- 5.0 PIM BIC Assignments
- 6.0 Systems Wiring Requirements
  - 6.1 System Priority
  - 6.2 Device Address
  - 6.3 PIM Interrupt; Interrupt Address Wiring
  - 6.4 BIC Delete Wiring
  - 6.5 Mag Tape/Disc Inter-Slot Wiring
  - 6.6 Analog to Digital Wiring
  - 6.7 Mainframe Wiring
    - 6.7.1 Memory Wrap Around\*
  - 6.8 Misc. Special Wiring
- 7.0 Special System Information
- 8.0 Cable Identification List
- 9.0 Appendix

## 1.0 EQUIPMENT SUMMARY

E-2861E - 620L-103, 16K Memory with two Chassis and one Power Supply.

E-2861E is similar to E-2861B except in areas of cable lengths, type cables, and front panel modifications.

E-2861B is documented under 01A1497.

E-2861E is documented under 01A1659.

E-2861B and E contain the standard 620L features except PIM and RTC.

Features:

- HMD-EA
- PFR
- DMA
- E-2847 Special Bootstrap Protect

E-2847 Special Bootstrap Protect performs the function of the 620/L-115 plus protects the first (0-77 octal) locations in memory.

A special documentation package is to be prepared excluding the options not contained within the system.

Special power supply cables are to be provided and tested.

The front panel is to be removed before shipping and a special termination board installed and tested on the front panel connectors.

## 2.0 N/A

## 3.0 System Power Requirement - 230VAC, 50HZ

The DC power supply should draw 6 amperes AC maximum. It is rated at 17 amps DC on the +5VDC output.

## 4.0 Controller Board Slot Assignments

### Chassis A2

<u>Slot</u>	<u>Device</u>
14	HMD-EA
15	DMA
16	PFR
01	Memory Cable Board

### Chassis A1

02	Memory Cable Board
----	--------------------

5.0 N/A

6.0 SYSTEM WIRING REQUIREMENTS

6.1 System Priority

NOTE: RTC has been purposely left out of the priority string.

6.2 - 6.6 N/A

6.7 Mainframe Wiring

6.7.1 Memory Wraparound +16K

DELETE - L14X+ 10-32 to 13-52

ADD - Ground 13-01 to 13-52

6.8 Miscellaneous Special Wiring

Insure E-2847 boot protect wiring is installed per W/L 95W0997, Revision F or later.

Bootstrap protect jumpers should be installed on the memory timing and control board for 16K.

7.0 SPECIAL SYSTEM INFORMATION

Each system should receive a special maintenance manual consisting of documentation for the following:

1. Power Failure Restart
2. Hardware Multiply Divide
3. Bootstrap Protect E-2847  
98A0935 Engineering Description  
91D0436 Logic Diagram
4. 620/L-100 Maintenance Manual, Chapters VIII and X less the following:  
Exclude: a. Display Board Drawing 44E0515  
b. Front panel switch schematic 91D0291

NOTE: E-2847 Bootstrap Protect should be tested with the procedure given in the Engineering Description.

	<p>PREPARED BY</p>	<p>APPR</p>	<p>SHT 2 OF 10</p>

SECTION 1  
GENERAL DESCRIPTION

The loader protect feature consists of additional logic located on the memory timing and control board plus additional backplane wiring to a switch. Drawing describes the modification procedure.

The purpose of the loader protect is to prevent writing into the last  $400_8$  locations of a selected 4K memory increment and locations  $0$  through  $77_8$  of the first 4K memory increment.

varian data machines  
a varian subsidiary

CODE  
IDENT NO.  
**21101**

98A0935

SH 3 OF 10 REV 

SECTION 2  
FUNCTIONAL DESCRIPTION

The loader protect feature prevents writing into memory locations which are used by the bootstrap and binary load/dump routines. These locations are normally the last 400 octal addresses of the core memory. The loader protect circuitry is located on the timing and control card located in CPU card slot 6. The card contains jumper pads for the three most significant address terms (L12X+, L13X+, L14X+). Jumpers are installed at the factory or in the field when the system memory capacity exceeds 4K. Address may be adjusted to protect any memory increment from 4 to 32K.

NOTE: If no jumpers are installed, the last 400 octal locations of each 4K section is controlled by the loader protect circuitry. (See Table 1 for jumper configuration).

There is a switch mounted on the chassis inside the front panel that enables and disables the option.

There are no additional instructions or control terms for this option. All addresses for write type operation are compared for error. An error occurs whenever a write type operation is attempted in a protected area with the option enabled.

A  
REV

## SECTION 3 THEORY OF OPERATION

All addresses being accessed in memory are checked by the loader protect option. When the address being accessed is equal to that of a protected address, and LPEX+ (loader protect enable from switch) is true, and H2XX+ (decode for a store instruction) is true, then the WRTX+ (write control to memory) is forced to ground. This causes the memory cycle to be a read/restore cycle.

After an error, the WRTX+ signal will be forced to ground causing a read cycle, and the computer will continue to cycle, changing all write cycles in a protected area. During a trap-in operation, the read/write command (WRTX+) and the memory start pulse (MSPX+) are forced to the low state and the CPU continues to cycle.

### 3.1 TRAP-IN OPERATION

When executing a trap-in request with the option enabled, if the memory address provided by the trapping device is in the protected area, the following events occur. The read/write command (WRTX+) and the memory start pulse (MSPX+) are forced to the low state.

### 3.2 LOADER PROTECT ENABLE/DISABLE SWITCH

A toggle switch located on the chassis inside the front panel is used to enable the loader protect circuitry. When the switch is in the disable position, all memory locations are available for storage. However, when the switch is in the enable position, the loader protect feature prevents writing into the memory locations X7400 through X7777 and locations 0 through 77g.

\*X = 4K core segment

### 3.3 ADDRESS SELECTION

Table 1 shows jumper placement on the memory timing and control board for address selection. Typically, the system memo will specify the proper jumpering.

SECTION 5  
TEST DESCRIPTION

5.1 PROGRAM MODE TEST

Using Aid II program with loader protect disabled write a fixed data pattern in locations 0 through 77 and X7400 through X7777.

i.e.  
| 0, 77, 177777, .  
| X7400, X7777, 177777, .

X = 0-7 for  
4 → 32K  
1<sup>E</sup> 4K = 0  
8K = 1

Enable loader protect then write a different fixed pattern in locations 0 through 77 and locations X7400 through X7777.

i.e.  
| 0, 77, 0.  
  
| X7400, X777, 0, .

Now verify that the original pattern did not get altered by reading locations 0 77 and X7400 X7777 and comparing it with the original pattern by using the search function of Aid II program.

i.e.  
S 0, 77, 177777, N  
S X7400, X7777, 177777, N

If any errors occurred, they will be listed as follows: There should be no errors.

i.e.  
Address            Contents  
000043        (000000)

5.2 TRAP-IN TEST

Using the Aid II program load the following program into core starting at location 100.

PARTS LIST FOR 620/L AND 620/L-100 CIRCUIT CARDS

The following is a composite parts list for the 620/L and 620/L-100. It is divided into three sections. Section 1 contains the standard circuit cards, section 2 the power supply, and section 3 the controller cards. The parts for each circuit card are listed in numerical order according to Varian part numbers. The reference designations in the parts list also appear on the assembly drawings and logic diagrams.

<u>Card P/N and Name</u>	<u>Varian P/N</u>	<u>Manufacturer and P/N</u>	<u>Reference Designation</u>
