Dynamic Random Access Memories

TOSHIBA MOS MEMORY PRODUCTS

16384 WORD x 1 BIT DYNAMIC RAM

N CHANNEL SILICON GATE MOS

TMM416P/D-2, TMM416P/D-3,
TMM416P/D-4

DESCRIPTION

The TMM416P/D is a 16,384 words by 1 bit MOS random access memory circuit fabricated with TOSHIBA's double poly N-channel silicon gate process for high performance and high functional density.

The TMM416P/D uses a single transistor dynamic storage cell and dynamic control circuitry to achieve

high speed and low power dissipation. Multiplexed address inputs permit the TMM416P/D to be packaged in a standard 16 pin plastic and cerdip DIP. This package size provides high system bit densities and is compatible with widely available automatic testing and insertion equipment.

FEATURES

- 16,384 words by 1 bit organization
- Fast access time and cycle time

DEVICE	t_{RAC}	t_{RC}
TMM416P/D-2	150 ns	320 ns
TMM416P/D-3	200 ns	375 ns
TMM416P/D-4	250 ns	410 ns

- Industry standard 16 pin DIP
- Standard $\pm 10\%$ power supply (+12V, $\pm 5V$)
- Lower power 462mW operating (max)
20mW standby (max)

- Output unlatched at cycle end allows two-dimensional chip select
- Common I/O capability using "Early Write" operation
- Read-Modify-Write, \overline{RAS} -only refresh, and Page-Mode capability
- All inputs and output TTL compatible
- 128 refresh cycles / 2 msec
- Compatible with MK4116
- Package

Plastic DIP TMM416P

Cerdip DIP TMM416D

PIN CONNECTIONS

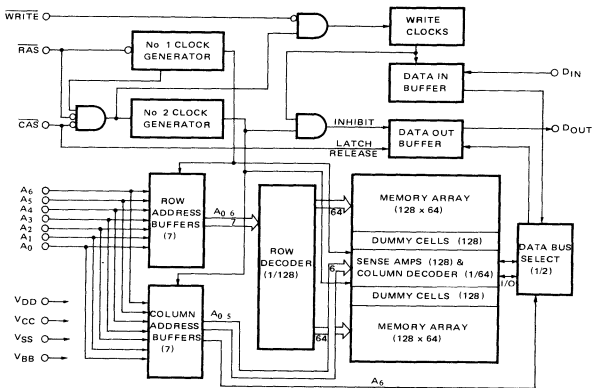

(TOP VIEW)

PIN NAMES

A_0 - A_6	Address Inputs
CAS	Column Address Strobe
DIN	Data In
DOUT	Data Out
RAS	Row Address Strobe
WRITE	Read/Write Input
VBB	Power (-5V)
VCC	Power (+5V)
VDD	Power (+12V)
VSS	Ground

BLOCK DIAGRAM

ABSOLUTE MAXIMUM RATINGS

RATING		VALUE	UNITS	NOTES
Voltage on any pin relative to V_{BB}		-0.5 ~ +20	V	1
Voltage on V_{DD} , V_{CC} supplies relative to V_{SS}		-1.0 ~ +15	V	1
$V_{BB} - V_{SS}$ ($V_{DD} - V_{SS} > 0V$)		0	V	1
Operating temperature		0 ~ 70	°C	1
Storage temperature		-55 ~ 150	°C	1
Soldering temperature Time		260 10	°C sec	1
Power dissipation	TMM416P	600	mW	1
	TMM416D	1000		
Short circuit output current		50	mA	1

RECOMMENDED DC OPERATING CONDITIONS (Ta = 0 ~ 70°C) (Note 2)

SYMBOL	PARAMETER	MIN	TYP	MAX	UNITS	NOTES
V_{DD}	Supply Voltage	10.8	12.0	13.2	V	3
V_{CC}		4.5	5.0	5.5	V	3,4
V_{SS}		0	0	0	V	3
V_{BB}		-4.5	-5.0	-5.5	V	3
V_{IHC}	Input High Voltage, RAS, CAS, WRITE	2.7		7.0	V	3
V_{IH}	Input High Voltage, except RAS, CAS, WRITE	2.4		7.0	V	3
V_{IL}	Input Low Voltage, all inputs	-1.0		0.8	V	3

DC ELECTRICAL CHARACTERISTICS

($V_{DD} = 12.0V \pm 10\%$, $V_{CC} = 5.0V \pm 10\%$, $V_{SS} = 0V$, $V_{BB} = -5.0V \pm 10\%$, $T_a = 0^\circ C \sim 70^\circ C$) (Note 2)

SYMBOL	PARAMETER	MIN.	MAX.	UNITS	NOTES
I_{DD1}	OPERATING CURRENT		35	mA	5
I_{CC1}	Average power supply operating current				6
I_{BB1}	(RAS, CAS cycling $t_{RC} = \text{minimum value}$)		200	μA	
I_{DD2}	STANDBY CURRENT		1.5	mA	
I_{CC2}	Power supply standby current	-10	10	μA

POWER DERATING CHARACTERISTICS

Fig 1 T_a vs t_{RC}

Fig 3 I_{DD3} vs t_{RC}

Fig 2 I_{DD1} vs t_{RC}

Fig 4 I_{DD4} vs t_{RC}

NOTES

- Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device
- T_a is specified here for operation at frequencies to $f_{RC} \geq t_{RC}(\min)$. Operation at higher cycle rates with reduced ambient temperatures and higher power dissipation is permissible, however, provided AC operating parameters are met. See Fig 1 for derating curve
- All voltages are referenced to V_{SS}
- Output voltage will swing from V_{SS} to V_{CC} when activated with no current loading. For purposes of maintaining data in standby mode, V_{CC} may be reduced to V_{SS} without affecting refresh operations or data retention. However, the $V_{OH}(\min)$ specification is not guaranteed in this mode
- I_{DD1} , I_{DD3} and I_{DD4} depend on cycle rate. See figures 2, 3 and 4 for I_{DD} limits at other cycle rates
- I_{CC1} and I_{CC4} depend upon output loading. During readout of high level data V_{CC} is connected through a low impedance to data out. At all other times I_{CC} consists of leakage currents only
- After the application of supply voltages or after extended periods of bias (greater than $t_{REF} = 2ms$) without clocks, the device must perform about eight initialization cycles prior to normal operation
- AC measurements assume $t_T = 5ns$
- The specifications for $t_{RC}(\min)$, $t_{RMW}(\min)$ and $t_{RCW}(\min)$ are used only to indicate cycle time at which proper operation over the full temperature range ($0^\circ C \leq T_a \leq 70^\circ C$) is assured
- $V_{IHC}(\min)$ or $V_{IH}(\min)$ and $V_{IL}(\max)$ are reference levels for

measuring timing of input signals. Also, transition times are measured between V_{IHC} or V_{IH} and V_{IL}

- Assumes that $t_{RCD} \leq t_{RCD}(\max)$. If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} will increase by the amount that t_{RCD} exceeds the value shown
- Assumes that $t_{RCD} \geq t_{RCD}(\max)$
- Measured with a load equivalent to 2 TTL loads and 100pF
- $t_{OFF}(\max)$ defines the time at which the output achieves the open circuit condition and is not referenced to output voltage levels
- Operation within the $t_{RCD}(\max)$ limit insures that $t_{RAC}(\max)$ can be met. $t_{RCD}(\max)$ is specified a reference point only if t_{RCD} is greater than the specified $t_{RCD}(\max)$ limit, then access time is controlled exclusively by t_{CAC}
- These parameters are referenced to CAS leading edge in early write cycles and to $WRITE$ leading edge in delayed write or read-modify-write cycles
- t_{WCS} , t_{CWD} and t_{RWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only.
 - If $t_{WCS} \geq t_{WCS}(\min)$, the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle
 - If $t_{CWD} \leq t_{CWD}(\min)$ and $t_{RWD} \geq t_{RWD}(\min)$, the cycle is a read-write cycle and the data out will contain data read from the selected cell. If neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate

APPLICATION INFORMATION

ADDRESSING

The 14 address bits required to decode 1 of the 16,384 cell locations within the TMM416P/D are multiplexed onto the 7 address inputs and latched into the on-chip address latches by externally applying two negative going TTL-level clocks

The first clock, the Row Address Strobe ($\overline{\text{RAS}}$), latches the 7 row address bits into the chip. The second clock, the Column Address Strobe ($\overline{\text{CAS}}$), subsequently latches the 7 column address bits into the chip. Each of these signals, $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$, triggers a sequence of events which are controlled by different delayed internal clocks

The two clock chains are linked together logically in such a way that the address multiplexing operation is done outside of the critical path timing sequence for read data access. The later events in the $\overline{\text{CAS}}$ clock sequence are inhibited until the occurrence of a delayed signal derived from the $\overline{\text{RAS}}$ clock chain. This "gated $\overline{\text{CAS}}$ " feature allows the $\overline{\text{CAS}}$ clock to be externally activated as soon as the Row Address Hold Time specification (t_{RAH}) has been satisfied and the address inputs have been changed from Row address to Column address information.

DATA INPUT/OUTPUT

Data to be written into a selected cell is latched into an on-chip register by a combination of $\overline{\text{WRITE}}$ and $\overline{\text{CAS}}$ while $\overline{\text{RAS}}$ is active. The later of the signals ($\overline{\text{WRITE}}$ or $\overline{\text{CAS}}$) to make its negative transition is the strobe for the Data In (D_{IN}) register. This permits several options in the write cycle timing. In a write cycle, if the $\overline{\text{WRITE}}$ input is brought low (active) prior to $\overline{\text{CAS}}$, the D_{IN} is strobed by $\overline{\text{CAS}}$ and the set-up and hold times are referenced to $\overline{\text{CAS}}$. If the input data is not available at $\overline{\text{CAS}}$ time or if it is desired that the cycle be a read-write cycle the $\overline{\text{WRITE}}$ signal will be delayed until after $\overline{\text{CAS}}$ has made its negative transition. In this "delayed write cycle" the data input set-up and hold times are referenced to the negative edge of $\overline{\text{WRITE}}$ rather than $\overline{\text{CAS}}$. (To illustrate this feature, D_{IN} is referenced to $\overline{\text{WRITE}}$ in the timing diagrams depicting the read-write and page-mode write cycles while the "early write" cycle diagram shows D_{IN} referenced to $\overline{\text{CAS}}$).

Data is retrieved from the memory in a read cycle by maintaining $\overline{\text{WRITE}}$ in the inactive or high state throughout the portion of the memory cycle in which $\overline{\text{CAS}}$ is active (low). Data read from the selected cell will be available at the output within the specified access time.

DATA OUTPUT CONTROL

The normal condition of the Data Output (D_{OUT}) of the TMM416P/D is the high impedance (open-circuit) state. That is to say, anytime $\overline{\text{CAS}}$ is at a high level, the D_{OUT} pin will be floating. The only time the output will turn on and contain either a logic 0 or logic 1 is at access time during a read cycle. D_{OUT} will remain valid from access time until $\overline{\text{CAS}}$ is taken back to the inactive (high level) condition.

If the memory cycle in progress is a read, read-modify write, or a delayed write cycle, then the data output will go from the high impedance state to the active condition, and at access time will contain the data read from the selected cell. This output data is the same polarity (not inverted) as the input data. Once having gone active, the output will remain valid until $\overline{\text{CAS}}$ is taken to the precharge (logic 1) state, whether or not $\overline{\text{RAS}}$ goes into precharge.

If the cycle in progress is an "early-write" cycle ($\overline{\text{WRITE}}$ active before $\overline{\text{CAS}}$ goes active), then the output pin will maintain the high impedance state throughout the entire cycle. Note that with this type of output configuration, the user is given full control of the D_{OUT} pin simply by controlling the placement of $\overline{\text{WRITE}}$ command during a write cycle, and the pulse width of the Column Address Strobe during read operations. Note also that even though data is not latched at the output, data can remain valid from access time until the beginning of a subsequent cycle without paying any penalty in overall memory cycle time (stretching the cycle).

PAGE MODE OPERATION

The "Page-Mode" feature of the TMM416P/D allows for successive memory operations at multiple column locations of the same row address with increased speed without an increase in power. This is done by

strobing the row address into the chip and maintaining the RAS signal at a logic 0 throughout all successive memory cycles in which the row address is common. This "page-mode" of operation will not dissipate the power associated with the negative going edge of RAS. Also, the time required for strobing in a new row address is eliminated, thereby decreasing the access and cycle times.

REFRESH

Refresh of the dynamic cell matrix is accomplished by performing a memory cycle at each of the 128 row addresses within each 2 millisecond time interval. Although any normal memory cycle will perform the refresh operation, this function is most easily accomplished with "RAS-only" cycles, RAS only refresh results in a substantial reduction in operating power. This reduction in power is reflected in the I_{DD3} specification.

POWER CONSIDERATIONS

Most of the circuitry used in the TMM416P/D is dynamic and most of the power drawn is the result of an address strobe edge (refer to the TMM416P/D cur-

rent waveforms in Fig 5). In system applications requiring lower power dissipation, the operating frequency (cycle rate) of the TMM416P/D can be reduced and the (guaranteed maximum) average power dissipation of the device will be lowered in accordance with the I_{DD1} (max) spec limit curve illustrated in Fig 2.

It is possible to operate certain versions of the TMM416P/D family (-2 and 3 speed selections for example) at frequencies higher than specified, provided all AC operating parameters are met. Operation at shorter cycle times ($< t_{RC}$ min.) results in higher power dissipation and, therefore, a reduction in ambient temperature is required. Refer to Fig 1 for derating curve.

POWER UP

The TMM416P/D requires no particular power supply sequencing so long as the Absolute Maximum Rating Conditions are observed. However, in order to insure compliance with the Absolute Maximum Ratings, TOSHIBA recommends sequencing of power supplies such that V_{BB} is applied first and removed last. V_{BB} should never be more positive than V_{SS} when power is applied to V_{DD} .

TOSHIBA MOS MEMORY PRODUCTS

65,536 WORD X 1 BIT DYNAMIC RAM

N-CHANNEL SILICON GATE MOS

TMM4164C-3 TMM4164C-4

DESCRIPTION

The TMM4164C is the new generation dynamic RAM organized 65,536 words by 1 bit, it is successor to the industry standard TMM416D/P

The TMM4164C utilizes TOSHIBA's double poly N-channel Silicon gate process technology as well as advanced circuit techniques to provide wide operating margins, both internally and to the system user

FEATURES

- 65,536 words by 1 bit organization
 - Fast access time and cycle time
- | DEVICE | t _{RAC} | t _{RC} |
|------------|------------------|-----------------|
| TMM4164C-3 | 150 ns | 320 ns |
| TMM4164C-4 | 200 ns | 330 ns |
- Single power supply of 5V ± 10% with a built-in V_{BB} generator
 - Low power, 275mW operating (MAX) 27.5mW standby (MAX)

Multiplexed address inputs permit the TMM4164C to be packaged in a standard 16 pin ceramic DIP. This package size provides high system bit densities and is compatible with widely available automated testing and insertion equipment

System oriented features single power supply of 5V include ± 10% tolerance, direct interfacing capability with high performance logic families such as Schottky TTL

- Industry standard 16 pin ceramic DIP
- Output unlatched at cycle end allows two-dimensional chip selection
- Common I/O capability using "EARLY WRITE" operation
- Read-Modify-Write, $\overline{\text{RAS}}$ -only refresh and Page Mode capability
- All inputs and output TTL compatible
- 128 refresh cycles/2ms

NOTES

- Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device
- All voltages are referenced to V_{SS}
- I_{CC1} , I_{CC3} , I_{CC4} depend on cycle rate
- I_{CC1} , I_{CC4} depend on output loading. Specified values are obtained with the output open
- An initial pause of $100\mu\text{s}$ is required after power-up followed by any 8 $\overline{\text{RAS}}$ cycles before proper device operation is achieved
- AC measurements assume $t_T = 5\text{ns}$
- V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL}
- Assumes that $t_{RCD} \leq t_{RCD}(\text{max})$. If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} will increase by the amount that t_{RCD} exceeds the value shown
- Assumes that $t_{RCD} \geq t_{RCD}(\text{max})$
- Measured with a load equivalent to 2 TTL loads and 100pF
- t_{OFF} (max) defines the time at which the output achieves the open circuit condition and is not referenced to output voltage levels
- Operation within the $t_{RCD}(\text{max})$ limit insures that $t_{RAC}(\text{max})$ can be met. $t_{RCD}(\text{max})$ is specified a reference point only. If t_{RCD} is greater than the specified $t_{RCD}(\text{max})$ limit, then access time is controlled exclusively by t_{CAC}
- These parameters are referenced to $\overline{\text{CAS}}$ leading edge in early write cycles and to $\overline{\text{WRITE}}$ leading edge in delayed write or read-modify-write cycles
- t_{WCS} , t_{CWD} and t_{RWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} \geq t_{WCS}(\text{min})$, the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle.
If $t_{CWD} \geq t_{CWD}(\text{min})$ and $t_{RWD} \geq t_{RWD}(\text{min})$, the cycle is a read-write cycle and the data out will contain data read from the selected cell. If neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate

APPLICATION INFORMATION

ADDRESSING

The 16 address bits required to decode 1 of the 65,536 cell locations within the TMM4164C are multiplexed onto the 8 address inputs and latched into the on-chip address latches by externally applying two negative going TTL-level clocks.

The first clock, the Row Address Strobe ($\overline{\text{RAS}}$), latches the 8 row address bits into the chip. The second clock, the Column Address Strobe ($\overline{\text{CAS}}$), subsequently latches the 8 column address bits into the chip. Each of these signals, $\overline{\text{RAS}}$, and $\overline{\text{CAS}}$, triggers a sequence of events which are controlled by different

delayed internal clocks.

The two clock chains are linked together logically in such a way that the address multiplexing operation is done outside of the critical path timing sequence for read data access. The later events in the $\overline{\text{CAS}}$ clock sequence are inhibited until the occurrence of a delayed signal derived from the $\overline{\text{RAS}}$ clock chain. This "gated $\overline{\text{CAS}}$ " feature allows the $\overline{\text{CAS}}$ clock to be externally activated as soon as the Row Address Hold Time specification (t_{RAH}) has been satisfied and the address inputs have been changed from Row address to Column address information.

DATA INPUT/OUTPUT

Data to be written into a selected cell is latched into an on-chip register by a combination of $\overline{\text{WRITE}}$ and $\overline{\text{CAS}}$ while $\overline{\text{RAS}}$ is active. The later of the signals ($\overline{\text{WRITE}}$ or $\overline{\text{CAS}}$) to make its negative transition is the strobe for the Data In (D_{IN}) register. This permits several options in the write cycle timing. In a write cycle, if the $\overline{\text{WRITE}}$ input is brought low (active) prior to $\overline{\text{CAS}}$, the D_{IN} is strobed by $\overline{\text{CAS}}$ and the set-up and hold times are referenced to $\overline{\text{CAS}}$. If the input data is not available at $\overline{\text{CAS}}$ time or if it is desired that the cycle be a read-write cycle the $\overline{\text{WRITE}}$ signal will be delayed until after $\overline{\text{CAS}}$ has made its negative transition. In this "delayed write cycle" the data input set-up and hold times are referenced to the negative edge of $\overline{\text{WRITE}}$ rather than $\overline{\text{CAS}}$. (To illustrate this feature, D_{IN} is referenced to $\overline{\text{WRITE}}$ in the timing diagrams depicting the read-write and page mode write cycles while the "early write" cycle diagram shows D_{IN} referenced to $\overline{\text{CAS}}$.)

Data is retrieved from the memory in a read cycle by maintaining $\overline{\text{WRITE}}$ in the inactive or high state throughout the portion of the memory cycle in which $\overline{\text{CAS}}$ is active (low). Data read from the selected cell will be available at the output within the specified access time.

DATA OUTPUT CONTROL

The normal condition of the Data Output (D_{OUT}) of the TMM4164C is the high impedance (open cir-

cuit) state. That is to say, anytime $\overline{\text{CAS}}$ is at a high level, the D_{OUT} pin will be floating. The only time the output will turn on and contain either a logic 0 or logic 1 is at access time during a read cycle. D_{OUT} will remain valid from access time until $\overline{\text{CAS}}$ is taken back to the inactive (high level) condition.

PAGE MODE

The "Page-Mode" feature of the TMM4164C allows for successive memory operations at multiple column locations of the same row address with increased speed without an increase in power. This is done by strobing the row address into the chip and maintaining the $\overline{\text{RAS}}$ signal at a logic 0 throughout all successive memory cycles in which the row address is common. This "Page-Mode" of operation will not dissipate the power associated with the negative going edge of $\overline{\text{RAS}}$. Also, the time required for strobing in a new row address is eliminated, thereby decreasing the access and cycle times.

REFRESH

Refresh of the dynamic cell matrix is accomplished by performing a memory cycle at each of the 128 row address ($A_0 \sim A_6$) within each 2 millisecond time interval. Although any normal memory cycle will perform the refresh operation, this function is most easily accomplished with " $\overline{\text{RAS}}$ -only" cycles, $\overline{\text{RAS}}$ only refresh results in a substantial reduction in operating power. This reduction in power is reflected in the I_{CC3} specification.

Static Random Access Memories

TOSHIBA MOS MEMORY PRODUCTS

1024 WORD x 4 BIT STATIC RAM

N CHANNEL SILICON GATE DEPLETION LOAD

TMM314AP TMM314APL
 TMM314AP-1 TMM314APL-1
 TMM314AP-3 TMM314APL-3

DESCRIPTION

TMM314AP family is 1024 word x 4 bit high speed read write memories operated with 5 V single power supply. The memories with 6 Tr cells are static in operation and require no clocks or refresh period and suitable for use in microprocessor application systems where high performance, low cost, simple interfacing are important design objectives.

TMM314AP family is able to be connected to

TTL directly and to drive 1 STTL or 5 LSTTLs

TMM314AP family is fabricated with N channel silicon gate depletion load type MOS technology by ion implantation for fast speed, stable performance and reliability.

The chip is moulded in the standard 18 pin plastic package of 0.3 inch width for low cost and high density assembly.

FEATURES

- Fully decoded 1024 word x 4 bit organization
- Static operation – No clocks or refresh period
- Single 5V supply voltage – $V_{CC} = 5V \pm 10\%$
- Easy memory expansion – CS input
- Three state output – Wired OR tie capability
- Inputs and outputs directly TTL compatible
- Data input/output terminal is common
- Input protected – All inputs have protection against static charge
- 2114 Type Pin compatible

- Low Power dissipation and Access time

	Access time	Power
TMM314AP-1	200 ns	550 mW
TMM314AP-3	300 ns	550 mW
TMM314AP	450 ns	550 mW

TOSHIBA MOS MEMORY PRODUCTS

4096 WORD x 1 BIT STATIC RAM

N CHANNEL SILICON GATE DEPLETION LOAD

TMM315D
TMM315D-1

DESCRIPTION

TMM315D/TMM315D-1 are 4096 word x 1 bit read write memories operated with 5V single power supply. The memories are static in operation and require no clocks or refresh period. This device has two types in data access - address access and chip select access which are equal and very high speed. When \overline{CS} goes high, this device is deselected and changes into the low power standby mode automatically, and keep its state during the period that \overline{CS} is high. Accordingly, this device is suitable for use in

larger memory system which the majority of devices are deselected, and is suitable for use in cache memory required very high speed. TMM315D/TMM315D-1 are directly TTL compatible and its output can drive the TTL up to 5. TMM315D/TMM315D-1 are fabricated with N-channel silicon gate depletion load type technology for stable and high performance. The chip is mounted in the standard 18 pin package of 0.3 inch width for low cost purpose.

FEATURES

- Fully decoded 4096 word x 1 bit organization
- Static operation - No clocks
- 5V single power supply
- Easy memory expansion - \overline{CS} input
- Standby feature - $\overline{CS} = V_{IH}$
- I/O separate
- Three state output
- Directly TTL compatible

- Current and Access time (Maximum value)

PARAMETER	TMM315D-1	TMM315D
Active Current (Max)	180 mA	160 mA
Standby Current (Max)	30 mA	20 mA
Address Access time	55 ns	70 ns
Chip select Access time	55 ns	70 ns

- Pin to pin compatible - i2147/i2147-3
- Inputs protected - All inputs have protection against static charge

TOSHIBA MOS MEMORY PRODUCTS

2048 WORD X 8 BIT STATIC RAM

N CHANNEL SILICON GATE DEPLETION LOAD

TMM2016P
TMM2016P-1
TMM2016P-2

DESCRIPTION

The TMM2016P is a 16384-bit static random access memory organized as 2048-words by 8-bits and operates from a single 5V power supply. Common 8-bit input/output, output enable (\overline{OE}) and pin-compatibility with 2716 type EPROM (TMM323D) allow a wide application in microprocessor peripheral memory.

In memory expansion, low power application is possible by using the chip select input (\overline{CS}). When \overline{CS}

is in V_{IH} level, the device is in low power standby mode.

TMM 2016P is fabricated with ion implanted N-channel silicon gate technology. This technology provides high performance and high reliability. The chip is moulded in a 24 pin standard plastic package, 0.6 inch in width.

FEATURES

- Pin compatible with 2716 type EPROM
- Single 5V supply – $V_{CC} = 5V \pm 10\%$
- Access time and current
- Output buffer control – \overline{OE}
- Easy memory expansion – \overline{CS}
- Static operation – No clock or timing strobe required
- Directly TTL compatible – All inputs and outputs
- Common data input and output
- Three state outputs – Wired OR capability
- Inputs protected – All inputs have protection against static charge

	TMM2016P	TMM2016P-1	TMM2016P-2
Access time (MAX)	150 ns	100 ns	200 ns
Operating current (MAX)	100mA	120mA	140mA
Standby current (MAX)	15mA	15mA	30mA

- Power down feature – \overline{CS}

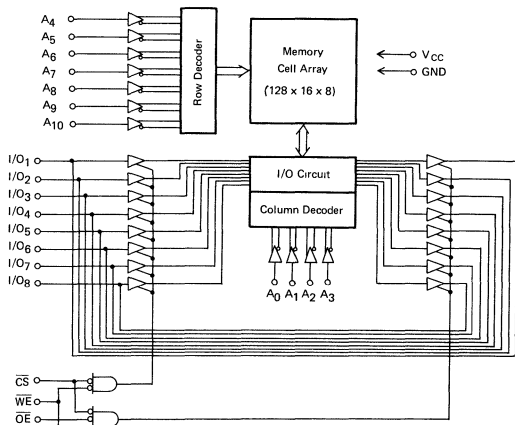

PIN CONNECTION

CMOS Static Random Access Memories

TOSHIBA MOS MEMORY PRODUCTS

256 WORD x 4 BIT CMOS RAM

SILICON GATE CMOS

TC5501P/- I TC5501D/- I

DESCRIPTION

The TC5501P/D is a fully static read write memory organized as 256 words by 4 bits using CMOS technology. Because of ultra low power dissipation, the TC5501P/D can be used as battery operated portable memory system and also as a nonvolatile memory with battery back up. The TC5501P/D operates from a single 5V power supply with a static operation, so that the no refresh periods are required. This simplifies the power supply circuit design.

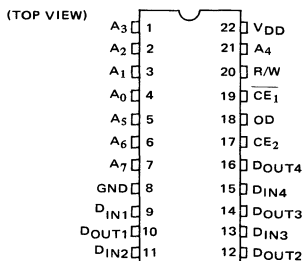

The three state outputs simplify the memory expansion making the TC5501P/D suitable for use in a microprocessor peripheral memory. Since the minimum data retention voltage is 2V, the battery back up system needs only simple circuit. By using Toshiba's original C²MOS technology, the device circuitry is not only simplified but wide operating margin and noise margin are also realized.

The TC5501P/D is offered in standard 22 pin plastic and cerdip packages, 0.4 inch in width.

FEATURES

- Low Power Dissipation
 - 55μW (MAX) STANDBY
 - 83mW (MAX) OPERATING
- Single 5V Power Supply
- Data Retention Voltage 2V to 5.5V
- Package
 - Plastic DIP TC5501P
 - Cerdip DIP TC5501D
- Fully static operation
- Three State Output
- Input/output, TTL Compatible
- Access Time
 - TC5501P/D, $t_{ACC} \leq 450\text{ns}$ (MAX.)
 - TC5501P-1/D-1, $t_{ACC} \leq 650\text{ns}$ (MAX.)

TOSHIBA MOS MEMORY PRODUCTS

1024 WORD X 1 BIT CMOS RAM

SILICON GATE CMOS

TC5508P TC5508P-4
TC5508P-1

DESCRIPTION

The TC5508P is a static read write memory organized as 1024 words by 1 bit using CMOS technology. Because of ultra low power dissipation, the TC5508P can be used as battery operated portable memory system and also as a nonvolatile memory with battery back up. The TC5508P operates from a single 5V power supply with a static operation, so that the no refresh periods are required. This simplifies the power supply circuit design.

FEATURES

- Low Power Dissipation
55 μ W (MAX.) STANDBY
55mW (MAX.) OPERATING
- Single 5V Power Supply
- Data Retention Voltage, 2.0~5.5V
- 16 PIN Plastic Package
- Static Operation

The three state output simplify the memory expansion making the TC5508P suitable for use in a microprocessor peripheral memory. Since the minimum data retention voltage is 2V, the battery back up system needs only simple circuit. By using Toshiba's original C²MOS technology, the device circuitry is not only simplified but wide operating margin and noise margin are also realized.

The TC5508P family is moulded in a dual-in-line 16 pin plastic package, 0.3 inch in width.

- Three State Output
- Input/Output, TTL Compatible
- Latched Address Inputs
- Access Time
TC5508P, $t_{ACC} = 370$ ns (MAX.)
TC5508P-4, $t_{ACC} = 450$ ns (MAX.)
TC5508P-1, $t_{ACC} = 550$ ns (MAX.)

TOSHIBA MOS MEMORY PRODUCTS

1024 WORD X 4BIT CMOS RAM

SILICON GATE CMOS

TC5047AP-1 TC5047AP-2

DESCRIPTION

The TC5047AP is a static read write memory organized as 1024 words by 4 bits using CMOS technology. Because of ultra low power dissipation, the TC5047AP can be used as battery operated portable memory system and also as a nonvolatile memory with battery back up. The TC5047AP operates from a single 5V power supply with a static operation, so that the no refresh periods are required. This simplifies the power supply circuit design.

FEATURES

- Low Power Dissipation
110 μ W (MAX.) STANDBY
110mW (MAX.) OPERATING
- Single 5V Power Supply
- Data Retention Voltage, 2.0~5.5V
- 20 PIN Plastic Package
- Static Operation
- Three State Outputs
- Input/Output, TTL Compatible
- Access Time
TC5047AP-1, $t_{ACC} \leq 550$ ns (MAX.)
TC5047AP-2, $t_{ACC} \leq 800$ ns (MAX.)

PIN CONNECTION

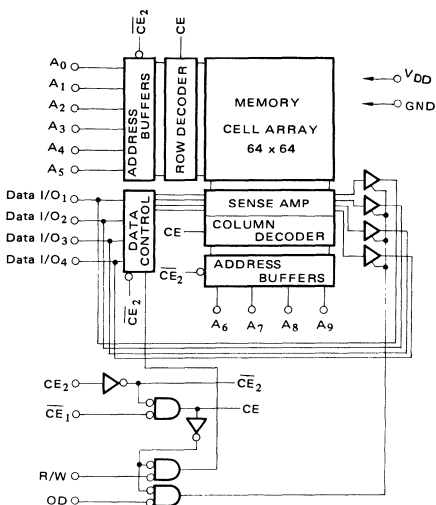

PIN NAMES

$A_0 \sim A_9$	Address Inputs
R/W	Read Write Input
$\overline{CE}_1, \overline{CE}_2$	Chip Enable inputs
Data I/O _{1~4}	Data Input/Output
OD	Output Disable Input
V_{DD}/GND	Power Supply Terminals

The three state outputs simplify the memory expansion making the TC5047AP suitable for use in a microprocessor peripheral memory. Since the minimum data retention voltage is 2V, the battery back up system needs only simple circuit. By using Toshiba's original C²MOS technology, the device circuitry is not only simplified but wide operating margin and noise margin are also realized.

The TC5047AP family is moulded in a dual-in-line 20 pin plastic package, 0.4 inch in width.

TOSHIBA MOS MEMORY PRODUCTS

4096 WORD x 1 BIT CMOS STATIC RAM

TC5504AP-2/-3, TC5504APL-2/-3

SILICON GATE CMOS

TC5504AD-2/-3, TC5504ADL-2/-3

DESCRIPTION

The TC5504AP/AD is a 4,096 bit high speed and low power static random access memory organized as 4,096 words by 1 bit using CMOS technology, and operates from a single 5-volt supply

On chip latches are provided for addresses, data input and output, and read write control allowing efficient interfacing with microprocessor systems

The TC5504AP/AD is a fully CMOS RAM, therefore it is suited for use in low power applications where battery operation and battery back up for non-

volatility are required Furthermore the TC5504APL/ADL guaranteed a standby current equal to or less than 1 μ A at 60°C ambient temperature

The TC5504AP/AD is guaranteed for data retention at a power supply as low as 2 volts The TC5504AP/AD is directly TTL compatible in all inputs and output

The TC5504AP/AD is offered in both standard 18 pin plastic and cerdip packages, 0.3 inch in width

FEATURES

- Standby Current
0.2 μ A (Max) at Ta = 25°C
1.0 μ A (Max) at Ta = 60°C } TC5504APL/ADL
20 μ A (Max.) TC5504AP/AD
- Low Power Dissipation 15mW (Typ) operating
- Single 5V Power Supply 5V \pm 10%
- Data Retention Supply Voltage 2 ~ 5.5V
- All Inputs and Output Directly TTL Compatible

- Access Time
200ns (Max) TC5504AP/APL/AD/ADL-2
300ns (Max) TC5504AP/APL/AD/ADL-3
- Static Operation
- On Chip Address Register
- Three State Output
- Package
Plastic DIP TC5504AP/APL
Cerdip DIP TC5504AD/ADL

TOSHIBA MOS MEMORY PRODUCTS

1024 WORD X 4 BIT CMOS RAM

SILICON GATE CMOS

TC5514P TC5514P-1
TC5514P-2

DESCRIPTION

The TC5514P is a full static read write memory organized as 1024 words by 4 bits using CMOS technology. Because of ultra low power dissipation, the TC5514P can be used as battery operated portable memory system and also as a nonvolatile memory with battery back up. The TC5514P operates from a single 5V power supply with a static operation, so that no refresh periods are required. This simplifies the power supply circuit design.

The three state outputs simplify the memory expansion making the TC5514P suitable for use in a microprocessor peripheral memory. Since the minimum data retention voltage is 2V, the battery back up system needs only simple circuit. By using Toshiba's original C²MOS technology, the device circuitry is not only simplified but wide operating margin and noise margin are also realized.

The TC5514P family is moulded in a dual-in-line 18-pin plastic package, 0.3 inch in width.

FEATURES

- Low Power Dissipation
110 μ W (MAX) STAND BY
110mW (MAX) OPERATING, TC5514P-1/-2
138mW (MAX) OPERATING, TC5514P
- Data Retention Voltage 2V to 5 V
- Single 5V Power Supply
- 18 PIN Plastic Package

- Full Static Operation
- Three State Outputs
- Input/Output TTL Compatible
- Access Time
TC5514P, $t_{ACC} = 450\text{ns}$ (MAX)
TC5514P-1, $t_{ACC} = 650\text{ns}$ (MAX)
TC5514P-2, $t_{ACC} = 800\text{ns}$ (MAX)

1024 WORD X 4 BIT CMOS STATIC RAM

SILICON GATE CMOS

TC5514AP-2/-3, TC5514APL-2/-3

TC5514AD-2/-3, TC5514ADL-2/-3

DESCRIPTION

The TC5514AP/AD is a 4,096 bit high speed and low power static random access memory organized as 1,024 words by 4 bits using CMOS technology, and operates from a single 5-volt supply

The TC5514AP/AD is compatible with the industry produced NMOS 2114 type 4KRAM, yet offers a more than 90% reduction in power of their NMOS equivalents

The TC5514AP/AD is a fully CMOS RAM, therefore it is suited for use in low power applications where battery operation and battery back up for

nonvolatility are required. Furthermore the TC5514 APL/ADL guaranteed a standby current equal to or less than $1\mu\text{A}$ at 60°C ambient temperature is available

The TC5514AP/AD is guaranteed for data retention at a power supply as low as 2 volts. The TC5514 AP/AD is directly TTL compatible in all inputs and outputs

The TC5514AP/AD is offered in both standard 18 pin plastic and cerdip packages, 0.3 inches in width

FEATURES

- Standby Current
 - 0.2 μA (Max.) at $T_a=25^\circ\text{C}$
 - 1.0 μA (Max.) at $T_a=60^\circ\text{C}$
- Low Power Dissipation 15mW (Typ.) operating
- Single 5-volt Supply $5\text{V} \pm 10\%$
- Data Retention Supply Voltage $2 \sim 5\text{V}$
- Three State Outputs
- All Inputs and Outputs Directly TTL Compatible

- Access Time
 - 200ns (Max.) TC5514AP/APL/AD/ADL-2
 - 300ns (Max.) TC5514AP/APL/AD/ADL-3
- Fully Static Operation
- On-chip Address Transition Detector
- Fully Compatible with TMM314AP Family (Nch 2114 type 4KRAM)
- Package
 - Plastic DIP TC5514AP/APL
 - Cerdip DIP TC5514AD/ADL

2048 WORD x 8 BIT CMOS STATIC RAM

SILICON GATE CMOS

TC5516AP TC5516APL

DESCRIPTION

The TC5516AP is a 16384-bit static random access memory organized as 2048 words by 8 bits using CMOS technology, and operates from a single 5 volt supply

The TC5516AP is featured by two chip enable inputs, that is, \overline{CE}_1 for fast memory access and \overline{CE}_2 for a minimum standby current mode, and is suited for low power application where battery operation or battery back up for nonvolatility are required. Furthermore the TC5516APL guaranteed a standby current equal to or less than $1\mu A$ at $60^\circ C$ ambient

temperature is available

The TC5516AP is also featured by pin compatibility with 2716 type EPROM. This means that the TC5516AP and EPROM can be interchanged in the same socket, and the flexibility in the definition of the quantity of RAM versus EPROM obtained as a result allows the wide application in microcomputer system

The TC5516AP is moulded in a dual-in-line 24 pin standard plastic package

FEATURES

- Standby Current
 $0.2\mu A$ (Max) at $T_a = 25^\circ C$ TC5516APL
 $1.0\mu A$ (Max) at $T_a = 60^\circ C$
 $30\mu A$ (Max) TC5516AP
- Low Power Dissipation 200mW (Typ) Operating
- Single 5V Power Supply
- Data Retention Supply Voltage 2.0 ~ 5.5V

- Fully Static Operation
- Fast Access Time 250ns (Max)
- Two Chip Enable (\overline{CE}_1 , \overline{CE}_2) for Simple Memory Expansion and Battery Back Up
- All Inputs and Output Directly TTL Compatible
- Three State Outputs
- Standard 24 pin Plastic Package

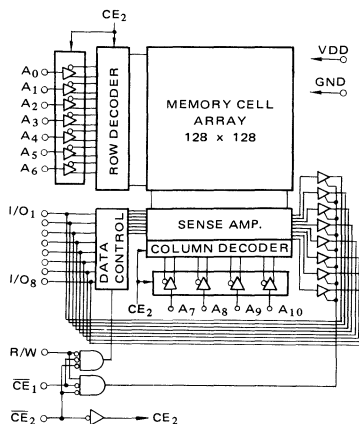

PIN CONNECTION (TOP VIEW)

: UNKNOWN

- NOTE
- (1) R/W is high for a Read Cycle
 - (2) t_{WP} is specified as the logical "AND" of \overline{CE}_1 , \overline{CE}_2 and R/W.
 t_{WP} is measured from the latter of \overline{CE}_1 , \overline{CE}_2 or R/W going low to the earlier of \overline{CE}_1 , \overline{CE}_2 or R/W going high
 - (3) t_{DH} , t_{DS} are measured from the earlier of \overline{CE}_1 , \overline{CE}_2 or R/W going high
 - (4) If the \overline{CE}_1 or \overline{CE}_2 low transition occurs simultaneously with or latter from the R/W low transition in a Write Cycle 1, the output buffers remain in a high impedance state in this period
 - (5) If the \overline{CE}_1 or \overline{CE}_2 high transition occurs prior to or simultaneously with the R/W high transition in a Write Cycle 1, the output buffers remain in a high impedance state in this period
 - (6) If the R/W is low or the R/W low transition occurs prior to or simultaneously with the \overline{CE}_1 or \overline{CE}_2 low transition, the output buffers remain in a high impedance state in this period
 - (7) A write occurs during the overlap of a low \overline{CE}_1 , low \overline{CE}_2 and low R/W
 In write cycle 2, write is controlled by either \overline{CE}_1 or \overline{CE}_2

DATA RETENTION CHARACTERISTICS (Ta = -30 ~ 85°C)

Mask Programmable Read Only Memories

TOSHIBA MOS MEMORY PRODUCTS

2048 WORD x 8 BIT MASK ROM

N CHANNEL SILICON GATE DEPLETION LOAD

TMM334P

DESCRIPTION

TMM334P is a 16,384 bits read only memory organized as 2048 words by 8 bits and is compatible with i2716 type (16K EPROM). It is suitable for use in programming of production apparatus used micro processor because of its low cost per bit

TMM334P's mask making is carried out by computer using punched paper tape data of customer and then sample manufacturing will start. Then for customer, 16384 bits memory data and three chip select input active logic are programmable

Therefore TMM334P manufacturing procedure goes through three steps before mass production. First step is a acceptance of customer's punched

paper tape data. Second step is a presentation of programmed sample (Engineering Sample) for customers. Third step is a verification of Engineering Sample by customers. Sample verification is most important and Toshiba will enter into mass production after above three steps are concluded. Then Toshiba will adopt a established on-line system and so can respond to a customer's needs quickly and can maintain a stable delivery.

TMM334P is fabricated with ion implanted N-channel silicon gate technology. This technology allows a production of high performance TMM334P is moulded in a 24 pin standard plastic package

FEATURES

- Single 5V supply voltage, $V_{CC} = 5V \pm 10\%$
- Access time, $t_{ACC} = 450 \text{ ns}$ (Max)
- Directly TTL compatible, All inputs and outputs
- Programmable chip select inputs, CS1, CS2, CS3 Easy memory expansion
- Three state output, OR tie capability
- Static operation, No clocks are required
- Input protected, All inputs have protection against static charge
- Pin to pin compatible, TMM323D, i2316E, i2716

PIN CONNECTION

TIMING WAVEFORMS

PAPER TAPE FORMAT

Punched paper tape data must be a positive logic and use a 7 to 8 bit ASCII code Format 1 (including Data and Check sum every word).

```

NULL
▼TMM334P - XXXX ▼
CR LF
▼MSB = D7 ▼
CR LF
N8,
CR LF
Ruuu0, X07P3, . , XF1P5,
CR LF
R2040, X01P1, , X3AP4,
CR LF
(CS1 = 0)
CR LF
(CS2 = 1)
CR LF
(CS3 = 0)
CR LF
$
CR LF
NULL

```

Take NULL more than fifty characters

Contents in single quotation mark (▼ ▼) indicates a comment and XXXX is a user's number

CR and LF indicate carriage return and line feed respectively

Specify MSB pin. (D₇ or D₀)

N8 indicates a 8-bit mask pattern

Semicolon (,) indicates a punctuation of data

R indicates an absolute address Enter the address by decimal code every eight words

X indicates hexadecimal code. So enter the data represented by hexadecimal code every word after X

P indicates a check sum of its word So enter a sum of one's number in a word by decimal code after P

Data modification Enter the modified address before the End mark and then enter the data following above procedure independently or serialy Modification can be allowed from 0 address to 2047 address

Customers can program the active logic of three chip select inputs independently. Specify the active logic of chip select input in the brackets

The example is shown in Figure. In this example, chip is active under the condition that CS1 = '0' and CS2 = '1' and CS3 = '0'

\$ Indicates an End mark

Take NULL more then fifty characters

Format 2 (including Data only every word)

```

NULL
▼TMM334P - XXXX▼
CR LF
▼MSB = D7▼
CR LF
NS,
CR LF
Ruuu0, X075A ..3BF1,
CR LF
.
.
R2032, XBCAE . 0085,
CR LF
(CS1 = 0)
CR LF
(CS2 = 0)
CR LF
(CS3 = 0)
CR LF
$
CR LF
NULL
    
```

R indicates an absolute address. Enter the address by decimal code every sixteen words.

X indicates a hexadecimal code and so enter the data of sixteen words continuously after X.

Data modification. This procedure is following to Format 1. Otherwise specified in Format 1.

Format 1 and Format 2 are Toshiba preferred Format
The other acceptable Format is Intel BNPF Format

OUTLINE DRAWINGS

Note Each lead pitch is 2.54 mm. All leads are located within 0.25 mm of their true longitudinal position with respect to No. 1 and No. 24 leads. All dimensions are in millimeters.

TIMING WAVEFORMS

PAPER TAPE FORMAT

Punched paper tape data must be a positive logic and use a 7 to 8 bit ASCII code Format 1 (including Data and Check sum every word).

Take NULL more than fifty characters.

Contents in single quotation mark (▼ . . ▼) indicates a comment and XXXX is a user's number.

CR and LF indicate carriage return and line feed respectively.

Specify MSB pin (D₇ or D₀)

N8 indicates a 8-bit mask pattern.

Semicolon (,) indicates a punctuation of data

R indicates an absolute address. Enter the address by decimal code every eight words

X indicates hexadecimal code So enter the data represented by hexadecimal code every word after X.

P indicates a check sum of its word So enter a sum of one's number in a word by decimal code after P

Data modification: Enter the modified address before the End mark and then enter the data following above procedure independently or serialy. Modification can be allowed from 0 address to 4095 address

Customers can program the active logic of two chip select inputs independently. Specify the active logic of chip select input in the brackets The example is shown in Figure. In this example, chip is active under the condition that CS₁ = '0' and CS₂ = '1'.

\$ Indicates an End mark .

Take NULL more then fifty characters.

Format 2 (including Data only every word)

R indicates an absolute address. Enter the address by decimal code every sixteen words.

X indicates a hexadecimal code and so enter the data of sixteen words continuously after X.

Data modification. This procedure is following to Format 1. Otherwise specified in Format 1.

Format 1 and Format 2 are Toshiba preferred Format.
The other acceptable Format is Intel BNPP Format.

OUTLINE DRAWINGS

Note Each lead pitch is 2.54 mm. All leads are located within 0.25 mm of their true longitudinal position with respect to No. 1 and No. 24 leads. All dimensions are in millimeters.

TOSHIBA MOS MEMORY PRODUCTS

4,096 WORD X 8 BIT MASK ROM

N-CHANNEL SILICON GATE MOS

TMM2332P

DESCRIPTION

The TMM2332P is a 32768-bit read only memory organized as 4096 words by 8 bits with a low bit cost, thus being most suitable for use in programming of production apparatus using microprocessor

The TMM2332P features an automatic power down mode. When deselected by Chip Select ($\overline{CS}/\overline{CS}$), the device is in low power ($I_{SB}=15\text{mA MAX}$) standby mode. This device feature results in system power

saving in larger systems, where the majority of devices are deselected

The TMM2332P is fabricated with ion implanted N-channel silicon gate technology. This technology allows a production of high performance.

The TMM2332P is moulded in a 24-pin standard plastic package.

FEATURES

- Single 5V-Power Supply
- Fast Access Time 350ns (MAX)
- Low Power Dissipation
 - Operating Current = 100mA (MAX.)
 - Standby Current = 15mA (MAX)
- Power Down Feature $\overline{CS}/\overline{CS}$
- Programmable Chip Select $\overline{CS}/\overline{CS}$
- Output Buffer Control \overline{OE}
- Easy memory Expansion $\overline{CS}/\overline{CS}$

- Static Operation
- Pin Compatible with 2732 Type EPROM and i2332
- All Inputs and Outputs Directly TTL Compatible
- Three State Outputs Wired OR Capability
- Inputs Protected. All inputs have protection against static charge

TOSHIBA MOS MEMORY PRODUCTS

64K BIT (8K WORD X 8 BIT) MASK PROGRAMMABLE ROM

TMM2364P

N CHANNEL SILICON GATE MOS

DESCRIPTION

The TMM2364P is a 65536 bit read only memory organized as 8192 words by 8 bits with a low bit cost, thus being most suitable for use in programming of production apparatus using micro-processor

Consisting of static memory cells and clocked peripheral circuitry, the TMM2364P provides a high speed and low power dissipation (access time 250ns, operating current 40mA)

The TMM2364P also features an automatic stand-by power mode. When deselected by Chip Enable (CE), the operating current is reduced from 40mA to

15mA. Output Enable (\overline{OE}) is effective in preventing data confliction on a common bus line.

The TMM2364P uses the address latch system that the falling edge of \overline{CE} latches all inputs except for \overline{OE} , thus can be easily connected to a system where address and data buses are commonly used.

The TMM2364P is fabricated with ion implanted N-channel silicon gate technology. This technology allows a production of high performance.

The TMM2364P is moulded in a 28 pin standard plastic package, 0.6 inch in width.

FEATURES

- Single 5V \pm 10% power Supply
- Access Time 250ns max
- Low Power Dissipation
 - Average Current 40mA max
 - Standby Current 15mA max
- Input and Output TTL Compatible
- Three State Outputs Wired OR Capability

- Edge Enabled Operation \overline{CE}
- Output Buffer Control \overline{OE}
- Programmable Chip Select CS_1, CS_2
 - Easy Memory Expansion
- Pin Compatible with i2364
- Inputs protected. All inputs have protection against static charge.

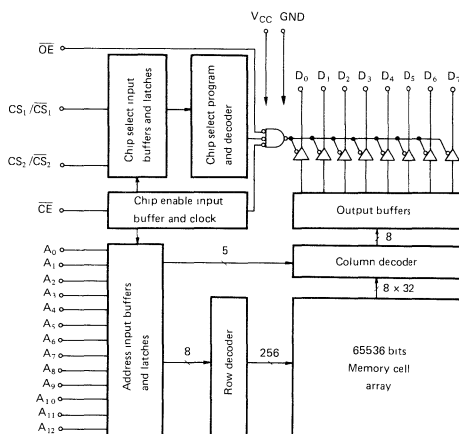

PIN CONNECTION

H	(1)	(1)	High Z	Standby
	Valid	(1)	High Z	Latch
L	(2)	L	Data out	Read

Note (1) Don't care

(2) CS_1, CS_2 , Address may change after t_{AH}

APPLICATION INFORMATION

1. POWER SUPPLY DECOUPLING

The operating current I_{CC} waveforms for TMM2364P are shown in Fig 1, 2

The TMM2364P is a clocked device, so the transient current peaks are produced on the \overline{CE} transition and \overline{CE} active level

The I_{CC} current transients require adequate decoupling of V_{CC} power supply

2. POWER ON

The TMM2364P requires initialization prior to normal operation. Two initialization methods are as follows:

- (1) A minimum 100 μ s time delay is required after the application of V_{CC} (+5V) before proper device operation is achieved. And during this period, \overline{CE} must be at V_{IH} level.
- (2) A minimum 100 μ s time delay is required after the application of V_{CC} (5V), and then a minimum of one initialization cycle must be performed before proper device operation is achieved.

Initialization cycle An initialization cycle is one Chip Enable clock cycle from the first down edge of the \overline{CE} till the next down edge.

Fig 1 I_{CC} vs time (CS Select)

Fig 2 I_{CC} vs time (CS Deselect)

TOSHIBA PAPER TAPE FORMAT

Use 7 or 8-bit (even parity) ASCII code paper Tape for ROM data input.
Two acceptable formats which are described in section A and B are available

A. Format 1 (when a check sum per word is used)

Preceding the first data field and following the last data field there must be a leader/trailer length of at least 50 null characters

Contents in a single quotation mark (,) signify a comment and □□□□ indicates a four-digit user pattern number

↵ indicates carriage return and line feed

Specify the most significant bit (MSB) of the device outputs (D₇ or D₀)

N8 indicates that the mask pattern is an 8-bit pattern

Semicolon (,) signifies a punctuation of data

R signifies an address Enter the address with the four decimal digits every 8-words after the character R

X signifies a hexadecimal digit

Enter the data with the two hexadecimal digits every word after the character X

P signifies the check sum per word

Enter the sum of 1 in a one word decimal after the character P

* Data Modification

Modifying single and continuous word data can be carried out by specifying the modifying addresses and inputting the data following the above procedure before the end symbol

Modification can be allowed from 0 to 8191 addresses

Specify the active logic of chip selects (CS₁ and CS₂) in the parentheses respectively

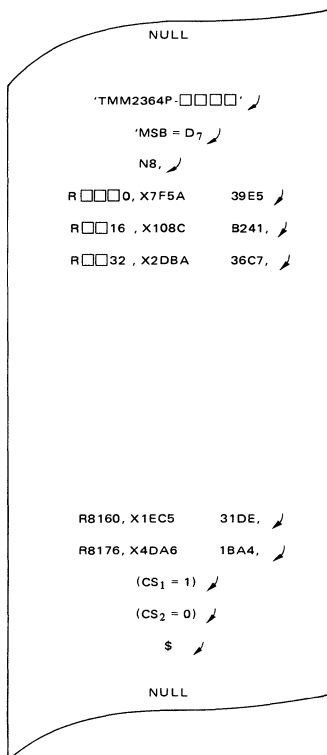

Enter "1" and "0" when active at high and low levels, respectively

An example is shown in the left figure

In this example, the device is selected under the condition that CS₁ and CS₂ are at high and low levels, respectively

\$ signifies the End symbol

B Format 2 (When a check sum per word is not used)

R signifies an address

Enter the address with the four decimal digits every sixteen words after the character R

X signifies a hexadecimal digit

Enter the data of sixteen words continuously after the character X

Otherwise specified in Format 1

In addition, Toshiba can also accept programming and masking information for TMM2364P in the form of punched paper tape with Intel BNPF format or master devices (EPROMs)

OUTLINE DRAWINGS

Unit mm

Note Each lead pitch is 2.54 mm
 All leads are located within 0.25 mm of their true longitudinal position with respect to No 1 and No 28 leads

Erasable/Programmable Read Only Memory

TOSHIBA MOS MEMORY PRODUCTS

2048 WORD x 8 BIT EPROM

N CHANNEL SILICON STACKED GATE MOS.

TMM323D TMM323D-1

DESCRIPTION

The TMM323D is a 2048 word x 8 bit ultraviolet erasable and electrically programmable read only memory. For read operation it requires a single 5-volt power supply only. The maximum active power dissipation is 525mW while the maximum standby power dissipation is only 132mW, a 75% savings. Programming can be executed by applying 25-volt and 5-volt at the V_{pp} and V_{cc} terminals respectively, and applying a TTL level signal at the other input terminals. Programming the one bit location requires

only a single pulse, and it is possible to program sequentially, individually or at random. Under the condition V_{pp} = 25V, read operation is permitted in the program verify mode, and also programming is inhibited by selecting the program inhibit mode.

The TMM323D is fabricated with the N-channel silicon double layer gate MOS technology and is packaged in a standard 24-pin dual-in-line cerdip package.

FEATURES

- Single 5-volt power supply
- Access time TMM323D, 450ns (MAX)
TMM323D-1, 350ns (MAX)
- Current 100mA (active)
25mA (standby)
- Three state output
- Particular bit location programming

- Programs with one 50ms pulse
- Total programming time 100 second
- Inputs and outputs TTL compatible during read and program
- Pin to pin compatible to 2716 type EPROM

• A.C. Test Conditions

- Input Rise and Fall Times (10% ~ 90%) $\leq 20ns$
- Input Pulse Levels $V_{1L} = 0.8V$, $V_{1H} = 2.2V$
- Timing Measurement Reference Level Input 1V & 2V, Output 0.8V & 2V

TIMING WAVEFORMS (PROGRAM)

$V_{PP} = 25V \pm 1V$, $V_{CC} = 5V \pm 5\%$

Note 1 V_{CC} must be applied simultaneously or before V_{PP} and cut off simultaneously or after V_{PP}

- Sometimes removing the device from socket and setting the device in socket under the condition $V_{PP} = 25V \pm 1V$ may destroy its device, so it should be noted during programming
- V_{PP} supply voltage is permitted up to 26V programming, so the voltage over 26V should not be applied to V_{PP} . Particularly when switching pulse voltage is applied to V_{PP} , also the over-shoot voltage of its pulse should not be exceeded 26-volt

ERASURE CHARACTERISTICS

The TMM323D's memory cell data can be erased by applying light with wavelengths shorter than 4000 Å. ($1\text{Å} = 10^{-8}\text{ cm}$)

Sunlight and the fluorescent lamps may include 3000 ~ 4000 Å wavelength components

Therefore when used under such lighting for extended periods of time, an opaque seal (Toshiba EPROM Protecting Seal AC 901 etc) will be required to protect the TMM323D. Generally, ultraviolet light with a wavelength of 2537 Å is recommended for TMM323D-erasing, and in this case the integrated dose (ultraviolet light intensity [w/cm^2] x time [sec]) should be over 15 [w sec/cm^2]

When Toshiba sterilizing lamp GL-15 is used and the device is exposed at a distance of 1-cm from the lamp surface, erasure should be completed in about 60 minutes

And using a lamp whose ultraviolet light intensity is a 12000 [$\mu\text{w/cm}^2$] will reduce the exposure time to about 20 minutes

(In this case the integrated dose should be 12000 [$\mu\text{w/cm}^2$] x (20 x 60) [sec] \approx 15 [w sec/cm^2])

OPERATING INFORMATION

TMM323D-operation-modes are classified into six types, as shown in the following table. Each mode can be selected by TTL level signals only. The V_{CC} and V_{PP} power supplies required are only 5-volt for read operation, and the V_{PP} power supply required is 25-volt during program operation only.

MODE		PINS	PD/PGM (18)	\overline{CS} (20)	V_{PP} (21)	V_{CC} (24)	Outputs (9-11, 13-17)
Read Operation	Read		V_{IL}	V_{IL}	5V	5V	D out
	Deselect		*	V_{IH}	5V	5V	High Z
	Power Down		V_{IH}	*	5V	5V	High Z
Program Operation	Program		V_{IH} V_{IL}	V_{IH}	25V	5V	D in
	Program Verify		V_{IL}	V_{IL}	25V	5V	D out
	Program Inhibit		V_{IL}	V_{IH}	25V	5V	High Z

* V_{IL} or V_{IH}

Read Mode

Assuming that $PD/PGM = V_{IL}$ and $\overline{CS} = V_{IL}$, the output data is available within t_{ACC1} (MAX.) after stabilizing of the address.

And assuming that $PD/PGM = V_{IH}$ or $\overline{CS} = V_{IH}$, the outputs will become high impedance in state.

When all addresses are in the fixed state and $\overline{CS} = V_{IL}$, the output data is available within t_{ACC2} (MAX.) after the PD/PGM input is changes to V_{IL} from the V_{IH} level. (Outputs change to data available state from a high impedance state.)

When all addresses are in the fixed state and $PD/PGM = V_{IL}$, the output data is available within t_{CO} (MAX.) after the \overline{CS} input is changed to V_{IL} from the V_{IH} level. (Outputs change to data available state from a high impedance state.)

Deselect Mode

Assuming that $\overline{CS} = V_{IH}$, the outputs will be in a high impedance state. So two or more TMM323Ds may be tied together on the same data bus. And the \overline{CS} input of the selected chip must be at the V_{IL} level, and that of the other chip must be at the V_{IH} level.

Power Down Mode

Assuming that $PD/PGM = V_{IH}$, the power dissipation will be reduced to one-fourth of normal active power. (i.e. 525mW \rightarrow 132mW)
Then all outputs will become high impedance in state independent of the \overline{CS} input level

Program Mode

Initially when received by customers all bits of the TMM323D are in the "1" state which is the erased state

Therefore programming is carried out by electricaly writing in the "0" state at the desired bit locations

Programming can be completed by applying the TTL level pulse signal with a pulse width of from 45 to 55 ms to PD/PGM input under the condition where $V_{PP} = 25V$ and $\overline{CS} = V_{IH}$

Programming the TMM323D is permitted in any sequence and also at any particular bit location

But the PD/PGM pulse width applied at one bit location should be over 45ms up to 55ms, and rewriting into the written location is not permitted

When programming is carried out by applying a DC voltage (V_{IH} level) instead of a pulse to the PD/PGM input, erroneous writing may occur sometimes,

so a pulse whose recommended width is 50ms should be used in programming.

Programming the same data to two or more TMM 323Ds simultaneously can be accomplished by connecting the respective pins together

Program Verify Mode

In this mode the V_{PP} power supply is 25V

But assuming that $PD/PGM = V_{IL}$ and $\overline{CS} = V_{IL}$, it can be possible to read written data

For normal read operation, the V_{PP} power supply voltage required is 5V

Program Inhibit Mode

Assuming that $PD/PGM = V_{IL}$ and $\overline{CS} = V_{IH}$ under $V_{PP} = 25V$, it is able to inhibit the programming

According to the above, programming into two or more TMM323Ds mounted on a board will be possible

Programming into a desired chip tied on a common bus line independently is possible by connecting all respective inputs except PD/PGM together and applying a pulse to the PD/PGM input of a desired chip and applying DC voltage at the V_{IL} level to the PD/PGM inputs of the other chip.

TOSHIBA MOS MEMORY PRODUCTS

2048 WORD x 8 BIT UV ERASABLE AND ELECTRICALLY PROGRAMMABLE READ ONLY MEMORY

TMM323DI

N CHANNEL SILICON STACKED GATE MOS.

DESCRIPTION

The TMM323DI is a 2048 word x 8 bit ultraviolet light erasable and electrically programmable read only memory. For read operation it requires a single 5-volt power supply only, the output data is accessed within 450ns, and power up to 525mW is dissipated. For standby mode, the maximum power dissipation can be reduced to 158mW, a 70% saving, by changing the mode to power down mode. Also when the mode is changed from power down to the read mode, the output data is accessed within 450ns. Programming can be executed by applying 25-volt and 5-volt at the V_{pp} and V_{cc} terminals respectively, and applying a

TTL level signal at the other input terminal. Programming the one bit location requires only a single pulse, and it is possible to program sequentially, individually or at random. Under the condition $V_{pp} = 25V$, read operation is permitted in the program verify mode, and also programming is inhibited by selecting the program inhibit mode.

The TMM323DI is fabricated with the N-channel silicon double layer gate MOS technology and is packaged in a standard 24-pin dual-in-line cerdip package.

FEATURES

- Wide operating temperature range
 $T_a = -40 \sim 85^\circ C$
- Single 5-volt power supply
- Access time 450ns (max)
Power dissipation 525mW (active power)
158mW (standby power)
- Three state output
- Particular bit location programming
- Programs with one 50ms pulse
- Total programming time 100 second
- Inputs and outputs TTL compatible during read and program
- Pin to pin compatible to 2716 type EPROM

TOSHIBA MOS MEMORY PRODUCTS

4096 WORD x 8 BIT UV ERASABLE AND ELECTRICALLY PROGRAMMABLE ROM

TMM2732D

N CHANNEL SILICON STACKED GATE MOS

DESCRIPTION

The TMM2732D is a 4096 word x 8 bit ultraviolet light erasable and electrically programmable read only memory. For read operation, the TMM2732D's maximum access time is 350 ns, and the TMM2732D operates from a single 5-volt power supply and has a low power standby mode which reduces the power dissipation without increasing access time. The standby mode is achieved by applying a TTL-high level signal to the \overline{CE} input. The maximum active current is 150 mA and the maximum standby current is 25 mA.

FEATURES

- Single 5-volt power supply
- Fast access time 350 ns Max
- Power dissipation
 - 150 mA Max (active current)
 - 25 mA Max (standby current)
- Low power standby mode \overline{CE}
- Output buffer control \overline{OE}

PIN CONNECTION

PIN NAMES

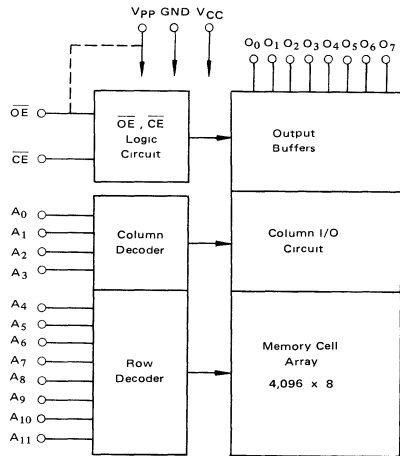

$A_0 \sim A_{11}$	Address Inputs
$O_0 \sim O_7$	Data Outputs (Inputs)
\overline{CE}	Chip Enable Input
\overline{OE} / V_{PP}	Output Enable Input/Program Power
V_{CC}	Power (+5V)
GND	Ground

For program operation, the programming is achieved by applying a 50 ms active TTL low program pulse to the \overline{CE} input, and it is possible to program sequentially, individually, or at random.

The TMM2732D is fabricated with the N-channel silicon double layer gate MOS technology and is packaged in a standard 24 pin dual in line cerdip package.

- Fully static operation
- Programs with one 50 ms pulse
- Single location programming
- Total programming time about 200 second
- Three state outputs
- Inputs and outputs TTL compatible
- Pin compatible with i2732 and ROM TMM2332P

Outputs $0.8 \text{ V} \ \& \ 2.0 \text{ V}$

TIMING WAVEFORMS (PROGRAM OPERATION)

Program Operation 1

Program Operation 2 ($\overline{OE}/V_{pp} = V_{pp}$)

- NOTE
- 1 V_{CC} must be applied simultaneously or before V_{pp} and cut off simultaneously or after V_{pp}
 - 2 Sometimes removing the device from socket and setting the device in socket under the condition V_{pp} = 25V ± 1V may cause permanent damage to the device
 - 3 The V_{pp} supply voltage is permitted up to 26V for program operation, so the voltage over 26V should not be applied to the V_{pp} input. When the switching pulse voltage is applied to the V_{pp} input, the over-shoot voltage of its pulse should not be exceeded 26V

ERASURE CHARACTERISTICS

The TMM2732D's erasure is achieved by applying shortwave ultraviolet light which has a wavelength of 2537Å (Angstroms) to the chip through the transparent window. Then integrated dose (ultraviolet light intensity [$\mu\text{w}/\text{cm}^2$] × exposure time [sec]) for erasure should be a minimum of 15 [$\mu\text{w sec}/\text{cm}^2$].

When the Toshiba sterilizing lamp GL-15 is used and the device is exposed at a distance of 1 cm from the lamp surface, the erasure will be achieved within 60 minutes. And using commercial lamps whose ultraviolet light intensity is a 12000 [$\mu\text{w}/\text{cm}^2$] will reduce the exposure time to about 20 minutes. (In this case, the integrated dose is 12000 [$\mu\text{w}/\text{cm}^2$] × (20 × 60) [sec] ≈ 15 [$\mu\text{w sec}/\text{cm}^2$].)

The TMM2732D's erasure begins to occur when exposed to light with wavelength shorter than 4000Å. The

sunlight and the fluorescent lamps will include 3000 ~ 4000Å wavelength components. Therefore when used under such lighting for extended periods of time, the opaque seals – Toshiba EPROM Protect Seal AC901 – are available.

OPERATION INFORMATION

The TMM2732D's six operation modes are listed in the following table. Mode selection can be achieved by applying TTL level signal to all inputs except for \overline{OE}/V_{PP} . In the read operation mode, a signal 5-volt power supply is required and the levels required for all inputs are TTL.

In the program operation mode the \overline{OE}/V_{PP} is pulsed from a TTL level to 25V.

MODE		PINS (NO.)			
		\overline{CE} (18)	\overline{OE}/V_{PP} (20)	V_{CC} (24)	$O_0 \sim O_7$ (9–11, 13–17)
READ OPERATION ($T_a = 0 \sim 70^\circ\text{C}$)	READ	V_{IL}	V_{IL}	+5V	DATA OUTPUT
	OUTPUT DESELECT	*	V_{IH}	+5V	HIGH IMPEDANCE
	STANDBY	V_{IH}	*	+5V	HIGH IMPEDANCE
PROGRAM OPERATION ($T_a = 25 \pm 5^\circ\text{C}$)	PROGRAM	V_{IL}	V_{PP}	+5V	DATA INPUT
	PROGRAM VERIFY	V_{IL}	V_{IL}	+5V	DATA OUTPUT
	PROGRAM INHIBIT	V_{IH}	V_{PP}	+5V	HIGH IMPEDANCE

* V_{IH} or V_{IL}

READ MODE

The TMM2732D has two control functions. Chip Enable (\overline{CE}) controls the operation power and should be used for device selection. Output Enable (\overline{OE}) controls the output buffers, independent of device selection.

Assuming that $\overline{CE} = \overline{OE} = V_{IL}$, the output data is valid at the outputs within address access time (350 ns max.) after stabilizing of the addresses.

The \overline{CE} to output valid (t_{CE}) is equal to the address access time.

Assuming that $\overline{CE} = V_{IL}$ and addresses are stable, the output data is valid at the outputs within t_{OE} (120 ns max.) after the falling edge of \overline{OE} .

OUTPUT DESELECT MODE

Assuming that $\overline{OE} = V_{IH}$ or $\overline{CE} = V_{IH}$, the outputs will be in a high impedance state. So two or more TMM2732Ds can be connected together on a common bus line. When \overline{CE} is decoded for device selection, all deselected devices are in low power standby mode.

STANDBY MODE

The TMM2732D has a low power standby mode controlled by \overline{CE} signal. By applying a TTL high level signal to the \overline{CE} input, the TMM2732D is placed in the standby mode which reduce the operating current from 150 mA to 25mA, and then the outputs are in a high impedance state, independent of the \overline{OE} input.

PROGRAM MODE

Initially, when received by customers, all bits of the TMM2732D are in the “1” state which is erased state. Therefore the program operation is to introduce “0s” data into the desired bit locations by electrically programming. The TMM2732D is set up in the program operation mode when applied the program input voltage (+25V) to the \overline{OE}/V_{PP} input under $\overline{CE} = V_{IH}$.

Then programming is achieved by applying a 50 ms active low TTL program pulse to the \overline{CE} input after the addresses and data are stable. This program pulse should be a single pulse with 50 ms pulse width per address word, and its maximum value is 55 ms. The levels required for the address and data inputs are TTL. The TMM2732D can be programmed at any time individually, sequentially, or at random. The TMM2732D must not be programmed with a DC signal applied to the \overline{CE} input.

PROGRAM VERIFY MODE

The verify mode is to check that the desired data is correctly programmed on the programmed bits. The verify is accomplished with \overline{OE}/V_{PP} and \overline{CE} at V_{IL} . Data should be verified within t_{CE} (350 ns max.) after the falling edge of \overline{CE} .

PROGRAM INHIBIT MODE

Under the condition that the program input voltage (+25V) is applied to the \overline{OE}/V_{PP} input, a TTL high level \overline{CE} input inhibits the TMM2732D from being programmed.

Programming of two or more TMM2732Ds in parallel with different data is easily accomplished. That is, all inputs except for \overline{CE} are commonly connected, and the program pulse is applied to the \overline{CE} input of the desired device only and the TTL high level signal is applied to the other devices.

TOSHIBA MOS MEMORY PRODUCTS

4096 WORD x 8 BIT UV ERASABLE AND ELECTRICALLY PROGRAMMABLE ROM

TMM2732DI

N CHANNEL SILICON STACKED GATE MOS

DESCRIPTION

The TMM2732DI is a 4096 word x 8 bit ultraviolet light erasable and electrically programmable read only memory. For read operation, the TMM2732DI's maximum access time is 350 ns, and the TMM2732DI operates from a single 5-volt power supply and has a low power standby mode which reduces the power dissipation without increasing access time. The standby mode is achieved by applying a TTL-high level signal to the \overline{CE} input. The maximum active current is 150 mA and the maximum standby current is 30 mA.

FEATURES

- Wide operating temperature range
 $T_a = -40 \sim 85^\circ\text{C}$
- Fast access time 350 ns Max
- Power dissipation
 150 mA Max. (active current)
 30 mA Max. (standby current)
- Low power standby mode \overline{CE}

PIN CONNECTION

PIN NAMES

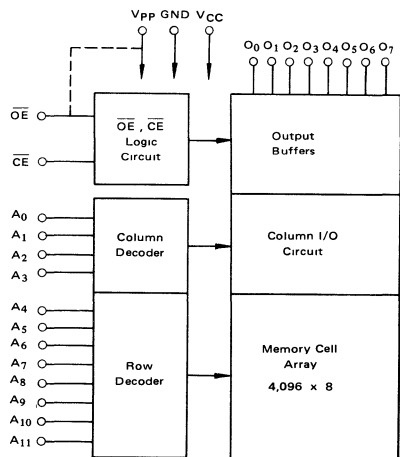

$A_0 \sim A_{11}$	Address Inputs
$O_0 \sim O_7$	Data Outputs (Inputs)
\overline{CE}	Chip Enable Input
\overline{OE} / V_{PP}	Output Enable Input/Program Power
V_{CC}	Power (+5V)
GND	Ground

For program operation, the programming is achieved by applying a 50 ms active TTL low program pulse to the \overline{CE} input, and it is possible to program sequentially, individually, or at random.

The TMM2732DI is fabricated with the N-channel silicon double layer gate MOS technology and is packaged in a standard 24 pin dual in line cerdip package.

- Output buffer control \overline{OE}
- Fully static operation
- Programs with one 50 ms pulse
- Single location programming
- Total programming time about 200 second
- Three state outputs
- Inputs and outputs TTL compatible
- Pin compatible with 12732 and ROM TMM2332P

ERASURE CHARACTERISTICS

The TMM2732D1's erasure is achieved by applying shortwave ultraviolet light which has a wavelength of 2537Å (Angstroms) to the chip through the transparent window. Then integrated dose (ultraviolet light intensity [w/cm^2] × exposure time [sec]) for erasure should be a minimum of 15 [$w \text{ sec}/cm^2$].

When the Toshiba sterilizing lamp GL-15 is used and the device is exposed at a distance of 1 cm from the lamp surface, the erasure will be achieved within 60 minutes. And using commercial lamps whose ultraviolet light intensity is a 12000 [$\mu w/cm^2$] will reduce the exposure time to about 20 minutes. (In this case, the integrated dose is 12000 [$\mu w/cm^2$] × (20 × 60) [sec] \cong 15 [$w \text{ sec}/cm^2$].)

The TMM2732D1's erasure begins to occur when exposed to light with wavelength shorter than 4000Å. The

sunlight and the fluorescent lamps will include 3000 ~ 4000Å wavelength components. Therefore when used under such lighting for extended periods of time, the opaque seals — Toshiba EPROM Protect Seal AC901 — are available.

OPERATION INFORMATION

The TMM2732DI's six operation modes are listed in the following table. Mode selection can be achieved by applying TTL level signal to all inputs except for \overline{OE}/V_{PP} . In the read operation mode, a signal 5-volt power supply is required and the levels required for all inputs are TTL.

In the program operation mode the \overline{OE}/V_{PP} is pulsed from a TTL level to 25V.

	PROGRAM INHIBIT	V_{IH}	V_{PP}	+5V	HIGH IMPEDANCE

* V_{IH} or V_{IL}

READ MODE

The TMM2732DI has two control functions. Chip Enable (\overline{CE}) controls the operation power and should be used for device selection. Output Enable (\overline{OE}) controls the output buffers, independent of device selection.

Assuming that $\overline{CE} = \overline{OE} = V_{IL}$, the output data is valid at the outputs within address access time (350 ns max.) after stabilizing of the addresses.

The \overline{CE} to output valid (t_{CE}) is equal to the address access time.

Assuming that $\overline{CE} = V_{IL}$ and addresses are stable, the output data is valid at the outputs within t_{OE} (120 ns max.) after the falling edge of \overline{OE} .

OUTPUT DESELECT MODE

Assuming that $\overline{OE} = V_{IH}$ or $\overline{CE} = V_{IH}$, the outputs will be in a high impedance state. So two or more TMM2732DI can be connected together on a common bus line. When \overline{CE} is decoded for device selection, all deselected devices are in low power standby mode.

STANDBY MODE

The TMM2732DI has a low power standby mode controlled by \overline{CE} signal. By applying a TTL high level signal to the \overline{CE} input, the TMM2732DI is placed in the standby mode which reduce the operating current from 150 mA to 30mA, and then the outputs are in a high impedance state, independent of the \overline{OE} input.

PROGRAM MODE

Initially, when received by customers, all bits of the TMM2732DI are in the "1" state which is erased state. Therefore the program operation is to introduce "0s" data into the desired bit locations by electrically programming. The TMM2732DI is set up in the program operation mode when applied the program input voltage (+25V) to the \overline{OE}/V_{PP} input under $\overline{CE} = V_{IH}$.

Then programming is achieved by applying a 50 ms active low TTL program pulse to the \overline{CE} input after the addresses and data are stable. This program pulse should be a single pulse with 50 ms pulse width per address word, and its maximum value is 55 ms. The levels required for the address and data inputs are TTL. The TMM2732DI can be programmed at any time individually, sequentially, or at random. The TMM2732DI must not be programmed with a DC signal applied to the \overline{CE} input.

PROGRAM VERIFY MODE

The verify mode is to check that the desired data is correctly programmed on the programmed bits. The verify is accomplished with \overline{OE}/V_{PP} and \overline{CE} at V_{IL} . Data should be verified within t_{CE} (350 ns max.) after the falling edge of \overline{CE} .

PROGRAM INHIBIT MODE

Under the condition that the program input voltage (+25V) is applied to the \overline{OE}/V_{PP} input, a TTL high level \overline{CE} input inhibits the TMM2732DI from being programmed.

Programming of two or more TMM2732DI s in parallel with different data is easily accomplished. That is, all inputs except for \overline{CE} are commonly connected, and the program pulse is applied to the \overline{CE} input of the desired device only and the TTL high level signal is applied to the other devices.

TOSHIBA MOS MEMORY PRODUCTS

2,048 WORD x 8 BIT CMOS STATIC RAM
SILICON GATE CMOS

TC5517BP

DESCRIPTION

The TC5517BP is a 16384-bit high speed and low power static random access memory organized as 2048 words by 8 bits using CMOS technology, and operates from a single 5 volt supply

The TC5517BP is featured by output enable and chip enable inputs, that is, \overline{OE} for fast memory access and \overline{CE} for a minimum standby current mode, and is suited for low power application where battery operation or battery back up for nonvolatility are required

FEATURES

- Low Power Dissipation
0.25 μ W (TYP) Standby
25 mW (TYP) Operating
- Fast Access Time
200 ns (Max)
- Single 5V Power Supply
- Fully Static Operation

PIN CONNECTION

PIN NAMES

$A_0 \sim A_{10}$	Address Inputs
R/W	Read/Write Control Input
\overline{OE}	Output Enable Input
\overline{CE}	Chip Enable Input
$I/O_1 \sim I/O_8$	Data Input/Output
V_{DD}	Power (+5V)
GND	Ground

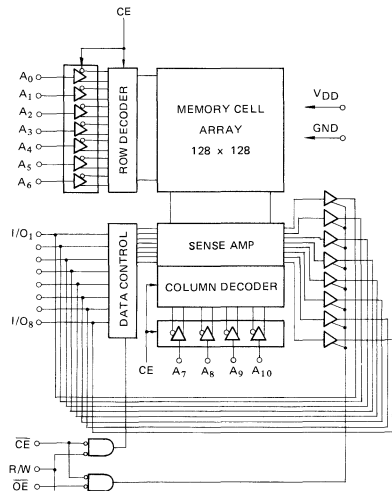

* This is advance information and specifications are subject to change without notice.

The TC5517BP is also featured by pin compatibility with 2716 type EPROM. This means that the TC5517BP and EPROM can be interchanged in the same socket, and the flexibility in the definition of the quantity of RAM versus EPROM obtained as a result allows the wide application in microcomputer system

The TC5517BP is moulded in a dual-in-line 24 pin standard plastic package

- Low Power Standby Mode \overline{CE}
- Data Retention Supply Voltage . 2V to 5.5V
- All Inputs and Outputs Directly TTL Compatible
- Three State Outputs
- Pin Compatible with TC5516AP
- Standard 24 pin Plastic Package

TMM2016H

DESCRIPTION

The TMM2016H is a 16384-bit high speed static random access memory organized as 2048-words by 8-bits and operates from a single 5V power supply Common 8 bit inputs/outputs are provided

In memory expansion, low power application is possible by using the chip select input (\overline{CS}) When \overline{CS} is in V_{IH} level, the device is in low power standby

FEATURES

- Fast Access Time
 $t_{ACC} = 35/45 \text{ ns (Max)}$
- Power Dissipation
 $I_{CC} = 150\text{mA (Operating)}$
 $I_{SB} = 20\text{mA (Standby)}$
- Single 5V Power Supply
- Power Down Feature \overline{CS}
- Output Buffer Control \overline{OE}

PIN CONNECTION

mode, and the operating current is reduced to 20mA from 150mA.

TMM2016H is fabricated with ion implanted N-channel silicon gate technology This technology provides high performance and high reliability The chip is placed in a 24 pin standard dual in line pack-age, 0.6 inch in width

- Easy Memory Expansion \overline{CS}
- Fully Static Operation
No clocks or timing strobe required
- Common Data Inputs/Outputs
- Three State Outputs – Wired OR Capability
- Inputs protected – All inputs have protection against static charge

TOSHIBA MOS MEMORY PRODUCTS

TMM2764D 8,192 WORD x 8 BIT UV ERASABLE AND ELECTRICALLY PROGRAMMABLE READ ONLY MEMORY

TMM2764D

N-CHANNEL SILICON STACKED GATE MOS

DESCRIPTION

The TMM2764D is a 8192 word x 8 bit ultraviolet light erasable and electrically programmable read only memory. For read operation, the TMM2764D's access time is 200 ns, and the TMM2764D operates from a single 5-volt power supply and has a low power standby mode which reduces the power dissipation without increasing access time. The standby mode is achieved by applying a TTL-high level signal to the \overline{CE} input. The maximum active current is 150

mA and the maximum standby current is 35 mA

For program operation, the programming is achieved by applying a 50 ms active TTL low program pulse to the PGM input, and it is possible to program sequentially, individually, or at random

The TMM2764D is fabricated with the N-channel silicon double layer gate MOS technology and is packaged in a standard 28 pin dual in line cerdip package.

* This is advance information and specifications are subject to change without notice.

FEATURES

- Single 5-volt power supply
- Fast access time . 200 ns
- Power dissipation :
150 mA (active current)
35 mA (standby current)
- Low power standby mode . \overline{CE}
- Output buffer control . \overline{OE}

- Fully static operation
- Programs with one 50 ms pulse
- Single location programming
- Three state outputs
- Inputs and outputs TTL compatible
- Pin compatible with i2764 and ROM TMM2364P

TOSHIBA MOS MEMORY PRODUCTS

TMM23256P 256K BIT (32K WORD x BIT) MASK PROGRAMMABLE ROM
N-CHANNEL SILICON GATE MOS

TMM23256P

* This is advance information and specifications are subject to change without notice.

DESCRIPTION

The TMM23256P is a 262,144 bit read only memory organized as 32,768 words by 8 bits with a low bit cost, thus being most suitable for use in character generator

Consisting of static memory cells and clocked peripheral circuitry, the TMM23256P provides a high speed and low power dissipation (access time 150ns, operating current 40mA).

The TMM23256P also features an automatic stand-by power mode. When deselected by Chip Enable (\overline{CE}), the operating current is reduced from 40mA to

10mA. Output Enable (\overline{OE}) is effective in preventing data confliction on a common bus line.

The TMM23256P uses the address latch system that the falling edge of \overline{CE} latches all inputs except for \overline{OE} , thus can be easily connected to a system where address and data buses are commonly used.

The TMM23256P is fabricated with ion implanted N-channel silicon gate technology. This technology allows a production on high performance.

The TMM23256P is moulded in a 28 pin standard plastic package, 0.6 inch in width.

FEATURES

- Single 5V Power Supply
- Fast Access Time . 150ns (Max.)
- Low Power Dissipation
 - Average Current . 40mA (Max.)
 - Standby Current . 10mA (Max.)
- Inputs protected
 - All Inputs Have Protection Against Static Charge

- Edge Enabled Operation . \overline{CE}
- Output Buffer Control . \overline{OE}
- Input and Output . TTL Compatible
- Three State Outputs . Wired OR Capability
- 28 pin Standard Plastic DIP

NONVOLATILE APPLICATION

Example Current Capacity VS Retention Time and Memory Size

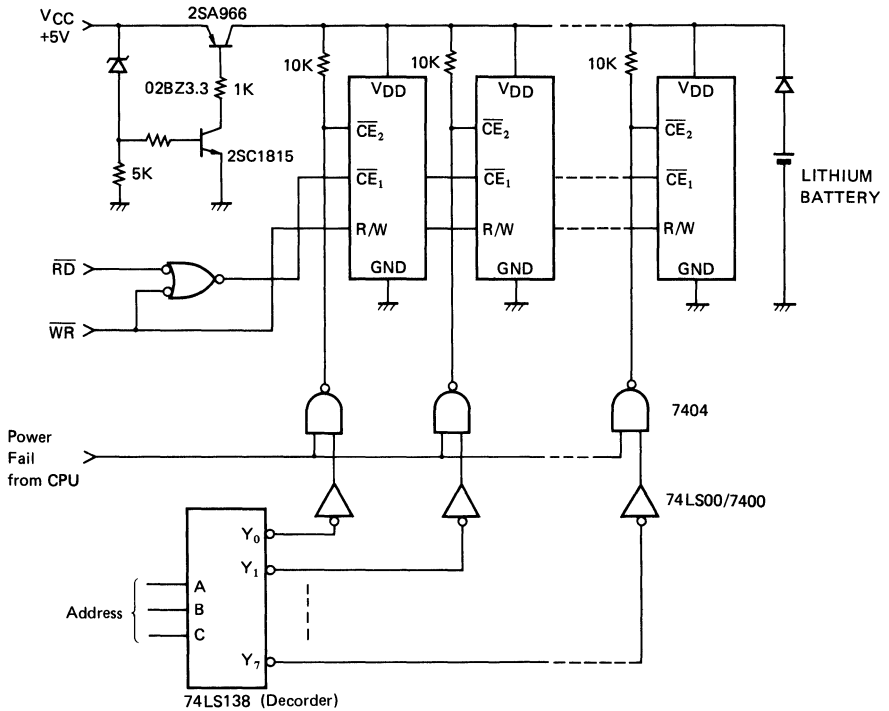

Units mA H

Retention Time (Year)	Memory Size (K byte)					
	2	4	8	16	32	64
1	8.8	17.6	35.2	70	140	280
5	44	88	176	352	700	1400
10	88	176	352	700	1400	2800

Nominal Current Capacity of Lithium Battery is usually from 750 to 5000 mA H in Cylinder type and from 60 to 160 mA H in coin type

Even if the derating factor is considered, Lithium Battery is most suitable battery for nonvolatile memory applications

TIMING CHART

TC5516AP Low Power Application

When $\overline{CE_2}$ goes high, the TC5516AP becomes to a low power standby state ($I_{DDS} = 30\mu\text{A Max.}$).

The average operating current of TC5516AP depends on the $\overline{CE_2}$ active duty ($\overline{CE_2}$ active time to cycle time ratio) and input levels

Following figure show the above characteristics

Therefore the application with $\overline{CE_2}$ clocked offers a reduction in average operating power of TC5516AP

16K BIT STATIC RAM TMM2016P Low Power Application

Operating Average Current of TMM2016P

When the \overline{CS} goes high, the TMM2016P becomes to low power standby mode automatically. Therefore using of \overline{CS} with clock make it possible to reduce the operating average power.

This characteristics are shown as following.

Note (1) \overline{CS} Duty = $t_{CS} \div t_{cycle}$

Application

The synchronous applications using clock from MPU reduce the operating average power of TMM2016P, and achieve the system power saving.

Examples are as follows.

Example 1. (8085, Z80, etc.)

In this application, \overline{CS} is controlled by \overline{WR} and \overline{RD} signal from MPU.

In MPU-8085 application with 3MHz, the duty cycle of \overline{CS} becomes about 40%, and this application offers an about 50% reduction in operating power of TMM2016P

Example 2. (8085, Z80)

In this application, \overline{CS} is controlled by \overline{MREQ} signal from MPU-Z80 or ALE signal from MPU-8085.

In MPU-Z80 application, the duty cycle of \overline{CS} becomes about 65%, and this application offers an about 30% reduction in operating power of TMM2016P.

Example 3. (6800)

In this application, \overline{CS} is controlled by $\phi 2$ clock.

Use of $\phi 2$ clock with 50% duty cycle offers an about 40% reduction in operating power of TMM2016P.

In application with MPU-6802 in space of 6800, enable $\phi 2$ output (E) signal is used as a clock of \overline{CS} .

Example 4

Advantage of two chip enable inputs in CMOS Memory

- Two chip enables offers both fast memory access and battery backup.
- Achievement of standby mode is simplified by elimination of requirements on inputs. Only requirements involve CE₂ or $\overline{CE_2}$ (for example, CE₂ for TC5501P/D and TC5047AP, and $\overline{CE_2}$ for TC5516AP refer to specification)

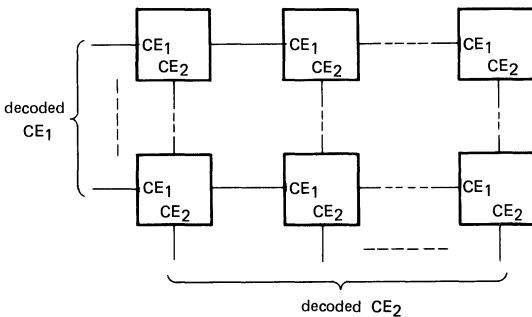

Example 1 : Nonvolatile application simplified

- One chip enable can be commonly used
- No gates are required

Example 2 : Two-dimensional arrangement by decoding two chip enables

- This application makes memory expansion easy without increase in decoder devices

16K RAM Interchangeability

• TC5516AP and TMM2016P Operation Mode

MODE	TC5516AP			TMM2016P		
	\overline{CE}_2 (18)	\overline{CE}_1 (20)	R/W (21)	\overline{CS} (18)	\overline{OE} (20)	\overline{WE} (21)
Write Mode	L	*L	L	L	*L or H	L
Read Mode	L	L	H	L	L	H

* For write mode, there is a difference between TC5516AP and TMM2016P
 But in usual application, two RAM's are interchangeable in same socket each other by simple jumper wiring
