
IBM WebSphere Application Server V8

Centralized Installation Manager (including new changes in fixpack 1)

This presentation describes support for the centralized installation manager included in IBM WebSphere Application Server V8. It has been updated to include the new changes in the fixpack 1.

Table of contents

- Overview and history
- Centralized Installation Manager in WebSphere Application Server V7
- What's new in V8
- Centralized Installation Manager in Job Manager
- New Centralized Installation Manager Jobs
- What is new in fixpack 1 (V8.0.0.1)

 - Register a target
 - Install IBM Installation Manager
- Summary

This presentation will introduce the Centralized Installation Manager in WebSphere Application Server V8. It will cover these topics:

Overview and history

Centralized Installation Manager in WebSphere Application Server V7

What's new in V8

Centralized Installation Manager in Job Manager

New Centralized Installation Manager Jobs

What's new in fixpack 1

Supported platforms and software

A demonstration

Register a target

Install IBM Installation Manager

And finally, a Summary of this presentation

Centralized Installation Manager – Overview and History

- Centralized Installation Manager (CIM) was first introduced in WebSphere Virtual Enterprise version 6.1 and made available to WebSphere Application Server version 7.0.
- Accessible from the Deployment Manager
- Remotely drive ISMP and Update Installer
- Remotely install and update WebSphere Application Server version 7 onto multiple nodes within a cell

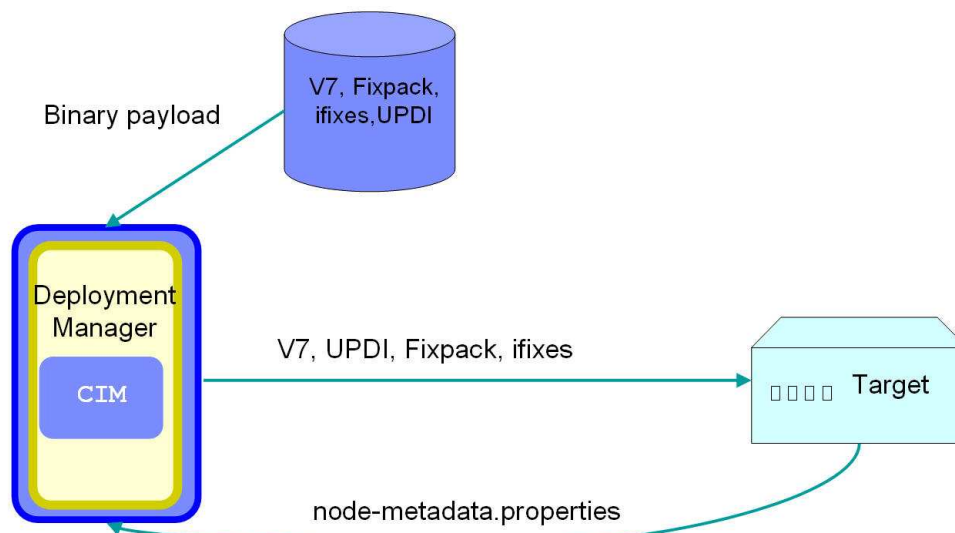

Centralized installation manager was first introduced in WebSphere Virtual Enterprise version 6.1. It was able to remotely install WebSphere Virtual Enterprise version 6.1 and apply maintenance of WebSphere Virtual Enterprise and WebSphere Application Server. Centralized installation manager can be accessed from the deployment manager.

CIM remotely drives the Install Shield Multiple Platform (ISMP) and the Update Installer to perform install and update operations.

Later, CIM has been made available to WebSphere Application Server version 7.0. CIM can be used to install WebSphere Application Server version 7.0 and apply its maintenance to remote targets.

WebSphere Application Server V7 CIM in Deployment Manager

Deployment manager pushes binary payload to targets

4

Centralized Installation Manager

© 2011 IBM Corporation

In WebSphere Application Server V7, CIM is available in the deployment manager. The CIM repository was created during the installation of WebSphere Application Server V7. Next, a deployment manager profile was created. The deployment manager was represented as a blue rectangle in the left side.

A new target was added to CIM and WebSphere Application Server V7 will be installed into the target. CIM retrieved the WebSphere Application Server V7 binary from the repository and pushed it out to the target. After WebSphere Application Server has been installed on the target, CIM would create a custom profile on the target and run `addNode`. The target would become a managed node in the deployment manager.

CIM can also be used to apply WebSphere Application Server fixpacks and interim fixes to its targets in a similar fashion.

What's new in Centralized Installation Manager in V8

- CIM is now available from the Job Manager
- Remotely drive IBM Installation Manager
- Install WebSphere Application Server, IBM HTTP Server, Application Clients, DMZ Secure Proxy Server, web Server Plug-ins and WebSphere Customization Toolbox
- Support job scheduling
- Support multiple cells
- Better scalability

5

Centralized Installation Manager

© 2011 IBM Corporation

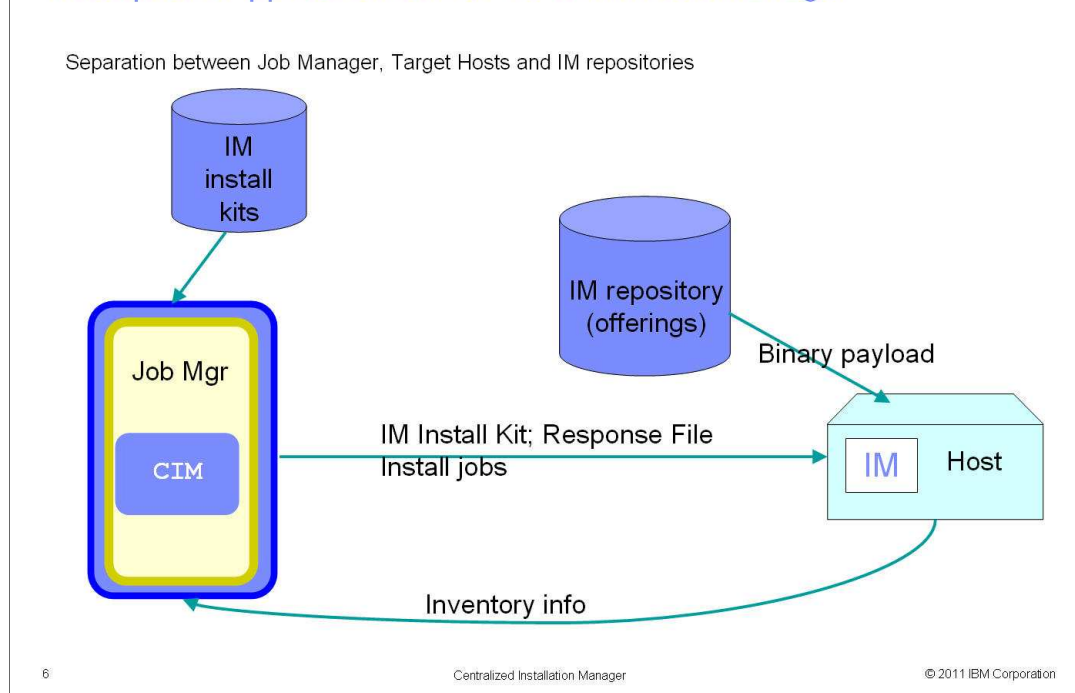

In WebSphere Application Server version 8, CIM is integrated into the Job Manager. CIM can drive IBM Installation Manager remotely to perform install, update or modify operations. In version 7, CIM was able to install WebSphere Application Server only. In version 8, CIM can remotely install WebSphere Application Server, IBM HTTP Server, Application Clients, DMZ Secure Proxy Server, web Server Plugin-ins and WebSphere Customization Toolbox.

Since CIM's functions are implemented as jobs, they support job scheduling.

In version 7, CIM can manage nodes within a cell only. In version 8, CIM can manage targets across cells.

With the adoption of IBM Installation Manager and its network repository, CIM does not push the product binary from the server. Instead, Installation Manager on the targets will pull the product binary from the network repository directly. This reduces the network traffic between the server and the targets and it also reduces the CPU utilization on the server. Therefore, the scalability has improved.

WebSphere Application Server V8 CIM in Job Manager

In WebSphere Application Server version 8, CIM has been integrated into the Job Manager. It was represented as a blue rectangle on the left side. The Installation Manager repository was separated from the server. The server, which was the Job Manager, only contained the Installation Manager installation kits.

First, a new host was registered to the Job Manager. During the installation of Installation Manager to the target, the Installation Manager installation kit was pushed to the target. Next, WebSphere Application Server V8 can be installed by CIM with response files. Product binary was pulled from the IM repository. Profiles can be created by running manage profiles job with response files.

Installation information was gathered by CIM from the targets by running an inventory job.

New Centralized Installation Manager jobs

- Inventory
- Install, update and uninstall Installation Manager (**New** capability in version 8)
- Manage offerings (like install, update, uninstall WebSphere Application Server)
- Manage profiles (**New** capability in version 8)
- Run command (**New** capability in version 8)
- Install SSH public key
- Distribute, collect and delete file (**New** capability in version 8)
- Test connection
- Add or search Installation Manager agent data locations

These are new CIM jobs in the Job Manager.

Inventory: To collect installation information.

Install, update and uninstall Installation Manager: Use these jobs to install, update and uninstall Installation Manager.

Manage offerings: Use this job to install, update or uninstall WebSphere Application Server and its supplementary products.

Manage profiles: Use this job to create, augment and remove profiles.

Run command: Use this job to run any operating system, shell or product commands.

Install SSH public key: Use this job to install the SSH public key to the targets. This is a prerequisite of using SSH private/public key authentication.

Distribute, collect and delete file: Use these jobs to send shell scripts to targets, collect log files from targets.

Test connection: Use this job just to test the connection between the job manager and targets.

Add or search Installation Manager agent data locations: (for advanced users only) Use this job to add or search non-default location of Installation Manager agent data locations.

What is new in fixpack 1 (V8.0.0.1)

- Added sudo support for Linux, AIX, Solaris and HP-UX hosts
- Setup is required on each host before using sudo option to connect
- Typical usage scenario
 - A large customer has a group of system administrators
 - Use a common ID (e.g. websphere) to install and maintain WebSphere Application Server
 - Direct login with the common ID is disabled
 - Each administrator login using his/her own user ID
 - Switch user to websphere using sudo
 - sudo logs who has switched user

In WebSphere Application Server V8 fixpack 1, CIM has introduced the support of using sudo to connect to Linux, AIX, Solaris and HP-UX hosts. To switch user using sudo, you must be given permissions in the sudoers file on each host. For the setup instructions, see the IBM WebSphere Application Server V8 InfoCenter.

The following is a typical usage scenario of sudo. A large customer has a group of system administrators. WebSphere Application Server is installed and maintained by a common user ID (e.g. websphere). If the administrators share the same user ID and password, it will be difficult to trace who did what. If each administrator logs in using his/her own ID and use sudo to switch to the common user ID, sudo can log who has switched user.

Supported platforms and software

- Supported platforms
 - Windows, Linux, AIX, Solaris, HP-UX, IBM i and z/OS
- Supported Installation Manager version
 - Version 1.4.3 and later
- Supported WebSphere Application Server version
 - Install and uninstall of WebSphere Application Server V8 and the supplemental products
 - IBM HTTP Server
 - Web Server Plug-ins
 - WebSphere Customization Toolbox
 - Application Client
 - DMZ Secure Proxy Server

In WebSphere Application Server version 8, CIM adds support of z/OS.

CIM can remotely drive IBM Installation Manager version 1.4.3 or later.

CIM can also remotely install these supplemental products:

IBM HTTP Server

Web Server Plug-ins

WebSphere Customization Toolbox

Application Client

DMZ Secure Proxy Server

Centralized Installation Manager

© 2011 IBM Corporation

Centralized Installation Manager functions in WebSphere Application Server version 8 can be found in the Job Manager administrative console under the Jobs section.

Most of the CIM functions in the console can also be performed using AdminTask in the wsadmin tool.

Register a new host

12

Centralized Installation Manager

© 2011 IBM Corporation

First, register a new target to the Job Manager.

From the Jobs section, click Targets. On the Targets page, click New Host

Provide this information:

Host name

(Optional) Operating system

Administrative user with installation authority (User name)

Select password authentication or public-private key authentication

For password authentication, provide the password

Since V8.0.0.1, sudo is support for Linux, AIX, Solaris and HP-UX hosts. To use sudo, check the Use sudo check box. If the sudo user name is not specified, the default is root. If the sudo password is not specified, the user's password is used.

For public-private key, provide a fully qualified path of the private key file located at the Job Manager. Passphrase is optional.

Check the save security information check box

Click OK

Target properties

The screenshot shows a web interface titled 'Targets' with a sub-header 'Targets > wasvm044'. Below this, a message states: 'This panel shows the properties defined for the target being viewed.' Under the 'General Properties' section, there is a text input field for 'Target name' containing 'wasvm044'. Below this is a table titled 'Target properties' with the following data:

Name	Value
Administrative agent UUID (com.ibm.websphere.management.agent.uuid)	JobMgr01-JOB_MANAGER-3bcec414-624c-453b-95cc-7763b00f1ed4
Host name (hostname)	wasvm044
Node name (managedNodeName)	wasvm044
OS_Arch	i686
OS_BitMode	32
OS_Name	linux
OS_Type	RedHat Linux

Once a target has been registered successfully, click the host name and the target properties are displayed.

Add Installation Manager installation kit

The screenshot shows the 'Add Installation Manager installation kits' page in the IBM WebSphere software. The page title is 'Add Installation Manager installation kit'. The main content area is titled 'Installation Manager installation kits' and contains the following text: 'Installation Manager installation kits are required for application inst' and 'Installation Manager installation kits are stored. The list of Installation Manager'. Below this text is a section for 'Installation Manager installation kits location' with a text box containing the path 'C:\WAS\profiles\JobMgr01\IMKits' and a 'Refresh' button. There is also a 'Preferences' section with 'Add...' and 'Delete' buttons. At the bottom, there is a table with one row showing a selected kit: 'agent.installer.linux.gtk.x86_1.4.3000.20110303_1846.zip'. The table has columns for 'Select' and 'Name'. The total count is 'Total 1'.

14

Centralized Installation Manager

© 2011 IBM Corporation

Before Installation Manager can be remotely installed to targets, add an Installation Manager installation kit of the corresponding platform.

From the Jobs section, click Installation Manager installation kits. Click Add to add an Installation Manager installation kit zip file or copy the zip file into the location specified in the Installation Manager installation kits location text box.

In this screen capture, a Linux installation kit is added.

Install IBM Installation Manager

The screenshot shows the IBM Installation Manager web interface. At the top, there is a header with 'WebSphere, software' on the left and 'Welcome adm' on the right. Below the header, there is a navigation pane on the left with a 'View: All tasks' dropdown and a tree view containing 'Welcome', 'Jobs', 'Resources', 'Security', 'Environment', 'System administration', 'Users and Groups', and 'Troubleshooting'. The 'Jobs' section is expanded, showing sub-items like 'Submit', 'Status', 'Targets', 'Target resources', 'Target groups', and 'Installation Manager installation kits'. The main content area is titled 'Submit a job to the job manager' and contains a wizard with five steps: 'Step 1: Choose a job type', 'Step 2: Choose job targets', 'Step 3: Specify job parameters', 'Step 4: Schedule the job', and 'Step 5: Review the summary and submit the job'. The 'Step 1' section is active, showing a 'Choose a job type' dropdown menu with 'Install IBM Installation Manager' selected and a 'Description' text box containing 'installIM'. A 'Next' button is visible at the bottom of the wizard.

To install IBM Installation Manager on a target, from the Jobs section, click Submit.

From the Job type dropdown list, select Install IBM Installation Manager and click Next.

Select targets

Submit a job to the job manager

Choose the targets to use. Targets can be either a target group or a list of one or more target names. If a target is enabled on a target, then the saved authentication information for the target is used. Otherwise, you can provide authentication parameters. If a user name is not provided, then the current console user ID is used. If authentication parameters are entered, they are used for all targets and take precedence over the saved authentication associated with the host.

Choose job targets

Job type: Install IBM Installation Manager

Target groups

-- No groups --

Target names

wasvm044

Select a target by typing its name into the text box and click Add. To select multiple targets, click Find and a query can be setup to find multiple targets.

Click Next.

Input the job parameters

Submit a job to the job manager

Enter the parameters for the job. The parameters vary based on the type of job that you previously selected.

Step 1: Choose a job type
Step 2: Choose job targets
→ Step 3: Specify job parameters
Step 4: Schedule the job
Step 5: Review the summary and submit the job

Specify job parameters

Job type: Install IBM Installation Manager

Previous Next Cancel

17 Centralized Installation Manager © 2011 IBM Corporation

For the Install IBM Installation Manager job, there are six parameters.

The path and file name of Installation Manager kit – This field can be left blank and CIM will select the latest installation kit that is suitable for the target platform.

Installation Manager agent data location – This field can be left blank and the default location is used.

Installation Manager installation directory - This field can be left blank and the default location is used.

Installation action – Select Install based on login credentials

Skip prerequisite checking – Leave this unchecked

I accept the terms in the license agreements – Check this check box

Click Next to continue.

Schedule job

Submit a job to the job manager

Schedule the job by specifying when the job available, when the job expires, if the job is to rerun after a period of time, and what email address is to receive notification when the job is done. Jobs are scheduled for availability and expiration relative to the time of the machine on which the job manager resides.

Step 1: Choose a job type

Step 2: Choose job targets

Step 3: Specify job parameters

→ Step 4: Schedule the job

Step 5: Review the summary and submit the job

Schedule the job

Job type: Install IBM Installation Manager

Summary

- CIM can drive IBM Installation Manager
- Install WebSphere Application Server version 8 and its supplementary products
- Support job scheduling
- No limitation of cell boundary
- Better scalability

To summarize, centralized installation manager in WebSphere Application Server version 8 works with IBM Installation Manager to install WebSphere Application Server version 8 and its supplementary products to remote targets. Centralized installation manager is accessible from job manager. Unlike CIM version 7 in the deployment manager, CIM version 8 is not limited by the boundary of a cell. It also supports job scheduling and has better scalability.
