IBM® WebSphere® Application Server V6.1 Feature Pack for Web services

JAX-WS overview

@business on demand.

© 2007 IBM Corporation
Updated July 27, 2007

This presentation will provide an understanding of the JAX-WS programming model, supported by the Feature Pack for Web services.

Agenda

- Java™ API for XML based Web services (JAX-WS) overview
- Architecture and details

This presentation will begin with an overview of the Java API for XML based Web services or JAX-WS. Next, the presentation will explain the architecture and details of the JAX-WS support.

Section

JAX-WS overview

This section will provide an overview of JAX-WS.

JAX-WS design

- JAX-WS is a follow on to the JAX-RPC 1.1 specification
 - ▶ The next evolution of JAX-RPC
 - ▶ More than JAX-RPC 2.0
- JAX-RPC defined conventions for developing remote procedure call (RPC) based Web services
 - ▶ JAX-WS deals with both RPC and message based services
- Core specification for a newly redesigned API stack for Web services
 - ▶ This "integrated stack" includes JAX-WS 2.0, JAX-B 2.0, and SAAJ 1.3

The Java API for XML Web services (JAX-WS) is a key component of a newly redesigned API stack for Web services. This "integrated stack" includes JAX-WS 2.0, JAXB 2.0, and SAAJ 1.3. JAX-WS began as an addition to the JAX-RPC 1.1 specification, but evolved further into its own specification as it came to deal with more than just remote procedure call based services. JAX-WS goes further by dealing with message based services and remote procedure call based services.

JAX-WS enhancements

- JAX-WS uses JAX-B to define binding of XML to Java artifacts
 - ▶ JAX-RPC defined it's own rules for basic data binding
 - ▶ Later specifications enhanced the binding rules
- JAX-WS built on top of Axis2 Web services engine as an additional programming model
 - ▶ Axis2 programming model is not supported
- Defines annotations to ease development of Web services
- JAX-WS is designed to run on Java 5

For historical reasons, in the previous Web services design there was considerable overlap of data binding functionality between JAX-RPC and JAXB APIs. This is because JAX-RPC originally included basic data binding functionality as part of its specification. When JAXB emerged after JAX-RPC, the need to separate the Web services definition and data binding components became clearer. JAX-WS is built upon the AXIS2 Web services engine, though it's important to understand that the Feature Pack for Web services does not support the AXIS 2 programming model. The Feature Pack for Web services instead provides support for its own implementation of a JAX-WS programming model. JAX-WS helps define annotations to make development of Web services easier. JAX-WS is designed to be run on Java 5 or later.

JAX-WS enhancements

- Asynchronous support for clients
 - ▶ Using either a polling or callback mechanism
- Transport neutral
 - ▶ Support for HTTP/HTTPS in this release
- As in JAX-RPC, JAX-WS provides a mechanism for application handlers
 - ▶ Insert or retrieve data from a message as it moves through the Web services engine

JAX-WS provides other important enhancements, such as support for asynchronous polling and callback. The JAX-WS specification is transport neutral, but the Feature Pack for Web services only provides support for HTTP and HTTPS. Much like JAX-RPC, JAX-WS defines a model for creating application handlers that can deal with message data as it works through the Web services runtime.

JAX-WS enhancements

- JAX-WS provides support for SOAP 1.2
 - ▶ Does not add SOAP 1.2 support with JAX-RPC
- Also allows for generic XML/HTTP as a protocol binding
 - ▶ Create clients and providers that do not use SOAP for their wire level message format
- Supports Message Transmission Optimization Mechanism (MTOM)
 - ▶ Improved method for sending binary attachments

The JAX-WS specification provides support for the SOAP 1.2 specification. It also allows for a generic XML over HTTP protocol binding, for applications that want to deal in pure XML and avoid SOAP. JAX-WS is designed to work with the Message Transmission Optimization Mechanism or MTOM. This is an improved method for sending large binary attachments with Web services.

Section

Architecture and details

The next section discusses the architecture of the JAX-WS programming model.

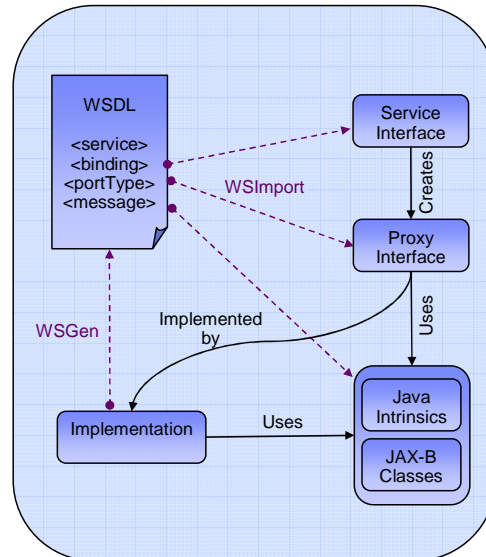

JAX-WS features

- API for developing Web services with Java and XML
- A JAX-WS implementation integrated with the Web services engine
- Support for Web services annotations
 - ▶ Incorporates JSR-181 and defines Java SE 5.0 annotations
- Tools for creating portable artifacts for the client
 - ▶ WSImport for top down development
 - Create a Web service from a WSDL
 - JAX-WS equivalent of WSDL2Java
 - ▶ WSGen can be used for bottom up development
 - Create a Web service from Java code
 - JAX-WS equivalent of Java2WSDL

JAX-WS includes the standard implementation of the specification along with tools for building Web services, such as annotations. JAX-WS features an API for creating Web services with Java and XML. The JAX-WS implementation is integrated with the Web services engine, and support annotations based on the JAX-WS specification and JSR 181. There are also two command line tools for generating the necessary Java artifacts, WSImport for top down development from a WSDL file, and WSGen for bottom up development from Java code.

JAX-WS 2.0

- Java API for XML Web services
 - Successor to JAX-RPC 1.1
- Maps WSDL to Java
- Maps Java to WSDL
- Supports multiple data bindings
 - JAX-B 2.0 - Preferred
 - SAAJ 1.3 (SOAPMessage)
 - XML Source
 - Activation data source
- Defines WSDL customizations
- To be included in Java SE 6

10

The Java API for XML based Web services was designed to be a major improvement over JAX-RPC. The specification describes how to map WSDL elements to and from Java artifacts. The specification supported multiple data bindings, JAX-B 2.0 is the preferred binding provider, but SAAJ 1.3, XML source and activation data source are also options. The JAX-WS specification is planned on being included in Java SE 6.

JAX-WS / JAX-RPC comparison

JAX-RPC 1.1 Code

```
public interface StockQuote
    extends Remote {
    public float getQuote(String sym)
        throws RemoteException;
}

public class QuoteBean implements
{
    public float getQuote(String sym)
    { ... }
}
```

JAX-WS 2.0 Code

```
@WebService public interface
    StockQuote {
    public float getQuote(String sym);
}

@WebService public class
    QuoteBean implements
    StockQuote {
    public float getQuote(String sym)
    { ... }
}
```

This shows an example of the JAX-WS programming model shown side by side with JAX-RPC. Notice the removal of the remote interface, this is consistent with what is coming in Java EE 5 in the EJB support. Take note of the Web service annotation that tells you that this will be exposed as a Web service. Similar to the rest of Java EE 5, the service endpoint interface isn't required to be specified.

Section

Summary

Following is the summary of the presentation.

Summary

- The JAX-WS specification provides enhancements and new features to Web services development
- This specification combines with JAX-B 2.0, and SAAJ 1.3 to form the new Web services “integrated stack”
 - ▶ Better integration between WS specifications
 - ▶ Easier development

The Java API for XML Web services (JAX-WS) is a key component in Web services development by providing new enhancements such as an annotation based programming model, and other new features. Combined with the JAX-B and SAAJ 1.3 specifications, it helps create an easier development experience for Web services.

Performance is based on measurements and projections using standard IBM benchmarks in a controlled environment. All customer examples described are presented as illustrations of how those customers have used IBM products and the results they may have achieved. The actual throughput or performance that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput or performance improvements equivalent to the ratios stated here.
