## About this book

This book provides information for the Client APIs (ECI V1, ESI V1 and EPI) that CICS® Transaction Gateway and CICS Transaction Gateway Desktop Edition support for the C, C++ and COM programming languages.

For information about programming methodology see the *CICS Transaction Gateway for Multiplatforms: Programming Guide*, SC34-7056-00. For further information about Java™ programming for the CICS Transaction Gateway, see the Javadocs shipped with this product.

---

## Who should read this book

This book is intended for anyone involved with programming for CICS Transaction Gateway.

It is assumed that you are familiar with the operating system under which your CICS Transaction Gateway runs.

An understanding of Internet terminology is helpful.

---

## Terminology

The term <install\_path> is used in file paths to represent the directory where you installed the product. See the *CICS Transaction Gateway: Administration* book for your operating system, for the default installation locations.

---

## Directory delimiters

References to directory path names in this book use the Microsoft Windows convention of a backslash (\) as delimiter, instead of the forward slash (/) delimiter used on UNIX and Linux operating systems.

---

## Chapter 1. C

Programming reference information for the CICS Transaction Gateway C APIs.

---

### ECI V1

This section describes CICS\_ExternalCall and the call types that control its function.

#### CICS\_ExternalCall (ECI\_Parms)

CICS\_ExternalCall gives access to the program link calls, status information calls, and reply solicitation calls.

The function performed is controlled by the eci\_call\_type field in the ECI parameter block.

#### Parameters

This topic lists the parameters of the CICS\_ExternalCall function.

##### ECI\_Parms

A pointer to the ECI parameter block. *Set the parameter block to nulls before use.* The parameter block fields that are used as input and output are described in detail for each call type in the following sections. A brief summary of the fields follows:

##### eci\_abend\_code

Abend code for a failed program.

##### eci\_callback

A pointer to a callback routine for an asynchronous request. Not supported in COBOL applications.

##### eci\_call\_type

An integer field defining the type of call being made.

##### eci\_commarea

A COMMAREA for use by a called program, or for returned status information.

##### eci\_commarea\_length

The length of the COMMAREA. The size of the COMMAREA must be set to the largest size of the input or output data. This length must not exceed 32,500 bytes. If the input data is less than the length of the COMMAREA, pad the COMMAREA with nulls. The Client daemon strips off the null padding and sends only the data on the ECI request to the CICS server.

##### eci\_extend\_mode

Used to manage logical units of work that span multiple ECI requests. See the information about managing logical units of work in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* for more details.

##### eci\_luw\_token

An identifier for a logical unit of work.

**eci\_message\_qualifier**

A user-provided reference to an asynchronous call.

**eci\_password**

Password for security checking.

**eci\_password2**

Password for security checking. This is used if the password is more than 8 characters.

**eci\_program\_name**

The name of a program to be called.

**eci\_sysid**

Reserved for future use; leave null.

**eci\_system\_name**

The name of a CICS server.

**eci\_timeout**

The time to wait for a response from the CICS server. For more information on the ECI time-out support, see the information about timeout of the ECI request in the *CICS Transaction Gateway for Multiplatforms: Programming Guide*. For remote mode IPIC, this value can be overridden by the ECITIMEOUT property on the IPIC server definition.

**eci\_tpn**

A transaction identifier for the mirror transaction.

**eci\_transid**

A transaction identifier.

**eci\_userid**

User ID for security checking.

**eci\_userid2**

User ID for security checking. This is used if the User ID is more than 8 characters.

**eci\_version**

The version of the ECI for which the application is coded. Use the value ECI\_VERSION\_1A.

**reserved1**

This field was previously **eci\_system\_return\_code**. In Version 3.1 and higher of the product, this field is kept for compatibility. No information is returned in this field; all system errors are written to the CICS Transaction Gateway's error log.

## Return Codes

This topic describes return codes not listed for each call type.

In addition to the return codes described for each call type in the following sections, the following return codes are possible.

**ECI\_ERR\_INVALID\_CALL\_TYPE**

The call type was not one of the valid call types.

**ECI\_ERR\_CALL\_FROM\_CALLBACK**

The call was made from a callback routine.

**ECI\_ERR\_REQUEST\_TIMEOUT**

The time-out interval expired before the request could be processed, or the specified interval was negative.

**ECI\_ERR\_RESPONSE\_TIMEOUT**

The time-out interval expired while the program was running.

**ECI\_ERR\_SYSTEM\_ERROR**

An internal system error occurred. The error might be in the CICS Transaction Gateway or in the server. Save the information returned in the CICS Transaction Gateway's error log, because this will help service personnel to diagnose the error.

**ECI\_ERR\_INVALID\_VERSION**

The value supplied for **eci\_version** was invalid.

In some implementations, some of the return codes documented here and for each call type will never be returned.

The mapping of actual return code values to the symbolic names is contained in the following files:

**C**        <install\_path>/include/cics\_eci.h

**COBOL**  
          <install\_path>/copybook/cicsecl.cbl

## Call types

Call types define the action requested by the call.

**ECI\_SYNC call type**

The ECI\_SYNC call type is available in all environments.

**Purpose**

The ECI\_SYNC call type provides a synchronous program link call to start, continue, or end a logical unit of work. The calling application does not get control back until the called CICS program has run to completion.

**ECI parameter block fields**

Set the ECI parameter block to nulls before setting the input parameter fields.

**eci\_call\_type**

Required input parameter, which must be set to ECI\_SYNC.

**eci\_program\_name**

Input parameter; required except when **eci\_extend\_mode** is ECI\_COMMIT or ECI\_BACKOUT. See the information about managing logical units of work in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* for more details.

An 8-character field containing the name of the program to be called. Pad unused characters with spaces. This field is transmitted to the server without conversion to uppercase.

The characters used are translated from the client's code page to an EBCDIC code page before transmission. If the server uses an ASCII code page, they will be retranslated. The only characters guaranteed to be invariant under these translations are the uppercase characters A to Z, and

the numeric characters 0 to 9. Some EBCDIC servers (Katakana and Hebrew character set A) do not use the standard representations of the lowercase alphabetic characters; use them with care when communicating with such servers.

#### **eci\_userid**

Required input parameter.

An 8-character field containing a user ID. Pad unused characters with spaces.

Consult the documentation for the CICS Transaction Gateway and the server to check whether this field is converted to uppercase before being transmitted to the server. If a user ID or password longer than 8 characters is required, set **eci\_userid** and **eci\_password** to nulls, and use fields **eci\_userid2** and **eci\_password2** instead.

If a user ID is supplied, the server uses the user ID and any supplied password to authenticate the user. The supplied user ID and password are used in subsequent security checking in the server.

#### **eci\_password**

Required input parameter.

An 8-character field containing a password. Pad unused characters with spaces.

Consult the documentation for the CICS Transaction Gateway and the server to check whether this field is converted to uppercase before being transmitted to the server. If a user ID or password longer than 8 characters is required, set this field and **eci\_userid** to nulls, and use fields **eci\_userid2** and **eci\_password2** instead.

#### **eci\_transid**

Optional input parameter

A 4-character field optionally containing the ID of a CICS transaction. Pad unused characters with spaces. The parameter is ignored if **eci\_tpn** is used (set to any value other than nulls). The use of this parameter depends on the client from which the request is sent. The value of **eci\_transid** is converted from ASCII to EBCDIC, with no uppercase translation, and stored in EIBTRNID for the duration of the LINK to the program specified in the **eci\_program\_name**.

The called program runs under the mirror transaction CPMI, but is linked to under the **eci\_transid** transaction name. This name is available to the called program for querying the transaction ID. Some servers use the transaction ID to determine security and performance attributes for the called program. In those servers, use this parameter to control the processing of your called programs.

If the field is all nulls, and **eci\_tpn** is not specified, the default server transaction ID is used.

#### **eci\_abend\_code**

Output parameter.

A 4-character field in which a CICS abend code is returned if the transaction that executes the called program ends abnormally. Unused characters are padded with spaces.

#### **eci\_commarea**

Optional input parameter.

A pointer to the data to be passed to the called CICS program as its COMMAREA. The COMMAREA will be used by the called program to return information to the application.

If no COMMAREA is required, supply a null pointer and set the length (specified in **eci\_commarea\_length**) to zero.

If the code page of the application is different from the code page of the server, data conversion must be performed at the server. To do this, use CICS-supplied resource conversion capabilities, such as the DFHCNV macro definitions.

#### **eci\_commarea\_length**

Optional input parameter.

The length of the COMMAREA in bytes. Application developers are advised to use a maximum size of 32,500 bytes because this is guaranteed to be flowed successfully across all protocols. COMMAREA sizes greater than this might cause an ECI\_ERR\_INVALID\_DATA\_LENGTH return code to be generated.

If no COMMAREA is required, set this field to zero and supply a null pointer in **eci\_commarea**.

#### **eci\_timeout**

The time in seconds to wait for a response from the CICS server. A value of 0 means that no limit is set.

If timeout occurs, the conversation ends abnormally.

#### **reserved1**

Output parameter.

This field was previously **eci\_system\_return\_code**. In the CICS Transaction Gateway Version 3.1, and higher, this field is reserved for compatibility with earlier versions. No information is returned in this field; all system errors are written to the CICS Transaction Gateway's error log.

#### **eci\_extend\_mode**

Required input parameter.

An integer field determining whether a logical unit of work is terminated at the end of this call. (See the information about managing logical units of work in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* for more details.)

The values for this field (shown by their symbolic names) are as follows:

##### **ECI\_NO\_EXTEND**

1. If the input **eci\_luw\_token** field is zero, this is the only call for a logical unit of work.
2. If the input **eci\_luw\_token** field is not zero, this is the last call for the specified logical unit of work.

In each case, changes to recoverable resources are committed by a CICS end-of-task sync point, and the logical unit of work ends.

If you set **eci\_extend\_mode** to **ECI\_NO\_EXTEND** and **eci\_luw\_token** to 0, you will observe one request flowing from client to server and one reply flowing from server to client. The server sends the reply after the program specified in **eci\_program\_name** has been invoked and the changes made by that program have been committed.

## ECI\_EXTENDED

1. If the input **eci\_luw\_token** field is zero, this is the first call for a logical unit of work that is to be continued.
2. If the input **eci\_luw\_token** field is not zero, this call is intended to continue the specified logical unit of work.

In each case the logical unit of work continues after the called program completes successfully, and changes to recoverable resources remain uncommitted.

## ECI\_COMMIT

Terminate the current logical unit of work, identified by the input **eci\_luw\_token** field, and commit all changes made to recoverable resources.

## ECI\_BACKOUT

Terminate the logical unit of work identified by the input **eci\_luw\_token** field, and back out all changes made to recoverable resources.

### **eci\_luw\_token**

Required input and output parameter.

An integer field used for identifying the logical unit of work to which a call belongs. It must be set to zero at the start of a logical unit of work (regardless of whether the logical unit of work is going to be extended). If the logical unit of work is to be extended, the ECI updates **eci\_luw\_token** with a valid value on the first call of the logical unit of work, and this value is used as input to all later calls related to the same logical unit of work. (See the information about managing logical units of work in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* for more details.)

If the return code is not ECI\_NO\_ERROR, and the call was continuing or ending an existing logical unit of work, this field is used as output to report the condition of the logical unit of work. If it is set to zero, the logical unit of work has ended, and its updates have been backed out. If it is nonzero, it is the same as the input value, the logical unit of work is continuing, and its updates are still pending.

### **eci\_sysid**

Required input parameter.

Reserved for future use, but initialize this field with nulls before the start of each logical unit of work.

### **eci\_version**

Required input parameter.

The version of the ECI for which the application is coded. Use the value ECI\_VERSION\_1A.

### **eci\_system\_name**

Optional input parameter.

An 8-character field that specifies the name of the server to which the ECI request is to be directed. Pad unused characters with spaces. If supplied, it is one of the server names returned by **CICS\_EciListSystems**. The value can be supplied whenever **eci\_luw\_token** is set to zero. (If it is supplied when **eci\_luw\_token** is not zero, it is ignored, because the server was established at the start of the logical unit of work.)

If the field is set to nulls, the default CICS server is selected; the name of the chosen server is returned in this field, and must be used in subsequent related ECI requests. If ECI requests made in different logical units of work must be directed to the same server, **eci\_system\_name** must identify that server by name.

#### **eci\_userid2**

Optional input parameter.

If the **eci\_userid** field is set to nulls, the **eci\_userid2** field specifies the user ID (if any) to be used at the server for any authority validation. The user ID can be up to 16 characters.

See the description of the **eci\_userid** field for information about how the user ID is used.

#### **eci\_password2**

Optional input parameter.

If the **eci\_password** field is set to nulls, the **eci\_password2** field specifies the password (if any) to be used at the server for any authority validation. The password can be up to 16 characters.

See the description of the **eci\_password** field for information about how the password is used.

#### **eci\_tpn**

Optional input parameter.

A 4-character field that specifies the transaction ID of the transaction that will be used in the server to process the ECI request. This transaction must be defined in the server as a CICS mirror transaction. If the field is not set, the default mirror transaction CPMT is used.

If the ECI request is extended (see the description of **eci\_extend\_mode**), this parameter has a meaning only for the first request in the unit of work. Subsequent requests within the same unit of work will use the mirror transaction specified on the first request.

If this field is used, the contents of **eci\_transid** are ignored.

### **Return codes**

See also the general list of return codes for **CICS\_ExternalCall** in “CICS\_ExternalCall (ECI\_Parms)” on page 1.

#### **ECI\_NO\_ERROR**

The call completed successfully.

#### **ECI\_ERR\_INVALID\_DATA\_LENGTH**

The value in **eci\_commarea\_length** field is outside the valid range, or is inconsistent with the value in **eci\_commarea**, being zero for a non-null **eci\_commarea** pointer, or non-zero for a null **eci\_commarea** pointer.

#### **ECI\_ERR\_INVALID\_EXTEND\_MODE**

The value in **eci\_extend\_mode** field is not valid.

#### **ECI\_ERR\_NO\_CICS**

The CICS Transaction Gateway is unavailable, or the server implementation is unavailable, or a logical unit of work was to be begun, but the CICS server specified in **eci\_system\_name** is not available. No resources have been updated.

#### **ECI\_ERR\_CICS\_DIED**

A logical unit of work was to be begun or continued, but the CICS server was no longer available. If **eci\_extend\_mode** was ECI\_EXTENDED, the changes are backed out, and the logical unit of work ends. If **eci\_extend\_mode** was ECI\_NO\_EXTEND, ECI\_COMMIT, or ECI\_BACKOUT, the application cannot determine whether the changes have been committed or backed out, and must log this condition to aid future manual recovery.

#### **ECI\_ERR\_TRANSACTION\_ABEND**

The CICS transaction that executed the requested program ended abnormally. The abend code is in **eci\_abend\_code**. For information about abend codes and their meaning, consult the documentation for the server system to which the request was directed.

#### **ECI\_ERR\_LUW\_TOKEN**

The value supplied in **eci\_luw\_token** is invalid.

#### **ECI\_ERR\_ALREADY\_ACTIVE**

An attempt was made to continue an existing logical unit of work, but there was an outstanding asynchronous call for the same logical unit of work.

#### **ECI\_ERR\_RESOURCE\_SHORTAGE**

The server implementation or the Client daemon did not have enough resources to complete the request.

#### **ECI\_ERR\_NO\_SESSIONS**

A new logical unit of work was being created, but the application already has as many outstanding logical units of work as the configuration will support.

#### **ECI\_ERR\_INVALID\_DATA\_AREA**

Either the pointer to the ECI parameter block is invalid, or the pointer supplied in **eci\_commarea** is invalid.

#### **ECI\_ERR\_ROLLEDBACK**

An attempt was made to commit a logical unit of work, but the server was unable to commit the changes, and backed them out instead.

#### **ECI\_ERR\_UNKNOWN\_SERVER**

The requested server could not be located. Only servers returned by **CICS\_EciListSystems** are acceptable.

#### **ECI\_ERR\_MAX\_SESSIONS**

The maximum number of concurrent requests handled by the Client daemon, as defined by the configuration parameter **maxrequests** in the configuration file, has been reached.

#### **ECI\_ERR\_MAX\_SYSTEMS**

You tried to start requests to more servers than your configuration allows. Consult the documentation for your CICS Transaction Gateway or server to see how to control the number of servers you can use.

#### **ECI\_ERR\_SECURITY\_ERROR**

You did not supply a valid combination of user ID and password.

#### **ECI\_ASYNC call type**

The ECI\_ASYNC call type provides an asynchronous program link call to start, continue, or end a logical unit of work.

## Purpose

The calling application gets control back when the ECI has accepted the request. At this point the parameters have been validated; however, the request might still be queued for later processing.

If no callback routine is provided, the application must use a reply solicitation call to determine whether the request has ended and what the outcome was.

If a callback routine is provided, the callback routine **eci\_callback** is invoked when a response is available.

**Note:** Some compilers do not support the use of callback routines. Consult your compiler documentation for more information.

It is important that the Eci parameter blocks of outstanding ECI\_ASYNC calls are not modified before the results of the call are received. Results will be incorrect if these blocks are modified before this stage.

When the callback routine is called, it is passed a single parameter—the value specified in **eci\_message\_qualifier**. This enables the callback routine to identify the asynchronous call that is completing. Follow these guidelines when using the callback routine:

1. Perform the minimum possible processing within the callback routine.
2. ECI functions cannot be invoked from within the callback routine.
3. The callback routine indicates to the main body of the application that the reply is available using an appropriate technique for the operating system upon which the ECI application is executing. For example, in a multithreaded environment, the callback routine might post a semaphore to signal another thread that an event has occurred.
4. The application, not the callback routine, must use a reply solicitation call to receive the actual response.

## ECI parameter block fields

Set the ECI parameter block to nulls before you set the input parameter fields.

### **eci\_call\_type**

Required input parameter.

Must be set to ECI\_ASYNC.

### **eci\_program\_name**

Input only, required parameter except when **eci\_extend\_mode** is ECI\_COMMIT or ECI\_BACKOUT. (See the information about managing logical units of work in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* for more details.)

An 8-character field containing the name of the program to be called. Pad unused characters with spaces. This field is transmitted to the server without conversion to uppercase.

The characters used are translated from the client's code page to an EBCDIC code page before transmission. If the server uses an ASCII code page, they will be retranslated. The only characters guaranteed to be invariant under these translations are the uppercase characters A to Z, and the numeric characters 0 to 9. Some EBCDIC servers (Katakana and

Hebrew character set A) do not use the standard representations of the lowercase alphabetic characters; use them with care when communicating with such servers.

#### **eci\_userid**

Required input parameter.

An 8-character field containing a user ID. Pad unused characters with spaces.

Consult the documentation for the CICS Transaction Gateway and the server to check whether this field is converted to uppercase before being transmitted to the server. (If a user ID or password longer than 8 characters is required, set **eci\_userid** and **eci\_password** to nulls, and use **eci\_userid2** and **eci\_password2** instead.)

If a user ID is supplied, the server uses the user ID and any supplied password to authenticate the user. The supplied user ID and password are used in subsequent security checking in the server.

#### **eci\_password**

Required input parameter.

An 8-character field containing a password. Pad unused characters with spaces.

Consult the documentation for the CICS Transaction Gateway and the server to check whether this field is converted to uppercase before being transmitted to the server. (If a user ID or password longer than 8 characters is required, set **eci\_userid** and **eci\_password** to nulls, and use **eci\_userid2** and **eci\_password2** instead.)

#### **eci\_transid**

Optional input parameter

A 4-character field optionally containing the ID of a CICS transaction. Pad unused characters with spaces. The parameter is ignored if **eci\_tpn** is used (set to any value other than nulls). The use of this parameter depends on the client from which the request is sent. The value of **eci\_transid** is converted from ASCII to EBCDIC, with no uppercase translation, and stored in EIBTRNID for the duration of the LINK to the program specified in the **eci\_program\_name**.

The called program runs under the mirror transaction CPML, but is linked to under the **eci\_transid** transaction name. This name is available to the called program for querying the transaction ID. Some servers use the transaction ID to determine security and performance attributes for the called program. In those servers, use this parameter to control the processing of your called programs.

If the field is all nulls, and **eci\_tpn** is not specified, the default server transaction ID is used.

#### **eci\_commarea**

Required input parameter.

A pointer to the data to be passed to the called CICS program as its COMMAREA.

If no COMMAREA is required, supply a null pointer and set the length (specified in **eci\_commarea\_length**) to zero.

If the code page of the application is different from the code page of the server, data conversion must be performed at the server. To do this, use CICS-supplied resource conversion capabilities, such as the DFHCNV macro definitions.

#### **eci\_commarea\_length**

Required input parameter.

The length of the COMMAREA in bytes. Application developers are advised to use a maximum size of 32,500 bytes, as this is guaranteed to be flowed successfully across all protocols. COMMAREA sizes greater than this may generate an ECI\_ERR\_INVALID\_DATA\_LENGTH return code.

If no COMMAREA is required, set this field to zero and supply a null pointer in **eci\_commarea**.

#### **eci\_timeout**

The time in seconds to wait for a response from the CICS server. A value of 0 means that no limit is set.

If timeout occurs, the conversation ends abnormally.

#### **reserved1**

Output parameter.

This field was previously **eci\_system\_return\_code**. In the CICS Transaction Gateway Version 3.1, and higher, this field is reserved for compatibility with earlier versions. No information is returned in this field; all system errors are written to the error log.

#### **eci\_extend\_mode**

Required input parameter.

An integer field determining whether a logical unit of work is terminated at the end of this call. (See the information about managing logical units of work in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* for more details.)

Values (shown by their symbolic names) for this field are as follows:

##### **ECI\_NO\_EXTEND**

1. If the input **eci\_luw\_token** field is zero, this is the only call for a logical unit of work.
2. If the input **eci\_luw\_token** field is not zero, this is the last call for the specified logical unit of work.

In each case, changes to recoverable resources are committed by a CICS end-of-task sync point, and the logical unit of work ends.

##### **ECI\_EXTENDED**

1. If the input **eci\_luw\_token** field is zero, this is the first call for a logical unit of work that is to be continued.
2. If the input **eci\_luw\_token** field is not zero, this call is intended to continue the specified logical unit of work.

In each case the logical unit of work continues after the called program completes, and changes to recoverable resources remain uncommitted.

## ECI\_COMMIT

Terminate the current logical unit of work, identified by the input **eci\_luw\_token** field, and commit all changes made to recoverable resources.

## ECI\_BACKOUT

Terminate the logical unit of work identified by the input **eci\_luw\_token** field, and back out all changes made to recoverable resources.

### **eci\_message\_qualifier**

Optional input parameter.

An integer field allowing the application to identify each asynchronous call if it is making more than one. If a callback routine is specified, the value in this field is returned to the callback routine during the notification process.

### **eci\_luw\_token**

Required input and output parameter.

An integer field used for identifying the logical unit of work to which a call belongs. It must be set to zero at the start of a logical unit of work (regardless of whether the logical unit of work is going to be extended), and the ECI updates it with a valid value on the first or only call of the logical unit of work. If the logical unit of work is to be extended, use this as input to all later calls related to the same logical unit of work. (See the information about managing logical units of work in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* for more details.)

If the return code is not ECI\_NO\_ERROR, and the call was continuing or ending an existing logical unit of work, this field is used as output to report the condition of the logical unit of work. If it is set to zero, the logical unit of work has ended, and its updates have been backed out. If it is nonzero, it is the same as the input value, the logical unit of work is continuing, and its updates are still pending.

### **eci\_sysid**

Required input parameter.

Reserved for future use, but initialize this field with nulls before the start of each logical unit of work.

### **eci\_version**

Required input parameter.

The version of the ECI for which the application is coded. Use the value ECI\_VERSION\_1A.

### **eci\_system\_name**

Optional input parameter.

An 8-character field that specifies the name of the server to which the ECI request is to be directed. Pad unused characters with spaces. The value might be supplied whenever **eci\_luw\_token** is set to zero. (If it is supplied when **eci\_luw\_token** is not zero, it is ignored, because the server was established at the start of the logical unit of work.)

If the field is set to nulls, the default CICS server is selected. You can obtain the name of the chosen server from the **eci\_system\_name** field of the reply solicitation call you use to get the result of this asynchronous request. (If later ECI requests made in different logical units of work must

be directed to the same server as this request, **eci\_system\_name** in those requests must identify that server by name.)

#### **eci\_callback**

Optional input parameter.

A pointer to the routine to be called when the asynchronous request completes. (The callback routine will be called only if the return code is **ECI\_NO\_ERROR**, and the pointer is not null.)

#### **eci\_userid2**

Optional input parameter.

If the **eci\_userid** field is set to nulls, the **eci\_userid2** field specifies the user ID (if any) to be used at the server for any authority validation. The user ID can be up to 16 characters.

See the description of the **eci\_userid** field for information about how the user ID is used.

#### **eci\_password2**

Optional input parameter.

If the **eci\_password** field is set to nulls, the **eci\_password2** field specifies the password (if any) to be used at the server for any authority validation. The password can be up to 16 characters.

See the description of the **eci\_password** field for information about how the password is used.

#### **eci\_tpn**

Optional input parameter.

A 4-character field that specifies the transaction ID of the transaction that will be used in the server to process the ECI request. This transaction must be defined in the server as a CICS mirror transaction. If the field is not set, the default mirror transaction CPMT is used.

If the ECI request is extended (see the description of **eci\_extend\_mode**), this parameter has a meaning only for the first request in the unit of work. Subsequent requests within the same unit of work will use the mirror transaction specified on the first request.

If this field is used, the contents of **eci\_transid** are ignored.

### **Return codes**

See also the general list of return codes for **CICS\_ExternalCall** in “CICS\_ExternalCall (ECI\_Parms)” on page 1.

If the return code is not **ECI\_NO\_ERROR**, the callback routine will not be called, and there will be no asynchronous reply for this request.

#### **ECI\_NO\_ERROR**

The call to the ECI completed successfully. No errors have yet been detected. The callback routine will be called when the request completes.

#### **ECI\_ERR\_INVALID\_DATA\_LENGTH**

The value in **eci\_commarea\_length** field is outside the valid range, or is inconsistent with the value in **eci\_commarea**, being zero for a non-null **eci\_commarea** pointer, or non-zero for a null **eci\_commarea** pointer.

**ECI\_ERR\_INVALID\_EXTEND\_MODE**

The value in **eci\_extend\_mode** field is not valid.

**ECI\_ERR\_NO\_CICS**

Either the client or the server implementation is not available.

**ECI\_ERR\_LUW\_TOKEN**

The value supplied in **eci\_luw\_token** is invalid.

**ECI\_ERR\_THREAD\_CREATE\_ERROR**

The server implementation or the client failed to create a thread to process the request.

**ECI\_ERR\_ALREADY\_ACTIVE**

An attempt was made to continue an existing logical unit of work, but there was an outstanding asynchronous call for the same logical unit of work.

**ECI\_ERR\_RESOURCE\_SHORTAGE**

The server implementation or the client did not have enough resources to complete the request.

**ECI\_ERR\_NO\_SESSIONS**

A new logical unit of work was being created, but the application already has as many outstanding logical units of work as the configuration will support.

**ECI\_ERR\_INVALID\_DATA\_AREA**

Either the pointer to the ECI parameter block is invalid, or the pointer supplied in **eci\_commarea** is invalid.

**ECI\_STATE\_SYNC call type**

The ECI\_STATE\_SYNC call type is available in all environments.

**Purpose**

The ECI\_STATE\_SYNC call type provides a synchronous call that gives information about the status of the server.

**ECI parameter block fields**

Set the ECI parameter block to nulls before setting the input parameter fields.

**eci\_call\_type**

Required input parameter.

Must be set to ECI\_STATE\_SYNC.

**eci\_commarea**

Input parameter, required except when **eci\_extend\_mode** has the value ECI\_STATE\_CANCEL.

A pointer to the area of storage where the application receives the returned COMMAREA containing status information. See the information about status information calls in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* and “ECI status block” on page 26, for more details.

If **eci\_extend\_mode** has the value ECI\_STATE\_CANCEL, supply a null pointer and set the length (specified in **eci\_commarea\_length**) to zero.

**eci\_commarea\_length**

Required input and output parameter, except when **eci\_extend\_mode** has the value ECI\_STATE\_CANCEL.

The length of the COMMAREA in bytes, which must be the length of the ECI\_STATUS structure that gives the layout of the status information COMMAREA. See the information about status information calls in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* and “ECI status block” on page 26, for more details. Area size must not exceed 32,500 bytes

If no COMMAREA is required, set this field to zero and supply a null pointer in **eci\_commarea**.

#### **reserved1**

Output parameter.

This field was previously **eci\_system\_return\_code**. In the CICS Transaction Gateway Version 3.1, and higher, this field is reserved for compatibility with earlier versions. No information is returned in this field; all system errors are written to the error log.

#### **eci\_extend\_mode**

Required input parameter.

An integer field further qualifying the call type. The values for this field (shown by their symbolic names) are as follows:

##### **ECI\_STATE\_IMMEDIATE**

Force a status reply to be sent as soon as it is available. The layout of the returned COMMAREA is defined in the ECI\_STATUS structure. See the information about status information calls in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* and “ECI status block” on page 26, for more details.

##### **ECI\_STATE\_CHANGED**

Force a status reply to be sent only when the status changes. The supplied COMMAREA must contain the status as perceived by the application. A reply is sent only when there is a change from the status that the application supplied. The layout of the COMMAREA is defined in the ECI\_STATUS structure. See the information about status information calls in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* and “ECI status block” on page 26, for more details. The **eci\_luw\_token** field that is returned on the immediate response provides a token to identify the request.

##### **ECI\_STATE\_CANCEL**

Cancel an ECI\_STATE\_CHANGED type of operation. No COMMAREA is required for this request. The **eci\_luw\_token** field must contain the token that was received during the ECI\_STATE\_CHANGED call.

#### **eci\_luw\_token**

Optional input and output parameter.

When a deferred status request is being set up (**eci\_extend\_mode** set to ECI\_STATE\_CHANGED), the token identifying the request is returned in the **eci\_luw\_token** field.

When a deferred status request is being cancelled (**eci\_extend\_mode** set to ECI\_STATE\_CANCEL), the **eci\_luw\_token** field must contain the token that was received during the ECI\_STATE\_CHANGED call.

This field is not used when other values of **eci\_extend\_mode** are specified.

**eci\_sysid**

Required input parameter.

Reserved for future use, initialize this field with nulls before the start of each logical unit of work.

**eci\_version**

Required input parameter.

The version of the ECI for which the application is coded. Use the value ECI\_VERSION\_1A.

**eci\_system\_name**

Optional input parameter.

An 8-character field that specifies the name of the server for which status information is required. Pad unused characters with spaces. If supplied, it is one of the server names returned by **CICS\_EciListSystems**. The value might be supplied whenever **eci\_luw\_token** is set to zero.

If the field is set to nulls, the default CICS server is selected; the name of the chosen server is returned in this field.

**Return codes**

See also the general list of return codes for **CICS\_ExternalCall** in “CICS\_ExternalCall (ECI\_Parms)” on page 1.

**ECI\_NO\_ERROR**

The call completed successfully.

**ECI\_ERR\_INVALID\_DATA\_LENGTH**

The value in **eci\_commarea\_length** field is outside the valid range, or is inconsistent with the value in **eci\_commarea**, being zero for a non-null **eci\_commarea** pointer, or non-zero for a null **eci\_commarea** pointer.

**ECI\_ERR\_INVALID\_EXTEND\_MODE**

The value in **eci\_extend\_mode** field is not valid.

**ECI\_ERR\_LUW\_TOKEN**

The value supplied in **eci\_luw\_token** is invalid.

**ECI\_ERR\_INVALID\_DATA\_AREA**

Either the pointer to the ECI parameter block is invalid, or the pointer supplied in **eci\_commarea** is invalid.

**ECI\_ERR\_UNKNOWN\_SERVER**

The requested server could not be located. Only servers returned by **CICS\_EciListSystems** are acceptable.

**ECI\_STATE\_ASYNC call type**

The ECI\_STATE\_ASYNC call type provides an asynchronous status information call. The calling application gets control back when the ECI accepts the request. At this point the parameters have been validated; however, the request might still be queued for later processing.

**Purpose**

If no callback routine is provided, the application must use a reply solicitation call to determine that the request has ended and what the outcome was.

If a callback routine is provided, the callback routine **eci\_callback** is invoked when a response is available.

**Note:** Some compilers do not support the use of callback routines. Consult your compiler documentation for more information.

**Note:** It is important that the ECI parameter blocks of outstanding ECI\_STATE\_ASYNC calls are not modified before the results of the call are received. Results will be incorrect if these blocks are modified before this stage.

When the callback routine is called, it is passed a single parameter—the value specified in **eci\_message\_qualifier**. This enables the callback routine to identify the asynchronous call that is completing. Note the following guidelines on the use of the callback routine:

1. Perform the minimum possible processing within the callback routine.
2. ECI functions cannot be invoked from within the callback routine.
3. The callback routine indicate to the main body of the application that the reply is available using an appropriate technique for the operating system upon which the ECI application is executing. For example, in a multithreaded environment, the callback routine might post a semaphore to signal another thread that an event has occurred.
4. The application, not the callback routine, must use a reply solicitation call to receive the actual response.

## ECI parameter block fields

Set the ECI parameter block to nulls before setting the input parameter fields.

### **eci\_call\_type**

Required input parameter.

Must be set to ECI\_STATE\_ASYNC.

### **eci\_commarea**

Input parameter, required except when **eci\_extend\_mode** has the value ECI\_STATE\_CANCEL.

A pointer to the area of storage where the application receives the returned COMMAREA containing status information. See the information about status information calls in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* and “ECI status block” on page 26 for more details.

If **eci\_extend\_mode** has the value ECI\_STATE\_CANCEL, supply a null pointer and set the length (specified in **eci\_commarea\_length**) to zero.

### **eci\_commarea\_length**

Required input parameter, except when **eci\_extend\_mode** has the value ECI\_STATE\_CANCEL.

The length of the COMMAREA in bytes, which must be the length of the ECI\_STATUS structure that gives the layout of the status information COMMAREA. See the information about status information calls in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* and “ECI status block” on page 26, for more details. Area size must not exceed 32,500 bytes

If no COMMAREA is required, set this field to zero and supply a null pointer in **eci\_commarea**.

**reserved1**

Output parameter.

This field was previously **eci\_system\_return\_code**. In the CICS Transaction Gateway Version 3.1, and higher, this field is reserved for compatibility with earlier versions. No information is returned in this field; all system errors are written to the error log.

**eci\_extend\_mode**

Required input parameter.

An integer field further qualifying the call type. The values for this field (shown by their symbolic names) are as follows:

**ECI\_STATE\_IMMEDIATE**

Force a status reply to be sent immediately it is available. The layout of the returned COMMAREA is defined in the ECI\_STATUS structure. See the information about status information calls in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* and “ECI status block” on page 26, for more details.

**ECI\_STATE\_CHANGED**

Force a status reply to be sent only when the status changes. The supplied COMMAREA must contain the status as perceived by the application. A reply is sent only when there is a change from the status that the application supplied. The layout of the COMMAREA is defined in the ECI\_STATUS structure. See the information about status information calls in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* and “ECI status block” on page 26, for more details. The **eci\_luw\_token** field that is returned on the immediate response identifies the logical unit of work to which this call belongs.

**ECI\_STATE\_CANCEL**

Cancel an ECI\_STATE\_CHANGED type of operation. No COMMAREA is required for this request. The **eci\_luw\_token** field must contain the token that was received during the ECI\_STATE\_CHANGED call.

**eci\_message\_qualifier**

Optional input parameter.

An integer field allowing you to identify each asynchronous call if you are making more than one. If a callback routine is specified, the value in this field is returned to the callback routine during the notification process.

**eci\_luw\_token**

Optional input and output parameter.

When a deferred status request is being set up (**eci\_extend\_mode** set to ECI\_STATE\_CHANGED), the token identifying the request is returned in the **eci\_luw\_token** field.

When a deferred status request is being cancelled (**eci\_extend\_mode** set to ECI\_STATE\_CANCEL), the **eci\_luw\_token** field must contain the token that was received during the ECI\_STATE\_CHANGED call.

This field is not used when other values of **eci\_extend\_mode** are specified.

**eci\_sysid**

Required input parameter.

Reserved for future use, but initialize this field with nulls before the start of each logical unit of work.

#### **eci\_version**

Required input parameter.

The version of the ECI for which the application is coded. Use the value ECI\_VERSION\_1A.

#### **eci\_system\_name**

Optional input parameter.

An 8-character field that specifies the name of the server for which status information is requested. Pad unused characters with spaces. If supplied, it is one of the server names returned by **CICS\_EciListSystems**. The value might be supplied whenever **eci\_luw\_token** is set to zero.

If the field is set to nulls, the default CICS server is selected. You can find out the name of the server from the **eci\_system\_name** field of the reply solicitation call you use to get the result of this asynchronous request. field.

#### **eci\_callback**

Optional input parameter.

A pointer to the routine to be called when the asynchronous request completes. (The callback routine will be called only if the return code is ECI\_NO\_ERROR, and the pointer is not null.)

### **Return codes**

See also the general list of return codes for **CICS\_ExternalCall** in “CICS\_ExternalCall (ECI\_Parms)” on page 1.

If the return code is not ECI\_NO\_ERROR, the callback routine will not be called, and there will be no asynchronous reply for this request.

#### **ECI\_NO\_ERROR**

The call completed successfully.

#### **ECI\_ERR\_INVALID\_DATA\_LENGTH**

The value in **eci\_commarea\_length** field is outside the valid range, or is inconsistent with the value in **eci\_commarea**, being zero for a non-null **eci\_commarea** pointer, or non-zero for a null **eci\_commarea** pointer.

#### **ECI\_ERR\_INVALID\_EXTEND\_MODE**

The value in **eci\_extend\_mode** field is not valid.

#### **ECI\_ERR\_LUW\_TOKEN**

The value supplied in **eci\_luw\_token** is invalid.

#### **ECI\_ERR\_INVALID\_DATA\_AREA**

Either the pointer to the ECI parameter block is invalid, or the pointer supplied in **eci\_commarea** is invalid.

### **ECI\_GET\_REPLY call type**

The ECI\_GET\_REPLY call type provides a reply solicitation call to return information appropriate to any outstanding reply for any asynchronous request. If there is no such reply, ECI\_ERR\_NO\_REPLY is returned. (To cause the application to wait until a reply is available, use call type ECI\_GET\_REPLY\_WAIT instead.)

## Purpose

**Note:** It is important that the Eci parameter blocks of outstanding ECI\_ASYNC calls are not modified before the results of the call are received (for example using this get reply call). Results will be incorrect if these blocks are modified before this stage.

## ECI parameter block fields

Set the ECI parameter block to nulls before setting the input parameter fields.

The following fields are the fields of the ECI parameter block that might be supplied as input.

In the course of an ECI\_GET\_REPLY call, the ECI parameter block is updated as follows:

1. All the outputs from the reply, some of which overwrite input fields, are added. These fields are those that are output from the corresponding synchronous version of the asynchronous request.
2. The **eci\_message\_qualifier** value supplied as input to the asynchronous request to which this reply relates is restored.
3. Any inputs that are not updated become undefined, except the pointer to the COMMAREA. Do not use the contents of these fields again.

### **eci\_call\_type**

Required input parameter.

Must be set to ECI\_GET\_REPLY.

### **eci\_commarea**

Optional input parameter.

A pointer to the area of storage where the application receives the returned COMMAREA. The contents of the returned commarea depend on the type of asynchronous call to which a reply is being sought. For a program link call, it is the COMMAREA expected to be returned from the called program, if any. For a status information call, except when **eci\_extend\_mode** has the value ECI\_STATE\_CANCEL, it is a COMMAREA containing status information. See the information about status information calls in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* and “ECI status block” on page 26, for more details.

If no COMMAREA is required, supply a null pointer and set the length (specified in **eci\_commarea\_length**) to zero.

If the code page of the application is different from the code page of the server, data conversion must be performed at the server. To do this, use CICS-supplied resource conversion capabilities, such as the DFHCNV macro definitions.

### **eci\_commarea\_length**

Required input parameter.

The length of the COMMAREA in bytes. This value must not exceed 32,500. (Some client/server combinations might allow larger COMMAREAs, but this is not guaranteed to work.)

If no COMMAREA is required, set this field to zero and supply a null pointer in **eci\_commarea**.

**eci\_sysid**

Required input parameter.

Reserved for future use, but initialize this field with nulls before the start of each logical unit of work.

**eci\_version**

Required input parameter.

The version of the ECI for which the application is coded. Use the value ECI\_VERSION\_1A.

**Return codes**

See also the general list of return codes for **CICS\_ExternalCall** in “CICS\_ExternalCall (ECI\_Parms)” on page 1.

**ECI\_NO\_ERROR**

The asynchronous request to which this reply relates completed successfully.

**ECI\_ERR\_INVALID\_DATA\_LENGTH**

The value in **eci\_commarea\_length** field is unacceptable for one of the following reasons:

- It is outside the valid range.
- It is inconsistent with the value in **eci\_commarea**, being zero for a non-null **eci\_commarea** pointer, or non-zero for a null **eci\_commarea** pointer.
- It is not large enough for the output COMMAREA from the asynchronous request to which this reply relates.

In the last case, you can use the output **eci\_commarea\_length** to allocate more storage for the COMMAREA, and then use the output **eci\_message\_qualifier** (if it identifies the asynchronous request uniquely) with an ECI\_GET\_SPECIFIC\_REPLY call type to retrieve the reply.

**ECI\_ERR\_NO\_CICS**

The CICS server specified in **eci\_system\_name** in the asynchronous request to which this reply relates is not available. No resources have been updated.

**ECI\_ERR\_CICS\_DIED**

A logical unit of work was to be begun or continued by the asynchronous request to which this reply relates, but the CICS server was no longer available. If **eci\_extend\_mode** was ECI\_EXTENDED, the changes are backed out, and the logical unit of work ends. If **eci\_extend\_mode** was ECI\_NO\_EXTEND, ECI\_COMMIT, or ECI\_BACKOUT, the application cannot determine whether the changes have been committed or backed out, and must log this condition to aid future manual recovery.

**ECI\_ERR\_NO\_REPLY**

There was no outstanding reply.

**ECI\_ERR\_TRANSACTION\_ABEND**

The asynchronous request to which this reply relates caused a program to be executed in the server, but the CICS transaction that executed the requested program abended. The abend code will be found in **eci\_abend\_code**. For information about abend codes and their meaning, consult the documentation for the server system to which the request was directed.

**ECI\_ERR\_THREAD\_CREATE\_ERROR**

The CICS server or CICS Transaction Gateway failed to create the thread to process the asynchronous call to which this reply relates.

**ECI\_ERR\_RESOURCE\_SHORTAGE**

The server implementation or CICS Transaction Gateway did not have enough resources to complete the asynchronous request to which this reply relates.

**ECI\_ERR\_INVALID\_DATA\_AREA**

Either the pointer to the ECI parameter block is invalid, or the pointer supplied in `eci_commarea` is invalid.

**ECI\_ERR\_ROLLEDBACK**

The asynchronous request to which this reply relates attempted to commit a logical unit of work, but the server was unable to commit the changes, and backed them out instead.

**ECI\_ERR\_UNKNOWN\_SERVER**

The asynchronous request to which this reply relates specified a server that could not be located. Only servers returned by `CICS_EciListSystems` are acceptable.

**ECI\_ERR\_MAX\_SESSIONS**

There were not enough resources to satisfy the asynchronous request to which this reply relates. The maximum number of concurrent requests handled by the Client daemon, as defined by the configuration parameter `maxrequests` in the configuration file, has been reached.

**ECI\_ERR\_MAX\_SYSTEMS**

The asynchronous request to which this reply relates attempted to start requests to more servers than your configuration allows. Consult the documentation for your CICS Transaction Gateway or server to see how to control the number of servers you can use.

**ECI\_ERR\_SECURITY\_ERROR**

You did not supply a valid combination of user ID and password on the asynchronous request to which this reply relates.

**ECI\_GET\_REPLY\_WAIT call type**

The `ECI_GET_REPLY_WAIT` call type provides a reply solicitation call to return information appropriate to any outstanding reply for any asynchronous request. If there is no such reply, the application waits until there is. (You can get an indication that no reply is available by using call type `ECI_GET_REPLY` instead.)

**Purpose**

**Note:** It is important that the Eci parameter blocks of outstanding `ECI_STATE_ASYNC` calls are not modified before the results of the call are received. Results will be incorrect if these blocks are modified before this stage.

**ECI parameter block fields**

Same as for `ECI_GET_REPLY`, but `eci_call_type` must be set to `ECI_GET_REPLY_WAIT`.

**Return codes**

Same as for `ECI_GET_REPLY`, except that `ECI_ERR_NO_REPLY` cannot be returned.

## ECI\_GET\_SPECIFIC\_REPLY call type

The ECI\_GET\_SPECIFIC\_REPLY call type provides a reply solicitation call to return information appropriate to any outstanding reply that matches the **eci\_message\_qualifier** input. If there is no such reply, ECI\_ERR\_NO\_REPLY is returned. (To cause the application to wait until a reply is available, use call type ECI\_GET\_REPLY\_WAIT instead.)

### Purpose

It is important that the Eci parameter blocks of outstanding ECI\_STATE\_ASYNC calls are not modified before the results of the call are received. Results will be incorrect if these blocks are modified before this stage.

### ECI parameter block fields

Set the ECI parameter block to nulls before setting the input parameter fields.

The following fields are the fields of the ECI parameter block that might be supplied as input.

In the course of an ECI\_GET\_REPLY call, the ECI parameter block is updated as follows:

1. All the outputs from the reply, some of which overwrite input fields, are added. These fields are those that are output from the corresponding synchronous version of the asynchronous request.
2. Any inputs that are not updated become undefined, except the pointer to the COMMAREA and the input **eci\_message\_qualifier**. Do not use the contents of these fields again.

#### **eci\_call\_type**

Required input parameter.

Must be set to ECI\_GET\_SPECIFIC\_REPLY.

#### **eci\_commarea**

Optional input parameter.

A pointer to the area of storage where the application receives the returned COMMAREA. The contents of the returned commarea depend on the type of asynchronous call to which a reply is being sought. For a program link call, it is the COMMAREA expected to be returned from the called program, if any. For a status information call, except one in which **eci\_extend\_mode** had the value ECI\_STATE\_CANCEL, it is a COMMAREA containing status information. See the information about status information calls in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* and “ECI status block” on page 26, for more details.

If the code page of the application is different from the code page of the server, data conversion must be performed at the server. To do this, use CICS-supplied resource conversion capabilities, such as the DFHCNV macro definitions.

#### **eci\_commarea\_length**

Required input parameter.

The length of the COMMAREA in bytes. This value must not exceed 32,500. (Some client/server combinations might allow larger COMMAREAs, but this is not guaranteed to work.)

**eci\_message\_qualifier**

Required input parameter.

An integer field that identifies the asynchronous call for which a reply is being solicited.

**eci\_sysid**

Required input parameter.

Reserved for future use, but initialize this field with nulls before the start of each logical unit of work.

**eci\_version**

Required input parameter.

The version of the ECI for which the application is coded. Use the value ECI\_VERSION\_1A.

**Return codes**

See also the general list of return codes for **CICS\_ExternalCall** in “CICS\_ExternalCall (ECI\_Parms)” on page 1.

**ECI\_NO\_ERROR**

The call completed successfully.

**ECI\_ERR\_INVALID\_DATA\_LENGTH**

The value in **eci\_commarea\_length** field is unacceptable for one of the following reasons:

- It is outside the valid range.
- It is inconsistent with the value in **eci\_commarea**, being zero for a non-null **eci\_commarea** pointer, or non-zero for a null **eci\_commarea** pointer.
- It is not large enough for the output COMMAREA from the asynchronous request to which this reply relates.

In the last case, you can use the output **eci\_commarea\_length** to allocate more storage for the COMMAREA, and then retry the ECI\_GET\_SPECIFIC\_REPLY call.

**ECI\_ERR\_NO\_CICS**

The CICS server specified in **eci\_system\_name** in the asynchronous request to which this reply relates is not available. No resources have been updated.

**ECI\_ERR\_CICS\_DIED**

A logical unit of work was to be begun or continued by the asynchronous request to which this reply relates, but the CICS server was no longer available. If **eci\_extend\_mode** was ECI\_EXTENDED, the changes are backed out, and the logical unit of work ends. If **eci\_extend\_mode** was ECI\_NO\_EXTEND, ECI\_COMMIT, or ECI\_BACKOUT, the application cannot determine whether the changes have been committed or backed out, and must log this condition to aid future manual recovery.

**ECI\_ERR\_NO\_REPLY**

There was no outstanding reply that matched the input **eci\_message\_qualifier**.

**ECI\_ERR\_TRANSACTION\_ABEND**

The asynchronous request to which this reply relates caused a program to be executed in the server, but the CICS transaction that executed the

requested program ended abnormally. The abend code is in **eci\_abend\_code**. For information about abend codes and their meaning, consult the documentation for the server system to which the request was directed.

#### **ECI\_ERR\_THREAD\_CREATE\_ERROR**

The CICS server or CICS Transaction Gateway failed to create the thread to process the asynchronous request to which this reply relates.

#### **ECI\_ERR\_RESOURCE\_SHORTAGE**

The CICS server or CICS Transaction Gateway did not have enough resources to complete the asynchronous request to which this reply relates.

#### **ECI\_ERR\_INVALID\_DATA\_AREA**

Either the pointer to the ECI parameter block is invalid, or the pointer supplied in **eci\_commarea** is invalid.

#### **ECI\_ERR\_ROLLEDBACK**

The asynchronous request to which this reply relates attempted to commit a logical unit of work, but the server was unable to commit the changes, and backed them out instead.

#### **ECI\_ERR\_UNKNOWN\_SERVER**

The asynchronous request to which this reply relates specified a server that could not be located. Only servers returned by **CICS\_EciListSystems** are acceptable.

#### **ECI\_ERR\_MAX\_SESSIONS**

There were not enough resources to satisfy the asynchronous request to which this reply relates. The maximum number of concurrent requests handled by the Client daemon, as defined by the configuration parameter **maxrequests** in the configuration file, has been reached.

#### **ECI\_ERR\_MAX\_SYSTEMS**

The asynchronous request to which this reply relates attempted to start requests to more servers than your configuration allows. Consult the documentation for your CICS Transaction Gateway or server to see how to control the number of servers you can use.

#### **ECI\_ERR\_SECURITY\_ERROR**

You did not supply a valid combination of user ID and password on the asynchronous request to which this reply relates.

#### **ECI\_GET\_SPECIFIC\_REPLY\_WAIT call type**

The **ECI\_GET\_SPECIFIC\_REPLY\_WAIT** call type provides a reply solicitation call to return information appropriate to any outstanding reply that matches the input **eci\_message\_qualifier**.

### **Environment**

#### **Purpose**

If there is no such reply, the application waits until there is. (You can get an indication that no reply is available by using call type **ECI\_GET\_SPECIFIC\_REPLY** instead.)

**Note:** It is important that the ECI parameter blocks of outstanding **ECI\_STATE\_ASYNC** calls are not modified before the results of the call are received. Results will be incorrect if these blocks are modified before this stage.

## ECI parameter block fields

Same as for ECI\_GET\_SPECIFIC\_REPLY, but **eci\_call\_type** must be set to ECI\_GET\_SPECIFIC\_REPLY\_WAIT.

## Return codes

Same as for ECI\_GET\_SPECIFIC\_REPLY, except that ECI\_ERR\_NO\_REPLY cannot be returned.

**Note:** If you issue an ECI\_GET\_SPECIFIC\_REPLY\_WAIT call against an outstanding ECI\_STATE\_AYSNC call with **eci\_extend\_mode** set to ECI\_STATE\_CHANGED, no response will ever be received if an ECI\_STATE\_ASYNC call with **eci\_extend\_mode** set to ECI\_STATE\_CANCEL is issued.

## ECI status block

The ECI status block is used in status information calls to pass information to and from the ECI. It contains the following fields:

### ConnectionType

An integer field specifying the type of system on which the application is running, with the following possible values:

#### ECI\_CONNECTED\_NOWHERE

Application is not connected to anything.

#### ECI\_CONNECTED\_TO\_CLIENT

Application is running on a client system.

#### ECI\_CONNECTED\_TO\_SERVER

Application is using a server implementation of the ECI.

### CicsServerStatus

An integer field specifying the state of the CICS server, with the following possible values:

#### ECI\_SERVERSTATE\_UNKNOWN

The CICS server state could not be determined.

#### ECI\_SERVERSTATE\_UP

The CICS server is available to run programs.

#### ECI\_SERVERSTATE\_DOWN

The CICS server is not available to run programs.

### CicsClientStatus

An integer field specifying the state of the Client daemon, with the following possible values:

#### ECI\_CLIENTSTATE\_UNKNOWN

The Client daemon state could not be determined.

#### ECI\_CLIENTSTATE\_UP

The Client daemon is available to receive ECI calls.

#### ECI\_CLIENTSTATE\_INAPPLICABLE

The application is using a server implementation of the ECI.

## CICS\_EciListSystems (NameSpace Systems List)

### Purpose

The **CICS\_EciListSystems** function provides a list of CICS servers to which **CICS\_ExternalCall** requests can be directed. There is no guarantee that a communications link exists between the Client daemon and any server in the list, or that any of the servers is available to process requests.

The list of servers is returned as an array of system information structures, one element for each CICS server. The structure, called **CICS\_EciSystem\_t**, defines the following fields.

### SystemName

A pointer to a null-terminated string specifying the name of a CICS server. If the name is shorter than **CICS\_ECI\_SYSTEM\_MAX**, it is padded with spaces to a length of **CICS\_ECI\_SYSTEM\_MAX + 1**.

### Description

A pointer to a null-terminated string that provides a description of the system, if one is available. If the description is shorter than **CICS\_ECI\_DESCRIPTION\_MAX** characters, it is padded with nulls to a length of **CICS\_ECI\_DESCRIPTION\_MAX + 1**.

### Parameters

#### NameSpace

A pointer reserved for future use. Ensure that this is a null pointer.

#### Systems

On entry to the function, this parameter specifies the number of elements in the array provided in the **List** parameter. On return it contains the actual number of systems found.

**List** An array of **CICS\_EciSystem\_t** structures that are filled in and returned by the function. The application must provide storage for the array, and must set the **Systems** parameter to indicate the number of elements in the array.

### Return Codes

#### ECI\_NO\_ERROR

The function completed successfully. The number of systems found is at least one, and does not exceed the value supplied as input in the **Systems** parameter.

#### ECI\_ERR\_MORE\_SYSTEMS

There was not enough space in the **List** array to store the information. The supplied array has been filled, and the **Systems** parameter has been updated to contain the total number of systems found, so that you can reallocate an array of suitable size and try the function again.

#### ECI\_ERR\_NO\_SYSTEMS

No CICS servers can be located. In this case, the value returned in **Systems** is zero.

#### ECI\_ERR\_NO\_CICS

The Client daemon is not active.

#### ECI\_ERR\_INVALID\_DATA\_LENGTH

The value specified in the **Systems** parameter is so large that the length of storage for the **List** parameter exceeds 32 767.

#### **ECI\_ERR\_CALL\_FROM\_CALLBACK**

The call was made from a callback routine.

#### **ECI\_ERR\_SYSTEM\_ERROR**

An internal system error occurred.

---

## **EPI**

This section describes the constants and data structures that you need to use the EPI, the functions provided by the EPI that can be called from an application program, and the EPI events that occur when CICS has data to pass to the EPI application.

### **EPI constants and data structures**

This section describes the constants and data structures that you will need to use the EPI.

They are referred to in “EPI functions” on page 33.

#### **EPI constants**

The following constants are referred to symbolically in the descriptions of the EPI data structures, functions, and events in this section.

The values given here are to help you understand the descriptions. However, your code uses the symbolic names of EPI constants provided for the programming language you are using.

#### **Lengths of fields**

- CICS\_EPI\_SYSTEM\_MAX (8)
- CICS\_EPI\_DESCRIPTION\_MAX (60)
- CICS\_EPI\_NETNAME\_MAX (8)
- CICS\_EPI\_TRANSID\_MAX (4)
- CICS\_EPI\_ABEND\_MAX (4)
- CICS\_EPI\_DEVTYPE\_MAX (16)
- CICS\_EPI\_ERROR\_MAX (60).
- CICS\_EPI\_PASSWORD\_MAX (10)
- CICS\_EPI\_USERID\_MAX (10)
- CICS\_EPI\_MAPNAME\_MAX (7)
- CICS\_EPI\_MAPSETNAME\_MAX (8)
- CICS\_EPI\_TERMID\_MAX (4)

#### **Relating to TermIndex**

- CICS\_EPI\_TERM\_INDEX\_NONE 0xFFFF.

**Version numbers** (See the information about EPI versions in the *CICS Transaction Gateway for Multiplatforms: Programming Guide*.)

- CICS\_EPI\_VERSION\_200

#### **EPI data structures**

The following data structures are available for use with the EPI.

- CICS\_EpiSystem\_t
- CICS\_EpiAttributes\_t

- **CICS\_EpiDetails\_t**
- **CICS\_EpiEventData\_t**

In the descriptions of the fields in the data structures, fields described as strings are null-terminated strings.

### **CICS\_EpiSystem\_t:**

The **CICS\_EpiSystem\_t** structure contains the name and description of a CICS server.

#### **Purpose**

An array of these structures is returned from the **CICS\_EpiListSystems** function.

#### **Fields**

##### **SystemName**

A string naming the CICS server. It can be passed as a parameter to the **CICS\_EpiAddTerminal** and **CICS\_EpiAddExTerminal** functions, to identify the CICS server in which the terminal resource is installed. If the name is shorter than **CICS\_EPI\_SYSTEM\_MAX** characters, it is padded with nulls to a length of **CICS\_EPI\_SYSTEM\_MAX + 1**.

##### **Description**

A string giving a brief description of the server. If the description is shorter than **CICS\_EPI\_DESCRIPTION\_MAX**, it is padded with nulls to a length of **CICS\_EPI\_DESCRIPTION\_MAX + 1**.

### **CICS\_EpiAttributes\_t:**

The **CICS\_EpiAttributes\_t** structure holds information about the attributes to be associated with a terminal resource installed by the **CICS\_EpiAddExTerminal** function.

#### **Fields**

##### **EpiAddType**

Indicates whether the application is prepared to wait until the request to install the terminal is complete. Use one of the following values:

##### **CICS\_EPI\_ADD\_ASYNC**

The calling application gets control back when the request to install the terminal resource has been accepted; at this point the parameters have been validated.

Assuming valid parameters, the **CICS\_EPI\_EVENT\_ADD\_TERM** event is generated when the request to install the terminal has completed.

The **TermIndex** is returned for use with the **CICS\_EpiGetEvent** function.

##### **CICS\_EPI\_ADD\_SYNC**

The calling application gets control back when the request to install the terminal resource has completed. Returned information is immediately available.

**InstallTimeOut**

A value in the range 0 through 3600, specifying the maximum time in seconds that installation of the terminal resource is allowed to take; a value of 0 means that no limit is set.

A value of 3600 is assumed if a larger value is specified.

**ReadTimeOut**

A value in the range 0 through 3600, specifying the maximum time in seconds that is allowed between notification of a CICS\_EPI\_EVENT\_CONVERSE event for the terminal resource and the following invocation of the **CICS\_EpiReply**; a value of 0 means that no limit is set.

A value of 3600 is assumed if a larger value is specified.

If time out occurs, the conversation is abended. This results in a CICS\_EPI\_EVENT\_END\_TRAN event being generated; the **EndReason** field is set to CICS\_EPI\_READTIMEOUT\_EXPIRED; the **AbendCode** field is not set.

**SignonCapability**

Indicates whether the application can start server-provided sign-on and sign-off transactions from the terminal resource. Use one of the following values:

**CICS\_EPI\_SIGNON\_CAPABLE**

The terminal resource is to be installed as sign-on capable.

**CICS\_EPI\_SIGNON\_INCAPABLE**

The resource is to be installed as sign-on incapable.

**CCSID**

A value in the range 1 through 65536 specifying the coded character set identifier (CCSID) that identifies the coded graphic character set used by the client application for data passed between the terminal resource and CICS transactions.

A value of 0 means that a default CCSID is used.

For details on the CCSID values for various character sets, see the information about Supported conversions in the *CICS Transaction Gateway: UNIX and Linux Administration*.

**UserId**

A string specifying the user ID to be associated with the terminal resource. If the user ID is shorter than CICS\_EPI\_USERID\_MAX, it must be padded with nulls to a length of CICS\_EPI\_USERID\_MAX+1.

**Password**

A string specifying the password to be associated with the terminal resource. If the password is shorter than CICS\_EPI\_PASSWORD\_MAX characters, it must be padded with nulls to a length of CICS\_EPI\_PASSWORD\_MAX+1.

**CICS\_EpiDetails\_t:**

The **CICS\_EpiDetails\_t** structure holds information about a terminal resource installed by the **CICS\_EpiAddTerminal** or the **CICS\_EpiAddExTerminal** function.

## Fields

### NetName

A string specifying the VTAM-style netname of the terminal resource. If the name is shorter than CICS\_EPI\_NETNAME\_MAX characters, it is padded with nulls to a length of CICS\_EPI\_NETNAME\_MAX + 1.

### NumLines

The number of rows supported by the terminal resource.

### NumColumns

The number of columns supported by the terminal resource.

### MaxData

The maximum size of data that can be sent to this terminal resource from a CICS transaction, and the maximum size of data that can be sent from this terminal resource to a CICS transaction by a **CICS\_EpiStartTran** call or **CICS\_EpiReply** call.

The maximum size can be defined in the model terminal definition specified by the **DevType** parameter on the **CICS\_EpiAddTerminal** call that installed the terminal resource in the server. If the value is not specified in the model terminal definition, a default value of 12000 is assumed.

### ErrLastLine

1 if the terminal resource will display error messages on its last row, 0 otherwise.

### ErrIntensify

1 if the terminal resource will display error messages intensified, 0 otherwise.

### ErrColor

The 3270 attribute defining the color to be used to display error messages.

### ErrHighlight

The 3270 attribute defining the highlight value to be used to display error messages.

### Hilight

1 if the terminal resource is defined to support extended highlighting, 0 otherwise.

**Color** 1 if the terminal resource is defined to support color, 0 otherwise.

### System

A string specifying the name of the server in which the terminal resource has been installed. If the name is shorter than CICS\_EPI\_SYSTEM\_MAX characters, it is padded with nulls to a length of CICS\_EPI\_SYSTEM\_MAX + 1.

### TermId

A string specifying the name of the terminal resource. If the name is shorter than CICS\_EPI\_TERMID\_MAX characters, it is padded with nulls to a length of CICS\_EPI\_TERMID\_MAX + 1.

### SignonCapability

The sign-on capability assigned by the server to the terminal resource:

#### CICS\_EPI\_SIGNON\_CAPABLE

The application might start server-provided sign-on and sign-off transactions at the terminal resource.

### **CICS\_EPI\_SIGNON\_INCAPABLE**

The application might not start server-provided sign-on and sign-off transactions at the terminal resource.

### **CICS\_EPI\_SIGNON\_UNKNOWN**

The **CICS\_EpiAddTerminal** function was used to add the terminal resource. (This value is also returned if the **CICS\_EpiAddExTerminal** function was used to add the terminal resource and prerequisite changes have not been applied to the server.)

## **CICS\_EpiEventData\_t:**

The **CICS\_EpiEventData\_t** structure holds details of a terminal-related event.

### **Purpose**

Not all fields are valid for all events, and fields that are not valid are set to nulls. This structure is an output from **CICS\_EpiGetEvent**.

### **Fields**

#### **TermIndex**

The terminal index for the terminal resource against which this event occurred.

**Event** The event indicator; that is, one of the event codes listed in “EPI events” on page 52.

#### **EndReason**

The reason for termination, if the event is a **CICS\_EPI\_EVENT\_END\_TERM** or **CICS\_EPI\_EVENT\_END\_TRAN** event.

#### **TransId**

A string specifying a transaction name. If the name is shorter than **CICS\_EPI\_TRANSID\_MAX** characters, it is padded with spaces to this length, followed by a single null character.

#### **Reserved1**

A reserved field.

Prior to CICS Transaction Gateway Version 3.1, this field was called **AbendCode**.

**Data** A pointer to a buffer that is updated with any terminal data stream associated with the event.

On input set the **Data** parameter to point to a **CICS\_EpiDetails\_t** structure on the first invocation of **CICS\_EpiGetEvent** for a terminal being added asynchronously. The details structure is updated on return from **CICS\_EpiGetEvent**.

**Size** The maximum size of the buffer addressed by **Data**. On return from the **CICS\_EpiGetEvent** call, this contains the actual length of data returned.

#### **EndReturnCode**

A string containing the **CICS\_EPI\_returncode**.

#### **MapName**

A string specifying the name of the map that was most recently referenced in the MAP option of a SEND MAP command processed for the terminal resource, if the event is a **CICS\_EPI\_EVENT\_SEND** or a

CICS\_EPI\_EVENT\_CONVERSE event. If the terminal resource is not supported by BMS, or the server has no record of any map being sent, the value returned is spaces. If the name is shorter than CICS\_EPI\_MAPNAME\_MAX characters, it is padded with spaces to this length, followed by a single null character.

#### MapSetName

A string specifying the name of the mapset that was most recently referenced in the MAPSET option of a SEND MAP command processed for the terminal resource, if the event is a CICS\_EPI\_EVENT\_SEND or a CICS\_EPI\_EVENT\_CONVERSE event. If the MAPSET option was not specified on the most recent request, BMS used the map name as the mapset name. In both cases, the mapset name used might have been suffixed by a terminal suffix. If the terminal resource is not supported by BMS, or the server has no record of any mapset being sent, the value returned is spaces. If the name is shorter than CICS\_EPI\_MAPSETNAME\_MAX characters, it is padded with spaces to this length, followed by a single null character.

**Note:** Set the **Data** and **Size** fields before the call to **CICS\_EpiGetEvent** is made.

## EPI functions

This section describes the functions provided by the EPI that can be called from an application program.

Table 1 summarizes the functions of the interface, the parameters passed to each function, and the possible return codes from each function.

The mapping of actual return code values to the symbolic names is contained in the following files:

**C**        /include/cics\_epi.h

#### COBOL

      /copybook/cicsepi.cbl

*Table 1. Summary of EPI functions*

Function name	Parameters	Return codes: CICS_EPI_

Refer to the definitions of the functions to discover the types and usage of the parameters, the data structures used by the functions, and the meanings of the return codes.

## CICS\_EpiInitialize

The CICS\_EpiInitialize function initializes the EPI. All other EPI calls from this application are invalid before this call is made.

### Parameters

#### Version

The version of the EPI for which this application is coded. This makes it possible for old applications to remain compatible with future versions of the EPI. The version described here is CICS\_EPI\_VERSION\_200. See the information about EPI versions in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* for more information.

The EPI uses this parameter only for input.

### Return codes

#### CICS\_EPI\_ERR\_FAILED

The function failed for an unexpected reason.

#### CICS\_EPI\_ERR\_IS\_INIT

The EPI is already initialized.

#### CICS\_EPI\_ERR\_VERSION

The EPI cannot support the version requested.

#### CICS\_EPI\_NORMAL

The function completed successfully.

## CICS\_EpiTerminate

The CICS\_EpiTerminate function ends the application's use of the EPI, typically just before the application terminates.

All other EPI calls (except for CICS\_EpiInitialize) are invalid when this call has completed.

The application issues CICS\_EpiDelTerminal calls before terminating, to delete any terminal resources.

## Parameters

None.

## Return codes

### CICS\_EPI\_ERR\_FAILED

The function failed for an unexpected reason.

### CICS\_EPI\_ERR\_TTI\_ACTIVE

A transaction started from the EPI is still active or a CICS\_EpiGetEvent call is still outstanding.

### CICS\_EPI\_ERR\_NOT\_INIT

CICS\_EpiInitialize has not been executed.

### CICS\_EPI\_ERR\_IN\_CALLBACK

The function was called from a callback routine.

### CICS\_EPI\_NORMAL

The function completed successfully.

## CICS\_EpiListSystems

The CICS\_EpiListSystems function returns a list of CICS servers that are candidates to act as servers for EPI requests. There is no guarantee that a communications link exists between the CICS Transaction Gateway and any server in the list, or that any of the servers is available to process requests.

The list is returned as an array of system information structures, one element for each CICS server. See “CICS\_EpiSystem\_t” on page 29 for the contents of the structure.

EPI applications call this function immediately after each CICS\_EpiInitialize call made to determine which CICS servers are available.

## Parameters

### Namespace

A pointer reserved for future use. Ensure that this is a null pointer.

### Systems

A pointer to a number. On entry to the function, this number specifies the number of elements in the array specified in the **List** parameter. This value must accurately reflect the amount of storage that is available to the EPI to store the result. On return, it contains the actual number of servers found.

The EPI uses this parameter for both input and output.

**List** An array of CICS\_EpiSystem\_t structures that are filled in and returned by the function. The application must provide the storage for the array and must set the **Systems** parameter to indicate the number of elements in the array.

The EPI uses this parameter only for output.

## Return codes

### **CICS\_EPI\_ERR\_FAILED**

The function failed for an unexpected reason.

### **CICS\_EPI\_ERR\_MORE\_SYSTEMS**

There was not enough space in the **List** array to store the details of all the CICS servers found. The supplied array has been filled, and the **Systems** parameter has been updated to contain the total number of servers found, thus allowing you to reallocate an array of suitable size and try the function again.

### **CICS\_EPI\_ERR\_NO\_SYSTEMS**

No CICS servers can be located. In this case, the value returned in **Systems** is zero.

### **CICS\_EPI\_ERR\_NOT\_INIT**

CICS\_EpiInitialize has not been executed.

### **CICS\_EPI\_ERR\_NULL\_PARM**

**Systems** is a null pointer.

### **CICS\_EPI\_ERR\_IN\_CALLBACK**

The function was called from a callback routine.

### **CICS\_EPI\_NORMAL**

The function completed successfully. The number of systems found is at least one, and does not exceed the value supplied as input in the **Systems** parameter.

## **CICS\_EpiAddTerminal**

The CICS\_EpiAddTerminal function installs a new terminal resource, or reserves an existing terminal resource, for the application.

It provides a terminal index, which is used to identify the terminal resource on all further EPI calls. It also provides the information defined in the **CICS\_EpiDetails\_t** data structure.

The number of terminals that you can add with this operation is limited; the maximum varies according to the resources available on the client system.

The **CICS\_EpiAddTerminal** function adds terminal resources that have sign-on capability that depends on the server in which the terminal resource is installed; for example, they cannot sign on to CICS Transaction Server for z/OS® servers.

## Parameters

### **Namespace**

A pointer reserved for future use. Ensure that it is a null pointer.

### **System**

A pointer to a null-terminated string that specifies the name of the server in which the terminal resource is to be installed or reserved. If the name is shorter than CICS\_EPI\_SYSTEM\_MAX characters, it must be padded with nulls to a length of CICS\_EPI\_SYSTEM\_MAX + 1.

If the string is all nulls, the default CICS server is selected by the EPI. To determine the name of the server chosen, use **CICS\_EpiInquireSystem**.

The EPI uses this parameter only for input.

### NetName

A pointer to a null-terminated string that specifies the name of the terminal resource to be installed or reserved, or null. The interpretation of this name is server-dependent.

If a string is supplied that is shorter than CICS\_EPI\_NETNAME\_MAX, it must be padded with nulls to a length of CICS\_EPI\_NETNAME\_MAX + 1.

The string is transmitted to the server without conversion to uppercase.

The characters used are translated from the client code page to an EBCDIC code page before transmission. If the server uses an ASCII code page, they will be retranslated. The only characters guaranteed to be invariant under these translations are the uppercase characters A to Z and the numeric characters 0 to 9. Some EBCDIC servers (Katakana and Hebrew character set A) do not use the standard representations of the lowercase alphabetic characters; use them with care when communicating with such servers.

The use of **NetName** is as follows:

1. If a name is supplied using the **NetName**, and it matches the name of an existing terminal resource in the server, the server attempts to reserve that terminal resource.
2. If a name is supplied, but it does not match the name of an existing terminal resource in the server, the server installs a terminal resource using the model terminal definition specified by the **DevType** parameter, and gives it the input name. (If **DevType** is a null pointer, CICS\_EPI\_ERR\_TERMID\_INVALID is returned for CICS\_EPI\_VERSION\_200 or later, otherwise CICS\_EPI\_ERR\_FAILED is returned.)
3. If **NetName** is a null pointer, a terminal resource is installed using the model terminal definition specified in **DevType**. If **DevType** is a null pointer, the selected terminal type is not predictable, so you are advised to use **DevType** to ensure consistent results. The name of the terminal resource is returned in the **NetName** field of the CICS\_EpiDetails\_t structure.

The EPI uses this parameter only for input.

### DevType

A pointer to a null-terminated string that is used in the server to select a model terminal definition from which a terminal resource definition is generated, or a null pointer.

If a string is supplied that is shorter than CICS\_EPI\_DEVTYPE\_MAX characters, pad it with nulls to a length of CICS\_EPI\_DEVTYPE\_MAX + 1.

The string is transmitted to the server without conversion to uppercase.

The characters used are translated from the client's code page to an EBCDIC code page before transmission. If the server uses an ASCII code page, they will be retranslated. The only characters guaranteed to be invariant under these translations are the uppercase characters A to Z, and the numeric characters 0 to 9. Some EBCDIC servers (Katakana and Hebrew character set A) do not use the standard representations of the lowercase alphabetic characters; use them with care when communicating with such servers.

The EPI uses this parameter only for input.

### NotifyFn

A pointer to a callback routine that is called whenever an event occurs for

the terminal resource, such as the arrival of an ATI request. If a callback routine is not required, set this parameter to null. Not supported in COBOL applications.

The EPI uses this parameter only for input.

#### **Details**

A pointer to the **CICS\_EpiDetails\_t** structure that on return contains various details about the terminal resource that was installed or reserved.

The EPI uses the fields in this structure only for output.

#### **TermIndex**

A pointer to a terminal index for the terminal resource just installed or reserved. The returned terminal index must be used as input to all further EPI function calls to identify the terminal resource to which the function is directed. The terminal index supplied is the first available integer starting from 0.

The EPI uses this parameter only for output.

#### **Return codes**

##### **CICS\_EPI\_ERR\_FAILED**

The function failed for an unexpected reason.

##### **CICS\_EPI\_ERR\_NOT\_INIT**

**CICS\_EpiInitialize** has not been executed.

##### **CICS\_EPI\_ERR\_SYSTEM**

The specified server is not known to the client.

##### **CICS\_EPI\_ERR\_SECURITY**

The server rejected the attempt for security reasons.

##### **CICS\_EPI\_ERR\_NULL\_PARM**

**TermIndex** was a null pointer.

##### **CICS\_EPI\_ERR\_IN\_CALLBACK**

The function was called from a callback routine.

##### **CICS\_EPI\_ERR\_SERVER\_DOWN**

The function failed because the server was down.

##### **CICS\_EPI\_ERR\_TERMID\_INVALID**

The function failed because an invalid TermId was supplied.

##### **CICS\_EPI\_ERR\_MODELID\_INVALID**

The function failed because an invalid Model terminal definition was supplied.

##### **CICS\_EPI\_ERR\_NOT\_3270\_DEVICE**

The function failed because the device type supplied was not for a 3270 device.

##### **CICS\_EPI\_ERR\_ALREADY\_INSTALLED**

The function failed because the terminal was already installed.

##### **CICS\_EPI\_ERR\_SERVER\_BUSY**

The function failed because the server was busy.

##### **CICS\_EPI\_ERR\_RESOURCE\_SHORTAGE**

The CICS server or CICS Transaction Gateway did not have enough resources to complete the terminal installation.

### **CICS\_EPI\_ERR\_MAX\_SESSIONS**

The maximum number of concurrent requests handled by the Client daemon, as defined by the configuration parameter **maxrequests** in the configuration file, has been reached.

### **CICS\_EPI\_ERR\_MAX\_SYSTEMS**

An attempt was made to start connections to more servers than your configuration allows.

### **CICS\_EPI\_NORMAL**

The function completed successfully.

## **CICS\_EpiAddExTerminal**

The CICS\_EpiAddExTerminal function installs a new terminal resource, or reserves an existing terminal resource, for the application's use.

It provides a terminal index, which you can use to identify the terminal resource on all further EPI calls. It also provides the information defined in the CICS\_EpiDetails\_t data structure.

Some attributes, for example the character set and encoding scheme to be used for 3270 data and the sign-on capability, can be determined by the application. These attributes are specified in the **CCSID** and **SignonCapability** fields in the CICS\_EpiAttributes\_t structure.

## **Parameters**

### **System**

A pointer to a null-terminated string that specifies the name of the server in which the terminal resource is to be installed or reserved. If the name is shorter than CICS\_EPI\_SYSTEM\_MAX characters, it must be padded with nulls to a length of CICS\_EPI\_SYSTEM\_MAX + 1.

If the string is all nulls, the default CICS server is selected by the EPI. To determine the name of the server chosen, use CICS\_EpiInquireSystem.

The EPI uses this parameter only for input.

### **NetName**

A pointer to a null-terminated string that specifies the name of the terminal resource to be installed or reserved, or null. The interpretation of this name is server-dependent.

If a string is supplied that is shorter than CICS\_EPI\_NETNAME\_MAX, it must be padded with nulls to a length of CICS\_EPI\_NETNAME\_MAX + 1.

The string is transmitted to the server without conversion to uppercase.

The characters used are translated from the client's code page to an EBCDIC code page before transmission. If the server uses an ASCII code page, they will be retranslated. The only characters guaranteed to be invariant under these translations are the uppercase characters A to Z, and the numeric characters 0 to 9. Some EBCDIC servers (Katakana and Hebrew character set A) do not use the standard representations of the lowercase alphabetic characters; use them with care when communicating with such servers.

The use of **NetName** is as follows:

1. If a name is supplied using the **NetName**, and it matches the name of an existing terminal resource in the server, the server attempts to reserve that terminal resource.

2. If a name is supplied, but does not match the name of an existing terminal resource in the server, the server installs a terminal resource using the model terminal definition specified by the **DevType** parameter described below, and gives it the input name. (If **DevType** is a null pointer, CICS\_EPI\_ERR\_TERMID\_INVALID is returned for CICS\_EPI\_VERSION\_200 or later, otherwise CICS\_EPI\_ERR\_FAILED is returned.)
3. If **NetName** is a null pointer, a terminal resource is installed using the model terminal definition specified in **DevType**. If **DevType** is a null pointer, the selected terminal type is not predictable, so you are advised to use **DevType** to ensure consistent results. The name of the terminal resource is returned in the **NetName** field of the **CICS\_EpiDetails\_t** structure.

The EPI uses this parameter only for input.

### DevType

A pointer to a null-terminated string that is used in the server to select a model terminal definition from which a terminal resource definition is generated, or a null pointer.

If a string is supplied that is shorter than CICS\_EPI\_DEVTYPE\_MAX characters pad it with nulls to a length of CICS\_EPI\_DEVTYPE\_MAX + 1.

The string is transmitted to the server without conversion to uppercase.

The characters used are translated from the client's code page to an EBCDIC code page before transmission. If the server uses an ASCII code page, they will be retranslated. The only characters guaranteed to be invariant under these translations are the uppercase characters A to Z, and the numeric characters 0 to 9. Some EBCDIC servers (Katakana and Hebrew character set A) do not use the standard representations of the lowercase alphabetic characters; use them with care when communicating with such servers.

The EPI uses this parameter only for input.

### NotifyFn

A pointer to a callback routine that is called whenever an event occurs for the terminal resource, such as the arrival of an ATI request. If a callback routine is not required set this parameter to null. Not supported in COBOL applications.

The EPI uses this parameter only for input.

### Details

A pointer to the **CICS\_EpiDetails\_t** structure that on return contains various details about the terminal resource that was installed or reserved. For asynchronous calls set the **Details** parameter to NULL. If the pointer is not set to nulls, the details are added to the structure when the request to install the terminal resource has completed. For asynchronous calls this is done when the CICS\_EPI\_EVENT\_ADD\_TERM event occurs.

The EPI uses the fields in this structure only for output.

### TermIndex

A pointer to a terminal index for the terminal resource just installed or reserved. The returned terminal index must be used as input to all further EPI function calls to identify the terminal resource to which the function is directed. The terminal index supplied is the first available integer starting from 0.

The EPI uses this parameter only for output.

#### Attributes

A pointer to the **CICS\_EpiAttributes\_t** structure that specifies attributes definable by the client application for the terminal resource that is to be installed *The structure must be set to nulls before use.*

Default attributes are assumed if the pointer is set to null.

The EPI uses this parameter only for input.

#### Return codes

##### **CICS\_EPI\_ERR\_FAILED**

The function failed for an unexpected reason.

##### **CICS\_EPI\_ERR\_NOT\_INIT**

**CICS\_EpiInitialize** has not been executed.

##### **CICS\_EPI\_ERR\_SYSTEM**

The specified server is not known to the CICS Transaction Gateway.

##### **CICS\_EPI\_ERR\_SECURITY**

The server rejected the attempt for security reasons.

##### **CICS\_EPI\_ERR\_NULL\_PARM**

**TermIndex** was a null pointer.

##### **CICS\_EPI\_ERR\_IN\_CALLBACK**

The function was called from a callback routine.

##### **CICS\_EPI\_ERR\_RESPONSE\_TIMEOUT**

No response was received from the server within the specified interval.

##### **CICS\_EPI\_ERR\_SIGNON\_NOT\_POSS**

The server does not allow terminal resources to be installed as sign-on capable.

##### **CICS\_EPI\_ERR\_SERVER\_DOWN**

The function failed because the server was down.

##### **CICS\_EPI\_ERR\_PASSWORD\_INVALID**

The length of the password exceeds **CICS\_EPI\_PASSWORD\_MAX**.

##### **CICS\_EPI\_ERR\_ADDTYPE\_INVALID**

The value assigned to the *EpiAddType* field in the **CICS\_EpiAttributes\_t** structure is neither **CICS\_EPI\_ADD\_ASYNC** nor **CICS\_EPI\_ADD\_SYNC**.

##### **CICS\_EPI\_ERR\_SIGNONCAP\_INVALID**

The value assigned to the *SignonCapability* field in the **CICS\_EpiAttributes\_t** structure is neither **CICS\_EPI\_SIGNON\_CAPABLE** nor **CICS\_EPI\_SIGNON\_INCAPABLE**.

##### **CICS\_EPI\_ERR\_USERID\_INVALID**

The length of the user ID exceeds **CICS\_EPI\_USERID\_MAX**.

##### **CICS\_EPI\_ERR\_TERMID\_INVALID**

The function failed because an invalid TermId was supplied.

##### **CICS\_EPI\_ERR\_MODELID\_INVALID**

The function failed because an invalid Model terminal definition was supplied.

**CICS\_EPI\_ERR\_NOT\_3270\_DEVICE**

The function failed because the device type supplied was not for a 3270 device.

**CICS\_EPI\_ERR\_ALREADY\_INSTALLED**

The function failed because the terminal was already installed.

**CICS\_EPI\_ERR\_CCSID\_INVALID**

The function failed because an invalid CCSID was supplied.

For details on the CCSID values for various character sets, see the information about Supported conversions in the *CICS Transaction Gateway: UNIX and Linux Administration*.

**CICS\_EPI\_ERR\_SERVER\_BUSY**

The function failed because the server was busy.

**CICS\_EPI\_ERR\_VERSION**

The function is not supported for the version at which the EPI was initialized.

**CICS\_EPI\_ERR\_RESOURCE\_SHORTAGE**

The CICS server or CICS Transaction Gateway did not have enough resources to complete the terminal installation.

**CICS\_EPI\_ERR\_MAX\_SESSIONS**

The maximum number of concurrent requests handled by the Client daemon, as defined by the configuration parameter **maxrequests** in the configuration file, has been reached.

**CICS\_EPI\_ERR\_MAX\_SYSTEMS**

An attempt was made to start connections to more servers than your configuration allows.

**CICS\_EPI\_NORMAL**

The function completed successfully.

**CICS\_EpiInquireSystem**

The CICS\_EpiInquireSystem function returns the name of the server on which a given terminal resource (identified by its terminal index) is installed.

**Parameters****TermIndex**

The terminal index of the terminal resource, the location of which is to be determined.

The EPI uses this parameter only for input.

**System**

A pointer to a string of length CICS\_ECI\_SYSTEM\_MAX + 1 in which the name of the server will be returned.

The EPI uses this parameter only for output.

**Return codes****CICS\_EPI\_ERR\_BAD\_INDEX**

The **TermIndex** value is not a valid terminal index.

**CICS\_EPI\_ERR\_FAILED**

The function failed for an unexpected reason.

**CICS\_EPI\_ERR\_NOT\_INIT**

**CICS\_EpiInitialize** has not been executed.

**CICS\_EPI\_ERR\_NULL\_PARM**

**System** was a null pointer.

**CICS\_EPI\_ERR\_IN\_CALLBACK**

The function was called from a callback routine.

**CICS\_EPI\_NORMAL**

The function completed successfully. The name of the server is returned in the **System** parameter padded with nulls to a length of **CICS\_EPI\_SYSTEM\_MAX + 1**.

**CICS\_EpiDelTerminal**

The **CICS\_EpiDelTerminal** function deletes a previously added terminal resource.

The application does not consider the deletion complete until it receives the corresponding **CICS\_EPI\_EVENT\_END\_TERM** event. The terminal index remains allocated until a **CICS\_EpiGetEvent** call retrieves the **CICS\_EPI\_EVENT\_END\_TERM** event. A call to this function fails if the terminal resource is currently running a transaction. To ensure that a terminal resource is deleted, the application must wait until the current transaction finishes and process all outstanding events before issuing the **CICS\_EpiDelTerminal** call.

If the terminal resource was autoinstalled, its definition is deleted from the server. When a **CICS\_EpiDelTerminal** call has completed successfully for a terminal resource, use of the terminal index is restricted to **CICS\_EpiGetEvent** calls until the application has received the corresponding **CICS\_EPI\_EVENT\_END\_TERM** event.

**Parameters****TermIndex**

The terminal index of the terminal resource to be deleted.

The EPI uses this parameter only for input.

**Return codes****CICS\_EPI\_ERR\_BAD\_INDEX**

The **TermIndex** value is not a valid terminal index.

**CICS\_EPI\_ERR\_FAILED**

The function failed for an unexpected reason.

**CICS\_EPI\_ERR\_NOT\_INIT**

**CICS\_EpiInitialize** has not been executed.

**CICS\_EPI\_ERR\_TRAN\_ACTIVE**

A transaction is currently running against the terminal resource, or there are unprocessed events for the terminal resource.

**CICS\_EPI\_ERR\_IN\_CALLBACK**

The function was called from a callback routine.

**CICS\_EPI\_NORMAL**

The function completed successfully.

**CICS\_EpiPurgeTerminal**

The **CICS\_EpiPurgeTerminal** function purges a previously added terminal resource.

The application does not consider the deletion complete until it receives the corresponding CICS\_EPI\_EVENT\_END\_TERM event.

The **CICS\_EpiPurgeTerminal** call differs from the **CICS\_EpiDelTerminal** call in that the application does not have to wait until the current transaction finishes or process all outstanding events before issuing the call.

If the terminal resource was autoinstalled, its definition is deleted from the server.

This purge function does not cancel ATI requests already received by the server, and queued against the terminal.

## Parameters

### TermIndex

The terminal index of the terminal resource to be deleted.

The EPI uses this parameter only for input.

## Return codes

### CICS\_EPI\_ERR\_BAD\_INDEX

The **TermIndex** value is not a valid terminal index.

### CICS\_EPI\_ERR\_FAILED

The function failed for an unexpected reason.

### CICS\_EPI\_ERR\_NOT\_INIT

**CICS\_EpiInitialize** has not been executed.

### CICS\_EPI\_ERR\_IN\_CALLBACK

The function was called from a callback routine.

### CICS\_EPI\_ERR\_VERSION

The function is not supported for the version at which the EPI was initialized.

### CICS\_EPI\_NORMAL

The function completed successfully.

## CICS\_EpiSetSecurity

The CICS\_EpiSetSecurity function allows a client application to specify a user ID and password to be associated with a terminal resource previously installed as sign-on incapable.

The CICS\_EpiSetSecurity function can be invoked at any time; the user ID and password will be used as further transactions are started for the terminal resource. A CICS Transaction Gateway determined user ID and password will be used if the function either has not been invoked for the terminal resource or has been invoked and has set the user ID, and by implication the password, to nulls.

Note that the client application is responsible for verifying the user ID and password.

## Parameters

### TermIndex

The terminal index of the terminal.

The EPI uses this parameter only for input.

**UserId**

A pointer to a null-terminated string that specifies the user ID. If the user ID is shorter than CICS\_EPI\_USERID\_MAX characters, it must be padded with nulls to a length of CICS\_EPI\_USERID\_MAX+1.

The EPI uses this parameter only for input.

**Password**

A pointer to a null-terminated string that specifies the password. If the password is shorter than CICS\_EPI\_PASSWORD\_MAX characters, it must be padded with nulls to a length of CICS\_EPI\_PASSWORD\_MAX+1.

The EPI uses this parameter only for input.

**Return codes****CICS\_EPI\_ERR\_BAD\_INDEX**

The **TermIndex** value is not a valid terminal index.

**CICS\_EPI\_ERR\_NOT\_INIT**

**CICS\_EpiInitialize** has not been executed.

**CICS\_EPI\_ERR\_IN\_CALLBACK**

The function was called from a callback routine.

**CICS\_EPI\_ERR\_SYSTEM\_ERROR**

An internal system error occurred.

**CICS\_EPI\_ERR\_VERSION**

The function is not supported for the version at which the EPI was initialized.

**CICS\_EPI\_ERR\_NULL\_PASSWORD**

**Password** was a null pointer.

**CICS\_EPI\_ERR\_NULL\_USERID**

**UserId** was a null pointer.

**CICS\_EPI\_ERR\_PASSWORD\_INVALID**

The length of the password exceeds CICS\_EPI\_PASSWORD\_MAX.

**CICS\_EPI\_ERR\_USERID\_INVALID**

The length of the user ID exceeds CICS\_EPI\_USERID\_MAX.

**CICS\_EPI\_NORMAL**

The function completed successfully.

**CICS\_EpiStartTran**

The CICS\_EpiStartTran function starts a new transaction from a terminal resource, or continues a pseudoconversation.

- *Starting a new transaction*—do this after CICS\_EpiAddTerminal, or after a CICS\_EPI\_EVENT\_END\_TRAN event indicated that the previous transaction *did not* specify a transaction to process the next input from the terminal resource.
- *Continuing a pseudoconversation*—do this after a CICS\_EPI\_EVENT\_END\_TRAN event that indicated that the previous transaction specified *did* specify a transaction to process the next input from the terminal resource.

If the call is successful, no further start requests can be issued for this terminal resource until the transaction ends; this is indicated by the CICS\_EPI\_EVENT\_END\_TRAN event.

## Parameters

### TermIndex

The terminal index of the terminal resource that is to run the transaction.

The EPI uses this parameter only for input.

### TransId

A pointer to a string specifying the transaction to be run, or the null pointer. If a new transaction is being started, and this input is the null pointer, the name of the transaction is extracted from the data stream supplied in the **Data** parameter. If a pseudoconversation is being continued, and the pointer is not null, the string must be the name of the transaction returned in the preceding CICS\_EPI\_EVENT\_END\_TRAN event for this terminal resource. If the pointer is not null, and the string is shorter than CICS\_EPI\_TRANSID\_MAX characters, pad it with spaces to this length.

The EPI uses this parameter only for input.

### Data

A pointer to the 3270 data stream to be associated with the transaction. This parameter must not be a null pointer, because the data stream must contain at least an AID byte.

If a new transaction is being started, and the **TransId** parameter is the null pointer, the data stream must be at least 4 bytes long, must contain the name of the transaction to be started, and might contain data to be supplied to the transaction on its first EXEC CICS RECEIVE command.

If a new transaction is being started, and the **TransId** parameter is not the null pointer, the data stream might be only one byte (an AID byte), or 3 bytes (an AID byte and a cursor address), or longer than 3 bytes (an AID byte, a cursor address, and data and SBA commands). In the last case, the data is supplied to the transaction program on the first EXEC CICS RECEIVE command.

If a pseudoconversation is being continued, the data stream might be only one byte (an AID byte), or 3 bytes (an AID byte and a cursor address), or longer than 3 bytes (an AID byte, a cursor address, and data and SBA commands). In the last case the data is supplied to the transaction program on the first EXEC CICS RECEIVE command.

The details of the format of 3270 data streams for CICS are described in the information about 3270 data streams for the EPI in the *CICS Transaction Gateway for Multiplatforms: Programming Guide*.

The length of the 3270 data stream must not exceed the value that was returned in *MaxData* in *CICS\_EpiDetails\_t* when the terminal resource was installed with *CICS\_EpiAddTerminal*.

The EPI uses this parameter only for input.

**Size** The size in bytes of the initial data to be passed to the transaction.

The EPI uses this parameter only for input.

**Note:** The application might expect a terminal resource to be free to start a transaction and yet get an unexpected return code of CICS\_EPI\_ERR\_ATI\_ACTIVE from a call to CICS\_EpiStartTran. If this happens, it means that the EPI has started an ATI request against the terminal resource and issued the corresponding CICS\_EPI\_EVENT\_START\_ATI event, but the application has not yet retrieved the event by issuing a **CICS\_EpiGetEvent** call.

## Return codes

### **CICS\_EPI\_ERR\_ATI\_ACTIVE**

An ATI transaction is active for this terminal resource.

### **CICS\_EPI\_ERR\_BAD\_INDEX**

The *TermIndex* value is not a valid terminal index.

### **CICS\_EPI\_ERR\_FAILED**

The function failed for an unexpected reason.

### **CICS\_EPI\_ERR\_NO\_DATA**

No initial data was supplied.

### **CICS\_EPI\_ERR\_NOT\_INIT**

*CICS\_EpiInitialize* has not been executed.

### **CICS\_EPI\_ERR\_TTI\_ACTIVE**

A transaction started from the EPI is already active for this terminal resource.

### **CICS\_EPI\_ERR\_IN\_CALLBACK**

The function was called from a callback routine.

### **CICS\_EPI\_ERR\_SERVER\_DOWN**

The function failed because the server was down.

### **CICS\_EPI\_ERR\_RESOURCE\_SHORTAGE**

The CICS server or CICS Transaction Gateway did not have enough resources to complete the terminal installation.

### **CICS\_EPI\_ERR\_MAX\_SESSIONS**

The maximum number of concurrent requests handled by the Client daemon, as defined by the configuration parameter **maxrequests** in the configuration file, has been reached.

### **CICS\_EPI\_NORMAL**

The function completed successfully.

## **CICS\_EpiReply**

The *CICS\_EpiReply* function sends data from a terminal resource to a CICS transaction.

*CICS\_EpiReply* is only issued in response to a *CICS\_EPI\_EVENT\_CONVERSE* event.

## Parameters

### **TermIndex**

The terminal index of the terminal resource from which the data is being sent.

The EPI uses this parameter only for input.

### **Data**

A pointer to the 3270 data stream to be sent to the transaction. This parameter must not be a null pointer, because the data stream must contain at least an AID byte. The data stream might be one byte (an AID byte), 3 bytes (an AID byte and a cursor address), or more than 3 bytes (an AID byte, a cursor address, and data and SBA commands). In the last case, what follows the cursor address is supplied to the transaction program on the first EXEC CICS RECEIVE command.

The length of the 3270 data stream must not exceed the value that was returned in *MaxData* in *CICS\_EpiDetails\_t* when the terminal resource was installed with **CICS\_EpiAddTerminal**.

The EPI uses this parameter only for input.

**Size** The size of the data in bytes.

The EPI uses this parameter only for input.

### Return codes

#### **CICS\_EPI\_ERR\_BAD\_INDEX**

The **TermIndex** value is not a valid terminal index.

#### **CICS\_EPI\_ERR\_FAILED**

The function failed for an unexpected reason.

#### **CICS\_EPI\_ERR\_NO\_CONVERSE**

No reply is expected by the terminal resource.

#### **CICS\_EPI\_ERR\_NO\_DATA**

No reply data was supplied.

#### **CICS\_EPI\_ERR\_NOT\_INIT**

**CICS\_EpiInitialize** has not been executed.

#### **CICS\_EPI\_ERR\_IN\_CALLBACK**

The function was called from a callback routine.

#### **CICS\_EPI\_ERR\_SERVER\_DOWN**

The function failed because the server was down.

#### **CICS\_EPI\_ERR\_ABENDED**

The read timeout period has expired and an abend of the conversation has occurred, but the **CICS\_EPI\_EVENT\_END\_TRAN** event has not yet been received by the application.

#### **CICS\_EPI\_NORMAL**

The function completed successfully.

### **CICS\_EpiATISate**

The **CICS\_EpiATISate** function allows the calling application to query and alter the way in which ATI requests for a terminal resource are handled.

If ATI requests are enabled (**CICS\_EPI\_ATI\_ON**) and an ATI request is issued in the server, the request is started when the terminal resource becomes free. If ATI requests are held (**CICS\_EPI\_ATI\_HOLD**), any ATI requests issued are queued, and started when ATI requests are next enabled.

The state for ATI requests after a **CICS\_EpiAddTerminal** call is **CICS\_EPI\_ATI\_HOLD**. The EPI application might change the state to **CICS\_EPI\_ATI\_ON** when it is ready to allow ATI requests to be processed. (The server also maintains a ATI state for terminal resources, which is independent of the ATI state maintained in the EPI. Changes to the ATI state on the server do not affect the ATI status in the EPI.)

### Parameters

#### **TermIndex**

The terminal index of the terminal resource with the ATI state that is required.

The EPI uses this parameter only for input.

#### **ATISState**

The EPI uses this parameter for both input and output depending on the input value as follows:

##### **CICS\_EPI\_ATI\_ON**

Enable ATI requests, and return the previous ATI state in this parameter.

##### **CICS\_EPI\_ATI\_HOLD**

Hold ATI requests until they are next enabled, and return the previous ATI state in this parameter.

##### **CICS\_EPI\_ATI\_QUERY**

Do not change the ATI state; just return the current state in this parameter.

#### **Return codes**

##### **CICS\_EPI\_ERR\_ATI\_STATE**

An invalid **ATISState** value was provided.

##### **CICS\_EPI\_ERR\_BAD\_INDEX**

The **TermIndex** value is not a valid terminal index.

##### **CICS\_EPI\_ERR\_FAILED**

The function failed for an unexpected reason.

##### **CICS\_EPI\_ERR\_NOT\_INIT**

**CICS\_EpiInitialize** has not been executed.

##### **CICS\_EPI\_ERR\_IN\_CALLBACK**

The function was called from a callback routine.

##### **CICS\_EPI\_NULL\_PARAM**

**ATISState** was a null pointer.

##### **CICS\_EPI\_NORMAL**

The function completed successfully.

#### **CICS\_EpiGetEvent**

The **CICS\_EpiGetEvent** function obtains information about an event that has occurred for a terminal resource.

Remember that this call can be attempted only from the application, not from the callback routine.

#### **Parameters**

##### **TermIndex**

The terminal index of the terminal resource for which to obtain an event. This can be set to the constant **CICS\_EPI\_TERM\_INDEX\_NONE** to indicate that the next event for any terminal resource used by this application is to be returned. The application can examine the **TermIndex** field in the returned **CICS\_EpiEventData\_t** structure to determine the terminal resource against which the event was generated.

The EPI uses this parameter for both input and output.

##### **Wait**

An indication of what happens if no event has been generated for the terminal resource. Use one of the following values:

### **CICS\_EPI\_WAIT**

Do not return until the next event occurs.

### **CICS\_EPI\_NOWAIT**

Return immediately with an error code. This option is used if the application elects to poll for events.

The EPI uses this parameter only for input.

**Event** A pointer to a `CICS_EpiEventData_t` structure that on return contains the details of the event that occurred. The **Data** field in the structure must be set to point to the data buffer that is updated with any terminal data stream associated with the event. The **Size** field must be set to indicate the maximum size of this buffer, and is updated to contain the actual length of data returned.

### **Return codes**

#### **CICS\_EPI\_ERR\_BAD\_INDEX**

The **TermIndex** value is not a valid terminal index.

#### **CICS\_EPI\_ERR\_FAILED**

The function failed for an unexpected reason.

#### **CICS\_EPI\_ERR\_MORE\_DATA**

The supplied data buffer was not large enough to contain the terminal data; the data has been truncated.

#### **CICS\_EPI\_ERR\_MORE\_EVENTS**

An event was successfully obtained, but there are more events outstanding against this terminal resource.

#### **CICS\_EPI\_ERR\_NO\_EVENT**

No events are outstanding for this terminal resource.

#### **CICS\_EPI\_ERR\_NOT\_INIT**

**CICS\_EpiInitialize** has not been executed.

#### **CICS\_EPI\_ERR\_WAIT**

The **Wait** parameter is not valid.

#### **CICS\_EPI\_ERR\_NULL\_PARM**

**Event** is a null pointer.

#### **CICS\_EPI\_ERR\_IN\_CALLBACK**

The function was called from a callback routine.

#### **CICS\_EPI\_NORMAL**

The function completed successfully, and there are no more events.

## **EPI events**

EPI events occur when CICS has data to pass to the EPI application.

The application can handle EPI events in a variety of ways. See the information about events and callbacks in the *CICS Transaction Gateway for Multiplatforms: Programming Guide*. Whichever mechanism is used, the data from CICS is obtained by calling **CICS\_EpiGetEvent**.

## CICS\_EPI\_EVENT\_ADD\_TERM

The CICS\_EPI\_EVENT\_ADD\_TERM event indicates that an asynchronous request to install a terminal resource has completed. If the terminal resource was installed details will have been placed in the **CICS\_EpiDetails\_t** structure, pointed to by **Data**.

### Fields completed

**Event** The CICS\_EPI\_EVENT\_ADD\_TERM event code.

#### EndReturnCode

The reason for termination. Refer to the **CICS\_EpiAddExTerminal** function for details of return codes.

**Data** A pointer to the **CICS\_EpiDetails\_t** structure that is updated with the terminal details, if the **EndReturnCode** is CICS\_EPI\_NORMAL.

## CICS\_EPI\_EVENT\_SEND

The CICS\_EPI\_EVENT\_SEND event indicates that a transaction has sent some 3270 data to a terminal resource, typically as a result of an EXEC CICS SEND command. No reply is expected, and none should be attempted.

### Fields completed

**Event** The CICS\_EPI\_EVENT\_SEND event code.

**Data** A pointer to the buffer that is updated to contain the data sent by the transaction. See the information about 3270 data streams for the EPI in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* for details of the data stream format.

**Size** The length of the data in the **Data** buffer.

## CICS\_EPI\_EVENT\_CONVERSE

The CICS\_EPI\_EVENT\_CONVERSE event indicates that a transaction is expecting a reply as a result of either an EXEC CICS RECEIVE command, or an EXEC CICS CONVERSE command.

The application issues a **CICS\_EpiReply** call to return the data to CICS, as follows:

- If the transaction has issued an EXEC CICS RECEIVE command without specifying the BUFFER option, the buffer might contain data sent from the transaction, or it might be empty. If there is data to process, deal with it before replying. Send the reply when the data to be sent is available.
- If the transaction has issued an EXEC CICS RECEIVE BUFFER command, the data buffer contains the 3270 Read Buffer command and the **Size** field is set to 1. The reply is be sent immediately.

### Fields completed

**Event** The CICS\_EPI\_EVENT\_CONVERSE event code.

**Data** A pointer to the buffer that is updated to contain the data sent by the transaction, as defined above.

**Size** The length of the data in the buffer. This can be set to zero to indicate that no data was sent, but a reply is still expected.

## CICS\_EPI\_EVENT\_END\_TRAN

The CICS\_EPI\_EVENT\_END\_TRAN event indicates the end of a transaction that was running against a terminal resource. If the transaction failed, the **EndReason** and **EndReturnCode** specify the cause.

If the transaction completed typically, the **EndReason** field is set to CICS\_EPI\_TRAN\_NO\_ERROR and **EndReturnCode** is set to CICS\_EPI\_NORMAL. If the transaction was pseudoconversational, the **TransId** field contains the name of the next transaction required. The application starts this transaction by issuing a **CICS\_EpiStartTran** call.

The CICS\_EPI\_EVENT\_END\_TRAN event occurs when a transaction running against a terminal resource abends or ends following execution of a RETURN command for which the IMMEDIATE option was not specified.

### Fields completed

**Event** The CICS\_EPI\_EVENT\_END\_TRAN event code.

#### EndReason

An indication of what caused the end transaction event. It can be one of the following values:

##### CICS\_EPI\_TRAN\_NO\_ERROR

Typical transaction termination.

##### CICS\_EPI\_TRAN\_NOT\_STARTED

The transaction failed to start.

##### CICS\_EPI\_TRAN\_STATE\_UNKNOWN

The transaction failed to complete.

##### CICS\_EPI\_READTIMEOUT\_EXPIRED

The read timeout expired.

#### TransId

The name of the next transaction to start, if the previous transaction was pseudoconversational. This name is 4 characters long and null-terminated. If there is no next transaction, the field is set to nulls.

#### EndReturnCode

A string containing the CICS\_EPI\_returncode.

## CICS\_EPI\_EVENT\_START\_ATI

The CICS\_EPI\_EVENT\_START\_ATI event indicates that an ATI transaction has been started against the terminal resource. If the terminal resource receives an ATI request while it is running another transaction, the request is held until the transaction ends. The transaction is then started on behalf of the terminal resource, and the CICS\_EPI\_EVENT\_START\_ATI event is generated to inform the application.

### Fields completed

**Event** The CICS\_EPI\_EVENT\_START\_ATI event code.

#### TransId

The name of the transaction that was started. This name is 4 characters long and null-terminated.

## **CICS\_EPI\_EVENT\_END\_TERM**

The CICS\_EPI\_EVENT\_END\_TERM event indicates that a terminal resource no longer exists. After this event, the terminal index that was previously used for the terminal resource is not valid. If the EPI detects that a CICS server has shut down, CICS\_EPI\_EVENT\_END\_TERM events are generated for all terminal resources that the application has installed in that server and not subsequently deleted.

### **Fields completed**

**Event** The CICS\_EPI\_EVENT\_END\_TERM event code.

#### **EndReason**

An indication of why the terminal resource was deleted. It can be one of the following values:

##### **CICS\_EPI\_END\_SIGNOFF**

The terminal resource was signed off. This can be as a result of running the CESF transaction or of calling the **CICS\_EpiDelTerminal** function.

##### **CICS\_EPI\_END\_SHUTDOWN**

The CICS server is shutting down.

##### **CICS\_EPI\_END\_OUTSERVICE**

The terminal resource has been switched out of service.

##### **CICS\_EPI\_END\_UNKNOWN**

An unexpected error has occurred.

##### **CICS\_EPI\_END\_FAILED**

An attempt to delete a terminal resource failed.

---

## **ESI V1**

This section describes the constants and data structures that you need to use the ESI, and the functions provided by the ESI that can be called from an application program.

## **ESI constants and data structures**

This section describes the constants and data structures that you need to use the ESI.

### **ESI constants**

The following constants are referred to symbolically in the descriptions of the ESI data structures, and functions in this information. Their values are given here to help you understand the descriptions. However, you must always use the symbolic names of ESI constants provided for the programming language you are using in your code.

#### **Lengths of fields**

- CICS\_ESI\_PASSWORD\_MAX (10)
- CICS\_ESI\_SYSTEM\_MAX (8)
- CICS\_ESI\_USERID\_MAX (10)

### **ESI data structures**

The three data structures are available for use with the ESI are **CICS\_EsiDate\_t**, **CICS\_EsiTime\_t** and **CICS\_EsiDetails\_t**.

In the descriptions of the fields in the data structures, fields described as strings are null-terminated strings.

#### **CICS\_EsiDate\_t:**

The **CICS\_EsiDate\_t** structure contains a date represented as year, month, and day.

##### **Fields**

**Year** 4-digit year held in **cics\_ushort\_t** format.

##### **Month**

Month held in **cics\_ushort\_t** format; values range from 1 to 12 with 1 representing January.

**Day** Day held in **cics\_ushort\_t** format; values range from 1 to 31 with 1 representing the first day of the month.

#### **CICS\_EsiTime\_t:**

The **CICS\_EsiTime** structure contains a time represented as hours, minutes, seconds, and hundredths of a second.

##### **Fields**

**Hours** Hours held in **cics\_ushort\_t** format; values range from 0 to 23.

##### **Minutes**

Minutes held in **cics\_ushort\_t** format; values range from 0 to 59.

##### **Seconds**

Seconds held in **cics\_ushort\_t** format; values range from 0 to 59.

##### **Hundredths**

Hundredths of a second held in **cics\_ushort\_t** format; values range from 0 to 99.

#### **CICS\_EsiDetails\_t:**

The **CICS\_EsiDetails\_t** structure contains information returned from a successful invocation of the **CICS\_VerifyPassword** or **CICS\_ChangePassword** functions.

##### **Fields**

##### **LastVerifiedDate**

The date on which the password was last verified.

##### **LastVerifiedTime**

The time at which the password was last verified.

##### **ExpiryDate**

The date on which the password will expire.

##### **ExpiryTime**

The time at which the password will expire.

##### **LastAccessDate**

The date on which the user ID was last accessed.

##### **LastAccessTime**

The time at which the user ID was last accessed.

### InvalidCount

The number of invalid password verification attempts for the user ID since the last successful password verification. This value is zero on a successful invocation of the CICS\_ChangePassword function.

## ESI functions

This section describes the functions provided by the ESI that can be called from an application program.

### CICS\_VerifyPassword

The CICS\_VerifyPassword function allows a client application to verify that a password matches the password recorded by an external security manager for a specified user ID.

CICS\_VerifyPassword

*UserId*  
*Password*  
*System*  
*Details*

### Purpose

Note that the external security manager is assumed to be located in a server to which the client is connected.

### Parameters

#### UserId

A pointer to a null-terminated string that specifies which user ID to verify the password for. If the user ID is shorter than CICS\_ESI\_USERID\_MAX characters, it must be padded with nulls to a length of CICS\_ESI\_USERID\_MAX+1.

The ESI uses this parameter only for input.

#### Password

A pointer to a null-terminated string that specifies the password to be checked by the external security manager for the specified user ID. If the password is shorter than CICS\_ESI\_PASSWORD\_MAX characters, it must be padded with nulls to a length of CICS\_ESI\_PASSWORD\_MAX+1.

The ESI uses this parameter only for input.

#### System

A pointer to a null-terminated string that specifies the name of the server in which the password is to be verified. If the name is shorter than CICS\_ESI\_SYSTEM\_MAX characters, it must be padded with nulls to a length of CICS\_ESI\_SYSTEM\_MAX+1.

If the string is all nulls, the default CICS server is selected.

The ESI uses this parameter only for input.

#### Details

A pointer to the CICS\_EsiDetails\_t structure that on return contains further information returned by the external security manager.

The ESI uses the fields in this structure only for output.

## **Return codes**

### **CICS\_ESI\_NO\_ERROR**

The function completed successfully.

### **CICS\_ESI\_ERR\_CALL\_FROM\_CALLBACK**

The function was invoked from a callback routine.

### **CICS\_ESI\_ERR\_SYSTEM\_ERROR**

An internal system error occurred.

### **CICS\_ESI\_ERR\_NO\_CICS**

The CICS Transaction Gateway is unavailable, or the specified server is unavailable.

### **CICS\_ESI\_ERR\_CICS\_DIED**

The specified server is no longer available.

### **CICS\_ESI\_ERR\_RESOURCE\_SHORTAGE**

The CICS Transaction Gateway did not have enough resources to complete the request.

### **CICS\_ESI\_ERR\_NO\_SESSIONS**

The application has as many outstanding ECI and EPI requests as the configuration will support.

### **CICS\_ESI\_ERR\_UNKNOWN\_SERVER**

The requested server could not be located. Only servers returned by the **CICS\_EciListSystems** and **CICS\_EpiListSystems** functions are acceptable.

### **CICS\_ESI\_ERR\_MAX\_SESSIONS**

There were not enough communications resources to satisfy the request. Consult the documentation for your CICS Transaction Gateway or server to see how to control the number of servers you can use.

### **CICS\_ESI\_ERR\_MAX\_SYSTEMS**

You tried to start requests to more servers than your configuration allows. Consult the documentation for your CICS Transaction Gateway or server to see how to control the number of servers you can use.

### **CICS\_ESI\_ERR\_NULL\_USERID**

The user ID is set to nulls.

### **CICS\_ESI\_ERR\_NULL\_PASSWORD**

The password is set to nulls.

### **CICS\_ESI\_ERR\_PEM\_NOT\_SUPPORTED**

Password expiry management is supported only for communications with the requested server over SNA.

### **CICS\_ESI\_ERR\_PEM\_NOT\_ACTIVE**

The requested server does not support password expiry management.

### **CICS\_ESI\_ERR\_PASSWORD\_EXPIRED**

The password has expired.

### **CICS\_ESI\_ERR\_PASSWORD\_INVALID**

The password is invalid.

### **CICS\_ESI\_ERR\_USERID\_INVALID**

The user ID is not known to the external security manager.

### **CICS\_ESI\_ERR\_SECURITY\_ERROR**

An error has been detected by the external security manager. The most likely explanation is that the user ID has been revoked.

The mapping of actual return code values to the symbolic names is contained in the <install\_path>\include\cics\_esi.h file. COBOL users can find it in the <install\_path>\copybook\cicsesi.cbl file.

## CICS\_ChangePassword

The CICS\_ChangePassword function allows a client application to change the password recorded by an external security manager for a specified user ID.

CICS\_ChangePassword

*UserId*  
*OldPassword*  
*NewPassword*  
*System*  
*Details*

### Purpose

Note that the external security manager is assumed to be located in a server to which the CICS Transaction Gateway is connected.

### Parameters

#### UserId

A pointer to a null-terminated string that specifies which user ID requires a password change. If the user ID is shorter than CICS\_ESI\_USERID\_MAX characters, it must be padded with nulls to a length of CICS\_ESI\_USERID\_MAX+1.

The ESI uses this parameter only for input.

#### OldPassword

A pointer to a null-terminated string that specifies the current password for the specified user ID. If the password is shorter than CICS\_ESI\_PASSWORD\_MAX characters, it must be padded with nulls to a length of CICS\_ESI\_PASSWORD\_MAX+1.

The ESI uses this parameter only for input.

#### NewPassword

A pointer to a null-terminated string that specifies the new password for the specified user ID. If the password is shorter than CICS\_ESI\_PASSWORD\_MAX characters, it must be padded with nulls to a length of CICS\_ESI\_PASSWORD\_MAX+1.

The password is changed only if the currently password is correctly specified.

The ESI uses this parameter only for input.

#### System

A pointer to a null-terminated string that specifies the name of the server in which the password is to be verified. If the name is shorter than CICS\_ESI\_SYSTEM\_MAX characters, it must be padded with nulls to a length of CICS\_ESI\_SYSTEM\_MAX+1.

If the string is all nulls, the default CICS server is selected.

The ESI uses this parameter only for input.

## Details

A pointer to the CICS\_EsiDetails\_t structure that on return contains further information returned by the external security manager.

The ESI uses the fields in this structure only for output.

## Return codes

### **CICS\_ESI\_NO\_ERROR**

The function completed successfully.

### **CICS\_ESI\_ERR\_CALL\_FROM\_CALLBACK**

The function was invoked from a callback routine.

### **CICS\_ESI\_ERR\_SYSTEM\_ERROR**

An internal system error occurred.

### **CICS\_ESI\_ERR\_NO\_CICS**

The CICS Transaction Gateway is unavailable, or the specified server is unavailable.

### **CICS\_ESI\_ERR\_CICS\_DIED**

The specified server is no longer available. To confirm that the password has been changed, use the CICS\_VerifyPassword function.

### **CICS\_ESI\_ERR\_RESOURCE\_SHORTAGE**

The CICS Transaction Gateway did not have enough resources to complete the request.

### **CICS\_ESI\_ERR\_NO\_SESSIONS**

The application has as many outstanding ECI and EPI requests as the configuration will support.

### **CICS\_ESI\_ERR\_UNKNOWN\_SERVER**

The requested server could not be located. Only servers returned by the CICS\_EciListSystems and CICS\_EpiListSystems functions are acceptable.

### **CICS\_ESI\_ERR\_MAX\_SESSIONS**

There were not enough communications resources to satisfy the request. Consult the documentation for your CICS Transaction Gateway or server to see how to control the number of servers you can use.

### **CICS\_ESI\_ERR\_MAX\_SYSTEMS**

You tried to start requests to more servers than your configuration allows. Consult the documentation for your CICS Transaction Gateway or server to see how to control the number of servers you can use.

### **CICS\_ESI\_ERR\_NULL\_USERID**

The user ID is set to nulls.

### **CICS\_ESI\_ERR\_NULL\_OLD\_PASSWORD**

The current password is set to nulls.

### **CICS\_ESI\_ERR\_NULL\_NEW\_PASSWORD**

The new password is set to nulls.

### **CICS\_ESI\_ERR\_PEM\_NOT\_SUPPORTED**

Password expiry management is supported only for communications with the requested server over SNA.

### **CICS\_ESI\_ERR\_PEM\_NOT\_ACTIVE**

The requested server does not support password expiry management.

### **CICS\_ESI\_ERR\_PASSWORD\_INVALID**

The password is invalid.

### **CICS\_ESI\_ERR\_PASSWORD\_REJECTED**

The new password does not confirm to the standards defined for the external security manager.

### **CICS\_ESI\_ERR\_USERID\_INVALID**

The user ID is not known to the external security manager.

### **CICS\_ESI\_ERR\_SECURITY\_ERROR**

An error has been detected by the external security manager. The most likely explanation is that the user ID has been revoked.

The mapping of actual return code values to the symbolic names is contained in the <install\_path>\include\cics\_esi.h file. COBOL users can find it in the <install\_path>\copybook\cicsesi.cbl file.

## **CICS\_SetDefaultSecurity**

A client application can specify a default user ID and password to be used for ECI and EPI requests passed to the server by using the CICS\_SetDefaultSecurity function.

CICS_SetDefaultSecurity
-------------------------

<i>UserId</i> <i>Password</i> <i>System</i>
---

## **Purpose**

The user ID, and the password, can be set to nulls, that is, binary zeroes. In this case the default user ID and password are unset, so that CICS Transaction Gateway acts as if no user ID and password has been set.

The user ID, and the password, can also be set to spaces. However, this is valid only if **Usedfltuser=yes** is specified in the CICS connection definition. In this case CICS uses its default user ID. See the documentation for your CICS server for more information on the Usedfltuser specification.

The client application is responsible for verifying the user ID and password.

Note that the user ID and password, if required, can be obtained from any one of several places. The assumption is that the CICS Transaction Gateway uses the following search order:

1. Either the ECI parameter block for the ECI or the terminal specific values set by the CICS\_EpiSetSecurity function.
2. The server specific values set by the CICS\_SetDefaultSecurity function.
3. Defaults, for example the Windows user ID, from the CICS Transaction Gateway's pop-up window, and other similar defaults.

## **Parameters**

### **UserId**

A pointer to a null-terminated string that specifies the user ID to be set. If the user ID is shorter than CICS\_ESI\_USERID\_MAX characters, it must be padded with nulls to a length of CICS\_ESI\_USERID\_MAX+1.

The ESI uses this parameter only for input.

### **Password**

A pointer to a null-terminated string that specifies the password to be set for the specified user ID. If the password is shorter than CICS\_ESI\_PASSWORD\_MAX characters, it must be padded with nulls to a length of CICS\_ESI\_PASSWORD\_MAX+1.

The ESI uses this parameter only for input.

### **System**

A pointer to a null-terminated string that specifies the name of the server for which the password and user ID are to be set. If the name is shorter than CICS\_ESI\_SYSTEM\_MAX characters, it must be padded with nulls to a length of CICS\_ESI\_SYSTEM\_MAX+1.

If the string is all nulls, the default CICS server is selected.

The ESI uses this parameter only for input.

### **Return codes**

#### **CICS\_ESI\_NO\_ERROR**

The function completed successfully.

#### **CICS\_ESI\_ERR\_CALL\_FROM\_CALLBACK**

The function was invoked from a callback routine.

#### **CICS\_ESI\_ERR\_SYSTEM\_ERROR**

An internal system error occurred.

#### **CICS\_ESI\_ERR\_NO\_CICS**

The CICS Transaction Gateway is unavailable, or the specified server is unavailable.

#### **CICS\_ESI\_ERR\_UNKNOWN\_SERVER**

The requested server could not be located. Only servers returned by the **CICS\_EciListSystems** and **CICS\_EpiListSystems** functions are acceptable.

#### **CICS\_ESI\_ERR\_USERID\_INVALID**

The length of the user ID exceeds CICS\_ESI\_USERID\_MAX.

#### **CICS\_ESI\_ERR\_PASSWORD\_INVALID**

The length of the password exceeds CICS\_ESI\_PASSWORD\_MAX.

The mapping of actual return code values to the symbolic names is contained in the <install\_path>\include\cics\_esi.h file. COBOL users can find it in the <install\_path>\copybook\cicsesi.cbl file.

---

## Chapter 2. C++

---

### Ccl class

This class defines enumerations which are used by other classes—both ECI and EPI.

#### Enumerations

##### Bool

There are two equivalent pairs of values:

- no and yes
- off and on

##### Sync

Possible values are:

**async** asynchronous  
**dsync** deferred synchronous  
**sync** synchronous

##### ExCode

For possible values, see “C++ Exception Objects” on page 102.

---

### CclBuf class

A CclBuf object contains a data area in memory that can be used to hold information. A particular use for a CclBuf object is to hold a COMMAREA, which passes data to and from a CICS server.

The CclBuf object is primarily intended for use with byte (binary) data. A typical COMMAREA contains an application-specific data structure, often originating from a CICS server PL/I or C program. Methods such as **assign()** and **insert()** therefore provide a **void\*** parameter type for application data input. There is limited support for SBCS null-terminated strings (some of the code samples use this), but there is no code-page conversion or DBCS support in the **CclBuf** class.

The maximum data length for a buffer is the maximum value for unsigned long (2<sup>32</sup>) for 32-bit platforms. CICS imposes a limit of 32 KB in COMMAREAs. This can be reduced by setting the *MaxBufferSize* parameter in the CICS Transaction Gateway configuration file (ctg.ini). See the information about Maximum buffer size in the *CICS Transaction Gateway: UNIX and Linux Administration* or the *CICS Transaction Gateway: Windows Administration* for more information. If a buffer object used as a COMMAREA is too long, a data length exception is raised.

When a CclBuf object is created it either uses an area of memory passed to it as its buffer, or allocates its own. The length of the data in this buffer can be reduced after the CclBuf object is created. The length of the data in this buffer can only be

increased beyond the original length if the CclBuf object is created with a **DataAreaType** of extensible, rather than fixed.

If a buffer object has a **DataAreaType** of fixed and a method is called which would result in its data area length being exceeded, a buffer overflow exception is raised. If the exception is not handled, the buffer will contain the result of the call, truncated to the data area length.

If a method is called that results in a buffer object having a data length smaller than its data area length, the data is padded with nulls.

Many of the methods return object references. This makes it possible for users to chain calls to member functions. For example, the code:

```
CclBuf comm1;  
comm1="Some text";  
comm1.insert( 9,"inserted ",5) += " at the end";
```

would create the following string:  
Some inserted text at the end

## CclBuf constructors

### CclBuf (1)

**CclBuf(unsigned long *length*, DataAreaType *type* = extensible)**

*length*

The initial length of the data area, in bytes. The default is 0.

*type*

An enumeration indicating whether the data area can be extended. Possible values are extensible or fixed. The default is extensible.

Creates a CclBuf object, allocating its own data area with the given length. All the bytes within it are set to null. The data length is set to zero and remains zero until data is put in the buffer.

### CclBuf (2)

**CclBuf(unsigned long *length*, void\* *dataArea*)**

*length*

The length of the supplied data area, in bytes.

*dataArea*

The address of the first byte of the supplied data area.

Creates a CclBuf object that cannot be extended, adopting the given data area as its own. The DataAreaOwner is set external.

### CclBuf (3)

**CclBuf(const char\* *text*, DataAreaType *type* = extensible)**

*text*

A string to be copied into the new CclBuf object.

*type*

An enumeration indicating whether the data area can be extended. Possible values are extensible or fixed. The default is extensible.

Creates a CclBuf object, allocating its own data area with the same length as the *text* string and copies the string into its data area.

## CclBuf (4)

**CclBuf(const CclBuf& *buffer*)**

*buffer*

A reference to the CclBuf object that is to be copied.

This copy constructor creates a new CclBuf object, which is a copy of the given object. The data length, data area length and data area type of the new buffer are the same as the old buffer. The data area owner of the new buffer is internal.

## Public methods

### assign

**CclBuf& assign(unsigned long *length*, const void\* *dataArea*)**

*length*

The length of the source data area, in bytes.

*dataArea*

The address of the source data area.

Overwrites the current contents of the data area with the source data and resets the data length.

### cut

**CclBuf& cut(unsigned long *length*, unsigned long *offset* = 0)**

*length*

The number of bytes to be cut from the data area.

*offset*

The offset into the data area. The default is zero.

Cuts the specified data from the data area. Data in the data area is padded with nulls.

### dataArea

**const void\* dataArea(unsigned long *offset* = 0) const**

*offset*

The offset into the data area. The default is zero.

Returns the address of the given offset into the data area.

### dataAreaLength

Returns the length of the data area in bytes.

**unsigned long dataAreaLength() const**

## **dataAreaOwner**

Returns an enumeration value indicating whether the data area has been allocated by the **CclBuf** constructor or has been supplied from elsewhere.

**DataAreaOwner dataAreaOwner() const**

Possible values are internal and external.

## **dataAreaType**

Returns an enumeration value indicating whether the data area can be extended.

**DataAreaType dataAreaType() const**

Possible values are extensible and fixed.

## **dataLength**

Returns the length of data in the data area. This cannot be greater than the value returned by **dataAreaLength**.

**unsigned long dataLength() const**

## **insert**

**CclBuf& insert(unsigned long *length*,  
const void\* *dataArea*,  
unsigned long *offset* = 0)**

*length*

The length of the data, in bytes, to be inserted into the CclBuf object.

*dataArea*

The start of the source data to be inserted into the CclBuf object.

*offset*

The offset into the data area where the data is to be inserted. The default is zero.

Inserts the source data into the data area at the given offset.

## **listState**

Returns a formatted string containing the current state of the object.

**const char\* listState() const**

For example:

```
Buffer state..&CclBuf=000489B4 &CclBufI=00203A00  
dataLength=8 &dataArea=002039C0  
dataAreaLength=8 dataAreaOwner=0 dataAreaType=1
```

## **operator= (1)**

**CclBuf& operator=(const CclBuf& *buffer*)**

*buffer*

A reference to a CclBuf object.

Assigns data from another buffer object.

## **operator= (2)**

**CclBuf& operator=(const char\* text)**

*text*

The string to be assigned to the CclBuf object.

Assigns data from a string.

## **operator+= (1)**

**CclBuf& operator+=(const CclBuf& buffer)**

*buffer*

A reference to a CclBuf object.

Appends data from another buffer object to the data in the data area.

## **operator+= (2)**

**CclBuf& operator+=(const char\* text)**

*text*

The string to be appended to the CclBuf object.

Appends a string to the data in the data area.

## **operator==**

**Ccl::Bool operator==(const CclBuf& buffer) const**

*buffer*

A reference to a CclBuf object.

Returns an enumeration indicating whether the data contained in the buffers of the two CclBuf objects is the same. Possible values are yes, indicating that the data lengths and contents are the same, or no.

## **operator!=**

**Ccl::Bool operator!=(const CclBuf& buffer) const**

*buffer*

A reference to a CclBuf object.

Returns an enumeration indicating whether the data contained in the buffers of the two CclBuf objects is different. Possible values are yes or no. no means that the data lengths are the same and the contents are the same.

## **replace**

**CclBuf& replace(unsigned long length,  
                  const void\* dataArea,  
                  unsigned long offset = 0)**

*length*

The length of the source data area, in bytes.

*dataArea*

The address of the start of the source data area.

*offset*

The position where the new data is to be written, relative to the start of the **CclBuf** data area. The default is zero.

Overwrites the current contents of the data area at the given offset with the source data. The data length remains the same.

### **setDataLength**

**unsigned long setDataLength(unsigned long *length*)**

*length*

The new length of the data area, in bytes.

Changes the current length of the data area and returns the new length. If the **CclBuf** object is not extensible, the data area length is set to either the original length of the data area, or *length*, whichever is less.

If *length* is greater than the data area length, the data is padded with nulls.

## **Enumerations**

### **DataAreaOwner**

Indicates whether the data area of a **CclBuf** object has been allocated outside the object.

Possible values are:

**internal**

The data area has been allocated by the **CclBuf** constructor.

**external**

The data area has been allocated externally.

### **DataAreaType**

Indicates whether the data area of a **CclBuf** object can be made longer than its original length.

Possible values are:

**extensible**

The data area of a **CclBuf** object can be made longer than its original length.

**fixed**

The data area of a **CclBuf** object cannot be made longer than its original length.

---

## **CclConn class**

An object of class **CclConn** is used to represent an ECI connection between a client and a named server.

See the information about linking to a CICS server program in the *CICS Transaction Gateway for Multiplatforms: Programming Guide*. Access to the server is optionally controlled by a user ID and password. It can call a program in the server or get information on the state of the connection. See the information about passing data

to a server program and the information about monitoring server availability in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* for more information.

The creation of a CclConn object does not cause any interaction with the CICS server, nor does it guarantee that the server is available to process requests.

Any interaction between client and server requires the use of a CclFlow object. See the information about controlling server interactions in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* for more information.

A CclConn object cannot be copied or assigned. Any attempt to delete a CclConn object for which there are active CclFlow or CclUOW objects raises an activeFlow or an activeUOW exception.

## CclConn constructor

```
CclConn(const char* serverName = 0,
        const char* userId = 0,
        const char* password = 0,
        const char* runTran = 0,
        const char* attachTran = 0)
```

### *serverName*

The name of the server. If no name is supplied the default CICS server is used. After the first call to the server you can discover this name by using the **serverName** method. The length is adjusted to 8 characters by padding with blanks or truncating, if necessary.

### *userId*

The user ID, if needed. The length is adjusted to 16 characters by padding with blanks or truncating, if necessary.

### *password*

The password corresponding to the user ID in *userId*, if needed. The length is adjusted to 16 characters by padding with blanks or truncating, if necessary.

### *runTran*

The CICS transaction under which the called program will run. The default is to use the default server transaction. The length is adjusted to 4 characters by padding with blanks or truncating, if necessary.

### *attachTran*

The CICS transaction to which the called program is attached. The default is to use the default CPML. The length is adjusted to 4 characters by padding with blanks or truncating, if necessary.

This constructor creates a CclConn object; it does not cause any interaction with the CICS server or guarantee that the server is available to process requests. The user ID and password are not needed if the connection is used only for status calls, or if the server has no security.

## Public methods

### **alterSecurity**

```
void alterSecurity(const char* newUserId, const char* newPassword)
```

*newUserId*

The new user ID

*newPassword*

The new password corresponding to the new user ID

Updates the user ID and Password to be used on the next link call

## **cancel**

**void cancel(CclFlow& flow)**

*flow*

A reference to the CclFlow object used to control the server request call.

Cancels all changed calls that were previously issued to the server associated with this connection.

## **changed**

**void changed(CclFlow& flow)**

*flow*

A reference to the CclFlow object used to control the server request call.

Requests the server to notify the Client daemon when the current connection status changes. The call is ignored if there is already an outstanding **changed** call for this connection. Use **serverStatus** or **serverStatusText** to obtain server availability.

## **changePassword**

**CclSecAttr\* changePassword(const char\* newPassword)**

*newPassword*

the new password to be given

Allows a Client application to change:

- The password held in the terminal object
- The password recorded by an external security manager for the user ID held in the terminal object

The external security manager is assumed to be located in the server defined by the terminal object.

## **link**

**void link(CclFlow& flow,  
          const char\* programName,  
          CclBuf\* commarea = 0,  
          CclUOW\* unit = 0)**

*flow*

A reference to the CclFlow object used to control the server request call.

*programName*

The name of the server program that is being called. The length is adjusted to 8 characters by padding with blanks or truncating, if necessary.

*commarea*

A pointer to a CclBuf object that holds the data to be passed to the called program in a COMMAREA. The default is not to pass a COMMAREA.

*unit*

A pointer to the CclUOW object that identifies the unit of work (UOW) in which this call participates. The default is none. See the information about managing logical units of work in the *CICS Transaction Gateway for Multiplatforms: Programming Guide*.

Requests execution of the specified program on the server. The server program sees the incoming call as an EXEC CICS LINK call.

If the *commarea* buffer object is too long, a `dataLength` exception is raised and the request is denied. CICS imposes a limit of 32 KB which can be made smaller by using the `MaxBufferSize` parameter in the CICS Transaction Gateway Initialization file.

## **listState**

Returns a formatted string containing the current state of the object.

**const char\* listState() const**

For example:

```
Connection state..&CclConn=000489AC &CclConnI=00203A50
flowCount=0 &CclFlow(changed)=00000000 token(changed)=0
serverName="server " userId="userId " password="password "
&CclUOWI=00000000 runTran="run " attachTran="att "
```

## **makeSecurityDefault**

Informs the client that the current user ID and password for this object is to become the default for ECI and EPI requests passed to the server as specified in the construction of the connection object.

**void makeSecurityDefault()**

## **password (1)**

Returns the password held by the CclConn object, padded with spaces to 10 characters, or blanks if there is no password.

**const char\* password() const**

## **password (2)**

**void password(Ccl::Bool *unpadded*)**

*unpadded*

**Ccl::Yes**

returns a null terminated string of the stored password with no space padding in the string.

**Ccl::No**

returns the string padded with spaces — the same as invoking the password method with no parameters.

## **serverName (1)**

Returns the name of the server system held by the CclConn object, padded with spaces, or blanks if the default CICS server is being used and no calls have yet been made.

**const char\* serverName() const**

## serverName (2)

**void serverName(Ccl::Bool *unpadded*)**

*unpadded*

**Ccl::Yes**

returns a null terminated string of the stored server name with no space padding in the string.

**Ccl::No**

returns the string padded with spaces — the same as invoking the `serverName` method with no parameters.

## status

**void status(CclFlow& *flow*)**

*flow*

A reference to the `CclFlow` object used to control the server request call.

Requests the status of the server connection. When the reply has been received, use **serverStatus** or **serverStatusText** to obtain server availability.

## serverStatus

Returns an enumeration value, set by an earlier **status** or **changed** request, indicating the availability of the server. Possible values are listed under Enumerations.

**ServerStatus serverStatus() const**

## serverStatusText

Returns a string, set by an earlier **status** or **changed** request, indicating the availability of the server.

**const char\* serverStatusText() const**

## userId (1)

Returns the user ID held by the `CclConn` object, padded with spaces, or blanks if none.

**const char\* userId() const**

## userId (2)

**void userId(Ccl::Bool *unpadded*)**

*unpadded*

**Ccl::Yes**

returns a null terminated string of the stored user ID with no space padding in the string.

**Ccl::No**

returns the string padded with spaces exactly as invoking the user ID method with no parameters.

## verifyPassword

**CclSecAttr\* verifyPassword()**

Allows a Client application to verify that the password held in the CclConn object matches the password recorded by an external security manager for the user ID held in the CclConn object. The external security manager is assumed to be located in the server defined by the CclConn object.

## Enumerations

### ServerStatus

Indicates the availability of the server.

Possible values are:

#### unknown

The server status is unknown.

#### available

The server is available.

#### unavailable

The server is not available.

---

## CclECI class

One instance only of the **CclECI** class can exist. It is created by the **instance** class method. It controls the client interface to the available servers.

Subclass the **CclECI** to implement your own `handleException` method.

One instance only of a **CclECI** subclass can exist. Any attempt to create more than one raises a `multipleInstance` exception.

A **CclECI** object cannot be copied or assigned.

## CclECI constructor (protected)

This constructor is protected and can be accessed only from a subclass.

**CclECI()**

## Public methods

### exCode

Returns an enumeration indicating the most recent exception code.

### Deprecated method

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**Ccl::ExCode exCode() const**

The possible values are listed under “C++ Exception Objects” on page 102.

### exCodeText

Returns a text string describing the most recent exception code.

### Deprecated method

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**const char\* exCodeText() const**

## **handleException**

**virtual void handleException(CclException &except)**

*except*

A CclException object that contains information about the exception just raised.

This method is called whenever an exception is raised. To deal with exceptions, you must always subclass **CclECI**, and provide your own implementation of **handleException**. See the information about handling exceptions in the *CICS Transaction Gateway for Multiplatforms: Programming Guide*. The default implementation merely throws the exception object.

## **instance**

A class method that returns a pointer to the single CclECI object that exists on the client.

**static CclECI\* instance()**

Here is an example of its use:

```
CclECI* pmgr = CclECI::instance();
```

## **listState**

Returns a formatted string containing the current state of the object.

**const char\* listState() const**

For example:

```
ECI state..&CclECI=00203AE0 &CclECII=00203B20  
retCode=0 exCode=0  
serverCount=0 &serverBuffer=00000000
```

## **serverCount**

Returns the number of available servers to which the CICS Transaction Gateway might be connected, as configured in the CICS Transaction Gateway initialization file.

**unsigned short serverCount() const**

In practice, some or all of these servers might not be available. See the information about finding potential servers in the *CICS Transaction Gateway for Multiplatforms: Programming Guide*.

## **serverDesc**

**const char\* serverDesc(unsigned short index = 1) const**

*index*

The index of a connected server in the list. The default index is 1.

Returns the description of the *index*th server. See the information about finding potential servers in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* for more information.

## serverName

**const char\* serverName(unsigned short index = 1) const**

*index*

The index of a connected server in the list. The default index is 1.

Returns the name of the *index*th server. See the information about finding potential servers in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* for more information.

---

## CcIEPI class

The **CcIEPI** class initializes and terminates the CICS Transaction Gateway EPI function. It also has methods which allow you to obtain information about CICS servers configured in the CICS Transaction Gateway initialization file. You must create one object of this class for each application process before you create **CclTerminal** objects to connect to CICS servers.

### CcIEPI constructor

This method initializes the CICS EPI interface on the client.

**CcIEPI()**

An **initEPI** exception is raised if initialization fails. Initialization of the CICS Transaction Gateway EPI is synchronous. In other words, initialization is complete when the call to the **CcIEPI** constructor returns.

### Public methods

#### diagnose

Returns a character string that holds a description of the condition returned by the most recent server call.

**const char\* diagnose() const**

#### exCode

Returns an enumeration indicating the most recent exception code.

#### Deprecated method

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**Ccl::ExCode exCode() const**

The possible values are listed under “C++ Exception Objects” on page 102.

#### exCodeText

Returns a text string describing the most recent exception code.

#### Deprecated method

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**const char\* exCodeText() const**

## **handleException**

**virtual void handleException(CclException &except)**

*except*

A CclException object that contains information about the exception just raised.

This method is called whenever an exception is raised. To deal with exceptions, use *try...catch*, or subclass **CclEPI** and provide your own implementation of **handleException**. The default implementation merely throws the exception object.

## **serverCount**

Returns the number of available servers to which the CICS Transaction Gateway might be connected, as configured in the CICS Transaction Gateway initialization file.

**unsigned short serverCount()**

## **serverDesc**

**const char\* serverDesc(unsigned short index = 1)**

*index*

The index of a configured server

Returns a description of the selected CICS server, or NULL if no information is available in the CICS Transaction Gateway initialization file for the specified server. If the index exceeds the number of servers configured, a maxServers exception is raised.

## **serverName**

**const char\* serverName(unsigned short index = 1)**

*index*

The index of a configured server

Returns the name of the requested CICS server, or NULL if no information is available in the CICS Transaction Gateway initialization file for the specified server. If the index exceeds the number of servers configured, a maxServers exception is raised.

## **state**

Returns an enumeration indicating the state of the EPI.

**State state() const**

Possible values are:

**active** EPI has been initialized successfully

**discon**

EPI has terminated

**error** EPI initialization has failed

## terminate

Terminates the CICS Transaction Gateway EPI in a controlled manner. The CclEPI object remains in existence, so that anything which occurs during the termination can be monitored by the application.

### Deprecated method

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**void terminate()**

Because the terminate method is started during CclEPI object destruction, you do not need to start this method.

## Enumerations

### State

An enumeration indicating the state of the EPI.

Possible values are:

**active** EPI has been initialized successfully

**discon** EPI has terminated

**error** EPI initialization has failed

---

## CclException class

A CICS Transaction Gateway object constructs an object of the **CclException** class if it encounters a problem.

To deal with such a problem, subclass the **CclECI** or **CclEPI** class and provide your own implementation of the **handleException** method. See the information about handling exceptions in the *CICS Transaction Gateway for Multiplatforms: Programming Guide*. This method has access to the methods of the CclException object and can be coded to take whatever action is necessary. For example, it can stop the program or display a dialog box.

Alternatively, you can use a C++ *try...catch* block to handle exceptions.

A CclException object cannot be assigned and its constructors are intended for use by the CICS Transaction Gateway class implementation only.

## Public methods

### abendCode

Returns a null-terminated string containing the ECI abend code, or blanks if no abend code is available.

**const char\* abendCode()**

### className

Returns the name of the class in which the exception was raised.

**const char\* className() const**

## diagnose

**const char\* diagnose() const**

Returns text explaining the exception for use in diagnostic output, for example:  
unknown server, classname=CclFlowI, methodName=afterReply, originCode=13  
"link", flowId=2, retCode=-22, abendCode=" "

## exCode

Returns the exception code.

**Ccl::ExCode exCode() const**

For further information see "C++ Exception Objects" on page 102.

## exCodeText

Returns a text string that describes the exception code.

**const char\* exCodeText() const**

## exObject

This method is relevant to to both the ECI and EPI.

**void\* exObject() const**

**exObject** returns a pointer to the object controlling any server interaction at the time of the exception. If there was no such object, a null pointer is returned.

- In the case of ECI the pointer must be cast to a **CclFlow\***. For example:  
`CclFlow* pFlo = (CclFlow*) ex.exObject();`
- In the case of EPI **exObject** returns the relevant **CclTerminal** object pointer in the exception block. Cast this to a **CclTerminal\***; for example:  
`CclTerminal* pTerm = (CclFlow*)ex.exObject();`

## methodName

Returns the name of the method in which the exception was raised.

**const char\* methodName() const**

---

## CclField class

An object of the **CclField** class is responsible for looking after a single field on a 3270 screen. **CclField** objects are created and deleted when 3270 data from the CICS server is processed by a **CclScreen** object.

Methods in this class allow field text and attributes to be read and updated. Modified fields are sent to the CICS server on the next **send**.

## Public methods

### appendText (1)

**void appendText(const char\* text, unsigned short length)**

*text*

The text to be appended to the field

*length*

The number of characters to be appended to the field

Appends *length* characters from *text* to the end of the text already in the field.

## **appendText (2)**

**void appendText(const char\* text)**

*text*

The null-terminated text string to be appended to the field

Appends the characters within the *text* string to the end of the text already in the field.

## **backgroundColor**

Returns an enumeration indicating the background color of the field. The possible values are shown under **Color** at the end of the description of this class.

**Color backgroundColor() const**

## **baseAttribute**

Returns the 3270 base attribute of the field.

**char baseAttribute() const**

## **column**

Returns the column number of the position of the start of the field on the screen, with the leftmost column being 1.

**unsigned short column() const**

## **dataTag**

Returns an enumeration indicating whether the data in the field has been modified.

**BaseMDT dataTag() const**

Possible values are:

- modified
- unmodified

## **foregroundColor**

Returns an enumeration indicating the foreground color of the field. The possible values are shown under **Color** at the end of the description of this class.

**Color foregroundColor() const**

## **highlight**

Returns an enumeration indicating which type of highlight is being used. The possible values are shown under **Highlight** at the end of the description of this class.

**Highlight highlight() const**

## **inputProt**

Returns an enumeration indicating whether the field is protected.

**BaseProt inputProt() const**

Possible values are:

- protect
- unprotect

## **inputType**

Returns an enumeration indicating the input data type for this field.

**BaseType inputType() const**

Possible values are:

- alphanumeric
- numeric

## **intensity**

Returns an enumeration indicating the field intensity.

**BaseInts intensity() const**

Possible values are :

- dark
- normal
- intense

## **length**

Returns the total length of the field.

**unsigned short length() const**

This includes one byte used to store the 3270 attribute byte information. The actual space for data is one byte less than the value returned by this method. See also the “textLength” on page 81 method.

## **position**

**unsigned short position() const**

Returns the position of the start of the field on the screen, given by position = column number + ( $n \times$  row number), where  $n$  is the number of columns in a row (usually 80).

## **resetDataTag**

**void resetDataTag()**

Resets the modified data tag (MDT) to *unmodified*.

## **row**

Returns the row number of the position of the start of the field on the screen. The top row is 1.

**unsigned short row() const**

### **setBaseAttribute**

**void setBaseAttribute(char attribute)**

*attribute*

The value of the base 3270 attribute byte to be entered into the field

Sets the 3270 base attribute.

### **setExtAttribute**

**void setExtAttribute(char attribute, char value)**

*attribute*

The type of extended attribute being set

*value*

The value of the extended attribute

Sets an extended 3270 attribute. If an invalid 3270 attribute type or value is supplied, a parameter exception is raised.

### **setText (1)**

These methods update the field with the given text.

**void setText(const char\* text, unsigned short length)**

*text*

The text to be entered into the field

*length*

The number of characters to be entered into the field

Copies *length* characters from *text* into the field.

### **setText (2)**

**void setText(const char\* text)**

*text*

The null-terminated text to be entered into the field

Copies *text*, without the terminating null, into the field.

### **text**

Returns the text currently held in the field.

**const char\* text() const**

### **textLength**

Returns the number of characters currently held in the field.

**unsigned short textLength() const**

### **transparency**

Returns an enumeration indicating the background transparency of the field. Possible values are shown under **Transparency** at the end of the description of this class.

Transparency transparency() const

## Enumerations

### BaseInts

Indicates the field intensity.

Possible values are:

- normal
- intense
- dark

### BaseMDT

Indicates whether data in the field has been modified.

Possible values are:

- unmodified
- modified

### BaseProt

Indicates whether the field is protected.

Possible values are:

- protect
- unprotect

### BaseType

Indicates field input data type.

Possible values are:

- alphanumeric
- numeric

### Color

Possible values are:

defaultColor	yellow	paleGreen
blue	neutral	paleCyan
red	black	gray
pink	darkBlue	white
green	orange	
cyan	purple	

### Highlight

Indicates which type of highlight is being used. Possible values are:

defaultHlt	blinkHlt	underscoreHlt
normalHlt	reverseHlt	intenseHlt

### Transparency

Indicates the background transparency of the field.

Possible values are:

**defaultTran**  
default transparency

**orTran**  
OR with underlying color

**xorTran**  
XOR with underlying color

**opaqueTran**  
opaque

---

## CclFlow class

A CclFlow object is used to control ECI communications for a client/server pair and to determine the synchronization of reply processing.

See the information about compiling and running a C++ Client application in the *CICS Transaction Gateway for Multiplatforms: Programming Guide* for an explanation of synchronization. **CclFlow** automatically calls its **handleReply** method when a reply is available; this simplifies control of interleaved replies. Subclass **CclFlow** to implement your own **handleReply** method.

A CclFlow object is created for each client/server interaction (request from client and response from server). CclFlow objects can be reused when they become inactive, that is, when reply processing is complete. An attempt to delete or reuse an active CclFlow object raises an activeFlow exception.

## CclFlow constructor

### CclFlow (1)

**CclFlow(Ccl::Sync syncType, unsigned long stackPages = 3)**

*syncType*

The type of synchronization

*stackPages*

If asynchronous, the number of 4kb stack pages. The default is 3. If not asynchronous, this parameter is ignored.

### CclFlow (2)

**CclFlow(Ccl::Sync syncType,  
          unsigned long stackPages,  
          const unsigned short &timeout)**

*syncType*

The type of synchronization

*stackPages*

If asynchronous, the number of 4kb stack pages. If not asynchronous, this parameter is ignored.

*timeout*

The time in seconds to wait for the ECI program to respond. If a timeout occurs, the HandleException method is called with a timeout CclException Object. Valid values are 0-32767.

## Public methods

### **abendCode**

Returns the abend code from the most recently executed CICS transaction, or blank if there have been none.

**const char\* abendCode() const**

### **callType**

Returns an enumeration value indicating the most recent type of server request.

**CallType callType() const**

### **callTypeText**

Returns the name of the most recent server request.

**const char\* callTypeText() const**

### **connection**

Returns a pointer to the CclConn object that represents the server being used, if any, or zeros.

**CclConn\* connection() const**

### **diagnose**

**const char\* diagnose() const**

Returns text explaining the exception for use in diagnostic output; for example:

"link", flowId=2, retCode=-22, abendCode=" "

### **flowId**

Returns the unique identity of this CclFlow object.

**unsigned short flowId() const**

### **forceReset**

Makes the flow inactive and resets it.

**void forceReset()**

This is typically used to prepare a CclFlow object for re-use or deletion after a flow has been abandoned, for example when a C++ throw is used in a exception handler. This applies only to dsync and async flows. You cannot issue this on a sync call from another thread.

### **handleReply**

**virtual void handleReply(CclBuf\* commarea)**

*commarea*

A pointer to the CclBuf object containing the returned COMMAREA or zero if none.

This method is called whenever a reply is received from a server, irrespective of the type of synchronization or the type of call. See the information about Programming in C++ in the *CICS Transaction Gateway for Multiplatforms*:

*Programming Guide*. To deal with replies, subclass **CclFlow** and provide your own implementation of **handleReply**. The default implementation merely returns to the caller.

## **listState**

Returns a formatted string containing the current state of the object.

**const char\* listState() const**

For example:

```
Flow state..&CclFlow=000489A4 &CclFlowI=00203B70  
syncType=2 threadId=0 stackPages=9 callType=0 flowId=0 commLength=0  
retCode=0 systemRC=0 abendCode=" " &CclConnI=00000000 &CclUOWI=00000000
```

## **poll**

**Ccl::Bool poll(CclBuf\* commarea = 0)**

*commarea*

An optional pointer to the CclBuf object that will be used to contain the returned COMMAREA.

Returns an enumeration, defined within the **Ccl** class indicating whether a reply has been received from a deferred synchronous **Backout**, **Cancel**, **Changed**, **Commit**, **Link**, or **Status** call request. If **poll** is used on a flow object that is not deferred synchronous, a syncType exception is raised. Possible values are:

**yes** A reply has been received. **handleReply** has been called synchronously.

**no** No reply has been received. The client process is not blocked.

## **setTimeout**

**void setTimeout(const unsigned short &timeout)**

*timeout*

the defined time in seconds to wait for the ECI program to respond. If a timeout occurs, the HandleException method is called with a timeout CclException Object. Valid values are 0-32767.

Sets the timeout value for the flow object for the next activation of the flow. This value can be set while a flow is active but does not affect the current active flow

## **syncType**

Returns an enumeration, defined within the **Ccl** class indicating the type of synchronization being used.

**Ccl::Sync syncType() const**

Possible values are shown in “Sync” on page 63.

## **timeout**

Retrieves the current timeout value set for the flow object.

**short timeout()**

## **uow**

Returns a pointer to any CclUOW object containing information on any units of work (UOWs) associated with this interaction.

**CclUOW\* uow() const**

**wait**

Waits for a reply from the server, blocking the client process in the meantime.

**void wait()**

If **wait** is used on a synchronous flow object, a **syncType** exception is raised.

## Enumerations

### CallType

The possible values for server requests in progress under the control of a **CclFlow** object are:

**inactive**

No server call is currently in progress

**link** A **CclConn::link** call to a server program

**backout**

A **CclUOW::backout** call to back out changes made to recoverable resources on the server

**commit**

A **CclUOW::commit** call to commit changes made to recoverable resources on the server

**status** A **CclConn::status** call to determine the status of a server connection

**changed**

A **CclConn::changed** call to request notification when the status of a connection to a server changes

**cancel**

A **CclConn::cancel** call to cancel an earlier **CclConn::changed** request.

---

## CclMap class

The **CclMap** class is a base class for map classes created by the CICS BMS Map Conversion Utility. The methods provided by **CclMap** class are inherited by the classes generated from BMS maps.

### CclMap constructor

**CclMap(CclScreen\* screen)**

*screen*

A pointer to the matching **CclScreen** object.

Creates a **CclMap** object and checks (validates) that the map matches the content of the screen, defined by the **CclScreen** object. If validation was unsuccessful, an **invalidMap** exception is raised. If the supplied **CclScreen** object is invalid, a **parameter** exception is raised.

### Public methods

**exCode**

Returns an enumeration indicating the most recent exception code.

**Deprecated method**

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**Ccl::ExCode exCode() const**

The possible values are listed in “C++ Exception Objects” on page 102.

### **exCodeText**

Returns a text string describing the most recent exception code.

### **Deprecated method**

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**const char\* exCodeText() const**

### **field (1)**

**CclField\* field(unsigned short *index*)**

*index*

The index number of the required CclField object.

Returns a pointer to the CclField object identified by *index* in the BMS map.

### **field (2)**

**CclField\* field(unsigned short *row*, unsigned short *column*)**

*row*

The row number of the required CclField object within the map. The top row is 1.

*column*

The column number of the required CclField object within the map. The left column is 1.

Returns a pointer to the CclField object identified by position in the BMS map.

## **Protected methods**

### **namedField**

**CclField\* namedField(unsigned long *index*)**

*index*

The index number of the required CclField object.

Returns the address of the *indexth* object.

### **validate**

**void validate(const MapData\* *map*,  
const FieldIndex\* *index*,  
const FieldData\* *fields*)**

#### *map*

A structure that contains information about the map. The structure is defined within this class and contains the following members, which are all unsigned short integers:

**row**     Map row position on screen  
**col**     Map column position on screen  
**width**     Map width in columns  
**depth**   Map depth in rows  
**fields**   Number of fields  
**labels**     Number of labeled fields

#### *index*

The index number of the required CclField object. **FieldIndex** is a typedef of this class and is equivalent to an unsigned short integer.

#### *fields*

A structure that contains information about a particular field. The structure is defined within this class and contains the following members, which are all unsigned short integers:

**row**     Field row (within map)  
**col**     Field column (within map)  
**len**     Field length

Validate map against the current screen.

---

## CclScreen class

The **CclScreen** EPI class maintains all data on the 3270 virtual screen and provides access to this data. It contains a collection of CclField objects which represent the fields on the current 3270 screen.

A single CclScreen object is created by the CclTerminal object; use the **screen** method on the CclTerminal object to obtain it. The CclScreen object is updated by the CclTerminal object when 3270 data is received from CICS. A dataStream exception is raised if an unsupported data stream is received.

## Public methods

### **cursorCol**

Returns the column number of the current position of the cursor. The left column is 1.

**unsigned short cursorCol() const**

### **cursorRow**

Returns the row number of the current position of the cursor. The top row is 1.

**unsigned short cursorRow() const**

### **depth**

Returns the number of rows in the screen.

**unsigned short depth() const**

## field (1)

These methods allow you to access fields on the current screen by returning a pointer to the relevant CclField object.

**CclField\* field(unsigned short *index*)**

*index*

The index number of the field of interest

## field (2)

**CclField\* field(unsigned short *row*, unsigned short *column*)**

*row*

The row number of the field

*column*

The column number of the field

## fieldCount

Returns the number of fields in the screen.

**unsigned short fieldCount() const**

## mapName

Returns a padded null terminated string specifying the name of the map that was most recently referenced in the MAP option of a SEND MAP command processed for the terminal resource.

**const char\* mapName()**

If the terminal resource is not supported by BMS, or the server has no record of any map being sent, the value returned is spaces.

## mapSetName

Returns a padded null terminated string specifying the name of the mapset that was most recently referenced in the MAPSET option of a SEND MAP command processed for the terminal resource.

**const char\* mapSetName()**

If the MAPSET option was not specified on the most recent request, BMS used the map name as the mapset name. In both cases, the mapset name used might have been suffixed by a terminal suffix. If the terminal resource is not supported by BMS, or the server has no record of any mapset being sent, the value returned is spaces.

## setAID

**void setAID(const AID *key*)**

*key*

An AID key. See the "AID" on page 90 enumerations at the end of this section.

Sets the AID key value to be passed to the server on the next transmission.

## setCursor

**void setCursor(unsigned short *row*, unsigned short *col*)**

*row*

The required row number of the cursor. The top row is 1.

*col*

The required column number of the cursor. The left column is 1.

Requests that the cursor position be set. If the supplied row or column values are outside the screen boundaries, a parameter exception is raised.

### **width**

Returns the number of columns on the screen.

**unsigned short width() const**

## **Enumerations**

### **AID**

Indicates an AID key.

Possible values are:

- enter
- clear
- PA1—PA3
- PF1—PF24

---

## **CclSecAttr**

The CclSecAttr class provides information about passwords reported back by the external security manager when verifyPassword or changePassword methods are issued on CclConn or CclTerminal objects.

This object is created and owned by the CclConn or CclTerminal Object; access to this object is provided when the verifyPassword or changePassword methods are invoked.

## **Public Methods**

### **expiryTime**

Returns a CclSecTime object that contains the Date and Time at which the password will expire

**CclSecTime\* expiryTime() const**

### **invalidCount**

Returns the Number of times that an invalid password has been entered for the user ID.

**unsigned short invalidCount() const**

### **lastAccessTime**

Returns a CclSecTime object that contains the date and time when the user ID was last accessed.

**CclSecTime\* lastAccessTime() const**

## **lastVerifiedTime**

Returns a CclSecTime object that contains the date and time of the Last Verification.

**CclSecTime\* lastVerifiedTime() const**

---

## **CclSecTime**

The CclSecTime class provides date and time information in the CclSecAttr object for various entries reported back by the external security manager when verifyPassword or changePassword methods are issued on CclConn or CclTerminal objects.

These objects are created and owned by the CclSecAttr object and access is obtained via the various methods available on this object. No Constructors or Destructors are available.

### **Public Methods**

#### **day**

Returns the day with a range from 1 to 31; 1 represents the first day of the month.

**unsigned short day() const**

#### **get\_time\_t**

Returns the date and time in a time\_t format.

**time\_t get\_time\_t() const**

#### **get\_tm**

Returns the date and time in a tm structure.

**tm get\_tm() const**

#### **hours**

Returns the hours with a range from 0 to 23.

**unsigned short hours() const**

#### **hundredths**

Returns the hundredths of seconds with a range from 0 to 99.

**unsigned short hundredths() const**

#### **minutes**

Returns the minutes with a range from 0 to 59.

**unsigned short minutes() const**

#### **month**

Returns the month with a range from 1 to 12. January is 1.

**unsigned short month() const**

**seconds**

Returns the seconds with a range from 0 to 59.

**unsigned short seconds() const**

**year**

Returns a 4-digit year

**unsigned short year() const**

---

## CclSession class

The **CclSession** class allows the programmer to implement reusable code to handle a segment (one or more transmissions) of a 3270 conversation. In multi-threaded environments it provides asynchronous handling of replies from CICS.

The **CclSession** class controls the flow of data to and from CICS within a single 3270 session. Derive your own classes from **CclSession**.

### CclSession constructor

**CclSession(Ccl::Sync *syncType*)**

*syncType*

The protocol to be used on transmissions to the CICS server. Possible values are:

**async** asynchronous

**dsync** deferred synchronous

**sync** synchronous

### Public methods

**diagnose**

Returns a text description of the last error.

**const char\* diagnose() const**

**handleReply**

**virtual void handleReply(State *state*, CclScreen\* *screen*)**

*state*

An enumeration indicating the state of the data flow. The scope of the values is shown under **State** at the end of the description of this class.

*screen*

A pointer to the CclScreen object.

This is a virtual method which you can override when you develop your own class derived from **CclSession**. It is called when data is received from CICS.

**state**

Returns an enumeration indicating the current state of the session. Possible values are shown under **State** at the end of the description of this class.

**State state() const**

## **terminal**

Returns a pointer to the `CclTerminal` object for this session. This method returns a `NULL` pointer until the `CclSession` object has been associated with a `CclTerminal` object (that is, until the `CclSession` object has been used as a parameter on a `CclTerminal` **send** method).

`CclTerminal* terminal() const`

## **transID**

Returns the 4-letter name of the current transaction.

`const char* transID() const`

## **Enumerations**

### **State**

Indicates the state of a session.

Possible values are:

**idle** The terminal is connected and no CICS transaction is in progress.

**server** A CICS transaction is in progress in the server.

**client** A CICS transaction is in progress, and the server is waiting for a response from the client.

**discon** The terminal is disconnected.

**error** There is an error in the terminal.

---

## **CclTerminal class**

An object of class **CclTerminal** represents a 3270 terminal connection to a CICS server. A CICS connection is established when the object is created. Methods can then be used to converse with a 3270 terminal application (often a BMS application) in the CICS server.

The EPI must be initialized (that is, a `CclEPI` object created) before a `CclTerminal` object can be created.

The `CclTerminal` class destructor does not purge ATI requests queued against the terminal.

## **CclTerminal constructor**

### **CclTerminal (1)**

```
CclTerminal(const char* server = NULL,  
            const char* devtype = NULL,  
            const char* netname = NULL)
```

*server*

The name of the server with which you want to communicate. If no name is provided the default CICS server system is assumed. The length is adjusted to 8 characters by padding with blanks.

*devtype*

The name of the model terminal definition that the server uses to generate a terminal resource definition. If no string is provided the default model is used. The length is adjusted to 16 characters by padding with blanks.

*netname*

The name of the terminal resource to be installed or reserved. The default is to use the contents of *devtype*. The length is adjusted to 8 characters by padding with blanks.

Creates the CclTerminal object that is used for EPI communication between the client and server.

This constructor does an implicit install terminal. You do not need to start the install method if you construct a terminal object this way.

If the named server is not configured in the CICS Transaction Gateway initialization file, an unknownServer exception is raised.

If invalid values are supplied for *server*, *devtype* or *netname*, a parameter exception is raised.

If a CclEPI object has not been created, an initEPI exception is raised.

If the maximum number of supported terminal connections has been exceeded, a maxRequests exception is raised.

## CclTerminal (2)

```
CclTerminal(const char* server,
            const char* devtype,
            const char* netname,
            signonType signonCapability
            const char* userid
            const char* password
            const unsigned short &readTimeOut,
            const unsigned short &CCSid)
```

*server*

The name of the server with which you want to communicate. If no name is provided the default CICS server system is assumed. The length is adjusted to 8 characters by padding with blanks.

*devtype*

The name of the model terminal definition which the server uses to generate a terminal resource definition. If no string is provided the default model is used. The length is adjusted to 16 characters by padding with blanks.

*netname*

The name of the terminal resource to be installed or reserved. The default is to use the contents of *devtype*. The length is adjusted to 8 characters by padding with blanks.

*signonCapability*

Sets the type of sign-on capability for the terminal.

Possible values are:

- CclTerminal::SignonCapable

- `CcITerminal::SignonIncapable`

*userid*

The name of the user ID to associate with this terminal resource

*password*

The password to associate with the user ID

*readTimeOut*

A value in the range 0 through 3600, specifying the maximum time in seconds between the time the classes go clientrepl state and the application program invokes the reply method.

*CCSid*

An unsigned short specifying the coded character set identifier (CCSID) that identifies the coded graphic character set used by the Client application for data passed between the terminal resource and CICS transactions. A zero string means that a default will be used.

Creates a Terminal object that does not do an implicit install terminal. You must run the install method to install the terminal.

## Public methods

### **alterSecurity**

You can call the method before you install a terminal. It changes only the terminal definition; the new user ID and password will be used for the terminal when install is called.

**void alterSecurity(const char\* *userid*,const char\* *password*)**

*userid*

The new user ID

*password*

The new password for *userid*

Allows you to re-define the user ID and password for a terminal resource.

### **changePassword**

Allows a Client application to change the password held in the terminal object and the password recorded by an external security manager for the user ID held in the terminal object.

**CcISecAttr\* changePassword(const char\* *newPassword*)**

*newPassword*

The new password

The external security manager is assumed to be located in the server defined by the terminal object.

### **CCSid**

Returns the selected code page as an unsigned short.

**unsigned short CCSid()**

## **diagnose**

Returns a character string that holds a description of the error returned by the most recent server call.

**const char\* diagnose()**

## **disconnect (1)**

Disconnects the terminal from CICS. No attempt is made to purge outstanding running transactions.

**void disconnect()**

## **disconnect (2)**

Disconnects the terminal from CICS.

**void disconnect(Ccl::Bool *withPurge*)**

*withPurge*

**Ccl::Yes**

Disconnects the terminal from CICS and attempts to purge any outstanding running transaction. This purge function does not cancel ATI requests queued against the terminal.

**Ccl::No**

Disconnects the terminal from CICS. No attempt is made to purge outstanding running transactions.

## **discReason**

Returns the reasons for a disconnection.

**void discReason(void)**

See “EndTerminalReason” on page 101.

## **exCode**

Returns an enumeration indicating the most recent exception code.

### **Deprecated method**

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**Ccl::ExCode exCode() const**

The possible values are listed in “C++ Exception Objects” on page 102.

## **exCodeText**

Returns a text string describing the most recent exception code.

### **Deprecated method**

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**const char\* exCodeText() const**

## install

Connects a non-connected terminal resource.

```
void install(CclSession *session,  
            const unsigned short &installTimeout)
```

*session*

A pointer to the CclSession object that is to be used for the CICS server interaction.

*installTimeout*

A value in the range 0 to 3600, specifying the maximum time in seconds that installation of the terminal resource is allowed to take. A value of 0 means that no limit is set.

Throws an invalidState error if already connected, or a timeout error if a timeout occurs.

## makeSecurityDefault

Informs the client that the current user ID and password for this object are to become the default for ECI and EPI requests passed to the server as specified in the construction of the Terminal object.

```
void makeSecurityDefault()
```

## netName

Returns the network name of the terminal as a null terminated string.

```
const char* netName() const
```

## password

Returns a null terminated string containing the current password setting for the terminal, or null if the terminal has no password.

```
const char* password()
```

## poll

Polls for data from the CICS server.

```
Ccl::Bool poll()
```

For deferred synchronous transmissions (that is, if a deferred synchronous CclSession object was used on a previous send call) the **poll** method is called by the application when it wants to receive data from the CICS server. If a reply from CICS is ready, the CclTerminal object updates the CclScreen object with the contents of the 3270 data stream received from CICS, the **handleReply** virtual function on the CclSession object is called, and the **poll** method returns Ccl::yes. If no reply has been received from CICS, the **poll** method returns Ccl::no.

The **poll** method is used only for deferred synchronous transmissions; a syncType exception is raised if the poll method is called when a synchronous or asynchronous session is in use. An invalidState exception is raised if the **poll** method is called when there was no previous **send** call. The CclTerminal object must be in server state for poll to be called.

A CICS server transaction can send more than one reply in response to a CclTerminal **send** call. More than one CclTerminal **poll** call can therefore be needed

to collect all the replies. Use the `CclTerminal` **state** method to find out whether further replies are expected. If there are, the value returned will be `server`. See the information about EPI call synchronization types in the *CICS Transaction Gateway for Multiplatforms: Programming Guide*.

### **queryATI**

Returns an enumeration indicating whether the “Automatic Transaction Initiation” (ATI) is enabled or disabled.

**ATISState** `queryATI()`

Possible values are:

- `disabled`
- `enabled`

### **readTimeout**

Returns the read timeout value for the terminal as a null terminated string .

**const char\*** `readTimeout()`

### **receiveATI**

Waits for and receives 3270 data stream for a CICS ATI transaction.

**void** `receiveATI(CclSession* session)`

*session*

pointer to the `CclSession` object that is to be used for the CICS server interaction.

The `CclSession` object supplied as a parameter determines whether the call is synchronous or asynchronous, and can be subclassed to provide a reply handler

### **screen**

Returns a pointer to the `CclScreen` object that is handling the 3270 screen associated with this terminal session.

**CclScreen\*** `screen()` **const**

### **send (1)**

Formats and sends a 3270 data stream, starting the named transaction.

**void** `send(CclSession* session,`  
                  **const char\*** *transid*,  
                  **const char\*** *startdata* = **NULL**)

*session*

A pointer to the `CclSession` object that controls the session which is to be used. If no valid `CclSession` object is supplied, a parameter exception is raised.

*transid*

The name of the transaction which is to be started

*startdata*

start transaction data. The default is to have no data for the transaction being started.

The CclTerminal object must be in idle state (connected to a CICS server but with no transaction in progress). If the object is not in idle state, an `invalidState` exception is raised.

## **send (2)**

Formats and sends a 3270 data stream.

**void send(CclSession\* session)**

The *session* parameter is described above.

The CclTerminal object must be in idle state (see above) or in client state (that is, with a transaction in progress and the CICS server waiting for a response). If the object is not in idle or client state, an `invalidState` exception is raised.

## **setATI**

Indicates whether the ATI is to be enabled or disabled.

**void setATI(ATIState newstate)**

*newstate*

An enumeration indicating whether the ATI is to be enabled or disabled. The scope of the values is within this class and the possible values are disabled and enabled.

## **signonCapability**

Returns the type of sign-on capability applied to the terminal at installation.

**signonType signonCapability()**

Possible values are:

- `CclTerminal::signonCapable`
- `CclTerminal::signonIncapable`
- `CclTerminal::signonUnknown`

## **state**

Returns an enumeration indicating the current state of the session. Possible values are shown at the end of the description of this class.

**State state() const**

## **serverName**

Returns the name of the CICS server to which this terminal session is connected.

**const char\* serverName() const**

## **termID**

Returns the 4-character terminal ID.

**const char\* termID() const**

## **transID**

Returns the 4-character name of the current CICS transaction. If a RETURN IMMEDIATE is run from the current transaction, TransId does not provide the name of the new transaction; it still contains the name of the first transaction.

**const char\* transID() const**

### **userId**

Returns a null terminated string containing the current user ID setting for the terminal, Null if none.

**const char\* userId()**

### **verifyPassword**

Allows a Client application to verify that the password held in the terminal object matches the password recorded by an external security manager for the user ID held in the terminal object. The external security manager is assumed to be located in the server defined by the terminal object.

**CclSecAttr\* verifyPassword()**

## **Enumerations**

### **ATIState**

Indicates whether “Automatic Transaction Initiation” (ATI) is enabled or disabled.

Possible values are:

- enabled
- disabled

### **signonType**

Indicates the sign-on capability of a terminal.

Possible values are:

#### **signonCapable**

Sign-on Capable

#### **signonIncapable**

Sign-on Incapable

#### **signonUnknown**

Sign-on Unknown

### **State**

Indicates the state of the CclTerminal object.

Possible values are:

**client** A CICS transaction is in progress and the server is waiting for a response from the client.

#### **discon**

The terminal is disconnected.

**error** There is an error in the terminal.

**idle** The terminal is connected and no CICS transaction is in progress.

#### **server**

A CICS transaction is in progress in the server.

#### **termDefined**

A terminal has been defined but not installed.

#### **txnTimedOut**

A conversational transaction has timed out, but the END\_TRAN event has not been retrieved. For synchronous and asynchronous terminals the terminal method blocks until the event has been received and the terminal

becomes idle. For deferred synchronous terminals it indicates that a poll() needs to be done to get the event. This resets the terminal to the idle state; handleException() and handleReply() are not invoked.

### EndTerminalReason

Indicates the EndTerminalReason of the CclTerminal object.

Possible values are:

#### signoff

A disconnect was requested or the user has signed off the terminal.

#### shutdown

The CICS server has been shut down.

#### outofService

The terminal has been switched to out of service.

#### unknown

An unknown situation has occurred.

**failed** The terminal failed to disconnect.

#### notDiscon

The terminal is not disconnected.

---

## CclUOW class

Use this ECI class when you make updates to recoverable resources in the server within a “unit of work” (UOW).

Each update in a UOW is identified at the client by a reference to its CclUOW—see [link](#) in CclConn (“link” on page 70).

A CclUOW object cannot be copied or assigned. An attempt to delete a CclUOW object for which there is an active CclFlow object raises an activeFlow exception. Any attempt to delete an active CclUOW object, that is one which has not been committed or backed out, raises an activeUOW exception.

### CclUOW constructor

Creates a CclUOW object.

CclUOW()

### Public methods

#### backout

**void backout(CclFlow& *flow*)**

*flow*

A reference to the CclFlow object that is used to control the client/server call

Terminate this UOW and back out all changes made to recoverable resources in the server.

#### commit

**void commit(CclFlow& *flow*)**

*flow*

A reference to the CclFlow object that is used to control the client/server call

Terminate this UOW and commit all changes made to recoverable resources in the server.

### **forceReset**

Make this UOW inactive and reset it.

**void forceReset()**

### **listState**

Returns a zero-terminated formatted string containing the current state of the object.

**const char\* listState() const**

For example:

```
UOW state..&CclUOW=0004899C  &CclUOWI=00203BD0  
&CclConnI=00000000  uowId=0  &CclFlowI=00000000
```

### **uowId**

Returns the identifier of the UOW. 0 means that the UOW is either complete or has not yet started and it is, therefore, inactive.

**unsigned long uowId() const**

---

## **C++ Exception Objects**

All exception objects provide the following information:

- Class Name
- Method Name
- Exception Code
- Exception Text
- Abend Code (ECI Only)
- Origin Point

The Class name can contain a trailing 'I', which implies it is an internally-contained class for the well known class. For example, CclFlowI is contained by CclFlow. If an internal class is reported the method reported might be an internal method, not an external one.

The Origin Point is a unique value which defines the exact point within the class library where the exception was generated. These are mainly useful for service.

The more important items of information are the Exception Code, Exception Text and Abend Code (ECI only). The following is a Summary of these Exception Codes and Text and whether they are relevant to ECI or EPI or both.

*Table 2. Exception codes*

Enumeration	Text	Description	ECI	EPI
Ccl::noError	no error	No error occurred	Yes	Yes
Ccl::bufferOverflow	buffer overflow	Attempted to increase a CclBuf object which isn't Extensible	Yes	
Ccl::multipleInstance	multiple instance	Attempted to create more than one ECI object	Yes	

Table 2. Exception codes (continued)

Enumeration	Text	Description	ECI	EPI
Ccl::activeFlow	flow is active	Current Flow is still active, you cannot use this flow until it is inactive	Yes	
Ccl::activeUOW	UOW is active	Current UOW is still active, you need to backout or commit.	Yes	
Ccl::syncType	sync error	Incorrect synchronization type for method call.	Yes	Yes
Ccl::threadCreate	thread create error	Internal thread creation error	Yes	Yes
Ccl::threadWait	thread wait error	Internal thread wait error	Yes	
Ccl::threadKill	thread kill error	Internal thread kill error	Yes	
Ccl::dataLength	data length invalid	CommArea > 32768 Bytes or inbound 3270 data stream too large for Terminal Buffer size.	Yes	Yes
Ccl::noCICS	no CICS	The Gateway is unavailable, or the server implementation is unavailable, or a logical unit of work was to be begun, but the CICS server specified is not available. No resources have been updated	Yes	Yes
Ccl::CICSDied	CICS died	A logical unit of work was to be begun or continued, but the CICS server was no longer available. If this is a link call with an active UOW, the changes are backed out. If this was a UOW Commit or Backout, the application cannot determine whether the changes have been committed or backed out, and must log this condition to aid future manual recovery.	Yes	
Ccl::noReply	no reply	There was no outstanding reply	Yes	
Ccl::transaction	transaction abend	ECI Program Abended	Yes	
Ccl::systemError	system error	Unknown internal error occurred	Yes	Yes
Ccl::resource	resource shortage	The server implementation or the Gateway did not have enough resources to complete the request e.g. insufficient SNA sessions.	Yes	Yes
Ccl::maxUOWs	exceeded max UOWs	A new logical unit of work was being created, but the application already has as many outstanding logical units of work as the configuration will support.	Yes	
Ccl::unknownServer	unknown server	The requested server could not be located	Yes	Yes

Table 2. Exception codes (continued)

Enumeration	Text	Description	ECI	EPI
Ccl::security	security error	You did not supply a valid combination of user ID and password, though the server expects it.	Yes	Yes
Ccl::maxServers	exceeded max servers	You attempted to start requests to more servers than your configuration allows. Consult the documentation for your Gateway or server to see how to control the number of servers you can use.	Yes	Yes
Ccl::maxRequests	exceeded max requests	There were not enough communication resources to satisfy the request. Consult the documentation for your Gateway or server to see how to control communication resources	Yes	Yes
Ccl::rolledBack	rolled back	An attempt was made to commit a logical unit of work, but the server was unable to commit the changes, and backed them out instead	Yes	
Ccl::parameter	parameter error	Incorrect parameter supplied	Yes	Yes
Ccl::invalidState	invalid object state	The Object is not in the correct state to start the method, e.g. terminal object still in server state and an attempt to send data is made.	Yes	Yes
Ccl::transId	invalid transaction	Null transid supplied or returned for a pseudo conversational transaction		Yes
Ccl::initEPI	EPI not initialized	EPI has failed to initialize correctly or EPI object is missing		Yes
Ccl::connect	connection failed	Unexpected error trying to add the terminal		Yes
Ccl::data stream	3270 data stream error	Unsupported Data Stream		Yes
Ccl::invalidMap	map/screen mismatch	Map definition and Screen do not match		Yes
Ccl::cclClass	CICS class error	Unknown internal Class error occurred.	Yes	Yes
Ccl::startTranFailure	Start Transaction Failure	Transaction failed to start		Yes
Ccl::timeout	Timeout Occurred	Timeout occurred before response from Server	Yes	Yes
Ccl::noPassword	Password is Null	The object's password is null.	Yes	Yes
Ccl::noUserid	Userid is Null	The object's user ID is null	Yes	Yes
Ccl::nullNewPassword	A NULL new password was supplied	The provided password is null	Yes	Yes

Table 2. Exception codes (continued)

Enumeration	Text	Description	ECI	EPI
Ccl::pemNotSupported	PEM is not supported on the server	The CICS Server does not support the Password Expiry Management facilities. The method cannot be used	Yes	Yes
Ccl::pemNotActive	PEM is not active on the server	Password Expiry Management is not active	Yes	Yes
Ccl::passwordExpired	Password has expired	The password has expired. No information has been returned	Yes	Yes
Ccl::passwordInvalid	Password is invalid	The password is invalid.	Yes	Yes
Ccl::passwordRejected	New password was rejected	Change password failed because the password does not conform to standards defined	Yes	Yes
Ccl::useridInvalid	Userid unknown at server	The user ID is unknown	Yes	Yes
Ccl::invalidTermid	Termid is invalid	The terminal ID is invalid		Yes
Ccl::invalidModelid	Modelid is invalid	Invalid Model/Device Type		Yes
Ccl::not3270	Not a 3270 device	Not a 3270 device		Yes
Ccl::invalidCCSid	Code page (CCSid value) is invalid	Invalid CCSid		Yes
Ccl::serverBusy	Server is too busy	CICS server is busy		Yes
Ccl::signonNotPossible	Sign-on Capable terminal is not possible	The server does not allow the terminal to be installed as sign-on capable.		Yes

---

## Chapter 3. COM

---

### Buffer COM class

A CclOBuffer object contains a data area in memory which can be used to hold information. A particular use for a CclOBuffer object is to hold a COMMAREA used to pass data to and from a CICS server.

The CclOBuffer object is primarily intended for use with byte (binary) data. Typically a COMMAREA contains an application-specific data structure, often originating from a CICS server C program. The preferred method for handling binary data in Visual Basic is now the Byte data type. The **SetData** and **Data** methods allow the contents of the CclOBuffer object to be accessed as a Byte array. The CclOBuffer object can be used for string data, and stores strings as single-byte ANSI characters, but it does not provide any support for code-page conversions or DBCS. Note that in 32-bit environments Visual Basic uses 2-byte Unicode character representation; the COM class converts this to and from single-byte ANSI.

When a CclOBuffer object is created it allocates an area of memory as its buffer. The length of this buffer can be set explicitly via the **SetLength** method.

### Interface Selection

The interfaces available for Visual Basic.

The interfaces are:

```
Dim var as Object  
Dim var as CclOBuf
```

The second method is preferred.

If you do not dim a variable, dim it with no type, or are using VBScript, the variable is assumed to be of type **Object**.

### Object Creation

Ways of creating an object.

To create an object use one of the following:

```
set var = CreateObject("Ccl.Buffer")  
set var = New CclOBuf
```

**New** is the preferred method in Visual Basic. For VBScript, you can use only the **CreateObject** method.

### Methods

Methods available on this class.

#### **AppendString**

Appends a string to existing data in the **Ccl.Buffer** object.

**AppendString**(*string* as String)

*string*

The source string.

## Data

Returns the contents of the buffer as a Byte array.

Data() as Variant

## ExtractString

Returns a string from the data area starting at the specified offset.

**ExtractString** (*offset* as Integer[,  
                  *length* as Integer]) as String

*offset*

The offset into the data area.

*length*

(optional) The length, in bytes, of the string to be extracted.

If *length* is not specified, **ExtractString** returns data until it finds the first null terminator. If *length* is specified, **ExtractString** returns the number of bytes requested, including any nulls found in the string.

## InsertString

Inserts the given string into the data area at the given offset.

**InsertString** (*offset* as Integer,  
                  *string* as String)

*offset*

The offset in the data area where the string is to be inserted.

*string*

The source string.

## Length

Returns the length of the data area in bytes.

Length() as Integer

## Overlay

Overlays the data area with the given string, starting at the given offset.

**Overlay** (*offset* as Integer,  
                  *string* as String)

*offset*

The offset in the data area where the string is to be inserted.

*string*

The source string.

## SetData

Copies the supplied array into the buffer. Byte, Integer, and Long arrays are supported.

**SetData**(*array* as Variant)

*array*

The array containing the source data.

## SetLength

Changes the current length of the data area.

**SetLength**(*length* as Integer)

*length*

The new length of the data area, in bytes.

If you increase the length of the buffer object, the extra space is padded with nulls. The Client daemon truncates any nulls before sending the buffer to a CICS server. If you decrease the length of the buffer object, the contents are truncated.

## SetString

Copies the supplied string into the object.

**SetString**(*string* as String)

*string*

Source string

## String

Returns the contents of the **Ccl.Buffer** object as a string.

**String()** as String

---

## Connect COM class

The **Connect** COM class is used to maintain and represent an ECI connection between a client and a named server. Access to the server is optionally controlled by a user ID and password. It can call a program in the server or get information on the state of the connection.

Before the **Connect** COM class can be used to make calls to CICS, it must be initialized using the **Details** method and, optionally, the **TranDetails** method.

Any interaction between client and server requires a **CclOFlow** object and a **CclOConnect** object.

## Interface Selection

The interfaces available for Visual Basic.

The interfaces are:

```
Dim var as Object
Dim var as Cc10Conn
```

The second method is preferred.

If you do not dim a variable, dim it with no type, or are using VBScript, the variable is assumed to be of type **Object**.

## Object Creation

Ways of creating an object.

To create an object use one of the following:

```
set var = CreateObject("Ccl.Connect")
set var = New Cc10Conn
```

**New** is the preferred method in Visual Basic. For VBScript, you can use only the **CreateObject** method.

## Methods

Methods available on this class.

### AlterSecurity

Sets the user ID and password to be used on the next link call.

**AlterSecurity**(*newUserid* as String, *newPassword* as String)

*newUserid*

The new user ID

*newPassword*

The new password corresponding to the new user ID.

### Cancel

Cancels **Changed** calls that were previously issued to the server associated with this connection.

**Cancel**(*flow* as Object)

**Cancel**(*flow* as Cc1OFlow)

*flow*

The Cc1OFlow object used to control the client/server call

### Changed

Requests the server to notify the client when the current connection status changes. The call is ignored if there is an outstanding **Changed** call for this connection.

**Changed**(*flow* as Object)

**Changed**(*flow* as Cc1OFlow)

*flow*

The Cc1OFlow object used to control the client/server call.

## ChangePassword

Allows a client application to change the password held in the Connect object and the password recorded by an external security manager for the user ID held in the Connect object.

**ChangePassword** (*newPassword* as String) as Object

**ChangePassword** (*newPassword* as String) as CclOSecAttr

*newPassword*

The new password

The external security manager is assumed to be located in the server defined by the Connect object. A CclOSecAttr object is returned if no errors occur.

## Details

Supplies details of the CICS server.

**Details** (*serverName* as String,  
    *userId* as String,  
    *password* as String)

*serverName*

The name of the server. If no name is supplied the default server—the first server named in the Gateway initialization file—is used. You can discover this name, after the first call to the server by using the **ServerName** method. The length is adjusted to 8 characters by padding with blanks.

*userId*

The user ID, if needed. The length is adjusted to 16 characters by padding with blanks.

*password*

The password corresponding to the user ID in *userId*, if needed. The length is adjusted to 16 characters by padding with blanks.

No interaction with the CICS server takes place until the **Link**, **Status** or **Changed** methods are called. The user ID and password are not needed if the connection is only used for status calls or if the server has no security.

## Link

Calls the specified program on the server.

**Link** (*flow* as Object,  
    *programName* as String,  
    *commArea* as Object,  
    *unitOfWork* as Object)

**Link** (*flow* as CclOFlow,  
    *programName* as String,  
    *commArea* as CclOBuf,  
    *unitOfWork* as CclOUOW)

*flow*

The CclOFlow object used to control the client/server call.

*programName*

The name of the server program that is being called. The length is adjusted to 8 characters by padding with blanks or truncating, if necessary.

*commArea*

A CcIOBuffer object that holds the data to be passed to the called program in a COMMAREA. A NULL value is supplied if no COMMAREA is to be sent.

*unitOfWork*

The CcIOUOW object that identifies the unit of work (UOW) with which this call is being associated. A NULL value is supplied if no UOW is to be used.

The server program sees the incoming call as an EXEC CICS LINK call.

### **MakeSecurityDefault**

Informs the client that the current user ID and password for this object is to become the default for ECI and EPI requests passed to the server as specified in the construction of the Connect object.

**MakeSecurityDefault()**

### **Password**

Returns the password held by the CcIOConnect object, padded with spaces.

**Password() as String**

### **ServerName**

Returns the name of the server system held by the CcIOConnect object and listed by the Gateway initialization file, or blanks if the default CICS server is being used and no calls have yet been made.

**ServerName() as String**

### **ServerStatus**

Returns the status of the server connection, set by an earlier **status** or **changed** request.

**ServerStatus() as Integer**

**ServerStatus() as CclConnectStatusCodes**

Possible values are:

**cclUnknowncclUnknown**

The CICS server status is unknown

**cclAvailablecclAvailable**

The CICS server is available

**cclUnavailablecclUnavailable**

The CICS server is not available

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

## ServerStatusText

Returns a string, set by an earlier **status** or **changed** request, indicating the availability of the server.

ServerStatusText() as String

## Status

Requests the status of the server connection.

Status(*flow* as Object)

Status(*flow* as CclOFlow)

*flow*

The CclOFlow object used to control the client/server call

## TranDetails

Supplies additional information about the related transaction to the CICS server.

TranDetails (*runTran* as String,  
              *attachTran* as String)

*runTran*

The CICS transaction under which called programs will run. The default is to use the default server transaction. The length is adjusted to four characters by padding with blanks.

*attachTran*

The CICS transaction to which called programs are attached. The default is to use the default CPMT. The length is adjusted to four characters by padding with blanks.

The information is optional, but can be used to affect the environment in which programs are run on the CICS server.

**Note:** Use the Details method, to supply details of the CICS server, before using the TranDetails method; see “Details” on page 111.

## UnpaddedPassword

Returns the password held by the CclOConnect object, but with no padding with spaces at the end.

UnpaddedPassword() as String

## UnpaddedServerName

Returns the server name held by the CclOConnect object, but with no padding with spaces at the end.

UnpaddedServerName() as String

### **UnpaddedUserid**

Returns the user ID held by the CclOConnect object, but with no padding with spaces at the end.

**UnpaddedUserid()** as String

### **UserId**

Returns the user ID held by the CclOConnect object, padded with spaces, or blanks if none.

**UserId()** as String

### **VerifyPassword**

Allows a client application to verify that the password held in the Connect object matches the password recorded by an external security manager for the user ID held in the Connect object.

**VerifyPassword()** as Object

**VerifyPassword()** as CclOSecAttr

The external security manager is assumed to be located in the server defined by the Connect object. A CclOSecAttr Object is returned if no errors occur.

---

## **ECI COM class**

All applications using the ECI COM class must first create a CclOECI object.

The ECI COM class provides details of candidate CICS servers. It can also be used to obtain error information.

### **Interface Selection**

The interfaces available for Visual Basic.

For Visual Basic, the following types of interface are available:

```
Dim var as Object  
Dim var as CclOECI
```

The second method is preferred.

If you do not dim a variable, dim it with no type, or are using VBScript, the variable is assumed to be of type **Object**.

### **Object Creation**

Ways of creating an object.

You can create an object in two ways:

```
set var = CreateObject("Ccl.ECI")  
set var = New CclOECI
```

**New** is the preferred method in Visual Basic. For VBScript, you can use only the **CreateObject** method.

## Methods

Methods available on this class.

### ErrorFormat

Returns a value indicating the current setting for the Error Message Format.

#### ErrorFormat() as Integer

See “SetErrorFormat” on page 116 for a current list of valid values.

### ErrorOffset

Returns a value that can be used to convert a Client daemon error value retrieved from the ERR.Number method into the documented ExCode error values.

#### ErrorOffset() as Long

For more information on how to do this, see the information about handling exceptions in the *CICS Transaction Gateway for Multiplatforms: Programming Guide*.

### ErrorWindow

Determines whether or not an error window is displayed to the user. This is a deprecated method.

#### Deprecated method

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

#### ErrorWindow(*display* as Boolean)

*display*

**true** Permits the error window to be displayed to the user. This is the default setting.

**false** The error window will not be displayed to the user. The application must check for errors using the “ExCode” method.

### ExCode

Returns an enumeration that indicates the last ECI error. This is a deprecated method.

#### Deprecated method

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

#### ExCode() as Integer

#### ExCode() as CcIECIExceptionCodes

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

The **ExCodeText** method returns a text string describing the error value.

### ExCodeText

Returns a text string describing the last ECI error.

#### Deprecated method

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**ExCodeText()** as **String**

### ServerCount

Returns the number of candidate servers to which the client might be connected, as configured in the Gateway initialization file.

**ServerCount()** as **Integer**

### ServerDesc

Returns the description of the *index*th server.

**ServerDesc(*index* as Integer)** as **String**

*index*

The number of a connected server in the list, starting from 1

### ServerName

Returns the name of the *index*th server.

**ServerName(*index* as Integer)** as **String**

*index*

The number of a connected server in the list, starting from 1

### SetErrorFormat

Specifies the error message format.

**SetErrorFormat(*format* as Integer)**

*format*

- |   |   |
|---|---|
| 0 | Old format, provided for compatibility with earlier versions only.  |
| 1 | New format, provides more information in the Visual Basic and VBScript <b>Err</b> object. This format is recommended. |

---

## EPI COM class

The EPI COM class initializes the Client daemon EPI function.

It also has methods that allow you to obtain information about CICS servers which can be used. You create a CcIOEPI object before you create CcIOTerminal objects to connect to CICS servers. The **Diagnose**, **ExCode**, and **State** methods provide information on error conditions.

## Interface Selection

The interfaces available for Visual Basic.

For Visual Basic, the following types of interface are available:

```
Dim var as Object  
Dim var as Cc10EPI
```

The second method is preferred.

If you do not dim a variable, dim it with no type, or are using VBScript, the variable is assumed to be of type **Object**.

## Object Creation

Ways of creating an object.

You can create an object in two ways

```
set var = CreateObject("Ccl.EPI")  
set var = New Cc10EPI
```

**New** is the preferred method in Visual Basic. For VBScript, you can use only the **CreateObject** method.

## Methods

Methods available on this class.

### Diagnose

Returns a character string which holds a description of the last error.

**Diagnose()** as String

### ErrorFormat

Returns a value indicating the current setting for the Error Message Format.

**ErrorFormat()** as Integer

See "SetErrorFormat" on page 119 for a current list of valid values.

### ErrorOffset

Returns a value that can be used to convert a Client daemon error value retrieved from the ERR.Number method into the documented ExCode error values.

**ErrorOffset()** as Long

For more information on how to do this, see the information about handling exceptions in the *CICS Transaction Gateway for Multiplatforms: Programming Guide*.

### ErrorWindow

Determines whether or not an error window is displayed to the user. This is a deprecated method.

### Deprecated method

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**ErrorWindow**(*display* as Boolean)

*display*

- true** Permits the error window to be displayed to the user. This is the default setting.
- false** The error window will not be displayed to the user. The application must check for errors using the **ExCode** method.

### **ExCode**

Returns the condition code. This is a deprecated method.

#### **Deprecated method**

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**ExCode()** as Integer

**ExCode()** as CcIEPIExceptionCodes

Possible values are:

**ccISystemErrorccISystemError**

An internal Client daemon system error occurred.

**ccIUnknownServerccIUnknownServer**

There is no CICS server corresponding to the supplied *index* on **ServerDesc** or **ServerName** methods.

**ccINoErrorccINoError**

The call has executed normally.

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

### **ExCodeText**

Returns a string containing descriptive text for the most recent exception.

#### **Deprecated method**

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**ExCodeText()** as String

### **ServerCount**

Returns the number of candidate servers to which the Client daemon might be connected, as configured in the Gateway initialization file.

**ServerCount()** as Integer

### **ServerDesc**

Returns a description of the selected CICS server, or a NULL string if no information is available in the Gateway initialization file for the specified server.

**ServerDesc**(*index* as Integer) as String

*index*

The index number of a connected server (starting from 1).

### **ServerName**

Returns the name of the requested CICS server, or a NULL string if no information is available in the Gateway initialization file for the specified server.

**ServerName**(*index* as Integer) as String

*index*

The index number of a connected server (starting from 1).

### **SetErrorFormat**

Specifies the format for error messages.

**SetErrorFormat**(*format* as Integer)

*format*

0 Old format, provided for compatibility with earlier versions only.

1 New format, provides more information in the Visual Basic and VBScript **Err** object. This format is recommended.

### **State**

Returns a value that indicates the state of the EPI.

**State**() as Integer

**State**() as CcIEPIStates

Possible values are:

**cclActive**

Initialized

**cclDiscon**

Terminated

**cclError**

Error. See the information about Programming in COM in the *CICS Transaction Gateway for Multiplatforms: Programming Guide*.

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

### **Terminate**

Terminates the Client daemon EPI in a controlled manner.

### **Deprecated method**

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**Terminate**()

---

## Field COM class

The **Field** COM class is used to access a single field on a 3270 screen.

CclOField objects are created and deleted when 3270 data from the CICS server is processed by a CclOScreen object.

Field objects are returned by invoking a CclOScreen object's **fieldbyIndex** or **fieldbyPosition** method. For example:

```
set var=Screen.fieldbyIndex(1)
```

Methods in this class allow field text and attributes to be read and updated. Updated fields are sent to the CICS server on the next transmission.

## Interface Selection

The interfaces available for Visual Basic.

For Visual Basic, the following types of interface are available:

```
Dim var as Object  
Dim var as CclOField
```

The second method is preferred.

If you do not dim a variable, dim it with no type, or are using VBScript, the variable is assumed to be of type **Object**.

## Methods

Methods available on this class.

### AppendText

Appends the characters within *textString* to the end of the text already in the field.

**AppendText**(*textString* as String)

*textString*

The text string to be appended to the field.

### BackgroundColor

Returns a value which indicates the background color of the field.

**BackgroundColor()** as Integer

**BackgroundColor()** as CclColorAttributes

Returns a value which indicates the background color of the field as listed in "CclField Color Attributes" on page 145.

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

### BaseAttribute

Returns the 3270 base attribute of the field.

**BaseAttribute()** as Integer

## **Column**

Returns the column number of the position of the start of the field on the screen, with the leftmost column being 1.

**Column() as Integer**

## **DataTag**

Returns a value which indicates whether the data in the field has been modified.

**DataTag() as Integer**

**DataTag() as CclModifiedAttributes**

Possible values are:

- cclModified
- cclUnmodified

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

## **ForegroundColor**

Returns a value which indicates the foreground color of the field.

**ForegroundColor() as Integer**

**ForegroundColor() as CclColorAttributes**

Returns a value which indicates the foreground color of the field as listed in "CclField Color Attributes" on page 145.

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

## **Highlight**

Returns a value which indicates the type of highlight used.

**Highlight() as Integer**

**Highlight() as CclHighlightAttributes**

Returns a value which indicates which type of highlight is being used as listed in "CclField Highlight Attributes" on page 145.

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

## **InputProt**

Returns a value which indicates whether the field is protected.

**InputProt() as Integer**

**InputProt() as CclProtAttributes**

Possible values are:

- cclProtect
- cclUnprotect

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

## **InputType**

Returns a value which indicates whether the field is alphanumeric or numeric.

**InputType() as Integer**

**InputType() as CclNumericAttributes**

Possible values are:

- cclAlphanumeric
- cclNumeric

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

## **Intensity**

Returns a value which indicates whether the field is normal, intense or dark.

**Intensity() as Integer**

**Intensity() as CclIntensityAttributes**

Possible values are:

- cclDark
- cclNormal
- cclIntense

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

## **Length**

Returns the total length of the field.

**Length() as Integer**

This includes one byte used to store the 3270 attribute byte information; therefore the actual space for data is one less byte than the value returned by this method. See also the "TextLength" on page 123 method.

## **Position**

Returns the position of the start of the field as an offset from the top left corner of the screen. The top row consists of positions 0 to 79; the second row, positions 80 to 159; and so on.

**Position() as Integer**

## **ResetDataTag**

Resets the modified data tag (MDT) to cclUnmodified.

**ResetDataTag()**

## **Row**

Returns the row number of the position of the start of the field on the screen. The top row is 1.

**Row() as Integer**

## **SetBaseAttribute**

Sets the 3270 base attribute.

**SetBaseAttribute(*Attribute* as Integer)**

*Attribute*

The value of the base 3270 attribute to be entered into the field.

## **SetExtAttribute**

Sets the extended 3270 attribute.

**SetExtAttribute(*Attribute* as Integer, *Value* as Integer)**

*Attribute*

The type of extended attribute to be set.

*Value*

The value of the extended attribute.

If an invalid 3270 attribute type or value is supplied a parameter exception is raised.

## **SetText**

Copies *textString* into the field.

**SetText(*textString* as String)**

*textString*

The null-terminated text to be entered into the field.

## **Text**

Returns the text currently held in the field.

**Text() as String**

## **TextLength**

Returns the number of characters currently held in the field.

**TextLength()** as Integer

### **Transparency**

Returns a value which indicates the background transparency of the field.

**Transparency()** as Integer

**Transparency()** as CclTransparencyAttributes

Returns a value which indicates the background transparency of the field as listed in "CclField Transparency Attributes" on page 145.

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

---

## **Flow COM class**

A CclOFlow object is used to control ECI communications for a client/server pair.

A CclOFlow object is created for each client server interaction (call from client and response from server) and destroyed when it has been used. CclOFlow objects can be reused but an attempt to reuse a CclOFlow object that is already in use is rejected.

### **Interface Selection**

The interfaces available for Visual Basic.

For Visual Basic, the following types of interface are available:

```
Dim var as Object  
Dim var as CclOFlow
```

The second method is preferred.

If you do not dim a variable, dim it with no type, or are using VBScript, the variable is assumed to be of type **Object**.

### **Object Creation**

Ways of creating an object.

You can create an object in two ways:

```
set var = CreateObject("Ccl.Flow")  
set var = New CclOFlow
```

**New** is the preferred method in Visual Basic. For VBScript, you can use only the **CreateObject** method.

### **Methods**

Methods available on this class.

#### **AbendCode**

Returns a four-character CICS transaction abend code, or spaces if no abend has occurred.

**AbendCode()** as String

## CallType

Returns the call type for the call currently being executed.

**CallType()** as Integer

**CallType()** as CclFlowCallTypes

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

## CallTypeText

Returns the type of call the flow is currently executing as text.

**CallTypeText()** as String

## Diagnose

Returns text describing the current state of the flow object.

**Diagnose()** as String

## Flowid

Returns a unique identifier for this flow object.

**Flowid()** as Integer

## ForceReset

Makes the flow inactive and resets it. Typically, this method is used to prepare a flow object for re-use or deletion after a flow has been abandoned.

**ForceReset()**

## Poll

Indicates whether a reply has been received from a deferred synchronous **Backout**, **Cancel**, **Changed**, **Commit**, **Link**, or **Status** call request.

**Poll(commArea as Object)** as Boolean

**Poll(commArea as CclOBuf)** as Boolean

*commArea*

A CclOBuffer object into which the returned COMMAREA will be placed. This parameter can be set to **Nothing** if you do not want a COMMAREA to be returned.

This method is only valid for deferred synchronous communications. Possible values are:

**True** A reply has been received.

**False** A reply has not been received.

## SetSyncType

Sets the synchronization type required for this CclOFlow object.

**SetSyncType(syncType as Integer)**

**SetSyncType(syncType as CclFlowSyncTypes)**

*syncType*

The synchronization type required for this CclOFlow object. Possible values are:

- cclSync
- cclDSynccclDSync

If cclSync is used, **link** and **status** calls using this flow block the calling program until a reply is received from CICS. If cclDSynccclDSync is used, **link** and **status** calls using this flow return immediately to the calling program. The program can then use the **Poll** method to receive the reply from CICS later.

### **SetTimeout**

Sets the timeout value for the flow object for the next activation of the flow. This value can be set while a flow is active, but does not affect the current active flow.

**SetTimeout(Timeout as Integer)**

### **SyncType**

Returns the type of synchronization being used.

**SyncType() as Integer**

**SyncType() as CclFlowSyncTypes**

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

### **Timeout**

Returns the current timeout value set for the flow object.

**Timeout() as Integer**

### **Wait**

Waits for a reply from the server, blocking the client process in the meantime. This method is used when a deferred synchronous call was made, but the application now wants to wait synchronously for a reply.

**Wait()**

---

## **Map COM class**

The **Map** COM class provides validation and access to 3270 screen data using symbolic information obtained from CICS BMS maps.

To use this interface, run the CICSBMSC utility on your server program BMS maps.

**Note:** CICSBMSC is not provided with CICS Transaction Gateway for the Linux operating system. If you require this functionality, contact your local IBM® support representative and ask them to forward your request to the CICS service team.

## Interface Selection

The interfaces available for Visual Basic.

For Visual Basic, the following types of interface are available:

```
Dim var as Object  
Dim var as Cc10Map
```

The second method is preferred.

If you do not dim a variable, dim it with no type, or are using VBScript, the variable is assumed to be of type **Object**.

## Object Creation

Ways of creating an object.

You can create an object in two ways:

```
set var = CreateObject("Ccl.Map")  
set var = New Cc10Map
```

**New** is the preferred method in Visual Basic. For VBScript, you can use only the **CreateObject** method.

## Methods

Methods available on this class.

### ExCode

Returns a value that indicates the current condition code.

### Deprecated method

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**ExCode()** as Integer

**ExCode()** as Cc1EPIExceptionCodes

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

### FieldByName

Returns the specified Cc1OField object.

**FieldByName**(*name* as Integer) as Object

**FieldByName**(*name* as Integer) as Cc1OField

*name*

Symbolic value for the required field. This value is provided in the <mapname>.BAS file generated from the source BMS by the CICSBMSC utility.

### Validate

Validates a BMS map against the current screen and verifies that a specific map has been received from the CICS server.

**Validate** (*screenRef* as **Object**, *mapname* as **String**) as **Boolean**

**Validate** (*screenRef* as **CclOScreen**, *mapname* as **String**) as **Boolean**

*screenRef*

CclOScreen object

*mapname*

String value supplied in <mapname>.BAS file generated from the source BMS by the CICSBMSC utility.

Possible return values are:

**TRUE**

Specified BMS map matches current screen contents.

**FALSE**

Specified BMS map does not match current screen contents

If **TRUE** is returned, the **FieldByName** method can be used to access fields using their BMS name.

---

## Screen COM class

The **Screen** COM class maintains all data on the 3270 virtual screen and provides access to this data.

It contains a collection of **CclOField** objects which represent the fields on the current 3270 screen.

A single **Screen** object is created by the **Terminal** object when the terminal is installed either with the **Ccl Terminal** **connect** or **install** method. The application gets access to the **CclOScreen** object via the **Ccl Terminal** **Screen** method.

## Interface Selection

The interfaces available for Visual Basic.

For Visual Basic, the following types of interface are available:

Dim var as **Object**

Dim var as **CclOScreen**

The second method is preferred.

If you do not dim a variable, dim it with no type, or are using VBScript, the variable is assumed to be of type **Object**.

## Methods

Methods available on this class.

### CursorCol

Returns the current cursor column (the left col is 1).

**CursorCol()** as **Integer**

## CursorRow

Returns the current cursor row (the top row is 1).

**CursorRow()** as Integer

## Depth

Returns the number of rows on the screen.

**Depth()** as Integer

## FieldByIndex

Returns the index number of the field required.

**FieldByIndex**(*index* as Integer) as Object

**FieldByIndex**(*index* as Integer) as CclOField

*index*

The first field is number 1.

## FieldByPosition

Returns the row number and column number of the field.

**FieldByPosition** (*rowPos* as Integer, *colPos* as Integer) as Object

**FieldByPosition** (*rowPos* as Integer, *colPos* as Integer) as CclOField

*rowPos*

The row number of the field (topmost row = 1).

*colPos*

The column number of the field (leftmost column = 1).

## FieldCount

Returns the number of fields on the screen.

**FieldCount()** as Integer

## MapName

Returns a string specifying the name of the map that was most recently referenced in the MAP option of a SEND MAP command processed for the terminal resource.

**MapName()** as String

If the terminal resource is not supported by BMS, or the server has no record of any map being sent, the value returned is blank.

## MapSetName

Returns a string specifying the name of the mapset that was most recently referenced in the MAPSET option of a SEND MAP command processed for the terminal resource.

**MapSetName()** as String

If the MAPSET option was not specified on the most recent request, BMS used the map name as the mapset name. In both cases, the mapset name used might have been suffixed by a terminal suffix. If the terminal resource is not supported by BMS, or the server has no record of any mapset being sent, the value returned is blank.

### **SetAID**

Sets the AID key value to be passed to the server on the next transmission.

**SetAID**(*key* as Integer)

**SetAID**(*key* as CclADIKeys)

*key*

The AID key value as listed in “CclScreen AID key codes” on page 143.

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

### **SetCursor**

Sets the column number and row number of the cursor.

**SetCursor** (*rowPos* as Integer, *colPos* as Integer)

*rowPos*

The required row number of the cursor (the top row is 1).

*colPos*

The required column number of the cursor (the left column is 1).

### **Width**

Returns the number of columns on the screen.

**Width()** as Integer

---

## **SecAttr COM class**

The **SecAttr** COM class provides information about passwords reported back by the external security manager when issuing **verifySecurity** or **changePassword** methods on **CclOConnect** or **CclOTerminal** objects.

This object is created and owned by the **CclOConnect** or **CclOTerminal** Object and access to this object is provided when invoking the **VerifyPassword** or **ChangePassword** methods.

## **Interface Selection**

The interfaces available for Visual Basic.

For Visual Basic, the following types of interface are available:

```
Dim var as Object  
Dim var as Ccl0SecAttr
```

The second method is preferred.

If you do not dim a variable, dim it with no type, or are using VBScript, the variable is assumed to be of type **Object**.

## Methods

Methods available on this class.

### **ExpiryTime**

Returns a CclOSecTime object that contains the date and time when the password expires.

**ExpiryTime()** as **Object**

**ExpiryTime()** as **CclOSecTime**

### **InvalidCount**

Returns the number of times an invalid password has been entered for the user ID.

**InvalidCount()** as **Integer**

### **LastAccessTime**

Returns a CclOSecTime object which contains the date and time when the user ID was last accessed.

**LastAccessTime()** as **Object**

**LastAccessTime()** as **CclOSecTime**

### **LastVerifiedTime**

Returns a CclOSecTime object which contains the date and time of the last verification.

**LastVerifiedTime()** as **Object**

**LastVerifiedTime()** as **CclOSecTime**

---

## SecTime COM class

The **SecTime** COM class provides date and time information in the CclOSecAttr object for various entries reported back by the external security manager when issuing verifySecurity or changePassword methods on Connect or Terminal objects. These objects are created and owned by the CclOSecAttr object and access is obtained via the various methods available on this object. No constructors or destructors are available.

## Interface Selection

The interfaces available for Visual Basic.

For Visual Basic, the following types of interface are available:

```
Dim var as Object  
Dim var as CclOSecTime
```

The second method is preferred.

If you do not dim a variable, dim it with no type, or are using VBScript, the variable is assumed to be of type **Object**.

## Methods

Methods available on this class.

### **Day**

Returns the day in the range 1 to 31.

**unsigned short Day() as Integer**

### **GetDate**

Returns the date and time in a Visual Basic DATE type format.

**GetDate() as Date**

### **Hours**

Returns the hours in the range 0 to 23.

**unsigned short Hours() as Integer**

### **Hundredths**

Returns the hundredths of a second in the range 0 to 99.

**unsigned short Hundredths() as Integer**

### **Minutes**

Returns the minutes in the range 0 to 59.

**unsigned short Minutes() as Integer**

### **Month**

Returns the month in the range 1 to 12.

**unsigned short Month() as Integer**

### **Seconds**

Returns the seconds in the range 0 to 59.

**unsigned short Seconds() as Integer**

### **Year**

Returns a 4 digit year.

**unsigned short Year() as Integer**

---

## Session COM class

The **Session** COM class controls the flow of data to and from CICS within a single EPI session.

## Interface Selection

The interfaces available for Visual Basic.

For Visual Basic, the following types of interface are available:

```
Dim var as Object  
Dim var as Cc10Session
```

The second method is preferred.

If you do not dim a variable, dim it with no type, or are using VBScript, the variable is assumed to be of type **Object**.

## Object Creation

Ways of creating an object.

You can create an object in two ways:

```
set var = CreateObject("Ccl.Session")  
set var = New CclOSession
```

**New** is the preferred method in Visual Basic. For VBScript, you can use only the **CreateObject** method.

## Methods

Methods available on this class.

### Diagnose

Returns the text description of the current state of the session.

**Diagnose()** as **String**

### SetSyncType

Sets the synchronization type required for this CclOSession object.

**SetSyncType(syncType as Integer)**

**SetSyncType(syncType as CclFlowSyncTypes)**

*syncType*

The synchronization type required for this CclOSession object. Possible values are:

- cclSync
- cclDSynccclDSync

If cclSync is used, **Start** and **Send** calls using this flow will block the calling program until a reply is received from CICS. If cclDSynccclDSync is used, **Start** and **Send** calls using this flow will return immediately to the calling program. The program can then use the **Poll** method to receive the reply from CICS at a later time.

### State

Returns a value which indicates the current state of the session.

**State()** as **Integer**

**State()** as **CclEPIStates**

Possible values are:

**cclActive**

Connected

**cclServer**

Transaction in progress in the CICS server.

**cclClient**

CICS server is waiting for a response from the client

### **cclDiscon**

Disconnected

### **cclError**

Error, call **ExCode** and **Diagnose** methods for further information.

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

### **TransId**

Returns the four-letter name of the current transaction.

**TransId()** as **String**

---

## **Terminal COM class**

The **Terminal** COM class represents a 3270 terminal connection to a CICS server.

A CICS connection is established when the **Connect** method is called. Methods can then be used to converse with a 3270 terminal application (often a BMS application) in the CICS server.

## **Interface Selection**

The interfaces available for Visual Basic.

For Visual Basic, the following types of interface are available:

```
Dim var as Object  
Dim var as Cc10Terminal
```

The second method is preferred.

If you do not dim a variable, dim it with no type, or are using VBScript, the variable is assumed to be of type **Object**.

## **Object Creation**

Ways of creating an object.

You can create an object in two ways:

```
set var = CreateObject("Ccl.Terminal")  
set var = New Cc10Terminal
```

**New** is the preferred method in Visual Basic. For VBScript, you can use only the **CreateObject** method.

## **Methods**

Methods available on this class.

### **AlterSecurity**

Redefines the user ID and password for a terminal resource that has been constructed without these values (a sign-on incapable terminal).

**AlterSecurity**(*newUserId* as **String**,*newPassword* as **String**)

*newPassword*

The new password to be given to *newUserId*.

*newUserid*

The new user ID.

This method can be called before you install a terminal. It changes the terminal definition; the new user ID and password are be used for the terminal when install is called.

## **CCSIId**

Returns a long showing the selected code page.

CCSIId() as long

## **ChangePassword**

Enables a client application to change the password held in the terminal object and the password recorded by an external security manager for the user ID held in the terminal object.

**ChangePassword**(*newPassword* as String) as Object

**ChangePassword**(*newPassword* as String) as CclOSecAttr

*newPassword*

The new password to be given

The external security manager is assumed to be located in the server defined by the terminal object. A CclOSecAttr Object is returned if no errors occurred.

## **Connect**

Establishes a 3270 communication to the specified CICS server.

**Connect**(*servName* as String,  
          *devType* as String,  
          *nworkName* as String)

*servName*

The name of the server with which you want to communicate. If a NULL string is provided, the default CICS server system, defined in the Gateway initialization file, is assumed. The name is expanded to 8 characters by padding with blanks, if necessary.

*devType*

The name of the model terminal definition which the server uses to generate a terminal resource definition. If a NULL string is provided the default model is used. The name is expanded to 16 characters by padding with blanks, if necessary.

*nworkName*

The name of the terminal resource to be installed or reserved. The name is expanded to 8 characters by padding with blanks, if necessary. If a NULL string is supplied, the CICS server allocates a name.

## **Devtype**

Returns the terminal device type as a string.

**Devtype()** as String

### **Diagnose**

Returns a character string which holds a description of the error returned by the most recent server call.

**Diagnose()** as String

### **Disconnect**

Disconnects the terminal from CICS. No attempt is made to purge outstanding running transactions.

**Disconnect()**

### **DisconnectWithPurge**

**DisconnectWithPurge** disconnects the terminal from CICS and attempts to purge all outstanding running transactions. This purge function does not cancel ATI requests queued against the terminal.

**DisconnectWithPurge()**

### **DiscReason**

This method will return an enumeration showing the reason the terminal has been disconnected.

**DiscReason()** as CclEndTermReasons

Possible values are shown in “CclTerminal EndTermReasons” on page 143.

### **ExCode**

Returns a value which indicates the most recent condition code returned by the server.

#### **Deprecated method**

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**ExCode()** as Integer

**ExCode()** as CclEPIExceptionCodes

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

### **ExCodeText**

Returns a text string describing the most recent condition code returned by the server.

#### **Deprecated method**

: Do not use this method in new applications. The method has been deprecated and is provided only for compatibility.

**ExCodeText()** as String

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

## **Install**

Installs a non-connected terminal resource.

**Install**(*session* as **Object**, *timeout* as **Integer**)

**Install**(*session* as **CclOSession**, *timeout* as **Integer**)

*session*

The session object to be used by this terminal object.

*InstallTimeout*

A value in the range 0 through 3600, specifying the maximum time in seconds that installation of the terminal resource is allowed to take. A value of 0 means that no limit is set.

A **cclInvalidState** error is raised if the terminal is already installed.

## **MakeSecurityDefault**

Informs the client that the current user ID and password for this object is to become the default for ECI and EPI requests passed to the server as specified in the construction of the Terminal object.

**MakeSecurityDefault()**

## **NetName**

Returns the network name of the terminal.

**NetName()** as **String**

## **Password**

Returns a text string containing the current password for the user ID associated with the terminal. The string is empty if there is no password.

**Password()** as **String**

## **Poll**

Checks to see if a replies have been received from a deferred synchronous **Start** or **Send** request.

**Poll()** as **Boolean**

Possible values are:

**True** No further replies outstanding  
**False** Further replies outstanding

A CICS server transaction can send more than one reply in response to a **Terminal.Start** or **Terminal.Send** call. More than one **Terminal.Poll** call might therefore be needed to collect all the replies. The return code indicates whether you need to perform more poll requests.

## PollForReply

Checks to see whether replies have been received from a deferred synchronous Start or Send request.

### PollForReply() as Boolean

Possible values are

- true**     Replies have been received
- false**    No replies have been received

A CICS server transaction can send more than one reply in response to a Terminal.Start or Terminal.Send call. More than one Terminal.PollForReply call might therefore be needed to collect all replies. Use the Terminal.State method to find out whether further replies are expected. If there are, the value returned will be cclServer.

## QueryATI

Returns a value that indicates whether Automatic Transaction Initiation (ATI) is enabled or disabled.

### QueryATI() as Integer

### QueryATI() as CclATISStates

Possible values are:

- cclATIEnabled
- cclATIDisabled

## ReadTimeout

Returns the read timeout setting for the terminal.

### ReadTimeout() as Integer

## ReceiveATI

Waits for and receives 3270 data stream for a CICS ATI transaction.

### ReceiveATI (*session* as Object)

### ReceiveATI (*session* as CclOSession)

*session*

A pointer to the CclOSession object which is to be used for the CICS server interaction.

The CclOSession object supplied can only be synchronous.

## Screen

Returns the CclOScreen object that is handling the 3270 screen associated with this terminal.

### Screen() as Object

## Send

Generates a 3270 data stream from the current contents of the **CclOScreen** object and transmits it to the CICS server.

**Send**(*session* as Object)

**Send**(*session* as CclOSession)

*session*

The CclOSession object which controls the session which is to be used. It is set to NULL if no CclOSession object is used.

## ServerName

Returns the name of the server system held by the CclOTerminal object and listed by the Gateway initialization file, or blanks if the default CICS server is being used and no calls have yet been made.

**ServerName**() as String

## SetATI

Indicates whether the ATI is to be enabled or disabled.

**SetATI**(*stateVal* as Integer)

**SetATI**(*stateVal* as CclATISStates)

*stateVal*

Possible values are:

- cclATIEnabled
- cclATIDisabled

## SetTermDefns

Creates a terminal resource but does not make the connection to the Server.

**SetTermDefns** (*servName* as String,  
                  *devType* as String,  
                  *nworkName* as String  
                  *signonCapability* as CclSignonTypes  
                  *userid* as String  
                  *password* as String  
                  *ReadTimeout* as Integer  
                  *CCSid* as Long)

*servName*

The name of the server with which you want to communicate. If a NULL string is provided, the default CICS server system, defined in the Gateway initialization file, is assumed. The name is expanded to 8 characters by padding with blanks, if necessary.

*devType*

The name of the model terminal definition which the server uses to generate a terminal resource definition. If a NULL string is provided the default model is used. The name is expanded to 16 characters by padding with blanks, if necessary.

*nworkName*

The name of the terminal resource to be installed or reserved. The name is expanded to 8 characters by padding with blanks, if necessary. If a NULL string is supplied, the CICS server will allocate a name.

*signonCapability*

Set the sign-on capability to one of the following:

**cclSignonCapable**

**cclSignonIncapable**

*ReadTimeout*

A value in the range 0 through 3600, specifying the maximum time in seconds between the time the classes go clientrepl state and the time that the application program invokes the reply method.

*userid*

The name of the user ID to associate with this terminal resource.

*password*

The password to associate with the user ID.

*CCSid*

A long specifying the coded character set identifier (CCSID) that identifies the coded graphic character set used by the client application for data passed between the terminal resource and CICS transactions. A zero indicates that a default will be used.

## **SignonCapability**

Returns the type of terminal installed.

**SignonCapability() as Integer**

**SignonCapability() as CclSignonTypes**

Possible values are:

- cclSignonCapable
- cclSignonIncapable

## **Start**

Generates a 3270 data stream from the supplied data and transmits it to the CICS server, starting the named transaction.

**Start** (*session* as Object,  
      *tranCode* as String,  
      *startData* as String)

**Start** (*session* as CclOSession,  
      *tranCode* as String,  
      *startData* as String)

*session*

The CclOSession object which controls the session which is to be used. It is set to NULL if no CclOSession object is used.

*tranCode*

The name of the transaction which is to be started

#### *startData*

Start transaction data. A NULL value indicates no data is required for the transaction being started.

### **State**

Returns a value which indicates the current state of the session.

**State()** as Integer

**State()** as CcLEPIStates

These values are the same as those returned by the **state** method in the **Session** COM class.

Constants are available in the type library. Use the Visual Basic Object Browser to view them.

### **TermId**

Returns the terminal ID.

**TermId()** as String

### **TransId**

Returns the 4-character name of the current CICS transaction. Note that if a RETURN IMMEDIATE is run from the current transaction, TransId does not provide the name of the new transaction; it still contains the name of the first transaction.

**TransId()** as String

### **Userid**

Returns a text string containing the current user ID for the terminal. The string is empty if there is no user ID.

**Userid()** as String

### **VerifyPassword**

Enables a client application to verify that the password held in the terminal object matches the password recorded by an external security manager for the user ID held in the terminal object.

**VerifyPassword()** as Object

**VerifyPassword()** as CclOSecAttr

The external security manager is assumed to be located in the server defined by the terminal object. A CclOSecAttr Object is returned if no errors occurred.

---

## **UOW COM class**

Use this COM class when you make updates to recoverable resources in the server within a “unit of work” (UOW).

Each update in a UOW is identified by a reference to its CclOUOW object — see **Link** method in **Connect** COM class (“Link” on page 111).

## COM Global Constants

Constants are provided in the type libraries for the Client daemon COM libraries. The libraries are in CCLIECI.DLL and CCLIEPI.DLL.

If you are using Visual Basic, you can look at the definitions in the type libraries by using Visual Basic Object viewer or another type library viewer.

If you are using VBScript, you cannot access the enumerations defined in the type library; use the numeric values provided here.

The exception code constants are listed in “COM Error Code References” on page 147.

## COM EPI Specific Constants

### Synchronization Types

Table 3. Synchronization types

VB Enumeration	Value	Description
cclSync	0	Synchronous call type
cclDsync	1	Deferred synchronous call type

### CclEPI states

Table 4. CclEPI States

VB Enumeration	Value	Description
cclEPIActive	0	EPI initialized
cclDiscon	1	EPI Terminated
cclEPIError	2	EPI failed to initialize, handle exception for more information

### CclSession States

Table 5. CclSession States

VB Enumeration	Value	Description
cclSessionIdle	0	Idle, client needs to initiate transaction
cclSessionServer	1	Waiting for server
cclSessionClient	2	Waiting for Client daemon to respond
cclSessionDiscon	3	Disconnected
cclSessionError	4	Session Error, handle exception for more information

### CclTerminal States

Table 6. CclTerminal States

VB Enumeration	Value	Description
cclInit	0	Terminal defined but not installed
cclActive	1	Terminal connected (not used)

Table 6. CclTerminal States (continued)

VB Enumeration	Value	Description
cclIdle	2	Idle, Client daemon needs to initiate transaction
cclServer	3	Waiting for server
cclClient	4	Waiting for client to respond
cclDiscon	5	Disconnected
cclError	6	Terminal error, handle exception for more information

## CclTerminal ATI States

Table 7. CclTerminal ATI states

VB Enumeration	Value	Description
cclATIEabled	0	ATIs are allowed
cclATIDisabled	1	ATIs are not allowed

## CclTerminal EndTermReasons

Table 8. CclTerminal ATI states

VB Enumeration	Value	Description
cclSignoff	0	Disconnect request or user has signed off the terminal
cclShutdown	1	The CICS server has been shut down
cclOutOfService	2	The terminal has been switched to out of use
cclUnknown	3	An unknown situation as occurred
cclFailed	4	The terminal failed to disconnect
cclNotDiscon	5	The terminal is not disconnected

## CclTerminal Sign-on Types

Table 9. CclTerminal Sign-on Types

VB Enumeration	Value	Description
cclSignonCapable	0	Terminal supports sign-on transaction
cclSignonIncapable	1	Terminal does not support sign-on transaction
cclSignonUnknown	2	Terminal sign-on capability is unknown

## CclScreen AID key codes

Table 10. CclScreen AID key codes

VB Enumeration	Value	Description
cclEnter	0	Enter key
cclClear	1	Clear key
cclPA1	2	Program Attention key 1
cclPA2	3	Program Attention key 2

Table 10. CclScreen AID key codes (continued)

VB Enumeration	Value	Description
cclPA3	4	Program Attention key 3
cclPF1	5	Program Function key 1
cclPF2	6	Program Function key 2
cclPF3	7	Program Function key 3
cclPF4	8	Program Function key 4
cclPF5	9	Program Function key 5
cclPF6	10	Program Function key 6
cclPF7	11	Program Function key 7
cclPF8	12	Program Function key 8
cclPF9	13	Program Function key 9
cclPF10	14	Program Function key 10
cclPF11	15	Program Function key 11
cclPF12	16	Program Function key 12
cclPF13	17	Program Function key 13
cclPF14	18	Program Function key 14
cclPF15	19	Program Function key 15
cclPF16	20	Program Function key 16
cclPF17	21	Program Function key 17
cclPF18	22	Program Function key 18
cclPF19	23	Program Function key 19
cclPF20	24	Program Function key 20
cclPF21	25	Program Function key 21
cclPF22	26	Program Function key 22
cclPF23	27	Program Function key 23
cclPF24	28	Program Function key 24

## CclField Protected State Attributes

Table 11. CclField Protected state attributes

VB Enumeration	Value	Description
cclProtect	0	Protected Field (cannot be modified)
cclUnprotect	1	Unprotected (input) field

## CclField Numeric Attributes

Table 12. CclField Numeric Attributes

VB Enumeration	Value	Description
cclAlphanumeric	0	Alphanumeric input field
cclNumeric	1	Numeric input field

## CclField Intensity Attributes

Table 13. CclField Intensity attributes

VB Enumeration	Value	Description
cclNormal	0	Normal display
cclIntense	1	Intensified display
cclDark	2	Non-display field

## CclField Modified Attributes

Table 14. CclField Modified Attributes

VB Enumeration	Value	Description
cclUnmodified	0	Field has not been changed
cclModified	1	Field has been changed

## CclField Highlight Attributes

Table 15. CclField Highlight attributes

VB Enumeration	Value	Description
cclHltDefault	0	Default field text highlighting
cclHltNormal	1	Field text highlight as specified by 3270 base attribute
cclHltBlink	2	Blinking text
cclHltReverse	3	Reverse video text
cclHltUnderscore	4	Underscored text
cclHltIntense	5	High intensity text

## CclField Transparency Attributes

Table 16. CclField Transparency attributes

VB Enumeration	Value	Description
cclTrnDefault	0	Default (opaque) field background
cclTrnOr	1	Transparent field background (OR)
cclTrnXorcclTrnXor	2	Transparent field background (XOR)
cclTrnOpaque	3	Opaque field background

## CclField Color Attributes

Table 17. CclField Color attributes

VB Enumeration	Value	Description
cclDefaultColor	0	
cclBlue	1

## COM ECI Constants

### Synchronization Types

Table 18. Synchronization types

VB Enumeration	Value	Description
cclSync	0	Synchronous call type
cclDsync	1	Deferred synchronous call type

### Flow status types

Table 19. Flow status types

VB Enumeration	Value	Description
cclInactive	0	Flow is inactive
cclLink	1	Flow is currently making a link call
cclBackout	2	Flow is currently backing out a UOW
cclCommit	3	Flow is currently committing a UOW
cclStatus	4	Flow is requesting status
cclChanged	5	Flow is requesting a status change
cclCancel	6	Flow is requesting a status cancel

### Connection Status Codes

Table 20. Connection status code

VB Enumeration	Value	Description
cclUnknown	0	The CICS server status is unknown
cclAvailable	1	The CICS server status is available
cclUnavailable	2	The CICS server status is unavailable

## COM Error Code References

Enumeration	Value	Description	ECI	EPI
cclNoError	0	No error occurred	Yes	Yes
cclBufferOverflow	1	Attempted to increase a CclBuf object which isn't Extensible	Yes	
cclMultipleInstance	2	Attempted to create more than one ECI object	Yes	
cclActiveFlow	3	Current Flow is still active, you cannot use this flow until it is inactive	Yes	
cclActiveUOW	4	Current UOW is still active, you need to backout or commit.	Yes	
cclSyncType	5	Incorrect synchronization type for method call.	Yes	Yes
cclDataLength	9	CommArea > 32768 Bytes or inbound 3270 data stream too large for Terminal Buffer size.	Yes	Yes
cclNoCICS	10	The Client daemon is unavailable, or the server implementation is unavailable, or a logical unit of work was to be begun, but the CICS server specified is not available. No resources have been updated	Yes	Yes
cclCICSDied	11	A logical unit of work was to be begun or continued, but the CICS server was no longer available. If this is a link call with an active UOW, the changes are backed out. If This was a UOW Commit or the application cannot determine whether the changes have been committed or backed out, and must log this condition to aid future manual recovery	Yes	
cclNoReply	12	There was no outstanding reply	Yes	
cclTransaction	13	ECI program ended abnormally	Yes	
cclSystemError	14	Unknown internal error occurred	Yes	Yes
cclResource	15	The server implementation or the Client daemon did not have enough resources to complete the request e.g. insufficient SNA sessions.	Yes	Yes
cclMaxUOWs	16	A new logical unit of work was being created, but the application already has as many outstanding logical units of work as the configuration will support.	Yes	
cclUnknownServer	17	The requested server could not be located	Yes	Yes
cclSecurity	18	You did not supply a valid combination of user ID and password, though the server expects it.	Yes	Yes
cclMaxServers	19	You attempted to start requests to more servers than your configuration allows. Consult the documentation for your Client daemon or server to see how to control the number of servers you can use.	Yes	Yes
cclMaxRequests	20	There were not enough communication resources to satisfy the request. Consult the documentation for your Client daemon or server to see how to control communication resources	Yes	Yes
cclRolledBack	21	An attempt was made to commit a logical unit of work, but the server was unable to commit the changes, and backed them out instead	Yes	

Enumeration	Value	Description	ECI	EPI
cclParameter	22	Incorrect parameter supplied	Yes	Yes
cclInvalidState	23	The Object is not in the correct state to start the method, e.g. terminal object still in server state and an attempt to send data is made.	Yes	Yes
ccltransId	24	Null transid supplied or returned for a pseudo conversational transaction		Yes
cclInitEPI	25	No EPI object or EPI failed to initialize correctly		Yes
cclConnect	26	Unexpected error trying to add the terminal		Yes
ccldata stream	27	Unsupported Data Stream		Yes
cclInvalidMap	28	Map definition and Screen do not match		Yes
cclClass	29	Unknown internal Class error occurred.	Yes	Yes
cclStartTranFailure	30	Transaction failed to start		Yes
cclTimeout	31	Timeout occurred before response from Server	Yes	Yes
cclNoPassword	32	The object's password is null.	Yes	Yes
cclNoUserid	33	The object's user ID is null	Yes	Yes
cclNullNewPassword	34	The provided password is null	Yes	Yes
cclPemNotSupported	35	The CICS Server does not support the Password Expiry Management facilities. The method cannot be used	Yes	Yes
cclPemNotActive	36	Password Expiry Management is not active	Yes	Yes
cclPasswordExpired	37	The password has expired. No information has been returned	Yes	Yes
cclPasswordInvalid	38	The password is invalid.	Yes	Yes
cclPasswordRejected	39	Change password failed because the password doesn't conform to standards defined	Yes	Yes
cclUseridInvalid	40	The user ID is unknown	Yes	Yes
cclInvalidTermid	41	Invalid Terminal ID		Yes
cclInvalidModelId	42	Invalid Model/Type		Yes
cclnot3270	43	Not a 3270 device		Yes
cclinvalidCCSid	44	Invalid CCSid		Yes
cclServerBusy	45	CICS server is busy		Yes
cclSignonNotPoss	46	The server does not allow the terminal to be installed as sign-on capable.		Yes

## COM Global Constants

Constants are provided in the type libraries for the Client daemon COM libraries. The libraries are in CCLIECI.DLL and CCLIEPI.DLL.

If you are using Visual Basic, you can look at the definitions in the type libraries by using Visual Basic Object viewer or another type library viewer.

If you are using VBScript, you cannot access the enumerations defined in the type library; use the numeric values provided here.

The exception code constants are listed in “COM Error Code References” on page 147.

## COM EPI Specific Constants

### Synchronization Types

Table 21. Synchronization types

VB Enumeration	Value	Description
cclSync	0	Synchronous call type
cclDsync	1	Deferred synchronous call type

### CcIEPI states

Table 22. CcIEPI States

VB Enumeration	Value	Description
cclEPIActive	0	EPI initialized
cclDiscon	1	EPI Terminated
cclEPIError	2	EPI failed to initialize, handle exception for more information

### CclSession States

Table 23. CclSession States

VB Enumeration	Value	Description
cclSessionIdle	0	Idle, client needs to initiate transaction
cclSessionServer	1	Waiting for server
cclSessionClient	2	Waiting for Client daemon to respond
cclSessionDiscon	3	Disconnected
cclSessionError	4	Session Error, handle exception for more information

### CclTerminal States

Table 24. CclTerminal States

VB Enumeration	Value	Description
cclInit	0	Terminal defined but not installed
cclActive	1	Terminal connected (not used)
cclIdle	2	Idle, Client daemon needs to initiate transaction
cclServer	3	Waiting for server
cclClient	4	Waiting for client to respond
cclDiscon	5	Disconnected
cclError	6	Terminal error, handle exception for more information

### CclTerminal ATI States

Table 25. CclTerminal ATI states

VB Enumeration	Value	Description
cclATIEnabled	0	ATIs are allowed

Table 25. CclTerminal ATl states (continued)

VB Enumeration	Value	Description
cclATIDisabled	1	ATIs are not allowed

## CclTerminal EndTermReasons

Table 26. CclTerminal ATl states

VB Enumeration	Value	Description
cclSignoff	0	Disconnect request or user has signed off the terminal
cclShutdown	1	The CICS server has been shut down
cclOutOfService	2	The terminal has been switched to out of use
cclUnknown	3	An unknown situation as occurred
cclFailed	4	The terminal failed to disconnect
cclNotDiscon	5	The terminal is not disconnected

## CclTerminal Sign-on Types

Table 27. CclTerminal Sign-on Types

VB Enumeration	Value	Description
cclSignonCapable	0	Terminal supports sign-on transaction
cclSignonIncapable	1	Terminal does not support sign-on transaction
cclSignonUnknown	2	Terminal sign-on capability is unknown

## CclScreen AID key codes

Table 28. CclScreen AID key codes

VB Enumeration	Value	Description
cclEnter	0	Enter key
cclClear	1	Clear key
cclPA1	2	Program Attention key 1
cclPA2	3	Program Attention key 2
cclPA3	4	Program Attention key 3
cclPF1	5	Program Function key 1
cclPF2	6	Program Function key 2
cclPF3	7	Program Function key 3
cclPF4	8	Program Function key 4
cclPF5	9	Program Function key 5
cclPF6	10	Program Function key 6
cclPF7	11	Program Function key 7
cclPF8	12	Program Function key 8
cclPF9	13	Program Function key 9
cclPF10	14	Program Function key 10

Table 28. CclScreen AID key codes (continued)

VB Enumeration	Value	Description
cclPF11	15	Program Function key 11
cclPF12	16	Program Function key 12
cclPF13	17	Program Function key 13
cclPF14	18	Program Function key 14
cclPF15	19	Program Function key 15
cclPF16	20	Program Function key 16
cclPF17	21	Program Function key 17
cclPF18	22	Program Function key 18
cclPF19	23	Program Function key 19
cclPF20	24	Program Function key 20
cclPF21	25	Program Function key 21
cclPF22	26	Program Function key 22
cclPF23	27	Program Function key 23
cclPF24	28	Program Function key 24

## CclField Protected State Attributes

Table 29. CclField Protected state attributes

VB Enumeration	Value	Description
cclProtect	0	Protected Field (cannot be modified)
cclUnprotect	1	Unprotected (input) field

## CclField Numeric Attributes

Table 30. CclField Numeric Attributes

VB Enumeration	Value	Description
cclAlphanumeric	0	Alphanumeric input field
cclNnumeric	1	Numeric input field

## CclField Intensity Attributes

Table 31. CclField Intensity attributes

VB Enumeration	Value	Description
cclNormal	0	Normal display
cclIntense	1	Intensified display
cclDark	2	Non-display field

## CclField Modified Attributes

Table 32. CclField Modified Attributes

VB Enumeration	Value	Description
cclUnmodified	0	Field has not been changed
cclModified	1	Field has been changed

## CclField Highlight Attributes

Table 33. CclField Highlight attributes

VB Enumeration	Value	Description
cclHltDefault	0	Default field text highlighting
cclHltNormal	1	Field text highlight as specified by 3270 base attribute
cclHltBlink	2	Blinking text
cclHltReverse	3	Reverse video text
cclHltUnderscore	4	Underscored text
cclHltIntense	5	High intensity text

## CclField Transparency Attributes

Table 34. CclField Transparency attributes

VB Enumeration	Value	Description
cclTrnDefault	0	Default (opaque) field background
cclTrnOr	1	Transparent field background (OR)
cclTrnXorcclTrnXor	2	Transparent field background (XOR)
cclTrnOpaque	3	Opaque field background

## CclField Color Attributes

Table 35. CclField Color attributes

VB Enumeration	Value	Description
cclDefaultColor	0	
cclBlue	1	
cclRed	2	
cclPink	3	
cclGreen	4	
cclCyan	5	
cclYellow	6	
cclNeutral	7	
cclBlack	8	
cclDarkBlue	9	
cclOrange	10	
cclPurple	11	
cclPaleGreen	12	
cclPaleCyan	13	
cclGray	14	
cclWhite	15	

## COM ECI Constants

### Synchronization Types

Table 36. Synchronization types

VB Enumeration	Value	Description
cclSync	0	Synchronous call type
cclDsync	1	Deferred synchronous call type

### Flow status types

Table 37. Flow status types

VB Enumeration	Value	Description
cclInactive	0	Flow is inactive
cclLink	1	Flow is currently making a link call
cclBackout	2	Flow is currently backing out a UOW
cclCommit	3	Flow is currently committing a UOW
cclStatus	4	Flow is requesting status
cclChanged	5	Flow is requesting a status change
cclCancel	6	Flow is requesting a status cancel

### Connection Status Codes

Table 38. Connection status code

VB Enumeration	Value	Description
cclUnknown	0	The CICS server status is unknown
cclAvailable	1	The CICS server status is available
cclUnavailable	2	The CICS server status is unavailable

## COM Error Code References

Enumeration	Value	Description	ECI	EPI
cclNoError	0	No error occurred	Yes	Yes
cclBufferOverflow	1	Attempted to increase a CclBuf object which isn't Extensible	Yes	
cclMultipleInstance	2	Attempted to create more than one ECI object	Yes	
cclActiveFlow	3	Current Flow is still active, you cannot use this flow until it is inactive	Yes	
cclActiveUOW	4	Current UOW is still active, you need to backout or commit.	Yes	
cclSyncType	5	Incorrect synchronization type for method call.	Yes	Yes
cclDataLength	9	CommArea > 32768 Bytes or inbound 3270 data stream too large for Terminal Buffer size.	Yes	Yes

Enumeration	Value	Description	ECI	EPI
cclNoCICS	10	The Client daemon is unavailable, or the server implementation is unavailable, or a logical unit of work was to be begun, but the CICS server specified is not available. No resources have been updated	Yes	Yes
cclCICSDied	11	A logical unit of work was to be begun or continued, but the CICS server was no longer available. If this is a link call with an active UOW, the changes are backed out. If This was a UOW Commit or the application cannot determine whether the changes have been committed or backed out, and must log this condition to aid future manual recovery	Yes	
cclNoReply	12	There was no outstanding reply	Yes	
cclTransaction	13	ECI program ended abnormally	Yes	
cclSystemError	14	Unknown internal error occurred	Yes	Yes
cclResource	15	The server implementation or the Client daemon did not have enough resources to complete the request e.g. insufficient SNA sessions.	Yes	Yes
cclMaxUOWs	16	A new logical unit of work was being created, but the application already has as many outstanding logical units of work as the configuration will support.	Yes	
cclUnknownServer	17	The requested server could not be located	Yes	Yes
cclSecurity	18	You did not supply a valid combination of user ID and password, though the server expects it.	Yes	Yes
cclMaxServers	19	You attempted to start requests to more servers than your configuration allows. Consult the documentation for your Client daemon or server to see how to control the number of servers you can use.	Yes	Yes
cclMaxRequests	20	There were not enough communication resources to satisfy the request. Consult the documentation for your Client daemon or server to see how to control communication resources	Yes	Yes
cclRolledBack	21	An attempt was made to commit a logical unit of work, but the server was unable to commit the changes, and backed them out instead	Yes	
cclParameter	22	Incorrect parameter supplied	Yes	Yes
cclInvalidState	23	The Object is not in the correct state to start the method, e.g. terminal object still in server state and an attempt to send data is made.	Yes	Yes
ccltransId	24	Null transid supplied or returned for a pseudo conversational transaction		Yes
cclInitEPI	25	No EPI object or EPI failed to initialize correctly		Yes
cclConnect	26	Unexpected error trying to add the terminal		Yes
ccldata stream	27	Unsupported Data Stream		Yes
cclInvalidMap	28	Map definition and Screen do not match		Yes
cclClass	29	Unknown internal Class error occurred.	Yes	Yes
cclStartTranFailure	30	Transaction failed to start		Yes

Enumeration	Value	Description	ECI	EPI
cclTimeout	31	Timeout occurred before response from Server	Yes	Yes
cclNoPassword	32	The object's password is null.	Yes	Yes
cclNoUserid	33	The object's user ID is null	Yes	Yes
cclNullNewPassword	34	The provided password is null	Yes	Yes
cclPemNotSupported	35	The CICS Server does not support the Password Expiry Management facilities. The method cannot be used	Yes	Yes
cclPemNotActive	36	Password Expiry Management is not active	Yes	Yes
cclPasswordExpired	37	The password has expired. No information has been returned	Yes	Yes
cclPasswordInvalid	38	The password is invalid.	Yes	Yes
cclPasswordRejected	39	Change password failed because the password doesn't conform to standards defined	Yes	Yes
cclUseridInvalid	40	The user ID is unknown	Yes	Yes
cclInvalidTermid	41	Invalid Terminal ID		Yes
cclInvalidModelId	42	Invalid Model/Type		Yes
cclnot3270	43	Not a 3270 device		Yes
cclinvalidCCSid	44	Invalid CCSid		Yes
cclServerBusy	45	CICS server is busy		Yes
cclSignonNotPoss	46	The server does not allow the terminal to be installed as sign-on capable.		Yes

## COM Global Constants

Constants are provided in the type libraries for the Client daemon COM libraries. The libraries are in CCLIECI.DLL and CCLIEPI.DLL.

If you are using Visual Basic, you can look at the definitions in the type libraries by using Visual Basic Object viewer or another type library viewer.

If you are using VBScript, you cannot access the enumerations defined in the type library; use the numeric values provided here.

The exception code constants are listed in "COM Error Code References" on page 147.

## COM EPI Specific Constants

### Synchronization Types

Table 39. Synchronization types

VB Enumeration	Value	Description
cclSync	0	Synchronous call type
cclDsync	1	Deferred synchronous call type

## CclEPI states

Table 40. CclEPI States

VB Enumeration	Value	Description
cclEPIActive	0	EPI initialized
cclDiscon	1	EPI Terminated
cclEPIError	2	EPI failed to initialize, handle exception for more information

## CclSession States

Table 41. CclSession States

VB Enumeration	Value	Description
cclSessionIdle	0	Idle, client needs to initiate transaction
cclSessionServer	1	Waiting for server
cclSessionClient	2	Waiting for Client daemon to respond
cclSessionDiscon	3	Disconnected
cclSessionError	4	Session Error, handle exception for more information

## CclTerminal States

Table 42. CclTerminal States

VB Enumeration	Value	Description
cclInit	0	Terminal defined but not installed
cclActive	1	Terminal connected (not used)
cclIdle	2	Idle, Client daemon needs to initiate transaction
cclServer	3	Waiting for server
cclClient	4	Waiting for client to respond
cclDiscon	5	Disconnected
cclError	6	Terminal error, handle exception for more information

## CclTerminal ATI States

Table 43. CclTerminal ATI states

VB Enumeration	Value	Description
cclATIEnabled	0	ATIs are allowed
cclATIDisabled	1	ATIs are not allowed

## CclTerminal EndTermReasons

Table 44. CclTerminal ATI states

VB Enumeration	Value	Description
cclSignoff	0	Disconnect request or user has signed off the terminal
cclShutdown	1	The CICS server has been shut down

Table 44. CclTerminal ATI states (continued)

VB Enumeration	Value	Description
cclOutOfService	2	The terminal has been switched to out of use
cclUnknown	3	An unknown situation as occurred
cclFailed	4	The terminal failed to disconnect
cclNotDiscon	5	The terminal is not disconnected

## CclTerminal Sign-on Types

Table 45. CclTerminal Sign-on Types

VB Enumeration	Value	Description
cclSignonCapable	0	Terminal supports sign-on transaction
cclSignonIncapable	1	Terminal does not support sign-on transaction
cclSignonUnknown	2	Terminal sign-on capability is unknown

## CclScreen AID key codes

Table 46. CclScreen AID key codes

VB Enumeration	Value	Description
cclEnter	0	Enter key
cclClear	1	Clear key
cclPA1	2	Program Attention key 1
cclPA2	3	Program Attention key 2
cclPA3	4	Program Attention key 3
cclPF1	5	Program Function key 1
cclPF2	6	Program Function key 2
cclPF3	7	Program Function key 3
cclPF4	8	Program Function key 4
cclPF5	9	Program Function key 5
cclPF6	10	Program Function key 6
cclPF7	11	Program Function key 7
cclPF8	12	Program Function key 8
cclPF9	13	Program Function key 9
cclPF10	14	Program Function key 10
cclPF11	15	Program Function key 11
cclPF12	16	Program Function key 12
cclPF13	17	Program Function key 13
cclPF14	18	Program Function key 14
cclPF15	19	Program Function key 15
cclPF16	20	Program Function key 16
cclPF17	21	Program Function key 17
cclPF18	22	Program Function key 18

Table 46. CclScreen AID key codes (continued)

VB Enumeration	Value	Description
cclPF19	23	Program Function key 19
cclPF20	24	Program Function key 20
cclPF21	25	Program Function key 21
cclPF22	26	Program Function key 22
cclPF23	27	Program Function key 23
cclPF24	28	Program Function key 24

## CclField Protected State Attributes

Table 47. CclField Protected state attributes

VB Enumeration	Value	Description
cclProtect	0	Protected Field (cannot be modified)
cclUnprotect	1	Unprotected (input) field

## CclField Numeric Attributes

Table 48. CclField Numeric Attributes

VB Enumeration	Value	Description
cclAlphanumeric	0	Alphanumeric input field
cclNnumeric	1	Numeric input field

## CclField Intensity Attributes

Table 49. CclField Intensity attributes

VB Enumeration	Value	Description
cclNormal	0	Normal display
cclIntense	1	Intensified display
cclDark	2	Non-display field

## CclField Modified Attributes

Table 50. CclField Modified Attributes

VB Enumeration	Value	Description
cclUnmodified	0	Field has not been changed
cclModified	1	Field has been changed

## CclField Highlight Attributes

Table 51. CclField Highlight attributes

VB Enumeration	Value	Description
cclHltDefault	0	Default field text highlighting
cclHltNormal	1	Field text highlight as specified by 3270 base attribute
cclHltBlink	2	Blinking text

Table 51. CclField Highlight attributes (continued)

VB Enumeration	Value	Description
cclHltReverse	3	Reverse video text
cclHltUnderscore	4	Underscored text
cclHltIntense	5	High intensity text

## CclField Transparency Attributes

Table 52. CclField Transparency attributes

VB Enumeration	Value	Description
cclTrnDefault	0	Default (opaque) field background
cclTrnOr	1	Transparent field background (OR)
cclTrnXor	2	Transparent field background (XOR)
cclTrnOpaque	3	Opaque field background

## CclField Color Attributes

Table 53. CclField Color attributes

VB Enumeration	Value	Description
cclDefaultColor	0	
cclBlue	1	
cclRed	2	
cclPink	3	
cclGreen	4	
cclCyan	5	
cclYellow	6	
cclNeutral	7	
cclBlack	8	
cclDarkBlue	9	
cclOrange	10	
cclPurple	11	
cclPaleGreen	12	
cclPaleCyan	13	
cclGray	14	
cclWhite	15	

## COM ECI Constants

### Synchronization Types

Table 54. Synchronization types

VB Enumeration	Value	Description
cclSync	0	Synchronous call type
cclDsync	1	Deferred synchronous call type

## Flow status types

Table 55. Flow status types

VB Enumeration	Value	Description
cclInactive	0	Flow is inactive
cclLink	1	Flow is currently making a link call
cclBackout	2	Flow is currently backing out a UOW
cclCommit	3	Flow is currently committing a UOW
cclStatus	4	Flow is requesting status
cclChanged	5	Flow is requesting a status change
cclCancel	6	Flow is requesting a status cancel

## Connection Status Codes

Table 56. Connection status code

VB Enumeration	Value	Description
cclUnknown	0	The CICS server status is unknown
cclAvailable	1	The CICS server status is available
cclUnavailable	2	The CICS server status is unavailable

## COM Error Code References

Enumeration	Value	Description	ECI	EPI
cclNoError	0	No error occurred	Yes	Yes
cclBufferOverflow	1	Attempted to increase a CclBuf object which isn't Extensible	Yes	
cclMultipleInstance	2	Attempted to create more than one ECI object	Yes	
cclActiveFlow	3	Current Flow is still active, you cannot use this flow until it is inactive	Yes	
cclActiveUOW	4	Current UOW is still active, you need to backout or commit.	Yes	
cclSyncType	5	Incorrect synchronization type for method call.	Yes	Yes
cclDataLength	9	CommArea > 32768 Bytes or inbound 3270 data stream too large for Terminal Buffer size.	Yes	Yes
cclNoCICS	10	The Client daemon is unavailable, or the server implementation is unavailable, or a logical unit of work was to be begun, but the CICS server specified is not available. No resources have been updated	Yes	Yes
cclCICSDied	11	A logical unit of work was to be begun or continued, but the CICS server was no longer available. If this is a link call with an active UOW, the changes are backed out. If This was a UOW Commit or the application cannot determine whether the changes have been committed or backed out, and must log this condition to aid future manual recovery	Yes	
cclNoReply	12	There was no outstanding reply	Yes	

Enumeration	Value	Description	ECI	EPI
cclTransaction	13	ECI program ended abnormally	Yes	
cclSystemError	14	Unknown internal error occurred	Yes	Yes
cclResource	15	The server implementation or the Client daemon did not have enough resources to complete the request e.g. insufficient SNA sessions.	Yes	Yes
cclMaxUOWs	16	A new logical unit of work was being created, but the application already has as many outstanding logical units of work as the configuration will support.	Yes	
cclUnknownServer	17	The requested server could not be located	Yes	Yes
cclSecurity	18	You did not supply a valid combination of user ID and password, though the server expects it.	Yes	Yes
cclMaxServers	19	You attempted to start requests to more servers than your configuration allows. Consult the documentation for your Client daemon or server to see how to control the number of servers you can use.	Yes	Yes
cclMaxRequests	20	There were not enough communication resources to satisfy the request. Consult the documentation for your Client daemon or server to see how to control communication resources	Yes	Yes
cclRolledBack	21	An attempt was made to commit a logical unit of work, but the server was unable to commit the changes, and backed them out instead	Yes	
cclParameter	22	Incorrect parameter supplied	Yes	Yes
cclInvalidState	23	The Object is not in the correct state to start the method, e.g. terminal object still in server state and an attempt to send data is made.	Yes	Yes
ccltransId	24	Null transid supplied or returned for a pseudo conversational transaction		Yes
cclInitEPI	25	No EPI object or EPI failed to initialize correctly		Yes
cclConnect	26	Unexpected error trying to add the terminal		Yes
ccldata stream	27	Unsupported Data Stream		Yes
cclInvalidMap	28	Map definition and Screen do not match		Yes
cclClass	29	Unknown internal Class error occurred.	Yes	Yes
cclStartTranFailure	30	Transaction failed to start		Yes
cclTimeout	31	Timeout occurred before response from Server	Yes	Yes
cclNoPassword	32	The object's password is null.	Yes	Yes
cclNoUserid	33	The object's user ID is null	Yes	Yes
cclNullNewPassword	34	The provided password is null	Yes	Yes
cclPemNotSupported	35	The CICS Server does not support the Password Expiry Management facilities. The method cannot be used	Yes	Yes
cclPemNotActive	36	Password Expiry Management is not active	Yes	Yes
cclPasswordExpired	37	The password has expired. No information has been returned	Yes	Yes
cclPasswordInvalid	38	The password is invalid.	Yes	Yes

Enumeration	Value	Description	ECI	EPI
cclPasswordRejected	39	Change password failed because the password doesn't conform to standards defined	Yes	Yes
cclUseridInvalid	40	The user ID is unknown	Yes	Yes
cclInvalidTermid	41	Invalid Terminal ID		Yes
cclInvalidModelId	42	Invalid Model/Type		Yes
cclnot3270	43	Not a 3270 device		Yes
cclinvalidCCSid	44	Invalid CCSid		Yes
cclServerBusy	45	CICS server is busy		Yes
cclSignonNotPoss	46	The server does not allow the terminal to be installed as sign-on capable.		Yes

## Interface Selection

The interfaces available for Visual Basic.

For Visual Basic, the following types of interface are available:

```
Dim var as Object
Dim var as Cc1OUOW
```

The second method is preferred.

If you do not dim a variable, dim it with no type, or are using VBScript, the variable is assumed to be of type **Object**.

## Object Creation

Ways of creating an object.

You can create an object in two ways:

```
set var = CreateObject("Ccl.UOW")
set var = New Cc1OUOW
```

**New** is the preferred method in Visual Basic. For VBScript, you can use only the **CreateObject** method.

## Methods

Methods available on this class.

### BackOut

Terminates this UOW and backs out all changes made to recoverable resources in the server.

**BackOut**(*flow* as Object)

**BackOut**(*flow* as CclOFlow)

*flow*

The CclOFlow object which is used to control the client/server call

### Commit

Terminates this UOW and commits all changes made to recoverable resources in the server.

**Commit**(*flow* as Object)

**Commit**(*flow* as CclOFlow)

*flow*

The CclOFlow object which is used to control the client/server call

### **ForceReset**

Makes this UOW inactive and resets it. The UOW is neither committed or backed out.

**ForceReset**()

### **UowId**

Returns the identifier of the UOW. A zero return indicates that the UOW is either complete or has not yet started, and is therefore inactive.

**UowId**() as long

---

## **COM Global Constants**

Constants are provided in the type libraries for the Client daemon COM libraries. The libraries are in CCLIECI.DLL and CCLIEPI.DLL.

If you are using Visual Basic, you can look at the definitions in the type libraries by using Visual Basic Object viewer or another type library viewer.

If you are using VBScript, you cannot access the enumerations defined in the type library; use the numeric values provided here.

The exception code constants are listed in “COM Error Code References” on page 147.

---

## **COM EPI Specific Constants**

### **Synchronization Types**

*Table 57. Synchronization types*

<b>VB Enumeration</b>	<b>Value</b>	<b>Description</b>
cclSync	0	Synchronous call type
cclDsync	1	Deferred synchronous call type

### **CclEPI states**

*Table 58. CclEPI States*

<b>VB Enumeration</b>	<b>Value</b>	<b>Description</b>
cclEPIActive	0	EPI initialized
cclDiscon	1	EPI Terminated
cclEPIError	2	EPI failed to initialize, handle exception for more information

## CclSession States

Table 59. CclSession States

VB Enumeration	Value	Description
cclSessionIdle	0	Idle, client needs to initiate transaction
cclSessionServer	1	Waiting for server
cclSessionClient	2	Waiting for Client daemon to respond
cclSessionDiscon	3	Disconnected
cclSessionError	4	Session Error, handle exception for more information

## CclTerminal States

Table 60. CclTerminal States

VB Enumeration	Value	Description
cclInit	0	Terminal defined but not installed
cclActive	1	Terminal connected (not used)
cclIdle	2	Idle, Client daemon needs to initiate transaction
cclServer	3	Waiting for server
cclClient	4	Waiting for client to respond
cclDiscon	5	Disconnected
cclError	6	Terminal error, handle exception for more information

## CclTerminal ATI States

Table 61. CclTerminal ATI states

VB Enumeration	Value	Description
cclATIEnabled	0	ATIs are allowed
cclATIDisabled	1	ATIs are not allowed

## CclTerminal EndTermReasons

Table 62. CclTerminal ATI states

VB Enumeration	Value	Description
cclSignoff	0	Disconnect request or user has signed off the terminal
cclShutdown	1	The CICS server has been shut down
cclOutOfService	2	The terminal has been switched to out of use
cclUnknown	3	An unknown situation as occurred
cclFailed	4	The terminal failed to disconnect
cclNotDiscon	5	The terminal is not disconnected

## CclTerminal Sign-on Types

Table 63. CclTerminal Sign-on Types

VB Enumeration	Value	Description
cclSignonCapable	0	Terminal supports sign-on transaction
cclSignonIncapable	1	Terminal does not support sign-on transaction
cclSignonUnknown	2	Terminal sign-on capability is unknown

## CclScreen AID key codes

Table 64. CclScreen AID key codes

VB Enumeration	Value	Description
cclEnter	0	Enter key
cclClear	1	Clear key
cclPA1	2	Program Attention key 1
cclPA2	3	Program Attention key 2
cclPA3	4	Program Attention key 3
cclPF1	5	Program Function key 1
cclPF2	6	Program Function key 2
cclPF3	7	Program Function key 3
cclPF4	8	Program Function key 4
cclPF5	9	Program Function key 5
cclPF6	10	Program Function key 6
cclPF7	11	Program Function key 7
cclPF8	12	Program Function key 8
cclPF9	13	Program Function key 9
cclPF10	14	Program Function key 10
cclPF11	15	Program Function key 11
cclPF12	16	Program Function key 12
cclPF13	17	Program Function key 13
cclPF14	18	Program Function key 14
cclPF15	19	Program Function key 15
cclPF16	20	Program Function key 16
cclPF17	21	Program Function key 17
cclPF18	22	Program Function key 18
cclPF19	23	Program Function key 19
cclPF20	24	Program Function key 20
cclPF21	25	Program Function key 21
cclPF22	26	Program Function key 22
cclPF23	27	Program Function key 23
cclPF24	28	Program Function key 24

## CclField Protected State Attributes

Table 65. CclField Protected state attributes

VB Enumeration	Value	Description
cclProtect	0	Protected Field (cannot be modified)
cclUnprotect	1	Unprotected (input) field

## CclField Numeric Attributes

Table 66. CclField Numeric Attributes

VB Enumeration	Value	Description
cclAlphanumeric	0	Alphanumeric input field
cclNnumeric	1	Numeric input field

## CclField Intensity Attributes

Table 67. CclField Intensity attributes

VB Enumeration	Value	Description
cclNormal	0	Normal display
cclIntense	1	Intensified display
cclDark	2	Non-display field

## CclField Modified Attributes

Table 68. CclField Modified Attributes

VB Enumeration	Value	Description
cclUnmodified	0	Field has not been changed
cclModified	1	Field has been changed

## CclField Highlight Attributes

Table 69. CclField Highlight attributes

VB Enumeration	Value	Description
cclHltDefault	0	Default field text highlighting
cclHltNormal	1	Field text highlight as specified by 3270 base attribute
cclHltBlink	2	Blinking text
cclHltReverse	3	Reverse video text
cclHltUnderscore	4	Underscored text
cclHltIntense	5	High intensity text

## CclField Transparency Attributes

Table 70. CclField Transparency attributes

VB Enumeration	Value	Description
cclTrnDefault	0	Default (opaque) field background
cclTrnOr	1	Transparent field background (OR)
cclTrnXorcclTrnXor	2	Transparent field background (XOR)
cclTrnOpaque	3	Opaque field background

## CclField Color Attributes

Table 71. CclField Color attributes

VB Enumeration	Value	Description
cclDefaultColor	0	
cclBlue	1	
cclRed	2	
cclPink	3	
cclGreen	4	
cclCyan	5	
cclYellow	6	
cclNeutral	7	
cclBlack	8	
cclDarkBlue	9	
cclOrange	10	
cclPurple	11	
cclPaleGreen	12	
cclPaleCyan	13	
cclGray	14	
cclWhite	15	

---

## COM ECI Constants

### Synchronization Types

Table 72. Synchronization types

VB Enumeration	Value	Description
cclSync	0	Synchronous call type
cclDsync	1	Deferred synchronous call type

### Flow status types

Table 73. Flow status types

VB Enumeration	Value	Description
cclInactive	0	Flow is inactive

Table 73. Flow status types (continued)

VB Enumeration	Value	Description
cclLink	1	Flow is currently making a link call
cclBackout	2	Flow is currently backing out a UOW
cclCommit	3	Flow is currently committing a UOW
cclStatus	4	Flow is requesting status
cclChanged	5	Flow is requesting a status change
cclCancel	6	Flow is requesting a status cancel

## Connection Status Codes

Table 74. Connection status code

VB Enumeration	Value	Description
cclUnknown	0	The CICS server status is unknown
cclAvailable	1	The CICS server status is available
cclUnavailable	2	The CICS server status is unavailable

## COM Error Code References

Enumeration	Value	Description	ECI	EPI
cclNoError	0	No error occurred	Yes	Yes
cclBufferOverflow	1	Attempted to increase a CclBuf object which isn't Extensible	Yes	
cclMultipleInstance	2	Attempted to create more than one ECI object	Yes	
cclActiveFlow	3	Current Flow is still active, you cannot use this flow until it is inactive	Yes	
cclActiveUOW	4	Current UOW is still active, you need to backout or commit.	Yes	
cclSyncType	5	Incorrect synchronization type for method call.	Yes	Yes
cclDataLength	9	CommArea > 32768 Bytes or inbound 3270 data stream too large for Terminal Buffer size.	Yes	Yes
cclNoCICS	10	The Client daemon is unavailable, or the server implementation is unavailable, or a logical unit of work was to be begun, but the CICS server specified is not available. No resources have been updated	Yes	Yes
cclCICSDied	11	A logical unit of work was to be begun or continued, but the CICS server was no longer available. If this is a link call with an active UOW, the changes are backed out. If This was a UOW Commit or the application cannot determine whether the changes have been committed or backed out, and must log this condition to aid future manual recovery	Yes	
cclNoReply	12	There was no outstanding reply	Yes	
cclTransaction	13	ECI program ended abnormally	Yes	
cclSystemError	14	Unknown internal error occurred	Yes	Yes

Enumeration	Value	Description	ECI	EPI
cclResource	15	The server implementation or the Client daemon did not have enough resources to complete the request e.g. insufficient SNA sessions.	Yes	Yes
cclMaxUOWs	16	A new logical unit of work was being created, but the application already has as many outstanding logical units of work as the configuration will support.	Yes	
cclUnknownServer	17	The requested server could not be located	Yes	Yes
cclSecurity	18	You did not supply a valid combination of user ID and password, though the server expects it.	Yes	Yes
cclMaxServers	19	You attempted to start requests to more servers than your configuration allows. Consult the documentation for your Client daemon or server to see how to control the number of servers you can use.	Yes	Yes
cclMaxRequests	20	There were not enough communication resources to satisfy the request. Consult the documentation for your Client daemon or server to see how to control communication resources	Yes	Yes
cclRolledBack	21	An attempt was made to commit a logical unit of work, but the server was unable to commit the changes, and backed them out instead	Yes	
cclParameter	22	Incorrect parameter supplied	Yes	Yes
cclInvalidState	23	The Object is not in the correct state to start the method, e.g. terminal object still in server state and an attempt to send data is made.	Yes	Yes
ccltransId	24	Null transid supplied or returned for a pseudo conversational transaction		Yes
cclInitEPI	25	No EPI object or EPI failed to initialize correctly		Yes
cclConnect	26	Unexpected error trying to add the terminal		Yes
ccldata stream	27	Unsupported Data Stream		Yes
cclInvalidMap	28	Map definition and Screen do not match		Yes
cclClass	29	Unknown internal Class error occurred.	Yes	Yes
cclStartTranFailure	30	Transaction failed to start		Yes
cclTimeout	31	Timeout occurred before response from Server	Yes	Yes
cclNoPassword	32	The object's password is null.	Yes	Yes
cclNoUserid	33	The object's user ID is null	Yes	Yes
cclNullNewPassword	34	The provided password is null	Yes	Yes
cclPemNotSupported	35	The CICS Server does not support the Password Expiry Management facilities. The method cannot be used	Yes	Yes
cclPemNotActive	36	Password Expiry Management is not active	Yes	Yes
cclPasswordExpired	37	The password has expired. No information has been returned	Yes	Yes
cclPasswordInvalid	38	The password is invalid.	Yes	Yes
cclPasswordRejected	39	Change password failed because the password doesn't conform to standards defined	Yes	Yes

Enumeration	Value	Description	ECI	EPI
cclUserIdInvalid	40	The user ID is unknown	Yes	Yes
cclInvalidTermid	41	Invalid Terminal ID		Yes
cclInvalidModelId	42	Invalid Model/Type		Yes
cclnot3270	43	Not a 3270 device		Yes
cclinvalidCCSid	44	Invalid CCSid		Yes
cclServerBusy	45	CICS server is busy		Yes
cclSignonNotPoss	46	The server does not allow the terminal to be installed as sign-on capable.		Yes

---

## Chapter 4. User exits

Programming references for the CICS Transaction Gateway user exits.

---

### ECI Client API exits

The ECI Client API exits are available for use with ECI requests that are sent to servers connected by the TCP/IP and SNA protocols. They are not available if using the IPIC protocol.

The exits are called from the Gateway daemon process when running in remote mode and from the application process when running in local mode. The exits are called for ECI requests issued from all APIs. For more information on creating and deploying user exits see ../progde/eiexits.dita.

Table 75 summarizes the exit names, the parameters passed to each exit, and the possible return codes.

*Table 75. Summary of ECI exits*

Function name	Parameters	Return codes:
"CICS_EciInitializeExit" on page 172	<b>Version</b> <b>Anchor</b>	CICS_EXIT_OK CICS_EXIT_NO_EXIT CICS_EXIT_CANT_INIT_EXITS user-defined
"CICS_EciTerminateExit" on page 173	<b>Anchor</b>	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_STORAGE user-defined
"CICS_EciExternalCallExit1" on page 174	<b>Anchor</b> <b>Token</b> <b>ParmPtr</b>	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM user-defined
"CICS_EciExternalCallExit2" on page 175	<b>Anchor</b> <b>Token</b> <b>ParmPtr</b>	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM user-defined
"CICS_EciSystemIdExit" on page 176	<b>Anchor</b> <b>Token</b> <b>ParmPtr</b> <b>Reason</b>	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM CICS_EXIT_GIVE_UP user_defined
"CICS_EciDataSendExit" on page 177	<b>Anchor</b> <b>Token</b>	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM user_defined

Table 75. Summary of ECI exits (continued)

Function name	Parameters	Return codes:
"CICS_EciDataReturnExit" on page 178	<b>Anchor Token ParmPtr</b>	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM user_defined
"CICS_EciSetProgramAliasExit" on page 179	<b>Anchor EciParms Program</b>	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM user_defined

## Identification token

So that the exits can correlate calls for the same ECI request, an identification token is passed in as a parameter to all exits except **CICS\_EciInitializeExit** and **CICS\_EciTerminateExit**.

The token is the same for **CICS\_EciExternalCallExit1** and **CICS\_EciExternalCallExit2** that relate to the same call, and on intervening **CICS\_EciDataSendExit**, **CICS\_EciDataReturnExit**, and **CICS\_EciSystemIdExit** exits. **CICS\_EciExternalCallExit1** and **CICS\_EciExternalCallExit2** are not called for a reply solicitation request.

The token is unique within the CICS Transaction Gateway instance for the duration of the request. It can be reused when the last exit for the request has been called.

In the case of an extended logical unit of work, the token might be different on different requests within the logical unit of work. Because reuse of the token, and a new program link call cannot be made until the ECI\_GET\_REPLY request for the previous asynchronous request has completed, the token might also be the same.

The token is 8 bytes long. A value of 8 null bytes is not valid for the token and is not supplied to the exits.

## Process model implementation

All exits that relate to a particular request (that is, have the same identification token) are called in the context of the application process.

## CICS\_EciInitializeExit

This exit allows the user to set up an ECI exit initialization environment.

<i>Function name:</i>	Parameters
CICS_EciInitializeExit	Version
	Anchor

## When called

The **CICS\_EciInitializeExit** exit is invoked when the first ECI request is flowed through the CICS Transaction Gateway for remote mode applications, and when the first ECI request is flowed from each local mode application process. The exit is

called after ECI parameter validation has occurred.

## Parameters

### Version

Input parameter. The version of the ECI under which the exit is running.

### Anchor

Output parameter. A pointer to a pointer that is passed to the ECI exits. The second pointer is not used by the ECI; it is passed to the exits as supplied. You can acquire storage in this exit and pass its address to the other exits.

## Return codes

### CICS\_EXIT\_OK

The ECI continues processing this request, calling the exits where appropriate.

### CICS\_EXIT\_NO\_EXIT

The ECI continues processing this request, but does not call any more exits.

### CICS\_EXIT\_CANT\_INIT\_EXITS

The ECI writes a CICS Transaction Gateway trace record, and then continues processing this request, but does not call any more exits.

### user-defined

User-defined return codes must have a value not less than CICS\_EXIT\_USER\_BASE. The ECI writes a CICS Transaction Gateway trace record, and then continues processing this request, but does not call any more exits.

## CICS\_EciTerminateExit

This exit allows the user to clean up the exit environment.

<i>Function name:</i>	<b>Parameters</b>
CICS_EciTerminateExit	Anchor

CICS\_EciTerminateExit is not called by CICS Transaction Gateway.

## When called

On termination of the process that issued the **CICS\_EciInitializeExit**.

## Parameters

### Anchor

Input parameter. The pointer set up by **CICS\_EciInitializeExit**.

## Return codes

### CICS\_EXIT\_OK

Termination continues.

### CICS\_EXIT\_BAD\_ANCHOR

CICS detected an invalid anchor field. The ECI writes a CICS Transaction Gateway trace record, and then continues with termination.

## CICS\_EXIT\_BAD\_STORAGE

CICS detected a storage error. The ECI writes a CICS Transaction Gateway trace record, and then continues with termination.

### user-defined

User-defined return codes must have a value not less than CICS\_EXIT\_USER\_BASE. The ECI writes a CICS Transaction Gateway trace record, and then continues with termination.

## CICS\_EciExternalCallExit1

This exit enables the user to specify the destination CICS server where the ECI request is to be sent.

Function name:	Parameters:
CICS_EciExternalCallExit1	Anchor Token ParmPtr

The exit can select a system if the call is a program link or status information call, and if a new logical unit of work is being started. In other cases, the exit should return CICS\_EXIT\_OK.

### When called

This exit is called once on each program link and each status information call, after the ECI has validated the parameters. It is not called on a reply solicitation call. Although the exit is called when **eci\_luw\_token** is not zero, any change made to **eci\_system\_name** in the ECI parameter block is ignored, as the server was selected when the logical unit of work was started. If **eci\_system\_name** is changed to contain binary zeros as the server name, then CICS Transaction Gateway dynamically selects the server to which the ECI request is sent.

### Parameters

#### Anchor

Input parameter. The pointer setup by **CICS\_EciInitializeExit**.

**Token** Input parameter. The identification token established by the ECI for this request.

#### ParmPtr

Input parameter. A pointer to the ECI parameter block. The exit must treat all fields in the ECI parameter block as inputs, except the **eci\_system\_name** field, which it can change.

### Return codes

#### CICS\_EXIT\_OK

The ECI continues to process the request with the **eci\_system\_name** now specified in the ECI parameter block.

#### CICS\_EXIT\_BAD\_ANCHOR

CICS detected an invalid anchor field. The ECI writes a CICS Transaction Gateway trace record, and then continues to process the request with the **eci\_system\_name** now specified in the ECI parameter block.

### **CICS\_EXIT\_BAD\_PARM**

CICS detected an invalid parameter. The ECI writes a CICS Transaction Gateway trace record, and then continues to process the request with the **eci\_system\_name** now specified in the ECI parameter block.

### **user-defined**

User-defined return codes must have a value not less than **CICS\_EXIT\_USER\_BASE**. The ECI writes a CICS Transaction Gateway trace record, and then continues to process the request with the **eci\_system\_name** now specified in the ECI parameter block.

## **CICS\_EciExternalCallExit2**

This exit enables the user to view the results of synchronous ECI calls, and is used for information gathering purposes.

*Function name:*

CICS\_EciExternalCallExit2

### **Parameters:**

Anchor

Token

ParmPtr

### **Purpose**

### **When called**

This exit is called once on every application program link or status information call. It is not called on reply solicitation calls. The exit is called before the ECI call returns to the application, and after the return data is filled into the ECI parameter block.

### **Parameters**

#### **Anchor**

Input parameter. The pointer setup by **CICS\_EciInitializeExit**.

**Token** Input parameter. The identification token established by the ECI for this request.

#### **ParmPtr**

Input parameter. A pointer to the ECI parameter block. The exit must treat all fields in the ECI parameter block as inputs.

### **Return codes**

#### **CICS\_EXIT\_OK**

The ECI returns control to the application that issued the **CICS\_ExternalCall** request.

#### **CICS\_EXIT\_BAD\_ANCHOR**

CICS detected an invalid anchor field. The ECI writes a CICS Transaction Gateway trace record, and then returns control to the application that issued the **CICS\_ExternalCall** request.

#### **CICS\_EXIT\_BAD\_PARM**

CICS detected an invalid parameter. The ECI writes a CICS Transaction Gateway trace record, and then returns control to the application that issued the **CICS\_ExternalCall** request.

### user-defined

User-defined return codes must have a value not less than CICS\_EXIT\_USER\_BASE. The ECI writes a CICS Transaction Gateway trace record, and then returns control to the application that issued the **CICS\_ExternalCall** request.

## CICS\_EciSystemIdExit

This exit enables the user to supply a new system ID, if the value supplied in the ECI parameter block is not valid.

<i>Function name:</i> CICS_EciSystemIdExit	<b>Parameters:</b> Anchor Token ParmPtr Reason
---	--

### When called

This exit is called when an error occurs that can be corrected by selection of a new system, user ID, or password. This would be when the ECI has returned one of the following codes:

- ECI\_ERR\_NO\_CICS
- ECI\_ERR\_UNKNOWN\_SERVER
- ECI\_ERR\_SECURITY\_ERROR
- ECI\_ERR\_SYSTEM\_ERROR
- ECI\_ERR\_RESOURCE\_SHORTAGE
- ECI\_ERR\_MAX\_SYSTEMS.

It can be called when the Client daemon detects an error before data is sent to the server, or after data returns from the server.

### Parameters

#### Anchor

Input parameter. The pointer setup by **CICS\_EciInitializeExit**.

**Token** Input parameter. The identification token established by the ECI for this request.

#### ParmPtr

Input parameter. A pointer to the ECI parameter block. The exit must treat all fields in the ECI parameter block as inputs, except the following, which it can set:

- **eci\_system\_name**
- **eci\_userid**
- **eci\_password.**

#### Reason

Input parameter. A standard ECI error code that explains why the application request has not so far succeeded.

## Return codes

### **CICS\_EXIT\_OK**

The ECI retries the application call using the new parameters in the ECI parameter block. (The CICS program communication area supplied by the application to the **CICS\_ExternalCall** is preserved.) The application callback routine is not called, nor is **CICS\_EciExternalCallExit2**.

### **CICS\_EXIT\_BAD\_ANCHOR**

CICS detected an invalid anchor field. The ECI writes a CICS Transaction Gateway trace record, and then returns to the application that issued the **CICS\_ExternalCall** request.

### **CICS\_EXIT\_BAD\_PARM**

CICS detected an invalid parameter. The ECI writes a CICS Transaction Gateway trace record, and then returns to the application that issued the **CICS\_ExternalCall** request.

### **CICS\_EXIT\_GIVE\_UP**

The ECI returns to the application that issued the **CICS\_ExternalCall** request.

### **user-defined**

User-defined return codes must have a value not less than **CICS\_EXIT\_USER\_BASE**. The ECI writes a CICS Transaction Gateway trace record, and then retries the application call as described for **CICS\_EXIT\_OK**.

## **CICS\_EciDataSendExit**

This exit enables the user to time ECI calls, and is used for performance analysis purposes.

*Function name:*

**CICS\_EciDataSendExit**

**Parameters:**

Anchor

Token

## When called

As close as possible to the time that the request is sent to the server.

## Parameters

### **Anchor**

Input parameter. The pointer setup by **CICS\_EciInitializeExit**.

**Token** Input parameter. The identification token established by the ECI for this request.

## Return codes

### **CICS\_EXIT\_OK**

The ECI continues processing the request.

### **CICS\_EXIT\_BAD\_ANCHOR**

CICS detected an invalid anchor field. The ECI writes a CICS Transaction Gateway trace record, and then continues processing the request.

### **CICS\_EXIT\_BAD\_PARM**

CICS detected an invalid parameter. The ECI writes a CICS Transaction Gateway trace record, and then continues processing the request.

#### **user-defined**

User-defined return codes must have a value not less than CICS\_EXIT\_USER\_BASE. The ECI writes a CICS Transaction Gateway trace record, and then continues processing the request.

## **CICS\_EciDataReturnExit**

This exit enables the user to time ECI calls, and is used for performance analysis purposes.

Function name:	Parameters:
CICS_EciDataReturnExit	Anchor Token ParmPtr

### **When called**

As close as possible to the time that the response from the server has been received, and the ECI block and commarea data for eventual return to the application has been built. It is also called if there is a timeout because of a lack of response from the server.

### **Parameters**

#### **Anchor**

Input parameter. The pointer setup by **CICS\_EciInitializeExit**.

**Token** Input parameter. The identification token established by the ECI for this request.

#### **ParmPtr**

Input parameter. A pointer to the ECI parameter block. The exit must treat all fields in the ECI parameter block as inputs.

### **Return codes**

#### **CICS\_EXIT\_OK**

The ECI continues processing the request.

#### **CICS\_EXIT\_BAD\_ANCHOR**

CICS detected an invalid anchor field. The ECI writes a CICS Transaction Gateway trace record, and then continues processing the request.

#### **CICS\_EXIT\_BAD\_PARM**

CICS detected an invalid parameter. The ECI writes a CICS Transaction Gateway trace record, and then continues processing the request.

#### **user-defined**

User-defined return codes must have a value not less than CICS\_EXIT\_USER\_BASE. The ECI writes a CICS Transaction Gateway trace record, and then continues processing the request.

## CICS\_EciSetProgramAliasExit

This exit allows the user to change the program name that the WorkLoad Manager of CICS Transaction Gateway for Windows uses for load balancing.

<i>Function name:</i> CICS_EciSetProgramAliasExit	<b>Parameters:</b> Anchor EciParms Program
--	---

This exit is only available when the WorkLoad Manager is enabled.

### When called

Immediately before the WorkLoad Manager tries to select a server for an ECI program to connect to.

### Parameters

#### Anchor

Input parameter. The pointer setup by **CICS\_EciInitializeExit**.

#### ECIParms

ECI parameter block.

#### Program

The alias name of the ECI program that the WorkLoad Manager uses for load balancing.

### Return codes

#### CICS\_EXIT\_OK

The ECI continues processing the request.

#### CICS\_EXIT\_BAD\_ANCHOR

CICS detected an invalid anchor field. The ECI writes a CICS Transaction Gateway trace record, and then continues processing the request.

#### CICS\_EXIT\_BAD\_PARM

CICS detected an invalid parameter. The ECI writes a CICS Transaction Gateway trace record, and then continues processing the request.

#### user-defined

User-defined return codes must have a value not less than CICS\_EXIT\_USER\_BASE. The ECI writes a CICS Transaction Gateway trace record, and then continues processing the request.

---

## EPI Client API exits

The EPI Client API exits can be used with EPI requests sent to CICS servers over either the TCP/IP or SNA protocol.

For more information on creating and deploying user exits see [../progde/eiexits.dita](#).

The C EPI exits are:

- CICS\_EpiInitializeExit
- CICS\_EpiTerminateExit

- CICS\_EpiAddTerminalExit
- CICS\_EpiTermIdExit
- CICS\_EpiTermIdInfoExit
- CICS\_EpiStartTranExtendedExit
- CICS\_EpiStartTranExit
- CICS\_EpiReplyExit
- CICS\_EpiDelTerminalExit
- CICS\_EpiGetEventExit
- CICS\_EpiSystemIdExit
- CICS\_EpiTranFailedExit

Table 76 summarizes the exit names, the parameters passed to each exit, and the possible return codes.

*Table 76. Summary of EPI exits*

Function name	Parameters	Return codes:
CICS_EpiInitializeExit	<b>Version</b> <b>Anchor</b>	CICS_EXIT_OK CICS_EXIT_NO_EXIT CICS_EXIT_CANT_INIT_EXITS user-defined
CICS_EpiTerminateExit	<b>Anchor</b>	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_STORAGE user-defined
CICS_EpiAddTerminalExit	<b>Anchor</b> <b>NameSpace</b> <b>System</b> <b>NetName</b> <b>DevType</b>	CICS_EXIT_OK CICS_EXIT_DONT_ADD_TERMINAL CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM user-defined
CICS_EpiTermIdExit	<b>Anchor</b> <b>TermIndex</b> <b>System</b>	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM user-defined
CICS_EpiTermIdInfoExit	<b>Anchor</b> <b>Version</b> <b>TermIndex</b> <b>EpiDetails</b>	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM user-defined
CICS_EpiStartTranExtendedExit	<b>Anchor</b> <b>TermIndex</b> <b>TransId</b> <b>Data</b> <b>Size</b>	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM user-defined
CICS_EpiStartTranExit	<b>Anchor</b> <b>TransId</b> <b>Data</b>	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM user-defined

Table 76. Summary of EPI exits (continued)

Function name	Parameters	Return codes:
CICS_EpiReplyExit	Anchor TermIndex Data Size	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM user_defined
CICS_EpiDelTerminalExit	Anchor TermIndex	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM user_defined
CICS_EpiGetEventExit	Anchor TermIndex Wait Event	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM user_defined
CICS_EpiSystemIdExit	Anchor NameSpace System NetName DevType FailedSystem Reason SubReason UserId PassWord	CICS_EXIT_OK CICS_EXIT_DONT_ADD_TERMINAL CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM user_defined
CICS_EpiTranFailedExit	Anchor TermIndex Wait Event	CICS_EXIT_OK CICS_EXIT_BAD_ANCHOR CICS_EXIT_BAD_PARM user_defined

## CICS\_EpiInitializeExit

This exit enables the user to set up an EPI exit initialization environment.

Function name:	Parameters:
CICS_EpiInitializeExit	Version Anchor

### Purpose

### When called

On each invocation of **CICS\_EpiInitialize**, after the EPI has validated the parameters.

### Parameters

#### Version

Input parameter. The version of the EPI under which the exit is running.

### Anchor

Output parameter. A pointer to a pointer that will be passed to the EPI exits. The second pointer is not used by the EPI; it is passed to the exits as supplied. You can acquire storage in this exit and pass its address to the other exits.

### Return codes

#### CICS\_EXIT\_OK

The EPI continues processing this request, calling the exits where appropriate.

#### CICS\_EXIT\_NO\_EXIT

The EPI continues processing this request, but does not call any more exits.

#### CICS\_EXIT\_CANT\_INIT\_EXITS

The EPI writes a CICS Transaction Gateway trace record, and then continues processing this request, but does not call any more exits.

### user-defined

User-defined return codes must have a value not less than CICS\_EXIT\_USER\_BASE. The EPI writes a CICS Transaction Gateway trace record, and then continues processing this request, but does not call any more exits.

## CICS\_EpiTerminateExit

This exit enables the user to clean up the EPI exit termination environment. Any storage acquired by CICS\_EpiInitializeExit must be released in this exit.

<i>Function name:</i>	<b>Parameters:</b>
CICS_EpiTerminateExit	Anchor

### Purpose

### When called

On each invocation of **CICS\_EpiTerminate**, after the EPI has validated the parameters.

### Parameters

#### Anchor

Input parameter. The pointer set up by **CICS\_EpiInitializeExit**.

### Return codes

#### CICS\_EXIT\_OK

Termination continues.

#### CICS\_EXIT\_BAD\_ANCHOR

CICS detected an invalid anchor field. The EPI writes a CICS Transaction Gateway trace record, and then continues with termination.

#### CICS\_EXIT\_BAD\_STORAGE

CICS detected a storage error. The EPI writes a CICS Transaction Gateway trace record, and then continues with termination.

### user-defined

User-defined return codes must have a value not less than CICS\_EXIT\_USER\_BASE. The EPI writes a CICS Transaction Gateway trace record, and then continues with termination.

## CICS\_EpiAddTerminalExit

To allow the user to select a server, or override the one passed to CICS\_EpiAddTerminal or CICS\_EpiAddExTerminal in the **System** parameter.

Function name:	Parameters:
CICS_EpiAddTerminalExit	Anchor NameSpace System NetName DevType

### Purpose

### When called

On each invocation of CICS\_EpiAddTerminal or CICS\_EpiAddExTerminal, after the EPI has validated the parameters.

### Parameters

#### Anchor

Input parameter. The pointer storage set up by CICS\_EpiInitializeExit.

#### NameSpace

Input-output parameter. On input, its value depends on the value supplied for the **NameSpace** parameter of the CICS\_EpiAddTerminal or CICS\_EpiAddExTerminal call to which this exit relates:

- If a null pointer was supplied, this input is a pointer to a null string.
- If a non-null pointer was supplied, the **Namespace** input parameter points to a copy of this data.

On output, it will be used by the EPI in the same way as the value specified on the call would have been used.

#### System

Input-output parameter. On input, it is the value supplied for the **System** parameter of the CICS\_EpiAddTerminal or CICS\_EpiAddExTerminal call to which this exit relates. On output, it will be used by the EPI in the same way as the value specified on the call would have been used.

#### NetName

Input-output parameter. On input, it is the value supplied for the **NetName** parameter of the CICS\_EpiAddTerminal or CICS\_EpiAddExTerminal call to which this exit relates. On output, it will be used by the EPI in the same way as the value specified on the call would have been used.

#### DevType

Input-output parameter. On input, it is the value supplied for the **DevType** parameter of the CICS\_EpiAddTerminal or CICS\_EpiAddExTerminal call

to which this exit relates. On output, it will be used by the EPI in the same way as the value specified on the call would have been used.

## Return codes

### **CICS\_EXIT\_OK**

Processing continues with the output values of **NameSpace**, **System**, **NetName**, and **DevType**.

### **CICS\_EXIT\_DONT\_ADD\_TERMINAL**

The **CICS\_EpiAddTerminal** or **CICS\_EpiAddExTerminal** is ended with a return code of **CICS\_EPI\_ERR\_FAILED**.

### **CICS\_EXIT\_BAD\_ANCHOR**

CICS detected an invalid anchor field. The EPI writes a CICS Transaction Gateway trace record, and then continues as for **CICS\_EXIT\_OK**.

### **CICS\_EXIT\_BAD\_PARM**

CICS detected an invalid parameter. The EPI writes a CICS Transaction Gateway trace record, and then continues as for **CICS\_EXIT\_OK**.

### **user-defined**

User-defined return codes must have a value not less than **CICS\_EXIT\_USER\_BASE**. The EPI writes a CICS Transaction Gateway trace record, and then continues as for **CICS\_EXIT\_OK**.

## Notes

### **Note on selection of systems:**

If the calling application does not specify system name in its parameter list, then it is expecting that the system will be dynamically selected, and the exit can safely select the system.

If however the calling application specifies a system name, then it might not be expecting the target system to change and application errors could result. In this case the exit would generally not specify a replacement system, with the result that the specified or default system name, device type, etc. is to be used. If the exit chooses to change the selected system in this situation, then it can do so, but bear in mind the following.

- The exit routine must be sensitive to whether or not the modification of the target system will cause errors in the EPI application running on the client.
- The exit routine must maintain a knowledge base, keyed on appropriate data available to it, so the exit routine can determine whether this modification is acceptable to the client application.

### **CICS\_EpiAddTerminalExit and CICS\_EpiSystemIdExit:**

The relationship between these exits is as follows. The exits will get multiple chances to make a selection of the system. The first chance will always occur on the **CICS\_EpiAddTerminalExit**. This exit will only receive the parameters passed by the application to **CICS\_EpiAddTerminal** or **CICS\_EpiAddExTerminal**. If an error occurs when CICS tries to add the terminal (whether or not the exit has made a selection) then **CICS\_EpiSystemIdExit** will be called.

**CICS\_EpiSystemIdExit** will additionally be passed the error that occurred on the attempt to add the terminal, and will get a chance to correct the error. This continues to occur until either a terminal is successfully added, or until **CICS\_EpiSystemIdExit** signals to give up.

If no error occurs on the attempt to add the terminal, then **CICS\_EpiSystemIdExit** will not be called.

## CICS\_EpiTermIdExit

This exit enables the user to find out the terminal ID allocated to a new EPI terminal, after a successful EPI call to **CICS\_EpiAddTerminal**.

Function name:	Parameters:
CICS_EpiTermIdExit	Anchor TermIndex System

### Purpose

**CICS\_EpiTermIdExit** is provided for compatibility with older applications only. All new applications that use the EPI exits use **CICS\_EpiTermIdInfoExit** instead.

### When called

On each invocation of **CICS\_EpiAddTerminal**, after the server has allocated the terminal.

### Parameters

#### Anchor

Input parameter. The pointer set up by **CICS\_EpiInitializeExit**.

#### TermIndex

Input parameter. This is the terminal index for the terminal resource just reserved or installed.

#### System

Input parameter. A pointer to a null-terminated string that specifies the name of the server in which the terminal resource has been reserved or installed.

### Return codes

#### CICS\_EXIT\_OK

Processing continues.

#### CICS\_EXIT\_BAD\_ANCHOR

CICS detected an invalid anchor field. The EPI writes a CICS Transaction Gateway trace record, and then continues as for CICS\_EXIT\_OK.

#### CICS\_EXIT\_BAD\_PARM

CICS detected an invalid parameter. The EPI writes a CICS Transaction Gateway trace record, and then continues as for CICS\_EXIT\_OK.

#### user-defined

User-defined return codes must have a value not less than CICS\_EXIT\_USER\_BASE. The EPI writes a CICS Transaction Gateway trace record, and then continues as for CICS\_EXIT\_OK.

## CICS\_EpiTermIdInfoExit

This exit enables the user to retrieve information about the current EPI terminal.

<i>Function name:</i> CICS_EpiTermIdInfoExit	<b>Parameters:</b> Anchor Version TermIndex EpiDetails
---	--

## Purpose

## When called

Immediately after a CICS terminal has been installed

## Parameters

### Anchor

Input parameter. The pointer set up by **CICS\_EpiInitializeExit**.

### Version

Input parameter. The EPI version.

### TermIndex

Input parameter. The index of the terminal being installed.

### EpiDetails

Input parameter. A pointer to the **CICS\_EpiDetails\_t** structure, containing details about the terminal being installed.

## Return codes

### CICS\_EXIT\_OK

Processing continues.

### CICS\_EXIT\_BAD\_ANCHOR

CICS detected an invalid anchor field. The EPI writes a CICS Transaction Gateway trace record, and then continues as for CICS\_EXIT\_OK.

### CICS\_EXIT\_BAD\_PARM

CICS detected an invalid parameter. The EPI writes a CICS Transaction Gateway trace record, and then continues as for CICS\_EXIT\_OK.

### user-defined

User-defined return codes must have a value not less than CICS\_EXIT\_USER\_BASE. The EPI writes a CICS Transaction Gateway trace record, and then continues as for CICS\_EXIT\_OK.

## CICS\_EpiStartTranExtendedExit

This exit enables the user to see when an EPI transaction is started, and is used for information gathering purposes. This exit does not select a system, and does not return data.

<i>Function name:</i> CICS_EpiStartTranExtendedExit	<b>Parameters:</b> Anchor TermIndex TransId Data Size
--	--

## Purpose

## When called

On invocation of **CICS\_EpiStartTran**, after the EPI has validated the parameters.

## Parameters

### Anchor

Input parameter. The pointer set up by **CICS\_EpiInitializeExit**.

### TermIndex

Input parameter. The value supplied by the **TermIndex** parameter of the **CICS\_EpiReply** call to which this exit relates.

### TransId

Input parameter. The value supplied for the **TransId** parameter of the **CICS\_EpiStartTran** call to which this exit relates.

**Data** Input parameter. The value supplied for the **Data** parameter of the **CICS\_EpiStartTran** call to which this exit relates.

**Size** Input parameter. The value supplied for the **Size** parameter of the **CICS\_EpiStartTran** call to which this exit relates.

## Return codes

### CICS\_EXIT\_OK

Processing of the **CICS\_EpiStartTran** call continues.

### CICS\_EXIT\_BAD\_ANCHOR

CICS detected an invalid anchor field. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiStartTran** call continues.

### CICS\_EXIT\_BAD\_PARM

CICS detected an invalid parameter. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiStartTran** call continues.

### user-defined

User-defined return codes must have a value not less than **CICS\_EXIT\_USER\_BASE**. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiStartTran** call continues.

## CICS\_EpiStartTranExit

This exit enables the user to see when an EPI transaction is started, and is used for information gathering purposes. This exit does not select a system, and does not return data.

*Function name:*  
CICS\_EpiStartTranExit

**Parameters:**  
Anchor  
TransId  
Data  
Size

## Purpose

## When called

On invocation of **CICS\_EpiStartTran**, after the EPI has validated the parameters.

## Parameters

### Anchor

Input parameter. The pointer set up by **CICS\_EpiInitializeExit**.

### TransId

Input parameter. The value supplied for the **TransId** parameter of the **CICS\_EpiStartTran** call to which this exit relates.

### Data

Input parameter. The value supplied for the **Data** parameter of the **CICS\_EpiStartTran** call to which this exit relates.

### Size

Input parameter. The value supplied for the **Size** parameter of the **CICS\_EpiStartTran** call to which this exit relates.

## Return codes

### CICS\_EXIT\_OK

Processing of the **CICS\_EpiStartTran** call continues.

### CICS\_EXIT\_BAD\_ANCHOR

CICS detected an invalid anchor field. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiStartTran** call continues.

### CICS\_EXIT\_BAD\_PARM

CICS detected an invalid parameter. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiStartTran** call continues.

### user-defined

User-defined return codes must have a value not less than **CICS\_EXIT\_USER\_BASE**. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiStartTran** call continues.

## CICS\_EpiReplyExit

This exit enables the user to see when a reply is sent to an EPI transaction, and is used for information gathering purposes.

*Function name:*  
**CICS\_EpiReplyExit**

**Parameters:**  
Anchor  
TermIndex  
Data  
Size

## Purpose

## When called

On invocation of **CICS\_EpiReply**, after the EPI has validated the parameters.

## Parameters

### Anchor

Input parameter. The pointer set up by **CICS\_EpiInitializeExit**.

**TermIndex**

Input parameter. The value supplied for the **TermIndex** parameter of the **CICS\_EpiReply** call to which this exit relates.

**Data** Input parameter. The value supplied for the **Data** parameter of the **CICS\_EpiReply** call to which this exit relates.

**Size** Input parameter. The value supplied for the **Size** parameter of the **CICS\_EpiReply** call to which this exit relates.

**Return codes****CICS\_EXIT\_OK**

Processing of the **CICS\_EpiReply** call continues.

**CICS\_EXIT\_BAD\_ANCHOR**

CICS detected an invalid anchor field. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiReply** call continues.

**CICS\_EXIT\_BAD\_PARM**

CICS detected an invalid parameter. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiReply** call continues.

**user-defined**

User-defined return codes must have a value not less than **CICS\_EXIT\_USER\_BASE**. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiReply** call continues.

**CICS\_EpiDelTerminalExit**

This exit enables the user to clean up EPI terminal data structures.

*Function Name:*

CICS\_EpiDelTerminalExit

**Parameters:**

Anchor

TermIndex

**Purpose****When called**

On invocation of **CICS\_EpiDelTerminal** or **CICS\_EpiPurgeTerminal**, after the EPI has validated the parameters. To allow the user to clean up any terminal-related data structures.

**Parameters****Anchor**

Input parameter. The pointer set up by **CICS\_EpiInitializeExit**.

**TermIndex**

Input parameter. The value supplied for the **TermIndex** parameter of the **CICS\_EpiDelTerminal** or **CICS\_EpiPurgeTerminal** call to which this exit relates.

## Return codes

### CICS\_EXIT\_OK

Processing of the **CICS\_EpiDelTerminal** or **CICS\_EpiPurgeTerminal** call continues.

### CICS\_EXIT\_BAD\_ANCHOR

CICS detected an invalid anchor field. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiDelTerminal** or **CICS\_EpiPurgeTerminal** call continues.

### CICS\_EXIT\_BAD\_PARM

CICS detected an invalid parameter. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiDelTerminal** or **CICS\_EpiPurgeTerminal** call continues.

### user-defined

User-defined return codes must have a value not less than **CICS\_EXIT\_USER\_BASE**. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiDelTerminal** or **CICS\_EpiPurgeTerminal** call continues.

## CICS\_EpiGetEventExit

This exit enables the user to collect EPI event data.

### Function name:

CICS\_EpiGetEventExit

### Parameters:

Anchor

TermIndex

Wait

Event

## Purpose

### When called

Immediately before **CICS\_EpiGetEvent** returns to the caller. The exit can then examine the data returned, time the response from the system, etc.

### Parameters

#### Anchor

Input parameter. The pointer set up by **CICS\_EpiInitializeExit**.

#### TermIndex

Input parameter. The value to be returned to the application in the **TermIndex** parameter of the **CICS\_EpiGetEvent** call to which this exit relates.

#### Wait

Input parameter. The value supplied for the **Wait** parameter of the **CICS\_EpiGetEvent** call to which this exit relates.

#### Event

Input parameter. The value to be returned to the application in the **Event** parameter of the **CICS\_EpiGetEvent** call to which this exit relates.

## Return codes

### CICS\_EXIT\_OK

Processing of the **CICS\_EpiGetEvent** call continues.

### **CICS\_EXIT\_BAD\_ANCHOR**

CICS detected an invalid anchor field. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiGetEvent** call continues.

### **CICS\_EXIT\_BAD\_PARM**

CICS detected an invalid parameter. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiGetEvent** call continues.

### **user-defined**

User-defined return codes must have a value not less than **CICS\_EXIT\_USER\_BASE**. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiGetEvent** call continues.

## **CICS\_EpiSystemIdExit**

This exit enables the user to supply a new EPI system ID, if the value supplied by **CICS\_Epi\_AddTerminal** or **CICS\_EpiAddExTerminal** is not valid.

*Function name:*  
**CICS\_EpiSystemIdExit**

*Parameters:*  
Anchor  
NameSpace  
System  
NetName  
DevType  
FailedSystem  
Reason  
SubReason  
UserId  
PassWord

### **Purpose**

### **When called**

Immediately before **CICS\_EpiAddTerminal** or **CICS\_EpiAddExTerminal** returns to the application when an error occurred while trying to add the terminal. The error can be **CICS\_EPI\_ERR\_SYSTEM**, **CICS\_EPI\_ERR\_FAILED**, or **CICS\_EPI\_ERR\_SERVER\_DOWN**. It occurs whether or not **CICS\_EpiAddTerminalExit** or **CICS\_EpiAddExTerminal** has been called previously.

**Note:** On some systems the completion of **CICS\_EpiAddTerminal** or **CICS\_EpiAddExTerminal** is returned to the application asynchronously, and in this case this exit will be called asynchronously.

### **Parameters**

#### **Anchor**

Input parameter. The pointer set up by **CICS\_EpiInitializeExit**.

#### **NameSpace**

Input-output parameter. The **NameSpace** parameter used in the failed **CICS\_EpiAddTerminal** or **CICS\_EpiAddExTerminal**.

#### **System**

Input-output parameter. The **System** parameter used in the failed **CICS\_EpiAddTerminal** or **CICS\_EpiAddExTerminal**.

**NetName**

Input-output parameter. The **NetName** parameter used in the failed **CICS\_EpiAddTerminal** or **CICS\_EpiAddExTerminal**.

**DevType**

Input-output parameter. The **DevType** parameter used in the failed **CICS\_EpiAddTerminal** or **CICS\_EpiAddExTerminal**.

**FailedSystem**

Input parameter. The identifier of the system on which the failure occurred.

**Reason**

Input parameter. The reason for the failure: **CICS\_EPI\_ERR\_SYSTEM** or **CICS\_EPI\_ERR\_FAILED**.

**SubReason**

Input parameter. More about the failure.

**UserId**

Output parameter. Not used.

**PassWord**

Output parameter. Not used.

**Return codes****CICS\_EXIT\_OK**

The EPI will retry the **CICS\_EpiAddTerminal** or **CICS\_EpiAddExTerminal** call using the values specified as output of this exit. Note that in this case the considerations described in “CICS\_EpiAddTerminalExit” on page 183 apply.

**CICS\_EXIT\_DONT\_ADD\_TERMINAL**

The **CICS\_EpiAddTerminal** or **CICS\_EpiAddExTerminal** is ended with a return code of **CICS\_EPI\_ERR\_FAILED**.

**CICS\_EXIT\_BAD\_ANCHOR**

CICS detected an invalid anchor field. The EPI writes a CICS Transaction Gateway trace record, and then the error that caused the exit to be called is returned to the application.

**CICS\_EXIT\_BAD\_PARM**

CICS detected an invalid parameter. The EPI writes a CICS Transaction Gateway trace record, and then the error that caused the exit to be called is returned to the application.

**user-defined**

User-defined return codes must have a value not less than **CICS\_EXIT\_USER\_BASE**. The EPI writes a CICS Transaction Gateway trace record, and then the error that caused the exit to be called is returned to the application.

**CICS\_EpiTranFailedExit**

This exit enables the user to collect data if an EIP transaction ends abnormally or if an EPI terminal fails.

*Function Name:*  
**CICS\_EpiTranFailedExit**

**Parameters:** Anchor  
TermIndex  
Wait  
Event

## When called

Immediately before **CICS\_EpiGetEvent** returns to the caller, with or without **GetEventExit**, when the event is **CICS\_EPI\_EVENT\_END\_TRAN**, and the **AbendCode** field is not blank.

Note that there are some failures on remote systems that can occur and will simply cause the presentation of a 3270 data stream with an error message and no abend code in the **CICS\_EPI\_EVENT\_END\_TRAN**. This error message might not even occur on the same event as the **CICS\_EPI\_EVENT\_END\_TRAN**. If the exit requires to handle this situation, it can monitor it through **CICS\_EpiGetEventExit** and scan the appropriate 3270 data streams.

## Parameters

### Anchor

Input parameter. The pointer set up by **CICS\_EpiInitializeExit**.

### TermIndex

Input parameter. The value to be returned to the application in the **TermIndex** parameter of the **CICS\_EpiGetEvent** call to which this exit relates.

**Wait** Input parameter. The value supplied for the **Wait** parameter of the **CICS\_EpiGetEvent** call to which this exit relates.

**Event** Input parameter. The value to be returned to the application in the **Event** parameter of the **CICS\_EpiGetEvent** call to which this exit relates.

## Return codes

### **CICS\_EXIT\_OK**

Processing of the **CICS\_EpiGetEvent** call continues.

### **CICS\_EXIT\_BAD\_ANCHOR**

CICS detected an invalid anchor field. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiGetEvent** call continues.

### **CICS\_EXIT\_BAD\_PARM**

CICS detected an invalid parameter. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiGetEvent** call continues.

### user-defined

User-defined return codes must have a value not less than **CICS\_EXIT\_USER\_BASE**. The EPI writes a CICS Transaction Gateway trace record, and then processing of the **CICS\_EpiGetEvent** call continues.

---

## Chapter 5. Code pages

This table provides the following information about each code page: canonical name, description and CCSID.

A canonical name is converted to the corresponding CCSID so that a CICS server can determine the code page location for a data stream. The CICS server must support EPI Version 2 for the encodings to be implemented. To find out which CCSIDs your CICS server supports check your CICS Server documentation.

Canonical name	Description	CCSID
Cp1252	Windows Latin-1	5348
ISO8859_1	ISO 8859-1, Latin alphabet No. 1	819

## Related literature

Other documentation relating to CICS Transaction Gateway.

IBM Redbooks® titles are available on a wide range of subjects relevant to CICS Transaction Gateway programming, installation, operation and troubleshooting. See the: IBM Redbooks site for more information.

Documentation for many IBM products is available online from the IBM Publications Center.

---

## Accessibility

Accessibility features help users with a physical disability, for example restricted mobility or limited vision, to use information technology products successfully. CICS Transaction gateway is compatible with the JAWS screen reader. CICS Transaction Gateway provides accessibility by enabling keyboard-only operation.

For more information about the IBM commitment to accessibility, visit the IBM Accessibility Center.

---

## Starting the Gateway daemon

You can start the Gateway daemon from a command prompt using a screen reader.

In some Telnet sessions, the screen reader might reread CICS Transaction Gateway log output or the command prompt after the CICS Transaction Gateway has started. This behavior is expected, and does not mean that the CICS Transaction Gateway has failed to start.

To determine if the CICS Transaction Gateway started correctly, check for the message:

```
'CTG6512I CICS Transaction Gateway initialization complete'.
```

If the CICS Transaction Gateway did not start successfully, this message is produced:

```
'CTG6513E CICS Transaction Gateway failed to initialize'.
```

---

## Setting EPITerminal properties programmatically

The EPITerminal terminal properties sheet is not accessible.

To set properties programmatically, use the `getTerminal()` method of the `EPITerminal` object and cast it to a `Terminal` object. For example, if `epiTerm` is an `EPITerminal` object, code something like the following:

```
Terminal term = (Terminal)epiTerm.getTerminal();
```

You can then use methods on the `Terminal` object to set these properties. To set the name for a CICS server named `YOURSERV`, code the following:

```
term.setServerName("YOURSERV");
```

See the Javadoc supplied with the product for full details of these setter methods.

---

## Glossary

This glossary defines the terms and abbreviations used in CICS Transaction Gateway and in the information centers.

### A

#### **abnormal end of task (abend)**

The termination of a task, job, or subsystem because of an error condition that recovery facilities cannot resolve.

#### **Advanced program-to-program communication (APPC)**

An implementation of the SNA/SDLC LU 6.2 protocol that allows interconnected systems to communicate and share the processing of programs. The Client daemon uses APPC to communicate with CICS systems.

**APAR** See *Authorized program analysis report*.

**API** See *application programming interface*.

**APPC** See *Advanced program-to-program communication*.

#### **application programming interface (API)**

A functional interface that allows an application program that is written in a high-level language to use specific data or functions of the operating system or another program.

#### **APPLID**

1. On CICS Transaction Gateway: The application identifier that is used to identify connections on the CICS server and tasks in a CICSplex. See also *APPLID qualifier* and *fully-qualified APPLID*.
2. On CICS Transaction Server: The name by which a CICS system is known in a network of interconnected CICS systems. CICS Transaction Gateway application identifiers do not need to be defined in SYS1.VTAMLST. The CICS APPLID is specified in the APPLID system initialization parameter.

#### **APPLID qualifier**

Optionally used as a high-level qualifier for the APPLID to form a fully-qualified APPLID. See also *APPLID* and *fully-qualified APPLID*.

**ARM** See *automatic restart manager*.

#### **Authorized program analysis report (APAR)**

A request for correction of a defect in a current release of an IBM-supplied program.

**ATI** See *automatic transaction initiation*.

**attach** In SNA, the request unit that flows on a session to initiate a conversation.

#### **Attach Manager**

The component of APPC that matches attaches received from remote computers to accepts issued by local programs.

#### **autoinstall**

A method of creating and installing resources dynamically as terminals log on, and deleting them at logoff.

**automatic restart manager (ARM)**

A z/OS recovery function that can improve the availability of specific batch jobs or started tasks, and therefore result in faster resumption of productive work.

**automatic transaction initiation (ATI)**

The initiation of a CICS transaction by an internally generated request, for example, the issue of an EXEC CICS START command or the reaching of a transient data trigger level. CICS resource definition can associate a trigger level and a transaction with a transient data destination. When the number of records written to the destination reaches the trigger level, the specified transaction is automatically initiated.

**B**

**bean** A definition or instance of a JavaBeans component. See also *JavaBeans*.

**bean-managed transaction**

A transaction where the JEE bean itself is responsible for administering transaction tasks such as committal or rollback. See also *container-managed transaction*.

**BIND command**

In SNA, a request to activate a session between two logical units (LUs).

**business logic**

The part of a distributed application that is concerned with the application logic rather than the user interface of the application. Compare with *presentation logic*.

**C**

**CA** See *certificate authority*.

**CCIN** The CCIN transaction is invoked by the Client daemon, for each TCP/IP or SNA connection established. CCIN installs a Client connection on the CICS server.

**CCSID**

Coded Character Set Identifier. A 16-bit number that includes a specific set of encoding scheme identifiers, character set identifiers, code page identifiers, and other information that uniquely identifies the coded graphic-character representation.

**CTIN** The CTIN transaction is invoked by the Client daemon to install a Client terminal definition on the CICS server.

**callback**

A way for one thread to notify another application thread that an event has happened.

**certificate authority (CA)**

In computer security, an organization that issues certificates. The certificate authority authenticates the certificate owner's identity and the services that the owner is authorized to use. It issues new certificates and revokes certificates from users who are no longer authorized to use them.

**change-number-of-sessions (CNOS)**

An internal transaction program that regulates the number of parallel sessions between the partner LUs with specific characteristics.

**channel**

A channel is a set of containers, grouped together to pass data to CICS. There is no limit to the number of containers that can be added to a channel, and the size of individual containers is limited only by the amount of storage that you have available.

**CICS connectivity components**

A generic reference to the Client daemon, EXCI, and the IPIC protocol.

**CICS connectivity components**

The Client daemon, the EXCI (External CICS Interface), and the IPIC (IP Interconnectivity) protocol are collectively called the 'CICS connectivity components'. The Client daemon handles the TCP/IP and the SNA protocols.

**CICS Request Exit**

An exit that is invoked by the CICS Transaction Gateway for z/OS at run time to determine which CICS server to use.

**CICS server name**

A defined server known to CICS Transaction Gateway.

**CICS TS**

Abbreviation of CICS Transaction Server.

**class**

In object-oriented programming, a model or template that can be instantiated to create objects with a common definition and therefore, common properties, operations, and behavior. An object is an instance of a class.

**CLASSPATH**

In the execution environment, an environment variable keyword that specifies the directories in which to look for class and resource files.

**Client API**

The Client API is the interface used by Client applications to interact with CICS using the Client daemon. See External Call Interface, External Presentation Interface, and External Security Interface.

**Client application**

The client application is a user application written in a supported programming language that uses one or more of the CICS Transaction Gateways APIs.

**Client daemon**

The Client daemon manages TCP/IP and SNA connections to CICS servers on UNIX, Linux, and Windows. It processes ECI, EPI, and ESI requests, sending and receiving the appropriate flows to and from the CICS server to satisfy Client application requests. It can support concurrent requests to one or more CICS servers. The CICS Transaction Gateway initialization file defines the operation of the Client daemon and the servers and protocols used for communication.

**client/server**

Pertaining to the model of interaction in distributed data processing in which a program on one computer sends a request to a program on another computer and awaits a response. The requesting program is called a client; the answering program is called a server.

**CNOS** See *Change-Number-of-Sessions*.

**code page**

An assignment of hexadecimal identifiers (code points) to graphic characters. Within a given code page, a code point can have only one meaning.

**color mapping file**

A file that is used to customize the 3270 screen color attributes on client workstations.

**COMMAREA**

See *communication area*.

**commit phase**

The second phase in a XA process. If all participants acknowledge that they are prepared to commit, the transaction manager issues the commit request. If any participant is not prepared to commit the transaction manager issues a back-out request to all participants.

**communication area (COMMAREA)**

A communication area that is used for passing data both between programs within a transaction and between transactions.

**Configuration file**

A file that specifies the characteristics of a program, system device, server or network.

**connection**

In data communication, an association established between functional units for conveying information.

In Open Systems Interconnection architecture, an association established by a given layer between two or more entities of the next higher layer for the purpose of data transfer.

In TCP/IP, the path between two protocol application that provides reliable data stream delivery service.

In Internet, a connection extends from a TCP application on one system to a TCP application on another system.

**container**

A container is a named block of data designed for passing information between programs. A container is a "named COMMAREA" that is not limited to 32KB. Containers are grouped together in sets called channels.

**container-managed transaction**

A transaction where the EJB container is responsible for administration of tasks such as committal or rollback. See also *bean-managed transaction*.

**control table**

In CICS, a storage area used to describe or define the configuration or operation of the system.

**conversation**

A connection between two programs over a session that allows them to communicate with each other while processing a transaction.

**conversation security**

In APPC, a process that allows validation of a user ID or group ID and password before establishing a connection.

**D**

**daemon**

A program that runs unattended to perform continuous or periodic systemwide functions, such as network control. A daemon can be launched automatically, such as when the operating system is started, or manually.

**data link control (DLC)**

A set of rules used by nodes on a data link (such as an SDLC link or a token ring) to accomplish an orderly exchange of information.

**DBCS** See *double-byte character set*.

**default CICS server**

The CICS server that is used if a server name is not specified on an ECI, EPI, or ESI request. The default CICS server name is defined as a product wide setting in the configuration file (ctg.ini).

**dependent logical unit**

A logical unit that requires assistance from a system services control point (SSCP) to instantiate an LU-to-LU session.

**deprecated**

Pertaining to an entity, such as a programming element or feature, that is supported but no longer recommended, and that might become obsolete.

**digital certificate**

An electronic document used to identify an individual, server, company, or some other entity, and to associate a public key with the entity. A digital certificate is issued by a certificate authority and is digitally signed by that authority.

**digital signature**

Information that is encrypted with an entity's private key and is appended to a message to assure the recipient of the authenticity and integrity of the message. The digital signature proves that the message was signed by the entity that owns, or has access to, the private key or shared secret symmetric key.

**distinguished name**

The name that uniquely identifies an entry in a directory. A distinguished name is made up of attribute:value pairs, separated by commas. The format of a distinguished name is defined by RFC4514. For more information, see <http://www.ietf.org/rfc/rfc4514.txt>. See also *realm name* and *identity propagation*.

**distributed application**

An application for which the component application programs are distributed between two or more interconnected processors.

**distributed identity**

User identity information that originates from a remote system. The distributed identity is created in one system and is passed to one or more other systems over a network. See also *distinguished name* and *realm name*.

**distributed processing**

The processing of different parts of the same application in different systems, on one or more processors.

**distributed program link (DPL)**

A link that enables an application program running on one CICS system to link to another application program running in another CICS system.

**DLC** See *data link control*.

**DLL** See *dynamic link library*.

**domain**

In the Internet, a part of a naming hierarchy in which the domain name consists of a sequence of names (labels) separated by periods (dots).

**domain name**

In TCP/IP, a name of a host system in a network.

**domain name server**

In TCP/IP, a server program that supplies name-to-address translation by mapping domain names to IP addresses. Synonymous with name server.

**dotted decimal notation**

The syntactical representation for a 32-bit integer that consists of four 8-bit numbers written in base 10 with periods (dots) separating them. It is used to represent IP addresses.

**double-byte character set (DBCS)**

A set of characters in which each character is represented by 2 bytes. Languages such as Japanese, Chinese and Korean, which contain more symbols than can be represented by 256 code points, require double-byte character sets. Because each character requires 2 bytes, the typing, display, and printing of DBCS characters requires hardware and programs that support DBCS. Contrast with *single-byte character set*.

**DPL** See *distributed program link*.

**dynamic link library (DLL)**

A collection of runtime routines made available to applications as required.

**dynamic server selection (DSS)**

The mapping of a logical CICS server name to an actual CICS server name at run time.

**E**

**EBCDIC**

See *extended binary-coded decimal interchange code*.

**ECI** See *external call interface*.

**EJB** See *Enterprise JavaBeans*.

**emulation program**

A program that allows a host system to communicate with a workstation in the same way as it would with the emulated terminal.

**emulator**

A program that causes a computer to act as a workstation attached to another system.

**encryption**

The process of transforming data into an unintelligible form in such a way that the original data can be obtained only by using a decryption process.

**enterprise bean**

A Java component that can be combined with other resources to create JEE applications. There are three types of enterprise beans: entity beans, session beans, and message-driven beans.

**Enterprise Information System (EIS)**

The applications that comprise an enterprise's existing system for handling

company-wide information. An enterprise information system offers a well-defined set of services that are exposed as local or remote interfaces or both.

**Enterprise JavaBeans (EJB)**

A component architecture defined by Sun Microsystems for the development and deployment of object-oriented, distributed, enterprise-level applications (JEE).

**environment variable**

A variable that specifies the operating environment for a process. For example, environment variables can describe the home directory, the command search path, the terminal in use, and the current time zone.

**EPI** See *external presentation interface*.

**ESI** See *external security interface*.

**Ethernet**

A local area network that allows multiple stations to access the transmission medium at will without prior coordination, avoids contention by using carrier sense and deference, and resolves contention by using collision detection and transmission. Ethernet uses carrier sense multiple access with collision detection (CSMA/CD).

**EXCI** See *external CICS interface*.

**extended binary-coded decimal interchange code (EBCDIC)**

A coded character set of 256 8-bit characters developed for the representation of textual data.

**extended logical unit of work (extended LUW)**

A logical unit of work that is extended across successive ECI requests to the same CICS server.

**external call interface (ECI)**

A facility that allows a non CICS program to run a CICS program. Data is exchanged in a COMMAREA or a channel as for usual CICS interprogram communication.

**external communications interface (EXCI)**

An MVS™ application programming interface provided by CICS Transaction Server for z/OS that enables a non-CICS program to call a CICS program and to pass and receive data using a COMMAREA. The CICS application program is started as if linked-to by another CICS application program.

**external presentation interface (EPI)**

A facility that allows a non CICS program to appear to CICS as one or more standard 3270 terminals. 3270 data can be presented to the user by emulating a 3270 terminal or by using a graphical user interface.

**external security interface (ESI)**

A facility that enables client applications to verify and change passwords for user IDs on CICS servers.

**External Security Manager (ESM)**

A security manager that operates outside CICS. For example, RACF® can be used as an external security manager with CICS Transaction Server.

**F**

**firewall**

A configuration of software that prevents unauthorized traffic between a trusted network and an untrusted network.

**FMH** See *function management header*.

**fully-qualified APPLID**

Used to identify CICS Transaction Gateway connections on the CICS server and tasks in a CICSplex. It is composed of an APPLID with an optional network qualifier. See also *APPLID* and *APPLID qualifier*.

**function management header (FMH)**

One or more headers, optionally present in the leading request units (RUs) of an RU chain, that allow one LU to (a) select a transaction program or device at the session partner and control the way in which the end-user data it sends is handled at the destination, (b) change the destination or the characteristics of the data during the session, and (c) transmit between session partners status or user information about the destination (for example, a program or device). Function management headers can be used with LU type 1, 4, and 6.2 protocols.

**G****Gateway**

A device or program used to connect two systems or networks.

**Gateway classes**

The Gateway classes provide APIs for ECI, EPI, and ESI that allow communication between Java client applications and the Gateway daemon.

**Gateway daemon**

A long-running Java process that listens for network requests from remote Client applications. It issues these requests to CICS servers using the CICS connectivity components. The Gateway daemon on z/OS processes ECI requests and on UNIX, Windows, and Linux platforms it process EPI and ESI requests as well. The Gateway daemon uses the GATEWAY section of ctg.ini for its configuration.

**Gateway group**

A set of Gateway daemons that share an APPLID qualifier, and where each Gateway daemon has a unique APPLID within the Gateway group.

**Gateway token**

A token that represents a specific Gateway daemon, when a connection is established successfully. Gateway tokens are used in the C language statistics and ECI V2 APIs.

**global transaction**

A recoverable unit of work performed by one or more resource managers in a distributed transaction processing environment and coordinated by an external transaction manager.

**H****HA group**

See *highly available Gateway group*.

**highly available Gateway group (HA group)**

A Gateway group that utilizes TCP/IP load balancing, and can be viewed

as a single logical Gateway daemon. A Gateway daemon instance in a HA group can recover indoubt XA transactions on behalf of another Gateway daemon within the HA group

**host** A computer that is connected to a network (such as the Internet or an SNA network) and provides an access point to that network. The host can be any system; it does not have to be a mainframe.

**host address**

An IP address that is used to identify a host on a network.

**host ID**

In TCP/IP, that part of the IP address that defines the host on the network. The length of the host ID depends on the type of network or network class (A, B, or C).

**host name**

In the Internet suite of protocols, the name given to a computer. Sometimes, host name is used to mean the fully qualified domain name; other times, it is used to mean the most specific subname of a fully qualified domain name. For example, if mycomputer.city.company.com is the fully qualified domain name, either of the following can be considered the host name: mycomputer.city.company.com, mycomputer.

**hover help**

Information that can be viewed by holding a mouse over an item such as an icon in the user interface.

**HTTP** See *Hypertext Transfer Protocol*.

**HTTPS**

See *Hypertext Transfer Protocol Secure*.

**Hypertext Transfer Protocol (HTTP)**

In the Internet suite of protocols, the protocol that is used to transfer and display hypertext and XML documents.

**Hypertext Transfer Protocol Secure (HTTPS)**

A TCP/IP protocol that is used by World Wide Web servers and Web browsers to transfer and display hypermedia documents securely across the Internet.

**I**

**ID data**

An ID data structure holds an individual result from a statistical API function.

**identity propagation**

The concept of preserving a user's security identity information (the distributed identity) independent of where the identity information has been created, for use during authorization and for auditing purposes. The distributed identity is carried with a request from the distributed client application to the CICS server, and is incorporated in the access control of the server as part of the authorization process, for example, using RACF. CICS Transaction Gateway flows the distributed identity to CICS. See also *distributed identity*.

**identity propagation login module**

A code component that provides support for identity propagation. The identity propagation login module is included with the CICS Transaction

Gateway ECI resource adapter (cicseci.rar), conforms to the JAAS specification and is contained in a single Java class within the resource adapter. See also *identity propagation*.

**iKeyman**

A tool for maintaining digital certificates for JSSE.

**in doubt**

The state of a transaction that has completed the prepare phase of the two-phase commit process and is waiting to be completed.

**in flight**

The state of a transaction that has not yet completed the prepare phase of the two-phase commit process.

**independent logical unit**

A logical unit (LU) that can both send and receive a BIND, and which supports single, parallel, and multiple sessions. See *BIND*.

**<install\_path>**

This term is used in file paths to represent the directory where you installed the product. For more information, see File path terminology.

**Internet Architecture Board**

The technical body that oversees the development of the internet suite of protocols known as TCP/IP.

**Internet Protocol (IP)**

In TCP/IP, a protocol that routes data from its source to its destination in an Internet environment.

**interoperability**

The capability to communicate, run programs, or transfer data among various functional units in a way that requires the user to have little or no knowledge of the unique characteristics of those units.

**IP** Internet Protocol.

**IPIC** See *IP interconnectivity*.

**IP address**

A unique address for a device or logical unit on a network that uses the IP standard.

**IP interconnectivity (IPIC)**

The IPIC protocol enables Distributed Program Link (DPL) access from a non-CICS program to a CICS program over TCP/IP, using the External Call Interface (ECI). IPIC passes and receives data using COMMAREAs, or containers.

**J**

**JEE (formerly J2EE)**

See *Java 2 Platform Enterprise Edition*

**JEE Connector architecture (JCA)**

A standard architecture for connecting the JEE platform to heterogeneous enterprise information systems (EIS).

**Java** An object-oriented programming language for portable interpretive code that supports interaction among remote objects.

**Java 2 Platform Enterprise Edition (JEE)**

An environment for developing and deploying enterprise applications,

defined by Sun Microsystems Inc. The JEE platform consists of a set of services, application programming interfaces (APIs), and protocols that allow multi-tiered, Web-based applications to be developed.

**JavaBeans**

As defined for Java by Sun Microsystems, a portable, platform-independent, reusable component model.

**Java Client application**

The Java client application is a user application written in Java, including servlets and enterprise beans, that uses the Gateway classes.

**Java Development Kit (JDK)**

The name of the software development kit that Sun Microsystems provided for the Java platform, up to and including v 1.1.x. Sometimes used erroneously to mean the Java platform or as a generic term for any software developer kits for Java.

**JavaGateway**

The URL of the CICS Transaction Gateway with which the Java Client application communicates. The JavaGateway takes the form `protocol://address:port`. These protocols are supported: `tcp://`, `ssl://`, and `local:`. CICS Transaction Gateway runs with the default port value of 2006. This parameter is not relevant if you are using the protocol `local:`. For example, you might specify a JavaGateway of `tcp://ctg.business.com:2006`. If you specify the protocol as `local:` you will connect directly to the CICS server, bypassing any CICS Transaction Gateway servers.

**Java Native Interface (JNI)**

A programming interface that allows Java code running in a Java virtual machine to work with functions that are written in other programming languages.

**Java Runtime Environment (JRE)**

A subset of the Java Software Development Kit (SDK) that supports the execution, but not the development, of Java applications. The JRE comprises the Java Virtual Machine (JVM), the core classes, and supporting files.

**Java Secure Socket Extension (JSSE)**

A Java package that enables secure Internet communications. It implements a Java version of the Secure Sockets Layer (SSL) and Transport Layer Security (TLS) protocols and supports data encryption, server authentication, message integrity, and optionally client authentication.

**Java virtual machine (JVM)**

A software implementation of a processor that runs compiled Java code (applets and applications).

**JDK** See *Java development kit*.

**JCA** See *JEE Connector Architecture*.

**JNI** See *Java Native Interface*.

**JRE** See *Java Runtime Environment*.

**JSSE** See *Java Secure Socket Extension*.

**JVM** See *Java Virtual Machine*.

**K**

**keyboard mapping**

A list that establishes a correspondence between keys on the keyboard and characters displayed on a display screen, or action taken by a program, when that key is pressed.

**Keystore**

In the JSSE protocol, a file that contains public keys, private keys, trusted roots, and certificates.

**L****local mode**

Local mode describes the use of the CICS Transaction Gateway *local* protocol. The Gateway daemon is not used in local mode.

**local transaction**

A recoverable unit of work managed by a resource manager and not coordinated by an external transaction manager.

**logical CICS server**

An alias that can be passed on an ECI request when running in remote mode to CICS Transaction Gateway for z/OS. The alias name is mapped to an actual CICS server name by a dynamic server selection (DSS) mechanism.

**logical end of day**

The local time of day on the 24-hour clock to which a Gateway daemon aligns statistics intervals. If the statistics interval is 24 hours, this is the local time at which interval statistics will be reset and, on z/OS, optionally recorded to SMF. This time is set using the **stateod** parameter in the configuration file (ctg.ini).

**logical unit (LU)**

In SNA, a port through which an end user accesses the SNA network to communicate with another end user and through which the end user accesses the functions provided by system services control points (SSCP). An LU can support at least two sessions, one with an SSCP and one with another LU, and might be capable of supporting many sessions with other logical units. See also *network addressable unit*, *primary logical unit*, *secondary logical unit*.

**logical unit 6.2 (LU 6.2)**

A type of logical unit that supports general communications between programs in a distributed processing environment.

The LU type that supports sessions between two applications using APPC.

**logical unit of work (LUW)**

The processing that a program performs between synchronization points

**LU** See *logical unit*.

**LU 6.2** See *logical unit 6.2*.

**LU-LU session**

In SNA, a session between two logical units (LUs) in an SNA network. It provides communication between two end users, or between an end user and an LU services component.

**LU-LU session type 6.2**

In SNA, a type of session for communication between peer systems. Synonymous with APPC protocol.

**LUW** See *logical unit of work*.

## **M**

### **managed mode**

Describes an environment in which connections are obtained from connection factories that the JEE server has set up. Such connections are owned by the JEE server.

### **media access control (MAC) sublayer**

One of two sublayers of the ISO Open Systems Interconnection data link layer proposed for local area networks by the IEEE Project 802 Committee on Local Area Networks and the European Computer Manufacturers Association (ECMA). It provides functions that depend on the topology of the network and uses services of the physical layer to provide services to the logical link control (LLC) sublayer. The OSI data link layer corresponds to the SNA data link control layer.

### **method**

In object-oriented programming, an operation that an object can perform. An object can have many methods.

**mode** In SNA, a set of parameters that defines the characteristics of a session between two LUs.

## **N**

### **name server**

In TCP/IP, synonym for Domain Name Server. In Internet communications, a host that translates symbolic names assigned to networks and hosts into IP addresses.

**NAU** See *network addressable unit*.

### **network address**

In SNA, an address, consisting of subarea and element fields, that identifies a link, link station, or network addressable unit (NAU). Subarea nodes use network addresses; peripheral nodes use local addresses. The boundary function in the subarea node to which a peripheral node is attached transforms local addresses to network addresses and vice versa. See also *network name*.

### **network addressable unit (NAU)**

In SNA, a logical unit, a physical unit, or a system services control point. The NAU is the origin or the destination of information transmitted by the path control network. See also *logical unit*, *network address*, *network name*.

### **network name**

In SNA, the symbolic identifier by which end users refer to a network addressable unit (NAU), link station, or link. See also *network address*.

### **node type**

In SNA, a designation of a node according to the protocols it supports and the network addressable units (NAUs) it can contain. Four types are defined: 1, 2, 4, and 5. Type 1 and type 2 nodes are peripheral nodes; type 4 and type 5 nodes are subarea nodes.

### **nonextended logical unit of work**

See *SYNCONRETURN*.

### **nonmanaged mode**

An environment in which the application is responsible for generating and

configuring connection factories. The JEE server does not own or know about these connection factories and therefore provides no Quality of Service facilities.

## O

**object** In object-oriented programming, a concrete realization of a class that consists of data and the operations associated with that data.

### **object-oriented (OO)**

Describing a computer system or programming language that supports objects.

### **one-phase commit**

A protocol with a single commit phase, that is used for the coordination of changes to recoverable resources when a single resource manager is involved.

**OO** See *object-oriented*.

## P

### **pacing**

A technique by which a receiving station controls the rate of transmission of a sending station to prevent overrun.

### **parallel session**

In SNA, two or more concurrently active sessions between the same two LUs using different pairs of network addresses. Each session can have independent session parameters.

**PING** In Internet communications, a program used in TCP/IP networks to test the ability to reach destinations by sending the destinations an Internet Control Message Protocol (ICMP) echo request and waiting for a reply.

### **partner logical unit (PLU)**

In SNA, the remote participant in a session.

### **partner transaction program**

The transaction program engaged in an APPC conversation with a local transaction program.

### **password phrase**

A character string, between 9 and 100 characters in length, that is used for authentication when a user signs on to CICS. Because a password phrase can provide an exponentially greater number of possible combinations of characters than a standard 8 character password, the use of password phrases can enhance system security. Password phrases are verified by the External Security Manager (ESM), and can contain alphanumeric characters, and any of the other non alphanumeric characters that are supported by the ESM. See also *External Security Manager (ESM)*.

**PLU** See *primary logical unit* and *partner logical unit*.

**port** An endpoint for communication between devices, generally referring to a logical connection. A 16-bit number identifying a particular Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) resource within a given TCP/IP node.

### **port sharing**

A way of load balancing TCP/IP connections across a group of servers running in the same z/OS image.

**prepare phase**

The first phase of a XA process in which all participants are requested to confirm readiness to commit.

**presentation logic**

The part of a distributed application that is concerned with the user interface of the application. Compare with *business logic*.

**primary logical unit (PLU)**

In SNA, the logical unit that contains the primary half-session for a particular logical unit-to-logical unit (LU-to-LU) session. See also *secondary logical unit*.

**<product\_data\_path>**

This term represents the directory used by the Windows CICS Transaction Gateway for common application data. For more information, see File path terminology.

**protocol boundary**

The signals and rules governing interactions between two components within a node.

**Q****Query strings**

Query strings are used in the statistical data API. A query string is an input parameter, specifying the statistical data to be retrieved.

**R**

**RACF** See *Resource Access Control Facility*.

**realm** A named collection of users and groups that can be used in a specific security context. See also *distinguished name* and *identity propagation*.

**Recoverable resource management services (RRMS)**

The registration services, context services, and resource recovery services provided by the z/OS sync point manager that enable consistent changes to be made to multiple protected resources.

**Resource Access Control Facility (RACF)**

An IBM licensed program that provides access control by identifying users to the system; verifying users of the system; authorizing access to protected resources; logging detected unauthorized attempts to enter the system; and logging detected accesses to protected resources.

**region** In workload management on CICS Transaction Gateway for Windows, an instance of a CICS server.

**remote mode**

Remote mode describes the use of one of the supported CICS Transaction Gateway network protocols to connect to the Gateway daemon.

**remote procedure call (RPC)**

A protocol that allows a program on a client computer to run a program on a server.

**Request monitoring exits**

Exits that provide information about individual requests as they are processed by the CICS Transaction Gateway.

**request unit (RU)**

In SNA, a message unit that contains control information such as a request code, or function management (FM) headers, end-user data, or both.

**request/response unit**

A generic term for a request unit or a response unit. See also *request unit* and *response unit*.

**response file**

A file that contains predefined values that is used instead of someone having to enter those values one at a time. See also *CID methodology*.

**response unit (RU)**

A message unit that acknowledges a request unit; it can contain prefix information received in a request unit.

**Resource adapter**

A system-level software driver that is used by an EJB container or an application client to connect to an enterprise information system (EIS). A resource adapter plugs in to a container; the application components deployed on the container then use the client API (exposed by adapter) or tool-generated, high-level abstractions to access the underlying EIS.

**resource group ID**

A resource group ID is a logical grouping of resources, grouped for statistical purposes. A resource group ID is associated with a number of resource group statistics, each identified by a statistic ID.

**resource ID**

A resource ID refers to a specific resource. Information about the resource is included in resource-specific statistics. Each statistic is identified by a statistic ID.

**resource manager**

The participant in a transaction responsible for controlling access to recoverable resources. In terms of the CICS resource adapters this is represented by an instance of a ConnectionFactory.

**Resource Recovery Services (RRS)**

A z/OS facility that provides two-phase sync point support across participating resource managers.

**Result set**

A result set is a set of data calculated or recorded by a statistical API function.

**Result set token**

A result set token is a reference to the set of results returned by a statistical API function.

**rollback**

An operation in a transaction that reverses all the changes made during the unit of work. After the operation is complete, the unit of work is finished. Also known as a backout.

**RU** See *Request unit* and *Response unit*.

**RPC** See *remote procedure call*.

**RRMS**

See *Recoverable resource management services*.

**RRS** See *Resource Recovery Services*.

## S

**SBCS** See *single-byte character set*.

**secondary logical unit (SLU)**

In SNA, the logical unit (LU) that contains the secondary half-session for a particular LU-LU session. Contrast with primary logical unit. See also *logical unit*.

**Secure Sockets Layer (SSL)**

A security protocol that provides communication privacy. SSL enables client/server applications to communicate in a way that is designed to prevent eavesdropping, tampering, and message forgery. SSL applies only to internet protocols, and is not applicable to SNA.

**server name remapping**

See *dynamic server selection*.

**servlet**

A Java program that runs on a Web server and extends the server's functionality by generating dynamic content in response to Web client requests. Servlets are commonly used to connect databases to the Web.

**session limit**

In SNA, the maximum number of concurrently active logical unit to logical unit (LU-to-LU) sessions that a particular logical unit (LU) can support.

**silent installation**

Installation that does not display messages or windows during its progress. Silent installation is not a synonym of "unattended installation", although it is often improperly used as such.

**single-byte character set (SBCS)**

A character set in which each character is represented by 1 byte. Contrast with double-byte character set.

**sign-on capable terminal**

A sign-on capable terminal allows sign-on transactions that are either supplied with CICS (CESN) or written by the user, to be run. Contrast with sign-on incapable terminal.

**SIT** See *system initialization table*.

**SLU** See *secondary logical unit*.

**SMF** The z/OS System Management Facility (SMF) collects and records system and job-related information that your z/OS installation can use for reporting, billing, analysis, profiling, and maintaining system security. CICS TG for z/OS writes statistical data to SMF.

**SMIT** See *System Management Interface Tool*.

**SNA** See *Systems Network Architecture*.

**SNA sense data**

An SNA-defined encoding of error information. In SNA, the data sent with a negative response, indicating the reason for the response.

**SNASVCMG mode name**

The SNA service manager mode name. This is the architecturally-defined mode name identifying sessions on which CNOS is exchanged. Most APPC-providing products predefine SNASVCMG sessions.

**socket** A network communication concept, typically representing a point of

connection between a client and a server. A TCP/IP socket will normally combine a host name or IP address, and a port number.

**SSL** See *Secure Sockets Layer*.

**SSLight**

An implementation of SSL, written in Java, and no longer supported by CICS Transaction Gateway.

**statistic data**

A statistic data structure holds individual statistical result returned after calling a statistical API function.

**statistic group**

A generic term for a collection of statistic IDs.

**statistic ID**

A label referring to a specific statistic. A statistic ID is used to retrieve specific statistical data, and always has a direct relationship with a statistic group.

**standard error**

In many workstation-based operating systems, the output stream to which error messages or diagnostic messages are sent.

**subnet**

An interconnected, but independent segment of a network that is identified by its Internet Protocol (IP) address.

**subnet address**

In Internet communications, an extension to the basic IP addressing scheme where a portion of the host address is interpreted as the local network address.

**sync point**

Synchronization point. During transaction processing, a reference point to which protected resources can be restored if a failure occurs.

**SYNCONRETURN**

A request where the CICS server takes a sync point on successful completion of the server program. Changes to recoverable resources made by the server program are committed or rolled-back independently of changes to recoverable resources made by the client program issuing the ECI request, or changes made by the server in any subsequent ECI request. Also referred to as a *nonextended logical unit of work*.

**system initialization table (SIT)**

A table containing parameters used to start a CICS control region.

**System Management Command**

An administrative request received by a Gateway daemon (or Gateway daemon address space on z/OS) from the **ctgadmin** command (on UNIX, Linux, or Windows) or the z/OS console. The request might be made to retrieve information about the Gateway daemon, or to alter some aspect of Gateway daemon behavior. Typically, a **ctgadmin** command in the form **ctgadmin <command string>** is entered by an operator using the command line interface, or a modify command in the form **/F <job name>,APPL=<command string>** is entered by an operator on the z/OS console.

**System Management Interface Tool (SMIT)**

An interface tool of the AIX operating system for installing, maintaining, configuring, and diagnosing tasks.

**Systems Network Architecture (SNA)**

An architecture that describes the logical structure, formats, protocols, and operational sequences for transmitting information units through the networks and also the operational sequences for controlling the configuration and operation of networks.

**System SSL**

An implementation of SSL, no longer supported by CICS Transaction Gateway on z/OS.

**T****TCP/IP**

See *Transmission Control Protocol/Internet Protocol*.

**TCP/IP load balancing**

The ability to distribute TCP/IP connections across target servers.

**terminal emulation**

The capability of a personal computer to operate as if it were a particular type of terminal linked to a processing unit and to access data. See also *emulator*, *emulation program*.

**thread** A stream of computer instructions that is in control of a process. In some operating systems, a thread is the smallest unit of operation in a process. Several threads can run concurrently, performing different jobs.

**timeout**

A time interval that is allotted for an event to occur or complete before operation is interrupted.

**TLS** See *Transport Layer Security*.

**token-ring network**

A local area network that connects devices in a ring topology and allows unidirectional data transmission between devices by a token-passing procedure. A device must receive a token before it can transmit data.

**trace** A record of the processing of a computer program. It exhibits the sequences in which the instructions were processed.

**transaction manager**

A software unit that coordinates the activities of resource managers by managing global transactions and coordinating the decision to commit them or roll them back.

**transaction program**

A program that uses the Advanced Program-to-Program Communications (APPC) application programming interface (API) to communicate with a partner application program on a remote system.

**Transmission Control Protocol/Internet Protocol (TCP/IP)**

An industry-standard, nonproprietary set of communications protocols that provide reliable end-to-end connections between applications over interconnected networks of different types.

**Transport Layer Security (TLS)**

A security protocol that provides communication privacy. TLS enables client/server applications to communicate in a way that is designed to

prevent eavesdropping, tampering, and message forgery. TLS applies only to internet protocols, and is not applicable to SNA. TLS is also known as SSL 3.1.

**Two-phase commit**

A protocol with both a prepare and a commit phase, that is used for the coordination of changes to recoverable resources when more than one resource manager is used by a single transaction.

**type 2.0 node**

A node that attaches to a subarea network as a peripheral node and provides a range of end-user services but no intermediate routing services.

**type 2.1 node**

An SNA node that can be configured as an endpoint or intermediate routing node in a network, or as a peripheral node attached to a subarea network.

**U**

**unattended installation**

Unattended installation is installation performed without user interaction during its progress, or, with no user present at all, except for the initial launch of the process. -

**Uniform Resource Locator (URL)**

A sequence of characters that represent information resources on a computer or in a network such as the Internet. This sequence of characters includes (a) the abbreviated name of the protocol used to access the information resource and (b) the information used by the protocol to locate the information resource.

**unit of recovery (UR)**

A defined package of work to be performed by the RRS.

**unit of work (UOW)**

A recoverable sequence of operations performed by an application between two points of consistency. A unit of work begins when a transaction starts or at a user-requested sync point. It ends either at a user-requested sync point or at the end of a transaction.

**UOW** See *unit of work*.

**UR** See *unit of recovery*.

**URL** See *Uniform Resource Locator*.

**user registry**

The location where the distinguished name of a user is defined and authenticated. See also *distinguished name*.

**user session**

Any APPC session other than a SNASVCMG session.

**V**

**verb** A reserved word that expresses an action to be taken by an application programming interface (API), a compiler, or an object program.

In SNA, the general name for a transaction program's request for communication services.

**version string**

A character string containing version information about the statistical data API.

**W**

**WAN** See *wide area network*.

**Web browser**

A software program that sends requests to a Web server and displays the information that the server returns.

**Web server**

A software program that responds to information requests generated by Web browsers.

**wide area network (WAN)**

A network that provides communication services to a geographic area larger than that served by a local area network or a metropolitan area network, and that can use or provide public communication facilities.

**Wrapping trace**

On Windows, UNIX, and Linux, a configuration in which the **Maximum Client wrap size** setting is greater than 0. The total size of Client daemon binary trace files is limited to the value specified in the **Maximum Client wrap size** setting. With standard I/O tracing, two files, called `cicscli.bin` and `cicscli.wrp`, are used; each can be up to half the size of the **Maximum Client wrap size**.

**X****XA request**

Any request sent or received by the CICS Transaction Gateway in support of an XA transaction. These requests include the XA commands commit, complete, end, forget, prepare, recover, rollback, and start.

**XA transaction**

A global transaction that adheres to the X/Open standard for distributed transaction processing (DTP.)

## Notices

This information was developed for products and services offered in the U.S.A. IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing  
IBM Corporation  
North Castle Drive  
Armonk, NY 10504-1785  
U.S.A.

For license inquiries regarding double-byte character set (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

Intellectual Property Licensing  
Legal and Intellectual Property Law  
IBM Japan, Ltd.  
19-21, Nihonbashi-Hakozakicho, Chuo-ku  
Tokyo 103-8510, Japan

**The following paragraph does not apply in the United Kingdom or any other country where such provisions are inconsistent with local law:**

INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore this statement may not apply to you.

This publication could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Licensees of this program who want to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact IBM United Kingdom

Laboratories, MP151, Hursley Park, Winchester, Hampshire, England, SO21 2JN. Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Programming License Agreement, or any equivalent agreement between us.

Publication No. SC34-2831-02

We appreciate your comments about this publication. Please comment on specific errors or omissions, accuracy, organization, subject matter, or completeness of this book. The comments you send should pertain to only the information in this manual or product and the way in which the information is presented.

For technical questions and information about products and prices, please contact your IBM branch office, your IBM business partner, or your authorized remarketer.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you. IBM or any other organizations will only use the personal information that you supply to contact you about the issues that you state on this form.

Comments:

Thank you for your support.

Submit your comments using one of these channels:

- Send your comments to the address on the reverse side of this form.
- Send a fax to the following number: +44 1962 816151
- Send your comments via email to: [idrctf@uk.ibm.com](mailto:idrctf@uk.ibm.com)
