

A decorative graphic in the top left corner features a large blue circle with a white center, connected to several smaller blue circles by solid and dashed lines, resembling a circuit or data flow diagram.

IBM Service Virtualisation ROI Assessment

Do I need service virtualisation?

- Are dependencies on system components or third party applications delaying your projects?
- How much time does your software delivery team spend trying to build their own testing simulations?
- Are release dates slipping or quality issues arising late in the development cycle and requirements being de-scoped?

Are you developing applications to enhance customer experience and boost your business' bottom line?

Many organisations still struggle to deliver quality software in a timely and cost-effective manner. Complicated and fragmented infrastructure environments increase costs and delays, meaning your valuable resources end up waiting for dependent software and service availability.

As a result, organisations like yours are turning to service virtualisation and simulation to eliminate testing bottlenecks, improve application quality, and reduce project risk. Service virtualisation provides your teams with the ability to simulate the interdependencies of complex applications and systems for testing and development. It enables earlier and continuous testing, even when dependent systems are unavailable, under construction, or being migrated or upgraded.

The IBM® Service Virtualisation ROI Calculator, developed by WinterGreen Research, can illustrate the financial impact IBM Service Virtualisation will have on your organisation. You can quickly determine the probable return on a service virtualisation investment in a 2-hour consultation that customises data based on real client scenarios.

Why participate?

Learn how you can significantly impact software delivery efficiency with IBM Service Virtualisation.

Cost

No charge. No obligation. Two hour time investment.
