmarking the instructional system should be planned.

PROGRAM PRODUCTS

Interactive Instructional Authoring System (cont'd)

Courses that utilize 3270 native mode facilities (light-pen, PF keys, field definitions, etc.) will not operate under CMS unless necessary extensions to diagnose code 58 function have been added to the VM/370 system.

The necessary extensions are available in each of the following programs:

- VM/System Extensions Program Product, 5748-XE1
- VM/Basic Systems Extensions Program Product, 5748-XX8
- VM/System Product, 5664-167

PROGRAM PRODUCTS
**INTERACTIVE INSTRUCTIONAL PRESENTATION
 SYSTEM
 5668-012**
DESCRIPTION

The Interactive Instructional Presentation System is an IBM Program Product that provides terminal based training and instructional capability by utilizing available IBM Data Base/Data Communication Systems (IMS/VS and CICS/VS), Interactive Systems (CMS and TSO), and Terminal Access Methods (VTAM and TCAM). No modification is necessary to the programs of the host system. Interactive Instructional Presentation System (5668-012) is a prerequisite for its companion product, Interactive Instructional Authoring System (5668-011) which is used to create course material for delivery under Interactive Instructional Presentation System.

The Interactive Instructional Presentation System provides an environment in which users can maintain, administer and deliver instructional materials via an online training system. They can use their existing data processing equipment and teleprocessing terminal network for training or instructional applications while at the same time running other programs.

Interactive Instructional Presentation System is a follow-on product to Interactive Instructional System (5748-XX6) and is compatible at the language level with that product (see "Compatibility" section). Courses developed under Interactive Instructional System will run without change under Interactive Instructional Presentation System.

Through the use of specific terminal commands, an administrator can view the record(s) of a particular student, a group of students or all students as they relate to course registrations, performance in a course and course completions.

Depending on the options specified during student registration, printed reports may be obtained to aid authors in improving their courses during and after the course validation cycle.

Students can use any terminal identified for the Interactive Instructional Presentation System; however, they can only take the course(s) for which they are registered. The students' progress through the course is based on their keyed responses and the logic flow of the course as determined by the course author.

Student commands allow the student to:

- Ask for optional help or hint statements which the author may have included in the course.
- Move around the course at will, provided the author agrees with this approach and has supplied the proper keywords to enter.
- Access a glossary for definitions of important words.
- Page backward or forward through previously presented material.
- Send comments directly to the author.

Additional commands permit maintenance of the courses at the Coursewriter language level.

CUSTOMER RESPONSIBILITIES

Before installation of the Interactive Instructional Presentation System, the customer must meet the "Hardware Requirements" as specified in this document and ensure that the host telecommunications system is fully operational.

Then, the Interactive Instructional Presentation System must be installed and the customer must:

- Register courses and students as required.
- Load the course materials into the system, and
- Administer course offerings and schedules.

Course materials may be purchased or authored by the customer.

Note: Customer authoring of course materials requires the availability of the companion product "Interactive Instructional Authoring System" (5668-011) on the processor(s) used for authoring.

SPECIFIED OPERATING ENVIRONMENT
HARDWARE REQUIREMENTS

The Interactive Instructional Presentation System is designed to operate on all sufficiently configured IBM Virtual Storage processors capable of supporting the host environments depicted in Figure 1. Machine requirements vary depending on operating environment. The Interactive Instructional Presentation System requires a properly configured IBM S/370, 303X or 4300 processor. Storage requirements given below are estimates for planning purposes. (Note, K = 1024.)

VTAM, TCAM

The versions of the Interactive Instructional Presentation System that support the VTAM and TCAM environments will be pre-generated for each environment. The pre-generated version will utilize 456K bytes of virtual storage for VS1 and VS2, in addition to the storage requirements of the host system, and will include provision for:

- 20 Course Files
- 200 Courses
- 7 Work Files
- 100 Users

These parameters can be changed by the customer at execution time through the use of control cards. Working storage (real storage) for the default system with all 100 users on the system simultaneously (assuming 85% of the users are students) is estimated to be less than 200K bytes in addition to that required by the teleprocessing access method and other components of the host system. Utilization of system resources, and therefore working storage will increase as the number of active authors increases.

IMS/VS, CICS/VS, TSO, CMS

The Interactive Instructional Presentation System under IMS/VS, TSO or CMS will require the following S/370 virtual storage for the duration of each transaction:]

- 280K Administrator
- 280K Author
- 280K Student

Under CICS/VS, a shared program storage area of 260K bytes is required. Each transaction requires an additional 20K bytes for the duration of that transaction.

Input/Output Devices: Sufficient direct access storage must be provided to satisfy the requirements of the online data sets. This will be approximately 35 cylinders of 3330 space for all host environments except IMS/VS. Approximately 60 cylinders of 3330 space are required under IMS/VS. Additional space for course materials will be required. Approximately 10 cylinders of 3330 DASD space will be required for the storage of courses delivered with the Interactive Instructional Presentation System.

DOS based installations of this product do not support 23XX DASD.

Distribution and Maintenance: Installation and maintenance of the instructional system requires the availability of one tape drive.

Terminals Supported: The Interactive Instructional Presentation System provides support for IBM 3277, IBM 3275, IBM 3276, IBM 3278 and IBM 3279 terminals. Screen sizes of 24x80, 32x80 and 43x80 are supported in those environments supporting and identifying the appropriate models. Typewriter, data entry, APL and text keyboards are supported in those environments that permit identification of the keyboard type. SDLC, BSC and local IBM protocols are supported as permitted by each environment. Support for IBM 3279 terminals is for IBM 3278 functions. Color support is provided only via the 4-color default mode of the 3279. Support for IBM 3278 mdl 5 is in default mode (24x80). Programmable Symbol Set is not supported.

The Interactive Instructional Presentation System provides support for non-3270 type terminals only in line-at-a-time mode. The IBM 2741 mdl 1 is supported in those environments with appropriate support. CPT-TWX (Model 33/35) Line Control Type is supported in those environments with appropriate support.

It is the user's responsibility to assure the equivalence at the software interface of other terminals as well as the suitability of non-hardcopy terminals using hardcopy interfaces.

Since update transactions are employed under IMS, non-checking terminals are not supported.

SOFTWARE REQUIREMENTS

The Interactive Instructional Presentation System permits the user to manage use of transaction processing and the training facilities. It is written in Assembler language and can use any of the following IBM S/370 facilities to present courses to students.

The Interactive Instructional Presentation System will operate with the version, release and/or levels of the host system current at the initial availability of the Interactive Instructional Presentation System. It will also operate with subsequent host system releases unless otherwise identified.

Note: DOS based installations require DOS/VSE Release 2 and do not support 23XX DASD.

- Data Base/Data Communication Systems (DB/DC)
 - Information Management System/Virtual Storage (5740-XX2)

PROGRAM PRODUCTS

Interactive Instructional Presentation System (cont'd)

- Customer Information Control System/OS/VS (5740-XX1)
- Customer Information Control System/DOS/VS (5746-XX3)

For operating system support refer to IMS/VS and CICS/VS programming systems support in the appropriate IMS/VS and CICS/VS documentation.

- Interactive Systems
 - Conversational Monitor System
 - Time Sharing Option with TCAM or VTAM (MVS only)

For interactive system support refer to the CMS and TSO programming systems support in the appropriate CMS and TSO documentation.

- Terminal Access Methods
 - Virtual Telecommunications Access Method
 - Telecommunications Access Method

For terminal access method support refer to VTAM and TCAM programming systems support in the appropriate VTAM and TCAM documentation.

The following figure portrays facilities and access methods used during instructional system operation.

S/370 Facility	Teleprocess Facility	Access Method	
		DIRECT	SEQUENTIAL
IMS/VS	IMS	IMS	QSAM
CICS/OS/VS	CICS	CICS	CICS
CICS/DOS/VS	CICS	CICS	CICS

BATCH OS/VS	QSAM	BDAM	QSAM

* = CP Diagnose 57 for 3277 Display Station
** = VSAM is intended primarily for use on FBA devices

Figure 1. System/370 Facility and Access Methods

COMPATIBILITY

Courses running under the predecessor product, Interactive Instructional System 5748-XX6, will run without change.

Users planning simultaneous operation of this product and its predecessor should carefully review the pertinent operations guides for information on special installation and operational restrictions when using this mode of operation.

Courses using 3270 dynamic formatting operation codes are not supported by the instructional system in the IMS/VS environment.

Courses that utilize 3270 native mode facilities (light-pen, PF keys, field definitions, etc.) will not operate under CMS unless necessary extensions to diagnose code 58 function have been added to the VM/370 system.

The necessary extensions are available in each of the following programs:

- VM/System Extensions Program Product, 5748-XE1
- VM/Basic Systems Extensions Program Product, 5748-XX8
- VM/System Product, 5664-167

PERFORMANCE CONSIDERATIONS

The performance of the instructional system in a virtual storage environment is dependent on the system resources available, the programs that operate concurrently and their relative priorities, system and application data set placement and system timing. Performance also depends on the paging characteristics and storage reference patterns of the system and its courses, the allocation of data sets to particular devices and the particular data being processed.

For specific online performance and response time requirements, attention must be given to ensuring that adequate real resources (main storage, processor computing capability, channels, direct access devices, etc.) are available. To verify specific performance (particularly on systems with large number of concurrent terminal users), benchmarking the instructional system should be planned.

**5668-870 - 4730 PBM CUSTOMIZATION IMAGE BLDR.
4730 PERSONAL BANKING MACHINE
CUSTOMIZATION IMAGE BUILDER****PURPOSE**

The 4730 Personal Banking Machine (PBM) Customization Image Builder provides a method for the customer to create and/or modify a customization image for the 4730 Personal Banking Machine. The program product consists of the customization image builder program and a collection of sample input source files. The financial institution selects one or more of the samples provided, and then uses the program to process the sample file and to create an image for the 4730

HIGHLIGHTS

- Easy to customize by modifying sample images provided.
 - Unnecessary to structure or write user program using macros.
 - User changes fields in easy-to-read sample source image by expressing alternate customization options in decimal or mnemonic values.
 - User-selected full-screen editor for changes.
- Customization Image Builder outputs are self-documenting and aid security.
 - Customized image, ready to transmit.
 - New, easy-to-read record of selected options in customized image.
 - Image audit code (optional) as basis for image security verification system.

CUSTOMER RESPONSIBILITIES

The following are customer responsibilities:

- Provision of specified operating environment.
- Program installation.
- Modification of sample source images to meet customer requirements.
- Transmission of image to 4730.
- Problem determination.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The Customization Image Builder can run on any IBM hardware configuration that supports one of the operating systems listed below under "Software Requirements". The program is distributed on magnetic tape at 1600 or 6250 bits per inch; therefore, a magnetic tape drive is required to load the program. The program requires approximately 40,000 bytes of virtual storage in addition to the storage required by the operating system.

Direct access storage is required for the program input (the image source file), and for the program outputs (the listing file and the image file). The sizes of these files depend on the 4730 options that are specified in the image. The source and listing files may require from one to several hundred thousand bytes each. The image file may require up to 20K bytes.

SOFTWARE REQUIREMENTS

Required Programs: The Customization Image Builder requires one of the following standard operating systems at the level current when the Customization Image Builder is available, or at a later level:

- VSE/Advanced Function
- SSX/VSE
- OS/VS1
- OS/VS2 MVS
- MVS/XA

Optional Programs:

- It is expected that most installations will use a display terminal and a full-screen editor program to modify the sample image source files that are supplied with the Customization Image Builder program. The Customization Image Builder does not provide the editing function.
- Additional programming is required to transmit the image file that is produced by the Customization Image Builder to the 4730. The customization image builder does not provide the loading function. At the time of Limited Availability of Customization Image Builder, the then current release of the 4700 Finance Communication System Host Support program will contain facilities to store and manage the output customization image file, and to transmit it to the 4730. However, user coding will be required to transmit the customization image from an intermediate 4701 Finance Communication Controller to a 4730(s).

- The DES data encryption program BDKDES, or equivalent, allows the Customization Image Builder to calculate an audit check code for the image. The program BDKDES is available as a feature of the 4700 Finance Communication System Host Support program.

SECURITY, AUDITABILITY and CONTROL

Customization Image Builder utilizes the security and auditability features of the S/370, 303X, 308X, or 43XX processors. User management is responsible for evaluating, selecting, applying, and implementing such features and for the appropriate administrative and application controls.

MVS INTEGRITY

IBM will accept APARs describing any situation where the installation of this program introduces an exposure to the system integrity of MVS. Refer to the IBM Programming Announcement on MVS System Integrity dated October 21, 1980. This program is intended to run unauthorized.

RPQs ACCEPTED: No

**5668-871 - 4730 PBM NETWORK MONITOR
4730 PERSONAL BANKING MACHINE
NETWORK MONITOR**

PURPOSE

The 4730 Personal Banking Machine (PBM) Network Monitor, a licensed program operating with S/370 Computers (including 303X and 308X) and 4300 Processors, provides monitor and control functions for a network of 4730 Personal Banking Machines. The PBM Network Monitor maintains a record of the current status of each 4730 and provides continuous control of 4730 operations. It operates interactively as either a CICS or an IMS application program that uses online data files for 4730 status data collection.

HIGHLIGHTS

- Facilitates continuous operation of the 4730 network and provides for continuous network monitoring.
- Automates the function of controlling the 4730.
- Separates the 4730 monitor and control functions from the user-written financial applications.
- Provides for accurate and current 4730 status information enabling an operator to quickly identify 4730 problems and expedite servicing.
- Provides for flexibility in defining the 4730 network.
- Provides for monitor and control functions to be performed at multiple sites.
- Supports remote monitor sites for intermediate processor/controller-based systems.
- Provides a complete audit trail of 4730 environment changes.
- Provides for user access to the 4730 environment data.
- Provides 4730 message security facilities.
- Supports the use of color in displays capable of color display.
- Provides a user-friendly monitor and control interface.

DESCRIPTION

The 4730 Personal Banking Machine Network Monitor program product provides 4730 monitor and control functions, thereby permitting the user to direct his programming efforts to developing application programs supporting 4730 financial transactions. The functions and facilities provided are:

- Automated Functions: PBM Network Monitor has automated many of the tasks associated with monitoring and controlling the 4730s such as:
 - Performing initialization and startup procedures to open the 4730 for business.
 - Performing recovery action to reopen the 4730 after certain closures such as servicing or communication failure.
 - Logging 4730 events, such as status changes, and PBM Network Monitor actions to a data base; and selectively printing to an online monitor printer. This function provides a record of changes to a 4730, as well as all of its components, and alerts the operator to situations that need attention.
 - Notifying an operator when supplies need replenishing or containers, such as the envelope and check depositories, are nearly full and should be emptied.
 - Soliciting status from idle 4730s.
 - Periodically changing communication encryption keys.

By automating the device reporting functions necessary to manage the 4730s, the operator may now dedicate his attention to those functions required to monitor the availability and status of the 4730s under his control.

- Status Monitoring: This includes online operator commands to solicit current status from the 4730, request several different views of the current status of a network of 4730s or components of a 4730, and view online event history data of a 4730. The availability of accurate and current 4730 status information can assist an operator to quickly identify 4730 problems and expedite servicing.
- Network Control: This includes the ability for a 4730 network operator to open and close a 4730, change the 4730's date and time, reconfigure 4730 components, and acquire the 4730 supply and usage totals. These totals include the currency and depository counts. All of these functions can be performed for either a single 4730 or for a group of 4730s.
- Monitor and Control Operator Interface: Monitor and control functions are presented to the operator through a set of logically connected menus and screens. PBM Network Monitor is designed to accommodate both the novice and the more experienced operator. An extensive use of menus, which guide the operator

~~from one screen to the next, helps accelerate operator training. (As the operator becomes more proficient, a direct, command-line access to the desired screen is provided.)~~ PBM Network Monitor allows the user to partition network control operations among more than one operator and more than one monitor site. These monitor sites may be either located at the host computer or at various locations throughout the 4730 network.

- Security Control: This includes the ability to manage 4730 message security and access security. Message security is accomplished using DES encryption to verify data content in messages exchanged between the PBM Network Monitor and the 4730 Personal Banking Machine. This function is available to user application programs which may call PBM Network Monitor encryption and decryption routines to authenticate messages received from and sent to the 4730. Access security facilities verify the identity of the 4730 Personal Banking Machine prior to allowing it to gain access to a customer's system.
- Network Definition: This includes the ability to define and change the 4730 network structure and the 4730 startup and administrative servicing options. Each 4730 in the network can be identified by user naming conventions and organized into the network using user unique logical structure. Changes can be accomplished online without disrupting daily operations. These facilities allow the installation to customize the network structure as well as control the amount of resources associated with 4730 startup sequence.
- Remote Application Interface: This includes an interface that allows the PBM Network Monitor to monitor and control 4730s that are indirectly attached through an intermediate processor, such as the 4701 Finance Communication System Controller. It also includes functions to support receipt of device status and operational information that is collected by user-written device control applications in the intermediate processor during periods of offline operation.
- User Application Interfaces: This includes encryption and decryption service routines that may be called by the customer's programs. These routines perform authentication of messages received from and sent to the 4730. The PBM Network Monitor also provides an interface that allows the user application to gain access to the 4730 currency denominations, currency counters and the depository counts. The PBM Network Monitor provides support for invoking user-written programs designed to interact with an operator at the 4730 Personal Banking Machine. With access to these PBM Network Monitor facilities, user financial applications can more easily perform settlement functions and make records available for internal auditing purposes.
- Change Phrase Maintenance: This includes the ability to allow the 4730 network operator to alter information that is displayed or printed at the 4730 by entering simple instructions. These phrase changes are managed automatically by the PBM Network Monitor and can apply to either a single 4730 or to a group of 4730s.

CUSTOMER RESPONSIBILITIES

The following are customer responsibilities:

- Provision of specified operating environment.
- Install PBM Network Monitor and run sample program.
- Customize installation-dependent tables.
- Define the 4730 network.
- Provide financial application programs.
- Choose IMS or CICS security features.
- Staff and train monitor and control operators.
- Problem determination.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The IBM PBM Network Monitor can run on any hardware configuration that supports one of the operating systems listed below under "Software Requirements". The program is distributed on magnetic tape at 1600 or at 6250 bits per inch; therefore, a magnetic tape drive is required to load the program.

The PBM Network Monitor consists of approximately 100 modules; each module is approximately 20,000 bytes. For each concurrent transaction that may be scheduled in the IMS or CICS installation, no more than five PBM Network Monitor modules will be in virtual storage at the same time. Auxiliary storage space is required for approximately 5 megabytes of PBM Network Monitor application data.

4730 Personal Banking System Network Monitor (cont'd)**SOFTWARE REQUIREMENTS**

Required Programs: The PBM Network Monitor requires one of the following standard operating systems at the level current when PBM Network Monitor is available, or at a later level:

- VSE/Advanced Functions
- OS/VS1
- OS/VS2 (MVS)
- MVS/XA

In addition, one of the following data base/data communication systems, at or later than the indicated release level, is required:

- IMS/VS Version 1 Release 2
- CICS/OS/VS Version 1 Release 5
- CICS/VSE Version 1 Release 5

Support Program Requirements: The IBM 4730 Personal Banking Machine Network Monitor includes tables which can be customized by each installation. If the user chooses to customize the information in these tables, the user must compile and link edit the tables after modification.

PBM Network Monitor is supported by the following program products for the specified operating system:

- VSE
 - DOS/VS COBOL Compiler and Library
 - DOS/VS SORT/MERGE
- OS
 - OS/VS COBOL Compiler and Library
 - OS/VS SORT/MERGE Release 5

SECURITY, AUDITABILITY, and CONTROL

PBM Network Monitor utilizes the security and auditability features of the S/370, 303X, 308X, or 43XX processors. User management is responsible for evaluating, selecting, applying, and implementing such features and for the appropriate administrative and application controls.

RPQs Accepted: Yes

MVS INTEGRITY

IBM will accept APARs describing any situation where the installation of this program introduces an exposure to the system integrity of MVS. Refer to the IBM Programming Announcement on MVS System Integrity dated October 21, 1980. This program is intended to run unauthorized.

LICENSED PROGRAM MATERIALS AVAILABILITY

Restricted materials: No. This program will be available without source licensed program materials. It will be available with object code. The sample program will be available in both object code and source code.

5668-896 - APPLICTN PROTOTYPE ENVIR. R1.0, 1.1
APPLICATION PROTOTYPE ENVIRONMENT
RELEASES 1.0 and 1.1

PURPOSE

Application Prototype Environment provides a set of building blocks and design tools for interactive development of VS APL applications. It is intended to be used both by the professional programmer, and by knowledge workers (such as managers, planners, educators, scientists, and engineers) who have some knowledge of APL.

The professional programmer will use Application Prototype Environment to develop prototypes of commercial DP applications, or to build complete applications with VS APL as a base. The knowledge worker will use it to create small applications. Help screens and tutorials are provided within the program.

Application Prototype Environment Release 1.0 operates under VM/SP. Application Prototype Environment Release 1.1 operates under VM/SP and MVS/TSO.

Application Prototype Environment incorporates and extends certain functions of the IFP Application Prototype Environment (5785-RAB) for the above environments.

HIGHLIGHTS

Three full-screen interactive dialogs in Application Prototype Environment allow the user to:

- Design a panel (screen) to be used as part of the application.
- Design a graphics chart as part of a panel.
- Define a file to be used by the application.

An object library allows application functions to be stored outside the Application Prototype Environment workspace when not required, and to be retrieved when needed by the application. This allows large applications to run in a small workspace.

Full-screen browse and editing facilities are provided.

Help panels and tutorials can be invoked throughout the design of an application to assist the user.

DESCRIPTION

With Application Prototype Environment, an application is built in two phases:

- A specification phase, in which the layout of display panels, charts and files is defined.
- An operational phase, using a set of building blocks that describe the operational characteristics of an application.

Specification Phase: In this phase, the panels and charts for the application are designed. Panels can contain fixed text and fields to enter, display and modify data. Charts are defined as panel areas to display data in graphics form, for example, line graphs, bar charts, pie charts.

Field lengths and positions, field types, field colors, fixed text, labels, chart types, etc., are described as part of the panel design.

Application Prototype Environment prompts the application designer for the above information during the specification phase. The layout of the designed panel is displayed at different stages of the definition.

The specification phase is also used to define files, access path and access method, length and type of fields in physical records, cross-references, names of variables, etc., in an interactive dialog.

Operational Phase: Application Prototype Environment provides a series of functions that describe the communication of data in the application. This includes panel functions to read data from a display, write data on a display, and placing data on a display for modification. A set of declaration functions support the retrieval of information from the application.

Object Library: The object library provides the capability to store functions and data external to the APL workspace, and to load them dynamically during program execution. This capability:

- Allows the user to keep a single workspace image for APL applications.
- Eliminates the need to keep copies of functions in different workspaces.
- Ensures that an application always uses the master copy of a function.
- Simplifies installation and maintenance procedures.

Browse and Edit: These facilities provide:

- Independent scrolling of variables.
- Dynamic display of variables within fields.
- Capability to perform editing on the variables shown in a scroll field.

CUSTOMER RESPONSIBILITIES

Installation of a licensed program is the responsibility of the customer.

VM/SP and MVS/SP provide facilities designed to prevent unauthorized use of data.

Customer management is responsible for the selection, application and implementation of all security features, and for appropriate application and administrative controls. Where natural language text and/or data is to be transmitted via public communication facilities, management may wish to consider the use of encryption.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This licensed program is designed to operate on the following IBM machines:

Release 1.0: Any IBM processor supported by:

- VM/SP Release 2 or subsequent release.

Release 1.1: Any IBM processor supported by:

- VM/SP Release 2 or subsequent release.
- MVS/SP Version 1 Release 3 or subsequent release.
- MVS/SP Version 2 Release 1.1 or subsequent release.

Application Prototype Environment is designed to operate in an APL workspace of minimum 512K bytes. This minimum will increase if user code is to be resident, or if large quantities of data are required by the user to be kept in the APL work area.

IBM terminals supported by Application Prototype Environment:

- 3277-2
- 3278-2, 3, 4, 5
- 3279-2, 3
- 3290
- 3287 Printer for hard-copy graphics

Chart design requires:

- IBM 3278 mdl 3 or 4 with ECSA and PS features, or
- IBM 3279 mdl S3G or 3X, or
- IBM 3290.

One terminal with APL feature is required for maintenance functions, and one tape drive is required for installation.

SOFTWARE REQUIREMENTS

Application Prototype Environment requirements are:

- Operating System
 - For Release 1.0:
 - VM/SP Release 2
 - For Release 1.1
 - VM/SP Release 2
 - MVS/TSO: MVS/SP Version 1 Release 3 (MVS/370) or MVS/SP Version 2 Release 1.1 (MVS/XA)
- VS APL language, Release 4.0 with PUT 8211
- Graphical Data Display Manager (GDDM Release 2, 5748-XXH) with Presentation Graphics feature (PGF). (Support of 3290 or MVS/XA requires GDDM Release 3.)

Subsequent releases and modifications are supported unless otherwise stated.

COMPATIBILITY

The IFP Application Prototype Environment and the Application Prototype Environment program product may coexist without conflict.

CONVERSION

Conversion from the IFP to the Application Prototype Environment program product is a minor effort.

The conversion steps are:

1. Expunge all IFP functions and variables from the workspace.
2. Copy in the Application Prototype Environment program product workspace.
3. Save the new workspace.

PROGRAM PRODUCTS

Application Prototype Environment (cont'd)

SECURITY/INTEGRITY

IBM will accept APARs describing any situation where the installation of Application Prototype Environment (5668-896) causes an exposure to the system integrity of MVS. This program is not intended to run in an authorized state at any time and should, therefore, represent no threat to the system integrity of MVS.

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**VS FORTRAN INTERACTIVE DEBUG
5668-903****PURPOSE**

VS FORTRAN Interactive Debug provides FORTRAN programmers with the ability to debug programs conversationally at a terminal using high-level language.

DESCRIPTION

VS FORTRAN Interactive Debug operates under TSO and CMS through a comprehensive set of subcommands which enable programmers to control, monitor, and modify executing FORTRAN programs. Program locations can be referred to by FORTRAN statement labels or by ISN numbers; and FORTRAN variables can be accessed or have values changed by specifying the corresponding symbolic FORTRAN variable names.

VS FORTRAN Interactive Debug does not require any compile-time option. Any program compiled under VS FORTRAN Release 3 or higher will be debuggable (unless compiled with NOTEST and NOSDUMP). Programs compiled at a level of optimization above 0 are debuggable with restrictions. The FORTRAN programmers will just specify DEBUG as a run-time option.

HIGHLIGHTS

- Full- or split-screen support using ISPF dialog management.
- Scrollable log of the debug session.
- Ability to run under split-screen mode of ISPF and view the listing of the executing programs. A program function key will position on the currently executing statements. This facility requires the use of PDF.
- Setting breakpoints at statements.
- Displaying and changing values of variables.
- Tracing the execution of FORTRAN programs.
- Tracing back subroutines and the last ten transfers prior to the execution of the current statements.
- Correcting invalid arguments passed to FORTRAN library routines.
- Conditional execution of Debug subcommands.
- Providing information (HELP) about using the VS FORTRAN Interactive Debug product.
- Providing an execution frequency count for each FORTRAN source statement.
- Allowing the user to monitor a specified condition or a change in value of a variable.
- Dynamic control of the FORTRAN Extended Error Handling Facility.
- Listing all breakpoints and WHEN conditions.
- Subset mode allowing the user to enter many system commands.
- Controlling the execution by halting the program on each FORTRAN statement, branch, or ENTRY and RETURN.
- Allowing the manipulation of files, and giving the capability to allocate files on different data sets or to edit results from disk before the end of the program.
- Allowing comments to be entered as a notepad facility.
- Providing the possibility of suspending normal terminal I/O to enter Debug commands.
- Providing the ability to give at execution time a list of programs to be run at normal execution speed (not debuggable) in order to improve the performance.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

VS FORTRAN Interactive Debug operates on all IBM hardware/system configurations supported by the IBM Time Sharing Option of MVS and the CMS component of VM SP/CMS.

The TSO Terminal Monitor program Command Scan, and the service routines GETLINE, PUTLINE, and PUTGET are assumed to reside in the time sharing link pack area, and do not figure into the user region requirement.

SOFTWARE REQUIREMENTS

VS FORTRAN Interactive Debug operates under the Time Sharing Option of OS, MVS/370, MVS/XA (in the 24-bit addressing mode) and the CMS component of VM/SP. It operates on and in conjunction with programs compiled by the VS FORTRAN Compiler (5748-FO3). The VS FORTRAN Library (5748-LM3) is required. In order to operate in full-screen mode, ISPF (5668-960) and PDF (5664-172 for VM/CMS or 5665-268 for TSO) must be available.

COMPATIBILITY

No changes are required to the FORTRAN source program to use the VS FORTRAN Interactive Debug. The user merely indicates at execution time on the parameter area that the DEBUG option is to be used. This will signal to the library that the VS FORTRAN Interactive Debug has to be loaded.

VS FORTRAN Interactive Debug will operate with programs containing debug packets. The debug packets are not themselves debuggable.

VS FORTRAN Interactive Debug is designed for use only with modules compiled by VS FORTRAN. Users who must debug modules compiled by FORTRAN G1 must use FORTRAN Interactive Debug Version 1 Release 2.2 (5734-FO5) with those modules.

VS FORTRAN Interactive Debug does not have a batch debugging capability. All debugging must be performed interactively.

PERFORMANCE CONSIDERATIONS

Compile Time: Compile time with SDUMP using the default options (without NOSDUMP) will be faster than with the Test Option. Since no special compile-time options need to be specified for the VS FORTRAN Interactive Debug to be used, recompilation will usually not be necessary.

Execution Time: When not in debug mode, the execution time of a program compiled without NOSDUMP option will be faster than that of the same program compiled with the TEST option.

VS FORTRAN Interactive Debug will require the latest level of VS FORTRAN in order to get the best performance. A program compiled with VS FORTRAN Release 3 (without the VS FORTRAN Release 3.0 enhancement) will be debuggable but with degraded performance.

PROGRAM PRODUCTS

**IGES PROCESSOR
RELEASE 1
5668-904**

PURPOSE

The IGES Processor, a program product, will help perform the job of transferring engineering data between a CADAM® system and another system via the Initial Graphics Exchange Specification (IGES Standard). Data transfer is done in a two-step process. First, the user on the sending system transfers CAD/CAM data to the IGES file. Second, the user on the receiving system transfers data from the IGES file to the CAD/CAM data model format. The IGES Processor provides IGES to CADAM and CADAM to IGES data transfer support.

®CADAM is a registered trademark of CADAM INC.

SPECIAL SALES INFORMATION (not applicable)

HIGHLIGHTS

- Supports a subset of the IGES ANSI Standard Version 1.0 for data interchange.
- Supports transmission to and receipt of data from CADAM.
- CADAM two-dimensional data is supported.
- User options provided for translation.
- Error reports available for data incompatibility.

DESCRIPTION

The IGES Processor translates an IGES file into CADAM system entities by reading the IGES file, converting it into an external file, and then processing this internal file entity-by-entity to build a CADAM system model. The entities are geometric, annotation, and structural data. The reverse process is used to create the IGES files.

The program flags entities that it cannot translate for any reason so that the user may identify such entities and take appropriate action.

Figures 1 and 2 list the IGES ANSI Standard Version 1.0 entities that the IGES Processor converts and the corresponding CADAM system entities to which they are converted. Figures 3, 4, and 5 describe how CADAM entities are mapped to IGES entities when IGES files are created.

Entities handled by the IGES Processor may be classified in four groups according to how the IGES Processor selects a matching CADAM entity or entities. These four groups are listed below and identified in Figure 1 in the column labeled "Relation".

One-to-one: The IGES entity is translated into an equivalent or similar CADAM system entity.

One-to-many: The IGES entity is translated into several CADAM system entities collectively equivalent or similar to the IGES entity.

Many-to-one: Several IGES entities are translated into a single CADAM system entity.

Approximation: The CADAM system has no true equivalent to the IGES entity, so the IGES entity is translated to a CADAM system entity that is a visually close approximation to the IGES entity. For example, the CADAM system has no parabolic segment, so an IGES parabolic segment is translated to a CADAM system spline.

In a few cases, the CADAM system has more than one meaningful equivalent to an IGES entity. In these cases, the user has the ability to override the Processor's default choice of a CADAM system entity, and to specify an alternate. The list of IGES entities for which the user can override the Processor's default is given in Figure 2.

IGES TO CADAM

Relation	IGES Type	IGES Entity Name	CADAM System Entity Names	GEOM Interface Module Names
One-to-One	100	Circular Arc	Circle, Arc	CADARC, CADCIR

CUSTOMER RESPONSIBILITIES

Detailed information on installation tasks is provided in the *IGES Processor Program Description/Operations Manual (SJ20-5630)*. The principal installation tasks are the following:

- Install the FORTRAN and CADAM system products.
- Unload the program from the distribution tape.
- Build the load module containing the IGES Processor, FORTRAN library, and CADAM system modules.
- Execute the sample data and check results.

IGES Processor (cont'd)

The IGES Processor is a functional replacement for the Initial Graphic Exchange Specification (IGES) Translator (5796-PRK). As previously announced, the IGES Translator will receive Central Service until November, 1984.

BRANCH OFFICE RESPONSIBILITIES (not applicable)

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The minimum machine requirements for the IGES Processor is the following:

- IBM 4321 or larger Processor with 1 megabyte of memory.
- IBM 3310 mdl A2 or 3340 mdl A2 Direct Access Storage Facility or equivalent, consistent with operating system support.
- One 9-track tape drive.

SOFTWARE REQUIREMENTS

The prerequisite licensed programs for the IGES Processor are:

- VM/SP Release 1.1 (5564-167), or MVS Release 3.8 (5752-VS2), or VS/1 Release 7.0 (5652-VS1).
- Current level of CADAM System Data Management licensed program, Release 19 (5796-ATC) at availability.
- Current level of CADAM System Geometry Interface licensed program, Release 19 (5796-ATJ) at availability.
- FORTRAN IV Library Mod II (5374-LM3).

COMPATIBILITY (not applicable)

CONVERSION (not applicable)

DATA SECURITY

The IGES Processor runs under OS/VS1, MVS, VM/SP and is subject to the controls those systems provide. User management is responsible for evaluating, selecting, applying and implementing such features and for the appropriate administrative and application controls.

PERFORMANCE CONSIDERATIONS (not applicable)

DOCUMENTATION

(available from Mechanicsburg)

IGES Processor Program Description Manual (SH20-5630).

MVS SYSTEM INTEGRITY

IBM will accept APARs describing any situation where the installation of the IGES Processor (5668-904) causes an exposure to the system integrity of MVS. This program is not intended to run in an authorized state at any time and should, therefore, represent no threat to the system integrity of MVS.

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**GRAPHICAL DISPLAY AND QUERY FACILITY
(GDQF) RELEASE 1
5668-905**

PURPOSE

The Graphical Display and Query Facility (GDQF) is a program product that may be used to view CADAM* models, APT Geometry (PUNCH) files, or Graphic Data Files (GDF) on a 3270-family Display device. GDQF may also be used to prepare output for the 3287 and 4250 Printers.

SPECIAL SALES INFORMATION (not applicable)

HIGHLIGHTS

- Easy-to-use, full-screen menus
- 3-dimensional rotation and viewing commands
- Multiple view-ports to display different models simultaneously
- Comprehensive online help and tutorial assistance
- Display CADAM* and APT Geometry models
- Display plot files from CADAM*, CATIA**, and CBDS2
- Merge displayed data with SCRIPT (DCF) onto hardcopy devices
- Supports 3278 (with light-pen), 3279 (with light-pen), 3290 and 3277GA terminals
- Batch and foreground support for the 3287 and 4250 Printers
- Operates under VM/SP Release 2

* CADAM is a registered trademark of CADAM, INC.

** CATIA is a registered trademark of Dassault Systemes.

DESCRIPTION

GDQF allows a CADAM user to view geometry or CADAM plot files with equal ease. The data may be scaled automatically to fit the screen, panned (left, right, up, and down) and re-sized larger or smaller.

GDQF provides the APT user with a facility for viewing APT-created geometry. Previously, there was no IBM facility for viewing this data. The ability to view the geometry, before running a numerical control tool, will be a valuable asset to numerical control part programmers.

For CADAM, CBDS2 and CATIA users, GDQF provides the ability to preview plot files before sending them to the plotter. GDQF utilizes the GDDM GDF format for plot files so that the plot files may also be processed by other IBM GDDM-based graphics applications.

For APT models, the GDQF program provides full 3-dimensional viewing control with an easy-to-use human interface. The viewer may change his viewpoint with six rotational commands, may ask for perspective or parallel projections, and can see different objects in multiple colors. In addition, GDQF provides the ability to split the screen and to view, for example, CADAM data side-by-side with APT data on the same screen.

The *User's Guide* is written for the enduser and provides numerous examples for the terminal user. To provide online assistance, a comprehensive help and tutorial facility is also provided with GDQF. There are two levels of messages, a short format and a long format. The short format gives a brief description of the status or error. The long format may be requested by the user for more detailed information about the message. If the user still requires more detailed information, the HELP/Tutorial facility may be invoked.

After data is viewed or pre-viewed, the data may be prepared for inclusion in documents that will be eventually printed on the 4250 Printer. Any data viewed on a screen can be merged with SCRIPT (DCF) files and then printed on the 4250 Printer. This ability to merge text and graphics is provided by the Composed Document Printing Facility. GDQF provides plotter support via the industry standard plotting interface, and a customer may link-edit installation-specific plotter support that is not provided through GDQF.

GDQF also provides foreground and batch support for commonly-used utilities. Printing and plotting functions may be invoked from a batch machine, thereby freeing the user terminal for other jobs.

CUSTOMER RESPONSIBILITIES

Detailed installation tasks are described in the *Graphical Display and Query Facility Installation and Customization Guide* (SH20-5631). The principal installation tasks are:

1. Install GDDM Release 3.
2. Install ISPF Release 1.
3. Unload the GDQF installation tape.
4. If CADAM models are to be viewed, install the prerequisite programs.
5. Build the GDQF libraries.

6. If plot files from CADAM, CATIA, or CBDS2 are to be viewed or plotted, build the appropriate modules as described in the *Installation and Customization Guide*.
7. If the 4250 Printer is to be used, install the 4250 Printer support.
8. Verify the installation using the sample data.

The *User's Guide* contains information that a terminal user will require to use the interactive and batch facilities of GDQF. The *Installation and Customization Guide* contains information necessary to install and customize GDQF for a particular installation. The *Utilities and Subroutines Manual* contains information necessary to use and call the utilities provided with GDQF.

BRANCH OFFICE RESPONSIBILITIES (not applicable)

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The minimum machine configuration for GDQF is the following:

- IBM S/370 mdl 135, 3031, or 4321 or larger Processor with a minimum of 1,024K memory.
- An IBM 3270-family device, for console.
- One IBM 3330 mdl 1, 3340 mdl A2, 3310 mdl A2 or 3370 mdl A1 Direct Access Storage Facility.
- One 9-track tape drive.
- An IBM 3278, 3279 or 3290 Display with programmed symbols support, or 3277GA.

A minimum virtual machine size of 3 megabytes is required if the CADAM models are not accessed. A minimum of 3.5 megabytes is required if CADAM models are accessed. Larger virtual machine sizes may be required to display larger models.

An IBM 4250 or 3287 Printer is required for hardcopy printed output.

Performance of GDQF depends on many factors, such as processor and memory size, terminal supported, and hardcopy device supported. For configuration guidance, consult your local IBM representative.

SOFTWARE REQUIREMENTS

The prerequisite licensed programs for GDQF are:

- Virtual Machine System Product (5665-167) Release 2
- Interactive System Productivity Facility (5668-960) Release 1
- Graphical Display Data Manager (5748-XXH) Release 3

For viewing of CADAM models, the following CADAM programs at Release 19 are prerequisites:

- CADAM Geometry Interface (5796-ATJ)
- One of the following is required to load CADAM data into the system:
 - CAD Only Interactive (5796-ATA)
 - CAD/CAM Interactive (5796-ATB)
 - Data Management (5796-ATC)
- To view CADAM plot files, CADAM hardcopy (5796-ATD) is required.
- To link-edit and install CADAM products, FORTRAN IV library (5734-LM3) is required.

Due to interface conventions with the CADAM Geometry Interface, data displayed by GDQF may not be identical in format to the data as displayed by CADAM.

For printing on the IBM 4250, the following is a prerequisite:

- Composed Document Printing Facility (5668-997)

For merging SCRIPT files with graphics on the 4250, the following is required:

- Document Composition Facility (5748-XX9) Release 3

COMPATIBILITY (not applicable)

CONVERSION (not applicable)

DATA SECURITY

GDQF utilizes the security and auditability of VM/SP. User management is responsible for evaluation, selecting, applying and implementing such features, and for the appropriate administrative and application controls.

**COPICS CUSTOMER ORDER SERVICING (COS)
SHIPPING MANAGEMENT
5668-906****PURPOSE**

COPICS COS Shipping Management (SHIPPING) uses the order data and provides online and batch functions required to control the shipping process from selection of customer orders for shipment to invoicing. SHIPPING is functionally integrated into COPICS, especially in COPICS COS Data Management and Order Management, and COPICS Inventory Accounting. It may be implemented without having installed any of these COPICS products.

SPECIAL SALES INFORMATION

- Customers and prospects for integrated offerings within the COPICS implementation architecture, mainly in the manufacturing and process industries.
- Organizations with a need for engineering, construction, repair/maintenance, service for equipment, installations and buildings. These organizations may be industries like airlines, distribution, utilities, public sector and government.

DESCRIPTION

This program has been designed around the COPICS DL/I Manufacturing Data Base architecture to operate in an integrated mode with the other COPICS products.

Within its overall architecture and applications framework, the Communication-Oriented Production Information and Control System (COPICS) includes Customer Order Servicing functions designed to assist end-users in:

- Entering orders completely, quickly and correctly.
- Servicing customer requests for delivery information.
- Changing existing order schedules, quantities and/or specifications.
- Maintaining order status.

These facilities are provided by the COPICS International Field Programs COS Data Management (5785-DCN) and COS Order Management (5785-DPC).

Thus, with these programs, the user is able to create and maintain customer order data and hold it available for subsequent programs in the area of customer order servicing. SHIPPING uses this order data and provides additional online and batch functions required to control the shipping process of a company from selection of customer orders for shipment to invoicing.

Shipping Management is relevant to Manufacturing, Process and Distribution Companies, and with minimum effort can be extended to cover inter-company as well as customer orders.

Although functionally integrated into COPICS, COS Shipping Management can be implemented without any other COPICS product.

HIGHLIGHTS

SHIPPING supports different user environments and shipping methods. For example, in a single user environment, both normal and rush orders can be processed using multiple shipment methods, including:

- Company transport
- Forwarding agencies
- Railcar
- Postal Services
- Customer pick-up

The Shipping process consists of several discrete phases, some of which may be inappropriate in some companies. COS Shipping thus allows alternative implementations within the following broad framework:

- Selection of customer orders for shipment
- Delivery planning
- Picking control
- Packing control
- Load control
- Processing of the shipping results

In addition, functions are provided to perform a number of miscellaneous tasks, including the maintenance of infrequently needed text data to be included in shipping documentation. This will comprise freight and other cost information for invoicing purposes, the number and type of pallets used, etc.

In addition to these maintenance functions, Shipping uses online interface functions to ease the handling of Communications-Oriented Message System (CORMES) messages.

SHIPPING is offered within the COPICS Implementation program. It has been designed around the COPICS DL/I Manufacturing Data Base architecture to operate in an integrated mode with the other products offered within that program. COPICS Implementation is the IBM Manufacturing Industry program for implementing COPICS. It is based

on the use of DL/I-DOS/VS or IMS/VS as the data base manager and CICS/VS as the communications manager.

CUSTOMER RESPONSIBILITIES

To implement COPICS COS/Shipping Management, the customer must have installed appropriate machines and programs (see "Specified Operating Environment") and establish procedures to provide the data necessary to fulfill his requirements.

The installation of COPICS COS/Shipping Management is supported by a sample. The programs are available in source code form (for customization purposes).

Users should review the data base definitions and screen design for compatibility with their objectives.

The major installation steps for the user who has already installed DL/I-DOS/VS or IMS/VS and CICS/VS are:

- Print the program tape and review its contents and job control statements.
- Catalog, provided software includes:
 - COBOL programs
 - DL/I-DOS/VS or IMS/VS DBDs and PSBs
- Review the supplied CICS/VS table entries for compatibility with the user's system.
- Run the sample problem which loads the data bases.
- Run the batch and online programs against the sample data base.
- Confirm the successful operation of all programs before making modifications and loading user data.
- Establish recovery procedures for data base integrity.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

This program product is designed to operate on an IBM S/370, 30XX or 43XX Processor which supports DL/I-DOS/VS or IMS/VS in a CICS/VS environment. The minimum storage requirement is 512K bytes of memory. The specific user operating environment will determine the actual storage requirements, depending on the number of transactions, number of terminals, and so on. At least one 1,920-character IBM 3270 Visual Display Unit and an IBM 3287 mdl 2C Printer is also required.

SOFTWARE REQUIREMENTS**DOS/VS Version:**

This program is written in ANS-COBOL and requires the use of the DOS/VS COBOL Compiler and Library (5746-CB1) Version 1 Release 2.5 for installation and error correction.

It is designed to operate with the following programs:

- DOS/VSE (5745-030) Version 1 Release 2
- VSE/Advanced Functions (5646-XE8) Version 1 Release 2
- DL/I-DOS/VS (5746-XX1) Version 1 Release 5
- CICS/DOS/VS (5746-XX3) Version 1 Release 5
- DOS/VS Sort/Merge (5746-SM2) Version 1 Release 3

OS/VS Version:

This program is written in ANS-COBOL and requires the use of the COBOL Compiler and Library (5740-CB1) Version 1 Release 2.3 for installation and error correction.

It is designed to operate with the following programs:

- OS/VS1 (5652-VS1) Version 1 Release 7
- IMS/VS-DB (5740-XX2) Version 1 Release 2
- CICS/OS/VS (5740-XX1) Version 1 Release 5
- OS/VS Sort/Merge (5740-SM1) Version 1 Release 5

For both versions, the program is designed to operate optionally in conjunction with:

- COPICS Customer Order Servicing/Data Management (5785-DCN)
- COPICS Customer Order Servicing/Order Management (5785-DPC)
- COPICS Inventory Accounting (5785-GBE)
- CORMES (5746-XXM for DOS/VS, 5668-007 for OS/VS)

Note: Where release numbers are specified for operating systems and licensed programs in this section, the above statements also apply to subsequent releases and modification levels unless otherwise provided by IBM.

**COPICS FACILITIES DATA MANAGEMENT
RELEASE 1 Modification Level 0
5668-907**

PURPOSE

COPICS Facilities Data Management is designed to bring the Resource/Facility Data Base (containing details of work centers and machines) and Tool Data Base (containing details of tools and tool kits) directly to manufacturing engineering and production engineering departments, along with all other functions which require access to this information. Through the use of online video display terminals, the user can create and maintain work center and machine, and tool and tool kit data as well as make inquiries against it.

COPICS Facilities Data Management allows manufacturing engineering and production engineering departments to manage effectively the changes that affect work centers, machines, tools and tool kits. These changes are due to a number of factors such as:

- Adding new machines
- Changing the capacity of work centers or machines
- Changing the standard cost rates of work centers or machines
- Changing which machines are contained within a work center
- Adding new tools and tool kits
- Changing which tools (or how many) are contained within tool kit

Facilities Data Management is offered within the COPICS Implementation program. It has been designed around the COPICS DL/I Manufacturing Data Base architecture to run in an integrated mode with the other products offered within that program. COPICS implementation is the IBM Manufacturing Industry Marketing program for implementing COPICS, and is based on the use of DL/I-DOS or IMS/VS-DB as the data base manager and CICS/VS as the communications manager.

HIGHLIGHTS

- Online creation and maintenance of the Resource/Facility Data Base, including checks of the input data
- Online creation and maintenance of the Tool Data Base, including validity checks of the input data
- Sequencing of machines contained within a work center
- Sequencing of the alternates to a work center or machine
- Specification of variation of standard cost rates of a work center or machine by time
- Specification of variation of capacity of a work center or machine, and variation of number of machines within a work center, by time
- Sequencing of tools contained within a tool kit
- Sequencing of the alternates to a tool or tool kit
- Migration of the respective data bases from the format supported by COPICS Facilities Data Control program (5798-CZH)
- Online inquiries on all data created. These include:
 - Resource (work center and machine) information
 - Usage of work centers by:
 - Department
 - Cost center
 - Usage of machines by:
 - Department
 - Cost center
 - Work center or work center and subgroup
 - Alternate resources
 - Alternate resource where-used
 - Tool information
 - Usage of tools by:
 - Tool kit
 - Group number or group number and subgroup
 - Alternate tools
 - Alternate tool where-used
- The COPICS-CORMES Interface is provided to facilitate the creation of 'action messages' by COPICS Facilities Data Management for distribution and control by the CORMES program. When CORMES is installed, 'action messages' are created when:
 - A work center is created
 - A work center is deleted
 - Capacity records are created, changed, or deleted.

CUSTOMER RESPONSIBILITIES

To implement COPICS Facilities Data Management, the customer must have installed appropriate machines and programs (see "Specified Operating Environment") and establish procedures to provide the data necessary to fulfill his requirements.

The installation of COPICS Facilities Data Management is supported by a sample. The programs are available in source code form (for customization purposes). COPICS Facilities Data Management uses

and updates two data bases: Resource/Facility and Tool. Users should review the data base definitions and screen designs for compatibility with their objectives. The major installation steps for the user who has already installed DL/I-DOS/VS or IMS/VS-DB and CICS/VS are:

- Print the program tape and review its contents and job control statements.
- Catalog, provided software includes:
 - COBOL programs
 - DL/I-DOS/VS or IMS/VS-DBDs and PSBs.
- Review the supplied CICS/VS table entries for compatibility with the user's system.
- Run the sample problem which loads the data bases.
- Run the batch and online programs against the sample data bases.
- Confirm the successful operation of all programs before making modifications and loading user data.
- Establish recovery procedures for data base integrity.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

COPICS Facilities Data Management is designed to operate on an IBM S/370, 30XX or 43XX Processor which supports DL/I-DOS/VS or IMS/VS-DB in a CICS/VS environment. The minimum configuration is 512K bytes of memory. Disk storage to hold the necessary DL/I data bases is also required. At least one 1,920-character IBM 3270 Visual Display Unit is required. The specific user operating environment will determine the actual storage requirements, depending on the number of transactions, number of terminals, and so on.

Furthermore, the following is required:

- One IBM 3340 Direct Access Storage Facility, or an equivalent device supported by DL/I-DOS/VS or IMS/VS
- One IBM 1403 Printer mdl NO1, or an equivalent device supported by the operating system, with at least 132 print positions, and
- One tape unit 9-track, 1600 bpi or 6250 bpi for installation purposes only.

SOFTWARE REQUIREMENTS

DOS/VS Version: This program is written in ANS-COBOL and requires the use of the DOS/VS COBOL Compiler and Library (5746-CB1) Version 1, Release 2.5 for installation and error correction. It is designed to operate with the following programs:

- DOS/VSE (5745-030) Version 1, Release 2
- VSE/Advanced Functions (5746-XE8) Version 1, Release 2
- DL/I-DOS/VS (5746-XX1) Version 1, Release 5
- CICS/DOS/VS (5746-XX3) Version 1, Release 5
- DOS/VS Sort/Merge (5746-SM2) Version 1, Release 3

OS/VS Version: This program is written in ANS-COBOL and requires the use of the OS/VS COBOL Compiler and Library (5740-CB1) Version 1, Release 2.3 for installation and error correction. It is designed to operate with the following programs:

- OS/VS1 (5652-VS1) Version 1, Release 7
- IMS/VS (5740-XX2) Version 1, Release 2
- CICS/OS/VS (5740-XX1) Version 1, Release 5
- OS/VS Sort/Merge (5740-SM1) Version 1, Release 5

For both versions, the program is designed to operate in conjunction with the following optional programs:

- COPICS Product Cost Calculation II (5785-GBD)
- COPICS Online Routing (5746-XX1 for DOS/VSE and 5740-XYX for OS/VS, Version 1, Release 1.1)
- COPICS Shop Order Load Analysis and Reporting (5665-908)
- CORMES (5746-XXM for DOS/VS and 5668-007 for OS/VS)
- CAPOSS-E (5746-M41 for DOS/VS and 5740-M41 for OS/VS1)

Note: Where release numbers are specified for operating systems and licensed programs in this section, the above statements also apply to subsequent releases and modification levels unless otherwise provided by IBM.

**COPICS SHOP ORDER ANALYSIS and REPORTING
RELEASE 1 Modification Level 0
5668-908**

PURPOSE

The planning and control of the manufacturing process is characterized, as all complex processes, by a multi-level structure of planning, control, and execution.

Within this overall architecture, manufacturing activity planning is subdivided into discrete functional areas that span from the long-term resource requirements planning required to validate the master production schedule, through the release of manufacturing or shop orders, to monitoring and controlling the actual work performed on the factory floor.

COPICS Shop Order Load Analysis and Reporting represents the implementation of one of these levels within a general manufacturing activity planning system, and is designed to support the production planner activities associated with release, planning and control of shop orders.

These planning and control activities can be thought of as a bridge between the planning and execution functions of the manufacturing process, and include aspects of both environments.

HIGHLIGHTS

Together with material requirements planning and manufacturing order release functions, this program translates the master production schedule into work center schedules for open and released orders and calculates the resultant load on company resources. It assists the production planner in analyzing potential problem areas and in assessing alternatives. It facilitates that any resultant order, schedule, quantity or other change is updated in the shop order data base and subsequently is reflected in a revised material plan (for instance, by using COPICS Advanced Functions/Material Requirements Planning, 5785-GBF).

Within COPICS, 'opening' an order includes allocating component materials, firming the due date and quantity, and copying the relevant routing or process information into a shop order data base. This activity is performed by COPICS Shop Order Release II (5798-DCQ), or by a user-written shop order release program. 'Releasing' an order authorizes work to begin. When an order is completed, this fact can be recorded either through functions provided within COPICS Shop Order Release II, or within COPICS Plant Monitoring and Control System, Programs 5798-DFR and 5798-DFT, or a user-written plant monitoring and control system.

The manufacturing plan represented by these shop orders can thus be seen as a short/medium-term plan, usually covering a few weeks or a few months into the future.

COPICS Shop Order Load Analysis and Reporting uses forward and backward scheduling:

- Forward scheduling, from the order release date, determines the arrival time of work in the work centers for use in load planning and analysis.
- Backward scheduling, from the order due date, calculates the required dates of operations for use in establishing dispatch list priorities.

This technique of scheduling assumes average manufacturing lead times, and is sometimes referred to as infinite capacity scheduling.

The efficiency of work centers and work flow are measured using input/output control techniques.

DESCRIPTION

Primary functions are:

- To schedule open and released shop orders, operation by operation, backward from due date, and forward from the order release date.

Shop orders are forward and backward scheduled to set start and finish dates for all operations under control of this program, and to calculate the delay or slack associated with each order. This process is performed at regular intervals to maintain a prioritized schedule of manufacturing orders, taking into account work-in-process order and operation completions, and new or changed orders.

- To provide a load profile against each work center based on the forward schedule dates.

After the start and finish dates have been established for each operation, during forward scheduling, the resultant loads against individual work centers are calculated for a user-specified period into the future. These load profiles can be displayed. They show the daily or weekly loads and highlight any overloads and underloads. The cumulative effects of the latter are also shown, together with a projection of how long the situation will prevail, if corrective action is not taken. The load profile for any period can then be further analyzed to show the orders which make up the total. Thus,

an acute overload situation can be analyzed to determine whether the orders causing the overload can be replanned or whether additional short-term capacity should be supplied. The information for the display and analysis of load profiles is presented in numerical data form. Programs are also provided to display and analyze the load profiles in color-graphical form. These displays, using a 3279 Visual Display Unit, allow the user to assimilate very quickly the make-up of the load profiles and to determine whether any specific situation requires more detailed analysis.

Three color-graphical displays are provided:

- The profile of the total load compared with the available capacity.
- The make-up of the total load by orders, giving the number of days in delay.
- The total load, showing open, released and in-process orders.

- To provide an input/output control system, by maintaining historical and projected loads, and comparing the actual throughput of work with the planned input.

Information is provided to control the flow of work through the work centers by comparing the actual output with the planned input. In addition, the actual queue sizes are displayed which can be compared to the planned queue time for the work center, so that the production planner can see if work is building up at a particular work center or if a work center is likely to be starved of work.

The information for the display and analysis of the flow of work through the work centers is presented in numerical data form. Programs are also provided to display and analyze this information in color-graphical form. These displays, using a 3279 Visual Display Unit, allow the user to assimilate very quickly the trends of workloads and queue sizes and to determine whether any specific situation requires more detailed analysis.

Three color-graphical displays are provided:

- The historical trend of actual workload received compared to that released for a work center.
- The historical trend of the distribution of queue sizes across all work centers scheduled by this program.
- The historical trend of the queue size for an individual work center.

- To highlight deviations in planned manufacturing lead times.

A batch report can be produced showing statistics of the lead times used in the material planning system compared with the actual manufacturing lead times achieved. Any deviations are highlighted and this information can be used to revise the lead times in materials planning: If COPICS Advanced Functions/Material Requirements Planning is used, this will be done the next time this program is run.

- To prepare suggested job dispatch lists for each work center, based on the dates derived from backward scheduling.

The preparation of work center dispatch lists is a function of shop floor supervision. COPICS Shop Order Load Analysis and Reporting provides information which can be used as a starting point to plan the day-to-day activities at each work center. All operations in process and planned at each work center may be displayed in priority sequence. This priority sequence is determined as follows:

- The status of operations.
- The start date of the operation determined during backward scheduling.
- The external priority of the operation's associated order.

- To report work done against individual operations and orders by quantity and/or by time.

This information reflects the latest position of orders as they progress on the shop floor. The system allows for the reporting of any scrap quantities. An entire order with its operations and accumulated feedback data can be displayed so that urgent orders can be progressed. The ability to report feedback of work done is provided via online terminals. This feedback facility provided can be regarded as a first step in implementing a full production recording system. A more complete system of feedback reporting is provided by COPICS Plant Monitoring and Control System.

- Online rescheduling of single or multiple orders which have changed since the last batch regenerative scheduling run.

This function is provided so that the production planner can ensure that the projected work center loads are current, and that the operation schedules reflect the latest order status.

- Maintain basic Work Center data.

This function creates and maintains all Work Center data required by this program to perform scheduling and build load profiles.

PROGRAM PRODUCTS

COPICS Shop Order Load Analysis & Reporting (cont'd)

- Color Graphic Displays.

This program offers the optional use of Color Graphics, a medium particularly well suited to complex and dynamic situations. Through use of this medium, the projections of work center loads, the historical trends of both the actual work done and the queue sizes measured, are clearly and quickly assimilated.

It is assumed that the shop orders are organized according to the Shop Order Data Base as described in the *Program Description and Operations Manual* (SB11-5807).

This program is offered within the COPICS Implementation program. It has been designed around the COPICS DL/I Manufacturing Data Base architecture to operate in an integrated mode with the other products offered within that program. COPICS Implementation is the IBM Manufacturing Industry program for implementing COPICS. It is based on the use of DL/I DOS/VS or IMS/VS-DB as the data base manager and CICS/VS as the communications manager.

CUSTOMER RESPONSIBILITIES

To implement COPICS Shop Order Load Analysis and Reporting, the customer must have installed appropriate machines and programs (see "Specified Operating Environment") and establish procedures to provide the data necessary to fulfill his requirements.

The installation of COPICS Shop Order Load Analysis and Reporting is supported by a sample. The programs are available in source code form (for customization purposes). COPICS Shop Order Load Analysis and Reporting uses and updates four data bases: Shop Order, Work Center Load, Resource/Facility, and Standard Text. Users should review the data base definitions and screen designs for compatibility with their objectives. The major installation steps for the user who has already installed DL/I-DOS/VS or IMS/VS-DB and CICS/VS are:

- Print the program tape and review its contents and job control statements.
- Catalog, provided software includes:
 - COBOL programs.
 - DL/I-DOS/VS or IMS/VS DBDs and PSBs.
- Review the supplied CICS/VS table entries for compatibility with the user's system.
- Run the sample problem which loads the data bases.
- Run the batch and online programs against the sample data bases.
- Confirm the successful operation of all programs before making modifications and loading user data.
- Establish recovery procedures for data base integrity.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This program is designed to operate on an IBM S/370, 30XX, or 43XX Processor which supports DL/I-DOS/VS or IMS/VS-DB in a CICS/VS environment. The minimum configuration is 512K bytes of memory. Disk storage to hold the necessary DL/I data bases is required. At least one 1,920-character IBM 3270 Visual Display Unit is required. An IBM 3287 mdl 2C Printer is optional. The execution of graphic displays requires the use of at least one IBM 3279 Visual Display Unit mdl 3B with program symbols. The specific user operating environment will determine the actual storage requirements, depending on the number of transactions, number of terminals, and so on.

SOFTWARE REQUIREMENTS

DOS/VS Version: This program is written in ANS-COBOL and requires the use of the COBOL/VS Compiler and Library (5746-CB1) Version 1, Release 2.5 for installation and error correction. The program is designed to operate with the following programs:

- DOS/VSE (5745-030) Version 1, Release 2
- VSE/Advanced Functions (5746-XE8) Version 1, Release 2
- DL/I-DOS/VS (5746-XX1) Version 1, Release 5
- CICS/DOS/VS (5746-XX3) Version 1, Release 5
- DOS/VS Sort/Merge (5746-SM2) Version 1, Release 3

OS/VS Version: This program is written in ANS-COBOL and requires the use of the COBOL/VS Compiler and Library (5740-CB1) Version 1, Release 2.3 for installation and error correction. It is designed to operate with the following programs:

- OS/VS1 (5652-VS1) Version 1, Release 7
- IMS/VS-DB (5740-XX2) Version 1, Release 2
- CICS/OS/VS (5740-XX1) Version 1, Release 5
- OS/VS Sort/Merge (5740-SM1) Version 1, Release 5

For both versions, the program is designed to operate in conjunction with the following optional programs:

- COPICS Plant Monitoring and Control System (5798-DFR and 5798-DFT)

- COPICS Facilities Data Management (5668-907)
- COPICS Shop Order Release (5798-DCQ)
- CORMES, (5746-XXM for DOS/VS, 5668-007 for OS/VS)
- Graphical Data Display Manager/Presentation Graphics Feature (GDDM/PGF) (5748-XXH) Version 1, Release 2

Note: Where release numbers are specified for operating systems and licensed programs in this section, the above statements also apply to subsequent releases and modification levels unless otherwise provided by IBM.

**PROGRAMMABLE STORE SYSTEM
LANGUAGE and HOST SERVICES - DOS/VSE and OS/VS
VERSION 1 RELEASE 1 (5668-912)**

PURPOSE

The Language and Host Services (LHS) program supports the 3650 and 3680 Programmable Store Systems. It is a replacement for support previously available with 3650/3680 PSS SPSS II (PP) and Host Support (SCP).

DESCRIPTION**HOST SERVICES SUPPORT**

Host Services supports the 3650 Programmable Store System and 3680 Programmable Store System residing in a Host S/370, 43XX or 30XX. It consists of the following basic components: Controller Configuration Facility, Terminal Configuration Facility, Data Base Facility and Data Communication Facility. Host Services supplies the support to maintain PSS system libraries, tailor and transmit controller and terminal programs from a host to a 3651 or 3684, generate microcode tables for use in a 3651 or 3684 Controller and the POS terminals, create file format controls and allocate space for files, and provide problem determination aids. It also provides support to retrieve data files, dump files and PDS members. Either BTAM or BSC or VTAM for SDLC provides transmission to and from the store controller.

LANGUAGE SUPPORT

SPSS II is the user program facility for the Programmable Store System. Programs written with SPSS II can support the 3561 mdls 25 or 75 Store Controllers or 3684 Point-of-Sale Control Unit mdls 1 and 2. Devices executing the Subsystem Programming Preparation Support II programs are the 3651 mdls 25 or 75, 3683, 3684, host communications, 3275-3 Display Station, 3653 mdl 1P and 3663 mdls 1P and 3P.

SPSS II provides the following additional services:

SPSS II Assembler Language: SPSS II provides Assembler language (F) instructions supported as macros. These instructions are assembled at the host processor and executed at the store controller or the programmable terminal or both. Arithmetic, logical and branching instructions are included in the set.

SPSS II Macros: The SPSS II macros, along with assembler instructions, are assembled together at the host processor, then transmitted as a program to the store controller. SPSS II programs are executed in the 3651 mdls 25 and 75, 3684, or the programmable terminal.

- SPSS II supervisory macros are provided to define: (1) the message routing path between a terminal program and a controller program, (2) to initialize a user program for execution and, (3) allocate system resources and control blocks.
- SPSS II controller-to-controller communications macros are provided to control the Auxiliary Communications Adapter available on the 3651 mdl 75.
- SPSS II Debug Macros are included to provide a diagnostic tool to the SPSS II programmer.
- SPSS II macros are provided that execute in the programmable terminal, perform various terminal functions and control terminal operations.

Post-Processor: SPSS II provides a Post-Processor as a stand-alone program, executing in the host S/370, 43XX or 30XX. It uses the SPSS II program assembly listing as input, and produces a reformatted and edited assembly listing as output.

CUSTOMER RESPONSIBILITIES

The customer must create a unique macro library for SPSS II, for the Controller Configuration Facility macros, and for the Terminal Configuration Facility macros. The user must then install the macros supplied with these three facilities in the library.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

A minimum IBM 3650 or 3680 Programmable Store System requires support from:

- (1) One IBM S/370, 43XX or 30XX with one of the following operating systems, BTAM or VTAM, and the system assembler.
 - DOS/VSE
 - VSE/SP
 - OS/VS1
 - OS/VS2 (MVS/370 and MVS/XA)
- (2) LHS Version 1 Release 1 requires 50K bytes of virtual storage over and above the virtual storage required for Access Method Services. (More memory is required depending on the amount of data to be processed from the LHS unique data sets and the number of controllers communicating with the transmission facility of LHS.)

- (3) An IBM 3704, 3705 or 3725 Communications Controller in emulation mode (EP) or network control mode (NCP), or a S/370 ICA or 43XX CA using BTAM-ES or ACF/VTAM.
- (4) A telecommunications access method (BTAM for BSC or ACF/VTAM for SDLC).
- (5) The Virtual Storage Access Method (VSAM).
- (6) The IBM 3651 mdl A25, B25, A75, B75, C75 or D75 Store Controller or 3684 Point-of-Sale Control Unit mdl 1 or 2.
- (7) An IBM 3653 mdl 1 or 1P, 3663 mdl 1P or 3P, 3275 mdl 3 Display Station, or a 3683 Point-of-Sale Terminal.

Additional terminal devices may be added. (See appropriate Machine pages.)

PROGRAM PRODUCTS

DATA INTERFILE TRANSFER, TESTING and OPERATIONS UTILITY for VSE and VM 5668-917**PURPOSE**

Data Interfile Transfer, Testing and Operations Utility for VSE and VM licensed program (hereinafter referred to as DITTO for VSE and VM or simply DITTO) is a general-purpose utility program for card, magnetic tape, disk, and diskette input/output devices for use in both the VSE/Advanced Functions and VM/CMS environments. It provides the facility to list, scan, display, copy, alter, and create files or portions of files. The wide range of user-oriented functions is intended to aid programmer testing, reduce the need for separate specialized utility programs, and provided greater operational productivity. DITTO offers the user an efficient and easy-to-use tool for testing and file-handling in both a batch and interactive environment.

DESCRIPTION

- Processing control functions which allow changes to the card end-of-data delimiter, dump output format, printed output formatting, language for messages, and header page suppression.

A profile capability is also provided to allow the user to preset this control information to individual or installation defaults.

- File-to-File functions including diskette file, SAM (Sequential Access Method), ISAM (Indexed Sequential Access Method), VSAM (Virtual Storage Access Method), and, under VM/CMS, CMS file support, providing the user with the ability to create diskette, SAM, ISAM, VSAM or CMS files from cards, tapes, diskette, or other SAM, ISAM, VSAM or CMS files. The user may also change blocking factors and file locations. These functions may be performed on a complete file or portions of a file.

A function to allow direct updating of VSAM file data is also provided.

- Device-to-Console functions, allowing the user to display small amounts of tape, disk, or diskette data directly on a console for scanning and verification purposes.
- Card functions to list and copy, also permitting interpretation of punched output and pre-punched cards.
- Tape functions to scan, alter, list, copy and compare tape files or portions of tape files.

A tapemap function is also available to list in compact form information about the contents of a tape including tape usage statistics.

- Disk functions to scan, alter, list, and display data stored on Direct Access Storage Devices on a physical address basis.

Disk functions support both count-key-data (CKD) and fixed block architecture (FBA) devices.

For data stored on FBA devices in control intervals (CI) which span one or more physical blocks, DITTO allows the user a physical view of the data on either an individual block basis or on a CI basis, depending on the specification of a CISIZE parameter.

- Disk VTOCs can also be listed or sorted either by name, creation or expiration date, or by extents (including free areas). VTOC entries can also be scratched or renamed.
- Buffer functions allow creation of simple test data on tape, SAM, ISAM, VSAM, and diskette files directly from data in an in-core buffer according to user specifications.
- A documentation function provides a program-generated document of the DITTO functions and associated parameter requirements. Additionally, under VM/CMS, a help file is available for use with the CMS HELP command.

Operations may be performed in (interactive) online mode from a VSE system console, a VSE/ICCF terminal, or a VM/CMS terminal. In batch mode, operations are controlled via job control statements. In online operation, multiple parameters may be entered in a single operator command, thus reducing console message time. Control card parameters are free form and variable-length format.

A tape error correction routine allows the user to correct records in error directly on the console before copying onto an output file.

Tape, Disk, and Diskette scanning functions are provided to search records for a given scan argument.

Enhancements in Comparison to VSE/DITTO (5746-UT3)

- Ability to run in the VM/CMS environment as well as under VSE. Under VM/CMS it is possible to run a large subset of the functions available under VSE. Both batch and online execution modes are supported.
- Full screen display mode for record display and alteration functions. This support includes data scrolling and locate functions to rapidly find the data of interest.

- A tape-to-tape compare function to compare the contents of two different files. If an inequality is found, the input and output records will be printed out.
- A VSAM Record Load function to allow direct alteration of VSAM file records.
- Further control function extensions are provided to allow the user to specify:
 - Dump formats of UPDOWN or ACROSS (new horizontal format)
 - Print length of 80 or 132. The shorter length is especially useful on VSE/ICCF screens to avoid overlapped output lines.
 - Print destination for VM/CMS users to allow redirection of print output to the screen (as in VSE/ICCF).
- Significant ease-of-use improvements, for example:
 - SET function defaults can be set and changed via a profile.
 - Horizontal Dump format for printouts and full screen displays.
 - The VTOC display function is extended to provide additional information about the files on the disk including expiration dates, and is presented in a more compact format.
 - The Disk Record Scan function is extended to also show the offset of the data found in the record and to provide printouts of each record where a hit is found.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

DITTO is designed to operate on all IBM processing units supported by VSE and/or VM/SP, that is, IBM S/370, 303X, 308X, and 4300 Processors.

DITTO can be used with the following devices:

Card	IBM 1442, 2501, 2520, 2540, 2560, 2596, 3504, 3505, 3525, 5424, and 5425.
Tape	IBM 2401, 2420, 3410, 3411, 3420, 3430, and 8809.
Disk	IBM 2311, 2314, 3310, 3330-1, 3330-11, 3340/44, 3350, 3370, 3375, and 3380 (under VM/SP only).
Console	Any console eligible device (screens in Printer/Keyboard or Display Operator Console mode only).
Screens	IBM 3270 (full screen functions only).
Printer	All printers supported by VSE or VM.

Specific Requirements

- IBM 3524 Card Punch features: VSE/DITTO supports either the Two-Line Print feature (#8339) or the Multi-Line Print feature (#5273) for punched output. For interpreting pre-punched cards, in addition to one of the above print features, the Punch Card Read feature (feature #1533) is required.
- IBM 2560 Multi-Function Card Machine features: Punched output can be interpreted, if the 2560 is equipped with the Card Print feature (#1575, #1576, or #1577).

DITTO for VSE and VM has program space requirements ranging from 70K up to a maximum of 120K. Buffer space for I/O areas are used beyond the program space. Buffer space requirements range from 0 to 128K (for two 64K buffers) depending on the function and devices used. Therefore, total space requirements range from 70K to 220K.

SOFTWARE REQUIREMENTS

DITTO for VSE and VM is designed to operate under VSE/Advanced Functions Release 3.0 and 3.5 (5746-XE8) or later, or VM/SP Release 1.0 (5664-167) or later.

If VSAM functions are to be used, VSE/VSAM (5746-AM2) Release 2.0 or later must be installed. For the dynamic allocation of SAM files under VSE, the VSE/VSAM Space Management for SAM feature is required.

INSTALLATION

For VSE systems:

DITTO will be shipped in private libraries. The distribution medium is tape in RESTORE format. DITTO is installed by invoking the INSTALL COMPONENT function of the VSE Maintain System History Program (MSHP).

For VM/CMS systems:

DITTO will be shipped as a set of modules, text, source and exec files. The distribution medium is tape in VMFPLC2 format. DITTO is installed by use of the VMFPLC2 LOAD command.

COMPATIBILITY

DITTO for VSE and VM is compatible with the existing program product VSE/DITTO (5746-UT3) as regards functions already available with this product.

Do not reproduce without written permission

PP 5668-917.2

PROGRAM PRODUCTS

DITTO (cont'd)

Source Materials: Source materials for DITTO for VSE and VM will not be made available to customers. A Restricted Materials Amendment to the agreement for IBM licensed programs must be signed prior to a customer receiving any licensed program materials for this licensed program.

PERFORMANCE CONSIDERATIONS

Performance is equal to that of VSE/DITTO Release 3 when measured within the same or comparable environments and conditions.

RPQs ACCEPTED: No

**CROSS SYSTEM PRODUCT/QUERY
5668-918**

PURPOSE

Cross System Product/Query is an interactive query/report writer for use by the business professional and the data processing professional. It provides access to Virtual Storage Access Method (VSAM) files through easy-to-use, menu-oriented dialogs or through a non-procedural query language. In either query mode, Cross System Product/Query allows the user to select and view VSAM data in simple tabular form. A menu-oriented dialog then assists the user in formatting the information for report generation. The query language of Cross System Product/Query is a subset of the Structured Query Language (SQL).

SPECIAL SALES INFORMATION

Cross System Product/Query is a member of the Cross System Product set of programs, and makes use of Cross System Product/Application Development library facilities for storage of data and query specifications. Cross System Product/Query is a companion product to Cross System Product/AD, and is intended to be marketed with Cross System Product/AD. Cross System Product/Query reduces the skill requirement for one-time query and report generation, and significantly expands the report writing capabilities of Cross System Product/AD.

Cross System Product/Query is a complementary product to Query Management Facility/VSE (QMF/VSE) in the DOS/VSE and SSX/VSE environments. Cross System Product/Query should be used by customers who need online access to operational information stored in VSAM files. Customers installing QMF/VSE and/or SQL/DS may also use Cross System Product/Query as a supplemental query facility against those VSAM files not planned for conversion to SQL/DS.

QMF/VSE is the query-report writing offering for customers with relational data bases installed in the VSE environment. QMF/VSE is a full function and easy-to-use product designed to work with SQL/DS. Since it is ultimately desirable for most customers to install a data base management system, Cross System Product/Query externals have been designed taking SQL/DS and QMF/VSE into consideration. In particular, Cross System Product/Query supports a subset of the Structured Query Language, and uses the same terminology as QMF/VSE where possible.

Cross System Product/Query provides the customer with dual growth paths:

- For those users who desire the efficiencies of a data base manager, or who require additional query capability, the addition of SQL/DS and QMF/VSE will be a natural progression. This growth path is also available to customers with MVS and VM systems through the use of QMF with DB2 or SQL/DS.
- For users who wish to progress beyond query into more general application development, Cross System Product/AD can be used with minimal additional learning.

HIGHLIGHTS

- Menu-oriented dialogs for query and report generation.
- SQL query specifications.
- Results online or printed.
- Direct access to VSAM data.
- Tabular view of data.
- Saved query capability.
- Stored query results for later use by Cross System Product/Query and other applications.
- Access to Cross System Product/AD data definitions.

DESCRIPTION

Cross System Product/Query supports a dynamic interaction between users and their existing data. Through Cross System Product/Query, the user can view selected data on a terminal. If desired, the data can be selected, formatted and printed as a report. Further, the user may create a copy of the selected data in a new file. User interactions can be minimal to accommodate simple data requirements with little effort, or involve more sophisticated query facilities which accommodate complex information requirements. These include the ability to specify selection conditions, invoke built-in functions, sort the output, and collect the data into convenient groups for reporting purposes.

Modes of Use: Cross System Product/Query supports two levels of user interface: Menu and command level.

The menu interface to Cross System Product/Query is primarily for the non-DP user and/or occasional user. The menu interface is a full-screen, prompted interface providing dialogs, each of which support a Cross System Product/Query service.

Cross System Product/Query also offers a command interface. Through this interface, a subset of the SQL SELECT statement and the Cross System Product/Query display commands are available. The

primary users of this interface are envisioned to be skilled users and frequent users of Cross System Product/Query.

Direct Access to VSAM Data: Once a file is defined through the Cross System Product/AD data definition facility, it can be accessed by a Cross System Product/Query user. Cross System Product Query supports access to the following VSAM file organizations:

- ESDS
- KSDS
- RRDS

Tabular View of Data: Cross System Product/Query supports a tabular view of flat files. Data is defined and accessed in terms of data tables and operations on data tables. The two-dimensional tables, which are a structured part of the relational model, normally have a fixed number of columns and a variable number of unnumbered rows. The relational model can effectively support a broad range of user data requirements. Views may be defined on tables such that user logical tables need not conform to actual VSAM files.

Query Specification: Cross System Product/Query provides a rich set of query capabilities. In particular, through the query facility, the user can:

- Access one or two files at a time.
- Collect all records meeting a condition or only unique records.
- Use SQL built-in functions:

SUM
AVG
MIN
MAX
COUNT

- Create derived data using calculations:

ADD
SUBTRACT
MULTIPLY
DIVIDE

- Use record selection criteria:

EQUAL/NOT EQUAL
LESS THEN/LESS THAN OR EQUAL
GREATER THAN/GREATER THAN OR EQUAL
LIKE
BETWEEN
IN

- Test for multiple conditions using conjunctions:

AND
OR
NOT

- Order the results of a query (SORT).
- Sample the results of a query.
- Store the results of a query.

Report Specification: With Cross System Product/Query, query output can be displayed or printed. The report specification dialog provides considerable flexibility in formatting this output. Reports can be tailored directly to users needs. In particular, Cross System Product/Query provides the following functions.

- Titles
- Headings and footings
- Default date and page numbering
- Control break and control break text
- Summing for totals and subtotals
- Multiple copies
- Field editing
- Outlining
- Reordering of columns
- Include and exclude columns
- Column spacing

Saved Query Capability: Once a query is created and run, either through the menu or command interface, the user can save the query specification for execution at a subsequent session. At the time the query is saved, the formatting information is also retained. When a saved query is run, formatting takes place as if the stored format specifications had been entered from the terminal. To modify the display/report format, the user merely uses the menu support to modify the display to fit requirements. The updated query may also be saved.

Besides these capabilities, a saved query can be edited, renamed or erased.

Stored Results: The results of a query can be saved in a VSAM ESDS data set and used in subsequent queries or processed by other applications.

PROGRAM PRODUCTS

Cross System Product/Query (cont'd)

Access to Cross System Product/AD Data Definitions: Cross System Product/Query uses the Cross System Product/AD development library as the source of the data definitions for creating a query. Therefore, the same file definitions used to create application programs can be used for query.

Online HELP: Upon request, Cross System Product/Query will provide online reference information. This includes end-user-oriented explanations of menu entries, command syntax and Cross System Product/Query error messages.

CUSTOMER RESPONSIBILITIES

The customer must perform the following tasks:

- Provide adequate system resources.
- Install the prerequisite program products.
- Install Cross System Product/Query.
- Install optional program products (such as VSE/POWER, etc., or equivalents).

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Cross System Product/Query is designed to operate on any IBM S/370, 4300 or 3000-series system with one megabyte or more of memory.

Any display terminal supported by Cross System Product/AD and the underlying software environment operating in 3270 single-byte character mode may be used with Cross System Product/Query.

SOFTWARE REQUIREMENTS**CICS/DOS/VS:**

Cross System Product/Query requires the following configuration of software:

- VSE/SP 1.1 or DOS/VSE SCP with VSE Advanced Functions Release 2 or later.
- CICS/DOS/VS Release 1.5 or later.
- Cross System Product/Application Development (5668-944) Release 1.1.
- Cross System Product/Application Execution (5668-945) Release 1.1.
- Virtual Storage Access Method (VSAM) Release 2 or later.
- ACF/VTAM or ACF/VTAME or BTAM-ES.

SSX/VSE:

- SSX/VSE Release 1.3 or later.
- Cross System Product/Application Development (5668-944) Release 1.1.
- Cross System Product/Application Execution (5668-945) Release 1.1.

COMPATIBILITY

Cross System Product/Query externals have been designed taking SQL/DS and QMF/VSE into consideration. In particular, Cross System Product/Query supports a subset of the SQL SELECT command and, where possible, uses the same terminology as QMF/VSE.

Queries are not portable to either QMF/VSE or SQL/DS. The similarity in language, however, should allow the user to quickly respecify queries once data is available under SQL/DS.

CONVERSION (not applicable)**DATA SECURITY**

The two primary aspects of security in Cross System Product/Query are:

- Controlling access to Cross System Product/Query itself, and
- Controlling access to the data.

Access to Cross System Product/Query itself is via CICS/DOS/VS. At most installations, Cross System Product/Query users will be required to first signon to CICS/DOS/VS by entering a valid user identification (userid) and password. Userids and passwords are usually controlled and assigned by the installation's system administrator.

Access to the data is through Cross System Product/AD libraries which are also controlled by the system administrator. Each library defines one or more existing VSAM files. If desired, the libraries can be defined so that particular fields within the files are inaccessible.

PERFORMANCE CONSIDERATIONS

Cross System Product/Query can be used for query/report writing on a 4321 or a one-megabyte 4331 supporting a limited number of

terminals. Customers who plan to use Cross System Product/Query in conjunction with Cross System Product/AD for query, application development and concurrent application execution will require two megabytes or more of memory. Query/report writing with volume workloads also require two megabytes or more of memory and additional system capacity.

PROGRAM PRODUCTS

**INFORMATION/VM-VSE
5668-919****PURPOSE**

The Information/VM-VSE product is a consolidated collection of IBM technical data of interest to data processing staffs responsible for planning, installing, supporting and tuning IBM systems, subsystems and components appropriate to the VM/370 and VSE environments.

When used in conjunction with Information/System, it provides data processing personnel with keyword access to a wide range of selected technical information regarding IBM products.

SPECIAL SALES INFORMATION

See pages for Information/System (5735-OZS).

**HIGHLIGHTS OF INFORMATION/SYSTEM with
INFORMATION/VM-VSE**

- Interactive retrieval facility for keyword searches of the data.
- Designed for ease-of-use.
- Load program to load the Information/VM-VSE product into the user system.
- Capability to insert user data.
- Ability to optionally print selected screens or entries.

DESCRIPTION OF INFORMATION/SYSTEM

Information/System in conjunction with Information/VM-VSE is a productivity tool designed for use by data processing personnel supporting a VM/370 or VSE environment. It consists of an interactive information retrieval facility designed to provide access to the Information/VM-VSE files via previously assigned keywords, and of the appropriate programs for loading the data base.

Design objectives of Information/System and the companion Information/VM-VSE product are to:

- Make the data available to the user online and on the user's system.
- Simplify and speed keyword searches of information.
- Integrate IBM technical information from many sources.
- Broaden the amount of technical information available to users.
- Keep the information up to date by addition of new data and by purging the out-of-date material.
- Enable users to add information to Information/VM-VSE.

The Information/System interactive retrieval facility provides the user with a set of commands to access the data provided by Information/VM-VSE through display terminals. The retrieval facility provides a keyword search function through which the user can search documents by specifying one or more previously assigned keywords connected by Boolean operators ('and', 'or', 'not'). The search can include all the document types or can be restricted only to selected types (e.g., EWS, PTF cover letters). The user can display the complete stored text of the documents or the titles only.

The user also has the option to search all of Information/VM-VSE or to limit the search only to any new entries added since the previous distribution tape.

Other Functions of Information/System include:

- Sequential display of contiguous data entries of Information/VM-VSE.
- A PRINT command to allow the user to print a section of a document or entire documents for later reference.
- A keyword glossary to expedite and facilitate the search process.
- A FIND command to locate specific words inside a pre-identified document.
- A HELP facility is built into Information/VM-VSE to describe error conditions and to suggest corrective actions.

HIGHLIGHTS OF INFORMATION/VM-VSE

- Online, consolidated collection of technical information from many IBM sources.
- Periodic updates to the Information/VM-VSE product to provide current information.
- Self-instruction and usage assistance information.

DESCRIPTION OF INFORMATION/VM-VSE

Technical information from a number of development, system and support locations worldwide is edited, structured and incorporated into Information/VM-VSE.

Types of information in Information/VM-VSE include:

- Selected IBM system support center flashes, memos, question and answer logs and technical articles produced by the support organization responsible for the subject element. Selected lengthy articles are abstracted and ordering information is included. (Occasionally, such documents are added as an additional file on the distribution tape.)
- Technical descriptions of recent IBM programming announcements.
- Service information on selected IBM software products including early warning system (EWS) data and systems engineering communications (SECOM).
- Status information on selected program products, installed user programs and field developed programs. Included is information on availability, feature numbers, optional features and documentation order numbers.
- A selection of Program Temporary Fix (PTF) cover letters and Program Level Change (PLC) information that may be used in conjunction with the EWS file to locate appropriate fixes for identified problems.
- Brief descriptions of schedules for some of the education courses that IBM is conducting.
- An interactive HELP file designed to assist the user in making the most effective use of Information/System. A part of this file is a self-instruction tutorial for new users of the system.
- A keyword glossary giving alphabetical access to all keywords, whether abbreviated, hyphenated or misspelled by the author, which enhances the ability to find the required document.

The major products addressed by Information/VM-VSE include:

- Systems - S/370, 4300, 8100 Information System, industry and cross industry terminal systems, storage and printing units.
- Programming - Operating systems, compilers and assemblers, access methods, DB/DC products, emulators, job entry subsystems, utilities and interactive products.

The update of Information/VM-VSE is distributed by the standard IBM distribution centers. The distribution tapes are available in 9-track/1600 bpi and 9-track/6250 bpi. Utility programs in Information/System merge the updates into the existing data base.

During the installation process, users have the option to:

- Insert their own data into Information/VM-VSE.
- Select only those types of data from Information/VM-VSE that are likely to be relevant to their environment.

All the IBM-provided Information/VM-VSE material must be regarded as working documents intended to assist the professional data processing personnel. The information does not provide formal IBM recommendations or documentation. The information provided is intended for use by data processing personnel who are sufficiently familiar with the necessary background material to understand the topics discussed and to use the information within the proper context and with the proper safeguards.

The technical material included in Information/VM-VSE addresses a wide variety of IBM products that are commonly used in a VM/370 or VSE installation. Although the main objective of Information/VM-VSE is to assist the user with useful, timely and up-to-date information, there is no commitment to provide exhaustive or complete information on any product addressed.

The customer may make printed copies of limited portions of the Information/VM-VSE product for use within the customer's organization for purposes of maintenance and improvement of the customer's data processing installation.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Storage Estimates: Direct Access storage requirements for the data product varies with the amount of data selected by the user. Information/VM-VSE requires approximately 80 to 100 megabytes of direct access storage for an untailored data base.

RPQs ACCEPTED: No

PROGRAM PRODUCTS

EXPANDABLE LEVEL INTERACTIVE APPLICATION SYSTEM/MULTIPLE VIRTUAL SYSTEM ELIAS/MVS (5668-923)

PURPOSE

Expandable Level Interactive Application System/Multiple Virtual System is a productivity tool which assists programmers operating in the MVS environment in developing and maintaining batch and online applications written in COBOL and/or PL/I, supporting all ranges of application types, from the simplest to the most complex. It is a major functional and environmental extension of the productivity concepts proven by the Entry Level Interactive Application System-One (ELIAS-I) product family currently available in the VSE and SSX environments. In addition, ELIAS/MVS extends the potential for significant improvements in application programming productivity to programmers of all skill levels from DP novices to experienced professionals.

SPECIAL SALES INFORMATION

All established or new MVS installations having significant application backlog and significant application maintenance workload should benefit from the use of ELIAS/MVS. This product will prove very helpful in speeding up new application programming and application maintenance, especially in complex DB/DC applications and in large installations.

HIGHLIGHTS

- Single interface to application development and maintenance functions through use of ISPF dialog manager, and inline invocation of SDF Release 4.
- Interactive interface to macro parameter specification for CICS, DL/I, IMS/DB and VSAM.
- Supports all COBOL and PL/I non-floating-point functions.
- Productivity benefits for both experienced and entry-level programmers.
- Ease of use for entry-level users doing batch and DB/DC programming.
- 'Fast Path' for experienced programmers.
- Pre-coded program frameworks automatically filled in from data input procedures.
- Pre-coded, pre-tested sets of source code statements called 'bricks' to handle repetitive, commonly-used functions.
- System services to handle user-written bricks.
- Repository facilities to store, retrieve and reuse application elements.
- Application maintenance support through repository services.
- Export/Import capability of DBDs, PSBs and Data Structures, particularly intended to support Data Dictionary users.
- Import/Export of application elements between different ELIAS/MVS installations.
- Authorization mechanism to control access to dialogs.
- Three levels of default values.
- Online 'Help' and tutorials for ease-of-use and 'as-required' education.
- ELIAS/MVS will run under either TSO or VM/CMS (no-charge specify feature).
- Capability to specify code that the user may transport and adapt for compilation and execution in the VSE environment.
- Upward compatibility from ELIAS-I/VM.

DESCRIPTION

- ELIAS/MVS dialogs run under the control of the Interactive System Productivity Facility (ISPF, 5668-960), which provides a unique interface to most application development and maintenance functions, standardized panel layouts and, where appropriate, standardized Program Function key assignments. While ELIAS/MVS will support BMS macro definition, the use of SDF Release 4 is encouraged as a high-level, ease-of-use screen definition tool. ELIAS/MVS supports SDF/CICS OS/VS Release 4 (5740-XYF), and SDF/CICS CMS Release 1 (5664-178), providing services to handle map definitions generated by these products. SDF can be directly invoked by an ELIAS/MVS panel to which control will be automatically returned once the user has executed the desired SDF functions.
- ELIAS/MVS provides a user-friendly interface to specify CICS (both OS and VSE), IMS/DB, DL/I and VSAM parameters. Application execution, however, is dependent upon the availability of the corresponding products and features in the target (execution) system.

- This interface consists of a set of interactive dialogs which accept user specifications and automatically build the correct input for control blocks and program skeletons generation. These dialogs are sufficiently straightforward for the new user to understand, yet they provide the means for the advanced programmer to create more sophisticated function. This function can be used to build and maintain data communication, data base and VSAM file specifications.
 - ELIAS/MVS supports all functions provided by COBOL (5740-CB1) Release 2.3 and PL/I (5734-PL3) Release 4.0 (excluding floating-point functions).
 - ELIAS/MVS functions provide productivity benefits for the experienced programmer while retaining the ease-of-use characteristics necessary for entry-level customers. With this capability, ELIAS/MVS provides a single application development tool that spans the range of user skills and needs.
 - To accommodate the experienced programmer, fast-path dialogs are provided. A summary screen can be used to input data normally gathered through a series of prompting screens. The experienced programmer can go directly to this screen, bypassing the more detailed portions of any dialog.
 - As a result of definition dialogs, ELIAS/MVS generates pre-coded input/output sections and program frameworks, called 'skeletons'. The programmer has only to provide the logic that is unique to the application. These skeletons not only reduce the effort required to construct the program (and the attendant possibility for coding errors), but also standardize program layout. This can contribute to reduced programming and maintenance effort, and improve the self-documenting nature of COBOL and PL/I.
 - ELIAS/MVS provides a number of pre-tested sets of source code, called 'bricks'. These bricks provide the logic necessary to perform a range of commonly-used functions such as CICS services, error checking, error handling, and data base access that can be reused by all programmers. They can easily be inserted into the program through the use of a Program Function key or command. This capability not only saves the programmer time and effort, but also reduces the potential for error.
 - Through ELIAS/MVS facilities, users may add their own bricks to the library. These bricks will be supported by the same repository services available for the ELIAS/MVS-supplied bricks. The user-written bricks may be more application-oriented than the functional bricks supplied with ELIAS/MVS. The re-usability of these functional bricks can 'amplify' the work of skilled programming personnel by allowing easy inclusion of their code in programs written by less experienced people, reducing development and maintenance effort.
 - Repository facilities encourage the reuse of application items, thereby easing maintenance. As application items, such as DBDs, PSBs, Data Structures, VSAM file definitions, programs, user bricks, and screen maps are developed and tested, they may be entered into the ELIAS/MVS repository. These elements then become available to all designers and programmers for creating new applications and/or modifying old ones. Even in those cases where there is not a perfect fit, often only a small change will be needed to create a new element, saving much of the work.
- This easy way to integrate proven code while developing new applications and/or maintaining existing ones should significantly reduce the amount of testing and rework required.
- ELIAS/MVS also provides directory services. A programmer looking for an application element with specific characteristics will be able to search the repository using key-word queries. The relationship between elements can be determined through a where-used facility.
- This capability can be very useful for maintenance purposes. When a change is made to one element, all other affected elements can automatically be re-generated, including recompilation where required.
- ELIAS/MVS provides a dialog to support batch export of DBDs, PSBs, COBOL and PL/I data structures from ELIAS/MVS to the DB/DC Data Dictionary OS/VS Release 4 (5740-XXF). ELIAS/MVS also provides a function called ELIIMP which can read user pre-formatted data sets, containing existing DBDs, PSBs, and Data Structures created outside of ELIAS/MVS, into the repository. This facility is intended to assist migration of current application elements, including those previously input to the OS/VS DB/DC Data Dictionary, without the need to redefine them in the ELIAS/MVS application development environment.
 - Repository items can be exchanged between different ELIAS/MVS installations, to support migration and DDP installations.
 - ELIAS/MVS provides procedures for the system administrator to control the access of different user-IDs to specific projects and/or

ELIAS/MVS (cont'd)

- dialogs. Each user-ID can be associated with multiple projects and may be authorized for different functions and dialogs for each project.
- ELIAS/MVS contains a recommended set of predefined system default values which can be easily modified by authorized users to personalize their application development environment. Default values can be established at three different levels: Project, user and system, with higher-level default values overriding lower-level values.
- Help panels are provided which can be requested in any dialog. These panels address specific information the programmer may need to better understand both the function he/she is working with and the error messages displayed by the system. In addition, a set of tutorials is available that describes the overall operations of ELIAS/MVS. This can save time ordinarily required to look up information in a manual.
- The user, via a no-charge specify feature, may order an ELIAS/MVS product to generate code either in the MVS/TSO or the VM/CMS environments. This code will be primarily intended to be compiled and executed in an MVS environment.
- Although ELIAS/MVS generated code is primarily intended for compilation and execution in an MVS environment, users may also generate code to be compiled and executed in a VSE environment, provided that the specified code matches the requirements of the VSE compilation and execution target environments, and that the appropriate JCL is provided by the user. Installations having centralized application development and maintenance operations should find this facility helpful in supporting remote VSE systems.
- ELIAS/MVS is upward compatible from ELIAS-1/VM (5748-XXXK); the VM option of ELIAS/MVS provides a conversion utility, ELICON, which allows the user to migrate IPF tables in the form of CMS files used by ELIAS-1/VM to the ISPF tables used by ELIAS/MVS.

CUSTOMER RESPONSIBILITIES

The system default values shipped with the product are derived from experience, and are intended to provide a powerful yet simple application development environment. It is the user's responsibility to verify whether the defaults provided will meet his/her particular needs, and to override or change these default values to obtain the best fit.

The user should ensure that the hardware configuration is sufficient to allow realization of the benefits of an online programming environment.

When generating source code for compilation and execution in a non-MVS environment (e.g., VSE, SSX), it is the user's responsibility to transport, adapt if necessary, include JCL, and submit the output of ELIAS/MVS to the target system. It is the user's responsibility to make sure that the target system has the software and hardware configuration necessary for compilation, link editing and correct execution.

The user is also responsible that all user-written bricks (code) will compile and execute correctly on the target system.

When importing pre-defined application elements such as DBDs, PSBs and Data Structures, the user is responsible to prepare and submit to ELIAS/MVS a sequential data set formatted as specified in the ELIAS/MVS documentation.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

ELIAS/MVS is designed to operate on the following IBM machines: All IBM S/370, 303X and 308X Processing Units and IBM 4300 Processors supporting the current version/release of ISPF (5668-960).

SOFTWARE REQUIREMENTS

ELIAS/MVS is designed to operate in an MVS environment with the MVS/Time Sharing Option (5752-VS2) Release 3.8 (or compatible successor) installed, and with SE2 or MVS/SP V1 or MVS/SP V2.

The VM option is designed to operate in a VM/SP environment supported by VM/SP CMS (5664-167) Release 2 (or compatible successor).

The product operates under control of the Interactive System Productivity Facility (ISPF, 5668-960), which provides a common dialog manager facility across systems.

Note: The Program Development Facility of ISPF (ISPF/PDF MVS, 5665-268) is not required to run ELIAS/MVS dialogs. However, it is required for MVS/TSO users, since the ISPF editor is part of ISPF/PDF MVS. Customers ordering the VM option of ELIAS/MVS may use, as an editor, the VM/CMS XEDIT or the Display Editing System (EDGAR) Release 1 (5796-PJP), or ISPF/PDF VM (5664-172).

TARGET SYSTEM ENVIRONMENTS

The set of macros and application programs generated by ELIAS/MVS may interface with the following programs:

- CICS/OS/VS Version 1 Release 6.0 (5740-XX1)

- IMS/VS DB Version 1 Release 2 (5740-XX2)
- OS/VS COBOL Compiler and Library Version 4 Release 2.3 (5740-CB1)
- PL/I Optimizing Compiler and Libraries Release 5.1 (5734-PL3), or its separate components
 - PL/I Optimizing Compiler (5734-PL/I)
 - PL/I Resident Library (5734-LM4)
 - PL/I Transient Library (5734-LM5)
- DMS/CICS/VS OS Releases 3.0 and 4.0 (5740-XC5)
- DB/DC Data Dictionary OS/VS Release 4 (5740-XXF)

Each product referenced above is required only if the corresponding facility is used by the application program.

ELIAS generated code does not require modification to any software component. It interfaces with the above products at the source level, and only through their standard interfaces as documented in their related publications.

MIGRATION

Migration from ELIAS-I VSE and ELIAS SSX/VSE: Since ELIAS-I VSE and ELIAS SSX/VSE tables are stored as members of an ICCF library, not available in the MVS environment, migration support will not be provided for these two products.

Migration from ELIAS-1/VM: Since ELIAS-1/VM tables are stored as CMS files, they can be migrated to the ELIAS/MVS repository using the conversion utility ELICON which is available in the ELIAS/MVS version running in the VM/CMS environment.

SECURITY

ELIAS/MVS runs under ISPF either in an MVS/TSO or a VM/SP environment, and is fully subject to the controls provided by these products according to the security options and procedures implemented in the installation. In addition, ELIAS/MVS provides a mechanism to control the usage of specific dialogs, both at the project and at the user level, allowing only selected users to execute sensitive ELIAS/MVS repository operations such as, for example, updating data base definitions. User management maintains full responsibility for selection, application, adequacy and implementation of security features, as well as for appropriate application controls.

PERFORMANCE CONSIDERATIONS

The response time for any ELIAS/MVS operation in a virtual storage environment depends upon the complexity of the function, the speed of the CPU and other devices, the programs running concurrently, system and application data set placement, paging characteristics and other factors. Among the specific factors influencing ELIAS/MVS performance, particular consideration should be given to the ISPF response time in the different supported environments, the size of the repository, and the number of accesses to the repository that can be expected in each particular installation.

The ELIAS/MVS repository is a significant breakthrough in IBM's efforts to improve the productivity of the application developer. The powerful facilities offered by the repository help the developer to avoid re-writing sections of programs which already exist and have been proven in operation, leaving him/her to give undivided attention to only those sections which are unique to the application under development. Of course, when these 'unique' sections are eventually stored in the ELIAS/MVS repository, they in turn become eligible for reusability in subsequent applications.

In preparing ELIAS/MVS for the marketplace, IBM has exercised the product in various machine configurations, with various numbers of concurrent users, and with various repository sizes. Our experience shows that it is beneficial from a performance point of view to limit the size of each repository to 2,000 items. Since ELIAS/MVS can operate with multiple repositories, different repositories can be established for each application team/project team etc. DP items can be exchanged between repositories as required, using the ELIAS/MVS Unload/Reload facility.

PROGRAM PRODUCTS

**DIRECT S.W.I.F.T. NETWORK LINK (DSNL)
VERSION 1 RELEASE 1
5668-926****PURPOSE**

Direct S.W.I.F.T. Network Link enables a member of S.W.I.F.T. (Society for Worldwide Interbank Financial Telecommunication s.c., Brussels, Belgium) to send messages via the S.W.I.F.T. network.

HIGHLIGHTS

Direct S.W.I.F.T. Network Link (DSNL) provides the connection to the S.W.I.F.T. network. It is a separately orderable program product that operates together with and under the control of Direct Multinetwork Link (DMNL). DSNL is based on the network interface function of DMNL. Direct S.W.I.F.T. Network Link allows a user to:

- Control the link to the S.W.I.F.T. network via operator commands.
- Send messages based on S.W.I.F.T. protocols.
- Process messages according to S.W.I.F.T. standards and formats.
- Recover S.W.I.F.T. messages.
- Authenticate and deauthenticate S.W.I.F.T. messages.
- Maintain the authenticator key file.
- Journal message traffic.

DESCRIPTION

Direct S.W.I.F.T. Network Link (DSNL) is the interface between the message processing facility Direct Multinetwork Link (DMNL) and the S.W.I.F.T. network. DSNL is a separate program product but operates concurrently with, and under the control of DMNL (see "Reference Information"). DSNL allows a bank that is a member or user of S.W.I.F.T. (Society for Worldwide Interbank Telecommunications s.c., Brussels, Belgium) to send messages via the S.W.I.F.T. network to other S.W.I.F.T. members or users. Direct S.W.I.F.T. Network Link provides the communication with the S.W.I.F.T. regional processor. After connection is established, Direct S.W.I.F.T. Network Link is treated by the S.W.I.F.T. regional processor as a computer-based terminal according to the S.W.I.F.T. definition.

As general application packages, DMNL/DSNL are integrable into a banking application environment. Together with other banking applications that can automatically be initiated by the user application interface facility, DMNL/DSNL allow a full computer-assisted processing of banking transactions.

Predefined panels for all S.W.I.F.T. message types, control blocks and other related items required to process S.W.I.F.T. messages are contained in the distributed material.

Authentication: Authentication of S.W.I.F.T. messages is done automatically using coded versions of the authenticator keys that have been agreed on between a sending and a receiving bank.

The code for the authenticator algorithm is a feature of the Direct S.W.I.F.T. Network Link. It will be distributed separately. This feature can only be delivered after the customer has signed as agreement with S.W.I.F.T.

Reference Information: DSNL operates under the control of Direct Multinetwork Link (DMNL). When ordering DSNL, the appropriate feature code must be selected according to the DMNL installation. The following program products are available:

- DSNL (5668-926)
- DMNL-CICS/DOS/VS (5662-269)
- DMNL-CICS/OS/VS (5668-965)
- DMNL-IMS/VS (5668-964)

CUSTOMER RESPONSIBILITIES

Users are responsible for the following installation prerequisites:

- The operating system must be generated as required for Direct S.W.I.F.T. Network Link and Direct Multinetwork Link.
- CICS/DOS/VS (without ELS option), CICS/OS/VS or IMS/VS must be installed.
- The prerequisite PRPQs for the control unit or the ICA must be installed.
- Data communication lines and modems must be installed to attach to the S.W.I.F.T. network.
- Direct S.W.I.F.T. Network Link and Direct Multinetwork Link must be installed.
- The S.W.I.F.T. Bank Connection Procedure must be performed.
- The dummy authenticator module (delivered with Direct S.W.I.F.T. Network Link) must be replaced by the separately-ordered authenticator module (DSNL feature).

Restart/Recovery: Restart/Recovery assistance is supplied for:

- S.W.I.F.T. line problems.

- Messages coming and going to S.W.I.F.T. by DMNL queue management; messages are also written to the journal.
- Failure of the IBM system covered by the recovery capabilities of CICS/DOS/VS, CICS/OS/VS, IMS/VS, DOS/VSE or OS/VS.

SPECIFIED OPERATING ENVIRONMENT

DSNL operates together with, and under the control of DMNL, which makes the installation of the appropriate version of DMNL prerequisite. DSNL requires specific hardware and software in addition to the hardware and software requirements noted for DMNL.

HARDWARE REQUIREMENTS

The size of the processor depends on the operating system (DOS/VSE with VSE/Advanced Functions, or OS/VS1 or MVS) and the data communication system (CICS/DOS/VS or CICS/OS/VS or IMS/VS) used to control the operation of DMNL/DSNL.

The direct connection between the computer system and the S.W.I.F.T. network requires one of the following network control facilities:

- IBM 3704, IBM 3705 in EP or PEP mode (exclusively with Scanner Type 2).
- An Integrated Communication Adapter (ICA) where possible
 - For IBM S/370 mdls 135-3 and 138, an ICA with RPQ XA7464.
 - For IBM 4321 J11 and IBM 4331 model group 11, a Communications Adapter with RPQ XD1603 and RPQ 7B0752.
 - For IBM 4331 model group 1 and 2, a Communications Adapter with RPQ XD1603.

The connection between the ICA or the control unit and the S.W.I.F.T. regional processor is a point-to-point BSC line, switched or non-switched, using nontransparent EBCDIC code.

SOFTWARE REQUIREMENTS

The programs that constitute the Direct S.W.I.F.T. Network Link program product are written in IBM S/370 Assembler language.

The relevant feature code must be selected when ordering the program product according to the particular DMNL (CICS/DOS/VS or CICS/OS/VS or IMS/VS environment, see "Reference Information").

If an IBM 3704 or 3705 is used to communicate with the S.W.I.F.T. network, the S.W.I.F.T. BSC Procedure (5799-AQT) must be installed.

For ACF/NCP/VS Release 2 or 3 (5735-XX1), SSP (5735-XX3) and SCP (5747-CH1, with EP feature #6004), the DSNL installation requires the compatibility for OS/VS or DOS/VSE EP Programs (5799-WRF).

DSNL uses the Basic Telecommunication Access Method (BTAM) for message traffic to and from the S.W.I.F.T. network. BTAM/ES (5746-RC5) Release 1.0 must be available for DOS/VSE. For OS/VS, BTAM is a component of the OS/VS System Control Program.

For additional requirements, refer to the appropriate version of the base product Direct Multinetwork Link.

COMPATIBILITY and MIGRATION

Direct S.W.I.F.T. Network Link, together with Direct Multinetwork Link provide all S.W.I.F.T.-specific services. The program products DMNL/DSNL Release 1.0 are internally restructured, functional extensions of the program product Direct S.W.I.F.T. Link (DSL). With respect to DSL Release 2.0, DMNL/DSNL Release 1.0 provides the following additional new functions:

- Direct S.W.I.F.T. Network Link
 - Support of all S.W.I.F.T. message types, including message category 7 (documentary credits).
 - Optional automatic retry of LOGIN processing.
- Direct Multinetwork Link (DMNL). (Refer to program numbers listed in "Reference Information".)

To ease migration, DMNL/DSNL Release 1.0 are designed to be functionally upward compatible with DSL. However, a customer migrating from DSL to DMNL/DSNL must follow the same installation procedure as a new customer.

Message preparation and operational control of Direct S.W.I.F.T. Network Link requires the installation of Direct Multinetwork Link.

The generalization of the facility to define user-specific messages has implied modifications of the message format service, queue management and routing in DSL. User-written application programs that use these services may have to be rewritten.

**FILE TRANSFER PROGRAM
VERSION 2 (FTP-V2)
5668-932**

PURPOSE

The File Transfer Program Version 2, briefly referred to as File Transfer Program and abbreviated to FTP-V2 in this document, is a general-purpose utility program that provides remote file submission from any VSE- or SSX/VSE-based node to any other VSE- or SSX/VSE-based node by using SNA protocols. It offers transmission functions for VSAM and sequential disk or tape files.

HIGHLIGHTS

The File Transfer Program features the following highlights:

- Data Compression
- User control-statement interface independent of operating system
- Support of IBM standard-label and unlabeled tapes
- Support of VSAM files
- Checkpoint/restart and VTAM session recovery facilities
- Logging of file transmission activities
- Transmission invocation either at sending or at receiving location
- Trace facility
- Data Security

FTP-V2 is designed to support transfers of large, medium-sized, and small files. It is a ready-to-run program that does not require a generation step.

DESCRIPTION

The program product enables VSE-based installations to transfer data sets between nodes or within a node of a processor network. This function is known as the file-to-file function, which can be used for large, medium-sized and small files. The VSE operating system(s) can also run in a virtual machine provided by VM/370. FTP-V2 allows the user to transfer:

- Sequential data sets residing on tape or disk (only in VSAM-managed space)
- VSAM Entry Sequenced Data Sets
- VSAM Key Sequenced Data Sets

FTP-V2 can transfer a data set to another data set within the same node or in another node. A data set that is to be transferred (called the 'from' data set) and the receiving data set (called the 'to' data set) must have one of the following record formats:

Fixed
Fixed, blocked
Variable
Variable, blocked
Undefined

The 'from' and 'to' data sets can have different file characteristics. For example, the 'from' data set might be a VSAM KSDS and the 'to' data set might be a tape file.

CHECKPOINT/RESTART

FTP's checkpoint/restart facility provides two essentially differing types of restart:

Autonomous restart: A restart that takes place during file transfer and does not require any user involvement.

Deferred restart: A restart performed by FTP-V2 on resubmission by the user of the job to invoke FTP-V2.

Autonomous restart is performed by FTP-V2 after a session is temporarily broken. The break in session can be caused by a temporary telecommunications line failure or certain types of error being detected by the system during file transmission.

Deferred restart is performed by FTP-V2 only when the job to invoke FTP-V2 is resubmitted by the user of the system after a session was permanently broken. The break in session can be caused by a telecommunications line problem, a system software error, a system hardware error, or a procedural error.

MULTITHREAD OPERATION

FTP-V2 is designed as a single-thread application program. This means that one copy of FTP-V2 establishes one session, with one other copy of FTP-V2 at any one time. However, FTP-V2 can be used to perform multithread operation by having two or more copies of FTP-V2 started at various locations in the network. This allows two or more locations to concurrently communicate with one location and, vice-versa, one location to concurrently communicate with two or more locations.

CUSTOMER RESPONSIBILITIES

It is the customer's responsibility:

- To install ACF/VTAM (with MSNF) or ACF/VTAME, respectively, and VSE/VSAM
- To define the VSAM cluster for the checkpoint/restart file of FTP-V2

- To define and catalog the VTAM definitions according to the FTP-V2 requirements

If the Prompter Facility is being used, the customer must also create and catalog a node-connection table and a job-information table according to the FTP-V2 requirements.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

FTP-V2 is designed to run on any IBM processor supported by VSE with VSE/Advanced Functions or SSX/VSE. It will use disk devices supported by VSAM and tape devices supported by the operating system-dependent data management (VSE -- LIOCS).

There are no specific requirements in addition to those for VSE/Advanced Functions or SSX/VSE. Users of an IBM S/370 should consider that FTP-V2 uses the conditional swapping feature.

SOFTWARE REQUIREMENTS

The programs that constitute the File Transfer Program are written in IBM Assembler language.

The programs are available for operation under the following operating and data communication systems:

For FTP-V2 VSE

Small System Executive/Virtual Storage Extended (SSX/VSE, 5666-265) Release 3 or subsequent releases.

IBM Disk Operating System/Virtual Storage Extended (5745-030) Release 3.0, together with VSE/Advanced Functions (5748-XE8) Release 3.0 or subsequent releases.

VSE/VSAM (5746-AM2) Release 2 or subsequent releases.

Advanced Communications Function for VTAM (ACF/VTAM) (5746-RC3) Release 3, including the Multisystem Networking Facility (MSNF), or subsequent releases, or

Advanced Communications Function for VTAM Entry (ACF/VTAME) (5746-RC7) Release 1 or subsequent releases, or

Advanced Communications Function for VTAM Version 2 (ACF/VTAM-V2) (5666-280) Release 1 or subsequent releases.

If the Prompter Facility is being used, FTP-V2 needs, in addition to the above products:

VSE/POWER Version 2 (5666-273)

VSE/Interactive Computing and Control Facility (ICCF) (5746-TS1)

COMPATIBILITY and MIGRATION

FTP-V2 can be used concurrently with the File Transfer Program Version 1 (5748-XE6) at the same node. Both versions may coexist. However, they cannot exchange data between each other. The following must be considered for users migrating from the previous FTP to FTP-V2:

FTP-V2 is designed as an SNA product that uses its own data transmission facility via VTAM API. Therefore, ACF/VTAM definitions are required.

Because of the checkpoint/restart and logging facilities of FTP-V2, a checkpoint/restart file has to be provided and must be defined via job control statements to FTP-V2 within the FTP-V2 job stream. The file organization for the checkpoint/restart file is VSAM KSDS.

SAM DASD files on VSE systems have to be managed by VSAM. This requires the VSAM Space Management feature for SAM Files (5746-AM2).

DATA SECURITY

FTP-Version 2 does not provide new or independent security functions. FTP has been designed to allow an installation's management and users effective use of the security features of VSAM, VTAM, and access control. FTP-V2 provisions for data protection include the use of the ACF/VTAM, or ACF/VTAME password protection options, and the access control function of VSE/Advanced Functions or the corresponding functions in SSX/VSE.

DATA INTEGRITY

FTP-V2 has many checks to ensure that the file transfer between nodes occurs as the user wishes. It is particularly important that the integrity of data is ensured; therefore, FTP-V2 terminates whenever there is an inconsistency that could indicate a possibility of a loss of data integrity. However, it is not possible to detect all potential situations that could result in lost data integrity. Therefore, it is important to plan all file transfers before they take place to ensure the proper level of data integrity.

File Transfer Program V2 (cont'd)**PERFORMANCE**

The performance characteristics of FTP-V2 are dependent on two factors: The load on the processor caused by FTP-V2 and the efficiency with which data is sent to the network.

FTP-V2 is designed to use only pageable storage. The code is intended to be written to minimize the working storage set and the number of page references so that FTP will have minimum impact on the systems where it is running. The working set code is planned to be less than 10K of executable code excluding data management (for example, VSAM), I/O and work areas.

Where FTP must issue SEND, RECEIVE, GET, or PUT, it branches to code that is outside its direct control. The working set of this code is dependent on the access method and differs among VTAM, VSAM and SAM. Since the path length through the access methods is usually much longer than that through FTP, it is advisable to limit the number of calls to these routines and the path length through the routines by the following techniques:

- Using a large RU size (VTAM)
- Using a large block size (SAM)
- Using a large CI size (VSAM)

DOCUMENTATION
(available from Mechanicsburg)

General Information Manual (GH12-5141)

The following publications will be available at FTP-V2 availability:

Licensed Program Specifications (GH12-5261) ... *Program Reference and Operations Manual and Diagnosis Guide* (SH12-5349) ... *Diagnosis Reference* (SY12-5350).

Additionally, for the Prompting Facility:

User's Guide (SH12-5352) ... *Installation Guide* (SH12-5354).

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**4700 FINANCE COMMUNICATION SYSTEM
APPLICATION MAP GENERATOR
5668-934****PURPOSE**

The Application Map Generator for the 4700 Finance Communication System is a host-based online interactive programming tool for user presentation services development.

This licensed program is designed to execute on a S/370, 303X, 308X or 4300 with the Interactive Map Definition feature of the Graphical Data Display Manager. It will operate on SSX/VSE, DOS/VSE, OS/VS1, OS/VS2 (MVS), MVS/XA or VM/SP. Application Map Generator is used in application development environments to generate service-dependent control commands (maps) that are used with the Controller Resource Manager licensed program on the 4700 Finance Communication System, as part of Resource Manager.

HIGHLIGHTS

Application Map Generator utilizes a large-screen 1,920-character 3270 Keyboard/Display Terminal on a S/370, 303X, 308X, or 43XX Host Computer for the following:

- Creation of maps and operator guidance (panels) via an interactive map generation process
- Provides a map definition and flow concept that aids your programmer in structuring the normal, error, dynamic, and iterative flows of a transaction
- Supports field editing and data formatting
- Develops device format information (maps) that can be used with the Controller Resource Manager for the 4700 Finance Communication System
- Allows for device format independence in user application development
- Supports structures to describe a buffer of data using either 4700 COBOL or 4700 Assembler language
- Provides an online tutorial to assist the programmer in using RM4700AMG

This program development tool provides customer value by:

- Promoting early user involvement in application development
- Shortening the development cycle
- Increasing the productivity of programmers writing applications

DESCRIPTION

RM4700AMG allows definition of maps for the following media:

- Keyboard/Display
- PIN Keypad
- Magnetic Stripe
- Journal (continuous-forms) printer
- Cutform printer
- Passbook printer

RM4700AMG supports map definition of the following 4700 machines attached to the 4701 Controller, mdls 1 and 2:

- 4704 Display Workstation, mdls 1, 2, and 3 including MSR, MSR/E, and PIN Keypad
- 4710 Receipt/Validation Printer
- 4720 Printer, mdls 1 through 4
- 7463 Validation Printer mdl 3

RM4700AMG supports map definition of the following 3600 machines for attachment to the 4700:

- 3604 mdls 1 - 7 Keyboard/Displays including MSR, MSR/E, and PIN pad
- 3610 Document Printer
- 3611 Passbook Printer
- 3612 Passbook and Document Printer
- 3615 Administrative Terminal Printer
- 3616 Passbook/Journal Printer

RM4700AMG supports map definition of the following DCA machines for attachment to the 4700:

- 3178 mdls C1 and C2 Displays
- 3278 mdl 2 Display including MSR
- 3279 Color Display mdls S2A, 2A, S2B, 2B, and 2X including MSR (see Note 1)
- 3262 mdls 3 and 13 Line Printer
- 3287 mdls 1 and 2 Continuous Forms Printer
- 3210 mdls G01 and G02 (see Note 2)
- 7436 Printer (letter quality) (see Note 2)

Note 1: The Programmed Symbols (PS) feature is not supported.

Note 2: Supported in 3287-compatible mode only.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

Application Map Generator is designed to operate on the following IBM machines: S/370, 303X, 308X, or 43XX Processor with sufficient main and external storage capacity, and peripheral devices capable of operating the software supported.

SOFTWARE REQUIREMENTS

This licensed program has as prerequisites the Graphical Data Display Manager with the Interactive Map Definition feature and the 4700 Finance Communication System Host Support licensed programs, program numbers 3748-XXH and 5668-989, respectively. It requires a current level of one of the following operating systems:

DOS/VSE with VSE/AF
OS/VS1
OS/VS2 (MVS)
MVS/XA
VM/SP

DOCUMENTATION

(available from Mechanicsburg)

RM4700 General Information Manual (GC31-0508) ... RM4700 Licensed Program Specifications (GC31-1505) ... RM4700AMG User's Guide ... RM4700AMG User's Reference ... RM4700AMG Diagnosis Guide and Reference.

MVS SYSTEM INTEGRITY

IBM will accept APARs describing any situation where the installation of this program results in an exposure to the system integrity of MVS. Refer to the IBM Programming Announcement on MVS System Integrity dated April 21, 1980. This program is intended to run authorized.

PROGRAM PRODUCTS

**5668-935 - 4700 FINANCE COMMUNICATION SYSTEM
CONTROLLER RESOURCE MANAGER**

PURPOSE

The Controller Resource Manager for the 4700 Finance Communication System, a comprehensive controller based facility, is provided to reduce the effort and expense required to design, develop and install advanced application functions. This program is part of the Resource Manager for the 4700 Finance Communication System support and is designed to be used in conjunction with the Application Map Generator for the 4700 Finance Communication System (5668-934) in application development environments.

HIGHLIGHTS

This product provides a basis for application development and implementation by providing a comprehensive set of tested common subroutines for device and communications logic handling, and functions commonly associated with system control. This set of routines is designed to do the following:

- Allows for insulation of application processing logic from terminal layout by the use of maps, hence, allowing application logic to be largely device-independent.
- Allows for the development of applications in COBOL to utilize skills already existent in the customer environment. 4700 Assembler language is also supported.
- Provides logical access for Systems Network Architecture (SNA) and Binary Synchronous Communications support.
- Provides logical access to direct access files.
- Provides file sharing among workstations.
- Provides single workstation access to multiple application programs.
- Allows end-user to access multiple application functions, including accessing non-Controller Resource Manager and host-based applications from a single keyboard/display via the Universal Workstation support.
- Manages queues for timers, messages and shared devices.
- Has pass-thru transaction processors to work directly with host 3270 applications.
- Provides debugging and tracing aids to interact with Communication Network Management facilities.
- Provides for the standardization of error handling, processing, and recording for improved reliability, serviceability, and availability.
- Provides user exit facilities.
- Provides checkpoint/recovery function.
- Reduces programming requirements for application maintenance.

DESCRIPTION

Controller Resource Manager for the 4700 Finance Communication System is a comprehensive set of software service routines, running in a 4700 Controller, which are designed to relieve users from providing and developing code which most 4700 applications would require. It will allow the user to make optimum use of available hardware resources, which in turn will make easier installation and maintenance activities.

These service routines are designed to take full advantage of the 4700 architecture. The standard 4700 COBOL CALL interface is used for these service routines. The routines that form the components of RM4700CTLR are:

- **Nucleus** - The nucleus calls the appropriate I/O processor which collects the transaction data and calls a user-provided application program. The user-provided application program is referred to as the transaction processor. It also provides Universal Workstation support.
- **Mapping services** - Mapping services uses RM4700AMG-produced maps for transaction flow control, including the handling of physical and logical error situations. It is designed to handle multiple steps of data collection, provides edits and transforms on data, and returns the results to the transaction processor.
- **Mapped I/O processors** - The mapped I/O processors provide the required interface between the physical device and mapping services.
- **Record I/O processors** - The record I/O processors provide a direct interface between the physical device and the user application for selected devices.
- **Communications support** - The communications service routines support Systems Network Architecture (SNA) Synchronous Data Link Communications (SDLC) and Binary Synchronous Communications (BSC) to a host processor. A 'datastream' interface is presented to the transaction processor. Session initiation and termination is handled and data flow protocols are enforced.

- **File processor** - The file processor service routine supports the temporary file and data sets accessed via the Extended Diskette/Disk Access Method (EDAM).

Note: The file processor will allow utilization of Keyed Access support which is being provided as part of the controller data support EDAM enhancements for the 4701 disk storage features. This support enables data access via either a Random Keyed Access Path or Keyed Sequential Access Path.

- **General service processors** - The general service processors provide functions that are used by both the transaction processors and the I/O processors. These functions include wait or post an event, request timer interruptions, enqueue/dequeue, and create message queues between stations.

Since RM4700CTLR executes as an application program, it is capable of co-residing with other financial applications, such as those required for the 3624, in the same 4700. The universal workstation support provides the capability for the user to access either existing programs or RM4700-based programs with only minimal modifications to existing applications. This is limited only by resource and/or performance considerations.

A datastream pass-thru transaction processor is provided to support SNA LU-2 communication protocol (SNA 3270) and LU-1 SCS formatted data streams to/from user host application programs. This support allows Finance Communication System Keyboard/Displays and selected Printers to interface with host applications which utilize those datastreams. The LU-1 SCS formatted datastreams (e.g., POWER/VS-RJE and JES2-RJE) must only contain the SCS control characters supported by the target printer; no translation on the datastream is performed by RM4700CTLR. Local print support is also provided to allow printing of a display image on a designated printer.

A set of problem determination aids and routines is provided to allow users and operators to interrogate the system in order to understand and resolve problems. This includes the ability by the network operator to invoke trace and other problem recovery procedures via Communications Network Management facilities. These functions can also be invoked locally at the controller. Using 4700 Host Support, both dump and trace data can be transmitted to the host and printed.

User exits are available at key processing points throughout RM4700CTLR to allow for special editing and other user processing.

RM4700CTLR supports the 4701 controller, mdls 1 and 2, including the following features and attached 4700 terminals:

- 1035 and 1045 Auxiliary Diskette Drives
- 4701 mdl 2 Disk Storage features
- 4704 Display Workstation, mdls 1, 2 and 3 including MSR, MSR/E, and PIN Keypad
- 4710 Receipt/Validation Printer
- 4720 Printer, mdls 1 through 4
- 4730 Personal Banking Machine
- 7463 mdl 3 Validation Printer

RM4700CTLR supports the following 3600 terminals for attachment to the 4701:

- 3604 mdls 1 - 7 Keyboard/Displays including MSR, MSR/E, and PIN pad
- 3610 Document Printer
- 3611 Passbook Printer
- 3612 Passbook and Document Printer
- 3615 Administrative Terminal Printer
- 3616 Passbook/Journal Printer

RM4700CTLR supports the following DCA-attached terminals to the 4701:

- 3178 mdls C1 and C2 Displays
- 3278 mdl 2 Display including MSR
- 3279 Color Display mdls S2A, 2A, S2B, 2B, and 2X including MSR (see Note 1)
- 3262 mdls 3 and 13 Line Printer
- 3287 mdls 1 and 2 Printer
- 5210 mdls G01 and G02 (see Note 2)
- 7436 Printer (letter quality) (see Note 2)

Note 1: The Programmed Symbols (PS) feature is not supported.

Note 2: Supported in 3287-compatible mode only.

The 4700 using RM4700CTLR can be attached to a S/370, 303X, 308X, or 43XX using IMS or CICS. In addition, the System/34, System/36, and 8100 Information System (DPPX) are supported for communication only. RM4700CTLR provides for secondary communications facilities supporting the following protocols:

- SNA/SDLC
 - LU 0 (FMP3/TSP3)
 - LU 0 (FMP4/TSP4)

PROGRAM PRODUCTS

4700 FCS Controller Resource Manager (cont'd)

- LU 1
- LU 2
- FDX and HDX-FF
- BSC-3

Conversational communication is not supported for BSC-3.

SPECIFIED OPERATING ENVIRONMENT

IBM will ship to a host S/370, 303X, 308X, or 4300 computer location the licensed program materials for the customer to install. The customer will prepare, distribute, and install the licensed program materials on the designated controller(s) on which RM4700CTLR will execute.

This host computer location will be the designated Customer Service Location for Program Services which are provided by IBM for RM4700CTLR.

HARDWARE REQUIREMENTS

This licensed program will operate on an IBM 4701 mdl 1 Controller which has a minimum of 256K of memory and the latest applicable release of the 4700 Finance Communication System Controller data support. Consideration should be given to the amount of storage available for control program generation (CPGEN) data, user application program and data, and any optional controller support required.

SOFTWARE REQUIREMENTS

This licensed program has as a prerequisite the most current applicable release of the IBM 4700 Finance Communication System Host Support (5668-989), for installation, distribution, and maintenance of RM4700CTLR to the designated controller(s). The user needs a current release level of one of the following operating systems:

- DOS/VSE with VSE/AF
- OS/VS1

COEXISTENCE

RM4700CTLR may coreside on 4700 Controllers with other applications, including those migrating from 3600.

The Universal Workstation support enables existing and new applications to share devices and workstations. It allows non-Controller Resource Manager-based applications to provide the same user interface for application selection. It must be ensured that non-Controller Resources Manager applications observe the conditions specified for use of this feature.

PROGRAM PRODUCTS

**IMS APPLICATION DEVELOPMENT FACILITY II
5668-937**

PURPOSE

The IBM IMS Application Development Facility II (IMSADF II) is an application generator product which aids the development, maintenance and modification of applications for IMS/VS data base and data communication systems. It operates with IMS/VS to reduce the time and effort required for development and maintenance of data base and data communication applications. It provides increased capabilities in the areas of data independence, access control, data integrity, and routing messages between application systems.

Application Development Facility II is an upward compatible enhancement of the IMS Application Development Facility IUP (5796-PHX). It includes all of the IUP Release 1.3 function plus new functional and performance enhancements.

DESCRIPTION

IMSADF II OVERVIEW: The IMS Application Development Facility II is designed to allow quick and efficient application development for IMS/VS. The facility provides generalized functions (common modules) which relieve the need for a programmer to code, in a procedural language (Assembler, COBOL and PL/I), many of the most frequently developed and used modules. The common modules provide functions which execute DL/I calls, format and de-format 3270 screens, edit input data, validate segments, perform application logic, verify user authority, and route messages between applications and system users. Conversational, non-conversational, batch message processing, and batch drivers are furnished which provide the logic necessary to connect the generalized functional modules into executable IMS applications. The programmer specifies the required application function by defining parameters, called rules, which are stored in tables within the facility. During execution, the application drivers and common modules reference these tables to perform the application to meet the end-user's requirements.

Applications are implemented by coding and generating the static rule descriptions of the data bases, and the transaction rule(s). Optionally, display screens may be defined or a default display screen may be used. Screen field edits, data base segment validation, and processing logic definitions (audit rules) may be added to the transaction specifications to perform user edit functions and user processing functions. If a transaction requires additional processing logic, then a special processing routine, or audit exit routines coded in COBOL, PL/I or Assembler can be added.

IMSADF II also provides: (1) A message handling application to send and receive messages among user groups and individual users, and (2) a text processing application for simple text processing.

The enhancements contained in this release of the program product are described below and are followed by an outline of the four IMSADF IUP releases.

HIGHLIGHTS

- Program Product.
- Field Engineering Service.
- Data Dictionary Extension.
- IMS/VS 1.2 Data Sharing Support.
- Fast Path Data Base Access Support.
- New Auditor Functions.
- Extended Color Support.
- Screen Handler Improvements.
- PF Key Support.
- Rules Generator Enhancements.
- Batch Driver Enhancements.
- Performance Enhancements.
- Additional Exits.
- Serviceability Facility.
- Text Utility Processing Enhancements.
- Rules Documentation Improvements.

PROGRAM PRODUCT: IMSADF II code and documentation have been upgraded to program product standards. The product will follow the SMP process for installation and service. Service will be provided by Field Engineering.

DATA DICTIONARY EXTENSION: The Data Dictionary extension provides support for the IMSADF master rules concept (common rules which are used by multiple user transactions). The extension provides: (1) A Data Dictionary IMSADF extensibility data model which connects to Data Dictionary standard categories to represent IMSADF rules definitions, and (2) an IMSADF II Data Dictionary output processor to create rules generator source from the dictionary data definitions.

DATA BASE SUPPORT

IMS/VS 1.2 DATA SHARING SUPPORT: This IMSADF II segment handler enhancement supports the use of IMS/VS V1 Release 2 data sharing.

FAST PATH DATA BASE ACCESS SUPPORT: This modification allows IMSADF standard and special processing applications (IMS/VS mixed mode) to access IMS/VS fast path data bases (MSDBs and DEBbs) and use standard ADF facilities for retrieving, updating, inserting and deleting fast path data base segments.

NEW AUDITOR FUNCTIONS: The auditor facility enhancements provide:

- Support for twin segment processing.
- Support for IMS/VS Multiple System Coupling by allowing the auditor to directly route secondary transactions to another IMS/VS system.
- Capability to terminate secondary key selection.
- Capability to specify the encode/decode table key dynamically at execution time.
- Immediate secondary transaction generation.
- Ability to switch from static to dynamic rule if audit rule is not found in the static load module.
- Capability to control audits by IMSADF System ID.
- Greater flexibility for key audit naming conventions.
- Dynamic PCB# alteration.
- Ability to map DL/I status code into an audit error message.
- Ability for auditor to trigger multiple error and/or warning messages per audit.

SCREEN HANDLING: IMSADF II screen handling enhancements include the following:

- Full color and extended highlighting support for the 3279 terminal; the color characteristics and highlighting may be specified through the rules generator and modified dynamically through the auditor or special processing routines.
- An option to return directly to the signon screen in a single step.
- An option to control display of the transaction and key field on segment display screen.
- Support for four standard data formats:
 - MM/DD/YY - Former US standard with (/) separator.
 - YY-MM-DD - New standard with (-) separator.
 - YY MM DD - New standard with (blank) separator.
 - DD.MM.YY - Former European standard with (.) separator.

PF KEY SUPPORT: Provides support for using PF keys with conversational and non-conversational standard and special processing transactions.

RULES GENERATOR ENHANCEMENT: The rules generator enhancements provide support for new and modified ADF function, including the generation of MFS source for secondary transactions and output messages to screens and printers.

BATCH DRIVER ENHANCEMENTS: These enhancements allow the batch driver:

- As a BMP, to provide secondary transaction generation capability by giving the batch driver the ability to access the IMS/VS message queue for output, including the ability to send output to MFS-supported screens and printers.
- When used in DL/I batch, the same function causes output to be written to an OS/VS sequential data set providing a means to create output listings using audit rules.
- To coordinate special processing routine checkpoints on restart.

PERFORMANCE ENHANCEMENTS: Improvements to the architecture and performance characteristics of IMSADF II include:

- Utilizing a directory to reduce paging and speed up audit static rule searching.
- Reducing PL/I environment initializations on audit calls to PL/I audit user exits.
- Minimizing repetitive BLDLs for commonly used composite load modules.
- Providing the ability for multiple special processing routines to operate under the same IMS/VS transaction, thereby reducing program-to-program message switching.
- Providing an optional data mapper segment call when all fields of a DL/I segment are requested for a data area.

IMS Application Development Facility II (cont'd)

- Reducing number of Set Program Interrupt Exit (SPIE) calls to a minimum.

ADDITIONAL EXITS: The segment handler has been modified to provide a user exit before and after each segment handler DL/I call to allow for specialized user-developed processing, such as audit trails.

SERVICEABILITY FACILITY: The serviceability facility provides a diagnostic trace capability which will show the IMSADF II modular flow and details of the interfaces between modules.

TEXT UTILITY TRANSACTION ENHANCEMENTS: The text screen processor has been enhanced to support up to a 43-line screen. The utility will be able to handle up to 34 user segments per screen as compared to the current 15, and will allow a key of up to 20 bytes as compared to the current 8-byte key.

RULES DOCUMENTOR IMPROVEMENTS: The Rules Documentation facility has been improved to provide:

- IMSADF SYSID sensitivity consistent with other IMSADF II components.
- A report on a single input transaction rule similar to the SR02 report for all input transaction rules.
- A composite load module report.

IUP RELEASE HISTORY

There have been four releases of IMSADF as an IUP with extended support. The contents of each release is outlined below to provide a history of product enhancements.

VERSION 1 RELEASE 0: Announced January 28, 1977.

This release used as a base a program developed at an internal IBM location, the Manufacturing Floor Control System. The base product was modified to remove language dependencies, and user documentation was provided. A rules generator facility for creating the specifications of IMSADF conversational applications was provided.

VERSION 1 RELEASE 1: Announced November 9, 1977.

Enhancements were made in the following functional areas:

1. Rule Generator
 - Batch and non-conversational processing rules produced by the Rule Generator.
2. Data Base Processing Restrictions Eased
 - Segment length increased.
 - Concatenated key length increased.
 - Key length for each segment increased.
 - Number of PCBs accessed by Transaction Drivers increased.
 - GET NEXT processing changed to allow the display of multiple occurrences of the target segment.
 - Access to the root and its dependent segments allowed through both secondary key selection and usage of partial keys.
3. Screen Handling
 - Display screen formats specified by screen image format statements.
 - Option to control displayed system information.
4. Performance
 - Substantially reduced the number of DL/I calls required in several processing areas.

VERSION 1 RELEASE 2: Announced December 13, 1978.

Enhancements were made in the following functional areas:

1. Rule Generator
 - Common batch screen design facility.
2. DL/I Data Base Support
 - Access data base segments with non-disposable keys.
3. Transaction Processing
 - Data base compare prior to update with conversational processing.
 - SPA extension and flexibility.
 - Multiple path and data base access with standard processing.
4. Auditing
 - Expanded auditor operation descriptors.
 - Encode/decode function.

5. Screen Handling
 - Segment display ease-of-use.
 - Combine Standard and Special Processing menus.
6. Special Processing
 - Expanded DL/I call function.
 - Perform data base updates as directed by special processing routine.
 - PL/I interface for Audit user exit.
7. Performance Module Architecture
 - One copy of common modules.
8. Message Handling
 - Leading zero editing for message generation.

VERSION 1 RELEASE 3: Announced October 17, 1980.

Enhancements were made in the following functional areas:

1. Rule Generator
 - Screen support [3277, 3278 (mdls 2, 3, 4, 5), 3279 (base colors only)].
 - Performance enhancement - Bypass Assembler to generate rules.
 - Basic FIELD form for input of FIELD definitions and options.
 - SEGMENT statement override capability.
2. Transaction Processing
 - Increase number of user data bases from 15 to 120 per PSB.
3. Auditing
 - High-level Language - Batch compiler generates Batch Driver input.
 - New Audit phase - Key audits prior to DL/I calls.
 - Two levels of messages - Warning and error.
 - New audit operations
 - Related-to-related field moves, compares.
 - Immediate DL/I calls.
 - 20 other new operations for general use.
4. Screen Handling
 - Screen-to-screen dialog controlled through the auditor.
 - Full use of dynamic attributes for fields.
5. Performance Module Architecture
 - Install options - Test or production, work data base parameters, device type for prebuilt screens.
6. Utilities
 - Rule Reporter
7. Signon and Menu Processing
 - Merge Text Utility Menu with Transaction Selection Menu.
8. Batch
 - Error transaction data set.
9. Message Handling
 - Additional substitution functions into messages.
 - Externalize all execution time messages.

CUSTOMER RESPONSIBILITIES

The installation of IMSADF II requires a properly configured IMS/VS system with appropriate terminals and other devices, as required for IMS/VS and the desired operating system.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The machine configuration required for IBM IMS Application Development Facility II (5668-937) is determined by the requirements of the host operating system and the IMS/VS subsystem, and the objectives of the installation.

The minimum system requirements for which IBM IMS Application Development Facility has been designed to operate are:

- An IBM S/370 capable of supporting OS/VS1 or OS/VS2 and IMS/VS.
- An IBM nine-track tape drive for purposes of installing distributed

IMS Application Development Facility II (cont'd)

material.

TERMINALS: IMSADF II has been designed to support the IBM 3270 Information Display System family of display terminals. Terminals must be at least 24 lines by 80 columns in size, and be supported by the IMS/VS DC system and the IMS/VS MFS facility.

IMSADF II in an IMS/VS DB/DC host processing environment supports the IBM 3275, 3277, 3278 and 3279 (with an appropriate control unit).

SOFTWARE REQUIREMENTS

IBM IMSADF II has been designed to operate with current releases of OS/VS1 and OS/VS2 MVS, and requires one of the following release levels of the IMS/VS program product: IMS/VS Version 1 Release 1.6, Release 2 and subsequent releases, unless otherwise specified (either IMS/VS DB or IMS/VS DB/DC).

For IMS/VS operating system requirements, see "Software Requirements" in the IMS/VS pages.

OS/VS DB/DC Data Dictionary Release 4.0 (5740-XXF) is required to utilize the IMSADF II Data Dictionary Extension enhancement.

STORAGE REQUIREMENTS: The minimum virtual storage requirements to operate satisfactorily are:

- Adequate storage for IMS/VS DB/DC with at least 300K for conversational or non-conversational message regions or 512K for a batch message region.
- Requires an OS/VS batch region size of approximately 768K (varies with the number of control statements submitted) for the rules generator.

INSTALLATION: The System Modification Program (SMP) Release 4 for OS/VS2 MVS or OS/VS1 is required for installation.

COMPATIBILITY

IMSADF II includes all existing functions of IMSADF IUP (5796-PHX) Release 1.3.

MIGRATION

For IMSADF Release 1.3 IUP users - Regeneration of static rules or conversion of dynamic rules data bases *will not* be required.

IMS APPLICATION DEVELOPMENT FACILITY IUP: IMS Application Development Facility IUP (5796-PHX) Release 1.3 will be withdrawn from marketing at availability of IMSADF II, and service will be discontinued 12 months after IMSADF II availability.

DATA SECURITY, AUDITABILITY and CONTROL

IMSADF II runs as an application program under IMS/VS with OS/VS1 or OS/VS2 MVS and is subject to the controls that they provide. IMSADF II provides end-user signon validation and authorization functions to control end-user access to data bases. User profiles restrict data base access by segment type, processing option, and mode of access (retrieve, delete, etc.). A user exit before and after each segment handler DL/I call is provided for user-written audit trails, access controls or other specialized processing. User management is responsible for the selection, application, adequacy and implementation of these features, and for appropriate application controls.

PERFORMANCE

The combination of the functional and performance enhancements is expected to be equivalent to or better than IMSADF II Release 1.3 IUP depending on individual installation characteristics.

MVS INTEGRITY

IBM will accept APARs where installation of IMSADF II introduces an exposure to the system integrity of OS/VS2 (MVS). This program is intended to run unauthorized.

RPOs ACCEPTED: No

TERMS and CONDITIONS: See PP Index

PROGRAM PRODUCTS

**GRAPHICS PROGRAM GENERATOR
VERSION 1
5668-941**

PURPOSE

The Graphics Program Generator program is a set of programs designed to create, maintain and display information about facilities, their locations and relationships to one another. The Graphics Program Generator supports an interactive dialog on a graphics workstation. In this dialog, pictures of the facilities are displayed. The operator selects actions to be performed, and indicates the facility or location involved by pointing to the displayed picture. The Graphics Program Generator program is a significant enhancement of the Interactive Geo-Facilities Graphic Support Programming RPQ P09016 (5799-AYB). It contains all of the capabilities of the PRPQ as well as many totally new functions, performance improvements, and productivity options.

SPECIAL SALES INFORMATION

The Graphics Program Generator is a part of a family of IBM products intended to broaden and strengthen the marketability of a wide variety of geo-processing applications in several industries. Designed for use with the Geo-Facilities Data Base Support Programming RPQ P09030 (5799-BEB), it is a key systems component of the Distribution Facilities Information Systems (DFIS) architecture.

The DFIS architecture provides the basis for supporting geo-processing applications within the railroad, energy utility and communications industries, facilities or space management in addition to state and local governments.

DESCRIPTION

This product provides all the functions of the Interactive Geo-Facilities Graphic Support PRPQ which includes the following:

- **Workstation Control** - A comprehensive set of functions providing user controls for registering paper documents on a tablet; windowing and zooming picture data within the display; selecting picture scales and points of interest; and controlling cursor operations. (See "Specified Operating Environment" below for a description of a workstation.)
- **Graphic Data Entry and Editing** - A powerful set of interactive functions for constructing and modifying two-dimensional pictures in a workspace. Included are user-specified procedures for dynamically adding, deleting, and moving facilities in picture displays; constructing arcs, parallel or perpendicular lines; attaching, connecting, and offsetting lines; various forms of graphic annotation, etc.
- **Attribute Data Entry and Modification** - A set of programs support user data entry directly from menu keys and the keyboard into facilities data fields. Included are various formatting and data conversion options for internal storage of user data.
- **Symbol Generation** - Symbol Generation is the generation of symbols and characters from a user-specified symbol table. An installation has significant flexibility in the interactive design of its symbol character set. Symbol definitions also make it possible to easily support the generation of symbols of various sizes and orientations desired in the display.
- **Graphic Workspace Data Transformation to and from Interface Format** - Functions to manage picture data, and to maintain complex relationships between picture data and application data. Since data may be created outside of the Graphics Program Generator system, a device and system-independent Interface Format (SH20-5622) provides a common method for interfacing. The Graphics Program Generator will transform data from the Interface Format into the internal workspace structure, and from workspace structure into Interface Format.
- **Flexible Menu Layout and Function Definition** - Menu layouts are designed by the user. Each menu area may consist of one or more keys and subkeys. Each key corresponds to one menu function. Each subkey defines a set of data to be passed to the function. A single menu pointing may invoke one or more functions with different data input. Functions invoked via the menu may include both preprogrammed library functions and user application programs.

This product also includes the following functional additions and enhancements:

- **Performance Improvements** - A number of internal modifications have been made to improve picture generation and correlation. In addition, documentation is provided to enable the user to improve performance.
- **Menu Enhancements** - More flexibility is offered in creating graphics on the menu. References to entity variables and system variables can be used in menu definitions. Menu subroutines are provided to simplify menu preparation and reduce preparation time. Menus can now be used on the graphics screen as well as a digitizing tablet.

- **Program Variables** - Any entity ID or field may be used in menu subkeys, pointing rules, or picture definitions. In addition, they are more easily addressed by user exit routines. A number of predefined system entities are provided which contain a major portion of the internal variables. These are now available for use in definitions instead of constants without writing any user exit routines.
- **Pointing Rules** - A substantial amount of function allowing for interaction in the rule has been added to include execution of menu functions, expansion of checks and selection criteria, and the ability to perform computations. In addition, a number of graphic functions are provided to assist in user guidance to make the system easier to use.
- **Checkpoint/Restart** - A menu function to cause the saving of the current status and data is provided. Cold/warm/resume commands are provided to allow different stages of restart from the previously checkpointed condition.
- **Graphic Functions** - An expansion of geometric entities such as polygons, parabolas, ellipses and new geometric construction techniques are included. In addition, graphic copying, line paralleling, centerline expansion, mirroring, shading and a very comprehensive line definition facility are included.
- **Cadastral Data Entry** - Polygon functions provide support for parcel boundary descriptions. In addition, a metes and bounds process is provided to enter cadastral data descriptions (from surveyor notes) in order to describe the location of points and store the source information.
- **Report Generator** - Reports may be produced either ad hoc or on a standard basis. Output may be to the display screen or the printer. The data selection, sorting sequences and formats define the report results. Reports are based on the workspace attribute records.
- **Multiple Fonts** can be specified - A conversion program to convert the U.S. government's HERSHEY fonts is provided. Font spacing, slant, and aspect ratio are specifiable.
- **Frames, Insets and Registration** - Each workspace produced by Graphics Program Generator may contain a frame describing border conditions, as well as many insets which are expansions or contractions of some portion of the workspace. A document produced from a workspace can be registered automatically including the frame, as well as inset information. Insets can have different scales in the X and Y dimensions. A document can be registered using more than 2 points resulting in a polynomial transformation from tablet pointing to data base coordinates. Multiple menu and map documents may be registered simultaneously.
- **Map Projections** - Data can be displayed using the U.S. State Plane projections or different scales in both X and Y coordinates. User-supplied projection algorithms may be used.
- **Warping Functions** - Three explicit warping algorithms are provided: Linear similarity, linear affine and projective transformations.

CUSTOMER RESPONSIBILITIES

To use the Graphics Program Generator, the customer is required to:

- Define symbols beyond those provided, where needed ... Develop appropriate facility definitions and menu layouts ... Develop pointing rules and picture definitions.

Customers may install Geo-Facility Data Base Support (5799-BEB) to provide a companion data base function. Graphics Program Generator contains substantial amount of function that can be used to communicate data base information to Geo-Facility Data Base Support.

Customers installing this product to interface to application systems (other than Geo-Facility Data Base Support) will be required to program the interface modules. These could include data base detail layout, creation and maintenance module, facility retrieval module, transform modules (to/from the interface format) and special conversion programs.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

To operate Graphics Program Generator, each workstation must include:

1. A three-megabyte virtual machine or three megabytes of virtual storage for each workstation on an IBM 43XX or 30XX Processor.
2. Direct access storage of approximately 400K bytes for each saved workspace, and approximately 15 megabytes for saved entity pools, saved menu pools, source code and object modules.
3. IBM 3277 Display Station mdl 2 with 3277 Graphics Attachment RPQ (7H0284) with a storage tube display and optional digitizing

Graphics Program Generator (cont'd)

tablet connected. A plotter may also be attached. The tablet and plotter are connected via RS-232-C ports.

The workstation supported by Graphics Program Generator is the IBM 3277 Display Station mdl 2 with Graphics Attachment RPQ (7H0284) using a vendor-supplied storage tube, optional digitizing tablet and optional plotter. Device support will be provided for one variety of storage tube, digitizing tablet and plotter. The user may choose other storage tubes, digitizing tablets, or plotters, but may have to make minor modifications to the device support. Refer to *IBM 3277 Display Station Model 2 with Graphics Attachment RPQ (7H0284): Custom Feature Description (GA33-3039)*. The plotter supported is the IBM Instruments XY/750 Digital Plotter.

SOFTWARE REQUIREMENTS

Graphics Program Generator is designed to run under MVS/TSO or under VM/CMS.

Requirements for both CMS and TSO

1. IBM 3277 Graphics Attachment Support Programming RPQ P09013 (5799-AXX).
2. VS FORTRAN Release 2 Library (5748-LM3) is required. When the FORTRAN library is installed, the number of unit tables must be set to 99 (UNTABLE=99) to allow definition of files 1 through 99. The FORTRAN extended error handling should also be included using the parameter OPTERR=INCLUDE in the FORTLIB macro.
3. The VS FORTRAN Release 2 Compiler and Library (5748-FO3) are required if any of the FORTRAN programs are to be modified, or if user functions are to be written. See notes above about installing the library.
4. The OS/VS Assembler XF (SCP) or H (5734-AS1) is required if Assembler language programs are to be modified.

Requirements for CMS only

1. VM/SP Release 1 (5664-167) and subsequent releases. VM/High Performance Option (5664-173) is required for hardware environments that require this extension to VM/SP.

Requirements for TSO only

1. MVS/SP-JES2 (5740-XYS), MVS/SP-JES3 (5740-XYN), MVS/SP-JES2 Version 2 (5740-XC6), and MVS/SP-JES3 Version 2 (5665-291) and subsequent releases.
2. If the TCAM MCP buffer size is specified at less than 2,200 bytes, the variables MAXTULEN in the Graphics Attachment PRPQ TCAM Terminal I/O Handler module (GAATRMTS) must be modified to accommodate the lower buffer size and recompiled.
3. The TSO option installed must include the Basic Partitioned Access Method (BPAM) and either the Telecommunications Access Method (TCAM) or Virtual Telecommunications Access Method (VTAM).

COMPATIBILITY

Existing Interactive Geo-Facilities Graphic Support PRPQ source files (DEFN, MENU, SYMBOL) and workspaces are upward compatible. Documentation on source changes and possible conflicts with new function are provided.

CONVERSION

Existing Interactive Geo-Facilities Graphic Support PRPQ source files (DEFN, MENU, SYMBOL) must be recompiled with the Graphics Program Generator program product source compilers. Existing workspaces must be converted by a utility provided with the program product.

DOCUMENTATION

(available from Mechanicsburg)

Licensed Program Specifications (GH20-5355) ... Program Reference Manual (SH20-5621) ... Interface Format Definition Manual (SH20-5622) ... Terminal Operator's Guide (SH20-5623) ... Programmer's Guide (SH20-5624) ... Logic Manual (LY20-2591).

MVS SYSTEM INTEGRITY

IBM will accept APARs where the installation of this program introduces an exposure to the system integrity of MVS. Refer to Programming Announcement dated October 21, 1981. This program is intended to run unauthorized.

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**CROSS SYSTEM PRODUCT/APPLICATION
DEVELOPMENT (AD) for CICS/VS, SSX/VSE, MVS/TSO
and VM/SP CMS (5668-944)**

**CROSS SYSTEM PRODUCT/APPLICATION
EXECUTION (AE) for CICS/VS, SSX/VSE, MVS/TSO
and VM/SP CMS (5668-945)**

PURPOSE

Cross System Product/Application Development provides an interactive interface for defining, testing and generating application programs for execution on a CICS/VS, SSX/VSE, MVS/TSO, VM/SP CMS or DPPX/SP environment. Cross System Product/Application Development includes the facilities for developing, testing and generating applications. Cross System Product/Application Execution provides for production execution of Cross System Product/AD applications.

SPECIAL SALES INFORMATION

Cross System Product/Application Development and Cross System Product/Application Execution for CICS/VS, SSX/VSE, MVS/TSO and VM/SP CMS are members of the Cross System Product set of programs which also contains DMS/DPPX, DMS/DPCX, and Cross System Product/AD and Cross System Product/AE for DPPX/SP. Each of these programs shares a common, proven architecture and all are highly compatible in their implementation. The Cross System Product set provides the IBM customer with a highly productive capability for producing applications which, with little or no change, may be used in the SSX/VSE, CICS/DOS/VS, CICS/OS/VS, MVS/TSO, VM/SP CMS and DPPX/SP environments. Applications developed in the DMS/DPPX or DMS/DPCX environments may be moved to the Cross System Product/AD environment, regenerated and executed in the Cross System Product/AE environment, subject to published restrictions.

Cross System Product/AD provides a powerful tool for the customer who is planning distributed applications for the 4300 and/or the 8100 Information System. Cross System Product/AD can also be used by customers who have not previously used an application generator and are not developing or planning applications that make use of DL/I.

Execution in the TSO and VM/SP CMS environments is provided primarily to facilitate application development and test. It is expected that most applications will be generated for the CICS/VS environment or for DPPX/SP.6

Cross System Product/Query is a companion product to Cross System Product/AD in the DOS/VSE and SSX/VSE environments. It reduces the skill requirement for one-time query and report generation, and significantly expands the report writing capabilities of Cross System Product/AD. Cross System Product/Query is a complementary query product to Query Management Facility/VSE (QMF/VSE) and extends the customer audience for the Cross System Product set into the business professional community.

The DMS/CICS/VS application generator product continues to be recommended for the larger system customer and for the customer who plans to develop applications based on DL/I. DMS/CICS/VS, however, is not compatible with the members of the Cross System Product set.

HIGHLIGHTS

- Interactive definition, test and execution of application programs.
- Trace/debug facility at development time.
- Direct execution of generated applications.
- Call and transfer linkage to other applications.
- Access to user-defined VSAM files.
- Portability of application definitions (within published restrictions) across the supported environments of the Cross System Product set.

DESCRIPTION

Data Definition - Allows the definition of data structures and the characteristics associated with that data. Single elements of data are defined as data items. Each data item name is unique within a library called the Member Specification Library (MSL). Data items are components of a record, table, map or working storage. After a data item has been defined once, it may be used in other records, tables, maps or working storage by entering the data item name. The associated characteristics of the data item, collected from the MSL, need not be reentered.

Map Definition - Allows the definition of a map for a terminal display or printer. Each map is given a unique name within a map-group (a group of maps for use in an application) and device. The variable fields defined on a map are named and characteristics are defined for each. Characteristics may be collected from data definitions on the MSL if an already-defined data item name is used.

Application Definition - Provides for the definition of an application as a group of related processes. Processing statements can be used to

define arithmetic operations, movement of data, use of tables, access to map fields and record data items, and logical testing and branching.

Application Test - Allows the user to verify the syntax and logic design of any Cross System Product/AD-defined application, as well as to view the logical sequence of map displays as the user will see them in the production environment.

List Processor - Provides the capability to list all members of an MSL, or select subsets to be listed, and then invoke other Cross System Product/AD functions against them. These functions are: Copy, rename, delete, print, change, where used, edit, view, export. Most utilities and editors can be invoked directly from the list processor.

Tutorial - Can be used to learn about Cross System Product/AD by reading it as a manual or by direct selection of certain sections. It can be accessed at any point in Cross System Product/AD by pressing the HELP program function key.

Utilities

- **EXPORT** - Allows an MSL member to be moved out of an MSL.
- **IMPORT** - Allows a previously-exported member to be moved into an MSL.
- **Member Maintenance** - Allows members in an MSL to be copied, deleted, renamed, or printed.
- **File Maintenance** - Allows the user to view or change data that is stored in a file that has been previously created and defined. If the change option is selected, the user may display, replace, delete, add or copy records to the file.

Application Generation: This process translates the defined application into a set of tables which may be executed using Cross System Product/AE. Cross System Product/AE is required for Cross System Product/AD and must be installed first. These tables are placed in an application library called the Application Load File (ALF). Once there, the application can be executed without reference to this MSL. At generation time, the user may select one or all of the environments for execution (including the DPPX/SP environment).

Application Execution: Once an application has been generated, it may be executed under the control of Cross System Product/AE. Cross System Product/AE retrieves the application definition from the Application Load File, initializes it to the run-time environment, and manages the execution of the application.

Execution in the TSO and VM/CMS environments is provided primarily to facilitate development and test. While a user might choose to execute an occasional application under TSO or VM/CMS, it is expected that most applications will be generated for the CICS/VS environment or for DPPX/SP.

CUSTOMER RESPONSIBILITIES

INSTALLATION: The installation procedure consists of loading programs and data files from the distribution tape to disk. Cross System Product/AD and Cross System Product/AE are distributed in object module form and program assembly is not required. Cross System Product/AE is required for Cross System Product/AD and should be installed first.

CICS/DOS/VS: The distribution tape includes installation jobs and procedures which may be tailored by the user to a particular system. Maintain System History Program (MSHP) is supported for system and change management.

SSX/VSE: Installation is prompter-supported under SSX/VSE. This means that the installation is assisted by IBM-supplied prompting programs. These prompters reduce the system knowledge and user intervention required and shorten the install time. Maintain System History Program (MSHP) is supported for system and change management.

CICS/OS/VS and MVS/TSO: The distribution tape includes installation jobs and procedures which may be tailored by the user to a particular system. The installation procedure supports the use of the System Modification Program (SMP) Release 4 and SMP/E.

VM/SP CMS: Installation requires program and data files, and sample EXECs to be copied from the distribution tape to the CMS mini-disk. VSE/VSAM is required and EXECs are provided to define the VSAM space required. The procedures and EXECs may be tailored by the user to the particular system.

Cross System Product/AD & AE for CICS/VS, SSX/VSE, MVS/TSO and VM/SP CMS (cont'd)

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

Cross System Product/AD and Cross System Product/AE are designed to operate on any IBM S/370, 4300 or 3000-series Processor with a minimum of one megabyte of real storage.

The following equipment is also required:

- Depending upon the operating system used, any direct access storage device supported by the Virtual Storage Access Method (VSAM) and the operating system.
- Any magnetic tape drive supported by the operating system (required for installation only).
- A minimum of one IBM 3270 1,920-character Display Station or other compatible device with 12 program function keys.

SOFTWARE REQUIREMENTS

Both Cross System Product/AD and Cross System Product/AE must be installed for application development and test. Cross System Product/AE may be used separately when only application execution is planned.

Cross System Product/AD and Cross System Product/AE require one of the following operating environments

CICS/DOS/VS: Operating system facilities are:

- VSE/SP 1.1 (either Production or Generation) or VSE SIPO/E 1.3.1 or later or DOS/VSE SCP with VSE/Advanced Functions Release 2 or later with a current release of:
- CICS/DOS/VS 1.5 or later.
- Virtual Storage Access Method (VSAM) Release 2 or later with backup/restore and space management for SAM.
- ACF/VTAM Version 1 or 2 or ACF/VTAME or BTAM-ES.

Cross System Product/AD and AE are documented supported products in VSE SIPO/E 1.4.

SSX/VSE:

- SSX/VSE Release 1.2 or later.

CICS/OS/VS: Operating system facilities required are:

- MVS/SP 1.3 or MVS/SP 2 or OS/VS2 (MVS) Release 3.8 or later or OS/VS1 Release 7.
- VSAM.
- A teleprocessing access method:
 - ACF/VTAM
 - ACF/TCAM Version 2 Release 3 or later
 - BTAM
- CICS/OS/VS Release 1.5 or later.

Cross System Product/AD and AE when executing in the MVS/XA environment execute in 24-bit mode below 16 megabytes.

MVS/TSO: Operating system facilities required are:

- MVS/SP 1.3 or MVS/SP 2 with TSO/E or OS/VS2 (MVS) Release 3.8 or later.
- VSAM.
- A teleprocessing access method:
 - ACF/VTAM or
 - ACF/TCAM Version 2 Release 4 or later.

Cross System Product/AD and AE when executing in the MVS environment operate in 24-bit mode below 16 megabytes.

VM/SP CMS: VM/SP is required for definition and execution under CMS. VSAM is required for system files (ALFs, MSLs, etc.).

Storage Requirements: Cross System Product/AD requires 280K of virtual storage shared by all definition users; of this, 136K is shared with Cross System Product/AE. Each concurrently used definition terminal requires an additional 50K to 150K of virtual storage, most of which will be shared by multiple users of a particular Cross System Product/AD facility.

Cross System Product/AE requires 210K of virtual storage which is shared by all executing applications. Additional storage requirements vary by application.

Product modules are reentrant and may be placed in a discontinuous shared segment area of VM/CMS or in an MVS link pack area.

COMPATIBILITY and PORTABILITY

COMPATIBILITY Among Cross System Product/AD Environments: Cross System Product/AD application definitions are compatible across CICS/VS, SSX/VSE, MVS/TSO and VM/SP CMS. In addition, applications generated for CICS/VS or for SSX/VSE are compatible in Application Load File (ALF) form.

COMPATIBILITY With Cross System Product/AD for DPPX/SP: Cross System Product/AD provides a means for defining applications which, with little or no change, can be migrated between S/370, 3000-series, 4300 and 8100 systems. This is achieved as follows:

The definition facilities, by which a user describes his application and data, are identical in Cross System Product/AD for CICS/VS, SSX/VSE, MVS/TSO and VM/SP CMS (5668-944) and Cross System Product/AD for DPPX/SP (5660-284). These definitions are stored in a Member Specification Library which can be moved from one system to another. Each product includes utilities to assist in moving definitions between them.

Cross System Product/AD and Cross System Product/AE recognize differences between environments and allow use of certain facilities unique to the environment. While use of these facilities does not preclude portability, the user should be cautious in taking advantage of them during definition as they may introduce some extra effort into migrating between supported environments.

Additional information on application portability is included in the *Operation-Development Manual*.

COMPATIBILITY with DMS/DPPX and DMS/DPCX: DMS/DPPX, DMS/DPCX and Cross System Product/AD are conceptually the same in the definition phase, however, Cross System Product/AD offers functions that are not available with DMS/DPPX or DMS/DPCX. Applications developed on Cross System Product/AD execute only on Cross System Product/AE.

Applications defined using DMS/DPPX or DMS/DPCX are portable to Cross System Product/AD within published restrictions. For more information about portability, see the *Operation-Development Manual*.

COMPATIBILITY with DMS/CICS/VS: There is no compatibility or portability between Cross System Product/AD and DMS/CICS/VS.

CONVERSION (Not applicable)

PERFORMANCE GUIDELINES

Cross System Product/AD will support a limited number of concurrent users in application definition and/or execution within a 4321 or 4331 with one megabyte of main storage. Customers who plan to use Cross System Product/AD for application development and concurrent application execution will normally require two megabytes of storage. Applications designed for volume workloads will likely require two megabytes of more of storage.

DOCUMENTATION

MVS SYSTEM INTEGRITY APPLIES: Yes

RPQs ACCEPTED: No

**5668-947 - NCCF V2 for ACF/VTAM, ACF/TCAM
NETWORK COMMUNICATIONS CONTROL FACILITY
VERSION 2 for ACF/VTAM and ACF/TCAM
MVS/370 and MVS/XA (Compatibility Mode)**

PURPOSE

The Network Communications Control Facility (NCCF) Version 2 is a program product that operates with ACF/VTAM and ACF/TCAM as an application program under the control of MVS/370 or MVS/XA (Compatibility Mode). NCCF establishes a program base for communications network management (CNM). It provides facilities to support users in operating and managing their ACF/VTAM and ACF/TCAM data communication networks which include single-domain, multi-domain, and multi-network environments. NCCF provides enhanced ACF/VTAM and ACF/TCAM operator facilities. It provides telecommunications access method services, operating system services, and problem determination data services for the support of CNM applications that are either IBM-supplied or user-written. Examples of IBM-provided CNM applications include Network Problem Determination Application which provides problem management support and Operator Communications Control Facility which supports remote processor operations. Through these applications, network management capabilities beyond those directly available in NCCF can be obtained. Additionally, NCCF provides services which can be used to develop support for automating various elements of the network management task.

HIGHLIGHTS

NCCF provides:

- Enhanced ACF/VTAM and ACF/TCAM operator facilities
- Network management automation and application service support
 - Command Lists
 - Command Processors
 - User exits
 - Telecommunication and operating system services
- Support for IBM-supplied network management applications
- Terminal Access Facility support

In addition to the functions provided by NCCF Release 2, NCCF Version 2 provides:

- SNA Network Interconnection Support (requires ACF/VTAM Version 2 Release 2 and ACF/NCP Version 3)
- Support for NLDM Release 2 including session connectivity test
- Integration of the Terminal Access Facility (a feature of NCCF R2)
- CLIST and network operator automation enhancements
 - Command entry in CLIST Pause state
 - Enhanced network automation through CLIST WAIT function
 - CLIST statement continuation
- Usability improvements to unsolicited message handling
- Dynamic Program Function Key support
- Operator usability improvements
 - Timed autowrap
 - Non-deletable messages
 - Enhanced command input line handling
 - Enhanced cross-domain logon procedure and password protection
- Class of service support and logmode usability improvement
- New customization functions for command processors
- ASCII 8-bit support
- Katakana character set support
- Storage utilization improvements

DESCRIPTION

Enhanced ACF/VTAM and ACF/TCAM operator facilities: The following capabilities provide increased flexibility in distributing, implementing, and coordinating operator control throughout a network or multi-networks.

- NCCF operators can enter access method commands and receive access method messages.
- Screen management functions for operator stations provide line-by-line and full-screen message formatting support.
- NCCF operator stations can be located anywhere in a physical network as supported by the access method.
- Multiple NCCF operators can share control of a network.
- Operator-to-operator communications is supported.
- Commands and messages can be routed in a cross-domain environment.

- Authorization facilities are provided in the area of designated terminal usage, operator logon security, restricting operator control of network resources (ACF/VTAM systems only) and network management commands.
- Logging support is provided for CNM operator activity and NCCF operator messages. A hard copy log is supported for real time use and a disk log can be produced for later offline printing.

Network management automation and service support: NCCF provides facilities that enable users to automate various operator functions and to supplement the basic network management functions supplied by NCCF. This can aid the operator in managing the network, enhance the accuracy of network control, permit operator control at program execution speeds, and improve productivity. Functions provided in this area include:

- Command list (CLIST) support to allow the user: To write sequences of network management commands, to dynamically construct and modify commands, and to control the sequence of execution.
- The ability to invoke CLISTs by name, timer events, and messages.
- Support of user-written command processors to enable users to define their own commands for network operation. These commands can be invoked by timer events and messages.
- User exit points which can be exploited by user-written routines to perform such operations as screening and editing operator messages.
- Services to enable users to develop their own applications which can supplement NCCF's. Examples are: Data management, screen management, and isolation from telecommunication access method and operating system differences.

Support for IBM-supplied network management applications: NCCF provides the base support for the following IBM-developed network management applications:

- Network Problem Determination Application (NPDA) which provides hardware problem management facilities.
- Network Logical Data Manager (NLDM) which supports network software problem determination.
- Operator Communications Control Facility (OCCF) which supports remote processor operations.

The following are NCCF Version 2 enhancements:

SNA Network Interconnection Support

Together with ACF/VTAM V2R2, ACF/NCP V3, and NLDM R2, NCCF Version 2 provides facilities for supporting the interconnection of multiple, independent networks. NCCF supports an alias name translation function which allows interconnected networks to maintain their current network names. The alias name translation function permits the same names to coexist among the interconnected networks by translating the real resource name as defined in the owning network to an alias name for use in another network. Alias support also allows the mapping of class of service and logmode names for sessions between two networks.

NCCF supports, with NLDM R2, a connectivity test for active SNA sessions. This capability allows NLDM to obtain and display configuration and connectivity information about sessions in single-domain, multiple-domain, and interconnected SNA networks.

For a SNA network interconnection environment, IBM recommends that NLDM Release 2 and NCCF Version 2 be present at every ACF/VTAM host that serves as a gateway node to support the problem determination effort for cross-network sessions. With these products installed, the network operator will have access to data used for network problem determination and problem source identification. See the NLDM Release 2 announcement for further information.

Integration of the Terminal Access Facility

The NCCF terminal access facility enhances network management operations by enabling an operator at a single NCCF terminal to access subsystems without requiring intervening LOGON and LOGOFF procedures. Using single-line entry mode the NCCF terminal access facility operator can control CICS/VS, IMS/VS, DSX Version 2, and through HCF Version 2, the 8100 DPPX system. In full-screen mode, the NCCF terminal access facility operator has access to applications that execute on CICS/VS, IMS/VS, DSX Version 2, TSO, remote NCCF systems, and through HCF Version 2, the 8100 DPPX and DPCX systems. With the Multisystem Networking Feature of ACF/VTAM or ACF/TCAM, the terminal access facility can be used to link cross-domain and cross-network to CICS/VS, IMS/VS, TSO, HCF Version 2, DSX Version 2 with NCCF being required only in the first domain, and to remote NCCF systems.

NCCF V2 for ACF/VTAM, ACF/TCAM (cont'd)

The terminal access facility support to allow an NCCF operator in one domain to access a remote NCCF system in full-screen mode is now provided for both ACF/VTAM and ACF/TCAM systems. This was previously provided by NCCF Release 2 for ACF/VTAM systems only. Support for an NCCF operator to access local and remote TSO systems or another local NCCF is only provided for ACF/VTAM systems.

CLIST and Network Operator Automation Enhancements

- **Command entry in CLIST Pause state**
 Commands and CLISTs may be entered when CLIST execution has been suspended and the CLIST is in a Pause state. This function can be used to allow operator intervention for conditions not handled by the CLIST.
- **Enhanced network automation through CLIST WAIT function**
 Command lists can suspend their activity and WAIT for the reception of a predefined message or group of messages before causing CLIST execution to resume. Users can employ this function to further automate operations by eliminating the need for operator intervention to handle messages during CLIST execution. It enables users to synchronize the execution of their CLISTs with events that are identified by messages.
- **CLIST statement continuation**
 Continuation of CLIST statements beyond 80 characters is supported. This extends the number of operands specifiable on a single statement.
- **Usability enhancements to unsolicited message handling**
 The routing algorithm has been improved to enable unsolicited and authorized messages to be routed by assignment to a designated set of operators. Additional copies of messages can be routed to multiple operators for informational purposes. An ASSIGN command is provided for defining dynamic message routing based on message ID.
- **Dynamic setting of Program Function Keys**
 The NCCF SET command allows individual operators to define dynamically the commands to be executed using the Program Function Keys. The operator can also dynamically append information, such as parameters, to the command invoked by the Program Function Key before the command is executed. The SET command can be used in CLISTs to assign Program Function Keys. One useful application of this capability is to define a standard set of Program Function Key values which would be established for each operator at LOGON. Operators can use the LIST command to display the Program Function Key settings.

Operator Usability Improvements

- **Timed Autowrap**
 NCCF operators can set the amount of time NCCF will delay after a screen is filled with messages before writing over the messages with new ones. NCCF also provides a new HOLD command which allows the operator to freeze the screen display until it is manually unlocked.
- **Non-deletable messages**
 Users can define 'non-deletable' messages that will not be automatically rolled off the terminal screen or overlaid. Thus messages requiring operator attention will not be lost.
- **Enhanced command input handling**
 NCCF will erase the command input area immediately after the operator enters a command. This permits the operator to enter new commands as soon as the keyboard unlocks and to scroll the screen without the need to first erase the command input area. In the case that NCCF recognizes a command error, the command will be displayed to allow operator correction.
 NCCF handling of the immediate message area has also been changed to help eliminate a potential source for operator confusion when entering a series of commands. Previously, the immediate message area could contain a message that was continuously displayed during a sequence of commands inputs. Thus the operator might have difficulty associating the message with the actual command that caused it. In NCCF Version 2, the immediate message area is erased after each entry.
- **Enhanced cross-domain logon procedure and password protection**
 The cross-domain and cross-network logon procedure employs a screen format similar to the same domain logon. The full screen logon prompt will display the name of the other domain that was started. The password area will not be displayed on the screen and will also be suppressed if written to the hard copy device or disk log.
- **Class of Service support and logmode usability enhancement**

ACF/VTAM COS facilities can be independently applied to the different NCCF sessions that are established. In addition, NCCF will now accept any logmode entry name. This allows logmode tables to be consolidated and permits the use of ACF/VTAM default logmode tables.

- **Compound Command Processors**
 Command processor support has been extended by the addition of three new customization macros that provide for the implementation of commands which:
 - Communicate with other NCCF tasks including cross-domain and cross-network
 - Invoke CLISTs or other commands
 - Require ABEND or LOGOFF notification
 - Require access to storage by name rather than by address
- **ASCII-8 support**
 The ASCII 8-bit character code set, as defined in ANSI X3.41-1974, is supported for those devices listed in the Communication Devices section.
- **Katakana character set support**
 An option is provided at NCCF initialization that permits the user to specify NCCF support for the Katakana character set. This allows Katakana characters to be entered and displayed on an NCCF operator terminal, to be printed by the NCCF hard copy facility, and to be written to the disk log. A mix of Katakana and non-Katakana devices is not supported.
- **Improved storage utilization**
 Virtual storage utilization can be improved through the following NCCF Version 2 support. Savings will vary depending upon the environment.
 - NCCF initialization code will be loaded and deleted as required. This releases storage used during initialization for other use.
 - A user can identify specific Command processors to be loaded when called and deleted after execution is completed.
 - Only critical or frequently used messages will be resident. All other messages will reside on disk.

CUSTOMER RESPONSIBILITIES

To use NCCF, the customer must:

- Define the NCCF, ACF/VTAM or ACF/TCAM network environment.
- Determine the NCCF operator stations to be supported.
- Order and install any additional required communications equipment, e.g., 3270 terminals.
- Have the prerequisite ACF/VTAM or ACF/TCAM installed.
- Define all desired NCCF program definition parameters.
- Install NCCF.

SPECIFIED OPERATING ENVIRONMENT
HARDWARE REQUIREMENTS

NCCF Version 2 is designed to run in a virtual storage environment in any IBM system configuration that supports MVS as specified in the "Software Requirements" section.

Communication Devices: NCCF Version 2 supports the following terminals as operator stations:

Controllers:

- IBM 3271 mdl 2 (BSC)
- IBM 3271 mdl 12 (SNA/SDLC remote)
- IBM 3272 mdl 2 (local)
- IBM 3274 mdls 1A, 21A, 31A, and 41A (local SNA)
- IBM 3274 mdls 1B, 1D, 21B, 21D, and 31D (local non-SNA)
- IBM 3274 mdls 1C, 21C, 31C, 41C, 51C, and 61C (SNA/SDLC,BSC) [Note 1]
- IBM 3791, configuration support #9169 [Note 2]
- IBM 8100 (with DPPX, DPCX) [Note 2]
- IBM 5551 (with 3270 Emulation Program) [Note 11]

Controllers/Display Units [Note 6, 7]

- IBM 3275 mdl 2 (BSC)
- IBM 3275 mdl 12 (SNA/SDLC)
- IBM 3276 mdls 2, 3, and 4 (SNA/SDLC, BSC) [Note 10]
- IBM 3276 mdls 12, 13, and 14 (SNA/SDLC)

Display Units [Note 6, 7]

- IBM 3277 mdl 2
- IBM 3278 mdls 2, 3, 4, and 5 (mdl 5 supported as mdl 2) [Note 8]
- IBM 3279 mdls 2A, 2B, 2C, 3A, 3B, and 3C [Note 8, 9]
- IBM 3290 (supported as 3278 mdl 2)
- IBM 3178 (supported as 3278 mdl 2)

NCCF V2 for ACF/VTAM, ACF/TCAM (cont'd)

- IBM 8775 mdls 1, 2, 11, and 12 (supported as 3278 mdls 2, 3, and 4) [Note 2]
- IBM 5555 (attached to 5551) [Note 11]

NCCF Version 2 supports the following printers for hard copy output:

Printers [Note 3, 6, 7]

- IBM 3284 mdls 1 and 2 [Note 4]
- IBM 3286 mdls 1 and 2 [Note 4]
- IBM 3287 mdls 1, 1C, 2, 2C, 11, and 12 [Note 5]
- IBM 3288 mdls 1, 2, and 4
- IBM 3289 mdls 1, 2, and 4
- IBM 3262 mdls 1, 3, 11, and 13
- IBM 3230 mdl 2
- IBM 3268 mdl 2
- IBM 5553 (attached to 5551) [Note 11]

Notes:

1. ASCII-8 is supported on 3274 controller level only for SDLC/SNA.
2. 3270 data stream compatibility required.
3. NCCF supports printers attached to SNA controllers as LU type 1 logical units. All other printers are supported as LU type 0 logical units.
4. When attached to an IBM 3274 mdl 1C or 51C Controller, this printer is supported in BSC mode only.
5. Requires SCS feature #9660 when operating with controllers in SNA mode. The 3287 mdl 1C is supported as a mdl 1; the mdl 2C is supported as a mdl 2. Only one color (monochrome) is supported.
6. Katakana character set is supported as an NCCF option.
7. NCCF uses LU2 and LU1 protocols to communicate with SNA operator stations and printers, respectively. NCCF support of devices that utilize those protocols is limited to those that are listed above or their equivalent. Refer to the *NCCF Installation and Resource Definition* (SC27-0660) publication for additional information on device support.
8. The terminal access facility will log on to the application as a 3278 mdl 2. Thus a 3278 mdl 3 or 4 and a 3279 mdl 3A or 3B will only format the mdl 2 screen size when a full-screen session is being presented.
9. Mdls 2A, 2B, and 2C are supported as 3278 mdl 2. Mdls 3A, 3B, and 3C are supported as 3278 mdl 3. One color (monochrome) or base color mode is supported. Using full-screen presentation services, your own command processors can support extended color and programmable symbol sets.
10. For use with SNA/SDLC, the SDLC/BSC switch feature is required.
11. Kanji is not supported.

SOFTWARE REQUIREMENTS

NCCF Version 2 is designed to run with the the following operating system releases:

- OS/VS2 (MVS) Release 3.8, optionally with:
 - MVS/SP Version 1 for S/370
 - MVS/SP Version 2 for Extended Architecture (XA) processors. NCCF with MVS/XA operates in 24-bit mode.

NCCF Version 2 runs as an application program on the following access method levels and subsequent releases unless otherwise specified:

- ACF/VTAM V1R3, V2R1, and V2R2
- ACF/TCAM V2R4

The NCCF Version 2 alias name translation function and the enhanced connectivity test support for NLDM R2 require ACF/VTAM V2R2.

If NCCF data services or the NCCF disk log is used, the release of VSAM which is supported on the above operating systems is required.

Additional Considerations: NCCF Version 2 operates in a VM/370 environment using MVS and the above access method support in a guest virtual machine.

NCCF terminal access facility requirements

- In an environment that contains multiple TSO systems and uses the terminal access facility to access a TSO system in another domain, the requirement for NCCF and the terminal access facility to be present in that cross-domain host is eliminated as defined below.

Product	PTF No.	Put Tape
ACF/VTAM V1R3	UJ58908	8301 (superseded by
	UJ60689	8304
	UJ58907	8301
ACF/VTAM V2R1	UJ58907	8301
ACF/VTAM V2R2	(function integrated)	

- Terminal access facility support to allow an operator to use facilities of local and remote TSO systems or another local NCCF is only provided for ACF/VTAM systems.
- Multiple access methods: For a single host with multiple telecommunication access methods, a copy of NCCF is required for each access method supported.

Installation: The System Modification Program (SMP) Release 4 or a later level is required.

COMPATIBILITY

NCCF Release 2: NCCF Version 2 will operate with NCCF Release 2 definition statements providing equivalent function. NCCF Release 2 CLISTs will run on NCCF Version 2. Existing user code written in accordance with *NCCF Installation* (SC27-0430) and *NCCF Customization* (SC27-0433) publications will be source compatible; however a reassembly using NCCF Version 2 macro libraries is required. User-developed XITCI and XITCO exit routines may require modification if the new NLDM connectivity test is utilized. This test sends over the CNM interface new RUs that may affect user routines. User exit routines may also be affected by the change made to message DSI809A in the implementation of the enhanced cross-domain logon procedure.

IBM Products: NCCF Version 2 will support the following levels and subsequent levels of IBM products without a recompile unless otherwise specified:

- NPDA Versions 2 and 3.
- NLDM Releases 1 and 2. The NCCF Release 2 SPE supporting NLDM Release 1 has been integrated into NCCF Version 2.
- MVS/OCCF.
- Information/Systems Version 1 Release 2.

Terminal Access Facility: The NCCF Version 2 terminal access facility will support the following levels and subsequent releases of IBM products unless otherwise specified:

- CICS/VS Release 1.5.
- IMS/VS Version 1 Releases 1.6 and 2.
- Host Command Facility Version 2 supporting the 8100 DPPX and DPCX systems.
- TSO.
- DSX Version 2.
- NCCF Release 2 cross-domain sessions.

Cross-domain sessions: NCCF Version 2 cross-domain communications with NCCF Version 2 and NCCF Release 2 are supported.

MIGRATION

To facilitate migration from an installed level of NCCF, the user can run both the old and new levels of NCCF in the same host with the same telecommunications access method. Reference the *NCCF Installation and Resource Definition* publication (SC27-0660) for a description of the procedures and considerations.

To assist migration from NCCF Release 2 to NCCF Version 2, NCCF Release 2 is supported on ACF/VTAM Version 2 Release 2.

SECURITY/INTEGRITY

NCCF provides the following facilities to help prevent unauthorized access to information:

- Operator station security: If desired, NCCF access can be restricted to operator stations that have been defined by the user during program installation.
- Operator logon security: NCCF facilities check an operator's authorization prior to allowing the operator to use NCCF. Additionally, on OS/VS2 (MVS) and MVS/XA systems, NCCF provides an interface to the Resource Access Control Facility (RACF) to provide logon authorization checking.
- Resource control authorization: On ACF/VTAM systems, an individual operator can be restricted to a subset of network resources.
- Command authorization: An individual operator can be restricted to a subset of the commands available through NCCF.
- Auditability is enhanced through provisions for logging operator messages which can provide a hard copy audit trail of network operation activities.

These facilities provide security only in the context of NCCF. The RACF program product can be used to provide an integral foundation for security in MVS, complementing NCCF facilities by controlling access to system resources.

IBM will accept APARs where the installation of NCCF introduces an exposure to MVS system integrity.

NCCF V2 for ACF/VTAM, ACF/TCAM (cont'd)**PERFORMANCE CONSIDERATIONS**

NCCF storage is virtual and is in the private area of its address space. The minimum estimated virtual storage required for NCCF Version 2 in a single-domain VTAM environment, with one global control operator, one disk log task, and excluding the terminal access facility, alias support, and NLDM cross-domain support is 552,960 bytes. The use of the terminal access facility in an environment supporting one subsystem such as TSO with full-screen sessions requires an additional 106,496 bytes of storage.

Actual user storage requirements may vary widely depending upon the device configuration chosen by the user and the size of the network being controlled. Also NCCF Version 2 provides a facility to help reduce storage requirements through a user option for defining unique command processors to be loaded when called and deleted after execution. Virtual storage required for a particular user configuration can be estimated using tables contained in the *Network Program Products Planning* (SC27-0658) publication.

In environments that contain NCCF-supported applications such as NPDA and NLDM, which run in the same address space as NCCF, the user must include those applications when calculating the total virtual storage requirement.

NCCF is not expected to have any significant impact on the overall performance of the system. NCCF operator response time will depend on the complexity of the functions being executed and the system load.

MVS SYSTEM INTEGRITY APPLIES: Yes

RPOs ACCEPTED: Yes

RESTRICTED MATERIALS: Yes

This licensed program will be available with source licensed program for some modules designated as "RESTRICTED MATERIALS OF IBM". These modules will be those formerly available in NCCF Release 2 and are being provided to aid in migration.

In addition, some modules will be available without source licensed program materials. These modules will be available in object code.

PROGRAM PRODUCTS

**BATCH TERMINAL SIMULATOR
5668-948**

PURPOSE

The Batch Terminal Simulator is a productivity aid that allows the execution of IMS/VS applications in a batch or TSO environment. This facilitates the testing and debugging of IMS/VS application programs.

HIGHLIGHTS

- A means of accessing DL/I data bases from a TSO terminal.
- Increased application programmer productivity through comprehensive interaction with an application during testing, producing information that is not available from an online execution.
- Flexible application test periods making them easier to schedule and execute.
- A regression test tool for testing modifications to applications as well as modifications to the system, including new releases.
- A more stable online system in both test and production environments. After applications have been shown to execute properly with the Batch Terminal Simulator, they are much less likely to cause serious problems to the system when they are put online.
- A natural addition to a program's documentation because it traces all IMS/VS application interaction and prints 3270 input and output formats.
- A tool for training personnel in the internal and external operation of an application.

DESCRIPTION

The Batch Terminal Simulator is a productivity aid that allows the execution of IMS/VS applications in a batch or TSO environment. This facilitates the testing and debugging of IMS/VS application programs.

The Batch Terminal Simulator provides a comprehensive means of checking the following:

- Application program logic
- IMS/VS interfaces
 - Teleprocessing activity
 - 3270 format control blocks
 - Data base activity

The Batch Terminal Simulator supports testing of application programs written in:

- COBOL
- Assembler
- PL/I

The Batch Terminal Simulator operations are completely transparent to the application. No changes have to be made to:

- IMS/VS code
- IMS/VS control blocks
- IMS/VS libraries
- Application load modules

The Batch Terminal Simulator can be used to execute the following IMS/VS applications:

- Fast path
- BMP
- MSG
- Batch
- Conversational teleprocessing

The Batch Terminal Simulator intercepts each IMS/VS call made by an application program and reports details related to the call. The information may include:

- Segment Search Argument
- Scratch Pad Area
- Key Feedback Area
- I/O Area

The Batch Terminal Simulator can supply statistics that are useful in uncovering system resource contention problems and in evaluating the impact of new applications on an IMS/VS system. These statistics show the number of each type of function call made against each program communication block (PCB).

The Batch Terminal Simulator simplifies the comprehensive testing and debugging of program logic by:

- Supporting IMS/VS user-written transaction code (input) editing.

- Providing for dynamic modification of main storage contents.
- Accepting SNAP and ABEND requests.

The Batch Terminal Simulator allows the formatting of 3270 input and output during simulation. This provides a means for testing the IMS/VS Message Format Services (MFS) Utility generated control blocks. By either implicitly or explicitly specifying the position on the display screen, field-oriented input can be passed to the application program via MFS. Screen images of the application program's terminal input and output are printed. This includes field attribute characters, if desired.

When 3270 formatting is specified, the following application input and output is represented in the Batch Terminal Simulator output listing.

- Contents of the 3270 screen on receipt of a /FORMAT command.
- Terminal operator's input specifications simulating:
 - Keyboard entries
 - Function keys
 - Selector pen
 - Operator Identification Card Reader
- Message segments passed to the application program to service GU and GN calls and those transferred to IMS/VS with ISRT and PURG calls.
- First page of each output message and additional pages if requested.

With the Batch Terminal Simulator Full Screen Support (FSS), the user can take advantage of TSO in testing applications programs. The Batch Terminal Simulator uses the TSO terminal as an IMS/VS screen for formatted output from the application program. It also allows the user to enter new data through the IMS/VS formatted screen, and on request, writes a trace of application program calls to the TSO terminal. During this trace, the user can stop execution of the application program and enter the TSO Test Monitor to inspect the program, make temporary modifications to it, and resume execution. Also supported are the PL/I Checkout Compiler and COBOL Interactive Debug.

Finally, the Batch Terminal Simulator can produce a sequential data set which contains all data input to the Batch Terminal Simulator during the TSO session. This data set allows the user to create a regression test file for a subsequent test run.

CUSTOMER RESPONSIBILITIES

The Batch Terminal Simulator is distributed in SMP4 format and should be installed using SMP.

Execution requires the definition of at least one parameter card. If the application program is being tested in a batch environment, a Batch Terminal Simulator input data stream containing the transactions will be entered interactively through a TSO terminal.

SPECIFIED OPERATING ENVIRONMENT

All statements in the Specified Operating Environment section also apply to subsequent releases and modification levels of this licensed program unless otherwise specifically indicated in future updates to these pages.

HARDWARE REQUIREMENTS

At a minimum, the Batch Terminal Simulator requires an IMS/VS batch system machine configuration.

The Batch Terminal Simulator and application program load modules must reside on direct access storage.

When 3270 formatting is used, tape or direct access storage is required at execution time for work data sets.

The Batch Terminal Simulator program modules execute in 128K of virtual storage. This virtual storage is in addition to that required by:

- IMS/VS.
- The amount of virtual storage the Batch Terminal Simulator has to acquire dynamically by issuing GETMAINS.
- The amount of virtual storage required by the user's application program.

SOFTWARE REQUIREMENTS

The Batch Terminal Simulator programs are written in Assembler language.

The Batch Terminal Simulator is designed to work with IMS/VS Version 1 Release 1.6 (5740-XX2) and subsequent releases and modification levels and the Operating System environments within which that Version and Release of IMS/VS will operate, unless otherwise stated.

The Batch Terminal Simulator has the following software requirements:

PROGRAM PRODUCTS

Batch Terminal Simulator (cont'd)

- A current version of IMS/VS DB system.
- The IMS/VS DC feature is a prerequisite for the use of the 3270 formatting function.
- An IMS/VS DB/DC system is required to execute the Batch Terminal Simulator in an online IMS/VS environment.
- Operating System requirements are the same as those required by the corresponding IMS/VS release.
- The Time Sharing Option (TSO) of OS/VS2 is required to use the Batch Terminal Simulator Full Screen Support (FSS) which provides the 3270 Display Station simulation.
- SMP4 is required to install the Batch Terminal Simulator program product. No IBM Utilities or Service Aids are required during the execution of the Batch Terminal Simulator.

COMPATIBILITY

This program is a functional replacement of the BTS II IUP, 5796-PGT.

CONVERSION

No Batch Terminal Simulator parameters need to be changed when converting from Version 1 Modification Level 6 of BTS II IUP (5796-PGT), to the Batch Terminal Simulator program product.

DATA SECURITY

The Batch Terminal Simulator has no logging or security features within its own design philosophy. If a log tape is provided for the Batch Terminal Simulator run, normal data base logging can be accomplished as usual by IMS/VS. Multiple transaction logging will result in only the last transaction appearing on the log tape, when the Batch Terminal Simulator is executed in a batch IMS/VS-type region. No log records associated with teleprocessing activity are created by the Batch Terminal Simulator. The log tape so produced is not suitable for backout operations, so only test data bases should be used in the Batch Terminal Simulator run.

PERFORMANCE CONSIDERATIONS

The Batch Terminal Simulator does not simulate the execution times that could be experienced in an IMS/VS production environment. Application program execution times under the Batch Terminal Simulator can be affected by several factors:

- Machine speed.
- Nature of the processing of the IMS/VS application being simulated.
- Job environment within the machine at the time of simulation.
- Number of IMS/VS applications being simulated within the given Batch Terminal Simulator execution.

PROGRAM PRODUCTS

**SYSTEM MODIFICATION PROGRAM EXTENDED
(SMP/E) for OS/VS2 MVS and OS/VS1
5668-949**

PURPOSE

System Modification Program Extended (SMP/E), an IBM licensed program, provides enhanced system enabling and change management capability, improved product usability, and improved product RAS. SMP/E is designed to operate with MVS/370, MVS/XA, and VS1 system environments. Some SMP/E usability enhancements are not available to the VS1 user.

HIGHLIGHTS

The major enhancements of System Modification Program Extended include:

- Improved product usability
 - SMP interactive capability via dialogs which operate with the Interactive System Productivity Facility (ISPF) and the Interactive System Productivity Facility/Program Development Facility (ISPF/PDF). The dialogs provide:
 - Assistance in the construction of SMP jobs for installing software function and service.
 - A query capability against SMP data sets, to aid in researching system status.
 - Assistance in establishing and administering the SMP data sets.

The dialogs are available only to MVS/370 and MVS/XA users.

- Dynamic allocation support for key SMP data sets, and for target, distribution library, and temporary data sets. Dynamic allocation is available only to MVS/370 and MVS/XA users.
 - Automatic management of inputs having exceptional conditions, such as PTFs in error (PEs), or PTFs or functions requiring actions outside normal SMP processing.
 - List and report enhancements.
 - Restructure and consolidation of SMP data sets using VSAM.
 - Extended product capability:
 - Additional SMP processing selection options, such as:
 - The ability to direct SMP processing to modifications pertaining to only a single function (FMID) or to a user-defined set of functions.
 - The ability to direct SMP processing to a single modification type (FUNCTION, APAR, PTF, USERMOD).
 - The ability to direct SMP processing to modifications from a defined source, such as a product tape ID, a cumulative service tape ID, or a PUT tape number.
- Use of these selection options, singly or in combination facilitates the subsetting of SMP processing, without the necessity of generating lengthy and unique EXCLUDE and SELECT lists. The new selection options consolidate within SMP, and provide enhancements to, programming functions currently provided on PUT tapes.
- The capability of restructuring load modules (i.e., delete CSECTs) during SMP APPLY processing.
 - Product RAS Enhancements

DESCRIPTION

IMPROVED PRODUCT USABILITY

Dialogs (MVS only)

The full range of SMP function, as in SMP Release 4, can be executed as batch jobs by VS1, MVS/370, and MVS/XA users. Additionally, for MVS/370 and MVS/XA users, SMP/E can run as an application under ISPF/PDF. The menu of primary SMP/E dialog options includes:

1. Option 1 - ADMINISTRATION

Functions which assist in establishing and structuring the SMP data sets.

2. Option 2 - SYSMOD MANAGEMENT

Dialogs which provide a step-by-step path through the Processes of installing software changes (function and service) which are identified to SMP as system modification (SYSMOD) packages. These dialogs generate and submit appropriate SMP jobs for background execution.

3. Option 3 - QUERY

Functions to display information from the SMP/E data sets, such as:

- Status, contents, and attributes of a SYSMOD.

- Function and service level of a module or macro.
- SYSMODS installed in a system or subsystem.
- Values established for use by dynamic allocation.

4. Option T - TUTORIAL

Information on SMP/E dialog processes.

The SMP/E dialogs have the following usability attributes:

- The panels present a consistent format to the user.
- They are designed to be easily understood by the occasional or less experienced SMP user. Many panels display what options, selections, or responses can be made by the user. These are backed by tutorial panels to provide additional assistance.
- SMP/E dialogs reduce the amount of data required to be entered by the user to perform a task because:
 - When appropriate, user input for one execution is saved and used during the next execution.
 - Information saved in SPF tables or SMP/E data sets eliminates much user data entry.
 - In many dialogs, defaults or installation-defined values are assigned, so that the user need only enter the data if the default is not wanted.
- The dialogs simplify the performance of certain tasks by handling SMP syntax and technical detail for the user. The dialogs alert the user when any overt action (such as the submission of a background job) is to take place, and the user has the option of editing the jobstream, submitting the job, or deferring or canceling the job.
- A dialog session can be suspended and resumed across logons. The user has the option of resuming the dialog at the point it was suspended, or beginning a new dialog invocation.

DYNAMIC DATA SET ALLOCATION (MVS only): The MVS user can have SMP/E dynamically allocate each data set required for an SMP execution, using information previously stored in an SMP data set. SMP dynamic data set allocation can be overridden by supplying DD statements when SMP is invoked.

EXCEPTION SYSMOD CONTROL: SMP/E allows the user to better manage system modifications (SYSMODS) which require special processing. SMP/E supports an additional input file during RECEIVE processing. This file contains control statements which identify exception SYSMODS. A 'HOLD' control statement indicates to SMP that a SYSMOD is to be put back into 'exception' status; a 'RELEASE' control statement specifies that a SYSMOD is to be removed from 'exception' status. Three categories of exception status are supported:

- **ERROR**, indicating that the SYSMOD has had an APAR reported against it, and that the SYSMOD should not be processed until the APAR is resolved. This category is commonly referred to as PTF-in-error, or PE PTF. SMP/E will automatically release the held error SYSMOD when a SYSMOD which supersedes the APAR is processed. The PUT tape will have a file containing error HOD control statements for SMP processing.
- **SYSTEM**, indicating that special action outside SMP processing is required for the SYSMOD. Examples are: SYSMODs requiring UCLIN to be run prior to installation; SYSMODs requiring a SYSGEN after installation; SYSMODs requiring installation of an associated EC level. System HOLD control statements can appear in the SYSMOD itself, as well as in a separate HOLD input file.
- **USER**, indicating that the SYSMOD requires special processing because of a decision made by the user.

ENHANCED APAR REGRESSION: During the installation of a function SYSMOD, SMP/E provides a warning message if the function can potentially overlay (regress) an APAR which had been previously installed on a prior release of the function.

SMP DATA SET STRUCTURE: SMP/E control information is maintained in VSAM data sets, in contrast to the partitioned data sets used by SMP Release 4. The VSAM data sets are known as the Consolidated Software Inventory (CSI). These inventory data sets contain information on system structure, system function and service levels, and other control information required for SMP processing. Within any one VSAM data set, multiple products, subsystems, and systems may be represented as separate 'zones'. The 'zones' are analogous to the SMP Release 4 CDS and ACDS data sets. Both system target library and distribution library information can be maintained within one inventory data set as separate 'zones'.

The SMP Release 4 data sets which must be converted to the VSAM CSI structure are:

PROGRAM PRODUCTS

SMP/E (cont'd)

- Control information from the PTF Temporary Store (PTS) data set. The actual text of system modifications (SYSMODs) will continue to be maintained in a PTS partitioned data set in SMP/E.
- The control data set (CDS).
- The alternate control data set (ACDS).
- The conditional requisite queue (CRQ).
- The alternate conditional requisite queue (ACRQ).

The other SMP data sets require no conversion. SMP/E includes data set conversion and data set administration facilities.

The VSAM CSI implementation provides: An architectural base for new SMP function; increased data set management capability; simplification and consolidation of SMP data; inquiry capability against the SMP data set.

EXTENDED PRODUCT CAPABILITY

Processing Selection Option: SMP/E provides greater flexibility in specifying the SYSMODs to be processed, leading to processing efficiencies and reduced research.

The user may specify a function (FMID) or a set of related functions as a means of grouping modifications for SMP APPLY, ACCEPT, LIST and UNLOAD processing. Only those modifications applicable to the specified function(s) are eligible for processing.

SMP processing may also be qualified so that for an SMP APPLY, ACCEPT, LIST or REJECT operation, only a single modification type (FUNCTION, PTF, APAR, USERMOD), or combination of types will be eligible for processing.

During SMP RECEIVE processing, a user-defined source identifier (such as a PUT tape number) may be specified; the identifier will be associated with each SYSMOD processed during that RECEIVE operation. Subsequently, this source identifier can be specified for APPLY, ACCEPT, REJECT and LIST operations, restricting processing only to those SYSMODs associated with that identifier.

Use of these processing selection options (singly or in combination), along with the exception SYSMOD control capability, improves the RECEIVE process by removing the necessity of performing extensive SYSMOD research prior to executing RECEIVE. SMP/E allows SYSMODs to be 'warehoused' in the PTS, and selectively processed during subsequent APPLY and ACCEPT operations. This provides a convenient way of subsetting SMP processing without the labor-intensive research and job stream tailoring required with SMP Release 4 to generate and maintain extensive EXCLUDE and SELECT lists. This capability allows mass-mode SMP operations to be conveniently reduced to more manageable units.

RECEIVE processing in SMP/E is also changed so that, unless specifically requested by the user, the modification control statements (MCS) which constitute the SYSMODs are not listed as part of the RECEIVE operation. For each SYSMOD that SMP/E successfully RECEIVES, one message will be printed indicating successful RECEIVE. No messages will be produced for SYSMODs not applicable to the user's system. This eliminates the excessive amount of output produced by SMP Release 4, which included partial listings of SYSMODS not applicable to the user's system.

For SYSMODs found with syntax errors, SMP/E prints an error message, and the SYSMOD is not RECEIVED.

At the completion of RECEIVE processing, SMP/E produces a RECEIVE summary report containing information for each SYSMOD in the input file.

Since RECEIVE processing no longer prints MCS statements, a facility is provided to list them from the SMPPTS. An example of the use of this facility is to list the 'Cover Letter' of a PTF.

CSECT Delete Support: SMP/E provides the capability to restructure load modules (delete CSECTs) during SMP APPLY processing. This facilitates the installation of products which may have a requirement to delete CSECTs from load modules made up of modules from multiple products. Such products can be installed via SMP/E APPLY processing, eliminating the requirement for a system generation.

SMP/E RAS IMPROVEMENTS

VSAM Implementation: The SMP CSI data sets take advantage of RAS characteristics inherent to VSAM, such as the VERIFY function of data set integrity, and the VSAM statistical displays for data set management. With VSAM, updates to the CSI are written as they occur, so that the SMP/E CSI reflects current status more accurately than SMP Release 4, which batches many updates prior to writing them to the CDS.

Exception Processing: SMP/E exception SYSMOD processing enhances the reliability of the service process by preventing the inadvertent application of error PTFs. Exception processing also improves serviceability through the automatic recognition of other exception conditions, such as UCLIN, EC, or SYSGEN requirements associated with application of a PTF.

Processing Selection Options: The ability to subset SMP/E processing (to an FMIDset, to a source id, and to a modification type) provides for greater flexibility, shorter job steps, and shorter recovery runs in the event of error.

Dialogs: For the MVS user, the SYSMOD management dialogs reduce the potential for error in constructing SMP jobs. The dialogs also save information from one invocation to the next, resulting in less data entry and less potential for error.

Dynamic Allocation: For the MVS user, dynamic allocation also enhances SMP RAS by creating a report which lists all DD statements and data set names used during an SMP command execution. Dynamic allocation also writes data set usage records to the SMP LOG.

System Errors: When a system error is encountered, SMP/E attempts to take a SNAP dump to record status prior to potentially modifying storage with cleanup operations.

I/O Errors: To aid in diagnosing I/O errors, SMP/E functions requiring I/O operations to the SMP data sets record information about the function being attempted, the SMP module involved, and the cause of an I/O error.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

SMP/E runs on the IBM hardware supported by:

- MVS/370 - Release 3.8 and subsequent offerings
- MVS/XA
- VS1 - Release 7.0 and subsequent offerings

SOFTWARE REQUIREMENTS

SMP/E operates in the following IBM system environments:

- MVS/370 - Release 3.8 and subsequent offerings
- MVS/XA
- VS1 - Release 7.0 and subsequent offerings

SMP/E dialogs and dynamic allocation support are not available to VS1 users. Utilization of the dialog capability by MVS users is optional. If the dialogs are to be used, the following programs are required:

- Interactive System Productivity Facility (ISPF), Program Number 5668-960.
- Interactive System Productivity Facility/Program Development Facility (ISPF/PDF), Program Number 5665-288.

COMPATIBILITY

SMP/E and SMP Release 4 can co-exist in a system; this permits subsystems to be selectively migrated to SMP/E, with SMP Release 4 continuing to support those subsystems not yet migrated. When all subsystems have been migrated to SMP/E (i.e., all SMP Release 4 data sets have been converted), SMP Release 4 can be deleted from the system.

For compatibility, all currently available system modification (SYSMOD) input acceptable to SMP Release 4 will be acceptable to SMP/E. A PTF will be provided for SMP Release 4 to syntactically support new SMP/E SYSMOD statements or keywords. The PTF will not add any new function to SMP Release 4, but will prevent syntax errors during SYSMOD processing; i.e., the new SYSMOD statements or keywords will be ignored. The PTF will cause no significant changes to SMP Release 4 externals.

CONVERSION

After SMP/E is installed, the data conversion and data set administration facilities of SMP/E are used to convert SMP Release 4 data sets (CDS, ACDs CRQ, ACRQ and PTS) to the VSAM CSI format. If multiple groups of SMP Release 4 data sets exist in a system (e.g., one for MVS, one for each subsystem), not all groups need be converted at the same time.

SMP DATA SECURITY

The SMP CSI data set is defined with VSAM SHAREOPTION(2). This allows multiple users to share a CSI data set for READ operations, while WRITE operations to a CSI are serialized on the data set. This prevents the concurrent update of a CSI by more than one user. A CSI being updated by one user is still available for READ access by other users.

All SMP background jobs are assumed to include WRITE operations, and are serialized on the CSI data set.

MVS SECURITY

SMP/E runs as an authorized program under MVS. Use of this program can be controlled by RACF (5740-XXH) or password protection of the SMP data sets (e.g., SMPCSI). Customers are responsible for the selection, adequacy, and implementation of these controls for the protection of their data.

PERFORMANCE CONSIDERATIONS

PROGRAM PRODUCTS

SMP/E (cont'd)

The batch processing characteristics of SMP/E can be tuned via VSAM allocation parameters and VSAM index and data buffer specifications. For equivalent operations, SMP/E provides performance characteristics equivalent or better than SMP Release 4, with virtual storage requirements less than or equal to those of SMP Release 4. Direct access (DASD) requirements for SMP/E are less than or equal to those of SMP Release 4.

For the MVS user, the performance of SMP/E dialogs will be similar to that of other applications running under ISPF.

PROGRAM PRODUCTS

**NON-SNA INTERCONNECTION PROGRAM
for the 3705 and 3725
MVS/XA, MVS/370, OS/VS1 and VSE/AF
5668-951**

PURPOSE

For those facilities that are controlled by the Non-SNA Interconnection program, the BSC data and control characters are enveloped in an SNA/SDLC format and transported through the network in the same fashion as is SNA data. When the data exits the program and is sent to the terminal (via a BSC RJE line) or to the subsystem (via a 3705-II, 3705-80 or 3725 emulation subchannel), the SNA/SDLC envelope is removed and the original BSC data stream is presented to the receiving facility.

SPECIAL SALES INFORMATION

Non-SNA Interconnection has applicability in the following user environments:

- SNA customers with multiple host locations that use BSC RJE terminals and have a need to connect these RJE terminals to any subsystem (e.g., JES2) in network through the shared SDLC network links.
- SNA customers with multiple host locations that use BSC lines to transport the data between two subsystems (e.g., JES3 to JES3) and want to eliminate the need to store-and-forward the data in intermediate host facilities, and have the added advantage of being able to share SDLC network links for the SNA and BSC data.
- SNA customers, regardless of the number of host locations, who have a need to concentrate data from BSC RJE terminals and SNA devices over a shared SDLC line from a remote 3705-II, 3705-80 or 3725 Communication Controller in order to reduce communication line costs.

HIGHLIGHTS

The program supports the following BSC terminals/subsystems for point-to-point leased line operation using EBCDIC or ASCII code, dependent on subsystem support:

- BSC RJE Terminals:
 - 3780 Communications Terminal
 - 3776 mdl 1 Communication Terminal
 - 3776 mdl 2 Communication Terminal
 - 3777 mdl 1 Communication Terminal
 - IBM BSC Terminals supporting the IBM BSC Multi-Leaving protocols.
- Subsystems:
 - MVS/SP-JES 2 Version 1 Release 3
 - MVS/SP-JES 2 Version 2
 - MVS/SP-JES3 Version 1 Release 3
 - MVS/SP-JES3 Version 2
 - VM/RSCS Networking Releases 2 and 3
 - VSE/POWER Version 2 Networking Support

The Non-SNA Interconnection Program also permits the subsystems listed above, if currently communications-compatible, to communicate with one another on a host-to-host basis, using BSC line control, through the SNA network.

The Non-SNA Interconnection Program extends some of the enhanced networking functions and problem determination facilities offered in ACF/NCP Version 2 to the non-SNA facilities as follows:

- Improved network connectivity for BSC RJE terminals.
- Improved network connectivity for BSC host-to-host subsystem communications.
- Attachment of BSC RJE terminals to remote 3705-II, 3705-80 or 3725 Communication Controllers (remote concentration).
- Sharing of the SDLC network links between 3705-II, 3705-80 or 3725 Communication Controllers for SNA and SNA-enveloped BSC data.
- Improved network management for BSC RJE terminals and subsystems.
- Line cost reductions due to BSC/SNA network link sharing.
- Load sharing and backup for BSC RJE terminals and subsystems.
- Session initiation by either the Network Operator or the BSC RJE Terminal Operator (system generation option - Workstation-Initiated Subsystem Selection).

CUSTOMER RESPONSIBILITIES

To install and use the Non-SNA Interconnection Program, the customer must:

- Design the network:
 - Install the required communications equipment.

- Install corequisite programs:
 - SSP for ACF/NCP Version 2.
 - ACF/VTAM Version 2 (in at least one host).
- Generate ACF/NCP Version 2 and Non-SNA Interconnection using the ACF/System Support Program (ACF/SSP) Version 2.
- Load the 3705-II, 3705-80 or 3725 with the generated ACF/NCP and Non-SNA Interconnection load module.
- Possibly update the subsystem configuration for any new routes or emulation subchannels.
- Update the terminal operator's job execution instructions in order to take advantage of the program's networking capability.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The Non-SNA Interconnection Program is designed to operate in the IBM 3705-II, 3705-80 and 3725 Communication Controllers. At least one locally-attached IBM 3705-II, 3705-80 or 3725 Communication Controller meeting the storage requirements of both ACF/NCP Version 2 and the Non-SNA Interconnection Program is required. The program will support up to two Channel Adapters Type 4 on the 3705-II and 3705-80 and up to six 3725 Channel Adapters. The Channel Adapters used must provide emulation subchannels for Non-SNA Interconnection to interface to the host subsystem. The Non-SNA Interconnection Program also supports either the Communications Scanner Type 2 or Type 3 on the 3705-II and 3705-80 and the 3725 Communications Scanner. The Non-SNA Interconnection Program will also operate in a 3705-II, 3705-80 or 3725 that is remotely connected to the host by an SDLC line through a channel-attached communications controller.

SOFTWARE REQUIREMENTS

Non-SNA Interconnection Program requires that:

- ACF/VTAM Version 2 be installed in at least one host of the customer's network. This ACF/VTAM (or these ACF/VTAMs) will control the Non-SNA Interconnection Program resources (lines, Physical Units, Logical Units). The other resources in the network may be controlled by different ACF/VTAM versions or ACF/TCAM.
- ACF/NCP Version 2 be installed concurrently with the Non-SNA Interconnection Program in the IBM 3705-II, 3705-80 or 3725 Communication Controllers that directly attach either the Non-SNA Interconnection-controlled BSC RJE terminals or the Non-SNA Interconnection-controlled emulation subchannels - any current version of ACF/NCP can be installed in all other IBM 3705-II, 3705-80 or 3725 Communication Controllers in the network.
- ACF/System Support Program (ACF/SSP) Version 2 be used to generate the required ACF/NCP and Non-SNA Interconnection.
- ACF/SSP Version 2 and ACF/VTAM Version 2 will run under the following host operating systems:
 - MVS/370 Version 1 Release 3
 - MVS/XA Version 2
 - OS/VS1 Release 7
 - DOS/VSE and VSE/AF Release 3
- ACF/VTAM Version 2 may run in a VM/370 Virtual Machine under MVS/XA, MVS/370, OS/VS1 or VSE/AF operating system.
- The Non-SNA Interconnection Program must be ordered to run with the same host operating system as ACF/SSP Version 2 and ACF/VTAM Version 2, as well as the appropriate ACF/NCP Communication Controller.
- ACF/SSP Version 2 may run in a VM/370 Virtual Machine under MVS/XA, MVS/370, OS/VS1 or VSE/AF operating systems.

Limitations:

- Non-SNA Interconnection Program can coexist with PEP with the restriction that Non-SNA Interconnection-controlled BSC lines can not be alternated between Non-SNA Interconnection and emulation modes.
- Non-SNA Interconnection supports BSC nonswitched line, point-to-point operation only.
- Non-SNA Interconnection can not be used in conjunction with a 3705 Channel Adapter Type 1 or a Communication Scanner Type 1.
- Non-SNA Interconnection does not support the IBM 3705 mdl 1.
- Non-SNA Interconnection does not support Panel Line Test for the 3725 and 3705.
- Non-SNA Interconnection does not support Wrap Test for the 3725.

Non-SNA Interconnection Program (cont'd)**COMPATIBILITY**

Non-SNA Interconnection is a new program which can be used in lieu of Partitioned Emulation Program (PEP) or Emulation Program (EP) for BSC RJE terminals or for BSC Host-to-Host facilities. The data stream, as seen by the subsystem or the RJE terminal, is an unmodified BSC data stream. Therefore, no changes to the RJE subsystem are required other than possibly changing the job routing information and any associated tables.

COEXISTENCE

The Non-SNA Interconnection Program can coexist with any licensed program which uses the NCP customization facility [e.g., Network Terminal Option (NTO), Network Routing Facility (NRF)], and can coexist with PEP with the restriction that the Non-SNA Interconnection-controlled BSC lines can not be alternated between Non-SNA Interconnection and emulation modes or NTO BSC operation.

PERFORMANCE and STORAGE CONSIDERATIONS

Performance: The path lengths in each communication controller, for SNA attached devices or facilities (subarea to subarea), will not increase when the program is installed in each communication controller.

The path lengths in each communication controller, for BSC devices or facilities attached via Non-SNA Interconnection, will be longer than they were for those same devices or facilities that were previously attached using Emulation Program. This increase in path length is expected to have a small impact on throughput for those facilities not using the networking or BSC remote concentration capability of the Non-SNA Intercommunication Program.

The BSC data transported through the SNA network via the non-SNA Interconnection Program will have SNA headers appended to the BSC data for routing and control. The addition of these headers (29 bytes) can cause variations in expected terminal throughput. These potential variations are dependent upon the NCP buffer size; as the buffer size increases, the impact on throughput of the SNA headers decreases. The BSC data acknowledgements (ACK, NAK, ...) are end-to-end (terminal to subsystem) not terminal or subsystem to the local communications controller.

- For those facilities using the networking capability of Non-SNA Interconnection (BSC RJE terminal or subsystem communicating with a subsystem via one or more intermediate hosts in an EP environment), the throughput will be equal to or better than the throughput (input/output start to input/output complete) in the EP environment. Total throughput will be dependent upon system and network variables such as line speeds and the amount of other traffic on the shared SDLC network links.
- Due to the store-and-forward operation introduced when a remote communication controller is used to attach devices for remote concentration, consideration should be given to increasing the communication line speeds between the BSC RJE terminal and the remote communication controller, and between the remote and local communication controllers. This consideration is necessary if existing terminal throughput requirements are to be maintained.

Storage: In addition to the storage required for ACF/NCP Version 2 (including the BSC-Start/Stop Processor), Non-SNA Interconnection will require the following:

- For interfacing to the emulation subchannels, minimum 31.5K bytes.
- For interfacing to the BSC RJE terminals, minimum 18.5K bytes
- For interfacing to both, minimum 50K bytes.

More specific information regarding Communication Controller estimated storage requirements for the Non-SNA Interconnection Program will be provided in the *Non-SNA Interconnection Installation and Operations Manual* (SC33-2024), and in CF3205 and CF3725.

PROGRAM PRODUCTS
**DISTRIBUTED OFFICE SUPPORT SYSTEM/370
 VERSION 2 RELEASE 1 Modification Level 0**
5668-982
**DISTRIBUTED OFFICE SUPPORT SYSTEM/8100/DOSF
 RELEASE 1 Modification Level 0**
5668-955
PURPOSE

The Distributed Office Support System (abbreviated to DISOSS in this document) provides document-handling functions by means of licensed programs executing in a host/distributed subsystem environment. The Distributed Office Support S/370, Version 2, Release 1.0 operates on a host computer, such as the S/370, the 3031 or the 4331 or larger Processors, under the control of OS/VS1 or OS/VS2 (MVS) and under either the Customer Information Control System/Virtual Storage (CICS/VS) or the Information Management System/Virtual Storage (IMS/VS). It offers both interactive and deferred communication with the Distributed Office Support System/8100/DOSF Release 1.0 that operates on host-attached 8100 subsystems under the control of the Distributed Processing Control Executive (DPCX) and Distributed Office Support Facility (DOSF).

DESCRIPTION

Significant capabilities of the Distributed Office Support System include:

- Document and message distribution to users on the same or on different 8100/DPCX/DOSF systems. Optionally, confirmation of receipt can be requested.
- Automatic logging of received documents and messages per recipient.
- Display, printing and redistribution of received documents.
- Host document filing with indexing.
- Filed-document search and retrieval.
- Direct document viewing of a filed-document without copying the entire document into the 8100 system.
- Filed and distributed document access protection.
- Filed-document printing on host-attached printers.
- Filed-document formatting for input to a STAIRS data base.
- Submission of batch jobs to the host system.

These functions are achieved by means of programs in the host and in each attached subsystem.

The users of the Distributed Office Support System can be secretaries, typists, office clerks, editorial assistants, managers, or professionals. They use the system by means of 8100-attached 3732 Text Display Stations or 327X or 8775 Data Display Stations.

The Distributed Office Support System/370 Version 2, Program Number 5668-982, Release 1.0, and the Distributed Office Support System/8100/DOSF, Program Number 5668-955, Release 1.0, are designed to offer a replacement for, and an extension of, the Distributed Office Support System/370 Version 1, Program Number 5740-XY9, and the Distributed Office Support System/3730 Version 1, Program Number 5740-XYK, respectively.

Customers can easily migrate from DISOSS/370 Version 1 to DISOSS/370 Version 2 by using a migration utility that converts the host text library from the Version 1 to the Version 2 format.

On the subsystem, DISOSS does not maintain any data of a permanent nature; therefore, no migration is required. Documents that are stored in the permanent storage of a 3730 can be transferred to the 8100 by means of diskettes, using the archive function of the 3730 and the 8100/DOSF service for restore.

Distribution and Mail Processing: The user can distribute documents or messages to other DISOSS users on the same or on different 8100/DPCX/DOSF subsystems attached to the same DISOSS host system. Optionally, confirmation of receipt can be requested.

DISOSS collects and retains distribution information in the recipient's mail log. This distribution information essentially consists of the received date, the sender and either the subject of the received document or, in case of a received message, the message itself. The user can view his mail log in total, or he can view it selectively by specifying selection criteria such as a date or a date span.

Once a particular mail-log entry has been selected, the user can display, print, or redistribute the received document, send a response message to the sender, suspend the mail-log entry through the assignment of an action date, delete the entry, or insert a personal note.

Filing and Retrieving: The user can file documents created at, and stored in, the subsystem in a document library maintained by the host system. While filing a document, the user can specify filing information that indexes the document and can be used for later retrieval of the document. This filing information consists of search arguments, such as the document name, the author, recipients, and keywords describing

the contents of the document. In addition, access codes can be added to help control the document-access authorization.

To retrieve a filed-document, users first search for it using some of the search arguments specified when the document was filed. In such a search request, search arguments can be truncated, and one or more alternative search arguments can also be specified. Once a document has been identified, it can be restored in the subsystem, displayed at the subsystem, printed on the host or the subsystem, transferred to recipients on the same or on different subsystems, or deleted.

Filing and retrieval of documents can be performed interactively or in deferred mode. Deferred processing is particularly applicable for large documents because the operation is executed in parallel to other tasks performed at the terminal.

Host Printing: This facility allows the user to print documents that are filed in the host library on a host-attached printer upon request from his IBM-attached terminal. The IBM 6670 is supported as a host line printer.

STAIRS Input Formatting: Using this function, documents created at the 8100/DOSF system can be prepared for batch input to a STAIRS data base.

Job Submission: The job submission capability allows the user to send predefined jobs to the host system for batch execution.

This capability can also be used to submit a document from the subsystem to the host along with the job. A user-written program can place this document into a data set for subsequent host-application processing.

Installation: The Distributed Office Support System provides convenient techniques to ease the installation of the system and the maintenance of its data sets.

Significant installation support capabilities provided with DISOSS include:

- Customization of the system environment, which is supported by DISOSS facilities that generate system control information based on generation options selected by the user.
- Default values for installation parameters. These default values allow the user to reduce the time and effort required for the installation whenever the offered values are acceptable.
- A utility that supports the creation and maintenance of individual DISOSS user profile information, such as the user's name, location, password, and access codes.
- Facilities that support the translation of messages, prompting texts, and HELP texts into national languages.
- Utilities that support the migration of DISOSS/370 Version 1 host text libraries and user profiles to the DISOSS/370 Version 2 environment.

Document Security: In a multiple-user document processing system, data security is of great interest to its users. The Distributed Office Support System is designed to provide data security based on the interaction of the following:

- Access codes
- Document ownership
- Level of document privacy

Access codes are assigned to users centrally at the host and to documents during filing. A user who needs to gain access to a filed document must be assigned one access code that matches one access code of the document to be retrieved. The host user profiles can only be changed under central control.

Document ownership is another means to provide document-access authorization. DISOSS distinguishes between two types of document ownership.

Primary document ownership is assigned to the filing or original distribution requestor. Only primary owners of a document are authorized to assign access codes to the document or to delete existing access codes.

Secondary document ownership is assigned to the recipients of distributed or redistributed documents. They are not authorized to assign or change access codes.

Document deletion requests can only be issued by document owners; they cause deletion of the related ownership. Deletion by all owners causes the document to become inaccessible.

PROGRAM PRODUCTS**DISOSS/370 V2 & DISOSS/8100/DOSF (cont'd)**

With respect to privacy, DISOSS distinguishes between two types of documents: Private documents and public documents. Private documents are accessible to their owners alone and are, therefore, not assigned any access codes. Public documents, which are recognized by the presence of access codes, can be retrieved by all authorized users.

In the Distributed Office Support System, passwords can be assigned to users to control access to the central file from any 8100/DOSF Display Station on the same network.

These facilities for controlling access to protected resources are effective only within the context of the Distributed Office Support System itself.

Access control within OS/VS1 outside the scope of the Distributed Office Support System is not provided.

The Resource Access Control Facility (RACF) program product, Program Number 5740-XXH, can be used to provide an integral foundation for security in IMS/VS under MVS, complementing the Distributed Office Support System's facilities by controlling access to system resources.

For applications in which sensitive data is sent over external communication facilities, user management may wish to augment these facilities with the application of cryptography. User management is responsible for the selection, implementation, and adequacy of these security features for the company's environment.

HIGHLIGHTS

- Document and message distribution to users on the same or different 8100/DPCX/DOSF systems that are attached to the same host system. Optionally, confirmation of receipt can be requested.
- Redistribution of received documents with the option to attach a message (buck slip).
- Facility to create and reuse general purpose request forms such as distribution lists or "canned messages".
- Automatic logging of received documents and messages per recipient.
- Display, printing and redistribution of received documents.
- Filing of 8100/DPCX/DOSF documents in the host document library.
- Searching for documents in the host document library by specification of search arguments, such as document name or search terms, authors, recipients.
- Indexing of external (hard-copy) documents.
- Retrieval of filed-documents from the host document library.
- Direct document viewing of a filed-document without copying the entire document into the 8100 system.
- Submission of batch jobs to the host system from an 8100/DPCX/DOSF display station.
- Document access protection.
- Host support for the archive, retrieve from archive and delete from archive commands from 3730 and 8100/DPCX/DOSF.
- Printing of documents on a host-attached printer.
- Formatting of documents for batch input to a STAIRS data base.

CUSTOMER RESPONSIBILITIES

Customers generate the Distributed Office Support System by means of a set of specification statements. These statements provide options that can be selected to tailor the system to each company's individual needs.

SPECIFIED OPERATING ENVIRONMENT**DISTRIBUTED OFFICE SUPPORT SYSTEM/370 (5668-982)****HARDWARE REQUIREMENTS**

The IBM Distributed Office Support System/370 Version 2 is designed to operate on the following IBM machines:

One IBM S/370 Model 138 or larger, or one IBM 3031, or one IBM 3081, or one IBM 4331 or larger with main and external storage capacity and peripheral equipment as required for, and supported by, IMS/VS or CICS/VS.

SOFTWARE REQUIREMENTS

The Distributed Office Support System/370 is written in an IBM proprietary language and shipped as IBM S/370 Assembler language. It is designed to operate in the following environment:

Host System: OS/VS1 Release 7.0 or OS/VS2 Release 3.8 or subsequent releases unless otherwise specified, together with one of the following licensed programs:

- The then most current release of the IBM S/370 Information Management System/Virtual Storage (IMS/VS) Version 1, Program Number 5740-XX2, including the Data Communication (DC) feature, together with its required associated programs, or a subsequent release unless otherwise specified. In IMS/VS, data management is performed by Data Language/I (DL/I) and the Virtual Storage Access Method (VSAM). Communication with the IBM 8100 is via the SLU type P protocol.

- The then most current release of the IBM S/370 Customer Information Control System/Virtual Storage (CICS/VS) Version 1, Program Number 5740-XX1, together with its required associated programs, or a subsequent release unless otherwise specified. In CICS/VS, data management is performed by the Virtual Storage Access Method (VSAM). Communication with the IBM 8100 uses the Full Function Logical Unit (SNA LUO protocol). However, communication with the Document Transmission Function of the distributed subsystem is via the CICS/VS Data Interchange Program (DIP) and uses the Batch Data Interchange Logical Unit (SNA LU1 protocol).

In addition, the following programming support must be available:

- For IMS/VS, one of the following:
 - Advanced Communications Function for VTAM (ACF/VTAM), Program Number 5735-RC2, Release 2.0.
 - Advanced Communications Function for TCAM (ACF/TCAM), Program Number 5735-RC3.
- For CICS/VS, one of the following:
 - Advanced Communications Function for VTAM (ACF/VTAM), Program Number 5735-RC2, Release 2.0.
 - Advanced Communications Function for TCAM (ACF/TCAM), Program Number 5735-RC3.
 - An IBM OS/VS Sort/Merge program product.

IBM 3704 or 3705: One of the following is required for attachment of subsystems:

- 3704/3705 Network Control Program/Virtual Storage (NCP/VS), Program Number 5744-BA1, Release 5.
- Advanced Communications Function for NCP/VS (ACF/NCP/VS), Program Number 5735-XX1, Release 1.0.

DISTRIBUTED OFFICE SUPPORT SYSTEM/8100/DOSF (5668-955)**HARDWARE REQUIREMENTS**

The IBM Distributed Office Support System/8100/DOSF is designed to operate on IBM 8100/DPCX/DOSF systems with remote attachment to a host system. The minimum storage capacity is that required for DPCX Release 2.0 and DOSF Release 2.0 with Feature #6001 and host connection.

SOFTWARE REQUIREMENTS

DISOSS/8100/DOSF is written in DPPX/DOSF programming statements.

IBM Host Prep Release 4 (OS/VS), Program Number 5744-XR3, must be available. This consists of:

- Program Validation Services (PVS).
- Subsystem Support Services (SSS).
- DPCX/DOSF programming statement library.
- Subsystem Information Retrieval Facility (SYSINFOREF).

In the IBM 8100, the IBM Distributed Processing Control Executive (DPCX), Program Number 5761-DS1, Release 2.0 (or a subsequent release unless otherwise specified) with Feature #6001 is required, together with the IBM Distributed Office Support Facility (DOSF), Program Number 5761-XR1, Release 2.0 (or a subsequent release unless otherwise specified) and its associated programs.

RPQs ACCEPTED: No.

MVS SYSTEM INTEGRITY APPLIES: Yes

PROGRAM PRODUCTS

**INTERACTIVE DISPLAY TEXT FACILITY
IDTF (5668-956)**

PURPOSE

Interactive Display Text Facility (IDTF) program provides text entry and edit functions for an 8775 Display Terminal attached to an 8100 Information System. IDTF is licensed to an 8100 processor and is downstream-loaded into any appropriately configured 8775 attached to that processor for execution.

IDTF provides users with text functions similar to those provided by the 3732 Text Display Station, while giving users access to the existing data functions of the 8775. Thus an 8775 with IDTF downstream-loaded provides a single workstation that meets the requirements of users who need a terminal for text entry as well as an 8775 terminal for data applications. IDTF extends the use of the Distributed Office System into applications where only a single terminal can be justified, and provides text processing facilities for users accustomed to 8775 characteristics.

SPECIAL SALES INFORMATION

IDTF is designed to be used with other components of the Distributed Office System: Distributed Office Support Facility (DOSF), Distributed Processing Control Executive (DPCX), and Distributed Office Support System (DISOSS). With this support, an operator has access to the text functions of DOSF, and the host-oriented storage, retrieval, and distribution facilities of DISOSS.

The facilities of DPPX or DPPX/SP Data Stream Compatibility provide access only to DOSF from an 8775 attached to an 8100 Distributed Processing Programming Executive (DPPX) System or an 8100 Distributed Processing Programming Executive/System Product (DPPX/SP).

HIGHLIGHTS

IDTF supports the 8775 mdls 1, 2, 11 and 12 with the 87-Key EBCDIC Typewriter/Text Entry and Edit Keyboard Feature (see Product Announcement letter). This keyboard provides the characters and functions of the 87-Key EBCDIC Typewriter Keyboard available on the 8775, with additions for the IDTF text entry and edit characters and functions.

In addition to giving users access to the data functions provided by the 8775 Display Terminal, IDTF provides text entry and edit functions including:

- A single scale line with numerals for narrow and wide text.
- Tabulation and column tabulation.
- Normal, decimal, and centering tab stops.
- Automatic newline with forward and backward wordpill.
- Required characters.
- Definition and cancellation of temporary left margin.
- Adjust and no-adjust mode selection.
- Superscript and subscript control.
- Display/non-display and edit of text control symbols.
- Character delete, backspace character delete, work delete, and line delete.
- Word and character underscore and de-underscore.
- Horizontal displacement of wide text (screen left and right).
- Definition and cancellation of text reference segment.
- Ability to type more than one screen of typical memo-width text without using the Enter key.
- Character highlighting (underscore, blinking, reverse video) under program control.

Support is also provided for invoking DOSF text entry and edit functions programmed in an 8100 (for example screen and page advance and return, top and end, immediate command), together with DOSF advanced functions such as Spelling Verification, Automated Text, and Records Processing.

Support is provided for display and entry of characters from any one character set used by an 8775 Text Display Station. All the characters used by the 3732 can be displayed and entered, together with the special control symbols required for text. Additionally, any character in the DOSF graphics character set can be displayed.

IDTF, downstream-loaded from DPPX or DPPX/SP, offers the DPPX or DPPX/SP user access to the full functional capabilities of DOSF when operating with DPPX Data Stream Compatibility (DSC). The 8100 DPPX or DPPX/SP system attaches directly, or through a nonswitched line, to a communication port on the 8100 DPCX system. Up to five such attachments can be made to DPCX, with up to eight 8775s active per attachment. Text printing is provided only on the 8100 DPCX system. When not operating with DPPX DSC to DOSF, the 8775 retains its full capability to access DPPX or DPPX/SP applications.

OPERATION

IDTF is downstream loaded into an 8775 in a similar manner to the 8775 features Enhanced Function, Enhanced Function with Magnetics, and Multiple Partitions and Scrolling. Downstream loading is initiated via the 8775 terminal setup procedure.

Only one downstream load can reside in an 8775 at any one time.

When IDTF is downstream-loaded, the availability of text or data functions to an operator is controlled by the application to which the terminal is connected. In the data state the 8775 is unchanged, and remains compatible with the 3278 Display Terminal.

To switch an 8775 from IDTF to Enhanced Function or Multiple Partitions and Scrolling, the operator enters the terminal set up procedure and requests the required downstream load. On returning from the terminal set up procedure, the desired feature is loaded. A similar procedure is used to reload IDTF.

PROGRAMMING SUPPORT

IDTF is designed to be used with Release 2.1 of the Distributed Office Support Facility (DOSF) and Release 2.2 of the Distributed Processing Control Executive (DPCX).

Support for IDTF, downstream-loaded from DPPX or DPPX/SP with access to DOSF, is provided by DPPX FEP 6 or DPPX/SP, Release 3 of DPCX, and the latest version of DOSF at the time of DPCX Release 3 availability.

Facilities for host-oriented viewing of documents via the 8775 when in data state, and for storage, retrieval and distribution of documents using IDTF and DOSF are provided by:

- The current release of Distributed Office Support S/370 (DISOSS/370)
- The current release of Distributed Office Support S/370/VSE (DISOSS/VSE)
- The current release of the Distributed Office Support S/8100/DOSF (DISOSS/8100/DOSF)

USER SET

An 8775/IDTF/DOSF configuration is primarily intended for personnel whose normal tasks involve data applications and who have an occasional need for text functions, for example clerical personnel. Differences between the 8775 and 3732 keyboards, the performance differences described above, and the volume of text entry and edit work to be processed, should be taken into consideration when evaluating the suitability of an 8775 with the IDTF licensed program.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

An IBM 8775 with IDTF downstream-loaded requires as a minimum:

- One IBM 8100 Information System, configured to support DOSF Release 2.1 and DPCX Release 2.2.
- 8775 specify code #9600 and its prerequisite features #3623, #3905, #4670, #5781, #3624, #3626, and #5110.

SOFTWARE REQUIREMENTS

IDTF is designed to be used with:

- DOSF Release 2.1 (5761-XR1).
- DPCX Release 2.2 (5761-DS1).

IDTF, when attached to DPPX or DPPX/SP with access to DPCX/DOSF, can be used with:

- DOSF latest release at DPCX Release 3 (5761-XR1) availability time.
- DPCX Release 3 (5761-DS1).
- DPPX FEP 6 (5760-010).
- DPPX/SP (5660-281).

DISTRIBUTION AND INSTALLATION

IDTF will be distributed on diskette as a licensed program from the IBM program libraries. All shipments will consist of the same code: IDTF is not language-dependent.

Installation of the IDTF diskette is the responsibility of the customer. IBM will provide information describing how customers should install the diskette.

Note: Source code listings will not be provided for IDTF.

COMPATIBILITY

- When IDTF is downstream-loaded, the 8775 screen size is limited to 1920 characters for both text and data applications.
- The DOSF sentence delete function is not supported by IDTF.

Interactive Display Text Facility (cont'd)

- Certain other DOSF functions will be used by IDTF in a slightly different way compared with their use on a 3732. For more information refer to the *IDTF General Information Manual* (GA33-3115).

DATA SECURITY

The security facilities of DPCX and DOSF are available to users of an 8775 with IDTF downstream-loaded. For applications in which sensitive data is sent over external communication facilities, user management may wish to augment these facilities with the application of cryptography. User management is responsible for the selection, implementation, and adequacy of security features.

PERFORMANCE

Of the attachment modes available to the 8775 with IDTF, for performance reasons it is recommended that the 38.4K bps loop be chosen. It is also recommended that the 8100 system have one megabyte of processor storage. For an 8775 on DPPX or DPPX/SP accessing DOSF on DPCX, it is recommended that the highest speed point-to-point communication attachment appropriate for the system environment be used.

Response times for operations that require interaction between the terminal and an 8100/DPCX/DOSF system will be longer than with a directly-attached 3732 for equivalent systems and loads. When operating with DPPX or DPPX/SP DSC, response times that require interaction between the 8775 and DOSF will be lengthened. Certain operations, such as Screen Left, Screen Right and Line Delete, are performed within the terminal. For these operations, the response times will be shorter than with the 3732.

When an 8775 with the IDTF licensed program is operating in data state, response times will be similar to the standard 8775 response times.

An 8775 with the IDTF licensed program may also be attached to an 8100 via a communication port. In this case response times will be longer than with a 38.4K bps loop attachment and will vary considerably, depending on line speed and whether the teleprocessing connection is point-to-point or multidrop. Careful analysis and planning is required when considering a communication port attachment.

The time taken to load the IDTF licensed program into an 8775 will be similar to the time taken to load the Enhanced Function, Enhanced Function with Magnetics, or Multiple Partitions and Scrolling features.

RPOs ACCEPTED: No

PROGRAM PRODUCTS

**5668-960 - ISPF (MVS/TSO, VM/CMS)
INTERACTIVE SYSTEM PRODUCTIVITY FACILITY****PURPOSE**

The Interactive System Productivity Facility (ISPF) is a dialog manager for interactive applications. It provides control and services to support processing of interactive applications (dialogs) in different host environments. ISPF and the applicable ISPF/Program Development Facility (5665-268 for MVS and 5664-172 for VM) are related IBM program products. Together, they are designed to increase productivity in the development of applications by taking advantage of the features of display terminals. They contain special functions for the development and use of interactive applications (dialogs).

The dialog management functions of ISPF and the program development functions of the ISPF/Programming Development Facility (ISPF/PDF) products were previously combined in the predecessor program product, the Systems Productivity Facility (5668-009) for MVS/TSO and VM/CMS. Significant function and usability enhancements have been included in the dialog management facilities of ISPF. With this announcement of ISPF for TSO and CMS, IBM's direction is to extend this common dialog manager capability to the VSE/ICCF environment. Further information on the VSE/ICCF version of this product will be available later.

HIGHLIGHTS

- ISPF consists of a comprehensive set of dialog management services:
 - Display predefined screen images.
 - Build and maintain permanent tables for user information.
 - Generate output files for jobs submitted or other processing.
 - Define and control symbolic variables.
 - Interface to Edit/Browse.
- The ISPF dialog manager provides control facilities to:
 - Traverse a hierarchy of selection menus and invoke the appropriate dialog function.
 - Manage the physical display image in single screen or split screen mode.
 - Interpret program function (PF) key usage.
 - Transfer in and out of tutorials.
- A common dialog manager capability is provided across two major operating system environments.
- It is IBM's direction to extend the ISPF product to the VSE/ICCF environment at a future date.
- ISPF is the base dialog manager for the Program Development Facility products.
- ISPF includes significant function and usability enhancements over the previous System Productivity Facility (SPF) in the following areas:
 - Display Services:
 - Light-pen support - 'ATTENTION' mode.
 - Multiple line selection or modification.
 - Extended verification function.
 - Alternate locations for command and message fields.
 - Program Function (PF) key support including optional usage.
 - Variable Services:
 - Profile variables inclusion in standard variable search.
 - Profile variables stored by application and user.
 - User exits.
 - Variable names longer than screen fields.
 - Entry of APL and TEXT character data.
- ISPF contains a new facility, command tables, to intercept entered commands and take appropriate action.

DESCRIPTION

ISPF allows for a wide variety of dialog organizations so that the end user, at a display terminal, can approach an application in a natural, comfortable way.

A dialog managed by ISPF consists primarily of the following items:

- Selection panels (menus), from which the user selects a particular processing option.
- Functions (command procedures or programs), that perform the requested processing.

- Data entry panels, on which the user supplies additional information needed for the application.

Functions may take the form of an MVS/TSO CLIST, a VM/SP CMS EXEC or be written in a language such as assembler or one of the following:

- PL/I
- COBOL
- FORTRAN IV

One way to create and test these functions is through the related ISPF/PDF program product. This product provides a model facility that simplifies the generation of many of the dialog elements for various languages and a test facility that helps the developer find problems in user developed dialog applications.

When a dialog is invoked, ISPF facilities:

- Display a hierarchy of menus based on user selection.
- Invoke functions from menus. These functions may be command procedures (CLISTs or EXECs) or programs.
- Communicate with the user via data entry displays and messages.
- Provide online help and tutorial information.
- Generate sequential output to be passed as input to another function, or dialog (for example, JCL to be submitted as a batch job, or SCRIPT/VIS text to be formatted for printing).
- Maintain user-entered or program-generated data during this session or from one session to another. For example:
 - Define and control user variables.
 - Build and maintain permanent tables of user information.
- Provide split-screen displays where the user may partition the display screen into two "logical" areas.

Significant differences between the previous product and ISPF include:

- Table display services enhancements:
 - Multiple line selection or modification.
 - New JMODEL header statement keywords.
 - Variable names on model lines.
 - Multiple model lines.
 - Explicit cursor placement within scrollable data.
- Panel display services enhancements:
 - Extended verification functions.
 - "Z" variables as field name placeholders.
 - Truncation remainder function.
 - Alternate locations for command and message fields.
 - Profile variable support.
 - New attribute keywords: SKIP and ATTN.
 - Katakana and Canadian-French keyboard support.
- New profile variable support and the following enhancements to variable services:
 - Profile variables are included in standard search sequence.
 - Profile variables are now stored by application and user instead of just by user.
 - A name-list interface is provided for the VCOPY and VREPLACE services.
 - User exits are provided for variable access and conversion.
- A new facility allows the dialog manager to intercept user-entered commands and take appropriate action.
- Program function keys are no longer required. All functions for which PF keys were required in the previous product may now be entered in the command field of any display.
- ISPF detects fields on a panel via a light pen or via the cursor select key.
- The SELECT service and the ISPF command now allow specification of an optional application ID on the NEWAPPL keyword.
- A NOCHECK keyword may be specified with either the CMD or PGM keyword. With this keyword, the dialog function (command or program) is invoked even if the user specifies a chain of options.
- A parameter in a CALL ISPLINK no longer has to be enclosed in parentheses when there is only one variable in the list.

PROGRAM PRODUCTS

Interactive System Productivity Facility (cont'd)

- A new system variable, ZPARENT, allows the developer to indicate the next panel to be displayed when the user enters the END command or when a function completes operation. This alters the reverse-order sequence established during the original selection sequence.
- A new "set next message" function provides the ability to specify a message to be displayed with the next panel that is written by ISPF to the terminal.
- Help panels may now contain variables so that dialog information (including information entered by the user) may be displayed on the help panel.
- New selections may be added to existing menus.
- An application may direct table output to a table output library other than the library specified on the table output ISPTABL DD or FILEDEF statement.
- An application may direct file tailoring output to an output library other than the library specified on the file tailoring output ISPFIL DD of FILEDEF statement.
- Dialog control services enhancements:
 - An option has been added to allow display output without unlocking the keyboard.
 - Split-screen mode may be enabled or disabled by a function.
 - The display environment may be saved and restored.
- Non-interactive applications may be executed in the background.
- A utility is provided to assist with the conversion of Interactive Productivity Facility (IPF) tables in VM/CMS.
- Variable names may now be assigned that are longer than the screen field in a panel definition.

CUSTOMER RESPONSIBILITIES

The installation of ISPF requires a properly configured system, with appropriate terminals and other devices, as required for the desired operating system. Also, appropriate processing programs (and TSO prompters for MVS) must be installed to use the ISPF foreground and batch options. Support for printed output from the SCRIPT/VS utility is provided by the Document Composition Facility.

On an MVS system, if ISPF is to be used with TSO/TCAM, the standard TSO/TCAM message handler must be reassembled to incorporate minor modifications. These modifications are designed to eliminate interference between the full-screen I/O operations used by ISPF and the line-oriented I/O operations used by TSO. No other changes are required for TSO or TCAM.

A dialog developer must be familiar with the base operating system and appropriate programming languages, and should review *ISPF Dialog Management Services*. A user of the ISPF/Program Development Facility must be familiar with the base operating system and should review *ISPF/PDF Reference*.

INSTALLATION

In an MVS environment the installation of ISPF via SMP deletes the previous SPF product. You may want to take the necessary steps to have both products available during a transition stage.

This can be accomplished by maintaining the previous SPF product on a completely separate set of backup packs or in a set of libraries that do not interfere with the execution of ISPF. The previous SPF product can be used to assist in converting user parameter information into the new ISPF format of user profile data. See "SPF Parameters (User Profile Data) Convert Utility" for more information.

Installation procedures are available in *ISPF Installation and Customization*.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The Interactive System Productivity Facility is designed to operate on any IBM processors that meet the minimum requirements for the desired operating system. These include the IBM S/370, 43XX and 30XX processors.

MVS:
The machine requirements are the same as those for MVS with the Time Sharing Option (TSO).

Up to 325K bytes of pageable link pack area (PLPA) may be used for ISPF program residency. Use of PLPA is recommended for performance reasons but not required. Most of the performance benefits may be achieved by using 280K bytes of PLPA. The minimum region size required for ISPF is 512K bytes. The recommended size is 2M bytes.

Approximately 8 cylinders of 3330 equivalent direct access storage are required for the program, panel, message, table and skeleton libraries distributed with ISPF.

VM:
The machine requirements are the same as those for VM/System Product (VM/SP) Release 1 with the Conversational Monitor System (CMS).

Approximately 384K bytes of a discontinuous shared segment (DCSS) area are required for ISPF program residency. The virtual storage requirements for each user's virtual machine will vary depending upon the application being executed, the size of tables and files, and the use of "split screen". The minimum virtual machine size is 512K bytes. The recommended size is 2M bytes.

If ISPF is run on an IBM model 4331 with 1M bytes of real storage, VM/SP must be generated with the "small CP" option.

Note: ISPF performance on a processor with 1M bytes or less of real storage should be carefully evaluated.

Approximately 10 cylinders of 3330 equivalent direct access storage are required for the program, panel, message, table and skeleton libraries and EXECs distributed with ISPF.

TERMINALS: ISPF requires an IBM 3270 display terminal with at least 24 lines. 3270 models that may be used are:

For MVS/TSO Systems:

- 3275 Mdl 2 and 12
- 3276 Mdl 2, 3, 4, 12, 13 and 14
- 3277 Mdl 2 (local and remote attachment)
- 3278 Mdl 2, 3, 4 and 5 (local or remote attachment)*
- 3279 All models (local or remote attachment) when operated in 4-color compatibility mode.

For VM/SP Systems:

- 3275 Mdl 2
- 3275 Mdl 12 (via NM/VCNA)
- 3276 Mdl 2, 3 and 4
- 3276 Mdl 12, 13 and 14 (via VM/VCNA)
- 3277 Mdl 2 (local or remote attachment)
- 3278 Mdl 2, 3, 4 and 5 (local and remote attachment)*
- 3279 All models (local or remote attachment) when operated in 4-color compatibility mode.

* The 3278 mdl 5 operates on 80 characters per line except when used with the ISPF/PDF Edit and Browse facilities which can use up to 132 characters per line.

SOFTWARE REQUIREMENTS

The Interactive System Productivity Facility is designed for use on the OS/VS2 (MVS) and MVS/System Product (MVS/SP) operating systems with TSO and on the VM/System Product (VM/SP) operating system with CMS.

MVS

ISPF operates as a TSO command processor under the Time Sharing Option of VS2 Release 3.8 (MVS), MVS/SP Version 1 Release 1.1, or MVS/SP Version 2 Release 1 (when available). The BPAM and BSAM access methods are required by ISPF for reading and writing data sets, and TSO/TCAM or TSO/VTAM is required for terminal communication.

The telecommunications access methods supported are:

- TCAM 10 (available with MVS)
- ACF/TCAM Version 2, Release 2 or later (5735-RC3)
- VTAM 2 (available with MVS)
- ACF/VTAM Version 1, Release 2 or later (5735-RC2)
- ACF/VTAM Version 2 (5665-280)

Internal interfaces to the following IBM programs are provided. These programs are not required to operate ISPF. However, if an IBM 3284, 3286, 3287, 3288 or 3289 printer is used for ISPF output, the appropriate DSPRINT command processor must be installed on the system.

OS/VS2 MVS 3270 Extended Display Support Session Manager Release 2	5740-XE2
TSO/TCAM Command Processor "DSPRINT"	5798-AYF
TSO/VTAM Data Set Print (DSPRINT)	5798-CPF
TSO/VS2 Programming Control Facility (PCF)	5798-BBJ
TSO Programming Control Facility - II (PCF2)	5798-CLW

VM

ISPF operates as a CMS command under the VM/System Product (VM/SP). The operation of ISPF also requires a disconnected virtual machine (ISPVM) that communicates with each user's machine via the VM Communication Facility (VMCF).

PROGRAM PRODUCTS

Interactive System Productivity Facility (cont'd)

If ISPF is to be used with SNA 3270 displays, the following IBM program product must be installed:

Virtual Machine/VTAM Communications, Network Application (VM/VCNA), 5735-RC5.

COMPATIBILITY

All existing functions in the System Productivity Facility are available either in ISPF or ISPF/PDF.

MIGRATION

Migration considerations from SPF, the predecessor program product, to ISPF are documented in the migration section of the *General Information Manual*.

SYSTEM PRODUCTIVITY FACILITY: The System Productivity Facility (5668-009) will be withdrawn from marketing 6 months after the availability of the respective ISPF, ISPF/PDF program products.

DEPENDENCIES: ISPF is dependent upon the System Modification Program (SMP) for installation on OS/VS2 (MVS) and MVS/SP. ISPF under MVS and MVS/SP operates with TSO. ISPF under VM/SP operates with CMS.

DATA SECURITY

ISPF provides no security or data integrity functions beyond those provided by the environments in which it operates. It is the responsibility of customer management to use any existing programs to provide this support.

MVS INTEGRITY

IBM will accept APARs where installation of ISPF introduces an exposure to the system integrity of OS/VS2 (MVS).

RPQs ACCEPTED: No

PROGRAM PRODUCTS

5668-960 - VSE/ISPF
VSE/INTERACTIVE SYSTEM PRODUCTIVITY FACILITY

PURPOSE

The Interactive System Productivity Facility (ISPF) dialog manager for interactive applications is now available for Virtual System Extensions/Interactive Communications Control Facility (VSE/ICCF). This greatly enhances the capabilities of DOS/VSE, and provides complete 'cross-system' capability for the dialog manager function of ISPF. It provides control and services to support processing of interactive applications (dialogs) in different host environments. ISPF and the applicable ISPF/Program Development Facility are related IBM program products. Together, they are designed to increase productivity in the development of applications by taking advantage of the features of display terminals. They contain special functions for the development and use of interactive applications (dialogs). With this support of ISPF for VSE, IBM has extended this common dialog manager to the ICCF environment.

HIGHLIGHTS

The ISPF program product is the base dialog manager for the MVS and VM system IPOs. It is IBM's direction to extend the dialog manager to the future VSE system IPO.

ISPF is a dialog manager for interactive applications. It provides control and services to support processing of the dialogs in the different host environments.

A dialog managed by ISPF consists primarily of the following items:

- Selection panels (menus) from which the user selects a particular processing option.
- Functions that perform the requested processing.
- Data entry panels on which the user supplies additional information needed for the application.

Functions may be written in a language such as Assembler, or one of the following compilers:

Compiler	VSE/AF
PL/I Optimizer	5736-PL1
COBOL	5746-CB1
VS FORTRAN Rel.2	5748-FO3

One way to create and test the dialog is through the related PDF program product. This product provides a model facility that simplifies the generation of many of the dialog elements for several languages, and a test facility that helps a user test ISPF applications.

When a dialog is invoked, ISPF facilities:

- Display a hierarchy of menus based on user selection.
- Invoke program functions from the menus.
- Communicate with the user through data entry displays and messages.
- Provide online help and tutorial information.
- Generate sequential output to be passed as input to another process; for example, JCL to be submitted as a batch job.
- Maintain user-entered or program-generated data from one session to another. For example, ISPF facilities:
 - Define and control user variables.
 - Build and maintain permanent tables of user information.
- Provide split-screen displays through which the user may partition the display screen into two 'logical' areas.
- Intercept user-entered commands and take appropriate action based on information contained in command tables.

CUSTOMER RESPONSIBILITIES

The installation of ISPF requires a properly configured system, with appropriate terminals and other devices, as required for the desired operating system. Also, appropriate processing programs must be installed to use the ISPF batch option.

A dialog developer must be familiar with the base operating system and appropriate programming languages, and should review *ISPF Dialog Management Services*. A user of the ISPF/Program Development Facility must be familiar with the base operating system and should review *ISPF/PDF Reference*.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The Interactive System Productivity Facility is designed to operate on any IBM processor that meets the minimum requirements for the desired operating system; this includes the IBM S/370, 43XX and 30XX Processors.

The machine requirements are the same as those for VSE with the Interactive Communication Control Facility (ICCF).

Up to 388K bytes of shared virtual area (SVA) may be used for ISPF program residency. Use of SVA is recommended for performance reasons, but not required. Most of the performance benefits may be achieved by using 364K bytes of SVA. The minimum ICCF interactive partition size required for ISPF is 128K bytes. The recommended size is 256K bytes.

Approximately 10 cylinders of 3330-equivalent direct access storage are required for the program, panel, message, table and skeleton libraries distributed with ISPF.

Terminals: ISPF requires an IBM 3270 display terminal with at least 24 lines. 3270 models that may be used are:

For VSE/ICCF Systems:

- 3178
- 3275 mdl 2 or 12
- 3276 mdl 2, 3, 4, 12, 13 or 14
- 3277 mdl 2 (local or remote attachment)
- 3278 mdl 2, 3, 4 or 5 (local or remote attachment)*
- 3279 mdl 2A, 3A, 2B or 3B (local or remote attachment) (2B and 3B only when operated in 4-color compatibility mode)
- * The 3278 mdl 5 operates on 80 characters-per-line except when used with the ISPF/PDF Edit and Browse facilities which can use up to 132 characters-per-line.

SOFTWARE REQUIREMENTS

The Interactive System Productivity Facility is designed for use on the VSE operating system with ICCF.

ISPF may be invoked in a VSE batch partition or through an ICCF procedure as an application program in an ICCF interactive partition. It may not be invoked as a command.

The following VSE support programs are required:

- Advanced Functions Release 3.5 (5746-XX8)*
- VSE/POWER Version 2 Release 1 (5746-XE3)
- VSE/ICCF Release 3.5 in either of the following telecommunication environments:
 - ICCF/TTF (received with ICCF)
 - CICS/VS Version 1 Release 3.5 or later (5746-XX3)
- * This release is contained within VSE/SIPO 1.4.0 which is available as an Early Support Program (ESP).

Installation: Installation procedures are described in the *ISPF Installation and Customization* manual (SC34-2080).

Dependencies: ISPF is dependent upon the Maintain System History Program (MSHP) for installation on VSE. ISPF under VSE operates with ICCF.

DATA SECURITY

ISPF provides no security or data integrity functions beyond those provided by the environments in which it operates. It is the responsibility of customer management to use any existing programs to provide this support.

RPOs ACCEPTED: No

PROGRAM PRODUCTS

**5668-963 - NRF for 3705/3725 R1, R1.5
NETWORK ROUTING FACILITY RELEASE 1, 1.5
for the 3705 and 3725 COMMUNICATION CONTROLLERS**

PURPOSE

The Network Routing Facility Release 1 is designed to provide users of Advanced Communication Function/Network Control Program (ACF/NCP/VS) with a 3705-based message routing facility. The Network Routing Facility Release 1 resides in a 3705 Communication Controller with ACF/NCP/VS or ACF/NCP/VS Version 2 (3705) and routes messages between assorted devices without the use of host processor resources. The Network Routing Facility Release 1.5 resides in either a 3705 or 3725 Communication Controller with ACF/NCP Version 3, and routes messages between assorted devices without the use of host processor features.

HIGHLIGHTS

Network Routing Facility provides the following features:

- Message routing between supported terminals without the use of a host processor.
- Support for 3650 Programmable Store System, Series/1 and 3780 Data Communications Terminal.
- Multiple message routing options are selectable by the user.
- User exits allow customized routing, editing and error processing.
- Session continuation in the event of a host failure.
- Detection of abnormal conditions with reporting to the host ACF/VTAM.
- Provides the ability to route to or from a CICS/VS host application using the CICS/VS support for the 3650 Pipeline Logical Unit (NRF Release 1.5 only). Such a CICS/VS host application may be substituted for a terminal in the description of NRF Release 1.5 routing functions.

DESCRIPTION

Message Routing Functions: The Network Routing Facility communicates with terminals which are logically owned by ACF/VTAM Version 2. ACF/VTAM establishes sessions between the Network Routing Facility and the devices. Once sessions have been established the Network Routing Facility performs terminal to terminal routing without the use of host resources.

The Network Routing Facility routes incoming messages to the appropriate destination based on user specified options. Reply messages from the destination terminal can be automatically routed by the Network Routing Facility back to the originating terminal or can be forwarded to any other Network Routing Facility terminal specified by the user.

The Network Routing Facility permits the user to select from among the following routing options for each logical unit (LU) which it controls. These selections are made during the Network Routing Facility system generation.

- Fixed Table Routing - each message received from the LU is routed to a single specified destination.
- Argument Table Routing - A field in the incoming message is compared with entries in a routing table to determine the destination terminal.
- Correlation Routing - Reply messages are routed back to the originating terminal.
- User Routing - A user exit is invoked to determine the destination.

Capabilities are also provided to balance message traffic over several communications lines to improve performance.

User Exits: The Network Routing Facility provides the capability for user exit routines to be invoked at various stages in the routing process. These routines can be used with any of the routing techniques, and can perform functions such as message editing, customized routing and error handling. User exit routines are coded using 3705 Assembler language and included during the Network Routing Facility system generation process.

Error Conditions: The Network Routing Facility will maintain its terminal sessions and continue routing functions in the event of a failure of the owning ACF/VTAM system. The Network Terminal Option (NTO) has been enhanced to provide for session continuation.

The Network Routing Facility generates error messages in the event of routing errors. Conditions such as inactive or invalid destinations, correlation timeouts and unrecognizable messages generate ALERTs which are sent to ACF/VTAM in the controlling host. ALERTs can be formatted and displayed to the network operator by the Network Problem Determination Application (NPDA) Version 2. NPDA will provide a probable cause indication for each type of Network Routing Facility error ALERT.

CUSTOMER RESPONSIBILITIES

The customer must perform the following tasks in order to utilize the Network Routing Facility:

- Install the following products:
 - ACF/VTAM Version 2
 - ACF/NCP/VS Release 3, ACF/NCP Version 2 (3705) or ACF/NCP Version 3
 - Network Routing Facility
 - NTO Release 2 or 2.1 (if required)
 - NCCF (if required)
 - NPDA Version 2 (if required)
 - NLDM (if required)
- Choose an appropriate routing technique and create the related routing tables.
- Define the devices to ACF/NCP and the Network Routing Facility system generation.
- Code any desired user exit routines.

Network Routing Facility Planning (SC27-0598) should be reviewed for a more detailed explanation of these tasks.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The Network Routing Facility is designed to operate on the IBM 3705-II, 3705-80, and 3725 Communication Controllers.

Message routing functions are provided for the following systems:

- IBM Series/1
- IBM 3650 Programmable Store System: Host Positive Authorization Logical Unit and User Programs Logical Unit
- IBM 3780 Data Communications Terminal (in transparent mode only)
- IBM CICS/VS Version 1 Release 6 host application using the CICS/VS support for the IBM 3650 Pipeline Logical Unit (NRF Release 1.5 only)

The Network Routing Facility supports a full duplex LU Type 0 SNA protocol. For detailed information regarding supported communications protocols, see *Network Routing Facility Planning (SC27-0598)*.

SOFTWARE REQUIREMENTS

The Network Routing Facility is controlled by ACF/VTAM Version 2 (5665-280) operating with OS/VS2 (MVS Release 3.8). The Network Routing Facility Release 1 is designed to operate with ACF/NCP/VS Release 3 (5735-XX1) or ACF/NCP Version 2 (3705, 5735-XX9). The Network Routing Facility Release 1.5 is designed to work with ACF/NCP Version 3 (5667-124).

The Network Terminal Option (NTO) Release 2 or 2.1 (5735-XX7) is required if messages are to be routed to 3780 binary synchronous communications (BSC) devices. The following NTO Release 2 (3705 only) PTFs must be installed in order to use the NTO session continuation function: UR90037.

The following Series/1 licensed products are required if messages are to be routed to and from an IBM Series/1.

- Realtime Programming System (RPS) Release 5.1 (5719-FC5) with: System Network Architecture Extended (SNA-E) Release 1.1 (5719-SN1)

or

- Event Driven Executive (EDX) (5719-XS3) with: System Network Architecture (SNA) (5719-SX1)

The Network Problem Determination Application (NPDA) Version 2 (5668-983) may be used to collect and format network error information.

Storage Requirements: The performance of NRF Release 1 or NRF Release 1.5 with the corresponding level of ACF/NCP will vary depending upon particular hardware and network configuration. NRF Release 1 requires approximately 20K bytes of 3705 storage for static control blocks and modules. NRF Release 1.5 requires approximately 30K bytes of 3705 or 3725 storage for static control blocks and modules. Additional storage is required for each logical unit, for routing related tables and for user exit routines and control blocks. Additional storage is required if NTO Release 2 or NTO Release 2.1 is also used.

Since the performance and storage requirements will vary depending upon particular hardware configuration, the 3705 Configurator (CP3705) or the 3725 Configurator (CP3725) should be used to assess individual customer performance capability and storage requirements.

PROGRAM PRODUCTS

Network Routing Facility R1.5 (cont'd)

Customer Education: The Communications Systems curriculum will be updated to include the Network Routing Facility.

MIGRATION

The Network Routing Facility provides a functional replacement for the SDLC/BSC Path Function of NCP/VS Release 5 and ACF/NCP/VS Releases 2 and 2.1.

DATA SECURITY, AUDITABILITY and CONTROL

Network Routing Facility runs on ACF/NCP and is dependent upon ACF/VTAM to authorize terminal connections. The Network Routing Facility does not support the encrypt/decrypt feature. User management is responsible for selection, adequacy and implementation of features and the appropriate application and administrative control.

RELIABILITY, AVAILABILITY and SERVICEABILITY (RAS)

- The Network Routing Facility generates error ALERTs when an internal error condition is detected. These messages are formatted and sent to ACF/VTAM in the controlling host. If NPDA Version 2 is installed, NPDA will display the error ALERT and provide an action panel with a probable cause indication. If NPDA Version 2 is not installed, the ALERTs can be captured by activating ACF/VTAM buffer trace. The trace data can be printed using ACF/TAP.
- Message flow through the Network Routing Facility is traced in an internal trace table. This data can be received at the host by activating ACF/VTAM line trace for the Network Routing Facility line. The Generalized Trace Facility (GTF) can be used to format and print the trace data.
- User error routine exits are provided to allow user processing of error conditions.
- The Network Routing Facility will maintain its terminal sessions and continue routing functions in the event of a failure of the owning ACF/VTAM system. The Network Terminal Option (NTO) has been enhanced to provide for session continuation.

RPQs ACCEPTED: No

PROGRAM PRODUCTS

**DIRECT MULTINETWORK LINK (DMNL) for IMS/VIS
VERSION 1 RELEASE 1
5668-964****PURPOSE**

Direct Multinetwork Link (DMNL) is an application program product that enables the preparation and processing of messages related to banking transactions.

HIGHLIGHTS

As a generalized communication monitor, Direct Multinetwork Link is a base product and provides the following end-user oriented services for the banking environment.

- Message Processing
 - Online message processing
 - Batch message processing
 - User application program support
 - Operator control of the system
- Message Definition Facility
- General Services
 - Routing
 - Message format service
 - Queue management
 - Journaling

DESCRIPTION

DMNL is a message processing facility that allows the end user to work with a display terminal or sequential devices. With DMNL, a user can prepare messages based on user-specified or S.W.I.F.T. formats. These messages can be transmitted to the network interface for any public or private network including the S.W.I.F.T. network. Communication network interface functions provide a base to establish and operate the connection to any network including the S.W.I.F.T. network, and allow the concurrent operation of multiple network links within one DMNL installation.

DMNL provides message formatting and routing services to control the message flow from function to function, and to gain access to individual fields within a message. The Message Format Service (MFS) maps the various formats of the messages to a common internal format or maps a message from the internal format to a format compatible with the device where it is to appear. MFS simplifies the access to each individual message field for inspection and further processing. The level of detail to which a message is segmented is determined during DMNL generation by the facilities provided.

Routing services control the movement of input and output messages from one DMNL function to the next. Routing criteria are either found in the message itself or are introduced by the end user handling the message. All messages are stored in queues. The queues of all message processing functions are collected in one data set. Queue management dynamically utilizes this data set. The journal saves information on events that occur during the operation of DMNL. This information can be used for security and reliability purposes.

As a general application package, DMNL is integrable into a banking application environment. Together with other banking applications that can automatically be initiated by the user application interface facility, Direct Multinetwork Link allows a full computer-assisted processing of banking transactions.

Reference Information: Direct Multinetwork Link is available in the following environments:

- DMNL-CICS/DOS/VIS (5662-269)
- DMNL-CICS/OS/VIS (5668-965)
- DMNL-IMS/VIS (5668-964)

To communicate with the S.W.I.F.T. network, the user of Direct Multinetwork Link has to install Direct S.W.I.F.T. Network Link (DSNL) (5668-926).

DMNL/DSNL are internally restructured, functional extensions of the program product Direct S.W.I.F.T. Link (DSL), 5746-F14 for DSL-CICS/DOS/VIS, 5740-F15 for DSL-CICS/OS/VIS and 5740-F16 for DSL-IMS/VIS.

CUSTOMER RESPONSIBILITIES

Users are responsible for the following prerequisites:

- The operating system and data communication system must be generated and installed as required for Direct Multinetwork Link.
- The required library space must be provided.
- Customization and installation must be performed for DMNL.
- End users must be defined and end-user functions must be selected and defined.
- Routing modules that reflect the bank's organizational requirements must be provided.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

The Direct Multinetwork Link program product is designed to operate on the following IBM machines.

IBM S/370 mdls 158 and 168
IBM 303X, 308X and
IBM 4341

The size of the processor for DMNL depends on the operating system (OS/VIS) and the data communication system (IMS/VIS) used to control the operation of DMNL.

The system requirements of DMNL, in addition to those of the operating system used, are the following:

- At least one IBM 327X display station (i.e., 3278-2, 3279-2).
- If printing services are desired, one IBM 328X Printer (i.e., 3287-2, 3288-2) or equivalent.
- A direct access storage device for DMNL data sets and library.

SOFTWARE REQUIREMENTS

The programs that constitute the Direct Multinetwork Link program product are written in IBM S/370 Assembler language.

The operational requirements are:

- IBM Operating System/Virtual Storage 1 (OS/VIS1) Release 6.7 or subsequent releases, or
- IBM Operating System/Virtual Storage 2 (OS/VIS2) Release 3.8 MVS or subsequent releases.
- Information Management System/Virtual Storage (IMS/VIS) Version 1 (5740-XX2), Release 2.0, or subsequent releases.

The DMNL/DSNL queue, user table, journal and the authenticator-key file are VSAM data sets. For OS/VIS, VSAM is a component of the OS/VIS System Control Program.

Restart/Recovery: Restart/Recovery assistance is supplied for:

- DMNL restart based on queues.
- Device failures of IBM 3278-2 and 3287-2 and their equivalents.
- Failure of the IBM system covered by the recovery capabilities of the operating and data communication system.

COMPATIBILITY and MIGRATION

Direct Multinetwork Link together with the separate program product Direct S.W.I.F.T. Network Link support all S.W.I.F.T. specific services. Direct S.W.I.F.T. Network Link is the interface between Direct Multinetwork Link and the S.W.I.F.T. network. The program products DMNL/DSNL Release 1.0 are internally restructured, functional extensions of the program product Direct S.W.I.F.T. Link (DSL): 5746-F14 - DSL-CICS/DOS/VIS, 5740-F15 - DSL-CICS/OS/VIS, and 5740-F16 - DSL-IMS/VIS. With respect to DSL Release 2.0, DMNL/DSNL Release 1.0 provides the following new functions:

- Direct Multinetwork Link (DMNL)
 - NOPROMPT mode in addition to normal screen processing in PROMPT mode.
 - Compressed printer layout.
 - Dynamic queue-key table.
 - Separated signon processing.
 - Improved console operator messages.
 - Improved Message Format Service error diagnostics.
 - Extended panel command availability.
 - CICS command level interface.
 - 3375 and 3380 support.
 - Online maintenance of the USER-table (passwords, users).
 - Support of customer-added applications, including record formats other than S.W.I.F.T.
- Direct S.W.I.F.T. Network Link (DSNL)
 - Support of all S.W.I.F.T. message types, including message category 7 (documentary credits).
 - Optional automatic retry of LOGIN processing.

To ease migration, DMNL/DSNL are designed to be functionally upward compatible with DSL. However, a customer migrating from DSL to DMNL/DSNL must follow the same installation procedure as a new customer.

The generalization of the facility to define user-specific messages has implied modifications of the message format service, queue management and routing in DSL. User-written application programs that use these services may have to be rewritten.

User Modifications: During DMNL installation, each user can determine the customizing options that best meet his requirements. For

PROGRAM PRODUCTS

DMNL for IMS/VS (cont'd)

additional, individual changes, the programs are designed so that users can:

- Modify the layout and the language of the panels used to display a message or related data on screens, terminal printers, and line printers.
- Modify the layout of a S.W.I.F.T. message and other related data in internal storage.
- Add individual code of user-specific message processing steps.

**DIRECT MULTINETWORK LINK (DMNL) for CICS/OS/VS
VERSION 1 RELEASE 1
5668-965**

PURPOSE

Direct Multinetwork Link (DMNL) is an application program product that enables the preparation and processing of messages related to banking transactions.

HIGHLIGHTS

As a generalized communication monitor, Direct Multinetwork Link is a base product and provides the following end-user oriented services for the banking environment.

- Message Processing
 - Online message processing
 - Batch message processing
 - User application program support
 - Operator control of the system
- Message Definition Facility
- General Services
 - Routing
 - Message format service
 - Queue management
 - Journaling

DESCRIPTION

DMNL is a message processing facility that allows the end user to work with a display terminal or sequential devices. With DMNL, a user can prepare messages based on user-specified or S.W.I.F.T. formats. These messages can be transmitted to the network interface for any public or private network including the S.W.I.F.T. network. Communication network interface functions provide a base to establish and operate the connection to any network including the S.W.I.F.T. network, and allow the concurrent operation of multiple network links within one DMNL installation.

DMNL provides message formatting and routing services to control the message flow from function to function, and to gain access to individual fields within a message. The Message Format Service (MFS) maps the various formats of the messages to a common internal format or maps a message from the internal format to a format compatible with the device where it is to appear. MFS simplifies the access to each individual message field for inspection and further processing. The level of detail to which a message is segmented is determined during DMNL generation by the facilities provided.

Routing services control the movement of input and output messages from one DMNL function to the next. Routing criteria are either found in the message itself or are introduced by the end user handling the message. All messages are stored in queues. The queues of all message processing functions are collected in one data set. Queue management dynamically utilizes this data set. The journal saves information on events that occur during the operation of DMNL. This information can be used for security and reliability purposes.

As a general application package, DMNL is integrable into a banking application environment. Together with other banking applications that can automatically be initiated by the user application interface facility, Direct Multinetwork Link allows full computer-assisted processing of banking transactions.

Reference Information: Direct Multinetwork Link is available for the following environments:

- DMNL-CICS/DOS/VS (5662-269)
- DMNL-CICS/OS/VS (5668-965)
- DMNL-IMS/VS (5668-964)

To communicate with the S.W.I.F.T. network, the user of Direct Multinetwork Link has to install Direct S.W.I.F.T. Network Link (DSNL) (5668-926).

DMNL/DSNL are internally restructured, functional extensions of the program product Direct S.W.I.F.T. Link (DSL), Program Numbers 5746-F14 (DSL-CICS/DOS/VS), 5740-F15 (DSL-CICS/OS/VS) and 5740-F16 (DSL-IMS/VS).

CUSTOMER RESPONSIBILITIES

Users are responsible for the following prerequisites:

- The operating system and data communication system must be generated and installed as required for Direct Multinetwork Link.
- The required library space must be provided.
- Customization and installation must be performed for DMNL.
- End users must be defined and end-user functions must be selected and defined.
- Routing modules that reflect the bank's organizational requirements must be provided.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

The Direct Multinetwork Link program product is designed to operate on the following IBM machines.

IBM S/370 mdls 135 or larger
IBM 303X, 308X and
IBM 4341

The size of the processor for DMNL depends on the operating system (OS/VS) and the data communication system (CICS/OS/VS) used to control the operation of DMNL.

The system requirements of DMNL, in addition to those of the operating system used, are the following:

- At least one IBM 327X display station (i.e., 3278-2, 3279-2).
- If printing services are desired, one IBM 328X Printer (i.e., 3287-2, 3288-2) or equivalent.
- A direct access storage device for DMNL data sets and library.

SOFTWARE REQUIREMENTS

The programs that constitute the Direct Multinetwork Link program product are written in IBM S/370 Assembler language.

The operational requirements are:

- IBM Operating System/Virtual Storage 1 (OS/VS1) Release 6.7 or subsequent releases, or
- IBM Operating System/Virtual Storage 2 (OS/VS2) Release 3.8 MVS or subsequent releases.
- Customer Information Control System/Virtual Storage (CICS/OS/VS) Version 1 (5740-XX2), Release 5.0, or subsequent releases.

The DMNL/DSNL queue, user table, journal and the authenticator-key file are VSAM data sets. For OS/VS, VSAM is a component of the OS/VS System Control Program.

Restart/Recovery: Restart/Recovery assistance is supplied for:

- DMNL restart based on queues.
- Device failures of IBM 3278-2 and 3287-2 and their equivalents.
- Failure of the IBM system covered by the recovery capabilities of the operating and data communication system.

COMPATIBILITY and MIGRATION

Direct Multinetwork Link together with the separate program product Direct S.W.I.F.T. Network Link support all S.W.I.F.T. specific services. Direct S.W.I.F.T. Network Link is the interface between Direct Multinetwork Link and the S.W.I.F.T. network. The program products DMNL/DSNL Release 1.0 are internally restructured, functional extensions of the program product Direct S.W.I.F.T. Link (DSL), Program Numbers 5746-F14 (DSL-CICS/DOS/VS), 5740-F15 (DSL-CICS/OS/VS), and 5740-F16 (DSL-IMS/VS). With respect to DSL Release 2.0, DMNL/DSNL Release 1.0 provides the following new functions:

- Direct Multinetwork Link (DMNL)
 - NOPROMPT mode in addition to normal screen processing in PROMPT mode.
 - Compressed printer layout.
 - Dynamic queue-key table.
 - Separated signon processing.
 - Improved console operator messages.
 - Improved Message Format Service error diagnostics.
 - Extended panel command availability.
 - CICS command level interface.
 - 3375 and 3380 support.
 - Online maintenance of the user table (passwords, users).
 - Support of customer-added applications, including record formats other than S.W.I.F.T.
- Direct S.W.I.F.T. Network Link (DSNL)
 - Support of all S.W.I.F.T. message types, including message category 7 (documentary credits).
 - Optional automatic retry of LOGIN processing.

To ease migration, DMNL/DSNL are designed to be functionally upward compatible with DSL. However, a customer migrating from DSL to DMNL/DSNL must follow the same installation procedure as a new customer.

The generalization of the facility to define user-specific messages has implied modifications of the message format service, queue management and routing in DSL. User-written application programs that use these services may have to be rewritten.

PROGRAM PRODUCTS

DMNL for CICS/OS/VS (cont'd)fcN

User Modifications: During DMNL installation, each user can determine the customizing options that best meet his requirements. For additional, individual changes, the programs are designed so that users can:

- Modify the layout and the language of the panels used to display a message or related data on screens, terminal printers, and line printers.
- Modify the layout of a S.W.I.F.T. message and other related data in internal storage.
- Add individual code of user-specific message processing steps.

PROGRAM PRODUCTS

**SERVICE LEVEL REPORTER (SLR)
VERSION 2 RELEASE 1.0
5668-966****PURPOSE**

Service Level Reporter Version 2 (SLR) program is designed to help DP management with information to help manage the DP installation.

DESCRIPTION

SLR runs under VS1, MVS/370, and MVS/XA.

SLR Version 1 reported on data from many systems -- VS1, MVS, MVS/SP Version 1, TSO, RMF Version 2, CICS/VS, and IMS/VS. In addition to these, SLR Version 2 reports on data from MVS/SP Version 2, RMF Version 3, and other systems providing a sequential log. Information is collected in one data base and is presented in a readily understandable format. SLR Version 2 can merge data from several sources into one report.

Graphics and color can be used to present information, thereby giving a versatile, easily-used pictorial display capability for use by data processing professionals at all levels.

An SLR objective is to minimize the number of printed reports presented to management, by presenting the information in an understandable format, and supplementing printed reports with online inquiries to the SLR data base when necessary.

The following list gives some examples on the areas SLR can be used to report on:

System Overviews - SLR can produce comprehensive "one-page" management reports combining key measurements from several sources into one report.

Service Levels - SLR can be used to monitor the level of service provided to users of data processing, for example, response times. Exception reporting can be used to detect deviations from objectives.

Availability - SLR can report on system and subsystem availability, based on data from system log data.

Performance - System performance data, (i.e., processor utilization, paging, channel load) can be reported on, and related to IMS/VS, CICS/VS, or TSO response times or transaction load.

Equipment Utilization - SLR can provide data on equipment utilization, for example: Processor utilization, channel load, DASD, tape, and printer usage.

Capacity Planning - SLR includes a capacity planning application to measure the system load by application area, which helps when forecasting future growth.

Network - The customer can use SLR to provide reports giving network information, based, for example, on: VTAM, NPA, or console log data.

Accounting - SLR can provide the basis for DP accounting for batch, TSO, CICS/VS, IMS/VS, and other systems. For online systems, chargeout can be based on transactions, providing users with bills in terms they can understand and influence.

SLR is easy to install and operate. Results are available immediately. After installation, which in an MVS TSO environment takes less than one day, users have immediate access to the many SLR reports.

SLR has many powerful functions based on a data base containing historic data, for example: Online inquiry through TSO, processing of user defined log records, multiprocessor and multisystem support, an easy-to-use language to define additional reports and "views" of the data base, and customizing the SLR data base. Two key considerations in developing SLR have been ease-of-use combined with flexibility.

VERSION 2 RELEASE 1 HIGHLIGHTS

Users of SLR Version 1 Release 2 (5740-DC3) can use supplied tools and procedures to migrate to SLR Version 2 Release 1 (5668-966).

Expanded capabilities in SLR Version 2 Release 1 are:

Adaptable Log Layout (ALL Function)

Users may now use SLR to collect and report on sequential log data that contains timestamped records.

In addition to the logs processed by Version 1 Release 2, the user can now define the record layout of sequential files to SLR and subsequently process such data sets using the SLR data base and reporting functions. This facility enables the user to process log data produced by, for example:

- SYS1.LOGREC
- VSPC
- NPA
- VM accounting data
- VM monitor data

- SMF and IMS (not processed by SLR Version 1)

- User applications

The ALL function allows processing of user defined SMF and IMS records in the same run as the standard SMF and IMS records, thus reducing the need for multiple runs of the SMF and IMS log data sets.

Samples are provided to show the different capabilities of the ALL function.

VIEW Function

This is a function that allows the user to combine and manipulate data from one or more tables. The VIEW function enables the user to:

- produce a report with data from more than one table, for example to provide comprehensive one-page reports with data from several subsystems
- calculate percentages based on subtotals from the same table
- allows the user to relate values from different tables, and from different systems
- add new computed columns without re-assembling tables
- change column names in tables without re-assembly

SPF Interface

In SLR Version 2 Release 1, the System Productivity Function (SPF, 5668-009) will be the major TSO interface, replacing the use in SLR Version 1 Release 2 of TSO CLISTS for panel definitions. Main features of this interface are:

- Full screen support
- Split screen
- SPF browse of SLR reports, including scrolling
- Rapid access to desired panel by short cut function

Support for the processing of SMF log data from MVS/SP 2.1.0 and processing of RMF 3.1.0 log data.

Other Enhancements

- FILTER function to eliminate log records that contain values outside of desired ranges, thus giving more accurate statistics.
- RECALCULATE function, enabling corrections to detail rows in tables being resummarized into total columns without a COLLECT run.
- Selective UNLOAD, allowing selection of specific rows and columns to be unloaded.

CUSTOMER RESPONSIBILITIES

Installation of SLR, and tailoring, updating, and maintenance of the SLR data base are customer responsibilities.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

This licensed program is designed to operate on the following IBM machines:

S/370 mdls 148, 155II, 158, 165II, IBM 30XX Processors, and IBM 4341, 4361 and 4381 Processors.

If SLR is to be used under TSO, without color or graphics, a suitable terminal must be available, either one of the following, or equivalent:

IBM 3276 Control Unit Display Station - Models 2, 3, 4, 12, 13, or 14

IBM 3277 Display Station - Model 2

IBM 3278 Display Station - Models 2, 3, 4, or 5

IBM 3279 Color Display Station - Models 2A or 3A

SLR uses the program GDDM (Graphical Data Display Manager, 5748-XXH) and its feature PGF (Presentation Graphics Feature) to produce color and/or graphics reports. Thus, SLR supports the same devices as GDDM with PGF under MVS TSO. In summary, the following terminals or equivalent devices are supported:

IBM 3278 Display Station - Models 2 or 3 with the ECSA, PS-2, and PS-4 features (monochrome)

IBM 3279 Color Display Station - Models 2B or 3B with the PS-2 and PS-4 features (color).

IBM 3287 Printer - Models 1 or 2 (monochrome)

IBM 3287 Printer - Models 1C or 2C (color)

PROGRAM PRODUCTS

Service Level Reporter (SLR) V2.1 (cont'd)

SLR requires hardware floating-point capability.

SLR requires a minimum of 2.5M bytes of virtual storage in the private area. SLR does not allocate any storage in the common area. When using the COLLECT command it is advisable to request a large buffer pool and use up to 3M bytes of virtual storage.

Additional virtual storage is also required by Sort/Merge and GDDM/PGF.

SOFTWARE REQUIREMENTS

This licensed program requires the functions provided by the following IBM programs:

Running SLR requires one of the following:

- OS/VS1 Release 7.0 with VSAM, and subsequent releases, unless otherwise identified
- OS/VS2 (MVS) Release 3.8 with or without MVS/SP Version 2 Release 1 (MVS/XA), or MVS/SP Version 1 Release 1 (MVS/370), and their subsequent releases, unless otherwise identified

Installing and maintaining SLR requires the System Modification Program Release 4 (SMP4).

Optionally, to use certain SLR functions in the applicable environments, the following IBM Program Products are required:

Using the SLR SORT command:
OS/VS Sort/Merge (5740-SM1), or equivalent.

Using the SPF interface:
Systems Productivity Facility (SPF, 5668-009).

Producing 3279/3278/3287 color graphics SLR reports:
Graphical Data Display Manager (GDDM, 5748-XXH) and its feature PGF (Presentation Graphics Feature). Hence ACF/TCAM Version 2 Release 2 (or later), or ACF/VTAM Version 1 Release 2 or 3, or ACF/VTAM Version 2 Release 1 (or later) is required.

Running SLR as a TSO command processor in batch:
Either the OS/VS2 TSO Command Package (5740-XT6), or the TSO Extensions (TSO/E, 5665-285 for MVS/370, 5665-293 for MVS/XA).

INPUT LOGS SUPPORTED

Using the Adaptable Log Layout (ALL) function, SLR can process any sequential data set containing timestamped records. The user can map the input records into SLR log tables. Each field to be entered into an SLR log table must be at a fixed offset in the record. Records that do not have this property may be processed in an exit. This facility enables the user to process log data produced by, for example:

- SYS1.LOGREC
- VSPC
- NPA
- VM accounting data
- VM monitor data
- SMF and IMS (not processed by SLR Version 1)
- User applications

The ALL function allows processing of user defined SMF and IMS records in the same run as the standard SMF and IMS records, thus reducing the need for multiple runs of the SMF and IMS log data sets.

Samples are provided to show the different capabilities of the ALL function.

SLR has log tables defined for processing log data sets produced by the following programs and subsequent releases and modifications unless otherwise stated:

SMF

SMF records from:

- OS/VS1 Release 6.7 and 7.0
- OS/VS2 Release 3.8
- MVS/SE Release 2.0
- MVS/SP Version 1 Release 1.0, 2.0, and 3.0
- MVS/SP Version 2 Release 1.0

RMF

- RMF Version 2 Release 2.0, 3.0, 4.0, and 4.1
- RMF Version 3 Release 1.0

IMS/VS

IMS/VS Version 1 Release 1.5, 1.6, and 2.0

IMS/VS Fast Path transaction records are not supported by SLR. Records from IMS/VS systems with the Multiple Systems Coupling feature are processed by SLR, but without using the MSC information.

CICS/VS

CICS/VS Monitoring Facility records produced by CICS/VS Release 1.5. SLR accepts both native CICS/VS logs written under OS/VS or DOS/VSE, or records written via the SMF writer under MVS/SE2 or MVS/SP.

MVS SYSTEM INTEGRITY APPLIES: Yes

RPOs ACCEPTED: No

5668-967 - INTERACTIVE FINANCIAL SYSTEM 1 - OS/VS POSTINGS AND GENERAL LEDGER RELEASE 1 (5668-967)

PURPOSE

The Interactive Financial System 1 (IFS 1) is part of the Interactive Financial System (IFS). The Interactive Financial System is a set of application programs designed to perform accounting and related functions. The set consists of IFS 1, IFS 2, IFS 3 and IFS 4. IFS 1 allows for posting either in interactive mode using 3277, 3278 or 3279 Display Stations or in batch mode. Any account and any voucher can be displayed and, if necessary, processed randomly at the terminal. IFS 1 (OS/VS) is functionally compatible with IFS 1 (DOS/VS), 5746-F52, Release 1.5.

SPECIAL SALES INFORMATION

Primary Potential Industries:

- Manufacturing
- Process
- Distribution
- Health

Other Potential Industries:

- Transportation
- Insurance
- Media
- Finance

IFS can be run in parallel with other applications.

HIGHLIGHTS

- IFS 1 provides the accounting data base organization and management functions for the four program products IFS 1 through IFS 4. It is a prerequisite for the installation of IFS2, IFS3 and IFS 4. Accounting data necessary for IFS 1-4 is stored in the following DL/I data bases:
 - The parameter data base contains general information on the installed IFS, for example, the accountant identifications, authorizations of accountants and terminals, table of clients, posting keys and payment conditions.
 - The accounts data base includes the impersonal and personal accounts per client and the related posting entries of the actual posting periods. Included are segments for historical and budget data and user-defined structuring of accounts for the balance sheet, profit and loss reports, or financial status reports (for use by IFS 2).
 - The match-code data base is a secondary index data base for retrieval of accounts using match codes as search arguments.
 - The document data base is a secondary index data base allowing for retrieval of posting entries using voucher numbers as search arguments.
 - The combination data base includes key-reference information useful for the secondary-account coding function and for recording additional data about postings.
- A temporary non-DL/I data set is used as intermediate storage for the posting material (Daily Work File).
- System restart facilities and data base recovery functions are available for IFS 1 through IFS 4.
- Accounting functions for up to 99 separately maintained clients (separately balanced subsidiaries or branches of a company) are possible.
- The main accounting functions that the user can request are:
 - Display, creation and changing of account master data.
 - Entering, verifying and posting in one operation either directly at a display terminal or in machine-readable form. After entry in batch mode, this posting material is available for display and modification in interactive mode at a display terminal.
- Posting Interactively:
Postings are entered and processed in groups (a sequence of related postings for which control totaling can be performed). IFS 1 provides posting masks on the screen (corresponding to the conventional processing cycle) to handle these groups.
- Posting in Foreign Currencies:
Posting in foreign currencies is done by entering the values in foreign-currency and/or in local-currency notation in specified foreign-currency accounts. These values are always stored in both local and foreign currency. If an amount is entered only in foreign-currency notation, a stored currency exchange rate is used to calculate the corresponding local-currency amount.
- Posting of Unverified Invoice Receipts:
Received purchase invoices can be recorded before verification to achieve, for example, tracking of unverified invoices, payment with optimum conditions, or early deduction of pretax. Unverified

invoices are processed by common IFS posting facilities, using specific accounts (suspense accounts). These postings are displayed and reported separately.

- Standing-Journal Entries/Forward Postings:
Postings with explicit posting dates can be entered beforehand. Once entered, such postings are repeatedly posted at the specified dates (standing-journal entries) or only once (forward postings).
- Match-code Function:
The accountant can search for the account number of a debtor or creditor by means of match codes he defines himself.
- Posting Group and Account Display:
Before a short-period summary is produced, the user can display on the screen any posting group as entered or all postings of an account for a certain period.
- Accounting Summaries:
During short period summary (normally performed daily) IFS 1 provides various reports, such as a list of all postings entered (journal) and a posting group list.

During a monthly summary, IFS 1 prepares a trial balance and a final account report.

In the annual summary, all the accounts of a client, as well as the supplementary postings of the preceding accounting year, are printed.
- Data Integrity Precautions:
Before using the online facilities, each accountant must enter his name, authorization code and client number so that the system can determine what processing he is allowed to do for the given client, and which operation he is permitted to perform, for instance, display, maintain, or post certain accounts, or open new accounts.
- Creation of the general journal and the general ledger for each client.
- Provisions are made for the adaptation of messages, commands, the date format, the use of a decimal point or comma, and screen text according to national requirements.
- Testing and training can be carried out in parallel to normal operations by simply reserving one client for these purposes.

CUSTOMER RESPONSIBILITIES

The program products IFS 1-4 constitute an application package affecting several departments within a company.

The organizational prerequisites should be planned and considered early. The departments affected should be made familiar with the arrangements necessary in the financial accounting area.

Before IFS 1 can be installed and executed, the user must provide for:

- The definition of the company's account structure.
- The identification of all necessary accounting data by keys, codes or abbreviations.
- The definition of match codes to facilitate postings of debtors and creditors even if the account numbers are unknown (optional).
- The specification of control information about the different accounting procedures, for example, arrears procedure, sales tax procedure or discount posting procedure.
- The provision of account data in the required format.
- The initial loading of the collected account data into the data bases.
- The adaptation of messages, commands, screen text, report headings and currency amounts to national requirements, if necessary.

SPECIFIED OPERATING ENVIRONMENT

HARDWARE REQUIREMENTS

This licensed program is designed to operate on the following IBM processors:

IBM S/370 model 138 or larger
IBM 3031 or larger
IBM 3081
IBM 4331 or larger

Note: For the IBM S/370 and the IBM 4300 Processors, the capacity of the processor model must comply with the requirements of the operating system used (see "Software Requirements").

The minimum machine requirements for IFS 1 (OS/VS) are:

- One IBM direct access storage device such as the IBM 3330, 3340, 3350, 3370, 3380, or equivalent devices supported by the operating system used.

PROGRAM PRODUCTS

IFS 1 R1 (cont'd)

- One IBM 2540 Card Reader, or any other device supported by the operating system to process SYSIN data.
- One IBM 4245 Printer mdl 1, or an equivalent device supported by the operating system, with at least 132 print positions.
- One IBM tape unit, such as IBM 2400, or IBM 3400, or equivalent.
- One IBM 3277 Display Station mdl 2 or equivalent with data entry keyboard.

SOFTWARE REQUIREMENTS

IFS 1 (OS/VS) is written in PL/I and Assembler language and is supplied in the form of object code and source code. It operates under OS/VS1 Release 7.0, program number 5741-VS1, MVS/SP-JES2, program number 5740-XYS, Release 1.0, or MVS/SP-JES3, program number 5740-XYN, Release 1.0 or subsequent releases, unless otherwise specified.

To recompile IFS 1 (OS/VS), the OS/VS PL/I Optimizing Compiler, program number 5734-PL1 and the OS/VS Assembler are required.

To link-edit and execute IFS 1 (OS/VS), the OS/VS PL/I Resident Library, program number 5734-LM4, the OS/VS PL/I Transient Library, program number 5734-LM5 and the OS/VS Sort/Merge, program number 5740-SM1 are required. IFS uses the data management and access methods VSAM and SAM.

The online communication facility CICS/VS, program number 5740-XX1, Version 1 Release 5 or a subsequent release (unless otherwise indicated) is required.

For data base management, IMS/VS, program number 5740-XX2, Version 1 Release 1.6 or subsequent releases are required unless otherwise stated.

MIGRATION

It is possible for a user of IFS DOS/VS (Release 1.5 of IFS 1, Release 1.4 of IFS 2, IFS 3 and IFS 4) to migrate to IFS (OS/VS). Existing IFS data bases can be converted from DL/I DOS/VS to IMS/VS by using available utilities of both products.

PERFORMANCE CONSIDERATIONS

The performance of the system can be influenced, in online and in batch mode, by VSAM specifications such as the buffer space, the control interval size and the record size. When the data base is distributed over more than one disk drive or when the index data base resides on a separate disk drive or when additional disk storage is allocated, this may result in an increase in performance.

Processing of open items in accounts that have a large number of open items may increase the online response time.

**5668-968 - INTERACTIVE FINANCIAL SYSTEM 2 - OS/VS
PROFIT & LOSS, BALANCE SHEET
RELEASE 1****PURPOSE**

The Interactive Financial System 2 (IFS 2) is part of the Interactive Financial System (IFS). The Interactive Financial System is a set of application programs designed to perform accounting and related functions. The set consists of IFS 1, IFS 2, IFS 3 and IFS 4. IFS 1 Release 1 Modification Level 0 is a prerequisite to IFS 2. With IFS 2, the user can define the profit and loss statement, balance sheet and financial status report to his individual requirements. IFS 2 (OS/VS) is functionally compatible with IFS 2 (DOS/VS), 5746-F53, Release 1.4.

SPECIAL SALES INFORMATION**Primary Potential Industries:**

- Manufacturing
- Process
- Distribution
- Health

Other Potential Industries:

- Transportation
- Insurance
- Media
- Finance

IFS may be run in parallel with other applications.

HIGHLIGHTS

IFS 2 is designed to:

- Prepare and print profit and loss statements.
- Prepare and print balance sheets for different posting periods according to a format specified by the user.
- Prepare and print financial status reports in various formats.
- Print a summary of the status of user-selected accounts and account groups, differentiating between the various posting periods.
- Report the balance brought forward, the debit and credit turnover of the corresponding report period, the accumulated annual sales (debit and credit), and the current balance.

Provisions are made for the adaptation of messages, report headings, currency amounts, the date format, and the use of a decimal point or comma according to national requirements.

CUSTOMER RESPONSIBILITIES

Before installing and executing IFS 2, the program product IFS 1, Program Number 5668-967, which includes the IFS data base management, must be installed.

In connection with the installation of IFS 1, the appropriate organizational prerequisites must be resolved by the user.

The adaptation of messages, report headings and currency amounts to national requirements must be performed if applicable.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

This licensed program is designed to operate on the following IBM processors:

IBM S/370 model 138 or larger
IBM 3031 or larger
IBM 3081
IBM 4331 or larger

Note: For the IBM S/370 and the IBM 4300 Processors, the capacity of the processor model must comply with the requirements of the operating system used (see "Software Requirements").

IFS 2 uses approximately 130K bytes of real storage in addition to that required by the operating system and IMS/VS.

The minimum machine requirements for IFS 2 (OS/VS) are:

- One IBM direct access storage device, such as IBM 3330, 3340, 3350, 3370, 3380, or equivalent devices supported by the operating system used.
- One IBM 2540 Card Reader, or any other device supported by the operating system to process SYSIN data.
- One IBM 4245 Printer mdl 1, or an equivalent device supported by the operating system, with at least 132 print positions.
- One IBM tape unit, such as the IBM 2400 or IBM 3400 or equivalent.

SOFTWARE REQUIREMENTS

IFS 2 is written in PL/I and Assembler language and is supplied in the form of object code and source code. It operates under OS/VS1 Release 7.0, program number 5741-VS1, MVS/SP-JES2, program number 5740-XYS, Release 1.0, or MVS/SP-JES3, program number 5740-XYN, Release 1.0 or subsequent releases, unless otherwise specified.

To recompile IFS 2 (OS/VS), the OS PL/I Optimizing Compiler, program number 5734-PL1 and the OS/VS Assembler are required.

To link-edit and execute IFS 2 (OS/VS), the OS/VS PL/I Resident Library, program number 5734-LM4, the OS/VS PL/I Transient Library, program number 5734-LM5, and the OS/VS Sort/Merge, program number 5740-SM1, are required. IFS 2 uses the data management and access methods VSAM and SAM.

For data base management, IMS/VS, program number 5740-XX2, Version 1 Release 1.6 or subsequent releases are required unless otherwise stated.

PERFORMANCE CONSIDERATIONS

The performance of the system may be influenced by VSAM specifications such as the buffer space, the control interval size, and the record size. When the data base is distributed over more than one disk drive or when the index data base resides on a separate disk drive or when additional disk storage is allocated, this may result in an increase in performance.

PROGRAM PRODUCTS

**5668-969 - INTERACTIVE FINANCIAL SYSTEM 3 - OS/VS
OPEN ITEM ACCOUNTING
RELEASE 1 §****PURPOSE**

The Interactive Financial System 3 (IFS 3) is part of the Interactive Financial System (IFS).

The Interactive Financial System is a set of application programs designed to perform accounting and related functions. The set consists IFS 1, IFS 2, IFS 3 and IFS 4. IFS 1 Release 1 Modification Level 0 is a prerequisite to IFS 3. IFS 3 extends the account management functions provided by IFS 1 by the open item accounting procedure for debtor, creditor and impersonal accounts. IFS 3 (OS/VS) is functionally compatible with IFS 3 (DOS/VS), 5746-F54, Release 1.4.

SPECIAL SALES INFORMATION**Primary Potential Industries:**

- Manufacturing
- Process
- Distribution
- Health

Other Potential Industries:

- Transportation
- Insurance
- Media
- Finance

IFS may be run in parallel with other applications.

HIGHLIGHTS

The user can select a display of either all open items, the due items, the matched items (that is, items with identical item match numbers), the settled items, or all stored items of an account. This includes the request for account statements of open item accounts.

- Some information can be changed in an open item account, such as:
 - Payment conditions
 - Item match numbers
 - Arrears-letter level, arrears-letter exclusion
 - Affirmation or negation of automatic matching
 - Textual information
 - Verification department for purchase invoices

With the exception of the update of payment conditions and textual information, this information can be changed in one operation for the entire account.

- Payments can be matched to open items. Various classification methods are available for posting payments and maintaining accounts.
- Open items are allocated to payments and the allocated items are marked as settled. At the same time, the related postings (as a result of the allocation) are established. The sales tax is automatically corrected for the postings involving revenue reductions, and optionally, the cash discount posting is performed.
- Payments in foreign currency can be matched manually against open items in foreign currency. A possible currency exchange difference caused by different exchange rates, is automatically calculated and posted to specific accounts (foreign-currency-exchange profit-and-loss accounts).
- At certain dates determined by the user, all the debtors' accounts, or a specified number of them, are scanned for overdue items to print arrears letters. The accounts excluded from arrears procedures or debtor accounts not treated as open item accounts are ignored.
- An account statement is printed for the due debits and can be furnished for open items that are not yet due.
- The number of arrears letters written for each customer is recorded in the account data base as a basis for judgment on a customer's payment behavior.
- At the end of an arrears letter procedure, an address list of all debtors who have reached the highest arrears level is printed for the legal department.
- A list of settled open items can be written for all open item accounts.
- A list of unverified invoices, sorted by verification department and client number, can be printed on request.
- Provisions are made for the adaptation of messages, commands, screen text, report headings, currency amounts, the date format, and the use of a decimal point or comma according to national requirements.

CUSTOMER RESPONSIBILITIES

Before installing and executing IFS 3, the program product IFS 1, program number 5668-967, which includes the IFS data management, must be installed.

In connection with the installation of IFS 1, the appropriate organizational prerequisites must be resolved by the user.

The adaptation of messages, commands, screen text and report headings to comply with national requirements must be performed, if required.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

This licensed program is designed to operate on the following IBM processors:

IBM S/370 model 138 or larger
IBM 3031 or larger
IBM 3081
IBM 4331 or larger

Note: For the IBM S/370 and the IBM 4300 Processors, the capacity of the processor model must comply with the requirements of the operating system used (see "Software Requirements") below.

IFS 3 uses, in online processing, 30K bytes of real storage in addition to the storage required for the operating system, CICS/VS and IMS/VS. For batch processing, approximately 130K bytes of real storage are required in addition to that required by the operating system and IMS/VS.

The minimum machine requirements for IFS 3 OS/VS are:

- One IBM direct access storage device such as IBM 3330, 3340, 3350, 3370 or 3380, or equivalent devices supported by the operating system used.
- One IBM 2540 Card Reader, or any other device supported by the operating system to process SYSIN data.
- One IBM 4245 Printer mdl 1, or an equivalent device supported by the operating system, with at least 132 print positions.
- One IBM tape unit, such as IBM 2400 or IBM 3400 or equivalent.
- One IBM 3277 Display Station mdl 2 or equivalent with data entry keyboard.

SOFTWARE REQUIREMENTS

IFS 3 is written in PL/I and Assembler language and is supplied in the form of object code and source code. It operates under OS/VS1 Release 7.0, program number 5741-VS1, MVS/SP-JES2, program number 5740-XYS, Release 1.0, or MVS/SP-JES3, program number 5740-XYN, Release 1.0 or subsequent releases unless otherwise specified.

To recompile IFS 3 OS/VS, the OS PL/I Optimizing Compiler, program number 5734-PL1 and the OS/VS Assembler are required.

To link-edit and execute IFS 3 OS/VS, the OS/VS PL/I Resident Library, program number 5734-LM4, the OS/VS PL/I Transient Library, program number 5734-LM5, and the OS/VS Sort/Merge, program number 5740-SM1, are required. IFS uses the data management and access methods VSAM and SAM.

The online communication facility CICS/VS, program number 5740-XX1, Version 1 Release 1.6 or a subsequent release is required unless otherwise stated.

For data base management, IMS/VS, program number 5740-XX2, Version 1 Release 1.6, or subsequent releases are required unless otherwise stated.

PERFORMANCE CONSIDERATIONS

The performance of the system can be influenced by VSAM specifications such as the buffer space, the control interval size and the record size. When the data base is distributed over more than one disk drive, or when the index data base resides on a separate disk drive or when additional real storage is allocated, this can result in an increase in performance.

**5668-970 - INTERACTIVE FINANCIAL SYSTEM 4 (OS/VS)
PAYMENT PROCESSING
RELEASE 1****PURPOSE**

The Interactive Financial System 4 (IFS 4) is part of the Interactive Financial System (IFS). The Interactive Financial System is a set of application programs designed to perform accounting and related functions. The set consists of IFS 1, IFS 2, IFS 3 and IFS 4. IFS 1 Release 2 Modification Level 0 and IFS 3 Release 2 Modification Level 0 are prerequisites to IFS 4. IFS 4 is designed to determine the maturity of open items by user-specified criteria, such as settlement periods and payment strategy, and to prepare and print a payment proposal list of the selected items. The user can change and release the payment proposal at the display terminal. When the user has released the payment proposal, IFS 4 can automatically post the related payments and print the payment orders. IFS 4 (OS/VS) is functionally compatible with IFS 4 (DOS/VS), program number 5746-F55, Release 1.4.

SPECIAL SALES INFORMATION**Primary Potential Industries:**

- Manufacturing
- Process
- Distribution
- Health

Other Potential Industries:

- Transportation
- Insurance
- Media
- Finance

IFS can be run in parallel with other applications.

HIGHLIGHTS

- An automatic account payment procedure can be performed for user-defined accounting periods.
- A payment proposal list is prepared that shows the individual due invoices, the total amount of all due invoices per payment method, and the amounts for credit notes, prepayments, and cash discounts, separated according to the specified terms of payment.
- For due invoices in foreign currencies, the amounts are printed in both local and foreign currency and proposed for manual payment during payment processing. The foreign-currency amounts are summed up and printed as totals per currency.
- Unverified invoices are processed in the payment procedure in accordance with the payment option as specified for the creditor.
- The following alterations are possible using a display terminal before a payment proposal is released for payment processing:
 - A client's payment proposal can be withdrawn.
 - Individual open items per creditor can be withdrawn.
 - New terms of payment can be specified.
 - Manually-processed items can be inserted.
 - Payment information, such as payment-due date or payment methods can be changed.
 - Individual items can be removed for manual processing.

Using the accepted payment proposal and the specified bank and method of payment, IFS 4 is designed to perform the postings automatically, that is, to creditors and cash accounts, and open items are matched and marked as settled.

- Payment orders, collective lists, and accompanying letters for the banks are printed in a format as required in Germany, but a payment file, containing payment order information, is prepared so that individual payment order forms can be created by user-written print programs.
- Provisions are made for the adaptation of messages, commands, screen text, report headings, currency amounts, the date format, and the use of a decimal or comma according to national requirements.

CUSTOMER RESPONSIBILITIES

Before installing and executing IFS 4, the program product IFS 1, program number 5668-987, which includes the IFS data base management, must be installed. In addition, IFS 3, program number 5668-969, must be installed.

In connection with the installation of IFS 1 and IFS 3, the appropriate organizational prerequisites must be resolved by the user.

The adaptation of messages, commands, screen text and report headings to comply with national requirements must be performed, if required.

SPECIFIED OPERATING ENVIRONMENT**HARDWARE REQUIREMENTS**

This licensed program is designed to operate on the following IBM processors:

IBM S/370 model 138 or larger
IBM 3031 or larger
IBM 3081
IBM 4331 or larger

Note: For the IBM S/370 and IBM 4300 Processors, the capacity of the processor must comply with the requirements of the operating system used (see "Programming Requirements" below).

IFS 4 uses, in online processing, 30K bytes of real storage in addition to the storage required for the operating system, CICS/VS and IMS/VS. For batch processing, approximately 130K bytes of real storage are required in addition to that required for the operating system and IMS/VS.

The minimum machine requirements for IFS 4 OS/VS are:

- One IBM direct access storage device such as IBM 3330, 3340, 3350, 3370, 3380 or equivalent devices supported by the operating system used.
- One IBM 2540 Card Reader, or any other device supported by the operating system to process SYSIN data.
