
InfoSphere Information Server

How to configure Information Analyzer 11.3

© 2014 IBM Corporation

This presentation explains how to configure Information Analyzer version 11.3 after the installation. Information Analyzer is referred to as IA[®] throughout this presentation.

Objectives

- How to configure ODBC to connect to IADB
- How to configure user roles
- How to configure and import IADB using IMAM
- How to configure IA analysis settings

The objectives of this presentation are to show how to configure the user roles that are required to analyze data sources with Information Analyzer, and how to configure an ODBC connection to the Information Analyzer Analysis Database, referred to as IADB. It also shows you how to import the IADB database using InfoSphere® Metadata Asset Manager, referred to as IMAM, and how to configure the IADB and analysis engine settings in Information Analyzer.

ODBC for IADB (1 of 2)

- Create ODBC connection to IADB database on engine tier
 - Windows
 - Configure with ODBC Manager: Windows\SysWOW64\odbcad32.exe
 - UNIX and Linux
 - Configure in \$DSHOME/.odbc.ini file

IA requires the engine layer to have a valid ODBC connection to the IADB. This database is created during the installation of IA and is used to store information that is generated during data analysis. By default, a Data Source Name, referred to as DSN, is created during installation and can be used to configure the connection to IADB.

If the engine is installed on Windows, use the 32-bit ODBC driver manager to update the DSN. On UNIX and Linux platforms, you must configure the DSN by editing the file .odbc.ini in the DataStage® engine home directory, InformationServer/Server/DSEngine/.odbc.ini.

Look for a DSN entry that is called IADB and if it does not exist, create one using the information for the database source you are connecting to.

Make sure that the database name and port are correct. On UNIX and Linux, also make sure that the DSN is listed at the top of the .odbc.ini file in the section “ODBC Data Sources”.

ODBC for IADB (2 of 2)

- UNIX and Linux -Test using example program

```
$ cd $DSHOME
$. ./dsenv
$cd ../branded_odbc/example
$./example
example DataDirect Technologies, Inc. ODBC Example Application

Enter the data source name: iadb
Enter the user name      :iauser
Enter the password      :iauser
Enter SQL statement (Press ENTER to QUIT)
SQL>
```

Test your IADB DSN connection to be sure that it connects successfully. In Windows, you can test the DSN by using the test connection button. On UNIX and Linux, you can test the DSN by running the example program included under the InformationServer/Server/branded_odbc/example folder. Before you run this program, source the dsenv file that is located in the DataStage home directory. Once dsenv is sourced, change to the example directory.

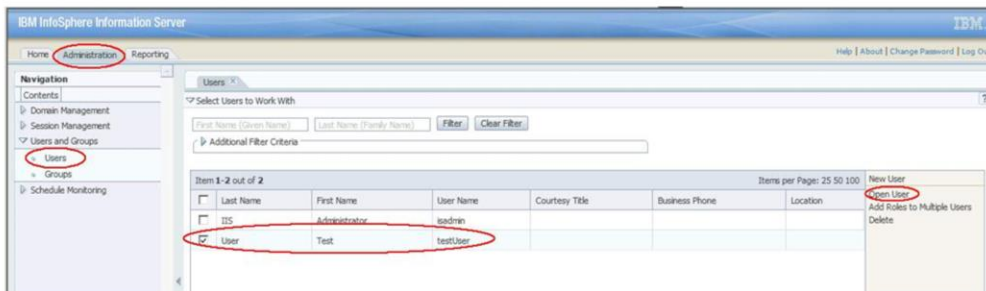

Type ./example to start the example program.

After invoking the example program, you have to provide the data source name IADB and then enter the database username and the password.

If the connection is successful, you see an SQL prompt after entering the password, this confirms that the connection is established. Once the connection is successful, quit out of the SQL prompt.

Configure user roles (1 of 2)

- Open web console
 - Click Administration =>User and Groups=>Users
 - Select default user
 - Click Open User

5

How to configure Information Analyzer 11.3

© 2014 IBM Corporation

Once you establish that the ODBC connection is working properly, the next step is to configure user roles. This is done from the IBM InfoSphere Information Server web console. Open the web console and go to the Administration tab and click Users and Groups and then Users.

Select the user that you want to use to be the Information Analyzer Administrator and click Open User. If you are using the internal registry, you can also create a new user by clicking new user.

Configure user roles (2 of 2)

- Minimum required roles for IA users
 - Suite User
 - Information Analyzer User
- Minimum required role to import metadata
 - Common Metadata Importer
- Required role to run DataStage jobs
 - DataStage and QualityStage User
- Required role to modify IA Analysis Settings
 - Information Analyzer Data Administrator
- Required role to create IA projects
 - Information Analyzer Project Administrator

The screenshot shows the 'Users' configuration page. On the left, there is a form for user details with fields for User Name, Password, Confirm Password, Courtesy Title, First Name, Last Name, User, Instant Messaging ID, Job Title, Home Phone Number, Office Phone Number, Mobile Phone Number, Pager Number, Fax Number, Email Address, and Business Address. On the right, the 'Roles' section is expanded. It shows two main categories: 'Suite' and 'Suite Component'. Under 'Suite', the roles 'Common Metadata Importer' and 'Suite User' are checked. Under 'Suite Component', the roles 'DataStage and QualityStage Administrator', 'DataStage and QualityStage User', 'Information Analyzer Data Administrator', and 'Information Analyzer Project Administrator' are checked. Other roles like 'Information Analyzer User', 'Rules Administrator', 'Rules Author', 'Rules Manager', and 'Rules User' are listed but not checked. A message at the bottom of the roles section states 'Inherited roles will not update until saved.'

Next, verify that the user has the roles that you want them to have in IA. Under Suite, you must have a Suite User role. Under Suite component, click the desired roles for your user. This slide displays the roles for the IA administrator user. The minimum roles that are required for an IA user are DataStage and QualityStage user and Information Analyzer user. To modify the analysis settings, you need the IA Data Administrator role. When you are finished adding the roles to the user, click Save and close at the bottom of the screen.

Configure and import IADB (1 of 12)

- Open IS Console=>Metadata Management=>Import Metadata

The next step is to configure IADB and import source databases. Open the IBM InfoSphere Information Console. Login with the user that has the IA Data Administrator role and DataStage and QualityStage Administrator role. Click the pillar menu. Go to Metadata Management, and Import Metadata.

Configure and import IADB (2 of 12)

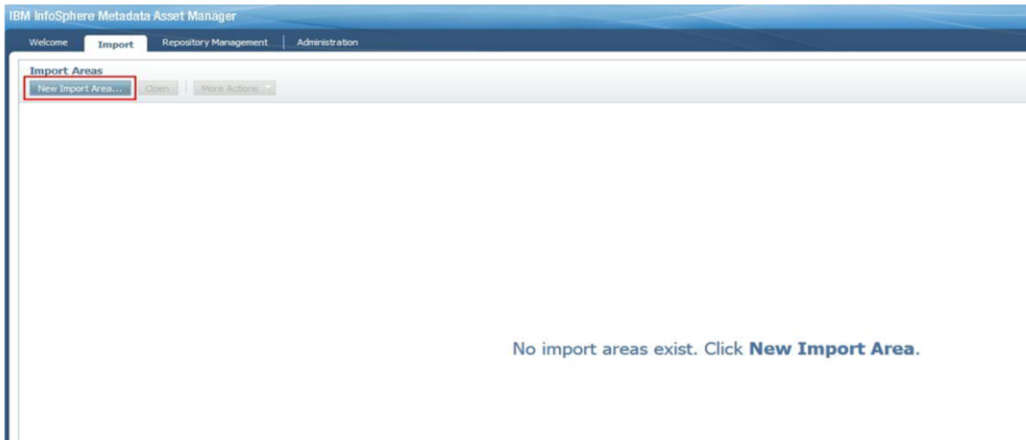

- Click Import Metadata link from Tasks panel

Click the Import Metadata link from the Tasks panel on the right side of the screen.

Configure and import IADB (3 of 12)

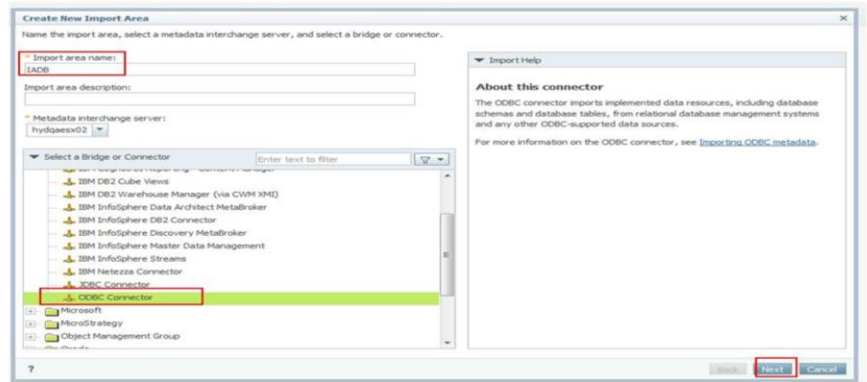

- Click New Import Area

A new web screen opens for IBM InfoSphere Metadata Asset Manager. Click the Import tab and New Import Area.

Configure and import IADB (4 of 12)

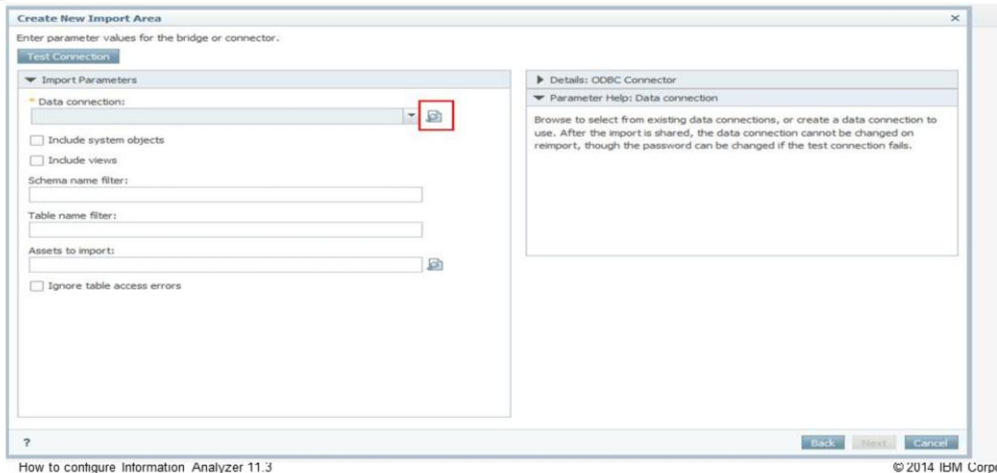

- Import Area Name
 - IADB
- Select ODBC Connector
- Click Next

Enter Import Area name for IADB as IADB. From the Select a Bridge or Connector selection, select ODBC Connector and click the Next button.

Configure and import IADB (5 of 12)

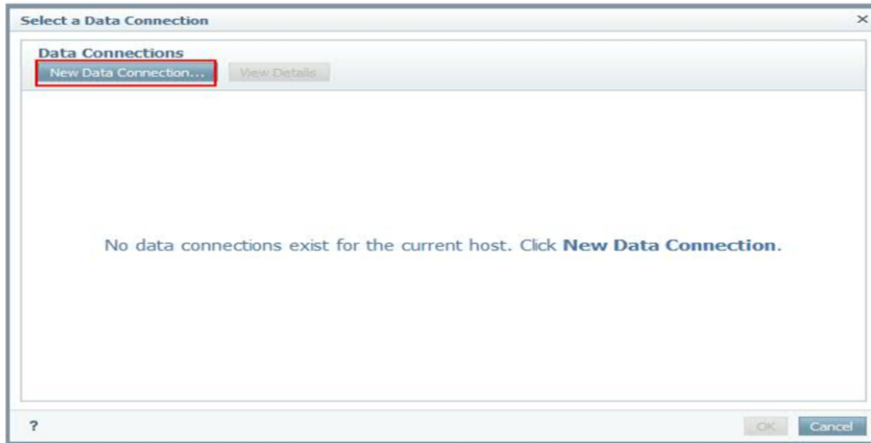

- Click search glass for new data connection

Click the search glass for the new data connection.

Configure and import IADB (6 of 12)

- Click New Data Connection

Click New Data Connection from the Select a Data Connection window.

Configure and import IADB (7 of 12)

- Enter data connection details
- Click Test Connection

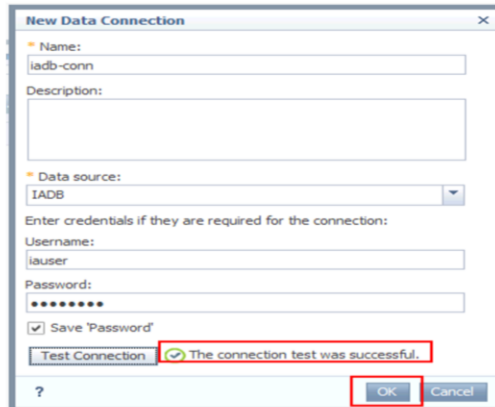

The screenshot shows the 'New Data Connection' dialog box with the following fields and values:

- Name: iadb-conn
- Description: (empty)
- Data source: IADB
- Username: iauser
- Password: (masked with dots)
- Save Password:
- Test Connection: (button)

Enter Name as iadb-conn, then, select the data source that points to the IADB database. Enter the username and password for the IADB database. Check the check box on Save Password and click the Test Connection button to test the settings.

Configure and import IADB (8 of 12)

- Test Connection should show successful
- Click OK

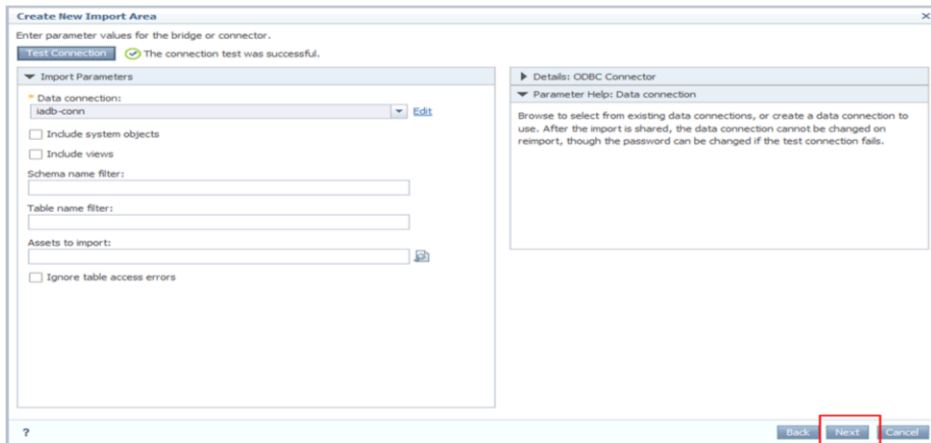

The screenshot shows a 'New Data Connection' dialog box with the following fields and options:

- Name:** iadb-conn
- Description:** (empty text area)
- Data source:** IADB (selected in a dropdown menu)
- Enter credentials if they are required for the connection:**
 - Username:** iauser
 - Password:** (masked with dots)
- Save 'Password'
- Test Connection:** A button that has been clicked, resulting in a green checkmark and the text 'The connection test was successful.' (This text and the button are highlighted with a red box in the image).
- Buttons:** OK and Cancel (The OK button is highlighted with a red box in the image).

If the test connection is successful, it displays as the connection test was successful. If you get an error, verify all the information that is provided on this page is correct. Click OK.

Configure and import IADB (9 of 12)

- Click Next in the Create New Import Area screen after creating data connection

At version 11, IMAM is now used for all metadata import so the IADB information must first be imported into IMAM. Type in the name you want to use for your data connection and click Next.

Configure and import IADB (10 of 12)

- Enter host system name or select an existing host by clicking browse icon
- Click Next

Create New Import Area

Enter values for identity parameters.

Identity Parameters

Host system name: [IADB_HOST] 

Database name: 

Parameter Help: Host system name

Type the name of the computer or browse the metadata repository to select the computer that hosts or will host the database, data file, or data file folder. This value is important for creating and reconciling the identity of the asset in the repository.

You can specify a different name than the name of the source computer. For example, you might specify the computer that will host this database during development or production.

Back Next Cancel

16

How to configure Information Analyzer 11.3

© 2014 IBM Corporation

Enter the host name or click the browse icon to select a host and click Next.

Configure and import IADB (11 of 12)

- Select Express Import
- Click Import

Create New Import Area

Add a description for this import event and choose the type of import you would like to perform.

Import Description:

Express Import
Import to the staging area and automatically perform analysis, preview, and share of the import.

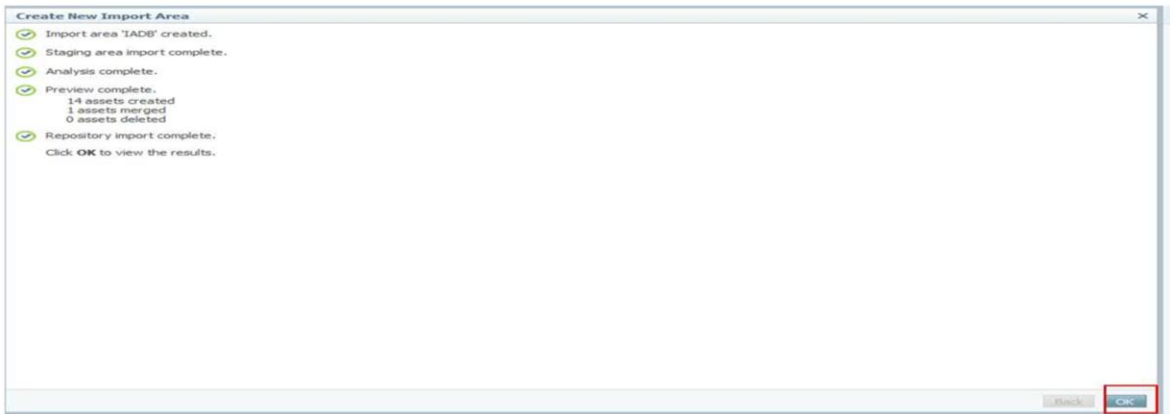

Managed Import
Import to the staging area, where you can manually analyze, preview, and work with the metadata before you import it to the metadata repository.

Back Import Cancel

Select Express Import and click the Import button.

Configure and import IADB (12 of 12)

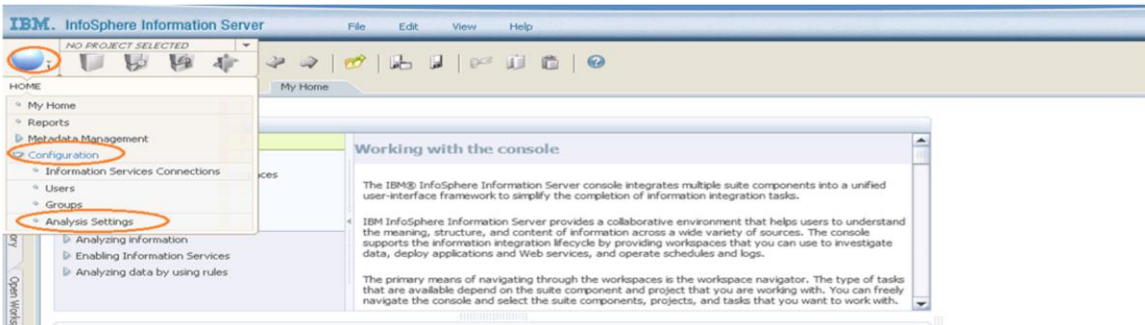

- Click OK

The screen shows the status of each step performed on the screen. Once the OK button is enable, click OK. This completes the IADB import.

Configure analysis settings (1 of 3)

- Open IS Console=>Configuration=>Analysis Settings

Once the IADB database is imported, the next step is to configure the analysis settings. Open the IBM InfoSphere Information console and login with the user that has the Information Analyzer Data Administrator role and the DataStage and QualityStage Administrator role. Click the pillar menu. Go to Configuration, and then click Analysis Settings.

Configure analysis settings (2 of 3)

- Click Analysis Engine tab
- Enter Analysis Engine connection information
- Be sure user has permissions to project and engine

The screenshot shows the 'Analysis Engine' configuration tab in the IBM Information Analyzer software. The interface includes a breadcrumb trail with 'Analysis Engine' selected. Below the breadcrumb, there is a section titled 'Specify Analysis Engine' with a help icon and a note: 'Specify connection information for the analysis engine. These settings apply to all analysis jobs in the suite unless overridden at the project level.' The configuration fields are: 'Host' (HYDQAESK02), 'Port' (31538), 'DataStage Project' (ANALYZERPROJECT), and 'Array Size' (2,000). A section titled 'InfoSphere Information Server Engine Credentials' contains a checked checkbox for 'Use Static Engine Credentials', a 'User Name' field with the value '.administrator', and a 'Password' field with masked characters. A 'Validate Settings' button is located at the bottom right of the form. A 'Return Screens' link is visible at the bottom left.

20

How to configure Information Analyzer 11.3

© 2014 IBM Corporation

Click the Analysis Engine tab and enter the Analysis Engine connection information. Select Use Static Credentials. The server engine credentials should be set to an operating system user that has permissions to create and run DataStage jobs from the analyzer project. If the Analysis Engine is installed on Windows, the specified user should be in the local Administrator's group. If the Analysis Engine is installed on UNIX, the specified user should be the DataStage administrator that is specified at installation time, typically called 'dsadm'. Click Validate Settings to confirm that the information is correct. If you get an error, verify all the information that is provided on this page is correct.

Configure analysis settings (3 of 3)

- Click Analysis Database tab
- Select IADB database
 - Host
 - Data Connection
 - JDC Data Source

Analysis Engine Analysis Database Analysis Settings

Specify Analysis Database

Specify connection information to the database that will store analysis results, and settings apply to all analysis jobs in the suite unless overridden at the project level.

Connection Details:

Host: IADB_HOST

Data Connection: iadb-conn

JDBC Data Source: jdbc/IADB

Validate

Next, click the Analysis Database tab. Select the Host and Database Connection that were configured in the IMAM import for the IADB. Select the JDBC Data Source, jdbc/IADB, that connects to the IADB. The 'jdbc/IADB' data source is created at install-time. Click the Validate button to confirm this is working. IA is now configured and you can begin configuring your source databases.
