

CICS Interdependency Analyzer for z/OS  
Version 5 Release 1

# User's Guide and Reference

CICS Interdependency Analyzer for z/OS  
Version 5 Release 1

# User's Guide and Reference

**Note**

Before using this information and the product it supports, read the information in "Notices" on page 403.

This edition applies to Version 5 Release 1 of the CICS Interdependency Analyzer for z/OS, program number 5655-Y22, and to all subsequent releases and modifications until otherwise indicated in new editions. Make sure you are using the correct edition for the level of the product.

<b>Chapter 1. Overview of the CICS Interdependency Analyzer</b> . . . . .	<b>1</b>
---	----------

CICS IA requirements . . . . .	2
--------------------------------	---

CICS IA interdependency functions . . . . .	3
---	---

CICS IA dependency-related components overview . . . . .	4
--	---

Dependency-related commands . . . . .	6
---------------------------------------	---

CICS IA affinity related functions . . . . .	6
--	---

What are transaction affinities? . . . . .	7
--	---

CICS IA affinity-related components: overview . . . . .	10
---	----

Affinity-related commands . . . . .	12
-------------------------------------	----

CICS IA Command Flow functions . . . . .	14
--	----

CICS IA Command Flow components overview . . . . .	14
--	----

The Command Flow Feature . . . . .	14
------------------------------------	----

The Collector component . . . . .	15
-----------------------------------	----

What can be monitored . . . . .	17
---------------------------------	----

What is not monitored. . . . .	17
--------------------------------	----

Controlling the Collector . . . . .	18
-------------------------------------	----

How dependency data is collected. . . . .	19
---	----

How affinity data is collected . . . . .	20
--	----

Saving data . . . . .	20
-----------------------	----

The dependency data and affinity data VSAM files . . . . .	21
--	----

The control record VSAM file . . . . .	22
--	----

The Dependency database objects . . . . .	23
---	----

The Affinity database objects . . . . .	23
---	----

The CICS IA plug-in for CICS Explorer . . . . .	23
---	----

CICS IA reports . . . . .	24
---------------------------	----

The Dependency Reporter . . . . .	24
-----------------------------------	----

The Affinities Reporter . . . . .	25
-----------------------------------	----

The Threadsafe Reporter . . . . .	25
-----------------------------------	----

The Scanner component . . . . .	26
---------------------------------	----

The Load Module Scanner . . . . .	26
-----------------------------------	----

The CSECT Scanner . . . . .	27
-----------------------------	----

The Builder component . . . . .	27
---------------------------------	----

<b>Chapter 2. Getting Started with the CICS IA plug-in for CICS Explorer</b> . . . . .	<b>29</b>
--	-----------

<b>Chapter 3. Preparing to use CICS IA</b> . . . . .	<b>31</b>
--	-----------

Running the installation customization program . . . . .	31
--	----

Starting CICS IA customization . . . . .	32
--	----

Building the CICS IA database . . . . .	37
---	----

DB2 configuration . . . . .	38
-----------------------------	----

DB2 considerations . . . . .	38
------------------------------	----

Defining the database . . . . .	41
---------------------------------	----

Migrating the DB2 tables . . . . .	41
------------------------------------	----

Loading static DB2 tables . . . . .	42
-------------------------------------	----

DB2 Stored Procedures setup . . . . .	43
---------------------------------------	----

Setting up your CICS environment to collect data . . . . .	43
--	----

CICS configuration . . . . .	43
------------------------------	----

Defining VSAM files and associated tasks . . . . .	45
--	----

Defining Log Streams and GDGs . . . . .	47
---	----

Updating CICS resources . . . . .	48
-----------------------------------	----

Collecting DB2 resources in your CICS region . . . . .	49
--	----

Security considerations . . . . .	50
-----------------------------------	----

Tailoring your CICS startup job. . . . .	50
--	----

Post configuration tasks . . . . .	50
------------------------------------	----

Creating your own program exclude, transaction exclude, and resource prefix lists . . . . .	51
---	----

Grouping transactions and programs into applications . . . . .	54
--	----

CICS IA Natural support . . . . .	54
-----------------------------------	----

Restarting your CICS regions . . . . .	56
--	----

CICS IA supplied modules required in the MVS link list . . . . .	57
--	----

Running the installation verification program . . . . .	57
---	----

About the IVP . . . . .	57
-------------------------	----

Running the IVP. . . . .	58
--------------------------	----

Loading IVP sample data. . . . .	58
----------------------------------	----

<b>Chapter 4. Running the Collector</b> . . . . .	<b>61</b>
---	-----------

Running the Collector for the first time . . . . .	61
--	----

Displaying the Collector Main Administration Menu panel . . . . .	62
---	----

Command Flow User Administration using transaction CINT . . . . .	63
---	----

Controlling the collection of dependency and affinity data . . . . .	70
--	----

Starting data collection . . . . .	70
------------------------------------	----

Changing the data collection options dynamically . . . . .	73
--	----

Pausing the collection of data . . . . .	74
--	----

Resuming the collection of data . . . . .	75
---	----

Stopping the collection of data . . . . .	76
---	----

Displaying Collector statistics for a specified region . . . . .	78
--	----

Changing the Collector options. . . . .	79
---	----

Specifying region-specific options: region configuration . . . . .	79
--	----

Specifying Resource options: region configuration . . . . .	81
---	----

Specifying region-specific options: general . . . . .	82
---	----

Specifying region-specific options: API and SPI commands to be monitored . . . . .	86
Specifying region-specific options: Application data collection . . . . .	89
Specifying which dependency-related DB2, IMS, MQ commands and TRUEs are to be monitored . . . . .	90
Specifying which affinity-related CICS commands are to be monitored. . . . .	91
Specifying region-specific options: timers . . . . .	93
Specifying Natural options . . . . .	95
Changing global options . . . . .	96
Managing the Command Flow collection using transaction CINC . . . . .	97
Displaying the CICS IA Command Flow Options panel . . . . .	97
Displaying the CICS IA Command Flow ApplID list panel . . . . .	101
Displaying the CICS IA Command Flow Application data collection panel . . . . .	103
Displaying CICS IA Command Flow Statistics panel . . . . .	104
Displaying the list of available CICS regions . . . . .	105
Operating CICS IA Collection from the CICS IA Explorer plug-in . . . . .	106

## **Chapter 5. Updating the Dependency and Affinity database objects . . . . . 109**

Updating the Dependency database objects . . . . .	109
Database update procedure. . . . .	110
Updating the Affinity database objects . . . . .	110
Updating the Command Flow database objects . . . . .	111

## **Chapter 6. Managing your CICS IA data . . . . . 113**

Identifying the data that you collect . . . . .	113
Identifying patterns in resource names . . . . .	113
Identifying the data by using a collection ID . . . . .	114
Managing the collected data . . . . .	114
Identifying data to delete . . . . .	115
Deleting by collection ID . . . . .	118
Deleting by application ID . . . . .	118
Managing affinity data . . . . .	119
Removing duplicate resources from the Collector files . . . . .	119

## **Chapter 7. Creating and updating a CICS IA UDB database . . . . . 123**

Preparing CSV files . . . . .	123
-------------------------------	-----

## **Chapter 8. Running the Reporter . . . . . 125**

Running the Dependency Reporter . . . . .	125
Modifying a Dependency Reporter Job . . . . .	125
Output from the Dependency Reporter. . . . .	128
Running the Affinities Reporter . . . . .	133
Requesting a report from the Affinities Reporter . . . . .	134
Output from the Affinities Reporter . . . . .	134
Running the affinity report . . . . .	138
Compressing affinity data . . . . .	140

## **Chapter 9. Running the Program Threadsafe report . . . . . 141**

Analyzing the program dynamic analysis threadsafe report . . . . .	142
--	-----

## **Chapter 10. Running the Load Module Scanner. . . . . 147**

Creating a summary report. . . . .	147
Creating a summary report with DB2 output . . . . .	149
Creating a detailed report . . . . .	150
Contents of a detailed report . . . . .	151
Creating a detailed report with DB2 output . . . . .	153

## **Chapter 11. Running the CSECT Scanner. . . . . 155**

The CIUJCLCS job. . . . .	156
Contents of the printed report. . . . .	156

## **Chapter 12. Running the Builder . . . . . 161**

Editing the CIUAFFBL job . . . . .	161
Syntax for input to the Builder . . . . .	162
HEADER statements . . . . .	164
Output from the Builder. . . . .	165
Combined affinity-transaction-group definitions . . . . .	165
Data sets processed report . . . . .	167
Empty transaction groups report . . . . .	168
Group merge report . . . . .	168
Error report . . . . .	169

## **Chapter 13. Running the sample DB2 query . . . . . 171**

The CIUJSAMP job . . . . .	171
Tailoring the job for your environment . . . . .	171
Running SPUFI. . . . .	171

## **Chapter 14. Solving problems . . . . . 173**

Overview of CICS IA problem determination. . . . .	173
Dealing with errors . . . . .	173
Collector errors. . . . .	173
Preliminary checks . . . . .	174
Classifying the problem . . . . .	174
Supplying a CICS IA trace . . . . .	175
Taking a dump of CICS IA . . . . .	175
CICS IA plug-in for CICS Explorer level . . . . .	177
Obtaining an error log . . . . .	177
Obtaining configuration details . . . . .	177
Viewing Eclipse plug-ins . . . . .	178
Contacting IBM Support. . . . .	178
When to contact the Support Center. . . . .	178
Working with the Support Center . . . . .	179
Information data sheet . . . . .	179

## **Appendix A. Details of dependencies and affinities collected . . . . . 181**

Commands monitored for potential dependencies . . . . .	181
CICS commands detected . . . . .	181
CICS FEPI commands detected . . . . .	200
Non-CICS API commands detected . . . . .	201

Commands monitored for potential affinities . . . . .	202
CICS API commands . . . . .	202
CICS SPI commands . . . . .	203
Details of what is detected . . . . .	203
ENQ/DEQ . . . . .	203
TS commands . . . . .	204
LOAD HOLD/RELEASE . . . . .	204
RETRIEVE WAIT/START . . . . .	205
ADDRESS CWA . . . . .	205
GETMAIN SHARED/FREEMAIN and GETMAIN64 SHARED/FREEMAIN64 . . . . .	205
LOAD/FREEMAIN . . . . .	206
CANCEL/DELAY/POST/START . . . . .	206
SPI commands . . . . .	207
WAIT commands . . . . .	207

## **Appendix B. Correlating Load Module Scanner and Dependency Reporter output to source . . . . . 209**

Dependency Reporter output . . . . .	209
Load Module Scanner output . . . . .	209
Examples . . . . .	209

## **Appendix C. The structure of the CICS IA database . . . . . 213**

The structure of the Dependency database objects . . . . .	213
Dependency base tables . . . . .	213
Dependency facilitating tables . . . . .	220
Threadsafe table . . . . .	220
Dependency views . . . . .	221
The structure of the Affinity objects . . . . .	222
Affinity base tables . . . . .	222
Affinity facilitating table . . . . .	224
Affinity views . . . . .	225
The structure of the Load Module Scanner objects . . . . .	228
Load Module Scanner base tables . . . . .	228
The structure of the CSECT Scanner objects . . . . .	230
CSECT Scanner base tables . . . . .	230
CSECT Scanner object views . . . . .	231
The structure of the CICS regions objects . . . . .	232
CICS regions base table . . . . .	232
The structure of the resource objects . . . . .	233
File resource table . . . . .	234
Program resource table . . . . .	235
Transaction resource table . . . . .	237
Transient Data queue resource table . . . . .	240
Temporary Storage queue resource table . . . . .	242
Web service resource table . . . . .	243
GLUE and TRUE exit resource table . . . . .	245
Event table . . . . .	246
The structure of the CICS IA plug-in for CICS Explorer resource objects . . . . .	247
The structure of the Version objects . . . . .	248
The structure of the Command Flow table objects Type and Function mapping for monitored commands . . . . .	248
	252

## **Appendix D. Messages and codes . . . . . 269**

Contacting IBM Support . . . . .	269
Messages that CICS IA can issue . . . . .	269

Collector table manager diagnostics . . . . .	331
Function code values . . . . .	331
Table identifier values . . . . .	332
Reason code values . . . . .	332
Collector CINB request queue manager diagnostics . . . . .	333
Function code values . . . . .	333
Reason code values . . . . .	333
Date formatter diagnostics . . . . .	333
Reason code values . . . . .	333

## **Appendix E. Worksheet for the installation customization program . . . . . 335**

## **Appendix F. CICS IA space considerations . . . . . 347**

Required data . . . . .	347
Data space allocation . . . . .	348
Calculating the space required for interdependency collection . . . . .	348
Calculating the space required for affinity collection . . . . .	351
VSAM data set allocation . . . . .	351
Control file: CIUCNTL . . . . .	351
Dependency files: CIUINT1, 2, 3, 4, 5, 6, 7 . . . . .	352
Affinity files: CIUAFF1,2,3 . . . . .	352
Application file: CIUAPPL . . . . .	353
DB2 space allocation . . . . .	353
CICS tables and index: CIUCICS1 and CIUCICSX . . . . .	354
DB2 tables and index: CIUDB2 . . . . .	355
MQ tables and index: CIUMQ1 . . . . .	355
IMS tables and index: CIUIMS . . . . .	356
Natural tables and an index: CIUNAT . . . . .	356
Exit resource tables and index: CIUREXIT . . . . .	357
File resource tables and index: CIURFILE . . . . .	357
Program resource tables and index: CIURPROG . . . . .	358
Transaction resource tables and index: CIURTRAN . . . . .	358
Transient data queue resource tables and index: CIURTDQ . . . . .	359
Temporary storage queue resource tables and index: CIURTSQ . . . . .	359
Web services resource tables and index: CIURWEB . . . . .	360
Affinity tables and indexes . . . . .	360
Load Module Scanner tables . . . . .	361
CSECT Module Scanner tables . . . . .	362
CICS region tables . . . . .	363
CICS IA plug-in for CICS Explorer Resource table: CIURESTB/X . . . . .	363

## **Appendix G. CICS IA security . . . . . 365**

CICS IA transaction security . . . . .	365
DB2 security . . . . .	365

## **Appendix H. CICS IA External Interfaces . . . . . 367**

DB2 Stored Procedures . . . . .	367
CIUSPAPP Stored Procedure . . . . .	367

CIUSPAFF Stored Procedure . . . . .	371
CIUSPTSR Stored Procedure . . . . .	376
I CIUSPAP1 Stored Procedure . . . . .	381
The CICS IA Command Flow user exit . . . . .	383

**Appendix I. Collecting dynamic  
COBOL calls. . . . . 389**

**Appendix J. Bibliography . . . . . 391**  
CICS Transaction Server . . . . . 391

DB2 . . . . .	391
---------------	-----

**Appendix K. Accessibility . . . . . 393**  
Enabling hover help for screen readers . . . . . 393

**Index . . . . . 395**

**Notices . . . . . 403**  
Trademarks . . . . . 404

## Figures

1. The Collector structure of CICS IA components	4	39. Records before the selected LAST_RUN date.	115
2. The reporting structure of CICS IA dependency-related components . . . . .	5	40. Query to show program versions and FIRST_RUN timestamps. . . . .	116
3. The reporting structure of the CICS IA affinity-related components . . . . .	11	41. Query to show all distinct programs by latest FIRST_RUN timestamp. . . . .	116
4. Command Flow option structure . . . . .	15	42. Query to show latest program and program lengths. . . . .	117
5. Collector components . . . . .	16	43. Query showing commands to be deleted.	117
6. Panel CIUCNF04. . . . .	33	44. Query to delete commands from the CICS table for old commands. . . . .	118
7. Panel CIUCNF06. . . . .	34	45. The CICS IA plug-in Collection IDs window	118
8. Panel CIUCNF05. . . . .	35	46. Example clean up utility report . . . . .	122
9. Panel CIUCNF13. . . . .	36	47. Example CICS report from the Dependency Reporter—header page . . . . .	129
10. Panel CIUCNF12. . . . .	37	48. Example CICS report from the Dependency Reporter—main body . . . . .	130
11. Example program exclude list . . . . .	51	49. Example DB2 report from the Dependency Reporter . . . . .	131
12. Example transaction exclude list . . . . .	52	50. Example MQ report from the Dependency Reporter . . . . .	132
13. Example resource name prefix list . . . . .	53	51. Example IMS report from the Dependency Reporter . . . . .	133
14. Collector Main Administration Menu panel, CIU000 . . . . .	62	52. A sample report output by the Affinities Reporter . . . . .	135
15. User Administration Menu panel, CIU400	64	53. Sample basic affinity-transaction-group definitions . . . . .	138
16. Add User Menu panel, CIU410 . . . . .	65	54. Example program dynamic analysis threadsafe report, header page . . . . .	143
17. Copy User Menu panel, CIU420. . . . .	67	55. Example programs dynamic analysis threadsafe report, main body . . . . .	143
18. User Details Menu panel, CIU440 . . . . .	68	56. Example of a summary report produced by the Load Module Scanner . . . . .	149
19. Collector Operations Menu screen, CIU100	70	57. Builder input syntax . . . . .	164
20. Collector Statistics Menu panel, CIU150	78	58. Sample definitions for combined affinity transaction groups . . . . .	165
21. Collector Region Configuration Menu panel, CIU200 . . . . .	80	59. Sample data sets processed report. . . . .	168
22. Collector Resource Options panel, CIU290	81	60. Example empty Tranguroups report . . . . .	168
23. Collector General Options panel, CIU260	83	61. Sample group merge report. . . . .	169
24. Collector CICS Resources Options panel, CIU240 . . . . .	87	62. Sample error report . . . . .	170
25. Collector CICS Resources Options panel, CIU245 . . . . .	88	63. Collector Statistics Menu panel, CIU150, showing the CICS IA data space name . . . . .	175
26. Application Data Collection Options screen, CIU210 . . . . .	89	64. Example output from an MVS DISPLAY ACTIVE command, showing a data space name of 00000INT . . . . .	176
27. Collector DB2/MQ/IMS/RMI True Resource Options panel, CIU250 . . . . .	91	65. Example of finding an EXEC CICS command from the argument zero . . . . .	210
28. Collector Affinities Options panel, CIU270	92	66. Calculation for PRIQTY for tablespaces and indexes . . . . .	353
29. Collector Time and Dates Options screen, CIU280 . . . . .	94	67. The sample user exit program . . . . .	386
30. Collector Natural Options screen, CIU29N	95		
31. Collector Global Options Menu panel, CIU300	96		
32. Command Flow Options panel, CIUA01	98		
33. Command Flow ApplID list panel, CIUA02	102		
34. Command Flow Application Data Collection panel, CIUA0A . . . . .	103		
35. CICS IA Command Flow Statistics panel, CIUA03 . . . . .	104		
36. List of available CICS regions , CIUA04	105		
37. Configuring Explorer plug-in variables	107		

# Tables

1. Affinity-related CICS API and SPI commands detected by the CICS IA Collector and the CICS IA Load Module Scanner . . . . .	13	40. The CIU_SCAN_SUMMARY table . . . . .	228
2. Jobs and files supplied in hlq.SCIUSAMP.DB2	38	41. The CIU_SCAN_DETAIL table . . . . .	228
3. Jobs and files supplied in hlq.SCIUSAMP.CICS	43	42. The V_CIU_SCAN_TRDSAFE table . . . . .	229
4. CICS IA VSAM files and associated jobs	45	43. The CIU_PROGRAM_INFO table . . . . .	230
5. Editing the CIUDELGR job to remove old CICS IA definitions from CICS TS . . . . .	48	44. The CIU_CSECT_INFO table . . . . .	231
6. The groups of CICS resource definitions	49	45. The CIU_TRANSLATORS table . . . . .	231
7. The control keys on the User Administration Menu panel . . . . .	64	46. View V_CIU_CICS_LINKED . . . . .	232
8. The control keys on the Add User Menu panel	66	47. View V_CIU_CSECT_TRANS . . . . .	232
9. The control keys on the Copy User Menu panel. . . . .	68	48. The CIU_REGION_INFO table. . . . .	233
10. The control keys on the User Details Menu panel. . . . .	69	49. The CIU_FILE_DETAIL table . . . . .	234
11. Methods to start data collection by the Collector . . . . .	71	50. The CIU_PROGRAM_DETAIL table . . . . .	235
12. Methods for changing data collection options	73	51. The CIU_TRANSID_DETAIL table . . . . .	237
13. Methods for pausing data collection by the Collector . . . . .	74	52. The CIU_TDQUEUE_DETAIL table . . . . .	240
14. Methods for resuming data collection by the Collector . . . . .	75	53. The CIU_TSQUEUE_DETAIL table . . . . .	242
15. Methods for stopping data collection by the Collector . . . . .	76	54. The CIU_WEBSERV_DETAIL table . . . . .	243
16. The User Command Flow Utility control keys on the Command Flow Options panel . . . . .	100	55. The CIU_EXIT_INFO table . . . . .	245
17. The User Command Flow Utility control keys on the Command Flow ApplID list panel . . . . .	102	56. The CIU_TRUEEXIT_INFO table . . . . .	245
18. The User Command Flow Utility control keys on the User Command Flow Statistics panel . . . . .	105	57. The V_CIU_TRUEEXIT_INFO table . . . . .	245
19. The User Command Flow Utility control keys on the CIUA04 panel . . . . .	106	58. The CIU_EVENT_DETAIL table . . . . .	246
20. Resulting affinity relations . . . . .	166	59. The CIU_RESOURCE table . . . . .	248
21. Resulting affinity lifetimes (LUNAME relation) . . . . .	166	60. CIU_VERSION table . . . . .	248
22. Resulting affinity lifetimes (BAPPL relation)	167	61. The CIU_CMDFLOW_DATA table . . . . .	249
23. Resulting affinity lifetimes (USERID relation)	167	62. The CIU_CMDFLOW_INDEX table . . . . .	251
24. Resulting affinity lifetimes (LINK3270 relation) . . . . .	167	63. Type and Function mapping for monitored commands using the API ATOMServices CICS resource option flag . . . . .	252
25. Resulting affinity lifetimes (GLOBAL relation)	167	64. Type and Function mapping for monitored commands using the SPI ATOMServices CICS resource option flag . . . . .	252
26. Data sheet of problem determination information for IBM Support Center . . . . .	179	65. Type and Function mapping for monitored commands using the SPI BRFacility CICS resource option flag . . . . .	252

138. Worksheet for CSECT Module Scanner table space . . . . .	362	153. <b>rc</b> values . . . . .	379
139. Worksheet for CICS region tablespace	363	154. <b>sqlcode</b> values . . . . .	379
		155. CIUSPAP1 parameters . . . . .	381
		156. <b>calltype</b> values. . . . .	382
		157. <b>return-code</b> values . . . . .	382
		158. User exit return code values . . . . .	385

---

## Preface

This information describes the IBM® CICS® Interdependency Analyzer. It explains what the program does and how to set up and run its various components.

### What this information is about

CICS Interdependency Analyzer (CICS IA) is a run time tool for use with CICS Transaction Server for z/OS®. It has three main purposes:

1. To identify the sets of resources used by individual CICS transactions, and their relationships to other resources.

CICS IA enables you to understand the characteristics of your application set, that is:

- what a CICS region contains,
- which resources a transaction needs to be able to run,
- which programs use which resources,
- which resources are no longer used.

Understanding these characteristics improves your ability to maintain, enhance, modify, or redistribute your applications.

CICS IA captures interdependency information while CICS is running and stores it in VSAM files, from which detailed reports can be produced. The VSAM files are used to load DB2® databases, on which SQL queries can be performed.

2. To collect and analyze data about transaction affinities. Transaction affinities require particular groups of transactions to be run either in the same CICS region, or in a particular region.

This function is useful in a dynamic routing environment, you might need to know of any restrictions that prevent particular transactions being routed to particular application-owning regions (AORs) or that require particular transactions to be routed to particular AORs.

CICS IA loads the affinity data into DB2 databases, on which SQL queries can be performed and from which detailed reports can be produced.

3. To collect and analyze Command Flow data for a given transaction or terminal.

The Command Flow feature records all CICS, DB2, MQ and IMS™ commands issued in a chronological order. This allows you to understand the different paths a given transaction can go. You can run your own Command Flow captures and view it through the IA Explorer plug-in.

---

### Who this information is for

This information is for anyone who needs to understand, install, or use the CICS Interdependency Analyzer.

It will be particularly useful to system architects, system programmers, application programmers, and operators in organizations that need to do one or more of the following:

- Reuse existing applications as e-business
- Split the workload to plan for high availability
- Reduce the cost of application maintenance

- Set up or maintain a dynamic routing environment

### **What you need to know to understand this information**

You need to be familiar with the CICS application programming interface (API), SQL, and the various programming techniques available to CICS application programmers.

---

## **How to use this information**

This information is intended to be read sequentially.

This information will allow you to understand how to:

1. Set up the Analyzer
2. Run the separate components

Later, when you are familiar with the utility, you need only refer to the section dealing with the particular component that you want to run.

---

## What's new in this version

CICS IA V5.1 delivers a wide range of important new capabilities:

### **CICS TS application support**

In CICS TS V5.1, you can package applications for deployment into a platform. You can now logically define the various resources that make up a business application in CICS as a single entity and deploy these resources to CICS as a single resource. An application that is defined in this way can be managed as a single entity throughout its lifecycle, making CICS application management faster, easier, and less error prone. For more information, see Applications in the CICS TS infocenter.

The updated CICS IA V5.1 exits capture Application information and associate them with Dependency Data and Command Flow Data collected.

### **Improved installation and configuration steps**

In CICS IA V5.1 the configuration execution is split into two tasks:

- Configuring the target DB2 Environment.
- Configuring the CICS regions in which you want to collect data.
- Assign DSNAMES for your SORT utility
- Assign your system DUMP High Level Qualifier

“Cheat sheets” are added to the CICS IA plug-in for CICS Explorer® so you can select the configured output sample JCL jobs for both the DB2 and CICS configurations. The Cheat sheets also guide you through the jobs that must run to complete the tasks when you use the “z/OS perspective” in the CICS Explorer.

### **Threadsafe analysis**

The ability to run a batch job to report on the “threadsafe” readiness of a particular program or all programs in a particular region is now a DB2 Stored Procedure and can be started with the CICS IA plug-in for CICS Explorer.

### **DB2 data lifecycle management**

You can now delete your CICS IA data by “collection id” and by CICS TS Application definitions. There is a new section on Data lifecycle management in the User Guide.

### **Native SQL language stored procedures**

In CICS IA V5.1, you can choose to use native SQL language stored procedures or external SQL language stored procedures. Native SQL Stored Procedures are available in DB2 V91 onwards.

A native SQL language stored procedure is used instead of an external SQL language stored procedure, in that the source code is included within the CREATE PROCEDURE statement. The difference is in the executable procedures, and also in a richer SQL language.

When using a native SQL procedure, the entire executable is contained within DB2. The advantage of this approach is that DB2 can manage these stored procedures directly. The stored procedures run in the DBM1 address space, so there is no need to create a WLM environment to manage the procedures. Because native SQL procedures run under an enclave SRB instead of a TCB, if they are remote, they are also eligible to be run in a System z9<sup>®</sup> Integrated Information processor (zIIP) if one is available.

### **Updated exits**

CICS IA V5.1 provides CICS exits so that you can collect Dependency, Affinity, and Command Flow data in a CICS TS V5.1 region.

### **Command flow enhancements**

- Timestamp columns added to collected data
- Individual Exclude lists

### **New commands collected**

- COBOL DISPLAY command

---

## Summary of changes for earlier versions

The changes made in earlier versions are listed in this section.

---

### Changes for Version 3 Release 2

CICS IA V3.2 delivers a wide range of important new capabilities:

#### **Enhanced CICS IA Command Flow Feature**

CICS IA V3.2 introduces a new User Command Flow Feature. This allows individual developers to collect Command Flow data, use batch jobs to load their data and the CICS IA Explorer plug-in to view their data. The Command Flow feature can collect data in a chronological order by transaction(s) or terminal. A new transaction, CINC, is used to operate and administer Command Flow runs. You can also operate and administer it from the CICS IA Explorer plug-in.

#### **Operating the Collector through the CICS IA plug-in for the CICS Explorer**

In CICS IA V3.2, you can control the operation of the CICS IA Dependency and Affinity Collector using the CICS IA plug-in for the CICS Explorer. You can START/STOP/PAUSE/CONTINUE and REFRESH the controller.

#### **Enhanced dynamic call support**

CICS IA V3.2 now identifies the program invoking CICS/MQ/IMS/DB2 commands, even if this is a dynamically called program.

#### **Enhanced Affinity collection support**

In CICS IA V3.2, you can store collected affinity data in both DB2 zOS and DB2 UDB databases. It provides the ability to extract the Affinity data into CSV files and a sample stored procedure to load the data into DB2 for zOS or a UDB database table.

#### **Enhanced MQ API support**

CICS IA V3.2 provides the ability to collect MQ V7.1 API commands supported by CICS TS 4.1 and above.

#### **Enhanced installation and customization**

In CICS IA V3.2, you can take advantage of the enhanced ISPF configuration support that simplifies CICS IA installation and customization process.

This includes "shared" configuration support. Previously, all configurable variables were stored in a dataset owned by the *userid*. Now, you can save them in a shared dataset.

#### **CICS TRUE mapping support**

In CICS IA V3.2, you can use a DB2 table to map the TRUE name to a description. The description will be shown in the detailed information for that TRUE in the Properties view in the CICS IA Explorer plug-in.

#### **Enhanced Application Resource Information**

In CICS IA V3.2 Explorer plug-in, you can now discover resources used by Application.

#### **Internal trace**

CICS IA V3.2 now uses the CICS TS user trace feature. This allows up to three levels of tracing and helps with CICS IA problem determination.

## **Data Life Cycle Management**

CICS IA V3.2 introduces the ability to identify a CICS Dependency collection at DB2 load time. This enables the user to load, manage, and compare resource usage by collection id.

---

## **Changes for Version 3 Release 1**

CICS IA V3.1 delivers this wide range of important new capabilities:

### **Command Flow feature**

CICS IA V3.1 introduces a new feature to capture all CICS, DB2, IMS, and MQ commands in chronological order. The user can define up to five transactions for which data will be captured. The data is written to a *User Journal*, which can be defined on DASD or in a Coupling Facility. The data is subsequently written to a new DB2 table, CIU\_CMDFLOW\_DATA. The data captured includes TCB swap information, Task IDs, and Units of Work.

The user can also give the trace an 8-character name. The trace name, and the start and end timestamps are written to the journal and subsequently to a new DB2 table, CIU\_CMDFLOW\_INDEX.

### **Enhanced Natural and ADABAS support**

CICS IA V3.1 introduces new exits to enable the capture of Natural program calls and ADABAS calls in the Natural environment.

This data is written to a new DB2 table, CIU\_NATURAL\_DATA.

### **CICS IA plug-in for the CICS Explorer**

In CICS IA V3.1 the CICS IA Explorer is now shipped as the CICS IA plug-in for the CICS Explorer™. It includes enhancements so that the user can query more CICS IA tables, including the CIU\_CMDFLOW\_DATA and CIU\_NATURAL\_DATA.

### **DB2 batch jobs**

In CICS IA V3.1, the DB2 batch jobs for the dependency and command flow data use LOAD and UNLOAD utilities for better performance.

### **Support for CSV files**

CICS IA V3.1 provides sample jobs to unload the dependency and command flow data to CSV files rather than to DB2 on z/OS. These files can be sent by FTP to other platforms for use with Universal DB2 or spreadsheets.

### **Enhanced Configuration**

The configuration step in CICS IA V3.1 has been enhanced to include more configurable options and to store multiple configurations.

You can customize CICS IA V3.1 for more than one configuration of CICS TS versions and DB2 versions. See “Starting CICS IA customization” on page 32.

### **The Collector**

In CICS IA V3.1, the Collector exits have been reworked to improve performance.

### **The CINQ transaction**

In CICS IA V3.1, the CINQ transaction has been removed.

### **Information about how IA affects the performance of your system**

A new section describing how using CICS IA affects performance has been

added. This section describes the performance overhead associated with collecting interdependency and affinity data.

#### **Ability to recognize EGL programs**

CICS IA V3.1 can now capture and view EGL segments in the scanned load modules.

#### **Time stamps**

In version 3.1, time stamps in CICS IA trace records are reflected in the local time format.

#### **Affinity and Dependency issues**

CICS IA V3.1 makes it possible to capture both Dependency data and Affinity data at the same time.

#### **Dynamic updating options**

You can change the CICS IA V3.1 monitoring options without restarting.

#### **API and SPI commands**

CICS IA V3.1 provides an expanded range of API and SPI commands that are supported by the runtime collector. These commands are written to the DB2 table CIU\_CICS\_DATA.

#### **Logging the Collector options values**

In this version, every issued Collector command is written to the CINT log. For the START and REFRESHOPTIONS commands, the list of the Collector runtime options is also written.

All the changed collection options are written to the CINT log after saving to the control file.

---

## **Changes for Version 2 Release 2**

CICS IA V2.2 delivers a wide range of important new capabilities, including:

#### **CICS IA plug-in**

A new CICS IA plug-in for CICS Explorer, (CICS IA plug-in), that you download to a workstation. Using the Eclipse-based CICS IA plug-in, you can run predefined queries provided with CICS IA and create your own queries to analyze CICS IA data. The CICS IA plug-in replaces the client program that was provided with CICS IA V2.1.

When connected to a system containing the DB2 database with CICS IA data, it can be used to explore and analyze that data. The Eclipse-based interface enables effective data presentation. You can use the queries provided with CICS IA or easily build your own that meet your exact need for information. The CICS IA plug-in presents this information in an hierarchical fashion, showing clearly the resource relationships.

#### **New resource tables**

CICS IA V2.2 introduces seven new resource tables. They contain detailed information for seven of the primary resource types:

- Transactions
- Programs
- Files
- TD queues
- TS queues
- Web services

- Exits

These tables are repositories for information returned from an EXEC CICS INQUIRE request for the relevant resource type. For example, the File table contains information about the file type.

#### **More detailed information on programs**

CICS IA V2.2 collects more detailed information on programs. It also provides sample queries that can help plan for CICS TS version-to-version migration. It can help you see which task-related user exits (TRUEs) and global user exits (GLUEs) are customized by your CICS organization. When you have determined the CICS user exits that have changed in the new version, you can identify which exit programs need testing.

#### **Sample queries**

CICS IA V2.2 provides sample queries that tell you which programs include CICS SPIs or APIs that have been removed or changed from one version to the next.

#### **Threadsafe identification**

CICS IA V2.2 delivers a DB2 table that indicates, by CICS version, which APIs and SPIs are considered to be threadsafe (that is, they do not perform a swap to the QR TCB). It has been shown that running applications as threadsafe can save as much as 15% of processor usage. This CICS IA table, along with detailed information on programs and files, can be used to produce a report for a given program that will provide information such as:

- Count of threadsafe calls.
- Count of non-threadsafe calls.
- Details of these calls.
- Listings of programs that contain the four EXEC CICS commands that could cause an unsafe affinity between transactions. These commands might need to be resolved for the program to be threadsafe (ADDRESS CWA, LOAD HOLD, GETMAIN SHARED and EXTRACT EXIT).
- Count of MQ, IMS, and DB2 calls.
- Count of dynamic calls.

CICS IA provides the most comprehensive analysis available of threadsafe attributes, so that it provides you with the information you need to assess and modify applications and remove constraints.

#### **Ability to capture new resources**

CICS IA V2.2 provides a new table to capture resources used by a Web service. It captures the program name, URIMAP, container, pipeline, mapping levels, WSDL file name, and WSBIND file name. This enables you to understand which resources are required when deploying your Web service from development into test, and from test into production.

CICS IA V2.2 captures resource information for EXEC CICS commands that are considered to be presentation logic. It also captures when the program is called with a COMMAREA or CHANNEL resource. With this information you can identify a legacy program that contains only business logic and could be a candidate to be re-factored into a Web service.

In each new release, CICS IA expands the scope of its data capture. CICS IA V2.2 captures information on the two new resources introduced in CICS TS 3.2 (IPCONN and LIBRARY). It also captures for the first time information on any EXEC CICS command that has more than one resource

associated with it. For example, where an EXEC CICS LINK PROGRAM has a channel associated with it, CICS IA collects both the program name and the channel name. In this case, the program is referred to as the primary resource and the channel as the secondary resource. CICS IA maintains such information about related resources so that the CICS IA plug-in can present a useful hierarchical view of resource relationships.

#### **Additional WebSphere® MQ attributes**

CICS IA V2.2 delivers extensions to existing support, now reporting on two additional attributes of the MQOPEN request. These are:

- MQOO\_FAIL\_IF QUIESCING
- MQOO\_BIND\_ON\_OPEN

#### **Improved program call chain**

CICS IA V2.2 reports on all programs involved in a chain of called programs, even those that do not invoke CICS services. Previously it reported only on programs that contained EXEC CICS commands. This enhancement ensures you have a complete record of assets involved in a CICS transaction.

#### **WebSphere Studio Asset Analyzer**

CICS IA V2.2 makes it easy to launch WebSphere Studio Asset Analyzer to extend the scope of analysis. An on-screen button in the CICS IA plug-in launches this companion discovery tool.

#### **Enhanced ISPF configuration EXEC**

The ISPF configuration EXEC has been updated to allow you to select further DB2 and data management options. You can:

- Use DFSMS data, storage, and management classes to define the VSAM datasets used by CICS IA.
- Customize the size of the VSAM files allocated. For DB2, customize the database name, the storage group name, the plan name for both CICS and batch, and the buffer pools used for table spaces and indexes.

#### **Natural fourth generation language (4GL)**

CICS IA V2.2 identifies the use of CICS resources accessed by application programs using Software AG Natural 4GL software. CICS IA V2.2 introduces initial support to identify CICS resources within their Software AG Natural environment:

- CICS programs called from within Natural programs.
- Resources used by the CICS programs called from within Natural programs.
- Calls made to the Adabas task related user exits.

---

## **Changes for Version 2 Release 1**

The most significant changes for this release are:

- The CINT transaction, used to control the collection of dependency and affinity data, has been enhanced as follows:
  - Start, stop, pause, or resume the collection of data on multiple regions at the same time, that is, with a single command. See “Controlling the collection of dependency and affinity data” on page 70.
  - Set a region-specific attribute to the same value on multiple regions with a single command. See “Changing the Collector options” on page 79.

- Set default values for region-specific attributes. See “Changing the Collector options” on page 79.
- You can now set a timer, to control the dates and times at which dependency or affinity data is collected on a region. See “Specifying region-specific options: timers” on page 93.
- You can specify, by means of a list of name prefixes, a set of programs for which data is not to be collected. See “Creating a program exclude list” on page 51.
- You can specify, by means of a list of name prefixes, a set of CICS transactions for which data is not to be collected: see “Creating a transaction exclude list” on page 52.
- A new database table, CIU\_REGION\_INFO, is introduced, to store information about the CICS regions on which the Collector runs. CIU\_REGION\_INFO is described in “The structure of the CICS regions objects” on page 232.
- A new installation customization program helps you to customize the CICS IA sample jobs, clists, and SQL definitions. It creates customized installation jobs in which the names of system entities, such as the high-level qualifier (hlq) of the CICS IA data sets, are set to specified values to suit your local environment. The installation customization program is described in “Running the installation customization program” on page 31.
- Appendix E, “Worksheet for the installation customization program,” on page 335 is a new appendix that contains a worksheet for use with the installation customization program.
- A new program, the CICS IA client, which is designed to run in an Eclipse development environment, provides a graphical front end to CICS IA; See “The CICS IA plug-in for CICS Explorer ” on page 23.
- A new Scanner, the CSECT Scanner, is introduced. It scans load modules for information that can be used to identify the version of each CSECT. The output is stored in DB2 tables and can be used to identify different versions of programs. See “The CSECT Scanner” on page 27, Chapter 11, “Running the CSECT Scanner,” on page 155, and “The structure of the CSECT Scanner objects” on page 230.
- New and changed messages are listed in Appendix D, “Messages and codes,” on page 269.
- Chapter 14, “Solving problems,” on page 173 is a new chapter.

## **Changes for Version 2 Release 1, PTF PK35107**

The most significant changes made for this PTF are:

- New Chapter 13, “Running the sample DB2 query,” on page 171
- New Appendix F, “CICS IA space considerations,” on page 347
- New Appendix G, “CICS IA security,” on page 365
- Addition of references to CICS TS V3.2

---

## **Changes for Version 1 Release 3**

The most significant changes for this release are:

- CICS IA Version 1.3 can now collect and analyze data about transaction affinities, as well as data about resource dependencies. It loads the affinity data into DB2 databases, on which SQL queries can be performed and from which detailed reports can be produced. For more information see the following new sections:
  - “CICS IA affinity related functions” on page 6

- “How affinity data is collected” on page 20
- “The Affinity database objects” on page 23
- “The Affinities Reporter” on page 25
- “The Load Module Scanner” on page 26
- “The Builder component” on page 27
- “Updating the Affinity database objects” on page 110
- Displaying affinities data
- “Running the Affinities Reporter” on page 133
- Chapter 12, “Running the Builder,” on page 161
- “Commands monitored for potential affinities” on page 202
- “The structure of the Affinity objects” on page 222
- “The structure of the Load Module Scanner objects” on page 228
- “Changes for Version 2 Release 1” on page xxi summarizes the new features in CICS IA Version 1.3.
- The configuration information in Chapter 3, “Preparing to use CICS IA,” on page 31 has been updated.
- Migrating from CICS(r) IA Version 3.1 has been rewritten.
- “Running the installation verification program” on page 57 is a new chapter.
- Chapter 4, “Running the Collector,” on page 61 has been rewritten to include the collection of affinity data.
- New JCL to update the Dependency database objects is described in “Updating the Dependency database objects” on page 109.
- Chapter 10, “Running the Load Module Scanner,” on page 147 has been rewritten. “Creating a summary report with DB2 output” on page 149, “Creating a detailed report with DB2 output” on page 153, and “The structure of the Load Module Scanner objects” on page 228 are new sections.
- New messages have been added to “Messages that CICS IA can issue” on page 269.
- The collection of resource dependencies caused by EXEC DLI calls to IMS databases is documented in:
  - “Non-CICS API commands detected” on page 201
  - Displaying interdependency data for IMS resources
  - “IMS database: EXEC DLI” on page 201
- The name of the specific DB2 resource causing a DB2 dependency is now supplied in the CIU3\_DB2\_DATA base table. In CICS IA Version 1.2 it had to be looked up in the DB2 SYSIBM.SYSPACKSTMT or SYSIBM.SYSTMT table. See:
  - Viewing the DB2 resource referenced by a DB2 command
  - The description of the CIU3\_DB2\_DATA base table in “Dependency base tables” on page 213

---

## Changes for Version 1 Release 2

The book was largely rewritten to describe the new features in this release. The most significant changes were:

- “Dependency-related commands” on page 6 was updated to include additional CICS API, SPI, and FEPI commands that can now be monitored by CICS IA.
- “Non-CICS API commands detected” on page 201 listed the non-CICS commands that can now be monitored by CICS IA.
- The first section of Chapter 3, “Preparing to use CICS IA,” on page 31 listed the revised set of installation files now supplied with CICS IA.
- “DB2 considerations” on page 38 was a new section.
- Migrating from CICS(r) IA Version 3.1 was a new section.

- Chapter 4, “Running the Collector,” on page 61 was rewritten to describe the new interface to the CICS IA Collector.
- “Updating the Dependency database objects” on page 109 was rewritten to describe how to update the new tables in the Dependency database objects.
- ‘Using the CICS IA Client’ was rewritten to describe CICS IA’s revised Query interface.
- “Running the Dependency Reporter” on page 125 was rewritten to describe how to generate the new reports that are now available.
- “CICS SPI commands” on page 189 gave details of the dependencies collected for CICS system programming interface (SPI) commands.
- “CICS FEPI commands detected” on page 200 gave details of the dependencies collected for CICS Front End Programming Interface (FEPI) commands.
- “Non-CICS API commands detected” on page 201 gave details of the dependencies collected for non-CICS API commands.
- Appendix C, “The structure of the CICS IA database,” on page 213 was rewritten to describe the structure of the new tables in the set of Dependency database objects.
- “Messages that CICS IA can issue” on page 269 was updated with new and changed CICS IA messages.
- “Collector table manager diagnostics” on page 331 was updated.

---

## Chapter 1. Overview of the CICS Interdependency Analyzer

This section gives an overview of the CICS Interdependency Analyzer (CICS IA), and describes its components.

CICS IA is a run time tool for use with CICS Transaction Server for z/OS. It has three purposes:

1. To identify the sets of resources used by individual CICS transactions and their relationships to other resources. Then you can understand the characteristics of your application set: you can see what a CICS region contains; what resources a transaction needs in order to run; which programs use which resources; and which resources are no longer used. Thus your ability to maintain, enhance, modify, or redistribute your applications is much improved.

This function of CICS IA is described in “CICS IA interdependency functions” on page 3.

2. To identify possible transaction affinities. Affinities require particular groups of transactions to be run either in the same CICS region, or in a particular region. The ability to identify transaction affinities is useful in a dynamic routing environment: you need to know of any restrictions that prevent particular transactions being routed to particular application-owning regions (AORs); or that require particular transactions to be routed to particular AORs.

This function of CICS IA is described in “CICS IA affinity related functions” on page 6.

3. To identify and analyze resource usage flow within a transaction or transactions. This is done using the Command Flow feature. It allows individual users to capture all CICS/DB2/MQ/IMS commands in chronological order. The data is stored in DB2 tables, and each individual user can populate these tables with their own data. The CICS IA Explorer plug-in provides a new view to list all the Command Flow captures by a userid.

This function of CICS IA is described in “CICS IA Command Flow functions” on page 14.

## CICS IA requirements

Requirements for running CICS IA.

### CICS Requirements

CICS IA V5.1 captures data for CICS Transaction Server Version 1.3 for z/OS and later. However, some new features are supported only in later versions of CICS TS for z/OS.

The CICS IA Command Flow feature requires CICS TS V3.1 or later.

If you want to operate the CICS IA Controller from the CICS IA Explorer plug-in, the CICS IA region that you intend to control requires CICS Transaction Server V4.1 or later.

Each CICS region, on which the CICS IA Collector is to run, must have Language Environment<sup>®</sup> installed and active.

### DB2 requirements

CICS IA requires DB2 V8.0 for z/OS or above. You will also require the *DB2 Utilities Suite for z/OS* for the version DB2 that you are using.

The CICS IA sample jobs support utilities provided by other vendor with minor changes.

### VSAM file support

To control CICS IA Collectors on multiple regions from a single CICS terminal, the VSAM files to which CICS saves dependency data, affinity data, and control information must be shared across all the regions. See “The dependency data and affinity data VSAM files” on page 21 and “The control record VSAM file” on page 22. To share these files, you can use either:

1. VSAM record-level sharing (RLS). If you use VSAM RLS, all the regions must be in the same MVS<sup>™</sup> parallel sysplex. A parallel sysplex is a sysplex that uses a coupling facility, which is required to support VSAM RLS. For information about using VSAM RLS in CICS, see the *CICS Installation Guide*.
2. Function shipping to a file-owning region (FOR). For information about CICS function shipping, see the *CICS Intercommunication Guide*.

### Other Requirements

CICS IA V5.1 uses the IBM supplied DFSORT utility in the sample batch jobs used to load DB2 tables.

These jobs can be used with other vendor SORT utilities with minor changes to the sample JCL.

**Note:** The SORT utility uses SYMBOLIC names. CICS IA does not provide support for vendor utilities that do not meet this requirement.

---

## CICS IA interdependency functions

CICS IA assists in understanding, in a controlled manner, the inter relationships between the shared common resources of applications and services.

Many large organizations have been using CICS since the early 1970s, their systems growing and evolving with the business. During this time, many techniques for implementing applications have been used, as a result of new function, changing corporate standards, technical requirements, and business pressures. Frequently, this growth has not been as structured as it might have been, with the result that many applications and services share common resources, and changes in one area typically affect many others. Unstructured growth can reach such a level that the system can no longer develop in a controlled manner without a full understanding of these inter relationships. CICS IA can help you achieve this understanding.

For example, to change the content or structure of a file, you must know which programs use this file, because they will need to be changed. CICS IA can identify the programs and the transactions that drive the programs.

CICS IA records the interdependencies between resources, such as files, programs, and transactions, by monitoring programming commands that operate on resources. The application that issues such a command has a dependency on the resource named in the command. For example, if an application program issues the command EXEC CICS WRITE FILE *myfile* it has a dependency on the file called “*myfile*”. It might have similar dependencies on transient data queues, temporary storage queues, transactions, and other programs.

The commands that are monitored are typically CICS application programming interface (API) and system programming interface (SPI) commands that operate on CICS resources. However, you can also instruct CICS IA to monitor some types of commands that operate on resources that are not CICS. For example:

- EXEC SQL calls to DB2 resources
- MQ calls to WebSphere MQ resources
- EXEC DLI calls and language-dependent native calls to IMS Database resources
- Dynamic COBOL calls to other programs

Potentially, the inclusion of any non-CICS resources gives you a fuller picture of the resources used by a transaction.

All the CICS and non-CICS commands that can be monitored are listed in Appendix A, “Details of dependencies and affinities collected,” on page 181.

The Collector component of CICS IA collects the dependencies that apply to a single CICS region; that is, a single application-owning region (AOR) or a single, combined routing region and AOR. It can be run against production CICS regions and is also useful in a test environment, to monitor possible dependencies introduced by new or changed application suites or packages. From the interactive interface of CICS IA, you can control Collectors running on multiple regions.

**Note:** To ensure that you monitor as many potential dependencies as possible, use CICS IA with all parts of your workload, including rarely used transactions and abnormal situations.

CICS IA collects these dependencies into a database. You can store the dependency information from several CICS regions into the same database.

You can review the collected dependencies using the CICS IA Query interface, or list them using the Reporter.

The rest of this section contains:

- “CICS IA dependency-related components overview”
- “Dependency-related commands” on page 6

## CICS IA dependency-related components overview

CICS IA comprises a number of components, which divide into collecting and reporting parts. Study these figures to help you understand how the dependency-related components of CICS IA relate to each other.

Figure 1. The Collector structure of CICS IA components

Figure 2. The reporting structure of CICS IA dependency-related components

## CICS IA contains these dependency-related components:

### The Collector

The Collector is a CICS transaction that runs in your CICS region and intercepts selected CICS and non-CICS programming commands. Depending on what you have specified, it records, in an MVS data space, details of either of the following:

- The resources used by the commands
- The potential affinities created by the commands

You can collect both dependency data and affinity data on the same region at the same time. The dependency data, affinity data, or both are saved to VSAM files.

### The Dependency database objects

The Dependency database objects contain data extracted from the VSAM dependency file created by the Collector. It is updated periodically to add data from new or infrequently run applications.

### The CICS IA plug-in for CICS Explorer

The CICS IA plug-in for CICS Explorer provides a graphical front end to CICS IA. For more information, see the *Analyzing CICS IA data using the CICS IA plug-in for CICS Explorer* section in the *IBM CICS Explorer User Guide*.

### The Dependency Reporter

The Dependency reporter is a batch utility that you can use to convert the dependency data in the VSAM files into reports in a readable format. You might use this function if, for example, you do not have DB2.

### The Load Module Scanner

The Load Module Scanner is a batch utility that scans a load module library to detect those programs in the library that issue commands that might cause either of the following:

- Transaction resource dependencies
- Transaction affinities

It produces a printed report. The dependencies data that it collects is written to the Load Module Scanner database objects.

## Dependency-related commands

All the commands listed in this section are the dependency-related commands detected by CICS IA.

The dependency-related commands are divided into CICS and non-CICS commands, which are capable of causing resource dependencies, although they might not do so.

For details about CICS and non-CICS dependency related commands, see “Commands monitored for potential dependencies” on page 181.

---

## CICS IA affinity related functions

The affinity related functions of CICS IA help users of CICS dynamic routing, who need to determine whether any of the transactions in their CICS applications use programming techniques that require them to be run in the same region thus creating an inter-transaction affinity, or in a particular region, thus creating a transaction-system affinity. Application programmers can use CICS IA to detect whether the programs they are developing are likely to cause transaction affinities.

The affinity-related functions of CICS IA work in a similar way to the interdependency functions, by collecting information about programs and transactions that issue specific commands, but in this case the objective is to detect affinities rather than interdependencies.

CICS IA detects possible affinities by monitoring those EXEC CICS commands that have the potential to create them. All the CICS API and SPI commands that might create affinities and can be monitored are listed in “Affinity-related commands” on page 12.

The Collector component of CICS IA collects the affinities that apply to a single CICS region, that is, a single application-owning region (AOR) or a single, combined, routing region and AOR. It can be run against production CICS regions and is also useful in a test environment, to monitor possible affinities introduced by new or changed application suites or packages.

The CINT transaction provides an interactive interface with which to control the Collector.

**Note:** To ensure that you monitor as many potential affinities as possible, run the Collector against all parts of your workload, including rarely used transactions and abnormal situations.

The affinity data collected by the Collector is stored in data tables in a data space. When you stop the Collector and, optionally, at predetermined intervals, the affinity data in the data space is saved to VSAM files by the CICS IA autosave transaction, CINB.

Using CICS IA, you can:

- Collect data about potential affinities
- Load the affinity data into DB2 databases
- Use the Query interface to analyze the affinities data by means of SQL queries

- Use the Load Module Scanner to check a load module library for programs that issue commands that might cause transaction affinities
- Use the Affinities Reporter to produce detailed affinity reports
- Use the Builder to create a file of affinity-transaction-group definitions suitable for input to CICSplex® SM

The rest of this section contains:

- “What are transaction affinities?”
- “CICS IA affinity-related components: overview” on page 10
- “Affinity-related commands” on page 12

## What are transaction affinities?

CICS transactions use many different techniques to pass data from one to another. Some techniques require that the transactions exchanging data must execute in the same CICS region, and therefore impose restrictions on the dynamic routing of transactions. If transactions exchange data in ways that impose such restrictions, an affinity exists between them.

There are two categories of affinity, inter transaction affinity; see “Inter transaction affinity” and transaction system affinity; see “Transaction system affinity” on page 8.

The restrictions on dynamic routing caused by transaction affinities depend on the duration and scope of the affinities. Clearly, the ideal situation for a dynamic routing program is that no transaction affinity exists, indicating no restriction in the choice of available target regions. However, even when transaction affinities do exist, limits to the scope of these affinities are determined by the affinity relations; see “Affinity relations” on page 8 and Affinity lifetime; see “Affinity lifetimes” on page 8.

CICS IA cannot detect affinities in the following types of dynamically-routed requests:

- Non-terminal-related START requests
- Distributed program link (DPL) requests
- Method requests for enterprise beans or CORBA stateless objects

For these types of dynamically routed requests, you must review your application to determine whether or not it is suitable for dynamic routing.

### Inter transaction affinity

An inter transaction affinity is an affinity between two or more CICS transactions. It is caused by the transactions using techniques to pass information between one another, or to synchronize activity between one another, in a way that requires the transactions to execute in the same CICS region.

Inter-transaction affinities, which impose restrictions on the dynamic routing of transactions, can occur in the following circumstances:

- One transaction terminates, leaving “state data” in a place that a second transaction can access only by running in the same CICS region as the first transaction.
- One transaction creates data that a second transaction accesses while the first transaction is still running. To ensure safe working, the first transaction usually waits on an event, which the second transaction posts when it has read the data created by the first transaction. This synchronization technique requires that both transactions are routed to the same CICS region.

## Transaction system affinity

A transaction system affinity is an affinity between a transaction and a particular CICS region, it is not an affinity between transactions. It is caused by the transaction interrogating or changing the properties of the CICS region.

Transactions with an affinity to a particular CICS region, rather than to another transaction, are not eligible for dynamic transaction routing. Typically, they are transactions that use CICS SPI commands, such as EXEC CICS INQUIRE or SET, or that depend on global user exit programs.

## Affinity relations

When a transaction is associated with an affinity, the affinity relation determines how the dynamic routing program selects a target region for an instance of the transaction.

An affinity relation can be classified as one of the following:

### Global

A group of transactions, in which all instances of all transactions in the group that are initiated from any terminal, or are BTS or Link3270 transactions, must execute in the same target region for the lifetime of the affinity. The affinity lifetime for global relations can be “system” or “permanent”.

### BAPPL

All instances of all transactions in the group are associated with the same CICS Business Transaction Services (BTS) process. Many different user IDs and terminals associated with the transactions might be included in this affinity group.

### LINK3270

All instances of all transactions in the group are associated with the same Link3270 bridge facility.

### LUnicode

A group of transactions, in which all instances of all transactions in the group that are initiated from the same terminal must execute in the same target region for the lifetime of the affinity. The affinity lifetime for LUnicode relations can be “pseudoconversation”, “logon”, “system”, or “permanent”.

### User ID

A group of transactions, in which all instances of the transactions that are initiated from a terminal and executed on behalf of the same user ID, must execute in the same target region for the lifetime of the affinity. The affinity lifetime for user ID relations can be “pseudoconversation”, “sign-on”, “system”, or “permanent”.

## Affinity lifetimes

The affinity lifetime determines when the affinity is ended.

An affinity lifetime can be classified as one of:

### System

The affinity lasts for as long as the target region exists and ends whenever the target region terminates, at a normal, immediate, or abnormal termination. The resource shared by transactions that take part in the affinity is not recoverable across CICS restarts.

**Permanent**

The affinity extends across all CICS restarts. The resource shared by transactions that take part in the affinity is recoverable across CICS restarts. This affinity is the most restrictive of all the inter-transaction affinities.

**Process**

The affinity exists until the BTS process completes.

**Activity**

The affinity exists until the BTS activity completes.

**Facility**

The affinity exists until the Link3270 bridge is deleted.

**Pseudoconversation**

The LUsername or user ID affinity lasts for the whole pseudoconversation and ends when the pseudoconversation ends at the terminal.

**Logon**

The LUsername affinity lasts for as long as the terminal remains logged on to CICS and ends when the terminal logs off.

**Signon**

The user ID affinity lasts for as long as the user is signed on, and ends when the user signs off.

**Note:**

1. For user ID affinities, the “pseudoconversation” and “sign-on” lifetimes are possible only in those situations in which one user per user ID is permitted. Such lifetimes are meaningless if multiple users are permitted to be signed on with the same user ID at the same time even at different terminals.
2. If an affinity is both “userid” and “LUsername” that is, all instances of all transactions in the group were initiated from the same terminal and by the same user ID, “LUsername” takes precedence.

**Worsening of transaction affinities relations:**

The worsening of transaction affinities relations is flagged by the Detector and reported by the Reporter.

In some cases, the Detector may not detect enough occurrences (at least 10) of an affinity command to be sure that the affinity is definitely with a terminal (LUNAME), user ID (USERID), or CICS BTS process (BAPPL). In such cases, the Detector records the (worsened) affinity relation as GLOBAL instead of LUNAME or USERID.

**Worsening of transaction affinities lifetimes:**

Lifetime worsening is flagged by the Detector, and reported by the Reporter.

If a pseudoconversation ends, and the resource still exists, the Detector deduces that the lifetime is longer than PCONV, that is, one of LOGON, SIGNON, SYSTEM, or PERMANENT.

If a logoff or sign-off occurs, and the resource still exists, the Detector deduces that the lifetime is longer than LOGON or SIGNON: that is, either SYSTEM or PERMANENT.

If a CICS BTS activity completes and the resource still exists, the lifetime is worsened to process. If a CICS BTS process completes and the resource still exists, the lifetime is worsened to system.

In some cases, the Detector may not detect a logoff or sign-off, so cannot be sure that the affinity lifetime is LOGON or SIGNON. In such cases, the Detector records the (worsened) lifetime as SYSTEM or PERMANENT instead of LOGON or SIGNON. For example, this occurs when the CICS region that the Detector is running on is a target region, because it is impossible in some cases to detect a logoff or sign-off that occurs in a connected routing region.

## **CICS IA affinity-related components: overview**

Study the figures to help you understand how the affinity-related components of CICS IA relate to each other.

Refer to Figure 1 on page 4 for the Collector structure.

Figure 3. The reporting structure of the CICS IA affinity-related components

## CICS IA includes these affinity-related components:

### The Collector

The Collector is a CICS transaction that runs in your CICS region and intercepts selected CICS and non-CICS programming commands. Depending on what you have specified, it records, in an MVS data space, details of either of the following:

- The potential affinities created by the commands
- The resources used by the commands

You can collect both dependency data and affinity data on the same region at the same time. The dependency data, affinity data, or both are saved to VSAM files.

#### **The Affinity database objects**

The Affinity database objects contain data extracted from the VSAM affinity files created by the Collector. It is updated periodically to add data from new or infrequently run applications.

#### **The CICS IA plug-in for CICS Explorer**

The CICS IA plug-in provides a graphical front end to CICS IA. For more information about the CICS IA plug-in, see the *Analyzing CICS IA data using the CICS IA plug-in for CICS Explorer* section in the *IBM CICS Explorer User Guide*.

#### **The Affinities Reporter**

The Affinities Reporter is a batch utility that you can use to do any of the following:

- Convert the affinity data in the Affinity database objects into reports in a readable format.
- Convert the affinity data in the VSAM files into reports in a readable format. You might use this function if, for example, you do not have DB2.
- From the affinity data, in the Affinity database objects, create a file of affinity-transaction-group definitions in a syntax approximating to the batch API of CICSplex SM. This file is intended as input to the Builder component.

#### **The Builder**

The Builder is a batch utility that takes as input the file of basic affinity-transaction-group definitions created by the Affinities Reporter. It produces a file of “combined” affinity-transaction-group definitions suitable for input to CICSplex SM, which requires that a specific CICS transaction ID (TRANSID) is in only one transaction group.

## **Affinity-related commands**

This section lists the affinity-related EXEC CICS commands detected by the Collector and the Load Module Scanner. All commands listed here are *capable of* causing affinities; they might or might not actually do so.

In Affinity-related CICS API and SPI commands detected by the CICS IA Collector and the CICS IA Load Module Scanner:

- The left-hand column shows the CICS *API* commands that might create inter transaction affinities.
- The center column shows the CICS *API* commands that might create transaction system affinities.
- The right-hand column shows the CICS *SPI* commands that might create transaction system affinities.

Table 1. Affinity-related CICS API and SPI commands detected by the CICS IA Collector and the CICS IA Load Module Scanner

CICS API commands that might create inter-transaction affinities	CICS API commands that might create transaction-system affinities	CICS SPI commands that might create transaction-system affinities
ENQ DEQ READQ TS WRITEQ TS DELETEQ TS ADDRESS CWA LOAD RELEASE GETMAIN SHARED FREEMAIN RETRIEVE WAIT DELAY POST START CANCEL COLLECT STATISTICS	STARTBROWSE ACTIVITY STARTBROWSE CONTAINER STARTBROWSE EVENT STARTBROWSE PROCESS GETNEXT ACTIVITY GETNEXT CONTAINER GETNEXT EVENT GETNEXT PROCESS ENDBROWSE ACTIVITY ENDBROWSE CONTAINER ENDBROWSE EVENT ENDBROWSE PROCESS WAIT EXTERNAL WAIT EVENT WAITCICS	ENABLE PROGRAM DISABLE PROGRAM EXTRACT EXIT INQUIRE SET PERFORM RESYNC DISCARD CREATE CSD

**Notes:**

1. The CICS IA Load Module Scanner might detect some instances of these commands that do not cause an affinity. For example, all FREEMAIN commands are detected but only those used to free GETMAIN SHARED storage might cause an affinity.
2. The CICS IA Load Module Scanner also detects MVS POST SVC calls and MVS POST LINKAGE=SYSTEM non-SVC calls, because of their relationship to the various EXEC CICS WAIT commands.
3. The CICS IA Collector does not search for transient data and file control EXEC CICS commands. They are assumed not to cause affinities because you can define transient data and file control resources as remote, in which case the request is function-shipped, causing no affinity problem.
4. The Collector ignores commands that target remote resources and are function-shipped, because function-shipped commands do not cause affinity problems.
5. The Collector and the CICS IA Load Module Scanner do not search for commands issued by any program named CAUxxxxx, CIUxxxxx, or DFHxxxxx, because CICS programs are not considered part of the workload. Also, the Collector does not search for commands issued from:
  - DB2 and DBCTL task-related user exits
  - User-replaceable programs
6. There are other ways in which transactions can cause affinity with each other, but they are not readily detectable by the Collector because they do not take place through the EXEC CICS API.
7. The Collector lists WAIT commands as transaction-system affinities because only half of the affinity can be detected. The Collector does not detect MVS POST calls or the hand posting of ECBs.
8. The Collector and the CICS IA Affinities Reporter ignore ENQ and DEQ commands that specify an ENQSCOPE name.

For details about affinity-related commands see “Commands monitored for potential affinities” on page 202.

---

## CICS IA Command Flow functions

The CICS IA Command Flow utility allows individual users to capture CICS, DB2, MQ and IMS commands in a chronological order for one or more transactions. Each user can capture information for his or her given transaction or transactions. They can also individually load and view the data that they have captured.

### CICS IA Command Flow components overview

CICS IA comprises a number of the Command Flow components, which divide into collecting and reporting parts.

#### CICS IA contains these Command Flow components:

Refer to Figure 1 on page 4 for the Collector structure.

##### The Command Flow Collector

The Command Flow Collector collects all CICS, DB2, MQ and IMS commands in chronological order and writes them to the CICS Journal log stream.

##### The Command Flow database objects

The Command Flow database objects contain data extracted from the CICS Journal log stream created by the Collector. It is updated periodically to add data from new or infrequently run applications. See “The structure of the Command Flow table objects” on page 248.

##### The CICS IA plug-in for CICS Explorer

The CICS IA plug-in for CICS Explorer provides a graphical front end to CICS IA. For more information, see the *Analyzing CICS IA data using the CICS IA plug-in for CICS Explorer* section in the *IBM CICS Explorer User Guide*.

### The Command Flow Feature

The Command Flow feature enables you to capture all EXEC CICS, SQL, MQ and IMS calls in chronological order.

With the Command Flow Feature you can trace the command flow in up to five transactions in chronological order. A trace name can be associated with each instance of the trace. CICS IA uses a number of CICS Global User Exits (GLUEs) and a CICS Task Related User Exit (TRUE) to intercept commands. The command records are written to a CICS User Journal, which uses the MVS logger subsystem to write them to a log streams data set. At the end of a trace, a record containing the name, start time, end time, and the five possible transactions is written to the journal.

The data is read from the log stream data sets into a generation data set. The data in the generation data set is formatted to update the CIU\_CMDFLOW\_DATA and CIU\_CMDFLOW\_INDEX DB2 tables, or to create QSAM data sets with the data stored in the Comma Separated Value (CSV) format. See Figure 4 on page 15.

Figure 4. Command Flow option structure

## The Collector component

You can use the Collector in real-time to detect transaction resource definitions and transaction affinities in a running CICS region.

You can collect both dependency data and affinity data on the same region at the same time.

The Collector saves details of the dependencies or affinities in an MVS data space. This data is subsequently saved to storage. The details of the Command flow are saved in the CICS Journal Log Stream. The Collector consists of:

- A control transaction, CINT
- An autosave transaction, CINB
- A control transaction for Command Flow data collection, CINC
- Some global user exit programs
- A task-related user exit program

The Collector components are shown in Figure 5 on page 16.

Figure 5. Collector components

Dependency data is collected by global user exit programs at the exit points. Affinity data is collected by the task-related and global user exit programs. Command Flow data is collected by the task-related and global user exit programs. The exit programs coexist with any other exit programs that are invoked at the same exit points.

You are recommended to place the CICS IA exit programs after any other exit programs that are invoked at the same exit points and make them the last to be enabled. This enables CICS to capture, where applicable, the correct remote SYSID associated with resources such as programs, files, TS queues, TD queues, and transactions.

Where more than one global user exit program is invoked from the same global user exit point, the order in which the programs are invoked is the order in which they are activated by EXEC CICS ENABLE commands. For more information, see "Invoking more than one exit program at a single exit" in the *CICS Customization Guide*.

Run the Collector in stable CICS regions only. Do not apply maintenance to application programs while the Collector is running. Such maintenance could introduce or remove dependencies or affinities, thus rendering collected data inaccurate.

## What can be monitored

The commands that the Collector actually monitors depend on the way you configure it.

See “Controlling the Collector” on page 18 and “What is not monitored” for more information on the configuration of the Collector. The Collector can monitor:

- The EXEC CICS API commands, listed in Dependency-related CICS API commands detected by the CICS Interdependency Analyzer, that can cause transaction dependencies
- The EXEC CICS SPI commands, listed in Dependency-related CICS SPI commands detected by the CICS Interdependency Analyzer, that can cause transaction dependencies
- The CICS Front End Programming Interface (FEPI) API commands, listed in Dependency-related CICS SPI commands detected by the CICS Interdependency Analyzer, that can cause transaction dependencies
- The CICS FEPI SPI commands, listed in Dependency-related CICS FEPI SPI commands detected by the CICS Interdependency Analyzer, that can cause transaction dependencies
- The non-CICS API commands, listed in “Non-CICS API commands detected” on page 201, that can cause transaction dependencies
- The EXEC CICS API and SPI commands, listed in Affinity-related CICS API and SPI commands detected by the CICS IA Collector and the CICS IA Load Module Scanner, that can cause transaction affinities
- The dynamic COBOL calls, collected by the Dependency and Command Flow Data collectors for the LE COBOL programs if the Language Environment option, CBLPSHPOP, is active and the load program name for the calling and the called programs correspond to the program name in the LE prolog.

For information about the Language Environment runtime CBLPSHPOP option refer to *the CICS TS Application Programming Guide*, section *Language Environment CBLPSHPOP option*.

For information about what the Collector reports for each monitored command, see Appendix A, “Details of dependencies and affinities collected,” on page 181.

As well as monitoring program commands, the Collector also collects information about the CICS regions on which it runs and stores that information in the CIU\_REGION\_INFO database table. For example, for each collection of dependency or affinity data, the table contains the names of the CICS System Definition data set (CSD) and the first four resource group lists in the CSD.

## What is not monitored

The Collector does not monitor all program commands.

The Collector does not monitor program commands when:

- The Collector is not running.
- The issuing program was translated with the SYSEIB option. An exception here is the EXEC CICS PUSH HANDLE command. Monitoring these commands enables CICS IA to capture dynamic COBOL calls.

- You are collecting interdependency data and the command is not one that can cause transaction resource dependency.
- You are collecting affinity data and the command is not one that can cause transaction affinities.
- The program is a DB2 or DBCTL task-related user exit.
- The program is a CICS user-replaceable program.
- The program issues a CALL to named COUNTERS.
- The transaction identifier does not match the prefix, if specified, for transactions to be monitored. See “Specifying region-specific options: general” on page 82.
- The command is not in the relevant subset of command-types specified to be monitored. There are three such subsets: one for dependency-related CICS commands, one for dependency-related DB2, IMS, and MQ commands, and one for affinity-related CICS commands: see “Specifying region-specific options: API and SPI commands to be monitored” on page 86, “Specifying which dependency-related DB2, IMS, MQ commands and TRUEs are to be monitored” on page 90, and “Specifying which affinity-related CICS commands are to be monitored” on page 91.
- The first few letters of the program name match a prefix in the list of “excluded” program prefixes, which identify programs for which data is not to be collected. See “Creating a program exclude list” on page 51.  
The default program exclude list excludes programs with names that start with “ABL”, “CAU”, “CBM”, “CEE”, “CIU”, “CME”, “CPA”, “CSQ”, “DFH”, “DSN2”, “DSNC”, “DWW”, “EDC”, “EQA”, “EYU”, “IBM”, “IN25”, “IGZ”, “ISZ”, or “VID”.
- The first few letters of the transaction name match a prefix in the list of “excluded” transaction prefixes, which identify transactions for which data is not to be collected: see “Creating a transaction exclude list” on page 52.
- The command causes an un-handled abend.

The Collector does not monitor pseudoconversations in which you continue a pseudoconversation by setting a transid in the TIOA rather than by using RETURN TRANSID.

Ideally, CICS IA will ignore commands issued by task related user exits and global user exits because they are not part of applications. However, it cannot distinguish such commands from others, and does monitor them. If your user exits use commands that can cause transaction dependencies, the commands are monitored, perhaps making any dependency problem seem worse than it actually is.

When capturing dynamic COBOL call, the Collector can record the name of the enclave program and an undefined command offset under one of the following conditions:

- The called program does not conform to the LE prolog and LE linkage conventions.
- The ADABAS or Natural program request is received.
- The DBCTL request that relates to the recorded EXEC DLI command is received.

## Controlling the Collector

You can monitor and control the Collector through the CINT transaction. Also you can control the Collector from CICS Explorer through the CICS IA plug-in for CICS Explorer.

For example, the CINT transaction enables you to:

- Start, pause, continue, and stop the collection of dependency or affinity data.  
If necessary, you can start, stop, pause, or resume the collection of data on multiple regions at once, that is, with a single CINT command. How to do this is described in “Controlling the collection of dependency and affinity data” on page 70.  
You can also set timers, one per region, to control the dates and times at which dependency or affinity data is collected. A timer pauses and resumes the Collector automatically at predetermined times. How to set a timer is described in “Specifying region-specific options: timers” on page 93.
- Specify which type of data, dependency or affinity, is to be collected on each region.
- Specify for which programming commands, and for which transactions, data is to be collected. For example, you could specify that only dependency data for transactions with names beginning with “PAY” will be collected; and that, within this subset of transactions, only EXEC CICS file control commands will be monitored.
- Specify, by means of a list of name prefixes, a set of programs for which data is not to be collected. See “Specifying region-specific options: general” on page 82.
- Specify, by means of a list of name prefixes, a set of CICS transactions for which data is not to be collected.
- Set default values for the Collector's region specific options. How to set default values is described in “Changing the Collector options” on page 79.
- Set a region-specific Collector option to the same value on multiple regions with a single CINT command. How to set this option is described in “Changing the Collector options” on page 79.
- Specify, by means of the USER-control record in the CINT control file, individual user's Command Flow options and region configurations.
- Control USER-records (ADD, COPY, DELETE and DETAIL).

For detailed information about controlling the Collector, see Chapter 4, “Running the Collector,” on page 61.

The options that you specify to control the Collector for a CICS region are preserved in a recoverable VSAM control file. For more information about this file, see “The control record VSAM file” on page 22.

## How dependency data is collected

The Collector uses tables in a data space to hold collected dependency data.

These tables are the main dependency-related tables:

- The CICS table, which records every dependency on a CICS resource.
- The DB2 table, which records every dependency on a DB2 resource.
- The IMS table, which records every dependency on an IMS resource.
- The MQ table, which records every dependency on an MQ resource.
- The Natural table, which records every dependency on a Natural resource.
- The DTP table, which records each ALLOCATE where the Collector has not found a matching SEND, FREE, CONVERSE, or CONNECT PROCESS for the same convid or session.

- The MQX table, which records the MQ queue name used on each MQOPEN command. The entry is used on subsequent MQPUT and MQGET commands for the same task. It is removed at MQCLOSE.
- The file table, which records detailed file information.
- The program table, which records detailed program information.
- The transaction table, which records detailed transaction information.
- The TDQueue table, which records detailed TDQueue information.
- The TSQueue table, which records detailed TSQueue information.
- The exit data table, which records detailed exit information.
- The Web service data table, which records detailed Web service information.

The dependency tables reside in the data space. The tables, excluding the DTP and MQX tables, are saved to VSAM files when you stop the Collector and, optionally, at predetermined intervals.

## How affinity data is collected

The Collector uses tables in a data space to hold collected affinity data.

The main affinity-related tables are of the following types:

- The affinity group table, which records every affinity-transaction-group; that is, every group of CICS transactions that have been grouped together because they have the potential to create the same type of affinities.
- The affinity command table, which records every unique combination of:
  - EXEC CICS command with the potential to create an affinity
  - Program
  - Transaction ID

The affinity tables reside in the data space. The affinity group and affinity command tables are saved to VSAM files when you stop the Collector and, optionally, at predetermined intervals.

## Saving data

The dependency and affinity data collected by the Collector is saved to CICS IA VSAM files by the autosave transaction, CINB.

For more information about these files, see “The dependency data and affinity data VSAM files” on page 21.

The CINB transaction is invoked automatically by CICS; it is not a user transaction. The CINB transaction is invoked in a number of ways:

- When you pause or stop the Collector.
- If the **Periodic Save** option is selected, every five minutes.
- When the trigger value is reached. You can define the value “n” in thousands of updates to the data space. The value for “n” can be in the range 2 to 9999. A value of “1” will not trigger the start of the CINB transaction.

The CINB transaction saves dependency and affinity data automatically when you stop the Collector. You can also specify that data is saved as follows:

- On a predetermined time and activity basis. That is, data is saved if either more than 300 seconds has passed or more than 1 000 table elements have changed, since the last save.
- When you pause the Collector.

After the CINB transaction has saved any data collected, it either becomes dormant until next activated while the Collector is still running, or pauses or terminates if the Collector has been stopped.

Only the CICS, DB2, IMS, MQ, affinity, and resource detail tables in the data space need to be saved. The DTP and MQX tables are not saved because they hold only temporary data about DTP conversations and MQ queue names. Also, when data is saved, only those table elements that have been added or changed since the last save are written to the file. Time stamps in each table element indicate whether the element has been written already, and whether it has changed since the last write, to minimize the number of writes performed.

## The dependency data and affinity data VSAM files

To control the operation of multiple instances of the Collector, running on different CICS regions, from a single CICS terminal, you must share the dependency data files, the affinity data files, and the control record file across all the regions being monitored.

To do so, you can use either of these methods:

- VSAM record-level sharing (RLS). For information about using VSAM RLS in CICS, see the *CICS Installation Guide*.
- Function shipping to a file-owning region (FOR). For information about CICS function shipping, see the *CICS Intercommunication Guide*.

The alternative is to define local dependency and affinity data files, and a control record file, on each region to be monitored. In this way, from a CICS terminal you can control only an instance of the Collector running on the local region.

The Collector uses a separate, nonrecoverable, VSAM KSDS files to record dependencies on each of the following:

- CICS resources with names up to 32 bytes long: file CIUINT1
- DB2 resources: file CIUINT2
- IMS resources: file CIUINT3
- MQ resources: file CIUINT4
- CICS resources with names longer than 32 bytes: file CIUINT5
- Detail data resources: file CIUINT6
- Natural resources: file CIUINT7

Ensure that each file is big enough to hold the maximum amount of dependency data that might be collected.

The Collector uses other nonrecoverable VSAM KSDS files to record intertransaction and transaction-system affinities:

- Affinity resources with a 16-byte key: file CIUAFF1
- Affinity resources with a 32-byte key: file CIUAFF2
- Affinity resources with a 224-byte key: file CIUAFF3

Ensure that each file is big enough to hold the maximum amount of affinity data that might be collected.

KSDS files are used because the Collector and the Dependency and Affinity Reporters need keyed access to the data. The files are not recoverable because of the large amount of data that might need to be written.

The dependency data files and affinity data files contain a header record for each CICS region that has been or is being monitored by the Collector. The header

record enables both the Collector and the Reporter to validate that the files that are presented are data files suitable for CICS IA. The header record has a key in the same format as the rest of the keys on the file, so a table identifier of zero is used. No real table will have a table identifier of zero. The header record contains the CICS specific APPLID, thus allowing files to be cross validated.

## The control record VSAM file

The CICS IA control file is a recoverable VSAM KSDS file that holds a single header record that holds global options that apply to all the CICS regions, a single DEFAULT control record that contains the default values for all regions and one control record for each CICS region being monitored that contains options that overrides the default record.

- A single header record that holds global options that apply to all the CICS regions that have been or are being monitored by the Collector. How to specify the Collector global options is described in “Changing global options” on page 96.
- One DEFAULT control record for all CICS regions. The control record contains region-specific options and statistics that are maintained across Collector runs, transaction failures, system failures, and restarts.

Each control record holds the following, region-specific, information:

- CINT options for this region. How to specify the Collector region-specific options is described in “Specifying region-specific options: region configuration” on page 79.
- The APPLID and SYSID of the CICS region.
- Collector statistics.
- History information:
  - Reason why STOPPED
  - user ID if STOPPED by user
  - Abend code if STOPPED by abend
  - user ID for last Collector options update
  - Date and time of last Collector options update

The record is updated whenever any of the above information changes, when the Collector options or statistics for this region change, or, the Collector state changes to STOPPED on this region.

- One control record for each CICS region that has been or is being monitored by the Collector. The control record contains region-specific options and statistics that override the options set by the DEFAULT record.

## USER control record

The CICS IA control file also holds a USER control record that is used by the CINC transaction and contains individual user's Command Flow options and regions configurations.

The CICS IA User Command Flow Utility uses the control file for regions configuration data, global options and user's control data. The administration functions for these types of information are supported by the CINT transaction, which supplies options to add, copy, delete and detail user's control data. The initial values of user's control data are default values.

To control the operation of multiple instances of the Command Flow Utility, running on different CICS regions, from a single CICS terminal, it shares the

Control record file across all the regions being monitored. To do so, you can use either a VSAM record-level sharing (RLS) or a function shipping to a file-owning region.

---

## The Dependency database objects

The Dependency database objects contain accumulated data about all your programs and transactions and the resources that they use.

You also have the option to group your transactions into applications so that you can query application dependencies. Update the database regularly to add new information recorded by the Collector in the VSAM dependency files. CICS IA provides a job to create the database objects and a suite of batch programs to update the database. See “Updating the Dependency database objects” on page 109 for more details.

Typically, there is only one set of Dependency database objects, even if you have separate dependency data and control record files for each region monitored by the Collector. In the latter case, you would typically feed the information in every VSAM dependency data file into the one set of Dependency database objects. Using one database makes it easier to compare and contrast dependency data from different regions.

For details about the dependency database objects, see Appendix C, “The structure of the CICS IA database,” on page 213.

In addition facilitating tables are used in the updates of the base tables.

---

## The Affinity database objects

The Affinity database objects contain accumulated data about all your programs and transactions and the affinities between them.

You can also, optionally, group your transactions into applications so that you can query application affinities. Update the database objects regularly to add new information recorded by the Collector in the VSAM affinity files. CICS IA provides a job to create the database and a suite of batch programs to update the database. See “Updating the Affinity database objects” on page 110 for more details.

Typically, there is only one set of Affinity database objects, even if you have separate affinity data and control record files for each region being monitored. In the latter case, you would typically feed the information in every VSAM affinity data file into the one set of Affinity database objects. Using one database makes it easier to compare and contrast affinity data from different regions.

For the affinity base tables see “Affinity base tables” on page 222.

In addition, facilitating tables are used in the updates of the base tables.

---

## The CICS IA plug-in for CICS Explorer

The CICS IA plug-in for CICS Explorer (CICS IA plug-in) is an Eclipse plug-in that operates on top of the IBM CICS Explorer to help you analyze the CICS IA data, including the interdependency data, affinity data and Command Flow data.

Using the CICS IA plug-in, you can perform the following tasks:

- For the dependency data you can:
  - View resources used by a region, transaction or program.
  - View the programs or transactions that use a given resource.
  - View resources used by an application.
  - Create your own queries to analyze the data.
  - View detailed information for programs, transactions, files, TSQueues, Events, Exits or Regions.
  - Compare resources used by a transaction, program or region.
- For the affinity data you can:
  - View Affinities by Region.
  - View Affinities by Transaction.
  - View Affinities by Program.
- For the Command Flow data you can:
  - View collections by time or userid.
  - View tasks within a Collection.
  - View the execution tree for a given task.

You can also use the CICS Explorer to operate the controller. You can perform the following tasks:

- For a given CICS region you can issue a START, STOP, PAUSE, CONTINUE or REFRESH of the dependency or affinity collection.
- For a given user you can START or STOP the Command Flow feature.
- For more information about the IBM CICS Explorer, see <http://www.ibm.com/cics/explorer>.

---

## CICS IA reports

CICS IA can create dependency reports, affinity reports and threadsafe reports by running batch jobs.

- The Dependency Reporter.
- The Affinities Reporter.
- The Threadsafe Reporter.

### The Dependency Reporter

The Dependency Reporter consists of a batch job that converts the dependency data collected by the Collector into reports that present the data in a readable format.

The files of dependency data produced by the Collector are the input to the Dependency Reporter. Depending on how you configure the Reporter job, the output might be, for example, a listing of the CICS, DB2, MQ, or IMS commands that were monitored, naming the transactions and programs where they occurred, the resource being acted upon, and other details.

If the dependency data files are shared by multiple regions, you can run one Dependency Reporter job to produce a report showing dependencies, for example, dependencies on DB2 resources, found in either of the following:

- A single, specified, region
- All of the regions

If, however, each monitored region has its own, region-specific, dependency data files, each Dependency Reporter job always retrieves data for a single region; to

retrieve data from multiple regions, you must run your job multiple times, against the relevant dependency files for each region in which you are interested.

## The Affinities Reporter

The Affinities Reporter consists of a batch job that converts the affinity data collected by the Collector into reports presenting the data in a readable format. It can also be used to create a file of affinity-transaction-group definitions in a syntax approximating the batch API of CICSplex SM. This file is used as input to the Builder component.

The files of affinity data produced by the Collector are the input to the Affinities Reporter. Depending on how you configure the Affinities Reporter job, the output might be, for example:

- A listing of possible transaction-system affinities for a particular CICS region, naming the transactions and programs involved, and the affinity relations and lifetimes
- A file of affinity-transaction-group definitions

If the affinity data files are shared by multiple regions, you can run one Reporter job to produce a report showing affinities, for example, inter-transaction affinities, found in either of the following:

- A single, specified, region
- All of the regions

If, however, each monitored region has its own, region-specific, affinity data files, each Affinities Reporter job always retrieves data for a single region; to retrieve data from multiple regions, you must run your job multiple times, against the relevant affinity files for each region in which you are interested.

## The Threadsafe Reporter

The Threadsafe Reporter consists of a batch job that produces reports displaying the threadsafe status of each command in the requested programs.

The threadsafe status for a command can be as follows:

### **Threadsafe**

An EXEC CICS command that does not cause a TCB swap.

### **Non-Threadsafe**

An EXEC CICS command that can cause a TCB swap.

### **Indeterminate Threadsafe**

An EXEC CICS command where it cannot be determined if the call causes a TCB swap.

### **Dynamic call**

A call to another module at execution time. The call was not initiated using an EXEC CICS command.

### **Threadsafe Inhibitor call**

An EXEC CICS command that can cause an unsafe affinity between transactions. The call needs to be investigated before knowing if it inhibits the program from being threadsafe. These commands are ADDRESS CWA, LOAD HOLD, GETMAIN SHARED, and EXTRACT EXIT.

### **DB2 calls**

The calls to the CICS DB2 interface are threadsafe.

### IMS calls

The calls to the CICS IMS interface are threadsafe from CICS TS V4.2 onwards.

### MQ calls

The calls to the CICS MQ interface are threadsafe from CICS TS V3.2 onwards.

To request a Dynamic Analysis Threadsafe report, edit and run the CIUJTSQ2 job.

The threadsafe report consists of a header page and one or more pages of program data. The header page lists the report options used to create the report and provides definitions for some of the terms used in the report. The remaining pages report on each program that meets the criteria specified by the report options PROGRAMNAME and REGIONNAME.

---

## The Scanner component

The Scanner component consists of two scanners: the Load Module Scanner and the CSECT Scanner.

### The Load Module Scanner

The Load Module Scanner is a batch utility that scans a load module library to detect those programs in the library that issue commands that might cause transaction dependency or transaction affinities.

For EXEC CICS commands, the Load Module Scanner examines the individual object programs looking for patterns matching the argument zero format for such commands. When an EXEC CICS command is translated and compiled, it results in an encoded parameter list to be used with a call statement. The first parameter in this list is a constant known as the CICS *argument zero*. The first two bytes of this constant identify the command; for example, X'0A04' identifies it as a READQ TS command.

The Load Module Scanner:

- Detects the use of:
  - The dependency-related commands listed in “Dependency-related commands” on page 6
  - The affinity-related EXEC CICS API and SPI commands listed in Affinity-related CICS API and SPI commands detected by the CICS IA Collector and the CICS IA Load Module Scanner
  - MVS POST requests
- Produces a printed report
- Writes the affinity-related data that it collects to the Load Module Scanner database objects

The report produced by the Load Module Scanner indicates only that potential dependency or affinity problems might exist because it only identifies the programs that issue the commands. It cannot obtain dynamic information about the transactions using the programs or the names of the resources acted upon. Use the report in conjunction with the main reports produced by the Dependency and Affinity Reporters. See “The Dependency Reporter” on page 24 and “The Affinities Reporter” on page 25.

**Note:**

1. The Load Module Scanner operation is independent of the language that the scanned program was written in and the release of CICS the scanned program was translated under.
2. The Load Module Scanner might indicate a dependency or affinity problem that does not really exist, because the bit pattern found accidentally matches the argument zero format for a dependency command.

#### **The Load Module Scanner database objects**

The Load Module Scanner database objects contain accumulated data, collected by the Load Module Scanner component, about programs and commands that might cause affinities. The purpose of the set of Load Module Scanner database objects is to allow you to compare, using SQL commands, the data produced by the Load Module Scanner to that produced by the Collector.

## **The CSECT Scanner**

The CSECT Scanner scans load modules for information that can be used to identify the version of each CSECT.

The output is stored in DB2 tables and can be used, in conjunction with the DB2 dependency tables, to identify different versions of programs. For information about using the CSECT Scanner, see Chapter 11, “Running the CSECT Scanner,” on page 155.

---

## **The Builder component**

The Builder is a batch utility that takes as input a file of basic affinity-transaction-group definitions created by the Reporter. It produces a file of “combined” affinity-transaction-group definitions suitable for input to CICSplex SM.

You must combine the basic transaction groups because of a CICSplex SM rule stating that a specific CICS transaction ID (TRANSID) can appear in only one transaction group. Because a TRANSID might appear in more than one basic group, you must combine them to form larger groups to satisfy CICSplex SM.

---

## Chapter 2. Getting Started with the CICS IA plug-in for CICS Explorer

The CICS Interdependency Analyzer plug-in for CICS Explorer provides an Eclipse-based interface to analyze your CICS IA data. It also provides cheat sheets that guide you through the steps required to configure and install CICS IA. It is recommended that you download the CICS IA plug-in and follow the steps in the cheat sheets.

When you install the CICS IA plug-in for CICS Explorer there are cheat sheets supplied for configuring CICS IA, **Help > Cheat Sheets**. You can find additional help for using the cheat sheets by navigating to **Help > Help Contents > CICS IA User Plug-in guide**.

For more information about CICS Explorer and the CICS Interdependency Analyzer plug-in, see <https://www.ibm.com/cics/explorer>.

This site guides you on how to download the CICS Explorer and the CICS IA plug-in for CICS Explorer. As part of the download you receive the *cicsia\_plugin\_release\_notes.html* and the *cicts\_explorer\_release\_notes.html* files. These files guide you on how to install and configure the CICS IA plug-in.

**Note:** The CICS IA plug-in connects to the CICS IA DB2 database. In order to use the CICS IA plug-in, you need to set up only this connection. You do not need to connect the base CICS Explorer to a CICS CPSM environment or a CICS single region with the CMCI connection.

You can find more information about the CICS Explorer plug-in usage in the *IBM CICS Explorer User Guide*.

---

## Chapter 3. Preparing to use CICS IA

This section describes what you need to do before you can use CICS IA.

- “Running the installation customization program”
- “Building the CICS IA database” on page 37
- “Setting up your CICS environment to collect data” on page 43
- “Post configuration tasks” on page 50
- “Running the installation verification program” on page 57

---

### Running the installation customization program

The installation customization program assists you to customize the CICS IA sample jobs, clists, and SQL definitions. It creates customized installation jobs in which the names of system entities, such as the high-level qualifier (hlq) of the CICS IA data sets, are set to specified values to suit your local environment. The customization program assists you to customize both the DB2 environment where the CICS IA data is stored, and the CICS regions for which the data is collected.

Appendix E, “Worksheet for the installation customization program,” on page 335 contains a worksheet for use with the installation customization program. The worksheet consists of a table of installation variables, such as `_dbid_`, the identifier of the DB2 database, that can be passed to the installation customization program. You can record the value that you assign to each variable in the “Value” column of the table.

Before running the installation customization program talk to the relevant systems personnel to gather the information about the local system environment, such as the high-level qualifiers of data sets that you need to run the installation customization program. Use the worksheet as a memory jogger, and to record the values that you need.

To invoke the installation customization program, run member `CIUCNFG1` of the `SCIUEXEC` library. The program requires two parameters to be passed to it:

1. The high-level qualifier of the CICS IA data sets `&HLQ`.
2. The national language to be used in messages and on panels `&LANG`. Two languages are supported:

**ENU** American English (the default)

**JPN** Japanese

For example, you could invoke the installation customization program by entering the following at an ISPF command line:

```
tso ex 'CICSIA.V510.SCIUEXEC(CIUCNFG1)' 'CICSIA.V510 ENU'
```

Customized members for the configuration of the DB2 environment are saved as follows:

- Customized members of `'&HLQ.SCIUSQL'` in `'&HLQ.SCIUSQL.DB2'`
- Customized members of `'&HLQ.SCIUSAMP'` in `'&HLQ.SCIUSAMP.DB2'`
- Customized members of `'&HLQ.SCIUDAT1'` in `'&HLQ.SCIUDAT1.DB2'`
- Customized members of `'&HLQ.SCIUDAT2'` in `'&HLQ.SCIUDAT2.DB2'`

Customized members for the configuration of the CICS environment are saved as follows:

- Customized members of '&HLQ.SCIUSQL' in '&HLQ.SCIUSQL.CICS'
- Customized members of '&HLQ.SCIUSAMP' in '&HLQ.SCIUSAMP.CICS'
- Customized members of '&HLQ.SCIUDAT1' in '&HLQ.SCIUDAT1.CICS'
- Customized members of '&HLQ.SCIUSAME/K' in '&HLQ.SCIUSAME.CICS'

**Note:**

1. For convenience, in this section and the following sections the customized output files are given the names of their respective input files with a suffix of “DB2” for DB2 jobs and “CICS” for CICS jobs. However, you can change the names of the output files so you can create configured data for different DB2 target environments, different CICSplexes, and different levels of CICS.
2. You cannot change the names of some system entities with the installation customization program. For lists of those system entities that can and those system entities that cannot, see Appendix E, “Worksheet for the installation customization program,” on page 335.

## Starting CICS IA customization

You can customize CICS IA by creating new configurations or changing parameters of the configurations that exist.

CICS IA stores configuration information in your ISPF profile for CICSIA(CIUCPROF) and in the ISPF tables. The tables, CIUCICT5 and CIUDB2T5, are stored in an ISPF ISPTABL data set. The first time you use the configuration utility it creates these tables in a data set that is called *userid*.ISPTABL. You can use the SETTINGS option to rename the data set that holds the ISPF tables. You can then share your configurations with other users.

If CICS IA is configured with CICS IA V3.X the first time you run the configuration it attempts to migrate existing configurations to the V5.1 format.

If you are migrating from CICS IA V3.1 the configurations in the CIUCNTB table are migrated to the CIUCICT5 and CIUDB2T5 tables in the *userid*.ISPTABL data set.

If you are migrating from CICS IA V3.2 the configurations in the CIUCICST and CIUDB2T tables are migrated to the CIUCICT5 and CIUDB2T5 tables.

To customize CICS IA, on the Welcome panel, CIUCNF00, press Enter to proceed to the CIUCNF04 panel, shown in CIUCNF04.

CIUCNF04 \*\*\*\*\* CICS Interdependency Analyzer for z/OS - V5R1M0 \*\*\*\*\*

Press ENTER to complete, PF3 to go back or PF1 for help.

Please select how would you like to configure the CICS region or DB2:

- |                            |          |
|----------------------------|----------|
| 0. Settings                | <b>0</b> |
| 1. Configure new DB2       | <b>1</b> |
| 2. Configure existing DB2  | <b>2</b> |
| 3. Configure new CICS      | <b>3</b> |
| 4. Configure existing CICS | <b>4</b> |

Command ==>

Figure 6. Panel CIUCNF04

#### Note:

##### **0 Settings**

To define the library for storing the ISPF table, type action code 0 and press Enter. Panel CIUCNF07, is displayed.

##### **1 Configure new DB2**

To create a DB2 configuration, type action code 1 on panel CIUCNF04 and press Enter. Panel CIUCNF06, is displayed.

##### **2 Configure existing DB2**

To choose an existing DB2 configuration type action code 2 and press Enter. Panel CIUCNF05 is displayed

##### **3 Configure new CICS**

To create a CICS configuration, type action code 3 on panel CIUCNF04 and press Enter. Panel CIUCNF13 is displayed.

##### **4 Configure existing CICS**

To choose an existing CICS configuration type action code 4 and press Enter. Panel CIUCNF12, is displayed.

### Configuring settings

When defining a library to store the ISPF table, complete the appropriate fields on panel CIUCNF07.

```

CIUCNF07 ***** CICS Interdependency Analyzer for z/OS - V5R1M0 *****
Command = = = > _____

Press ENTER to update, PF3 to go back or PF1 for help.

Please specify settings:

CICS IA ISPTABL . . . . . CICSIA.MKOSH.ISPT000      1

JOB CARD HEADER:                                     2
//_CIUJOB_ JOB USER=MKOSH,NOTIFY=MKOSH,
//          CLASS=A,MSGCLASS=Y,REGION=0M
//*
//*

DATASET NAME AND PROGRAM NAME FOR SORT:              3
SORT DATA SET NAME . . . . . SYS1.SORTLIB
SORT PROGRAM NAME . . . . . SORT

. . . . .

```

Figure 7. Panel CIUCNF07

**Note:**

**1 CICS IA ISPTABL**

Enter the name of the library in which you want the ISPF table to be stored. This library can be used to share configurations with other users.

**2 JOB CARD HEADER**

Enter the Jobcard Header that is included in all the configured output JCL. Do not change \_CIUJOB\_

**3 DATASET NAME AND PROGRAM NAME FOR SORT**

Enter the data set name and program name for SORT

## Configure a new DB2 configuration

When creating a DB2 configuration, complete the appropriate fields on panel CIUCNF06.

```

CIUCNF06 ***** CICS Interdependency Analyzer for z/OS - V5R1M0 *****

Press ENTER to complete, PF3 to go back or PF1 for help.

Please enter configuration name, DB2 version and description:

Configuration . . . . . NEW      1
DB2version . . . . . V910      2
Description . . . . . NEW TEST  3

Command ==>

```

Figure 8. Panel CIUCNF06

**Note:**

### **1 Configuration**

Type the name of the configuration that you intend to create.

### **2 DB2version**

Choose the version of DB2 for the new configuration.

### **3 Description**

Enter a short description of the new configuration.

## **Configure an existing DB2 configuration**

If you want to use one of the existing DB2 configurations, select this configuration from the list displayed on panel CIUCNF05.

```
CIUCNF05 ***** CICS Interdependency Analyzer for z/OS - V5R1M0 Row 1 to 3 of 3

                          CICS IA Customization Function

Available DB2 configurations:

      Cmd  Configuration DB2Version  Description
      1    CICSIA51      V10         CICSIA 51 Database

***** Bottom of data *****

Command ==>                               Scroll ==> PAGE
```

Figure 9. Panel CIUCNF05

**Note:**

### **1 Cmd**

You can use this field for the following actions:

- To select one of the configurations represented, type action code s next to the configuration name and press Enter.
- To delete a configuration, type d and press Enter.
- To rename an existing configuration, type r and press Enter.
- To copy an existing configuration and all its parameters to a new configuration, type action code c and press Enter. The new configuration is displayed in the configurations list and the first two symbols of its name are replaced with "c\_."

## **Configuring a new CICS configuration**

When creating a CICS configuration, complete the appropriate fields on panel CIUCNF13.

```
CIUCNF13 ***** CICS Interdependency Analyzer for z/OS - V5R1M0 *****
Command = = = > _____
```

Press ENTER to complete, PF3 to go back or PF1 for help.

Please enter CICS configuration name and description:

```
CICS Configuration . . . CICS
Description . . . . . TEST CICS
```

**1**  
**2**

Figure 10. Panel CIUCNF13

### **1 Configuration**

Type the name of the configuration that you intend to create.

### **2 Description**

Enter a short description of the new configuration.

## **Configuring an existing CICS configuration**

If you want to use one of the existing CICS configurations select this configuration from the list displayed on panel CIUCNF12.

```
CIUCNF12 ***** CICS Interdependency Analyzer for z/OS - V5R1M0 *****
Command = = = > _____
```

```
                                CICS IA Customization Function
Available CICS configurations:
```

Cmd	Configuration	CICSVersion	Description
<b>1</b>	IYDZZ518	V510	test

```
. . . . .
```

**Note:**

**1 Cmd**

You can use this field for the following actions:

- To select one of the configurations represented, type action code **s** next to the configuration name and press Enter.
- To delete a configuration, type **d** and press Enter.
- To rename an existing configuration, type **r** and press Enter.
- To copy an existing configuration and all its parameters to a new configuration, type action code **c** and press Enter. The new configuration is displayed in the configurations list and the first two symbols of its name are replaced with "c\_."

Figure 11. Panel CIUCNF12

## Building the CICS IA database

This section describes how to set up the CICS IA Database environment where collected data is stored.

There is one set of Dependency database objects, even if you have separate dependency data and control record files for each region monitored by the Collector. Typically, you feed the dependency information in the dependency data files for each region into the Dependency database objects, which helps you to compare and contrast dependency data from different regions.

Similarly, there is one set of Affinity database objects, even if you have separate affinity data files for each region monitored by the CICS IA Collector. Typically, you feed the affinity information in the affinity data files for each region into the Affinity database objects, which helps you to compare and contrast affinity data from different regions.

Because there is typically only one set of Dependency and one set of Affinity database objects, which contain the dependency and affinity data for all the monitored regions, you can use one instance of the Query interface to access, compare, and contrast dependency and affinity data from different regions.

## DB2 configuration

After running the configuration utility to define your DB2 database variables you should have the following output data sets.

- hlq.SCIUSAMP.DB2
- hlq.SCIUSQL.DB2
- hlq.SCIUDAT1.DB2
- hlq.SCIUDAT2.DB2

The data set hlq.SCIUSAMP.DB2 contains the sample jobs required to define and maintain your CICS IA DB2 environment. These jobs are listed in the following table.

*Table 2. Jobs and files supplied in hlq.SCIUSAMP.DB2*

Member	Description
CIUALOAD	Job to load the CIU_APPLS_DESC and CIU_APPLS_RESOURCES tables.
CIUAPMIG	Job to migrate applications from CICS IA V3.1 to CICS IA V3.2.
CIUCLR	Job to clear the CIU_CICS_DATA, CIU_DB2_DATA, CIU_MQ_DATA, CIU_NATURAL_DATA, and CIU_IMS_DATA tables.
CIUDBCQ	Job to create DB2 tables.
CIUDBCT	Job to create indexes for SYSIBM.
CIUDBLOD	Sample job to run the DB2 utility LOAD against CICS IA data.
CIUDBNB	Job to bind CIUCINB2.
CIUDBNT	Job to bind programs that update DB2 tables.
CIUDBN2	Job to bind program CIUAPEXT to CICS IA V2 tables.
CIUDBORG	Sample job to run the DB2 utility REORG against CICS IA data.
CIUDBSTA	Sample job to run the DB2 utility RUNSTATS against CICS IA data.
CIUDBUNL	Sample job to run the DB2 utility UNLOAD against CICS IA data.
CIUIVPLD	Job to load the Dependency database objects with IVP-supplied data.
CIUMIG31	Sample JCL to migrate DB2 tables from CICS IA V3.1 to CICS IA V5.1.
CIUMIG32	Sample JCL to migrate DB2 tables from CICS IA V3.2 to CICS IA V5.1.
CIUSPTSK	Sample JCL for a DB2 WLM started task.
CIUTLOAD	Job to load the CIU_TRANSLATORS table.
CIUTRLOD	Job to load a TRUE list into the CIU_TRUEEXIT_INFO table
CIUTSLOD	Job to load data into the CIU_THREADSAFE_CMD table.
CIUVERLD	Job to update the CIU_VERSION table.

## DB2 considerations

Before running the installation jobs to create the DB2 environment you must consider and decide the following questions.

- Under which qualifier to create DB2. This qualifier is used to tie the database tables to the applications at bind time. The customization variable *\_qual\_* is set to this value throughout all the installation jobs.
- The owner of the DB2 plans. The customization variable *\_own\_* is set to this value throughout all the installation jobs.
- How to grant access to the plans and tables. See “Granting access to the plans and tables.”
- For other DB2 variables, refer to Appendix E, “Worksheet for the installation customization program,” on page 335.

## DB2 versions

CICS IA supports DB2 Version 8.1 and above. If you are planning to install CICS IA with a DB2 Version running in compatibility mode then please make sure that you set the *DB2 Compatability Mode* option to YES when you use the supplied configuration exec.

## DB2 access

On any region, on which you intend to collect DB2 data, ensure that the user ID, under which the CINB transaction runs, has permission to access the SYSIBM.SYSPACKSTMT and SYSIBM.SYSSTMT DB2 tables. You can get this access by giving the user ID access to the CICS IA plan for the CINB transaction. See section “Granting access to the plans and tables.”

The user ID under which the CINB transaction runs is dependent on how CICS IA is activated when using CINT. In most cases, the “CICS default user ID” is used. However, there are cases where it might be the PLT user ID if started by PLT processing, the ID of the current CINT transaction, or the “Link ID” if the CINT transaction is routed to another CICS region.

The batch jobs to load all CICS IA database use the DB2 LOAD and UNLOAD utilities. The RACF® user ID or group used for these jobs requires DB2 Application Development Manager authority on the CICS IA database.

Read this section in conjunction with the *CICS DB2 Guide*

## Granting access to the plans and tables

The CICS system programmer and the DB2 administrator must decide how to control access to the CICS IA plan and the CIU tables.

### About this task

CICS IA uses both static and dynamic SQL, you need more than just a GRANT EXECUTE ON PLAN CICSIA TO PUBLIC command. You must also allow dynamic SQL requests to access the tables. You have two options:

#### Option 1

Specify the DYNAMICRULES(BIND) option on the BIND PLAN command in CIUDBNB and CIUDBNT. This option is recommended for these reasons:

- The way in which security works is the same for both dynamic and static SQL.
- If you grant permissions by issuing one or more GRANT EXECUTE ON PLAN CICSIA TO *\_xxxx\_* commands, all security checks are done at the plan level; this option is simple to administer and offers good performance.

- If, as is typically the case, the `_xxxx_` in the GRANT EXECUTE command specifies a RACF group rather than a single RACF user ID, to add new users you just connect the users to the RACF group.

The sample installation jobs CIUDBNB and CIUDBNT use the DYNAMICRULES(BIND) option and then issue GRANT EXECUTE commands for the appropriate plans. These commands are issued against a RACF group.

To use this option:

1. Select your RACF group.
2. Change `_racfgrp_` to your chosen RACF group.
3. Ensure that all CIU users are connected to your chosen RACF group, with RACF “list of groups” active in the system.
4. Enable secondary authorization in DB2. See the DB2 install job DSNTIJEX.

**Note:**

1. Review DSNTIJEX job with your DB2 administrator.
2. For a full understanding of the implications of DYNAMICRULES(BIND), see the description of the BIND COMMAND in the *DB2 Commands* manual.
3. See also the section on DB2 security in the *CICS RACF Security Guide*.
4. Review this job with your DB2 administrator.

**Option 2**

Grant all CIU users access to the tables explicitly. This option is not recommended because you have to do this every time you give access to a new user.

To use this option:

1. In the sample jobs CIUDBNB and CIUDBNT, on the BIND PLAN command change the DYNAMICRULES option from DYNAMICRULES(BIND) to DYNAMICRULES(RUN).
2. In `hlq.SCIUSQL.OUT(CIUGRNTC)`, change the sample GRANT commands to GRANT EXECUTE on the CICSIA plan and GRANT SELECT, GRANT UPDATE, GRANT INSERT, GRANT DELETE, and any other GRANT commands, on the CIU tables.
3. If the GRANT permissions are made to a RACF group, note these requirements:
  - a. Ensure that all CIU users are connected to that RACF group.
  - b. Enable secondary authorization in DB2. See the DB2 install job DSNTIJEX for more information if required.

The Query interface uses dynamic SQL to access the CIU\_CICS\_DATA, CIU\_DB2\_DATA, CIU\_MQ\_DATA, and CIU\_IMS\_DATA tables. For guidance on using dynamic SQL with CICS, refer to the *CICS DB2 Guide* for your CICS release.

The delivered SQL is constructed and sized for a default application. You must tailor the sizings for PRIQTY and SECQTY in the index creation batch job to suit your requirements. If you create a new query you must carry out an evaluation to ensure that the existing indexing supports the query. If the existing indexing does not support the query, you must construct additional indexes. Contact your Database administrator if you require assistance.

## Defining the database

This section describes defining and binding the DB2 objects that make up the CICS IA database.

### About this task

Before you run the installation customization program, read “DB2 considerations” on page 38.

For DB2 tablespace and index allocations, refer to “DB2 space allocation” on page 353.

To define the CICS IA database perform the following steps:

1. Review sample job CIUDBCQ in hlq.SCIUSAMP.DB2.
2. Review the associated SQL member, CIUMAIN, in hlq.SCIUSQL.DB2.
3. Run sample job CIUDBCQ to create the database objects.

To bind the DB2 batch packages required by the CICS IA database perform the following steps:

1. Review sample job CIUDBNB in hlq.SCIUSAMP.DB2.
2. Review the associated SQL member, CIUGRNTB, in hlq.SCIUSQL.DB2. This sample member includes sample SQL to grant a RACF group or userid to the CICS IA plans. It is used in the STEP 3 of the sample job.
3. Run sample job CIUDBNB to bind the DB2 batch programs used by CICS IA sample jobs and to grant access to the bound plan.

**Note:** If you use method 2 in “Migrating the DB2 tables” you must perform the migration first. After the migration, only run the DB2 bind jobs, do not run the definition job CIUDBCQ.

## Migrating the DB2 tables

CICS IA Version 5.1 provides sample jobs to migrate your CICS IA Version 3.1, or CICS IA Version 3.2 DB2 tables to CICS IA Version 5.1 tables.

There are two methods to migrate the DB2 tables.

1. Migrate all the old CICS IA DB2 tables to a new database.
  - a. You must have created the new CICS IA V5.1 tables as described in “Defining the database.”
    - CICS, DB2, WebSphere MQ, IMS, Natural, and Region tables.
    - Load Module and CSECT Scanner tables.
    - Affinity tables.
    - Detailed CICS resource tables.
  - b. To migrate these tables from CICS IA V3.1 or CICS IA V3.2, review and run:
    - hlq.SCIUSAMP.DB2(CIUMIG31) for CICS IA 3.1 migration.
    - hlq.SCIUSAMP.DB2(CIUMIG32) for CICS IA 3.2 migration.
2. Migrate only the tables that have a different structure from the tables in your previous CICS IA version. This method is a single database migration method.
  - a. Do not run any CICS IA 5.1 definition jobs for DB2 before you use this migration method. This migration empties your CIU\_CMDFLOW\_DATA table and does not use the CICS IA configurator migration settings.

- b. Ensure that your old CICS IA DB2 settings remain unchanged.
  - DB2 database for table spaces.
  - DB2 schema name, (table qualifier).
  - DB2 table owner.
- c. To migrate these tables from CICS IA V3.1 or CICS IA V3.2, review and run:
  - hlq.SCIUSAMP.DB2(CIUNMG31) for CICS IA 3.1 migration.
  - hlq.SCIUSAMP.DB2(CIUNMG32) for CICS IA 3.2 migration.

**Note:**

- CICS IA V5.1 does not provide jobs to migrate your existing collector VSAM files. You must load all your VSAM data in to your existing DB2 tables before you proceed with the DB2 migration. CICS IA V5.1 does not provide migration of Command Flow data.
- The default tablespace size for tables created in DSN1TIAD step of jobs CIUNMG3\* might not suit your system requirements. If they do not, change the size in the corresponding SQL files contained in the hlq.SCIUSQL library.

## Loading static DB2 tables

CICS IA uses the following static tables.

### CIU\_VERSION

The CIU\_VERSION table contains CICS IA Version and Service information and is used by the CICS IA plug-in for CICS Explorer.

To load the version table, review and run job hlq.SCIUSAMP.DB2(CIUVERLD).

### CIU\_TRANSLATORS

the CIU\_TRANSLATORS table contains a one to one relationship between the IBM program component numbers for compilers, translators and linkage editors and a description for each component.

To load the translator table, review and run job hlq.SCIUSAMP.DB2(CIUTLOAD).

### CIU\_THREADSAFE\_CMD

The CIU\_THREADSAFE\_CMD table contains information on whether an EXEC CICS command is threadsafe or not for each version of CICS TS. It is used by threadsafe report program and stored procedure to determine whether a command is threadsafe.

To load the threadsafe table, review and run job hlq.SCIUSAMP.DB2(CIUTSLOD).

### CIU\_TRUEEXIT\_INFO

The CIU\_TRUEEXIT\_INFO table contains a one to one relationship between the CICS TRUEs used in your environment and a description for each TRUE. This table is used by the CICS IA plug-in for CICS Explorer.

To add your own TRUEs to the table edit and save hlq.SCIUDAT2.DB2(CIUTRCD).

To load the TRUE exit table, review and run job hlq.SCIUSAMP.DB2(CIUTRLOD).

## DB2 Stored Procedures setup

CICS IA uses DB2 Stored Procedures to perform complex DB2 tasks.

A stored procedure is an executable code that can be called by other programs. You might choose to use stored procedures for the code that is used repeatedly. Other benefits of stored procedures include network traffic reduction, result sets returned directly to an application, or access to data without granting the privileges to the applications.

CICS IA supports both Native and External SQL Stored Procedures. Native Stored Procedures are only supported in DB2 V9.1 or above. For more information about available stored procedures, see CICS IA External Interfaces.

External DB2 Stored Procedures run in a started task called *WLM* (Work Load Manager) associated with each DB2 subsystem. Sample JCL for a stored procedure can be found in `hlq.SCIUSAMP.DB2(CIUSPTSK)`. The name of the started task must match the one supplied in the CICS IA configuration variable `_wlm_`.

You can find more information about implementing DB2 Stored Procedures in the *DB2 for z/OS Administration Guide*.

---

## Setting up your CICS environment to collect data

This section describes the tasks required to collect data in your CICS environment.

### CICS configuration

After running the configuration utility to define your CICS environment variables you should have the following output data sets.

- `hlq.SCIUSAMP.CICS`
- `hlq.SCIUSAME.CICS`
- `hlq.SCIUSQL.CICS`
- `hlq.SCIUDAT1.CICS`

The data set `hlq.SCIUSAMP.CICS` contains the sample jobs required to define and maintain your CICS IA collector environment. These jobs are listed in the following table.

*Table 3. Jobs and files supplied in `hlq.SCIUSAMP.CICS`*

Member	Description
CIUAFFBL	Job to run the Builder to create combined affinity-transaction-group definitions suitable for input to CICSplex SM.
CIUAFFLD	Job to load the affinities tables, <code>CIU_AFF_CMD_DATA</code> and <code>CIU_AFF_GRP_DATA</code> , with data from the CICS IA affinity files.
CIUAFFRD	Job to run the Affinities Reporter against the Affinities database, to report transaction affinities.
CIUAFFRP	Job to run the Affinities Reporter against the CICS IA VSAM affinity data files, to report transaction affinities.
CIUDBCT	Job to create the index for <code>SYSIBM</code> table.
CIUDBNT	Job to bind the <code>CIUCINB2</code> or <code>CIUCINB0</code> program.
CIUDEFDB	Job to define DB2 CSD resources for the Collector.
CIUDELSP	Job to delete dependency data by collection ID.

Table 3. Jobs and files supplied in hlq.SCIUSAMP.CICS (continued)

Member	Description
CIUDEFF	Definition of local file resources that are used by the Collector.
CIUDEFL	Defines CSD resources for the Collector: specifically, group name for CICS resource LIBRARY.
CIUDEFR	Definition of remote file resources that are used by the Collector.
CIUDEFT	Definition of CSD resources for the Collector.
CIUDEFW	Definition of Web Support resources.
CIUDELGR	Job to delete and remove old groups that contain resource definitions from CICS list.
CIUINDEX	List of all sample JCLs that are contained in SCIUSAMP.
CIUJCDLS	Define the Command Flow log stream data set.
CIUJCFIL	Job to define local files to all CICS TS releases.
CIUJCFIR	Job to define remote files to all CICS TS releases.
CIUJCINT	Job to define CICS resources for the Collector to all CICS TS releases.
CIUJCLCA	Job to create the VSAM dependency files.
CIUJCLCC	Job to create the VSAM control file.
CIUJCLCG	Define the Command Flow GDG data set.
CIUJCLCS	Sample JCL to run the CSECT Scanner.
CIUJCLDL	Sample JCL to run the Cleaner.
CIUJCLLD	Job to run the Load Module Scanner (Detail report).
CIUJCLLS	Job to run the Load Module Scanner (Summary report).
CIUJCLPL	Sample JCL to assemble and link the sample resource prefix list.
CIUJCLRP	Job to run the Dependency Reporter to report dependencies on CICS, DB2, MQ, or IMS resources.
CIUJCLTD	Job to run the Load Module Scanner (Detail report) and to load the DB2 table CIU_SCAN_DETAIL.
CIUJCLTR	Sample JCL to assemble and link the sample TRUE include list.
CIUJCLTS	Job to run the Load Module Scanner (Summary report) and to load the DB2 table CIU_SCAN_SUMMARY.
CIUJCLXP	Sample JCL to assemble and link the sample program exclude list.
CIUJCLXT	Sample JCL to assemble and link the sample transaction exclude list.
CIUJCNL	Sample JCL to assemble and link-edit the Natural Name List.
CIUJCUPD	Job to run program CIUCFUPD.
CIUJLCPY	Copy Command Flow records from the log stream data set to a sequential GDG data set.
CIUJLDEL	Delete processed Command Flow records from the log stream data set.
CIUJSAMP	Sample JCL to run sample queries.
CIUJTSQ2	Job to run the Threadsafe Analysis report.
CIUJCWEB2	Sample JCL to install Web Support resources.
CIUMIGCO	Job to migrate the VSAM control data set CIUCNTL.

Table 3. Jobs and files supplied in hlq.SCIUSAMP.CICS (continued)

Member	Description
CIUPRUNE	Job to prune old rows from DB2 tables.
CIURES LD	Job to update the CIU_RESOURCE table.
CIUUDB	Job to prepare QSAM CSV files for all basic tables.
CIUUDBAF	Job to create CSV file for the CIU_AFF_EVENTS table.
CIUUDBAP	Job to create CSV file from the Applications XML file.
CIUUDB4	Create data set of Command Flow records in CSV format.
CIUUESMP	Sample job for compiling and link editing CICS IA Command Flow user exit program with a sample user exit program.
CIUUPDB	Job to update all types of dependencies, CICS, DB2, MQ, Natural and IMS, in the Dependency database objects from the dependency data files.
CIUUPDBN	Job to update Natural dependencies in the Dependency database objects from the Natural dependency data file.
CIUUPDB1	Job to update CICS dependencies in the Dependency database objects from the CICS dependency data files.
CIUUPDB2	Job to update DB2 dependencies in the Dependency database objects from the DB2 dependency data file.
CIUUPDB3	Job to update MQ dependencies in the Dependency database objects from the MQ dependency data file.
CIUUPDB4	Job to update IMS dependencies in the Dependency database objects from the IMS dependency data file.
CIUUPDB5	Update DB2 table CIU_CMDFLOW_DATA with Command Flow data.

## Defining VSAM files and associated tasks

The VSAM files that CICS IA uses are listed below.

For VSAM file space allocation refer to “VSAM data set allocation” on page 351.

Table 4. CICS IA VSAM files and associated jobs

File	Description	Job
hlq.CIUAFF1	The CICS Affinities data file for keys equal to 16.	CIUJCLCA
hlq.CIUAFF2	The CICS Affinities data file for keys equal to 32.	CIUJCLCA
hlq.CIUAFF3	The CICS Affinities data file for keys greater than 32.	CIUJCLCA
hlq.CIUAPPL	The Application file. An unrecoverable file that contains records for the new CICS TS Applications introduced in CICS TS V5.1.	CIUJCLCA
hlq.CIUCNTL	The control record file. An unrecoverable file used to hold control information.	CIUJCLCC
hlq.CIUINT1	The CICS dependency data file. An unrecoverable file used to record dependencies on CICS resources with names up to 32 bytes long.	CIUJCLCA

Table 4. CICS IA VSAM files and associated jobs (continued)

File	Description	Job
hlq.CIUINT2	The DB2 dependency data file. An unrecoverable file used to record dependencies on DB2 resources.	CIUJCLCA
hlq.CIUINT3	The MQ dependency data file. An unrecoverable file used to record dependencies on MQ resources.	CIUJCLCA
hlq.CIUINT4	The IMS dependency data file. An unrecoverable file used to record dependencies on IMS resources.	CIUJCLCA
hlq.CIUINT5	The CICS +32 dependency data file. An unrecoverable file used to record dependencies on CICS resources with names longer than 32 bytes.	CIUJCLCA
hlq.CIUINT6	The resource detail data file. An unrecoverable file used to record extra detail data for CICS resources.	CIUJCLCA
hlq.CIUINT7	The Natural dependency data file. An unrecoverable file used to record dependencies on Natural resources.	CIUJCLCA

To control the operation of multiple instances of the Collector, running on different CICS regions, from a single CICS terminal, you must share the dependency and affinity data files and the control record file across all the regions being monitored. To share the files use either:

- VSAM record-level sharing (RLS). For information about using VSAM RLS in CICS, see the *CICS Installation Guide*.
- Function shipping to a file-owning region (FOR). For information about CICS function shipping, see the *CICS Intercommunication Guide*. If you use function shipping, it is recommended that, for performance reasons, you define the files as local to the region in which you expect to do most monitoring activity and remote in all the other regions to be monitored.

## Defining the Control file

This section describes defining the control file.

### Procedure

Review and submit the sample job in hlq.SCIUSAMP.CICS(CIUJCLCC).

## Defining the Collector files

This section describes defining the collector files.

### Procedure

Review and submit the sample job in hlq.SCIUSAMP.CICS(CIUJCLCA).

## Migrating your control file

If you have previously installed CICS IA you can migrate your control file from CICS IA Version 3.1 or CICS IA Version 3.2.

## Before you begin

Before migrating your previous control file you must have created the new control file. See Defining the control file.

## Procedure

Review and submit the sample job in hlq.SCIUSAMP.CICS(CIUMIGCO).

**Note:** You cannot migrate your collector files from previous releases. Jobs are provided only to migrate your DB2 environment to CICS IA Version 5.1 to ensure that all your collected data is loaded into DB2 tables.

## Defining Log Streams and GDGs

This section describes the process of collecting and updating command flow data.

To get the latest command flow data, you should complete two basic tasks:

1. Review and run the sample CIUJCDLS job that collects the data, and
2. Review and run the sample CIUJCLCG job that defines the attributes for the command flow GDG dataset.

Both these tasks are covered in the sections that follow.

Before you start collecting data, consider the possible storage options for the CICS IA log stream:

1. Coupling facility, where log stream data is duplexed to a logger data space or staging data set. The coupling facility allows data from multiple CICS regions running on multiple z/OS images to log command flow data to the same log stream
2. DASD-only, where log stream data is duplexed in the MVS logger data space. The DASD-only option allows data from multiple CICS regions running on the same z/OS image to log command flow data to the same log stream

### Editing and running the CIUJCDLS job

The sample CIUJCDLS job can be found in hlq.SCIUSAMP.CICS.

Before running the job, make sure that

- the value defined for the logstream name matches the one specified in the CICS JOURNALMODEL definition in hlq.SCIUSAMP.CICS(CIUDEFT).

**Note:** The logstream name and its attributes may be changed to meet your system requirements.

- the value for MAXBUFSIZE is not larger than 32760.

### Editing and running the CIUJCLCG job

The sample CIUJCLCG job can be found in hlq.SCIUSAMP.CICS.

Command flow records are recorded to a MVS log stream data set. Once collected they are copied to a GDG data set that you can then use to update the CIU\_CMDFLOW\_DATA table or CSV file.

To define the attributes for the command flow GDG data set, run the sample CIUJCLCG job.

**Note:** You can set the LIMIT option to your system requirements.

## Updating CICS resources

This section describes all the CICS resource definitions required by the CICS IA collector.

The supplied jobs and resource definitions provide JCL and statements to define the following resources:

- Resources required by the collector.
- CICS DB2 resources . These are optional and are only required if you intend to collect DB2 resource information in the target region.
- Library Resources. These are optional and supported only in CICS TS V3.2 and above. They are used to define the CICS IA load libraries rather than adding them to the DFHRPL concatenation in the CICS startup job.
- CICS Explorer Admin resources. These are optional and are required only if you want to use this CICS region as a central controlling region. These resources allow you to do this from the CICS IA plug-in for CICS Explorer. The resources include programs, atomservices, URIMAPs, and TCPIP ports. These are only supported by CICS TS V4.1 and above.

## Removing old resource definitions

You must remove any resource definitions for previous CICS IA versions from CICS when you migrate to a later version.

To remove resource definitions from previous CICS IA versions:

1. Edit the CIUDELGR job in hlq.SCIUSAMP.CICS and set the lines as shown in Table 5.

*Table 5. Editing the CIUDELGR job to remove old CICS IA definitions from CICS TS*

CICS IA version from which you are migrating	Lines to be edited
CICS IA Version 1.1	DELETE GROUP(INxxGRP) REMOVE GROUP(INxxGRP)
CICS IA Version 1.2	DELETE GROUP(CIUxxGRP) REMOVE GROUP(CIUxxGRP)
CICS IA Version 1.3	DELETE GROUP(CIUxxG13) REMOVE GROUP(CIUxxG13)
CICS IA Version 2.1	DELETE GROUP(CIUxxG21) REMOVE GROUP(CIUxxG21)
CICS IA Version 2.2	DELETE GROUP(CIUxxG22) REMOVE GROUP(CIUxxG22)

2. Run hlq.SCIUSAMP.CICS(CIUDELGR).
3. Remove the previous CICS IA Version SCIULOAD library from the CICS startup JCL.

## Defining CICS resources

To define the CICS resources for the CICS IA collector, edit and run job CIUJCINT.

In this job, you can also define LIBRARY resources for the SCIULOAD and SCIULODE/K data sets, and they will be loaded dynamically during the startup job execution.

To define the CICS Atomservice resources, edit and run job CIUJWEB2.

To define the CICS file resources for the CICS IA collector, edit and run one or both of the following jobs:

- CIUJCFIL to define the CICS file resources locally or in a file-owning region
- CIUJCFIR to define the CICS file resources as remote to a file-owning region

To define the CICS IA national language message handler and panels to CICS, use the definition supplied in hlq.SCIUSAME . This version is the default English version, and you must always use it, unless you require the Japanese version. For the Japanese version, use the definition supplied in hlq.SCIUSAMK.

You create the names of the CICS IA resource definition groups during configuration.

The group names of CICS resource definitions are shown in the following table. For the information on the definitions contained in these groups, see also hlq.SCIUSAME and hlq.SCIUSAMK.

*Table 6. The groups of CICS resource definitions*

Group name	Description	Contained definition(s)
_groupf_	Group name for local files	CIUDEFF
_grouppr_	Group name for remote files	CIUDEFR
_grouppt_	Group name for CINT CSD, LIBRARY resource definitions, and DB2 definitions	CIUDEFT CIUDEFTE CIUDEFL CIUDEFLE CIUDEFDB
_groupw_	Group name for Atomservice definitions	CIUDEFW

## Collecting DB2 resources in your CICS region

If you want to collect DB2 resource information in your target CICS region follow these steps.

### About this task

Before collecting DB2 resource information in your CICS region, it is highly recommended that you create an new index against your SYSIBM.SYSPACKSTMT and SYSIBM.SYSSTMT tables. This improves performance of the online collection. If you choose not to create these indexes, switch off the DB2 query in the SYSIBM tables by entering N in the Inquire for DB2 Resources field in the CINT DB2/MQ/IMS panel for that region. For more information see, "Specifying which dependency-related DB2, IMS, MQ commands and TRUEs are to be monitored" on page 90.

To collect DB2 data:

1. Review the following members in hlq.SCIUSAMP.CICS:
  - CIUDBCT
  - CIUDBNT

2. Review the associate SQL members for the above jobs. They can be found in hlq.SCIUSQL.CICS.
3. Run hlq.SCIUSAMP.CICS(CIUDBCT) to create indexes for the SYSIBM.SYSPACKSTMT and the SYSIBM.SYSSTMT tables.
4. Run hlq.SCIUSAMP.CICS(CIUDBNT) to bind the CIUCINB2 program to CICS.

**Note:** You must have defined the CICS resources for DB2TRAN and DB2ENTRY. For more information, see “Defining CICS resources” on page 48.

**Note:** On any region where you want to collect DB2 data, ensure that the user ID, under which CICS IA runs, has GRANT permission to the batch plan created in the sample job SCIUSAMP.CICS(CIUDBNT). This enables the background transaction CINB to access the SYSIBM.SYSDUMMY1, SYSIBM.SYSPACKSTMT and SYSIBM.SYSSTMT DB2 tables.

## Security considerations

Security considerations are described in an appendix.

For information on how to set up RACF security for CICS IA refer to Appendix G, “CICS IA security,” on page 365.

## Tailoring your CICS startup job

To enable CICS IA to run in your CICS region, do the following when setting up your CICS startup job:

### About this task

1. Set the ICVR system initialization parameter to at least 10 seconds; that is, ICVR=10000 or a larger value. If you do not do this, the Collector or one of your own transactions might end prematurely with an abend code of AICA.
2. If you use VSAM RLS to share the dependency data file and control record file across multiple regions, specify the system initialization parameter RLS=YES.
3. Add the following load libraries to the DFHRPL concatenation in the startup job JCL:
  - hlq.SCIULOAD
  - hlq.SCIULODE (the default, English, national language: this is always required)
  - Optionally, add hlq.SCIUL0DJ (if you require Japanese national language support)

If you are configuring a CICS environment running at CICS TS V3.2 and above, at CICS configuration time you can select to use the CICS LIBRARY resource definitions to define the load libraries rather than adding them to the DFHRPL concatenation. If you selected this option during configuration job CIUJCINT automatically defines the LIBRARY resource definitions to you CSD group.

4. Add the following DD statement for the CINT transient data message log:
 

```
//CIULOG DD SYSOUT=*
```

---

## Post configuration tasks

This section describes some optional tasks that you might be required to be perform.

## Creating your own program exclude, transaction exclude, and resource prefix lists

You can use program exclude lists, transaction exclude lists, and resource prefix list to limit the volume of information collected by the Collector. In this section the term, Collector, refers to the Affinity and Dependency collector functions. The User Command Flow collector function does not reference the exclude lists.

A program exclude list contains a list of program-name prefixes; the Collector does not collect data for any program that has the name beginning with one of the prefixes. Similarly, a transaction exclude list contains a list of transaction-name prefixes; the Collector does not collect data for any transaction that has a name beginning with one of the prefixes.

For details of how to specify which exclude lists the Collector is to use, see “Specifying region-specific options: general” on page 82.

CICS IA supplies sample program exclude, transaction exclude, and resource prefix lists:

- The default program exclude list, supplied with CICS IA, is called CIUXPROG; it contains the name prefixes of IBM components about which you do not normally want to collect information.
- The default transaction exclude list, supplied with CICS IA, is called CIUXTRAN and is empty.
- The default program prefix list, supplied with CICS IA, is called CIUPFXTB and is empty.

### Creating a program exclude list

A program exclude list is a load module that contains a simple list of program name prefixes. You can use the provided sample batch job to create and edit the sample program exclude list.

#### About this task

Each list item consists of a 1-byte length field, followed by the characters of the program name prefix. The length is the number of characters in the prefix, which must be in the range 1 through 8. A length of zero indicates the end of the list. Figure 12 is an example of a program exclude list.

```
MYXPROG CSECT
MYXPROG AMODE 31
MYXPROG RMODE ANY
DS      0F
DC      AL1(8),C'TEST      '      Excludes a program called TEST
DC      AL1(4),C'TEST'      Excludes names starting with TEST
DC      AL1(3),C'UCC'       Excludes names starting with UCC
DC      AL1(0)              End of list
END      MYXPROG
```

Figure 12. Example program exclude list

#### Procedure

1. A sample batch job, CIUJCLXP, is provided to assemble and link-edit the sample program exclude list, CIUXPROG. Before running the CIUJCLXP job, change the following:

##### The JOB accounting parameters

Modify the JOB card statement to meet your site standards.

**The PGM keyword of the EXEC statement of the ASM step**

Insert the name of the assembler to use.

**The SYSIN DD statement**

Specify the name of the assembler language source library where your exclude list is to be found. The default is hlq.SCIUSRCE, where “hlq” is the data set qualifier assigned during installation.

Change the member name to the name of your own program exclude list.

**The SYSLMOD DD statement**

Specify the name of the CICS IA load library where the exclude list is to be placed. The default is hlq.SCIULOAD, where “hlq” is the data set qualifier assigned during installation.

Change the member name to the name of your own program exclude list.

2. To make the exclude list from your customized program available to the Collector:
  - a. Place the generated load module in a load library concatenated with DDNAME DFHRPL.
  - b. Define the generated load module to CICS, using the same attributes as those used for CIUXPROG in the CIUJnnCR sample JCL in the CICS IA load library. In particular, specify RELOAD(NO) on the PROGRAM definition.

**Creating a transaction exclude list**

A transaction exclude list is a load module that contains a simple list of transaction name prefixes.

**About this task**

Each list item consists of a 1-byte length field, followed by the characters of the transaction name prefix. The length is the number of characters in the prefix, which must be in the range 1 through 4. A length of zero indicates the end of the list. Figure 13 is an example of a transaction exclude list.

```

MYXTRAN  CSECT
MYXTRAN  AMODE 31
MYXTRAN  RMODE ANY
          DS    0F
          DC    AL1(1),C'C'          Excludes names starting with C
          DC    AL1(3),C'UCC'        Excludes names starting with UCC
          DC    AL1(0)                End of list
          END  MYXTRAN

```

*Figure 13. Example transaction exclude list*

A sample batch job, CIUJCLXT, is provided to assemble and link-edit the sample transaction exclude list, CIUXTRAN.

Before running the CIUJCLXT job, change the following:

1.

**The JOB accounting parameters**

Modify the JOB card statement to meet your site standards.

**The PGM keyword of the EXEC statement of the ASM step**

Insert the name of the assembler to use.

### The SYSIN DD statement

Specify the name of the assembler language source library where your exclude list is to be found. The default is hlq.SCIUSRCE, where "hlq" is the data set qualifier assigned during installation.

Change the member name to the name of your own transaction exclude list.

### The SYSLMOD DD statement

Specify the name of the CICS IA load library where the exclude list is to be placed. The default is hlq.SCIULOAD, where "hlq" is the data set qualifier assigned during installation.

Change the member name to the name of your own transaction exclude list.

2.

To make your customized transaction exclude list available to the Collector:

- a. Place the generated load module in a load library concatenated with DDNAME DFHRPL.
- b. Define the generated load module to CICS, using the same attributes as those used for CIUXTRAN in the CIUJnnCR sample JCL in the CICS IA load library. In particular, specify RELOAD(NO) on the PROGRAM definition).

## Creating a resource prefix list

A resource prefix list is a load module that contains a simple list of TSQueue and ENQ/DEQ resource name prefixes that helps to avoid collecting unnecessary information. You can use the provided sample batch job to create the edit the sample resource prefix list.

### About this task

Each list item consists of a 1-byte length field, followed by the characters of the resource name prefix. The length is the number of characters in the prefix, which must be in the range 1 - 32. A length of zero indicates the end of the list. Figure 14 is an example of a resource name prefix list.

```
CIUPFXTB CSECT
CIUPFXTB AMODE 31
CIUPFXTB RMODE ANY
        DS 0F
Add user prefixes here
        DC AL1(4),C'TEST'           Example
Predefined prefixes
        DC AL1(3),C'DFH' CICS
        DC AL1(0)                   End of list
        END CIUPFXTB
```

Figure 14. Example resource name prefix list

### Procedure

1. A sample batch job, CIUJCLPL, is provided to assemble and link-edit the sample resource prefix list, CIUPFXTB. Before running the CIUJCLPL job, change the following:

#### The JOB accounting parameters

Modify the JOB card statement to meet your site standards.

### The PGM keyword of the EXEC statement of the ASM step

Insert the name of the assembler to use.

### The SYSIN DD statement

Specify the name of the assembler language source library where your resource prefix list is to be found. The default is hlq.SCIUSRCE, where hlq is the data set qualifier assigned during installation.

Change the member name to the name of your own program resource prefix list.

### The SYSLMOD DD statement

Specify the name of the CICS IA load library where the resource prefix list is to be placed. The default is hlq.SCIULOAD, where hlq is the data set qualifier assigned during installation.

Change the member name to the name of your own resource prefix list.

2. To make your customized resource prefix list available to the Collector:
  - a. Place the generated load module in a load library concatenated with DDNAME DFHRPL.
  - b. Define the generated load module to CICS, using the same attributes as those used for CIUPFXTB in the CIUDEFT sample JCL in the CICS IA load library. In particular, specify RELOAD(NO) on the PROGRAM definition.

## Grouping transactions and programs into applications

In CICS IA Version 3.2, you could group transactions, programs, or both to form a notional *Application*. In CICS IA Version 5.1, you can still use these Application definitions and the utilities shipped to provide this are available.

It is now recommended that you use the new function introduced in CICS Transaction Server Version 5.1 to define applications as part of the platform capabilities. You can now logically define the various resources that make up a business application in CICS TS as a single entity and deploy these resources to CICS TS as a single resource. An application that is defined in this way can be managed as a single entity throughout its lifecycle, making CICS TS application management faster, simpler, and less error prone. For more information, see Platforms in the CICS TS info center.

### Migrating application definitions

You can use your CICS IA V3.2 Application definitions in your CICS IA V5.1 environment by reloading the XML files you created in CICS IA V3.2: v32hlq.SCIUDAT2.OUT(CIUAPPLS). To do this, review and run the sample job in hlq.SCIUSAMP.DB2(CIUALOAD). You must use the CICS IA V3.2 data set as input to CIUMIGXT DD statement in the second step.

## CICS IA Natural support

With CICS IA, you can gather CICS resource information for COBOL, PL/I, and Assembler language programs called from within a Software AG Natural program.

Additionally, with CICS IA you can gather detailed information on both Adabas calls and Natural program calls from Natural applications running in the Software AG Natural environment. In this way, you can identify Adabas resources used by Natural applications and Natural program relationships. You can use the Natural Resource Options to control the collection data on Adabas calls and Natural program calls as described in the “Changing the Collector options” on page 79.

CICS IA Natural support runs as an exit to the Natural Review Data Collector. Both the Natural Review Data Collector and the CICS IA Natural support exit must be link-edited into a Natural Shared Nucleus (NSN). The CICS IA Natural support exit is a TP-specific module for the CICS environment, and must be included as part of a Single-Environment Shared Nucleus for CICS. Refer to the *Natural Operations Manual* for more information regarding the Natural Shared Nucleus, TP-specific modules, and Single-Environment Shared Nuclei.

The installation of Natural Support will not change the structure of the data interfaces to CICS IA. However, the content of the data collected will change in that the name of the Natural nucleus will be replaced by the name of the Natural program that is currently executing.

## Installing Natural support

CICS IA Natural support runs as an exit to the Natural Review Data Collector. The Natural Review Data Collector and the CICS IA Natural support exit must be link-edited into an NSN.

### Before you begin

Follow these steps to install Natural Support:

#### Procedure

1. Verify that the CICS IA Natural exit is available, using program CIURDCX1 found in the hlq.SCIULOAD library
2. Follow the instructions for link-editing the Natural Review Data Collector, (NATRDC) into an NSN as provided by the vendor. The exit can be linked into one of three places:
  - The Independent (shared) nucleus NATvvvSH.
  - The CICS dependent nucleus NCvvvRE.
  - A dynamically loaded CICS parameter module.
3. Link the exit into the CICS dependent nucleus, NCvvvRE:
  - a. Specify the RDCEXIT and RDCSIZE parameters in the Natural/CICS parameter module. These parameters are options on the NTPRM macro. Set the parameters as follows:
    - RDCSIZE=2
    - RDCEXIT=(CIURDCX1,400)
4. Add the following DD statement for the CICS IA load library to the job used to link-edit the NSN:

```
//ACIUMOD DD DISP=SHR,DSN=hlq.ACIUMOD
```
5. Add the following linkage-editor control statement to the linkage-editor input stream:

```
INCLUDE ACIUMOD(CIURDCX1)
```
6. If you are linking into the Independent (shared) nucleus add the following into the job stream:

```
//SCIULOAD DD DISP=SHR,DSN=hlq.SCIULOAD
```

```
INCLUDE SCIULOAD(CIURDCX1)
```

## What to do next

When the above steps have been completed the CICS IA collection of interdependency data will record the names of the Natural programs involved in place of the name of the Natural nucleus.

## Customizing the CICS IA Natural Interface

Customizing the CICS IA Natural Interface includes two tasks: Modifying the Exclusive Work Area (EWA) size and the Natural Name List size.

### Modifying the Exclusive Work Area (EWA) size

The default size of the EWA allows you to collect information for up to 12 Natural programs for each Natural session. You can change the EWA size by modifying the RDCEXIT Natural profile parameter for the CICS IA Natural support exit. If you increase the EWA by 8 bytes you can collect information for one more Natural program.

### Modifying the Natural Name List size

The CICS IA Natural support exit extracts the Natural information and saves it in an area called the Natural Name List (NNL). The default size of the NNL allows you to collect information on up to 252 simultaneous Natural sessions.

To modify the size of the NNL area:

1. Update the supplied source member hlq.SCIUSRCE(CIUNNLP). Follow the instructions in the source.
  - \* NSESS specifies the maximum number of simultaneous Natural sessions. The number must be a value between 2 and 32256.
  - \* A value 252 is the installation default setting.
  - \*

```
CIUNNL  DS    0D                                Natural Name list
        CIUNNLD DSECT=NO,NSESS=252
        SPACE
        END
```
2. Review and modify sample job hlq.SCIUSAMP.CICS(CIUJCNNL):
  - Modify the Job card to meet your site standards.
  - Review the ASM.SYSIN card to make sure you are picking up the modified source.
  - Review the LKED.SYSLMOD card to make sure you are linking the module into the required dataset.
3. To make the modified NNL table available to the IA Natural Collector, ensure that the dataset into which you have linked the modified NNL module is before the CICS IA load library in the DFHRPL.

## Restarting your CICS regions

Restart each CICS region in which CICS IA is to run, using a CICS startup job modified for CICS IA support.

## Starting and stopping CICS IA from the PLT

You can start CICS IA from a program list table (PLT) program that is initiated during the third stage of CICS initialization; that is, a program that is specified in the second part of the program list table post initialization (PLTPI) list for the CICS region.

## About this task

A PLTPI program to start the Collector, CIUSTART, is supplied with CICS IA. To start CICS IA from the PLT, add the following lines to your PLT startup table:

```
DFHPLT TYPE=ENTRY,PROGRAM=DFHDELIM  
DFHPLT TYPE=ENTRY,PROGRAM=CIUSTART
```

A program list table shutdown (PLTSD) program to stop the Collector, CIUSTOP, is supplied with CICS IA. To stop CICS IA from the PLT:

1. Add the following lines to your PLT shutdown table:  

```
DFHPLT TYPE=ENTRY,PROGRAM=CIUSTOP  
DFHPLT TYPE=ENTRY,PROGRAM=DFHDELIM
```
2. Ensure that the definition of the CINT transaction specifies SHUTDOWN(ENABLED).

For definitive information about installing and running PLTPI and PLTSD programs, see the *CICS Customization Guide*.

## CICS IA supplied modules required in the MVS link list

If you use the MVS interactive problem control system (IPCS) to format and analyze CICS system dumps, you can use the CICS IA system dump formatting routines, CIUIADUF and CIUICDUF, to format the CICS IA collector data areas.

To make these routines accessible to IPCS, copy them from hlq.SCIULOAD into a data set of your choice that is in the MVS link list.

---

## Running the installation verification program

Use the CICS IA installation verification program (IVP) to verify that CICS IA has been installed correctly on your system.

You are strongly recommended to fix any errors reported by the IVP before running any other CICS IA program.

The rest of this section contains:

- “About the IVP”
- “Running the IVP” on page 58
- “Loading IVP sample data” on page 58
- “Viewing the IVP sample data” on page 59

### About the IVP

The installation verification program checks CICS RDO definitions to ensure that all software elements, programs, maps, transactions, files, transient data queues, and DB2 entries are correctly defined to CICS and are available.

During the verification process, the IVP writes messages to the CICS system log. These messages indicate the success or failure of the installation. They show verified elements and also any elements of CICS IA that are missing or unavailable. The lack or unavailability of an element could be caused, for example, by an error in loading the software, or by a faulty RDO definition.

The messages that can be issued by the IVP are in the range CIU1001 through CIU1013. They are listed in “Messages that CICS IA can issue” on page 269. Error messages give the probable cause of the error and the action to be taken to correct it.

## Running the IVP

How to run the IVP.

### About this task

1. Clear the CICS screen.
2. Type the transaction name CIUT.
3. Press Enter to start the program. The program might take several minutes to validate the software.
4. When the verification program has completed, check the messages displayed on your terminal:

#### **CICS IA was installed successfully**

If the IVP finds that CICS IA was installed successfully, the following message appears:

```
CIU1002I  INSTALLATION VERIFICATION ENDED SUCCESSFULLY
```

Quit the IVP and go to “Loading IVP sample data.”

#### **CICS IA was not installed successfully**

If the IVP finds that one or more elements of CICS IA were not installed correctly, or are missing, the following message appears:

```
CIU1009  VERIFICATION UNSUCCESSFUL - HIGHEST RETURN CODE: n
```

Go to step 5.

5. Check all the messages that were issued by the IVP during the verification process. Messages indicating either successful or unsuccessful verification of each CICS IA software element are written to the CICS system log. The default CICS system log is CSMT.  
Messages issued by the IVP are in the range CIU1001 through CIU1013 and are listed in “Messages that CICS IA can issue” on page 269.
6. Locate any missing resources identified by the IVP. Ensure that all the resources required by CICS IA are correctly defined to CICS and are available.  
If you cannot locate or restore a missing resource, contact the IBM Software Support Center (ISC).
7. Run the IVP again until it confirms that CICS IA has been installed correctly.

## Loading IVP sample data

When the IVP confirms that CICS IA is installed correctly, to familiarize yourself with the product, and to check that it is working correctly. You can load some sample interdependency data into the Dependency database objects and use the Query interface to view it.

### About this task

Edit and run the CIUIVPLD job to load the sample IVP data.

The CIUIVPLD job is put into the hlq.SCIUSAMP.DB2 library by the CICS IA installation procedure where “hlq” is a prefix that is defined during installation. Before you run the CIUIVPLD, edit it to meet the requirements of your system.

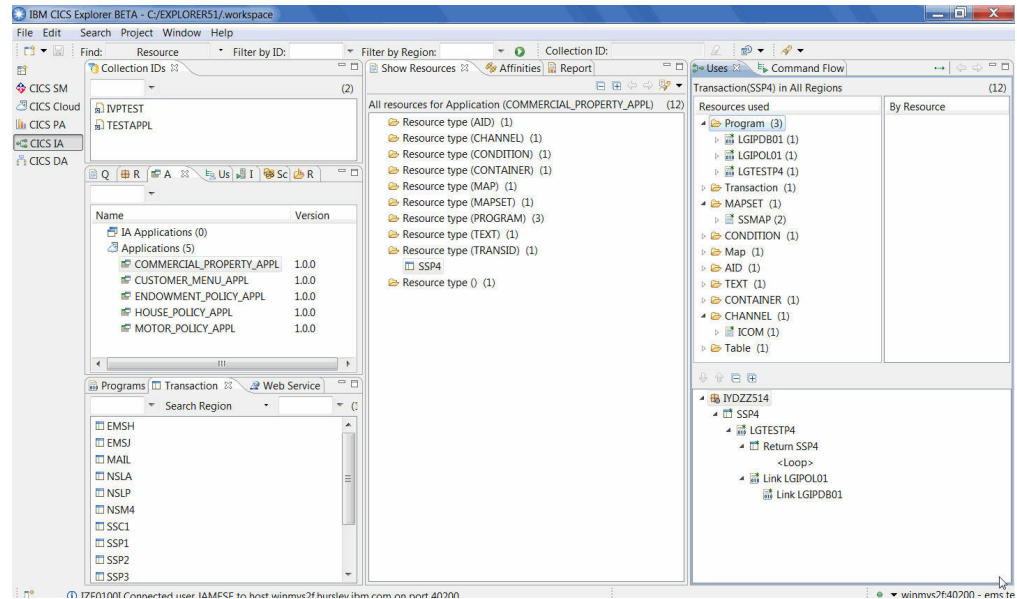

After the CIUIVPLD job runs successfully, you can use the CICS IA plug-in for CICS Explorer to view the sample data. For detailed instructions on how to view and analyze data with the CICS Explorer, see *IBM CICS Explorer User Guide*.

## Viewing the IVP sample data

After the CIUIVPLD job runs successfully, you can use the CICS IA plug-in interface to interrogate the sample data.

### About this task

1. Expand **TS Applications** in the **Applications** view.
2. Right-click **COMMERCIAL\_PROPERTY\_APPL**, and select **Show all resources**.
3. Expand transaction resources in the **Show resources** view.
4. Right-click transaction **SSP4** in the **Show resources** view and select **Uses Resources>All Regions**, the results are displayed in the **Uses** view.

---

## Chapter 4. Running the Collector

You run the CICS IA Collector to look for instances of program commands that might cause resource dependencies or transaction affinities.

This section contains the following topics:

- “Displaying the Collector Main Administration Menu panel” on page 62
- “Controlling the collection of dependency and affinity data” on page 70, which contains:
  - “Starting data collection” on page 70
  - “Changing the data collection options dynamically” on page 73
  - “Pausing the collection of data” on page 74
  - “Resuming the collection of data” on page 75
  - “Stopping the collection of data” on page 76
  - “Displaying Collector statistics for a specified region” on page 78
- “Changing the Collector options” on page 79
- “Collector errors” on page 173

The CICS and non-CICS commands that the Collector can monitor are listed in “Dependency-related commands” on page 6.

You can run the Collector either at a CICS 3270-type terminal (through interactive screens or single-line commands), from a console, or from an application program. This section primarily describes how to use the Collector through the interactive screens at a CICS terminal, but also gives equivalent commands to use at a terminal, at a console, or in an application program.

For an overview of the Collector, see “The Collector component” on page 15.

To control the Collector:

- Change its state, which is described in “Controlling the collection of dependency and affinity data” on page 70.
- Change its run time options, which is described in “Changing the Collector options” on page 79.

---

### Running the Collector for the first time

To run the Collector for the first time configure the region options using option 2 of the Collector Main Administration Screen before gathering any dependency or affinity data.

See Figure 15 on page 62, to:

- Specify at least one CICS region to be monitored
- Specify (in further screens) the CICS, DB2, MQ, and IMS commands to be monitored on that region
- Specify (in a further screen) whether dependency or affinity data is to be collected on that region, with some other region-specific options

For more information about setting Collector options, see “Changing the Collector options” on page 79.

If you have migrated the CIUCNTL control file from a previous CICS IA release, some CICS regions might already be configured for monitoring. For information about migrating the CICS IA control file, see “Migrating your control file” on page 46

If you have not migrated the CIUCNTL control file from a previous CICS IA release (in which case, CICS IA's global values will already have been set up), before you try to gather any dependency or affinity data choose the global values menu options to set up CICS IA's global values, see Figure 32 on page 96.

## Displaying the Collector Main Administration Menu panel

Display the Collector Main Administration Menu panel by following the steps below.

### About this task

To display the Collector Main Administration Menu panel:

1. At a CICS terminal type the transaction identifier CINT
2. Press Enter and panel CIU000, see Collector Main Administration Menu screen, CIU000, is displayed. You can use the Main Administration Menu panel to:
  - Display the Operations Menu panel, which enables you to review and change the state of the Collector, on each of the CICS regions being monitored.
  - Display configuration panels that enable you to set the run time options used by the Collector.
3. Press the F3 (or F12) function key to close the Collector Main Administration Menu panel. Closing the panel does not affect the state of the Collector.

```
CIU000          CICS Interdependency Analyzer for z/OS - V5R1M0          2012/10/01
                  Main Administration Menu                                09:25:50AM

Select one of the following. Then press Enter.  0

-  1  Operations Menu.                1
   2  Configure Region Options.       2
   3  Configure Global Options.       3
   4  User Administration.            4

```

Figure 15. Collector Main Administration Menu panel, CIU000

The meaning of each part of the Collector Main Administration Menu panel, CIU000, is as follows:

**0** The functions that you can select from this state of the Collector. For any state of the Collector, only appropriate functions are displayed. Type a number from 1 through 3 at the cursor. Then press Enter.

- 1** Displays the Operations Menu panel, shown in Collector Operations Menu screen, CIU100, which enables you to review the current state of the Collector on each of the CICS regions being monitored by CICS IA, to start, stop, pause, or resume the Collector on any of those regions, and to display statistics about any of the regions.
- 2** Displays the Region Configuration Menu panel, shown in Collector Region Configuration Menu screen, CIU200, which enables you to specify the CICS regions that are to be monitored by CICS IA and, in further panels, to specify which CICS, DB2, IMS, and MQ commands are to be monitored.
- 3** Displays the Global Configuration Menu panel, shown in Collector Global Options Menu screen, CIU300, which enables you to specify global values for CICS IA, such as national language, date and time formats, trace level and HLQ for dump data set.
- 4** Displays the User Administration Menu panel, CIU400, with which you can add, delete or display user records for the CICS IA Command Flow feature.
- 5** The 4-character system ID (SYSID) and APPLID of the CICS region on which the CINT transaction is running, with the terminal identifier (TERMIN) of the terminal from which it was started.
- 6** The message line used to display diagnostic messages. When the CINT transaction is first entered, this line displays the copyright notice:  
CIU7000I 5655-Y22 (C) Copyright IBM Corp. 2001, 2012
- 7** The keys that select functions to affect the operation of the Collector or to get help information about it. This line displays all possible functions, not all of which are appropriate, or selectable, for a given state of the Collector.

## Command Flow User Administration using transaction CINT

You can use the Command Flow User Administration using transaction CINT feature to view and manage the accounts of the Command Flow collector users. This function is implemented through the CINT transaction and provides the usage of the Command Flow collector for multiple regions.

### Managing Command Flow collector users

With the CICS IA User Administration Menu panel you can manage the Command Flow collector users.

#### About this task

You can use the User Administration Menu panel to add, copy, delete the Command Flow collector users or see specific information about users.

#### Procedure

1. At a CICS terminal, type the transaction identifier CINT.
2. Press Enter. The Collector Main Administration Menu panel, CIU000, is displayed. See Figure 15 on page 62.
3. On panel CIU000, choose option 4.
4. Press Enter. The User Administration Menu panel, CIU400, is displayed. See Figure 16 on page 64.

The meaning of each part of the CICS IA User Administration Menu panel, CIU400, is as follows:

**1** Specify one of the following action codes:

**1=Add User:** In any of the Act fields, type action code 1 and press Enter. The Add User Menu panel, CIU410, is displayed.

**2=Copy User:** In the Act field corresponding to the user that you want to copy, type action code 2 and press Enter. The Copy User Menu panel, CIU420, is displayed.

**3=Delete User:** In the Act field corresponding to the user that you want to delete, type action code 3 and press Enter. You are asked to confirm that the specified user is to be deleted.

**Note:** To delete a user, make sure that the Command Flow collector is stopped and the CINC session for this user is closed.

**4=User Details:** In the Act field corresponding to the chosen user, type action code 4. The User Details Menu panel, CIU440, is displayed.

**2** The control keys that you can use to select functions that control the operation of the User Administration feature and provide help information about it. Actions are summarized in Table 7.

5. Press F3 to close the CICS IA User Administration Menu panel.

## Adding new Command Flow collector users

With the CICS IA Add User Menu panel you can add new users to the list of the Command Flow collector users.

### About this task

You can use the Add User Menu panel to add new Command Flow collector users.

### Procedure

1. On the User Administration Menu panel, CIU400, type action code 1.
2. Press Enter. The Add User Menu panel, CIU410, is displayed; see Figure 17.

Add a new user without leaving the panel.	Enter
Return to the User Administration Menu panel without adding the new user specified on the Add User Menu panel.	F12

3. Press F3 (or F12) to close the CICS IA Add User Menu panel.

### **Copying Command Flow collector users**

With the CICS IA Copy User Menu panel you can copy the Command Flow collector users.

#### **About this task**

You can use the CICS IA Copy User Menu panel to create a new Command Flow collector user by copying the parameters of an existing user.

#### **Procedure**

1. On the User Administration Menu panel, CIU400, type action code 2.
2. Press Enter. The Copy User Menu panel, CIU420, is displayed; see Figure 18 on page 67.

```

CIU420      CICS Interdependency Analyser for Z/OS - V5R1M0      2012/07/02
              Copy User Menu                                     12:38:07PM

Press Enter to add new user without leaving this panel.

Specify parameters for the copy of user XXUSERXX :
New user name . . . . . : USER1313      1
Journal name for trace data . . : CIUMTJNL      2

Parameters below will be copied
Traced transactions IDs. . . . . :      3
Traced user USERID . . . . . : XXUSERXX      4
Traced terminal TERMID . . . . . : *      5
Command Flow data ID . . . . . :      6
Dynamic call . . . . . : Y      7
User modifiable exit name. . . . . :      8
Traced regions APPLIDs . . . . . :      9

Figure 18. Copy User Menu panel, CIU420

The meaning of each part of the CICS IA Copy User Menu panel, CIU420, is as follows:

**1** The 8-character identifier for a copy of user that you want to create.

**2** Specify the journal name for trace data. The length of the name is up to 8 characters. The default journal name is CIUMTJNL.

**Note:**

- a. The journal name must have the same name as the corresponding journal model.
- b. The log stream name in a given journal model must be the same on all regions.

**3** The identifiers of the transactions for which you want to trace the Command Flow data.

**4** The user identifier associated with CICS transactions, for which you want to collect the Command Flow data.

**5** The terminal identifier associated with CICS transactions, for which you want to collect the Command Flow data.

**6** The name of the Command Flow trace that is to be captured.

**7** A flag that determines whether or not dynamic call programs are captured. Specify Y (Yes) or N (No). The default value of this field is Y.

**8** The 8-character user modifiable exit name that you can use to add data to a user Command Flow record.

**9** The 8-character APPLID of the CICS region for which you want to trace the Command Flow data.

**10** The control keys that you can use to select functions that control the operation of the User Administration feature and provide help information about it. Actions are summarized in Table 9.

Table 9. The control keys on the Copy User Menu panel

Action	Function key
Copy a user and return to the User Administration Menu panel, CIU400.	F3
Clear the user parameters fields on panel CIU420.	F5
Copy a user without leaving the panel.	Enter
Return to the User Administration Menu panel, CIU400.	F12

3. Press F3 (or F12) to close the CICS IA Copy User Menu panel.

### Viewing details of a Command Flow collector user

With the CICS IA User Details Menu panel you can see collection options and statistics information for the chosen user.

#### About this task

You can use the CICS IA User Details Menu panel to display a Command Flow collector user statistics information.

#### Procedure

1. On the User Administration Menu panel, CIU400, type action code 4.
2. Press Enter. The User Details Menu panel, CIU440 is displayed; see Figure 19.

The meaning of each part of the CICS IA User Details Menu panel, CIU440, is as follows:

**1** The identifiers of the transactions for which you want to trace the Command Flow data.

**2** The user identifier associated with CICS transactions, for which you want to collect the Command Flow data.

**3** The terminal identifier associated with CICS transactions, for which you want to collect the Command Flow data.

**4** The name of the Command Flow trace that is to be captured.

**2** Specify the journal name for trace data. The length of the name is up to 8 characters. The default journal name is CIUMTJNL.

**Note:**

- a. The journal name must have the same name as the corresponding journal model.
- b. The log stream name in a given journal model must be the same on all regions.

**6** A flag that determines whether or not dynamic call programs are captured. Specify Y (Yes) or N (No). The default value of this field is Y.

**7** The 8-character user modifiable exit name that you can use to add data to a user Command Flow records.

**8** The 8-character APPLID of the CICS region for which you want to trace the Command Flow data.

**9** The Command Flow collector status for the specified user.

**10** The date and time when the Command Flow data collection process was last started. The time shown is the local time, and the date is given in the format specified by the Global Options Menu panel of the CINT transaction.

**11** The date and time when the Command Flow data collection process was last stopped. The time shown is the local time, and the date is given in the format specified by the Global Options Menu panel of the CINT transaction.

**12** The control keys that you can use to select functions that control the operation of the CINC collector and provide help information about it. Actions are summarized in Table 10.

*Table 10. The control keys on the User Details Menu panel*

Action	Function key
Save all the changes and return to the User Administration Menu panel, CIU400.	F3
Refresh the CINC user option fields.	F5
Update the journal name without leaving panel CIU440.	Enter
Return to the User Administration Menu panel, CIU400.	F12

3. Press F3 (or F12) to close the CICS IA User Details Menu panel.

## Controlling the collection of dependency and affinity data

Use the menu CIU100 to control the collection of dependency and affinity data.

Select **1 Operations Menu** from the Collector Main Administration Menu screen, CIU000 (shown in Figure 15 on page 62). The Collector Operations Menu screen, CIU100, shown in Figure 20, is displayed. From this screen, you can perform these actions:

- Review the current state of the Collector on each of the CICS regions being monitored by CICS IA.
- Start, stop, pause, or restart the Collector on any or all of the monitored regions.
- Call up a further screen to show Collector statistics for any of the monitored regions.
- Refresh the Collector options on any or all of the monitored regions.

CIU100      CICS Interdependency Analyzer for z/OS - V5R1M0      2012/09/26

Figure 20. Collector Operations Menu screen, CIU100

**1** If more than one CICS region is listed on the Operations Menu, an extra item, with an APPLID and SYSID of “ALL”, is displayed at the top of the list. With this item you can specify that the chosen operation is to be applied to all the regions in the list. You can select ALL with all action codes except 5, Statistics.

## Starting data collection

If the CICS IA Collector is not already running in a specific region, you can start collecting dependency data, affinity data, or both on that region. Only one CICS IA Collector can run on each CICS region.

To start collecting data on a specified CICS region, use one of the methods shown in Methods to start data collection by the Collector. The Collector records transaction dependencies or affinities until you pause or stop data collection.

Table 11. Methods to start data collection by the Collector

Where used	Command or function key
CINT transaction Operations Menu, CIU100	Type 1 against a listed CICS APPLID and press Enter, to start the Collector on the specified region. <b>1</b>
CINT transaction Operations Menu, CIU100	If more than one CICS region is listed on the Operations Menu, you can type 1 against the first CICS APPLID in the list ("ALL") and press Enter to start the Collector on all the regions. <b>2</b>
3270 terminal	CINT <start_options> <b>3</b>
Console	F cicsjob, CINT <start_options> <b>4</b>
Application program	EXEC CICS START TRANSID('CINT') FROM('<start_options>') <b>5</b>

**Note:**

1. If you enter action code 1 against a CICS region, you are asked to confirm that you want the Collector to start recording data.
2. If you enter action code 1 against ALL, you are asked to confirm that you want the Collector to start recording data on all the regions.
3. The start options are as follows:

**START**

Starts the Collector on the local CICS region; that is, the region to which the 3270 terminal is connected. The type of data collected (interdependency or affinity) depends on what you have specified for the Data to Collect region-specific option on the Collector General Options screen, CIU260, shown in Collector General Options screen, CIU260.

**STARTALL**

Starts the Collectors on all the monitored CICS regions. For each region, the type of data collected depends on what you have specified for the Data to Collect region-specific option on the Collector General Options screen, CIU260.

**STARTAFF**

Starts the collection of affinity data on the local CICS region. This command overrides what you have specified for the Data to Collect region-specific option. In other words, even if you have specified the type of Data to Collect as interdependency, the CINT STARTAFF command causes affinity, not interdependency, data to be collected.

**STARTALLAFF**

Starts the collection of affinity data on all the monitored CICS regions. This command overrides what you have specified, for each region, on the Data to Collect region-specific option. In other words, even if, for some regions, you have specified the type of Data to Collect as interdependency, the CINT STARTALLAFF command causes affinity data to be collected on all the regions.

**STARTINT**

Starts the collection of interdependency data on the local CICS region. This command overrides what you have specified for the Data to Collect region-specific option. In other words, even if you have

specified the type of Data to Collect as affinity, the CINT STARTINT command causes interdependency, not affinity, data to be collected.

#### **STARTALLINT**

Starts the collection of interdependency data on all the monitored CICS regions. This command overrides what you have specified, for each region, on the Data to Collect region-specific option. In other words, even if, for some regions, you have specified the type of Data to Collect as affinity, the CINT STARTALLINT command causes interdependency data to be collected on all the regions.

#### **STARTBOTH**

Starts the collection of both affinity data and interdependency data on the local CICS region. This command overrides what you have specified for the Data to Collect region-specific option. In other words, even if you have specified the type of Data to Collect as affinity, the CINT STARTBOTH command causes both affinity data and interdependency data to be collected.

#### **STARTALLBOTH**

Starts the collection of both affinity data and interdependency data on all the monitored CICS regions. This command overrides what you have specified for the Data to Collect option in each region. In other words, even if you have specified, for each region, the type of Data to Collect as affinity, the CINT STARTALLBOTH command causes both affinity data and interdependency data to be collected for all the regions.

4. `cicsjob` is the name of your CICS startup job. The `<start_options>` are described in note **3**.
5. This command, issued from a program initiated during the third stage of CICS initialization (that is, a program specified in the second part of the PLTPI list for the CICS region), starts the Collector during CICS initialization. The `<start_options>` are described in note **3**. A PLTPI program to start the Collector, CIUSTART, is supplied with CICS IA. For more information, see Starting and stopping CICS IA from the PLT.

On each region, the data that is collected depends on the following options:

1. The start option (such as START, STARTAFF, STARTINT, or STARTALLAFF) that you specify, as listed earlier.
2. The region-specific options that you specify. For example, if you are collecting dependency data, data is collected only for the (CICS and non-CICS) API commands that you choose to be monitored (by specifying Y for the command type on the CICS Resources Options screen, CIU240, and the DB2/MQ/IMS/RMI Trace Resource Options screen, CIU250. See Collector CICS Resources Options screen, CIU240 and Collector DB2/MQ/IMS Resource Options screen, CIU250).

Similarly, if you are collecting affinity data, data is collected only for the CICS API commands that you choose to be monitored (by specifying Y for the command type on the CICS Affinities Options screen, CIU270. See Collector Affinities Options screen, CIU270).

In addition, data collection is filtered by the region-specific options that you set on the General Options screen, CIU260. See "Transid prefix", "Program exclude list", and "Transaction exclude list", under Specifying region-specific options: general.

For a complete list of the program commands that are not monitored, see What is not monitored.

Each time the Collector is started, a new data space is created. You specify its size on the Collector's Regional Resource Options screen, CIU260—see Collector General Options screen, CIU260. You can also specify that data from the VSAM dependency or affinity files (for example, from previous CICS IA runs) is to be loaded into the data space when it is created. For more information about the Regional Resource Options screen, see Specifying region-specific options.

**Note:** If there are a large number of data records to be loaded into the data space when it is created (for example, from previous CICS IA runs), the Operations Menu screen might be frozen for some appreciable time, until the records have been loaded.

## Changing the data collection options dynamically

You can change the CICS IA monitoring options without restarting CICS IA.

To change which CINT resources to monitor:

1. Change the collector options, see “Changing the Collector options” on page 79.
2. Use one of the methods shown in Methods for changing data collection options to start CINT using the updated options.

*Table 12. Methods for changing data collection options*

Where used	Command or function key
CINT transaction Operations Menu, CIU100	Type 6 against a listed CICS APPLID and press Enter to have CICS IA use the updated set of options for selecting the resources to monitor.
CINT transaction Operations Menu, CIU100	If more than one CICS region is listed on the Operations Menu, you can type 6 against the first CICS APPLID in the list (ALL) and press Enter to have all CICS IA regions use the updated set of options for selecting the resources to monitor.
3270 terminal	CINT REFRESHOPTIONS <b>1</b>
3270 terminal	CINT REFRESHALLOPTIONS <b>2</b>
Console	F cicsjob, CINT REFRESHOPTIONS <b>3</b>
Console	F cicsjob, CINT REFRESHALLOPTIONS <b>4</b>
Application program	EXEC CICS START TRANSID('CINT') FROM('REFRESHOPTIONS') <b>5</b>
Application program	EXEC CICS START TRANSID('CINT') FROM('REFRESHALLOPTIONS') <b>6</b>

### Note:

**1** REFRESHOPTIONS causes the Collector to read the options that are currently defined for the local CICS region from the control file. The Collector uses these options to override the ones that are currently in use. The Collector must be in the Running state or the Paused state at the time this option is specified; otherwise, no action is taken.

**2** REFRESHALLOPTIONS causes the Collector for all regions where it is running to read the options that are currently defined for their local CICS region from the control file. Each collector uses the new options to override the options currently in use.

The options that can be updated by the CINT transaction REFRESHOPTIONS or REFRESHALLOPTIONS commands are the following:

- All CICS options on screens CIU240 and CIU245
- All DB2, IMS, WebSphere MQ, or RMI True options on screen CIU250
- The General Options on screen CIU260 that follow:
  - Data to Collect
  - Inquire for DB2 resources
  - Maintain usage counts
  - Perform periodic saves
  - Program exclude list
  - Restore data on start
  - Resource prefix list
  - Transaction exclude list
  - Transid prefix
  - Trigger for CINB start
  - TRUEs Include list
  - Size of dataspace
- ALL Affinity options on screen CIU270
- The Time and Date Options on screen CIU280

**3** cicsjob is the name of your CICS startup job. This job refreshes the Collector options on the local CICS region from its region record in the CICS IA control file.

**4** cicsjob is the name of your CICS startup job. This job refreshes the Collector options on all the monitored CICS regions from records in the CICS IA control file.

**5** This command, issued from a PLTPI program, refreshes the Collector options on the local CICS region from its region record in the CICS IA control file.

**6** This command, issued from a PLTPI program, refreshes the Collector options on all the monitored CICS regions from records in the CICS IA control file.

## Pausing the collection of data

You can pause the collection of dependency or affinity data on a particular region only when the Collector is running on that region.

To pause the collection of data on a specified CICS region, use one of the methods shown in Table 13. **1**

*Table 13. Methods for pausing data collection by the Collector*

Where used	Command or function key
CINT transaction's Operations Menu, CIU100	Type 3 against a listed CICS APPLID and press Enter.
CINT transaction's Operations Menu, CIU100	If there is more than one CICS region listed on the Operations Menu, you can type "3" against the first CICS APPLID in the list ("ALL") and press Enter to pause the Collector on all the regions.
3270 terminal	CINT PAUSE <b>2</b>
3270 terminal	CINT PAUSEALL <b>3</b>
Console	F cicsjob, CINT PAUSE <b>4</b>

Table 13. Methods for pausing data collection by the Collector (continued)

Where used	Command or function key
Console	F cicsjob, CINT PAUSEALL <b>5</b>
Application program	EXEC CICS START TRANSID('CINT') FROM('PAUSE') <b>6</b>
Application program	EXEC CICS START TRANSID('CINT') FROM('PAUSEALL') <b>7</b>

**Note:**

1. If you have set up a timer to control the dates and times at which the Collector runs on the specified region, pausing the Collector by any of the methods in Table 13 on page 74 overrides the action of the timer. However, the timer continues to operate and to pause and resume the collection of data at the specified times. For details of how to set up a timer, see “Specifying region-specific options: timers” on page 93.
2. This command pauses the Collector on the local CICS region; that is, the region to which the 3270 terminal is connected.
3. This command pauses the Collectors on all the monitored CICS regions.
4. cicsjob is the name of your CICS startup job. This job pauses the Collector on the local CICS region.
5. cicsjob is the name of your CICS startup job. This job pauses the Collector on all the monitored CICS regions.
6. This command, issued from a PLTPI program, pauses the Collector on the local CICS region.
7. This command, issued from a PLTPI program on the local CICS region, pauses the Collectors on all the monitored CICS regions.

Using one of the methods listed in Table 13 on page 74 causes the Collector to stop collecting data until you are ready to resume. The data already collected remains in the data space, and is saved to the dependency data or affinity data VSAM files if that option has been set. (You can specify that data be saved when the Collector is paused on the Regional Resource Options screen, as described in “Specifying region-specific options: general” on page 82.)

## Resuming the collection of data

You can resume collecting dependency or affinity data on a particular region only when the Collector is paused on that region.

To resume collecting data on a specified CICS region, use one of the methods shown in Table 14. **1**

Table 14. Methods for resuming data collection by the Collector

Where used	Command or function key
CINT transaction's Operations Menu, CIU100	Type 4 against a listed CICS APPLID and press Enter.
CINT transaction's Operations Menu, CIU100	If there is more than one CICS region listed on the Operations Menu, you can type 4 against the first CICS APPLID in the list <b>ALL</b> and press Enter to resume the collection of data on all the regions.
3270 terminal	CINT CONTINUE <b>2</b>

Table 14. Methods for resuming data collection by the Collector (continued)

Where used	Command or function key
3270 terminal	CINT CONTINUEALL <b>3</b>
Console	F cicsjob, CINT CONTINUE <b>4</b>
Console	F cicsjob, CINT CONTINUEALL <b>5</b>
Application program	EXEC CICS START TRANSID('CINT') FROM('CONTINUE') <b>6</b>
Application program	EXEC CICS START TRANSID('CINT') FROM('CONTINUEALL') <b>7</b>

**1** If you have set up a timer to control the dates and times at which the Collector runs on the specified region, resuming the collection of data by any of the methods in Table 14 on page 75 overrides the action of the timer. However, the timer continues to operate and to pause and resume the collection of data at the specified times. For details of how to set up a timer, see “Specifying region-specific options: timers” on page 93.

**2** This option causes the Collector to resume on the local CICS region: that is, the region to which the 3270 terminal is connected.

**3** This command causes the Collectors on all the monitored CICS regions to resume.

**4** cicsjob is the name of your CICS startup job. This job causes the Collector to resume on the local CICS region.

**5** cicsjob is the name of your CICS startup job. This job causes the Collectors on all the monitored CICS regions to resume.

**6** This command, issued from a PLTPI program, causes the Collector on the local CICS region to resume.

**7** This command, issued from a PLTPI program on the local CICS region, causes the Collectors on all the monitored CICS regions to resume.

Using one of the methods listed in Table 14 on page 75 causes the Collector to resume the collection of transaction dependencies or affinities in the CICS region, until you pause or stop data collection.

## Stopping the collection of data

You can stop collecting dependency or affinity data on a particular region only when the Collector is running or paused on that region.

To stop collecting data on a specified CICS region, use one of the methods shown in Table 15.

Table 15. Methods for stopping data collection by the Collector

Where used	Command or function key
CINT transaction's Operations Menu, CIU100	Type 2 against a listed CICS APPLID and press Enter. You are asked to confirm that you want data collection to be stopped on the specified region.

Table 15. Methods for stopping data collection by the Collector (continued)

Where used	Command or function key
CINT transaction's Operations Menu, CIU100	If there is more than one CICS region listed on the Operations Menu, you can type 2 against the first CICS APPLID in the list <b>ALL</b> and press Enter to stop the Collector on all the regions. You are asked to confirm that you want data collection to be stopped on all regions.
3270 terminal	CINT STOP <b>1</b>
3270 terminal	CINT STOPALL <b>2</b>
Console	F cicsjob, CINT STOP <b>3</b>
Console	F cicsjob, CINT STOPALL <b>4</b>
Application program	EXEC CICS START TRANSID('CINT') FROM('STOP') <b>5</b>
Application program	EXEC CICS START TRANSID('CINT') FROM('STOPALL') <b>6</b>

**Note:**

1. This option stops the Collector on the local CICS region; that is, the region to which the 3270 terminal is connected.
2. This option stops the Collectors on all the monitored CICS regions.
3. `cicsjob` is the name of your CICS startup job. This job stops the Collector on the local CICS region.
4. `cicsjob` is the name of your CICS startup job. This job stops the Collectors on all the monitored CICS regions.
5. This command, issued from a program initiated during the first quiesce stage of CICS shutdown (that is, a program specified in the first half of the PLT for CICS shutdown) stops the Collector on the local region. You are recommended to implement this command, to prevent the Collector delaying CICS shutdown if it is not in the STOPPED state. A PLTSD program to stop the Collector, CIUSTOP, is supplied with CICS IA. For information about installing and running PLTSD programs, see the *CICS Customization Guide*.
6. This command, issued from a PLTSD program on the local CICS region, stops the Collectors on all the monitored CICS regions.

Using one of the methods in Table 15 on page 76 stops the Collector recording any dependency or affinity data in the CICS region until you next start the Collector. Stopping the collector also destroys the data space, and saves the data collected to the VSAM data files.

If there are many data records to be saved, the Operations Menu screen might be frozen for some time, until the records have been saved.

You might want to stop the Collector, on a specified CICS region, when it has detected all dependencies there. You can find out when this has happened from the Collector Statistics Menu screen, CIU150; see “Displaying Collector statistics for a specified region” on page 78. When the Collector has detected all dependencies, the “Date/time of last change” field changes very infrequently and, if optional periodic saves are performed, the “Records written last save” field is consistently near zero.

## Displaying Collector statistics for a specified region

You can display statistics for a specified region with the Collector Statistics Menu panel, CIU150.

From the Collector Operations Menu panel, CIU100 (shown in Figure 20 on page 70), type 5 (the action code for Statistics) against a listed CICS APPLID and press Enter. The Collector Statistics Menu panel, CIU150, shown in Figure 21, is displayed.

```
CIU150          CICS Interdependency Analyzer for z/OS - V5R1M0      2012/08/18
                  Statistics Menu for                                12:40:17PM

```

Figure 21. Collector Statistics Menu panel, CIU150

The meaning of each part of the Collector Statistics Menu panel, CIU150, is as follows:

**1** The current state of the Collector on this region (RUNNING, PAUSED, or STOPPED) and the type of data (dependency, affinity, or both) being collected, if any.

### Notes:

1. When you stop the Collector, the CINT state changes to STOPPED only after the Collector has saved the dependency or affinity data.
2. When you pause the Collector, the CINT state changes to PAUSED *before* the Collector saves the data to ensure that the Collector pauses immediately. After the state has changed to PAUSED, you can refresh the data displayed by pressing Enter.

**2** Depending on whether the Collector has been configured to collect dependency data, affinity data, or both on this region, the number of records written to either the dependency VSAM data files, affinity VSAM data files, or both dependency and affinity VSAM data files when data was last saved.

**3** Depending on whether the Collector has been configured to collect dependency data, affinity data, or both on this region, the total number of records in either the dependency VSAM data files, affinity VSAM data files, or both dependency and affinity VSAM data files.

**4** The number of times that the Collector has been paused since the last time that it was started.

**5** The number of times that data has been saved since the last time the Collector was started.

**6** The dates and times when the Collector was last started, data was saved, and a change was made to a dependency or affinity table. The times are shown in the local time and the dates are given in the format specified by the Date and Time options of the Collector Global Options Menu panel, CIU300; see Figure 32 on page 96.

**7** The total times that the Collector has been in the running and paused states since it was last started.

**8** The name and current percentage occupied of the MVS data space being used. This information is not displayed while in STOPPED state.

**9** The keys that select functions to affect the operation of the Collector or to get help information about it. This line displays all possible functions, not all of which are appropriate (or selectable) for a given state of the Collector.

---

## Changing the Collector options

You can control how the Collector operates by changing the options that it uses.

Option values are preserved in the CICS IA control file, CIUCNTL, so that they can be used across separate runs of the Collector. For more information about the control file, see “The control record VSAM file” on page 22.

Running the CINT transaction at one CICS terminal, you can:

- Set region-specific options for a single Collector running on the local, or on a remote, CICS region; see “Specifying region-specific options: region configuration.”
- Set region-specific options for each of multiple Collectors running on different CICS regions; see “Specifying region-specific options: region configuration.” You can set options for all the monitored regions simultaneously, provided that the options are to be set to identical values on each region.
- Set global options that apply to all the Collectors you are running; see “Changing global options” on page 96.

Changes take effect only when the Collector is either restarted, Operations action 6 (**Refresh Run Options**) on screen CIU100 is selected, or the CINT REFRESHOPTIONS transaction is issued.

### Specifying region-specific options: region configuration

Select 2 Configure Region Options from the Collector Main Administration Menu panel, CIU000 . The Collector Region Configuration Menu panel, CIU200 appears.

The Region Configuration Menu contains a list, which might be empty, of CICS regions to be monitored by CICS IA. If more than one CICS region is in the list, you can use the list item named **ALL** which allows you to specify that an operation be applied to all the regions in the list. In addition the list item named **DEFAULTS** allows you to set or change the default values for a specified operation. Initially:

- The values of all the DEFAULTS options are set to the CICS IA system defaults.
- The values of all the Collector region-specific options are set to blanks, which means that you use the DEFAULTS values.

From the Region Configuration Menu panel, you can:

- Add a CICS region to the list of those to be monitored by CICS IA.
- Delete a CICS region from the list of those to be monitored by CICS IA.
- Copy a CICS region and create a new region with the same resource options as the region being copied.
- Call up a further panel to set or modify some region-specific options for one or for all of the regions being monitored; see “Specifying Resource options: region configuration” on page 81.

**Note:**

1. The action codes that you can specify:

**1=Add Region**

On any line, enter the new region APPLID and SYSID in the New Applid and New Sysid fields, respectively. Type 1 in the Act field and press Enter. CICS IA adds the new region to its list of regions to be monitored, giving system default values to all region-specific Collector options for the new region.

**2=Copy Region**

On a line describing an existing region, enter the new region APPLID and SYSID in the New Applid and New Sysid fields, respectively. Type 2 in the Act field and press Enter. CICS IA adds the new region to its list of regions to be monitored, copying the values to all region-specific Collector options from those of the existing region.

### 3=Delete Region

On a line describing an existing region, type 3 in the Act field and press Enter. CICS IA deletes the region from its list of regions to be monitored.

### 4=Options

Displays the Resource Options panel, CIU290, which enables you to select, in further panels, what commands are to be monitored.

2. This item allows you to set or change the default values for your chosen operation. You cannot select DEFAULTS with action codes 2 or 3.
3. If more than one CICS region is listed on the Region Configuration Menu, an extra item appears at the top of the list, with an APPLID and SYSID of **ALL**. This item allows you to specify that the chosen operation is to be applied to all the regions in the list. You cannot select **ALL** with action codes 2 or 3.
4. Each line that contains data represents a CICS region. To perform an action against one of the listed regions, type an action code in its Act field and press Enter.

## Specifying Resource options: region configuration

The Resource Options panel allows you to specify the resource options to modify. To call up this panel, from the general Region Configuration Menu panel, CIU200, type 4 and press Enter.

The Resource Options panel, CIU290, appears.

CIU290

### Note:

1. The action codes that you can specify:

#### 1=General Options

This option allows you to set or modify some region-specific options (for example, which CICS transactions are to be monitored, and whether dependency or affinity data is to be collected) for one or more regions. See “Specifying region-specific options: general” on page 82.

## **2=Time/Date Options**

This option calls up the Time and Date Options panel, CIU280, shown in “Specifying region-specific options: timers” on page 93.

On this panel, you can specify whether or not the timer is to be active during this time period. Specify Y (Yes) or N (No), or to use the default value in the CICS IA control file, specify a blank. When the control file is first created, the system default value is Y (Yes), but you might have modified it since.

## **3=CICS Options for APIs**

This option allows you to set or modify which dependency-related CICS API commands are to be monitored on one or more regions. See “Specifying region-specific options: API and SPI commands to be monitored” on page 86.

## **4=CICS Options for SPIs**

This option allows you to set or modify which dependency-related CICS SPI commands are to be monitored on one or more regions. See “Specifying region-specific options: API and SPI commands to be monitored” on page 86.

## **5=DB2/IMS/MQ/TRUE Options**

This option allows you to set or modify which dependency-related DB2, IMS, MQ commands, and task related user exits are to be monitored on one or more regions. See “Specifying which dependency-related DB2, IMS, MQ commands and TRUEs are to be monitored” on page 90.

## **6=Natural Options**

This option calls up the Natural Options panel, CIU29N, shown in Figure 31 on page 95.

This panel allows the user to configure the collection of data on Adabas and Natural program calls.

## **7=Affinity Options**

This option allows you to set or modify which affinity-related commands are to be monitored on one or more regions. See “Specifying which affinity-related CICS commands are to be monitored” on page 91.

## **8=Application Data**

This option allows you switch Application Data collection on or off and display a selected application for selected region(s).

# **Specifying region-specific options: general**

The Region Configuration Menu panel is used for specifying general region-specific options.

You can use the Region Configuration Menu in these ways:

- To specify CICS IA general region-specific options for a particular CICS region, type action code 4 against the APPLID of the region on the Region Configuration Menu panel, CIU200 (shown in Figure 22 on page 80). Press Enter. Type action code 1 on panel CIU290 and press Enter.
- If more than one CICS region is listed on the Region Configuration Menu, to apply your choices to all the regions type action code 4 against **ALL** at the top of the list on panel CIU200 and press Enter. Type action code 1 on panel CIU290 and press Enter.

- To set or change the default values for the general region-specific options, type action code 4 against **DEFAULTS** on the CIU200 panel and press Enter. Type action code 1 on panel CIU290 and press Enter.

The General Options panel, CIU260, shown in Figure 24, is displayed.

**Note:**

1. If you specified **ALL** on the Region Configuration Menu, the initial values of the fields on the General Options panel are set to those of the first “real” CICS region listed on the Region Configuration Menu; that is, the values are taken from the first region listed after the special **ALL** and **DEFAULT** applids. Both the CICS APPLID and the SYSID are shown as **ALL**.
2. If you specified **DEFAULTS** on the Region Configuration Menu, the initial values of the fields on the General Options panel are the defaults, taken from the CICS IA control file, CIUCNTL. The CICS APPLID is shown as **DEFAULTS** and the SYSID as **DFTS**. Any changes that you make are saved in the control file and become the new default values.

```

Figure 24. Collector General Options panel, CIU260

**1 Data to Collect**

This field is used to specify which type of data you want to collect: affinity data, interdependency data, or both. Use A for affinity, I for interdependency, or B for both affinity and interdependency data. Alternatively, you can use the default value in the CICS IA control file by leaving the field blank. When the control file is first created, the system default value is I for interdependency, but you might have modified it since.

- You can choose to collect interdependency data on one region and affinity data on another.
- You can change the type of data (interdependency or affinity) to be collected on a region while the Collector is running on that region, but changes do not take effect until the Collector is restarted.

The options specified for the Time and Date Options fields will override the value specified for the **Data to Collect** field when they are set to a value other than Y.

## **2 Perform periodic saves**

This field is used to specify whether you want the collected interdependency data, affinity data, or both to be saved to the VSAM data files, if one of these conditions applies:

- More than 300 seconds have passed since the last save.
- More than the number of table elements specified by the **Trigger for CINB start** option have changed since the last save.
- You pause the Collector. (The autosave transaction, CINB, writes the collected data to the data VSAM data files automatically when you stop the Collector.)

You can specify Y or N, or use the default value in the CICS IA control file to specify a blank. When the control file is first created, the system default value is Y (Yes), but you might have modified it since.

## **3 Trigger for CINB start**

Enter the number of records to be updated to trigger a CINB save, in thousands. You can enter a value from 1 - 9999. A value of 1 indicates that no saves will be triggered. The default is 5.

## **4 Restore data on start**

This field is used to specify whether you want data to be restored from the VSAM data files when the Collector is started, which enables newly collected data to be added to the data collected from previous runs of the Collector. If you are gathering data, use one of the following ways:

- For one set of transaction identifiers at a time
- For one set of commands at a time
- For either interdependency data, affinity data, or both
- If the Collector is being run, at varying times

Setting the option is also of particular value if the Collector stops unexpectedly, because you do not have to start collecting data all over again; you can start from the last time data was saved.

You can specify Y or N, or, to use the default value in the CICS IA control file, specify a blank. When the control file is first created, the system default value is Y (Yes), but you might have modified it since.

## **5 Multiple sign-on with same ID**

If your conventions allow more than one user to be signed on to CICS with the same user ID at the same time, set the Multiple sign-on with same ID field to Y. If you do not, the Collector might incorrectly deduce some affinity lifetimes and create erroneous affinity transaction groups. You also set the field to Y for conventions where more than one user is simultaneously not signed on; that is, they all take the default user ID CICSUSER.

Also, if you are running the Collector in an AOR, the user IDs examined depend on whether the user ID is propagated from the TOR or derived from the SESSION and CONNECTION resource definitions. In the latter case, set the multiple sign-on option to Y if your conventions allow the same AOR user IDs to be signed on to CICS at the same time.

It is very important that this option is set correctly. If you are about to start a new run of the Collector, and intend to restore data from the affinity data VSAM files, ensure that this option is the same as that used in the previous run of the Collector, for which affinity data is to be restored.

You can specify Y or N or, to use the default value in the CICS IA control file, specify a blank. When the control file is first created, the system default value is N (No), but you might have modified it since.

## **6 Maintain usage counts**

This field is used to specify whether the Collector will record the number of times an interdependency or affinity is detected. The usage count tells you how often resources are used by different applications.

If usage data is not required, switch it off. When usage counts are not maintained, the Collector does not have to update an interdependency or affinity record each time it detects an interdependency or affinity that it has already seen. Hence, when the Collector has been running for some time, and it is detecting fewer and fewer new interdependencies or affinities, fewer and fewer records will be saved to VSAM. Thus, you have a useful test for the completeness of the set of detected interdependencies or affinities.

You can specify Y or N, or, to use the default value in the CICS IA control file, specify a blank. When the control file is first created, the system default value is Y (Yes), but you might have modified it since.

## **7 Size of data space**

The size, in megabytes, that you specify for the data space to store the collected data. The size of the data space is fixed for a run of the Collector.

For information about calculating the size of the data space, refer to Appendix F, “CICS IA space considerations,” on page 347.

If the data space becomes full while the Collector is running, the Collector stops with abend code IUXB. If the Collector was saving data at the time, a delay might occur from the time the data space becomes full until the time the Collector stops.

The default value is 16.

## **8 Transid prefix**

The 1- to 4-character prefix of the CICS transactions for which you want to gather interdependency or affinity data. If you do not specify any characters, data is collected for all transactions. If you specify a valid prefix (for example, ABC), data is collected only for those transactions with identifiers starting with the prefix. If you specify a blank, the default transid prefix in the CICS IA control file is used.

## **9 Program exclude list**

The 1- to 8-character name of a table containing a list of 1- to 8-character program prefixes. Data is not collected for any program with a name beginning with any of the prefixes. If you specify a blank, the default table name in the CICS IA control file is used. The system default name is CIUXPROG, which is the name of an exclude list supplied with I. For information about how to create your own program exclude lists, see “Creating your own program exclude, transaction exclude, and resource prefix lists” on page 51.

#### **10 Transaction exclude list**

The 1- to 8-character name of a table containing a list of 1- to 4-character transaction prefixes. Data is not collected for any transaction with the name beginning with any of the prefixes. If you specify a blank, the default table name in the CICS IA control file is used. The system default name is CIUXTRAN, which is the name of an exclude list supplied with CICS IA. For information about how to create your own transaction exclude lists, see “Creating your own program exclude, transaction exclude, and resource prefix lists” on page 51.

#### **11 Resource prefix list**

The 1- to 8-character name of a table containing a list of 1- to 32-character resource prefixes. The resource prefix is used to scan a resource name. If a match is found, the remainder of the resource name is replaced by “+”s. For example, if your application program uses a TSQueue or ENQ/DEQ resource name, which consists of a 3-character prefix “DFH” and a 5-character numerical value, and if you do not have an entry in the resource prefix list for “DFH”, CICS IA records an entry for the EXEC CICS command with all the possible TSQueue resource names: DFH00001, DFH00002, DFH00003... DFHnnnnn. This redundancy might lead to many thousand entries for the same EXEC CICS command. If the “DFH” prefix is added to the list, CICS IA reports only one entry for the EXEC CICS command with a resource name of DFH+++++. The system default name CIUPFXTB is the name of a resource prefix list supplied with CICS IA. For information about how to create your own resource prefix lists, see “Creating your own program exclude, transaction exclude, and resource prefix lists” on page 51. See also “ENQ/DEQ” on page 203 and “TS commands” on page 204 to learn about these resources.

#### **12 TRUEs include list**

The 1- to 8-character name of a table containing a list of TRUE names and corresponding to these TRUEs product names. Data is collected for any pair of a TRUE and product name from this list. If you specify a blank, the default table name in the CICS IA control file is used. The system default name is CIUXITTB, which is the name of an include list supplied with CICS IA.

#### **13 Dump HLQ**

This field is used to define the high-level qualifier for CICS IA dump data set that will be produced.

#### **14 Dynamic call**

This field is used to specify whether you want the dynamic calls to be detected. Specify Y (Yes) or N (No). The default value is Y. Specifying Y (Yes) might result in an increase in the performance cost while collecting data. If you are aware that your environment or your application does not perform dynamic program calls, specify N (No).

#### **14 Help**

Pressing F1 for help does not save any changes made; you must press the Enter key to save changes.

## **Specifying region-specific options: API and SPI commands to be monitored**

Use the Region Configuration Menu panel CIU200 to specify the API and SPI commands to be monitored.

These two types of dependency-related CICS commands can be collected:

- To specify which API commands are to be monitored on a particular CICS region, type action code 3 at the top of the Resource Options panel, CIU290, shown in Collector Resource Options panel, CIU290.. Press Enter.  
The CICS Resources Options panel, CIU240, shown in Collector Resource Options panel, CIU290, is displayed.
- To specify which SPI commands are to be monitored on a particular CICS region, type action code 4 at the top of the Resource Options panel, CIU290, shown in Collector Resource Options panel, CIU290.. Press Enter.  
The CICS Resources Options panel, CIU245, shown in CICS(r) Resources Options panel, CIU245, is displayed.

**Note:**

1. If you specified **ALL** on the Region Configuration Menu, the initial values of the fields on the CICS Resources Options panel are set to those of the first “real” CICS region listed on the Region Configuration Menu; that is, the values are taken from the first region listed after the special **ALL** and **DEFAULT** applids. Both the CICS APPLID and the SYSID are shown as ALL.
2. If you specified **DEFAULTS** on the Region Configuration Menu, the initial values of the fields on the CICS Resources Options panel are the defaults, taken from the CICS IA control file, CIUCNTL. The CICS APPLID is shown as DEFAULTS and the SYSID as DFTS. Any changes that you make are saved in the control file and become the new default values.

If you are editing the DEFAULTS record, you must specify Y or N in each field. You cannot specify a blank.

```

Figure 25. Collector CICS Resources Options panel, CIU240

**1 Detect command types**

This option determines whether the Collector is to monitor each of the types of dependency-related API command listed. For each type of API command that you want the Collector to monitor, type Y. For each type of API command that you do not want the Collector to monitor, type N or, to use the default value in the CICS IA control file, specify a blank. When the control file is first created, the system default value for each command is Y (Yes), but you might have modified it since.

**Note:** If you are editing the DEFAULTS record, you must specify Y or N in each field. You cannot specify a blank.

## 2 APIs

The groups of CICS API commands that can be monitored.

The commands are listed by groups on the panel. The individual API commands that make up each group are listed in Dependency-related CICS API commands detected by the CICS Interdependency Analyzer. The individual EXEC CICS FEPI commands that make up the FEPI API group are listed in “CICS FEPI API commands” on page 200.

**Note:** When collecting Command Flow data for CICS TS V2.2 or earlier, set the TD Queues option to N so that CICS IA collects the Transient Data queue commands correctly. If the TD Queue flag is not set to N, the results are unpredictable.

## 3 D=Yes+Detail option

You can use option D only for the API types marked with an asterisk.

CIU245 CICS Interdependency Analyzer for z/OS - V5R2M0 2013/10/21

Figure 26. Collector CICS Resources Options panel, CIU245

## 1 Detect command types

This option determines whether the Collector is to monitor each of the types of dependency-related SPI command listed. For each type of SPI command that you want the Collector to monitor, type Y. For each type of SPI command that you do not want the Collector to monitor, type N or, to use the default value in the CICS IA control file, specify a blank. When the control file is first created, the system default value for each command is Y (Yes), but you might have modified it since.

**Note:** If you are editing the DEFAULTS record, you must specify Y or N in each field. You cannot specify a blank.

## 2 SPIs

The groups of CICS SPI commands that can be monitored.

The individual SPI commands that make up each group are listed in “CICS SPI commands” on page 189. The individual EXEC CICS FEPI commands

that make up the FEPI SPI group are listed in Dependency-related CICS FEPI SPI commands detected by the CICS Interdependency Analyzer.

### 3 D=Yes+Detail option

You can use option D only for the SPI types marked with an asterisk.

If you are going to run the threadsafe report you must collect Detailed information for Programs and Files, select **D** for **Programs and Files**.

For more information about restrictions affecting the monitoring of commands that might cause dependencies or affinities, see “What is not monitored” on page 17 and Appendix A, “Details of dependencies and affinities collected,” on page 181.

## Specifying region-specific options: Application data collection

You can configure the collection of CICS TS Application data associated with programs and other CICS TS Resources from the Application Data Collection Options screen.

1. If you specified **ALL** on the Region Configuration menu the initial value of the **Enable collection of Application Data** field on the Application Data Collection Options screen is set to the first CICS region listed on the Region Configuration menu. That is, the value of the first region listed after the special ALL and DEFAULTAPPLIDs. Both the CICS APPLID and the SYSID are shown as ALL. Selected Application is not displayed in this mode.
2. If you specified **DEFAULTS** on the Region Configuration menu the initial values of the fields on the Application Data Collection Options screen are the defaults, taken from the CICS IA control file, CIUCNTL. The CICS APPLID is shown as **DEFAULTS** and the SYSID as **DFTS**. Any updates are saved in the control file and become the new default values. If you are editing the DEFAULTS record, you must specify **Y** or **N**, you cannot leave a blank.

To call up this screen, from the Resource Options screen, CIU290, type action code 8, and press Enter. The Application Data Collection Options screen, CIU210, is displayed:

```
CIU210          CICS Interdependency Analyzer for z/OS - V5R1M0      2012/08/30
                  Application Data Collection Options                  03:28:35PM

Type Collection Option then press ENTER :

Enable collection of Application Data: Y  1

Selected Application:  2
NAME: CICS_TS_SAMPLE_APPLICATION
VERSION: 2.4.1

CICS Sysid: T51B   CICS Applid: IYDZT51B   TermID: TC10

F1=Help   F2=          F3=Save&Exit  F4=          F5= Refresh  F6=
F7=       F8=          F9=          F10=         F11=         F12=Cancel
```

Figure 27. Application Data Collection Options screen, CIU210

**Note:**

### **1 Enable collection of Application Data**

- Enter Y (Yes) to capture application associated data within your CICS region or regions.
- If you are editing the DEFAULTS record, you must specify Y or N. You cannot specify a blank.
- If this option is N (NO), selected application is still displayed, but Application Data is not collected.

### **2 Selected Application**

- Displays Application selected in CICS IA plug-in for CICS Explorer. If no Applications are selected the value is set to ALL.
- You cannot change the selected application from this screen.

## **Specifying which dependency-related DB2, IMS, MQ commands and TRUEs are to be monitored**

Use the Resource Options panel CIU290, to specify which dependency related commands are monitored.

To specify whether dependency-related DB2, IMS, MQ, and RMI TRUE commands are to be monitored on a particular CICS region, type action code 5 at the top of the Resource Options panel CIU290, as shown in Collector Resource Options panel, CIU290, and press Enter.

The following panel DB2/MQ/IMS/RMI True Resources Options panel, is displayed.

#### **Note:**

1. If you specified **ALL** on the Region Configuration Menu, the initial values of the fields on the DB2/MQ/IMS/RMI True Resources Options panel are set to those of the first “real” CICS region listed on the Region Configuration Menu; that is, the values are taken from the first region listed after the special ALL and DEFAULT applids. Both the CICS APPLID and the SYSID are shown as ALL .
2. If you specified DEFAULTS on the Region Configuration Menu, the initial values of the fields on the DB2/MQ/IMS/RMI True Resources Options panel are the defaults, taken from the CICS IA control file, CIUCNTL. The CICS APPLID is shown as DEFAULTS and the SYSID as DFTS. Any changes that you make are saved in the control file and become the new default values.

If you are editing the DEFAULTS record, you must specify Y or N in each field. You cannot specify a blank.

Figure 28. Collector DB2/MQ/IMS/RMI True Resource Options panel, CIU250

**Note:**

**1 Detect command types**

This option is used to specify whether or not the Collector is to monitor each of the types of commands listed. For each type of command that you want the Collector to monitor, type **Y**. For each type of command that you do not want the Collector to monitor, type **N**, or, to use the default value in the CICS IA control file, specify a blank. When the control file is first created, the system default value is **N** (No), but you might have modified it since.

The individual commands that make up each of the DB2, MQ, and IMS groups are listed in “Non-CICS API commands detected” on page 201. You cannot select a subset of commands within a group.

If you are editing the DEFAULTS record, you must specify **Y** or **N** in each field. You cannot specify a blank.

For more information about restrictions affecting the monitoring of commands that might cause dependencies, see “What is not monitored” on page 17.

**2 DB2 Options: Collect resource name**

Enter a value of **Y** for YES and **N** for NO. If set to YES, the SYSIBM.SYSPACKSTMT and SYSIBM.SYSSTMT tables are queried to obtain further information. The default is **Y**.

# Specifying which affinity-related CICS commands are to be monitored

Use the Resource Options panel CIU290 to specify which affinity related commands are to be monitored.

To specify which affinity-related CICS commands are to be monitored on a particular CICS region, type action code 8 at the top of the Resource Options panel, CIU290, shown in Figure 23 on page 81, and press Enter.

The CICS Affinities Options panel, CIU270, shown in Figure 29, is displayed.

**Note:**

1. If you specified **ALL** on the Region Configuration Menu, the initial values of the fields on the CICS Affinities Options panel are set to those of the first “real” CICS region listed on the Region Configuration Menu; that is, the values are taken from the first region listed after the special ALL and DEFAULT applids. Both the CICS APPLID and the SYSID are shown as ALL .
2. If you specified **DEFAULTS** on the Region Configuration Menu, the initial values of the fields on the CICS Affinities Options panel are the defaults, taken from the CICS IA control file, CIUCNTL. The CICS APPLID is shown as DEFAULTS and the SYSID as DFTS. Any changes that you make are saved in the control file and become the new default values.

If you are editing the DEFAULTS record, you must specify **Y** or **N** in each field. You cannot specify a blank.

**1 Detect affinity types**

This option is used to specify whether or not the Collector is to monitor each of the types of affinity-related command listed. For each type of command that you want the Collector to monitor, type Y. For each type of command that you do not want the Collector to monitor, type N, or use the default value in the CICS IA control file, specify a blank. When the control file is first created, the system default value is Y **Yes**, but you might have modified it since. If you are editing the DEFAULTS record, you must specify Y or N in each field. You cannot specify a blank.

**2 Inter-transaction**

This group of CICS commands can cause inter-transaction affinities.

### 3 Transaction-system

This group of CICS commands can cause inter-system affinities.

## Specifying region-specific options: timers

A timer controls the times and dates at which dependency data, affinity data, or both are collected in a CICS region.

After the Collector is started, the timer automatically pauses and resumes data collection at specified times. You can override the actions of the timer: see “Pausing the collection of data” on page 74 and “Resuming the collection of data” on page 75. However, the timer continues to operate and to pause and resume the collection of data at the specified times.

The timer does not pause or resume data collection exactly on the hour when data is being collected on multiple regions, to minimize contention for shared resources.

Do one of the following:

- To specify CICS IA the Time and Date options for a particular CICS region, type action code 4 against the APPLID of the region on the Region Configuration Menu panel, CIU200, shown in Figure 22 on page 80. Press Enter. Then type action code 2 on panel CIU290 and press Enter.
- If more than one CICS region is listed on the Region Configuration Menu, to apply your choices to all the regions type action code 4 against **ALL** at the top of the list on panel CIU200 and press Enter. Type action code 2 on panel CIU290 and press Enter.
- To set or change the default values for the Time and Date options, type action code 4 against **DEFAULTS** on the CIU200 panel and press Enter. Then type action code 2 on panel CIU290 and press Enter.

The Time and Date Options screen, CIU280, shown in Figure 30 on page 94, is displayed.

- If you specified **ALL** on the Region Configuration Menu, the initial values of the fields on the Time and Date Options panel are set to those of the first “real” CICS region listed on the Region Configuration Menu; that is, the values are taken from the first region listed after the special **ALL** and **DEFAULTS** applids. Both the CICS APPLID and the SYSID are shown as **ALL**.
- If you specified **DEFAULTS** on the Region Configuration Menu, the initial values of the fields on the Time and Date Options panel are the defaults, taken from the CICS IA control file, CIUCNTL. The CICS APPLID is shown as **DEFAULTS** and the SYSID as **DFTS**. Any changes that you make are saved in the control file and become the new default values.

If you are editing the **DEFAULTS** record, you cannot specify a blank for any of the slots.

F7=	F8=	F9=	F10=	F11=	F12=Cancel

Figure 30. Collector Time and Dates Options screen, CIU280

The Hour slots and Month, Day, and Week slots are used to specify whether or not the timer is to be active during this time period and what type of data to collect. When the control file is first created, the system default value for all of the slots is Y (Yes), but you might have modified it since.

**1 Hour of day**

Specify the type of data to collect or specify a blank, to use the default value in the CICS IA control file. The types of data values are as follows:

- A, collect Affinity data
- B, collect both Affinity and Interdependency data
- I, collect Interdependency data
- N, do not collect data
- Y, collect data as specified by the **Data to Collect** value on the General Options panel

**2 Day of week**

Specify Y (Yes) or N (No), or specify a blank to use the default value in the CICS IA control file.

**3 Day of month**

Specify Y (Yes) or N (No), or specify a blank to use the default value in the CICS IA control file.

**4 Month of year**

Specify Y (Yes) or N (No), or specify a blank to use the default value in the CICS IA control file.

**Note:** If you are editing the **DEFAULTS** record, you cannot specify a blank for any of the slots.

**Example:**

You want the Collector to run every Monday between 1 and 2 a.m. for the next year collecting affinity data. Set 1-2 to A and all the other Hour of day slots to N. Set Mon to Y and all of the other Day of week slots to N. Set all the Day of month and Month of year slots to Y.

## Specifying Natural options

The Natural Options screen allows you to configure the collection of data on Adabas and Natural program calls.

### Note:

1. If you specified “ALL” on the Region Configuration Menu, the initial values of the fields on the Natural Options screen are set to those of the first “real” CICS region listed on the Region Configuration Menu; that is, the values are taken from the first region listed after the special “ALL” and “DEFAULT” applids. Both the CICS APPLID and the SYSID are shown as “ALL” .
2. If you specified “DEFAULTS” on the Region Configuration Menu, the initial values of the fields on the Natural Options screen are the defaults, taken from the CICS IA control file, CIUCNTL. The CICS APPLID is shown as “DEFAULTS” and the SYSID as “DFTS”. Any changes that you make are saved in the control file and become the new default values.

If you are editing the DEFAULTS record, you must specify Y or N in each field. You cannot specify a blank.

To call up this screen, go to the Resource Options screen, CIU290, type action code 6, and press Enter. The Natural Options screen, CIU29N, looks as follows:

CIU29N

CICS Interdependency Analyzer for z/OS - V5R1M0

Figure 31. Collector Natural Options screen, CIU29N

### **1** ADABAS Calls

Enter Y (Yes) to capture ADABAS calls within your Natural CICS environment.

**Note:** If you are editing the DEFAULTS record, you must specify Y or N in each field. You cannot specify a blank.

## 2 Program Calls

Enter Y (Yes) to capture Natural program calls within your Natural CICS environment.

**Note:** If you are editing the DEFAULTS record, you must specify Y or N in each field. You cannot specify a blank.

## Changing global options

Use the Global Options Menu panel to modify the Collector global options.

Select 3 Configure Global Options from the Collector Main Administration Menu panel, CIU000 (shown in Figure 15 on page 62). The Collector Global Options Menu panel, Figure 32, is displayed. From this panel, you can set or modify the following global options that apply to all the regions being monitored:

- Whether VSAM file sharing is to be used
- Whether high-level tracing is on or off
- Whether CICS TS tracing is on or off

Figure 32. Collector Global Options Menu panel, CIU300

**Note:**

### 1 VSAM file sharing

This option is used to specify whether the Collector is to save the dependency and affinity data for all monitored CICS regions to a single set of VSAM files that you have shared between regions using either VSAM RLS or function shipping, or to multiple separate, region-specific, sets of files. Type Y or N. The default is N (No), data will be saved in separate sets of files.

To control the operation of multiple instances of the Collector, running on different regions, from a single CICS terminal, set this option to Y.

## **2 High Level Trace**

This option is used to specify whether the high-level trace is to be turned on for the Collector. Type 1, 2, or 3 to specify which level of trace points you want to collect, or type N to turn off this option. The default is N (No), trace is turned off.

The CICS IA trace points are of the following types:

- The points of level 1 are included in CICS IA modules at the entry and exit of a module.
- The points of level 2 are included in CICS IA modules in all other cases.
- The points of level 3 are included in GLUE or TRUE.

You can set this levels through the CINT transaction.

## **3 Restore Trace flags**

This option is used to specify whether to restore Trace flags values after a CICS IA stop. Type Y or N. The default is N (No), trace is turned off.

## **4 National Language Option**

The 1-character code for the National Language to be used by CICS IA. The possible values are as follows:

- |          |   |
|----------|---|
| <b>E</b> | US English.   |
| <b>K</b> | Japanese. For Japanese to be displayed, the terminal must be configured with the CICS SOSI attribute. |

## **5 Date and Time Formats**

To set the date format to be used by CICS IA, type the corresponding number (1 - 4) in the Date field. The default is 4. Type the separator character to be used in dates (for example, / or -) in the Date Separator field. The default character is “/”.

To set the time format to be used by CICS IA, type the corresponding number (1 for 12-hour clock format or 2 for 24-hour clock format) in the Time field. The times are shown in the local time. The default is 1. Type the separator character to be used in times in the Time Separator field. The default character is “:”.

---

# **Managing the Command Flow collection using transaction CINC**

You can manage the Command Flow data collection with the aid of the User Command Flow Utility, which helps you to create new configurations of the Command Flow data collection options, change or define parameters of the configurations that already exist, and display statistics about data collection.

## **Displaying the CICS IA Command Flow Options panel**

With the CICS IA Command Flow Options panel you can control the Command Flow data collection.

## About this task

You can use the CICS IA Command Flow Options panel to perform the following tasks:

- Start and stop the collection of the Command Flow data in the selected region or regions.
- Submit the batch jobs for loading some predefined data sets (GDG, CSV) and DB2 tables, or flushing data sets (LogStream). **(This option is reserved for future use.)**
- Configure the initial part of the Command Flow data collection options.
- Show information about the current state of the CINC collector.
- Show the start (and stop) date and time of the last data collection and last Command Flow data loading into GDG. **(This option is reserved for future use.)**
- Display the CICS IA Command Flow ApplID list panel, CIUA02, which helps you to configure the second part of the Command Flow data collection options.
- Display the CICS IA User Command Flow Statistics panel, CIUA03, which helps you to view the Command Flow data statistics for all the regions from the user's regions configuration.
- Display the CICS IA Command Flow Application Data Collection panel, CIUA0A, to view or change the Application Data collection options.

## Procedure

1. At a CICS terminal, type the transaction identifier CINC.
2. Press Enter. Panel CIUA01 is displayed; see Figure 33.

Figure 33. Command Flow Options panel, CIUA01

The meaning of each part of the CICS IA Command Flow Options panel, CIUA01, is as follows:

**1** The 8-character APPLID of the CICS region on which the CICS IA Command Flow Utility is running.

**2** The current state of the Command Flow data collection process on all the regions for the user's regions configuration:

**RUNNING**

The Command Flow Collector is running on all the regions.

**PARTLY STA**

The Command Flow Collector is running on some of the regions.

**STOPPED**

The Command Flow Collector is stopped on all the regions

**START FAIL**

An error was detected during the Command Flow Collector start process.

**STOP FAIL**

An error was detected during the Command Flow Collector stop process.

**INCOMPLETE**

The Command Flow start (or stop) process was not completed. Press F6 (stop) to reset this status.

**NO APPLIDS**

The Command Flow APPLID list is empty.

**3** The date and time when the Command Flow data collection process was last started. The time shown is the local time, and the date is given in the format specified by the Global Options Menu panel of the CINT transaction.

**4** The date and time when the Command Flow data collection process was last stopped. The time shown is the local time, and the date is given in the format specified by the Global Options Menu panel of the CINT transaction.

**5** The name of the Command Flow trace that is to be captured.

**6** The user identifier associated with CICS transactions, for which you want to collect the Command Flow data.

**Note:** Wildcard \* is not allowed in the user ID field. The CICS IA Command Flow utility allows you to capture CICS, DB2, MQ, and IMS commands in a chronological order for one or more transactions. You can capture information for you given transaction or transactions. You can also individually load and view the data that you have captured.

**7** The terminal identifier associated with CICS transactions, for which you want to collect the Command Flow data.

**8** The list of transaction identifiers, for which you want to collect the Command Flow data. You can enter up to five transaction IDs and you can use wildcard characters.

**9** The names for program and transaction exclude lists that are to be used by command flow collector. The exclude list format is the same with Dependency/Affinity collector (CINT). If the transaction name in the list of collected transactions does not contain wildcards, the transaction exclude list will not be applied to it.

**10** The journal name for trace data. The length of the name can be up to 8 characters. The default journal name is CIUMTJNL.

**11** The LAST, USER or CFID criteria:

- LAST specifies that the CIUJLCPY job must copy Command Flow records collected at the last Command Flow run.
- USER specifies that the CIUJLCPY job must copy all the Command Flow records for the USER.
- CFID specifies that the CIUJLCPY job must copy the Command Flow records that were collected for a specified Command Flow ID.

**12** The 8-character user modifiable exit name that you can use to add data to a user Command Flow records.

**13** Capturing the dynamic calls. Specify Y (Yes) or not N (No). The default value of this field is Y.

**14** The number of CICS tasks processed before stopping the collector. The default value of this field is 0. This value is used to indicate that there is no limit to the number of tasks for which command flow data is collected.

**15** The number of CICS IA journal records collected before stopping. The default value of this field is 0. This value is used to indicate that there is no limit to the number of journal records collected.

**16** The control keys that you can use to select functions that control the operation of the CICS IA User Command Flow Utility and provide help information about it. Actions are summarized in Table 16.

*Table 16. The User Command Flow Utility control keys on the Command Flow Options panel*

Action	Function key
Getting help information about the CICS IA User Command Flow Utility.	F1
Starting the Command Flow data collection. The data collecting is started for all the CICS regions from the user's regions configuration of the CICS IA User Command Flow Utility. All the changed user command flow options are saved.	F5
Stopping collecting Command Flow data on all the CICS regions from the user regions configuration.	F6
Displaying the statistics of the Command Flow data collection on all the CICS regions from the user's regions configuration. (The CICS IA User Command Flow Statistics panel, CIUA03, is displayed.)	F7
Accessing to the second part of the Command Flow options in order to view or change it. (The CICS IA Command Flow ApplID list panel, CIUA02, is displayed.) This function does not preserve the Command Flow options changes made on the CIUA01 panel.	F4
Saving all the changed Command Flow options and returning to CICS. <b>Note:</b> The changes of the Command Flow options are rejected if the Command Flow Collector is running.	F3
Saving all the changed Command Flow options without returning to CICS. <b>Note:</b> The changes of the Command Flow options are rejected if the Command Flow Collector is running.	Enter

Table 16. The User Command Flow Utility control keys on the Command Flow Options panel (continued)

Action	Function key
Returning to CICS without saving any changed Command Flow options.	F12
Accessing Application Data collection options in order to view or change them. The CICS IA Command Flow Application Data Collection panel, CIUA0A, is displayed. <b>Note:</b> This function does not preserve the Command Flow options changes made on the CIUA01 panel.	F10

**17** Accessing Application Data collection options to view or change them. (The CICS IA Command Flow Application Data Collection panel, CIUA0A, is displayed.) This function does not preserve the Command Flow options changes made on the CIUA01 panel.

#### Notes:

- a. Multiple users on the same CICS region can use the CICS IA Command Flow Utility concurrently. The current state of the CINC collector represents personal working status of the Command Flow data collection process for every user associated with the CINC transaction. The information about the current state includes working status itself (running or stopped) and the date and time when the Command Flow data collection process was last started by a user. **(This option is reserved for future use.)**
- b. You can start the collection of the Command Flow data only when the current state of the CINC collector is stopped for you. The type of the data collected depends on what you have specified for the Command Flow options on the CICS IA Command Flow Options and CICS IA Command Flow ApplID list panels.
3. Press F3 (or F12) to close the CICS IA Command Flow Options panel. Closing the panel does not affect the state of the CINC collector.

## Displaying the CICS IA Command Flow ApplID list panel

With the CICS IA Command Flow ApplID list panel you can modify the advanced command flow data collection options.

### About this task

You can use the CICS IA Command Flow ApplID list panel to configure the second part of the Command Flow data collection options.

### Procedure

1. Press F4 on the CICS IA Command Flow Options panel, CIUA01. The CICS IA Command Flow ApplID list panel, CIUA02, is displayed. See Figure 34 on page 102.

Figure 34. Command Flow ApplID list panel, CIUA02

The meaning of each part of the CICS IA Command Flow ApplID list panel, CIUA02, is as follows:

- 1** The 8-character APPLID of the CICS region on which the CICS IA Command Flow Utility is running.
- 2** The list of CICS APPLIDs, for which you want to collect the Command Flow data. User can enter up to 15 APPLIDs.
- 3** The control keys that you can use to select functions that control the operation of the CICS IA User Command Flow Utility or provide help information about it. Actions are summarized in Table 17.

Table 17. The User Command Flow Utility control keys on the Command Flow ApplID list panel

Action	Function key
Getting help information about the CICS IA User Command Flow Utility.	F1
Saving all the changed Command Flow options and returning to the CICS IA Command Flow Options panel, CIUA01. <b>Note:</b> The changes of the Command Flow APPLID list are rejected if the Command Flow Collector is running.	F3
Saving all the changed Command Flow options without returning to the CICS IA Command Flow Options panel, CIUA01. <b>Note:</b> The changes of the Command Flow APPLID list are rejected if the Command Flow Collector is running.	Enter
Returning to the CICS IA Command Flow Options panel (CIUA01) without saving any changed Command Flow options.	F12
Getting the list of available CICS regions (Prompt for Regions).	F4
Delete the selected region from the ApplIDs list (Delete).	F5

**Note:** With the CICS IA Command Flow ApplID list panel you can set up your own regions configuration. This panel contains the list of CICS APPLIDs (up to 15 regions) that are to be monitored by the Command Flow Utility. You can form this list by using the **Prompt for Regions** function (F4 key), and the Delete function (F5 key).

2. Press F3 (or F12) to close the CICS IA Command Flow ApplID list panel and return to the CICS IA Command Flow Options panel, CIUA01. Closing the panel does not affect the state of the CINC collector.

## Displaying the CICS IA Command Flow Application data collection panel

With the Command Flow Application data collection panel you can configure collection of CICS TS Application data associated with programs and other CICS TS Resources.

### About this task

You can use the Command Flow Application data collection panel to switch the Application Data collection feature of CICS IA Command Flow Collector ON and OFF. This screen also displays application selected for collection in CICS IA plug-in for CICS Explorer

Press F10 (Applications) on the Command Flow Application data collection panel, CIUA0A is displayed.

```
CIUA0A      CICS IA Command Flow Application Data Collection      ApplID IYDZT51B

Type Collection Option then press ENTER :

Enable collection of Application Data: Y  1

Selected Application:  2
ALL.

F1=Help    F2=          F3=Save&Exit  F4=          F5= Refresh  F6=
F7=        F8=          F9=          F10=         F11=         F12=Cancel
```

Figure 35. Command Flow Application Data Collection panel, CIUA0A

### Note:

#### **1** Enable collection of Application Data

- Enter Y (Yes) to capture application associated data within your CICS region(s).

- If this option is N (NO), the selected application is still displayed but the Application Data is not collected.

**2 Selected Application**

- Displays Application selected in IA plug-in for CICS Explorer. If no Applications selected, its value will be set to ALL.
- It is not possible to change selected application from this screen.

## Displaying CICS IA Command Flow Statistics panel

With the CICS IA Command Flow Statistics panel you can monitor all the regions that you have specified in your own regions configuration.

### About this task

You can use the CICS IA Command Flow Statistics panel to display statistics for all of the specified regions from your regions configuration.

### Procedure

1. Press F7 (Statistics) on the CICS IA Command Flow Options panel, CIUA01. The CICS IA Command Flow Statistics panel, CIUA03, is displayed. See Figure 36.

CIUA03	CICS IA Command Flow Statistics			<b>1</b> ApplID IYDZZ41A
CICS ApplID	CICS SysID	Records written	Collector/Region state <b>2</b>

Figure 36. CICS IA Command Flow Statistics panel, CIUA03

The meaning of each part of the CICS IA User Command Flow Statistics panel, CIUA03 is as follows:

- 1** The 8-character APPLID of the CICS region on which the CICS IA Command Flow Utility is running.
- 2** Table of Command Flow statistics:
  - Details in the CICS ApplID and CICS SysID columns represent the user regions configuration.
  - Details in the Record written represent the total number of Command Flow records written to a user journal for each region during the most recent period of data collection.
  - The status of the Command Flow collector in the region.
- 3** The control keys that you can use to select functions that control the operation of the CICS IA User Command Flow Utility or provide help information about it. Actions are summarized in Table 18 on page 105.

Table 18. The User Command Flow Utility control keys on the User Command Flow Statistics panel

Action	Function key
Getting help information about the CICS IA User Command Flow Utility.	F1
Returning to the CICS IA Command Flow Options panel, CIUA01.	F3 or F12
Redisplaying the CICS IA User Command Flow Statistics panel, CIUA03	Enter

- Press F3 (or F12) to close the CICS IA User Command Flow Statistics panel and return to the CICS IA Command Flow Options, CIUA01. Closing the panel does not affect the state of the CINC collector.

## Displaying the list of available CICS regions

You can use the list of available CICS regions to select the regions that you want to monitor.

### About this task

You can use this panel to select the APPLID from the list of available regions for your Command Flow configuration. The selected APPLID is transferred to the CICS IA Command Flow ApplID list panel, CIUA02. You can iteratively select up to 15 APPLIDs.

### Procedure

- Press F4 (Prompt for Regions) on the CICS IA Command Flow ApplID list panel, CIUA02. The list of available CICS regions, CIUA04, is displayed. See Figure 37.

Returning to the CICS IA Command Flow ApplID list panel, CIUA02, without getting any selected CICS APPLIDs.	F12
Displaying the CIUA04 panel again.	Enter

**Note:** The list of available CICS regions panel displays up to 60 regions.

- Press F3 (or F12) to close the list of available CICS regions and return to the CICS IA Command Flow ApplID list panel, CIUA02. Closing the panel does not affect the state of the CINC collector.

---

## Operating CICS IA Collection from the CICS IA Explorer plug-in

In CICS IA V3.2, you can manage data collection not only with the CINT transaction, but also with the CICS IA Explorer plug-in.

The CINT transaction enables you to configure CICS IA to manage multiple regions. To do this, you need to:

- Share the CIUCNTL control file. For details, see Creating VSAM files.
- Define the CONNECTION and SESSION resources between the controlling CICS region and the regions you want to manage.

In CICS IA V3.2, you can use the CICS IA Explorer plug-in to operate the dependency and affinity data collection. You can START, STOP, PAUSE, CONTINUE, and REFRESH the collection. You can also operate and administer the Command Flow feature by *userid*.

To be able to administer data collection tasks with the Explorer plug-in, define further resources to the region, from which you want to manage CICS IA. Since CICS IA uses Atomservices resources to ensure seamless interaction between the components, your controlling region must be at CICS TS 4.1 or above.

**Note:** This requirement is critical for the controlling region only. For the regions you want to manage previous versions of CICS TS will suffice.

In the configuration EXEC, you need to configure the selected region to include the above mentioned resources.

Explorer Plugin variables:

```
CICS IA CONTROL REGION . . . . . ____ (YES or NO)
URI PATH . . . . . /CICSIA/IBM/atom/ciuiatom/*
TCP IP PORT . . . . . ____
ATOM CONFIG FILE LOCATION . . . . . ____
```

1  
2  
3  
4

Figure 38. Configuring Explorer plug-in variables

**Note:**

1. Select YES to change the region status to controlling.
2. Specify a URI PATH. The default path name is /CICSIA/IBM/atom/ciuiatom/\*.
3. Specify the TCP/IP port number.
4. Specify the Atom Configuration file location. The default value is @pathprefix@/usr/lpp/cicsia/@ciuver@. This will be concatenated with IBM/atomservices/config/CIUATM01 to provide the HFS location of the configuration file used by the CICS IA Atomservice. The @pathprefix@ and @ciuver@ are variables chosen during the SMPE install jobs CIUIHFS0, CIUIHFS1, and CIUMKDIR.

Once you have run the configuration for the controlling region, you need to define the configured resources to CICS. For details, see Defining resources to CICS.

Your controlling region should now be ready to enable CICS IA tasks administration from the Explorer plug-in. For more information on configuring the CICS IA Explorer plug-in, refer to the its built-in HELP.

---

## Chapter 5. Updating the Dependency and Affinity database objects

The Dependency database objects contain accumulated data about your applications and the resources that they use. Update the database objects regularly to add new information recorded by the Collector in the VSAM dependency files.

The Affinity database objects contain accumulated data about your applications and the potential affinities that might affect them. Update the database objects regularly to add new information recorded by the CICS IA Collector, in the VSAM affinity files.

---

### Updating the Dependency database objects

CICS IA provides a number of batch jobs to update the database from the VSAM files.

#### **CIUUPDB1**

Updates the CICS table, CIU\_CICS\_DATA, from the CICS dependency data files, CIUINT1, CIUINT5, and CIUINT6.

#### **CIUUPDB2**

Updates the DB2 table, CIU\_DB2\_DATA, from the DB2 dependency data file, CIUINT2.

#### **CIUUPDB3**

Updates the MQ table, CIU\_MQ\_DATA, from the MQ dependency data file, CIUINT3.

#### **CIUUPDB4**

Updates the IMS table, CIU\_IMS\_DATA, from the IMS dependency data file, CIUINT4.

#### **CIUUPDBN**

Updates the Natural table, CIU\_NATURAL\_DATA, from the Natural dependency data file, CIUINT7.

#### **CIUUPDB**

Updates *all* tables (CICS, DB2, MQ, Natural, and IMS), from all the dependency data files, CIUINT1 through CIUINT7.

#### **CIURES LD**

Updates the CIU\_RESOURCE table that is used by the CICS IA plug-in for CICS Explorer.

If your dependency data files are shared by multiple CICS regions, you can use a single run of these jobs to store the dependency information for all the regions into the set of Dependency database objects.

If, however, you have separate sets of dependency data files for each region, you can run the jobs once for each region in which you are interested and feed the dependency information for each region into the same set of Dependency database objects. For example, you must run multiple jobs if you: run the Collector on multiple regions, do not use a shared set of dependency files, and want to keep the dependency data for all the regions in the same set of Dependency database objects.

Run the Collector with your normal weekly workload to collect the base data and also run it at month ends, quarter ends, and year ends to collect data from infrequently run programs. When you have recorded all your applications, you might need to update the database only for new applications and changes.

CICS IA V3.2 introduced the ability to identify a CICS dependency collection at DB2 load time. This ability enables the user to load, manage, and compare resource usage by collection ID. Before you submit the job, you must review the collection name that you use. The job is first setup with a collection ID of `_collid_`. This collection ID is used in several places so you must run a global change to the collection ID of your choice. The collection ID can be up to 16 characters in length. If you want to change the collection ID every time you run the update jobs, you can edit the job, run "FIND COLLID=", and replace the collection ID name appropriately.

For more information about how to view and manage your data by collection ID, see Chapter 6, "Managing your CICS IA data," on page 113.

## Database update procedure

The job streams to update the dependency tables are put into the `hlq.SCIUSAMP.CICS` library by the CICS IA installation procedure, where "hlq" is a prefix that is defined during installation.

Before you run any of the jobs, you must edit the dependency tables to meet the requirements of your system.

---

## Updating the Affinity database objects

CICS IA provides the CIUAFFLD batch job to update the database from the VSAM files.

If your affinity data files are shared by multiple CICS regions, you can use a single run of the CIUAFFLD job to store the affinity information for all the regions into the set of Affinity database objects.

If, on the other hand, you have separate affinity data files for each region, you can run the job once for each region you're interested in and feed the affinity information for each region into the same set of Affinity database objects. For example, you must run multiple jobs if you run the Collector on multiple regions, do not use shared affinity files, and want to keep the affinity data for all the regions in the same set of Affinity database objects.

Run the Collector with your normal weekly workload to collect the base data and also run it at month ends, quarter ends, and year ends to collect data from infrequently run programs. When you have recorded all your applications, you might need to update the database objects only for new applications and changed programs.

The CIUSPAFF program is a DB2 UDB stored procedure that is an affinity data update and query interface program. The CIUAFFL1 program, which is run by the CIUAFFLD JCL sample, issues one SQL CALL to the CIUSPAFF program that updates affinity DB2 objects.

Before running CIUAFFLD, which is put into the `hlq.SCIUSAMP.CICS` library by the CICS IA installation procedure, edit it to meet the requirements of your system.

---

## Updating the Command Flow database objects

CICS IA provides batch jobs to update the database from the command flow log stream.

### **CIUJLCPY**

Copies command flow data from the log stream to a GDG dataset.

### **CIUJLDEL**

Deletes data from the log stream. This job must be used only for a non-shared single user log stream.

### **CIUUPDB5**

Updates the CIU\_CMDFLOW\_DATA table from the GDG dataset.

---

## Chapter 6. Managing your CICS IA data

CICS IA captures more data with each release. In volatile development environments, this data can soon become out of date and no longer be of use. Out of date data can further impede your analysis by retrieving more data when you use the CICS IA plug-in because unwanted data can be retrieved which could provide confusing results.

The data can be stored in three places at the same time:

- The CICS IA dataspace when the collector is running
- The CICS IA VSAM collector VSAM files
- The CICS IA database

This information explores how to manage the data you collect and manage the data that you have collected already.

---

### Identifying the data that you collect

You can reduce the amount of data you initially collect by identifying patterns in your resource names, and by using a collection ID to identify the data you load into DB2.

#### Identifying patterns in resource names

Some CICS resource types can have resource names that are based on a prefix or a suffix concatenated with a counter or an address. These resource names can create millions of records that are stored in the CICS IA data space, VSAM files, and the DB2 database.

For example, if you could have a CICS TSQUEUE resource with a name based on `QUEUE $n$` , where:  $n$  is a 10-digit string that is controlled by a CICS counter.

If you have `WRITEQ`, `READQ` and, `DELETEQ` commands for this TSQUEUE resource in the program, CICS IA, will have three entries for each TSQUEUE name that is processed, starting with `QUEUE0000000001` and ending with `QUEUE9999999999`. Based on this format, there are already 3 billion records for that single program. The number of records can increase substantially if the data for that program is collected in more than one region, or if the queue name is used by more than one program.

Because of this issue, CICS IA uses a function that can reduce the number of records as described in this scenario to only three. These records are:

- `WRITEQ QUEUE+++++++`
- `READQ QUEUE+++++++`
- `DELETEQ QUEUE+++++++`

You can reduce the number of records to three if you create a “resource prefix list” table. This resource prefix list consists of a simple assembler CSECT where you can use prefixes, suffixes, or any pattern. Currently you can create these lists for CICS TSQUEUE names, CICS ENQ/DEQ names, and WebSphere MQ queue names. You can configure the same table for each CICS region or you can configure individual ones dependent upon the content of that region.

When you first start collecting CICS IA data, use the CICS IA plug-in for CICS Explorer to identify the resource names that match a pattern, and add these names to your resource prefix list. You must remove the duplicated data by deleting them from the VSAM file and the DB2 tables. A cleanup job is provided to remove duplicate resource names for TS QUEUE names, ENQ/DEQ, and WebSphere MQ queue names.

For more information about removing duplicate resources, see “Removing duplicate resources from the Collector files” on page 119.

For more information about resource prefix lists, see “Creating a resource prefix list” on page 53.

## Identifying the data by using a collection ID

The COLLECTION\_ID column in the CICS Dependency Data tables is assigned to the data during the DB2 load utilities for Dependency data.

### Why use a collection ID?

If your CICS development or test environment, or both, are volatile, they are subject to frequent program changes, if you use a different collection ID every time you load the data it can help you to analyze the data in the CICS IA plug-in and, eventually, to delete unwanted collections. If you load the data on a weekly basis, it is beneficial to identify the DB2 load with a unique weekly identifier. If you have a unique weekly identifier, you can:

- Reduce the amount of data that you retrieve in the CICS IA plug-in if you set the scope to be the collection ID.
- Compare data in the CICS IA plug-in by collection ID.
- Delete the data for the unwanted collection IDs.

For more information about how to set the scope for a collection ID, see the online help shipped with the CICS IA plug-in.

You can also use the COLLECTION\_ID column when you upgrade your CICS environment, or embark on a major project where you will use CICS IA data from before and after the upgrade. You can give the data that is captured during testing before you upgrade a collection ID name such as “before image” and, similarly, after the upgrade you can use a collection ID name such as “after image”. This naming convention means you can analyze the data in the CICS IA plug-in more easily, and delete the “before image” data when the upgrade is complete.

---

## Managing the collected data

To manage the data that you have collected, you can delete your unwanted data and keep your data sources in sync.

Utilities that are provided by CICS IA to delete data from the DB2 database. These utilities include the following jobs:

- Sample job SCIUSAMP.DB2(CIUCLR). This job provides the skeleton JCL and SQL to delete data that is based on specified conditions from the CICS IA tables.
- Sample job SCIUSAMP.CICS(CIUPRUNE). This job provides JCL and SQL to delete data that is based on the last used date from the tables.
- Sample job SCIUSAMP.CICS(CIUDELSP). This sample job calls the DB2 stored procedure to delete data that is based on the collection ID from all of the tables.

- If you use the CICS IA plug-in for CICS Explorer you can delete data by TS application and by collection ID.

## Identifying data to delete

The CICS IA data that you collect can change, which can lead to redundant records being stored in the database. You can delete data from the database in a number of ways. You can use SQL queries to help you to delete the unwanted data from your database tables, which improves performance.

The CICS IA data is loaded into the DB2 tables from the VSAM files. You must ensure that you clear the VSAM files and the DB2 tables. For development and test regions, it is prudent to empty the files and tables at CICS IA startup.

The supplied sample job, `h1q.SCIUSAMP.CICS(CIUPRUNE)`, is used to delete data from the DB2 tables. You can use this job to run sample supplied SQL that is provided in `h1q.SCIUSQL.CICS`. These sample SQL jobs begin with the prefix `CIUP`; for example, `CIUPCICS` deletes data from the `CIU_CICS_DATA` table. The sample jobs use the `LAST_RUN` date. The query first displays the records before the selected `LAST_RUN` date:

```
--
-- Show rows that are older then specified timestamp
SELECT APPLID, TRANSID, PROGRAM, FUNCTION, TYPE, OBJECT
FROM CIU_CICS_DATA READONLY
WHERE LAST_RUN<='2012-01-01-00.00.00.000000';
-- Uncomment this statement when you want to delete rows
--DELETE FROM CIU_CICS_DATA
--
-- WHERE LAST_RUN<='2012-01-01-00.00.00.000000';
COMMIT;
```

*Figure 39. Records before the selected LAST\_RUN date.*

An alternative method involves deleting records based on the program version. You do this by querying on the program, the program length, and the first used timestamp. Program and program length are part of the unique key that is used the data is stored in the CICS IA dependency tables.

When a program changes, the program length probably changes too. CICS IA uses this information as a crude method for a programming version. The EXEC commands for a changed program contain a `FIRST_RUN` timestamp, which is used to identify the latest program. You can then delete all of the commands that are reported for previous programs.

If you want to use the method that involves deleting records based on the program version, you must first examine the data to look for programs with different program lengths. In the following figure, program `DB900001` has two different program lengths. From the `FIRST_RUN` timestamp, you can see that program length 2180 corresponds to the latest program.

```

| SELECT DISTINCT APPLID, PROGRAM, PROGLN,
| MAX(CAST(FIRST_RUN AS CHAR(26)))
| FROM CIU_CICS_DATA
| WHERE APPLID='IYCYZC37'
| GROUP BY APPLID, PROGRAM , PROGLN;
| -----+-----+-----+-----+-----+-----+-----+
| APPLID PROGRAM PROGLN
| -----+-----+-----+-----+-----+-----+-----+
| IYCYZC37 DB900001 000021E8 2007-10-30-11.31.33.000000
| IYCYZC37 DB900001 00002180 2007-11-22-11.23.57.000000
| IYCYZC37 DB910001 000032A0 2007-11-22-11.23.57.000000
| IYCYZC37 DB910001 000033E0 2007-10-30-11.31.33.000000
| IYCYZC37 DB930001 00002000 2007-11-22-11.23.57.000000
| IYCYZC37 DB930001 00002050 2007-10-30-11.31.33.000000
| IYCYZC37 DB940001 00002698 2007-11-22-11.23.57.000000
| IYCYZC37 DB940001 00002720 2007-10-30-11.31.33.000000
| IYCYZC37 EMSTESTA 00002110 2008-04-03-12.38.48.000000
| IYCYZC37 EMSTESTB 00001500 2008-04-03-12.38.48.000000
|

```

Figure 40. Query to show program versions and FIRST\_RUN timestamps.

You can now find all of the latest programs in region IYCYZC37. The query in the following figure shows the latest FIRST\_RUN timestamp. In this query, the output is concatenated so it can be used later as an SQL subquery.

```

| SELECT DISTINCT APPLID||PROGRAM||MAX(CAST(FIRST_RUN AS CHAR(26)))
| FROM CIU_CICS_DATA
| WHERE APPLID='IYCYZC37'
| GROUP BY APPLID, PROGRAM ;
| -----+-----+-----+-----+-----+-----+-----+
| -----+-----+-----+-----+-----+-----+-----+
| IYCYZC37DB9000012007-11-22-11.23.57.000000
| IYCYZC37DB9100012007-11-22-11.23.57.000000
| IYCYZC37DB9300012007-11-22-11.23.57.000000
| IYCYZC37DB9400012007-11-22-11.23.57.000000
| IYCYZC37EMSTESTA2008-04-03-12.38.48.000000
| IYCYZC37EMSTESTB2008-04-03-12.38.48.000000
| IYCYZC37EMSTESTS2008-04-03-12.38.45.000000
| IYCYZC37FC0100012007-11-19-15.09.18.000000
| IYCYZC37FC0200012007-11-19-15.09.17.000000
|

```

Figure 41. Query to show all distinct programs by latest FIRST\_RUN timestamp.

You can now get the program length for the latest programs. The query in the following figure shows the program and program length for the most recently used programs. The output is concatenated so it can be used later as an SQL subquery.

```

| SELECT DISTINCT APPLID||PROGRAM||PROGLEN
| FROM CIU_CICS_DATA , (
| SELECT DISTINCT APPLID AS A, PROGRAM AS P,
| MAX(CAST(FIRST_RUN AS CHAR(26))) AS S
| FROM CIU_CICS_DATA
| WHERE APPLID='IYCYZC37'
| GROUP BY APPLID, PROGRAM) X
| WHERE CAST(FIRST_RUN AS CHAR(26)) = X.S;
| -----+-----+-----+-----+-----
| -----+-----+-----+-----+-----
| IYCYZC37DB90000100002180
| IYCYZC37DB910001000032A0
| IYCYZC37DB93000100002000
| IYCYZC37DB94000100002698
| IYCYZC37EMSTESTA00002110
| IYCYZC37EMSTESTB00001500

| IYCYZC37 TS07 DB90 DB900001 SEND MAP S1
| IYCYZC37 TS07 DB90 DB900001 SEND MAP S1
| IYCYZC37 TS07 DB90 DB900001 SEND MAP MAPSET CBMS01
| IYCYZC37 TS07 DB90 DB900001 SEND MAP MAPSET CBMS01
| IYCYZC37 TS07 DB91 DB910001 RECEIVE MAP S2

```

Figure 43. Query showing commands to be deleted.

You must repeat this delete action for the other tables: CIU\_DB2\_DATA, CIU\_IMS\_DATA, and CIU\_MQ\_DATA.

```

-----+-----+-----+-----+-----+-----+
DELETE FROM CIU_CICS_DATA
WHERE APPLID='IYCYZC37'
AND APPLID||PROGRAM||PROGLEN NOT IN
(SELECT DISTINCT APPLID||PROGRAM||PROGLEN
FROM CIU_CICS_DATA , (
SELECT DISTINCT APPLID AS A, PROGRAM AS P,
MAX(CAST(FIRST_RUN AS CHAR(26))) AS S
FROM CIU_CICS_DATA
WHERE APPLID='IYCYZC37'
GROUP BY APPLID, PROGRAM) X
WHERE CAST(FIRST_RUN AS CHAR(26)) = X.S)
-----+-----+-----+-----+-----+
DSNE615I NUMBER OF ROWS AFFECTED IS 24
DSNE616I STATEMENT EXECUTION WAS SUCCESSFUL, SQLCODE IS 0
-----+-----+-----+-----+-----+

```

Figure 44. Query to delete commands from the CICS table for old commands.

You can also use these queries as the basis for writing your own delete functions.

When the data from these tables is deleted, you must reload the CIU\_RESOURCE table that is used by the CICS IA plug-in by running the sample job SCIUSAMP.CICS(CIURESLD).

## Deleting by collection ID

You can now delete CICS IA data from all the dependency tables by using the stored procedure CIUSPDEL, and using a collection ID.

You can call the stored procedure CIUSPDEL from the sample job SCIUSAMP.CICS(CIUDELSP) or from the CICS IA plug-in.

To delete the data by using the CICS IA plug-in, right-click the name of the collection ID for which you want to delete data in the Collection IDs window, then click **Delete associated data**. The stored procedure CIUSPDEL deletes the data, based on the collection ID, from all the CICS dependency tables.

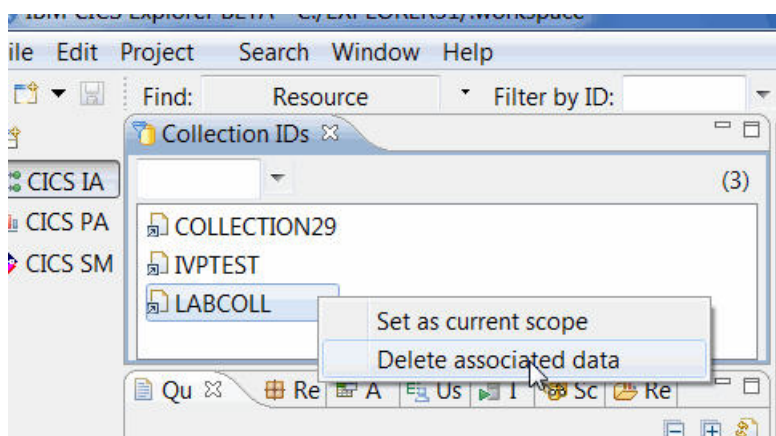

Figure 45. The CICS IA plug-in Collection IDs window

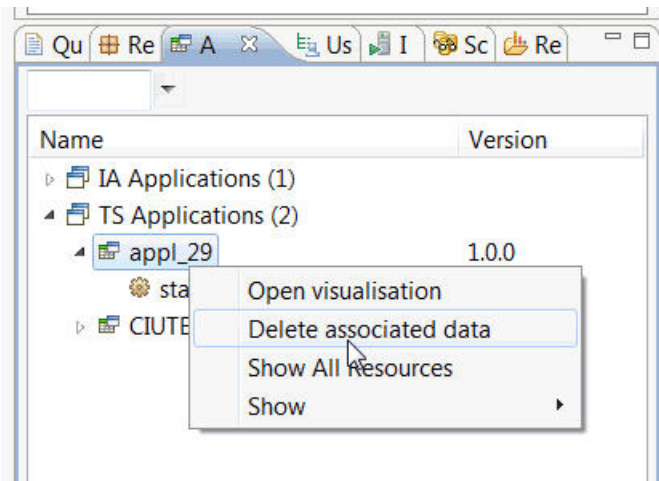

## Deleting by application ID

In CICS Transaction Server you can deploy applications in a platform. You can define the various resources that make up a business application in CICS as a single entity and deploy these resources to CICS as a single resource.

An application that is defined as part of the platform can be managed as a single entity throughout the lifecycle, making CICS application management faster, easier, and less prone to error. For more information about applications, see Applications in the CICS TS infocenter.

The CICS IA exits capture application information and associate them with the dependency data and the command flow data that is collected.

You can use the CICS IA plug-in to delete the data by application and version. Right-click the name of the application for which you want to delete data, then click **Delete associated data**.

## Managing affinity data

You can capture affinity data by CICS region, and you can use the affinity data when you want to implement workload balancing across cloned regions.

Capturing affinity data is typically a one-off task and it is recommended that you empty both the affinity files and the DB2 tables that are associated with affinity data, every time you run such a task. To empty the affinity DB2 files, run the CIUCLR sample job by modifying the following commands:

```
DELETE FROM _schema_.CIU_AFF_EVENTS WHERE APPLID='cicsappl';
DELETE FROM _schema_.CIU_AFF_GRP_DATA WHERE APPLID='cicsappl';
DELETE FROM _schema_.CIU_AFF_CMD_DATA WHERE APPLID='cicsappl';
COMMIT;
```

To empty the affinity VSAM files, start the affinity collector without restoring the data. For more information about the restoring data on startup, see, “Specifying region-specific options: general” on page 82.

## Removing duplicate resources from the Collector files

You can use the cleanup batch utility to remove duplicate resources which minimizes the volume of data stored in the Collector files.

CICS IA provides a batch utility to remove the collected resource types, which have a resource name that consists of a constant prefix and a variable. These types of resource names might lead to a large amount of duplicate data being stored for the same command in a particular transaction and program combination.

To avoid collecting unnecessary data, set up a resource prefix list table. See “Creating a resource prefix list” on page 53.

The batch utility consists of the CIUJCLDL sample batch job, which calls the CIUDEL program. With this utility, you can clean up collected TSQUEUE CICS resource prefixes, ENQUEUE CICS resource prefixes, and the detailed record associated with a TSQueue. You can remove data from all of the CICS regions or from one chosen region.

### **Running the CICS IA VSAM cleanup utility**

The CICS IA VSAM cleanup utility can remove resources from one particular region or from all regions.

For information about the dependency-causing program commands that you can clean up see “Dependency-related commands” on page 6.

You can clean up the following program commands:

- The transactions and commands that you have specified to be monitored by the Collector. See “Specifying region-specific options: API and SPI commands to be monitored” on page 86.
- The command types that you specify in the REPTYPE DD statement of the cleanup job. See “Modifying a cleanup utility job.”
- The CICS command groups that you specify in the CMDGRPS DD statement. See “Modifying a cleanup utility job.”

If your dependency data files are shared by multiple regions, you can run only one cleanup job to remove resources whether from one particular region or from all the regions. However, if each monitored region has its own region-specific set of the dependency data files, you must run the job multiple times against the relevant dependency files for each region to clean up data from multiple regions.

### **Modifying a cleanup utility job**

To request a resource cleanup from the dependency VSAM files, edit and run the CIUJCLDL job.

Before you run the CIUJCLDL job, modify the following settings:

#### **JOB accounting parameters**

Modify the JOB card statement to meet your site standards.

#### **STEPLIB DD statement**

Specify the name of the CICS IA load library in which you have installed the cleanup utility program, CIUDEL.

#### **CIUINT1 DD statement**

Specify the name of the CICS dependency data file for the chosen region.

Each dependency data file has a header record, which specifies the APPLID of the CICS region that creates the record. The cleanup utility checks the correspondence between the APPLID of the region and the APPLID recorded in the control record file, CIUCNTL, and proceeds only if they match.

If the dependency data files and the control record file are shared by multiple regions, they contain a header record for each of the monitored regions.

| **CIUINT2 DD statement**

| Specify the name of the DB2 dependency data file for the chosen region.

| **CIUINT3 DD statement**

| Specify the name of the MQ dependency data file for the chosen region.

| **CIUINT4 DD statement**

| Specify the name of the IMS dependency data file for the chosen region.

| **CIUINT5 DD statement**

| For the chosen region, specify the name of the CICS dependency data file  
| in which you want to store the dependency resources with the names that  
| are longer than 32 bytes.

| **CIUINT6 DD statement**

| Specify the resource detail data file for the chosen region.

| **CIUCNTL DD statement**

| Specify the name of your CICS IA VSAM control file for the chosen CICS  
| region.

| **APPLID DD statement**

| Specify the APPLID DD statement as follows:

- | • Enter a region VTAM® APPLID, if you want to clean up the dependency  
| data from a particular region.
- | • Select **ALL**, if you want to clean up the data from all the regions in the  
| dependency data files.

| Leaving the field blank also causes cleanup the data from all the regions.

| **REPTYPE**

| Specify the type of command for which you want to clean up the  
| dependency data.

| **Note:** You can specify only CICS commands.

| **CMDGRPS DD statement**

| Specify the CICS command groups for which you want to clean up the  
| dependency data.

| **Note:** This statement is effective only if you have specified CICS  
| commands as a REPTYPE.

| You can specify the CICS command groups directly from the commands  
| selected to be monitored by the Collector.

| The following command groups are supported:

- | • TS commands (READQ TS, WRITEQ TS, DELETEQ TS)
- | • TC commands (ENQ, DEQ)

| You can enter one of these command groups or both of them.

| **Note:** Make sure that there is no prefixes superposition, when using more  
| than one command group.

| **PRFGRPS DD statement**

| Specify the resource prefixes as follows:

- | • Each prefix must be written in a separate string.
- | • The maximum length of a prefix is 32 symbols.
- | • The first symbol of a prefix must not be blank, because it indicates the  
| end of a prefix.

- The empty string indicates the end of a file.
- The empty file means that all the records for the specified command group must be deleted.
- The ALL prefix in the first and the only string also means that all the records for the specified command group must be deleted.

The number of prefixes is not limited and they may be written in any order.

**SYSPRINT DD statement**

Specify where to save the report produced by the cleanup utility.

**Note:** The cleanup utility requires correct access to the CICS IA VSAM files. Make sure that the CICS IA Collector is stopped and the VSAM files are unavailable for batch update processing. If necessary, close the VSAM files with the CEMT SET FILE transaction.

The output report consists of a list of the selected command groups and a report about the deleted records. For an example of the output report, see Figure 46.

## Chapter 7. Creating and updating a CICS IA UDB database

CICS IA provides jobs to unload CICS IA data into CSV files. These files can be used to populate the IBM supported UDB databases.

CICS IA also provides the Definition Data Language (DDL) sample to create a UDB on Windows NT. This DDL is provided only as a sample. CICS IA also supplies sample tasks to run in your UDB environment. These sample tasks help you to load the tables from the CSV files. The process of creating a UDB CICS IA database usually comprises the following steps:

1. Review and edit a sample DDL provided in hlq.SCIUSAMP.DB2(CIUUDBC).
2. Run the DDL to create your UDB CICS IA database objects:
  - TABLES
  - VIEWS
  - Stored Procedures

When you have created a UDB IA database, perform the following steps to load the data:

1. Run the supplied sample jobs to unload the data from the VSAM files into CSV files. See "Preparing CSV files."
2. After you have created your CSV files, transfer them in ASCII to your DB2 Windows NT Server workstation.
3. Load the CSV files by using a UDB load utility. At this point, you can choose either to use a standard load utility or to write a custom update program. If you use a UDB IMPORT facility to load the CSV files, do the following:
  - a. Select the INSERT option.
  - b. Select the DELIMITER options as follows:
    - 1) The column delimiter is a comma (,).
    - 2) The character string delimiter is a double quote (").
4. For affinity collection, run the CIUSPAFF stored procedure to load the affinity tables used by the Explorer. A sample task is provided in hlq.SCIUSAMP.CICS3(CIUUDBT3).
5. After you have loaded any of the dependency tables, reload the CIU\_RESOURCE table used by the Explorer. A sample task is provided in hlq.SCIUSAMP.DB2(CIUUDBT1).
6. Before connecting to the Explorer, load the CIU\_VERSION table. A sample LOAD task is provided in hlq.SCIUSAMP.DB2(CIUUDBT2).

---

### Preparing CSV files

Before you can update a non-DB2 database with new data, you need to convert the VSAM files created by the Collector to the QSAM flat files or, in other words, Comma Separated Values (CSV) files.

CICS IA provides the following batch jobs that you can use for managing dependency tables:

#### CIUUDB

Prepares QSAM CSV files for all Dependency tables including DETAILED tables.

**CIUUDB4**

Prepares QSAM CSV files for the CIU\_CMDFLOW\_DATA table.

**CIUUDBAF**

Prepares QSAM CSV file for the CIU\_AFF\_EVENTS table.

**CIUUDBAP**

Prepares QSAM CSV files for the CIU\_APPLS\_RESOURCE and CIU\_APPLS\_DESC tables.

When creating a new CSV file for the Dependency tables, you can associate the collection by using a new column, `COLLECTION_ID`, in the tables. You can use the same `COLLECTION_ID` for each load or select a new one (recommended in case of major changes in your application or environment). The CICS IA Explorer plug-in enables you to compare resources across `COLLECTION_ID`s. You can also manage your CICS IA data by `COLLECTION_ID`: for example, delete it from a table.

---

## Chapter 8. Running the Reporter

The Reporter consists of:

- The Dependency Reporter: described in “Running the Dependency Reporter”
- The Affinities Reporter: described in “Running the Affinities Reporter” on page 133

---

### Running the Dependency Reporter

This section describes how to run the CICS IA Dependency Reporter. The Dependency Reporter consists of a batch job, CIUJCLRP, that produces reports of the dependencies found by the Collector.

The dependency-causing program commands that can be reported on are those listed in “Dependency-related commands” on page 6. The program commands that are actually reported depend on:

1. The transactions and commands that you specified to be monitored by the Collector. See “Specifying region-specific options: API and SPI commands to be monitored” on page 86.
2. The types of command, CICS, DB2, MQ, IMS, or ALL, that you specify to be reported on the REPTYPE DD statement of the Reporter job; see REPTYPE in “Modifying a Dependency Reporter Job”.
3. If CICS commands are to be reported, the CICS command groups that you specify on the CMDGRPS DD statement of the Reporter job; see the CMDGRPS DD statement in “Modifying a Dependency Reporter Job.”

If your dependency data files are shared by multiple regions, you can run one Reporter job to produce a report showing dependencies, for example, dependencies on CICS resources or dependencies on DB2 resources, found in either of the following:

- A single, specified, region
- All of the regions

If, on the other hand, each monitored region has its own, region-specific, set of dependency data files, each Reporter job always retrieves data for a single region; to retrieve data from multiple regions you must run your job multiple times, against the relevant dependency files for each region in which you are interested.

To request a report from the Reporter, edit and run the CIUJCLRP job.

### Modifying a Dependency Reporter Job

Changes to make before running the CIUJCLRP job.

#### The JOB accounting parameters

Modify the JOB card statement to meet your site standards.

#### The STEPLIB DD statement

Specify the name of the CICS IA load library in which you have installed the Dependency Reporter program, CIUREP.

#### The CIUINT1 DD statement

Specify the name of the CICS dependency data file for this region.

- Each dependency data file has a header record that specifies the APPLID of the CICS region that created the record. The Dependency Reporter checks this APPLID with the APPLID recorded in the control record file, CIUCNTL, and only proceeds if they match.
- If the dependency data files and the control record file are shared across multiple regions, they contain a header record for each of the monitored regions.

**The CIUINT2 DD statement**

Specify the name of the DB2 dependency data file for this region.

**The CIUINT3 DD statement**

Specify the name of the MQ dependency data file for this region.

**The CIUINT4 DD statement**

Specify the name of the IMS dependency data file for this region.

**The CIUINT5 DD statement**

Specify the name of the CICS "+32" dependency data file for this region. This CICS dependency file that records dependencies on CICS resources with names longer than 32 bytes.

**The CIUCNTL DD statement**

Specify the name of your CICS IA control VSAM file for this CICS region.

**The APPLID DD statement**

Specify this statement as follows:

*APPLID*

Specify the VTAM application identifier (APPLID) of the CICS region for which you want dependency data to be reported. Dependency data is returned for the specified region only.

**ALL** Returns data for all regions in the dependency data files.

**blank** Causes data for all regions in the dependency data files to be returned.

**REPTYPE**

Specify the type of command, CICS, DB2, MQ, IMS, or all, that you want to be included in the report:

**CICS** Only CICS commands are to be included.

**DB2** Only DB2 commands are to be included.

**MQ** Only MQ commands are to be included.

**IMS** Only IMS commands are to be included.

**ALL** All types of command are to be included.

**blank** All types of command are to be included.

**The CMDGRPS DD statement**

Specify the CICS commands and command groups that are to be reported. Enter each one on a separate line.

The statement is effective only if you have specified, on the REPTYPE statement, that CICS (or all) commands are to be included in the report.

The command groups that can be specified map directly to those that can be selected on the Collector. If no command or group is given, all detected interdependencies are reported. If one or more commands or command groups is specified, only they are reported.

Here are the commands and command groups that you can specify, with the commands that are reported in each case:

**BMS** PURGE MESSAGE, RECEIVE MAP, RECEIVE PARTN, ROUTE, SEND CONTROL, SEND MAP, SEND PAGE, SEND PARTNSET, SEND TEXT

**COUNTER**

BIF DEEDIT, BIF DIGEST, DEFINE COUNTER, DEFINE DCOUNTER, DELETE COUNTER, DELETE DCOUNTER, GET COUNTER, GET DCOUNTER, QUERY COUNTER, QUERY DCOUNTER, REWIND COUNTER, REWIND DCOUNTER, UPDATE COUNTER, UPDATE DCOUNTER

**DTP** ALLOCATE SESSION, ALLOCATE SYSID, CONNECT PROCESS, CONVERSE CONVID, CONVERSE SESSION, FREE, RECEIVE CONVID, RECEIVE SESSION, SEND CONVID, SEND SESSION

**FC** DELETE, ENDBR, READ, READNEXT, READPREV, RESETBR, REWRITE, STARTBR, UNLOCK, WRITE

**FEPI** All the FEPI API commands listed in Dependency-related CICS FEPI API commands detected by the CICS Interdependency Analyzer

**HANDLE**

HANDLE ABEND PROGRAM

**IBRFA**

INQUIRE BRFACILITY, SET BRFACILITY

**ICORB**

CREATE CORBASERVER, DISCARD CORBASERVER, INQUIRE CORBASERVER, PERFORM CORBASERVER, SET CORBASERVER

**IDB2** CREATE DB2ENTRY, CREATE DB2TRAN, DISCARD DB2ENTRY, DISCARD DB2TRAN, INQUIRE DB2ENTRY, INQUIRE DB2TRAN, SET DB2ENTRY, SET DB2TRAN

**IDJAR**

CREATE DJAR, DISCARD DJAR, INQUIRE DJAR, INQUIRE JVMPROFILE, PERFORM DJAR

**IFEPI** All the FEPI SPI commands listed in Dependency-related CICS FEPI SPI commands detected by the CICS Interdependency Analyzer

**IJRNL** DISCARD JOURNALNAME, DISCARD JOURNALNUM, INQUIRE JOURNALNAME, INQUIRE JOURNALNUM, SET JOURNALNAME, SET JOURNALNUM

**ISFC** CREATE FILE, DISCARD FILE, INQUIRE FILE, SET FILE

**ISPC** CREATE PROGRAM, DISCARD PROGRAM, INQUIRE PROGRAM, SET PROGRAM

**ISTD** CREATE TDQUEUE, INQUIRE TDQUEUE, SET TDQUEUE

**ISTR** CREATE TRANSACTION, DISCARD TRANSACTION, INQUIRE TRANSACTION, SET TRANSACTION

**ISTS** CREATE TSMODEL, DISCARD TSMODEL, INQUIRE TSMODEL, INQUIRE TSPool, INQUIRE TSQNAME, INQUIRE TSQUEUE, SET TSQNAME, SET TSQUEUE

**ITCP** CREATE TCPIPSERVICE, DISCARD TCPIPSERVICE, INQUIRE TCPIPSERVICE, SET TCPIPSERVICE

**JRNL** WAIT JOURNALNAME, WAIT JOURNALNUM, WRITE JOURNALNAME, WRITE JOURNALNUM

**LINK** GET64 CONTAINER, LINK, PUT64 CONTAINER

**LOAD**

LOAD, dynamic COBOL calls

**OTHER**

ADDRESS CWA, ASSIGN APPLID, CHANGE PASSWORD, CHANGE PHRASE, DUMP TRANSACTION, GETMAIN64, FREEMAIN64, SIGNAL EVENT, SIGNON, SIGNOFF, VERIFY PASSWORD, VERIFY PHRASE

**RETURN**

RETURN TRANSID

**START**

ASKTIME, CANCEL, DELAY, FORMATTIME, POST, RETRIEVE, START

**TC** CHANGE TASK, DEQ, ENQ, SUSPEND, WAIT EVENT

**TD** DELETEQ TD, READQ TD, WRITEQ TD

**TS** DELETEQ TS, READQ TS, WRITEQ TS

**WEB** CONVERTTIME, WEB ENDBROWSE FORMFIELD, WEB ENDBROWSE HTTPHEADER, WEB EXTRACT, WEB READ FORMFIELD, WEB READ HTTPHEADER, WEB READNEXT FORMFIELD, WEB READNEXT HTTPHEADER, WEB RECEIVE, WEB RETRIEVE, WEB SEND, WEB STARTBROWSE FORMFIELD, WEB STARTBROWSE HTTPHEADER, WEB WRITE HTTPHEADER

**XCTL** XCTL

**SYSPRINT DD statement**

Specify the destination for the report produced by the Dependency Reporter.

The Reporter cannot read from a dependency data file while the Collector has the file open for update, so you cannot run the Reporter if the Collector is RUNNING or PAUSED.

## Output from the Dependency Reporter

The Dependency Reporter produces sample reports. Here are examples of CICS, DB2, MQ, and IMS reports.

### CICS report

A CICS report consists of a header page and, if the dependency data file contains interdependency records, one or more pages of interdependency records.

Figure 47 on page 129 shows an example header page and Figure 48 on page 130 an example page of interdependency records.

2011/01/04 - CICS INTERDEPENDENCY ANALYZER (CIU) - Version 320 - Page: 1

Figure 47. Example CICS report from the Dependency Reporter—header page

### 1 Incorrect command types

On an interdependency report that includes CICS commands (that is, where the REPTYPE statement is specified as “CICS” or “ALL”), this area lists any CICS command groups that were specified incorrectly on the CMDGRPS DD statement.

### 2 Command types reported

On an interdependency report that includes CICS commands, this list shows all the command types that are to be reported. Command groups selected on the CMDGRPS DD statement are marked Yes, and those not selected No.

Tran	Program	Offset	Command	Resource					
		Sysid	Usage	First Run	Last Run		Term	TCBmode

		00001020 ----	SEND MAP 27	2011-01-27 09.34.34	DSN8CCG 2011-01-27 09.35.24		Y	QR	
		0000106A ----	RETURN TRANSID 27	2011-01-27 09.34.34	D8CS 2011-01-27 09.35.24		Y	QR	

Figure 48. Example CICS report from the Dependency Reporter—main body

The report lists all the CICS commands that were collected by the Collector and (because this is a CICS dependency report) selected in the CMDGRPS DD statement of the CIUJCLRP job. The report entries contain the following information:

**Tran** The identifier of the CICS transaction under which the command was issued.

**Program** The name of the program that issued the command.

**Offset** The offset, from the load point of the program, of the BALR instruction of the command detected. The Dependency Reporter produces an offset of -1 (X'FFFFFFFF') if it could not determine an offset; that is, if either of the following is true:

- The program was defined with RELOAD(YES).
- The offset calculated is not within the program, which might indicate that the program or perhaps language runtime code has passed control to another program by using a non-CICS mechanism, for example, a VS COBOL II dynamic call.

**Note:**

1. This offset is not the same as the offset given by the Load Module Scanner. For an EXEC CICS command, the offset given by the Load Module Scanner is the offset of the command argument 0 declaration from the start of the load module. See page Appendix B, “Correlating Load Module Scanner and Dependency Reporter output to source,” on page 209.
2. An output of X'FFFFFFFF' indicates that individual commands cannot be directly located in a program. The program must be scanned for all instances of the command, because more than one instance might be present.

**Command**

The command that was detected.

**Resource**

The resource against which the command was issued, causing a dependency between it and the named program.

**Sysid** If the command was shipped or routed to a remote CICS region, the system identifier of the remote region.

**Usage** The number of times that this command, with the same CICS APPLID, SYSID, transaction, program, offset, resource, remote SYSID, remote name, command group, command function and program length has been detected.

**First Run**

The date and time at which this command, with the same CICS APPLID, SYSID, transaction, program, offset, resource, remote SYSID, remote name, command group, command function and program length, was first detected. Times are shown in local time.

**Last Run**

The date and time at which this command, with the same CICS APPLID, SYSID, transaction, program, offset, resource, remote SYSID, remote name, command group, command function and program length, was first detected. Times are shown in local time.

**Term** Whether or not the transaction was associated with a terminal.

**TCBmode**

The CICS TCB mode at the time the command was executed.

**DB2 report**

The report lists all the DB2 commands that were collected by the Collector.

Figure 49 shows an example DB2 report.

Figure 49. Example DB2 report from the Dependency Reporter

The report fields contain the same information as the identically named fields on the CICS report, with the following additions and deletions:

**DB2ID**

The identifier (ID) of the DB2 subsystem.

**PLAN** The DB2 plan.

**SECTION#**

The section number in the source code of the CICS program at which the DB2 command is issued.

**STATEMENT#**

The statement number in the source code of the CICS program at which the DB2 command is issued.

**TYPE** The type of resource against which the command was issued.

**Sysid** Not reported on the DB2 report.

**MQ report**

The report lists all the MQ commands that were collected by the Collector.

Figure 50 shows an example MQ report.

Figure 50. Example MQ report from the Dependency Reporter

The report fields contain the same information as the identically named fields on the CICS report, with the following variations and deletions:

**Resource**

The resource against which the command was issued, causing a dependency between it and the named program. For the MQ report, this resource is the fully-qualified queue name.

**Sysid** Not reported on the MQ report.

**IMS report**

The report lists all the IMS commands that were collected by the Collector.

Figure 51 on page 133 shows an example IMS report.

Tran	Program	Offset	Command	Resource					
			Usage	First Run	Last Run			Term	TCBmode
DLE1	DLE10001	0000034A	EXEC DLI SCHEDULE	MDLPSBC

Figure 51. Example IMS report from the Dependency Reporter

The report fields contain the same information as the identically named fields on the CICS report, with the following variations and deletions:

**Sysid** Not reported on the IMS report.

## Running the Affinities Reporter

The CICS IA Affinities Reporter can be used to produce reports and definitions.

You can produce the following:

- A report of the affinities found in your CICS region. The commands reported are those listed in “Commands monitored for potential affinities” on page 202.
- Definitions of the basic affinity transaction groups that correspond to the report. The definitions of the basic affinity transaction groups are suitable for input to the Builder.

You can run the Affinities Reporter against either of the following:

- The Affinities database using the CIUAFFRD job.
- The VSAM affinity data files using the CIUAFFRP job. This option is useful if you do not have DB2.

The CIUAFFRD and CIUAFFRP jobs produce the same kinds of output. If the Affinities database and the VSAM files contain the same affinity data, the output from the jobs is identical.

For information about interpreting the report output by the Affinities Reporter, see “Running the affinity report” on page 138.

This rest of this section contains:

- “Requesting a report from the Affinities Reporter” on page 134
- “Output from the Affinities Reporter” on page 134
- “Running the affinity report” on page 138
- “Compressing affinity data” on page 140

## Requesting a report from the Affinities Reporter

To run the Affinities Reporter against the Affinity database objects, edit and run the CIUAFFRD job. To run the Affinities Reporter against the VSAM affinity data files, edit and run the CIUAFFRP job. Before running either of the jobs, change the values of the parameters listed below, as appropriate.

The changes you need to make to the job stream are similar to those described in Updating the Affinity database objects and are listed in the header of the JCL file:

- The JOB accounting parameters.
- The PARM parameter of the EXEC statement

For example:

```
REPORT EXEC PGM=CIUAFFR,PARM='WORSEN'
```

. Worsen specifies that the Reporter is to worsen transaction affinity relations for affinities on which the Collector has not detected at least 10 occurrences.

- The STEPLIB DD statement; specify the name of the CICS IA load library where you have installed the Affinities Reporter program, CIUAFFR.
- The APPLID DD statement; specify the APPLID of the CICS TS region, for which you want to receive a report.
- The CMDGRPS DD statement, specify the affinity command types you want to see in the report. Only those affinity types listed on this DD statement are shown in the report. You can specify any of the following affinity types, with each type on a separate line, starting in column one:

CANCEL	DISCARD	GETMAIN	RESYNC
COLLECT	ENABLE	INQUIRE	RETRIEVE
CREATE	ENQ	LOAD	TS
CWA	EXTRACT	PERFORM	WAIT

If you do not specify any affinity types on the CMDGRPS DD statement or specify CMDGRPS DD DUMMY, all affinity types are selected for reporting.

The first part of the report lists the affinity types selected.

- The TRANGRPS DD statement; specify the name of the sequential data set where the basic affinity-transaction-group definitions are to be sent.
- The SYSPRINT DD statement; specify the destination for the report.

## Output from the Affinities Reporter

Each affinity type specified on the CMDGRPS DD statement, for example, CWA or TS is given its own section in the affinity report.

In each affinity-type section, there is an entry for each individual affinity of that type. And for each affinity, the Affinities Reporter creates a basic affinity-transaction-group definition that is suitable for input to the Builder.

### Note:

1. The Affinities Reporter produces basic affinity-transaction-group definitions for *inter-transaction* affinities only.
2. Transactions not initiated from a terminal, not associated with a CBTS process or activity, and not associated with Link3270 bridge facilities, do not appear in a basic affinity transaction group. If none of the transactions in an inter-transaction affinity group are initiated from a terminal, are not associated with a CBTS process or activity, and are not associated with Link3270 bridge

facilities, a special reporting affinity relation of background is used; no basic affinity transaction group is created, ignore the affinity lifetime.

## Affinity report

A sample report output by the Affinities Reporter.

The sample report below shows an example report for two affinities, a TS queue affinity and a CWA affinity. Only those affinity types were selected, as shown.

CICS INTERDEPENDENCY ANALYZER		2007/09/24	Page 1

Figure 52. A sample report output by the Affinities Reporter

Notes for the sample report output by the Affinities Reporter, above:

### **1** Incorrect affinity types

This column lists any affinity types that were specified incorrectly on the CMDGRPS DD statement of the CIUAFFRD or CIUAFFRP job.

### **2** Affinity types reported

This column lists any affinity types that were selected for reporting; that is, those affinity types specified correctly on the CMDGRPS DD statement of the

CIUAFFRD or CIUAFFRP job. The affinity types are listed under their associated affinity category: inter-transaction or transaction-system.

### **3 Affinities reports**

For each affinity transaction group, a report lists appropriate characteristics of the affinities, explained in the following notes.

#### **Trangroup**

The name of the affinity transaction group, assigned by the Affinities Reporter. This name is used only to cross-reference the group to the corresponding affinity-transaction-group definition in the data set specified on the TRANGRPS DD statement, for this run of the Affinities Reporter. The Trangroup value for an affinity transaction group might vary from one run to another of the Affinities Reporter.

#### **Affinity**

The affinity relation. If appropriate, this entry also indicates whether the relation was worsened from a less restrictive relation.

#### **Lifetime**

The affinity lifetime. If appropriate, this entry also indicates whether the lifetime was worsened from a less restrictive lifetime.

#### **Queue (resource)**

The resource causing the affinity. This entry might be the name of the resource, for example, Queue : LOCA1 (D7D6C3C1F140404040404040404040) as shown, or the address of the resource, depending on the type of affinity. An unprintable character appears as a period (.).

#### **Recoverable**

Whether or not the resource is recoverable. For TS queues, this entry also indicates whether the queue is in auxiliary or main temporary storage.

#### **Terminal Id**

The identifier of the terminal at which the transactions taking part in the affinity were initiated. This information is available only for TS queue affinity and is meaningful only if the affinity is LUNAME or worsened from LUNAME to GLOBAL. Therefore, the terminal identifier is included in the report only in these cases.

**Tranid** The identifier of each transaction taking part in the affinity. An affinity transaction group can contain only one transaction ID. An example of such a situation is when each part of a pseudoconversation accesses a TS queue and each part runs under the same transaction ID.

#### **Program**

The name of each program taking part in the affinity.

**Offset** The offset from the load point of the BALR instruction to the EXEC CICS command causing the affinity. The Affinities Reporter produces a negative offset (X'FFFFxxx') if it cannot determine an offset; that is, if the offset calculated is not within the program. A negative offset might indicate that the program, or perhaps language runtime code has passed control to another program by using a non-CICS mechanism; for example, a COBOL dynamic call.

This offset is not the same as the offset given by the Load Module Scanner, which is the offset of the command argument 0 declaration from the start of the load module.

If a negative offset (X'FFFFxxxx') is given, individual affinity commands cannot be directly located within a program. The program must be scanned for every instance of the affinity command, because there might be more than one.

**Usage** The number of times that this particular EXEC CICS command, with the transaction, program, and offset values reported, takes part in the affinity, up to a limit of 5000.

The usage count is an indication of the relative importance of the affinity. It is not a completely accurate usage count. For performance reasons, when the usage count is incremented by the Collector, the “save to file” flag is not necessarily set to indicate that the record needs to be saved to the data file. The save flag is set as follows:

0	<= usage count < 10,	save flag set every increment
10	<= usage count < 100,	save flag set every 10 increments
100	<= usage count < 5000,	save flag set every 100 increments
5000	<= usage count	neither increment nor save flag set

If the usage count is 1+, at least one example of the affinity was seen but the total number of occurrences of that affinity is unknown.

#### **Command**

The EXEC CICS command causing the affinity.

#### **Terminal**

Whether this particular EXEC CICS command, with the transaction, program, and offset values reported, was ever issued by a transaction initiated from a terminal; that is, started as a result of terminal input or for an EXEC CICS RETURN TRANSID command. ATI-started transactions are not included.

The word Mix in this column indicates that a particular EXEC CICS command was issued by a transaction initiated from a terminal and also issued by the transaction when it was initiated with no associated terminal.

#### **CBTS Task**

Whether this particular EXEC CICS command, with the transaction, program, and offset values reported, was ever issued by a BTS task.

#### **Link3270**

Whether this particular EXEC CICS command, with the transaction, program, and offset values reported, was ever issued by a transaction initiated by the Link3270 bridge mechanism.

#### **Total Transactions**

The total number of different transactions in the affinity transaction group.

#### **Total Programs**

The total number of different programs in the affinity transaction group.

### **Producing affinity-transaction-group definitions**

The Affinities Reporter produces affinity-transaction-group definitions suitable for input to the Builder, but not to CICSplex SM.

Each definition consists of a unique transaction group name, a relation, a lifetime, and a set of transaction IDs (tranids).

Not every affinity in the report appears as an affinity transaction group. In particular, transaction-system affinities do not appear, because they are not of

interest to a dynamic routing program; nor, for the same reason, do transactions that were not initiated from a terminal, nor by BTS, nor by the Link3270 bridge mechanism.

Figure 53 shows a sample set of definitions to match the report in Figure 52 on page 135.

**Note:**

1. The transaction group name is not a valid CICSplex SM transaction group name, because the latter must be eight characters or less; it is used only as a cross-reference to the report.
2. MATCH or STATE attributes are not generated on CREATE TRANGRP commands, because those attributes are relevant only to the combined affinity transaction groups.
3. The HEADER statement is generated so that the Builder can detect a new data set in its input concatenation. It also gives the CICS APPLID and the date and time of the last Collector save. For more information see “HEADER statements” on page 164.

```
* HEADER APPLID(CICSPDN1)  SAVEDATE(2007/09/24)  SAVETIME(10:11:45);

```

*Figure 53. Sample basic affinity-transaction-group definitions*

After these definitions have been created, you can edit them to add extra definitions for affinities that the Collector could not detect, or to modify definitions in the light of further knowledge about the affinity; for example, to correct a worsened lifetime. The report output from the Load Module Scanner might be particularly useful at this stage. See “Running the affinity report.”

## Running the affinity report

Purpose of the report and assumptions to make.

The affinity report has two main purposes:

- To help you understand the affinities present in the CICS region concerned.

- To help you modify the affinity transaction-group-definitions before they are given to the Builder, if such modification is required.

You must be able to investigate whether any application changes could reduce the amount of affinity.

- Assume that the affinity information is complete.
- Assume that any worsening of affinity relation or affinity lifetime by the Collector does not create too pervasive an affinity, making dynamic routing less effective.

## Understanding the affinities

The inter-transaction affinities listed in the report highlight those transactions that have affinities with other transactions.

Understanding the affinities present in the CICS region enables you to determine which of the them are most pervasive. If you decide that it is worth changing your application programs, it is generally more cost-effective to remove the most pervasive affinities, because those affinities most restrict dynamic routing. The most pervasive affinities are those with a relation of GLOBAL, or a lifetime of SYSTEM or PERMANENT, and are heavily used.

The transaction-system affinities listed in the report highlight those transactions that use system programming commands. It might not be appropriate to dynamically route such a transaction, because its action might be tied to a particular CICS region, as opposed to a particular set of other transactions.

The affinity report also lists affinities occurring between transactions that were not initiated from a terminal and are not BTS or Link3270 bridge transactions. These background transactions are known as “background relations”. This information is really for completeness, because such transactions cannot be dynamically routed.

To obtain complete information on affinities, use as many code paths as possible while running the Collector, because it can find an affinity only if the commands that cause it have been executed. However, the Load Module Scanner detects all instances of affinity commands in the corresponding load library. So a comparison of the Affinities Reporter and Load Module Scanner outputs is very useful when establishing the full picture.

## Important note

Both the Affinities Reporter and the Load Module Scanner might identify commands that, on closer examination, do not cause real affinities. Relate the output from the Reporter and the Load Module Scanner to your knowledge of your applications, to distinguish between such commands and those causing real affinities that impact CICS dynamic routing.

## Modifying affinity-transaction-group definitions

Modifications to consider before providing affinity-transaction-group definitions to the Builder.

- Remove any false affinities that might arise because the sharing of a resource is done on a read-only basis, making it possible for the resource to be replicated across cloned CICS regions. The prime example of this is a read-only CWA, where the CWA is set up at CICS startup, for example, from a PLTPI program, and only read afterward. An alternative way to remove this false affinity is to prohibit detection of ADDRESS CWA by the Collector.

- Remove affinity relation worsening. An affinity that has a relation of LUNAME, BAPPL, LINK3270, or user ID might be worsened to GLOBAL because the Collector has not seen enough examples of the affinity to be convinced that it is related to a terminal, user ID, a BTS process or activity, or a Link3270 bridge. Change it to LUNAME, USERID, BAPPL, or LINK3270, and correct the lifetime, if you know that the affinity really is related to a terminal, user ID, a BTS process or activity, or a Link3270 bridge facility. You might want to prevent worsening by specifying WORSEN=NO.
- Remove affinity lifetime worsening; an LUNAME affinity with a lifetime of LOGON, or a USERID affinity with a lifetime of SIGNON, might be worsened to SYSTEM or PERMANENT because the Collector cannot always observe log offs or signoffs. Change this to LOGON or SIGNON if you know that to be the correct lifetime.
- You can change LUNAME affinity relation to USERID. An LUNAME affinity group might be both LUNAME and USERID, because all instances of all transactions in the group were initiated from the same terminal by the same USERID. This affinity group appears in the report as LUNAME, because LUNAME takes precedence. If you know that the affinity is primarily USERID related, change the affinity to USERID. This affinity might be indicated by other, similar, affinity groups appearing in the report with USERID.
- You can add WAIT affinities. The Affinities Reporter reports the use of WAIT EVENT, WAITCICS, and WAIT EXTERNAL commands as transaction-system affinities, because the Collector cannot detect the corresponding posting of the ECBs being waited on. Identify the posting transactions and create affinity transaction groups to describe the affinities. The output from the Load Module Scanner might be particularly useful here, because it finds programs that issue MVS POST commands.
- You can add other affinities. Load Module Scanner output or your knowledge of your applications might identify additional affinities. Create affinity transaction groups to describe them.
- You can add GETMAIN storage sharers. The Collector cannot detect transactions that share storage other than by EXEC CICS commands. Although it detects GETMAIN SHARED and FREEMAIN affinities, the address of the storage might have been passed to a third transaction. Add such transactions to the affinity transaction group.

## Compressing affinity data

If your temporary storage queue names contain a unique counter or a terminal name (termid), a very large number of basic affinity transaction groups might be created for what might seem to be a small number of logical queues.

For example, consider the queues ABCD0001 through ABCD1000, with the name comprising a fixed part (ABCD) and a counter 0001 through 1000. They might result in 1000 basic affinity transaction groups, each with relation, LUNAME, lifetime PCONV, and transactions ABCD and ABCE. These groups form one logical queue, ABCD\*, which causes an affinity that might be described by one affinity transaction group. However, the result is 1000 basic affinity transaction groups.

The affinity data might be more readable if compressed to its logical form. Use the Builder to do this, because it combines all affinity transaction groups that contain the same transaction ID. The Builder output for the previous example would be one affinity transaction group with relation LUNAME, lifetime PCONV, and transactions ABCD and ABCE.

---

## Chapter 9. Running the Program Threadsafe report

The threadsafe report can be executed from the IA Explorer plug-in or as a batch job using sample CIUJTSQ2 that can be found in SCIUSAMP.CICS. The report executes the DB2 stored procedure CIUSPTR.

The stored procedure gathers the data required to generate the report from the following DB2 table:

- CIU\_CICS\_DATA
- CIU\_DB2\_DATA
- CIU\_MQ\_DATA
- CIU\_IMS\_DATA
- CIU\_REGION\_INFO
- CIU\_FILE\_DETAIL **1**
- CIU\_PROGRAM\_DETAIL **1**
- CIU\_THREADSAFE\_CMD **2**
- **1** To obtain data for the CIU\_PROGRAM\_DETAIL and CIU\_FILE\_DETAIL you must select the **DETAILED** collection option when configuring your collector options. For more information, see “Specifying region-specific options: API and SPI commands to be monitored” on page 86.
- **2** To populate the CIU\_THREADSAFE\_CMD table you must run the sample job SCIUSAMP.DB2(CIUTSLOD). This is part of the installation and configuration of CICS IA.

### Running the report

To run the threadsafe report edit, review the options and run the CIUJTSQ2 job found in SCIUSAMP.CICS.

The following options are available as input parameters from the CIUOPTS DD card:

#### COLLECTION\_ID

The collection ID that you want to run the report against. An asterisk can be used for wildcard requests, for example, **COLLECTION\_ID=\***. The default is all the collection IDs.

#### REGIONNAME

The region from which programs are analyzed. Asterisks can be used for wildcard request, for example, **REGIONNAME=\***. The default is all the regions in a PROGRAM table.

#### PROGRAMNAME

The name of the program or programs that you want to analyze. Asterisks can be used for wild card requests, for example, **PROGRAMNAME=\*ab\*c**. The default is all the programs in PROGRAM table.

#### CICSLEVEL

The CICS level for which the threadsafe analysis is considered. The default is the release level of the region for the program.

**Note:** You can use the **CICSLEVEL** parameter to run a report for a later level of CICS. For example, if you have collected data on a CICS TS V4.1 system you can run the report as if it was CICS TS V5.1 system. This report shows you how many of your commands are now threadsafe at this level.

#### **REPORT**

The type of report, for example, SUMMARY or DETAIL. The default is a DETAIL report.

#### **LINESPERPAGE**

The maximum number of lines that are written to the report before a page break. The value can be 30 - 99999. The default is 60 lines a page.

### **Analyzing the report**

The report assists in the following aspects of threadsafe analysis.

1. The threadsafe status of the command. The status can be as follows:

#### **Threadsafe**

An EXEC CICS command that does not cause a TCB swap.

#### **Non-Threadsafe**

An EXEC CICS command that can cause a TCB swap.

#### **Indeterminate Threadsafe**

An EXEC CICS command where it cannot be determined if the call causes a TCB swap.

2. The report also informs you if you have any of the following types of calls present.

#### **Dynamic call**

A call to another module at execution time. The call was not initiated with an EXEC CICS command.

#### **Threadsafe Inhibitor call**

An EXEC CICS command that can cause an unsafe affinity between transactions. You must investigate the call to determine if it inhibits the program from being threadsafe. These commands are, **ADDRESS CWA**, **LOAD HOLD**, **GETMAIN SHARED**, and **EXTRACT EXIT**.

#### **DB2 calls**

The calls to the CICS DB2 interface are threadsafe.

#### **IMS calls**

The calls to the CICS IMS interface are threadsafe from CICS TS V4.2 onwards.

#### **CPMS calls**

The calls to the CPMS interface are not threadsafe.

#### **MQ calls**

The calls to the CICS WebSphere MQ interface are threadsafe from CICS TS V3.2 onwards.

---

## **Analyzing the program dynamic analysis threadsafe report**

A sample of part of the report created by the program dynamic analysis threadsafe report program.

The threadsafe report consists of a header page and one or more pages of program data. The header page lists the report options used to create the report and

provides definitions for some of the terms used in the report. The remaining pages report on each program that meets the criteria specified by the report options PROGRAMNAME and REGIONNAME.

CICS INTERDEPENDENCY ANALYZER VERSION 5.1.0				2012/08/09:20.38.38		PAGE	1
Program Dynamic Analysis - THREADSAFE DETAIL LISTING FOR CICS TS							
Report options:							
COLLECTION_ID=*	REGIONNAME=*	PROGRAMNAME=*	CICSLEVEL=	REPORT=DETAIL	LINESPERPAGE=60		
Definitions of Terms:							
'Threadsafe' calls are EXEC CALLS commands that do not cause a TCB swap.							
'Non-Threadsafe' calls are EXEC CALLS commands that cause a TCB swap.							
'Indeterminate Threadsafe' calls are EXEC CALLS commands where it cannot be determined if the call causes a TCB swap.							
'Dynamic calls' are calls to modules at execution time. Programs that are called dynamically take on the same environment as the calling program.							
'Threadsafe Inhibitor calls' are EXEC CICS commands that need to be investigated further because they may prevent you from defining your program as threadsafe. These commands are: ADDRESS CWA, EXTRACT EXIT, GETMAIN SHARED, and LOAD.

Figure 55. Example programs dynamic analysis threadsafe report, main body

**1** For the detail and summary report, the programs requested by the report options PROGRAMNAME and REGIONNAME are listed. These program entries contain the following information:

#### APPLID

The application ID for the CICS region from which the Collector captured the program information. This field matches the report criteria specified by the REGIONNAME report option.

#### Program

The name of the program for which the information is reported.

#### Linkedit Date

The linkedit date of the program.

**Execution Key**

The storage key of the program. Values are CICS, USER, and NOTAPPLIC.

**Concurrency**

Indicates the concurrency attribute of the installed program definition.  
Values are: QUASIRENT and THREADSAFE.

**APIST**

Indicates the API attribute of the installed program definition. Values are: CICSAPI and OPENAPI.

**Storage Protect**

Indicates if storage protection was active for the program. Values are: ACTIVE or INACTIVE.

**CICS Rel**

The CICS release number for the region in which the program is running.

**LIB Dataset Name**

The 44-character name of the data set from which the program was loaded into the CICS region.

**2** For the detail report, all of the commands that were collected by the Collector for each program are listed. These command entries contain the following information:

**CMD Type**

The type of command invoked by the program. Values are: CICS, DB2, IMS, and MQ.

**Function**

The command function, as specified in the CIU\_CICS\_DATA table.

**Type** The resource type such as TS, or Program, as specified in the CIU\_CICS\_DATA table.

**Resource**

The name of the resource that the command was acting upon, as specified in the CIU\_CICS\_DATA table.

**Offset** The offset of the command from the start of the program module.

**Program Length**

The length of the program module. Used to help determine the program version.

**Use Count**

The number of times that the command was run.

**Threadsafe**

The threadsafe status of the command. Values are:

**Y** The command is threadsafe.

**Note:** The asterisk (\*) marks the threadsafe inhibitor call commands. These are commands that are potentially threadsafe, however you should investigate the command further because it might prevent a program from being threadsafe.

**N** The command is not threadsafe.

**I** The threadsafe status of the command is indeterminate. More investigation is needed to determine if the command is threadsafe.

**3** A summary of the types of commands issued by the program are listed after each program entry.

**CICS calls**

The number of **EXEC CICS** commands invoked by the program.

**Threadsafe**

The number of **EXEC CICS** commands invoked by the program that are threadsafe.

**Non-Threadsafe**

The number of **EXEC CICS** commands invoked by the program that are not threadsafe.

**Indeterminate Threadsafe**

The number of **EXEC CICS** commands invoked by the program that cannot be determined to be threadsafe or not.

**DB2 calls**

The number of DB2 commands invoked by the program.

**MQ calls**

The number of MQ commands invoked by the program.

**IMS calls**

The number of IMS commands invoked by the program.

**Dynamic calls**

The number of calls made to other modules by the program.

**Threadsafe Inhibitor calls**

The number of **EXEC CICS** commands invoked by the program for which you need to investigate the command further to determine if it prevents the program from being threadsafe.

---

## Chapter 10. Running the Load Module Scanner

The Load Module Scanner scans load modules for instances of program commands that could cause resource dependencies or transaction affinities.

This section describes how to run the CICS IA Load Module Scanner. The Load Module Scanner works by scanning the load modules for patterns of bits that might be commands.

The Load Module Scanner detects the use of:

- The dependency-related commands listed in “Dependency-related commands” on page 6
- The affinity-related EXEC CICS API and SPI commands listed in Affinity-related CICS API and SPI commands detected by the CICS IA Collector and the CICS IA Load Module Scanner
- MVS POST requests

You can use the Load Module Scanner to obtain any of the following:

- A summary printed report listing the total number of modules scanned, the total that contain possible dependency-causing or affinity-causing commands, and similar conditions by running the CIUJCLLS job.
- A summary printed report as above, with a separate list of modules that contain possible dependency-causing or affinity-causing commands, for input to a further job to produce a detailed report by running the CIUJCLLS job.
- A summary printed report as above, with or without a separate module list, with updates to the CIU\_SCAN\_SUMMARY DB2 table by running the CIUJCLTS job. Your own programs can process the scan results by querying the CIU\_SCAN\_SUMMARY table.
- A detailed printed report listing each possible dependency-causing or affinity-causing command in the scanned modules, with further information about the command by running the CIUJCLLD job.
- A detailed printed report as above, with updates to the CIU\_SCAN\_DETAIL DB2 table by running the CIUJCLTD job. Your own programs can process the scan results by querying the CIU\_SCAN\_DETAIL table.

You are recommended to use the Load Module Scanner by:

1. Create a summary report and module list to identify modules that contain possible dependency-causing or affinity-causing commands. See “Creating a summary report.”
2. Produce detailed reports to review modules that the summary report has identified. See “Creating a detailed report” on page 150.

---

### Creating a summary report

You can request a summary report from the Load Module Scanner by editing and running the CIUJCLLS job.

This job can also produce a separate list of modules that contain possible dependency-causing or affinity-causing commands, for input to the CIUJCLLD or CIUJCLTD job for more detailed reporting.

Before running the CIUJCLLS job, change the following as appropriate:

- The JOB accounting parameters
- The PARM keyword of the EXEC statement:

PARM= ' SUMMARY[,DETAILMODS] '

where:

#### **gjSUMMARY**

Specifies that a summary scan and report is required for the entire library, except for CICS modules, CICS IA modules, CICS tables, and those modules that cannot be loaded, because of an error.

#### **DETAILMODS**

Specifies that the names of those modules containing at least one possible dependency-causing or affinity-causing command are to be written to the sequential file defined by the INTMOD DD statement. This file might be used to restrict a subsequent detailed report, by specifying it on the DETAIL DD statement of a detailed report run of the Load Module Scanner.

- The STEPLIB DD statement; specify the name of the CICS IA load library in which you have installed the Load Module Scanner program, CIULMS. The default is hlq.SCIULOAD, where hlq is the data set qualifier assigned during installation.
- The INPUT DD statement; specify the name of the load library to be scanned.
- The SYSPRINT DD statement; specify the destination for the summary report.
- The INTMOD DD statement; specify the name of the sequential data set to which the list of modules that contain possible dependency-causing or affinity-causing commands is to be sent. You can edit the data set to alter the list of modules to be scanned before running the Load Module Scanner to produce a detailed report.
- The CIUPRINT DD statement; specify the destination of error messages (SYSOUT=\*).

You do not need the DETAIL DD statement, dummy, for a summary run.

Each summary report contains:

- A separate line giving the following information about each module in the library:
  - Name
  - Size
  - Language (if determined)
  - Language version: Language Environment (LE) or non-LE
  - Number of possible affinity-causing commands
  - Number of possible dependency-causing commands
  - Number of possible MVS POST commands

**Note:** If a load module is created from several source languages, only one language is indicated.

- The total count of:
  - Modules in the library
  - Modules scanned
  - CICS modules and tables (not scanned)
  - Modules in error (not scanned)
  - Modules that contain MVS POST commands
  - Modules that contain commands that might cause dependencies

- Modules that contain commands that might cause affinities
- Assembler modules
- C modules
- COBOL modules
- PL/I modules

Figure 56 is an example of a summary report produced by the Load Module Scanner.

Total number of possible Dependency commands	= 17
Total number of possible Affinity commands	= 17

Figure 56. Example of a summary report produced by the Load Module Scanner

## Creating a summary report with DB2 output

You can request a summary report, with DB2 output, by editing and running the CIUJCLTS job.

The CIUJCLTS job updates the CIU\_SCAN\_SUMMARY DB2 table with the results of the scan. Your own programs can then process the scan results by querying the CIU\_SCAN\_SUMMARY table.

Like CIUJCLLS, the CIUJCLTS job can also produce a separate list of modules that contain possible dependency-causing or affinity-causing commands, for input to the CIUJCLLD or CIUJCLTD job for more detailed reporting.

Before running the CIUJCLTS job, change the following:

- The JOB accounting parameters

- The PARM keyword of the EXEC statement:

PARM= ' SUMMARY[,DETAILMODS] [,TABLE] '

where:

#### **SUMMARY**

Specifies that a summary scan, and report, is required for the entire library, except for CICS modules, CICS IA modules, CICS tables, and those modules that cannot be loaded, because of an error.

#### **DETAILMODS**

Specifies that the names of those modules containing at least one possible dependency-causing or affinity-causing command are to be written to the sequential file defined by the INTMOD DD statement. This file might be used to restrict a subsequent detailed report, by specifying it on the DETAIL DD statement of a detailed report run of the Load Module Scanner.

#### **TABLE**

Specifies that the results of the summary scan are to be written to the DB2 table CIU\_SCAN\_SUMMARY.

- The SYS keyword of the PARM keyword of the EXEC statement; specify the name of the DB2 subsystem.
- The STEPLIB DD statement; specify the name of the CICS IA load library in which you have installed the Load Module Scanner program, CIULMS. The default is hlq.SCIULOAD, where hlq is the data set qualifier assigned during installation.  
In the concatenation DD statement, specify the name of the DB2 load library. The default is db2hlq.SDSNLOAD, where db2hlq is the data set qualifier assigned to the DB2 subsystem during installation.
- The INPUT DD statement; specify the name of the load library to be scanned.
- The SYSPRINT DD statement; specify the destination for the summary report.
- The INTMOD DD statement; specify the name of the sequential data set to which the list of modules that contain possible dependency-causing or affinity-causing commands is to be sent. You can edit the data set to alter the list of modules to be scanned before running the Load Module Scanner to produce a detailed report.

You do not need the DETAIL DD statement, dummy, for a summary run.

---

## **Creating a detailed report**

You can request a detailed report from the Load Module Scanner by editing and running the job CIUJCLLD.

Change the following statements as appropriate:

- The JOB accounting parameters
- The PARM keyword of the EXEC statement

PARM= 'DETAIL[,ALL] '

where:

#### **DETAIL**

Specifies that a detailed scan and report is required. The extent of the scan is defined by either the ALL parameter or the DETAIL DD statement.

### ALL

Specifies that all modules in the load library are to be scanned for possible dependency-causing and affinity-causing commands.

If ALL is omitted, only those modules listed in the file specified on the DETAIL DD statement are scanned. This file would normally be from the INTMOD DD output of a Load Module Scanner summary report run, which you can edit before creating a detailed report.

- The STEPLIB DD statement, specify the name of the CICS IA load library in which you have installed the Load Module Scanner program, CIULMS. The default is hlq.SCIULOAD.
- The INPUT DD statement, specify the name of the load library to be scanned.
- The SYSPRINT DD statement, specify the destination for the detailed report.
- The DETAIL DD statement, specify the name of the data set containing the list of modules to be scanned. This list might be created initially as the output from a summary run of the Load Module Scanner. If you specify ALL on the PARM statement, change the DETAIL DD statement to specify //DETAIL DD DUMMY.
- CIUPRINT DD statement; specify the destination of error messages (SYSOUT=\*).

You do not need the INTMOD DD, dummy, statement for a detailed run.

## Contents of a detailed report

An example of a detailed report produced by the Load Module Scanner.

Each detailed report contains a section for each module, with these contents:

- A header line giving the name, size, and entry point of the module.
- A line for each possible dependency-causing, affinity-causing, and MVS POST command found, giving:
  - The offset of the command argument zero declaration from the start of the load module. This offset is not the same as the offset given by the Reporter; the offset given by the Reporter is for the command itself.
  - The contents of the command argument zero declaration, in hexadecimal.
  - The EDF DEBUG line number, if present. The line number can provide a useful clue for identifying false dependencies. If a section of a load module was translated with the DEBUG option, EDF DEBUG line numbers are given. For such a module, the absence of a DEBUG line number might indicate that what was found was not an argument zero.
  - What the command appears to be, for example, WRITEQ TS.
  - Whether the command appears to be a dependency-causing command.
  - The type of affinity, if any, that might be caused by this command.
- A summary report of the modules, giving:
  - The total possible affinity-causing commands
  - The total possible dependency-causing commands
  - The total possible MVS POST commands
- Library totals, as for the summary report, but only for those modules selected for the detailed run.

An example of a detailed report produced by the Load Module Scanner is below:

```
CICS INTERDEPENDENCY ANALYZER Version 3.2.0                      09/01/11    Page    1
LOAD MODULE SCANNER - DETAILED LISTING OF CICSTLS.STRESS.LOADLIB

## Creating a detailed report with DB2 output

You can request a detailed report, with DB2 output, by editing and running the CIUJCLTD job.

The CIUJCLTD job updates the CIU\_SCAN\_DETAIL DB2 table with the results of the scan. Your own programs can then process the scan results by querying the CIU\_SCAN\_DETAIL table.

Before running the CIUJCLTD job, change the following:

- The JOB accounting parameters
- The PARM keyword of the EXEC statement

PARM='DETAIL[,ALL][,TABLE]'

where:

**DETAIL**

Specifies that a detailed scan and report is required. The extent of the scan is defined by either the ALL parameter or the DETAIL DD statement.

**ALL**

Specifies that all modules in the load library are to be scanned for possible dependency-causing and affinity-causing commands.

If ALL is omitted, only those modules listed in the file specified on the DETAIL DD statement are scanned. This file would normally be from the INTMOD DD output of a Load Module Scanner summary report run, which you can edit before creating a detailed report.

**TABLE**

Specifies that the results of the summary scan are to be written to the DB2 table CIU\_SCAN\_SUMMARY.

- The SYS keyword of the PARM keyword of the EXEC statement, specify the name of the DB2 subsystem.
- The STEPLIB DD statement, specify the name of the CICS IA load library in which you have installed the Load Module Scanner program, CIULMS. The default is hlq.SCIULOAD.

In the concatenation DD statement, specify the name of the DB2 load library. The default is db2hlq.SDSNLOAD, where db2hlq is the data set qualifier assigned to the DB2 subsystem during installation.

- The INPUT DD statement, specify the name of the load library to be scanned.
- The SYSPRINT DD statement, specify the destination for the detailed report.
- The DETAIL DD statement, specify the name of the data set containing the list of modules to be scanned. This list might be created initially as the output from a summary run of the Load Module Scanner. If you specify ALL on the PARM statement, change the DETAIL DD statement to specify //DETAIL DD DUMMY.

You do not require the IMTMOD DD, dummy, statement for a detailed run.

---

## Chapter 11. Running the CSECT Scanner

This section describes how to run the CICS IA CSECT Scanner. The CSECT Scanner scans load modules for information that can be used to identify the version of each CSECT.

The output is stored in DB2 tables and can be used, in conjunction with the DB2 dependency tables, to identify different versions of programs.

For each load module the CSECT Scanner records:

- Load module length
- Entry point offset
- AMODE
- RMODE
- Linkage editor or binder identifier and version
- Linkage edit or bind timestamp

For each CSECT the CSECT Scanner records:

- Translator (compiler) identifier and version
- Translation (compile) date
- User data specified on the Linkage Editor IDENTIFY control statement
- HMASPZAP data, specified during HMASPZAP processing

The Scanner generates a printed report. Optionally, the load module information is added to the CIU\_PROGRAM\_INFO DB2 table and the CSECT information is added to the CIU\_CSECT\_INFO table.

To help you identify translators and linkage editors, a third DB2 table, CIU\_TRANSLATORS, is preloaded with information about the IBM assemblers, compilers, linkage editors, and binders that are likely to be found. You can use this table to convert translator identifiers into more easily understood descriptions.

The key items of information in the DB2 dependency tables that can be used to identify load module versions are program name and program length. This information is not ideal because the program length is not always unique for each version of a program; however, it is all that is available to the Collector at run time. Also, the length of programs placed in a Partitioned Data Set Extended (PDSE) can be rounded up to multiples of 4 KB, to prevent this rounding specify the FETCHOPT(PACK,PRIME) option when link-editing the programs.

Run the CSECT Scanner whenever load libraries that contain programs for which interdependency data is being collected are changed. This run adds information about any new or changed programs and CSECTS to the DB2 tables. The structure of the tables produced by the CSECT Scanner is shown in “The structure of the CSECT Scanner objects” on page 230.

You can use the CSECT Scanner database objects with the Dependency database objects to compare the dependencies of different versions of a program. You can also use the two database objects to identify dependency data that applies only to an old version of a program, so that the data can be deleted.

---

## The CIUJCLCS job

Run the CSECT Scanner by editing and running the CIUJCLCS job.

This job produces a printed report and updates the CIU\_PROGRAM\_INFO and CIU\_CSECT\_INFO DB2 tables.

Before running the CIUJCLCS job, change the following as appropriate:

- The JOB accounting parameters
- The PARM keyword of the EXEC statement:  
`PARM= ' [TABLE] '`  
where TABLE specifies that the results of the scan are to be added to the DB2 tables CIU\_PROGRAM\_INFO and CIU\_CSECT\_INFO.
- The SYS keyword of the PARM keyword of the EXEC statement; specify the name of the DB2 subsystem.
- The STEPLIB DD statement; specify the name of the CICS IA load library where you have installed the CSECT Scanner program, CIUCSS. The default is hlq.SCIULOAS, where hlq is the high-level data set qualifier assigned during installation.

In the concatenation DD statement, specify the name of the DB2 load library. The default is db2hlq.SDSNLOAD, where db2hlq is the high-level data set qualifier assigned to the DB2 subsystem during installation.

- The LOADLIB DD statement; specify the name of the load library to be scanned.
- The SYSPRINT DD statement; specify the destination for the printed report.

---

## Contents of the printed report

The printed report has two line formats, one for load module information and one for CSECT information.

The load module information consists of:

- Program (load module) name.
- Program length in hexadecimal.
- Entry point offset in hexadecimal.
- If the program name is an alias, the name of the program of which it is an alias. CSECT information is not listed for aliases.
- Binder or linkage editor identifier.
- Binder or linkage editor version.
- Bind or link-edit timestamp.
- Addressing mode (AMODE).
- Residency mode (RMODE).

The CSECT information consists of:

- CSECT name.
- First translation date.
- First translator identifier.
- First translator version.
- Second translation date.
- Second translator identifier.
- Second translator version.
- User data date.
- User data.
- HMASPZAP date.
- HMASPZAP data.

Below is an example of a report produced by the CSECT Scanner:

## Chapter 12. Running the Builder

The CICS IA Builder runs as a batch job to build affinity-transaction-group definitions suitable for input to the CICS system management product, CICSplex SM.

The Builder takes as input a set of files containing basic affinity transaction groups, combines those groups, and produces a file containing combined affinity transaction groups. CICSplex SM requires a transaction identifier to be in one transaction group only, and the Builder satisfies this by combining groups that contain the same transaction identifier.

You can use the CICS IA Affinities Reporter to produce files of basic transaction affinity groups for input to the Builder. The input to the Reporter, in the Affinity database objects, can be from several runs of the Collector, for example, against a production CICS region and a test CICS region, but must be for the same workload.

The rest of this section contains the following information:

- “Editing the CIUAFFBL job”
- “Syntax for input to the Builder” on page 162
- “Output from the Builder” on page 165

---

### Editing the CIUAFFBL job

To run the Builder, edit and run the CIUAFFBL job.

Before running the CIUAFFBL job, change the values of the parameters listed below, as appropriate.

The changes you make to the job stream are similar to those described in Updating the Affinity database objects and are listed in the header of the JCL file.

- The JOB accounting parameters
- The PARM parameter of the EXEC statement

For example:

```
//BUILD    EXEC PGM=CIUBLD,  
// PARM=('STATE=ACTIVE,MATCH=LUNAME,DSPSIZE=16',  
//      'CONTEXT=CICPLEX1')
```

**[DSPSIZE={16|number}].**

Specify the size, in the range 2 through 2000 (MB), of the data space created internally by the Builder to store the group tables.

**[MATCH={LUNAME|USERID}].**

Specify the filter that CICSplex SM will use for workload separation, and which applies to all combined affinity groups produced by the Builder.

**[STATE={ACTIVE|DORMANT}].**

Specify whether the combined affinity groups are to be defined as active or dormant to CICSplex SM.

**[CONTEXT=plexname].**

Specify the name, one through eight characters, of a CICSplex. If you specify

this parameter, the Builder generates a CICSplex SM CONTEXT statement, which enables CICSplex SM to associate the combined affinity transaction groups with a particular CICSplex that it is managing. The default is to not generate a CONTEXT statement; in which case, CICSplex SM assumes the local CICS-managed address space (CMAS).

For more information about defining transaction groups to CICSplex SM, see *CICSplex SM Managing Business Applications*.

- The STEPLIB DD statement; specify the name of the CICS IA load library in which you have installed the Builder program, CIUBLD.
- The REPGRPS DD statement; specify the concatenation of names of the sequential data sets containing the basic affinity transaction groups to be input to the Builder. The Builder reads the lines of the input data sets and checks them for syntax and logic errors. For information about the valid syntax, see “Syntax for input to the Builder.”
- The AFFGRPS DD statement; specify the name of the sequential data set to which the combined affinity transaction groups are to be sent. This data set is suitable for input to CICSplex SM.
- The SYSPRINT DD statement; specify the destination for the report output by the Builder.

---

## Syntax for input to the Builder

The syntax in the sequential data sets used as input for the Builder is similar, but not identical, to that allowed by CICSplex SM.

For more information, see *CICS Transaction Server for z/OS Installation Guide*. The differences are given in the following list:

- The only statements you can supply are:
  - CREATE statements for TRANGRPs and DTRINGRPs.
  - REMOVE statements for TRANGRPs.
  - TEXT statements and line comments. A line comment is a line that starts with an asterisk (\*) in column 1.
  - HEADER statements for the Builder, but not for a CICSplex SM statement.
- Block comments delimited by '/\*' and '\*/' are not recognized.
- Transaction group names of up to 11 characters are allowed. CICSplex SM allows only 8 characters.
- A CREATE TRANGRP statement must have exactly one NAME, one AFFINITY, and one AFFLIFE value. MATCH and STATE values are optional and ignored; they are overridden by the values on the PARM statement or the default. A DESC value is optional and ignored. Any other keywords are reported as errors.
- A CREATE DTRINGRP statement must have exactly one TRANGRP and one TRANID value. Any other keywords are reported as errors.
- REMOVE TRANGRP statements are optional and are ignored by the Builder. However, if a REMOVE TRANGRP statement appears in an input data set, it must have exactly one NAME value. Any other keywords are reported as errors.
- CONTEXT statements in the input data set are optional and are ignored by the Builder. They are overridden by the CONTEXT operand of the PARM statement, if specified, or the default.
- A HEADER statement requires no keyword. APPLID, SAVEDATE, and SAVETIME are all optional, and, if specified, their values are not validated. The

HEADER statement must end in a semi-colon (;) and not span lines. Each input data set must start with a HEADER statement. See “HEADER statements” on page 164.

- If a line comment contains the characters HEADER anywhere in it, it is not treated as a comment and is parsed like any ordinary line in case it is a HEADER statement. Otherwise comment lines are thrown away.
- The only valid values for AFFINITY are GLOBAL, LUNAME, USERID, BAPPL , and LINK3270. NONE is not allowed.
- Keywords and values, including surrounding brackets, must not be split across input lines.
- Nested brackets are not allowed within values.
- The Builder is case-sensitive, both for keywords and their values. Keywords must be in uppercase.

Any syntax error causes an error message to be issued. Logic errors are also possible; for example, CREATE DTRINGRP before CREATE TRANGRP can cause error messages to be issued.

Any such errors do not cause the Builder to terminate immediately, but normally cause a skip to either the next keyword or the next statement, depending on the error. The Builder terminates with a return code of 8 when EOF is finally reached. An error report lists all errors encountered. For each error, the line containing the error is produced, with up to four preceding lines for the same statement to put the error in context, and the error message. The input syntax is shown in Figure 57 on page 164.

```

input_statement = {create_statement |
                   remove_statement |
                   header_statement |
                   context_statement |
                   comment}
create_statement = CREATE
                  {create_trangrp |
                   create_dtringrp}
                  ;
create_trangrp   = TRANGRP
                  NAME      (Trangroup)
                  AFFINITY  ({GLOBAL|LUNAME|USERID})
                  AFFLIFE   ({PERMANENT|SYSTEM|LOGON|SIGNON|PCONV})
                  [DESC     (string)]
                  [MATCH    ({LUNAME|USERID})]
                  [STATE    ({ACTIVE|DORMANT})]
create_dtringrp  = DTRINGRP
                  TRANGRP (Trangroup)
                  TRANID  (tranid)
remove_statement = REMOVE
                  TRANGRP
                  NAME      (Trangroup)
                  ;
context_statement = CONTEXT
                  [plexname]
                  ;
header_statement  = HEADER
                  [APPLID   (applid)]
                  [SAVEDATE (date)]
                  [SAVETIME (time)]
                  ;
comment           = '*'
                  [string |
                   header_statement]

```

*Figure 57. Builder input syntax*

## HEADER statements

The HEADER statement is specific to the Builder and is not a CICSplex SM statement. It is produced by the Affinities Reporter and is needed by the Builder to create unique transaction-group names.

The Affinities Reporter generates temporary transaction group names, for example, CW.00000001 and TS.00000001, while it is running, and stores these names in the output data set for that run. However, the Builder can take several Reporter data sets as input, and might therefore obtain the same transaction group name from different input data sets, describing different affinity transaction groups.

To ensure that the transaction group names are unique, the input transaction group names are qualified by the input data set name. To do this, when the Builder reads a HEADER statement, the first line of an input data set, it obtains the data set name from MVS. The HEADER statement is vital because without it the Builder cannot detect the change from one input data set to another.

If you omit a HEADER statement, the Builder might generate error messages or add transactions to the wrong group, and give incorrect line numbers in the error report and an incomplete report of data sets processed.

---

## Output from the Builder

The Builder produces a file containing a set of definitions of combined affinity transaction groups and a report listing the combinations that occurred.

### Combined affinity-transaction-group definitions

Before each definition of a combined group in the output file, the Builder adds a commented-out REMOVE command for that group. If you already have combined groups of the same name, check that it is appropriate to delete them before you uncomment the REMOVE command.

The name of each combined affinity transaction group is derived from the first alphanumeric transaction identifier in the combined group. For example, if ABCD was first, the transaction group name would be ABCDGRP.

For CICSplex SM, the name of each combined affinity transaction group must be unique.

Figure 58 shows a set of combined definitions. A MATCH filter of LUNAME, a STATE of ACTIVE, and a CONTEXT of CICIPLEX1 were specified on the PARM parameter of the EXEC statement.

```
* HEADER  APPLID(BUILDER )  SAVEDATE(07/09/27)  SAVETIME(12:00:51);      1
*
* Generated by the CICS IA TRANSACTION AFFINITIES (Builder) on 2007/09/27
* Note: Suitable for input to CICSplex SM
*
CONTEXT CICIPLEX1;
*
* REMOVE TRANGRP NAME(AFF1GRP );
CREATE TRANGRP NAME(AFF1GRP ) AFFINITY(LUNAME) AFFLIFE(SYSTEM )
      MATCH(LUNAME) STATE(DORMANT);
  CREATE DTRINGRP TRANGRP(AFF1GRP ) TRANID(AFF1);
  CREATE DTRINGRP TRANGRP(AFF1GRP ) TRANID(AFF2);
  CREATE DTRINGRP TRANGRP(AFF1GRP ) TRANID(AFF3);
  CREATE DTRINGRP TRANGRP(AFF1GRP ) TRANID(AFF4);
  CREATE DTRINGRP TRANGRP(AFF1GRP ) TRANID(AFF5);
  CREATE DTRINGRP TRANGRP(AFF1GRP ) TRANID(AFF6);
  CREATE DTRINGRP TRANGRP(AFF1GRP ) TRANID(AFF7);
  CREATE DTRINGRP TRANGRP(AFF1GRP ) TRANID(AFF8);
*
* REMOVE TRANGRP NAME(AFTDGRP );
CREATE TRANGRP NAME(AFTDGRP ) AFFINITY(LUNAME) AFFLIFE(PCONV )
      MATCH(LUNAME) STATE(DORMANT);
  CREATE DTRINGRP TRANGRP(AFTDGRP ) TRANID(AFTD);
  CREATE DTRINGRP TRANGRP(AFTDGRP ) TRANID(AFTR);
  CREATE DTRINGRP TRANGRP(AFTDGRP ) TRANID(AFTW);
*
* REMOVE TRANGRP NAME(AUXXGRP );
CREATE TRANGRP NAME(AUXXGRP ) AFFINITY(GLOBAL) AFFLIFE(SYSTEM )
      MATCH(LUNAME) STATE(DORMANT);
  CREATE DTRINGRP TRANGRP(AUXXGRP ) TRANID(AUXX);
  CREATE DTRINGRP TRANGRP(AUXXGRP ) TRANID(CWA1);
```

Figure 58. Sample definitions for combined affinity transaction groups

#### Note:

1. The values of the SAVEDATE and SAVETIME fields in the HEADER statement give the latest save date and save time from any of the input data sets. See Figure 58 ( 1 ) and Figure 59 on page 168.

2. The combined transaction groups can be provided again to the Builder. For example, you might decide to:
  - a. Use the Affinities Reporter, then the Builder, to produce combined groups for temporary storage affinities.
  - b. Use the Affinities Reporter, then the Builder, to produce combined groups for all other affinity command types.
  - c. Merge the two files produced by the Builder in steps 2a and 2b, by providing those files to the Builder together.
  - d. Provide to CICSplex SM the file produced by the Builder in step 2c.

### Combining basic affinity transaction groups

When the Builder combines two basic affinity transaction groups, it assigns relations and lifetimes to the combined group based on the relations and lifetimes derived from the basic groups.

This assignment might cause some worsening of the relations and lifetimes. For example, LUNAME combined with USERID gives GLOBAL. Table 20 through Table 25 on page 167 show the relations and lifetimes that result from combining basic affinity transaction groups.

To help you analyze the effect of combining basic transaction affinity groups, the Builder produces a report that lists the combinations that occurred.

*Table 20. Resulting affinity relations*

Relation A	Relation B	Resulting relation C
GLOBAL	Any relation	GLOBAL
BAPPL	BAPPL	BAPPL
BAPPL	LUNAME	GLOBAL
BAPPL	USERID	GLOBAL
LINK3270	LINK3270	LINK3270
LINK3270	BAPPL	GLOBAL
LINK3270	LUNAME	GLOBAL
LINK3270	USERID	GLOBAL
LUNAME	LUNAME	LUNAME
LUNAME	USERID	GLOBAL
USERID	USERID	USERID

*Table 21. Resulting affinity lifetimes (LUNAME relation)*

Lifetime X	Lifetime Y	Resulting lifetime Z

Table 25. Resulting affinity lifetimes (GLOBAL relation)

Lifetime X	Lifetime Y	Resulting lifetime Z
PERMANENT	Any lifetime	PERMANENT
Any other lifetime combination		SYSTEM

## Data sets processed report

The data sets processed report gives the names of all the input data sets, specified on the REPGRPS DD statement, that were read.

This report is produced even if errors occur in the input data sets.

Only data sets that contain a HEADER statement appear in the report.

	CICS APPLID	Collector Last Save Date	Collector Last Save Time
-----	-----	-----	-----
CICSPDN1.TRANGRPS.MERGE1	CICSPDN1	07/10/25	09:05:09
CICSPDN1.TRANGRPS.MERGE2	CICSPDN1	07/10/26	15:22:34
CICSPDN1.TRANGRPS.ONE	CICSPDN1	07/10/27	12:00:51

Figure 59. Sample data sets processed report

## Empty transaction groups report

The empty transaction groups report gives all basic transaction groups (Trangroups) that were defined, but contained no transactions.

It is produced only if the input data sets have no errors. An empty Trangroup probably indicates that you have made a mistake. The Reporter cannot produce empty Trangroups, so you must have created the input by hand, and probably omitted some corresponding CREATE DTRINGRP statements.

CICSPDN1.TRANGRPS.EMPTY1					
G1	(GLOBAL SYSTEM )	G2	(GLOBAL PERMANENT)	G3	(GLOBAL SYSTEM )
CICSPDN1.TRANGRPS.EMPTY2					
L2	(LUNAME PERMANENT)	L3	(LUNAME LOGON )	L4	(LUNAME PCONV )

Figure 60. Example empty Trangroups report

## Group merge report

For each combined group, the group merge report gives the constituent transactions and basic groups that comprise the combined group and provides a type of audit trail.

It is produced only if there are no errors in the input data sets. It is very useful when establishing which basic group has caused the severe worsening of an affinity lifetime. For example, in Figure 61 on page 169, four groups were merged: three were LUNAME and PCONV, and one was LUNAME and SYSTEM. The latter caused the lifetime worsening.

```

Trangroup   : AFF1GRP
Affinity    : LUNAME
Lifetime    : SYSTEM
Match       : LUNAME
State       : DORMANT
  Consists of Transactions
    AFF1 AFF2 AFF3 AFF4 AFF5 AFF6 AFF7 AFF8
  Consists of groups merged from
    CICSPDN1.TRANGRPS.MERGE1
      TS.00000001 (LUNAME PCONV ) TS.00000002 (LUNAME PCONV )
    CICSPDN1.TRANGRPS.MERGE2
      TS.00000001 (LUNAME SYSTEM ) TS.00000002 (LUNAME PCONV )
Trangroup   : AFTDGRP
Affinity    : LUNAME
Lifetime    : PCONV
Match       : LUNAME
State       : DORMANT
  Consists of Transactions
    AFTD AFTR AFTW
  Consists of groups merged from
    CICSPDN1.TRANGRPS.ONE
      TS.00000001 (LUNAME PCONV ) TS.00000002 (LUNAME PCONV )
Trangroup   : AUXXGRP
Affinity    : GLOBAL
Lifetime    : SYSTEM
Match       : LUNAME
State       : DORMANT
  Consists of Transactions
    AUXX CWA1
  Consists of groups merged from
    CICSPDN1.TRANGRPS.ONE
      CW.00000001 (GLOBAL SYSTEM )
  
```

Figure 61. Sample group merge report

## Error report

The error report gives the syntax or logic of any errors that were detected in the processing of the input files.

## BUILDER REPGRPS ERROR REPORT

Dataset = CICSPDN1.TRANGRPS.ERR1

Line Number Statement in error

```

-----
5  CREATE TRANGRP NAME(G3          ) AFFINITY(GLOBAL) AFFLIFE(LOGON  );
   CIUAU5038 INVALID AFFLIFE for AFFINITY.
6  CREATE TRANGRP NAME(G4          ) AFFINITY(GLOBAL) AFFLIFE(SIGNON );
   CIUAU5038 INVALID AFFLIFE for AFFINITY.
7  CREATE TRANGRP NAME(G5          ) AFFINITY(GLOBAL) AFFLIFE(PCONV  );
   CIUAU5038 INVALID AFFLIFE for AFFINITY.

```

Dataset = CICSPDN1.TRANGRPS.ERR2

Line Number Statement in error

```

-----
11 CREATE TRANGRP NAME(L4          ) AFFINITY(LUNAME) AFFLIFE(SIGNON );
   CIUAU5038 INVALID AFFLIFE for AFFINITY.
15 CREATE TRANGRP NAME(U3          )
16     AFFINITY(USERID) AFFLIFE(LOGON  );
   CIUAU5038 INVALID AFFLIFE for AFFINITY.

```

*Figure 62. Sample error report*

Each error is accompanied by a message. For a description of the message, see Appendix D, “Messages and codes,” on page 269.

---

## Chapter 13. Running the sample DB2 query

This section describes how to run the sample CICS IA batch query job CIUJSAMP.

It also describes how the supplied samples are run using the DB2 SQL Processing Using File Input (SPUFI) interface. The sample job uses the DB2 program DSNTEP2. It is a sample program and must be compiled, link-edited, and bound as usual. These programs are documented in the *DB2 Utility Guide and Reference* and the *DB2 Application Programming and SQL Guide*. SPUFI is a part of the distributed DB2 product. An installation job is used to bind it. For further information, see the *DB2 Utility Guide and Reference*.

---

### The CIUJSAMP job

This CIUJSAMP job produces SQL output for the sample query you have selected.

Run the sample query JCL by editing and running the job CIUJSAMP. Before running CIUJSAMP, edit it to meet the requirements of your system.

### Tailoring the job for your environment

Steps to take to ensure that the CIUJSAMP job will run in your environment.

#### About this task

1. Edit the job card to meet the requirements of your own system.
2. Change the following parameters:
  - \_dbid\_**  
Your DB2 identifier (ID)
  - \_hlq\_** The high-level qualifier for CICS IA
  - \_db2hlq\_**  
The high-level qualifier of the DB2 SDSNLOAD data set
  - \_db2runhlq\_**  
The high level qualifier for the DB2 RUNLIB.LOAD data set
3. Select the SCIUSQL sample you want to run. Each sample contains several SQL queries. You can review and edit these members before running the job.

### Running SPUFI

The sample SQL members can be run using the DB2 supplied utility SPUFI.

Contact your DB2 administrator to see if SPUFI is available at your site.

---

## Chapter 14. Solving problems

This section helps you to isolate and determine the cause of CICS IA problems.

It contains these sections:

- “Overview of CICS IA problem determination”
- “Dealing with errors”
- “Contacting IBM Support” on page 178

---

### Overview of CICS IA problem determination

This section describes tools and techniques that you can use to find the cause of a problem, and suggests one or more actions for solving it.

Software problems are generally defined by a symptom or set of symptoms. Problem determination involves classifying the symptoms and tracing them back to the source of the error.

Sometimes you cannot solve the problem yourself. For example, limitations in the hardware or software you are using could be causing the problem. If the cause of the problem is in the CICS IA code, you might need to contact IBM for further help.

CICS IA interfaces with several other components:

- DB2
- One or more CICS address spaces
- VSAM RLS
- The z/OS operating system
- The CICS IA plug-in for CICS Explorer

Problem determination might involve examining information from other products. If you determine that the error lies outside the CICS IA components reference the problem determination documentation for these other products.

---

### Dealing with errors

Steps to take to try to solve errors with CICS IA.

#### Collector errors

If the CINT, CINB or CINC transaction or an exit program, encounters a serious error the Collector stops by terminating CINT, CINB and CINC.

CINT, CINB and CINC termination codes:

- A code in the IUxx range accompanied by messages on the CINT transient data queue that indicate the cause of the error.
- One of the other CICS transaction abend codes. For a description of the code, see the *CICS Messages and Codes* manual.

If the CINT transaction stops with code ATCH, ATNI, or AKCT, the Collector continues to collect data. For all other codes from either the CINT, CINB or CINC transaction, the Collector is stopped. After performing the actions suggested by the message explanations, you can restart the Collector.

If a program check or MVS abnormal termination occurs in an exit program, it results in an abnormal termination of the transaction that caused the exit to be invoked, probably indicating a problem with the Collector. Use the CINT transaction to stop the Collector and contact your IBM Support Center if the evidence points to the Collector being at fault.

A termination code of AICA, might be caused by the Collector scanning the table of dependency or affinity data when the amount of data is very large. You can prevent this problem by increasing the value of the ICVR system initialization parameter.

## Preliminary checks

Before looking further for the cause of the problem, review the following preliminary checks. These checks might highlight a simple cause or, at least, narrow the range of possible causes.

### About this task

As you go through the questions, make a note of anything that might be relevant to the problem. Even if the observations you record do not at first suggest a cause, they could be useful later if you need to carry out systematic problem determination.

#### 1. Has CICS IA executed successfully before?

If CICS IA has not run successfully before perhaps an error has occurred during installation.

Have you applied all the prerequisite APARs?

Have you reviewed all the information in the CICS IA *Program Directory* and the latest information in the Preventive Service Planning (PSP) upgrade for CICS IA Version 3.2?

#### 2. Are there any messages explaining the failure?

If a problem is encountered, the CICS IA run time issues messages to the CINT transient data destination.

Check the CICS MSGUSR and JESMSGLG logs for any security-related messages: for example, message DFHXS1111 or ICH408I. Insufficient authority to start required CICS IA transactions can result in various failure symptoms.

#### 3. Can you reproduce the error?

If the failure can be reproduced, note the exact sequence of events required to re-create the problem. IBM support personnel might request the activation of various traces to determine the cause of the error situation.

#### 4. What to do next

If the preliminary checks have enabled you to find the cause of the problem, you can now resolve it. Use other information in the CICS library and in the libraries of other licensed programs. If you have not yet found the cause, look at the problem in greater detail. Begin by trying to classify the type of problem.

## Classifying the problem

One of the first requirements in solving a CICS IA problem is to determine what type of problem you are experiencing.

Problems can be classified into the following areas:

- Incorrect output or unexpected results
- Waits or hangs

- High CPU usage, perhaps caused by looping

Problems involving incorrect output or unexpected results can sometimes be the most difficult problems to solve. If you can re-create the problem, activating various levels of tracing usually provides IBM support personnel with sufficient information to solve the problem.

If the problem is a wait or hang, or high CPU usage on the CICS IA server, IBM support personnel might require a dump of the CICS IA address space.

## Supplying a CICS IA trace

For certain problem types, you might be asked to supply a CICS TS trace. To switch tracing on and off, use the Global Options Menu.

The Global Options Menu, CIU300, is shown in Figure 32 on page 96.

CICS TS trace can be obtained using the CICS trace utility program.

## Taking a dump of CICS IA

For certain types of problem, you might be asked to supply a dump of CICS IA. To request a dump of a CICS IA address space and its associated data space, use the MVS DUMP command.

You can issue the MVS DUMP command from the console. Use the ASID= keyword to identify the address space and the DSPNAME= keyword to identify the data space.

The data space name takes the form *nnnnn*INT, where *nnnnn* is a five-character number that can be obtained from the CICS IA Operations Statistics Menu, CIU150, shown in Figure 63. It is usually 00000INT.

CIU150	CICS Interdependency Analyzer for z/OS - V5R1M0		2012/07/31
	Statistics Menu for		01:16:31PM

		F5=Refresh	F6=
		F11=	F12=

Figure 63. Collector Statistics Menu panel, CIU150, showing the CICS IA data space name

To obtain the data space name for the CICS address space in which CICS IA is active, use the MVS DISPLAY ACTIVE command:

```
/D A,cicsname
```

where *cicsname* is the name of the CICS address space.

Figure 64 shows some example output from the MVS DISPLAY ACTIVE command. In this example, the *cicsname* is CICSTS0A, the ASID is 00A8 and the data space name is 00000INT. The data space name is also available from the CICS IA Operations Statistics Menu, shown above. In the following examples a dump for CICS region CICSTS0A has been taken, where CICSTS0A is the name of the CICS address space. The CICS applid for this region is IYCYZC3A and the CICS sysid is TS0A.

```
RESPONSE=MV2E

                        ADDR SPACE ASTE=04937A00
                        DSPNAME=DFHDT001 ASTE=5EA66400
                        DSPNAME=00000INT ASTE=049CCC80
```

Figure 64. Example output from an MVS DISPLAY ACTIVE command, showing a data space name of 00000INT

To dump this data space, use the following command, where *nn* and *mm* are the outstanding reply numbers:

```
/DUMP COMM=(IA DUMP)
/R nn,JOBNAME=CICSTS0A,CONT
/R mm,DSPNAME=('CICSTS0A'.00000INT),END
```

## Formatting the CICS IA Dump

If you use the MVS interactive problem control system (IPCS) to format and analyze CICS system dumps, you can use the CICS IA system dump formatting routine to format the CICS IA Collector data areas and trace, the dump formatting routine accessible to IPCS, as described in “CICS IA supplied modules required in the MVS link list” on page 57. When your CICS system dump is formatted by the CICS release-dependent formatting routine, the CICS IA Collector data areas and trace are also formatted under the heading “CICS Interdependency Analyzer Control Blocks”.

Use the IPCS command:

```
IPCS VERBX DFHPDnnn 'ft'
```

where *nnn* is the CISC TS version; for example DFHPD650. This command invokes the feature table and routine for a CICS TS dump. The CICS IA feature routines are called CIUIADUF and CIUICDUF, and can be located in the output by searching on **=CIUIADUF** (or **=CIUICDUF**).

For example:

```
=CIUIADUF: Feature routine
===IA: CICS Interdependency Analyser Control Blocks
Collector status: FAILING           Collecting: INTERDEPENDENCIES
Date last started: 20110125         Time last started: 145212
Date last saved:                   Time last saved:
Saves: 0      Records last save: 0  Pauses: 0      Records total: 146
```

## CICS IA plug-in for CICS Explorer level

The CICS IA plug-in and APAR level are obtained from two places. The IBM Support team will ask for one or both of these.

### About this task

- The level of the SMP/E zip file in SCIUJAVE or SCIUJAVK can be obtained by querying the CIU\_VERSION table:

```
SELECT DB_APAR_LEVEL,EXP_APAR_LEVEL,EXP_MIN_VER,EXP_LATEST_VER FROM CIU_VERSION
```

where:

#### **DB\_APAR\_LEVEL**

The APAR level of the latest changes to the CICS IA database.

#### **EXP\_APAR\_LEVEL**

The APAR level of the latest changes to the CICS IA plug-in.

#### **EXP\_MIN\_VER**

The minimum level of the CICS IA plug-in required on your workstation.

#### **EXP\_LATEST\_VER**

The latest level of the CICS IA plug-in that is available to download.

The CICS IA plug-in startup routine checks to see if it is equal to, or greater than, the EXP\_MIN\_LEVEL and issues an appropriate message to inform you to download and install the latest level of the CICS IA plug-in. The startup routine also checks against the EXP\_LATEST\_VER. If the current version is earlier then you are informed that a later version of the CICS IA plug-in is available to download.

## Obtaining an error log

How to gather required documentation.

### About this task

To obtain an error log:

#### Procedure

1. Click **Help>About IBM CICS Explorer** to open the About IAExplorer window.
2. Click **Configuration Details**.
3. Click **View Error Log**.
4. Click an appropriate Web browser in the Open With window, for example, Notepad.
5. Click **File>Save As** to save the log to an appropriate directory.

## Obtaining configuration details

How to gather required documentation.

### About this task

To obtain configuration details:

### Procedure

1. Click **Help>About IBM CICS Explorer** to open the About IAExplorer window.
2. Click **Configuration Details**.
3. Click **Copy to clipboard**.
4. Paste in an appropriate file.

## Viewing Eclipse plug-ins

How to gather required documentation.

### About this task

How to view Eclipse plug-ins, shipped with the CICS Explorer, and their levels:

### Procedure

1. Click **Help>About IBM CICS Explore** to open the About CICS IA plug-in window.
2. Click **Plug-in Details**. The CICS IA plug-ins are provided by IBM. You might be required to check the version number of the plug-ins.

---

## Contacting IBM Support

The IBM Support structure helps you to resolve problems with IBM products and ensure that you can make the best use of your IBM computing systems. Program support is available to all licensed users of IBM licensed programs.

You can obtain help with your IBM software in any of the following ways:

- By searching for a solution at the CICS Technical Support Page at <http://www-306.ibm.com/software/http/cics/ianaly/support/>  
At this site you can, for example:
  - View Technotes and FAQs
  - Open a problem electronically, using the Electronic Service Request (ESR) form
- If you are a registered IBMLink user, by logging on to IBMLink at: <http://www.ibm.link.ibm.com/>
- By telephone call to your local Support Center.

The following topics help you decide when to contact the Support Center, and what information you need to collect before contacting the Center.

## When to contact the Support Center

Before contacting the Support Center, try to ensure that the problem cannot be resolved without IBM's assistance.

In practice, many of the problems reported to Software Support turn out to be user errors. Other reported problems either cannot be reproduced or need to be handled by other parts of IBM Service, such as Hardware Customer Engineering or Systems Engineering. If you have followed the suggestions in this book and investigated all possible causes without finding the answer to your problem it is time to contact the Support Center.

## Working with the Support Center

When you call the Support Center, your first contact will be with a Support Center operator. The operator records some initial details about your problem, and then places it on a problem queue. You might be transferred directly to a technical support specialist or you might receive a call back from a Support Center representative.

The Support Center needs to know as much as possible about your problem. Have the following information ready before making your first call:

- Your organization's name
- Your IBM Support Services' access code
- The suspected source of the problem
- The severity of the problem
- A complete description of the problem

"Information data sheet" is a checklist of the additional, problem-related, information.

## Information data sheet

This data sheet lists the problem determination information you need to have available when you contact IBM Support Services.

Table 26. Data sheet of problem determination information for IBM Support Center

Information for CICS IA plug-in for CICS Explorer problems
CICS IA plug-in for CICS Explorer operating system level, including the service pack level if any.
CICS IA "Help About" service level.
Frequency of the failure.
CIU_VERSION table information.
Can you recreate the failure?
When did the failure first occur?
Has the failing function ever worked correctly?
Detailed information about the CICS IA plug-in navigation or screen shots of the navigation.
CICS IA DB2 Host Connection Values.
CICS IA plug-in exception log files.
CICS IA plug-in popup messages.
Information on any recent maintenance that has been applied.
Information for CICS IA host problems
z/OS operating system level.
DB2 version and maintenance level.
Service levels for CICS and CICS IA.
The complete CICS region job logs, including CEEMSG and MSGUSR.
Information on any recent PTFs that have been applied.
CICS region auxiliary trace data sets.
Any dumps or other diagnostic information which were produced.
Frequency of the failure.
Can you recreate the failure?
When did the failure first occur?

Table 26. Data sheet of problem determination information for IBM Support Center (continued)

Information for CICS IA plug-in for CICS Explorer problems
Has the failing function ever worked correctly?

---

## Appendix A. Details of dependencies and affinities collected

This section describes:

- The programming commands that are detected by the CICS IA Collector and what is reported for each type of command.
- The differences, if any, between what the Collector detects and what the Load Module Scanner detects. In general, the Load Module Scanner always detects more, because it covers paths that might not get exercised by the Collector, and because it cannot see beyond the command argument 0 to eliminate EXEC CICS commands that do not cause dependencies or affinities.

This information adds detail to the general description of “What can be monitored” on page 17.

### Note:

1. In all cases, the Load Module Scanner reports only the verbs detected, without the resource name or, where appropriate, the SYSID.
2. For some commands, the Collector does not store the resource name. For example, on an EXEC CICS FEPI CONVERSE DATASTREAM CONVID command, when the dependency is between a FEPI program and a FEPI conversation, the Collector does not store the ID of the conversation, because of its transitory nature. When the resource name is not stored, the command is not saved in the DB2 tables in the Dependency database objects. The command is, however, reported by the Reporter.

This section contains these topics:

- “Commands monitored for potential dependencies”
- “Commands monitored for potential affinities” on page 202

---

## Commands monitored for potential dependencies

This section lists the commands monitored by the Collector because they have the potential to create dependencies.

- “CICS commands detected”
- “CICS FEPI commands detected” on page 200
- “Non-CICS API commands detected” on page 201

### CICS commands detected

The CICS commands detected by the Collector are listed here, excluding Front End Programming Interface (FEPI) commands, which are listed in “CICS FEPI commands detected” on page 200.

#### CICS API commands

This section lists the presentation commands.

#### Presentation commands

##### Authentication commands:

Authentication commands detected:

- EXEC CICS VERIFY PASSWORD
- EXEC CICS CHANGE PASSWORD

- EXEC CICS VERIFY PHRASE
- EXEC CICS CHANGE PHRASE
- EXEC CICS SIGNOFF
- EXEC CICS SIGNON

#### **Built-in functions commands:**

Command detected:

- EXEC CICS BIF DIGEST RECORD
- EXEC CICS BIF DEEDIT FIELD

#### **BMS commands:**

BMS commands detected:

- EXEC CICS PURGE MESSAGE
- EXEC CICS RECEIVE MAP
  - Primary resource captured: Map Name
  - Secondary resource captured (if specified): Mapset Name
- EXEC CICS ROUTE
- EXEC CICS SEND MAP
  - Primary resource captured: Map Name
  - Secondary resource captured (if specified): Mapset Name
- EXEC CICS SEND PAGE

The dependency here is between a program and a mapset. Where only the map name is specified BMS uses the map name as the mapset name.

- RECEIVE PARTITIONSET
- SEND PARTITIONSET
- SEND CONTROL
- SEND TEXT

#### **Terminal control and information commands:**

Commands detected:

- EXEC CICS ADDRESS TCTUA
- EXEC CICS ASSIGN ALTSCRNHT
- EXEC CICS ASSIGN ALTSCRNWD
- EXEC CICS ASSIGN APLKYBD
- EXEC CICS ASSIGN APLTEXT
- EXEC CICS ASSIGN COLOR
- EXEC CICS ASSIGN DEFSCRNHT
- EXEC CICS ASSIGN DEFSCRNWD
- EXEC CICS ASSIGN DS3270
- EXEC CICS ASSIGN EXTDS
- EXEC CICS ASSIGN HILIGHT
- EXEC CICS ASSIGN MAPCOLUMN
- EXEC CICS ASSIGN MAPHEIGHT
- EXEC CICS ASSIGN MAPLINE
- EXEC CICS ASSIGN MAPWIDTH
- EXEC CICS ASSIGN PS
- EXEC CICS ASSIGN SCRNHT
- EXEC CICS ASSIGN SCRNWD
- EXEC CICS ASSIGN SYSID
- EXEC CICS ASSIGN TEXTKYBD
- EXEC CICS ASSIGN TEXTPRINT
- EXEC CICS BUILD ATTACH
- EXEC CICS EXTRACT ATTACH
- EXEC CICS EXTRACT ATTRIBUTES

- EXEC CICS EXTRACT LOGONMSG
- EXEC CICS EXTRACT TCT
- EXEC CICS ISSUE COPY
- EXEC CICS ISSUE ENDFILE
- EXEC CICS ISSUE ENDOUTPUT
- EXEC CICS ISSUE EODS
- EXEC CICS ISSUE ERASEAUP
- EXEC CICS ISSUE LOAD
- EXEC CICS ISSUE PASS
- EXEC CICS ISSUE PREPARE
- EXEC CICS ISSUE PRINT
- EXEC CICS ISSUE RESET
- EXEC CICS POINT
- EXEC CICS WAIT CONVID (APPC)
- EXEC CICS WAIT SIGNAL

The option specified on the EXEC CICS commands is reported as the resource.

**Batch data interchange commands:**

Commands detected:

- EXEC CICS ISSUE ADD
- EXEC CICS ISSUE ERASE
- EXEC CICS ISSUE REPLACE
- EXEC CICS ISSUE ABORT
- EXEC CICS ISSUE QUERY
- EXEC CICS ISSUE END
- EXEC CICS ISSUE RECEIVE
- EXEC CICS ISSUE NOTE
- EXEC CICS ISSUE WAIT
- EXEC CICS ISSUE SEND

**APPC mapped conversation commands without the CONVID option:**

Commands detected:

- EXEC CICS CONVERSE
- EXEC CICS EXTRACT PROCESS
- EXEC CICS ISSUE ABEND
- EXEC CICS ISSUE CONFIRMATION
- EXEC CICS ISSUE SIGNAL
- EXEC CICS ISSUE ERROR
- EXEC CICS ISSUE DISCONNECT
- EXEC CICS RECEIVE
- EXEC CICS SEND

**Console support commands:**

Console support commands detected:

- EXEC CICS WRITE OPERATOR

**Distributed transaction processing (DTP) commands:**

Commands detected:

- EXEC CICS ALLOCATE
- EXEC CICS CONNECT PROCESS
- EXEC CICS CONVERSE CONVID
- EXEC CICS CONVERSE SESSION
- EXEC CICS SEND SESSION
- EXEC CICS FREE CONVID

This dependency is between a program and a remote transaction or process.

The convid or session returned on the ALLOCATE call is stored with the SYSID or session name in a temporary table. The ALLOCATE call is reported, with the SYSID or session as a resource.

Every CONNECT PROCESS, SEND SESSION, CONVERSE CONVID, CONVERSE SESSION, or FREE CONVID is matched by convid against the table entries. If the CONVID and SESSION or CONVID or SESSION match a temporary table entry:

- For CONNECT PROCESS, the PROCNAME and previously specified SYSID/SESSION from the ALLOCATE are reported. The temporary table entry is deleted.
- For SEND SESSION, the first four characters of data are assumed to be the process name. This process name and the previously specified SYSID/SESSION are reported. If the command is successful, the temporary table entry is deleted, because the remote system and remote process name are now associated.
- CONVERSE CONVID, CONVERSE SESSION is the same as SEND SESSION, above.
- For FREE, the temporary table entry is deleted. No information is reported, because no process was started.

**Event command:**

Command detected:

- EXEC CICS SIGNAL EVENT

This dependency is between a program and business event processed.

The resource reported is the event.

**Exception support:**

Commands detected:

- EXEC CICS DUMP TRANSID
- EXEC CICS HANDLE ABEND PROGRAM
- EXEC CICS HANDLE AID
- EXEC CICS HANDLE CONDITION
- EXEC CICS IGNORE CONDITION
- EXEC CICS POP HANDLE
- EXEC CICS PUSH HANDLE

**File Control commands:**

Commands detected:

- EXEC CICS DELETE FILE()
- EXEC CICS ENDBR FILE()
- EXEC CICS READ FILE()
- EXEC CICS READ UPD FILE()
- EXEC CICS READNEXT FILE()
- EXEC CICS READPREV FILE()
- EXEC CICS RESETBR FILE()
- EXEC CICS REWRITE FILE()
- EXEC CICS STARTBR FILE()
- EXEC CICS UNLOCK FILE()
- EXEC CICS WRITE FILE()

This dependency is between a program and a file, possibly remote.

The resource reported is the file name.

If the command is shipped to a remote region, the system identifier (SYSID) of the remote region is reported.

**Interval Control commands:**

Command detected:

- EXEC CICS ASKTIME
- EXEC CICS CANCEL
- EXEC CICS DELAY
- EXEC CICS FORMATTIME
- EXEC CICS POST
- EXEC CICS RETRIEVE
- EXEC CICS RETURN
- EXEC CICS START
- EXEC CICS WAIT EVENT

This dependency is between a program and a transaction, local or remote.

The resource reported is the transaction name.

If the command is shipped or routed to a remote region, the SYSID of the remote region is reported.

If the CHANNEL option is specified on the command the channel name is also reported as a resource.

These resources are captured when the “Transactions” flag for transaction CINT, panel CIU240, is set to Y or D.

**Journal Control commands:**

Commands detected:

- EXEC CICS WAIT JOURNALNAME
- EXEC CICS WAIT JOURNALNUM
- EXEC CICS WRITE JOURNALNAME
- EXEC CICS WRITE JOURNALNUM

This dependency is between a program and a CICS journal.

The resource reported is the journal number.

**Named Counter Server commands:**

Commands detected:

- EXEC CICS DEFINE COUNTER and DEFINE DCOUNTER
- EXEC CICS DELETE COUNTER and DELETE DCOUNTER
- EXEC CICS GET COUNTER and GET DCOUNTER
- EXEC CICS QUERY COUNTER and QUERY DCOUNTER
- EXEC CICS REWIND COUNTER and REWIND DCOUNTER
- EXEC CICS UPDATE COUNTER and UPDATE DCOUNTER

This dependency is between a program and a named counter in a named counter pool in the coupling facility.

The resource reported is the named counter.

If the POOL option is specified on the command there is an additional dependency between a program and a pool resource. Therefore the pool name is also reported as a dependency resource.

#### **Program Control commands:**

An alphabetic list of commands detected:

- EXEC CICS ABEND
  - There is no dependency.
  - The only report is that an ABEND command has been issued.
- EXEC CICS DELETE CONTAINER
  - This dependency is between a program and a container.
  - The CONTAINER name is reported as the resource.
  - If the CHANNEL option is specified on the command there is an additional dependency between the program and the channel resource. The channel name is reported as a resource.
- EXEC CICS GET CONTAINER
- EXEC CICS GET64 CONTAINER
- EXEC CICS LINK
  - This dependency is between a program and another program, possibly remote.
  - The program name is reported as the resource.
  - If the command is routed to a remote region, the SYSID of the remote region is reported.
  - If the CHANNEL option is specified on the command there is an additional dependency between the program and the channel resource. The channel name is reported as a resource.
- EXEC CICS LOAD
- EXEC CICS MOVE CONTAINER
- EXEC CICS PUT CONTAINER
- EXEC CICS PUT64 CONTAINER
- EXEC CICS RELEASE
- EXEC CICS RETURN TRANSID
  - This dependency is between a program and a local or remote transaction.
  - The transaction name is reported as a resource.
  - If the CHANNEL option is specified on the command there is an additional dependency between the program and the channel resource. The channel name is reported as a resource.
- EXEC CICS XCTL
  - This dependency is between a program and another local program.
  - The program name is reported as the resource.
  - If the CHANNEL option is specified on the command there is an additional dependency between the program and the channel resource. The channel name is reported as a resource.

#### **Security services commands:**

Security commands detected:

- EXEC CICS QUERY SECURITY

#### **Syncpoint commands:**

Syncpoint commands detected:

- EXEC CICS SYNCPOINT

**Task control commands:**

CICS commands detected:

- EXEC CICS DEQ
- EXEC CICS ENQ

This dependency is between a program and the resource that it is enqueued upon. The name of the resource, limited to the first 50 characters, is reported.

- EXEC CICS SUSPEND

The program has issued a SUSPEND.

- EXEC CICS CHANGE TASK

The program has issued a CHANGE TASK command.

**Temporary Storage commands:**

Commands detected:

- EXEC CICS READQ TS
- EXEC CICS WRITEQ TS
- EXEC CICS DELETEQ TS

This dependency is between a program and a Temporary Storage queue, either local or remote.

The resource reported is the Temporary Storage queue name.

If the command is shipped to a remote region, the SYSID of the remote region is reported.

If the current task number is detected in the Temporary Storage queue name, it is shown as +TA+ in the resource name by the Reporter. Using +TA+ prevents all references to unique Temporary Storage queues being recorded, causing unnecessary filling of the dependency table and file.

If the current terminal identifier is detected in the Temporary Storage queue name, it is indicated by +TE+ in the Reporter. Using +TE+ prevents storage wastage in the dependency table and file.

**Trace commands:**

Trace commands detected:

- EXEC CICS DUMP TRASACTION
- EXEC CICS ENTER TRACENUM
- EXEC CICS MONITOR

**Transient Data commands:**

Commands detected:

- EXEC CICS READQ TD
- EXEC CICS WRITEQ TD
- EXEC CICS DELETEQ TD

This dependency is between a program and a Transient Data queue, either local or remote.

The resource reported is the Transient Data queue name.

If the command is shipped to a remote region, the SYSID of the remote region is reported.

**WEB commands:**

Commands detected:

- WEB CLOSE
- WEB CONVERSE
- CONVERTTIME
- WEB ENDBROWSE
- WEB EXTRACT
- WEB OPEN
- WEB PARSE URL
- WEB READ
- WEB READNEXT
- WEB RECEIVE
- WEB RETRIEVE
- WEB SEND
- WEB STARTBROWSE
- WEB WRITE

A resource is not recorded for WEB commands. The only fact that is recorded for a WEB command is that the WEB command has been issued.

**Web Services Addressing commands:**

Commands detected:

- EXEC CICS INVOKE SERVICE
- EXEC CICS INVOKE WEBSERVICE
- EXEC CICS SOAPFAULT ADD
- EXEC CICS SOAPFAULT CREATE
- EXEC CICS SOAPFAULT DELETE
- EXEC CICS WSACONTEXT BUILD
- EXEC CICS WSACONTEXT GET
- EXEC CICS WSACONTEXT DELETE
- EXEC CICS WSAEPR CREATE

**Document services commands:**

Commands detected:

- EXEC CICS DOCUMENT CREATE
- EXEC CICS DOCUMENT DELETE
- EXEC CICS DOCUMENT INSERT
- EXEC CICS DOCUMENT RETRIEVE
- EXEC CICS DOCUMENT SET

**TCP/IP services commands:**

Commands detected:

- EXEC CICS EXTRACT CERTIFICATE
- EXEC CICS EXTRACT TCPIP

**Exit commands:**

Commands detected:

- EXEC CICS ENABLE PROGRAM

The dependency is between a program and an exit name. The exit name is reported as the resource.

- EXEC CICS DISABLE PROGRAM

The dependency is between a program and an exit name. The exit name is reported as the resource.

- EXEC CICS EXTRACT EXIT  
The dependency is between a program and an exit name. The exit name is reported as the resource.
- CALL exit  
The dependency is between the program and the called task related user exit. The exit name is reported as the resource.

#### **Other commands:**

Commands detected:

- EXEC CICS ADDRESS CWA  
CWA is reported as the resource.
- EXEC CICS ASSIGN APPLID  
APPLID is reported as the resource.
- EXEC CICS FREEMAIN
- EXEC CICS FREEMAIN64
- EXEC CICS GETMAIN  
If the ADDR option is specified on the command “ADDR” is reported as the resource.
- EXEC CICS GETMAIN64

#### **XML parser commands:**

Commands detected:

- EXEC CICS TRANSFORM XFORMTYPE(DATATOXML)
- EXEC CICS TRANSFORM XFORMTYPE(XMLTODATA)

### **CICS SPI commands**

Commands detected:

#### **Atomservice commands:**

Commands detected:

- EXEC CICS CREATE ATOMSERVICE
- EXEC CICS DISCARD ATOMSERVICE
- EXEC CICS INQUIRE ATOMSERVICE
- EXEC CICS INQUIRE ATOMSERVICE NEXT
- EXEC CICS SET ATOMSERVICE

#### **Autoinstall commands:**

Commands detected:

- CICS EXEC INQUIRE AUTOINSTALL
- CICS EXEC SET AUTOINSTALL

#### **Brfacility commands,:**

Commands detected:

- CICS EXEC INQUIRE BRFACILITY
- CICS EXEC SET BRFACILITY
- This dependency is between a program and a local 3270 virtual terminal, bridge facility.
- The name of the bridge facility is reported as the resource.

#### **Bundle commands:**

Commands detected:

- EXEC CICS CREATE BUNDLE

- EXEC CICS DISCARD BUNDLE
- EXEC CICS INQUIRE BUNDLE
- EXEC CICS INQUIRE BUNDLE NEXT
- EXEC CICS SET BUNDLE
- EXEC CICS INQUIRE BUNDLEPART
- EXEC CICS INQUIRE BUNDLEPART NEXT

This dependency is between a program and application bundles.

**Capture commands:**

Commands detected:

- CICS EXEC INQUIRE CAPTURESPEC
- CICS EXEC INQUIRE CAPOPTPRED
- CICS EXEC INQUIRE CAPDATAPRED
- CICS EXEC INQUIRE CAPINFOSRCE

**Connection commands:**

Commands detected:

- CICS EXEC CREATE CONNECTION
- CICS EXEC INQUIRE CONNECTION
- CICS EXEC SET CONNECTION
- CICS EXEC DISCARD CONNECTION

**Corbaserver commands:**

Commands detected:

- CICS EXEC CREATE CORBASERVER
- CICS EXEC INQUIRE CORBASERVER
- CICS EXEC SET CORBASERVER
- CICS EXEC PERFORM CORBASERVER
- CICS EXEC DISCARD CORBASERVER
- This dependency is between a program and a local CorbaServer.
- The name of the CorbaServer is reported as the resource.

**Other CREATE commands:**

Commands detected:

- CICS EXEC CREATE LSRPOOL
- CICS EXEC CREATE MAPSET
- CICS EXEC CREATE PARTITIONSET
- CICS EXEC CREATE SESSIONS
- CICS EXEC CREATE TYPETERM

**CSD commands:**

Commands detected:

- EXEC CICS CSD ADD GROUP
- EXEC CICS CSD ALTER RESTYPE
- EXEC CICS CSD APPEND LIST
- EXEC CICS CSD COPY GROUP
- EXEC CICS CSD COPY RESTYPE
- EXEC CICS CSD DEFINE RESTYPE
- EXEC CICS CSD DELETE LIST
- EXEC CICS CSD DELETE GROUP

- EXEC CICS CSD DELETE RESTYPE
- EXEC CICS CSD ENDBRGROUP
- EXEC CICS CSD ENDBRLIST
- EXEC CICS CSD ENDBRRSRCE
- EXEC CICS CSD GETNEXTGROUP GROUP
- EXEC CICS CSD GETNEXTLIST LIST
- EXEC CICS CSD GETNEXTRSRCE RESTYPE
- EXEC CICS CSD INQUIREGROUP GROUP
- EXEC CICS CSD INQUIREGROUP GROUP LIST
- EXEC CICS CSD INQUIRELIST LIST
- EXEC CICS CSD INQUIRERSRCE RESTYPE
- EXEC CICS CSD INSTALL LIST
- EXEC CICS CSD INSTALL GROUP
- EXEC CICS CSD INSTALL RESTYPE
- EXEC CICS CSD LOCK LIST
- EXEC CICS CSD LOCK GROUP
- EXEC CICS CSD REMOVE GROUP
- EXEC CICS CSD RENAME RESTYPE
- EXEC CICS CSD STARTBRGROUP
- EXEC CICS CSD STARTBRLIST
- EXEC CICS CSD STARTBRRSRCE
- EXEC CICS CSD UNLOCK LIST
- EXEC CICS CSD UNLOCK GROUP
- EXEC CICS CSD USERDEFINE RESTYPE
- EXEC CICS CSD DISCONNECT

#### **DB2 commands:**

Commands detected:

- CICS EXEC CREATE DB2CONN
- CICS EXEC INQUIRE DB2CONN
- CICS EXEC SET DB2CONN
- CICS EXEC DISCARD DB2CONN
- CICS EXEC CREATE DB2ENTRY
- CICS EXEC INQUIRE DB2ENTRY
- CICS EXEC SET DB2ENTRY
- CICS EXEC DISCARD DB2ENTRY
- CICS EXEC CREATE DB2TRAN
- CICS EXEC INQUIRE DB2TRAN
- CICS EXEC SET DB2TRAN
- CICS EXEC DISCARD DB2TRAN
- This dependency is between a program and a local DB2ENTRY, used to define resources to be used by a specific transaction or group of transactions when accessing DB2.
- The name of the DB2ENTRY is reported as the resource.
- This dependency is between a program and a local DB2TRAN, associated with a DB2ENTRY.
- The name of the DB2TRAN is reported as the resource.

#### **Deleteshipped commands:**

Commands detected:

- CICS EXEC INQUIRE DELETSHIPED
- CICS EXEC SET DELETSHIPED

- CICS EXEC PERFORM DELETSHIPED

**Dispatcher commands:**

Commands detected:

- CICS EXEC INQUIRE DISPATCHER
- CICS EXEC SET DISPATCHER

**DJAR commands:**

Commands detected:

- CICS EXEC CREATE DJAR
- CICS EXEC INQUIRE DJAR
- CICS EXEC PERFORM DJAR
- CICS EXEC DISCARD DJAR
- This dependency is between a program and a local deployed JAR file.
- The name of the deployed JAR file is reported as the resource.

**Doctemplate commands:**

Commands detected:

- CICS EXEC CREATE DOCTEMPLATE
- CICS EXEC INQUIRE DOCTEMPLATE
- CICS EXEC SET DOCTEMPLATE
- CICS EXEC DISCARD DOCTEMPLATE

**DSNAME commands:**

Commands detected:

- CICS EXEC INQUIRE DSNAME
- CICS EXEC SET DSNAME

**DUMPDS commands:**

Commands detected:

- CICS EXEC INQUIRE DUMPDS
- CICS EXEC SET DUMPDS

**ENQMODEL commands:**

Commands detected:

- CICS EXEC INQUIRE ENQMODEL
- CICS EXEC SET ENQMODEL
- CICS EXEC DISCARD ENQMODEL

**EPADAPTER commands:**

Commands detected:

- CICS EXEC INQUIRE EPADAPTER
- CICS EXEC SET EPADAPTER
- CICS EXEC DISCARD EPADAPTER

**Event commands:**

Commands detected:

- EXEC CICS INQUIRE EVENTBINDING
- EXEC CICS INQUIRE EVENTBINDING NEXT
- EXEC CICS SET EVENTBINDING
- EXEC CICS INQUIRE EVENTPROCESS

- EXEC CICS SET EVENTPROCESS
- EXEC CICS INQUIRE CAPTURESPEC
- EXEC CICS INQUIRE CAPTURESPEC NEXT
- EXEC CICS INQUIRE EPADAPTERSET
- EXEC CICS SET EPADAPTERSET
- EXEC CICS INQUIRE EPADAPTINSET

This dependency is between a program and business event processed.

The resource reported is the events.

**Exit commands:**

Commands detected:

- CICS EXEC ENABLE EXIT
- CICS EXEC DISABLE EXIT
- CICS EXEC EXTRACT EXIT

**File commands:**

Commands detected:

- CICS EXEC CREATE FILE
- CICS EXEC INQUIRE FILE
- CICS EXEC SET FILE
- CICS EXEC DISCARD FILE
- This dependency is between a program and a local file.
- The file name is reported as the resource.

**Host commands:**

Commands detected:

- CICS EXEC INQUIRE HOST
- CICS EXEC SET HOST

**Other INQUIRE commands:**

Inquire commands detected:

- CICS EXEC INQUIRE ASSOCIATION
- CICS EXEC INQUIRE CFDTPOOL
- CICS EXEC INQUIRE ENQ
- CICS EXEC INQUIRE EXCI
- CICS EXEC INQUIRE EXITPROGRAM
- CICS EXEC INQUIRE IPFACILITY
- CICS EXEC INQUIRE JVMPROFILE
  - This dependency is between a program and a JVM profile.
  - The name of the JVM profile is reported as the resource.
- CICS EXEC INQUIRE MVSTCB
- CICS EXEC INQUIRE OSGIBUNDLE
- CICS EXEC INQUIRE OSGISERVICE
- CICS EXEC INQUIRE REQID
- CICS EXEC INQUIRE RRMS
- CICS EXEC INQUIRE STORAGE
- CICS EXEC INQUIRE STREAMNAME

- CICS EXEC INQUIRE SUBPOOL
- CICS EXEC INQUIRE TSPOOL
  - This dependency is between a program and a local shared temporary storage pool.
  - The name of the TS pool is reported as the resource.
- CICS EXEC INQUIRE UOWDSNFAIL

#### **IPCONN commands:**

Commands detected:

- CICS EXEC CREATE IPCONN
- CICS EXEC INQUIRE IPCONN
- CICS EXEC SET IPCONN
- CICS EXEC DISCARD IPCONN
- This dependency is between a program and the name of the connection to the remote system or region.
- The connection name is reported as the resource.

#### **IRC commands:**

Commands detected:

- CICS EXEC INQUIRE IRC
- CICS EXEC SET IRC

#### **JVM server commands:**

Commands detected:

- EXEC CICS CREATE JVMSERVER
- EXEC CICS DISCARD JVMSERVER
- EXEC CICS INQUIRE JVMSERVER
- EXEC CICS INQUIRE JVMSERVER NEXT
- EXEC CICS SET JVMSERVER

#### **JOURNAL commands:**

Commands detected:

- CICS EXEC INQUIRE JOURNALNAME
- CICS EXEC SET JOURNALNAME
- CICS EXEC DISCARD JOURNALNAME
- CICS EXEC CREATE JOURNALMODEL
- CICS EXEC INQUIRE JOURNALMODEL
- CICS EXEC DISCARD JOURNALMODEL
- CICS EXEC INQUIRE JOURNALNUM
- CICS EXEC SET JOURNALNUM
- CICS EXEC DISCARD JOURNALNUM
- This dependency is between a program and a CICS journal.
- The journal name is reported as the resource.

#### **LIBRARY commands:**

Commands detected:

- CICS EXEC CREATE LIBRARY
- CICS EXEC INQUIRE LIBRARY
- CICS EXEC SET LIBRARY,
- CICS EXEC DISCARD LIBRARY

- This dependency is between a program and the library resource.
- The library name is reported as the resource.

**MODENAME commands:**

Commands detected:

- CICS EXEC INQUIRE MODENAME
- CICS EXEC SET MODENAME

**Monitor commands:**

Commands detected:

- CICS EXEC INQUIRE MONITOR
- CICS EXEC SET MONITOR

**MQ commands:**

Commands detected:

- EXEC CICS CREATE MQCONN
- EXEC CICS INQUIRE MQCONN
- EXEC CICS DISCARD MQCONN
- EXEC CICS SET MQCONN
- EXEC CICS INQUIRE MQINI
- EXEC CICS DISCARD MQINI

**NETNAME commands:**

Commands detected:

- CICS EXEC INQUIRE NETNAME
- CICS EXEC SET NETNAME

**PARTNER commands:**

Commands detected:

- CICS EXEC CREATE PARTNER
- CICS EXEC INQUIRE PARTNER
- CICS EXEC DISCARD PARTNER

**Other PERFORM commands:**

Other PERFORM commands detected:

- CICS EXEC PERFORM DUMP
- CICS EXEC PERFORM ENDAFFINITY
- CICS EXEC PERFORM RESETTIME
- CICS EXEC PERFORM SECURITY
- CICS EXEC PERFORM SHUTDOWN
- CICS EXEC PERFORM SSL REBUILD

**PROCESSTYPE commands:**

Commands detected:

- CICS EXEC CREATE PROCESSTYPE
- CICS EXEC INQUIRE PROCESSTYPE
- CICS EXEC SET PROCESSTYPE
- CICS EXEC DISCARD PROCESSTYPE

**PIPELINE commands:**

Commands detected:

- CICS EXEC CREATE PIPELINE
- CICS EXEC INQUIRE PIPELINE
- CICS EXEC SET PIPELINE
- CICS EXEC DISCARD PIPELINE
- CICS EXEC PERFORM PIPELINE
- This dependency is between a program and a PIPELINE.
- The name of the PIPELINE is reported as the resource.

**PROFILE commands:**

Commands detected:

- CICS EXEC CREATE PROFILE
- CICS EXEC INQUIRE PROFILE
- CICS EXEC DISCARD PROFILE

**PROGRAM commands:**

Commands detected:

- CICS EXEC CREATE PROGRAM
- CICS EXEC INQUIRE PROGRAM
- CICS EXEC SET PROGRAM
- CICS EXEC DISCARD PROGRAM
- This dependency is between a program and another local program.
- The program name is reported as the resource.

**RESYNC command:**

**STATISTICS commands:**

Commands detected:

- CICS EXEC COLLECT STATISTICS
- CICS EXEC EXTRACT STATISTICS
- CICS EXEC INQUIRE STATISTICS
- CICS EXEC SET STATISTICS
- CICS EXEC PERFORM STATISTICS

**SYSDUMPCODE commands:**

Commands detected:

- CICS EXEC INQUIRE SYSDUMPCODE,
- CICS EXEC SET SYSDUMPCODE

**SYSTEM commands:**

Commands detected:

- CICS EXEC INQUIRE SYSTEM
- CICS EXEC SET SYSTEM

**Task commands:**

Commands detected:

- CICS EXEC INQUIRE TASK
- CICS EXEC SET TASK

**TCLASS commands:**

Commands detected:

- CICS EXEC INQUIRE TCLASS
- CICS EXEC SET TCLASS

**TCPIP commands:**

Commands detected:

- CICS EXEC INQUIRE TCPIP
- CICS EXEC SET TCPIP

**TCPIPSERVICE commands:**

Commands detected:

- CICS EXEC CREATE TCPIPSERVICE
- CICS EXEC INQUIRE TCPIPSERVICE
- CICS EXEC SET TCPIPSERVICE
- CICS EXEC DISCARD TCPIPSERVICE
- This dependency is between a program and a local TCP/IP service.
- The name of the TCP/IP service is reported as the resource.

**TDQUEUE commands:**

Commands detected:

- CICS EXEC CREATE TDQUEUE
- CICS EXEC INQUIRE TDQUEUE
- CICS EXEC SET TDQUEUE
- CICS EXEC DISCARD TDQUEUE
- This dependency is between a program and a local transient data (TD) queue.
- The name of the TD queue is reported as the resource.

**TEMPSTORAGE commands:**

Commands detected:

- CICS EXEC INQUIRE TEMPSTORAGE
- CICS EXEC SET TEMPSTORAGE

**Terminal commands:**

Commands detected:

- CICS EXEC ACQUIRE TERMINAL
- CICS EXEC CREATE TERMINAL
- CICS EXEC INQUIRE TERMINAL
- CICS EXEC SET TERMINAL
- CICS EXEC DISCARD TERMINAL

**TRACEDEST commands:**

Commands detected:

- CICS EXEC INQUIRE TRACEDEST
- CICS EXEC SET TRACEDEST

**TRACEFLAG commands:**

Commands detected:

- CICS EXEC INQUIRE TRACEFLAG
- CICS EXEC SET TRACEFLAG

**TRACETYPE commands:**

Commands detected:

- CICS EXEC INQUIRE TRACETYPE
- CICS EXEC SET TRACETYPE

**TRANCLASS commands:**

Commands detected:

- CICS EXEC CREATE TRANCLASS,
- CICS EXEC DISCARD TRANCLASS
- CICS EXEC INQUIRE TRANCLASS
- CICS EXEC SET TRANCLASS

**TRANDUMPCODE commands:**

Commands detected:

- CICS EXEC INQUIRE TRANDUMPCODE
- CICS EXEC SET TRANDUMPCODE

**Transaction commands:**

Commands detected:

- CICS EXEC CREATE TRANSACTION
- CICS EXEC INQUIRE TRANSACTION,
- CICS EXEC SET TRANSACTION,
- CICS EXEC DISCARD TRANSACTION
- This dependency is between a program and a local transaction.
- The transaction name is reported as the resource.

**TSMODEL commands:**

Commands detected:

- CICS EXEC CREATE TSMODEL
- CICS EXEC INQUIRE TSMODEL
- CICS EXEC DISCARD TSMODEL
- This dependency is between a program and a local temporary storage (TS) model.
- The name of the TS model is reported as the resource.

**TSQNAME commands:**

Commands detected:

- CICS EXEC INQUIRE TSQNAME
- CICS EXEC SET TSQNAME
- This dependency is between a program and a local temporary storage queue.
- The name of the TS queue is reported as the resource.

**TSQUEUE commands:**

Commands detected:

- CICS EXEC INQUIRE TSQUEUE
- CICS EXEC SET TSQUEUE
- This dependency is between a program and a local temporary storage queue.
- The name of the TS queue is reported as the resource.

**UOW commands:**

Commands detected:

- CICS EXEC INQUIRE UOW
- CICS EXEC SET UOW

**UOWLINK commands:**

Commands detected:

- CICS EXEC INQUIRE UOWLINK
- CICS EXEC SET UOWLINK

**URIMAP commands:**

Commands detected:

- CICS EXEC CREATE URIMAP
- CICS EXEC INQUIRE URIMAP
- CICS EXEC SET URIMAP
- CICS EXEC DISCARD URIMAP
- This dependency is between a program and a URIMAP.
- The name of the URIMAP is reported as the resource.

**VTAM commands:**

Commands detected:

- CICS EXEC INQUIRE VTAM
- CICS EXEC SET VTAM

**WEB commands:**

Commands detected:

- CICS EXEC INQUIRE WEB
- CICS EXEC SET WEB

**WEBSERVICE commands:**

Commands detected:

- CICS EXEC CREATE WEBSERVICE
- CICS EXEC INQUIRE WEBSERVICE
- CICS EXEC SET WEBSERVICE
- CICS EXEC DISCARD WEBSERVICE
- This dependency is between a program and a WEBSERVICE.
- The name of the WEBSERVICE is reported as the resource.

**WORKREQUEST commands:**

Commands detected:

- CICS EXEC INQUIRE WORKREQUEST
- CICS EXEC SET WORKREQUEST

**XML parser commands:**

Commands detected:

- EXEC CICS INQUIRE XMLTRANSFORM
- EXEC CICS INQUIRE XMLTRANSFORM NEXT
- EXEC CICS SET XMLTRANSFORM

## CICS FEPI commands detected

### CICS FEPI API commands

An alphabetic list of the commands detected.

- FEPI ALLOCATE PASSCONVID
- FEPI CONVERSE DATASTREAM CONVID, FEPI CONVERSER FORMATTED CONVID
- FEPI EXTRACT CONV, FEPI EXTRACT FIELD, FEPI EXTRACT STSN
- FEPI FREE
- FEPI ISSUE
- FEPI RECEIVE DATASTREAM, FEPI SEND DATASTREAM
- FEPI RECEIVE FORMATTED, FEPI SEND FORMATTED
- FEPI REQUEST PASSTICKET

The dependency for these commands is between a FEPI program and a FEPI conversation. No resource name is reported. See note 2 on page 181.

- FEPI ALLOCATE POOL
- FEPI CONVERSE DATASTREAM POOL, FEPI CONVERSE FORMATTED POOL

This dependency for these commands is between a FEPI program and a FEPI pool. The name of the pool is reported as the resource.

- FEPI START

This dependency is between a FEPI program and a local CICS transaction or conversation. The name of the transaction, if available, is reported as the resource.

### CICS FEPI SPI commands

Commands detected:

#### FEPI INQUIRE CONNECTION, FEPI SET CONNECTION:

- This dependency is between a FEPI program and a FEPI node and target.
- The name of the node is reported as the resource.

#### FEPI INQUIRE NODE, FEPI SET NODE:

- This dependency is between a FEPI program and a FEPI node.
- The name of the node is reported as the resource.

#### FEPI ADD POOL, FEPI INSTALL POOL, FEPI DELETE POOL, FEPI INQUIRE POOL, FEPI SET POOL, FEPI DISCARD POOL:

- This dependency is between a FEPI program and a FEPI pool.
- The name of the pool is reported as the resource.

#### FEPI INSTALL PROPERTYSET, FEPI INQUIRE PROPERTYSET, FEPI DISCARD PROPERTYSET:

- This dependency is between a FEPI program and a named set of FEPI properties.
- The name of the property set is reported as the resource.

#### FEPI INQUIRE TARGET, FEPI SET TARGET:

- This dependency is between a FEPI program and a FEPI target.
- The name of the target is reported as the resource.

## Non-CICS API commands detected

### DB2: EXEC SQL

Commands detected:

- ALTER
- CLOSE
- CREATE
- DELETE
- DESCRIBE
- DROP
- EXECUTE
- EXECUTE IMMEDIATE
- EXPLAIN
- FETCH
- INSERT
- OPEN
- PREPARE
- SELECT
- UPDATE

### WebSphere MQ: MQM

Commands detected:

- MQCLOSE
- MQGET
- MQOPEN
- MQPUT
- MQPUT1
- MQBUFMH
- MQCB
- MQCTL
- MQCRTMH
- MQDLTMH
- MQDLTMP
- MQINQ
- MQINQMP
- MQMHBUFF
- MQSETMP
- MQSTAT
- MQSUB
- MQSUBRQ

### IMS database: EXEC DLI

Commands detected:

- DELETE
- GET NEXT
- GET NEXT IN PARENT
- GET UNIQUE
- INSERT
- REPLACE
- SCHEDULE

### IMS database: CBLTDLI, ASMTDLI and PLITDLI calls

Commands detected:

- DELETE
- GET NEXT
- GET NEXT IN PARENT

- GET UNIQUE
- INSERT
- REPLACE
- SCHEDULE

### **Natural commands**

Commands detected:

- CALL ADABAS
- CALL NATURAL PROGRAM

---

## **Commands monitored for potential affinities**

This section lists the affinity-related EXEC CICS commands detected by the CICS IA Collector.

All commands listed here are *capable of* causing affinities; they might or might not actually do so.

### **CICS API commands**

This section contains CICS API commands detected by the Collector, that might create *inter-transaction* affinities.

#### **Interval Control commands**

An alphabetic list of the commands detected.

- EXEC CICS CANCEL
- EXEC CICS DELAY
- EXEC CICS POST
- EXEC CICS RETRIEVE WAIT
- EXEC CICS START

#### **Program Control commands**

An alphabetic list of the commands detected.

- EXEC CICS LOAD
- EXEC CICS RELEASE

#### **Storage Control commands**

An alphabetic list of the commands detected.

- EXEC CICS FREEMAIN
- EXEC CICS FREEMAIN64
- EXEC CICS GETMAIN64
- EXEC CICS GETMAIN

#### **Task Control commands**

An alphabetic list of the commands detected.

- EXEC CICS DEQ
- EXEC CICS ENQ

#### **Temporary Storage commands**

An alphabetic list of the commands detected.

- EXEC CICS DELETEQ TS
- EXEC CICS READQ TS
- EXEC CICS WRITEQ TS

#### **Other commands**

An alphabetic list of the commands detected.

- EXEC CICS ADDRESS CWA

- EXEC CICS COLLECT STATISTICS

The following CICS API commands, detected by the Collector, might create *transaction-system* affinities:

### **Business Transaction Services (BTS) commands**

An alphabetic list of the commands detected.

- EXEC CICS ENDBROWSE ACTIVITY
- EXEC CICS ENDBROWSE CONTAINER
- EXEC CICS ENDBROWSE EVENT
- EXEC CICS ENDBROWSE PROCESS
- EXEC CICS GETNEXT ACTIVITY
- EXEC CICS GETNEXT CONTAINER
- EXEC CICS GETNEXT EVENT
- EXEC CICS GETNEXT PROCESS
- EXEC CICS STARTBROWSE ACTIVITY
- EXEC CICS STARTBROWSE CONTAINER
- EXEC CICS STARTBROWSE EVENT
- EXEC CICS STARTBROWSE PROCESS

### **CICS SPI commands**

The following CICS SPI commands, detected by the Collector, might create *transaction-system* affinities.

- EXEC CICS CREATE
- EXEC CICS DISABLE PROGRAM
- EXEC CICS DISCARD
- EXEC CICS ENABLE PROGRAM
- EXEC CICS EXTRACT EXIT
- EXEC CICS INQUIRE
- EXEC CICS PERFORM
- EXEC CICS RESYNC
- EXEC CICS SET
- EXEC CICS WAITCICS
- EXEC CICS WAIT EVENT
- EXEC CICS WAIT EXTERNAL

---

## **Details of what is detected**

This section describes what is detected by the Detector and Reporter for each affinity type.

Additionally, it highlights the differences, if any, with what the Scanner detects. (In general, the Scanner always detects more, because it covers paths that may not get exercised by the Detector, and because it cannot see beyond the command argument zero to eliminate commands that do not actually cause affinity.)

### **ENQ/DEQ**

- The affinity here is between all transactions that ENQ or DEQ on a given resource. The match is made on the resource.
- It is possible for the ENQ/DEQ resource to be either a character string of length 1 to 255 bytes, or an address (which has an implied length of 4 bytes).
- The affinity relation can be GLOBAL, BAPPL, or USERID.
- Lifetime is always SYSTEM.

- Commands that result in a LENGERR condition are grouped together and treated as a resource of 'LENGERR'. Any other condition results in a valid resource and does not affect the treatment of the command.
- Because of affinity record size limitations, character string resources of greater than 207 bytes in length are compressed to 207 bytes. The compression is achieved by removing bytes from the middle of the string (these are probably less significant than those at either end). This means that such resources may be flagged as being the same when they are not, if the only variation is in the removed bytes. Check all such compressed resources to see if that is the case. The Reporter flags such compression, and pads the resource back out to the correct length for the report, by inserting '?' characters.

## TS commands

- The affinity here is between all transactions that use the same TS queue. It applies to both MAIN and AUXILIARY TS. The match is made on the name of the TS queue.
- The affinity relation can be GLOBAL, BAPPL, LUNAME, or USERID.
- Lifetime can be PCONV, LOGON, SIGNON, ACTIVITY, PROCESS, SYSTEM, and PERMANENT. A MAIN queue cannot be recovered, regardless of definition, so cannot cause PERMANENT.
- No data is collected if a TS queue is defined as remote or if a remote SYSID is specified on the TS command. In such cases, the request is satisfied by a remote CICS region or by a temporary storage pool in the coupling facility.
- Commands in error are treated in the same way as commands that give a NORMAL response, so data is collected.
- If a TS queue is created and deleted within the same task, no data is collected.

*Scanner differences:* Scanner detects all instances of TS commands.

## LOAD HOLD/RELEASE

- The affinity here is between all transactions that LOAD HOLD and RELEASE the same program (or, more probably, table). The match is made on the program name.
- The LOAD and RELEASE protocol applies only to programs that are defined with RELOAD(NO). If the Detector can not establish the RELOAD attribute for some reason, RELOAD(NO) is assumed.
- Once a LOAD HOLD has occurred for a program, any subsequent LOAD (with or without HOLD) or RELEASE is part of the affinity.
- The affinity relation is GLOBAL or BAPPL.
- Lifetime is always SYSTEM.
- Commands in error are treated in the same way as commands that give a NORMAL response, so data is collected.
- LOAD with no HOLD for programs defined as RESIDENT is not treated as an affinity because relying on residency for sharing is inherently unsafe, the program can be replaced by SET PROG() NEWCOPY.
- The incorrect use of RELEASE for a program defined with RELOAD(YES) is not detected.

*Scanner differences:* Scanner detects all instances of LOAD, not just LOAD HOLD, and all instances of RELEASE.

## RETRIEVE WAIT/START

- The affinity here is between all the transactions that issue START commands for a particular transaction at a terminal, where that transaction issues RETRIEVE WAIT. The transaction that issues the RETRIEVE WAIT is also part of the affinity. The match is made on the transid.
- The affinity relation can be GLOBAL or USERID.
- Lifetime can be SYSTEM or PERMANENT. PERMANENT is assumed if PROTECT is specified on any START.
- If the transaction to be STARTed is defined as remote or a remote SYSID was specified on the START command so that the command is function shipped to a remote CICS region, no data is collected.
- Commands in error are treated in the same way as commands that give a NORMAL response, so data is collected.

*Scanner differences:* Scanner detects all instances of RETRIEVE WAIT, and all instances of START that either specify TERMID, or omit NOCHECK, or specify REQID (because of CANCEL affinity).

## ADDRESS CWA

- The affinity here is between all transactions that issue ADDRESS CWA.
- The affinity relation is GLOBAL or BAPPL.
- Lifetime is always SYSTEM.

*Scanner differences:* None.

## GETMAIN SHARED/FREEMAIN and GETMAIN64 SHARED/FREEMAIN64

- The affinity here is between the transaction that obtains storage via GETMAIN SHARED and the transaction that frees the same piece of storage via FREEMAIN. Both transactions must be seen for there to be affinity. The match is made on storage address.
- However, the situation is complicated by the fact that the storage address may be passed to other transactions; and if they access the storage, they cannot be detected, because the storage access does not take place through the CICS API.
- The affinity relation may be GLOBAL, BAPPL, LUNAME, or USERID.
- Lifetime can be PCONV, LOGON, SIGNON, ACTIVITY, PROCESS, or SYSTEM. However, the Detector always worsens LOGON and SIGNON to SYSTEM, because of limitations in the way that this affinity is detected.
- Commands in error are ignored, as there is no address for matching GETMAIN with FREEMAIN, no data is collected.
- A GETMAIN/FREEMAIN affinity is considered to be initiated from a terminal if the GETMAIN is initiated from a terminal. Whether the FREEMAIN was so initiated or not is irrelevant.
- Any unmatched GETMAIN SHAREDs are also reported if they have never matched by the time a Detector stop occurs. They are output in a separate report section. Note that on a start with restore data, they are not restored and are deleted from the affinity file.

*Scanner differences:* Scanner finds all instances of GETMAIN SHARED and all instances of FREEMAIN.

## LOAD/FREEMAIN

- The affinity here is between the transaction that loads the program via LOAD and the transaction that releases the same program via FREEMAIN. The match is made on load point address.
- However, the situation is complicated by the fact that the load point address may be passed to other transactions (for example, the program is actually a table); and if they access the program, they cannot be detected. This is analogous to storage address passing with GETMAIN SHARED/FREEMAIN.
- The LOAD and FREEMAIN protocol applies only to programs defined as RELOAD(YES). Note that HOLD is irrelevant, as CICS Program Control never sees the FREEMAIN, or knows the storage location of the individual task's copy, and so cannot release the program at task end. This implies that all LOADs must be examined as they are all effectively LOAD HOLDs.
- The affinity relation may be GLOBAL, BAPPL, LUNAME, or USERID.
- Lifetime can be PCONV, LOGON, SIGNON, ACTIVITY, PROCESS, or SYSTEM. However, the Detector always worsens LOGON and SIGNON to SYSTEM, because of limitations in the way that this affinity is detected.
- Commands in error are ignored, because there is no load address on which to match LOAD with FREEMAIN, so no data is collected. LOADs with no SET option are ignored, because no load address is returned, so no data is collected.
- A LOAD/FREEMAIN affinity is considered to be initiated from a terminal if the LOAD is initiated from a terminal. Whether the FREEMAIN was so initiated or not is irrelevant.
- Any unmatched LOADs are also reported if they have never matched by the time a Detector stop occurs. They are output in a separate report section. Note that on a start with restore data, they are not restored and are deleted from the affinity file.

*Scanner differences:* Scanner finds all instances of LOAD and all instances of FREEMAIN.

## CANCEL/DELAY/POST/START

- The affinity here is between the transaction that issues the DELAY, POST or START command and the transaction that issues the CANCEL command via REQID. The match is on REQID.
- In order for another task to CANCEL a DELAY, REQID must be explicitly specified on the DELAY command. If no REQID is specified on a DELAY command, it cannot be canceled, and therefore cannot be detected. In order for another task to CANCEL a START or POST, it is not necessary to specify REQID on the command because CICS supplies a unique REQID that may be used (unless START specifies NOCHECK). So only START commands that do not both specify NOCHECK and omit REQID, and all POST commands, are detected.
- Further, data is not collected for commands that expire on entry to Interval Control, because they cannot be canceled (because an element control interval (ICE) is not created). DELAY and POST commands get an EXPIRED response. For START commands there is no such response; so 'expired on entry' is deduced if INTERVAL(0) was specified. This detects most 'expired on entry' STARTs, but not all.
- START, DELAY, and POST commands in error are ignored, so no data is collected.

- CANCEL commands that omit REQID are ignored because they cannot cancel another task. CANCEL commands that return a NOTFND response are also ignored because the ICE must have expired and the CANCEL must have failed. No data is collected for these.
- REQIDs are assumed to be unique; that is, there are no simultaneous pairs of START/CANCEL using the same REQID. Having such a pair violates CICS programming guidelines, and the results from CICS are unpredictable.
- The affinity relation for START might be GLOBAL, BAPPL, LUNAME, or USERID. The lifetime for START might be PCONV, LOGON, SIGNON, ACTIVITY, PROCESS, SYSTEM, or PERMANENT. If the PROTECT option is specified on the START, the lifetime is SYSTEM or PERMANENT. However, the Detector always worsens LOGON and SIGNON to SYSTEM or PERMANENT, because of limitations in the way that this affinity is detected.
- The affinity relation for DELAY and POST might be GLOBAL, BAPPL, LUNAME, or USERID. The Lifetime might be only SYSTEM, PROCESS, ACTIVITY, or PCONV. If the affinity relation is LUNAME or USERID, the lifetime must be PCONV because neither DELAY nor POST exist beyond task termination.
- If the transaction specified on a START or CANCEL command is defined as remote, or a remote SYSID was specified on the command so that the command is function shipped to a remote CICS region, no data is collected. (It is not possible to function ship POST or DELAY commands.)
- A CANCEL affinity is considered to be initiated from a terminal if the START, DELAY or POST is initiated from a terminal. Whether the CANCEL was so initiated or not is irrelevant.

*Scanner differences:* Scanner detects all instances of POST, all instances of DELAY REQID, all instances of CANCEL REQID, and all instances of START that either omit NOCHECK or specify REQID or specify TERMID (because of RETRIEVE WAIT affinity).

## SPI commands

- The commands included here are INQUIRE, SET, CREATE, DISCARD, ENABLE, DISABLE, EXTRACT EXIT, COLLECT STATISTICS, PERFORM, and RESYNC.
- CBTS BROWSE COMMANDS are treated as inquire COMMANDS.
- The affinity here is not an affinity between transactions, but rather an affinity with the system on which the command was issued; that is, a transaction-system affinity. Such affinities do not generate transaction affinity groups, because it does not generally make sense to dynamically route such transactions.
- The use of these commands does require reporting, however, because the system programmer should be aware of the transactions and programs that issue such commands.

*Scanner differences:* None.

## WAIT commands

- The affinity here is really an inter-transaction affinity between the issuer of the WAIT EVENT, WAIT EXTERNAL, or WAITCICS command, and one or more posters. However, the poster of the ECB(s) associated with the WAIT command cannot be detected, because this is not performed via the CICS API. Only half the affinity can be detected.

- This means affinity transaction groups cannot be created, because the affinity degenerates to an affinity with the system on which the WAIT command was issued; that is, a transaction-system affinity.
- The use of WAIT commands does require reporting, however, because the system programmer should be aware of the transactions and programs that issue such commands, and should attempt to locate the posters and so create the correct inter-transaction affinity groups.

*Scanner differences:* None.

---

## Appendix B. Correlating Load Module Scanner and Dependency Reporter output to source

This section describes how to match an API command in a Dependency Reporter report and in a Load Module Scanner detail report with the program source code. It also gives some examples of the procedures described.

---

### Dependency Reporter output

The reported offset of a command is the offset from the start of the load module of the BALR to the CICS stub.

To obtain the offset from the start of the program, subtract the length of the CICS stub from the offset reported. You might also need to subtract the lengths of any additional preceding CSECTs. You can then use the compiler listing to find the command.

---

### Load Module Scanner output

The reported offset of a command is the offset from the start of the load module of the command CICS argument zero.

This offset is a constant and therefore is located in the literal pool for the program. As with the Reporter, subtract the length of the CICS stub and preceding CSECTs to obtain the offset from the start of the program. Then locate the argument zero in the compiler listing. Next, match the argument zero to the command, which involves finding the instruction that referenced the argument zero, using the compiler listing.

### Examples

This section contains some examples of these procedures for the Load Module Scanner.

#### Example 1: assembler language

Before the BALR to the CICS stub, the CICS translator generates an LA instruction with the argument zero as source.

For example:

```
LA    14,=X'0202800008070000000000000000000000000000000000000000000000000000'
```

To locate the EXEC CICS command, you can match the argument zero in the literal pool with the same argument zero in the LA instruction.

#### Example 2: COBOL

The literal pool in VS COBOL II is part of the Constant Global Table (CGT). Having calculated the offset from the start of the program, subtract the start of the CGT from your calculated offset to obtain the offset within the CGT.

An MVC instruction with the argument zero as the source is in the listing, in this form:

```
MVC    D1(L,R1),D2(R2)          DFHEIV0          PGMLIT AT ...
```

where :

#### DFHEIV0

Is the slot in working storage into which the argument zero is copied before the BALR to the CICS stub.

**D2** Is the decimal offset of the argument zero within the CGT, which you have just calculated.

**R2** Is the CGT base register.

When you know the offset of the argument zero within the CGT, you can find the MVC and hence the EXEC CICS command.

An example of finding an EXEC CICS command is given in Figure 65.

For the Load Module Scanner output:

CICS INTERDEPENDENCIES ANALYZER

LOAD MODULE SCANNER - DETAILED LISTING OF CICS.DEVR212.LOCLLOAD

Module Name - ACCT04	/ Load Module Length - 000159D0	/ Module Entry Point
Offset	Storage Content (HEX)	EDF DEBUG Possibl
000007A6	0A02E0000700004100	00669 WRITEQ
Total possible Dependency cmds = 1		

The COBOL source after translation was:

```

001123
001124      *EXEC CICS WRITEQ TS QUEUE('ACERLOG') FROM(ACCTERRO)
001125      *      LENGTH(ERR-LNG) END-EXEC.
001126      MOVE ' \      00669 ' TO DFHEIV0
001127      MOVE 'ACERLOG' TO DFHC0080
001128      CALL 'DFHEI1' USING DFHEIV0 DFHC0080 ACCTERRO ERR-LNG

```

The equivalent assembly-language is:

001126	MOVE			
002764	D210 8558 A6C6	MVC	1368(17,8),1734(10)	DFHEIV0
00276A	9240 8569	MVI	1385(8),X'40'	DFHEIV0+17
00276E	D232 856A 8569	MVC	1386(51,8),1385(8)	DFHEIV0+18
001127	MOVE			
002774	D207 8340 ACEA	MVC	832(8,8),3306(10)	DFHC0080
001128	CALL			
00277A	4130 8558	LA	3,1368(0,8)	DFHEIV0
00277E	5030 D1B0	ST	3,432(0,13)	TS2=0
002782	4130 8340	LA	3,832(0,8)	DFHC0080
002786	5030 D1B4	ST	3,436(0,13)	TS2=4
00278A	4130 75A8	LA	3,1448(0,7)	ACCTERRO
00278E	5030 D1B8	ST	3,440(0,13)	TS2=8
002792	4130 9A0E	LA	3,2574(0,9)	ERR-LNG
002796	5030 D1BC	ST	3,444(0,13)	TS2=12
00279A	9680 D1BC	OI	444(13),X'80'	TS2=12
00279E	4110 D1B0	LA	1,432(0,13)	TS2=0
0027A2	4100 D150	LA	0,336(0,13)	CLLE@=2
0027A6	0530	BALR	3,0	
0027A8	5030 D158	ST	3,344(0,13)	TGT FDMPT/TEST-
0027AC	58F0 A000	L	15,0(0,10)	V(DFHEI1 )
0027B0	05EF	BALR	14,15	
0027B2	50F0 D078	ST	15,120(0,13)	TGTFIXD+120
0027B6	BF38 D089	ICM	3,8,137(13)	TGTFIXD+137
0027BA	0430	SPM	3,0	

Figure 65. Example of finding an EXEC CICS command from the argument zero

For this example, the calculations are:

```
Load Module Scanner offset      = X'7A6'  
CICS stub length    = X'28'  
Offset of CGT       = X'B8'  
CGT base register   = GPR 10  
Offset within CGT   = X'7A6' - X'28' - X'B8' = X'6
```

MVC instruction looks like:

```
MVC    d(1,r),1734(10)      DFHEIV0      PGMLIT AT ...'
```

To determine the EXEC CICS command:

1. Look at the assembly language for:

```
MVC    d(1,r),1734(10)      DFHEIV0      PGMLIT AT ...
```

which occurs for the first MOVE:

```
001126  MOVE
```

2. Look at the COBOL source for the MOVE at line 001126. This code is for the EXEC CICS WRITEQ TS command starting on line 001124.

---

## Appendix C. The structure of the CICS IA database

This section describes the following objects:

- “The structure of the Dependency database objects”
- “The structure of the Affinity objects” on page 222
- “The structure of the Load Module Scanner objects” on page 228
- “The structure of the CSECT Scanner objects” on page 230
- “The structure of the CICS regions objects” on page 232
- “The structure of the Command Flow table objects” on page 248
- “The structure of the resource objects” on page 233

---

### The structure of the Dependency database objects

This section describes the tables and views defined in the Dependency database.

- “Dependency base tables”
- “Dependency facilitating tables” on page 220
- “Dependency views” on page 221

#### Dependency base tables

The Dependency base tables are defined in the database objects. You can write your own SQL applications to query the tables; these applications must use native SQL queries.

##### **CIU\_CICS\_DATA**

This table stores information about every unique combination of CICS region, transaction, program, function, and CICS resource recorded by the Collector. With this table, you can answer questions such as:

“Which CICS resources are used by this transaction?”

“If I change this CICS resource, which programs and transactions are affected?”

*Table 27. The CIU\_CICS\_DATA table*

Column	Type	Description
COLLECTION_ID	CHAR(16)	Collection ID.
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
APPLID	CHAR(8)	CICS region APPLID.
HOMESYSID	CHAR(4)	SYSID of local region.
APPL_NAME	CHAR(64)	Application name
APPL_VER1	INTEGER	Major version number
APPL_VER2	INTEGER	Minor version number
APPL_VER3	INTEGER	Micro version number
APPL_OPER	CHAR(64)	The operation associated with the task
TRANSID	CHAR(4)	CICS transaction ID
PROGRAM	CHAR(8)	Currently active CICS program.
FUNCTION	CHAR(24)	EXEC CICS command name, such as READ, WRITEQ. <sup>1 4</sup>
TYPE	CHAR(16)	Resource type, such as TS, program. <sup>1 4</sup>

Table 27. The CIU\_CICS\_DATA table (continued)

Column	Type	Description
OBJECT	CHAR(255)	Resource name. <sup>2</sup>
OBJLENGTH	INTEGER	Length of resource name in OBJECT field.
RMTSYSID	CHAR(4)	Remote SYSID, if relevant. <sup>3</sup>
RMTNAME	CHAR(8)	Name by which the resource is known in the remote region.
TERMTRAN	CHAR(1)	Whether a terminal is associated with the transaction: Y Terminal transaction N Non terminal transaction
TCBMODE	CHAR(2)	CICS TCB in which the application is running; for example, QR or L8.
AFFINITY	CHAR(1)	Whether the EXEC CICS command might cause an affinity: Y Yes N No
OFFSET	CHAR(8)	The offset of the command from the start of the program.
PROGLEN	CHAR(8)	Length of CICS program. Used for program versioning.
COMMAREA	CHAR(1)	Whether a commarea is associated with the transaction: Y Yes N No
CHANNEL	CHAR(1)	Whether a channel is associated with the transaction: Y Yes N No
USECOUNT	INTEGER	Number of occurrences.
FIRST_RUN	TIMESTAMP	Time of first occurrence, in the local time format.
LAST_RUN	TIMESTAMP	Time of latest observation, in the local time format.
USER_DATA1	CHAR(48)	Reserved.
USER_DATA2	CHAR(48)	Reserved.
USER_DATA3	CHAR(48)	Reserved.

**Note:**

1. If the EIBCODE in the dependency data is not recognized by the database update program, both the FUNCTION and TYPE columns contain ???????.
2. The resource name is the name of the object of the function. This column is 50 bytes to accommodate the names of objects such as programs and files, but the data, the 4-byte name of a TD queue, might occupy less space.
3. If the command is shipped or routed to a remote region, these characters represent the system identifier (SYSID) of the remote region.
4. For information about Function and Type values, see Table 65 on page 252 to Table 101 on page 264Services.

**CIU\_DB2\_DATA**

This table stores information about every unique combination of CICS region,

transaction, program, function, and DB2 resource recorded by the Collector. With this table, you can answer questions such as:

“Which DB2 resources are used by this transaction?”

“If I change this DB2 resource, which programs and transactions are affected?”

Table 28. The CIU\_DB2\_DATA table

Column	Type	Description
COLLECTION_ID	CHAR(16)	Collection ID.
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
APPLID	CHAR(8)	CICS region APPLID.
HOMESYSID	CHAR(4)	SYSID of local region.
APPL_NAME	CHAR(64)	Application name
APPL_VER1	INTEGER	Major version number
APPL_VER2	INTEGER	Minor version number
APPL_VER3	INTEGER	Micro version number
APPL_OPER	CHAR(64)	The operation associated with the task
DB2ID	CHAR(4)	DB2 subsystem ID.
TRANSID	CHAR(4)	CICS transaction ID.
PROGRAM	CHAR(8)	CICS program name.
PLAN	CHAR(8)	DB2 plan ID.
RESTYPE	CHAR(16)	DB2 resource type. <sup>1</sup>
RESNAME	CHAR(40)	DB2 resource name.
FUNCTION	CHAR(24)	EXEC SQL command name, such as CREATE, UPDATE. <sup>1 2</sup>
SECTION	SMALL INT	The section number, in the source code of the CICS program, at which the DB2 command is issued.
STATEMENT	SMALL INT	The precompiler statement number, in the source code of the CICS program, at which the DB2 command is issued.
TERMTRAN	CHAR(1)	Whether a terminal is associated with the transaction: Y        Terminal transaction. N        Nonterminal transaction.
TCBMODE	CHAR(2)	CICS TCB in which the application is running; for example, QR or L8.
OFFSET	CHAR(8)	The offset of the command from the start of the program.
PROGLEN	CHAR(8)	Length of CICS program. Used for program versioning.
USECOUNT	INTEGER	Number of occurrences.
FIRST_RUN	TIMESTAMP	Time of first occurrence, in the local time format.
LAST_RUN	TIMESTAMP	Time of latest observation, in the local time format.
USER_DATA1	CHAR(48)	Reserved.
USER_DATA2	CHAR(48)	Reserved.
USER_DATA3	CHAR(48)	Reserved.

**Note:**

1. For more information about RESTYPE and FUNCTION, see Table 105 on page 265in.
2. If the command in the dependency data is not recognized by the database update program, the FUNCTION column contains ???????.
3. The RESOURCE column might not contain the actual name of the DB2 resource that is used. It might, for example, contain the name of a variable. In this case, use the values of the PROGRAM, SECTION, and STATEMENT columns to look up, in the DB2 SYSIBM.SYSPACKSTMT or SYSIBM.SYSSTMT table, the DB2 resource name. The views V\_CIU\_DB2\_RES for SYSIBM.SYSPACKSTMT and V\_CIU\_DB2\_RES2, for SYSIBM.SYSSTMT are provided to help you.

**CIU\_IMS\_DATA**

This table stores information about every unique combination of CICS region, transaction, program, function, and IMS resource recorded by the Collector. With this table, you can answer questions such as:

“Which IMS resources are used by this transaction?”

“If I change this IMS resource, which programs and transactions are affected?”

Table 29. The CIU\_IMS\_DATA table

Column	Type	Description
COLLECTION_ID	CHAR(16)	Collection ID.
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
APPLID	CHAR(8)	CICS region APPLID.
HOMESYSID	CHAR(4)	SYSID of local region.
APPL_NAME	CHAR(64)	Application name
APPL_VER1	INTEGER	Major version number
APPL_VER2	INTEGER	Minor version number
APPL_VER3	INTEGER	Micro version number
APPL_OPER	CHAR(64)	The operation associated with the task
TRANSID	CHAR(4)	CICS transaction ID.
PROGRAM	CHAR(8)	Currently active CICS program.
CALLTYPE	CHAR(4)	EXEC for EXEC DLI calls. CBLT for CBLTDLI calls. ASMT for ASMTDLI calls. PLIT for PLITDLI calls.
FUNCTION	CHAR(24)	DLI command. <sup>1</sup>
TYPE	CHAR(16)	PSB or PCB. <sup>1</sup>
OBJECT	CHAR(8)	PSB name or PCB name.
TERMTRAN	CHAR(1)	Whether a terminal is associated with the transaction: Y       Terminal transaction. N       Nonterminal transaction.
TCBMODE	CHAR(2)	CICS TCB in which the application is running; for example, QR or L8.
OFFSET	CHAR(8)	The offset of the command from the start of the program.

Table 29. The CIU\_IMS\_DATA table (continued)

Column	Type	Description
PROGLEN	CHAR(8)	Length of CICS program. Used for program versioning.
USECOUNT	INTEGER	Number of occurrences.
FIRST_RUN	TIMESTAMP	Time of first occurrence, in the local time format.
LAST_RUN	TIMESTAMP	Time of last occurrence, in the local time format.
USER_DATA1	CHAR(48)	Reserved.
USER_DATA2	CHAR(48)	Reserved.
USER_DATA3	CHAR(48)	Reserved.

**Note:**

1. For more information about Function and Type, see Table 106 on page 268in.

**CIU\_MQ\_DATA**

This table stores information about every unique combination of CICS region, transaction, program, function, and WebSphere MQ resource recorded by the Collector. With this table, you can answer questions such as:

“Which WebSphere MQ resources are used by this transaction?”

“If I change this WebSphere MQ resource, which programs and transactions are affected?”

Table 30. The CIU\_MQ\_DATA table

Column	Type	Description
COLLECTION_ID	CHAR(16)	Collection ID.
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
APPLID	CHAR(8)	CICS region APPLID.
HOMESYSID	CHAR(4)	SYSID of local region.
APPL_NAME	CHAR(64)	Application name
APPL_VER1	INTEGER	Major version number
APPL_VER2	INTEGER	Minor version number
APPL_VER3	INTEGER	Micro version number
APPL_OPER	CHAR(64)	The operation associated with the task
TRANSID	CHAR(4)	CICS transaction ID.
PROGRAM	CHAR(8)	CICS program name.
FUNCTION	CHAR(24)	MQ command name, such as MQGET, MQPUT <sup>1 2</sup> .
TYPE	CHAR(16)	Resource type. <sup>1 2</sup>
OBJECT	CHAR(48)	Resource name. <sup>3</sup>
QMGRNAME	CHAR(48)	Name of the queue manager.
TERMTRAN	CHAR(1)	Whether a terminal is associated with the transaction: <b>Y</b> Terminal transaction. <b>N</b> Nonterminal transaction.
TCBMODE	CHAR(2)	CICS TCB in which the application is running; for example, QR or L8.

Table 30. The CIU\_MQ\_DATA table (continued)

Column	Type	Description
OFFSET	CHAR(8)	The offset of the command from the start of the program.
PROGLEN	CHAR(8)	Length of CICS program. Used for program versioning.
MQFIQ	CHAR(1)	Whether the MQOO_FAIL_IF QUIESCING option is set for the FUNCTION: Y Yes N No
MQBOO	CHAR(1)	Whether the MQOO_BIND_ON_OPEN option is set for the FUNCTION: Y Yes N No
USECOUNT	INTEGER	Number of occurrences.
FIRST_RUN	TIMESTAMP	Time of first occurrence,in the local time format.
LAST_RUN	TIMESTAMP	Time of latest observation, in the local time format.
USER_DATA1	CHAR(48)	Reserved.
USER_DATA2	CHAR(48)	Reserved.
USER_DATA3	CHAR(48)	Reserved.

**Note:**

1. If the command in the dependency data is not recognized by the database update program, both the FUNCTION and TYPE columns contain ???????.
2. For more information about Function and Type, see Table 107 on page 268.
3. The resource name is the name of the object of the function. This column has a size of 48 bytes to accommodate the names of objects such as programs and files, but the data might occupy less space.

**CIU\_NATURAL\_DATA**

This table stores information about every unique combination of CICS region, transaction, program, function, and Natural resource recorded by the Collector.

Table 31. The CIU\_NATURAL\_DATA table

Column	Type	Description
COLLECTION_ID	CHAR(16)	Collection ID.
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
APPLID	CHAR(8)	CICS region APPLID.
HOMESYSID	CHAR(4)	SYSID of local region.
APPL_NAME	CHAR(64)	Application name
APPL_VER1	INTEGER	Major version number
APPL_VER2	INTEGER	Minor version number
APPL_VER3	INTEGER	Micro version number
APPL_OPER	CHAR(64)	The operation associated with the task
TRANSID	CHAR(4)	CICS transaction ID.
PROGRAM	CHAR(8)	Current program name.

Table 31. The CIU\_NATURAL\_DATA table (continued)

Column	Type	Description
FUNCTION	CHAR(8)	Natural command name, such as CALL.
TYPE	CHAR(8)	Natural command type, such as ADABAS, PROGRAM.
OBJECT	CHAR(32)	Database type code (for CALL ADABAS) or calling program name (for CALL PROGRAM).
COMMAND_CODE	CHAR(4)	Database command code (for CALL ADABAS), such as OP, L1, CL.
COMMAND_ID	CHAR(8)	Database command identifier (for CALL ADABAS).
COMMAND_DESC	CHAR(36)	Database command descriptor (for CALL ADABAS).
PROGRAM_TYPE	CHAR(16)	Calling program type (for CALL PROGRAM), such as FETCH PROGRAM, MAP, CALLNAT SUBPROG, VIEW.
PROGRAM_MODE	CHAR(16)	Calling program mode (for CALL PROGRAM), such as STATIC, DYNAMIC.
PROGRAM_CALL	CHAR(16)	Calling program parameter call type (for CALL PROGRAM), such as BY VALUE, BY REFERENCE.
LOCATION	CHAR(8)	Calling program location (for CALL PROGRAM), such as a library name, LIBRARY (load program library), NUCLEUS (Natural shared nucleus).
DATABASE_ID	INTEGER	Database identifier (for CALL ADABAS) or system file database identifier (for CALL PROGRAM).
FILE_NUMBER	INTEGER	File number (for CALL ADABAS) or system file number (for CALL PROGRAM).
TERMTRAN	CHAR(1)	Whether a terminal is associated with the transaction: Y        Terminal transaction. N        Nonterminal transaction.
TCBMODE	CHAR(2)	CICS TCB in which the application is running; for example, QR or L8.
LEVEL	INTEGER	Current program level.
LINE	CHAR(4)	Current statement number.
OFFSET	CHAR(8)	The offset of the command from the start of the program.
PROGLEN	CHAR(8)	Length of the program (Natural nucleus).
USECOUNT	INTEGER	Number of occurrences.
FIRST_RUN	TIMESTAMP	Time of first occurrence, in the local time format.
LAST_RUN	TIMESTAMP	Time of latest observation, in the local time format.
USER_DATA1	CHAR(48)	Reserved.
USER_DATA2	CHAR(48)	Reserved.
USER_DATA3	CHAR(48)	Reserved.

**Note:** For more information about Function and Type, see Table 108 on page 268.

## Dependency facilitating tables

These tables are used by CICS IA to help its processing.

### CIU\_APPLS\_DESC

This table holds the list of applications and a textual description.

Table 32. The CIU\_APPLS\_DESC table

Column	Type	Description
APPLIC_CODE	CHAR(8)	Application code.
APPLIC_NAME	CHAR(50)	Application Description.

### CIU\_APPLS\_RESOURCES

This table contains all the transactions and programs that make up an application.

Table 33. The CIU\_APPLS\_RESOURCES table

Column	Type	Description
APPLIC_CODE	CHAR(8)	Application code.
APPLIC_TYPE	CHAR(8)	Resource type (program or transid).
APPLIC_RESNAME	CHAR(32)	Resource name.

## Threadsafe table

This table contains a list of CICS commands that are threadsafe in at least one of the supported CICS TS releases. Use the information in this table when reporting which CICS commands used by a program are threadsafe. Load by running job CIUTSLOD in the SCIUSAMP.DB2 data set.

### CIU\_THREADSafe\_CMD

This table stores resource usage information for all resource types for both Web service and program names.

Table 34. The CIU\_THREADSafe\_CMD table

Field Name	Type	Description
COMMAND	CHAR(24)	The EXEC CICS command name, such as READ, WRITEQ. <b>Note:</b> The values in this field match those in the COMMAND field in the CIU_SCAN_DETAIL table or the FUNCTION field in the CIU_CICS_DATA table.
RESOURCE_TYPE	CHAR(16)	The resource type, such as TS or PROGRAM. <b>Note:</b> The values in this field match those in the RESOURCE_TYPE field in the CIU_SCAN_DETAIL table or the TYPE field in the CIU_CICS_DATA table.
CICS_TS23	CHAR(1)	Indicates the threadsafe status of the command for CICS TS V2.3. Values are: <b>Y</b> command is threadsafe <b>N</b> command in non-threadsafe <b>I</b> command is indeterminate-threadsafe <b>blank</b> not analyzed to allow for table migration

Table 34. The CIU\_THREADSafe\_CMD table (continued)

Field Name	Type	Description
CICS_TS31	CHAR(1)	Indicates the threadsafe status of the command for CICS TS V3.1. Values are: <b>Y</b> command is threadsafe <b>N</b> command in non-threadsafe <b>I</b> command is indeterminate-threadsafe <b>blank</b> not analyzed to allow for table migration
CICS_TS32	CHAR(1)	Indicates the threadsafe status of the command for CICS TS V3.2. Values are: <b>Y</b> command is threadsafe <b>N</b> command in non-threadsafe <b>I</b> command is indeterminate-threadsafe <b>blank</b> not analyzed to allow for table migration
CICS_TS41	CHAR(1)	Indicates the threadsafe status of the command for CICS TS V4.1 Values are: <b>Y</b> command is threadsafe <b>N</b> command in non-threadsafe <b>I</b> command is indeterminate-threadsafe <b>blank</b> not analyzed to allow for table migration
CICS_TS42	CHAR(1)	Indicates the threadsafe status of the command for CICS TS V4.2 Values are: <b>Y</b> command is threadsafe <b>N</b> command in non-threadsafe <b>I</b> command is indeterminate-threadsafe <b>blank</b> not analyzed to allow for table migration
CICS_TS51	CHAR(1)	Indicates the threadsafe status of the command for CICS TS V5.1 Values are: <b>Y</b> command is threadsafe <b>N</b> command in non-threadsafe <b>I</b> command is indeterminate-threadsafe <b>blank</b> not analyzed to allow for table migration

## Dependency views

The dependency views show gathered data about dependency.

### V\_CIU\_DB2\_RES

This view is a simple DB2 equi-join of CIU\_DB2\_DATA and SYSIBM.SYSPACKSTMT, using the PROGRAM, SECTION, and STATEMENT fields in CIU\_DB2\_DATA, and the NAME, SECTNO, and STMTNO fields in SYSIBM.SYSPACKSTMT. You can use it to display the DB2 commands, and therefore the DB2 resources, used by a CICS program.

Table 35. View V\_CIU\_DB2\_RES

Column	Type	Description
APPLID	CHAR(8)	CICS applid.
HOMESYSID	CHAR(4)	SYSID of local region.
DB2ID	CHAR(4)	DB2 subsystem ID.
TRANSID	CHAR(4)	CICS Transaction ID.
PROGRAM	CHAR(8)	CICS program name.
PLAN	CHAR(8)	DB2 plan ID.
SECTNO	SMALLINT	The section number, in the source code of the CICS program, at which the DB2 command is issued .

Table 35. View V\_CIU\_DB2\_RES (continued)

Column	Type	Description
STMTNO	SMALLINT	The precompiler statement number, in the source code of the CICS program, at which the DB2 command is issued.
STMT	CHAR(*)	The DB2 command (statement) in SYSIBM.SYSPACKSTMT.

#### V\_CIU\_DB2\_RES2

This view is the same as V\_CIU\_DB2\_RES, except that it joins CIU\_DB2\_DATA with SYSIBM.SYSSTMT, rather than SYSIBM.SYSPACKSTMT.

## The structure of the Affinity objects

This section describes the tables and views defined in the set of Affinity database objects.

- “Affinity base tables”
- “Affinity facilitating table” on page 224
- “Affinity views” on page 225

### Affinity base tables

This section describes the Affinity base tables defined in the database. You can write your own SQL applications to query the tables; these applications must use native SQL queries to do this.

#### CIU\_AFF\_GRP\_DATA

This table stores information about every affinity transaction group; that is, every group of CICS transactions that have been grouped together because they have the potential to create an affinity.

Table 36. The CIU\_AFF\_GRP\_DATA table

Column	Type	Description
APPLID	CHAR(8)	CICS region APPLID.
TRANGROUP	CHAR(10)	Name of the transaction group; for example, TS00000002.
AFFTYPE	CHAR(2)	The type of affinity: <b>IT</b> Intertransaction <b>TS</b> Transaction-system.
GROUPTYPE	CHAR(30)	The group of CICS commands used by this transaction group; one of the following: <ul style="list-style-type: none"> <li>• ADDRESS CWA</li> <li>• CANCEL, DELAY, POST, START group</li> <li>• ENQ and DEQ pair</li> <li>• GETMAIN and FREEMAIN pair</li> <li>• GETMAIN UNMATCHED and FREEMAIN UNMATCHED pair</li> <li>• LOAD and RELEASE pair</li> <li>• LOAD and FREEMAIN pair</li> <li>• LOAD UNMATCHED and FREEMAIN UNMATCHED pair</li> <li>• RETRIEVE</li> <li>• TEMPORARY STORAGE</li> <li>• COLLECT</li> <li>• DISCARD</li> <li>• ENABLE and DISABLE pair.</li> </ul>

Table 36. The CIU\_AFF\_GRP\_DATA table (continued)

Column	Type	Description
AFFINITY	CHAR(10)	The affinity relation type; one of the following: <ul style="list-style-type: none"> <li>• GLOBAL</li> <li>• BACKGROUND</li> <li>• BAPPL</li> <li>• LINK3270</li> <li>• LUNAME</li> <li>• USERID.</li> </ul>
AFFWORSENE	CHAR(10)	The relation type from which the affinity has worsened from one of the following: <ul style="list-style-type: none"> <li>• BACKGROUND</li> <li>• BAPPL</li> <li>• LINK3270</li> <li>• LUNAME</li> <li>• USERID.</li> </ul>
LIFETIME	CHAR(10)	The lifetime of the affinity; one of the following: <ul style="list-style-type: none"> <li>• ACTIVITY = BTS activity</li> <li>• FACILITY = Link3270 bridge facility</li> <li>• LOGON = Logon</li> <li>• PCONV = Pseudoconversation</li> <li>• PERMANENT = Permanent</li> <li>• PROCESS = BTS process</li> <li>• SIGNON = Signon</li> <li>• SYSTEM = System</li> </ul> For an explanation of these lifetime values, see “Affinity lifetimes” on page 8.
LIFEWORSENE	CHAR(10)	The affinity lifetime has worsened from one of the following: <ul style="list-style-type: none"> <li>• ACTIVITY</li> <li>• FACILITY</li> <li>• LOGON</li> <li>• PCONV</li> <li>• PROCESS</li> <li>• SIGNON</li> <li>• SYSTEM.</li> </ul>
RECOVERY	CHAR(1)	Whether the CICS resource is recoverable: <b>Y</b> Recoverable <b>N</b> Not recoverable.
RESOURCE	CHAR(50)	The name of the CICS resource; for example, a program name.
RESLENGTH	INTEGER	Length of resource.
TYPE	CHAR(8)	The type of the CICS resource, such as TS queue, program.
TRANCOUNT	SMALLINT	The total number of CICS transactions in this affinity group.
PROGCOUNT	SMALLINT	The total number of CICS programs in this affinity group.
BUILD	CHAR(1)	Whether this affinity transaction group is to be included in a “combined” affinity-transaction-group definition, created by the CICS IA Builder. <b>Y</b> This affinity transaction-group is to be included in a “combined” affinity transaction group definition. <b>N</b> This affinity transaction group is not to be included in a “combined” affinity transaction group definition.

### CIU\_AFF\_CMD\_DATA

This table records every unique combination of:

- EXEC CICS command with the potential to create an affinity
- Program
- Transaction ID

Table 37. The CIU\_AFF\_CMD\_DATA table

Column	Type	Description
APPLID	CHAR(8)	CICS region APPLID
TRANSID	CHAR(4)	CICS transaction ID
PROGRAM	CHAR(8)	Currently active CICS program
OFFSET	CHAR(8)	Offset, from the start of the program, at which this command occurs
COMMAND	CHAR(24)	EXEC CICS command
RESTYPE	CHAR(16)	Resource type; for example, program
AFFGROUP	CHAR(10)	Name of the affinity transaction group to which this transaction belongs
TERMINAL	CHAR(1)	Whether there is a terminal associated with the transaction: Y      Terminal transaction N      Nonterminal transaction
BTS	CHAR(1)	Whether this is a BTS task: Y      BTS task N      Non-BTS task
LINK3270	CHAR(1)	Whether this is a LINK3270 transaction: Y      LINK3270 transaction N      Non-LINK3270 transaction
USAGE	SMALLINT	Number of times this CICS command is called from this program

## Affinity facilitating table

This table is used by CICS IA to help its processing.

### CIU\_AFF\_INDEX\_DATA

This table holds the next free index number for the CICS command type, defined by the AFFPREFIX value. It is used, as a numerical suffix, when creating the transaction group (TRANGROUP) name.

Table 38. The CIU\_AFF\_INDEX\_DATA table

Column	Type	Description
AFFPREFIX	CHAR(2)	Prefix indicating a type of CICS command; one of the following: <b>CA</b> CANCEL <b>CO</b> COLLECT <b>CW</b> CWA <b>CR</b> CREATE <b>DI</b> DISCARD <b>EN</b> ENABLE <b>EQ</b> ENQ <b>EX</b> EXTRACT <b>G4</b> GETMAIN64 <b>G6</b> GETMAIN64 unmatched <b>GM</b> GETMAIN <b>GU</b> GETMAIN unmatched <b>IN</b> INQUIRE <b>LD</b> LOAD <b>LF</b> LOAD – FREE <b>LU</b> LOAD – UNLOAD <b>PE</b> PERFORM <b>RE</b> RESYNC <b>RW</b> RETRIEVE <b>TS</b> Temporary storage <b>WA</b> WAIT
AFFINDEX	INTEGER	Next free index number

## Affinity views

The following affinity views are defined.

### V\_CIU\_AFFINITY

This view is a simple DB2 equi-join of CIU\_AFF\_GRP\_DATA and CIU\_AFF\_CMD\_DATA, using TRANGROUP and APPLID in CIU\_AFF\_GRP\_DATA and AFFGROUP and APPLID in CIU\_AFF\_CMD\_DATA.

Table 39. View V\_CIU\_AFFINITY

Column	Type	Description
APPLID	CHAR(8)	CICS region APPLID.
TRANGROUP	CHAR(10)	Name of the transaction group, for example, TS00000002.
AFFTYPE	CHAR(2)	The type of affinity: <b>IT</b> Inter transaction <b>TS</b> Transaction system.

Table 39. View V\_CIU\_AFFINITY (continued)

Column	Type	Description
GROUPTYPE	CHAR(30)	<p>The group of CICS commands used by this transaction, one of the following:</p> <ul style="list-style-type: none"> <li>• ADDRESS CWA</li> <li>• CANCEL, DELAY, POST, START group</li> <li>• ENQ and DEQ pair</li> <li>• GETMAIN and FREEMAIN pair</li> <li>• GETMAIN UNMATCHED and FREEMAIN UNMATCHED pair</li> <li>• LOAD and RELEASE pair</li> <li>• LOAD and FREEMAIN pair</li> <li>• LOAD UNMATCHED and FREEMAIN UNMATCHED pair</li> <li>• RETRIEVE</li> <li>• TEMPORARY STORAGE</li> <li>• COLLECT</li> <li>• DISCARD</li> <li>• ENABLE and DISABLE pair.</li> </ul>
AFFINITY	CHAR(10)	<p>The affinity relation type, one of the following:</p> <ul style="list-style-type: none"> <li>• GLOBAL</li> <li>• BACKGROUND</li> <li>• BAPPL</li> <li>• LINK3270</li> <li>• LUNAME</li> <li>• USERID.</li> </ul>
AFFWORSENE	CHAR(10)	<p>The relation type of the affinity has worsened from one of the following:</p> <ul style="list-style-type: none"> <li>• BACKGROUND</li> <li>• BAPPL</li> <li>• LINK3270</li> <li>• LUNAME</li> <li>• USERID</li> </ul> <p>For an explanation of these lifetime values, see "Worsening of transaction affinities relations" on page 9.</p>
LIFETIME	CHAR(10)	<p>The lifetime of the affinity, one of the following:</p> <ul style="list-style-type: none"> <li>• ACTIVITY = BTS activity</li> <li>• FACILITY = Link3270 bridge facility</li> <li>• LOGON = Logon</li> <li>• PCONV = Pseudoconversation</li> <li>• PERMANENT = Permanent</li> <li>• PROCESS = BTS process</li> <li>• SIGNON = Signon</li> <li>• SYSTEM = System</li> </ul> <p>For an explanation of these lifetime values, see "Affinity lifetimes" on page 8.</p>

Table 39. View V\_CIU\_AFFINITY (continued)

Column	Type	Description
LIFEWORSENE	CHAR(10)	The affinity lifetime has worsened from, one of the following: <ul style="list-style-type: none"> <li>• ACTIVITY</li> <li>• FACILITY</li> <li>• LOGON</li> <li>• PCONV</li> <li>• PROCESS</li> <li>• SIGNON</li> <li>• SYSTEM</li> </ul> For an explanation of these lifeworsened values, see “Worsening of transaction affinities lifetimes” on page 9.
RECOVERY	CHAR(1)	Whether the CICS resource is recoverable: <b>Y</b> Recoverable <b>N</b> Not recoverable.
RESOURCE	CHAR(50)	The name of the CICS resource, for example, a program name.
RESLENGTH	SMALLINT	The length of the name of the CICS resource.
TYPE	CHAR(8)	The type of the CICS resource, such as TS queue, program.
TRANCOUNT	SMALLINT	The total number of CICS transactions in this affinity group.
PROGCOUNT	SMALLINT	The total number of CICS programs in this affinity group.
BUILD	CHAR(1)	Whether this affinity transaction-group is to be included in a “combined” affinity-transaction-group definition, created by the CICS IA Builder. <b>Y</b> This affinity transaction-group is to be included in a “combined” affinity-transaction-group definition. <b>N</b> This affinity transaction-group is not to be included in a “combined” affinity-transaction-group definition.
TRANSID	CHAR(4)	CICS transaction ID.
PROGRAM	CHAR(8)	Currently active CICS program.
OFFSET	INTEGER	Offset, from the start of the program, at which this command occurs.
COMMAND	CHAR(24)	EXEC CICS command.
RESTYPE	CHAR(16)	Resource type, for example, program.
TERMINAL	CHAR(1)	Whether there is a terminal associated with the transaction: <b>Y</b> Terminal transaction <b>N</b> Nonterminal transaction.
BTS	CHAR(1)	Whether this is a BTS task: <b>Y</b> BTS task <b>N</b> Non-BTS task.
LINK3270	CHAR(1)	Whether this is a LINK3270 transaction: <b>Y</b> LINK3270 transaction <b>N</b> Non-LINK3270 transaction.

---

## The structure of the Load Module Scanner objects

This section describes the tables and views defined in the Load Module Scanner database objects.

- “Load Module Scanner base tables”

### Load Module Scanner base tables

This section describes the Load Module Scanner base tables defined in the database. You can write your own SQL applications to query the tables; these applications must use native SQL queries to do this.

#### CIU\_SCAN\_SUMMARY

This table stores summary information about every module in the load libraries that have been scanned.

*Table 40. The CIU\_SCAN\_SUMMARY table*

Column	Type	Description
DSNAME	CHAR(44)	Data set name
PROGRAM	CHAR(8)	Module name
LANGUAGE	CHAR(10)	Programming language detected
LE	CHAR(7)	Language Environment (LE) detected
CICS_OR_BATCH	CHAR(5)	CICS transaction or batch
AFFINITY_COUNT	INTEGER	Number of commands with potential to create affinities
MVS_POST_COUNT	INTEGER	Number of MVS POST commands
DEPENDENCY_COUNT	INTEGER	Number of commands with potential to create dependencies

#### CIU\_SCAN\_DETAIL

This table records detailed information about every command, in specified modules of the load libraries that have been scanned, that has the potential to create a resource dependency or a transaction affinity.

*Table 41. The CIU\_SCAN\_DETAIL table*

Column	Type	Description
DSNAME	CHAR(44)	Data set name
PROGRAM	CHAR(8)	Module name
OFFSET	INTEGER	Offset, from the start of the program, at which this command occurs
COMMAND	CHAR(24)	EXEC CICS command or MVS POST
RESOURCE_TYPE	CHAR(16)	Resource type; for example, program
AFFINITY	CHAR(1)	Whether this command has the potential to create an affinity: Y Yes N No
AFFINITY_TYPE	CHAR(2)	The type of affinity: IT Inter-transaction TS Transaction-system

Table 41. The CIU\_SCAN\_DETAIL table (continued)

Column	Type	Description
DEPENDENCY	CHAR(1)	Whether this command has the potential to create a dependency: Y Yes N No
MVS_POST	CHAR(1)	Whether this command is a possible MVS POST: Y Yes N No
COMMAND_HEX	CHAR(50)	Data at the command offset, shown in hexadecimal

#### V\_CIU\_SCAN\_TRDSAFE

This view is a simple join between the CIU\_SCAN\_DETAIL table and the CIU\_THREADSafe\_CMD table using the COMMAND and RESOURCE\_TYPE fields from each table. This table is used to query, by CICS TS release, which commands in the CIU\_SCAN\_DETAIL table are threadsafe, non-threadsafe, or indeterminate-threadsafe.

Table 42. The V\_CIU\_SCAN\_TRDSAFE table

Column	Type	Description
DSNAME	CHAR(44)	Data set name
PROGRAM	CHAR(8)	Module name
LANGUAGE	CHAR(10)	Programming language detected
LE	CHAR(7)	Language Environment (LE) detected
CICS_OR_BATCH	CHAR(5)	CICS transaction or batch
AFFINITY_COUNT	INTEGER	Resource type; for example, program
MVS_POST_COUNT	INTEGER	Number of MVS POST commands
DEPENDENCY_COUNT	INTEGER	Number of commands with potential to create dependencies
CICS_TS23	CHAR(1)	Indicates the threadsafe status if the command is for CICS TS V2.3. Values are: Y command is threadsafe N command is not threadsafe I command is indeterminate threadsafe
CICS_TS31	CHAR(1)	Indicates the threadsafe status if the command is for CICS TS V3.1. Values are: Y command is threadsafe N command is not threadsafe I command is indeterminate threadsafe
CICS_TS32	CHAR(1)	Indicates the threadsafe status if the command is for CICS TS V3.2. Values are: Y command is threadsafe N command is not threadsafe I command is indeterminate threadsafe
CICS_TS41	CHAR(1)	Indicates the threadsafe status if the command is for CICS TS V4.1. Values are: Y command is threadsafe N command is not threadsafe I command is indeterminate threadsafe

Table 42. The V\_CIU\_SCAN\_TRDSAFE table (continued)

Column	Type	Description
CICS_TS42	CHAR(1)	Indicates the threadsafe status if the command is for CICS TS V4.2. Values are: Y command is threadsafe N command is not threadsafe I command is indeterminate threadsafe
CICS_TS51	CHAR(1)	Indicates the threadsafe status if the command is for CICS TS V5.1. Values are: Y command is threadsafe N command is not threadsafe I command is indeterminate threadsafe

## The structure of the CSECT Scanner objects

This section describes the tables and views defined in the CSECT Scanner database.

It contains:

- “CSECT Scanner base tables”
- “CSECT Scanner object views” on page 231

### CSECT Scanner base tables

Use the information in the CSECT Scanner base tables defined in the database to write your own SQL applications to query the tables; these applications must use native SQL queries.

#### CIU\_PROGRAM\_INFO

This table stores load-module-related information from the load libraries that have been scanned. It allows you to answer questions such as:

“Given a load module name and length, when was it link-edited?”

“Is a program resource a GLUE or TRUE program?”

Table 43. The CIU\_PROGRAM\_INFO table

Column	Type	Description
DSNAME	CHAR(44)	Data set name.
PROGRAM	CHAR(8)	Load module name.
PROGLEN	CHAR(8)	Load module length in hexadecimal.
ENTRY_POINT	CHAR(8)	Entry point offset in hexadecimal.
ALIAS_OF	CHAR(8)	If the program name is an alias, this program is the one for which it is an alias.
LINKER_NAME	CHAR(10)	Identifier of the binder or link-editor.
LINKER_VERSION	CHAR(5)	Version number of the binder or link-editor (VV.RR).
LINKED	TIMESTAMP	Date and local time that the program was bound or link-edited.
AMODE	CHAR(3)	Addressing mode.
RMODE	CHAR(3)	Residence mode.

### CIU\_CSECT\_INFO

This table stores CSECT-related information from the load libraries that have been scanned. It allows you to answer questions such as:

“Given a load module name and length, what is the user data of the CSECT with the same name as the load module?”

Table 44. The CIU\_CSECT\_INFO table

Column	Type	Description
DSNAME	CHAR(44)	Data set name.
PROGRAM	CHAR(8)	Load module name.
PROGLEN	CHAR(8)	Load module length in hexadecimal.
LINKED	TIMESTAMP	Date and local time that the program was bound or link-edited.
CSECT_NAME	CHAR(8)	CSECT name.
TRAN_1_DATE	CHAR(7)	First translation date (YYYYDDD).
TRAN_1_NAME	CHAR(10)	First translator identifier.
TRAN_1_VERSION	CHAR(5)	First translator version (VV.RR).
TRAN_2_DATE	CHAR(7)	Second translation date (YYYYDDD).
TRAN_2_NAME	CHAR(10)	Second translator identifier.
TRAN_2_VERSION	CHAR(5)	Second translator version (VV.RR).
USER_DATA_DATE	CHAR(7)	User data date (YYYYDDD).
USER_DATA	VARCHAR(80)	User data.
HMASPZAP_DATE	CHAR(7)	ZAP date (YYYYDDD).
HMASPZAP_DATA	CHAR(8)	ZAP data.

#### Note:

1. Some CSECTs are translated, or compiled, twice. For example, programs created using the IBM internal PL/X language are first translated by the PL/X compiler and then translated by the assembler-program.
2. Dates are in the format “YYYYDDD”, where YYYY is the year and DDD is the day of the year. For example: “2007124”.

### CIU\_TRANSLATORS

This table stores descriptions of translators, binders, and linkage editors. It is loaded with predefined information about a range of IBM products by the CIUTLOAD job. It allows you to determine the full descriptions of these programs from the identifiers used in the tables above.

Table 45. The CIU\_TRANSLATORS table

Column	Type	Description
TRANSLATOR_NAME	CHAR(10)	The translator identifier.
DESCRIPTION	CHAR(64)	Description of translator.

## CSECT Scanner object views

The CSECT Scanner object views show scanned data about programs and dependency.

### V\_CIU\_CICS\_LINKED

This view is a simple DB2 equi-join of CIU\_CICS\_DATA and CIU\_PROGRAM\_INFO, using PROGRAM and PROGLLEN. It shows the link-edit timestamps of the programs that are using CICS resources.

Table 46. View V\_CIU\_CICS\_LINKED

Column	Type	Description
TRANSID	CHAR(4)	CICS transaction ID.
PROGRAM	CHAR(8)	Load module name.
LINKED	TIMESTAMP	Bind or link-edit timestamp, in the local time format.
FUNCTION	CHAR(8)	Name of EXEC CICS command.
TYPE	CHAR(8)	Resource type.
OBJECT	CHAR(255)	Resource name.

### V\_CIU\_CSECT\_TRANS

This view is a simple DB2 equi-join of CIU\_CSECT\_INFO and CIU\_TRANSLATORS using TRAN\_1\_NAME in CIU\_CSECT\_INFO and TRANSLATOR\_NAME in CIU\_TRANSLATORS. It shows the descriptions of the compilers used to create the CSECTs in each scanned load module.

Table 47. View V\_CIU\_CSECT\_TRANS

Column	Type	Description
DSNAME	CHAR(44)	Data set name.
PROGRAM	CHAR(8)	Load module name.
LINKED	TIMESTAMP	Bind or link-edit timestamp, in the local time format.
CSECT_NAME	CHAR(8)	CSECT name.
TRAN_1_NAME	CHAR(10)	Compiler ID.
DESCRIPTION	CHAR(64)	Compiler description.

---

## The structure of the CICS regions objects

This section describes the structure of the CICS regions objects.

- “CICS regions base table”

### CICS regions base table

Use the information in the CIU\_REGION\_INFO table in the CICS regions base table defined in the database to write your own SQL applications to query the tables; these applications must use native SQL queries.

#### CIU\_REGION\_INFO

This table stores information about the CICS regions on which the Collector has run. Whenever a collection of dependency or affinity data is started, the names of the CICS System Definition data set (CSD) and of the first four resource group lists in the CSD are stored, together with date and time information.

Table 48. The CIU\_REGION\_INFO table

Column	Type	Description
COLLECTION_ID	CHAR(16)	Collection ID.
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
APPLID	CHAR(8)	CICS region APPLID.
HOMESYSID	CHAR(4)	CICS region system identifier (SYSID).
CICS_RELEASE	CHAR(4)	The CICS level number for the CICS region.
CSD_NAME	CHAR(44)	Name of the CICS System Definition data set (CSD) used during the last collection in this region.
CSD_GROUP_LIST1	CHAR(8)	Name of the first resource group list in the CSD defined at system startup.
CSD_GROUP_LIST2	CHAR(8)	Name of the second resource group list in the CSD defined at system startup.
CSD_GROUP_LIST3	CHAR(8)	Name of the third resource group list in the CSD defined at system startup.
CSD_GROUP_LIST4	CHAR(8)	Name of the fourth resource group list in the CSD defined at system startup.
STORAGE_PROTECT	CHAR(8)	Indicates whether storage protection was active for the region.
DEP_COLL_LASTSTART	TIMESTAMP	Time at which the last collection of dependency data was started, in the local time format.
DEP_COLL_LASTSAVE	TIMESTAMP	Time at which collected dependency data was last saved, in the local time format.
APP_COLL_LASTSTART	TIMESTAMP	Time at which the last collection of affinity data was started, in the local time format.
APP_COLL_LASTSAVE	TIMESTAMP	Time at which collected affinity data was last saved, in the local time format.
DEP_COLL_FIRST_COLLECTED	TIMESTAMP	First time dependency data was collected, in the local time format.
DEP_COLL_LAST_COLLECTED	TIMESTAMP	Last time dependency data was collected, in the local time format.
AFF_COLL_FIRST_COLLECTED	TIMESTAMP	First time affinity data was collected, in the local time format.
AFF_COLL_LAST_COLLECTED	TIMESTAMP	Last time affinity data was collected, in the local time format.

## The structure of the resource objects

This section describes the structure of the resource objects.

- “File resource table” on page 234
- “Program resource table” on page 235
- “Transaction resource table” on page 237
- “Transient Data queue resource table” on page 240
- “Temporary Storage queue resource table” on page 242
- “Web service resource table” on page 243
- “Threadsafe table” on page 220
- “GLUE and TRUE exit resource table” on page 245

## File resource table

Use the information in the CIU\_FILE\_DETAIL table to write your own SQL applications to query the tables; these applications must use native SQL queries.

### CIU\_FILE\_DETAIL

This table stores detailed information about every CICS file referenced in a transaction recorded by the Collector. File information is stored in this table only if the **Files** field on the CICS Resources Options panel, CIU240, is set to D.

Table 49. The CIU\_FILE\_DETAIL table

Field Name	Type	Description
COLLECTION_ID	CHAR(16)	Collection ID.
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
APPLID	CHAR(8)	CICS region applid.
HOMESYSID	CHAR(4)	SYSID of local region.
APPL_NAME	CHAR(64)	Application name
APPL_VER1	INTEGER	Major version number
APPL_VER2	INTEGER	Minor version number
APPL_VER3	INTEGER	Micro version number
APPL_OPER	CHAR(64)	The operation associated with the task
FILE_NAME	CHAR(8)	Name of the file resource.
ACCESSMETHOD	CHAR(8)	Access Method of the file. Values are: BDAM, REMOTE, and VSAM.
BASEDSNAME	CHAR(44)	The base name of the file resource.
BLOCKFORMAT	CHAR(10)	Whether records in the file are blocked or unblocked. Values are: BLOCKED, UNBLOCKED.
BLOCKKEYLEN	INTEGER	Physical block key length for the file.
BLOCKSIZE	INTEGER	The length in bytes for the block size of the file.
CFDTPOOL	CHAR(8)	Name of the coupling facility data table pool.
DISPOSITION	CHAR(8)	The disposition option for the file. Values are: OLD, SHARE.
DSNAME	CHAR(44)	The data set name of the file resource.
JOURNALNUM	INTEGER	The number of the journal to which CICS writes the information that is required for autojournaling.
KEYLENGTH	INTEGER	The length of the record key for the file.
KEYPOSITION	INTEGER	The starting position of the key field in each record relative to the beginning of the record.
LOADTYPE	CHAR(10)	The load type for a coupling facility data table. Values are: LOAD, NOLOAD, and NOTAPPLIC.
LSRPOOLID	INTEGER	The number of VSAM LSR pool associated with this file.
MAXNUMRECS	INTEGER	The maximum number of records that the file can hold.
OBJECT	CHAR(8)	Whether the file is associated with a data set or a VSAM path that links an alternate index to its base cluster. Value are as follow: <b>BASE</b> The file is associated with a data set that is a VSAM base. <b>PATH</b> The file is associated with a path.
RBATYPE	CHAR(12)	Identifies whether the records can be read from the file. Values are: NOTREADABLE or READABLE.

Table 49. The CIU\_FILE\_DETAIL table (continued)

Field Name	Type	Description
RECORDFORMAT	CHAR(10)	Identifies the format of the records on the file. Values are: FIXED, VARIABLE, or UNDEFINED.
RECORDSIZE	INTEGER	The size of a fixed-length record or the maximum size of a variable-length record.
RECOVSTATUS	CHAR(14)	Indicates whether the file is recoverable. Values are: NOTRECOVERABLE or RECOVERABLE.
RELTYPE	CHAR(10)	Indicates whether relative or absolute addressing is used to access the file and, if relative, the type of relative addressing. Value are as follows: <b>BLK</b> Relative block addressing. <b>DEC</b> Zoned decimal format. <b>HEX</b> Hexadecimal relative track format. <b>NOTAPPLIC</b> Absolute addressing is being used or the file is a VSAM file.
REMOTENAME	CHAR(8)	The name by which the file is known to the CICS region named in the REMOTESYSTEM field.
REMOTESYSTEM	CHAR(4)	The name of the CICS region in which the file is defined.
REMOTETABLE	CHAR(8)	Indicates whether the file represents an open remote data table. Value is: REMTABLE (an open remote data table).
RLSACCESS	CHAR(10)	Indicates whether the file is defined to be opened in RLS mode. Values are: NOTAPPLIC, NOTRLS, or RLS.
STRINGS	INTEGER	Indicates the number of strings (concurrent operations) specified for the file.
TABLE	CHAR(10)	Identifies the type of data set that corresponds to this file. Values are: CFTABLE, CICSTABLE, NOTTABLE, or USERTABLE.
TABlename	CHAR(8)	The name specified for the coupling facility data table.
TYPE	CHAR(10)	The type of data set that corresponds to this file. Values are: ESDS, KEYED, KSDS, NOTKEYED, RRDS, VRRDS, NOTAPPLIC.
FIRST_RUN	TIMESTAMP	Time of first occurrence, in the local time format.
LAST_RUN	TIMESTAMP	Time of latest observation, in the local time format.

## Program resource table

Use the information in the CIU\_PROGRAM\_DETAIL table to write your own SQL applications to query the tables; these applications must use native SQL queries.

### CIU\_PROGRAM\_DETAIL

This table stores information about every CICS program referenced in a transaction recorded by the Collector. Program information is stored in this table only if the **Programs** field on the CICS Resources Options panel, CIU240, is set to D.

Table 50. The CIU\_PROGRAM\_DETAIL table

Field Name	Type	Description
COLLECTION_ID	CHAR(16)	Collection ID.
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
APPLID	CHAR(8)	CICS region applid.
HOMESYSID	CHAR(4)	SYSID of local region.

Table 50. The CIU\_PROGRAM\_DETAIL table (continued)

Field Name	Type	Description
APPL_NAME	CHAR(64)	Application name
APPL_VER1	INTEGER	Major version number
APPL_VER2	INTEGER	Minor version number
APPL_VER3	INTEGER	Micro version number
APPL_OPER	CHAR(64)	The operation associated with the task
PROGRAM_NAME	CHAR(8)	Name of the program resource.
LINKEDIT_DATE	TIMESTAMP	Reserved for future use.
LIB_NAME	CHAR(8)	Name of the library resource from which this program was loaded.
LIB_DATASET-NAME	CHAR(44)	Name of the data set from which the program was loaded.
ACCESS	CHAR(8)	The type of storage into which the program is loaded. Values are: CICS, USER, READONLY, and NONE.
APIST	CHAR(8)	Indicates the API attribute of the installed program definition. Values are: CICSAPI and OPENAPI.
CONCURRENCY	CHAR(12)	Indicates the concurrency attribute of the installed program definition. Values are: QUASIRENT and THREADSAFE.
DATA_LOCATION	CHAR(10)	Indicates whether this program can accept data address higher than 16 MB. Values are: ANY, BELOW, and NOTAPPLIC.
DYNAMIC_STATUS	CHAR(10)	Indicates if the program is the subject of a program-link request; that is, the request can be dynamically routed. Values are: DYNAMIC and NOTDYNAMIC.
EXECUTION_KEY	CHAR(10)	Indicates the storage key of the program. Values are: CICS, USER, and NOTAPPLIC.
EXECUTION_SET	CHAR(10)	Indicates whether the program is restricted to the distributed program link subset of the CICS API. Values are: DPLSUBSET, FULLAPI, and NOTAPPLIC.
HOLD_STATUS	CHAR(10)	Indicates how long the program is to remain loaded. Values are: CICSLIFE, TASKLIKE, and NOTAPPLIC.
INSTALL_TYPE	CHAR(10)	Indicates the method used to install the program resource definition. Values are: AUTO, CATALOG, GROUPLIST, MANUAL, RDO, and SYSAUTO.
LANGUAGE_DEDUCED	CHAR(12)	Indicates the language deduced by CICS for the program. Values are: ASSEMBLE, C370, COBOL, COBOL2, LE370, PLI, Java™, NOTDEDUCED, and NOTAPPLIC.
LANGUAGE_DEFINED	CHAR(12)	Indicates the programming language specified on the resource definition. Values are: ASSEMBLE, C370, COBOL, LE370, PLI, NOTDEFINED, and NOTAPPLIC.
LOAD_STATUS	CHAR(12)	Indicates whether the program can be loaded. Values are: LOADABLE, NOTLOADABLE, NOTLOADED, and NOTAPPLIC.
LOCATION	CHAR(8)	Indicates where the most recently loaded copy of the program resides. Values are: CDSA, ECDSA, ELPA, ERDSA, ESDSA, LPA, RDSA, SDSA, and NONE
MODULE_TYPE	CHAR(12)	Indicates the type of this program resource. Values are: MAPSET, PARTITIONSET, and PROGRAM.

Table 50. The CIU\_PROGRAM\_DETAIL table (continued)

Field Name	Type	Description
PROGRAM_ATTRIBUTE	CHAR(10)	Indicates the residency status of the program. Values are: RELOAD, RESIDENT, REUSABLE, TRANSIENT, and TEST.
PROGRAM_LENGTH	INTEGER	The length of the program in bytes.
PROGRAM_TYPE	CHAR(10)	Indicates where the next new copy of the program is to be loaded from. Values are: PRIVATE, SHARED, TYPEANY, and NOTAPPLIC.
PROGRAM_USAGE	CHAR(12)	Indicates whether the program is used as a CICS nucleus program or as a user application program. Values are: APPLICATION or NUCLEUS.
REMOTE_DEFINITION	CHAR(8)	Indicates whether this program is a local or a remote resource. Values are: LOCAL or REMOTE.
REMOTE_PROGID	CHAR(8)	The name by which this program is known in the remote CICS region.
REMOTE_SYSID	CHAR(4)	The name of the remote CICS region that owns the program.
REMOTE_TRANID	CHAR(4)	The name of the transaction under which the program runs on the remote CICS region.
SPECIFIED_AMODE	CHAR(12)	The addressing mode specified for the resource. Values are: AMODE24, AMODE31, AMODEANY, and NOTSPECIFIED.
SPECIFIED_RMODE	CHAR(12)	The residency mode specified for the resource. Values are: RMODE24, RMODE31, RMODEANY, and NOTSPECIFIED.
FIRST_RUN	TIMESTAMP	Time of first occurrence, in the local time format.
LAST_RUN	TIMESTAMP	Time of latest observation, in the local time format.

## Transaction resource table

Use the information in the CIU\_TRANSID\_DETAIL tables to write your own SQL applications to query the tables; these applications must use native SQL queries.

### CIU\_TRANSID\_DETAIL

This table stores detailed information about every CICS transaction recorded by the Collector. Transaction information is stored in this table only if the **Transactions** field on the CICS Resources Options panel, CIU240, is set to D.

Table 51. The CIU\_TRANSID\_DETAIL table

Field Name	Type	Description
COLLECTION_ID	CHAR(16)	Collection ID.
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
APPLID	CHAR(8)	CICS region applid.
HOMESYSID	CHAR(4)	SYSID of local region
APPL_NAME	CHAR(64)	Application name
APPL_VER1	INTEGER	Major version number
APPL_VER2	INTEGER	Minor version number
APPL_VER3	INTEGER	Micro version number
APPL_OPER	CHAR(64)	The operation associated with the task
TRANSID	CHAR(4)	The name of the transaction definition.

Table 51. The CIU\_TRANSID\_DETAIL table (continued)

Field Name	Type	Description
BREXIT	CHAR(8)	The name of the bridge exit defined by the BREXIT parameter of the named transaction definition.
CMDSEC	CHAR(1)	Indicates whether command security checking will be performed for the tasks running the transaction. Values are: Y Yes N No
DTIMEOUT	INTEGER	The deadlock time-out value in seconds for the task running this transaction.
DUMP	CHAR(1)	Indicates whether the transaction is defined for dumping. Values are: Y Yes N No
DYNAMIC	CHAR(1)	Indicates whether the transaction is defined for dynamic transaction routing. Values are: Y Yes N No
INDOUBT	CHAR(8)	The action CICS takes if the CICS region fails or loses connectivity with its coordinator while a unit of work is in the indoubt period.
INDOUBT_WAIT	CHAR(1)	The response that the CICS unit of work takes if a failure occurs while in an indoubt state. Values are: Y The UOW is to wait, pending recovery from a failure, to determine whether recoverable resources are to be backed out or committed. N The UOW is not to wait. CICS immediately takes the action specified on the ACTION attribute of the TRANSACTION definition.
INDOUBT_WAIT_TIME	INTEGER	The length of time, in minutes, after a failure during the indoubt period, before the transaction takes the action returned in the INDOUBT field.
INITIAL_PROGRAM	CHAR(8)	The name of the initial program given control for the transaction.
ISOLATE	CHAR(1)	Indicated whether transaction isolation is required for the transaction task-lifetime user-key storage. Values are: Y Transaction isolation is required. N Transaction isolation is not required.
LOCAL_QUEUEING	CHAR(1)	Indicates whether the started request for this transaction is eligible to be queued locally if the transaction is to be started on another system and the remote system is not available. Values are: Y The request can be queued locally. N The request is not queued locally.
OTSTIMEOUT	INTEGER	The period of time, in seconds, that an Object Transaction Service (OTS) transaction is allowed to run without the initiator of the OTS transaction taking a sync point (or rolling back the OTS transaction).
PARTITIONSET	CHAR(8)	Indicates the partition set specified on the transaction definition. Values are: KEEP, NAMED, OWN, and NONE.
PARTITIONSET_NAME	CHAR(8)	The partition set defined on the transaction definition.

Table 51. The CIU\_TRANSID\_DETAIL table (continued)

Field Name	Type	Description
PROFILE_NAME	CHAR(8)	The profile definition associated with the transaction definition.
REMOTE	CHAR(1)	Indicates whether the transaction is defined as remote. Values are: Y Yes N No
REMOTE_NAME	CHAR(8)	The remote name as specified on the transaction definition.
REMOTE_SYSTEM	CHAR(4)	The remote system as specified on the transaction definition.
RESSEC	CHAR(1)	Indicates whether resource security checking is required for the transaction. Values are: Y Yes N No
RESTART	CHAR(1)	Indicates whether the transaction is considered for transaction restart. Values are: Y The transaction can be restarted. N The transaction can not be restarted.
ROUTABLE_STATUS	CHAR(12)	Indicates whether the transaction, from a START command, is routed using the enhanced routing method. Values are: ROUTABLE and NOTROUTABLE.
RUNAWAY_LIMIT	INTEGER	The runaway-task time limit specified on the transaction definition.
SHUTDOWN	CHAR(8)	Indicates whether the transaction can be run during CICS shutdown. Values are: ENABLED and DISABLED.
SPURGE	CHAR(1)	Indicates whether the transaction is defined as system-purgeable. Values are: Y Yes N No
STORAGE_CLEAR	CHAR(1)	Indicates whether task-lifetime storage is cleared before it is freed by a FREEMAIN command. Values are: Y Yes N No
STORAGE_FREEZE	CHAR(1)	Indicates whether the storage freeze option is defined for the transaction. Values are: Y Yes N No
SYSTEM_ATTACH	CHAR(1)	Indicates whether the tasks attached with this transaction are attached as system tasks. Values are: Y Yes N No
SYSTEM_RUNAWAY	CHAR(8)	Indicates whether the transaction is governed by the system runaway limit. Values are: Y Yes N No
TASKDATAKEY	CHAR(8)	The storage key for the task-lifetime storage associated with the transaction. Values are: CICS and USER.

Table 51. The CIU\_TRANSID\_DETAIL table (continued)

Field Name	Type	Description
TASKDATALOC	CHAR(8)	The storage location for the task-lifetime storage associated with the transaction. Values are: <b>Any</b> The storage can be located above 16 MB in virtual storage. <b>Below</b> The storage must be located below 16 MB in virtual storage.
TCLASS	CHAR(1)	Indicates whether the transaction belongs to a transaction class. Values are: <b>Y</b> Yes <b>N</b> No
TCLASS_NAME	CHAR(8)	The name of the transaction class that the transaction belongs to.
TPURGE	CHAR(1)	Indicates whether the transaction is purgeable in the event of a VTAM terminal error. Values are: <b>Y</b> Yes <b>N</b> No
TRACE	CHAR(8)	The level of tracing defined for the transaction. Values are: SPECIAL, STANDARD, and SUPPRESSED.
TRAN_ROUTING_PROFILE	CHAR(8)	The name of the profile CICS uses to route the transaction to a remote system.
PRIMARY_TRANSID	CHAR(4)	The primary transaction identifier for the transaction definition.
TWASIZE	INTEGER	The size of the transaction work area specified on the transaction definition.
FIRST_RUN	TIMESTAMP	Time of first occurrence, in the local time format.
LAST_RUN	TIMESTAMP	Time of latest observation, in the local time format.

## Transient Data queue resource table

Use the information in the CIU\_TDQUEUE\_DETAIL table to write your own SQL applications to query the tables; these applications must use native SQL queries.

### CIU\_TDQUEUE\_DETAIL

This table stores detailed information about every CICS transient data queue referenced in a transaction recorded by the Collector. Transient data queue information is stored in this table only if the **TD Queues** field on the CICS Resources Options panel, CIU240, is set to D.

Table 52. The CIU\_TDQUEUE\_DETAIL table

Field Name	Type	Description
COLLECTION_ID	CHAR(16)	Collection ID.
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
APPLID	CHAR(8)	CICS region applid.
HOMESYSID	CHAR(4)	SYSID of local region.
APPL_NAME	CHAR(64)	Application name
APPL_VER1	INTEGER	Major version number
APPL_VER2	INTEGER	Minor version number
APPL_VER3	INTEGER	Micro version number

Table 52. The CIU\_TDQUEUE\_DETAIL table (continued)

Field Name	Type	Description
APPL_OPER	CHAR(64)	The operation associated with the task
TDQUEUE_NAME	CHAR(4)	The name of the transient data queue definition.
ATIFACILITY	CHAR(10)	Indicates whether the queue has a terminal or session associated with it. Values are: NOTAPPLIC, NOTERMINAL, and TERMINAL
ATITERMID	CHAR(4)	The name of the terminal or session associated with the queue.
ATITRANID	CHAR(4)	Identifies the transaction to be run when CICS initiates a task automatically to process the queue.
ATIUSER	CHAR(8)	The user identifier associated with the queue.
BLOCKFORMAT	CHAR(10)	Indicates whether the data set associated with the queue is in blocked record format or not. Values are: BLOCKED, UNBLOCKED, and NOTAPPLIC.
BLOCKSIZE	INTEGER	The length of the block in bytes.
DATABUFFERS	INTEGER	The number of buffers to be used by this queue.
DDNAME	CHAR(8)	An identifier that refers to an associated data set name.
DISPOSITION	CHAR(10)	Indicates the status of the associated data set. Values are: MOD, OLD, SHARE, and NOTAPPLIC.
DSNAME	CHAR(44)	The name of the associated QSAM data set.
ERROROPTION	CHAR(8)	Indicates the action CICS takes if an I/O error is encountered. Values are: <b>IGNORERR</b> The block that caused the error is accepted. <b>SKIP</b> The block that caused the error is skipped.
INDIRECTNAME	CHAR(4)	The name of the queue to which this indirect queue points.
INDOUBT	CHAR(8)	Indicates the action that CICS takes for an indoubt unit of work, if the definition for this queue specifies WAIT(YES). Values are: QUEUE and REJECT.
INDOUBTWAIT	CHAR(8)	Indicates whether an indoubt unit of work will wait for resynchronization with its coordinator to determine whether to commit or back out the changes. Values are: NOWAIT and WAIT.
IOTYPE	CHAR(10)	Indicates whether the queue is defined for input or output. Values are: INPUT, OUTPUT, RDBACK, or NOTAPPLIC.
MEMBER	CHAR(8)	Member name if the queue is a member of a partitioned data set.
PRINTCONTROL	CHAR(10)	Indicates the type of print control, if any, defined for the queue. Values are: ASACTL, MCHCTL, NOCTL, and NOTAPPLIC.
RECORDFORMAT	CHAR(10)	Indicates whether the queue has fixed-length or variable-length records. Values are: FIXED VARIABLE, and NOTAPPLIC.
RECORDLENGTH	INTEGER	The record length, in bytes, for queues having fixed-length records, or the maximum record length of queues having variable-length records. Applies only to extrapartition queues; for others, -1 is present.

Table 52. The CIU\_TDQUEUE\_DETAIL table (continued)

Field Name	Type	Description
RECOVSTATUS	CHAR(12)	Indicates the type of recovery defined for the queue. Recovery is available only for intrapartition queues. Values are: LOGICAL, PHYSICAL, NOTRECOVABLE, and NOTAPPLIC.
REMOTENAME	CHAR(4)	The name of the queue in the remote CICS region in which the queue is defined. Applies only to queues defined as remote, for other queues the value is blanks.
REMOTESYSTEM	CHAR(4)	The name of the CICS region in which the queue is defined. Applies only to queues defined as remote; for other queues the value is blanks.
REWIND	CHAR(8)	Indicates the disposition of a tape data set. Values are: LEAVE and REREAD.
SYSOUTCLASS	CHAR(1)	Indicates the class attribute of the associated SYSOUT data set, or blank if DSNAME is used.
TRIGGERLEVEL	INTEGER	The number of items the queue must contain before automatic transaction initiation (ATI) occurs. A value of zero means the queue is not subject to ATI. A value of -1 means the queue is not intrapartition.
TYPE	CHAR(8)	Identifies the type of queue. Values are: EXTRA, INDIRECT, INTRA, and REMOTE.
FIRST_RUN	TIMESTAMP	Time of first occurrence, in the local time format.
LAST_RUN	TIMESTAMP	Time of latest observation, in the local time format.

## Temporary Storage queue resource table

Use the information in the CIU\_TSQUEUE\_DETAIL table to write your own SQL applications to query the tables; these applications must use native SQL queries.

### CIU\_TSQUEUE\_DETAIL

This table stores detailed information about every CICS temporary storage queue referenced in a transaction recorded by the Collector. TS Queue information is stored in this table only if the **TS Queues** field on the CICS Resources Options panel, CIU240, is set to D.

Table 53. The CIU\_TSQUEUE\_DETAIL table

Field Name	Type	Description
COLLECTION_ID	CHAR(16)	Collection ID.
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
APPLID	CHAR(8)	CICS region applid.
HOMESYSID	CHAR(4)	SYSID of local region.
APPL_NAME	CHAR(64)	Application name
APPL_VER1	INTEGER	Major version number
APPL_VER2	INTEGER	Minor version number
APPL_VER3	INTEGER	Micro version number
APPL_OPER	CHAR(64)	The operation associated with the task
TSQUEUE_NAME	CHAR(16)	Name of the temporary storage queue.
FLENGTH	INTEGER	The total length in bytes of all items in the temporary storage queue.

Table 53. The CIU\_TSQUEUE\_DETAIL table (continued)

Field Name	Type	Description
LOCATION	CHAR(10)	Indicates where the temporary storage queue resides. Values are: <b>AUXILIARY</b> The queue is held in CICS temporary storage VSAM data sets. <b>MAIN</b> The queue is held in main storage.
MAXITEMLEN	INTEGER	The length in bytes of the largest item in the queue.
MINITEMLEN	INTEGER	The length in bytes of the smallest item in the queue.
POOLNAME	CHAR(8)	The name of a temporary storage pool. CICS ships the command to the temporary storage server that manages the pool.
RECOVSTATUS	CHAR(14)	Indicates the recovery status of the queue. Values are: RECOVERABLE and NOTRECOVERABLE.
SYSID	CHAR(8)	The system name that corresponds to a temporary storage pool name.
TRANSID	CHAR(4)	Identifies the transaction that created the temporary storage queue.
FIRST_RUN	TIMESTAMP	Time of first occurrence, in the local time format.
LAST_RUN	TIMESTAMP	Time of latest observation, in the local time format.

## Web service resource table

Use the information in the CIU\_WEBSERV\_DETAIL table to write your own SQL applications to query the tables; these applications must use native SQL queries.

### CIU\_WEBSERV\_DETAIL

This table stores detailed information about every CICS Web service resource referenced in a transaction recorded by the Collector. Web service information is stored in this table only if the **Web Services** field on the CICS Resource Options panel, CIU240, is set to D.

Table 54. The CIU\_WEBSERV\_DETAIL table

Field Name	Type	Description
COLLECTION_ID	CHAR(16)	Collection ID.
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
APPLID	CHAR(8)	CICS region applid
HOMESYSID	CHAR(4)	SYSID of local region.
APPL_NAME	CHAR(64)	Application name
APPL_VER1	INTEGER	Major version number
APPL_VER2	INTEGER	Minor version number
APPL_VER3	INTEGER	Micro version number
APPL_OPER	CHAR(64)	The operation associated with the task
NAME	CHAR(32)	The name of the Web service.
PROGRAM	CHAR(8)	The name of the CICS program that implements the Web service.
URIMAP	CHAR(8)	The name of the dynamically installed URIMAP.

Table 54. The CIU\_WEBSERV\_DETAIL table (continued)

Field Name	Type	Description
CCSID	CHAR(8)	The CCSID that is used to encode the character data in the application data structure at run time.
CONTAINER	CHAR(16)	The name of the container used if PGMINTERFACE contains a value of CHANNEL.
MAPPINGLEVEL	CHAR(8)	The mapping level that is used to convert data between language structures and Web service description (WSDL) documents. Values are 1.0, 1.1, 1.2, 2.0, or 2.1.
MAPPINGRNUM	INTEGER	The release number for the mapping level that is used to convert data between language structures and Web services description (WSDL) documents. Values are: 0, 1, or 2.
MAPPINGVNUM	INTEGER	The version number of the mapping level that is used to convert data between language structures and Web service description (WSDL) documents. Values are: 1 or 2.
MINRUNLEVEL	CHAR(8)	The minimum runtime level that is required to run the Web service in CICS. Values are 1.0, 1.1, 1.2, 2.0, or 2.1.
MINRUNRNUM	INTEGER	The release number for the minimum runtime level that is required to run the Web services in CICS. Values are: 0, 1, or 2.
MINRUNVNUM	INTEGER	The version number for the minimum runtime level that is required to run the Web services in CICS. Values are: 0, 1, or 2.
PIPELINE	CHAR(8)	The name of the PIPELINE resource that contains this WEBSERVICE resource.
PGMINTERFACE	CVDA	Indicates whether the CICS program that implements the Web service expects input in a channel or in a commarea. Values are: CHANNEL or COMMAREA.
VALIDATIONSTATUS	CHAR(12)	Indicates whether full validation of SOAP messages is currently enabled for this WEBSERVICE. Values are: VALIDATION or NOVALIDATION.
XOPDIRECTST	CHAR(12)	Indicates whether the Web service is currently able to handle XOP documents in direct mode. Values are: NOXOPDIRECT or XOPDIRECT.
XOPSUPPORTST	CHAR(12)	Indicates whether the Web service implementations is capable of handling XOP documents and binary attachments in direct mode. Values are: NOXOPSUPPORT or XOPSUPPORT.
WSDL_FILENAME	CHAR(255)	The name of the Web service description file associated with the WEBSERVICE resource.
WSBIND_FILENAME	CHAR(255)	The name of the Web service binding file.
ENDPOINT	CHAR(255)	The endpoint URI of a remote WEBSERVICE.
BINDING	CHAR(255)	The WSDL binding represented by the WEBSERVICE.
LAST_MODIFIED	TIMESTAMP	The time the deployed WSBIND file on z/OS UNIX was last updated, in the local time format.
FIRST_RUN	TIMESTAMP	Time of first occurrence, in the local time format.
LAST_RUN	TIMESTAMP	Time of latest observation, in the local time format.

## GLUE and TRUE exit resource table

Use the information in the CIU\_EXIT\_INFO tables to write your own SQL applications to query the tables; these applications must use native SQL queries.

### CIU\_EXIT\_INFO

This table stores detailed information about every CICS GLUE and TRUE exit that is called by at least one transaction. Exit information is stored in this table only if the **Exits** field on the CICS Resources Options panel, CIU240, is set to Y.

Table 55. The CIU\_EXIT\_INFO table

Field Name	Type	Special restrictions
COLLECTION_ID	CHAR(16)	Collection ID.
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
APPLID	CHAR(8)	CICS region applid.
HOMESYSID	CHAR(4)	SYSID of local region.
APPL_NAME	CHAR(64)	Application name
APPL_VER1	INTEGER	Major version number
APPL_VER2	INTEGER	Minor version number
APPL_VER3	INTEGER	Micro version number
APPL_OPER	CHAR(64)	The operation associated with the task
EXIT_PROGRAM	CHAR(8)	The name of the exit program.
EXIT_NAME	CHAR(8)	The name of the exit.
EXIT_POINT	CHAR(8)	The name of the entry point associated with the exit. GLUEs only.
EXIT_TYPE	CHAR(4)	The type of exit. Values are GLUE or TRUE.
FIRST_RUN	TIMESTAMP	Time of first occurrence, in the local time format.
LAST_RUN	TIMESTAMP	Time of latest observation, in the local time format.

### CIU\_TRUEEXIT\_INFO

Table 56. The CIU\_TRUEEXIT\_INFO table

Field Name	Type	Special restrictions
TRUE_NAME	CHAR(8)	The TRUE exit program name.
PRODUCT_INFO	CHAR(50)	The product name.

### V\_CIU\_TRUEEXIT\_INFO

Table 57. The V\_CIU\_TRUEEXIT\_INFO table

Field Name	Type	Special restrictions
COLLECTION_ID	CHAR(16)	Collection ID.
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
APPLID	CHAR(8)	CICS region applid.
HOMESYSID	CHAR(4)	SYSID of local region.
TRANSID	CHAR(4)	CICS transaction ID.
PROGRAM	CHAR(8)	Currently active CICS program.
FUNCTION	CHAR(24)	CALL.
TYPE	CHAR(24)	EXIT.

Table 57. The V\_CIU\_TRUEEXIT\_INFO table (continued)

Field Name	Type	Special restrictions
LAST_RUN	TIMESTAMP	Time of latest observation, in the local time format.
TRUE_NAME	CHAR(8)	The TRUE exit program name.
PRODUCT_INFO	CHAR(50)	The product name.

## Event table

Use the information in the CIU\_EVENT\_DETAIL table to write your own SQL applications to query the tables; these applications must use native SQL queries.

### CIU\_EVENT\_DETAIL

This table stores detailed EVENT information.

Table 58. The CIU\_EVENT\_DETAIL table

Column	Type	Description
COLLECTION_ID	CHAR(16)	Collection ID.
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
APPLID	CHAR(8)	CICS region applid.
HOMESYSID	CHAR(4)	SYSID of local region.
APPL_NAME	CHAR(64)	Application name
APPL_VER1	INTEGER	Major version number
APPL_VER2	INTEGER	Minor version number
APPL_VER3	INTEGER	Micro version number
APPL_OPER	CHAR(64)	The operation associated with the task
EVENT_NAME	CHAR(32)	Event name.
CAPTURE_SPEC	CHAR(32)	Capture Specification name.
EVENT_BINDING	CHAR(32)	Event Binding name.
EVENT_TYPE	CHAR(1)	Event type (application or system).
EVENT_STRUCID	CHAR(4)	Event structure identifier.
EVENT_VERSION	INTEGER	Event Structure version number.
SCHEMA_VER	INTEGER	Schema version number.
SCHEMA_REL	INTEGER	Schema release number.
EVENT_USERTAG	CHAR(8)	Event Binding user tag.
EB_DEF_SOURCE	CHAR(8)	Event Binding definition source. The source of the definition, depending on which, agent made the last change.
EB_DEF_TIME	TIMESTAMP	Event Binding definition time. The local date and time when the resource definition record was created.
EB_STATUS	CHAR(12)	Event Binding status. Indicates whether the event binding is enabled or not.
EB_ADAPTER	CHAR(32)	Event Binding Adapter.
EB_CHG_AGENT	CHAR(12)	Event Binding change agent identifier.
EB_CHG_REL	CHAR(4)	The CICS release level of the agent that made the last modification.

Table 58. The CIU\_EVENT\_DETAIL table (continued)

Column	Type	Description
EB_CHG_TIME	TIMESTAMP	The local date and time when the definition was last changed.
EB_CHG_USERID	CHAR(8)	The user ID that made the last modification.
EB_INST_AGENT	CHAR(12)	The install agent identifier that made the installation.
EB_INST_TIME	TIMESTAMP	The local date and time when the definition was installed.
EB_INST_USERID	CHAR(8)	The user ID that installed the resource definition.
BUNDLE_BASESCOPE	CHAR(255)	Base scope of bundle.
BUNDLE_DIR	CHAR(255)	Name of the BUNDLE directory.
BUNDLE_CHG_AGENT	CHAR(12)	Last modification agent.
BUNDLE_CHG_AGREL	CHAR(4)	Last modification agent release.
BUNDLE_CHG_TIME	TIMESTAMP	Last modification time.
BUNDLE_CHG_USERID	CHAR(8)	Last modification user ID.
BUNDLE_DEF_SOURCE	CHAR(8)	Source of the resource definition.
BUNDLE_DEF_TIME	TIMESTAMP	Creation time.
BUNDLE_ENA_COUNT	INTEGER	Enabled count.
BUNDLE_ENA_STATUS	CHAR(12)	Status.
BUNDLE_INST_AGENT	CHAR(12)	Installation agent.
BUNDLE_INST_TIME	TIMESTAMP	Installation time.
BUNDLE_INST_USERID	CHAR(8)	Installation user ID.
BUNDLE_PART_COUNT	INTEGER	Part count.
BUNDLE_TARGET_COUNT	INTEGER	Target count.
FIRST_RUN	TIMESTAMP	Time of first occurrence, in the local time format.
LAST_RUN	TIMESTAMP	Time of latest observation, in the local time format.

CCSID EBCDIC		

## The structure of the CICS IA plug-in for CICS Explorer resource objects

This section describes the CIU\_RESOURCE table. This table is used by the CICS IA plug-in to improve performance and combine resource tables.

### CIU\_RESOURCE

This CIU\_RESOURCE table stores distinct information on all the resources collected by CICS IA, by region. It is reloaded every time the primary, dependency, or affinity tables are updated.

Table 59. The CIU\_RESOURCE table

Field name	Type	Description
COLLECTION_ID	CHAR(16)	Collection ID.
APPL_NAME	CHAR(64)	Application name
APPL_VER1	INTEGER	Major version number
APPL_VER2	INTEGER	Minor version number
APPL_VER3	INTEGER	Micro version number
APPL_OPER	CHAR(64)	The operation associated with the task
ARCHIVE_DATE	TIMESTAMP	Time of archiving.
TYPE	CHAR(16)	Resource type
OBJECT	VARCHAR(255)	Resource name
APPLID	CHAR(8)	CICS region applid

## The structure of the Version objects

This section describes the CIU\_VERSION table. This table is used by the CICS IA plug-in for CICS Explorer to synchronize the CICS IA plug-in version being used and the base IA database objects.

### CIU\_VERSION table

IBM Support will request the information in the CIU\_VERSION table if you have any CICS IA plug-in issues. For more information see CICS IA Explorer Level in the Solving problems section.

The CIU\_VERSION table stores APAR and release information for the CICS IA plug-in. When maintenance is applied to the base IA DB2 tables, or the CICS IA plug-in, reload the table using the sample job CIUVERLD.

Table 60. CIU\_VERSION table

Field name	Type	Description
PRODID	CHAR(8)	Product ID"5655-Y22"
DB_APAR_LEVEL	CHAR(7)	APAR level of the IA database
EXP_APAR_LEVEL	CHAR(7)	APAR level of the CICS IA plug-in
EXP_MIN_VER	CHAR(4)	Minimum level of the CICS IA plug-in required
EXP_LATEST_VER	CHAR(4)	Latest version of the CICS IA plug-in required
VER_DESC	CHAR(40)	Description of the latest CICS IA plug-in APAR
VER_CUST_DESC	CHAR(80)	Customer modifiable field that indicates action to take if a new CICS IA plug-in needs to be downloaded

## The structure of the Command Flow table objects

This section describes the Command Flow base table that contains records for each command that is issued by the transactions. You can write your own SQL applications to query the table; these applications must use native SQL to write the queries.

## CIU\_CMDFLOW\_DATA

This table stores information about every unique detail of the commands that are issued by the transaction.

Table 61. The CIU\_CMDFLOW\_DATA table

Column	Type	Description
TRACE_ID	CHAR(16)	Unique Command Flow run ID.
CMDFLOW_ID	CHAR(08)	Name of the command flow trace.
APPLID	CHAR(8)	CICS region APPLID.
SYSID	CHAR(4)	SYSID of local region.
APP_NAME	CHAR(64)	Application name
APP_VER1	INTEGER	Major version number
APP_VER2	INTEGER	Minor version number
APP_VER3	INTEGER	Micro version number
APP_OPER	CHAR(64)	The operation that is associated with the task
TRANSID	CHAR(4)	CICS transaction ID.
TASKID	CHAR(4)	The transaction task ID, from which the command is started.
DISTRIBUTED_UOW	CHAR(27)	Distributed (Network) unit of work for task (the value of this field is the distributed UOW value that is recorded in the start of task).
CICS_UOW	CHAR(8)	CICS unit of work for task.
USERID	CHAR(8)	The CICS user ID of the transaction.
CONCURRENCY	CHAR(10)	Threadsafe. Quasirent. The value of this field is determined from the first program started for the transaction.
API	CHAR(8)	CICSAPI; OPENAPI. The value of this field is determined from the first program started for the transaction.
"PROGRAM"	CHAR(8)	The name of the CICS program that starts the command.
OFFSET	CHAR(8)	The offset of the command from the start of the program.
FUNCTION_TYPE	CHAR(8)	The type of command, DB2, DLI, WebSphere MQ, CICS, or the name of the TRUE exit if the type of command cannot be determined.
FUNCTION_ID	CHAR(4)	The function ID of the command.
FUNCTION	CHAR(24)	Command name.
TYPE	CHAR(16)	Resource type.
RESOURCE_NAME	CHAR(32)	The name of the resource the command is acting upon (if known).
TCBMODE	CHAR(2)	The TCB Mode value at the time the command is processed.
FUNCTION_DESC	CHAR(32)	The description of the command (if known).
PREV_TCBMODE	CHAR(2)	The TCB Mode value that is recorded for the previous command. The value of this field is determined by the batch DB2 table upload program.

Table 61. The CIU\_CMDFLOW\_DATA table (continued)

Column	Type	Description
BEFORE_MODESWITCH	CHAR(1)	This field is determined by comparing the TCB mode of this command to the following command. The value is determined by the batch DB2 upload program. Y Last Command that is started before a TCB mode switch N Not the last command that is started before a TCB mode switch
AFTER_MODESWITCH	CHAR(1)	This field is determined by comparing the TCB mode of this command to the previous command. The value is determined by the batch DB2 upload program. Y Last Command that is started after a TCB mode switch N Not the last command that is started after a TCB mode switch
TCB_SWITCH_BEFORE_COUNT	INTEGER	Number of TCB mode switches from task start to start of execution of current EXEC CICS command.
TCB_SWITCH_AFTER_COUNT	INTEGER	Number of TCB mode switches from task start to end of execution of current EXEC CICS command.
CICS_VERSION	CHAR(4)	The version of CICS from which the data is recorded.
CMD_TCB_CPU_TIME_BEFORE	CHAR(16)	The processor time during which the user task was dispatched by the CICS dispatcher domain, recorded before the current CICS command started.
CMD_TCB_CPU_TIME_AFTER	CHAR(16)	The processor time during which the user task was dispatched by the CICS dispatcher domain, recorded after the current CICS command ended.
CMD_TIME_LOCAL	TIMESTAMP	Time the command was issued, in the local time format.
CMD_EIBRESP	CHAR(08)	The response code is EIBRESP.
CMD_EIBRESP2	CHAR(08)	The response code is EIBRESP2.
CMD_EIDARG0_DATA	CHAR(56)	The Argument zero value of EXEC CICS command, in alphanumeric form.
CMD_USER_DAT1	CHAR(48)	User data 1 provided by the Command Flow User Exit program.
CMD_USER_DAT2	CHAR(48)	User data 2 provided by the Command Flow User Exit program.
CMD_USER_DAT3	CHAR(48)	User data 3 provided by the Command Flow User Exit program.

#### CIU\_CMDFLOW\_INDEX

This table contains all instances of the command flows that have run.

Table 62. The CIU\_CMDFLOW\_INDEX table

Column	Type	Description
OWNER_USERID	CHAR(8)	Name of USER collecting commands.
TRACE_ID	CHAR(16)	Unique Command Flow run ID.
CMDFLOW_ID	CHAR(08)	Name of the command flow trace.
COL_APPLID	CHAR(08)	APPLID of the CICS region in which it was collected.
CMD_TIME_START	TIMESTAMP	Date and time of collection start, in the local time format.
CMD_TIME_END	TIMESTAMP	Date and time of collection end, in the local time format.
CMD_APPLID1	CHAR(08)	APPLID of the CICS region 1 for this Command Flow that is run if specified.
CMD_APPLID2	CHAR(08)	APPLID of the CICS region 2 for this Command Flow that is run if specified.
CMD_APPLID3	CHAR(08)	APPLID of the CICS region 3 for this Command Flow that is run if specified.
CMD_APPLID4	CHAR(08)	APPLID of the CICS region 4 for this Command Flow that is run if specified.
CMD_APPLID5	CHAR(08)	APPLID of the CICS region 5 for this Command Flow that is run if specified.
CMD_APPLID6	CHAR(08)	APPLID of the CICS region 6 for this Command Flow that is run if specified.
CMD_APPLID7	CHAR(08)	APPLID of the CICS region 7 for this Command Flow that is run if specified.
CMD_APPLID8	CHAR(08)	APPLID of the CICS region 8 for this Command Flow that is run if specified.
CMD_APPLID9	CHAR(08)	APPLID of the CICS region 9 for this Command Flow that is run if specified.
CMD_APPLID10	CHAR(08)	APPLID of the CICS region 10 for this Command Flow that is run if specified.
CMD_APPLID11	CHAR(08)	APPLID of the CICS region 11 for this Command Flow that is run if specified.
CMD_APPLID12	CHAR(08)	APPLID of the CICS region 12 for this Command Flow that is run if specified.
CMD_APPLID13	CHAR(08)	APPLID of the CICS region 13 for this Command Flow that is run if specified.
CMD_APPLID14	CHAR(08)	APPLID of the CICS region 14 for this Command Flow that is run if specified.
CMD_APPLID15	CHAR(08)	APPLID of the CICS region 15 for this Command Flow that is run if specified.
CMD_TRANID1	CHAR(04)	Transaction that is captured by the trace.
CMD_TRANID2	CHAR(04)	Transaction that is captured by the trace.
CMD_TRANID3	CHAR(04)	Transaction that is captured by the trace.
CMD_TRANID4	CHAR(04)	Transaction that is captured by the trace.
CMD_TRANID5	CHAR(04)	Transaction that is captured by the trace.
CMD_COUNT	INTEGER	Number of records that are captured during trace in this region.

Table 62. The CIU\_CMDFLOW\_INDEX table (continued)

Column	Type	Description
CMD_APPLNAME	CHAR(8)	Application name.
CMD_USERID	CHAR(8)	Traced user ID.
CMD_TERMID	CHAR(4)	Traced term ID.
JOURNAL_NAME	CHAR(8)	Journal name.
JOURNAL_COPY_HLQ	CHAR(35)	Reserved.
USER_EXIT_NAME	CHAR(8)	The name of Command Flow User Exit program.

## Type and Function mapping for monitored commands

Learn about the correspondence between resource type and command function for the monitored CICS commands.

The TYPE (resource type) and FUNCTION (command) columns have specific values defined by CICS IA at the time the data is loaded into DB2.

For a list of the possible combinations of TYPE and FUNCTION values in DB2 queries, see Table 105 on page 265.

For a list of the possible combinations of TYPE and FUNCTION values in IMS queries, see Table 106 on page 268.

For a list of the possible combinations of TYPE and FUNCTION values in MQ queries, see Table 107 on page 268.

Table 63. Type and Function mapping for monitored commands using the API ATOMServices CICS resource option flag

Resource type	Function	CICS command name
RECORD	BIF DIGEST	BIF DIGEST RECORD

Table 64. Type and Function mapping for monitored commands using the SPI ATOMServices CICS resource option flag

Resource type	Function	CICS command name
ATOMSERVICE	CREATE	CREATE ATOMSERVICE
	DISCARD	DISCARD ATOMSERVICE
	INQUIRE	INQUIRE ATOMSERVICE
	INQUIRE NEXT	INQUIRE ATOMSERVICE NEXT
	SET	SET ATOMSERVICE

Table 65. Type and Function mapping for monitored commands using the SPI BRFacility CICS resource option flag

Resource type	Function	CICS command name
BRFACIL	INQ NEXT	INQUIRE BRFACILITY NEXT
	INQUIRE	INQUIRE BRFACILITY
	SET	SET BRFACILITY

Table 66. Type and Function mapping for monitored commands using the SPI Bundles CICS resource option flag

Resource type	Function	CICS command name
BUNDLE	CREATE	CREATE BUNDLE
	DISCARD	DISCARD BUNDLE
	INQUIRE	INQUIRE BUNDLE
	INQUIRE NEXT	INQUIRE BUNDLE NEXT
	SET	SET BUNDLE
BUNDLEPART	INQUIRE	INQUIRE BUNDLEPART
	INQUIRE NEXT	INQUIRE BUNDLEPART NEXT

## Appendix D. Messages and codes

This section describes the messages that the Collector, Query interface, Dependency Reporter, Affinities Reporter, Load Module Scanner, CSECT Scanner, and Builder can issue, and the transaction abend codes that the Collector can produce.

The messages and abend codes are described in alphabetic order, starting on page.

As an aid to problem determination, this section also lists the meaning for each possible value of the call parameters that are included in the error messages issued if an error occurs on a call to the:

- Collector table manager, CIUTABM. See “Collector table manager diagnostics” on page 331.
- Collector CINB request queue manager, CIUCINP. See page “Collector CINB request queue manager diagnostics” on page 333.
- CICS IA date formatter, CIUCINDT. See page “Date formatter diagnostics” on page 333.

---

## Contacting IBM Support

Information on IBM support policy can be found on our Web site.

Follow the Support link in the left-hand column at [ibm.com/software/ts/cics/](http://ibm.com/software/ts/cics/)

---

## Messages that CICS IA can issue

---

### CIU1000E CIUMSGE Language Module Not Found

**Explanation:** The English Language message module has not been found.

**System action:** None.

**User response:** Check the CICS IA load library @hlq.SCIULODE is in the CICS DFHRPL concatenation.

**Module:** CIUIVPC

#### Destination

Terminal end user and CINT TD Queue.

---

### CIU1001I Begin CICS IA IVP for TS version: *CICS-version-number*

**Explanation:** The CICS IA installation verification program (IVP) has started on this CICS TS region. *CICS-version-number* is the CICS version number; for example, 2.3.

**System action:** The IVP checks that CICS IA has been installed correctly.

**User response:** Check the CICS IA load library @hlq.SCIULODE is in the CICS DFHRPL concatenation.

**Module:** CIUIVPC

#### Destination

Terminal end user and CINT TD queue.

---

### CIU1002I Installation verification ended successfully

**Explanation:** CICS IA has been installed correctly on this region.

**System action:** None.

**User response:** None.

**Module:** CIUIVPC

#### Destination

Terminal end user and CINT TD queue.

---

### CIU1003E Transaction verification failed, transaction ID: *transaction-name*

**Explanation:** The CICS IA installation verification program (IVP) has found that a required resource, transaction *transaction-name*, has not been defined to CICS correctly, or is not available.

**System action:** The CICS IA IVP continues to run, to check whether other software objects of CICS IA have been installed correctly.

**User response:**

1. Use the CEDA transaction to verify that the required CICS IA resource group, CIUnnG13, is included in the startup group list.
2. Use the CEDA transaction to verify that the required transaction, *transaction-name*, is included in the CIUnnG13 resource group.
3. If transaction *transaction-name* is missing, contact your IBM Software Support Center (ISC).

**Module:** CIUIVPC

**Destination**

CINT TD queue.

**CIU1004E    Program verification failed, program ID:**  
*program-name*

**Explanation:** The CICS IA installation verification program (IVP) has found that a required resource, file *program-name*, has not been defined to CICS correctly, or is not available.

**System action:** The CICS IA IVP continues to run, to check whether other software elements of CICS IA have been installed correctly.

**User response:**

1. Use the CEDA transaction to verify that the required CICS IA resource group, CIUnnG13, is included in the startup group list.
2. Use the CEDA transaction to verify that the required program, *program-name*, is included in the CIUnnG13 resource group.
3. Check that the CICS IA load library has been added to the DFHRPL list at CICS startup.
4. If program *program-name* is missing, contact your IBM Software Support Center (ISC).

**Module:** CIUIVPC

**Destination**

CINT TD queue.

**CIU1005E    VSAM file verification failed, file ID:**  
*file-name*

**Explanation:** The CICS IA installation verification program (IVP) has found that a required resource, file *file-name*, has not been defined to CICS correctly, or is not available.

**System action:** The CICS IA IVP continues to run, to check whether other software elements of CICS IA have been installed correctly.

**User response:**

1. Use the CEDA transaction to verify that the required CICS IA resource group, CIUnnG13, is included in the startup group list.

2. Use the CEDA transaction to verify that the required file, *file-name*, is included in the CIUnnG13 resource group.
3. If file *file-name* is missing, contact your IBM Software Support Center (ISC).

**Module:** CIUIVPC

**Destination**

CINT TD queue

**CIU1006I    Transaction verified, transaction ID:**  
*transaction-name*

**Explanation:** The CICS IA installation verification program (IVP) has verified that a required resource, transaction *transaction-name*, has been defined to CICS correctly, and is available.

**System action:** None.

**User response:** None.

**Module:** CIUIVPC

**Destination**

CINT TD queue.

**CIU1007I    Program verified, program ID:**  
*program-name*

**Explanation:** The CICS IA installation verification program (IVP) has verified that a required resource, program *program-name*, has been defined to CICS correctly, and is available.

**System action:** None.

**User response:** None.

**Module:** CIUIVPC

**Destination**

CINT TD queue.

**CIU1008I    VSAM file verified, file ID: *file-name***

**Explanation:** The CICS IA installation verification program (IVP) has verified that a required resource, VSAM file *file-name*, has been defined to CICS correctly, and is available.

**System action:** None.

**User response:** None.

**Module:** CIUIVPC

**Destination**

CINT TD queue.

---

**CIU1009E    Verification unsuccessful — highest return code:** *return-code*

**Explanation:** The CICS IA installation verification program (IVP) has found that CICS IA has not been installed correctly on this region.

**System action:** None.

**User response:**

1. Investigate the cause of the problem by examining the CICS IA messages in the CICS system log. CICS IA messages are in the range CIU1001 through CIU1013.
2. Locate any missing resources identified by the IVP. Ensure that all the resources required by CICS IA are correctly defined to CICS and are available.
3. If you cannot locate or restore a missing resource, contact the IBM Software Support Center (ISC).
4. Re-run the IVP until it confirms that CICS IA has been installed correctly.

**Module:** CIUIVPC

**Destination**

Terminal end user and CINT TD queue.

---

**CIU1010I    TD queue verified, TD queue ID:** *TDqueue-name*

**Explanation:** The CICS IA installation verification program (IVP) has verified that a required resource, TD queue *TDqueue-name*, has been defined to CICS correctly, and is available.

**System action:** None.

**User response:** None.

**Module:** CIUIVPC

**Destination**

CINT TD queue.

---

**CIU1011E    TD queue verification failed, TD queue ID:** *TDqueue-name*

**Explanation:** The CICS IA installation verification program (IVP) has found that a required resource, transient data queue *TDqueue-name*, has not been defined to CICS correctly, or is not available.

**System action:** The CICS IA IVP continues to run, to check whether other software elements of CICS IA have been installed correctly.

**User response:**

1. Use the CEDA transaction to verify that the required CICS IA resource group, CIUnnG13, is included in the startup group list.
2. Use the CEDA transaction to verify that the required TD queue, *TDqueue-name*, is included in the CIUnnG13 resource group.

3. If TD queue *TDqueue-name* is missing, contact your IBM Software Support Center (ISC).

**Module:** CIUIVPC

**Destination**

CINT TD queue.

---

**CIU1012I    DB2ENTRY verified, DB2ENTRY ID:** *DB2entry-name*

**Explanation:** The CICS IA installation verification program (IVP) has verified that a required resource, DB2ENTRY *DB2entry-name*, has been defined to CICS correctly, and is available.

**System action:** None.

**User response:** None.

**Module:** CIUIVPC

**Destination**

CINT TD queue.

---

**CIU1013W    DB2ENTRY verification failed, DB2ENTRY ID:** *DB2ENTRY-name*

**Explanation:** The CICS IA installation verification program (IVP) has found that a required resource, DB2 entry *DB2ENTRY-name*, has not been defined to CICS correctly, or is not available.

**System action:** The CICS IA IVP continues to run, to check whether other software elements of CICS IA have been installed correctly.

**User response:** CICS IA has not been configured to collect DB2 resource information in this CICS region but the CICS region has a DB2 connection. If you want to collect DB2 resource information, rerun the configuration EXEC for this CICS region and supply the required DB2 variables.

**Module:** CIUIVPC

**Destination**

CINT TD queue.

---

**CIU1014I    DB2TRAN verified, DB2TRAN ID:** *DB2TRAN-name*

**Explanation:** The CICS IA installation verification program (IVP) has verified that a required resource, DB2TRAN *DB2TRAN-name*, has been defined to CICS correctly, and is available.

**System action:** None.

**User response:** None.

**Module:** CIUIVPC

**Destination**

CINT TD queue

---

**CIU1015W DB2TRAN verification failed,  
DB2TRAN ID: DB2TRAN-name**

**Explanation:** The CICS IA installation verification program (IVP) has found that a required resource, DB2TRAN DB2TRAN-name, has not been defined correctly or is not available.

**System action:** The CICS IA IVP continues to run, to check whether other software elements of CICS IA have been installed correctly.

**User response:** CICS IA has not been configured to collect DB2 resource information in this CICS region but the CICS region has a DB2 connection. If you want to collect DB2 resource information, rerun the configuration EXEC for this CICS region and supply the required DB2 variables.

**Module:** CIUIVPC

### Destination

CINT TD queue.

---

**CIU1016I JOURNALMODEL verified, model ID:  
model-name**

**Explanation:** The CICS IA installation verification program (IVP) has verified that a required resource, journal model *model-name*, has been defined to CICS correctly, and is available.

**System action:** None.

**User response:** None.

**Module:** CIUIVPC

### Destination

CINT TD queue.

---

**CIU1017E JOURNALMODEL verification failed,  
model ID: model-name**

**Explanation:** The CICS IA installation verification program (IVP) has verified that a required resource, journal model *model-name*, has not been defined to CICS correctly, and is not available.

**System action:** The CICS IA IVP continues to run, to check whether other software elements of CICS IA have been installed correctly.

**User response:**

1. Use the CEDA transaction to verify that the required CICS IA resource group is included in the startup group list.
2. Use the CEDA transaction to verify that the required file, *model-name*, is included in the resource group.
3. If the file *model-name* is missing, contact your IBM Software Support Center (ISC).

**Module:** CIUIVPC

### Destination

CINT TD queue.

---

**CIU2101W CINT already in use by user userid**

**Explanation:** The CINT transaction is already being used when an attempt is made to start another CINT transaction.

**System action:** The second CINT transaction is terminated, as only one instance of CINT is permitted.

**User response:** Check where CINT is currently in use. Only one user should be attempting to run the Collector at a given time.

**Module:** CIUA000C, CIUATM01, CIUATM03

### Destination

Terminal end user or CINT TD queue.

---

**CIU2102W Collector is not state**

**Explanation:** An attempt was made to Start, Stop, Pause, or Continue the Collector from CINT. However, the Collector was not currently in an appropriate *state* to make the change.

**System action:** The Collector state is not changed.

**User response:** Check why the Collector is currently in that state.

**Module:** CIUA000C, CIUA100C

### Destination

Terminal end user or CINT TD queue.

---

**CIU2103W Collector is already stopped**

**Explanation:** An attempt was made to Stop the Collector from CINT when the Collector was already STOPPED.

**System action:** The Collector state is not changed.

**User response:** Check why the Collector is currently in that state.

**Module:** CIUA000C

### Destination

Terminal end user or CINT TD queue.

---

**CIU2104W Invalid key was pressed**

**Explanation:** The terminal operator has pressed a function key in response to a screen displayed by the CINT or CINC transaction, but the function key was not valid for that screen.

**System action:** The function key is ignored.

**User response:** Use the correct function key.

**Module:** CIUA00HC, CIUA000C, CIUA100C, CIUA150C, CIUA200C, CIUA240C, CIUA250C, CIUA260C, CIUA300C, CIUA400C, CIUA410C, CIUA420C, CIUA440C, CIUA900C, CIUACM00, CIUACM10, CIUACM20, CIUACM30, CIUACM40.

## Destination

Terminal end user.

---

### CIU2105I CINT session has ended

**Explanation:** The transaction CINT has ended.

**System action:** The state of the Collector is unchanged.

**User response:** None.

**Module:** CIUA000C

## Destination

Terminal end user and CINT TD queue.

---

### CIU2106W Options must be Y(Yes) or N(No)

**Explanation:** The only valid values for this CINT operation option are 'Y' and 'N'.

**System action:** The CINT operation options will not be changed unless all of the input is correct.

**User response:** Correct the invalid input.

**Module:** CIUIVPC

## Destination

CIUA240C, CIUA250C, CIUA260C, CIUA270C, CIUA280C, CIUA300C

---

### CIU2107W Size must be integer (10 to 2000 Mb)

**Explanation:** The only valid value for the Collector data space size is an integer in the range 10 to 2000, in megabytes.

**System action:** The CINT operation options will not be changed unless all of the input is correct.

**User response:** Correct the invalid input.

**Module:** CIUA260C

## Destination

Terminal end user.

---

### CIU2108W Select a valid date/time format

**Explanation:** An invalid date/time format has been entered.

**System action:** None.

**User response:** Select a valid date/time format. See HELP panel for valid formats.

**Module:** CIUA300C

## Destination

Terminal end user.

---

### CIU2109W Select a valid date/time separator

**Explanation:** An invalid date/time separator has been entered.

**System action:** None.

**User response:** Select a valid date/time separator. See HELP panel for valid formats.

**Module:** CIUA300C

## Destination

Terminal end user.

---

### CIU2110I No amendments were entered

**Explanation:** The Enter key was pressed, but no changes had been input.

**System action:** No options are changed.

**User response:** Enter any changes and then press Enter again.

**Module:** CIUA240C, CIUA250C, CIUA260C, CIUA300C, CIUACM10, CIUACM20.

## Destination

Terminal end user.

---

### CIU2111I CINT options are updated

**Explanation:** The CINT transaction has successfully amended the operation options.

**System action:** The operation options held on VSAM control file CIUCNTL are updated.

**User response:** None.

**Module:** CIUA240C, CIUA250C, CIUA260C, CIUA300C

## Destination

Terminal end user and CINT TD queue.

---

### CIU2113W Options must be Y(Yes), N(No) or blank(default)

**Explanation:** The only valid values for this CINT operation option are 'Y', 'N', and ' '.

**System action:** The CINT operation options will not be changed unless all of the input is correct.

**User response:** Correct the invalid input.

**Module:** CIUA240C, CIUA250C, CIUA260C, CIUA270C, CIUA280C

## Destination

Terminal end user.

---

### CIU2114I      Records are restored

**Explanation:** The Collector is being started with the restore data option set to Y. Records from the previous Collector run are retained on the dependency data file, CIUINT1.

Records for those dependency command types that are being detected on this Collector run were found on the files and were read into the data space.

**System action:** The Collector is started with any records from a previous run retained on the dependency data file and read into the data space.

**User response:** None.

**Module:** CIUA110C

## Destination

Terminal end user.

---

### CIU2115I      Dependency files are emptied

**Explanation:** The Collector is being started with the restore data option set to N. All existing records were deleted from the dependency data file, CIUINT1.

**System action:** The Collector is started with an empty dependency data file.

**User response:** None.

**Module:** CIUA110C

## Destination

Terminal end user and CINT TD queue.

---

### CIU2116W      Dataspace too large - no storage available

**Explanation:** The Collector is being started and it received a response from the table manager, CIUTABM, that it was unable to obtain the amount of storage requested for the MVS data space, because the MVS Real Storage Manager does not have enough resources.

**System action:** The Collector start is aborted and the Collector is stopped.

**User response:** Decrease the data space size using the CINT operation options.

**Module:** CIUA110C

## Destination

Terminal end user.

---

### CIU2117W      Dataspace too large - IEFUSI limit reached

**Explanation:** The Collector is being started and it received a response from the table manager, CIUTABM, that it was unable to obtain the amount of storage requested for the MVS data space, because MVS exit IEFUSI has imposed a limit on address space size.

**System action:** The Collector start is aborted and the Collector is stopped.

**User response:** Decrease the data space size using the CINT operation options or else ask the MVS system programmer to increase the IEFUSI limit.

**Module:** CIUA110C

## Destination

Terminal end user.

---

### CIU2118I      No records were restored

**Explanation:** The Collector is being started with the restore data option set to Y. Records from the previous Collector run are retained on the dependency data file, CIUINT1

No records for those dependency command types that are being detected on this Collector run were found on the files, so none were read into the data space.

**System action:** The Collector is started with any records from a previous run retained on the dependency data file.

**User response:** None.

**Module:** CIUA110C

## Destination

Terminal end user.

---

### CIU2119I      CICS is terminating

**Explanation:** The CINT or CINC transaction has detected that CICS is terminating.

**System action:** CICS IA is stopped.

**User response:** None.

**Module:** CIUA000C, CIUACM10,

## Destination

Terminal end user and CINT TD queue.

---

### CIU2120I      Press Enter to confirm Start with data restore or PF12 to cancel

**Explanation:** Confirmation is required that the Collector is to be started with the restore data option set to Y.

**System action:** If Enter is pressed, the Collector is started with dependency data retained on the

dependency data file and read into the data space. Otherwise, F12 must be pressed to cancel the collection operation.

**User response:** Press Enter or PF12.

**Module:** CIUA100C

### Destination

Terminal end user.

---

**CIU2121I**      **Press Enter to confirm Start without restore or PF12 to cancel**

**Explanation:** Confirmation is required that the Collector is to be started with the restore data option set to N.

**System action:** If Enter is pressed, the Collector is started and all of the data on the dependency data file deleted. Otherwise, F12 must be pressed to cancel the collection operation.

**User response:** Press Enter or PF12.

**Module:** CIUA100C

### Destination

Terminal end user.

---

**CIU2122I**      **Press Enter to confirm Stop or PF12 to cancel**

**Explanation:** Confirmation is required that the Collector is to be stopped. The dependency data in the data space will be saved to the dependency data file.

**System action:** If Enter is pressed, the Collector is stopped and any changes made to the dependency data in the data space since the last save are saved to the dependency data file. Otherwise, F12 must be pressed to cancel the stop request.

**User response:** Press Enter or PF12.

**Module:** CIUA100C

### Destination

Terminal end user.

---

**CIU2123I**      **Enter to confirm Start ALL or PF12 to cancel**

**Explanation:** Confirmation is required that the Collector is to be started in all regions.

**System action:** If Enter is pressed then the collector will be started in all regions where it can be started. Otherwise, PF12 must be pressed and the Collector will not be started.

**User response:** Press Enter or PF12.

**Module:** CIUA100C

### Destination

Terminal end user.

---

**CIU2124I**      **Enter to confirm Stop ALL or PF12 to cancel**

**Explanation:** Confirmation is required that the Collector is to be stopped in all regions.

**System action:** If Enter is pressed then the collector will be stopped in all regions where it can be stopped. Otherwise, PF12 must be pressed and the Collector will not be stopped.

**User response:** Press Enter or PF12.

**Module:** CIUA100C

### Destination

Terminal end user.

---

**CIU2125E**      **A CINT action must be supplied**

**Explanation:** The transid CINT is being entered at a console device. It is mandatory to supply a Collector action with CINT at a console device.

**System action:** The CINT transaction is not initiated.

**User response:** Ensure that an action, one of START, STOP, PAUSE, CONTINUE, is entered after the transid CINT.

**Module:** CIUA000C

### Destination

Console.

---

**CIU2126I**      **No actions to take**

**Explanation:** The Enter key was pressed but no action code has been entered, or an action code for ALL regions was entered, but the action could not be applied to any regions.

**System action:** None. There was nothing to do.

**User response:** If you want something to happen then key in an action code before pressing Enter.

**Module:** CIUA100C

### Destination

Terminal end user.

---

**CIU2127W**      **Transaction ID prefix is invalid**

**Explanation:** The transid prefix input on screen CINT02 is invalid. The input was rejected because it contained an embedded blank space character.

**System action:** The CINT options will not be changed unless all of the input is correct.

**User response:** Correct the invalid input.

Module: CIUA260C

## Destination

Terminal end user.

---

### CIU2128W Language code is invalid

**Explanation:** The language code input on the screen is invalid.

**System action:** The CINT option will not be changed unless all of the input is correct.

**User response:** Enter a valid language code.

Module: CIUA300C

## Destination

Terminal end user.

---

### CIU2129W Control file CIUCNTL not open in the FOR

**Explanation:** CICS IA encountered an error while trying to open the CIUCNTL control file in the file-owning region.

**System action:** The CINT or CINC transaction is stopped.

**User response:** Contact your CICS system support.

Module: CIUA000C, CIUACM10, CIUACM60, CIUACM70.

## Destination

CINT TD queue and terminal end user.

---

### CIU2130W Dependency file CIUINTh not open in the FOR

**Explanation:** CICS IA encountered an error while trying to open the dependency file CIUINTh in the file-owning region.

**System action:** The CINT transaction is stopped.

**User response:** Contact your CICS system support.

Module: CIUA000C

## Destination

INT TD queue and terminal end user.

### CIU2131W Control file CIUCNTL is not available

**Explanation:** The CICS IA Control file, CIUCNTL, is disabled.

**System action:** None.

**User response:** Contact your CICS system support person.

Module: CIUA000C, CIUA400C, CIUA420C, CIUA440C, CIUACM10, CIUACM20, CIUACM31,

CIUACM60, CIUACM70, CIUATM03.

## Destination

Terminal end user and CINT TD queue.

---

### CIU2132W Dependency file CIUINT1 is not available

**Explanation:** The CICS IA dependency file, CIUINT1, is disabled.

**System action:** None.

**User response:** Contact your CICS system support person.

Module: CIUA000C

## Destination

Terminal end user.

---

### CIU2133W Error opening Control file CIUCNTL

**Explanation:** CICS IA encountered an error while trying to open the CIUCNTL control file.

**System action:** None.

**User response:** Contact your CICS system support person.

Module: CIUA000C, CIUA400C, CIUA420C, CIUA440C, CIUACM10, CIUACM20, CIUACM31, CIUACM60, CIUACM70, CIUATM01, CIUATM03.

## Destination

Terminal end user and CINT TD queue.

---

### CIU2134W Error opening Dependency file CIUINT1

**Explanation:** CICS IA encountered an error while trying to open the CIUINT1 dependency file.

**System action:** None.

**User response:** Contact your CICS system support person.

Module: CIUA000C

## Destination

Terminal end user.

---

### CIU2135S CICS command data failed RESP=eibresp RESP2=eibresp2 RCODE=eibrcode

**Explanation:** Transaction CINT, CINB, or CINC received an invalid response when issuing EXEC CICS command. The response is in *eibresp*, *eibresp2* and *eibrcode*. Other *data*, if present, might give the object operated on by the *command*.

**System action:** The CINT, CINB, or CINC transaction

continues. A message is sent to the terminal. The requested action fails.

**User response:** For further details of the exception *eibresp* refer to the *command* in the *CICS Application Programming Reference* manual or the *CICS System Programming Reference* manual.

For further information on how to determine system problems refer to the *CICS Problem Determination Guide*.

**Module:** CIUA000C, CIUACM10, CIUACM20, CIUACM30, CIUACM31, CIUACM40, CIUACM60, CIUACM70.

### Destination

Terminal end user and CINT TD queue.

---

#### CIU2136W Exclude list name is invalid

**Explanation:** The name of the program exclude list or the transaction exclude list that has been input on the screen is invalid.

**System action:** The CINT options will not be changed unless all of the input is correct.

**User response:** Correct the invalid input.

**Module:** CIUA260C

### Destination

Terminal end user.

---

#### CIU2137I Affinity files are emptied

**Explanation:** The Collector is being started with the restore data option set to N. All existing records were deleted from the affinity data files.

**System action:** The Collector is started with an empty affinity data file.

**User response:** None.

**Module:** CIUA110C

### Destination

Terminal end user and CINT TD queue.

---

#### CIU2138W Options must be Y(Yes), N(No), or D(Detail)

**Explanation:** The valid values for this operation are Y, N, and D.

**System action:** The CINT operation options will not change until all of the input is correct.

**User response:** Correct the invalid input.

**Module:** CIUA240C

### Destination

Terminal end user

---

#### CIU2139W Options must be Y(Yes), N(No), D(Detail) or blank(default)

**Explanation:** The valid values for this operation are Y, N, D, and blank.

**System action:** The CINT operation options will not change until all of the input is correct.

**User response:** Correct the invalid input.

**Module:** CIUA240C

### Destination

Terminal end user

---

#### CIU2140W Value must be between 2 and 9999, or 1 for no updates

**Explanation:** Enter the value in thousands between 2 and 9999. This relates to the number of records to be updated before CICS IA triggers the save transaction. A value of 1 indicates that no saves will be triggered.

**System action:** None

**User response:** Correct the invalid input.

**Module:** CIUA260C

### Destination

Terminal End User

---

#### CIU2141W Options must be A (Affinity), I (Interdependency), or B (Both)

**Explanation:** The valid values for this option are A, I, or B.

**System action:** The value changes only if the input is correct.

**User response:** Correct the invalid input.

**Module:** CIUA260C

### Destination

Terminal end user.

---

#### CIU2142W Options must be A (Affinity), I (Interdependency), B (Both), or blank

**Explanation:** The valid values for this option are A, I, B, or blank.

**System action:** The value changes only if the input is correct.

**User response:** Correct the invalid input.

**Module:** CIUA260C

### Destination

Terminal end user.

---

**CIU2143W** Options must be Y (Yes), N (No), A (Aff.), I (Dep.), or B (Both)

**Explanation:** The valid values for this option are Y, N, A, I, or B.

**System action:** The value changes only if the input is correct.

**User response:** Correct the invalid input.

**Module:** CIUA280C

### Destination

Terminal end user.

---

**CIU2144W** Options must be Y (Yes), N (No), A (Aff.), I (Dep.), B (Both), or blank

**Explanation:** The valid values for this option are Y, N, A, I, B, or blank.

**System action:** The value changes only if the input is correct.

**User response:** Correct the invalid input.

**Module:** CIUA280C

### Destination

Terminal end user.

---

**CIU2146I** Press Enter to confirm REFRESH or PF12 to cancel

**Explanation:** Confirmation that the Collector is to use the updated CICS IA options is required.

**System action:** If Enter is pressed, the Collector performs the following steps:

1. Reads the options from the control file.
2. Disables collection of data that is no longer requested.
3. Offloads collected data from the data space to VSAM files.
4. Enables collection of data for new options.

**User response:** Press Enter or PF12.

**Module:** CIUA100C

### Destination

Terminal end user.

---

**CIU2147I** Press Enter to confirm REFRESH ALL or PF12 to cancel

**Explanation:** Confirmation that the Collector is to use the updated CICS IA options is required.

**System action:** If Enter is pressed, the Collector sends a REFRESH command to all active regions.

**User response:** Press Enter or PF12.

**Module:** CIUA100C

### Destination

Terminal end user.

---

**CIU2148I** CINT *applid* CICS Resource options are updated

**Explanation:** The CINT transaction has successfully amended the CICS Resource operation options.

**System action:** The operation options held on VSAM control file CIUCNTL are updated.

**User response:** None.

**Module:** CIUA240C

### Destination

Terminal end user and CINT TD queue.

---

**CIU2149I** CINT *applid* DB2/MQ/IMS options are updated

**Explanation:** The CINT transaction has successfully amended the DB2/MQ/IMS operation options.

**System action:** The operation options held on VSAM control file CIUCNTL are updated.

**User response:** None.

**Module:** CIUA250C

### Destination

Terminal end user and CINT TD queue.

---

**CIU2150I** CINT *applid* General options are updated

**Explanation:** The CINT transaction has successfully amended the General operation options.

**System action:** The operation options held on VSAM control file CIUCNTL are updated.

**User response:** None.

**Module:** CIUA260C

### Destination

Terminal end user and CINT TD queue.

---

**CIU2151I** CINT *applid* Time and Date options are updated

**Explanation:** The CINT transaction has successfully amended the Time and Date operation options.

**System action:** The operation options held on VSAM control file CIUCNTL are updated.

**User response:** None.

**Module:** CIUA280C

## Destination

Terminal end user and CINT TD queue.

---

### CIU2152I CINT *applid* CICS Affinity options are updated

**Explanation:** The CINT transaction has successfully amended the CICS Affinity operation options.

**System action:** The operation options held on VSAM control file CIUCNTL are updated.

**User response:** None.

**Module:** CIUA270C

## Destination

Terminal end user and CINT TD queue.

---

### CIU2153I CINT *applid* Global options are updated

**Explanation:** The CINT transaction has successfully amended the Global operation options.

**System action:** The operation options held on VSAM control file CIUCNTL are updated.

**User response:** None.

**Module:** CIUA300C

## Destination

Terminal end user and CINT TD queue.

---

### CIU2154I CINT *applid* Task options are updated

**Explanation:** The CINT transaction has successfully amended the Task operation options.

**System action:** The operation options held on VSAM control file CIUCNTL are updated.

**User response:** None.

**Module:** CIUA295C

## Destination

Terminal end user and CINT TD queue.

---

### CIU2155I CINT *applid* Natural resource options are updated

**Explanation:** The CINT transaction has successfully updated the Natural resource options.

**System action:** The operation options held on VSAM control file CIUCNTL are updated.

**User response:** None.

**Module:** CIUA29NC

## Destination

Terminal end user and CINT TD queue.

---

### CIU2157W Include list name is invalid

**Explanation:** The name of the TRUEs include list that had been input on the screen is invalid.

**System action:** The CINT options will not be changed unless all the input is correct.

**User response:** Correct the invalid input.

**Module:** CIUA260C

## Destination

Terminal end user.

---

### CIU2159W Invalid key was pressed

**Explanation:** A function key pressed in response to a screen displayed by the CINC transaction is not valid for this screen.

**System action:** The function key is ignored.

**User response:** Use the correct function key.

**Module:** CIUACM10

## Destination

Terminal end user.

---

### CIU2160I CINC session has ended

**Explanation:** The CINC transaction has ended.

**System action:** The state of the Collector is unchanged.

**User response:** None.

**Module:** CIUACM10

## Destination

Terminal end user and CINT TD queue.

---

### CIU2161I CICS is terminating

**Explanation:** The CINC transaction has detected that CICS is terminating.

**System action:** CICS IA is stopped.

**User response:** None.

**Module:** CIUACM10

## Destination

Terminal end user and CINT TD queue.

---

### CIU2162W Control file CIUCNTL is not available

**Explanation:** The CICS IA Control file, CIUCNTL, is disabled.

**System action:** None.

**User response:** Contact your CICS system support person.

Module: CIUACM10

## Destination

Terminal end user.

---

### CIU2163W Error opening Control file CIUCNTL

**Explanation:** CICS IA encountered an error while trying to open the CIUCNTL control file.

**System action:** None.

**User response:** Contact your CICS system support person.

Module: CIUACM10

## Destination

CINT TD queue and terminal end user.

---

### CIU2164W There are no connected CICS regions

**Explanation:** Prompt for regions request did not find any connected regions for your local CICS region.

**System action:** None.

**User response:** None.

Module: CIUACM20

## Destination

Terminal end user.

---

### CIU2165W Too large number of selected regions

**Explanation:** More than one region was selected.

**System action:** The input is rejected.

**User response:** Select only one region.

Module: CIUACM40

## Destination

Terminal end user.

---

### CIU2166W Invalid selection of APPLID

**Explanation:** The field with no APPLID was selected.

**System action:** The input is rejected.

**User response:** Select the field that contains an APPLID.

Module: CIUACM40

## Destination

Terminal end user.

---

### CIU2168W Option option is invalid

**Explanation:** The *Option* input field on a screen is invalid because it contains an embedded blank space character, or starts with a digit, or has more than one wildcard character.

**System action:** The input is rejected.

**User response:** Correct the invalid input.

Module: CIUACM10, CIUACM20, CIUATM03

## Destination

Terminal end user and CINT TD queue.

---

### CIU2170W Options must be 1, 2, 3 or N(No)

**Explanation:** The valid values for this option are 1, 2, 3 or N(No).

**System action:** The value changes only if the input is correct.

**User response:** Correct the invalid input.

Module: CIUA300C

## Destination

Terminal end user.

---

### CIU2185I CINT *region-name* Application Collection Options are updated.

**Explanation:** Application collection options are successfully saved.

**System action:** Save updated application collection options.

**User response:** None.

Module: CIUA210C

## Destination

Terminal end user.

---

### CIU2186E Maximum *applications-amount* applications can be selected for dependency collection.

**Explanation:** User tried to save settings with amount of selected applications over the supported *applications-amount*.

**System action:** Do not save application collection options.

**User response:** Reduce amount of selected applications to *applications-amount* or lower.

Module: CIUA210C

## Destination

Terminal end user.

---

**CIU2186I**     **CINT region-name Application Collection Options are updated by user ID.**

**Explanation:** Application collection options for region region-name are successfully saved by CICS TS user ID. The changed options are listed below this message.

**System action:** Save updated application collection options for CICS TS region region-name.

**User response:** None.

**Module:** CIUA210C

### Destination

CINT TD queue.

---

**CIU2187I**     **Enable collection of Application Data collection-option.**

**Explanation:** Displays chosen **Enable collection of Application Data** collection-option, this message is displayed with message "CIU2186I."

**System action:** None.

**User response:** None.

CINT TD queue.

---

**CIU2216S     Destroy pool action failed**  
**REASON=***reason code* **ERROR=***error code*

**Explanation:** The transaction CINT received an invalid response when issuing a call to the table manager, CIUTABM, to destroy the MVS data space when stopping the Collector.

**System action:** The transaction is terminated by abending IUZN and the Collector is stopped.

**User response:** The *reason code* value can be looked up in "Collector table manager diagnostics" on page 331. If it is AUTM\_DSPSERV\_DELETE\_ERROR then *error code* is the value of GPR 0 after the MVS DSPSERV DELETE call. If it is AUTM\_ALESERV\_DELETE\_ERROR then *error code* is the value of GPR 15 after the MVS ALESERV DELETE call. Use the appropriate MVS manual to find out the meaning of the error code.

**User response:** Contact IBM support.

**Module:** CIUA150C

### Destination

CINT TD queue.

**CIU2225E    Unsupported type of CINT task initiation**

**Explanation:** The CINT transaction has been initiated in a way which is not allowed. The only valid ways to initiate a CINT transaction are:

- From a terminal
- From a console
- By issuing EXEC CICS START TRANSID('CINT') from another task.

**System action:** The transaction is terminated by abending IUZV and the Collector is stopped.

**User response:** Use one of the methods above to initiate CINT.

**Module:** CIUA000C

### Destination

CINT TD queue

**CIU2226E    Incorrect CINT action: *action***

**Explanation:** The CINT transaction received an incorrect value for <action> when it was started by another task using EXEC CICS START TRANSID('CINT') FROM(<action>), or started from a terminal by entering CINT <action>. Only these <action> values are acceptable:

- START
- STOP
- PAUSE
- CONTINUE
- REFRESHOPTIONS
- STARTALL
- STOPALL
- PAUSEALL
- CONTINUEALL
- REFRESHALLOPTIONS
- STARTAFF
- STARTINT
- STARTBOTH
- STARTALLAFF
- STARTALLINT
- STARTALLBOTH

**System action:** The CINT transaction is stopped.

**User response:** Correct the <action> passed to CINT to be one of those above.

**Module:** CIUA000C

### Destination

CINT TD queue and terminal end user, if started from a terminal.

**System action:** CINT runs in the background.

**User response:** None.

**Module:** CIUA000C

### Destination

CINT TD queue

**CIU2228S    Replace element action failed**  
**REASON=***reason code* **TABLE=***table number*

**Explanation:** Transaction CINT or CINB received an

invalid response when issuing a call to the table manager, CIUTABM, to replace a table element for table *table number*.

**System action:** The transaction is terminated by abending IUZY and the Collector is stopped.

**User response:** The *reason code* and *table number* values can be looked up in "Collector table manager diagnostics" on page 331.

**Module:** CIUCINB2

### Destination

CINT TD queue

**CIU2229S**    **UT/TT table update failed**  
**FUNC=***function code* **REASON=***reason code*  
**TABLE=***table number*

**Explanation:** The transaction CINT received an invalid response when issuing a call to the table manager, CIUTABM, for table *table number*.

**System action:** The transaction is terminated by abending IUZZ and the Collector is stopped.

**User response:** The *function code*, *reason code*, and *table number* values can be looked up in "Collector table manager diagnostics" on page 331.

**Module:** CIUA110C, CIU140C, CIUA180C

### Destination

CINT TD queue

**CIU2230S**    **VSAM dependency file *filename* header**  
**READ failed RESP=***eibresp*  
**RESP2=***eibresp2*

**Explanation:** Transaction CINT received an invalid response when issuing an EXEC CICS READ command for the header record on VSAM dependency data file *filename*, when the Collector was starting with the restore data option set to Y. Either an incorrect file has been allocated for the dependency data file *filename* or the file is empty.

**System action:** The transaction is terminated by abending IUZ1 and the Collector is stopped.

**User response:** Check that the correct file is allocated, and that the Collector has previously been started with the same files. The first time the Collector is started, the CINT restore data option must be N. If the restore data option is initially set to Y, then CINT will abend with this message, because initially the VSAM dependency data file will be completely empty. The dependency file header records are added by CINT after the Collector has been started for the first time. For further details of the exceptions *eibresp* and *eibresp2* refer to the READ command in the *CICS Application Programming Reference manual*. For further information on how to determine

system problems refer to the *CICS Problem Determination Guide*.

**Module:** CIUA110C

### Destination

**CIU2298I CINC Collector is started in your regions**

**Explanation:** An attempt to start the Collector from CINC was made.

**System action:** The Collector state is changed to running in all the regions from your configuration.

**User response:** None.

**Module:** CIUACM60

**Destination**

Terminal end user.

---

---

**CIU2299W** CINC Collector is not started. All options are empty.

**Explanation:** An attempt to start the Collector from CINC was made. However, all the Collector options are empty.

**System action:** None.

**User response:** None.

**Module:** CIUACM60, CIUACM61

### Destination

CINT TD queue.

---

**CIU2300W** CINC Collector is not started. *Option option is empty*

**Explanation:** An attempt to start the Collector from CINC was made. However, the *option* option is empty.

**System action:** The CINC Collector start request is rejected.

**User response:** Change values for the CINC Collector option.

**Module:** CIUACM60

### Destination

Terminal end user.

---

**CIU2301W** CINC Collector is not started. Some regions are not connected.

**Explanation:** An attempt to start the Collector from CINC was made. However, all or some of the regions from your configuration are not connected to the local CICS region.

**System action:** The CINC Collector start request is rejected.

**User response:** Check why the region configuration is in an inappropriate state.

**Module:** CIUACM60

### Destination

Terminal end user.

---

**CIU2303W** CINC Collector is not stopped. There are no active collector sessions.

**Explanation:** An attempt to stop the Collector from CINC was made. However, there are no active collector sessions in the regions from your regions configuration.

**System action:** The CINC Collector stop request is rejected.

**User response:** None.

**Module:** CIUACM70

### Destination

Terminal end user.

---

**CIU2304W** CINC Collector is not stopped. There are no connected regions.

**Explanation:** An attempt to stop the Collector from CINC was made. However, all the regions from your configuration are not connected to or not defined for the local CICS region.

**System action:** The CINC Collector stop request is rejected.

**User response:** None.

**Module:** CIUACM70

### Destination

Terminal end user.

---

| **CIU2308I** CINC Collector is stopped by *uuuu*

| **Explanation:** CINC collector is stopped by the user where:

| • *uuuu* - is the user ID.

| **System action:** CINC command flow collection is stopped.

| **User response:** None.

| **Module:** CIUACM71

### Destination

| CINT TD queue.

---

| **CIU2309I** CINC Collector has logged *nnnn* records for *uuuu*

| **Explanation:** CINC collector has completed logging for the user, where:

| • *nnnn* - is the number of collected records.

| • *uuuu* - is the user ID.

| **System action:** CINC collector terminates for the user.

| **User response:** None.

| **Module:** CIUACM71

### Destination

| CINT TD queue.

---

**CIU2310W** CINC Collector is not stopped. *Option option is empty.*

**Explanation:** An attempt to Stop the Collector from CINC was made. However, the *option* option is empty.

**System action:** The CINC Collector stop request is rejected.

**User response:** Change values for CINC Collector option.

**Module:** CIUACM70

### Destination

Terminal end user.

---

| **CIU2311I**    **CINC Collector is stopped for *uuuu*.**  
 |                    **Limit of tasks: *nnnn* .**

| **Explanation:** The specified limit of tasks is reached.  
 | CINC collector is stopped for the user, where:

- | • *uuuu* - is the user ID.
- | • *nnnn* - is the reached number of tasks.

| **System action:** The CINC command flow collection is stopped.

| **User response:** None.

| **Module:** CIUACM71

| **Destination**

| CINT TD queue

---

| **CIU2312I**    **CINC Collector is stopped for *uuuu*.**  
 |                    **Limit of records: *nnnn* .**

| **Explanation:** The specified limit of records is reached.  
 | CINC collector is stopped for the user, where:

- | • *uuuu* - is the user ID.
- | • *nnnn* - is the reached number of records.

| **System action:** The CINC command flow collection is stopped.

| **User response:** None.

| **Module:** CIUACM71

| **Destination**

| CINT TD queue

---

### CIU2313W    Invalid cursor position

**Explanation:** The cursor was set to the wrong position and the F4 function key was pressed.

**System action:** None.

**User response:** Place the cursor in the APPLID field and press F4.

**Module:** CIUACM20

### Destination

Terminal end user.

---

### CIU2314W    CINC already in use by user *user*

**Explanation:** The CINC transaction is already used by user *userid* when an attempt to start another CINC transaction by the same user is made.

**System action:** The second CINC transaction is terminated, because only one instance of CINC is permitted for the same user.

**User response:** Check where CINC is currently in use. Only one instance of CINC is permitted for the same user at a given time.

**Module:** CIUACM10, CIUATM03

### Destination

Terminal end user and CINT TD queue.

---

### CIU2316W    CINC Collector is not started. All regions are not connected

**Explanation:** The Collector is not started in all requested regions.

**System action:** The request to start the Collector fails for all requested regions.

**User response:** Ensure that all APPLIDs are correct and the corresponding regions are started and connected.

**Module:** CIUACM60

### Destination

Terminal end user.

---

### CIU2317W    CINC Collector is already active for some regions

**Explanation:** The Collector is already active for some regions from the APPLID list.

**System action:** The request to start the Collector fails for the regions where the Collector is stopped.

**User response:** Press F7 to get the statistics about the Collector state on the regions. Exclude the regions with the active Collector status from the APPLID list. Start the Collector again.

**Module:** CIUACM60

### Destination

Terminal end user and CINT TD queue.

---

### CIU2319W    Updates are rejected because CINC Collector is running for *userid*

**Explanation:** The updates are rejected because the Command Flow collector is running for the specified user.

**System action:** The request to update the options or the APPLID list fails.

**User response:** Stop the Collector. Update the options or the APPLID list, or both. Start the Collector.

**Module:** CIUACM10, CIUACM20

### Destination

Terminal end user.

---

**CIU2320I CINC Collector is stopped. Total records written: *number***

**Explanation:** The Collector is stopped. The *number* is the total number of the Command Flow records written to a user journal during data collection.

**System action:** The Collector is stopped. The Command Flow Statistics panel, CIUA03, appears. See Figure 36 on page 104.

**User response:** None.

**Module:** CIUACM70

### Destination

Terminal end user.

---

**CIU2322W Duplicate APPLIDs specified. Updates are rejected.**

**Explanation:** The updates are rejected because duplicate APPLIDs were specified.

**System action:** The updates are rejected.

**User response:** Eliminate the duplicate APPLIDs.

**Module:** CIUACM20

### Destination

Terminal end user.

---

**CIU2323W Journal Copy Criteria option is invalid. Enter LAST, USER or CFID**

**Explanation:** An invalid value was entered for the Journal Copy Criteria option.

**System action:** The updates are rejected.

**User response:** Enter the correct value: LAST, USER or CFID.

**Module:** CIUACM10, CIUATM03

### Destination

Terminal end user and CINT TD queue.

---

**CIU2324W CINC Collector is not started in all your regions**

**Explanation:** The Collector is not started on all your regions.

**System action:** The start Collector request failed on all the requested regions.

**User response:** Press F7 to get the list of all regions. To detect the reason of the problem, check CINT TDQ on all regions for the messages related to this start Collector request.

**Module:** CIUACM31, CIUACM60

### Destination

Terminal end user.

---

**CIU2325W CINC Collector is started in some your regions**

**Explanation:** The Collector is started on some your regions.

**System action:** The start Collector request failed in some of the requested regions.

**User response:** Press F7 to get the list of all regions. To detect the reason of the problem, check CINT TDQ on the regions with the stopped Collector status for the messages related to this start Collector request.

**Module:** CIUACM31, CIUACM60

### Destination

Terminal end user.

---

**CIU2326W CINC was not completed for *userid***

**Explanation:** The previous instance of the CINC transaction for the user *userid* was not completed successfully, or the CINC transaction is already running in another region or regions for the specified user.

**System action:** None.

**User response:** Be careful when changing the Command Flow Options while the CINC transaction is running in a few regions at the same time for the user.

**Module:** CIUACM10

### Destination

Terminal end user.

---

**CIU2327W CICS ApplIDs option is empty**

**Explanation:** No applIDs are defined.

**System action:** The request is rejected.

**User response:** Define at least one applID.

**Module:** CIUACM31

### Destination

Terminal end user.

---

**CIU2328W** CINC Collector was not completed for *userid*

**Explanation:** The Collector stopping was not completed for user *userid*. For example, the Collector was stopped from another region.

**System action:** None.

**User response:** Stop the Collector on the region where the message was encountered.

**Module:** CIUACM31

### Destination

Terminal end user.

---

**CIU2329S** An abend occurred in program *program* for region *region*

**Explanation:** An abend occurred in the remote *region* region.

**System action:** The Collector is not started in the remote region. The CINC transaction in a local region is terminated by abending IUXI.

**User response:** Check CINT TD queue in the remote region to fix the problem. Start the CINC transaction again.

**Module:** CIUACM31, CIUACM60, CIUACM70

### Destination

CINT TD queue.

---

**CIU2330S** CINC Collector for USERID *userid1* is already started by *userid2*

**Explanation:** The CINC collector with the option USERID *userid1* is already started by user *userid2*.

**System action:** None.

**User response:** None.

**Module:** CIUACM61

### Destination

CINT TD queue.

---

**CIU2351E** Invalid journal type in model

**Explanation:** The TYPE attribute in the JOURNALMODEL definition is not MVS.

**System action:** The Collector start failed.

**User response:** Set the TYPE attribute (MVS) in the JOURNALMODEL definition.

**Module:** CIUACM61

### Destination

CINT TD queue.

---

**CIU2352E** Different journal stream names

**Explanation:** The Collector is not started because of the log stream names inconsistency.

**System action:** The request to start the Collector failed.

**User response:** Correct the log stream names according to the following:

1. The journal name must have the same name as the corresponding journal model.
2. The log stream name in a given journal model must be the same on all regions.

**Module:** CIUACM61

### Destination

CINT TD queue.

---

**CIU2353E** Different Control file names

**Explanation:** The Collector is not started because of the dataset names inconsistency for the CIUCNTL control file.

**System action:** The request to start the Collector failed.

**User response:** Check the CIUCNTL control file definition on all regions. It must point to the same dataset if the control file is shared between the regions.

**Module:** CIUACM61

### Destination

CINT TD queue.

---

**CIU2354I** User exit *exit* was loaded

**Explanation:** The specified user exit was loaded.

**System action:** None.

**User response:** None.

**Module:** CIUACM61

### Destination

CINT TD queue.

---

**CIU2500I** There is no action to process.

**Explanation:** The message appears when Enter is pressed without any action specified.

**System action:** None.

**Module:** CIUA400C

### Destination

3270

---

**CIU2501W**    **No more users allowed. Maximum limit of users reached.**

**Explanation:** The maximum limit of users is already reached when an attempt to add or copy a user is made.

**System action:** None.

**User response:** Delete unnecessary users to clear the space for a new user.

**Module:** CIUA400C, CIUA410C, CIUA420C, CIUATM03

### Destination

Terminal end user and CINT TD queue.

---

**CIU2502I**    **No users were added.**

**Explanation:** The Add User Menu panel is closed without adding a new user.

**System action:** None.

**User response:** None.

**Module:** CIUA400C

### Destination

3270

---

**CIU2503I**    **User *userid* was not copied.**

**Explanation:** No user was copied when returning to the User Administration Menu panel, CIU400, from the Copy User Menu panel, CIU420.

**System action:** None.

**User response:** None.

**Module:** CIUA400C

### Destination

3270

---

**CIU2504E**    **Cannot manage user *userid*. It is in use by someone else.**

**Explanation:** The program cannot access the user record in the control file. The record is blocked because it is used by another person or program.

**System action:** None.

**User response:** Try the action again later.

**Module:** CIUA400C, CIUA440C, CIUATM03

### Destination

Terminal end user and CINT TD queue.

---

**CIU2505E**    **User *userid* has "ACTIVE" status. Stop CINC collector and try again.**

**Explanation:** The Command Flow collector is active for the specified user. You cannot delete a user when the Command Flow collector has an ACTIVE status for this user.

**System action:** None.

**User response:** Stop the Command Flow collector and try the action again.

**Module:** CIUA400C

### Destination

3270

---

**CIU2506I**    **User *userid* was not updated.**

**Explanation:** The action specified on the User Details Menu panel, CIU440, is canceled.

**System action:** None.

**User response:** None.

**Module:** CIUA400C

### Destination

3270

---

**CIU2507W**    **Confirm the deletion of user *userid*.**

**Explanation:** To prevent accidental deletion of a user, confirm whether you are sure that the specified user is to be deleted.

**System action:** None.

**User response:** Confirm or cancel the deletion of the user.

**Module:** CIUA400C

### Destination

3270

---

**CIU2508I**    **The deletion of user *userid* was cancelled.**

**Explanation:** The user is not deleted.

**System action:** None.

**User response:** None.

**Module:** CIUA400C

### Destination

3270

---

---

**CIU2509W** Journal name must begin with a letter.

**Explanation:** The journal name might be entered improperly. Check the first character and change it with a valid symbol.

**System action:** None.

**User response:** Correct the invalid input.

**Module:** CIUA410C, CIUA420C, CIUA440C

**Destination**

3270

---

**CIU2510E** Cannot delete user *userid* – CINC session is active.

**Explanation:** You can delete a user only when a CINC session for this user is closed.

**System action:** None.

**User response:** Quit the CINC transaction.

**Module:** CIUA400C

**Destination**

3270

---

**CIU2511W** User name can contain national characters. It must be alphanumeric.

**Explanation:** The specified user name might contain national characters or other non-alphanumeric symbols. A user name must consist of alphanumeric characters.

**System action:** None.

**User response:** Type the user name using proper characters.

**Module:** CIUA410C, CIUA420C, CIUATM03

**Destination**

Terminal end user and CINT TD queue

---

**CIU2512W** Journal name can contain national characters. It must be alphanumeric.

**Explanation:** The specified journal name might contain national characters or other non-alphanumeric symbols. A user name must consist of alphanumeric characters.

**System action:** None.

**User response:** Type the journal name using proper characters.

**Module:** CIUA410C, CIUA420C, CIUA440C

**Destination**

3270

---

---

**CIU2513E** Cannot update user *userid* – CINC session is active.

**Explanation:** You can update user data only when the CINC transaction session for this user is closed.

**System action:** None.

**User response:** Quit the CINC transaction.

**Module:** CIUA440C, CIUATM03

**Destination**

Terminal end user and CINT TD queue

---

**CIU2514I** User *userid* was added.

**Explanation:** The user was successfully added.

**System action:** None.

**User response:** None.

**Module:** CIUA410C, CIUA420C, CIUATM03

**Destination**

Terminal end user and CINT TD queue

---

**CIU2515E** Cannot add user *userid* – CINC user or CINT region already exists.

**Explanation:** A user or a region with the same name already exists.

**System action:** None.

**User response:** Enter another user name.

**Module:** CIUA410C, CIUA420C, CIUATM03

**Destination**

Terminal end user and CINT TD queue

---

**CIU2516E** Cannot add user *userid* – internal error occurred.

**Explanation:** An internal error is encountered when adding the user record to the control file.

**System action:** None.

**User response:** Try the action again.

**Module:** CIUA410C, CIUA420C, CIUATM03

**Destination**

Terminal end user and CINT TD Queue

---

**CIU2517W** Cannot update user *userid* – CINC collector is active.

**Explanation:** You can update a user data only when the Command Flow collector has a NOT ACTIVE status for this user.

**System action:** None.

**User response:** Stop the Command Flow collector for this user.

**Module:** CIUA440C, CIUATM03

### Destination

Terminal end user and CINT TD queue.

---

**CIU2518I**    **User *userid* updated.**

**Explanation:** The user data is successfully updated.

**System action:** None.

**User response:** None.

**Module:** CIUA440C, CIUATM03

### Destination

Terminal end user and CINT TD queue.

---

**CIU2519E**    **Update failed – user *userid* does not exist.**

**Explanation:** The user record was deleted from the control file by another transaction during the administration of CINC users.

**System action:** None.

**User response:** Close panel CIU440 and refresh the users list.

**Module:** CIUA440C, CIUATM03

### Destination

Terminal end user and CINT TD Queue.

---

**CIU2520E**    **Cannot update user *userid* – internal error occurred.**

**Explanation:** The user record data has a wrong format.

**System action:** None.

**User response:** Close panel CIU440 and refresh the users list.

**Module:** CIUA440C, CIUATM03

### Destination

Terminal end user and CINT TD Queue.

---

**CIU2521E**    **CICS TS release is *current\_release*. Release *required\_release* or higher is required.**

**Explanation:** The used version of CICS TS is out of date.

**System action:** All the actions, except displaying user list, are blocked.

**User response:** Migrate to CICS TS version 3.1 or later.

**Module:** CIUA400C

### Destination

3270 and CINT TD Queue.

---

**CIU2522W**    **Consequences of deleting user with unknown status are unpredictable.**

**Explanation:** If the user status is unknown, you are asked to confirm or cancel the deletion of this user.

**System action:** None.

**User response:** Confirm or cancel the deletion.

**Module:** CIUA400C

### Destination

3270 and CINT TD Queue.

---

**CIU2523I**    **CICS Interdependency Analyzer for z/OS - *nnnnnn***

**Explanation:** Version message that indicates a session of CICS IA.

*nnnnnn* version and release of CICS IA

**System action:** None

**User response:** None

**Module:** CIUA000C, CIUACM10, CIUATM00, CIUATM02, CIUATM03.

### Destination

CINT TD Queue

---

**CIU3117I**    **CINT options refreshed**

**Explanation:** This message is written in the CINT TDQ when the IA options are refreshed.

**System action:** None.

**User response:** None.

**Module:** CIUA105C

### Destination

CINT TDQ.

---

**CIU3301I**    **CINB task is starting**

**Explanation:** The CINB transaction has been initiated by CINT. CINB saves dependency data from the data space to the dependency data file.

**System action:** The Collector continues RUNNING.

**User response:** None.

**Module:** CIUCINB1

### Destination

CINT TD queue

---

**CIU3302S      CINB received an unrecognizable request**

**Explanation:** Transaction CINB received an invalid request to perform one of its functions from another component of the Collector, CINT or a Collector exit program.

**System action:** The transaction is terminated by abending IUYA and the Collector is stopped.

**User response:** Contact IBM support.

**Module:** CIUCINB1

**Destination**

CINT TD queue

---

**CIU3303S      CINB has abended *abend code* in program *program***

**Explanation:** This message is issued when the CINB HANDLE ABEND exit program is driven to handle a transaction abend that occurred within the CINB transaction. The abend code is given by *abend code*, and the failing program is given by *program*. Note that abends are issued by CINB (codes IUxx) as well as by CICS.

**System action:** The transaction is terminated with a transaction dump, with a dumpcode of *abend code*, and the Collector is stopped.

**User response:** If the original abend was issued by CINB, then there will be a preceding message on the CINT TD queue describing the abend. If so, refer to the description for that message. Otherwise, the abend was issued by CICS, for example, ASRA, so refer to the *CICS Messages and Codes* .

**Module:** CIUCINBE

**Destination**

CINT TD queue and console.

---

**CIU3304S      CINB abending - system error elsewhere in the Collector**

**Explanation:** The transaction CINB received a request to abend from another component of the Collector. The request was sent because of an error encountered elsewhere, either in CINT or a Collector exit program.

**System action:** The transaction is terminated by abending IUYC and the Collector is stopped.

**User response:** Refer to any earlier messages on the CINT TD queue for the cause of the error.

**Module:** CIUCINB1

**Destination**

CINT TD queue

---

**CIU3305I      CINB save started - because of *reason***

**Explanation:** Transaction CINB is commencing a scan of the dependency table in the data space to write any data changed since the previous save to the dependency data file. The save might have been started for one of four possible *reasons*:

- Collector stopped (STOP)
- Save interval reached (TIME)
- Activity count reached (TRIGGER)
- Collector paused (PAUSE)

Note that the latter three reasons can only occur when the CINT perform periodic saves option is set to Y.

**System action:** CINB saves changed data elements from the data space to the dependency data file.

**User response:** None.

**Module:** CIUCINB2

**Destination**

CINT TD queue

---

**CIU3306I      CINB save ended - *count* records saved**

**Explanation:** Transaction CINB has finished the scan of the dependency table in the data space and wrote *count* records to the dependency data file.

**System action:** The number of records given by *count* were saved to the dependency data file.

**User response:** If the CINT perform periodic saves option is set to Y, and *count* has been consistently near zero for the past few saves, this might indicate that the Collector has detected all the dependencies it can and the Collector might be stopped.

**Module:** CIUCINB2

**Destination**

CINT TD queue

---

**CIU3307I      CINB terminated - Collector is stopping**

**Explanation:** Transaction CINB received a request to terminate, from CINT, because the Collector is stopping.

**System action:** The transaction is terminated and the Collector is stopped.

**User response:** None.

**Module:** CIUCINB1

**Destination**

CINT TD queue

---

---

**CIU3308I    Message received from program *program***

**Explanation:** Transaction CINB received a message from program *program* to write to CINT TD queue.

**System action:** The associated message is written to CINT, which is the only mechanism available to the Collector exit programs when they wish to issue a message.

**User response:** Examine the following message on the CINT TD queue.

**Module:** CIUCINB1

**Destination**

CINT TD queue.

---

**CIU3309I    Collector *action* by date/time options**

**Explanation:** The date/time options have caused the collector to be PAUSED or CONTINUED at this time.

**System action:** Collection is automatically PAUSED or CONTINUED as required by the date/time options.

**User response:** None.

**Module:** CIUCINB3

**Destination**

CINT TD queue.

---

**CIU3310S    Invalid file number for table in GWA**

**Explanation:** Transaction CINB found an incorrect value, the dependency file number, in an internal array in the Collector GWA, suggesting that the GWA has been corrupted.

**System action:** The transaction is terminated by abending IUYE and the Collector is stopped.

**User response:** Attempt to find out the cause of the corruption. It could be due to an application accidentally overwriting the GWA.

**Module:** CIUA110C, CIUCINB2

**Destination**

CINT TD queue

---

**CIU3311E    Transaction CINB must be initiated by transaction CINT**

**Explanation:** Transaction CINB could not have been initiated by CINT, as its CICS startcode indicates something other than EXEC CICS START with no data.

**System action:** The transaction is terminated by abending IUYF and the Collector is stopped.

**User response:** The CINB transaction can only be started by the Collector control transaction CINT.

**Module:** CIUCINB1

**Destination**

CINT TD queue

---

**CIU3312S    CINB abending - CICS is terminating**

**Explanation:** Transaction CINB found that CICS had entered quiesce state before shutdown and the Collector was still RUNNING.

**System action:** The transaction is terminated by abending IUYG and the Collector is stopped.

**User response:** None. To avoid this, always stop the Collector before shutting down CICS. The CINT STOP action could be submitted from a CICS Shutdown PLT program, using EXEC CICS START.

**Module:** CIUCINB1

**Destination**

CINT TD queue

---

**CIU3313S    Invalid address for *program* in the GWA**

**Explanation:** Transaction CINT or CINB found that the address of Collector program *program* in the GWA was a null value, suggesting that the GWA has been corrupted.

**System action:** The transaction is terminated by abending IUYH and the Collector is stopped.

**User response:** Attempt to find out the cause of the corruption. It could be due to an application accidentally overwriting the GWA.

**Module:** CIUA120C, CIUA130C, CIUCINB1

**Destination**

CINT TD queue

---

**CIU3314S    Function call failed FUNCTION=*function code* REASON=*reason code* TABLE=*table number***

**Explanation:** Transaction CINT or CINB received an invalid response when issuing a call to the table manager, CIUTABM, to access a table element for table *table number*.

**System action:** The transaction is terminated by abending IUYI and the Collector is stopped.

**User response:** The *reason code*, *table number* and *function code* values can be looked up in "Collector table manager diagnostics" on page 331.

**Module:** CIUCINB2

**Destination**

CINT TD queue

---

**CIU3315S**    **File *filename* is full**

**Explanation:** Transaction CINB received a NOSPACE response when issuing EXEC CICS WRITE for VSAM dependency file *filename*. The file has filled up.

**System action:** The transaction is terminated by abending IUYJ and the Collector is stopped.

**User response:** Allocate more space to the file and rerun the Collector.

**Module:** CIUCINB2

**Destination**

CINT TD queue

---

**CIU3316S**    **Unexpected resource type *resourcetype***

**Explanation:** Transaction CINB received an unrecognized resource type from another Collector component.

**System action:** The Collector is stopped.

**User response:** Contact your CICS IA support representative.

**Module:** CIUCIND

**Destination**

Terminal end user.

---

| **CIU3318I**    **Tasks before stopping:: *nnnn* .**

| **Explanation:** CINC Collector run time option, where:  
| • *nnnn* is the number of tasks before CINC Collector  
| stops.

| **System action:** None.

**CIU4300E**      **Interaction with Natural failed**  
**REASON=reason**

**Explanation:** The CICS IA interface to Natural has detected an inconsistent (recoverable) error during interaction with Natural SYSRDC. The following list gives possible reasons:

- SILOST: Natural session initialization event is lost.
- STLOST: Natural session termination event is lost.
- PLLOST: Program load event is lost.
- EWAOVER: Natural SYSRDC exit work area overflow, not enough storage for all the Natural program names.
- EWAMISM: Natural SYSRDC exit work area mismatch, possibly the exit work area overflowed previously.
- EWAEXHST: Natural SYSRDC exit work area is exhausted, possibly the exit work area overflowed previously.
- NNLOVER: Natural Name List overflow, not enough storage for all the Natural sessions.
- NNLMISM: Natural Name List mismatch. It is possible that the list overflowed previously.

**System action:** The interface tries to recover and continue interaction with Natural SYSRDC, but it is possible that not all Natural programs will be identified correctly in the data collected.

**User response:** The following list gives possible actions based on the reason:

- SILOST: None.
- STLOST: None.
- PLLOST: None.
- EWAOVER: Change the RDCEXIT Natural profile parameter for CIURDCX1 specifying a larger exit work area.
- EWAMISM: None.
- EWAEXHST: None.
- NNLOVER: Recreate the Natural Name List specifying a larger number of Natural sessions.
- NNLMISM: None.

**Module:** CIURDCX1

**Module:** CIUREPFM

### Destination

Console.

---

**CIU5012E**    **Invalid PARM specified. Program terminated.**

**Explanation:** A syntax error was detected in the specified PARM information when invoking the Scanner.

**System action:** The Scanner is terminated with RC=8.

**User response:** Correct the PARM information and run the job again.

**Module:** CIULMS, CIUCSS

### Destination

Console.

---

**CIU5015E**    **Invalid {MATCH | STATE | CONTEXT} value specified. Correct and rerun**

**Explanation:** When invoking the Builder, a PARM field has been specified on the EXEC that contains an invalid value for the keyword given.

Keyword	Allowed values
MATCH	LUNAME and USERID
STATE	ACTIVE and DORMANT
CONTEXT	plexname, 1 through 8 characters

**System action:** The Builder is terminated.

**User response:** Correct the PARM information and rerun the job.

**Module:** CIUBLD

### Destination

Console

---

**CIU5016E**    **DSPSIZE value is not numeric. Correct and rerun**

**Explanation:** When invoking the Builder, a PARM field has been specified on the EXEC that contains an invalid value for keyword DSPSIZE. A character other than a digit in the range 0 through 9 was encountered. The value must be an integer in the range 2 through 2000.

**System action:** The Builder is terminated.

**User response:** Correct the PARM information and rerun the job.

**Module:** CIUBLD

## Destination

Console

---

**CIU5017E    DSPSIZE is invalid. It must be between 2 and 2000**

**Explanation:** When invoking the Builder, a PARM field has been specified on the EXEC that contains an invalid value for keyword DSPSIZE. The value must be an integer in the range 2 through 2000.

**System action:** The Builder is terminated.

**User response:** Correct the PARM information and rerun the job.

**Module:** CIUBLD

## Destination

Console

---

**CIU5018E    Load of CIUTABM has failed AC *abcode* RC *reason\_code***

**Explanation:** The Builder attempted to load the table manager module, CIUTABM, but the MVS LOAD macro failed. The *abcode* is returned in GPR 1 and is the abend code that would have resulted had the task abended. The *reason\_code* is returned in GPR 15 and is the reason code associated with the abend.

**System action:** The Builder is terminated.

**User response:** The MVS *abcode* and *reason\_code* indicate the cause of the error. Correct the problem and rerun the job.

**Module:** CIUBLD

## Destination

Console

---

**CIU5019E    Dataspace too large - no storage available**

**Explanation:** The Builder received a response from the table manager, CIUTABM, reporting that it was unable to obtain the amount of storage requested for the MVS data space because the MVS real storage manager does not have enough resources.

**System action:** The Builder is terminated.

**User response:** Decrease the data space size specified on the PARM field of the EXEC statement in the job, and rerun the job.

**Module:** CIUBLD

## Destination

Console

---

**CIU5020E    Dataspace too large – IEFUSI limit reached**

**Explanation:** The Builder received a response from the table manager, CIUTABM, that it was unable to obtain the amount of storage requested for the MVS data space, because MVS exit IEFUSI has imposed a limit on address space size.

**System action:** The Builder is terminated.

**User response:** Either decrease the data space size specified on the PARM field of the EXEC statement in the job, or ask your MVS system programmer to increase the IEFUSI limit. Rerun the job.

**Module:** CIUBLD

## Destination

Console

---

**CIU5021E    Create dataspace failed REASON *reason\_code* ERROR *error\_code***

**Explanation:** The Builder received an invalid response when issuing a call to the table manager, CIUTABM, to create the MVS data space.

**System action:** The Builder is terminated.

**User response:** See the *CICS Transaction Affinities Utility Guide* for the meaning of the reason code. If it is AUTM\_DSPSERV\_CREATE\_ERROR, *error\_code* is the value of GPR 0 after the MVS DSPSERV CREATE call. If it is AUTM\_ALESERV\_ADD\_ERROR, *error\_code* is the value of GPR 15 after the MVS ALESERV ADD call. Use the appropriate MVS manual to find out the meaning of the error code.

**Module:** CIUBLD

## Destination

Console

---

**CIU5022E    Create table failed REASON *reason\_code* TABLE *table\_number***

**Explanation:** The Builder received an invalid response when issuing a create table call to the table manager, CIUTABM, for table *table\_number*.

**System action:** The Builder is terminated.

**User response:** See the *CICS Transaction Affinities Utility Guide* for the meaning of the reason code and the table number.

**Module:** CIUBLD

## Destination

Console

---

**CIU5023E    Keyword *keyword* is invalid or unexpected**

**Explanation:** When reading statements from its REPGRPS input stream, the Builder encountered a keyword it did not recognize, or a keyword that occurred in an unexpected place.

**System action:** The Builder skips to the next input statement and continues, but terminates when the end of the input is encountered.

**User response:** Refer to the *CICS Transaction Affinities Utility Guide* to correct the statement, and rerun the job. A likely cause of this message is the omission of the terminating semi-colon from the preceding statement.

**Module:** CIUBLDIN

**Destination**

SYSPRINT

---

**CIU5024E    Keyword *keyword* is missing**

**Explanation:** When reading statements from its REPGRPS input stream, the Builder encountered a statement in which the required keyword *keyword* was missing.

**System action:** The Builder skips to the next input statement and continues, but terminates when the end of the input is encountered.

**User response:** Refer to the *CICS Transaction Affinities Utility Guide* to correct the statement, and rerun the job.

**Module:** CIUBLDIN

**Destination**

SYSPRINT

---

**CIU5025E    A value of *value* is invalid for keyword *keyword***

**Explanation:** When reading statements from its REPGRPS input stream, the Builder encountered an invalid value for keyword *keyword*.

**System action:** The Builder skips to the next keyword and continues, but terminates when the end of the input is encountered.

**User response:** Refer to the *CICS Transaction Affinities Utility Guide* to correct the statement, and rerun the job.

**Module:** CIUBLDIN

**Destination**

SYSPRINT

---

**CIU5026E    Invalid CREATE type**

**Explanation:** When reading statements from its REPGRPS input stream, the Builder encountered a CREATE statement. The only keywords that are allowed to follow immediately after the CREATE keyword are TRANGRP and DTRINGRP.

**System action:** The Builder skips to the next input statement and continues, but will terminate when the end of the input is encountered.

**User response:** Refer to the *CICS Transaction Affinities Utility Guide* to correct the statement, and rerun the job.

**Module:** CIUBLDIN

**Destination**

SYSPRINT

---

**CIU5027E    Incorrect number of brackets**

**Explanation:** When reading statements from its REPGRPS input stream the Builder encountered a keyword for which a corresponding value was expected. This value is invalid because it:

- Does not start with a bracket
- Does not end with a bracket
- Contains a bracket in the middle
- Spans input lines.

**System action:** The Builder skips to the next input statement and continues, but terminates when the end of the input is encountered.

**User response:** Refer to the *CICS Transaction Affinities Utility Guide* to correct the statement, and rerun the job.

**Module:** CIUBLDIN

**Destination**

SYSPRINT

---

**CIU5028E    Missing semicolon**

**Explanation:** When reading statements from its REPGRPS input stream the Builder encountered the end of the input in the middle of a statement, implying that a terminating semicolon is missing from the last statement.

**System action:** The Builder is terminated.

**User response:** Refer to the *CICS Transaction Affinities Utility Guide* to correct the statement, and rerun the job.

**Module:** CIUBLDIN

**Destination**

SYSPRINT

---

---

**CIU5029E    Keyword *keyword* is duplicated**

**Explanation:** When reading statements from its REPGRPS input stream the Builder encountered a keyword that occurred more than once in the same statement. Duplicate keywords are not allowed.

**System action:** The Builder continues, but terminates when the end of the input is encountered.

**User response:** Refer to the *CICS Transaction Affinities Utility Guide* to correct the statement, and rerun the job.

**Module:** CIUBLDIN

**Destination**

SYSPRINT

---

**CIU5030E    No valid statements in REPGRPS – processing terminated**

**Explanation:** When reading statements from its REPGRPS input stream the Builder did not find a single complete statement.

**System action:** The Builder is terminated.

**User response:** The most likely cause of this message is an empty input file. Correct the problem and rerun the job.

**Module:** CIUBLDMR

**Destination**

Console

---

**CIU5031E    CIUTABM error *function* element TABLE  
                  *table\_number* REASON *reason\_code*  
                  MODULE *progrname***

**Explanation:** Builder module *progrname* received an unexpected response when issuing a call to the table manager, CIUTABM.

**System action:** The Builder is terminated.

**User response:** The *function* is the operation being performed. See the *CICS Transaction Affinities Utility Guide* for the meaning of the reason code and the table number.

**Module:** CIUBLDMR, CIUBLDOT

**Destination**

Console

---

**CIU5032E    No HEADER record found – statement ignored**

**Explanation:** When reading statements from its REPGRPS input stream, the Builder encountered a CREATE statement. However, no HEADER statement had been encountered first. The HEADER statement is mandatory and must be the first statement in each data set in the REPGRPS concatenation.

**System action:** The Builder skips to the next input statement and continues, but terminates when the end of the input is encountered.

**User response:** Ensure that each data set in the REPGRPS concatenation has a HEADER statement as the first statement in the data set. Correct the problem and rerun the job.

**Module:** CIUBLDMR

**Destination**

SYSPRINT

---

**CIU5033E    Duplicate TRANGRP name**

**Explanation:** When reading statements from its REPGRPS input stream, the Builder encountered a CREATE TRANGRP statement. However, the Trangroup name supplied in the statement is not unique within the current input data set. Duplicate Trangroup names are not allowed.

**System action:** The Builder skips to the next input statement and continues, but terminates when the end of the input is encountered.

**User response:** Ensure that each CREATE TRANGRP statement within the data set specifies a unique Trangroup name. If this is already the case, the probable cause of this message is that the HEADER statement is missing from the data set. Correct the problem and rerun the job.

**Module:** CIUBLDMR

**Destination**

SYSPRINT

---

**CIU5034E    Transaction group has not been previously created**

**Explanation:** When reading statements from its REPGRPS input stream, the Builder encountered a CREATE DTRINGRP statement. However, no corresponding valid CREATE TRANGRP statement for the Trangroup in question was encountered.

**System action:** The Builder skips to the next input statement and continues, but terminates when the end of the input is encountered.

**User response:** Either the CREATE TRANGRP statement was missing or was in error. Correct the problem and rerun the job.

**Module:** CIUBLDMR

**Destination**

SYSPRINT

---

---

**CIU5035W    Dependency data may be incomplete because of *abend type* *abend***

**Explanation:** The control record on dependency control file CIUCNTL indicates that the Collector did not stop cleanly. Either CICS crashed or the Collector abended, as indicated by *abend type*. If the termination occurred during a Collector save, it is possible that the data on the dependency file might be incomplete.

**System action:** The Reporter continues.

**User response:** If incomplete data is a significant problem to you, rerun the Collector to ensure a complete set of data.

**Module:** CIUREP

**Destination**

Console

---

**CIU5036E    Dataspace is full**

**Explanation:** A Builder module received a reason code of AUTM\_NO\_STORAGE when issuing a call to the table manager, CIUTABM to add an element to a table. The data space is full.

**System action:** The Builder is terminated.

**User response:** Increase the data space size specified on the PARM field of the EXEC statement in the job, and rerun the job.

**Module:** CIUBLDMR

**Destination**

Console

---

**CIU5037E    No valid transaction IDs in REPGRPS – processing terminated**

**Explanation:** When reading statements from its REPGRPS input stream, the Builder did not find a single valid CREATE DTRINGRP statement.

**System action:** The Builder is terminated.

**User response:** The most likely cause of this message is an input stream that contains valid CREATE TRANGRP statements, but no CREATE DTRINGRP statements. Correct the problem and rerun the job.

**Module:** CIUBLDMR

**Destination**

Console

---

**CIU5038E    Invalid AFFLIFE for AFFINITY**

**Explanation:** When reading statements from its REPGRPS input stream, the Builder encountered a CREATE TRANGRP statement. However, the value specified for AFFLIFE is not one of those permitted given the value specified for AFFINITY.

**System action:** The Builder skips to the next input statement and continues, but terminates when the end of the input is encountered.

**User response:** Refer to *CICS Problem Determination Guide* to correct the statement, and rerun the job.

**Module:** CIUBLDMR

**Destination**

SYSPRINT

---

**CIU5039E    PARM keyword is duplicated. Correct and rerun**

**Explanation:** When invoking the Builder or Reporter, a PARM field has been specified on the EXEC that contains a duplicate keyword. Duplicate keywords are not allowed.

**System action:** The Builder or Reporter is terminated.

**User response:** Correct the PARM information and rerun the job.

**Module:** CIUBLD

**Destination**

Console

---

**CIU5040E    Invalid REMOVE type**

**Explanation:** When reading statements from its REPGRPS input stream, the Builder encountered a REMOVE statement. The only keyword allowed to follow immediately after the REMOVE keyword is TRANGRP.

**System action:** The Builder skips to the next input statement and continues, but terminates when the end of the input is encountered.

**User response:** Refer to the *CICS Transaction Affinities Utility Guide* to correct the statement, and rerun the job. Alternatively, comment out the statement.

**User response:** Contact your CICS system support person.

Module: CIUATM03

### Destination

Terminal end user and CINT TD Queue.

---

**CIU7046E** CINC user *userid* entry not found.

**Explanation:** The user record was not found in the Control file.

**System action:** The XML response containing the message is sent to the user.

**User response:** Contact your CICS system support person.

**Module:** CIUATM03

**Destination**

Terminal end user and CINT TD Queue.

---

**CIU7047S** CINC Unknown request has been received.

**Explanation:** Web Service received an unknown request from the client.

**System action:** Program terminates with the IUXH abend code.

**User response:** Contact your CICS system support person.

**Module:** CIUATM03

**Destination**

CINT TD queue

---

**CIU7048E** CINC CONTROL1 record is not found in Control file.

**Explanation:** The CONTROL1 record was not found in the Control file.

**System action:** The XML response containing the message is sent to the user.

**User response:** Contact your CICS system support person.

**Module:** CIUATM03

**Destination**

Terminal end user and CINT TD Queue.

---

**CIU7049E** CINC CONTROL1 record in Control file is corrupted.

**Explanation:** The CONTROL1 record in the Control file has an incorrect format.

**System action:** The XML response containing the message is sent to the user.

**User response:** Contact your CICS system support person.

**Module:** CIUATM03

**Destination**

Terminal and user and CINT TD Queue.

---

---

**CIU7050E** CINC Unable to retrieve information about journal *journal*.

**Explanation:** An error has occurred during opening the *journal* journal.

**System action:** The XML response containing the message is sent to the user.

**User response:** Refer to the CIU2201S message.

**Module:** CIUATM03

**Destination**

Terminal end user and CINT TD Queue.

---

**CIU7051S** Parsing error occurred, XML-CODE: *code*.

**Explanation:** An error occurred in the XML parser, the internal code is *code*.

**System action:** The XML response containing message CIU7001S is sent to the user.

**User response:** Contact your CICS support person.

**Module:** CINT TD queue

**Destination**

CIUATM02

---

**CIU7052E** Region *name* record Control file has an incorrect format.

**Explanation:** The entry related to *<name>* region in Control file has an incorrect format.

**System action:** The XML response containing the message is sent to the user.

**User response:** Run CINT transaction in 3270 mode and then delete or add the region.

**Module:** CIUATM01

**Destination**

Client, CINT TD queue.

---

**CIU7053E** Region *name* record is not found in Control file.

**Explanation:** The entry related to *<name>* region was not found in Control file.

**System action:** The XML response containing the message is sent to the user.

**User response:** Run CINT transaction in 3270 mode and then add the region using the panel user interface.

**Module:** CIUATM01

**Destination**

Client, CINT TD queue.

---

---

**CIU8000E**    The file you have selected could not be found. Please select another file.

**Explanation:** The file you chose to open cannot be found.

**System action:** Returns to wizard; no file is opened.

**User response:** Open a different file.

**Module:** QueryMenu1.java

### Destination

Client.

---

**CIU8001E**    File read error: an internal key value is not a valid integer. Please select another file.

**Explanation:** There was an error in reading the primary key from the specified file.

**System action:** Returns to wizard; no file is opened.

**User response:** Open a different file.

**Module:** QueryMenu1.java

### Destination

Client.

---

**CIU8002E**    File read error: an internal key value is not a valid integer. Please select another file.

**Explanation:** There was an error in reading the secondary key from the specified file.

**System action:** Returns to wizard; no file is opened.

**User response:** Open a different file.

**Module:** QueryMenu1.java

### Destination

Client.

---

**CIU8003E**    File read error: an internal key value is not a valid integer. Please select another file.

**Explanation:** There was an error in reading key3 from the specified file.

**System action:** Returns to wizard; no file is opened.

**User response:** Open a different file.

**Module:** QueryMenu1.java

### Destination

Client.

---

---

**CIU8004E**    File read error: an internal key value is not a valid key value. Please select another file.

**Explanation:** There was an error in reading key4 from the specified file.

**System action:** Returns to wizard; no file is opened..

**User response:** Open a different file.

**Module:** QueryMenu1.java

### Destination

Client.

---

**CIU8005E**    File read error: an internal key value is not a valid key value. Please select another file.

**Explanation:** There was an error in reading key2 from the specified file.

**System action:** Returns to wizard; no file is opened.

**User response:** Open a different file.

**Module:** QueryMenu1.java

### Destination

Client.

---

**CIU8006E**    File read error: an internal key value is not a valid key value. Please select another file.

**Explanation:** There was an error in reading key3 from the specified file.

**System action:** Returns to wizard; no file is opened.

**User response:** Open a different file.

**Module:** QueryMenu1.java

### Destination

Client.

---

**CIU8007E**    File read error: APPS must be a 3 character code.

**Explanation:** There was an error in reading the application code (APPS) from the specified file.

**System action:** Returns to wizard; no file is opened.

**User response:** Open a different file.

**Module:** QueryMenu1.java

### Destination

Client.

---

---

**CIU8008E**    **File read error: error reading the selected file.**

**Explanation:** There was an error in reading SELECT (CSEL), WHERE (CWHE), or EQUALS (CEQU) values from the specified file.

**System action:** Returns to wizard; no file is opened.

**User response:** Open a different file.

**Module:** QueryMenu1.java

### Destination

Client.

---

**CIU8009E**    **Error closing file.**

**Explanation:** There was an error in closing an open file.

**System action:** Prints a message to the log; does not notify user.

**User response:** None.

**Module:** QueryMenu1.java

### Destination

Client.

---

**CIU8040E**    **The URL provided in the CICS IA Preferences appears invalid. Please check the Host URL given in the CICS IA Preferences.**

**Explanation:** While running a query, the Universal Resource Locator (URL) of the CICS TS region, specified in the client's CICS IA Preferences, was found to be invalid.

**System action:** The query cannot be executed. The query wizard remains open.

**User response:** Enter, in the client's CICS IA Preferences, the correct target address for the CICS TS region.

**Module:** QueryWizard.java

### Destination

Client.

---

**CIU8045E**    **Communication with the host failed.**

**Explanation:** A remote method call to CICS TS failed.

**System action:** The query cannot be executed. The query wizard remains open.

**User response:** Ensure that the CICS TS region is available, and that you have specified, in the client's CICS IA Preferences, the correct target address for the CICS TS region.

**Module:** QueryWizard.java

### Destination

Client.

---

**CIU8050E**    **Communication with the host failed.**

**Explanation:** CICS IA client could not communicate with the CICS TS region.

**System action:** The query cannot be executed. The query wizard remains open.

**User response:** Ensure that the CICS TS region is available, and that you have specified, in the client's CICS IA Preferences, the correct target address for the CICS TS region.

**Module:** QueryWizard.java

### Destination

Client.

---

**CIU8055E**    **The data could not be displayed in a table. Please try the client again. If the problem persists contact IBM support.**

**Explanation:** An error occurred while attempting to display, in a table, the data returned from a query on CICS resources.

**System action:** The query results cannot be displayed.

**User response:** Try the wizard again. If the error persists, contact your CICS support person.

**Module:** QueryEditorData.java

### Destination

Client.

---

**CIU8060E**    **Copy fail: Cannot copy row numbers. Select another cell and try again.**

**Explanation:** An attempt was made to copy a cell in the first column of the table, the row numbers. The copy is unsuccessful.

**System action:** The first column cannot be copied. No new data is copied to the system clipboard.

**User response:** Make a new selection from the table and try copy again.

**Module:** CopyAction.java

### Destination

Client.

---

**CIU8061E**    **Copy fail: No Cell in the table was selected. Select an individual cell and try again.**

**Explanation:** An attempt was made to copy an individual cell value, but no cell was selected in the table.

**System action:** None. No new data is copied to the system clipboard.

**User response:** Select an individual cell and try again.

**Module:** CopyAction.java

### Destination

Client.

---

**CIU8067E    FileIO error: error saving *FILENAME*. Please try again.**

**Explanation:** An error occurred creating a file or writing data to a file.

**System action:** A file can be created and no data written to the file, or there might be no system action.

**User response:** Try saving the file again, with a different file name. If the error persists, contact your CICS support representative.

**Module:** SaveQueryTableDataAction.java

### Destination

Client.

---

**CIU8068E    FileIO error: error overwriting file. Please try again.**

**Explanation:** An error occurred overwriting a saved query file.

**System action:** None. File will not be overwritten.

**User response:** Try saving the file again, with a different file name. If the error persists, contact your CICS support representative.

**Module:** SaveQueryTableDataAction.java

### Destination

Client.

---

**CIU8100I    All available data for this query retrieved from the host.**

**Explanation:** The query is successful. All data for this query is returned from the host.

**System action:** No message is displayed to the user. All data retrieved from the host is shown in a query table. The 'fetch next 4000 rows' button is disabled to indicate there are no more rows available.

**User response:** None.

**Module:** Rcode\_Messages.java

### Destination

Client.

---

**CIU8101I    There are more records to be retrieved.**

**Explanation:** The query is successful. The first 4000 rows of data are returned from the host.

**System action:** No message is displayed to the user. The first 4000 rows of data returned from the host are shown in a query table. The 'fetch next 4000 rows' button is enabled to indicate more rows are available.

**User response:** Click the 'fetch next 4000 rows' button in the top right corner of the query editor to fetch up to the next 4000 rows.

**Module:** Rcode\_Messages.java

### Destination

Client.

---

**CIU8102I    No data to retrieve for this query.**

**Explanation:** No data was found for this query.

**System action:** An information message is displayed to user. The query wizard remains open.

**User response:** None.

**Module:** Rcode\_Messages.java

### Destination

Client.

---

**CIU8103W    CICS region is not connected to DB2. See message CIU8200I in the CINT log.**

**Explanation:** CICS IA has detected that there is no DB2 connection.

**System action:** A warning message is displayed to the user. The query wizard remains open. No query data is returned from the host or displayed in a query table.

**User response:** Contact your CICS IA support representative.

**Module:** Rcode\_Messages.java

### Destination

Client.

---

**CIU8104W    Invalid Application code. See message CIU8202W in the CINT log.**

**Explanation:** You have not entered a valid application code. The code must be 3 characters long and must match an application code defined to CICS IA.

**System action:** A warning message is displayed to the user. The query wizard remains open. No query data is returned from the host or displayed in a query table.

**User response:** Contact your CICS IA support representative.

**Module:** Rcode\_Messages.java

## Destination

Client.

---

**CIU8105W** Enter a valid 2 digit KEY1 field. See CIU8203W in the CINT log.

**Explanation:** You have entered an invalid code for KEY1 of the API call.

**System action:** A warning message is displayed to the user. The query wizard remains open. No query data is returned from the host or displayed in a query table.

**User response:** Contact your CICS IA support representative.

**Module:** Rcode\_Messages.java

## Destination

Client.

---

**CIU8106W** Enter correct WHERE clause. See message CIU8204W.

**Explanation:** Your input includes one or more non-alphanumeric characters in a field that requires alphanumeric data.

**System action:** A warning message is displayed to the user. The query wizard remains open. No query data is returned from the host or displayed in a query table.

**User response:** Correct selection.

**Module:** Rcode\_Messages.java

## Destination

Client.

---

**CIU8107W** No columns selected for display. See message CIU8206W.

**Explanation:** You have not selected any columns to retrieve.

**System action:** A warning message is displayed to the user. The query wizard remains open. No query data is returned from the host or displayed in a query table.

**User response:** Select a column.

**Module:** Rcode\_Messages.java

## Destination

Client.

---

**CIU8108E** Bad CICS return code. See message CIU8205E in the CINT log.

**Explanation:** The CICS IA API received an invalid response when issuing an EXEC CICS command.

**System action:** An error message written to the error log and displayed to the user. The query wizard

remains open. No query data is returned from the host or displayed in a query table.

**User response:** Contact your CICS IA support representative.

**Module:** Rcode\_Messages.java

## Destination

Client.

---

**CIU8109E** Bad SQL return code. See message CIU8201E in the CINT log.

**Explanation:** The CICS IA API has encountered an SQL error during processing.

**System action:** An error message written to the error log and displayed to the user. The query wizard remains open. No query data is returned from the host or displayed in a query table.

**User response:** Contact your CICS IA support representative.

**Module:** Rcode\_Messages.java

## Destination

Client.

---

**CIU8110E** Client and server not compatible. See message CIU8207E in the CINT log.

**Explanation:** The client code and the server API CIUAQRYC are not at the same APAR level.

**System action:** An error message written to the error log and displayed to the user. The query wizard remains open. No query data is returned from the host or displayed in a query table.

**User response:** Contact your CICS IA support representative.

**Module:** Rcode\_Messages.java

## Destination

Client.

---

**CIU8111E** No message file found on host.

**Explanation:** No server error message module could be found on the host. Ensure that the default language module CIUMSGE is defined and available to CICS.

**System action:** An error message written to the error log and displayed to the user. The query wizard remains open. No query data is returned from the host or displayed in a query table.

**User response:** Contact your CICS IA support representative.

**Module:** Rcode\_Messages.java

## Destination

Client.

---

**CIU8120E Invalid return code from the host.  
Contact IBM support.**

**Explanation:** The return code from the host is not recognized within the CICS IA client.

**System action:** An error message written to the error log and displayed to the user. The query wizard remains open. No query data is returned from the host or displayed in a query table.

**User response:** Try to replicate this problem then contact your CICS support person.

**Module:** Rcode\_Messages.java

## Destination

Client.

---

**CIU8200W CICS region is not connected to DB2**

**Explanation:** CICS IA has detected that there is no DB2 connection.

**System action:** None.

**User response:** Contact your CICS system support person.

**Module:** CIUAQRYC

## Destination

CINT log

---

**CIU8201E DB2 table error on function SQL code  
code**

**Explanation:** SQL error *code* has occurred while executing DB2 function *function*.

**System action:** The transaction is terminated.

**User response:** Ensure that CICS IA is properly installed. Contact your system support group.

**Module:** CIUAQRYC

## Destination

CINT log

---

**CIU8202W Enter a valid 3 digit application code.**

**Explanation:** You have not entered a valid application code. The code must be 3-characters long and must match an application code defined to CICS IA.

**System action:** None.

**User response:** Enter a valid application code.

**Module:** CIUAQRYC

## Destination

CINT log

---

**CIU8203W Input a valid 2 digit KEY1 field.**

**Explanation:** You have not entered a valid code for KEY1.

**System action:** None.

**User response:** Enter a valid code for KEY1. The valid codes are:

01	CICS
02	DB2
03	MQ
04	IMS
05	Affinities

**Module:** CIUAQRYC

## Destination

CINT log

---

**CIU8204W One or more WHERE fields are not alphanumeric.**

**Explanation:** Your input includes one or more non-alphanumeric characters in a field that requires alphanumeric data.

**System action:** None.

**User response:** Check your input, correct, and try again.

**Module:** CIUAQRYC

## Destination

CINT log

---

**CIU8205S CICS command failed RESP=resp  
RESP2=resp2**

**Explanation:** The CICS IA API received an invalid response when issuing the EXEC CICS *command* command.

**System action:** None.

**User response:** For further details of the exception *resp* refer to the *command* in the *CICS System Programming Reference* manual. For further information on how to solve system problems, refer to the *CICS Problem Determination Guide*.

**Module:** CIUAQRYC

## Destination

CINT log

---

---

**CIU8206W    No columns SELECTED for display.**

**Explanation:** You have not selected any columns to retrieve.

**System action:** None.

**User response:** You must select at least one column for the query to retrieve.

**Module:** CIUAQRYC

**Destination**

CINT log

---

**CIU8207E    Client and server not at the same service level.**

**Explanation:** The CICS IA client and the CICS IA server API program , CIUAQRYC , are at different service levels.

**System action:** None.

**User response:** Ensure that the client is at the latest APAR level. You can review the APAR level of the client by:

From the Eclipse dialog select HELP.  
Select 'About Eclipse'  
Select 'plug-in details'  
Scroll down and select 'CICS IA Client'  
Select 'More Info'

**Module:** CIUAQRYC

CINT log

---

**IUXA**

**Explanation:** An unexpected error occurred when calling Collector program CIUTABM, from one of the Collector exit programs. Transaction CINB issues this abend on behalf of the exit program.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU4100S.

**Module:** CIUCINB1

---

**IUXB**

**Explanation:** The data space has filled up. If the situation was detected by a Collector exit program, transaction CINB issues this abend on its behalf.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU4200S.

**Module:** CIUCINT3, CIUCINT6, CIUCINB1

---

---

**IUXD**

**Explanation:** A USER type record for a specified user is not found in the CIUCNTL control file.

**System action:** The transaction is terminated.

**User response:** Create the USER record again. If the problem recurs, contact the IBM support.

**Module:** Refer to message CIU2277S

**Destination**

---

**IUXE**

**Explanation:** A USER type record for a specified user in the CIUCNTL control file has an incorrect format.

**System action:** The transaction is terminated.

**User response:** Contact your CICS system support person.

**Module:** CIUCINB1

**Destination**

Refer to message CIU2278S.

---

**IUXF**

**Explanation:** The CINC transaction was initiated in a way, which is not allowed. The CINC transaction can be initiated only from the 3270 terminal.

**System action:** The transaction is terminated.

**User response:** Use the proper methods to initiate CINC.

**Module:** Refer to message CIU2285E.

**Destination**

---

**IUXG**

**Explanation:** The CINC transaction was initiated on a version, release or modification of CICS, which is not supported by the Command Flow collector.

**System action:** The transaction is terminated.

**User response:** The Command Flow collector cannot be run on this CICS release.

**Module:** Refer to message CIU2287E

**Destination**

---

**IUXI**

**Explanation:** An abend occurred on a remote region.

**System action:** The Collector is not started on the remote region. The CINC transaction is terminated on a local region .

**User response:** Check CINT TD queue on the remote

## IUXT • IUYG

region to fix the problem. Start the CINC transaction again.

**Module:** Refer to message CIU2329S.

### Destination

---

#### IUXT

**Explanation:** An unexpected error occurred when a program from the CINC transaction issued an EXEC CICS command related to the CINC Collector user exit. The command is one of ENABLE, DISABLE or EXTRACT EXIT.

**System action:** The CINC Collector is not stopped.

**User response:** Refer to message CIU2291S.

**Module:** CIUACM61

---

#### IUXU

**Explanation:** The method of initiating the CINC transaction is incorrect.

**System action:** The Command flow collector is not stopped.

**User response:** Refer to message CIU2285E.

**Module:** CIUACM10

---

#### IUXV

**Explanation:** A REGION type record is not found in the CIUCNTL control file.

**System action:** The CINC transaction is terminated.

**User response:** Refer to message CIU2280S.

**Module:** CIUACM10

---

#### IUXW

**Explanation:** A USER type record in the CIUCNTL control file has an incorrect format for the specified user.

**System action:** The CINC Collector is not stopped.

**User response:** Refer to message CIU2291S.

**Module:** CIUACM61

---

#### IUXX

**Explanation:** The internal error appears in the CINC transaction.

**System action:** The Command flow collector is stopped.

**User response:** Refer to message CIU2288S.

**Module:** CIUACM10

---

#### IUXY

**Explanation:** A CONTROL1 type record is not found in the CIUCNTL control file.

**System action:** The Command flow collector is stopped.

**User response:** Refer to message CIU2279S.

**Module:** CIUACM10

---

#### IUXZ

**Explanation:** A USER type record for the specified user is not found in the CIUCNTL control file.

**System action:** The CINC transaction is not terminated.

**User response:** Refer to message CIU2277S.

**Module:** CIUACM10

---

#### IUYA

**Explanation:** Transaction CINB received an unrecognisable request from another Collector component, CINT or a Collector exit program.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU3302S.

**Module:** CIUCINB1

---

#### IUYC

**Explanation:** Transaction CINB received a request from another Collector component, CINT or an exit program, to abend because of an unexpected error.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU3304S.

**Module:** CIUCINB1

---

#### IUYE

**Explanation:** A Collector program found an invalid dependency file number in an internal array in the Collector GWA.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU3310S.

**Module:** CIUCINB2, CIUCINT3

---

#### IUYG

**Explanation:** Transaction CINB was still running at CICS termination.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU3312S.

**Module:** CIUCINB1

---

### IUYH

**Explanation:** A Collector program found that the address held in the Collector GWA for one of the Collector internal modules was invalid.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU3313S.

**Module:** CIUCINT4, CIUCINT5, CIUCINB1

---

### IUYI

**Explanation:** An unexpected error occurred when calling Collector program CIUTABM to access dependency table data in the data space, from transaction CINT or CINB.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU3314S.

**Module:** CIUCINB2, CIUCINT6

---

### IUYJ

**Explanation:** The dependency data file has filled up.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU3315S.

**Module:** CIUCINB2

---

### IUYK

**Explanation:** Transaction CINB received an unrecognized resource type from another Collector component.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU3316E.

**Module:** CIUCIND

---

### IUZ1

**Explanation:** When the Collector was being started by transaction CINT, the header record could not be found on the VSAM dependency data file.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2230S.

**Module:** CIUCINT3

---

### IUZ3

**Explanation:** Transaction CINT or CINB is running on a release of CICS which does not support the Collector.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2232E.

**Module:** CIUCINT1, CIUCINB1

---

### IUZ4

**Explanation:** Records in control file CIUCNTL have incorrect format.

**System action:** Transaction CINT or CINC is terminated.

**User response:** Refer to message CIU2209S.

**Module:** Refer to message CIU2209S.

---

### IUZ5

**Explanation:** When transaction CINT attempted to start the Collector it found that a program or transaction exclude list had invalid contents.

**System action:** Transaction CINT is terminated.

**User response:** Refer to message CIU2244S.

**Module:** CIUA110C

---

### IUZ6

**Explanation:** Transaction CINT or CINC detected an unexpected error from a CICS dump domain function.

**System action:** Transaction CINT or CINC is terminated.

**User response:** Refer to message CIU2245S.

**Module:** Refer to message CIU2245S.

### Destination

CINT TD queue.

---

### IUZ7

**Explanation:** An unexpected error was detected when the CICS IA interface to Natural interacted with Natural SYSRDC.

**System action:** The CICS IA interface to Natural is stopped.

**User response:** Refer to message CIU4307S.

**Module:** CIURDCX1

---

### IUZ8

**Explanation:** An unexpected error occurred when the CICS IA interface to Natural issued an EXEC CICS command.

**System action:** The CICS IA interface to Natural is stopped.

**User response:** Refer to message CIU4308S.

**Module:** CIURDCX1

---

IUZ9

**Explanation:** An abend occurred within the CICS IA interface to Natural.

**System action:** The CICS IA interface to Natural is stopped.

**User response:** Refer to message CIU4309S.

**Module:** CIURDCX1

---

## IUZA

**Explanation:** An unexpected error occurred when issuing an EXEC CICS command, by a program from transaction CINT, CINB or CINC.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2201S.

**Module:** Refer to message CIU2201S.

---

## IUSB

**Explanation:** An unexpected error occurred when issuing a VSAM file control EXEC CICS command, by a program from transaction CINT, CINB or CINC.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2202S.

**Module:** Refer to message CIU2202S.

---

## IUZC

**Explanation:** The internal field holding the Collector state has an invalid value.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2203S.

**Module:** CIUCINT1, CIUCINT2

---

## IUZD

**Explanation:** One of the files contains a CICS APPLID that does not match the APPLID of the CICS system.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2205S.

**Module:** CIUCINT1, CIUCINT2

---

## IUZF

**Explanation:** An unexpected error occurred when issuing a Collector user exit related EXEC CICS command, by a program from transaction CINT or CINB. The command is one of ENABLE, DISABLE or EXTRACT EXIT.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2206S.

**Module:** CIUCINT1, CIUCINT2, CIUCINT3, CIUCINT4, CIUCINT5, CIUCINT6, CIUCINB1

---

## IUZH

**Explanation:** An unexpected error occurred when calling Collector program CIUTABM to create the MVS data space to hold the dependency data, from transaction CINT.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2210S.

**Module:** CIUCINT3

---

## IUZI

**Explanation:** An unexpected error occurred when calling Collector program CIUTABM to create a dependency table in the data space, from transaction CINT.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2211S.

**Module:** CIUCINT3, CIUCINT6

---

## IUZJ

**Explanation:** An unexpected error occurred when calling Collector program CIUTABM to add an element to a dependency table in the data space, from transaction CINT.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2212S.

**Module:** CIUCINT3

---

## IUZN

**Explanation:** An unexpected error occurred when calling Collector program CIUTABM to destroy the data space, from transaction CINT.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2216S.

**Module:** CIUCINT4

---

## IUZO

**Explanation:** An unexpected error occurred when calling Collector program CIUTABM to destroy a table in the data space, from transaction CINT.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2217S.

**Module:** CIUCINT6

---

**IUZQ**

**Explanation:** An unexpected error occurred when calling Collector program CIUCINP to create its MVS CPOOL storage, from transaction CINT.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2220S.

**Module:** CIUCINT3

---

**IUZR**

**Explanation:** An unexpected error occurred when calling Collector program CIUCINP to access its MVS CPOOL storage, from transaction CINT or CINB.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2221S.

**Module:** CIUCINT4, CIUCINT5, CIUCINB1

---

**IUZS**

**Explanation:** An unexpected error occurred when calling Collector program CIUCINP to destroy its MVS CPOOL storage, from transaction CINT.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2222S.

**Module:** CIUCINT4

---

**IUZU**

**Explanation:** An unexpected error occurred when calculating what percentage of the data space is occupied by dependency data, from transaction CINT.

**System action:** The Collector is stopped.

---

**User response:** Refer to message CIU2224S.

**Module:** CIUCINT1

---

**IUZV**

**Explanation:** The method of initiating transaction CINT is incorrect.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2225E.

**Module:** CIUCINT1

---

**IUZY**

**Explanation:** An unexpected error occurred when calling Collector program CIUTABM to replace a table element in the data space, from transaction CINT or CINB.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2228S.

**Module:** CIUCINT3, CIUCINB2

---

**IUZZ**

**Explanation:** An unexpected error occurred when calling Collector program CIUTABM to access an element in UT or TT tables in the data space, from transaction CINT.

**System action:** The Collector is stopped.

**User response:** Refer to message CIU2229S.

**Module:** CIUA110C, CIUA140C, CIUA180C

---

## Collector table manager diagnostics

This section lists the meaning for each possible value of the call parameters that are included in the error messages issued if an error occurs on a call to the Collector table manager, CIUTABM.

### Function code values

A list of function code values.

AUTM_CREATE_POOL	1
AUTM_DESTROY_POOL	2
AUTM_CREATE_TABLE	3

## Appendix E. Worksheet for the installation customization program

This section contains a worksheets for use with the installation customization program.

The installation customization program allows you to create customized installation jobs in which the names of system entities, such as the high-level qualifier (hlq) of the CICS IA data sets, are set to specified values to suit your local environment. The worksheets consist of a table of installation variables, such as `_dbid_`, the identifier of the DB2 database, that can be passed to the installation customization program. You can record the value that you assign to each variable in the **Value** column of the table.

**Note:** If you are creating the CICS IA DB2 database on a version of DB2 running in compatibility mode, then make sure you set the **DB2 Compatibility Mode** option to YES during configuration.

The installation customization program is described in “Running the installation customization program” on page 31.

### Output data sets

The CICS IA configuration execution produces separate DB2 and CICS configurations.

The DB2 configuration has the following variables, see the table Variables for DB2 configuration, for CICS configuration see the table Variables for CICS configuration.

The CICS IA configuration execution produces separate output data sets depending on the type of configuration that you have performed.

### Variables for DB2 configuration

Table 109. Variables for DB2 configuration. The output data set for a DB2 configuration.

Variable	Description	Value
<code>_outsmp2d_</code>	<b>OUTPUT DSN FOR SCIUAMP.DB2</b> The output data set that contains the modified database related hlq.SCIUSAMP members.  REQUIRED	
<code>_outsqld_</code>	<b>OUTPUT DSN FOR DB2 SCIUSQL</b> The output data set that contains the modified SCIUSQL members to configure DB2 objects.  REQUIRED	

Table 109. Variables for DB2 configuration (continued). The output data set for a DB2 configuration.

Variable	Description	Value
_outdat1d_	<b>OUTPUT DSN FOR DB2 SCIUDAT1</b> The output data set that contains the copied SCIUDAT1 members to configure DB2 objects.  REQUIRED	
_outdat2d_	<b>OUTPUT DSN FOR DB2 SCIUDAT2</b> The output data set that contains the copied SCIUDAT2 members to configure DB2 objects.  REQUIRED	
_volserd_	<b>OUTPUT DEVICE TYPE</b> The output data set that contains the device type to configure DB2 objects.  REQUIRED	
_dsver_	<b>DATA SET VERIFICATION</b> The data set verification. Defines whether it's necessary to verify the existence of data sets or not (DB2 load data set name, DB2 runlib data set name, DB2 proclib data set name).  REQUIRED	

## DB2 variables

Table 110. DB2 variables

Variable	Description	Value
_db2hlq_	<b>DB2 LOAD DATASET NAME</b> The name of the DB2 data set for SDSNLOAD.  REQUIRED	
_db2run_	<b>DB2 RUNLIB DATASET NAME</b> The name of the DB2 data set for RUNLIB.LOAD.  REQUIRED	
_db2proc_	<b>DB2 PROCLIB DATASET NAME</b> The DB2 data set name for the PROCLIB that contains DSNUPROC.  REQUIRED	
_db2templ_	<b>DB2 LOAD TEMPLATE</b> The DB2 template using during DB2 LOAD processing.  REQUIRED	
_db2vcat_	<b>DB2 VCAT QUALIFIER</b> The DB2 data set qualifier for the CICS IA DB2 data sets.  REQUIRED	

Table 110. DB2 variables (continued)

Variable	Description	Value
_db2sys_	<b>DB2 SUB SYSTEM</b> The DB2 sub system identifier.  REQUIRED	
_db2qual_	<b>DB2 TABLE QUALIFIER</b> The DB2 qualifier (schema) for the CICS IA DB2 objects.  REQUIRED	
_db2own_	<b>DB2 TABLE OWNER</b> The TSO userid that will own the DB2 resources.  REQUIRED	
_db2vol_	<b>DB2 DASD VOLUME</b> The DASD volume on which DB2 resources will be cataloged. See SCIUSQL(CIUMAIN).  REQUIRED	
_db2ver_	<b>DB2 VERSION</b> The DB2 version.  REQUIRED	
_db2mode_	<b>DB2 COMPATIBILITY MODE</b> The DB2 compatibility mode.  REQUIRED	
_db2grp_	<b>DB2 RACF GROUP</b> The RACF group that is authorized to access the DB2 resources.  OPTIONAL	
_db2bfpt_	<b>DB2 BUFFERPOOL FOR TBSPC</b> The BUFFERPOOL value, used in CREATE TABLESPACE statements.  REQUIRED	
_db2bfpi_	<b>DB2 BUFFERPOOL FOR INDEX</b> The BUFFERPOOL value, used in CREATE INDEX statements.  REQUIRED	
_db2stgt_	<b>DB2 STOGROUP FOR TBLSPCS</b> The STOGROUP value, used in CREATE TABLESPACE statements.  REQUIRED	

Table 110. DB2 variables (continued)

Variable	Description	Value
_db2stgi_	<b>DB2 STOGROUP FOR INDEXES</b> The STOGROUP value, used in CREATE INDEX statements.  REQUIRED	
_dsntep2p_	<b>DB2 PLAN NAME FOR DSNTep2</b> The plan name for DSNTep2 program used in jobs.  REQUIRED	
_dsntiaul_	<b>DB2 PLAN NAME FOR DSNTIAUL</b> The plan name for DSNTIAUL used in jobs.  REQUIRED	
_db2styn_	<b>USE EXISTING STORAGE GROUP</b> Use existing storage groups or create new one.  REQUIRED	
_db2dbnt_	<b>DB2 DATABASE FOR TBLSPCS</b> The database name to host all tablespaces.  REQUIRED	
_db2planb_	<b>DB2 PLAN NAME FOR BATCH</b> The plan name for batch programs.  OPTIONAL	
_db2cc_	<b>DB2 CCSID (CODE PAGE)</b> The code character set identifier for SBCS data that is found in the input file during DB2 LOAD processing.  REQUIRED	
_db2wlm_	<b>DB2 WLM PROCEDURE NAME</b> WLM (workload manager) environment, in which the stored procedure is to run.  REQUIRED	
_db2pack_	<b>DB2 COLLECTION ID</b> The package collection that is to be used when the stored procedure is executed.  REQUIRED	

## Migration variables

Table 111. Migration variables

Variable	Description	Value
_ciuhlq_	<b>IA PRODUCT QUALIFIER</b> The CICS IA data set qualifier  REQUIRED	

Table 111. Migration variables (continued)

Variable	Description	Value
_migver_	<b>PREVIOUS RELEASE</b> The CICS IA release number to be migrated from.  REQUIRED	
_ciuhlqo_	<b>PREVIOUS IA QUALIFIER</b> The CICS IA data set qualifier for VSAM files used in the previous version.  OPTIONAL	
_oldqual_	<b>OLD DB2 TABLE QUALIFIER</b> The implicit TSO user ID for unqualified names of DB2 resources (tables) used in the previous version of CICS IA.  OPTIONAL	

## General variables

Table 112. General variables

Variable	Description	Value
_ciuhlqq_	<b>QSAM FILE QUALIFIER</b> Prefix for QSAM data sets. This qualifier is used to create the CSV files for application load and the table space unload data sets in the DB2 UNLOAD tablespace utility.  REQUIRED	
_ciuspacd_	<b>QSAM FILE SPACE UNITS</b> The space units to express the data set size in.  REQUIRED	
_ciupquad_	<b>QSAM FILE PRIMARY QTY</b> The primary allocation quantity for the QSAM files, in cylinders, tracks, records, kilobytes or megabytes as indicated in the SPACE UNITS field.  REQUIRED	
_ciusquad_	<b>QSAM FILE SECNDRY QTY</b> The secondary allocation quantity for the QSAM files, in cylinders, tracks, records, kilobytes or megabytes as indicated in the SPACE UNITS field.  OPTIONAL	

## Variables for CICS configuration

Table 113. Variables for CICS configuration. The output data set for CICS configuration.

Variable	Description	Value
_db2conf_	<b>DB2 CONFIGURATION FOR IA</b> The name of DB2 configuration. You can type the name of existing DB2 configuration for CICS IA or press PF4 to select from a list of DB2 configurations.  REQUIRED	
_outsmp1_	<b>OUTPUT DSN FOR SCIUSAMP</b> The output data set that contains the modified SCIUSAMP members to configure CICS objects.  REQUIRED	
_outsamn_	<b>OUTPUT DSN FOR CICS SCIUSAME/K</b> The output data set that contains the modified SCIUSAME/K members to configure CICS objects.  REQUIRED	
_outsq1_	<b>OUTPUT DSN FOR CICS SCIUSQL</b> The output data set that contains the modified SCIUSQL members to configure CICS objects.  REQUIRED	
_outdat1_	<b>OUTPUT DSN FOR CICS SCIUDAT1</b> The output data set that contains the copied SCIUDAT1 members to configure CICS objects.  REQUIRED	
_volserd_	<b>OUTPUT DEVICE TYPE</b> The output data set that contains the device type to configure CICS objects.  REQUIRED	
_dsver_	<b>DATA SET VERIFICATION</b> The data set verification defines whether or not it is necessary to verify the existence of data sets. (CICS load data set name, DB2 runlib data set name, CICS qualifier, CICS CSD file name, LE SCEERUN data set.)  REQUIRED	

## CICS IA variables

Table 114. CICS IA variables

Variable	Description	Value
_ciuhlq_	<b>IA PRODUCT QUALIFIER</b> The CICS IA data set qualifier.  REQUIRED	

Table 114. CICS IA variables (continued)

Variable	Description	Value
_ciuhlv_	<b>IA VSAM FILE QUALIFIER</b> The CICS IA data set qualifier for the VSAM files used by CICS IA.  REQUIRED	
_ciuhlc_	<b>IA CSV FILE QUALIFIER</b> The CICS IA data set qualifier for the QSAM CSV files. If it is blank then the IA VSAM FILE QUALIFIER is used.  OPTIONAL	
_lsnamhlq_	<b>IA LOG STREAM QUALIFIER</b> The stream name qualifier for the CIUMTJNL log stream data sets used by the Task Command Flow option.  REQUIRED	
_lscfdasd_	<b>COUPLING FACILITY or DASD</b> Define the log stream using the Coupling Facility or DASD-only.  REQUIRED	
_lshlq_	<b>LOG STREAM DATASET NAME HLQ</b> The stream name qualifier for DASD.  REQUIRED	
_lsstrcnm_	<b>IA LOG STREAM STRUCTNAME</b> The name of the coupling facility structure associated with the coupling facility log stream being defined.  OPTIONAL	
_lsretpd_	<b>LOG STREAM RETENTION PERIOD</b> Retention period for log stream can be from 0 to 999 days.  OPTIONAL	
_ciugdg_	<b>IA GDG DATASET QUALIFIER</b> Prefix for GDG data set.  REQUIRED	
_smsdatac_	<b>IA VSAM FILE DATACLASS</b> The data class that to use for the allocation of the VSAM data sets.  OPTIONAL	
_smsstorc_	<b>IA VSAM FILE STORAGECLS</b> The storage class that should be used for the allocation of the VSAM data sets.  OPTIONAL	

Table 114. CICS IA variables (continued)

Variable	Description	Value
_smsgngc_	<b>IA VSAM FILE MNGMNTCLASS</b> The management class that should be used for the allocation of the VSAM data sets.  OPTIONAL	
_ciuspace_	<b>IA VSAM FILE SPACE UNITS</b> The space units that reflect the data set size.  REQUIRED	
_ciupquan_	<b>IA VSAM FILE PRIMARY QTY</b> Prefix for GDG data set.  REQUIRED	
_ciusquan_	<b>IA VSAM FILE SECNDRY QTY</b> The data class that should be used for the allocation of the VSAM data sets.  OPTIONAL	
_dumpqlq_	<b>DUMP QUALIFIER</b> The dump qualifier. Default to DUMP.  REQUIRED	

## DB2 variables for CINT

Table 115. DB2 variables for CINT

Variable	Description	Value
_db2ireq_	<b>COLLECTING DB2 INFORMATION</b> To check collecting DB2 information for CINT. Value YES or NO.  REQUIRED	
_db2hlqc_	<b>DB2 LOAD DATASET NAME</b> The DB2 data set name for SDSNLOAD.  OPTIONAL	
_db2runc_	<b>DB2 RUNLIB DATASET NAME</b> The DB2 data set name for RUNLIB.LOAD.  OPTIONAL	
_db2sysc_	<b>DB2 SUB SYSTEM</b> The DB2 sub system identifier.  OPTIONAL	
_db2ownc_	<b>DB2 TABLE OWNER</b> The TSO user ID that owns the DB2 resources.  OPTIONAL	

Table 115. DB2 variables for CINT (continued)

Variable	Description	Value
_db2verc_	<b>DB2 VERSION</b> The DB2 version. Defaults to V910.  OPTIONAL	
_db2modec_	<b>DB2 COMPATIBILITY MODE</b> The DB2 compatability mode.  OPTIONAL	
_db2grpc_	<b>DB2 RACF GROUP</b> The RACF group which grants access to DB2 resources.  OPTIONAL	
_db2bfpic_	<b>DB2 BUFFERPOOL FOR INDEX</b> The BUFFERPOOL value used in the CREATE INDEX statements.  OPTIONAL	
_dsntep2c_	<b>DB2 PLAN NAME FOR DSNTDP2</b> The name for plans for the DSNTDP2 program used in jobs.  OPTIONAL	
_db2planc_	<b>DB2 PLAN NAME FOR CICS</b> The DB2 plan name for CICS programs.  OPTIONAL	
_db2packc_	<b>DB2 COLLECTION ID</b> The package collection that is used when the stored procedure is executed.  OPTIONAL	

## CICS variables

Table 116. CICS variables

Variable	Description	Value
_cicsver_	<b>CICS VERSION</b> The CICS Transaction Server version.  OPTIONAL	
_cicshlq_	<b>CICS QUALIFIER</b> The data set qualifier of the CICS TS SDFHLOAD library.  REQUIRED	
_cicscsd_	<b>CICS CSD FILE NAME</b> The name of the CICS System Definition (CSD) file.  REQUIRED	

Table 116. CICS variables (continued)

Variable	Description	Value
_aorlist_	<b>CICS AOR LIST NAME</b> The CICS AOR CSD group list to which to append the CICS IA resource group.  REQUIRED	
_forlist_	<b>CICS FOR LIST NAME</b> The CICS FOR CSD group list to which to append the CICS IA local files resource group. If using RLS set this to the same value as your AOR CSD LIST to define the CICS IA files as local to the AOR.  REQUIRED	
_ciugrpt_	<b>CICS CSD COLLECTOR GROUP</b> The CICS FOR CSD group list to which to append the CICS IA local files resource group.  REQUIRED	
_ciugrpf_	<b>CICS LOCAL FILES GROUP</b> The group name for file resource definitions defined locally.  REQUIRED	
_ciugrpr_	<b>CICS REMOTE FILES GROUP</b> The group name for file resource definitions defined remotely.  REQUIRED	
_ciugrpw_	<b>CICS WEB SUPPORT GROUP</b> The group name for file resource definitions defined for web support.  REQUIRED	
_cicsrls_	<b>RLSACCESS FOR VSAM FILES</b> Are you using RLS to share VSAM files? Value must be YES or NO.  REQUIRED	
_cicslsr_	<b>LSRPOOLID FOR VSAM FILES</b> The CICS LSRPOOLID for VSAM resources.  REQUIRED	
_cicssys_	<b>CICS FILE OWNING REGION</b> The CICS SYSID for the file owning region.  OPTIONAL	

Table 116. CICS variables (continued)

Variable	Description	Value
_libnm_	<b>LIBRARY RESOURCE NAME</b> (for SCIULOAD) CICS LIBRARY resource name for defining SCIULOAD data set (used for CICS TS version 3.2 or higher).  OPTIONAL	
_libnmek_	<b>LIBRARY RESOURCE NAME (for SCIULODE/K)</b> CICS LIBRARY resource name for defining SCIULODE/K data set (used for CICS TS version 3.2 or higher).  OPTIONAL	

### CICS IA plug-in for CICS Explorer variables

Table 117. CICS IA plug-in for CICS Explorer variables

Variable	Description	Value
_cntreg	<b>CICS IA CONTROL REGION</b> A CICS region where you can administer CICS IA for all other regions that share the CICS VSAM Control file. This region is connected to using Atom services from CICS IA plug-in for CICS Explorer. The region must be at CICS V4.1 and above.	
_tcpport_	<b>TCP IP PORT</b> The TCP/IP port used by Atom service to control the collector.  REQUIRED	
_atomcfg1_	<b>ATOM CONFIG FILE LOCATION</b> The location of the Atom service configuration file in the HFS file system. This is the first part of the HFS directory path that contains the CIUATM01 configuration file. The default is pathprefix/usr/lpp/cicsia/ciuver. The <i>pathprefix</i> and <i>ciuver</i> are variables used during the SMP/E install of CICS IA. This value is concatenated with IBM/atomservices/config/CIUATM01 to define the location of the Atom service Configuration file for CICS IA.  OPTIONAL	

### JCL settings variables

Table 118. JCL settings variables

Variable	Description	Value
_sortdsn_	<b>SORT DATASET NAME</b> The name of the dataset name for SORT. Default to SYS1.SORTLIB.  REQUIRED	

Table 118. JCL settings variables (continued)

Variable	Description	Value
_sortpgm_	<b>SORT PROGRAM NAME</b> The name of the program name for SORT. Default to SORT.  REQUIRED	

## General variables

Table 119. General variables

Variable	Description	Value
_asmprg_	<b>ASSEMBLER PROGRAM</b> ASMA90 or IEV90.  OPTIONAL	
_lehlq_	<b>LE QUALIFIER</b> Data set qualifier of the SCEERUN library.  REQUIRED	

## Variables that are not customized by the installation customization program

Table 120. Variables that are not customized by the installation customization program

Variable	Description	Value
_xxx_	CICS IA application suffixes.	
_cauhlq_	The high-level data set qualifier of the VSAM affinities file.	
_applid_	The CICS region APPLID used in reporting and load jobs.	
_ciudet_	The data set qualifier of the output data set used by the CICS IA Load Module Scanner.	
_scan_	The data set name of the load module to be scanned by the CICS IA Load Module Scanner.	

---

## Appendix F. CICS IA space considerations

This appendix contains information on how to calculate the space requirements for the following:

- “Data space allocation” on page 348
- “VSAM data set allocation” on page 351
- “DB2 space allocation” on page 353

---

### Required data

To calculate the space allocation requirements, estimate some values for the environment in which you want to run CICS IA.

Refer to the worksheet supplied in Table 121 and Table 122 on page 348. These values are used in later calculations.

*Table 121. Values required for each CICS region*

Required Data	Description	Value
PROG_TRAN_RATIO	Estimate of the number of transactions and program associations. For example, program PROGA can be associated with more than one transaction.	
NUM_CICS_PROG	Number of programs that contain EXEC CICS commands.	
AVG_EXEC_LONG	Average number of EXEC CICS calls, per program, that have a data space key greater than 32. These commands are the EXEC CICS ENQ and EXEC CICS DEQ.	
AVG_EXEC_SHORT	Average number of EXEC CICS calls, per program, that have a data space key less than or equal to 32. These commands are all EXEC CICS commands apart from EXEC CICS ENQ and EXEC CICS DEQ commands above.	
AVG_DTP	Average number of EXEC CICS DTP calls, ALLOCATE, CONNECT, SEND, CONVERSE, and FREE commands.	
NUM_DB2_PROG	Number of programs that contain EXEC SQL commands.	
AVG_DB2	Average number of EXEC SQL calls per program.	
NUM_IMS_PROG	Number of programs that contain EXEC IMS commands.	
AVG_IMS	Average number of EXEC IMS calls per program.	
NUM_MQ_PROG	Number of programs that contain EXEC MQ commands.	
AVG_MQ	Average number of EXEC MQ calls per program.	

Table 121. Values required for each CICS region (continued)

Required Data	Description	Value
NUM_AFF_PROG	Number of programs that contain EXEC AFF commands.	
AVG_AFF	Average number of EXEC AFF calls per program.	
NUM_NATURAL_PROG	Number of Natural programs that contain ADABAS or PROGRAM calls.	
AVG_NATURAL	Average number of ADABAS or PROGRAM calls per Natural program.	

Table 122. Values required for VSAM and DB2 calculations

Required Data	Description	Value
NUM_REGION_V	Number of CICS regions sharing the VSAM file. This value is required to calculate the VSAM file space allocation.	
NUM_REGION_D	Total number of CICS regions in which CICS IA is collecting. This value is required to calculate the DB2 table and index sizes. The CICS IA DB2 database can contain data from more than one set of VSAM files.	

## Data space allocation

The data space consists of a number of tables, both permanent and temporary. The number and size of the tables varies depending on whether you are collecting Interdependency data or Affinities data.

### About this task

The size of the data space used by CICS IA is defined in the 'General Options' panel.

1. Select option 2 from the CINT transaction main menu.
2. Select option 6 against the region or against the default record. The size can vary from 10 MB to 2000 MB; the default is set to 16 MB.

To view the percentage of the data space used in the statistics panel for each region

1. Select option 1 in the CINT transaction main menu.
2. Select option 5 against the region. The data space name is 00000INT.

## Calculating the space required for interdependency collection

The interdependency collection can consist of up to eight tables depending on the options selected.

This section describes how to calculate the space required for Interdependency Collection.

### Calculating CICS data space

Three tables are used to create CICS data.

## About this task

Collect CICS data as described below:

1. Estimate the number of application programs that are used in the CICS region, using the CICS IA scanner. Call this number NUM\_CICS\_PROG.
2. Estimate the average number of EXEC CICS calls per program, using the CICS IA scanner. Run the scanner against all load module data sets in the DFHRPL that make up your applications. There are three types:
  - a. Key less than or equal to 32 bytes. Including all EXEC CICS calls other than those listed in step b. below. Call this number AVG\_EXEC\_SHORT.
  - b. Resources greater than 32 characters. Currently only EXEC CICS ENQ or EXEC CICS DEQ have resource names greater than 32 bytes. Call this number AVG\_EXEC\_LONG.
  - c. Resources that use DTP. These resources consist of the following commands: ALLOCATE, CONNECT, SEND, CONVERSE and FREE. Call this number AVG\_DTP.
3. Estimate the number of transaction and program associations. In this example, the estimate is that each can be associated with five transactions. Call this number PROG\_TRAN\_RATIO.
4. Calculate CICS data space as follows:
$$(108 * \text{NUM\_CICS\_PROG} * \text{AVG\_EXEC\_SHORT} * \text{PROG\_TRAN\_RATIO}) + (338 * \text{NUM\_CICS\_PROG} * \text{AVG\_EXEC\_LONG} * \text{PROG\_TRAN\_RATIO}) + (16 * \text{NUM\_CICS\_PROG} * \text{AVG\_DTP} * \text{PROG\_TRAN\_RATIO}) = \text{CICS\_DS bytes.}$$

## Calculating DB2 data space

One table is used to store DB2 data.

## About this task

Collect DB2 data as follows:

1. Estimate the number of application programs that are used in the CICS region that use DB2. Call this number NUM\_DB2\_PROG.
2. Estimate the average number of EXEC SQL calls per program. Call this number AVG\_DB2.
3. Estimate the number of transaction and program associations. In this example the estimate is that each can be associated with five transactions.
4. Calculate DB2 data space as follows:
$$(120 * \text{NUM\_DB2\_PROG} * \text{AVG\_DB2} * \text{PROG\_TRAN\_RATIO}) = \text{DB2\_DS bytes}$$

## Calculating IMS data space

Two tables are used to store IMS data.

## About this task

Collect IMS data as follows:

1. Estimate the number of application programs that are used in the CICS region that use DLI calls. Call this number NUM\_IMS\_PROG.
2. Estimate the average number of EXEC DLI calls per program. Call this number AVG\_IMS.
3. Estimate the number of transaction and program associations. In this example, the estimate is that each can be associated with five transactions.
4. Calculate IMS data space as follows:

$$(75 * \text{NUM\_IMS\_PROG} * \text{AVG\_IMS} * \text{PROG\_TRAN\_RATIO}) + \\ (20 * \text{NUM\_IMS\_PROG} * \text{AVG\_IMS} * \text{PROG\_TRAN\_RATIO}) = \text{IMS\_DS bytes.}$$

## Calculating MQ data space

Two tables are used to store MQ data.

### About this task

Collect MQ data as follows:

1. Estimate the number of application programs that are used in the CICS region that use MQ. Call this number NUM\_MQ\_PROG.
2. Estimate the average number of MQ calls per program. Call this number AVG\_MQ.
3. Estimate the number of transaction and program associations. In this example, the estimate is that each can be associated with five transactions.
4. Calculate MQ data space as follows:

$$(103 * \text{NUM\_MQ\_PROG} * \text{AVG\_MQ} * \text{PROG\_TRAN\_RATIO}) + \\ (60 * \text{NUM\_MQ\_PROG} * \text{AVG\_MQ} * \text{PROG\_TRAN\_RATIO}) = \text{MQ\_DS bytes}$$

## Calculating Natural data space

One table is used to store Natural data.

### About this task

Collect Natural data as follows:

1. Estimate the number of Natural programs that contain ADABAS or PROGRAM calls. Call this number NUM\_NATURAL\_PROG.
2. Estimate the average number of ADABAS or PROGRAM calls per Natural program. Call this number AVG\_NATURAL.
3. Estimate the number of transaction and program associations. In this example, the estimate is that each can be associated with five transactions.
4. Calculate Natural data space as follows:

$$(144 * \text{NUM\_NATURAL\_PROG} * \text{AVG\_NATURAL} * \text{PROG\_TRAN\_RATIO}) = \text{NATURAL\_DS bytes}$$

## Calculating the resource data space

There is one table used to capture the CICS resource data.

### About this task

To collect the CICS resource data:

### Procedure

1. Estimate the number of each of the following resources used in the CICS region:
  - File resources. Call this number NUM\_CICS\_FILE.
  - Program resources. Call this number NUM\_CICS\_PROG.
  - Transaction resources. Call this number NUM\_CICS\_TRAN.
  - Transient Data Queue resources. Call this number NUM\_CICS\_TDQ.
  - Temporary Storage Queue resources. Call this number NUM\_CICS\_TSQ.
  - Web services resources. Call this number NUM\_CICS\_WEBS
  - TRUE and GLUE exits. Call this number NUM\_CICS\_EXIT
2. Calculate the CICS data space:

```

(NUM_CICS_FILE +
 NUM_CICS_PROG +
 NUM_CICS_TRAN +
 NUM_CICS_TDQ +
 NUM_CICS_TSQ +
 NUM_CICS_WEBS +
 NUM_CICS_EXIT) * 165 = CICS_RES_DS bytes

```

### Total Interdependency data space calculation for Interdependency

Calculation for the total data space required for interdependency.

$CICS\_DS + DB2\_DS + IMS\_DS + MQ\_DS + NATURAL\_DS + CICS\_RES\_DS = TOTAL\_DS$  in bytes

## Calculating the space required for affinity collection

A number of data spaces are tables used when collecting affinity information.

### About this task

Use the average length for the calculation, 200 bytes plus another 100 bytes for temporary tables. Using the average length removes the requirement to break the calculation down to each table. Collect affinity data as follows:

1. Estimate the number of programs that possibly have affinity commands using the IA scanner. Call this number NUM\_AFF\_PROG.
2. Estimate the number of affinity commands per program using the IA scanner. Call this number AVG\_AFF.
3. Calculate for Affinity data space as follows:  
 $(300 * NUM\_AFF\_PROG * AVG\_AFF) = NUM\_AFF\_DS$  in bytes

---

## VSAM data set allocation

There are ten VSAM files associated with CICS IA.

The JCL to create these files is in SCIUSAMP.CICS members CIUJCLCC and CIUJCLCA.

The allocation parameters of the VSAM files can be customized by the installation customization program. The values for the following parameters can be specified:

- VSAM file data class
- VSAM file storage class
- VSAM file management class
- VSAM file space units (CYLINDERS, TRACKS, RECORDS, KILOBYTES or MEGABYTES)
- VSAM file primary quantity, in the space units specified
- VSAM file secondary quantity, in the space units specified

See Appendix E, "Worksheet for the installation customization program," on page 335 for a list of the variables for the above parameters.

## Control file: CIUCNTL

Maximum record length is 898 bytes. Number of records is the number of CICS regions in the shared environment and the number of Command Flow user records. Call this number NUM\_REGION\_V and NUM\_CMDF\_USERS respectively.

```
Size = (( 898 * NUM_REGION_V) +
        ( 560 * NUM_CMDF_USERS) + 32)
```

## Dependency files: CIUINT1, 2, 3, 4, 5, 6, 7

The size of the VSAM files can be calculated with the formulas listed.

The formulas refer to the information collected in “Data space allocation” on page 348.

### CIUINT1 - CICS

```
Size = ((109 * NUM_REGION_V) +
        (139 * NUM_CICS_PROG * AVG_EXEC_SHORT * PROG_TRAN_RATIO *
         NUM_REGION_V)) bytes
```

### CIUINT2 - DB2

```
Size = ((122 * NUM_REGION_V) +
        (151 * NUM_DB2_PROG * AVG_DB2 * PROG_TRAN_RATIO *
         NUM_REGION_V)) bytes
```

### CIUINT3 - MQ

```
Size = ((163 * NUM_REGION_V) +
        (192 * NUM_MQ_PROG * AVG_MQ * PROG_TRAN_RATIO *
         NUM_REGION_V)) bytes
```

### CIUINT4 - IMS

```
Size = ((77 * NUM_REGION_V) +
        (106 * NUM_IMS_PROG * AVG_IMS * PROG_TRAN_RATIO *
         NUM_REGION_V)) bytes
```

### CIUINT5 - CICS

```
Size = ((273 * NUM_REGION_V) +
        (357 * NUM_CICS_PROG * AVG_EXEC_LONG * PROG_TRAN_RATIO *
         NUM_REGION_V)) bytes
```

### CIUINT6 - CICS resources

```
Size = (( 128 * NUM_REGION_V) +
        ( 377 * NUM_CICS_FILE) +
        ( 280 * NUM_CICS_PROG) +
        ( 279 * NUM_CICS_TRAN) +
        ( 325 * NUM_CICS_TDQ) +
        ( 920 * NUM_CICS_EVENT) +
        ( 224 * NUM_CICS_TSQ) +
        (1539 * NUM_CICS_WEBS) +
        ( 176 * NUM_CICS_EXIT)) bytes
```

### CIUINT7 - Natural

```
Size = ((127 * NUM_REGION_V) +
        (171 * NUM_NATURAL_PROG * AVG_NATURAL * PROG_TRAN_RATIO *
         NUM_REGION_V)) bytes
```

## Affinity files: CIUAFF1,2,3

The calculation considers that the average number of affinity commands per program is split into the three files, with the ratio 50%, 40% and 10%.

### CIUAFF1 – Affinity (Key <= 16)

```
Size = ((47 * NUM_REGION_V) +
        (255 * NUM_AFF_PROG * (AVG_AFF/2) * NUM_REGION_V)) bytes
```

CIUAFF2 – Affinity (Key <= 32)

Size = ((63 \* NUM\_REGION\_V) +  
(255 \* NUM\_AFF\_PROG \* (AVG\_AFF/10\*4) \* NUM\_REGION\_V)) bytes

CIUAFF3 – Affinity (Key > 32)

Size = ((255 \* NUM\_REGION\_V) +  
(255 \* NUM\_AFF\_PROG \* (AVG\_AFF/10) \* NUM\_REGION\_V)) bytes

## Application file: CIUAPPL

Record length is 152 bytes. Number of records is the number of applications that have been defined in region. Call this number APPL\_NUMB.

Number of records is the number of application names that have been defined in region:

Size = ((152 \* (APPL\_NUMB+1))) bytes

---

## DB2 space allocation

Calculate the DB2 space allocations using these assumptions and guidance.

In the following calculations, the following assumptions apply:

- All data spaces and indexes in CICS IA use Bufferpool BP0, which is a 4 KB page.
- Number of bytes available in a 4 KB page is 4089.
- You have to calculate the PRIQTY for all tables and indexes.
- SECQTY is set to 10% of the PRIQTY. For more information on SECQTY, see the *DB2 Administration Guide*.

To calculate the PRIQTY for tablespaces and indexes, use the calculation in Figure 66:

```
ROWS_PER_PAGE = 4089/ROW_SIZE  
FREE_BYTES = 4089/100 * PERCENT_FREE  
FREE_ROWS = FREE_BYTES/ROW_SIZE
```

```
NUM_OF_4K_PAGES = NUM_ROWS / (ROWS_PER_PAGE - FREE_ROWS)  
PRIQTY = 4 * NUM_OF_4K_PAGES
```

*Figure 66. Calculation for PRIQTY for tablespaces and indexes*

The calculation in Figure 66 has three variables:

- ROW\_SIZE
- PERCENT\_FREE
- NUM\_ROWS

The ROW\_SIZE and PERCENT\_FREE for each tablespace and the indexes are in the tables provided for each DB2 table. To calculate the number of rows for each tablespace and index, see CICS tables and indexes: CIUCICS1 and CIUCICSX.

However, until you know how many EXEC CICS statements are used by the applications, it is difficult to estimate the number of rows for a DB2 table.

The DB2 table update jobs, CIUUPDB1, CIUUPDB2, CIUUPDB3, CIUUPDB4, CIUUPDBN, and CIUAFFLD, include a step to report on the number of rows in a table. For example:

```
--Show me the number of rows in the CIU_CICS_DATA table
***INPUT STATEMENT:
SELECT COUNT(*) FROM CIU_CICS_DATA READONLY;
+-----+
1_| 3037 |
+-----+
```

For the CIU\_CICS\_DATA table use the row count from the load module scanner jobs CIUJCLTS and CIUJCLTD. Or run the sample SQL member, CIUSPACE, to report on the row count for all of the CICS IA tables. Use the reported values to re-create the table space and index if required.

## CICS tables and index: CIUCICS1 and CIUCICSX

How to calculate the space required for the DB2 tablespace and DB2 index for CICS data.

To calculate the space, in KB, to allocate for the DB2 tablespace and the DB2 index required for CICS data, estimate the total number of rows. This number is calculated from the following values; see Values required for each CICS region:

- NUM\_CICS\_PROG
- AVG\_EXEC\_SHORT
- AVG\_EXEC\_LONG
- PROG\_TRAN\_RATIO
- NUM\_REGION\_D

Calculate the number of rows for the CICS table as follows:

```
NUM_ROWS = (NUM_CICS_PROG * AVG_EXEC_SHORT
             * PROG_TRAN_RATIO * NUM_REGION_D) +
            (NUM_CICS_PROG * AVG_EXEC_LONG
             * PROG_TRAN_RATIO * NUM_REGION_D)
```

If you are using DB2 V7.1, use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 123 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353.

Table 123. Worksheet for CICS tablespace using DB2 V7.1

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
CIUCIC1	315	15		
<b>Indexes</b>				
XICICS11	245	20		

If you are using DB2 V8.1, use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 124 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353.

Table 124. Worksheet for CICS tablespace using DB2 V8.1

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
CIUCIC1	387	15		
<b>Indexes</b>				
XICICS11	317	20		

## DB2 tables and index: CIUDB2

Calculation of the space required for the DB2 tablespace and DB2 index for DB2 data.

To calculate the space, in KB, to allocate for the DB2 tablespace and the DB2 index required for DB2 data, you need to estimate the total number of rows.

This number is calculated from the following values; see Values required for each CICS region.

- NUM\_DB2\_PROG
- AVG\_DB2
- PROG\_TRAN\_RATIO
- NUM\_REGION\_D

Calculate the number of rows for the DB2 table as follows:

$$\text{NUM\_ROWS} = (\text{NUM\_DB2\_PROG} * \text{AVG\_DB2} * \text{PROG\_TRAN\_RATIO} * \text{NUM\_REGION\_D})$$

Use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 125 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353 for the DB2 tablespace.

Table 125. Worksheet for DB2 tablespace

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
CIUDB2D	189	15		
<b>Indexes</b>				
XIDB2D1	133	20		

## MQ tables and index: CIUMQ1

Calculation of the space required for the DB2 tablespace and DB2 index for Websphere MQ data.

To calculate the space, in KB, to allocate for the DB2 tablespace and the DB2 index required for Websphere MQ data, you need to estimate the total number of rows.

This number is calculated from the following values; see Values required for each CICS region.

- NUM\_MQ\_PROG
- AVG\_MQ
- PROG\_TRAN\_RATIO
- NUM\_REGION\_D

Calculate the number of rows for the DB2 table as follows:

$$\text{NUM\_ROWS} = (\text{NUM\_MQ\_PROG} * \text{AVG\_MQ} * \text{PROG\_TRAN\_RATIO} * \text{NUM\_REGION\_D})$$

Use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 126 on page 356 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353 for the MQ tablespace.

Table 126. Worksheet for MQ tablespace

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
CIUMQD	163	15		
<b>Indexes</b>				
XIMQD1	107	20		

## IMS tables and index: CIUIMS

Calculation of the space required for the DB2 tablespace and DB2 index for IMS data.

To calculate the space, in KB, to allocate for the DB2 tablespace and the DB2 index required for IMS data, you need to estimate the total number of rows.

Calculate this number from the following values; see Values required for each CICS region.

- NUM\_IMS\_PROG
- AVG\_IMS
- PROG\_TRAN\_RATIO
- NUM\_REGION\_D

Calculate the number of rows for the DB2 table as follows:

$$\text{NUM\_ROWS} = (\text{NUM\_IMS\_PROG} * \text{AVG\_IMS} * \text{PROG\_TRAN\_RATIO} * \text{NUM\_REGION\_D})$$

Use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 127 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353 for the IMS tablespace.

Table 127. Worksheet for IMS tablespace

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
CIUIMSD	127	15		
<b>Indexes</b>				
XIIMSD1	69	20		

## Natural tables and an index: CIUNAT

Calculate the space required for the DB2 tablespace and DB2 index for Natural data.

To calculate the space, in KB, to allocate for the DB2 tablespace and the DB2 index required for Natural data, you estimate the total number of rows.

This number is calculated from the following values:

- NUM\_NATURAL\_PROG
- AVG\_NATURAL
- PROG\_TRAN\_RATIO
- NUM\_REGION\_D

See Values required for each CICS region.

Calculate the number of rows for the Natural table as follows:

$$\text{NUM\_ROWS} = (\text{NUM\_NATURAL\_PROG} * \text{AVG\_NATURAL} * \text{PROG\_TRAN\_RATIO} * \text{NUM\_REGION\_D})$$

Use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 128 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353 for the DB2 tablespace.

*Table 128. Worksheet for Natural tablespace*

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
CIUNATD	267	15		
<b>Index</b>				
XNATDUNI	124	20		

## Exit resource tables and index: CIUREXIT

Calculation of the space required for the DB2 tablespace and DB2 index for the exit resource data.

To calculate the space, in KB, to allocate for the DB2 tablespace and the DB2 index required for exit resource data, you need to estimate the total number of rows.

Calculate this number from the following values:

- NUM\_CICS\_EXIT
- NUM\_REGION\_D

Calculate the number of rows for the DB2 table as follows:

$$\text{NUM\_ROWS} = (\text{NUM\_CICS\_EXIT} * \text{NUM\_REGION\_D})$$

Use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 129 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353.

*Table 129. Worksheet for exit resource tablespace*

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
CIUEXIT	68	15		
<b>Indexes</b>				
XEXITA	44	20		

## File resource tables and index: CIURFILE

Calculation of the space required for the DB2 tablespace and DB2 index for the file resource data.

To calculate the space, in KB, to allocate for the DB2 tablespace and the DB2 index required for file resource data, you need to estimate the total number of rows.

Calculate this number from the following values:

- NUM\_CICS\_FILE
- NUM\_REGION\_D

Calculate the number of rows for the DB2 table as follows:

$NUM\_ROWS = (NUM\_CICS\_FILE * NUM\_REGION\_D)$

Use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 130 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353.

*Table 130. Worksheet for file detail resource table*

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
CIUFILE	330	15		
<b>Indexes</b>				
XFILEA	20	20		

## Program resource tables and index: CIURPROG

Calculation of the space required for the DB2 tablespace and DB2 index for the program resource data.

To calculate the space, in KB, to allocate for the DB2 tablespace and the DB2 index required for program resource data, you need to estimate the total number of rows.

Calculate this number from the following values:

- NUM\_CICS\_PROG
- NUM\_REGION\_D

Calculate the number of rows for the DB2 table as follows:

$NUM\_ROWS = (NUM\_CICS\_PROG * NUM\_REGION\_D)$

Use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 131 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353.

*Table 131. Worksheet for program detail resource table*

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
CIUPROG	339	15		
<b>Indexes</b>				
XPROGA	20	20		

## Transaction resource tables and index: CIURTRAN

Calculation of the space required for the DB2 tablespace and DB2 index for the transaction ID resource data.

To calculate the space, in KB, to allocate for the DB2 tablespace and the DB2 index required for transaction resource data, you need to estimate the total number of rows.

Calculate this number from the following values:

- NUM\_CICS\_TRAN
- NUM\_REGION\_D

Calculate the number of rows for the DB2 table as follows:

$NUM\_ROWS = (NUM\_CICS\_TRAN * NUM\_REGION\_D)$

Use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 132 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353.

*Table 132. Worksheet for the TRANSID detail resource table*

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
CIUTRANS	211	15		
<b>Indexes</b>				
XTRANA	16	20		

## Transient data queue resource tables and index: CIURTDQ

Calculation of the space required for the DB2 tablespace and DB2 index for the transient data queue resource data.

To calculate the space, in KB, to allocate for the DB2 tablespace and the DB2 index required for transient data queue resource data, you need to estimate the total number of rows.

Calculate this number from the following values:

- NUM\_CICS\_TDQ
- NUM\_REGION\_D

Calculate the number of rows for the DB2 table as follows:

$$\text{NUM\_ROWS} = (\text{NUM\_CICS\_TDQ} * \text{NUM\_REGION\_D})$$

Use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 133 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353.

*Table 133. Worksheet for the TDQUEUE detail resource table*

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
CIUTDQ	291	15		
<b>Indexes</b>				
XTDQUEA	16	20		

## Temporary storage queue resource tables and index: CIURTSQ

Calculation of the space required for the DB2 tablespace and DB2 index for the temporary storage queue resource data.

To calculate the space, in KB, to allocate for the DB2 tablespace and the DB2 index required for temporary storage queue resource data, you need to estimate the total number of rows.

Calculate this number from the following values:

- NUM\_CICS\_TSQ
- NUM\_REGION\_D

Calculate the number of rows for the DB2 table as follows:

$$\text{NUM\_ROWS} = (\text{NUM\_CICS\_TSQ} * \text{NUM\_REGION\_D})$$

Use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 134 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353.

*Table 134. Worksheet for the TSQUEUE detail resource table*

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
CIUTSQ	114	15		
<b>Indexes</b>				
XTSQUEA	28	20		

## Web services resource tables and index: CIURWEB

Calculation of the space required for the DB2 tablespace and DB2 index for the Web services resource data.

To calculate the space, in KB, to allocate for the DB2 tablespace and the DB2 index required for Web services resource data, you need to estimate the total number of rows.

Calculate this number from the following values:

- NUM\_CICS\_WEBS
- NUM\_REGION\_D

Calculate the number of rows for the DB2 table as follows:

$\text{NUM\_ROWS} = (\text{NUM\_CICS\_WEBS} * \text{NUM\_REGION\_D})$

Use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 135 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353.

*Table 135. Worksheet for the WEBSERV detail resource table*

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
CIUWEBS	1228	15		
<b>Indexes</b>				
XWEBSA	44	20		

## Affinity tables and indexes

How to calculate the space required for the DB2 tablespace and DB2 indexes for Affinity data.

To calculate the space, in KB, to allocate for the DB2 tablespace and the DB2 indexes required for the Affinity collection, estimate the total number of rows. In this example, there are three tables:

**CIU\_AFF\_INDEX.** This table holds the group count for all the different affinity types. The number of rows is fixed at 20.

$\text{NUM\_ROWS} = 20$

**CIU\_AFF\_CMD\_DATA.** The number of rows for this table is an estimate of the total number of commands that cause affinities for each program in each region. Calculate this number from the following values; see Table 136 on page 361.

- NUM\_AFF\_PROG
- AVG\_AFF
- NUM\_REGION\_D

The number of rows for the CICS table can be calculated as follows:

$$\text{NUM\_ROWS} = (\text{NUM\_AFF\_PROG} * \text{AVG\_AFF} * \text{NUM\_REGION\_D})$$

**CIU\_AFF\_GROUP\_DATA.** The number of this table is an estimate of how many affinity groups are required. Affinity commands stored in the CIU\_AFF\_CMD\_DATA table are grouped by affinity type, for example TSQueue type. Assume there are four affinity commands per group.

$$\text{NUM\_ROWS} = (\text{NUM\_AFF\_PROG} * \text{AVG\_AFF} * \text{NUM\_REGION\_D}) / 4$$

Use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 136 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353 for the Affinity tablespace.

*Table 136. Worksheet for Affinity tablespace*

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
<b>CIUAFFD</b>				
CIU_AFF_INDEX	6	15		
CIU_AFF_CMD_DATA	61	15		
CIU_AFF_GRP_DATA	367	15		
<b>Indexes</b>				
X4AFFG11	10	20		
X4AFFG12	81	20		
X4AFFC11	57	20		
X4AFFC12	53	20		
X4AFFI11	6	20		
X3GRPDAT	255	20		
X1GRPDAT	10	20		
X2AFFDAT	22	20		
X1AFFDAT	42	20		

## Load Module Scanner tables

The default values set by CICS IA are larger than required. To calculate the space to allocate for the DB2 tablespace and the DB2 indexes required for the Load Module Scanner, estimate the total number of rows.

In this case there are two tables:

**CIU\_SCAN\_SUMMARY:** The number of rows for this table is the number of programs that contain Affinity or Interdependency commands from all the application load modules.

**CIU\_SCAN\_DETAIL:** The number of rows for this table is the number of programs defined above multiplied by the average number of EXEC CICS commands per program.

Obtain these values by running the Load Module Scanner in report mode only; that is, running CIUJCLLS and CIUJCLLD.

Use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 137 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353 for the Load Module Scanner tablespace.

*Table 137. Worksheet for Load Module Scanner tablespace*

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
<b>CIULMSD</b>				
Summary	86	15		
Detail	127	15		
<b>Indexes</b>				
X4LMSDA	44	20		
X4LMSDB	44	20		

## CSECT Module Scanner tables

The default values set by CICS IA are larger than required. To calculate the space to allocate for the DB2 table space and the DB2 indexes required for the CSECT Module Scanner, estimate the total number of rows.

There are three tables in two table spaces:

**CIU\_PROGRAM\_INFO:** The number of rows for this table is the number of programs that are in all the application load modules.

**CIU\_CSECT\_INFO:** The number of rows for this table is the number of programs defined above, multiplied by the average number of CSECTS per program.

**CIU\_TRNSLATORS:** This table is static. It holds the program product number for compilers and translators with the corresponding names. The number is set to 50. The default values for CICS IA PRIQTY and SECQTY for this table are larger than required. Set them to the value you obtain from the calculation below:

Use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 138 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353 for the CSECT Module Scanner table space.

*Table 138. Worksheet for CSECT Module Scanner table space*

Table space	Row_Size	Percent_Free	PRIQTY	SECQTY
<b>CIUCSSD</b>				
Program	123	15		
CSECT	240	15		
<b>Indexes</b>				
X4CSSDA	86	20		
X4CSSDB	94	20		
X4CSSDE	8	20		

## CICS region tables

The default values set by CICS IA are larger than required. To calculate the space to allocate for the DB2 tablespace and the DB2 indexes required for CICS region information, estimate the total number of rows.

In this example, the number of rows equals the number of CICS regions for which CICS IA data is being captured:

NUM of ROWS = Number of CICS regions

Use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 139 to calculate the PRIQTY and SECQTY as described in Figure 66 on page 353 for the CICS region tablespace.

Table 139. Worksheet for CICS region tablespace

Tablespace	Row_Size	Percent_Free	PRIQTY	SECQTY
CIUREGD	192	15		
<b>Indexes</b>				
XIREGDB	8	20		

## CICS IA plug-in for CICS Explorer Resource table: CIURESTB/X

Calculation of the space required for the DB2 table space and the DB2 indexes required for the CICS region information.

The default values set by CICS IA are larger than required. To calculate the space to allocate for the DB2 table space and the DB2 indexes required for CICS region information, estimate the total number of rows.

In this example, the number of rows calculated for the CICS table in CICS tables and indexes section can be used.

If you are using DB2 V7.1 use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 140 to calculate the PRIQTY and SECQTY as described in Calculation for PRIQTY for table spaces and indexes for the Resource table space.

Table 140. Worksheet for Resource table space using DB2 V7.1

Table space	Row_Size	Percent_Free	PRIQTY	SECQTY
CIURSRC	201	15		
<b>Indexes</b>				
X01RES01	201	2		
X01RES02	183	2		
X01RES03	8	2		

If you are using DB2 V8.1 or later use the value calculated for NUM\_ROWS and the values for ROW\_SIZE and PERCENT\_FREE in Table 141 on page 364 to calculate the PRIQTY and SECQTY as described in Calculation for PRIQTY for table spaces and indexes for the Resource table space.

Table 141. Worksheet for Resource table space using DB2 V8.1

Table space	Row_Size	Percent_Free	PRIQTY	SECQTY
CIURSRC	273	15		
<b>Indexes</b>				
X01RES01	273	2		
X01RES02	255	2		
X01RES03	8	2		

---

## Appendix G. CICS IA security

This section contains information on how to set up RACF security for CICS IA.

---

### CICS IA transaction security

CICS IA has no internal RACF security classes. The two main interfaces are application programs. These two interfaces are the Operations and Administration Interface driven by transaction CINT and the Eclipse-based Query Interface.

All CICS IA transactions are defined with RESSEC(NO) and CMDSEC(NO). If you want to categorize and define the IA transactions in a similar way to CICS transactions, see Table 142. It shows the CICS IA transactions and their RACF categories as described in the *CICS RACF Security Guide*. It also indicates whether the transaction runs a program that has a DB2 DBRM associated with it.

Table 142. RACF categories for CICS IA transactions

Transid	Description	Category	DB2
CINT	Drives program CIUA000C for Operation and Administration.	3	YES
CINB	Drives program CIUCINB1 for a long running task that writes the data to VSAM (see note below).	1	
CINC	Drives program CIUACM10 for the Command Flow feature.	3	

#### Note:

Authorization can be given by granting the user ID access to the CICS IA batch plan.

On all regions, where you want to collect DB2 data ensure that the user ID, that CICS IA runs under, has GRANT permission to the batch plan created in the sample job SCIUSAMP.CICS(CIUDBNT). This permission enables the background transaction, CINB, to access the SYSIBM.SYSDUMMY1, SYSIBM.SYSPACKSTMT, and SYSIBM.SYSSTMT DB2 tables. In most cases, the CICS default user ID is used. However, in some cases it might be that the PLT user ID is used, if it was started by PLT processing, the user ID of the current CINT transaction, or the Link user ID if the CINT transaction is routed to another CICS region.

---

### DB2 security

CICS IA uses DB2 packages to control access to the tables in CICS and batch. All the packages are bound in to both the batch plan and the CICS plan. The plan names can be defined at customization time.

CICS IA provides DB2ENTRY and DB2TRAN resource definitions to control access to the IA tables in CICS. The following DB2ENTRY resource definition is supplied.

```

DEFINE DB2ENTRY(CICSIAD) GROUP(_groupt_)
  DESCRIPTION(CICS IA DB2 ENTRY)
  ACCOUNTREC(NONE) AUTHTYPE(USER) DROLLBACK(YES)
  PLAN(_db2planc_) PRIORITY(EQUAL) PROTECTNUM(0)
  THREADLIMIT(15)
  THREADWAIT(POOL)

```

The DB2TRAN resource definition is `DEFINE DB2TRAN(CINB) ENTRY(CICSIAD) GROUP(_groupt_)`.

See “DB2 considerations” on page 38 for further information on defining DB2 resources.

---

## Appendix H. CICS IA External Interfaces

The Appendix describes available Stored Procedures and Command Flow user exit.

CICS IA provides a number of external interfaces you can use to further adjust the processes of collecting and saving data, as well as to get access to that data from one of your own applications. These interfaces include four ready-to-use Stored Procedures and customizable Command Flow user exit.

---

### DB2 Stored Procedures

You can use the CICS IA External Interfaces to directly access different types of collected data from you application.

To learn more about CICS IA Stored Procedures, read this section. For details about stored procedures as such, refer to *DB2 Version x.1 for z/OS Administration Guide*.

#### CIUSPAPP Stored Procedure

With the help of this CICS IA External Interface, you can access saved dependency data directly from your application.

##### What is the CIUSPAPP Stored Procedure?

CIUSPAPP is a DB2 Stored Procedure that acts as dependency data query interface. It can be called from a user application with the SQL CALL statement to get the collected dependency data from CICS IA interdependency database.

##### Syntax

You can call the CIUSPAPP procedure with the following SQL CALL statement:

```
EXEC SQL  
CALL CIUSPAPP (calltype, appcode, restype, error-message, return-code);
```

##### Procedure parameters

There are several input parameters that assist you to manage CIUSPAPP processing and several output parameters that inform about the process completion and errors, if any.

The following table lists all the CIUSPAPP parameters.

Table 143. CIUSPAPP parameters

Parameter name	input/output	Type	Description
calltype	INPUT	CHAR(4)	Type of call
appcode	INPUT	CHAR(8)	Application code
restype	INPUT	CHAR(8)	Resource type
error-message	OUTPUT	CHAR(300)	Error message text
return-code	OUTPUT	INTEGER	Return code

## CIUSPAPP INPUT parameters (calltype, appcode, restype)

The **calltype** parameter specifies queries that can be called by the application. The following table lists all available queries and their description.

Table 144. **calltype** values

calltype value	Description
LIST	Calls for a list of the applications that are defined in CICS IA. Fetches information from the CIU_APPLS_DESC table (APPLIC_CODE and APPLIC_NAME).
CICS	Calls for a list of CICS resources. Fetches information from the CIU_CICS_DATA table (TYPE and OBJECT).
DB2	Calls for a list of DB2 resources. Fetches information from the CIU_DB2_DATA table ( <b>restype</b> and <b>resname</b> ).
MQ	Calls for a list of MQ resources. Fetches information from the CIU_MQ_DATA table (TYPE and OBJECT).
IMS	Calls for a list of IMS resources. Fetches information from the CIU_IMS_DATA table (TYPE and OBJECT).
DEFN	Calls for a list of all transactions/programs. Fetches information from the CIU_APPLS_RESOURCE table (APPLIC_CODE, APPLIC_TYPE, and APPLIC_RESNAME).
RES	Calls for a list of CICS, DB2, IMS, and MQ resources for the defined <b>appcode</b> and <b>restype</b> parameters.

The **appcode** parameter specifies the Application Code. Required for **calltype** values CICS, DB2, MQ, IMS, DEFN, RES.

The **restype** parameter specifies the resource type. Required for the **calltype** value DEFN and has itself three values: PROGRAM, TRANSID, or null.

## CIUSPAPP OUTPUT parameters (error-message, return-code)

The **return-code** parameter contains value of the CIUSPAPP return code. Possible **return-code** values are listed in the following table.

Table 145. **return-code** values

Return code	Description
0	CIUSPAPP procedure that completed successfully.
4	One of the following conditions exists: either the <b>calltype</b> value is invalid, or an SQL exception/warning occurred during the CIUSPAPP run time.
5	The <b>appcode</b> value is not specified.

The **error-message** parameter contains message text that describes the error or warning:

- For **return-code** = 4, it provides either the relevant SQL warning, or the "Invalid call type" message, depending on the error cause.
- For **return-code** = 5, it provides the following message: "Application Code must be specified".

## Returned result sets

The CIUSPAPP stored procedure returns a number of result sets depending on the input parameters values. A result set is a set of rows, effectively a table, which is associated with a cursor opened in the stored procedure and returned to the caller program. You can access the data that is returned in a result set when you run the SQL ASSOCIATE LOCATORS, followed by the SQL ALLOCATE cursor, and then the SQL FETCH loop as shown in the COBOL example for CIUSPAPP stored procedure.

### List applications that are defined to CICS IA

To retrieve a list of user applications that are defined to CICS IA, you must set the input parameters as follows:

**calltype** = 'LIST'

The other input parameters are ignored and can be set to null values.

This call returns one result set with APPLIC\_CODE and APPLIC\_NAME columns from CIU\_APPLS\_DESC table.

### List CICS resources that are used by an application

To retrieve a list of CICS resources that are used by one particular application, you must set the input parameters as follows;

**calltype** = 'CICS'

**appcode** = application code

The **restype** input parameter is ignored and can be set to null value.

This call returns one result set with TYPE and OBJECT columns from the CIU\_CICS\_DATA table.

### List DB2 resources that are used by an application

To retrieve a list of DB2 resources that are used by one particular application, you must set the input parameters as follows;

**calltype** = 'DB2'

**appcode** = application code

The **restype** input parameter is ignored and can be set to null value.

This call returns one result set with **restype** and **resname** columns from the CIU\_DB2\_DATA table.

### List MQ resources that are used by an application

To retrieve a list of MQ resources that are used by one particular application, you must set the input parameters as follows:

**calltype** = 'MQ'

**appcode** = application code

The **restype** input parameter is ignored and can be set to null value.

This call returns one result set with TYPE and OBJECT columns from the CIU\_MQ\_DATA table.

### List IMS resources that are used by an application

To retrieve a list of IMS resources that are used by one particular application, you must set the input parameters as follows:

**calltype** = 'IMS'

**appcode** = application code

The **restype** input parameter is ignored and can be set to null value.

This call returns one result set with TYPE and OBJECT columns from the CIU\_IMS\_DATA table

#### List all transactions and programs that are used by an application

To retrieve a list of transactions and programs that are used by one particular application, you must set the input parameters as follows:

**calltype** = 'DEFN'  
**appcode** = application code  
**restype** = resource type

The **restype** input parameter must be set to either PROGRAM to list all application programs or to TRANSID to list all application transactions. To list both application programs and transactions, it must be set to null value.

This call returns one result set with APPLIC\_CODE, APPLIC\_TYPE and APPLIC\_RESNAME columns from the CIU\_APPLS\_RESOURCE table.

#### List all CICS, DB2, MQ, and IMS resources that are used by an application.

To retrieve a list of all CICS, DB2, MQ, and IMS resources that are used by one particular application, you must set the input parameters as follows:

**calltype** = 'RES'  
**appcode** = application code

The **restype** input parameter is ignored and can be set to null value.

This call returns four result sets which returned separately for CICS, DB2, MQ, and IMS call types.

### CIUSPAPP invocation

An example of a COBOL program, which calls the CIUSPAPP stored procedure and receives the contents of table CIU\_APPLS\_DESC:

```

         'NAME= '  WV-APPLIC-NAME
  GOBACK.

```

## CIUSPAFF Stored Procedure

With the help of this CICS IA External Interface, you can access saved affinity data directly from your application.

### What is the CIUSPAFF Stored Procedure?

CIUSPAFF is a DB2 Stored Procedure that acts as affinity data update and query interface. It can be called from a user application with the SQL CALL statement to get the collected affinity data from CICS IA interdependency database.

### Syntax

You can call the CIUSPAFF procedure with the following SQL CALL statement:

```

EXEC SQL
CALL CIUSPAFF (qtype, qarg1, qarg2, rc, sqlcode, errmsg);

```

### Procedure parameters

There are several input parameters that manage CIUSPAFF processing and several output parameters that inform about the process completion and errors, if any.

The following table lists all CIUSPAFF parameters.

*Table 146. CIUSPAFF parameters*

Parameter name	input/output	Type	Description
<b>qtype</b>	INPUT	CHAR(3)	Query type
<b>qarg1</b>	INPUT	VARCHAR(8)	First query argument
<b>qarg2</b>	INPUT	CHAR(10)	Second query argument

Table 146. CIUSPAFF parameters (continued)

Parameter name	input/output	Type	Description
<b>rc</b>	OUTPUT	INTEGER	Return code
<b>sqlcode</b>	OUTPUT	INTEGER	SQLCODE
<b>errmsg</b>	OUTPUT	VARCHAR(300)	Error message text

## CIUSPAFF INPUT parameters (qtype, qarg1, qarg2)

The **qtype** parameter defines which cursors the CIUSPAFF program opens on either CIU\_AFF\_GRP\_DATA or CIU\_AFF\_CMD\_DATA tables and return them as result sets, except for the BLD query. There are five **qtype** values, or query types, you can use: BLD, RGN, PGM, TRN, and GRP.

**qarg1** and **qarg2** are query arguments that you must specify for each query type.

When you configure the **qtype** parameter, consider the following points:

- The *BLD* query is the only query interface that does not provide any information. Instead, it updates the tables CIU\_AFF\_GRP\_DATA and CIU\_AFF\_CMD\_DATA for all affinity group types and the supplied region, if it is listed in CIU\_REGION\_INFO table. The CICS region APPLID must be specified in **qarg1**. If wildcard mask is specified instead of the APPLID value, the CIU\_AFF\_GRP\_DATA and CIU\_AFF\_CMD\_DATA tables for all regions that are listed in the CIU\_REGION\_INFO table are processed. No result set is returned.
- The *RGN* query fetches information about affinity groups of the specified type for the supplied region from the CIU\_AFF\_GRP\_DATA table. The CICS region APPLID must be specified in the **qarg1** parameter. The affinity group type must be specified in **qarg2** as affinity group ID MASK.
- The *PGM* query fetches information about affinity groups of the specified type that contain the specified program. The PROGRAM NAME must be specified in **qarg1**. The affinity group type must be specified in **qarg2** as affinity group ID MASK.
- The *TRN* query fetches information about affinity groups of the specified type that contain the specified transaction. The TRANSACTION ID must be specified in **qarg1**. The affinity group type must be specified in **qarg2** as affinity group ID MASK.
- The *GRP* query fetches information about all commands of the specified affinity group ID in the supplied region from the CIU\_AFF\_CMD\_DATA table.

When you have defined the **qtype** value, you can configure the **qarg1** and **qarg2** parameters. The following table provides a list of matching values for the selected query type.

Table 147. Available qarg1 and qarg2 values

qtype value	qarg1 value	qarg2 value
BLD	APPLID	N/A
RGN	APPLID	Group ID MASK
PGM	PROGRAM NAME	Group ID MASK
TRN	TRANSACTION ID	Group ID MASK
GRP	APPLID	Group ID

Table 3 describes **qarg1** and **qarg2** value types and lengths.

Table 148. **qarg1** and **qarg2** values in detail

Query argument value	Length	Description
APPLID	8	CICS TS region APPLID.
PROGRAM NAME	≤8	CICS application program name, wildcard characters % allowed.
TRANSACTION ID	4	CICS application transaction ID, wildcard characters % allowed.
Group ID	10	Affinity group ID.
Group ID MASK	10	Group mask format is 'PP:%%%%%%%%%', where PP is affinity group prefix (one of the following CW, CA, EQ, GM, GU, G4, G6, LD, LF, LU, RW, TS, CO, DI, EN, EX, IN, PE, RE, WA, CR, CS, UN) and '%' is a wildcard character.

## CIUSPAFF OUTPUT parameters (rc, sqlcode, errmsg)

The **rc** parameter contains value of the CIUSPAFF return code. Possible **rc** values are listed in the following table.

Table 149. **rc** values

Return code	Description
0	CIUSPAFF procedure that completed successfully.
4	CIUSPAFF procedure that completed successfully, but one or more SQL warning conditions were received during SQL statements execution.
8	CIUSPAFF procedure failed because of a critical error caused by incorrect parameter values.
12	CIUSPAFF procedure failed because of a disaster error caused by SQL Exception conditions during SQL statement execution.

**errmsg** contains message text that describes the error or warning:

- For **rc**=4, it provides the last SQL warning message out of all SQL warnings that occurred during CIUSPAFF run time.
- For **rc**=8, it provides the invalid parameter value that caused the error. The incorrect parameter can also be found in SQLSTATE (SQLCA):
  - 99150: Invalid **qtype** value specified
  - 99155: Invalid **qarg1** value specified
  - 99160: Invalid **qarg2** value specified
- For **rc** =12, it provides SQL error message for the failed SQL statement.

The **sqlcode** parameter values depend on the return code and can be found in the following table.

Table 150. **sqlcode** values

Return code	sqlcode value
0	0

Table 150. **sqlcode** values (continued)

Return code	sqlcode value
4	Shows SQLCODE for the last statement that caused SQL warning condition.
8	0
12	Shows SQLCODE of the failed SQL statement.

## Returned result sets

The CIUSPAFF stored procedure returns result sets. The number and structure of the result sets is dependent on the input parameters values. A result set is a set of rows that are associated with a cursor opened in the stored procedure and returned to caller program. A result set is effectively a table. You can access the data that is returned in result set by running an SQL ASSOCIATE LOCATORS, followed by an SQL ALLOCATE cursor, and then the SQL FETCH loop as shown in the COBOL example for CIUSPAFF stored procedure. The following subsections describe result sets that are returned by the CIUSPAFF procedure.

### Build affinity groups tables

To build affinity groups tables, CIU\_AFF\_GRP\_DATA and CIU\_AFF\_CMD\_DATA, you must set the input parameters as follows:

**qtype** = 'BLD'  
**qarg1** = applid

If you want to build affinity groups for all CICS TS regions set **qarg1** to %%%%%%%%%.

The **qarg2** input parameter is ignored and can be set to null value.

This call returns no result sets, it processes data from the CIU\_AFF\_EVENTS table and creates new, or updates the existing affinity groups data in the CIU\_AFF\_GRP\_DATA and CIU\_AFF\_CMD\_DATA tables.

### List affinity groups of the specified type for the specified CICS TS region

To receive a list of existing affinity groups of the specified type for the specified CICS TS region, you must set the input parameters as follows:

**qtype** = 'RGN'  
**qarg1** = applid  
**qarg2** = affinity group ID mask

If you want to build affinity groups for all CICS TS regions set **qarg1** to %%%%%%%%%.

This call returns one result set with APPLID, TRANGROUP, AFFTYPE, GROUPTYPE, AFFINITY, AFFWORSENER, LIFETIME, LIFEWORSENER, RECOVERY, RESOURCE, RESLENGTH, and TYPE columns from the CIU\_AFF\_GRP\_DATA table.

### List affinity groups of the specified type that contain the specified program

To receive a list of existing affinity groups of the specified type, and which contains a specified program, you must set the input parameters as follows:

**qtype** = 'PGM'  
**qarg1** = program name  
**qarg2** = affinity group ID mask

This call returns one result set with APPLID, TRANGROUP, AFFTYPE, GROUPTYPE, AFFINITY, AFFWORSENER, LIFETIME, LIFEWORSENER, RECOVERY, RESOURCE, and TYPE columns from the CIU\_AFF\_GRP\_DATA.

#### List affinity groups of the specified type that contains the specified transaction

To receive a list of existing affinity groups of the specified type, and which contains the specified transaction ID, you must set the input parameters as follows:

```
qtype = 'GRP'
qarg1 = transaction ID
qarg2 = affinity group ID mask
```

If you want to build affinity groups for all CICS TS regions, set **qarg1** to %%%%%%%%%.

This call returns one result set with APPLID, TRANGROUP, AFFTYPE, GROUPTYPE, AFFINITY, AFFWORSENER, LIFETIME, LIFEWORSENER, RECOVERY, RESOURCE, and TYPE columns from the CIU\_AFF\_GRP\_DATA.

#### List commands for the specified affinity group in the specified region

To receive a list of commands for the existing affinity group, you must set the input parameters as follows:

```
qtype = 'TRN'
qarg1 = applid
qarg2 = affinity group ID
```

If you want to build affinity groups for all CICS TS regions set **qarg1** to %%%%%%%%%.

This call returns one result set with APPLID, TRANSID, PROGRAM, OFFSET, COMMAND, RESTYPE, AFFGROUP, TERMINAL, BTS, LINK3270, and USAGE columns from the CIU\_AFF\_CMD\_DATA.

## CIUSPAFF invocation

Below you can see an example of CISPAAFF invocation from COBOL program:

```

## CIUSPTSR Stored Procedure

With the help of this CICS IA External Interface, you can produce threadsafe reports directly from your application.

### What is the CIUSPTSR Stored Procedure?

CIUSPTSR is a DB2 Stored Procedure that gathers threadsafe information for the specified programs. It queries the CICS IA interdependency database, gets all necessary data, and returns either a summary or detailed threadsafe information for the specified programs in a result set. It can be called from a user application with a SQL CALL statement.

### Syntax

To call the CIUSPTSR procedure with a SQL CALL statement, use this syntax:

```
EXEC SQL
CALL CIUSPTSR (ctype, collid, applid, qarg, cicslevel, rc, sqlcode, errmsg);
```

## Procedure parameters

There are several input parameters that manage the CIUSPTSR processing and several output parameters that inform about the process completion and errors, if any.

The following table lists all CIUSPTSR parameters.

*Table 151. CIUSPTSR parameters*

Parameter name	input/output	Type	Description
<b>ctype</b>	INPUT	CHAR(4)	Call type
<b>collid</b>	INPUT	CHAR(16)	CICS IA collection identifier (COLLECTION_ID)
<b>applid</b>	INPUT	CHAR(8)	CICS TS region APPLID
<b>qarg</b>	INPUT	VARCHAR(8)	Query argument
<b>cicslevel</b>	INPUT	CHAR(4)	Version of the CICS TS
<b>rc</b>	OUTPUT	INTEGER	Return code
<b>sqlcode</b>	OUTPUT	INTEGER	SQLCODE
<b>errmsg</b>	OUTPUT	VARCHAR(300)	Error message text

## CIUSPTSR INPUT parameters (ctype, collid, applid, qarg, cicslevel)

Table 2 describes the parameters and their matching values.

*Table 152. Input parameters*

Parameter	Description and values
<b>ctype</b>	<p>Mandatory parameter.</p> <p>The <b>ctype</b> parameter defines the type of the returned program threadsafe information, either summary or detailed, and the method which is used to gather this information, that is by specified program or by transaction.</p> <p>Values:</p> <p><b>PGMS</b> For a summary threadsafe information for the specified program.</p> <p><b>TRNS</b> For a summary threadsafe information for the programs that are started by the specified transaction.</p> <p><b>PGMD</b> For a detailed threadsafe information , a list of called commands, for the specified program.</p>

Table 152. Input parameters (continued)

Parameter	Description and values
<b>collid</b>	<p>Mandatory parameter.</p> <p>The collection ID parameter specifies the CICS IA collection ID under which data was collected.</p> <p>A wildcard mask, "%", is valid only for call types <b>PGMS</b> and <b>TRNS</b>.</p>
<b>applid</b>	<p>Mandatory parameter.</p> <p>The <b>applid</b> parameter specifies the CICS region in which the program or transaction to be reported on was running.</p> <p>A wildcard mask, "%", is valid only for call types <b>PGMS</b> and <b>TRNS</b>.</p>
<b>qarg</b>	<p>Mandatory parameter.</p> <p>The query argument must specify either the program name or the transaction, depending on the specified <b>ctype</b> parameter.</p> <p>Wildcard masks are not permissible.</p>
<b>cicslevel</b>	<p>Optional parameter.</p> <p>The <b>cicslevel</b> parameter defines the version of CICS TS to be used to determine the threadsafe status of the commands that are issued by the specified program.</p> <p>Values:</p> <p><b>null or blank</b></p> <p>Produce a threadsafe report that is based on the threadsafe status of the commands of the CICS TS version of the region on which the specified program was run and collected.</p> <p><b>3.1</b></p> <p>Produce a threadsafe report that is based on the threadsafe status of the CICS TS 3.1 commands.</p> <p><b>4.1</b></p> <p>Produce a threadsafe report that is based on the threadsafe status of the CICS TS 4.1 commands.</p> <p><b>4.2</b></p> <p>Produce a threadsafe report that is based on the threadsafe status of the CICS TS 4.2 commands.</p> <p><b>5.1</b></p> <p>Produce a threadsafe report that is based on the threadsafe status of the CICS TS 5.1 commands.</p>

## CIUSPTSR OUTPUT parameters (rc, sqlcode, errmsg)

The **rc** parameter contains value of the CIUSPTSR return code. Possible **rc** values are listed in the following table.

Table 153. rc values

Return code	Description
0	CIUSPTSR procedure that completed successfully.
4	CIUSPTSR procedure that completed successfully, but one or more SQL warning conditions were received.
8	CIUSPTSR procedure that failed because of a critical error that is caused by incorrect input parameter values.
12	CIUSPTSR procedure that failed because of a disastrous error that is caused by SQL Exception conditions during SQL statement execution.

The **sqlcode** parameter values depend on the return code and can be found in the following table.

Table 154. sqlcode values

Return code	sqlcode value
0	0
4	Shows <b>sqlcode</b> for the last statement that caused the SQL warning condition.
8	0
12	Shows <b>sqlcode</b> of the failed SQL statement.

**errmsg** contains message text that describes the error or warning:

- For **rc**=4, it contains the SQL message of the last SQL statement that caused the warning condition.
- For **rc**=8, it provides the invalid parameter value that caused the error.
- For **rc**=12, it provides SQL error message for the failed SQL statement.

## Returned result sets

The CIUSPTSR stored procedure returns result sets. The number and structure of the result sets is dependent on the input parameters values. A result set is a set of rows that are associated with a cursor opened in the stored procedure and returned to caller program. A result set is effectively a table. You can access the data that is returned in a result set by running an SQL ASSOCIATE LOCATORS, followed by an SQL ALLOCATE cursor, and then the SQL FETCH loop as shown in the COBOL example for the CIUSPAPP stored procedure. The following information describes the result sets that are returned by the CIUSPTSR procedure.

### List summary threadsafe information about specified program

To list summary threadsafe information about the specified program, you must set the input parameters as follows:

```
ctype      = 'PGMS'  
collid     = collection ID  
applid     = applid  
qarg       = program name  
cicslevel  = CICS TS level
```

If you want to list summary threadsafe information for all existing collection IDs, set **collid** to %.

If you want to list summary threadsafe information for all existing **applids**, set **applid** to %.

If you want to list summary threadsafe information for all existing programs, set **qarg** to %

Set **cicslevel** either to a particular CICS TS version or set it to null to use the CICS TS version of the region on which the program was run and collected. Null is the default.

This call returns one result set with all columns of the CIU\_THREADSafe\_SUMMARY global temporary table.

#### List summary threadsafe information about programs that are started by the specified transaction

To list summary threadsafe information about the programs that were started by the specified transaction, you must set the input parameters as follows:

```
ctype      = 'TRNS'  
collid     = collection ID  
applid     = APPLID  
qarg       = program name  
cicslevel = CICS TS level
```

If you want to list summary threadsafe information for all existing collection IDs, set **collid** to %.

If you want to list summary threadsafe information for all existing APPLIDs, set **applid** to %.

If you want to list summary threadsafe information for programs that were started under any of existing transaction set **qarg** to %.

Set **cicslevel** either to particular CICS TS version or set it to null to use CICS TS version of the region on which the program was run and collected. Null is the default.

This call returns one result set with all columns of the CIU\_THREADSafe\_DETAIL global temporary table.

#### List detailed threadsafe information about specified program

To list detailed threadsafe information about the specified program, you must set the input parameters as follows:

```
ctype      = 'DTLD'  
collid     = collection ID  
applid     = APPLID  
qarg       = program name  
cicslevel = CICS TS level
```

Set COLLID to existing CICS IA resources collection ID. Set APPLID to existing CICS TS region APPLID.

Set QARG to existing collected program name.

Set CICSLEVEL either to particular CICS TS version or set it to null to use CICS TS version of the region on which the program was run and collected. Null is the default.

This call returns one result set with all columns of the CIU\_THREADSafe\_DETAIL global temporary table.

## CIUSPAP1 Stored Procedure

When you use the CIUSPAP1 stored procedure you can view or delete resource information for a CICS TS application definition.

### What is the CIUSPAP1 Stored Procedure?

Use the CIUSPAP1 is a DB2 Stored Procedure to carry out the following actions:

- List CICS TS Applications for which you have collected data.
- Retrieve or delete resources that are used by a specific TS application or operations that are associated with that application.

### Syntax

You can invoke the CIUSPAP1 procedure with the following SQL CALL statement:

```
EXEC SQL  
CALL CIUSPAP1 (calltype, appname, version1, version2, version3,  
message, return-code);
```

### Procedure parameters

There are several input parameters that help you to manage CIUSPAP1 processing and several output parameters that inform about the process completion and errors, if any.

This table lists all CIUSPAP1 parameters.

Table 155. CIUSPAP1 parameters

Parameter name	Input/Output	Type	Description
<b>calltype</b>	INPUT	CHAR(4)	Type of call
<b>appname</b>	INPUT	CHAR(64)	Specifies the application name (this parameter is used for all <b>calltypes</b> other than LIST).
<b>version 1</b>	INPUT	INTEGER	Specifies a Major Version of Application (this parameter is used for all <b>calltypes</b> other than LIST).
<b>version 2</b>	INPUT	INTEGER	Specifies a Minor Version of Application (this parameter is used for all <b>calltypes</b> other than LIST).
<b>version 3</b>	INPUT	INTEGER	Specifies a Micro Version of Application (this parameter is used for all <b>calltypes</b> other than LIST).
<b>operation</b>	INPUT	CHAR(64)	Specifies the operation name (this parameter is optional and can be used for all <b>calltypes</b> other than LIST).
<b>message</b>	OUTPUT	CHAR(300)	Specifies a message buffer. Contains error info in case of List call type or result of procedure execution in case of Delete call type.
<b>return-code</b>	OUTPUT	INTEGER	Return code

## CIUSPAP1 INPUT parameters (calltype, appname)

The **calltype** parameter specifies queries that can be called by the application. Table **calltype** values lists all available queries and their description.

Table 156. **calltype** values

calltype value	Description
LIST	List of Applications for which CICS IA has collected data.
DEL	Deletes all resources that are associated with the Application.
RES	Lists all resources that are associated with the Application.
CICS	Lists all CICS resources that are associated with the Application.
DB2	Lists all DB2 resources that are associated with the Application.
IMS	Lists all IMS resources that are associated with the Application.
MQ	Lists all WebSphere MQ resources that are associated with the Application.
NAT	Lists all Natural resources that are associated with the Application.

## CIUSPAP1 OUTPUT parameters (error-message, return-code)

The **return-code** parameter contains value of the CIUSPAP1 return code. Possible **return-code** values are listed in this table:

Table 157. **return-code** values

Return code	Description
0	CIUSPAP1 procedure has completed successfully.
4	Any SQL Exception or SQL Warning occurred, in this case ERROR-MESSAGE contains the message with explanation of exception/warning.
8	One of the following conditions exists: <b>calltype</b> Is invalid, that is the value is not L/D, in this case ERROR-MESSAGE contains the following text: 'Invalid call type' <b>appname</b> Is invalid, that is the value is empty, in this case ERROR-MESSAGE contains the following text: 'Application Name must be specified'

The **error-message** parameter contains message text that describes the error or warning:

- For **return-code**=4, it provides either the relevant SQL warning, or the "Invalid call type" message, depending on the error cause.
- For **return-code**=8, it provides the following message: "Application name must be specified".

## Listing all CICS TS applications

To retrieve a list of all CICS TS Applications that you have collected data for, you must set the input parameters as follows:

CALLTYPE='LIST'

Set the other input parameters can be to null values.

This call returns one OPEN cursor which you use to FETCH the returned data by running an SQL ASSOCIATE LOCATORS, followed by an SQL ALLOCATE cursor, and then the SQL FETCH loop as shown in the COBOL example for “CIUSPAPP Stored Procedure” on page 367.

## Resources used by applications

To retrieve a list of all resources used by a CICS TS Applications, you must set the input parameters as follows:

- **calltype** = 'RES'
- Set the **applname** and version fields as required.

If you want to list the resources by the Operation within an Application, set the **Operation** field to the name of the operation, otherwise leave blank.

This call returns one 5 OPEN cursor which you use to FETCH the returned data by running an SQL ASSOCIATE LOCATORS, followed by an SQL ALLOCATE cursor, and the SQL FETCH loop as shown in the COBOL example for “CIUSPAPP Stored Procedure” on page 367.

---

## The CICS IA Command Flow user exit

The CICS IA Command Flow user exit provides additional options when you are saving information about the traced commands into the dataspace.

### What is the CICS IA Command Flow user exit?

The CICS IA Command Flow user exit point (or the CICS IA Command Flow user exit point ) is a part of the CICS IA Command Flow collector, which is used by your written program to controls the information about CICS TS traced commands that is saved to the dataspace.

Besides the data written by the Command Flow collector, the CICS IA Command Flow user exit can write some additional information to the dataspace. Depending on the input data, the user exit might include or not include user-supplied data to the journal record, or might decline a journal record.

The CICS IA Command Flow collector invokes this user exit for the following CICS TS commands:

- LINK
- XCTL
- START

**Note:** The CICS IA Command Flow user exit runs as a part of the XEIOUT global user exit program. For additional information about CICS TS GLUE programming conventions refer to the *CICS TS Customization Guide*.

### Writing the CICS IA Command Flow user exit program

The CICS IA Command Flow user exit program must be written in assembly language and must be reentrant.

## Register conventions

The following register values are provided on entry to an exit program:

- Register 1 contains the address of the user exit parameter list.
- Register 13 contains the address of the standard register save area where your exit program should store its own registers immediately after being invoked.
- Register 14 contains the return address to which the exit program should branch on completion of its work. You do this by using the BR 14 instruction after restoring the calling module registers, or by using the RETURN macro.
- Register 15 contains the entry address of the exit program.

## 31-bit addressing implications

The implications for the Command Flow user exit program are as follows:

- The CICS IA Command Flow user exit program is invoked in 31-bit AMODE.
- The user exit can be either RMODE 24 or RMODE ANY.
- If you find it necessary to switch to 24-bit AMODE in the exit program, make sure that you return correctly in 31-bit AMODE.

## The user exit parameters list

When the Command Flow user exit is invoked, the CICS IA Command Flow collector that handles the user exit provides it with a parameters list. The address of this 32-byte parameters list is passed to register 1.

The Command Flow user exit parameters list contains the following eight entries:

### Parameter 1

The address of the command arguments list.

### Parameter 2

The address of an 8-character application program name.

### Parameter 3

The reserved parameter.

### Parameter 4

The address of a 128-byte work area provided for the user exit program.

### Parameter 5

The address of a 48-character output field 1 in which your user exit program must return user data 1.

### Parameter 6

The address of a 48-character output field 2 in which your user exit program must return user data 2.

### Parameter 7

The address of a 48-character output field 3 in which your user exit program must return user data 3.

### Parameter 8

The address of a 4-byte field in which your user exit program must return code 0, 4 or 8.

Possible return code values are shown in the table below.

Table 158. User exit return code values

Return code	Return code meaning
0	User exit completed. Add user-supplied resource data to the journal record.
4	User exit completed. Do not include user-supplied data in the journal record.
8	User exit completed. Do not log the journal record.

## Preparing the CICS IA Command Flow user exit program

The SCIUSAMP member, CIUCMDUE, contains the sample job for compiling and link editing the CICS IA Command Flow user exit and sample user exit programs. The Command Flow user exit program must be added to the RPL data set and defined to CICS TS with the CICS key.

## Activating the CICS IA Command Flow user exit program

To activate the CICS IA Command Flow user exit program, specify the name of the exit load module in the **User Exit Name** field on the CICS IA Command Flow Options panel, CIUA01. See Figure 33 on page 98.

## The Sample User Exit program

The sample user exit program gives you a basic idea about how to use the CINC user exit interface. It allows journal records for the XCTL, START and LINK commands to be written only when the EXEC CICS LINK command occurs in the monitored program, and only if the control is passed from a specific program.

The logic of this program can be divided into the following steps:

1. Prepare for the command for execution.
2. Check whether the EXEC CICS command is a LINK command. If it is not a LINK command, do not write the journal record.
3. Check whether the EXEC CICS LINK command was issued by the specific program. If it is not issued by the specific program, do not write the journal record.
4. Fill the first User Data Area with the program name that is to be linked. Fill the second User Data Area with the content of COMMAREA, which was passed by that EXEC CICS LINK command.
5. Restore registers and pass control to CICS IA.

For the sample of the user exit program see Figure 67 on page 386.

## Appendix I. Collecting dynamic COBOL calls

CICS IA detects dynamic COBOL calls, which are collected by the Dependency and Command Flow Data collectors.

To support the collection of dynamic COBOL Language Environment calls, CICS IA assumes that the Call parameter list for IBM COBOL for OS/390<sup>®</sup> program conforms to the structure documented in the publication *Language Environment Vendor Interfaces for COBOL Call routine*

To support the collection of dynamic VS COBOL II calls, the call must be an ID type call and not a Literal call.

If neither of the two previous statements applies, the called program name is not collected and the called name is replaced in the **OBJECT** field:

UNEXP-hn

where *n* is reserved for IBM diagnostics,

and *h* is a hex digit that indicates the program attributes as shown:

- |      |   |
|------|---|
| 0xx  | The calling program is detected as COBOL for OS/390.    |
| 1xy  | The calling program is detected as VS COBOL II program. |
| x0x  | The called program is detected as COBOL for OS/390.     |
| x1x  | The called program is detected as VS COBOL II program.  |
| xx0x | The calling program AMODE is detected as 31.            |
| xx1x | The calling program AMODE is detected as 24.            |
| xxx0 | The AMODE of the called program is detected as 31 bit.  |
| xxx1 | The AMODE of the called program is detected as 24 bit.  |

---

## Appendix K. Accessibility

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully

You can perform most tasks required to set up, run, and maintain your CICS system in one of these ways:

- Using a 3270 emulator logged on to CICS
- Using a 3270 emulator logged on to TSO
- Using a 3270 emulator as an MVS system console

IBM Personal Communications (Version 5.0.1 for Windows 95, Windows 98, Windows NT and Windows 2000; version 4.3 for OS/2) provides 3270 emulation with accessibility features for people with disabilities. You can use this product to provide the accessibility features you need in your CICS system.

---

### Enabling hover help for screen readers

The CICS IA plug-in for CICS Explorer uses hover help to provide you with extra information, however tooltips might not be readily available when using a screen reader such as JAWS.

To enable JAWS to read hover help when using the CICS IA plug-in, follow the steps below:

1. Press Ctrl + Insert + number pad minus to tie the JAWS and PC cursors together. The JAWS cursor will follow the PC cursor as it moves around the screen.
2. To save this setting across sessions press Ctrl + Insert + number pad minus quickly twice.
3. If JAWS is reading out too much information when reading the hover help or application dialogues, press Ctrl + Insert + number pad minus again to turn off tooltip reading.
