Note!

Before using this information and the product it supports, be sure to read the general information under “Notices” on page 693.

Third edition (July 2010)

This edition applies to Version 3 Release 1 of CICS Transaction Server for z/OS, program number 5655-M15, and to all subsequent versions, releases, and modifications until otherwise indicated in new editions. Make sure you are using the correct edition for the level of product.

Preface

What this book is about

This book lists the major data storage areas used by CICS® Transaction Server for z/OS®, and indicates the storage layout and usage of each area.

Who this book is for

This book is for anyone who needs to look at a CICS dump or trace:

- IBM® service personnel
- CICS system programmers
- CICS application programmers.

What you need to know to understand this book

It is assumed that you have an understanding of CICS. You need to know how data is represented in storage. To understand the general approach to CICS problem-solving, you should look at the *CICS Problem Determination Guide*. The *CICS Diagnosis Reference* includes a list of CICS modules and the data areas used by each.

How to use this book

You should use this reference book when you are trying to solve a problem with a CICS system.

This book includes the tables that define and control a CICS system and its resources, as well as input and output areas and work areas used by CICS functions and application programs. The contents may be determined at system generation or system initialization time, or they may be set dynamically while CICS is running.

Note: You may see references in this book to items that belong to other CICS products, such as CICS/DOS/VS, CICS/OS/VS, CICS/MVS®, CICS/ESA®, or CICS/VSE®. These items are in source used by all versions of CICS, and have no effect in this version.

Determining if a publication is current

IBM regularly updates its publications with new and changed information. When first published, both hardcopy and BookManager® softcopy versions of a publication are usually in step. However, due to the time required to print and distribute hardcopy books, the BookManager version is more likely to have had last-minute changes made to it before publication.

Subsequent updates will probably be available in softcopy before they are available in hardcopy. This means that at any time from the availability of a release, softcopy versions should be regarded as the most up-to-date.

For CICS Transaction Server books, these softcopy updates appear regularly on the *Transaction Processing and Data Collection Kit* CD-ROM, SK2T-0730-xx. Each reissue of the collection kit is indicated by an updated order number suffix (the -xx

part). For example, collection kit SK2T-0730-42 is more up-to-date than SK2T-0730-41. The collection kit is also clearly dated on the cover.

Updates to the softcopy are clearly marked by revision codes (usually a # character) to the left of the changes.

Chapter 1. CICS Transaction Server for z/OS Data Areas

How the data areas are presented

The data areas are listed in alphabetical order of their shortened names. The shortened name usually, but not always, matches the first few characters of the data area name, disregarding the DFH prefix; for example DFHTCA is shortened to TCA. Some data areas are grouped together according to usage. If you do not find a data area under the expected short name, you should look in the table of contents or the index for the full name of the area or for the name of the macro or copy book that generates the area.

For each field in each data area, the following information is listed:

- The hexadecimal offset, in parentheses
- The data type and for bitstring values, the bit representation
- The length in bytes (decimal)
- The name (symbolic label)
- A brief description of the function

Where the name of a field is shown as an asterisk (*), the field is reserved.

Where bit settings are indicated, the symbolic labels that have been equated to the bit settings are given. These labels are used to refer to the numeric values in programs that use the data area, and are included in this book to help you understand the program listings. The offset given for one of these fields applies only to the symbolic label assigned to the field as a unit; it does not apply to the labels equated to bit settings (hex values).

Where a storage definition has a duplication factor, for example DCREGS (16), the length of the field is the length of each element of the storage. The total length of the storage is this length multiplied by the duplication factor which is shown in parentheses after the name.

For EQUATE statements, the operand is shown in quotation marks in the description.

Use of the index

- All fields are listed in the index at the back of this book.
- Each field name listed in the index is followed by:
 - the hexadecimal offset of the field, shown in parentheses,
 - If the field name applies to a bit value, this is indicated by the word **BIT** in place of the hexadecimal offset.
 - the field length, shown in square brackets,
 - the short name of the area in which it appears,
 - and the page number.

Use the index to find where this book shows the field that you are seeking, in a Data Area. Don't use the index for anything else — for example, you will probably not find enough information in the index to diagnose a problem.

AUTHORISED FUNCTION COMMON
CONTROL BLOCK

The authorised function common control block (AFCS) is used to control the authorised functions of the operating system. It is an anchor for the storage that can be shared by tasks using the CICS SVC paths. There is one AFCS per CICS address space. Each AFCB points to the single AFCS. Storage for the AFCS is obtained at initialization by DFHCSVC (MVS getmain from key 0 subpool 253), invoked from the Kernel.

FUNCTION = This control block contains the time at which AP domain statistics were last reset and also a map of statistics resource types, statistics modules, module entry points and module status to enable DFHAPST to manage the collection of statistics in the AP domain.
This module is part of the APPLICATION DOMAIN (AP).
This control block is created the first time that DFHAPST is called to perform a statistics function in the AP domain. The control block persists until CICS is shutdown (whether literally or 'logically' via the 'end-of-day' command).
LIFETIME = This control block is created by DFHAPST the first time it is called. The control block is not explicitly deleted by DFHAPST but the pointer to it is lost when CICS is terminated.

AP STATISTICS GLOBAL STORAGE BLOCK, consists of:
Standard header tag so that the block can be found in storage.
Last-reset-time field which contains the time in MVS STCK format when statistics counters in the AP domain were last reset.
A map of:
Restype---->
 Module---->
 Entry point---->
 Status

The map relates resource types to the modules that access the statistics for those resource types and to an entry point for the module and to a status which shows whether statistics for that resource type/id are available.

FUNCTION = This DSECT describes VTAM global statistics.
The data described by this DSECT is placed in storage by DFHSTVT, one of the the statistics modules in the AP domain. It contains VTAM global statistics.
The same DSECT describes the system and user copies of the statistics. Several copies of the statistics may exist until the callers request has been satisfied.
LIFETIME = The storage area is created when a request for VTAM global stats is received. It is released when the caller has acknowledged receipt of the data .
LOCATION = Caller is passed a pointer to the storage.

BRARC BRXA definition

-
This is the description of the BRXA passed to the Bridge Exit as its COMMAREA.
-
The BRXA header contains the following fields:
BRXA_HEADER_EYECATCHER An eyecatcher to identify the area as an BRXA. This is initialised by CICS to the value BRXA_HEADER_EYE ('>BRAREA '), which is defined in the DFHBRACx copy book.
BRXA_HEADER_LENGTH The length of the header.
BRXA_HEADER_VERSION_NO The version number of the BRXA. This allows future releases to extend the BRXA. This is initialised by CICS to brxa_current_version_no.
BRXA_TRANSACTION_AREA_PTR The address of the BRXA_TRANSACTION_AREA, which contains information relating to the Bridge Transaction and the User Transaction. This will be set by CICS, and should not be modified by the Bridge or LT Exit code.
BRXA_TRANSACTION_AREA_LEN The length of the BRXA_TRANSACTION_AREA. This will be set by CICS, and should not be modified by the Bridge or LT Exit code.
BRXA_COMMAND_AREA_PTR The address of the BRXA_COMMAND_AREA, which contains information relating to the command causing the Bridge Exit to be driven. This will be set by CICS, and should not be modified by the Bridge Exit code.
BRXA_COMMAND_AREA_LEN The length of the BRXA_COMMAND_AREA. This will be set by CICS, and should not be modified by the Bridge or LT Exit code.
BRXA_USER_AREA_PTR A user field which allows the address of a user area to be saved across Bridge Exit calls within a task. The user area should be obtains using an EXEC CICS GETMAIN.
BRXA_USER_AREA_LEN A user fields which can be used to save the length of the user area.
TRANSACTION. BRXA_INPUT_MSG_PTR A field used to save the address of an input message. This field is intended to be used in conjunction with a formatter.
BRXA_INPUT_MSG_LEN A field used to save the current length of the input message.
BRXA_OUTPUT_MSG_PTR A field used to save the address of an output message. This field is intended to be used in conjunction with a formatter.
BRXA_OUTPUT_MSG_LEN A field used to save the current length of the output message.

The transaction area contains the following information:

BRXA_TRAN_AREA_EYECATCHER
An eyecatcher to identify the area as an BRXA Transaction Area. This will be set by CICS, before passing control to the Bridge Exit, to the value BRXA_TRAN_AREA_EYE (>BRTRANA), which is defined in the DFHBRACx copy book.

BRXA_BRIDGE_TRANID
The transaction id of the Bridge Transaction.

BRXA_TRANID
The transaction id of the user transaction.

BRXA_NEXTTRANID
The transaction id of the next transaction.

BRXA_ABEND_CODE
If the User Transaction abends, then the abend code is placed here. If the transaction hasn't abended this field is blanks.

BRXA_CALLING_PROG
The name of the program in the User Transaction which issued the command causing the Bridge Exit to be invoked. For the BRXA_INIT, BRXA_BIND, BRXA_TERM and BRXA_ABEND calls this fields is set to blanks.

BRXA_USERID
specifies the userid under whose authority the Linked Transaction is to run.

BRXA_STARTCODE
specifies the type of method which would normally be used to start this transaction. This value is returned in the assign command, but has no other effect on processing. The following values are allowed:

S
START command without data

SD
START command with data

TD
Terminal Input (this is the default value)

If an invalid value is specified the value TD is assumed.

On invocation of the Bridge Exit for TERM and ABEND processing, this field contains the start code appropriate to the BRXA_NEXTTRANID value.

BRXA_LOAD_ADS_DESCRIPTOR
If this one character field is set to 'Y' by the Bridge Transaction, then for BMS SEND MAP and RECEIVE MAP, CICS will load the mapset and locate the ADS descriptor for the map, and the address of this descriptor will be passed to the LT exit in the command area. The format of this descriptor is defined in ADS_ descriptor. If this field has any value other than 'Y', then CICS will not attempt to load the mapset and locate the descriptor, and brxa_ADS_descriptor_ptr will be set to null.

BRXA_TRACE
This field is set to 'Y' if level 2 tracing is set on for BR. The exit should use this flag to trace important information for diagnostic purposes. In particular the input and output data should be traced. Note that for BR level 2 tracing, the BRXA is already traced by CICS on input and output.

BRXA_RESP

The resp code to be set (by CICS) in EIBRESP. This will be set to zero by CICS before calling the exit, and the exit must set this value if anything other than a normal response is required.

CICS will generate an ABRN transaction abend if the value returned is not one that could normally be produced by CICS for this command. If this value is zero, CICS may itself set the EIBRESP value and raise a condition.

BRXA_RESP2

The resp code to be set (by CICS) in EIBRESP2. This will be set to zero by CICS before calling the exit, and the exit must set this value if anything other than a normal response is required.

CICS does not check the value specified for consistency with the command. If this value is zero, CICS may itself set the EIBRESP value and raise a condition.

BRXA_CPOSN

The cursor position to be set (by CICS) in EIBCPOSN for RECEIVE, CONVERSE, RECEIVE MAP commands. This will be set to zero by CICS before calling the exit, and the exit must set this value, if the User Transaction uses the value in EIBCPOSN.

BRXA_AID

The attention id (PF key code) to be set (by CICS) in EIBAID for RECEIVE, CONVERSE, RECEIVE MAP commands. This will be set to ENTER (X'7D') by CICS before calling the exit, and the exit must set this value, if the User Transaction uses the value in EIBAID. The exit can use the values defined in DFHAID copy books to set the value (these are EBCDIC values of the 3270 AID characters).

BRXA_ERASE_INDICATOR

A one character value which is set (by CICS) to indicate whether ERASE, ERASE ALTERNATE or ERASE DEFAULT is specified on SEND, CONVERSE SEND MAP, SEND TEXT or SEND CONTROL commands. Constants with meaningful names are provided for all languages to allow the Bridge Exit to test this value if necessary.

BRXA_LAST_INDICATOR

a one character field indicating whether LAST specified on SEND command. Valid values are 'Y' or 'N', and constants are provided for the exit to test this field.

BRXA_WAIT_INDICATOR

a one character field indicating whether WAIT specified on SEND, RETRIEVE or ISSUE ERASEAUP. Valid values are 'Y' or 'N', and constants are provided for the exit to test this field.

BRXA_FMT_RESPONSE

This field is used by the formatter to tell the CICS that the bridge exit should be called to read or write a message. Possible values are:

BRXA_FMT_NONE

No action. The formatter has processed the request.

BRXA_FMT_OUTPUT_BUFFER_FULL

There is no room to add the next vector. Call the bridge exit to write the message, clear the buffer, then call the formatter again.

BRXA_FMT_WRITE_MESSAGE

The request required data to be flushed. Call the bridge exit to write the message.

BRXA_FMT_REQUEST_NEXT_MESSAGE

The formatter has run out of data in the message. Call the bridge exit to read a message, then call the formatter again.

BRXA_FMT_READ_MESSAGE_NOWAIT

The formatter has run out of data in the message. Check to see if there is a new message before requesting any further input. Call the bridge exit to read a message, then call the formatter again.

BRXA_READ_NOWAIT_ISSUED

This field is used by the formatter to check if it has already returned a brxa_fmt_read_message_nowait for this command.

This command area defines actions at the initialisation and
termination of the bridge. There are four functions:

Init
The purpose of this call is for the Bridge Exit pass CICS
various parameters to run the transaction. Typically the BRDATA
will be used to obtain this information.

The following values can be set in the transaction and common
areas area for this request.

- BRXA_ STARTCODE

- BRXA_ LOAD_ADS_ DESCRIPTOR

- BRXA_ FACILITYLIKE

- BRXA_ FACILITY_TOKEN

- BRXA_ USER_ABEND_CODE

- BRXA_ IDENTIFIER

- BRXA_ FORMATTER

Requests using recoverable resources can not be made in this
call.
Bind
The purpose of this call is for the Bridge Exit to obtain data
to answer 3270 requests in subsequent calls.

Recoverable requests can be made in this call.

The exit must not use the TWA, as this is not setup for the
Bridge.

The following values can be set in the transaction and common
areas area for this request.

- BRXA_ STARTCODE

- BRXA_ LOAD_ADS_ DESCRIPTOR

- BRXA_ FACILITY_ KEEP_TIME

- BRXA_ USER_ABEND_CODE

- BRXA_ IDENTIFIER

Term
The purpose of this call is to inform the Bridge Exit that the
user transaction is terminating. It also identifies the next
transaction if this has been specified by the user transaction.

This call is not made if the user transaction abends.

Recoverable requests can be made in this call.

The following values can be set in the transaction and common
areas area for this request.

- BRXA_ FACILITY_ KEEP_TIME

- BRXA_ USER_ABEND_CODE

Abend
In the event of the user transaction abending this call allows
the Bridge Exit to issue non recoverable requests to the
external resource, for example a non-syncpointing MQPUT can be
issued for the MQ Bridge.

The call can also change the abend code.

Recoverable requests can not be made in this call.

The following values can be set in the transaction and common
areas area for this request Any other values are ignored.

- BRXA_ FACILITY_ KEEP_TIME

- BRXA_ USER_ABEND_CODE

The Terminal Control command interface overlays the common command interface, and defines some Terminal Control specific parameters.

Commands supported are SEND, RECEIVE and CONVERSE.

The terminal control specific parameters are

BRXA_CTLCHAR

The 3270 Write Control Character (WCC) passed on SEND and CONVERSE commands as CTLCHAR. If not specified on the command the default value 'X'C3'- unlock keyboard, reset MDT flags) is passed to the exit.

BRXA_BUFFER_INDICATOR

a one character field indicating whether BUFFER specified on RECEIVE command. Valid values are 'Y' or 'N', and constants are provided for the exit to test this field.

(BUFFER is not allowed on CONVERSE - diagnosed by translator)

BRXA_STRFIELD_INDICATOR

a one character field indicating whether STRFIELD specified on SEND or CONVERSE command. Valid values are 'Y' or 'N', and constants are provided for the exit to test this field.

BRXA_DEFRESP_INDICATOR

a one character field indicating whether DEFRESP specified on SEND or CONVERSE command. Valid values are 'Y' or 'N', and constants are provided for the exit to test this field.

BRXA_INVITE_INDICATOR

a one character field indicating whether INVITE specified on SEND command. Valid values are 'Y' or 'N', and constants are provided for the exit to test this field.

The BMS command interface overlays the common command interface, and defines some BMS specific parameters.

Commands supported are SEND MAP, SEND TEXT, SEND CONTROL and RECEIVE MAP.

The BMS specific parameters are:

BRXA_MAPSET
The (unsuffixd) mapset name specified on SEND MAP or RECEIVE MAP.

BRXA_MAP
The map name specified on SEND MAP or RECEIVE MAP.

BRXA_ADS_DESCRIPTOR_PTR
The address of the ADS descriptor for BMS SEND MAP and RECEIVE MAP commands. This will be set by the interface code, if the Bridge has set the flag in the BRXA indicating that the descriptor should be loaded, and if the relevant mapset has been regenerated to include the descriptor. Otherwise this pointer will be set to 0.

BRXA_CURSOR
A halfword value containing the CURSOR position specified on SEND MAP, SEND TEXT or SEND CONTROL command, which identifies where the cursor is to be positioned on the 3270 screen. A value of -1 is passed if the application specified CURSOR with no value on SEND MAP command, indicating that symbolic cursor positioning is required, that is, that the cursor is to be positioned in the first field in the application data structure that has a value of -1 in the corresponding length field. A value of -2 is passed if the application did not specify CURSOR on the SEND MAP command.

BRXA_MSR_DATA
The four character value specified in MSR on SEND MAP, SEND CONTROL or SEND TEXT command. Constants are provided in the copy book DFHMSRCA which will allow the exit to test the values specified.

NOTE: If we can assume that a BFB will always be constructed as if its TYPETERM was defined with MSRCONTROL(NO), then this parameter could be omitted, as for a 3270 terminal fro which MSRCONTROL(NO) is specified, BMS ignores the MSR field specified on the command.

BRXA_DATA_INDICATOR
a one character field indicating whether DATAONLY, MAPONLY or neither are specified on the SEND MAP command. Valid values are 'D' (DATAONLY), 'M' (MAPONLY) or 'N'(neither specified) and constants are provided for the exit to test this field. (Note that if MAPONLY is specified, the FROM pointer and length will be zero, as there is no Application Data Structure in this case.)

BRXA_ERASEAUP_INDICATOR
a one character field indicating whether ERASAUP is specified on a SEND MAP or SEND CONTROL command. Valid values are 'Y' or 'N', and constants are provided for the exit to test this field.

BRXA_FREEKB_INDICATOR
a one character field indicating whether FREEKB is specified on a SEND MAP SEND TEXT or SEND CONTROL command. Valid values are 'Y' or 'N', and constants are provided for the exit to test this field.

BRXA_ALARM_INDICATOR
a one character field indicating whether ALARM is specified on a SEND MAP, SEND TEXT or SEND CONTROL command. Valid values are 'Y' or 'N', and constants are provided for the exit to test this field.

BRXA_MSR_INDICATOR
a one character field indicating whether MSR is specified on a SEND MAP , SEND TEXT or SEND CONTROL command. Valid values are 'Y' or 'N', and constants are provided for the exit to test this field.

BRXA_FRSET_INDICATOR
a one character field indicating whether FRSET is specified on a SEND MAP or SEND CONTROL command. Valid values are 'Y' or 'N', and constants are provided for the exit to test this field.

BRXA_TEXT_TYPE
a one character field indicating whether NOEDIT or MAPPED is specified on a SEND TEXT command. Valid values are ' ' (neither NOEDIT nor MAPPED specified), 'N' (NOEDIT specified) and 'M' (MAPPED specified) and constants are provided for the exit to test this field.

	<p>ADSD_STRUCTURE_LENGTH the length of the application data structure</p>
	<p>ADSD_ATTRIBUTE_NUMBER the number of extended attributes in each field of the ADS, that is the number of attributes specified in DSATTS in the map definition.</p>
	<p>ADSD_ATTRIBUTE_TYPE_CODES one character code for the attribute types in each field, in order, derived from DSATTS</p>

... continuation

ADSD_MAP_LINES
the number of lines in the map from SIZE= operand

ADSD_MAP_COLUMNS
the number of columns in the map from SIZE= operand

ADSD_WRITE_CONTROL_CHAR
the 3270 encoded WCC derived from CONTROL= operand

ADSD_FIRST_FIELD
the first field descriptor occurs here. Use the address of
ADSD_FIRST_FIELD as the initial value of the pointer for the
field descriptor (unless ADSD_field_count is 0).

The field descriptor for each field within the map consists of

ADSD_FIELD_NAME
the unsuffixed field name padded with blanks

ADSD_FIELD_NAME_LEN
the number of characters in the field name

ADSD_OCCURS_INDEX
when OCCURS is specified for a field definition there will be a
separate field descriptor for each element of the array, and
occurs_index will indicate the array index for the particular
field if OCCURS not specified, then occurs_index will be 0

ADSD_FIELD_OFFSET
the offset of the field within the ADS the offset is to the
beginning of the (halfword) length field, and users must add 2
(for the length field) + 1 (for the 3270 attribute) +
attribute_number (for the extended attributes specified in
DSATTS) to get the offset of the data part of the field

ADSD_FIELD_DATA_LEN
the length of the field in the ADS

ADSD_FIELD_JUSTIFY
indicates whether the data is to be justified left (L) or right
(R) if the supplied length is less than the length in the ADS

ADSD_FIELD_FILL_CHAR
the character (blank or '0') to be used to fill the remainder of
the field in the ADS.

ADSD_NEXT_FIELD
the next field descriptor occurs here. Use the address of
ADSD_NEXT_FIELD to update the pointer for the field descriptor.

These are the statistics returned by the AXM page pool management routines for the pools AXMPGANY and AXMPGLOW. Storage in these pools is allocated in multiples of 4K pages on a 4K boundary. The most frequent use is for segments of LIFO stack storage. Storage is initially allocated from the pool using a bit map. For faster allocation, free areas are not normally returned to the pool but are added to a vector of free chains depending on the size of the free area (1 to 32 pages). When storage is being acquired, this vector is checked before going to the pool bit map. If there are no free areas of the right size and there is not enough storage left in the pool, free areas in the vector are put back into the pool, starting from the smallest end, until a large enough area has been created. This action appears as a compress attempt in the statistics. If there is still insufficient storage to satisfy the request, the request is failed.

+++ COMMAND LIST TABLE
 ENTRY FORMAT
The CLT contains the following:
 o MVS System Operator commands and WTOs to be issued during takeover by a CICS Alternate of a CICS Active.
 o Identification data for the JES systems in use.
 o Data used to verify authority to takeover.
The CLT load module is link-edited into an APF Authorized library.
During takeover, the CICS Alternate calls the XRF Takeover Initiation program to terminate the CICS Active with an MVS System Operator command and to have the commands specified in the CLT issued to, for example, request MRO related systems to takeover.

CRB Cross region block

CONTROL BLOCK NAME = DFHCRBPS
DESCRIPTIVE NAME = CICS Cross Region Block
@BANNER_START 02

@BANNER_END
FUNCTION =
This DSECT describes the CICS region block, which is
used by the CICS inter-region communication facility.
The block is used to control inter-region activity
at a global level, as opposed to controlling the
activity of individual links with other regions.
The conversational TCTTE (hung off the 'ISLINK'
system entry in the TCT) is the block which
controls individual 'conversations' between CICS
and other regions.
The CRB is allocated when the facility is started
up (by the start-up program, DFHCRSP), and freed when
the facility is shut down (via the IS LOGOFF COMMND).
The block contains, amongst other things, argument
lists and other information required to communicate
with the inter-region SVC (DFHIRCP)

FUNCTION =
Copybook DFHDCTPS provides structures, DFHDCTPS and DCTSDSCI, that are used to describe entries in the Destination Control Table (DCT).
DFHDCTPS describes entries for queues, these will be generated by invocations of the following macros
1. DFHDCT TYPE=EXTRA
2. DFHDCT TYPE=INDIRECT
3. DFHDCT TYPE=INTRAPARTITION
4. DFHDCT TYPE=REMOTE
while DCTSDSCI describes entries for data sets, these will be generated by invocations of the following macro
1. DFHDCT TYPE=SDSCI
LIFETIME =
The lifetime of all DCT entries is essentially that of CICS.
STORAGE CLASS =
All DCT entries, with the exception of those for queue CXRF and data set DFHCXRF, are located in the DCT load module.
The exceptions are located in storage allocated from the DFHTDG24 subpool.
LOCATION =
Entries for queues are located from the Table Manager DCT table.
Entries for data sets are located from the associated entries for extrapartition queues.
INNER CONTROL BLOCKS =
Each data set entry contains a Data Control Block (DCB).
NOTES :
DEPENDENCIES =
S/370
RESTRICTIONS =
There are no restrictions.
MODULE TYPE =
Control block definition.
Moving the DCT above the line
As SDSCIs interact with QSAM they must be resident below the line. So the complete DCT has been copied above the line with the SDSCI referred to as the model SDSCI.
A copy of this occurs below the line and it is known as the real SDSCI. Existing SDSCI addresses refer to the real SDSCI and a new field (TDEXASDM) has been added to contain the address of model SDSCI. In the SDSCI dsect a new field (DCTSDSRP) has been added. This contains the address of the real SDSCI which corresponds to the model SDSCI.

DGBDBCTL-CICS Global Block

CONTROL BLOCK NAME = DFHDGB
(In DFHDBCOP, invoked via DFHDBMAC)
(Invoked by DFHDLPGDB=DSECT)
DESCRIPTIVE NAME = CICS DBCTL-CICS Global Block
@BANNER_START 02
Licensed Materials - Property of IBM
"Restricted Materials of IBM"
5697-E93
@BANNER_END
FUNCTION =
Used to store connection/disconnection information
regarding the CICS-DBCTL interface.
LIFETIME =
The DBCTL Global Block (DGB) is acquired when initialisation
of the CICS-DBCTL interface is first attempted.
It is used to store connection/disconnection information
regarding the CICS-DBCTL interface.
It is released at the end of the CICS session.

DFHDHTX COPY				
This copybook contains the interface definition for the user-replaceable program specified in an EXITPGM type of template.				
The following input parameters are passed to the user program in a standard CICS commarea:				
dhtx_length The halfword binary length of the entire parameter list.				
dhtx_eyecatcher A 13-character eyecatcher, set to '>DFHDHTXPARMS'.				
dhtx_version A one-byte character version number of the parameter list, currently set to '0'.				
dhtx_buffer_ptr The address of a CICS-provided buffer in which the EXITPGM must return the data that is to become the template.				
dhtx_buffer_len The fullword binary length of the buffer addressed by dhtx_buffer_ptr .				
dhtx_template_name_ptr The address of the 48-character name of the template for which this EXITPGM is being executed.				
dhtx_append_crlf A one-byte character field that indicates whether the APPENDCRLF option was specified for this template. It is set to '1' if the option was specified, and to '0' otherwise.				
The following output parameters must be set by the EXITPGM:				
dhtx_template_len The fullword binary length of the template being returned in the buffer addressed by dhtx_buffer_ptr . This value should be the size actually required for the template, even if it exceeds dhtx_buffer_len (although the data moved into the buffer must not exceed that length). If dhtx_template_len exceeds dhtx_buffer_len , the EXITPGM will be re-driven with a larger buffer.				
dhtx_return_code A fullword binary return code that indicates whether the EXITPGM was successful. It should be one of:				
0 Indicates successful completion. A valid template, or a template truncated to fit the supplied buffer, has been returned.				
8 Indicates failure. No valid template has been returned.				
dhtx_message_ptr Optionally, the address of a message that explains why the EXITPGM was unsuccessful. CICS writes this message to the CSDH transient data destination.				
dhtx_message_len The fullword binary length of the message addressed by dhtx_message_ptr , if one is provided.

FUNCTION =
This data area contains global statistics provided by the Dispatcher Domain
It is provided for use in users monitoring applications to map the statistics returned via the API or the statistics exit.
There is a single instance of this data block.
LIFETIME =
This data block is created by the Dispatcher to store statistics to be passed to the user in response to a request to a request for statistics. The storage is released when the user task is detached.
The DSECT also maps the contents of part of the SMF buffer created by the statistics domain and is used in the statistics exit.
STORAGE CLASS =
LOCATION =
The user is passed a pointer to the head of the storage block.

DSN File control dataset name

MACRO NAME = DFHDSND
DESCRIPTIVE NAME = CICS/ESA File control DATA-SET NAME BLOCK
and BASE CLUSTER block.

@BANNER_START 02

@BANNER_END
FUNCTION =
Create or map an instance of the DATASET NAME block.
This block is dependent from the File Control Table,
and contains a dataset name (up to 44 characters long)
or equivalently a /VSE file-ID.
It is pointed to by any number of FCT file entries,
for either or both the purposes:
a) to carry a name for possible DYNAMIC ALLOCATION when the
file is next opened. (The "optative" name.)
b) to represent the BASE CLUSTER (in VSAM), DATA SET (BDAM),
(or any other entity) that the file, being open,
can update and that CICS needs to guard for backout
integrity.

DATASET NAME BLOCK
The File Control Data Set Name Block (DSNB) holds the name
for dynamic allocation of a data set. Any number of files
(represented by File Control Table Entries, FCTEs) may address
a DSNB. Dynamic allocation takes place at the time a file is
opened. At this time, if the DSNB represents a VSAM base cluster
or a BDAM data set, further information describing the data set
is stored in the Base Cluster Block that is part of the DSNB.

The following block contains the data areas which are associatd
with the dump dataset DCB. It is allocated when the dataset is
opened, and freed when either an explicit close is issued or
the end of the current dataset is reached, and autoswitching
is not enabled. The address of this block is in the dump domain
anchor block.

The elements which are contained in this block are as follows:-

- ECB to be used with all I/O
- DCB for the dump dataset
- Write list expansion used with all MVS macros against the dataset.
- I/O buffer

Constants

Len	Type	Value	Name	Description
-				
The valid functions for the Dump SVC routine, passed in the "DAFPB" field "dafpb_function".				
The functions currently supported are:				
take_sdumpx provides a fast unformatted dump of virtual storage and returns a response/reason.				
take_related_sdumpx uses IWMWQWRK to obtain a list of active units of work. This data is passed to SDUMPX with a request for REMOTE dumps across the SYSPLEX for CICS systems in XCF group DFHIR00 which are involved in the active units of work. A dump of virtual storage is also taken for the local address space.				
csvdynex_add_dfhdumpx adds dfhdumpx to the SDUMPX IEASDUMP.QUERY dynamic exit and returns a response.

-				
				The valid responses from the Dump SVC routine, passed in the "DAFPB" field "dafpb_response".
				The responses currently produced are:
				ok
				The operation was executed successfully.
				not_supported
				The function code supplied is not valid.
				getmain_failed
				A GETMAIN request for SP 253 storage failed.
				festae_failed
				The FESTAE could not be established.
				not_authorized
				The authorization check failed.
				sdumpx_failed
				The SDUMPX request failed to complete the dump. The MVS response and reason are returned in "dafpb_sdumpx_response".
				csvdynex_failed
				The CSVODYNEX request failed. The MVS return code and reason are returned in "dafpb_csvdynex_return_code" and "dafpb_csvdynex_reason".
				iwmwqwrk_failed
				The IWMWQWRK request failed. The MVS return code and reason are returned in "dafpb_iwmwqwrk_return_code" and "dafpb_iwmwqwrk_reason".
				dfhdumpx_not_found
				The exit module DFHDUMPX was not found in the LPA.
				invalid_probdesc
				The SDUMPX PROBDISC data is invalid.

 @BANNER_END
FUNCTION =
 The Event Control Area is used by interval control (DFHICP).
 The ECA is obtained for a POST type ICE.
 It contains the ECB. The ECA's are getmained from a
 subpool called APECA which resides below the line and has
 USER access. The ICETECOA field will contain the address
 of the ECA associated with an ICE. If there is no ECA for the
 ICE then ICETECOA is zero. Inline DFHSMGFI calls are made
 to get and free ECAs.
LIFETIME =
 The control block is created with a POST type ICE.
 The ECA is freed when the assoiated ICE is freed.
STORAGE CLASS =
 The storage class is APECA.
LOCATION =
 To locate an ECA use the ICETECOA field which contains the
 address of the ECA associated with the ICE. If the ICETECOA
 field equals zero then there is no ECA.

This DSECT describes the user task data that is used by EDF
to display the status information, etc.
It is obtained in DFHEDFX for each EDF call. It is then
filled with data describing the user transaction state.
It is passed to the EDF task as an ATTACH parm, and is used
by the attached EDF task. The storage is freed in DFHEDFX
when the user task is resumed.

FUNCTION = EXEC Interface Block.
 The exec interface block contains information on the transaction identifier, the time and date, and the cursor position on a display device. Some of the other fields are set indicating the next action that a program should take in certain circumstances.
 DFHEIBLK also contains information that will be helpful when a dump is being used to debug a program.
 This control block is included automatically by an application program using the command-level interface.
 EISEIBA in the EIS addresses the EIB.

EJDNC

Enterprise Java Bean Distinguished name

-
Distinguished Name URM
This structure maps the commarea that is passed to the Distinguished Name User-Replaceable Module, DFHEJDNX.
The Distinguished Name URM is a CICS command-level program that is used to obtain a string representation of the distinguished name of an EJB client, when the client has not presented an X.509 certificate containing a name.
The URM must be called DFHEJDNX.
The following parameters are passed to DFHEJDNX in a commarea:
ejdn_parameter_list_length A binary halfword that contains the length of this parameter list.
ejdn_parameter_list_eyecatcher A 14-byte character string that contains an eyecatcher ('>DFHEJDNX_PARM') to identify this parameter list in dumps and traces.
ejdn_parameter_list_version A binary halfword that contains the version number of this parameter list. It is zero for CICS Transaction Server V2R1.
ejdn_parameter_list_flags A binary halfword reserved for indicator flags for this interface. At present, no indicator flags are defined.
ejdn_distinguished_name_ptr A pointer to a 512-character workarea in which DFHEJDNX can build the distinguished name to be assigned to the client.
.... continued

... continuation

The distinguished name output by this routine must be an EBCDIC null-delimited character string in the format proposed by RFC2253, "Lightweight Directory Access Protocol (v3): UTF-8 String Representation of Distinguished Names", described (among other places) at "ftp://ftp.isi.edu/in-notes/rfc2253.txt". The character string must be encoded in EBCDIC code page 1047.

ejdn_distinguished_name_len
A binary fullword that contains the length of the workarea pointed to by "ejdn_distinguished_name_ptr" on input, and in which DFHEJDNX must return the length of the distinguished name it has built.

ejdn_userid_ptr
A pointer to the client's userid.

ejdn_userid_len
A binary fullword containing the length of the client's userid.

ejdn_common_name_ptr
A pointer to the proposed common name of the client, derived from the username associated with the client's userid in the external security manager's database.

ejdn_common_name_len
A binary fullword containing the length of the client's common name.

ejdn_title_ptr
A pointer to the proposed title of the client, derived from the title in the X.509 certificate associated with the CORBAServer.

ejdn_title_len
A binary fullword containing the length of the client's title.

ejdn_email_address_ptr
A pointer to the proposed e-mail address of the client, derived from the e-mail address in the (extended) X.509 certificate associated with the CORBAServer.

ejdn_email_address_len
A binary fullword containing the length of the client's e-mail address.

ejdn_organizational_unit_ptr
A pointer to the proposed organizational unit of the client, derived from the organizational unit in the X.509 certificate associated with the CORBAServer.

ejdn_organizational_unit_len
A binary fullword containing the length of the client's organizational unit.

ejdn_organization_ptr
A pointer to the proposed organization of the client, derived from the organization in the X.509 certificate associated with the CORBAServer.

ejdn_organization_len
A binary fullword containing the length of the client's organization

ejdn_locality_ptr
A pointer to the proposed locality of the client, derived from the locality in the X.509 certificate associated with the CORBAServer.

ejdn_locality_len
A binary fullword containing the length of the client's locality.

ejdn_state_or_province_ptr
A pointer to the proposed state or province of the client, derived from the state or province (if any) in the X.509 certificate associated with the CORBAServer.

ejdn_state_or_province_len
A binary fullword containing the length of the client's state or province.

ejdn_country_ptr
A pointer to the proposed country of the client, derived from the country in the X.509 certificate associated with the CORBAServer.

ejdn_country_len
A binary fullword containing the length of the client's country.

Each of the character fields pointed to by an "ejdn_ _ptr" parameter contains EBCDIC character data terminated by a null character (X'00') to simplify processing in the C language. If a value for a field is not available, its corresponding length ("ejdn_ _len") is zero.

FUNCTION =
 This data area contains the CORBAServer statistics
 provided by the EJ Domain.
 It is provided for use in users monitoring applications
 to map the statistics returned via the API or the
 statistics global user exit.
 There is a single instance of this data block.
LIFETIME =
 This data block is created by the EJ Domain to store
 statistics to be passed to the user in response to a
 for CORBAServer statistics. The storage is released
 when the user task is detached.
 The DSECT also maps the contents of part of the SMF buffer
 created by the statistics domain and is used in the
 statistics exit.
STORAGE CLASS =
LOCATION =
 The user is passed a pointer to the head of the storage
 block.

FUNCTION =
 To define fields that may be of use to File Control User Exits:-
 (1) The Command Level Parameter List.
 (2) EIBRCODE, EIBRESP and EIBRESP2 values.
 (3) The byte of File Control Indicators.
 On entry to the XFCREQ and XFCREQC User exits, the EXEC parameter list is pointed to by UEPCLPS. The EXEC parameter list for file control consists of twelve addresses.
 The twelve addresses are defined by FC_ADDR0 to FC_ADDRB. Only FC_ADDR0 to FC_ADDR7 may be used by user exits, and also FC_ADDRB.
 FC_ADDR8 to FC_ADDRA are reserved for CICS internal use only.
 This DSECT defines FC_ADDR0 to FC_ADDRB and the areas that they point to.
 On entry to the XFCREQ and XFCREQC user exits, the copy of EIBRCODE is pointed to by UEPRCODE, the copy of EIBRESP is pointed by UEPRESP and the copy of EIBRESP2 is pointed to by UEPRESP2.
 This DSECT also contains equates for values of EIBRCODE, EIBRESP and EIBRESP2 used by File Control.

LIFETIME = Lifetime of the FC command request
 STORAGE CLASS = As the storage being mapped is the translated source in the user's application program, the storage may be either above or below the line.
 LOCATION = (1) EXEC Parameter List is addressed by UEPCLPS.
 (2) Fields copied from the EIB are addressed by UEPRCODE, UEPRESP and UEPRESP2.
 (3) The token for use in communicating between XFCREQ and XFCREQC is addressed by UEPFCTOK.

INNER CONTROL BLOCKS =
 FC_ADDR_LIST declares the EXEC addresses
 FC_EID defines the EID pointed by FC_ADDR0

 MODULE TYPE = Control Block definition
 The Command Parameter List
 FC_ADDR_LIST defines twelve addresses, that form the EXEC parameter list for File Control. Only FC_ADDR0 to FC_ADDR7 and FC_ADDRB may be referenced by user exits.
 In addition, FC_ADDR1 to FC_ADDR7 and FC_ADDRB may be modified by a user exit.
 Any attempt to modify FC_ADDR0 will be ignored.

FC_EID defines: (1) The type of request (2) Existence bits indicating which addresses in the EXEC Parameter List are valid. (3) Bits to indicate the keywords specified. FC_ADDR0 contains the address of FC_EID. The following bits may be modified from a File Control user exit. (1) Existence bits FC_EXIST3, FC_EXIST5, FC_EXIST6, FC_EXIST7 and FC_EXISTB. (2) The keyword descriptors FC_MASSINSERT_X, FC_GENERIC_X, FC_GTEQ_X, FC_NRI_X, FC_CR_X, FC_RR_X and FC_NO_SUSPEND. Any attempt to modify any other part of the EID will be ignored.

FUNCTION =
This describes the format of File Control's part of log records written to the system log for backout, log records written to forward recovery logs and autojournal records written to autojournals.

LIFETIME =
This just describes the layout of log and journal records so does not have any particular lifetime.

LOCATION =
Log and journal records are built in LIFO storage by module DFHFCLJ.

STORAGE CLASS =
Since log and journal records are built in DFHFCLJ's LIFO this is CICS storage class.

FLJB - File Log and Journal Block

The FLJB forms the basis of the data that File Control writes as part of its log and journal records. The FLJB is, in general, built from two parts, one part which contains data that mostly applies to all log and journal records, and a second part which contains data specific to the type of record. All log and journal records have data specific to the type of record.

The FLJB is always written to the log or journal (as appropriate), but there may also be some variable length data written immediately after the fixed length parts of the FLJB. Precisely what variable length data is written depends on the record type. The resulting log and journal records for each record type are described below.

Note that what follows is a description of only what File Control writes to the log or journal. In practice these records themselves also have a header prepended to them, either by the CICS Logger (in the case of autojournal and forward recovery records) or by the Recovery Manager (for all system log records).

The format of File Control's part of log and journal records written for read only, read update, write update, and write add, and journal records written for the write add complete record type, is as shown below. The respective length of each block is also indicated.

- o fljb_general_data of length length(fljb_general_data), followed by:
- o fljb_common_data of length length(fljb_common_data), followed by:
- o fljb_cd_key of length fljb_cd_key_length, followed by:
- o fljb_cd_data of length fljb_cd_data_length.

The format of File Control's part of log records written for the write add complete record type, is as shown below. The respective length of each block is also indicated.

- o fljb_general_data of length length(fljb_general_data), followed by:
- o fljb_common_data of length length(fljb_common_data).

The format of File Control's part of log and journal records written for write delete is shown below. The respective length of each block is also indicated.

- o fljb_general_data of length length(fljb_general_data), followed by:
- o fljb_write_delete_data of length length(fljb_write_delete_data), followed by:
- o fljb_wdd_base_key of length fljb_wdd_base_key_length, followed by:
- o fljb_wdd_path_key of length fljb_wdd_path_key_length.

The format of File Control's part of log and journal records written for file close is shown below. This record is one of the simplest of all the log and journal records. It just contains the general data block followed by data specific to file close. The respective length of each block is indicated alongside. There are no variable length records in the file close record.

- o fljb_general_data of length length(fljb_general_data), followed by:
- o fljb_file_close_data of length length(fljb_file_close_data).

The format of File Control's part of tie up records is shown below. The respective length of each block is indicated alongside. There are no variable length records in the tie up record.

- o fljb_general_data of length length(fljb_general_data), followed by:
- o fljb_tie_up_record of length length(fljb_tie_up_record)

FUNCTION =
To map an entry in the File Control Table.
The File Control Table is the principal repository of definitions of the database (or FILE) component.
Other modules access it at their peril.
Each entry ordinarily matches a call of the DFHFCT macro, and describes a database file.
There is another dsect (DFHFCTSR) to treat shared resource pools, which appear in another connected table.
The following fields form part of the Product Sensitive Programming Interface:
FCTDSID
FCTDSVR1 to FCTDSKL
FCTDSRKP
FCTDSJID
FCTSDSP
FCTDSBCP
Bit settings FCTKSDS,FCTESDS,FCTRRDS of FCTVSVR1
Bit settings FCTJFR, FCTJWAC of byte FCTDSVR6
FCTDSREC
FCTDSBLK
FCTDTSIZ
LIFETIME =
FCT entries are created at File Control restart and are always present thereafter.
STORAGE CLASS =
Part of the CICS nucleus.
LOCATION =
By the Table Management Program.
INNER CONTROL BLOCKS =
None. There are some fields with alternative meanings.
NOTES :
DEPENDENCIES = S/370
RESTRICTIONS = Sequence symbols must not coincide with any that are used by objects that imbed this; in particular, the prefix .FC causes the Assembler to loop.
MODULE TYPE = Control block definition

ACCESS - STATE PROTECTION				
Some flags are defined for in-progress state changes				
The following three ECBs (or "wait bytes") exist to serialise				
certain combinations of state-change requests. Only one of				
them can be WAITing at any moment, but any combination may be				
POSTed (implying present or past existence of tasks that waited				
for an action of the specific kind to complete).				
Next there is an ECB for serialising data table loads

FLABC

FLABC File Lasting Access Block

CONTROL BLOCK NAME = DFHFLABC
DESCRIPTIVE NAME = CICS File Lasting Access Block (FLAB)
@BANNER_START 02
Licensed Materials - Property of IBM
"Restricted Materials of IBM"
5697-E93
@BANNER_END
FUNCTION =
DFHFLAB describes the DSECT for the File Lasting Access Block. This block serves as an anchor for the set of of File Request Thread Elements (FRTEs) belonging to a particular file within a given transaction and a given environment.
If a transaction accesses several files from within the same environment, there will be one FLAB for each file.
If a transaction accesses the same file from more than one environment, there will be one FLAB for each environment.
The FLAB holds the following data:-
(1) The address of the corresponding FCTE and the name of the corresponding file
(2) The environment identifier
(3) The address of the owning FRAB
(4) The address of the first FRTE in the chain of FRTEs owned by this FLAB. Note that the associated file can not be closed if there are any FRTEs addressed by this FLAB.
(5) An indicator that the associated file must not be closed until syncpoint phase 2, even if the FRTE chain is empty.
(6) An indicator that recoverable work has been done against this file. If this bit is OFF and do_not_close is ON, this indicates that the uow has only done repeatable reads.
(7) An indicator that the corresponding file entry must not be reallocated to a different dataset, even if the file is closed and disabled.
(8) An indicator of whether or not backout attempts are currently disabled for this file by this unit of work which is set on when the associated data set first suffers a backout failure, and is cleared when the unit of work is unshunted for a backout retry.
(9) Some indicators used to keep track of state during the rebuilding of enqueues on CICS restart.
(10) An indicator that an RLS QUICOPY or QUIBWO request was received for the dataset, and the UOW that owns the FLAB has updated the file.
(11) Fields to record the type of syncpoint failure which has caused the FLAB to be retained.
(12) Fields to record the address, length, location & key of SET storage owned by a READ SET issued for this file within this environment.
.... continued

... continuation

LIFETIME =

The File Lasting Access Block is built by File Control as part of processing of the first File Control request for a particular file within a given transaction and environment.

The storage for the FLAB is obtained from a FLAB storage subpool, created by DFHFICRP during File Control initialisation.

The File Lasting Access Block is deleted after all the FRTEs have been processed during syncpoint terminate processing, provided that there have been no syncpoint failures for the file within the unit of work. At this point, the FLAB storage is not returned to the FLAB storage subpool, but is instead added to a chain of free FLABs, addressed by FC_STATIC_FLAB_FREE_CHAIN in FC static. Subsequent requests to build a FLAB are, if possible, satisfied by a quick cell mechanism from this chain. If the UOW is shunted, FLABs may be shunted with it. Recoverable FLABs are rebuilt at Emergency Restart, and sometimes also at warm restart.

Note.

If new fields are added to the FLAB, DFHFICIR must be modified to rebuild those fields at warm or emergency restart.

STORAGE CLASS =

Above 16M line. CICS key.

LOCATION =

Issuing an INQUIRE_WORK_TOKEN to the recovery manager with a client name of 'FC' returns the address of the FRAB. The FRAB contains the address of the first FLAB in field FRAB_FLAB_CHAIN_ADDRESS. Subsequent FLABs for this transaction are addressed by field FLAB_NEXT_FLAB_ADDRESS.

THE FOLLOWING DSECT DESCRIBES FUNCTION MANAGEMENT HEADERS AND IN SOME CASES THE DATA THAT CAN FOLLOW THE HEADER. THE ORGANIZATION OF THE DEFINITIONS WITHIN THIS PART OF THE COPY BOOK IS AS FOLLOWS :-				
1. THE STANDARD PART OF A FUNCTION MANAGEMENT HEADER. THESE DEFINITIONS APPLY WHATEVER TYPE, GROUP AND FUNCTION CODE THE HEADER MAY CARRY.				
2. DEFINITIONS FOR FUNCTION MANAGEMENT HEADERS OF TYPE 5; THAT IS, ATTACH HEADERS. THESE MAY BE IDENTIFIED BY THE PREFIX 'FMHA' FOR LU6.1 AND BY THE PREFIX 'FMHB' FOR LU6.2.				
3. DEFINITIONS FOR FUNCTION MANAGEMENT HEADERS OF TYPE 6; THAT IS, SCHEDULER MODEL, QUEUE MODEL AND DL/I MODEL HEADERS. THESE MAY BE IDENTIFIED BY THE PREFIXES 'FMHS', 'FMHQ' AND 'FMHD' RESPECTIVELY.				
4. DEFINITIONS FOR FUNCTION MANAGEMENT HEADERS OF TYPE 7; THAT IS, SYSTEM MESSAGES. THESE ARE IDENTIFIED BY THE PREFIX 'FMHSM'				
5. DEFINITIONS FOR FUNCTION MANAGEMENT HEADERS OF TYPE 10; THAT IS, SYNCPOINT HEADERS. THESE ARE IDENTIFIED BY THE PREFIX 'FMHP'				
6. DEFINITIONS FOR FUNCTION MANAGEMENT HEADERS OF TYPE 12; THAT IS, TRANSFORMED PASSWORD HEADERS. THESE ARE IDENTIFIED BY THE PREFIX 'FMHV'.				
7. DEFINITIONS FOR FUNCTION MANAGEMENT HEADERS OF TYPE 43; THAT IS, CICS PRIVATE HEADERS. THESE MAY BE IDENTIFIED BY THE PREFIX 'FMHC'.				
NOTE THAT THE DECLARED LENGTHS OF VARIABLE LENGTH PARAMETERS ALLOW FOR THE (REASONABLE) LENGTH OF THE PARAMETER VALUES. TO EACH MUST BE ADDED ONE BYTE FOR THE PRECEEDING LENGTH FIELD. (REFER TO MODULE DFHXFP FOR EXAMPLES OF HOW VARIABLE LENGTH PARAMETERS ARE HANDLEED.)				
NOTE ALSO THAT A THEORETICAL MAXIMUM LENGTH IS QUOTED FOR MOST FMHS. THIS PERMITS THE FASTER CONSTRUCTION OF FMHS AT THE EXPENSE OF A FEW EXTRA BYTES OF STORAGE.

FRABC File Request Anchor Block

CONTROL BLOCK NAME = DFHFRABC
DESCRIPTIVE NAME = CICS File Request Anchor Block (FRAB)
@BANNER_START 02
Licensed Materials - Property of IBM
"Restricted Materials of IBM"
5697-E93
@BANNER_END
FUNCTION =
 DFHFRAB describes the DSECT for the File Request Anchor Block. This block serves as an anchor for the set of File Lasting Access Blocks (FLABs) belonging to a particular transaction. The File Request Thread Elements (FRTes) are chained from the FLABs. The FRAB identifies the transaction to which a given File Control request belongs.
 The File Request Anchor Block is built by File Control as part of processing of the first File Control request in a transaction. The storage for the FRAB is obtained from a FRAB storage subpool, created by DFHFICRP during File Control initialisation. The address of the FRAB is then used as the Recovery Manager token associated with the client name 'FC'.
 The File Request Anchor Block is deleted after all the FLABs have been processed during SYNCPOINT at transaction termination. At the same time, the Recovery Manager token is reset to zero. At this point, the FRAB storage is not returned to the FRAB storage subpool, but is instead added to a chain of free FRABs, addressed by the FC_STATIC_FRAB_FREE_CHAIN pointer in FC static. Subsequent requests to build a FRAB are, if possible, satisfied by a quick cell mechanism from this chain.
LIFETIME =
 Normal creation is when the first File Control Request for a transaction is processed.
 A FRAB is also created if a failure occurs during phase 2 of an intermediate syncpoint: the original FRAB for the transaction is shunted along with the failed parts of the unit of work, and the new FRAB is passed on to the next unit of work in the transaction.
 FRABs are deleted at transaction termination (for a shunted FRAB this will be at termination of the transaction which was created in order to retry the failure).
 If a UOW is shunted, the FRAB is shunted with it, unless there was no recoverable File Control work in the unit of work.
 When CICS is warm or emergency restarted, FRABs will be rebuilt for any units of work which had made file control updates that were not committed at the time of the CICS termination.
 Note that if new fields are added to the FRAB, DFHFICIR must be modified to rebuild these fields.
STORAGE CLASS =
 Above 16M line. CICS key.
LOCATION =
 Issuing an INQUIRE_WORK_TOKEN to the recovery manager with client name 'FC' returns the address of the File Request Anchor Block.

The LUWID should be on a dblword boundary. In PL/X, if LIKE is used, LIKE must specify BDY(DWORD). To avoid potential problems with how the user gets the LUWID block, whether PL/X or ASM, VSAM will save result of TIMEUSED in a BDY(DWORD) internal field and then move to LUWIDCPU				
(40)	CHARACTER	8	LUWIDCPU	Total CPU time used by the
current SRB up until TIMEUSED is issued. Time used by TCB is NOT included. (Field must be cleared by user before issuing a VSAM request. Field is not available until the VSAM request is complete. For SYN,RLSWAIT, field is available when control is returned from RLSWAIT exit. For ASY requests, field is available when CHECK completes. VSAM may not be able to set this field if Cancel or ABEND occurs, or TIMEUSED fails.)				
(48)	ADDRESS	4	LUWIDSVa	Ptr to a 20-word BDY(DWORD)
user-provided area required for VSAM to use TIMEUSED

@BANNER_END
FUNCTION =
DFHFRTEC describes the dsect for File Request Thread Elements (FRTEs). These elements are used to represent active File Control Requests. They are also used to reconcile related requests (eg READ_UPDATE -> REWRITE
FRTEs are created by DFHF CFR and hung off a chain for the particular file within a given task and environment.
The FRTE is created at the start of the request thread and destroyed at the end of the request thread. For example, a FRTE is created on a STARTBR and destroyed by an ENDBR.
LIFETIME =
For the duration of the File Control request thread.
STORAGE CLASS =
Above 16M line. CICS key.
LOCATION =
Issuing an INQUIRE_WORK_TOKEN to the recovery manager returns the address of the FRAB. The FRAB contains the address of the head of the FLAB chain for this task.
Each FLAB addresses the chain of active FRTEs for that specific file and environment.
INNER CONTROL BLOCKS =

Request Header
The Request Header is made up of the following service contexts
and the request ID etc. It follows the GIOP request header
The fields following 'rh' determine their positions at run
time after the lengths have been 'endian' converted and any
alignment has been forced.
=====
Service Contexts
Service contexts exist at the beginning of a request header.
Their general form is as follows:
```

FUNCTION =
An ICE is created for each time-dependent request received by the interval control program. These ICEs are logically chained from CSAICEBA in the CSA in expiration time-of-day sequence.
LIFETIME =
Expiration of a time-ordered request is detected by the expired request logic of the interval control program running as a CICS system task. The type of service represented by the expired ICE is initiated, if all resources required for the service are available, and the ICE is removed from the chain. If the resources are not available, the ICE remains on the chain and another attempt to initiate the request service is made the next time the expiry logic runs.

The command parameter list is a list of addresses which reference the various elements of the EXEC CICS command. The addresses are only valid if the element is applicable to this command. The existence bits in the EID component (IC_BITS1) specify those addresses that are valid, and the flagword bits (IC_EIDOPT5 - IC_EIDOPT8) specify the keywords that were given in the EXEC CICS command.

IC_EID (addressed by IC_ADDR0) gives the request type, and uses bits to identify those keywords that are valid and/or have been explicitly stated in the EXEC CICS command being processed. Note: Equates for IC_GROUP, IC_FUNCT, EIBRCODE, EIBRESP and EIBRESP2 values are defined at the end of this data structure.

Request Receiver Connection Data
WARNING - The conn_ data DSECT also appears in module DFHZIS2. Any changes to the DSECT made in DFHIIDCD need to also be copied to DFHZIS2. After modifying DFHIIDCC, rebuild DFHIIDCD and copy the changes into DFHZIS2.
This block contains data relevant to the socket connection life-time and is used both by the dump formatters and to keep data across transactions until the socket is closed. It is obtained from the IIGENRAL subpool by DFHIIRR and freed when the RR task terminates when the socket is closed or after an error.
A 2nd use of this block is to hold data needed by the so notify gate when a request receiver task has been suspended.

=====

Listen Data - Request Receiver and Request Processor

This control block contains all the information relevant to an outstanding reply. It is created when an LSTN LISTEN is issued for a request or locate request. It is deleted when the reply has been processed. The LISTEN passes a pointer to this data to the notify gate.

This same mechanism is also used for request processor LSTN LISTEN.

FRAG_BLOCK

This block represents a fragment which has been sent to the request receiver. It is created when a request is received with the fragment bit on in the GIOPHeader. It is deleted when the last fragment (~fragment) has been received. The block is chained from txn_ data storage from frag_ chain and ends in frag_ chain_end.

Server data - Request Receiver

This block contains information about an incoming request. It is held in LIFO and extracted by the request handler (DFHIIRH) from the object key and used as input to Request Stream CREATE.

Debug data - Request Handler

This block contains information extracted from an incoming request to be used if DEBUG=YES is specified in the request processor SIT. It is held in LIFO and extracted by the request handler (DFHIIRH) from the object key and used as input to Request Stream CREATE and JOIN.

Security vault entry

=====

The security vault is a linklist of entries held off vault_ptr in conn_data. Each vault entry represents a connection from a single client, and is used to map the session id in the incoming service context to a userid and/or kerberos principal.

Request Processor data.

=====

rp_data represents all the data needed for the lifetime of an ORB task. It is obtained by IIRP GET_INITIAL_DATA or INITIALISE and freed by IIRP TERMINATE or after an error.

Any data that needs to be kept across calls should be kept in here.

It is chained off IIA_IIRP_DATA_CHAIN to enable the dump formatter to find the request processor blocks.

FUNCTION =
This data area contains the Requestmodel statistics provided by the II Domain.
It is provided for use in users monitoring applications to map the statistics returned via the API or the statistics global user exit.
There is a single instance of this data block.
LIFETIME =
This data block is created by the II Domain to store statistics to be passed to the user in response to a for Requestmodel statistics. The storage is released when the user task is detached.
The DSECT also maps the contents of part of the SMF buffer created by the statistics domain and is used in the statistics exit.
STORAGE CLASS =
LOCATION =
The user is passed a pointer to the head of the storage block.

 Descriptions of all inter-region communication control
 blocks which are visible to the subsystem level of
 inter-region communication.
 The control blocks defined are:
 SLCB Subsystem Logon Control Block
 SCCB Subsystem Connection Control Block
 SCACB(E) Subsystem Connection Address Control Block

MODULE TYPE = Control block definition
 Subsystem Logon Control Block
 This DSECT describes the format of the SLCB which is the
 control block that contains the information relevant to
 the logon session which is of interest to the sybsystem
 level of inter-region communication.
 First define the format of the fields in the SLCB.

Subsystem Connection Control Block
This DSECT defines the SCCB, the control block which
contains the information about a particular connection
which can be accessed by the subsystem level of inter-
region communication function.
First define the format of the fields in the SCCB.

Subsystem Connection Address Control Block

These DSECTs define the format of the SCACB and its entries. The SCACB is used by the subsystem level of interregion communication function to obtain the addresses of the SCCBs representing its connections.

The SVC argument list comprises a list of addresses, each of which is the address of a function argument list.

IRC

Offset Hex	Type	Len	Name (Dim)	Description
(0)	STRUCTURE	4	IRSVCADS	Address of function argument list
(0)	FULLWORD	4	IRVCAARG	

The function argument list, addressed from the SVC argument list, contains different arguments according to the function being requested. The first six arguments identify the function required, the function modifier (for SWITCH, DISCONNECT or QUIESCE), the user number and identification, and the thread number and identification (where required). The remaining three arguments depend on the function requested and identify a system name (for LOGON, INSERV or QUIESCE), a subsystem control block address (for LOGON or CONNECT) and a parameter list (for LOGON or SWITCH).

KERRD Kernel error data

CONTROL BLOCK NAME = DFHKERRD DESCRIPTIVE NAME = CICS Kernel Error Data @BANNER_START 02 Licensed Materials - Property of IBM "Restricted Materials of IBM" 5697-E93 @BANNER_END FUNCTION = Kernel Error Data. After an MVS Abend, Program Check or Domain Requested Recovery, The following data is available to the task in recovery state. Once the recovery state is cleared or percolated, this data is no longer available. The data splits into three parts: 1. Error Code and Interrupt information. The Error Code is supplied on a CICS Request Recovery Call and is a CICS Abend Code (as documented in CICS Messages and Codes). If the Error Code is AKEA then there has been a program check and the System Interrupt data will be the program check code (00CX). If the Error Code is AKEB then there has been an MVS Abend and then System and User Interrupt data will contain the MVS Abend Code split up into the System and User parts. The Kernel will calculate the offset within your program that the CICS error occurred. If not in your program, this field is set negative. 2. SYSTEM Error Data - PSW and Registers taken from the SDWA. SDWA: "PSW and Registers at time of error." There are two sets of PSW and Registers, which are different when CICS has called an SVC (say) which then issues an Abend. In this case the phrase 'at time of error' indicates that this set of PSW and Registers will be those of the SVC: the PSW will be the address (in the SVC routine) of an Abend SVC (13). 3. CICS Error Data - PSW and Registers taken from the SDWA. SDWA: "PSW and Registers of last interrupt of the RB that issued this STAE/ESTAE." This is a rather cryptic phrase. Remember, however, that the RB that issued the ESTAE is actually CICS and that, since CICS does not issue LINK, CICS only ever has the one RB EXCEPT when we issue an SVC. S370 hardware implements SVC's and Program Checks as interrupts. Thus, if CICS issues an SVC that then abends, the last interrupt we received WAS the SVC. So, this save area describes the last thing CICS did before the Abend. Notes 1. If CICS issues an Abend (or program checks) from its own code, these two save areas are identical and identify the place where the Abend or program check happenned. 2. In the case of requested recovery, both sets of PSW and Registers will identify the state at the time the request recovery was issued. 3. When the Abend is issued from 'the System', the two save areas are used for different purposes. If the problem is to diagnose what VTAM/VSAM/MVS/etc. was doing for us at the time, the appropriate Error Data is the SYSTEM's, since that tells us what the state was on that side of the SVC. If the problem is to diagnose an invalid request made by CICS, then the last thing CICS did is relevant and so the CICS Error Data is relevant. LGGF General Log Format

-

A General Log is any CICS log other than the CICS System Log. It may reside upon the MVS Logger or upon MVS SMF. Such a log comprises a sequence of contiguous blocks. A block is the unit of output when flushing the internal log buffer.

Each block comprises a block header followed by a variable number of CICS records. The format of the block header is defined by the dsect "lgbh_block_header".

Each CICS record comprises a record header followed by the caller data part. The record header is defined by the dsect "glrh_record_header".

The format of the caller data part is unknown at the Log Manager functional level. It usually comprises one or several other CICS component record headers followed by yet another embedded caller data part. The record header fields "glrh_rec_type" and "glrh_rec_compid" indicates which CICS component is to be used to define this part of the record.

If this is 'UJ', which means the record originated from an application program, then this record header is followed by a user header as defined by "cl_user_header".

The following diagram shows the physical layout of a General Log block.

```
general log
__ first general log block
__ __ block header (lgbh_block_header)
__ __ __ first cics record
__ __ __ __ record header (glrh_record_header)
__ __ __ __ caller data
__ __ __ __ next cics record
__ __ __ ...
__ __ __ last cics record
__ __ __ ...
__ next general log block
__ ...
__ last general log block
__ ...
```

This copybook defines the block header, record header, general user header, and 'start of run' record body for General Logs.

When CICS connects to a MVS Logger General Log it writes a 'start-of-run' record to the log as the first record written during this run of CICS. This record is made up of a record header as defined above followed by the dsect "gl_ sor_body".

NOTE: "gl_ sor_body" is a particular case of 'caller data' referred to above.

The following diagram shows how a 'start-of-run' record appears within a General Log block.

The CICS API supports writing directly to a user journal (which may be a General Log or the System Log) using the EXEC CICS WRITE JOURNALNAME command. This takes as input the journal type, user data and optional user prefix data. These elements are put together as shown in the dsect "cl_user_header".

NOTE: "cl_user_header" is a particular case of 'caller data' referred to above.

In this case "glrh_rec_compid" will be set to 'UJ'.

The following diagram shows how a user header appears within a General Log record.

NOTE: "cl_uh_prefix_length" shows the number of bytes of data that is contained in the user prefix. The user prefix data, if present, immediately follows this header, which in turn is followed by the user data.

LGMS SMF Log Format

-

A CICS user journal (not the System Log) can be defined to reside upon SMF (a special log that MVS SMF manages). This log comprises a sequence of contiguous blocks, some of which are built and written by CICS.

Each block built and written by CICS comprises a SMF block header, CICS SMF product section, followed by a CICS data section. The latter comprises of a variable number of CICS records. The format of the block header is defined by the dsect "smf_block_header".

The SMF CICS data section, which only shows its start address, has been included for completeness. In reality this section includes a variable number of CICS records.

Each CICS record comprise a record header followed by the caller data part. The format of the record header is defined by the dsect "glrh_record_header". The format of the caller data part is unknown at the Log Manager functional level. It usually comprises one or several other CICS component record headers. The record header fields "glrh_rec_type" and "glrh_rec_compid" indicates which CICS component is to be used to define this part of the record.

The following diagram shows the physical layout of an SMF log block

MVS SMF log
__ first log block
__ __ smf block header (smf_header)
__ __ smf cics product section (smf_product_section)
__ __ smf cics data section (smf_data_section)
__ __ __ first cics record

__ __ __ caller data
__ __ __ next cics record
__ __ __ ...
__ __ __ last cics record
__ __ __ ...
__ next general log block
__ ...
__ last general log block
__ ...

This copybook defines the SMF block header. It should be used in conjunction with the General Log copybook DFHLGGFD which defines the record header and user header.

FUNCTION =
 This data area contains logstream statistics provided by
 the Log Manager Domain.
 It is provided for use in users monitoring applications
 to map the statistics returned via the API or the statistics
 exit.
 There is a single instance of this data block.
LIFETIME =
 This data block is created by the Log Manager
 Domain to store statistics to be passed to the user in
 response to a request for statistics. The storage is
 released when the user task is detached.
 The DSECT also maps the contents of part of the SMF buffer
 created by the statistics domain and is used in the
 statistics exit.

FUNCTION =
Contains the request and response for modules called by the DFHLUC macro.
When the DFHLUC macro is used to invoke a LU6.2 request appropriate fields in the parameter list are set, and module DFHZARL is invoked. All information passed to and from DFHZARL is passed in this parameter list.
It is also used to pass information from DFHZARL to DFHZERH and DFHZARR for certain requests, and to DFHZXR3 for LU6.2 transaction routing.
LIFETIME =
STORAGE CLASS =
LOCATION =
The control block is located in the LIFO storage of the module which issues the DFHLUC macro; it may also be copied into the LIFO of the called module.

FUNCTION =
This control block is used to pass parameter information to the LU services manager.
Note that the PLX version of this control block differs somewhat from the assembler version:
1. The assembler version is prefixed by two halfwords which are used by DFHIC GET/PUT. Users of the PLX version are expected to manage define that extra storage themselves. This apparent snag is balanced by the fact that the PLX version is more useful for command level usage, where the length is logically separated from the data
2. The assembler version does not define the DCE signoff structure, since no assembler code uses it

ALIAS EXTENSION AREA THIS IS THE FIRST USE OF A MAP HEADER EXTENSION AREA. THIS FOLLOWS THE LAST FIELD IN A MAP, AND IS POINTED TO BY BMSMSS THE FLAG BMSMODE(BMSMHEXT) IS SET ON IF THIS AREA IS PRESENT THIS AREA CONTAINS A NUMBER OF EXTENSION RECORDS, EACH HEADE BY ONE BYTE LENGTH AND TYPE FIELDS. IT IS THUS EXTENDABLE. NOTE HOWEVER THAT THE CICS/VS 1.5 OBF CODE DOES NOT TEST THE EXTENSION RECORD TYPE AND LENGTH. ANY FURTHER USE OF THIS MAY REQUIRE REWORK OF THE OBF SUPPORT IN PBP AND M32. THE MAP ALIAS EXTENSION RECORD IS USED FOR PASSING THE NAMES OF OUTBOARD MAP-GROUP AND OUTBOARD FORMAT TO M32

Transient data buffer control

MODULE NAME = DFHMBPCS
DESCRIPTIVE NAME = **Transient Data Buffer Control**
CICS/ESA AP Domain
@BANNER_START 02
Licensed Materials - Property of IBM

@BANNER_END
FUNCTION =
Copybook DFHMBPCS provides structures, DFHMBCA and DFHMBCB and DFHMQCB.
DFHMBCA describes the Buffer Common Area (MBCA), only one MBCA is allocated.
DFHMBCB describes the Buffer Control Block (MBCB), one MBCB is allocated for each I/O buffer.
DFHMQCB describes the Queue Control Block (MQCB), one MQCB is allocated for each I/O buffer. MQCBs are used to optimize the search for I/O buffers containing records for a given queue.
LIFETIME =
The lifetime of the control blocks and I/O buffers is essentially that of CICS.
STORAGE CLASS =
The control blocks are located in storage allocated from the DFHTDG31 subpool.
The I/O buffers, if required, are located in storage allocated from the DFHTDIOB subpool.
Note that the number of I/O buffers is defined as a SIT parameter / override.
Note also that the number of I/O buffers allocated may exceed the number requests where this does not cause further pages to be allocated.
LOCATION =
The MBCA is located from the TDST.
MBCBs are located on one of three bi-directional chains whose anchors are located in the MBCA
1. unallocated, I/O buffer is (logically) empty
2. unallocated, I/O buffer contains valid data
3. allocated, I/O buffer is (logically) modified
MQCBs are located on one of many bi-directional chains
1. anchor located in the MBCA when the associated MBCB is on chain 1
2. anchor located in the relevant DCTE when the associated MBCB is on chain 2 or chain 3.
Each MQCB may be located from its associated MBCB and vice versa.
INNER CONTROL BLOCKS =
There are no inner control blocks.
NOTES :
DEPENDENCIES =

RESTRICTIONS =

MODULE NAME = DFHMCAD
DESCRIPTIVE NAME = CICS MAP CONTROL AREA DESCRIPTION
@BANNER_START 02
Licensed Materials - Property of IBM

FUNCTION = DESCRIBE MAP CONTROL AREA FOR SETTING UP BMS OUTPUT
DATA STREAM FOR 3270 OR LU1 SCS PRINTER DEVICE
This area contains information pertinent to one of the
maps being used in a page build process for a 3270
or LU1 SCS printer device.
The Map Control Areas for one page of data are maintained
on a chain which is anchored in field TTPMMFCP contained
in the current TTP. The chain is maintained in order
by the field position of the next field to be processed
in each map. The last Map Control Area in the chain is
always a dummy MCA containing only a zero chain address
and a maximum possible field position. Each MCA contains
copies of those fields of the map header which are
required to build the data stream. All the Map Control
Areas for one page of data are contained in one area of
storage with the first one being the dummy MCA.

MCB BMS message control block

MODULE NAME = DFHMCBDS
DESCRIPTIVE NAME = **CICS BMS MESSAGE CONTROL BLOCK**
 @BANNER_START 02
 Licensed Materials - Property of IBM
 "Restricted Materials of IBM"
 5697-E93
 @BANNER_END
FUNCTION = DEFINE THE STATE OF A BMS LOGICAL MESSAGE. THIS IS
 USED BY THE TERMINAL PAGE RETRIEVAL PROGRAM DFHTPR.
 THERE IS ONE MCB PER LEVEL OF PAGE CHAINING. THE
 MCBS ARE CHAINED TOGETHER, WITH AN ANCHOR IN THE BMS
 TCTTE EXTENSION. MCBS ARE ALLOCATED AND FREED BY
 DFHTPR. THEY RESIDE IN SHARED STORAGE.
 THE MCB HAS SEVERAL PARTS:-
 A) A COMMON PART CONTAINING INFORMATION SUCH AS THE
 TS QUEUE NAME.
 B) A PART CONTAINING STATUS INFORMATION (E.G. CURRENT
 PAGE NUMBER) FOR THE CURRENT LDC OR PARTITION.
 C) AN ENTRY FOR EACH LDC OR PARTITION CONTAINING DSTATUS
 DATA (E.G. CURRENT PAGE NUMBER, TOTAL PAGE COUNT)
 FOR THAT LDC OR PARTITION. THIS IS COPIED INTO B)
 WHEN THE LDC OR PARTITION BECOMES CURRENT.
 D) THE PAGE/LDC TABLE WITH ONE ENTRY PER PAGE OF THE
 MESSAGE, INDICATING THE LDC OR PARTITION FOR THIS
 PAGE
 THE MCB IS PARTIALLY BUILT FROM THE MESSAGE CONTROL
 RECORD (MCR) WHEN THIS IS RETRIEVED FROM TS. OTHER
 PARTS ARE MAINTAINED BY DFHTPR.

It is provided for use in users monitoring applications to map the statistics written to SMF by the statistics domain.
There is a single instance of this data block.
LIFETIME =
This data block is created when the Monitoring Domain is initialised and remains until the domain is shut down.
LOCATION =
User is passed a pointer to the head of the storage block.

MRC

MRC Transient data VSAM control

MODULE NAME = DFHMRCPS
DESCRIPTIVE NAME = **Transient Data VSAM Control**
CICS/ESA AP Domain
@BANNER_START 02
Licensed Materials - Property of IBM
"Restricted Materials of IBM"
5697-E93
@BANNER_END
FUNCTION =
Copybook DFHMRCPS provides structures, DFHMRCA and DFHMRCB and DFHMRSD.
DFHMRCA describes the String Common Area (MRCA), only one MRCA is allocated.
DFHMRCB describes the String Control Block (MRCB), one MRCB is allocated for each VSAM string.
DFHMRSD describes the Segment Descriptor (MRSD), the number of MRSDs allocated depends on the size of the intrapartition data set.
LIFETIME =
The lifetime of the control blocks and I/O buffers is essentially that of CICS.
STORAGE CLASS =
The control blocks are located in storage allocated from the DFHTDG31 subpool.
Note that the number of VSAM strings is defined as a SIT parameter / override.
LOCATION =
The MRCA is located from the TDST.
MRCBs, if unallocated, are located on a chain whose anchor is located in the MRCA.
MRSDs are located on a chain whose anchor is located in the MRCA.
Note that the update ACB and output ACB are located from the MRCA.
Note also that the RPL and VSAM Error Message Area (VEMA) are located from the associated MRCB.
INNER CONTROL BLOCKS =
There are no inner control blocks.
NOTES :
DEPENDENCIES =
S/370
RESTRICTIONS =
There are no restrictions.
MODULE TYPE =
Control block definition.

FUNCTION =
Copybook DFHMCWPS provides structure DFHMCWCB.
DFHMCWCB describes the Wait Control Block (MWCB),
a MWCB is allocated on an as required basis.
LIFETIME =
The lifetime of the control block is essentially
that of the wait. They are allocated when it is
necessary to suspend a task and freed when the task is
resumed.
STORAGE CLASS =
The control block is located in storage allocated
from the DFHTDWCB subpool.
LOCATION =
The MWCB is located from
1. a DCTE
2. the MBCA
3. a MBCB
2. the MRCA
3. a MRCB
depending on the event being waited on.
INNER CONTROL BLOCKS =
There are no inner control blocks.

These are the statistics returned by the AXM page pool management routines for the pools AXMPGANY and AXMPGLOW. Storage in these pools is allocated in multiples of 4K pages on a 4K boundary. The most frequent use is for segments of LIFO stack storage. Storage is initially allocated from the pool using a bit map. For faster allocation, free areas are not normally returned to the pool but are added to a vector of free chains depending on the size of the free area (1 to 32 pages). When storage is being acquired, this vector is checked before going to the pool bit map. If there are no free areas of the right size and there is not enough storage left in the pool, free areas in the vector are put back into the pool, starting from the smallest end, until a large enough area has been created. This action appears as a compress attempt in the statistics. If there is still insufficient storage to satisfy the request, the request is failed. Statistics for LOC=ANY storage pool.

Although provided in a general library, DFHNQUED is not to be used as a general programming interface. Refer to product documentation to determine intended usage.
The following fields are part of the Product-sensitive Programming Interface.

NQ_ADDR0
NQ_ADDR1
NQ_ADDR2
NQ_ADDR3
NQ_GROUP
NQ_FUNCT
NQ_BITS1
NQ_BITS2
NQ_EIDOPT5
NQ_EIDOPT6
NQ_EIDOPT7
NQ_EIDOPT8
NQ_ENQ
NQ_DEQ
NQ_RESOURCE
NQ_LENGTH
NQ_MAXLIFETIME

All equates for values of EIBRCODE, EIBRESP and EIBRESP2 form part of the General-purpose Programming Interface.
All remaining fields used in defining the Exec Parameter List are product sensitive and may vary between CICS releases.

FUNCTION =
To define the EXEC parameter list for ENQ/DEQ requests, for use by global user exit programs at exit points XNQEREQ and XNQEREQC.
On entry to the XNQEREQ and XNQEREQC User Exits, the EXEC parameter list is pointed to by UEPCLPS.
The EXEC parameter list for ENQ/DEQ consists of four addresses.
The four addresses are defined by NQ_ADDR0 to NQ_ADDR3.
This DSECT defines these addresses and the areas that they point to.
On entry to the XNQEREQ and XNQEREQC User Exits, the copy of EIBRCODE is pointed to by UEPRCODE, the copy of EIBRESP is pointed to by UEPRESP and the copy of EIBRESP2 is pointed to by UEPRESP2.
This DSECT also contains equates for values of EIBRCODE, EIBRESP and EIBRESP2 used by ENQ/DEQ.

LIFETIME = Lifetime of the NQ command request

STORAGE CLASS = As the storage being mapped is the translated source in the user's application program, the storage may be either above or below the line.

LOCATION = (1) EXEC Parameter List is addressed by UEPCLPS.
(2) Fields copied from the EIB are addressed by UEPRCODE, UEPRESP and UEPRESP2.
(3) The token for use in communicating between XNQEREQ and XNQEREQC is addressed by UEPNQTK.

INNER CONTROL BLOCKS =
NQ_ADDR_LIST declares the EXEC addresses.
NQ_EID defines the EID pointed to by NQ_ADDR0.

The command parameter list is a list of addresses which reference the argument values for this EXEC CICS command. The addresses are only valid if the argument is applicable to this command.
The existence bits in the EID component (NQ_BITS1) specify those addresses that are valid, and the flagword bits (NQ_EIDOPT5 - NQ_EIDOPT7) specify the keywords that were given in the EXEC CICS command.
Therefore, you can deduce the useage of each address by testing these bits in conjunction with the command function(NQ_FUNCT).

NQUE

(4)	ADDRESS	4	NQ_ADDR1	RESOURCE
(8)	ADDRESS	4	NQ_ADDR2	LENGTH
(C)	ADDRESS	4	NQ_ADDR3	MAXLIFETIME

NQ_EID (addressed by NQ_ADDR0) gives the command function, and contains the existence and flagword bits.
Note: Equates for NQ_GROUP, NQ_FUNCT, EIBRCODE, EIBRESP and EIBRESP2 values are defined at the end of this data structure.

The existence bits (NQ_BITS1) specify the parameters that are valid for this command.
For example, NQ_EXIST2 set on indicates that NQ_ADDR2 is valid, meaning that it addresses a LENGTH value.
NQ_ADDR0 is always valid and has no existence bit.

All equates for values of EIBRCODE, EIBRESP and EIBRESP2 form part of the General-purpose Programming Interface.

FUNCTION =

To define fields that may be of use to Program Control User Exits:-

- (1) The Command Level Parameter List.
- (2) EIBRCODE, EIBRESP and EIBRESP2 values.
- (3) The application environment indicators

On entry to the XPCREQ and XPCREQC User exits, the EXEC parameter list is pointed to by UEPCPLPS. The EXEC parameter list for program control consists of up to eleven addresses.

The eleven addresses are defined by PC_ADDR0 to PC_ADDRA. This DSECT defines PC_ADDR0 to PC_ADDRA and the areas that they point to.

On entry to the XPCREQ and XPCREQC user exits, the copy of EIBRCODE is pointed to by UEPRCODE, the copy of EIBRESP is pointed by UEPRESP and the copy of EIBRESP2 is pointed to by UEPRESP2.

The address of an application environment flag byte pointed to by UEPINDS is also passed to the user exit program. It contains flags which are mapped by the PC_INDS DSECT. These flags allow the exit program to decide whether the user application can access storage above or below the 16M line and which key such storage should be in, CICS or USER.

This copybook also contains equates for values of EIBRCODE, EIBRESP and EIBRESP2 used by Program Control.

LIFETIME = Lifetime of the PC command request

STORAGE CLASS = As some of the storage being mapped is the translated source in the user's application program, the storage may be either above or below the line.

LOCATION = (1) EXEC Parameter List is addressed by UEPCPLPS.

- (2) Fields copied from the EIB are addressed by UEPRCODE, UEPRESP and UEPRESP2.
- (3) The exit token is addressed by UEPCCTOK

INNER CONTROL BLOCKS =

- PC_ADDR_LIST declares the EXEC addresses
- PC_EID defines Argument 0 pointed to by PC_ADDR0

The Command Parameter List

PC_ADDR_LIST defines eleven addresses, that form the EXEC parameter list for Program Control.

In addition, PC_ADDR1 to PC_ADDR8 and PC_ADDRA may be modified by a user exit.

PC_ADDR9 is not used.

Any attempt to modify PC_ADDR0 will be ignored.

PC_EID defines: (1) The type of request (2) Existence bits indicating which addresses in the EXEC Parameter List are valid. (3) Bits to indicate the keywords specified. PC_ADDR0 contains the address of PC_EID. The following bits may be modified in a Program Control user exit. (1) Existence bits PC_EXIST2, PC_EXIST3, PC_EXIST4, PC_EXIST5, PC_EXIST6, PC_EXIST7, PC_EXIST8 and PC_EXISTA (2) The keyword descriptor PC_SYNCONRET_X. Any attempt to modify any other part of PC_EID will be ignored.

PGACC Program Manager Autoinstall Commarea

CONTROL BLOCK NAME = DFHPGACC
 DESCRIPTIVE NAME = CICS/ESA (PG) Program Manager Autoinstall
 exit program parameter list

@BANNER_START 02
 Licensed Materials - Property of IBM
 "Restricted Materials of IBM"
 5697-E93
 @BANNER_END

FUNCTION = Defines the commarea passed by the Program Manager
 autoinstall function to the autoinstall exit program.
 The PGAC control block belongs to the Program Manager (PG)
 domain. The control block is used to pass the name of the
 program and the module type to the exit program and enables
 the user to return information for the program to be
 autoinstalled. Storage for the control block is obtained
 by the autoinstall function (DFHPGAI).

LIFETIME =
 The control block is created when the autoinstall function
 (DFHPGAI) is called. The storage is released on return
 from the autoinstall function.

STORAGE CLASS =
 The control block uses the automatic storage for DFHPGAI.
 This storage is above the line.

LOCATION =
 In the automatic storage for DFHPGAI at the label PGAC.
 The address and length of the control block are passed
 to the program autoinstall exit program via the commarea.

NOTES :
 This control block is provided as a sample and is not to be
 used as a general programming interface. Refer to the
 CICS/ESA Customisation Guide to determine its intended
 usage.
 Matching COBOL control block is DFHPGACO
 Matching C control block is DFHPGACH
 The control block includes the following fields:

Input fields:
 PGAC_PROGRAM - name of program to be autoinstalled
 PGAC_MODULE_TYPE - program, mapset or partitionset

Output fields:
 PGAC_MODEL_NAME - autoinstall model program name
 PGAC_LANGUAGE - assembler, cobol, C370, LE370, PL/I
 PGAC_CEDF_STATUS - cedf status, yes or no
 PGAC_DATA_LOCATION - data location, below or any
 PGAC_EXECUTION_KEY - execution key, CICS or user
 PGAC_LOAD_ATTRIBUTE - reload, transient, resident, reusable
 PGAC_USE_LPA_COPY - use LPA copy, yes or no
 PGAC_EXECUTION_SET - use DPL subset or full API
 PGAC_REMOTE_SYSID - remote system ID
 PGAC_REMOTE_PROGID - remote program name
 PGAC_REMOTE_TRANSID - remote transaction ID
 PGAC_DYNAMIC_STATUS - DPL dynamic or not dynamic
 PGAC_CONCURRENCY - QUASIRENT or THREADSAFE
 PGAC_API - CICSAPI or OPENAPI
 PGAC_JVM - the program is to be run under the JVM
 PGAC_JVM_CLASS_LENGTH - length of JVM class name data
 PGAC_JVM_CLASS_DATA - the JVM class name data
 PGAC_JVM_PROFID - the JVM profile member name
 PGAC_RETURN_CODE - OK, or don't define the program
 The return fields are initialized to blank on entry to the
 autoinstall exit program.

FUNCTION =
DFHPSGPS (PSG) is the master control block for the System
Spooling Interface facility.
Description
PSG - This Block contains the central control information
through which the System Spooling Interface works.
It is anchored from CSAPSCBA in the CSA Optional
Features List.
LIFETIME =
If SPOOL=YES is specified at CICS Initialization, then
control will be passed to DFHPSIP from DFHSIJ1. PSIP will
construct and initialize DFHPSGPS, which will remain in
existence all the time that CICS is running.

This copybook includes definitions for the anchor block, the state block, the pool block and all trace ids used by the domain. At present this is the only copybook for the PT domain. Everything is in a single copybook because this domain is so small. In time different definitions may be separated out into separate copybooks as the domain grows.

FUNCTION =
This data area contains global statistics provided by the Recovery Manager Domain.
It is provided for use in users monitoring applications to map the statistics returned via the API, the statistics exit, or offline formatting products.
There is a single instance of this data block.
LIFETIME =
This data block is created by the Recovery Manager Domain to store statistics to be passed to the user in response to a request for statistics. The storage is released when the user task is detached.
STORAGE CLASS =
LOCATION =
The user is passed a pointer to the head of the storage block.

<p>This structure is used to define the parts of a UOW object which may be accessed by inline macros. Since these need to be insensitive to the fact that the UOW is an object, we define these parts in a single structure which is addressed via the second half of the Recovery Manager transaction token.</p> <p>The fields are the local UOW id., the remote UOW id. (a variable length field of at most 27 bytes), the work token array, and a flag which indicates whether any non-optimal work tokens have been set.</p>

FUNCTION =
 DFHSSC describes the DSECT for the Set Storage Control area. This area describes the address, length, location (above or below) and key (CICS or USER) of storage that is returned in response to requests that specify the keyword SET.
 The Set Storage Control dsect is intended to be imbedded within other dsects. It may be used by any component that allocates SET storage.
 For example, the Set Storage Control dsect is used by File Control. It is imbedded within the FRTE, where it is used to describe SET storage acquired by READ UPDATE SET, READNEXT SET and READPREV SET requests. It is also imbedded within the FLAB where it is used to describe storage acquired by READ SET requests.
LIFETIME =

SUBTASK CONTROL AREA

Offset Hex	Type	Len	Name (Dim)	Description
(0)	STRUCTURE	176	DFHSKAPS	Subtask control area
SKASKENA contains the entry point of DFHSKE - the subtask executor. This field must remain at the start of DFHSKAPS. It is set by SKC and referenced by SIP on MVS, and by SKC on DOS.				
(0)	ADDRESS	4	SKASKENA	DFHSKENA entry point
SKASTGP contains the address of automatic storage to be used by SKE.				
(4)	ADDRESS	4	SKASTGP	add of subtask auto storage
SKAQUES contain the WQE queues for the subtask. SKAWORKQ contains WQEs as yet unprocessed by the subtask. SKAPROGQ contains WQEs currently being processed. SKAWAITQ contains WQEs that have issued a DFHSK CTYPE= WAIT macro.				
(8)	CHARACTER	12	SKAQUES	WQE queues for subtask
(8)	ADDRESS	4	SKAWORKQ	work
(C)	ADDRESS	4	SKAPROGQ	in_progress
(10)	ADDRESS	4	SKAWAITQ	waiting
SKAINWQE contains the address of the WQE currently being processed by SKE.				
(14)	ADDRESS	4	SKAINWQE	WQE being processed
SKAEWRK is the work ECB for the subtask. It is posted by SKM when it adds a WQE onto the work queue. When SKE has no work to do, it waits on this ECB.				
(18)	UNSIGNED	4	SKAEWRK	work ECB for subtask
SKASCOMP is the subtask completion ECB. It is waited on by SKC, and is posted by the operating system when the subtsk terminates.				
(1C)	CHARACTER	4	SKASCOMP	subtask completion ECB
SKADTECB is posted by SKC when either it DETACHes the subtask(MVS) or the subtask DETACHes itself(DOS). SKM, processing a DFHSK CTYPE=TERMINATE waits for subtasks to go away, before allowing DFHSTP to continue.				
(20)	UNSIGNED	4	SKADTECB	MVS DETACH issued for subtask
SKAINECB is an ECB that is posted by the subtask to indicate it has been attached. SKC waits for this to be posted before assuming the subtask is running.				
(24)	UNSIGNED	4	SKAINECB	ECB for sub initialisation
SKASRETC contains the completion code of the subtask and is used to indicate to SKC the type of completion.				
(28)	UNSIGNED	1	SKASRETC	subtask completion code

SKA

Offset Hex	Type	Len	Name (Dim)	Description
SKAESFCD contains the completion code of an ESTAE or STXIT AB macro if not zero. SKC examines this field and outputs it in a message if the exit macro failed in the subtask.				
(29)	UNSIGNED	1	SKAESFCD	ESTAE/STXIT failure code
SKAFAILS is a count of failures that occur when SKE code is executing (not SK exit code). It is set and referenced by SKE.				
(2A)	HALFWORD	2	SKAFAIL	count of our code failures
SKAFLAG1 IS A FLAG BYTE. UPDATED BY DFHSKC ONLY				
(2C)	BIT(8)	1	SKAFLAG1	flags - TRUE means..
SKAFLAG1 HAS BEEN SPLIT OVER FLAG1,2 AND 3 TO OVERCOME MULTIPLE PROCESSORS UPDATING SHARED STORAGE CONCURRENTLY. Following 5 flags are spare.				
	1...		*	moved to FLAG2
	.1..		*	moved to FLAG2
	..1.		*	moved to FLAG2
	...1		*	moved to FLAG3
 1...		*	reserved
SKASINIT indicates that this subtask has been initialised and is running.				
1..		SKASINIT	subtask is initialised
Following flag is spare.				
1.		*	moved to FLAG2
SKASDEAD indicates the subtask has encountered an error preventing further execution. It is set by SKC and referenced by SKM.				
1		SKASDEAD	subtask is dead
SKAFLAG2 IS A FLAG BYTE UPDATED BY DFHSKE ONLY				
(2D)	BIT(8)	1	SKAFLAG2	FLAGS - TRUE MEANS..
SKARGPSW indicates the presence of the regs and PSW at the time of failure in DFHSKAPS. It is set by the SKE exit code, and tested thereafter in SKE mainline code.				
	1...		SKARGPSW	regs&psw are in SKA
SKAABCP indicates the presence of the operating system abend code in DFHSKAPS.				
	.1..		SKAABCP	abend code is in SKA
SKARUNNG is set by SKE on entry, and turned off on exit from SKE. SKC references this field to see if the subtask was running when it terminated.				
	..1.		SKARUNNG	subtask running
Following 3 flags are spare.				
	...1 11..		*	spare flags
SKAUSCOD indicates this subtask is currently executing an SK exit routine.				
1.		SKAUSCOD	user code in progress
Following flag is spare.				
1		*	spare flag
SKAFLAG3 IS A FLAG BYTE UPDATED BY DFHSKM ONLY				
(2E)	BIT(8)	1	SKAFLAG3	FLAGS - TRUE MEANS..
Following 3 flags are spare.				
	111.		*	spare flags
SKAQUIES is set by SKM to indicate that the subtask should terminate processing.				
	...1		SKAQUIES	quiesce requested
Following 4 flags are spare.				
 1111		*	spare flags
SKAMWLST is a list of pointers used for an operating system multiple wait. It is used by DFHSKE. On MVS the list is terminated by the top bit in the last ECB ptr being on, and on DOS the byte after the last ECB ptr is non-zero ('FF'X).				
(30)	ADDRESS	4	SKAMWLST (6)	multiple WAIT list
(30)	CHARACTER	1	SKAMFB	first byte of each address

Offset Hex	Type	Len	Name (Dim)	Description
	1... ..		SKAMEOL	first bit thereof
SKASAV13 is set by SKE on entry to point to the MVS save area.				
(48)	UNSIGNED	4	SKASAV13	ADDR(MVS save area)
SKAPICA is an MVS Program Interrupt Control Area used by SKE.				
(4C)	UNSIGNED	4	SKAPICA (4)	subtask MVS PICA (ESPIE)
SKAABC contains the operating system abend code, and is used by SKE. An existance bit is in SKAFLAG1.				
(5C)	CHARACTER	4	SKAABC	operating system abend code
SKAPSAV contains the registers at time of failure, and is used by SKE. An existance bit is in SKAFLAG1.				
(60)	CHARACTER	64	SKAPSAV	program check save area
(60)	FULLWORD	4	* (16)	registers
SKAPSW contains the PSW at time of failure, and is used by SKE. An existance bit is in SKAFLAG1.				
(A0)	CHARACTER	8	SKAPSW	EC mode program check PSW
SKAINT contains extran interrupt information, and is used by SKE.				
(A8)	CHARACTER	8	SKAINT	interrupt information
(A8)	HALFWORD	2	SKAINTL	instruction length

FUNCTION = PLS structure describing WQE.
This structure is used by the CICS General Purpose Subtasking mechanism.
Each instance of this control block represents a piece of work to be performed (usually by a subtask).
One instance of the WQE is created per DFHSK PERFORM macro invocation.
LIFETIME = Space for WQEs is allocated in DFHSKP static storage.
Further WQEs as necessary are obtained during CICS execution
The WQEs are freed at CICS termination.
STORAGE CLASS =
Static initially, and subsequent WQEs are obtained in SHARED storage.
LOCATION =
WQEs reside on queues controlled by the Subtask Manager(SKM) and the subtask executor(SKE). The queues are anchored from static storage (nb CICS STATIC STORAGE) belonging to SKP.

WORK QUEUE ELEMENT

Offset Hex	Type	Len	Name (Dim)	Description
(0)	STRUCTURE	100	DFHSKWPS	Work Queue Element (WQE)
			SKWCHAIN - contains the address of the next WQE in chain	
(0)	ADDRESS	4	SKWCHAIN	chain to next WQE
			SKWUPARM - contains the contents of the PARM field specified in the DFHSK CTYPE=PERFORM macro.	
(4)	ADDRESS	4	SKWUPARM	PARM specified on SK wait
			SKWUCADD - contains the address of SK EXIT routine - the label specified in the ROUTINE keyword on the SK CTYPE=PERFORM macro.	
(8)	ADDRESS	4	SKWUCADD	user code address to execute
			SKWSREGS - used by to save the registers before branching to the SK EXIT routine by SKM (synchronous) and SKE (asynchronous)	
(C)	CHARACTER	64	SKWSREGS	SKM/SKE register save area
			SKWCECB - this is the ECB used to communicate between SKM and SKE. SKM waits on it when the WQE has been put onto a subtask work queue. SKE posts it when the WQE has been processed.	
(4C)	UNSIGNED	4	SKWCECB	CICS work complete ECB

The Logical Device Code (LDC) structure is the mechanism used by CICS to identify the output message destination in an SNA environment. The SLDC table is generated by the DFHTCT TYPE=LDC macro instruction. It contains an entry for each LDC mnemonic used by the system. The logical page size, page disposition and terminal type are used by BMS to control the format of the output message.

SNEX Signon Extension Block

CONTROL BLOCK NAME = DFHSNEXC DESCRIPTIVE NAME = CICS Sign-on Extension to the TCTTE @BANNER_START 02 Licensed Materials - Property of IBM "Restricted Materials of IBM" 5697-E93 @BANNER_END FUNCTION = The Signon Extension is owned by the Signon component of the AP Domain and contains information related to the Signon and Terminal Timeout processes. Each TCTTE has its own Signon Extension which is pointed to by the TCTESNEX pointer. LIFETIME = A SNEX is created at the same time that a TCTTE is created when a terminal definition is installed. STORAGE CLASS = CICS storage, above the 16Mb line in the subpool 'SNEX'. No element chaining. LOCATION = A SNEX is located by using the TCTESNEX pointer in the TCTTE. NOTES : DEPENDENCIES = S/390 MODULE TYPE = Control block definition

Offset Hex	Type	Len	Name (Dim)	Description
(0)	STRUCTURE	56	DFHSNEX	Start of SNEX control block
Userid: SNEX_USERID: This field is used to contain the preset userid for macro defined terminals only. When the terminal has been installed, and the userid has been signed on, this field is overlaid by the principal user token and session user token (null). The flag SNEX_PRESET_USERID_PRESENT indicates whether this field currently contains a userid or tokens.				
(0)	CHARACTER	8	SNEX_USERID	
User Tokens: SNEX_PRINCIPAL_USER_TOKEN: This field contains the user token associated with the user currently signed on at this terminal. SNEX_SESSION_USER_TOKEN: If this terminal represents a session, this field contains the user token associated with the userid signed on at this terminal.				
(0)	UNSIGNED	4	SNEX_PRINCIPAL_USER_TOKEN	
(4)	UNSIGNED	4	SNEX_SESSION_USER_TOKEN	

Offset Hex	Type	Len	Name (Dim)	Description
Terminal Timeout Information:				
SNEX_TIMEOUT_TIME:				
				This is the time (in STCK format) that this terminal is next due to timeout.
SNEX_TIMEOUT_INTERVAL:				
				This is the timeout interval for the currently signed on user expressed as the top word of a STCK value.
SNEX_TIMEOUT_FLAGS:				
SNEX_TIMEOUT_ELIGIBLE This flag is on only if the terminal is eligible for timeout processing. To be eligible, the terminal must:				
				- not be defined with SIGNOFF=NO
				- not have preset security
				- be signed on
				- be signed on by a userid that has a non-zero timeout interval
				- not be performing transaction routing unless under the CRTE transaction
SNEX_TIMEOUT_ENABLED:				
				When ON this flag indicates that the terminal is in the TIMEOUT ENABLED state. When OFF this flag indicates that the terminal is in the TIMEOUT DISABLED state.
SNEX_TIMEOUT_TIMEDOUT:				
				When ON this flag indicates that the terminal is currently being timed out.
SNEX_SAVED_ATI_STATUS:				
				This flag is used to save the setting of the ATI status of the terminal while the goodnight transaction is being scheduled.

XRF Information				
SNEX_XRF_FLAGS:				
SNEX_XRF_REFLECTABLE:				
				This flag indicates whether the terminal should have its signon state reflected on an ALTERNATE XRF system. For this flag to be ON, the XRFSOFF SIT parameter must be set to NOFORCE, the XRFSIGNOFF flag in the terminal's TYPETERM definition must be set to NOFORCE and the users CICS segment in RACF must show that the user is not to be signed off after an XRF takeover. If any of the above conditions are false, this flag is set OFF.

Userid Length				
SNEX_USERID_LENGTH This field contains the length of the userid contained in SNEX_USERID. This field is only valid for macro defined terminals. Once the terminal has been installed by CICS this field is returned to zeros.

Transaction Statistics Information				
SNEX_TXN_COUNT:				
Keeps tally of the number of txns run by this user at this terminal for the duration of the current signon.				
SNEX_TXN_ERROR_COUNT:				
Keeps tally of the number of txn errors in this signon session.				
(18)	FULLWORD	4	SNEX_TXN_COUNT

Miscellaneous Flags				
SNEX_PRESET_SECURITY: Flag used to signal if this terminal has preset security. This flag is also set on for sessions that have a preset session userid.				
SNEX_SESSION_SIGNED_ON: Flag used to signal that this session has been session (link) signed on.				
SNEX_PRESET_USERID_PRESENT: Flag used to indicate that a preset userid exists in the SNEX_USERID field. This is used to perform a preset signon when the terminal is installed. This is only used in the case of macro defined terminals.				
SNEX_SESSION_SIGNED_ON_AS_DEFAULT: Flag used to signal that this session has been session (link) signed on with default attributes. This is used in signoff session userid to stop unnecessary delete user processing.				
SNEX_SESSION_USER_TOKEN_X: Flag used to indicate that this SNEX contains a valid user token in the SNEX_SESSION_USER_TOKEN field. The session user token might be null, but this can still be a valid session user token. This happens in the cases where it is necessary to enforce a link security check against the default user.				
SNEX_LUIT_TABLE_UPDATED: Flag used to indicate whether during a signon_attach_header the LUIT table was updated. This flag should only be set on during a signon attach header for a persistent verification FMH-5. When this terminal is attach signed off, then this flag should be turned off ready for the next user of this terminal.				
SNEX_EQUIVALENT_SYSTEMS: Flag used to let DFHZNCA know that although this session does not have the snex preset security flag on, it did however have a preset session userid, but it was the same as this system's jobstep userid. This is known as equivalent systems for LU6.1 and LU6.2, but a different check is made for MRO for equivalent systems. Namely that the link security name is the same as the jobstep userid of the connecting system. Hence this flag is not required for MRO, because we can only make the equivalence check when we know the connectee's userid. This is done in DFHCRNP when the connection is acquired.

TACB Transaction abend control block

CONTROL BLOCK NAME = DFHTACBS
DESCRIPTIVE NAME = CICS Transaction Abend Control Block

FUNCTION =
A Transaction Abend Control Block is built, usually by DFHPCP, when abend processing is performed. It contains details of the abend, such as the abend code. The address of the latest TACB for a task is in TCAPCACB in the TCA. If multiple abends occur, one TACB per abend is built. TACBs are chained together using ABNDNXT in the TACB. Note that for ASRA, ASRB, ASRD and AICA abends the TACB is built by DFHSRP, so we can capture (1) the PSW and registers at the time of the program check, MVS abend or runaway, and (2) the diagnostics provided by DFHSRP such as storage hit by 0C4, and offset of program check or MVS abend in program. Note that abends in a remote DPL server program are re-issued with the same abend code on the local system. The PSW and registers are not valid for such re-issued abends, and the TACB contains a REMOTE eyecatcher to indicate this. The TACB for such abends is built by DFHEPC.

FUNCTION = The DFHTCAPS copybook declares the structure for the TASK CONTROL AREA (TCA). The TCA is the primary control block used by CICS to represent a transaction within AP domain.
The TCA is a single area of storage described by structure DFHUSTCA. However, it is also possible to access the TCA as two separate structures, DFHUSTCA (User area) and DFHTCADY (System area). Field TCASYAA in DFHUSTCA contains the address of DFHTCADY, for this purpose.
When reading code that deals with TCA fields, it is important to know which method of access is used.

TCPRA Receive any control element

BI-LINGUAL Control Block
=====
MODULE NAME = DFHTCPRA
DESCRIPTIVE NAME = CICS Receive Any Control Element
FUNCTION = Receive Any Control Elements (RACE) are obtained at initialisation time by DFHZRPL. Each element is a control block used when processing a Receive Any RPL. The RACE contains the ECB and a pointer to the RPL. RACEs are contained in a pool pointed to by the TCTVRVRA field of the terminal control table prefix.

FUNCTION = Store remote install/remote delete data for use by module DFHZATS. The DSECT is used exclusively by DFHZTSP DFHCRS and DFHZATS.
The WE contains:
FIELD LENGTH
=====
Request type 1 byte
ECB 1 byte
Reserved 2 bytes
Terminal ID 4 bytes
Remote system ID 4 bytes
TCSE address 4 bytes
Netname 8 bytes
Pointer to BPS 4 bytes
New TCTTE address 4 bytes
Token 8 bytes
LIFETIME = Storage is obtained by a GETMAIN issued by the calling module (DFHZTSP or DFHCRS) and released by a FREEMAIN following completion or failure of the remote install or remote delete. In the event of the calling program ABENDING before completion of the remote install or delete storage is released by DFHZATS.
STORAGE CLASS = Shared
LOCATION = The address is placed in TCAFCAAA for retrieval by DFHZATS

CONTROL BLOCK NAME = DFHTCTTE
DESCRIPTIVE NAME = CICS TCT Terminal Entry
Many assembler bit names are not included in this structure.
E.G. The TCTEIGBF in 'OI TCTEIGBF,TCTEGBF' will be found under TCTEGBF and not TCTEIGBF.
Old L0 to LZ removed to allow resuse of change flags.
Old @L0 to @LZ have been changed to @I0 and @Iz.
Use cruise on older releases if you need the original flag

This is the token returned by ADD_LINK, and represents &rm.'s link state. It is supplied to &rm. on subsequent calls.

(148)	BIT(32)	4	CR_CURRENT_ LINK
-------	---------	---	------------------

--

-

This field is used to keep &rm.'s token for a link which we have deleted but not forgotten (ie. the conversation has gone out of bracket, but the implicit forget flow has not been received yet).

In addition to this field, there is a flag to indicate that we have set FORGET(NO) in response to PERFORM_COMMIT, and are therefore obliged to inform &rm. that he can forget the link status on the next inbound flow (or that he must remember the link status if the session is lost).

Also, there is a flag to indicate that the session is a 'dummy', in the sense that a DFHRMLNM ADD_LINK has not been issued for the session. This happens for MRO sessions which are used to perform bind processing (DFHCRR). Bind sessions do not need recovery manager actions, and do not participate in syncpoint (even in failure situations). There can be many concurrent bind sessions at start of day, and if we were to issue ADD_LINKs for all of them, then RM could be swamped.

The PENDING mechanism for adding/setting links is managed by a new piece of state, CR_PEND_RECOVERY_STATUS, associated with the session.

The following fields form part of a dummy AID which acts as the anchor for this TCTSE's AID chain. The only fields which actually exist in this dummy AID are the forward and backward chain pointers. The dummy AID forward pointer points to the first AID on the chain. The dummy AID backward pointer points to the last AID on the chain. The first AID's backward pointer points to the dummy AID. The last AID's forward pointer points to the dummy AID. If the chain is empty, the dummy AID forward and backward pointers both point to the dummy AID itself. Field TCSEDAID points to the notional start of the dummy AID.

Address of TCTEPSQ + the CONTENTS of TCTEPSQL.
When CICS is the PRIMARY SESSION then the LENGTH

the LENGTH of the SSQ is 4 IE. The CICS SESSION NAME

This DSECT describes a WORK ELEMENT which is GETMAINED in order
to hold information regarding unknown LOGONS.
Because the Error may occur many times before ZNAC can process
each WE, the WE'S are CHAINED together off the DUMMY TCTTE(VIA

Each element is used to hold a qualified name identifying the
unknown LU(NETNAME.2NDARY_SESSION_QUALIFIER), and other sundry

DESCRIPTIVE NAME = Terminal Control Table Skeleton Entry

The TCT skeleton represents a terminal that is attached to another CICS address space and may interact with this CICS address space via the terminal sharing facility.

The two fields which form the key in the table management index 'TCTN', identify the TCTSE by which this CICS will access the terminal-owning address space and the name that the terminal has in its own address space.

The skeleton also exists in the 'TCTE' table management index

The skeleton is used by the Transaction Routing (some times called Terminal Shipping) component to hold definition information between INSTALL, and task-attach. The skeleton contains only the names unique to the entry, the other parameters are in a "model" referenced by the skeleton.

Models are shareable between skeletons.

The skeleton resides on the 'application' system, there must be a matching normal terminal entry on the 'terminal' system.

When a transaction is to be run, a 'surrogate' TCTTE is created in task-attach and made visible to the transaction program in the usual way.

A reference to the surrogate is placed in the skeleton while one exists.

LIFETIME = Created by ZC INSTALL: destroyed by ZC DELETE.
See DFHZCQ00.

DESCRIPTIVE NAME = **Terminal Control Table Transaction**
Restart Extension

If a transaction is defined to be eligible for restart, copies of the TCTUA and the first TIOA have to be kept in case the transaction is restarted.

When a transaction is defined as restartable, a transaction restart extension is getmained and hung off the TCTTE (TCTTERST) Copies of the TCTUA and the initial TIOA are taken. The extension consists of addresses of the copies, followed by the copied data itself. If no TCTUA or TIOA exists the relevant address is zero. If neither the TCTUA nor TIOA exists, no extension is getmained.

LIFETIME = Created by DFHZSUP at transaction start, deleted by DFHZISP when a transaction ends and is not restarting.

Any change to this structure must be reflected in DFHTCTZE A

TCTWE VTAM Autoinstall work element

Bilingual Control block

=====

CONTROL BLOCK NAME = DFHTCTWE

DESCRIPTIVE NAME = CICS (VTAM) AUTOINSTALL WORK EMENT

@BANNER_START 02

Licensed Materials - Property of IBM

"Restricted Materials of IBM"

5697-E93

@BANNER_END

FUNCTION = Provide mapping for autoinstall work element components.

The DSECT is used solely within the ZCP DOMAIN.

There are as many WE's as there are autoinstall requests in progress.

The WE is used to store the CINIT_RU or BIND so that the logon may be attempted by DFHZATA.

If the WE contains a TCTTE address then this is a Postponed autoinstall work elemment (PWE), created by DFHZLGX when there is a LOGON for a TCTTE which is currently being deleted.

If the WE has TCTTECWE set then it is a Autoinstall Work Element used to autoinstall a console and to sign-off or sign-on a known console automatically.

LIFETIME = The WE is created by a GETMAIN issued by DFHZLGX (LOGON-EXIT) or DFHZSCX (SCIP exit) or DFHZCNA (Console Input) when an unknown terminal or console or APPC device attempts to LOGON or BIND or an unknown console issues an MVS MODIFY. It is also created if a known console needs to be signed-off or signed-on automatically. It is also created for a known terminal subject to certain restrictions. The WE is freed by DFHZNCA after DFHZNEP is driven for the OPNDST contition TWAEC=TCSOPSIN or prior to DFHZNEP being driven for a CLSDST contition TWAEC=TCACLSIN.

The WE is freed by DFHZATA when the request has been processed.

STORAGE CLASS = USER(OS - SUBPOOL 1)

LOCATION = For unknown terminals, each WE is chained off the previous one and the first one is anchored from TCTVANWE in the TCT prefix. After the TCTTE is built by DFHZATA for autoinstall-eligible devices, the WE address is saved in TCTEAWEA. For known terminals, DFHZLGX updates TCTEAWEA.

FUNCTION =
For XRF:-
Defines the data returned in response to the XRF Switch
command. When the XRF backup system issues the Switch
command to take over a session, the response data
received is described by Session State Data Control
Vector X'29'.
This data is used by CICS to determine state of the session
at takeover so that the appropriate Cleanup action can
be taken.
For Persistent Sessions:-
The data is returned following the OPNDST OPTCD=RESTORE
issued by DFHZGRP after a Persistent Sessions restart.
LIFETIME =
For a Persistent sessions restart, a TIOA is
acquired to hold this data when the OPNDST OPTCD=RESTORE
command is issued.
For XRF, this data is held in the RPL after the Switch
command is issued.
The area is freemained when the data has been examined.

FUNCTION =
To define the EXEC parameter list for Transient Data
requests, for use by global user exit programs at exit
points XTDEREQ and XTDEREQC.
On entry to the XTDEREQ and XTDEREQC User Exits, the EXEC
parameter list is pointed to by UEPCLPS.
The EXEC parameter list for Transient Data consists of
eight addresses.
The eight addresses are defined by TD_ADDR0 to TD_ADDR7.
This DSECT defines these addresses and the areas that
they point to.
On entry to the XTDEREQ and XTDEREQC User Exits, the copy
of EIBRCODE is pointed to by UEPRCODE, the copy of EIBRESP
is pointed to by UEPRESP and the copy of EIBRESP2 is
pointed to by UEPRESP2.
This DSECT also contains equates for values of EIBRCODE,
EIBRESP and EIBRESP2 used by Transient Data.

The command parameter list is a list of addresses which reference the argument values for this this EXEC CICS command. The addresses are only valid if the argument is applicable to this command.

For example, address 1 is of the TD QUEUE name for all TD commands, whereas the address 2 is of the FROM data area on WRITEQ commands, the SET address or INTO data area for READQ commands, and is not valid for DELETEQ commands.

The existance bits in the EID component (TD_BITS1) specify those addresses that are valid, and the flagword bits (TD_EIDOPT5 - TD_EIDOPT7) specify the keywords that were given in the EXEC CICS TD command.

Therefore, you can deduce the useage of each address by testing these bits in conjunction with the command function(TD_FUNCT).

Offset Hex	Type	Len	Name (Dim)	Description
(0)	STRUCTURE	32	TD_ADDR_LIST	TD_ADDR_LIST consists of
(0)	ADDRESS	4	TD_ADDR0	the EID

(14)	ADDRESS	4	TD_ADDR5	Reserved
(18)	ADDRESS	4	TD_ADDR6	Reserved
(1C)	ADDRESS	4	TD_ADDR7	SYSID

TD_EID (addressed by TD_ADDR0) gives the command function, and contains the existence and flagword bits.

Note: Equates for TD_GROUP, TD_FUNCT, EIBRCODE, EIBRESP and EIBRESP2 values are defined at the end of this data structure.

'04'X for READQ				
'06'X for DELETEQ				
The existence bits (TD_BITS1) specify the parameters that are valid for this command.				
For example, TD_EXIST7 set on indicates that TD_ADDR7 is valid, meaning that it addresses a SYSID value.				
TD_ADDR0 is always valid and has no existence bit.				
TD_EXIST3 may be modified by a user exit program invoked for a READQ command with the SET option.				
TD_EXIST7 may be modified by a user exit program invoked for any TD request.				
None of the other bits may be modified.

TIE

TIE Task interface element

CONTROL BLOCK NAME = DFHTIEPS
DESCRIPTIVE NAME = CICS Task Interface Element
@BANNER_START 02
Licensed Materials - Property of IBM

@BANNER_END
FUNCTION =
PLX Structure of the TIE, which represents the intersection of a CICS task (TCA) with a named External Resource Manager represented by a Task Related User Exit (TRUE). An enabled TRUE is represented by an User Exit Program Block (EPB). The TIE holds all the task lifetime information which is passed between a CICS task and a named External Resource Manager.
The TIE belongs to the external resource manager module DFHERM. There can be many TIEs per CICS task. TIEs are chained off the TCA.
LIFETIME =
A TIE is acquired the first time a TRUE is invoked by a CICS task. There is one TIE for each TRUE a task invokes. All TIEs for a task are freed by DFHERM at end of task.
STORAGE CLASS =
TIEs are getmained from a dedicated subpool for each TRUE. Appended to the end of the TIE, is the Task Local Work Area for the TRUE, whose size is specified when the TRUE is enabled. Hence TIEs for different TRUEs are different sizes. A TIE subpool is located above the line only if the TRUE TRUE is ENABLED specifying LINKEDITMODE, and the TRUE has been linked into amode(31), meaning that the TRUE is always invoked in amode(31).
LOCATION =
The head of the TIE chain is TCATIEBA in the system TCA. Within a TIE is TIECHNA which points to the next TIE on the chain for the task.

DESCRIPTIVE NAME = CICS Table Manager Directory Element
@BANNER_START 02
Licensed Materials - Property of IBM

@BANNER_END
FUNCTION =
The table management directory element is a set of pointers that address members of chains of directory elements and a pointer to the corresponding directory segment. SKTFDEA in the table points to the first directory element and DIRGNCHN in each directory element points to its successor. DIRGPCHN points back to the predecessor and is 0 if at the front of the chain
LIFETIME =
Since directory elements are grouped into directory segments, see the prolog for DFHTMDSG (directory segment) for details about storage allocation.
Storage for a directory element will last for the duration of a CICS run though, if a table entry is deleted then its corresponding directory element will be marked as reusable and placed on a chain of free directory elements.
STORAGE CLASS =
Shared storage above the 16M line.
LOCATION =
SKTFDEA in the scatter table points to the first directory element, and DIRGNCHN in each directory element points to its successor.
DIRELEMA in a directory segment points to the start of a group of directory elements.
SKTFRDE in the scatter table points to the first free directory element. Subsequent free directory elements are chained together by the DIROWCHN field in the directory element.

TMDSG Table Manager Directory Segment

DESCRIPTIVE NAME = **CICS Table Manager Directory Segment**.
@BANNER_START 02
Licensed Materials - Property of IBM
"Restricted Materials of IBM"
5697-E93
@BANNER_END
FUNCTION =
 The table management directory segment holds a group of directory elements (for each table entry there is a directory element. For a table entry which has aliases, there will be a directory element for each alias). Directory elements are grouped together in this way in order to reduce the number of requests for storage allocation. The number of directory elements per directory segment is controlled by TMNDESG in the table manager static storage.
LIFETIME =
 Storage for a directory segment is acquired when adding a table entry, adding an alias name to an existing table entry, or when adding an entry to a secondary table (ie. a table which contains entries for remote objects). On subsequent additions to the table, storage for a new directory segment is acquired only when there are no free directory elements in the existing segment.
 Once created, directory segments last for the duration of the CICS run. Note that if a table entry is deleted then its directory element is marked as reusable.
STORAGE CLASS =
 Shared storage above the 16M line.
LOCATION =
 The first segment is located by SKTDIRSA in the scatter table. Subsequent segments are chained by DIRSGCHN in the directory segments themselves.

TMELD

TMELD Table Manager Read Lock Block

CONTROL BLOCK NAME = DFHTMELD
DESCRIPTIVE NAME = **CICS - Table Management Read Lock Block.**
FUNCTION =
The table management read lock block consists of a set of read locks and a count of locks assigned, on primary directory entries. Each time a task uses a locate function, a read lock on the primary directory entry, corresponding to the table entry found, is created by the locate function. A directory entry which has a read lock(s) can not be modified until the lock(s) is(are) released. Read locks are released at task termination or on specific request.
LIFETIME =
The initial read lock block is allocated at AP domain transaction initialization, and release in AP domain transaction termination and so a lock block is part of the AP transaction environemnt. TMP will acquire storage for a lock block when a task issues a function that requires a lock on a primary table entry (eg. a locate function). Note, when all locks within a lock block are released, the storage for the lock block is not released but re-initialised, thus making it reusable. If a task should require re-starting, then storage for any lock blocks which are not being used is released. Otherwise, storage for all read lock blocks is released at task termination.
STORAGE CLASS = CICS storage (CSATCA31/24) above/below the 16M line.
LOCATION =
In the TCA, TCARLB is the address of the first read lock block. Further read lock blocks are chained by TMELPTR, which is in the read lock block itself.

TMSKT Table Manager Scatter Table

DESCRIPTIVE NAME = CICS Table Manager Scatter Table.
@BANNER_START 02
Licensed Materials - Property of IBM

@BANNER_END
FUNCTION =
The table management scatter table holds pointers to
directory elements for use by the Table Manager Program.
TMSKTx in the table management static storage area holds
the address of this area.
LIFETIME =
It exists for the duration of the CICS System.
Storage for the scatter table (for each CICS table supported
by the table manager) is allocated at CICS initialisation.
However, the table manager reserves the right to dynamically
rehash a scatter table when TMCOUNT (the number of table
entries) is greater than or equal to TMTRIGR (triger value
for rehash). During rehash, storage (above the 16M line) is
acquired for the new hash table, and storage used by the old
hash table is released.
STORAGE CLASS =
Shared storage above the 16M line.
LOCATION =
Pointed to by TMSKTx in the table manager static storage.

Offset Hex	Type	Len	Name (Dim)	Description
(0)	STRUCTURE	48	DFHTRADS	DUMMY SECTION - PLIST TO TRAP
TRAFLGSA - Address of return actions flag word Return actions flag settings are in the byte addressed from field TRAFLGSA in the parameter list to DFHTRAP. The individual flag settings are as follows : TRAPFTRE EQU X'80' .. Make further trace entry on behalf of trap exit TRAPDUMP EQU X'40' .. Take a system dump TRAPCABD EQU X'10' .. Abend CICS (with a dump) TRAPDISA EQU X'08' .. Disable trap so that it cannot be used until reactivated Any combination of these flags may be set and wherever possible all requested actions will be honoured upon return to the trace domain. Note also that the trap will be disabled when requests to abend CICS are returned.				
(0)	ADDRESS	4	TRAFLGSA	A(Return actions flag word)
TRACURTA - Address of current entry in internal trace table This field points to the trace entry constructed by DFHTRPT on the same invocation for which it is calling DFHTRAP. This entry should not be modified by DFHTRAP. Its structure is mapped by the DSECT DFHTREN.				
(4)	ADDRESS	4	TRACURTA	A(Current entry)
TRAWORKA - Address of 80-byte work area for DFHTRAP. This work area is acquired when DFHTRAP is activated and is not changed by CICS until DFHTRAP is de-activated, so it may be used for saving information between invocations of DFHTRAP				
(8)	ADDRESS	4	TRAWORKA	A(80-byte work area)
TRAD1A/L, TRAD2A/L and TRAD3A/L These six fields are used in conjunction with the setting of TRAPFTRE in the return actions flag byte. This flag indicates that DFHTRPT should make a further trace entry. TRADnA/L are address and length pairs for the data fields to be included in this entry. If TRAPFTRE is set, DFHTRPT examines the length fields in turn. All fields up to the first with a zero length will be included in the extra trace entry.

@BANNER_END
FUNCTION = This is the header for a trace entry made by
a Feature when the DFHTRFTM TRACE_PUT interface is
used.
It appears immediately after the TREN_HEADER for
a Feature trace entry, as the first part of the
TREN_DATA. The remaining trace entry data,
supplied by the Feature as TRFT_DATAn (where n is
between 1 and 7) on the TRFT TRACE_PUT call,
follows immediately after the TRFTE_HEADER.
LIFETIME = Created by DFHTRFT in the internal trace table for
each TRACE_PUT. Destroyed when overwritten after
the next trace table wrap. Trace entries are also
held on auxiliary trace datasets and GTF datasets.
STORAGE CLASS = Held in the internal trace table in MVS storage.
LOCATION = Each trace table block contains a block header
followed by as many entries contiguously as will
fit in the rest of the block.
INNER CONTROL BLOCKS =
This is an inner control block to the DFHTREN.
DFHTRFTE has no inner control blocks itself.

TRFTE Feature Trace Entry Header

CONTROL BLOCK NAME = DFHTRFTC
DESCRIPTIVE NAME = **CICS/ESA (TR) Feature Trace Entry Header**
@BANNER_START 02
Licensed Materials - Property of IBM
"Restricted Materials of IBM"
5697-E93
@BANNER_END
FUNCTION = This is the header for a trace entry made by
a Feature when the DFHTRFTM TRACE_PUT interface is
used.
It appears immediately after the TREN_HEADER for
a Feature trace entry, as the first part of the
TREN_DATA. The remaining trace entry data,
supplied by the Feature as TRFT_DATAn (where n is
between 1 and 7) on the TRFT TRACE_PUT call,
follows immediately after the TRFTE_HEADER.
LIFETIME = Created by DFHTRFT in the internal trace table for
each TRACE_PUT. Destroyed when overwritten after
the next trace table wrap. Trace entries are also
held on auxiliary trace datasets and GTF datasets.
STORAGE CLASS = Held in the internal trace table in MVS storage.
LOCATION = Each trace table block contains a block header
followed by as many entries contiguously as will
fit in the rest of the block.
INNER CONTROL BLOCKS =
This is an inner control block to the DFHTREN.
DFHTRFTE has no inner control blocks itself.

TEMPORARY STORAGE INPUT/OUTPUT AREA (TSIOA)				
The TSIOA is a class of user storage and is chained off the TCA (TCASCCA). It can be acquired by the user or, in response to a GET or GETQ request, it is acquired by the temporary storage program when no TSDADDR is specified. TSIOAs acquired by, or on behalf of, a user task are normally released by the task. If not, the area is freed by the task control program when the task is terminated.				
If necessary, an extension header is inserted in the TSIOA preceding the user data. This extension carries information specified on an EXEC CICS START command (for example, PROTECT FMH RTRANSID).

TEMPORARY STORAGE TABLE (TST)				
The temporary storage table (TST) is a list of generic mnemonics used:				
1. To identify temporary storage DATAIDs for which CICS is to provide recoverability in the event of abnormal termination of CICS and subsequent emergency restart.				
2. To identify DATAIDs for which security checking is to be performed.				
3. To identify DATAIDs on a remote system.				
4. To map selected remote system SYSIDs to shared queue pools.				
Each recovery entry in the table specifies the leading characters of user-defined DATAIDs for which CICS will provide protection (enqueueing) during a logical unit of work by an application program and automatic logging of the status of the data at task termination (or sync point). CSATSTBA in the CSA optional features list (CSAOPFL) points to the temporary storage table (TST).

FUNCTION =
To define the EXEC parameter list for Temporary Storage
requests, for use by global user exit programs at exit
points XTSEREQ and XTSEREQC.
On entry to the XTSEREQ and XTSEREQC User Exits, the EXEC
parameter list is pointed to by UEPCLPS.
The EXEC parameter list for Temporary Storage consists of
eight addresses.
The eight addresses are defined by TS_ADDR0 to TS_ADDR7.
This DSECT defines these addresses and the areas that
they point to.
On entry to the XTSEREQ and XTSEREQC User Exits, the copy
of EIBRCODE is pointed to by UEPRCODE, the copy of EIBRESP
is pointed to by UEPRESP and the copy of EIBRESP2 is
pointed to by UEPRESP2.
This DSECT also contains equates for values of EIBRCODE,
EIBRESP and EIBRESP2 used by Temporary Storage.

(3) The token for use in communicating between XTSEREQ and XTSEREQC is addressed by UEPTQTOK.

The command parameter list is a list of addresses which reference the argument values for this this EXEC CICS command. The addresses are only valid if the argument is applicable to this command.

For example, address 1 is of the TS QUEUE (if used) for all TS commands, whereas the address 2 is of the FROM data area on WRITEQ commands, the SET address or INTO data area for READQ commands, and is not valid for DELETEQ commands.

The existance bits in the EID component (TS_BITS1) specify those addresses that are valid, and the flagword bits (TS_EIDOPT5 - TS_EIDOPT8) specify the keywords that were given in the EXEC CICS TS command.

Therefore, you can deduce the usage of each address by testing these bits in conjunction with the command function(TS_FUNCT).

(18)	ADDRESS	4	*	Reserved
(1C)	ADDRESS	4	TS_ADDR7	SYSID

TS_EID (addressed by TS_ADDR0) gives the command function, and contains the existence and flagword bits.
Note: Equates for TS_GROUP, TS_FUNCT, EIBRCODE, EIBRESP and EIBRESP2 values are defined at the end of this data structure.

The existence bits (TS_BITS1) specify the parameters that are valid for this command. For example, TS_EXIST7 set on indicates that TS_ADDR7 is valid, meaning that it addresses a SYSID value. TS_ADDR0 is always valid and has no existence bit. A user exit program at XTSEREQ can set the TS_EXIST7 bit on or off for all TS commands. All other changes will be ignored.

TTP Terminal type parameter

MODULE NAME = DFHTTPDS DESCRIPTIVE NAME = CICS Terminal Type Parameter @BANNER_START 02 Licensed Materials - Property of IBM "Restricted Materials of IBM" 5697-E93 @BANNER_END FUNCTION = Defines the terminal type parameter. This control block contains terminal type or partition or LDC specific data. The OSPWA addresses a chain of direct TTPS (one per partition or LDC) and if routing is in effect the OSPWA addresses a chain of routed TTPS, one per target terminal type. Note that routing and LDCS or partitions are mutually exclusive. TTPS are built by DFHRLR, and freed by DFHMCP on SEND PAGE. FUNCTION =	
This DSECT maps the information provided by File Control	
to the FCFS User Exits :	
XFCSREQ - Global User Exit called before the File Control	
request.	
XFCSREQC- Global User Exit called after the File Control	
request has been processed.	
LIFETIME =	
DFHFCFS supplies the information for this DSECT before	
the global User Exits around File Open, Close, Enable	
and Disable are called.	
The information provided is valid for a single invocation	
of the exit only.	
LOCATION =	
The content of parameter UEPPINFO passed from DFHFCFS	
on the Exit calls, is the address of this control block.

FUNCTION = Copybook for EPB DSECT.

The EPBs are used by User Exits to hold information about programs that have been enabled as User exit programs. The EPBs are shared by the exit points that have had the program enabled, so that there is only one EPB for a program even if it has been enabled at multiple exit points. They are chained off the UETHEPBC field in the User Exit Table Header (UETH).

For a particular exit, when the first program is enabled for the exit, an EPB is created (or reused if one already exists for another exit). The address of the first EPB for an exit point is stored in the User Exit Table Entry (UETE) for that exit point.

For every subsequent program enabled at the same exit point, an EPL will be created. This EPL chain is also chained off the UETE. The EPLs simply point to EPBs for all the programs enabled for an exit point.

FUNCTION = Copybook for UETE DSECT.
The UETE contains information specific to a particular exit point. There is one entry per exit point in CICS and all the entries are GETMAINED and initialised by DFHSIC1 during CICS Initialisation.
When a program is enabled at an exit point, a pointer to the EPB for the program is set in the UETE.
For the first program enabled at the exit point, the EPB address is stored directly in the UETEEPBA field.
Subsequent programs enabled at the same exit point, will get an EPL created for them. (The EPL points to an EPB). The EPL chain is chained off the UETENEPL field.
When a CICS Exit is invoked, the UETE associated with the exit point is checked. If the UETEEBPA field is non zero, then control is passed to the program defined in the first EPB. On return from this program, the UETENEPL is chained down, and every program pointed to via the EPL is passed control (in the order the exits were enabled).

FUNCTION =
The VSWA is the File Control VSAM Work Area.
The VSAM Work Area is created by the File Control Program DFHFCVS at the start of processing of a VSAM request (GET, PUT) or series of requests (GET UPDATE - PUT UPDATE, STARTBR - READNEXT - END BROWSE, etc.) and contains information related to the request. The VSWA consists of a CICS part and a VSAM part. The VSAM part is the VSAM RPL that represents the request to VSAM. The VSWA is deleted when the request is terminated.
LIFETIME =
Created by DFHFCVS at the start of a request or series of requests. Destroyed by FCVS when the request/series ends.
STORAGE CLASS =
Above 16M line.
LOCATION =
VSWA is pointed to by the field FRT_WORK_AREA_ADDRESS in the File Request Thread Element (FRTE).
INNER CONTROL BLOCKS =
The VSWA contains within it (at offset 8) the VSAM Request Parameter List (RPL).

The fields at the start of the converter commarea must be accessible independent of the converter function being called. These declarations provide a definition of the commarea in terms of these common fields.

< Variable >
Meaning

< converter_ parms >
The high-level definition of the parameter area passed to the converter in the COMMAREA.

< converter_ eyecatcher >
The eyecatcher used to determine that the converter COMMAREA is not corrupt. The value it takes varies depending on the converter function involved. The possible values are defined in the DFHWBUCx copybook.

< converter_ function >
The value used to determine which converter function is involved on this call. Possible values are the constants DECODE, ENCODE.

< converter_ response >
The fullword response value produced by a converter which has not been passed a valid converter_ function value. The recommended response in this circumstance is URP_ INVALID.

< converter_ reason >
The fullword reason value returned by a converter which has not been passed a valid converter_ function value. No reason values are architected for this error situation in the CICS Web Browser Interface. Users may define their own values.

< converter_ parmlist >
The rest of the parameters. The structure of this data varies depending on which converter function is involved.

These declarations define the parameter list which
is passed to the DECODE function of the user replaceable
converter program. It is called by the server controller.

The variables in the decode parameter list are as follows:

< Variable >
Meaning

< decode_  eyecatcher > (input)
A character field to contain an eyecatcher to help with
diagnostics and provide a sanity check for the Converter
program if required. The
Server Controller sets this to the value of constant
DECODE_ EYECATCHER_ INIT before calling decode.

< decode_  version > (input)
A single-character parameter-list version identifier.
It will change whenever the layout of the parameter list changes.
Possible values:
Binary zero (X'00') -- pre-CICS/TS1.3 version parameter list
Character zero (X'F0') -- CICS/TS1.3 version parameter list

< decode_  volatile > (input)
A single-character code that indicates whether the data area
pointed to by "decode_  data_ptr" can be replaced or not:
'0' -- The area cannot be replaced: it is part of another
commarea.
'1' -- The storage pointed to by "decode_  data_ptr" can be freed
and replaced by a different size workarea.

< decode_  function > (input)
A halfword set to the constant value URP_ DECODE .
Set to indicate to the converter the function required.

< decode_  response > (output)
The response value produced by decode.
Possible values are:

- URP_OK
- URP_EXCEPTION
- URP_INVALID
- URP_DISASTER

< decode_  reason > (output)
The reason for a response produced by decode.
The architected values for EXCEPTION responses are:

- URP_SECURITY_FAILURE

Other values may be supplied and given user-defined meanings.

< decode_  client_ address > (input)
The IP address of the client.

< decode_  client_ address_string > (input)
The IP address of the client in "ww.xx.yy.zz" format.

< decode_  data_ptr > (input / output)
A pointer to the HTTP request sent by the client.

< decode_  method_ ptr > (input)
Pointer to the method specified on the HTTP request sent by the
client.

< decode_  http_version_ ptr > (input)
Pointer to a string identifying the HTTP version supported by the
client.

.... continued
```

... continuation				
< decode_ http_resource_ ptr > (input)				
Pointer to the CICS resource requested by the client. In HTTP protocol terminology, this is the "absolute path" information in the HTTP request. Because CICS does not have any concept of "paths" or the hierarchical file systems on which paths rely, we have elected to use a term more appropriate to CICS in our documentation.				
< decode_ request_ header_ ptr > (input)				
Pointer to the first HTTP header in the HTTP request. There are usually multiple HTTP headers for each HTTP request. Each header is delimited by a CR+LF. The end of the header information is delimited by a null header (that is, an additional CR+LF following final HTTP header).				
< decode_ user_data_ ptr > (input)				
A pointer to any user data for this HTTP request.				
< decode_ method_ length > (input)				
Length of the method specified on the HTTP request sent by the client.				
< decode_ http_version_ length > (input)				
Length of the string identifying the version of HTTP supported by the client.				
< decode_ http_resource_ length > (input)				
Length of the string containing the HTTP header information for this HTTP request. This length includes the lengths of all the delimiting CR+LFs for all the headers, including the final CR+LF of the null header which signals the end of the headers.				
< decode_ request_ header_ length > (input)				
Length of the string identifying the CICS resource requested by supported by the client.				
< decode_ user_data_ length > (input)				
Length of the user data.				
< decode_ input_data_ len > (output)				
The server input data length associated with the program processing the HTTP request. This is set to the default 32767, but can be overwritten in decode, possibly to reflect information contained in the client data. This length is used as INPUTDATALENGTH on the EXEC CICS LINK to the user program.				
< decode_ output_ data_ len > (output)				
The server output data length associated with the program processing the HTTP request. This is set to the default 32767, but can be overwritten in decode, possibly to reflect information contained in the client data. It is the size of the output commarea.				
< decode_ server_ program > (input / output)				
The CICS program invoked to process the incoming HTTP request. Initialised to the program name allocated by the ATTACH exit for the requested URL. The program name can be changed by the analyzer.				
< decode_ user_token > (input / output)				
A token for use by users. Could for example identify any state data associated with this HTTP request.				
< decode_ entry_count > (input)				
This parameter shows how many times the decode and encode converter functions have been executed in the current CWI execution. It is useful when looping back from encode.

These declarations define the parameter list which
is passed to the ENCODE function of the user replaceable
Converter program. It is called by the alias program
if data mapping of the remote procedure's output is required.
The parameter list is passed as a commarea from the alias.

< Variable >
Meaning

< encode_ eyecatcher >
A character field to contain an eyecatcher
to help with diagnostics and provide a sanity check for
the Converter program if required. The alias
sets this to the value of constant ENCODE_ EYECATCHER_INIT
before calling encode.

< encode_ version > (input)
A single-character parameter-list version identifier.
It will change whenever the layout of the parameter list changes.
Possible values:
Binary zero (X'00') -- pre-CICS/TS1.3 version parameter list
Character zero (X'F0') -- CICS/TS1.3 version parameter list

< encode_ volatile > (input)
A single-character code that indicates whether the data area
pointed to by "encode_ data_ptr" can be replaced or not:
'0' -- The area cannot be replaced: it is part of another
commarea.
'1' -- The storage pointed to by "encode_ data_ptr" can be freed
and replaced by a different size workarea.

< encode_ function > (input)
A halfword set to the constant value URP_ ENCODE .
This is set by the alias before linking to the converter
program. It allows the converter to determine which function
is being requested.

< encode_ response > (output)
The fullword response value produced by decode.
Possible values are:

- URP_OK
- URP_EXCEPTION
- URP_INVALID
- URP_DISASTER

< encode_ reason > (output)
The fullword reason value returned by encode for response
values other than OK. No reason values are architected for
encode in the CICS Web Browser Interface.
Users may define their own values.

< encode_ data_ptr > (input)
A pointer reference to the storage area containing
the output from the server program which is to be manipulated
by the encode function

< encode_ input_data_ len > (input)
A fullword field indicating the length of the data to be
encoded by the converter.

< encode_ user_token > (input)
A token for use by users. Could for example identify
any state data associated with this HTTP request.
< encode_ entry_count > (input)
This parameter shows how many times the decode and encode
converter functions have been executed in the current CWI
execution. It is useful when looping back from encode.

WBEPC Web Error Program parms

-
These declarations define the commarea which is passed to the user replaceable Web Error program by the CICS WEB Interface via a Program Manager Domain EXEC_LINK call.
Variable Meaning
< wbep_length > (input) Length of DFHWBEP copybook
< wbep_eyecatcher > A character field to contain an eyecatcher to help with diagnostics. The caller sets this to '>wbepca ' before calling the Web Error Program
< wbep_version > Version of DFHWBEP copybook being passed by CICS
< wbep_error_code > (input) The two byte signed binary number indicating the cause of the original error. Constants which this field may contain can be found in copybook DFHWBUCC.
< wbep_abend_code > (input) The four character abend code associated with this exception.
< wbep_message_number > (input) Message number associated with this exception
< wbep_message_ptr > (input) A pointer to the CICS message text associated with this exception
< wbep_response_len > (input) The full word length of the HTTP error response to be returned to the the HTTP client. On entry to DFHWBEP this contains the default CICS HTTP error response for the reported error.
< wbep_response_ptr > (input) A pointer to the 32K buffer containing the HTTP error response to be returned to the HTTP client. On entry to DFHWBEP this contains the default HTTP error response returned by CICS for the reported error.
< wbep_response_len > (input) The full word length of the response message text associated with this exception.
< wbep_client_address_len > (input) One byte field containing the length of the address contained in wbep_client_address
< wbep_client_address > (input) The 15 character TCPIP address of the client.
.... continued

< wbep_server_address_len > (input) One byte field containing the length of the address contained in wbep_server_address
< wbep_server_address > (input) The 15 character TCPIP address of the TCP/IP stack on which this request was received
< wbep_tcpipservice_name > (input) Name of the TCPIPSERVICE associated with the failing request
< wbep_converter_program < (input) The 8 character name of the converter program associated with this request
< wbep_target_program > (input) The target program associated with the web request.
< wbep_failing_program > (input) The program which CICS was invoking when the failure occurred
< wbep_http_response_code > (input) HTTP error response code CICS is returning for this error. This can be overridden by changing the content of the buffer containing the HTTP response
< wbep_analyzer_response > (input) Response code returned by analyzer program

Constants

Len	Type	Value	Name	Description
-				
This is the parameter list for the CICS Web Interface Template Manager, DFHWBTL.				
-				
The Template Manager supports the following functions:				
BUILD_HTML_PAGE				
This function builds a whole HTML page from a specified template, using optional symbol substitution. This function is a composite of all the other HTML building functions of this module.				
START_HTML_PAGE				
This function initializes an environment for the ADD_HTML_TEMPLATE function, and optionally builds an symbol table from the list supplied in the parameter SYMBOL_LIST. It returns a token in CONNECT_TOKEN that represents the created environment.				
ADD_HTML_SYMBOLS				
This function adds further symbols to the symbol table created by START_HTML_PAGE. The names of the symbols are case-sensitive. If a symbol is added with the same name as one that is already defined, the new symbol definition replaces the old one.				
READ_HTML_TEMPLATE				
This function reads a named HTML template into main storage. If the template named in WBTL_TEMPLATE_NAME exists as a member of the partitioned dataset allocated to the DFHHTML data definition statement, it is read into main storage. The address and length of the storage containing the buffer are returned in WBTL_TEMPLATE_BUFFER_PTR and WBTL_TEMPLATE_BUFFER_LEN, and the template name is cleared to binary zeroes.				
ADD_HTML_TEMPLATE				
This function interprets an HTML template by substituting into it the current values of the symbols.				
END_HTML_PAGE				
This function destroys the environment created by the START_HTML_PAGE function, and releases any storage acquired by earlier functions in the sequence.

transmission control.

@BANNER_START 02
Licensed Materials - Property of IBM
"Restricted Materials of IBM"

@BANNER_END

FUNCTION =
Contains an RPL for issuing VSAM requests against a particular CI buffer, and data representing the state of that buffer.
XRF message management builds these blocks to control the reading and writing of CIs in the message dataset.
Each instance represents a single buffer. At present, with single buffering, only a single instance each exists for the PUTMSG and GETMSG processes.

LIFETIME =
Created by DFHWMMT when called during the initialization of the GETMSG or PUTMSG process. Lasts for the lifetime of the process.

STORAGE CLASS =
Non-CICS storage. MVS GETMAIN above 16M line.

LOCATION =
Addressed by WMTPCCCA or WMTGCCA.

INNER CONTROL BLOCKS =
WMTPUTMSG transmission control area. Addressed by WMGPMTA. Contains data controlling the position reached in writing to the message dataset.
WMTGETMSG transmission control area. Addressed by WMGGMTA. Contains data controlling the position reached in reading the message dataset.

FUNCTION =

The various CAVM Surveillance Status Control Blocks exist to permit the 4 independent CAVM surveillance processes (2 status writers and 2 status readers) to communicate with other CAVM processes and with each other.

Each XRF system contains a single set of these Surveillance Status Control Blocks.

LIFETIME =

The Surveillance Status Control Block, Public Status Area Descriptors and Public Status Areas in a given XRF system are all created at the same time during CAVM SIGNON by DFHWSSN2.

The actual Status CIs are created by DFHWSSN3 as records filled with binary zeroes when it formats a new CAVM Control or Message Data Set. They are never destroyed except by deletion of the data set.

STORAGE CLASS =

Non-CICS storage. In MVS subpool 0 above the 16M line.

The Status CIs themselves reside on DASD in the CAVM Control or Message Data Sets or in I/O buffers in MVS subpool 0 above the 16M line.

LOCATION =

Field WCGSA in the CAVM Global Control Block (DFHWCGBS) contains a pointer to the Surveillance Status Control Block (DFHWSADS), which itself includes an array of Public Status Area Descriptors (WSADs) starting at WSAGWSAD.

INNER CONTROL BLOCKS =

FUNCTION =
This control block defines the format of the State Management Record in the CAVM Control Data Set, which is used to keep track of what CICS jobs are signed on to CAVM and their current state (ACTIVE, normal BACKUP, BACKUP performing TAKEOVER, etc.).
There is one State Management Record in each CAVM Control Data Set. It contains just one instance of SMDESCR and instances of WSJDESC for each ACTIVE or BACKUP job which CAVM will allow to sign on concurrently using that particular CAVM Control Data Set. The instance of WSJDESC which immediately follows SMDESCR always refers to the ACTIVE job.
LIFETIME =
The State Management Record is created by DFHWSSN3 when it formats a new CAVM Control Data Set and is initialised by DFHWSSN2 during the first successful SIGNON.
It is never destroyed except by deletion of the data set.
STORAGE CLASS =
This control block resides on DASD in the CAVM Control Data Set or in an I/O buffer or work area in MVS subpool 0 above the 16M line.
LOCATION =
Field WFGSMRBA in the CAVM File Control Block (DFHWFGDS) contains the RBA of the State Management Record within the CAVM Control Data Set. It is always the second CI in the data set.

@BANNER_START 02	
Licensed Materials - Property of IBM

FUNCTION =	
The Surveillance Communications Areas are needed to allow the 4 independent CAVM surveillance processes (2 status writers and 2 status readers) to share some common data. In each XRF system, there are separate Surveillance Communications Areas referring to each actual or potential partner XRF system as well as a single Surveillance Communications Area referring to that system itself. The Status Record Header contains a TOD clock reading used in clock difference calculations and a sequence number used to determine which of two status records contains the more up-to-date information. It is built immediately before writing an XRF system's status to its Status CI in the CAVM Control Data Set or Message Data Set.

WSTXRF takeover parameter area

DESCRIPTIVE NAME = CICS (XRF) - Takeover Parameter Area
@BANNER_START 02
Licensed Materials - Property of IBM
"Restricted Materials of IBM"
5697-E93
@BANNER_END
FUNCTION =
The Takeover Parameter Area is a storage area belonging to the CAVM TCB which is used to keep copies of the parameters CICS specified on the TAKEOVER request that the CAVM TCB is currently working on. DFHWSRTR makes the copies of the TAKEOVER parameters while running under the CICS TCB and the requesting TCA. If a subsequent failure in this TCA should lead to the freeing of the storage it owns, the CAVM TCB's processing of the TAKEOVER request will not be affected.
Each XRF BACKUP system has a single TAKEOVER parameter area.
To avoid the problems which might arise from concurrent use of the Takeover Parameter Area, the CAVM TCB does not reference it unless the POST bit in WCSTXECB is 1, whereas the CICS TCB does not reference it unless this bit is 0 and also issues a CICS ENQ on WCSTCECB to serialise with other CICS TCAs which might be issuing TAKEOVER requests.
LIFETIME =
The Takeover Parameter Area is created by DFHWSXPI when a BACKUP system signs on to CAVM and is destroyed by DFHWSTKV during TAKEOVER processing.

FUNCTION =
XRF process analogue of the CICS TCA supporting the XRF LIFO mechanism and process dispatching.
LIFETIME =
Created by XRF ATTACH (DFHWDATT) and destroyed when process returns (DFHWDISP).
Artificial instances are sometimes created by other modules, e.g. DFHWMS10, when they wish to create an environment in which the XRF LIFO mechanism can be used, though such instances are never visible to the XRF process dispatcher.
STORAGE CLASS =
Non-CICS storage. Usually in MVS subpool 0 storage above 16M line.

Conventionally addressed by R12. Those created by ATTACH are also on the XRF dispatcher chain WDGFXPB.

LIFETIME =
Created by GET LIFO (DFHWLGET) when a new stack block is

Destroyed by FREE LIFO (DFHWLFRE) when a all allocations

FUNCTION = This file contains the XCTRA_PLIST definition. This

XCTRA_PLIST - Parameter list passed to Global trap DFHXCTRA

Offset Hex	Type	Len	Name (Dim)	Description
(0)	STRUCTURE	64	XCTRA_PLIST	
XCTRA_FLGSA Address of return actions flag word Return actions flag settings are in the byte addressed from field XCTRA_FLGSA in the parameter list to DFHXCTRA. The individual flag settings are as follows, and are declared as constants at the end of the structure. XCTRA_FTRE EQU X'80' .. Make further trace entry on behalf of trap exit XCTRA_DUMP EQU X'40' .. Take a system dump XCTRA_SKIP EQU X'20' .. Skip putting current trace entry out to GTF XCTRA_DISA EQU X'10' .. Disable trap so that it cannot be used again under this TCB. Any combination of these flags may be set and wherever possible all requested actions will be honoured upon return to DFHXCTRP.				
(0)	ADDRESS	4	XCTRA_FLGSA	A(Return actions flag word)
XCTRA_CURTA Address of current entry in internal trace table This field points to the trace entry constructed by DFHXCTRP on the same invocation for which it is calling DFHXCTRA. This entry should not be modified by DFHXCTRA. Its structure is mapped by the DSECT DFHTREN.				
(4)	ADDRESS	4	XCTRA_CURTA	A(Current entry)
XCTRA_WORKA Address of 80-byte work area for DFHXCTRA. This work area is acquired when DFHXCTRA is activated and is not changed by the EXCI until DFHXCTRA is de-activated, so it may be used for saving information between invocations of DFHXCTRA.				
(8)	ADDRESS	4	XCTRA_WORKA	A(80-byte work area)
TRAD1A/L, TRAD2A/L and TRAD3A/L These six fields are used in conjunction with the setting of XCTRA_FTRE in the return actions flag byte. This flag indicates that DFHXCTRP should make a further trace entry. TRADnA/L are address and length pairs for the data fields to be included in this entry. If XCTRA_FTRE is set, DFHXCTRP examines the length fields in turn. All fields up to the first with a zero length will be included in the extra trace entry.				
(C)	CHARACTER	24	XCTRA_TRDAT	Total length of data fields
(C)	ADDRESS	4	XCTRA_TRAD1A	Address of DATA1 information

CHANNEL data has been added. Since this may overflow into second and further TIOAs, the beginning of the channel data must be the very last thing in the first TIOA. Field XRQICCTO gives the offset to the start of the CHANNEL data from the beginning of XRQICCTO. CHANNEL data is addressed by ADDR(XRQICCTO) + XRQICCTO Any new fields added in subsequent releases must be added AFTER XRQICCTO and before XRQCHAND. This copy book includes the following areas.

sXOPUS - security URM commarea

=====

=====

sXOPUS -

This block is created by DFHIIRH and used as input (in the C version) to DFHXOPUS or the customer IIOP security URM.

The C version is contained in DFHIIURH which must be kept in step with this version.

=====

=====

sXOPUS - Request Receive Security URM - default DFHXOPUS

This block contains the COMMAREA obtained by DFHIIRR, completed by DFHIIRH and used as input the security URM called by DFHIIRH. It is deleted by DFHIIRR before the transaction instance terminates.

The block is obtained from the IIGENRAL subpool.

Lengths of data contained in the message buffer such as IIIOPDATA and LRequestBody are the lengths available in the IIOP buffer.

It is possibly, but very unlikely, that the fields are partially or wholly in the buffer extension pIIOPData_extension.

If a field does not exist its pointer and length will be 0.

These statistics are for the queue index buffer pool, which is used to read and write queue index entries plus the associated data if the total queue size does not exceed 32K bytes. Buffers containing recently accessed queue index entries are added to a least recently used chain, which means that if another request for the same queue arrives shortly afterwards, it may be possible to optimize the processing based on the assumption that the copy in the buffer is probably already correct. If all other buffers are in used, a request for a new buffer will discard the contents of the least recently used buffer and reuse the storage as a free buffer. These statistics are returned by AXM buffer management interface. The queue server does not use some of the AXM buffer management functions (such as KEEP or PURGE) so those counters will be zero. These fields describe the current state of the buffer pool.

These are the statistics returned by the AXM page pool management routines for the pools AXMPGANY and AXMPGLOW. Storage in these pools is allocated in multiples of 4K pages on a 4K boundary. The most frequent use is for segments of LIFO stack storage. Storage is initially allocated from the pool using a bit map. For faster allocation, free areas are not normally returned to the pool but are added to a vector of free chains depending on the size of the free area (1 to 32 pages). When storage is being acquired, this vector is checked before going to the pool bit map. If there are no free areas of the right size and there is not enough storage left in the pool, free areas in the vector are put back into the pool, starting from the smallest end, until a large enough area has been created. This action appears as a compress attempt in the statistics. If there is still insufficient storage to satisfy the request, the request is failed. Statistics for LOC=ANY storage pool.

FUNCTION =
DFHXRSPS defines the XRF static storage area managed
by CICS and referred to as XRP static storage.
XRP static storage contains
1. the communications area for DFHXRFB and DFHXRSP
2. ECBs used to control the progress of alternate
CICS before, during and after takeover
3. system status data for active CICS
4. system status data for alternate CICS
5. system health data
System status data for active CICS is maintained by
alternate CICS and contains
1. status data - e.g. signed on / off
2. action flags - e.g. heartbeat overdue
2. action modifier flags - e.g. message sent
System status data for alternate CICS is maintained
by active CICS and and is very similar in content to
system status data for active CICS.
The structure XRS# provides the common definition
for system status data.
The structure DFHXRHPS, contained in DFHXRHPS,
provides the definition for system health data.
LIFETIME =
There is only one instance of the control block. It
is allocated by DFHXRFA in response to a DFHXR
CTYPE=INITIALIZE call in DFHSIC1.
STORAGE CLASS =
The control block is allocated by DFHSIC1.
LOCATION =
The control block is addressed from SSAXRP in the
static storage address list.
INNER CONTROL BLOCKS =
XRP static storage contains inner control blocks.
These are
1. system status data for active CICS
2. system status data for alternate CICS
3. system health data

XRW XRF work element definition

@BANNER_START 02
Licensed Materials - Property of IBM

@BANNER_END
FUNCTION =
DFHXRWPS defines the XRF work elements managed by CICS.
XRF work elements are used to pass information from DFHXRFB, the notify exit program which runs under the CAVM TCB, to DFHXRSP, the surveillance program which runs under the CICS TCB.
The information passed from DFHXRFB to DFHXRSP, and the action taken by DFHXRSP, depends on the event notified to DFHXRFB by the CAVM.
LIFETIME =
XRF work elements are created by DFHXRFB and are destroyed by DFHXRSP.
STORAGE CLASS =
XRF work elements are allocated from OS storage.
LOCATION =
Two work element chains exist.
1. The first chain, addressed from XRSWECHN in XRP static storage, contains those elements created by DFHXRFB ... but ... not yet seen by DFHXRSP - elements appear reverse order of creation.
2. The second chain, addressed from DFHXRSP LIFO storage, contains those elements seen ... but ... not yet processed by DFHXRSP; elements appear in order of creation.

CONTROL BLOCKS = ZC BIND-stub.
GLOBAL VARIABLES (Macro pass) = no public globals.
The builder parameter set data areas (ZCQPS) are used when
creating a terminal control table resource dynamically, for
example, by resource definition online (RDO). They are
allocated by the RDO front end, by DFHZATD, or by DHZCQIS.
These areas describe the properties of a terminal, connection
session, modegroup, or terminal pool.
ZCQPS consists of a fixed-length prefix, a bit map preceded
by its length, an area for fixed-length parameters preceded
by its length, and three variable-length parameters for BIND,
USERID and password, each holding its own length.
Prefix
00LL | Existence Bits
00LL | Fixed-length paramenters
Beginning of the variable areas
LL | BIND area
LL | USERID
LL | Password
The bits in the bit map show the value of a fixed-length
parameter if it has two values, or, in other cases, whether
it has a value or not.
The other areas are overlays or values for the areas already
described.
The following area is the root for the overlay structure

Offset Hex	Type	Len	Name (Dim)	Description

Overlay for connection.

Generally, if it ends in _xxx_X (e.g._YES_X) and the bit is on then the appropriate option will be set in the TCSE.

If it only ends in _X and the bit is on then additional information will be contained in the fixed length parameter area whose value will be set in the TCSE.

Persistent Sessions control blocks

ZGRP

```
=====
CONTROL BLOCK NAME = DFHZGRPC
DESCRIPTIVE NAME  = CICS PRSS initialisaton blocks
@BANNER_START 02
Licensed Materials - Property of IBM
"Restricted Materials of IBM"
5697-E93
@BANNER_END
The following control blocks are all created by DFHZGRP.
FUNCTION = PRSS_CV29
This is SHARED CICS data which contains:
CV29, FMH5, BIS and BID data.
There will be one PRSS CV29 per OPNDST RESTOREd TCTTE.
LIFETIME =
It is built by DFHZGRP during persistent session recovery
(EMER | VTAM_RESART) and is freemained by DFHZNCA when
DFHZC0146 or DFHZC0156 (good PS recover) is issued,
or when DFHZCLS is run to cover all the cases where
the session failed to restore and was unbound.
STORAGE CLASS =
SMMC SHARED_CICS
LOCATION =
Chained of the TCTTE via TCTE_PRSS_CV29_PTR.
INNER CONTROL BLOCKS = none
FUNCTION = NIBLIST
Persistent sessions INQUIRE NIBLIST - created and used by
DFHZGRP to hold data supplied by VTAM containing the
following information about each NIB that persists.
See VTAM Programming SC31-6436 for a full description.
LIFETIME =
It is built by DFHZGRP during persistent session recovery
(startup or dynamic open) and freemained by DFHZGRP before
it exits.
STORAGE CLASS =
USAGE(DOMAIN)
LOCATION =
Anchored off the TCT Prefix TCTV_FIRST_NIBLIST_PTR
INNER CONTROL BLOCKS = See SC31-6436
FUNCTION = TCT_BIND
Defines the bind in the TCT, starting with the length.
This is used to copy the PRSS BIND into the TCTTE.
LIFETIME =
It is built by DFHZGRP during persistent session recovery
(emergency restart or vtam restart) when logmode= n
is used and freemained if and when the TCTTE is
deleted.
STORAGE CLASS =
ZCBIMG subpool
LOCATION =
Anchored off TCTEBIMG
INNER CONTROL BLOCKS = none
FUNCTION = ZGRP_RPL
Defines a set of 11 RPLs for use by DFHZGRP and DFHZGUB.
LIFETIME =
It is built by DFHZGRP during persistent session recovery
(startup or dynamic open) and freemained by DFHZGRP before
it exits. However, if some of the RPLs are still active the
pool will remain and then be re-used and freemained by
subsequent dynamic OPEN VTAM ACB requests.
STORAGE CLASS =
ZCNIBLST subpool
LOCATION =
Anchored off the TCT Prefix TCTV_PRSS_RPL_POOL_PTR
INNER CONTROL BLOCKS = none

Persistent sessions NIBLIST - as produced by DFHZGRP as a result				
or INQUIRE PERSESS and OPNDST RESTORE.				
The NIB and BIND definitions should be replaced by the VTAM				
versions when they become available. If they are not replaced				
then they should be kept in step with the VTAM versions.				
The NIBLIST is anchored from TCTV_FIRST_NIBLIST_PTR

ZGRP

RPL_POOL Defines a set of 11 RPLs for use by DFHZGRP and DFHZGUB. The block is obtained from the ZCNIBLST variable length subpool when DFHZGRP is entered and deleted by DFHZGRP if all the RPLs are inactive. The ECB is for use by DFHZGUB to wait until an RPL becomes free. The first RPL is for use by DFHZGRP - INQUIRE and OPNDST. The next 10 are for DFHZGUB, which initiates up to 10 CLSDSTs or TERMSESS's. After that it needs to wait for one to become inactive. The RPL POOL is anchored from TCTV_PRSS_RPL_POOL_PTR. The last 10 RPLs for use by DFHZGUB are anchored from TCTV_PRSS_UNBIND_RPLS_PTR

ZLUIT ZCP local userid table definition

definition.
@BANNER_START 02

FUNCTION =
This control block contains the DSECTs for:
1) Local Userid Table (LUIT) entries.
The LUIT contains a list of Userids, who are using Persistent Verification, and are considered ALREADY VERIFIED for use on this connection.
2) The Local Userid Table Area (LUITA).
This is the header for each LUIT, containing a pointer to the first LUIT entry, the SYSID associated with the LUIT, and some flags. This DSECT is physically part of the TCSE, but contains only those TCSE fields required by DFHZCUT to perform its functions.
There is one LUIT per connection, composed of a LUITA header followed by one entry for each userid that is Persistently Signed On.
Both of these control blocks are owned by DFHZCUT.
LIFETIME =
For the LUITA - Lifetime of the TCSE - connection lifetime.
Destroyed when the TCSE is freed.
For the LUIT entries - Task related. Tasks will attach and add or reuse LUIT entries. As tasks end, the use counts in the LUIT entries are decremented. If the entries have not been used for a set time (SIT - PVDELAY) the LUIT entries will be deleted.
STORAGE CLASS =
The LUITA is part of the TCSE
The LUIT entries come from Subpool USIDTBL
They have a fixed length of 32 bytes.
LOCATION =
LOCAL_USERID_TABLE_AREA (LUITA) is a field in the TCSE.
LOCAL_USERID_TABLE_ELEMENT is chained off:
LUITA_HEAD_POINTER (TCSELUIT) for the first LUIT entry
LUIT_FORWARD_POINTER for the next LUIT entry
(end of chain = Null pointer)
INNER CONTROL BLOCKS =
The LOCAL_USERID_TABLE_AREA is an inner control block of the TCSE defined at TCSEUTA

The Local Userid Table Area is a sub control block within the TCSE - at TCSEUTA.
DFHZCUT uses the LUITA as the head control block for the LUIT.
HEAD_POINTER points to the start of the LUIT element chain.
SYSID is the 4 char connection sysid associated with the LUIT.
FLAGS that are used in Time Out of the LUIT entries:
TIME_OUT_IN_PROGRESS

ZLUIT

The Local Userid Table Elements consist of userids that are using Persistent Verification for a particular SYSID.

FORWARD_POINTER is used to chain to the next element - search

BACKWARD_POINTER is used when deleting entries from the middle of the list.

TIME_LAST_END_BRACKET is set to zero when the entry is added to the list. Subsequently, it is set to the 4 High Order bytes of the STCK macro time, whenever tasks that use the entry send an end bracket to complete the session (at task end). The time is used to remove the LUIT entry from the list if the count is zero, and the entry has not been used for a set time.

USE_COUNT is the total number of transactions currently running that are using this LUIT entry.

FLAGS

LOGICALLY_DELETED indicates that the LUIT entry has logically and architecturally been deleted, however since the use count is non zero, we must wait for the transactions that are currently using it to end, before we can Freemain it.

Note. Instead of adding a new entry to the list a logically deleted entry can be made valid again. This saves us from having multiple entries for the same userid.

USERID is the userid (and length) that is using PV and can be considered Already Verified for use on the connection.

The RPL is the parameter list used for VTAM request

made using HPO, is appended to it. The RPL and
extension are always getmained together but the
length of the extension does not affect RPLLEN (used
with the VTAM API).

(a) If XTR_ID is XTR_ID_BROADCAST then
this is a start-of-stream record,
which is the first record generated
by a (new) active.
(b) If XTR_ID is not XTR_ID_BROADCAST then
this is a start-of-catchup record,

may capture the value in XTR_ID which
will be used in all subsequent records
for this particular catchup.

Programming interface information

This book is intended to help you diagnose problems in your CICS system, and primarily documents Diagnosis, Modification, or Tuning Information.

Warning: Do not use this Diagnosis, Modification, or Tuning Information as a programming interface.

However, this book also documents General-use Programming Interface and Associated Guidance Information and Product-sensitive Programming Interface and Associated Guidance Information provided by CICS.

General-use programming interfaces allow the customer to write programs that obtain the services of CICS.

General-use Programming Interface and Associated Guidance Information is identified where it occurs by an introductory statement to a data area.

Product-sensitive programming interfaces allow the customer installation to perform tasks such as diagnosing, modifying, monitoring, repairing, tailoring, or tuning of CICS. Use of such interfaces creates dependencies on the detailed design or implementation of the IBM software product. Product-sensitive programming interfaces should be used only for these specialized purposes. Because of their dependencies on detailed design and implementation, it is to be expected that programs written to such interfaces may need to be changed in order to run with new product releases or versions, or as a result of service.

Product-sensitive Programming Interface and Associated Guidance Information is identified where it occurs by an introductory statement to a data area.
