SECEXITINIT

The user data that is passed to a channel security exit when it is called.

Applicable Objects

ConnectionFactory, QueueConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XAQueueConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: SECEXITINIT

JMS administration tool short name: SCXI

Programmatic access

Setters/getters

- MQConnectionFactory.setSecurityExitInit()
- MQConnectionFactory.getSecurityExitInit()

Values

null Any string can be the default value.

SENDCHECKCOUNT

The number of send calls to allow between checking for asynchronous put errors, within a single non-transacted JMS session.

Applicable Objects

ConnectionFactory, QueueConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XAQueueConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: SENDCHECKCOUNT

JMS administration tool short name: SCC

Programmatic access

Setters/getters

- MQConnectionFactory.setSendCheckCount()
- MQConnectionFactory.getSendCheckCount()

Values

null Any string can be the default value.

SENDEXIT

Identifies a channel send exit, or a sequence of send exits to be run in succession.

Applicable Objects

ConnectionFactory, QueueConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XAQueueConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: SENDEXIT

JMS administration tool short name: SDX

Programmatic access

Setters/getters

- MQConnectionFactory.setSendExit()
- MQConnectionFactory.getSendExit()

Values

null Any string comprising one or more items separated by commas, where each item is either:

- The name of a class that implements the WMQSendExit interface (for a channel send exit written in Java).
- A string in the format *libraryName(entryPointName)* (for a channel send exit not written in Java).
-

This is the default value.

SENDEXITINIT

The user data that is passed to channel send exits when they are called.

Applicable Objects

ConnectionFactory, QueueConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XAQueueConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: SENDEXITINIT

JMS administration tool short name: SDXI

Programmatic access

Setters/getters

- MQConnectionFactory.setSendExitInit()
- MQConnectionFactory.getSendExitInit()

Values

null Any string comprising one or more items of user data separated by commas can be the default value.

SHARECONVALLOWED

This property determines whether a client connection can share its socket with other top-level JMS connections from the same process to the same queue manager, if the channel definitions match.

Applicable Objects

ConnectionFactory, QueueConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XAQueueConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: SHARECONVALLOWED

JMS administration tool short name: SCALD

Programmatic access

Setters/getters

- MQConnectionFactory.setShareConvAllowed()
- MQConnectionFactory.getShareConvAllowed()

Values

YES This is the default value for administrative tools.

For programs, use WMQConstants.WMQ_SHARE_CONV_ALLOWED_YES.

NO This value is for administrative tools.

For programs, use WMQConstants.WMQ_SHARE_CONV_ALLOWED_NO.

SPARSESUBS

Controls the message retrieval policy of a TopicSubscriber object.

Applicable Objects

ConnectionFactory, TopicConnectionFactory

JMS administration tool long name: SPARSESUBS

JMS administration tool short name: SSUBS

Programmatic access

Setters/getters

- MQConnectionFactory.setSparseSubscriptions()
- MQConnectionFactory.getSparseSubscriptions()

Values

NO Subscriptions receive frequent matching messages. This is the default value for administrative tools.

For programs, use false.

YES Subscriptions receive infrequent matching messages. This value requires that the subscription queue can be opened for browse.

For programs, use true.

SSLCIPHERSUITE

The CipherSuite to use for an SSL connection.

Applicable Objects

ConnectionFactory, QueueConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XAQueueConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: SSLCIPHERSUITE

JMS administration tool short name: SCPHS

Programmatic access

Setters/getters

- MQConnectionFactory.setSSLCipherSuite()
- MQConnectionFactory.getSSLCipherSuite()

Values

null This is the default value. For more information, see SSL properties of JMS objects.

SSLCRL

CRL servers to check for SSL certificate revocation.

Applicable Objects

ConnectionFactory, QueueConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XAQueueConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: SSLCRL

JMS administration tool short name: SCRL

Programmatic access

Setters/getters

- MQConnectionFactory.setSSLCertStores()
- MQConnectionFactory.getSSLCertStores()

Values

null Space-separated list of LDAP URLs. This is the default value. For more information, see SSL properties of JMS objects.

SSLFIPSREQUIRED

This property determines whether an SSL connection must use a CipherSuite that is supported by the IBM Java JSSE FIPS provider (IBMJSSEFIPS).

Applicable Objects

ConnectionFactory, QueueConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XAQueueConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: SSLFIPSREQUIRED

JMS administration tool short name: SFIPS

Programmatic access

Setters/getters

- MQConnectionFactory.setSSLFipsRequired()
- MQConnectionFactory.getSSLFipsRequired()

Values

NO An SSL connection can use any CipherSuite that is not supported by the IBM Java JSSE FIPS provider (IBMJSSEFIPS).

This is the default value. In programs, use false.

YES An SSL connection must use a CipherSuite that is supported by IBMJSSEFIPS.

In programs, use true.

SSLPEERNAME

For SSL, a *distinguished name* skeleton that must match that provided by the queue manager.

Applicable Objects

ConnectionFactory, QueueConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XAQueueConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: SSLPEERNAME

JMS administration tool short name: SPEER

Programmatic access

Setters/getters

- MQConnectionFactory.setSSLPeerName()
- MQConnectionFactory.getSSLPeerName()

Values

null This is the default value. For more information, see SSL properties of JMS objects.

SSLRESETCOUNT

For SSL, the total number of bytes sent and received by a connection before the secret key that is used for encryption is renegotiated.

Applicable Objects

ConnectionFactory, QueueConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XAQueueConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: SSLRESETCOUNT

JMS administration tool short name: SRC

Programmatic access

Setters/getters

- MQConnectionFactory.setSSLResetCount()
- MQConnectionFactory.getSSLResetCount()

Values

0 Zero, or any positive integer less than or equal to 999, 999, 999. This is the default value. For more information, see SSL properties of JMS objects.

STATREFRESHINT

The interval, in milliseconds, between refreshes of the long running transaction that detects when a subscriber loses its connection to the queue manager.

This property is relevant only if SUBSTORE has the value QUEUE.

Applicable Objects

ConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: STATREFRESHINT

JMS administration tool short name: SRI

Programmatic access

Setters/getters

- MQConnectionFactory.setStatusRefreshInterval()
- MQConnectionFactory.getStatusRefreshInterval()

Values

6000 Any positive integer can be the default value. For more information, see SSL properties of JMS objects.

SUBSTORE

Where WebSphere MQ classes for JMS stores persistent data relating to active subscriptions.

Applicable Objects

ConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: SUBSTORE

JMS administration tool short name: SS

Programmatic access

Setters/getters

- MQConnectionFactory.setSubscriptionStore()
- MQConnectionFactory.getSubscriptionStore()

Values

BROKER
Use the broker-based subscription store to hold details of subscriptions. This is the default value for administrative tools.

For programs, use WMQConstants.WMQ_SUBSTORE_BROKER.

MIGRATE
Transfer subscription information from the queue-based subscription store to the broker-based subscription store.

For programs, use WMQConstants.WMQ_SUBSTORE_MIGRATE.

QUEUE
Use the queue-based subscription store to hold details of subscriptions.

For programs, use WMQConstants.WMQ_SUBSTORE_QUEUE.

SYNCPOINTALLGETS

This property determines whether all gets are to be performed under syncpoint.

Applicable Objects

ConnectionFactory, QueueConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XAQueueConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: SYNCPOINTALLGETS

JMS administration tool short name: SPAG

Programmatic access

Setters/getters

- MQConnectionFactory.setSyncpointAllGets()
- MQConnectionFactory.getSyncpointAllGets()

Values

No This is the default value.

Yes

TARGCLIENT

This property determines whether the WebSphere MQ RFH2 format is used to exchange information with target applications.

Applicable Objects

Queue, Topic

JMS administration tool long name: TARGCLIENT

JMS administration tool short name: TC

Programmatic access

Setters/getters

- MQDestination.setTargetClient()
- MQDestination.getTargetClient()

Values

JMS The target of the message is a JMS application. This is the default value for administrative tools.

For programs, use WMQConstants.WMQ_CLIENT_JMS_COMPLIANT.

MQ The target of the message is a non-JMS WebSphere MQ application.

For programs, use WMQConstants.WMQ_CLIENT_NONJMS_MQ.

TARGCLIENTMATCHING

This property determines whether a reply message, sent to the queue identified by the JMSReplyTo header field of an incoming message, has an MQRFH2 header only if the incoming message has an MQRFH2 header.

Applicable Objects

ConnectionFactory, QueueConnectionFactory, XAConnectionFactory, XAQueueConnectionFactory

JMS administration tool long name: TARGCLIENTMATCHING

JMS administration tool short name: TCM

Programmatic access

Setters/getters

- MQConnectionFactory.setTargetClientMatching()
- MQConnectionFactory.getTargetClientMatching()

Values

YES If an incoming message does not have an MQRFH2 header, the TARGCLIENT property of the Queue object derived from the JMSReplyTo header field of the message is sent to MQ. If the message does have an MQRFH2 header, the TARGCLIENT property is set to JMS instead. This is the default value for administrative tools.

For programs, use true.

NO The TARGCLIENT property of the Queue object derived from the JMSReplyTo header field of an incoming message is always set to JMS.

For programs, use false.

TEMPMODEL

The name of the model queue from which JMS temporary queues are created.

Applicable Objects

ConnectionFactory, QueueConnectionFactory, XAConnectionFactory, XAQueueConnectionFactory

JMS administration tool long name: TEMPMODEL

JMS administration tool short name: TM

Programmatic access

Setters/getters

- MQConnectionFactory.setTemporaryModel()
- MQConnectionFactory.getTemporaryModel()

Values

SYSTEM.DEFAULT.MODEL.QUEUE

Any string can be the default value.

TEMPQPREFIX

The prefix that is used to form the name of a WebSphere MQ dynamic queue.

Applicable Objects

ConnectionFactory, QueueConnectionFactory, XAConnectionFactory, XAQueueConnectionFactory

JMS administration tool long name: TEMPQPREFIX

JMS administration tool short name: TQP

Programmatic access

Setters/getters

- MQConnectionFactory.setTempQPrefix()
- MQConnectionFactory.getTempQPrefix()

Values

" " (empty string)
The prefix used is `CSQ.*` on z/OS and `AMQ.*` on all other platforms. These are the default values.

queue prefix
The queue prefix is any string that conforms to the rules for forming contents of the *DynamicQName* field in a WebSphere MQ object descriptor (structure MQOD), but the last non-blank character must be an asterisk.

TEMPTOPICPREFIX

When creating temporary topics, JMS generates a topic string of the form "TEMP/*TEMPTOPICPREFIX*/*unique_id*", or if this property is left with the default value, just "TEMP/*unique_id*". Specifying a non-empty TEMPTOPICPREFIX allows specific model queues to be defined for creating the managed queues for subscribers to temporary topics created under this connection.

Applicable Objects

ConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: TEMPTOPICPREFIX

JMS administration tool short name: TTP

Programmatic access

Setters/getters

- MQConnectionFactory.setTempTopicPrefix()
- MQConnectionFactory.getTempTopicPrefix()

Values

Any non-null string consisting only of valid characters for a WebSphere MQ topic string. The default value is " " (empty string).

TOPIC

The name of the JMS topic destination, this value is used by the queue manager as the topic string of a publication or subscription.

Applicable Objects

Topic

JMS administration tool long name: TOPIC

JMS administration tool short name: TOP

Values

Any string

A string that forms a valid IBM WebSphere MQ topic string. When using IBM WebSphere MQ as a messaging provider with WebSphere Application Server, specify a value that matches the name by which the topic is known for administrative purposes within WebSphere Application Server.

Related information:

Topic strings

TRANSPORT

The nature of a connection to a queue manager or broker.

Applicable Objects

ConnectionFactory, QueueConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XAQueueConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: TRANSPORT

JMS administration tool short name: TRAN

Programmatic access

Setters/getters

- MQConnectionFactory.setTransportType()
- MQConnectionFactory.getTransportType()

Values

BIND For a connection to a queue manager in bindings mode. This is the default value for administrative tools.

For programs, use WMQConstants.WMQ_CM_BINDINGS.

CLIENT

For a connection to a queue manager in client mode.

For programs, use WMQConstants.WMQ_CM_CLIENT.

DIRECT

For a real-time connection to a broker not using HTTP tunnelling.

For programs, use WMQConstants.WMQ_CM_DIRECT_TCPIP.

DIRECTHTTP

For a real-time connection to a broker using HTTP tunnelling. Only HTTP 1.0 is supported.

For programs, use WMQConstants.WMQ_CM_DIRECT_HTTP.

WILDCARDFORMAT

This property determines which version of wildcard syntax is to be used.

Applicable Objects

ConnectionFactory, TopicConnectionFactory, XAConnectionFactory, XATopicConnectionFactory

JMS administration tool long name: WILDCARDFORMAT

JMS administration tool short name: WCFMT

Programmatic access

Setters/getters

- MQConnectionFactory.setWildCardFormat()
- MQConnectionFactory.getWildCardFormat()

Values

TOPIC_ONLY

Recognizes topic level wildcards only, as used in broker version 2. This is the default value for administrative tools.

For programs, use WMQConstants.WMQ_WILDCARD_TOPIC_ONLY.

CHAR_ONLY

Recognizes character wildcards only, as used in broker version 1.

For programs, use WMQConstants.WMQ_WILDCARD_CHAR_ONLY.

Dependencies between properties of WebSphere MQ classes for JMS objects

The validity of some properties is dependent on the particular values of other properties.

This dependency can occur in the following groups of properties:

- Client properties
- Properties for a real-time connection to a broker
- Exit initialization strings

Client properties

For a connection to a queue manager, the following properties are relevant only if TRANSPORT has the value CLIENT:

- HOSTNAME
- PORT
- CHANNEL
- LOCALADDRESS
- CCDTURL
- CCSID
- COMPHDR
- COMPMSG
- RECEXIT
- RECEXITINIT
- SECEXIT

- SECEXITINIT
- SENDEXIT
- SENDEXITINIT
- SHARECONVALLOWED
- SSLCIPHERSUITE
- SSLCRL
- SSLFIPSREQUIRED
- SSLPEERNAME
- SSLRESETCOUNT
- APPLICATIONNAME

You cannot set values for these properties by using the administration tool if TRANSPORT has the value BIND.

If TRANSPORT has the value CLIENT, the default value of the BROKERVER property is V1 and the default value of the PORT property is 1414. If you set the value of BROKERVER or PORT explicitly, a later change to the value of TRANSPORT does not override your choices.

Properties for a real-time connection to a broker

Only the following properties are relevant if TRANSPORT has the value DIRECT or DIRECTHTTP:

- BROKERVER
- CLIENTID
- DESCRIPTION
- DIRECTAUTH
- HOSTNAME
- LOCALADDRESS
- MAXBUFFSIZE
- MULTICAST (supported only for DIRECT)
- PORT
- PROXYHOSTNAME (supported only for DIRECT)
- PROXYPORT (supported only for DIRECT)

If TRANSPORT has the value DIRECT or DIRECTHTTP, the default value of the BROKERVER property is V2, and the default value of the PORT property is 1506. If you set the value of BROKERVER or PORT explicitly, a later change to the value of TRANSPORT does not override your choices.

Exit initialization strings

Do not set any of the exit initialization strings without supplying the corresponding exit name. The exit initialization properties are:

- RECEXITINIT
- SECEXITINIT
- SENDEXITINIT

For example, specifying `RECEXITINIT(myString)` without specifying `RECEXIT(some.exit.classname)` causes an error.

The ENCODING property

The ENCODING property comprises three sub-properties, in twelve possible combinations.

The valid values that the ENCODING property can take are constructed from the three sub-properties:

integer encoding
Either normal or reversed

decimal encoding
Either normal or reversed

floating-point encoding
IEEE normal, IEEE reversed, or z/OS

The ENCODING property is expressed as a three-character string with the following syntax:
`{N|R}{N|R}{N|R|3}`

In this string:

- N denotes normal
- R denotes reversed
- 3 denotes z/OS
- The first character represents *integer encoding*
- The second character represents *decimal encoding*
- The third character represents *floating-point encoding*

This provides a set of twelve possible values for the ENCODING property.

There is an additional value, the string NATIVE, which sets appropriate encoding values for the Java platform.

The following examples show valid combinations for ENCODING:

```
ENCODING(NNR)
ENCODING(NATIVE)
ENCODING(RR3)
```

SSL properties of JMS objects

Enable Secure Sockets Layer (SSL) encryption using the SSLCIPHERSUITE property. You can then change the characteristics of the SSL encryption using several other properties.

When you specify TRANSPORT(CLIENT), you can enable Secure Sockets Layer (SSL) encrypted communication using the SSLCIPHERSUITE property. Set this property to a valid CipherSuite provided by your JSSE provider; it must match the CipherSpec named on the SVRCONN channel named by the CHANNEL property.

However, CipherSpecs (as specified on the SVRCONN channel) and CipherSuites (as specified on ConnectionFactory objects) use different naming schemes to represent the same SSL encryption algorithms. If a recognized CipherSpec name is specified on the SSLCIPHERSUITE property, JMSAdmin issues a warning and maps the CipherSpec to its equivalent CipherSuite. See SSL CipherSpecs and CipherSuites in JMS for a list of CipherSpecs recognized by WebSphere MQ and JMSAdmin.

If you require a connection to use a CipherSuite that is supported by the IBM Java JSSE FIPS provider (IBMJSSEFIPS), set the SSLFIPSREQUIRED property of the connection factory to YES. The default value of this property is NO, which means that a connection can use any supported CipherSuite. The property is ignored if SSLCIPHERSUITE is not set.

The SSLPEERNAME matches the format of the SSLPEER parameter, which can be set on channel definitions. It is a list of attribute name and value pairs separated by commas or semicolons. For example:

```
SSLPEERNAME(CN=QMGR.*, OU=IBM, OU=WEBSPHERE)
```

The set of names and values makes up a *distinguished name*. For more details about distinguished names and their use with WebSphere MQ, see .

The example given checks the identifying certificate presented by the server at connect-time. For the connection to succeed, the certificate must have a Common Name beginning QMGR., and must have at least two Organizational Unit names, the first of which is IBM and the second WEBSPHERE. Checking is not case-sensitive.

If SSLPEERNAME is not set, no such checking is performed. SSLPEERNAME is ignored if SSLCIPHERSUITE is not set.

The SSLCRL property specifies zero or more CRL (Certificate Revocation List) servers. Use of this property requires a JVM at Java 2 v1.4. This is a space-delimited list of entries of the form:

```
ldap://hostname:[port]
```

optionally followed by a single /. If *port* is omitted, the default LDAP port of 389 is assumed. At connect-time, the SSL certificate presented by the server is checked against the specified CRL servers. See for more about CRL security.

If SSLCRL is not set, no such checking is performed. SSLCRL is ignored if SSLCIPHERSUITE is not set.

The SSLRESETCOUNT property represents the total number of bytes sent and received by a connection before the secret key that is used for encryption is renegotiated. The number of bytes sent is the number before encryption, and the number of bytes received is the number after decryption. The number of bytes also includes control information sent and received by WebSphere MQ classes for JMS.

For example, to configure a ConnectionFactory object that can be used to create a connection over an SSL enabled MQI channel with a secret key that is renegotiated after 4 MB of data have flowed, issue the following command to JMSAdmin:

```
ALTER CF(my.cf) SSLRESETCOUNT(4194304)
```

If the value of SSLRESETCOUNT is zero, which is the default value, the secret key is never renegotiated. The SSLRESETCOUNT property is ignored if SSLCIPHERSUITE is not set.

Rules for selecting the WebSphere MQ messaging provider mode

The WebSphere MQ messaging provider has two modes of operation: WebSphere MQ messaging provider normal mode, and WebSphere MQ messaging provider migration mode. You can select which mode a JMS application uses to publish and subscribe.

The WebSphere MQ messaging provider normal mode uses all the features of a MQ queue manager to implement JMS. This mode is used only to connect to a WebSphere MQ queue manager and can connect to queue managers in either client or bindings mode. This mode is optimized to use the new function.

If you are not using WebSphere MQ Real-Time Transport, the mode of operation used is determined primarily by the **PROVIDERVERSION** property of the connection factory. If you cannot change the connection factory that you are using, you can use the `com.ibm.msg.client.wmq.overrideProviderVersion` property to override any setting on the connection factory. This override applies to all connection factories in the JVM but the actual connection factory objects are not modified.

You can set **PROVIDERVERSION** to the possible values: `7`, `6`, or *unspecified*. However, **PROVIDERVERSION** can be a string in any one of the following formats:

- V.R.M.F
- V.R.M
- V.R
- V

where V, R, M and F are integer values greater than or equal to zero.

7 - Normal mode
Uses the WebSphere MQ messaging provider normal mode.

If you set **PROVIDERVERSION** to 8 only the WebSphere MQ messaging provider normal mode of operation is available. If the queue manager specified in the connection factory settings is not a Version 7.0.1, or later, queue manager, the createConnection method fails with an exception.

The WebSphere MQ messaging provider normal mode uses the sharing conversations feature and the number of conversations that can be shared is controlled by the **SHARECNV()** property on the server connection channel. If this property is set to 0, you cannot use WebSphere MQ messaging provider normal mode and the createConnection method fails with an exception.

6 - Migration mode
Uses the WebSphere MQ messaging provider migration mode.

The WebSphere MQ classes for JMS use the features and algorithms supplied with WebSphere MQ version 6.0. If you want to connect to WebSphere Event Broker version 6.0 or WebSphere Message Broker version 6.0 or 6.1 using WebSphere MQ Enterprise Transport version 6.0, you must use this mode. You can connect to a WebSphere MQ version 7.0.1 queue manager using this mode, but none of the new features of a version 7.0.1 queue manager are used, for example, read ahead or streaming. If you have a WebSphere MQ version 7.0.1 client connecting to a WebSphere MQ version 7.0.1 queue manager on a distributed platform or a WebSphere MQ version 7.0.1 queue manager on z/OS, then the message selection is done by the queue manager rather than on the client system.

unspecified
The **PROVIDERVERSION** property is set to *unspecified* by default.

A connection factory that was created with a previous version of WebSphere MQ classes for JMS in JNDI takes this value when the connection factory is used with the new version of WebSphere MQ classes for JMS. The following algorithm is used to determine which mode of operation is used. This algorithm is used when the createConnection method is called and uses other aspects of the connection factory to determine if WebSphere MQ messaging provider normal mode or WebSphere MQ messaging provider migration mode is required.

1. First, an attempt to use WebSphere MQ messaging provider normal mode is made.
2. If the queue manager connected is not WebSphere MQ version 7.0.1, or later, the connection is closed and WebSphere MQ messaging provider migration mode is used instead.
3. If the **SHARECNV** property on the server connection channel is set to 0, the connection is closed and WebSphere MQ messaging provider migration mode is used instead.
4. If **BROKERVER** is set to V1 or the new default *unspecified* value, WebSphere MQ messaging provider normal mode continues to be used, and therefore any publish/subscribe operations use the new WebSphere MQ version 7.0.1, or later, features.

   See ALTER QMGR for information about the PSMODE parameter of the ALTER QMGR command for further information on compatibility.
5. If **BROKERVER** is set to V2 the action taken depends on the value of **BROKERQMGR** :
   - If the **BROKERQMGR** is blank:

     If the queue specified by the **BROKERCONQ** property can be opened for output (that is, MQOPEN for output succeeds) and **PSMODE** on the queue manager is set to COMPAT or DISABLED, then WebSphere MQ messaging provider migration mode is used.

- If the queue specified by the **BROKERCONQ** property cannot be opened for output, or the **PSMODE** attribute is set to ENABLED:

  WebSphere MQ messaging provider normal mode is used.
- If **BROKERQMGR** is non-blank :

  WebSphere MQ messaging provider mode is used.

When to use PROVIDERVERSION

BROKERQMGR

BROKERCONQ

PSMODE

When to use PROVIDERVERSION

In two cases you must override the default selection of **PROVIDERVERSION** for the WebSphere MQ classes for JMS to work correctly.

There are two scenarios where you cannot use the algorithm described in Rules for selecting the WebSphere MQ messaging provider mode; consider using **PROVIDERVERSION** in these scenarios.

1. If WebSphere Event Broker or WebSphere Message Broker is in compatibility mode, you must specify **PROVIDERVERSION** for them to work correctly.
2. If you are using WebSphere Application Server Version 6.0.1, WebSphere Application Server Version 6.0.2, or WebSphere Application Server Version 6.1, connection factories are defined using the WebSphere Application Server administrative console.

   In WebSphere Application Server the default value of the **BROKERVER** property on a connection factory is V2. The default **BROKERVER** property for connection factories created by using **JMSAdmin** or WebSphere MQ Explorer is V1. This property is now "unspecified" in WebSphere MQ.

If **BROKERVER** is set to V2 (either because it was created by WebSphere Application Server or the connection factory has been used for publish/subscribe before) and has an existing queue manager that has a **BROKERCONQ** defined (because it has been used for publish/subscribe messaging before), the WebSphere MQ messaging provider migration mode is used.

However, if you want the application to use peer-to-peer communication and the application is using an existing queue manager that has ever done publish/subscribe, and has a connection factory with **BROKERVER** set to 2 (if the connection factory was created in WebSphere Application Server this is the default), the WebSphere MQ messaging provider migration mode is used. Using WebSphere MQ messaging provider migration mode in this case is unnecessary; use WebSphere MQ messaging provider normal mode instead. You can use one of the following methods to work around this:

- Set **BROKERVER** to 1 or unspecified. This is dependent on your application.
- Set **PROVIDERVERSION** to 7, which is a custom property in WebSphere Application Server Version 6.1. The option to set custom properties in WebSphere Application Server Version 6.1 and later is not currently documented in the WebSphere Application Server product documentation.

  Alternatively, use the client configuration property, or modify the queue manager connected so it does not have the **BROKERCONQ**, or make the queue unusable.

IBM WebSphere MQ Telemetry Reference

Information about programming MQTT clients

MQ Telemetry Transport format and protocol

The MQ Telemetry Transport (MQTT) is a lightweight publish/subscribe protocol flowing over TCP/IP to connect large numbers of remote sensors and control devices. MQTT is used by specialized applications on small footprint devices that must tolerate low bandwidth and unreliable communication. You can write your own clients to use the published protocol, or use one of the clients supplied with the installation of IBM WebSphere MQ Telemetry. There are additional MQTT clients available as SupportPacs, and from business partners.

IBM WebSphere MQ Telemetry uses version 3.1 of the MQ Telemetry Transport (MQTT) protocol. IBM publishes the protocol specification at http://public.dhe.ibm.com/software/dw/webservices/ws-mqtt/mqtt-v3r1.html.

If you have obtained an MQTT client from a source other then an installation of IBM WebSphere MQ, check the version of the MQTT protocol supported by the client.

Currently, clients from sources other than IBM WebSphere MQ Telemetry typically support a different level of the MQTT protocol and do not work correctly with the IBM WebSphere MQ Telemetry service. For these clients, a thin conversion layer is required that converts the clients to MQTT v3.1. Check with the source of your client if the conversion layer is available as an update to the client you intend to use.

WebSphere MQ Telemetry daemon for devices reference information

Reference information for configuring the WebSphere MQ Telemetry daemon for devices.

WebSphere MQ Telemetry daemon for devices configuration file

Use the daemon configuration file to set WebSphere MQ Telemetry daemon for devices configuration parameters. The configuration file contains three types of parameters that control the daemon: global, bridge, and listener parameters.

Daemon configuration file

WebSphere MQ Telemetry daemon for devices configuration options are selected by entries in the daemon configuration file. The default configuration file is named `amqtdd.cfg`. It is in the same directory as the daemon executable program.

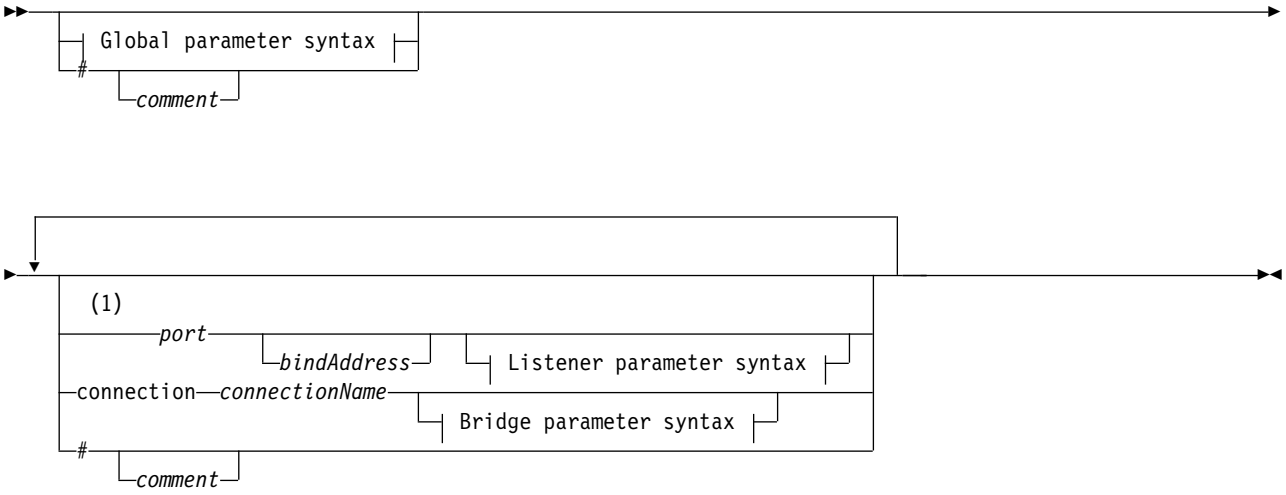
Specify a different configuration file by passing the path and file name as a single parameter when you start the daemon. For example, if the configuration file is called `testdaemon.cfg`, enter the following command to start the daemon:

```
./amqtdd testdaemon.cfg
```

When started, the daemon checks for the existence of the configuration file. If the file does not exist, the daemon runs with default settings.

You can change some of the configuration options while the WebSphere MQ Telemetry daemon for devices is running. Place the updates in a file named `amqtdd.upd`. See Modifying daemon configuration while it is running for the complete list of the commands and options that you can place in `amqtdd.upd`.

Configuration file syntax



Global parameter syntax:

Bridge parameter syntax:

Listener parameter syntax:

Notes:

1 A default listener exists on port. port is a global parameter and defaults to 1883

2 See "Global parameters syntax" on page 2809.

3 See Bridge parameters syntax.

4 See Listener parameters syntax.

The configuration file is a text file. Type each configuration parameter in the configuration file on a single line. You can format the file with spaces and tabs anywhere on a line.

Configuration file parameters

Bridge parameters

Bridge parameters control how this daemon connects to another publish/subscribe broker using the MQTT v3 protocol; see "Bridge parameters" on page 2815.

Bridge parameters must follow any global parameters. All bridge parameters for each connection must be on consecutive lines.

Note: The term bridge is used to describe the bridge component of the daemon. The bridge component makes connections to other brokers using the MQTT V3 protocol and propagates publications from broker to broker; see WebSphere MQ Telemetry daemon for devices bridgesWebSphere MQ Telemetry daemon for devices bridges. A connection is a instance of the bridge that connects to a specific broker. Examples of connections would be a connection to WebSphere MQ using a WebSphere MQ Telemetry channel, or a connection to another daemon.

connection *connectionName*

The name of the connection. The name must be alphanumeric; for example, `connection1`. A connection connects the daemon to a queue manager using a WebSphere MQ telemetry channel or to another daemon using a listener; see "WebSphere MQ Telemetry daemon for devices listener parameters" on page 2818.

connectionName is combined with the system *hostname* to create a `ClientIdentifier`. `ClientIdentifier` identifies the bridge to the listener or telemetry channel it connects to. The bridge is an MQTT v3 client.

Connection indicates the start of a bridge connection section in the configuration file and must follow all the global parameters. Listener sections and bridge sections can occur in any order.

Global parameters

Global parameters control the overall operation of the daemon; see "Global parameters" on page 2811. Global parameters must precede any listener or bridge parameters.

listener *portNumber*|**default** *bindAddress*

Creates a new listener with the specified *portNumber* and an optional local *bindAddress*; see bind_address. The listener connects MQTT clients to the daemon.

listener indicates the start of a listener section in the configuration file and must follow all the global settings. Listener sections and bridge sections can occur in any order.

Listener parameters

Listener parameters control how MQTT clients and other daemons connect to this WebSphere MQ daemon for devices; see "Listener parameters" on page 2819. Listener parameters must follow any global parameters. All listener parameters for each listener must be on consecutive lines.

 # comment

Comments can be placed on any line in the file, by placing a # as the first nonwhite-space character on the line. Trailing comments on a line are not supported.

Example configuration file

```
# Sample configuration
# Daemon listens on port 1882 with persistence in /tmp
port 1882
persistence_location /tmp/
retained_persistence true
```

WebSphere MQ Telemetry daemon for devices global parameters

Set global parameters in the daemon configuration file to control the daemon.

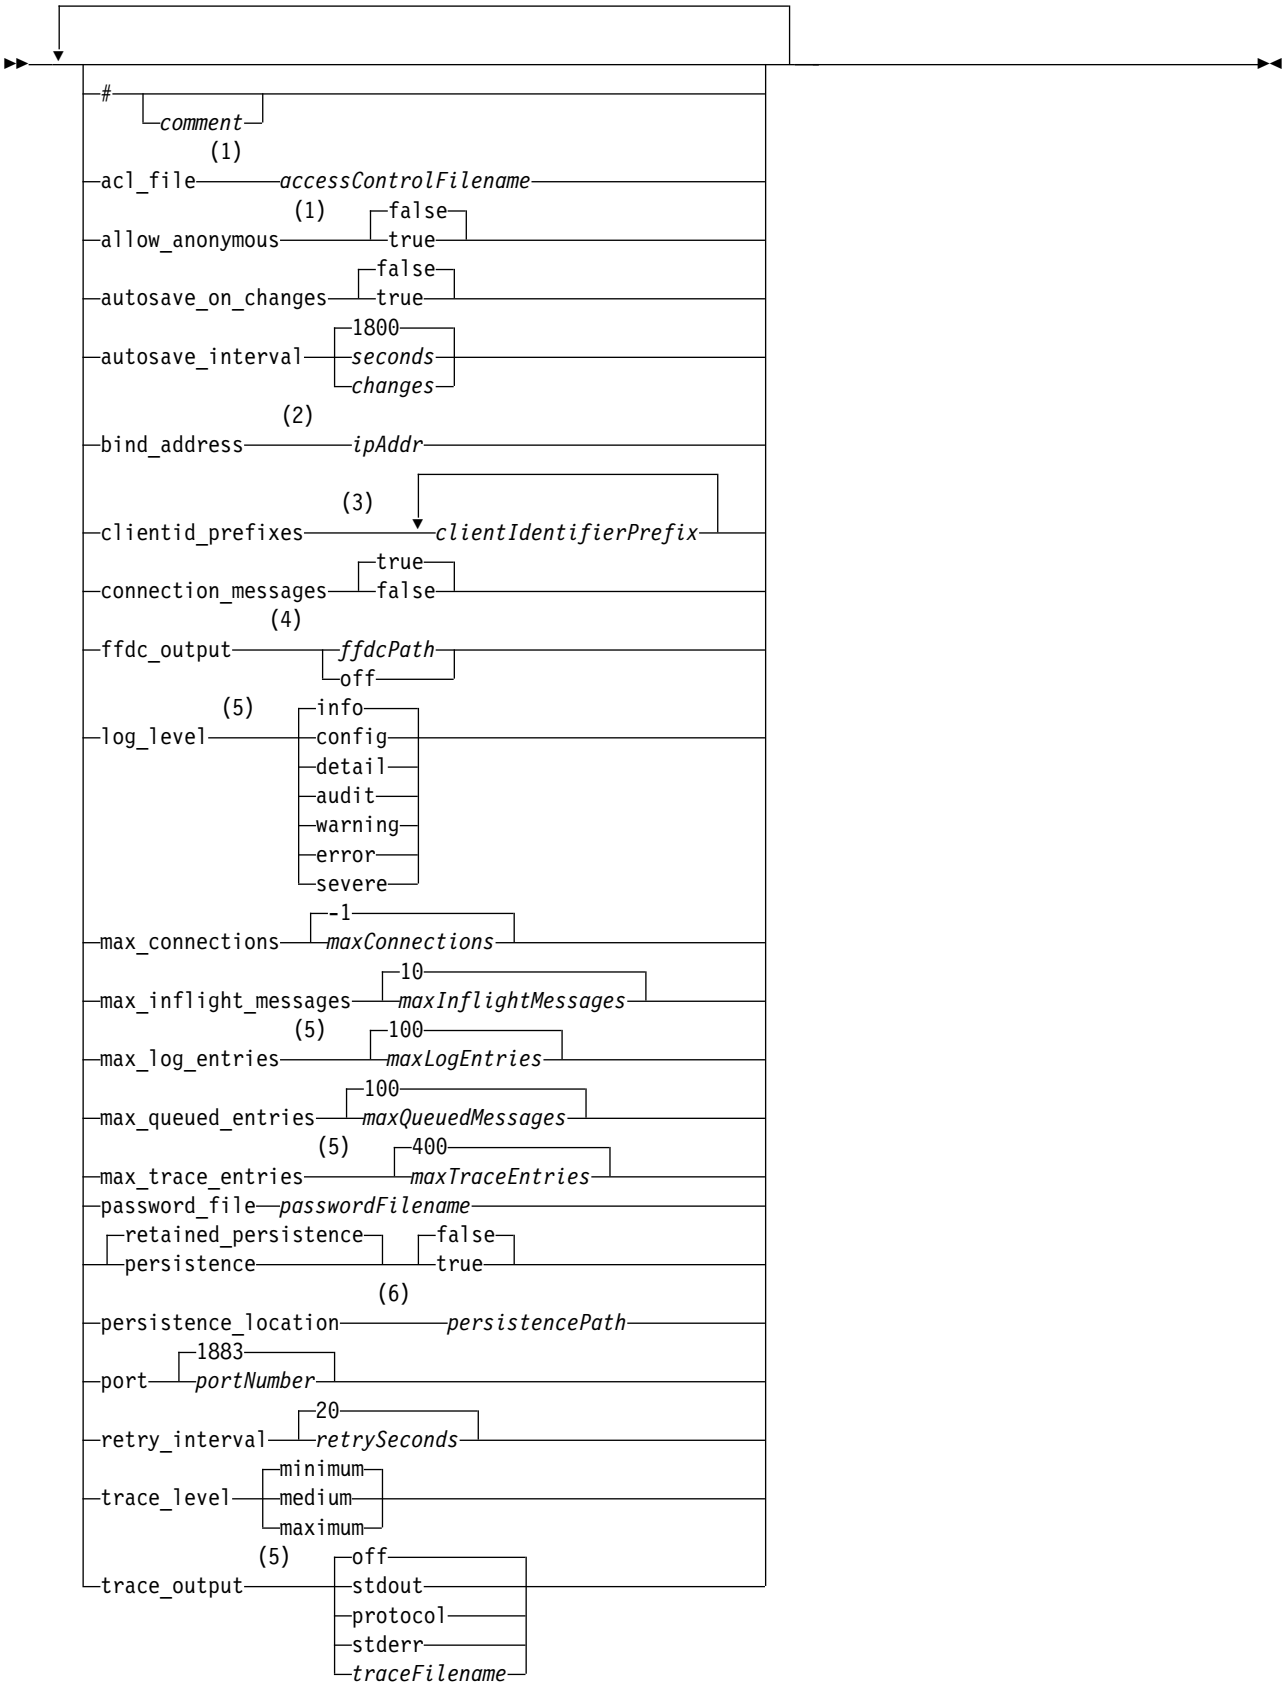
Global parameters syntax

Global parameter settings must precede any bridge or listener sections in the configuration file.

The name and format of the configuration file are described in "WebSphere MQ Telemetry daemon for devices configuration file" on page 2807.

You can modify some of the parameters, while the daemon is running, by placing updates in the `amqtdd.upd` file; see Modifying the daemon while it is running.

Global parameters syntax



Notes:

1 Only allowed if *passwordFilename* specified.

2 The default is connections from all network interfaces are allowed.

3 The default is any client identifiers allowed.

4 The default path is *persistencePath*.

5 Update this parameter while WebSphere MQ Telemetry daemon for devices is running by placing it in the `amqtdd.upd` file.

6 The default path is the installation directory for the WebSphere MQ Telemetry daemon for devices.

Global parameters

Global parameters control the overall operation of the daemon.

 # comment

Comments can be placed on any line in the file, by placing a # as the first nonwhite-space character on the line. Trailing comments on a line are not supported.

acl_file *accessControlFilename*

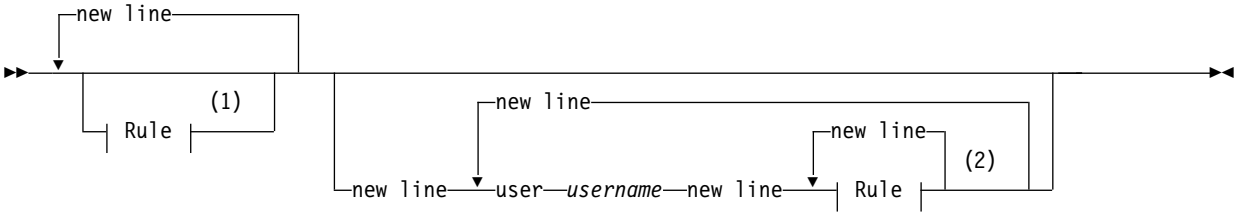
accessControlFilename is the name of a file containing access control rules. The default is not to provide an access control file, and not to apply any access control. Access control is turned on only if `password_file` and *accessControlFilename* are specified. If access control is turned on, the default is to restrict access to every topic. Access is granted to topics by rules in the access control file.

The file is in plain text, with one access control rule per line. The first set of rules is universal, and apply to all users, including anonymous users. After the universal rules, there are sets of rules for any user in the password definition file.

Each rule is a permission, followed by a topic string that can contain wildcards that identify the topics to which the permission is applied. The effect of the rules is cumulative. That is, the daemon starts with no one permitted access any topic. It applies each rule to add to the topics each user is permitted to read and write.

The file is organized as follows:

Access control file syntax



Rule:

Permission:

Notes:

1 Universal rules

2 User-specific rules

3 read/write

The access control file has the following parameters:

permission topicString

Add read or write, or read and write permission to topics that match *topicString*. The rules apply either to all users, or in the user sections of the file, to individual users. The effect of the rules is additive. The rules extend the set of topics a user is allowed to read and write.

Rules that provide full, or read access, cannot use the + wildcard. Write-only rules can use the + wildcard.

Topics in the access control list file must include topic prefixes applied by the use of mount points.

user *username*

The following rules apply to the user in the password file with the user ID, *username*.

allow_anonymous true|false

allow_anonymous is applicable only if `password_file` has been specified. Set allow_anonymous to true to allow clients to connect without providing authentication information. Set allow_anonymous to false to force clients to provide authentication information. See Authentication of clients.

autosave_on_changes true|false

Set autosave_on_changes to change how the value of autosave_interval is used. Set autosave_on_changes to true to trigger an autosave when the number of changes reaches *autosaveChanges*. Set autosave_on_changes to false to trigger an autosave when the number of seconds since the last autosave reaches *autosaveSeconds*.

autosave_interval *autosaveSeconds*|*autosaveChanges*|**1800**

autosave_interval is the length of the autosave interval either in seconds or the number of changes, depending on the autosave_on_changes setting. `0` means no autosave. See Saving retained messages and subscriptions.

bind_address *ipAddr*

The default bind_address value is for the daemon to allow connections from all network interfaces

ipAddr is the local IP address to bind to for the default listener. Use bind_address if the host system has multiple network cards and you want to limit access to be from one network. Specify *ipAddr* as `127.0.0.1` to restrict client connections only to connections from the same workstation as the daemon.

clientid_prefixes *clientIdentifierPrefix*

clientid_prefixes is a list of prefixes to restrict the clients that are allowed to connect to the daemon. Only clients with client identifiers that start with *clientIdentifierPrefix* are allowed to connect. Any other connections are rejected. For example, setting *clientIdentifierPrefix* to `test_` allows only clients with client identifiers such as `test_1` and `test_connection` to connect.

connection_messages true|false

Set connection_messages to true to log client connection and disconnection messages. Set connection_messages to false to turn logging of connection messages off.

ffdc_output *ffdcPath*|**off|Persistence_location**

The default value of ffdc_output is persistencePath.

ffdcPath is the directory path, excluding the file name, used to store FFDC files. The prefix must include the trailing directory separator, / or \.

The value off turns off FFDC writing altogether. Turning off FFDC writing makes problem determination difficult.

log_level config|detail|info|audit|warning|error|severe

log_level is the level of log output required. The log levels are listed in order of increasing importance.

Log messages are written to `stdout` and to the `$SYS/broker/log` topic.

max_connections *maxConnections*|**-1**

The default value of max_connections is `-1`, no limit.

maxConnections is the maximum number of active clients that can connect to the default port. See Listener settings to set this parameter for other ports.

max_inflight_messages *maxInflightMessages*|**10**

maxInflightMessages is the maximum number of QoS=1 or QoS=2 outbound messages that are being acknowledged or sent again for a client; see Qualities of service provided by an MQ Telemetry Transport client.

max_log_entries *maxLogEntries*|**100**

maxLogEntries is the maximum number of log entries remembered for retrieval by the **trace_dump** command or in an FFDC.

max_queued_entries *maxQueuedMessages*|**100**

maxQueuedMessages is the maximum number of QoS=1 or QoS=2 messages that can be queued for delivery to each client; see Qualities of service provided by an MQ Telemetry Transport client.

Note: If the queue of messages for a client fills up, any subsequent messages for that client are discarded and are not delivered to that client. When the queue is able to accept messages again, normal message delivery resumes.

max_trace_entries *maxTraceEntries*|**400**

maxTraceEntries is the maximum number of trace entries remembered for retrieval by the **trace_dump** command or in an FFDC.

password_file *passwordFilename*

The default, having no password file, is not to apply authentication.

passwordFilename is the name of a file containing user name and password authentication information. The file is in plain text, with one password definition per line. Each definition has the following format:

username:*password*

persistence|retained_persistence true|false

Set retained_persistence to true to save retained publications and durable subscriptions when the daemon is shut down and restored when the daemon restarts. Set retained_persistence to false to discard retained messages and subscriptions. See Saving retained messages and subscriptions.

Note: Persistence and retained_persistence are synonyms. Use retained_persistence in preference to persistence.

persistence_location *persistencePath*

The default persistence_location is the directory in which the daemon is installed.

persistencePath is the directory path to store retained messages and durable subscriptions. The path must include the trailing directory separator, / or \ and does not include a file name.

port *portNumber*|**1883**

The default listener uses *portNumber* to listen for MQTT client connections.

retry_interval *retrySeconds*|**20**

retrySeconds is the number of seconds before the daemon tries to send an unacknowledged message with at least once or at most once quality of service again.

trace_level **minimum**|**medium**|**maximum**

trace_level is the level of trace taken and stored in an internal buffer.

trace_output **off**|**stdout**|**stderr**|**protocol**|*tracePath*

trace_output is the destination to write trace entries as they occur. It also controls whether a full trace or just a message trace is taken.

Tracing continues indefinitely until explicitly turned off and results in large files.

The **protocol** setting writes an entry for every MQTT message sent to or received from a client to stdout.

The stdout, stderr and *tracePath* settings write a complete trace to the specified destination.

tracePath is either a path, or a file name, relative to the working directory.

IBM WebSphere MQ Telemetry daemon for devices bridge parameters

Configure a IBM WebSphere MQ Telemetry daemon for devices bridge connection by setting bridge parameters in the daemon configuration file.

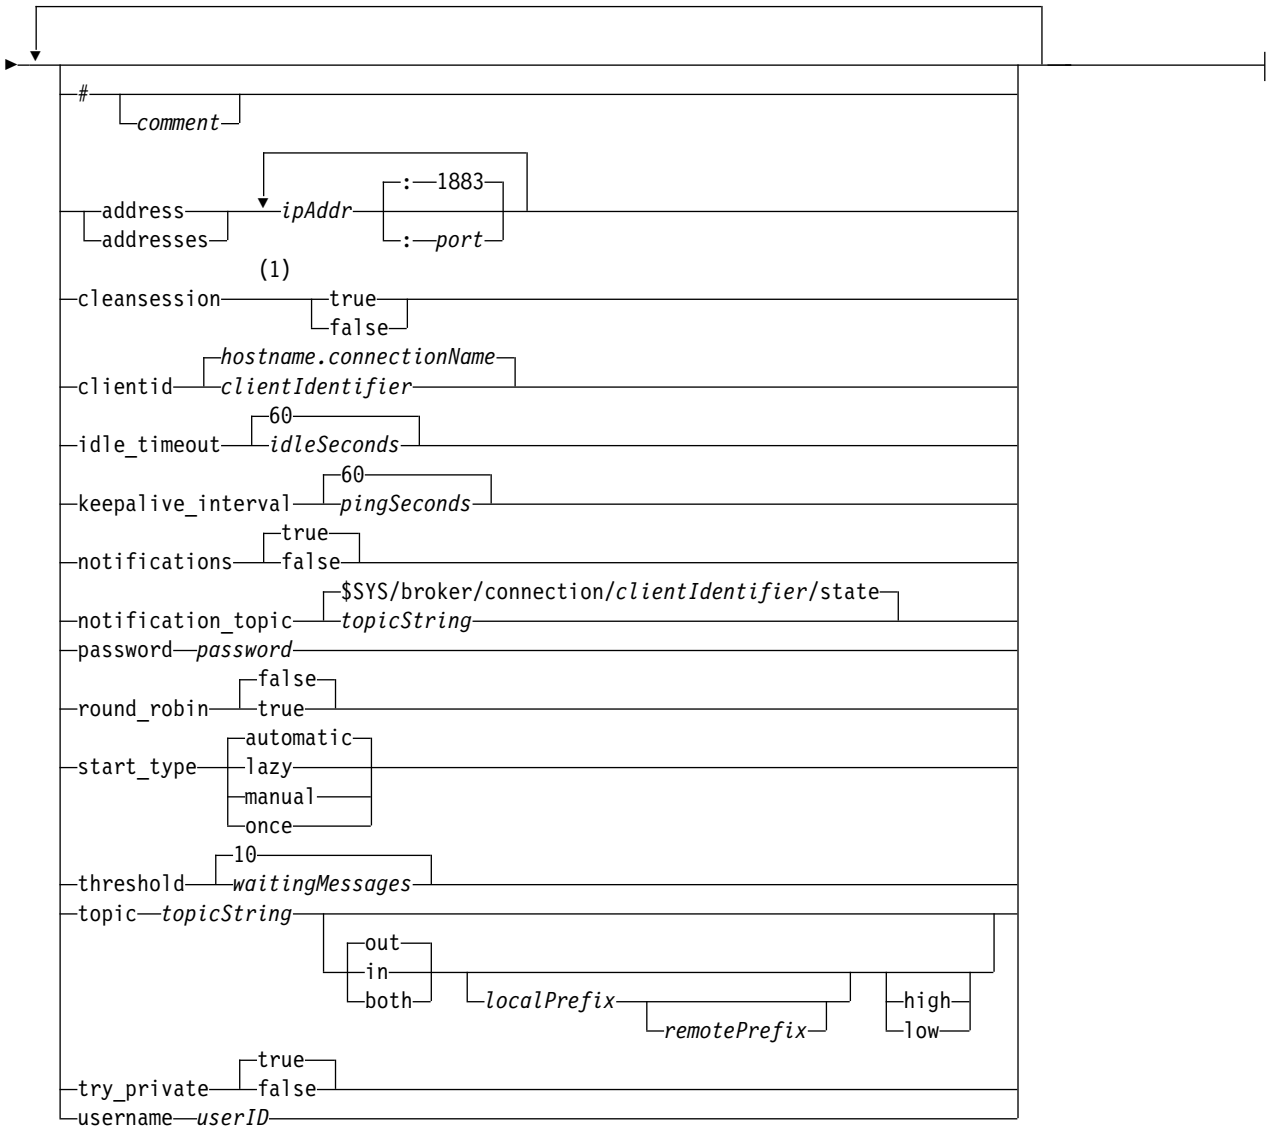
See WebSphere MQ Telemetry daemon for devices bridgesWebSphere MQ Telemetry daemon for devices bridges for an explanation and examples showing how a bridge connection propagates publications to and from the IBM WebSphere MQ Telemetry daemon for devices.

Bridge parameters syntax

Each bridge section of the configuration file starts with a connection parameter, see "WebSphere MQ Telemetry daemon for devices configuration file" on page 2807. The parameters specific to a particular connection immediately follow the connection entry.

The only parameters allowed in the file following a bridge section are parameters belonging to listener sections or additional bridge sections.

Connection:



Notes:

1 If the number of addresses is greater than one, cleansession is true by default, otherwise it is false.

Bridge parameters

 # comment
Comments can be placed on any line in the file, by placing a # as the first nonwhite-space character on the line. Trailing comments on a line are not supported.

address|addresses *ipAddr*:*port*|**1883**
addresses[10] is a list of TCP/IP socket addresses to which the daemon attempts to make a bridge connection. By default, the first address in the list is treated as the primary server; see round_robin.

Use multiple addresses with WebSphere MQ Telemetry in the following configurations;

Multiple queue managers and multiple network addresses.
The list of *ipAddr* connects to telemetry channels on different queue managers. Set

10. Address and Addresses are synonyms. Use either.

round_robin to false if one network address is preferred. Make this the first address in the list. Set cleansession to true. If cleansession is set to false, unpredictable behavior, including lost publications and subscriptions results.

Single multi-instance queue manager
Provide two addresses; the first address is the active queue manager instance and the second address is the standby. Set round_robin to true and cleansession to false.

Single queue manager and multiple network addresses
In this configuration the list of IP addresses all connect to the same queue manager through different network paths. The queue manager is configured with multiple telemetry channels listening to different socket addresses. You might configure the server in this way to introduce redundancy into the network connectivity, or to spread the load of many client connections over multiple network adapters. Set round_robin to false if one network address is preferred. Make this the first address in the list. Set cleansession to false.

See Availability of IBM WebSphere MQ Telemetry daemon for devices bridge connections for more information about using multiple addresses.

cleansession true|false

The default value of cleansession is true if the number of addresses is greater than one, otherwise it is false.

cleansession controls session state when the daemon connects, disconnects, and reconnects. Session state includes subscriptions and queued messages.

Set cleansession to true to discard session state when connecting and disconnecting. Set cleansession to false to save state on disconnecting and restore state on connecting, if possible.

Note: Do not set cleansession to false if addresses lists multiple IP addresses, and the IP addresses connect to telemetry channels hosted by different queue managers, or to different telemetry daemons. Session state is not transferred between queue managers or daemons. Trying to restart an existing session on a different queue manager or daemon results in a new session being started. In-doubt messages are lost, and subscriptions might not behave as expected.

clientid *clientIdentifier*|*hostname.connectionName*

The default *clientIdentifier* is constructed from concatenating the daemon host name with *connectionName*. The host name is truncated after the first `'.'` character or 14 characters, whichever is fewer. The combination is truncated at 23 characters if it is longer than 23 characters.

clientid is passed to the remote server when connecting.

clientid must only contain characters from the range: `A-Z, a-z, 0-9, './_%`.

connection *connectionName*

The name of the connection. The name must be alphanumeric; for example, `connection1`. A connection connects the daemon to a queue manager using a WebSphere MQ telemetry channel or to another daemon using a listener; see "WebSphere MQ Telemetry daemon for devices listener parameters" on page 2818.

connectionName is combined with the system *hostname* to create a `ClientIdentifier`. `ClientIdentifier` identifies the bridge to the listener or telemetry channel it connects to. The bridge is an MQTT v3 client.

Connection indicates the start of a bridge connection section in the configuration file and must follow all the global parameters. Listener sections and bridge sections can occur in any order.

idle_timeout *idleSeconds*|**60**

Set *idleSeconds* to the number of seconds to elapse before the connection is closed.

keepalive_interval *pingSeconds*|**60**

Set *pingSeconds* to the number of seconds between sending MQTT ping requests to the remote system when there has been no other traffic. The minimum value is 5.

notifications true|false

Set notifications to true to switch on bridge connection notifications. Set notifications to false to switch off bridge notifications.

Notifications are retained messages published at both ends of the bridge published to a specially defined topic; see notification_topic.

The notification publication contains a single character indicating the status of the bridge connection. The status is either `1`, connected, or `0`, disconnected.

The status of a bridge connection can be checked at any time.

notification_topic *topicString*|**$SYS/broker/connection/***clientIdentifier***/state**

The default notification_topic is **$SYS/broker/connection/***clientIdentifier***/state**. The default topic includes the *clientIdentifier* of the bridge connection.

Set *topicString* to an alternative topic, if you want to use a different topic to track connection status.

Connection notification messages, with the value `1`, connected, or `0`, disconnected, are published to this topic.

Note: The default *topicString* contains the prefix `$SYS`. Subscribe to topics beginning with `$SYS` by defining a topic filter beginning with `$SYS`. The topic filter `#`, subscribe to everything, does not subscribe to topics beginning with `$SYS` on the daemon. Think of `$SYS` as defining a special system topic space distinct from the application topic space.

password *password*

The default is not to set *password*.

Sets a *password*, which is used in combination with *userID* to authenticate the connection to the remote broker. If the remote connection is to a WebSphere MQ telemetry channel, *userID* is authenticated using JAAS.

round_robin true|false

Set round_robin to true to connect to each address in the addresses list until it is successful. The daemon tries each address in turn starting with the first address, the primary server.

Set round_robin to false to force the daemon to connect to the primary server whenever it is available.

If the primary server is unavailable, the daemon tries each address in turn until it makes a connection. It keeps trying to connect to the primary server in the background. As soon as the primary server becomes available again, the daemon reconnects to it, dropping the connection it is currently using.

start_type automatic|lazy|once|manual

Set start_type to automatic to keep the bridge connected. The connection opens as soon as the daemon starts. If the connection fails, the daemon restarts it after about 20 seconds.

Set to start_type to lazy to reduce network usage and costs. The connection starts when the number of messages waiting reaches *waitingMessages*. The connection is closed when the bridge has been idle for *idleSeconds*.

Set to start_type to manual to start and stop the bridge using start and stop commands; see Modifying daemon configuration while it is running.

Set start_type to once to connect the bridge when the daemon is started and to delete it if it is stopped or disconnected. If start_type is set to once and the bridge is stopped manually, or disconnected due to an error, the bridge cannot be restarted until the daemon is restarted.

threshold *waitingMessages*

If start_type is lazy, the connection starts when the number of queued messages reaches *waitingMessages*.

topic *topicString* **in|out|both** *local_prefix remote_prefix* **high|low**

The value of the topic parameter can comprise up to five parts:

The first part, *topicString* can be prefixed by an additional topic string: *localPrefix*, or *remotePrefix*. Unlike *topicString*, *localPrefix* and *remotePrefix* must not contain wildcards. *localPrefix* and *remotePrefix* usually end with a / character, to align with topic hierarchies at each end of the bridge.

The second part, which takes the values, **in** | **out** | **both**, is called the direction parameter. out is the default setting.

If the direction is out, then the bridge connection subscribes to publications at the local daemon using the topic filter *localPrefix*||*topicString*. The publications that are selected are published to the remotely attached broker with the topic string *remotePrefix*||*topicString*.

If the direction is in, then the bridge connection subscribes to publications at the remote broker using the topic filter *remotePrefix*||*topicString*. The publications that are selected are published to the local daemon with the topic string *localPrefix*||*topicString*.

If the direction is both, then the result is the same as having two topic settings, one set to in and one set to out. Only use the both setting when the brokers have a publication loop detection mechanism. A loop detection mechanism stops a publication entering a perpetual loop. There is no loop detection for a bridge is connected to a WebSphere MQ telemetry channel; see try_private.

The optional fifth part is priority, which signifies the priority given to messages sent or received through the bridge, where the topic matches *topicString*. The priority applies only within the WebSphere MQ Telemetry daemon for devices. You can specify a value of **high** or **low**. If you do not specify a value, the priority is between **high** and **low**. When messages are queued for a client or bridge connection, the messages with the highest priority are sent first. When multiple topics are applied to one bridge connection, the priority applied to a message is the one from the first matching topic. Therefore it is important to consider the order in which the priority value is set in the configuration file.

See Example topic settings for the bridgeWebSphere MQ Telemetry daemon for devices bridges for examples of using the topic parameter.

try_private **true**|**false**

Set **try_private** to check whether the remote broker is another instance of the daemon. If the remote broker is another WebSphere MQ Telemetry daemon for devices, and try_private is set to true, then publication loops between a pair of daemons are detected. Loops involving more complex topologies might not be detected.

username *userID*

The default is not to set *userID*.

Sets a *userID*, which is used in combination with *password* to authenticate the connection to the remote broker. If the remote connection is to a WebSphere MQ telemetry channel, *userID* is authenticated using JAAS.

userID is used for access control if the remote connection is to a daemon. If the remote connection is to a telemetry channel, you have the choice of using *userID* for authorization, or using another identification; see MQTT client identification, authorization, and authentication.

WebSphere MQ Telemetry daemon for devices listener parameters

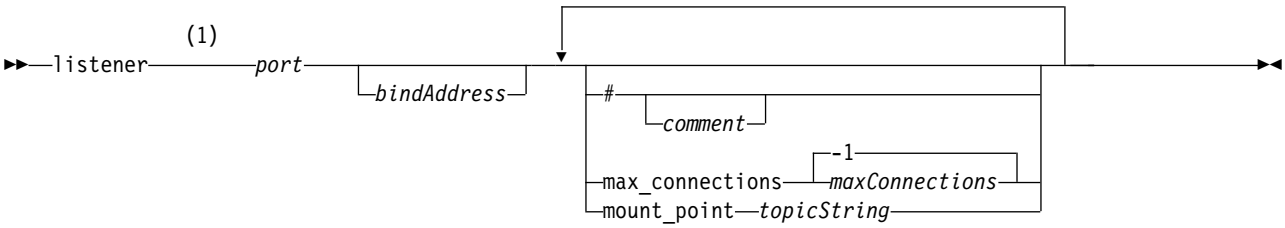
Configure a WebSphere MQ daemon for devices listener by setting listener parameters in the daemon configuration file. MQTT clients and other daemons can connect to a listener and publish and subscribe to topics at the daemon.

Listener parameters syntax

Each listener section of the configuration file starts with a listener parameter, see "WebSphere MQ Telemetry daemon for devices configuration file" on page 2807. The parameters specific to a particular listener immediately follow the listener entry.

The only parameters allowed in the file following a listener section are bridge sections or additional listener sections.

Listener parameters syntax



Notes:

1 A default listener exists on port. port is a global parameter and defaults to 1883

Listener parameters

Configure a listener using the following parameters:

 # comment
Comments can be placed on any line in the file, by placing a # as the first nonwhite-space character on the line. Trailing comments on a line are not supported.

listener *portNumber*|**default** *bindAddress*

Creates a new listener with the specified *portNumber* and an optional local *bindAddress*; see bind_address. The listener connects MQTT clients to the daemon.

listener indicates the start of a listener section in the configuration file and must follow all the global settings. Listener sections and bridge sections can occur in any order.

max_connections *maxConnections*|**-1**

The default value of max_connections is -1, no limit.

Set *maxConnections* to the maximum number of active clients that are allowed to be connected to the port simultaneously.

You can set the global parameter, max_connections to set *maxConnections* for the default port.

mount_point *topicString*

A string that is prefixed to all topic strings published by and subscribed to by clients connecting to this listener. This can be used to ensure clients on different listeners cannot interfere with each other; see Mount points.

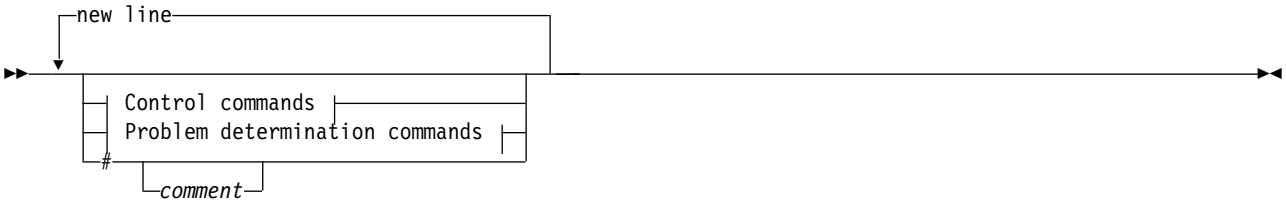
WebSphere MQ Telemetry daemon for devices command file

Use the daemon command file to modify the behavior of a running daemon. You can start and stop a bridge connection, stop the daemon, clear retained publications, and do problem determination.

Command file syntax

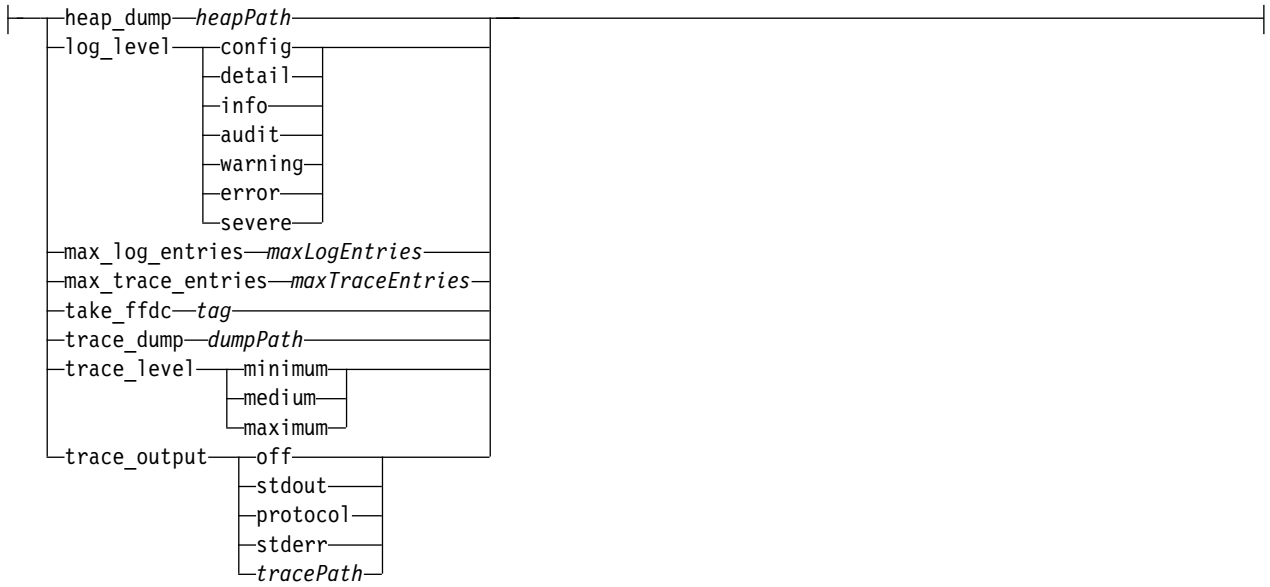
Place commands in the command file, `amqtdd.upd`. Every 5 seconds the daemon runs the commands in the file, and deletes the file.

Each command is a separate line in the command file. The commands are acted upon, in order, line by line. Unrecognized commands are written to the command window from which the daemon was started.

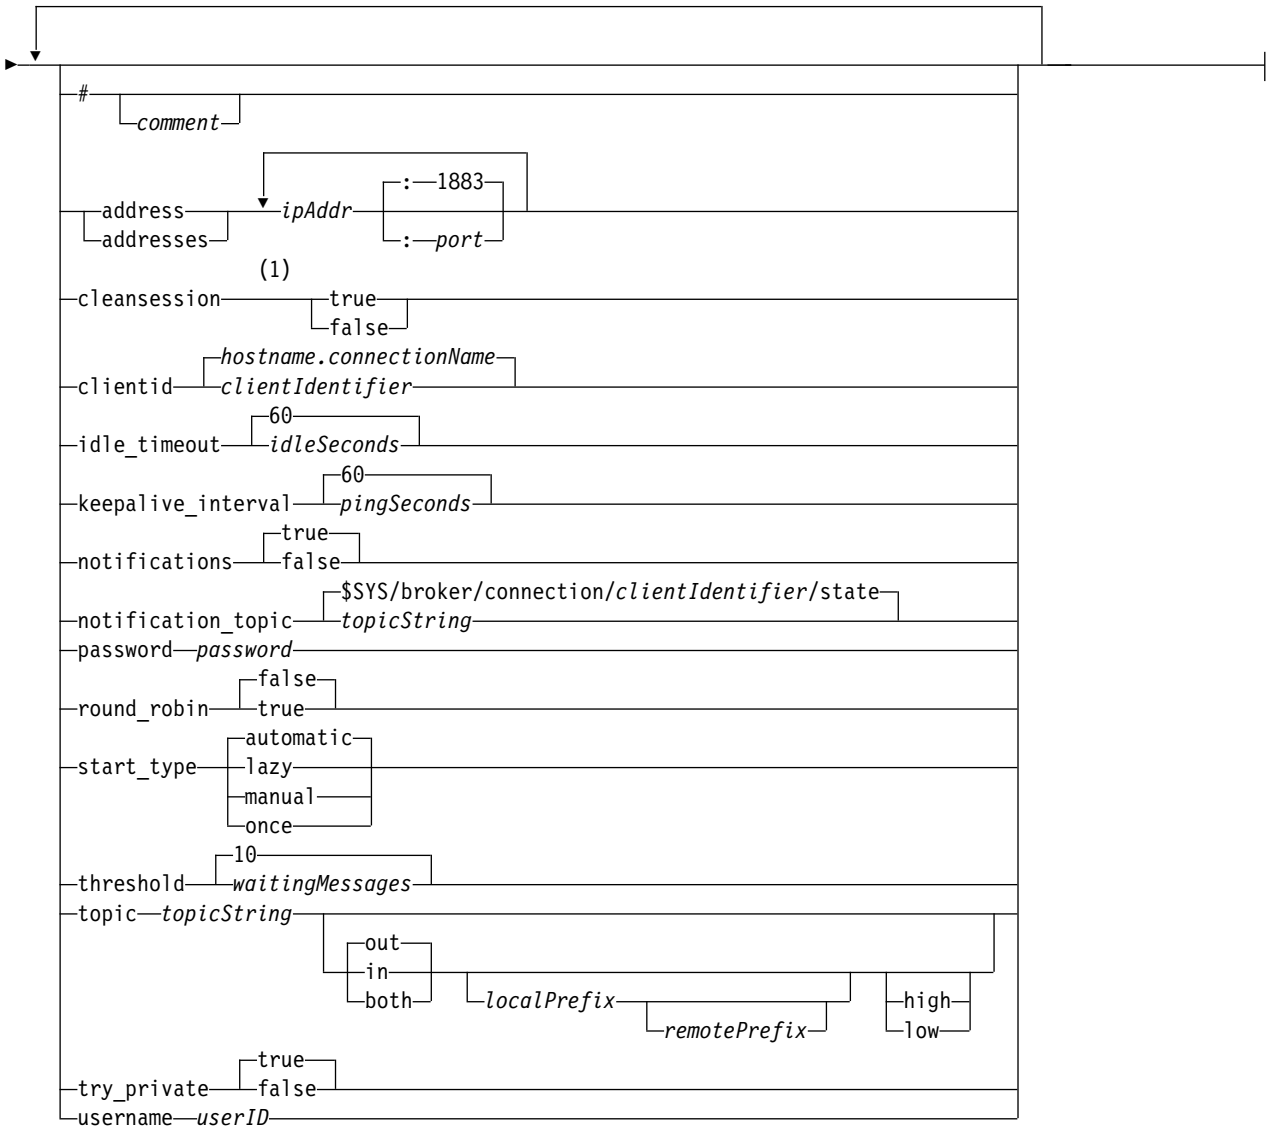


Control commands:

Problem determination commands:



Connection:



Notes:

1 If the number of addresses is greater than one, cleansession is true by default, otherwise it is false.

Control commands

clear_retained *topicString*

Remove retained messages for any topics that match *topicString*. *topicString* can contain wildcards.

Connection

See "Bridge parameters" on page 2815.

delete_connection *connectionName*

Delete the bridge connection *connectionName*. If the connection is running, it is stopped first.

start_connection *connectionName*

Start the bridge connection *connectionName*.

stop_connection *connectionName*

Stop the bridge connection *connectionName*.

Problem determination commands

With the problem determination commands you can modify the settings of log_level, max_log_entries, max_trace_entries, and trace_output. You can also take a heap dump, an FFDC snapshot, or a trace buffer dump.

heap_dump *heapPath*

Create a heap dump and write it to *heapPath*. *heapPath* is either a path, or a filename, relative to the working directory.

log_level config|detail|info|audit|warning|error|severe

log_level is the level of log output required. The log levels are listed in order of increasing importance.

Log messages are written to `stdout` and to the `$SYS/broker/log` topic.

max_log_entries *maxLogEntries*

maxLogEntries is the maximum number of log entries remembered for retrieval by the **trace_dump** command or in an FFDC.

max_trace_entries *maxTraceEntries*

maxTraceEntries is the maximum number of trace entries remembered for retrieval by the **trace_dump** command or in an FFDC.

take_ffdc *tag*

Take a First Failure Data Capture (FFDC) snapshot of the state of the daemon. The snapshot is written to a `.fdc` file in the folder defined by the daemon configuration parameter, `ffdc_output`; see `ffdc_output`. *tag* is embedded in the file for identification purposes.

trace_dump *dumpPath*

Dump the trace buffer to *dumpPath*. *dumpPath* is either a path, or a filename, relative to the working directory.

trace_level minimum|medium|maximum

trace_level is the level of trace taken and stored in an internal buffer.

trace_output off|stdout|stderr|protocol|*tracePath*

trace_output is the destination to write trace entries as they occur. It also controls whether a full trace or just a message trace is taken.

Tracing continues indefinitely until explicitly turned off and results in large files.

The **protocol** setting writes an entry for every MQTT message sent to or received from a client to stdout.

The stdout, stderr and *tracePath* settings write a complete trace to the specified destination.

tracePath is either a path, or a file name, relative to the working directory.

MQXR properties

MQXR property settings are stored in a platform-specific properties file: `mqxr_win.properties` or `mqxr_unix.properties`. You normally configure these properties by using MQSC admin commands or MQ Explorer.

When you start a queue manager for the first time, the template version of the MQXR properties file for your platform is copied from the *mqinstall*`/mqxr/config` directory to the *mqinstall*`/qmgrs/`*qmgr_name*`/mqxr/config` directory.

You do not normally need to edit the MQXR properties file directly, because all properties except one can be configured through MQSC admin commands or MQ Explorer. If you do decide to edit the file directly, stop the queue manager before you make your changes.

The property that you can only set by editing the file directly is **webcontentpath**. If your telemetry client app is a web app, you also need to serve the web app executable JavaScript to the browser. This requirement is explained in The MQTT messaging client for JavaScript and web apps. You use the **webcontentpath** property to specify the directory from which the web app executable files are served:

- By default, **webcontentpath** is not present in the MQXR properties file. If **webcontentpath** is not present, the MQ telemetry server serves the web app executable files from the following default location: *mqinstall*/qmgrs/*qmgr_name*/mqxr/WebContent/*your_client_app*
- if **webcontentpath** specifies a path, the MQ telemetry server serves the web app executable files from that location.
- if **webcontentpath** is present and blank, the MQ telemetry server does not serve the web app executable files.

The list of digital certificate signature algorithms in GSKit that are compliant with FIPS 140-2

The API exit

An *API exit* is a program module that monitors or modifies the function of MQI calls. An API exit comprises multiple *API exit functions*, each with its own entry point in the module.

Note: The information in this section does not apply to WebSphere MQ for z/OS.

There are two categories of exit function:

An exit function that is associated with an MQI call

There are two exit functions in this category for each MQI call and an additional one for an MQGET call with the MQGMO_CONVERT option. The MQCONN and MQCONNX calls share the same exit functions.

For each MQI call, one of the two exit functions is invoked before the queue manager starts to process the call and the other is invoked after the queue manager has completed processing the call. The exit function for an MQGET call with the MQGMO_CONVERT option is invoked during the MQGET call, after the message has been retrieved from the queue by the queue manager but before any data conversion takes place. This allows, for example, a message to be decrypted before data conversion.

An exit function can inspect and modify any of the parameters on an MQI call. On an MQPUT call, for example, an exit function that is invoked before the processing of the call has started can:

- Inspect and modify the contents of the application data in the message being put
- Change the length of the application data in the message
- Modify the contents of the fields in the message descriptor structure, MQMD
- Modify the contents of the fields in the put message options structure, MQPMO

An exit function that is invoked before the processing of an MQI call has started can suppress the call completely. The exit function for an MQGET call with the MQGMO_CONVERT option can suppress data conversion of the message being retrieved.

Initialization and termination exit functions

There are two exit functions in this category, the initialization exit function and the termination exit function.

The initialization exit function is invoked by the queue manager when an application connects to the queue manager. Its primary purpose is to register exit functions and their entry points with the queue manager and perform any initialization processing. You do not have to register all the exit functions, only those that are required for this connection. When the application disconnects from the queue manager, the registrations are removed automatically.

The initialization exit function can also be used to acquire any storage required by the exit and examine the values of any environment variables.

The termination exit function is invoked by the queue manager when an application disconnects from the queue manager. Its purpose is to release any storage used by the exit and perform any required cleanup operations.

An API exit can issue calls to the MQI but, if it does, the API exit is not invoked recursively a second time. The following exit functions, however, are not able to issue MQI calls because the correct environment is not present at the time the exit functions are invoked:

- The initialization exit function
- The exit function for an MQCONN and MQCONNX call that is invoked *before* the queue manager starts to process the call
- The exit function for the MQDISC call that is invoked *after* the queue manager has completed processing the call
- The termination exit function

An API exit can also use other APIs that might be available; for example, it can issue calls to DB2.

An API exit can be used with a WebSphere MQ client application, but it is important to note that the exit is invoked at the *server* end of an MQI channel. For more information, see Comparing link level security and application level security.

An API exit is written using the C programming language.

To enable an API exit, you must configure it. On IBM i, Windows, UNIX and Linux systems, you do this by editing the WebSphere MQ configuration file, mqs.ini, and the queue manager configuration file, qm.ini, for each queue manager.

For a client, modify the `ApiExitLocal` stanza in the mqclient.ini file to identify API exit routines for a queue manager.

You configure an API exit by providing the following information:

- The descriptive name of the API exit.
- The name of the module and its location; for example, the full path name.
- The name of the entry point for the initialization exit function.
- The sequence in which the API exit is invoked relative to other API exits. You can configure more than one API exit for a queue manager.
- Optionally, any data to be passed to the API exit.

For more information about how to configure an API exit, see Configuring API exits.

For information about how to write an API exit, see Using and writing API exits.

The API-crossing exit

An *API-crossing exit* is a program that monitors or modifies the function of MQI calls issued by CICS applications on z/OS.

Note: The information in this section applies only to CICS applications on z/OS.

The API-crossing exit program is invoked by the CICS adapter and runs in the CICS address space.

The API-crossing exit is invoked for the following MQI calls only:

MQBUFMH
MQCB
MQCB_FUNCTION
MQCLOSE
MQCRTMH
MQCTL
MQDLTMH
MQGET
MQINQ
MQOPEN
MQPUT
MQPUT1
MQSET
MQSTAT

MQSUB
MQSUBRQ

For each MQI call, it is invoked once before the processing of the call has started and once after the processing of the call has been completed.

The exit program can determine the name of an MQI call and can inspect and modify any of the parameters on the call. If it is invoked before an MQI call is processed, it can suppress the call completely.

The exit program can use any of the APIs that a CICS task-related user exit can use; for example, the IMS, DB2, and CICS APIs. It can also use any of the MQI calls except MQCONN, MQCONNX, and MQDISC. However, any MQI calls issued by the exit program do not invoke the exit program a second time.

You can write an API-crossing exit in any programming language supported by WebSphere MQ for z/OS.

Before an API-crossing exit can be used, the exit program load module must be available when the CICS adapter connects to a queue manager. The load module is a CICS program that must be named CSQCAPX and reside in a library in the DFHRPL concatenation sequence. CSQCAPX must be defined in the CICS system definition file (CSD), and the program must be enabled.

An API-crossing exit can be managed using the CICS adapter control panels, CKQC. When CSQCAPX is loaded, a confirmation message is written to the adapter control panels or to the system console. The adapter control panels can also be used to enable or disable the exit program.

For more information about how to write and implement an API-crossing exit, see 'The CICS-WebSphere MQ Adapter' section in the CICS Transaction Server for z/OS Version 4.1 product documentation at: CICS Transaction Server for z/OS Version 4.1, The CICS-WebSphere MQ adapter.

Certificate validation and trust policy design on UNIX, Linux and Windows systems

WebSphere MQ validates SSL or TLS certificates according to two types of policy, basic, and standard. Standard policy checking conforms to RFC 5280.

The information in these topics applies to the following systems:

- WebSphere MQ for UNIX and Linux systems
- WebSphere MQ for Windows systems

The following terms are used in this section:

Certificate policy
Determines which fields in a certificate are understood and processed.

OCSP policy
Determines which fields in an OCSP request or response are understood and processed.

CRL policy
Determines which fields in a certificate revocation list are understood and processed.

Path validation policy
Determines how the certificate, OCSP, and CRL policy types interact with each other to determine whether a certificate chain (a trust point "RootCA" to an end-entry "EE") is valid.

The basic and standard path validation policies are described separately because it reflects the implementation within WebSphere MQ for UNIX, Linux and Windows systems. However, the standard

OCSP and CRL policies are the same as the basic policies, and the standard certificate policy is an extended version of the basic policy, so these policies are not described separately.

By default, WebSphere MQ applies basic policy validation first. If basic policy validation fails, WebSphere MQ applies standard policy (RFC 5280) validation. If basic policy validation succeeds, standard policy validation is not applied. Thus, a validation failure means that both basic and standard policy validation failed, possibly for different reasons. A validation success means that either basic policy validation succeeded and standard policy validation was therefore not applied, or basic policy validation failed and standard policy validation succeeded.

Enforcing strict RFC 5280 compliance

To enforce strict RFC 5280 compliance, use the certificate validation policy configuration setting. This setting allows you to disable the basic policy, so that only the standard RFC 5280 policy is used. For more information about the certificate validation policy configuration setting, see Certificate validation policies in WebSphere MQ.

The following examples are digital certificates which are accepted by the basic certificate validation policy, but which are rejected by the RFC 5280 compliant standard policy. In order for a digital certificate chain to be trusted, the entire chain must satisfy the configured validation policy.

To view the full details of a digital certificate, use the **runmqakm** command:

```
runmqakm -cert -details -db key.kdb -pw password -label certificate_label
```

A certificate which has trust status enabled in the **runmqakm** output is not necessarily trusted for use in an SSL or TLS handshake. Trust status enabled means that the certificate is eligible to be used as a CA certificate to verify other certificates, if the certificate also satisfies the rules of the certificate validation policy. For more information about the RFC 5280 compliant standard certificate validation policy, see "Standard path validation policy" on page 2836.

Example certificate 1 - incorrect key usage

This example shows a certificate where the key usage field does not comply with the standard certificate validation policy rules for a CA certificate. One of the requirements for a certificate to be valid for use as a CA certificate is that the key usage field must indicate that it is permitted to sign other certificates using the keyCertSign flag. A certificate without this flag cannot be used as a CA certificate.

Trust Status : Enabled
```

In this example, the key usage field contains only the encipherOnly flag. The keyCertSign flag is not set, so this certificate is not permitted to sign other certificates. It therefore cannot be used as a CA certificate.

Example certificate 2 - missing basic constraints extension

This example shows a certificate which lacks the basic constraints extension. The basic constraints extension is used to indicate whether this certificate is permitted for use as a CA. It is also used to indicate the maximum length of any certificate chain which can be signed by the certificate. The standard certificate validation policy requires that the certificate has a basic constraints extension with the isCA flag set in order to be used as a CA.

Trust Status : Enabled
```

In this example, the certificate lacks the basic constraints field entirely. Therefore this certificate cannot be used as a CA certificate.

Example certificate 3 - intermediate CA with old version of X.509

This example shows an intermediate CA certificate which is at X.509 version 1. The standard certificate validation policy requires that all intermediate CA certificates must be at least X.509 version 3. Root CA certificates are exempt from this requirement as there are still some commonly used version 1 root CA certificates in existence. However, this exemption might change in future.

```

In this example, the version field is X.509 V1. This certificate is an X.509 version 1 certificate and therefore cannot be used as an intermediate CA.

Basic and standard certificate policies

The basic and standard certificate policies support the same fields: the standard policy supports additional certificate extensions.

The supported fields for both the basic and standard policies are as follows:

- OuterSigAlgID[11]
- Signature[12]
- Version
- SerialNumber
- InnerSigAlgID[13]
- Issuer
- Validity
- SubjectName
- SubjectPublicKeyInfo
- IssuerUniqueID
- SubjectUniqueID

The supported extensions for the basic policy are as follows. Where an entry is marked as "not supported", WebSphere MQ does not attempt to process extensions containing a field of that specific type, but does process other types of the same extension.

- AuthorityKeyID
- AuthorityInfoAccess
- SubjectKeyID
- IssuerAltName
- SubjectAltName
- KeyUsage
- BasicConstraints
- PrivateKeyUsage
- CRLDistributionPoints
  - DistributionPoint
    - DistributionPointName (X.500 Name and LDAP Format URI only)
    - NameRelativeToCRLIssuer (not supported)
    - Reasons (ignored)
    - CRLIssuer fields (not supported)

The supported extensions for the standard policy are all those listed for the basic policy and those in the following list. Where an entry is marked as "not supported", WebSphere MQ does not attempt to process extensions containing a field of that specific type, but does process other types of the same extension.

- NameConstraints
- ExtendedKeyUsage
- CertificatePolicies
  - PolicyInformation
    - PolicyIdentifier

---

11. This field is called *signatureAlgorithm* in RFC 5280.
12. This field is called *signatureValue* in RFC 5280.
13. This field is called *signature* in RFC 5280.

    - PolicyQualifiers (not supported)
- PolicyMappings
- PolicyConstraints

Basic and standard OCSP policies

The basic and standard OCSP policies support the same fields.

The supported fields for a request are as follows. Where an entry is marked as "not supported", WebSphere MQ does not attempt to process a request containing a field of that specific type, but does process other requests containing the same higher-level field.

- Signature (Optional)
- Version (Version 1 Only)
- RequesterName (Optional)
- RequestList (single request only)
  - CertID [14]
  - singleRequestExtensions (not supported)
- RequestExtensions
  - Nonce (if enabled)

The supported fields for a response are as follows:

- ResponseStatus
- Response
  - responseType (id-pkix-ocsp-basic)
  - BasicOCSPResponse
    - Signature
    - Certs
      - Extensions
      - extendedKeyUsage
        - id-kp-OCSPSigning
      - id-pkix-ocsp-nocheck
    - ResponseData
      - Version (Version 1 Only)
      - ResponderID (by name or by hash)
      - ProducedAt (ignored)
      - Responses (multiple responses supported)
        - SingleResponse
          - certID
          - certStatus
            - RevokedInfo (ignored)
          - thisUpdate (ignored)
          - nextUpdate
          - singleExtensions (ignored)
      - responseExtensions
        - Nonce (if enabled)

14. This field is called reqCert in RFC 2560

Basic and standard CRL policies

The basic and standard CRL policies support the same fields and extensions.

The supported fields for these policies are as follows:

- OuterSigAlgID[15]
- Signature[16]
- Version
- InnerSigAlgID[17]
- Issuer
- ThisUpdate
- NextUpdate
- RevokedCertificate
  - UserCertificate
  - RevocationDate

There are no supported CRLEntry extensions.

The supported CRL extensions for these policies are as follows. Where an entry is marked as "not supported", WebSphere MQ does not attempt to process extensions containing a field of that specific type, but does process other types of the same extension.

- AuthorityKeyID
- IssuerAltName
- CRLNumber
- IssuingDistributionPoint
  - DistributionPoint
  - DistributionPointName
    - FullName (X.500 Name and LDAP Format URI only)
    - NameRelativeToCRLIssuer (not supported)
  - Reasons (ignored)
  - CRLIssuer
  - OnlyContainsUserCerts (not supported)
  - OnlyContainsCACerts (not supported)
  - OnlySomeReasons (not supported)
  - IndirectCRL[18] (rejected)

15. This field is called *signatureAlgorithm* in RFC 5280.
16. This field is called *signatureValue* in RFC 5280.
17. This field is called *signature* in RFC 5280.
18. IndirectCRL extensions will result in CRL validation failing. IndirectCRL extensions must not be used because they cause identified certificates to not be rejected.

Basic path validation policy

The basic path validation policy determines how the certificate, OCSP, and CRL policy types interact with each other to determine if a certificate chain is valid.

The validation of a chain is performed in the following manner (but not necessarily in the following order):

1. Ensure that the name of the certificate's issuer is equal to the subject name in the previous certificate, and that there is not an empty issuer name in this certificate or the previous certificate subject name. If no previous certificate exists in the path and this is the first certificate in the chain, ensure that the issuer and subject name are identical and that the trust status is set for the certificate[19].

   Note: WebSphere MQ for UNIX, Linux and Windows systems will fail path validation in situations where the previous certificate in a path has the same subject name as the current certificate.
2. Ensure that the signature algorithm used to actually sign the certificate matches the signature algorithm indicated within the certificate, by ensuring that the issuer signature algorithm identifier in the certificate matches the algorithm identifier in the signature data.
3. Ensure that the certificate was signed by the issuer, using the subject public key from the previous certificate in the path to verify the signature on the certificate. If no previous certificate exists and this is the first certificate, use the subject public key of the certificate to verify the signature on it. WebSphere MQ supports DSA and RSA signature algorithms; however it does not support DSA Parameter Inheritance.
4. Ensure that the certificate is a known X509 version, unique IDs are not present for version 1 certificates, and extensions are not present for version 1 and version 2 certificates.
5. Ensure that the certificate has not expired, or not been activated yet, and that its validity period is good[20].
6. Ensure that there are no unknown critical extensions or any duplicate extensions.
7. Ensure that the certificate has not been revoked. Here, the following operations apply:
   a. If the OCSP connection is enabled and a Responder Address is configured or the Certificate has a valid AuthorityInfoAccess extension specifying a HTTP format GENERALNAME_uniformResourceID check revocation status with OCSP.
   b. If revocation status from 7a above is undetermined the CRLDistributionPoints extension is checked for a list of X.500 distinguished name GENERALNAME_directoryname and URI GENERALNAME_uniformResourceID. Only LDAP, HTTP and FILE format URIs are supported. If the extension is not present, or use of the CRLDistributionPoints extension results in undetermined status and the extension is not Critical, the certificate's issuer's name is used to query revocation status. A CRL database (LDAP) is then queried for CRLs. If the certificate is not the last certificate, or if the last certificate has the basic constraint extension with the "isCA" flag turned on, the database is queried for ARLs and CRLs instead. If CRL checking is enabled, and no CRL database can be queried, the certificate is treated as revoked. Currently, the X500 directory name form and the LDAP/HTTP/FILE URI forms are the only supported name forms used to look up CRLs and ARLs[21].

      Note: RelativeDistinguishedNames are not supported.

---

19. Trust status is an administrative setting in the key database file. You can access and alter the trust status of a particular signer certificate in iKeyman. Select the required certificate from the signer list and click **View/Edit...**. The **Set the certificate as a trusted root** check box on the resulting panel indicates the trust status. You can also set Trust status using iKeycmd with the `-trust` flag on the **-cert -modify** command. For further information about this command, see Managing keys and certificates.
20. There are no checks to ensure the subject's validity is within bounds of the issuer's validity. This is not required, and it has been shown that certificates from some CAs do not pass such a check.
21. After they are retrieved from the database, ARLs are evaluated in exactly the same fashion as CRLs. Many CAs do not issue ARLs. However, WebSphere MQ will look for ARLs and CRLs if checking a CA certificate for revocation status.

c. If revocation status from both 7a on page 2833 and 7b on page 2833 is undetermined, WebSphere MQ checks the *OCSPAuthentication* configuration setting to decide whether to allow the connection.[22]

8. If the issuerAltName extension is marked critical, ensure that the name forms are recognized. The following general name forms are currently recognized:
   - rfc822
   - DNS
   - directory
   - URI
   - IPAddress(v4/v6)
9. If the subjectAltName extension is marked critical, ensure that the name forms are recognized. The following general name forms are currently recognized:
   - rfc822
   - DNS
   - directory
   - URI
   - IPAddress(v4/v6)
10. If the KeyUsage extension is critical on a non-EE certificate, ensure that the keyCertSign flag is on, and ensure that if the BasicConstraints extension is present, the "isCA" flag is true.
11. If the BasicConstraints extension is present, the following checks are made:
    - If the "isCA" flag is false, ensure the certificate is the last certificate in the chain and that the pathLength field is not present.
    - If the "isCA" flag is true and the certificate is NOT the last certificate in the chain, ensure that the number of certificates until the last certificate in the chain is not greater than the pathLength field.
12. The AuthorityKeyID extension is not used for path validation, but is used when building the certificate chain.
13. The SubjectKeyID extension is not used for path validation, but is used when building the certificate chain.
14. The PrivateKeyUsagePeriod extension is ignored by the validation engine, because it cannot determine when the CA actually signed the certificate. The extension is always non-critical and therefore can be safely ignored.

An OCSP Response is also validated to ensure that the response itself is valid. Validation is performed in the following manner (but not necessarily the following order):

1. Ensure that response status is `Successful` and the response type is PKIX_AD_OCSP_basic.r
2. Ensure that response version data is present and the response is the correct version (Version 1)
3. Ensure that the response is correctly signed. The signature will be rejected if the signer does not meet at least one of the following criteria:
   - The signer matches a local configuration of OCSP signing authority[23] for the certificate.
   - The signer is using the CA key for which the public key is contained in the CA certificate, that is, the CA itself is directly signing the response.
   - The signer is a direct sub-ordinate of the CA that signed the certificate for which revocation information is being checked and is authorized by the CA by including the value of id-ad-ocspSigning in an ExtendedKeyUsage extension.

---

22. If *OCSPAuthentication* is set to `WARN`, WebSphere MQ logs the unknown revocation status and allows the connection to continue.

23. This is a Certificate in the KeyStore a user has installed and that has Trust Status set.

Note: Revocation checking of the response signer certificate is not performed if the id-pkix-ocsp-nocheck extension is present.

4. Ensure that response hash algorithm, serialNumber, issuerNameHash, and issuerKeyHash match those of the request.
5. Ensure that the response has not expired, that is, that the nextUpdate time is greater than the current time.[24]
6. Ensure that the certificate has valid revocation status.

The validation of a CRL is also performed to ensure that the CRL itself is valid, and is performed in the following manner (but not necessarily the following order):

1. Ensure that the signature algorithm used to actually sign the CRL matches the signature algorithm indicated within the CRL, by ensuring that the issuer signature algorithm identifier in the CRL matches the algorithm identifier in the signature data.
2. Ensure that the CRL was signed by the issuer of certificate in question, verifying that the CRL has been signed with the key of the certificate issuer.
3. Ensure that the CRL has not expired[25], or not been activated yet, and that its validity period is good.
4. Ensure that if the version field is present, it is version 2. Otherwise the CRL is version 1 and must not have any extensions. However, WebSphere MQ for UNIX, Linux and Windows systems only verifies that no critical extensions are present for a version 1 CRL.
5. Ensure that the certificate in question is on the revokedCertificates field list and that the revocation date is not in the future.
6. Ensure that there are no duplicate extensions.
7. If unknown critical extensions, including critical entry extensions, are detected in the CRL, this causes identified certificates to be treated as revoked[26] (provided the CRL passes all other checks).
8. If the authorityKeyID extension in the CRL and the subjectKeyID in the CA certificate are present and if the keyIdentifier field is present within the authorityKeyID of the CRL, match it with the CACertificate's subjectKeyID.
9. If the issuerAltName extension is marked critical, ensure that the name forms are recognized. The following general name forms are currently recognized:
   - rfc822
   - DNS
   - directory
   - URI
   - IPAddress(v4/v6)

---

24. If no current OCSP responses are returned from the responder, WebSphere MQ will attempt to use out of date responses in determining the revocation status of a Certificate. WebSphere MQ attempts to use out of date Responses so that security will not be adversely reduced.

25. If no current CRLs are found, WebSphere MQ for UNIX, Linux and Windows systems will attempt to use out of date CRLs to determine the revocation status of a Certificate. It is not clearly specified in RFC 5280 what action to take in the event of no current CRLs. WebSphere MQ for UNIX, Linux and Windows systems attempt to use out of date CRLs so that security will not be adversely reduced.

26. ITU X.509 and RFC 5280 are in conflict in this case because the RFC mandates that CRLs with unknown critical extensions must fail validation. However, ITU X.509 requires that identified certificates must still be treated as revoked provided the CRL passes all other checks. WebSphere MQ for UNIX, Linux and Windows systems adopt the ITU X.509 guidance so that security will not be adversely reduced.

    A potential scenario exists where the CA that issues a CRL might set an unknown critical extension to indicate that even though all other validation checks are successful, a certificate which is identified must not be considered revoked and thus not rejected by the application. In this scenario, following X.509, WebSphere MQ for UNIX, Linux and Windows systems will function in a fail-secure mode of operation. That is, they might reject certificates that the CA did not intend to be rejected and therefore might deny service to some valid users. A fail-insecure mode ignores a CRL because it has an unknown critical extension and therefore certificates that the CA intended to be revoked are still accepted. The administrator of the system should then query this behavior with the issuing CA.

10. If the issuingDistributionPoint extension is present in the CRL, process as follows:
    - If the issuingDistributionPoint specifies an InDirectCRL then fail the CRL validation.
    - If the issuingDistributionPoint indicates that a CRLDistributionPoint is present but no DistributionPointName is found, fail the CRL validation
    - If the issuingDistributionPoint indicates that a CRLDistributionPoint is present and specifies a DistributionPointName ensure that it is a GeneralName or LDAP format URI that matches the name given by the certificate's CRLDistributionPoint or the certificate's issuer's name. If the DistributionPointName is not a GeneralName then the CRL validation will fail.

      Note: RelativeDistinguishedNames are not supported and will fail CRL validation if encountered.

Standard path validation policy

The standard path validation policy determines how the certificate, OCSP, and CRL policy types interact with each other to determine if a certificate chain is valid. Standard policy checking conforms to RFC 5280.

Path validation uses the following concepts:

- A certification path of length *n*, where the trust point or root certificate is certificate 1, and the EE is *n*.
- A set of initial policy identifiers (each comprising a sequence of policy element identifiers), that identifies one or more certificate policies, any one of which is acceptable for the purposes of certification path processing, or the special value "any-policy". Currently this is always set to "any-policy".

  Note: WebSphere MQ for UNIX, Linux and Windows systems only supports policy identifiers that are created by WebSphere MQ for UNIX, Linux and Windows systems.
- Acceptable policy set: a set of certificate policy identifiers comprising the policy or policies recognized by the public key user, together with policies deemed equivalent through policy mapping. The initial value of the acceptable policy set is the special value "any-policy".
- Constrained subtrees: a set of root names defining a set of subtrees within which all subject names in subsequent certificates in the certification path can fall. The initial value is "unbounded".
- Excluded subtrees: a set of root names defining a set of subtrees within which no subject name in subsequent certificates in the certification path can fall. The initial value is "empty".
- Explicit policy: an integer which indicates if an explicit policy identifier is required. The integer indicates the first certificate in the path where this requirement is imposed. When set, this variable can be decreased, but cannot be increased. (That is, if a certificate in the path requires explicit policy identifiers, a later certificate cannot remove this requirement.) The initial value is n+1.
- Policy mapping: an integer which indicates if policy mapping is permitted. The integer indicates the last certificate on which policy mapping may be applied. When set, this variable can be decreased, but cannot be increased. (That is, if a certificate in the path specifies policy mapping is not permitted, it cannot be overridden by a later certificate.) The initial value is n+1.

The validation of a chain is performed in the following manner (but not necessarily the following order):

1. The information in the following paragraph is consistent with the basic path validation policy described in “Basic path validation policy” on page 2833:

   Ensure that the name of the certificate's issuer is equal to the subject name in the previous certificate, and that there is not an empty issuer name in this certificate or the previous certificate subject name. If no previous certificate exists in the path and this is the first certificate in the chain, ensure that the issuer and subject name are identical and that the trust status is set for the certificate[27].

27. Trust status is an administrative setting in the key database file. You can access and alter the trust status of a particular signer certificate in iKeyman. Select the required certificate from the signer list and click **View/Edit...**. The **Set the certificate as a trusted root** check box on the resulting panel indicates the trust status. You can also set Trust status using iKeycmd with the `-trust` flag on the **-cert -modify** command. For further information about this command, see Managing keys and certificates.

If the certificate does not have a subject name, the subjectAltName extension must be present and critical.

2. The information in the following paragraph is consistent with the basic path validation policy described in “Basic path validation policy” on page 2833:

   Ensure that the signature algorithm used to actually sign the certificate matches the signature algorithm indicated within the certificate, by ensuring that the issuer signature algorithm identifier in the certificate matches the algorithm identifier in the signature data.

   If both the certificate's issuersUniqueID and the issuer's subjectUniqueID are present, ensure they match.

3. The following information is consistent with the basic path validation policy described in “Basic path validation policy” on page 2833:

   Ensure that the certificate was signed by the issuer, using the subject public key from the previous certificate in the path to verify the signature on the certificate. If no previous certificate exists and this is the first certificate, use the subject public key of the certificate to verify the signature on it.

4. The following information is consistent with the basic path validation policy described in “Basic path validation policy” on page 2833:

   Ensure that the certificate is a known X509 version, unique IDs are not present for version 1 certificates and extensions are not present for version 1 and version 2 certificates.

5. The following information is consistent with the basic path validation policy described in “Basic path validation policy” on page 2833:

   Ensure that the certificate has not expired, or not been activated yet, and that its validity period is good[28]

6. The following information is consistent with the basic path validation policy described in “Basic path validation policy” on page 2833:

   Ensure that there are no unknown critical extensions, nor any duplicate extensions.

7. The following information is consistent with the basic path validation policy described in “Basic path validation policy” on page 2833:

   Ensure that the certificate has not been revoked. Here, the following operations apply:

   a. If the OCSP connection is enabled and a Responder Address is configured or the Certificate has a valid AuthorityInfoAccess extension specifying an HTTP format GENERALNAME_uniformResourceID check revocation status with OCSP.

      1) WebSphere MQ for UNIX and Windows systems allows the OCSP Request to be optionally signed for preconfigured responders but this has otherwise no impact on OCSP Response processing.

   b. If revocation status from 7a is undetermined the CRLDistributionPoints extension is checked for a list of X.500 distinguished name GENERALNAME_directoryname and URI GENERALNAME_uniformResourceID. If the extension is not present, the certificate's issuer's name is used. A CRL database (LDAP) is then queried for CRLs. If the certificate is not the last certificate, or if the last certificate has the basic constraint extension with the "isCA" flag turned on, the database is queried for ARL's and CRL's instead. If CRL checking is enabled, and no CRL database can be queried, the certificate is treated as revoked. Currently, the X500 directory name form and the LDAP/HTTP/FILE URI forms are the only supported name forms used to look up CRLs and ARLs15.

28. There are no checks to ensure the subject's validity is within bounds of the issuer's validity. This is not required, and certificates from some CAs have been shown to not pass such a check.

Note: RelativeDistinguishedNames are not supported.

8.

The following information is consistent with the basic path validation policy described in “Basic path validation policy” on page 2833:

If the subjectAltName extension is marked critical, ensure that the name forms are recognized. The following general name forms are currently recognized:

- rfc822
- DNS
- directory
- URI
- IPAddress(v4/v6)

9. Ensure that the subject name and subjectAltName extension (critical or noncritical) is consistent with the constrained and excluded subtrees state variables.
10. If the EmailAddress OID is present in the subject name field as an IA5 string, and there is no subjectAltName extension, the EmailAddress must be consistent with the constrained and excluded subtrees state variable.
11. Ensure that policy information is consistent with the initial policy set :
    a. If the explicit policy state variable is less than or equal to the current certificate's numeric sequence value, a policy identifier in the certificate shall be in the initial policy set.
    b. If the policy mapping variable is less than or equal to the current certificate's numeric sequence value, the policy identifier cannot be mapped.
12. Ensure that policy information is consistent with the acceptable policy set:
    a. If the certificate policies extension is marked critical[29], the intersection of the policies extension and the acceptable policy set is non-null.
    b. The acceptable policy set is assigned the resulting intersection as its new value.
13. Ensure that the intersection of the acceptable policy set and the initial policy set is non-null. If the special Policy of anyPolicy is present then allow it only if it has not been inhibited by the inhibitAnyPolicy extension at this chain position.
14. If an inhibitAnyPolicy extension is present ensure that it is marked Critical and, if so, set the inhibitAnyPolicy state and chain position to the value of the integer value of the extension provided it is not greater than the current value. This is the number of certificates to allow with an anyPolicy Policy before disallowing the anyPolicy Policy.
15. The following steps are performed for all certificates except the last one:
    a. If the issuerAltName extension is marked critical, ensure that the name forms are recognized. The following general name forms are currently recognized:
       - rfc822
       - DNS
       - directory
       - URI
       - IPAddress(v4/v6)
    b.
       1) If the BasicConstraints extension is not present, the certificate is only valid as an EE certificate.
       2) If the BasicConstraints extension is present, ensure that the "isCA" flag is true. Note that "isCA" is always checked to ensure it is true to be as part of the chain building itself,

29. This is maintained as a legacy requirement from RFC2459 (6.1 (e)(1))

however this specific test is still made. If the pathLength field is present, ensure the number of certificates until the last certificate is not greater than the pathLength field.

c. If the KeyUsage extension is critical, ensure that the keyCertSign flag is on, and ensure that if the BasicConstraints extension is present, that the "isCA" flag is true[30].

d. If a policy constraints extension is included in the certificate, modify the explicit policy and policy mapping state variables as follows:
   - i. If requireExplicitPolicy is present and has value *r*, the explicit policy state variable is set to the minimum of its current value and the sum of *r* and *i* (the current certificate in the sequence).
   - ii. If inhibitPolicyMapping is present and has value *q*, the policy mapping state variable is set to the minimum of its current value and the sum of *q* and *i* (the current certificate in the sequence).

e. If the policyMappings extension is present (see 12(b)), ensure that it is not critical, and if policy mapping is allowed, these mappings are used to map between this certificate's policies and its signee's policies.

f. If the nameConstraints extension is present, ensure that it is critical, and that the permitted and excluded subtrees adhere to the following rules before updating the chain's subtree's state in accordance with the algorithm described in RFC 5280 section 6.1.4 part (g):
   1) The minimum field is set to zero.
   2) The maximum field is not present.
   3) The base field name forms are recognized. The following general name forms are currently recognized:
      - rfc822
      - DNS
      - directory
      - URI
      - IPAddress(v4/v6)

16. The ExtendedKeyUsage extension is not checked by WebSphere MQ.

17. The following information is consistent with the basic path validation policy described in “Basic path validation policy” on page 2833:

    The AuthorityKeyID extension is not used for path validation, but is used when building the certificate chain.

18. The following information is consistent with the basic path validation policy described in “Basic path validation policy” on page 2833:

    The SubjectKeyID extension is not used for path validation, but is used when building the certificate chain.

19. The following information is consistent with the basic path validation policy described in “Basic path validation policy” on page 2833:

    The PrivateKeyUsagePeriod extension is ignored by the validation engine, because it cannot determine when the CA actually signed the certificate. The extension is always non-critical and therefore can be safely ignored.

30. This check is in fact redundant because of step (b), but the check is still made.

Cryptographic hardware

On UNIX, Linux and Windows systems, WebSphere MQ provides support for a variety of cryptographic hardware using the PKCS #11 interface. On IBM i and z/OS, the operating system provides the cryptographic hardware support.

For a list of currently supported cryptography cards, see Cryptography Card List for WebSphere MQ.

On all platforms, cryptographic hardware is used at the SSL handshaking stage and at secret key reset.

On IBM i, when you use DCM to create or renew certificates, you can choose to store the key directly in the coprocessor or to use the coprocessor master key to encrypt the private key and store it in a special keystore file.

On z/OS, when you use RACF to create certificates, you can choose to store the key using ICSF (Integrated Cryptographic Service Facility) to obtain improved performance and more secure key storage. During the SSL handshake, and secret key negotiations, a crypto express card, (if available) is used to do RSA operations. After the handshake completes and data begins to flow, data is decrypted in the CPACF and the crypto express card is not used.

On UNIX, Linux and Windows systems, WebSphere MQ support is also provided for SSL cryptographic hardware symmetric cipher operations. When using SSL cryptographic hardware symmetric cipher operations, data sent across an SSL or TLS connection is encrypted/decrypted by the cryptographic hardware product.

On the queue manager, this is switched on by setting the SSLCryptoHardware queue manager attribute appropriately (see ALTER QMGR and Change Queue Manager). On the Websphere MQ MQI client, equivalent variables are provided (see SSL stanza of the client configuration file). The default setting is off.

If this attribute is switched on, WebSphere MQ attempts to use symmetric cipher operations whether the cryptographic hardware product supports them for the encryption algorithm specified in the current CipherSpec or not. If the cryptographic hardware product does not provide this support, WebSphere MQ performs the encryption and decryption of data itself, and no error is reported. If the cryptographic hardware product supports symmetric cipher operations for the encryption algorithm specified in the current CipherSpec, this function is activated and the cryptographic hardware product performs the encryption and decryption of the data sent.

In a situation of low processor usage it is often quicker to perform the encryption/decryption in software, rather than copying the data onto the card, encrypting/decrypting it, and copying it back to the SSL protocol software. Hardware symmetric cipher operations become more useful when the processor usage is high.

On z/OS with cryptographic hardware, support is provided for symmetric cipher operations. This means that the user's data is encrypted and decrypted by the hardware if the hardware has this capability for the CipherSpec chosen, and is configured to support data encryption and decryption.

On IBM i, cryptographic hardware is not used for encryption and decryption of the user's data, even if the hardware has the capability of performing such encryption for the encryption algorithm specified in the current CipherSpec.

WebSphere MQ rules for SSLPEER values

The SSLPEER attribute is used to check the Distinguished Name (DN) of the certificate from the peer queue manager or client at the other end of a IBM WebSphere MQ channel. IBM WebSphere MQ uses certain rules when comparing these values

When SSLPEER values are compared with DNs, the rules for specifying and matching attribute values are as follows:

1. You can use either a comma or a semicolon as a separator.
2. Spaces before or after the separator are ignored. For example:

   ```
   CN=John Smith, O=IBM ,OU=Test , C=GB
   ```
3. The values of attribute types `SERIALNUMBER`, `MAIL`, `E`, `UID OR USERID`, `CN`, `T`, `OU`, `DC`, `O`, `STREET`, `L`, `ST`, `SP`, `S`, `PC`, `C`, `UNSTRUCTUREDNAME`, `UNSTRUCTUREDADDRESS`, `DNQ` are text strings that typically include only the following:
   - Uppercase and lowercase alphabetic characters `A` through `Z` and `a` through `z`
   - Numeric characters `0` through `9`
   - The space character
   - Characters `, . ; ' " ( ) / -`

   To avoid conversion problems between different platforms, do not use other characters in an attribute value. The attribute types, for example `CN`, must be in uppercase characters.
4. Strings containing the same alphabetic characters match irrespective of case.
5. Spaces are not allowed between the attribute type and the `=` character.
6. Optionally, you can enclose attribute values in double quotation marks, for example `CN="John Smith"`. The quotation marks are discarded when matching values.
7. Spaces at either end of the string are ignored unless the string is enclosed in double quotation marks.
8. The comma and semicolon attribute separator characters are considered to be part of the string when enclosed in double quotation marks.
9. The names of attribute types, for example `CN` or `OU`, are considered to be part of the string when enclosed in double quotation marks.
10. Any of the attribute types `ST`, `SP`, and `S` can be used for the State or Province name.
11. Any attribute value can have an asterisk (`*`) as a pattern-matching character at the beginning, the end, or in both places. The asterisk character substitutes for any number of characters at the beginning or end of the string to be matched. This character enables your SSLPEER value specification to match a range of Distinguished Names. For example, `OU=IBM*` matches every Organizational Unit beginning with IBM, such as IBM Corporation.

    The asterisk character can also be a valid character in a Distinguished Name. To obtain an exact match with an asterisk at the beginning or end of the string, the backslash escape character (\) must precede the asterisk: `\*`. Asterisks in the middle of the string are considered to be part of the string and do not require the backslash escape character.
12. The DN can contain multiple OU attributes and multiple DC attributes.
13. When multiple OU attributes are specified, all must exist and be in descending hierarchical order. For an example, see DEFINE CHANNEL.
14. A digital certificate Subject DN can additionally contain multiple attributes of the same type other than OU or DC, but only if the SSLPEER value does not filter on the repeated attribute type. For example, consider a certificate with the following Subject DN:

    ```
    CN=First, CN=Second, O=IBM, C=US
    ```

    An SSLPEER value of `O=IBM, C=US` does not filter on CN, so matches this certificate and allows the connection. An SSLPEER value of `CN=First, O=IBM, C=US` fails to match this certificate because the certificate contains multiple CN attributes. You cannot match multiple CN values.

Digital certificates and CipherSpec compatibility in WebSphere MQ

Migrating with AltGSKit from WebSphere MQ V7.0.1 to WebSphere MQ V7.1

Perform this task only if you are migrating from WebSphere MQ V7.0.1 using the AltGSKit configuration setting to load an alternative GSKit. The alternative GSKit used by WebSphere MQ V7.0.1 with the AltGSKit setting is separate from the GSKit used by WebSphere MQ V7.1; changes to each GSKit do not affect the other. This is because WebSphere MQ V7.1 uses a private local copy of GSKit in its installation directory and does not support the use of an alternative GSKit.

Overview of the main migration steps for AltGSKit

When migrating from WebSphere MQ V7.0.1 utilizing AltGSKit to WebSphere MQ V7.1 there are a number of tasks to be performed to enable the new GSKit to operate successfully. The main steps to consider when migrating:

1. Ensure that no applications require the use of the currently installed alternative GSKit before initiating removal.
2. Remove the AltGSKit setting from the SSL stanza of each queue manager and client configuration file.

3. Restart each MQI client application which is using the alternative GSKit to ensure that no client applications have the alternative GSKit loaded.
4. Issue the REFRESH SECURITY TYPE(SSL) on each queue manager which is using the alternative GSKit to ensure that no queue managers have the alternative GSKit loaded.
5. Uninstall the alternative GSKit as per the platform specific instructions outlined in this topic.
6. Install the alternative GSKit as per the platform specific instructions referred to in this topic.

Removing the AltGSKit setting

Before the alternative GSKit can be uninstalled, the AltGSKit setting must be removed from the SSL stanza of each queue manager and client configuration file.

To view the contents and for further information about the queue manager configuration files, see Queue manager configuration files, qm.ini

For information about the the SSL stanza of the client configuration file, see SSL stanza of the client configuration file.

Once the configuration file has been altered:

1. Restart each MQI client application which is using the alternative GSKit to ensure that no client applications have the alternative GSKit loaded.
2. Issue the REFRESH SECURITY TYPE(SSL) on each queue manager which is using the alternative GSKit to ensure that no queue managers have the alternative GSKit loaded.

Uninstalling GSKit

Here we outline the platform specific instructions for uninstalling the alternative GSKit:

- "Uninstalling GSKit V8 on Windows"
- "Uninstalling GSKit V8 on Linux"
- "Uninstalling GSKit V8 on AIX" on page 2844
- "Uninstalling GSKit V8 on HP-UX" on page 2844
- "Uninstalling GSKit V8 on Solaris" on page 2844

Uninstalling GSKit V8 on Windows

You can uninstall GSKit Version 8 interactively using Add or Remove Programs in the Windows Control Panel. You can uninstall GSKit Version 8 silently using the Windows Installer **msiexec** utility or the GSKit installation file. If you want to use an accessible interface to uninstall GSKit Version 8, use either of the silent uninstallation methods.

Procedure

- To uninstall GSKit V8 by using **msiexec**:
  1. Issue the command

     ```
     msiexec /x PackageName
     ```

     PackageName is one of the values `GSKit8 SSL 32-bit`, `GSKit8 Crypt 32-bit`, `GSKit8 SSL 64-bit`, or `GSKit8 Crypt 64-bit`.
  2. Repeat for each package to be uninstalled.

Uninstalling GSKit V8 on Linux

You can uninstall GSKit V8 using the **rpm** command.

Procedure

Uninstall GSKit v8 by using the following command:

```
rpm -ev gskssl32-8.0.X.Y gskcrypt32-8.0.X.Y
```

X.Y represents the version number of GSKit installed.

On 64-bit Linux platforms run the following additional command:

```
rpm -ev gskssl64-8.0.X.Y gskcrypt64-8.0.X.Y
```

Uninstalling GSKit V8 on AIX

You can uninstall GSKit V8 using the **installp** command.

Procedure

Uninstall GSKit V8 by using the following command:

```
installp -u -g -V2 gskcrypt32.ppc.rte gskssl32.ppc.rte gskcrypt64.ppc.rte gskssl64.ppc.rte
```

Uninstalling GSKit V8 on HP-UX

You can uninstall GSKit Version 8 using the **swremove** command.

Procedure

Uninstall GSKit V8 by using the following command:

```
swremove gskcrypt32 gskssl32 gskcrypt64 gskssl64
```

Uninstalling GSKit V8 on Solaris

You can uninstall GSKit V8 using the **pkgrm** command.

Procedure

Uninstall GSKit V8 by using the following command:

```
pkgrm gsk8ssl32 gsk8cry32 gsk8ssl64 gsk8cry64
```

Installing GSKit on WebSphere MQ V 7.1

On WebSphere MQ V7.1 for Windows, GSKit is automatically installed.

To install GSKit on WebSphere MQ V 7.1 on Linux and UNIX platforms, refer to instructions outlined in the following topics:

- IBM WebSphere MQ components for Linux systems
- IBM WebSphere MQ components for HP-UX systems
- IBM WebSphere MQ components for AIX systems
- IBM WebSphere MQ components for Solaris systems

CipherSpec mismatches

Both ends of a WebSphere MQ SSL channel must use the same CipherSpec. Mismatches can be detected during the SSL handshake or during channel startup.

A CipherSpec identifies the combination of the encryption algorithm and hash function. Both ends of a WebSphere MQ SSL channel must use the same CipherSpec, although they can specify that CipherSpec in a different manner. Mismatches can be detected at two stages:

During the SSL handshake
The SSL handshake fails when the CipherSpec specified by the SSL client is unacceptable to the SSL support at the SSL server end of the connection. A CipherSpec failure during the SSL handshake arises when the SSL client proposes a CipherSpec that is not supported by the SSL provision on the SSL server. For example, when an SSL client running on AIX proposes the `DES_SHA_EXPORT1024` CipherSpec to an SSL server running on IBM i.

During channel startup
Channel startup fails when there is a mismatch between the CipherSpec defined for the responding end of the channel and the CipherSpec defined for the calling end of channel. Channel startup also fails when only one end of the channel defines a CipherSpec.

See Specifying CipherSpecs for more information.

Note: If Global Server Certificates are used, a mismatch can be detected during channel startup even if the CipherSpecs specified on both channel definitions match.

Global Server Certificates are a special type of certificate which require that a minimum level of encryption is established on all the communications links with which they are used. If the CipherSpec requested by the WebSphere MQ channel configuration does not meet this requirement, the CipherSpec is renegotiated during the SSL handshake. This is detected as a failure during WebSphere MQ channel startup as the CipherSpec no longer matches the one specified on the channel.

In this case, change the CipherSpec at both sides of the channel to one which meets the requirements of the Global Server Certificate. To establish whether a certificate that has been issued to you is a Global Server Certificate, contact the certificate authority which issued that certificate.

SSL servers do not detect mismatches when an SSL client channel on UNIX, Linux or Windows systems specifies the `DES_SHA_EXPORT1024` CipherSpec, and the corresponding SSL server channel on UNIX, Linux or Windows systems is using the `DES_SHA_EXPORT` CipherSpec. In this case, the channel runs normally.

Authentication failures

There are a number common reasons for authentication failures during the SSL handshake.

These reasons include, but are not limited to, those in the following list:

A certificate has been found in a Certificate Revocation List or Authority Revocation List
You can check certificates against the revocation lists published by the Certificate Authorities.

A Certificate Authority can revoke a certificate that is no longer trusted by publishing it in a Certificate Revocation List (CRL) or Authority Revocation List (ARL). For more information, see Working with revoked certificates.

An OCSP responder has identified a certificate as Revoked or Unknown
You can check certificates using OCSP. An OCSP responder can return a response of Revoked, indicating that a certificate is no longer valid, or Unknown, indicating that it has no revocation data for that certificate. For more information, see Working with revoked certificates.

A certificate has expired or is not yet active
Each digital certificate has a date from which it is valid and a date after which it is no longer valid, so an attempt to authenticate with a certificate that is outside its lifetime fails.

A certificate is corrupted
If the information in a digital certificate is incomplete or damaged, authentication fails.

A certificate is not supported
If the certificate is in a format that is not supported, authentication fails, even if the certificate is still within its lifetime.

The SSL client does not have a certificate
The SSL server always validates the client certificate if one is sent. If the SSL client does not send a certificate, authentication fails if the end of the channel acting as the SSL server is defined:

- With the SSLCAUTH parameter set to REQUIRED or
- With an SSLPEER parameter value

There is no matching CA root certificate or the certificate chain is incomplete
Each digital certificate is issued by a Certificate Authority (CA), which also provides a root certificate that contains the public key for the CA. Root certificates are signed by the issuing CA itself. If the key repository on the computer that is performing the authentication does not contain a valid root certificate for the CA that issued the incoming user certificate, authentication fails.

Authentication often involves a chain of trusted certificates. The digital signature on a user certificate is verified with the public key from the certificate for the issuing CA. If that CA certificate is a root certificate, the verification process is complete. If that CA certificate was issued by an intermediate CA, the digital signature on the intermediate CA certificate must itself be verified. This process continues along a chain of CA certificates until a root certificate is reached. In such cases, all certificates in the chain must be verified correctly. If the key repository on the computer that is performing the authentication does not contain a valid root certificate for the CA that issued the incoming root certificate, authentication fails.

However, certain SSL implementations such as GSKit, DCM, and RACF validate the certificates as long as the trust anchor (ROOT CA) is present, with some of the intermediate CA not present in the trust chain. Therefore, it is important to ensure that the server-side certificate store contains the complete trust chain. Also, the technique of selectively removing signer (CA) certificates must not be used to control connectivity to the queue manager.

For more information, see How certificate chains work.

For more information about the terms used in this topic, see:

- Secure Sockets Layer (SSL) and Transport Layer Security (TLS) concepts
- Digital certificates

Structure data types

Use this topic to understand the structure data types used in the message data that WebSphere MQ monitoring techniques generate.

The following topics describe in a language-independent form the structure data types used in monitor message data. The declarations are shown in the following programming languages:

- C
- COBOL
- PL/I
- RPG (ILE) (IBM i only)
- S/390 assembler (z/OS only)
- Visual Basic (Windows platforms only)
- "MQCFBS - Byte string parameter"
- "MQCFGR - Group parameter" on page 2849
- "MQCFH - PCF header" on page 2851
- "MQCFIL - Integer list parameter" on page 2855
- "MQCFIL64 - 64–bit integer list parameter" on page 2857
- "MQCFIN - Integer parameter" on page 2859
- "MQCFIN64 - 64–bit integer parameter" on page 2861
- "MQCFSL - String list parameter" on page 2863
- "MQCFST - String parameter" on page 2865
- "MQEPH - Embedded PCF header" on page 2868

MQCFBS - Byte string parameter

Use this page to view the structure of an MQCFBS parameter and the declarations for the following programming languages: C, COBOL, PL/I, RPG/ILE, and S/390 assembler

The MQCFBS structure describes a byte string parameter. Following the links to the declarations is a description of the fields making up the MQCFBS structure:

- C language
- COBOL language
- PL/I language (z/OS only)
- RPG/ILE language (IBM i only)
- S/390 assembler-language (z/OS only)

Type

Description: This indicates that the structure is an MQCFBS structure describing a byte string parameter.
Data type: MQLONG.
Value:

MQCFT_BYTE_STRING
Structure defining a byte string.

StrucLength

Description: This is the length in bytes of the MQCFBS structure, including the variable-length string at the end of the structure (the *String* field).
Data type: MQLONG.

Parameter

Description: This identifies the parameter with a value that is contained in the structure.
Data type: MQLONG.

StringLength

Description: This is the length in bytes of the data in the *String* field, and is zero or greater.
Data type: MQLONG.

String

Description: This is the value of the parameter identified by the *Parameter* field. The string is a byte string, and so is not subject to character-set conversion when sent between different systems.
Note: A null byte in the string is treated as normal data, and does not act as a delimiter for the string.
Data type: MQBYTE ×*StringLength*.

C language declaration

```
struct tagMQCFBS {
  MQLONG  Type;          /* Structure type */
  MQLONG  StrucLength;   /* Structure length */
  MQLONG  Parameter;     /* Parameter identifier */
  MQLONG  StringLength;  /* Length of string */
  MQBYTE  String[1];     /* String value -- first character */
 } MQCFBS;
```

MQCFGR - Group parameter

Use this page to view the structure of an MQCFGR parameter and the declarations for the following programming languages: C, COBOL, PL/I, RPG/ILE, S/390 assembler, and Visual Basic

The MQCFGR structure describes a group parameter. Following the links to the declarations is a description of the fields making up the MQCFGR structure:

- C language
- COBOL language
- PL/I language (z/OS only)
- RPG/ILE language (IBM i only)
- System/390 assembler-language (z/OS only)
- Visual Basic language (Windows only)

The MQCFGR structure is a group parameter in which the subsequent parameter structures are grouped together as a single logical unit. The number of subsequent structures that are included is given by *ParameterCount*. This structure, and the parameter structures it includes, are counted as one structure only in the *ParameterCount* parameter in the PCF header (MQCFH) and the group parameter (MQCFGR).

Type

Description: Indicates that the structure type is MQCFGR describing which parameters are in this group.
Data type: MQLONG.
Value:

MQCFT_GROUP
Structure defining a group of parameters.

StrucLength

Description: Length in bytes of the MQCFGR structure.
Data type: MQLONG.
Value:

MQCFGR_STRUC_LENGTH
Length of the command format group-parameter structure.

Parameter

Description: This identifies the type of group parameter.
Data type: MQLONG.

ParameterCount

Description: The number of parameter structures following the MQCFGR structure that are contained within the group identified by the *Parameter* field. If the group itself contains one or more groups, each group and its parameters count as one structure only.
Data type: MQLONG.

C language declaration

```
typedef struct tagMQCFGR {
  MQLONG  Type;            /* Structure type */
  MQLONG  StrucLength;     /* Structure length */
  MQLONG  Parameter;       /* Parameter identifier */
  MQLONG  ParameterCount;  /* Count of the grouped parameter structures */
 } MQCFGR;
```

COBOL language declaration

```
**   MQCFGR structure
  10 MQCFGR.
**    Structure type
   15 MQCFGR-TYPE           PIC S9(9) BINARY.
**    Structure length
   15 MQCFGR-STRUCLENGTH    PIC S9(9) BINARY.
**    Parameter identifier
   15 MQCFGR-PARAMETER      PIC S9(9) BINARY.
**    Count of grouped parameter structures
   15 MQCFGR-PARAMETERCOUNT PIC S9(9) BINARY.
```

PL/I language declaration (z/OS and Windows only)

```
dcl
 1 MQCFGR based,
  3 Type           fixed bin(31), /* Structure type */
  3 StrucLength    fixed bin(31), /* Structure length */
  3 Parameter      fixed bin(31), /* Parameter identifier */
  3 ParameterCount fixed bin(31), /* Count of grouped parameter structures */
```

RPG/ILE declaration (IBM i only)

```

  End Type
```

MQCFH - PCF header

Use this page to view the structure of an MQCFH header and the declarations for the following programming languages: C, COBOL, PL/I, RPG/ILE, S/390 assembler, and Visual Basic

The MQCFH structure describes the information that is present at the start of the message data of a monitoring message. Following the links to the declarations is a description of the fields making up the MQCFH structure:

- C language
- COBOL language
- PL/I language (z/OS only)
- RPG/ILE language (IBM i only)
- S/390 assembler language (z/OS only)
- Visual Basic language (Windows only)

Type

Description: Structure type This indicates the content of the message.
Data type: MQLONG.
Values:

MQCFT_ACCOUNTING
Message is an accounting message.

MQCFT_EVENT
Message is reporting an event.

MQCFT_REPORT
Message is an activity report.

MQCFT_RESPONSE
Message is a response to a command.

MQCFT_STATISTICS
Message is a statistics message.

MQCFT_TRACE_ROUTE
Message is a trace-route message.

StrucLength

Description: This is the length in bytes of the MQCFH structure
Data type: MQLONG.
Value:

MQCFH_STRUC_LENGTH
Length of command format header structure.

Version

Description: Structure version number.
Data type: MQLONG.
Value:

MQCFH_VERSION_1
Version number for all events except configuration and command events.

MQCFH_VERSION_2
Version number for configuration events.

MQCFH_VERSION_3
Version number for command events, activity reports, trace-route messages, accounting and statistics messages.

Command

Description: Specifies the category of the message.
Data type: MQLONG.
Value: Refer to the *Command* values in the following structure descriptions:

- "Event message MQCFH (PCF header)" on page 2913.
- Activity report MQCFH (PCF header) .
- Trace-route message MQCFH (PCF header).
- Message data in accounting and statistics messages.

MsgSeqNumber

Description: Message sequence number. This is the sequence number of the message within a set of related messages.
Data type: MQLONG.

Control

Description: Control options.
Data type: MQLONG.
Value:

MQCFC_LAST
Last message in the set.

MQCFC_NOT_LAST
Not the last message in the set.

CompCode

Description: Completion code.
Data type: MQLONG.
Value:

MQCC_OK
Events reporting OK condition, activity reports, trace-route messages, accounting messages, or statistics messages.

MQCC_WARNING
Event reporting warning condition.

Reason

Description: Reason code qualifying completion code.
Data type: MQLONG.
Value: For event messages:

MQRC_*
Dependent on the event being reported.
Note: Events with the same reason code are further identified by the *ReasonQualifier* parameter in the event data.

For activity reports, trace-route messages, accounting messages, and statistics messages:

MQRC_NONE

ParameterCount

Description: Count of parameter structures. This is the number of parameter structures that follow the MQCFH structure.
Data type: MQLONG.
Value: 0 or greater.

C language declaration

```
typedef struct tagMQCFH {
  MQLONG  Type;            /* Structure type */
  MQLONG  StrucLength;     /* Structure length */
  MQLONG  Version;         /* Structure version number */
  MQLONG  Command;         /* Command identifier */
  MQLONG  MsgSeqNumber;    /* Message sequence number */
  MQLONG  Control;         /* Control options */
  MQLONG  CompCode;        /* Completion code */
  MQLONG  Reason;          /* Reason code qualifying completion code */
  MQLONG  ParameterCount;  /* Count of parameter structures */
 } MQCFH;
```

COBOL language declaration

MQCFIL - Integer list parameter

Use this page to view the structure of an MQCFIL parameter and the declarations for the following programming languages: C, COBOL, PL/I, RPG/ILE, S/390 assembler, and Visual Basic

The MQCFIL structure describes an integer list parameter. Following the links to the declarations is a description of the fields making up the MQCFIL structure:

- C language
- COBOL language
- PL/I language (z/OS only)
- RPG/ILE language (IBM i only)
- System/390 assembler-language (z/OS only)
- Visual Basic language (Windows only)

Type

Description: Indicates that the structure type is MQCFIL and describes an integer-list parameter.
Data type : MQLONG.
Value:

MQCFT_INTEGER_LIST
Structure defining an integer list.

StrucLength

Description: Length in bytes of the MQCFIL structure, including the array of integers at the end of the structure (the *values* field).
Data type : MQLONG.

Parameter

Description: Identifies the parameter with a value that is contained in the structure.
Data type : MQLONG.

Count

Description: Number of elements in the *Values* array.
Data type : MQLONG.
Values: Zero or greater.

Values

Description: Array of values for the parameter identified by the *Parameter* field.
Data type : MQLONG×*Count*.

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For the COBOL, PL/I, RPG, and System/390 assembler programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, you must include MQCFIL in a larger structure, and declare additional fields following MQCFIL, to represent the Values field as required.

C language declaration

```
typedef struct tagMQCFIL {
  MQLONG  Type;         /* Structure type */
  MQLONG  StrucLength;  /* Structure length */
  MQLONG  Parameter;    /* Parameter identifier */
  MQLONG  Count;        /* Count of parameter values */
  MQLONG  Values[1];    /* Parameter values - first element */
 } MQCFIL;
```

COBOL language declaration

```
**   MQCFIL structure
  10 MQCFIL.
**    Structure type
   15 MQCFIL-TYPE        PIC S9(9) BINARY.
**    Structure length
   15 MQCFIL-STRUCLENGTH PIC S9(9) BINARY.
**    Parameter identifier
   15 MQCFIL-PARAMETER   PIC S9(9) BINARY.
**    Count of parameter values
   15 MQCFIL-COUNT       PIC S9(9) BINARY.
```

PL/I language declaration

```
dcl
 1 MQCFIL based,
  3 Type        fixed bin(31), /* Structure type */
  3 StrucLength fixed bin(31), /* Structure length */
  3 Parameter   fixed bin(31), /* Parameter identifier */

```

MQCFIL64 - 64–bit integer list parameter

Use this page to view the structure of an MQCFIL64 parameter and the declarations for the following programming languages: C, COBOL, PL/I, RPG/ILE, and S/390 assembler

The MQCFIL64 structure describes a 64–bit integer list parameter. Following the links to the declarations is a description of the fields making up the MQCFIL64 structure:

- C language
- COBOL language
- PL/I language (z/OS only)
- RPG/ILE language (IBM i only)
- System/390 assembler-language (z/OS only)

Type

Description: Indicates that the structure is a MQCFIL64 structure describing a 64–bit integer list parameter.

Data type: MQLONG.

Value:

MQCFT_INTEGER64_LIST
Structure defining a 64–bit integer list.

StrucLength

Description: Length in bytes of the MQCFIL64 structure, including the array of integers at the end of the structure (the *Values* field).

Data type: MQLONG.

Parameter

Description: Identifies the parameter with a value that is contained in the structure.
Data type: MQLONG.

Count

Description: Number of elements in the *Values* array.
Data type: MQLONG.
Values: 0 or greater.

Values

Description: Array of values for the parameter identified by the *Parameter* field.
Data type: (MQINT64×*Count*)

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For the COBOL, PL/I, RPG, and System/390 assembler programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, you must include MQCFIL64 in a larger structure, and declare additional fields following MQCFIL64, to represent the *Values* field as required.

For COBOL, additional fields should be declared as:

```
PIC  S9(18)
```

For PL/I, additional fields should be declared as `FIXED BINARY SIGNED` with a precision of 63.

For System/390 assembler, additional fields should be declared `D` (double word) in the `DS` declaration.

C language declaration

```
typedef struct tagMQCFIN64 {
  MQLONG  Type;         /* Structure type */
  MQLONG  StrucLength;  /* Structure length */
  MQLONG  Parameter;    /* Parameter identifier */
  MQLONG  Count;        /* Count of parameter values */
  MQINT64 Values[1];        /* Parameter value */
 } MQCFIL64;
```

MQCFIN - Integer parameter

Use this page to view the structure of an MQCFIN parameter and the declarations for the following programming languages: C, COBOL, PL/I, RPG/ILE, S/390 assembler, and Visual Basic

The MQCFIN structure describes an integer parameter. Following the links to the declarations is a description of the fields making up the MQCFIN structure:

- C language
- COBOL language
- PL/I language (z/OS only)
- RPG/ILE language (IBM i only)
- S/390 assembler-language (z/OS only)
- Visual Basic language (Windows only)

Type

Description: Indicates that the structure type is MQCFIN and describes an integer parameter.
Data type: MQLONG.
Value:

MQCFT_INTEGER
Structure defining an integer.

StrucLength

Description: Length in bytes of the MQCFIN structure.
Data type: MQLONG.
Value:

MQCFIN_STRUC_LENGTH
Length of MQCFIN structure.

Parameter

Description: Identifies the parameter with a value that is contained in the structure.
Data type: MQLONG.

Value

Description: Value of parameter identified by the *Parameter* field.
Data type: MQLONG.

C language declaration

```
typedef struct tagMQCFIN {
  MQLONG  Type;         /* Structure type */
  MQLONG  StrucLength;  /* Structure length */
  MQLONG  Parameter;    /* Parameter identifier */
  MQLONG  Value;        /* Parameter value */
 } MQCFIN;
```

COBOL language declaration

```
**   MQCFIN structure
  10 MQCFIN.
**    Structure type
   15 MQCFIN-TYPE        PIC S9(9) BINARY.
**    Structure length

MQCFIN64 - 64–bit integer parameter

Use this page to view the structure of an MQCFIN64 parameter and the declarations for the following programming languages: C, COBOL, PL/I, RPG/ILE, and S/390 assembler

The MQCFIN64 structure describes a 64–bit integer parameter. Following the links to the declarations is a description of the fields making up the MQCFIN64 structure:

- C language
- COBOL language
- PL/I language (z/OS only)
- RPG/ILE language (IBM i only)
- System/390 assembler-language (z/OS only)

Type

Description: Indicates that the structure is a MQCFIN64 structure describing a 64–bit integer parameter.
Data type: MQLONG.
Value:

MQCFT_INTEGER64
Structure defining a 64–bit integer.

StrucLength

Description: Length in bytes of the MQCFIN64 structure.
Data type: MQLONG.
Value:

MQCFIN64_STRUC_LENGTH
Length of 64–bit integer parameter structure.

Parameter

Description: Identifies the parameter with a value that is contained in the structure.
Data type: MQLONG.

Values

Description: This is the value of the parameter identified by the *Parameter* field.
Data type: (MQINT64)

C language declaration

```
typedef struct tagMQCFIN64 {
  MQLONG  Type;         /* Structure type */
  MQLONG  StrucLength;  /* Structure length */
  MQLONG  Parameter;    /* Parameter identifier */
  MQLONG  Reserved;     /* Reserved */

```

MQCFSL - String list parameter

Use this page to view the structure of an MQCFSL parameter and the declarations for the following programming languages: COBOL, PL/I, RPG/ILE, S/390 assembler, and Visual Basic

The MQCFSL structure describes a string list parameter. Following the links to the declarations is a description of the fields making up the MQCFSL structure:

- COBOL language
- PL/I language (z/OS only)
- RPG/ILE language (IBM i only)
- System/390 assembler-language (z/OS only)
- Visual Basic language (Windows only)

Type

Description: This indicates that the structure is an MQCFSL structure describing a string-list parameter.
Data type: MQLONG.
Value:

MQCFT_STRING_LIST
Structure defining a string list.

StrucLength

Description: This is the length in bytes of the MQCFSL structure, including the array of strings at the end of the structure (the *Strings* field).
Data type: MQLONG.

Parameter

Description: This identifies the parameter with values that are contained in the structure.
Data type: MQLONG.

CodedCharSetId

Description: This specifies the coded character set identifier of the data in the *Strings* field.
Data type: MQLONG.

Count

Description: This is the number of strings present in the *Strings* field; zero or greater.
Data type: MQLONG.

StringLength

Description: This is the length in bytes of one parameter value, that is the length of one string in the *Strings* field; all of the strings are this length.

Data type: MQLONG.

String

Description: This is a set of string values for the parameter identified by the *Parameter* field. The number of strings is given by the *Count* field, and the length of each string is given by the *StringLength* field. The strings are concatenated together, with no bytes skipped between adjacent strings. The total length of the strings is the length of one string multiplied by the number of strings present (that is, *StringLength*×*Count*).

In MQFMT_EVENT messages, trailing blanks can be omitted from string parameters (that is, the string may be shorter than the defined length of the parameter). *StringLength* gives the length of the string actually present in the message.
Note: In the MQCFSL structure, a null character in a string is treated as normal data, and does not act as a delimiter for the string. This means that when a receiving application reads a MQFMT_EVENT message, the receiving application receives all of the data specified by the sending application. The data may, of course, have been converted between character sets (for example, by the receiving application specifying the MQGMO_CONVERT option on the MQGET call).

Data type: MQCHAR × *StringLength*×*Count*.

COBOL language declaration

```
**   MQCFSL structure
  10 MQCFSL.

End Type
```

MQCFST - String parameter

Use this page to view the structure of an MQCFST parameter and the declarations for the following programming languages: C, COBOL, PL/I, RPG/ILE, S/390 assembler, and Visual Basic

The MQCFST structure describes a string parameter. Following the links to the declarations is a description of the fields making up the MQCFST structure:

- C language
- COBOL language
- PL/I language (z/OS only)
- RPG/ILE language (IBM i only)
- System/390 assembler-language (z/OS only)
- Visual Basic language (Windows only)

The MQCFST structure ends with a variable-length character string; see the *String* field for further details.

Type

Description: Indicates that the structure type is MQCFST and describes a string parameter.
Data type: MQLONG.
Value:

MQCFT_STRING
Structure defining a string.

StrucLength

Description: Length in bytes of the MQCFST structure, including the string at the end of the structure (the *String* field).
Data type: MQLONG.

Parameter

Description: Identifies the parameter with a value that is contained in the structure.
Data type: MQLONG.
Values: Dependent on the event message.

CodedCharSetId

Description: Coded character set identifier of the data in the *String* field.
Data type: MQLONG.

StringLength

Description: Length in bytes of the data in the *String* field; zero or greater.
Data type: MQLONG.

String

Description: The value of the parameter identified by the *Parameter* field.

In MQFMT_EVENT messages, trailing blanks can be omitted from string parameters (that is, the string may be shorter than the defined length of the parameter). *StringLength* gives the length of the string actually present in the message.

Data type: MQCHAR×*StringLength*.
Value: The string can contain any characters that are in the character set defined by *CodedCharSetId*, and that are valid for the parameter identified by *Parameter*.
Language considerations: The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure should be allocated dynamically, and pointers used to address the fields within it.
- For the COBOL, PL/I, System/390 assembler, and Visual Basic programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, the user should include MQCFST in a larger structure, and declare additional fields following MQCFST, to represent the *String* field as required.

A null character in the string is treated as normal data, and does not act as a delimiter for the string. This means that when a receiving application reads an MQFMT_EVENT message, the receiving application receives all of the data specified by the sending application. The data may, of course, have been converted between character sets (for example, by the receiving application specifying the MQGMO_CONVERT option on the MQGET call).

C language declaration

```
typedef struct tagMQCFST {
  MQLONG  Type;            /* Structure type */
  MQLONG  StrucLength;     /* Structure length */
  MQLONG  Parameter;       /* Parameter identifier */
  MQLONG  CodedCharSetId;  /* Coded character set identifier */
  MQLONG  StringLength;    /* Length of string */
  MQCHAR  String[1];       /* String value - first
                              character */
 } MQCFST;
```

COBOL language declaration

```

MQEPH - Embedded PCF header

Use this page to view the structure of an MQEPH embedded PCF header and the declarations for the following programming languages: C, COBOL, PL/I, RPG/ILE, S/390 assembler, and Visual Basic

The MQEPH structure describes the additional data that is present in a message when that message is a programmable command format (PCF) message. Following the links to the declarations is a description of the fields making up the MQEPH structure:

- C language
- COBOL language
- PL/I language (z/OS only)
- RPG/ILE language (IBM i only)
- S/390 assembler-language (z/OS only)
- Visual Basic language (Windows only)

The additional data consists of the MQEPH structure followed by an array of PCF parameter structures. To include the MQEPH structure in a message, the *Format* parameter in the message descriptor is set to MQFMT_EMBEDDED.

StrucId

Description: Structure identifier.
Data type: MQCHAR4.
Value:

MQEPH_STRUC_ID
Identifier for distribution header structure.

Version

Description: Structure version number.
Data type: MQLONG.
Value:

MQEPH_VERSION_1
Version number for embedded PCF header structure.

StrucLength

Description: Structure length. This is the length in bytes of the MQEPH structure and is set to the amount of data preceding the next header structure.
Data type: MQLONG.

Encoding

Description: Numeric encoding. This specifies the numeric encoding of the data that follows the last PCF parameter structure.
Data type: MQLONG.

CodedCharSetId

Description: Coded character set identifier. This specifies the coded character set identifier of the data that follows the last PCF parameter structure.
Data type: MQLONG.

Format

Description: Format. This specifies the format name of the data that follows the last PCF parameter structure.
Data type: MQCHAR8.

Flags

Description: Flags. This is a reserved field.
Data type: MQLONG.
Value:

MQEPH_NONE
No flags have been specified.

MQEPH_CCSID_EMBEDDED
The character set of the parameters containing character data is specified individually within the CodedCharSetId field in each structure. The character set of the StrucId and Format fields is defined by the CodedCharSetId field in the header structure that precedes the MQEPH structure, or by the CodedCharSetId field in the MQMD if the MQEPH is at the start of the message.

PCFHeader

Description: Command format header.
Data type: MQCFH.

C language declaration

```
struct tagMQEPH  {
  MQCHAR4 StrucId;         /* Structure identifier */
  MQLONG  Version;         /* Structure version number */
  MQLONG  StrucLength      /* Structure length */
  MQLONG  Encoding;        /* Numeric encoding */
  MQLONG  CodedCharSetId;  /* Coded character set identifier */
  MQCHAR8 Format;          /* Data format */
  MQLONG  Flags;           /* Flags */
  MQCFH   PCFHeader;       /* PCF header */
 } MQEPH;
```

Object attributes for event data

Use this page to view the object attributes that WebSphere MQ monitoring techniques can include in the configuration event data recorded in event messages. The amount of event data depends on the type of object to which the configuration event relates.

Authentication information attributes

Event messages relating to objects can include authentication information attributes

AlterationDate **(MQCFST)**
Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered.

AlterationTime **(MQCFST)**
Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered.

AuthInfoConnName **(MQCFST)**
Authentication information connection name (parameter identifier: MQCA_AUTH_INFO_CONN_NAME).

The maximum length of the string is 48.

AuthInfoDesc **(MQCFST)**
Authentication information description (parameter identifier: MQCA_AUTH_INFO_DESC).

The maximum length of the string is MQ_AUTH_INFO_DESC_LENGTH.

AuthInfoType **(MQCFIN)**
Authentication information type (parameter identifier: MQIA_AUTH_INFO_TYPE).

The value is MQAIT_CRL_LDAP.

LDAPPassword **(MQCFST)**
LDAP password (parameter identifier: MQCA_LDAP_PASSWORD).

The maximum length of the string is MQ_LDAP_PASSWORD_LENGTH.

LDAPUserName **(MQCFST)**
LDAP user name (parameter identifier: MQCA_LDAP_USER_NAME).

The maximum length of the string is 256.

CF structure attributes

Event messages relating to objects can include CF structure attributes

AlterationDate **(MQCFST)**
Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered.

AlterationTime **(MQCFST)**
Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered.

CFLevel **(MQCFIN)**
CF level (parameter identifier: MQIA_CF_LEVEL).

CFStrucDesc **(MQCFST)**
CF Structure description (parameter identifier: MQCA_CF_STRUC_DESC).

The maximum length of the string is MQCA_CF_STRUC_DESC_LENGTH.

Recovery **(MQCFIN)**
Recovery (parameter identifier: MQIA_CF_RECOVER).

Communication information attributes

AlterationDate **(MQCFST)**
Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered, in the form `yyyy-mm-dd`.

AlterationTime **(MQCFST)**
Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered, in the form `hh.mm.ss`.

Bridge **(MQCFIN)**
Bridge (parameter identifier: MQIA_MCAST_BRIDGE).

Specifies whether publications from applications not using Multicast are bridged to applications using multicast.

The value can be:

MQMCB_DISABLED
Bridging is disabled.

MQMCB_ENABLED
Bridging is enabled.

CCSID **(MQCFIN)**
Coded character set identifier (parameter identifier: MQIA_CODED_CHAR_SET_ID).

The CCSID that messages are transmitted on.

CommEvent **(MQCFIN)**
Communication event (parameter identifier: MQIA_COMM_EVENT).

Controls whether event messages are generated for multicast handles that are created using this COMMINFO object.

The value can be:

MQEVR_DISABLED
Event messages are not generated.

MQEVR_ENABLED
Event messages are generated.

MQEVR_EXCEPTION
Event messages are generated if the message reliability is below the reliability threshold.

ComminfoName **(MQCFST)**
Communication information name (parameter identifier: MQCA_COMM_INFO_NAME).

The name of the administrative communication information definition about which information is to be returned.

Description **(MQCFST)**
Description (parameter identifier: MQCA_COMM_INFO_DESC).

Plain-text comment that provides descriptive information about the communication information object.

Encoding **(MQCFIN)**
Encoding (parameter identifier: MQIACF_ENCODING).

The encoding that the messages are transmitted in.

The value can be:

MQENC_AS_PUBLISHED

MQENC_NORMAL

MQENC_REVERSED

MQENC_S390

MQENC_TNS

GrpAddress **(MQCFST)**
Group address (parameter identifier: MQCACH_GROUP_ADDRESS).

The group IP address or DNS name.

MonitorInterval **(MQCFIN)**
Frequency of monitoring (parameter identifier: MQIA_MONITOR_INTERVAL).

How frequently, in seconds, monitoring information is updated and event messages are generated.

MulticastHeartbeat **(MQCFIN)**
Multicast heartbeat (parameter identifier: MQIACH_MC_HB_INTERVAL).

Heartbeat interval measured in milliseconds.

MulticastPropControl **(MQCFIN)**
Multicast properties control (parameter identifier: MQIACH_MULTICAST_PROPERTIES).

Controls how many of the MQMD properties and user properties flow with the message.

The value can be:

MQMCP_ALL
All properties are transmitted.

MQMCP_REPLY
Only user properties and MQMD fields that deal with replying to the messages are transmitted.

MQMCP_USER
Only user properties are transmitted.

MQMCP_NONE
No properties are transmitted.

MQMCP_COMPAT
Properties are transmitted in a format compatible with previous WebSphere MQ multicast clients.

MsgHistory **(MQCFIN)**
Message history (parameter identifier: MQIACH_MSG_HISTORY).

The amount of message history in kilobytes that is kept by the system to handle retransmissions in the case of NACKs.

NewSubHistory **(MQCFIN)**
New Subscriber History (parameter identifier: MQIACH_NEW_SUBSCRIBER_HISTORY).

Controls how much historical data a new subscriber receives. The value can be:

MQNSH_NONE
Only publications from the time of the subscription are sent.

MQNSH_ALL
As much history as is known is retransmitted.

PortNumber **(MQCFIN)**
Port Number (parameter identifier: MQIACH_PORT).

The port number to transmit on.

Type **(MQCFIN)**
Type (parameter identifier: MQIA_COMM_INFO_TYPE).

The type of the communications information object.

Channel attributes

Event messages relating to objects can include channel attributes

Only those attributes that apply to the type of channel in question are included in the event data.

AlterationDate **(MQCFST)**
Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered.

AlterationTime **(MQCFST)**
Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered.

BatchHeartbeat **(MQCFIN)**
The value being used for the batch heartbeating (parameter identifier: MQIACH_BATCH_HB).

The value can be in the range 0 through 999999. A value of 0 indicates heartbeating is not in use.

BatchInterval **(MQCFIN)**
Batch interval (parameter identifier: MQIACH_BATCH_INTERVAL).

BatchSize **(MQCFIN)**
Batch size (parameter identifier: MQIACH_BATCH_SIZE).

ChannelDesc **(MQCFST)**
Channel description (parameter identifier: MQCACH_DESC).

The maximum length of the string is MQ_CHANNEL_DESC_LENGTH.

ChannelMonitoring **(MQCFIN)**
Level of monitoring data collection for the channel (parameter identifier: MQIA_MONITORING_CHANNEL).

The value can be:

MQMON_OFF
Monitoring data collection is turned off.

MQMON_LOW
Monitoring data collection is turned on with a low ratio of data collection.

MQMON_MEDIUM
Monitoring data collection is turned on with a medium ratio of data collection.

MQMON_HIGH
Monitoring data collection is turned on with a high ratio of data collection.

MQMON_Q_MGR
The level of monitoring data collected is based on the queue manager attribute *ChannelMonitoring*.

ChannelName **(MQCFST)**
Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelType **(MQCFIN)**
Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

The value can be:

MQCHT_SENDER
Sender.

MQCHT_SERVER
Server.

MQCHT_RECEIVER
Receiver.

MQCHT_REQUESTER
Requester.

MQCHT_SVRCONN
Server-connection (for use by clients).

MQCHT_CLNTCONN
Client connection.

MQCHT_CLUSRCVR
Cluster-receiver.

MQCHT_CLUSSDR
Cluster-sender.

CipherSpec **(MQCFST)**
SSL cipher specification (parameter identifier: MQCACH_SSL_CIPHER_SPEC).

The maximum length of the string is MQ_SSL_CIPHER_SPEC_LENGTH.

ClusterName **(MQCFST)**
Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

ClusterNamelist **(MQCFST)**
Cluster namelist (parameter identifier: MQCA_CLUSTER_NAMELIST).

CLWLChannelPriority **(MQCFIN)**
Cluster workload channel priority (parameter identifier: MQIACH_CLWL_CHANNEL_PRIORITY).

CLWLChannelRank **(MQCFIN)**
Cluster workload channel rank (parameter identifier: MQIACH_CLWL_CHANNEL_RANK).

CLWLChannelWeight **(MQCFIN)**
Cluster workload channel weight (parameter identifier: MQIACH_CLWL_CHANNEL_WEIGHT).

ConnectionName **(MQCFST)**
Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

The maximum length of the string is MQ_CONN_NAME_LENGTH.

DataConversion **(MQCFIN)**
Whether sender should convert application data (parameter identifier: MQIACH_DATA_CONVERSION).

The value can be:

MQCDC_NO_SENDER_CONVERSION
No conversion by sender.

MQCDC_SENDER_CONVERSION
Conversion by sender.

DiscInterval **(MQCFIN)**
Disconnection interval (parameter identifier: MQIACH_DISC_INTERVAL).

HeaderCompression **(MQCFIL)**
Header data compression techniques supported by the channel (parameter identifier: MQIACH_HDR_COMPRESSION).

For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference.

The value can be one, or more, of the following:

MQCOMPRESS_NONE
No header data compression is performed.

MQCOMPRESS_SYSTEM
Header data compression is performed.

HeartbeatInterval **(MQCFIN)**
Heartbeat interval (parameter identifier: MQIACH_HB_INTERVAL).

KeepAliveInterval **(MQCFIN)**
Keep alive interval (parameter identifier: MQIACH_KEEP_ALIVE_INTERVAL).

LocalAddress **(MQCFST)**
Local communications address for the channel (parameter identifier: MQCACH_LOCAL_ADDRESS).

The maximum length of the string is MQ_LOCAL_ADDRESS_LENGTH.

LongRetryCount **(MQCFIN)**
Long retry count (parameter identifier: MQIACH_LONG_RETRY).

LongRetryInterval **(MQCFIN)**
Long timer (parameter identifier: MQIACH_LONG_TIMER).

MaxMsgLength **(MQCFIN)**
Maximum message length (parameter identifier: MQIACH_MAX_MSG_LENGTH).

MCAName **(MQCFST)**
Message channel agent name (parameter identifier: MQCACH_MCA_NAME).

The maximum length of the string is MQ_MCA_NAME_LENGTH.

MCAType **(MQCFIN)**
Message channel agent type (parameter identifier: MQIACH_MCA_TYPE).

The value can be:

MQMCAT_PROCESS
Process

MQMCAT_THREAD
Thread

MCAUserIdentifier **(MQCFST)**
Message channel agent user identifier (parameter identifier: MQCACH_MCA_USER_ID).

The maximum length of the MCA user identifier is MQ_MCA_USER_ID_LENGTH.

MessageCompression **(MQCFIL)**
Message data compression techniques supported by the channel (parameter identifier: MQIACH_MSG_COMPRESSION).

For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference.

The value can be one, or more, of:

MQCOMPRESS_NONE
No message data compression is performed. This is the default value.

MQCOMPRESS_RLE
Message data compression is performed using run-length encoding.

MQCOMPRESS_ZLIBFAST
Message data compression is performed using ZLIB encoding with speed prioritized.

MQCOMPRESS_ZLIBHIGH
Message data compression is performed using ZLIB encoding with compression prioritized.

MQCOMPRESS_ANY
Any compression technique supported by the queue manager can be used. This is only valid for receiver, requester, and server-connection channels.

ModeName **(MQCFST)**
Mode name (parameter identifier: MQCACH_MODE_NAME).

The maximum length of the string is MQ_MODE_NAME_LENGTH.

MsgExit **(MQCFSL)**
Message exit name (parameter identifier: MQCACH_MSG_EXIT_NAME).

The number of names in the list is given by the *Count* field in the MQCFSL structure. It will be the same as the *Count* for *MsgUserData*. It may exceed the number of exit names specified for the channel, in which case the excess names are blank; the minimum is 1. The length of each name is given by the *StringLength* field in that structure.

The maximum length of the exit name is MQ_EXIT_NAME_LENGTH.

MsgRetryCount **(MQCFIN)**
Message retry count (parameter identifier: MQIACH_MR_COUNT).

Specifies the number of times that a failing message should be retried.

This parameter is only valid for receiver, cluster-receiver, and requester channels.

MsgRetryExit **(MQCFST)**
Message retry exit name (parameter identifier: MQCACH_MR_EXIT_NAME).

This parameter is only valid for receiver, cluster-receiver, and requester channels.

The maximum length of the string is MQ_MAX_EXIT_NAME_LENGTH.

MsgRetryInterval **(MQCFIN)**
Message retry interval (parameter identifier: MQIACH_MR_INTERVAL).

Specifies the minimum time interval in milliseconds between retries of failing messages.

This parameter is only valid for receiver, cluster-receiver, and requester channels.

MsgRetryUserData **(MQCFST)**
Message retry exit user data (parameter identifier: MQCACH_MR_EXIT_USER_DATA).

Specifies user data that is passed to the message retry exit.

This parameter is only valid for receiver, cluster-receiver, and requester channels.

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

MsgUserData **(MQCFSL)**
Message exit user data (parameter identifier: MQCACH_MSG_EXIT_USER_DATA).

The number of names in the list is given by the *Count* field in the MQCFSL structure. It will be the same as the count for *MsgExit*. The length of each name is given by the *StringLength* field in that structure.

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

NetworkPriority **(MQCFIN)**
Network priority (parameter identifier: MQIACH_NETWORK_PRIORITY).

NonPersistentMsgSpeed **(MQCFIN)**
Speed at which nonpersistent messages are to be sent (parameter identifier: MQIACH_NPM_SPEED).

The value can be:

MQNPMS_NORMAL
Normal speed.

MQNPMS_FAST
Fast speed.

Password **(MQCFST)**
Password (parameter identifier: MQCACH_PASSWORD).

The maximum length of the string is MQ_PASSWORD_LENGTH.

PeerName **(MQCFST)**
SSL peer name (parameter identifier: MQCACH_SSL_PEER_NAME).

The maximum length of the string is 256.

PutAuthority **(MQCFIN)**
Put authority (parameter identifier: MQIACH_PUT_AUTHORITY).

The value can be:

MQPA_DEFAULT
Default user identifier is used.

MQPA_CONTEXT
Context user identifier is used.

MQPA_ALTERNATE_OR_MCA
Alternate or MCA user identifier is used.

MQPA_ONLY_MCA
Only MCA user identifier is used.

QMgrName **(MQCFST)**
Queue manager name (parameter identifier: MQCA_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

ReceiveExit **(MQCFSL)**
Receive exit name (parameter identifier: MQCACH_RCV_EXIT_NAME).

The number of names in the list is given by the *Count* field in the MQCFSL structure. It will be the same as the *Count* for *ReceiveUserData*. It may exceed the number of exit names specified for the channel, in which case the excess names are blank; the minimum is 1. The length of each name is given by the *StringLength* field in that structure.

For a client-connection channel the maximum length of the exit name is MQ_MAX_EXIT_NAME_LENGTH. For all other channels, the maximum length of the exit name is MQ_EXIT_NAME_LENGTH.

ReceiveUserData **(MQCFSL)**
Receive exit user data (parameter identifier: MQCACH_RCV_EXIT_USER_DATA).

The number of names in the list is given by the *Count* field in the MQCFSL structure. It will be the same as the count for *ReceiveExit*. The length of each name is given by the *StringLength* field in that structure.

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

SecurityExit **(MQCFST)**
Security exit name (parameter identifier: MQCACH_SEC_EXIT_NAME).

For a client-connection channel the maximum length of the exit name is MQ_MAX_EXIT_NAME_LENGTH. For all other channels, the maximum length of the exit name is MQ_EXIT_NAME_LENGTH.

SecurityUserData **(MQCFST)**
Security exit user data (parameter identifier: MQCACH_SEC_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

SendExit **(MQCFSL)**
Send exit name (parameter identifier: MQCACH_SEND_EXIT_NAME).

The number of names in the list is given by the *Count* field in the MQCFSL structure. It will be the same as the *Count* for *SendUserData*. It may exceed the number of exit names specified for the channel, in which case the excess names are blank; the minimum is 1. The length of each name is given by the *StringLength* field in that structure.

For a client-connection channel the maximum length of the exit name is MQ_MAX_EXIT_NAME_LENGTH. For all other channels, the maximum length of the exit name is MQ_EXIT_NAME_LENGTH.

SendUserData **(MQCFSL)**
Send exit user data (parameter identifier: MQCACH_SEND_EXIT_USER_DATA).

The number of names in the list is given by the *Count* field in the MQCFSL structure. It will be the same as the count for *SendExit*. The length of each name is given by the *StringLength* field in that structure.

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

SeqNumberWrap **(MQCFIN)**
Sequence wrap number (parameter identifier: MQIACH_SEQUENCE_NUMBER_WRAP).

ShortRetryCount **(MQCFIN)**
Short retry count (parameter identifier: MQIACH_SHORT_RETRY).

ShortRetryInterval **(MQCFIN)**
Short timer (parameter identifier: MQIACH_SHORT_TIMER).

SSLClientAuthentication **(MQCFIN)**
SSL client authentication (parameter identifier: MQIACH_SSL_CLIENT_AUTH).

The value can be:

MQSCA_REQUIRED
Certificate required.

MQSCA_OPTIONAL
Certificate optional.

TpName **(MQCFST)**
Transaction program name (parameter identifier: MQCACH_TP_NAME).

The maximum length of the string is MQ_TP_NAME_LENGTH.

TransportType **(MQCFIN)**
Transmission protocol type (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value may be:

MQXPT_LU62
LU 6.2.

MQXPT_TCP
TCP.

MQXPT_NETBIOS
NetBIOS.

MQXPT_SPX
SPX.

UserIdentifier **(MQCFST)**
Task user identifier (parameter identifier: MQCACH_USER_ID).

The maximum length of the string is MQ_USER_ID_LENGTH.

XmitQName **(MQCFST)**
Transmission queue name (parameter identifier: MQCACH_XMIT_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

Channel authentication attributes

Event messages relating to objects can include channel authentication attributes

Only those attributes that apply to the type of channel in question are included in the event data.

ChannelProfile **(MQCFST).**
Channel Profile (parameter identifier: MQCACH_CHANNEL_NAME).

Maximum length is MQ_CHANNEL_NAME_LENGTH.

Returned: Always.

ChannelAuthType **(MQCFIN).**
Channel Authentication Type (parameter identifier: MQIACF_CHLAUTH_TYPE).

Returned: Always.

Warning **(MQCFIN).**
Warning (parameter identifier: MQIACH_WARNING).

Returned: Always.

connectionNameList **(MQCFSL).**
Connection Name List (parameter identifier: MQCACH_CONNECTION_NAME_LIST).

Element length: MQ_CONN_NAME_LENGTH.

Returned: Only when Channel Auth Type is MQAUT_BLOCKADDR.

MCAUserIdList **(MQCFSL).**
MCA User Id List (parameter identifier: MQCACH_MCA_USER_ID_LIST).

Element length: MQ_MCA_USER_ID_LENGTH

Returned: Only when Channel Auth Type is MQAUT_BLOCKUSER

MCAUser **(MQCFST).**
MCA User (parameter identifier: MQCACH_MCA_USER_ID).

Maximum length: MQ_MCA_USER_ID_LENGTH.

Returned: Only when Channel Auth Type is of a mapping type (MQCAUT_SSLPEERMAP, MQCAUT_ADDRESSMAP, MQCAUT_USERMAP or MQCAUT_QMGRMAP).

ConnectionName **(MQCFST).**
Connection Name (parameter identifier: MQCACH_CONNECTION_NAME).

Maximum length: MQ_CONN_NAME_LENGTH

Returned: Only when Channel Auth Type is of a mapping type (MQCAUT_SSLPEERMAP, MQCAUT_ADDRESSMAP, MQCAUT_USERMAP or MQCAUT_QMGRMAP).

UserSource **(MQCFIN).**
User Source (parameter identifier: MQIACH_USER_SOURCE).

Returned: Only when Channel Auth Type is of a mapping type (MQCAUT_SSLPEERMAP, MQCAUT_ADDRESSMAP, MQCAUT_USERMAP or MQCAUT_QMGRMAP).

SSLPeerName **(MQCFST).**
SSL Peer Name (parameter identifier: MQCACH_SSL_PEER_NAME).

Maximum length: MQ_SSL_PEER_NAME_LENGTH.

Returned: Only when Channel Auth Type is MQCAUT_SSLPEERMAP.

ClientUserId **(MQCFST).**
Client User Id (parameter identifier: MQCACH_CLIENT_USER_ID).

Maximum length: MQ_MCA_USER_ID_LENGTH.

Returned: Only when Channel Auth Type is MQCAUT_USERMAP.

RemoteQueueManagerName **(MQCFST).**
Remote Queue Manager Name (parameter identifier: MQCA_REMOTE_Q_MGR_NAME).

Maximum length: MQ_Q_MGR_NAME_LENGTH.

Returned: Only when Channel Auth Type is MQCAUT_QMGRMAP.

Listener attributes

AlterationDate **(MQCFST)**
Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date, in the form `yyyy-mm-dd`, on which the information was last altered.

AlterationTime **(MQCFST)**
Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time, in the form `hh.mm.ss`, at which the information was last altered.

Adapter **(MQCIN)**
Adapter number (parameter identifier: MQIACH_ADAPTER).

The adapter number on which NetBIOS listens. This parameter is valid only on Windows.

Backlog **(MQCIN)**
Backlog (parameter identifier: MQIACH_BACKLOG).

The number of concurrent connection requests that the listener supports.

Commands **(MQCIN)**
Adapter number (parameter identifier: MQIACH_COMMAND_COUNT).

The number of commands that the listener can use. This parameter is valid only on Windows.

IPAddress **(MQCFST)**
IP address (parameter identifier: MQCACH_IP_ADDRESS).

IP address for the listener specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric host name form.

ListenerDesc **(MQCFST)**
Description of listener definition (parameter identifier: MQCACH_LISTENER_DESC).

ListenerName **(MQCFST)**
Name of listener definition (parameter identifier: MQCACH_LISTENER_NAME).

LocalName **(MQCFST)**
NetBIOS local name (parameter identifier: MQCACH_LOCAL_NAME).

The NetBIOS local name that the listener uses. This parameter is valid only on Windows.

NetbiosNames **(MQCFIN)**
NetBIOS names (parameter identifier: MQIACH_NAME_COUNT).

The number of names that the listener supports. This parameter is valid only on Windows.

Port **(MQCFIN)**
Port number (parameter identifier: MQIACH_PORT).

The port number for TCP/IP. This parameter is valid only if the value of TransportType is MQXPT_TCP.

Sessions **(MQCFIN)**
NetBIOS sessions (parameter identifier: MQIACH_SESSION_COUNT).

The number of sessions that the listener can use. This parameter is valid only on Windows.

Socket **(MQCFIN)**
SPX socket number (parameter identifier: MQIACH_SOCKET).

The SPX socket on which to listen. This parameter is valid only if the value of TransportType is MQXPT_SPX.

StartMode **(MQCFIN)**
Service mode (parameter identifier: MQIACH_LISTENER_CONTROL).

Specifies how the listener is to be started and stopped. The value can be:

MQSVC_CONTROL_MANUAL
The listener is started and stopped manually, by user command.

MQSVC_CONTROL_Q_MGR
The listener is started and stopped when the queue manager starts and stops.

MQSVC_CONTROL_Q_MGR_START
The listener is started when the queue manager starts, but does not stop when the queue manager stops.

TPName **(MQCFST)**
Transaction program name (parameter identifier: MQCACH_TP_NAME).

The LU 6.2 transaction program name. This parameter is valid only on Windows.

TransportType **(MQCFIN)**
Transmission protocol (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value can be:

MQXPT_TCP
TCP

MQXPT_LU62
LU 6.2

MQXPT_NETBIOS
NetBIOS

MQXPT_SPX
SPX

Namelist attributes

Event messages relating to objects can include namelist attributes

AlterationDate **(MQCFST)**
Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered.

AlterationTime **(MQCFST)**
Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered.

NameCount **(MQCFIN)**
Number of names in the namelist (parameter identifier: MQIA_NAME_COUNT).

The number of names contained in the namelist.

NamelistDesc **(MQCFST)**
Description of namelist definition (parameter identifier: MQCA_NAMELIST_DESC).

The maximum length of the string is MQ_NAMELIST_DESC_LENGTH.

NamelistName **(MQCFST)**
The name of the namelist definition (parameter identifier: MQCA_NAMELIST_NAME).

The maximum length of the string is MQ_NAMELIST_NAME_LENGTH.

NamelistType **(MQCFIN)**
Namelist type (parameter identifier: MQIA_NAMELIST_TYPE).

Names **(MQCFSL)**
The names contained in the namelist (parameter identifier: MQCA_NAMES).

The number of names in the list is given by the *Count* field in the MQCFSL structure. The length of each name is given by the *StringLength* field in that structure. The maximum length of a name is MQ_OBJECT_NAME_LENGTH.

Process attributes

Event messages relating to objects can include process attributes

AlterationDate **(MQCFST)**
Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered.

AlterationTime **(MQCFST)**
Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered.

ApplId **(MQCFST)**
Application identifier (parameter identifier: MQCA_APPL_ID).

The maximum length of the string is MQ_PROCESS_APPL_ID_LENGTH.

ApplType **(MQCFIN)**
Application type (parameter identifier: MQIA_APPL_TYPE).

EnvData **(MQCFST)**
Environment data (parameter identifier: MQCA_ENV_DATA).

The maximum length of the string is MQ_PROCESS_ENV_DATA_LENGTH.

ProcessDesc **(MQCFST)**
Description of process definition (parameter identifier: MQCA_PROCESS_DESC).

The maximum length of the string is MQ_PROCESS_DESC_LENGTH.

ProcessName **(MQCFST)**
The name of the process definition (parameter identifier: MQCA_PROCESS_NAME).

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

UserData **(MQCFST)**
User data (parameter identifier: MQCA_USER_DATA).

The maximum length of the string is MQ_PROCESS_USER_DATA_LENGTH.

Queue attributes

Event messages relating to objects can include queue attributes

Only those attributes that apply to the type of queue in question are included in the event data.

AlterationDate **(MQCFST)**
Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered.

AlterationTime **(MQCFST)**
Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered.

BackoutRequeueName **(MQCFST)**
Excessive backout requeue name (parameter identifier: MQCA_BACKOUT_REQ_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

BackoutThreshold **(MQCFIN)**
Backout threshold (parameter identifier: MQIA_BACKOUT_THRESHOLD).

BaseQName **(MQCFST)**
Queue name to which the alias resolves (parameter identifier: MQCA_BASE_Q_NAME).

This is the name of a queue that is defined to the local queue manager.

The maximum length of the string is MQ_Q_NAME_LENGTH.

CFstructure **(MQCFST)**
CF structure name (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

ClusterName **(MQCFST)**
Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

ClusterNamelist **(MQCFST)**
Cluster namelist (parameter identifier: MQCA_CLUSTER_NAMELIST).

CLWLQueuePriority **(MQCFIN)**
Queue priority (parameter identifier: MQIA_CLWL_Q_PRIORITY).

CLWLQueueRank **(MQCFIN)**
Queue rank (parameter identifier: MQIA_CLWL_Q_RANK).

CLWLUseQ **(MQCFIN)**
This defines the behavior of an MQPUT when the target queue has both a local instance and at least one remote cluster instance (parameter identifier: MQIA_CLWL_USEQ).

The value can be:

MQCLWL_USEQ_ANY
Use remote and local queues.

MQCLWL_USEQ_LOCAL
Do not use remote queues.

MQCLWL_USEQ_AS_Q_MGR
Inherit definition from the queue manager attribute *CLWLUseQ*.

CreationDate **(MQCFST)**
Queue creation date (parameter identifier: MQCA_CREATION_DATE).

The maximum length of the string is MQ_CREATION_DATE_LENGTH.

CreationTime **(MQCFST)**
Creation time (parameter identifier: MQCA_CREATION_TIME).

The maximum length of the string is MQ_CREATION_TIME_LENGTH.

DefBind **(MQCFIN)**
Default binding (parameter identifier: MQIA_DEF_BIND).

The value can be:

MQBND_BIND_ON_OPEN
Binding fixed by MQOPEN call.

MQBND_BIND_NOT_FIXED
Binding not fixed.

MQBND_BIND_ON_GROUP
Allows an application to request that a group of messages are all allocated to the same destination instance.

DefinitionType **(MQCFIN)**
Queue definition type (parameter identifier: MQIA_DEFINITION_TYPE).

The value can be:

MQQDT_PREDEFINED
Predefined permanent queue.

MQQDT_PERMANENT_DYNAMIC
Dynamically defined permanent queue.

MQQDT_SHARED_DYNAMIC
Dynamically defined permanent queue that is shared.

DefInputOpenOption **(MQCFIN)**
Default input open option for defining whether queues can be shared (parameter identifier: MQIA_DEF_INPUT_OPEN_OPTION).

The value can be:

MQOO_INPUT_EXCLUSIVE
Open queue to get messages with exclusive access.

MQOO_INPUT_SHARED
Open queue to get messages with shared access.

DefPersistence **(MQCFIN)**
Default persistence (parameter identifier: MQIA_DEF_PERSISTENCE).

The value can be:

MQPER_PERSISTENT
Message is persistent.

MQPER_NOT_PERSISTENT
Message is not persistent.

DefPriority **(MQCFIN)**
Default priority (parameter identifier: MQIA_DEF_PRIORITY).

HardenGetBackout **(MQCFIN)**
Whether to harden backout (parameter identifier: MQIA_HARDEN_GET_BACKOUT).

The value can be:

MQQA_BACKOUT_HARDENED
Backout count remembered.

MQQA_BACKOUT_NOT_HARDENED
Backout count may not be remembered.

IndexType **(MQCFIN)**
Index type (parameter identifier: MQIA_INDEX_TYPE).

InhibitGet **(MQCFIN)**
Whether get operations are allowed (parameter identifier: MQIA_INHIBIT_GET).

The value can be:

MQQA_GET_ALLOWED
Get operations are allowed.

MQQA_GET_INHIBITED
Get operations are inhibited.

InhibitPut **(MQCFIN)**
Whether put operations are allowed (parameter identifier: MQIA_INHIBIT_PUT).

The value can be:

MQQA_PUT_ALLOWED
Put operations are allowed.

MQQA_PUT_INHIBITED
Put operations are inhibited.

InitiationQName **(MQCFST)**
Initiation queue name (parameter identifier: MQCA_INITIATION_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

MaxMsgLength **(MQCFIN)**
Maximum message length (parameter identifier: MQIA_MAX_MSG_LENGTH).

MaxQDepth **(MQCFIN)**
Maximum queue depth (parameter identifier: MQIA_MAX_Q_DEPTH).

MsgDeliverySequence **(MQCFIN)**
Whether priority is relevant (parameter identifier: MQIA_MSG_DELIVERY_SEQUENCE).

The value can be:

MQMDS_PRIORITY
Messages are returned in priority order.

MQMDS_FIFO
Messages are returned in FIFO order (first in, first out).

ProcessName **(MQCFST)**
Name of process definition for queue (parameter identifier: MQCA_PROCESS_NAME).

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

QDepthHiEvent **(MQCFIN)**
Controls whether Queue Depth High events are generated. (parameter identifier: MQIA_Q_DEPTH_HIGH_EVENT).

The value can be:

MQEVR_ENABLED
Queue depth high events are enabled.

MQEVR_DISABLED
Queue depth high events are disabled.

QDepthHighLimit **(MQCFIN)**
High limit for queue depth (parameter identifier: MQIA_Q_DEPTH_HIGH_LIMIT).

The threshold against which the queue depth is compared to generate a Queue Depth High event.

QDepthLoEvent **(MQCFIN)**
Controls whether Queue Depth Low events are generated. (parameter identifier: MQIA_Q_DEPTH_LOW_EVENT).

The value can be:

MQEVR_ENABLED
Queue depth lowevents are enabled.

MQEVR_DISABLED
Queue depth low events are disabled.

QDepthLowLimit **(MQCFIN)**
Low limit for queue depth (parameter identifier: MQIA_Q_DEPTH_LOW_LIMIT).

The threshold against which the queue depth is compared to generate a Queue Depth Low event.

QDepthMaxEvent **(MQCFIN)**
Controls whether Queue Full events are generated. (parameter identifier: MQIA_Q_DEPTH_MAX_EVENT).

The value can be:

MQEVR_ENABLED
Queue depth full events are enabled.

MQEVR_DISABLED
Queue depth full events are disabled.

QDesc **(MQCFST)**
Queue description (parameter identifier: MQCA_Q_DESC).

The maximum length of the string is MQ_Q_DESC_LENGTH.

QName **(MQCFST)**
Queue name (parameter identifier: MQCA_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

QServiceInterval **(MQCFIN)**
Target for queue service interval (parameter identifier: MQIA_Q_SERVICE_INTERVAL).

The service interval used for comparison to generate Queue Service Interval High and Queue Service Interval OK events.

QType **(MQCFIN)**
Queue type (parameter identifier: MQIA_Q_TYPE).

The value can be:

MQQT_ALIAS
Alias queue definition.

MQQT_LOCAL
Local queue.

MQQT_REMOTE
Local definition of a remote queue.

MQQT_MODEL
Model queue definition.

QueueAccounting **(MQCFIN)**
Specifies whether accounting information is collected (parameter identifier: MQIA_ACCOUNTING_Q).

The value can be:

MQMON_ON
Accounting information is collected for the queue.

MQMON_OFF
Accounting information is not collected for the queue.

MQMON_Q_MGR
The collection of accounting information for this queue is based is based on the queue manager attribute *QueueAccounting*.

QueueMonitoring **(MQCFIN)**
Level of monitoring data collection for the queue (parameter identifier: MQIA_MONITORING_Q).

The value can be:

MQMON_OFF
Monitoring data collection is turned off.

MQMON_LOW
Monitoring data collection is turned on with a low ratio of data collection.

MQMON_MEDIUM
Monitoring data collection is turned on with a moderate ratio of data collection.

MQMON_HIGH
Monitoring data collection is turned on with a high ratio of data collection.

MQMON_Q_MGR
The level of monitoring data collected is based on the queue manager attribute *QueueMonitoring*.

RemoteQMgrName **(MQCFST)**
Name of remote queue manager (parameter identifier: MQCA_REMOTE_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

RemoteQName **(MQCFST)**
Name of remote queue as known locally on the remote queue manager (parameter identifier: MQCA_REMOTE_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

RetentionInterval **(MQCFIN)**
Retention interval (parameter identifier: MQIA_RETENTION_INTERVAL).

ServiceIntervalEvent **(MQCFIN)**
Controls whether Service Interval High or Service Interval OK events are generated. .

The value can be:

MQQSIE_NONE
No service interval events are generated.

MQQSIE_OK
Service interval OK events are generated.

MQQSIE_HIGH
Service interval high events are generated.

Shareability **(MQCFIN)**
Whether queue can be shared (parameter identifier: MQIA_SHAREABILITY).

The value can be:

MQQA_SHAREABLE
Queue is shareable.

MQQA_NOT_SHAREABLE
Queue is not shareable.

StorageClass **(MQCFST)**
Storage class name (parameter identifier: MQCA_STORAGE_CLASS).

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

TriggerControl **(MQCFIN)**
Trigger control (parameter identifier: MQIA_TRIGGER_CONTROL).

The value can be:

MQTC_OFF
Trigger messages not required.

MQTC_ON
Trigger messages required.

TriggerData **(MQCFST)**
Trigger data (parameter identifier: MQCA_TRIGGER_DATA).

The maximum length of the string is MQ_TRIGGER_DATA_LENGTH.

TriggerDepth **(MQCFIN)**
Trigger depth (parameter identifier: MQIA_TRIGGER_DEPTH).

TriggerMsgPriority **(MQCFIN)**
Threshold message priority for triggers (parameter identifier: MQIA_TRIGGER_MSG_PRIORITY).

TriggerType **(MQCFIN)**
Trigger type (parameter identifier: MQIA_TRIGGER_TYPE).

The value can be:

MQTT_NONE
No trigger messages.

MQTT_FIRST
Trigger message when queue depth goes from 0 to 1.

MQTT_EVERY
Trigger message for every message.

MQTT_DEPTH
Trigger message when depth threshold exceeded.

Usage **(MQCFIN)**
Usage (parameter identifier: MQIA_USAGE).

The value can be:

MQUS_NORMAL
Normal usage.

MQUS_TRANSMISSION
Transmission queue.

XmitQName **(MQCFST)**
Transmission queue name (parameter identifier: MQCA_XMIT_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

Queue manager attributes

Event messages relating to objects can include queue manager attributes.

ActivityRecording **(MQCFIN)**
Specifies whether activity recording is enabled or disabled (parameter identifier: MQIA_ACTIVITY_RECORDING).

The value can be:

MQRECORDING_MSG
Activity recording is enabled. Activity reports are delivered to the reply-to queue specified in the message descriptor of the message.

MQRECORDING_Q
Activity recording is enabled. Activity reports are delivered to a fixed name queue.

MQRECORDING_DISABLED.
Activity recording is disabled.

AdoptNewMCACheck **(MQCFIN)**
Procedure to determine if an existing receiver MCA is to be adopted when an inbound channel is detected of the same name (parameter identifier: MQIA_ADOPTNEWMCA_CHECK).

The value can be:

MQADOPT_CHECK_Q_MGR_NAME
Compare the receiver MCA and the inbound channel. If the queue manager names match, the existing receiver MCA is adopted providing it is active. If they don't match, the existing receiver MCA is canceled, and a new MCA is created.

MQADOPT_CHECK_NET_ADDR
Compare the receiver MCA and the inbound channel. If the network addresses match, the existing receiver MCA is adopted providing it is active. If they don't match, the existing receiver MCA is canceled, and a new MCA is created.

MQADOPT_CHECK_ALL
Compare the receiver MCA and the inbound channel. If both the queue manager names, and the network addresses match, the existing receiver MCA is adopted providing it is active. If they don't match, the existing receiver MCA is canceled, and a new MCA is created.

MQADOPT_CHECK_NONE
If the existing receiver MCA is active it is adopted with no checks.

AdoptNewMCAType **(MQCFIN)**
Specifies whether orphaned receiver MCAs are to be restarted when an inbound channel matching the *AdoptNewMCACheck* procedure is detected (parameter identifier: MQIA_ADOPTNEWMCA_TYPE).

The value can be:

MQADOPT_TYPE_NO
Do not restart and adopt orphaned receiver MCAs.

MQADOPT_TYPE_ALL
Restart and adopt orphaned receiver MCAs.

AlterationDate **(MQCFST)**
Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered.

AlterationTime **(MQCFST)**
Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered.

AuthorityEvent **(MQCFIN)**
Controls whether authorization (Not Authorized) events are generated (parameter identifier: MQIA_AUTHORITY_EVENT).

The value can be:

MQEVR_DISABLED
Event reporting disabled.

BridgeEvent **(MQCFIN)**
Determines whether IMS bridge events are generated (parameter identifier: MQIA_BRIDGE_EVENT).

The value can be:

MQEVR_ENABLED
All IMS bridge events are enabled.

MQEVR_DISABLED
All IMS bridge events are disabled.

ChannelAuthenticationRecords **(MQCFIN)**
Controls whether channel authentication records are used (parameter identifier: MQIA_CHLAUTH_RECORDS).

Channel authentication records can be set and displayed regardless of the value of this attribute.

The value can be any of the following values:

MQCHLA_DISABLED
Channel authentication records are not checked.

MQCHLA_ENABLED
Channel authentication records are checked.

ChannelAutoDefExit **(MQCFST)**
Channel auto-definition exit name (parameter identifier: MQCA_CHANNEL_AUTO_DEF_EXIT).

The maximum length of the exit name is MQ_EXIT_NAME_LENGTH.

This parameter is supported only in the environments in which an MQSeries Version 5.1 product, or later, is available.

ChannelEvent **(MQCFIN)**
Determines whether channel events are generated (parameter identifier: MQIA_CHANNEL_EVENT).

The value can be:

MQEVR_ENABLED
All channel events are enabled.

MQEVR_EXCEPTION
Only the following channels events are enabled:

- MQRC_CHANNEL_ACTIVATED
- MQRC_CHANNEL_CONV_ERROR
- MQRC_CHANNEL_NOT_ACTIVATED
- MQRC_CHANNEL_STOPPED

MQEVR_DISABLED
All channel events are disabled.

ChannelMonitoring **(MQCFIN)**
Level of real-time monitoring data collection for channels (parameter identifier: MQIA_MONITORING_CHANNEL).

The value can be:

MQMON_NONE
Monitoring data collection is disabled, regardless of the setting for the *ChannelMonitoring* channel attribute.

MQMON_OFF
Monitoring data collection is turned off for channels specifying MQMON_Q_MGR in the *ChannelMonitoring* channel attribute.

MQMON_LOW
Monitoring data collection is turned on with a low ratio of data collection for channels specifying MQMON_Q_MGR in the *ChannelMonitoring* channel attribute.

MQMON_MEDIUM
Monitoring data collection is turned on with a moderate ratio of data collection for channels specifying MQMON_Q_MGR in the *ChannelMonitoring* channel attribute.

MQMON_HIGH
Monitoring data collection is turned on with a high ratio of data collection for channels specifying MQMON_Q_MGR in the *ChannelMonitoring* channel attribute.

ChinitAdapters **(MQCFIN)**
Number of channel initiator adapter subtasks to use for processing WebSphere MQ calls (parameter identifier: MQIA_CHINIT_ADAPTERS).

This value must be in the range 0 through 9999.

ChinitDispatchers **(MQCFIN)**
Number of dispatchers to use for the channel initiator (parameter identifier: MQIA_CHINIT_DISPATCHERS).

ChinitServiceParm **(MQCFST)**
This attribute is reserved for use by IBM (parameter identifier: MQCA_CHINIT_SERVICE_PARM).

ChinitTraceAutoStart **(MQCFIN)**
Specifies whether the channel initiator trace should start automatically (parameter identifier: MQIA_CHINIT_TRACE_AUTO_START).

The value can be:

MQTRAXSTR_YES
Channel initiator trace starts automatically.

MQTRAXSTR_NO
Channel initiator trace does not starts automatically.

ChinitTraceTableSize **(MQCFIN)**
Size of the channel initiator's trace data space, in MB (parameter identifier: MQIA_CHINIT_TRACE_TABLE_SIZE).

ClusterSenderMonitoring **(MQCFIN)**
Level of real-time monitoring data collection for auto-defined cluster sender channels (parameter identifier: MQIA_MONITORING_AUTO_CLUSSDR).

The value can be:

MQMON_Q_MGR
The collection of monitoring data is inherited from the setting of the *ChannelMonitoring* attribute in the queue manager object.

MQMON_OFF
Monitoring data collection is disabled.

MQMON_LOW
Monitoring data collection is turned on with a low ratio of data collection.

MQMON_MEDIUM
Monitoring data collection is turned on with a moderate ratio of data collection.

MQMON_HIGH
Monitoring data collection is turned on with a high ratio of data collection.

ClusterWorkLoadData **(MQCFST)**
Data passed to the cluster workload exit (parameter identifier: MQCA_CLUSTER_WORKLOAD_DATA).

ClusterWorkLoadExit **(MQCFST)**
Name of the cluster workload exit (parameter identifier: MQCA_CLUSTER_WORKLOAD_EXIT).

The maximum length of the exit name is MQ_EXIT_NAME_LENGTH.

ClusterWorkLoadLength **(MQCFIN)**
Cluster workload length (parameter identifier: MQIA_CLUSTER_WORKLOAD_LENGTH).

The maximum length of the message passed to the cluster workload exit.

CLWLMRUChannels **(MQCFIN)**
Maximum number of most recently used channels for cluster workload balancing (parameter identifier: MQIA_CLWL_MRU_CHANNELS).

CLWLUseQ **(MQCFIN)**
This defines the behavior of an MQPUT when the target queue has both a local instance and at least one remote cluster instance (parameter identifier: MQIA_CLWL_USEQ).

The value can be:

MQCLWL_USEQ_ANY
Use remote and local queues.

MQCLWL_USEQ_LOCAL
Do not use remote queues.

CodedCharSetId **(MQCFIN)**
Coded character set identifier (parameter identifier: MQIA_CODED_CHAR_SET_ID).

CommandEvent **(MQCFIN)**
Controls whether command events are generated (parameter identifier: MQIA_COMMAND_EVENT).

The value can be:

MQEVR_DISABLED
Command event generation disabled.

MQEVR_ENABLED
Command event generation enabled.

MQEVR_NO_DISPLAY
Command events are generated for all commands other than MQSC DISPLAY commands and PCF Inquire commands.

CommandInputQName **(MQCFST)**
Command input queue name (parameter identifier: MQCA_COMMAND_INPUT_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

CommandLevel **(MQCFIN)**
Command level supported by queue manager (parameter identifier: MQIA_COMMAND_LEVEL).

ConfigurationEvent **(MQCFIN)**
Controls whether configuration events are generated (parameter identifier: MQIA_CONFIGURATION_EVENT).

The value can be:

MQEVR_DISABLED
Configuration event generation disabled.

MQEVR_ENABLED
Configuration event generation enabled.

CPILevel **(MQCFIN)**
CPI level (parameter identifier: MQIA_CPI_LEVEL).

DeadLetterQName **(MQCFST)**
Dead letter (undelivered message) queue name (parameter identifier: MQCA_DEAD_LETTER_Q_NAME).

Specifies the name of the local queue that is to be used for undelivered messages. Messages are put on this queue if they cannot be routed to their correct destination.

The maximum length of the string is MQ_Q_NAME_LENGTH.

DefXmitQName **(MQCFST)**
Default transmission queue name (parameter identifier: MQCA_DEF_XMIT_Q_NAME).

This is the name of the default transmission queue that is used for the transmission of messages to remote queue managers, if there is no other indication of which transmission queue to use.

The maximum length of the string is MQ_Q_NAME_LENGTH.

DNSGroup **(MQCFST)**
The name of the group that the TCP listener that handles inbound transmissions for the queue sharing group must join when using Workload Manager for Dynamic Domain Name Services (parameter identifier: MQCA_DNS_GROUP).

The maximum length of this name is MQ_DNS_GROUP_NAME_LENGTH.

DNSWLM **(MQCFIN)**
Specifies whether the TCP listener that handles inbound transmissions for the queue sharing group will register with the Workload Manager for Dynamic Domain Name Services (parameter identifier: MQIA_DNS_WLM).

The value can be:

MQDNSWLM_YES
Register with the Workload Manager for Dynamic Domain Name Services.

MQDNSWLM_NO
Do not register with the Workload Manager for Dynamic Domain Name Services.

ExpiryInterval **(MQCFIN)**
Expiry interval (parameter identifier: MQIA_EXPIRY_INTERVAL).

GroupUR **(MQCFIN)**
Controls whether XA client applications can establish transactions with a GROUP unit of recovery disposition.

The value can be:

MQGUR_DISABLED
XA client applications must connect using a queue manager name.

MQGUR_ENABLED
XA client applications can establish transactions with a group unit of recovery disposition by specifying a QSG name when they connect.

IGQPutAuthority **(MQCFIN)**
IGQ put authority (parameter identifier: MQIA_IGQ_PUT_AUTHORITY).

IGQUserId **(MQCFST)**
IGQ user identifier (parameter identifier: MQCA_IGQ_USER_ID).

The maximum length of the **string** is MQ_USER_ID_LENGTH.

InhibitEvent **(MQCFIN)**
Controls whether inhibit (Inhibit Get and Inhibit Put) events are generated (parameter identifier: MQIA_INHIBIT_EVENT).

The value can be:

MQEVR_DISABLED
Event reporting disabled.

MQEVR_ENABLED
Event reporting enabled.

IntraGroupQueueing **(MQCFIN)**
Intra group queueing (parameter identifier: MQIA_INTRA_GROUP_QUEUING).

IPAddressVersion **(MQCFIN)**
Specifies the IP version to be used (parameter identifier: MQIA_IP_ADDRESS_VERSION).

The value can be:

MQIPADDR_IPV4
The IPv4 stack is used.

MQIPADDR_IPV6
The IPv6 stack is used.

ListenerTimer **(MQCFIN)**
The time interval, in seconds, between attempts to restart a listener following an APPC or TCP/IP failure (parameter identifier: MQCA_LISTENER_TIMER).

LocalEvent **(MQCFIN)**
Controls whether local error events are generated (parameter identifier: MQIA_LOCAL_EVENT).

The value can be:

MQEVR_DISABLED
Event reporting disabled.

MQEVR_ENABLED
Event reporting enabled.

LU62ARMSuffix **(MQCFST)**
The suffix of the SYS1.PARMLIB member APPCPMxx, that nominates the LUADD for this channel initiator (parameter identifier: MQCA_LU62_ARM_SUFFIX).

The maximum length of this name is MQ_ARM_SUFFIX_LENGTH.

LU62Channels **(MQCFIN)**
Maximum number of current channels that use the LU 6.2 transmission protocol, including clients connected to server connection channels (parameter identifier: MQIA_LU62_CHANNELS).

LUGroupName **(MQCFST)**
The generic LU name that the LU 6.2 listener that handles inbound transmissions for the queue sharing group is to use. This name must be the same as *LUName* (parameter identifier: MQCA_LU_GROUP_NAME).

The maximum length of this name is MQ_LU_NAME_LENGTH.

LUName **(MQCFST)**
The LU name that the LU 6.2 listener that handles outbound transmissions is to use. This name must be the same as *LUGroupName* (parameter identifier: MQCA_LU_NAME).

The maximum length of this name is MQ_LU_NAME_LENGTH.

MaxActiveChannels **(MQCFIN)**
Maximum number of channels that can be active at the same time (parameter identifier: MQIA_ACTIVE_CHANNELS).

MaxChannels **(MQCFIN)**
Maximum number of current channels, including clients connected to server connection channels (parameter identifier: MQIA_MAX_CHANNELS).

MaxHandles **(MQCFIN)**
Maximum number of handles (parameter identifier: MQIA_MAX_HANDLES).

Specifies the maximum number of handles that any one job can have open at the same time.

MaxMsgLength **(MQCFIN)**
Maximum message length (parameter identifier: MQIA_MAX_MSG_LENGTH).

MaxPriority **(MQCFIN)**
Maximum priority (parameter identifier: MQIA_MAX_PRIORITY).

MaxUncommittedMsgs **(MQCFIN)**
Maximum number of uncommitted messages within a unit of work (parameter identifier: MQIA_MAX_UNCOMMITTED_MSGS).

That is:

- The number of messages that can be retrieved, plus
- The number of messages that can be put on a queue, plus
- Any trigger messages generated within this unit of work

under any one syncpoint. This limit does not apply to messages that are retrieved or put outside syncpoint.

OutboundPortMax **(MQCFIN)**
Outbound port range maximum (parameter identifier: MQIA_OUTBOUND_PORT_MAX).

The upper limit for the range of port numbers used when binding outgoing channels.

OutboundPortMin **(MQCFIN)**
Outbound port range minimum (parameter identifier: MQIA_OUTBOUND_PORT_MIN).

The lower limit for the range of port numbers used when binding outgoing channels.

PerformanceEvent **(MQCFIN)**
Controls whether performance-related events are generated (parameter identifier: MQIA_PERFORMANCE_EVENT).

The value can be:

MQEVR_DISABLED
Event reporting disabled.

MQEVR_ENABLED
Event reporting enabled.

Platform **(MQCFIN)**
Platform on which the queue manager resides (parameter identifier: MQIA_PLATFORM).

QMgrDesc **(MQCFST)**
Queue manager description (parameter identifier: MQCA_Q_MGR_DESC).

The maximum length of the string is MQ_Q_MGR_DESC_LENGTH.

QMgrIdentifier **(MQCFST)**
Queue manager identifier (parameter identifier: MQCA_Q_MGR_IDENTIFIER).

The unique identifier of the queue manager.

QMgrName **(MQCFST)**
Name of local queue manager (parameter identifier: MQCA_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

QSGName **(MQCFST)**
Queue sharing group name (parameter identifier: MQCA_QSG_NAME).

The maximum length of the string is MQ_QSG_NAME_LENGTH.

QueueAccounting **(MQCFIN)**
Specifies whether accounting information is collected for queues (parameter identifier: MQIA_ACCOUNTING_Q).

The value can be:

MQMON_ON
For all queues that have the queue parameter *QueueAccounting* specified as MQMON_Q_MGR, accounting information is collected.

MQMON_OFF
For all queues that have the queue parameter *QueueAccounting* specified as MQMON_Q_MGR, accounting information is not collected.

MQMON_NONE
Accounting information is not collected for queues.

QueueMonitoring **(MQCFIN)**
Level of real-time monitoring data collection for queues (parameter identifier: MQIA_MONITORING_Q).

The value can be:

MQMON_NONE
Monitoring data collection is disabled, regardless of the setting for the *QueueMonitoring* queue attribute.

MQMON_OFF
Monitoring data collection is turned off for queues specifying MQMON_Q_MGR in the *QueueMonitoring* queue attribute.

MQMON_LOW
Monitoring data collection is turned on with a low ratio of data collection for queues specifying MQMON_Q_MGR in the *QueueMonitoring* queue attribute.

MQMON_MEDIUM
Monitoring data collection is turned on with a moderate ratio of data collection for queues specifying MQMON_Q_MGR in the *QueueMonitoring* queue attribute.

MQMON_HIGH
Monitoring data collection is turned on with a high ratio of data collection for queues specifying MQMON_Q_MGR in the *QueueMonitoring* queue attribute.

ReceiveTimeout **(MQCFIN)**
In conjunction with *ReceiveTimeoutType* specifies how long a TCP/IP channel will wait to receive data, including heartbeats, from its partner before returning to the inactive state (parameter identifier: MQIA_RECEIVE_TIMEOUT).

ReceiveTimeoutMin **(MQCFIN)**
The minimum time, in seconds, that a TCP/IP channel will wait to receive data, including heartbeats, from its partner before returning to the inactive state (parameter identifier: MQIA_RECEIVE_TIMEOUT_MIN).

ReceiveTimeoutType **(MQCFIN)**
In conjunction with *ReceiveTimeout* specifies how long a TCP/IP channel will wait to receive data, including heartbeats, from its partner before returning to the inactive state (parameter identifier: MQIA_RECEIVE_TIMEOUT_TYPE).

The value can be:

MQRCVTIME_MULTIPLY
The *ReceiveTimeout* value is a multiplier to be applied to the negotiated value of *HeartbeatInterval* to determine how long a channel will wait. This is the queue manager's initial default value.

MQRCVTIME_ADD
ReceiveTimeout is a value, in seconds, to be added to the negotiated value of *HeartbeatInterval* to determine how long a channel will wait.

MQRCVTIME_EQUAL
ReceiveTimeout is a value, in seconds, representing how long a channel will wait.

RemoteEvent **(MQCFIN)**
Controls whether remote error events are generated (parameter identifier: MQIA_REMOTE_EVENT).

The value can be:

MQEVR_DISABLED
Event reporting disabled.

MQEVR_ENABLED
Event reporting enabled.

RepositoryName **(MQCFST)**
Repository name (parameter identifier: MQCA_REPOSITORY_NAME).

The name of a cluster for which this queue manager is to provide a repository service.

RepositoryNamelist **(MQCFST)**
Repository name list (parameter identifier: MQCA_REPOSITORY_NAMELIST).

The name of a list of clusters for which this queue manager is to provide a repository service.

SharedQueueQueueManagerName **(MQCFIN)**
Specifies how messages are put on a shared queue that specifies another queue manager from a queue sharing group as the object queue manager (parameter identifier: MQIA_SHARED_Q_Q_MGR_NAME).

The value can be:

MQSQQM_USE
Messages are delivered to the object queue manager before being put on the shared queue.

MQSQQM_IGNORE
Messages are put directly on the shared queue.

SSLCRLNameList **(MQCFST)**
SSL CRL name list (parameter identifier: MQCA_SSL_CRL_NAMELIST).

The maximum length of the string is MQ_NAMELIST_NAME_LENGTH.

SSLEvent **(MQCFIN)**
Determines whether IMS bridge events are generated (parameter identifier: MQIA_SSL_EVENT).

The value can be:

MQEVR_ENABLED
All SSL events are enabled.

MQEVR_DISABLED
All SSL events are disabled.

SSLKeyRepository **(MQCFST)**
SSL key repository (parameter identifier: MQCA_SSL_KEY_REPOSITORY).

The maximum length of the string is MQ_SSL_KEY_REPOSITORY_LENGTH.

SSLKeyResetCount **(MQCFIN)**
SSL key reset count (parameter identifier: MQIA_SSL_RESET_COUNT).

The maximum length of the string is MQ_SSL_KEY_REPOSITORY_LENGTH.

SSLTasks **(MQCFIN)**
SSL tasks (parameter identifier: MQIA_SSL_TASKS).

StartStopEvent **(MQCFIN)**
Controls whether start and stop events are generated (parameter identifier: MQIA_START_STOP_EVENT).

The value can be:

MQEVR_DISABLED
Event reporting disabled.

MQEVR_ENABLED
Event reporting enabled.

SyncPoint **(MQCFIN)**
Syncpoint availability (parameter identifier: MQIA_SYNCPOINT).

TCPChannels **(MQCFIN)**
Maximum number of current channels that use the TCP/IP transmission protocol, including clients connected to server connection channels (parameter identifier: MQIA_TCP_CHANNELS).

TCPKeepAlive **(MQCFIN)**
Specifies whether to use the TCP KEEPALIVE facility to check whether the MCA at the opposite end of a channel is available (parameter identifier: MQIA_TCP_KEEP_ALIVE).

The value can be:

MQTCPKEEP_YES
Use the TCP KEEPALIVE facility as specified in the TCP profile configuration data set.

MQTCPKEEP_NO
Do not use the TCP KEEPALIVE facility.

TCPName **(MQCFST)**
TCP name (parameter identifier: MQIA_TCP_NAME).

The name of the current TCP/IP system in use.

The maximum length of this value is MQ_TCP_NAME_LENGTH.

TCPStackType **(MQCFIN)**
TCP stack type (parameter identifier: MQIA_TCP_STACK_TYPE).

Specifies whether the channel initiator uses the TCP/IP address space specified in TCPNAME only, or whether it can bind to any selected TCP/IP address.

The value can be:

MQTCPSTACK_SINGLE
The channel initiator uses the TCP/IP address space specified in TCPNAME only.

MQTCPSTACK_MULTIPLE
The initiator can use any TCP/IP address space available to it. If no other address spaces are available, the address space specified in TCPNAME is used.

TraceRouteRecording **(MQCFIN)**
Specifies whether trace-route messaging is enabled or disabled (parameter identifier: MQIA_TRACE_ROUTE_RECORDING).

The value can be:

MQRECORDING_MSG
Trace-route messaging is enabled. Trace-route reply messages are delivered to the reply-to queue specified in the message descriptor of the message.

MQRECORDING_Q
Trace-route messaging is enabled. Trace-route reply messages are delivered to a fixed name queue.

MQRECORDING_DISABLED.
Trace-route messaging is disabled.

TriggerInterval **(MQCFIN)**
Trigger interval (parameter identifier: MQIA_TRIGGER_INTERVAL).

Specifies the trigger time interval, expressed in milliseconds, for use only with queues where *TriggerType* has a value of MQTT_FIRST.

Storage class attributes

Event messages relating to objects can include storage class attributes

AlterationDate **(MQCFST)**
Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered.

AlterationTime **(MQCFST)**
Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered.

PageSetId **(MQCFIN)**
Page set identifier (parameter identifier: MQIA_PAGESET_ID).

PassTicketApplication **(MQCFST)**
Name of the application used to authenticate IMS bridge passtickets (parameter identifier: MQCA_PASS_TICKET_APPL).

The maximum length of the string is MQ_PASS_TICKET_APPL_LENGTH.

StgClassDesc **(MQCFST)**
Storage class description (parameter identifier: MQCA_STORAGE_CLASS_DESC).

The maximum length of the string is MQ_STORAGE_CLASS_DESC_LENGTH.

XCFGroupName **(MQCFST)**
XCF group name (parameter identifier: MQCA_XCF_GROUP_NAME).

The maximum length of the string is MQ_XCF_GROUP_NAME_LENGTH.

XCFMemberName **(MQCFST)**
XCF member name (parameter identifier: MQCA_XCF_MEMBER_NAME).

The maximum length of the string is MQ_XCF_MEMBER_NAME_LENGTH.

Topic attributes

Event messages relating to objects can include topic attributes

AlterationDate **(MQCFST)**
Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered, in the form `yyyy-mm-dd`.

AlterationTime **(MQCFST)**
Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered, in the form `hh.mm.ss` .

ClusterName **(MQCFST)**
The name of the cluster to which this topic belongs (parameter identifier: MQCA_CLUSTER_NAME).

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

The value can be as follows:

Blank This topic does not belong to a cluster. Publications and subscriptions for this topic are not propagated to publish/subscribe cluster-connected queue managers.

This is the default value for this parameter if no value is specified.

String This topic belongs to the indicated cluster.

Additionally, if PublicationScope or SubscriptionScope is set to MQSCOPE_ALL, this cluster is to be used for the propagation of publications and subscriptions, for this topic, to publish/subcribe cluster-connected queue managers.

DefPersistence **(MQCFIN)**
Default persistence (parameter identifier: MQIA_TOPIC_DEF_PERSISTENCE).

The value can be:

MQPER_PERSISTENCE_AS_PARENT
The default persistence is based on the setting of the closest parent administrative topic object in the topic tree.

MQPER_PERSISTENT
Message is persistent.

MQPER_NOT_PERSISTENT
Message is not persistent.

DefPriority **(MQCFIN)**
Default priority (parameter identifier: MQIA_DEF_PRIORITY).

DefPutResponse **(MQCFIN)**
Default put response (parameter identifier: MQIA_DEF_PUT_RESPONSE_TYPE).

The value can be:

MQPRT_ASYNC_RESPONSE
The put operation is issued asynchronously, returning a subset of MQMD fields.

MQPRT_RESPONSE_AS_PARENT
The default put response is based on the setting of the closest parent administrative topic object in the topic tree.

MQPRT_SYNC_RESPONSE
The put operation is issued synchronously, returning a response.

DurableModelQName **(MQCFST)**
Name of the model queue to be used for durable managed subscriptions (parameter identifier: MQCA_MODEL_DURABLE_Q).

The maximum length of the string is MQ_Q_NAME_LENGTH.

DurableSubscriptions **(MQCFIN)**
Whether applications are permitted to make durable subscriptions (parameter identifier: MQIA_DURABLE_SUB).

The value can be:

MQSUB_DURABLE_AS_PARENT
Whether durable subscriptions are permitted is based on the setting of the closest parent administrative topic object in the topic tree.

MQSUB_DURABLE
Durable subscriptions are permitted.

MQSUB_NON_DURABLE
Durable subscriptions are not permitted.

InhibitPublications **(MQCFIN)**
Whether publications are allowed for this topic (parameter identifier: MQIA_INHIBIT_PUB).

The value can be:

MQTA_PUB_AS_PARENT
Whether messages can be published to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

MQTA_PUB_INHIBITED
Publications are inhibited for this topic.

MQTA_PUB_ALLOWED
Publications are allowed for this topic.

InhibitSubscriptions **(MQCFIN)**
Whether subscriptions are allowed for this topic (parameter identifier: MQIA_INHIBIT_SUB).

The value can be:

MQTA_SUB_AS_PARENT
Whether applications can subscribe to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

MQTA_SUB_INHIBITED
Subscriptions are inhibited for this topic.

MQTA_SUB_ALLOWED
Subscriptions are allowed for this topic.

NonDurableModelQName **(MQCFST)**
Name of the model queue to be used for non durable managed subscriptions (parameter identifier: MQCA_MODEL_NON_DURABLE_Q).

The maximum length of the string is MQ_Q_NAME_LENGTH.

NonPersistentMsgDelivery **(MQCFIN)**
The delivery mechanism for non-persistent messages published to this topic (parameter identifier: MQIA_NPM_DELIVERY).

The value can be:

MQDLV_AS_PARENT
The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQDLV_ALL
Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_DUR
Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a non-persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_AVAIL
Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

PersistentMsgDelivery **(MQCFIN)**
The delivery mechanism for persistent messages published to this topic (parameter identifier: MQIA_PM_DELIVERY).

The value can be:

MQDLV_AS_PARENT
The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQDLV_ALL
Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_DUR
Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_AVAIL
Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

ProxySubscriptions **(MQCFIN)**
Whether a proxy subscription is to be sent for this topic, even if no local subscriptions exist, to directly connected queue managers (parameter identifier: MQIA_PROXY_SUB).

The value can be:

MQTA_PROXY_SUB_FORCE
A proxy subscription is sent to connected queue managers even if no local subscriptions exist.

MQTA_PROXY_SUB_FIRSTUSE
A proxy subscription is sent for this topic only when a local subscription exists.

PublicationScope **(MQCFIN)**
Whether this queue manager propagates publications to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA_PUB_SCOPE).

The value can be:

MQSCOPE_ALL
Publications for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

MQSCOPE_AS_PARENT
Whether this queue manager will propagate publications to queue managers as part of a hierarchy or as part of a publish/subscribe cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

This is the default value for this parameter if no value is specified.

MQSCOPE_QMGR
Publications for this topic are not propagated to other queue managers.

Note: You can override this behavior on a publication-by-publication basis, using MQPMO_SCOPE_QMGR on the Put Message Options.

QMgrName **(MQCFST)**
Name of local queue manager (parameter identifier: MQCA_CLUSTER_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH

SubscriptionScope **(MQCFIN)**
Whether this queue manager propagates subscriptions to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA_SUB_SCOPE).

The value can be:

MQSCOPE_ALL
Subscriptions for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

MQSCOPE_AS_PARENT
Whether this queue manager will propagate subscriptions to queue managers as part of a hierarchy or as part of a publish/subscribe cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

This is the default value for this parameter if no value is specified.

MQSCOPE_QMGR
Subscriptions for this topic are not propagated to other queue managers.

Note: You can override this behavior on a subscription-by-subscription basis, using MQSO_SCOPE_QMGR on the Subscription Descriptor or SUBSCOPE(QMGR) on DEFINE SUB.

TopicDesc **(MQCFST)**
Topic description (parameter identifier: MQCA_TOPIC_DESC).

The maximum length is MQ_TOPIC_DESC_LENGTH.

TopicName **(MQCFST)**
Topic object name (parameter identifier: MQCA_TOPIC_NAME).

The maximum length of the string is MQ_TOPIC_NAME_LENGTH

TopicString **(MQCFST)**
The topic string (parameter identifier: MQCA_TOPIC_STRING).

The '/' character within this string has special meaning. It delimits the elements in the topic tree. A topic string can start with the '/' character but is not required to. A string starting with the '/' character is not the same as the string which starts without the '/' character. A topic string cannot end with the "/" character.

The maximum length of the string is MQ_TOPIC_STR_LENGTH.

TopicType **(MQCFIN)**
Whether this object is a local or cluster topic (parameter identifier: MQIA_TOPIC_TYPE).

The value can be:

MQTOPT_LOCAL
This object is a local topic.

MQTOPT_CLUSTER
This object is a cluster topic.

WildcardOperation **(MQCFIN)**
Behavior of subscriptions including wildcards made to this topic (parameter identifier: MQIA_WILDCARD_OPERATION).

The value can be:

MQTA_PASSTHRU
Subscriptions made using wildcard topic names that are less specific than the topic string at this topic object will receive publications made to this topic and to topic strings more specific than this topic. This is the default supplied with WebSphere MQ.

MQTA_BLOCK
Subscriptions made using wildcard topic names that are less specific than the topic string at this topic object will not receive publications made to this topic or to topic strings more specific than this topic.

Event message reference

Use this page to obtain an overview of information about the format of event messages.

For each instrumentation event, information is returned in both the message descriptor and message data parts of the events messages.

Related concepts:

"Event message descriptions" on page 2915
The event message data contains information specific to the event that was generated. This data includes the name of the queue manager and, where appropriate, the name of the queue.

Related reference:

"Event message format" on page 2907
Event messages are standard WebSphere MQ messages containing a message descriptor and message data.

"Event message MQMD (message descriptor)" on page 2908
The message descriptor for an event message contains information that a system monitoring application can use, such as the message type and format, and the date and time that the message was put on the event queue.

“Event message MQCFH (PCF header)” on page 2913
The message data in event messages is in programmable command format (PCF), as used in PCF command inquiries and responses. The message data consists of two parts: the event header and the event data.

Related information:

Instrumentation events

Event message format

Event messages are standard WebSphere MQ messages containing a message descriptor and message data.

Table 264 shows the basic structure of event messages and, in the Event data column, the names of the fields in an event message for queue service interval events.

Table 264. Event message structure for queue service interval events

Message descriptor	**Message data**	
MQMD structure	**PCF header** **MQCFH structure**	**Event data** [1]
Structure identifier Structure version Report options Message type Expiration time Feedback code Encoding Coded character set ID Message format Message priority Persistence Message identifier Correlation identifier Backout count Reply-to queue Reply-to queue manager User identifier Accounting token Application identity data Application type Application name Put date Put time Application origin data Group identifier Message sequence number Offset Message flags Original length	Structure type Structure length Structure version Command identifier Message sequence number Control options Completion code Reason code Parameter count	Queue manager name Queue name Time since last reset Maximum number of messages on queue Number of messages put to queue Number of messages retrieved from queue

Note:

1. The parameters shown are those returned for a queue service interval event. The actual event data depends on the specific event.

In general, you need only a subset of this information for any system management programs that you write. For example, your application might need the following data:

- The name of the application causing the event
- The name of the queue manager on which the event occurred
- The queue on which the event was generated
- The event statistics

Event message MQMD (message descriptor)

The message descriptor for an event message contains information that a system monitoring application can use, such as the message type and format, and the date and time that the message was put on the event queue.

The information in the descriptor informs a system management application that the message type is MQMT_DATAGRAM, and the message format is MQFMT_EVENT.

Many of the fields in an event message contain fixed data, which is supplied by the queue manager that generated the message. The MQMD also specifies the name of the queue manager (truncated to 28 characters) that put the message.

For an event message, the MQMD structure contains the following values:

StrucId

Description: Structure identifier.
Data type: MQCHAR4.
Value: MQMD_STRUC_ID

Version

Description: Structure version number.
Data type: MQLONG.
Values:

MQMD_VERSION_1
Version-1 message descriptor structure, supported in all environments.

MQMD_VERSION_2
Version-2 message descriptor structure, supported on AIX, HP-UX, z/OS, IBM i, Solaris, Linux, Windows, and all WebSphere MQ MQI clients connected to these systems.

Report

Description: Options for report messages.
Data type: MQLONG.
Value:

MQRO_NONE
No reports required.

MsgType

Description: Indicates type of message.
Data type: MQLONG.
Value: MQMT_DATAGRAM.

Expiry

Description: Message lifetime.
Data type: MQLONG.
Value:

MQEI_UNLIMITED
The message does not have an expiry time.

Feedback

Description: Feedback or reason code.
Data type: MQLONG.
Value: MQFB_NONE.

Encoding

Description: Numeric encoding of message data.
Data type: MQLONG.
Value: MQENC_NATIVE.

CodedCharSetId

Description: Character set identifier of event message data.
Data type: MQLONG.
Value: Coded character set ID (CCSID) of the queue manager generating the event.

Format

Description: Format name of message data.
Data type: MQCHAR8.
Value:

MQFMT_EVENT
Event message.

Priority

Description: Message priority.
Data type: MQLONG.
Value:

MQPRI_PRIORITY_AS_Q_DEF
The priority is that of the event queue.

Persistence

Description: Message persistence.
Data type: MQLONG.
Value:

MQPER_PERSISTENCE_AS_Q_DEF
The priority is that of the event queue.

MsgId

Description: Message identifier.
Data type: MQBYTE24.
Value: A unique value generated by the queue manager.

CorrelId

Description: Correlation identifier.
Data type: MQBYTE24.
Value:

For performance, queue manager, logger, channel, bridge, and SSL events:

MQCI_NONE
No correlation identifier is specified. This is for private queues only.

For such events on a shared queue, a nonzero correlation identifier is set. This parameter is set so that you can track multiple event messages from different queue managers. The characters are specified in the following way:

1–4 Product identifier ('CSQ ')

5–8 Queue-sharing group name

9 Queue manager identifier

10–17 Time stamp

18–24 Nulls

For configuration and command events:

A unique nonzero correlation identifier
All messages relating to the same event have the same CorrelId.

BackoutCount

Description: Backout counter.
Data type: MQLONG.
Value: 0.

ReplyToQ

Description: Name of reply queue.
Data type: MQCHAR48.
Values: Blank.

ReplyToQMgr

Description: Name of reply queue manager.
Data type: MQCHAR48.
Value: The queue manager name at the originating system.

UserIdentifier

Description: Identifies the application that originated the message.
Data type: MQCHAR12.
Value: Blank.

AccountingToken

Description: Accounting token that allows an application to charge for work done as a result of the message.
Data type: MQBYTE32.
Value: MQACT_NONE.

ApplIdentityData

Description: Application data relating to identity.
Data type: MQCHAR32.
Values: Blank.

PutApplType

Description: Type of application that put the message.
Data type: MQLONG.
Value:

MQAT_QMGR
Queue manager generated message.

PutApplName

Description: Name of application that put the message.
Data type: MQCHAR28.
Value: The queue manager name at the originating system.

PutDate

Description: Date when message was put.
Data type: MQCHAR8.
Value: As generated by the queue manager.

PutTime

Description: Time when message was put.
Data type: MQCHAR8.
Value: As generated by the queue manager.

ApplOriginData

Description: Application data relating to origin.
Data type: MQCHAR4.
Value: Blank.

Note: If *Version* is MQMD_VERSION_2, the following additional fields are present:

GroupId

Description: Identifies to which message group or logical message the physical message belongs.
Data type: MQBYTE24.
Value:

MQGI_NONE
No group identifier specified.

MsgSeqNumber

Description: Sequence number of logical message within group.
Data type: MQLONG.
Value: 1.

Offset

Description: Offset of data in physical message from start of logical message.
Data type: MQLONG.
Value: 0.

MsgFlags

Description: Message flags that specify attributes of the message or control its processing.
Data type: MQLONG.
Value: MQMF_NONE.

OriginalLength

Description: Length of original message.
Data type: MQLONG.
Value: MQOL_UNDEFINED.

Event message MQCFH (PCF header)

The message data in event messages is in programmable command format (PCF), as used in PCF command inquiries and responses. The message data consists of two parts: the event header and the event data.

The MQCFH header specifies the following information:

- The category of event: whether the event is a queue manager, performance, channel, configuration, command, or logger event.
- A reason code specifying the cause of the event. For events caused by MQI calls, this reason code is the same as the reason code for the MQI call.

Reason codes have names that begin with the characters MQRC_. For example, the reason code MQRC_PUT_INHIBITED is generated when an application attempts to put a message on a queue that is not enabled for puts.

For an event, the MQCFH structure contains the following values:

Type

Description: Structure type that identifies the content of the message.
Data type: MQLONG.
Value:

MQCFT_EVENT
Message is reporting an event.

StrucLength

Description: Structure length.
Data type: MQLONG.
Value:

MQCFH_STRUC_LENGTH
Length in bytes of MQCFH structure.

Version

Description: Structure version number.
Data type: MQLONG.
Values:

MQCFH_VERSION_1
Version-1 in all events except configuration and command events.

MQCFH_VERSION_2
Version-2 for configuration events.

MQCFH_VERSION_3
Version-3 for command events.

Command

Description: Command identifier. This identifies the event category.
Data type: MQLONG.
Values:

MQCMD_Q_MGR_EVENT
Queue manager event.

MQCMD_PERFM_EVENT
Performance event.

MQCMD_CHANNEL_EVENT
Channel event.

MQCMD_CONFIG_EVENT
Configuration event.

MQCMD_COMMAND_EVENT
Command event.

MQCMD_LOGGER_EVENT
Logger event.

MsgSeqNumber

Description: Message sequence number. This is the sequence number of the message within a group of related messages.
Data type: MQLONG.
Values:

1 For change object configuration events with attribute values before the changes, and for all other types of events.

2 For change object configuration events with the attribute values after the changes

Control

Description: Control options.
Data type: MQLONG.
Values:

MQCFC_LAST
For change object configuration events with attribute values after the changes, and for all other types of events.

MQCFC_NOT_LAST
For Change Object configurations events only, with the attribute values from before the changes.

CompCode

Description: Completion code.
Data type: MQLONG.
Values:

MQCC_OK
Event reporting OK condition.

MQCC_WARNING
Event reporting warning condition. All events have this completion code, unless otherwise specified.

Reason

Description:	Reason code qualifying completion code.
Data type:	MQLONG.
Values:	MQRC_* Dependent on the event being reported. **Note:** Events with the same reason code are further identified by the *ReasonQualifier* parameter in the event data.

ParameterCount

Description:	Count of parameter structures. This is the number of parameter structures that follow the MQCFH structure. A group structure (MQCFGR), and its included parameter structures, are counted as one structure only.
Data type:	MQLONG.
Values:	0 or greater.

Event message descriptions

The event message data contains information specific to the event that was generated. This data includes the name of the queue manager and, where appropriate, the name of the queue.

The data structures returned depend on which particular event was generated. In addition, for some events, certain parameters of the structures are optional, and are returned only if they contain information that is relevant to the circumstances giving rise to the event. The values in the data structures depend on the circumstances that caused the event to be generated.

Note:

1. The PCF structures in the message data are not returned in a defined order. They must be identified from the parameter identifiers shown in the description.
2. Events are available on all platforms, unless specific limitations are shown at the start of an event description.

Alias Base Queue Type Error:

Event name:	Alias Base Queue Type Error.
Reason code in MQCFH:	MQRC_ALIAS_BASE_Q_TYPE_ERROR (2001, X'7D1'). Alias base queue not a valid type.
Event description:	An MQOPEN or MQPUT1 call was issued specifying an alias queue as the destination, but the *BaseObjectName* in the alias queue definition resolves to a queue that is not a local queue, or local definition of a remote queue.
Event type:	Local.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

QName

Description: Queue name from object descriptor (MQOD).
Identifier: MQCA_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: Always.

BaseObjectName

Description: Object name to which the alias resolves.
Identifier: MQCA_BASE_OBJECT_NAME. For compatibility with existing applications you can still use MQCA_BASE_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: Always.

QType

Description: Type of queue to which the alias resolves.
Identifier: MQIA_Q_TYPE.
Data type: MQCFIN.
Values:

MQQT_ALIAS
Alias queue definition.

MQQT_MODEL
Model queue definition.

Returned: Always.

ApplType

Description: Type of the application making the call that caused the event.
Identifier: MQIA_APPL_TYPE.
Data type: MQCFIN.
Returned: Always.

ApplName

Description: Name of the application making the call that caused the event.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

ObjectQMgrName

Description:	Name of the object queue manager.
Identifier:	MQCACF_OBJECT_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	If the *ObjectName* in the object descriptor (MQOD), when the object was opened, is not the queue manager currently connected.

ConnName

Description:	Connection name for client connection.
Identifier:	MQCACH_CONNECTION_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CONN_NAME_LENGTH.
Returned:	If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description:	Channel name for client connection.
Identifier:	MQCACH_CHANNEL_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CHANNEL_NAME_LENGTH
Returned:	If the application making the MQI call that caused the event is a client attached application.

Bridge Started:

Event name:	Bridge Started.
Reason code in MQCFH:	MQRC_BRIDGE_STARTED (2125, X'84D'). Bridge started.
Event description:	The IMS bridge has been started.
Event type:	IMS Bridge.
Platforms:	WebSphere MQ for z/OS only.
Event queue:	SYSTEM.ADMIN.CHANNEL.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

BridgeType

Description: Bridge type.
Identifier: MQIACF_BRIDGE_TYPE.
Data type: MQCFIN.
Values:

MQBT_OTMA
OTMA bridge.

Returned: Always.

BridgeName

Description: Bridge name. For bridges of type MQBT_OTMA, the name is of the form `XCFgroupXCFmember`, where `XCFgroup` is the XCF group name to which both IMS and WebSphere MQ belong. `XCFmember` is the XCF member name of the IMS system.
Identifier: MQCACF_BRIDGE_NAME.
Data type: MQCFST.
Maximum length: MQ_BRIDGE_NAME_LENGTH.
Returned: Always.

Bridge Stopped:

Event name:	Bridge Stopped.
Reason code in MQCFH:	MQRC_BRIDGE_STOPPED (2126, X'84E'). Bridge stopped.
Event description:	The IMS bridge has been stopped.
Event type:	IMS Bridge.
Platforms:	WebSphere MQ for z/OS only.
Event queue:	SYSTEM.ADMIN.CHANNEL.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

ReasonQualifier

Description: Identifier that qualifies the reason code in MQCFH.
Identifier: MQIACF_REASON_QUALIFIER.
Data type: MQCFIN.
Values:

MQRQ_BRIDGE_STOPPED_OK
Bridge has been stopped with either a zero return code or a warning return code. For MQBT_OTMA bridges, one side or the other issued a normal IXCLEAVE request.

MQRQ_BRIDGE_STOPPED_ERROR
Bridge has been stopped but there is an error reported.

Returned: Always.

BridgeType

Description:	Bridge type.
Identifier:	MQIACF_BRIDGE_TYPE.
Data type:	MQCFIN.
Value:	**MQBT_OTMA** OTMA bridge.
Returned:	Always.

BridgeName

Description:	Bridge name. For bridges of type MQBT_OTMA, the name is of the form `XCFgroupXCFmember`, where `XCFgroup` is the XCF group name to which both IMS and WebSphere MQ belong. `XCFmember` is the XCF member name of the IMS system.
Identifier:	MQCACF_BRIDGE_NAME.
Data type:	MQCFST.
Maximum length:	MQ_BRIDGE_NAME_LENGTH.
Returned:	Always.

ErrorIdentifier

Description:	When a bridge is stopped because of an error, this code identifies the error. If the event reports a bridge stop failure, the IMS sense code is set.
Identifier:	MQIACF_ERROR_IDENTIFIER.
Data type:	MQCFIN.
Returned:	If *ReasonQualifier* is MQRQ_BRIDGE_STOPPED_ERROR.

Change object:

Event name:	Change object.
Reason code in MQCFH:	MQRC_CONFIG_CHANGE_OBJECT (2368, X'940'). Existing object changed.
Event description:	An ALTER or DEFINE REPLACE command or an MQSET call was issued that successfully changed an existing object.
Event type:	Configuration.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.CONFIG.EVENT.

Note: Two event messages are generated for the change object event. The first has the object attribute values **before** the change, the second has the attribute values **after** the change.

Event data

EventUserId

Description: The user id that issued the command or call that generated the event. (This is the same user id that is used to check the authority to issue the command or call; for commands received from a queue, this is also the user identifier (UserIdentifier) from the MQMD of the command message).
Identifier: MQCACF_EVENT_USER_ID.
Datatype: MQCFST.
Maximum length: MQ_USER_ID_LENGTH.
Returned: Always.

EventOrigin

Description: The origin of the action causing the event.
Identifier: MQIACF_EVENT_ORIGIN.
Datatype: MQCFIN.
Values:

MQEVO_CONSOLE
Console command.

MQEVO_INIT
Initialization input data set command.

MQEVO_INTERNAL
Directly by queue manager.

MQEVO_MQSET
MQSET call.

MQEVO_MSG
Command message on SYSTEM.COMMAND.INPUT.

MQEVO_OTHER
None of the above.

Returned: Always.

EventQMgr

Description: The queue manager where the command or call was entered. (The queue manager where the command is executed and that generates the event is in the MQMD of the event message).
Identifier: MQCACF_EVENT_Q_MGR.
Datatype: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

EventAccountingToken

Description: For commands received as a message (MQEVO_MSG), the accounting token (AccountingToken) from the MQMD of the command message.
Identifier: MQBACF_EVENT_ACCOUNTING_TOKEN.
Datatype: MQCFBS.
Maximum length: MQ_ACCOUNTING_TOKEN_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplIdentity

Description: For commands received as a message (MQEVO_MSG), application identity data (ApplIdentityData) from the MQMD of the command message.
Identifier: MQCACF_EVENT_APPL_IDENTITY.
Datatype: MQCFST.
Maximum length: MQ_APPL_IDENTITY_DATA_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplType

Description: For commands received as a message (MQEVO_MSG), the type of application (PutApplType) from the MQMD of the command message.
Identifier: MQIACF_EVENT_APPL_TYPE.
Datatype: MQCFIN.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplName

Description: For commands received as a message (MQEVO_MSG), the name of the application (PutApplName) from the MQMD of the command message.
Identifier: MQCACF_EVENT_APPL_NAME.
Datatype: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplOrigin

Description: For commands received as a message (MQEVO_MSG), the application origin data (ApplOriginData) from the MQMD of the command message.
Identifier: MQCACF_EVENT_APPL_ORIGIN.
Datatype: MQCFST.
Maximum length: MQ_APPL_ORIGIN_DATA_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

ObjectType

Description: Object type:
Identifier: MQIACF_OBJECT_TYPE.
Datatype: MQCFIN.

Values:

MQOT_CHANNEL
Channel.

MQOT_CHLAUTH
Channel authentication record.

MQOT_NAMELIST
Namelist.

MQOT_NONE
No object.

MQOT_PROCESS
Process.

MQOT_Q
Queue.

MQOT_Q_MGR
Queue manager.

MQOT_STORAGE_CLASS
Storage class.

MQOT_AUTH_INFO
Authentication information.

MQOT_CF_STRUC
CF structure.

MQOT_TOPIC
Topic.

MQOT_COMM_INFO
Communication information.

MQOT_LISTENER
Channel Listener.

Returned: Always.

ObjectName

Description: Object name:
Identifier : Identifier will be according to object type.

- MQCACH_CHANNEL_NAME
- MQCA_NAMELIST_NAME
- MQCA_PROCESS_NAME
- MQCA_Q_NAME
- MQCA_Q_MGR_NAME
- MQCA_STORAGE_CLASS
- MQCA_AUTH_INFO_NAME
- MQCA_CF_STRUC_NAME
- MQCA_TOPIC_NAME
- MQCA_COMM_INFO_NAME
- MQCACH_LISTENER_NAME

Note: MQCACH_CHANNEL_NAME can also be used for channel authentication.

Datatype: MQCFST.
Maximum length: MQ_OBJECT_NAME_LENGTH.
Returned: Always

Disposition

Description:	Object disposition:
Identifier:	MQIA_QSG_DISP.
Datatype:	MQCFIN.
Values:	**MQQSGD_Q_MGR** Object resides on page set of queue manager. **MQQSGD_SHARED** Object resides in shared repository and messages are shared in coupling facility. **MQQSGD_GROUP** Object resides in shared repository. **MQQSGD_COPY** Object resides on page set of queue manager and is a local copy of a GROUP object.
Returned:	Always, except for queue manager and CF structure objects.

Object attributes

A parameter structure is returned for each attribute of the object. The attributes returned depend on the object type. For more information see "Object attributes for event data" on page 2872.

Channel Activated:

Event name:	Channel Activated.
Reason code in MQCFH:	MQRC_CHANNEL_ACTIVATED (2295, X'8F7'). Channel activated.
Event description:	This condition is detected when a channel that has been waiting to become active, and for which a Channel Not Activated event has been generated, is now able to become active, because an active slot has been released by another channel. This event is not generated for a channel that is able to become active without waiting for an active slot to be released.
Event type:	Channel.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.CHANNEL.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

ChannelName

Description: Channel Name.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH.
Returned: Always.

XmitQName

Description: Transmission queue name.
Identifier: MQCACH_XMIT_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: For sender, server, cluster-sender, and cluster-receiver channels only.

ConnectionName

Description: If the channel has successfully established a TCP connection, this is the Internet address. Otherwise it is the contents of the *ConnectionName* field in the channel definition.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: Only for commands that do not contain a generic name.

Channel Auto-definition Error:

Event name:	Channel Auto-definition Error.
Reason code in MQCFH:	MQRC_CHANNEL_AUTO_DEF_ERROR (2234, X'8BA'). Automatic channel definition failed.
Event description:	This condition is detected when the automatic definition of a channel fails; this may be because an error occurred during the definition process, or because the channel automatic-definition exit inhibited the definition. Additional information indicating the reason for the failure is returned in the event message.
Event type:	Channel.
Platforms:	All, except WebSphere MQ for z/OS.
Event queue:	SYSTEM.ADMIN.CHANNEL.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

ChannelName

Description: Name of the channel for which the auto-definiton has failed.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH.
Returned: Always.

ChannelType

Description: Channel Type. This specifies the type of channel for which the auto-definition has failed.
Identifier: MQIACH_CHANNEL_TYPE.
Data type: MQCFIN.
Values:

MQCHT_RECEIVER
Receiver.

MQCHT_SVRCONN
Server-connection (for use by clients).

MQCHT_CLUSSDR
Cluster-sender.

Returned: Always.

ErrorIdentifier

Description: Identifier of the cause of the error. This contains either the reason code (MQRC_* or MQRCCF_*) resulting from the channel definition attempt or the value MQRCCF_SUPPRESSED_BY_EXIT if the attempt to create the definition was disallowed by the exit.
Identifier: MQIACF_ERROR_IDENTIFIER.
Data type: MQCFIN.
Returned: Always.

ConnectionName

Description: Name of the partner attempting to establish connection.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: Always.

AuxErrorDataInt1

Description: Auxiliary error data. This contains the value returned by the exit in the *Feedback* field of the MQCXP to indicate why the auto definition has been disallowed.
Identifier: MQIACF_AUX_ERROR_DATA_INT_1.
Data type: MQCFIN.
Returned: Only if *ErrorIdentifier* contains MQRCCF_SUPPRESSED_BY_EXIT.

Channel Auto-definition OK:

Event name:	Channel Auto-definition OK.
Reason code in MQCFH:	MQRC_CHANNEL_AUTO_DEF_OK (2233, X'8B9'). Automatic channel definition succeeded.
Event description:	This condition is detected when the automatic definition of a channel is successful. The channel is defined by the MCA.
Event type:	Channel.
Platforms:	All, except WebSphere MQ for z/OS.
Event queue:	SYSTEM.ADMIN.CHANNEL.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

ChannelName

Description: Name of the channel being defined.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH.
Returned: Always.

ChannelType

Description: Type of channel being defined.
Identifier: MQIACH_CHANNEL_TYPE.
Data type: MQCFIN.
Values:

MQCHT_RECEIVER
Receiver.

MQCHT_SVRCONN
Server-connection (for use by clients).

MQCHT_CLUSSDR
Cluster-sender.

Returned: Always.

ConnectionName

Description: Name of the partner attempting to establish connection.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: Always.

Channel Blocked:

Event name:	Channel Blocked.
Reason code in MQCFH:	MQRC_CHANNEL_BLOCKED Channel blocked. MQRC_CHANNEL_BLOCKED_WARNING Channel blocked – warning mode.
Event description:	This event is issued when an attempt to start an inbound channel is blocked. For MQRC_CHANNEL_BLOCKED_WARNING, temporary access has been granted to the channel because the channel authentication record is defined with WARN set to YES.
Event type:	Channel.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.CHANNEL.EVENT

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

Reason qualifier

Description: Identifier that qualifies the reason code
Identifier: MQIACF_REASON_QUALIFIER
Data type: MQCFIN.
Values:

MQRQ_CHANNEL_BLOCKED_ADDRESS
Channel was blocked due to its IP address being in the list to be refused

MQRQ_CHANNEL_BLOCKED_USERID
Channel was blocked due to its asserted or mapped user ID being in the list to be refused.

MQRQ_CHANNEL_BLOCKED_NOACCESS
Channel was blocked due to its IP address; SSL Peer name; remote queue manager name or client user ID being mapped to have no access.

Returned: Always.

ChannelName

Description: Channel Name.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH.
Returned: If the Reason Qualifier is not MQRQ_CHANNEL_BLOCKED_ADDRESS. In that case the inbound connection is blocked before the channel name is known.

UserIdentifier

Description: User identifier that was blocked.
Identifier: MQCACF_USER_IDENTIFIER
Data type: MQCFST.
Maximum length: MQ_USER_ID_LENGTH
Returned: Only if the Reason Qualifier is MQRQ_CHANNEL_BLOCKED_USERID

ConnectionName

Description: Address of the partner attempting to establish connection
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: Always

RemoteQMgrName

Description: Name of the partner queue manager attempting to establish connection.
Identifier: MQCA_REMOTE_Q_MGR_NAME
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH
Returned: Only for inbound queue manager connections.

SSLPeerName

Description: The Distinguished Name in the certificate sent from the remote system.
Identifier: MQCACH_SSL_PEER_NAME
Data type: MQCFST.
Maximum length: MQ_DISTINGUISHED_NAME_LENGTH
Returned: Whenever the channel is using SSL and the client has not connected anonymously.

ClientUserIdentifier

Description: Client side user identifier of the partner attempting to establish connection.
Identifier: MQCACH_CLIENT_USER_ID
Data type: MQCFST.
Maximum length: MQ_USER_ID_LENGTH
Returned: Only for inbound client connections, if the Reason Qualifier is not MQRQ_CHANNEL_BLOCKED_ADDRESS. In that case the inbound connection is blocked before the client user Id name is known.

ApplType

Description:	Type of application that made the API call.
Identifier:	MQIA_APPL_TYPE
Data type:	MQCFIN.
Returned:	Only for inbound client connections. If the Reason Qualifier is not MQRQ_CHANNEL_BLOCKED_ADDRESS. In that case the inbound connection is blocked before the application name is known.

ApplName

Description:	Name of the application that made the API call.
Identifier:	MQCACF_APPL_NAME
Data type:	MQCFST.
Maximum length:	MQ_APPL_NAME_LENGTH
Returned:	Only for inbound client connections. If the Reason Qualifier is not MQRQ_CHANNEL_BLOCKED_ADDRESS. In that case the inbound connection is blocked before the application name is known.

Channel Conversion Error:

Event name:	Channel Conversion Error.
Reason code in MQCFH:	MQRC_CHANNEL_CONV_ERROR (2284, X'8EC'). Channel conversion error.
Event description:	This condition is detected when a channel is unable to carry out data conversion and the MQGET call to get a message from the transmission queue resulted in a data conversion error. The reason for the failure is identified by *ConversionReasonCode*.
Event type:	Channel.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.CHANNEL.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

ConversionReasonCode

Description: Identifier of the cause of the conversion error.
Identifier: MQIACF_CONV_REASON_CODE.
Data type: MQCFIN.
Values:

MQRC_CONVERTED_MSG_TOO_BIG (2120, X'848')
Converted message too big for application buffer.

MQRC_FORMAT_ERROR (2110, X'83E')
Message format not valid.

MQRC_NOT_CONVERTED (2119, X'847')
Application message data not converted.

MQRC_SOURCE_CCSID_ERROR (2111, X'83F')
Source coded character set identifier not valid.

MQRC_SOURCE_DECIMAL_ENC_ERROR (2113, X'841')
Packed-decimal encoding in message not recognized.

MQRC_SOURCE_FLOAT_ENC_ERROR (2114, X'842')
Floating-point encoding in message not recognized.

MQRC_SOURCE_INTEGER_ENC_ERROR (2112, X'840')
Integer encoding in message not recognized.

MQRC_TARGET_CCSID_ERROR (2115, X'843')
Target coded character set identifier not valid.

MQRC_TARGET_DECIMAL_ENC_ERROR (2117, X'845')
Packed-decimal encoding specified by receiver not recognized.

MQRC_TARGET_FLOAT_ENC_ERROR (2118, X'846')
Floating-point encoding specified by receiver not recognized.

MQRC_TARGET_INTEGER_ENC_ERROR (2116, X'844')
Integer encoding specified by receiver not recognized.

MQRC_TRUNCATED_MSG_ACCEPTED (2079, X'81F')
Truncated message returned (processing completed).

MQRC_TRUNCATED_MSG_FAILED (2080, X'820')
Truncated message returned (processing not completed).

Returned: Always.

ChannelName

Description: Channel name.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH.
Returned: Always.

Format

Description:	Format name.
Identifier:	MQCACH_FORMAT_NAME.
Data type:	MQCFST.
Maximum length:	MQ_FORMAT_LENGTH.
Returned:	Always.

XmitQName

Description:	Transmission queue name.
Identifier:	MQCACH_XMIT_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	Always.

ConnectionName

Description:	If the channel has successfully established a TCP connection, this is the Internet address. Otherwise it is the contents of the *ConnectionName* field in the channel definition.
Identifier:	MQCACH_CONNECTION_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CONN_NAME_LENGTH.
Returned:	Always.

Channel Not Activated:

Event name:	Channel Not Activated.
Reason code in MQCFH:	MQRC_CHANNEL_NOT_ACTIVATED (2296, X'8F8'). Channel cannot be activated.
Event description:	This condition is detected when a channel is required to become active, either because it is starting, or because it is about to make another attempt to establish connection with its partner. However, it is unable to do so because the limit on the number of active channels has been reached. See the following: • MaxActiveChannels parameter in the qm.ini file for AIX, HP-UX, and Solaris • MaxActiveChannels parameter in the Registry for Windows. • ACTCHL parameter on the ALTER QMGR command for z/OS The channel waits until it is able to take over an active slot released when another channel ceases to be active. At that time a Channel Activated event is generated.
Event type:	Channel.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.CHANNEL.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

ChannelName

Description: Channel name.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH.
Returned: Always.

XmitQName

Description: Transmission queue name.
Identifier: MQCACH_XMIT_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: For sender, server, cluster-sender, and cluster-receiver channel types only.

ConnectionName

Description: If the channel has successfully established a TCP connection, this is the Internet address. Otherwise it is the contents of the *ConnectionName* field in the channel definition.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: Only for commands that do not contain a generic name.

Channel Not Available:

Event name:	Channel Not Available.
Reason code in MQCFH:	MQRC_CHANNEL_NOT_AVAILABLE (2537, X'9E9'). Channel not available.
Event description:	This is issued when an attempt to start an inbound channel is rejected.
Event type:	Channel.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.CHANNEL.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

ReasonQualifier

Description: Identifier that qualifies the reason code.
Identifier: MQIACF_REASON_QUALIFIER.
Data type: MQCFIN.
Values:

MQRQ_MAX_ACTIVE_CHANNELS
Channel was unavailable due to maximum active channel instances (MaxActiveChannels qm.ini stanza on distributed or ACTCHL MQSC keyword on z/OS) limit being reached for the queue manager.

MQRQ_MAX_CHANNELS
Channel was unavailable due to maximum channel instances (MaxChannels qm.ini stanza on distributed or MAXCHL MQSC keyword on z/OS) limit being reached for the queue manager.

MQRQ_SVRCONN_INST_LIMIT
Channel was unavailable due to maximum active channel instances (MAXINST) limit being reached for the channel.

MQRQ_CLIENT_INST_LIMIT
Channel was unavailable due to maximum active channel instances (MAXINSTC) limit being reached for the client for the channel.

MQRQ_CAF_NOT_INSTALLED (z/OS only)
Channel was unavailable due to the client attach feature not being installed.

Returned: Always.

ChannelName

Description: Channel name.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH.
Returned: Always.

ConnectionName

Description: Address of the partner attempting to establish connection.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: Always.

MaximumActiveChannels

Description: Maximum active channels.
Identifier: MQIA_ACTIVE_CHANNELS
Data type: MQCFIN.
Returned: Only where reason qualifier MQRQ_MAX_ACTIVE_CHANNELS.

MaximumChannels

Description: Maximum channels.
Identifier: MQIA_MAX_CHANNELS
Data type: MQCFIN
Returned: Only where reason qualifier MQRQ_MAX_CHANNELS.

MaximumInstances

Description: Maximum channel instances.
Identifier: MQIACH_MAX_INSTANCES
Data type: MQCFIN
Returned: Only where reason qualifier MQRQ_SVRCONN_INST_LIMIT.

MaximumClientInstances

Description: Maximum channel instances per client.
Identifier: MQIACH_MAX_INSTS_PER_CLIENT
Data type: MQCFIN
Returned: Only where reason qualifier MQRQ_CLIENT_INST_LIMIT.

Channel SSL Error:

Event name:	Channel SSL Error.
Reason code in MQCFH:	MQRC_CHANNEL_SSL_ERROR (2371, X'943'). Channel SSL Error.
Event description:	This condition is detected when a channel using Secure Sockets Layer (SSL) or Transport Layer Security (TLS) fails to establish a connection. *ReasonQualifier* identifies the nature of the error.
Event type:	SSL.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.CHANNEL.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

ReasonQualifier

Description: Identifier that qualifies the reason code.
Identifier: MQIACF_REASON_QUALIFIER.
Data type: MQCFIN.
Values:

MQRQ_SSL_HANDSHAKE_ERROR
The key exchange / authentication failure arose during the SSL or TLS handshake.

MQRQ_SSL_CIPHER_SPEC_ERROR
This error can mean any one of the following:

- The SSL or TLS client CipherSpec does not match that on the SSL or TLS server channel definition.
- An invalid CipherSpec has been specified.
- A CipherSpec has only been specified on one end of the SSL or TLS channel.

MQRQ_SSL_PEER_NAME_ERROR
The Distinguished Name in the certificate sent by one end of the SSL or TLS channel does not match the peer name on the end of the channel definition at the other end of the SSL or TLS channel.

MQRQ_SSL_CLIENT_AUTH_ERROR
The SSL or TLS server channel definition specified either SSLCAUTH(REQUIRED) or a SSLPEER value that was not blank, but the SSL or TLS client did not provide a certificate.

Returned: Always.

ChannelName

Description: Channel Name.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH.
Returned: The *ChannelName* might not be available if the channel has not yet got far enough through its start-up process, in this case the channel name will not be returned. Otherwise always.

XmitQName

Description: Transmission queue name.
Identifier: MQCACH_XMIT_Q_NAME.
Data type: MQCFST.
Returned: For sender, server, cluster-sender and cluster-receiver channels only.

ConnectionName

Description:	If the channel has successfully established a TCP connection, this is the Internet address. Otherwise it is the contents of the ConnectionName field in the channel definition.
Identifier:	MQCACH_CONNECTION_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CONN_NAME_LENGTH.
Returned:	The *ConnectionName* might not be available if the channel has not yet got far enough through its start-up process, in this case the connection name will not be returned. Otherwise always.

SSLHandshakeStage

Description:	Information about the SSL or TLS function call giving the error. For z/OS, details of function names can be found in the *System Secure Sockets Layer Programming Guide and Reference* SC24-5877.
Identifier:	MQCACH_SSL_HANDSHAKE_STAGE.
Data type:	MQCFST.
Maximum length:	MQ_SSL_HANDSHAKE_STAGE_LENGTH.
Returned:	This field is only present if *ReasonQualifier* is set to MQRQ_SSL_HANDSHAKE_ERROR.

SSLReturnCode

Description:	A numeric return code from a failing SSL or TLS call. Details of SSL or TLS Return Codes for specific platforms can be found as follows: • For platforms other than z/OS, see Secure Sockets Layer (SSL) return codes.
Identifier:	MQIACH_SSL_RETURN_CODE.
Data type:	MQCFIN.
Returned:	This field is only present if *ReasonQualifier* is set to MQRQ_SSL_HANDSHAKE_ERROR.

SSLPeerName

Description:	The Distinguished Name in the certificate sent from the remote system.
Identifier:	MQCACH_SSL_PEER_NAME.
Data type:	MQCFST.
Maximum length:	MQ_DISTINGUISHED_NAME_LENGTH.
Returned:	This field is only present if *ReasonQualifier* is set to MQRQ_SSL_PEER_NAME_ERROR and is not always present for this reason qualifier.

Channel SSL Warning:

Event name:	Channel SSL Warning.
Reason code in MQCFH:	MQRC_CHANNEL_SSL_WARNING (2552, X'9F8'). Channel SSL Warning.
Event description:	This condition is detected when a channel using Secure Sockets Layer (SSL) or Transport Layer Security (TLS) experiences a problem that does not cause it to fail to establish an SSL or TLS connection. *ReasonQualifier* identifies the nature of the event.
Event type:	SSL.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.CHANNEL.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

ReasonQualifier

Description: Identifier that qualifies the reason code.
Identifier: MQIACF_REASON_QUALIFIER.
Data type: MQCFIN.
Values:

MQRQ_SSL_UNKNOWN_REVOCATION
An OCSP responder returned a response of Unknown. WebSphere MQ is configured to produce warnings but allow the connection to continue.

Returned: Always.

ChannelName

Description: Channel Name.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH.
Returned: The *ChannelName* might not be available if the channel has not yet got far enough through its start-up process, in this case the channel name will not be returned. Otherwise always.

XmitQName

Description: Transmission queue name.
Identifier: MQCACH_XMIT_Q_NAME.
Data type: MQCFST.
Returned: For sender, server, cluster-sender and cluster-receiver channels only.

ConnectionName

Description: If the channel has successfully established a TCP connection, this is the Internet address. Otherwise it is the contents of the ConnectionName field in the channel definition.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: The *ConnectionName* may not be available if the channel has not yet got far enough through its start-up process, in this case the connection name will not be returned. Otherwise always.

Channel Started:

Event name:	Channel Started.
Reason code in MQCFH:	MQRC_CHANNEL_STARTED (2282, X'8EA'). Channel started.
Event description:	Either an operator has issued a Start Channel command, or an instance of a channel has been successfully established. This condition is detected when Initial Data negotiation is complete and resynchronization has been performed where necessary, such that message transfer can proceed.
Event type:	Channel.
Platforms:	All. Client connections do not produce this event.
Event queue:	SYSTEM.ADMIN.CHANNEL.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

ChannelName

Description:	Channel name.
Identifier:	MQCACH_CHANNEL_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CHANNEL_NAME_LENGTH.
Returned:	Always.

XmitQName

Description:	Transmission queue name.
Identifier:	MQCACH_XMIT_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	For sender, server, cluster-sender, and cluster-receiver channels only.

ConnectionName

Description:	If the channel has successfully established a TCP connection, this is the Internet address. Otherwise it is the contents of the *ConnectionName* field in the channel definition.
Identifier:	MQCACH_CONNECTION_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CONN_NAME_LENGTH.
Returned:	Only for commands that do not contain a generic name.

Channel Stopped:

Event name:	Channel Stopped.
Reason code in MQCFH:	MQRC_CHANNEL_STOPPED (2283, X'8EB'). Channel stopped.
Event description:	This is issued when a channel instance stops. It will only be issued if the channel instance previously issued a channel started event.
Event type:	Channel.
Platforms:	All. Client connections do not produce this event.
Event queue:	SYSTEM.ADMIN.CHANNEL.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

ReasonQualifier

Description: Identifier that qualifies the reason code.
Identifier: MQIACF_REASON_QUALIFIER.
Data type: MQCFIN.
Values:

MQRQ_CHANNEL_STOPPED_OK
Channel has been closed with either a zero return code or a warning return code.

MQRQ_CHANNEL_STOPPED_ERROR
Channel has been closed but there is an error reported and the channel is not in stopped or retry state.

MQRQ_CHANNEL_STOPPED_RETRY
Channel has been closed and it is in retry state.

MQRQ_CHANNEL_STOPPED_DISABLED
Channel has been closed and it is in a stopped state.

Returned: Always.

ChannelName

Description: Channel name.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH.
Returned: Always.

ErrorIdentifier

Description: Identifier of the cause of the error. If a channel is stopped due to an error, this is the code that identifies the error. If the event message is because of a channel stop failure, the following fields are set:

1. *ReasonQualifier*, containing the value MQRQ_CHANNEL_STOPPED_ERROR
2. *ErrorIdentifier*, containing the code number of an error message that describes the error
3. *AuxErrorDataInt1*, containing error message integer insert 1
4. *AuxErrorDataInt2*, containing error message integer insert 2
5. *AuxErrorDataStr1*, containing error message string insert 1
6. *AuxErrorDataStr2*, containing error message string insert 2
7. *AuxErrorDataStr3*, containing error message string insert 3

The meanings of the error message inserts depend on the code number of the error message. Details of error-message code numbers and the inserts for specific platforms can be found as follows:

- For platforms other than z/OS, the last four digits of *ErrorIdentifier* when displayed in hexadecimal notation indicate the decimal code number of the error message.

  For example, if *ErrorIdentifier* has the value X'xxxxyyyy', the message code of the error message explaining the error is AMQyyyy. See “Diagnostic messages: AMQ4000-9999” on page 3026 for a description of these error messages.

Identifier: MQIACF_ERROR_IDENTIFIER.
Data type: MQCFIN.
Returned: Always.

AuxErrorDataInt1

Description: First integer of auxiliary error data for channel errors. If a channel is stopped due to an error, this is the first integer parameter that qualifies the error. This information is for use by IBM service personnel; include it in any problem report that you submit to IBM regarding this event message.
Identifier: MQIACF_AUX_ERROR_DATA_INT_1.
Data type: MQCFIN.
Returned: Always.

AuxErrorDataInt2

Description: Second integer of auxiliary error data for channel errors. If a channel is stopped due to an error, this is the second integer parameter that qualifies the error. This information is for use by IBM service personnel; include it in any problem report that you submit to IBM regarding this event message.
Identifier: MQIACF_AUX_ERROR_DATA_INT_2.
Data type: MQCFIN.
Returned: Always.

AuxErrorDataStr1

Description: First string of auxiliary error data for channel errors. If a channel is stopped due to an error, this is the first string parameter that qualifies the error. This information is for use by IBM service personnel; include it in any problem report that you submit to IBM regarding this event message.
Identifier: MQCACF_AUX_ERROR_DATA_STR_1.
Data type: MQCFST.
Returned: Always.

AuxErrorDataStr2

Description: Second string of auxiliary error data for channel errors. If a channel is stopped due to an error, this is the second string parameter that qualifies the error. This information is for use by IBM service personnel; include it in any problem report that you submit to IBM regarding this event message.
Identifier: MQCACF_AUX_ERROR_DATA_STR_2.
Data type: MQCFST.
Returned: Always.

AuxErrorDataStr3

Description: Third string of auxiliary error data for channel errors. If a channel is stopped due to an error, this is the third string parameter that qualifies the error. This information is for use by IBM service personnel; include it in any problem report that you submit to IBM regarding this event message.
Identifier: MQCACF_AUX_ERROR_DATA_STR_3.
Data type: MQCFST.
Returned: Always.

XmitQName

Description: Transmission queue name.
Identifier: MQCACH_XMIT_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: For sender, server, cluster-sender, and cluster-receiver channels only.

ConnectionName

Description: If the channel has successfully established a TCP connection, this is the Internet address. Otherwise it is the contents of the *ConnectionName* field in the channel definition.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: Only for commands that do not contain a generic name.

Channel Stopped By User:

Event name:	Channel Stopped By User.
Reason code in MQCFH:	MQRC_CHANNEL_STOPPED_BY_USER (2279, X'8E7'). Channel stopped by user.
Event description:	This is issued when a user issues a STOP CHL command. *ReasonQualifier* identifies the reasons for stopping.
Event type:	Channel.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.CHANNEL.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

ReasonQualifier

Description:	Identifier that qualifies the reason code.
Identifier:	MQIACF_REASON_QUALIFIER.
Data type:	MQCFIN.
Values:	**MQRQ_CHANNEL_STOPPED_DISABLED** Channel has been closed and it is in a stopped state.
Returned:	Always.

ChannelName

Description:	Channel name.
Identifier:	MQCACH_CHANNEL_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CHANNEL_NAME_LENGTH.
Returned:	Always.

Command:

Event name:	Command.
Reason code in MQCFH:	MQRC_COMMAND_MQSC (2412, X'96C'). MQSC command successfully issued, or, MQRC_COMMAND_PCF (2413, X'96D'). PCF command successfully issued.
Event description:	Command successfully issued.
Event type:	Command.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.COMMAND.EVENT.

Event data

The event data consists of two groups, *CommandContext* and *CommandData*.

CommandContext

Description: PCF group containing the elements related to the context of the issued command.
Identifier: MQGACF_COMMAND_CONTEXT.
Data type: MQCFGR.
PCF elements in group:
- *EventUserId*
- *EventOrigin*
- *EventQMgr*
- *EventAccountingToken*
- *EventIdentityData*
- *EventApplType*
- *EventApplName*
- *EventApplOrigin*
- *Command*

Returned: Always.

EventUserId

Description: The user ID that issued the command or call that generated the event. (This is the same user ID that is used to check the authority to issue the command; for commands received from a queue, this is also the user identifier (UserIdentifier) from the MQMD of the command message).
Identifier: MQCACF_EVENT_USER_ID.
Data type: MQCFST.
Maximum length: MQ_USER_ID_LENGTH.
Returned: Always.

EventOrigin

Description: The origin of the action causing the event.
Identifier: MQIACF_EVENT_ORIGIN.
Data type: MQCFIN.
Values:

MQEVO_CONSOLE
Console command.

MQEVO_INIT
Initialization input data set command.

MQEVO_MSG
Command message on SYSTEM.COMMAND.INPUT.

MQEVO_INTERNAL
Directly by queue manager.

MQEVO_OTHER
None of the above.

Returned: Always.

EventQMgr

Description: The queue manager where the command was entered. (The queue manager where the command is executed and that generates the event is in the MQMD of the event message).
Identifier: MQCACF_EVENT_Q_MGR.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

EventAccountingToken

Description: For commands received as a message (MQEVO_MSG), the accounting token (AccountingToken) from the MQMD of the command message.
Identifier: MQBACF_EVENT_ACCOUNTING_TOKEN.
Data type: MQCFBS.
Maximum length: MQ_ACCOUNTING_TOKEN_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

EventIdentityData

Description: For commands received as a message (MQEVO_MSG), application identity data (ApplIdentityData) from the MQMD of the command message.
Identifier: MQCACF_EVENT_APPL_IDENTITY.
Data type: MQCFST.
Maximum length: MQ_APPL_IDENTITY_DATA_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplType

Description: For commands received as a message (MQEVO_MSG), the type of application (PutApplType) from the MQMD of the command message.
Identifier: MQIACF_EVENT_APPL_TYPE.
Data type: MQCFIN.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplName

Description: For commands received as a message (MQEVO_MSG), the name of the application (PutApplName) from the MQMD of the command message.
Identifier: MQCACF_EVENT_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplOrigin

Description: For commands received as a message (MQEVO_MSG), the application origin data (ApplOriginData) from the MQMD of the command message.
Identifier: MQCACF_EVENT_APPL_ORIGIN.
Data type: MQCFST.
Maximum length: MQ_APPL_ORIGIN_DATA_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

Command

Description: The command code.
Identifier: MQIACF_COMMAND.
Data type: MQCFIN.
Values:

- If the event relates to a PCF command, then the value is that of the Command parameter in the MQCFH structure in the command message.
- If the event relates to an MQSC command, then the value is as follows:

MQCMD_SUSPEND_Q_MGR
SUSPEND QMGR other than CLUSTER/CLUSNL

MQCMD_SUSPEND_Q_MGR_CLUSTER
SUSPEND QMGR CLUSTER/CLUSNL

Returned: Always.

CommandData

Description: PCF group containing the elements related to the command data.
Identifier: MQGACF_COMMAND_DATA.
Data type: MQCFGR.
PCF elements in group:
- If generated for an MQSC command, this group only contains the PCF element *CommandMQSC*.
- If generated for a PCF command, this group contains the PCF elements that make up the PCF command, exactly as in the command message.

Returned: Always.

CommandMQSC

Description: The text of the MQSC command.
Identifier: MQCACF_COMMAND_MQSC.
Data type: MQCFST.
Maximum length: MQ_COMMAND_MQSC_LENGTH.
Returned: Only if Reason in the message descriptor is MQRC_COMMAND_MQSC.

Create object:

Event name:	Create object.
Reason code in MQCFH:	MQRC_CONFIG_CREATE_OBJECT (2367, X'93F'). New object created.
Event description:	A DEFINE or DEFINE REPLACE command was issued which successfully created a new object.
Event type:	Configuration.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.CONFIG.EVENT.

Event data

EventUserId

Description: The user id that issued the command or call that generated the event. (This is the same user id that is used to check the authority to issue the command or call; for commands received from a queue, this is also the user identifier (UserIdentifier) from the MQMD of the command message).
Identifier: MQCACF_EVENT_USER_ID.
Data type: MQCFST.
Maximum length: MQ_USER_ID_LENGTH.
Returned: Always.

EventOrigin

Description: The origin of the action causing the event.
Identifier: MQIACF_EVENT_ORIGIN.
Data type: MQCFIN.
Values:

MQEVO_CONSOLE
Console command.

MQEVO_INIT
Initialization input data set command.

MQEVO_INTERNAL
Directly by queue manager.

MQEVO_MQSET
MQSET call.

MQEVO_MSG
Command message on SYSTEM.COMMAND.INPUT.

MQEVO_OTHER
None of the above.

Returned: Always.

EventQMgr

Description: The queue manager where the command or call was entered. (The queue manager where the command is executed and that generates the event is in the MQMD of the event message).
Identifier: MQCACF_EVENT_Q_MGR.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

EventAccountingToken

Description: For commands received as a message (MQEVO_MSG), the accounting token (AccountingToken) from the MQMD of the command message.
Identifier: MQBACF_EVENT_ACCOUNTING_TOKEN.
Data type: MQCFBS.
Maximum length: MQ_ACCOUNTING_TOKEN_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplIdentity

Description: For commands received as a message (MQEVO_MSG), application identity data (ApplIdentityData) from the MQMD of the command message.
Identifier: MQCACF_EVENT_APPL_IDENTITY.
Data type: MQCFST.
Maximum length: MQ_APPL_IDENTITY_DATA_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplType

Description: For commands received as a message (MQEVO_MSG), the type of application (PutApplType) from the MQMD of the command message.
Identifier: MQIACF_EVENT_APPL_TYPE.
Data type: MQCFIN.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplName

Description: For commands received as a message (MQEVO_MSG), the name of the application (PutApplName) from the MQMD of the command message.
Identifier: MQCACF_EVENT_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplOrigin

Description: For commands received as a message (MQEVO_MSG), the application origin data (ApplOriginData) from the MQMD of the command message.
Identifier: MQCACF_EVENT_APPL_ORIGIN.
Data type: MQCFST.
Maximum length: MQ_APPL_ORIGIN_DATA_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

ObjectType

Description: Object type:
Identifier: MQIACF_OBJECT_TYPE.
Data type: MQCFIN.

Values:

MQOT_CHANNEL
Channel.

MQOT_CHLAUTH
Channel authentication record.

MQOT_NAMELIST
Namelist.

MQOT_NONE
No object.

MQOT_PROCESS
Process.

MQOT_Q
Queue.

MQOT_STORAGE_CLASS
Storage class.

MQOT_AUTH_INFO
Authentication information.

MQOT_CF_STRUC
CF structure.

MQOT_TOPIC
Topic.

MQOT_COMM_INFO
Communication information.

MQOT_LISTENER
Channel Listener.

Returned: Always.

ObjectName

Description: Object name:
Identifier : Identifier will be according to object type.

- MQCACH_CHANNEL_NAME
- MQCA_NAMELIST_NAME
- MQCA_PROCESS_NAME
- MQCA_Q_NAME
- MQCA_STORAGE_CLASS
- MQCA_AUTH_INFO_NAME
- MQCA_CF_STRUC_NAME
- MQCA_TOPIC_NAME
- MQCA_COMM_INFO_NAME
- MQCACH_LISTENER_NAME

Note: MQCACH_CHANNEL_NAME can also be used for channel authentication.

Data type: MQCFST.
Maximum length: MQ_OBJECT_NAME_LENGTH.
Returned: Always

Disposition

Description:	Object disposition:
Identifier:	MQIA_QSG_DISP.
Data type:	MQCFIN.
Values:	**MQQSGD_Q_MGR** Object resides on page set of queue manager. **MQQSGD_SHARED** Object resides in shared repository and messages are shared in coupling facility. **MQQSGD_GROUP** Object resides in shared repository. **MQQSGD_COPY** Object resides on page set of queue manager and is a local copy of a GROUP object.
Returned:	Always, except for CF structure objects.

Object attributes

A parameter structure is returned for each attribute of the object. The attributes returned depend on the object type. For more information see “Object attributes for event data” on page 2872

Default Transmission Queue Type Error:

Event name:	Default Transmission Queue Type Error.
Reason code in MQCFH:	MQRC_DEF_XMIT_Q_TYPE_ERROR (2198, X'896'). Default transmission queue not local.
Event description:	An MQOPEN or MQPUT1 call was issued specifying a remote queue as the destination. Either a local definition of the remote queue was specified, or a queue-manager alias was being resolved, but in either case the *XmitQName* attribute in the local definition is blank. No transmission queue is defined with the same name as the destination queue manager, so the local queue manager has attempted to use the default transmission queue. However, although there is a queue defined by the *DefXmitQName* queue-manager attribute, it is not a local queue. See Defining a transmission queue for more information about transmission queues.
Event type:	Remote.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

QName

Description: Queue name from object descriptor (MQOD).
Identifier: MQCA_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: Always.

XmitQName

Description: Default transmission queue name.
Identifier: MQCA_XMIT_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: Always.

QType

Description: Type of default transmission queue.
Identifier: MQIA_Q_TYPE.
Data type: MQCFIN.
Values:

MQQT_ALIAS
Alias queue definition.

MQQT_REMOTE
Local definition of a remote queue.

Returned: Always.

ApplType

Description: Type of application making the MQI call that caused the event.
Identifier: MQIA_APPL_TYPE.
Data type: MQCFIN.
Returned: Always.

ApplName

Description: Name of the application making the MQI call that caused the event.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

ObjectQMgrName

Description:	Name of the object queue manager.
Identifier:	MQCACF_OBJECT_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	If the *ObjectName* in the object descriptor (MQOD), when the object was opened, is not the queue manager currently connected.

ConnName

Description:	Connection name for client connection.
Identifier:	MQCACH_CONNECTION_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CONN_NAME_LENGTH.
Returned:	If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description:	Channel name for client connection.
Identifier:	MQCACH_CHANNEL_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CHANNEL_NAME_LENGTH
Returned:	If the application making the MQI call that caused the event is a client attached application.

Defining a transmission queue

DefXmitQName (MQCHAR48)

DefaultTransmissionQueueName property

Default Transmission Queue Usage Error:

Event name:	Default Transmission Queue Usage Error.
Reason code in MQCFH:	MQRC_DEF_XMIT_Q_USAGE_ERROR (2199, X'897'). Default transmission queue usage error.
Event description:	An MQOPEN or MQPUT1 call was issued specifying a remote queue as the destination. Either a local definition of the remote queue was specified, or a queue-manager alias was being resolved, but in either case the *XmitQName* attribute in the local definition is blank. No transmission queue is defined with the same name as the destination queue manager, so the local queue manager has attempted to use the default transmission queue. However, the queue defined by the *DefXmitQName* queue-manager attribute does not have a *Usage* attribute of MQUS_TRANSMISSION. See the Defining a transmission queue for more information about default transmission queues.
Event type:	Remote.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

QName

Description: Queue name from object descriptor (MQOD).
Identifier: MQCA_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: Always.

XmitQName

Description: Default transmission queue name.
Identifier: MQCA_XMIT_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: Always.

ApplType

Description: Type of application making the MQI call that caused the event.
Identifier: MQIA_APPL_TYPE.
Data type: MQCFIN.
Returned: Always.

ApplName

Description: Name of the application making the MQI call that caused the event.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

ObjectQMgrName

Description: Name of the object queue manager.
Identifier: MQCACF_OBJECT_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: If the *ObjectName* in the object descriptor (MQOD), when the object was opened, is not the queue manager currently connected.

ConnName

Description:	Connection name for client connection.
Identifier:	MQCACH_CONNECTION_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CONN_NAME_LENGTH.
Returned:	If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description:	Channel name for client connection.
Identifier:	MQCACH_CHANNEL_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CHANNEL_NAME_LENGTH
Returned:	If the application making the MQI call that caused the event is a client attached application.

Returned:	Always.

EventOrigin

Description: The origin of the action causing the event.
Identifier: MQIACF_EVENT_ORIGIN.
Data type: MQCFIN.
Values:

MQEVO_CONSOLE
Console command.

MQEVO_INIT
Initialization input data set command.

MQEVO_INTERNAL
Directly by queue manager.

MQEVO_MSG
Command message on SYSTEM.COMMAND.INPUT.

MQEVO_OTHER
None of the above.

Returned: Always.

EventQMgr

Description: The queue manager where the command or call was entered. (The queue manager where the command is executed and that generates the event is in the MQMD of the event message).
Identifier: MQCACF_EVENT_Q_MGR.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

EventAccountingToken

Description: For commands received as a message (MQEVO_MSG), the accounting token (AccountingToken) from the MQMD of the command message.
Identifier: MQBACF_EVENT_ACCOUNTING_TOKEN.
Data type: MQCFBS.
Maximum length: MQ_ACCOUNTING_TOKEN_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplIdentity

Description: For commands received as a message (MQEVO_MSG), application identity data (ApplIdentityData) from the MQMD of the command message.
Identifier: MQCACF_EVENT_APPL_IDENTITY.
Data type: MQCFST.
Maximum length: MQ_APPL_IDENTITY_DATA_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplType

Description: For commands received as a message (MQEVO_MSG), the type of application (PutApplType) from the MQMD of the command message.
Identifier: MQIACF_EVENT_APPL_TYPE.
Data type: MQCFIN.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplName

Description: For commands received as a message (MQEVO_MSG), the name of the application (PutApplName) from the MQMD of the command message.
Identifier: MQCACF_EVENT_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplOrigin

Description: For commands received as a message (MQEVO_MSG), the application origin data (ApplOriginData) from the MQMD of the command message.
Identifier: MQCACF_EVENT_APPL_ORIGIN.
Data type: MQCFST.
Maximum length: MQ_APPL_ORIGIN_DATA_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

ObjectType

Description: Object type:
Identifier: MQIACF_OBJECT_TYPE.
Data type: MQCFIN.

Values:

MQOT_CHANNEL
Channel.

MQOT_CHLAUTH
Channel authentication record.

MQOT_NAMELIST
Namelist.

MQOT_NONE
No object.

MQOT_PROCESS
Process.

MQOT_Q
Queue.

MQOT_STORAGE_CLASS
Storage class.

MQOT_AUTH_INFO
Authentication information.

MQOT_CF_STRUC
CF structure.

MQOT_TOPIC
Topic.

MQOT_COMM_INFO
Communication information.

MQOT_LISTENER
Channel Listener.

Returned: Always.

ObjectName

Description: Object name:
Identifier : Identifier will be according to object type.

- MQCACH_CHANNEL_NAME
- MQCA_NAMELIST_NAME
- MQCA_PROCESS_NAME
- MQCA_Q_NAME
- MQCA_STORAGE_CLASS
- MQCA_AUTH_INFO_NAME
- MQCA_CF_STRUC_NAME
- MQCA_TOPIC_NAME
- MQCA_COMM_INFO_NAME
- MQCACH_LISTENER_NAME

Note: MQCACH_CHANNEL_NAME can also be used for channel authentication.

Data type: MQCFST.
Maximum length: MQ_OBJECT_NAME_LENGTH.
Returned: Always

Description:	Object disposition:
Identifier:	MQIA_QSG_DISP.
Data type:	MQCFIN.
Values:	**MQQSGD_Q_MGR** Object resides on page set of queue manager. **MQQSGD_SHARED** Object resides in shared repository and messages are shared in coupling facility. **MQQSGD_GROUP** Object resides in shared repository. **MQQSGD_COPY** Object resides on page set of queue manager and is a local copy of a GROUP object.
Returned:	Always, except for CF structure objects.

Object attributes

A parameter structure is returned for each attribute of the object. The attributes returned depend on the object type. For more information see "Object attributes for event data" on page 2872.

Get Inhibited:

Event name:	Get Inhibited.
Reason code in MQCFH:	MQRC_GET_INHIBITED (2016, X'7E0'). Gets inhibited for the queue.
Event description:	MQGET calls are currently inhibited for the queue (see InhibitGet (MQLONG) for the *InhibitGet* queue attribute) or for the queue to which this queue resolves.
Event type:	Inhibit.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

QName

Description: Queue name from object descriptor (MQOD).
Identifier: MQCA_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: Always.

ApplType

Description: Type of application that issued the get.
Identifier: MQIA_APPL_TYPE.
Data type: MQCFIN.
Returned: Always.

ApplName

Description: Name of the application that issued the get.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

ConnName

Description: Connection name for client connection.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description: Channel name for client connection.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH
Returned: If the application making the MQI call that caused the event is a client attached application.

Logger:

Event name:	Logger.
Reason code in MQCFH:	MQRC_LOGGER_STATUS (2411, X'96B') New log extent started.
Event description:	Issued when a queue manager starts writing to a new log extent.
Event type:	Logger.
Platforms:	All, except WebSphere MQ for z/OS.
Event queue:	SYSTEM.ADMIN.LOGGER.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

CurrentLogExtent

Description:	Name of the log extent.
Identifier:	MQCACF_CURRENT_LOG_EXTENT_NAME.
Data type:	MQCFST.
Maximum length:	MQ_LOG_EXTENT_NAME_LENGTH.
Returned:	Always.

RestartRecoveryLogExtent

Description:	Name of the oldest log extent.
Identifier:	MQCACF_RESTART_LOG_EXTENT_NAME.
Data type:	MQCFST.
Maximum length:	MQ_LOG_EXTENT_NAME_LENGTH.
Returned:	Always.

MediaRecoveryLogExtent

Description:	Name of the oldest log extent.
Identifier:	MQCACF_MEDIA_LOG_EXTENT_NAME.
Data type:	MQCFST.
Maximum length:	MQ_LOG_EXTENT_NAME_LENGTH.
Returned:	Always.

LogPath

Description:	The directory where log files are created by the queue manager.
Identifier:	MQCACF_LOG_PATH.
Data type:	MQCFST.
Maximum length:	MQ_LOG_PATH_LENGTH.
Returned:	Always.

Not Authorized (type 1):

Event name:	Not Authorized (type 1).
Reason code in MQCFH:	MQRC_NOT_AUTHORIZED (2035, X'7F3'). Not authorized for access.
Event description:	On an MQCONN or system connection call, the user is not authorized to connect to the queue manager. *ReasonQualifier* identifies the nature of the error.
Event type:	Authority.
Platforms:	All, except WebSphere MQ for z/OS.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

ReasonQualifier

Description: Identifier for type 1 authority events.
Identifier: MQIACF_REASON_QUALIFIER.
Data type: MQCFIN.
Values:

MQRQ_CONN_NOT_AUTHORIZED
Connection not authorized.

MQRQ_SYS_CONN_NOT_AUTHORIZED
Missing system authority.

Returned: Always.

UserIdentifier

Description: User identifier that caused the authorization check.
Identifier: MQCACF_USER_IDENTIFIER.
Data type: MQCFST.
Maximum length: MQ_USER_ID_LENGTH.
Returned: Always.

ApplType

Description: Type of application causing the event.
Identifier: MQIA_APPL_TYPE.
Data type: MQCFIN.
Returned: Always.

ApplName

Description: Name of the application causing the event.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

ConnName

Description:	Connection name for client connection.
Identifier:	MQCACH_CONNECTION_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CONN_NAME_LENGTH.
Returned:	If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description:	Channel name for client connection.
Identifier:	MQCACH_CHANNEL_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CHANNEL_NAME_LENGTH
Returned:	If the application making the MQI call that caused the event is a client attached application.

Not Authorized (type 2):

Event name:	Not Authorized (type 2).
Reason code in MQCFH:	MQRC_NOT_AUTHORIZED (2035, X'7F3'). Not authorized for access.
Event description:	On an MQOPEN or MQPUT1 call, the user is not authorized to open the object for the options specified.
Event type:	Authority.
Platforms:	All, except WebSphere MQ for z/OS.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

ReasonQualifier

Description:	Identifier for type 2 authority events.	
Identifier:	MQIACF_REASON_QUALIFIER.	
Data type:	MQCFIN.	
Values:	MQRQ_OPEN_NOT_AUTHORIZED	Open not authorized.
Returned:	Always.	

Options

Description: Options specified on the MQOPEN call.
Identifier: MQIACF_OPEN_OPTIONS.
Data type: MQCFIN.
Returned: Always.

UserIdentifier

Description: User identifier that caused the authorization check.
Identifier: MQCACF_USER_IDENTIFIER.
Data type: MQCFST.
Maximum length: MQ_USER_ID_LENGTH.
Returned: Always.

ApplType

Description: Type of application that caused the authorization check.
Identifier: MQIA_APPL_TYPE.
Data type: MQCFIN.
Returned: Always.

ApplName

Description: Name of the application that caused the authorization check.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

ObjectQMgrName

Description: Object queue manager name from object descriptor (MQOD).
Identifier: MQCACF_OBJECT_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: If the *ObjectQMgrName* in the object descriptor (MQOD) when the object was opened is not the queue manager currently connected.

QName

Description: Object name from object descriptor (MQOD).
Identifier: MQCA_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: If the object opened is a queue object.

ProcessName

Description: Name of process object from object descriptor (MQOD).
Identifier: MQCA_PROCESS_NAME.
Data type: MQCFST.
Maximum length: MQ_PROCESS_NAME_LENGTH.
Returned: If the object opened is a process object.

TopicString

Description: Topic string being subscribed to, or opened.
Identifier: MQCA_TOPIC_STRING.
Data type: MQCFST.
Maximum length: MQ_TOPIC_STR_LENGTH.
Returned: If the object opened is a topic object.

AdminTopicNames

Description: List of topic admin objects against which authority is checked.
Identifier: MQCA_ADMIN_TOPIC_NAME.
Data type: MQCFSL.
Maximum length: MQ_TOPIC_NAME_LENGTH.
Returned: If the object opened is a topic object.

ObjectType

Description: Object type from object descriptor (MQOD).
Identifier: MQIACF_OBJECT_TYPE.
Data type: MQCFIN.
Values:
- MQOT_NAMELIST Namelist.
- MQOT_PROCESS Process.
- MQOT_Q Queue.
- MQOT_Q_MGR Queue manager.
- MQOT_TOPIC Topic.

Returned: Always.

NamelistName

Description: Object name from object descriptor (MQOD).
Identifier: MQCA_NAMELIST_NAME.
Data type: MQCFST.
Maximum length: MQ_NAMELIST_NAME_LENGTH.
Returned: If the object opened is a namelist object.

ConnName

Description:	Connection name for client connection.
Identifier:	MQCACH_CONNECTION_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CONN_NAME_LENGTH.
Returned:	If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description:	Channel name for client connection.
Identifier:	MQCACH_CHANNEL_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CHANNEL_NAME_LENGTH
Returned:	If the application making the MQI call that caused the event is a client attached application.

Not Authorized (type 3):

Event name:	Not Authorized (type 3).
Reason code in MQCFH:	MQRC_NOT_AUTHORIZED (2035, X'7F3'). Not authorized for access.
Event description:	When closing a queue using the MQCLOSE call, the user is not authorized to delete the object, which is a permanent dynamic queue, and the *Hobj* parameter specified on the MQCLOSE call is not the handle returned by the MQOPEN call that created the queue. When closing a subscription using an MQCLOSE call, the user has requested that the subscription is removed using the MQCO_REMOVE_SUB option, but the user is not the creator of the subscription or does not have *sub* authority on the topic associated with the subscription.
Event type:	Authority.
Platforms:	All, except WebSphere MQ for z/OS.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

ReasonQualifier

Description: Identifier for type 3 authority events.
Identifier: MQIACF_REASON_QUALIFIER.
Data type: MQCFIN.
Values:

MQRQ_CLOSE_NOT_AUTHORIZED
Close not authorized.

Returned: Always.

UserIdentifier

Description: User identifier that caused the authorization check
Identifier: MQCACF_USER_IDENTIFIER
Data type: MQCFST.
Maximum length: MQ_USER_ID_LENGTH.
Returned: Always.

ApplType

Description: Type of application causing the authorization check.
Identifier: MQIA_APPL_TYPE.
Data type: MQCFIN.
Returned: Always.

ApplName

Description: Name of the application causing the authorization check.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

QName

Description: Object name from object descriptor (MQOD).
Identifier: MQCA_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: If the handle being closed is a queue

SubName

Description: Name of subscription being removed.
Identifier: MQCACF_SUB_NAME.
Data type: MQCFST.
Maximum length: MQ_SUB_NAME_LENGTH.
Returned: If the handle being closed is a subscription.

TopicString

Description: Topic string of the subscription.
Identifier: MQCA_TOPIC_STRING
Data type: MQCFST.
Maximum length: MQ_TOPIC_STR_LENGTH.
Returned: If the handle being closed is a subscription.

AdminTopicNames

Description: List of topic administration objects against which authority was checked.
Identifier: MQCA_ADMIN_TOPIC_NAME
Data type: MQCFSL.
Maximum length: MQ_TOPIC_NAME_LENGTH.
Returned: If the handle being closed is a subscription.

ConnName

Description: Connection name for client connection.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description: Channel name for client connection.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH
Returned: If the application making the MQI call that caused the event is a client attached application.

Not Authorized (type 4):

Event name:	Not Authorized (type 4).
Reason code in MQCFH:	MQRC_NOT_AUTHORIZED (2035, X'7F3'). Not authorized for access.
Event description:	Indicates that a command has been issued from a user ID that is not authorized to access the object specified in the command.
Event type:	Authority.
Platforms:	All, except WebSphere MQ for z/OS.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

ReasonQualifier

Description: Identifier for type 4 authority events.
Identifier: MQIACF_REASON_QUALIFIER.
Data type: MQCFIN.
Values:

MQRQ_CMD_NOT_AUTHORIZED
Command not authorized.

Returned: Always.

Command

Description: Command identifier. See the MQCFH header structure, described in "Event message MQCFH (PCF header)" on page 2913.
Identifier: MQIACF_COMMAND.
Data type: MQCFIN.
Returned: Always.

UserIdentifier

Description: User identifier that caused the authorization check.
Identifier: MQCACF_USER_IDENTIFIER.
Data type: MQCFST.
Maximum length: MQ_USER_ID_LENGTH.
Returned: Always.

Not Authorized (type 5):

Event name:	Not Authorized (type 5).
Reason code in MQCFH:	MQRC_NOT_AUTHORIZED (2035, X'7F3'). Not authorized for access.
Event description:	On an MQSUB call, the user is not authorized to subscribe to the specified topic.
Event type:	Authority.
Platforms:	All, except WebSphere MQ for z/OS.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

ReasonQualifier

Description: Identifier for type 5 authority events.
Identifier: MQIACF_REASON_QUALIFIER.
Data type: MQCFIN.
Values:

MQRQ_SUB_NOT_AUTHORIZED
Subscribe not authorized.

Returned: Always.

Options

Description: Options specified on the MQSUB call.
Identifier: MQIACF_SUB_OPTIONS
Data type: MQCFIN.
Returned: Always.

UserIdentifier

Description: User identifier that caused the authorization check.
Identifier: MQCACF_USER_IDENTIFIER.
Data type: MQCFST.
Maximum length: MQ_USER_ID_LENGTH.
Returned: Always.

ApplType

Description: Type of application that caused the authorization check.
Identifier: MQIA_APPL_TYPE.
Data type: MQCFIN.
Returned: Always.

ApplName

Description: Name of the application that caused the authorization check.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

TopicString

Description:	Topic string being opened or subscribed to.
Identifier:	MQCA_TOPIC_STRING.
Data type:	MQCFST.
Maximum length:	MQ_TOPIC_STR_LENGTH.
Returned:	Always.

AdminTopicNames

Description:	List of topic administration objects against which authority is checked.
Identifier:	MQCA_ADMIN_TOPIC_NAME.
Data type:	MQCFSL.
Maximum length:	MQ_TOPIC_NAME_LENGTH.
Returned:	Always.

ConnName

Description:	Connection name for client connection.
Identifier:	MQCACH_CONNECTION_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CONN_NAME_LENGTH.
Returned:	If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description:	Channel name for client connection.
Identifier:	MQCACH_CHANNEL_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CHANNEL_NAME_LENGTH
Returned:	If the application making the MQI call that caused the event is a client attached application.

Not Authorized (type 6):

Event name:	Not Authorized (type 6).
Reason code in MQCFH:	MQRC_NOT_AUTHORIZED (2035, X'7F3'). Not authorized for access.
Event description:	On an MQSUB call, the user is not authorized to use the destination queue with the required level of access. This event is only returned for subscriptions using non-managed destination queues. When creating, altering, or resuming a subscription, and a handle to the destination queue is supplied on the request, the user does not have PUT authority on the destination queue provided. When resuming or alerting a subscription and the handle to the destination queue is to be returned on the MQSUB call, and the user does not have PUT, GET and BROWSE authority on the destination queue.
Event type:	Authority.
Platforms:	All, except WebSphere MQ for z/OS.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

ReasonQualifier

Description: Identifier for type 6 authority events.
Identifier: MQIACF_REASON_QUALIFIER.
Data type: MQCFIN.
Values:

MQRQ_SUB_DEST_NOT_AUTHORIZED
Subscription destination queue usage not authorized.

Returned: Always.

Options

Description: Options specified on the MQSUB call.
Identifier: MQIACF_SUB_OPTIONS
Data type: MQCFIN.
Returned: Always.

UserIdentifier

Description: User identifier that caused the authorization check.
Identifier: MQCACF_USER_IDENTIFIER.
Data type: MQCFST.
Maximum length: MQ_USER_ID_LENGTH.
Returned: Always.

ApplType

Description: Type of application that caused the authorization check.
Identifier: MQIA_APPL_TYPE.
Data type: MQCFIN.
Returned: Always.

ApplName

Description: Name of the application that caused the authorization check.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

TopicString

Description: Topic string being subscribed to.
Identifier: MQCA_TOPIC_STRING.
Data type: MQCFST.
Maximum length: MQ_TOPIC_STR_LENGTH.
Returned: Always.

DestQMgrName

Description: Hosting queue manager name of the subscription's destination queue.
Identifier: MQCACF_OBJECT_Q_MGR_NAME
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: If the queue manager hosting the destination queue is not the queue manager to which the application is currently connected.

DestQName

Description: The name of the destination queue of the subscription..
Identifier: MQCA_Q_NAME
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: Always.

DestOpenOptions

Description: The open options requested for the destination queue.
Identifier: MQIACF_OPEN_OPTIONS
Data type: MQCFIN.
Returned: Always.

ConnName

Description: Connection name for client connection.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description: Channel name for client connection.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH
Returned: If the application making the MQI call that caused the event is a client attached application.

Put Inhibited:

Event name:	Put Inhibited.
Reason code in MQCFH:	MQRC_PUT_INHIBITED (2051, X'803'). Put calls inhibited for the queue or topic.
Event description:	MQPUT and MQPUT1 calls are currently inhibited for the queue or topic (see the *InhibitPut* queue attribute in InhibitPut (MQLONG) or the *InhibitPublications* topic attribute in "Topic attributes" on page 2902 for the queue to which this queue resolves.
Event type:	Inhibit.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

QName

Description: Queue name from object descriptor (MQOD).
Identifier: MQCA_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: If the object opened is a queue object

ApplType

Description: Type of application that issued the put.
Identifier: MQIA_APPL_TYPE.
Data type: MQCFIN.
Returned: Always.

ApplName

Description: Name of the application that issued the put.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

ObjectQMgrName

Description: Name of queue manager from object descriptor (MQOD).
Identifier: MQCACF_OBJECT_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Only if this parameter has a value different from *QMgrName*. This occurs when the *ObjectQMgrName* field in the object descriptor provided by the application on the MQOPEN or MQPUT1 call is neither blank nor the name of the application's local queue manager. However, it can also occur when *ObjectQMgrName* in the object descriptor is blank, but a name service provides a queue-manager name that is not the name of the application's local queue manager.

TopicString

Description: Topic String being opened
Identifier: MQCA_TOPIC_STRING
Data type: MQCFST.
Maximum length: MQ_TOPIC_STR_LENGTH.
Returned: If the object opened is a topic.

ConnName

Description: Connection name for client connection.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description: Channel name for client connection.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH
Returned: If the application making the MQI call that caused the event is a client attached application.

Related information:

InhibitPut property

Inquire Queue (Response)
The response to the Inquire Queue command MQCMD_INQUIRE_Q consists of the response header followed by the *QName* structure. On z/OS only, response includes the *QSGDisposition* structure, and the requested combination of attribute parameter structures.

Inquire Topic (Response)
The response to the Inquire Topic (MQCMD_INQUIRE_TOPIC) command consists of the response header followed by the *TopicName* structure (and on z/OS only, the *QSG Disposition* structure), and the requested combination of attribute parameter structures (where applicable).

Inquire Topic Status (Response)
The response of the Inquire topic (MQCMD_INQUIRE_TOPIC_STATUS) command consists of the response header, followed by the *TopicString* structure, and the requested combination of attribute parameter structures (where applicable). The Inquire Topic Status command returns the values requested when the *StatusType* is MQIACF_TOPIC_STATUS. The Inquire Topic Status command returns the values requested when the *StatusType* is MQIACF_TOPIC_STATUS_SUB. The Inquire Topic Status command returns the values requested when the *StatusType* is MQIACF_TOPIC_STATUS_PUB.

Change, Copy, and Create Topic
The Change Topic command changes existing topic definitions. The Copy and Create Topic commands create new topic definitions - the Copy command uses attribute values of an existing topic definition.

Queue Depth High:

Event name:	Queue Depth High.
Reason code in MQCFH:	MQRC_Q_DEPTH_HIGH (2224, X'8B0'). Queue depth high limit reached or exceeded.
Event description:	An MQPUT or MQPUT1 call has caused the queue depth to be incremented to or above the limit specified in the *QDepthHighLimit* attribute.
Event type:	Performance.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.PERFM.EVENT.

Note:

1. WebSphere MQ for z/OS supports queue depth events on shared queues. You might receive a NULL event message for a shared queue if a queue manager has performed no activity on that shared queue.
2. For shared queues, the correlation identifier, *CorrelId* in the message descriptor (MQMD) is set. See "Event message MQMD (message descriptor)" on page 2908 for more information.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

QName

Description:	Name of the queue on which the limit has been reached.
Identifier:	MQCA_BASE_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	Always.

TimeSinceReset

Description:	Time, in seconds, since the statistics were last reset. The value recorded by this timer is also used as the *interval time* in queue service interval events.
Identifier:	MQIA_TIME_SINCE_RESET.
Data type:	MQCFIN.
Returned:	Always.

HighQDepth

Description:	Maximum number of messages on the queue since the queue statistics were last reset.
Identifier:	MQIA_HIGH_Q_DEPTH.
Data type:	MQCFIN.
Returned:	Always.

MsgEnqCount

Description:	Number of messages enqueued. This is the number of messages put on the queue since the queue statistics were last reset.
Identifier:	MQIA_MSG_ENQ_COUNT.
Data type:	MQCFIN.
Returned:	Always.

MsgDeqCount

Description:	Number of messages removed from the queue since the queue statistics were last reset.
Identifier:	MQIA_MSG_DEQ_COUNT.
Data type:	MQCFIN.
Returned:	Always.

Queue Depth Low:

Event name:	Queue Depth Low.
Reason code in MQCFH:	MQRC_Q_DEPTH_LOW (2225, X'8B1'). Queue depth low limit reached or exceeded.
Event description:	A get operation has caused the queue depth to be decremented to or below the limit specified in the *QDepthLowLimit* attribute.
Event type:	Performance.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.PERFM.EVENT.

Note:

1. WebSphere MQ for z/OS supports queue depth events on shared queues. You might receive a NULL event message for a shared queue if a queue manager has performed no activity on that shared queue.
2. For shared queues, the correlation identifier, *CorrelId* in the message descriptor (MQMD) is set. See "Event message MQMD (message descriptor)" on page 2908 for more information.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

QName

Description: Name of the queue on which the limit has been reached.
Identifier: MQCA_BASE_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: Always.

TimeSinceReset

Description: Time, in seconds, since the statistics were last reset. The value recorded by this timer is also used as the *interval time* in queue service interval events.
Identifier: MQIA_TIME_SINCE_RESET.
Data type: MQCFIN.
Returned: Always.

HighQDepth

Description: Maximum number of messages on the queue since the queue statistics were last reset.
Identifier: MQIA_HIGH_Q_DEPTH.
Data type: MQCFIN.
Returned: Always.

MsgEnqCount

Description: Number of messages enqueued. This is the number of messages put on the queue since the queue statistics were last reset.
Identifier: MQIA_MSG_ENQ_COUNT.
Data type: MQCFIN.
Returned: Always.

MsgDeqCount

Description: Number of messages removed from the queue since the queue statistics were last reset.
Identifier: MQIA_MSG_DEQ_COUNT.
Data type: MQCFIN.
Returned: Always.

Queue Full:

Event name:	Queue Full.
Reason code in MQCFH:	MQRC_Q_FULL (2053, X'805'). Queue already contains maximum number of messages.
Event description:	On an MQPUT or MQPUT1 call, the call failed because the queue is full. That is, it already contains the maximum number of messages possible (see the *MaxQDepth* local-queue attribute
Event type:	Performance.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.PERFM.EVENT.

Note:

1. WebSphere MQ for z/OS supports queue depth events on shared queues. You might receive a NULL event message for a shared queue if a queue manager has performed no activity on that shared queue.
2. For shared queues, the correlation identifier, *CorrelId* in the message descriptor (MQMD) is set. See "Event message MQMD (message descriptor)" on page 2908 for more information.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

QName

Description:	Name of the queue on which the put was rejected.
Identifier:	MQCA_BASE_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	Always.

TimeSinceReset

Description:	Time, in seconds, since the statistics were last reset.
Identifier:	MQIA_TIME_SINCE_RESET.
Data type:	MQCFIN.
Returned:	Always.

HighQDepth

Description: Maximum number of messages on a queue.
Identifier: MQIA_HIGH_Q_DEPTH.
Data type: MQCFIN.
Returned: Always.

MsgEnqCount

Description: Number of messages enqueued. This is the number of messages put on the queue since the queue statistics were last reset.
Identifier: MQIA_MSG_ENQ_COUNT.
Data type: MQCFIN.
Returned: Always.

MsgDeqCount

Description: Number of messages removed from the queue since the queue statistics were last reset.
Identifier: MQIA_MSG_DEQ_COUNT.
Data type: MQCFIN.
Returned: Always.

Queue Manager Active:

Event name:	Queue Manager Active.
Reason code in MQCFH:	MQRC_Q_MGR_ACTIVE (2222, X'8AE'). Queue manager active.
Event description:	This condition is detected when a queue manager becomes active.
Event type:	Start And Stop.
Platforms:	All, except the first start of a WebSphere MQ for z/OS queue manager. In this case it is produced only on subsequent restarts.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

Queue Manager Not Active:

Event name:	Queue Manager Not Active.
Reason code in MQCFH:	MQRC_Q_MGR_NOT_ACTIVE (2223, X'8AF'). Queue manager unavailable.
Event description:	This condition is detected when a queue manager is requested to stop or quiesce.
Event type:	Start And Stop.
Platforms:	All, except WebSphere MQ for z/OS.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

ReasonQualifier

Description:	Identifier of causes of this reason code. This specifies the type of stop that was requested.
Identifier:	MQIACF_REASON_QUALIFIER.
Data type:	MQCFIN.
Values:	**MQRQ_Q_MGR_STOPPING** Queue manager stopping. **MQRQ_Q_MGR_QUIESCING** Queue manager quiescing.
Returned:	Always.

Queue Service Interval High:

Event name:	Queue Service Interval High.
Reason code in MQCFH:	MQRC_Q_SERVICE_INTERVAL_HIGH (2226, X'8B2'). Queue service interval high.
Event description:	No successful get operations or MQPUT calls have been detected within an interval greater than the limit specified in the *QServiceInterval* attribute.
Event type:	Performance.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.PERFM.EVENT.

Note: WebSphere MQ for z/OS does not support service interval events on shared queues.

Event data

QMgrName

Description: Name of the queue manager generating the event.
Identifier: MQCA_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

QName

Description: Name of the queue specified on the command that caused this queue service interval event to be generated.
Identifier: MQCA_BASE_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: Always.

TimeSinceReset

Description: Time, in seconds, since the statistics were last reset. For a service interval high event, this value is greater than the service interval.
Identifier: MQIA_TIME_SINCE_RESET.
Data type: MQCFIN.
Returned: Always.

HighQDepth

Description: Maximum number of messages on the queue since the queue statistics were last reset.
Identifier: MQIA_HIGH_Q_DEPTH.
Data type: MQCFIN.
Returned: Always.

MsgEnqCount

Description: Number of messages enqueued. This is the number of messages put on the queue since the queue statistics were last reset.
Identifier: MQIA_MSG_ENQ_COUNT.
Data type: MQCFIN.
Returned: Always.

MsgDeqCount

Description: Number of messages removed from the queue since the queue statistics were last reset.
Identifier: MQIA_MSG_DEQ_COUNT.
Data type: MQCFIN.
Returned: Always.

Queue Service Interval OK:

Event name:	Queue Service Interval OK.
Reason code in MQCFH:	MQRC_Q_SERVICE_INTERVAL_OK (2227, X'8B3'). Queue service interval OK.
Event description:	A successful get operation has been detected within an interval less than or equal to the limit specified in the *QServiceInterval* attribute.
Event type:	Performance.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.PERFM.EVENT.

Note: WebSphere MQ for z/OS does not support service interval events on shared queues.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

QName

Description:	Queue name specified on the command that caused this queue service interval event to be generated.
Identifier:	MQCA_BASE_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	Always.

TimeSinceReset

Description:	Time, in seconds, since the statistics were last reset.
Identifier:	MQIA_TIME_SINCE_RESET.
Data type:	MQCFIN.
Returned:	Always.

HighQDepth

Description:	Maximum number of messages on the queue since the queue statistics were last reset.
Identifier:	MQIA_HIGH_Q_DEPTH.
Data type:	MQCFIN.
Returned:	Always.

MsgEnqCount

Description:	Number of messages enqueued. This is the number of messages put on the queue since the queue statistics were last reset.
Identifier:	MQIA_MSG_ENQ_COUNT.
Data type:	MQCFIN.
Returned:	Always.

MsgDeqCount

Description:	Number of messages removed from the queue since the queue statistics were last reset.
Identifier:	MQIA_MSG_DEQ_COUNT.
Data type:	MQCFIN.
Returned:	Always.

Queue Type Error:

Event name:	Queue Type Error.
Reason code in MQCFH:	MQRC_Q_TYPE_ERROR (2057, X'809'). Queue type not valid.
Event description:	On an MQOPEN call, the *ObjectQMgrName* field in the object descriptor specifies the name of a local definition of a remote queue (in order to specify a queue-manager alias). In that local definition the *RemoteQMgrName* attribute is the name of the local queue manager. However, the *ObjectName* field specifies the name of a model queue on the local queue manager, which is not allowed. See the Queue manager events for more information.
Event type:	Remote.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

QName

Description:	Queue name from object descriptor (MQOD).
Identifier:	MQCA_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	Always.

ApplType

Description:	Type of application making the MQI call that caused the event.
Identifier:	MQIA_APPL_TYPE.
Data type:	MQCFIN.
Returned:	Always.

ApplName

Description:	Name of the application making the MQI call that caused the event.
Identifier:	MQCACF_APPL_NAME.
Data type:	MQCFST.
Maximum length:	MQ_APPL_NAME_LENGTH.
Returned:	Always.

ObjectQMgrName

Description:	Name of the object queue manager.
Identifier:	MQCACF_OBJECT_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

ConnName

Description:	Connection name for client connection.
Identifier:	MQCACH_CONNECTION_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CONN_NAME_LENGTH.
Returned:	If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description:	Channel name for client connection.
Identifier:	MQCACH_CHANNEL_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CHANNEL_NAME_LENGTH
Returned:	If the application making the MQI call that caused the event is a client attached application.

Refresh object:

Event name:	Refresh object.
Reason code in MQCFH:	MQRC_CONFIG_REFRESH_OBJECT (2370, X'942'). Refresh queue manager configuration.
Event description:	A REFRESH QMGR command specifying TYPE (CONFIGEV) was issued.
Event type:	Configuration.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.CONFIG.EVENT.

Note: The REFRESH QMGR command can produce many configuration events; one event is generated for each object that is selected by the command.

Event data

EventUserId

Description: The user id that issued the command or call that generated the event. (This is the same user id that is used to check the authority to issue the command or call; for commands received from a queue, this is also the user identifier (UserIdentifier) from the MQMD of the command message).
Identifier: MQCACF_EVENT_USER_ID.
Data type: MQCFST.
Maximum length: MQ_USER_ID_LENGTH.
Returned: Always.

EventOrigin

Description: The origin of the action causing the event.
Identifier: MQIACF_EVENT_ORIGIN.
Data type: MQCFIN.
Values:

MQEVO_CONSOLE
Console command.

MQEVO_INIT
Initialization input data set command.

MQEVO_INTERNAL
Directly by queue manager.

MQEVO_MSG
Command message on SYSTEM.COMMAND.INPUT.

MQEVO_OTHER
None of the above.

Returned: Always.

EventQMgr

Description: The queue manager where the command or call was entered. (The queue manager where the command is executed and that generates the event is in the MQMD of the event message).
Identifier: MQCACF_EVENT_Q_MGR.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: Always.

EventAccountingToken

Description: For commands received as a message (MQEVO_MSG), the accounting token (AccountingToken) from the MQMD of the command message.
Identifier: MQBACF_EVENT_ACCOUNTING_TOKEN.
Data type: MQCFBS.
Maximum length: MQ_ACCOUNTING_TOKEN_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplIdentity

Description: For commands received as a message (MQEVO_MSG), application identity data (ApplIdentityData) from the MQMD of the command message.
Identifier: MQCACF_EVENT_APPL_IDENTITY.
Data type: MQCFST.
Maximum length: MQ_APPL_IDENTITY_DATA_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplType

Description: For commands received as a message (MQEVO_MSG), the type of application (PutApplType) from the MQMD of the command message.
Identifier: MQIACF_EVENT_APPL_TYPE.
Data type: MQCFIN.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplName

Description: For commands received as a message (MQEVO_MSG), the name of the application (PutApplName) from the MQMD of the command message.
Identifier: MQCACF_EVENT_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

EventApplOrigin

Description: For commands received as a message (MQEVO_MSG), the application origin data (ApplOriginData) from the MQMD of the command message.
Identifier: MQCACF_EVENT_APPL_ORIGIN.
Data type: MQCFST.
Maximum length: MQ_APPL_ORIGIN_DATA_LENGTH.
Returned: Only if EventOrigin is MQEVO_MSG.

ObjectType

Description: Object type:
Identifier: MQIACF_OBJECT_TYPE.
Data type: MQCFIN.

Values:

MQOT_CHANNEL
Channel.

MQOT_CHLAUTH
Channel authentication record.

MQOT_NAMELIST
Namelist.

MQOT_NONE
No object.

MQOT_PROCESS
Process.

MQOT_Q
Queue.

MQOT_Q_MGR
Queue manager.

MQOT_STORAGE_CLASS
Storage class.

MQOT_AUTH_INFO
Authentication information.

MQOT_CF_STRUC
CF structure.

MQOT_TOPIC
Topic.

MQOT_COMM_INFO
Communication information.

MQOT_LISTENER
Channel Listener.

Returned: Always.

ObjectName

Description: Object name:
Identifier : Identifier will be according to object type.

- MQCACH_CHANNEL_NAME
- MQCA_NAMELIST_NAME
- MQCA_PROCESS_NAME
- MQCA_Q_NAME
- MQCA_Q_MGR_NAME
- MQCA_STORAGE_CLASS
- MQCA_AUTH_INFO_NAME
- MQCA_CF_STRUC_NAME
- MQCA_TOPIC_NAME
- MQCA_COMM_INFO_NAME
- MQCACH_LISTENER_NAME

Note: MQCACH_CHANNEL_NAME can also be used for channel authentication.

Data type: MQCFST.
Maximum length: MQ_OBJECT_NAME_LENGTH.
Returned: Always

Disposition

Description:	Object disposition:
Identifier:	MQIA_QSG_DISP.
Data type:	MQCFIN.
Values:	**MQQSGD_Q_MGR** Object resides on page set of queue manager. **MQQSGD_SHARED** Object resides in shared repository and messages are shared in coupling facility. **MQQSGD_GROUP** Object resides in shared repository. **MQQSGD_COPY** Object resides on page set of queue manager and is a local copy of a GROUP object.
Returned:	Always, except for queue manager and CF structure objects.

Object attributes

A parameter structure is returned for each attribute of the object. The attributes returned depend on the object type. For more information see "Object attributes for event data" on page 2872.

Remote Queue Name Error:

Event name:	Remote Queue Name Error.
Reason code in MQCFH:	MQRC_REMOTE_Q_NAME_ERROR (2184, X'888'). Remote queue name not valid.
Event description:	On an MQOPEN or MQPUT1 call one of the following occurs: • A local definition of a remote queue (or an alias to one) was specified, but the *RemoteQName* attribute in the remote queue definition is blank. Note that this error occurs even if the *XmitQName* in the definition is not blank. • The *ObjectQMgrName* field in the object descriptor is not blank and not the name of the local queue manager, but the *ObjectName* field is blank.
Event type:	Remote.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

QName

Description: Queue name from object descriptor (MQOD).
Identifier: MQCA_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: Always.

ApplType

Description: Type of application making the MQI call that caused the event.
Identifier: MQIA_APPL_TYPE.
Data type: MQCFIN.
Returned: Always.

ApplName

Description: Name of the application making the MQI call that caused the event.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

ObjectQMgrName

Description: Name of the object queue manager.
Identifier: MQCACF_OBJECT_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: If the *ObjectName* in the object descriptor (MQOD), when the object was opened, is not the queue manager currently connected.

ConnName

Description: Connection name for client connection.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description: Channel name for client connection.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH
Returned: If the application making the MQI call that caused the event is a client attached application.

Transmission Queue Type Error:

Event name:	Transmission Queue Type Error.
Reason code in MQCFH:	MQRC_XMIT_Q_TYPE_ERROR (2091, X'82B'). Transmission queue not local.
Event description:	On an MQOPEN or MQPUT1 call, a message is to be sent to a remote queue manager. The *ObjectName* or *ObjectQMgrName* field in the object descriptor specifies the name of a local definition of a remote queue but one of the following applies to the *XmitQName* attribute of the definition. Either: • *XmitQName* is not blank, but specifies a queue that is not a local queue, or • *XmitQName* is blank, but *RemoteQMgrName* specifies a queue that is not a local queue This also occurs if the queue name is resolved through a cell directory, and the remote queue manager name obtained from the cell directory is the name of a queue, but this is not a local queue.
Event type:	Remote.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

QName

Description:	Queue name from object descriptor (MQOD).
Identifier:	MQCA_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	Always.

XmitQName

Description:	Transmission queue name.
Identifier:	MQCA_XMIT_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	Always.

QType

Description: Type of transmission queue.
Identifier: MQIA_Q_TYPE.
Data type: MQCFIN.
Values:

MQQT_ALIAS
Alias queue definition.

MQQT_REMOTE
Local definition of a remote queue.

Returned: Always.

ApplType

Description: Type of application making the MQI call that caused the event.
Identifier: MQIA_APPL_TYPE.
Data type: MQCFIN.
Returned: Always.

ApplName

Description: Name of the application making the MQI call that caused the event.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

ObjectQMgrName

Description: Name of the object queue manager.
Identifier: MQCACF_OBJECT_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: If the *ObjectName* in the object descriptor (MQOD), when the object was opened, is not the queue manager currently connected.

ConnName

Description: Connection name for client connection.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description: Channel name for client connection.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH
Returned: If the application making the MQI call that caused the event is a client attached application.

Transmission Queue Usage Error:

Event name:	Transmission Queue Usage Error.
Reason code in MQCFH:	MQRC_XMIT_Q_USAGE_ERROR (2092, X'82C'). Transmission queue with wrong usage.
Event description:	On an MQOPEN or MQPUT1 call, a message is to be sent to a remote queue manager, but one of the following occurred. Either: • *ObjectQMgrName* specifies the name of a local queue, but it does not have a *Usage* attribute of MQUS_TRANSMISSION. • The *ObjectName* or *ObjectQMgrName* field in the object descriptor specifies the name of a local definition of a remote queue but one of the following applies to the *XmitQName* attribute of the definition: – *XmitQName* is not blank, but specifies a queue that does not have a *Usage* attribute of MQUS_TRANSMISSION – *XmitQName* is blank, but *RemoteQMgrName* specifies a queue that does not have a *Usage* attribute of MQUS_TRANSMISSION • The queue name is resolved through a cell directory, and the remote queue manager name obtained from the cell directory is the name of a local queue, but it does not have a *Usage* attribute of MQUS_TRANSMISSION.
Event type:	Remote.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

QName

Description:	Queue name from object descriptor (MQOD).
Identifier:	MQCA_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	Always.

XmitQName

Description: Transmission queue name.
Identifier: MQCA_XMIT_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: Always.

ApplType

Description: Type of application making the MQI call that caused the event.
Identifier: MQIA_APPL_TYPE.
Data type: MQCFIN.
Returned: Always.

ApplName

Description: Name of the application making the MQI call that caused the event.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

ObjectQMgrName

Description: Name of the object queue manager.
Identifier: MQCACF_OBJECT_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: If the *ObjectName* in the object descriptor (MQOD), when the object was opened, is not the queue manager currently connected.

ConnName

Description: Connection name for client connection.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description: Channel name for client connection.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH
Returned: If the application making the MQI call that caused the event is a client attached application.

Unknown Alias Base Queue:

Event name:	Unknown Alias Base Queue.
Reason code in MQCFH:	MQRC_UNKNOWN_ALIAS_BASE_Q (2082, X'822'). Unknown alias base queue or topic.
Event description:	An MQOPEN or MQPUT1 call was issued specifying an alias queue as the destination, but the *BaseObjectName* in the alias queue attributes is not recognized as a queue or topic name.
Event type:	Local.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

QName

Description:	Queue name from object descriptor (MQOD).
Identifier:	MQCA_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	Always.

BaseObjectName

Description:	Object name to which the alias resolves.
Identifier:	MQCA_BASE_OBJECT_NAME. For compatibility with existing applications, you can still use MQCA_BASE_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	Always.

ApplType

Description:	Type of application making the MQI call that caused the event.
Identifier:	MQIA_APPL_TYPE.
Data type:	MQCFIN.
Returned:	Always.

ApplName

Description: Name of the application making the MQI call that caused the event.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

ObjectQMgrName

Description: Name of the object queue manager.
Identifier: MQCACF_OBJECT_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: If the *ObjectName* in the object descriptor (MQOD), when the object was opened, is not the queue manager currently connected.

BaseType

Description: Type of object to which the alias resolves.
Identifier: MQIA_BASE_TYPE.
Data type: MQCFIN.
Values:

MQOT_Q
Base object type is a queue

MQOT_TOPIC
Base object type is a topic

Returned: Always.

ConnName

Description: Connection name for client connection.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description: Channel name for client connection.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH
Returned: If the application making the MQI call that caused the event is a client attached application.

Unknown Default Transmission Queue:

Event name:	Unknown Default Transmission Queue.
Reason code in MQCFH:	MQRC_UNKNOWN_DEF_XMIT_Q (2197, X'895'). Unknown default transmission queue.
Event description:	An MQOPEN or MQPUT1 call was issued specifying a remote queue as the destination. If a local definition of the remote queue was specified, or if a queue-manager alias is being resolved, the *XmitQName* attribute in the local definition is blank. No queue is defined with the same name as the destination queue manager. The queue manager has therefore attempted to use the default transmission queue. However, the name defined by the *DefXmitQName* queue-manager attribute is not the name of a locally-defined queue.
Event type:	Remote.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

QName

Description:	Queue name from object descriptor (MQOD).
Identifier:	MQCA_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	Always.

XmitQName

Description:	Default transmission queue name.
Identifier:	MQCA_XMIT_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	Always.

ApplType

Description: Type of application attempting to open the remote queue.
Identifier: MQIA_APPL_TYPE.
Data type: MQCFIN.
Returned: Always.

ApplName

Description: Name of the application attempting to open the remote queue.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

ObjectQMgrName

Description: Name of the object queue manager.
Identifier: MQCACF_OBJECT_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: If the *ObjectName* in the object descriptor (MQOD), when the object was opened, is not the queue manager currently connected.

ConnName

Description: Connection name for client connection.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description: Channel name for client connection.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH
Returned: If the application making the MQI call that caused the event is a client attached application.

Unknown Object Name:

Event name:	Unknown Object Name.
Reason code in MQCFH:	MQRC_UNKNOWN_OBJECT_NAME (2085, X'825'). Unknown object name.
Event description:	On an MQOPEN or MQPUT1 call, the *ObjectQMgrName* field in the object descriptor MQOD is set to one of the following options. It is either: • Blank • The name of the local queue manager • The name of a local definition of a remote queue (a queue-manager alias) in which the *RemoteQMgrName* attribute is the name of the local queue manager However, the *ObjectName* in the object descriptor is not recognized for the specified object type.
Event type:	Local.

Platforms:	All.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

ApplType

Description:	Type of application making the MQI call that caused the event.
Identifier:	MQIA_APPL_TYPE.
Data type:	MQCFIN.
Returned:	Always.

ApplName

Description:	Name of the application making the MQI call that caused the event.
Identifier:	MQCACF_APPL_NAME.
Data type:	MQCFST.
Maximum length:	MQ_APPL_NAME_LENGTH.
Returned:	Always.

QName

Description:	Queue name from object descriptor (MQOD).
Identifier:	MQCA_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	If the object opened is a queue object. Either *QName* or *TopicName* is returned.

ProcessName

Description:	Process object name from object descriptor (MQOD).
Identifier:	MQCA_PROCESS_NAME.
Data type:	MQCFST.
Maximum length:	MQ_PROCESS_NAME_LENGTH.
Returned:	If the object opened is a process object. One of *ProcessName*, *QName*, or *TopicName* is returned.

ObjectQMgrName

Description:	Name of the object queue manager.
Identifier:	MQCACF_OBJECT_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	If the *ObjectName* in the object descriptor (MQOD), when the object was opened, is not the queue manager currently connected.

TopicName

Description:	Topic object name from object descriptor (MQOD).
Identifier:	MQCA_TOPIC_NAME.
Data type:	MQCFST.
Maximum length:	MQ_TOPIC_NAME_LENGTH.
Returned:	If the object opened is a topic object. One of *ProcessName*, *QName*, or *TopicName* is returned.

ConnName

Description:	Connection name for client connection.
Identifier:	MQCACH_CONNECTION_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CONN_NAME_LENGTH.
Returned:	If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description:	Channel name for client connection.
Identifier:	MQCACH_CHANNEL_NAME.
Data type:	MQCFST.
Maximum length:	MQ_CHANNEL_NAME_LENGTH
Returned:	If the application making the MQI call that caused the event is a client attached application.

Unknown Remote Queue Manager:

Event name:	Unknown Remote Queue Manager.
Reason code in MQCFH:	MQRC_UNKNOWN_REMOTE_Q_MGR (2087, X'827'). Unknown remote queue manager.

Event description:	On an MQOPEN or MQPUT1 call, an error occurred with queue-name resolution, for one of the following reasons: • *ObjectQMgrName* is either blank or the name of the local queue manager, and *ObjectName* is the name of a local definition of a remote queue that has a blank *XmitQName*. However, there is no (transmission) queue defined with the name of *RemoteQMgrName*, and the *DefXmitQName* queue-manager attribute is blank. • *ObjectQMgrName* is the name of a queue-manager alias definition (held as the local definition of a remote queue) that has a blank *XmitQName*. However, there is no (transmission) queue defined with the name of *RemoteQMgrName*, and the *DefXmitQName* queue-manager attribute is blank. • *ObjectQMgrName* specified is not: – Blank – The name of the local queue manager – The name of a local queue – The name of a queue-manager alias definition (that is, a local definition of a remote queue with a blank *RemoteQName*) and the *DefXmitQName* queue-manager attribute is blank. • *ObjectQMgrName* is blank or is the name of the local queue manager, and *ObjectName* is the name of a local definition of a remote queue (or an alias to one), for which *RemoteQMgrName* is either blank or is the name of the local queue manager. This error occurs even if the *XmitQName* is not blank. • *ObjectQMgrName* is the name of a local definition of a remote queue. In this case, it should be a queue-manager alias definition, but the *RemoteQName* in the definition is not blank. • *ObjectQMgrName* is the name of a model queue. • The queue name is resolved through a cell directory. However, there is no queue defined with the same name as the remote queue manager name obtained from the cell directory. Also, the *DefXmitQName* queue-manager attribute is blank. • On z/OS only: a message was put to a queue manager in a queue-sharing group and *SQQMNAME* is set to USE. This routes the message to the specified queue manager in order to be put on the queue. If *SQQMNAME* is set to IGNORE, the message is put to the queue directly.
Event type:	Remote.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

QName

Description: Queue name from object descriptor (MQOD).
Identifier: MQCA_Q_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_NAME_LENGTH.
Returned: Always.

ApplType

Description: Type of application attempting to open the remote queue.
Identifier: MQIA_APPL_TYPE.
Data type: MQCFIN.
Returned: Always.

ApplName

Description: Name of the application attempting to open the remote queue.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

ObjectQMgrName

Description: Name of the object queue manager.
Identifier: MQCACF_OBJECT_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: If the *ObjectName* in the object descriptor (MQOD), when the object was opened, is not the queue manager currently connected.

ConnName

Description: Connection name for client connection.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description: Channel name for client connection.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH
Returned: If the application making the MQI call that caused the event is a client attached application.

Unknown Transmission Queue:

Event name:	Unknown Transmission Queue.
Reason code in MQCFH:	MQRC_UNKNOWN_XMIT_Q (2196, X'894'). Unknown transmission queue.
Event description:	On an MQOPEN or MQPUT1 call, a message is to be sent to a remote queue manager. The *ObjectName* or the *ObjectQMgrName* in the object descriptor specifies the name of a local definition of a remote queue (in the latter case queue-manager aliasing is being used). However, the *XmitQName* attribute of the definition is not blank and not the name of a locally-defined queue.
Event type:	Remote.
Platforms:	All.
Event queue:	SYSTEM.ADMIN.QMGR.EVENT.

Event data

QMgrName

Description:	Name of the queue manager generating the event.
Identifier:	MQCA_Q_MGR_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_MGR_NAME_LENGTH.
Returned:	Always.

QName

Description:	Queue name from object descriptor (MQOD).
Identifier:	MQCA_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	Always.

XmitQName

Description:	Transmission queue name.
Identifier:	MQCA_XMIT_Q_NAME.
Data type:	MQCFST.
Maximum length:	MQ_Q_NAME_LENGTH.
Returned:	Always.

ApplType

Description:	Type of application making the MQI call that caused the event.
Identifier:	MQIA_APPL_TYPE.
Data type:	MQCFIN.
Returned:	Always.

ApplName

Description: Name of the application making the MQI call that caused the event.
Identifier: MQCACF_APPL_NAME.
Data type: MQCFST.
Maximum length: MQ_APPL_NAME_LENGTH.
Returned: Always.

ObjectQMgrName

Description: Name of the object queue manager.
Identifier: MQCACF_OBJECT_Q_MGR_NAME.
Data type: MQCFST.
Maximum length: MQ_Q_MGR_NAME_LENGTH.
Returned: If the *ObjectName* in the object descriptor (MQOD), when the object was opened, is not the queue manager currently connected.

ConnName

Description: Connection name for client connection.
Identifier: MQCACH_CONNECTION_NAME.
Data type: MQCFST.
Maximum length: MQ_CONN_NAME_LENGTH.
Returned: If the application making the MQI call that caused the event is a client attached application.

ChannelName

Description: Channel name for client connection.
Identifier: MQCACH_CHANNEL_NAME.
Data type: MQCFST.
Maximum length: MQ_CHANNEL_NAME_LENGTH
Returned: If the application making the MQI call that caused the event is a client attached application.

Figure 83. Sample WebSphere MQ for AIX trace

Examples of trace output

Use this topic as an example of how to interpret trace output.

Figure 84 on page 3014 shows an example of a trace taken on entry to an MQPUT1 call. The following items have been produced:

- Queue request parameter list
- Object descriptor (MQOD)
- Message descriptor (MQMD)
- Put message options (MQPMO)
- The first 256 bytes of message data

Compare this to Figure 85 on page 3015, which illustrates the same control blocks on exit from WebSphere MQ.

Figure 85. Example trace data from an exit trace of an MQPUT1 request

Examples of CEDF output

Use this topic as a reference for example CEDF output from MQI calls.

This topic gives examples of the output produced by the CICS execution diagnostic facility (CEDF) when using WebSphere MQ. The examples show the data produced on entry to and exit from the following MQI calls, in both hexadecimal and character format. Other MQI calls produce similar data.

Example CEDF output for the MQOPEN call

The parameters for this call are:

Parameter	Description
ARG 000	Connection handle
ARG 001	Object descriptor
ARG 002	Options
ARG 003	Object handle
ARG 004	Completion code
ARG 005	Reason code

```

Messages

You can use the following messages to help you solve problems with your WebSphere MQ components or applications.

Diagnostic messages: AMQ4000-9999

Diagnostic messages are listed in this section in numeric order, grouped according to the part of WebSphere MQ from which they originate.

- AMQ4000-4999: User interface messages (WebSphere MQ for Windows and Linux systems)
- AMQ5000-5999: Installable services
- AMQ6000-6999: Common services
- AMQ7000-7999: WebSphere MQ
- AMQ8000-8999: Administration
- AMQ9000-9999: Remote

Reading a message

For each message, this information is provided:

- The message identifier, in two parts:
  1. The characters "AMQ" which identify the message as being from WebSphere MQ
  2. A four-digit decimal code

  If a message is specific to a single platform, this is indicated after the message identifier. Although some messages are listed several times, each instance relates to a different platform. If present, the version common to a number of platforms is listed first, followed by versions for individual platforms. Ensure that you read the appropriate version.
- The text of the message.
- The severity of the message:

  0: Information
  10: Warning
  20: Error
  30: Severe error
  40: Stop Error
  50: System Error
- An explanation of the message giving further information.
- The response required from the user. In some cases, particularly for information messages, this might be "none".

Message variables

Some messages display text or numbers that vary according to the circumstances giving rise to the message; these are known as *message variables*. The message variables are indicated as <insert_1>, <insert_2>, and so on.

In some cases a message might have variables in the Explanation or Response. Find the values of the message variables by looking in the error log. The complete message, including the Explanation and the Response, is recorded there.

AMQ4000-4999: User interface messages (WebSphere MQ for Windows and Linux systems)

AMQ4000

New object not created because the default object for the object type could not be found.

Severity

10: Warning

Explanation

The creation of an object requires a default template for each object type. The required default template for this object type could not be found.

Response

Determine why the default object is unavailable, or create a new one. Then try the request again.

AMQ4001

The queue manager specified has already been added to WebSphere MQ Explorer.

Severity

0: Information

Response

Message for information only. If the queue manager is not displayed in the Navigator view ensure that the queue manager is not hidden.

AMQ4002

Are you sure that you want to delete the object named <*insert_0*>?

Severity

10: Warning

Explanation

A confirmation is required before the specified object is deleted. The type of object and name are provided in the message.

Response

Continue only if you want to permanently delete the object.

AMQ4003

WebSphere MQ system objects are used internally by WebSphere MQ. You are advised not to delete them. Do you want to keep the WebSphere MQ system object?

Severity

0: Information

Explanation

A confirmation is required before an internal WebSphere MQ system object (for example SYSTEM.DEFAULT.LOCAL.QUEUE) is deleted.

Response

Continue only if you want to permanently delete the system object.

AMQ4004

Clear all messages from the queue?

Severity

10: Warning

Explanation
The removal of the messages from the queue is an irreversible action. If the command is allowed to proceed the action cannot be undone.

Response
Continue only if you want to permanently delete the messages.

AMQ4005
The object has been replaced or deleted. The properties could not be applied.

Severity
10: Warning

Explanation
During the process of updating the properties of the object, it was determined that the object has either been deleted or replaced by another instance. The properties have not been applied.

AMQ4006
WebSphere MQ successfully sent data to the remote queue manager and received the data returned.

Severity
0: Information

Explanation
An open channel has been successfully verified by WebSphere MQ as the result of a user request.

Response
Message for information only.

AMQ4007
The message sequence number for the channel was reset.

Severity
0: Information

Explanation
A channel has had its sequence number successfully reset by WebSphere MQ as the result of a user request.

Response
Message for information only.

AMQ4008
The request to start the channel was accepted.

Severity
0: Information

Explanation
A channel has been started successfully by WebSphere MQ as the result of a user request.

Response
Message for information only.

AMQ4009
The request to stop the channel was accepted.

Severity
0: Information

Explanation
A channel has been stopped successfully by WebSphere MQ as the result of a user request.

Response
Message for information only.

AMQ4010
The 'in-doubt' state was resolved.

Severity
0: Information

Explanation
A channel has had its 'in-doubt' state resolved successfully by WebSphere MQ as the result of a user request.

Response
Message for information only

AMQ4011
The queue has been cleared of messages.

Severity
0: Information

Explanation
The CLEAR command has completed successfully and has removed all messages from the target queue. If the CLEAR was performed using the MQGET API command, uncommitted messages might still be on the queue.

AMQ4012
The object was created successfully but it is not visible with the current settings for visible objects.

Severity
0: Information

Response
Message for information only.

AMQ4014
The character <*insert_0*> is not valid.

Severity
10: Warning

AMQ4015
Supply a non-blank name.

Severity
0: Information

Response
Enter a valid name.

AMQ4016
The test message was put successfully.

Severity
0: Information

Explanation
The request to place a message on the target queue has completed successfully. The queue now contains the message.

Response
Message for information only.

AMQ4019
An object called <*insert_0*> exists. Do you want to replace the definition of the existing object?

Severity
0: Information

Response
Confirm that you want to replace the definition.

AMQ4020
The changes you are making to the attributes of page <*insert_0*> will affect the operation of the queue manager or another program currently using the object. Do you want to force the change to the object's attributes?

Severity
10: Warning

Explanation
You are trying to change an object that cannot be changed because it is in use, or the change affects other programs or queue managers. Some changes can be forced anyway.

Response
Select Yes to try forcing the changes, or No to abandon the change.

AMQ4021
Failed to access one or more WebSphere MQ objects.

Severity
10: Warning

Explanation
The icons of the objects have been marked to indicate the objects in error.

AMQ4022
The name specified for the initiation queue is the same as the name of the queue itself.

Severity
0: Information

Response
Specify a different name to that of the object being created or altered.

AMQ4023
The queue manager <*insert_0*> does not exist on this computer.

Severity
0: Information

Response
Message for information only.

AMQ4024
The object cannot be replaced.

Severity
0: Information

Explanation
The request to replace the object was unsuccessful.

Response
To define this object, delete the existing object and try the operation again.

AMQ4025
The changes made to the cluster attributes of the queue take effect once they have propagated across the network.

Severity
0: Information

Response
Refresh any views containing the cluster queues in the affected clusters to show the changes.

AMQ4026
You have created a queue which is shared in one or more clusters. The queue will be available as a cluster queue once its definition has propagated across the network.

Severity
0: Information

Response
Refresh any views containing the cluster queues in the affected clusters to show the cluster queue.

AMQ4027
An error occurred connecting to queue manager <*insert_0*>. Are you sure that you want to show this queue manager in the folder anyway?

Severity
10: Warning

Explanation
A connection could not be made to the specified remote queue manager.

Response
Ensure that the named queue manager is running on the host and port specified, and has a channel corresponding to the specified name. Ensure that you have the authority to connect to the remote queue manager, and ensure that the network is running. Select Yes if you believe that the problem can be resolved later. Select No if you want to correct the problem now and try again.

AMQ4028
Platform not supported. This queue manager cannot be administered by the WebSphere MQ Explorer because it is running on an unsupported platform. The value <*insert_0*> for the Platform attribute of the queue manager is not supported by the WebSphere MQ Explorer.

Severity
20: Error

AMQ4029
Command level too low. This queue manager cannot be administered by the WebSphere MQ Explorer.

Severity
20: Error

Response
If you want to administer this queue manager, you must upgrade it to a newer version of WebSphere MQ.

AMQ4030
Queue manager cannot be administered because code page conversion table not found.

Severity
20: Error

Explanation
This queue manager cannot be administered by the WebSphere MQ Explorer because a code page conversion table was not found.

Response
Install a code page conversion table from CCSID <*insert_0*> to CCSID <*insert_1*> on the computer on which the WebSphere MQ Explorer is running.

AMQ4031
Queue manager cannot be administered because CCSID not found.

Severity
20: Error

Explanation
This queue manager cannot be administered by the WebSphere MQ Explorer because CCSID <*insert_0*> cannot be found in the CCSID table. The WebSphere MQ Explorer cannot convert character data to or from the unrecognized CCSID.

AMQ4032
Command server not responding within timeout period.

Severity
10: Warning

Response
Ensure that the command server is running and that the queue called 'SYSTEM.ADMIN.COMMAND.QUEUE' is configured to enable programs to get messages from it.

AMQ4033
Cannot get messages from the queue.

Severity
0: Information

Explanation
A reason code returned when the object was opened for input indicated that the queue is disabled for MQGET request.

Response
To get messages from this queue, enable it for GET requests.

AMQ4034
Message too long. You tried to put a message on a queue that was bigger than the maximum allowed for the queue or queue manager.

Severity
10: Warning

Explanation
The request to put a message on a queue returned a reason code indicating that the data length of the message exceeds the maximum allowed in the definition of the queue.

Response
Either change the MAXMSGL attribute of the queue so that it is equal to or greater than the length of the message, or reduce the length of the message being put on the queue.

AMQ4035
No message available. The response message did not arrive within a reasonable amount of time.

Severity
0: Information

Explanation
The request to get a message from a queue returned a reason code indicating that there are currently no messages on the queue that meet the selection criteria specified on the GET request.

AMQ4036
Access not permitted. You are not authorized to perform this operation.

Severity
10: Warning

Explanation

The security mechanism of the queue manager has indicated that the user ID associated with this request is not authorized to access the object.

AMQ4037

Object definition changed since it was opened.

Severity

0: Information

Explanation

Object definitions that affect this object have been changed since the Hobj handle used on this call was returned by the MQOPEN call.

Response

Issue an MQCLOSE call to return the handle to the system. It is then normally sufficient to reopen the object and try the operation again.

AMQ4038

Object damaged.

Severity

10: Warning

Explanation

The object is damaged and cannot be accessed.

Response

The object must be deleted. Alternatively, it might be possible to recover it from a media image or backup.

AMQ4039

Object in use. The object is already opened by another application.

Severity

10: Warning

Explanation

An MQOPEN call was issued, but the object in question has already been opened by this application or another application with options that conflict with those options specified in the Options parameter. This situation arises if the request is for shared input, but the object is already open for exclusive input. It also arises if the request is for exclusive input, but the object is already open for input (of any sort).

Response

To change the attributes of an object, specify the Force option as 'Yes' to apply the changes. If you specify the Force option as 'Yes', any applications using the object must close and reopen the object to proceed.

AMQ4040

Cannot put messages on this queue.

Severity

0: Information

Explanation

MQPUT and MQPUT1 calls are currently inhibited for the queue, or for the queue to which this queue resolves.

AMQ4042

Queue full. The queue contains the maximum number of messages.

Severity

10: Warning

Explanation
On an MQPUT or MQPUT1 call, the call failed because the queue is full; that is, it already contains the maximum number of messages possible.

AMQ4043
Queue manager not available for connection.

Severity
20: Error

Response
Ensure that the queue manager is running. If the queue manager is running on another computer, ensure that it is configured to accept remote connections.

AMQ4044
Queue manager <*insert_0*> is stopping.

Severity
0: Information

Explanation
An MQI call was issued, but the call failed because the queue manager is shutting down. If the call was an MQGET call with the MQGMO_WAIT option, the wait has been canceled.

Response
You cannot issue any more MQI calls.

AMQ4045
Queue not empty. The queue contains one or more messages or uncommitted PUT or GET requests.

Severity
0: Information

Explanation
An operation that requires the queue to be empty has failed because the queue either contains messages or has uncommitted PUT or GET requests outstanding.

AMQ4046
Insufficient system resources available.

Severity
20: Error

AMQ4047
Insufficient storage available.

Severity
20: Error

AMQ4048
The request received an unexpected reason code from an underlying API or command request. The reason code was <*insert_0*>.

Severity
20: Error

Explanation
While running the requested operation, an unexpected return code was received, resulting in the operation not completing as expected.

Response
Use the reason code to determine the underlying reason for the failure.

AMQ4049
Unknown object name.

Severity
10: Warning

Explanation
A command or API request was issued, but the object cannot be found.

AMQ4050
Allocation failed. An attempt to allocate a conversation to a remote system failed.

Severity
10: Warning

Explanation
The error might be due to an incorrect entry in the channel definition or it might be that the listening program on the remote system was not running.

AMQ4051
Bind failed. The bind to a remote system during session negotiation failed.

Severity
10: Warning

AMQ4052
Coded character-set ID error. Cannot convert a command message to the CCSID of the target queue manager.

Severity
10: Warning

AMQ4053
Channel in doubt. Operation not completed.

Severity
10: Warning

Explanation
The operation could not be completed because the channel was in doubt.

AMQ4054
Channel in use.

Severity
10: Warning

Explanation
An attempt was made to perform an operation on a channel, but the channel is currently active.

AMQ4055
Channel status not found.

Severity
10: Warning

Explanation
No channel status is available for this channel, possibly indicating that the channel has not been used.

AMQ4056
Command failed.

Severity
10: Warning

AMQ4057
Configuration error in the channel definition or communication subsystem.

Severity
10: Warning

Explanation
Allocation of a conversation is not possible.

AMQ4058
Connection closed.

Severity
10: Warning

Explanation
The connection to a remote system has unexpectedly broken while receiving data.

AMQ4059
Could not establish a connection to the queue manager.

Severity
10: Warning

Explanation
The attempt to connect to the queue manager failed. This failure might be because the queue manager is incorrectly configured to allow a connection from this system, or the connection has been broken.

Response
Try the operation again. If the error persists, examine the problem determination information to see if any information has been recorded.

AMQ4060
Dynamic queue scope error.

Severity
10: Warning

Explanation
The Scope attribute of the queue was set to MQSCO_CELL but this value is not allowed for a dynamic queue.

AMQ4061
Remote system unavailable and unable to allocate a conversation to a remote system.

Severity
10: Warning

Response
The error might be transitory; try again later.

AMQ4062
An MQINQ call failed when the queue manager inquired about a WebSphere MQ object.

Severity
10: Warning

Response
Check the error log of the queue manager for more information about the error.

AMQ4063
An MQOPEN call failed when the queue manager tried to open a WebSphere MQ object.

Severity
20: Error

Response

If the error occurred while starting a channel check that the transmission queue used by the channel exists and try the operation again. If the error persists check the error log of the queue manager for more information about the error.

AMQ4064

An MQSET call failed when the queue manager tried to set the values of the attributes of a WebSphere MQ object.

Severity

10: Warning

Response

Check the error log of the queue manager for more information about the error.

AMQ4065

Message sequence number error.

Severity

10: Warning

Explanation

The message sequence number parameter was not valid.

AMQ4066

Message truncated because it is larger than the command server's maximum valid message size.

Severity

10: Warning

AMQ4067

Communications manager not available.

Severity

20: Error

Explanation

The communications subsystem is unavailable.

AMQ4068

The queue specified in the channel definition is not a transmission queue, or is in use.

Severity

10: Warning

AMQ4069

Object already exists.

Severity

10: Warning

Explanation

Unable to create object because the object already existed.

AMQ4070

Object is open.

Severity

10: Warning

Explanation

An attempt was made to delete, change, or clear an object that is in use.

Response

Wait until the object is not in use, then try again.

AMQ4071
Object has wrong type. Could not replace a queue object of a different type.

Severity
10: Warning

AMQ4072
Queue already exists in cell.

Severity
10: Warning

Explanation
cannot define a queue with cell scope or change the scope of an existing queue from queue-manager scope to cell scope, because a queue with that name already exists in the cell.

AMQ4073
Ping error. You can only ping a sender or server channel. If the local channel is a receiver channel, ping from the remote queue manager.

Severity
10: Warning

AMQ4074
Receive failed, possibly due to a communications failure.

Severity
10: Warning

AMQ4075
Error while receiving data from a remote system, possibly due to a communications failure.

Severity
10: Warning

AMQ4076
Remote queue manager terminating.

Severity
10: Warning

Explanation
The channel stopped because the remote queue manager was terminating.

AMQ4077
Remote queue manager not available.

Severity
10: Warning

Explanation
The channel could not be started because the remote queue manager was not available.

Response
Ensure that the remote queue manager is started, and that it is configured to accept incoming communication requests.

AMQ4078
Send failed. An error occurred while sending data to a remote system, possibly due to a communications failure.

Severity
10: Warning

AMQ4079
Channel closed by security exit.

Severity
10: Warning

AMQ4080
Remote channel not known.

Severity
10: Warning

Explanation
There is no definition of this channel on the remote system.

AMQ4081
User exit not available.

Severity
10: Warning

Explanation
The channel was closed because the user exit specified does not exist.

AMQ4082
Unexpected WebSphere MQ error (<*insert_0*>).

Severity
20: Error

AMQ4083
Queue manager name not known.

Severity
10: Warning

Explanation
If the queue manager is remote, this might indicate that another queue manager is incorrectly using the same connection name. Queue managers using TCP/IP on the same computer must listen on different port numbers. This means that they will also have different connection names.

AMQ4084
Cell directory is not available.

Severity
10: Warning

Explanation
The Scope attribute of the queue was set to MQSCO_CELL but no name service supporting a cell directory has been configured.

Response
Configure a name service to support the cell directory.

AMQ4085
No name supplied for transmission queue.

Severity
10: Warning

Response
Supply a non-blank transmission queue name for this channel type.

AMQ4086
No connection name supplied.

Severity
10: Warning

Response
Supply a non-blank connection name for this channel type.

AMQ4087
An error occurred while trying to use a cluster resource.

Severity
10: Warning

Response
Check that the queues with names that start with 'SYSTEM.CLUSTER.' are not full and that messages are allowed to be put on them.

AMQ4088
Cannot share transmission queue in cluster.

Severity
10: Warning

Explanation
The queue is a transmission queue and cannot be shared in a cluster.

AMQ4089
PUT commands inhibited for system command queue called <*insert_0*>.

Severity
10: Warning

AMQ4090
Are you sure that you want to inhibit PUT and GET commands for the queue called 'SYSTEM.ADMIN.COMMAND.QUEUE'? If you do, you will no longer be able to administer the queue manager using the WebSphere MQ Explorer.

Severity
10: Warning

Explanation
WebSphere MQ Explorer uses the queue called 'SYSTEM.ADMIN.COMMAND.QUEUE' to administer the queue manager.

Response
Continue only if you really want to inhibit PUT or GET commands for this queue and stop using the WebSphere MQ Explorer to administer the queue manager.

AMQ4091
Cannot connect to remote queue manager.

Severity
10: Warning

Explanation
The remote queue manager is using an unsupported protocol for connections. The WebSphere MQ Explorer only supports connections to remote queue managers using the TCP/IP protocol.

AMQ4092
The queue manager could not be removed from the cluster because its membership of the cluster is defined using namelist <*insert_0*>.

Severity
10: Warning

Response
To remove the queue manager from the cluster, remove it from the namelist. Ensure that you do not inadvertently affect the definitions of other objects using the namelist.

AMQ4093
The cluster specified is already shown in the console.

Severity
0: Information

AMQ4094
An error occurred adding this cluster to the console. Are you sure that you want to show this cluster in the console anyway?

Severity
10: Warning

Response
Select Yes if you believe that the problem can be resolved later. Select No if you want to correct the problem now and try again.

AMQ4095
Queue manager <*insert_0*> is not a repository queue manager for cluster <*insert_1*>.

Severity
0: Information

Explanation
To administer a cluster, the WebSphere MQ Explorer needs a connection to the repository queue manager.

AMQ4096
Are you sure that you want to clear the password?

Severity
0: Information

Response
Check with the user before clearing the password. Continue only if you really want to clear the password.

AMQ4097
Unmatched quotation mark.

Severity
10: Warning

Explanation
An unmatched quotation mark has been found in a list of attributes. Each value in the list can be enclosed in a pair of single or double quotation marks. (Only required for values which contain spaces, commas, or quotation marks.)

Response
Check that all opening and closing quotation marks are in pairs. (To include a quotation mark within an attribute, use two together with no space between.)

AMQ4098
Incorrect list format.

Severity
10: Warning

Explanation
The attribute can contain a list of values which must be separated by a space or a comma. Each value in the list can be enclosed in a pair of single or double quotation marks. (Only required for values which contain spaces, commas, or quotation marks.)

Response

Check that values are separated by a space or a comma, and that all opening and closing quotation marks are in pairs. (To include a quotation mark within an attribute, use two together with no space between.)

AMQ4099

Cannot communicate with one or more repository queue managers. Cluster <*insert_0*> is configured to use one or more repository queue managers which communicate using a protocol other than TCP/IP.

Severity

10: Warning

Explanation

The WebSphere MQ Explorer can only establish connections to remote queue managers using TCP/IP.

Response

To complete removal of the queue manager from the cluster, issue the RESET CLUSTER ACTION(FORCEREMOVE) command from the repository queue manager.

AMQ4103

An error occurred connecting to the queue manager. Are you sure that you want to show this queue manager in the folder?

Severity

10: Warning

Explanation

A connection could not be made to the specified remote queue manager.

Response

Ensure that the named queue manager is running on the machine specified in the selected channel definition table. Ensure that you have the authority to connect to the remote queue manager, and ensure that the network is operational. Select Yes if you believe that the problem can be resolved later. Select No if you want to correct the problem now and try again.

AMQ4104

The specified file <*insert_0*> does not contain a client definition table in the correct format.

Severity

10: Warning

Explanation

The channel definition table is not in the correct format.

Response

Specify a file in the correct format.

AMQ4105

The remote queue manager has not been removed because it is still required by other plug-ins.

Severity

10: Warning

Explanation

Other plug-ins have responded to the attempted removal of this queue manager by indicating that they are still using it.

Response

Ensure that the other plug-ins have finished using the queue manager before trying to delete it again.

AMQ4117

This action cannot be undone. Are you sure that you want to delete the WebSphere MQ queue manager <*insert_0*> from your system?

Severity

10: Warning

Explanation

A confirmation is required before the queue manager is deleted.

Response

Continue only if you want to permanently delete the queue manager.

AMQ4121

The MQGET request received an unexpected reason code of <*insert_0*>.

Severity

10: Warning

Explanation

An unexpected reason code was returned from an MQGET API request. Use the reason code to determine the underlying reason why the request failed.

Response

The MQGET request was not successful. Some messages might not have been retrieved.

AMQ4122

The MQPUT request received an unexpected reason code of <*insert_0*>.

Severity

10: Warning

Explanation

An unexpected reason code was returned from an MQPUT API request. Use the reason code to determine the underlying reason why the request failed.

Response

MQPUT processing was unsuccessful. No message was placed on the queue.

AMQ4123

The object <*insert_0*> was deleted successfully.

Severity

0: Information

Explanation

The object of the specified name has been successfully deleted.

Response

none.

AMQ4124

The MQOPEN request received an unexpected reason code of <*insert_0*>.

Severity

10: Warning

Explanation

An unexpected reason code was returned from an MQOPEN API request. The queue has not been opened.

Response

Use the reason code to determine the underlying reason for the failure.

AMQ4125

Putting a test message on the queue received an unexpected reason code <*insert_0*>.

Severity
10: Warning

Explanation
One of the underlying API requests was unsuccessful. The test message was not placed on the queue.

AMQ4126
The value of one of the properties specified is not valid. The request was not processed.

Severity
20: Error

Response
Specify a different value.

AMQ4127
WebSphere MQ failed to read queue manager information from disk because the file format is not valid. The request was not processed.

Severity
20: Error

Explanation
The format of the WebSphere MQ_Handles file is incorrect. This file has been backed up and removed, meaning that any remote queue manager definitions are lost. All local queue managers should be detected automatically and displayed in the WebSphere MQ Explorer.

Response
Ensure that the Eclipse workspace has not been corrupted.

AMQ4128
Could not start the iKeyMan program.

Severity
30: Severe error

Explanation
An error was encountered when trying to execute the iKeyMan program.

Response
Try again. If symptoms persist contact your System Administrator.

AMQ4129
Could not query the user ID from Java.

Severity
10: Warning

Explanation
The Java API System.getProperty("user.id") threw a SecurityException.

Response
Configure your Java security environment using the 'policytool' to allow WebSphere MQ Explorer to query the 'user.id'.

AMQ4130
A Browser Control could not be opened. Make sure Mozilla has been installed.

Severity
10: Warning

Explanation
The SWT Browser control depends on Mozilla being installed.

Response
Ensure that the Mozilla browser is correctly installed.

AMQ4131
A Browser Control could not be opened.

Severity
10: Warning

Explanation
The SWT Browser control depends on the system browser being installed.

Response
Ensure that the system browser is correctly installed.

AMQ4132
Are you sure that you want to stop the object named <*insert_0*>?

Severity
10: Warning

Explanation
A confirmation is required before the specified object is stopped. The type of object and name are provided in the message.

Response
Continue only if you want to stop the object.

AMQ4133
When a queue manager is removed, WebSphere MQ Explorer destroys the connection information for that queue manager.

To see the queue manager at a later date use the Add Queue Manager wizard.

Remove the queue manager <*insert_0*> ?

Severity
10: Warning

Response
Continue only if you want to remove the queue manager.

AMQ4134
The default channel used by remote queue managers to administer this queue manager does not exist.

Do you want to create the default remote administration channel SYSTEM.ADMIN.SVRCONN to allow this queue manager to be administered by other queue managers?

Severity
0: Information

Response
Select Yes to create the channel.

AMQ4135
The default channel used by remote queue managers to administer this queue manager is SYSTEM.ADMIN.SVRCONN.

Do you want to delete this channel to prevent the queue manager being administered by other queue managers?

Severity
0: Information

Response
Select Yes to delete the channel.

AMQ4136
This operation deletes all files in the errors and trace directories (including, for example, read only files). This operation cannot be undone. Are you sure that you want to proceed?

Severity
10: Warning

Explanation
Deleting all FFSTs and Trace from this machine means that any historical error logs and trace will be lost.

Response
Select Yes to clear the contents of the errors and trace directories.

AMQ4137
The default remote administration channel SYSTEM.ADMIN.SVRCONN has been deleted successfully.

Severity
0: Information

Response
Message for information only.

AMQ4138
Are you sure that you want to import new settings that will overwrite the current settings? This operation cannot be undone.

Severity
10: Warning

Explanation
Importing settings into the WebSphere MQ Explorer will overwrite the current settings.

Response
Continue only if you want to overwrite the current settings.

AMQ4139
The default remote administration channel SYSTEM.ADMIN.SVRCONN was created successfully.

Severity
0: Information

Response
Message for information only.

AMQ4140
The custom CipherSpec is not valid.

Severity
10: Warning

AMQ4141
The Distinguished Names specification is not valid.

Severity
10: Warning

AMQ4142
The default remote administration channel SYSTEM.ADMIN.SVRCONN could not be created.

Severity
10: Warning

Explanation
A problem has occurred when issuing a command to the command server to create the channel.

Response
Try again. If symptoms persist contact your System Administrator.

AMQ4143
The default remote administration channel SYSTEM.ADMIN.SVRCONN could not be created.

Severity
10: Warning

Explanation
A problem occurred when copying the default administration channel to use as a template for the channel creation.

Response
Try again. If symptoms persist contact your System Administrator.

AMQ4144
The default remote administration channel SYSTEM.ADMIN.SVRCONN could not be deleted.

Severity
10: Warning

Explanation
A problem has occurred issuing a command to the command server to delete the channel.

Response
Ensure that the channel is not in use and try again. If symptoms persist contact your System Administrator.

AMQ4145
An error occurred connecting to the remote queue manager using the intermediate queue manager. Are you sure that you want to show this queue manager in the folder anyway?

Severity
10: Warning

Explanation
A connection could not be made to the specified remote queue manager.

Response
Ensure that the intermediate queue manager is available and that the named remote queue manager is running, and is accessible from the intermediate queue manager. Ensure that you have the authority to connect to the remote queue manager, and ensure that the network is operational. Select Yes if you believe that the problem can be resolved later. Select No if you want to correct the problem now and try again.

AMQ4146
Eclipse cannot create or read the workspace for WebSphere MQ Explorer.

Severity
40: Stop Error

Explanation
To load the WebSphere MQ Explorer, a valid workspace is required.

Response
Ensure that you can write to the Eclipse workspace.

AMQ4147
Eclipse cannot write to the workspace for WebSphere MQ Explorer in <*insert_0*>.

Severity
40: Stop Error

Explanation
To load the WebSphere MQ Explorer, write access to the workspace is required.

Response
Ensure that you can write to the Eclipse workspace.

AMQ4148
The object was created successfully.

Severity
0: Information

Response
Message for information only.

AMQ4149
The request to start the listener was accepted.

Severity
0: Information

Explanation
A user request to start the listener was accepted by WebSphere MQ.

Response
Message for information only.

AMQ4150
The request to stop the listener was accepted.

Severity
0: Information

Explanation
A user request to stop the listener was accepted by WebSphere MQ.

Response
Message for information only.

AMQ4151
The request to start the service was accepted.

Severity
0: Information

Explanation
A user request to start the service was accepted by WebSphere MQ.

Response
Message for information only.

AMQ4152
The request to stop the service was accepted.

Severity
0: Information

Explanation
A user request to stop the service was accepted by WebSphere MQ.

Response
Message for information only.

AMQ4153
WebSphere MQ cannot stop the listener because it is not running.

Severity
10: Warning

AMQ4154
WebSphere MQ cannot start the service because no start command has been specified.

Severity
10: Warning

Response
Ensure that the service has a start command specified.

AMQ4155
WebSphere MQ cannot stop the service because no stop command has been specified.

Severity
10: Warning

Response
Ensure that the service has a stop command specified.

AMQ4156
WebSphere MQ cannot stop the service because the service is not running.

Severity
10: Warning

AMQ4157
WebSphere MQ cannot start the service because the services is already running.

Severity
10: Warning

AMQ4158
WebSphere MQ cannot start the listener because it is already running.

Severity
10: Warning

AMQ4159
WebSphere MQ cannot start the client connection channel because one or more of the properties are incorrectly specified.

Severity
10: Warning

Response
Ensure that the client connection has the correct queue manager name and connection name before trying to start.

AMQ4160
WebSphere MQ cannot process the request because the executable specified cannot be started.

Severity
10: Warning

Explanation
The requested was unsuccessful because the program which was defined to be run to complete the action could not be started.

Reasons why the program could not be started are :-

The program does not exist at the specified location.

The WebSphere MQ user does not have sufficient access to execute the program.

If StdOut or StdErr are defined for the program, the WebSphere MQ user does not have sufficient access to the locations specified.

Response
Check the Queue Manager error logs for further details on the cause of the failure, correct the problem and try again.

AMQ4161
The parameter specified is not valid.

Severity
20: Error

Explanation
The parameter specified when trying to create or alter an object is not valid.

Response
Ensure that valid parameters are specified, then try again.

AMQ4162
The password cannot be cleared.

Severity
0: Information

Response
Try to clear the password again later.

AMQ4163
The password cannot be changed.

Severity
10: Warning

Explanation
The attempt to change the password failed because of an error.

Response
Try a different password

AMQ4164
The password was successfully changed.

Severity
0: Information

Response
Message for information only.

AMQ4165
No password entered in the new password field. No change applied.

Severity
10: Warning

Explanation
You must enter a new password in both the new and confirm password fields.

Response
Enter a new password in the new password field.

AMQ4166
No password entered in the confirm new password field. No change applied.

Severity
10: Warning

Explanation
You must enter a new password in both the new and confirm password fields.

Response
Re-enter the new password in the confirm new password field.

AMQ4167
Passwords do not match. No change applied.

Severity
10: Warning

Explanation
You must enter the same new password in both the new and confirm password fields.

Response
Ensure that the passwords in the new and confirm fields match.

AMQ4168
WebSphere MQ failed to start listening for objects.

Severity
20: Error

Explanation
No objects will be displayed in the currently selected view.

Response
Check the problem determination information, and ensure that WebSphere MQ and the queue manager in question are both running correctly.

AMQ4169
WebSphere MQ failed to set the object filter.

Severity
20: Error

Explanation
The WebSphere MQ Explorer cannot listen for objects, so no objects will be displayed in the currently selected view.

Response
Check the problem determination information, and ensure that WebSphere MQ and the queue manager in question are both running correctly.

AMQ4170
The object name specified is not valid.

Severity
20: Error

Explanation
The object name specified when trying to create or alter an object is not valid.

Response
Ensure that a valid object name is specified, then try again.

AMQ4171
There was an error when communicating with the queue manager.

Severity
20: Error

Explanation
A request for information from the queue manager failed.

Response
Try the operation again. If the error persists, examine the problem determination information to see if any details have been recorded.

AMQ4172
There was an error when trying to set or retrieve information.

Severity
20: Error

Explanation
There was an error when trying to set or retrieve information from the queue manager. This might have happened because you specified incorrect or inconsistent attributes when trying create or update an object.

Response
If this error occurred during object creation or modification, ensure that the attributes specified are correct for this type of object. If the error persists, examine the problem determination information to see if any details have been recorded.

AMQ4173
WebSphere MQ cannot clear one or more Trace and FFST files.

Severity
10: Warning

Explanation
WebSphere MQ cannot clear some files, because of one of the following:

The files are currently in use.

WebSphere MQ Explorer does not have the appropriate access permission.

The trace or errors directories contain user-created subdirectories which WebSphere MQ Explorer cannot delete.

Response
Check that tracing is disabled, and that the WebSphere MQ Explorer has appropriate access permission to delete the Trace and FFST files or remove user created subdirectories.

AMQ4174
FFSTs and Trace were cleared successfully.

Severity
0: Information

Response
Message for information only.

AMQ4175
WebSphere MQ cannot process your request because the value specified is not valid.

Severity
20: Error

Explanation
Only certain combinations and values are valid for the object your are trying to alter or create.

Response
Specify a valid value and try again.

AMQ4176
WebSphere MQ cannot process your request because the object name specified is not valid.

Severity
20: Error

Explanation
Only certain combinations and values are valid for the object your are trying to alter or create. You might also see this message if you have specified a QSG disposition that is not valid or an invalid topic object for a subscription.

Response
Check all values are valid for this type of object and try again. If you have altered the disposition of this object, check that the value is correct. If you are creating a new subscription, check the topic object exists.

AMQ4177
The WebSphere MQ Explorer cannot process your request because the connection to WebSphere MQ is quiescing.

Severity
20: Error

Explanation
The connection to WebSphere MQ is quiescing, so no new information can be queried.

Response
Wait for the connection to end, then try reconnecting.

AMQ4178
WebSphere MQ cannot process your request because there was a disposition conflict detected.

Severity
20: Error

Explanation
A disposition conflict was detected. Ensure that all disposition related fields are correct for this type of object.

Response
Ensure that all disposition related fields are correct for this type of object and try again.

If the error occurred when creating a shared queue check that the Coupling facility structure name on the Storage page has been entered correctly.

If the error occurred while starting a channel that uses a transmission queue with a queue sharing group disposition (QSGDISP) value of SHARED, check that the default channel disposition (DEFCDISP) is set to SHARED or FIXSHARED (and not PRIVATE).

AMQ4179
WebSphere MQ cannot process your request because the string provided was of an incorrect length.

Severity
20: Error

Explanation
A string value has been modified or supplied that is too long or too short when creating or modifying an object.

Response
Check the values being supplied and try again.

Note: If adding exit names on IBM i enter exactly 20 characters, the program name occupies the first 10 characters and the library name occupies the second 10 characters, use blanks to pad to the right if necessary.

AMQ4180
WebSphere MQ cannot process your request because there was a parameter conflict.

Severity
20: Error

Explanation
When creating or modifying an object, the combination of parameters specified is not valid.

Response
Check that the combination specified is valid for the object and try again.

AMQ4181
WebSphere MQ is not responding. Do you want to continue waiting?

Severity
10: Warning

Explanation
WebSphere MQ does not appear to be responding. This could be because of a heavily loaded remote system, or a slow network connection. However there could have been a system failure. Choosing not to continue could leave the WebSphere MQ Explorer in an unknown state, so you should restart it.

Response
If you choose not to continue waiting, restart the WebSphere MQ Explorer, if the problem persists check for problem determination information.

AMQ4182
No objects were found.

Severity
10: Warning

Explanation
The query did not find any objects.

Response
If you were expecting objects to be found, check the problem determination information, and ensure that WebSphere MQ and the queue manager in question are both running correctly.

AMQ4183
Query failed because the queue manager is not in a queue-sharing group.

Severity
10: Warning

Explanation
WebSphere MQ issued a query that required the queue manager to be a member of a queue-sharing group.

Response
Try the operation again, if the problem persists check the problem determination information for more details.

AMQ4184
The channel is not currently active.

Severity
10: Warning

Explanation
The channel was not stopped because it was not currently active.

Response

If attempting to stop a specific instance of a channel, change the connection name or remote queue manager name and try the operation again.

AMQ4185

WebSphere MQ failed to import your settings.

Severity

20: Error

Explanation

One or more of the selected preferences has failed to import your settings.

Response

Try again. If the error persists, examine the problem determination information to see if any details have been recorded.

AMQ4186

WebSphere MQ failed to export your settings.

Severity

20: Error

Response

Try again. If the error persists, examine the problem determination information to see if any details have been recorded.

AMQ4187

WebSphere MQ has successfully imported your settings. (You must restart WebSphere MQ Explorer to apply the imported settings.)

Severity

0: Information

Response

Restart WebSphere MQ explorer to apply the imported settings

AMQ4188

Are you sure that you want to remove queue manager <*insert_0*> from cluster <*insert_1*>?

Severity

10: Warning

Explanation

A confirmation is required before the queue manager is removed from the cluster.

Response

Continue only if you want to permanently remove the queue manager from the cluster.

AMQ4189

The queue manager could not be suspended from the cluster. The operation failed with error <*insert_0*>.

Severity

20: Error

Explanation

The queue manager has not been removed from the cluster.

Response

Try the operation again. If the error persists, examine the problem determination information to see if any information has been recorded.

AMQ4190

An error occurred when clearing the queue manager's REPOS field. The operation failed with error <*insert_0*>.

Severity

20: Error

Explanation

The queue manager has only partially been removed from the cluster. The queue manager has been suspended from the cluster. The REPOS field of the queue manager and the CLUSTER fields of the associated cluster channels have not been cleared.

Response

Try the operation again. If the error persists, examine the problem determination information to see if any information has been recorded.

AMQ4191

An error occurred when clearing the CLUSTER field of channel <*insert_0*>. The operation failed with error <*insert_1*>.

Severity

20: Error

Explanation

The queue manager has only partially been removed from the cluster. The queue manager has been suspended from the cluster and the queue manager's REPOS field has been cleared. Some of the CLUSTER fields of other associated cluster channels might also have been cleared.

Response

To completely remove the queue manager, ensure that all the CLUSTER fields of associated cluster channels are cleared.

AMQ4192

The queue manager could not be removed from a cluster because channel <*insert_0*> is using cluster namelist <*insert_1*>.

Severity

10: Warning

Response

Remove the cluster channel from the cluster namelist. Ensure that you do not inadvertently affect the definitions of other objects using the namelist. Then try removing the queue manager again.

AMQ4193

The information supplied could not be correctly converted to the required code page.

Severity

20: Error

Explanation

All or part of the information entered required conversion to a different code page. One or more characters could not be converted to an equivalent character in the new code page.

Response

Change the characters used, then try the operation again.

AMQ4194

Request failed because the queue manager attempted to use a default transmission queue which is not valid.

Severity

20: Error

Explanation

An MQOPEN or MQPUT1 call specified a remote queue as the destination. The queue manager used the default transmission queue, as there is no queue defined with the same name as the destination queue manager, but the attempt failed because the default transmission queue is not a valid local queue.

Response

Check that the queue manager's default transmission queue property (DefXmitQName) specifies a valid local queue.

AMQ4195

WebSphere MQ Explorer is now in an unknown state and should be restarted. Do you want to restart WebSphere MQ Explorer?

Severity

10: Warning

Explanation

You have chosen not to wait for WebSphere MQ to respond to a request. WebSphere MQ Explorer is therefore in an unknown state and should be restarted.

Response

Restart the WebSphere MQ Explorer and try the operation again. If the problem persists check for problem determination information.

AMQ4196

The command or operation is not valid against the type of object or queue specified

Severity

20: Error

Explanation

You have attempted a command or operation against an object or queue with a type that is not valid for the operation specified. For example, browsing a remote queue; issuing the clear command against a queue with a type that is not QLOCAL; clearing by API calls, a queue who type cannot be opened for input.

Response

Retry the command or operation against an object or queue with a type that is valid for the operation requested.

AMQ4197

An MQOPEN or MQPUT1 call was issued specifying an alias queue as the target, but the BaseObjectName in the alias queue attributes is not recognized as a queue name.

Severity

20: Error

Explanation

An MQOPEN or MQPUT1 call was issued specifying an alias queue as the target, but the BaseObjectName in the alias queue attributes is not recognized as a queue name. This reason code can also occur when BaseObjectName is the name of a cluster queue that cannot be resolved successfully.

Response

Correct the queue definitions.

AMQ4198

Queue manager <*insert_0*> has not been removed from one or more clusters.

If you do not remove the queue manager from the clusters, you might get unexpected errors

Do you want to delete the queue manager without removing it from these clusters?

Severity
10: Warning

Explanation
The user has chosen to delete a queue manager that is currently a member of one or more clusters. The queue manager should first be removed cleanly from these clusters before deleting the queue manager. Other queue managers in the cluster might expect the queue manager to be available.

Response
Remove the queue manager from the clusters it is a member of.

AMQ4199
Queue manager <*insert_0*> is not available for client connection due to an SSL configuration error.

Severity
30: Severe error

Explanation
The user is trying to connect to a remote queue manager using a secure connection.

Response
Check the SSL configuration of the target queue manager and the local SSL trust store.

AMQ4200
There is a problem with the default configuration. Unable to display the Default Configuration window.

Severity
20: Error

Explanation
There is a problem with WebSphere MQ.

Response
Use the 'Details>>' button to show further details about the problem and contact your systems administrator.

AMQ4201
Unable to check if the computer exists.

Severity
20: Error

Explanation
WebSphere MQ was unable to check if the computer name you entered exists on your computer's domain.

Response
Retry the operation, if the problem persists contact your systems administrator.

AMQ4202
Unable to contact the computer <*insert_0*>.

Severity
10: Warning

Explanation
WebSphere MQ was unable to locate a computer with this name on your computer's TCP/IP domain.

Response
Enter a different computer name.

AMQ4203
Unable to set up the default configuration.

Severity
20: Error

Explanation
WebSphere MQ was unable to set up the default configuration. This error may occur if WebSphere MQ is busy with another operation.

Response
Retry the operation. If the problem persists, use the 'Details>>' and 'Print' buttons to record further details about the problem and contact your systems administrator.

AMQ4204
Unable to join the default cluster.

Severity
20: Error

Explanation
WebSphere MQ was unable to join your computer to the default cluster. This error may occur if WebSphere MQ is busy with another operation.

Response
Retry the operation. If the problem persists, use the 'Details>>' and 'Print' buttons to record further details about the problem and contact your systems administrator.

AMQ4205
Unable to allow remote administration of the queue manager.

Severity
20: Error

Explanation
WebSphere MQ was unable change the configuration of your queue manager to allow it to be remotely administered. This error may occur if WebSphere MQ is busy with another operation.

Response
Retry the operation. If the problem persists, use the 'Details>>' and 'Print' buttons to record further details about the problem and contact your systems administrator.

AMQ4206
Unable to prevent remote administration of the queue manager.

Severity
20: Error

Explanation
WebSphere MQ was unable change the configuration of your queue manager to prevent it from being remotely administered. This error may occur if WebSphere MQ is busy with another operation.

Response
Retry the operation. If the problem persists, use the 'Details>>' and 'Print' buttons to record further details about the problem and contact your systems administrator.

AMQ4207
The path specified is not valid.

Severity
20: Error

Response
Check the path specified and try again.

AMQ4208
Show this panel again the next time the queue manager is started?

Severity
0: Information

Explanation
You can choose whether you want the same panel to be shown the next time this queue manager is started, and the default configuration is not complete.

Response
Select whether you want the panel to be shown next time.

AMQ4209
The TCP/IP name of the remote computer must not be your own computer name.

Severity
0: Information

Explanation
You have selected that the repository queue manager is on another computer, but you have entered the name of your own computer.

Response
Enter the correct name of the repository queue manager.

AMQ4210
The command server must be active to complete this operation. Use the WebSphere MQ Services to start it, then retry the operation.

Severity
10: Warning

Explanation
The operation you requested needs the command server to be running.

Response
Use WebSphere MQ Services to start the command server, then retry the operation.

AMQ4211
The computer name entered must be on your local domain (<*insert_0*>).

Severity
10: Warning

Response
Enter the computer name which is on your local domain

AMQ4212
Unable to complete this task because you do not have authority to administer WebSphere MQ.

You must be in the mqm group to administer WebSphere MQ.

Severity
10: Warning

Explanation
Your userid is not authorized to carry out the operation you requested.

Response
Retry the operation on a userid with the required authority, or contact your systems administrator.

AMQ4213
Unable to delete the queue manager <*insert_0*> because it is being used by another program.

Close any program using the queue manager, then click 'Retry'.

Severity
10: Warning

Explanation
WebSphere MQ was unable to delete the old default configuration queue manager because another program is using the queue manager.

Response
Close the programs that are using the queue manager, and click Retry.

AMQ4214
The computer <*insert_0*> is not known on the network.

Severity
10: Warning

Explanation
WebSphere MQ is unable to locate a computer with this name on your network.

Response
Enter a different computer name.

AMQ4215
Upgrade of the default configuration was canceled.

Severity
10: Warning

Explanation
You pressed 'Cancel' while running the default configuration wizard to upgrade the default configuration.

Response
None

AMQ4216
The WebSphere MQ services component does not have the authority it requires.

Severity
10: Warning

AMQ4217
The MQSeriesServices component does not have the authority to create the default configuration.

Severity
10: Warning

AMQ4250
No nickname supplied - supply one.

Severity
10: Warning

Explanation
Requires to enter the user nick name in the text box

Response
Enter the nickname in the text box

AMQ4251
Cannot Initialise WinSock - TCP/IP may not be installed. Install TCP/IP and try again

Severity
20: Error

Explanation
Postcard was not able to initialize the interface to TCP/IP.

Response
Check that TCP/IP has been installed successfully. If the problem persists, refer to your systems administrator.

AMQ4252
Cannot Find WinSock - TCP/IP may not be installed. Install TCP/IP and try again.

Severity
20: Error

Explanation
Postcard was not able to find the interface to TCP/IP.

Response
Check that TCP/IP has been installed successfully. If the problem persists, refer to your systems administrator.

AMQ4253
Cannot get fully qualified TCP/IP domain name - Ensure that the TCP/IP protocol is configured.

Severity
20: Error

Explanation
Postcard was not able to determine the TCP/IP domain name for your computer.

Response
Check that TCP/IP has been installed successfully. If the problem persists, refer to your systems administrator.

AMQ4254
Failed to Allocate System Memory - Contact your system administrator.

Severity
20: Error

Explanation
Postcard was not able to allocate enough memory to run correctly.

Response
Close other programs to release system memory. If the problem persists, refer to your systems administrator.

AMQ4255
Supply a user name with which you wish to communicate.

Severity
10: Warning

Explanation
Requires to enter a user nick name in the To text box.

Response
Enter the user nickname in the To text box

AMQ4256
Supply <*insert_0*>s computer name (this must be a TCP/IP name).

Severity
10: Warning

Explanation
Requires to enter the mail box computer name on the On field

Response
Enter the mail box computer name or queue manager name on the On text box

AMQ4257
The call MQCONN failed while preparing for a Put operation,

with Completion Code [<*insert_0*> (<*insert_1*>)], Reason Code [<*insert_2*> (<*insert_3*>)].

Severity
20: Error

Explanation
An error occurred when Postcard tried to connect to the queue manager in order to send the postcard. This error may occur if WebSphere MQ is busy with another operation.

Response
Try to send the postcard again. If the problem persists contact your systems administrator.

AMQ4258
The call MQOPEN failed while preparing for a Put operation,

with Completion Code [<*insert_0*> (<*insert_1*>)], Reason Code [<*insert_2*> (<*insert_3*>)].

Severity
20: Error

Explanation
An error occurred when Postcard tried to open a queue in order to send the postcard. This error may occur if WebSphere MQ is busy with another operation.

Response
Try to send the postcard again. If the problem persists contact your systems administrator.

AMQ4259
The call MQCLOSE failed while preparing for a Put operation,

with Completion Code [<*insert_0*> (<*insert_1*>)], Reason Code [<*insert_2*> (<*insert_3*>)].

Severity
20: Error

Explanation
An error occurred when Postcard tried to close the queue after sending the postcard. This error may occur if WebSphere MQ is busy with another operation.

Response
If the problem persists contact your systems administrator.

AMQ4260
The call MQDISC failed while preparing for a Put operation,

with Completion Code [<*insert_0*> (<*insert_1*>)], Reason Code [<*insert_2*> (<*insert_3*>)].

Severity
20: Error

Explanation
An error occurred when Postcard tried to disconnect from the queue manager after sending the postcard. This error may occur if WebSphere MQ is busy with another operation.

Response
If the problem persists contact your systems administrator.

AMQ4261
The call MQPUT failed with Completion Code [<*insert_0*> (<*insert_1*>)], Reason Code [<*insert_2*> (<*insert_3*>)].

Severity
20: Error

Explanation
An error occurred when Postcard tried to send the postcard by putting its data to the queue. This error may occur if WebSphere MQ is busy with another operation.

Response
Try to send the postcard again. If the problem persists contact your systems administrator.

AMQ4262
The call MQCONN failed while preparing for a Get operation,

with Completion Code [<*insert_0*> (<*insert_1*>)], Reason Code [<*insert_2*> (<*insert_3*>)].

Severity
20: Error

Explanation
An error occurred when Postcard tried to connect to the queue manager in order to receive postcards. This error may occur if WebSphere MQ is busy with another operation.

Response
Restart Postcard. If the problem persists contact your systems administrator.

AMQ4263
The call MQOPEN failed while preparing for a Get operation,

with Completion Code [<*insert_0*> (<*insert_1*>)], Reason Code [<*insert_2*> (<*insert_3*>)].

Severity
20: Error

Explanation
An error occurred when Postcard tried to open a queue in order to send the postcard. This error may occur if WebSphere MQ is busy with another operation.

Response
Restart Postcard. If the problem persists contact your systems administrator.

AMQ4264
The call MQCLOSE failed while preparing for a Get operation,

with Completion Code [<*insert_0*> (<*insert_1*>)], Reason Code [<*insert_2*> (<*insert_3*>)].

Severity
20: Error

Explanation
An error occurred when Postcard tried to close the queue after receiving postcards. This error may occur if WebSphere MQ is busy with another operation.

Response
If the problem persists contact your systems administrator.

AMQ4265
The call MQDISC failed while preparing for a Get operation,

with Completion Code [<*insert_0*> (<*insert_1*>)], Reason Code [<*insert_2*> (<*insert_3*>)].

Severity
20: Error

Explanation
An error occurred when Postcard tried to disconnect from the queue manager after receiving postcards. This error may occur if WebSphere MQ is busy with another operation.

Response
If the problem persists contact your systems administrator.

AMQ4266
Enter the message that you want to send to <*insert_0*>.

Severity
10: Warning

Response
Enter the message in the Message text field.

AMQ4267
The call MQGET failed with Completion Code [<*insert_0*> (<*insert_1*>)], Reason Code [<*insert_2*> (<*insert_3*>)].

Severity
20: Error

Explanation
An error occurred when Postcard tried to receive postcards by getting its data from the queue. This error may occur if WebSphere MQ is busy with another operation.

Response
Restart Postcard. If the problem persists contact your systems administrator.

AMQ4268
Postcard is unable to contact the queue manager on the remote computer.

Verify that the default configuration is running on the remote computer.

Severity
20: Error

Explanation
The mail box queue manager in the On text box not reachable.

Response
Verify that the default configuration is running on the remote computer.

AMQ4269
Unable to run Postcard because you do not have authority to use WebSphere MQ.

You must be in the mqm group to use WebSphere MQ.

Severity
20: Error

Explanation
The mail box queue manager in the On text box not reachable.

Response
Use Postcard on a user Id with the required authority, or contact your systems administrator.

AMQ4270
Postcard is unable to send messages to the remote computer. Postcard can only exchange messages with computers that are on the same TCP/IP domain as this computer.

Severity
20: Error

Explanation
Unable to send messages to the remote computer

Response
Use default configuration application to add the remote computer to the same cluster.

AMQ4271
Unable to open a local queue called <*insert_0*> on the mailbox queue manager <*insert_1*>.

Use WebSphere MQ Explorer to create the queue, then restart Postcard.

Severity
20: Error

Explanation
Postcard was unable to automatically create the queue it uses on the queue manager.

Response
Use WebSphere MQ Explorer to create the queue, and restart Postcard.

AMQ4272
The mailbox queue manager <*insert_0*> does not exist on this computer.

Severity
20: Error

Explanation
The mailbox queue manager name specified after the '-m' parameter to Postcard does not exist on this computer.

Response
Restart Postcard specifying the name of a queue manager that does exist on this computer.

AMQ4273
Unable to contact the target mailbox <*insert_0*>.

Severity
10: Warning

Explanation
Postcard was unable send the message as it could not contact the target mailbox.

Response
Click 'Retry' to attempt to send the message again, otherwise click 'Cancel'.

AMQ4274
Postcard has detected that <*insert_0*> is the name of a computer and a queue manager.

Severity
10: Warning

Explanation
Postcard has detected that the destination mailbox name is the name of a computer and of a queue manager.

Response
Select whether you want to send the message to the computer or the queue manager with this name, then click OK.

AMQ4300
Supply some text in order for the MQPUT(1) operation to succeed.

Explanation
No text has been supplied for the user so that the MQPUT or MQPUT1 operation can proceed.

Response
Supply some text in the editable area so that the MQPUT or MQPUT1 operation can proceed.

AMQ4301
Supply some text in order for the MQPUT operation to succeed.

Explanation
No text has been supplied for the user so that the MQPUT operation may proceed.

Response
Supply some text in the editable area so that the MQPUT may proceed.

AMQ4302
Supply some text in order for the MQPUT1 operation to succeed.

Explanation
No text has been supplied for the user so that the MQPUT1 operation may proceed.

Response
Supply some text in the editable area so that the MQPUT1 may proceed.

AMQ4303
The command server for the queue manager [%s] is not started. Start the command server and try again.

Explanation
In order for the API Exerciser to function, a command server must be running.

Response
Either start the command server from the MQServices application or run strmqcsv <Queue Manager> from the command line.

AMQ4304
API Exerciser cannot enumerate objects for queue manager [%s].

Explanation
The API Exerciser encountered a problem trying to enumerate queues.

Response
Ensure that the command server is running (from the Service application) and that there are queues configured for the queue manager.

AMQ4305
There are no queue managers present in the system. Create one and try again.

Explanation
The API Exerciser could not find any queue managers on the system.

Response
Use the Services application to create one or run crtmqm <Queue Manager>.

AMQ4306
Memory allocation failure. Stop some other applications and try again.

Explanation
There are not sufficient system resources available in the system to satisfy the running of API Exerciser.

Response
Shut some other applications down and try running the API Exerciser again.

AMQ4307
API Exerciser encountered a COM failure and cannot continue. Ensure that WebSphere MQ has been correctly installed and configured and that your user id. is a member of the mqm group.

Explanation
When the API Exerciser started, it was unable to make a COM connection to WebSphere MQ Services.

Response
Ensure that WebSphere MQ has been correctly installed and configured, and that your user ID is a member of the mqm group. If the problem persists, refer to your systems administrator.

AMQ4308
API Exerciser cannot continue. Ensure that the userid you are using is a member of the mqm group.

Explanation
None.

Response
None.

AMQ4309
API Exerciser cannot continue. Ensure that the userid you are using is a member of the Administrator group.

Explanation
None.

Response
None.

AMQ4350
Setup cannot continue; a later version of this product is installed.

Explanation
Installation detected that a version of this product later than version 5.3 is already installed on the computer.

Response
Do not attempt to install version 5.3 when a later version is already installed.

AMQ4351
Uninstallation cannot continue; uninstallation is already running.

Explanation
An attempt was made to run two copies of uninstallation at once.

Response
Run only one copy of uninstallation at a time.

AMQ4352
Setup cannot continue; a supported version of Windows is required.

Explanation
None.

Response
None.

AMQ4353
Setup cannot continue; '%s' is not an Administrator.

Explanation
The user running installation does not have administrator authority.

Response
Log off and log back on using a user ID with administrator authority.

AMQ4354
No repository computer name entered.

Explanation
None.

Response
None.

AMQ4355
Repository computer name is not valid.

Explanation
None.

Response
None.

AMQ4356
Enter a remote computer name.

Explanation
None.

Response
None.

AMQ4357
Registration failed for file '%s' (code 0x%8.8lx).

Explanation
None.

Response
None.

AMQ4358
Unregistration failed for file '%s' (code 0x%8.8lx).

Explanation
None.

Response
None.

AMQ4359
Unable to register file '%s'.

Explanation
None.

Response
None.

AMQ4360
Unable to unregister file '%s'.

Explanation
None.

Response
None.

AMQ4361
Uninstall cannot continue; Administrator logon required.

Explanation
None.

Response
None.

AMQ4362
Failed to create the default configuration.

Explanation
None.

Response
None.

AMQ4363
Setup could not detect the Windows NT Service Pack level (Service Pack 3 or later is required). Is Service Pack 3 or later installed?

Explanation
None.

Response
None.

AMQ4364
Setup could not detect the Windows NT Service Pack level (Service Pack 6a or later is required). Is Service Pack 6a or later installed?

Explanation
None.

Response
None.

AMQ4365
Setup cannot continue because Service Pack 3 is not installed.

Explanation
None.

Response
None.

AMQ4366
Setup cannot continue because Service Pack 6a or later is not installed.

Explanation
None.

Response
None.

AMQ4367
Setup cannot continue because Internet Explorer Version 4.01 SP1 is not installed.

Explanation
None.

Response
None.

AMQ4368
Select at least one component to proceed.

Explanation
None.

Response
None.

AMQ4369
The 'Web Administration Server' component requires the 'Server' component.

Explanation

Response

AMQ4370
Uninstallation of the 'Server' component requires uninstallation of the 'Web Administration Server' component.

Explanation
None.

Response
None.

AMQ4371
The 'Documentation in Other Languages' component requires the 'Documentation in English' component.

Explanation
None.

Response
None.

AMQ4372
Uninstallation of the 'Documentation in English' component requires uninstallation of the 'Documentation in Other Languages' component.

Explanation
None.

Response
None.

AMQ4373
There is not enough space on drive %s (program files) to install these components. Free up some disk space or modify your selections

Explanation
None.

Response
None.

AMQ4374
There is not enough space on drive %s (data files) to install these components. Free up some disk space or modify your selections

Explanation
None.

Response
None.

AMQ4375
The program files top-level folder is not valid.

Explanation
The program files top-level folder is not a valid path.

Response
Enter a valid path.

AMQ4376
The data files top-level folder is not valid.

Explanation
The data files top-level folder is not a valid path.

Response
Enter a valid path.

AMQ4377
The log files folder is not valid.

Explanation
The log files folder name is not a valid path.

Response
Enter a valid path.

AMQ4378
A root folder is not allowed for the program files top-level folder.

Explanation
WebSphere MQ cannot be installed in a root folder, for example 'C:\'.

Response
Enter a non-root folder.

AMQ4379
A root folder is not allowed for the data files top-level folder.

Explanation
WebSphere MQ cannot be installed in a root folder, for example 'C:\'.

Response
Enter a non-root folder.

AMQ4380
A root folder is not allowed for the log files folder.

Explanation
WebSphere MQ cannot be installed in a root folder, for example 'C:\'.

Response
Enter a non-root folder.

AMQ4381
here is not enough space on drive %s (log files) to install these components. Free up some disk space or modify your selections

Explanation
None.

Response
None.

AMQ4382
Unable to create or replace folder '%s'

Explanation
None.

Response
None.

AMQ4385
Unknown language specified ('%s')

Explanation
None.

Response
None.

AMQ4386
Codepage (%d) for specified language not available.

Explanation
None.

Response
None.

AMQ4387
Before Setup can display help, this computer's help system needs upgrading to HTML Help 1.3. Would you like to upgrade now? (You might need to restart the computer.)

Explanation
None.

Response
None.

AMQ4388
WebSphere MQ Setup or uninstallation is already running.

Explanation
None.

Response
None.

AMQ4389
Setup could not create a local 'mqm' group (code %d).

Explanation
An error occurred creating a local user group called 'mqm'.

Response
Review the installation log file for details of any problems. If the error persists, contact your systems administrator.

AMQ4390
Setup could not create a global 'Domain mqm' group (code %d).

Explanation
An error occurred creating a local user group called 'mqm'.

Response
Review the installation log file for details of any problems. If the error persists, contact your systems administrator.

AMQ4391
Setup could not find the global 'Domain mqm' group.

Explanation
The global 'mqm ' group was created, but could not then be found.

Response
Review the installation log file for details of any problems. If the error persists, contact your systems administrator.

AMQ4392
Setup could not add the global 'Domain mqm' group to the local 'mqm' group (code %d).

Explanation
An error occurred adding the global 'mqm' group to the local 'mqm' group.

Response
Review the installation log file for details of any problems. If the error persists, contact your systems administrator.

AMQ4393
No ports were specified; no listeners will be created.

Explanation
None.

Response
None

AMQ4394
No queue managers are selected for remote administration.

Explanation
None.

Response
None.

AMQ4395
One or more 'Server' component prerequisites were not selected; the component cannot be installed.

Explanation
None.

Response
None.

AMQ4396
One or more prerequisite upgrades were not selected; WebSphere MQ will not operate correctly.

Explanation
None.

Response
None.

AMQ4397
Cannot install on a network drive (drive %s).

Explanation
None.

Response
None.

AMQ4400
Explorer cannot administer the queue manager because the queue <*insert_0*> is not defined.

Severity
10: Warning

Explanation
Explorer uses the queue <*insert_0*> to administer queue managers.

Response
Define the queue <*insert_0*> and retry.

AMQ4401

Explorer cannot administer the queue manager because the user is not authorised to open the queue <*insert_0*>.

Severity

10: Warning

Explanation

Explorer uses the queue <*insert_0*> to administer this queue manager.

Response

Allow Explorer to open the queue <*insert_0*> and retry.

AMQ4402

The queue <*insert_0*> could not be opened for reason <*insert_1*>.

Severity

10: Warning

Explanation

Explorer uses the queue <*insert_0*> to administer this queue manager.

Response

Allow Explorer to open the queue <*insert_0*> and retry.

AMQ4403

The queue manager you are connecting to is at a higher command level than the intermediate queue manager you are using, which will cause some operations not to work. Are you sure that you want to show the destination queue manager in the folder anyway?

Severity

10: Warning

Explanation

You are making a connection to a remote queue manager which is at a command level higher than the intermediate queue manager you are trying to use. This means that errors will occur when selecting new items such as Application Connections or queue status.

Response

Select Yes if you want to continue to use the remote queue manager with this intermediate queue manager, even though the command levels are inconsistent. Select No to chose a different intermediate queue manager.

AMQ4404

The queue manager <*insert_0*> is the only full repository in cluster <*insert_1*> and there are still partial repository queue managers defined. Removing this queue manager from the cluster prevents further repository actions from being run. Are you sure that you want to remove this queue manager?

Severity

10: Warning

Explanation

To be able to display cluster information, the clustering component of the WebSphere MQ Explorer requires at least one full repository to be selected as the source. Removing the last full repository will prevent the display of cluster members, and hence will prevent cluster actions being run on these full repositories.

Response

Select Yes if you want to remove the full repository even though it will prevent access to remaining partial repository information.

AMQ4405

An unexpected error occurred connecting to the JNDI service provider.

The following message contains text from the JNDI service provider which might not be translated.

Error <*insert_0*> performing JNDI operation <*insert_1*> on object name <*insert_2*>.

Severity
30: Severe error

Explanation
An unexpected JNDI error prevented the operation from completing.

Response
Check for FFSTs to determine the reason for the error. If symptoms persist, contact your Systems Administrator.

AMQ4406
The connection could not be made to the JNDI service provider because the specified security credentials (distinguished name and password) are not valid for this service provider.

Severity
20: Error

Explanation
Either the distinguished name or password is not valid for the service provider

Response
Correct the security credentials and try again.

AMQ4407
The Provider URL was not supplied.

Severity
20: Error

Explanation
The Provider URL must be supplied when opening an Initial Context.

Response
Supply the Provider URL.

AMQ4408
The NAME was missing from the JMS Administration data file.

Severity
20: Error

Response
Check for FFSTs to determine the reason for the error.

AMQ4409
A context with the nickname <*insert_0*> already exists.

Severity
20: Error

Explanation
Nicknames for each context in the tree must be unique.

Response
Choose a different nickname for this context.

AMQ4410
Object type <*insert_0*> is not recognised when retrieving details for attribute <*insert_1*>.

Severity
20: Error

Explanation
The object ID is not valid.

Response
Ensure that only supported object types are used.

AMQ4411
Object type <*insert_0*> is not recognised when loading objects from context <*insert_1*>.

Severity
20: Error

Explanation
The object class is not valid.

Response
Ensure that only supported object types are used.

AMQ4412
Unexpected Exception: <*insert_0*> message <*insert_1*>.

Severity
20: Error

Explanation
An unexpected error occurred.

Response
Check for FFSTs to determine the reason for the error.

AMQ4413
The context <*insert_0*> could not be removed, because it was not empty.

Severity
20: Error

Explanation
A context can only be removed if it is empty.

Response
Remove the contents of the context and try again.

AMQ4414
An unexpected error occurred when connecting to the JNDI service provider.

The following message contains text from the JNDI service provider which might not be translated.

Error <*insert_0*> because of <*insert_3*> performing JNDI operation <*insert_1*> on object name <*insert_2*>.

Severity
30: Severe error

Explanation
An unexpected JNDI error prevented the operation from completing.

Response
Check for FFSTs to determine the reason for the error. If symptoms persist contact your Systems Administrator.

AMQ4415
The object could not be created because an object with the name <*insert_0*> already exists.

Severity
20: Error

Explanation

An object with the same name already exists in JNDI. Note that the existing object might be of a different type to the one being created as Connection Factories, Destinations and other JNDI objects all share the same namespace within a particular JNDI context. To locate the existing object, select the JMS context tree node to display all objects within that JNDI location.

Response

Choose a different name for the new object, or delete the existing object.

AMQ4416

The object <*insert_0*> could not be created because you do not have authority to create objects, or there is no connection to the context.

Severity

20: Error

Explanation

If the JNDI service provider is LDAP then the connection might not have a sufficient level of security to create objects.

If the JNDI service provider is a file system then the bindings file might be read-only,

or there is no connection to the context.

Response

Connect to the JNDI service provider with the correct level of security, or ensure the permissions on the bindings file are correct and try again.

AMQ4417

The Local address could not be set to the value <*insert_0*>.

Severity

20: Error

Explanation

The Local address must be a valid address in the form ip_address(port-number), where the port number can be a specific port, a range of ports (low-port,high-port), or can be omitted. A host name can be specified instead of an IP address.

Response

Correct the Local address and try again.

AMQ4418

The SSL Peer name could not be set to the value <*insert_0*>.

Severity

20: Error

Explanation

SSL Peer name must be a valid Distinguished Name.

Response

Enter a valid SSL Peer name.

AMQ4419

The JNDI context was opened out of order.

Severity

20: Error

Explanation

A context which is already open cannot be opened again.

Response

Check for FFSTs to determine the reason for the error.

AMQ4420
The JNDI context was closed out of order.

Severity
20: Error

Explanation
A context which is already closed cannot be closed again.

Response
Check for FFSTs to determine the reason for the error.

AMQ4421
The connection could not be made to the JNDI service provider. This could be either because the physical connection has been broken, or the distinguished name in the provider URL or the distinguished name provided for the security credentials is not valid.

Severity
20: Error

Explanation
The name provided must be a properly formed distinguished name, valid on the specified JNDI service provider.

Response
Correct the distinguished name and try again.

AMQ4422
There is a communication error connecting to the JNDI service provider with the provider URL <*insert_0*>.

Severity
20: Error

Explanation
The connection to the JNDI service provider has timed out.

Response
Check the connection information and ensure that the service provider is running at the remote end and try again.

AMQ4423
The object <*insert_0*> could not be deleted because you do not have authority to delete objects.

Severity
20: Error

Explanation
If the JNDI service provider is LDAP then the connection might not have a sufficient level of security to delete objects.

If the JNDI Service provider is a file system then the bindings file might be read-only.

Response
Connected to the JNDI service provider with the correct level of security or ensure the permissions on the bindings file are correct and try again.

AMQ4424
The requested level of security is not supported by the JNDI service provider.

Severity
20: Error

Explanation
The level of security requested (none, simple or CRAM_MD5) is not supported by the JNDI service provider being used.

Response
Either change the level of security requested or the JNDI service provider and try again.

AMQ4425
It is not clear to which queue manager the value of the <*insert_0*> field on the <*insert_1*> page refers.

* Ensure that the queue manager is in WebSphere MQ Explorer.

* Ensure that the queue manager is running.

* Ensure that WebSphere MQ Explorer is connected to the queue manager.

* Ensure you have authority to list queues on the queue manager

* If there are two queue managers with the same name in WebSphere MQ Explorer, use the <*insert_0*> Select button to specify the queue manager again.

Severity
20: Error

Explanation
WebSphere MQ Explorer needs to know exactly which queue manager to query to populate the object selection dialog.

Response
If the queue manager name is ambiguous, use the selection button to choose a running queue manager, before selecting the object.

AMQ4426
The location <*insert_0*> cannot be resolved.

Severity
20: Error

Explanation
The specified location could not be found because it is not bound.

Response
Ensure that the details for the JNDI context are correct and the context itself is accessible. Try again.

AMQ4427
The JNDI service provider cannot be found

Severity
20: Error

Explanation
A JNDI service provider has been entered that is not valid, or it cannot be found in the CLASSPATH.

Response
Correctly specify the JNDI service provider and try again.

AMQ4428
There is an error connecting to the JNDI service provider with the provider URL <*insert_0*>.

The host name or IP address is not correct.

Severity
20: Error

Explanation
The connection to the JNDI service provider has timed out due to an incorrect host name or IP address.

Response
Correct the host name or IP address and try again.

AMQ4429
There is an error connecting to the JNDI service provider with the provider URL <*insert_0*>.

The host name or port number is not correct or the remote server is not running.

Severity
20: Error

Explanation
The connection to the JNDI service provider has timed out due an incorrect host name or port number, or the remote server is not running.

Response
Check the host name and port number and ensure that the remote service provider is running.

AMQ4430
There is an error connecting to the JNDI service provider with the provider URL <*insert_0*>.

The Local area network (LAN) is not available.

Severity
20: Error

Explanation
The connection to the JNDI service provider has timed out due to the LAN not being available.

Response
Ensure the LAN is available and try again.

AMQ4431
The object <*insert_0*> could not be updated as you do not have authority to update objects.

Severity
20: Error

Explanation
If the JNDI service provider is LDAP, then the connection might not have a sufficient level of security to update objects.

If the JNDI Service provider is a file system, then the bindings file might be read-only.

Response
Connected to the JNDI service provider with the correct level of security, or ensure the permissions on the bindings file are correct and try again.

AMQ4432
There is a communication error with the JNDI service provider.

Severity
20: Error

Explanation
The connection to the JNDI service provider has timed out.

Response
Ensure that the LAN is available and that the remote service provider is running, then try again.

AMQ4433
The object <*insert_0*> could not be renamed because you do not have authority to rename objects.

Severity
20: Error

Explanation
If the JNDI service provider is LDAP, then the connection might not have a sufficient level of security to rename objects.

If the JNDI Service provider is a file system then the bindings file might be read-only.

Response
Connect to the JNDI service provider with the correct level of security, or ensure the permissions on the bindings file are correct and try again.

AMQ4434
The object <*insert_0*> could not be renamed to <*insert_1*> because the name already exists.

Severity
20: Error

Explanation
Names within the JNDI namespace must be unique.

Response
Choose another name and try again.

AMQ4435
The field <*insert_0*> must start with the prefix <*insert_1*>

Severity
20: Error

Explanation
The name entered must start with the particular prefix.

Response
Correct the name and try again.

AMQ4436
The <*insert_0*> on the <*insert_1*> page cannot be <*insert_2*> when the <*insert_3*> on the <*insert_4*> page is <*insert_5*>.

Severity
20: Error

Explanation
The attributes are inconsistent.

Response
Change one or both of the attributes to make them consistent.

AMQ4437
Unknown event; type <*insert_0*>.

Severity
20: Error

Explanation
The JMS Administration plug-in encountered an unexpected event.

Response
Check for FFSTs to determine the reason for the error.

AMQ4438
The value <*insert_3*> from the parameter <*insert_0*> <*insert_1*> of class <*insert_2*> cannot be converted into a URL.

Severity
20: Error

Explanation
The JMS Administration plug-in encountered an unexpected URL string.

Response
Check for FFSTs to determine the reason for the error.

AMQ4439
The last non-blank character of <*insert_0*> must be an asterisk.

Severity
20: Error

Explanation
The name entered must end with an asterisk.

Response
Correct the name and try again.

AMQ4440
The following error was encountered when setting the field <*insert_0*>.

<*insert_1*>

Severity
20: Error

Explanation
A JMS exception was generated when setting the SSL CRL

Response
Check that all the URLs in the SSL CRL field are in the format "ldap://host".

AMQ4441
The type of the object underlying the JMS Parameter <*insert_0*> <*insert_1*> is unexpected: <*insert_2*>.

Severity
20: Error

Explanation
The JMS Administration plug-in encountered an unexpected object type.

Response
Check for FFSTs to determine the reason for the error.

AMQ4442
Unexpected JMS Exception: pcfid: <*insert_0*> <*insert_1*>, object type: <*insert_2*>, JMS error <*insert_3*> <*insert_4*>.

Severity
20: Error

Explanation
The JMS Administration plug-in encountered an unexpected JMS error.

Response
Check for FFSTs to determine the reason for the error.

AMQ4443
One or more JNDI errors prevented objects being retrieved from the namespace. The last of these errors was <*insert_0*> for the object <*insert_1*>.

Severity
30: Severe error

Explanation
An unexpected JNDI error prevented the operation from completing. The objects might have been damaged and cannot be retrieved from the namespace. Damaged objects are shown in WebSphere MQ Explorer

Response
Either delete the object (using the Explorer), or repair it using some other tool.

AMQ4444
One or more JNDI errors prevented objects being looked up from the namespace. The last of these errors was <*insert_0*> for the object <*insert_1*>.

The JNDI service provider returned the following message text:

<*insert_2*>.

Severity
30: Severe error

Explanation
An unexpected JNDI error prevented the operation from completing. The objects might have been damaged and cannot be retrieved from the namespace. Damaged objects are shown in WebSphere MQ Explorer

Response
Either delete the object (using the Explorer), or repair it using some other tool.

AMQ4445
The following error, reported by JNDI, prevented the transport being changed for the object: <*insert_1*>.

<*insert_0*>.

Severity
30: Severe error

Explanation
The objects might have properties which prevent the transport being changed.

Response
Before trying to change the transport, change any conflicting properties.

AMQ4446
You are about to remove the Initial context <*insert_0*> (<*insert_1*>) from WebSphere MQ Explorer. Are you sure that you want to continue?

Severity
0: Information

Explanation
If you remove this Initial context, it will no longer be displayed in WebSphere MQ Explorer. The context itself and its contents, will not be deleted.

Response
Continue only if you want to remove the context from WebSphere MQ Explorer.

AMQ4447
Are you sure that you want to delete the JMS object <*insert_0*> (<*insert_1*>)?

Severity
0: Information

Explanation
The JMS object will be permanently removed from the JMS Context.

Response
Continue only if you want to permanently delete the object.

AMQ4448
The <*insert_0*> on the <*insert_1*> page cannot be specified when the <*insert_2*> on the <*insert_3*> page has not been specified.

Severity
20: Error

Explanation
The attributes are inconsistent.

Response
Change one or both of the attributes to make them consistent.

AMQ4449
The factory class location <*insert_0*> is not valid.

Severity
20: Error

Explanation
The factory class location must be in a URL format.

Response
Remove the Initial context from WebSphere MQ Explorer and add it again.

AMQ4450
This operation is not supported. The following message contains text from the JNDI service provider which might not be translated:

<*insert_0*>

Use this message to help you diagnose the problem.

Severity
20: Error

Explanation
The JNDI provider does not support the operation performed. One common problem is trying to connect without a password.

Response
Determine and solve the problem from the JNDI error message and try again.

AMQ4451
The <*insert_0*> property on the JMS object <*insert_1*> is set to <*insert_2*> but WebSphere MQ Explorer is not connected to a queue manager with that name.

Severity
20: Error

Explanation
To create the appropriate object on the queue manager, WebSphere MQ Explorer must be connected to it.

Response
Add the required queue manager to WebSphere MQ Explorer and ensure that it is connected before attempting this operation again.

AMQ4452

The coupling-facility structure name specified in the queue definition for this queue is not defined in the CFRM data set, or is not the name of a list structure.

Severity

20: Error

Explanation

An MQOPEN or MQPUT1 call was issued to access a shared queue, but the call failed because the coupling-facility structure name specified in the queue definition is not defined in the CFRM data set, or is not the name of a list structure.

Response

Modify the queue definition to specify the name of a coupling-facility list structure that is defined in the CFRM data set.

AMQ4453

The storage class defined for this queue does not exist.

Severity

20: Error

Explanation

The MQPUT or MQPUT1 call was issued, but the storage-class object defined for the queue does not exist.

Response

Create the storage class object required by the queue, or modify the queue definition to use an existing storage class. The name of the storage class object used by the queue is specified by the StorageClass queue attribute.

AMQ4454

There is an error associated with this channel.

Severity

20: Error

Explanation

A possible error cause is that the channel references a host name that cannot be resolved.

Response

Ensure that all of the properties for the channel have been defined correctly. Ensure that the channel references a host name that can be resolved.

AMQ4455

The Distinguished Name specified is not valid.

Severity

20: Error

Response

Ensure that a valid Distinguished Name is specified.

AMQ4456

The Db2 subsystem is currently not available.

Severity

20: Error

Explanation

An MQOPEN, MQPUT1, or MQSET call was issued to access a shared queue, but the call failed because the queue manager is not connected to a Db2 subsystem. As a result, the queue manager is unable to access the object definition relating to the shared queue. A possible cause for this error is that the Db2 subsystem is being restarted.

Response

Configure the Db2 subsystem so that the queue manager can connect to it. Ensure that the Db2 subsystem is available and running.

AMQ4457

The value <*insert_0*> from attribute <*insert_1*> on JMS object <*insert_2*> is not a valid name for an MQ object.

Severity

20: Error

Explanation

The value of the specified attribute either contains invalid characters or is an invalid length for an MQ object name.

Response

Modify the attribute value by removing any invalid characters or reducing the length.

AMQ4458

The property <*insert_0*> on JMS object <*insert_1*> could not be retrieved or updated.

Severity

20: Error

Explanation

An error occurred while requesting or updating the value of a property on a JMS object.

Response

Check for FFST information to determine the reason for the error. If symptoms persist, contact your Systems Administrator.

AMQ4459

The <*insert_0*> property on the JMS object <*insert_1*> is set to <*insert_2*> but no known queue managers of that name support the creation of administrative topic objects.

Severity

20: Error

Explanation

To create the appropriate object on the queue manager, it must support the creation of administrative topic objects.

Response

Either add a queue manager of the appropriate name and that supports the creation of administrative topics to WebSphere MQ Explorer, or modify the JMS object property. Try the operation again.

AMQ4460

The default remote administration listener LISTENER.TCP was created successfully.

Severity

0: Information

Response

Message for information only.

AMQ4461

The default remote administration listener LISTENER.TCP could not be created.

Severity

10: Warning

Explanation

A problem occurred when issuing a command to the command server to create the listener.

Response
Check that the command server is running on the queue manager and try again. If symptoms persist contact your System Administrator.

AMQ4462
Successfully added queue manager <*insert_0*>.

Severity
0: Information

Explanation
The requested queue manager was successfully added to the list of known queue managers in the WebSphere MQ Explorer.

Response
Message for information only.

AMQ4463
The <*insert_0*> attribute on JMS object <*insert_1*> is set to <*insert_2*> but this is not a valid name for an MQ Queue Manager.

Severity
20: Error

Explanation
The attribute must only contain valid characters and be of the appropriate length for an MQ Queue Manager name.

Response
Modify the attribute to the name of a real MQ Queue Manager.

AMQ4464
An error occurred while trying to connect to the queue manager. WebSphere MQ Explorer could not determine the name of the queue manager so it cannot be added.

Severity
20: Error

Explanation
Queue manager names must be determined before adding them to the WebSphere MQ Explorer. Where an asterisk (*) is used to connect, the Queue Manager must be available so that the queue manager name can be determined.

Response
Ensure the required queue manager is available before attempting this operation again, or make the queue manager name explicit rather than using an asterisk (*).

AMQ4465
New attributes have been added to WebSphere MQ Explorer objects. Your existing user-defined schemes have not been updated. If you want your user-defined schemes to contain these new attributes, you must manually add the new attributes.

Severity
0: Information

Response
Message for information only.

AMQ4466
Successfully connected to the queue manager <*insert_0*>. As the required queue manager name <*insert_1*> starts with an asterisk (*), there might be multiple queue managers that could result from the same connection. Are you sure that you want to add this queue manager?

Severity
0: Information

Explanation
The queue manager name used to connect starts with an asterisk (*). This means that the same connection details could be used to connect to multiple queue managers.

Response
Add the queue manager specified if it is the one you required.

AMQ4467
The filter has not been removed because it is still required by other plug-ins.

Severity
10: Warning

Explanation
Other plug-ins have responded to the attempted removal of this filter by indicating that they are still using it.

Response
Ensure that the other plug-ins have finished using the filter before trying to delete it again.

AMQ4468
The filter named <*insert_0*> is used by the following automatic sets:<*insert_1*> Are you sure that you want to delete this filter?

Severity
10: Warning

Explanation
A confirmation is required before the specified filter is deleted. The name is provided in the message.

Response
Continue only if you want to permanently delete the filter.

AMQ4469
The automatic set <*insert_0*> no longer has any filters to decide its membership.

Severity
10: Warning

Explanation
The only filter that this set was using has been deleted. An automatic set needs at least one filter to determine which objects should be members of the set.

Response
Press OK to edit this set and in the Edit Set dialog, select one or more filters to use with this set.

AMQ4470
The Provider Version is not in the correct form.

Severity
20: Error

Explanation
The Provider Version consists of up to 4 groups of digits separated with periods (.)but not ending with one, 63, 1.2 or 1.2.34.56 for example. Alternatively you can enter the word 'unspecified'.

Response
Correct the provider version and try again.

AMQ4471
Are you sure that you want to delete the set named <*insert_0*>?

Note that deleting a set does not delete its members.

Severity
10: Warning

Explanation
A confirmation is required before the specified set is deleted.

Response
Continue only if you want to permanently delete the set.

AMQ4472
The WMQ_Schemes.xml file used to save schemes is incomplete.

A backup copy of this file has been made:

<insert_0>.

Where possible, user-defined schemes from this file have been extracted and retained,

but it is possible that some have been lost.

Severity
10: Warning

Explanation
When reading in schemes from the WMQ_Schemes.xml file, some required information was missing.

Response
Re-create user-defined schemes where necessary. Refer to the backup copy of the schemes file that was created to identify what has been changed.

AMQ4473
The WMQ_Schemes.xml file used to save schemes was found to be in an invalid format.

A backup copy of this file was made:

<insert_0>.

All user-defined schemes must be re-created.

Severity
10: Warning

Explanation
WebSphere MQ Explorer was unable to process the WMQ_Schemes.xml file as it had an invalid format. It was possibly truncated.

Response
Re-create all user-defined schemes. If possible, refer to the backup copy of the schemes file to obtain information.

AMQ4474
The WMQ_Filters.xml file used to save filters is incomplete. A backup copy of this file has been made: *<insert_0>*. Where possible, user-defined filters from this file have been extracted and retained, but it is possible that some have been lost.

Severity
10: Warning

Explanation
When reading in filters from the WMQ_Filters.xml file, some required information was missing.

Response
Re-create user-defined filters where necessary. Refer to the backup copy of the filters file that was created to identify what has been changed.

AMQ4475

The WMQ_Filters.xml file used to save filters was found to be in an invalid format. A backup copy of this file was made: <*insert_0*>. All user-defined filters must be re-created.

Severity

10: Warning

Explanation

WebSphere MQ Explorer was unable to process the WMQ_Filters.xml file as it had an invalid format. It was possibly truncated.

Response

Re-create all user-defined filters. If possible, refer to the backup copy of the filters file to obtain information.

AMQ4476

The WMQ_Sets.xml file used to save sets was found to be in an invalid format. A backup copy of this file was made: <*insert_0*>. All sets must be re-created.

Severity

10: Warning

Explanation

WebSphere MQ Explorer was unable to process the WMQ_Sets.xml file as it had an invalid format. It was possibly truncated.

Response

Re-create all sets as necessary. If possible, refer to the backup copy of the sets file that was created to obtain information.

AMQ4477

The topic string supplied is invalid.

Severity

10: Warning

Explanation

A topic string was missing or contained invalid characters.

Response

Ensure a topic string has been defined or that there are no invalid characters in the topic string.

AMQ4478

The publication could not be retained.

Severity

10: Warning

Explanation

An attempt was made to publish a message on a topic, using the MQPMO_RETAIN option, but the publication could not be retained. The publication was not published to any matching subscribers. Retained publications are stored on the SYSTEM.RETAINED.PUB.QUEUE. Possible reasons for failure include the queue being full, the queue being 'put' inhibited, or the queue not existing.

Response

Ensure that the SYSTEM.RETAINED.PUB.QUEUE queue is available for use by the application.

AMQ4479

An MQOPEN or MQPUT1 call was issued, specifying an alias queue as the target, but the BaseObjectName in the alias queue attributes was not recognized as a queue or topic name.

Severity

20: Error

Explanation
This error can also occur when BaseObjectName is the name of a cluster queue that cannot be resolved successfully.

Response
Correct the queue definitions.

AMQ4480
An MQOPEN or MQPUT1 call was issued, specifying an alias queue as the target, but the BaseObjectName in the alias queue definition resolves to a queue that is not a local queue, or local definition of a remote queue.

Severity
20: Error

Response
Correct the queue definitions.

AMQ4481
An error occurred when unsubscribing from the topic. The operation failed with reason code <*insert_0*>.

Severity
20: Error

Response
Use the reason code to determine the underlying reason for the failure.

AMQ4482
An error occurred when obtaining a publication. The operation failed with reason code <*insert_0*>.

Severity
20: Error

Explanation
An error occurred when performing a get operation for the subscribed topic. The topic was automatically unsubscribed.

Response
Use the reason code to determine the underlying reason for the failure.

AMQ4483
An error occurred when publishing a message on the topic. The operation failed with reason code <*insert_0*>.

Severity
20: Error

Response
Use the reason code to determine the underlying reason for the failure.

AMQ4484
An error occurred when obtaining the topic string for a publication. The operation failed with reason code <*insert_0*>.

Severity
20: Error

Explanation
The topic was automatically unsubscribed.

Response
Use the reason code to determine the underlying reason for the failure.

AMQ4485

This action removes the retained publication from the topic string <*insert_0*> on the selected queue manager only.

Are you sure you want to clear the retained publication?

Severity

10: Warning

Explanation

A confirmation is required before the retained publication is cleared.

Response

Continue only if you want to permanently clear the retained publication on this topic string.

AMQ4486

The retained publication on the topic string <*insert_0*> has been successfully cleared.

Severity

0: Information

Response

Message for information only.

AMQ4487

Error initialising <*insert_0*>.

Severity

30: Severe error

Explanation

An error occurred while starting this application.

Response

Check that the WebSphere MQ runtime libraries are available and the PATH system environment variable includes the directory for these runtime libraries.)

AMQ4488

Unable to locate a Web browser, product documentation, or IBM Eclipse Help System to display the help.

Severity

10: Warning

Explanation

To launch the help system, the Web browser or product documentation or IBM Eclipse Help System must be included in the PATH system environment variable.

Response

Install the product documentation or IBM Eclipse Help System or set the available Web browser on the system path. Re-launch the application and try again.

AMQ4489

Error launching the IBM Eclipse Help System.

Severity

10: Warning

Explanation

The application failed to create an instance of the IBM Eclipse Help System.

Response

Check that the IBM Eclipse Help System has been installed.

AMQ4490

Error starting the IBM Eclipse Help System.

Severity
10: Warning

Explanation
The application failed to start the IBM Eclipse Help System.

Response
Check that the IBM Eclipse Help System has been installed.

AMQ4491
Error launching the help system with a Web browser.

Severity
10: Warning

Explanation
The application failed to launch the help system through a Web browser.

Response
Check that the Web browser specified in the system path is working.

AMQ4492
Error launching the help system with IBM Eclipse Help System.

Severity
10: Warning

Explanation
The application failed to launch the help system through IBM Eclipse Help System.

Response
Check that the IBM Eclipse Help System has been installed.

AMQ4493
The help documentation is not available on the system.

Severity
10: Warning

Explanation
The application failed to locate the help documentation on the system.

Response
Check that the available help documentation for WebSphere MQ is installed.

AMQ4494
Unable to locate a Web browser in the system path.

Severity
10: Warning

Explanation
The application failed to locate a Web browsers in the system path.

Response
Check that a suitable Web browser is specified in the system path.

AMQ4495
This action resynchronizes all the proxy subscriptions with all other directly connected queue managers in all clusters and hierarchies in which this queue manager is participating.

Are you sure you want to continue with this action?

Severity
10: Warning

Explanation

This should only be used if the queue manager is receiving proxy subscriptions that it should not be, or is not receiving proxy subscriptions that it should be.

Missing proxy subscriptions can be observed if the closest matching Topic definition has been specified with Publication scope or Subscription scope set to Queue Manager, or if it has an empty or incorrect Cluster name.

Extraneous proxy subscriptions can be observed if the closest matching Topic definition has been specified with Proxy subscription behavior set to Force.

Response

Check the Topic definitions before resynchronizing the proxy subscriptions.

AMQ4496

The request to refresh the proxy subscriptions was accepted by WebSphere MQ.

Severity

0: Information

Response

Message for information only.

AMQ4497

The topic string has already been specified for another topic. Enter a different topic string.

Severity

10: Warning

Response

Enter a different topic string.

AMQ4498

This action removes the retained publication from the topic string <*insert_0*> on all queue managers connected in the Publish/Subscribe cluster.

Are you sure you want to clear the retained publication?

Severity

10: Warning

Explanation

A confirmation is required before the retained publication is cleared.

Response

Continue only if you want to permanently clear the retained publication on this topic string.

AMQ4499

The queue attribute for the JMS queue <*insert_0*> is empty. A queue name needs to be entered before mapping the JMS queue to an MQ queue.

Severity

10: Warning

Explanation

The user has not entered a queue name for the JMS Queue and therefore an MQ Queue cannot be created.

Response

Enter a value for the queue attribute on the JMS Queue and then try to create the MQ Queue again.

AMQ4500

Are you sure that you want to forcibly remove queue manager <*insert_0*> from cluster <*insert_1*>?

Severity
10: Warning

Explanation
You should only forcibly remove a queue manager from a cluster when it has already been deleted and cannot be removed from the cluster in the normal way. A confirmation is required before the queue manager is forcibly removed.

Response
Continue only if you want to forcibly remove the queue manager.

AMQ4501
The queue manager was successfully removed from the cluster. This might take some time to be reflected in the WebSphere MQ Explorer.

Severity
0: Information

Explanation
The queue manager will still appear as a member of the cluster until the configuration changes have been sent across the network and the cluster channels to the queue manager have become inactive. This might take a long time.

AMQ4502
You have shared the queue in cluster <*insert_0*>. The queue manager is not a member of this cluster.

Severity
10: Warning

Response
To make the queue available to the members of this cluster, you must join the queue manager to the cluster.

AMQ4503
The list of values is too long.

Severity
10: Warning

Explanation
The list of values that you have entered is too long. The maximum number of characters allowed for this value is <*insert_0*>.

AMQ4504
The value is too long.

Severity
10: Warning

Explanation
You have entered a value containing too many characters. The maximum number of characters allowed for each value of this attribute is <*insert_0*>.

AMQ4505
There are too many entries in the list.

Severity
10: Warning

Explanation
You have entered too many values in the list. The maximum number of values is <*insert_0*>.

AMQ4506

Cannot connect to queue manager <*insert_0*>. It cannot be removed from the cluster in the normal way.

Severity

10: Warning

Response

Try the operation again when the queue manager is available. If the queue manager no longer exists, you can choose to forcibly remove the queue manager from the cluster.

AMQ4507

The remote queue manager is not using TCP/IP.

Severity

10: Warning

Explanation

The connection information available for the remote queue manager uses a communication protocol other than TCP/IP. The WebSphere MQ Explorer cannot connect to the queue manager to remove it from the cluster in the normal way.

Response

If the queue manager no longer exists, you can choose to forcibly remove the queue manager from the cluster.

AMQ4508

The queue manager successfully left the cluster.

Severity

0: Information

Explanation

The queue manager will still appear as a member of the cluster until the configuration changes have been sent across the network and the cluster channels to the queue manager have become inactive. This might take a long time.

AMQ4509

The request to suspend membership of the cluster has been accepted.

Severity

0: Information

Response

Message for information only.

AMQ4510

The request to resume membership of the cluster has been accepted.

Severity

0: Information

Response

Message for information only.

AMQ4511

The queue manager is not a member of the cluster.

Severity

0: Information

Response

Message for information only.

AMQ4512
An error occurred while performing a cluster operation. The operation failed with error <*insert_0*>.

Severity
0: Information

Response
Message for information only.

AMQ4513
The request to refresh the information about the cluster has been accepted.

Severity
0: Information

Response
Message for information only.

AMQ4514
The queue manager is not a member of cluster <*insert_0*>.

Severity
10: Warning

Explanation
The object that you have shared in the cluster will not be available to other members of the cluster until you make this queue manager a member of the cluster.

AMQ4515
The repository queue manager for cluster <*insert_0*> is not available for connection.

Severity
10: Warning

Explanation
Views showing cluster queues in this cluster might not be complete.

AMQ4516
Cluster workload exit error.

Severity
10: Warning

Explanation
The queue manager's cluster workload exit failed unexpectedly or did not respond in time.

AMQ4517
Cluster resolution error.

Severity
10: Warning

Explanation
The definition of the cluster queue could not be resolved correctly because a response from a repository queue manager was not available.

AMQ4518
AMQ4518=A call was stopped by the cluster exit.

Severity
10: Warning

Explanation
The queue manager's cluster workload exit rejected a call to open or put a message onto a cluster queue.

AMQ4519
No destinations are available.

Severity
10: Warning

Explanation
At the time that the message was put, there were no longer any instances of the queue in the cluster.

AMQ4520
The WebSphere MQ Explorer could not initialize TCP/IP. Administration of remote queue managers and clusters is not possible.

Severity
10: Warning

AMQ4521
The text you entered contained a comma (,) which is used as a list separator character.

Severity
10: Warning

Explanation
This value does not accept lists.

Response
If you want to use a comma as part of a value, enclose the value in double quotation marks.

AMQ4522
The wizard was unable to add the queue manager to the cluster.

All changes will be rolled back.

Severity
10: Warning

Explanation
A problem occurred while defining objects or modifying the queue manager's properties.

Response
Ensure that the default objects exist for the queue manager.

AMQ4523
The wizard was unable to add one of the queue managers to the cluster.

All changes will be rolled back.

Severity
10: Warning

Explanation
A problem occurred while defining objects or modifying one of the queue managers' properties.

Response
Ensure that the default objects exist for the queue manager.

AMQ4524
The queue manager <*insert_0*> is the source repository in cluster <*insert_1*>. Removing this queue manager from the cluster prevents further repository actions from being run. To enable repository actions again, re-select another queue manager as the source of information. Are you sure that you want to remove this queue manager?

Severity
10: Warning

Explanation

To be able to display cluster information, the clustering component of the WebSphere MQ Explorer requires at least one full repository to be selected as the source. Removing the last full repository prevents the display of cluster members, and hence will prevent cluster actions being run on these full repositories.

Response

Select Yes if you want to remove the source repository, even though it will prevent access to remaining cluster information.

AMQ4525

Cluster workload exit load error.

Severity

10: Warning

Explanation

The queue manager's cluster workload exit failed to load.

Response

Check that the cluster workload exit exists and the name has been specified correctly.

AMQ4526

During the import further plug-ins were enabled. Do you want to import their settings?

Severity

0: Information

Explanation

The import file contains settings for the plug-ins enabled during the import.

Response

Select Yes to import the settings.

AMQ4527

Default Configuration is already running.

Severity

10: Warning

Explanation

There is an instance of default configuration already running on the system.

Response

Use the previously launched default configuration application. If you fail to get the previous default configuration dialog, stop the JVM running the application and try re-launching the application.

AMQ4528

The file selected does not contain any import settings.

Severity

20: Error

Response

Select another file and try again.

AMQ4529

Put message failed. The page set ID specified for the storage class defined for this queue is not valid.

Severity

20: Error

Explanation
The MQPUT or MQPUT1 call was issued, but the page set id specified in the storage class object defined for the queue is not valid.

Response
Correct the page set ID value in the storage class definition used by this queue and try again. If the error persists contact your System Administrator.

AMQ4530
The request to create and start a new z/OS listener was accepted.

Severity
0: Information

Explanation
A user request to create the listener was accepted by WebSphere MQ.

Response
Message for information only.

AMQ4531
The subscription is in use.

Severity
20: Error

Explanation
An attempt was made to delete or change a subscription in use.

Response
Ensure that the subscription is not in use and try again.

AMQ4547

Severity
20: Error

Explanation
Unable to load system libraries as the java.library.path and the native library path reference different installations.

Response
Ensure that the native library path (LD_LIBRARY_PATH, LIBPATH, or SHLIB_PATH) is set correctly.

AMQ4548

Severity
20: Error

Explanation
MQ Explorer encountered a problem with the system browser when trying to display the web page.

Response
Ensure that a browser is available to display the web page. If symptoms persist, contact your System Administrator.

AMQ4549
An unexpected error occurred copying settings from workspace <*insert_0*>.

Severity
10: Warning

Explanation
Some files or preferences could not be copied from the previous workspace.

Response
Ensure that the Eclipse workspace exists at the specified location and can be read.

AMQ4570
The requested application is either not installed or could not be launched.

Severity
20: Error

Response
Check that the corresponding product feature has been installed successfully. If symptoms persist contact your System Administrator.

AMQ4571
Are you sure that you want to change the location of the Key Repository for queue manager <*insert_0*>?

Severity
10: Warning

Explanation
You might prevent the queue manager from starting if you change the Key Repository field to a location which is not valid.

Response
Ensure that the location specified is correct before continuing.

AMQ4572
The request to refresh the information about all clusters has been accepted.

Severity
0: Information

Response
Message for information only.

AMQ4573
A queue manager has not been entered in the <*insert_0*> field on the <*insert_1*> page. A value must be entered in this field before the Select button can be used to set the <*insert_2*> field. Note that this value can also be entered manually.

Severity
20: Error

Explanation
WebSphere MQ Explorer needs to know exactly which queue manager to query to populate the object selection dialog.

Response
Enter a valid value into the appropriate field

AMQ4574
IBM WebSphere Explorer is already running.

Severity
30: Severe error

AMQ4575
An error occurred initializing the data model.

Severity
30: Severe error

AMQ4576
The working directory <*insert_0*> is not valid.

Severity
30: Severe error

AMQ4577
An error occurred initializing the process.

Severity
30: Severe error

AMQ4578
An error occurred loading the messages file <*insert_0*>.

Severity
30: Severe error

AMQ4579
An error occurred loading the system libraries.

Severity
30: Severe error

AMQ4580
An internal method detected an unexpected system return code. The method <*insert_0*> returned <*insert_1*>.

Severity
30: Severe error

Response
Examine the problem determination information on this computer to establish the cause of the error.

AMQ4581
Parameter check failed on the internal function <*insert_0*>. The error was <*insert_1*>.

Severity
30: Severe error

Response
Examine the problem determination information on this computer to establish the cause of the error.

AMQ4582
Queue manager <*insert_0*> is not available for client connection.

Severity
30: Severe error

Response
Ensure the queue manager is running and is configured to accept remote connections.

AMQ4583
Queue manager <*insert_0*> is not available for connection.

Severity
30: Severe error

Response
Ensure the queue manager is running.

AMQ4584
Queue manager <*insert_0*> is not available for cluster connection.

Severity
30: Severe error

Response
Ensure that the queue manager is running. If the queue manager has been deleted it might continue to be displayed as a member of a cluster for up to 30 days.

AMQ4585
An internal method <*insert_0*> encountered an unexpected error.

Severity
30: Severe error

Response
Examine the problem determination information on this computer to establish the cause of the error.

AMQ4586
The attempt to create the URL for file <*insert_0*> failed.

Severity
30: Severe error

Explanation
The file name specified was not recognized.

Response
Ensure that the file exists at the specified location and can be read.

AMQ4587
The attempt to read from URL <*insert_0*> failed.

Severity
30: Severe error

Explanation
There was an error when the system tried to read the Client channel definition table.

Response
Ensure that the file exists at the specified location and can be read.

AMQ4588
The attempt to read from URL <*insert_0*> failed.

Severity
30: Severe error

Explanation
There was an error when the system tried to read the file.

Response
Ensure that the file exists at the specified location and can be read.

AMQ4589
No connection was found to application <*insert_0*>.

Severity
10: Warning

Explanation
The connection was not found. Possibly the connection was closed before the command was issued.

Response
Check that the application connection has not been closed in the background.

AMQ4590
The queue manager connection to application <*insert_0*> could not be closed.

Severity
20: Error

Explanation
The connection could not be closed due to a PCF error.

Response
Check for FFSTs.

AMQ4591
The command server for <*insert_0*> is not running.

Severity
30: Severe error

Explanation
The command server has stopped for some reason, so the request cannot be processed.

Response
Start the command server. If the error persists, examine the problem determination information to see if any details have been recorded.

AMQ4592
The connection was closed successfully.

Severity
0: Information

Explanation
The request to close the connection to an application was successful.

Response
Message for information only.

AMQ4593
Do you really want to stop the connection to application <*insert_0*>

Severity
0: Information

Explanation
WebSphere MQ explorer is about to stop a connection, stopping the connection will prevent further communication between MQ and the application in question.

Response
Select yes if you want to stop the connection.

AMQ4594
The queue manager connection to application <*insert_0*> has not been closed.

Severity
0: Information

Explanation
Certain WebSphere MQ queue manager processes cannot be stopped.

Response
Message for information only.

AMQ4595
No response was received to the request to close the connection to application <*insert_0*>.

Severity
30: Severe error

Explanation
The command server might no longer be running.

Response
If the error persists, examine the problem determination information to see if any details have been recorded.

AMQ4596
Key store file <*insert_0*> cannot be found.

Severity
10: Warning

Explanation
The SSL key store or trust store does not exist.

Response
Create a new store file or change the connection property. Then try the request again.

AMQ4597
No certificates were loaded from key store file <*insert_0*>.

Severity
10: Warning

Explanation
The SSL key store or trust store does not contain any certificates.

Response
Add the appropriate certificates to the key store file. Then try the request again.

AMQ4598
Key store file <*insert_0*> could not be opened with the given password.

Severity
10: Warning

Explanation
The SSL key store or trust store could not be opened.

Response
Change the password. Then try the request again.

AMQ4599
Changing the FIPS required setting will affect all client connections using SSL and requires the WebSphere MQ Explorer to be restarted. Are you sure that you want to restart the WebSphere MQ Explorer now ?

Severity
10: Warning

Explanation
The FIPS required value is an application-wide setting and can only be changed from the Preferences page. All client connections using SSL will be affected by this setting.

Response
Restart the WebSphere MQ Explorer to apply this change.

AMQ4600
The password store <*insert_0*> could not be opened using the given key.

Severity
10: Warning

Explanation
The specified password store file cannot be opened.

Response
Make sure the password store file exists. Enter a different key and try again.

AMQ4601
Do you want to copy entries from the old password store to the new one?

Severity
10: Warning

Explanation
The user has changed the name of the password store file.

Response
Click Yes to copy entries to the new file.

AMQ4602
Unable to validate the given key for password store <*insert_0*>.

Severity
10: Warning

Explanation
The password store cannot be opened with the specified key.

Response
Enter a different key and try the operation again.

AMQ4603
Invalid password store <*insert_0*>.

Severity
10: Warning

Explanation
The file name is the name of a directory.

Response
Enter a valid file name.

AMQ4604
Password store <*insert_0*> is read-only.

Severity
10: Warning

Explanation
WebSphere MQ Explorer only has read access to the file name.

Response
Specify the name of a file that has both read and write access.

AMQ4605
Format of password store <*insert_0*> is unknown.

Severity
10: Warning

Explanation
The contents of the password store file is unknown. This may be an existing XML file which has not been created as a password store or a non-XML file.

Response
Specify an existing password store file name or specify a new XML file.

AMQ4606
Password store <*insert_0*> was not opened.

Severity
10: Warning

Explanation
The user chose not to open the password store.

Response
Restart the WebSphere MQ Explorer to open the password store or use the Password preference page.

AMQ4607
Queue manager has been disabled for Publish/Subscribe operations.

Severity
10: Warning

Explanation
An error occurred trying to perform a publish or subscribe operation.

Response
Change the PSMODE attribute on the queue manager to enable Publish/Subscribe operations.

AMQ4608
The specified destination does not exist.

Severity
30: Severe error

Explanation
An error occurred trying to create a new subscription.

Response
Change the destination name and try again.

AMQ4609
The listener was started.

Severity
0: Information

Explanation
The request to start a listener was successful.

Response
Message for information only.

AMQ4610
Invalid connection name.

Severity
10: Warning

Explanation
The connection name in the channel definition could not be resolved into a network address. Either the name server does not contain the entry, or the name server was not available.

Response
Ensure that the connection name is correctly specified and that the name server is available.

AMQ4611
Applying these changes will disconnect the queue manager and reconnect with the new details. Do you want to continue?

Severity
0: Information

Explanation
Connection details have been changed to a connected queue manager. Without reconnecting, the current connection details cannot be seen.

Response
Select yes to continue or no to cancel the changes.

AMQ4616
A newer command level has been found when connecting to <*insert_0*>. The old level is <*insert_1*> and the new level is <*insert_2*>. The connection to the queue manager will be replaced.

Severity
0: Information

Explanation
A previous connection to this queue manager has been successful; the queue manager is the same but the command level is now higher. The version of WebSphere MQ has been changed.

Response
Message for information only.

AMQ4620
Channel Authentication Record already exists.

Severity
20: Error

Explanation
An attempt was made to add a Channel Authentication Record, but it already exists.

Response
Use the properties panel to change an existing record.

AMQ4621
Channel Authentication Record not found.

Severity
20: Error

Explanation
The specified channel authentication record does not exist.

Response
Specify a channel authentication record that exists.

AMQ4622
A Channel Authentication Record contained an IP address with a range that conflicted with an existing range.

Severity
20: Error

Explanation
A range must be a complete superset or subset of any existing ranges for the same channel profile name.

Response
Specify a range that is a superset or a subset of existing ranges.

AMQ4623
The maximum number of Channel Authentication Records has been exceeded.

Severity
20: Error

Explanation
A Channel Authentication Record was set taking the total number of entries for that type on a single channel profile, over the maximum number allowed.

Response
Remove some Channel Authentication Records to make room.

AMQ4624
A Channel Authentication Record contained an invalid IP address.

Severity
20: Error

Explanation
A Channel Authentication Record contained an invalid IP address, or invalid wildcard pattern to match against IP addresses.

Response
Specify a valid IP address.

AMQ4625
A Channel Authentication Record contained an invalid IP address range.

Severity
20: Error

Explanation
A Channel Authentication Record contained an IP address with a range that was invalid, for example, the lower number is higher or equal to the upper number of the range.

Response
Specify a valid range in the IP address.

AMQ4626
The Channel Authentication Record client user value is not valid.

Severity
20: Error

Explanation
The client user value contains a wildcard character which is not allowed.

Response
Specify a valid value for the client user field.

AMQ4627
Channel authentication profile name is invalid.

Severity
20: Error

Explanation
The channel profile name used in the command was not valid. This might be because it contained characters which are not accepted names, or characters which are not valid for the specified profile type.

Response
Specify a valid value for the channel authentication profile name.

AMQ4700
PCF command identifier (<*insert_0*>) not valid for queue manager <*insert_1*>.

Severity
10: Warning

Explanation
The specified PCF command is not supported by this queue manager.

AMQ4701
The command level of the queue manager does not support the requested version of the command.

Severity
10: Warning

Explanation
There is a mismatch between the command requested and the command level supported by the queue manager. This might be because an intermediate queue manager is being used which is of a lower command level than the remote queue manager.

Response
Ensure that the intermediate queue manager is at the same or higher command level than the queue manager it is being used to connect to. If necessary, reconnect to the queue manager using a different intermediate queue manager.

AMQ4702
The current filter not supported for queue manager <*insert_0*>.

Severity
10: Warning

Explanation
The filter being applied to this view is not supported by this queue manager.

Response
Ensure that the filter settings are supported by the queue manager.

AMQ4766
Setup needs to install or upgrade this computer to version 2.0 of Microsoft Windows Installer. (MSI).

Explanation
After the upgrade you might need to reboot.

Response
Select Yes or No to Proceed.

AMQ4800
Error initializing <*insert_0*>.

Severity
30: Severe error

Explanation
An error occurred while starting this application.

Response
Check that the WebSphere MQ runtime libraries are available.

Check that the PATH system environment variable includes the directory for these runtime libraries.)

AMQ4807
The message size specified (<*insert_0*>) is outside the permitted range.

Severity
10: Warning

Response
Specify a value of 1000 to 100 000 000.

AMQ4808
Unknown <*insert_0*> <*insert_1*>.

Severity
10: Warning

Explanation
The named entity for the particular type is not defined on the system.

Response
Make sure the entity is defined and it matches the type of entity.

AMQ4809
You are about to delete the authority for <*insert_0*> to <*insert_1*>. Are you sure that you want to continue?

Severity
10: Warning

Explanation
You must confirm that you want to delete the specified authority. The entity name and object name are provided in the message.

Response
Continue only if you want to permanently delete the authority.

AMQ4810
The authority for <*insert_0*> to <*insert_1*> was deleted successfully.

Severity
0: Information

Response
Message for information only.

AMQ4811
The authority was created successfully.

Severity
0: Information

Response
Message for information only.

AMQ4812
You are about to delete all create authorities for <*insert_0*>. Are you sure that you want to continue?

Severity
10: Warning

Explanation
You must confirm that you want to delete the specified authority. The entity name is provided in the message.

Response
Continue only if you want to permanently delete the authority.

AMQ4813
You are about to refresh SSL security for <*insert_0*>. This might affect the running status of active channels. Are you sure that you want to continue?

Severity
10: Warning

Explanation
A confirmation is required before the refresh command is issued. Certain active channel types might be stopped as a result of this command. The queue manager name is provided in the message.

Response
Continue only if you want to refresh SSL security.

AMQ4814
The command server is not allowing security requests.

Severity
10: Warning

Explanation
The command server has been started with the "-a" option which blocks security related PCFs.

Response
Restart the command server without using the "-a" option.

AMQ4815
You are about to add authority for a non-generic profile name <*insert_0*>. Are you sure that you want to continue?

Severity
10: Warning

Explanation
You chose to add authorities for a generic profile name, but entered the name for a specific profile.

Response
Continue if you want to add authority for a specific profile name.

AMQ4816
The list of authorizations held internally by the authorization services component will be refreshed. Are you sure that you want to continue?

Severity
10: Warning

Explanation
A confirmation is required before the refresh command is issued.

Response
Continue only if you want to refresh authorization service component security.

AMQ4817
The in-storage profiles for the requested resources will be refreshed. Are you sure that you want to continue?

Severity
10: Warning

Explanation
A confirmation is required before the refresh command is issued to the WebSphere MQ in-storage ESM (External Security Manager).

Response
Continue only if you want to refresh the ESM.

AMQ4818
No authority records were found.

Severity
10: Warning

Explanation
There are no authority records matching the specific request.

Response
Change the entity or profile name and try again.

AMQ4819
Unable to write to file <*insert_0*>.

Severity
10: Warning

Explanation
You do not have write access to the file name.

Response
Check that your userid has write access to the file name.

AMQ4820
A file called <*insert_0*> already exists. Do you want to replace this file?

Severity
0: Information

Response
Confirm that you want to replace the file.

AMQ4821
This action replaces an existing authority record. Are you sure that you want to continue?

Severity
0: Information

Explanation
An explicit authority record already exists for this entity. Creating a new authority record replaces the existing authority record.

Response
Continue only if you want replace the existing authority record.

AMQ4822
You must enter a specific profile name when using an entity name.

Severity
0: Information

Response
Enter a specific profile name.

AMQ4823
Profile <*insert_0*> does not exist.

Severity
0: Information

Explanation
The profile name entered by the user does not exist for the type of object.

Response
Change the name of the profile or use the select button and try again.

AMQ4824
Invalid profile name <*insert_0*>.

Severity
0: Information

Explanation
The generic profile name entered by the user is not allowed.

Response
Change the name of the profile to match the supported wildcard characters and try again.

AMQ4825
The security exit class <*insert_0*> is invalid or cannot be found.

Severity
10: Warning

Response
Ensure that the security exit class is available and that it implements the com.ibm.mq.MQSecurityExit interface.

AMQ4826
There is a security profile case conflict.

Severity
10: Warning

Explanation
The security profile case attribute of the queue manager is different from that issued on the refresh command.

Response
Change the security profile case attribute of the queue manager or of the class specified on the refresh command.

AMQ4830
You are about to add authority for a generic profile name "<*insert_0*>". Are you sure that you want to continue?

Severity
10: Warning

Explanation
You chose to add authorities for a specific profile name, but entered the name for a generic profile.

Response
Continue if you want to add authority for a generic profile name.

AMQ4850
Further tests cannot be run because the WebSphere MQ Explorer Test Plug-in is currently in use.

Severity
10: Warning

Explanation
You must either cancel these tests or wait for them to complete before initiating further tests.

Response
Either stop the current tests using the progress view, or wait until the current tests are completed.

AMQ4851
There are no tests available to run.

Severity
0: Information

Explanation
The configuration used to launch these tests has no tests selected, this could be because no tests are selected, or there are no appropriate tests available.

Response
Try a difference configuration which has tests enabled, or try testing from a different point to ensure that there are appropriate tests available.

AMQ4852
WebSphere MQ Explorer Test Plug-in initialization error.

Severity
20: Error

Explanation
An error has occurred during initialization of the a Tests Plug-in. This might cause problems with running tests.

Response
Examine the problem determination information to see if any details have been recorded.

AMQ4853
The test cannot be disabled because no configurations currently have this test enabled.

Severity
0: Information

Response
No further action is required; the test is already disabled.

AMQ4854
Finished running <*insert_0*> tests.

Severity
0: Information

Explanation
The requested test run is complete, and the number of tests specified have been run. This message can be disabled from the Tests plug-in preferences.

Response
No further action is required; the test run has finished

AMQ4855
The test run was canceled.

Severity
0: Information

Explanation
The requested test run was canceled as the result of a user request. This message can be disabled from the Tests plug-in preferences.

Response
Message for information only.

AMQ4856
Are you sure that you want to clear the subscription named <*insert_0*>?

For a managed destination, messages already queued to the destination will be deleted.

Severity
10: Warning

Explanation
A confirmation is required before the subscription is cleared.

Response
Continue only if you want to clear the subscription.

AMQ4857
The Subscription was cleared.

Severity
0: Information

Explanation
The subscription was cleared to a well defined state. For a managed destination any messages already queued to the destination were deleted.

Response
Message for information only.

AMQ4858
A parameter change has been detected.

Severity
0: Information

Explanation
A parameter has been changed without using the WebSphere MQ Explorer.

Response
Refresh the WebSphere MQ Explorer view and try the operation again.

AMQ4859
The requested function is not available.

Severity
0: Information

Explanation
WebSphere MQ Explorer was not able to carry out the function requested.

Response
Try again. If symptoms persist contact your System Administrator.

AMQ4860
The queue manager is running in standby mode.

Severity
0: Information

Explanation
The queue manager has been started in standby mode.

AMQ4861
WebSphere MQ cannot stop the listener because the listener is already stopped.

Severity
10: Warning

AMQ4862
The default remote administration listener LISTENER.TCP could not be deleted.

Severity
10: Warning

Explanation
A problem has occurred trying to delete the listener.

Response
Check that the listener has been stopped or that it has not already been deleted.

AMQ4863
The property <*insert_0*> has not been prefixed correctly.

Severity
20: Error

Explanation
Service definition destination names must be prefixed with 'msg/queue/' for queues, or 'msg/topic/' for topics.

Response
Prefix the destination name with the relevant prefix.

AMQ4864
The property <*insert_0*> is not the correct length.

Severity
20: Error

Explanation
Queue names cannot exceed 48 characters.

Response
Check that the name of the queue is correct.

AMQ4865
The property <*insert_0*> does not contain a destination name.

Severity
20: Error

Explanation
The value entered does not include the name of a destination.

Response
Enter the name of a valid destination. Service definition destination names must be prefixed with 'msg/queue/' for queues, or 'msg/topic/' for topics.

AMQ4866
The property <*insert_0*> is not a valid URI format.

Severity
20: Error

Explanation
Only valid URIs can be specified for this property.

Response
Check that the value entered is in a valid URI syntax.

AMQ4867
The property <*insert_0*> on page <*insert_1*> is not a valid URI format.

Severity
20: Error

Explanation
Only valid URIs can be specified for this property.

Response
Check that the value entered is in a valid URI syntax.

AMQ4868
An unexpected error has occurred.

Severity
20: Error

Explanation
An unexpected error has occurred.

Response
Contact your system administrator.

AMQ4869
The export location <*insert_0*> already exists. Do you want to overwrite the existing files?

Severity
10: Warning

Explanation
The export location already exists. If you continue, existing files may be overwritten.

Response
Confirm that you want you overwrite files at the chosen export location.

AMQ4870
Could not establish a connection to the queue manager. Channel not available.

Severity
10: Warning

Explanation
The attempt to connect to the queue manager failed. See reason code MQRC_CHANNEL_NOT_AVAILABLE for more information.

Response
Examine the queue manager and client error logs for messages explaining the cause of the problem.

AMQ4871
Could not establish a connection to the queue manager. Channel name not recognized.

Severity
10: Warning

Explanation
The attempt to connect to the queue manager failed. The queue manager did not recognize the channel name.

Response
Use a different channel name and try again.

AMQ4999
An unexpected error (<*insert_0*>) has occurred.

Severity
10: Warning

Explanation
An unlisted error has occurred in the system while retrieving PCF data.

Response
Try the operation again. If the error persists, examine the problem determination information to see if any details have been recorded.

AMQ5000-5999: Installable services

AMQ5005
Unexpected error

Severity
20 : Error

Explanation
An unexpected error occurred in an internal function of the product.

Response
Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5006
Unexpected error: rc = <*insert_1*>

Severity
20 : Error

Explanation
An unexpected error occurred in an internal function of the product.

Response
Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5008
An essential IBM WebSphere MQ process <*insert_1*> (<*insert_3*>) cannot be found and is assumed to be terminated.

Severity
40 : Stop Error

Explanation
1) A user has inadvertently terminated the process. 2) The system is low on resources. Some operating systems terminate processes to free resources. If your system is low on resources, it is possible it has terminated the process so that a new process can be created.

Response
IBM WebSphere MQ will stop all MQ processes. Inform your systems administrator. When the problem is rectified IBM WebSphere MQ can be restarted.

AMQ5009
IBM WebSphere MQ agent process <*insert_1*> has terminated unexpectedly.

Severity
40 : Stop Error

Explanation
IBM WebSphere MQ has detected that an agent process has terminated unexpectedly. The queue manager connection(s) that this process is responsible for will be broken.

Response
Try to eliminate the following reasons before taking any further action:

1) A user has inadvertently terminated the process.

2) The system is low on resources. Some operating systems terminate processes to free resources. If your system is low on resources, it is possible that the operating system has terminated the process so that a new process can be created. If you believe the problem is not a result of the above reasons, save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at

http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5010
The system is restarting the WorkLoad Management Server process.

Severity
10 : Warning

Explanation
The system has detected that the WorkLoad Management server process (amqzlwa0, pid:<*insert_1*>) has stopped and is restarting it.

Response
Save the generated output files which may indicate the reason why the WorkLoad Management process stopped. If the reason the WorkLoad Management Server process stopped is a problem in a WorkLoad Management user exit, correct the problem, otherwise use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5011
The Queue Manager ended for reason <*insert_1*> <*insert_3*>

Severity
10 : Warning

Explanation
The Queue Manager ended because of a previous error <*insert_1*> or <*insert_3*>

Response
This message should be preceded by a message or FFST information from the internal routine that detected the error. Take the action associated with the earlier error information.

AMQ5019
Unable to access program <*insert_3*>.

Severity
40 : Stop Error

Explanation
A request was made to execute the program <*insert_3*>, however the operation was unsuccessful because the program could not be found in the specified location.

Response
Check the definition of the service specifies the correct and full path to the program to run. If the path is correct then verify that the program exists in the specified location and that WebSphere MQ userid has permission to access it.

AMQ5020
Permission denied attempting to execute program <*insert_3*>.

Severity
40 : Stop Error

Explanation
A request was made to execute the program <*insert_3*>, however the operation was unsuccessful because the IBM WebSphere MQ operating environment has insufficient permissions to access the program file.

Response
Check the access permissions of the of the program to be executed and if necessary alter them to

include execute permission for the IBM WebSphere MQ userId. Also check that the IBM WebSphere MQ userId has search access on all directories which compose the path to the program file.

AMQ5021
Unable to start program <*insert_3*>.

Severity
40 : Stop Error

Explanation
A request was made to execute the program <*insert_3*> however the operation was unsuccessful. Reasons for the failure may include

a shortage of available system resources

a problem with the program to be started

Response
If the problem persists then the IBM WebSphere MQ error logs should be consulted for further information related to this error. The Operating System error recording facilities should also be consulted for information relating to shortage of system resources.

AMQ5022
The Channel Initiator has started. ProcessId(<*insert_1*>).

Severity
0 : Information

Explanation
The Channel Initiator process has started.

Response
None.

AMQ5023
The Channel Initiator has ended. ProcessId(<*insert_1*>).

Severity
0 : Information

Explanation
The Channel Initiator process has ended.

Response
None.

AMQ5024
The Command Server has started. ProcessId(<*insert_1*>).

Severity
0 : Information

Explanation
The Command Server process has started.

Response
None.

AMQ5025
The Command Server has ended. ProcessId(<*insert_1*>).

Severity
0 : Information

Explanation
The Command Server process has ended.

Response
None.

AMQ5026
The Listener <*insert_3*> has started. ProcessId(<*insert_1*>).

Severity
0 : Information

Explanation
The Listener process has started.

Response
None.

AMQ5027
The Listener <*insert_3*> has ended. ProcessId(<*insert_1*>).

Severity
0 : Information

Explanation
The Listener process has ended.

Response
None.

AMQ5028
The Server <*insert_3*> has started. ProcessId(<*insert_1*>).

Severity
0 : Information

Explanation
The Server process has started.

Response
None.

AMQ5029
The Server <*insert_3*> has ended. ProcessId(<*insert_1*>).

Severity
0 : Information

Explanation
The Server process has ended.

Response
None.

AMQ5030
The Command <*insert_3*> has started. ProcessId(<*insert_1*>).

Severity
0 : Information

Explanation
The Command has started.

Response
None.

AMQ5032
Error (<*insert_4*>) accessing file <*insert_3*>.

Severity
40 : Stop Error

Explanation
While attempting to access the file <*insert_3*> the error <*insert_4*> occurred.

Response
Use the information contained in the error to locate and correct the cause of the failure.

AMQ5036
Error detected processing line <*insert_1*>, position <*insert_2*> in service environment file.

Severity
40 : Stop Error

Explanation
While processing the environment file <*insert_3*> an error was detected on line <*insert_1*> at position <*insert_2*>. Possible causes are

Variable name too long

Variable value too long

Incorrectly formed line. Lines must be in the format <name>=<value>. There should be no blank characters in name field. All characters following the '=' are part of the value field.

Response
This error will not stop the command from executing but any data on the invalid line is not processed.

AMQ5037
The Queue Manager task <*insert_3*> has started.

Severity
0 : Information

Explanation
The <*insert_4*> Utility Task Manager, processId(<*insert_1*>), has started the <*insert_3*> task. This task has now started <*insert_2*> times.

Response
None.

AMQ5038
The Queue Manager task <*insert_3*> failed to start with error-code <*insert_1*>.

Severity
40 : Stop Error

Explanation
The Utility Task Manager, attempted to start the task <*insert_3*> but the start request failed with error code <*insert_1*>.

Response
The failure to start the identified task may not be critical to queue-manager operation however all of the queue manager functionality may not be available. Further details of the failure are available in IBM WebSphere MQ error logs.

AMQ5041
The Queue Manager task <*insert_3*> has ended.

Severity
0 : Information

Explanation
The Queue Manager task <*insert_3*> has ended.

Response
None.

AMQ5042
Request to start <*insert_3*> failed.

Severity
40 : Stop Error

Explanation
The request to start the process <*insert_3*> failed.

Response
Consult the Queue Manager error logs for further details on the cause of the failure.

AMQ5043
Statistics recording is unavailable due to error code <*insert_1*>.

Severity
40 : Stop Error

Explanation
The statistics collection task was unable to start due the error code <*insert_1*>. Statistics collection will be unavailable until the problem is rectified and the Queue Manager is restarted.

Response
Consult the Queue Manager error logs for further details on the cause of the failure.

AMQ5044
<*insert_3*> task operation restricted due to Reason Code <*insert_1*>.

Severity
10 : Warning

Explanation
The <*insert_3*> task encountered a non-fatal error which may effect the operation of the task.

Response
Using the Reason Code <*insert_1*> and any previous messages recorded in the Error Logs correct the error. It may be necessary to restart the Queue Manager in order remove the restriction caused by the failure.

AMQ5045
System reconfiguration event received

Severity
0 : Information

Explanation
The Queue Manager received a system re-configuration event. This is likely to have been caused by an administrative change in the configuration of the machine (for example dynamically adding or removing resources such as memory or processors).

Response
No action is required unless this notification was unexpected.

AMQ5046
Automatic unmarking of messages is unavailable due to error code <*insert_1*>.

Severity
40 : Stop Error

Explanation
An error was encountered by the task that unmarks messages which have been marked for cooperative browse but have not been destructively got within the timeout period. The error code was <*insert_1*>. Automatic unmarking of messages will be unavailable until the problem is rectified and the queue manager is restarted.

Response
Consult the queue manager error logs for further details on the cause of the failure.

AMQ5049
The Queued Pubsub Daemon cannot be started/stopped due to error code <*insert_1*>.

Severity
40 : Stop Error

Explanation
An error was encountered by the task that starts and stops the queued pubsub daemon. The error code was <*insert_1*>. The daemon will be unable to be started or stopped until the problem is rectified and the queue manager is restarted.

Response
Consult the queue manager error logs for further details on the cause of the failure.

AMQ5050
An essential WebSphere MQ process <*insert_1*> *(*<*insert_3*>*)* cannot be found and is assumed to be terminated.

Severity
40 : Stop Error

Explanation
1) A user has inadvertently terminated the process. 2) The system is low on resources. Some operating systems terminate processes to free resources. If your system is low on resources, it is possible it has terminated the process so that a new process can be created. 3) MQ has encountered an unexpected error. Check for possible errors reported in the MQ error logs and for any FFSTs that have been generated.

Response
WebSphere MQ will attempt to restart the terminated process.

AMQ5051
The queue manager task <*insert_3*> has started.

Severity
0 : Information

Explanation
The critical utility task manager has started the <*insert_3*> task. This task has now started <*insert_2*> times.

Response
None.

AMQ5052
The queue manager task <*insert_3*> has started.

Severity
0 : Information

Explanation
The publish/subscribe utility task manager has started the <*insert_3*> task. This task has now started <*insert_2*> times.

Response
None.

AMQ5053
WebSphere MQ process <*insert_1*> (<*insert_3*>) cannot be found and is assumed to be terminated.

Severity
10 : Warning

Explanation
A queue manager process has terminated, the queue manager will continue to run but the functionality of the queue manager may be limited until the problem is resolved. Possible reasons for the termination are: 1) A user has inadvertently terminated the process. 2) The system is low on resources. Some operating systems terminate processes to free resources. 3) The process encountered an error.

Response
Check for earlier messages in the queue manager and system error logs that may indicate the problem. When the problem is rectified the queue manager will need to be restarted to restore the lost functionality.

AMQ5203
An error occurred calling the XA interface.

Severity
0 : Information

Explanation
The error number is <*insert_2*> where a value of

1 indicates the supplied flags value of <*insert_1*> was invalid,

2 indicates that there was an attempt to use threaded and non-threaded libraries in the same process,

3 indicates that there was an error with the supplied queue manager name <*insert_3*>,

4 indicates that the resource manager id of <*insert_1*> was invalid,

5 indicates that an attempt was made to use a second queue manager called <*insert_3*> when another queue manager was already connected,

6 indicates that the Transaction Manager has been called when the application is not connected to a queue manager,

7 indicates that the XA call was made while another call was in progress,

8 indicates that the xa_info string <*insert_3*> in the xa_open call contained an invalid parameter value for parameter name <*insert_4*>,

9 indicates that the xa_info string <*insert_3*> in the xa_open call is missing a required parameter, parameter name <*insert_4*>, and

10 indicates that MQ was called in dynamic registration mode but cannot find the ax_reg and ax_unreg functions ! Either call MQ in non-dynamic registration mode or supply the correct library name via the AXLIB parameter in the xa_open string.

Response
Correct the error and try the operation again.

AMQ5204
A non-threaded application tried to run as a Trusted application.

Severity
10 : Warning

Explanation
Only applications linked with the threaded MQ libraries can run as Trusted applications.

Response
Make sure that the application is relinked with the threaded MQ libraries, or set the environment variable MQ_CONNECT_TYPE to STANDARD.

AMQ5205
File or directory <*insert_3*> not owned by user <*insert_4*>.

Severity
10 : Warning

Explanation
IBM WebSphere MQ has detected that the file or directory <*insert_3*> is not owned by the user <*insert_4*>. This is not necessarily an error but you should investigate further if this is unexpected.

Response

If this is unexpected then you should alter the ownership of the file or directory back to the user <*insert_4*>.

If this is expected, then IBM WebSphere MQ will continue however WebSphere MQ will be unable to verify the security of this file or directory. If the access permissions are too strict then you may encounter problems if IBM WebSphere MQ cannot access the contents of the file or directory. If the access permissions are too relaxed then there may be an increased risk to the security of the IBM WebSphere MQ system.

AMQ5206
Duplicate parameters detected.

Severity
10 : Warning

Explanation
IBM WebSphere MQ has detected that the activity about to be displayed contains two or more parameters in the same group with the same parameter identifier. The activity may be displayed incorrectly.

Response
Inform the author of the activity that there may be an error in it.

AMQ5211
Maximum property name length exceeded.

Severity
10 : Warning

Explanation
IBM WebSphere MQ was in the process of parsing an MQRFH2 folder that is known to contain message properties. However, one of the elements in folder <*insert_3*> has a name which is longer than MQ_MAX_PROPERTY_NAME_LENGTH. The element name begins <*insert_4*>. The name of the parsed message property will be limited to the maximum number of characters which may cause inquiry of that property or selection of the message to fail.

Response
Reduce the size of the MQRFH2 element name or move the element into a folder which does not contain properties.

AMQ5358
IBM WebSphere MQ could not load AX support module <*insert_3*>.

Severity
20 : Error

Explanation
An error has occurred loading the AX support module <*insert_3*>. This module needs to be loaded so that dynamically-registering resource managers, such as Db2, can participate in global units of work.

Response
Look for a previous message outlining the reason for the load failure. Message AMQ6175 should have been issued if the load failed because of a system error. If this is the case then follow the guidance given in message AMQ6175 to resolve the problem. In the absence of prior messages or FFST information related to this problem check that the AX support module and the mqmax library have been correctly installed on your system.

AMQ5370
IBM WebSphere MQ client for HP Integrity NonStop Server (<*insert_1*>) enlisting with wrong TMF/Gateway.

Severity
10 : Warning

Explanation
A IBM WebSphere MQ client for HP Integrity NonStop Server, process (<*insert_1*>), connected to <*insert_3*> has incorrectly attempted to enlist with TMF/Gateway connected to <*insert_4*>.

Response
The configuration for the IBM WebSphere MQ client for HP Integrity NonStop Server is incorrect. Ensure the mqclient.ini TMF and TMFGateway stanza have been correctly configured to match the correct TMF/Gateway instances for the queue managers being used.

AMQ5371
TMF/Gateway shutting down due to TMF operator closing RM file <*insert_3*>.

Severity
20 : Error

Explanation
The TMF/Gateway is shutting down due to the TMF operator closing RM file <*insert_3*>.

Response
Contact the TMF administrator to determine why the RM file has been closed.

AMQ5372
TMF has shutdown.

Severity
10 : Warning

Explanation
TMF has shutdown. The TMF/Gateway for queue manager <*insert_3*> will reset and wait for TMF to become available before restarting operation.

Response
Contact the TMF administrator to determine why TMF has been shutdown.

AMQ5373
TMF not configured.

Severity
20 : Error

Explanation

The TMF/Gateway for queue manager <*insert_3*>is unable to start due to the TMF subsystem not being configured.

Response

Contact the TMF administrator to ensure the TMF subsystem is configured.

AMQ5374

TMF/Gateway not authorized to access RM file.

Severity

20 : Error

Explanation

The TMF/Gateway for queue manager <*insert_3*>is not authorized to access TMF RM file.

Response

There is an existing RM file <*insert_4*> within TMF, associated with a different owner from that specified for the TMF/Gateway server class for queue manager <*insert_3*> within Pathway.

Ensure the TMF/Gateway server class within Pathway is configured with the same owner as the existing TMF RM file.

AMQ5375

TMF/Gateway for queue manager <*insert_3*> has encountered a TMF resource error <*insert_1*>.

Severity

20 : Error

Explanation

The TMF/Gateway for queue manager <*insert_3*> has encountered a TMF resource error <*insert_1*>.

Response

These errors are typically as a result of reaching configured resource limits within the TMF subsystem. Refer to the HP NonStop Guardian Procedure Errors and Messages Manual for the appropriate corrective action based on the error <*insert_1*>.

AMQ5376

IBM WebSphere MQ

Severity

0 : Information

Explanation

Queue manager <*insert_3*> is unavailable for communication with the TMF/Gateway.

Response

Ensure that the queue manager has been started. The TMF/Gateway uses a client channel connection so additional channel definition and channel status checks might be required.

The TMF/Gateway will periodically attempt to reestablish communication with the queue manager.

If the queue manager continues to remain unavailable, this message will be reissued at regular intervals.

AMQ5377

The TMF/Gateway is not authorized to connect to queue manager <*insert_3*>.

Severity

20 : Error

Explanation
The TMF/Gateway is not authorized to connect to queue manager <*insert_3*>.

Response
Ensure the TMF/Gateway has been configured to use the correct queue manager and that queue manager has granted appropriate authority for the owner of the TMF/Gateway.

AMQ5378
Participation in TMF transactions is not support by queue manager <*insert_3*>.

Severity
20 : Error

Explanation
TMF/Gateway has detected WebSphere MQ for z/OS queue manager <*insert_3*> does not support participation in TMF transactions.

Response
The version of z/OS queue manager that you are connecting to does not support the TMF Gateway, please upgrade to a supported release.

AMQ5379
TMF/Gateway started with missing or invalid parameters

Severity
0 : Information

Explanation
Usage: runmqtmf -m QMgrName [-c ChannelName] [-h HostName] [-p Port] [-n MaxThreads] where:

-m is the name of the queue manager for this Gateway process. If you are using a queue sharing group (or other port distribution technology), this parameter must be targeted to a specific queue manager. This parameter is mandatory.

-c is the name of the server channel on the queue manager to be used by this gateway process. This parameter is optional.

-p is the TCP/IP port for the queue manager. This parameter is optional.

-h is the host name of the queue manager. This parameter is optional.

-n is the maximum number of worker threads that are created by the Gateway process. This parameter can be a value of 10 or greater. This parameter is optional. If no value is provided, the Gateway process creates up to a maximum of 50 threads.

If you specify one or more, but not all of the -c, -p, and -h attributes, then those attributes that you do not specify default to the following values:

ChannelName defaults to SYSTEM.DEF.SVRCONN

HostName defaults to localhost

Port defaults to 1414

Response
Ensure the TMF/Gateway is started with only valid parameters.

AMQ5380
A single TMF/Gateway process must be configured with TMF for each queue manager that is to participate in TMF coordinated units of work.

Severity
20 : Error

Explanation
None.

Response
Use the TMFCOM **STATUS RESOURCEMANAGER** command to identify the process that is already using RM-file <*insert_4*>.

If you are using multiple installations, you must nominate a single Gateway process from one of these installation to coordinate queue manager <*insert_3*>. The interface to the Gateway process supports any client at the same version or earlier. Ensure the TMF/Gateway server class definition within pathway for queue manager <*insert_3*> has been configured with MAXSERVER set to 1.

AMQ5390
Invalid process name <*insert_3*> provided in the MQTMF_GATEWAY_NAME environment variable for the TMF/Gateway for queue manager <*insert_4*>.

Severity
20 : Error

Explanation
Invalid process name <*insert_3*> provided in the MQTMF_GATEWAY_NAME environment variable for the TMF/Gateway for queue manager <*insert_4*>.

Response
Ensure the TMF/Gateway is running and the MQTMF_GATEWAY_NAME environment variable is correctly set to the Guardian process name of the TMF/Gateway.

AMQ5391
No PATHMON process name provided in the mqclient.ini for the TMF/Gateway for queue manager <*insert_3*>.

Severity
20 : Error

Explanation
None.

Response

Ensure an mqclient.ini file is available for use by the IBM WebSphere MQ client for HP Integrity NonStop Server and that it contains a TMFGateway stanza providing the server class name to be used for queue manager <*insert_3*>.

Refer to the IBM WebSphere MQ product documentation for further information about using an mqclient.ini file with the IBM WebSphere MQ client for HP Integrity NonStop Server system.

AMQ5392
No server class name provided in the mqclient.ini for the TMF/Gateway for queue manager <*insert_3*>.

Severity
20 : Error

Explanation
None.

Response

Ensure an mqclient.ini file is available containing a TMF stanza providing the Guardian process name of a PATHCOM that is hosting a TMF/Gateway server class for queue manager <*insert_3*>.

The mqclient.ini file also requires a TMFGateway stanza providing the server class name to be used for queue manager <*insert_3*>.

Refer to the IBM WebSphere MQ product documentation for further information about using an mqclient.ini file.

AMQ5393
The TMF/Gateway for queue manager <*insert_3*> is unable to process the request, return code (<*insert_1*>:<*insert_3*>).

Severity
20 : Error

Explanation
None.

Response
Check the TMF/Gateway error logs for further details.

AMQ5394
The TMF/Gateway for queue manager <*insert_3*> has successfully processed the request.

Severity
0 : Information

Explanation
None.

Response
None.

AMQ5395
Unable to locate server class <*insert_4*> hosted by PATHMON process <*insert_3*>.

Severity
20 : Error

Explanation
None.

Response

The configuration error may be one of the following:

1. The mqclient.ini TMFGateway stanza contains an invalid server class name for queue manager <*insert_5*>.
2. The PATHMON process <*insert_3*> has not been configured with server class <*insert_4*>.
3. Server class <*insert_4*> has not been started or is currently frozen.

AMQ5396
Unable to locate PATHMON process <*insert_3*>.

Severity
20 : Error

Explanation
None.

Response

The configuration error may be one of the following:

1. The mqclient.ini TMF stanza contains an invalid process name.
2. The PATHMON process <*insert_3*> is not currently running.

AMQ5397
Not authorized to use server class <*insert_4*> hosted by PATHMON process <*insert_3*>

Severity
20 : Error

Explanation
None.

Response
Check with your systems administrator to ensure you have the correct access permissions. When confirmed you have the correct access permissions, retry the operation.

AMQ5398
Error encountered while establishing contact with the TMF/Gateway server class <*insert_4*> hosted by PATHMON process <*insert_3*>. Pathsend error (<*insert_1*>), file system error (<*insert_2*>).

Severity
20 : Error

Explanation
None.

Response
These errors are typically the result of configuration problems with the PATHMON process <*insert_3*> or the server class <*insert_4*>. Refer to the HP NonStop TS/MP Pathsend and Server Programming Manual for the appropriate corrective action based on the pathsend error (<*insert_1*>) and file system error (<*insert_2*>).

AMQ5399
The TMF/Gateway server class <*insert_4*> hosted by PATHMON process <*insert_3*> has not be configured appropriately.

Severity
20 : Error

Explanation
None.

Response

The configuration error may be one of the following:

1. The server class has not been configured with TMF enabled.
2. The server class has been configured with MAXLINKS set too low for the number of IBM WebSphere MQ client for HP Integrity NonStop Server applications needing to concurrently enlist with the TMF/Gateway.

AMQ5501
There was not enough storage to satisfy the request

Severity
20 : Error

Explanation
An internal function of the product attempted to obtain storage, but there was none available.

Response
Stop the product and restart it. If this does not resolve the problem, save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5502
The CDS directory name <*insert_3*> is not in the correct format.

Severity
20 : Error

Explanation

An internal function of the DCE Naming service found a CDS directory name in the wrong format. The name was expected to start with either '/...' for a fully qualified name (from global root), or '/.:' for a partially qualified name (from local cell root).

Response

Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5503

The name of the local DCE cell cannot be determined, status = <*insert_1*>

Severity

20 : Error

Explanation

The DCE Naming Service attempted to determine the name of the local DCE cell by calling 'dce_cf_get_cell_name()', which returned a nonzero return code.

Response

Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5504

DCE error. No value for the XDS attribute found.

Severity

20 : Error

Explanation

The DCE Naming service called om_get() to get the entry from the object returned by ds_read(). Although the status was correct, no objects were returned.

Response

Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5505

DCE error. No value for the XDS attribute number <*insert_1*> found.

Severity

20 : Error

Explanation

The DCE Naming service called om_get() to get the entry from the object returned by ds_read(). Although the status was correct, no objects were returned.

Response

Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5506

DCE error. <*insert_3*> returned <*insert_1*> for attribute number <*insert_2*>.

Severity
20 : Error

Explanation
The DCE Naming service queried an object by calling <*insert_3*> which returned a nonzero return code.

Response
Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5507
DCE error. <*insert_3*> failed for an unknown reason.

Severity
20 : Error

Explanation
An unexpected error occurred in an internal function of the DCE Naming service.

Response
Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5508
DCE error. The requested attribute is not present.

Severity
20 : Error

Explanation
The DCE Naming service was attempting to extract the value from an attribute, but the attribute cannot be found in the XDS object.

Response
Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5509
DCE error. The XDS workspace cannot be initialized.

Severity
20 : Error

Explanation
The DCE Naming service called 'ds_initialize()' to initialize the XDS workspace, but 'ds_initialize()' returned a nonzero return code.

Response
Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5510
DCE error. <*insert_3*> returned with problem <*insert_1*>.

Severity
20 : Error

Explanation
The DCE Naming service found an unexpected XDS error.

Response
Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5511
Installable service component <*insert_3*> returned <*insert_4*>.

Severity
20 : Error

Explanation
The internal function, that adds a component to a service, called the component initialization process. This process returned an error.

Response
Check the component was installed correctly. If it was, and the component was supplied by IBM, then save the generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. If the component was not supplied by IBM, save the generated output files and follow the support procedure for that component.

AMQ5511 (IBM i)
An installable service component returned an error.

Severity
20 : Error

Explanation
Installable service component <*insert_3*> returned <*insert_4*>. The internal function, that adds a component to a service, called the component initialization process. This process returned an error.

Response
Check the component was installed correctly. If it was, and the component was supplied by IBM, then save the generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. If the component was not supplied by IBM, save the generated output files and follow the support procedure for that component.

AMQ5512
Installable service component <*insert_3*> returned <*insert_4*> for queue manager name = <*insert_5*>.

Severity
20 : Error

Explanation
An installable service component returned an unexpected return code.

Response
Check the component was installed correctly. If it was, and the component was supplied by IBM,

then save the generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. If the component was not supplied by IBM, save the generated output files and follow the support procedure for that component.

AMQ5512 (IBM i)
An installable service component returned an unexpected return code.

Severity
20 : Error

Explanation
Installable service component <*insert_3*> returned <*insert_4*> for queue manager name = <*insert_5*>.

Response
Check the component was installed correctly. If it was, and the component was supplied by IBM, then save the generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. If the component was not supplied by IBM, save the generated output files and follow the support procedure for that component.

AMQ5513
<*insert_3*> returned <*insert_1*>.

Severity
20 : Error

Explanation
An unexpected error occurred.

Response
Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5519
Bad DCE identity. Status = <*insert_1*>, auth = <*insert_2*>, keytab file = <*insert_3*>, principal = <*insert_4*>.

Severity
20 : Error

Explanation
The keytab file was not installed correctly, or the WebSphere MQ user ID has a different password from that used to create the keytab file.

Response
Make sure that the MQ user ID defined when the product was installed has the same password as that defined by the keytab file, and that the keytab file has been installed correctly.

AMQ5519 (IBM i)
Bad DCE identity.

Severity
20 : Error

Explanation

Status = <*insert_1*>, auth = <*insert_2*>, keytab file = <*insert_3*>, principal = <*insert_4*>. The keytab file was not installed correctly, or the IBM WebSphere MQ user ID has a different password from that used to create the keytab file.

Response

Make sure that the MQ user ID defined when the product was installed has the same password as that defined by the keytab file, and that the keytab file has been installed correctly.

AMQ5520

The system could not load the module <*insert_5*> for the installable service <*insert_3*> component <*insert_4*>. The system return code was <*insert_1*>. The Queue Manager is continuing without this component.

Severity

10 : Warning

Explanation

The queue manager configuration data included a stanza for the installable service <*insert_3*> component <*insert_4*> with the module <*insert_5*>. The system returned <*insert_1*> when it tried to load this module. The Queue Manager is continuing without this component.

Response

Make sure that the module can be loaded. Put the module into a directory where the system can load it, and specify its full path and name in the configuration data . Then stop and restart the queue manager.

AMQ5520 (IBM i)

The system could not load a module. The Queue Manager is continuing without this component.

Severity

10 : Warning

Explanation

The queue manager configuration data included a stanza for the installable service <*insert_3*> component <*insert_4*> with the module <*insert_5*>. The system returned <*insert_1*> when it tried to load this module. The Queue Manager is continuing without this component.

Response

Make sure that the module can be loaded. Put the module into a directory where the system can load it, and specify its full path and name in the configuration data . Then stop and restart the queue manager.

AMQ5521

The system could not open "<*insert_3*>".

Severity

10 : Warning

Explanation

The system failed to open the default object "<*insert_3*>" at connect time for reason <*insert_4*>. This may be because "<*insert_3*>" has been deleted or changed.

Response

re-create the default objects by running "strmqm -c <qmgr>" (where <qmgr> is the name of the queue manager) and retry the application.

AMQ5522

A IBM WebSphere MQ installable service component could not be initialized.

Severity

20 : Error

Explanation
An installable service component returned an unexpected return code.

Response
Check the queue manager error logs for messages explaining which installable service could not be initialized and why that service could not be initialized. Check the component was installed correctly. If it was, and the component was supplied by IBM, then save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. If the component was not supplied by IBM, save the generated output files and follow the support procedure for that component.

AMQ5524
The IBM WebSphere MQ Object Authority Manager has failed to migrate authority data.

Severity
20 : Error

Explanation
The object authority manager has attempted to migrate existing queue manager authority data from a previous version of an object authority manager and failed.

Response
Check this log for any previous related messages, follow their recommendations then restart the queue manager.

AMQ5525
The IBM WebSphere MQ Object Authority Manager has failed.

Severity
20 : Error

Explanation
The object authority manager has failed to complete an MQ request.

Response
Check the queue manager error logs for messages explaining the failure and try to correct the problem accordingly.

AMQ5526
The IBM WebSphere MQ Object Authority Manager has failed with reason <*insert_1*>

Severity
20 : Error

Explanation
The object authority manager has failed an operation on the object authority manager's data queue <*insert_3*> with reason <*insert_1*>.

Response
Investigate why the error has occurred and correct the problem.

AMQ5527
The IBM WebSphere MQ Object Authority Manager has failed to locate an essential authority file

Severity
20 : Error

Explanation
The object authority manager has failed to locate the authority file <*insert_3*>. The migration of authority data cannot continue until the file has been restored. The queue manager will shutdown.

Response
Restore the authority file mentioned above and restart the queue manager.

AMQ5528
The IBM WebSphere MQ Object Authority Manager has failed to locate an object's authority file

Severity
20 : Error

Explanation
The object authority manager has failed to locate the authority file for the object <*insert_3*> of type (<*insert_1*>). The authority access to this object will initially be limited to members of the mqm group. Where type is one of the following:

1) Queue

2) Namelist

3) Process

5) Queue Manager

Response
To extend access to this object use the setmqaut command, see the IBM WebSphere MQ System Administration documentation for details.

AMQ5529
The Remote OAM Service is not available.

Severity
20 : Error

Explanation
The Remote OAM service is not available. The <*insert_1*> call returned <*insert_1*>, errno <*insert_2*> : <*insert_3*>. The context string is <*insert_4*>

Response
To extend access to this object use the setmqaut command, see the IBM WebSphere MQ System Administration documentation for details.

Explanation
This shows the correct usage.

Response
None.

AMQ5615
Default objects cannot be created: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity
20 : Error

Explanation
During the creation of a queue manager, using the crtmqm command, the default objects could not be created. Possible reasons for this include another command, issued elsewhere, quiescing or stopping the queue manager, or insufficient storage being available.

Response
Use the Completion and Reason codes shown in the message to determine the cause of the failure, then re-try the command.

AMQ5616
Usage: setmqprd LicenseFile

Severity
0 : Information

Explanation
This shows the correct usage.

Response
None.

AMQ5617
Default objects cannot be created.

Severity
20 : Error

Explanation
During the creation of a queue manager using the crtmqm command, the default objects could not be created. The most likely reason for this error is that the queue manager was started before the crtmqm command had completed.

Response
Ensure that the queue manager being created is not started before the create request completes. Stop the queue manager if it is already running. Restart the queue manager using the strmqm command with the '-c' option to request that the default objects are created.

AMQ5652
The Deferred Message process failed to connect to the WebSphere MQ queue manager for reason <*insert_1*>.

Severity
30 : Severe error

Explanation
The IBM WebSphere MQ queue manager <*insert_3*> might have generated earlier messages or FFST information explaining why the deferred message process (amqzdmaa) could not connect.

Response
Correct any configuration errors. Configuration errors that can cause this problem include badly configured CLWL Exit modules. If the problem persists save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5653
The mqm user is not defined.

Severity
30 : Severe error

Explanation
The system call getpwnam("mqm") failed with errno <*insert_1*>. The program was running as <*insert_3*>.

Response
Create the mqm user as a member of the mqm group and retry the operation.

AMQ5654

AMQ5659 (UNIX and Linux)
Unable to access trace shared memory: <*insert_1*>

Severity
0 : Information

Explanation
This applies to UNIX and Linux systems.

Response
Refer to IBM Service Personnel

AMQ5659 (IBM i)
Unable to access trace control shared memory (<*insert_1*>)

Severity
0 : Information

Explanation
An unexpected error accessing trace control memory has occurred whilst attempting to start or stop trace. The attempt to access trace control failed with a return code of <*insert_1*>.

Response
Contact your IBM representative.

AMQ5660
-q TargetQName | -ts TargetTopicString

Severity
0 : Information

Explanation
This shows the correct usage of the DSPMQRTE command.

Response
None.

AMQ5675
Inconsistent use of installations detected.

Severity
20 : Error

Explanation
When executing program <*insert_3*> from installation <*insert_4*>, IBM WebSphere MQ detected that due to the configuration of the environment resources were loaded from installation <*insert_5*>. The program cannot complete successfully while the program is executing using inconsistent installations.

Response
If applicable, run program <*insert_3*> from installation <*insert_5*> or configure the environment so that all resources required by program <*insert_3*> are loaded from installation <*insert_4*>.

AMQ5688
Unable to associate queue manager <*insert_3*> with installation <*insert_4*>.

Severity
20 : Error

Explanation
The request to associate queue manager <*insert_3*> with installation <*insert_4*> failed. This could be caused by the MQ version with which the queue manager was previously running being greater than the version of installation <*insert_4*>.

Response
Check that the installation specified is as intended and reissue the command.

AMQ5691
Queue manager <*insert_4*> is associated with a different installation.

Severity
20 : Error

Explanation

The command <*insert_3*> was issued against queue manager <*insert_4*>, but the queue manager is associated with a different installation than the one currently in use, <*insert_5*>. In order for the command to succeed, the installation that the command is executing from must match the installation that the queue manager is associated with.

Response

Either change the installation the command is being executed from using the setmqenv command or associate the queue manager with the current installation using the setmqm command.

AMQ5805
IBM WebSphere MQ Publish/Subscribe broker currently running for queue manager.

Severity
10 : Warning

Explanation
The command was unsuccessful because queue manager <*insert_3*> currently has an IBM WebSphere MQ Publish/Subscribe broker running.

Response
None.

AMQ5806
IBM WebSphere MQ Publish/Subscribe broker started for queue manager <*insert_3*>.

Severity
0 : Information

Explanation
IBM WebSphere MQ Publish/Subscribe broker started for queue manager <*insert_3*>.

Response
None.

AMQ5807
IBM WebSphere MQ Publish/Subscribe broker for queue manager <*insert_3*> ended.

Severity
0 : Information

Explanation
The IBM WebSphere MQ Publish/Subscribe broker on queue manager <*insert_3*> has ended.

Response
None.

AMQ5808
IBM WebSphere MQ Publish/Subscribe broker for queue manager <*insert_3*> is already quiescing.

Severity
10 : Warning

Explanation
The endmqbrk command was unsuccessful because an orderly shutdown of the IBM WebSphere MQ Publish/Subscribe broker running on queue manager <*insert_3*> is already in progress.

Response
None.

AMQ5808 (IBM i)
IBM WebSphere MQ Publish/Subscribe broker is already quiescing.

Severity
10 : Warning

Explanation
The endmqbrk command was unsuccessful because an orderly shutdown of the broker, running on queue manager <*insert_3*>, is already in progress.

Response
None.

AMQ5809
IBM WebSphere MQ Publish/Subscribe broker for queue manager <*insert_3*> starting.

Severity
0 : Information

Explanation
The dspmqbrk command has been issued to query the state of the IBM WebSphere MQ Publish/Subscribe broker. The IBM WebSphere MQ Publish/Subscribe broker is currently initializing.

Response
None.

AMQ5810
IBM WebSphere MQ Publish/Subscribe broker for queue manager <*insert_3*> running.

Severity
0 : Information

Explanation
The dspmqbrk command has been issued to query the state of the IBM WebSphere MQ Publish/Subscribe broker. The IBM WebSphere MQ Publish/Subscribe broker is currently running.

Response
None.

AMQ5811
IBM WebSphere MQ Publish/Subscribe broker for queue manager <*insert_3*> quiescing.

Severity
0 : Information

Explanation
The dspmqbrk command has been issued to query the state of the IBM WebSphere MQ Publish/Subscribe broker. The IBM WebSphere MQ Publish/Subscribe broker is currently performing a controlled shutdown.

Response
None.

AMQ5812
IBM WebSphere MQ Publish/Subscribe broker for queue manager <*insert_3*> stopping.

Severity
0 : Information

Explanation
Either the dspmqbrk command or the endmqbrk command has been issued. The IBM WebSphere MQ Publish/Subscribe broker is currently performing an immediate shutdown. If the endmqbrk command has been issued to request that the broker terminate, the command is unsuccessful because the broker is already performing an immediate shutdown.

Response
None.

AMQ5813
IBM WebSphere MQ Publish/Subscribe broker for queue manager <*insert_3*> not active.

Severity
0 : Information

Explanation
An IBM WebSphere MQ Publish/Subscribe broker administration command has been issued to query or change the state of the broker. The WebSphere MQ Publish/Subscribe broker is not currently running.

Response
None.

AMQ5814
IBM WebSphere MQ Publish/Subscribe broker for queue manager <*insert_3*> ended abnormally.

Severity
0 : Information

Explanation
The dspmqbrk command has been issued to query the state of the IBM WebSphere MQ Publish/Subscribe broker. The IBM WebSphere MQ Publish/Subscribe broker has ended abnormally.

Response
Refer to the queue manager error logs to determine why the broker ended abnormally.

AMQ5815
Invalid IBM WebSphere MQ Publish/Subscribe broker initialization file stanza for queue manager (<*insert_3*>).

Severity
20 : Error

Explanation
The broker was started using the strmqbrk command. The broker stanza in the queue manager initialization file is not valid. The broker will terminate immediately. The invalid attribute is <*insert_5*>.

Response
Correct the broker stanza in the queue manager initialization file.

AMQ5815 (Windows)
The IBM WebSphere MQ Publish/Subscribe broker configuration for queue manager (<*insert_3*>) is not valid.

Severity
20 : Error

Explanation
The broker was started using the strmqbrk command. The broker configuration information is not valid. The broker will terminate immediately. The invalid attribute is <*insert_5*>.

Response
Correct the broker attribute using the cfgmqbrk configuration tool.

AMQ5815 (IBM i)
Invalid IBM WebSphere MQ Publish/Subscribe broker initialization file stanza.

Severity
20 : Error

Explanation
The broker was started using the strmqbrk command. The Broker stanza in the queue manager(<*insert_3*>) initialization file is not valid. The broker will terminate immediately. The invalid attribute is <*insert_5*>.

Response
Correct the Broker stanza in the queue manager initialization file.

AMQ5816
Unable to open IBM WebSphere MQ Publish/Subscribe broker control queue for reason <*insert_1*>,<*insert_2*>.

Severity
20 : Error

Explanation
The broker has failed to open the broker control queue (<*insert_3*>). The attempt to open the queue failed with completion code <*insert_1*> and reason <*insert_2*>. The most likely reasons for this error are that an application program has opened the broker control queue for exclusive access, or that the broker control queue has been defined incorrectly. The broker will terminate immediately.

Response
Correct the problem and restart the broker.

AMQ5817
An invalid stream queue has been detected by the broker.

Severity
10 : Warning

Explanation
IBM WebSphere MQ has detected an attempt to use a queue (<*insert_3*>) as a stream queue, but the attributes of the queue make it unsuitable for use as a stream queue. The most likely reason for this error is that the queue is: (1) Not a local queue; (2) A shareable queue; (3) A temporary dynamic queue. If the queue was created using implicit stream creation, the model stream might have been defined incorrectly. The message that caused the stream to be created will be rejected or put to the dead-letter queue, depending upon the message report options and broker configuration.

Response
Correct the problem and resubmit the request.

AMQ5818
Unable to open IBM WebSphere MQ Publish/Subscribe broker stream queue.

Severity
10 : Warning

Explanation
The broker has failed to open a stream queue (<*insert_3*>). The attempt to open the queue failed

with completion code <*insert_1*> and reason <*insert_2*>. The most likely reasons for this error are (1) a new stream name has been added to SYSTEM.QPUBSUB.QUEUE.NAMELIST but the stream queue does not exist (2) an application has the queue open for exclusive access.

Response
Correct the problem.

AMQ5819
An IBM WebSphere MQ Publish/Subscribe broker stream has ended abnormally.

Severity
10 : Warning

Explanation
The broker stream (<*insert_3*>) has ended abnormally for reason <*insert_1*>. The broker will attempt to restart the stream. If the stream should repeatedly fail then the broker will progressively increase the time between attempts to restart the stream.

Response
Investigate why the problem occurred and take appropriate action to correct the problem. If the problem persists, save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5820
IBM WebSphere MQ Publish/Subscribe broker stream (<*insert_3*>) restarted.

Severity
0 : Information

Explanation
The broker has restarted a stream that ended abnormally. This message will frequently be preceded by message AMQ5867 or AMQ5819 indicating why the stream ended.

Response
Correct the problem.

AMQ5821
IBM WebSphere MQ Publish/Subscribe broker unable to contact parent broker.

Severity
10 : Warning

Explanation
The broker has been started specifying a parent broker. The broker has been unable to send a message to the parent broker (<*insert_3*>) for reason <*insert_1*>.

Response
Investigate why the problem occurred and take appropriate action to correct the problem. The problem is likely to be caused by the parent broker name not resolving to the name of a transmission queue on the local broker.

AMQ5822
IBM WebSphere MQ Publish/Subscribe broker failed to register with parent broker.

Severity
10 : Warning

Explanation
The broker has been started specifying a parent broker (<*insert_3*>). The broker attempted to register as a child of the parent broker, but received an exception response (<*insert_1*>) indicating that this was not possible. The broker will attempt to reregister as a child of the parent

periodically. The child might not be able to process global publications or subscriptions correctly until this registration process has completed normally.

Response

Investigate why the problem occurred and take appropriate action to correct the problem. The problem is likely to be caused by the parent broker not yet existing, or a problem with the SYSTEM.BROKER.INTER.BROKER.COMMUNICATIONS queue at the parent broker.

AMQ5823

Exit path attribute invalid in IBM WebSphere MQ Publish/Subscribe broker stanza.

Severity

10 : Warning

Explanation

The broker exit path attribute <*insert_3*> is not valid. The attribute should be specified as: <path><module name>(<function name>). The broker will terminate immediately.

Response

Correct the problem with the attribute and restart the broker.

AMQ5825

The address of the IBM WebSphere MQ Publish/Subscribe broker exit function could not be found.

Severity

10 : Warning

Explanation

The address of the broker exit function <*insert_4*> could not be found in module <*insert_3*> for reason <*insert_1*>:<*insert_5*>. The broker will terminate immediately.

Response

Correct the problem with the broker exit function <*insert_4*> in module <*insert_3*>, and restart the broker.

AMQ5826

IBM WebSphere MQ Publish/Subscribe has failed to propagate a subscription to another queue manager.

Severity

10 : Warning

Explanation

The queue manager failed to propagate subscription to stream (<*insert_4*>) at broker (<*insert_3*>). Reason codes <*insert_1*> and <*insert_2*>. An application has either registered or deregistered a subscription to stream (<*insert_4*>). The queue manager has attempted to propagate the subscription change to broker (<*insert_3*>) but the request has not been successful. Messages published on stream (<*insert_4*>) through queue manager (<*insert_3*>) might not reach this queue manager.

Response

Use the reason codes to investigate why the problem occurred and take appropriate action to correct the problem. Use the command REFRESH QMGR TYPE(PROXYSUB) to refresh proxy subscriptions. ????????

AMQ5827

An IBM WebSphere MQ Publish/Subscribe broker internal subscription has failed.

Severity

10 : Warning

Explanation

The broker failed to subscribe to stream (<*insert_4*>) at broker (<*insert_3*>) with reason codes

<*insert_1*> and <*insert_2*>. Related brokers learn about each others configuration by subscribing to information published by each other. A broker has discovered that one of these internal subscriptions has failed. The broker will reissue the subscription immediately. The broker cannot function correctly without knowing some information about neighboring brokers. The information that this broker has about broker (<*insert_3*>) is not complete and this could lead to subscriptions and publications not being propagated around the network correctly.

Response

Investigate why the problem occurred and take appropriate action to correct the problem. The most likely cause of this failure is a problem with the SYSTEM.BROKER.CONTROL.QUEUE at broker (<*insert_3*>), or a problem with the definition of the route between this broker and broker (<*insert_3*>).

AMQ5828

IBM WebSphere MQ Publish/Subscribe broker exit returned an ExitResponse that is not valid.

Severity

10 : Warning

Explanation

The broker exit returned an ExitResponse <*insert_1*> that is not valid. The message has been allowed to continue and an FFST has been generated that contains the entire exit parameter structure.

Response

Correct the problem with the broker exit.

AMQ5829

Usage: amqfqpub [-m QMgrName]. Do not run this command manually.

Severity

0 : Information

Explanation

This shows the correct usage.

Response

None.

AMQ5830

The endmqbrk command can no longer be used. The &MQQPUBSUB_short is enabled/disabled by altering the Queue manager's PSMODE attribute. Setting PSMODE to "COMPAT" disables the queued pubsub interface.

Severity

0 : Information

Explanation

The endmqbrk command (shipped with earlier versions of MQ) is no longer used to enable/disable the IBM WebSphere MQ Publish/Subscribe Instead of issuing the endmqbrk command the PSMODE attribute of the queue manager should be set to COMPAT.

Response

None.

AMQ5832

IBM WebSphere MQ Publish/Subscribe broker failed to publish configuration information on SYSTEM.BROKER.ADMIN.STREAM.

Severity

10 : Warning

Explanation

Related brokers learn about each others configuration by subscribing to information published by

each other. A broker has discovered that one of these internal publications has failed. The broker will republish the information immediately. Brokers cannot function correctly without knowing some information about neighboring brokers. The information that neighboring brokers have of this broker might not be complete and this could lead to some subscriptions and publications not being propagated around the network.

Response
Investigate why the problem occurred and take appropriate action to correct the problem.

AMQ5833
A loop has been detected in the IBM WebSphere MQ Publish/Subscribe broker hierarchy.

Severity
20 : Error

Explanation
The broker, on queue manager (<*insert_3*>), introduced a loop in the broker hierarchy. This broker will terminate immediately.

Response
Remove broker (<*insert_3*>) from the hierarchy, either by deleting the broker, or by removing knowledge of the broker's parent, using the clrmqbrk command.

AMQ5834
Conflicting queue manager names in the IBM WebSphere MQ Publish/Subscribe broker hierarchy.

Severity
10 : Warning

Explanation
The names of the queue managers (<*insert_3*>) and (<*insert_4*>) in the broker hierarchy both start with the same 12 characters. The first 12 characters of a broker's queue manager name should be unique to ensure that no confusion arises within the broker hierarchy, and to guarantee unique message ID allocation.

Response
Use a queue manager naming convention that guarantees uniqueness of the first 12 characters of the queue manager name.

AMQ5835
IBM WebSphere MQ Publish/Subscribe broker failed to inform its parent of a relation for reason <*insert_1*>.

Severity
0 : Information

Explanation
The failed to notify its parent on queue manager (<*insert_3*>) of the relation (<*insert_4*>) in the broker hierarchy. The notification message will be put to the parent's dead-letter queue. A failure to notify a broker of a new relation will mean that no loop detection can be performed for the new relation.

Response
Diagnose and correct the problem on the parent queue manager. One possible reason for this is that the parent broker does not yet exist.

AMQ5836
Duplicate queue manager name located in the IBM WebSphere MQ Publish/Subscribe hierarchy.

Severity
0 : Information

Explanation

Multiple instances of the queue manager name (<*insert_3*>) have been located. This could either be the result of a previously resolved loop in the broker hierarchy, or multiple queue managers in the broker hierarchy having the same name.

Response

If this broker introduced a loop in the hierarchy (typically identified by message AMQ5833), this message can be ignored. It is strongly recommended that every queue manager in a broker hierarchy has a unique name. It is not recommended that multiple queue managers use the same name.

AMQ5837

IBM WebSphere MQ Publish/Subscribe broker failed to quiesce queue (<*insert_3*>) for reason <*insert_1*>.

Severity

10 : Warning

Explanation

When a broker is deleted, the broker's input queues are quiesced by making the queue get inhibited, and writing the contents of the queue to the dead-letter queue (depending upon the report options of the message). The broker was unable to quiesce the named queue for the reason shown. The attempt to delete the broker will fail.

Response

Investigate why the problem occurred, take appropriate action to correct the problem, and reissue the dltmqbrk command. Likely reasons include the queue being open for input by another process, there being no dead-letter queue defined at this queue manager, or the operator setting the queue to get inhibited while the dltmqbrk command is running. If there is no dead-letter queue defined, the reason will be reported as MQRC_UNKNOWN_OBJECT_NAME. If the problem occurs because there is no dead-letter queue defined at this broker, the operator can either define a dead-letter queue, or manually empty the queue causing the problem.

AMQ5837 (IBM i)

IBM WebSphere MQ Publish/Subscribe broker failed to quiesce queue.

Severity

10 : Warning

Explanation

When a broker is deleted, the broker's input queues are quiesced by making the queue get inhibited, and writing the contents of the queue to the dead-letter queue (depending upon the report options of the message). The broker was unable to quiesce the queue (<*insert_3*>) for reason <*insert_1*>. The attempt to delete the broker will fail.

Response

Investigate why the problem occurred, take appropriate action to correct the problem, and reissue the dltmqbrk command. Likely reasons include the queue being open for input by another process, there being no dead-letter queue defined at this queue manager, or the operator setting the queue to get inhibited while the dltmqbrk command is running. If there is no dead-letter queue defined, the reason will be reported as MQRC_UNKNOWN_OBJECT_NAME. If the problem occurs because there is no dead-letter queue defined at this broker, the operator can either define a dead-letter queue, or manually empty the queue causing the problem.

AMQ5838

IBM WebSphere MQ Publish/Subscribe broker cannot be deleted.

Severity

10 : Warning

Explanation

The broker cannot be deleted as child (<*insert_3*>) is still registered. A broker cannot be deleted until all other brokers that have registered as children of that broker, have deregistered as its children.

Response

Use the clrmqbrk and dltmqbrk commands to change the broker topology so that broker (<*insert_3*>) is not registered as a child of the broker being deleted.

AMQ5839

IBM WebSphere MQ Publish/Subscribe broker received an unexpected inter-broker communication.

Severity

10 : Warning

Explanation

A broker has received an inter-broker communication that it did not expect. The message was sent by broker (<*insert_3*>). The message will be processed according to the report options in that message. The most likely reason for this message is that the broker topology has been changed while inter-broker communication messages were in transit (for example, on a transmission queue) and that a message relating to the previous broker topology has arrived at a broker in the new topology. This message may be accompanied by an informational FFST including details of the unexpected communication.

Response

If the broker topology has changed and the broker named in the message is no longer related to the broker issuing this message, this message can be ignored. If the clrmqbrk command was issued to unilaterally remove knowledge of broker (<*insert_3*>) from this broker, the clrmqbrk command should also be used to remove knowledge of this broker from broker (<*insert_3*>). If the clrmqbrk command was issued to unilaterally remove knowledge of this broker from broker (<*insert_3*>), the clrmqbrk command should also be used to remove knowledge of broker (<*insert_3*>) at this broker.

AMQ5840

IBM WebSphere MQ Publish/Subscribe broker unable to delete queue.

Severity

10 : Warning

Explanation

The broker has failed to delete the queue (<*insert_3*>) for reason <*insert_2*>. The broker typically attempts to delete queues during dltmqbrk processing, in which case the dltmqbrk command will fail.

Response

The most likely reason for this error is that some other process has the queue open. Determine why the queue cannot be deleted, remove the inhibitor, and retry the failed operation. In a multi-broker environment, it is likely that a message channel agent might have queues open, which the broker needs to delete for a dltmqbrk command to complete.

AMQ5841

IBM WebSphere MQ Publish/Subscribe broker (<*insert_3*>) deleted.

Severity

0 : Information

Explanation

The broker (<*insert_3*>) has been deleted using the dltmqbrk command.

Response

None.

AMQ5842
IBM WebSphere MQ Publish/Subscribe broker (<*insert_3*>) cannot be deleted for reason <*insert_1*>:<*insert_5*>.

Severity
20 : Error

Explanation
An attempt has been made to delete the broker (<*insert_3*>) but the request has failed for reason <*insert_1*>:<*insert_5*>.

Response
Determine why the dltmqbrk command cannot complete successfully. The message logs for the queue manager might contain more detailed information on why the broker cannot be deleted. Resolve the problem that is preventing the command from completing and reissue the dltmqbrk command.

AMQ5842 (IBM i)
IBM WebSphere MQ Publish/Subscribe broker cannot be deleted.

Severity
20 : Error

Explanation
An attempt has been made to delete the IBM WebSphere MQ Publish/Subscribe broker (<*insert_3*>) but the request has failed for reason <*insert_1*>:<*insert_5*>.

Response
Determine why the dltmqbrk command cannot complete successfully. The message logs for the queue manager might contain more detailed information on why the broker cannot be deleted. Resolve the problem that is preventing the command from completing and reissue the dltmqbrk command.

AMQ5843
IBM WebSphere MQ Publish/Subscribe broker (<*insert_3*>) cannot be started as it is partially deleted.

Severity
10 : Warning

Explanation
An attempt has been made to start a broker that is in a partially deleted state. An earlier attempt to delete the broker has failed. The broker deletion must be completed before the broker will be allowed to restart. When broker deletion is successful, message AMQ5841 is issued, indicating that the broker has been deleted. If this message is not received on completion of a dltmqbrk command, the broker deletion has not been completed and the command will have to be reissued.

Response
Investigate why the earlier attempt to delete the broker failed. Resolve the problem and reissue the dltmqbrk command.

AMQ5843 (IBM i)
IBM WebSphere MQ Publish/Subscribe broker cannot be started as it is partially deleted.

Severity
10 : Warning

Explanation
An attempt has been made to start the broker <*insert_3*> that is in a partially deleted state. An earlier attempt to delete the broker has failed. The broker deletion must be completed before the broker will be allowed to restart. When broker deletion is successful, message AMQ5841 is

issued, indicating that the broker has been deleted. If this message is not received on completion of a dltmqbrk command, the broker deletion has not been completed and the command will have to be reissued.

Response
Investigate why the earlier attempt to delete the broker failed. Resolve the problem and reissue the dltmqbrk command.

AMQ5844
The relation between two IBM WebSphere MQ Publish/Subscribe brokers is unknown.

Severity
10 : Warning

Explanation
The clrmqbrk command has been issued in an attempt to remove a brokers knowledge of a relation of that broker. The relative (<*insert_4*>) is unknown at broker (<*insert_3*>). If the "-p" flag was specified, the broker does not currently have a parent. If the "-c" flag was specified, the broker does not recognize the named child.

Response
Investigate why the broker is unknown.

AMQ5845
Usage: dltmqbrk -m QMgrName

Severity
0 : Information

Explanation
This shows the correct usage.

Response
None.

AMQ5847
IBM WebSphere MQ Publish/Subscribe broker (<*insert_3*>) has removed knowledge of relation (<*insert_4*>).

Severity
0 : Information

Explanation
The clrmqbrk command has been used to remove knowledge of broker (<*insert_4*>) from broker (<*insert_3*>).

Response
None.

AMQ5847 (IBM i)
IBM WebSphere MQ Publish/Subscribe broker relation removed.

Severity
0 : Information

Explanation
The clrmqbrk command has been used to remove knowledge of broker (<*insert_4*>) from broker (<*insert_3*>).

Response
None.

AMQ5848
IBM WebSphere MQ Publish/Subscribe broker (<*insert_3*>) has failed to remove references to relation (<*insert_4*>) for reason <*insert_1*>:<*insert_5*>.

Severity
20 : Error

Explanation
An attempt has been made to remove references to broker (<*insert_4*>) from broker (<*insert_3*>) using the clrmqbrk command, but the request has been unsuccessful.

Response
Determine why the clrmqbrk command cannot complete successfully. The message logs for the queue manager might contain more detailed information on why the broker cannot be deleted. Resolve the problem that is preventing the command from completing and then reissue the clrmqbrk command.

AMQ5848 (IBM i)
IBM WebSphere MQ Publish/Subscribe broker has failed to remove references to a related broker.

Severity
20 : Error

Explanation
An attempt has been made to remove references to broker (<*insert_4*>) from broker (<*insert_3*>) using the clrmqbrk command, but the request has been unsuccessful for reason <*insert_1*>:<*insert_5*>.

Response
Determine why the clrmqbrk command cannot complete successfully. The message logs for the queue manager might contain more detailed information on why the broker cannot be deleted. Resolve the problem that is preventing the command from completing and then reissue the clrmqbrk command.

AMQ5849
IBM WebSphere MQ Publish/Subscribe broker may not change parent.

Severity
10 : Warning

Explanation
An attempt has been made to start broker (<*insert_3*>), nominating broker (<*insert_4*>) as its parent. The broker (<*insert_3*>) has previously been started, nominating broker (<*insert_5*>) as its parent. The strmqbrk command cannot be used to change an existing relationship.

Response
Do not attempt to change the broker topology by using the strmqbrk command. The dltmqbrk and clrmqbrk commands are the only supported means of changing the broker topology. Refer to the documentation of those commands for guidance on changing the broker topology.

AMQ5850
IBM WebSphere MQ Publish/Subscribe broker interrupted while creating queue.

Severity
10 : Warning

Explanation
The broker was interrupted while creating queue (<*insert_3*>) for user ID (<*insert_4*>). When the broker creates a queue, it first creates the queue with default security attributes and it then sets the appropriate security attributes for the queue. If the broker should be interrupted during this operation (for example the queue manager is shut down), the broker cannot reliably detect that the security attributes have not been set correctly. The broker was creating a queue, but was interrupted before it could complete creation of the queue and setting the initial authority. If the interrupt occurred before the initial authority of the queue could be set, it might be necessary for the operator to set the appropriate authorities using the setmqaut command.

Response

Confirm that the named queue has the appropriate security attributes and modify them as necessary.

AMQ5851

IBM WebSphere MQ Publish/Subscribe broker interrupted while creating internal queue.

Severity

10 : Warning

Explanation

The broker was interrupted while creating internal queue (<*insert_3*>) for user ID (<*insert_4*>). When the broker creates an internal queue, it first creates the queue with default security attributes and it then sets the appropriate security attributes for the queue. If the broker should be interrupted during this operation (for example the queue manager is shut down), the broker attempts to delete and redefine the queue. If the internal queue is available to users (for example, the default stream or the administration stream), it is possible that a user will put a message on the queue while it is in this invalid state, or that a user application has the queue open. In this situation the broker does not automatically redefine the queue and cannot be restarted until the queue has been emptied or closed.

Response

Examine any messages on the named queue and take appropriate action to remove them from the queue. Ensure that no applications have the queue open.

AMQ5852

IBM WebSphere MQ Publish/Subscribe broker failed to propagate delete publication command.

Severity

0 : Information

Explanation

The broker failed to propagate delete publication command for stream (<*insert_3*>) to related broker (<*insert_4*>) for reason <*insert_1*>. When an application issues a delete publication command to delete a global publication, the command has to be propagated to all brokers in the sub-hierarchy supporting the stream. The broker reporting the error has failed to forward a delete publication command to a related broker (<*insert_4*>) who supports stream (<*insert_3*>). Delete publication commands are propagated without MQRO_DISCARD_MSG and the command message might have been written to a dead-letter queue. The topic for which the delete publication has failed is (<*insert_5*>).

Response

If the delete publication has failed because the stream has been deleted at the related broker, this message can be ignored. Investigate why the delete publication has failed and take the appropriate action to recover the failed command.

AMQ5853

IBM WebSphere MQ Publish/Subscribe failed to propagate a delete publication command.

Severity

0 : Information

Explanation

The broker failed to propagate a delete publication command for stream (<*insert_3*>) to a previously related broker. When an application issues a delete publication command to delete a global publication, the command is propagated to all brokers in the sub-hierarchy supporting the stream. The broker topology was changed after deleting the publication, but before a broker removed by the topology change processed the propagated delete publication message. The topic for which the delete publication has failed is (<*insert_5*>).

Response

It is the user's responsibility to quiesce broker activity before changing the broker topology using

the clrmqbrk command. Investigate why this delete publication activity was not quiesced. The delete publication command will have been written to the dead-letter queue at the broker that was removed from the topology. In this case, further action might be necessary to propagate the delete publication command that was not quiesced before the clrmqbrk command was issued. If this message occurs as a result of the dltmqbrk command, the publication will have been deleted as a result of the dltmqbrk command, and the delete publication message will have been written to the dead-letter queue at the queue manager where the broker was deleted. In this case the delete publication message on the dead-letter queue can be discarded.

AMQ5854

IBM WebSphere MQ Publish/Subscribe broker failed to propagate a delete publication command.

Severity

0 : Information

Explanation

When an application issues a delete publication command to delete a global publication, the command has to be propagated to all brokers in the sub-hierarchy supporting the stream. At the time the delete publication was propagated, broker (<*insert_4*>) was a known relation of this message broker supporting stream (<*insert_3*>). Before the delete publication command arrived at the related broker, the broker topology was changed so that broker (<*insert_4*>) no longer supported stream (<*insert_3*>). The topic for which the delete publication has failed is (<*insert_5*>).

Response

It is the user's responsibility to quiesce broker activity before changing the stream topology of the broker. Investigate why this delete publication activity was not quiesced. The delete publication command will have been written to the dead-letter queue at broker (<*insert_4*>).

AMQ5855

IBM WebSphere MQ Publish/Subscribe broker ended.

Severity

10 : Warning

Explanation

An attempt has been made to run the broker (<*insert_3*>) but the broker has ended for reason <*insert_1*>:<*insert_5*>.

Response

Determine why the broker ended. The message logs for the queue manager might contain more detailed information on why the broker cannot be started. Resolve the problem that is preventing the command from completing and reissue the strmqbrk command.

AMQ5856

Broker publish command message cannot be processed. Reason code <*insert_1*>.

Severity

10 : Warning

Explanation

The IBM WebSphere MQ Publish/Subscribe broker failed to process a publish message for stream (<*insert_3*>). The broker was unable to write the publication to the dead-letter queue and was not permitted to discard the publication. The broker will temporarily stop the stream and will restart the stream and consequently retry the publication after a short interval.

Response

Investigate why the error has occurred and why the publication cannot be written to the dead-letter queue. Either manually remove the publication from the stream queue, or correct the problem that is preventing the broker from writing the publication to the dead-letter queue.

AMQ5857

Broker control command message cannot be processed. Reason code <*insert_1*>.

Severity

10 : Warning

Explanation

The IBM WebSphere MQ Publish/Subscribe broker failed to process a command message on the SYSTEM.BROKER.CONTROL.QUEUE. The broker was unable to write the command message to the dead-letter queue and was not permitted to discard the command message. The broker will temporarily stop the stream and will restart the stream and consequently retry the command message after a short interval. Other broker control commands cannot be processed until this command message has been processed successfully or removed from the control queue.

Response

Investigate why the error has occurred and why the command message cannot be written to the dead-letter queue. Either, manually remove the command message from the stream queue, or correct the problem that is preventing the broker from writing the command message to the dead-letter queue.

AMQ5858

Broker could not send publication to subscriber queue.

Severity

10 : Warning

Explanation

A failure has occurred sending a publication to subscriber queue (<*insert_4*>) at queue manager (<*insert_3*>) for reason <*insert_1*>. The broker configuration options prevent it from recovering from this failure by discarding the publication or by sending it to the dead-letter queue. Instead the broker will back out the unit of work under which the publication is being sent and retry the failing command message a fixed number of times. If the problem still persists, the broker will then attempt to recover by failing the command message with a negative reply message. If the issuer of the command did not request negative replies, the broker will either discard or send to the dead-letter queue the failing command message. If the broker configuration options prevent this, the broker will restart the affected stream, which will reprocess the failing command message again. This behavior will be repeated until such time as the failure is resolved. During this time the stream will be unable to process further publications or subscriptions.

Response

Usually the failure will be due to a transient resource problem, for example, the subscriber queue, or an intermediate transmission queue, becoming full. Use reason code <*insert_1*> to determine what remedial action is required. If the problem persists for a long time, you will notice the stream being continually restarted by the broker. Evidence of this occurring will be a large number of AMQ5820 messages, indicating stream restart, being written to the error logs. In such circumstances, manual intervention will be required to allow the broker to dispose of the failing publication. To do this, you will need to end the broker using the endmqbrk command and restart it with appropriate disposition options. This will allow the publication to be sent to the rest of the subscribers, while allowing the broker to discard or send to the dead-letter queue the publication that could not be sent.

AMQ5859

IBM WebSphere MQ Publish/Subscribe broker stream is terminating due to an internal resource problem.

Severity

10 : Warning

Explanation

The broker stream (<*insert_3*>) has run out of internal resources and will terminate with reason code <*insert_1*>. If the command in progress was being processed under sync point control, it will

be backed out and retried when the stream is restarted by the broker. If the command was being processed out of sync point control, it will not be able to be retried when the stream is restarted.

Response

This message should only be issued in very unusual circumstances. If this message is issued repeatedly for the same stream, and the stream is not especially large in terms of subscriptions, topics, and retained publications, save all generated diagnostic information and use either the IBM WebSphere MQ support web page, or the IBM support assistant at the IBM SupportAssistant web page, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5862

IBM WebSphere MQ Publish/Subscribe broker for queue manager <*insert_3*> migrating.

Severity

0 : Information

Explanation

The dspmqbrk command has been issued to query the state of the broker. The broker is currently being migrated.

Response

None.

AMQ5863

WebSphere Brokers broker not ready for migration. See message logs for guidance.

Severity

10 : Warning

Explanation

The migmqbrk command was unsuccessful because the WebSphere Brokers broker was not ready to accept messages. The state of the WebSphere MQ Publish/Subscribe message broker is exported to the WebSphere Brokers broker in a series of messages sent to queue SYSTEM.BROKER.INTERBROKER.QUEUE. Before migration commences the IBM WebSphere MQ Publish/Subscribe broker checks whether the WebSphere Brokers broker is ready to accept messages on this queue. This check has failed for reason <*insert_1*> so migration has been abandoned.

Response

Reason code <*insert_1*> should be used to determine the nature of the problem. A value of 1 means that queue SYSTEM.BROKER.INTERBROKER.QUEUE does not exist. This is probably because no WebSphere Brokers broker has been defined yet on this queue manager. A value of 2 means that the WebSphere Brokers broker does not have the queue open probably because it hasn't been started or the first message flow has yet to be deployed for it. If both of these steps have been taken then the WebSphere Brokers broker may have been created incorrectly. In particular, it should have been created in migration mode. If the broker was not created with the migration flag set then it will need to be deleted and re-created before migration can commence. For any other value in the reason code, use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Note that until the problem has been resolved the IBM WebSphere MQ Publish/Subscribe broker can still be restarted with the the strmqbrk command.

AMQ5864

Broker reply message could not be sent. The command will be retried.

Severity

10 : Warning

Explanation

While processing a publish/subscribe command, the IBM WebSphere MQ Publish/Subscribe broker could not send a reply message to queue (<*insert_4*>) at queue manager (<*insert_3*>) for reason <*insert_1*>. The broker was also unable to write the message to the dead-letter queue. Since the command is being processed under sync point control, the broker will attempt to retry the command in the hope that the problem is only of a transient nature. If, after a set number of retries, the reply message still could not be sent, the command message will be discarded if the report options allow it. If the command message is not discardable, the stream will be restarted, and processing of the command message recommenced.

Response

Use reason code <*insert_1*> to determine what remedial action is required. If the failure is due to a resource problem (for example, a queue being full), you might find that the problem has already cleared itself. If not, this message will be issued repeatedly each time the command is retried. In this case you are strongly advised to define a dead-letter queue to receive the reply message so that the broker can process other commands while the problem is being investigated. Check the application from which the command originated and ensure that it is specifying its reply-to queue correctly.

AMQ5865

Broker reply message could not be sent.

Severity

10 : Warning

Explanation

While processing a publish/subscribe command, the IBM WebSphere MQ Publish/Subscribe broker could not send a reply message to queue (<*insert_4*>) at queue manager (<*insert_3*>) for reason <*insert_1*>. The broker was also unable to write the message to the dead-letter queue. As the command is not being processed under sync point control, the broker is not able to retry the command.

Response

Use reason code <*insert_1*> to determine what remedial action is required. If the failure is due to a resource problem (for example, a queue being full), you might find that the problem has already cleared itself. If not, check the application from which the command originated and ensure that it is specifying its reply-to queue correctly. You might find that defining a dead-letter queue to capture the reply message on a subsequent failure will help you with this task.

AMQ5866

Broker command message has been discarded. Reason code <*insert_1*>.

Severity

10 : Warning

Explanation

The IBM WebSphere MQ Publish/Subscribe broker failed to process a publish/subscribe command message, which has now been discarded. The broker will begin to process new command messages again.

Response

Look for previous error messages to indicate the problem with the command message. Correct the problem to prevent the failure from happening again.

AMQ5867

IBM WebSphere MQ Publish/Subscribe broker stream has ended abnormally.

Severity

10 : Warning

Explanation

The broker stream (<*insert_3*>) has ended abnormally for reason <*insert_1*>. The broker will

attempt to restart the stream. If the stream should repeatedly fail, the broker will progressively increase the time between attempts to restart the stream.

Response

Use the reason code <*insert_1*> to investigate why the problem occurred. A reason code of 1 indicates that the stream ended because a command message could not be processed successfully. Look in the error logs for earlier messages to determine the reason why the command message failed. A reason code of 2 indicates that the stream ended because the broker exit could not be loaded. Until the problem with the broker exit has been resolved, the stream will continue to fail.

AMQ5868

User is no longer authorized to subscribe to stream.

Severity

0 : Information

Explanation

The broker has attempted to publish a publication to a subscriber, but the subscriber no longer has browse authority to stream queue (<*insert_4*>). The publication is not sent to the subscriber and his subscription is deregistered. An event publication containing details of the subscription that was removed is published on SYSTEM.BROKER.ADMIN.STREAM. While user ID (<*insert_3*>) remains unauthorized, the broker will continue to deregister subscriptions associated with that user ID.

Response

If the authority of user ID (<*insert_3*>) was intentionally removed, consider removing all of that user IDs subscriptions immediately by issuing an MQCMD_DEREGISTER_SUBSCRIBER command, specifying the MQREGO_DEREGISTER_ALL option on the subscriber's behalf. If the authority was revoked accidentally, reinstate it, but be aware that some, if not all, of the subscriber's subscriptions will have been deregistered by the broker.

AMQ5869

IBM WebSphere MQ Publish/Subscribe broker is checkpointing registrations.

Severity

0 : Information

Explanation

A large number of changes have been made to the publisher and subscriber registrations of stream (<*insert_3*>). These changes are being checkpointed, in order to minimize both stream restart time and the amount of internal queue space being used.

Response

None.

AMQ5875
IBM WebSphere MQ Publish/Subscribe broker cannot write a message to the dead-letter queue.

Severity
10 : Warning

Explanation
The broker attempted to put a message to the dead-letter queue (<*insert_3*>) but the message could not be written to the dead-letter queue for reason <*insert_1*>:<*insert_4*>. The message was being written to the dead-letter queue with a reason of <*insert_2*>:<*insert_5*>.

Response
Determine why the message cannot be written to the dead-letter queue. Also, if the message was not deliberately written to the dead-letter queue, for example by a message broker exit, determine why the message was written to the dead-letter queue and resolve the problem that is preventing the message from being sent to its destination.

AMQ5876
A parent conflict has been detected in the IBM WebSphere MQ Publish/Subscribe broker hierarchy.

Severity
20 : Error

Explanation

The broker (<*insert_3*>) has been started, naming this broker as its parent. This broker was started naming broker (<*insert_3*>) as its parent. The broker will send an exception message to broker (<*insert_3*>) indicating that a conflict has been detected. The most likely reason for this message is that the broker topology has been changed while inter-broker communication messages were in transit (for example, on a transmission queue) and that a message relating to the previous broker topology has arrived at a broker in the new topology. This message may be accompanied by an informational FFST including details of the unexpected communication.

Response

If the broker topology has changed and the broker named in the message no longer identifies this broker as its parent, this message can be ignored - for example, if the command "clrmqbrk -m <*insert_3*> -p" was issued. If broker (<*insert_3*>) has been defined as this broker's parent, and this broker has been defined as broker (<*insert_3*>)'s parent, the clrmqbrk or the dltmqbrk commands should be used to resolve the conflict.

AMQ5877

IBM WebSphere MQ Publish/Subscribe broker stream has ended abnormally.

Severity

10 : Warning

Explanation

A broker stream (<*insert_3*>) has ended abnormally for reason <*insert_1*>. The broker recovery routines failed to reset the stream state and the stream cannot be restarted automatically.

Response

Investigate why the stream failed and why the broker's recovery routine could not recover following the failure. Take appropriate action to correct the problem. Depending upon the broker configuration and the nature of the problem it will be necessary to restart either the broker,or both the queue manager and the broker, to make the stream available. If the problem persists save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5878

IBM WebSphere MQ Publish/Subscribe broker recovery failure detected.

Severity

10 : Warning

Explanation

An earlier problem has occurred with the broker, and either a stream has been restarted or the broker has been restarted. The restarted stream or broker has detected that the previous instance of the stream or broker did not clean up successfully and the restart will fail.

Response

Investigate the cause of the failure that caused a stream or broker restart to be necessary, and why the broker or stream was unable to clean up its resources following the failure. When the broker processes with a non trusted routing exit (RoutingExitConnectType=STANDARD), the broker runs in a mode where it is more tolerant of unexpected failures and it is likely that the restart will succeed after a short delay. In the case of a stream restart, the broker will normally periodically retry the failing restart. In the case of a broker restart, it will be necessary to manually retry the broker restart after a short delay. When the broker processes without a routing exit, or with a trusted routine exit (RoutingExitConnectType=FASTPATH), the broker runs in a mode where it is less tolerant of unexpected failures and a queue manager restart will be necessary to resolve this problem. When the broker is running in this mode, it is important that the broker processes are not subjected to unnecessary asynchronous interrupts, for example, kill. If the problem persists, save any generated output files and use either the http://www.ibm.com/

support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ5879

IBM WebSphere MQ Publish/Subscribe broker has been migrated.

Severity

10 : Warning

Explanation

The command was unsuccessful because the MQ Pub/Sub broker at queue manager <*insert_3*> has been migrated. After migration the only command which can be issued against the migrated broker is the dltmqbrk command.

Response

Issue the dltmqbrk command to delete the migrated broker.

AMQ5880

User is no longer authorized to subscribe to stream.

Severity

0 : Information

Explanation

The broker has attempted to publish a publication to a subscriber but the subscriber no longer has altusr authority to stream queue (<*insert_4*>). The publication is not sent to the subscriber and that user IDs subscription is deregistered. An event publication containing details of the subscription that was removed is published on SYSTEM.BROKER.ADMIN.STREAM. While user ID (<*insert_3*>) remains unauthorized, the broker will continue to deregister subscriptions associated with that user ID.

Response

If the authority of user ID (<*insert_3*>) was intentionally removed, consider removing subscriptions immediately by issuing an MQCMD_DEREGISTER_SUBSCRIBER command for the appropriate topics on the subscriber's behalf. If the authority was revoked accidentally, reinstate it, but be aware that some, if not all, of the subscriber's subscriptions will have been deregistered by the broker.

AMQ5881

The IBM WebSphere MQ Publish/Subscribe broker configuration parameter combination <*insert_1*> is not valid.

Severity

20 : Error

Explanation

A combination of Broker stanzas in the queue manager initialization file is not valid. The broker will not operate until this has been corrected.

An combination of (1) indicates that SyncPointIfPersistent has been set to TRUE and DiscardNonPersistentInputMsg has been set to FALSE. DiscardNonPersistentInputMsg must be set to TRUE when SyncPointIfPersistent is set to TRUE.

An combination of (2) indicates that SyncPointIfPersistent has been set to TRUE and DiscardNonPersistentResponse has been set to FALSE. DiscardNonPersistentResponse must be set to TRUE when SyncPointIfPersistent is set to TRUE.

An combination of (3) indicates that SyncPointIfPersistent has been set to TRUE and DiscardNonPersistentPublication has been set to FALSE. DiscardNonPersistentPublication must be set to TRUE when SyncPointIfPersistent is set to TRUE.

Response

Alter the message broker stanzas to comply with the above rules and retry the command.

AMQ5881 (Windows)

The IBM WebSphere MQ Publish/Subscribe broker configuration parameter combination <*insert_1*> is not valid.

Severity

20 : Error

Explanation

A combination of Broker parameters in the broker configuration information is not valid. The broker will not operate until this has been corrected.

An combination of (1) indicates that SyncPointIfPersistent has been set to TRUE and DiscardNonPersistentInputMsg has been set to FALSE. DiscardNonPersistentInputMsg must be set to TRUE when SyncPointIfPersistent is set to TRUE.

An combination of (2) indicates that SyncPointIfPersistent has been set to TRUE and DiscardNonPersistentResponse has been set to FALSE. DiscardNonPersistentResponse must be set to TRUE when SyncPointIfPersistent is set to TRUE.

An combination of (3) indicates that SyncPointIfPersistent has been set to TRUE and DiscardNonPersistentPublication has been set to FALSE. DiscardNonPersistentPublication must be set to TRUE when SyncPointIfPersistent is set to TRUE.

Response

Alter the message broker configuration information using the cfgmqbrk tool to comply with the above rules and retry the command.

AMQ5882

IBM WebSphere MQ Publish/Subscribe broker has written a message to the dead-letter queue.

Severity

10 : Warning

Explanation

The broker has written a message to the dead-letter queue (<*insert_3*>) for reason <*insert_1*>:<*insert_5*>. Note. To save log space, after the first occurrence of this message for stream (<*insert_4*>), it will only be written periodically.

Response

If the message was not deliberately written to the dead-letter queue, for example by a message broker exit, determine why the message was written to the dead-letter queue, and resolve the problem that is preventing the message from being sent to its destination.

AMQ5883

IBM WebSphere MQ Publish/Subscribe broker state not recorded.

Severity

10 : Warning

Explanation

The broker state on stream (<*insert_3*>) not recorded while processing a publication outside of sync point. A nonpersistent publication has requested a change to either a retained message or a publisher registration. This publication is being processed outside of sync point because the broker has been configured with the SyncPointIfPersistent option set. A failure has occurred hardening either the publisher registration or the retained publication to the broker's internal queue. All state changes attempted as a result of this publication will be backed-out. Processing of the publication will continue and the broker will attempt to deliver it to all subscribers.

Response

Investigate why the failure occurred. It is probably due to a resource problem occurring on the

broker. The most likely cause is 'queue full' on a broker queue. If your publications also carry state changes, you are advised to send them either as persistent publications or turn off the SyncPointIfPersistent option. In this way, they will be carried out under sync point and the broker can retry them in the event of a failure such as this.

AMQ5884
IBM WebSphere MQ Publish/Subscribe broker control queue is not a local queue.

Severity
10 : Warning

Explanation
IBM WebSphere MQ Publish/Subscribe has detected that the queue 'SYSTEM.BROKER.CONTROL.QUEUE' exists and is not a local queue. This makes the queue unsuitable for use as the control queue of the broker. The broker will terminate immediately.

Response
Delete the definition of the existing queue and, if required, re-create the queue to be of type MQQT_LOCAL. If you do not re-create the queue the broker will automatically create one of the correct type when started.

AMQ5885
Usage: runmqbrk (or strmqbrk) -m QMgrName [-f] [-l logfile]

Severity
0 : Information

Explanation
This shows the correct usage.

Response
None.

AMQ5886
IBM WebSphere MQ Publish/Subscribe broker is being migrated.

Severity
10 : Warning

Explanation
The command cannot be issued at this time because the MQ Pub/Sub broker at queue manager <*insert_3*> is being migrated.

Response
Once migration has commenced then the only command which can be issued against the MQ Pub/Sub broker is the endmqbrk command to cancel the migration. Once the broker has ended if migration did not complete then it can be reattempted using the migmqbrk command again. Alternatively it can be canceled by restarting the broker using the strmqbrk command.

AMQ5887
Migration started for stream <*insert_3*>

Severity
0 : Information

Explanation
Migration of stream <*insert_3*> has started.

Response
None.

AMQ5888
Migration complete for stream <*insert_3*>

Severity
0 : Information

Explanation
All of the state of stream <*insert_3*> has been exported to the WebSphere Brokers broker.

Response
None.

AMQ5889
IBM WebSphere MQ Publish/Subscribe broker has been successfully migrated.

Severity
0 : Information

Explanation
Migration of the broker has completed successfully.

Response
The broker has been migrated. Resources used by it can now be freed by using the dltmqbrk command.

AMQ5890
The migration of the IBM WebSphere MQ Publish/Subscribe broker has failed.

Severity
10 : Warning

Explanation
The IBM WebSphere MQ Publish/Subscribe broker is being migrated. During this migration all persistent state, for example subscriptions, are exported to the WebSphere Brokers broker as a series of messages sent to queue <*insert_3*>. A migration message could not be written to this queue for reason <*insert_1*>.

Response
Use the MQPUT failure code <*insert_1*> to determine why the message cannot be written to the queue. The reason code could indicate that the queue manager is terminating in which case the migmqbrk command will need to be re-issued after the queue manager has restarted. Alternatively there may be a problem with the queue which may need to be rectified before migration can be attempted again.

AMQ5891
IBM WebSphere MQ Publish/Subscribe broker has failed to receive a reply while exporting its state to WebSphere Brokers

Severity
10 : Warning

Explanation
The IBM WebSphere MQ Publish/Subscribe broker is being migrated. During this migration all persistent state, for example subscriptions, are exported to the WebSphere Brokers broker as a series of messages. A reply message for one of the migration messages could not be retrieved from queue <*insert_3*> for reason <*insert_1*>. The migration of the IBM WebSphere MQ Publish/Subscribe broker has failed.

Response
Use the MQGET failure code <*insert_3*> to determine why the reply message could not be received from the reply queue. The reason code could indicate that the queue manager is terminating in which the migmqbrk command will need to be re-issued after the queue manager has restarted. A reason code of 2033 indicates that no reply message was received within a 30 second wait interval. In this case the problem is more likely to have occurred at the WebSphere Brokers broker. Check for error messages issued at the WebSphere Brokers broker.

AMQ5892

Migration of stream <*insert_3*> has failed for reason <*insert_1*>:<*insert_4*>.

Severity

0 : Information

Explanation

Migration of stream <*insert_3*> has failed.

Response

Use reason code <*insert_1*> to investigate the reason for the failure. Once the problem has been resolved, re-issue the migmqbrk command to retry migration.

AMQ5892 (IBM i)

Migration of stream <*insert_3*> has failed.

Severity

0 : Information

Explanation

Migration of stream <*insert_3*> has failed for reason <*insert_1*>:<*insert_4*>.

Response

Use reason code <*insert_1*> to investigate the reason for the failure. Once the problem has been resolved, re-issue the migmqbrk command to retry migration.

AMQ5893

IBM WebSphere MQ Publish/Subscribe broker (<*insert_3*>) cannot be migrated for reason <*insert_1*>:<*insert_5*>.

Severity

20 : Error

Explanation

An attempt has been made to migrate the IBM WebSphere MQ Publish/Subscribe broker (<*insert_3*>) but the request has failed for reason <*insert_1*>:<*insert_5*>.

Response

Determine why the migmqbrk command cannot complete successfully. The message logs for the queue manager might contain more detailed information outlining why the broker cannot be migrated. Resolve the problem that is preventing the command from completing and reissue the migmqbrk command.

AMQ5893 (IBM i)

IBM WebSphere MQ Publish/Subscribe broker cannot be migrated.

Severity

20 : Error

Explanation

An attempt has been made to migrate the broker (<*insert_3*>) but the request has failed for reason <*insert_1*>:<*insert_5*>.

Response

Determine why the migmqbrk command cannot complete successfully. The message logs for the queue manager might contain more detailed information outlining why the broker cannot be migrated. Resolve the problem that is preventing the command from completing and reissue the migmqbrk command.

AMQ5894

IBM WebSphere MQ Publish/Subscribe broker cannot be migrated.

Severity

10 : Warning

Explanation

The IBM WebSphere MQ Publish/Subscribe broker cannot be migrated yet because the state of stream <*insert_3*> is not consistent with respect to related broker <*insert_4*>. While an IBM WebSphere MQ Publish/Subscribe broker is being migrated a check is made to ensure that the state of each stream is consistent with respect to all of the broker's relations. This check has failed because an inconsistency has been detected in the state of stream <*insert_3*> with respect to broker <*insert_4*>. The problem will most likely be of a transient nature, caused because the WebSphere MQ Publish/Subscribe broker has yet to complete processing a recent change to the topology of the broker network. For example, the stream in question may have recently been created or deleted at related broker <*insert_4*> and this broker has yet to complete its processing for this change. Another cause maybe that either this broker, or broker <*insert_4*>, have just been added into the broker network and subscriptions have yet to be exchanged the two brokers. If this is the case then the brokers will be inconsistent with respect to all streams. If no recent topology changes have been made then there maybe a current failure with the propagation of subscriptions to broker <*insert_4*>.

Response

In all cases migration of the IBM WebSphere MQ Publish/Subscribe broker will need to be suspended until the inconsistency has been resolved. You will need to restart the broker using the strmqbrk command so that it can resolve the problem. After a short while, the broker can be ended and migration reattempted. If repeated attempts to migrate the broker all fail with this message then try to resolve the underlying problem. Look for earlier occurrences of message AMQ5826 and follow the guidance given there. In all cases ensure that the channels between the two brokers are running.

AMQ5895

IBM WebSphere MQ Publish/Subscribe broker cannot be migrated.

Severity

10 : Warning

Explanation

A topic has been detected which cannot be exported to the WebSphere Brokers broker. The topic <*insert_3*> cannot be migrated because it contains wildcard characters recognized by the WebSphere Brokers broker. The wildcard characters used by WebSphere Brokers are the '+' and the '#' characters. The state associated with the topic is not migrated and migration of the IBM WebSphere MQ Publish/Subscribe broker fails.

Response

The IBM WebSphere MQ Publish/Subscribe broker cannot be migrated while topic <*insert_3*> is in use. All applications using topics which contain either the '+' or '#' characters will need to be redesigned to use different topic strings. Until the problem has been resolved the IBM WebSphere MQ Publish/Subscribe broker can be restarted as normal using the strmqbrk command.

AMQ5896

Unknown attribute for IBM WebSphere MQ Publish/Subscribe broker configuration parameter GroupId.

Severity

20 : Error

Explanation

The broker has attempted to create stream <*insert_4*> belonging to group <*insert_3*>, this group is unknown.

Response

Modify the attribute for broker configuration parameter GroupId, to a group that exists, or create the group <*insert_3*>.

AMQ5897

Subscription (subname <*insert_5*>, traditional identity <*insert_4*>, topicstring <*insert_3*>) not migrated, reason code <*insert_2*>

Severity

10 : Warning

Explanation

The migration of a subscription has failed and will be skipped (The migration failed with reason code <*insert_2*>). The subscription has topic string is <*insert_3*>, traditional identity <*insert_4*> and subcription name <*insert_5*>.

Response

Either manually migrate this subscription or investigate and fix the problem and perform the migration again.

AMQ5898

Changing parent queue manager cannot be performed during migration.

Severity

20 : Error

Explanation

A different queue manager was supplied with the '-p' parameter to the current parent manager.

Response

Reissue the migration command without the -p option. Once the migration has been performed, use MQSC to alter the queue manager's parent queue manager.

AMQ5900

Usage: migmbbrk [-r] [-o] [-s] [-z] -b BrokerName

Severity

0 : Information

Explanation

This shows the correct usage.

Response

None.

AMQ5901

Migrating Publish/Subscribe ACLs Header.

Severity

0 : Information

Explanation

Migrating Publish/Subscribe ACLs.

From WebSphere Message Broker: <*insert_3*>

To WebSphere MQ Queue Manager: <*insert_4*>

Timestamp: <*insert_5*>

Response

Follow the instructions to migrate ACLs

AMQ5902

Migrating Publish/Subscribe ACLs. No Broker ACLs

Severity

0 : Information

Explanation

The simplest way to migrate to IBM WebSphere MQ is to choose or create a user group with members that are all the user ids that will use publish/subscribe services. Edit the setmqaut command shown here to replace <AllPSUsers> with the group you have chosen. Then execute the resulting command to modify the security attributes of the root MQ topic to be equivalent to WebSphere Brokers

setmqaut -m <*insert_4*> -n SYSTEM.BASE.TOPIC -t topic -g <AllPSUsers> +pub +sub

Response
Follow the instructions to migrate ACLs

AMQ5903
Migrating Publish/Subscribe ACLs. No Negative ACLs

Severity
0 : Information

Explanation

The root of the topic tree in <*insert_3*> has been changed to the same setting that is used by MQ. Furthermore, the topic tree contains only postive ACLs. Therefore it is possible to migrate the ACLs directly from <*insert_3*> to <*insert_4*> as follows.

1. Use the following MQSC commands to create topic objects in the topic tree for <*insert_4*>.

Response
Follow the instructions to migrate ACLs

AMQ5904
Migrating Publish/Subscribe ACLs. MQSC Create Topic

Severity
0 : Information

Explanation

Topic Object Name: <*insert_3*>

Topic String: <*insert_4*>

Response
Follow the instructions to migrate ACLs

AMQ5905
Migrating Publish/Subscribe ACLs. setmqaut

Severity
0 : Information

Explanation

setmqaut -m <*insert_3*> -n <*insert_4*> -t topic <*insert_5*>

Response
Follow the instructions to migrate ACLs

AMQ5906
Migrating Publish/Subscribe ACLs. setmqaut intro

Severity
0 : Information

Explanation
2. Use the following setmqaut commands to create authorisations in <*insert_4*>.

Response
Follow the instructions to migrate ACLs

AMQ5907
Migrating Publish/Subscribe ACLs. Redundant ACLs

Severity
0 : Information

Explanation

The WebSphere Brokers <*insert_3*> has the protection on its root topic set to allow all users to perform all actions (the default). However, there are additional ACLs defined elsewhere in the topic tree that also grant access to named users. These ACLs are redundant because of the setting on the root. You should review the ACLs defined in the broker since they may not be implementing the security that you intend.

Response
Follow the instructions to migrate ACLs

AMQ5908
Migrating Publish/Subscribe ACLs. Manual intervention required.

Severity
0 : Information

Explanation

The WebSphere Brokers <*insert_3*> has an ACL structure that cannot be migrated directly to IBM WebSphere MQ Typically this happens when the broker uses negative ACLs (which appear as "Deny" in the broker tooling) although it can sometimes occur when the root of the topic tree has multiple ACLs. You must review the broker's ACL structure and migrate it manually to <*insert_4*>.

Response
Follow the instructions to migrate ACLs

AMQ5909
Unable to create temporary queue <*insert_3*>.

Severity
20 : Error

Explanation
Unable to create temporary queue <*insert_3*>.

Response
Run the application again with service trace enabled and then contact your IBM support center.

AMQ5910
Unable to open migration log file.

Severity
20 : Error

Explanation
Unable to open migration log file.

Response
The log file is called amqmigmbbrk.log and is created in the current working directory. Determine why this file cannot be created and then re-run this application.

AMQ5911
Unable to delete temporary queue <*insert_3*>.

Severity
20 : Error

Explanation
Unable to delete temporary queue <*insert_3*>.

Response
If the migration log file shows that the application completed successfully then delete queue <*insert_3*> manually. If not, then run the application again with service trace enabled and then contact your IBM support center.

AMQ5912
Unable to open queue <*insert_3*>. Reason code: <*insert_1*>.

Severity
20 : Error

Explanation
Unable to open queue <*insert_3*>. Reason code: <*insert_1*>.

Response
Determine why the application cannot open the queue. Re-running the application while collecting trace may help with this. If necessary, contact your IBM service centre.

AMQ5913
WebSphere Brokers <*insert_3*> is not responding.

Severity
20 : Error

Explanation
WebSphere Brokers <*insert_3*> is not responding.

Response
Check that the WebSphere Brokers <*insert_3*> is started and working normally. If necessary, contact your IBM service centre.

AMQ5914
Unable to read a message from queue <*insert_3*>. Reason code: <*insert_1*>.

Severity
20 : Error

Explanation
Unable to read a message from queue <*insert_3*>. Reason code: <*insert_1*>.

Response
Determine why the application cannot read from the queue. Re-running the application while collecting service trace may help with this. If necessary, contact your IBM service centre.

AMQ5915
Unable to put a message to queue <*insert_3*>. Reason code: <*insert_1*>.

Severity
20 : Error

Explanation
Unable to put a message to queue <*insert_3*>. Reason code: <*insert_1*>.

Response
Determine why the application cannot put to the queue. Re-running the application while collecting service trace may help with this. If necessary, contact your IBM service centre.

AMQ5916
Unable to close queue <*insert_3*>. Reason code: <*insert_1*>.

Severity
20 : Error

Explanation
Unable to close queue <*insert_3*>. Reason code: <*insert_1*>.

Response
Determine why the application cannot close the queue. Re-running the application while collecting trace may help with this. If necessary, contact your IBM service centre.

AMQ5917
Unable to initialise the XML parser.

Severity
20 : Error

Explanation
Unable to initialise the XML parser.

Response
This is an internal error. Re-run the application while collecting service trace, then contact your IBM service centre.

AMQ5918
An XML message from the WebSphere Brokers <*insert_3*> could not be parsed.

Severity
20 : Error

Explanation
An XML message from the WebSphere Brokers <*insert_3*> could not be parsed.

Response
An XML message provided by WebSphere Brokers <*insert_3*> resulted in an error when &MQ tried to parse it. The XML message that caused the problem has been written to <*insert_4*>. The problem occurred in line <*insert_1*> at column <*insert_2*>. Contact your IBM service centre and report this problem.

AMQ5919
The XML parser encountered an error and had to stop.

Severity
20 : Error

Explanation
The XML parser encountered an error and had to stop.

Response
An XML message provided by WebSphere Brokers <*insert_3*> resulted in an error when &MQ tried to parse it. The XML message has been written to <*insert_4*>. Contact your IBM service centre and report this problem.

AMQ5920
Unable to clear temporary queue <*insert_3*>.

Severity
20 : Error

Explanation
Unable to clear temporary queue <*insert_3*>.

Response
Examine the queue and try to clear it manually. If the problem persists then run the application again with service trace enabled and then contact your IBM support center.

AMQ5921
Unable to create UTF-8 transcoder.

Severity
20 : Error

Explanation
Unable to create UTF-8 transcoder. This is an internal error from the XML message parser.

Response
Run the application again with service trace enabled and then contact your IBM support center.

AMQ5922
Unable to migrate a topic string from WebSphere Brokers because it is too long or contains an unrecognised character. The start of the string is <*insert_3*>.

Severity
20 : Error

Explanation
Unable to process a topic string from WebSphere Brokers because it is too long or contains an unrecognized character. The start of the string is <*insert_3*>.

Response
Migrate the topic string manually. (Reviewing the migration log may provide additional information about the source of the problem.)

AMQ5923
Unable to retrieve the CCSID for queue manager <*insert_3*>. Reason code: <*insert_1*>

Severity
20 : Error

Explanation
Unable to retrieve the CCSID for queue manager <*insert_3*>. Reason code: <*insert_1*>

Response
Re-run the application with trace enabled to determine the cause of the problem. If necessary, contact your IBM support centre.

AMQ5924
Duplicate topic object <*insert_3*> already exists.

Severity
20 : Error

Explanation
While attempting to create topic object <*insert_3*> for topic string <*insert_4*> the migration utility found that a topic object of that name already exists and was unable to replace it.

Response
Examine the topic object to determine whether it represents the correct topic string. If it does, then it was probably created by a previous run of this utility and it is safe to either use it as it is, or overwrite it. If not, then the conflict will have to be resolved manually. Further details of this problem are recorded in the migration log file.

AMQ5925
The execution environment for WebSphere Brokers has not been initialised

Severity
20 : Error

Explanation
This utility must be run from a command window that can execute WebSphere Brokers commands and this not the case.

Response

Either run this utility from an WebSphere Brokers command console or manually execute the mqsiprofile command script before running the migration tool.

AMQ5926

Unable to subscribe to topic for migration completion message.

Severity

20 : Error

Explanation

This utility subscribes to topic, <*insert_3*>, to determine whether the pub/sub state for this broker has already been migrated. However the subscription failed with reason code %d.

Response

This is an unexpected error. Contact your IBM support centre

AMQ5927

Migration for this broker has been completed successfully in the past. Since the -z switch was not specified, this attempt will be abandoned.

Severity

0 : Information

Explanation

Migration for this broker has been completed successfully in the past. Since the -z switch was not specified, this attempt will be abandoned.

Response

If the previous successful run produced satisfactory results then there is nothing more to do. If you really do intend to run the migration again then specify the -z switch. You may also want to use the -o switch if you wish to overwrite existing artifacts in the queue manager with ones found during migration.

AMQ5928

Migrating subscription (subname <*insert_5*>, traditional identity <*insert_4*>, topicstring <*insert_3*>) failed when replacing an existing subscription with reason <*insert_2*>

Severity

20 : Error

Explanation

Because the migration command was run with the force flag (-f) it has tried to replace an existing subscription. Replacing the existing subscription failed with reason <*insert_2*>. The subscription has topic string is <*insert_3*>, traditional identity <*insert_4*> and subcription name <*insert_5*>.

Response

Use the migration log to investigate and fix the problem and perform the migration again.

AMQ5929

Migration of a subscription was skipped as a existing subscription exists with the same subname. (The subscription that was not migrated had: subname <*insert_5*>, traditional identity <*insert_4*> and topicstring <*insert_3*>.

Severity

10 : Warning

Explanation

The migration command was run without the force flag (-f). Therefore existing subscriptions are not overwritten. Two subscriptions cannot have the same subname so migration of the subscription was skipped.

Response

If the subscription that has been skipped is still required then either the existing subscription

with the same name can be removed and the migration command then re-run, or the migration command can be re-run with the force option (-f) which will cause any existing subscriptions with the same subname to be migrated.

AMQ5930
Migration of stream <*insert_3*> encountered non-fatal errors, reason <*insert_1*>:<*insert_4*>.

Severity
0 : Information

Explanation
During migration of stream <*insert_3*>, an error occurred but the migration of the stream continued

Response
Use earlier error messages, the migration log, or both to investigate the reason for the failure. Once the problem has been resolved, iissue the migmqbrk command again to retry migration.

AMQ5931
Failed to create topic object for stream <*insert_3*> reason <*insert_1*>

Severity
20 : Error

Explanation
During migration a topic object is created for each stream. Creation of the topic object that corresponds to stream <*insert_3*> failed for reason <*insert_1*>.

Response
Use the migration log to investigate and fix the problem and perform the migration again.

AMQ5932
Migration of security for stream <*insert_3*> failed with reason <*insert_1*>

Severity
20 : Error

Explanation
During migration, security access for the stream is migrated to the corresponding topic object. Migrating the security for stream <*insert_3*> failed for reason <*insert_1*>.

Response
Use the migration log to investigate and fix the problem and perform the migration again.

AMQ5933
Could not open migration log: <*insert_3*>

Severity
20 : Error

Explanation
A log of actions performed during publish/subscribe migration is kept. (Its location can be set using the "-l" command line parameter - currently it is set to <*insert_3*>). The log could not be opened for writing.

Response
Ensure that the file <*insert_3*> can be written to and then rerun the migration. Alternatively rerun the migration specifying a different log file location with the "-l" parameter.

AMQ5934
Could not write to migration log: <*insert_3*>

Severity
20 : Error

Explanation

A log of actions performed during publish/subscribe migration is kept. (Its location can be set using the "-l" command line parameter - currently is is set to <*insert_3*>). The log could not be written to.

Response

Ensure that the file <*insert_3*> can be wriiten to and then rerun the migration. Alternatively rerun the migration specifying a different log file location with the "-l" parameter.

AMQ5935

None of the following subscription properties were encountered during migration

JoinExcl

JoinShared

NoAlter

VariableUserId

SubIdentity

SubName

If your subscriptions do not use these properties then no further action is required. However if you do have subscriptions that rely on these properties then you must upgrade WebSphere Brokers and re-run the migration.

Severity

10 : Warning

Explanation

These properties are only visible to the migration tool if WebSphere Brokers has been upgraded to the most recent fix pack level.

Response

If your subscriptions do not use these properties then no action is required.

However, if any of your subscriptions use any of these properties then you need to upgrade WebSphere Brokers and then re-run the migration process.

AMQ5936

Unable to commit a read from queue <*insert_3*>.

Severity

20 : Error

Explanation

A message was read from queue <*insert_3*> under synch point but the subsequent attempt to commit that read failed.

Response

Re-run the application using the -s switch which will force all intermediate queues to be cleared before they are used. If the problem persists, contact your IBM service centre.

AMQ5937

Duplicate subscription already exists.

Severity

20 : Error

Explanation

While attempting to create a subscription named <*insert_3*> for topic string <*insert_4*> the migration utility found that a subscription of that name already exists and was unable to replace it.

Response

Examine the subscription to determine whether it is correct. If it is, then it was probably created by a previous run of this utility and it is safe to either use it as it is, or overwrite it. If not, then the conflict will have to be resolved manually. Further details of this problem are recorded in the migration log file.

AMQ5938

Unable to make subscription.

Severity

20 : Error

Explanation

A failure occurred while attempting to create a subscription to topic string <*insert_4*> using the subscription name <*insert_3*>. The associated reason code is <*insert_1*>.

Response

Use the reason code shown in the message to determine the cause of the failure and take appropriate action to rectify the problem.

AMQ5939

Unexpected message read from queue <*insert_3*>.

Severity

20 : Error

Explanation

A message read from queue <*insert_3*> was not expected at this stage of migration.

Response

The unexpected message should not have been on the queue. Re-run the application using the -s switch which will force all intermediate queues to be cleared before they are used. If the problem persists, contact your IBM service centre.

AMQ5940

Failed to migrate relations

Severity

20 : Error

Explanation

During migration of the hierarchy relations an error was encountered. See the migration log for more details.

Response

Look at the migration log for details of the error, correct the problem and run the migration command again.

AMQ5941

Unable to allocate a unique name for a subscription point.

Severity

20 : Error

Explanation

The queue manager allocates a unique topic object name for each subscription point up to a maximum of 256 and that limit has been reached. No further subscription points can be migrated to this queue manager. In addition, any artifact that depends on this subscription point, for example, retained publications, will also not be migrated.

Response

If possible reduce the number of subscription points used by the WebSphere Brokers broker that is the source of the migration.

AMQ5942
A userid, <*insert_3*>, supplied by the WebSphere Brokers is not valid

Severity
20 : Error

Explanation
The userid, <*insert_3*>, is not valid for use with the queue manager.

Response
Examine the migration log or product trace to determine why the userid is not valid for this queue manager. If possible, alter the userid that is stored in the broker and re-run the migration step.

AMQ5943
Migration cannot be performed as the IBM WebSphere MQ Publish/Subscribe is currently active

Severity
10 : Warning

Explanation
The runmqbrk (and strmqbrk) commands migrate publish/subscribe data (for example, subscriptions and retained messages) from earlier versions of &MQ. The migration can only be performed when the IBM WebSphere MQ Publish/Subscribe is inactive.

Response
If migration is required, the IBM WebSphere MQ Publish/Subscribe should first be disabled, which can be achieved using the following MQSC: alter qmgr psmode(compat)

AMQ5944
Migration has completed with errors. The IBM WebSphere MQ Publish/Subscribe will need to be started manually

Severity
10 : Warning

Explanation
The migration command has completed but not all data could be migrated. Details of the error(s) can be found in earlier error messages and the migration log.

Response
Examine earlier error messages and review the migration log, then manually perform migration of any remaining data that is still required (or if the problem was transitory by re-running the migration command). Once migration has been completed, the IBM WebSphere MQ Publish/Subscribe can be started by issuing the following MQSC command: alter qmgr psmode(enabled)

AMQ5945
The retained message for topic-string <*insert_3*> on stream <*insert_4*> could not be migrated for reason code <*insert_2*>

Severity
10 : Warning

Explanation
The migration of a retained message has failed and will be skipped (The migration failed with reason code <*insert_2*>). The retained message has topic string <*insert_3*>, on stream <*insert_4*>.

Response
Either manually republish the message for this topic or investigate and fix the problem and perform the migration again.

AMQ5946
The &MQQPUBSUB_short could not be started for reason <*insert_1*>

Severity
20 : Error

Explanation
After the migration, the starting of the &MQQPUBSUB_short could not be performed.

Response
Determine (from the reason) why the &MQQPUBSUB_short could not be started, correct the problem and then manually issue the following MQSC command: ALTER QMGR PSMODE(ENABLED)

AMQ5947
The setting of PSMODE is not COMPAT for queue manager <*insert_1*>

Severity
20 : Error

Explanation
The queue manager property PSMODE must be set to COMPAT for queue manager <*insert_1*> to allow pub/sub migration to happen.

Response
None.

AMQ5948
Some properties of RFH1 format retained messages cannot be retrieved from the broker. If there are RFH1 format retained messages in the broker then you should check that the retained publication that has been migrated to the queue manager is in fact correct.

Severity
10 : Warning

Explanation
Some properties of RFH1 format retained messages cannot be retrieved from the broker. If there are RFH1 format retained messages in the broker then you should check that the retained publication that has been migrated to the queue manager is in fact correct. See the MQ documentation for more details.

Response
Check whether the WMB broker does in fact have retained publications that were published in RFH1 format and, if so, manually migrate them to the queue manager.

AMQ5949
Unable to set environment for mqsistop command.

Severity
20 : Error

Explanation
The migration tool attempts to stop the broker once migration is complete and has to set environment variables in order to do this. The attempt to set one or more of those variables failed.

Response
Review the migration log file or run the migration again with trace turned on to obtain more detail of the reason for the failure.

AMQ5950
Unable to resume an interrupted migration run.

Severity
20: Error

Explanation

The migration tool found that a previous run had been interrupted. It normally attempts to resume that migration run from the point where it was interrupted, but on this occasion was unable to do so because the interruption occurred while processing multiple subIdentities for a subscription.

Response

Run the migration again with the -s switch turned on to prevent resumption of the previous run and also with the -o switch to force existing definitions in the queue manager to be overwritten by the definitions brought from the broker.

AMQ5960

Distributed pub/sub command processor stopping because of errors.

Severity

20 : Error

Explanation

A severe error, as reported in the preceding messages, occurred during distributed pub/sub command processing. The pub/sub command processor was unable to continue and terminates.

Response

Correct the problem reported in the preceding messages.

AMQ5961

Distributed pub/sub publication processor stopping because of errors.

Severity

20 : Error

Explanation

A severe error, as reported in the preceding messages, occurred during distributed pub/sub publication processing. The pub/sub publication processor was unable to continue and terminates.

Response

Correct the problem reported in the preceding messages.

AMQ5962

Distributed pub/sub proxy-subscription fan out process is stopping because of errors.

Severity

20 : Error

Explanation

A severe error, as reported in the preceding messages, occurred during distributed pub/sub proxy-subscription fan out. The pub/sub proxy-subscription fan out process was unable to continue and terminates.

Response

Correct the problem reported in the preceding messages.

AMQ5963

Queued Pub/Sub Daemon Unavailable.

Severity

20 : Error

Explanation

The Distributed publish/subscribe process was unable to contact the queued pub/sub Daemon. If there is a problem with the Daemon, this should be highlighted in preceding messages. Hierarchical connections will not be further processed until the problem is rectified.

Response
Correct the problem reported in the preceding messages. When the Daemon becomes available, it may be necessary to perform a REFRESH QMGR TYPE(PROXYSUB) to resync subscriptions.

AMQ5964
Pub/sub hierarchy connected.

Severity
0 : Information

Explanation
A pub/sub hierarchy connection has been established with child or parent queue manager <*insert_3*>.

Response
None.

AMQ5965
Pub/sub hierarchy disconnected.

Severity
0 : Information

Explanation
A pub/sub hierarchy connection has ended with child or parent queue manager <*insert_3*>.

Response
None.

AMQ5966
A previous publication is being incorrectly processed again.

Severity
30 : Severe error

Explanation
A publication, previously processed by this queue manager, has been received. This message will not be published again and will be processed according to the message's report options. Additional messages may be written if this publication is sent to the dead-letter queue. This is caused by an invalid configuration of a hierarchy and a pub/sub cluster.

Response
Correct the configuration to remove the loop. Check the message properties in the dead-letter queue to determine the route taken.

AMQ5967
Unable to deliver proxy subscription to queue manager <*insert_3*>. Reason code: <*insert_1*>.

Severity
20 : Error

Explanation
Unable to deliver proxy subscription to queue manager <*insert_3*>. Reason code: <*insert_1*>. This may result in subscriptions not receiving publications from <*insert_3*>.

Response
Correct the configuration to allow proxy subscriptions to be delivered to <*insert_3*>. When the problem has been resolved, it will be necessary to perform a REFRESH QMGR TYPE(PROXYSUB) to resynchronize subscriptions.

AMQ5972
Distributed Pub/Sub fanout request put failed.

Severity
20 : Error

Explanation

Unable to place subscription fanout request to the Distributed publish/subscribe fanout request queue <*insert_3*>. The associated reason code is <*insert_1*>.

Response

Correct the problem reported in the preceding messages. When the problem has been resolved, it may be necessary to perform a REFRESH QMGR TYPE(PROXYSUB) to resync subscriptions.

AMQ5979

Proxy subscription from <*insert_3*> rejected because PSCLUS(DISABLED).

Severity

10 : Warning

Explanation

Queue manager attribute PSCLUS has been set to DISABLED to indicate that Publish/Subscribe activity is not expected between queue managers in this cluster. However, a cluster subscription has been sent to this queue manager over a channel from <*insert_3*>. The proxy subscription request will be ignored and no subscription locally registered.

Response

If you need to enable publish/subscribe clustering, alter the PSCLUS attribute on all queue managers in the cluster to ENABLED. You might also need to issue REFRESH CLUSTER and REFRESH QMGR commands as detailed in the PSCLUS documentation. If you are not using publish/subscribe clusters you should delete the clustered topic object, and ensure that PSCLUS is DISABLED on all queue managers.

AMQ5980

Distributed Pub/Sub proxy subscription re-synchronization occurred at startup.

Severity

0 : Information

Explanation

The Distributed publish/subscribe process was unable to determine that the proxy subscription state was consistent across shutdown and restart so a re-synchronization with remote queue managers has been performed. This is usually seen when a queue manager was not quiesced cleanly on the previous shutdown or when the system was particularly busy.

Response

None.

AMQ5981

Disabling Publish/Subscribe when participating in a Publish/Subscribe Cluster.

Severity

10 : Warning

Explanation

This queue manager is a member of a Publish/Subscribe Cluster but Publish/Subscribe has been disabled. Other queue managers within the cluster will continue to send publications and proxy subscriptions to this queue manager. They will accumulate on the Publish/Subscribe Cluster system queues and will not be processed until Publish/Subscribe is enabled. If these queues become full channel failure may occur, which will affect the operation of Publish/Subscribe on other queue managers in the cluster. This will also affect the delivery of other messages, unrelated to Publish/Subscribe, that are sent to this queue manager from other queue managers within the cluster.

Response

Enable Publish/Subscribe by setting PSMODE to ENABLED or COMPAT with the ALTER QMGR command, and then issue the REFRESH QMGR TYPE(PROXYSUB) command to resynchronize subscriptions.

AMQ5982

Disabling Queued Publish/Subscribe while participating in a Publish/Subscribe Hierarchy.

Severity

10 : Warning

Explanation

This queue manager is a member of a Publish/Subscribe hierarchy but Queued Publish/Subscribe has been disabled. Any parent-child relations within the Publish/Subscribe hierarchy will continue to send publications and proxy subscriptions to this queue manager. They will accumulate on the Queued Publish/Subscribe system queues and will not be processed until Queued Publish/Subscribe is enabled. If the Queued Publish/Subscribe system queues become full channel failure may occur, which will affect the operation of Publish/Subscribe on parent-child relations sending messages to this queue manager. This will also affect the delivery of other messages, unrelated to Publish/Subscribe, that are to be delivered using the same channels.

Response

Enable Queued Publish/Subscribe by setting PSMODE to ENABLED with the ALTER QMGR command. When Queued Publish/Subscribe has been restarted, use the DISPLAY PUBSUB ALL command to confirm this has completed, and then issue the REFRESH QMGR TYPE(PROXYSUB) command to resynchronize subscriptions.

AMQ6000-6999: Common services

AMQ6004

An error occurred during IBM WebSphere MQ initialization or ending.

Severity

30 : Severe error

Explanation

An error was detected during initialization or ending of IBM WebSphere MQ The IBM WebSphere MQ error recording routine has been called.

Response

Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6005 (IBM i)

An error occurred during IBM WebSphere MQ startup.

Severity

30 : Severe error

Explanation

An attempt to start the storage monitor process (job QMQM in subsystem QSYSWRK) was unsuccessful.

Response

Check the joblog for this job and for the QMQM job for possible reasons for failure, correct the error and try the command again. If the problem is not resolved, a problem may have been logged. Use WRKPRB to record the problem identifier, and to save the QPSRVDMP, QPJOBLOG, and QPDSPJOB files. Save any generated output files and use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6015

The operating system is either too busy or has insufficient resources to complete a system request.

Severity

30 : Severe error

Explanation

A system request <*insert_3*> was rejected by the operating system with return code <*insert_1*>. IBM WebSphere MQ retried the request, but it continued to fail. This failure may indicate that the operating system is either too busy or has insufficient resources to complete the request.

Response

Investigate whether the system is constrained by the workload on this system or by the workload on a server that it is using, and reduce the workload.

AMQ6024

Insufficient resources are available to complete a system request.

Severity

30 : Severe error

Explanation

A system request was rejected by the operating system because insufficient resources are available to complete the request. Use any previous FFSTs, error log messages or, on Windows, system event log messages, to determine which resource is insufficient.

Response

Investigate whether the system has been configured in accordance with the documentation and increase the necessary resource to allow the system request to complete successfully.

AMQ6025

Program not found.

Severity

30 : Severe error

Explanation

IBM WebSphere MQ is unable to start program <*insert_3*> because it was not found.

Response

Check the program name is correctly specified and rerun the program.

AMQ6026

A resource shortage prevented the creation of a IBM WebSphere MQ process.

Severity

30 : Severe error

Explanation

An attempt to create an IBM WebSphere MQ process was rejected by the operating system due to a process limit (either the number of processes for each user or the total number of processes running system wide), or because the system does not have the resources necessary to create another process.

Response

Investigate whether a process limit is preventing the creation of the process and if so why the system is constrained in this way. Consider raising this limit or reducing the workload on the system.

AMQ6035

IBM WebSphere MQ failed, no storage available.

Severity
30 : Severe error

Explanation
An internal function of the product attempted to obtain storage, but there was none available.

Response
Stop the product and restart it. If this does not resolve the problem, save any generated output files and use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ6037
IBM WebSphere MQ was unable to obtain enough storage.

Severity
20 : Error

Explanation
The product is unable to obtain enough storage. The product's error recording routine may have been called.

Response
Stop the product and restart it. If this does not resolve the problem see if a problem has been recorded. If a problem has been recorded, use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6047
Conversion not supported.

Severity
30 : Severe error

Explanation
IBM WebSphere MQ is unable to convert string data tagged in CCSID <*insert_1*> to data in CCSID <*insert_2*>.

Response
Check the IBM WebSphere MQ Application Programming Reference Appendix and the appropriate National Language Support publications to see if the CCSIDs are supported by your system.

AMQ6048
DBCS error

Severity
30 : Severe error

Explanation
IBM WebSphere MQ is unable to convert string data due to a DBCS error. Conversion is from CCSID <*insert_1*> to CCSID <*insert_2*>.

Response
Check the IBM WebSphere MQ Application Programming Reference Appendix and the appropriate National Language Support publications to see if the CCSIDs are supported by your system.

AMQ6049
DBCS-only string not valid.

Severity
30 : Severe error

Explanation
IBM WebSphere MQ is unable to convert string data in CCSID <*insert_1*> to data in CCSID <*insert_2*>. Message descriptor data must be in single-byte form. CCSID <*insert_2*> is a DBCS-only CCSID.

Response
Check the CCSID of your job or system and change it to one supporting SBCS or mixed character sets. Refer to the IBM WebSphere MQ Application Programming Reference Appendix and the appropriate National Language Support publications for character sets and CCSIDs supported.

AMQ6050
CCSID error.

Severity
30 : Severe error

Explanation
IBM WebSphere MQ is unable to convert string data in CCSID <*insert_1*> to data in CCSID <*insert_2*>.

Response
Check the IBM WebSphere MQ Application Programming Reference Appendix and the appropriate National Language Support publications to see if the CCSIDs are supported by your system.

AMQ6051
Conversion length error.

Severity
30 : Severe error

Explanation
IBM WebSphere MQ is unable to convert string data in CCSID <*insert_1*> to data in CCSID <*insert_2*>, due to an input length error.

AMQ6052
Conversion length error.

Severity
30 : Severe error

Explanation
IBM WebSphere MQ is unable to convert string data in CCSID <*insert_1*> to data in CCSID <*insert_2*>.

AMQ6053
CCSID error

Severity
30 : Severe error

Explanation
IBM WebSphere MQ is unable to convert string data in CCSID <*insert_1*> to data in CCSID <*insert_2*>.

Response
One of the CCSIDs is not supported by the system. Check the IBM WebSphere MQ Application

Programming Reference Appendix and the appropriate National Language Support publications to see if the CCSIDs are supported by your system.

AMQ6064
An internal IBM WebSphere MQ error has occurred.

Severity
30 : Severe error

Explanation
An error has been detected, and the IBM WebSphere MQ error recording routine has been called.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6088 (IBM i)
An internal IBM WebSphere MQ error has occurred.

Severity
40 : Stop Error

Explanation
An internal error occurred when API call <*insert_3*> was made.

Response
Use WRKPRB to record the problem identifier, and to save the QPSRVDMP, QPJOBLOG, and QPDSPJOB files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6089 (IBM i)
IBM WebSphere MQ was unable to display an error message.

Severity
30 : Severe error

Explanation
An attempt to display an error message was unsuccessful. This may be because the AMQMSG message file could not be found. The message identifier is <*insert_3*>.

Response
Check that the library list is set up correctly to access the AMQMSG message file. If a change is necessary, rerun the failing application and record the error message. If you are unable to resolve the problem, save any generated output files and use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ6090
IBM WebSphere MQ was unable to display an error message <*insert_6*>.

Severity
0 : Information

Explanation

IBM WebSphere MQ has attempted to display the message associated with return code hexadecimal <*insert_6*>. The return code indicates that there is no message text associated with the message. Associated with the request are inserts <*insert_1*> : <*insert_2*> : <*insert_3*> : <*insert_4*> : <*insert_5*>.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6091

An internal IBM WebSphere MQ error has occurred.

Severity

0 : Information

Explanation

Private memory has detected an error, and is abending due to <*insert_3*>. The error data is <*insert_1*>.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6092 (Windows)

Manual conversion required for CCSID: <*insert_1*>

Severity

0 : Information

Explanation

CCSID <*insert_1*> exists in new format but could not be reconciled against your old format.

Response

Manually edit CCSID entry <*insert_1*> in conv\table\ccsid.tbl if you wish to retain your old conversion. For assistance call your Service Representative.

AMQ6100

An internal IBM WebSphere MQ error has occurred.

Severity

0 : Information

Explanation

IBM WebSphere MQ has detected an error, and is abending due to <*insert_3*>. The error data is <*insert_1*>.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a

solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6103 (IBM i)
IBM WebSphere MQ job submission error.

Severity
30 : Severe error

Explanation
IBM WebSphere MQ is unable to submit job <*insert_3*>.

AMQ6107
CCSID not supported.

Severity
30 : Severe error

Explanation
IBM WebSphere MQ is unable to convert string data in CCSID <*insert_1*> to data in CCSID <*insert_2*>, because one of the CCSIDs is not recognized.

Response
Check the IBM WebSphere MQ Application Programming Reference Appendix and the appropriate National Language Support publications to see if the CCSIDs are supported by your system.

AMQ6109
An internal IBM WebSphere MQ error has occurred.

Severity
30 : Severe error

Explanation
An error has been detected, and the IBM WebSphere MQ error recording routine has been called.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6110
An internal IBM WebSphere MQ error has occurred.

Severity
30 : Severe error

Explanation
An error has been detected, and the IBM WebSphere MQ error recording routine has been called.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6112 (IBM i)
IBM WebSphere MQ CCSID <*insert_1*> is using a default value.

Severity
10 : Warning

Explanation
When initializing IBM WebSphere MQ, no valid job CCSID was found, so the CCSID used is the default 37. This warning message will be issued until a valid CCSID has been set correctly.

Response
Set the job CCSID.

AMQ6114 (IBM i)
An internal IBM WebSphere MQ error has occurred.

Severity
30 : Severe error

Explanation
An error has been detected, and the IBM WebSphere MQ error recording routine has been called.

Response
Use WRKPRB to record the problem identifier, and to save the QPSRVDMP, QPJOBLOG, and QPDSPJOB files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6115
An internal IBM WebSphere MQ error has occurred.

Severity
10 : Warning

Explanation
An error has been detected, and the IBM WebSphere MQ error recording routine has been called.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6118
An internal IBM WebSphere MQ error has occurred (<*insert_1*>)

Severity
40 : Stop Error

Explanation
An error has been detected, and the IBM WebSphere MQ error recording routine has been called.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6119
An internal IBM WebSphere MQ error has occurred (<*insert_3*>)

Severity
40 : Stop Error

Explanation
IBM WebSphere MQ detected an unexpected error when calling the operating system. The IBM WebSphere MQ error recording routine has been called.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6120
An internal IBM WebSphere MQ error has occurred.

Severity
40 : Stop Error

Explanation
An error has been detected, and the IBM WebSphere MQ error recording routine has been called.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6121
An internal IBM WebSphere MQ error has occurred.

Severity
40 : Stop Error

Explanation
An error has been detected, and the IBM WebSphere MQ error recording routine has been called.

Response
IBM WebSphere MQ has detected a parameter count of <*insert_1*> that is not valid. Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6122
An internal IBM WebSphere MQ error has occurred.

Severity
40 : Stop Error

Explanation
An error has been detected, and the IBM WebSphere MQ error recording routine has been called.

Response
IBM WebSphere MQ has detected parameter <*insert_1*> that is not valid, having value <*insert_2*><*insert_3*>. Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web

page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6125
An internal IBM WebSphere MQ error has occurred.

Severity
40 : Stop Error

Explanation
An internal error has occurred with identifier <*insert_1*>. This message is issued in association with other messages.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6148
An internal IBM WebSphere MQ error has occurred.

Severity
0 : Information

Explanation
IBM WebSphere MQ has detected an error, and is abending due to <*insert_3*>. The error data is <*insert_1*>.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6150 (Windows)
IBM WebSphere MQ semaphore is busy.

Severity
10 : Warning

Explanation

IBM WebSphere MQ was unable to acquire a semaphore within the normal timeout period of <*insert_1*> minutes.

Response

IBM WebSphere MQ will continue to wait for access. If the situation does not resolve itself and you suspect that your system is locked then investigate the process which owns the semaphore. The PID of this process will be documented in the accompanying FFST.

AMQ6150 (IBM i)

IBM WebSphere MQ resource <*insert_3*> busy.

Severity

30 : Severe error

Explanation

IBM WebSphere MQ was unable to access an IBM WebSphere MQ object within the normal timeout period of <*insert_1*> minutes.

Response

IBM WebSphere MQ will continue to wait for access. Ensure that all jobs using IBM WebSphere MQ are released. If the situation persists, quiesce the queue manager.

AMQ6151 (IBM i)

IBM WebSphere MQ resource <*insert_3*> released.

Severity

30 : Severe error

Explanation

An IBM WebSphere MQ resource, for which another process has been waiting, for a period of over <*insert_1*> minutes has been released.

Response

No recovery is needed.

AMQ6152 (IBM i)

IBM WebSphere MQ failed to end commitment control while attempting to quiesce a queue manager.

Severity

30 : Severe error

Explanation

IBM WebSphere MQ failed to end commitment control whilst quiescing queue manager <*insert_3*>.

Response

There are one or more active resources under commitment control. Use the Work with Job (WRKJOB) command with the OPTION(*CMTCTL) parameter to display the active resources under commitment control. Check the job log for previously issued messages.

AMQ6153 (IBM i)

The attempt to quiesce queue manager <*insert_3*> failed

Severity

30 : Severe error

Explanation

The attempt to quiesce queue manager <*insert_3*> was unsuccessful

Response
Check the job log for previously issued messages. If the quiesce was issued with the *CNTRLD option, re-issue the command with the *IMMED option. If a low TIMEOUT retry delay was used, re-issue the request with a higher value.

AMQ6154 (IBM i)
Queue manager <*insert_3*> has been quiesced.

Severity
0 : Information

Explanation
The queue manager has been successfully quiesced.

Response
None.

AMQ6158 (IBM i)
SBCS CCSID not found.

Severity
30 : Severe error

Explanation
IBM WebSphere MQ is unable to find an SBCS CCSID which corresponds to mixed DBCS-SBCS CCSID <*insert_1*>.

Response
Check the CCSID of your job or system and check it has a SBCS equivalent. Refer to the National Language Support Planning Guide for character sets and CCSIDs supported. If the CCSID used does have an SBCS equivalent, save the job log containing this message and use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ6159 (IBM i)
IBM WebSphere MQ job submission error.

Severity
30 : Severe error

Explanation
IBM WebSphere MQ for IBM i is unable to release job <*insert_3*>.

Response
Contact you System Administrator to remove job <*insert_3*>. Ensure you have *JOBCTL authority and try again.

AMQ6160
EXPLANATION:

Severity
0 : Information

AMQ6161
ACTION:

Severity
0 : Information

AMQ6162
An error has occurred reading an INI file.

Severity
20 : Error

Explanation
An error has occurred when reading the MQS.INI file or a queue manager QM.INI file.

Response
If you have been changing the INI file content check and correct the change. If you have not changed the INI file, use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6162 (Tandem)
An error has occurred reading an INI file.

Severity
20 : Error

Explanation
An error has occurred when reading the MQSINI file or a queue manager QMINI file.

Response
If you have been changing the INI file content check and correct the change. If you have not changed the INI file, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6162 (Windows)
An error occurred when reading the configuration data.

Severity
20 : Error

Explanation
An error has occurred when reading the configuration data.

Response
If you have changed the configuration data, check and correct the change. If you have not changed the configuration data, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6163
An error has occurred locking an INI file.

Severity
10 : Warning

Explanation
An error has occurred locking the MQS.INI file or a queue manager QM.INI file.

Response
If you have been changing the INI file permissions check and correct the change. If you have not changed the INI file, use the standard facilities supplied with your system to record the problem

identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6163 (Tandem)
An error has occurred locking an INI file.

Severity
10 : Warning

Explanation
An error has occurred locking the MQSINI file or a queue manager QMINI file.

Response
If you have been changing the INI file permissions check and correct the change. If you have not changed the INI file, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6163 (Windows)
An error has occurred locking the configuration data.

Severity
10 : Warning

Explanation
An error has occurred locking the configuration data.

Response
If you have changed the the registry permissions, check and correct the change. If you have not changed the registry, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6164
An expected stanza in an INI file is missing or contains errors.

Severity
10 : Warning

Explanation
An expected stanza is missing from the MQS.INI file or a queue manager QM.INI file or the stanza contains errors.

Response
If you have been changing the INI file content check and correct the change.

AMQ6164 (Tandem)
An expected stanza in an INI file is missing or contains errors.

Severity
10 : Warning

Explanation
An expected stanza is missing from the MQSINI file or a queue manager QMINI file or the stanza contains errors.

Response
If you have been changing the INI file content check and correct the change.

AMQ6164 (Windows)
An expected stanza in the configuration data is missing or contains errors.

Severity
10 : Warning

Explanation
An expected stanza is missing from the configuration data or the stanza contains errors.

Response
If you have changed the configuration data, check and correct the change.

AMQ6165
Unable to access an INI file.

Severity
10 : Warning

Explanation
Access to the MQS.INI file or a queue manager QM.INI file is denied.

Response
If you have been changing the INI file permissions check and correct the change.

AMQ6165 (Tandem)
Unable to access an INI file.

Severity
10 : Warning

Explanation
Access to the MQSINI file or a queue manager QMINI file is denied.

Response
If you have been changing the INI file permissions check and correct the change.

AMQ6165 (Windows)
Unable to access the configuration data.

Severity
10 : Warning

Explanation
Access to the configuration data is denied.

Response
If you have changed the configuration data permissions, check and correct the changes.

AMQ6166
An INI file is missing.

Severity
20 : Error

Explanation
The MQS.INI file or a queue manager QM.INI file is missing.

Response
If you have been changing the INI file recover the previous file and retry the operation.

AMQ6166 (Tandem)
An INI file is missing.

Severity
20 : Error

Explanation
The MQSINI file or a queue manager QMINI file is missing.

Response
If you have been changing the INI file recover the previous file and retry the operation.

AMQ6166 (Windows)
An entry in the configuration data is missing.

Severity
20 : Error

Explanation
A required entry in the configuration data is missing.

Response
If you have changed the configuration data, recover the previous configuration data and retry the operation.

AMQ6172
No codeset found for current locale.

Severity
20 : Error

Explanation
No codeset could be determined for the current locale. Check that the locale in use is supported.

Response
None.

AMQ6173
No CCSID found for codeset <*insert_3*>.

Severity
20 : Error

Explanation
Codeset <*insert_3*>. has no supported CCSID. Check that the locale in use is supported. CCSIDs can be added by updating the file /var/mqm/conv/table/ccsid.tbl.

Response
None.

AMQ6174
The library <*insert_3*> was not found. The queue manager will continue without this module.

Severity
0 : Information

Explanation
The dynamically loadable library <*insert_3*> was not found.

Response
Check that the file exists and is either fully qualified or is in the appropriate directory.

AMQ6174 (UNIX and Linux)
The dynamically loadable shared library <*insert_3*> was not found. The system returned error number <*insert_2*> and error message <*insert_4*>. The queue manager will continue without this module.

Severity
0 : Information

Explanation
This message applies to UNIX and Linux systems. The shared library <*insert_3*> was not found.

Response
Check that the file exists, and is either fully qualified or is in the appropriate director, also check the file access permissions.

AMQ6174 (IBM i)
The library was not found.

Severity
0 : Information

Explanation
The dynamically loadable file <*insert_3*> was not found. The queue manager will continue without this module.

Response
Check that the file exists and is either fully qualified or is in the appropriate directory.

AMQ6175 (AIX)
The system could not dynamically load the shared library <*insert_3*>. The system returned error number <*insert_2*> and error message <*insert_4*>. The queue manager will continue without this module.

Severity
20 : Error

Explanation
This message applies to AIX systems. The shared library <*insert_3*> failed to load correctly due to a problem with the library.

Response
Check the file access permissions and that the file has not been corrupted.

AMQ6175 (UNIX and Linux)
The system could not dynamically load the shared library <*insert_3*>. The system returned error message <*insert_4*>. The queue manager will continue without this module.

Severity
20 : Error

Explanation
This message applies to UNIX and Linux systems. The shared library <*insert_3*> failed to load correctly due to a problem with the library.

Response
Check the file access permissions and that the file has not been corrupted.

AMQ6175 (Windows)
The system could not dynamically load the library <*insert_3*>. The system returned error message <*insert_4*>. The queue manager will continue without this module.

Severity
20 : Error

Explanation
This message applies to Windows NT and Windows 2000 systems only. The dynamically loadable file <*insert_3*> failed to load correctly due to an internal error. The IBM WebSphere MQ error recording routine has been called.

Response

Check that the file has not been corrupted then use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6177 (Windows)

An internal IBM WebSphere MQ error has occurred.

Severity

40 : Stop Error

Explanation

An error has been detected, and the IBM WebSphere MQ error recording routine has been called.

Response

Details of the error have been stored at <*insert_3*>. A synopsis is given in the data section below. Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6179

The system could not find symbol <*insert_5*> in the dynamically loaded library <*insert_3*>. The system returned error number <*insert_2*> and error message <*insert_4*>.

Severity

20 : Error

Explanation

The library <*insert_3*> does not contain symbol <*insert_5*> or it has not been exported.

Response

Check that symbol name <*insert_5*> is correct and has been exported from the library.

AMQ6179 (UNIX and Linux)

The system could not find the symbol <*insert_5*> in the dynamically loaded shared library <*insert_3*>. The system returned error message <*insert_4*>.

Severity

20 : Error

Explanation

This message applies to UNIX and Linux systems. The shared library <*insert_3*> does not contain symbol <*insert_5*> or it has not been exported.

Response

Check that symbol name <*insert_5*> is correct and has been exported from the library.

AMQ6180 (Windows)

Default conversion not supported.

Severity

30 : Severe error

Explanation

IBM WebSphere MQ is unable to convert string data tagged in CCSID <*insert_1*> to data in CCSID <*insert_2*>.

Response

Check the default CCSIDs specified in the ccsid.tbl file and make sure that conversion is supported between these CCSIDs.

AMQ6182

Error found in line <*insert_1*> of ccsid.tbl

Severity

30 : Severe error

Explanation

Line <*insert_1*> contains and error. The content of the line is <*insert_3*>. Processing continues but the line in error is ignored.

Response

Correct the line and rerun the program or command giving this message.

AMQ6183

An internal IBM WebSphere MQ error has occurred.

Severity

10 : Warning

Explanation

An error has been detected, and the IBM WebSphere MQ error recording routine has been called. The failing process is process <*insert_1*>.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6184

An internal IBM WebSphere MQ error has occurred on queue manager <*insert_3*>.

Severity

10 : Warning

Explanation

An error has been detected, and the IBM WebSphere MQ error recording routine has been called. The failing process is process <*insert_1*>.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6184 (IBM i)

An internal IBM WebSphere MQ error has occurred.

Severity

10 : Warning

Explanation

An internal IBM WebSphere MQ error has occurred on queue manager <*insert_3*> and the IBM WebSphere MQ error recording routine has been called. The failing process is process <*insert_1*>.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6187

User is not authorized for RestrictedMode queue manager.

Severity

40 : Stop Error

Explanation

All users must be in the RestrictedMode application_group.

AMQ6188 (AIX)

The system could not dynamically load the shared library <*insert_3*> as the entry point to the library, symbol 'MQStart', could not be located within the library. The queue manager will continue without this library.

Severity

20 : Error

Explanation

This message applies to AIX systems. The shared library <*insert_3*> failed to load correctly due to a problem with the library.

Response

Check that the entry point to the library, symbol 'MQStart', exists and has been exported from the library.

AMQ6188 (UNIX and Linux)

The system could not dynamically load the shared library <*insert_3*> as the entry point to the library, symbol 'MQStart', could not be located within the library. The system returned error message <*insert_4*>. The queue manager will continue without this library.

Severity

20 : Error

Explanation

This message applies to UNIX and Linux systems. The shared library <*insert_3*> failed to load correctly due to a problem with the library.

Response

Check that the entry point to the library, symbol 'MQStart', exists and has been exported from the library.

AMQ6188 (Windows)

The system could not dynamically load the library <*insert_3*> due to a problem with the dll. The errno was <*insert_1*>. The queue manager will continue without this module.

Severity

20 : Error

Explanation

This message applies to Windows NT and Windows 2000 systems only. The dynamically loadable file <*insert_3*> failed to load correctly due to a problem with the dll.

Response

Check that the dll is in the correct place with the correct file permissions etc. and has not been corrupted.

AMQ6190 (Windows)
Program <*insert_3*> not found.

Severity
30 : Severe error

Explanation
The program <*insert_3*> cannot be found.

Response
Check that the program specified is available on your system. If the program name is not fully qualified, ensure that the PATH environment variable includes the directory where the program is located.

AMQ6191 (Windows)
Program <*insert_3*> failed to start, return code <*insert_1*>.

Severity
30 : Severe error

Explanation
The program <*insert_3*> was invoked, but failed to start. The failure reason code is <*insert_1*>.

Response
Check that the program specified is available on your system, and that sufficient system resources are available. Where applicable, verify that the user is authorized to run the program.

AMQ6192 (Windows)
IBM IBM WebSphere MQ Utilities

Severity
0 : Information

AMQ6193 (Windows)
The registry entry <*insert_3*> was not found.

Severity
20 : Error

Explanation
IBM WebSphere MQ for Windows NT and Windows 2000 sets the registry entry <*insert_3*> when the product is installed, but the entry is now missing.

Response
If the registry has been edited, restore the previous version. If the product is newly installed, check whether the installation was successful, and reinstall the product if necessary.

AMQ6196
An error has occurred whilst processing a temporary INI file <*insert_3*>

Severity
20 : Error

Explanation
An error has occurred when creating a backup of an INI file. The backup file <*insert_4*> already exists

Response
You may have created a backup of the INI file with the name <*insert_4*>, or an earlier operation may have failed. Move or delete the file <*insert_4*> and reattempt the operation. If you have not changed the INI file, use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to

see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ6207 (AIX)

Failed to attach shared memory segment as Segment table is Full.

Severity

20 : Error

Explanation

IBM WebSphere MQ has attempted to attach a memory segment but was unable to do so because all available segment areas are in use. 32 bit programs on AIX may attach up to a maximum of 10 shared memory segments. If the application has modified the data area layout, for example by reserving more of the address space for the program heap, this maximum number may be further reduced.

Response

Examine the needs of your application to see if the number of attached segments can be reduced. Alternatively by building your application as a 64bit program the limit of 10 shared memory segments is removed.

AMQ6209

An unexpected asynchronous signal (<*insert_1*> : <*insert_3*>) has been received and ignored.

Severity

10 : Warning

Explanation

Process <*insert_2*> received an unexpected asynchronous signal and ignored it. This has not caused an error but the source of the signal should be determined as it is likely that the signal has been generated externally to IBM WebSphere MQ

Response

Determine the source of the signal and prevent it from recurring.

AMQ6212

Failed to load Library <*insert_3*> as C++ environment is not initialised.

Severity

20 : Error

Explanation

An attempt was made to load the identified C++ shared library. However, the attempt failed because the C++ environment has not been initialized for the current process.

Response

Ensure the application is linked with the appropriate C++ runtime environment.

AMQ6218 (AIX)

EXTSHM variable detected with unrecognised value <*insert_3*> and has been reset to <*insert_4*>.

Severity

20 : Error

Explanation

Processes that access the internal queue manager control blocks must use the AIX Extended Shared Memory model, and while one such process was starting, IBM WebSphere MQ detected that the EXTSHM variable was set but did not contain an appropriate value. This value has been reset and the process will continue with the new setting.

Response

No further action is required. To prevent this message being issued in future, correct the value of the EXTSHM variable in your environment.

AMQ6224 (Tandem)
The environment variable have not been set up correctly.

Severity
10 : Warning

Response
Check that the environment variables correspond to the configuration file.

AMQ6230
Message <*insert_3*> suppressed <*insert_1*> times in the last <*insert_4*> seconds.

Severity
10 : Warning

Explanation
Message <*insert_3*> was issued <*insert_2*> times in the last <*insert_4*> seconds but only the first instance of the message was written to the log. The suppressed messages may have included differing message arguments.

Response
If you wish to see all occurrences of this message you should alter the definition of the SuppressMessage attribute in the Queue Manager configuration.

AMQ6232 (UNIX and Linux)
Operating System userid <*insert_3*> not found.

Severity
20 : Error

Explanation
A request was made to the operating system to lookup the details of the identified userid but the request failed.

Response
Using the operating system supplied tools check for the existence of the identified userid, and if missing then re-create it.

AMQ6233 (UNIX and Linux)
Operating System authorisation group <*insert_3*> not found.

Severity
20 : Error

Explanation
A request was made to the operating system to lookup the details of the identified group but the request failed.

Response
Using the operating system supplied tools check for the existence of the identified group, and if missing then re-create it.

AMQ6234 (UNIX and Linux)
Unknown Queue Manager name specified.

Severity
20 : Error

Explanation
An invalid Queue Manager name <*insert_3*> was specified in the parameters to the command.

Response
Reissue the command specifying a valid Queue Manager name.

AMQ6235 (UNIX and Linux)
Directory <*insert_3*> missing.

Severity
20 : Error

Explanation
The identified directory is missing.

Response
Reissue the command selecting the option to create missing directories.

AMQ6236 (UNIX and Linux)
Missing directory <*insert_3*> has been created.

Severity
20 : Error

Explanation
The identified directory was missing but has been created.

Response
None

AMQ6237 (UNIX and Linux)
File <*insert_3*> missing.

Severity
20 : Error

Explanation
The identified file is missing.

Response
Reissue the command selecting the option to create missing files.

AMQ6238 (UNIX and Linux)
Missing file <*insert_3*> has been created.

Severity
20 : Error

Explanation
The identified file was missing but has been created.

Response
None

AMQ6239 (Windows, UNIX and Linux)
Permission denied attempting to access filesystem location <*insert_3*>.

Severity
20 : Error

Explanation
An attempt to query the filesystem object identified failed because the command issued did not have authority to access the object.

Response
Check the authority on the object and of the user executing the command and reissue the command.

AMQ6240 (UNIX and Linux)
You must be an operating system superuser to run this command.

Severity
20 : Error

Explanation
In irder to run this command you must be logged on as a user with superuser privelages.

Response
Log in as an appropriate user and reissue the command.

AMQ6241 (UNIX and Linux)
The filesystem object <*insert_3*> is a symbolic link.

Severity
20 : Error

Explanation
While checking the filesystem, an object was found which is a symbolic link.

Response
This is not an error however you should verify that the symbolic link is expected and that the destination of the symbolic link is correct.

AMQ6242 (UNIX and Linux)
Incorrect ownership for <*insert_3*>. Current(<*insert_1*>) Expected(<*insert_2*>)

Severity
20 : Error

Explanation
The filesystem object <*insert_3*> is owned by the user with uid <*insert_1*> when it was expected to be owned by the user with uid <*insert_2*>.

Response
Correct the ownership using operating system commands or reissue the command selecting the option to fix the incorrect owership.

AMQ6243 (UNIX and Linux)
Incorrect group ownership for <*insert_3*>. Current(<*insert_1*>) Expected(<*insert_2*>)

Severity
20 : Error

Explanation
The filesystem object <*insert_3*> is owned by the group with gid <*insert_1*> when it was expected to be owned by the group with gid <*insert_2*>.

Response
Correct the ownership using operating system commands or reissue the command selecting the option to fix the incorrect owership.

AMQ6244 (UNIX and Linux)
Incorrect permissions on object <*insert_3*>. Current(<*insert_4*>) Expected(<*insert_5*>)

Severity
20 : Error

Explanation
The filesystem object <*insert_3*> has the wrong file permissions.

Response
Correct the ownership using operating system commands or reissue the command selecting the option to fix the incorrect owership.

AMQ6245 (UNIX and Linux)
Error executing system call <*insert_3*> on file <*insert_4*> error <*insert_2*>.

Severity
20 : Error

Explanation
The execution of the system call <*insert_3*> on file <*insert_4*> failed and the error code <*insert_2*> was returned.

Response
Investigate the cause of the failure using the operating system error code <*insert_1*> and reissue the command.

AMQ6251 (UNIX and Linux)
The system could not dynamically load the shared library <*insert_3*>. The queue manager will continue without this module.

Severity
20 : Error

Explanation
This message applies to UNIX and Linux systems. The shared library <*insert_3*> failed to load as it is probably a <*insert_1*>-bit library, a <*insert_2*>-bit library is required. Note that IBM WebSphere MQ tried to find a <*insert_2*>-bit library named either <*insert_4*> or <*insert_5*>, but failed. The following message gives details of the original failure.

Response
Supply the name of a <*insert_2*>-bit library.

AMQ6252 (UNIX and Linux)
The system could not dynamically load the shared library <*insert_3*>. The queue manager will continue without this module.

Severity
20 : Error

Explanation
This message applies to UNIX and Linux systems. The shared library <*insert_3*> failed to load as it is probably a <*insert_1*>-bit library, a <*insert_2*>-bit library is required. Note that IBM WebSphere MQ found and loaded a <*insert_2*>-bit library named <*insert_4*> however this also failed to load with the system returning error message <*insert_5*>. The following message gives details of the original failure.

Response
Supply the name of a <*insert_2*>-bit library.

AMQ6253 (UNIX and Linux)
The system could not dynamically load the shared library <*insert_3*>. The queue manager will continue without this module.

Severity
20 : Error

Explanation
This message applies to UNIX and Linux systems. The shared library <*insert_3*> failed to load as it is probably a <*insert_1*>-bit library, a <*insert_2*>-bit library is required. Note that IBM WebSphere MQ attempted to locate and load a <*insert_2*>-bit library named either of these: <*insert_4*>. The first library failed to load as it also is probably a <*insert_1*>-bit library, the second library is a <*insert_2*>-bit library, however this also failed to load with the system returning error message <*insert_5*>. The following message gives details of the original failure.

Response
Supply the name of a <*insert_2*>-bit library.

AMQ6254 (UNIX and Linux)

The system could not dynamically load the shared library <*insert_3*>, library <*insert_4*> has been used instead.

Severity

0 : Information

Explanation

This message applies to UNIX and Linux systems. The shared library <*insert_3*> failed to load as it is probably a <*insert_1*>-bit library, a <*insert_2*>-bit library is required. Note that IBM WebSphere MQ has sucessfully located and loaded a <*insert_2*>-bit library named <*insert_4*>.

Response

Supply the name of a <*insert_2*>-bit library or put the library (alternatively a symbolic link can be used) in the appropriate place: 32-bit libraries in /var/mqm/exits; 64-bit libraries in /var/mqm/exits64.

AMQ6255 (UNIX and Linux)

The system could not dynamically load the shared library <*insert_3*>. The queue manager will continue without this module.

Severity

20 : Error

Explanation

This message applies to UNIX and Linux systems. The shared library <*insert_3*> failed to load as it is probably a <*insert_1*>-bit library, a <*insert_2*>-bit library is required. The following message gives details of the original failure.

Response

Supply the name of a <*insert_2*>-bit library.

AMQ6256 (Windows)

The system could not dynamically load the shared library <*insert_3*>. The queue manager will continue without this module.

Severity

20 : Error

Explanation

This message applies to Windows systems. The shared library <*insert_3*> failed to load as it is probably a <*insert_1*>-bit library, a <*insert_2*>-bit library is required. Note that IBM WebSphere MQ tried to find a <*insert_2*>-bit library named <*insert_4*>, but failed. The following message gives details of the original failure.

Response

Supply the name of a <*insert_2*>-bit library.

AMQ6257

Message suppression enabled for message numbers (<*insert_3*>).

Severity

0 : Information

Explanation

The message contain's a list of message id's for which entries repeated within the <*insert_1*> suppression interval will be suppressed.

Response

If you wish to see all occurrences of these messages you should alter the definition of the SuppressMessage attribute in the Queue Manager configuration.

AMQ6258

Message exclusion enabled for message numbers (<*insert_3*>).

Severity
0 : Information

Explanation
The message contain's a list of message id's which have been excluded. Requests to write these messages to the error log will be discarded.

Response
If you wish to see instances of these messages you should alter the definition of the ExcludeMessage attribute in the Queue Manager configuration.

AMQ6259
Message <*insert_3*> cannot be <*insert_4*>.

Severity
10 : Warning

Explanation
Message <*insert_3*> cannot be excluded or suppressed but was specified in the ExcludeMessage or SuppressMessage configuration for the Queue Manager. The Queue Manager will continue however the request to suppress or exclude this message will be ignored.

Response
Update the Queue Manager configuration to remove the specified message identifier.

AMQ6260
Help Topic not found

Severity
10 : Warning

Explanation
The requested help topic could not be located.

For further assistance, refer to the IBM WebSphere MQ manuals.

Response
Ensure that the IBM WebSphere MQ InfoCenter is installed.

AMQ6261 (UNIX and Linux)
An exception occurred trying to dynamically load shared library <*insert_3*>. The queue manager will continue without this module.

Severity
20 : Error

Explanation
This message applies to UNIX and Linux systems. Exception number <*insert_1*> name <*insert_4*>, occurred trying to dynamically load shared library <*insert_3*>.

Response
Check the shared library has not been corrupted. If the shared library contains any initializer functions, ensure these are not causing the problem and that they conform to the expected function prototype.

AMQ6261 (Windows)
An exception occurred trying to load DLL <*insert_3*>. The queue manager will continue without this module.

Severity
20 : Error

Explanation
This message applies to Windows systems only. Exception number <*insert_1*> error <*insert_4*>, occurred trying to load DLL <*insert_3*>.

Response

Check the DLL has not been corrupted. If the DLL contains any initializer functions, ensure these are not causing the problem and that they conform to the expected function prototype.

AMQ6263

Usage: dspmqras [-t CollectionType]

Severity

20 : Error

Response

None.

AMQ6266 (Windows)

Error <*insert_1*> occurred accessing shared trace data, <*insert_3*>

Severity

30 : Severe error

Explanation

The IBM WebSphere MQ common services module needs to access an area of named shared memory so that various functions, including trace, can be co-ordinated between all processes on a machine or session.

For a server install, this area should have been created by the IBM WebSphere MQ services process (amqsvc.exe) and is thus shared globally, on a client-only install, or where the IBM WebSphere MQ services are not running, it should be created for this session only.

This failure implies that the named shared memory (normally mqm.SHRSEG.0) has been created by another process on the system in such a way that access to it from IBM WebSphere MQ processes is denied.

Response

Investigate which process on the machine has created the named shared memory and, if it is an IBM WebSphere MQ process or IBM WebSphere MQ application investigate why the permissions have been set to disallow others to connect.

If the process that created this area is not related to IBM WebSphere MQ, investigate why it has created this specifically named area.

AMQ6271

Detected 64-bit JVM, but not using the Resource Recovery Services adapter

Severity

30 : Severe error

Explanation

The only zOS adapter supported in the 64-bit mode is the Resource Recovery Services adapter

Response

Do not specify the com.ibm.mq.adapter system property

AMQ6272

com.ibm.mq.adapter set to <*insert_0*>, which is invalid

Severity

30 : Severe error

Explanation

The adapter is not valid in this environment

Response

Set the com.ibm.mq.adapter to a valid value

AMQ6276

group name <*insert_3*> size <*insert_1*> is too long to be used for <*insert_4*>.

Severity

20 : Error

Explanation

<*insert_4*> has not been authorised for use by the groupname <*insert_3*>. This will not affect users who are members of group mqm.

Response

Save any generated output files and use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ6277

function name <*insert_5*> returned <*insert_1*> when creating a SID for group <*insert_3*> while creating object '$4'.

Severity

20 : Error

Explanation

<*insert_4*> has not been authorised for use by the groupname <*insert_3*>. This will not affect users who are members of group mqm.

Response

Save any generated output files and use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ6280

Usage: **amqxdbg** ([-x] (-i pid[.tid] | -p program_name) | -s)

Severity

00 : Information

Explanation

The user provided an incorrect set of arguments to the **amqxdbg** command.

```
-i - Request a program FDC from the process identified by
     'pid' and 'tid'.
-p - Request a program FDC from the process identified by the
     supplied program name. To match more than one program name
     the wildcard character '*' may be used at the end of the
     'program_name' specification.
-x - Delete the entry identified by the -i or -p parameters
-s - Show the status of debug entries
```

Response

Re-issue the command using the appropriate arguments.

AMQ6281

Debug entry defined.

Severity

00 : Information

Explanation

The **amqxdbg** command completed successfully and a debug entry was added.

Response

None.

AMQ6282
Debug entry removed.

Severity
00 : Information

Explanation
The **amqxdbg** command completed successfully and a debug entry was removed.

Response
None.

AMQ6283
Debug entry not found.

Severity
20 : Error

Explanation
The debug entry identified was not found and could not removed.

Response
None.

AMQ6284
Debug entry could not be defined. The limit on the number of entries has been reached.

Severity
20 : Error

Explanation
The **amqxdbg** command attempted to add a debug entry but could not becuase the limit on the number of entries which can be defined was reached.

Response
Use the '-x' option to remove debug entries which are no longer required and re-issue the command.

AMQ6285
Process <*insert_1*> does not exist.

Severity
20 : Error

Explanation
The **amqxdbg** command attempted to add a debug entry but could not because the process with process identifier <*insert_1*> is not running.

Response
Check the supplied process identifier and re-issue the command.

AMQ6286
The filesystem at location <*insert_3*> is read-only.

Severity
20 : Error

Explanation
An attempt to write to the filesystem failed because it is read-only. Likely causes are that you specified the location incorrectly or the filesystem has been incorrectly configured.

Response
Identify where the location was specified and check it is correct. Check that the filesystem has been configured correctly.

AMQ6287
IBM WebSphere MQ V<*insert_5*>.

Severity
00 : Information

Explanation
IBM WebSphere MQ system information:

```
Host Info         :- <insert_3>
Installation      :- <insert_4>
Version           :- <insert_5>
```

Response
None.

AMQ6290
Unknown installation <*insert_3*> detected.

Severity
20 : Error

Explanation
When executing program <*insert_4*>, IBM WebSphere MQ detected that, due to the configuration of the environment, resources were loaded from <*insert_3*>. MQ could not determine the installation name for these resources. The program cannot complete successfully while the program is executing using resources from an unknown installation.

Response
Configure the environment so that all resources required by program <*insert_4*> are loaded from an correctly installed installation.

AMQ6290 (UNIX)
Unknown installation path <*insert_3*> detected.

Severity
20 : Error

Explanation
When executing program <*insert_4*>, MQ detected that its resources were loaded from <*insert_3*>, MQ could not determine from <*insert_5*> the installation name and identifier for these resources. The program cannot complete successfully while the program is executing using resources from an unknown installation.

Response
Check that <*insert_5*> exists and has an Installation entry with 'Path=<*insert_3*>'. If '<*insert_5*> has been corrupted, run **crtmqinst -r** to reconstruct the file.

AMQ6291
Error <*insert_1*> occurred during IBM WebSphere MQ process initialization.

Severity
20 : Error

Explanation
An unexpected error was encountered while initializing the process. The process will terminate immediately. The error was <*insert_1*>. The MQ error recording routine may have been called.

Response
Use the standard facilities supplied with your system to record the problem identifier, and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard any files until the problem has been resolved.

AMQ6292
The queue manager is associated with a different installation.

Severity
20 : Error

Explanation
A command was issued which attempted to connect to a queue manager, but the installation that the command was issued from does not match the installation that the queue manager is associated with. The attempt to connect failed.

Response
Reissue the command from the installation that the queue manager is associated with.

AMQ6293
Cannot create symbolic link as a file with the name <*insert_3*> already exists. Error Number: <*insert_1*>.

Severity
20 : Error

Explanation
An attempt was made to create a symbolic link with the name <*insert_3*> but the symbolic link could not be created as a file already exists with the same name.

Response
Verify if the file named <*insert_3*> as been created in error. If so, remove before reissuing the command. The Error Number may give more details about the cause of the failure.

AMQ6294
Failed to create symbolic link with the name <*insert_3*>. Error Number: <*insert_1*>.

Severity
20 : Error

Explanation
An attempt was made to create a symbolic link with the name <*insert_3*> but the symbolic link could not be created.

Response
The Error Number for the failure may give details about why the symbolic link could not be created. Correct the problem before reissuing the command.

AMQ6295
Unable to remove symbolic link with the name <*insert_3*>. Error Number: <*insert_1*.

Severity
20 : Error

Explanation
An attempt was made to remove a symbolic link with the name <*insert_3*> but the symbolic link could not be removed.

Response
The Error Number for the failure may give details about why the symbolic link could not be removed. Correct the problem before reissuing the command.

AMQ6296
Cannot remove file <*insert_3*> as it is not a symbolic link.

Severity
20 : Error

Explanation

An attempt was made to remove a symbolic link with the name <*insert_3*> but it was not removed because the file was not a symbolic link.

Response

Check the definition of the symbolic link and, if incorrect, remove the file before reissuing the command.

AMQ6297

Symbolic link with the name <*insert_3*> cannot be removed. Target <*insert_4*> does not match the expected target <*insert_5*>.

Severity

20 : Error

Explanation

An attempt was made to remove a symbolic link with the name <*insert_3*> but it was not removed because the target of the symbolic link <*insert_4*>does not match the expected target <*insert_5*>.

Response

Check the definition of the symbolic link and, if incorrect, remove the symbolic link manually before reissuing the command.

AMQ6299

An error occurred while creating or checking the directory structure for the queue manager.

Severity

40 : Stop Error

Explanation

During creation, startup or deletion of the queue manager, an error occurred while creating or checking a file or directory. The queue manager could not access the path <*insert_3*>.

Response

None.

AMQ6666 (IBM i)

Required IBM WebSphere MQ system profile(s) can not be accessed.

Severity

40 : Stop Error

Explanation

The required IBM WebSphere MQ system profile(s) QMQM, QMQMADM, or both are not found or have been disabled. IBM WebSphere MQ cannot continue processing the command without the profiles existing and enabled on the system. The major error code is <*insert_3*>, the minor error code is <*insert_4*>. The major error codes and their meanings are as follows: *DISABLED - The user profile has been disabled. *PWDEXP - The password for the user profile has expired . *EXIST - The user profile does not exist. If none of these error codes are shown the major error code contains the exception identifier. The minor error code identifies the user profile which cannot be accessed.

Response

Check that both QMQM and QMQMADM profiles exist and are both enabled using the DSPUSRPRF command, or contact the IBM WebSphere MQ system administrator.

AMQ6708

A disk full condition was encountered when formatting a new log file in location <*insert_3*>.

Severity

20 : Error

Explanation

The queue manager attempted to format a new log file in directory <*insert_3*>. The drive or file system containing this directory did not have sufficient free space to contain the new log file.

Response

Increase the amount of space available for log files and retry the request.

AMQ6708 (IBM i)

A disk full condition was encountered when formatting a new log file.

Severity

20 : Error

Explanation

The queue manager attempted to format a new log file in directory <*insert_3*>. The drive or file system containing this directory did not have sufficient free space to contain the new log file.

Response

Increase the amount of space available for log files and retry the request.

AMQ6709

The log for the Queue manager is full.

Severity

20 : Error

Explanation

This message is issued when an attempt to write a log record is rejected because the log is full. The queue manager will attempt to resolve the problem.

Response

This situation may be encountered during a period of unusually high message traffic. However, if you persistently fill the log, you may have to consider enlarging the size of the log. You can either increase the number of log files by changing the values in the queue manager configuration file. You will then have to stop and restart the queue manager. Alternatively, if you need to make the log files themselves bigger, you will have to delete and re-create the queue manager.

AMQ6710

Queue manager unable to access directory <*insert_3*>.

Severity

20 : Error

Explanation

The queue manager was unable to access directory <*insert_3*> for the log. This could be because the directory does not exist, or because the queue manager does not have sufficient authority.

Response

Ensure that the directory exists and that the queue manager has authority to read and write to it. Ensure that the LogPath attribute in the queue manager's configuration file matches the intended log path.

AMQ6767

Log file <*insert_3*> could not be opened for use.

Severity

20 : Error

Explanation

Log file <*insert_3*> could not be opened for use. Possible reasons include the file being missing, the queue manager being denied permission to open the file or the contents of the file being incorrect.

Response

If the log file was required to start the queue manager, ensure that the log file exists and that the queue manager is able to read from and write to it. If the log file was required to re-create an object from its media image and you do not have a copy of the required log file, delete the object instead of recreating it.

AMQ6774

Log file <*insert_3*> did not contain the requested log record.

Severity

20 : Error

Explanation

Log file <*insert_3*> does not contain the log record with an LSN that is <*insert_4*>. This is because the log file numbers have wrapped and the log file name <*insert_3*> has been reused by a newer file. Once a log file name has been reused, it is not possible to access the data in the previous versions of the file to use this name. The operation which requested this log record cannot be completed.

AMQ6782

The log file numbers have wrapped.

Severity

0 : Information

Explanation

Each log file formatted is assigned a number which makes up part of its file name. The numbers are allocated sequentially and consist of seven digits giving a maximum of 10 million different log file names. Once all available numbers have been allocated, the queue manager again starts allocating numbers starting from zero. Once a file number has been re-allocated, you can no longer access data in the previous log files allocated the same number. The file numbers wrapped at log sequence number <*insert_3*>.

Response

You should periodically take media images of all IBM WebSphere MQ objects. You must ensure that media images of all objects which you may need to re-create do not span more than 10 million log files.

AMQ6901 (IBM i)

IBM WebSphere MQ for IBM i

AMQ6902 (IBM i)

IBM WebSphere MQ for IBM i - Samples

AMQ6903 (IBM i)

Installation or uninstallation failed, IBM WebSphere MQ resources are still active.

Severity

30 : Severe error

Explanation

An attempt to install or uninstall IBM WebSphere MQ was unsuccessful because IBM WebSphere MQ resources from a previous installation of IBM WebSphere MQ are still active. This failure may indicate that a queue manager from a previous installation of IBM WebSphere MQ is still running or has active jobs.

Response

Ensure that all queue managers from previous installations of IBM WebSphere MQ have been quiesced, and that the QMQM subsystem is not active using the WRKSBS and ENDSBS commands. Refer to the installation section in the IBM WebSphere MQ for IBM i Quick Beginnings publication for further details.

AMQ6904 (IBM i)
Installation of IBM WebSphere MQ for IBM i failed due to previous release installed.

Explanation
Some releases of IBM WebSphere MQ for IBM i require migration before a later release can be installed.

Response

If you wish to retain your current IBM WebSphere MQ information you must step through the migration process - see the Quick Beginnings Manual.

If you do not wish to retain your current IBM WebSphere MQ information remove the current version of IBM WebSphere MQ before retrying the install.

AMQ6905 (IBM i)
Found <*insert_3*> new IBM WebSphere MQ jobs to end, and <*insert_4*> IBM WebSphere MQ jobs currently ending.

Severity
0 : Information

Explanation
Jobs with locks on library QMQM are ended so that IBM WebSphere MQ may be deleted or updated.

Response
None.

AMQ6906 (IBM i)
<*insert_3*> jobs still ending.

Severity
40 : Stop Error

Explanation
Jobs report state of 'already being deleted' after timeout.

Response
If system is heavily loaded wait and reissue the command CALL QMQM/AMQIQES4 to try to delete jobs using IBM WebSphere MQ resources. If this message is issued again, issue the command WRKOBJLCK for library QMQM to see which jobs have not been deleted, and end them manually.

AMQ6907 (IBM i)
All IBM WebSphere MQ pre-requisite PTFs on OS/400 programs are installed.

Severity
0 : Information

Explanation
None.

Response
None.

AMQ6908 (IBM i)
IBM WebSphere MQ pre-requisite PTF <*insert_4*> for program <*insert_3*> is not installed.

Severity
40 : Stop Error

Explanation

PTF <*insert_3*>-<*insert_4*> is not installed on system in state 'Permanently applied' 'Temporarily applied' or 'Superseded'. IBM WebSphere MQ installation will proceed, but you must install the PTF before starting IBM WebSphere MQ

Response

Use the command GO CMDPTF to display commands to order and apply the required PTF <*insert_3*>-<*insert_4*>..

AMQ6909 (IBM i)

User space recovery failed, IBM WebSphere MQ is running.

Severity

30 : Severe error

Explanation

An attempt to recover user space was unsuccessful because IBM WebSphere MQ was running.

Response

Quiesce IBM WebSphere MQ for IBM i and try again. See the section on "Quiescing IBM WebSphere MQ" in the IBM WebSphere MQ for IBM i Quick Beginnings.

AMQ6910 (IBM i)

The attempt to quiesce the queue manager failed.

Severity

30 : Severe error

Explanation

The attempt to quiesce the queue manager was unsuccessful because the current job has locks on library QMQM.

Response

Sign off the current job, sign on and attempt to quiesce the queue manager again. See the section on "Quiescing IBM WebSphere MQ" in the IBM WebSphere MQ for IBM i Quick Beginnings.

AMQ6911 (IBM i)

IBM WebSphere MQ quiesce is performing a RCDMQMIMG. There may be some delay before completion.

Severity

0 : Information

Explanation

IBM WebSphere MQ quiesce is performing a Record Object Image (RCDMQMIMG) for all objects. There may be some delay until before completion.

Response

None.

AMQ6912 (IBM i)

IBM WebSphere MQ Java Messaging and Web Services

AMQ6913 (IBM i)

IBM WebSphere MQ Java Messaging and Web Services

AMQ6914 (IBM i)

Apply PTF failed, IBM WebSphere MQ resources are still active.

Severity

30 : Severe error

Explanation

An attempt to apply PTFs to a IBM WebSphere MQ installation was unsuccessful because IBM WebSphere MQ resources are still active. This failure may indicate that one or more queue

managers have not been fully quiesced, some IBM WebSphere MQ resources have not been released, some IBM WebSphere MQ jobs are still running or a IBM WebSphere MQ subsystem is still active.

Response

Ensure that all queue managers have been fully quiesced, using the ENDMQM command with ENDCCTJOB(*YES). Ensure that all IBM WebSphere MQ subsystems (including the QMQM subsystem) are not active using the WRKSBS and ENDSBS commands. Repeat the apply PTF action. Note - Delete Licensed Program (DLTLICPGM) is not a circumvention for this condition, because the same checks which are listed as a possible cause, will be made before deleting a IBM WebSphere MQ installation.

AMQ6915 (IBM i)

Remove PTF failed, IBM WebSphere MQ resources are still active.

Severity

30 : Severe error

Explanation

An attempt to remove PTFs from a IBM WebSphere MQ installation was unsuccessful because IBM WebSphere MQ resources are still active. This failure may indicate that one or more queue managers have not been fully quiesced, some IBM WebSphere MQ resources have not been released, some IBM WebSphere MQ jobs are still running or a IBM WebSphere MQ subsystem is still active.

Response

Ensure that all queue managers have been fully quiesced, using the ENDMQM command with ENDCCTJOB(*YES). Ensure that all IBM WebSphere MQ subsystems (including the QMQM subsystem) are not active using the WRKSBS and ENDSBS commands. Repeat the remove PTF action. Note - Delete Licensed Program (DLTLICPGM) is not a circumvention for this condition, because the same checks which are listed as a possible cause, will be made before deleting a IBM WebSphere MQ installation.

AMQ6992 (IBM i)

Program <*insert_3*> parameter error.

Severity

40 : Stop Error

Explanation

IBM WebSphere MQ for IBM i program <*insert_3*> has an incorrect number of parameters, or an error in the parameter value.

Response

Display the job log, using the DSPJOBLOG command, for more information on the problem.

AMQ6993 (IBM i)
Program <*insert_3*> ended abnormally.

Severity
40 : Stop Error

Explanation
A IBM WebSphere MQ for IBM i program, <*insert_3*>, is ending abnormally.

Response
Display the job log, using the DSPJOBLOG command, for information why the job or subsystem ended abnormally. Correct the error and retry the request.

AMQ6994 (Windows)

Severity
0 : Information

Explanation
None.

Response
None.

AMQ6995 (IBM i)
xcsFFST has been called; take a look at the job log.

Severity
0 : Information

AMQ6998 (IBM i)
An internal IBM WebSphere MQ error has occurred.

Severity
40 : Stop Error

Explanation
IBM WebSphere MQ for IBM i is diagnosing an unexpected error.

Response
Save the job log, and use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ6999 (IBM i)
An internal IBM WebSphere MQ error has occurred.

Severity
0 : Information

Explanation
IBM WebSphere MQ has experienced an internal failure, from which it could not recover.

Response
Use WRKPRB to check if a problem has been created. If one has, record the problem identifier, and save the QPSRVDMP, QPJOBLOG, and QPDSPJOB files. If a problem has not been created, save the job log. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ7000-7999: WebSphere MQ product

AMQ7001

The location specified for creation of the queue manager is not valid.

Severity

40 : Stop Error

Explanation

The directory under which queue managers are to be created is not valid. It might not exist, or there might be a problem with authorization.

Response

The location is specified in the machine-wide ini file. Correct the file and submit the request again.

AMQ7001 (Windows)

The location specified for the creation of the queue manager is not valid.

Severity

40 : Stop Error

Explanation

The directory under which the queue managers are to be created is not valid. It might not exist, or there might be a problem with authorization.

Response

The location is specified in the configuration data. Correct the configuration data and submit the request again.

AMQ7002

An error occurred manipulating a file.

Severity

40 : Stop Error

Explanation

An internal error occurred while trying to create or delete a queue manager file. It is likely that the error was caused by a disk having insufficient space, or by problems with authorization to the underlying file system.

Response

Identify the file that caused the error, using problem determination techniques. For example check if there are any FFST files, which might identify the queue manager file causing the error. This error might also be caused if users have created, renamed or deleted that file. Correct the error in the file system and submit the request again.

AMQ7002 (Windows)

An error occurred manipulating a file.

Severity

40 : Stop Error

Explanation

An internal error occurred while trying to create or delete a queue manager file.

In the case of a failure to delete a file a common reason for this error is that a non MQ process, such as the windows explorer or a virus checker, is accessing the file. In the case where the object that cannot be deleted is a directory then a non MQ process might be accessing a file within the directory or one of its subdirectories.

It is also possible that the error was caused by a disk having insufficient space, or by problems with authorization to the underlying file system.

Response

Identify the file that caused the error, using problem determination techniques. For example check if there are any FFST files, which might identify the queue manager file causing the error. This error might also be caused if users have created, renamed or deleted that file. Correct the error in the file system and submit the request again.

AMQ7005

The queue manager is running.

Severity

40 : Stop Error

Explanation

You tried to perform an action that requires the queue manager stopped, however, it is currently running. You probably tried to delete or start a queue manager that is currently running.

Response

If the queue manager should be stopped, stop the queue manager and submit the failed command again.

AMQ7006

Missing attribute <*insert_5*> on stanza starting on line <*insert_1*> of ini file <*insert_3*>.

Severity

20 : Error

Explanation

The <*insert_4*> stanza starting on line <*insert_1*> of configuration file <*insert_3*> is missing the required <*insert_5*> attribute.

Response

Check the contents of the file and retry the operation.

AMQ7006 (Windows)

Missing attribute <*insert_5*> from configuration data.

Severity

20 : Error

Explanation

The <*insert_4*> stanza in the configuration data is missing the required <*insert_5*> attribute.

Response

Check the contents of the configuration data and retry the operation.

AMQ7008

The queue manager already exists.

Severity

40 : Stop Error

Explanation

You tried to create a queue manager that already exists.

Response

If you specified the wrong queue manager name, correct the name and submit the request again.

AMQ7010

The queue manager does not exist.

Severity

40 : Stop Error

Explanation

You tried to perform an action against a queue manager that does not exist. You might have specified the wrong queue manager name.

Response

If you specified the wrong name, correct it and submit the command again. If the queue manager should exist, create it, and then submit the command again.

AMQ7011

The queue manager files have not been completely deleted.

Severity

40 : Stop Error

Explanation

While deleting the queue manager, an error occurred deleting a file or directory. The queue manager might not have been completely deleted.

Response

Follow problem determination procedures to identify the file or directory and to complete deletion of the queue manager.

AMQ7012

The specified trigger interval is not valid.

Severity

40 : Stop Error

Explanation

You specified a value for the trigger interval that is not valid. The value must be not less than zero and not greater than 999 999 999.

Response

Correct the value and resubmit the request.

AMQ7013

There is an error in the name of the specified dead-letter queue.

Severity

40 : Stop Error

Explanation

You specified a name for the dead-letter queue that is not valid.

Response

Correct the name and resubmit the request.

AMQ7014

There is an error in the name of the specified default transmission queue.

Severity

40 : Stop Error

Explanation

You specified a name for the default transmission queue that is not valid.

Response

Correct the name and submit the command again.

AMQ7015

There is an error in the maximum number of open object handles specified.

Severity

40 : Stop Error

Explanation

You specified a value for the maximum number of open object handles to be allowed that is not valid. The value must be not less than zero and not greater than 999 999 999.

Response

Correct the value and submit the command again.

AMQ7016

There is an error in the maximum number of uncommitted messages specified.

Severity

40 : Stop Error

Explanation

You specified a value for the maximum number of uncommitted messages to be allowed that is not valid. The value must be not less than 1 and not greater than 999 999 999.

Response

Correct the value and submit the command again.

AMQ7017

Log not available.

Severity

40 : Stop Error

Explanation

The queue manager was unable to use the log. This could be due to a log file being missing or damaged, or the log path to the queue manager being inaccessible.

Response

Ensure that the LogPath attribute in the queue manager configuration file is correct. If a log file is missing or otherwise unusable, restore a backup copy of the file, or the entire queue manager.

AMQ7018

The queue manager operation cannot be completed.

Severity

20 : Error

Explanation

An attempt has been made to perform an operation on a queue manager. Resources required to perform the operation are not available.

AMQ7019

An error occurred while creating or checking the directory structure for the queue manager.

Severity

40 : Stop Error

Explanation

During creation or startup of the queue manager an error occurred while creating or checking a file or directory. Further information detailing the cause of the failure is written to the queue manager error logs.

Response

Identify why the queue manager files cannot be created or why the check failed. It is probable that there is insufficient space on the specified disk, or that there is a problem with access permissions on a file or directory. Correct the problem and submit the command again.

AMQ7020

The operation was carried out, but one or more transactions remain in-doubt.

Severity

10 : Warning

Explanation

The queue manager tried to resolve all internally coordinated transactions which are in-doubt. In-doubt transactions still remain after the queue manager has attempted to deliver the outcome of these transactions to the resource managers concerned. Transactions remain in-doubt when the queue manager cannot deliver the outcome of the transaction to each of the participating resource managers. For example, a resource manager might not be available at this time. Another possibility is that an earlier attempt to resolve the transaction resulted in an unexpected failure, in this case no attempt will be made to resolve the transaction until the queue manager is restarted.

Response

Use the DSPMQTRN command to display the remaining in-doubt transactions.

AMQ7020 (IBM i)

The operation was carried out, but one or more transactions remain in-doubt.

Severity

10 : Warning

Explanation

The queue manager tried to resolve all internally coordinated transactions which are in-doubt. In-doubt transactions still remain after the queue manager has attempted to deliver the outcome of these transactions to the resource managers concerned. Transactions remain in-doubt when the queue manager cannot deliver the outcome of the transaction to each of the participating resource managers. For example, a resource manager might not be available at this time.

Response

Use the Work with Transactions (WRKMQMTRN) command to display the remaining in-doubt transactions.

AMQ7021

An error occurred while deleting the directory structure for the queue manager.

Severity

40 : Stop Error

Explanation

While deleting the queue manager, an error occurred deleting a file or directory. The queue manager might not have been completely deleted.

Response

Follow problem determination procedures to identify the file or directory and to complete deletion of the queue manager.

AMQ7022

The resource manager identification number is not recognized.

Severity

20 : Error

Explanation

The identification number of the resource manager you supplied was not recognized.

Response

Ensure that you entered a valid resource manager identification number. Use the DSPMQTRN command to display a list of resource managers and their identification numbers.

AMQ7023

The resource manager was in an invalid state.

Severity

20 : Error

Explanation

The resource manager, the identification number of which you supplied, was in an invalid state.

Response

Ensure that you entered the correct resource manager identification number. Use the DSPMQTRN command to display a list of resource managers and their identification numbers. A resource manager is in an invalid state, if it is still available to resolve the transaction, use the -a optional flag to resolve this and all other internally coordinated in-doubt transactions.

AMQ7024

Arguments supplied to a command are not valid.

Severity

20 : Error

Explanation

You supplied arguments to a command that it could not interpret. It is probable that you specified a flag not accepted by the command, or that you included extra flags.

Response

Correct the command and submit it again. Additional information on the arguments causing the error might be found in the error logs for the queue, or queue manager, referenced in the command.

AMQ7025

Error in the descriptive text argument (-c parameter) of the crtmqm command.

Severity

40 : Stop Error

Explanation

The descriptive text you supplied to the crtmqm command was in error.

Response

Correct the descriptive text argument and submit the command again.

AMQ7026

A principal or group name was invalid.

Severity

40 : Stop Error

Explanation

You specified the name of a principal or group which does not exist.

Response

Correct the name and resubmit the request.

AMQ7027

Argument <*insert_3*> supplied to command <*insert_4*> is invalid.

Severity

20 : Error

Explanation

The argument <*insert_3*> was supplied to the command <*insert_4*> which could not be interpreted. This argument is either not accepted by the command, or an extra flag has been included.

Response

Correct the command and submit it again.

AMQ7028

The queue manager is not available for use.

Severity

40 : Stop Error

Explanation
You have requested an action that requires the queue manager running, however, the queue manager is not currently running.

Response
Start the required queue manager and submit the command again.

AMQ7030
Quiesce request accepted. The queue manager will stop when all outstanding work is complete.

Severity
0 : Information

Explanation
You have requested that the queue manager end when there is no more work for it. In the meantime, it will refuse new applications that attempt to start, although it allows those already running to complete their work.

Response
None.

AMQ7031
The queue manager is stopping.

Severity
40 : Stop Error

Explanation
You issued a command that requires the queue manager running, however, it is currently in the process of stopping. The command cannot be run.

Response
None

AMQ7041
Object already exists.

Severity
40 : Stop Error

Explanation
A Define Object operation was performed, but the name selected for the object is already in use by an object that is unknown to WebSphere MQ The object name selected by MQ was <*insert_3*>, in directory <*insert_4*>, of object type <*insert_5*>.

Response
Remove the conflicting object from the MQ system, then try the operation again.

AMQ7042
Media image not available for object <*insert_3*> of type <*insert_4*>.

Severity
20 : Error

Explanation
The media image for object <*insert_3*>, type <*insert_4*>, is not available for media recovery. A log file containing part of the media image cannot be accessed.

Response
A previous message indicates which log file could not be accessed. Restore a copy of the log file and all subsequent log files from backup. If this is not possible, you must delete the object instead.

AMQ7042 (IBM i)
Media image not available for object <*insert_3*>.

Severity
20 : Error

Explanation
The media image for object <*insert_3*>, type <*insert_4*>, is not available for media recovery. A log file containing part of the media image cannot be accessed.

Response
A previous message indicates which log file could not be accessed. Restore a copy of the log file and all subsequent log files from backup. If this is not possible, you must delete the object instead.

AMQ7044
Media recovery not allowed.

Severity
20 : Error

Explanation
Media recovery is not possible on a queue manager using a circular log. Damaged objects must be deleted on such a queue manager.

Response
None.

AMQ7047
An unexpected error was encountered by a command.

Severity
40 : Stop Error

Explanation
An internal error occurred during the processing of a command.

Response
Follow problem determination procedures to identify the cause of the error.

AMQ7048
The queue manager name is either not valid or not known

Severity
40 : Stop Error

Explanation
Either the specified queue manager name does not conform to the rules required by WebSphere MQ or the queue manager does not exist. The rules for naming MQ objects are detailed in the WebSphere MQ Command Reference.

Response
Correct the name and submit the command again.

AMQ7048 (Windows)
The queue manager name is either not valid or not known

Severity
40 : Stop Error

Explanation
Either the specified queue manager name does not conform to the rules required by WebSphere MQ or the queue manager does not exist. The rules for naming MQ objects are detailed in the WebSphere MQ Command Reference.

This message can also occur when specifying an option to a command that contains a path. To ensure that the queue manager name is correctly passed to MQ by the Microsoft Windows command interpreter escape all directory separators in the path ("\\") or do not surround the path in quotation marks.

Response
Correct the name and submit the command again.

AMQ7053
The transaction has been committed.

Severity
0 : Information

Explanation
The prepared transaction has been committed.

Response
None.

AMQ7054
The transaction has been backed out.

Severity
0 : Information

Explanation
The prepared transaction has been backed out.

Response
None.

AMQ7055
The transaction number is not recognized.

Severity
20 : Error

Explanation
The number of the transaction you supplied was not recognized as belonging to an in-doubt or heuristically completed transaction.

Response
Ensure that you entered a valid transaction number. It is possible that the transaction number you entered corresponds to a transaction which was committed or backed out before you issued the command to resolve it. It is also possible that the transaction number you entered corresponds to a transaction which is not in the appropriate state for the options you specified. For example, you cannot commit or back out a transaction which is already heuristically completed.

AMQ7056
Transaction number <*insert_1*>,<*insert_2*> is in-doubt.

Severity
0 : Information

Explanation
This message is used to report the number of an in-doubt transaction.

Response
None.

AMQ7059
An error has occurred reading an INI file.

Severity
20 : Error

Explanation
An error has occurred when reading the MQS.INI file or a queue manager QM.INI file.

Response
If you have been changing the INI file content check and correct the change. If you have not changed the INI file, use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ7059 (Tandem)
An error has occurred reading an INI file.

Severity
20 : Error

Explanation
An error has occurred when reading the MQSINI file or a queue manager QMINI file.

Response
If you have been changing the INI file content check and correct the change. If you have not changed the INI file, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ7059 (Windows)
An error occurred when reading the configuration data.

Severity
20 : Error

Explanation
An error has occurred when reading the configuration data.

Response
If you have changed the configuration data, check and correct the change. If you have not changed the configuration data, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ7060
An error has occurred locking an INI file.

Severity
20 : Error

Explanation
An error has occurred locking the MQS.INI file or a queue manager QM.INI file.

Response
If you have been changing the INI file permissions check and correct the change. If you have not changed the INI file, use the standard facilities supplied with your system to record the problem

identifier and to save any generated output files. Use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ7060 (Tandem)
An error has occurred locking an INI file.

Severity
20 : Error

Explanation
An error has occurred locking the MQSINI file or a queue manager QMINI file.

Response
If you have been changing the INI file permissions check and correct the change. If you have not changed the INI file, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ7060 (Windows)
An error has occurred locking the configuration data.

Severity
20 : Error

Explanation
An error has occurred locking the configuration data.

Response
If you have changed the configuration data permissions, check and correct the change. If you have not changed the configuration data, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ7061
An expected stanza in an INI file is missing or contains errors.

Severity
20 : Error

Explanation
An expected stanza is missing from the MQS.INI file or a queue manager QM.INI file or the stanza contains errors.

Response
If you have been changing the INI file content check and correct the change.

AMQ7061 (Tandem)
An expected stanza in an INI file is missing or contains errors.

Severity
20 : Error

Explanation
An expected stanza is missing from the MQSINI file or a queue manager QMINI file or the stanza contains errors.

Response
If you have been changing the INI file content check and correct the change.

AMQ7061 (Windows)
An expected stanza in the configuration data is missing or contains errors.

Severity
20 : Error

Explanation
An expected stanza is missing from the configuration data or the stanza contains errors.

Response
If you have changed the configuration data, check and correct the change.

AMQ7062
Unable to access an INI file.

Severity
20 : Error

Explanation
Access to the MQS.INI file or a queue manager QM.INI file is denied.

Response
If you have been changing the INI file permissions check and correct the change.

AMQ7062 (Tandem)
Unable to access an INI file.

Severity
20 : Error

Explanation
Access to the MQSINI file or a queue manager QMINI file is denied.

Response
If you have been changing the INI file permissions check and correct the change.

AMQ7062 (Windows)
Unable to access the configuration data.

Severity
20 : Error

Explanation
Access to the configuration data is denied.

Response
If you have changed the configuration data permissions, check and correct the change.

AMQ7063
An INI file is missing.

Severity
20 : Error

Explanation
The MQS.INI file or a queue manager QM.INI file is missing.

Response
If you have been changing the INI file recover the previous file and retry the operation.

AMQ7063 (Tandem)
An INI file is missing.

Severity
20 : Error

Explanation
The MQSINI file or a queue manager QMINI file is missing.

Response
If you have been changing the INI file recover the previous file and retry the operation.

AMQ7063 (Windows)
Configuration data is missing.

Severity
20 : Error

Explanation
The configuration data for WebSphere MQ is missing.

Response
If you have changed the configuration data, recover the previous configuration data and retry the operation.

AMQ7064
Log path not valid or inaccessible.

Severity
40 : Stop Error

Explanation
The supplied log path could not be used by the queue manager. Possible reasons for this include the path not existing, the queue manager not being able to write to the path, or the path residing on a remote device.

Response
Ensure that the log path exists and that the queue manager has authority to read and write to it. If the queue manager already exists, ensure that the LogPath attribute in the queue manager's configuration file matches the intended log path.

AMQ7064 (IBM i)
Auxiliary storage pool identifier not found.

Explanation
The auxiliary storage pool identifier supplied does not exist on the system and could not be used by the queue manager to create a journal receiver.

Response
Specify *SYSTEM, or the identifier of an existing auxiliary storage pool and try the request again. You can use WRKDSKSTS to check the assignment of disk units to auxiliary storage pools.

AMQ7065
Insufficient space on disk.

Severity
40 : Stop Error

Explanation
The operation cannot be completed due to shortage of disk space.

Response
Either make more disk space available, or reduce the disk requirements of the command you issued.

AMQ7066
There are no matching prepared or heuristically completed transactions.

Severity
10 : Warning

Explanation
There are no prepared transactions to be resolved or heuristically completed transactions which match the parameters given.

Response
None.

AMQ7068
Authority file contains an authority stanza that is not valid.

Severity
40 : Stop Error

Explanation
A syntax error has been found in one of the files containing authorization information for the queue manager.

Response
Correct the contents of the incorrect authorization file by editing it.

AMQ7069
The queue manager was created successfully, but cannot be made the default.

Severity
40 : Stop Error

Explanation
The queue manager was defined to be the default queue manager for the machine when it was created. However, although the queue manager has been created, an error occurred trying to make it the default. There might not be a default queue manager defined for the machine at present.

Response
There is probably a problem with the machine-wide ini file. Verify the existence of the file, its access permissions, and its contents. If its backup file exists, reconcile the contents of the two files and then delete the backup. Finally, either update the machine-wide ini file by hand to specify the desired default queue manager, or delete and re-create the queue manager.

AMQ7069 (Windows)
The queue manager was created successfully, but cannot be made the default.

Severity
40 : Stop Error

Explanation
The queue manager was defined to be the default queue manager for the machine when it was created. However, although the queue manager has been created, an error occurred trying to make it the default. There might not be a default queue manager defined for the machine at present.

Response
There is probably a problem with the configuration data. Update the configuration data to specify the desired default queue manager, or delete and re-create the queue manager.

AMQ7072
Invalid QM.INI file stanza. Refer to the error log for more information.

Severity
40 : Stop Error

Explanation
An invalid QM.INI file stanza was found. Refer to the error log for more information.

Response
Correct the error and then retry the operation.

AMQ7072 (Tandem)
Invalid QMINI file stanza. Refer to the error log for more information.

Severity
40 : Stop Error

Explanation
An invalid QMINI file stanza was found. Refer to the error log for more information.

Response
Correct the error and then retry the operation.

AMQ7072 (Windows)
Stanza not valid. Refer to the error log for more information.

Severity
40 : Stop Error

Explanation
A stanza that is not valid was found. Refer to the error log for more information.

Response
Correct the error and retry the operation.

AMQ7073
Log size not valid.

Severity
40 : Stop Error

Explanation
Either the number of log files or the size of the log files was outside the accepted values.

Response
Make sure that the log parameters you enter lie within the valid range.

AMQ7074
Unknown stanza key <*insert_4*> on line <*insert_1*> of ini file <*insert_3*>.

Severity
10 : Warning

Explanation
Line <*insert_1*> of the configuration file <*insert_3*> contained a stanza called <*insert_3*>. This stanza is not recognized.

Response
Check the contents of the file and retry the operation.

AMQ7074 (Windows)
Unknown stanza key <*insert_4*> at <*insert_3*> in the configuration data.

Severity
10 : Warning

Explanation
Key <*insert_3*> contained a stanza called <*insert_4*>. This stanza is not recognized.

Response
Check the contents of the configuration data and retry the operation.

AMQ7074 (IBM i)
Unknown stanza key.

Severity
10 : Warning

Explanation
Line <*insert_1*> of the configuration file <*insert_3*> contained a stanza key <*insert_4*>. This stanza is not recognized.

Response
Check the contents of the file and retry the operation.

AMQ7075
Unknown attribute in ini file.

Severity
10 : Warning

Explanation
Line <*insert_1*> of the configuration file <*insert_3*> contained an attribute called <*insert_4*> that is not valid. This attribute is not recognized in this context.

Response
Check the contents of the file and retry the operation.

AMQ7075 (Windows)
Unknown attribute <*insert_4*> at <*insert_3*> in the configuration data.

Severity
10 : Warning

Explanation
Key <*insert_3*> in the configuration data contained an attribute called <*insert_4*> that is not valid. This attribute is not recognized in this context.

Response
Check the contents of the configuration data and retry the operation.

AMQ7076
Invalid value for attribute in ini file.

Severity
10 : Warning

Explanation
Line <*insert_1*> of the configuration file <*insert_3*> contained value <*insert_5*> that is not valid for the attribute <*insert_4*>.

Response
Check the contents of the file and retry the operation.

AMQ7076 (Windows)
Value <*insert_5*> not valid for attribute <*insert_4*> at <*insert_3*> in the configuration data.

Severity
10 : Warning

Explanation
Key <*insert_3*> in the configuration data contained value <*insert_5*> that is not valid for the attribute <*insert_4*>.

Response
Check the contents of the configuration data and retry the operation.

AMQ7077
You are not authorized to perform the requested operation.

Severity
40 : Stop Error

Explanation
You tried to issue a command for the queue manager. You are not authorized to perform the command.

Response
Contact your system administrator to perform the command for you. Alternatively, request authority to perform the command from your system administrator.

AMQ7078
You entered an object type that is invalid with a generic profile name.

Severity
40 : Stop Error

Explanation
You entered an object type of *ALL or *MQM and an object name that contains generic characters, this is an invalid combination.

Response
Correct the command and submit it again.

AMQ7080
No objects processed.

Severity
10 : Warning

Explanation
No objects were processed, either because no objects matched the criteria given, or because the objects found did not require processing.

Response
None.

AMQ7081
Object <*insert_3*>, type <*insert_4*> recreated.

Severity
0 : Information

Explanation
The object <*insert_3*>, type <*insert_4*> was re-created from its media image.

Response
None.

AMQ7082
Object <*insert_3*>, type <*insert_4*> is not damaged.

Severity
10 : Warning

Explanation
Object <*insert_3*>, type <*insert_4*> cannot be re-created since it is not damaged.

Response
None

AMQ7083
A resource problem was encountered by a command.

Severity
20 : Error

Explanation
The command failed due to a resource problem. Possible causes include the log being full or the command running out of memory.

Response
Look at the previous messages to diagnose the problem. Rectify the problem and retry the operation.

AMQ7084
Object <*insert_3*>, type <*insert_4*> damaged.

Severity
20 : Error

Explanation
The object <*insert_3*>, type <*insert_4*> was damaged. The object must be deleted or, if the queue manager supports media recovery, re-created from its media image.

Response
Delete the object or re-create it from its media image.

AMQ7085
Object <*insert_3*>, type <*insert_4*> not found.

Severity
20 : Error

Explanation
Object <*insert_3*>, type <*insert_4*> cannot be found.

Response
None.

AMQ7086
Media image for object <*insert_3*>, type <*insert_4*> recorded.

Severity
0 : Information

Explanation
The media image for object <*insert_3*>, type <*insert_4*>, defined in Queue Manager <*insert_5*>, has been recorded.

Response
None.

AMQ7087
Object <*insert_3*>, type <*insert_4*> is a temporary object

Severity
20 : Error

Explanation
Object <*insert_3*>, type <*insert_4*> is a temporary object. Media recovery operations are not permitted on temporary objects.

Response
None.

AMQ7088
Object <*insert_3*>, type <*insert_4*> in use.

Severity
20 : Error

Explanation
Object <*insert_3*>, type <*insert_4*> is in use. Either an application has it open or, if it is a local queue, there are uncommitted messages on it.

Response
Ensure that the object is not opened by any applications, and that there are no uncommitted messages on the object, if it is a local queue. Then, retry the operation.

AMQ7089
Media recovery already in progress.

Severity
20 : Error

Explanation
Another media recovery operation is already in progress. Only one media recovery operation is permitted at a time.

Response
Wait for the existing media recovery operation to complete and retry the operation.

AMQ7090 (Windows)
The queue manager CCSID is not valid.

Severity
40 : Stop Error

Explanation
The CCSID to be used by the QMGR is not valid, because:

1) It is a DBCS CCSID.

2) The CCSID encoding is not ASCII or ASCII related. EBCDIC or UCS2 encodings are not valid on this machine.

3) The CCSID encoding is unknown.

Response
Check the CCSID is valid for the machine on which you are working.

AMQ7090 (IBM i)
The queue manager CCSID is not valid.

Severity
40 : Stop Error

Explanation
The CCSID to be used by the QMGR is not valid for the IBM i platform. The CCSID encoding must be a valid EBCDIC value.

Response
Check that the CCSID that you have entered is a valid EBCDIC value.

AMQ7091
You are performing authorization for the queue manager, but you specified an object name.

Severity
40 : Stop Error

Explanation
Modification of authorizations for a queue manager can be performed only from that queue manager. You must not specify an object name.

Response
Correct the command and submit it again.

AMQ7092
An object name is required but you did not specify one.

Severity
40 : Stop Error

Explanation
The command needs the name of an object, but you did not specify one.

Response
Correct the command and submit it again.

AMQ7093
An object type is required but you did not specify one.

Severity
40 : Stop Error

Explanation
The command needs the type of the object, but you did not specify one.

Response
Correct the command and submit it again.

AMQ7094
You specified an object type that is not valid, or more than one object type.

Severity
40 : Stop Error

Explanation
Either the type of object you specified was not valid, or you specified multiple object types on a command which supports only one.

Response
Correct the command and submit it again.

AMQ7095
An entity name is required but you did not specify one.

Severity
40 : Stop Error

Explanation
The command needs one or more entity names, but you did not specify any. Entities can be principals or groups.

Response
Correct the command and submit it again.

AMQ7096
An authorization specification is required but you did not provide one.

Severity
40 : Stop Error

Explanation
The command sets the authorizations on WebSphere MQ objects. However you did not specify which authorizations are to be set.

Response
Correct the command and submit it again.

AMQ7097
You gave an authorization specification that is not valid.

Severity
40 : Stop Error

Explanation
The authorization specification you provided to the command contained one or more items that could not be interpreted.

Response
Correct the command and submit it again.

AMQ7098
The command accepts only one entity name. You specified more than one.

Severity
40 : Stop Error

Explanation
The command can accept only one principal or group name. You specified more than one.

Response
Correct the command and submit it again.

AMQ7099
Entity <*insert_3*> has the following authorizations for object <*insert_4*>:

Severity
0 : Information

Explanation
Informational message. The list of authorizations follows.

Response
None.

AMQ7100
New functions up to command level <*insert_1*> enabled.

Severity
0 : Information

Explanation
The queue manager's command level has been increased and any new function introduced has been enabled for use.

Response
None.

AMQ7104
Resource manager <*insert_1*> has prepared.

Severity
0 : Information

Explanation
This message reports the state of a resource manager with respect to an in-doubt transaction.

Response
None.

AMQ7105
Resource manager <*insert_1*> has committed.

Severity
0 : Information

Explanation
This message reports the state of a resource manager with respect to an in-doubt transaction.

Response
None.

AMQ7106
Resource manager <*insert_1*> has rolled back.

Severity
0 : Information

Explanation
This message reports the state of a resource manager with respect to an in-doubt transaction.

Response
None.

AMQ7107
Resource manager <*insert_1*> is <*insert_3*>.

Severity
0 : Information

Explanation
This message reports the identification number and name of a resource manager.

Response
None.

AMQ7108
Any in-doubt transactions have been resolved.

Severity
0 : Information

Explanation
All, if there were any, of the internally coordinated transactions which were in-doubt, have now been resolved. This message reports successful completion of the RSVMQTRN command when the -a option is used.

Response
None.

AMQ7108 (IBM i)
Any in-doubt transactions have been resolved.

Severity
0 : Information

Explanation
All, if there were any, of the internally coordinated transactions which were in-doubt, have now been resolved.

Response
None.

AMQ7109
A decision on behalf of the unavailable resource manager has been delivered.

Severity
0 : Information

Explanation
A decision for an internally coordinated transaction which was in-doubt, has now been delivered on behalf of the unavailable resource manager. This message reports successful completion of the RSVMQTRN command when the -r option is used.

Response
None.

AMQ7110
Media image for the syncfile recorded.

Severity
0 : Information

Explanation
The media image for the syncfile has been recorded.

Response
None.

AMQ7111
Resource manager <*insert_1*> has participated.

Severity
0 : Information

Explanation
This message reports the state of a resource manager with respect to an in-doubt transaction.

Response
None.

AMQ7112
Transaction number <*insert_1*>,<*insert_2*> has encountered an error.

Severity
0 : Information

Explanation
This message is used to report the number of an in-doubt transaction which has encountered an error with one or more resource managers.

Response
Refer to the queue manager error log for more information about which resource managers are in error. Ensure that the resource managers that were in error, are working correctly, restart the queue manager. If the problem persists, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ7113
The Database Name argument, -rn, is missing from the command crtmqm

Severity
20 : Error

Explanation
The required flag, -rn, was omitted from the command crtmqm

Response
Add the flag and associated database name and submit it again.

AMQ7114
The Database Password argument, -rp, is missing from the command crtmqm

Severity
20 : Error

Explanation
The required flag, -rp, was omitted from the command crtmqm

Response
Add the flag and associated database password and submit it again.

AMQ7115
The Database Type argument, -rt, is missing from the command crtmqm

Severity
20 : Error

Explanation
The required flag, -rt, was omitted from the command crtmqm

Response
Add the flag and associated database type and submit it again

AMQ7116
The Database Type argument, -rt, is greater than 8 characters long

Severity
20 : Error

Explanation
The argument supplied with the flag -rt, is greater than 8 characters long

Response
Reduce the length of the database type argument and submit it again

AMQ7117
The MSD shared library failed to load.

Severity
20 : Error

Explanation
The MSD shared library was either not located or failed to load correctly.

Response
Ensure that the database type is specified correctly when creating a queue manager since this is used to form the name of the shared library to be loaded. Further information on the failure might be found in the FFST logs. Also, ensure that the MSD shared library is installed correctly.

AMQ7118
Transaction number <*insert_1*>,<*insert_2*> is heuristically committed.

Severity
0 : Information

Explanation
This message is used to report the number of a heuristically committed transaction.

Response
None.

AMQ7119
Transaction number <*insert_1*>,<*insert_2*> is heuristically rolled back.

Severity
0 : Information

Explanation
This message is used to report the number of a heuristically rolled-back transaction.

Response
None.

AMQ7120
The Trial Period license for this copy of WebSphere MQ has expired.

Severity
20 : Error

Explanation
This copy of WebSphere MQ was licensed to be used in trial mode for a limited period only. This period has expired.

Response
Install a Production license for this copy of WebSphere MQ

AMQ7121
The trial period for this copy of WebSphere MQ has now expired.

Severity
20 : Error

Explanation
This copy of WebSphere MQ was licensed for a limited period only. This period has now expired.

Response
Install a Production license for this copy of WebSphere MQ

AMQ7122
The Trial Period License Agreement was not accepted.

Severity
10 : Warning

Explanation
When the Trial Period License Agreement is displayed, the user must accept it before this copy of WebSphere MQ can be used.

Response
Submit the command again and accept the agreement.

AMQ7123
There is one day left in the trial period for this copy of WebSphere MQ

Severity
0 : Information

Explanation
This copy of WebSphere MQ is licensed for a limited period only.

Response
None.

AMQ7124
This is the final day of the trial period for this copy of WebSphere MQ

Severity
10 : Warning

Explanation
This copy of WebSphere MQ is licensed for a limited period only.

Response
Install a Production license for this copy of WebSphere MQ

AMQ7125
There are <*insert_1*> days left in the trial period for this copy of WebSphere MQ

Severity
0 : Information

Explanation
This copy of WebSphere MQ is licensed for a limited period only.

Response
None.

AMQ7126
This copy of WebSphere MQ is now running in Production mode.

Severity
0 : Information

Explanation
A Production license has been installed for this copy of WebSphere MQ

Response
None.

AMQ7127

Press Enter when you have read the messages

Severity
0 : Information

Explanation
One or more messages have been displayed. They will disappear when the user presses the Enter key.

Response
Press the Enter key when the messages are no longer required.

AMQ7128
No license installed for this copy of WebSphere MQ

Severity
20 : Error

Explanation
The installation of WebSphere MQ is invalid since no Production, Beta, or Trial Period license has been installed.

Response
Check that the installation steps described in the Quick Beginnings documentation have been followed, and if the problem persists use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ7129
The trial period for this copy of WebSphere MQ has already been started.

Severity
0 : Information

Explanation

This copy of WebSphere MQ is licensed for a limited period only and the trial period has been started previously.

Response

None.

AMQ7130

This copy of WebSphere MQ is running in Production mode.

Severity

0 : Information

Explanation

A Production license has been installed for this copy of WebSphere MQ A beta or trial period cannot be started.

Response

None.

AMQ7131

International License Agreement for Evaluation of Programs

Part 1 - General Terms

PLEASE READ THIS AGREEMENT CAREFULLY BEFORE USING THE PROGRAM. IBM WILL LICENSE THE PROGRAM TO YOU ONLY IF YOU FIRST ACCEPT THE TERMS OF THIS AGREEMENT. BY USING THE PROGRAM YOU AGREE TO THESE TERMS. IF YOU DO NOT AGREE TO THE TERMS OF THIS AGREEMENT, PROMPTLY RETURN THE UNUSED PROGRAM TO IBM.

Severity

0 : Information

Explanation

This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response

None.

AMQ7132

The Program is owned by International Business Machines Corporation or one of its subsidiaries (IBM) or an IBM supplier, and is copyrighted and licensed, not sold.

The term "Program" means the original program and all whole or partial copies of it. A Program consists of machine-readable instructions, its components, data, audio-visual content (such as images, text, recordings, or pictures), and related licensed materials.

Severity

0 : Information

Explanation

This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response

None.

AMQ7133

This Agreement includes Part 1 - General Terms and Part 2 - Country Unique Terms and is the complete agreement regarding the use of this Program, and replaces any prior oral or written communications between you and IBM. The terms of Part 2 might replace or modify those of Part 1.

Severity
0 : Information

Explanation
This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7134

1. License

Use of the Program

IBM grants you a nonexclusive, nontransferable license to use the Program.

You may 1) use the Program only for internal evaluation, testing or demonstration purposes, on a trial or "try-and-buy" basis and 2) make and install a reasonable number of copies of the Program in support of such use, unless IBM identifies a specific number of copies in the documentation accompanying the Program. The terms of this license apply to each copy you make. You will reproduce the copyright notice and any other legends of ownership on each copy, or partial copy, of the Program.

Severity
0 : Information

Explanation
This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7135

THE PROGRAM MAY CONTAIN A DISABLING DEVICE THAT WILL PREVENT IT FROM BEING USED UPON EXPIRATION OF THIS LICENSE. YOU WILL NOT TAMPER WITH THIS DISABLING DEVICE OR THE PROGRAM. YOU SHOULD TAKE PRECAUTIONS TO AVOID ANY LOSS OF DATA THAT MIGHT RESULT WHEN THE PROGRAM CAN NO LONGER BE USED.

Severity
0 : Information

Explanation
This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7136

You will 1) maintain a record of all copies of the Program and 2) ensure that anyone who uses the Program does so only for your authorized use and in compliance with the terms of this Agreement.

You may not 1) use, copy, modify or distribute the Program except as provided in this Agreement; 2) reverse assemble, reverse compile, or otherwise translate the Program except as specifically permitted by law without the possibility of contractual waiver; or 3) sublicense, rent or lease the Program.

Severity
0 : Information

Explanation
This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7137

This license begins with your first use of the Program and ends 1) as of the duration or date specified in the documentation accompanying the Program or 2) when the Program automatically disables itself. Unless IBM specifies in the documentation accompanying the Program that you may retain the Program (in which case, an additional charge might apply), you will destroy the Program and all copies made of it within ten days of when this license ends.

Severity
0 : Information

Explanation
This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7138

2. No Warranty

SUBJECT TO ANY STATUTORY WARRANTIES WHICH CANNOT BE EXCLUDED, IBM MAKES NO WARRANTIES OR CONDITIONS EITHER EXPRESS OR IMPLIED, INCLUDING WITHOUT LIMITATION, THE WARRANTY OF NON-INFRINGEMENT AND THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, REGARDING THE PROGRAM OR TECHNICAL SUPPORT, IF ANY. IBM MAKES NO WARRANTY REGARDING THE CAPABILITY OF THE PROGRAM TO CORRECTLY PROCESS, PROVIDE AND/OR RECEIVE DATE DATA WITHIN AND BETWEEN THE 20TH AND 21ST CENTURIES.

This exclusion also applies to any of IBM's subcontractors, suppliers or program developers (collectively called "Suppliers").

Manufacturers, suppliers, or publishers of non-IBM Programs might provide their own warranties.

Severity
0 : Information

Explanation
This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7139

3. Limitation of Liability

NEITHER IBM NOR ITS SUPPLIERS ARE LIABLE FOR ANY DIRECT OR INDIRECT DAMAGES, INCLUDING WITHOUT LIMITATION, LOST PROFITS, LOST SAVINGS, OR ANY INCIDENTAL, SPECIAL, OR OTHER ECONOMIC CONSEQUENTIAL DAMAGES, EVEN IF IBM IS INFORMED OF THEIR POSSIBILITY. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE EXCLUSION OR LIMITATION MAY NOT APPLY TO YOU.

Severity
0 : Information

Explanation
This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7140

4. General

Nothing in this Agreement affects any statutory rights of consumers that cannot be waived or limited by contract.

Severity
0 : Information

Explanation
This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7141

IBM may terminate your license if you fail to comply with the terms of this Agreement. If IBM does so, you must immediately destroy the Program and all copies you made of it.

You may not export the Program.

Neither you nor IBM will bring a legal action under this Agreement more than two years after the cause of action arose unless otherwise provided by local law without the possibility of contractual waiver or limitation.

Neither you nor IBM is responsible for failure to fulfill any obligations due to causes beyond its control.

There is no additional charge for use of the Program for the duration of this license.

IBM does not provide program services or technical support, unless IBM specifies otherwise.

Severity
0 : Information

Explanation

This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response

None.

AMQ7142

Reply 'yes' to accept the Agreement. Reply 'no' if you do not agree to the terms of the Agreement. Reply 'no' and submit the command again, if you want to read the Agreement again.

Severity

0 : Information

Explanation

The Trial Period License Agreement has been displayed to the user and the user should now accept or reject the Agreement.

Response

Reply 'yes' or 'no' and press 'Enter'.

AMQ7143

Press Enter to continue

Severity

0 : Information

Explanation

Part of the Trial Period License Agreement has been displayed to the user. The user should press the Enter key to indicate that they are ready for the next part of the Agreement to be displayed.

Response

Press the Enter key when ready for the next part of the Agreement to be displayed.

AMQ7144

The laws of the country in which you acquire the Program govern this Agreement, except 1) in Australia, the laws of the State or Territory in which the transaction is performed govern this Agreement; 2) in Albania, Armenia, Belarus, Bosnia/Herzegovina, Bulgaria, Croatia, Czech Republic, Georgia, Hungary, Kazakhstan, Kirghizia, Former Yugoslav Republic of Macedonia (FYROM), Moldova, Poland, Romania, Russia, Slovak Republic, Slovenia, Ukraine, and Federal Republic of Yugoslavia, the laws of Austria govern this Agreement; 3) in the United Kingdom, all disputes relating to this Agreement will be governed by English law and will be submitted to the exclusive jurisdiction of the English courts; 4) in Canada, the laws of the Province of Ontario govern this Agreement; and 5) in the United States and Puerto Rico, and People's Republic of China, the laws of the State of New York govern this Agreement.

Severity

Explanation

This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response

None.

AMQ7145

Part 2 - Country Unique Terms

AUSTRALIA:

No Warranty (Section 2):

The following paragraph is added to this Section:

Although IBM specifies that there are no warranties, you might have certain rights under the Trade Practices Act 1974 or other legislation and are only limited to the extent permitted by the applicable legislation.

Limitation of Liability (Section 3):

The following paragraph is added to this Section:

Severity
0 : Information

Explanation
This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7146

Where IBM is in breach of a condition or warranty implied by the Trade Practices Act 1974, IBM's liability is limited to the repair or replacement of the goods, or the supply of equivalent goods. Where that condition or warranty relates to right to sell, quiet possession or clear title, or the goods are of a kind ordinarily acquired for personal, domestic or household use or consumption, then none of the limitations in this paragraph apply.

Severity
0 : Information

Explanation
This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7147

NEW ZEALAND:

No Warranty (Section 2):

The following paragraph is added to this Section:

Although IBM specifies that there are no warranties, you might have certain rights under the Consumer Guarantees Act 1993 or other legislation which cannot be excluded or limited. The Consumer Guarantees Act 1993 will not apply in respect of any goods or services which IBM provides, if you require the goods and services for the purposes of a business as defined in the Act.

Severity
0 : Information

None.

AMQ7149

GERMANY: No Warranty (Section 2):

The following paragraphs are added to this Section:

The minimum warranty period for Programs is six months.

In case a Program is delivered without specifications, we will only warrant that the Program information correctly describes the Program and that the Program can be used according to the Program information. You have to check the usability according to the Program information within the "money-back guaranty" period.

Limitation of Liability (Section 3):

The following paragraph is added to this Section:

The limitations and exclusions specified in the Agreement will not apply to damages caused by IBM with fraud or gross negligence, and for express warranty.

Severity

0 : Information

Explanation

This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response

None.

AMQ7150

INDIA:

General (Section 4):

The following replaces the fourth paragraph of this Section:

If no suit or other legal action is brought, within two years after the cause of action arose, in respect of any claim that either party might have against the other, the rights of the concerned party in respect of such claim will be forfeited and the other party will stand released from its obligations in respect of such claim.

Severity

0 : Information

Explanation
This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7151

IRELAND:

No Warranty (Section 2):

The following paragraph is added to this Section:

Except as expressly provided in these terms and conditions, all statutory conditions, including all warranties implied, but without prejudice to the generality of the foregoing all warranties implied by the Sale of Goods Act 1893 or the Sale of Goods and Supply of Services Act 1980 are hereby excluded.

ITALY:

Limitation of Liability (Section 3):

This section is replaced by the following:

Unless otherwise provided by mandatory law, IBM is not liable for any damages which might arise.

Severity
0 : Information

Explanation
This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

UNITED KINGDOM:

Limitation of Liability (Section 3):

The following paragraph is added to this Section at the end of the first paragraph:

The limitation of liability will not apply to any breach of IBM's obligations implied by Section 12 of the Sales of Goods Act 1979 or Section 2 of the Supply of Goods and Services Act 1982.

Severity
0 : Information

Explanation
This is part of the Trial Period License Agreement which must be accepted before a trial period can be started. A trial period allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7153
A license could not be installed for this copy of WebSphere MQ

Severity
20 : Error

Explanation
A Production, Beta or Trial Period license could not be installed for this copy of WebSphere MQ This is because the 'nodelock' file in the 'qmgrs/@SYSTEM' directory could not be created or updated.

Response
Check the ownership and permissions of the 'qmgrs/@SYSTEM' directory.

AMQ7154
The Production license for this copy of WebSphere MQ has expired.

Severity
20 : Error

Explanation
The production license for this copy of WebSphere MQ has an expiry date. This date has been passed.

Response
Contact your IBM support center.

AMQ7155
License file not found or not valid.

Severity
20 : Error

Explanation
The program requires that the License file is present, available and is a valid license file. You can also get this error if you try and use Advanced Message Security (for example, setmqspl) but do not have the AMS component installed.

Response
Check that the installation steps described in the documentation have been followed, and if the problem persists use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ7156
This copy of WebSphere MQ is already running in Production mode.

Severity
0 : Information

Explanation
A Production license has previously been installed for this copy of WebSphere MQ

Response
None.

AMQ7157
The Production license is not valid for this copy of WebSphere MQ

Severity
20 : Error

Explanation
The license <*insert_3*> has been installed but it is not a valid production license for this copy of WebSphere MQ

Response
Submit the SETMQPRD command again specifying the name of a valid production license.

AMQ7158
The Trial Period license is not valid for this copy of WebSphere MQ

Severity
20 : Error

Explanation
The license <*insert_3*> has been installed but it is not a valid trial period license for this copy of WebSphere MQ

Response
Check that the correct version of the file is available.

AMQ7159
A FASTPATH application has ended unexpectedly.

Severity
10 : Warning

Explanation
A FASTPATH application has ended in a way which did not allow the queue manager to clean up the resources owned by that application. Any resources held by the application can only be released by stopping and restarting the queue manager.

Response
Investigate why the application ended unexpectedly. Avoid ending FASTPATH applications in a way which prevents WebSphere MQ from releasing resources held by the application.

AMQ7164 (IBM i)
WebSphere MQ is waiting for a job to start.

Severity
0 : Information

Explanation

WebSphere MQ has been waiting <*insert_1*> seconds to start job <*insert_3*> for Queue Manager: <*insert_5*>

Response

Check that the job queue that is associated with job description <*insert_4*> is not held and that the appropriate maximum active jobs value in the job queue entry is sufficient to allow the job to start. Check that the subsystem that is associated with the job queue is active and has a sufficient value specified for the maximum number of jobs that can be active at the same time.

AMQ7165

The Beta license for this copy of WebSphere MQ has expired.

Severity

20 : Error

Explanation

This copy of WebSphere MQ was licensed to be used for Beta testing for a limited period only. This period has expired.

Response

Install a Production license for this copy of WebSphere MQ

AMQ7166

The Beta period for this copy of WebSphere MQ has now expired.

Severity

20 : Error

Explanation

This copy of WebSphere MQ was licensed for a limited period only. This period has now expired.

Response

Install a Production license for this copy of WebSphere MQ

AMQ7167

The 'Early Release of Programs License Agreement' was not accepted.

Severity

10 : Warning

Explanation

When the IBM International License Agreement for Early Release of Programs is displayed, the user must accept it before this copy of WebSphere MQ can be used.

Response

Submit the command again and accept the agreement.

AMQ7168

There is one day left in the Beta test period for this copy of WebSphere MQ

Severity

0 : Information

Explanation

This copy of WebSphere MQ is licensed for a limited period only.

Response

None.

AMQ7169

This is the final day of the Beta test period for this copy of WebSphere MQ

Severity

10 : Warning

Explanation
This copy of WebSphere MQ is licensed for a limited period only.

Response
Install a Production license for this copy of WebSphere MQ

AMQ7170 (IBM i)
Option is not valid for this transaction.

Severity
20 : Error

Explanation
The Resolve option is not valid for external transactions. The Commit and Backout options are not valid for internal transactions or heuristically completed transactions. The Forget option is only valid for heuristically completed transactions.

Response
Select a different option for this transaction.

AMQ7171
IBM International License Agreement for Early Release of Programs

Part 1 - General Terms

PLEASE READ THIS AGREEMENT CAREFULLY BEFORE USING THE PROGRAM. IBM WILL LICENSE THE PROGRAM TO YOU ONLY IF YOU FIRST ACCEPT THE TERMS OF THIS AGREEMENT. BY USING THE PROGRAM YOU AGREE TO THESE TERMS. IF YOU DO NOT AGREE TO THE TERMS OF THIS AGREEMENT, PROMPTLY RETURN THE UNUSED PROGRAM TO IBM.

Severity
0 : Information

Explanation
This is part of the Early Release of Programs License Agreement which must be accepted before a Beta test period can be started. A Beta test version allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7172

The Program is owned by International Business Machines Corporation or one of its subsidiaries (IBM) or an IBM supplier, and is copyrighted and licensed, not sold.

The term "Program" means the original program and all whole or partial copies of it. A Program consists of machine-readable instructions, its components, data, audio-visual content (such as images, text, recordings, or pictures), and related licensed materials.

Severity
0 : Information

Explanation
This is part of the Early Release of Programs License Agreement which must be accepted before a Beta test period can be started. A Beta test version allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7173

The term "Early Release" means that the Program is not formally released or generally available. The term does not imply that the Program will be formally released or made generally available. IBM does not guarantee that a Program formally released or made generally available will be similar to, or compatible with, Early Release versions.

THIS AGREEMENT INCLUDES PART 1 - GENERAL TERMS AND PART 2 - COUNTRY-UNIQUE TERMS AND IS THE COMPLETE AGREEMENT REGARDING THE USE OF THIS PROGRAM, AND REPLACES ANY PRIOR ORAL OR WRITTEN COMMUNICATIONS BETWEEN YOU AND IBM. THE TERMS OF PART 2 MAY REPLACE OR MODIFY THOSE OF PART 1.

Severity

0 : Information

Explanation

This is part of the Early Release of Programs License Agreement which must be accepted before a Beta test period can be started. A Beta test version allows a copy of WebSphere MQ to be used for a limited period only.

Response

None.

AMQ7174

1.License

Use of the Program

IBM grants you a nonexclusive, nontransferable license to use the Program.

You may

1) use the Program only for internal evaluation or testing purposes and

2) make and install a reasonable number of copies of the Program in support of such use, unless IBM identifies a specific number of copies in the documentation accompanying the Program. The terms of this license apply to each copy you make. You will reproduce the copyright notice and any other legends of ownership on each copy, or partial copy, of the Program.

Severity

0 : Information

Explanation

This is part of the Early Release of Programs License Agreement which must be accepted before a Beta test period can be started. A Beta test version allows a copy of WebSphere MQ to be used for a limited period only.

Response

None.

AMQ7175

THE PROGRAM MAY CONTAIN A DISABLING DEVICE THAT WILL PREVENT IT FROM BEING USED UPON EXPIRATION OF THIS LICENSE. YOU WILL NOT TAMPER WITH THIS DISABLING DEVICE OR THE PROGRAM. YOU SHOULD TAKE PRECAUTIONS TO AVOID ANY LOSS OF DATA THAT MIGHT RESULT WHEN THE PROGRAM CAN NO LONGER BE USED.

You will

1) maintain a record of all copies of the Program and

2) ensure that anyone who uses the Program does so only for your authorized use and in compliance with the terms of this Agreement.

Severity
0 : Information

Explanation
This is part of the Early Release of Programs License Agreement which must be accepted before a Beta test period can be started. A Beta test version allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7176

You may not

1) use, copy, modify, or distribute the Program except as provided in this Agreement;

2) reverse assemble, reverse compile, or otherwise translate the Program except as specifically permitted by law without the possibility of contractual waiver; or

3) sublicense, rent, or lease the Program.

Severity
0 : Information

Explanation
This is part of the Early Release of Programs License Agreement which must be accepted before a Beta test period can be started. A Beta test version allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7177

This license begins with your first use of the Program and ends

1) as of the duration or date specified in the documentation accompanying the Program,

2) when the Program automatically disables itself, or

3) when IBM makes the Program generally available. Unless IBM specifies in the documentation accompanying the Program that you may retain the Program (in which case, an additional charge might apply), you will destroy the Program and all copies made of it within ten days of when this license ends.

Severity
0 : Information

Explanation
This is part of the Early Release of Programs License Agreement which must be accepted before a Beta test period can be started. A Beta test version allows a copy of WebSphere MQ to be used for a limited period only.

Response
None.

AMQ7178

2.No Warranty

SUBJECT TO ANY STATUTORY WARRANTIES WHICH CANNOT BE EXCLUDED, IBM MAKES NO WARRANTIES OR CONDITIONS EITHER EXPRESS OR IMPLIED, INCLUDING WITHOUT LIMITATION, THE WARRANTY OF NON-INFRINGEMENT AND THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, REGARDING THE PROGRAM OR TECHNICAL SUPPORT, IF ANY.. IBM MAKES NO WARRANTY REGARDING

THE CAPABILITY OF THE PROGRAM TO CORRECTLY PROCESS, PROVIDE AND/OR RECEIVE DATE DATA WITHIN AND BETWEEN THE 20TH AND 21ST CENTURIES.

This exclusion also applies to any of IBM's subcontractors, suppliers or program developers (collectively called "Suppliers").

Manufacturers, suppliers, or publishers of non-IBM Programs might provide their own warranties.

Severity

0 : Information

Explanation

This is part of the Early Release of Programs License Agreement which must be accepted before a Beta test period can be started. A Beta test version allows a copy of WebSphere MQ to be used for a limited period only.

Response

None.

AMQ7179

3.Limitation of Liability

NEITHER IBM NOR ITS SUPPLIERS ARE LIABLE FOR ANY DIRECT OR INDIRECT DAMAGES, INCLUDING WITHOUT LIMITATION, LOST PROFITS, LOST SAVINGS, OR ANY INCIDENTAL, SPECIAL, OR OTHER ECONOMIC CONSEQUENTIAL DAMAGES, EVEN IF IBM IS INFORMED OF THEIR POSSIBILITY. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE EXCLUSION OR LIMITATION MAY NOT APPLY TO YOU.

4.Rights In Data

You hereby assign to IBM all right, title, and interest (including ownership of copyright) in any data, suggestions, and written materials related to your use of the Program you provide to IBM. If IBM requires it, you will sign an appropriate document to assign such rights.

Severity

0 : Information

Explanation

This is part of the Early Release of Programs License Agreement which must be accepted before a Beta test period can be started. A Beta test version allows a copy of WebSphere MQ to be used for a limited period only.

Response

None.

AMQ7180

5.General

Nothing in this Agreement affects any statutory rights of consumers that cannot be waived or limited by contract.

IBM may terminate your license if you fail to comply with the terms of this Agreement. If IBM does so, you must immediately destroy the Program and all copies you made of it.

You not export the Program.

Severity

0 : Information

Explanation

This is part of the Early Release of Programs License Agreement which must be accepted before a Beta test period can be started. A Beta test version allows a copy of WebSphere MQ to be used for a limited period only.

Response

None.

AMQ7181

Neither you nor IBM will bring a legal action under this Agreement more than two years after the cause of action arose unless otherwise provided by local law without the possibility of contractual waiver or limitation.

Neither you nor IBM is responsible for failure to fulfill any obligations due to causes beyond its control.

There is no additional charge for use of the Program for the duration of this license.

Neither of us will charge the other for rights in data or any work performed as a result of this Agreement.

IBM does not provide program services or technical support, unless IBM specifies otherwise.

Severity

0 : Information

Explanation

This is part of the Early Release of Programs License Agreement which must be accepted before a Beta test period can be started. A Beta test version allows a copy of WebSphere MQ to be used for a limited period only.

Response

None.

AMQ7182

The laws of the country in which you acquire the Program govern this Agreement, except

1) in Australia, the laws of the State or Territory in which the transaction is performed govern this Agreement;

2) in Albania, Armenia, Belarus, Bosnia/Herzegovina, Bulgaria, Croatia, Czech Republic, Georgia, Hungary, Kazakhstan, Kirghizia, Former Yugoslav Republic of Macedonia (FYROM), Moldova, Poland, Romania, Russia, Slovak Republic, Slovenia, Ukraine, and Federal Republic of Yugoslavia, the laws of Austria govern this Agreement;

3) in the United Kingdom, all disputes relating to this Agreement will be governed by English Law and will be submitted to the exclusive jurisdiction of the English courts;

4) in Canada, the laws of the Province of Ontario govern this Agreement; and

5) in the United States and Puerto Rico, and People's Republic of China, the laws of the State of New York govern this Agreement.

20 : Error

Explanation
The queue manager has previously been started by a newer release of WebSphere MQ at command level <*insert_1*>. This installation is not compatible with the newer release's data. Migration between these releases is not possible.

Response
If the queue manager's data is shared using networked storage, ensure that all installations used to start the queue manager are of the same release. The queue manager can be started by installing a release of WebSphere MQ which supports command level <*insert_1*> or higher.

AMQ7205
WebSphere MQ queue manager <*insert_3*> cannot be started because the authorization service is incompatible with the setting for ClusterQueueAccessControl.

Severity
20 : Error

Explanation
The queue manager has an authorization service at version <*insert_1*> and the queue manager is configured to use ClusterQueueAccessControl=RQMName. The authorization service version is incompatible with this setting for ClusterQueueAccessControl, and so the queue manager cannot be started.

Response
Update the setting for ClusterQueueAccessControl to be XmitQ instead of RQMName, or upgrade the authorization service to a minimum of version MQZAS_VERSION_6.

AMQ7206
Group name has been truncated.

Severity
40 : Stop Error

Explanation
WebSphere MQ only supports group names up to 12 characters long. The operating system is attempting to return a group longer than this.

Response
Reduce the group name to 12 characters or less.

AMQ7207 (Windows)
User ID longer than 12 characters.

Severity
40 : Stop Error

Explanation
WebSphere MQ only supports user names up to 12 characters long. This operation is being attempted from a user name longer than this.

Response
Reduce the user name to 12 characters or less.

AMQ7208
The queue manager failed to pass a PCF message to another queue manager.

Severity
10 : Warning

Explanation
The queue manager attempted to put a PCF message to <*insert_3*> to start the channel <*insert_4*> to cluster queue manager <*insert_5*>. The put failed with reason <*insert_1*>. When the queue manager resolves a cluster queue to a remote cluster queue manager, the message is put to the SYSTEM.CLUS.TRANSMIT.QUEUE. If the channel to the remote cluster queue manager is not running, the queue manager attempts to start the channel by sending a PCF message to <*insert_3*>.

Response
Resolve the problem with <*insert_3*> and if necessary start the channel manually.

AMQ7209
The queue manager attempted to open SYSTEM.CHANNEL.INITQ which failed with reason <*insert_3*>

Severity
10 : Warning

Explanation
When the queue manager resolves a cluster queue to a remote cluster queue manager, the message is put to the SYSTEM.CLUS.TRANSMIT.QUEUE. If the channel to the remote cluster queue manager is not running, the queue manager attempts to start the channel by sending a PCF message to the SYSTEM.CHANNEL.INITQ

Response
Resolve the problem with the SYSTEM.CHANNEL.INITQ and if necessary start the channels manually.

AMQ7210
The Cluster Workload exit module could not be loaded.

Severity
10 : Warning

Explanation
The Cluster Workload exit module <*insert_3*> could not be loaded for reason <*insert_4*>.

Response
Correct the problem with the Cluster Workload exit module <*insert_3*>

AMQ7211
The Queue Manager is still waiting for a reply from the Cluster Workload Exit server process.

Severity
10 : Warning

Explanation
The Queue Manager is configured to run the Cluster Workload Exit in SAFE mode. This means

that the Cluster Workload Exit is run by a server process (amqzlw0). The Queue Manager has been waiting <*insert_1*> seconds for this server process to reply to a request to run the Cluster Workload Exit. It is possible that the exit is hung or is looping.

Response
End the Queue Manager, resolve the problem with the Cluster Workload Exit and restart the Queue Manager

AMQ7212
The address of the Cluster exit function could not be found.

Severity
10 : Warning

Explanation
The address of the Cluster exit function <*insert_4*> could not be found in module <*insert_3*> for reason <*insert_1*> <*insert_5*>.

Response
Correct the problem with the Cluster exit function <*insert_4*> in the module <*insert_3*>

AMQ7214
The module for API Exit <*insert_3*> could not be loaded.

Severity
40 : Stop Error

Explanation
The module <*insert_4*> for API Exit <*insert_3*> could not be loaded for reason <*insert_5*>.

Response
Correct the problem with the API Exit module <*insert_3*>.

AMQ7215
The API Exit <*insert_3*> function <*insert_4*> could not be found in the module <*insert_5*>.

Severity
40 : Stop Error

Explanation
The API Exit <*insert_3*> function <*insert_4*> could not be found in the module <*insert_5*>. The internal return code was <*insert_1*>.

Response
Correct the problem with the API Exit <*insert_3*>.

AMQ7215 (IBM i)
Could not find a function in API Exit <*insert_3*>.

Severity
40 : Stop Error

Explanation
The API Exit <*insert_3*> function <*insert_4*> could not be found in the module <*insert_5*>. The internal return code was <*insert_1*>.

Response
Correct the problem with the API Exit <*insert_3*>.

AMQ7216
An API Exit initialization function returned an error.

Severity
10 : Warning

Explanation
The API Exit <*insert_3*> function <*insert_4*> in the module <*insert_5*> returned CompCode <*insert_1*> and ReasonCode <*insert_2*>.

Response
Correct the problem with the API Exit <*insert_3*>

AMQ7217
The response set by the exit is not valid.

Severity
10 : Warning

Explanation
The API Exit <*insert_3*> module <*insert_4*> function <*insert_5*> returned a response code <*insert_1*> that is not valid in the ExitResponse field of the API Exit parameters (MQAXP).

Response
Investigate why the API Exit <*insert_3*> set a response code that is not valid.

AMQ7219
profile: <*insert_3*>

Severity
0 : Information

AMQ7220
object type: <*insert_3*>

Severity
0 : Information

AMQ7221
entity: <*insert_3*>

Severity
0 : Information

AMQ7222
entity type: <*insert_3*>

Severity
0 : Information

AMQ7223
authority: <*insert_3*>

Severity
0 : Information

AMQ7224
profile: <*insert_3*>, object type: <*insert_4*>

Severity
0 : Information

AMQ7225
No matching authority records.

Severity
0 : Information

Explanation
No authority records match the specified parameters.

AMQ7226
The profile name is invalid.

Severity
20 : Error

Explanation
The profile name contains invalid characters, contains an invalid wildcard specification, or is of invalid length.

Response
Correct the profile name and submit it again.

AMQ7227
WebSphere MQ encountered the following network error: <*insert_3*>

Severity
10 : Warning

Explanation
MQ failed to successfully complete a network operation due to the specified error. If the error is encountered on systems that are part of a Windows 2000 domain it can indicate incorrect DNS or WINS configuration.

Response
Ensure that your network is functioning correctly. On the Windows platform check DNS and/or WINS settings to ensure that domain controllers, used for authentication or authorization functions, are accessible.

AMQ7228 (IBM i)
Display MQ Authority Records for <*insert_3*>

Severity
0 : Information

AMQ7229
<*insert_1*> log records accessed on queue manager <*insert_3*> during the log replay phase.

Severity
0 : Information

Explanation
<*insert_1*> log records have been accessed so far on queue manager <*insert_3*> during the log replay phase in order to bring the queue manager back to a previously known state.

Response
None.

AMQ7230
Log replay for queue manager <*insert_3*> complete.

Severity
0 : Information

Explanation
The log replay phase of the queue manager restart process has been completed for queue manager <*insert_3*>.

Response
None.

AMQ7231
<*insert_1*> log records accessed on queue manager <*insert_3*> during the recovery phase.

Severity
0 : Information

Explanation
<*insert_1*> log records have been accessed so far on queue manager <*insert_3*> during the recovery phase of the transactions manager state.

Response
None.

AMQ7232
Transaction manager state recovered for queue manager <*insert_3*>.

Severity
0 : Information

Explanation
The state of transactions at the time the queue manager ended has been recovered for queue manager <*insert_3*>.

Response
None.

AMQ7233
<*insert_1*> out of <*insert_2*> in-flight transactions resolved for queue manager <*insert_3*>.

Severity
0 : Information

Explanation
<*insert_1*> transactions out of <*insert_2*> in-flight at the time queue manager <*insert_3*> ended have been resolved.

Response
None.

AMQ7234
<*insert_1*> messages from queue <*insert_4*> loaded on queue manager <*insert_3*>.

Severity
0 : Information

Explanation
<*insert_1*> messages from queue <*insert_4*> have been loaded on queue manager <*insert_3*>.

This message might be issued during the WebSphere MQ checkpointing. See Using checkpointing to ensure complete recovery for more details.

Response
None.

AMQ7235 (IBM i)
Queue manager library <*insert_3*> already exists.

Severity
40 : Stop Error

Explanation
The library <*insert_3*> already exists.

Response
Specify a library which does not already exist.

AMQ7236
WebSphere MQ queue manager <*insert_3*> activated.

Severity
0 : Information

Explanation
WebSphere MQ queue manager <*insert_3*> has been activated.

Response
None.

AMQ7237
WebSphere MQ queue manager <*insert_3*> is not a backup queue manager.

Severity
10 : Warning

Explanation
WebSphere MQ queue manager <*insert_3*> is not a backup queue manager and so cannot be activated. A possible reason might be that the queue manager is configured for circular logging.

Response
Re-try the command without the '-a' option.

AMQ7238
WebSphere MQ queue manager <*insert_3*> replay completed.

Severity
0 : Information

Explanation
WebSphere MQ queue manager <*insert_3*> replay has completed.

Response
None.

AMQ7249
WebSphere MQ queue manager <*insert_3*> cannot be started for replay.

Severity
20 : Error

Explanation
WebSphere MQ queue manager <*insert_3*> cannot be started for replay. A possible reason might be that the queue manager is configured for circular logging.

Response
Re-try the command without the '-r' option.

AMQ7250
WebSphere MQ queue manager <*insert_3*> has not been activated.

Severity
20 : Error

Explanation
WebSphere MQ queue manager <*insert_3*> cannot be started because it has previously been started for replay but has not been activated.

Response
Activate the queue manager and try starting the queue manager again.

AMQ7253
The command <*insert_3*> requires one of the following arguments: <*insert_4*>.

Severity
20 : Error

Explanation

The command <*insert_3*> required at least one of the following arguments, none of which you supplied: <*insert_4*>.

Response

Check the WebSphere MQ System Administration documentation for details on the usage of the command, correct the command and then retry.

AMQ7254

Incompatible WebSphere MQ queue manager <*insert_3*> has not been allowed to start.

Severity

20 : Error

Explanation

An attempt to start a <*insert_1*>-bit queue manager was made, this was not allowed as previously this was a <*insert_2*>-bit queue manager. Migration between the previous <*insert_2*>-bit version to current <*insert_1*>-bit version is not possible and would result in an unrecoverable corrupted queue manager.

Response

Either delete this queue manager or uninstall the current <*insert_1*>-bit version and reinstall the previous <*insert_2*>-bit version.

AMQ7255

Arguments supplied to a command are incompatible.

Severity

20 : Error

Explanation

You supplied arguments to a command that it could not interpret. It is probable that you specified one or more flags that cannot be used at the same time.

Response

Correct the command and submit it again. Additional information on the arguments causing the error might be found in the error logs for the queue manager referenced in the command.

AMQ7256

Trace directory <*insert_3*> has restricted permissions <*insert_4*>.

Severity

10 : Warning

Explanation

The directory <*insert_3*> on your system has permissions <*insert_4*>. Some programs might attempt to write trace files to this directory, and fail because of these restricted permissions.

Response

If you want all WebSphere MQ programs on the system to be able to write trace, it is possible these permissions will restrict them from doing so. Please review the permissions and reset them to the product default, as appropriate.

AMQ7257 (Windows)

The MQ service for installation <*insert_2*> (<*insert_3*>) must be running.

Severity

40 : Stop Error

Explanation

The command <*insert_1*> requires the MQ service, amqsvc.exe, and process amqpsrvn.exe, which it launches, to be running.

Response

Ensure that the MQ service is running before issuing the command. Start the service in one of the following ways:

- From an administrative command prompt, issue the command: **<insert_3>\bin\strmqsvc.exe**
- From the Computer Management console, select and start the service named 'IBM WebSphere MQ (<*insert_2*>)' from the list of services shown.

AMQ7258

WebSphere MQ queue manager <*insert_3*> running as a standby.

Severity

0 : Information

Explanation

Queue manager <*insert_3*> is running as a standby instance, ready to become the primary instance if the existing primary instance fails.

Response

None.

AMQ7259

WebSphere MQ queue manager <*insert_3*> could not obtain data lock.

Severity

20 : Error

Explanation

Queue manager <*insert_3*> could not be started because it could not obtain a lock on its data in the file-system. The most likely cause is that the queue manager is running on another computer.

Response

None.

AMQ7260

WebSphere MQ queue manager <*insert_3*> is not permitted to become a standby.

Severity

0 : Information

Explanation

WebSphere MQ queue manager <*insert_3*> could not obtain a lock on its data in the file-system. It was not permitted to become a standby instance waiting to obtain the lock.

Response

None.

AMQ7261

The heuristically completed transaction has been forgotten.

Severity

0 : Information

Explanation

The heuristically completed transaction has now been forgotten by the queue manager.

Response

None.

AMQ7262

<*insert_1*> heuristically completed transactions for queue manager <*insert_3*>.

Severity

0 : Information

Explanation

There are <*insert_1*> heuristically completed transactions for queue manager <*insert_3*>. These transactions will remain heuristically completed until the queue manager is instructed to forget them by the transaction manager or the system administrator.

Response

None.

AMQ7263

Directory is not located on a local filesystem (<*insert_5*>).

Severity

10 : Warning

Explanation

Directory <*insert_4*> appears to be located on a <*insert_5*> file system. Although WebSphere MQ allows you to create this directory on a non-local file system it is not recommended. Please refer to the System Administration Guide for further information on configuring WebSphere MQ to use shared networked file systems.

Response

None.

AMQ7264

IPC directory path is too long.

Severity

40 : Stop Error

Explanation

IPC directory <*insert_3*> is too long for this environment. The length of the IPC directory path is <*insert_1*> characters, however the maximum length allowable is only <*insert_2*> characters.

Response

The length of the IPC directory path can be reduced by specifying a shorter IPC directory prefix when creating the queue manager, or, by shortening the queue manager name.

AMQ7265

Extended message selection available.

Severity

0 : Information

Explanation

A connection has been made by an application capable of performing extended selection of messages on behalf of IBM WebSphere MQ, including on the content of the message. Extended message selection is now available to subscriptions.

Response

None.

AMQ7266

Extended message selection not available.

Severity

0 : Information

Explanation

The application that connected in order to perform extended selection of messages has now disconnected. Extended message selection is no longer available to subscriptions.

Response

None.

AMQ7267
IBM WebSphere MQ configuration information added.

Severity
0 : Information

Explanation
IBM WebSphere MQ configuration information has been added successfully.

Response
None.

AMQ7268
IBM WebSphere MQ configuration information removed.

Severity
0 : Information

Explanation
IBM WebSphere MQ configuration information has been removed successfully.

Response
None.

AMQ7269
A standby instance of queue manager <*insert_5*> has been started. The active instance is running elsewhere.

Severity
0 : Information

Explanation
You tried to start the queue manager but it is already running elsewhere. A standby instance of the queue manager started, ready to become the active instance if the existing active instance fails.

Response
None.

AMQ7270
WebSphere MQ queue manager <insert_3> is already running elsewhere. It permits standby instances.

Severity
0 : Information

Explanation
IBM WebSphere MQ queue manager <*insert_3*> could not obtain a lock on its data in the file-system when it was starting. The lock is held by the active instance of the queue manager. The active instance of the queue manager was started permitting standby instances.

Response
If you are trying to start multiple instances of a queue manager to make it highly available, you must start all of the instances using **strmqm -x**.

AMQ7271
IBM WebSphere MQ configuration information does not exist.

Severity
20 : Error

Explanation
IBM WebSphere MQ configuration information does not exist.

Response
None.

AMQ7272
IBM WebSphere MQ configuration information already exists.

Severity
20 : Error

Explanation
IBM WebSphere MQ configuration information already exists.

Response
None.

AMQ7273
Configuration attribute <*insert_3*> must be supplied.

Severity
20 : Error

Explanation
IBM WebSphere MQ configuration attribute <*insert_3*> is required for this stanza.

Response
Supply a value for this attribute and reissue the command.

AMQ7274
IBM WebSphere MQ queue manager <*insert_3*> already has the maximum number of standby instances.

Severity
20 : Error

Exaplanation
You tried to start the queue manager but it is already running elsewhere. It is not possible to start another standby instance because the queue manager has already reached the maximum number of standby instances.

Response
None

AMQ7276
IBM WebSphere MQ queue manager cannot switch over.

Severity
20 : Error

Explanation
You cannot switch over the queue manager. This might be because the queue manager does not have a standby instance or the queue manager is ending.

Response
None

AMQ7279
IBM WebSphere MQ queue manager <insert_3> lost ownership of data lock.

Severity
20 : Error

Explanation
The instance of queue manager <insert_3> has lost ownership of a lock on its data in the file-system due to a transient failure. It was not able to reobtain the lock and will stop automatically to prevent the risk of data corruption.

Response

Check that another instance of the queue manager has become active. Restart this instance of the queue manager as a standby instance. If this problem recurs, it may indicate that the file-system is not sufficiently reliable to support file locking by a multi-instance queue manager.

AMQ7280

WebSphere MQ queue manager <insert_3> appears unresponsive.

Severity

20 : Error

Explanation

The queue manager is monitoring itself for responsiveness. It is not responding sufficiently quickly and will automatically stop if it continues to be unresponsive.

Response

None.

AMQ7282

Library name 'insert_3' is not expected value of 'insert_4'.

Severity

20 : Error

Explanation

The supplied queue manager library name of <*insert_3*> does not match the expected value of <*insert_4*> that was used when queue manager <*insert_5*> was previously created or started.

If a backup or multi-instance queue manager is being configured and the queue manager library is deliberately different between systems, this has the consequence that queue manager journals must be configured.

Response

Check that the library name <*insert_3*> is correct for this queue manager instance. If the library name is incorrect, use the RMVMQMINF command to remove the incorrect information and ADDMQMINF to re-enter the correct configuration information.

AMQ7285

The data contained within file <*insert_3*> cannot be processed by command <*insert_4*>.

Severity

20 : Error

Explanation

The file <*insert_3*> was read by the program insert_4 but the contents of the file were found to be incorrect. Possibly this error occurs because the file <*insert_4*> was incorrectly specified as an argument to command <*insert_4*> or possibly the file is corrupt.

Response

Ensure the file <*insert_3*> is of the required format and submit the command again.

AMQ7286

An error occurred while restoring the cluster cache, see the error logs for details

Severity

10 : Warning

Explanation

One or more errors were detected while restoring the cluster cache. This will not prevent the queue manager from starting but the cluster cache held by this queue manager is now incomplete which may result in inconsistencies in cluster resources visible to and owned by this queue manager. See messages in the error logs for details of the error encountered.

Response
Contact your IBM support center to resolve the problem.

AMQ7287
The command level is outside the range of acceptable values. The value must be at least <*insert_3*> and must not exceed <*insert_4*>.

Severity
20 : Error

Explanation
The command level specified lies outside the range of acceptable values for this command's installation.

Response
Reissue the command specifying a command level in the range of acceptable.

AMQ7288
The queue manager's command level is already <*insert_2*>. No new function has been enabled.

Severity
20 : Error

Explanation
The queue manager's command level is already greater than or equal to the value specified.

Response
None.

AMQ7289
The MQ service for installation <*insert_3*> failed to start with error <*insert_1*>.

Severity
40 : Stop Error

Explanation

The attempt to start the MQ service (`amqsvc.exe`) for installation 'insert_3' failed, the error from the operating system was <*insert_1*>.

The formatted message text for error <*insert_1*> is <*insert_4*> (if blank this indicates that no message text was available).

Response

In order for the MQ service to start it must have been configured to run using the Prepare WebSphere MQ Wizard, if this has not already happened the service may be configured with an invalid userid or be in a 'Disabled' state.

Check that the service named 'IBM WebSphere MQ (insert_3)' has been properly configured and is enabled, then re-issue the command.

AMQ7290
The MQ service for installation <*insert_3*> started successfully.

Severity
0 : Information

Explanation
The MQ service for installation <*insert_3*> was successfully started, or already running.

Response
None.

AMQ7291

Severity
40 : Stop Error

Explanation
The attempt to end the MQ service (`amqsvc.exe`) for installation <*insert_3*> failed, the error from the operating system was <*insert_1*>. The formatted message text for error <*insert_1*> is <*insert_4*> (if blank this indicates that no message text was available).

Response
Check that the service named 'IBM WebSphere MQ <*insert_3*>' has been properly configured and is enabled, then re-issue the command.

AMQ7292
The MQ service for installation <*insert_3*> ended successfully.

Severity
0 : Information

Explanation
The MQ service for installation <*insert_3*> was successfully ended, or already stopped.

Response
None.

AMQ7293
Usage: strmqsvc

Severity
0 : Information

Explanation
This shows the correct usage.

Response
None.

AMQ7294
Usage: endmqsvc

Severity
0 : Information

Explanation
This shows the correct usage.

Response
None.

AMQ7295
IBM WebSphere MQ queue manager <*insert_3*> has not been allowed to start due to migration not being supported.

Severity

Explanation
An attempt to start MQ queue manager <*insert_3*> was made. This was not allowed as previously this queue manager was started by an older version of MQ. Migration between these releases is not supported.

Response
If the queue manager data is shared, ensure that this queue manager is being started on the correct operating system. The queue manager can be started by installing a compatible release of IBM WebSphere MQ. See: http://www-01.ibm.com/software/integration/wmq/requirements

AMQ7305
Trigger message could not be put on an initiation queue.

Severity
10 : Warning

Explanation
The attempt to put a trigger message on queue <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>. The message will be put on the dead-letter queue.

Response
Ensure that the initiation queue is available, and operational.

AMQ7306
The dead-letter queue must be a local queue.

Severity
10 : Warning

Explanation
An undelivered message has not been put on the dead-letter queue <*insert_4*> on queue manager <*insert_5*>, because the queue is not a local queue. The message will be discarded.

Response
Inform your system administrator.

AMQ7307
A message could not be put on the dead-letter queue.

Severity
10 : Warning

Explanation
The attempt to put a message on the dead-letter queue <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>. The message will be discarded.

Response
Ensure that the dead-letter queue is available and operational.

AMQ7308
Trigger condition <*insert_1*> was not satisfied.

Severity
0 : Information

Explanation
At least one of the conditions required for generating a trigger message was not satisfied, so a trigger message was not generated. If you were expecting a trigger message, consult the WebSphere MQ Application Programming Guide for a list of the conditions required. (Note that arranging for condition <*insert_1*> to be satisfied might not be sufficient because the conditions are checked in an arbitrary order, and checking stops when the first unsatisfied condition is discovered.)

Response
If a trigger message is required, ensure that all the conditions for generating one are satisfied.

AMQ7310
Report message could not be put on a reply-to queue.

Severity
10 : Warning

Explanation
The attempt to put a report message on queue <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>. The message will be put on the dead-letter queue.

Response
Ensure that the reply-to queue is available and operational.

AMQ7315
Failed to put message to accounting queue. Reason(<*insert_1*>)

Severity
20 : Error

Explanation
The attempt to put a message containing accounting data to the queue <*insert_3*> failed with reason code <*insert_1*>. The message data has been discarded.

This error message will be written only once for attempts to put a message to the queue as part of the same operation which fail for the same reason.

Response
Ensure that the queue <*insert_3*> is available and operational.

AMQ7316
Failed to put message to statistics queue. Reason(<*insert_1*>)

Severity
20 : Error

Explanation
The attempt to put a message containing statistics data to the queue <*insert_3*> failed with reason code <*insert_1*>. The message data has been discarded.

This error message will be written only once for attempts to put a message to the queue as part of the same operation which fail for the same reason.

Response
Ensure that the queue <*insert_3*> is available and operational.

AMQ7320
Failed to access the retained publication queue. Reason(<*insert_1*>)

Severity
20 : Error

Explanation
An attempt to access messages on the system retained publication queue (<*insert_3*>) failed with reason code <*insert_4*> (<*insert_1*>).

Response
Ensure that the queue <*insert_3*> is available and operational.

AMQ7327
Failed to open topic object <*insert_3*> (referenced by <*insert_4*>)

Severity
20 : Error

Explanation
Each entry in <*insert_4*> must have an existing topic object, which has been created before the entry is added to the namelist.

The topic object <*insert_3*> does not exist, and must be created before that stream or subpoint can be used

Response
Ensure that the topic object <*insert_3*> is available. Remove the entry and add it again to the <*insert_4*> namelist to notify the queue manager to check the topic object again.

AMQ7341 (krcI_CLUSSDR_XMITQ_SWITCHED)
The transmission queue for channel <*insert_1*> is <*insert_3*>.

Severity
00 : Information

Explanation
The switch of transmission queue for channel <*insert one*> was required due to a change to the default cluster transmission queue configuration of the queue manager, or to the cluster channel name attribute of a cluster transmission queue.

This message is written because the queue manager completed switching the transmission queue for channel <*insert one*> to queue <*insert three*>'.

During the switch the queue manager moved <*n*> messages from <*insert two*> to <*insert three*>.

Response
No further action required.

AMQ7342 (krcE_CLUSSDR_XMITQ_SWITCH_FAILED)
WebSphere MQ was unable to display an error message `20007342`

Severity
40 : Error

Explanation
IBM WebSphere MQ attempted to display the message associated with return code `X'20007342'`. The return code indicates that there is no message text associated with the message. Associated with the request are inserts <*n*> : <*m*> : <*insertone*> : <*insert two*> : <*insert three*>.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. See IBM WebSphere MQ support web page, or IBM SupportAssistant web page, to find out if a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ7343 (krcE_DYNAMIC_Q_NOT_CREATED)
The request to create a dynamic queue named <*insert one*> failed with reason code <*n*>.

Severity
40 : Error

Explanation
A request was made to create a dynamic queue with the name <*insert one*>, based upon the model queue <*insert two*>, but the operation failed with reason code <*n*>. Possible reasons for the failure include:

- A queue of a different type with the same name already exists.
- The model queue could not be accessed.
- Insufficient resources were available to successfully complete the request.

Response
Use the supplied reason code to correct the cause of the failure and reissue the request.

AMQ7345 (krcE_OPEN_OLD_CLUSTER_XMITQ_FAILED)
Unable to open transmission queue <*insert two*> for channel <*insert one*>.

Severity
40 : Error

Explanation
In order to process the switch of transmission queue the original transmission queue <*insert two*>

must be opened in order to move any pending messages to the new transmission queue. The open request failed with reason code <*n*>. The switch of transmission queue for channel <*insert one*> cannot proceed.

Response

In order to allow the switch to progress, use the reason code provided to identify the cause of the failure and resolve the problem. If the issue cannot be resolved, or the original transmission queue has been deleted, use the **runswchl** command with the **-n** parameter to cause the transmission queue for the channel to be switched without attempting to move any messages from the original transmission queue to the new transmission queue.

Remember: When using this option it is the responsibility of the IBM WebSphere MQ administrator to deal with any messages pending on the original transmission queue.

AMQ7346 (krcE_OPEN_NEW_CLUSTER_XMITQ_FAILED)

Unable to open new transmission queue <*insert two*> for channel <*insert one*>.

Severity

40 : Error

Explanation

In order to process the switch of transmission queue the new transmission queue <*insert three*> must be opened in order to receive any pending messages from the old transmission queue. The open request failed with reason code <*n*>. The switch of transmission queue for channel <*insert one*> cannot proceed.

Response

In order to allow the switch to progress use the reason code provided to identify the cause of the failure and resolve the problem.

AMQ7347 (krcE_INTERNAL_MQGET_FAILED)

MQGET from queue <*insert one*> failed with reason code <*n*>.

Severity

40 : Error

Explanation

An internal MQGET request called as part of a queue manager operation failed with Reason Code <*n*>.

Response

This error message is issued in association with further error messages which explain the implications of this failure. Use the Queue Name <*insert one*> and reason code <*n*> provided in this message in conjunction with the messages which follow to resolve the problem.

AMQ7348 (krcE_INTERNAL_MQPUT_FAILED)

MQPUT to queue <*insert one*> failed with reason code <*n*>.

Severity

40 : Error

Explanation

An internal MQPUT request called as part of a queue manager operation failed with reason code <*n*>.

Response

This error message is issued in association with further error messages which explain the implications of this failure. Use the Queue Name <*insert one*> and reason code <*n*> provided in this message in conjunction with the messages which follow to resolve the problem.

AMQ7349 (krcE_INTERNAL_MQCMIT_FAILED)

MQCMIT failed with reason code <*n*>.

Severity
40 : Error

Explanation
An internal MQCMIT request called as part of a queue manager operation failed with reason code <*n*>.

Response
This error message is issued in association with further error messages which explain the implications of this failure. Use the reason code <*n*> provided in this message in conjunction with the messages which follow to resolve the problem.

AMQ7350 (krcI_CLUSSDR_XMITQ_SWITCH_STARTED)
The switch of transmission queue from queue <*insert two*> to queue <*insert three*> for channel <*insert one*> has been started.

Severity
00 : Information

Explanation
The switch of transmission queue for channel <*insert one*> is required due to a change to the default cluster transmission queue configuration of the queue manager, or to the cluster channel name attribute of a cluster transmission queue. This message is written when the process of switching the transmission queue is started.

Response
None.

AMQ7351 (krcI_CLUSSDR_XMITQ_SWITCH_MM_STARTED)
The moving of messages for channel <*insert one*> from transmission queue <*insert two*> to transmission queue <*insert three*> has started.

Severity
00 : Information

Explanation
The switch of transmission queue for channel <*insert one*> is required due to a change to the default cluster transmission queue configuration of the queue manager, or to the cluster channel name attribute of a cluster transmission queue. This message is written when the process of moving messages from the old transmission queue <insert two> to the new transmission queue is started.

If the switch operation is executing as part of a cluster sender channel starting, then the channel continues to run and transfer messages while the moving of messages is completed. If the switch operation is executing as part of the **runswchl** command, the **runswchl** command completes once all of the messages have been moved.

Response
None.

AMQ7352 (krcI_CLUSSDR_XMITQ_MM_STATUS)
<*n*> messages have been moved from queue <*insert two*> to queue <*insert three*>.

Severity
00 : Information

Explanation
The switch of transmission queue for channel <*insert one*> requires that messages are moved from the old transmission queue to the new transmission queue. <*m*> messages have been moved from queue <*insert two*> to queue <*insert three*> <*n*> times. The queue has been empty, but a message arrived before the switch could be completed.

Response

None.

AMQ7353 (krcE_SYNCFILE_UPDATE_FAILED)

Unable to update the channel synchronization file during the switch of transmission queue for channel <*insert one*>.

Severity

40 : Error

Explanation

The queue manager was unable to update the channel synchronization file while completing the change of transmission queue from <*insert two*> to <insert three> for channel <*insert one*>. The reason code for the failure was <*n*>.

Response

Use the reason code provided, and any other failure messages to correct the cause of the failure, before using the **rcrmqobj** command to recover the contents of the channel synchronization file. Run the command:

```
rcrmqobj -m QMgrName -t syncfile
```

The command rebuilds the synchronization file for the queue manager; see rcrmqobj .

AMQ7432 (IBM i)

WebSphere MQ journal entry not available for replay.

Severity

40 : Stop Error

Explanation

A journal replay operation was attempted, but the operation required journal entries from journal receivers that are not currently present on the system.

Response

Restore the required journal receivers from backup. Then try the operation again.

AMQ7433 (IBM i)

An Error occurred while performing a journal replay.

Severity

40 : Stop Error

Explanation

WebSphere MQ encountered a problem reading one or more journal entries while performing a journal replay operation.

Response

If you have previously created a journal receiver for a queue manager or are performing a cold restart of a queue manager, delete the QMQMCHKPT file from the queue manager subdirectory in /QIBM/UserData/mqm/qmgrs/ and attempt to restart the queue manager. If the problem persists, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ7434 (IBM i)

The MQ commitment control exit program was called incorrectly. Code <*insert_1*>.

Severity

40 : Stop Error

Explanation
The WebSphere MQ commitment control exit program was called with incorrect parameters.

Response
If the program was called by OS/400 as part of a commit or rollback, save the job log, and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ7435 (IBM i)
The MQ commitment control exit program failed. Code <*insert_1*>.

Severity
40 : Stop Error

Explanation
The WebSphere MQ commitment control exit program failed due to an unexpected error.

Response
Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ7459 (IBM i)
WebSphere MQ journal receiver <*insert_3*> is the oldest in the chain

Severity
0 : Information

Explanation
The oldest journal receiver in the receiver chain is <*insert_3*> in library <*insert_4*>.

Response
None

AMQ7460 (IBM i)
WebSphere MQ startup journal information.

Severity
0 : Information

Explanation
This message is issued periodically by WebSphere MQ to help you identify which journal receivers can be removed from the system because they are no longer required for startup recovery.

Response
None

AMQ7461 (IBM i)
WebSphere MQ object re-created - reapply authorities.

Severity
0 : Information

Explanation
A previously damaged object has been re-created, either automatically, or by explicit use of the re-create Object (RCRMQMOBJ) command. The authorities that applied to this object have not been re-created.

Response

Use the Grant Authority (GRTMQMAUT) command, as appropriate, to re-create the required authorities to this MQ object.

AMQ7462 (IBM i)

WebSphere MQ media recovery journal information.

Severity

0 : Information

Explanation

This message is issued periodically by WebSphere MQ to help you identify which journal receivers can be removed from the system because they are no longer required for media recovery.

Response

None

AMQ7463

The log for queue manager <*insert_3*> is full.

Severity

20 : Error

Explanation

This message is issued when an attempt to write a log record is rejected because the log is full. The queue manager will attempt to resolve the problem.

Response

This situation might be encountered during a period of unusually high message traffic. However, if you persistently fill the log, you might have to consider enlarging the size of the log. You can either increase the number of log files by changing the values in the queue manager configuration file. You will then have to stop and restart the queue manager. Alternatively, if you need to make the log files themselves bigger, you will have to delete and re-create the queue manager.

AMQ7464

The log for queue manager <*insert_3*> is no longer full.

Severity

0 : Information

Explanation

This message is issued when a log was previously full, but an attempt to write a log record has now been accepted. The log full situation has been resolved.

Response

None

AMQ7465

The log for queue manager <*insert_3*> is full.

Severity

20 : Error

Explanation

An attempt to resolve a log full situation has failed. This is due to the presence of a long-running transaction.

Response

Try to ensure that the duration of your transactions is not excessive. Commit or roll back any old transactions to release log space for further log records.

AMQ7466
There is a problem with the size of the logfile.

Severity
10 : Warning

Explanation
The log for queue manager <*insert_3*> is too small to support the current data rate. This message is issued when the monitoring tasks maintaining the log cannot keep up with the current rate of data being written.

Response
The number of primary log files configured should be increased to prevent possible log full situations.

AMQ7467
The oldest log file required to start queue manager <*insert_3*> is <*insert_4*>.

Severity
0 : Information

Explanation
The log file <*insert_4*> contains the oldest log record required to restart the queue manager. Log records older than this might be required for media recovery.

Response
You can move log files older than <*insert_4*> to an archive medium to release space in the log directory. If you move any of the log files required to re-create objects from their media images, you will have to restore them to re-create the objects. An older log file is one with a numerically smaller log number (but allowing for log number wrapping at 9999999).

AMQ7468
The oldest log file required to perform media recovery of queue manager <*insert_3*> is <*insert_4*>.

Severity
0 : Information

Explanation
The log file <*insert_4*> contains the oldest log record required to re-create any of the objects from their media images. Any log files prior to this will not be accessed by media recovery operations.

Response
Use this information together with the information in the most recent AMQ7467 message. Archivable log files are all those older than BOTH <*insert_4*> and the log file mentioned in the AMQ7467 message.

AMQ7469
Transactions rolled back to release log space.

Severity
0 : Information

Explanation
The log space for the queue manager is becoming full. One or more long-running transactions have been rolled back to release log space so that the queue manager can continue to process requests.

Response
Try to ensure that the duration of your transactions is not excessive. Consider increasing the size of the log to allow transactions to last longer before the log starts to become full.

AMQ7472
Object <*insert_3*>, type <*insert_4*> damaged.

Severity
10 : Warning

Explanation
Object <*insert_3*>, type <*insert_4*> has been marked as damaged. This indicates that the queue manager was either unable to access the object in the file system, or that some kind of inconsistency with the data in the object was detected.

Response
If a damaged object is detected, the action performed depends on whether the queue manager supports media recovery and when the damage was detected. If the queue manager does not support media recovery, you must delete the object as no recovery is possible. If the queue manager does support media recovery and the damage is detected during the processing performed when the queue manager is being started, the queue manager will automatically initiate media recovery of the object. If the queue manager supports media recovery and the damage is detected once the queue manager has started, it can be recovered from a media image using the rcrmqobj command or it can be deleted.

AMQ7472 (IBM i)
Object <*insert_3*>, type <*insert_4*> damaged.

Severity
10 : Warning

Explanation
Object <*insert_3*>, type <*insert_4*> has been marked as damaged. This indicates that the queue manager was either unable to access the object in the file system, or that some kind of inconsistency with the data in the object was detected.

Response
If a damaged object is detected, the action performed depends on whether the queue manager supports media recovery and when the damage was detected. If the queue manager does not support media recovery, you must delete the object as no recovery is possible. If the queue manager does support media recovery and the damage is detected during the processing performed when the queue manager is being started, the queue manager will automatically initiate media recovery of the object. If the queue manager supports media recovery and the damage is detected once the queue manager has started, it can be recovered from a media image using the RCRMQMOBJ command or it can be deleted.

AMQ7477 (IBM i)
WebSphere MQ session no longer active.

Severity
10 : Warning

Explanation
The commitment control exit program was called during a commit or rollback operation. The queue manager was stopped while the program was registered. This might have resulted in the rolling back of some uncommitted message operations.

Response
Inform your system administrator that uncommitted message operations might have been rolled back when the queue manager was stopped.

AMQ7484
Failed to put message to logger event queue. Reason(<*insert_2*>)

Severity
0 : Information

Explanation

The attempt to put a logger event message to the queue <*insert_3*> failed with reason code <*insert_2*>. The message data has been discarded.

Response

Ensure that the queue <*insert_3*> is available and operational. Current logger status information can be displayed with the DISPLAY QMSTATUS runmqsc command.

AMQ7485

Transactions rolled forward to release log space.

Severity

0 : Information

Explanation

The log space for the queue manager is becoming full. One or more long-running prepared transactions have been rolled forward to release log space so that the queue manager can continue to process requests. Equivalent log records for the long-running prepared transactions have been created in the active log.

Response

By the time you read this message, the long-running prepared transaction might already have been resolved automatically. If it is not resolved, this message reappears repeatedly whenever the log space for the queue manager is becoming full.

The following steps assume that there is a prepared transaction that is not being resolved automatically. You should investigate what type of transaction it is, and take steps appropriate to the type of transaction.

Use the DSPMQTRN command to check for externally managed in-doubt transactions and the DISPLAY CHS runmqsc command to check for in-doubt channels.

There are several possible responses:

1. If the long-running transaction is owned by external transaction manager software, then the queue manager cannot decide automatically to resolve it (commit it or roll it back). The queue manager remembers its work for this transaction until the external transaction manager software tells the queue manager the outcome (that is, either to commit the transaction or to roll it back). Therefore you must address this issue through your external transaction manager software, either by issuing commands to it, or (if no such commands exist) by restarting it.
2. If the long-running transaction is owned by an in-doubt channel, then investigate its status. If it will not automatically resolve, then consider using the RESOLVE CHANNEL command.
3. If the long-running transaction is owned by the local queue manager on behalf of an application using MQBEGIN, then perhaps the queue manager has lost contact with external resource manager software that participated in the transaction. Investigate and correct the connectivity from the queue manager to the external resource manager software.
4. If none of the other options succeed, consider using the rsvmqtrn command to tell the queue manager to commit or roll back its work done within the in-doubt transaction. Refer to the description of the rsvmqtrn command in the product documentation.

AMQ7486

Transaction *1111.2222* was preventing log space from being released.

Severity

0 : Information

Explanation

A long running transaction was detected. Message AMQ7469 or AMQ7485 has been issued indicating if the transaction was rolled back or rolled forward in the log to allow the log space to be released. The internal transaction identifier is *1111.2222* which can be correlated with '**dspmqtrn -a**' output. The transaction started at <*insert_1*> and first wrote to the queue manager recovery

log at <*insert_2*>. The following transaction context might be useful in identifying the application causing this behaviour: <*insert_3*>. This message can be correlated with the previous AMQ7469 or AMQ7485 message in the queue manager error logs.

Response

Identify the application responsible for the long running unit of work and ensure this application is creating and completing transactions in a timely manner. If the application is working as expected it may be appropriate to increase the size of the queue manager recovery log.

AMQ7487

Application <*insert_1*> was preventing log space from being released.

Severity

0 : Information

Explanation

A long running transaction was detected, this message is intended to help identify the application associated with this long running transaction. Message AMQ7469 or AMQ7485 has been issued indicating if the transaction was rolled back or rolled forward in the log to allow the log space to be released. Message AMQ7486 has been issued identifying the transaction context of the transaction that was rolled back or rolled forwards. The application associated with this transaction was running with *Pid 1111*, *Tid 2222*, under application name <*insert_1*> and with application description <*insert_2*>. The following application context may also be useful in identifying the application causing this behaviour:<*insert_3*>. This message can be correlated with the previous AMQ7486 message in the queue manager error logs.

Response

Identify the application responsible for the long running unit of work and ensure this application is creating and completing transactions in a timely manner. If the application is working as expected it may be appropriate to increase the size of the queue manager recovery log.

AMQ7540

WebSphere MQ program <*insert_3*> attempted to access file or directory (<*insert_4*>), however it does not exist.

Severity

20 : Error

Explanation

<*insert_3*> is not running as the root UserID, so cannot create the nonexistent file or directory (<*insert_4*>).

Response

If you believe there are existing MQ installations on this machine, or you wish to create a new MQ installation entry, rerun the command as UserID root.

AMQ7541

WebSphere MQ program <*insert_3*> attempted to access file or directory (<*insert_4*>), however access is denied.

Severity

20 : Error

Explanation

<*insert_3*> is not running as the root UserID, and does not have access to file or directory (<*insert_4*>).

Response

Either correct the permissions to allow access to (<*insert_4*>), or rerun the command with sufficient authority.

AMQ7542
WebSphere MQ program <*insert_3*> found that file or directory (<*insert_4*>) permissions were not as expected.

Severity
20 : Error

Explanation
<*insert_3*> is not runnig as the root UserID, so cannot correct file or directory (<*insert_4*>) permissions.

Response
Either correct the permissions to (<*insert_4*>), or rerun the command with sufficient authority to correct the permissions.

AMQ7543
WebSphere MQ program <*insert_3*> found that file (<*insert_4*>) was corrupt but has been repaired.

Severity
0 : Information

Explanation
<*insert_3*> found that file (<*insert_4*>) was corrupt and therefore has been repaired.

Response
Whilst <*insert_3*> has repaired (<*insert_4*>), you may wish to check that the output from WebSphere MQ program dspmqinst reflects the state of the WebSphere MQ installations on this machine.

AMQ7544
WebSphere MQ program <*insert_3*> found that configuration data held in (<*insert_4*>) is corrupt.

Severity
20 : Error

Explanation
<*insert_3*> needs to access MQ configuration data held in (<*insert_4*>), however the data has been corrupted.

Response
Contact your IBM support center.

AMQ7545
WebSphere MQ program <*insert_3*> was supplied an invalid installation path.

Severity
20 : Error

Explanation
<*insert_3*> was supplied with installation path (<*insert_4*>), however this matches an entry with a different installation name.

Response
Correct the installation path and rerun the command.

AMQ7546
WebSphere MQ program <*insert_3*> was supplied an invalid installation name.

Severity
20 : Error

Explanation
<*insert_3*> was supplied with installation name (<*insert_4*>), however this matches an entry with a different installation path.

Response
Correct the installation name and rerun the command.

AMQ7547
Entry created successfully.

Severity
0 : Information

Explanation
<*insert_3*> has successfully created the entry.

Response
None.

AMQ7548
Entry deleted successfully.

Severity
0 : Information

Explanation
<*insert_3*> has successfully deleted the entry.

Response
None.

AMQ7549
Entry does not exist.

Severity
20 : Error

Explanation
<*insert_3*> could not find an entry that matched the supplied parameters.

Response
Use the WebSphere MQ program dspmqinst to display all the WebSphere MQ installations on this machine, then rerun the command with valid parameters.

AMQ7550
Entry is still active and has not been deleted.

Severity
20 : Error

Explanation
<*insert_3*> has found that the entry to be deleted is still an active installation and therefore has not been deleted.

Response
Uninstall the installation then rerun the command.

AMQ7551
Entry uninstalled successfully.

Severity
0 : Information

Explanation
<*insert_3*> has successfully uninstalled the entry.

Response
None.

AMQ7552

WebSphere MQ program <*insert_3*> did not complete successfully.

Severity

20 : Error

Explanation

<*insert_3*> found problems with file (<*insert_4*>) and therefore could not successfully complete the command.

Response

Check the WebSphere MQ error logs and check if there are any FFST files for further details.

AMQ7553

WebSphere MQ program <*insert_3*> did not complete successfully.

Severity

20 : Error

Explanation

<*insert_3*> had an unexpected error and therefore could not successfully complete the command.

Response

Check the WebSphere MQ error logs and check if there are any FFST files for further details.

AMQ7554

WebSphere MQ program <*insert_3*> was supplied an invalid installation descriptive text.

Severity

20 : Error

Explanation

<insert_3> was supplied with installation descriptive text (<insert_4>), however this exceeds the maximum length allowed (<*insert_1*>).

Response

Correct the installation descriptive text and rerun the command.

AMQ7555

```
Usage: crtmqinst ((-n InstName | -p InstPath) [-d Text] )&P  -d   Descriptive text.
&N  -n   Installation name.
&N  -p   Installation path.
```

Severity

0

Explanation

This shows the correct usage.

Response

None.

AMQ7556

```
Usage: dltmqinst (-n InstName | -p InstPath)
&P  -n   Installation name.
&N  -p   Installation path.
```

Severity

0

Explanation

This shows the correct usage.

Response

None.

AMQ7557

```
Usage: dspmqinst [-n InstName | -p InstPath]
&P  -n   Installation name.
&N  -p   Installation path.
```

Severity

0

Explanation

This shows the correct usage.

Response

None.

AMQ7558

WebSphere MQ program <*insert_3*> has detected an invalid installation in path (<*insert_4*>). The minimum supported level of MQ for coexistence with another version of MQ is version: <*insert_5*>. This message may be the result of installing MQ onto a machine which already had an old version of MQ installed; or a FixPack may have been removed from the installation in path (<*insert_4*>).

The configuration of this machine is not supported. You should uninstall or upgrade to the minimum supported level, the installation in path (<*insert_4*>); or uninstall any secondary MQ installations.

Severity

40 : Stop Error

Explanation

<*insert_3*> has detected an invalid installation in path (<*insert_4*>). The minimum supported level of MQ for coexistence with another version of MQ is version: <*insert_5*>. This message may be the result of installing MQ onto a machine which already had an old version of MQ installed; or a FixPack may have been removed from the installation in path (<*insert_4*>).

Response

The configuration of this machine is not supported. You should uninstall or upgrade to the minimum supported level, the installation in path (<insert_4>); or uninstall any secondary MQ installations.

AMQ7559

WebSphere MQ program <*insert_3*> has detected an invalid installation.

Severity

40 : Stop Error

Explanation

<insert_3> has detected an invalid installation in path (<*insert_4*>). The minimum supported level of MQ for coexistence with another version of MQ is version: <*insert_5*>. This message may be the result of installing MQ onto a machine which already had an old version of MQ installed; or a FixPack may have been removed from the installation in path (<*insert_4*>).

Response

The configuration of this machine is not supported. You should uninstall or upgrade to the minimum supported level, the installation in path (<*insert_4*>); or uninstall any secondary MQ installations.

AMQ7560

WebSphere MQ program <*insert_3*> failed to get a lock on file (<*insert_4*>).

Severity

20 : Error

Explanation

<*insert_3*> attempted to lock file (<*insert_4*>) to ensure any reading or writing of the file would not result in the file being corrupted.

Response

The file permissions may be incorrect or another process may be preventing <*insert_3*> to obtain the lock. If it is the latter case, the value supplied here for the process identifier (<*insert_1*>) will be a non zero value, in this case rerun the command when that process has ended.

AMQ7561

WebSphere MQ program <*insert_3*> did not complete successfully due to a lack of system resources.

Severity

20 : Error

Explanation

<*insert_3*> could not obtain system resources such as: storage; handles; disk space, and therefore could not successfully complete the command.

Response

Check the WebSphere MQ error logs and check if there are any FFST files for further details. Rerun the command when sufficient system resources are available.

AMQ7562

WebSphere MQ program <*insert_3*> attempted to access MQ configuration data held in (<*insert_4*>), however access is denied.

Severity

20 : Error

Explanation

<*insert_3*> needs to access MQ configuration data held in (<*insert_4*>) but does not have permission to access it.

Response

Either correct the permissions to allow access to (<*insert_4*>), or rerun the command with sufficient authority.

AMQ7563

Entry modified successfully.

Severity

0 : Information

Explanation

<*insert_3*> has successfully modified the entry.

Response

None

AMQ7601

Duplicate XA resource manager is not valid.

Severity

40 : Stop Error

Explanation

Line <*insert_1*> of the configuration file <*insert_3*> contained a duplicate XA resource manager <*insert_5*>. This is not valid for attribute <*insert_4*>. Each XA resource manager must be given a unique name.

Response

Check the contents of the file and retry the operation.

AMQ7601 (Windows)

Duplicate XA resource manager <*insert_5*> not valid for attribute <*insert_4*> at <*insert_3*> in the configuration data.

Severity

40 : Stop Error

Explanation

Key <*insert_3*> in the configuration data contained a duplicate XA resource manager <*insert_5*>. This is not valid for attribute <*insert_4*>. Each XA resource manager must be given a unique name.

Response

Check the contents of the configuration data and retry the operation.

AMQ7602 (IBM i)

The MQ commitment control exit program was called incorrectly.

Severity

40 : Stop Error

Explanation

The WebSphere MQ commitment control exit program was called with incorrect parameters.

Response

If the program was called by OS/400 as part of a commit or rollback, save the job log, and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ7603

WebSphere MQ has been configured with invalid resource manager <*insert_3*>.

Severity

20 : Error

Explanation

The XA switch file <*insert_4*> for resource manager <*insert_3*> indicates that an attempt has been made to configure another queue manager as an external resource manager. This is not allowed so the queue manager will terminate.

Response

Remove the offending XAResourceManager stanza from the qm.ini configuration file and restart the queue manager.

AMQ7603 (Windows)

WebSphere MQ has been configured with resource manager <*insert_3*> that is not valid.

Severity

20 : Error

Explanation

The XA switch file <*insert_4*> for resource manager <*insert_3*> indicates that an attempt has been made to configure another queue manager as an external resource manager. This is not allowed, so the queue manager will terminate.

Response

Remove the offending XAResourceManager stanza from the configuration data and restart the queue manager.

AMQ7604

The XA resource manager <*insert_3*> was not available when called for <*insert_4*>. The queue manager is continuing without this resource manager.

Severity

10 : Warning

Explanation

The XA resource manager <*insert_3*> has indicated that it is not available, by returning XAER_RMERR on an xa_open request or XAER_RMFAIL when called for something else. Normally this indicates that the resource manager has been shut down. In this case the resource manager cannot participate in any new transactions. Any in-flight transactions in which it was involved will be backed out, and any transactions in which it is in-doubt will only be resolved when contact with the resource manager is re-established. A further message will be issued when the queue manager has been able to do this. If the problem occurred on an xa_open request, and the resource manager should be available, then there might be a configuration problem.

Response

Try to establish the reason why the resource manager is unavailable. It might be that an invalid XAOpenString has been defined for the resource manager in the 'qm.ini' configuration file. If this is the case, stop and then restart the queue manager so that any change will be picked up. Alternatively, the queue manager might be reaching a resource constraint with this resource manager. For example, the resource manager might not be able to accommodate all of the queue manager processes being connected at one time, you might need to alter one of its tuning parameters.

AMQ7604 (IBM i)

The XA resource manager was not available when called.

Severity

10 : Warning

Explanation

The XA resource manager <*insert_3*> has indicated that it is not available, by returning XAER_RMERR on an xa_open request or XAER_RMFAIL when called for <*insert_4*>. The queue manager is continuing without this resource manager. Normally this indicates that the resource manager has been shut down. In this case the resource manager cannot participate in any new transactions. Any in-flight transactions in which it was involved will be backed out, and any transactions in which it is in-doubt will only be resolved when contact with the resource manager is re-established. A further message will be issued when the queue manager has been able to do this. If the problem occurred on an xa_open request, and the resource manager should be available, then there might be a configuration problem.

Response

Try to establish the reason why the resource manager is unavailable. It might be that an invalid XAOpenString has been defined for the resource manager in the 'qm.ini' configuration file. If this is the case, stop and then restart the queue manager so that any change will be picked up. Alternatively, the queue manager might be reaching a resource constraint with this resource manager. For example, the resource manager might not be able to accommodate all of the queue manager processes being connected at one time, you might need to alter one of its tuning parameters.

AMQ7605

The XA resource manager <*insert_3*> has returned an unexpected return code <*insert_1*>, when called for <*insert_4*>.

Severity

20 : Error

Explanation

WebSphere MQ received an unexpected return code when calling XA resource manager <*insert_3*> at its <*insert_4*> entry point. This indicates an internal error, either within MQ or the resource manager.

Response

Try to determine the source of the error. A trace of the failure could be used to look at the XA flows between MQ and the resource manager. MQ has allocated an RMId of <*insert_2*> to this resource manager. This will be useful when isolating the flows associated with the resource manager concerned. If the error occurs on an xa_commit or xa_rollback request, the queue manager will not attempt to redeliver the commit or rollback instruction for this transaction, until after the queue manager has been restarted. The transaction indoubt is identified by the following XID of X<*insert_5*>. If you think that the error lies within the queue manager, save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard any information describing the problem until after the problem has been resolved.

AMQ7605 (IBM i)

The XA resource manager has returned an unexpected return code.

Severity

20 : Error

Explanation

WebSphere MQ received unexpected return code <*insert_1*> when calling XA resource manager <*insert_3*> at its <*insert_4*> entry point. This indicates an internal error, either within MQ or the resource manager.

Response

Try to determine the source of the error. A trace of the failure could be used to look at the XA flows between MQ and the resource manager. MQ has allocated an RMId of <*insert_2*> to this resource manager. This will be useful when isolating the flows associated with the resource manager concerned. If the error occurs on an xa_commit or xa_rollback request, the queue manager will not attempt to redeliver the commit or rollback instruction for this transaction, until after the queue manager has been restarted. The transaction indoubt is identified by the following XID of X<*insert_5*>. If you think that the error lies within the queue manager, save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard any information describing the problem until after the problem has been resolved.

AMQ7606

A transaction has been committed but one or more resource managers have backed out.

Severity

20 : Error

Explanation

WebSphere MQ was processing the commit operation for a transaction involving external resource managers. One or more of these resource managers failed to obey the commit request and instead rolled back their updates. The outcome of the transaction is now mixed and the resources owned by these resource managers might now be out of synchronization. MQ will issue further messages to indicate which resource managers failed to commit their updates.

Response

The transaction with the mixed outcome is identified by the following XID of X<*insert_3*>. The messages which identify the failing resource managers will also contain this same XID. If the transaction has completed it won't be displayed by the dspmqtrn command and all other transaction participants will have committed their updates. If the transaction is displayed by the dspmqtrn command then there are some participants still in prepared state. In order to preserve data integrity you will need to perform recovery steps local to the failing resource managers.

AMQ7607

A transaction has been rolled back but one or more resource managers have committed.

Severity

20 : Error

Explanation

WebSphere MQ was rolling back a transaction involving external resource managers. One or more of these resource managers failed to obey the rollback request and instead committed their updates. The outcome of the transaction is now mixed and the resources owned by these resource managers might now be out of synchronization. MQ will issue further messages to indicate which resource managers failed to roll back their updates.

Response

The transaction with the mixed outcome is identified by the following XID of X<*insert_3*>. The messages which identify the failing resource managers will also contain this same XID. If the transaction has completed it won't be displayed by the dspmqtrn command and all other transaction participants will have rolled back their updates. If the transaction is displayed by the dspmqtrn command then there are some participants still in prepared state. In order to preserve data integrity you will need to perform recovery steps local to the failing resource managers.

AMQ7608

XA resource manager returned a heuristic return code.

Severity

20 : Error

Explanation

This message is associated with an earlier AMQ7606 message reporting a mixed transaction outcome. It identifies one of the resource managers (<*insert_4*>) that failed to commit its updates. The transaction associated with this failure is identified by the following XID of X<*insert_3*>.

Response

Use the return code <*insert_1*> returned by the resource manager to determine the effects of the failure. The return code indicates that the resource manager made a heuristic decision about the outcome of the transaction which disagrees with the commit decision of the queue manager. In order to preserve data integrity you will need to perform recovery steps local to this resource manager.

AMQ7609

XA resource manager returned a heuristic return code.

Severity

20 : Error

Explanation

This message is associated with an earlier AMQ7607 message reporting a mixed transaction outcome. It identifies one of the resource managers (<*insert_4*>) that failed to roll back its updates. The transaction associated with this failure is identified by the following XID of X<*insert_3*>.

Response

Use the return code <*insert_1*> returned by the resource manager to determine the effects of the failure. The return code indicates that the resource manager made a heuristic decision about the outcome of the transaction which disagrees with the rollback decision of the queue manager. In order to preserve data integrity you will need to perform recovery steps local to this resource manager.

AMQ7612

Switch call exception

Severity
20 : Error

Explanation
Exception number <*insert_1*> occurred when calling resource manager switch <*insert_3*>.

Response
Check the resource manager switch has not been corrupted.

AMQ7622
WebSphere MQ could not load the XA switch load file for resource manager <*insert_3*>.

Severity
20 : Error

Explanation
An error has occurred loading XA switch file <*insert_4*>. If the error occurred during startup then the queue manager will terminate. At all other times the queue manager will continue without this resource manager meaning that it will no longer be able to participate in global transactions. The queue manager will also retry the load of the switch file at regular intervals so that the resource manager will be able to participate again should the load problem be resolved.

Response
Look for a previous message outlining the reason for the load failure. Message AMQ6175 is issued if the load failed because of a system error. If this is the case then follow the guidance given in message AMQ6175 to resolve the problem. In the absence of prior messages or FFST information related to this problem check that the name of the switch load file is correct and that it is present in a directory from which it can be dynamically loaded by the queue manager. The easiest method of doing this is to define the switch load file as a fully-qualified name. Note that if the queue manager is still running it will need to be restarted in order that any changes made to its configuration data can be picked up.

AMQ7623
WebSphere MQ has not been configured with XA resource manager.

Severity
10 : Warning

Explanation
The queue manager has noticed that XA resource manager <*insert_3*> was removed from the qm.ini file of the queue manager. However, it was logged as being involved in <*insert_1*> transactions that are still in-doubt. The queue manager cannot resolve these transactions. The queue manager is continuing without this resource manager.

Response
First check that the qm.ini configuration file of the queue manager concerned hasn't been mistakenly altered resulting in an 'XAResourceManager' stanza being removed, or the 'Name' of any the resource managers being changed. If the qm.ini file was changed by mistake then you will need to reinstate resource manager <*insert_3*> in the qm.ini file before stopping and then restarting the queue manager in order that the change will be picked up. If you have intentionally removed a resource manager from the qm.ini file, consider the integrity implications of your action since the resource manager concerned might be in an in-doubt state. If you are sure that is not the case then you can use the 'rsvmqtrn' command to deliver an outcome on behalf of the resource manager in order that the queue manager can forget about the transactions concerned. If you cannot be sure that such an action will not cause an integrity problem then you should consider re-instating the resource manager in the qm.ini file so that the queue manager can contact the resource manager and automatically resolve the transactions concerned next time the queue manager is restarted.

AMQ7623 (Windows)

WebSphere MQ has not been configured with XA resource manager <*insert_3*> which might be involved in in-doubt transactions. The queue manager is continuing without this resource manager.

Severity

10 : Warning

Explanation

The queue manager has recognized that XA resource manager <*insert_3*> was removed from the registry entry of the queue manager. However, it was logged as being involved in <*insert_1*> transactions that are still in-doubt. The queue manager cannot resolve these transactions.

Response

Check that the configuration data entry of the queue manager concerned has not been altered by mistake, resulting in an 'XAResourceManager' stanza being removed, or the 'Name' of any the resource managers being changed.

If the configuration data entry was changed by mistake, you need to reinstate resource manager <*insert_3*> in the configuration data before stopping, and then restarting the queue manager to access the change.

If you have intentionally removed a resource manager from the configuration data, consider the integrity implications of your action because the resource manager concerned might be in an in-doubt state.

If you are sure that this is not the case, you can use the 'rsvmqtrn' command to instruct the resource manager to inform the queue manager that it can forget about the transactions concerned.

If using the 'rsvmqtrn' command could result in an integrity problem, you should consider reinstating the resource manager in the configuration data, so that the queue manager can contact the resource manager and automatically resolve the transactions concerned next time the queue manager is restarted.

AMQ7624

An exception occurred during an <*insert_4*> call to XA resource manager <*insert_3*>.

Severity

20 : Error

Explanation

An exception has been detected during a call to an XA resource manager. The queue manager will continue after assuming a return code of XAER_RMERR from the call.

Response

An FFST should have been produced which documents the exception. Use this and any further FFSTs to try and determine the reason for the failure. A trace of the problem will be useful to identify the XA flows between the queue manager and the resource manager concerned. MQ has allocated an RMId of <*insert_1*> to this resource manager. Use this to isolate the flows concerned. First contact the supplier of the resource manager for problem resolution. If however you think that the problem lies within the queue manager then save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard any information describing the problem until after it has been resolved.

AMQ7625

The XA resource manager <*insert_3*> has become available again.

Severity
0 : Information

Explanation
WebSphere MQ has managed to regain contact with a resource manager that had become unavailable. Any in-doubt transactions involving this resource manager will be resolved. The resource manager will now be able to participate in new transactions.

Response
None.

AMQ7626
XA resource manager initialization failure. Refer to the error log for more information.

Severity
20 : Error

Explanation
The queue manager has failed to initialize one or more of the XA resource managers defined in the qm.ini configuration file.

Response
Correct the error and restart the queue manager.

AMQ7626 (Windows)
XA resource manager initialization failure. Refer to the error log for more information.

Severity
20 : Error

Explanation
The queue manager has failed to initialize one or more of the XA resource managers defined in the configuration data.

Response
Correct the error and restart the queue manager.

AMQ7627
The XA resource manager <*insert_3*> was not available when called for xa_open. The queue manager is continuing without this resource manager.

Severity
10 : Warning

Explanation
The XA resource manager <*insert_3*> has indicated that it is not available, by returning XAER_RMERR on an xa_open request. Normally this indicates that the resource manager has been shut down. In this case the resource manager cannot participate in any new transactions. Any in-flight transactions in which it was involved will be backed out, and any transactions in which it is in-doubt will only be resolved when contact with the resource manager is re-established. A further message will be issued when the queue manager has been able to do this. If the resource manager should be available, then there might be a configuration problem or another possibility is that you are using a 32-bit instance of Db2, this is not supported on this platform, as WebSphere MQ processes are 64-bit and Db2 does not support 64-bit processes with its 32-bit instances.

Response
Try to establish the reason why the resource manager is unavailable. It might be that an invalid XAOpenString has been defined for the resource manager in the 'qm.ini' configuration file. If this is the case, stop and then restart the queue manager so that any change will be picked up. Alternatively, the queue manager might be reaching a resource constraint with this resource

manager. For example, the resource manager might not be able to accommodate all of the queue manager processes being connected at one time, you might need to alter one of its tuning parameters.

AMQ7701
DMPMQLOG command is starting.

Severity
0 : Information

Explanation
You have started the DMPMQLOG command and it is processing your request.

Response
None.

AMQ7702
DMPMQLOG command has finished successfully.

Severity
0 : Information

Explanation
The DMPMQLOG command has finished processing your request and no errors were detected.

Response
None.

AMQ7703
DMPMQLOG command has used option <*insert_3*> with an invalid value <*insert_4*>.

Severity
20 : Error

Explanation
You started the DMPMQLOG command specifying an invalid option value. The <*insert_4*> value for option <*insert_3*> is either missing or of an incorrect format.

Response
Refer to the command syntax, and then try the command again.

AMQ7704
DMPMQLOG command has used an invalid option <*insert_3*>.

Severity
20 : Error

Explanation
You started the DMPMQLOG command specifying an invalid option of <*insert_3*>.

Response
Refer to the command syntax and then try the command again.

AMQ7705
Usage: dmpmqlog [-b | -s StartLSN | -n ExtentNumber] [-e EndLSN] [-f LogFilePath] [-m QMgrName]

Severity
0 : Information

Response
None.

AMQ7706
DMPMQLOG command has used an incorrect queue manager name <*insert_3*> or path <*insert_4*>.

Severity
20 : Error

Explanation
The DMPMQLOG command has used <*insert_3*> as the queue manager name and, if shown, <*insert_4*> as the directory path for <*insert_3*>. Either <*insert_3*> and/or <*insert_4*> is incorrect; if <*insert_4*> is not shown then it is <*insert_3*> which is incorrect.

Possible reasons for the error include:

that <*insert_3*> is not an existing queue manager name;

the entries for <*insert_3*> in the MQ system initialization (INI) file are incorrect;

<*insert_4*> is not a correct path for <*insert_3*>.

If you started the command specifying option -m (queue manager name option) with a value then this value will have been used as the queue manager name, otherwise the default queue manager name will have been used.

Response
Check that <*insert_3*> is an existing queue manager name. Check your MQ system's initialization (INI) file to ensure that <*insert_3*> and its associated entries are correct. If <*insert_4*> is shown, check that it is a correct MQ system directory path for <*insert_3*>.

AMQ7706 (Windows)
DMPMQLOG command has used an incorrect queue manager name <*insert_3*> or path <*insert_4*>.

Severity
20 : Error

Explanation
The DMPMQLOG command has used <*insert_3*> as the queue manager name and, if shown, <*insert_4*> as the directory path for <*insert_3*>. Either <*insert_3*> and/or <*insert_4*> is incorrect; if <*insert_4*> is not shown then it is <*insert_3*> which is incorrect.

Possible reasons for the error include:

that <*insert_3*> is not an existing queue manager name;

the entries for <*insert_3*> in the MQ configuration data are incorrect;

<*insert_4*> is not a correct path for <*insert_3*>.

If you started the command specifying option -m (queue manager name option) with a value then this value will have been used as the queue manager name, otherwise the default queue manager name will have been used.

Response
Check that <*insert_3*> is an existing queue manager name. Check your MQ configuration data to ensure that <*insert_3*> and its associated entries are correct. If <*insert_4*> is shown, check that it is a correct MQ system directory path for <*insert_3*>.

AMQ7706 (IBM i)
DMPMQLOG command has used an incorrect queue manager name or path.

Severity
20 : Error

Explanation
The DMPMQLOG command has used <*insert_3*> as the queue manager name and, if shown, <*insert_4*> as the directory path for <*insert_3*>. Either <*insert_3*> and/or <*insert_4*> is incorrect; if <*insert_4*> is not shown then it is <*insert_3*> which is incorrect.

Possible reasons for the error include:

that <*insert_3*> is not an existing queue manager name;

the entries for <*insert_3*> in the MQ system initialization (INI) file are incorrect;

<*insert_4*> is not a correct path for <*insert_3*>.

If you started the command specifying option -m (queue manager name option) with a value then this value will have been used as the queue manager name, otherwise the default queue manager name will have been used.

Response
Check that <*insert_3*> is an existing queue manager name. Check your MQ system's initialization (INI) file to ensure that <*insert_3*> and its associated entries are correct. If <*insert_4*> is shown, check that it is a correct MQ system directory path for <*insert_3*>.

AMQ7707
DMPMQLOG command has failed: CompCode = 0x<*insert_1*>.

Severity
20 : Error

Explanation
The DMPMQLOG command has detected an error and the MQ recording routine has been called. Possible reasons for this include a damaged log file, a problem during initialization for the queue manager or an internal MQ failure.

Response
Check that the queue manager being used by DMPMQLOG, as specified by you using the -m command option or defaulted, exists and is not currently running. If it does not exist, try the command again specifying an existing queue manager. If it is running, stop the queue manager and then try the command again. Otherwise, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Do not discard these files until the problem has been resolved. Note the completion code (CompCode) and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ7708
DMPMQLOG command has used an invalid default queue manager name.

Severity
20 : Error

Explanation
You started the DMPMQLOG command without specifying option -m (queue manager name option) and so your MQ default queue manager name has been used. However, this default name either could not be found or is invalid.

Response
Check that the default queue manager name exists and is valid, and then try the command again.

AMQ7709
DMPMQLOG command has used an invalid combination of options.

Severity
20 : Error

Explanation
You started the DMPMQLOG command specifying an invalid combination of the options -b (base LSN option), -s (start LSN option) and -n (extent number option). Only 1 or none of these options can be specified.

Response
Refer to the command syntax and then try the command again.

AMQ7710
DMPMQLOG command has used option -n which is invalid for circular logging.

Severity
20 : Error

Explanation
You started the DMPMQLOG command specifying option -n (extent number option) but this is not valid when your MQ log is defined as circular.

Response
Use a different option and then try the command again.

AMQ7711
DMPMQLOG command has used option -m with a value that is too long.

Severity
20 : Error

Explanation
You started the DMPMQLOG command specifying option -m (queue manager name option) with a value that is more than <*insert_1*> characters.

Response
Specify a shorter queue manager name and then try the command again.

AMQ7712
DMPMQLOG command has used option -f with a value which is too long.

Severity
20 : Error

Explanation
You started the DMPMQLOG command specifying option -f (log file path option) with a value which is more than <*insert_1*> characters.

Response
Specify a shorter log file path name and then try the command again.

AMQ7713
DMPMQLOG command was unable to allocate sufficient storage.

Severity
20 : Error

Explanation
The DMPMQLOG command has been unable to allocate some storage.

Response
Free some storage and then try the command again.

AMQ7714
DMPMQLOG command has reached the end of the log.

Severity
0 : Information

Explanation
The DMPMQLOG command has processed any log data and has now reached the end of the log.

Response
None.

AMQ7715
DMPMQLOG command cannot open file <*insert_3*>.

Severity
20 : Error

Explanation
The DMPMQLOG command was unable to open file <*insert_3*> for reading.

Response
Check that the file exists, can be opened for reading, and that you have authority to access it, and then try the command again.

AMQ7716
DMPMQLOG command has finished unsuccessfully.

Severity
0 : Information

Explanation
The DMPMQLOG command has finished with your request but an error has been detected. The previous message issued by the command can be used to identify the error.

Response
Refer to the previous message issued by the command.

AMQ7717
DMPMQLOG command has failed to initialize: CompCode = 0x<*insert_1*>.

Severity
20 : Error

Explanation
The DMPMQLOG command has failed during its initialization and the MQ recording routine has been called. Possible reasons for this include that your queue manager is already running. The completion code can be used to identify the error.

Response
Check that the queue manager being used by DMPMQLOG, as specified by you using the -m command option or defaulted, exists and is not currently running. If it is running, stop the queue manager and then try the command again. Otherwise, use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ7718
DMPMQLOG command is using a default of <*insert_3*> for the queue manager name.

Severity
0 : Information

Explanation
You have started the DMPMQLOG command without specifying option -m (queue manager name option) and so a default value of <*insert_3*> is being used. This value is obtained from your default queue manager name.

Response
None.

AMQ7718 (IBM i)
DMPMQLOG command is using the default queue manager name.

Severity
0 : Information

Explanation
You have started the DMPMQLOG command without specifying option -m (queue manager name option) and so a default value of <*insert_3*> is being used. This value is obtained from your MQ default queue manager name.

Response
None.

AMQ7719
DMPMQLOG command is using a default of <*insert_3*> for the starting dump location.

Severity
0 : Information

Explanation
You have started the DMPMQLOG command without specifying option -b (base LSN option), option -s (start LSN option) or option -n (extent number option), and so a default value of <*insert_3*> is being used. This value is the Log Sequence Number (LSN) of the first record in the active part of the log, and is used as the location from which to start dumping.

Response
None.

AMQ7719 (IBM i)
DMPMQLOG command is using the default starting dump location.

Severity
0 : Information

Explanation
You have started the DMPMQLOG command without specifying option -b (base LSN option), option -s (start LSN option) or option -n (extent number option), and so a default value of <*insert_3*> is being used. This value is the Log Sequence Number (LSN) of the first record in the active part of the log, and is used as the location from which to start dumping.

Response
None.

AMQ7720
DMPMQLOG command is using extent <*insert_1*> but the current extent is <*insert_2*>.

Severity
20 : Error

Explanation
You have started the DMPMQLOG command specifying option -n (extent number option) with a value of <*insert_1*> but this value is greater than <*insert_2*>, which represents the extent currently being used.

Response
When using option -n, specify its value as being less than or equal to the extent number currently being used.

AMQ7721
DMPMQLOG command has not found any log records in extent number <*insert_1*>.

Severity
0 : Information

Explanation
During its normal processing, the DMPMQLOG command did not find any log records in this extent.

Response
None.

AMQ7722
DMPMQLOG command cannot find the object catalog for queue manager <*insert_3*>.

Severity
20 : Error

Explanation
The DMPMQLOG command is using the queue manager named <*insert_3*> but cannot find the manager's object catalog file. This file should have been created at the time the queue manager was created.

Response
Refer to the "System Management Guide" for a description of the location and name of the object catalog file. Check that the file exists and is available for use by this command. If it does not exist then you will need to re-create the queue manager.

AMQ7722 (IBM i)
DMPMQLOG command cannot find the object catalog for the queue manager.

Severity
20 : Error

Explanation
The DMPMQLOG command is using the queue manager named <*insert_3*> but cannot find the manager's object catalog file. This file should have been created at the time the queue manager was created.

Response
Refer to the "System Management Guide" for a description of the location and name of the object catalog file. Check that the file exists and is available for use by this command. If it does not exist then you will need to re-create the queue manager.

AMQ7723
DMPMQLOG command cannot find the requested Log Sequence Number (LSN).

Severity
20 : Error

Explanation
The DMPMQLOG command has been started with an LSN but it cannot be found in the log.

Response
Check for an existing LSN and then try the command again.

AMQ7724
DMPMQLOG command cannot use the requested extent number.

Severity
20 : Error

Explanation
The DMPMQLOG command has been started with an extent number but it is beyond the end of the log.

Response
Check for an existing extent number and then try the command again.

AMQ7725
DMPMQLOG command cannot find an old Log Sequence Number (LSN).

Severity
20 : Error

Explanation
The DMPMQLOG command has been started specifying an LSN which is older than the log's base LSN. However, the specified LSN could not be found.

Response
Check for an existing LSN and then try the command again.

AMQ7726
DMPMQLOG command has used option -s with an incorrect value for circular logging.

Severity
20 : Error

Explanation
You started the DMPMQLOG command specifying option -s (start LSN option) with a value which is less than the base LSN of a log which is defined as circular. LSN values less than the base LSN can only be specified when using a linear log.

Response
When using option -s with a circular log, specify an option value which is equal or greater to the log's base LSN, and then try the command again.

AMQ7751 (IBM i)
MIGRATEMQM program is starting.

Severity
0 : Information

Explanation
You have started the MIGRATEMQM program.

Response
None.

AMQ7752 (IBM i)
MIGRATEMQM has completed successfully.

Severity
0 : Information

Explanation
The MIGRATEMQM program has completed migration of your queue manager and no errors were detected.

Response
None.

AMQ7753 (IBM i)
MIGRATEMQM has failed due to errors.

Severity
20 : Error

Explanation
See the previously listed messages in the job log. Correct the errors and then restart the MIGRATEMQM program.

Response
None.

AMQ7754 (IBM i)
MIGRATEMQM has detected an error and is unable to continue.

Severity
20 : Error

Explanation
See the previously listed messages in this job log, or in associated job logs. Correct the errors and then restart the MIGRATEMQM program.

Response
None.

AMQ7755 (IBM i)
Unable to locate a required journal receiver.

Severity
20 : Error

Explanation
The MIGRATEMQM program attempted to locate the journal receivers to use for migration, but the operation required access to a journal or journal receiver that is not currently present on the system.

Response
Restore the required journal or journal receiver from backup. Then restart the MIGRATEMQM program.

AMQ7756 (IBM i)
Unable to locate a required journal entry.

Severity
20 : Error

Explanation
The MIGRATEMQM program was unable to retrieve a journal entry required for migration. The operation might have failed because a required journal receiver is not currently present on the system.

Response
Restore the required journal receiver from backup. Then restart the MIGRATEMQM program.

AMQ7757 (IBM i)
Queue manager <*insert_3*> already exists.

Severity
20 : Error

Explanation
The MIGRATEMQM program is unable to create a queue manager with the same name as used in the previous release because a queue manager of this name has already been created.

Response
Delete the queue manager. Then restart the MIGRATEMQM program.

AMQ7758 (IBM i)
Queue manager starting.

Severity
0 : Information

Explanation
The queue manager "<*insert_3*>" is starting.

Response
None.

AMQ7759 (IBM i)
Recreating WebSphere MQ objects.

Severity
0 : Information

Explanation
WebSphere MQ objects are being re-created from their media images contained in the log.

Response
None.

AMQ7760 (IBM i)
Recreating WebSphere MQ channels.

Severity
0 : Information

Explanation
WebSphere MQ channels are being re-created from the previous channel definition file.

Response
None.

AMQ7761 (IBM i)
Unexpected return code from command <*insert_3*>.

Severity
20 : Error

Explanation
An unexpected return code, <*insert_1*>, was returned by command <*insert_3*>.

Response
See the previously listed messages in this job log, or in associated job logs.

AMQ7762 (IBM i)
Unexpected error from channel migration.

Severity
20 : Error

Explanation
The migration of channel definitions or channel synchronization data encountered an unexpected error.

Response
See the previously listed messages in this job log, or in associated job logs.

AMQ7770
Sent file <*insert_3*>

Severity
40 : Stop Error

Explanation
The file was successfully sent.

Response
None.

AMQ7771
Received file.

Severity
40 : Stop Error

Explanation
The file was successfully received.

Response
None.

AMQ7772
Complete file list

Severity
40 : Stop Error

Explanation
Displays a list of complete files.

Response
None.

AMQ7773
Incomplete file list

Severity
40 : Stop Error

Explanation
Displays a list of incomplete files.

Response
None.

AMQ7774
Other message list

Severity
40 : Stop Error

Explanation
Displays a list of other messages.

Response
None.

AMQ7775
Nothing to list.

Severity
40 : Stop Error

Explanation
Nothing to list.

Response
None.

AMQ7776
Deleted.

Severity
40 : Stop Error

Explanation
File deleted.

Response
None.

AMQ7777
Nothing to delete.

Severity
40 : Stop Error

Explanation
Nothing to delete.

Response
None.

AMQ7778
Syntax error. The correct syntax is:

Severity
40 : Stop Error

Explanation
Invalid arguments supplied.

Response
One or more options were incorrectly specified when issuing the send or receive command. Check the options used and reissue the command.

AMQ7779
Cannot connect to default queue manager.

Severity
40 : Stop Error

Explanation
Queue manager not available.

Response
Check that the queue manager exists and that the listener is running.

AMQ7780
Cannot connect to queue manager *<insert_3>*

Severity
40 : Stop Error

Explanation
Queue manager not available.

Response
Check that the queue manager exists and that the listener is running.

AMQ7781
Application memory unavailable.

Severity
40 : Stop Error

Explanation
There is insufficient memory to perform the requested action.

Response

1) Check the message size is not excessive

2) Close other applications and try the command again

AMQ7783
Queue name required.

Severity
40 : Stop Error

Explanation
A queue name was not specified when issuing a send or receive command.

Response
Reissue the command with the QueueName option.

AMQ7784
Cannot open queue <*insert_3*>

Severity
40 : Stop Error

Explanation
Cannot open queue <*insert_3*>

Response
Check that the queue exists.

AMQ7785
Cannot open file <*insert_3*>

Severity
40 : Stop Error

Explanation
Cannot open file <*insert_3*>

Response
Check that the file exists, that it is in the correct location and has the appropriate file permissions.

AMQ7786
Cannot put to queue <*insert_3*>

Severity
40 : Stop Error

Explanation
Cannot put to queue <*insert_3*>

Response

1) Check the Queue Manager has sufficient log space for sending large messages

2) Check the queue does not have put inhibited

3) Check the queue is not full

4) Check the message size of the queue is greater than the message size

5) Check the user has sufficient authority to put messages on the queue

AMQ7787
No file name specified.

Severity
40 : Stop Error

Explanation
No file name specified.

Response

A file name was not specified when issuing a send command. Reissue the command with the FileName option.

AMQ7788

Message length is too small to send data.

Severity

40 : Stop Error

Explanation

Message length is too small to send data.

Response

Increase the message size and resend with a send command, using the -l MessageSize option to specify a larger message size.

AMQ7789

Sending file has changed.

Severity

40 : Stop Error

Explanation

The file being sent has been changed before the complete file has been sent.

Response

Check the file for integrity and reissue the send command.

AMQ7790

Cannot get from queue <*insert_3*>

Severity

40 : Stop Error

Explanation

The list, get, delete or extract request has failed.

Response

1) Check the queue does have get inhibited

2) Check the user has sufficient WebSphere MQ authority to get messages from the queue

AMQ7791

Cannot write to file.

Severity

40 : Stop Error

Explanation

The get or extract request has failed.

Response

1) Check that the file is not write-protected. In Windows Explorer, right-click the file name and select Properties. Check the user has sufficient authority to write to the destination file system.

2) Check the destination file system exists

3) Check the destination file system is not full

AMQ7792

CorrelId is invalid.

Severity

40 : Stop Error

Explanation
CorrelId is invalid.

Response

1) Check that a valid correlation ID has been specified when receiving a file with the -c option.

2) It must be 48 characters in length.

3) Use the -v option of the receive command to display the correlation ID.

AMQ7793
MsgId is invalid.

Severity
40 : Stop Error

Explanation
MsgId is invalid.

Response

1) Check that a valid message ID has been specified when receiving an 'other' message with the -u option.

2) It must be 48 characters in length.

AMQ7794
No messages to receive.

Severity
40 : Stop Error

Explanation
There are no FTA files on the specified queue.

Response
Check with the sender that the file was actually sent.

AMQ7795
Cannot delete the file because it's not unique.

Severity
40 : Stop Error

Explanation
Cannot delete the file because it's not unique.

Response
None.

AMQ7796
Cannot replace an existing file.

Severity
40 : Stop Error

Explanation
Cannot replace an existing file.

Response
Reissue the command with the -y option.

AMQ7797
Unable to load the WebSphere MQ library.

Severity
40 : Stop Error

Explanation
Unable to load the WebSphere MQ library.

Response
None.

AMQ7798
Unable to locate <*insert_3*>.

Severity
40 : Stop Error

Explanation
This application requires <*insert_3*>.

Response
Check that <*insert_3*> is available and installed correctly.

AMQ7799
Unable to start <*insert_3*>.

Severity
40 : Stop Error

Explanation
This application cannot start <*insert_3*>.

Response
Check that <*insert_3*> is available and installed correctly.

AMQ7800
CorrelId <*insert_3*>

Severity
0 : Information

Explanation
None.

Response
None.

AMQ7801
Dir <*insert_3*>

Severity
0 : Information

Explanation
None.

Response
None.

AMQ7802
UserData <*insert_3*>

Severity
0 : Information

Explanation
None.

Response
None.

AMQ7803
FileName <*insert_3*>

Severity
0 : Information

Explanation
None.

Response
None.

AMQ7804
Length <*insert_3*>

Severity
0 : Information

Explanation
None.

Response
None.

AMQ7805
MsgId <*insert_3*>

Severity
0 : Information

Explanation
None.

Response
None.

AMQ7806
Could not start WebSphere MQ web administration server: <*insert_1*>.

Severity
0 : Information

Explanation
An unsuccessful attempt was made to start the web administration server on port <*insert_1*>.

Response
Check the product is installed correctly; the required registry keys and values are correct and the web server port is not already in use. If the problem persists save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ7807
WebSphere MQ web administration server running.

Severity
0 : Information

Explanation
WebSphere MQ web administration server running. Listening on port <*insert_4*>, root directory is <*insert_5*>.

Response
No action is required.

AMQ7808
Internal run-time error in WebSphere MQ web administration: <*insert_4*>.

Severity
0 : Information

Explanation
WebSphere MQ web administration had the following internal run-time error: <*insert_4*>.

Response
Check that: the product is installed correctly and that the required registry keys and values are correct. If the problem persists save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ7809
WebSphere MQ Publish/Subscribe web administration user limit reached.

Severity
10 : Warning

Explanation
The maximum number of concurrent web administration users has been reached (<*insert_4*>).

Response
Use the 'Web Administration Server' properties page in the Microsoft Management Console to increase the value of the web administration 'MaxClients' parameter.

AMQ7810 (Windows)
Failed to create class, reason code: <*insert_1*>.

Severity
20 : Error

Explanation
While trying to create class <*insert_3*> on <*insert_4*> error code <*insert_1*> was encountered. The associated error message generated by the operating system is: <*insert_5*>

Response
Check the system documentation to determine the course of action required to rectify the problem.

AMQ7880 (Windows)
Error code <*insert_1*> starting <*insert_4*>/<*insert_3*> WebSphere MQ service.

Severity
0 : Information

Explanation
The service was unable to start <*insert_4*>/<*insert_3*>. The error message reported was as follows: <*insert_5*>

Response
Use WebSphere MQ Explorer to investigate why the service could not begin. If recovery for this service is active, MQ attempts to recover.

AMQ7881 (Windows)
Unable to stop <*insert_4*>/<*insert_3*> WebSphere MQ service, return code <*insert_1*>.

Severity
10 : Warning

Explanation
The WebSphere MQ service was unable to stop <*insert_4*>/<*insert_3*>. The error message reported was as follows: <*insert_5*>

Response
Use WebSphere MQ Explorer to investigate why the service could not be stopped.

AMQ7882 (Windows)
Attempting to recover <*insert_4*>/<*insert_3*> WebSphere MQ service.

Severity
0 : Information

Explanation
The WebSphere MQ service has detected that <*insert_4*>/<*insert_3*> has failed, and is attempting to restart it.

Response
No Action Required.

AMQ7883 (Windows)
<*insert_4*>/<*insert_3*> WebSphere MQ service started from recovery.

Severity
0 : Information

Explanation
The WebSphere MQ service has successfully recovered <*insert_4*>/<*insert_3*>.

Response
No Action Required.

AMQ7884 (Windows)
Unable to recover <*insert_4*>/<*insert_3*> WebSphere MQ service.

Severity
10 : Warning

Explanation
The WebSphere MQ service has attempted to recover <*insert_4*>/<*insert_3*>, but all attempts have failed. There are no more attempts to recover this service.

Response
Use WebSphere MQ Explorer to investigate why the service failed and could not be restarted.

AMQ7885 (Windows)
Unable to delete queue manager <*insert_4*>, error <*insert_1*>.

Severity
10 : Warning

Explanation
An attempt to delete queue manager <*insert_4*> failed. WebSphere MQ returned error code <*insert_1*>: <*insert_5*>

Response
Ensure that the queue manager name has been specified correctly, and try again.

AMQ7886 (Windows)
Unable to create queue manager <*insert_4*>.

Severity
10 : Warning

Explanation

Queue manager <*insert_4*> could not be created. WebSphere MQ returned error <*insert_1*>: <*insert_5*>

Response

Check the error and application event logs to investigate the reason for the returned error and suggested responses to take to rectify the fault. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ7890 (Windows)

Unable to open mapped file containing WebSphere MQ performance data.

Severity

20 : Error

Explanation

The WebSphere MQ extensible counter dll was unable to open a mapped file used to collect queue performance data. Your system might be running short on virtual storage.

Response

No action required. Performance statistics for MQ queues will not be displayed.

AMQ7891 (Windows)

Unable to create a mutex to access WebSphere MQ performance data.

Severity

20 : Error

Explanation

The WebSphere MQ extensible counter dll was unable to create a mutex required to synchronize collection of queue performance data

Response

No action required. Performance statistics for MQ queues will not be displayed.

AMQ7892 (Windows)

Unable to map to shared memory file containing WebSphere MQ performance data.

Severity

20 : Error

Explanation

The WebSphere MQ extensible counter dll was unable to map the shared memory file required for collection of queue performance data.

Response

No action required. Performance statistics for MQ queues will not be displayed.

AMQ7893 (Windows)

Unable to open "Performance" key for WebSphere MQ services. Status code: <*insert_1*>.

Severity

20 : Error

Explanation

The WebSphere MQ extensible counter dll was unable to obtain performance counter values from the "Performance" key for WebSphere MQ services. Status code is the return value from the Windows registry call RegOpenKeyEx.

Response
No action required. Performance statistics for MQ queues will not be displayed.

AMQ7894 (Windows)
Unable to read the "Performance\First Counter" value for WebSphere MQ services. Status code: <*insert_1*>.

Severity
20 : Error

Explanation
The WebSphere MQ extensible counter dll was unable to obtain performance counter values from the "Performance\First Counter" key for WebSphere MQ services. Status code is the return value from the Windows registry call RegOpenKeyEx.

Response
No action required. Performance statistics for MQ queues will not be displayed.

AMQ7895 (Windows)
Unable to read the "Performance\First Help" value for WebSphere MQ services. Status code: <*insert_1*>.

Severity
20 : Error

Explanation
The WebSphere MQ extensible counter dll was unable to obtain performance counter values from the "Performance\First Help" key for WebSphere MQ services. Status code is the return value from the Windows registry call RegOpenKeyEx.

Response
No action required. Performance statistics for MQ queues will not be displayed.

AMQ7901
The data-conversion exit <*insert_3*> has not loaded.

Severity
30 : Severe error

Explanation
The data-conversion exit program, <*insert_3*>, failed to load. The internal function gave exception <*insert_4*>.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ7903
The data-conversion exit <*insert_3*> cannot be found.

Severity
30 : Severe error

Explanation
Message data conversion has been requested for a WebSphere MQ message with a user-defined format, but the necessary data-conversion exit program, <*insert_3*>, cannot be found. The internal function gave exception <*insert_4*>.

Response
Check that the necessary data-conversion exit <*insert_3*> exists.

AMQ7904

The data-conversion exit <*insert_3*> cannot be found, or loaded.

Severity

30 : Severe error

Explanation

Message data conversion was requested for a WebSphere MQ message with a user-defined format, but the necessary data conversion exit program, <*insert_3*>, was not found, or loaded. The <*insert_4*> function call gave a return code of <*insert_1*>.

Response

Check that the necessary data conversion exit routine exists in one of the standard directories for dynamically loaded modules. If necessary, inspect the generated output to examine the message descriptor (MQMD structure) of the MQ message for the conversion which was requested. This might help you to determine where the message originated.

AMQ7905

Unexpected exception <*insert_4*> in data-conversion exit.

Severity

30 : Severe error

Explanation

The data-conversion exit program, <*insert_3*>, ended with an unexpected exception <*insert_4*>. The message has not been converted.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ7907

Unexpected exception in data-conversion exit.

Severity

30 : Severe error

Explanation

The data-conversion exit routine, <*insert_3*>, ended with an unexpected exception. The message has not been converted.

Response

Correct the error in the data-conversion exit routine.

AMQ7908 (Windows)

Display active directory CRL server details.

Severity

0 : Information

Explanation

Display active directory CRL server details.

Response

None.

AMQ7909 (Windows)

There are no active directory CRL server details to display.

Severity
0 : Information

Explanation
No active directory CRL server definitions could be found.

Response
None.

AMQ7910 (Windows)
Usage: setmqscp [-a [-m QmgrName | *] | -r [-m QmgrName | *] | -d]

Severity
0 : Information

AMQ7911 (Windows)
The default Active Directory could not be located on your domain.

Severity
20 : Error

Explanation
No domain controllers with Active Directories could be found on the domain that your computer is a member of.

Response
Active Directory support for MQ MQI client connections cannot be used without a default Active Directory available on your domain.

AMQ7912 (Windows)
The Active Directory support library failed to initialize.

Severity
20 : Error

Explanation
WebSphere MQ support libraries for Active Directory client connections could not be initialized.

Response
Check that the Active Directory client pre-requisite software has been installed on your machine before attempting to use this feature.

AMQ7913 (Windows)
The WebSphere MQ Active Directory container could not be created.

Severity
20 : Error

Explanation
WebSphere MQ has failed to create an IBM-MQClientConnections container as a child of your domain's system container in the Active Directory.

Response
Ensure that you have permission to create sub-containers of the system container, and modify the otherWellKnownObjects property of the system container.

AMQ7914 (Windows)
Migration of the client connection table for Queue Manager <*insert_3*> failed with reason code <*insert_1*><*insert_4*>.

Severity
10 : Warning

Explanation
The client connection table for this Queue Manager could not be migrated at this time.

Response
Ensure that the client connection table exists and is not corrupted, and that you have authority to create new objects in the Active Directory on your domain.

AMQ7915 (Windows)
Created service connection point for connection <*insert_3*>.

Severity
0 : Information

Explanation
The service connection point was successfully created for this client connection.

Response
None.

AMQ7916 (Windows)
The Active Directory channel definition table could not be opened.

Severity
20 : Error

Explanation
The IBM-MQClientConnections Active Directory container could not be located in the Global Catalog.

Response
Ensure that setmqscp has been used to create the container object and that you have permission to read the container and its child objects.

AMQ7917 (Windows)
Display active directory channel details.

Severity
0 : Information

Explanation
Display active directory channel details.

Response
None.

AMQ7918 (Windows)
The WebSphere MQ Active Directory container could not be deleted.

Severity
20 : Error

Explanation
There was a problem when attempting to delete the MQ Active Directory container. The container must be empty before it can be deleted from the directory.

Response
None.

AMQ7919 (Windows)
There are no active directory client channel details to display.

Severity
0 : Information

Explanation
No active directory client channel definitions could be found.

Response
None.

AMQ7920 (Windows)

Usage: setmqcrl [-m QmgrName] [-a] [-d] [-r]

Severity

0 : Information

AMQ7921

An incorrect eye-catcher field in an MQDXP structure has been detected.

Severity

30 : Severe error

Explanation

The MQDXP structure passed to the Internal Formats Conversion routine contains an incorrect eye-catcher field.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ7922

A PCF message is incomplete.

Severity

30 : Severe error

Explanation

Message data conversion cannot convert a message in Programmable Command Format (PCF) because the message is only <*insert_1*> bytes long and does not contain a PCF header. The message has either been truncated, or it contains data that is not valid.

Response

Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Do not discard these files until the problem has been resolved. Use the file containing the Message Descriptor of the message to determine the source of the message and to see how data that is not valid became included in the message.

AMQ7923

A message had an unrecognized integer encoding - <*insert_1*>.

Severity

30 : Severe error

Explanation

Message data conversion cannot convert a message because the integer encoding value of the message, <*insert_1*>, was not recognized.

Response

Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Do not discard these files until the problem has been resolved. Use the file containing the Message Descriptor of the message to determine the source of the message and to see how data that is not valid became included in the message.

AMQ7924

Bad length in the PCF header (length = <*insert_1*>).

Severity

30 : Severe error

Explanation

Message data conversion cannot convert a message in Programmable Command Format (PCF) because the PCF header structure contains an incorrect length field. Either the message has been truncated, or it contains data that is not valid.

Response

Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Do not discard these files until the problem has been resolved. Use the file containing the Message Descriptor of the message to determine the source of the message and to see how data that is not valid became included in the message.

AMQ7925

Message version <*insert_1*> is not supported.

Severity

30 : Severe error

Explanation

Message data conversion cannot convert a message because the Version field of the message contains an incorrect value.

Response

Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Do not discard these files until the problem has been resolved. Use the file containing the Message Descriptor of the message to determine the source of the message and to see how data that is not valid became included in the message.

AMQ7926

A PCF message has an incorrect parameter count value <*insert_1*>.

Severity

30 : Severe error

Explanation

Message data conversion cannot convert a message in Programmable Command Format (PCF) because the parameter count field of the PCF header is incorrect.

Response

Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Do not discard these files until the problem has been resolved. Use the file containing the Message Descriptor of the message to determine the source of the message and to see how data that is not valid became included in the message.

AMQ7927

Bad type in PCF structure number <*insert_1*> (type = <*insert_2*>).

Severity

30 : Severe error

Explanation

A Programmable Command Format (PCF) structure passed to the Internal Formats Converter contained an incorrect type field.

Response

Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Do not discard these files until the problem has been resolved. Use the file containing the Message Descriptor of the message to determine the source of the message and to see how data that is not valid became included in the message.

AMQ7928

Bad length in PCF structure number <*insert_1*> (length = <*insert_2*>).

Severity
30 : Severe error

Explanation
A Programmable Command Format (PCF) structure passed to the Internal Formats Converter contained an incorrect length field.

Response
Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Do not discard these files until the problem has been resolved. Use the file containing the Message Descriptor of the message to determine the source of the message and to see how data that is not valid became included in the message.

AMQ7929
A PCF structure is incomplete.

Severity
30 : Severe error

Explanation
Message data conversion cannot convert a message in Programmable Command Format (PCF) because structure number <*insert_1*>, of Type value <*insert_2*>, within the message is incomplete. The message has either been truncated, or it contains data that is not valid.

Response
Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Do not discard these files until the problem has been resolved. Use the file containing the Message Descriptor of the message to determine the source of the message and to see how data that is not valid became included in the message.

AMQ7930
Bad CCSID in PCF structure number <*insert_1*> (CCSID = <*insert_2*>).

Severity
30 : Severe error

Explanation
A Programmable Command Format (PCF) structure passed to the Internal Formats Converter contains an incorrect CCSID.

Response
Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Do not discard these files until the problem has been resolved. Use the file containing the Message Descriptor of the message to determine the source of the message and to see how data that is not valid became included in the message.

AMQ7931
Bad length in PCF structure number <*insert_1*> (length = <*insert_2*>).

Severity
30 : Severe error

Explanation
Message data conversion cannot convert a message in Programmable Command Format (PCF) because one of the structures of the message contains an incorrect length field.

Response
Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Do not discard these files until the problem has been resolved. Use the file containing the Message Descriptor of the message to determine the source of the message and to see how data that is not valid became included in the message.

AMQ7932
Bad count in PCF structure number <*insert_1*> (count = <*insert_2*>).

Severity
30 : Severe error

Explanation
Message data conversion cannot convert a message in Programmable Command Format (PCF) because a StringList structure of the message contains an incorrect count field.

Response
Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Do not discard these files until the problem has been resolved. Use the file containing the Message Descriptor, the headers of the message, and the incorrect structure to determine the source of the message, and to see how data that is not valid became included in the message.

AMQ7933
Bad string length in PCF structure.

Severity
30 : Severe error

Explanation
Message data conversion cannot convert a message in Programmable Command Format (PCF) because structure number <*insert_1*> of the message contains an incorrect string length value <*insert_2*>.

Response
Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Do not discard these files until the problem has been resolved. Use the file containing the Message Descriptor, the headers of the message, and the incorrect structure to determine the source of the message and to see how data that is not valid became included in the message.

AMQ7934
Wrong combination of MQCCSI_DEFAULT with MQCCSI_EMBEDDED or MQEPH_CCSID_EMBEDDED.

Severity
30 : Severe error

Explanation
Message data conversion could not convert a message in Programmable Command Format (PCF) because structure <*insert_1*> of the message contained a CodedCharSetId field of MQCCSI_DEFAULT while the message itself had a CodedCharSetId of MQCCSI_EMBEDDED, or the Flags field of the MQEPH structure containing the PCF specified flag MQEPH_CCSID_EMBEDDED. These are incorrect combinations.

Response
Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Do not discard these files until the problem has been resolved. Use the file containing the Message Descriptor, the headers of the message and the incorrect structure to determine the source of the message and to see how data that is not valid became included in the message.

AMQ7935
Bad CCSID in message header (CCSID = <*insert_1*>).

Severity
30 : Severe error

Explanation
Message data conversion could not convert a message because the Message Descriptor of the message contained an incorrect CodedCharSetId field.

Response
Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Do not discard these files until the problem has been resolved. Use the file containing the Message Descriptor of the message to determine the source of the message and to see how data that is not valid became included in the message.

AMQ7936
The file <*insert_3*> already exists.

Severity
30 : Severe error

Explanation
The output file already exists, but REPLACE has not been specified.

Response
Specify REPLACE to over-write the existing file, or select a different output file name.

AMQ7937
Structure length <*insert_1*> in MQFMT_IMS_VAR_STRING format message is not valid.

Severity
30 : Severe error

Explanation
This error is detected when attempting data conversion. The valid range for the length is 4 (with no string data) to 32767. The message is returned unconverted with a reason code of MQRC_CONVERTED_STRING_TOO_BIG.

Response
Check the content of the message before data conversion and correct the message format. When converting data using two or more bytes per character, remember that the number of bytes in each character can change during data conversion. This causes the message lengths to change.

AMQ7943
Usage: crtmqcvx SourceFile TargetFile

Severity
0 : Information

Explanation
None.

Response
None.

AMQ7953
One structure has been parsed.

Severity
0 : Information

Explanation
The crtmqcvx command has parsed one structure.

Response
None.

AMQ7954
<*insert_1*> structures have been parsed.

Severity
0 : Information

Explanation
The crtmqcvx command has parsed <*insert_1*> structures.

Response
None.

AMQ7955
Unexpected field: <*insert_1*>.

Severity
0 : Information

Explanation
The field within the structure is of a type that is not recognized.

Response
Correct the field and retry the command.

AMQ7956
Bad array dimension.

Severity
0 : Information

Explanation
An array field of the structure has an incorrect dimension value.

Response
Correct the field and retry the command.

AMQ7957
Warning at line <*insert_1*>.

Severity
20 : Error

Explanation
The structure contains another field after a variable length field. A variable length field must be the last field of the structure.

Response
Correct the structure and retry the command.

AMQ7958
Error at line <*insert_1*> in field <*insert_3*>.

Severity
30 : Severe error

Explanation
Field name <*insert_3*> is a field of type 'float'. Fields of type float are not supported by this command.

Response
Either correct the structure to eliminate fields of type float, or write your own routine to support conversion of these fields.

AMQ7959
Error at line <*insert_1*> in field <*insert_3*>.

Severity
30 : Severe error

Explanation
Field name <*insert_3*> is a field of type 'double'. Fields of type double are not supported by this command.

Response
Either correct the structure to eliminate fields of type double, or write your own routine to support conversion of these fields.

AMQ7960
Error at line <*insert_1*> in field <*insert_3*>.

Severity
30 : Severe error

Explanation
Field name <*insert_3*> is a 'pointer' field. Fields of type pointer are not supported by this command.

Response
Either correct the structure to eliminate fields of type pointer, or write your own routine to support conversion of these fields.

AMQ7961
Error at line <*insert_1*> in field <*insert_3*>.

Severity
30 : Severe error

Explanation
Field name <*insert_3*> is a 'bit' field. Bit fields are not supported by this command.

Response
Either correct the structure to eliminate bit fields, or write your own routine to support conversion of these fields.

AMQ7962
No input file specified.

Severity
30 : Severe error

Explanation
This command requires that an input file is specified.

Response
Specify the name of the input file and retry the command.

AMQ7963
No output file specified.

Severity
30 : Severe error

Explanation
This command requires that an output file name is specified.

Response
Specify the name of the output file and retry the command.

AMQ7964
Unexpected option <*insert_3*>.

Severity
30 : Severe error

Explanation
The option specified is not valid for this command.

Response
Retry the command with a valid option.

AMQ7965
Incorrect number of arguments.

Severity
30 : Severe error

Explanation
The command was passed an incorrect number of arguments.

Response
Retry the command, passing it the correct number of arguments.

AMQ7968
Cannot open file <*insert_3*>.

Severity
30 : Severe error

Explanation
You cannot open the file <*insert_3*>.

Response
Check that you have the correct authorization to the file and retry the command.

AMQ7969
Syntax error.

Severity
30 : Severe error

Explanation
This line of the input file contains a language syntax error.

Response
Correct the syntax error and retry the command.

AMQ7970
Syntax error on line <*insert_1*>.

Severity
30 : Severe error

Explanation
This message identifies where, in the input file, a previously reported error was detected.

Response
Correct the error and retry the command.

AMQ7985 (Windows)
The WebSphere MQ Active Directory container already exists.

Severity
0 : Information

Explanation
The IBM-MQClientConnections Active Directory container already exists and does not need to be re-created.

Response
None.

AMQ7986 (Windows)
The WebSphere MQ Active Directory container was successfully created.

Severity
0 : Information

Explanation
The IBM-MQClientConnections Active Directory container was successfully created.

Response
None.

AMQ7987 (Windows)
Removed service connection point for connection <*insert_3*>.

Severity
0 : Information

Explanation
The service connection point was successfully removed for this client connection.

Response
None.

AMQ7988 (Windows)
Failure removing service connection point for connection <*insert_3*>.

Severity
10 : Warning

Explanation
The service connection point could not be removed for this client connection.

Response
None.

AMQ7989 (Windows)
The WebSphere MQ Active Directory container was removed successfully.

Severity
0 : Information

Explanation
The IBM-MQClientConnections Active Directory container was removed successfully.

Response
None.

AMQ7990 (Windows)
The WebSphere MQ Active Directory container does not exist.

Severity
0 : Information

Explanation
The IBM-MQClientConnections Active Directory container does not exist.

Response
None.

RTEINF(*YES) required for RPLYMSG(*YES).

Severity
30 : Severe error

Explanation
RPLYMSG(*YES) cannot be specified without RTEINF(*YES).

Response
If RPLYMSG(*YES) is specified then RTEINF(*YES) must also be specified.

AMQ7A55 (IBM i)
RPLYQ required for RPLYMQM.

Severity
30 : Severe error

Explanation
RPLYMQM cannot be specified without RPLYQ.

Response
If RPLYMQM is specified then RPLYQ must also be specified.

AMQ7A56 (IBM i)
CRRLID specified with invalid parameters.

Severity
30 : Severe error

Explanation
The CRRLID parameter was specified with one or more of MSGPST, MSGPRTY, OPTION, RPLYQ, RPLYMQM, EXPIRY, EXPRPT, RTEINF RPLYMSG, DLVRMSG, FWDMSG, MAXACTS, DETAIL and BIND which are invalid with CRRLID.

Response
Specify only those parameters which are valid with CRRLID.

AMQ7A57 (IBM i)
DSPMSG(*NO) specified with invalid parameters.

Severity
30 : Severe error

Explanation
DSPMSG(*NO) was specified with one or more of BROWSE, DSPINF and WAIT which are invalid with DSPMSG(*NO).

Response
Specify only those parameters which are valid with DSPMSG(*NO).

AMQ7A58 (IBM i)
RPLYQ required for DSPMSG(*NO) and RPLYMSG(*YES).

Severity
30 : Severe error

Explanation
DSPMSG(*NO) and RPLYMSG(*YES) cannot be specified without RPLYQ.

Response
If DSPMSG(*NO) and RPLYMSG(*YES) are specified than RPLYQ must also be specified.

AMQ7A59 (IBM i)
RPLYQ required for DSPMSG(*NO) and OPTION not *NONE.

Severity
30 : Severe error

Explanation
DSPMSG(*NO) and OPTION not *NONE cannot be specified without RPLYQ.

Response
If DSPMSG(*NO) and OPTION not *NONE are specified than RPLYQ must also be specified.

AMQ7A5A (IBM i)
Run WebSphere MQ Commands

AMQ7A5B (IBM i)
Non Persistent Message Class

AMQ7A5C (IBM i)
NPMCLASS not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The NPMCLASS parameter cannot be specified for a queue of type *ALS or *RMT.

Response
Remove the NPMCLASS parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ7A5D (IBM i)
MONQ not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The MONQ parameter cannot be specified for a queue of type *ALS or *RMT.

Response
Remove the MONQ parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ7A5E (IBM i)
STATQ not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The STATQ parameter cannot be specified for a queue of type *ALS or *RMT.

Response
Remove the STATQ parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ7A5F (IBM i)
ACCTQ not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The ACCTQ parameter cannot be specified for a queue of type *ALS or *RMT.

Response
Remove the ACCTQ parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ7A60 (IBM i)
All queue managers have been quiesced.

Severity
0 : Information

Explanation
All queue managers have been successfully quiesced.

Response
None.

AMQ7A61 (IBM i)
MQMNAME not valid for TRCEARLY(*YES).

Severity
40 : Stop Error

Explanation
The MQMNAME parameter can only be specified for TRCEARLY(*NO). TRCEARLY(*YES) applies to all queue managers.

Response
If TRCEARLY(*YES) is required remove MQMNAME from the command.

AMQ7A62 (IBM i)
MQMNAME not valid for SET(*END).

Severity
40 : Stop Error

Explanation
The MQMNAME parameter can only be specified for SET(*ON) or SET(*OFF). SET(*END) applies to all queue managers.

Response
If SET(*END) is required remove MQMNAME from the command.

AMQ7A63 (IBM i)
Bind Option

AMQ7A64 (IBM i)
TGTMQMNAME only valid for channel type *CLTCN.

Severity
40 : Stop Error

Explanation
The TGTMQMNAME parameter can only be specified with channel type *CLTCN.

Response
Remove the TGTMQMNAME parameter from the command or, if the command is CRTMQMCHL, specify a different value for CHLTYPE. Then try the command again.

AMQ7A65 (IBM i)
Invalid value specified for JOB parameter.

Severity
40 : Stop Error

Explanation
A value for the JOB parameter has been specified however the format of the parameter is incorrect. The value of this parameter can be one of the followng formats:

generic-jobname

Job-name/User/Number

Job-name/User/Number/thread-identifier.

Note that the thread-identifier cannot be specified without a fully qualified jobname.

Response
Specify a value in one of the acceptable formats and then try the command again. If you are prompting this command, you must enter characters in the job name field first to clear an invalid value specified elsewhere in the parameter entry.

AMQ7B0F (IBM i)
CLWLRANK not allowed with queue type *MDL.

Severity
40 : Stop Error

Explanation
The CLWLRANK parameter cannot be specified for a queue of type *MDL.

Response
Remove the CLWLRANK parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ7B10 (IBM i)
CLWLPRTY not allowed with queue type *MDL.

Severity
40 : Stop Error

Explanation
The CLWLPRTY parameter cannot be specified for a queue of type *MDL.

Response
Remove the CLWLPRTY parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ7B11 (IBM i)
LSRNAME not allowed with BACKLOG

Severity
40 : Stop Error

Explanation
A listener object cannot be specified with a listener backlog.

Response
Specify either a listener object or a listener backlog.

AMQ7B12 (IBM i)
MONCHL not valid for channel type *CLTCN.

Severity
40 : Stop Error

Explanation
The MONCHL parameter cannot be specified with channel type *CLTCN.

Response
Remove the MONCHL parameter from the command or, if the command is CRTMQMCHL, specify a different value for CHLTYPE. Then try the command again.

AMQ7B13 (IBM i)
STATCHL not valid for channel types *CLTCN and *SVRCN

Severity
40 : Stop Error

Explanation
The STATCHL parameter is valid only with channel type *SDR, *SVR, *RCVR, *RQSTR, *CLUSSDR or *CLUSRCVR.

Response
Remove the STATCHL parameter from the command or, if the command is CRTMQMCHL, specify a different value for CHLTYPE. Then try the command again.

AMQ7B14 (IBM i)
CLWLRANK only valid for channel types *CLUSSDR and *CLUSRCVR.

Severity
40 : Stop Error

Explanation
The CLWLRANK parameter can only be specified with channel types *CLUSSDR or *CLUSRCVR.

Response
Remove the CLWLRANK parameter from the command or, if the command is CRTMQMCHL, specify a different value for CHLTYPE. Then try the command again.

AMQ7B15 (IBM i)
CLWLPRTY only valid for channel types *CLUSSDR and *CLUSRCVR.

Severity
40 : Stop Error

Explanation
The CLWLPRTY parameter can only be specified with channel types *CLUSSDR or *CLUSRCVR.

Response
Remove the CLWLPRTY parameter from the command or, if the command is CRTMQMCHL, specify a different value for CHLTYPE. Then try the command again.

AMQ7B16 (IBM i)
CLWLWGHT only valid for channel types *CLUSSDR and *CLUSRCVR.

Severity
40 : Stop Error

Explanation
The CLWLWGHT parameter can only be specified with channel types *CLUSSDR or *CLUSRCVR.

Response
Remove the CLWLWGHT parameter from the command or, if the command is CRTMQMCHL, specify a different value for CHLTYPE. Then try the command again.

AMQ7B17 (IBM i)
CLWLUSEQ only allowed with queue type *LCL.

Severity
40 : Stop Error

Explanation
The CLWLUSEQ parameter can only be specified for a queue of type *LCL.

Response
Remove the CLWLUSEQ parameter from the command or, if the command is CRTMQMQ, specify a value of *LCL for QTYPE. Then try the command again.

AMQ7B18 (IBM i)
MCAUSRID not valid for channel type *CLTCN.

Severity
40 : Stop Error

Explanation
The MCAUSRID parameter cannot be specified with channel type *CLTCN.

Response
Remove the MCAUSRID parameter from the command or, if the command is CRTMQMCHL, specify a different value for CHLTYPE. Then try the command again.

AMQ7B20 (IBM i)
Message Read Ahead

AMQ7B21 (IBM i)
MSGREADAHD not allowed with queue type *RMT.

Severity
40 : Stop Error

Explanation
The MSGREADAHD parameter cannot be specified for a queue of type *RMT.

Response
Remove the MSGREADAHD parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ7B22 (IBM i)
Sharing Conversations

AMQ7B23 (IBM i)
SHARECNV is valid only when CHLTYPE is *SVRCN or *CLTCN.

Severity
40 : Stop Error

Explanation
The sharing conversations (SHARECNV) parameter cannot be specified for a channel type other than *SVRCN or *CLTCN.

Response
Remove the SHARECNV parameter from the command or, if the command is CRTMQMCHL, specify a different value for CHLTYPE. Then try the command again.

AMQ7B2D (IBM i)
PROPCTL not allowed with queue type *RMT.

Severity
40 : Stop Error

Explanation
The PROPCTL parameter cannot be specified for a queue of type *RMT.

Response
Remove the PROPCTL parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ7B2E (IBM i)
TARGTYPE only allowed with queue type *ALS.

Severity
40 : Stop Error

Explanation
The TARGTYPE parameter can only be specified for a queue of type *ALS.

Response
Remove the TARGTYPE parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ7B2F (IBM i)
PROPCTL only allowed with channel type *SDR, *SRV, *CLUSSDR or *CLUSRCVR.

Severity
40 : Stop Error

Explanation
The PROPCTL parameter can only be specified for a channel of type *SDR, *SVR, *CLUSSDR or *CLUSRCVR.

Response
Remove the PROPCTL parameter from the command or, if the command is CRTMQMCHL, specify a different value for CHLTYPE. Then try the command again.

AMQ7B30 (IBM i)
MAXINST only allowed with channel type *SVRCN.

Severity
40 : Stop Error

Explanation
The MAXINST parameter can only be specified for a channel of type *SVRCN.

Response
Remove the MAXINST parameter from the command or, if the command is CRTMQMCHL, specify a different value for CHLTYPE. Then try the command again.

AMQ7B31 (IBM i)
MAXINSTC only allowed with channel type *SVRCN.

Severity
40 : Stop Error

Explanation
The MAXINSTC parameter can only be specified for a channel of type *SVRCN.

Response
Remove the MAXINSTC parameter from the command or, if the command is CRTMQMCHL, specify a different value for CHLTYPE. Then try the command again.

AMQ7B32 (IBM i)
CLNTWGHT only allowed with channel type *CLTCN.

Severity
40 : Stop Error

Explanation
The CLNTWGHT parameter can only be specified for a channel of type *CLTCN.

Response
Remove the CLNTWGHT parameter from the command or, if the command is CRTMQMCHL, specify a different value for CHLTYPE. Then try the command again.

AMQ7B33 (IBM i)
AFFINITY only allowed with channel type *CLTCN.

Severity
40 : Stop Error

Explanation
The AFFINITY parameter can only be specified for a channel of type *CLTCN.

Response
Remove the AFFINITY parameter from the command or, if the command is CRTMQMCHL, specify a different value for CHLTYPE. Then try the command again.

Invalid combination of security exit parameters.

Severity
40 : Stop Error

Explanation
An invalid combination of security exit parameters has been provided on the command. The SCYEXIT parameter cannot be specified for a channel of type *CLTCN. The CSCYEXIT parameter can only be specified for a channel of type *CLTCN. You cannot specify both SCYEXIT and CSCYEXIT parameters together on the same command.

Response
Remove the invalid combination of security exit parameters from the command and then try the command again.

AMQ7B77 (IBM i)
Invalid combination of send exit parameters.

Severity
40 : Stop Error

Explanation
An invalid combination of send exit parameters has been provided on the command. The SNDEXIT parameter cannot be specified for a channel of type *CLTCN. The CSNDEXIT parameter can only be specified for a channel of type *CLTCN. You cannot specify both SNDEXIT and CSNDEXIT parameters together on the same command.

Response
Remove the invalid combination of send exit parameters from the command and then try the command again.

AMQ7B78 (IBM i)
Invalid combination of receive exit parameters.

Severity
40 : Stop Error

Explanation
An invalid combination of receive exit parameters has been provided on the command. The RCVEXIT parameter cannot be specified for a channel of type *CLTCN. The CRCVEXIT parameter can only be specified for a channel of type *CLTCN. You cannot specify both RCVEXIT and CRCVEXIT parameters together on the same command.

Response
Remove the invalid combination of receive exit parameters from the command and then try the command again.

AMQ7B79 (IBM i)
Command is not applicable to WebSphere MQ Publish/Subscribe broker.

Severity
0 : Information

Explanation
This command performs a null operation.

Response
Refer to Publish/Subscribe User's Guide publication for alternative ways to perform this function.

AMQ8000-8999: Administration

AMQ8001
IBM WebSphere MQ queue manager created.

Severity
0 : Information

Explanation
IBM WebSphere MQ queue manager <*insert_5*> created.

Response
None.

IBM WebSphere MQ queue manager changed.

Severity
0 : Information

Explanation
IBM WebSphere MQ queue manager <*insert_3*> changed.

Response
None.

AMQ8006
IBM WebSphere MQ queue created.

Severity
0 : Information

Explanation
IBM WebSphere MQ queue <*insert_3*> created.

Response
None.

AMQ8007
IBM WebSphere MQ queue deleted.

Severity
0 : Information

Explanation
IBM WebSphere MQ queue <*insert_3*> deleted.

Response
None.

AMQ8008
IBM WebSphere MQ queue changed.

Severity
0 : Information

Explanation
IBM WebSphere MQ queue <*insert_3*> changed.

Response
None.

AMQ8010
IBM WebSphere MQ process created.

Severity
0 : Information

Explanation
IBM WebSphere MQ process <*insert_3*> created.

Response
None.

AMQ8011
IBM WebSphere MQ process deleted.

Severity
0 : Information

Explanation
IBM WebSphere MQ process <*insert_3*> deleted.

Response
None.

AMQ8012
IBM WebSphere MQ process changed.

Severity
0 : Information

Explanation
IBM WebSphere MQ process <*insert_3*> changed.

Response
None.

AMQ8014
IBM WebSphere MQ channel created.

Severity
0 : Information

Explanation
IBM WebSphere MQ channel <*insert_3*> created.

Response
None.

AMQ8015
IBM WebSphere MQ channel deleted.

Severity
0 : Information

Explanation
IBM WebSphere MQ channel <*insert_3*> deleted.

Response
None.

AMQ8016
IBM WebSphere MQ channel changed.

Severity
0 : Information

Explanation
IBM WebSphere MQ channel <*insert_3*> changed.

Response
None.

AMQ8018
Start IBM WebSphere MQ channel accepted.

Severity
0 : Information

Explanation
The channel <*insert_3*> is being started. The start channel function has been initiated. This involves a series of operations across the network before the channel is actually started. The channel status displays "BINDING" for a short period while communication protocols are negotiated with the channel with which communication is being initiated.

Response
None.

AMQ8019
Stop IBM WebSphere MQ channel accepted.

Severity
0 : Information

Explanation
The channel <*insert_3*> has been requested to stop.

Response
None.

AMQ8020
Ping IBM WebSphere MQ channel complete.

Severity
0 : Information

Explanation
Ping channel <*insert_3*> complete.

Response
None.

AMQ8021
Request to start IBM WebSphere MQ Listener accepted.

Severity
0 : Information

Explanation
The Request to start the Listener has been accepted and is being processed.

Response
Should the request to start the listener be unsuccessful then information related to the error will be available in the queue manager error log. Once started the status of the listener may be monitored using the MQSC command 'DISPLAY LSSTATUS'. On IBM i the status of the listener may also be monitored using the 'WRKMQMLSR OPTION(*STATUS)' command.

AMQ8022
IBM WebSphere MQ queue cleared.

Severity
0 : Information

Explanation
All messages on queue <*insert_3*> have been deleted.

Response
None.

AMQ8023
IBM WebSphere MQ channel reset.

Severity
0 : Information

Explanation
Channel <*insert_3*> has been reset, the new sequence number of the channel is <*insert_1*>.

Response
None.

AMQ8024
IBM WebSphere MQ channel initiator started.

Severity
0 : Information

Explanation
The channel initiator for queue <*insert_3*> has been started.

Response
None.

AMQ8025
IBM WebSphere MQ channel resolved.

Severity
0 : Information

Explanation
In doubt messages for IBM WebSphere MQ channel <*insert_3*> have been resolved.

Response
None.

AMQ8026
End IBM WebSphere MQ queue manager accepted.

Severity
0 : Information

Explanation
A controlled stop request has been initiated for queue manager <*insert_5*>.

Response
None.

AMQ8027
IBM WebSphere MQ command server started.

Severity
0 : Information

Explanation
The command server has been started.

Response
None.

AMQ8028
IBM WebSphere MQ command server ended.

Severity
0 : Information

Explanation
The command server has been stopped.

Response
None.

AMQ8029
IBM WebSphere MQ authority granted.

Severity
0 : Information

Explanation
Authority for object <*insert_5*> granted.

Response
None.

AMQ8030
IBM WebSphere MQ authority revoked.

Severity
0 : Information

Explanation
Authority for object <*insert_3*> revoked.

Response
None.

AMQ8031 (IBM i)
Message Queue Manager connected.

Severity
0 : Information

Explanation
The message queue manager has been connected.

Response
None.

AMQ8032 (IBM i)
Message Queue Manager disconnected.

Severity
0 : Information

Explanation
The message queue manager has been disconnected.

Response
None.

AMQ8033
IBM WebSphere MQ object recreated.

Severity
0 : Information

Explanation
MQ object <*insert_5*> has been re-created from image.

Response
None.

AMQ8034
IBM WebSphere MQ object image recorded.

Severity
0 : Information

Explanation
Image of MQ object <*insert_3*> has been recorded.

Response
None.

AMQ8035
IBM WebSphere MQ Command Server Status . . : Running

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8036
IBM WebSphere MQ command server status . . : Stopping

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8037
IBM WebSphere MQ command server status . . : Starting

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8038
IBM WebSphere MQ command server status . . : Running with queue disabled

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8039
IBM WebSphere MQ command server status . . : Stopped

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8040
IBM WebSphere MQ command server ending.

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8041
The queue manager cannot be restarted or deleted because processes, that were previously connected, are still running.

Severity
40 : Stop Error

Explanation
Processes, that were connected to the queue manager the last time it was running, are still active. The queue manager cannot be restarted.

Response
Stop the processes and try to start the queue manager.

AMQ8041 (IBM i)
The queue manager cannot be restarted or deleted.

Severity
40 : Stop Error

Explanation
Jobs that were connected to the queue manager the last time it was running, are still active. The queue manager cannot be restarted or deleted.

Response
Use option 22 from WRKMQM to identify which jobs are connected to the queue manager. End the connected jobs and then retry the command.

AMQ8042
Process <*insert_1*> is still running.

Severity
0 : Information

AMQ8043
Non runtime application attempted to connect to runtime only queue manager.

Severity
0 : Information

Explanation
A non runtime application attempted to connect to a queue manager on a node where support for non runtime applications has not been installed. The connect attempt will be rejected with a reason of MQRC_ENVIRONMENT_ERROR.

Response
If the node is intended to support only runtime applications, investigate why a non runtime application has attempted to connect to the queue manager. If the node is intended to support non runtime only applications, investigate if the base option has been installed. The base option must be installed if non runtime applications are to run on this node.

AMQ8044 (Windows)
An error occurred while removing the queue manager from the Active Directory.

Severity
0 : Information

Explanation
The attempt to remove the queue manager from the Windows Active Directory failed. This may be because the appropriate entry could not be opened or modified, or the Service Control Point has already been removed.

Response
Check that your account has the authority to delete objects from the Active Directory, and that the entry has not already been deleted.

AMQ8045
WebSphere MQ channel in use.

Severity
20 : Error

Explanation
A process is either trying to delete a running telemetry channel, or to define a new telemetry channel using a port that is already in use. If the process is trying to define a new telemetry channel, the channel is defined but not started.

Response
Stop the process that is using the port, then either delete the previously-running channel, or start the newly-defined channel.

AMQ8046
Migrating objects for <*insert_3*>.

Severity
0 : Information

Response
None.

AMQ8047
Channel migration statistics : <*insert_1*> migrated. <*insert_2*> failed.

Severity
0 : Information

Explanation
Information on the number of channel objects migrated from previous versions of IBM WebSphere MQ channel definitions as well as any failures that occurred.

Response
None.

AMQ8048
Default objects statistics : <*insert_1*> created. <*insert_2*> replaced. <*insert_3*> failed.

Severity
0 : Information

Explanation
Information on the number of objects created or replaced successfully as well as any failures that occurred while creating the default objects.

Response
None.

AMQ8049
Object <*insert_4*>. Unable to create or replace.

Severity
20 : Error

Explanation
While creating or replacing the default object <*insert_4*> for IBM WebSphere MQ queue manager <*insert_5*> an error occurred. The error was due to improper authorization. The reason code is <*insert_1*>.

Response
Check this log for more details of what the problem may be. Make sure there are sufficient resources such as disk space and storage. For damaged or corrupted objects, replace these from backup objects. If all else fails, delete the queue manager <*insert_5*> using dltmqm and create it again using crtmqm.

AMQ8050
Creating or replacing default objects for <*insert_3*>.

Severity
0 : Information

Response
None.

AMQ8051
For details of the failures that occurred, please check AMQERR01.LOG.

Severity
0 : Information

Response
None.

AMQ8051 (Tandem)
For details of the failures that occurred, please check MQERRLG1.

Severity
0 : Information

Response
None.

AMQ8052
Completing setup.

Severity
0 : Information

Response
None.

AMQ8053
Object <*insert_4*>. Unable to create or replace.

Severity
20 : Error

Explanation
While creating or replacing the default object <*insert_4*> for IBM WebSphere MQ queue manager <*insert_5*> an error occurred. The error was due to a broken connection. The reason code is <*insert_1*>.

Response
Check this log for more details of what the problem may be. Make sure there is sufficient

resources such as disk space and storage. For damaged or corrupted objects, replace these from backup objects. If all else fails, delete the queue manager <*insert_5*> using dltmqm and create it again using crtmqm.

AMQ8054

Object <*insert_4*>. Unable to create or replace.

Severity

20 : Error

Explanation

While creating or replacing the default object <*insert_4*> for IBM WebSphere MQ queue manager <*insert_5*> an error occurred. The error was due to unavailable storage. The reason code is <*insert_1*>.

Response

Check this log for more details of what the problem may be. Make sure there is sufficient resources such as disk space and storage. For damaged or corrupted objects, replace these from backup objects. If all else fails, delete the queue manager <*insert_5*> using dltmqm and create it again using crtmqm.

AMQ8055

Object <*insert_4*>. Unable to create or replace.

Severity

20 : Error

Explanation

While creating or replacing the default object <*insert_4*> for IBM WebSphere MQ queue manager <*insert_5*> an error occurred. The error was due to a damaged object. The reason code is <*insert_1*>.

Response

Check this log for more details of what the problem may be. Make sure there is sufficient resources such as disk space and storage. For damaged or corrupted objects, replace these from backup objects. If all else fails, delete the queue manager <*insert_5*> using dltmqm and create it again using crtmqm.

AMQ8056

Object <*insert_4*>. Unable to create or replace.

Severity

20 : Error

Explanation

While creating or replacing the default object <*insert_4*> for IBM WebSphere MQ queue manager <*insert_5*> an error occurred. The error was due to a channel definition error. The error code is <*insert_1*> (X<*insert_2*>).

Response

Check this log for more details of what the problem may be. Make sure there is sufficient resources such as disk space and storage. For damaged or corrupted objects, replace these from backup objects. If all else fails, delete the queue manager <*insert_5*> using dltmqm and create it again using crtmqm.

AMQ8057

Object <*insert_4*>. Unable to create or replace.

Severity

20 : Error

Explanation

While creating or replacing the default object <*insert_4*> for IBM WebSphere MQ queue manager <*insert_5*> an error occurred. The error was due to invalid records in the channel definition file. The error code is <*insert_1*> (X<*insert_2*>).

Response

Check this log for more details of what the problem may be. Make sure there is sufficient resources such as disk space and storage. For damaged or corrupted objects, replace these from backup objects. If all else fails, delete the queue manager <*insert_5*> using dltmqm and create it again using crtmqm.

AMQ8058

Object <*insert_4*>. Unable to create or replace.

Severity

20 : Error

Explanation

While creating or replacing the default object <*insert_4*> for IBM WebSphere MQ queue manager <*insert_5*> an error occurred. The error was due to not finding the channel definition file. The error code is <*insert_1*> (X<*insert_2*>).

Response

Check this log for more details of what the problem may be. Make sure there is sufficient resources such as disk space and storage. For damaged or corrupted objects, replace these from backup objects. If all else fails, delete the queue manager <*insert_5*> using dltmqm and create it again using crtmqm.

AMQ8059

Object <*insert_4*>. Unable to create or replace.

Severity

20 : Error

Explanation

While creating or replacing the default object <*insert_4*> for IBM WebSphere MQ queue manager <*insert_5*> an error occurred. The error was due to an unexpected error, error code <*insert_1*> (X<*insert_2*>).

Response

Check this log for more details of what the problem may be. Make sure there is sufficient resources such as disk space and storage. For damaged or corrupted objects, replace these from backup objects. If all else fails, delete the queue manager <*insert_5*> using dltmqm and create it again using crtmqm.

AMQ8060

IBM WebSphere MQ queue manager <*insert_5*> started as a standby.

Severity

0 : Information

Explanation

Queue manager <*insert_5*> started as a standby instance, ready to become the primary instance if the existing primary instance fails.

Response

None.

AMQ8061 (Windows)

Command <*insert_4*> is not valid.

Severity

10 : Warning

Explanation

The command <*insert_4*> at line <*insert_1*> in the IBM WebSphere MQ service command file <*insert_3*> for queue manager <*insert_5*> is not valid for use in the service command file. The line is ignored.

Response

Check the contents of the file and retry the operation.

AMQ8062 (Windows)

Unexpected return code, <*insert_1*>, from command <*insert_3*>.

Severity

10 : Warning

Explanation

An unexpected return code, <*insert_1*>, was returned by command <*insert_3*>. This command was issued by the IBM WebSphere MQ service for queue manager <*insert_4*>.

Response

Verify that the command and parameters are correct.

AMQ8063 (Windows)

Not authorized to issue command <*insert_3*>.

Severity

20 : Error

Explanation

The current user <*insert_5*> is not authorized to issue the command <*insert_3*>. This can occur if the user is a member of the Administrators group but is not currently elevated. The command is ignored.

Response

Add the user to the local 'mqm' security group and retry the operation.

AMQ8064 (Windows)

Not authorized to start trusted application.

Severity

20 : Error

Explanation

The user <*insert_5*> is not authorized to start the trusted application <*insert_3*>. The application has not started.

Response

Add the user to the local 'mqm' security group and restart the application.

AMQ8065 (Windows)

Local group <*insert_3*> not found.

Severity

20 : Error

Explanation

The local group <*insert_3*> is unavailable. It is not possible to verify that the user is authorized. The function cannot continue.

Response

Create the required local group and retry the operation.

AMQ8066 (Windows)

Local mqm group not found.

Severity
20 : Error

Explanation
The local mqm group is unavailable. It is not possible to verify that the user is authorized. The function cannot continue.

Response
Create the local mqm group and retry the operation.

AMQ8067
IBM WebSphere MQ channel auto-defined.

Severity
0 : Information

Explanation
Channel <*insert_5*> auto-defined.

Response
None.

AMQ8068
Setup completed.

Severity
0 : Information

Response
None.

AMQ8069
ApplicationGroup for the crtmqm command does not contain the mqm userid.

Severity
40 : Stop Error

Explanation
IBM WebSphere MQ queue manager <*insert_5*> not created. The ApplicationGroup specified for the crtmqm command must contain the mqm userid when the RestrictedMode option (-g) is specified.

Response
None.

AMQ8070
ApplicationGroup for crtmqm command is not defined.

Severity
40 : Stop Error

Explanation
IBM WebSphere MQ queue manager <*insert_5*> not created. RestrictedMode option (-g) specified, but the ApplicationGroup does not exist.

Response
None.

AMQ8071
RestrictedMode option not supported on this platform.

Severity
40 : Stop Error

Explanation
IBM WebSphere MQ queue manager <*insert_5*> not created. The RestrictedMode option was specified but is not supported on this platform.

Response
None.

AMQ8072 (Windows)
Not authorized to administer channels.

Severity
10 : Warning

Explanation
The command server for queue manager <*insert_3*> received an administration command for channels. The user <*insert_5*> is not authorized to administer IBM WebSphere MQ channels. The command server has not processed the command.

Response
Add the user to the local 'mqm' security group, and ensure that the security policy is set as required.

AMQ8073 (Windows)
Authorization failed because SID: (<*insert_3*>) could not be resolved.

Severity
10 : Warning

Explanation
The object authority manager was unable to resolve the specified SID into entity and domain information.

Response
Ensure that the application provides a SID that is recognized on this system, that all necessary domain controllers are available, and that the security policy is set as you required.

AMQ8074 (Windows)
Authorization failed as the SID <*insert_3*> does not match the entity <*insert_4*>.

Severity
10 : Warning

Explanation
The object authority manager received inconsistent data - the supplied SID does not match that of the supplied entity information.

Response
Ensure that the application is supplying valid entity and SID information.

AMQ8075 (Windows)
Authorization failed because the SID for entity <*insert_3*> cannot be obtained.

Severity
10 : Warning

Explanation
The object authority manager was unable to obtain a SID for the specified entity.

Response
Ensure that the entity is valid, and that all necessary domain controllers are available.

AMQ8076 (Windows)
Authorization failed because no SID was supplied for entity <*insert_3*>.

Severity
10 : Warning

Explanation
The object authority manager was not supplied with SID information for the specified entity, and the security policy is set to 'NTSIDsRequired'.

Response
Ensure that the application is supplying a valid SID, and that the security policy is set as you require.

AMQ8077
Entity <*insert_3*> has insufficient authority to access object <*insert_4*>.

Severity
10 : Warning

Explanation
The specified entity is not authorized to access the required object. The following requested permissions are unauthorized: <*insert_5*>

Response
Ensure that the correct level of authority has been set for this entity against the required object, or ensure that the entity is a member of a privileged group.

AMQ8078
Waiting for queue manager <*insert_3*> to end.

Severity
0 : Information

Response
None.

AMQ8079 (Windows)
Access was denied when attempting to retrieve group membership information for user <*insert_3*>.

Severity
10 : Warning

Explanation
IBM WebSphere MQ, running with the authority of user <*insert_4*>, was unable to retrieve group membership information for the specified user.

Response
Ensure Active Directory access permissions allow user <*insert_4*> to read group memberships for user <*insert_3*>. To retrieve group membership information for a domain user, MQ must run with the authority of a domain user and a domain controller must be available.

AMQ8079 (IBM i)
IBM WebSphere MQ trigger monitor job started.

Severity
0 : Information

Explanation
The message queue manager trigger monitor job has been started for queue manager <*insert_3*> to process messages on the selected initiation queue. See previously issued messages for job details.'

Response
None.

AMQ8080 (IBM i)
IBM WebSphere MQ trigger monitor job start failed.

Severity
40 : Stop Error

Explanation
Message queue manager trigger job failed to start for manager <*insert_3*>. Failure reason code is <*insert_2*>. See previously issued messages for more information.'

Response
None.

AMQ8081 (Windows)
Not authorized to administer queue managers.

Severity
10 : Warning

Explanation
The command server for queue manager <*insert_3*> received an administration command for a queue manager. The user <*insert_5*> is not authorized to administer IBM WebSphere MQ queue managers. The command server has not processed the command.

Response
Add the user to the local 'mqm' security group, and ensure that the security policy is set as required.

AMQ8082 (Windows)
Not authorized to administer clusters.

Severity
10 : Warning

Explanation
The command server for queue manager <*insert_3*> received an administration command for clusters. The user <*insert_5*> is not authorized to administer IBM WebSphere MQ clusters. The command server has not processed the command.

Response
Add the user to the local 'mqm' security group, and ensure that the security policy is set as required.

AMQ8083
IBM WebSphere MQ queue manager <*insert_3*> starting.

Severity
0 : Information

Explanation
IBM WebSphere MQ queue manager <*insert_3*> starting.

Response
None.

AMQ8084
IBM WebSphere MQ connection not found.

Severity
0 : Information

Explanation
The connection specified does not exist.

Response
Correct the connection name and then try the command again.

AMQ8085
IBM WebSphere MQ queue manager <*insert_3*> is being started for replay.

Severity
0 : Information

Explanation
IBM WebSphere MQ queue manager <*insert_3*> is being started for replay. The strmqm command has been issued with the '-r' option. see the IBM WebSphere MQ System Administration documentation for details.

Response
None.

AMQ8086
IBM WebSphere MQ queue manager <*insert_3*> is being activated.

Severity
0 : Information

Explanation
IBM WebSphere MQ queue manager <*insert_3*> is being activated. The strmqm command has been issued with the '-a' option. see the IBM WebSphere MQ System Administration documentation for details.

Response
None.

AMQ8086 (IBM i)
IBM WebSphere MQ queue manager <*insert_3*> is being activated.

Severity
0 : Information

Explanation
IBM WebSphere MQ queue manager <*insert_3*> is being activated. The STRMQM command has been issued with the ACTIVATE(*YES) option. see the IBM WebSphere MQ System Administration documentation for further details.

Response
None.

AMQ8087
Attempt to migrate listener <*insert_3*> to a QM object failed with <*insert_1*>.

Severity
20 : Error

Explanation
Whilst processing legacy services, listener <*insert_3*> could not be migrated to an MQ object named <*insert_4*>, the object creation failed with <*insert_1*>.

Response
Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ8088
Attempt to migrate trigger monitor <*insert_3*> to a QM object failed with <*insert_1*>.

Severity
20 : Error

Explanation
Whilst processing legacy services, trigger monitor <*insert_3*> could not be migrated to an MQ object named <*insert_4*>, the object creation failed with <*insert_1*>.

Response
Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ8089
Attempt to migrate channel service <*insert_3*> to a QM object failed with <*insert_1*>.

Severity
20 : Error

Explanation
Whilst processing legacy services, channel service <*insert_3*> could not be migrated to an MQ object named <*insert_4*>, the object creation failed with <*insert_1*>.

Response
Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ8090
Attempt to migrate channel initiator <*insert_3*> to a QM object failed with <*insert_1*>.

Severity
20 : Error

Explanation
Whilst processing legacy services, channel initiator <*insert_3*> could not be migrated to an MQ object named <*insert_4*>, the object creation failed with <*insert_1*>.

Response
Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ8091
Attempt to migrate custom service <*insert_3*> to a QM object failed with <*insert_1*>.

Severity
20 : Error

Explanation
Whilst processing legacy services, custom service <*insert_3*> could not be migrated to an MQ object named <*insert_4*>, the object creation failed with <*insert_1*>.

Response
Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ8092
Service migration statistics : <*insert_1*> migrated. <*insert_2*> failed.

Severity
0 : Information

Explanation
Information on the number of service objects migrated from previous versions of IBM WebSphere MQ for Windows services as well as any failures that occurred.

Response
None.

AMQ8093
IBM WebSphere MQ subscription changed.

Severity
0 : Information

Explanation
IBM WebSphere MQ subscription <*insert_3*> changed.

Response
None.

AMQ8094
IBM WebSphere MQ subscription created.

Severity
0 : Information

Explanation
IBM WebSphere MQ subscription <*insert_3*> created.

Response
None.

AMQ8095
IBM WebSphere MQ subscription deleted.

Severity
0 : Information

Explanation
IBM WebSphere MQ subscription <*insert_3*> deleted.

Response
None.

AMQ8096
IBM WebSphere MQ subscription inquired.

Severity
0 : Information

Explanation
IBM WebSphere MQ subscription <*insert_3*> inquired.

Response
None.

AMQ8097
Default object <*insert_3*>. Unable to change attribute <*insert_1*> to value <*insert_2*>.

Severity
20 : Error

Explanation
While migrating a queue manager to a newer release an attempt was made to change the value

of an attribute of one of the default objects. The attribute of the above named default object could not be changed. While modifying the integer attribute <*insert_1*> of the default object <*insert_3*> for IBM WebSphere MQ queue manager <*insert_4*> an unexpected error occurred.

Response
The most likely cause of this error is that object <*insert_3*> has been redefined to be an object of a conflicting type for which the attribute <*insert_1*> is not applicable. For example if a default queue which was originally a local queue is changed to be an alias queue then the queue manager could fail to set the attribute MQIA_MAX_MSG_LENGTH (13) as MAXMSGL is not an attribute supported by alias queues. Review the customer configuration to see if a corresponding change needs to be made to the customer defined replacement for the named default object.

AMQ8098
IBM WebSphere MQ subscription copied.

Severity
0 : Information

Explanation
IBM WebSphere MQ subscription <*insert_3*> copied.

Response
None.

AMQ8099
IBM WebSphere MQ subscription status inquired.

Severity
0 : Information

Explanation
IBM WebSphere MQ subscription status <*insert_3*> inquired.

Response
None.

AMQ8101
IBM WebSphere MQ error (<*insert_1*>) has occurred.

Severity
40 : Stop Error

Explanation
An unexpected reason code with hexadecimal value <*insert_1*> was received from the IBM WebSphere MQ queue manager during command processing. (Note that hexadecimal values in the range X'07D1'-X'0BB7' correspond to MQI reason codes 2001-2999.) More information might be available in the log. If the reason code value indicates that the error was associated with a particular parameter, the parameter concerned is <*insert_4*>.

Response
Correct the error and then try the command again.

AMQ8102
IBM WebSphere MQ object name specified in <*insert_4*> not valid.

Severity
30 : Severe error

Explanation
The object name <*insert_3*> specified in <*insert_4*> is not valid. The length of the name must not exceed 48 characters, or 20 characters if it is a channel name. The name should contain the following characters only: lowercase a-z, uppercase A-Z, numeric 0-9, period (.), forward slash (/), underscore (_) and percent sign (%).

Response
Change the length of the parameter value or change the parameter value to contain a valid combination of characters, then try the command again.

AMQ8103
Insufficient storage available.

Severity
40 : Stop Error

Explanation
There was insufficient storage available to perform the requested operation.

Response
Free some storage and then try the command again.

AMQ8104
IBM WebSphere MQ directory <*insert_3*> not found.

Severity
40 : Stop Error

Explanation
Directory <*insert_3*> was not found. This directory is created when IBM WebSphere MQ is installed successfully. Refer to the log for more information.

Response
Verify that installation of IBM WebSphere MQ was successful. Correct the error and then try the command again.

AMQ8105
Object error.

Severity
40 : Stop Error

Explanation
An object error occurred. Refer to the log for more information.

Response
Correct the error and then try the command again.

AMQ8106
IBM WebSphere MQ queue manager being created.

Severity
0 : Information

Explanation
The queue manager is being created.

Response
Wait for the creation process to complete and then try the command again.

AMQ8107
IBM WebSphere MQ queue manager running.

Severity
10 : Warning

Explanation
The queue manager is running.

Response
None.

AMQ8108
IBM WebSphere MQ queue manager <*insert_3*> ending.

Severity
10 : Warning

Explanation
The queue manager <*insert_3*> is ending.

Response
Wait for the queue manager to end and then try the command again.

AMQ8109
IBM WebSphere MQ queue manager being deleted.

Severity
0 : Information

Explanation
The queue manager is being deleted.

Response
Wait for the deletion process to complete.

AMQ8110
IBM WebSphere MQ queue manager already exists.

Severity
40 : Stop Error

Explanation
The queue manager <*insert_5*> already exists.

Response
None.

AMQ8112 (IBM i)
PRCNAME not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The PRCNAME parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the PRCNAME parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8113 (IBM i)
TRGENBL not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The TRGENBL parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the TRGENBL parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8114 (IBM i)
GETENBL not allowed with queue type *RMT.

Severity
40 : Stop Error

Explanation
The GETENBL parameter may not be specified for a queue of type *RMT.

Response
Remove the GETENBL parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8115 (IBM i)
SHARE not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The SHARE parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the SHARE parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8116 (IBM i)
MSGDLYSEQ not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The MSGDLYSEQ parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the MSGDLYSEQ parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8117
IBM WebSphere MQ queue manager deletion incomplete.

Severity
40 : Stop Error

Explanation
Deletion of queue manager <*insert_5*> was only partially successful. An object was not found, or could not be deleted. Refer to the log for more information.

Response
Delete any remaining queue manager objects.

AMQ8118
IBM WebSphere MQ queue manager does not exist.

Severity
40 : Stop Error

Explanation
The queue manager <*insert_5*> does not exist.

Response
Either create the queue manager (crtmqm command) or correct the queue manager name used in the command and then try the command again.

AMQ8119
Unsupported threading model detected.

Severity
20 : Error

Explanation
The command executed could not run because the current threading model does not contain the required level of functionality.

Response
On Linux this may be caused by using a threading model such as LinuxThreads which does not provide process-shared mutex support. On some systems, the setting of the environment variable LD_ASSUME_KERNEL causes LinuxThreads to be used instead of native kernel threads.

AMQ8119 (IBM i)
TRGTYPE not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The TRGTYPE parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the TRGTYPE parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8120 (IBM i)
TRGDEPTH not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The TRGDEPTH parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the TRGDEPTH parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8121 (IBM i)
TRGMSGPTY not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The TRGMSGPTY parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the TRGMSGPTY parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8122 (IBM i)
TRGDATA not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The TRGDATA parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the TRGDATA parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8123 (IBM i)
RTNITV not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The RTNITV parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the RTNITV parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8124 (IBM i)
MAXMSGLEN not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The MAXMSGLEN parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the MAXMSGLEN parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8125 (IBM i)
BKTTHLD not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The BKTTHLD parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the BKTTHLD parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8126 (IBM i)
BKTQNAME not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The BKTQNAME parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the BKTQNAME parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8127 (IBM i)
INITQNAME not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The INITQNAME parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the INITQNAME parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8128 (IBM i)
USAGE not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The USAGE parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the USAGE parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8129 (IBM i)
DFNTYPE only allowed with queue type *MDL.

Severity
40 : Stop Error

Explanation
The DFNTYPE parameter may only be specified for a queue of type *MDL.

Response
Remove the DFNTYPE parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8130 (IBM i)
TGTQNAME only allowed with queue type *ALS.

Severity
40 : Stop Error

Explanation
The TGTQNAME parameter may only be specified for a queue of type *ALS.

Response
Remove the TGTQNAME parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8131 (IBM i)
RMTQNAME only allowed with queue type *RMT.

Severity
40 : Stop Error

Explanation
The RMTQNAME parameter may only be specified for a queue of type *RMT.

Response
Remove the RMTQNAME parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8132 (IBM i)
RMTMQMNAME only allowed with queue type *RMT.

Severity
40 : Stop Error

Explanation
The RMTMQMNAME parameter may only be specified for a queue of type *RMT.

Response
Remove the RMTMQMNAME parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8133 (IBM i)
TMQNAME only allowed with queue type *RMT.

Severity
40 : Stop Error

Explanation
The TMQNAME parameter may only be specified for a queue of type *RMT.

Response
Remove the TMQNAME parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8134 (IBM i)
HDNBKTCNT not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The HDNBKTCNT parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the HDNBKTCNT parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8135
Not authorized.

Severity
40 : Stop Error

Explanation
You are not authorized to perform the requested operation for the IBM WebSphere MQ object. Either you are not authorized to perform the requested operation, or you are not authorized to the specified MQ object. For a copy command, you may not be authorized to the specified source MQ object, or, for a create command, you may not be authorized to the system default MQ object of the specified type. If creating or altering a subscription it may also indicate that the subscribing user does not exist or have the required authority to the destination queue.

Response
Obtain the necessary authority from your security officer or IBM WebSphere MQ administrator. Then try the command again. If you are running amqmdain on the Windows platform, the user MUSR_MQADMIN may not be authorized.

AMQ8136 (IBM i)
Error detected by prompt control program.

Severity
30 : Severe error

Explanation
A prompt control program detected errors.

Response
See the previously listed messages in the job log. Correct the errors and then prompt for the command again.

AMQ8137
IBM WebSphere MQ queue manager already starting.

Severity
40 : Stop Error

Explanation
The strmqm command was unsuccessful because the queue manager <*insert_5*> is already starting.

Response
Wait for the strmqm command to complete.

AMQ8138
The IBM WebSphere MQ queue has an incorrect type.

Severity
40 : Stop Error

Explanation
The operation is not valid with queue <*insert_5*> because it is not a local queue.

Response
Change the QNAME parameter to specify a queue of the correct type.

AMQ8139
Already connected.

Severity
20 : Error

Explanation
A connection to the IBM WebSphere MQ queue manager already exists.

Response
None.

AMQ8140
Resource timeout error.

Severity
40 : Stop Error

Explanation
A timeout occurred in the communication between internal WebSphere MQ queue manager components. This is most likely to occur when the system is heavily loaded.

Response
Wait until the system is less heavily loaded, then try the command again.

AMQ8141
IBM WebSphere MQ queue manager starting.

Severity
40 : Stop Error

Explanation
The queue manager <*insert_5*> is starting.

Response
Wait for the queue manager startup process to complete and then try the command again.

AMQ8142
IBM WebSphere MQ queue manager stopped.

Severity
40 : Stop Error

Explanation
The queue manager <*insert_5*> is stopped.

Response
Use the strmqm command to start the queue manager, and then try the command again.

AMQ8143
IBM WebSphere MQ queue not empty.

Severity
40 : Stop Error

Explanation
The queue <*insert_5*> specified in <*insert_2*> is not empty or contains uncommitted updates.

Response
Commit or roll back any uncommitted updates. If the command is DELETE QLOCAL, use the CLEAR QLOCAL command to clear the messages from the queue. Then try the command again.

AMQ8144
Log not available.

Severity
40 : Stop Error

Explanation
The IBM WebSphere MQ logging resource is not available.

Response
Use the dltmqm command to delete the queue manager and then the crtmqm command to create the queue manager. Then try the command again.

AMQ8145
Connection broken.

Severity
40 : Stop Error

Explanation
The connection to the IBM WebSphere MQ queue manager failed during command processing. This may be caused by an endmqm command being issued by another user, or by a queue manager error.

Response
Use the strmqm command to start the message queue manager, wait until the message queue manager has started, and try the command again.

AMQ8146
IBM WebSphere MQ queue manager not available.

Severity
40 : Stop Error

Explanation
The queue manager is not available because it has been stopped or has not been created.

Response
Use the crtmqm command to create the message queue manager, or the strmqm command to start the message queue manager as necessary. Then try the command again.

AMQ8146 (IBM i)
IBM WebSphere MQ queue manager not available.

Severity
40 : Stop Error

Explanation
The queue manager is not available because it has been stopped or has not been created.

Response

Use the CRTMQM command to create the message queue manager or the STRMQM command to start the message queue manager as necessary, then retry the command. If a queue manager was not specified, ensure that a default queue manager has been created and is started using the WRKMQM command.

AMQ8147

IBM WebSphere MQ object <*insert_3*> not found.

Severity

40 : Stop Error

Explanation

If the command entered was Change or Display, the object <*insert_3*> specified does not exist. If the command entered was Copy, the source object does not exist. If the command entered was Create, the system default MQ object of the specified type does not exist.

Response

Correct the object name and then try the command again or, if you are creating a new queue or process object, either specify all parameters explicitly or ensure that the system default object of the required type exists. The system default queue names are SYSTEM.DEFAULT.LOCAL.QUEUE, SYSTEM.DEFAULT.ALIAS.QUEUE and SYSTEM.DEFAULT.REMOTE.QUEUE. The system default process name is SYSTEM.DEFAULT.PROCESS.

AMQ8147 (IBM i)

IBM WebSphere MQ object <*insert_3*> not found.

Severity

40 : Stop Error

Explanation

If the command entered was Change, Delete or Display, the MQ object <*insert_3*> specified does not exist. If the command entered was Copy, the source MQ object does not exist. If the command entered was Create, the system default MQ object of the specified type does not exist.

Response

Correct the MQ object name and then try the command again or, if you are creating a new MQ object, either specify all parameters explicitly or ensure that the system default object of the required type exists.

AMQ8148

IBM WebSphere MQ object in use.

Severity

40 : Stop Error

Explanation

The object <*insert_3*> is in use by an MQ application program.

Response

Wait until the object is no longer in use and then try the command again. If the command is ALTER or CHANGE, specify FORCE to force the processing of the object regardless of any application program affected by the change. If the object is the dead-letter queue and the open input count is nonzero, it may be in use by an MQ channel. If the object is another queue object with a nonzero open output count, it may be in use by a MQ channel (of type RCVR or RQSTR). In either case, use the STOP CHANNEL and START CHANNEL commands to stop and restart the channel in order to solve the problem. To alter the queue USAGE the FORCE option must be used if the queue is not empty.

AMQ8149

IBM WebSphere MQ object damaged.

Severity
40 : Stop Error

Explanation
The object <*insert_3*> specified in <*insert_4*> is damaged.

Response
The object contents are not valid. Issue the DISPLAY CHANNEL, DISPLAY QUEUE, or DISPLAY PROCESS command, as required, to determine the name of the damaged object. Issue the DEFINE command, for the appropriate object type, to replace the damaged object, then try the command again.

AMQ8150
IBM WebSphere MQ object already exists.

Severity
40 : Stop Error

Explanation
The object <*insert_3*> specified on the <*insert_5*> command could not be created because it already exists.

Response
Check that the name is correct and try the command again specifying REPLACE, or delete the object. Then try the command again.

AMQ8151
IBM WebSphere MQ object has different type.

Severity
40 : Stop Error

Explanation
The type specified for object <*insert_3*> is different from the type of the object being altered or defined.

Response
Use the correct MQ command for the object type, and then try the command again.

AMQ8152
Source IBM WebSphere MQ object has different type.

Severity
40 : Stop Error

Explanation
The type of the source object is different from that specified.

Response
Correct the name of the command, or source object name, and then try the command again, or try the command using the REPLACE option.

AMQ8153
Insufficient disk space for the specified queue.

Severity
40 : Stop Error

Explanation
The command failed because there was insufficient disk space available for the specified queue.

Response
Release some disk space and then try the command again.

AMQ8154
API exit load error.

Severity
40 : Stop Error

Explanation
The IBM WebSphere MQ queue manager was unable to load the API crossing exit.

Response
Ensure that the API crossing exit program is valid, and that its name and directory are correctly specified. Correct any error and then try the command again.

AMQ8155
Connection limit exceeded.

Severity
40 : Stop Error

Explanation
The queue manager connection limit has been exceeded.

Response
The maximum limit on the number of IBM WebSphere MQ application programs that may be connected to the queue manager has been exceeded. Try the command later.

AMQ8156
IBM WebSphere MQ queue manager quiescing.

Severity
40 : Stop Error

Explanation
The queue manager is quiescing.

Response
The queue manager was stopping with -c specified for endmqm. Wait until the queue manager has been restarted and then try the command again.

AMQ8157
Security error.

Severity
40 : Stop Error

Explanation
An error was reported by the security manager program.

Response
Inform your systems administrator, wait until the problem has been corrected, and then try the command again.

AMQ8158 (IBM i)
API exit not found.

Severity
40 : Stop Error

Explanation
The API crossing exit program was not found.

Response
Ensure that the API crossing exit program for the MQI exists, and that its name and library are correctly specified. Correct any errors and then try the command again.

AMQ8159 (IBM i)
MAXDEPTH not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The MAXDEPTH parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the MAXDEPTH parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8160 (IBM i)
DFTSHARE not allowed with queue type *ALS or *RMT.

Severity
40 : Stop Error

Explanation
The DFTSHARE parameter may not be specified for a queue of type *ALS or *RMT.

Response
Remove the DFTSHARE parameter from the command or, if the command is CRTMQMQ, specify a different value for QTYPE. Then try the command again.

AMQ8161 (IBM i)
AUT(*MQMPASSID) only allowed with OBJTYPE(*ADM).

Severity
40 : Stop Error

Explanation
AUT(*MQMPASSID) may only be specified with OBJTYPE(*ADM).

Response
Change the AUT parameter to specify another value and then try the command again.

AMQ8162 (IBM i)
AUT(*MQMPASSALL) only allowed with OBJTYPE(*ADM).

Severity
40 : Stop Error

Explanation
AUT(*MQMPASSALL) may only be specified with OBJTYPE(*ADM).

Response
Change the AUT parameter to specify another value and then try the command again.

AMQ8163 (IBM i)
AUT(*MQMSETID) only allowed with OBJTYPE(*ADM).

Severity
40 : Stop Error

Explanation
AUT(*MQMSETID) may only be specified with OBJTYPE(*ADM).

Response
Change the AUT parameter to specify another value and then try the command again.

AMQ8164 (IBM i)
AUT(*MQMSETALL) only allowed with OBJTYPE(*ADM).

Severity
40 : Stop Error

Explanation
AUT(*MQMSETALL) may only be specified with OBJTYPE(*ADM).

Response
Change the AUT parameter to specify another value and then try the command again.

AMQ8165 (IBM i)
AUT(*MQMALTUSR) only allowed with OBJTYPE(*ADM).

Severity
40 : Stop Error

Explanation
AUT(*MQMALTUSR) may only be specified with OBJTYPE(*ADM).

Response
Change the AUT parameter to specify another value and then try the command again.

AMQ8166 (IBM i)
IBM WebSphere MQ reference object not found.

Severity
40 : Stop Error

Explanation
The object specified by the REFOBJ and REFOBJTYPE parameters does not exist.

Response
Correct the reference object name and type, and then try the command again.

AMQ8167 (IBM i)
Referenced object name not valid.

Severity
30 : Severe error

Explanation
The referenced object name specified in REFOBJ is not valid. The length of the name must not exceed 48 characters and the name should contain the following characters only: lowercase a-z, uppercase A-Z, numeric 0-9, period (.), forward slash (/), underscore (_) and percent sign (%).

Response
Change the length of the parameter value or change the parameter value to contain a valid combination of characters. Then try the command again.

AMQ8168 (IBM i)
User profile name for parameter USER not found.

Severity
30 : Severe error

Explanation
The user profile name specified for parameter USER could not be found on the system, and is not the special value *PUBLIC.

Response
Correct the user profile name, or use the Create User Profile (CRTUSRPRF) command to create the user profile then try the request again.

AMQ8169 (IBM i)
Authorization list for parameter AUTL does not exist.

Severity
30 : Severe error

Explanation
The authorization list specified for parameter AUTL does not exist. It may have been destroyed.

Response
Either specify an authorization list that exists, or create the authorization list using the Create Authorization List (CRTAUTL) command. Try the request again.

AMQ8170 (IBM i)
REFOBJTYPE(*OBJTYPE) and OBJTYPE(*ALL) cannot be used together.

Severity
30 : Severe error

Explanation
REFOBJTYPE(*OBJTYPE) can be specified only with a specific object type.

Response
Change the REFOBJTYPE or OBJTYPE input value to a specific object type. Then try the Grant Authority (GRTMQMAUT) command again.

AMQ8171 (IBM i)
Authority of *AUTL is only allowed with USER(*PUBLIC).

Severity
30 : Severe error

Explanation
AUT(*AUTL) was specified on either the Grant Authority (GRTMQMAUT) command or the Revoke Authority (RVKMQMAUT) command with the USER parameter not set to *PUBLIC. Only the authority for *PUBLIC can be deferred to the authorization list.

Response
Change the AUT parameter to the authorities that are correct for the users or change the USER parameter to *PUBLIC. Then try the command again.

AMQ8172
Already disconnected.

Severity
10 : Warning

Explanation
The MQI reason code of 2018 was returned from the IBM WebSphere MQ queue manager in response to an MQDISC request issued during command processing.

Response
None.

AMQ8173
No processes to display.

Severity
0 : Information

Explanation
There are no matching processes defined on this system.

Response
Using the DEFINE PROCESS command to create a process.

AMQ8174
No queues to display.

Severity
0 : Information

Explanation
There are no matching queues defined on this system.

Response
Use the appropriate command to define a queue of the type that you require, that is, DEFINE QALIAS, DEFINE QLOCAL, DEFINE QMODEL, or DEFINE QREMOTE.

AMQ8175 (IBM i)
IBM WebSphere MQ trace has started.

Severity
0 : Information

Explanation
The trace has started successfully.

Response
None.

AMQ8176 (IBM i)
IBM WebSphere MQ trace has been written.

Severity
0 : Information

Explanation
The trace has been written successfully.

Response
None.

AMQ8177 (IBM i)
IBM WebSphere MQ trace has stopped.

Severity
0 : Information

Explanation
The trace has stopped.

Response
None.

AMQ8178 (IBM i)
IBM WebSphere MQ trace did not start.

Severity
40 : Stop Error

Explanation
The trace did not start successfully.

Response
None.

AMQ8179 (IBM i)
IBM WebSphere MQ trace output error.

Severity
40 : Stop Error

Explanation
The trace was not output successfully.

Response
None.

AMQ8180 (IBM i)
IBM WebSphere MQ trace end request failed.

Severity
40 : Stop Error

Explanation
Your request to end the trace was not successful.

Response
None.

AMQ8181 (IBM i)
No jobs to display.

Severity
10 : Warning

Explanation
There are no matching jobs running on this system.

Response
Specify another job name from the STRMQMSRV command.

AMQ8182 (IBM i)
IBM WebSphere MQ trace already off.

Severity
10 : Warning

Explanation
An attempt was made to set trace off, but the trace is not active.

Response
None.

AMQ8183 (IBM i)
IBM WebSphere MQ trace already running.

Severity
10 : Warning

Explanation
An attempt was made to start trace, but trace is already running.

Response
Either leave trace running as it is, or, if you want to change the trace settings, turn trace off and then turn it on again with appropriate settings.

AMQ8184 (IBM i)
Requested job cannot be found

Severity
10 : Warning

Explanation
The job specified cannot be found in the table that controls IBM WebSphere MQ for IBM i trace. As a result no trace action can be performed.

Response
Specify an appropriate job name.

AMQ8185
Operating system object already exists.

Severity
40 : Stop Error

Explanation
The IBM WebSphere MQ object cannot be created because an object that is not known to MQ already exists in the MQ directory with the name that should be used for the new object. Refer to the log for previous messages.

Response
Remove the non-MQ object from the MQ library, and try the command again.

AMQ8186
Image not available for IBM WebSphere MQ object <*insert_5*>.

Severity
40 : Stop Error

Explanation
The object <*insert_5*> type <*insert_3*> cannot be re-created because the image is not fully available in the logs that are currently online. Refer to earlier messages in the error log for information about the logs that need to be brought online for this object to be re-created.

Response
Bring the relevant logs online, and try the command again.

AMQ8187
IBM WebSphere MQ object <*insert_5*> is currently open.

Severity
40 : Stop Error

Explanation
The object <*insert_5*>, type <*insert_3*>, is currently in use, so the <*insert_1*> command cannot be issued against it. If a generic list was presented to the command, the command is still issued against the other objects in the list.

Response
Wait until the object is no longer in use, and try the command again.

AMQ8188
Insufficient authorization to IBM WebSphere MQ object <*insert_5*>.

Severity
40 : Stop Error

Explanation
You are not authorized to issue the <*insert_1*> command against the object <*insert_5*> type <*insert_3*>. If a generic list was presented to the command, the command is still issued against the other objects in the list.

Response
Obtain sufficient authorization for the object, and retry the command.

AMQ8189 (IBM i)
IBM WebSphere MQ object <*insert_3*> is damaged.

Severity
40 : Stop Error

Explanation
The object <*insert_3*> type <*insert_4*> is damaged and the <*insert_5*> command cannot be issued against it. If a generic list was presented to the command then the command is still issued against the other objects in the list.

Response
Issue the appropriate DEFINE command for the object, specifying REPLACE, and then try the command again.

AMQ8190
<*insert_3*> succeeded on <*insert_1*> objects and failed on <*insert_2*> objects.

Severity
40 : Stop Error

Explanation
An operation performed on a generic list of objects was not completely successful.

Response
Examine the log for details of the errors encountered, and take appropriate action.

AMQ8191
IBM WebSphere MQ command server is starting.

Severity
40 : Stop Error

Explanation
The command server is starting.

Response
Wait for the strmqcsv command to complete and then try the operation again.

AMQ8191 (IBM i)
IBM WebSphere MQ command server is starting.

Severity
40 : Stop Error

Explanation
The command server is starting.

Response
Wait for the STRMQMCSVR command to complete and then try the operation again.

AMQ8192
IBM WebSphere MQ command server already starting.

Severity
40 : Stop Error

Explanation
The request to start the command server was unsuccessful because the command server is already starting.

Response
Wait for the strmqcsv command to complete.

AMQ8192 (IBM i)
IBM WebSphere MQ command server already starting.

Severity
40 : Stop Error

Explanation
The request to start the command server was unsuccessful because the command server is already starting.

Response
Wait for the STRMQMCSVR command to complete.

AMQ8193
IBM WebSphere MQ command server is ending.

Severity
40 : Stop Error

Explanation
The command server is ending.

Response
Wait for the endmqcsv command to complete and then try the command again.

AMQ8193 (IBM i)
IBM WebSphere MQ command server is ending.

Severity
40 : Stop Error

Explanation
The command server is ending.

Response
Wait for the ENDMQMCSVR command to complete and then try the command again.

AMQ8194
IBM WebSphere MQ command server already ending.

Severity
40 : Stop Error

Explanation
The end command server request was unsuccessful because the command server is already ending.

Response
Wait for the endmqcsv command to complete.

AMQ8194 (IBM i)
IBM WebSphere MQ command server already ending.

Severity
40 : Stop Error

Explanation
The end command server request was unsuccessful because the command server is already ending.

Response
Wait for the ENDMQMCSVR command to complete.

AMQ8195
IBM WebSphere MQ command server already running.

Severity
40 : Stop Error

Explanation
The strmqcsv command was unsuccessful because the command server is already running.

Response
None.

AMQ8195 (IBM i)
IBM WebSphere MQ command server already running.

Severity
40 : Stop Error

Explanation
The STRMQMCSVR command was unsuccessful because the command server is already running.

Response
None.

AMQ8196
IBM WebSphere MQ command server already stopped.

Severity
40 : Stop Error

Explanation
The request to end the command server was unsuccessful because the command server is already stopped.

Response
None.

AMQ8197
Deleted IBM WebSphere MQ queue damaged.

Severity
20 : Error

Explanation
The deleted MQ queue <*insert_3*> was damaged, and any messages it contained have been lost.

Response
None.

AMQ8198 (IBM i)
Program <*insert_3*> called with incorrect number of parameters.

Severity
20 : Error

Explanation
The number of parameters passed in the call to program <*insert_3*> is not correct.

Response
Correct the calling program and then retry the operation.

AMQ8199 (IBM i)
Error in call identifier parameter passed to program QMQM.

Severity
20 : Error

Explanation
The call identifier, the first parameter passed to program QMQM, is not in the required packed decimal format, or its value is not supported. Permitted values of the call identifier are contained in the RPG copy file CMQR.

Response
Correct the calling program, and retry the call.

AMQ8200 (IBM i)
MODENAME only allowed with TRPTYPE(*LU62).

Severity
40 : Stop Error

Explanation
The MODENAME parameter may only be specified with TRPTYPE(*LU62).

Response
Remove the MODENAME parameter from the command or change the TRPTYPE parameter value to specify *LU62 and then try the command again.

AMQ8201 (IBM i)
TPGMNAME only allowed with TRPTYPE(*LU62).

Severity
40 : Stop Error

Explanation
The TPGMNAME parameter may only be specified with TRPTYPE(*LU62).

Response
Remove the TPGMNAME parameter from the command or change the TRPTYPE parameter value to specify *LU62. Then try the command again.

AMQ8202
TMQNAME only allowed with channel type *SDR or *SVR.

Severity
40 : Stop Error

Explanation
The TMQNAME parameter may only be specified with channel type *SDR or *SVR.

Response
Remove the TMQNAME parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *SDR or *SVR. Then try the command again.

AMQ8203 (IBM i)
CONNAME only allowed with channel type *SDR, *SVR, *RQSTR, *CLUSSDR, *CLTCN and *CLUSRCVR

Severity
40 : Stop Error

Explanation
The CONNAME parameter may only be specified with channel type *SDR, *SVR, *RQSTR, *CLUSSDR, *CLTCN or *CLUSRCVR.

Response
Remove the CONNAME parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *SDR, *SVR, *RQSTR, *CLUSSDR, *CLTCN or *CLUSRCVR. Then try the command again.

AMQ8204
MCANAME only allowed with channel type *SDR, *SVR, *RQSTR, *CLUSSDR or *CLUSRCVR

Severity
40 : Stop Error

Explanation
The MCANAME parameter may only be specified with channel type *SDR, *SVR, *RQSTR, *CLUSSDR or *CLUSRCVR.

Response

Remove the MCANAME parameter from the command, or if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *SDR, *SVR, *RQSTR, *CLUSSDR or *CLUSRCVR. Then try the command again.

AMQ8205

DSCITV only allowed with channel type *CLUSSDR, *CLUSRCVR, *SDR or *SVR.

Severity

40 : Stop Error

Explanation

The DSCITV parameter may only be specified with channel type *CLUSSDR, *CLUSRCVR, *SDR or *SVR.

Response

Remove the DSCITV parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *CLUSSDR, *CLUSRCVR, *SDR or *SVR. Then try the command again.

AMQ8206

SHORTRTY only allowed with channel type *CLUSSDR, CLUSRCVR, *SDR or *SVR.

Severity

40 : Stop Error

Explanation

The SHORTRTY parameter may only be specified with channel type *CLUSSDR, *CLUSRCVR, *SDR or *SVR.

Response

Remove the SHORTRTY parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *CLUSSDR, *CLUSRCVR, *SDR or *SVR. Then try the command again.

AMQ8207

SHORTTMR only allowed with channel type *CLUSSDR, CLUSRCVR, *SDR or *SVR.

Severity

40 : Stop Error

Explanation

The SHORTTMR parameter may only be specified with channel type *CLUSSDR, *CLUSRCVR, *SDR or *SVR.

Response

Remove the SHORTTMR parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *CLUSSDR, CLUSRCVR, *SDR or *SVR. Then try the command again.

AMQ8208

LONGRTY only allowed with channel type *CLUSSDR, *CLUSRCVR, *SDR or *SVR.

Severity

40 : Stop Error

Explanation

The LONGRTY parameter may only be specified with channel type *CLUSSDR, *CLUSRCVR, *SDR or *SVR.

Response

Remove the LONGRTY parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *CLUSSDR, CLUSRCVR, *SDR or *SVR. Then try the command again.

AMQ8209
LONGTMR only allowed with channel type *CLUSSDR, *CLUSRCVR, *SDR or *SVR.

Severity
40 : Stop Error

Explanation
The LONGTMR parameter may only be specified with channel type *CLUSSDR, *CLUSRCVR, *SDR or *SVR.

Response
Remove the LONGTMR parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *CLUSSDR, *CLUSRCVR, *SDR or *SVR. Then try the command again.

AMQ8210
PUTAUT only allowed with channel type *RCVR, *RQSTR or *CLUSRCVR

Severity
40 : Stop Error

Explanation
The PUTAUT parameter may only be specified with channel type *RCVR, *RQSTR or *CLUSRCVR.

Response
Remove the PUTAUT parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *RCVR, *RQSTR or *CLUSRCVR. Then try the command again.

AMQ8211
BATCHINT only allowed with channel type *SDR or *SVR.

Severity
40 : Stop Error

Explanation
The BATCHINT parameter may only be specified with channel type *SDR or *SVR.

Response
Remove the BATCHINT parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *SDR or *SVR. Then try the command again.

AMQ8212 (IBM i)
TPGMNAME parameter required with TRPTYPE(*LU62).

Severity
40 : Stop Error

Explanation
A required parameter was not specified.

Response
Enter a value for parameter TPGMNAME.

AMQ8213 (IBM i)
TMQNAME parameter required with channel type *SDR or *SVR.

Severity
40 : Stop Error

Explanation
The TMQNAME parameter must be specified with channel type *SDR or *SVR.

Response
Enter a value for parameter TMQNAME.

AMQ8214
CONNAME parameter missing.

Severity
40 : Stop Error

Explanation
The CONNAME parameter must be specified with channel types SDR, RQSTR, CLNTCONN, and CLUSSDR. It is also required with channel type CLUSRCVR if the TRPTYPE is not TCP.

Response
Enter a value for parameter CONNAME.

AMQ8214 (IBM i)
CONNAME parameter missing.

Severity
40 : Stop Error

Explanation
The CONNAME parameter must be specified with channel types *SDR, *RQSTR, *CLTCN and *CLUSSDR. It is also required with channel type *CLUSRCVR if the TRPTYPE is not *TCP.

Response
Enter a value for parameter CONNAME.

AMQ8215 (IBM i)
CVTMSG only allowed with channel type *SDR, *SVR, *CLUSSDR or *CLUSRCVR.

Severity
40 : Stop Error

Explanation
The CVTMSG parameter may only be specified with channel type *SDR, *SVR, *CLUSSDR or *CLUSRCVR.

Response
Remove the CVTMSG parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *SDR, *SVR, *CLUSSDR or CLUSRCVR. Then try the command again.

AMQ8216 (IBM i)
MODENAME only allowed with TRPTYPE(*LU62).

Severity
40 : Stop Error

Explanation
The MODENAME parameter may only be specified with TRPTYPE(*LU62).

Response
Remove the MODENAME parameter from the command or change the TRPTYPE parameter value to specify *LU62. Then try the command again.

AMQ8217 (IBM i)
CONNAME only allowed with channel type *SDR, *SVR, *RQSTR, *CLUSSDR or CLUSRCVR.

Severity
40 : Stop Error

Explanation
The CONNAME parameter may only be specified with channel type *SDR, *SVR, *RQSTR, CLUSSDR or CLUSRCVR.

Response
Remove the CONNAME parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *SDR, *SVR, *RQSTR, CLUSSDR or CLUSRCVR. Then try the command again.

AMQ8218
The system cannot accept the combination of parameters entered.

Severity
30 : Severe error

AMQ8219
Command server queue is open, retry later.

Severity
30 : Severe error

Response
Wait and try again later.

AMQ8220 (IBM i)
The PNGMQMCHL command has completed.

Severity
0 : Information

Explanation
The PNGMQMCHL command sent <*insert_1*> bytes of data to <*insert_3*> and received the data back in <*insert_4*>.<*insert_5*> seconds. The number of bytes will be less than the amount requested on the command, when the length requested is greater than the allowed maximum, in one communications transmission, for the operating system and communications protocol.

Response
None.

AMQ8221 (IBM i)
Ping data length truncated, specified length <*insert_1*>, actual length <*insert_2*>.

Severity
10 : Warning

Explanation
The length of the ping data sent was reduced because of constraints in the current configuration.

Response
None.

AMQ8222 (IBM i)
The data sent and received by the PNGMQMCHL command was not identical.

Severity
40 : Stop Error

Explanation
Ping data compare failed at offset <*insert_1*>, data sent <*insert_3*>, data received <*insert_4*>.

Response
This is probably due to a communications failure. Other messages may have been issued.

AMQ8223 (IBM i)
No channels to display.

Severity
0 : Information

Explanation
There are no channels defined on this system.

Response
Create a channel using the CRTMQMCHL command.

AMQ8224 (IBM i)
From channel <*insert_3*> not found.

Severity
30 : Severe error

Explanation
The source IBM WebSphere MQ channel does not exist.

Response
Correct the MQ channel name and then try the command again.

AMQ8225 (IBM i)
From channel and to channel names are equal.

Severity
30 : Severe error

Explanation
The same name has been specified for the from channel name and the to channel name.

Response
Choose two different names, of which the from channel must exist.

AMQ8226
IBM WebSphere MQ channel already exists.

Severity
40 : Stop Error

Explanation
The channel <*insert_3*> cannot be created because it already exists.

Response
Check that the name is correct and try the command again specifying REPLACE, or delete the channel and then try the command again.

AMQ8227
Channel <*insert_3*> not found.

Severity
30 : Severe error

Explanation
The channel could not be found.

Response
Correct the Channel Name if wrong and then try the command again. For DEFINE CHANNEL check that the Channel Name in error exists.

AMQ8229 (IBM i)
No message queue managers to display.

Severity
0 : Information

Explanation
There are no message queue managers to administer.

Response
Add a queue manager using PF6 or the ADMQMNAM command.

AMQ8230 (IBM i)
No queue manager objects to display.

Severity
0 : Information

Explanation
Either the queue manager has no objects to display (this is unlikely), or the selection criteria resulted in zero objects to display.

Response
Change or remove the selection criteria.

AMQ8231 (IBM i)
No responses to display.

Severity
0 : Information

Explanation
There are no commands or command responses to display.

Response
None.

AMQ8232 (IBM i)
No messages to display.

Severity
0 : Information

Explanation
The queue is empty, or the queue does not exist.

Response
None.

AMQ8233 (IBM i)
No message data to display.

Severity
0 : Information

Explanation
The message contains no data.

Response
None.

AMQ8234 (IBM i)
No response data to display.

Severity
0 : Information

Explanation
There is no response data to display for this command. This is probably because the command has not yet completed.

Response
None.

AMQ8235 (IBM i)
No command parameters to display.

Severity
0 : Information

Explanation
Some commands have no required parameters.

Response
None.

AMQ8236 (IBM i)
Channel <*insert_3*> not found.

Severity
30 : Severe error

Explanation
CHGMQMCHL was issued for a non-existent channel.

Response
Correct the IBM WebSphere MQ channel name and then try the command again.

AMQ8237 (IBM i)
NPMSPEED only allowed with channel type *SDR, *SVR, *RCVR *RQSTR, CLUSSDR or CLUSRCVR.

Severity
40 : Stop Error

Explanation
The NPMSPEED parameter may only be specified with channel type *SDR, *SVR, *RCVR *RQSTR, CLUSSDR or CLUSRCVR.

Response
Remove the NPMSPEED parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *SDR, *SVR, *RCVR *RQSTR, CLUSSDR or CLUSRCVR. Then try the command again.

AMQ8238 (IBM i)
Queue manager connection already open.

Severity
30 : Severe error

Explanation
An MQCONN call was issued, but the thread or process is already connected to a different queue manager. The thread or process can connect to only one queue manager at a time.

Response
Use the MQDISC call to disconnect from the queue manager which is already connected, and then issue the MQCONN call to connect to the new queue manager. Disconnecting from the existing queue manager will close any queues which are currently open, it is recommended that any uncommitted units of work should be committed or backed out before the MQDISC call is used.

AMQ8239 (IBM i)
LOCLADDR not valid for channel type *RCVR or *SVRCN.

Severity
40 : Stop Error

Explanation
The LOCLADDR parameter may only be specified with channel type *SDR, *SVR, *RQSTR, *CLUSSDR, *CLUSRCVR or *CLTCN.

Response
Remove the CONNAME parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *SDR, *SVR, *RQSTR, *CLUSSDR, *CLUSRCVR or *CLTCN. Then try the command again.

AMQ8240 (IBM i)
Unexpected error <*insert_1*> in <*insert_3*>.

Severity
40 : Stop Error

Explanation
The unexpected return code <*insert_1*> was returned during <*insert_3*> processing.

Response
This message is associated with an internal error. Use WRKPRB to record the problem identifier, and to save the QPSRVDMP, QPJOBLOG, and QPDSPJOB files. Use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8241 (IBM i)
Unexpected message format <*insert_3*> received.

Severity
40 : Stop Error

Explanation
The unexpected message format <*insert_3*> was received in message on the internal reply queue.

Response
This message is probably a message sent erroneously to this queue. The message in error is written to the SYSTEM.ADMIN.EXCEPTION.QUEUE, where it may be viewed using the WRKMQMMSG command.

AMQ8242
SSLCIPH definition wrong.

Severity
40 : Stop Error

Explanation
The definition of the SSLCIPH parameter was wrong.

Response
Correct the SSLCIPH definition and try the command again.

AMQ8243
SSLPEER definition wrong.

Severity
40 : Stop Error

Explanation
The definition of the SSLPEER parameter was wrong. Possible causes may be that the syntax was invalid or that it contained an invalid attribute type.

Response
Correct the SSLPEER definition and try the command again.

AMQ8266 (IBM i)
No objects to display.

Severity
0 : Information

Explanation
There are no objects with the specified name and type.

Response
None.

AMQ8276
Display Connection details.

Severity
0 : Information

Explanation
The DISPLAY CONN command completed successfully. Details follow this message.

AMQ8278 (IBM i)
Maximum handle limit reached.

Severity
40 : Stop Error

Explanation
An attempt was made to exceed the maximum handle limit specified for the message queue manager.

Response
Increase the maximum handle limit specified for the message queue manager using the CHGMQM command. Then try the command again.

AMQ8280 (IBM i)
Queue does not exist.

Severity
30 : Severe error

Explanation
The queue being displayed does not exist on this queue manager.

Response
Check the name of the queue and retry the operation. If you are attempting to display a queue of type *ALS, check the queue definition references an existing queue definition.

AMQ8282 (IBM i)
Queue manager <*insert_3*> is not defined on the connected queue manager.

Severity
30 : Severe error

Explanation
Either the necessary queue manager name has been entered incorrectly on the add queue manager panel, or the queue manager has not been defined on the connected queue manager.

Response
Correct the name, or define <*insert_3*> on the connected queue manager by creating a local queue with name <*insert_3*> and usage *TMQ (transmission queue), and then creating sender and receiver channels on both the connected queue manager and queue manager <*insert_3*>.

AMQ8284 (IBM i)
This user is not authorized to queue <*insert_3*>.

Severity
40 : Stop Error

Explanation
Queue <*insert_3*> (queue manager <*insert_4*>) has not been authorized for your use.

Response
Have queue <*insert_3*> authorized for your use. If queue manager <*insert_4*> is not the local queue manager, you might not be authorized to the transmission queue for this queue manager.

AMQ8287
No channels with status to display.

Severity
0 : Information

Explanation
There are no channels having status information to display. This indicates either, that the channel has not been started previously, or, that the channel has been started but has not yet completed a transmission sequence.

Response
None.

AMQ8288 (IBM i)
Not authorized to command <*insert_1*>

Severity
40 : Stop Error

Explanation
You are not authorized to perform the requested operation for IBM WebSphere MQ command <*insert_1*>.

Response
Obtain the necessary authority from your IBM WebSphere MQ administrator. Then try the command again.

AMQ8289 (IBM i)
You are not authorized to the IBM WebSphere MQ command.

Severity
40 : Stop Error

Explanation
You are not authorized to the IBM WebSphere MQ command because your user profile is not a member of the QMQMADM group.

Response
Ask your MQ administrator to give your user profile *ALLOBJ authority, or add your user profile to the QMQMADM group (either as a primary or supplemental group)

AMQ8291 (IBM i)
IBM WebSphere MQ remote trace already running.

Severity
10 : Warning

Explanation
An attempt was made to start remote trace, but it is already running.

Response
Either leave remote trace running as it is, or, if you want to change the settings, turn remote trace off and then turn it on again with appropriate settings.

AMQ8294 (IBM i)
IBM WebSphere MQ remote trace already off.

Severity
10 : Warning

Explanation
An attempt was made to end remote trace, but it is already off.

Response
Leave remote trace off.

AMQ8295 (IBM i)
IBM WebSphere MQ object not secured by authorization list.

Severity
40 : Stop Error

Explanation
The specified object is not secured by the authorization list to be revoked from it.

Response
Use the display authority (DSPMQMAUT) command to determine what authorization list is securing the object, if any. Issue the RVKMQMAUT command again with the authorization list that is securing the the object to revoke the authorization list's authority.

AMQ8296
<*insert_1*> MQSC commands completed successfully.

Severity
0 : Information

Explanation
The <*insert_3*> command has completed successfully. The <*insert_1*> MQ commands from <*insert_5*> have been processed without error and a report written to the printer spool file.

Response
None.

AMQ8297
<*insert_1*> MQSC commands verified successfully.

Severity
0 : Information

Explanation
The <*insert_3*> command completed successfully. The <*insert_1*> MQ commands from <*insert_5*> have been verified and a report written to the printer spool file.

Response
None.

AMQ8298
Error report generated for MQSC command process.

Severity
40 : Stop Error

Explanation
The <*insert_5*> command attempted to process a sequence of MQ commands and encountered some errors, however, the operation may have partially completed.

Response

If the <*insert_5*> command was executed a report has been written to a printer spool file. Examine the spooled printer file for details of the errors encountered and correct the MQSC source in <*insert_3*> and retry the operation.

AMQ8299

Cannot open <*insert_3*> for MQSC process.

Severity

40 : Stop Error

Explanation

The <*insert_5*> command failed to open <*insert_3*> for MQ command processing.

Response

Check that the intended file exists, and has been specified correctly. Correct the specification or create the object, and try the operation again.

AMQ8300 (IBM i)

Too many exit programs/user data fields defined.

Severity

30 : Severe error

Explanation

An attempt was made to create or change a channel which had more than the allowed maximum of a total of six exit programs, user data fields, or both defined.

Response

Define the channel again so that a maximum of six exit programs, user data fields, or both are defined.

AMQ8301 (IBM i)

IBM WebSphere MQ storage monitor job could not be started.

Severity

50 : System Error

Explanation

An attempt to start the storage monitor process (job QMQM in subsystem QSYSWRK) was unsuccessful.

Response

Check the job log for the reason for the failure, and try the command again.

AMQ8302

Internal failure initializing IBM WebSphere MQ services.

Severity

50 : System Error

Explanation

An error occurred while attempting to initialize IBM WebSphere MQ services.

Response

A call to xcsInitialize ended with the FAIL, STOP, or STOP_ALL return code. Refer to the log for messages diagnosing this problem.

AMQ8303

Insufficient storage available to process request.

Severity

50 : System Error

AMQ8304
Tracing cannot be started. Too many traces are already running.

Severity
40 : Stop Error

Explanation
A maximum of 15 traces may be running concurrently. This number is already running.

Response
Stop one or more of the other traces and try the command again.

AMQ8305
Tracing cannot be started. Too many traces are already running.

Severity
40 : Stop Error

Explanation
A maximum of 9 traces can be running concurrently, and this number of traces is already running.

Response
Stop one or more of the other traces and try the command again.

AMQ8306 (IBM i)
BATCHSIZE only allowed with channel type *SDR, *SVR, *RCVR, *RQSTR, CLUSSDR or CLUSRCVR.

Severity
40 : Stop Error

Explanation
The BATCHSIZE parameter may only be specified with channel type *SDR, *SVR, *RCVR, *RQSTR, CLUSSDR or CLUSRCVR.

Response
Remove the BATCHSIZE parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *SDR, *SVR, *RCVR *RQSTR, CLUSSDR or CLUSRCVR. Then try the command again.

AMQ8307 (IBM i)
SEQNUMWRAP only allowed with channel type *SDR, *SVR, *RCVR , *RQSTR, CLUSSDR or CLUSRCVR.

Severity
40 : Stop Error

Explanation
The SEQNUMWRAP parameter may only be specified with channel type *SDR, *SVR, *RCVR, *RQSTR, CLUSSDR or CLUSRCVR.

Response
Remove the SEQNUMWRAP parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *SDR, *SVR, *RCVR *RQSTR, CLUSSDR or CLUSRCVR. Then try the command again.

AMQ8308 (IBM i)
MSGRTYEXIT only allowed with channel type *CLUSRCVR, *RCVR or *RQSTR.

Severity
40 : Stop Error

Explanation
The MSGRTYEXIT parameter may only be specified with channel type *CLUSRCVR, *RCVR or *RQSTR.

Response
Remove the MSGRTYEXIT parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *CLUSRCVR, *RCVR or *RQSTR. Then try the command again.

AMQ8309 (IBM i)
MSGRTYDATA only allowed with channel type *CLUSRCVR, *RCVR or *RQSTR.

Severity
40 : Stop Error

Explanation
The MSGRTYDATA parameter may only be specified with channel type *CLUSRCVR, *RCVR or *RQSTR.

Response
Remove the MSGRTYDATA parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *CLUSRCVR, *RCVR or *RQSTR. Then try the command again.

AMQ8310 (IBM i)
MSGRTYNBR only allowed with channel type *CLUSRCVR, *RCVR or *RQSTR.

Severity
40 : Stop Error

Explanation
The MSGRTYNBR parameter may only be specified with channel type *CLUSRCVR, *RCVR or *RQSTR.

Response
Remove the MSGRTYNBR parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *CLUSRCVR, *RCVR or *RQSTR. Then try the command again.

AMQ8311 (IBM i)
MSGRTYITV only allowed with channel type *CLUSRCVR, *RCVR or *RQSTR.

Severity
40 : Stop Error

Explanation
The MSGRTYITV parameter may only be specified with channel type *CLUSRCVR, *RCVR or *RQSTR.

Response
Remove the MSGRTYITV parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *CLUSRCVR, *RCVR or *RQSTR. Then try the command again.

AMQ8312 (IBM i)
CLUSTER only allowed with queue type *ALS, *LCL and *RMT.

Severity
40 : Stop Error

Explanation
The CLUSTER parameter may only be specified with queue type *ALS, *LCL and *RMT.

Response
Remove the CLUSTER parameter from the command or, if the command is CRTMQMQ, change the QTYPE parameter value to specify *ALS, *LCL or *RMT. Then try the command again.

AMQ8313 (IBM i)
CLUSNL only allowed with queue type *ALS, *LCL and *RMT.

Severity
40 : Stop Error

Explanation
The CLUSNL parameter may only be specified with queue type *ALS, *LCL and *RMT.

Response
Remove the CLUSNL parameter from the command or, if the command is CRTMQMQ, change the QTYPE parameter value to specify *ALS, *LCL or *RMT. Then try the command again.

AMQ8314 (IBM i)
DEFBIND only allowed with queue type *ALS, *LCL and *RMT.

Severity
40 : Stop Error

Explanation
The DEFBIND parameter may only be specified with queue type *ALS, *LCL and *RMT.

Response
Remove the DEFBIND parameter from the command or, if the command is CRTMQMQ, change the QTYPE parameter value to specify *ALS, *LCL or *RMT. Then try the command again.

AMQ8315
No namelists to display.

Severity
0 : Information

Explanation
There are no matching namelists defined on this system.

Response
Use the Create Namelist (CRTMQMNL) command to create a namelist.

AMQ8316
No cluster queue managers to display.

Severity
0 : Information

Explanation
There are no matching cluster queue managers defined on this system.

Response
None.

AMQ8317 (IBM i)
CLUSTER only allowed with channel type *CLUSSDR and *CLUSRCVR.

Severity
40 : Stop Error

Explanation
The CLUSTER parameter may only be specified with channel type *CLUSSDR and *CLUSRCVR.

Response

Remove the CLUSTER parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *CLUSSDR or *CLUSRCVR. Then try the command again.

AMQ8318 (IBM i)

CLUSNL only allowed with channel type *CLUSSDR and *CLUSRCVR.

Severity

40 : Stop Error

Explanation

The CLUSNL parameter may only be specified with channel type *CLUSSDR and *CLUSRCVR.

Response

Remove the CLUSNL parameter from the command or, if the command is CRTMQMCHL, change the CHLQTYPE parameter value to specify *CLUSSDR or *CLUSRCVR. Then try the command again.

AMQ8319

MSGEXIT only allowed with channel type *SDR, *SVR, *RCVR *RQSTR, *CLUSSDR or *CLUSRCVR.

Severity

40 : Stop Error

Explanation

The MSGEXIT parameter may only be specified with channel type *SDR, *SVR, *RCVR, *RQSTR, *CLUSSDR, or *CLUSRCVR.

Response

Remove the MSGEXIT parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *SDR or *SVR or *RCVR or *RQSTR or *CLUSSDR or *CLUSRCVR. Then try the command again.

AMQ8320 (IBM i)

MSGUSRDATA only allowed with channel type *SDR, *SVR, *RCVR *RQSTR, or *CLUSSDR or *CLUSRCVR.

Severity

40 : Stop Error

Explanation

The MSGUSRDATA parameter may only be specified with channel type *SDR, *SVR, *RCVR *RQSTR, *CLUSSDR or *CLUSRCVR.

Response

Remove the MSGUSRDATA parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *SDR or *SVR or *RCVR or *RQSTR or *CLUSSDR or *CLUSRCVR. Then try the command again.

AMQ8321 (IBM i)

Process <*insert_3*> is still running.

Severity

0 : Information

AMQ8322 (IBM i)

TIMEOUT only allowed with ENDCCTJOB(*YES).

Severity

40 : Stop Error

Explanation

The TIMEOUT parameter may only be specified when connected jobs are being ended with the ENDCCTJOB option set to *YES.

Response

Remove the TIMEOUT parameter from the command or, if you want to fully quiesce the queue manager, change the ENDCCTJOB parameter to *YES. Then try the command again.

AMQ8323 (IBM i)

OPTION(*PREEMPT) must not be used with ENDCCTJOB(*YES).

Severity

40 : Stop Error

Explanation

When performing a pre-emptive shutdown of the queue manager the ENDCCTJOB(*YES) parameter is not allowed.

Response

Change the ENDCCTJOB(*YES) parameter to ENDCCTJOB(*NO) or, if you want to fully quiesce the queue manager without doing a pre-emptive shutdown, change the OPTION(*PREEMPT) parameter to another value. Then try the command again.

AMQ8324 (IBM i)

OPTION(*WAIT) not allowed with MQMNAME(*ALL).

Severity

40 : Stop Error

Explanation

The OPTION(*WAIT) parameter is not allowed when performing a shutdown of all queue managers.

Response

Remove the OPTION(*WAIT) parameter from the command or, specify individual queue manager names to shut down the queue managers one-by-one with the OPTION(*WAIT) parameter. Then try the command again.

AMQ8325 (IBM i)

MQMNAME(*ALL) is not allowed with ENDCCTJOB(*NO).

Severity

40 : Stop Error

Explanation

The MQMNAME(*ALL) parameter is only allowed when performing a full shutdown of the queue managers.

Response

Specify individual queue manager names to shut the queue managers down one-by-one or change the ENDCCTJOB parameter to *YES. Then try the command again.

AMQ8341
SUBPOOL(<*insert_3*>)<*insert_4*>PID(<*insert_1*>)

Severity
0 : Information

AMQ8342
No authorities to display.

Severity
0 : Information

Explanation
There are no authority records defined on this system, satisfying the input parameters.

Response
Use the appropriate input to list all the authorities defined on the system, or enter the command again with different input..

AMQ8343
Running as standby

Severity
0 : Information

AMQ8343 (IBM i)
The requested operation is not valid for user QMQMADM.

Severity
0 : Information

Explanation
You are not allowed to completely delete the authorities assigned to user QMQMADM, for a valid IBM WebSphere MQ object, with the authority *REMOVE or *NONE.

Response
Remove QMQMADM from the list of users to this command.

AMQ8344
Running elsewhere

Severity
0 : Information

AMQ8344 (IBM i)
The delete option is only valid for a generic profile name.

Severity
0 : Information

Explanation
The delete option, which will delete this authority profile by removing all the users from this authority profile, is not valid for an object name or the special value &class.

Response
To delete users from an object, work from the WRKMQMAUTD command.

AMQ8345 (IBM i)
BATCHHB not valid for channel type *RCVR, *RQSTR, *SVRCN or *CLTCN.

Severity
40 : Stop Error

Explanation
The BATCHHB parameter may only be specified with channel type *SDR, *SVR, *CLUSSDR, or *CLUSRCVR.

Response
Remove the BATCHHB parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *SDR, *SVR, *CLUSSDR or *CLUSRCVR. Then try the command again.

AMQ8346 (IBM i)
Parameter mismatch between QMNAME and QMID.

Severity
40 : Stop Error

Explanation
The Queue Manager Name for Removal (QMNAME) parameter is not *QMID and there is a value for the Queue Manager Identifier for Removal (QMID) parameter.

Response
A value for QMID is not allowed unless QMNAME is *QMID. Change the value specified on the QMNAME parameter or the value of the QMID parameter and then try the request again.

AMQ8347 (IBM i)
USERID not valid for channel type *RCVR, *SVRCN or *CLUSRCVR.

Severity
40 : Stop Error

Explanation
The USERID parameter may only be specified with channel type *SDR, *SVR, *RQSTR, *CLUSSDR, or *CLTCN.

Response
Remove the USERID parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *SDR, *SVR, *RQSTR, *CLUSSDR, or *CLTCN. Then try the command again.

AMQ8348 (IBM i)
PASSWORD not valid for channel type *RCVR, *SVRCN or *CLUSRCVR.

Severity
40 : Stop Error

Explanation
The PASSWORD parameter may only be specified with channel type *SDR, *SVR, *RQSTR, *CLUSSDR, or *CLTCN.

Response
Remove the PASSWORD parameter from the command or, if the command is CRTMQMCHL, change the CHLTYPE parameter value to specify *SDR, *SVR, *RQSTR, *CLUSSDR, or *CLTCN. Then try the command again.

AMQ8349 (IBM i)
Authority changes to <*insert_3*> failed.

Severity
40 : Stop Error

Explanation
Authority changes to an object were requested but could not be made.

Response
Check the authorities that you are granting are relevant to the object type of <*insert_3*>.

AMQ8350
Usage: dspmqver [-p Components] [-f Fields] [-b] [-v]

Severity
0 : Information

Explanation
This shows the correct usage.

Response
None.

AMQ8351
IBM WebSphere MQ Java environment has not been configured correctly.

Severity
20 : Error

Explanation
A command was issued that attempted to run a Java application. However either a working JRE (Java Runtime Environment) was not found or the IBM WebSphere MQ Java environment variables have not been set up. The command could not be run successfully.

Response
Ensure that you have a working JRE (Java Runtime Environment) and that the IBM WebSphere MQ Java environment variables have been set using the setjmsenv script. Retry the command.

AMQ8352
IBM WebSphere MQ queue manager <*insert_5*> becoming primary instance.

Severity
0 : Information

Explanation
Queue manager <*insert_5*> was running previously as a standby instance and is now becoming the primary instance.

Response
None.

AMQ8353
Quiesce request accepted. The queue manager will stop when all outstanding work is complete, permitting switchover to a standby queue manager.

Severity
0 : Information

Explanation
You have requested that the queue manager end when there is no more work for it. In the meantime, it will refuse new applications that attempt to start, although it allows those already running to complete their work. Once the queue manager has stopped, a switchover to a standby queue manager is permitted.

Response
None.

AMQ8354
IBM WebSphere MQ queue manager <*insert_5*> ended, permitting switchover to a standby queue manager.

Severity
0 : Information

Explanation
IBM WebSphere MQ queue manager <*insert_5*> ended. Once the queue manager has stopped, a switchover to a standby queue manager is permitted.

Response
None.

AMQ8355
IBM WebSphere MQ standby queue manager <*insert_5*> not permitted to become a primary instance.

Severity
20 : Error

Explanation
IBM WebSphere MQ standby queue manager <*insert_5*> obtained a lock on its data in the

file-system but was not permitted to become a primary instance. The most likely cause is that the queue manager was stopped without permitting a switchover.

Response
None.

AMQ8367
Active instance of IBM WebSphere MQ queue manager <*insert_3*> not ended.

Severity
20 : Error

Explanation
You tried to end the local instance of IBM WebSphere MQ queue manager <*insert_3*> using the '-x' option, which ends a standby instance. The local instance is not a standby instance.

Response
Issue the endmqm command without the '-x' option.

AMQ8368
Standby instance of IBM WebSphere MQ queue manager <*insert_3*> not ended.

Severity
20 : Error

Explanation
You tried to end the local instance of IBM WebSphere MQ queue manager <*insert_3*>. It is a standby instance so you must specify the '-x' option of endmqm.

Response
Issue the endmqm command with the '-x' option.

AMQ8370
Usage: runmqdnm -q Queue -a Assembly

[-m QueueManager] [-c ClassName] [-u Text] [-s Syncpoint]

[-n MaxThreads] [-t Timeout] [-b BackoutThreshold]

[-r BackoutQueue] [-p Context] [-d]

Severity
0 : Information

Explanation
This shows the correct usage.

Response
None.

AMQ8371
<*insert_3*> is not a valid command line option.

Severity
40 : Stop Error

Explanation
The option <*insert_3*> was specified on the command line to the application. This option is not a valid command line options for the application.

Response
Check the usage information for the application and then retry.

AMQ8372
The required command line option <*insert_3*> is missing.

Severity
40 : Stop Error

Explanation
The application expects several mandatory command line options. One of these, <*insert_3*>, was not specified.

Response
Check the usage information for the application and ensure that all required parameters are specified then retry.

AMQ8373
Invalid value specified for command line option <*insert_3*> (<*insert_4*>).

Severity
40 : Stop Error

Explanation
The value specified for command line option <*insert_3*> (<*insert_4*>) is invalid.

Response
Check the usage information for the application and ensure that all options specify values in the valid range then retry.

AMQ8374
IBM WebSphere MQ queue manager <*insert_3*> does not exist.

Severity
40 : Stop Error

Explanation
The IBM WebSphere MQ queue manager <*insert_3*> does not exist.

Response
Either create the queue manager (crtmqm command) or correct the queue manager name used in the command and then try the command again.

AMQ8375
IBM WebSphere MQ queue manager <*insert_3*> not available.

Severity
40 : Stop Error

Explanation
The IBM WebSphere MQ queue manager <*insert_3*> is not available because it has been stopped or is otherwise not contactable.

Response
Use the strmqm command to start the message queue manager as necessary or correct any intermittent problems (eg. network connectivity) then try the command again.

AMQ8376
IBM WebSphere MQ queue <*insert_3*> not found.

Severity
40 : Stop Error

Explanation
The queue <*insert_3*> could not be found, it may not have been created.

Response
Ensure that the name of the queue specified is correct, queue names are case sensitive. If the queue is not created, use the runmqsc command to create it. Then try the command again.

AMQ8377

Unexpected error <*insert_1*> was received by the application.

Severity

40 : Stop Error

Explanation

The error <*insert_1*> was returned unexpectedly to the application.

Response

Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ8378

Unexpected exception received from .NET Framework

<*insert_3*>

Severity

40 : Stop Error

Explanation

The application received an exception from the underlying .NET framework, information about the exception follows:

<*insert_4*>

Response

Examine the information contained within the exception to determine if it is possible to resolve locally.

If it is not possible to resolve the problem locally, save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ8379

Assembly <*insert_3*> could not be loaded

Severity

40 : Stop Error

Explanation

The IBM WebSphere MQ .NET Monitor attempted to load assembly <*insert_3*> but received an exception from the underlying .NET framework indicating that it could not be found. <*insert_4*>

Response

Check that the assembly does exist and is accessible to the user running the application then retry.

If the assembly should be available, save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ8380

No classes implementing IMQObjectTrigger found in <*insert_3*>.

Severity

40 : Stop Error

Explanation

The IBM WebSphere MQ .NET monitor was unable to identify any classes in referenced assembly <*insert_3*> which implement the IMQObjectTrigger interface.

Response

It is a requirement of the IBM WebSphere MQ .NET monitor that either a single class implementing the IMQObjectTrigger interface exists in the referenced assembly or that a class is identified in that assembly to execute. Either modify the assembly to include a single class implementing IMQObjectTrigger or specify a class name on the command line and retry.

AMQ8381

Too many classes implementing IMQObjectTrigger (<*insert_1*>) found in <*insert_3*>.

Severity

40 : Stop Error

Explanation

The IBM WebSphere MQ .NET monitor found <*insert_1*> classes in referenced assembly <*insert_3*> all of which implement the IMQObjectTrigger interface.

Response

It is a requirement of the IBM WebSphere MQ .NET monitor that either a single class implementing the IMQObjectTrigger interface exists in the referenced assembly or that a class is identified in that assembly to execute. Either modify the assembly to include a single class implementing IMQObjectTrigger or specify a class name on the command line and retry.

AMQ8382

A Message breaking the backout threshold (<*insert_1*>) was moved to <*insert_4*>

Severity

10 : Warning

Explanation

Whilst processing queue <*insert_3*> a message with a backout count that exceeded the specified backout threshold (<*insert_1*>) was successfully moved to <*insert_4*>

Response

The message moved to the backout queue has a backout count greater than the backout threshold specified (or picked up from the input queue BOTHRESH attribute). You should investigate the reason why this message was rolled back onto the input queue and resolve that issue. If backout processing is not required, modify the command line options and or queue definitions to achieve the required behaviour from the .NET monitor.

AMQ8383

A Message breaking the backout threshold (<*insert_1*>) could not be moved.

Severity

40 : Stop Error

Explanation

While processing queue <*insert_3*> a message with a backout count that exceeded the specified backout threshold (<*insert_1*>) was encountered however, it was not possible to move it to either a backout queue or the dead-letter queue.

Response

Because it was not possible to move the backed out message to another queue, it has been left on the input queue. As a result, the .NET monitor has ended.

It is possible that the backout queue or dead-letter queue are full or disabled for put - in this case, resolve this problem first.

If backout processing should have resulted in the message being placed on another queue, check the command line options, input queue definition and queue manager dead-letter queue attribute to ensure that they are correct, then retry.

AMQ8390
Usage: endmqdnm -q Queue [-m QueueManager]

Severity
0 : Information

Explanation
This shows the correct usage.

Response
None.

AMQ8391
<*insert_3*> is not a valid command line option.

Severity
40 : Stop Error

Explanation
The option <*insert_3*> was specified on the command line to the application. This option is not one of the valid set of command line options.

Response
Check the usage information for the application and then retry.

AMQ8392
The required command line option <*insert_3*> is missing.

Severity
40 : Stop Error

Explanation
The application expects mandatory command line options. One of these, <*insert_3*>, was not specified.

Response
Check the usage information for the application and ensure that all required parameters are specified then retry.

AMQ8393
Invalid value specified for command line option <*insert_3*> (<*insert_4*>).

Severity
40 : Stop Error

Explanation
The value specified for command line option <*insert_3*> (<*insert_4*>) is invalid.

Response
Check the usage information for the application and ensure that all options specify values in the valid range then retry.

AMQ8394
IBM WebSphere MQ queue manager <*insert_3*> does not exist.

Severity
40 : Stop Error

Explanation
The IBM WebSphere MQ queue manager <*insert_3*> does not exist.

Response

Either create the queue manager (crtmqm command) or correct the queue manager name used in the command and then try the command again.

AMQ8395

IBM WebSphere MQ queue manager <*insert_3*> not available.

Severity

40 : Stop Error

Explanation

The IBM WebSphere MQ queue manager <*insert_3*> is not available because it has been stopped or is otherwise not contactable.

Response

Use the strmqm command to start the message queue manager as necessary or correct any intermittent problems (eg. network connectivity) then try the command again.

AMQ8396

IBM WebSphere MQ queue <*insert_3*> not found.

Severity

40 : Stop Error

Explanation

The queue <*insert_3*> could not be found, it may not have been created.

Response

Ensure that the name of the queue specified is correct, queue names are case sensitive. If the queue is not created, use the runmqsc command to create it. Then try the command again.

AMQ8397

Unexpected error <*insert_1*> was received by the application.

Severity

40 : Stop Error

Explanation

The error <*insert_1*> was returned unexpectedly to the application.

Response

Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ8398

Unexpected exception received from .NET Framework

<*insert_3*>

Severity

40 : Stop Error

Explanation

The application received an exception from the underlying .NET framework, information about the exception follows:

<*insert_4*>

Response

Examine the information contained within the exception to determine if it is possible to resolve locally.

If it is not possible to resolve the problem locally, save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ8401
<*insert_1*> MQSC commands read.

Severity
0 : Information

Explanation
The MQSC script contains <*insert_1*> commands.

Response
None.

AMQ8402
<*insert_1*> commands have a syntax error.

Severity
0 : Information

Explanation
The MQSC script contains <*insert_1*> commands having a syntax error.

Response
None.

AMQ8403
<*insert_1*> valid MQSC commands could not be processed.

Severity
0 : Information

Explanation
The MQSC script contains <*insert_1*> commands that failed to process.

Response
None.

AMQ8404
Command failed.

Severity
0 : Information

Explanation
An MQSC command has been recognized, but cannot be processed.

Response
None.

AMQ8405
Syntax error detected at or near end of command segment below:-

Severity
0 : Information

Explanation
The MQSC script contains <*insert_1*> commands having a syntax error.

Response
None.

AMQ8406
Unexpected 'end of input' in MQSC.

Severity
0 : Information

Explanation
An MQSC command contains a continuation character, but the 'end of input' has been reached without completing the command.

Response
None.

AMQ8407
Display Process details.

Severity
0 : Information

Explanation
The MQSC DISPLAY PROCESS command completed successfully, and details follow this message.

Response
None.

AMQ8408
Display Queue Manager details.

Severity
0 : Information

Explanation
The MQSC DISPLAY QMGR command completed successfully, and details follow this message.

Response
None.

AMQ8409
Display Queue details.

Severity
0 : Information

Explanation
The MQSC DISPLAY QUEUE command completed successfully, and details follow this message.

Response
None.

AMQ8410
Parser Error.

Severity
0 : Information

Explanation
The MQSC Parser has an internal error.

Response
None.

AMQ8411
Duplicate Keyword Error.

Severity
0 : Information

Explanation
A command in the MQSC script contains duplicate keywords.

Response
None.

AMQ8412
Numeric Range Error.

Severity
0 : Information

Explanation
The value assigned to an MQSC command keyword is out of the permitted range.

Response
None.

AMQ8413
String Length Error.

Severity
0 : Information

Explanation
A string assigned to an MQSC keyword is either NULL, or longer than the maximum permitted for that keyword.

Response
None.

AMQ8414
Display Channel details.

Severity
0 : Information

Explanation
The MQSC DISPLAY CHL command completed successfully, and details follow this message.

Response
None.

AMQ8415
Ping IBM WebSphere MQ Queue Manager command complete.

Severity
0 : Information

Explanation
The MQSC PING QMGR command completed successfully.

Response
None.

AMQ8416
MQSC timed out waiting for a response from the command server.

Severity
0 : Information

Explanation
MQSC did not receive a response message from the remote command server in the time specified.

Response
None.

AMQ8417
Display Channel Status details.

Severity
0 : Information

Explanation
The MQSC DISPLAY CHANNEL STATUS command completed successfully, and details follow this message.

Response
None.

AMQ8418
<*insert_1*> command responses received.

Severity
0 : Information

Explanation
Running in queued mode, <*insert_1*> command responses were received from the remote command server.

Response
None.

AMQ8419
The Queue is already in the DCE cell.

Severity
0 : Information

Explanation
The Queue is already in the cell, that is, its SCOPE attribute is already CELL.

Response
None.

AMQ8420
Channel Status not found.

Severity
0 : Information

Explanation
No status was found for the specified channel(s).

Response
None.

AMQ8421
A required keyword was not specified.

Severity
0 : Information

Explanation
A keyword required in this command was not specified.

Response
None.

AMQ8422
MQSC found the following response to a previous command on the reply queue :-

Severity
0 : Information

Explanation
MQSC found additional command responses on the reply queue. They will follow this message.

Response
None.

AMQ8423
Cell Directory not available.

Severity
0 : Information

Explanation
The DCE cell directory is not available, so the requested operation has failed.

Response
None.

AMQ8424
Error detected in a name keyword.

Severity
0 : Information

Explanation
A keyword in an MQSC command contained a name string which was not valid. This may be because it contained characters which are not accepted in MQ names. Typical keywords which can produce this error are QLOCAL (and the other q types), CHANNEL, XMITQ, INITQ, MCANAME etc.

Response
None.

AMQ8425
Attribute value error.

Severity
0 : Information

Explanation
A keyword in an MQSC command contained a value that was not valid.

Response
None.

AMQ8426
Valid MQSC commands are:

Severity
0 : Information

Explanation
The text shows valid MQSC commands.

Response
None.

AMQ8427
Valid syntax for the MQSC command:

Severity
0 : Information

Explanation
The text shown is the valid syntax for the MQSC command.

Response
None.

AMQ8428
TYPE Keyword has already been specified.

Severity
0 : Information

Explanation
The TYPE has already been specified after the DISPLAY verb, for example DISPLAY QUEUE(*) type(QLOCAL) type(QALIAS).

Response
Delete the second TYPE keyword and run the command again.

AMQ8429 (IBM i)
Error detected in a exit parameter.

Severity
0 : Information

Explanation
A syntax error occurred an the exit parameter. This may be because it contained characters which are not accepted as exit names. Check the parameters in the MSGEXIT, RCVEXIT, SCYEXIT and SENDEXIT definitions.

Response
None.

AMQ8430
Remote queue manager name is unknown.

Severity
0 : Information

Explanation
The Remote queue manager name is not known to this queue manager. Check that a transmission queue of the same name as the remote queue manager name exists.

Response
Create a transmission queue of the same name as the remote queue manager if one does not exist.

AMQ8431
Transmission queue does not exist

Severity
0 : Information

Explanation
The transmission queue does not exist on this queue manager.

Response
None.

AMQ8432
You are not allowed to set both the REPOS and REPOSNL fields.

Severity
0 : Information

Explanation
An attempt to set both the REPOS and REPOSNL fields has been made. Only one of these fields can have a value other than blank. Both of the fields may be blank.

Response
None.

AMQ8433
You are not allowed to set both the CLUSTER and CLUSNL fields.

Severity
0 : Information

Explanation
An attempt to set both the CLUSTER and CLUSNL fields has been made. Only one of these fields can have a value other than blank. Both of the fields may be blank.

Response
None.

AMQ8434
The repository is unavailable.

Severity
0 : Information

Explanation
The repository is unavailable and the data cannot be accessed. Stop and restart the queue manager.

Response
None.

AMQ8435
All valid MQSC commands were processed.

Severity
0 : Information

Explanation
The MQSC script contains no commands that failed to process.

Response
None.

AMQ8436
One valid MQSC command could not be processed.

Severity
0 : Information

Explanation
The MQSC script contains one command that failed to process.

Response
None.

AMQ8437
No MQSC commands read.

Severity
0 : Information

Explanation
The MQSC script contains no commands.

Response
None.

AMQ8438
One MQSC command read.

Severity
0 : Information

Explanation
The MQSC script contains one command.

Response
None.

AMQ8439
No commands have a syntax error.

Severity
0 : Information

Explanation
The MQSC script contains no commands having a syntax error.

Response
None.

AMQ8440
One command has a syntax error.

Severity
0 : Information

Explanation
The MQSC script contains one command which has a syntax error.

Response
None.

AMQ8441
Display Cluster Queue Manager details.

Severity
0 : Information

Explanation
The MQSC DISPLAY CLUSQMGR command completed successfully, and details follow this message.

Response
None.

AMQ8442
USAGE can not be set to XMITQ with either the CLUSTER or CLUSNL fields set.

Severity
0 : Information

Explanation
An attempt has been made to set USAGE to XMITQ when the CLUSTER or CLUSNL field has a value. Change the value of USAGE, or set the CLUSTER and CLUSNL fields to blank, and try the command again.

Response
None.

AMQ8442 (IBM i)
USAGE can not be set to *TMQ with either the CLUSTER or CLUSNL fields set.

Severity
0 : Information

Explanation
An attempt has been made to set USAGE to *TMQ when the CLUSTER or CLUSNL field has a value. Change the value of USAGE, or set the CLUSTER and CLUSNL fields to blank, and try the command again.

Response
None.

AMQ8443
Only the CLUSTER or CLUSNL field may have a value.

Severity
0 : Information

Explanation
An attempt has been made to set both CLUSTER and CLUSNL fields. One and only one of the fields may have a value, the other field must be blank. Change the value of one of the fields to blank and try the command again.

Response
None.

AMQ8444
The CLUSTER or CLUSNL fields must have a value.

Severity
0 : Information

Explanation
Both the CLUSTER and CLUSNL fields are blank. One and only one of the fields may be blank, the other field must be a value. Change one of the fields from blank to a value and try the command again.

Response
None.

AMQ8445
Program cannot open queue manager object.

Severity
30 : Severe error

Explanation
An attempt to open a queue manager object has failed.

Response
See the previously listed messages in the job log.

AMQ8446
Channel is currently active.

Severity
30 : Severe error

Explanation
The requested operation failed because the channel is currently active.

Response
See the previously listed messages in the job log.

AMQ8447
Requested operation on channel <*insert_3*> not valid for this channel type.

Severity
30 : Severe error

Explanation
The operation requested cannot be performed because channel <*insert_3*> is not of a suitable type. For example, only sender, server and cluster-sender channels can be resolved.

Response
Check that the correct operation was requested. If it was, check that the correct channel name was specified.

AMQ8448
Channel <*insert_3*> is not running.

Severity
30 : Severe error

Explanation
A request to stop channel <*insert_3*> has failed because the channel is not running.

Response
Check that the correct operation was requested. If it was, check that the correct channel name was specified.

AMQ8449
Queue <*insert_3*> inhibited for MQGET.

Severity
30 : Severe error

Explanation
An MQGET failed because the queue <*insert_3*> had been previously inhibited for MQGET.

Response
None.

AMQ8450
Display queue status details.

Severity
0 : Information

Explanation
The MQSC DISPLAY QSTATUS command completed successfully. Details follow this message.

AMQ8451 (IBM i)
STATUS(*STOPPED) not allowed with CONNAME specified.

Severity
0 : Information

Explanation
The STATUS(*STOPPED) parameter is not allowed when specifying CONNAME on the ENDMQMCHL command.

Response
Remove the CONNAME parameter from the command or, specify STATUS(*INACTIVE) to end the channel instance for the specified connection name.

AMQ8452 (IBM i)
STATUS(*STOPPED) not allowed with RQMNAME specified.

Severity
0 : Information

Explanation
The STATUS(*STOPPED) parameter is not allowed when specifying RQMNAME on the ENDMQMCHL command.

Response
Remove the RQMNAME parameter from the command or, specify STATUS(*INACTIVE) to end the channel instance for the specified remote queue manager.

AMQ8453
The path <*insert_3*> is invalid

Severity
20 : Error

Explanation
You typed a path which was not syntactically correct for the operating system you are running IBM WebSphere MQ on.

Response
Determine the correct syntax of a path name for the operating system you are running IBM WebSphere MQ on and use this information to type in a valid path.

AMQ8454
Syntax error found in parameter <*insert_3*>.

Severity
20 : Error

Explanation
The data you entered for <*insert_3*> does not conform to the syntax rules laid down by IBM WebSphere MQ for this parameter.

Response
Carefully check the data entered for this parameter in conjunction with the IBM WebSphere MQ Command Reference to determine the cause of error.

AMQ8455
Password length error

Severity
20 : Error

Explanation
The password string length is rounded up by IBM WebSphere MQ to the nearest eight bytes. This rounding causes the total length of the SSLCRYP string to exceed its maximum.

Response
Decrease the size of the password, or of earlier fields in the SSLCRYP string.

AMQ8456
Conflicting parameters in command.

Severity
20 : Error

Explanation
The command contains parameters that cannot be used together.

Response
Refer to the IBM WebSphere MQ Script (MQSC) Command Reference to determine an allowable combination of parameters for this command.

AMQ8457
IBM WebSphere MQ connection stopped.

Severity
0 : Information

Explanation
The STOP CONN command successfully stopped the connection that was specified.

Response
None.

AMQ8458
IBM WebSphere MQ connection not stopped.

Severity
0 : Information

Explanation
The STOP CONN command could not stop the connection that was specified.

Response
None.

AMQ8459
Not Found.

Severity
0 : Information

Explanation
You specified an identifier that was not found. Please try the command again and supply a valid identifier.

Response
None.

AMQ8460
Syntax error in connection identifier.

Severity
0 : Information

Explanation
You specified an invalid connection identifier. A valid connection identifier contains 16 hex characters, where all of the characters in the connection identifier should lie within the range 0-9, a-z or A-Z.

Response
Correct the connection identifier so that it conforms to the above specification.

AMQ8461
Connection identifier not found.

Severity
0 : Information

Explanation
You specified a connection identifier which is not associated with this queue manager.

Response

Correct the connection identifier so that it describes a connection identifier which is associated with this queue manager. Use the command DISPLAY CONN to identify potential connection identifiers to use with this command.

AMQ8462

The required parameter <*insert_3*> is missing.

Severity

20 : Error

Explanation

The command you entered requires the <*insert_3*> parameter, which has not been specified.

Response

Make sure you specify the missing required parameter.

AMQ8463

At least one of <*insert_3*> must be specified.

Severity

20 : Error

Explanation

At least one of the parameters <*insert_3*> must be specified.

Response

Make sure you specify the required parameters.

AMQ8464

IBM WebSphere MQ subscription <*insert_3*> not found.

Severity

30 : Severe error

Explanation

If the command entered was Change or Display, the subscription <*insert_3*> specified does not exist. If the command entered was Copy, the source subscription does not exist. If the command entered was Create, the system default MQ subscription does not exist.

Response

Correct the subscription name or subscription id specified and then try the command again. If you are creating a new subscription, either specify all parameters explicitly or ensure that the system default subscription, SYSTEM.DEFAULT.SUB, exists.

AMQ8465

The <*insert_3*> attribute cannot be modified for an existing Subscription.

Severity

20 : Error

Explanation

The Subscription could not be altered or replaced.

Response

The Subscription could not be altered or replaced. Check that the command only contains changable attributes.

AMQ8466

The remote queue <*insert_3*> could not be opened.

Severity

30 : Severe error

Explanation
The remote queue could not be opened..

Response
Check that the remote Queue is correctly defined on the remote Queue Manager.

AMQ8467
There was a syntax error in the hex string representing the bytes value of a keyword.

Severity
0 : Information

Explanation
The hex string that was entered was found to contain a syntax error. This error may occur for one of the following reasons:

- The string was too long.
- The string contained invalid hex characters.

Valid characters are 0-9, A-F and a-f. Hex strings with an odd number of characters will be prefixed with a zero, for example, DESTCORL(A) will be interpreted as DESTCORL(0A)

Response
None.

AMQ8468
DEST field must not be set when using DESTCLAS(MANAGED)

Severity
30 : Severe error

Explanation
An attempt to set both DESTCLAS(MANAGED) and DEST has been made. When using DESTCLAS(MANAGED) do not specify a destination. If a destination is required then DESTCLAS(PROVIDED) should be used.

Response
None.

AMQ8469
IBM WebSphere MQ subscription <*insert_3*> in use.

Severity
30 : Severe error

Explanation
The subscription <*insert_3*> specified is currently in use by another application.

Response
Ensure that no applications are using the specified subscription, then try the command again.

AMQ8470
The object <*insert_3*> is not a valid subscription destination.

Severity
30 : Severe error

Explanation
The object <*insert_3*> is not of a permitted type for a subscription destination.

Response
If using a QALIAS as a subscription destination object, ensure that its TARGTYPE attribute has the value of QUEUE.

AMQ8471
IBM WebSphere MQ topic string error

Severity
30 : Severe error

Explanation
The topic string (TOPICSTR) supplied was not valid

Response
Correct the topic string definition and try the command again.

AMQ8472
IBM WebSphere MQ topic string not found

Severity
30 : Severe error

Explanation
The topic string supplied does not exist in the topic tree

Response
Correct the topic string used and try the command again

AMQ8473
A IBM WebSphere MQ topic using the supplied topic string already exists

Severity
30 : Severe error

Explanation
The topic string supplied has been specified on a previously created topic object. At most, one topic object per topic string is permitted.

Response
If the topic string specified is incorrect, modify the topic string and retry the operation. Alternatively, if the previously created topic object is not required, delete that topic object first, then retry the operation.

AMQ8474
The required parameter SUB is invalid.

Severity
20 : Error

Explanation
The command you entered requires a valid SUB parameter.

Response
Make sure the required parameter is correct.

AMQ8475
Subscription already exists.

Severity
20 : Error

Explanation
The Subscription <*insert_3*> could not be created because it already exists.

Response
Check that the name is correct and try the command again specifying REPLACE, or delete the Subscription. Then try the command again.

AMQ8476
The required parameter <*insert_3*> is missing.

Severity
20 : Error

Explanation
The command you entered requires the <*insert_3*> parameter, which has not been specified.

Response
Make sure you specify the missing required parameter.

AMQ8477
The specified options are invalid.

Severity
40 : Stop Error

Explanation
The combination of options supplied for the command are invalid.

Response
Check the specified options and ensure they are correct.

AMQ8478
Standby queue manager.

Severity
40 : Stop Error

Explanation
The queue manager is a standby queue manager. You must use the primary instance of a queue manager to administer it.

Response
Re-issue the command on the primary instance of the queue manager.

AMQ8480
Subscription <*insert_3*> could not be created. The reason code from the MQSUB function call was <*insert_1*>.

Severity
20: Error

Explanation
During the attempt to create subscription name '<*insert_3*>', an error was detected. The reason for failure is <*insert_1*>. This reason code is returned from the MQSUB function call.

Response
Check the reason code in the IBM WebSphere MQ Messages manual, correct the underlying problem and then try the command again.

AMQ8482
Cluster topics inhibited due to PSCLUS(DISABLED).

Severity
20: Error

Explanation
The queue manager attribute PSCLUS has been set to DISABLED so clustered topics cannot be defined and existing topics can not be altered to set the CLUSTER attribute. Topic <*insert_3*> has not been created or altered on this system.

Response
If you need to enable publish/subscribe clustering, modify the PSCLUS attribute to ENABLED on all queue managers participating in the cluster.

AMQ8483
Unable to modify PSCLUS because cluster topic(s) exist.

Severity
20: Error

Explanation
Queue manager attribute PSCLUS has been set to DISABLED to indicate that Publish/Subscribe activity is not expected between queue managers in this cluster. However, a cluster topic already exists, so the setting cannot be modified. The PSCLUS attribute remains unchanged.

Response
If you need to disable publish/subscribe activity within this cluster, first DELETE all cluster topic objects, then remodify the PSCLUS attribute.

AMQ8491
Timeout waiting for a reply from the Telemetry service.

Severity
0 : Information

Explanation
Timeout waiting for a reply from the Telemetry Service '`SYSTEM.MQXR.SERVICE`'.

Response
Reduce the number of responses expected from the Telemetry Service by using a **`where`** clause.

AMQ8492
The number of responses has been limited to <*insert_1*>

Severity
0 : Information

Explanation
The number of responses has been limited to the **`MAXDEPTH`** of the ReplyToQueue '`SYSTEM.MQSC.REPLY.QUEUE`'.

Response
Reduce the number of responses expected from the Telemetry Service by using a **`where`** clause, or increase the **`MAXDEPTH`** of the ReplyToQueue '`SYSTEM.MQSC.REPLY.QUEUE`'.

AMQ8498
Starting MQSC for queue manager <*insert_3*>.

Severity
0 : Information

Explanation
The MQSC script contains <*insert_1*> commands.

Response
None.

AMQ8499
Usage: runmqsc [-e] [-v] [-w WaitTime [-x]] [QMgrName]

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8499 (Tandem)
Usage: runmqsc [-e] [-v] [-w WaitTime] [-x] [-i In] [-o Out] QMgrName

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8500
IBM WebSphere MQ Display MQ Files

Severity
0 : Information

AMQ8501
Common services initialization failed with return code <*insert_1*>.

Severity
20 : Error

Explanation
A request by the command server to initialize common services failed with return code <*insert_1*>.

Response
None.

AMQ8502
Connect shared memory failed with return code <*insert_1*>.

Severity
20 : Error

Explanation
A request by the command server to connect shared memory failed with return code <*insert_1*>.

Response
None.

AMQ8503
Post event semaphore failed with return code <*insert_1*>.

Severity
20 : Error

Explanation
A request by the command server to post an event semaphore failed with return code <*insert_1*>.

Response
None.

AMQ8504
Command server MQINQ failed with reason code <*insert_1*>.

Severity
20 : Error

Explanation
An MQINQ request by the command server, for the IBM WebSphere MQ queue <*insert_3*>, failed with reason code <*insert_1*>.

Response
None.

AMQ8505
Reallocate memory failed with return code <*insert_1*>.

Severity
20 : Error

Explanation
A request by the command server to reallocate memory failed with return code <*insert_1*>.

Response
None.

AMQ8506
Command server MQGET failed with reason code <*insert_1*>.

Severity
20 : Error

Explanation
An MQGET request by the command server, for the IBM WebSphere MQ queue <*insert_3*>, failed with reason code <*insert_1*>.

Response
None.

AMQ8507
Command server MQPUT1 request for an undelivered message failed with reason code <*insert_1*>.

Severity
20 : Error

Explanation
An attempt by the command server to put a message to the dead-letter queue, using MQPUT1, failed with reason code <*insert_1*>. The MQDLH reason code was <*insert_2*>.

Response
None.

AMQ8508
Queue Manager Delete Object List failed with return code <*insert_1*>.

Severity
20 : Error

Explanation
A request by the command server to delete a queue manager object list failed with return code <*insert_1*>.

Response
None.

AMQ8509
Command server MQCLOSE reply-to queue failed with reason code <*insert_1*>.

Severity
20 : Error

Explanation
An MQCLOSE request by the command server for the reply-to queue failed with reason code <*insert_1*>.

Response
None.

AMQ8510
Command server queue is open, try again later.

Severity
30 : Severe error

AMQ8511
Usage: strmqcsv [QMgrName]

Severity
0 : Information

AMQ8512
Usage: endmqcsv [-c | -i] QMgrName

Severity
0 : Information

AMQ8513
Usage: dspmqcsv [QMgrName]

Severity
0 : Information

AMQ8514
No response received after <*insert_1*> seconds.

Severity
20 : Error

Explanation
The command server has not reported the status of running, to the start request, before the timeout of <*insert_1*> seconds was reached.

Response
None.

AMQ8515 (Tandem)
MQSeries Alter MQ Files

Severity
0 : Information

Explanation
Title for the altmqfls command.

Response
None.

AMQ8516 (Tandem)
MQSeries Clean Queue Manager

Severity
0 : Information

Explanation
Title for the cleanqm command.

Response
None.

AMQ8517 (Tandem)
The messages files are partitioned and cannot be moved.

Severity
0 : Information

Explanation
Partition Error from the altmqfls command.

Response
None.

AMQ8518
LOGGEREV is only valid when using a linear logging queue manager.

Severity
20 : Error

Explanation
The LOGGEREV attribute may only be set to ENABLED when the queue manager was created as a linear logging queue manager. For more information about logging, see Making sure that messages are not lost (logging).

Response
The system admistrator should only attempt to change the LOGGEREV queue manager attribute when the queue manager being administered was created as a linear logging queue manager.

AMQ8519
The topic object <*insert_3*> does not permit durable subscription.

Severity
30 : Severe error

Explanation
The topic object <*insert_3*> has been defined to disallow durable subscription.

Response
Ensure that the topic object to which you are creating a subscription allows durable subscription.

AMQ8520
The queue name supplied is not valid for DEFXMITQ.

Severity
20 : Error

Explanation
The specified queue is not allowed to be used as the default transmission queue because it is reserved for use exclusively by clustering.

Response
Change the value of DEFXMITQ, and try the command again.

AMQ8549
Total string length exceeds the maximum value of 999 characters.

Severity
0 : Information

Explanation
The total length of a channel exit string is 999 characters. The string list assigned to an MQSC keyword is longer than the maximum value of 999 characters permitted for that keyword.

Response
None.

AMQ8550
Display namelist details.

Severity
0 : Information

Explanation
The MQSC DISPLAY NAMELIST command completed successfully, and details follow this message.

Response
None.

AMQ8551
IBM WebSphere MQ namelist changed.

Severity
0 : Information

Explanation
IBM WebSphere MQ namelist <*insert_5*> changed.

Response
None.

AMQ8552
IBM WebSphere MQ namelist created.

Severity
0 : Information

Explanation
IBM WebSphere MQ namelist <*insert_5*> created.

Response
None.

AMQ8553
IBM WebSphere MQ namelist deleted.

Severity
0 : Information

Explanation
IBM WebSphere MQ namelist <*insert_5*> deleted.

Response
None.

AMQ8554
String List String Count Error.

Severity
0 : Information

Explanation
The number of strings within the stringlist is greater than the maximum number allowed for the keyword. Reduce the number of strings within the list and try the command again.

Response
None.

AMQ8555
String List String Length Error.

Severity
0 : Information

Explanation
A string in a string list assigned to a keyword is longer than the maximum permitted for that keyword.

Response
None.

AMQ8556
RESUME QUEUE MANAGER accepted.

Severity
0 : Information

Explanation
The RESUME QUEUE MANAGER command has been accepted for processing. The command will be sent to the repository which will process the command and notify all other repositories that this queue manager is now back in the cluster.

Response
None.

AMQ8557
SUSPEND QUEUE MANAGER accepted.

Severity
0 : Information

Explanation
The SUSPEND QUEUE MANAGER command has been accepted for processing. The command will be sent to the repository which will process the command and notify all other repositories that this queue manager is leaving the cluster.

Response
None.

AMQ8558
REFRESH CLUSTER accepted.

Severity
0 : Information

Explanation
The REFRESH CLUSTER command has been accepted for processing. The command will be sent to the Repository which will process the command and notify all other repositories that the Cluster needs refreshing.

Response
None.

AMQ8559
RESET CLUSTER accepted.

Severity
0 : Information

Explanation
The RESET CLUSTER command has been accepted for processing. The command will be sent to the Repository which will process the command and notify all other repositories that the Cluster needs resetting.

Response
None.

AMQ8560
IBM WebSphere MQ security cache refreshed.

Severity
0 : Information

Explanation
The object authority manager security cache has been refreshed.

Response
None.

AMQ8561 (Tandem)
IBM WebSphere MQ for HP Integrity NonStop Server does not support this option.

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8561 (Windows)
Domain controller unavailable.

Severity
10 : Warning

Explanation
IBM WebSphere MQ was unable to contact the domain controller to obtain information for user <*insert_3*>.

Response
Ensure that a domain controller for the domain on which user <*insert_3*> is defined is available. Alternatively, if you are using a computer which is not currently connected to the network and have logged on using a domain user ID, you may wish to log on using a local user ID instead.

AMQ8562
The Java application failed to connect to the Queue Manager because the version of the native JNI library <*insert_3*> is inconsistant with the version of the IBM WebSphere MQ Queue Manager <*insert_4*>.

Severity
10 : Warning

Explanation
The native JNI library <*insert_3*> is out-of-date compared to the IBM WebSphere MQ Queue Manager <*insert_4*>

Response
Ensure that the Java library path points to the current version of the JNI library

AMQ8562 (Tandem)
Command line does not exist

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8563
IBM WebSphere MQ authentication information object created.

Severity
0 : Information

Explanation
IBM WebSphere MQ authentication information object <*insert_3*> created.

Response
None.

AMQ8564
IBM WebSphere MQ authentication information object deleted.

Severity
0 : Information

Explanation
IBM WebSphere MQ authentication information object <*insert_3*> deleted.

Response
None.

AMQ8565
Queue Status not found.

Severity
0 : Information

Explanation
Queue Status for the specified queue could not be found.

Response
None.

AMQ8566
Display authentication information details.

Severity
0 : Information

Explanation
The MQSC DISPLAY AUTHINFO command completed successfully. Details follow this message.

Response
None.

AMQ8567
IBM WebSphere MQ authentication information changed.

Severity
0 : Information

Explanation
IBM WebSphere MQ authentication information <*insert_3*> changed.

Response
None.

AMQ8568
The native JNI library <*insert_3*> was not found.

Severity
10 : Warning

Explanation
The native JNI library <*insert_3*> could not be loaded because the library was not found.

Response
Ensure that the java library path points to the location of the JNI library.

AMQ8568 (IBM i)
No authinfo objects to display.

Severity
0 : Information

Explanation
There are no matching authinfo objects defined on this system.

Response
Using the DEFINE AUTHINFO command to create an authinfo object.

AMQ8569
Error in filter specification

Severity
0 : Information

Explanation
You specified an invalid filter. Check the WHERE statement and make sure that the operator is valid for the type of parameter, that the parameter can be filtered on, and that the value that you specified for the filter is valid for the type of attribute you are filtering on.

Response
None.

AMQ8570
Attribute value error in <*insert_3*>.

Severity
0 : Information

Explanation
The keyword <*insert_3*> contained a value that was not valid for this configuration. Please check the MQSC Command Reference to determine valid values for <*insert_3*>.

Response
None.

AMQ8571
<*insert_1*> authority not revoked from the <*insert_2*> group for reason "1111".

Severity
10 : Warning

Explanation
As part of queue manager migration an attempt was made to revoke <*insert_1*> authority from the <*insert_2*> group for the <*insert_3*> object. That attempt failed for reason "1111".

Response
An administrator must determine the cause of failure and then use the **setmqaut** command to manually revoke <*insert_1*> authority from the <*insert_2*> group for the <*insert_3*> object.

AMQ8572
Securing IBM WebSphere MQ objects against local groups may yield undesirable results.

Severity
10 : Warning

Explanation
A request was made to secure a IBM WebSphere MQ object against a local group in a Multi Instance queue manager environment. Access to these objects may be refused upon switch-over.

Response

An administrator should determine whether the request was intentional and use the setmqaut command to secure the IBM WebSphere MQ object against a corresponding domain group.

AMQ8574

Refreshing settings for primary installation "<*insert_1*>" (<*insert_2*>)

Severity

10 : Warning

Explanation

A request was issued to set installation "<*insert_1*>" as the primary installation however this installation is already set as the Primary Installation. The command continues and refreshes the settings which identify this installation as the primary installation.

Response

None.

AMQ8575

Unable to access installation task file "<*insert_1*>".

Severity

20 : Error

Explanation

An attempt was made to access the IBM WebSphere MQ installation task file "<*insert_1*>" however the command issued was unable to access the file.

Response

Further messages might have been issued giving more details about the failure to access the file. Check that the file exists, and the access permissions are correct. Correct any errors and re-issue the command.

AMQ8576

"<*insert_1*>" (<*insert_2*>) set as the primary installation. You must restart the operating system to complete the update.

Severity

0 : Information

Explanation

All tasks required to set installation "<*insert_1*>" as the primary installation have been completed. If the installation was not already set as the primary installation then the installation configuration has also been updated to identify installation "<*insert_1*>" as the primary installation.

In order to ensure that the updates are visible machine-wide, a restart of the operating system is required.

Response

None.

AMQ8577

Failed to set "<*insert_1*>" (<*insert_2*>) as the primary installation.

Severity

20 : Error

Explanation

The command attempted to set installation "<*insert_1*>" as the primary installation but one or more of the tasks required to set the installation as the primary installation failed to complete successfully. Any updates made by the command have been undone.

Response
Further messages have been issued giving more details about the failure. Correct any identified errors and re-issue the command.

AMQ8578
Failed to refresh configuration for primary installation "<*insert_1*>" (<*insert_2*>).

Severity
20 : Error

Explanation
The command attempted to refresh the tasks required to set installation "<*insert_1*>" as the primary installation but one or more of the tasks failed to complete successfully. Installation "<*insert_1*>" is still set as the primary installation.

Response
Further messages have been issued giving more details about the failure. Correct any identified errors and re-issue the command.

AMQ8579
Primary installation cannot be changed from "<*insert_2*>" to "<*insert_1*>".

Severity
20 : Error

Explanation
The command attempted to set installation "<*insert_1*>" as the primary installation but the operation could not be performed because installation "<*insert_2*>" is already set as the primary installation.

Response
In order to set installation "<*insert_1*>" as the primary installation you must first unset installation "<*insert_2*>" as the primary installation using the command "**setmqinst -x -n** <*insert_2*>". You can then re-issue the command to set installation "<*insert_1*>" as the primary installation.

AMQ8580
Failed to unset "<*insert_1*>" (<*insert_2*>) as the primary installation.

Severity
20 : Error

Explanation
The command attempted to unset installation "<*insert_1*>" as the primary installation but one or more of the tasks required to unset the installation as the primary installation failed to complete successfully. The installation remains set as the primary installation.

Response
Further messages have been issued giving more details about the failure. Correct any identified errors and re-issue the command.

AMQ8581
"<*insert_1*>" (<*insert_2*>) is not currently set as the primary installation.

Severity
20 : Error

Explanation
The command attempted to unset installation "<*insert_1*>" as the primary installation but installation "<*insert_1*>" is not currently set as the primary installation.

Response
Verify the name of the installation supplied is correct and re-issue the command if necessary.

AMQ8582
"<*insert_1*>" (<*insert_2*>) has been unset as the primary installation.

Severity
0 : Information

Explanation
All tasks required to unset installation "<*insert_1*>" as the primary installation have been completed.

Response
None

AMQ8583
Installation details for <*insert_3*> location <*insert_4*> missing or corrupt.

Severity
20 : Error

Explanation
The command attempted to access the installation details for installation <*insert_3*> location <*insert_4*> but the installation details were not found or are corrupt.

Response
Use the dspmqinst command to verfiy the contents of the installation configuration file. If the entry is missing or corrupt use the crtmqinst command with the -r parameter to rebuild the configuration information for the installation.

AMQ8584
Insufficient permission to update installation configuration.

Severity
20 : Error

Explanation
An attempt was made to update the IBM WebSphere MQ installation configuration for Installation <*insert_3*> location <*insert_4*> but the request was rejected as the current user does not have sufficient authority to make the update.

Response
Issue the command from a user with sufficient authority to update the installation configuration.

AMQ8585
Invalid value specified for <*insert_3*> parameter.

Severity
20 : Error

Explanation
The value supplied for the <*insert_3*> parameter is invalid.

Response
Verify that the value supplied is

- correctly specified
- contains only valid characters
- does not exceed the maxmium length for the parameter

AMQ8586
Usage: `setmqinst (-n InstName | -p InstPath) (-i | -x | -d Text)`

```
-d   Descriptive text.
-i   Set this installation as the primary installation.
-n   Installation name.
```

```
-p   Installation path.
-x   Unset this installation as the primary installation.
```

Severity
0 : Information

Explanation
This message shows correct usage.

Response
None.

AMQ8587
Note there are a number (1111) of other installations, use the "**-i**" parameter to display them.

Severity
0 : Information

Explanation

Response
None.

AMQ8588
No parameter was detected. The environment has been set for the installation from which the **setmqenv** command was issued.

Severity
10 : Warning

Explanation
The environment has been set for the installation that **setmqenv** originates from because **setmqenv** detected no parameters. If you specified parameters but these parameters have been ignored, it might be because the shell script you are using cannot pass parameters to a sourced script.

Response
If you intended to set up the environment for another installation but did not specify any parameters, issue the command again specifying the correct parameters. If you specified parameters for **setmqenv** but they have been ignored, use the **setmqenv** command from the installation you want to set up the environment for. Use the **dspmqinst** command to determine the path for other installations and use the **dspmq** command to determine the installation associated with a specific queue manager.

AMQ8589
Installation "<*insert_1*>" (<*insert_2*>) is implicitly primary.

Severity
10: Warning

Explanation
The command attempted to modify the primary installation "<*insert_1*>", however this installation is implicitly primary and can only be made non-primary by uninstalling this installation.

Response
Verify that the installation "<*insert_1*>" is required, if so no other installation can be made primary.

AMQ8590
Installation "<*insert_1*>" (<*insert_2*>) is not installed.

Severity
20 : Error

Explanation
A command was issued specifying an installation which is not currently installed. The installation must be installed for this command to run.

Response
None.

AMQ8592
Queue manager "<*insert_1*>" is now associated with installation "<*insert_2*>"

Severity
0: Information

Explanation
A command was issued that has associated queue manager "<*insert_1*>" with installation "<*insert_2*>". The queue manager is executed by this installation when it is next started.

Response
None

AMQ8593
Installation state for installation "<*insert_1*>" ("<*insert_2*>") detected as invalid.

Severity
20 : Error

Explanation
An attempt was made to modify the state of installation "<*insert_1*>" ("<*insert_2*>"), however an error was detected related to the current state of this installation which prevented the change from occurring.

Response
Investigate recent changes to the system that might have invalidated installation "<*insert_1*>". It might be necessary to contact your IBM support center, in which case a trace of the failing command might be required.

AMQ8595
The **setmqenv** command was not preceded by the **source** command.

Severity
20 : Error

Explanation
The command script containing **setmqenv** modifies the environment of the shell in which it is running. Because you did not precede **setmqenv** with the source command, it runs in a new shell and it modifies the environment in the new shell. When the **setmqenv** command ends, the new shell ends and control returns to the old shell. The old shell does not inherit changes to the environment from the new shell. The result is that the environment of the old shell, containing the **setmqenv** command does not change.

Response
Precede **setmqenv** with the **source** command. The combination of a dot followed by a space is a synonym for the source command; for example:

```
. setmqenv -s
```

AMQ8597
This process can only use installation "<*insert_4*>".

Severity
10 : Error

Explanation
An MQ_long shared library "<*insert_3*>" was detected in this process before the first connection to a queue manager was made.

Linking applications to this shared library is deprecated. Applications that do so should be re-linked because it inhibits the use of multiple installations from within the application.

As a temporary work-around, this process is allowed to connect to queue managers associated with installation "<*insert_4*>". Attempting to connect to a queue manager associated with an installation other than "<*insert_4*>" will either fail with reason code MQRC_INSTALLATION_MISMATCH or MQRC_FASTPATH_NOT_AVAILABLE.

To obtain full multiple installation functionality, you must re-link this application, omitting -lmqmcs and -lmqmzse from the link step.

Response

Re-link your application, omitting the -lmqmcs and -lmqmzse options from the command line. When the application is re-linked without libmqmcs or libmqmzse, these restrictions are lifted and the application supports connecting to queue managers from installations other than "<*insert_4*>".

This message can be suppressed by setting the AMQ_NO_MQMCS_MSG environment variable to any value.

AMQ8601

IBM WebSphere MQ trigger monitor started.

Severity

0 : Information

Explanation

The IBM WebSphere MQ trigger monitor has been started.

Response

None.

AMQ8601 (IBM i)

IBM WebSphere MQ trigger monitor started.

Severity

0 : Information

Explanation

The trigger monitor has been started with initiation queue <*insert_3*>.

Response

None.

AMQ8602

IBM WebSphere MQ trigger monitor ended with exit code <insert_1>. If this value is anything other than zero, it indicates an error condition.

Severity

0 : Information

Explanation

The IBM WebSphere MQ trigger monitor has ended with exit code <insert_1>.

Response

Look for earlier error messages from the trigger monitor.

AMQ8603

Usage: runmqtrm [-m QMgrName] [-q InitQ]

Severity

0 : Information

Explanation

None.

Response
None.

AMQ8604
Use of IBM WebSphere MQ trigger monitor not authorized.

Severity
0 : Information

Explanation
The trigger monitor cannot be run due to lack of authority to the requested queue manager or initiation queue.

Response
Obtain the necessary authority from your security officer or IBM WebSphere MQ administrator. Then try the command again.

AMQ8605
Queue manager not available to the IBM WebSphere MQ trigger monitor

Severity
0 : Information

Explanation
The queue manager specified for the trigger monitor does not exist, or is not active.

Response
Check that you named the correct queue manager. Ask your systems administrator to start it, if it is not active. Then try the command again.

AMQ8606
Insufficient storage available for the IBM WebSphere MQ trigger monitor.

Severity
0 : Information

Explanation
There was insufficient storage available for the IBM WebSphere MQ trigger monitor to run.

Response
Free some storage and then try the command again.

AMQ8607
IBM WebSphere MQ trigger monitor connection failed.

Severity
0 : Information

Explanation
The trigger monitor's connection to the requested queue manager failed because of MQI reason code <*insert_1*> from MQCONN.

Response
Consult your systems administrator about the state of the queue manager.

AMQ8608
IBM WebSphere MQ trigger monitor connection broken.

Severity
0 : Information

Explanation
The connection to the queue manager failed while the trigger monitor was running. This may be caused by an endmqm command being issued by another user, or by a queue manager error.

Response
Consult your systems administrator about the state of the queue manager.

AMQ8609
Initiation queue missing or wrong type

Severity
0 : Information

Explanation
The named initiation queue could not be found; or the queue type is not correct for an initiation queue.

Response
Check that the named queue exists, and is a local queue, or that the named queue is an alias for a local queue which exists.

AMQ8610
Initiation queue in use

Severity
0 : Information

Explanation
The IBM WebSphere MQ trigger monitor could not open the initiation queue because the queue is open for exclusive use by another application.

Response
Wait until the queue is no longer in use, and try the command again.

AMQ8611
Initiation queue could not be opened.

Severity
0 : Information

Explanation
The IBM WebSphere MQ trigger monitor could not open the initiation queue; reason code <*insert_1*> was returned from MQOPEN.

Response
Consult your systems administrator.

AMQ8612
Waiting for a trigger message

Severity
0 : Information

Explanation
The IBM WebSphere MQ trigger monitor is waiting for a message to arrive on the initiation queue.

Response
None.

AMQ8613
Initiation queue changed or deleted

Severity
0 : Information

Explanation
The IBM WebSphere MQ trigger monitor is unable to continue because the initiation queue has been deleted or changed since it was opened.

Response
Retry the command.

AMQ8614
Initiation queue not enabled for input.

Severity
0 : Information

Explanation
The IBM WebSphere MQ trigger monitor cannot read from the initiation queue because input is not enabled.

Response
Ask your systems administrator to enable the queue for input.

AMQ8615
IBM WebSphere MQ trigger monitor failed to get message.

Severity
0 : Information

Explanation
The IBM WebSphere MQ trigger monitor failed because of MQI reason code <*insert_1*> from MQGET.

Response
Consult your systems administrator.

AMQ8616
End of application trigger.

Severity
0 : Information

Explanation
The action to trigger an application has been completed.

Response
None.

AMQ8617
Not a valid trigger message.

Severity
0 : Information

Explanation
The IBM WebSphere MQ trigger monitor received a message that is not recognized as a valid trigger message. If the queue manager has a dead letter queue, the trigger monitor attempts to put the message onto that queue. If that operation succeeds, the trigger monitor continues. Otherwise, the trigger monitor checks whether the Report options in the message descriptor allow the message to be discarded. If so, the message is discarded and the trigger monitor continues. If not, the operation is backed out and the trigger monitor ends.

Response
Investigate the reason why the trigger message was invalid. Check that you have started the trigger monitor to consume from the correct queue. The trigger monitor must be given the name of an initiation queue, not an application queue. If you have started it to consume from an application queue, this should be corrected.

AMQ8618
Error <*insert_1*> starting triggered application (errno <*insert_2*>).

Severity
0 : Information

Explanation
An error was detected when trying to start the application identified in a trigger message. The system() call returned <*insert_1*>. This can cause the value of errno to be set. In this case the value was <*insert_2*>.

Response
Check that the application the trigger monitor was trying to start is available. Refer to documentation for the system() call as to why the triggered application failed to start.

AMQ8619
Application type <*insert_1*> not supported.

Severity
0 : Information

Explanation
A trigger message was received which specifies application type <*insert_1*>; the trigger monitor does not support this type.

Response
Use an alternative trigger monitor for this initiation queue.

AMQ8620
Trigger message with warning <*insert_1*>

Severity
0 : Information

Explanation
The trigger monitor received a message with a warning. For example, it may have been truncated or it could not be converted to the trigger monitor's data representation. The reason code for the warning is <*insert_1*>.

Response
None.

AMQ8621
Usage: runmqtmc [-m QMgrName] [-q InitQ]

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8622
Usage: CICS-Transaction-Name [MQTMC2 structure]

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8623
IBM WebSphere MQ listener changed.

Severity
0 : Information

Explanation
IBM WebSphere MQ listener <*insert_3*> changed.

Response
None.

AMQ8624
IBM WebSphere MQ service changed.

Severity
0 : Information

Explanation
IBM WebSphere MQ service <*insert_3*> changed.

Response
None.

AMQ8625
IBM WebSphere MQ service created.

Severity
0 : Information

Explanation
IBM WebSphere MQ service <*insert_3*> created.

Response
None.

AMQ8626
IBM WebSphere MQ listener created.

Severity
0 : Information

Explanation
IBM WebSphere MQ listener <*insert_3*> created.

Response
None.

AMQ8627
IBM WebSphere MQ service object deleted.

Severity
0 : Information

Explanation
IBM WebSphere MQ service object <*insert_3*> deleted.

Response
None.

AMQ8628
IBM WebSphere MQ listener object deleted.

Severity
0 : Information

Explanation
IBM WebSphere MQ listener object <*insert_3*> deleted.

Response
None.

AMQ8629
Display service information details.

Severity
0 : Information

Explanation
The MQSC DISPLAY SERVICE command completed successfully. Details follow this message.

Response
None.

AMQ8630
Display listener information details.

Severity
0 : Information

Explanation
The MQSC DISPLAY LISTENER command completed successfully. Details follow this message.

Response
None.

AMQ8631
Display listener status details.

Severity
0 : Information

Explanation
The MQSC DISPLAY LSSTATUS command completed successfully. Details follow this message.

AMQ8632
Display service status details.

Severity
0 : Information

Explanation
The MQSC DISPLAY SVSTATUS command completed successfully. Details follow this message.

AMQ8633
Display topic details.

Severity
0 : Information

Explanation
The MQSC DISPLAY TOPIC command completed successfully. Details follow this message.

AMQ8634 (Tandem)
Message Overflow file could not be created for queue <*insert_1*>

Severity
0 : Information

Explanation
When attempting to create a file to hold a large message (a message larger than the message overflow threshold for the queue) the Queue Manager was unable to identify a unique filename for the file. This is probably caused by too many existing large messages for the queue, or for the queue manager as a whole if the default location for large message storage is being used.

Response
Use altmqfls to change the subvolume for large message storage for this Queue.

AMQ8635 (Tandem)
A Queue Server has ended normally.

Severity
0 : Information

Explanation
A Queue Server in CPU <*insert_1*> has ended normally. The process was named <*insert_3*>.

Response
None.

AMQ8636 (Tandem)
A Queue Server has ended with errors.

Severity
0 : Information

Explanation
A Queue Server in CPU <*insert_1*> has ended with errors. The process was named <*insert_3*>. The error return code reported by the Queue Server is <*insert_2*>. The Queue Server should be restarted automatically by the Queue Manager.

Response
Verify that the Queue Server has restarted correctly. Examine the Queue Manager FD subvolume for FFST files that may have been generated by the Queue Server. Use the process name to locate the relevant FFSTs. Attempt to reconstruct the chain of events or symptoms that lead to the failure and save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ8637 (Tandem)
A Queue Server has detected a CPU failure.

Severity
0 : Information

Explanation
The Queue Server process <*insert_3*> has detected that CPU <*insert_1*> failed. If there were components of the Queue Manager that were running in this CPU, they will now no longer be available, and application connections and channels may be dropped. The Queue Manager should continue to be available to new connections and channels. Any Status Server and Queue Server processes that were running in that CPU will be replaced in other available CPUs.

Response
None normally necessary. Applications could experience the reason code MQRC_CONNECTION_BROKEN (2009) from MQI operations in progress that used agent processes running in the failed CPUs, but they should be able to immediatelt re-connect successfully.

AMQ8638 (Tandem)
A Queue Server completed takeover processing.

Severity
0 : Information

Explanation
The Queue Server process <*insert_3*> has completed processing that was associated with a prior

takeover from a failed primary Queue Server process, or the failure of the CPU that it was running in. Normal processing resumes after this point, and the Queue Server is again in a state where it is resilient to any single point of failure.

Response
None normally necessary. This message is logged to provide positive confirmation that the takeover is complete.

AMQ8639 (Tandem)
A Queue Server processed expired messages.

Severity
0 : Information

Explanation
The Queue Server process <*insert_3*> detected and processed <*insert_1*> messages that have expired.

Response
None normally necessary. This message is logged to provide information about the number of messages that expire for each Queue Server. If performance degradation is experienced for a particular Queue Server, verify that there are not an excessively large number of expired messages having to be processed by that Queue Server process.

AMQ8640 (Tandem)
Signal delivery timeout expired for an MQGET.

Severity
0 : Information

Explanation
The Queue Server process <*insert_3*> failed to open and send a signal to the application process <*insert_4*> within the timeout allowed for signal delivery. The MQGET with the MQGMO_SET_SIGNAL option issued by the application has been canceled by the Queue Server, but no notification can be delivered to the application.

Response
Manual intervention with the application may be necessary to ensure that it resumes normal processing. No further notification will be delivered to the application relating to the MQGET call that established the signal. The application can re-open the queue and re-issue the MQGET call to recover from this situation.

AMQ8641 (Tandem)
Signal delivery open error for an MQGET.

Severity
0 : Information

Explanation
The Queue Server process <*insert_3*> failed to open the application process <*insert_4*> in order to deliver a signal IPC. The file system error number was <*insert_1*>. The MQGET with the MQGMO_SET_SIGNAL option issued by the application has been canceled by the Queue Server, but no notification can be delivered to the application.

Response
Manual intervention with the application may be necessary to ensure that it resumes normal processing. No further notification will be delivered to the application relating to the MQGET call that established the signal. The application can re-open the queue and re-issue the MQGET call to recover from this situation.

AMQ8642 (Tandem)
Signal delivery error for an MQGET.

Severity
0 : Information

Explanation
The Queue Server process <*insert_3*> failed to deliver a signal IPC to the application process <*insert_4*>. The file system error number was <*insert_1*>. The MQGET with the MQGMO_SET_SIGNAL option issued by the application has been canceled by the Queue Server, but no notification can be delivered to the application.

Response
Manual intervention with the application may be necessary to ensure that it resumes normal processing. No further notification will be delivered to the application relating to the MQGET call that established the signal. The application can re-open the queue and re-issue the MQGET call to recover from this situation.

AMQ8643 (Tandem)
Signal delivery canceled for an MQGET.

Severity
0 : Information

Explanation
The Queue Server process <*insert_3*> was required to terminate an MQGET with the MQGMO_SET_SIGNAL option before the specified Waitinterval expired but failed to open the application process <*insert_4*> in order to deliver a signal IPC. The MQGET with the MQGMO_SET_SIGNAL option issued by the application has been canceled by the Queue Server, but no notification can be delivered to the application.

Response
Manual intervention with the application may be necessary to ensure that it resumes normal processing. No further notification will be delivered to the application relating to the MQGET call that established the signal. The application can re-open the queue and re-issue the MQGET call to recover from this situation.

AMQ8644 (Tandem)
Queue Server memory threshold exceeded.

Severity
0 : Information

Explanation
The Queue Server process <*insert_3*> reached the threshold memory usage (<*insert_1*> bytes) at which unused queues are eligible for unloading to disk.

Response
Verify that the Queue Server is not overloaded with queues, or that messages are not building up unexpectedly on queues supported by the Queue Server.

AMQ8645 (Tandem)
Memory usage for Queue Server now below threshold.

Severity
0 : Information

Explanation
The memory usage of Queue Server process <*insert_3*> has now reduced to below the threshold (<*insert_1*> bytes) at which unused queues are unloaded to disk.

Response
None.

AMQ8646 (Tandem)
NonStop TM/MP reports transactions disabled

Severity
0 : Information

Explanation
The Queue Server <*insert_3*> has detected that the Compaq NonStop TM/MP has disabled transactions on the NSK system. The Queue Servers in the Queue Manager will no longer accept MQPUT or non-browse MQGET operations on Persistent messages, or any sync point operation. Attempts to perform operations on persistent messages will be rejected with teh reason code MQRC_SYNCPOINT_NOT_AVAILABLE.

Response
NonStop TM/MP is a critical resource for MQSeries. Immediately determine the cause using system utilities and rectify.

AMQ8647 (Tandem)
NonStop TM/MP reports transactions enabled

Severity
0 : Information

Explanation
The Queue Server <*insert_3*> has detected that the Compaq NonStop TM/MP transactions are enabled on the NSK system.

Response
No action is normally necessary. If transactions were previously disabled, this message indicates that the system has returned to normal operation.

AMQ8648 (Tandem)
A Queue Server has started

Severity
0 : Information

Explanation
A Queue Server in CPU <*insert_1*> has started. The process is named <*insert_3*>.

Response
None.

AMQ8649
Reset IBM WebSphere MQ Queue Manager accepted.

Severity
0 : Information

Explanation
The MQSC RESET QMGR command completed successfully. Details follow this message.

Response
None.

AMQ8650
Activity information unavailable.

Severity
0 : Information

Explanation
The DSPMQRTE command was expecting activity information but it was unavailable. This does not always constitute an error. Reasons why the activity information is unavailable include the following:

1) One of the queue managers on the route did not support trace-route messaging.

2) One of the queue managers on the route did not allow route information to be returned to the reply queue. See the documentation on the ActivityRecording and TraceRouteRecording queue manager attributes for more details.

3) The report could not a find route back to the reply queue.

Response

Try and determine whether the activity information should have been available. Running the command with the 'outline' verbosity option (used with the -v flag) may be useful in determining where the message was when the activity information was generated.

AMQ8650 (IBM i)

Activity information unavailable.

Severity

0 : Information

Explanation

The DSPMQMRTE command was expecting activity information but it was unavailable. This does not always constitute an error. Reasons why the activity information is unavailable include the following:

1) One of the queue managers on the route did not support trace-route messaging.

2) One of the queue managers on the route did not allow route information to be returned to the reply queue. See the documentation on the ActivityRecording and TraceRouteRecording queue manager attributes for more details.

3) The report could not a find route back to the reply queue.

Response

Try and determine whether the activity information should have been available. Running the command with DSPINF(*ALL) may be useful in determining where the message was when the activity information was generated.

AMQ8651

DSPMQRTE command has finished with errors.

Severity

0 : Information

Explanation

The DSPMQRTE command has finished processing your request but an execution error was detected. Previous messages issued by the command can be used to identify the error.

Response

Refer to previous messages issued by the command.

AMQ8651 (IBM i)

DSPMQMRTE command has finished with errors.

Severity

0 : Information

Explanation

The DSPMQMRTE command has finished processing your request but an execution error was detected. Previous messages issued by the command can be used to identify the error.

Response

Refer to previous messages issued by the command.

AMQ8652

DSPMQRTE command has finished.

Severity
0 : Information

Explanation
The DSPMQRTE command has finished processing your request and no execution errors were detected.

Response
None.

AMQ8652 (IBM i)
DSPMQMRTE command has finished.

Severity
0 : Information

Explanation
The DSPMQMRTE command has finished processing your request and no execution errors were detected.

Response
None.

AMQ8653
DSPMQRTE command started with options <*insert_3*>.

Severity
0 : Information

Explanation
You have started the DSPMQRTE command with command line options <*insert_3*> and the command is now processing your request.

Response
Wait for the command to finish processing your request. Any further messages that are issued can be used to determine the outcome of the request.

AMQ8653 (IBM i)
DSPMQMRTE command started.

Severity
0 : Information

Explanation
You have started the DSPMQMRTE command and the command is now processing your request.

Response
Wait for the command to finish processing your request. Any further messages that are issued can be used to determine the outcome of the request.

AMQ8654
Trace-route message arrived on queue manager <*insert_3*>.

Severity
0 : Information

Explanation
The DSPMQRTE command has received confirmation of the successful arrival of the trace-route message at its destination queue on queue manager <*insert_3*>.

Response
None.

AMQ8654 (IBM i)
Trace-route message arrived on queue manager <*insert_3*>.

Severity
0 : Information

Explanation
The DSPMQMRTE command has received confirmation of the successful arrival of the trace-route message at its destination queue on queue manager <*insert_3*>.

Response
None.

AMQ8655
Trace-route message expired.

Severity
0 : Information

Explanation
The DSPMQRTE command has received confirmation that the trace-route message has expired.

Response
The expiry interval of trace-route messages generated by the DSPMQRTE command can be altered using the -xs option if this is required.

AMQ8655 (IBM i)
Trace-route message expired.

Severity
0 : Information

Explanation
The DSPMQMRTE command has received confirmation that the trace-route message has expired.

Response
The expiry interval of trace-route messages generated by the DSPMQMRTE command can be altered using the EXPIRY parameter if this is required.

AMQ8656
DSPMQRTE command received an exception report from queue manager <*insert_4*> with feedback <*insert_1*> <*insert_3*>.

Severity
0 : Information

Explanation
The DSPMQRTE command trace-route message caused an exception on queue manager <*insert_4*>. The Feedback field in the report was <*insert_1*> or <*insert_3*>.

Response
Use the feedback given to determine why the trace-route message caused the exception.

AMQ8656 (IBM i)
DSPMQMRTE command received an exception report from queue manager <*insert_4*> with feedback <*insert_1*> <*insert_3*>.

Severity
0 : Information

Explanation
The DSPMQMRTE command trace-route message caused an exception on queue manager <*insert_4*>. The Feedback field in the report was <*insert_1*> or <*insert_3*>.

Response
Use the feedback given to determine why the trace-route message caused the exception.

AMQ8657
DSPMQRTE command used <*insert_3*> 0x<*insert_4*>.

Severity
0 : Information

Explanation
You started the DSPMQRTE command specifying that it should generate a trace-route message. This took place and the trace-route message had <*insert_3*> X<*insert_4*>.

Response
The <*insert_3*> can be used to retrieve responses to this trace-route request. Run the DSPMQRTE command again specifying this identifier with the -i flag and with the target queue specified as the queue where the responses are expected to return or where the trace-route message is expected to have arrived. This may be on another queue manager.

AMQ8657 (IBM i)
DSPMQMRTE command used <*insert_3*> 0x<*insert_4*>.

Severity
0 : Information

Explanation
You started the DSPMQMRTE command specifying that it should generate a trace-route message. This took place and the trace-route message had <*insert_3*> X<*insert_4*>.

Response
The <*insert_3*> can be used to retrieve responses to this trace-route request. Run the DSPMQMRTE command again specifying this identifier for CRLLID and with the target queue specified as the queue where the responses are expected to return or where the trace-route message is expected to have arrived. This may be on another queue manager.

AMQ8658
DSPMQRTE command failed to put a message to the specified target.

Severity
0 : Information

Explanation
The request for the DSPMQRTE command to put a trace-route message was unsuccessful. Previous messages issued by the command can be used to identify why the message could not be put.

Response
Refer to previous messages issued by the command.

AMQ8658 (IBM i)
DSPMQMRTE command failed to put a message on the target queue.

Severity
0 : Information

Explanation
The request for the DSPMQMRTE command to put a trace-route message on the target queue was unsuccessful. Previous messages issued by the command can be used to identify why the message could not be put on the target queue.

Response
Refer to previous messages issued by the command.

AMQ8659
DSPMQRTE command successfully put a message on queue <*insert_3*>, queue manager <*insert_4*>.

Severity
0 : Information

Explanation
The request for the DSPMQRTE command to put a message on the target queue was successful. The target queue resolved to <*insert_3*> on queue manager <*insert_4*>.

Response
None.

AMQ8659 (IBM i)
DSPMQMRTE command successfully put a message on queue <*insert_3*>, queue manager <*insert_4*>.

Severity
0 : Information

Explanation
The request for the DSPMQMRTE command to put a message on the target queue was successful. The target queue resolved to <*insert_3*> on queue manager <*insert_4*>.

Response
None.

AMQ8660
DSPMQRTE command could not correctly order the following activities:

Severity
0 : Information

Explanation
The DSPMQRTE command received the following activities, but they could not be printed in the correct order. This is commonly because an activity report has been received that does not contain a TraceRoute PCF group or is missing the RecordedActivities parameter which would allow it to be ordered correctly.

Response
Find and correct the application that is generating activity reports without the necessary information for them to be ordered correctly.

AMQ8660 (IBM i)
DSPMQMRTE command could not correctly order the following activities:

Severity
0 : Information

Explanation
The DSPMQMRTE command received the following activities, but they could not be printed in the correct order. This is commonly because an activity report has been received that does not contain a TraceRoute PCF group or is missing the RecordedActivities parameter which would allow it to be ordered correctly.

Response
Find and correct the application that is generating activity reports without the necessary information for them to be ordered correctly.

AMQ8661
DSPMQRTE command will not put to queue <*insert_3*>, queue manager <*insert_4*>.

Severity
20 : Error

Explanation
You started the DSPMQRTE command specifying that the trace-route message must not be

delivered to a local queue (-d yes was not specified). However, it has been determined that the target queue does not resolve to a transmission queue. Therefore the DSPMQRTE command has chosen not to put the trace-route message to the target queue <*insert_3*> on queue manager <*insert_4*>.

Response
Determine whether it was expected that the target queue would resolve to a local queue.

AMQ8661 (IBM i)
DSPMQMRTE command will not put to queue <*insert_3*>, queue manager <*insert_4*>.

Severity
20 : Error

Explanation
You started the DSPMQMRTE command specifying that the trace-route message must not be delivered to a local queue (DLVRMSG(*NO) was specified). However, it has been determined that the target queue does not resolve to a transmission queue. Therefore the DSPMQMRTE command has chosen not to put the trace-route message to the target queue <*insert_3*> on queue manager <*insert_4*>.

Response
Determine whether it was expected that the target queue would resolve to a local queue.

AMQ8662
Trace-route message delivered on queue manager <*insert_3*>.

Severity
0 : Information

Explanation
The DSPMQRTE command has received confirmation of the successful delivery of the trace-route message on queue manager <*insert_3*> to a requesting application.

Response
None.

AMQ8662 (IBM i)
Trace-route message delivered on queue manager <*insert_3*>.

Severity
0 : Information

Explanation
The DSPMQMRTE command has received confirmation of the successful delivery of the trace-route message on queue manager <*insert_3*> to a requesting application.

Response
None.

AMQ8663
Client connection not supported in this environment.

Severity
20 : Error

Explanation
An attempt was made to connect to a queue manager using a client connection. However, client connections are not supported in your environment.

Response
Connect to the queue manager using a server connection.

AMQ8664
DSPMQRTE command could not connect to queue manager <*insert_3*>.

Severity
20 : Error

Explanation
You started the DSPMQRTE command specifying that it should connect to queue manager <*insert_3*>. The command could not connect to that queue manager. Previous messages issued by the command can be used to identify the error.

Response
Refer to previous messages issued by the command.

AMQ8664 (IBM i)
DSPMQMRTE command could not connect to queue manager <*insert_3*>.

Severity
20 : Error

Explanation
You started the DSPMQMRTE command specifying that it should connect to queue manager <*insert_3*>. The command could not connect to that queue manager. Previous messages issued by the command can be used to identify the error.

Response
Refer to previous messages issued by the command.

AMQ8665
DSPMQRTE command was supplied an invalid CorrelId <*insert_3*>.

Severity
20 : Error

Explanation
You started the DSPMQRTE command specifying option -i with a CorrelId <*insert_3*> that was invalid. The CorrelId was either too long or not in the correct format.

Response
Refer to the command syntax, and then try the command again.

AMQ8665 (IBM i)
DSPMQMRTE command was supplied an invalid CorrelId <*insert_3*>.

Severity
20 : Error

Explanation
You started the DSPMQMRTE command specifying CRLLID with a CorrelId <*insert_3*> that was invalid.

Response
Refer to the command syntax, and then try the command again.

AMQ8666
Queue <*insert_3*> on queue manager <*insert_4*>.

Severity
0 : Information

Explanation
The DSPMQRTE command trace-route message has been confirmed as having taken a route involving queue <*insert_3*> on queue manager <*insert_4*> in an attempt to reach the destination queue.

Response
Wait for subsequent messages which may indicate other queues or topics which the resultant message has been routed through.

AMQ8666 (IBM i)

Queue <*insert_3*> on queue manager <*insert_4*>.

Severity

0 : Information

Explanation

The DSPMQMRTE command trace-route message has been confirmed as having taken a route involving queue <*insert_3*> on queue manager <*insert_4*> in an attempt to reach the destination queue.

Response

Wait for subsequent messages which may indicate another queue which the message has been routed through.

AMQ8667

DSPMQRTE command could not open reply queue <*insert_3*>, queue manager <*insert_4*>.

Severity

20 : Error

Explanation

You started the DSPMQRTE command specifying reply queue <*insert_3*>. However the DSPMQRTE command could not successfully open a queue of that name on queue manager <*insert_4*>. Previous messages issued by the command can be used to identify the error. If the -rq option was not specified then the reply queue will be a temporary dynamic queue modelled on SYSTEM.DEFAULT.MODEL.QUEUE.

Response

Refer to previous messages issued by the command. Specify a reply queue that can be opened and then retry the command.

AMQ8667 (IBM i)

DSPMQMRTE command could not open reply queue <*insert_3*>, queue manager <*insert_4*>.

Severity

20 : Error

Explanation

You started the DSPMQMRTE command specifying reply queue <*insert_3*>. However the DSPMQMRTE command could not successfully open a queue of that name on queue manager <*insert_4*>. Previous messages issued by the command can be used to identify the error. If the RPLYQ parameter was not specified then the reply queue will be a temporary dynamic queue modelled on SYSTEM.DEFAULT.MODEL.QUEUE.

Response

Refer to previous messages issued by the command. Specify a reply queue that can be opened and then retry the command.

AMQ8668

DSPMQRTE command could not open queue <*insert_3*>, queue manager <*insert_4*>.

Severity

20 : Error

Explanation

You started the DSPMQRTE command specifying queue <*insert_3*>, using the -q option. However the DSPMQRTE command could not successfully open a queue of that name on queue manager <*insert_4*>. Previous messages issued by the command can be used to identify the error.

Response

Refer to previous messages issued by the command. Specify a queue, using the -q option, that can be opened and then retry the command.

AMQ8668 (IBM i)

DSPMQMRTE command could not open queue <*insert_3*>, queue manager <*insert_4*>.

Severity

20 : Error

Explanation

You started the DSPMQMRTE command specifying queue <*insert_3*> for the QNAME parameter. However the DSPMQMRTE command could not successfully open a queue of that name on queue manager <*insert_4*>. Previous messages issued by the command can be used to identify the error.

Response

Refer to previous messages issued by the command. Specify a queue, using the QNAME parameter, that can be opened and then retry the command.

AMQ8669

DSPMQRTE command failed to resolve queue manager <*insert_3*> on queue manager <*insert_4*>.

Severity

20 : Error

Explanation

The DSPMQRTE command attempted to resolve queue manager <*insert_3*> (supplied by the -qm option) on queue manager <*insert_4*> but the attempt failed. The queue specified by the -q option could not be opened.

Response

Ensure that queue manager <*insert_3*> can be resolved on queue manager <*insert_4*> or specify a different queue manager with the -qm option. Retry the command.

AMQ8669 (IBM i)

DSPMQMRTE command failed to resolve queue manager <*insert_3*> on queue manager <*insert_4*>.

Severity

20 : Error

Explanation

The DSPMQMRTE command attempted to resolve queue manager <*insert_3*> (supplied by the TGTMQM parameter) on queue manager <*insert_4*> but the attempt failed. The queue specified by the QNAME parameter could not be opened.

Response

Ensure that queue manager <*insert_3*> can be resolved on queue manager <*insert_4*> or specify a different queue manager with the TGTMQM parameter. Retry the command.

AMQ8670

Loading of server module <*insert_3*> failed.

Severity

20 : Error

Explanation

An attempt to dynamically load the server module <*insert_3*> failed. Typically this is because only the client modules are installed.

Response

Check which modules are installed and retry the command with the -c option specified if applicable.

AMQ8671

DSPMQRTE command was not supplied a reply queue when one was required.

Severity
20 : Error

Explanation
The DSPMQRTE command was expecting a reply queue specified by the -rq option but no reply queue was specified. Specifying a reply queue is mandatory if both the -n (no display) option and a response generating option (-ar or -ro [activity | coa | cod | exception | expiration]) is specified.

Response
Specify a reply queue and retry the command.

AMQ8672
DSPMQRTE command failed to get a message from queue <*insert_3*>, queue manager <*insert_4*>.

Severity
20 : Error

Explanation
The DSPMQRTE command attempted to get a message from queue <*insert_3*>, queue manager <*insert_4*>, but the attempt failed. Previous messages issued by the command can be used to identify the error.

Response
Refer to previous messages issued by the command.

AMQ8672 (IBM i)
DSPMQMRTE command failed to get a message from queue <*insert_3*>, queue manager <*insert_4*>.

Severity
20 : Error

Explanation
The DSPMQMRTE command attempted to get a message from queue <*insert_3*>, queue manager <*insert_4*>, but the attempt failed. Previous messages issued by the command can be used to identify the error.

Response
Refer to previous messages issued by the command.

AMQ8673
DSPMQRTE command was supplied option <*insert_3*> with an invalid object name <*insert_4*>.

Severity
20 : Error

Explanation
You started the DSPMQRTE command specifying option <*insert_3*> with an object name <*insert_4*> that is invalid. In general, the names of IBM WebSphere MQ objects can have up to 48 characters. An object name can contain the following characters:

1) Uppercase alphabetic characters (A through Z).

2) Lowercase alphabetic characters (a through z).

3) Numeric digits (0 through 9).

4) Period (.), forward slash (/), underscore (_), percent (%).

See the IBM WebSphere MQ System Administration documentation for further details and restrictions.

Response
Specify a valid object name and then try the command again.

AMQ8673 (IBM i)
DSPMQMRTE command was supplied with an invalid object name <*insert_4*>.

Severity
20 : Error

Explanation
You started the DSPMQMRTE command specifying an object name <*insert_4*> that is invalid. In general, the names of IBM WebSphere MQ objects can have up to 48 characters. An object name can contain the following characters:

1) Uppercase alphabetic characters (A through Z).

2) Lowercase alphabetic characters (a through z).

3) Numeric digits (0 through 9).

4) Period (.), forward slash (/), underscore (_), percent (%).

See the IBM WebSphere MQ System Administration documentation for further details and restrictions.

Response
Specify a valid object name and then try the command again.

AMQ8674
DSPMQRTE command is now waiting for information to display.

Severity
0 : Information

Explanation
The DSPMQRTE command has successfully generated and put the trace-route message and is now waiting for responses to be returned to the reply queue to indicate the route that the trace-route message took to its destination.

Response
Wait for responses to be returned to the reply queue and for the information about the route to be displayed.

AMQ8674 (IBM i)
DSPMQMRTE command is now waiting for information to display.

Severity
0 : Information

Explanation
The DSPMQMRTE command has successfully generated and put the trace-route message and is now waiting for responses to be returned to the reply queue to indicate the route that the trace-route message took to its destination.

Response
Wait for responses to be returned to the reply queue and for the information about the route to be displayed.

AMQ8675
DSPMQRTE command was supplied an invalid option <*insert_3*>.

Severity
20 : Error

Explanation
You started the DSPMQRTE command specifying an option of <*insert_3*> that was not recognized. The command will end.

Response
Refer to the command syntax and retry the command.

AMQ8676
DSPMQRTE command was supplied an invalid combination of options.

Severity
20 : Error

Explanation
You started the DSPMQRTE command specifying a combination of the options that is not valid. Only one of -ts or -q must be specified. The -i option cannot be specified with one or more of the following options: -ac, -ar, -d, -f, -l, -n, -o, -p, -qm, -ro, -rq, -rqm, -s, -t, -xs, -xp. The -n option cannot be specified with one or more of the following options: -b, -i, -v, -w. The -ar option can only be specified if the -ac option has also been specified. The -rqm option can only be specified if the -rq option has also been specified.

Response
Refer to the command documentation and then try the command again.

AMQ8677
DSPMQRTE command was supplied an option <*insert_3*> with conflicting values.

Severity
20 : Error

Explanation
You started the DSPMQRTE command specifying values for option <*insert_3*> that conflict. At least two values were specified for the same option but they conflict with each other. The DSPMQRTE command will end.

Response
Refer to the command syntax and then try the command again.

AMQ8677 (IBM i)
DSPMQMRTE command was supplied a parameter with conflicting values.

Severity
20 : Error

Explanation
You started the DSPMQMRTE command specifying values that conflict. At least two values were specified for the same parameter but they conflict with each other. The DSPMQMRTE command will end.

Response
Refer to the command syntax and then try the command again.

AMQ8678
DSPMQRTE command was supplied option <*insert_3*> with an invalid value <*insert_4*>.

Severity
20 : Error

Explanation
You started the DSPMQRTE command specifying an invalid option value. The <*insert_4*> value for option <*insert_3*> is either not recognized or of an incorrect format.

Response
Refer to the command syntax, and then try the command again.

AMQ8678 (IBM i)
DSPMQMRTE command was supplied an invalid value <*insert_4*>.

Severity
20 : Error

Explanation
You started the DSPMQMRTE command specifying an invalid parameter value. Value <*insert_4*> is either not recognized or of an incorrect format.

Response
Refer to the command syntax, and then try the command again.

AMQ8679
Persistent messages not allowed on reply queue <*insert_3*>, queue manager <*insert_4*>.

Severity
20 : Error

Explanation
It was specified that the DSPMQRTE command should put a persistent trace-route message on the target queue (see the documentation for the -l option). However, persistent messages are not allowed on the reply queue because it is a temporary dynamic queue and persistent responses were expected to return to it. The trace-route message was not put on the target queue.

Response
Ensure that the reply queue is not a temporary dynamic queue. Use the -rq option to specify the reply queue.

AMQ8679 (IBM i)
Persistent messages not allowed on reply queue <*insert_3*>, queue manager <*insert_4*>.

Severity
20 : Error

Explanation
It was specified that the DSPMQMRTE command should put a persistent trace-route message on the target queue (see the documentation for the MSGPST parameter). However, persistent messages are not allowed on the reply queue because it is a temporary dynamic queue and persistent responses were expected to return to it. The trace-route message was not put on the target queue.

Response
Ensure that the reply queue is not a temporary dynamic queue. Use the RPLYQ parameter to specify the reply queue.

AMQ8680
DSPMQRTE command failed to open queue manager <*insert_3*>.

Severity
20 : Error

Explanation
The DSPMQRTE command tried to open queue manager <*insert_3*> for inquire but the open failed. Previous messages issued by the command can be used to identify the error.

Response
Refer to previous messages issued by the command.

AMQ8680 (IBM i)
DSPMQMRTE command failed to open queue manager <*insert_3*>.

Severity
20 : Error

Explanation
The DSPMQMRTE command tried to open queue manager <*insert_3*> for inquire but the open failed. Previous messages issued by the command can be used to identify the error.

Response
Refer to previous messages issued by the command.

AMQ8681
DSPMQRTE command has detected an error, reason <*insert_1*> <*insert_3*>.

Severity
20 : Error

Explanation
The DSPMQRTE command has detected an error from an MQI call during the execution of your request. The reason for failure is <*insert_1*> or <*insert_3*>.

Response
See the IBM WebSphere MQ Messages documentation for an explanation of the reason for failure. Follow any correction action and retry the command.

AMQ8681 (IBM i)
DSPMQMRTE command has detected an error, reason <*insert_1*> <*insert_3*>.

Severity
20 : Error

Explanation
The DSPMQMRTE command has detected an error from an MQI call during the execution of your request. The reason for failure is <*insert_1*> or <*insert_3*>.

Response
See the IBM WebSphere MQ Messages documentation for an explanation of the reason for failure. Follow any correction action and retry the command.

AMQ8682
Trace-route message processed by application <*insert_3*> on queue manager <*insert_4*>.

Severity
0 : Information

Explanation
The DSPMQRTE command successfully put a trace-route message on the target queue and it was then delivered by queue manager <*insert_4*> to application <*insert_3*> which processed the message.

Response
Determine if it was expected that this application would process the trace-route message.

AMQ8682 (IBM i)
Trace-route message processed by application <*insert_3*> on queue manager <*insert_4*>.

Severity
0 : Information

Explanation
The DSPMQMRTE command successfully put a trace-route message on the target queue and it was then delivered by queue manager <*insert_4*> to application <*insert_3*> which processed the message.

Response
Determine if it was expected that this application would process the trace-route message.

AMQ8683
Trace-route message reached the maximum activities limit of <*insert_1*>.

Severity
0 : Information

Explanation
The DSPMQRTE command trace-route message was rejected after the number of activities of which it was a participant reached the maximum activities limit. The limit was set to <*insert_1*>. The maximum activities limit is set using the -s option.

Response
Using the output from the command determine whether it is expected that the trace-route message should have reached the maximum activities limit.

AMQ8683 (IBM i)
Trace-route message reached the maximum activities limit of <*insert_1*>.

Severity
0 : Information

Explanation
The DSPMQMRTE command trace-route message was rejected after the number of activities of which it was a participant reached the maximum activities limit. The limit was set to <*insert_1*>. The maximum activities limit is set using the MAXACTS parameter.

Response
Using the output from the command determine whether it is expected that the trace-route message should have reached the maximum activities limit.

AMQ8684
Trace-route message reached trace-route incapable queue manager <*insert_3*>.

Severity
0 : Information

Explanation
The DSPMQRTE command trace-route message was rejected because it was about to be sent to a queue manager which does not support trace-route messaging. This behaviour was requested because the forwarding options specified on the command only allowed the trace-route message to be forwarded to queue managers which support trace-route messaging. Sending a trace-route message to a queue manager which cannot process it in accordance with its specified options could cause undesirable results, including having the trace-route message be put to a local queue on the remote queue manager. If this is acceptable then the '-f all' option can be specified.

Response
Retry the command with different forwarding options, if appropriate.

AMQ8684 (IBM i)
Trace-route message reached trace-route incapable queue manager <*insert_3*>.

Severity
0 : Information

Explanation
The DSPMQMRTE command trace-route message was rejected because it was about to be sent to a queue manager which does not support trace-route messaging. This behaviour was requested because the forwarding options specified on the command only allowed the trace-route message to be forwarded to queue managers which support trace-route messaging. Sending a trace-route message to a queue manager which cannot process it in accordance with its specified options could cause undesirable results, including having the trace-route message be put to a local queue on the remote queue manager. If this is acceptable then FWDMSG(*ALL) can be specified.

Response
Retry the command with different forwarding options, if appropriate.

AMQ8685
Trace-route message rejected due to invalid forwarding options X<*insert_1*>.

Severity
20 : Error

Explanation
The DSPMQRTE command trace-route message was rejected because one or more of the forwarding options was not recognized and it was in the MQROUTE_FORWARD_REJ_UNSUP_MASK bitmask. The forwarding options, when they were last observed, in hexadecimal were X<*insert_1*>.

Response
Change the application that inserted the forwarding options that were not recognized to insert valid and supported forwarding options.

AMQ8685 (IBM i)
Trace-route message rejected due to invalid forwarding options X<*insert_1*>.

Severity
20 : Error

Explanation
The DSPMQMRTE command trace-route message was rejected because one or more of the forwarding options was not recognized and it was in the MQROUTE_FORWARD_REJ_UNSUP_MASK bitmask. The forwarding options, when they were last observed, in hexadecimal were X<*insert_1*>.

Response
Change the application that inserted the forwarding options that were not recognized to insert valid and supported forwarding options.

AMQ8686
Trace-route message rejected due to invalid delivery options X<*insert_1*>.

Severity
20 : Error

Explanation
The DSPMQRTE command trace-route message was rejected because one or more of the delivery options was not recognized and it was in the MQROUTE_DELIVER_REJ_UNSUP_MASK bitmask. The delivery options, when they were last observed, in hexadecimal were X<*insert_1*>.

Response
Change the application that inserted the delivery options that were not recognized to insert valid and supported delivery options.

AMQ8686 (IBM i)
Trace-route message rejected due to invalid delivery options X<*insert_1*>.

Severity
20 : Error

Explanation
The DSPMQMRTE command trace-route message was rejected because one or more of the delivery options was not recognized and it was in the MQROUTE_DELIVER_REJ_UNSUP_MASK bitmask. The delivery options, when they were last observed, in hexadecimal were X<*insert_1*>.

Response
Change the application that inserted the delivery options that were not recognized to insert valid and supported delivery options.

AMQ8687
Program ending.

Severity
0 : Information

Explanation
The program operation was interrupted by a SIGINT signal on UNIX systems or a CTRL+c/CTRL+BREAK signal on Windows systems. The program is now ending.

Response
Wait for the program to end.

AMQ8688
DSPMQRTE command has detected an unexpected error, reason <*insert_1*> <*insert_3*>.

Severity
20 : Error

Explanation
The DSPMQRTE command has detected an unexpected error during execution of your request. The reason for failure is <*insert_1*> or <*insert_3*>. The IBM WebSphere MQ error recording routine has been called.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8688 (IBM i)
DSPMQMRTE command has detected an unexpected error, reason <*insert_1*> <*insert_3*>.

Severity
20 : Error

Explanation
The DSPMQMRTE command has detected an unexpected error during execution of your request. The reason for failure is <*insert_1*> or <*insert_3*>. The IBM WebSphere MQ error recording routine has been called.

Response
Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8689
Loading of client module <*insert_3*> failed.

Severity
20 : Error

Explanation
An attempt to dynamically load the client module <*insert_3*> failed. Typically this is because the client modules are not installed.

Response
Check which modules are installed and retry the command without the -c option specified, if applicable.

AMQ8690
IBM WebSphere MQ topic created.

Severity
0 : Information

Explanation
IBM WebSphere MQ topic <*insert_3*> created.

Response
None.

AMQ8691
IBM WebSphere MQ topic changed.

Severity
0 : Information

Explanation
IBM WebSphere MQ topic <*insert_5*> changed.

Response
None.

AMQ8692
IBM WebSphere MQ topic object deleted.

Severity
0 : Information

Explanation
IBM WebSphere MQ topic object <*insert_3*> deleted.

Response
None.

AMQ8694
DSPMQRTE command successfully put a message to topic string <*insert_3*>, queue manager <*insert_4*>.

Severity
0 : Information

Explanation
The request for the DSPMQRTE command to put a message was successful. The destination specified resolved to topic string <*insert_3*> on queue manager <*insert_4*>.

Response
None.

AMQ8695
Topic string <*insert_3*> on queue manager <*insert_4*>.

Severity
0 : Information

Explanation
The DSPMQRTE command trace-route message has been confirmed as having taken a route involving topic string <*insert_3*> on queue manager <*insert_4*>.

Response
Wait for subsequent messages which may indicate other queues or topics which the resultant messages have been routed through.

AMQ8696
DSPMQRTE command could not open topic string <*insert_3*>, queue manager <*insert_4*>.

Severity
20 : Error

Explanation
You started the DSPMQRTE command specifying topic string <*insert_3*>, using the -ts option. However the DSPMQRTE command could not successfully open that topic string on queue manager <*insert_4*>. Previous messages issued by the command can be used to identify the error.

Response
Refer to previous messages issued by the command. Specify a topic string, using the -ts option, that can be opened and then retry the command.

AMQ8697
DSPMQRTE command could not open topic <*insert_3*>, queue manager <*insert_4*>.

Severity
20 : Error

Explanation
You started the DSPMQRTE command specifying topic <*insert_3*>, using the -to option. However the DSPMQRTE command could not successfully open a topic object of that name on queue manager <*insert_4*>. Previous messages issued by the command can be used to identify the error.

Response
Refer to previous messages issued by the command. Specify a topic, using the -to option, that can be opened and then retry the command.

AMQ8698
Too many keywords have been specified.

Severity
0 : Information

Explanation
Too many keywords for the command have been specified.

Response
None

AMQ8701
Usage: rcdmqimg [-z] [-l] [-m QMgrName] -t ObjType [GenericObjName]

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8702
Usage: rcrmqobj [-z] [-m QMgrName] -t ObjType [GenericObjName]

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8703
Usage: dspmqfls [-m QMgrName] [-t ObjType] GenericObjName

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8704 (Tandem)
Usage: altmqfls [--qmgr QMgrName] [--type ObjType] [--volume Volume] [-server ServerName] [--qsoptions options] [--msgofthresh Threshold] [--browse Bytes] [--meascount counter] [--qsize (primaryextent,secondaryextent, maxextents)] [--oflowsize (primaryextent,secondaryextent, maxextents)] ObjectName

Severity
0 : Information

Response
None.

AMQ8705
Display Queue Manager Status Details.

Severity
0 : Information

Explanation
The MQSC DISPLAY QMSTATUS command completed successfully. Details follow this message.

Response
None.

AMQ8706
Request to stop IBM WebSphere MQ Listener accepted.

Severity
0 : Information

Explanation
The channel listener program has been requested to stop. This command executes asynchronously so may complete after this message has been displayed.

Response
Further information on the progress of the request is available in the queue manager error log.

AMQ8707 (IBM i)
Start IBM WebSphere MQ DLQ Handler

Severity
0 : Information

AMQ8708
Dead-letter queue handler started to process INPUTQ(<*insert_3*>).

Severity
0 : Information

Explanation
The dead-letter queue handler (runmqdlq) has been started and has parsed the input file without detecting any errors and is about to start processing the queue identified in the message.

Response
None.

AMQ8708 (IBM i)
Dead-letter queue handler started to process INPUTQ(<*insert_3*>).

Severity
0 : Information

Explanation
The dead-letter queue handler (STRMQMDLQ) has been started and has parsed the input file without detecting any errors and is about to start processing the queue identified in the message.

Response
None.

AMQ8709
Dead-letter queue handler ending.

Severity
0 : Information

Explanation
The dead-letter queue handler (runmqdlq) is ending because the WAIT interval has expired and there are no messages on the dead-letter queue, or because the queue manager is shutting down, or because the dead-letter queue handler has detected an error. If the dead-letter queue handler has detected an error, an earlier message will have identified the error.

Response
None.

AMQ8709 (IBM i)
Dead-letter queue handler ending.

Severity
0 : Information

Explanation
The dead-letter queue handler (STRMQMDLQ) is ending because the WAIT interval has expired and there are no messages on the dead-letter queue, or because the queue manager is shutting down, or because the dead-letter queue handler has detected an error. If the dead-letter queue handler has detected an error, an earlier message will have identified the error.

Response
None.

AMQ8710
Usage: runmqdlq [QName[QMgrName]].

Severity
0 : Information

Explanation
Syntax for the usage of runmqdlq.

Response
None.

AMQ8711 (IBM i)
Job <*insert_3*> has terminated unexpectedly.

Severity
10 : Warning

Explanation
Execution of the command <*insert_5*> caused job <*insert_3*> to be started, but the job terminated unexpectedly.

Response
Consult the log for job <*insert_3*> to determine why it was terminated.

AMQ8712
PubSub is disabled for this queue manager.

Severity
40 : Stop Error

Explanation
The queue manager configuration inhibits any publication or subscription commands.

Response
Check the queue manager options and ensure they are correct.

AMQ8721
Dead-letter queue message not prefixed by a valid MQDLH.

Severity
10 : Warning

Explanation
The dead-letter queue handler (runmqdlq) retrieved a message from the nominated dead-letter queue, but the message was not prefixed by a recognizable MQDLH. This typically occurs because an application is writing directly to the dead-letter queue but is not prefixing messages with a valid MQDLH. The message is left on the dead-letter queue and the dead-letter queue handler continues to process the dead-letter queue. Each time the dead-letter queue handler repositions itself to a position before this message to process messages that could not be processed on a previous scan it will reprocess the failing message and will consequently re-issue this message.

Response
Remove the invalid message from the dead-letter queue. Do not write messages to the dead-letter queue unless they have been prefixed by a valid MQDLH. If you require a dead-letter queue handler that can process messages not prefixed by a valid MQDLH, you must change the sample program called amqsdlq to cater for your needs.

AMQ8721 (IBM i)
Dead-letter queue message not prefixed by a valid MQDLH.

Severity
10 : Warning

Explanation
The dead-letter queue handler (STRMQMDLQ) retrieved a message from the nominated dead-letter queue, but the message was not prefixed by a recognizable MQDLH. This typically occurs because an application is writing directly to the dead-letter queue but is not prefixing messages with a valid MQDLH. The message is left on the dead-letter queue and the dead-letter queue handler continues to process the dead-letter queue. Each time the dead-letter queue handler repositions itself to a position before this message to process messages that could not be processed on a previous scan it will reprocess the failing message and will consequently re-issue this message.

Response
Remove the invalid message from the dead-letter queue. Do not write messages to the dead-letter queue unless they have been prefixed by a valid MQDLH. If you require a dead-letter queue handler that can process messages not prefixed by a valid MQDLH, you must change the sample program called amqsdlq to cater for your needs.

AMQ8722
Dead-letter queue handler unable to put message: Rule <*insert_1*> Reason <*insert_2*>.

Severity
10 : Warning

Explanation
This message is produced by the dead-letter queue handler when it is requested to redirect a message to another queue but is unable to do so. If the reason that the redirect fails is the same as the reason the message was put to the dead-letter queue then it is assumed that no new error has occurred and no message is produced. The retry count for the message will be incremented and the dead-letter queue handler will continue.

Response
Investigate why the dead-letter queue handler was unable to put the message to the dead-letter queue. The line number of the rule used to determine the action for the message should be used to help identify to which queue the dead-letter queue handler attempted to PUT the message.

AMQ8723
Display pub/sub status details.

Severity
0 : Information

Explanation
The MQSC DISPLAY PUBSUB command completed successfully. Details follow this message.

AMQ8724
Refresh IBM WebSphere MQ Queue Manager accepted.

Severity
0 : Information

Explanation
The MQSC REFRESH QMGR command completed successfully. Details follow this message.

Response
None.

AMQ8729
The listener could not be stopped at this time.

Severity
10 : Warning

Explanation
A request was made to stop a listener, however the listener could not be stopped at this time. Reasons why a listener could not be stopped are:

The listener has active channels and the communications protocol being used is LU 6.2, SPX or NETBIOS.

The listener has active channels and the communications protocol being used is TCP/IP and channel threads are restricted to run within the listener process.

Response
End the channels using the STOP CHANNEL command and reissue the request.

AMQ8730
Listener already active.

Severity
10 : Warning

Explanation
A request was made to start a listener, however the listener is already running and cannot be started.

Response
If you do not want the listener to be running, then use the STOP LISTENER command to stop the listener before reissuing the command.

AMQ8731
Listener not active.

Severity
10 : Warning

Explanation
A request was made to stop a listener, however the listener is not running.

Response
If the listener should be running then use the START LISTENER command to start the listener.

AMQ8732
Request to stop Service accepted.

Severity
0 : Information

Explanation
The Request to stop the Service has been accepted and is being processed.

Response
None.

AMQ8733
Request to start Service accepted.

Severity
0 : Information

Explanation
The Request to start the Service has been accepted and is being processed.

Response
None.

AMQ8734
Command failed - Program could not be started.

Severity
20 : Error

Explanation
The command requested was unsuccessful because the program which was defined to be run to complete the action could not be started.

Reasons why the program could not be started are

The program does not exist at the specified location.

The WebSphere MQ user does not have sufficient access to execute the program.

If STDOUT or STDERR are defined for the program, the IBM WebSphere MQ user does not have sufficient access to the locations specified.

Response
Check the Queue Manager error logs for further details on the cause of the failure and correct before reissuing the command.

AMQ8735
Command failed - Access denied.

Severity
20 : Error

Explanation
The command requested was unsuccessful because access was denied attempting to execuete the program defined to run.

Response
Examine the definition of the object and ensure that the path to program file is correct. If the defined path is correct ensure that the program exists at the location specified and that the WebSphere MQ user has access to execute the program.

AMQ8737
Service already active.

Severity
10 : Warning

Explanation
A request was made to start a service, however the service is already running and cannot be started.

Response
If you do not want the service to be running, then use the STOP SERVICE command to stop the service before reissuing the command. If the intention is to allow more than one instance of s service to run, then the service definition may be altered to be of SERVTYPE(COMMAND) which allows more than one instance of the service to be executed concurrently, however status of services of type COMMAND is not available from the SVSTAUS command.

AMQ8738
Service not active.

Severity
10 : Warning

Explanation
A request was made to stop a service, however the service is not running.

Response
If the service should be running then use the START SERVICE command to start the service.

AMQ8739
Stop cannot be executed for service with blank STOPCMD.

Severity
20 : Error

Explanation
A request was made to STOP a service, however the service has no Stop Command defined so no action could be taken.

Response
Examine the definition of the service and if necessary update the definition of the service to include the command to run when STOP is issued. For services of type 'SERVER' the command to run when STOP is executed is stored when the service is started so any alteration to the service definition will have no effect until the service is restarted following the update.

AMQ8740
Start cannot be executed for service with blank STARTCMD.

Severity
20 : Error

Explanation

A request was made to START a service, however the service has no Start Command defined so no action could be taken.

Response

Examine the definition of the service and if necessary update the definition of the service to include the command to run when START is issued.

AMQ8741

Unable to connect to queue manager.

Severity

20 : Error

Explanation

The dead-letter queue handler (runmqdlq) could not connect to queue manager <*insert_3*>. This message is typically issued when the requested queue manager has not been started or is quiescing, or if the process does not have sufficient authority. The completion code (<*insert_1*>) and the reason (<*insert_2*>) can be used to identify the error. The dead-letter queue handler ends.

Response

Take appropriate action based upon the completion code and reason.

AMQ8741 (IBM i)

Unable to connect to queue manager.

Severity

20 : Error

Explanation

The dead-letter queue handler (STRMQMDLQ) could not connect to queue manager <*insert_3*>. This message is typically issued when the requested queue manager has not been started or is quiescing, or if the process does not have sufficient authority. The completion code (<*insert_1*>) and the reason (<*insert_2*>) can be used to identify the error. The dead-letter queue handler ends.

Response

Take appropriate action based upon the completion code and reason.

AMQ8742

Unable to open queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

20 : Error

Explanation

The dead-letter queue handler (runmqdlq) could not open the queue manager object. This message is typically issued because of a resource shortage or because the process does not have sufficient authority. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response

Take appropriate action based upon the completion code and reason.

AMQ8742 (IBM i)

Unable to open queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

20 : Error

Explanation

The dead-letter queue handler (STRMQMDLQ) could not open the queue manager object. This message is typically issued because of a resource shortage or because the process does not have sufficient authority. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response
Take appropriate action based upon the completion code and reason.

AMQ8743
Unable to inquire on queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity
20 : Error

Explanation
The dead-letter queue handler (runmqdlq) could not inquire on the queue manager. This message is typically issued because of a resource shortage or because the queue manager is ending. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response
Take appropriate action based upon the completion code and reason.

AMQ8743 (IBM i)
Unable to inquire on queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity
20 : Error

Explanation
The dead-letter queue handler (STRMQMDLQ) could not inquire on the queue manager. This message is typically issued because of a resource shortage or because the queue manager is ending. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response
Take appropriate action based upon the completion code and reason.

AMQ8744
Unable to close queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity
20 : Error

Explanation
The dead-letter queue handler (runmqdlq) could not close the queue manager. This message is typically issued because of a resource shortage or because the queue manager is ending. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response
Take appropriate action based upon the completion code and reason.

AMQ8744 (IBM i)
Unable to close queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity
20 : Error

Explanation
The dead-letter queue handler (STRMQMDLQ) could not close the queue manager. This message is typically issued because of a resource shortage or because the queue manager is ending. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response
Take appropriate action based upon the completion code and reason.

AMQ8745
Unable to open dead-letter queue for browse.

Severity
20 : Error

Explanation
The dead-letter queue handler (runmqdlq) could not open the dead-letter queue <*insert_3*> for browsing. This message is typically issued because another process has opened the dead-letter queue for exclusive access, or because an invalid dead-letter queue name was specified. Other possible reasons include resource shortages or insufficient authority. The completion code(<*insert_1*>) and the reason(<*insert_2*>) can be used to identify the error. The dead-letter queue handler ends.

Response
Take appropriate action based upon the completion code and reason.

AMQ8745 (IBM i)
Unable to open dead-letter queue for browse.

Severity
20 : Error

Explanation
The dead-letter queue handler (STRMQMDLQ) could not open the dead-letter queue <*insert_3*> for browsing. This message is typically issued because another process has opened the dead-letter queue for exclusive access, or because an invalid dead-letter queue name was specified. Other possible reasons include resource shortages or insufficient authority. The completion code(<*insert_1*>) and the reason(<*insert_2*>) can be used to identify the error. The dead-letter queue handler ends.

Response
Take appropriate action based upon the completion code and reason.

AMQ8746
Unable to close dead-letter queue: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity
20 : Error

Explanation
The dead-letter queue handler (runmqdlq) could not close the dead-letter queue. This message is typically issued because of a resource shortage or because the queue manager is ending. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response
Take appropriate action based upon the completion code and reason.

AMQ8746 (IBM i)
Unable to close dead-letter queue: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity
20 : Error

Explanation
The dead-letter queue handler (STRMQMDLQ) could not close the dead-letter queue. This message is typically issued because of a resource shortage or because the queue manager is ending. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response
Take appropriate action based upon the completion code and reason.

AMQ8747
Integer parameter outside permissible range.

Severity
20 : Error

Explanation
The integer parameter (<*insert_2*>) supplied to the dead-letter handler was outside of the valid range for <*insert_3*> on line <*insert_1*>.

Response
Correct the input data and restart the dead-letter queue handler.

AMQ8748
Unable to get message from dead-letter queue: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity
20 : Error

Explanation
The dead-letter queue handler (runmqdlq) could not get the next message from the dead-letter queue. This message is typically issued because of the queue manager ending, a resource problem, or another process having deleted the dead-letter queue. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response
Take appropriate action based upon the completion code and reason.

AMQ8748 (IBM i)
Unable to get message from dead-letter queue: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity
20 : Error

Explanation
The dead-letter queue handler (STRMQMDLQ) could not get the next message from the dead-letter queue. This message is typically issued because of the queue manager ending, a resource problem, or another process having deleted the dead-letter queue. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response
Take appropriate action based upon the completion code and reason.

AMQ8749
Unable to commit/backout action on dead-letter queue: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity
20 : Error

Explanation
The dead-letter queue handler (runmqdlq) was unable to commit or backout an update to the dead-letter queue. This message is typically issued because of the queue manager ending, or because of a resource shortage. If the queue manager has ended, the update to the dead-letter queue (and any associated updates) will be backed out when the queue manager restarts. If the problem was due to a resource problem then the updates will be backed out when the dead-letter queue handler terminates. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response
Take appropriate action based upon the completion code and reason.

AMQ8749 (IBM i)

Unable to commit/backout action on dead-letter queue: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

20 : Error

Explanation

The dead-letter queue handler (STRMQMDLQ) was unable to commit or backout an update to the dead-letter queue. This message is typically issued because of the queue manager ending, or because of a resource shortage. If the queue manager has ended, the update to the dead-letter queue (and any associated updates) will be backed out when the queue manager restarts. If the problem was due to a resource problem then the updates will be backed out when the dead-letter queue handler terminates. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response

Take appropriate action based upon the completion code and reason.

AMQ8750

No valid input provided to runmqdlq.

Severity

20 : Error

Explanation

Either no input was provided to runmqdlq, or the input to runmqdlq contained no valid message templates. If input was provided to runmqdlq but was found to be invalid, earlier messages will have been produced explaining the cause of the error. The dead-letter queue handler will ends.

Response

Correct the input data and restart the dead-letter queue handler.

AMQ8750 (IBM i)

No valid input provided to STRMQMDLQ.

Severity

20 : Error

Explanation

Either no input was provided to STRMQMDLQ, or the input to STRMQMDLQ contained no valid message templates. If input was provided to STRMQMDLQ but was found to be invalid, earlier messages will have been produced explaining the cause of the error. The dead-letter queue handler will ends.

Response

Correct the input data and restart the dead-letter queue handler.

AMQ8751

Unable to obtain private storage.

Severity

20 : Error

Explanation

The dead-letter queue handler (runmqdlq) was unable to obtain private storage. This problem would typically arise as a result of some more global problem. For example if there is a persistent problem that is causing messages to be written to the DLQ and the same problem (for example queue full) is preventing the dead-letter queue handler from taking the requested action with the message, it is necessary for the dead-letter queue handler to maintain a large amount of state data to remember the retry counts associated with each message, or if the dead-letter queue contains a large number of messages and the rules table has directed the dead-letter queue handler to ignore the messages.

Response

Investigate if some more global problem exists, and if the dead-letter queue contains a large number of messages. If the problem persists save any generated output files and use either the IBM WebSphere MQ support web page, or the IBM support assistant at the IBM SupportAssistant web page, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ8751 (IBM i)

Unable to obtain private storage.

Severity

20 : Error

Explanation

The dead-letter queue handler (STRMQMDLQ) was unable to obtain private storage. This problem would typically arise as a result of some more global problem. For example if there is a persistent problem that is causing messages to be written to the DLQ and the same problem (for example queue full) is preventing the dead-letter queue handler from taking the requested action with the message, it is necessary for the dead-letter queue handler to maintain a large amount of state data to remember the retry counts associated with each message, or if the dead-letter queue contains a large number of messages and the rules table has directed the dead-letter queue handler to ignore the messages.

Response

Investigate if some more global problem exists, and if the dead-letter queue contains a large number of messages. If the problem persists save any generated output files and use either the IBM WebSphere MQ support web page, or the IBM support assistant at the IBM SupportAssistant web page, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ8752

Parameter(<*insert_3*>) exceeds maximum length on line <*insert_1*>.

Severity

20 : Error

Explanation

A parameter supplied as input to the dead-letter handler exceeded the maximum length for parameters of that type.

Response

Correct the input data and restart the dead-letter queue handler.

AMQ8753

Duplicate parameter(<*insert_3*>) found on line <*insert_1*>.

Severity

20 : Error

Explanation

Two or more parameters of the same type were supplied on a single input line to the dead-letter queue handler.

Response

Correct the input and restart the dead-letter queue handler.

AMQ8754

Display topic status details.

Severity

0 : Information

Explanation
The MQSC DISPLAY TPSTATUS command completed successfully. Details follow this message.

AMQ8755
IBM WebSphere MQ topicstr cleared successfully.

Severity
0 : Information

Explanation
All messages on topicstr have been deleted.

AMQ8756
Error detected releasing private storage.

Severity
20 : Error

Explanation
The dead-letter queue handler (runmqdlq) was informed of an error while attempting to release an area of private storage. The dead-letter queue handler ends.

Response
This message should be preceded by a message or FFST information from the internal routine that detected the error. Take the action associated with the earlier error information.

AMQ8756 (IBM i)
Error detected releasing private storage.

Severity
20 : Error

Explanation
The dead-letter queue handler (STRMQMDLQ) was informed of an error while attempting to release an area of private storage. The dead-letter queue handler ends.

Response
This message should be preceded by a message or FFST information from the internal routine that detected the error. Take the action associated with the earlier error information.

AMQ8757
Integer parameter(<*insert_3*>) outside permissible range on line <*insert_1*>.

Severity
20 : Error

Explanation
An integer supplied as input to the dead-letter handler was outside of the valid range of integers supported by the dead-letter queue handler.

Response
Correct the input data and restart the dead-letter queue handler.

AMQ8758
<*insert_1*> errors detected in input to runmqdlq.

Severity
20 : Error

Explanation
One or more errors have been detected in the input to the dead-letter queue handler(runmqdlq). Error messages will have been generated for each of these errors. The dead-letter queue handler ends.

Response
Correct the input data and restart the dead-letter queue handler.

AMQ8758 (IBM i)
<*insert_1*> errors detected in input to STRMQMDLQ.

Severity
20 : Error

Explanation
One or more errors have been detected in the input to the dead-letter queue handler(STRMQMDLQ). Error messages will have been generated for each of these errors. The dead-letter queue handler ends.

Response
Correct the input data and restart the dead-letter queue handler.

AMQ8759
Invalid combination of parameters to dead-letter queue handler on line <*insert_1*>.

Severity
20 : Error

Explanation
An invalid combination of input parameters has been supplied to the dead-letter queue handler. Possible causes are: no ACTION specified, ACTION(FWD) but no FWDQ specified, HEADER(YES|NO) specified without ACTION(FWD).

Response
Correct the input data and restart the dead-letter queue handler.

AMQ8760
Unexpected failure while initializing process: Reason = <*insert_1*>.

Severity
30 : Severe error

Explanation
The dead-letter queue handler (runmqdlq) could not perform basic initialization required to use MQ services because of an unforeseen error. The dead-letter queue handler ends.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8760 (IBM i)
Unexpected failure while initializing process: Reason = <*insert_1*>.

Severity
30 : Severe error

Explanation
The dead-letter queue handler (STRMQMDLQ) could not perform basic initialization required to use MQ services because of an unforeseen error. The dead-letter queue handler ends.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a

solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8761

Unexpected failure while connecting to queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

30 : Severe error

Explanation

The dead-letter queue handler (runmqdlq) could not connect to the requested queue manager because of an unforeseen error. The dead-letter queue handler ends.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8761 (IBM i)

Unexpected failure while connecting to queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

30 : Severe error

Explanation

The dead-letter queue handler (STRMQMDLQ) could not connect to the requested queue manager because of an unforeseen error. The dead-letter queue handler ends.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8762

Unexpected error while attempting to open queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

30 : Severe error

Explanation

The dead-letter queue handler (runmqdlq) could not open the queue manager because of an unforeseen error. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8762 (IBM i)

Unexpected error while attempting to open queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

30 : Severe error

Explanation

The dead-letter queue handler (STRMQMDLQ) could not open the queue manager because of an unforeseen error. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8763

Unexpected error while inquiring on queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

30 : Severe error

Explanation

The dead letter queue handler (runmqdlq) could not inquire on the queue manager because of an unforeseen error. The completion code and the reason can be used to identify the error. The dead letter queue handler ends.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8763 (IBM i)

Unexpected error while inquiring on queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

30 : Severe error

Explanation

The dead letter queue handler (STRMQMDLQ) could not inquire on the queue manager because of an unforeseen error. The completion code and the reason can be used to identify the error. The dead letter queue handler ends.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8764

Unexpected error while attempting to close queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

30 : Severe error

Explanation

The dead-letter queue handler (runmqdlq) could not close the queue manager because of an unforeseen error. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8764 (IBM i)

Unexpected error while attempting to close queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

30 : Severe error

Explanation

The dead-letter queue handler (STRMQMDLQ) could not close the queue manager because of an unforeseen error. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8765

Unexpected failure while opening dead-letter queue for browse: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

30 : Severe error

Explanation

The dead-letter queue handler (runmqdlq) could not open the dead-letter queue for browsing because of an unforeseen error. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8765 (IBM i)

Unexpected failure while opening dead-letter queue for browse: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

30 : Severe error

Explanation

The dead-letter queue handler (STRMQMDLQ) could not open the dead-letter queue for browsing because of an unforeseen error. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8766

Unexpected error while closing dead-letter queue: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

30 : Severe error

Explanation

The dead-letter queue handler (runmqdlq) could not close the dead-letter queue because of an unforeseen error. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8766 (IBM i)

Unexpected error while closing dead-letter queue: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

30 : Severe error

Explanation

The dead-letter queue handler (STRMQMDLQ) could not close the dead-letter queue because of an unforeseen error. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8767

Unexpected error while getting message from dead-letter queue: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity
30 : Severe error

Explanation
The dead-letter queue handler (runmqdlq) could not get the next message from the dead-letter queue because of an unforeseen error. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8767 (IBM i)
Unexpected error while getting message from dead-letter queue: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity
30 : Severe error

Explanation
The dead-letter queue handler (STRMQMDLQ) could not get the next message from the dead-letter queue because of an unforeseen error. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8768
Unexpected error committing/backing out action on dead-letter queue: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity
30 : Severe error

Explanation
The dead-letter queue handler (runmqdlq) was unable to either commit or backout an update to the dead-letter queue because of an unforeseen error. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response
Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8768 (IBM i)
Unexpected error committing/backing out action on dead-letter queue: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity
30 : Severe error

Explanation

The dead-letter queue handler (STRMQMDLQ) was unable to either commit or backout an update to the dead-letter queue because of an unforeseen error. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8769

Unable to disconnect from queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

30 : Severe error

Explanation

The dead-letter queue handler (runmqdlq) was unable to disconnect from the queue manager because of an unexpected error. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8769 (IBM i)

Unable to disconnect from queue manager: CompCode = <*insert_1*> Reason = <*insert_2*>.

Severity

30 : Severe error

Explanation

The dead-letter queue handler (STRMQMDLQ) was unable to disconnect from the queue manager because of an unexpected error. The completion code and the reason can be used to identify the error. The dead-letter queue handler ends.

Response

Use the standard facilities supplied with your system to record the problem identifier and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8770 (IBM)

Cannot open <*insert_3*> for command <*insert_5*>.

Severity

40 : Stop Error

Explanation

The <*insert_5*> command failed to open <*insert_3*> for IBM WebSphere MQ processing.

Response
Check that the intended file or member exists, and was specified correctly. Correct the specification or create the object and try the operation again.

Cannot move queue files to <*insert_3*>.

Severity
0 : Information

Explanation
The MQSeries altmqfls utility cannot move the specified queue files to volume <*insert_3*>.

Response
Verify that the queue files are not already on volume <*insert_3*> using the dspmqfls utility. Verify that volume <*insert_3*> does not already contain queue files for this or any other queue manager in the same subvolume as used by this queue manager.

AMQ8798 (Tandem)
Queue files moved to <*insert_3*>.

Severity
0 : Information

Explanation
The MQSeries altmqfls utility has sucessfully moved the specified queue files to volume <*insert_3*>.

Response
None.

AMQ8801 (Tandem)
EC Boss <*insert_3*> for Queue Manager <*insert_4*> is initializing.

Severity
30 : Severe error

Explanation
The EC Boss for Queue Manager <*insert_4*> is beginning the startup sequence. The process name of the EC Boss is <*insert_3*>.

AMQ8802 (Tandem)
EC Boss <*insert_3*> for Queue Manager <*insert_4*> initialization complete.

Severity
30 : Severe error

Explanation
The EC Boss for Queue Manager <*insert_4*> has completed process startup actions. The process name of the EC Boss is <*insert_3*>.

AMQ8803 (Tandem)
EC Boss <*insert_3*> for Queue Manager <*insert_4*> controlled shutdown initiated.

Severity
30 : Severe error

Explanation
The EC Boss for Queue Manager <*insert_4*> has entered the controlled shutdown state. The Queue Manager will not accept new work, and once operations in progress have completed, connections will be terminated. When there are no more connections, the Queue Manager will end.

AMQ8804 (Tandem)
EC Boss <*insert_3*> for Queue Manager <*insert_4*> quiesce shutdown initiated.

Severity
30 : Severe error

Explanation

The EC Boss for Queue Manager <*insert_4*> has entered the quiesce shutdown state. The Queue Manager will not accept new work, but will allow existing connections to complete before ending.

AMQ8805 (Tandem)

EC Boss <*insert_3*> for Queue Manager <*insert_4*> immediate shutdown initiated.

Severity

30 : Severe error

Explanation

The EC Boss for Queue Manager <*insert_4*> has entered the immediate shutdown state. Any current connections are terminated and the Queue Manager will end immediately.

AMQ8806 (Tandem)

EC / EC Boss <*insert_3*> for Queue Manager <*insert_4*> cannot access file <*insert_5*>

Severity

40 : Stop Error

Explanation

An EC, or the EC Boss (process name <*insert_3*>) for Queue Manager <*insert_4*> has not been able to access the file named <*insert_5*>. This file is critical to the operation of the Queue Manager, and the Queue Manager will not start properly until the problem is corrected.

Response

End the Queue Manager and check the existence or file attributes of the file named <*insert_5*>. Verify that the file exists, and has the appropriate file security and type attributes, correct the problem and restart the Queue Manager.

AMQ8807 (Tandem)

EC / EC Boss <*insert_3*> for Queue Manager <*insert_4*> obtained file error <*insert_1*> on file <*insert_5*>

Severity

40 : Stop Error

Explanation

An EC, or the EC Boss (process name <*insert_3*>) for Queue Manager <*insert_4*> obtained Tandem file error <*insert_1*> while attempting an IO operation to file <*insert_5*>. The successful completion of the IO operation may be critical to the correct operation of the Queue Manager, and the Queue Manager may not operate properly until the problem is corrected.

Response

End the Queue Manager and check the file attributes of the file named <*insert_5*>. Verify that the file has the appropriate file security and type attributes, correct the problem and restart the Queue Manager.

AMQ8808 (Tandem)

Incorrect Queue Manager name <*insert_4*> supplied to process <*insert_4*>

Severity

40 : Stop Error

Explanation

A Queue Manager process (process name <*insert_3*>) was supplied with an invalid or non-existent Queue Manager name, <*insert_4*>. The initialization of the process failed as a result.

Response

End the Queue Manager and check the queue manager name that is being used in the configuration databases. After correcting the problem, restart the Queue Manager.

AMQ8809 (Tandem)
Queue Manager <*insert_4*> started.

Severity
30 : Severe error

Explanation
The EC Boss has reported that the Queue Manager named <*insert_4*> has entered the "started" state.

AMQ8810 (Tandem)
EC number <*insert_1*>, process name <*insert_3*>, for Queue Manager <*insert_4*> is initializing.

Severity
30 : Severe error

Explanation
An EC in the Queue Manager named <*insert_4*> has started and is performing process initialization.

AMQ8811 (Tandem)
EC number <*insert_1*>, process name <*insert_3*>, for Queue Manager <*insert_4*> has completed initialization.

Severity
30 : Severe error

Explanation
An EC in the Queue Manager named <*insert_4*> has completed process initialization.

AMQ8812 (Tandem)
EC number <*insert_1*>, process name <*insert_3*>, for Queue Manager <*insert_4*> has started controlled shutdown.

Severity
30 : Severe error

Explanation
An EC in the Queue Manager named <*insert_4*> has reported that a controlled shutdown has started. The EC will wait for all currently running agents to end before performing the final shutdown actions.

AMQ8813 (Tandem)
EC number <*insert_1*>, process name <*insert_3*>, for Queue Manager <*insert_4*> has started quiesce shutdown.

Severity
30 : Severe error

Explanation
An EC in the Queue Manager named <*insert_4*> has reported that a quiesce shutdown has started. The EC will wait for all currently running agents to end before performing the final shutdown actions.

AMQ8814 (Tandem)
EC number <*insert_1*>, process name <*insert_3*>, for Queue Manager <*insert_4*> has started immediate shutdown.

Severity
30 : Severe error

Explanation
An EC in the Queue Manager named <*insert_4*> has reported that an immediate shutdown has started. The EC will terminate immediately, without waiting for currently running agents to end.

AMQ8815 (Tandem)

EC number <*insert_1*>, process name <*insert_3*>, for Queue Manager <*insert_4*> has shutdown.

Severity

30 : Severe error

Explanation

An EC in the Queue Manager named <*insert_4*> has reported that it has completed shutdown actions. When all ECs in the Queue Manager have completed shutdown actions, the Queue Manager will end.

AMQ8816 (Tandem)

Queue Manager <*insert_4*> has started, though only <*insert_1*> of <*insert_2*> ECs have registered.

Severity

30 : Severe error

Explanation

The Queue Manager named <*insert_4*> has entered the started state, and will now accept connections. However, only <*insert_1*> of the expected <*insert_2*> ECs have registered with the EC Boss. The Queue manager's load balancing and overall performance will be adversly affected, however it will still be able to service connections.

Response

Examine the logs to determine the cause of the failure to start the missing ECs. End the Queue Manager, and rectify the problem if possible. Restart the Queue Manager and ensure that the Queue Manager starts correctly.

AMQ8817 (Tandem)

Process <*insert_3*> in Queue Manager <*insert_4*> cannot process a request due to a resource problem.

Severity

40 : Stop Error

Explanation

The process named <*insert_3*> has failed to process a request from another process due to a failure to allocate a resource, such as memory, or disk space. Depending upon the criticality of the resource itself, this may cause further errors, or the failure of certain Queue Manager components.

Response

Examine the logs to determine the cause of the failure. If there are resource problems that can be corrected, correct them and attempt the operation again.

AMQ8818 (Tandem)

EC Boss in Queue Manager <*insert_4*> rejected a registration from process <*insert_3*>.

Severity

40 : Stop Error

Explanation

The process named <*insert_3*> attempted to register with the EC Boss. The EC Boss detected a problem with the registration information and rejected the attempt.

Response

Examine the logs to determine further information about the problem. Determine the identity of the process, and verify that the process is an EC. If the process is not an EC, or cannot be identified, then a security threat may be present.

AMQ8819 (Tandem)

EC number <*insert_1*> registered with the EC Boss in Queue Manager <*insert_4*>.

Severity
40 : Stop Error

Explanation
EC number <*insert_1*> has registered with the EC Boss. When all the expected ECs in a Queue Manager have registered, the Queue Manager enters the started state.

AMQ8820 (Tandem)
An unknown message received by process <*insert_3*> in Queue Manager <*insert_4*> from process <*insert_5*> has been rejected.

Severity
40 : Stop Error

Explanation
The process <*insert_3*> has received and rejected a message that is either not of the correct format, or from an unknown source.

Response
Examine the log to see if further information is available. Try to identify the process to ensure that a security threat is not present.

AMQ8821 (Tandem)
The EC Boss in Queue Manager <*insert_4*> detected the failure of EC number <*insert_1*>.

Severity
40 : Stop Error

Explanation
The EC Boss has detected that EC number <*insert_1*> has terminated unexpectedly. If the maximum number of restarts performed on this EC has not already been exceeded, PATHWAY will attempt to restart the EC.

Response
Examine the log to see if further information is available.

AMQ8822
Invalid response, please re-enter (y or n):

Severity
0 : Information

Response
None.

AMQ8823 (Tandem)
Process <*insert_3*> in Queue Manager <*insert_4*> received and rejected a message from an unknown source, <*insert_5*>.

Severity
40 : Stop Error

Explanation
A process in Queue Manager <*insert_4*> received a message from a source that is not authorized or not registered to communicate with the Queue Manager. The process is identified by <*insert_5*>. The process that received the message is identified by <*insert_3*>.

Response
Examine the log to see if further information is available on the identity of the source of the message. Try to determine the identity of the sender and verify that no security threat is present.

AMQ8824 (Tandem)
The EC Boss in Queue Manager <*insert_4*> detected an inconsistency in the context data for agent process <*insert_3*>.

Severity
40 : Stop Error

Explanation
The EC Boss found that the information it had previously held about the agent <*insert_3*> is not consistent with new information.

Response
Examine the log to see if further information is available relating to process <*insert_3*>.

AMQ8825 (Tandem)
EC number <*insert_1*> in Queue Manager <*insert_4*> detected the failure of the EC Boss.

Severity
40 : Stop Error

Explanation
An EC detected that the EC Boss for the Queue Manager has failed. If the maximum number of restarts for the EC Boss has not been exceeded, PATHWAY will attempt to restart the EC Boss.

Response
Examine the log to see if further information is available relating to the failure of the EC Boss. If the problem persists, end the Queue Manager, correct the problem and restart. If the problem cannot be identified as a configuration problem, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8826 (Tandem)
EC number <*insert_1*> in Queue Manager <*insert_4*> detected the failure of an <*insert_5*> agent servicing <*insert_3*>.

Severity
40 : Stop Error

Explanation
An EC detected that an <*insert_5*> agent process for <*insert_3*> has failed. If the maximum number of restarts of agent processes has not already been exceeded, the EC will attempt to restart the agent process when it is required.

Response
Examine the log to see if further information is available relating to the failure of the agent process. If the problem persists, end the Queue Manager, correct the problem and restart. If the problem cannot be identified as a configuration problem, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8827 (Tandem)
EC number <*insert_1*> in Queue Manager <*insert_4*> failed to communicate with the EC Boss.

Severity
40 : Stop Error

Explanation
An EC attempted to communicate with the EC Boss, but the attempt failed. The failure to communicate is interpreted by the EC as EC Boss failure.

Response

Examine the log to see if further information is available relating to the failure to communicate with the EC Boss. If the problem persists, end the Queue Manager, correct the problem and restart. If the problem cannot be identified as a configuration problem, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8828 (Tandem)

EC number <*insert_1*> in Queue Manager <*insert_4*> failed to communicate with <*insert_5*> agent process <*insert_3*>.

Severity

40 : Stop Error

Explanation

An EC attempted to communicate with an agent process, but the attempt failed. The failure to communicate is interpreted by the EC as agent failure. Depending upon various factors, the EC may attempt to restart the agent.

Response

Examine the log to see if further information is available relating to the failure to communicate with the agent. If the problem persists, end the Queue Manager, correct the problem and restart. If the problem cannot be identified as a configuration problem, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8829 (Tandem)

EC number <*insert_1*> in Queue Manager <*insert_4*> failed to start an <*insert_5*> agent.

Severity

40 : Stop Error

Explanation

An EC attempted to create an agent process, but the attempt failed. If the maximum number of agent restarts has not already been exceeded, the EC will attempt to restart the agent process.

Response

Examine the log to see if further information is available relating to the failure to start the agent. If the problem persists, end the Queue Manager, correct the problem and restart. If the problem cannot be identified as a configuration problem, use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or thehttp://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ8830 (Tandem)

EC number <*insert_1*> in Queue Manager <*insert_4*> failed to service a Stop Channel request for channel <*insert_5*>.

Severity

40 : Stop Error

Explanation

An EC attempted to process a Stop Channel request, but the attempt failed. The failure will be relayed back to the original requestor via the EC Boss.

Response

Examine the log to see if further information is available relating to the failure to service the Stop Channel request. The originator of the Stop Channel request will be informed of the failure, togther with the reason for the failure.

AMQ8831 (Tandem)

EC number <*insert_1*> in Queue Manager <*insert_4*> failed to service an agent "done" request from agent process <*insert_3*>.

Severity

40 : Stop Error

Explanation

An EC attempted to process an agent "done" request, but the attempt failed. An agent "done" request indicates that agent process <*insert_3*> has completed its work and is asking the EC whether to terminate, or to go idle. For some reason, the EC failed to process the request. The EC will terminate the agent process.

Response

Examine the log to see if further information is available relating to the failure to service the agent "done" request.

AMQ8832 (Tandem)

EC number <*insert_1*> in Queue Manager <*insert_4*> created an idle <*insert_5*> agent process <*insert_3*>.

Severity

30 : Severe error

Explanation

An EC successfully created an idle agent.

AMQ8833 (Tandem)

EC number <*insert_1*> in Queue Manager <*insert_4*> failed to activate <*insert_5*> agent process <*insert_3*>.

Severity

40 : Stop Error

Explanation

An EC failed to activate an idle agent in order to service a connection, or start channel request. The request could not be satisfied by the EC. The EC returns a failure completion and reason code to the originator of the request.

Response

Examine the log to see if further information is available relating to the failure to activate the agent.

AMQ8834 (Tandem)

EC number <*insert_1*> in Queue Manager <*insert_4*> failed to deactivate <*insert_5*> agent process <*insert_3*>.

Severity

40 : Stop Error

Explanation

An EC failed to deactivate an active agent after the agent indicated that it had completed processing a connection or channel.

Response

Examine the log to see if further information is available relating to the failure to deactivate the agent.

AMQ8835 (Tandem)

EC number <*insert_1*> in Queue Manager <*insert_4*> destroyed idle <*insert_5*> agent process <*insert_3*>.

Severity

30 : Severe error

Explanation

An EC successfully destroyed an idle agent process. The EC normally performs this operation as a result of managing the pool of idle agents. Agents that have been used more than a certain (configurable) number of times are destroyed and a fresh agent created in their place.

AMQ8836 (Tandem)

EC number <*insert_1*> in Queue Manager <*insert_4*> failed to destroy an idle <*insert_5*> agent process <*insert_3*>.

Severity

40 : Stop Error

Explanation

An EC failed to destroy an idle agent process. The EC normally performs this operation as a result of managing the pool of idle agents. Agents that have been used more than a certain (configurable) number of times are destroyed and a fresh agent created in their place.

Response

Examine the log to see if further information is available relating to the failure to destroy the agent.

AMQ8837 (Tandem)

EC number <*insert_1*> in Queue Manager <*insert_4*> failed to create an idle <*insert_5*> agent.

Severity

40 : Stop Error

Explanation

An EC failed to create an idle <*insert_5*> agent process. The EC normally performs this operation as a result of managing the pool of idle agents. Agents that have been used more than a certain (configurable) number of times are destroyed and a fresh agent created in their place.

Response

Examine the log to see if further information is available relating to the failure to create the agent.

AMQ8838 (Tandem)

EC number <*insert_1*> in Queue Manager <*insert_4*> initiated creation of an idle <*insert_5*> agent.

Severity

30 : Severe error

Explanation

An EC successfully initiated the creation of an idle <*insert_5*> agent process. The EC normally performs this operation as a result of managing the pool of idle agents. Agents that have been used more than a certain (configurable) number of times are destroyed and a fresh agent created in their place.

AMQ8839 (Tandem)

EC number <*insert_1*> in Queue Manager <*insert_4*> failed to complete a <*insert_3*> request for channel <*insert_5*>.

Severity

40 : Stop Error

Explanation
An EC failed to complete the processing of a <*insert_3*> request. The originator of the request is passed the completion status and reason code.

Response
Examine the log to see if further information is available relating to the failure to complete the processing of the request.

AMQ8840 (Tandem)
EC number <*insert_1*> in Queue Manager <*insert_4*> failed to complete an agent status request for agent process <*insert_3*>.

Severity
40 : Stop Error

Explanation
An EC failed to complete the processing of an agent status request. The EC Boss or EC has detected an inconsistency in context information about the agent.

Response
Examine the log to see if further information is available relating to the failure to complete the processing of the request.

AMQ8841 (Tandem)
EC process <*insert_3*> in Queue Manager <*insert_4*> is waiting for the EC Boss to initialize.

Severity
30 : Severe error

Explanation
An EC is waiting for the EC Boss to initialize and create its entry in the RUNTIME file for the Queue Manager.

AMQ8842 (Tandem)
Error attempting to create queue manager.

Severity
40 : Stop Error

Explanation
MQ verification request, omvStartChildProcess, failed.

Response
None.

AMQ8843 (Tandem)
Queue manager, <*insert_3*>, created successfully

Severity
0 : Information

Response
None.

AMQ8844 (Tandem)
Queue manager, <*insert_3*>, already created

Severity
0 : Information

Response
None.

AMQ8845 (Tandem)
An MQSeries NonStop Server has restarted its backup process

Severity
40 : Stop Error

Explanation
The MQSeries NonStop Server process <*insert_3*> detected the failure of its backup process and has restarted a new backup in CPU <*insert_1*>.

Response
Use the standard operating system facilities to diagnose the cause of the backup NonStop Server failure and attempt to correct it. MQSeries will continue without interruption.

AMQ8846 (Tandem)
MQSeries NonStop Server takeover initiated

Severity
40 : Stop Error

Explanation
The MQSeries NonStop Server backup process <*insert_3*> detected the failure of its primary process and is in the process of taking over and starting a new backup. The new NonStop Server primary process is now running in CPU <*insert_1*>.

Response
Use the standard operating system facilities to diagnose the cause of the primary NonStop Server failure and attempt to correct it. MQSeries will continue without interruption.

AMQ8847 (Tandem)
The EC Boss in Queue Manager <*insert_4*> failed to find an EC to service a request.

Severity
40 : Stop Error

Explanation
The EC Boss failed to find an active EC to service a request that was made, either by an application (in order to start a connection), or by an administration command (for example, to start or stop a channel). It is possible that all ECs in the Queue Manager have failed repeatedly, exceeding the maximum number of restarts allowed by PATHWAY.

Response
Examine the log to see if further information is available on the state of the Queue Manager. The Queue Manager will need to be ended and restarted.

AMQ8850 (Tandem)
Warning: MQSeries Licence Exception Detected MQSeries has detected that this environment exceeds the authorized licence registration. Please review your licence registration by running the installation program INSTMQM with the -l option and if necessary, obtain the required extra use-authorization from your program provider to avoid being in breach of your MQSeries licence agreement.

Severity
0 : Information

Explanation
None.

Response
None.

AMQ8851 (Tandem)
MQSeries CleanRDF utility has detected an error

Severity
40 : Stop Error

Explanation

CleanRDF (queue manager <*insert_5*>) encountered a(n) <*insert_4*> error on the rdfpurge file <*insert_3*>. The file system returned error code <*insert_1*>.

Response

Use the standard operating system facilities to verify the state of this file and reinvoke the utility if the error is deemed transient.

AMQ8852 (Tandem)

MQSeries CleanRDF utility has detected an error

Severity

40 : Stop Error

Explanation

CleanRDF (queue manager <*insert_5*>) has detected that the backup system <*insert_4*> is inaccessible. The file system returned error code <*insert_1*>.

Response

Contact your systems administrator and reinvoke the utility if the error is deemed transient.

AMQ8853 (Tandem)

MQSeries CleanRDF utility has detected an error

Severity

40 : Stop Error

Explanation

CleanRDF (queue manager <*insert_5*>) has encountered a TM/MP <*insert_4*> error. The system returned error code <*insert_1*>.

Response

Contact your systems administrator and reinvoke the utility if the error is deemed transient.

AMQ8854 (Tandem)

MQSeries CleanRDF utility has detected an error

Severity

40 : Stop Error

Explanation

CleanRDF (queue manager <*insert_5*>) encountered a(n) <*insert_4*> error on file <*insert_3*>. The system returned error code <*insert_1*>.

Response

Ensure that a file with this name exists on the same volume and subvolume (i.e. create if necessary - format is irrelevant) on both the primary system and backup systems before reinvoking the utility.

AMQ8855 (Tandem)

MQSeries CleanRDF utility has detected an error

Severity

40 : Stop Error

Explanation

CleanRDF (queue manager <*insert_5*>) encountered a(n) <*insert_4*> error for the FUP process <*insert_3*>. The system returned error code <*insert_1*>.

Response

Use the standard operating system facilities to verify the MQRDFFUPPROGNAME and MQRDFFUPPROCESSNAME environment parameters. Reinvoke the utility if the error is deemed transient.

AMQ8856 (Tandem)
MQSeries CleanRDF utility has detected an error

Severity
40 : Stop Error

Explanation
CleanRDF (queue manager <*insert_5*>) encountered an error when attempting to duplicate file <*insert_3*> to backup system <*insert_4*>. The system returned error code <*insert_1*>.

Response
Use the standard operating system facilities to verify the state of this file on both primary and backup systems. Reinvoke the utility if the error is deemed transient.

AMQ8857 (Tandem)
MQSeries CleanRDF utility STATISTICS Message

Severity
40 : Stop Error

Explanation
CleanRDF of queue manager <*insert_5*> has completed operation. <*insert_1*> files were deleted. <*insert_2*> files were Skipped. <*insert_3*> static files were duplicated to backup system <*insert_4*>.

AMQ8871
Entity, principal or group not known.

Severity
20 : Error

Explanation
The authorization entity, which can be either a principal or a group, could not be found.

AMQ8877
WebSphere MQ channel authentication record set.

Severity
0 : Information

Explanation
WebSphere MQ channel authentication record set.

AMQ8878
Display channel authentication record details.

Severity
0 : Information

Explanation
The display channel authentication command completed successfully. Details follow this message.

AMQ8879
Channel authentication record type not valid.

Severity
20 : Error

Explanation
The type parameter specified on the command was not valid.

Response
Specify a valid type. Refer to the WebSphere MQ Script (MQSC) Command Reference to determine an allowable combination of parameters for this command.

AMQ8880
Channel authentication record action not valid.

Severity
20 : Error

Explanation
The action parameter specified on the command was not valid.

Response
Specify a valid action. Refer to the WebSphere MQ Script (MQSC) Command Reference to determine an allowable combination of parameters for this command.

AMQ8881
Channel authentication record user source not valid.

Severity
20 : Error

Explanation
The user source parameter specified on the command was not valid.

Response
Specify a valid user source. Refer to the WebSphere MQ Script (MQSC) Command Reference to determine an allowable combination of parameters for this command.

AMQ8882
Parameter not allowed for this channel authentication record type.

Severity
20 : Error

Explanation
The parameter is not allowed for the type of channel authentication record being set or displayed.

Response
Refer to the description of the parameter in error to determine the types of record for which this parameter is valid.

AMQ8883
Channel authentication record already exists.

Severity
20 : Error

Explanation
An attempt was made to add a channel authentication record, but it already exists.

Response
Specify action as MQACT_REPLACE.

AMQ8884
Channel authentication record not found.

Severity
20 : Error

Explanation
The specified channel authentication record does not exist.

Response
Specify a channel authentication record that exists.

AMQ8885
Parameter not allowed for this action on a channel authentication record.

Severity
20 : Error

Explanation
The parameter is not allowed for the action being applied to a channel authentication record. Refer to the description of the parameter in error to determine the actions for which this parameter is valid.

Response
Remove the parameter.

AMQ8886
Parameter not allowed for this channel authentication record user source value.

Severity
20 : Error

Explanation
The parameter is not allowed for a channel authentication record with the value that the user source field contains. Refer to the description of the parameter in error to determine the values of user source for which this parameter is valid.

Response
Remove the parameter.

AMQ8887
Parameter not allowed for this channel authentication record match value.

Severity
20 : Error

Explanation
The parameter is not allowed for an inquire channel authentication record with the value that the match field contains. Refer to the description of the parameter in error to determine the values of match for which this parameter is valid.

Response
Remove the parameter.

AMQ8888
Channel authentication record warn value not valid.

Severity
20 : Error

Explanation
The warn parameter specified on the command was not valid.

Response
Specify a valid value for warn. Refer to the WebSphere MQ Script (MQSC) Command Reference to determine an allowable combination of parameters for this command.

AMQ8891
Channel authentication profile name is invalid.

Severity
20 : Error

Explanation
The channel profile name used in the command was not valid. This may be because it contained characters which are not accepted in WebSphere MQ names, or characters which are not valid for the specified profile type.

Response
None.

AMQ8901 (Tandem)
A Status Server has started

Severity
0 : Information

Explanation
A Status Server in CPU <*insert_1*> has started. The process is named <*insert_3*>.

Response
None.

AMQ8902 (Tandem)
A Status Server has ended normally.

Severity
0 : Information

Explanation
A Status Server in CPU <*insert_1*> has ended normally. The process was named <*insert_3*>.

Response
None.

AMQ8903 (Tandem)
A Status Server has ended with errors.

Severity
0 : Information

Explanation
A Status Server in CPU <*insert_1*> has ended with errors. The process was named <*insert_3*>. The error return code reported by the Status Server is <*insert_2*>. The Status Server should be restarted automatically by the Queue Manager.

Response
Verify that the Status Server has restarted correctly. Examine the Queue Manager FD subvolume for FFST files that may have been generated by the Status Server. Use the process name to locate the relevant FFSTs. Attempt to reconstruct the chain of events or symptoms that lead to the failure and save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at

http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ8904 (Tandem)
A Status Server has detected a CPU failure.

Severity
0 : Information

Explanation
The Status Server process <*insert_3*> has detected that CPU <*insert_1*> failed. If there were components of the Status Manager that were running in this CPU, they will now no longer be available, and application connections and channels may be dropped. The Status Manager should continue to be available to new connections and channels. Any Status Server and Queue Server processes that were running in that CPU will be replaced in other available CPUs.

Response
None normally necessary. Applications could experience the reason code MQRC_CONNECTION_BROKEN (2009) from MQI operations in progress that used agent processes running in the failed CPUs, but they should be able to immediatelt re-connect successfully.

AMQ8905 (Tandem)
A Status Server completed takeover processing.

Severity
0 : Information

Explanation
The Status Server process <*insert_3*> has completed processing that was associated with a prior takeover from a failed primary Status Server process, or the failure of the CPU that it was running in. Normal processing resumes after this point, and the Status Server is again in a state where it is resilient to any single point of failure.

Response
None normally necessary. This message is logged to provide positive confirmation that the takeover is complete.

AMQ8906 (Tandem)
More Channel Status' hardened than Max allowed.

Severity
0 : Information

Explanation
There were more Channel Status' hardened to the STATABLE than the MAXACTIVECHANNELS in the QMINI File.

Response
None.

AMQ8919

AMQ9000-9999: Remote

AMQ9001
Channel <*insert_3*> ended normally.

Severity
0 : Information

Explanation
Channel <*insert_3*> ended normally.

Response
None.

AMQ9002
Channel <*insert_3*> is starting.

Severity
0 : Information

Explanation
Channel <*insert_3*> is starting.

Response
None.

AMQ9003 (IBM i)
Channel <*insert_3*> last message sequence number is <*insert_1*>.

Severity
0 : Information

Explanation
Channel <*insert_3*> last message sequence number is <*insert_1*>.

Response
None.

AMQ9004 (IBM i)
Channel <*insert_3*> status information.

Severity
0 : Information

Explanation
Channel <*insert_3*> status information: Number of Messages in Doubt - <*insert_1*> In Doubt Sequence Number - <*insert_2*> In Doubt Logic Unit of Work ID - <*insert_4*>

Response
None.

AMQ9181
The response set by the exit is not valid.

Severity
30 : Severe error

Explanation
The user exit <*insert_3*> returned a response code <*insert_1*> that is not valid in the ExitResponse field of the channel exit parameters (MQCXP). Message AMQ9190 is issued giving more details, and the channel stops.

Response
Investigate why the user exit program set a response code that is not valid.

AMQ9182
The secondary response set by the exit is not valid.

Severity
30 : Severe error

Explanation
The user exit <*insert_3*> returned a secondary response code <*insert_1*> in the ExitResponse2 field of the channel exit parameters (MQCXP) that is not valid. Message AMQ9190 is issued giving more details, and the channel stops.

Response
Investigate why the user exit program set a secondary response code that is not valid.

AMQ9184
The exit buffer address set by the exit is not valid.

Severity
30 : Severe error

Explanation
The user exit <*insert_3*> returned an address <*insert_1*> for the exit buffer that is not valid, when the secondary response code in the ExitResponse2 field of the channel exit parameters (MQCXP) is set to MQXR2_USE_EXIT_BUFFER. Message AMQ9190 is issued giving more details, and the channel stops.

Response
Investigate why the user exit program set an exit buffer address that is not valid. The most likely cause is the failure to set a value, so that the value is 0.

AMQ9185
The exit space set by the exit is not valid.

Severity
30 : Severe error

Explanation
The user exit <*insert_3*> returned an exit space value <*insert_1*> that is not valid in the ExitSpace field of the channel exit parameters (MQCXP). Message AMQ9190 is issued giving more details, and the channel stops.

Response
Investigate why the user exit program set an exit space value that is not valid. Correct the error.

AMQ9186
Too much exit space reserved by send exits.

Severity
30 : Severe error

Explanation
At exit initialization the send exits in the send exit chain for channel <*insert_3*> returned values in the ExitSpace field of the channel exit parameters (MQCXP). The total of these ExitSpace values is <*insert_1*>. The maximum number of bytes that can be sent in a single transmission is <*insert_2*>. Room must be left for at least 1024 bytes of message data in each transmission. So too much exit space has been reserved by the send exits. The channel stops.

Response
Investigate why the send exit programs set exit space values that are too large. Correct the error.

AMQ9187
The header compression value set by the exit is not valid.

Severity
30 : Severe error

Explanation
The user exit <*insert_3*> returned a header compression value <*insert_1*> in the CurHdrCompression field of the channel exit parameters (MQCXP) that was not one of the negotiated supported values specified in the HdrCompList field of the channel description (MQCD). Message AMQ9190 is issued giving more details, and the channel stops.

Response
Investigate why the user exit program specified a header compression value that was not one of the negotiated supported values.

AMQ9188
The message compression value set by the exit is not valid.

Severity
30 : Severe error

Explanation
The user exit <*insert_3*> returned a message compression value <*insert_1*> in the CurMsgCompression field of the channel exit parameters (MQCXP) that was not one of the negotiated supported values specified in the MsgCompList field of the channel description (MQCD). Message AMQ9190 is issued giving more details, and the channel stops.

Response
Investigate why the user exit program specified a message compression value that was not one of the negotiated supported values.

AMQ9189
The data length set by the exit is not valid.

Severity
30 : Severe error

Explanation
The user exit <*insert_3*> returned a data length value <*insert_1*> that was not greater than zero. Message AMQ9190 is issued giving more details, and the channel stops.

Response
Investigate why the user exit program set a data length that is not valid.

AMQ9190
Channel stopping because of an error in the exit.

Severity
30 : Severe error

Explanation
The user exit <*insert_3*>, invoked for channel <*insert_4*> with id <*insert_1*> and reason <*insert_2*>, returned values that are not valid, as reported in the preceding messages. The channel stops.

Response
Investigate why the user exit program set values that are not valid.

AMQ9195
Data length larger than maximum segment length.

Severity
30 : Severe error

Explanation
The data length <*insert_1*> set by send exit <*insert_3*> is larger than the maximum segment length (<*insert_2*>). The maximum segment length is the maximum number of bytes that can be sent in a single transmission minus the user exit space required by all the send exits subsequent to the current one in the send exit chain. Message AMQ9190 is issued giving more details, and the channel stops.

Response
Investigate why the user exit program set a data length that is not valid. Correct the error.

AMQ9196
Data length is larger than the agent buffer length.

Severity
30 : Severe error

Explanation
The data length <*insert_1*> set by exit <*insert_3*> is larger than the agent buffer length. The user exit returned data in the supplied agent buffer, but the length specified is greater than the length of the buffer. Message AMQ9190 is issued giving more details, and the channel stops.

Response
Investigate why the user exit program set a data length that is not valid. Correct the error.

AMQ9197
Data length is larger than the exit buffer length.

Severity
30 : Severe error

Explanation
The data length <*insert_1*> set by exit <*insert_3*> is larger than the exit buffer length. The user exit returned data in the supplied exit buffer, but the length specified is greater than the length of the buffer. Message AMQ9190 is issued giving more details, and the channel stops.

Response
Investigate why the user exit program set a data length that is not valid.

AMQ9201
Allocate failed to host <*insert_3*>.

Severity
30 : Severe error

Explanation
The attempt to allocate a conversation using <*insert_4*> to host <*insert_3*> was not successful.

Response
The error may be due to an incorrect entry in the <*insert_4*> parameters contained in the channel

definition to host <*insert_3*>. Correct the error and try again. If the error persists, record the error values and contact your systems administrator. The return code from the <*insert_4*> <*insert_5*> call was <*insert_1*> (X<*insert_2*>). It may be possible that the listening program at host <*insert_3*> is not running. If this is the case, perform the relevant operations to start the listening program for protocol <*insert_4*> and try again.

AMQ9202

Remote host <*insert_3*> not available, retry later.

Severity

30 : Severe error

Explanation

The attempt to allocate a conversation using <*insert_4*> to host <*insert_3*> was not successful. However the error may be a transitory one and it may be possible to successfully allocate a <*insert_4*> conversation later.

Response

Try the connection again later. If the failure persists, record the error values and contact your systems administrator. The return code from <*insert_4*> is <*insert_1*> (X<*insert_2*>). The reason for the failure may be that this host cannot reach the destination host. It may also be possible that the listening program at host <*insert_3*> was not running. If this is the case, perform the relevant operations to start the <*insert_4*> listening program, and try again.

AMQ9203

A configuration error for <*insert_4*> occurred.

Severity

30 : Severe error

Explanation

Error in configuration for communications to host <*insert_3*> . Allocation of a <*insert_4*> conversation to host <*insert_3*> was not possible.

Response

The configuration error may be one of the following:

1.If the communications protocol is LU 6.2, it may be that one of the transmission parameters (Mode, or TP Name) is incorrect. Correct the error and try again. The mode name should be the same as the mode defined on host <*insert_3*>. The TP name on <*insert_3*> should be defined.

2.If the communications protocol is LU 6.2, it may be that an LU 6.2 session has not been established. Contact your systems administrator.

3.If the communications protocol is TCP/IP, it may be that the host name specified is incorrect. Correct the error and try again.

4.If the communications protocol is TCP/IP, it may be that the host name specified cannot be resolved to a network address. The host name may not be in the name server.

The return code from the <*insert_4*><*insert_5*> call was <*insert_1*> (X<*insert_2*>).

Record the error values and tell the system administrator.

AMQ9204

Connection to host <*insert_3*> rejected.

Severity

30 : Severe error

Explanation

Connection to host <*insert_3*> over <*insert_4*> was rejected.

Response

The remote system may not be configured to allow connections from this host. Check the <*insert_4*> listener program has been started on host <*insert_3*>.

If the conversation uses LU 6.2, it is possible that either the User ID or Password supplied to the remote host is incorrect.

If the conversation uses TCP/IP, it is possible that the remote host does not recognize the local host as a valid host.

The return code from the <*insert_4*><*insert_5*> call was <*insert_1*> X(<*insert_2*>).

Record the error values and tell the systems administrator.

AMQ9205

The host name supplied is not valid.

Severity

30 : Severe error

Explanation

The supplied <*insert_4*> host name <*insert_3*> could not be resolved into a network address. Either the name server does not contain the host, or the name server was not available.

Response

Check the <*insert_4*> configuration on your host.

AMQ9206

Error sending data to host <*insert_3*>.

Severity

30 : Severe error

Explanation

An error occurred sending data over <*insert_4*> to <*insert_3*>. This may be due to a communications failure.

Response

The return code from the <*insert_4*> <*insert_5*> call was <*insert_1*> X(<*insert_2*>). Record these values and tell your systems administrator.

AMQ9207

The data received from host <*insert_3*> is not valid.

Severity

30 : Severe error

Explanation

Incorrect data format received from host <*insert_3*> over <*insert_4*>. It may be that an unknown host is attempting to send data. An FFST file has been generated containing the invalid data received.

Response

Tell the systems administrator.

AMQ9208

Error on receive from host <*insert_3*>.

Severity

30 : Severe error

Explanation

An error occurred receiving data from <*insert_3*> over <*insert_4*>. This may be due to a communications failure.

Response
The return code from the <*insert_4*> <*insert_5*> call was <*insert_1*> (X<*insert_2*>). Record these values and tell the systems administrator.

AMQ9209
Connection to host <*insert_3*> closed.

Severity
30 : Severe error

Explanation
An error occurred receiving data from <*insert_3*> over <*insert_4*>. The connection to the remote host has unexpectedly terminated.

Response
Tell the systems administrator.

AMQ9210
Remote attachment failed.

Severity
30 : Severe error

Explanation
There was an incoming attachment from a remote host, but the local host could not complete the bind.

Response
The return code from the <*insert_4*> <*insert_5*> call was <*insert_1*> (X<*insert_2*>). Record these values and tell the systems administrator who should check the <*insert_4*> configuration.

AMQ9211
Error allocating storage.

Severity
30 : Severe error

Explanation
The program was unable to obtain enough storage.

Response
Stop some programs which are using storage and retry the operation. If the problem persists contact your systems administrator.

AMQ9212
A TCP/IP socket could not be allocated.

Severity
30 : Severe error

Explanation
A TCP/IP socket could not be created, possibly because of a storage problem.

Response
The return code from the <*insert_4*> <*insert_5*> call was <*insert_1*> (X<*insert_2*>). Try the program again. If the failure persists, record the error values and tell the systems administrator.

AMQ9213
A communications error for <*insert_4*> occurred.

Severity
30 : Severe error

Explanation
An unexpected error occurred in communications.

Response
The return code from the <*insert_4*> <*insert_5*> call was <*insert_1*> (X<*insert_2*>). Record these values and tell the systems administrator.

AMQ9214
Attempt to use an unsupported communications protocol.

Severity
30 : Severe error

Explanation
An attempt was made to use an unsupported communications protocol type <*insert_2*>.

Response
Check the channel definition file. It may be that the communications protocol entered is not a currently supported one.

AMQ9215
Communications subsystem unavailable.

Severity
30 : Severe error

Explanation
An attempt was made to use the communications subsystem, but it has not been started.

Response
Start the communications subsystem, and rerun the program.

AMQ9216
Usage: <*insert_3*> [-m QMgrName] [-n TPName]

Severity
20 : Error

Explanation
Values passed to the responder channel program are not valid. The parameters that are not valid are as follows :-

<*insert_4*>

The responder channel program exits.

Response
Correct the parameters passed to the channel program and retry the operation.

AMQ9216 (AIX)
Usage: <*insert_3*> [-m QMgrName]

Severity
20 : Error

Explanation
Values passed to the responder channel program are not valid. The parameters that are not valid are as follows :-

<*insert_4*>

The responder channel program exits.

Response
Correct the parameters passed to the channel program and retry the operation.

AMQ9216 (HP-UX)
Usage: <*insert_3*> [-m QMgrName]

Severity
20 : Error

Explanation
Values passed to the responder channel program are not valid. The parameters that are not valid are as follows :-

<insert_4>

The responder channel program exits.

Response
Correct the parameters passed to the channel program and retry the operation.

AMQ9217
The TCP/IP listener program could not be started.

Severity
30 : Severe error

Explanation
An attempt was made to start a new instance of the listener program, but the program was rejected.

Response
The failure could be because either the subsystem has not been started (in this case you should start the subsystem), or there are too many programs waiting (in this case you should try to start the listener program later).

AMQ9218
The *<insert_4>* listener program could not bind to port number *<insert_1>*.

Severity
30 : Severe error

Explanation
An attempt to bind the *<insert_4>* socket to the listener port was unsuccessful.

Response
The failure could be due to another program using the same port number. The return code from the *<insert_3>* call for port *<insert_5><insert_1>* was *<insert_2>*. Record these values and tell the systems administrator.

AMQ9219
The TCP/IP listener program could not create a new connection for the incoming conversation.

Severity
30 : Severe error

Explanation
An attempt was made to create a new socket because an attach request was received, but an error occurred.

Response
The failure may be transitory, try again later. If the problem persists, record the return code *<insert_1>* and tell the systems administrator. It may be necessary to free some jobs, or restart the communications system.

AMQ9220
The *<insert_4>* communications program could not be loaded.

Severity
30 : Severe error

Explanation
The attempt to load the <*insert_4*> library or procedure <*insert_3*> failed with error code <*insert_1*>.

Response
Either the library must be installed on the system or the environment changed to allow the program to locate it.

AMQ9221
Unsupported protocol was specified.

Severity
30 : Severe error

Explanation
The specified value of <*insert_3*> was not recognized as one of the protocols supported.

Response
Correct the parameter and retry the operation.

AMQ9222
Cannot find the configuration file.

Severity
10 : Warning

Explanation
The configuration file <*insert_3*> cannot be found. This file contains default definitions for communication parameters. Default values will be used.

Response
None.

AMQ9223
Enter a protocol type.

Severity
30 : Severe error

Explanation
The operation you are performing requires that you enter the type of protocol.

Response
Add the protocol parameter and retry the operation.

AMQ9224
Unexpected .ini file entry.

Severity
30 : Severe error

Explanation
.ini file keyword <*insert_3*> is either not a valid keyword or has an invalid value.

Response
Correct the file and retry the operation.

AMQ9224 (Windows)
Invalid registry value.

Severity
30 : Severe error

Explanation
WebSphere MQ registry value name <*insert_3*> is either not valid or has invalid value data.

Response
Correct the registry value and retry the operation.

AMQ9225
File syntax error.

Severity
30 : Severe error

Explanation
A syntax error was detected on line <*insert_1*> while processing the INI file.

Response
Correct the problem and retry the operation.

AMQ9225 (Windows)
File syntax error.

Severity
30 : Severe error

Explanation
A syntax error was detected while processing the configuration data.

Response
Correct the problem and retry the operation.

AMQ9226
Usage: <*insert_3*> [-m QMgrName] -t (TCP | LU62 | NETBIOS | SPX) [ProtocolOptions]

Severity
10 : Warning

Explanation
Values passed to the listener program were invalid.

The parameter string passed to this program is as follows:

[-m QMgrName] (-t TCP [-p Port] |

-t LU62 [-n TPName] |

-t NETBIOS [-l LocalName] [-e Names] [-s Sessions]

[-o Commands] [-a Adapter] |

-t SPX [-x Socket])

Default values will be used for parameters not supplied.

Response
Correct the parameters passed to the listener program and retry the operation.

AMQ9226 (AIX)
Usage: <*insert_3*> [-m QMgrName] -t TCP [ProtocolOptions]

Severity
10 : Warning

Explanation
Values passed to the listener program were invalid.

The parameter string passed to this program is as follows:

[-m QMgrName] -t TCP [-p Port]

Default values will be used for parameters not supplied.

Response
Correct the parameters passed to the listener program and retry the operation.

AMQ9226 (Unix)
Usage: <*insert_3*> [-m QMgrName] -t TCP [ProtocolOptions]

Severity
10 : Warning

Explanation
Values passed to the listener program were invalid.

The parameter string passed to this program is as follows:

[-m QMgrName] -t TCP [-p Port]

Default values will be used for parameters not supplied.

Response
Correct the parameters passed to the listener program and retry the operation.

AMQ9227
<*insert_3*> local host name not provided.

Severity
30 : Severe error

Explanation
A name is required for the <*insert_3*> process to register with the network.

Response
Add a local name to the configuration file and retry the operation.

AMQ9228
The <*insert_4*> responder program could not be started.

Severity
30 : Severe error

Explanation
An attempt was made to start an instance of the responder program, but the program was rejected.

Response
The failure could be because either the subsystem has not been started (in this case you should start the subsystem), or there are too many programs waiting (in this case you should try to start the responder program later). The <*insert_5*> reason code was <*insert_1*>.

AMQ9229
The application has been ended.

Severity
30 : Severe error

Explanation
You have issued a request to end the application.

Response
None.

AMQ9230
An unexpected <*insert_4*> event occurred.

Severity
30 : Severe error

Explanation
During the processing of network events, an unexpected event <*insert_1*> occurred.

Response
None.

AMQ9231
The supplied parameter is not valid.

Severity
30 : Severe error

Explanation
The value of the <*insert_4*> <*insert_5*> parameter has the value <*insert_3*>. This value has either not been specified or has been specified incorrectly.

Response
Check value of the <*insert_5*> parameter and correct it if necessary. If the fault persists, record the return code (<*insert_1*>,<*insert_2*>) and <*insert_4*> and tell the systems administrator.

AMQ9232
No <*insert_3*> specified

Severity
30 : Severe error

Explanation
The operation requires the specification of the <*insert_3*> field.

Response
Specify the <*insert_3*> and retry the operation.

AMQ9233
Error creating <*insert_3*> thread.

Severity
30 : Severe error

Explanation
The process attempted to create a new thread. The most likely cause of this problem is a shortage of an operating system resource (for example, memory). Use any previous FFSTs to determine the reason for the failure. The WebSphere MQ internal return code describing the reason for the failure is <*insert_1*>.

Response
Contact the systems administrator. If the problem persists save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9235
The supplied local communications address cannot be resolved.

Severity
30 : Severe error

Explanation
The local communications address (LOCLADDR) value <*insert_3*> cannot be resolved into an IP address.

Response
Enter a local communications address value which can be resolved into an IP address, and try again.

AMQ9236
The supplied Partner LU was invalid.

Severity
30 : Severe error

Explanation
The <*insert_4*> Partner LU name <*insert_3*> was invalid.

Response
Either the Partner LU name was entered incorrectly or it was not in the <*insert_4*> communications configuration. Correct the error and try again.

AMQ9237
A configuration error for <*insert_4*> occurred.

Severity
30 : Severe error

Explanation
Allocation of a <*insert_4*> conversation to host <*insert_3*> was not possible. The configuration error may be one of the following:

1. It may be that one of the transmission parameters (Mode, or TP Name) was incorrect. Correct the error and try again. The mode name should be the same as the mode defined on host <*insert_3*>. The TP name on <*insert_3*> should be defined.

2. It may be that an LU 6.2 session has not been established. Contact your systems administrator.

The return code from <*insert_4*> is <*insert_1*> with associated <*insert_5*> <*insert_2*> .

Response
Record the error values and tell the system administrator.

AMQ9238
A communications error for <*insert_4*> occurred.

Severity
30 : Severe error

Explanation
An unexpected error occurred in communications.

Response
The return code from the <*insert_4*> <*insert_3*> call was <*insert_1*> with associated <*insert_5*> <*insert_2*> .

AMQ9239
Usage: <*insert_3*> [-m QMgrName] -n TpName -g Gateway-name

Severity
10 : Warning

Explanation
Values passed to the listener program were invalid. The parameter string passed to this program is as follows, default values being used for parameters not supplied: [-m QMgrName] -n TpName -g Gateway-name

Response
Correct the parameters passed to the listener program and retry the operation.

AMQ9240
An SPX socket was already in use.

Severity
30 : Severe error

Explanation
The Listener received return code <*insert_1*> when attempting to open socket <*insert_2*>.

Response
The specified socket is already in use by another process. To use another socket specify another socket on the command line to RUNMQLSR or update the default in the qm.ini file.

AMQ9240 (Windows)
An SPX socket was already in use.

Severity
30 : Severe error

Explanation
The listener received return code <*insert_1*> when attempting to open socket <*insert_2*>.

Response
The specified socket is already in use by another process. To use another socket, specify a different socket on the command line to the runmqlsr command, or update the default in the configuration data.

AMQ9240 (IBM i)
An SPX socket was already in use.

Severity
30 : Severe error

Explanation
The Listener received return code <*insert_1*> when attempting to open socket <*insert_2*>.

Response
The specified socket is already in use by another process. To use another socket specify another socket on the command line to STRMQMLSR or update the default in the qm.ini file.

AMQ9241
SPX is not available.

Severity
30 : Severe error

Explanation
WebSphere MQ received return code <*insert_1*> when attempting to start SPX communications.

Response
Ensure that IPX/SPX support is installed on the machine and that it is started before trying to start a WebSphere MQ SPX channel.

AMQ9242
SPX resource problem.

Severity
30 : Severe error

Explanation
WebSphere MQ received return code <*insert_1*> when attempting to start SPX communications, indicating a resource problem.

Response
Ensure that sufficient IPX/SPX resources are available before commencing communications over IPX/SPX.

AMQ9243
The queue manager <*insert_3*> does not exist.

Severity
30 : Severe error

Explanation
You tried to perform an action against a queue manager that does not exist. You may have specified the wrong queue manager name.

Response
If you specified the wrong name, correct the name and submit the command again. If the queue manager does not exist, create the queue manager and submit the command again.

AMQ9244
The default queue manager does not exist.

Severity
30 : Severe error

Explanation
You tried to perform an action against a queue manager that does not exist.

Response
Create the default queue manager and submit the command again.

AMQ9245 (Windows)
Unable to obtain account details for channel MCA user ID.

Severity
10 : Warning

Explanation
WebSphere MQ was unable to obtain the account details for MCA user ID <*insert_3*>. This user ID was the MCA user ID for channel <*insert_4*> on queue manager <*insert_5*> and may have been defined in the channel definition, or supplied either by a channel exit or by a client.

Response
Ensure that the user ID is correct and that it is defined on the Windows local system, the local domain or on a trusted domain. For a domain user ID, ensure that all necessary domain controllers are available.

AMQ9246
The TCP/IP listener on port <*insert_1*> could not start a new channel.

Severity
30 : Severe error

Explanation
An attempt has been made to connect to the queue manager by starting a new channel within the TCP/IP listener which is listening on port <*insert_1*>. The maximum socket number which can be used by a channel running on this listener is <*insert_2*> . A socket number beyond this maximum was allocated for the new channel. This connection attempt has been rejected, but the listener continues to listen for further connection requests. The socket number allocated for a new listener channel is related to the number of channels currently running within that listener process. The problem has arisen because too many channels are directed at the port on which this listener is listening.

Response
An extra listener process should be started to listen on a different port. Some of the channels to the queue manager should be redirected from the port on which the existing listener is listening to the new port.

AMQ9247
SSPI Security: bad return from SSPI call.

Severity
30 : Severe error

Explanation
Channel <*insert_3*> has been closed because the SSPI channel exit received a bad return code from SSPI.

Response
Consult the appropriate SSPI manuals to find out the meaning of status <*insert_4*> on call <*insert_5*> , and correct the error.

AMQ9248
The program could not bind to a <*insert_3*> socket.

Severity
30 : Severe error

Explanation
The attempt to bind to socket <*insert_4*> failed with return code <*insert_1*>. The failing <*insert_3*> call was <*insert_5*> . The most likely cause of this problem is incorrect configuration of the <*insert_3*> local address or incorrect start and end port parameters.

Response
Contact the system administrator. If the problem persists save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9255
Listener already running.

Severity
30 : Severe error

Explanation
The request to start the WebSphere MQ listener failed because there is already a listener running against the specified network resources.

Response
None.

AMQ9259
Connection timed out from host <*insert_3*> .

Severity
30 : Severe error

Explanation
A connection from host <*insert_3*> over <*insert_4*> timed out.

Response
Check to see why data was not received in the expected time. Correct the problem. Reconnect the channel, or wait for a retrying channel to reconnect itself.

AMQ9262 (HP-UX)
GSKit SSL support not available for 32-bit client applications.

Severity
20 : Error

Explanation
An attempt was made to start an SSL channel from a 32-bit client application. However, GSKit SSL 32-bit support is not provided on WebSphere MQ for HP-UX (Itanium platform).

Response

Compile the client application as a 64-bit application or change the application to use a non-SSL channel.

AMQ9268 (rrcI_SCTQ_SWITCH_SUCCESS)

Cluster sender channel <*insert one*> successfully switched to use the transmission queue <*insert three*> .

Severity

00 : Information

Explanation

The transmission queue for cluster sender channel <*insert one*> was successfully switched from <*insert two*> to <*insert three*>.

Response

None.

AMQ9270

Sharing conversation could not start.

Severity

30 : Severe error

Explanation

The attempt to start sharing conversation <*insert_1*> on socket <*insert_2*> (channel <*insert_3*>) was rejected at the server-connection end of the channel.

Response

Examine diagnostic information at the server-connection end of channel <*insert_3*> to see why the conversation did not start. If possible, correct the error causing the failure and retry.

AMQ9271

Channel <*insert_3*> timed out.

Severity

30 : Severe error

Explanation

A timeout occurred while waiting to receive from the other end of channel <*insert_3*>. The address of the remote end of the connection was <*insert_4*>.

Response

The return code from the <*insert_5*> call was <*insert_1*> (X<*insert_2*>). Record these values and tell the systems administrator.

AMQ9272

Thread mutex semaphore error.

Severity

30 : Severe error

Explanation

The process attempted an operation on a thread mutex semaphore. The most likely cause of this problem is a shortage of an operating system resource (for example, memory). Use any previous FFSTs to determine the reason for the failure. The WebSphere MQ function involded was <*insert_3*> and the internal return code describing the reason for the failure is <*insert_1*>.

Response

Contact the systems administrator. If the problem persists save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9273
Thread event error.

Severity
30 : Severe error

Explanation
The process attempted an operation on a thread event. The most likely cause of this problem is a shortage of an operating system resource (for example, memory). Use any previous FFSTs to determine the reason for the failure. The WebSphere MQ function involved was <*insert_3*> and the internal return code describing the reason for the failure is <*insert_1*>.

Response
Contact the systems administrator. If the problem persists save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9280 (rrcE_SSL_SUITE_B_INVALID_VALUE)
Parameter requesting Suite B contains an invalid value.

Severity
30 : Severe error

Explanation
An SSL or TLS channel running on an WebSphere MQ client has failed to start. This is because the MQSUITEB environment variable, or the MQSCO EncryptionPolicySuiteBStrength field, contains an invalid value. The values specified were ' <*insert_1*>'.

The channel is '<*insert_2*>', in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Set the MQSUITEB environment variable, or the MQSCO EncryptionPolicySuiteBStrength field to a valid value.

Restart the channel.

Refer to the WebSphere MQ Security documentation for more information on Suite B configuration.

AMQ9281 (rrcE_SSL_SUITE_B_BAD_COMBINATION)
Parameter requesting Suite B contains an invalid combination of values.

Severity
30 : Severe error

Explanation
An SSL or TLS channel running on an MQ client has failed to start. This is because the MQSUITEB environment variable, or the MQSCO EncryptionPolicySuiteBStrength field, contain mutually exclusive values. All of the values are valid, but some of them cannot be used together. The values specified were ' <*insert_1*>'

The channel is '<*insert_1*>', in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Set the MQSUITEB environment variable, or the MQSCO EncryptionPolicySuiteBStrength field, to a valid combination of values

Restart the channel.

Refer to the WebSphere MQ Security documentation for more information on Suite B configuration.

AMQ9282 (rrcE_SSL_CIPHER_INVALID_SUITE_B)
Invalid CipherSpec for the configured Suite B security level.

Severity
30 : Severe error

Explanation
The user is attempting to start a channel on a queue manager or WebSphere MQ client which has been configured to run in Suite B mode. The user has specified a CipherSpec which does not meet the configured Suite B security level.

The channel is '*<insert_1>*', in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

The address of the remote host is '*<insert_2>* '.

Response
Redefine the channel to run with a Suite B compliant CipherSpec which satisfies the configured Suite B security level. Alternatively, the channel may be defined with the correct CipherSpec and the queue manager or WebSphere MQ client should not be running in Suite B mode; if this is the case, ensure that Suite B mode is not configured. Once the error is corrected, restart the channel.

Refer to the WebSphere MQ Security documentation for more information on Suite B security levels or CipherSpecs.

This message might occur after applying WebSphere MQ maintenance because the FIPS and Suite B standards are updated periodically. When such changes occur, WebSphere MQ is also updated to implement the latest standard. As a result, you might see changes in behavior after applying maintenance. For more information about the versions of FIPS and Suite B standards enforced by WebSphere MQ, see the readme file.

AMQ9285 (rrcE_SSL_CIPHER_AND_CERT_INCOMPATIBLE)
The proposed CipherSpec is incompatible with a digital certificate.

Severity
30 : Severe error

Explanation
The SSL or TLS handshake failed because the proposed CipherSpec is incompatible with one of the digital certificates.

It is necessary for both the local and remote systems to use a digital certificate which is suitable for use with the channel CipherSpec. Common causes of this error include:

(a) An RSA-based CipherSpec was specified when using a certificate which contains a non-RSA public key.

(b) An Elliptic Curve-based CipherSpec was specified when using a certificate which contains a non-EC public key.

The channel is '*<insert_1>*', in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Specify a different CipherSpec which is suitable for use with the digital certificates used on both the local and remote systems. Restart the channel.

Refer to the WebSphere MQ Security documentation for further information on CipherSpecs.

AMQ9289 (rrcI_SCTQ_MSGMOVE_NONE)
Message move complete - no messages moved.

Severity
00 : Information

Explanation
No messages were moved whilst switching the transmission queue for cluster sender channel <*insert one*>. The message move operation is complete.

Response
None.

AMQ9290 (rrcI_SCTQ_MSGMOVE_IN_PROGRESS)
Message move in progress - <*n*> messages moved.

Severity
00 : Information

Explanation
<*n*> messages were moved whilst switching the transmission queue for cluster sender channel <*insert one*>. The message move operation is in progress.

Response
None.

AMQ9291 (rrcI_SCTQ_MSGMOVE_COMPLETE)
Message move complete - <*n*> messages moved.

Severity
00 : Information

Explanation
<*n*> messages were moved whilst switching the transmission queue for cluster sender channel <*insert one*>. The message move operation is complete.

Response
None.

AMQ9301 (Tandem)
An SNA communications error occurred.

Severity
30 : Severe error

Explanation
An unexpected error occurred in communications.

Response
The reply return code from the SNAX/ICE <*insert_3*> request was <*insert_1*> in the <*insert_4*> header. The detail return code was <*insert_2*> .

AMQ9302 (Tandem)
The TCP Listener <*insert_3*> in Queue Manager <*insert_4*> cannot find an available port.

Severity
40 : Stop Error

Explanation
The TCP Listener has tried all the ports that are configured in the QMINI file for this Queue Manager, and none were available for listening on. The TCP Listener has now terminated. The TCP Listener is either not needed (because there are already TCP Listeners running on all the Queue Manager ports), or there is a configuration problem with the Queue Manager.

Response
Review the QMINI file TCP/IP Listener stanzas to determine if there is a configuration problem. The ports numbers themselves may be incorrect, or overlap with the ports being used by other Queue Managers on the same system, or with other services.

AMQ9401
Channel <*insert_3*> autodefined.

Severity
0 : Information

Explanation
Channel <*insert_3*> which did not previously exist has been autodefined.

Response
None.

AMQ9402
Autodefinition exit for Channel <*insert_3*> failed to load.

Severity
30 : Severe error

Explanation
Autodefinition of Channel <*insert_3*> failed because <*insert_4*> would not load.

Response
Ensure that the user exit is specified correctly in the queue manager definition, and that the user exit program is correct and available.

AMQ9403
Autodefinition of Channel <*insert_3*> suppressed by user exit.

Severity
30 : Severe error

Explanation
Autodefinition exit <*insert_4*> for Channel <*insert_3*> returned a failure code.

Response
None.

AMQ9404
Phase one of REFRESH CLUSTER REPOS(YES) has completed.

Severity
0 : Information

Explanation
Phase one of REFRESH CLUSTER REPOS(YES) has completed. The Refresh Cluster(<*insert_4*>) command caused <*insert_1*> objects to be refreshed and republished to <*insert_2*> queue managers. Applications attempting to access cluster resources may see failures to resolve cluster resources until phase two of REFRESH CLUSTER is complete. Phase two is complete when all new information has been received from other members of the cluster.

Response
Monitor your SYSTEM.CLUSTER.COMMAND.QUEUE to determine when it has reached a consistently empty state to indicate that the refresh process has completed.

AMQ9405
FORCEREMOVE QUEUES(YES) command processed, cluster <*insert_3*> target <*insert_4*>.

Severity
0 : Information

Explanation
The repository queue manager successfully processed a RESET ACTION(FORCEREMOVE) command with the QUEUES(YES) option for the indicated cluster and target queue manager.

Response
None.

AMQ9406
REFRESH CLUSTER REPOS(YES) command failed, this queue manager is a full repository for cluster <*insert_4*>.

Severity
30 : Severe error

Explanation
The repository queue manager could not process a REFRESH CLUSTER command with the REPOS(YES) option for the indicated cluster, because the local queue manager provides full repository management services for the cluster. The command is ignored.

Response
Either

1) Reissue the command without REPOS(YES), or

2) Issue the command on a queue manager which is not a full repository, or

3) Change this queue manager definition so that it is not a full repository.

AMQ9407
Cluster queue <*insert_3*> is defined inconsistently.

Severity
10 : Warning

Explanation
The definition of cluster queue <*insert_3*> on the queue manager with UUID <*insert_4*> has different DEFPRTY, DEFPSIST and DEFBIND values from the definition of the same cluster queue on the queue manager with UUID <*insert_5*>. Both definitions now exist in the local repository. All definitions of the same cluster queue should be identical. In particular, problems arise if your applications rely on a queue default value which is defined inconsistently to determine messaging behavior. This applies, for example, if the applications open a cluster queue with option MQOO_BIND_AS_Q_DEF. If different instances of the queue have different DEFBIND values the behavior of the message transfer differs depending on which instance of the queue is selected when it is opened. In general the instance selected varies across opens.

Response
For each inconsistency decide which of the values is the correct one. Alter the definitions of cluster queue <*insert_3*> so that all definitions have correct DEFPRTY, DEFPSIST and DEFBIND values.

AMQ9408
BIND_ON_OPEN messages for channel <*insert_3*> to dead-letter queue.

Severity
0 : Information

Explanation
The remote CLUSRCVR for channel <*insert_3*> was deleted while undelivered BIND_ON_OPEN messages associated with that channel existed on the local SYSTEM.CLUSTER.TRANSMIT.QUEUE. These messages could not be allocated to another channel because they were put BIND_ON_OPEN, but were very unlikely to ever flow along the channel with which they were associated as this has now been deleted. An attempt has therefore been made to move them from the transmission queue to the local dead-letter queue. The MQDLH reason is MQFB_BIND_OPEN_CLUSRCVR_DEL. Note that any internal WebSphere MQ Clustering messages for the deleted channel will also have been removed from the SYSTEM.CLUSTER.TRANSMIT.QUEUE (these are discarded) so the current depth of the queue may have decreased by more than the number of user messages moved to the dead-letter queue.

Response

Examine the contents of the dead-letter queue. Each message is contained in an MQDLH structure that includes the reason why it was written and where it was originally addressed. Also look at previous error messages to see if the attempt to put messages to the dead-letter queue failed.

AMQ9409

Repository manager ended abnormally.

Severity

30 : Severe error

Explanation

The repository manager process ended abnormally. Termination of this process will cause the queue manager to terminate unless the tuning parameter TolerateRepositoryFailure has been set to 'TRUE'. If the queue manager does not terminate, further cluster management activity will not occur, this will effect the availability of cluster resources accessed or hosted by this queue manager.

Response

Look at previous error messages for the repository manager in the queue manager and system error logs to determine the cause of the failure or contact your IBM support center. Restart the queue manager to restart the repository manager process.

AMQ9410

Repository manager started

Severity

0 : Information

Explanation

The repository manager started successfully.

Response

None.

AMQ9411

Repository manager ended normally.

Severity

0 : Information

Explanation

The repository manager ended normally.

Response

None.

AMQ9412

Repository command received for <*insert_3*> .

Severity

30 : Severe error

Explanation

The repository manager received a command intended for some other queue manager, with identifier that is <*insert_3*> . The command was sent by the queue manager with identifier <*insert_4*>.

Response

Check the channel and cluster definitions of the sending queue manager.

AMQ9413

Repository command format error, command code <*insert_1*>

Severity
30 : Severe error

Explanation
An internal error has occurred.

Response
Collect the items listed in the 'Problem determination' section of the System Administration manual and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9415
Repository command unexpected, command code <*insert_1*> , cluster object <*insert_3*>, sender <*insert_4*>

Severity
30 : Severe error

Explanation
An internal error has occurred.

Response
Collect the items listed in the 'Problem determination' section of the System Administration manual and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9415 (IBM i)
An internal error has occurred.

Severity
30 : Severe error

Explanation
Repository command unexpected, command code <*insert_1*> , cluster object <*insert_3*>, sender <*insert_4*>

Response
Collect the items listed in the 'Problem determination' section of the System Administration manual and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9416
Repository command processing error, RC=<*insert_2*> , command code <*insert_1*>, cluster object <*insert_3*>, sender <*insert_4*>.

Severity
30 : Severe error

Explanation
An internal error has occurred.

Response
Collect the items listed in the 'Problem determination' section of the System Administration manual and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9416 (IBM i)

An internal error has occurred.

Severity

30 : Severe error

Explanation

Repository command processing error, RC=<*insert_2*> , command code <*insert_1*>, cluster object <*insert_3*>, sender <*insert_4*>.

Response

Collect the items listed in the 'Problem determination' section of the System Administration manual and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9417

Manually defined CLUSSDR channels have been forcibly removed.

Severity

0 : Information

Explanation

The administrator has asked for the queue manager <*insert_3*> to be deleted, or forcibly removed, but has not yet deleted the manually defined CLUSSDR channels to <*insert_3*> . The auto-defined channels to <*insert_3*> have been deleted, but <*insert_3*> continues to receive updates until the manually defined CLUSSDR channels have been deleted.

Response

Delete the manually defined CLUSSDR channels to <*insert_3*> .

AMQ9418

Only one repository for cluster <*insert_3*> .

Severity

0 : Information

Explanation

The queue manager has received information about a cluster for which it is the only repository.

Response

Alter the REPOS or REPOSNL attribute of the queue manager, that is to have the second full repository for the cluster, to specify the cluster name.

AMQ9419

No cluster-receiver channels for cluster <*insert_3*>

Severity

0 : Information

Explanation

The repository manager has received information about a cluster for which no cluster-receiver channels are known.

Response

Define cluster-receiver channels for the cluster on the local queue manager.

AMQ9420

No repositories for cluster <*insert_3*>.

Severity

0 : Information

Explanation

The queue manager has received information about a cluster for which no repositories are known.

Response

Alter the REPOS or REPOSNL attribute of the queue manager, that is to have a full repository for the cluster, to specify the cluster name.

AMQ9421

Invalid cluster record action code detected

Severity

30 : Severe error

Explanation

An invalid record was read from the SYSTEM.CLUSTER.REPOSITORY.QUEUE. An FFST record has been generated containing the invalid record.

Response

Collect the items listed in the Problem Determination section of the System Administration manual and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9422

Repository manager error, RC=<*insert_1*>

Severity

30 : Severe error

Explanation

An internal error has occurred.

Response

Collect the items listed in the 'Problem determination' section of the System Administration manual and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9425

An internal error has occurred.

Severity

30 : Severe error

Explanation

Repository command merge error, command code <*insert_1*> , cluster object <*insert_3*>, sender <*insert_4*>

Response

Collect the items listed in the 'Problem determination' section of the System Administration manual and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9426

Repository command recipient unknown.

Severity

30 : Severe error

Explanation

The repository manager tried to send a command to another queue manager using channel <*insert_4*>. The recipient queue manager, with an identifier that is <*insert_3*> , could not be found. Command code <*insert_1*> .

Response

Check the channel and cluster definitions of the sending and receiving queue managers.

AMQ9427

CLUSSDR channel does not point to a repository queue manager.

Severity

30 : Severe error

Explanation

A CLUSSDR channel must point to a queue manager that hosts repositories for all clusters of which the channel is a member. In addition, the CLUSRCVR for the channel must be a member of all the same clusters as the CLUSSDR channel. The queue manager pointed to by CLUSSDR channel <*insert_3*> does not meet these criteria for cluster <*insert_4*>. The remote queue manager has a QMID of <*insert_5*>.

Response

Check the definitions on the local and remote queue managers to ensure that the CLUSSDR channel points to a queue manager that hosts a repository for the cluster, and that the CLUSRCVR for the channel is a member of the cluster.

AMQ9428

Unexpected publication of a cluster queue object received.

Severity

30 : Severe error

Explanation

The local queue manager has received a publication of a cluster queue object from a remote queue manager on cluster <*insert_3*> . The local queue manager discards the request because it does not host a repository for cluster <*insert_3*> and has not subscribed to the published object. The remote CLUSSDR channel used to access the local queue manager has a channel name of <*insert_4*> and the remote queue manager has a QMID of <*insert_5*>.

Response

Check the definitions on the local and remote queue managers to ensure that the CLUSSDR channel points to a repository queue manager for the cluster.

AMQ9429

Unexpected publication of a cluster queue deletion received.

Severity

30 : Severe error

Explanation

The local queue manager has received a publication of a cluster queue deletion from a remote queue manager on cluster <*insert_3*> . The local queue manager discards the request because it does not host a repository for cluster <*insert_3*> and has not subscribed to the published object. The remote CLUSSDR channel used to access the local queue manager has a channel name of <*insert_4*> and the remote queue manager has a QMID of <*insert_5*>.

Response

Check the definitions on the local and remote queue managers to ensure that the CLUSSDR channel points to a repository queue manager for the cluster.

AMQ9430

Unexpected cluster queue manager publication received.

Severity
30 : Severe error

Explanation
The local queue manager has received a cluster queue manager publication on cluster <*insert_3*>. The local queue manager should not have received the publication because it does not host a repository for cluster <*insert_3*> , it has not subscribed to information concerning the published object, and the published object does not match any of its CLUSSDRs. The queue manager that sent the publication to the local queue manager has QMID <*insert_4*> (note that this is not necessarily the queue manager which originated the publication). CLUSSDR channel <*insert_5*> was used to send the publication.

Response
Check the CLUSSDR definition on the sending queue manager to ensure that it points to a repository queue manager for the cluster.

AMQ9431
Remote queue manager no longer hosts a repository for cluster

Severity
0 : Information

Explanation
The local queue manager has received a message from remote queue manager QMID <*insert_3*> indicating that it no longer hosts a repository for cluster <*insert_4*> . CLUSSDR channel <*insert_5*> is altered so that it can no longer be used to access queue manager <*insert_3*> within cluster <*insert_4*>. If the local queue manager does not host a repository for cluster <*insert_4*> the relevant subscriptions and publications are remade if possible.

Response
None.

AMQ9432
Query received by a non-repository queue manager

Severity
30 : Severe error

Explanation
The local queue manager has received a query from a remote queue manager on cluster <*insert_3*>. The local queue manager discards the query because it does not host a repository for cluster <*insert_3*>. The remote CLUSSDR channel used to access the local queue manager has a channel name of <*insert_4*> and the remote queue manager has a QMID of <*insert_5*>.

Response
Check the definitions on the local and remote queue managers to ensure that the CLUSSDR channel points to a repository queue manager for the cluster.

AMQ9433
CLUSRCVR must be in the same cluster as its matching CLUSSDR.

Severity
30 : Severe error

Explanation
CLUSRCVR channel <*insert_3*> is not defined as a member of cluster <*insert_4*>. The local queue manager has received a command that indicates that CLUSSDR channel <*insert_3*> on the remote queue manager with QMID <*insert_5*> is defined as a member of cluster <*insert_4*>.

Response
Alter the CLUSRCVR or CLUSSDR definitions for channel <*insert_3*>, so that they are both members of the same cluster.

AMQ9434

Unrecognized message on <*insert_3*>.

Severity

30 : Severe error

Explanation

The repository manager found a message on one of its queues having, either a format that could not be recognized, or that did not come from a queue manager or repository manager. The message was put on the dead-letter queue.

Response

Examine the message on the dead-letter queue to determine the originator of the message.

AMQ9435

Unable to put repository manager message.

Severity

30 : Severe error

Explanation

The repository manager tried to send a message to the SYSTEM.CLUSTER.COMMAND.QUEUE on another queue manager with an identifier that is <*insert_3*> , but the MQPUT call was unsuccessful. MQCC=<*insert_1*> , MQRC=<*insert_2*>. Processing continues, but the repository information may be out of date.

Response

Refer to the Application Programming Reference manual for information about MQCC <*insert_1*> and MQRC <*insert_2*> . Check the channel and cluster definitions on the local and target queue managers, and ensure that the channels between them are running. When the problem is corrected, the repository information will normally be updated automatically. The REFRESH CLUSTER command can be used to ensure that the repository information is up to date.

AMQ9436

Unable to send repository manager message.

Severity

30 : Severe error

Explanation

The repository manager tried to send a message to the SYSTEM.CLUSTER.COMMAND.QUEUE on a queue manager that has the full repository for the specified cluster(<*insert_3*>), but the MQPUT call was unsuccessful. MQCC=<*insert_1*>, MQRC=<*insert_2*>. Processing continues, but repository information may be out of date.

Response

Refer to the Application Programming Reference manual for information about MQCC <*insert_1*> and MQRC <*insert_2*> . Check the channel and cluster definitions on the local and target queue managers, and ensure that the channels between them are running. When the problem is corrected, the repository information will normally be updated automatically. The REFRESH CLUSTER command can be used to ensure that the repository information is up to date.

AMQ9437

Unable to commit repository manager changes.

Severity

30 : Severe error

Explanation

The repository manager tried to commit some internal operations but was unsuccessful. The reason code from the MQCMIT call was <*insert_1*>

Response

Inspect the reason code. If it does not seem reasonable in the context of the other queue manager operations taking place at the time, then save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9438

CONNAME could not be discovered for CLUSRCVR <*insert_3*> .

Severity

30 : Severe error

Explanation

TCP/IP CLUSRCVR <*insert_3*> was validly specified with a blank or absent CONNAME parameter. However when the repository process, amqrrmfa, attempted to obtain the CONNAME (IP address) for itself it was unable to. If there is an existing matching CLUSRCVR object in the cache its CONNAME is used. The CONNAME used was <*insert_4*>.

Response

Check the error log for a message arising from an associated TCP/IP call (gethostname, gethostbyname or inet_ntoa). Pass all the error information to your systems administrator.

AMQ9439

Repository corruption: bad CLQMGR object for channel <*insert_3*>.

Severity

30 : Severe error

Explanation

An internal error has occurred.

Response

Collect the items listed in Problem determination and use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9440

Reset command failed.

Severity

0 : Information

Explanation

Reset Cluster(<*insert_3*>) Qmname(<*insert_4*>) command failed. To issue this command, queue manager <*insert_5*> must be a repository for cluster <*insert_3*>. Alter the queue manager attributes Repos, or Reposnl, to include cluster <*insert_3*> and retry the command.

Response

None.

AMQ9441

Reset command processed.

Severity

0 : Information

Explanation

The reset Cluster(<*insert_3*>) Qmname(<*insert_4*>) command has processed on this repository and <*insert_1*> other queue managers have been sent notification.

Response
None.

AMQ9442
Phase one of the REFRESH CLUSTER command has completed.

Severity
0 : Information

Explanation
Phase one of the REFRESH CLUSTER command has completed. The Refresh Cluster(<*insert_4*>) command caused <*insert_1*> objects to be refreshed, and republished to <*insert_2*> queue managers.

Applications attempting to access cluster resources might see failures to resolve cluster resources until phase two of REFRESH CLUSTER is complete. Phase two is complete when all new information has been received from other members of the cluster.

Response
Monitor your SYSTEM.CLUSTER.COMMAND.QUEUE to determine when it has reached a consistently empty state to indicate that the refresh process has completed.

AMQ9443
Suspend Qmgr Cluster command processed.

Severity
0 : Information

Explanation
The Suspend Qmgr Cluster command completed. <*insert_1*> objects suspended.I n the case of a name list the cluster name is the first name in the list.

Response
None.

AMQ9444
Resume Qmgr Cluster command processed.

Severity
0 : Information

Explanation
The Resume Qmgr Cluster(<*insert_4*>) command completed. <*insert_1*> objects resumed. In the case of a name list the cluster name is the first name in the list.

Response
None.

AMQ9445
Error creating channel <*insert_3*>.

Severity
30 : Severe error

Explanation
Channel <*insert_4*> tried to replace itself by creating channel <*insert_3*>. The attempt to create the channel was unsuccessful for the following reason: " <*insert_5*>". A previous message may give further information.

Response
Rectify the problem which prevented successful creation of channel <*insert_3*>. Restart channel <*insert_4*> .

AMQ9446
Error deleting channel <*insert_3*>.

Severity

30 : Severe error

Explanation

Channel <*insert_3*> tried to delete itself after creating channel <*insert_4*> to replace it. The attempt to delete the channel was unsuccessful for the following reason: "<*insert_5*>".

Response

If channel <*insert_3*> still exists rectify the problem which prevented its deletion and then manually delete the channel.

AMQ9447

Unable to backout repository manager changes.

Severity

30 : Severe error

Explanation

The repository manager tried to back out some internal operations but was unsuccessful. The reason code from the MQBACK call was <*insert_1*>.

Response

Inspect the reason code. If it does not seem reasonable in the context of the other queue manager operations taking place at the time, then save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9448

Repository manager failed due to errors. Retry in <*insert_1*> minutes, queue manager will terminate in <*insert_2*> minutes.

Severity

30 : Severe error

Explanation

Repository manager encountered a severe problem. See the earlier messages in the queue manager or system error logs for details. The repository manager will retry the command in <*insert_1*> minutes. If the problem is not rectified in <*insert_2*> minutes the queue manager will terminate. Until this problem is rectified no further cluster management activity will occur, this will effect the availability of cluster resources accessed or hosted by this queue manager.

Response

If possible, rectify the identified problem, otherwise contact your IBM support center. To postpone the queue manager from terminating due to this problem set the SYSTEM.CLUSTER.COMMAND.QUEUE queue to be GET(DISABLED). Once the problem has been rectified, set the queue to be GET(ENABLED) and wait for the repository manager to retry the command or restart the queue manager.

AMQ9449

The repository manager is restarting following an error.

Severity

0 : Information

Explanation

The repository manager is restarting following an error, see earlier error messages for details of the failure.

Response

If the failure re-occurs contact your IBM support center and follow any instructions in the subsequent error messages.

AMQ9450

Usage: <*insert_3*> [-m QMgrName] -f OutputFile [-v OutputFileVersion]

Severity

10 : Warning

Explanation

Values passed to the channel table writer program were invalid.

The parameter string passed to this program is as follows:

[-m QMgrName] -f OutputFile [-v OutputFileVersion]

where OutputFileVersion can be either 2 or 5 (5 is the default)

Default values will be used for parameters not supplied.

Response

Correct the parameters passed to the channel table writer program and retry the operation.

AMQ9451 (Tandem)

Repository already active in CPU <*insert_1*>

Severity

0 : Information

Explanation

During initialization, a Repository Manager determined that the named CPU already had an active Repository Manager. This is probably caused by an incorrectly configured Pathway. Each CPU can support only one active Repository Manager.

Response

Ensure Pathway configuration only defines one Repository Manager per CPU

AMQ9453

FORCEREMOVE command failed, cluster <*insert_3*> target <*insert_4*> is not unique.

Severity

0 : Information

Explanation

The repository queue manager could not process a RESET ACTION(FORCEREMOVE) command for the indicated cluster and target queue manager, because there is more than one queue manager with the specified name in the cluster. The command is ignored.

Response

Reissue the command specifying the identifier (QMID) of the queue manager to be removed, rather than its name.

AMQ9453 (Tandem)

Repository Manager (CPU <*insert_1*>) partner in CPU <*insert_2*> closed

Severity

0 : Information

Explanation

The Repository Manager running in the first-named CPU noticed that a partner Repository Manager in the second-named CPU ended. This may be the result of the Queue Manager shutting down or it may indicate that the partner Repository Manager was forcibly stopped or suffered an error.

Response

If the Queue Manager is shutting down, this message is informational only. Otherwise, the WebSphere MQ error log, the system log, or both should be examined to determine why the partner Repository Manager ended.

AMQ9455
FORCEREMOVE command failed, cluster <*insert_3*> , target <*insert_4*>, not found.

Severity
0 : Information

Explanation
The repository queue manager could not process a RESET ACTION(FORCEREMOVE) command for the indicated cluster and target queue manager, because no information about that queue manager was found in the local repository. The command is ignored.

Response
Reissue the command, specifying the correct queue manager name or identifier.

AMQ9456
Update not received for queue <*insert_3*> , queue manager <*insert_4*> from full repository for cluster <*insert_5*>.

Severity
0 : Information

Explanation
The repository manager detected a queue that has been used in the last 30 days for which updated information should have been sent from a full repository. However, this has not occurred.

The repository manager will keep the information about this queue for a further 60 days.

Response
If the queue is still required, check that:

1) The cluster channels to and from the full repository and the queue manager that hosts the queue, are able to run.

2) The repository managers running on these queue managers have not ended abnormally.

AMQ9457
Repository available, cluster <*insert_4*> , channel <*insert_5*>, sender <*insert_3*> .

Severity
0 : Information

Explanation
The repository queue manager received a command from another queue manager, with an identifier that is <*insert_3*> , reporting that it is again a repository for cluster <*insert_4*> . The cluster-sender channel <*insert_5*> is changed so that it can be used to access the other queue manager in relation to the cluster.

Response
None.

AMQ9458
Unable to access the repository cache exclusively.

Severity
30 : Severe error

Explanation
A process remains registered as requiring access to the repository cache during an operation that must have exclusive access to the cache. The queue manager <*insert_3*> issues this message after waiting for the process to remove its registration, but the registration is still present. The process preventing exclusive access to the repository cache has <*insert_2*> outstanding registrations.

Response
The registered process identifier (PID) accessing the repository cache is <*insert_1*>. Determine if

this process is still running or terminated. If the process is not running or if the problem persists collect the items listed in the 'Problem determination' section of the System Administration manual and contact your IBM support center.

AMQ9459

Cluster topic <*insert_3*> from <*insert_4*> rejected due to PSCLUS(DISABLED).

Severity

10 : Warning

Explanation

Queue manager attribute PSCLUS has been set to DISABLED to indicate that inter queue manager Publish/Subscribe activity is not expected in this cluster. However, information regarding cluster topic <*insert_3*> has been sent to this queue manager over a channel from <*insert_4*>. The cluster topic definition is ignored and will not be visible from this queue manager.

Response

If you need to enable publish/subscribe clustering, alter the PSCLUS attribute on all queue managers in the cluster to ENABLED. You might also need to issue REFRESH CLUSTER and REFRESH QMGR commands as detailed in the PSCLUS documentation. If you are not using publish/subscribe clusters you should delete the clustered topic object, and ensure that PSCLUS is DISABLED on all queue managers.

AMQ9465

New cluster topic definition inconsistent.

Severity

10 : Warning

Explanation

The definition of cluster topic <*insert_3*> on the queue manager with UUID <*insert_4*> has a different <*insert_5*> attribute value than one or more cluster topics that already exist in the cluster cache. The existing topic objects are reported by message AMQ9466. All definitions of the same cluster topic should be identical, otherwise, problems may arise if your applications rely on one of these attributes to determine messaging behavior. For example, if an application opens a cluster topic and the different instances of the topic have different TOPICSTR values, the behavior of the message transfer depends on which instance of the topic happens to be selected when it is opened.

Response

Alter the definitions of the topic on the various queue managers so that they have identical values for all attributes.

AMQ9466

Cluster topic definitions inconsistent.

Severity

10 : Warning

Explanation

The definition of cluster topic <*insert_3*> on the queue manager with UUID <*insert_4*> has a different <*insert_5*> attribute value than a cluster topic being added to the cluster cache. The topic object being added is reported by message AMQ9465. All definitions of the same cluster topic should be identical, otherwise, problems may arise if your applications rely on one of these attributes to determine messaging behavior. For example, if an application opens a cluster topic and the different instances of the topic have different TOPICSTR values, the behavior of the message transfer depends on which instance of the topic happens to be selected when it is opened.

Response

Alter the definitions of the topic on the various queue managers so that they have identical values for all attributes.

AMQ9467

Repository error updating topic.

Severity

20 : Error

Explanation

The cluster repository manager received an unexpected error code from the queue manager while updating topic <*insert_3*> . The completion code was <*insert_1*>, reason code was <*insert_2*>.

Response

Refer to the WebSphere MQ product documentation for information about reason code <*insert_1*>.

Collect the items listed in the *Problem determination* section of the WebSphere MQ product documentation, and use either the WebSphere MQ Support site: , or the IBM Support Assistant (ISA): , to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9468

Cluster receiver channel <*insert_3*> has been configured by multiple queue managers.

Severity

0 : Informational

Explanation

Queue manager <*insert_4*> has joined a cluster using a cluster receiver channel with the same name as one that has already been defined by queue manager <*insert_5*> . All cluster receiver channels used within a cluster must be uniquely named. Only the last queue manager to join the cluster will use the named channel, Queue manager <*insert_5*> will not successfully participate in the cluster while the newer queue manager is a member.

Response

The use of a channel name currently associated with a different queue manager in the cluster may be intentional, for example, the original queue manager may have been deleted and re-created as a new queue manager. However, accidental duplication of a channel name across multiple queue managers will also result in this behaviour. If this was not intended, further investigation into the configuration of the queue managers should be performed.

AMQ9469

Update not received for CLUSRCVR channel &3 hosted on queue manager &4 in cluster &5.

Severity

10 : Warning

Explanation

The repository manager detected that the CLUSRCVR channel has not been republished by its owning queue manager. This republish action should have happened automatically <*insert_1*> between then and now.

The repository manager will check for this condition approximately every hour, continuing for a period of approximately <*insert_2*> days from now. If an update for the CLUSRCVR channel is received during this period, these messages will stop. If no update is received, these messages will continue to be written. However, after this period has elapsed, if no update has been received, the local queue manager will discard its knowledge of this channel, and these messages will stop. You should be aware that partial repository queue managers in this cluster will cease to be able to use the channel at about that time.

Response

There are several possible responses:

1. If the channel had been removed intentionally, and is no longer required, you should consider removing it fully by using the RESET CLUSTER command.
2. There is a long-running problem with the local queue manager's CLUSRCVR in cluster <*insert_5*>. If this is true, then correct the problem urgently to ensure that updates for the cluster are received.
3. There is a long-running problem on the remote queue manager's CLUSSDR in cluster <*insert_5*>. If this is true, then correct the problem urgently to ensure that updates for the cluster are sent.
4. Check that the repository manager on the remote queue manager has not ended abnormally.
5. The remote queue manager is out of step with this queue manager, potentially due to a restore of the queue manager from a backup. The remote queue manager must issue REFRESH CLUSTER to synchronize with other queue managers in the cluster.
6. If the above items have been checked and this problem persists over several days causing repeats of this error message in the local queue manager's error logs, contact your IBM support center.

AMQ9487

Remote queue manager is a standby queue manager.

Severity

30 : Severe error

Explanation

Channel <*insert_3*> is closing because the remote queue manager is a standby queue manager.

Response

None.

AMQ9488

Program cannot connect to the standby queue manager.

Severity

30 : Severe error

Explanation

The connection attempt to queue manager <*insert_4*> failed with reason code <*insert_1*> because the queue manager is a standby queue manager.

Response

Standby queue managers do not accept connections. Connect to the primary queue manager instead.

AMQ9489

The maximum number of instances, <*insert_1*> , of channel <*insert_3*> was reached.

Severity

30 : Severe error

Explanation

The server-connection channel <*insert_3*> is configured so that the maximum number of instances that can run at the same time is <*insert_1*>. This limit was reached.

Response

Try the operation again when a new instance can be started.

If the limit has been reached because there are too many connections from one or more of your client applications, consider changing the applications to make fewer connections.

If you are not making use of sharing conversations, consider switching to this mode of operation because several client connections can then share one channel instance.

AMQ9490

The maximum number of instances, <*insert_1*> , of channel <*insert_3*> was reached for an individual client.

Severity

30 : Severe error

Explanation

The server-connection channel <*insert_3*> is configured so that the maximum number of instances that can run at the same time for any individual client is <*insert_1*> . This limit was reached for the client with remote network address <*insert_4*>.

Response

Try the operation again when a new instance can be started for this client.

If the limit has been reached because there are too many connections from the relevant client application, consider changing the application to make fewer connections.

If you are not making use of sharing conversations, consider switching to this mode of operation because several client connections can then share one channel instance.

AMQ9491

Transmission Queue <*insert_3*> set to NOSHARE.

Severity

20 : Error

Explanation

The channel <*insert_4*> on queue manager <*insert_5*> cannot start because this queue manager has a setting for PipeLineLength greater than 1, and so multiple threads will run in this channel's MCA. Only the first thread would be able to open the Transmission Queue <*insert_3*> because it is set to be non-shareable.

Response

Check the definition of the Transmission Queue <*insert_3*> on queue manager <*insert_5*> and set it to be SHARE instead of NOSHARE. Alternatively, you can set all channels on this queue manager to use only a single thread, by using the PipeLineLength parameter.

AMQ9492

The <*insert_3*> responder program encountered an error.

Severity

30 : Severe error

Explanation

The responder program was started but detected an error.

Response

Look at previous error messages in the error files to determine the error encountered by the responder program.

AMQ9494

A protocol error was detected for channel <*insert_3*> .

Severity

30 : Severe error

Explanation

During communications with the remote queue manager, a TCP/IP read and receive call returned EINTR, indicating that it had been interrupted. Immediately after this the channel program detected a protocol error. The failure type was <*insert_1*> with associated data of <*insert_2*>.

Response

If you are running an AIX client you will avoid problems arising from EINTRs on TCP/IP reads, by writing your application so that system calls interrupted by signals are restarted. You must establish the signal handler with sigaction(2) and set the SA_RESTART flag in the sa_flags field of the new action structure. If you are running on a platform other than AIX, an AIX server, or an AIX client with an application that adheres to the restart guidelines provided above, contact the systems administrator who should examine the error logs to determine the cause of the failure.

AMQ9495

The CLWL exit <*insert_3*> is inconsistent with a dynamic cache.

Severity

30 : Severe error

Explanation

When the CLWL exit <*insert_3*> was called for the ExitReason MQXR_INIT, the value <*insert_1*> was returned in the ExitResponse2 field. This indicates the CLWL exit is incompatible with the Queue Manager cache type which is dynamic. Either change the Queue Manager cache type to static (using the Tuning Parameter, ClusterCacheType=STATIC) or rewrite the CLWL exit to be compatible with a dynamic cache". The CLWL exit has been suppressed.

Response

None.

AMQ9496

Channel ended by a remote exit.

Severity

30 : Severe error

Explanation

Channel program <*insert_3*> was ended because the channel exit at the remote end requested it.

Response

Examine the error logs at the remote end of the channel to see the reason why the remote exit ended the channel.

AMQ9498

The MQCD structure supplied was not valid.

Severity

30 : Severe error

Explanation

The value of the <*insert_3*> field has the value <*insert_4*>. This value is invalid for the operation requested.

Response

Change the parameter and retry the operation.

AMQ9499

A WebSphere MQ listener will end shortly.

Severity

0 : Information

Explanation

One listener detected in the system is scheduled for shutdown.

Response

None.

AMQ9500

No Repository storage

Severity
10 : Warning

Explanation
An operation failed because there was no storage available in the repository. An attempt was made to allocate <*insert_1*> bytes from <*insert_3*>.

Response
Reconfigure the Queue Manager to allocate a larger repository.

AMQ9501
Usage: <*insert_3*> [-m QMgrName] -c ChlName.

Severity
10 : Warning

Explanation
Values passed to the channel program are not valid. The parameter string passed to this program is as follows :- [-m QMgrName] -c ChlName Default values will be used for parameters not supplied.

Response
Correct the parameters passed to the Channel program and retry the operation.

AMQ9502
Type of channel not suitable for action requested.

Severity
30 : Severe error

Explanation
The operation requested cannot be performed on channel <*insert_3*>. Some operations are only valid for certain channel types. For example, you can only ping a channel from the end sending the message.

Response
Check whether the channel name is specified correctly. If it is check that the channel has been defined correctly.

AMQ9503
Channel negotiation failed.

Severity
30 : Severe error

Explanation
Channel <*insert_3*> between this machine and the remote machine could not be established due to a negotiation failure.

Response
Tell the systems administrator, who should attempt to identify the cause of the channel failure using problem determination techniques. For example, look for FFST files, and examine the error logs on the local and remote systems where there may be messages explaining the cause of failure. More information may be obtained by repeating the operation with tracing enabled.

AMQ9504
A protocol error was detected for channel <*insert_3*> .

Severity
30 : Severe error

Explanation
During communications with the remote queue manager, the channel program detected a protocol error. The failure type was <*insert_1*> with associated data of <*insert_2*>.

Response
Contact the systems administrator who should examine the error logs to determine the cause of the failure.

AMQ9505
Channel sequence number wrap values are different.

Severity
30 : Severe error

Explanation
The sequence number wrap value for channel <*insert_3*> is <*insert_1*>, but the value specified at the remote location is <*insert_2*>. The two values must be the same before the channel can be started.

Response
Change either the local or remote channel definitions so that the values specified for the message sequence number wrap values are the same.

AMQ9506
Message receipt confirmation failed.

Severity
30 : Severe error

Explanation
Channel <*insert_3*> has ended because the remote queue manager did not accept the last batch of messages.

Response
The error log for the channel at the remote site will contain an explanation of the failure. Contact the remote Systems Administrator to resolve the problem.

AMQ9507
Channel <*insert_3*> is currently in-doubt.

Severity
30 : Severe error

Explanation
The requested operation cannot complete because the channel is in-doubt with host <*insert_4*>.

Response
Examine the status of the channel, and either restart a channel to resolve the in-doubt state, or use the RESOLVE CHANNEL command to correct the problem manually.

AMQ9508
Program cannot connect to the queue manager.

Severity
30 : Severe error

Explanation
The connection attempt to queue manager <*insert_4*> failed with reason code <*insert_1*>.

Response
Ensure that the queue manager is available and operational.

AMQ9509
Program cannot open queue manager object.

Severity
30 : Severe error

Explanation
The attempt to open either the queue or queue manager object <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>.

Response
Ensure that the queue is available and retry the operation.

AMQ9510
Messages cannot be retrieved from a queue.

Severity
30 : Severe error

Explanation
The attempt to get messages from queue <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>.

Response
If the reason code indicates a conversion problem, for example, MQRC_SOURCE_CCSID_ERROR, remove the message(s) from the queue. Otherwise, ensure that the required queue is available and operational.

AMQ9511
Messages cannot be put to a queue.

Severity
30 : Severe error

Explanation
The attempt to put messages to queue <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>.

Response
Ensure that the required queue is available and operational.

AMQ9512
Ping operation is not valid for channel <*insert_3*> .

Severity
30 : Severe error

Explanation
Ping may only be issued for SENDER, SERVER or CLUSSDR channel types. Also, it may not be issued for an SSL channel on the HP-UX or Linux platforms.

Response
If the local channel is a receiver channel, you must issue the ping from the remote queue manager.

AMQ9513
Maximum number of channels reached.

Severity
30 : Severe error

Explanation
The maximum number of channels that can be in use simultaneously has been reached. The number of permitted channels is a configurable parameter in the queue manager configuration file.

Response
Wait for some of the operating channels to close. Retry the operation when some channels are available.

AMQ9514
Channel <*insert_3*> is in use.

Severity
30 : Severe error

Explanation
The requested operation failed because channel <*insert_3*> is currently active.

Response
Either end the channel manually, or wait for it to close, and retry the operation.

AMQ9515
Channel <*insert_3*> changed.

Severity
10 : Warning

Explanation
The statistics shown are for the channel requested, but it is a new instance of the channel. The previous channel instance has ended.

Response
None.

AMQ9516
File error occurred.

Severity
30 : Severe error

Explanation
The filesystem returned error code <*insert_1*> for file <*insert_3*>.

Response
Record the name of the file <*insert_3*> and tell the systems administrator, who should ensure that file <*insert_3*> is correct and available.

AMQ9516 (IBM i)
File error occurred.

Severity
30 : Severe error

Explanation
The filesystem returned error code <*insert_4*> for file <*insert_3*>.

Response
Record the name of the file <*insert_3*> and tell the systems administrator, who should ensure that file <*insert_3*> is correct and available.

AMQ9517
File damaged.

Severity
30 : Severe error

Explanation
The program has detected damage to the contents of file <*insert_3*>.

Response
Record the values and tell the systems administrator who must restore a saved version of file <*insert_3*>. The return code was <*insert_1*> and the record length returned was <*insert_2*>.

AMQ9518
File <*insert_3*> not found.

Severity
30 : Severe error

Explanation
The program requires that the file <*insert_3*> is present and available.

Response
This may be caused by invalid values for the optional environment variables MQCHLLIB, MQCHLTAB or MQDATA. If these variables are valid or not set then record the name of the file and tell the systems administrator who must ensure that file <*insert_3*> is available to the program.

AMQ9519
Channel <*insert_3*> not found.

Severity
30 : Severe error

Explanation
The requested operation failed because the program could not find a definition of channel <*insert_3*>.

Response
Check that the name is specified correctly and the channel definition is available.

AMQ9520
Channel not defined remotely.

Severity
30 : Severe error

Explanation
There is no definition of channel <*insert_3*> at the remote location.

Response
Add an appropriate definition to the remote hosts list of defined channels and retry the operation.

AMQ9521
Host is not supported by this channel.

Severity
30 : Severe error

Explanation
The connection across channel <*insert_5*> was refused because the remote host <*insert_4*> did not match the host <*insert_3*> specified in the channel definition.

Response
Update the channel definition, or remove the explicit mention of the remote machine connection name.

AMQ9522
Error accessing the status table.

Severity
30 : Severe error

Explanation
The program could not access the channel status table.

Response
A value of <*insert_1*> was returned from the subsystem when an attempt was made to access the Channel status table. Contact the systems administrator, who should examine the log files to determine why the program was unable to access the status table.

AMQ9523
Remote host detected a protocol error.

Severity
30 : Severe error

Explanation
During communications through channel <*insert_3*> , the remote queue manager channel program detected a protocol error. The failure type was <*insert_1*> with associated data of <*insert_2*>.

Response
Tell the systems administrator, who should examine the error files to determine the cause of the failure.

AMQ9524
Remote queue manager unavailable.

Severity
30 : Severe error

Explanation
Channel <*insert_3*> cannot start because the remote queue manager is not currently available.

Response
Either start the remote queue manager, or retry the operation later.

AMQ9525
Remote queue manager is ending.

Severity
30 : Severe error

Explanation
Channel <*insert_3*> is closing because the remote queue manager is ending.

Response
None.

AMQ9526
Message sequence number error for channel <*insert_3*> .

Severity
30 : Severe error

Explanation
The local and remote queue managers do not agree on the next message sequence number. A message with sequence number <*insert_1*> has been sent when sequence number <*insert_2*> was expected. The remote host is <*insert_4*>.

Response
Determine the cause of the inconsistency. It could be that the synchronization information has become damaged, or has been backed out to a previous version. If the situation cannot be resolved, the sequence number can be manually reset at the sending end of the channel using the RESET CHANNEL command.

AMQ9527
Cannot send message through channel <*insert_3*> .

Severity
30 : Severe error

Explanation
The channel has closed because the remote queue manager cannot receive a message.

Response
Contact the systems administrator who should examine the error files of the remote queue manager, to determine why the message cannot be received, and then restart the channel.

AMQ9528
User requested closure of channel <*insert_3*> .

Severity
10 : Warning

Explanation
The channel is closing because of a request by the user.

Response
None.

AMQ9529
Target queue unknown on remote host.

Severity
30 : Severe error

Explanation
Communication using channel <*insert_3*> has ended because the target queue for a message is unknown at the remote host.

Response
Ensure that the remote host contains a correctly defined target queue, and restart the channel.

AMQ9530
Program could not inquire queue attributes.

Severity
30 : Severe error

Explanation
The attempt to inquire the attributes of queue <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>.

Response
Ensure that the queue is available and retry the operation.

AMQ9531
Transmission queue specification error.

Severity
30 : Severe error

Explanation
Queue <*insert_4*> identified as a transmission queue in the channel definition <*insert_3*> is not a transmission queue.

Response
Ensure that the queue name is specified correctly. If so, alter the queue usage parameter of the queue to that of a transmission queue.

AMQ9532
Program cannot set queue attributes.

Severity
30 : Severe error

Explanation
The attempt to set the attributes of queue <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>.

Response
Ensure that the queue is available and retry the operation.

AMQ9533
Channel <*insert_3*> is not currently active.

Severity
10 : Warning

Explanation
The channel was not stopped because it was not currently active. If attempting to stop a specific instance of a channel by connection name or by remote queue manager name this message indicates that the specified instance of the channel is not running.

Response
None.

AMQ9534
Channel <*insert_3*> is currently not enabled.

Severity
30 : Severe error

Explanation
The channel program ended because the channel is currently not enabled.

Response
Issue the START CHANNEL command to re-enable the channel.

AMQ9535
User exit not valid.

Severity
30 : Severe error

Explanation
Channel program <*insert_3*> ended because user exit <*insert_4*> is not valid.

Response
Ensure that the user exit is specified correctly in the channel definition, and that the user exit program is correct and available.

AMQ9536
Channel ended by an exit.

Severity
30 : Severe error

Explanation
Channel program <*insert_3*> was ended by exit <*insert_4*>.

Response
None.

AMQ9537
Usage: <*insert_3*> [-m QMgrName] [-q InitQ]

Severity
10 : Warning

Explanation
Values passed to the Channel Initiator program are not valid. The parameters should be passed as follows: [-m QMgrName] [-q InitQ] Default values are used for parameters that are not supplied.

Response
Correct the parameters passed to the program and retry the operation.

AMQ9538
Commit control error.

Severity
30 : Severe error

Explanation
An error occurred when attempting to start commitment control. Either exception <*insert_3*> was received when querying commitment status, or commitment control could not be started.

Response
Refer to the error log for other messages pertaining to this problem.

AMQ9539
No channels available.

Severity
30 : Severe error

Explanation
The channel initiator program received a trigger message to start an MCA program to process queue <*insert_3*>. The program could not find a defined, available channel to start.

Response
Ensure that there is a defined channel, which is enabled, to process the transmission queue.

AMQ9540
Commit failed.

Severity
30 : Severe error

Explanation
The program ended because return code <*insert_1*> was received when an attempt was made to commit change to the resource managers. The commit ID was <*insert_3*>.

Response
Tell the systems administrator.

AMQ9541
CCSID supplied for data conversion not supported.

Severity
30 : Severe error

Explanation
The program ended because, either the source CCSID <*insert_1*> or the target CCSID <*insert_2*> is not valid, or is not currently supported.

Response
Correct the CCSID that is not valid, or ensure that the requested CCSID can be supported.

AMQ9542
Queue manager is ending.

Severity
10 : Warning

Explanation
The program will end because the queue manager is quiescing.

Response
None.

AMQ9543
Status table damaged.

Severity
30 : Severe error

Explanation
The channel status table has been damaged.

Response
End all running channels and issue a DISPLAY CHSTATUS command to see the status of the channels. Use the standard facilities supplied with your system to record the problem identifier and to save any generated output files. Use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9544
Messages not put to destination queue.

Severity
10 : Warning

Explanation
During the processing of channel <*insert_3*> one or more messages could not be put to the destination queue and attempts were made to put them to a dead-letter queue. The location of the queue is <*insert_1*>, where 1 is the local dead-letter queue and 2 is the remote dead-letter queue.

Response
Examine the contents of the dead-letter queue. Each message is contained in a structure that describes why the message was put to the queue, and to where it was originally addressed. Also look at previous error messages to see if the attempt to put messages to a dead-letter queue failed. The program identifier (PID) of the processing program was <*insert_4*>.

AMQ9545
Disconnect interval expired.

Severity
0 : Information

Explanation
Channel <*insert_3*> closed because no messages arrived on the transmission queue within the disconnect interval period.

Response
None.

AMQ9546
Error return code received.

Severity
30 : Severe error

Explanation
The program has ended because return code <*insert_1*> was returned from function <*insert_3*>

Response
Correct the cause of the failure and retry the operation.

AMQ9547
Type of remote channel not suitable for action requested.

Severity
30 : Severe error

Explanation
The operation requested cannot be performed because channel <*insert_3*> on the remote machine is not of a suitable type. For example, if the local channel is defined as a sender the remote machine must define its channel as either a receiver or requester.

Response
Check that the channel name is specified correctly. If it is, check that the remote channel has been defined correctly.

AMQ9548
Message put to the 'dead-letter queue'.

Severity
10 : Warning

Explanation
During processing a message has been put to the dead-letter queue.

Response
Examine the contents of the dead-letter queue. Each message is contained in a structure that describes why the message was put to the queue, and to where it was originally addressed.

AMQ9549
Transmission Queue <*insert_3*> inhibited for MQGET.

Severity
20 : Error

Explanation
An MQGET failed because the transmission queue had been previously inhibited for MQGET.

Response
None.

AMQ9550
Channel program <*insert_3*> cannot be stopped at this time.

Severity
30 : Severe error

Explanation
The channel program cannot be terminated immediately but should end shortly.

Response
If the channel does not end in a short time issue the STOP CHANNEL command again.

AMQ9551
Protocol not supported by remote host

Severity
30 : Severe error

Explanation
The operation you are performing over Channel <*insert_3*> to the host at <*insert_4*> is not supported by the target host.

Response
Check that the connection name parameter is specified correctly and that the levels of the products in use are compatible.

AMQ9552
Security flow not received.

Severity
30 : Severe error

Explanation
During communications through channel <*insert_3*> the local security exit requested security data from the remote machine. The security data has not been received so the channel has been closed.

Response
Tell the systems administrator who should ensure that the security exit on the remote machine is defined correctly.

AMQ9553
The function is not supported.

Severity
30 : Severe error

Explanation
The <*insert_3*> function <*insert_4*> attempted is not currently supported on this platform.

Response
None.

AMQ9554
User not authorized.

Severity
30 : Severe error

Explanation
You are not authorized to perform the Channel operation.

Response
Tell the systems administrator who should ensure that the correct access permissions are available to you, and then retry the operation.

AMQ9555
File format error.

Severity
30 : Severe error

Explanation
The file <*insert_3*> does not have the expected format.

Response
Ensure that the file name is specified correctly.

AMQ9556
Channel synchronization file missing or damaged.

Severity
30 : Severe error

Explanation
The channel synchronization file <*insert_3*> is missing or does not correspond to the stored channel information for queue manager <*insert_4*>.

Response
Rebuild the synchronization file using the rcrmqobj command

```
rcrmqobj -t syncfile (-m q-mgr-name)
```

AMQ9556 (IBM i)
Channel synchronization file missing or damaged.

Severity
30 : Severe error

Explanation
The channel synchronization file <*insert_3*> is missing or does not correspond to the stored channel information for queue manager <*insert_4*>.

Response
Rebuild the synchronization file using the RCRMQMOBJ command.

AMQ9557
Queue Manager User ID initialization failed.

Severity
30 : Severe error

Explanation
The call to initialize the User ID failed with CompCode <*insert_1*> and Reason <*insert_2*> .

Response
Correct the error and try again.

AMQ9558
The remote channel <*insert_3*> is not currently available.

Severity
30 : Severe error

Explanation
The channel program ended because an instance of channel <*insert_3*> could not be started on the remote system. This could be for one of the following reasons:

The channel is disabled.

The remote system does not have sufficient resources to run another instance of the channel.

In the case of a client-connection channel, the limit on the number of instances configured for the remote server-connection channel was reached.

Response
Check the remote system to ensure that the channel is able to run. Try the operation again.

AMQ9560
Rebuild Synchronization File - program started

Severity
0 : Information

Explanation
Rebuilding the Synchronization file for Queue Manager <*insert_3*> .

Response
None.

AMQ9561
Rebuild Synchronization File - program completed normally

Severity
0 : Information

Explanation
Rebuild Synchronization File program completed normally.

Response
None.

AMQ9562
Synchronization file in use.

Severity
30 : Severe error

Explanation
The Synchronization file <*insert_3*> is in use and cannot be re-created.

Response
Stop any channel activity and retry the rcrmqobj command.

AMQ9562 (IBM i)
Synchronization file in use.

Severity
30 : Severe error

Explanation
The Synchronization file <*insert_3*> is in use and cannot be re-created.

Response
Stop any channel activity and retry the RCRMQMOBJ command.

AMQ9563
Synchronization file cannot be deleted

Severity
30 : Severe error

Explanation
The filesystem returned error code <*insert_1*> for file <*insert_3*>.

Response
Tell the systems administrator who should ensure that file <*insert_3*> is available and not in use.

AMQ9564
Synchronization File cannot be created

Severity
30 : Severe error

Explanation
The filesystem returned error code <*insert_1*> for file <*insert_3*>.

Response
Tell the systems administrator.

AMQ9565
No dead-letter queue defined.

Severity
30 : Severe error

Explanation
The queue manager <*insert_4*> does not have a defined dead-letter queue. A message cannot be transferred across channel <*insert_5*>. The reason code is <*insert_1*>. The destination queue is <*insert_3*> .

Response
Either correct the problem that caused the program to try and write a message to the dead-letter queue or create a dead-letter queue for the queue manager.

AMQ9566
Invalid MQSERVER value

Severity
30 : Severe error

Explanation
The value of the MQSERVER environment variable was <*insert_3*> . The variable should be in the format 'ChannelName/Protocol/ConnectionName'.

Response
Correct the MQSERVER value and retry the operation.

AMQ9572
Message header is not valid.

Severity
30 : Severe error

Explanation
Channel <*insert_3*> is stopping because a message header is not valid. During the processing of the channel, a message was found that has a header that is not valid. The dead-letter queue has been defined as a transmission queue, so a loop would be created if the message had been put there.

Response
Correct the problem that caused the message to have a header that is not valid.

AMQ9573
Maximum number of active channels reached.

Severity
30 : Severe error

Explanation
There are too many channels active to start another. The current defined maximum number of active channels is <*insert_1*> .

Response
Either wait for some of the operating channels to close or use the stop channel command to close some channels. Retry the operation when some channels are available. The maximum number of active channels is a configurable parameter in the queue manager configuration file.

AMQ9574
Channel <*insert_3*> can now be started.

Severity
30 : Severe error

Explanation
Channel <*insert_3*> has been waiting to start, but there were no channels available because the maximum number of active channels was running. One, or more, of the active channels has now closed so this channel can start.

AMQ9575
DCE Security: failed to get the user's login name.

Severity
30 : Severe error

Explanation
System call <*insert_4*> to get the login name of the user running WebSphere MQ MQI client application process <*insert_1*> failed with error value <*insert_2*> . This occurred in security exit function create_cred. The exit will now attempt to open channel <*insert_3*> using the DCE default login context.

Response

If you wish to run using the DCE default login context take no action. If you wish to run using the user's login name as the DCE security exit principal examine the documentation for the operating system on which you are running MQ MQI clients and reconfigure the operating system as necessary to allow the <*insert_4*> call to succeed.

AMQ9576

DCE Security: an exit could not allocate memory.

Severity

30 : Severe error

Explanation

A DCE exit was unsuccessful in obtaining the memory it needed. The failure occurred in exit function <*insert_4*> . Channel <*insert_3*> is closed.

Response

Make more memory available to the WebSphere MQ system and restart the relevant channel.

AMQ9577

DCE security exit: no partner name.

Severity

30 : Severe error

Explanation

Channel <*insert_3*> has not been opened because the DCE security exit which initiates the security context was not passed a valid partner name. When the DCE security exit is called to initiate the security context it is essential that the PartnerName field in the MQCXP structure contains a valid partner name. On this call it did not. This can arise as a result of a usage error, for example, only specifying the security exit on one end of the channel. The error was reported from security exit function savePartnerName.

Response

Check your usage of the DCE security exit for errors, such as only specifying the exit in one of the matching channel definitions. Correct any errors found and retry.

AMQ9578

DCE Security: bad return from DCE call.

Severity

30 : Severe error

Explanation

Channel <*insert_3*> has been closed because one of the DCE channel exits received a bad return code from DCE.

Response

Consult the appropriate DCE manuals to find out the meaning of major_status <*insert_1*> and minor_status <*insert_2*> on call <*insert_5*>. Then rectify the error. The exit function name is <*insert_4*> .

AMQ9579

DCE Security: partner name does not match target.

Severity

30 : Severe error

Explanation

The DCE Security exit was requested to perform a trusted channel check: target partner name <*insert_4*> was specified in the SCYDATA field of channel <*insert_3*>. The actual partner name associated with channel <*insert_3*> was <*insert_5*>, so the security exit suppressed the channel.

Response

Examine the channel definition of channel <*insert_3*> and alter it so that the relevant name on the partner system matches that specified in the SCYDATA field.

AMQ9580

DCE Security: invalid message received.

Severity

30 : Severe error

Explanation

An IBM-supplied DCE exit on channel <*insert_3*> received a message that was not generated by a matching exit, or was not the expected type of message. The header.mechanism field had value <*insert_1*>. The header.msgtype field had value <*insert_2*>. The name of the exit function in which the error was discovered is <*insert_4*> .

Response

Make sure that the exits at both ends of the channel generate compatible flows.

AMQ9581

DCE Security: wrong exit called.

Severity

30 : Severe error

Explanation

Exit <*insert_4*> on channel <*insert_3*> was called for use as a WebSphere MQ exit of the wrong type. DCE_SEC_SCY_CHANNELEXIT functions as a security exit;
DCE_SEC_SRM_CHANNELEXIT functions as a send, receive or message exit. The ExitId parameter passed to the exit was <*insert_1*>.

Response

Alter the exit definitions to ensure that exit <*insert_4*> is called correctly.

AMQ9582

DCE Security: invalid exit function requested.

Severity

30 : Severe error

Explanation

Exit <*insert_4*> on channel <*insert_3*> was called with an invalid ExitReason (value <*insert_1*>).

Response

Check that the exit is being run with a compatible release of WebSphere MQ base code. If not then correct it. If it is, save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9583

The DCE security exit was not run.

Severity

30 : Severe error

Explanation

The DCE_SEC_SRM_CHANNELEXIT exit was called on channel <*insert_3*>; the value of pContext->mechanism (<*insert_1*>) passed was not valid.

Response

This is probably because the DCE_SEC_SRM_CHANNELEXIT exit has been called without first calling the DCE_SEC_SCY_CHANNELEXIT security exit. Alter the system so that either both or neither are run.

AMQ9584
DCE Security: message too short.

Severity
30 : Severe error

Explanation
The DCE_SEC_SRM_CHANNELEXIT receive or message exit was called on channel <*insert_3*> to process an incoming message. The pDataLength parameter supplied to the exit indicated that the message received was too short to be a valid message for the relevant exit. The *pDataLength value was <*insert_1*> .

Response
Configure the system so that compatible send/receive/message exits are run at both ends of the channel.

AMQ9585
Maximum number of channel initiators reached.

Severity
30 : Severe error

Explanation
The maximum number of channels initiators that can be in use simultaneously has been reached. The number of permitted channel initiators is a configurable parameter in the queue manager configuration file.

Response
Wait for one or more channel initiators to close and retry the operation or modify the configuration file to allow more initiators and restart the Queue Manager.

AMQ9586
Program cannot create queue manager object.

Severity
30 : Severe error

Explanation
The attempt to create object <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>.

Response
Use the standard facilities supplied with your system to record the problem identifier. Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ , or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9587
Program cannot open queue manager object.

Severity
30 : Severe error

Explanation
The attempt to open object <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>.

Response
Use the standard facilities supplied with your system to record the problem identifier. Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ , or the IBM support assistant at

http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9588

Program cannot update queue manager object.

Severity

30 : Severe error

Explanation

The attempt to update object <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>.

Response

Use the standard facilities supplied with your system to record the problem identifier. Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ , or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9589

Program cannot query queue manager object.

Severity

30 : Severe error

Explanation

The attempt to query object <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>.

Response

Use the standard facilities supplied with your system to record the problem identifier. Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ , or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9590

Program cannot close queue manager object.

Severity

30 : Severe error

Explanation

The attempt to close object <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>.

Response

Use the standard facilities supplied with your system to record the problem identifier. Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ , or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9591

Program cannot prepare queue manager object.

Severity

30 : Severe error

Explanation

The attempt to prepare object <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>.

Response

Use the standard facilities supplied with your system to record the problem identifier. Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ , or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9592

Program cannot resolve queue manager object.

Severity

30 : Severe error

Explanation

The attempt to resolve object <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>.

Response

Use the standard facilities supplied with your system to record the problem identifier. Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ , or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9593

Program cannot delete queue manager object.

Severity

30 : Severe error

Explanation

The attempt to delete object <*insert_4*> on queue manager <*insert_5*> failed with reason code <*insert_1*>.

Response

Use the standard facilities supplied with your system to record the problem identifier. Save any generated output files and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ , or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9594

Usage: runmqfmt [filename].

Severity

0 : Information

Explanation

Syntax for the usage of runmqfmt.

Response

None.

AMQ9595

Usage: endmqlsr [-w] [-m QMgrName]

Severity

10 : Warning

Explanation

The correct usage is shown.

Response

Correct the parameters passed to the endmqlsr program and retry the operation.

AMQ9596
Queue Manager <*insert_3*> still running

Severity
30 : Severe error

Explanation
The requested operation cannot complete because queue manager <*insert_3*> is still running.

Response
End the queue manager and retry the operation.

AMQ9597
No WebSphere MQ listeners for Queue Manager <*insert_3*> .

Severity
0 : Information

Explanation
No listener processes were found in the system for Queue Manager <*insert_3*>.

Response
None.

AMQ9598
<*insert_1*> WebSphere MQ listeners will end shortly.

Severity
0 : Information

Explanation
<*insert_1*> listeners detected in the system are scheduled for shutdown.

Response
None.

AMQ9599
Program could not open a queue manager object.

Severity
30 : Severe error

Explanation
The attempt to open either the queue or queue manager object <*insert_4*> on queue manager <*insert_5*> by user <*insert_3*> failed with reason code <*insert_1*>.

Response
Ensure that the queue is available and retry the operation. If the message is from a remote Queue Manager, check the Message Channel Agent User Identifier has the correct authority.

AMQ9601
Program could not inquire on queues on this queue manager.

Severity
30 : Severe error

Explanation
The WebSphere MQ clustering repository program was attempting to find out about the queues on queue manager <*insert_3*> . One of the calls failed with reason code <*insert_1*> . The repository command was backed out and the repository process went into a timed wait.

Response
Correct the error. When the repository process restarts it processes the backed out command again and continues.

AMQ9602
Maximum number of channel processes reached.

Severity
30 : Severe error

Explanation
The channel cannot start because the number of channel processes has already reached the maximum allowable value. The maximum number of channels processes is configured as <*insert_1*> . This value is a configurable parameter in the queue manager configuration file.

Response
Wait for some of the operating channels to close. Retry the operation when some channels are available.

AMQ9603
Error accessing the process pool shared segment.

Severity
30 : Severe error

Explanation
The program could not access the process pool shared segment

Response
A value of <*insert_1*> was returned from the subsystem when an attempt was made to access the Channel process pool shared memory. Contact the systems administrator, who should examine the log files to determine why the program was unable to access the process pool shared segment.

AMQ9604
Channel <*insert_3*> terminated unexpectedly

Severity
30 : Severe error

Explanation
The process or thread executing channel <*insert_3*> is no longer running. The check process system call returned <*insert_1*> for process <*insert_2*> .

Response
No immediate action is required because the channel entry has been removed from the list of running channels. Inform the system administrator who should examine the operating system procedures to determine why the channel process has terminated.

AMQ9605
<*insert_1*> WebSphere MQ listeners have been ended.

Severity
0 : Information

Explanation
<*insert_1*> listeners detected in the system have been ended.

Response
None.

AMQ9606
A WebSphere MQ listener has ended.

Severity
0 : Information

Explanation
One listener detected in the system has been ended.

Response
None.

AMQ9608
Remote resources in recovery

Severity
30 : Severe error

Explanation
Channel <*insert_3*> could not establish a successful connection with the remote Queue Manager because resources are being recovered.

Response
Restart the channel at a later time. If the problem persists then examine the error logs of the remote Queue Manager to see the full explanation of the cause of the problem.

AMQ9610
AMQ<*insert_1*> messages suppressed

Severity
0 : Information

Explanation
<*insert_2*> messages of type AMQ <*insert_1*> were suppressed

Response
Message suppression is controlled by MQ_CHANNEL_SUPPRESS_MSGS and MQ_CHANNEL_SUPPRESS_INTERVAL environment variables.

AMQ9611
Rebuild Client Channel Table - program completed normally

Severity
0 : Information

Explanation
Rebuild Client Channel Table program completed normally.

Response
None.

AMQ9612
<*insert_1*> WebSphere MQ listeners could not be ended.

Severity
0 : Information

Explanation
The request to the end the WebSphere MQ listeners for specified Queue Manager was completed however <*insert_1*> listeners could not be stopped. Reasons why listener may not be stopped are:

The listener process contains channels which are still active.

Response
Active channels may be stopped using the 'STOP CHANNEL' command or by ending the Queue Manager, and reissuing the end-listener request.

AMQ9614 (IBM i)
Certificate is not signed by a trusted Certificate Authority.

Severity
0 : Information

Explanation
The attempt to start channel <*insert_3*> failed because the certificate used in the SSL handshake is

not signed by a Certificate Authority (CA) listed in the certificate trust list for this queue manager. This error occurs when the SSL key repository for the queue manager is specified as '*SYSTEM' and the application definition in Digital Certificate Manager has been modified to specify a CA trust list.

Response

Use Digital Certificate Manager to add the required Certificate Authority (CA) certificates to the application definitions CA trust list.

AMQ9615 (IBM i)

Queue Manager is not registered with DCM.

Severity

0 : Information

Explanation

The attempt to start channel <*insert_3*> failed because the queue manager is not registered as a SSL server application with Digital Certificate Manager (DCM). This error occurs when the SSL key repository for the queue manager is specified as '*SYSTEM' but WebSphere MQ cannot register the queue manager as an SSL server application with DCM, or alternatively when the application definition for the queue manager has been manually removed from DCM.

Response

Attempt to re-register the queue manager with Digital Certificate Manager by issuing CHGMQM SSLKEYR(*SYSTEM). If this is unsuccessful you may need to manually add the application definition through Digital Certificate Manager, see the WebSphere MQ Security manual for more details.

AMQ9616

The CipherSpec proposed is not enabled on the server.

Severity

30 : Severe error

Explanation

The SSL or TLS subsystem at the server end of a channel been configured in such a way that it has rejected the CipherSpec proposed by an SSL or TLS client. This rejection occurred during the secure socket handshake (i.e. it happened before the proposed CipherSpec was compared with the CipherSpec in the server channel definition).

This error most commonly occurs when the choice of acceptable CipherSpecs has been limited in one of the following ways:

(a) The server queue manager SSLFipsRequired attribute is set to YES and the channel is using a CipherSpec which is not FIPS-certified on the server.

(b) The server queue manager EncyptionPolicySuiteB attribute has been set to a value other than NONE and the channel is using a CipherSpec which does not meet the server's configured Suite B security level.

The channel is '<*insert_3*>', in some cases its name cannot be determined and is shown as '????'. The channel did not start.

Response

Analyse why the proposed CipherSpec was not enabled on the SSL server. Alter the client CipherSpec, or reconfigure the SSL server to accept the original client CipherSpec. Restart the channel.

This message might occur after applying WebSphere MQ maintenance because the FIPS and Suite B standards are updated periodically. When such changes occur, WebSphere MQ is also updated to implement the latest standard. As a result, you might see changes in behavior after applying maintenance. For more information about the versions of FIPS and Suite B standards enforced by WebSphere MQ, see the readme file.

AMQ9617
Parameter requesting FIPS has an invalid value.

Severity
30 : Severe error

Explanation
An SSL channel running on an MQ MQI client has failed to start. This is because the value specified for the MQSSLFIPS environment variable, or in the MQSCO FipsRequired field, is invalid. The value specified was "<*insert_3*>".

Response
Set the MQSSLFIPS environment variable, or the MQSCO FipsRequired field, to a valid value. Restart the channel.

AMQ9618
SSLCRLNL attribute points to a namelist with no names.

Severity
30 : Severe error

Explanation
An SSL channel has failed to start because the SSLCRLNL queue manager attribute points to a namelist with an empty list of names.

Response
If OCSP or CRL checking is required, set up the namelist referenced by SSLCRLNL with a non-empty list of authentication information object names. If no OCSP or CRL checking is required, clear the SSLCRLNL queue manager attribute. Restart the failing channel.

AMQ9619
SSL cannot be run from an unthreaded HP-UX MQ MQI client.

Severity
30 : Severe error

Explanation
On HP-UX, SSL cannot be run from a WebSphere MQ MQI client which was linked with the unthreaded client libraries.

Response
Either relink your client application with the threaded client libraries, or do not attempt to use SSL from this application.

AMQ9620
Internal error on call to SSL function on channel <*insert_3*> .

Severity
30 : Severe error

Explanation
An error indicating a software problem was returned from a function which is used to provide SSL support. The error code returned was <*insert_1*>. The function call was <*insert_4*> . The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Collect the items listed in the 'Problem determination' section of the System Administration manual and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9620 (IBM i)

Unexpected SSL error on call to <*insert_4*> .

Severity

0 : Information

Explanation

An unexpected SSL error was returned from function <*insert_4*> for channel <*insert_3*>. The error code returned was <*insert_1*>. GSKit error codes are documented in the MQ manuals and also in the GSKSSL member of the H file in library QSYSINC.

Response

Collect the items listed in the 'Problem determination' section of the System Administration manual and use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center.

AMQ9621

Error on call to SSL function ignored on channel <*insert_3*> .

Severity

10 : Warning

Explanation

An error indicating a software problem was returned from a function which is used to provide SSL support. The error code returned was <*insert_1*>. The function call was <*insert_4*> . The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. This error is not regarded as sufficiently serious to interrupt channel operation; channel operation was not affected.

Response

None.

AMQ9622

AUTHINFO object <*insert_1*> does not exist.

Severity

30 : Severe error

Explanation

A channel or channel process has failed to start because the namelist of AUTHINFO objects includes the name <*insert_1*>, but no AUTHINFO object of that name exists.

Response

Ensure all the names in the namelist specified on the SSLCRLNL queue manager attribute correspond to AUTHINFO objects which are to be used on the SSL channels. Restart the failing channel or channel process.

AMQ9623

Error inquiring on AUTHINFO object <*insert_3*> .

Severity

30 : Severe error

Explanation

A channel or channel process has failed to start because reason code <*insert_1*> was returned when an inquire was performed on AUTHINFO object <*insert_3*>.

Response

Look at the MQRC_ values in the WebSphere MQ Application Programming Reference to determine the meaning of reason code <*insert_1*> , correct the error, and restart the failing channel or channel process.

AMQ9624
AUTHINFO object <*insert_3*> is not of type CRLLDAP or OCSP.

Severity
30 : Severe error

Explanation
A channel or channel process has failed to start because one of the AUTHINFO objects specified in the SSLCRLNL namelist does not have a valid AUTHTYPE. Instead the type value is <*insert_1*> .

Response
Include only AUTHINFO objects with AUTHTYPE CRLLDAP or AUTHTYPE OCSP in the namelist specified on the SSLCRLNL queue manager attribute. Restart the channel or channel process.

AMQ9625
AUTHINFO object <*insert_3*> was specified with an invalid CONNAME.

Severity
30 : Severe error

Explanation
A channel or channel process has failed to start because one of the AUTHINFO objects specified in the SSLCRLNL namelist has an invalid CONNAME parameter. The invalid value is <*insert_4*> .

Response
Correct the invalid parameter. Restart the channel or channel process.

AMQ9626
Channel hanging while initializing SSL.

Severity
30 : Severe error

Explanation
The current channel cannot start because another channel is hanging while initializing the SSL subsystem.

Response
Investigate the reason for the hang on the other channel. Once this is rectified, restart this channel.

AMQ9627
The path and stem name for the SSL key repository have not been specified.

Severity
30 : Severe error

Explanation
The directory path and file stem name for the SSL key repository have not been specified. On a MQ MQI client system there is no default location for this file. SSL connectivity is therefore impossible as this file cannot be accessed.

Response
Use the MQSSLKEYR environment variable or MQCONNX API call to specify the directory path and file stem name for the SSL key repository.

AMQ9628
An LDAP server containing CRLs was specified with an invalid CONNAME.

Severity
30 : Severe error

Explanation

The WebSphere MQ MQI client has failed to connect because an invalid CONNAME was found for one of the LDAP servers containing CRLs. The invalid value is <*insert_3*>.

Response

Correct the invalid parameter. If the LDAP details were defined on a queue manager system, regenerate the client definitions. Reconnect.

AMQ9629

Bad SSL cryptographic hardware parameters.

Severity

30 : Severe error

Explanation

The following string was supplied to specify or control use of SSL cryptographic hardware: <*insert_4*>. This string does not conform to any of the MQ SSL cryptographic parameter formats. The channel is <*insert_3*>. The channel did not start.

Response

Correct your SSL cryptographic hardware parameters and restart the channel.

AMQ9630

An expired SSL certificate was loaded.

Severity

30 : Severe error

Explanation

An SSL certificate that was loaded was not corrupt, but failed validation checks on its date fields. The certificate has either expired, or its date is not valid yet (that is, the from date is later than today), or the validity date range is incorrect (for example, the to date is earlier than the from date).

Response

Ensure that the specified SSL certificate has a valid expiry date.

AMQ9631

The CipherSpec negotiated during the SSL handshake does not match the required CipherSpec for channel <*insert_3*> .

Severity

30 : Severe error

Explanation

There is a mismatch between the CipherSpecs on the local and remote ends of channel <*insert_3*>. The channel will not run until this mismatch is resolved. The CipherSpec required in the local channel definition is <*insert_4*> . The name of the CipherSpec negotiated during the SSL handshake is <*insert_5*>. A code is displayed if the name of the negotiated CipherSpec cannot be determined.

Response

Change the channel definitions for <*insert_3*> so the two ends have matching CipherSpecs and restart the channel. If the certificate in use by one end of the channel is a Global Server Certificate, then the negotiated CipherSpec may not match that specified on either end of the channel. This is because the SSL protocol allows a Global Server Certificate to automatically negotiate a higher level of encryption. In these cases specify a CipherSpec which meets the requirements of the Global Server Certificate.

AMQ9631 (IBM i)

The CipherSpecs at the ends of channel <*insert_3*> do not match.

Severity

30 : Severe error

Explanation

There is a mismatch between the CipherSpecs on the local and remote ends of channel <*insert_3*>. The channel will not run until this mismatch is resolved. The local CipherSpec is <*insert_4*> and the remote CipherSpec is <*insert_5*>.

Response

Change the channel definition for <*insert_3*> so that both ends have matching CipherSpecs and restart the channel.

AMQ9633

Bad SSL certificate for channel <*insert_3*> .

Severity

30 : Severe error

Explanation

A certificate encountered during SSL handshaking is regarded as bad for one of the following reasons:

(a) it was formatted incorrectly and could not be validated

(b) it was formatted correctly but failed validation against the Certificate Authority (CA) root and other certificates held on the local system

(c) it was found in a Certification Revocation List (CRL) on an LDAP server

(d) a CRL was specified but the CRL could not be found on the LDAP server

(e) an OCSP responder has indicated that it is revoked

The channel is <*insert_1*> ; in some cases its name cannot be determined and so is shown as '????'. The remote host is '<*insert_3*>'. The channel did not start.

The details of the certificate which could not be validated are '<*insert_2*>'.

The certificate validation error was 2222.

Response

Check which of the possible causes applies on your system. Correct the error, and restart the channel.

AMQ9634

SSL security context expired.

Severity

30 : Severe error

Explanation

During an SSL operation to encrypt or decrypt a secured message, the SSL security context, which is used to secure communications and was previously established with the remote party, has expired because the remote party has shut down. The secured message has not been encrypted or decrypted. This failure has closed WebSphere MQ channel name <*insert_3*>. If the name is '????', the name is unknown. The SSL operation was <*insert_4*> and its completion code was <*insert_5*>.

Response

Determine why the remote party has shut down and if necessary re-start the channel. The shut down might be the result of controlled termination by a system administrator, or the result of an unexpected termination due to an error. The SSL operation is described in the Windows Schannel reference manual.

AMQ9635
Channel <*insert_3*> did not specify a valid CipherSpec.

Severity
30 : Severe error

Explanation
Channel <*insert_3*> did not specify a valid CipherSpec.

Response
Change channel <*insert_3*> to specify a valid CipherSpec.

AMQ9635 (IBM i)
Channel <*insert_3*> did not specify a valid CipherSpec.

Severity
30 : Severe error

Explanation
Channel <*insert_3*> did not specify a valid CipherSpec, or it specified a CipherSpec that is not available from the IBM Cryptographic Access Provider product installed on this machine. CipherSpecs that use 128-bit encryption algorithms are only available in 5722-AC3 (128-bit) IBM Cryptographic Access Provider.

Response
Change channel <*insert_3*> to specify a valid CipherSpec that is available from the IBM Cryptographic Access Provider product installed on this machine. Check that the CipherSpec you are using is available on this machine in either the 5722-AC2 (56-bit) IBM Cryptographic Access Provider or 5722-AC3 (128-bit) IBM Cryptographic Access Provider licensed program.

AMQ9636
SSL distinguished name does not match peer name, channel <*insert_3*>.

Severity
30 : Severe error

Explanation
The distinguished name, <*insert_4*>, contained in the SSL certificate for the remote end of the channel does not match the local SSL peer name for channel <*insert_3*> . The distinguished name at the remote end must match the peer name specified (which can be generic) before the channel can be started.

Response
If this remote system should be allowed to connect, either change the SSL peer name specification for the local channel so that it matches the distinguished name in the SSL certificate for the remote end of the channel, or obtain the correct certificate for the remote end of the channel. Restart the channel.

AMQ9637
Channel is lacking a certificate.

Severity
30 : Severe error

Explanation
The channel is lacking a certificate to use for the SSL handshake. The channel name is <*insert_3*> (if '????' it is unknown at this stage in the SSL processing). The channel did not start.

Response
Make sure the appropriate certificates are correctly configured in the key repositories for both ends of the channel.

If you have migrated from WebSphere MQ V5.3 to V6, it is possible that the missing certificate is due to a failure during SSL key repository migration. Check the relevant error logs. If these show

that an orphan certificate was encountered then you should obtain the relevant missing certificate authority (signer) certificates and then import these and the orphan certificate into the WebSphere MQ V6 key repository, and then re-start the channel.

AMQ9638
SSL communications error for channel <*insert_3*> .

Severity
30 : Severe error

Explanation
An unexpected SSL communications error occurred for a channel, as reported in the preceding messages. The channel is <*insert_3*> ; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Investigate the problem reported in the preceding messages. Review the local and remote console logs for reports of network errors. Correct the errors and restart the channel.

AMQ9639
Remote channel <*insert_3*> did not specify a CipherSpec.

Severity
30 : Severe error

Explanation
Remote channel <*insert_3*> did not specify a CipherSpec when the local channel expected one to be specified. The channel did not start.

Response
Change the remote channel <*insert_3*> to specify a CipherSpec so that both ends of the channel have matching CipherSpecs.

AMQ9640
SSL invalid peer name, channel <*insert_3*> , attribute <*insert_5*>.

Severity
30 : Severe error

Explanation
The SSL peer name for channel <*insert_3*> includes a distinguished name attribute key <*insert_5*> which is invalid or unsupported. The channel did not start.

Response
Correct the SSL peer name for the channel. Restart the channel.

AMQ9641
Remote CipherSpec error for channel <*insert_3*> .

Severity
30 : Severe error

Explanation
The remote end of channel <*insert_3*> has had a CipherSpec error. The channel did not start.

Response
Review the error logs on the remote system to discover the problem with the CipherSpec.

AMQ9642
No SSL certificate for channel <*insert_3*> .

Severity
30 : Severe error

Explanation

The channel <*insert_3*> did not supply a certificate to use during SSL handshaking, but a certificate is required by the remote queue manager. The channel did not start.

Response

Ensure that the key repository of the local queue manager or MQ MQI client contains an SSL certificate which is associated with the queue manager or client. Alternatively, if appropriate, change the remote channel definition so that its SSLCAUTH attribute is set to OPTIONAL and it has no SSLPEER value set.

If you have migrated from WebSphere MQ V5.3 to V6, it is possible that the missing certificate is due to a failure during SSL key repository migration. Check the relevant error logs. If these show that an orphan certificate was encountered then you should obtain the relevant missing certificate authority (signer) certificates and then import these and the orphan certificate into the WebSphere MQ V6 key repository, and then re-start the channel.

AMQ9642 (IBM i)

No SSL certificate for channel <*insert_3*> .

Severity

0 : Information

Explanation

The channel <*insert_3*> did not supply a certificate to use during SSL handshaking, but a certificate is required by the remote queue manager. The channel did not start.

Response

If the SSL key repository for the queue manager has been specified as '*SYSTEM' ensure that a certificate has been associated with the application description for the queue manager in Digital Certificate Manager. Alternatively, if appropriate, change the remote channel definition so that its SSLCAUTH attribute is set to OPTIONAL and it has no SSLPEER value set.

AMQ9643

Remote SSL peer name error for channel <*insert_3*> .

Severity

30 : Severe error

Explanation

The remote end of channel <*insert_3*> has had an SSL peer name error. The channel did not start.

Response

Review the error logs on the remote system to discover the problem with the peer name.

AMQ9645

Correctly labeled SSL certificate missing on channel <*insert_3*>.

Severity

30 : Severe error

Explanation

The key database file in use has not been set up with a correctly labeled SSL certificate. The channel is <*insert_3*> ; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response

Add a correctly labeled SSL certificate to the current key database file. Restart the channel.

AMQ9646

Channel <*insert_3*> could not connect to any LDAP CRL servers.

Severity

30 : Severe error

Explanation

LDAP Certification Revocation List (CRL) servers were specified but a connection could not be established to any of them. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response

Check that the LDAP CRL server specifications are correct. If they are, check that the servers are running and that the networking to access them is working correctly. Fix any errors found and restart the channel.

AMQ9647

I/O error on SSL key repository.

Severity

30 : Severe error

Explanation

An I/O error was encountered when attempting to read the SSL key repository. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response

Analyse why there is a I/O problem when reading the key repository. Fix the error if one is found, or it may be a temporary problem. Restart the channel.

AMQ9648

The SSL key repository has an invalid internal format.

Severity

30 : Severe error

Explanation

The SSL key repository has an invalid internal format. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response

re-create the SSL key repository and restart the channel.

AMQ9649

The SSL key repository contains duplicate keys.

Severity

30 : Severe error

Explanation

The SSL key repository contains two or more entries with the same key. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response

Use your key management tool to remove the duplicate keys. Restart the channel.

AMQ9650

The SSL key repository contains entries with duplicate labels.

Severity

30 : Severe error

Explanation

The SSL key repository contains two or more entries with the same label. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Use your key management tool to remove the duplicate entries. Restart the channel.

AMQ9651
The SSL key repository is corrupt or has a bad password.

Severity
30 : Severe error

Explanation
The SSL key repository has become corrupted or its password id is incorrect. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Use your key management tool to re-create the key repository with a new password. Restart the channel.

AMQ9652
The remote SSL certificate has expired.

Severity
30 : Severe error

Explanation
The SSL certificate used by MQ on the remote end of the channel has expired. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Use your key management tool to provide MQ with a current SSL certificate on the remote end of the channel. Restart the channel.

AMQ9653
An SSL trace file could not be opened.

Severity
10 : Warning

Explanation
An SSL trace file could not be opened. The SSL trace files are created in directory /var/mqm/trace and have names AMQ.SSL.TRC and AMQ.SSL.TRC.1. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. This error is not regarded as sufficiently serious to interrupt channel operation; channel operation was not affected.

Response
Check that you have a directory called /var/mqm/trace and that the userid under which WebSphere MQ runs has permissions and space to create and open a file in that directory. Fix the problem and you will get SSL trace output.

AMQ9654
An invalid SSL certificate was received from the remote system.

Severity
30 : Severe error

Explanation
An SSL certificate received from the remote system was not corrupt but failed validation checks on something other than its ASN fields and date. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Additionally, this error is seen for a certificate validation error 8(ssl_rc) - GSK_ERROR_CERT_VALIDATION. This error occurs when the certificate can not be validated, and the certificate chain can not be built because the certificate is not in the key database.

Response
Ensure that the remote system has a valid SSL certificate. Restart the channel.

AMQ9655
Problem loading GSKit SSL support.

Severity
30 : Severe error

Explanation
MQ SSL support is provided on this platform using a component called GSKit which is installed as part of MQ GSKit had an internal problem loading one if its dynamic link libraries. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Uninstall MQ and reinstall. Restart the channel.

AMQ9656
An invalid SSL certificate was received from the remote system.

Severity
30 : Severe error

Explanation
An SSL certificate received from the remote system was not corrupt but failed validation checks on its ASN fields. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Ensure that the remote system has a valid SSL certificate. Restart the channel.

AMQ9657
The key repository could not be opened (channel <*insert_3*>).

Severity
30 : Severe error

Explanation
The key repository could not be opened. The key repository either does not exist or has incorrect permissions associated with it. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Ensure that the key repository you specify exists and that its permissions are such that the MQ process involved can read from it. Restart the channel.

AMQ9658
An invalid SSL certificate has been encountered.

Severity
30 : Severe error

Explanation
An SSL certificate has been encountered which was not corrupt but which failed validation checks on its date fields. The certificate has either expired, or its date is not valid yet (i.e. the from date is later than today), or the validity date range is incorrect (for example, the to date is earlier than the from date). The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Ensure that both the local and remote systems have valid, current SSL certificates. Restart the channel.

AMQ9659

A failure occurred during SSL handshaking.

Severity

30 : Severe error

Explanation

During SSL handshaking, or associated activities, a failure occurred. The failure is <*insert_4*> and has caused WebSphere MQ channel name <*insert_3*> to be closed. If the name is '????' then the name is unknown.

Response

Refer to prior message in the WebSphere MQ error log for information related to this problem.

AMQ9660

SSL key repository: password stash file absent or unusable.

Severity

30 : Severe error

Explanation

The SSL key repository cannot be used because MQ cannot obtain a password to access it. Reasons giving rise to this error include:

(a) the key database file and password stash file are not present in the location configured for the key repository,

(b) the key database file exists in the correct place but that no password stash file has been created for it,

(c) the files are present in the correct place but the userid under which MQ is running does not have permission to read them,

(d) one or both of the files are corrupt.

The channel is <*insert_3*> ; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response

Ensure that the key repository variable is set to where the key database file is. Ensure that a password stash file has been associated with the key database file in the same directory, and that the userid under which MQ is running has read access to both files. If both are already present and readable in the correct place, delete and re-create them. Restart the channel.

AMQ9661

Bad SSL data from peer on channel <*insert_3*> .

Severity

30 : Severe error

Explanation

An SSL channel has stopped because bad SSL data was received from the remote end of the channel. More detail on the nature of the corruption can be found from the GSKit return value of <*insert_1*> (the GSKit return values are documented in the MQ manuals). The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'.

Response

Ensure you are connecting to a version of MQ which supports SSL at the remote end of the channel. Check your network between the two ends of the channel, and consider whether any possible causes of message corruption could be present. Fix any problems which may exist and restart the channel.

AMQ9661 (IBM i)

Bad SSL data from peer on channel <*insert_3*> .

Severity
0 : Information

Explanation
An SSL channel has stopped because bad SSL data was received from the remote end of the channel. More detail on the nature of the corruption can be found from the GSKit return value of <*insert_1*> (the GSKit return values are documented in the MQ manuals and also in the GSKSSL member of the H file in library QSYSINC). The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'.

Response
Ensure the remote queue manager and channel listener are running and that you are connecting to a version of MQ which supports SSL at the remote end of the channel. Check your network between the two ends of the channel, and consider whether any possible causes of message corruption could be present. Fix any problems which may exist and restart the channel.

AMQ9662
SSL has encountered something it does not support.

Severity
30 : Severe error

Explanation
This error can arise for a number of reasons:

(a) The platform does not support a particular type of cryptographic hardware, for example, nCipher nFast and Rainbow Cryptoswift are no longer supported.

(b) The cryptographic hardware cryptography has returned an error.

(c) Unsupported X509 General Name format when checking the remote certificate. The GSKit SSL provider incorporated in MQ only supports formats rfc822, DNSName, directoryname, uniformResourceID, and IPAddress. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Check that your cryptographic hardware is supported on your platform and test it to see that it is working correctly. Check that the remote certificates you are using conform to the X509 General Name formats listed. Fix the problem and restart the channel.

AMQ9663
An invalid SSL certificate was received from the remote system.

Severity
30 : Severe error

Explanation
An SSL certificate received from the remote system failed validation checks on its signature. The channel is <*insert_3*> ; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Ensure that the remote system has a valid SSL certificate. Restart the channel.

AMQ9664
Bad userid for CRL LDAP server; SSL channel <*insert_3*> .

Severity
30 : Severe error

Explanation
Certification Revocation List (CRL) checking on an LDAP server or servers has been configured

on the local MQ system. The userid information configured for the LDAP server or servers is incorrect. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Check the userid information for the CRL LDAP server or servers you have configured locally. Correct any problems found and restart the channel.

AMQ9665
SSL connection closed by remote end of channel <*insert_3*> .

Severity
30 : Severe error

Explanation
The SSL connection was closed by the remote end of the channel during the SSL handshake. The channel is <*insert_3*> ; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Check the remote end of the channel for SSL-related errors. Fix them and restart the channel.

AMQ9666
Error accessing CRL LDAP servers; SSL channel <*insert_3*> .

Severity
30 : Severe error

Explanation
CRL checking on LDAP servers has been configured on the local MQ system. An error was found when trying to access the CRL LDAP servers when validating a certificate from the remote system. Possible causes are:

(a) cannot connect to any of the LDAP servers, or

(b) the certificate issuer's Distinguished Name (DN) is not defined in the DIT of an LDAP server.

The channel is <*insert_3*> ; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Check access to the CRL LDAP server(s) you have configured locally. Put right any problems found and restart the channel.

AMQ9667
Bad user name or password for CRL LDAP server; SSL channel <*insert_3*>.

Severity
30 : Severe error

Explanation
Certification Revocation List (CRL) checking on an LDAP server or servers has been configured on the local MQ system. The user name or password information configured for the LDAP server or servers is incorrect. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Check the user name and password information for the CRL LDAP server or servers you have configured locally. Correct any problems found and restart the channel.

AMQ9668
The specified PKCS #11 shared library could not be loaded.

Severity
30 : Severe error

Explanation

A failed attempt was made to load the PKCS #11 shared library specified to MQ in the PKCS #11 driver path field of the GSK_PKCS11 SSL CryptoHardware parameter. The channel is <*insert_3*> ; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response

Ensure that the PKCS #11 shared library exists and is valid at the location specified. Restart the channel.

AMQ9669

The PKCS #11 token could not be found.

Severity

30 : Severe error

Explanation

The PKCS #11 driver failed to find the token specified to MQ in the PKCS #11 token label field of the GSK_PKCS11 SSL CryptoHardware parameter. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response

Ensure that the PKCS #11 token exists with the label specified. Restart the channel.

AMQ9670

PKCS #11 card not present.

Severity

30 : Severe error

Explanation

A PKCS #11 card is not present in the slot. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response

Ensure that the correct PKCS #11 card is present in the slot. Restart the channel.

AMQ9671

The PKCS #11 token password specified is invalid.

Severity

30 : Severe error

Explanation

The password to access the PKCS #11 token is invalid. This is specified to MQ in the PKCS #11 token password field of the GSK_PKCS11 SSL CryptoHardware parameter. The channel is <*insert_3*> ; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response

Ensure that the PKCS #11 token password specified on GSK_PKCS11 allows access to the PKCS #11 token specified on GSK_PKCS11. Restart the channel.

AMQ9672

An SSL security call failed.

Severity

30 : Severe error

Explanation

An SSPI call to the Secure Channel (Schannel) SSL provider failed. The failure has caused WebSphere MQ channel name <*insert_3*> to be closed. If the name is '????' then the name is unknown.

Response

Consult the Windows Schannel reference manual to determine the meaning of status <*insert_5*> for SSPI call <*insert_4*>. Correct the failure and if necessary re-start the channel.

AMQ9673

SSL client handshaking failed.

Severity

30 : Severe error

Explanation

During an SSL client's handshaking, an SSPI call to the Secure Channel (Schannel) SSL provider failed. The failure has caused WebSphere MQ channel name <*insert_3*> to be closed. If the name is '????' then the name is unknown.

Response

Consult the Windows Schannel reference manual to determine the meaning of status <*insert_4*> for SSPI call <*insert_5*>. Correct the failure and if necessary re-start the channel.

AMQ9674

An unknown error occurred during an SSL security call.

Severity

30 : Severe error

Explanation

An unknown error occurred during an SSPI call to the Secure Channel (Schannel) SSL provider. The error may be due to a Windows SSL problem or to a general Windows problem or to invalid WebSphere MQ data being used in the call. The WebSphere MQ error recording routine has been called. The error has caused WebSphere MQ channel name <*insert_3*> to be closed. If the name is '????' then the name is unknown.

Response

Consult the Windows Schannel reference manual to determine the meaning of status <*insert_5*> for SSPI call <*insert_4*>. If the problem can be resolved using the manual, correct the failure and if necessary re-start the channel. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9675

The requested certificate could not be found.

Severity

30 : Severe error

Explanation

A request for a certificate identified as <*insert_4*> <*insert_5*> in the store <*insert_3*> has failed, because the certificate could not be found. The Windows error code has been set to <*insert_1*>. The WebSphere MQ error recording routine has been called.

Response

Consult the Windows reference manual to determine the meaning of error <*insert_1*> if this value is non-zero. Check to see whether the specified certificate has been copied to the correct certificate store and has not been deleted. Use the WebSphere MQ Explorer administration application to configure certificate store for use with WebSphere MQ. If the problem cannot be resolved, use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ , or thehttp://www.ibm.com/software/

support/isa/ , to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9676

The Windows cryptographic services library could not be loaded.

Severity

30 : Severe error

Explanation

WebSphere MQ requires crypt32.dll to be available in order to carry out cryptographic functionality. The attempt to load this library returned the Windows error code <*insert_1*>. The WebSphere MQ error recording routine has been called.

Response

Consult the Windows reference manual to determine the meaning of error code <*insert_1*>. Check that the crypt32.dll file is available and not corrupt. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9677

The Windows security services library could not be loaded.

Severity

30 : Severe error

Explanation

WebSphere MQ requires <*insert_3*> to be available in order to run or configure SSL functionality. The attempt to load this library returned the Windows error code <*insert_1*> . The WebSphere MQ error recording routine has been called.

Response

Consult the Windows reference manual to determine the meaning of error code <*insert_1*>. Check that the <*insert_3*> file is available and not corrupt. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9678

The certificate <*insert_4*>/<*insert_5*> already exists in the store <*insert_3*>.

Severity

10 : Warning

Explanation

The certificate store <*insert_3*> already contains the specified certificate, identified by the issuer name of <*insert_4*>, serial number <*insert_5*> . The existing certificate has not been replaced.

AMQ9679

The certificate store <*insert_3*> could not be opened.

Severity

30 : Severe error

Explanation

The certificate store <*insert_3*> could not be opened, and failed with the Windows error code <*insert_1*> . The WebSphere MQ error recording routine has been called.

Response

Consult the Windows reference manual to determine the meaning of error <*insert_1*> if this value is non-zero. Check that either your MQSSLKEYR environment variable (for client connections), or SSLKEYR queue manager attribute (for WebSphere MQ queue managers) has been defined correctly, and that the file path specified is valid. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ , or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9680

A problem was encountered with the specified certificate file.

Severity

30 : Severe error

Explanation

A problem occurred when attempting to read the certificate from the file <*insert_3*>. The file may be corrupt or incorrectly formatted. The Windows error code reported is <*insert_1*>. The WebSphere MQ error recording routine has been called.

Response

Ensure that the certificate file is valid and complete, and in one of the file formats supported by WebSphere MQ If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9681

The requested functionality is not supported on this system.

Severity

30 : Severe error

Explanation

An SSL function was attempted that is not supported on this system. a) importing pfx format certificate files with private key data is only supported on Windows 2000 or greater. b) a the security library installed on your system is not of the correct level and does not contain the pre-requisite functions. On pre Windows 2000 systems, Internet Explorer 4.1 or greater must be installed. The WebSphere MQ error recording routine has been called.

Response

If pre-requisite software is missing, please install the necessary levels of software and retry the operation. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9682

The WebSphere MQ SSL library has not been initialized.

Severity
30 : Severe error

Explanation
The WebSphere MQ SSL library 'amqcssln.dll' has been called without it first being initialized by the calling process.

Response
Ensure that the initialization function has been called prior to issuing any amqcssln function calls.

AMQ9683
The private key data for this certificate is not exportable.

Severity
30 : Severe error

Explanation
An attempt has been made to export the private key data from a certificate, but the properties of the certificate will not allow this. WebSphere MQ needs to be able to export private key data when copying personal certificates between certificate stores. The Windows cryptographic API returned the error code <*insert_1*> .

Response
When requesting the certificate from the certificate authority, the private key data must be marked as exportable to enable WebSphere MQ to be able to copy the certificate and private key data into a WebSphere MQ store. The certificate file may need to be requested again to resolve this problem. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9684
A problem occurred while attempting to access the certificate's properties.

Severity
30 : Severe error

Explanation
The certificate issued by <*insert_3*> with serial number <*insert_4*>, or its private key data, appears to be unusable and may be corrupt. The Windows return code <*insert_1*> was generated when attempting to use this certificate. The WebSphere MQ error recording routine has been called.

Response
Consult the Windows reference manual to determine the meaning of error <*insert_1*>. Check that the certificate is valid and has not been corrupted. If it is possible that the certificate or private key data is corrupt, try to remove the certificate from your system and re-import it. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9685
A problem occurred while accessing the registry.

Severity
30 : Severe error

Explanation

An error occurred while attempting to load or unload the personal registry hive (HKEY_LOCAL_USER) for the user who launched this process. The WebSphere MQ error recording routine has been called.

Response

If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9686

An unexpected error occurred while attempting to manage a certificate store.

Severity

30 : Severe error

Explanation

The Windows cryptographic API returned error code <*insert_1*> when calling the function <*insert_3*> for certificate store <*insert_4*>. The error may be due to a certificate store problem or to a general Windows problem or to a problem with a certificate in the store. The WebSphere MQ error recording routine has been called.

Response

Consult the Windows reference manual to determine the meaning of error <*insert_1*>. Check that the certificate store is valid and not corrupt. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9687

The pfx password provided is invalid.

Severity

30 : Severe error

Explanation

The password supplied for importing or copying the certificate is incorrect, and the operation could not be completed.

Response

Make sure the password is correct and try again. If the password has been forgotten or lost, the certificate will need to be regenerated or exported from the original source.

AMQ9688

The private key data for this certificate is unavailable.

Severity

30 : Severe error

Explanation

The private key data associated with this certificate is reported as being present on the system, but has failed, returning the Windows error code <*insert_1*>. The WebSphere MQ error recording routine has been called.

Response

Consult the Windows reference manual to determine the meaning of error code <*insert_1*>. If the

problem can be resolved using the manual, correct the failure and if necessary re-try the operation. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ , or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9689

An unknown error occurred deleting the store <*insert_3*> .

Severity

30 : Severe error

Explanation

The WebSphere MQ certificate store for queue manager <*insert_3*> could not be deleted. The filename for the certificate store is <*insert_4*>. The Windows error code has been set to <*insert_1*>. The WebSphere MQ error recording routine has been called.

Response

Consult the Windows reference manual to determine the meaning of error <*insert_1*>. If the problem can be resolved using the manual, correct the failure and if necessary re-try the operation. Check that the store file exists and that other processes (such as queue managers) that may be accessing the store are not running. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9690

The public key in the issuer's certificate has failed to validate the subject certificate.

Severity

30 : Severe error

Explanation

The public key in the issuer's certificate (CA or signer certificate), is used to verify the signature on the subject certificate assigned to channel <*insert_3*>. This verification has failed, and the subject certificate therefore cannot be used. The WebSphere MQ error recording routine has been called.

Response

Check that the issuer's certificate is valid and available, and that it is up to date. Verify with the certificate's issuer that the subject certificate and issuer certificate should still be valid. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9691

The WebSphere MQ MQI library could not be loaded.

Severity

30 : Severe error

Explanation

The library file <*insert_3*> is expected to be available on your system, but attempts to load it have failed with Windows return code <*insert_1*>. The WebSphere MQ error recording routine has been called.

Response

Ensure that the WebSphere MQ <*insert_3*> library file exists and is available on your system. Consult the Windows reference manual to determine the meaning of error code <*insert_1*>. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ , or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9692

The SSL library has already been initialized.

Severity

20 : Error

Explanation

The SSL library has already been initialized once for this process, any changes to SSL attributes will not take affect, and the original values will remain in force.

Response

If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9693

The password provided for the LDAP server is incorrect.

Severity

30 : Severe error

Explanation

One or more of the LDAP servers used for providing CRL information to WebSphere MQ has rejected a login attempt because the password provided is incorrect. The WebSphere MQ error recording routine has been called. The error has caused WebSphere MQ channel name <*insert_3*> to be closed. If the name is '????' then the name is unknown.

Response

Ensure that the passwords specified in the AuthInfo objects are correct for each server name provided. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9694

The DN syntax provided for an LDAP search is invalid.

Severity

30 : Severe error

Explanation

The distinguished name provided in one or more AuthInfo object definitions is invalid, and the

request to a CRL LDAP server has been rejected. The WebSphere MQ error recording routine has been called. The error has caused WebSphere MQ channel name <*insert_3*> to be closed. If the name is '????' then the name is unknown.

Response

Verify that the details supplied in the AuthInfo object definitions for this channel are correct. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9695

The username provided for the LDAP server is incorrect.

Severity

30 : Severe error

Explanation

One or more of the LDAP servers used for providing CRL information to WebSphere MQ has rejected a login attempt because the username provided does not exist. The WebSphere MQ error recording routine has been called. The error has caused WebSphere MQ channel name <*insert_3*> to be closed. If the name is '????' then the name is unknown.

Response

Ensure that the usernamed specified in the AuthInfo objects for this channel are correct for each LDAP server name provided. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9697

WebSphere MQ Services could not be contacted on the target server.

Severity

30 : Severe error

Explanation

An attempt was made to contact the WebSphere MQ Services on the target server <*insert_3*>. The call failed with return code <*insert_1*>. The WebSphere MQ error recording routine has been called.

Response

Ensure that the target server name specified is correct and that you have sufficient access rights on that server to be able to administer WebSphere MQ If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9698

An SSL security call failed during SSL handshaking.

Severity

30 : Severe error

Explanation

An SSPI call to the Secure Channel (Schannel) SSL provider failed during SSL handshaking. The failure has caused WebSphere MQ channel name <*insert_3*> to be closed. If the name is '????' then the name is unknown.

Response

Consult the Windows Schannel reference manual to determine the meaning of status <*insert_5*> for SSPI call <*insert_4*>. Correct the failure and if necessary re-start the channel.

AMQ9699

An unknown error occurred during an SSL security call during SSL handshaking.

Severity

30 : Severe error

Explanation

An unknown error occurred during an SSPI call to the Secure Channel (Schannel) SSL provider during SSL handshaking. The error may be due to a Windows SSL problem or to a general Windows problem or to invalid WebSphere MQ data being used in the call. The WebSphere MQ error recording routine has been called. The error has caused WebSphere MQ channel name <*insert_3*> to be closed. If the name is '????' then the name is unknown.

Response

Consult the Windows Schannel reference manual to determine the meaning of status <*insert_5*> for SSPI call <*insert_4*>. If the problem can be resolved using the manual, correct the failure and if necessary re-start the channel. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9710

SSL security refresh failed.

Severity

30 : Severe error

Explanation

The request to refresh SSL security was unsuccessful.

Response

Look at previous error messages in the error files to determine the cause of the failure.

AMQ9711

SSL security refresh succeeded but channel restarts failed.

Severity

30 : Severe error

Explanation

The SSL environments for this queue manager have been refreshed so current values and certificates are in use for all SSL channels. However, not all the outbound SSL channels which were running when the security refresh was initiated could be restarted after the refresh had completed.

Response

Look at previous error messages in the error files to determine which channels could not be restarted. Restart these if necessary.

AMQ9712

SSL security refresh timed out waiting for channel <*insert_3*> .

Severity
30 : Severe error

Explanation
The system was performing a security refresh for SSL. This function requests all outbound and inbound SSL channels to stop. It then waits for these channels to actually stop. SSL channel <*insert_3*> did not stop within the timeout period.

Response
Investigate why channel <*insert_3*> is hung. Terminate the hung channel. Rerun the SSL security refresh.

AMQ9713
Channel <*insert_3*> ended: SSL refresh in progress.

Severity
0 : Information

Explanation
The SSL support on this queue manager is in the middle of a security refresh. An attempt was made to start outbound SSL channel <*insert_3*>. It cannot start while the SSL security refresh is in progress. The channel is restarted automatically once the SSL security refresh is complete.

Response
None.

AMQ9714
SSL refresh on receiving queue manager: channel did not start.

Severity
30 : Severe error

Explanation
An SSL security refresh is in progress on the queue manager at the receiving end of this SSL channel. The channel is <*insert_3*> ; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Restart the channel once the SSL refresh is complete. The channel will restart automatically if it is configured to retry the connection.

AMQ9715
Unexpected error detected in validating SSL session ID.

Severity
30 : Severe error

Explanation
This error can arise when the GSKit SSL provider is missing one or more pre-requisite PTFs on the OS/400 platform. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'.

Response
Ensure the GSKit SSL provider is at the latest level of maintenance and restart the channel.

AMQ9716
Remote SSL certificate revocation status check failed for channel <*insert_2*>.

Severity
30 : Severe error

Explanation
WebSphere MQ failed to determine the revocation status of the remote SSL certificate for one of the following reasons:

(a) The channel was unable to contact any of the CRL servers or OCSP responders for the certificate.

(b) None of the OCSP responders contacted knows the revocation status of the certificate.

(c) An OCSP response was received, but the digital signature of the response could not be verified.The details of the certificate in question are<*insert_1*>.

The channel name is <*insert_2*>. In some cases the channel name cannot be determined and so is shown as '????'.
The channel did not start
WebSphere MQ does not allow the channel to start unless the certificate revocation status can be determined.

Response

If the certificate contains an AuthorityInfoAccess extension, ensure that the OCSP server named in the certificate extension is available and is correctly configured.

If the certificate contains a CrlDistributionPoint extension, ensure that the CRL server named in the certificate extension is available and is correctly configured.

If you have specified any CRL or OCSP servers to WebSphere MQ, check that those servers are available and are correctly configured.

Ensure that the local key repository has the necessary SSL certificates to verify the digital signature of the response from the OCSP server.

AMQ9717
Remote SSL certificate revocation status check is unknown for channel <*insert_2*>.

Severity
10 : Warning

Explanation
WebSphere MQ was unable to determine the revocation status of the remote SSL certificate for one of the following reasons:

(a) The channel was unable to contact any of the CRL servers or OCSP responders for the certificate.

(b) None of the OCSP responders contacted knows the revocation status of the certificate.

(c) An OCSP response was received, but the digital signature of the response could not be verified.The details of the certificate in question are<*insert_1*>.

The channel name is <*insert_2*>. In some cases the channel name cannot be determined and so is shown as '????'.
The channel was allowed to start, but the revocation status of the remote SSL certificate has not been checked.

Response

If the certificate contains an AuthorityInfoAccess extension, ensure that the OCSP server named in the certificate extension is available and is correctly configured.

If the certificate contains a CrlDistributionPoint extension, ensure that the CRL server named in the certificate extension is available and is correctly configured.

If you have specified any CRL or OCSP servers to Websphere MQ, check that those servers are available and are correctly configured.

Ensure that the local key repository has the necessary SSL certificates to verify the digital signature of the response from the OCSP server.

If you require certificate revocation checks to be enforced, you should configure WebSphere MQ to require certificate revocation checking. Refer to the security section of the WebSphere MQ product documentation for more information on configuring certificate revocation checking.

AMQ9718

Invalid OCSP URL <*insert_1*>.

Severity

30 : Severe error

Explanation

WebSphere MQ was unable to start an SSL channel because one of the AUTHINFO objects specified in the SSLCRLNL namelist has an invalid OCSPURL parameter.

The OCSP URL is <*insert_1*> and the channel name is <*insert_2*>. In some cases the channel name cannot be determined and so is shown as '????'.

Response

The OCSP URL cannot be blank and must be a valid HTTP URL. Correct the OCSP URL and restart the channel or channel process.

Refer to the security section of the WebSphere MQ product documentation for details of how to use OCSP URLs.

AMQ9719

Invalid CipherSpec for FIPS mode.

Severity

30 : Severe error

Explanation

The user is attempting to start a channel on a queue manager or MQ MQI client which has been configured to run in FIPS mode. The user has specified a CipherSpec which is not FIPS-compliant. The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'.

Response

Redefine the channel to run with a FIPS-compliant CipherSpec. Alternatively, the channel may be defined with the correct CipherSpec and the queue manager or MQ MQI client should not be running in FIPS mode; if this is the case, ensure that FIPS mode is not configured. Once the error is corrected, restart the channel.

AMQ9720

Response
None.

AMQ9725

Expiry Time: <*insert_1*>

Migration Status: Failed

Password: ********

Severity
0 : Information

Explanation
None.

Response
None.

AMQ9726
A certificate failed to be migrated because it has an invalid date.

The certificate's details are:

[Microsoft Certificate Store], [Subject], [Issuer], [Serial Number]:

<*insert_3*> .

Severity
30 : Severe error

Explanation
During the migration of a certificate, the certificate's date fields have been found to be invalid. The certificate has either expired or its "from" date is later than today's date or its "to" date is earlier than the "from" date.

The certificate has not been migrated.

Response
If the certificate is required for migration then obtain a valid replacement before importing it into the GSKit key database <*insert_5*>.

AMQ9727
A certificate failed to be migrated because it has an incomplete certification path.

The certificate's details are:

[Microsoft Certificate Store], [Subject], [Issuer], [Serial Number]:

<*insert_3*>.

Severity
30 : Severe error

Explanation
During the migration of a certificate, the certificate's certificate authority (signer) certificate could not be found. The certificate is therefore regarded as an orphan certificate.

A copy of the certificate has been written to the file name <*insert_4*> .

If file name is suffixed ".cer" then the certificate is a certificate authority (signer) certificate. If file name is suffixed ".pfx" then the certificate is a personal certificate and it has a password which is the same as that specified for the GSKit key database <*insert_5*>. The certificate has not been migrated.

Response
If the certificate is required for migration then ensure that a complete certification path exists in the GSKit key database <*insert_5*> before importing the certificate.

AMQ9728
A certificate failed to be migrated because it could not be imported into the GSKit key database <*insert_5*>.

The certificate's details are:

[Microsoft Certificate Store], [Subject], [Issuer], [Serial Number]:

<*insert_3*> .

Severity
30 : Severe error

Explanation
A certificate failed to be imported because there was a problem during the migration of the certificate.

A copy of the certificate has been written to the file name <*insert_4*> .

If file name is suffixed ".cer" then the certificate is a certificate authority (signer) certificate. If file name is suffixed ".pfx" then the certificate is a personal certificate and it has a password which is the same as that specified for the GSKit key database <*insert_5*>. The certificate has not been migrated.

Response

Refer to the previous message in the error log to determine the cause of the failure. If appropriate, refer to the Windows or GSKit reference documentation to determine the cause.

AMQ9729

Unable to create certificate file <*insert_3*> .

Severity

30 : Severe error

Explanation

A certificate failed to be imported because there was a problem during the migration of the certificate. In addition to this first problem, a second problem occurred when trying to create a copy of the certificate by writing it to the file <*insert_3*> . The certificate is located in the Microsoft Certificate Store <*insert_4*>. The certificate is intended for the GSKit key database <*insert_5*>. If file name is suffixed ".cer" then the certificate is a certificate authority (signer) certificate. If file name is suffixed ".pfx" then the certificate is a personal certificate. The certificate has not been migrated.

Response

Determine the cause of the 2 problems. Refer to the previous message in the error log to determine the cause of the first failure. If appropriate, refer to the Windows or GSKit reference documentation to determine the cause. The second failure occurred during a call to the Windows 'CreateFile' function with a return code of <*insert_1*>. For this failure, check that file does not already exist and that you have authority to create this file.

AMQ9730

Certificate migration has completed with no failures. The number of certificates migrated was <*insert_1*>.

Severity

0 : Information

Explanation

The migration of certificates from the Microsoft Certificate Store <*insert_3*> to the GSKit key database <*insert_4*> has completed and there were no migration failures. The number of certificates migrated was <*insert_1*> .

Response

If any certificates were migrated, use the GSKit iKeyman GUI to verify that the GSKit key database contains all the certificates required to support the intended SSL channel. If no certificates were migrated then this is probably because <*insert_3*> contained only a default set of certificate authority (signer) certificates. The default set is not migrated because the newly created GSKit key database will have its own set which will be the same or more up to date.

Although there were no failures which caused certificates not to be migrated, there may have been other failures and these must be resolved otherwise the SSL channel may subsequently fail to start. Refer to the error log and check for any failures.

AMQ9732

A registry entry already exists for <*insert_3*> .

Severity

30 : Severe error

Explanation

The command has been used to request automatic migration for a queue manager's or a client's Microsoft Certificate Store. However, there is already an entry in the registry for this store. If the request was for a queue manager then <*insert_3*> is the queue manager name, otherwise it is the name of the client's Microsoft Certificate Store.

Response

List, and then check, the contents of the registry by running the Transfer Certificates (amqtcert) command with the options "-a -l". If it is necessary to replace the entry then firstly remove it, by using amqtcert with the "-r" option, then use amqtcert to request automatic migration.

AMQ9733

The request to automatically migrate certificates has completed successfully.

Severity

0 : Information

Explanation

A request was made to automatically migrate SSL certificates. This request may have been made during the installation of WebSphere MQ or by using the Transfer Certificates (amqtcert) command. The request has now been performed and the migration has completed successfully.

Response

Use the GSKit iKeyman GUI to verify that the GSKit key database contains all the certificates required to support the intended SSL channel. If no certificates were migrated then this is because the Microsoft Certificate Store contained only a default set of certificate authority (signer) certificates. The default set is not migrated because the newly created GSKit key database will have its own set which will be the same or more up to date.

AMQ9734

There was a failure during the automatic migration of certificates.

Severity

30 : Severe error

Explanation

A request was made to automatically migrate SSL certificates. This request may have been made during the installation of WebSphere MQ or by using the Transfer Certificates (amqtcert) command. The request has now been performed but there was a failure during the migration process.

Response

Refer to previous messages in the error log to determine the cause of the failure. It may be the case that all certificates have successfully migrated and that the failure did not affect this part of the migration process. In this case, use the GSKit iKeyman GUI to verify that the GSKit key database contains all the certificates required to support the intended SSL channel.

AMQ9735

Certificate migration has terminated unexpectedly. A failure occurred during GSKit initialization.

Severity

30 : Severe error

Explanation

The certificate migration process has terminated unexpectedly. The migration requires the GSKit environment to be successfully initialized. This involves the GSKit operations of initialization, creation of the key database and stashing of the key database password. There was a failure during one of these operations. No certificates have been migrated. If the stashing of the password failed then the key database <*insert_4*> will have been created. The failure occurred during the GSKit operation <*insert_3*> and the GSKit return code <*insert_1*> was generated.

Response

If the key database has been created then, after the cause of the failure has been resolved, delete it, remove the relevant registry state information and then re-try the certificate migration process. Use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at

http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9736

The library <*insert_3*> was not found.

Severity

30 : Severe error

Explanation

An attempt to dynamically load the library <*insert_3*> failed because the library was not found. If this an WebSphere MQ library, it is only available on WebSphere MQ server installations and is required when the Transfer Certificates (amqtcert) command is used to perform a queue manager operation. If this a GSKit library, it should have been installed during the WebSphere MQ installation.

Response

Do not use the command to perform a queue manager operation on a WebSphere MQ MQI client-only installation. If the command has been made on a WebSphere MQ server installation, or if it is a GSKit library which is missing, then record the problem identifier, save any generated output files and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9737

Unable to allocate memory.

Severity

30 : Severe error

Explanation

An attempt to allocate memory failed.

Response

Make more memory available to the command.

AMQ9739

The certificate store <*insert_3*> could not be accessed.

Severity

30 : Severe error

Explanation

The certificate store <*insert_3*> could not be accessed, and failed with Windows error code <*insert_1*> . If you are using the -c parameter check that the name given to amqtcert is correct. If you are using the -m parameter check the SSLKEYR value on the queue manager specified.

Response

Consult the Windows reference manual to determine the meaning of error <*insert_1*> if this value is non-zero. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9740

The certificate store <*insert_3*> could not be opened.

Severity
30 : Severe error

Explanation
The certificate store <*insert_3*> could not be opened, and failed with Windows error code <*insert_1*> .

Response
Consult the Windows reference manual to determine the meaning of error <*insert_1*> if this value is non-zero. If the problem cannot be resolved then use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9741
A problem occurred during a Windows operation.

Severity
30 : Severe error

Explanation
During operation <*insert_3*>, the Windows return code <*insert_1*> was generated.

Response
Consult the Windows reference manual to determine the meaning of return code <*insert_1*> for operation <*insert_3*>.

AMQ9742
A problem occurred during a GSKit operation.

Severity
30 : Severe error

Explanation
During operation <*insert_3*>, the GSKit return code <*insert_1*> was generated.

Response
Use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9743
A certificate failed to be migrated and failed to be logged.

The certificate's details are:

[Microsoft Certificate Store], [Subject], [Issuer], [Serial Number]:

<*insert_3*> .

Severity
30 : Severe error

Explanation
There was a problem trying to migrate a certificate to the GSKit key database <*insert_5*>.

Response
Refer to the previous message in the error log to determine why the migration failed.

AMQ9744
No matching automatic migration registry entry.

Severity
10 : Warning

Explanation
There is no automatic certificate migration entry in the registry which matches the input provided.

Response
None, if the entry was correctly specified. Otherwise, input the command again with correct parameters.

AMQ9745
amqtcert: insufficient memory to migrate certificates.

Severity
30 : Severe error

Explanation
An attempt to allocate memory failed while amqtcert was migrating certificate file <*insert_3*>.sto'. The migration did not complete successfully.

Response
Do not delete <*insert_3*>.sto', but delete all other files called <*insert_4*>.*' (these were created as a result of the failed migration). Also, if you want to rerun this migration automatically, use the -r flag on amqtcert to remove the automatic migration registry entry for this .sto file. Then use the -a flag on amqtcert to create a new automatic migration registry entry for this .sto file.

Make more memory available. Rerun the migration.

AMQ9746
File <*insert_3*> not found.

Severity
30 : Severe error

Explanation
The file specified as a command argument has not been found. The characters ".sto" have been automatically appended to the file name.

Response
Check that file exists and that it is specified as the absolute (rather than relative) directory path and file name (excluding the .sto suffix) of the Microsoft Certificate Store.

AMQ9747
Usage: amqtcert [-a] [-c [Filename | *]] [-e ExpirationTime] [-g FileName]

[-i ListNumber] [-l] [-m [QMgrName | *]] [-p Password]

[-r] [-u ClientLogonID] [-w FileName]

Severity
0 : Information

Response
None.

AMQ9748
A problem occurred accessing the Windows registry.

Severity
30 : Severe error

Explanation

An attempt to access a key or value or data field in the Windows registry key failed. The failure may be due to part of the registry being in an invalid state or may be due to insufficient authority to access that part. The WebSphere MQ error recording routine has been called.

Response

If <*insert_3*> includes the name of a Windows call, consult the Windows reference manual to determine the meaning of status <*insert_1*> for that call. Use the standard facilities supplied with your system to record the problem identifier, and to save the generated output files. Use either the IBM WebSphere MQ support web page at http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9749

Invalid combination of command arguments.

Severity

30 : Severe error

Explanation

The command syntax is incorrect because of an invalid combination of arguments.

Response

Re-try the command using a valid combination of arguments.

AMQ9750

File <*insert_3*> already exists.

Severity

30 : Severe error

Explanation

The file <*insert_3*> cannot be created because it already exists.

Response

Ensure that the file does not exist in the directory. If necessary, make a copy of the file before renaming or moving or deleting it.

AMQ9751

You are not authorized to perform the requested operation.

Severity

30 : Severe error

Explanation

You tried to issue a command for which you are not authorized.

Response

Contact your system administrator to perform the command for you or to request authority to perform the command.

AMQ9752

A certificate failed to be migrated because a Windows operation failed.

The certificate's details are:

[Microsoft Certificate Store], [Subject], [Issuer], [Serial Number]:

<*insert_4*> .

Severity

30 : Severe error

Explanation

A personal certificate could not be migrated because there was a failure during the Windows operation <*insert_3*> with a return code of <*insert_1*>. A personal certificate is exported, with its private key data, from the Microsoft Certificate Store prior to being imported into the GSKit key database. The failure occurred during the export and is probably due to a problem with accessing or using the private key data assoicated with the personal certificate.

Response

Check that the private key data is available and that you have authority to access it. Consult the Windows reference manual to determine the meaning of return code <*insert_1*> for operation <*insert_3*>.

AMQ9753

File <*insert_3*> is empty.

Severity

30 : Severe error

Explanation

The file <*insert_3*> cannot be used because it is empty.

Response

Ensure that the correct file has been used and if necessary investigate the reason for it being empty.

AMQ9754

A certificate failed to be migrated because a GSKit operation failed.

The certificate's details are:

[Microsoft Certificate Store], [Subject], [Issuer], [Serial Number]:

<*insert_4*> .

Severity

30 : Severe error

Explanation

During operation <*insert_3*>, the GSKit return code <*insert_1*> was generated.

Response

Use the standard facilities supplied with your system to record the problem identifier and save the generated output files, and then use either the http://www.ibm.com/support/entry/portal/Overview/Software/WebSphere/WebSphere_MQ, or the IBM support assistant at http://www.ibm.com/software/support/isa/, to see whether a solution is already available. If you are unable to find a match, contact your IBM support center. Do not discard these files until the problem has been resolved.

AMQ9755

Certificate migration has completed with some failures. The number of certificates migrated was <*insert_1*>.

Severity

0 : Information

Explanation

The migration of certificates from the Microsoft Certificate Store <*insert_3*> to the GSKit key database <*insert_4*> has completed but there has been one or more failures. The number of certificates migrated was <*insert_1*> .

Response

If any certificates were migrated, use the GSKit iKeyman GUI to verify that the GSKit key database contains all the certificates required to support the intended SSL channel. The failures

must be resolved otherwise the SSL channel may subsequently fail to start. Refer to previous messages in the error log to determine the cause of such failures.

AMQ9756
The number of certificates in the Microsoft Certificate Store <*insert_3*> is <*insert_1*>.

Severity
0 : Information

Explanation
Provides a count of the number of certificates in the Microsoft Certificate Store <*insert_3*>.

Response
None.

AMQ9757

Certificate <*insert_1*>

Severity
0 : Information

Explanation
None.

Response
None.

AMQ9758

Response
None.

AMQ9765
Personal certificate not found for the command option "-i <*insert_1*>".

Severity
30 : Severe error

Explanation
The Transfer Certificates (amqtcert) command was executed using the "-i ListNumber" option with a value of <*insert_1*> . However, no personal certificate was found which corresponded to this value. Certificate migration has failed and no certificates were migrated.

Response
Check that the option value corresponds to a correctly identified personal certificate. If it is not correct then run the command using the "-l List" option to determine the correct number. A GSKit key database, and its associated key database files, was created when the command was run using the "-i ListNumber" option. The database and associated files must be deleted before re-trying the command with the "-i" option.

AMQ9766
A failure occurred creating the GSKit key database <*insert_4*> .

Severity
30 : Severe error

Explanation
GSKit was unable to create the key database and its associated files. During the GSKit operation <*insert_3*> , the return code <*insert_1*> was generated. This is probably due to insufficient authority or to insufficient disk space being available.

Response
Check that you have sufficient authority and that there is sufficient disk space available.

AMQ9767
Usage: strmqikm [iKeymanWorkingDirectory]

Severity
0 : Information

Response
None.

AMQ9768
Directory <*insert_3*> not found.

Severity
30 : Severe error

Explanation
The directory specified as a command argument has not been found.

Response
Check that the directory exists and that it is specified as an absolute (rather than relative) directory path.

AMQ9769
Usage: runmqckm

-keydb -changepw Change the password for a key database

-convert Convert the format of a key database

-create Create a key database

-delete Delete a key database

-stashpw Stash the password of a key database into a file

-list Currently supported types of key database.

-cert -add Add a CA Certificate

-create Create a self-signed certificate

-delete Delete a certificate

-details Show the details of a specific certificate

-export Export a personal certificate and associated private key into a PKCS12 file or a key database

-extract Extract a certificate from a key database

-getdefault Show the default personal certificate

-import Import a certificate from a key database or a PKCS12 file

-list List certificates in a key database

-modify Modify a certificate (NOTE: the only field that my be modified is the trust field)

-receive Receive a certificate

-setdefault Set the default personal certificate

-sign Sign a certificate

-certreq -create Create a certificate request

-delete Delete a certificate request from a certificate request database

-details Show the details of a specific certificate request

-extract Extract a certificate from a certificate request database

-list List all certificate requests in a certificate request database

-recreate re-create a certificate request

-version Display iKeycmd version information

-help Display this help text

Severity
0 : Information

Response
None.

AMQ9770
The SSL key repository password has expired.

Severity
30 : Severe error

Explanation
The SSL key repository cannot be used because the password has expired.

The channel is <*insert_3*>; in some cases its name cannot be determined and so is shown as '????'. The channel did not start.

Response
Use your key management tool to reset the password of the SSL key repository, ensuring that a new password stash file is generated.

AMQ9771
SSL handshake failed.

Severity
30 : Severe error

Explanation
The SSL handshake with host <*insert_3*> failed. The SSL handshake was performed using the Java Secure Socket Extension (JSSE).

Response
The SSLSocketFactory used was <*insert_5*> , where 'default' indicates that the JVM's default SSLSocketFactory was used.

The exception thrown by the <*insert_4*> call was <*insert_1*>. Review the exception message for a description of the failure.

Also examine the error logs at the remote end of the channel. These may contain additional information on why the SSL handshake failed.

AMQ9774
Error accessing the channel authentication table

Severity
30 : Severe error

Explanation
The program could not access the channel authentication table.

Response
A value of <*insert_1*> was returned from the subsystem when an attempt was made to access the channel authentication table.

Contact the systems administrator, who should examine the log files to determine why the program was unable to access the authentication table.

AMQ9776
Channel was blocked by user ID

Severity
30 : Severe error

Explanation
The inbound channel <*insert_3*> was blocked from address <*insert_4*> because the active values of the channel were mapped to a userid which should be blocked. The active values of the channel were <*insert_5*> .

Response
Contact the systems administrator, who should examine the channel authentication records to ensure that the correct settings have been configured.

The command DISPLAY CHLAUTH can be used to query the channel authentication records.

AMQ9777
Channel was blocked

Severity
30 : Severe error

Explanation
The inbound channel <*insert_3*> was blocked from address <*insert_4*> because the active values of the channel matched a record configured with USERSRC(NOACCESS).

The active values of the channel were <*insert_5*> .

Response
Contact the systems administrator, who should examine the channel authentication records to ensure that the correct settings have been configured.

The command DISPLAY CHLAUTH can be used to query the channel authentication records.

AMQ9778
IP address is invalid.

Severity
30 : Severe error

Explanation
The IP address <*insert_3*> was found to be invalid.

Response
The processing of the command is terminated. Reissue the command with the IP address parameter specified correctly.

Refer to the commands section of the WebSphere MQ product documentation for more information on the specification of the IP address parameter.

AMQ9779
IP address range error.

Severity
30 : Severe error

Explanation
The IP address <*insert_3*> contains an invalid range. For example the first number is higher or equal to the second number in the range.

Response
The processing of the command is terminated. Reissue the command with the IP address parameter specified correctly.

Refer to the commands section of the WebSphere MQ product documentation for more information on the specification of the IP address parameter.

AMQ9781
IP address overlaps with previous definition.

Severity
30 : Severe error

Explanation
The IP address <*insert_3*> overlaps an existing IP address <*insert_4*>. For example the first number is higher than or equal to the second number in the range.

Response
The processing of the command is terminated. Reissue the command with an IP address parameter that does not overlap a previous definition or remove the existing record and then reissue the command.

Refer to the commands section of the WebSphere MQ product documentation for more information on the specification of the IP address parameter.

AMQ9782
Remote connection blocked.

Severity
30 : Severe error

Explanation
A connection from IP address <*insert_3*> was blocked because it matched the blocking address rule <*insert_4*> .

Response
Verify that the channel authentication blocking rules are correct. If necessary modify the rules to allow the inbound connection, using the SET CHLAUTH command.

Refer to the commands section of the WebSphere MQ product documentation for more information on the specification of the IP address parameter.

AMQ9783
Channel will run using MCAUSER(<*insert_3*>).

Severity
30 : Severe error

Explanation
No matching channel authentication (CHLAUTH) records were found which matched the given fields. Note that the returned MCAUSER value does not take into account any possible action by a channel security exit.

Response
None.

AMQ9784
Match runcheck found a generic value in <*insert_3*> .

Severity
30 : Severe error

Explanation
Match runcheck found a generic value in <*insert_3*> .

When using MATCH(RUNCHECK) all input fields must not contain generic values.

Response
Reissue the command with all fields containing fully specified values.

AMQ9785
Channel is configured to not use the dead-letter queue.

Severity
30 : Severe error

Explanation

A message cannot be transferred across channel <*insert_5*> from address <*insert_4*> and the channel is configured to not use the dead-letter queue. The reason code is <*insert_1*> and the destination queue is <*insert_3*>.

Response
Either correct the problem that caused the channel to try and write a message to the dead-letter queue or enable the channel to use the dead-letter queue.

AMQ9816
Invalid process name <*insert_3*> provided for TMF/Gateway.

Severity
20 : Error

Explanation
IBM WebSphere MQ client for HP Integrity NonStop Server is unable to enlist with the TMF/Gateway for queue manager <*insert_4*> due to an invalid process name provided in the MQTMF_GATEWAY_NAME environment variable.

Response
Ensure the TMF/Gateway is running and the MQTMF_GATEWAY_NAME environment variable is correctly set to the Guardian process name of the TMF/Gateway.

AMQ9817
No PATHMON process name provided to allow enlisting with TMF/Gateway.

Severity
20 : Error

Explanation

IBM WebSphere MQ client for HP Integrity NonStop Server has detected the presence of a TMF transaction and is attempting to enlist with the TMF/Gateway to allow correct participation of the queue manager in the transaction.

IBM WebSphere MQ client for HP Integrity NonStop Server has been unable to find a process name for the PATHMON process hosting the TMF/Gateway server class for queue manager <*insert_3*> in an mqclient.ini file.

Response

Ensure an mqclient.ini file is available for use by the IBM WebSphere MQ client for HP Integrity NonStop Server containing a TMF stanza providing the Guardian process name of a PATHMON that is hosting a TMF/Gateway server class for queue manager <*insert_3*>.

The mqclient.ini file also requires a TMFGateway stanza providing the server class name to be used for queue manager <*insert_3*>.

Refer to the IBM WebSphere MQ product documentation for further information on using an mqclient.ini file with the IBM WebSphere MQ client for HP Integrity NonStop Server.

AMQ9818

No server class provided to allow enlisting with TMF/Gateway for queue manager <*insert_3*>.

Severity

20 : Error

Explanation

IBM WebSphere MQ client for HP Integrity NonStop Server has detected the presence of a TMF transaction and is attempting to enlist with the TMF/Gateway to allow correct participation of the queue manager in the transaction.

IBM WebSphere MQ client for HP Integrity NonStop Server has been unable to find a server class name in an mqclient.ini file for queue manager <*insert_3*> hosted by PATHMON process <*insert_4*>.

Response

Ensure an mqclient.ini file is available for use by the IBM WebSphere MQ client for HP Integrity NonStop Server which contains a TMFGateway stanza providing the server class name to be used for queue manager <*insert_3*>.

Refer to the IBM WebSphere MQ product documentation for further information on using an mqclient.ini file with the IBM WebSphere MQ client for HP Integrity NonStop Server.

AMQ9819

Error encountered while enlisting with TMF/Gateway for queue manager <*insert_5*>.

Severity

20 : Error

Explanation

IBM WebSphere MQ client for HP Integrity NonStop Server has detected the presence of a TMF transaction and is attempting to enlist with the TMF/Gateway server class <*insert_4*> hosted by PATHMON process <*insert_3*> to allow correct participation of the queue manager in the transaction.

IBM WebSphere MQ client for HP Integrity NonStop Server has encountered an error while establishing contact with the TMF/Gateway. Pathsend error (<*insert_1*>), file system error (<*insert_2*>).

Response

These errors are typically the result of configuration problems with the PATHMON process <*insert_3*> or the server class <*insert_4*>. Refer to the HP NSS TS/MP Pathsend and Server Programming Manual for the appropriate corrective action based on the Pathsend error (<*insert_1*>) and file system error (<*insert_2*>).

AMQ9820

Participation in TMF transactions is not support by queue manager <*insert_3*>.

Severity

20 : Error

Explanation

IBM WebSphere MQ client for HP Integrity NonStop Server has detected the presence of a TMF transaction but IBM WebSphere MQ for z/OS queue manager <*insert_3*> does not support participation in TMF transactions.

Response

The version of z/OS queue manager that you are connecting to does not support the TMF Gateway, please upgrade to a supported release.

AMQ9821
Unable to locate PATHMON process <*insert_3*>.

Severity
20 : Error

Explanation
IBM WebSphere MQ client for HP Integrity NonStop Server is unable to locate PATHMON process <*insert_3*>.

Response

The configuration error may be one of the following:

1. The mqclient.ini TMF stanza contains an invalid process name.
2. The PATHMON process <*insert_3*> is not currently running.

AMQ9822
Unable to locate server class <*insert_4*>.

Severity
20 : Error

Explanation
IBM WebSphere MQ client for HP Integrity NonStop Server is unable to locate server class <*insert_4*> hosted by PATHMON process <*insert_3*>.

Response

The configuration error may be one of the following:

1. The mqclient.ini TMFGateway stanza contains an invalid server class name for queue manager <*insert_5*>.
2. The PATHMON process <*insert_3*> has not been configured with server class <*insert_4*>.
3. Server class <*insert_4*> has not been started or is currently frozen.

AMQ9823
Not authorized to use server class <*insert_4*> hosted by PATHMON process <*insert_3*>

Severity
20 : Error

Explanation
IBM WebSphere MQ client for HP Integrity NonStop Server is not authorized to use server class <*insert_4*> hosted by PATHMON process <*insert_3*>.

Response
Check with your systems administrator to ensure you have the correct access permissions. When confirmed you have the correct access permissions, retry the operation.

AMQ9824
TMF/Gateway server class <*insert_4*> has not been configured appropriately.

Severity
20 : Error

Explanation
The TMF/Gateway server class <*insert_4*> hosted by PATHMON process <*insert_3*> has not been configured appropriately.

Response

The configuration error may be one of the following:

1. The server class has not been configured with TMF enabled.

2. The server class has been configured with MAXLINKS set too low for the number of IBM WebSphere MQ client for HP Integrity NonStop Server applications needing to concurrently enlist with the TMF/Gateway.
3. The server class has been configured with TIMEOUT set too low for the time taken by the TMF/Gateway to process a request. Ideally TIMEOUT should not be set, but if it is then it needs to account for the time taken for the TMF/Gateway's associated remote queue manager to respond.

AMQ9871

Cluster maintenance has been running for <*insert_1*> minutes. Phase <*insert_3*> has so far processed <*insert_2*> records

Severity

0 : Information

Explanation

A queue manager will periodically perform a maintenance cycle to refresh and remove state associated with the clusters that it is a member of. This message gives an indication of the progress that is being made.

Response

For large clusters this maintenance process may take a significant period of time, in such situations this message will be periodically repeated until maintenance has completed. When the maintenance cycle has completed message AMQ9872 will be written to this log.

AMQ9872

Cluster maintenance has completed after <*insert_1*> minutes, <*insert_2*> records were processed

Severity

0 : Information

Explanation

A queue manager will periodically perform a maintenance cycle to refresh and remove state associated with the clusters that it is a member of. This message indicates that that cycle has now completed. This message corresponds with one or more instances of message AMQ9871 previously reported.

Response

This message is for informational purposes only, no user response is required.

AMQ9873

An error occurred while restoring the cluster repository cache, reason=<*insert_1*>

Severity

30 : Severe error

Explanation

An error was detected while restoring the cluster cache. The cluster cache held by this queue manager is now incomplete which may result in inconsistencies in cluster resources visible to and owned by this queue manager. See messages in the queue manager and system error logs for details of the error encountered.

Response

Contact your IBM support center to resolve the problem.

AMQ9874

Repository manager failed due of errors. Retry in <*insert_1*> minutes.

Severity

30 : Severe error

Explanation

Repository manager encountered a problem. See the earlier messages in the queue manager or

system error logs for details. The repository manager will retry the command in <*insert_1*> minutes. If the problem is not rectified no further cluster management activity will occur, this will affect the availability of cluster resources accessed or hosted by this queue manager.

Response

If possible, rectify the identified problem, otherwise contact your IBM support center. Once the problem has been rectified, if the SYSTEM.CLUSTER.COMMAND.QUEUE queue has been set to GET(DISABLED) set the queue to be GET(ENABLED) and wait for the repository manager to retry the command. If the repository manager process has terminated, restart the queue manager.

AMQ9875

REFRESH CLUSTER processing started for cluster.

Severity

0 : Information

Explanation

REFRESH CLUSTER processing started for cluster <*insert_3*> . A REFRESH CLUSTER command has been issued on this queue manager. In phase one this discards all locally cached information for the cluster and requests new information from other members of the cluster when necessary. Phase two processes the information received. For large cluster configurations this process can take a significant time, especially on full repository queue managers, and during this time applications attempting to access cluster resources might see failures to resolve cluster resources. In addition, cluster configuration changes made on this queue manager might not be processed until the refresh process has completed.

Response

Defer any cluster related work on this queue manager until both phases are complete. Message AMQ9442 or message AMQ9404 are issued to this log at the end of phase one. Completion of phase two can be determined when SYSTEM.CLUSTER.COMMAND.QUEUE has reached a consistently empty state.

AMQ9876

Cluster management is about to compress a large number of cache records.

Severity

0 : Information

Explanation

Periodically cluster management will compress its local cache. Compression can take a significant period of time for certain operations, such as performing a CLUSTER REFRESH. During the compression task, cluster management commands will not be processed. Once the compression task has completed message AMQ9877 will be written to this log.

Response

None.

AMQ9877

Cluster cache compression has completed.

Severity

0 : Information

Explanation

A large cache compression has completed. This message corresponds to message AMQ9876 being previously reported.

Response

None.

AMQ9913

The specified local address <*insert_3*> cannot be resolved to an IP address. The return code is <*insert_1*> .

Severity
30 : Severe error

Explanation
An attempt to resolve the local address host name to an IP address has failed.

Response
Check that the local address host name is correct and has an entry in the DNS database.

AMQ9914
The type of local address specified is incompatible with the IP protocol (<*insert_3*>) used.

Severity
30 : Severe error

Explanation
An attempt to use a local address that is incompatible with the IP protocol used.

Response
Make sure that the local address specified is of the same type (IPv4 or IPv6) as the IP Protocol.

AMQ9915
The IP protocol <*insert_3*> is not present on the system.

Severity
30 : Severe error

Explanation
An attempt to use an IP protocol that is not present on the system has been made.

Response
Install the required IP protocol or use an IP protocol that is available on the system. This error can also occur if the system is short of memory or other system resources.

AMQ9920
A SOAP Exception has been thrown.

Severity
30 : Severe error

Explanation
A SOAP method encountered a problem and has thrown an exception. Details of the exception are:

<*insert_3*>

Response
Investigate why the SOAP method threw the exception.

AMQ9921
An error was encountered writing to the Dead Letter Queue.

Severity
30 : Severe error

Explanation
An error was encountered when an attempt was made to write a message to Dead Letter Queue <*insert_3*>. The message was <*insert_4*>.

Response
Ensure that Dead Letter Queue <*insert_3*> exists and is put enabled. Ensure that the Queue Manager attribute DEADQ is set up correctly. Resend the SOAP message.

AMQ9922
Maximum wait time exceeded on queue <*insert_3*> .

Severity
30 : Severe error

Explanation
The maximum time waiting for a message to arrive on queue <*insert_3*> has been exceeded.

Response
Ensure that the queue is not put inhibited. Ensure that messages are being written to the queue.

AMQ9923
Insufficient parameters on command.

Severity
30 : Severe error

Explanation
The SOAP command has been issued with insufficient paramaters.

Response
Supply the correct number of parameters and reissue the command.

AMQ9924
Usage: amqwSOAPNETListener -u WebSphere MQUri

[-w WebServiceDirectory] [-n MaxThreads]

[-d StayAlive] [-i IdContext]

[-x TransactionalControl] [-a Integrity] [-? ThisHelp]

Severity
0 : Information

Explanation
This shows the correct usage.

Response
None.

AMQ9925
Cannot connect to queue manager <*insert_3*> .

Severity
30 : Severe error

Explanation
A SOAP application or the SOAP listener cannot connect to the queue manager <*insert_3*> using <*insert_4*> bindings.

Response
Ensure the bindings are set to the correct value and that the queue manager exists. Check any error messages from the Java MQQueueManager class.

AMQ9926
Null SOAP action specified in a received SOAP message.

Severity
30 : Severe error

Explanation
A NULL soap action has been specified in the SOAP message <*insert_3*>. The message will not be processed.

Response
Include the appropriate SOAP action in the SOAP message.

AMQ9927
MQ queue backout threshold exceeded.

Severity
30 : Severe error

Explanation
The WebSphere MQ backout threshold value has been exceeded for queue <*insert_3*>, processing message <*insert_4*>.

Response
Correct the backout threshold value for queue <*insert_3*> and resend the SOAP message.

AMQ9928
Target service or URI is missing from a SOAP message.

Severity
30 : Severe error

Explanation
The target service or the target URI is missing from SOAP message <*insert_3*>.

Response
Supply a target service or the target URI in the SOAP message.

AMQ9929
Message backout for message (<*insert_3*>) failed.

Severity
30 : Severe error

Explanation
Backout for a message has failed.

Response
Investigate the reason for the backout failure.

AMQ9930
Required Option <*insert_3*> missing from command.

Severity
30 : Severe error

Explanation
The SOAP command was issued with manadatory option <*insert_3*> missing.

Response
Reissue the SOAP command supplying the missing option.

AMQ9931
Invalid value <*insert_3*> specified for option <*insert_4*>.

Severity
30 : Severe error

Explanation
The SOAP command was issued with an invalid value for an option.

Response
Reissue the SOAP command supplying the correct option value.

AMQ9932
Application host class not found

Severity
30 : Severe error

Explanation
Application host class <*insert_3*> has not been found.

Response
Specify the correct application host class in the SOAP message.

AMQ9933
Options <*insert_3*> and <*insert_4*> are mutually exclusive

Severity
30 : Severe error

Explanation
The SOAP command was issued with incompatible options <*insert_3*> and <*insert_4*>.

Response
Reissue the SOAP command supplying compatible options.

AMQ9934
Could not parse URL <*insert_3*>. MQCC_FAILED(2) MQRC_SOAP_URL_ERROR(2212).

Severity
30 : Severe error

Explanation
Could not parse URL <*insert_3*>. MQCC_FAILED(2) MQRC_SOAP_URL_ERROR(2212).

Response
Correct the URL and retry.

AMQ9935
Invalid URL <*insert_3*>. MQCC_FAILED(2) MQRC_SOAP_URL_ERROR(2212).

Severity
30 : Severe error

Explanation
The URL <*insert_3*> failed validation.. MQCC_FAILED(2) MQRC_SOAP_URL_ERROR(2212).

Response
Correct the URL and retry.

AMQ9936
Cannot get connection using <*insert_3*> bindings. MQCC_FAILED(2) MQRC_CONNECTION_ERROR(2273).

Severity
30 : Severe error

Explanation
Cannot get connection using <*insert_3*> bindings. MQCC_FAILED(2) MQRC_CONNECTION_ERROR(2273).

Response
Check that the queue manager is available and running.

AMQ9937
The asyncResult is null. MQCC_FAILED(2) MQRC_SOAP_DOTNET_ERROR.(2210).

Severity
30 : Severe error

Explanation
The asyncResult is null. MQCC_FAILED(2) MQRC_SOAP_DOTNET_ERROR.(2210).

Response
Check why the SOAP responses are not being received.

AMQ9938
SOAP/WebSphere MQ Timeout.

Severity
30 : Severe error

Explanation
The MQGET operation timed out. MQCC_FAILED(2) MQRC_SOAP_DOTNET_ERROR.(2210).

Response
Check why the SOAP responses are not being received. MQCC_FAILED(2) MQRC_SOAP_DOTNET_ERROR.(2210).

AMQ9939
SOAP/WebSphere MQ Error. MQCC_FAILED(2) MQRC_SOAP_DOTNET_ERROR.(2210).

Severity
30 : Severe error

Explanation
A SOAP error was detected. MQCC_FAILED(2) MQRC_SOAP_DOTNET_ERROR.(2210).

Response
Check the WebSphere MQ logs for the reason of the failure.

AMQ9940
Report message returned in MQWebResponse. MQCC_FAILED(2) MQRC_SOAP_DOTNET_ERROR.(2210).

Severity
30 : Severe error

Explanation
Report message returned in MQWebResponse. MQCC_FAILED(2) MQRC_SOAP_DOTNET_ERROR.(2210).

Response
Check the report message for the reason of the failure.

AMQ9941
No RFH2 header recognised. MQCC_FAILED(2) MQRCCF_MD_FORMAT_ERROR(3023).

Severity
30 : Severe error

Explanation
No RFH2 header recognised. MQCC_FAILED(2) MQRCCF_MD_FORMAT_ERROR(3023).

Response
Check why the message is being sent with no RFH2 header.

AMQ9942
Message format is not MQFMT_NONE. MQCC_FAILED(2) MQRC_RFH_FORMAT_ERROR(2421).

Severity
30 : Severe error

Explanation
Message format is not MQFMT_NONE. MQCC_FAILED(2) MQRC_RFH_FORMAT_ERROR(2421).

Response
Correct the message format and retry.

AMQ9943
Unrecognised RFH2 version. MQCC_FAILED(2) MQRC_RFH_FORMAT_ERROR(2421).

Severity
30 : Severe error

Explanation
Unrecognised RFH2 version. MQCC_FAILED(2) MQRC_RFH_FORMAT_ERROR(2421).

Response
Correct the version in the RFH2 message and retry.

AMQ9944
Invalid RFH2 length. MQCC_FAILED(2) MQRC_RFH_FORMAT_ERROR(2421).

Severity
30 : Severe error

Explanation
Invalid RFH2 length. MQCC_FAILED(2) MQRC_RFH_FORMAT_ERROR(2421).

Response
Correct the RFH2 length and retry.

AMQ9945
Invalid RFH2 <*insert_3*> folder length. MQCC_FAILED(2) MQRC_RFH_FORMAT_ERROR(2421).

Severity
30 : Severe error

Explanation
Invalid RFH2 <*insert_3*> folder length. MQCC_FAILED(2) MQRC_RFH_FORMAT_ERROR(2421).

Response
Correct the RFH2 message and retry.

AMQ9946
Invalid actual message length. MQCC_FAILED(2) MQRC_RFH_FORMAT_ERROR(2421).

Severity
30 : Severe error

Explanation
Invalid actual message length. MQCC_FAILED(2) MQRC_RFH_FORMAT_ERROR(2421).

Response
Correct the RFH2 message and retry.

AMQ9947
Invalid RFH2 Folder <*insert_3*> <*insert_4*>. MQCC_FAILED(2) MQRC_RFH_FORMAT_ERROR(2421).

Severity
30 : Severe error

Explanation
Invalid RFH2 Folder <*insert_3*> <*insert_4*>. MQCC_FAILED(2) MQRC_RFH_FORMAT_ERROR(2421).

Response
Correct the RFH2 folder syntax/format and retry.

AMQ9948
Backout Threshold exceeded. MQCC_FAILED(2) MQRC_BACKOUT_THRESHOLD_REACHED(2362).

Severity
30 : Severe error

Explanation
Backout Threshold exceeded. MQCC_FAILED(2) MQRC_BACKOUT_THRESHOLD_REACHED(2362).

Response
Correct the backout threshold limit and retry.

AMQ9949
<*insert_3*> missing from RFH2. MQCC_FAILED(2) MQRC_RFH_PARM_MISSING(2339).

Severity
30 : Severe error

Explanation
<*insert_3*> missing from RFH2. MQCC_FAILED(2) MQRC_RFH_PARM_MISSING(2339).

Response
Correct the RFH2 message and retry.

AMQ9950
Target service missing from SOAP URL. MQCC_FAILED(2) MQRC_SOAP_URL_ERROR(2212).

Severity
30 : Severe error

Explanation
Target service missing from SOAP URL. MQCC_FAILED(2) MQRC_SOAP_URL_ERROR(2212).

Response
Correct the URL and retry.

AMQ9951
Asynchronous request queued successfully. MQCC_OK(0).

Severity
30 : Severe error

Explanation
Asynchronous request queued successfully. MQCC_OK(0).

Response
Wait for response if any is expected.

AMQ9952
Unexpected message type received. MQCC_FAILED(2) MQRC_UNEXPECTED_MSG_TYPE.(2215).

Severity
30 : Severe error

Explanation
A message of the wrong type was received; for example, a report message was received when one had not been requested.

Response
If you are running WebSphere MQ SOAP using the IBM supplied SOAP/WebSphere MQ sender, please contact IBM. If you are running WebSphere MQ SOAP using a bespoke sender, please check that the SOAP/WebSphere MQ request message has the correct options.

AMQ9953
Either the ContentType or the TransportVersion in the RFH2 header have the wrong value. MQCC_FAILED(2) MQRC_RFH_HEADER_FIELD_ERROR(2228)

Severity
30 : Severe error

Explanation
Either the ContentType or the TransportVersion in the RFH2 header have the wrong value. MQCC_FAILED(2) MQRC_RFH_HEADER_FIELD_ERROR(2228)

Response
Correct the message format and retry.

AMQ9954
ViaTran.Redirect called out of transaction MQCC_FAILED(2) MQRC_SOAP_DOTNET_ERROR(2410)

Severity
30 : Severe error

Explanation
ViaTran.Redirect called out of transaction MQCC_FAILED(2) MQRC_SOAP_DOTNET_ERROR(2410)

Response
Make sure ViaTran.Redirect is only called in a transaction.

AMQ9955
Usage: amqswsdl [?] Uri inputFile outputFile

Severity
0 : Information

Explanation
This shows the correct usage.

Response
None.

AMQ9990 (IBM i)
Keyword <*insert_3*> not valid for this command or the command is incomplete.

Severity
40 : Stop Error

Explanation
The command is incomplete, or an invalid keyword was specified, or the parameter value of the keyword was not specified.

Response
Complete the command, or correct the keyword, or add the parameter value, and then try the command again.

AMQ9991 (IBM i)
The value specified is not allowed by the command.

Severity
40 : Stop Error

Explanation
<*insert_3*> not valid for parameter <*insert_4*>.

Response
Enter one of the values that is defined for the parameter, and try the command again. More information on parameters and commands can be found in the CL reference manual or the appropriate licensed program manual.

AMQ9992 (IBM i)
A matching parenthesis not found.

Severity
40 : Stop Error

Explanation
A matching left or right parenthesis is missing.

Response
Add the missing parenthesis or remove the extra parenthesis.

AMQ9999
Channel program ended abnormally.

Severity
30 : Severe error

Explanation
Channel program <*insert_3*> ended abnormally.

Response
Look at previous error messages for channel program <*insert_3*> in the error files to determine the cause of the failure. For more information, see Problem determination in DQM.

AMQXR Messages

AMQCO1001E
MQXR service unexpectedly caught communications exception={0}(Exception).

Explanation
An exception was caught by the Communications Manager and it was not able to take a reasonable action in response to the exception.

User action
Investigate and resolve the cause of the underlying exception.

AMQCO1002E
A selection key={0} was found in an unexpected state.

Explanation
A selection key was found in a state that was not expected.

User action
Contact your IBM support center.

AMQCO1003E
Connection={0}(Connection) has insufficient data available to satisfy a get request.

Explanation
The application tried to read more data than is immediately available. After the application has processed the information available to it, it should release control and wait to be called again when more data is available.

User action
Change the application to handle this exception, or use Connection.available() before the get() method is called in order to determine if the get() will succeed.

AMQCO1004E
Connection Close error: {0}.

Explanation
An error occurred when a connection was closed. The session might not have completed normally.

User action
Check that the session completed normally.

AMQCO1005E
SSL key repository file invalid or not found for channel "{1}". The following exception was thrown: {0}

Explanation
The SSL key repository file specified for the channel is not valid.

User action
Check the validity of the specified SSL key repository file.

AMQCO1006I
Channel "{0}" has stopped.

Explanation
The channel has stopped. No further communication with clients will occur on this channel.

User action
No action is required.

AMQCO1007E
Connection "{0}" did not send or receive data for "{1}" milliseconds and has been closed.

Explanation
The application set the idle timer on the connection to {1} milliseconds, but did not send or receive any data within this time, so the connection was closed.

User action
Determine why the connection did not send or receive data and if appropriate set the idleTimer to a longer value.

AMQCO1008E
An SSL Handshake error occurred when a client at "{1}" attempted to connect to channel "{0}": {2}.

Explanation
An error occurred when performing an SSL handshake with a client application. This is often because the client is presenting certificates that the MQXR service does not trust.

User action
Use the information in the exception to diagnose and fix the problem.

AMQCO1009E
An invalid Key Store name="{1}" was specified.

Explanation
The key store name or the pass phrase specified is not valid.

User action
Specify a valid key store file name and password.

AMQCO1010E
An SSL Exception occurred when a client at "{1}" attempted to connect to channel "{0}": {2}.

Explanation
An error occurred when performing an SSL operation with a client application.

User action
Use the information in the exception to diagnose and fix the problem.

AMQCO2001E
An error (probe: {0}) occurred and a Failure Data Capture (FDC) file has been written.

Explanation
A problem was detected and a FDC file was written to aid diagnostics.

User action
Look at the FDC file and attempt to resolve the problem. If the problem cannot be resolved, contact your IBM support center.

AMQCO2002I
Trace is disabled.

Explanation
Tracing the MQXR Service (used in order to diagnose problems) is not currently running.

User action
No action is required.

AMQCO2003I
Trace is enabled.

Explanation
Tracing the MQXR Service (used in order to diagnose problems) is currently running.

User action
No action is required.

AMQCO2004I
"{0}" instances of message "{1}" were suppressed.

Explanation
The number {0} of message identifier "{1}" were suppressed from the log since the last message with this identifier was written.

User action
No additional action is required beyond that for the suppressed message.

AMQCO9999E
{0}

Explanation
If the message does not give sufficient information, check previous messages for further help.

User action
See previous messages for further information.

AMQHT1001E
Invalid text={0}(String) was found in an HTTP request or response.

Explanation
An HTTP request or response contained unexpected data not described in "http://www.w3.org/pub/WWW/Protocols/".

User action
Check that the originator or source of the HTTP request or response is producing valid requests or responses.

AMQHT1002E
HTTP header text={0}(String) was invalid.

Explanation
An HTTP request or response contained unexpected text.

User action
Check that the originator or source of the HTTP request or response is producing valid requests or responses.

AMQHT1003E
Invalid text at location={0} in string={1}(String).

Explanation
A Java Script Object Notation (JSON) string contained unexpected data not described in "http://www.json.org/".

User action
Check that the originator or JSON is producing valid data.

AMQHT2001E
WebSocket Close, status code= {0}

Explanation
The websocket was closed by the remote end.

User action
Examine the Websocket status code and determine why the Websocket was closed if this was not expected.

AMQHT9999E
{0}

Explanation
If the message does not give sufficient information, check previous messages for further help.

User action
See previous messages for further information.

AMQXR0001I
Client {0} disconnected normally.

Explanation
An MQTT disconnect flow was received and processed.

User action
None.

AMQXR0002E
On channel {2}, a throwable {1} resulted when the MQXR service received a message from an MQTT client {0}.

Explanation
Bad data was received from a network connection and could not be processed, the connection is closed by the server.

User action
Determine why the client sent the uninterpretable data.

AMQXR0003I
MQXR JAAS {0} : {1}.

Explanation
The JAAS callback in the MQXR service requested that the message is displayed to the user.

User action
Determine the cause of the security problem described in the text of the message issued by JAAS.

AMQXR0004E
MQSeries verb={0}(String) returned cc={1}(int) {2} rc={3}(int) {4}.

Explanation
A WebSphere MQ verb returned an unexpected reason and completion code.

User action
Look up the reason code to determine what caused the error.

AMQXR0005I
Running {0} version {1}.

Explanation
The command is running.

User action
None.

AMQXR0006E
Invalid argument {0} Usage: runMQXRService -m <queueManagerName> -d <Qmgr Data Directory> -g <MQ Global Data directory>

Explanation
The runMQXRService command arguments are incorrect.

User action
Correct the command.

AMQXR0007E
Invalid argument {0} Usage: endMQXRService -m <queueManagerName> -d <Qmgr Data Directory> -g <MQ Global Data directory>

Explanation
The endMQXRService command arguments are incorrect.

User action
Correct the command.

AMQXR0008E
Exception during start of MQXR service: {0}

Explanation
The MQXR service was starting but encountered a problem. Previous errors or FDCs will provide more detail.

User action
Use previous errors or FDCs to diagnose and address the problem then restart the MQXR service.

AMQXR0009E
Exception during shutdown of MQXR service: {0}

Explanation
The MQXR service was shutting down but encountered a problem. Previous errors or FDCs will provide more detail.

User action
Use previous errors or FDCs to diagnose and address the problem.

AMQXR0010E
An invalid ClientIdentifier {0} was received from "{1}" in an MQTT CONNECT packet on channel {2}.

Explanation
The MQXR service received a ClientIdentifier that is not valid because it contains too few, or too many characters, or the characters are not valid in a queue manager name.

User action
Change the ClientIdentifier to use valid characters.

AMQXR0011E
An error occurred during a publish on topic "{3}" from ClientIdentifier "{0}" UserName "{1}" on channel "{2}". A reason code of "{5}" "{6}" was received during an "{4}" operation.

Explanation
The publication from the client was not able to be completed

User action
Using the reason code, diagnose the cause of the problem, alter the configuration (of the client or the server as appropriate) and then retry the publish.

AMQXR0012E
An error occurred whilst subscribing on topic(s) "{3}" for ClientIdentifier "{0}" userNamer "{1}"on channel "{2}". A reason code of "{5}" "{6}" was received during an "{4}" operation.

Explanation
The subscription from the client was not able to be completed

User action
Using the reason code, diagnose the cause of the problem, alter the configuration (of the client or the server as appropriate) and then reconnect the client and retry the subscription.

AMQXR0013E
Error starting channel "{0}" (on host: "{1}" and port "{2}"). The exception was "{3}".

Explanation
The service was unable to listen for connections on the specified port

User action
Use the exception to diagnose and rectify the problem then restart the affected channel.

AMQXR0014E
Error starting channel "{0}". See earlier errors or FDCs for more details.

Explanation
The service was unable to listen for connections on the specified port because of problems that have been reported in earlier errors or FDCs.

User action
Use the preceding errors or FDCs to diagnose and rectify the problem then restart the affected channel.

AMQXR0015I
MQXR Service started successfully ({0} channels running, {1} channels stopped)

Explanation
The MQXR service has completed the processing that occurs on startup

User action
No action is required.

AMQXR0016I
Channel "{0}" has started

Explanation
This channel is now available for client connections

User action
No action is required

AMQXR0017I
A new channel (called "{0}") has been created

Explanation
In response to a request from a user, a new channel has been created

User action
No action is required

AMQXR0018I
Channel "{0}" has been altered

Explanation
In response to a request from a user, some settings on the channel were changed. Some settings do not take effect until the channel is restarted.

User action
No action is required

AMQXR0019I
Channel "{0}" has been deleted

Explanation
In response to a request from a user, a new channel has been deleted

User action
No action is required

AMQXR0020I
Channel "{0}" has been purged

Explanation
Clients have been disconnected from this channel and state associated with them has been removed

User action
No action is required

AMQXR0021W
Client "{0}" at network address "{1}" disconnected abnormally with exception "{2}".

Explanation
An MQTT client was disconnected from the network for the reason shown by the exception.

User action
Look into the exception cause to determine if action is required.

AMQXR0022I
Client "{0}" previously connected at network address "{1}" now connected at "{2}".

Explanation
A new connection has been made for the client taking over from an existing one.

User action
None, if this was intentional.

AMQXR0023I
Unsupported MQTT protocol version on channel {1}, the exception {0} was thrown.

Explanation
An MQTT client attempted to connect using an unsupported protocol version, the connection is closed by the server.

User action
Reconfigure the client to use a supported protocol version.

AMQXR0024I
A Telemetry Daemon for devices attempted to connect using its private protocol on channel {1}, the exception {0} was thrown.

Explanation
The Telemetry daemon for devices has a private protocol for communication. This protocol is not supported and the connection has been closed by the server.

User action
No user action is required, the daemon should reconnect with a supported protocol. To remove this message, reconfigure the Telemetry daemon for devices to not use the private protocol for this connection.

AMQXR0030W
Invalid Will Message from ClientIdentifier "{0}"

Explanation
The Will Message in the Connect packet is malformed, the client connection is closed by the server.

User action
Check the client application and make sure the will message has a non zero length topic name, and a valid Qos.

AMQXR1001E
MQTTV3Exception message={0}(String).

Explanation
An instance of com.ibm.mqttv3.internal.MQTTException has been caught and wrapped.

User action
Contact your IBM support center.

AMQXR1002E
MQTTV5Exception message={0}(String).

Explanation
An instance of com.ibm.mqtt.encoding.internal.MQTTException has been caught and wrapped.

User action
Contact your IBM support center.

AMQXR1003E
An invalid message type={0}(byte) was received.

Explanation
An invalid MQTT message type was received. The connection is disconnected.

User action
The client connected to the MQXR service is sending invalid MQTT messages. \ Find out what client has connected to the MQXR service and what data it has sent. Contact the provider of the client code. If you are using a client provided in the WebSphere MQ installation, \ contact your IBM support center.

AMQXR1004E
An invalid message version={0}(byte) subVersion={1}(byte) was received.

Explanation
An invalid MQTT message version was received. The connection is disconnected.

User action
The client connected to the MQXR service is sending invalid MQTT messages. Find out what client has connected to the MQXR service and what data it has sent. Contact the provider of the client code. If you are using a client provided in the WebSphere MQ installation, contact your IBM support center.

AMQXR1005E
An invalid message message={0}(Hex) was received.

Explanation
An invalid MQTT message was received. The connection is disconnected.

User action

The client connected to the MQXR service is sending invalid MQTT messages. Find out what client has connected to the MQXR service and what data it has sent. Contact the provider of the client code. If you are using a client provided in the WebSphere MQ installation, contact your IBM support center.

AMQXR10006E

An MQTT message with an invalid MultiByteLength={0}(long) was received.

Explanation

An invalid MQTT message containing an invalid multi-byte length was received. The connection is disconnected.

User action

The MQTT client application might have sent incorrect data, which is interpreted as an incorrect length. Check your MQTT client application, and verify that it is sending correct data. Contact the provider of the client code. If you are using a client provided in the WebSphere MQ installation, contact your IBM support center.

AMQXR1007E

An invalid Attribute type={0}(int) was found.

Explanation

An invalid MQTT attribute was found processing of this message is abandoned and the connection closed.

User action

Gather diagnostics and contact your IBM support center.

AMQXR1008E

An invalid mapped message was detected because of {0}(String).

Explanation

An invalid Mapped message was found, it cannot be processed.

User action

Determine where the message came from and correct the messages so that they are not mapped messages or are created with the correct format.

AMQXR1009E

An invalid WebSocket message was detected because of {0}(String).

Explanation

An invalid WebSocket message was found, it cannot be processed.

User action

Determine where the message came from and correct the messages so that they are correctly formed.

AMQXR1010E

An invalid message qos={0}(int) was received.

Explanation

An invalid MQTT qos was received.

User action

The client connected to the MQXR service is sending invalid MQTT messages. Find out what client has connected to the MQXR service and what data it has sent. Contact the provider of the client code. If you are using a client provided in the WebSphere MQ installation, contact your IBM support center.

AMQXR2001E

The command to end the MQXR service failed connecting to queue manager {0}. Exception: {1}

Explanation
The administrative layer could not connect to the queue manager.

User action
If the queue manager is no longer running, no action is required. If the queue manager is still running, check why the administrative layer is unable to connect.

AMQXR2002E
The command to end the MQXR service failed opening queue {0}. Exception: {1}

Explanation
The administrative layer could not open the queue that is required to send a request end the MQXR service.

User action
Determine why the queue could not be opened and retry stopping the service.

AMQXR2003E
The command to end the MQXR service failed: Failed Operation: {0} Exception ({1}): {2}

Explanation
The administrative layer failed to put or get a message that is required to stop the MQXR service.

User action
Correct the problem and then try stopping the service again.

AMQXR2004E
An error occurred while stopping the MQXR service. Completion Code: {0} Reason: {1}

Explanation
An error occurred while the MQXR service was shutting down.

User action
Use the reason code to diagnose the problem.

AMQXR2005E
An error occurred while releasing queue manager resources. Object: {0} Exception: {1}

Explanation
While cleaning up resources the EndMQXRService command encountered a transient problem.

User action
None.

AMQXR2010E
The MQXR service could not access the file: {0}. Exception: {1}

Explanation
The file is invalid, has an invalid format, or incorrect permissions.

User action
Check the file permissions and ensure the file is valid.

AMQXR2011I
Property {0} value {1}

Explanation
The runMQXRService command has read a property with the assigned value.

User action
None.

AMQXR2012E
Invalid property key={0} value={1}

Explanation
The runMQXRService command read an incorrect properties file.

User action
Look at the property in error, correct it, and reissue the command.

AMQXR2014E
Failed to rename {0} to {1}

Explanation
The file could not be renamed

User action
Look at the permissions on the target file and directory and alter them if necessary

AMQXR2013E
Duplicate authentication methods specified for channel={0}, previous={1} duplicate={2}

Explanation
The runMQXRService command read a properties file that specifies two authentication methods, only one is allowed.

User action
Look at the properties file and locate the definition of the named channel. Correct the file to specify a single authentication method and restart the channel.

AMQXR2014E
The following exception was thrown during the starting of an MQXR channel, channelName = "{0}" : {1}

Explanation
An MQXR channel was starting up but encountered a problem. Previous errors or FDCs will provide more detail.

User action
Use earlier errors or FDCs to diagnose and address the problem then restart the MQXR channel.

AMQXR2015E
The following exception was thrown during the stopping of an MQXR channel, channelName = "{0}" : {1}

Explanation
An MQXR channel was stopping but encountered a problem. Previous errors or FDCs will provide more detail.

User action
Use earlier errors or FDCs to diagnose and address the problem then restart the MQXR channel.

AMQXR2020E
Client {0} attempted to unsubscribe from the topic "{1}" which it is not subscribed to.

Explanation
An MQTT client attempted to unsubscribe from a topic it is not subscribed to.

User action
Check that the application logic is correct, and check for earlier errors that could have caused the application to get into an inconsistent state.

AMQXR2021E
Client {0} attempted to unsubscribe from the queue "{1}" which it is not subscribed to.

Explanation
An MQTT client attempted to unsubscribe from a queue it is not subscribed to.

User action
Check that the application logic is correct, and check for earlier errors that could have caused the application to get into an inconsistent state.

AMQXR2050E
Unable to load JAAS config: {0}. The following exception occurred {1}

Explanation
The JAAS configuration tried to authenticate a user on a connection that was unable to load

User action
Check that the JAAS config selected by the channel exists in the jaas.config file and is valid.

AMQXR2051E
Login failed for ClientIdentifier {0} with exception {1}.

Explanation
The JAAS login failed with the exception shown.

User action
Check that the username and password sent by the client are correct.

AMQXR2053E
Error in a trace factory. The following exception occurred {1}

Explanation
There was a problem starting or stopping trace.

User action
Use the exception to diagnose and rectify the problem and then restart trace.

AMQXR9999E
{0}

MQJMS Messages

List of messages with message numbers beginning with MQJMS.

Table 265. MQJMS Messages.

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS0000	MQJMS_EXCEPTION_ILLEGAL_STATE	Method "{0}" has been invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.
MQJMS0002	MQJMS_EXCEPTION_INVALID_CLIENTID	WebSphere MQ classes for JMS attempted to set invalid connection's client id.
MQJMS0003	MQJMS_EXCEPTION_INVALID_DESTINATION	Destination not understood or no longer valid.
MQJMS0004	MQJMS_EXCEPTION_INVALID_SELECTOR	WebSphere MQ classes for JMS has given JMS Provider a message selector with invalid syntax.
MQJMS0005	MQJMS_EXCEPTION_MESSAGE_EOF	Unexpected end of stream has been reached when a StreamMessage or BytesMessage is being read.

Table 265. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS0006	MQJMS_EXCEPTION_MESSAGE_FORMAT	WebSphere MQ classes for JMS attempts to use a data type not supported by a message or attempts to read data in the wrong type.
MQJMS0007	MQJMS_EXCEPTION_MESSAGE_NOT_READABLE	WebSphere MQ classes for JMS attempts to read a write-only message.
MQJMS0008	MQJMS_EXCEPTION_MESSAGE_NOT_WRITABLE	WebSphere MQ classes for JMS attempts to write a read-only message.
MQJMS0009	MQJMS_EXCEPTION_RESOURCE_ALLOCATION	WebSphere MQ classes for JMS is unable to allocate the resources required for a method.
MQJMS0010	MQJMS_EXCEPTION_TRANSACTION_IN_PROGRESS	Operation invalid because a transaction is in progress.
MQJMS0011	MQJMS_EXCEPTION_TRANSACTION_ROLLED_BACK	Call to Session.commit resulted in a rollback of the current transaction.
MQJMS1000	MQJMS_EXCEPTION_MSG_CREATE_ERROR	Failed to create JMS message.
MQJMS1001	MQJMS_EXCEPTION_UNKNOWN_ACK_MODE	Unknown acknowledge mode "{0}".
MQJMS1004	MQJMS_EXCEPTION_CONNECTION_CLOSED	Connection closed.
MQJMS1005	MQJMS_EXCEPTION_BAD_STATE_TRANSITION	Unhandled state transition from "{0}" to "{1}".
MQJMS1006	MQJMS_EXCEPTION_BAD_VALUE	invalid value for "{0}": "{1}".
MQJMS1007	MQJMS_E_BAD_EXIT_CLASS	failed to create instance of exit class "{0}".
MQJMS1008	MQJMS_E_UNKNOWN_TRANSPORT	unknown value of transportType: "{0}".
MQJMS1009	MQJMS_E_NO_STR_CONSTRUCTOR	no constructor with string argument.
MQJMS1010	MQJMS_E_NOT_IMPLEMENTED	not implemented.
MQJMS1011	MQJMS_E_SECURITY_CREDS_INVALID	security credentials cannot be specified when using MQ bindings.
MQJMS1012	MQJMS_E_NO_MSG_LISTENER	no message listener.
MQJMS1013	MQJMS_E_SESSION_ASYNC	operation invalid whilst session is using asynchronous delivery.
MQJMS1014	MQJMS_E_IDENT_PRO_INVALID_OP	operation invalid for identified producer.
MQJMS1015	MQJMS_E_UNKNOWN_TARGET_CLIENT	unknown value of target client: "{0}".
MQJMS1016	MQJMS_E_INTERNAL_ERROR	an internal error has occurred. Please contact your system administrator. Detail: "{0}".
MQJMS1017	MQJMS_E_NON_LOCAL_RXQ	non-local MQ queue not valid for receiving or browsing.
MQJMS1018	MQJMS_E_NULL_CONNECTION	no valid connection available.
MQJMS1019	MQJMS_E_SESSION_NOT_TRANSACTED	invalid operation for non-transacted session.
MQJMS1020	MQJMS_E_SESSION_IS_TRANSACTED	invalid operation for transacted session.
MQJMS1021	MQJMS_E_RECOVER_BO_FAILED	recover failed: unacknowledged messages might not get redelivered.
MQJMS1022	MQJMS_E_REDIRECT_FAILED	failed to redirect message.
MQJMS1023	MQJMS_E_ROLLBACK_FAILED	rollback failed.
MQJMS1024	MQJMS_E_SESSION_CLOSED	session closed.

Table 265. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS1025	MQJMS_E_BROWSE_MSG_FAILED	failed to browse message.
MQJMS1026	MQJMS_E_EXCP_LSTNR_FAILED	ExceptionListener threw exception: "{0}".
MQJMS1027	MQJMS_E_BAD_DEST_STR	failed to reconstitute destination from "{0}".
MQJMS1028	MQJMS_EXCEPTION_NULL_ELEMENT_NAME	element name is null.
MQJMS1029	MQJMS_EXCEPTION_NULL_PROPERTY_NAME	property name is null.
MQJMS1030	MQJMS_EXCEPTION_BUFFER_TOO_SMALL	buffer supplied by application is too small.
MQJMS1031	MQJMS_EXCEPTION_UNEXPECTED_ERROR	an internal error has occurred. Please contact your system administrator.
MQJMS1032	MQJMS_E_CLOSE_FAILED	close() failed because of "{0}".
MQJMS1033	MQJMS_E_START_FAILED	start() failed because of "{0}".
MQJMS1034	MQJMS_E_MSG_LSTNR_FAILED	MessageListener threw: "{0}".
MQJMS1042	MQJMS_E_DELIVERY_MODE_INVALID	invalid Delivery Mode.
MQJMS1044	MQJMS_E_INVALID_HEX_STRING	String is not a valid hexadecimal number - "{0}".
MQJMS1045	MQJMS_E_S390_DOUBLE_TOO_BIG	Number outside of range for double precision S/390 Float "{0}".
MQJMS1046	MQJMS_E_BAD_CCSID	The character set "{0}" is not supported.
MQJMS1047	MQJMS_E_INVALID_MAP_MESSAGE	The map message has an incorrect format.
MQJMS1048	MQJMS_E_INVALID_STREAM_MESSAGE	The stream message has an incorrect format.
MQJMS1049	MQJMS_E_BYTE_TO_STRING	The WebSphere MQ classes for JMS attempted to convert a byte array to a String.
MQJMS1050	MQJMS_E_BAD_RFH2	The MQRFH2 header has an incorrect format.
MQJMS1051	MQJMS_MSG_CLASS	JMS Message class.
MQJMS1052	MQJMS_E_BAD_MSG_CLASS	Unrecognizable JMS Message class.
MQJMS1053	MQJMS_E_INVALID_SURROGATE	Invalid UTF-16 surrogate detected "{0}".
MQJMS1054	MQJMS_E_INVALID_ESCAPE	Invalid XML escape sequence detected "{0}".
MQJMS1055	MQJMS_E_BAD_TYPE	The property or element in the message has incompatible datatype "{0}".
MQJMS1056	MQJMS_E_UNSUPPORTED_TYPE	Unsupported property or element datatype "{0}".
MQJMS1057	MQJMS_E_NO_SESSION	Message has no session associated with it.
MQJMS1058	MQJMS_E_BAD_PROPERTY_NAME	Invalid message property name: "{0}".
MQJMS1059	MQJMS_E_NO_UTF8	Fatal error - UTF8 not supported.
MQJMS1060	MQJMS_E_SERIALISE_FAILED	Unable to serialize object.
MQJMS1061	MQJMS_E_DESERIALISE_FAILED	Unable to deserialize object.
MQJMS1062	MQJMS_EXCEPTION_HAPPENED	Exception occurred reading message body: "{0}".
MQJMS1063	MQJMS_CHARS_OMITTED	Another "{0}" character(s) omitted.
MQJMS1064	MQJMS_ENCODINGS	Integer encoding: "{0}"=Floating point encoding "{1}".
MQJMS1065	MQJMS_E_COULD_NOT_WRITE	Exception occurred writing message body.
MQJMS1066	MQJMS_E_BAD_ELEMENT_NAME	Invalid message element name: "{0}".

Table 265. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS1067	MQJMS_E_BAD_TIMEOUT	timeout invalid for MQ.
MQJMS1068	MQJMS_E_NO_XARESOURCE	failed to obtain XAResource.
MQJMS1069	MQJMS_E_NOT_ALLOWED_WITH_XA	Not allowed with XASession.
MQJMS1072	MQJMS_E_QMGR_NAME_INQUIRE_FAILED	Could not inquire upon Queue Manager name.
MQJMS1073	MQJMS_E_QUEUE_NOT_LOCAL_OR_ALIAS	Specified MQ Queue is neither a QLOCAL nor a QALIAS.
MQJMS1074	MQJMS_E_NULL_MESSAGE	Unable to process null message.
MQJMS1075	MQJMS_E_DLH_WRITE_FAILED	Error writing dead letter header.
MQJMS1076	MQJMS_E_DLH_READ_FAILED	Error reading dead letter header.
MQJMS1077	MQJMS_E_CONN_DEST_MISMATCH	Connection/destination mismatch.
MQJMS1078	MQJMS_E_INVALID_SESSION	Invalid Session object.
MQJMS1079	MQJMS_E_DLQ_FAILED	Unable to write message to dead letter queue.
MQJMS1080	MQJMS_E_NO_BORQ	No Backout-Requeue queue defined.
MQJMS1081	MQJMS_E_REQUEUE_FAILED	Message requeue failed.
MQJMS1082	MQJMS_E_DISCARD_FAILED	Failure while discarding message.
MQJMS1085	MQJMS_E_RFH_WRITE_FAILED	Error writing RFH.
MQJMS1086	MQJMS_E_RFH_READ_FAILED	Error reading RFH.
MQJMS1087	MQJMS_E_RFH_CONTENTS_ERROR	Unrecognizable or invalid RFH content.
MQJMS1088	MQJMS_E_CC_MIXED_DOMAIN	Mixed-domain consumers acting on the same input is forbidden.
MQJMS1089	MQJMS_E_READING_MSG	Exception occurred reading message body: "{0}".
MQJMS1091	MQJMS_E_UNIDENT_PRO_INVALID_OP	operation invalid for unidentified producer.
MQJMS1093	MQJMS_E_NULL_PARAMETER	A null parameter was passed to the constructor: "{0}".
MQJMS1094	MQJMS_E_INVALID_QUANTITY_HINT	Invalid quantityHint.
MQJMS1096	MQJMS_E_INVALID_MESSAGE_REFERENCE	Invalid MessageReference.
MQJMS1098	MQJMS_E_INVALID_MSG_REF_VERSION	Invalid MessageReference version.
MQJMS1099	MQJMS_E_INVALID_THREAD_VERSION	Invalid MQQueueAgentThread version.
MQJMS1102	MQJMS_E_MULTICAST_NOT_AVAILABLE	Multicast connection cannot be established.
MQJMS1103	MQJMS_E_MULTICAST_LOST_MESSAGES	Lost "{0}" messages in reliable multicast mode.
MQJMS1104	MQJMS_E_MULTICAST_HEARTBEAT_TIMEOUT	Multicast connection disconnected due to timeout.
MQJMS1105	MQJMS_E_MULTICAST_PORT_INVALID	Cannot connect with a specific local port for disthub multicast.
MQJMS1106	MQJMS_DIR_PGM_LIB_NOT_FOUND	Unable to load the native library required for PGM/IP.
MQJMS1110	MQJMS_E_11_NOTSUPPORTED	JMS1.1 Operation not supported by this type.
MQJMS1111	MQJMS_E_11_SERVICES_NOT_SETUP	JMS1.1 The required Queues/Publish Subscribe services are not set up.
MQJMS1112	MQJMS_E_11_INVALID_DOMAIN_SPECIFIC	JMS1.1 Invalid operation for domain specific object.

Table 265. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS1113	MQJMS_E_11_INVALID_CROSS_DOMAIN	JMS1.1 Invalid operation for cross domain object.
MQJMS2000	MQJMS_EXCEPTION_MQ_Q_CLOSE_FAILED	failed to close MQ queue.
MQJMS2001	MQJMS_EXCEPTION_MQ_NULL_Q	MQ Queue reference is null.
MQJMS2002	MQJMS_EXCEPTION_GET_MSG_FAILED	failed to get message from MQ queue.
MQJMS2003	MQJMS_EXCEPTION_QMDISC_FAILED	failed to disconnect queue manager.
MQJMS2004	MQJMS_EXCEPTION_MQ_NULL_QMGR	MQQueueManager reference is null.
MQJMS2005	MQJMS_EXCEPTION_QMGR_FAILED	failed to create MQQueueManager for "{0}".
MQJMS2006	MQJMS_EXCEPTION_SOME_PROBLEM	MQ problem: "{0}".
MQJMS2007	MQJMS_EXCEPTION_PUT_MSG_FAILED	failed to send message to MQ queue.
MQJMS2008	MQJMS_EXCEPTION_MQ_Q_OPEN_FAILED	failed to open MQ queue "{0}".
MQJMS2009	MQJMS_EXCEPTION_MQ_QM_COMMIT_FAILED	MQQueueManager.commit() failed.
MQJMS2010	MQJMS_EXCEPTION_MQ_UNKNOWN_DEFTYPE	unknown value for MQ queue definitionType: "{0}".
MQJMS2011	MQJMS_EXCEPTION_MQ_Q_INQUIRE_FAILED	failed to inquire MQ queue depth.
MQJMS2012	MQJMS_EXCEPTION_XACLOSE_FAILED	XACLOSE failed.
MQJMS2013	MQJMS_EXCEPTION_AUTHENTICATION_FAILED	invalid security authentication supplied for MQQueueManager.
MQJMS2014	MQJMS_EXCEPTION_XACLIENT_FAILED	Queue manager rejected XA client connection.
MQJMS3000	MQJMS_E_TMPQ_FAILED	failed to create a temporary queue from "{0}".
MQJMS3001	MQJMS_E_TMPQ_CLOSED	temporary queue already closed or deleted.
MQJMS3002	MQJMS_E_TMPQ_INUSE	temporary queue in use.
MQJMS3003	MQJMS_E_TMPQ_DEL_STATIC	cannot delete a static queue.
MQJMS3004	MQJMS_E_TMPQ_DEL_FAILED	failed to delete temporary queue.
MQJMS3005	MQJMS_PS_GENERAL_ERROR	Publish/Subscribe failed due to "{0}".
MQJMS3006	MQJMS_PS_TOPIC_NULL	Topic reference is null.
MQJMS3008	MQJMS_PS_COMMAND_MSG_BUILD	Failed to build command "{0}".
MQJMS3009	MQJMS_PS_COMMAND_MSG_FAILED	Failed to publish command to MQ queue.
MQJMS3010	MQJMS_PS_PUBLISH_MSG_BUILD	Failed to build publish message.
MQJMS3011	MQJMS_PS_PUBLISH_MSG_FAILED	Failed to publish message to MQ queue.
MQJMS3013	MQJMS_PS_STORE_ADMIN_ENTRY	Failed to store admin entry.
MQJMS3014	MQJMS_PS_SUB_Q_OPEN_FAILED	Failed to open subscriber queue "{0}".
MQJMS3017	MQJMS_PS_SUB_Q_DELETE_FAILED	Failed to delete subscriber queue "{0}".
MQJMS3018	MQJMS_PS_UNKNOWN_DS	Unknown durable subscription "{0}".
MQJMS3019	MQJMS_E_TMPT_DELETED	TemporaryTopic already deleted.
MQJMS3020	MQJMS_E_TMPT_OUTOFSCOPE	TemporaryTopic out of scope.
MQJMS3021	MQJMS_PS_INVALID_SUBQ_PREFIX	Invalid subscriber queue prefix: "{0}".
MQJMS3022	MQJMS_PS_SUBQ_REQUEUE	Durable re-subscribe must use same subscriber queue; specified:"{0}" original:"{1}".
MQJMS3023	MQJMS_PS_SUB_ACTIVE	Subscription has an active TopicSubscriber.

Table 265. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS3024	MQJMS_PS_NULL_CLIENTID	Illegal use of uninitialized client ID.
MQJMS3025	MQJMS_E_TMPT_IN_USE	TemporaryTopic in use.
MQJMS3026	MQJMS_ERR_QSENDER_CLOSED	QueueSender is closed.
MQJMS3028	MQJMS_PUBLISHER_CLOSED	TopicPublisher is closed.
MQJMS3031	MQJMS_CLIENTID_FIXED	Can't set clientID after connection has been used.
MQJMS3032	MQJMS_CLIENTID_NO_RESET	Resetting the clientID is not allowed.
MQJMS3033	MQJMS_QRECEIVER_CLOSED	QueueReceiver is closed.
MQJMS3034	MQJMS_SUBSCRIBER_CLOSED	TopicSubscriber is closed.
MQJMS3037	MQJMS_MESSAGEPRODUCER_CLOSED	Message Producer is closed.
MQJMS3038	MQJMS_MESSAGECONSUMER_CLOSED	Message Consumer is closed.
MQJMS3039	MQJMS_PS_NULL_NAME	Illegal use of null name.
MQJMS3040	MQJMS_E_BROKER_MESSAGE_CONTENT	Invalid broker control message content: "{0}".
MQJMS3041	MQJMS_E_ALREADY_SET	Field "{0}" already set.
MQJMS3042	MQJMS_E_UNREC_BROKER_MESSAGE	Unrecognizable message from Pub/Sub Broker.
MQJMS3043	MQJMS_E_CLEANUP_REP_BAD_LEVEL	Invalid Level for repeating Cleanup.
MQJMS3044	MQJMS_E_CLEANUP_NONE_REQUESTED	Cleanup level of NONE requested.
MQJMS3045	MQJMS_E_CLEANUP_Q_OPEN_1	Failed to open "{0}": maybe a FORCE or NONDUR level cleanup is running?
MQJMS3046	MQJMS_E_CLEANUP_Q_OPEN_2	Failed to open "{0}": maybe another JMS application is using Pub/Sub with this queue manager?
MQJMS3047	MQJMS_PS_SUBSTORE_NOT_SUPPORTED	Subscription Store type not supported by queue manager.
MQJMS3048	MQJMS_PS_INCORRECT_SUBSTORE	Incorrect Subscription Store type.
MQJMS3049	MQJMS_PS_WRONG_SUBSCRIPTION_TYPE	MQJMS_Messages.MQJMS_PS_ WRONG_SUBSCRIPTION_TYPE = Incorrect Subscription type for this Subscription Store.
MQJMS3050	MQJMS_PS_SUBSCRIPTION_IN_USE	Subscription is already in use and cannot be updated.
MQJMS3051	MQJMS_PS_INVALID_SUB_NAME	Invalid Subscription name.
MQJMS4124	MQJMS_ADMIN_PROPVAL_NULL	Property value for "{0}" is null.
MQJMS4125	MQJMS_ADMIN_INV_PROP	Invalid property for a "{0}": "{1}".
MQJMS4131	MQJMS_ADMIN_OBJTYPE_MISMATCH	Expected and actual object types do not match.
MQJMS5053	MQJMS_UTIL_PS_NO_BROKER	*** No broker response. Please ensure that the broker is running. If you are using the WebSphere MQ broker check that your brokerVersion is set to V1 ***
MQJMS5087	MQJMS_UTIL_PS_INTERNALQ	Unexpected error "{1}" accessing internal queue "{0}".
MQJMS6040	MQJMS_DIR_IMB_BADSOCKNAME	Invalid socket family name: "{0}".
MQJMS6041	MQJMS_DIR_IMB_NOCLASS	An exception occurred while attempting to load socket factory class "{0}", exception: <"{1}">.

Table 265. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS6056	MQJMS_DIR_MIN_NOMORE	Cannot change parameter "{0}" since no more BaseConfig parameter changes are allowed.
MQJMS6057	MQJMS_DIR_MIN_BADSET	Cannot set parameter "{0}" to value "{1}".
MQJMS6058	MQJMS_DIR_MIN_BADGET	error occurred while getting BaseConfig parameter "{0}".
MQJMS6059	MQJMS_DIR_MIN_SECLDERR	An exception occurred while loading the minimal client security implementation.
MQJMS6060	MQJMS_DIR_MIN_UNXEXC	An unexpected exception in minimal client, "{0}".
MQJMS6061	MQJMS_DIR_MIN_BADTOP	A specified topic was malformed, "{0}".
MQJMS6062	MQJMS_DIR_MIN_EOF	EOF was encountered while receiving data in the minimal client.
MQJMS6063	MQJMS_DIR_MIN_BRKERR	The broker indicated an error on the minimal client connection.
MQJMS6064	MQJMS_DIR_MIN_BADMSG	Connector.send was called with an illegal message value.
MQJMS6065	MQJMS_DIR_MIN_BADFIELD	An illegal value was encountered for a field, "{0}".
MQJMS6066	MQJMS_DIR_MIN_INTERR	An unexpected internal error occurred in the minimal client.
MQJMS6067	MQJMS_DIR_MIN_NOTBYTES	A bytes message operation was requested on something that is not a bytes message.
MQJMS6068	MQJMS_DIR_MIN_NOTTEXT	A text message operation was requested on something that is not a text message.
MQJMS6069	MQJMS_DIR_MIN_NOTSTREAM	A stream message operation was requested on something that is not a stream message.
MQJMS6070	MQJMS_DIR_MIN_NOTMAP	A map message operation was requested on something that is not a map message.
MQJMS6071	MQJMS_DIR_MIN_BADBRKMSG	The broker sent an invalid message during authentication.
MQJMS6072	MQJMS_DIR_MIN_UNVPRO	The broker requested an unavailable protocol during authentication.
MQJMS6073	MQJMS_DIR_MIN_AUTHREJ	Minimal client connection rejected because of authentication failure.
MQJMS6074	MQJMS_DIR_MIN_NOQOP	No QOP available in the minimal client.
MQJMS6079	MQJMS_DIR_JMS_NOTHDPOOL	An exception occurred while attempting to load thread pooling support, "{0}".
MQJMS6081	MQJMS_DIR_JMS_FMTINT	An attempt was made to read from a Stream message before a previous read has completed.
MQJMS6083	MQJMS_DIR_JMS_THDEXC	An exception occurred while initializing a thread pool instance, "{0}".
MQJMS6085	MQJMS_DIR_JMS_NEXCLIS	No ExceptionListener has been set.
MQJMS6088	MQJMS_DIR_JMS_KILLMON	The client-side connection monitor is terminating.
MQJMS6090	MQJMS_DIR_JMS_LSTACT	Attempted to synchronously receive on a MessageConsumer for which a listener is active.

Table 265. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS6091	MQJMS_DIR_JMS_TCSTSTP	An IOException occurred when starting or stopping delivery on the connection, "{0}".
MQJMS6093	MQJMS_DIR_JMS_RUNKEXC	An exception occurred during synchronous receive, "{0}".
MQJMS6096	MQJMS_DIR_JMS_INVPRI	A JMSPriority level of "{0}" is outside the range specified in JMS.
MQJMS6097	MQJMS_DIR_JMS_BADID	The specified JMSMessageID, "{0}", is invalid.
MQJMS6105	MQJMS_DIR_JMS_NOMORE	No more client parameter changes allowed.
MQJMS6106	MQJMS_DIR_JMS_BADNUM	An exception occurred when initializing parameter "{0}", exception "{1}".
MQJMS6115	MQJMS_DIR_JMS_TCFLERR	An exception occurred while creating the TopicConnection, "{0}".
MQJMS6116	MQJMS_DIR_JMS_CLOSED	This operation is not permitted on an entity that is closed.
MQJMS6117	MQJMS_DIR_JMS_BDTOPIMPL	The "{0}" implementation of Topic is not supported.
MQJMS6118	MQJMS_DIR_JMS_PBNOWLD	Topic "{0}" contains a wildcard which is invalid for publishing.
MQJMS6119	MQJMS_DIR_JMS_PBIOERR	An IOException occurred while publishing, "{0}".
MQJMS6120	MQJMS_DIR_JMS_TMPVIO	Attempted to use a temporary topic not created on the current connection.
MQJMS6121	MQJMS_DIR_JMS_TSIOERR	An IOException occurred while subscribing, "{0}".
MQJMS6232	MQJMS_DIR_JMS_TSBADMTC	While creating a TopicSubscriber, attempting to add the subscription to the matching engine resulted in the following exception: "{0}".
MQJMS6233	MQJMS_DIR_MTCH_UNKEXC	An unexpected exception was caught in the matching engine: "{0}".
MQJMS6234	MQJMS_DIR_MTCH_NULRM	An attempt was made to remove an object with topic "{0}" from an empty matching engine: "{1}".
MQJMS6235	MQJMS_DIR_MTCH_NULCH	An attempt was made to remove an object with topic "{0}" from the matching engine, but it did not have a cache entry: "{1}".
MQJMS6236	MQJMS_DIR_MTCH_BDTYP	An unknown check type of class "{0}" was encountered in a type-specific matcher.
MQJMS6237	MQJMS_DIR_MTCH_UNKNM	An attempt was made to access an unknown field named "{0}".
MQJMS6238	MQJMS_DIR_MTCH_BDMSG	In attempting to access a field of a message=the following exception occurred: "{0}".
MQJMS6239	MQJMS_DIR_MTCH_ECPREP	An EvalCache get or put operation occurred when the cache was not loaded.
MQJMS6240	MQJMS_DIR_MTCH_ECNMIN	An EvalCache get or put operation specified an invalid id.
MQJMS6241	MQJMS_DIR_MTCH_TOMNY	Too many content attributes were specified.
MQJMS6242	MQJMS_DIR_MTCH_DUPDET	A duplicate MatchTarget was detected in MatchSpace.

Table 265. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS6243	MQJMS_DIR_MTCH_NOTPK	An attempt was made to remove MatchTarget "{0}" from MatchSpace, but it has no key (topic).
MQJMS6244	MQJMS_DIR_MTCH_NOSUB	The MatchTarget "{1}" with key (topic) "{0}" could not be removed from MatchSpace because it could not be found.
MQJMS6245	MQJMS_DIR_MTCH_NLTOP	An attempt was made to add a MatchTarget to MatchSpace without a key (topic).
MQJMS6246	MQJMS_DIR_MTCH_BDWLD	An incorrect use of a the topic wildcard character "{0}" was detected.
MQJMS6247	MQJMS_DIR_MTCH_BDSEP	The topic segment separator "{0}" appears in an incorrect position.
MQJMS6248	MQJMS_DIR_MTCH_CNTLD	An error occurred while trying to load or invoke the subscription selector parser.
MQJMS6249	MQJMS_DIR_MTCH_PSTPER	The following exception occurred while parsing a subscription selector: "{0}".
MQJMS6250	MQJMS_DIR_MTCH_BDESC	The escape character was used to terminate the following pattern: "{0}".
MQJMS6251	MQJMS_DIR_MTCH_BDESCL	The escape character "{0}" passed to the pattern tool is longer than one character.
MQJMS6252	MQJMS_DIR_MTCH_UNXTYP	A message field was expected to contain a value of type "{0}" but contained one of type "{1}".
MQJMS6228	MQJMS_DIR_MIN_AUTHEXC	Minimal client authentication failed because exception "{0}".
MQJMS6229	MQJMS_DIR_MIN_QOPDIS	QOP required but disabled for this minimal client.
MQJMS6312	MQJMS_DIR_MIN_NOSUB	Non-authorized subscription to topic "{0}".
MQJMS6311	MQJMS_DIR_MIN_NOXASUP	Transport type 'DIRECT' within a transaction is not supported.
MQJMS6350	MQJMS_DIR_MIN_NOTOBJECT	An object message operation was requested on something that is not an object message.
MQJMS6351	MQJMS_DIR_MIN_TSBADSYN	An exception occurred when creating subscription to <"{0}","{1}">, "{2}".
MQJMS6401	MQJMS_DIR_MIN_PER_NOT_SUPPORTED	Persistent messages not supported for transport type 'DIRECT'.
MQJMS6402	MQJMS_DIR_MIN_TTL_NOT_SUPPORTED	Time to Live > 0 not supported for transport type 'DIRECT'.
MQJMS6403	MQJMS_DIR_MIN_EXP_NOT_SUPPORTED	Topic Expiry > 0 not supported for transport type 'DIRECT'.
MQJMS6404	MQJMS_DIR_MIN_ACK_NOT_SUPPORTED	Client Acknowledge not supported for transport type 'DIRECT'.

WMQ JMS Exception Messages

WebSphere MQ Advanced Message Security messages

AMS0000

AMS0001
{0}

AMS1000
The IBM WebSphere MQ Advanced Message Security Java interceptor failed to obtain the security policy. Reason Code: "*{0}*"

Explanation
The IBM WebSphere MQ Advanced Message Security Java interceptor was not able to obtain the security policy.

Action
See subsequent messages in the exception for more details about the cause of the error.

AMS1010
The IBM WebSphere MQ Advanced Message Security Java interceptor failed to unprotect the received message.

Explanation
An error occurred when the IBM WebSphere MQ Advanced Message Security Java interceptor was unprotecting the received message.

Action
See subsequent messages in the exception for more details about the cause of the error

AMS1011
An internal error occurred: the IBM WebSphere MQ Advanced Message Security Java interceptor failed to get the character set and encoding from the incoming message.

Explanation
An error ocurred when IBM WebSphere MQ Advanced Message Security Java interceptor was getting the CCSID and encoding from the incoming message.

Action
Retry the operation. If the problem persists, contact your IBM service representative.

AMS1020
Usage: specify the keystore password and private key password java -cp*{0}* com.ibm.mq.ese.config. KeyStoreConfigProtector keystorepass privkeypass

AMS1030
Failed to retrieve the following system properties: "*{0}*"

Explanation
An error occurred when retrieving certain system properties.

Action
Ensure that the appropriate java permissions are set up in the java.policy for the Java runtime to retrieve these system properties.

AMS1035
Unknown message code: "*{0}*"

Explanation
The text for the message code could not be found in the resource bundles.

Action

Look up information about the displayed message code. Ensure that the appropriate IBM WebSphere MQ language packs are installed on this machine.

AMS1040

Failed to read keystore properties from the keystore configuration file.

Explanation

An error occurred when reading the properties from the keystore configuration file.

Action

Verify that the keystore configuration file is available and that the Java application has read access to this file.

AMS1041

Failed to retrieve the certificate for alias "*{0}*" from the keystore "*{1}*"

Explanation

Certificate for the alias could not be retrieved from the keystore.

Action

Use appropriate certificate management tools to ensure that the keystore contains the certificate for the alias.

AMS1042

Failed to retrieve the certificate for alias "*{0}*" from the keystore "*{1}*"

Explanation

Certificate for the alias could not be retrieved from the keystore.

Action

Use appropriate certificate management tools to ensure that the keystore contains the certificate for the alias.

AMS1043

Failed to retrieve the certificate for alias "*{0}*" from the keystore "*{1}*"

Explanation

Certificate for the alias could not be retrieved from the keystore.

Action

Use appropriate certificate management tools to ensure that the keystore contains the certificate for the alias.

AMS1044

Failed to retrieve the private key for alias "*{0}*" from the keystore "*{1}*"

Explanation

Private key for the alias could not be retrieved from the keystore.

Action

Use appropriate certificate management tools to ensure that the keystore contains the private key for the alias.

AMS1045

Failed to retrieve the private key for alias "*{0}*" from the keystore "*{1}*"

Explanation

Private key for the alias could not be retrieved from the keystore.

Action

Use appropriate certificate management tools to ensure that the keystore contains the private key for the alias.

AMS1046
Failed to retrieve aliases from the keystore: "*{0}*"

Explanation
An error occurred when retrieving aliases from the keystore.

Action
Look at subsequent messages for details on actions to perform to fix this problem.

AMS1047
Alias "*{0}*" not found in the keystore "*{1}*"

Explanation
An alias is not found in the keystore.

Action
Look at subsequent messages for details on actions to perform to fix this problem.

AMS1048
Failed to retrieve the certificate chain for alias "*{0}*" from the keystore "*{1}*"

Explanation
An error occurred when retrieving the certificate chain for an alias from the keystore.

Action
Look at subsequent messages for details on actions to perform to fix this problem.

AMS1049
Failed to verify whether the entry for alias "*{0}*" in the keystore "*{1}*" contains a certificate.

Explanation
An error occurred when verifying whether the entry for an alias in the keystore contains a certificate.

Action
Look at subsequent messages for details on actions to perform to fix this problem.

AMS1050
Failed to verify whether the entry for alias "*{0}*" in the keystore "*{1}*" contains a private key.

Explanation
An error occurred when verifying whether the entry for an alias in the keystore contains a private key.

Action
Look at subsequent messages for details on actions to perform to fix this problem.

AMS1051
Failed to initialize the keystore "*{0}*"

Explanation
Keystore initialization failed.

Action
Look at subsequent messages for details on actions to perform to fix this problem.

AMS1052
Failed to protect the password for alias "*{0}*" in keystore "*{1}*"

Explanation
An error occurred when protecting the password for an alias in the keystore.

Action
Look at subsequent messages for details on actions to perform to fix this problem.

AMS1053
Failed to unprotect the password for alias "*{0}*" in keystore "*{1}*"

Explanation
An error occurred when unprotecting the password for an alias in the keystore.

Action
Look at subsequent messages for details on actions to perform to fix this problem.

AMS1054
Failed to get the certificates for these recipients: "*{0}*"

Explanation
An error occurred when retrieving certificates for recipients.

Action
Verify that the certificates for these recipients are in the local keystore or in the user registry.

AMS1055
An error occurred when trying to retrieve the recipient certificates.

Explanation
An error occurred when trying to retrieve the recipient certificates.

Action
Look at subsequent messages for details on actions to perform to fix this problem.

AMS1056
The message does not contain an IBM WebSphere MQ Advanced Message Security header or it contains a header that is not valid.

Explanation
The message does not contain an IBM WebSphere MQ Advanced Message Security header or it contains a header that is not valid.

Action
Make sure that the IBM WebSphere MQ Advanced Message Security security policy is the same for the sender and the receiver.

AMS1057
The IBM WebSphere MQ Advanced Message Security header could not be converted from "*{0}*" to UTF8.

Explanation
An error occurred when converting the IBM WebSphere MQ Advanced Message Security header to UTF8.

Action
Make sure this character encoding is supported by your Java runtime. If the problem persists, contact your IBM service representative.

AMS1058
The IBM WebSphere MQ Advanced Message Security header could not be converted from "*{0}*" to UTF8.

Explanation
An error occurred when converting the IBM WebSphere MQ Advanced Message Security header to UTF8.

Action
Make sure this character encoding is supported by your Java runtime. If the problem persists, contact your IBM service representative.

AMS1059
An internal has error occurred. The IBM WebSphere MQ Advanced Message Security header could not be converted to an array of bytes.

Explanation
An internal error occurred when converting the IBM WebSphere MQ Advanced Message Security header to an array of bytes.

Action
Retry the failing operation. If the problem persists, contact your IBM service representative.

AMS1060
The format of the recipient name "*{0}*" is not valid.

Explanation
The format of the recipient name is not valid.

Action
Set the extended attribute for the recipients to a valid value.

AMS1061
The specified alias "*{0}*" was not found in the keystore "*{1}*"

Explanation
The alias could not be located on the keystore.

Action
Use appropriate certificate management tools to ensure that the keystore contains the alias specified.

AMS1062
The specified alias "*{0}*" was not found in the keystore "*{1}*"

Explanation
The alias could not be located on the keystore.

Action
Use appropriate certificate management tools to ensure that the keystore contains the alias specified.

AMS1063
The alias "*{0}*" is not a key entry. Keystore: "*{1}*"

Explanation
The alias specified is not a key entry.

Action
Use appropriate certificate management tools to ensure that the alias specified is a key entry.

AMS1064
The keystore password can only contain ASCII characters.

Explanation
The keystore password contains non-ASCII characters.

Action
Change your keystore password to contain only ASCII characters.

AMS1065
Could not read following keys from keystore configuration file: "*{0}*".

Explanation
An error occurred when reading properties from the keystore configuration file.

Action
Verify that the property in the keystore configuration file has correct value.

AMS1066
The PKCS11 keystore initialized succesfully, PKCS11 configuration: "*{0}*".

Explanation
The PKCS11 hardware based keystore has been successfully initialized.

Action
No action is required.

AMS1100
The IBM WebSphere MQ Advanced Message Security interceptor could not parse the keystore configuration file.

Explanation
The IBM WebSphere MQ Advanced Message Security interceptor could not parse the keystore configuration file.

Action
Make sure the keystore configuration file contains all required keys and does not contain duplicate keys.

AMS1101
The IBM WebSphere MQ Advanced Message Security keystore configuration file contains duplicate key: "*{0}*".

Explanation
The IBM WebSphere MQ Advanced Message Security keystore configuration file contains duplicate key.

Action
Make sure the keystore configuration file contains all required keys and does not contain duplicate keys.

AMS1102
The IBM WebSphere MQ Advanced Message Security keystore configuration file must contain absolute path "*{0}*".

Explanation
IBM WebSphere MQ Advanced Message Security expected absolute path but found relative one.

Action
Make sure the keystore configuration file contains absolute path.

AMS1120
An internal error occurred: the quality of protection received by the IBM WebSphere MQ Advanced Message Security Java interceptor is not valid. Quality of protection: "*{0}*"

Explanation
The quality of protection received by the Java interceptor is not valid.

Action
Retry the failing operation. If the problem persists, contact your IBM service representative.

AMS1121
An internal error occurred: the quality of protection received by the IBM WebSphere MQ Advanced Message Security Java interceptor is not valid. Quality of protection: "*{0}*"

Explanation
The quality of protection received by the Java interceptor is not valid.

Action
Retry the failing operation. If the problem persists, contact your IBM service representative.

AMS1122
An internal error occurred: the encryption strength "*{0}*" received by the IBM WebSphere MQ Advanced Message Security Java interceptor is not valid.

Explanation
The encryption strength received by the Java interceptor is not valid.

Action
Retry the failing operation. If the problem persists, contact your IBM service representative.

AMS1123
An internal error occurred: the signature algorithm "*{0}*" received by the IBM WebSphere MQ Advanced Message Security Java interceptor is not valid.

Explanation
The signature algorithm received by the Java interceptor is not valid.

Action
Retry the failing operation. If the problem persists, contact your IBM service representative.

AMS1124
An internal error occurred: the signature algorithm "*{0}*" received by the IBM WebSphere MQ Advanced Message Security Java interceptor is not valid.

Explanation
The signature algorithm received by the Java interceptor is not valid.

Action
Retry the failing operation. If the problem persists, contact your IBM service representative.

AMS1125
The IBM WebSphere MQ Advanced Message Security Java interceptor failed to protect message.

Explanation
The IBM WebSphere MQ Advanced Message Security Java interceptor was not able to protect the message.

Action
See subsequent messages in the exception for more details about the cause of the error.

AMS1126
The IBM WebSphere MQ Advanced Message Security Java interceptor failed to protect message.

Explanation
The IBM WebSphere MQ Advanced Message Security Java interceptor was not able to protect the message.

Action
See subsequent messages in the exception for more details about the cause of the error.

AMS1127
An internal error occurred: the IBM WebSphere MQ Advanced Message Security Java interceptor found more than one sender certificate in the protected message.

Explanation
Only one sender certificate is expected in the protected message.

Action
Retry the failing operation. If the problem persists, contact your IBM service representative.

AMS1128
An internal error occurred: the IBM WebSphere MQ Advanced Message Security Java interceptor failed to find the certificate of the sender in the protected message.

Explanation

The Java interceptor failed to find the certificate of the sender. The protected message is expected to contain the certificate of the sender.

Action

Retry the failing operation. If the problem persists, contact your IBM service representative.

AMS1129

An internal error occurred: the syntax of the protected message received by IBM WebSphere MQ Advanced Message Security Java interceptor is not valid.

Explanation

The syntax of the protected message received by the Java interceptor is not valid.

Action

Ensure that your security policy is specified correctly and retry the failing operation. If the problem persists, contact your IBM service representative.

AMS1130

The IBM WebSphere MQ Advanced Message Security Java interceptor failed to unprotect message.

Explanation

The IBM WebSphere MQ Advanced Message Security Java interceptor was not able to unprotect the message.

Action

See subsequent messages in the exception for more details about the cause of the error.

AMS1131

An internal error occurred: the IBM WebSphere MQ Advanced Message Security Java interceptor failed to find any recipients from the received message.

Explanation

The IBM WebSphere MQ Advanced Message Security Java interceptor was not able to obtain any recipients from the received message.

Action

Retry the failing operation. If the problem persists, contact your IBM service representative.

AMS1132

The certificate of the sender with the subject name "*{0}*" is not valid.

Explanation

The certificate of the sender is not valid.

Action

See subsequent messages in the exception for more details about the cause of the error.

AMS1133

The certificate of the sender with the subject name "*{0}*" is not valid.

Explanation

The certificate of the sender is not valid.

Action

See subsequent messages in the exception for more details about the cause of the error.

AMS1134

The certificate of the recipient with the subject name "*{0}*" is not valid.

Explanation

The certificate of the recipient is not valid.

Action
See subsequent messages in the exception for more details about the cause of the error.

AMS1135
The protected message type does not match the quality of protection (QOP) specified on the objectspace. The expected QOP is "*{0}*" whereas the actual one is "*{1}*"

Explanation
The protected message type does not match the QOP specified on the object space.

Action
Verify that the security policy is correctly specified.

AMS1136
The IBM WebSphere MQ Advanced Message Security Java interceptor failed to decrypt the protected message.

Explanation
The IBM WebSphere MQ Advanced Message Security Java interceptor was not able to decrypt the protected message.

Action
See subsequent messages in the exception for more details about the cause of the error.

AMS1137
The IBM WebSphere MQ Advanced Message Security Java interceptor failed to verify the protected message signature.

Explanation
The IBM WebSphere MQ Advanced Message Security Java interceptor was not able to verify the protected message signature.

Action
See subsequent messages in the exception for more details about the cause of the error.

AMS1138
The IBM WebSphere MQ Advanced Message Security Java interceptor failed to verify the certificate trust chain. The certificate subject name: "*{0}*"

Explanation
The IBM WebSphere MQ Advanced Message Security Java interceptor was not able to verify the certificate trust chain.

Action
See subsequent messages in the exception for more details about the cause of the error.

AMS1139
The protected message encryption mismatch. The expected encryption strength is "*{0}*" whereas the actual encryption strength is "*{1}*"

Explanation
The protected message encryption does not match the one specified on the object space.

Action
Verify that the security policy is correctly specified.

AMS1140
The receiver of this encrypted message is not on the message recipient list "*{0}*"

Explanation
The certificate of a user that is receiving a message is not on the message RecipientsInfo list.

Action
Verify that the user is on a recipients list in a security policy definition.

AMS1200

The certificate with the following subject name "*{0}*" is not yet valid. The certificate will become valid after "*{1}*"

Explanation

The certificate is not yet within its validity period.

Action

Retry the failing operation as soon as the certificate is valid or modify your configuration to use a valid certificate.

AMS1201

The certificate with the following subject name "*{0}*" is expired. The expiration date of the certificate is "*{1}*"

Explanation

The certificate is expired.

Action

Modify your configuration to use a valid certificate.

AMS1202

The IBM WebSphere MQ Advanced Message Security Java interceptor failed to verify the validity period of the certificate. The subject name of the certificate is "*{0}*"

Explanation

The IBM WebSphere MQ Advanced Message Security Java interceptor was not able to verify the validity period of a certificate.

Action

Retry the failing operation. If the problem persists, contact your IBM service representative.

AMS1203

A key usage bit that is not valid was found on the certificate with the following subject name "*{0}*". The "*{1}*" key usage bit should be set to "*{2}*" instead of "*{3}*"

Explanation

A key usage bit that is not valid was found on the certificate.

Action

Modify your configuration to use a certificate that has a valid key usage extension. Consult the Administration guide for more details about certificate settings.

AMS1204

An internal error occurred: the IBM WebSphere MQ Advanced Message Security Java interceptor failed to obtain the encryption algorithm name.

Explanation

An internal error occurred: the IBM WebSphere MQ Advanced Message Security Java interceptor failed to obtain the encryption algorithm name.

Action

Retry the failing operation. If the problem persists, contact your IBM service representative.

AMS1205

The IBM WebSphere MQ Advanced Message Security Java interceptor failed to obtain any recipient certificate.

Explanation

The IBM WebSphere MQ Advanced Message Security Java interceptor attempted to encrypt a message, but it did not find certificates of recipients

Action

Make sure that a keystore contains all certificates specifed in the appropriate security policy.

AMS1206
The IBM WebSphere MQ Advanced Message Security Java interceptor failed to obtain any recipient certificate.

Explanation
The IBM WebSphere MQ Advanced Message Security Java interceptor attempted to encrypt a message, but it did not find certificates of recipients

Action
Make sure that a keystore contains all certificates specifed in the appropriate security policy.

AMS1207
An internal error occurred: the IBM WebSphere MQ Advanced Message Security Java interceptor failed to obtain the signature algorithm name.

Explanation
An internal error occurred: the IBM WebSphere MQ Advanced Message Security Java interceptor failed to obtain the signature algorithm name.

Action
Retry the failing operation. If the problem persists, contact your IBM service representative.

AMS1208
No proper key bit was found for the certificate for the subject name "*{0}*". The actual values are: "*{1}*", the proper values are: "*{2}*", the state of at least one bit should match.

Explanation
A key usage bit that is not valid was found on the certificate.

Action
Modify your configuration to use a certificate that has a valid key usage extension. Consult the Administration guide for more details about certificate settings.

AMS1209
IBM WebSphere MQ Advanced Message Security Java interceptor failed to verify CRL signature signed by "*{0}*"

Explanation
IBM WebSphere MQ Advanced Message Security Java interceptor failed to verify CRL signed by the given issuer DN

Action
Make sure certificate of the issuer is present in the local keystore.

AMS1210
The Certificate Revocation List "*{0}*" could not be loaded

Explanation
The CRL cannot be found or accessed.

Action
Modify your configuration to point to a valid CRL. Make sure the CRL can be read.

AMS1211
The IBM WebSphere MQ Advanced Message Security Java interceptor could not access Certificate Revocation List.

Explanation
The CRL cannot be found or accessed.

Action
Modify your configuration to point to a valid CRL. Make sure the CRL can be read.

AMS1212

The IBM WebSphere MQ Advanced Message Security Java interceptor failed to validate the certificate. A certificate with BasicConstraint CA set to true cannot be used as End Entity. The subject name is "*{0}*"

Explanation

The IBM WebSphere MQ Advanced Message Security Java interceptor was not able to verify the certificate.

AMS1213

The IBM WebSphere MQ Advanced Message Security Java interceptor failed to validate the certificate. A certificate with the subject name "*{0}*" has been revoked.

Explanation

The IBM WebSphere MQ Advanced Message Security Java interceptor was not able to verify the certificate.

AMS1300

IBM WebSphere MQ Advanced Message Security internal error: queue manager information could not be saved.("*{0}*")

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor could not save the queue manager connection (hconn) information because an internal error occurred.

Action

If the problem occurs persistently, contact your IBM service representative.

AMS1310

IBM WebSphere MQ Advanced Message Security could not resolve current queue name from the object handle.("*{0}*")

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor could not resolve the current queue name from the object handle. The queue might be opened by some internal WebSphere MQ application program interface (API) other than Message Queue Interface (MQI).

Action

Make sure the application does not use internal WebSphere MQ APIs to open the queue. If the problem persists, contact your IBM service representative.

AMS1311

MQOPEN() call failed: reason code ("*{0}*").

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor call to the WebSphere MQ MQOPEN() function failed with the indicated error.

Action

Consult the WebSphere MQ documentation for an explanation of the error code and suggested corrective action. Ensure that the queue manager is operational, the queue exists.

AMS1312

MQCLOSE() call failed, reason code ("*{0}*").

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor call to the WebSphere MQ MQCLOSE() function failed with the indicated WebSphere MQ reason code.

Action

Consult the IBM WebSphere MQ documentation for an explanation of the error code and

suggested corrective action. Ensure that the queue manager is operational, protected object space are present and correct. Make sure that IBM WebSphere MQ Advanced Message Security are configured and running correctly.

AMS1313

IBM WebSphere MQ Advanced Message Security internal error: message could not be protected because the specified signature algorithm "*{0}*" is not valid.

Explanation

The unexpected signature algorithm has been specified

Action

This is an internal error. Contact your IBM service representative

AMS1325

IBM WebSphere MQ Advanced Message Security internal error: queue information could not be resolved from the current queue object handle. ("*{0}*")

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor could not resolve queue information from the current queue object handle because the current queue was not opened via IBM WebSphere MQ Advanced Message Security, or it was closed.

Action

Make sure that the queue has not already been opened by another WebSphere MQ application and that it has not been previously closed. If the problem persists, contact your IBM service representative.

AMS1326

IBM WebSphere MQ Advanced Message Security internal error: could not find local queue manager CodedCharSetId ("*{0}*").

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor could not find the local queue manager's CodedCharSetId because an internal error occurred.

Action

Make sure that the queue manager is connected through IBM WebSphere MQ Advanced Message Security. If the problem persists, contact your IBM service representative.

AMS1327

Quality of protection "*{0}*" for queue "*{1}*" is invalid

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor detected that the quality of protection specified in the security policy for the queue is invalid.

Action

Make sure that the encryption and signature algorithms specified for the queue in the IBM WebSphere MQ Advanced Message Security security policy definition have valid values.

AMS1328

Message with no protection has been put into the queue "*{0}*".

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor has successfully put a message with the 'none' protection level onto the selected queue.

Action

No action is required.

AMS1329

Message with integrity protection has been put into the queue "*{0}*".

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor has successfully put a message with the 'integrity' protection level onto the selected queue.

Action

No action is required.

AMS1330

Message with privacy protection has been put into the queue "*{0}*".

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor has successfully put a message with the 'privacy' protection level onto the selected queue.

Action

No action is required.

AMS1331

IBM WebSphere MQ Advanced Message Security internal error: could not inquire about queue manager properties ("*{0}*").

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor could not inquire about queue manager's properties because an internal error occurred.

Action

Make sure that the queue manager is connected through IBM WebSphere MQ Advanced Message Security. If the problem persists, contact your IBM service representative.

AMS1340

IBM WebSphere MQ Advanced Message Security internal error: queue information could not be resolved from the current queue object handle. ("*{0}*")

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor could not resolve queue information from the current queue object handle because the current queue was not opened by IBM WebSphere MQ Advanced Message Security, or it was closed.

Action

Make sure that the queue is not already been opened by another WebSphere MQ application, and that it has not been previously closed. If the problem persists, contact your IBM service representative.

AMS1341

IBM WebSphere MQ Advanced Message Security found a valid 'PDMQ' format header in the current message.

Explanation

IBM WebSphere MQ Advanced Message Security interceptor found a valid IBM WebSphere MQ Advanced Message Security header in the current message.

Action

No action is required.

AMS1342

The 'PDMQ' format header from the current message is invalid.

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor did not find a valid IBM WebSphere MQ Advanced Message Security header in the the current message.

Action

Check the Quality of Protection (QoP) setting for the queue object. If the QoP setting for the queue is not 'none', make sure that no IBM WebSphere MQ plain text messages are routed to this queue.

AMS1343

Message quality of protection (''*{0}*'') does not match the quality of protection (''*{1}*'') set for the queue ''*{2}*''.

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor detected a quality of protection (QoP) mismatch between the queue and a message in the queue. QoP mismatches usually occur because the queue QoP is changed between the message put and get.

Action

Make sure that the same queue quality of protection is used for the message put and get. When the queue QoP is changed, clean up all messages in the queue before resuming normal operation.

AMS1344

''*{0}*'' - message was signed by ''*{1}*'' at ''*{2}*'' using ''*{3}*''.

Explanation

This is an informational message used to indicate that a message was signed, and to display the signer's name, message timestamp and signature algorithm used.

Action

No action is required.

AMS1345

''*{0}*'' - message was signed and encrypted by ''*{1}*'' at ''*{2}*'' using ''*{3}*'' and ''*{4}*''.

Explanation

This is an informational message used to indicate that a message was signed and encrypted, and to display the signer's name, message timestamp, signature algorithm name and encryption algorithm name.

Action

No action is required.

AMS1346

Message does not have a valid protection type.

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor detected an invalid protection type in a message header. This usually occurs because the IBM WebSphere MQ message header is not valid.

Action

Retry the operation. If the problem persists, contact your IBM service representative.

AMS1347

The IBM WebSphere MQ Advanced Message Security interceptor has put a defective message on error handling queue ''*{0}*''.

Explanation

This is an informational message that indicates the IBM WebSphere MQ Advanced Message Security put a message it could not interpret on the specified error handling queue.

Action

Make sure only valid messages are put onto queues protected by IBM WebSphere MQ Advanced Message Security.

AMS1348

The IBM WebSphere MQ Advanced Message Security interceptor failed to put a defective message on error handling queue. MQ reason code (''*{0}*'')

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor was unable to put a message it could not interpret on the error handling queue because the indicated IBM WebSphere MQ error occurred.

Action

Consult the IBM WebSphere MQ documentation for more information about the reason code. If the problem persists, contact your IBM service representativ.

AMS1349

IBM WebSphere MQ Advanced Message Security internal error: message could not be converted from source CCSID ''*{0}*'' to target CCSID ''*{1}*''. IBM WebSphere MQ compcode ''*{2}*'' : reason ''*{3}*''.

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor could not convert the message from the source Coded Character Set Identifier (CCSID) to target CCSID.

Action

Consult the IBM WebSphere MQ documentation for the completion code and reason code, take corrective action. If the problem persists, contact your IBM service representative.

AMS1350

IBM WebSphere MQ Advanced Message Security internal error: message could not be retrieved from the queue. MQGET() failed. IBM WebSphere MQ compcode ''*{0}*'' : reason ''*{1}*''.

Explanation

The IBM WebSphere MQ Advanced Message Security interceptor could not get the message from the queue.

Action

Consult the IBM WebSphere MQ documentation for the completion code and reason code, take corrective action. If the problem persists, contact your IBM service representative.

AMS1351

IBM WebSphere MQ Advanced Message Security internal error: unprotected message size ''*{0}*'' bytes does not match the original message size ''*{1}*'' bytes.

Explanation

After unprotecting, the message size does not match the original message size. The message header might have been corrupted or tampered with.

Action

Check the message which has been put on the dead letter queue and the audit logs to find the cause of the error and the origin of the message. If the problem persists, contact your IBM service representative.

AMS1352

IBM WebSphere MQ Advanced Message Security internal error: unprotected message QoP does not match QoP indicated in the header. Queue manager is ''*{0}*'', queue is ''*{1}*'', msgId is ''*{2}*''

Explanation

During unprotecting the mismatch between the message buffer quality of protection type and the one specified by the IBM WebSphere MQ Advanced Message Security header was discovered. The message header might have been corrupted or tampered with.

Action

Check the message which has been put into the dead letter queue and the audit logs to find the cause of the error and the origin of the message. If the problem persists, contact your IBM service representative.

AMS1353
Message with quality of protection (''*{0}*'') higher than (''*{1}*'') set for the queue ''*{2}*'' has been accepted.

Explanation
The IBM WebSphere MQ Advanced Message Security interceptor detected a quality of protection (QoP) mismatch between the queue and a message in the queue. QoP mismatch usually occurs when the QoP of the queue is changed between the message put and get.

Action
Make sure that the same queue quality of protection is used for the message put and get. When the QoP of the queue is changed, remove all messages from the queue before resuming any operation.

AMS1354
Message signer is not in the list of authorised signers.

Explanation
The IBM WebSphere MQ Advanced Message Security interceptor detected that the message is signed by an unauthorised party.

Action
Make sure the sender is mentioned in the list of allowed signers.

AMS1355
Message could not be moved from queue (''*{0}*'') to error handling queue. IBM WebSphere MQ completion code (''*{1}*''), reason code (''*{2}*'').

Explanation
The IBM WebSphere MQ Advanced Message Security interceptor failed to remove the message before it attempted to put it on error handling queue.

Action
Consult the IBM WebSphere MQ documentation for the completion code and reason code, take corrective action. If the problem persists, contact your IBM service representative.

AMS1356
Message too big to fit the buffer, queue (''*{0}*''), MQ completion code (''*{1}*''), reason code (''*{2}*'').

Explanation
The IBM WebSphere MQ Advanced Message Security interceptor failed to unprotect data because provided buffer is too small

Action
Issue MQGET with bigger buffer

amq9001
Channel '*&3*' ended normally.

Explanation
Channel '*&3*' to host '*&5*' ended normally.

Action
None.

amq9002
Channel '*&3*' is starting.

Explanation
Channel '*&3*' is starting.

Action
None.

amq9005

The WebSphere MQ security policy interceptor failed to access the Public-Key Cryptography Standards (PKCS) #11 hardware token.

Explanation

The WebSphere MQ security policy interceptor failed in an attempt to open a Public-Key Cryptography Standards (PKCS) #11 token. Check GSKit ACME GSS minor reason*&1* for '*&3*'.

Action

Make sure that the PKCS #11 token is present and configured correctly, and retry the operation. Verify that the token label, PIN, and library name are configured correctly.

amq9006

The WebSphere MQ security policy interceptor did not attempt to open a PKCS #11 token because it did not have all required configuration information.

Explanation

The WebSphere MQ security policy interceptor did not attempt to open a Public-Key Cryptography Standards (PKCS) #11 token because one or more of the token label, PIN, or shared library name were not configured.

Action

If you want to use a PKCS #11 token, make sure that the token label, PIN, and library name are configured correctly.

amq9007

The WebSphere MQ security policy interceptor failed to convert a Public-Key Cryptography Standards (PKCS) #11 key certificate label.

Explanation

The WebSphere MQ security policy interceptor failed to convert a Public-Key Cryptography Standards (PKCS) #11 key certificate label needed to identify a key certificate item stored in a PKCS #11 token. Check GSKit ACME GSS minor reason*&1*.

Action

Make sure that the PKCS #11 key certificate label is defined correctly.

amq9008

Cannot acquire the certificate for the label:*&3* in the keystore file*&4*. GSKit ACME GSS minor reason is*&1*.

Explanation

WebSphere MQ security policy interceptor was unable to read the certificate for the given label from keystore.

Action

Make sure the label is correctly set as the cms.certificate entry of the configuration file. Check if the keystore contains the certificate for the given label.

amq9009

Cannot acquire credentials. GSKit ACME GSS minor reason is*&1*.

Explanation

WebSphere MQ security policy interceptor was unable to acquire credentials.

Action

Review the configuration to make sure the keystore database and stash files are not broken.

amq9010

WebSphere MQ security policy internal error: message could not be protected because specified encryption algorithm is not valid*&1*.

Explanation

The value identifier is specified to unexpected value.

Action

This is an internal error. Contact your IBM service representative.

amq9011

The WebSphere MQ security policy interceptor failed to turn on the Public-Key Cryptography Standards (PKCS) #11 hardware RSA private key algorithm for this ACME environment. Check GSKit ACME GSS minor reason*&1*.

Explanation

The WebSphere MQ security policy interceptor failed to register the Public-Key Cryptography Standards (PKCS) #11 cryptographic algorithm with the ACME environment.

Action

Make sure that the PKCS #11 token is functioning properly and retry the operation. If the problem persists, contact your IBM service representative.

amq9012

The WebSphere MQ security policy interceptor could not acquire the public key credential.

Explanation

The WebSphere MQ security policy interceptor could not perform a public key infrastructure (PKI) login.

Action

Check the error messages related to acquiring public key credentials to determine the cause of the failure. Check whether user has the permission to read the kdb and stash files and verify whether the kdb file contains a certificate with the label specified. Finally, check whether the certificate has not expired.

amq9013

WebSphere MQ security policy internal error: the Independent Data Unit Protection (IDUP) environment could not be terminated. GSKit reason code*&1*.

Explanation

The WebSphere MQ security policy interceptor could not release the GSKit IDUP environment because an internal error occurred.

Action

Consult the GSKit appendix in the product documentation for the explanation of the GSKit reason code and take corrective action. If the problem persists, contact your IBM service representative.

amq9014

The WebSphere MQ security policy interceptor failed to close a Public-Key Cryptography Standards (PKCS) #11 token. Check GSKit ACME GSS minor reason*&1*.

Explanation

The WebSphere MQ security policy interceptor failed to close a Public-Key Cryptography Standards (PKCS) #11 token.

Action

Make sure that the PKCS #11 token is functioning properly and retry the operation. If the problem persists, contact your IBM service representative.

amq9015

WebSphere MQ security policy internal warning: GSKit could not release*&3*. GSKit reason code*&1*.

Explanation

The WebSphere MQ security policy GSKit call with the indicated reason code failed because it could not release resources back to the system.

Action

No action is required. If the problem persists, contact your IBM service representative.

amq9016

WebSphere MQ security policy internal error: GSKit could not allocate*&3*. GSKit reason code*&1*.

Explanation

The WebSphere MQ security policy GSKit call with the indicated reason code failed because the system could not allocate resources.

Action

Make sure the system meets hardware and software requirements necessary to execute the application, then restart the application.

amq9017

WebSphere MQ security policy internal error: message could not be unprotected: GSKit error code*&1*, reason*&2*.

Explanation

The WebSphere MQ security policy interceptor could not verify or decrypt a message because the indicated GSKit error occurred. This can happen for several reasons, all of which are internal failures: (1) the message is not a valid PKCS#7 message; (2) the sender's certificate does not have the required key usage bit to be able to encrypt the message; (3) the sender's certificate was not recognized as a trusted certificate; (4) receiver is not among the recipients of the message.

Action

Consult the GSKit information in the product documentation for the explanation of the GSKit reason code and take corrective action. If the problem persists, contact your IBM service representative.

amq9018

The specified SHA-2 algorithm '*&3*' is not supported on this platform.

Explanation

The WebSphere MQ security policy interceptor failed to apply a policy as this platform lacks support for SHA-2 signing algorithm.

Action

Check that all platforms that open a queue with a policy that specifies a SHA-2 signing algorithm have the required cryptographic library support.

amq9019

WebSphere MQ security policy internal error: message could not be protected because specified signature algorithm is not valid*&1*

Explanation

The value identifier is specified to unexpected value.

Action

This is an internal error. Contact your IBM service representative.

amq9020

WebSphere MQ security policy internal error: message could not be protected because no recipients' DN is specified.

Explanation

The policy is set to privacy but does not contain any recipient DN.

Action

This is an internal error. Contact your IBM service representative.

amq9021

An error occurred during the certificate import for the following DN:*&3*, result:*&1*

Explanation
The distinguished name is not present in the keystore or invalid.

Action
Consult the GSKit appendix in the product documentation for the explanation of the GSKit reason code and take corrective action. If the problem persists, contact your IBM service representative.

amq9022
An error occurred during the certificate import for the following DN:*&3*, result:*&1*, reason:*&2*.

Explanation
The distinguished name is not present in the keystore or invalid.

Action
Consult the GSKit appendix in the product documentation for the explanation of the GSKit reason code and take corrective action. If the problem persists, contact your IBM service representative.

amq9023
The name of the keystore file '*&3*' was incorrectly provided with the file extension '*&4*'

Explanation
The WebSphere MQ security policy interceptor was unable to find the keystore file. It seems the value of the keystore configuration entry incorrectly contains the file extension.

Action
Ensure the keystore file name specified in the configuration file does not contain a file extension.

amq9024
The keystore file '*&3*' does not exist and the keystore configuration entry incorrectly ends with '*&4*'. Make sure the value of the keystore configuration does not contain the file extension and it points to an existing file.

Explanation
The WebSphere MQ security policy interceptor was unable to find the keystore file. The value of the keystore configuration entry incorrectly contains the file extension of '*&4*' and the resultant filename of '*&3*' does not exist.

Action
Make sure the value of the keystore configuration does not contain the file extension and it points to an existing file.

amq9025
The keystore file*&3&4* does not exist. Make sure the value of the keystore configuration entry points to an existing file.

Explanation
WebSphere MQ security policy interceptor was unable to find the keystore database file.

Action
Make sure the value of the keystore configuration entry points to an existing file.

amq9026
Cannot read the keystore file*&3&4*. Check the file permissions.

Explanation
WebSphere MQ security policy interceptor was unable to read the keystore database file.

Action
Set the proper permissions for the keystore database file.

amq9027
Cannot access the keystore file*&3&4*. Error code*&1*.

Explanation
WebSphere MQ security policy interceptor was unable to open the keystore database file.

Action
Ensure the application accessing the keystore file has appropriate permissions to access the keystore file.

amq9028
The keystore stash file*&3&4* does not exist.

Explanation
WebSphere MQ security policy interceptor was unable to find the keystore stash file.

Action
Ensure the application accessing the keystore stash file has appropriate permissions to access the file.

amq9029
Cannot read the keystore stash file*&3&4*.

Explanation
WebSphere MQ security policy interceptor was unable to read the keystore stash file.

Action
Check the permissions for the keystore stash file.

amq9030
WebSphere MQ security policy internal error: queue information could not be resolved from the current queue object handle (*&1*).

Explanation
The WebSphere MQ security policy interceptor could not resolve queue information from the current queue object handle because the object handle is invalid or unrecognised.

Action
Make sure that the queue has not already been opened by another WebSphere MQ application and that it has not been previously closed. If the problem persists, contact your IBM service representative.

amq9031
WebSphere MQ security policy interceptor has detected an error prior to callback exit execution. WebSphere MQ compcode*&1* : reason*&2*.

Explanation
The WebSphere MQ security policy interceptor received an WebSphere MQ completion code indicating an error prior to interceptor execution.

Action
Consult the product documentation for the completion code and reason code, take corrective action. If the problem persists, contact your IBM service representative.

amq9032
WebSphere MQ security policy interceptor could not find queue manager CodedCharSetId (*&1*). Make sure you have permission to inquire about queue manager properties.

Explanation
The WebSphere MQ security policy interceptor could not find the local queue manager's CodedCharSetId because an internal error occurred.

Action
Make sure that the application has inquire permission to the queue manager. If the problem persists, contact your IBM service representative.

amq9033

WebSphere MQ security policy internal error: could not find local queue manager CodedCharSetId (*&1*).

Explanation

The WebSphere MQ security policy interceptor could not find the local queue manager's CodedCharSetId because an internal error occurred.

Action

If the problem persists, contact your IBM service representative.

amq9034

Message does not have a valid protection type.

Explanation

The WebSphere MQ security policy interceptor detected an invalid protection type in a message header. This usually occurs because the WebSphere MQ message header is not valid.

Action

Retry the operation. If the problem persists, contact your IBM service representative.

amq9035

Message signer is not in the list of authorised signers.

Explanation

The WebSphere MQ security policy interceptor detected that the message is signed by an unauthorised party.

Action

Establish whether the identity associated with the sender of the message is authorized to send messages to this application. Ensure the sender is named in the list of allowed signers on the security policy for the queue.

amq9036

MQOPEN() call failed: reason code (*&1*).

Explanation

The WebSphere MQ security policy interceptor call to the WebSphere MQ MQOPEN() call failed with the indicated error.

Action

Consult the product documentation for an explanation of the error code and suggested corrective action. Ensure that the queue manager is operational and the queue exists.

amq9037

The WebSphere MQ security policy interceptor failed to process a message on queue*&3* with CompCode*&1* Reason code*&2*

Explanation

An unexpected error was encountered whilst applying a security policy to queue*&3*.

Action

This is an internal error. Contact your IBM service representative.

amq9038

The WebSphere MQ security policy interceptor failed to convert the*&3* field of the WebSphere MQ header from CCSID*&1* to CCSID*&2*. Verify that default data conversion has been enabled in WebSphere MQ.

Explanation

The WebSphere MQ security policy interceptor internal error: data conversion failed. This is usually a problem with incompatible character sets.

Action

Enable default data conversion in WebSphere MQ. If the problem persists, contact your IBM service representative.

amq9039

&3 - message was signed by*&4* using*&5*.

Explanation

This is an informational message used to indicate that a message was signed, and to display the signer's name, message timestamp and signature algorithm used.

Action

None.

amq9040

&3 - message was signed and encrypted by*&4* using*&5*.

Explanation

This is an informational message used to indicate that a message was signed and encrypted, and to display the signer's name and encryption algorithm name.

Action

None.

amq9041

Message was not protected.

Explanation

This is an informational message used to indicate that a message was neither signed nor encrypted.

Action

None.

amq9042

WebSphere MQ security policy internal error: unprotected message size*&1* bytes does not match the original message size*&2* bytes.

Explanation

After unprotecting, the message size does not match the original message size. The message header might have been corrupted or tampered with.

Action

Check the message which has been put on the SYSTEM.PROTECTION.ERROR.QUEUE queue to find the cause of the error and the origin of the message. If the problem persists, contact your IBM service representative.

amq9043

Message protection algorithm*&3* is different than the required*&4*.

Explanation

The WebSphere MQ security policy interceptor detected that a message did not meet the encryption strength required by the queue. This usually occurs when encryption strength for a queue is changed while there were still messages in the queue.

Action

Make sure that the same encryption strength is used for the message MQPUT and MQGET. When the queue encryption strength is changed, remove all messages in the queue before resuming normal operation.

amq9044

The WebSphere MQ security policy interceptor has put a defective message on error handling queue*&3*.

Explanation

This is an informational message that indicates the WebSphere MQ security policy put a message it could not interpret on the specified error handling queue.

Action

Make sure only valid messages are put onto queues protected by WebSphere MQ security policies.

amq9045

The WebSphere MQ security policy interceptor failed to put a defective message on error handling queue. WebSphere MQ reason code (*&1*)

Explanation

The WebSphere MQ security policy interceptor was unable to put a message it could not interpret on the error handling queue because the indicated WebSphere MQ error occurred.

Action

Consult the product documentation for more information about the reason code. If the problem persists, contact your IBM service representative.

amq9046

The 'PDMQ' format header from the current message is invalid.

Explanation

The WebSphere MQ security policy interceptor did not find a valid WebSphere MQ security policy header in the the current message.

Action

If the QoP setting for the queue is not set to 'none', make sure that no unprotected messages are routed to this queue.

amq9047

WebSphere MQ security policy found a valid 'PDMQ' format header in the current message.

Explanation

WebSphere MQ security policy interceptor found a valid WebSphere MQ security policy header in the current message.

Action

None.

amq9048

Message quality of protection (*&1*) does not match the quality of protection (*&2*) set for the queue*&3*.

Explanation

The WebSphere MQ security policy interceptor detected a quality of protection (QoP) mismatch between the queue and a message in the queue. QoP mismatches usually occur because the queue QoP is changed between the message put and get.

Action

Make sure that the same queue quality of protection is used for the message put and get. When the queue QoP is changed, clean up all messages in the queue before resuming normal operation.

amq9049

Message with quality of protection (*&1*) higher than (*&2*) set for the queue*&3* has been accepted.

Explanation

The WebSphere MQ security policy interceptor detected a quality of protection (QoP) mismatch between the queue and a message in the queue. QoP mismatch usually occurs when the QoP of the queue is changed between the message put and get.

Action

Make sure that the same queue quality of protection is used for the message put and get. When the QoP of the queue is changed, remove all messages from the queue before resuming any operation.

amq9050

WebSphere MQ security policy could not access the security policy definitions. Major code*&1* : Minor code*&2*

Explanation

The security policy definitions cannot be accessed.

Action

The security policy definitions must be accessible to this application. Check the object authority manager access control for this application to access the SYSTEM.PROTECTION.POLICY.QUEUE.

amq9051

WebSphere MQ could not find the security policy definition. Compcode*&1* : reason*&2*

Explanation

The security policy definition is not defined.

Action

Security policy definition must be defined before this action.

amq9052

Message with no protection has been put into the queue*&3*.

Explanation

The WebSphere MQ security policy interceptor has successfully put a message with a QoP of 'none' onto the selected queue.

Action

None.

amq9053

Message with integrity protection has been put into the queue*&3*.

Explanation

The WebSphere MQ security policy interceptor has successfully put a message with a QoP of 'integrity' onto the selected queue.

Action

None.

amq9054

Message with privacy protection has been put into the queue*&3*.

Explanation

The WebSphere MQ security policy interceptor has successfully put a message with a QoP of 'privacy' onto the selected queue.

Action

None.

amq9055

Quality of protection (QoP)*&1* for queue*&3* is invalid

Explanation

The WebSphere MQ security policy interceptor detected that the quality of protection specified in the security policy for the queue is invalid.

Action

Ensure that the encryption and signature algorithms specified for the queue in the WebSphere MQ security policy definition have valid values.

amq9056

WebSphere MQ security policy internal error: message could not be protected because the specified signature algorithm*&1* is not valid.

Explanation

An unexpected signature algorithm has been specified.

Action

This is an internal error. Contact your IBM service representative.

amq9057

WebSphere MQ security policy internal error: message could not be processed because the specified encryption algorithm*&1* is not valid.

Explanation

An unexpected encryption algorithm has been specified.

Action

This is an internal error. Contact your IBM service representative.

amq9058

The WebSphere MQ security policy interceptor cannot inquire the attributes for queue manager*&3*.

Explanation

The WebSphere MQ security policy interceptor failed to inquire queue manager attributes, compcode*&1*, reason code*&2*.

Action

Make sure that the application has appropriate access control permissions to inquire the queue manager object.

amq9059

The WebSphere MQ security policy interceptor failed to generate a configuration event for queue manager*&3*.

Explanation

The WebSphere MQ security policy interceptor failed to generate a configuration event, comp code*&1*, reason code*&2*.

Action

Ensure that the SYSTEM.ADMIN.CONFIG.EVENT queue is available for output from this process.

amq9060

The WebSphere MQ security policy keystore configuration file contains duplicate key:*&3*.

Explanation

The WebSphere MQ security policy keystore configuration file contains duplicate key:*&3*.

Action

Make sure the keystore configuration file contains all required keys and does not contain duplicate keys.

amq9061

The WebSphere MQ security policy keystore configuration file does not contain key*&3*.

Explanation

The WebSphere MQ security policy keystore configuration file does not contain key*&3*.

Action

Make sure the keystore configuration file contains all required keys and does not contain duplicate keys.

amq9062
The WebSphere MQ security policy interceptor could not read the keystore configuration file:*&3*.

Explanation
The WebSphere MQ security policy interceptor could not read the keystore configuration file:*&3*.

Action
Make sure that the user who executes the WebSphere MQ application has permissions to read the configuration file. Check if the configuration file is not corrupted or empty. If the problem persists, contact your local IBM service representative.

amq9063
The WebSphere MQ security policy interceptor could not parse the keystore configuration file.

Explanation
The WebSphere MQ security policy interceptor could not parse the keystore configuration file.

Action
Make sure the keystore configuration file contains all required keys and does not contain duplicate keys.

amq9064
The WebSphere MQ security policy interceptor failed to enable OCSP checking.

Explanation
The WebSphere MQ security policy interceptor encountered an error while configuring OCSP checking.

Action
Check the OCSP configuration, making sure that all parameters are specified correctly.

amq9065
The WebSphere MQ security policy interceptor failed to process the OCSP configuration.

Explanation
The OCSP configuration for WebSphere MQ is incorrect.

Action
Check the OCSP configuration, making sure that all mandatory parameters are specified.

amq9066
The WebSphere MQ security policy interceptor failed to enable CRL checking.

Explanation
The WebSphere MQ security policy interceptor encountered an error while configuring CRL checking.

Action
Check the CRL configuration, making sure that all parameters are correctly specified.

amq9067
The WebSphere MQ security policy interceptor failed to process the CRL configuration.

Explanation
The WebSphere MQ security policy interceptor failedto process the CRL configuration information.

Action
Check the CRL configuration, making sure that all mandatory parameters are specified.

amq9068
The WebSphere MQ security policy interceptor could not enable revocation checking.

Explanation

The WebSphere MQ security policy interceptor could not enable OCSP or CRL because the required functionality is not supported by the version of GSKit that is currently being used.

Action

The currently enabled version of GSKit does not meet the minimum requirements for WebSphere MQ security policy revocation checking. Install a newer version of GSKit that does meet the minimum requirements.

amq9069

The WebSphere MQ security policy interceptor failed to validate a certificate, GSKit status:*&3*.

Explanation

The WebSphere MQ security policy interceptor failed to validate a certificate.

Action

Read the GSKit log to determine the cause of validation failure.

amq9070

The WebSphere MQ security policy interceptor failed to validate a certificate.

Explanation

The WebSphere MQ security policy interceptor could not validate a certificate.

Action

Read the GSKit logs to determine the cause of validation failure.

amq9071

WebSphere MQ security policy interceptor internal error: could not read GSKit attribute*&3*, GSKit reason code:*&1*.

Explanation

The GSKit gskacme_cred_get function failed.

Action

Make sure you are using the correct version of GSKit for this installation of WebSphere MQ.

amq9072

The certificate revocation status is UNKNOWN, GSKit log:*&3*.

Explanation

The WebSphere MQ security policy interceptor failed to determine the certificate revocation status.

Action

Read the GSKit log to find out the certificate DN and serial number.

amq9073

The certificate revocation status is UNKNOWN, GSKit log:*&3*.

Explanation

The WebSphere MQ security policy interceptor failed to determine the certificate revocation status.

Action

Read the GSKit log to find out the certificate DN and serial number.

amq9074

The Trial Period license for this copy of WebSphere MQ Advanced Message Security has expired.

Explanation

This copy of WebSphere MQ Advanced Message Security was licensed to be used in trial mode for a limited period only. This period has expired.

Action
Install a Production license for this copy of WebSphere MQ Advanced Message Security.

amq9075
The Beta license for this copy of WebSphere MQ Advanced Message Security has expired.

Explanation
This copy of WebSphere MQ Advanced Message Security was licensed to be used for Beta testing for a limited period only. This period has expired.

Action
Install a Production license for this copy of WebSphere MQ Advanced Message Security.

amq9076
There are*&1* days left in the trial period for this copy of WebSphere MQ Advanced Message Security.

Explanation
This copy of WebSphere MQ Advanced Message Security is licensed for a limited period only.

Action
None.

amq9077
This is the final day of the trial period for this copy of WebSphere MQ Advanced Message Security.

Explanation
This copy of WebSphere MQ Advanced Message Security is licensed for a limited period only.

Action
Install a Production license for this copy of WebSphere MQ Advanced Message Security.

amq9078
There is one day left in the trial period for this copy of WebSphere MQ Advanced Message Security.

Explanation
This copy of WebSphere MQ Advanced Message Security is licensed for a limited period only.

Action
None.

amq9079
There are*&1* days left in the beta test period for this copy of WebSphere MQ Advanced Message Security.

Explanation
This copy of WebSphere MQ Advanced Message Security is licensed for a limited period only.

Action
None.

amq9080
There is one day left in the Beta test period for this copy of WebSphere MQ Advanced Message Security.

Explanation
This copy of WebSphere MQ Advanced Message Security is licensed for a limited period only.

Action
None.

amq9081

This is the final day of the Beta test period for this copy of WebSphere MQ Advanced Message Security.

Explanation

This copy of WebSphere MQ Advanced Message Security is licensed for a limited period only.

Action

Install a Production license for this copy of WebSphere MQ Advanced Message Security.

amq9082

No policies found.

Explanation

There are no policies defined.

Action

None.

Notices

This information was developed for products and services offered in the U.S.A.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
U.S.A.

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

Intellectual Property Licensing
Legal and Intellectual Property Law
IBM Japan, Ltd.
19-21, Nihonbashi-Hakozakicho, Chuo-ku
Tokyo 103-8510, Japan

The following paragraph does not apply to the United Kingdom or any other country where such provisions are inconsistent with local law: INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM Web sites are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this IBM product and use of those Web sites is at your own risk.

IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

IBM Corporation
Software Interoperability Coordinator, Department 49XA
3605 Highway 52 N
Rochester, MN 55901
U.S.A.

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this information and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement, or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

All statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs.

If you are viewing this information softcopy, the photographs and color illustrations may not appear.

Programming interface information

Programming interface information, if provided, is intended to help you create application software for use with this program.

This book contains information on intended programming interfaces that allow the customer to write programs to obtain the services of WebSphere MQ.

However, this information may also contain diagnosis, modification, and tuning information. Diagnosis, modification and tuning information is provided to help you debug your application software.

Important: Do not use this diagnosis, modification, and tuning information as a programming interface because it is subject to change.

Sending your comments to IBM

We appreciate your input on this publication. Feel free to comment on the clarity, accuracy, and completeness of the information or give us any other feedback that you might have.

Use one of the following methods to send us your comments:

- Send an email to ibmkc@us.ibm.com
- Use the form on the web here: www.ibm.com/software/data/rcf/

When you send information to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate, without incurring any obligation to you.

Include the following information:

- Your name and address
- Your email address
- Your telephone or fax number
- The publication title and order number
- The topic and page number related to your comment
- The text of your comment

IBM or any other organizations will only use the personal information that you supply to contact you about the issues that you submit.

Thank you for your participation.
