## Agenda

- 
1. Open Standards – Open Stack – IBM
  2. Cloud Enabled DataCenter: Reference Pattern
  3. SmartCloud Foundation Solutions in a Nutshell
  4. Q&A

# A history of collaborative participation

**IBM contributes to the standards & open source imperatives across the market as well as developing standards-based solutions**

*IBM recognizes there are different types of standards & open source development organizations, each contributing to a robust ICT landscape. We participate in discussions at all levels, from member to board member. We contribute our insight on a range of topics, from global Accessibility standards policy to HTML5 and Open Cloud. Wherever we engage, our commitment to open collaboration and excellence remains constant.*

**Global Standards Harmonization**

# Open Standards in a Cloud Concept

# Ecosystem: Building real-world use cases

The Cloud Standards Customer Council (CSCC) is the premier open, end-user advocacy group for cloud standards, interoperability & best practices.

# 400+

Organizations participating

- Providing customer-lead guidance to the multiple cloud standards & open source defining bodies
- Establishing criteria for interoperable cloud computing that address customer pain points

## “CSCC forms new Security Working Group”

- Established Feb 2012; Co-chairs: The Kroger Co. & Boeing

## “CSCC forms new SLA Working Group”

- Established Feb 2012; Co-chairs: Boeing & IBM

### 2011 Deliverables

Practical Guide to Cloud  
Cloud Computing Use Cases

### 2012 Deliverables

Practical Guide to Cloud SLAs  
Security for Cloud Computing

## Projected 2013 Projects

- Use Cases: Entry, Provisioning, Orchestration & Continuous Delivery
- Gap Analysis: DMTF CIMI (IaaS API) & OASIS TOSCA
- Banking, Healthcare & Government working groups

# OpenStack Foundation: Exponential Ecosystem Growth

OpenStack is a global collaboration of developers & cloud computing technologists working to produce an **ubiquitous Infrastructure as a Service (IaaS) open source** cloud computing platform for public & private clouds.

# OpenStack Design Guidelines ...

*„... delivering essential infrastructure on an available, scalable, elastic control panel“*

1. Scalability and elasticity are our main goals
2. Any feature that limits our main goals must be optional
3. Everything should be asynchronous
  - If you can't do something asynchronously, see #2
4. All required components must be horizontally scalable
5. Always use shared nothing (SN) architecture or sharding
  - If you can't share nothing/*shard*, see #2
6. Distribute everything
  - Especially logic. Move logic to where state naturally exists.
7. Accept eventual consistency and use it where it is appropriate.
8. Test everything.
  - We require tests with submitted code. (We will help you if you need it)

# Moving towards interoperable workloads

The Topology & Orchestration Specification for Cloud Applications (TOSCA) will enable compose once & play anywhere management of cloud infrastructure topologies.

TOSCA provides:

- A structural model for cloud services, components & relationships
- A process model for build & management plans
- A packaging specification for cloud services & related artifacts

 <http://oasis-open.org/committees/tosca>

Organizations have a choice to make...

## *Open Source Only*

*'Some Assembly  
Required'*

## *Proprietary*

*Vendor Lock-in  
Assured*

## *Open "Plus"*

*Enterprise-ready  
out of the box*

# PayPal Uses OpenStack

- Processed more than \$26,000 in mobile payments every minute in 2012
- OpenStack runs thousands of VMs to support their self-service developer model
- Internal team manages deployment and operations, using OpenStack Compute, Storage & Shared Services

*“We needed agility without sacrificing availability. By leveraging the collective innovation of the OpenStack community, we can develop and grow our private cloud much quicker without having to reinvent anything.”*

Saran Mandair, senior director of PayPal infrastructure engineering
