

IBM SmartCloud Provisioning V2.1

Exploring the user interface

In this module, you explore the IBM SmartCloud® Provisioning 2.1 user interface.

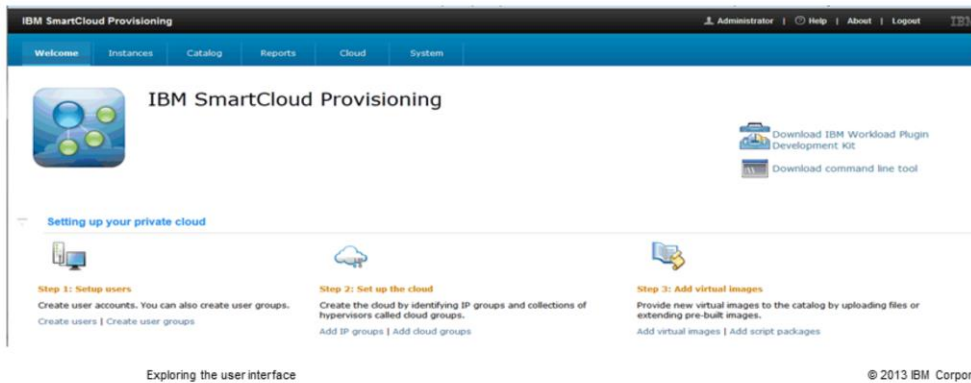

Objectives

- When you have completed this training module, you can accomplish these tasks:
 - Access the SmartCloud Provisioning user interface
 - Navigate through the SmartCloud Provisioning user interface

When you finish this module, you can open the SmartCloud Provisioning user interface and navigate through the most frequently used menus.

Accessing the SmartCloud Provisioning user interface

- Log in to the IBM SmartCloud Provisioning UI:
https://<webservice-IP>:443/login/
- Use the default credentials to access the console: **cbadmin** with password **cbadmin**
- The console opens to the **Welcome** tab

First, you log in to the SmartCloud Provisioning user interface through the web address, as shown on the slide. After you log in, the Welcome page is displayed.

Exploring the SmartCloud Provisioning user interface

- Explore the contents of the various tabs by clicking each one and examining the available options. First, select **Instances**.
- There you can see **Virtual Systems** submenu. In the Virtual Systems panel, you have a specific view per virtual system

Start exploring the SmartCloud Provisioning user interface. Click the **Instances** tab. There you find the **Virtual Systems** submenu. This submenu allows you to have a specific view of each configured virtual system.

Virtual System Instances window

- The Virtual System Instances window provides fields to view and work with the virtual system instances in SmartCloud Provisioning

The screenshot shows the 'Virtual System Instances' window in IBM SmartCloud Provisioning. The window title is 'RheIPonePattern111'. The interface includes a search bar and a list of instances on the left. The main area displays details for the selected instance:

- Created on:** Jan 24, 2013 4:47:54 PM GMT+01:00
- Provenance:** Pattern
- Provenance name:** RheIPonePattern
- Using Environment profile:** None provided
- Current status:** The virtual system has been deployed and is ready to use
- Updated on:** Jan 24, 2013 4:52:13 PM GMT+01:00
- Access granted to:** Administrator (cbadmin) [owner]
- Snapshot:** Create (none)

Below the details are sections for History, Virtual machines, and Comments.

5

Exploring the user interface

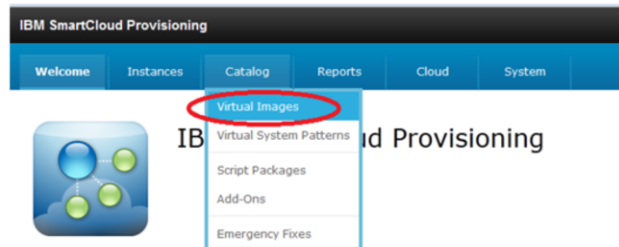

© 2013 IBM Corporation

In the Virtual System Instances window, you see details of the available virtual systems that you can work with. In the **Created on** field, you can view the date and time when the virtual system instance was created.

In the **From pattern** field, you have the pattern that was used to create this virtual system instance. The **Using Environment profile** option specifies the environment profile, if one is used, by providing a link to it. Clicking the link displays the details for that environment profile. The **Current status** specifies the state of the virtual machine. **Updated on** specifies the last date and time when the virtual system instance was updated. **Access granted to** is about the user who first deployed the virtual system instance. The first user who deploys the virtual system is automatically granted all access to the virtual image as the owner. If you want additional users to access this virtual system instance, you need to manually grant access to them. **Snapshot** includes links to any snapshot images that you take of this virtual system instance. **History** specifies the activity that was performed on this virtual system instance. **Virtual Machines** lists the virtual machines that are included in this virtual system instance. If an environment profile is used, then the virtual machine name is provided by the user who provides the environment profile. Expand any virtual machine to display detailed information about that virtual machine. **Comments** specifies optional information that a user can append to a virtual system instance.

Catalog menu

- Expand the **Catalog** menu. This menu represents your offering catalog. In the **Virtual Images** submenu you can see the list of master images that can be used for deployment

The next menu tab to explore is **Catalog**. This menu contains the application templates, plug-ins, reusable components, virtual images, virtual system patterns, script packages, emergency fixes, and add-ons that are used to build the virtual environment. The first option that you have in the Catalog menu is **Virtual Images**. You can use this option to see the list of master images that can be used for deployment.

Virtual images

- Notice the images in draft status (). Images in draft status are the ones for which the capability is not confirmed (basic, intermediate, advanced)
- Click one of the images to explore its characteristics

Virtual images provide the operating system and product binary files required to create a virtual system instance. Notice that some, if not all, the virtual images are in draft status. This means that the capabilities of such virtual images are not confirmed yet. Click a virtual image to explore it in depth.

The Access granted to field

- Notice the **Access granted to** field. This field is used to give access to the Virtual Image to other users or groups

The screenshot displays the IBM SmartCloud Provisioning user interface. The top navigation bar includes 'Welcome', 'Instances', 'Catalog', 'Reports', 'Cloud', and 'System'. The 'Catalog' tab is active, showing a list of 'Virtual Images' on the left and a detailed view of the 'rhel6.1-8g' image on the right. The 'Access granted to' field is highlighted with a red box, showing 'Administrator (cbadmin) [owner]' and an 'Add more...' button. Other fields include 'Product IDs', 'In cloud group', 'Location', 'Image capabilities', 'Contains parts', 'Included in patterns', and 'In the cloud now'.

One important field in the Virtual Image section is **Access granted to**. As mentioned before, the user who first deploys the virtual system instance is automatically granted access to the virtual image as the owner. If you want additional users to access this virtual system instance, you need to manually grant access to them. In this panel, you can give access to both users and groups.

Virtual system patterns

- Click the **Virtual System Patterns** submenu of the **Catalog** menu. You see the list of available patterns.
- Select one of the available patterns to display its details

The screenshot illustrates the user interface for IBM SmartCloud Provisioning. It shows the navigation menu with 'Catalog' selected. A dropdown menu is open, highlighting 'Virtual System Patterns'. A blue arrow points from this menu item to a detailed view of a 'Test Pattern'. The detailed view includes a search bar, a list of patterns (with 'Test Pattern' selected), and a detailed information panel on the right. The information panel displays the following details:

Description:	None provided
Created on:	Jan 9, 2013 5:30:15 PM GMT+01:00
Current status:	Draft
Updated on:	Jan 9, 2013 5:30:15 PM GMT+01:00
In the cloud now:	(none)
Access granted to:	Administrator (cbadmin) [owner]
	<input type="text" value="Add more..."/>
Topology for this pattern:	

9 Exploring the user interface © 2013 IBM Corporation

In the Catalog menu, you also have the **Virtual System Patterns** option. There you find the list of all available patterns. You can use a virtual system pattern to describe the topology of a system that you want to deploy. To build virtual system patterns, you use parts from one or more virtual images, add-ons, and script packages.

Script packages

- In the **Script Packages** submenu from the **Catalog** menu, you see all available script packages that can be reused to build patterns. Script packages are typically used to add software to the images

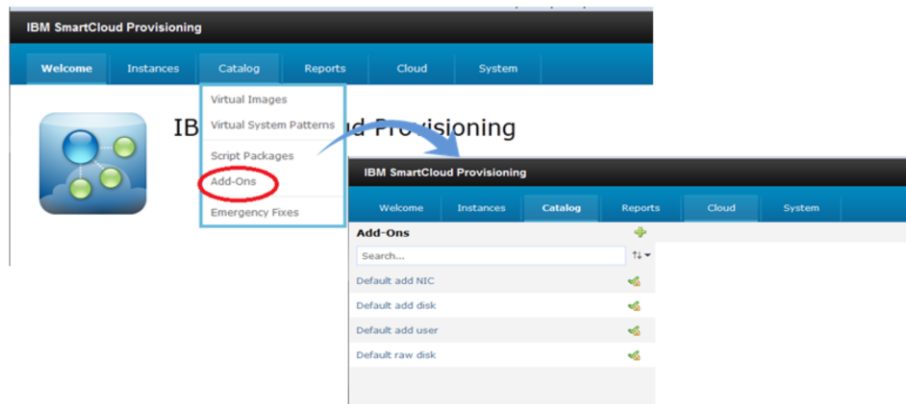

The screenshot displays the IBM SmartCloud Provisioning user interface. At the top, a navigation bar includes 'Welcome', 'Instances', 'Catalog', 'Reports', 'Cloud', and 'System'. The 'Catalog' menu is open, showing options for 'Virtual Images', 'Virtual System Patterns', 'Script Packages' (highlighted with a red circle), and 'Add-Ons'. A blue arrow points from the 'Script Packages' menu item to a detailed view of a script package titled 'Add IBM HTTP Server node'. This view shows a search bar, a list of script packages, and a detailed configuration form for the selected package. The form includes fields for 'Description', 'Created on', 'Current status', 'Updated on', 'Script package files', and 'Environment'. The 'Current status' is 'Draft' and the 'Updated on' date is 'Jan 7, 2013 7:31:58 PM GMT+01:00'. The 'Script package files' section has a 'Browse...' button and an 'Upload' button. The 'Environment' section shows 'ifs = true [remove]' and a 'Set variable' dropdown menu.

10 Exploring the user interface © 2013 IBM Corporation

You can use script packages to customize the behavior of parts in SmartCloud Provisioning topologies by adding script packages to pattern topologies. You can create script packages and then add them to the part you want to modify within the pattern containing that part.

Add-ons

- Use the **Add-Ons** submenu from the **Catalog** menu to view the available add-ons that can be used to configure the images. These four add-ons are built in:
 - Default add NIC
 - Default add disk
 - Default add user
 - Default raw disk

11

Exploring the user interface

© 2013 IBM Corporation

Add-ons are specialized scripts that customize virtual machine configuration. Use them to add and configure additional network interfaces, disks, and users.

In SmartCloud Provisioning, these built-in add-ons are provided in the catalog:

Default add NIC: Adds a virtual network interface controller (NIC) to the virtual machine. The default NIC add-on defines and initializes a new network interface. NIC add-ons must be deployed with environment profiles. NIC add-ons are not available for use with patterns that deploy to IBM PowerVM® hypervisors. Note that on Windows® systems, add-on disk and NIC are not automatically configured as in Linux®, and they only work for DHCP networks.

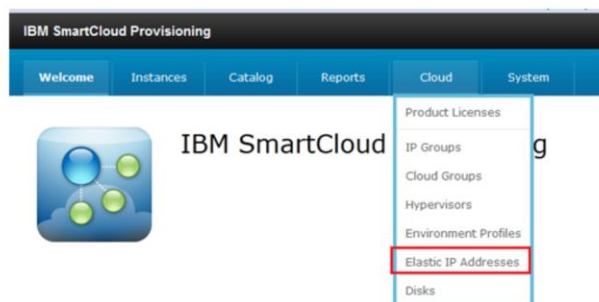

Default add disk: Adds a virtual disk to the virtual machine and optionally formats the file system and mounts the disk. Disk add-ons are not available for use with patterns that deploy to IBM PowerVM hypervisors. Note that on Windows systems, add-on disk and NIC are not automatically configured as in Linux, and they only work for DHCP networks.

Default add user: Defines an additional user on the virtual machine. The default add-on script runs a simple add user command. No additional account configuration is performed.

Default raw disk: Adds a virtual disk to the virtual machine; the disk is added raw without partitions or formatting. You either create your own add-on scripts or create a clone of an existing one and modify it.

Elastic IP addresses

- Expand the **Cloud** menu. In the **Elastic IP Addresses** panel, you can see all elastic IPs that are currently assigned to you

Now, click the **Cloud** menu tab and explore the **Elastic IP Addresses** option. It is used to allocate and assign elastic IP addresses to virtual machines deployed in a managed cloud group.

To allocate and assign elastic IP addresses to a virtual machine, there must be at least one High Scale Low Touch (HSLT) cloud group in the environment. There also must be a pool of elastic IP addresses created by the administrator. Elastic IP addresses are only supported for virtual machines deployed into a HSLT cloud group. This panel is always empty the first time you log in.

Disks panel

- In the **Disks** panel, you can see all disks that you created. These panels are empty the first time that you log on

Another interesting option in the Cloud menu is Disks. The Disks option is used to attach additional storage disks as volumes on deployed virtual machines. To attach additional storage disks to any virtual machine, there must be at least one HSLT cloud group defined by the administrator. The disk attachment function is supported only for virtual machines deployed into a HSLT cloud group.

Remember, this panel is always empty the first time you log in.

Summary

- Now that you have completed this training module, you can accomplish these tasks:
 - Access SmartCloud Provisioning UI
 - Navigate through SmartCloud Provisioning UI

Now that you have completed this training module, you know how to log in to a SmartCloud Provisioning user interface and navigate through its panels.
