Examine the channel authentication records to ensure that the correct settings have been configured. If the channel authentication record was not in warning mode the channel would be blocked. The ALTER QMGR **CHLAUTH** switch is used to control whether the channel authentication records are used. The DISPLAY CHLAUTH command can be used to query the channel authentication records.

## CSQX787I

*csect-name* Channel *channel-name* from *ipaddress* would have been blocked due to USERSRC(NOACCESS), Detail: *detail*

### Severity

4

### Explanation

The inbound channel *channel-name* would have been blocked from address *ipaddress* because the active values of the channel matched a channel authentication record configured with USERSRC(NOACCESS). It was not blocked due to the channel authentication record being in warning mode.

The active values of the channel were *detail*.

### System action

The channel is started.

### System programmer response

Examine the channel authentication records to ensure that the correct settings have been configured. If the channel authentication record was not in warning mode the channel would be blocked. The ALTER QMGR **CHLAUTH** switch is used to control whether the channel authentication records are used. The DISPLAY CHLAUTH command can be used to query the channel authentication records.

## CSQX788I

*csect-name* DNS lookup for address *address* using function '*func*' took *n* seconds

### Severity

4

### Explanation

An attempt to resolve address *address* using the '*func*' function call took *n* seconds to complete. This might indicate a problem with the DNS configuration.

### System action

Processing continues.

### System programmer response

Ensure that the DNS is correctly configured on the local system.

If the address was an IP address then the slow operation was a reverse DNS lookup. Some DNS configurations are not capable of reverse DNS lookups and some IP addresses have no valid reverse DNS entries.

If the problem persists, consider disabling reverse DNS lookups until the issue with the DNS can be resolved.

## CSQX790I

*csect-name* Connection authentication failed for user *user-id* due to CHLAUTH with CHCKCLNT(*chckclnt-value*), Detail: *detail*

### Severity

4

### Explanation

The user ID *user-id* and its password were checked because the inbound connection matched a channel authentication record with CHCKCLNT(*chckclnt-value*).

The active values of the channel were *detail*. The MATCH(RUNCHECK) mode of the DISPLAY CHLAUTH command can be used to identify the relevant CHLAUTH record.

This message accompanies a previous error to clarify the reason for the user ID and password check.

**System action**

The channel is not started.

**System programmer response**

Refer to the previous error for more information.

Ensure that a password is specified by the client application and that the password is correct for the User ID.

Alternatively, to avoid the authentication check you can amend the CHLAUTH record CHCKCLNT attribute. However, allowing unauthenticated remote access is not recommended.

**CSQX791E**

*csect-name* Client application *appl-name* from address *ip-address* did not supply a user ID and password, Detail: *detail*

**Severity**

8

**Explanation**

The client application *appl-name* running on host *ip-address* did not supply a user ID and password. The channel authentication (CHLAUTH) record for the connection requires a user ID and password, but none was supplied.

The active values of the channel were *detail*. The MATCH(RUNCHECK) mode of the DISPLAY CHLAUTH command can be used to identify the relevant CHLAUTH record.

**System action**

The channel is not started.

**System programmer response**

Ensure that the application provides a valid user ID and password, or change the queue manager connection authority (CONNAUTH) configuration to OPTIONAL to allow client applications to connect which have not supplied a user ID and password.

**CSQX793E**

*csect-name* The user ID and password for client application *appl-name* from address *ip-address* cannot be checked, Detail: *detail*

**Severity**

8

**Explanation**

The user ID and password for the client application *appl-name* running on host *ip-address* cannot be checked. The channel authentication (CHLAUTH) record for the connection requires an authentication check, but the queue manager is not configured to use connection authentication for clients.

The active values of the channel were *detail*. The MATCH(RUNCHECK) mode of the DISPLAY CHLAUTH command can be used to identify the relevant CHLAUTH record.

**System action**

The channel is not started.

### System programmer response

Change the CHLAUTH configuration so that client authentication is not required, or alter the queue manager connection authority (CONNAUTH) configuration to enable client authentication checks.

### CSQX830I

*csect-name* Channel initiator active

### Severity

0

### Explanation

This is issued in response to the DISPLAY CHINIT command if the channel initiator is active.

### CSQX831I

*csect-name nn* adapter subtasks started, *nn* requested

### Severity

0

### Explanation

This is issued in response to the DISPLAY CHINIT command, and shows how many adapter subtasks are currently active, and how many were requested by the CHIADAPS queue manager attribute. If the numbers differ, some adapter subtasks have failed and not been restarted, which could reduce processing capacity.

### CSQX832I

*csect-name nn* dispatchers started, *nn* requested

### Severity

0

### Explanation

This is issued in response to the DISPLAY CHINIT command, and shows how many dispatchers are currently active, and how many were requested by the CHIDISPS queue manager attribute. If the numbers differ, some dispatchers have failed and not been restarted. The number of current TCP/IP and LU 6.2 channels allowed will be reduced proportionately, and other processing capacity may be reduced.

### CSQX833I

*csect-name nn* SSL server subtasks started, *nn* requested

### Severity

0

### Explanation

This is issued in response to the DISPLAY CHINIT command, and shows how many SSL server subtasks are currently active, and how many were requested by the SSLTASKS queue manager attribute. If the numbers differ, some SSL server subtasks have failed and not been restarted, which could reduce processing capacity.

### CSQX836I

*csect-name nn* Maximum channels - TCP/IP *nn*, LU 6.2 *nn*

### Severity

0

### Explanation

This is issued in response to the DISPLAY CHINIT command. It shows the maximum numbers of each type of channel that are allowed.

#### CSQX840I

*csect-name nn channels current, maximum nn*

#### Severity

0

#### Explanation

This is issued in response to the DISPLAY CHINIT command. It shows how many channels are current, and how many are allowed altogether, as requested by the MAXCHL queue manager attribute.

#### CSQX841I

*csect-name nn channels active, maximum nn, including nn paused*

#### Severity

0

#### Explanation

This is issued in response to the DISPLAY CHINIT command. Of the channels that are current, it shows how many are active (transmitting messages), and how many are allowed altogether to be active, by the ACTCHL queue manager attribute. It also shows how many of the active channels are paused, waiting to retry putting a message.

#### CSQX842I

*csect-name nn channels starting, nn stopped, nn retrying*

#### Severity

0

#### Explanation

This is issued in response to the DISPLAY CHINIT command. Of the channels that are current, it shows how many are:

- waiting to become active, because the limit for active channels has been reached
- stopped, requiring manual intervention
- attempting to reconnect following a temporary error.

#### CSQX843I

*csect-name TCP/IP listener INDISP=*disposition* retrying, for port *port* address *ip-address**

#### Severity

0

#### Explanation

This is issued in response to the DISPLAY CHINIT command for each TCP/IP listener that is trying to restart after an error. The channel initiator will attempt to restart the listener, at the intervals specified by the LSTRTMR queue manager attribute.

*port* and *ip-address* show the port and IP address combination on which it listens; if *ip-address* is '\*', it listens on all available IP addresses. *disposition* shows which type of incoming requests the listener handles:

#### QMGR

those directed to the target queue manager

#### GROUP

those directed to the queue-sharing group.

## CSQX844I

*csect-name* LU 6.2 listener INDISP=*disposition* retrying, for LU name *name*

### Severity

0

### Explanation

This is issued in response to the DISPLAY CHINIT command for each LU 6.2 listener that is trying to restart after an error. The channel initiator will attempt to restart the listener at the intervals specified by the LSTRTMR queue manager attribute.

*disposition* shows which type of incoming requests the listener handles:

#### QMGR

those directed to the target queue manager

#### GROUP

those directed to the queue-sharing group.

## CSQX845I

*csect-name* TCP/IP system name is *name*

### Severity

0

### Explanation

This is issued in response to the DISPLAY CHINIT command, and shows the TCP/IP system name that is being used, as specified in the TCPNAME queue manager attribute.

## CSQX846I

*csect-name* TCP/IP listener INDISP=*disposition* started, for port *port* address *ip-address*

### Severity

0

### Explanation

This is issued in response to the DISPLAY CHINIT command for each TCP/IP listener that is active.

*port* and *ip-address* show the port and IP address combination on which it listens; if *ip-address* is '\*', it listens on all available IP addresses. *disposition* shows which type of incoming requests the listener handles:

#### QMGR

those directed to the target queue manager

#### GROUP

those directed to the queue-sharing group.

## CSQX847I

*csect-name* LU 6.2 listener INDISP=*disposition* started, for LU name *name*

### Severity

0

### Explanation

This is issued in response to the DISPLAY CHINIT command for each LU 6.2 listener that is active.

*disposition* shows which type of incoming requests the listener handles:

**QMGR**

those directed to the target queue manager

**GROUP**

those directed to the queue-sharing group.

**CSQX848I**

*csect-name* TCP/IP listener INDISP=*disposition* not started

**Severity**

0

**Explanation**

This is issued in response to the DISPLAY CHINIT command for each TCP/IP listener that is not active.

*disposition* shows which type of incoming requests the listener handles:

**QMGR**

those directed to the target queue manager

**GROUP**

those directed to the queue-sharing group.

**System programmer response**

If the listener had been started, and was not deliberately stopped, this might be because there was an error in the communications system. The channel initiator will attempt to restart the listener, at the intervals specified by the LSTRTMR queue manager attribute.

**CSQX849I**

*csect-name* LU 6.2 listener INDISP=*disposition* not started

**Severity**

0

**Explanation**

This is issued in response to the DISPLAY CHINIT command for each LU 6.2 listener that is not active.

*disposition* shows which type of incoming requests the listener handles:

**QMGR**

those directed to the target queue manager

**GROUP**

those directed to the queue-sharing group.

**System programmer response**

If the listener had been started, and was not deliberately stopped, this might be because there was an error in the communications system. The channel initiator will attempt to restart the listener, at the intervals specified by the LSTRTMR queue manager attribute.

**CSQX871I**

*csect-name* Cluster maintenance has been running for *num-mins* minutes, phase *maintenance-phase* has so far processed *num-records* records

**Severity**

0

**Explanation**

A queue manager will periodically perform a maintenance cycle to refresh and remove state associated with the clusters it is a member of. This message gives an indication of the progress being made.

**System action**

For large clusters this maintenance process may take a significant period of time. In such situations this message will be periodically repeated until maintenance has completed, at which time message CSQX872I will be output.

**CSQX872I**

*csect-name* Cluster maintenance has completed after *num-mins* minutes, *num-records* records were processed

**Severity**

0

**Explanation**

A queue manager will periodically perform a maintenance cycle to refresh and remove state associated with the clusters it is a member of. This message follows one or more instances of message CSQX871I and indicates the cycle has completed.

**System action**

None

**CSQX875I**

*csect-name* REFRESH CLUSTER processing started for cluster *cluster-name*

**Severity**

0

**Explanation**

A REFRESH CLUSTER command has been issued on this queue manager.

In phase one this will discard all locally cached information for the cluster and request new information from other members of the cluster when necessary. Phase two processes the information received. For large cluster configurations this process can take a significant amount of time, especially on full repository queue managers. During this time applications attempting to access cluster resources may see failures to resolve cluster resources. In addition, cluster configuration changes made on this queue manager may not be processed until the refresh process has completed.

**System action**

Defer any cluster related work on this queue manager until both phases are complete.

Message CSQX442I or CSQX404I will be issued at the end of phase one.

Completion of phase two can be determined when the SYSTEM.CLUSTER.COMMAND.QUEUE has reached a consistently empty state.

**CSQX876I**

*csect-name* Cluster cache compression started

**Severity**

0

**Explanation**

Periodically cluster management will compress its local cache. Compression can take a significant period of time for certain operations, such as performing a CLUSTER REFRESH. During the compression task, cluster management commands will not be processed.

Once the compression task has completed message CSQX877I will be issued.

#### **CSQX877I**

*csect-name* Cluster cache compression completed

#### **Severity**

0

#### **Explanation**

The cluster cache compression activity, indicated by message CSQX876I, has now completed.

#### **CSQX878I**

*csect-name* Repository command error, command *command*, cluster object *object-name*, sender *sender-id*, reason *reason*

#### **Severity**

8

#### **Explanation**

An internal cluster repository command failed to complete successfully. Earlier messages in the log will contain details of the problem. Failure to successfully process a command can leave a cluster in an inconsistent state.

#### **System action**

Processing continues

#### **System programmer response**

If the problem cannot be resolved, collect the items listed in the Problem Determination section and contact your IBM® support center.

#### **CSQX879E**

*csect-name* Conflicting clustered topic *topic-name* from queue manager *qmgr-name*

#### **Severity**

8

#### **Explanation**

A conflict has been detected for clustered topic *topic-name*.

Two clustered topics conflict if any of the following conditions are true:

1. They have the same topic string but have a different topic name
2. They have the same topic string, or one is an ancestor of the other in the topic tree, and they have a different cluster name
3. They have the same topic string, or one is an ancestor of the other in the topic tree, and they have incompatible values for the cluster route attribute

#### **System action**

The CLSTATE attribute of the clustered topic identified by *topic-name* is set to INVALID and the topic is no longer used by the queue manager.

#### **System programmer response**

Review the clustered topics visible to the queue manager and correct any conflicts by modifying or deleting the definitions in error. After updating the topic definitions, ensure all clustered topics have a CLSTATE of ACTIVE on all queue managers in the same cluster.

## Initialization procedure and general services messages (CSQY...):

### CSQY000I

IBM WebSphere MQ for z/OS Vn

#### Explanation

This message is issued when the queue manager starts, and shows the release level.

### CSQY001I

QUEUE MANAGER STARTING, USING PARAMETER MODULE *parm-name*

#### Explanation

The START QMGR command is accepted. System parameter values will be taken from the module *parm-name*. This message is issued to the z/OS console at which the START command was issued. Message CSQY022I is sent when the queue manager startup process has completed.

#### System action

Queue manager startup processing begins.

### CSQY002I

QUEUE MANAGER STOPPING

#### Explanation

The STOP QMGR command is accepted. Message CSQ9022I is issued when the queue manager shutdown process has completed. The message is issued either to the originator of the STOP QMGR command, or to the z/OS console from which the START QMGR command was received.

#### System action

Queue manager shutdown is initiated.

### CSQY003I

QUEUE MANAGER IS ALREADY ACTIVE

#### Explanation

The START QMGR command has not been accepted, because the queue manager is active. Message CSQ9023E is issued after this message.

### CSQY004I

QUEUE MANAGER IS ALREADY STOPPING

#### Explanation

The STOP QMGR command has not been accepted either because the queue manager shutdown is in progress for the specified option (QUIESCE or FORCE), or because the QUIESCE option was specified after a FORCE option had been accepted previously. Message CSQ9023E is issued after this message.

#### System action

Queue manager shutdown continues.

### CSQY005E

QUEUE MANAGER STARTUP TERMINATED, INVALID START COMMAND

#### Explanation

The queue manager can be started only by a START QMGR command.

#### System action

Queue manager startup is terminated.

**CSQY006E**

*csect-name* INVALID AMODE OR RMODE ATTRIBUTE FOUND FOR LOAD MODULE  
*module-name*

**Explanation**

The queue manager initialization procedures found that a module had an invalid AMODE or RMODE attribute when it was loaded. *module-name* is the name of the load module with an invalid addressing or residency mode.

**System action**

Queue manager startup terminates abnormally.

**System programmer response**

Verify that all installation and maintenance activities against IBM MQ have been done correctly. If you are unable to correct the problem, contact your IBM support center.

**CSQY007E**

*csect-name* QUEUE MANAGER STARTUP TERMINATED, INVALID OPERATING SYSTEM  
LEVEL

**Explanation**

The queue manager initialization procedures found that the level of the operating system did not have the function required for correct queue manager operation.

**System action**

Queue manager startup terminates abnormally.

**System programmer response**

Verify that the prerequisite, or later, level of the operating system is installed. If you are unable to correct the problem, contact your IBM support center.

**CSQY008I**

QUEUE MANAGER SHUTDOWN REQUEST NOT ACCEPTED

**Explanation**

The STOP QMGR command has not been accepted because startup has not completed to the point where shutdown can occur. Message CSQ9023E is issued after this message.

**System action**

Queue manager startup continues, and the STOP QMGR command is ignored.

**CSQY009I**

*verb-name* *pkw-name* COMMAND ACCEPTED FROM USER(*userid*), STOP MODE(*mode*)

**Explanation**

This message is issued to record who issued the command to stop IBM MQ, and what type of stop it was. *verb-name* might include the command prefix (CPF). This depends on how the command was entered.

**CSQY010E**

*csect-name* LOAD MODULE *module-name* IS NOT AT THE CORRECT RELEASE LEVEL

**Explanation**

The named load module is not at the correct level for the version of the queue manager that was being used.

**System action**

If detected by the queue manager, startup terminates abnormally with reason code X'00E80161'. If detected by the channel initiator (*module-name* is CSQXJST), it does not start.

If detected by the AMS enablement module (DRQ0NABL), the queue manager only fails to start if SPLCAP=YES is specified in the system parameters. In this case message CSQY029E is issued.

**System programmer response**

Verify that the correct IBM MQ program libraries are being used (for the queue manager or channel initiator as appropriate) and that all installation and maintenance activities against IBM MQ have been done correctly. If the early processing program is incorrect (*module-name* is CSQ3EPX), refresh it by issuing the REFRESH QMGR TYPE(EARLY) command.

If you are unable to correct the problem, contact your IBM support center.

**CSQY011E**

*csect-name* COMMAND PREFIX REGISTRATION FAILED. INVALID CHARACTER(S) IN CPF

**Explanation**

Command prefix registration failed because the command prefix (CPF) contains invalid characters.

**System action**

The queue manager does not start.

**System programmer response**

Reissue the z/OS command SETSSI ADD with the correct CPF parameter. Correct the CPF parameter in the record of SYS1.PARMLIB member IEFSSNxx. For information about the parameters, see Updating the subsystem name table.

**CSQY012E**

*csect-name* COMMAND PREFIX REGISTRATION FAILED. INVALID CHARACTER(S) IN QUEUE MANAGER NAME

**Explanation**

Command prefix registration failed because the queue manager name used as the owner of the command prefix (CPF) contains invalid characters.

**System action**

The queue manager does not start.

**System programmer response**

Reissue the z/OS command SETSSI ADD with the correct CPF parameter. Correct the CPF parameter in the record of SYS1.PARMLIB member IEFSSNxx. For information about the parameters, see Updating the subsystem name table.

**CSQY013E**

*csect-name* COMMAND PREFIX REGISTRATION FAILED. CPF ALREADY DEFINED

**Explanation**

Command prefix registration failed because the command prefix (CPF) was already defined to z/OS.

**System action**

The queue manager does not start.

**System programmer response**

Reissue the z/OS command SETSSI ADD with the correct CPF parameter. Correct the CPF parameter in the record of SYS1.PARMLIB member IEFSSNxx. For information about the parameters, see Updating the subsystem name table.

#### **CSQY014E**

*csect-name* COMMAND PREFIX REGISTRATION FAILED. CPF IS A SUBSET OF A CPF ALREADY DEFINED

#### **Explanation**

Command prefix registration failed because the command prefix (CPF) is a subset of a CPF already defined to z/OS.

#### **System action**

The queue manager does not start.

#### **System programmer response**

Reissue the z/OS command SETSSI ADD with the correct CPF parameter. Correct the CPF parameter in the record of SYS1.PARMLIB member IEFSSNxx. For information about the parameters, see Updating the subsystem name table.

#### **CSQY015E**

*csect-name* COMMAND PREFIX REGISTRATION FAILED. CPF IS A SUPERSET OF A CPF ALREADY DEFINED

#### **Explanation**

Command prefix registration failed because the command prefix (CPF) is a superset of a CPF already defined to z/OS.

#### **System action**

The queue manager does not start.

#### **System programmer response**

Reissue the z/OS command SETSSI ADD with the correct CPF parameter. Correct the CPF parameter in the record of SYS1.PARMLIB member IEFSSNxx. For information about the parameters, see Updating the subsystem name table.

#### **CSQY016E**

*csect-name* SYSTEM ERROR DURING COMMAND PREFIX REGISTRATION

#### **Explanation**

A z/OS error occurred during command prefix (CPF) registration.

#### **System action**

The queue manager does not start.

#### **System programmer response**

Check the z/OS console for other messages relating to the problem.

#### **CSQY017E**

*csect-name* INCORRECT STORAGE PROTECT KEY

#### **Explanation**

The queue manager initialization procedures found that the storage protect key was not 7. The most likely causes are that the program properties table (PPT) entry for CSQYASCP has not been specified correctly, or that the IBM MQ program libraries or other libraries in the IBM MQ STEPLIB are not APF authorized.

#### **System action**

Queue manager startup terminates abnormally with reason code X'00E80162'.

**System programmer response**

Check that all the libraries you include in the IBM MQ STEPLIB have been APF-authorized. Also, ensure that you use the actual library name and not the data set alias of the libraries in APF list.

For information about specifying the PPT entry for CSQYASCP and about APF authorization for the IBM MQ program libraries, see Updating the z/OS program properties table.

**CSQY018E**

*csect-name* INCORRECT APF AUTHORIZATION

**Explanation**

The queue manager initialization procedures found that they were not APF authorized. The most likely cause is that one or more of the data sets in the //STEPLIB concatenation is not APF authorized.

**System action**

Queue manager startup terminates abnormally with reason code X'00E80163'.

**System programmer response**

Check all the libraries that you include in the IBM MQ STEPLIB are APF-authorized. Also, check that you do not use a data set alias of the libraries in the APF list, use the actual library name instead.

For information about APF authorization for the IBM MQ program libraries, see APF authorize the IBM MQ load libraries.

**CSQY019E**

*csect-name* QUEUE MANAGER STARTUP TERMINATED, INVALID PARAMETER MODULE LEVEL, REBUILD *macro-name*

**Explanation**

The queue manager initialization procedures found that the level of the parameter module (named in the preceding CSQY001I message) is not at the correct level for this version of the queue manager.

**System action**

Queue manager startup terminates abnormally with reason code 00E80051.

**System programmer response**

Rebuild the parameter module ensuring that *macro-name* is recompiled with the same level of code that the queue manager is running with.

For more information about the macros used to build the parameter module see, Task 17: Tailor your system parameter module.

**CSQY020E**

*csect-name* CHANNEL INITIATOR STARTUP TERMINATED, INVALID START COMMAND

**Explanation**

The channel initiator can be started only by a **START CHINIT** command.

**System action**

Channel initiator startup is terminated.

**System programmer response**

Start the channel initiator using the **START CHINIT** command

**CSQY021E**

csect-name QUEUE MANAGER STARTUP TERMINATED, INSUFFICIENT MEMLIMIT

**Explanation**

The queue manager initialization procedures found that the configured MEMLIMIT is less than 512MB.

**System action**

Queue manager startup terminates abnormally.

**CSQY022I**

QUEUE MANAGER INITIALIZATION COMPLETE

**Explanation**

This message is issued when the initialization of the queue manager completes normally, and it is ready for use.

**CSQY023A**

SOME OBJECTS COULD NOT BE MIGRATED, MANUAL RESOLUTION REQUIRED. REPLY TO ACKNOWLEDGE AND CONTINUE STARTUP

**Explanation**

The queue manager has detected that it was previously running at an earlier version and forward migration has been performed. However, some objects could not be migrated because of locks held by in-doubt transactions. Message CSQI970E is also issued for each object that could not be migrated.

This message is not issued during subsequent restarts of the queue manager whilst it is running at the same version.

**System action**

Startup is suspended and the queue manager waits for the operator to reply with any single character.

**System programmer response**

Reply to acknowledge this message and allow queue manager startup to proceed.

Thereafter, additional action is required to complete forward migration of each identified object.

For more information see the description of message CSQI970E.

**CSQY024I**

IBM WebSphere MQ AMS for z/OS is not installed, but the system parameter SPLCAP is set to YES

**Severity**

8

**Explanation**

The system parameter SPLCAP is set to YES in the queue manager's ZPARM, however, IBM MQ Advanced Message Security has not been installed.

**System action**

Queue manager startup is terminated.

**System programmer response**

If IBM MQ Advanced Message Security is required, ensure it has been installed correctly and the queue manager's STEPLIB has been updated to include SDRQAUTH, otherwise update the queue manager's ZPARM to set the system parameter SPLCAP to NO.

**CSQY025I**

IBM WebSphere MQ AMS for z/OS is installed.

**Severity**

0

**Explanation**

This message indicates that IBM MQ Advanced Message Security is installed.

**System action**

Queue manager startup continues.

**System programmer response**

None.

**CSQY026E**

*csect-name* QUEUE MANAGER STARTUP TERMINATED, VUE IN NON-ZNALC LPAR

**Explanation**

An attempt was made to start a queue manager. The queue manager is configured to use 'IBM MQ for z/OS Value Unit Edition', however, VUE is not running in a z/OS LPAR defined for IBM Z Systems New Application License Charges (zNALC).

**System action**

Queue manager startup terminates abnormally.

**System programmer response**

Verify the LPAR is correctly enabled for zNALC, or remove the SCUEAUTH library from the queue manager STEPLIB concatenation.

**CSQY027I**

*csect-name* AMS STARTING

**Severity**

0

**Explanation**

The Advanced Message Security (AMS) address space has been started because the system parameter SPLCAP is set to YES in the queue manager's ZPARM.

**System action**

Connections to the queue manager are permitted, but MQI calls that might require AMS function are suspended until AMS is available. Further messages are output when the AMS feature initializes.

**CSQY028I**

*csect-name* AMS HAS STARTED

**Severity**

0

**Explanation**

Advanced Message Security (AMS) initialization has completed successfully.

**System action**

Applications waiting for AMS function are resumed.

**CSQY029E**

*csect-name* QUEUE MANAGER STARTUP TERMINATED, AMS INITIALIZATION FAILED

**Severity**  
12

**Explanation**

A severe error occurred during initialization of Advanced Message Security (AMS).

**System action**

The queue manager abnormally terminates with abend code 6C6 and reason 00F00003.

**System programmer response**

Investigate the problem reported by preceding messages in the job log for the AMS address space (xxxxAMSM). Resolve the problem, then restart the queue manager. If you are unable to resolve the error, contact your IBM support center.

**CSQY030E**

*csect-name* QUEUE MANAGER TERMINATING, AMS NOT AVAILABLE

**Severity**  
12

**Explanation**

The Advanced Message Security (AMS) address space has ended abnormally due to an unrecoverable error.

**System action**

The queue manager abnormally terminates with abend code 6C6 and reason 00F00003.

**System programmer response**

Investigate the problem reported by preceding messages in the job log for the AMS address space (xxxxAMSM). Resolve the problem, then restart the queue manager. If you are unable to resolve the error, contact your IBM support center.

**CSQY031I**

*csect-name* QUEUE MANAGER WAITING FOR AMS INITIALIZATION

**Severity**  
0

**Explanation**

The Advanced Message Security (AMS) address space has been started because the system parameter SPLCAP is set to YES in the queue manager's ZPARM. This message is periodically issued until AMS initialization completes.

**System action**

Processing continues. Connections to the queue manager are permitted, but MQI requests that might require AMS function are suspended until AMS is available.

**System programmer response**

Investigate the delay in initializing Advanced Message Security by reviewing the messages output in the job log for the AMS address space (xxxxAMSM).

**CSQY032E**

*csect-name* QUEUE MANAGER STARTUP TERMINATED, UNABLE TO START AMS

**Severity**  
12

**Explanation**

The queue manager attempted to start the Advanced Message Security (AMS) address space because the system parameter SPLCAP is set to YES in the queue manager's ZPARM. The AMS address space (xxxxAMSM) failed to start, which might be because another job with the same name is active, or there is an error in the started task JCL.

**System action**

The queue manager abnormally terminates with abend code 6C6 and reason 00F00003.

**System programmer response**

Investigate why the AMS address space could not be started. Resolve the problem by terminating an existing address space if one is active, or correct the started task JCL if required, then restart the queue manager.

**CSQY033A**

*csect-name* QUEUE MANAGER NOT AVAILABLE, AMS INITIALIZATION ERROR

**Severity**

12

**Explanation**

A severe error occurred during initialization of Advanced Message Security (AMS).

**System action**

Queue manager startup is interrupted. The queue manager accepts commands, but MQI requests that might require AMS function fail with reason code 2063 (MQRC\_SECURITY\_ERROR).

**System programmer response**

Investigate the problem reported by preceding messages in the job log for the AMS address space (xxxxAMSM). Resolve the problem, then shutdown and restart the queue manager. If you are unable to resolve the error, contact your IBM support center.

**CSQY034I**

*csect-name* QUEUE MANAGER WAITING FOR AMS TO SHUTDOWN

**Severity**

0

**Explanation**

The queue manager is stopping and has requested the Advanced Message Security (AMS) address space (xxxxAMSM) ends. This message is periodically issued until AMS shutdown completes.

**System action**

The queue manager continues to wait for the AMS address space to end.

**System programmer response**

If this message is repeatedly issued examine the job log for the AMS address space to determine why it has not ended. If the problem cannot be resolved terminate the address space to allow queue manager shutdown to continue.

**CSQY035I**

*csect-name* AMS HAS SHUTDOWN

**Severity**

0

**Explanation**

The Advanced Message Security (AMS) address space (xxxxAMSM) has ended.

**System action**

Queue manager shutdown continues.

**CSQY100I**

*csect-name* SYSTEM parameters ...

**Explanation**

The queue manager is being started with the system parameter values shown in the following messages.

**System action**

Queue manager startup processing continues.

**CSQY101I**

CSQY102I, CSQY103I, CSQY104I, CSQY105I, CSQY106I, CSQY107I, CSQY108I, CSQY109I, CSQY130I: *csect-name* parms

**Explanation**

This series of messages shows the system parameter values that the queue manager is using. (Some values are followed by their internal hexadecimal representation in parentheses.) For information about the system parameters for the CSQ6SYSP macro, see Using CSQ6SYSP.

**System action**

Queue manager startup processing continues.

**CSQY110I**

*csect-name* LOG parameters ...

**Explanation**

The queue manager is being started with the log parameter values shown in the following messages.

**System action**

Queue manager startup processing continues.

**CSQY111I**

CSQY112I, CSQY113I: *csect-name* parms

**Explanation**

This series of messages shows the log parameter values that the queue manager is using. For information about the log parameters in the CSQ6LOGP macro, see Using CSQ6LOGP.

**System action**

Queue manager startup processing continues.

**CSQY120I**

*csect-name* ARCHIVE parameters ...

**Explanation**

The queue manager is being started with the archive parameter values shown in the following messages.

**System action**

Queue manager startup processing continues.

**CSQY121I**

CSQY122I, CSQY123I, CSQY124I: *csect-name* parms

**Explanation**

This series of messages shows the archive parameter values that the queue manager is using. For information about the archive parameters in the CSQ6ARVP macro, see Using CSQ6ARVP.

**System action**

Queue manager startup processing continues.

**CSQY200E**

*csect-name* ARM *request-type* for element *arm-element* type *arm-element-type* failed, rc=*rc*  
reason=*reason*

**Explanation**

An ARM request (IXCARM REQUEST=*request-type*) for the specified element failed. *rc* is the return code and *reason* is the reason code (both in hexadecimal) from the call.

**System action**

None.

**System programmer response**

See the z/OS MVS *Programming Sysplex Services Reference* manual for information about the return and reason codes from the IXCARM call. If you are unable to solve the problem, contact your IBM support center.

**CSQY201I**

*csect-name* ARM REGISTER for element *arm-element* type *arm-element-type* successful

**Explanation**

The specified element was successfully registered with ARM.

**System action**

None.

**CSQY202E**

*csect-name* ARM registration failed

**Explanation**

An attempt to register with ARM failed.

**System action**

Processing continues, but automatic restart is not available.

**System programmer response**

See the preceding CSQY200E message for more information about the failure.

**CSQY203E**

*csect-name* ARM *request-type* for element *arm-element* type *arm-element-type* timed out, rc=*rc*  
reason=*reason*

**Explanation**

An ARM request (IXCARM REQUEST=*request-type*) was issued but some predecessor element specified in the ARM policy did not issue an ARM READY request within its specified time interval.

**System action**

Processing continues.

**System programmer response**

None required. However, if your program cannot run without the predecessor element, some installation-defined action might be necessary.

**CSQY204I**

*csect-name* ARM DEREGISTER for element *arm-element* type *arm-element-type* successful

**Explanation**

The specified element was successfully deregistered from ARM.

**System action**

None.

**CSQY205I**

*csect-name* ARM element *arm-element* is not registered

**Explanation**

A STOP QMGR command requested ARM restart, but the queue manager was not registered for ARM.

**System action**

The queue manager stops normally, but will not be automatically restarted.

**System programmer response**

Restart the queue manager manually.

**CSQY210E**

*csect-name call-name* call for name *name-token* failed, *rc=rc*

**Explanation**

During processing for a group connect, a name token services call failed. *rc* is the return code (in hexadecimal) from the call.

**System action**

If the failure occurs in the batch adapter (*csect-name* CSQBCON or CSQBDSC), the application call will fail with a reason code of MQRC\_UNEXPECTED\_ERROR. Otherwise (*csect-name* CSQYGRA1), processing continues, but the group connect facility will not be available.

**System programmer response**

See the *MVS Authorized Assembler Services Reference* manual for information about the return codes from the name token services call. If you are unable to solve the problem, take a stand-alone system dump and contact your IBM support center.

**CSQY211I**

*csect-name* Unable to add entry to group connect name table (at *table-addr*)

**Explanation**

During initialization for the group connect facility, a new entry could not be added to the name table for this queue manager. The most likely cause is that there is already the maximum of 32 queue managers active in the group.

**System action**

Processing continues, but this queue manager will not be available for group connection.

**System programmer response**

Reduce the number of active queue managers and restart this queue manager. If this does not solve the problem, contact your IBM support center.

**CSQY212E**

*csect-name* Unable to find the group attach table

**Explanation**

During initialization for the group connect facility, the group attach table could not be found. The most likely causes are that an error occurred during subsystem initialization, or that the subsystem was not initialized with the latest version of the IBM MQ early code.

#### **System action**

Processing continues, but the group connect facility will not be available to CICS.

#### **System programmer response**

Ensure that the libraries with the latest version, release, or maintenance level of the IBM MQ early code are in the libraries used for the z/OS LPA, and refresh the early code for the queue manager using the IBM MQ command REFRESH QMGR TYPE(EARLY). See the Task 3: Update the z/OS link list and LPA.

#### **CSQY220I**

csect-name Queue manager storage usage : local storage : used *mmm*MB, free *nn*MB : above bar : used *aabb*,free *cc*

#### **Explanation**

This message displays the amount of virtual storage currently used and available:

- in the extended private region (local storage).
- above the Bar (64 bit storage).

The amount of storage used is displayed in the most appropriate unit (MB / GB) according to the number of bytes, and are approximations. If the amount of storage available exceeds 10 GB, '>10 GB' is displayed. In all other cases the amount of storage available is displayed in the most appropriate unit. For the amount of storage space available, the total is rounded down to a whole number in the appropriate unit (MB /GB). For example, if the value of 3 GB is displayed the amount of free storage is greater than or equal to 3 GB and less than 4 GB.

This message is logged at queue manager start and then either every hour if the usage does not change or when the memory usage changes (up or down) by more than 2%.

#### **System action**

Processing continues. Any special actions taken by IBM MQ or that are required, are indicated by the CSQY221I and CSQY222E messages.

#### **System programmer response**

No action is required at this time. However, a frequent occurrence of this message might be an indication that the system is operating beyond the optimum region for the current configuration.

#### **CSQY221I**

csect-name Queue manager is short of local storage

#### **Explanation**

The queue manager is running short of virtual storage in the extended private region.

#### **System action**

Processing continues. Storage contraction processing is performed, which attempts to remove unused storage from internal subpools so that it can be reused in other subpools. This might be necessary after a temporary need for a large amount of storage; for example, an unusually large unit of work being performed.

#### **System programmer response**

If only a few of these messages are output then no action is required at this time. However, a frequent occurrence of this message may be an indication that the system is operating beyond the optimum region for the current configuration and should be investigated.

**CSQY222E**

csect-name Queue manager is critically short of local storage - take action

**Explanation**

The queue manager is running critically short of virtual storage in the extended private region. Action should be taken to relieve the situation, and to avoid the possible abnormal termination of the queue manager.

**System action**

Processing continues. Storage contraction processing has been performed, but the remaining unallocated virtual storage is less than a predetermined safe amount. If storage use continues to increase, the queue manager might terminate abnormally in an unpredictable way.

**System programmer response**

Virtual storage is over-allocated for the current configuration. The following actions can reduce the virtual storage requirement:

- For buffer pools that have the LOCATION parameter set to BELOW, you can reduce buffer pool sizes with the ALTER BUFFPOOL command. Buffer pool statistics can be used to determine buffer pools which are over-allocated.
- Reduce the number of concurrent connections to the queue manager. The DISPLAY CONN command can be used to determine connections which are consuming queue manager resources.

If the problem persists after taking actions described above, it might be an indication of an internal error where storage is not freed (a 'storage leak'). If you suspect this, then collect at least two system dumps of the queue manager, separated by an interval of time, and contact your IBM support center.

**CSQY223I**

csect-name Queue manager is no longer short of local storage

**Explanation**

The queue manager is no longer short of virtual storage in the extended private region.

**System action**

Processing continues. Storage contraction processing has been performed, and the remaining unallocated virtual storage is more than a predetermined safe amount.

**CSQY224I**

csect-name Queue manager is short of local storage above the bar

**Explanation**

The queue manager is running short of virtual storage above the bar.

**System action**

Processing continues. Storage contraction processing is performed, which attempts to remove unused storage from internal subpools so that it can be reused in other subpools. This might be necessary after a temporary need for lots of storage; for example, more than the usual number of messages held on an indexed queue, or an unusually large unit of work being performed.

**CSQY225E**

csect-name Queue manager is critically short of local storage above the bar - take action

**Explanation**

The queue manager is running critically short of virtual storage above the bar. Action should be taken to relieve the situation, and to avoid the possible abnormal termination of the queue manager.

**System action**

Processing continues. Storage contraction processing has been performed, but the remaining unallocated virtual storage is less than a predetermined safe amount. If storage use continues to increase, the queue manager might terminate abnormally in an unpredictable way.

**CSQY226I**

*csect-name* Queue manager is no longer short of local storage above the bar

**Explanation**

The queue manager is no longer short of virtual storage above the bar.

**System action**

Processing continues. Storage contraction processing has been performed, and the remaining unallocated virtual storage is more than a predetermined safe amount.

**CSQY227E**

*csect-name* Unable to allocate storage above the bar using IARV64, RC=*rc*, reason=*reason*

**Explanation**

A request by the queue manager to allocate storage above the bar failed. *rc* is the return code and *reason* is the reason code (both in hexadecimal) from the z/OS IARV64 service.

**System action**

The queue manager will attempt to recover from the error. If recovery is not possible an application or queue manager abend, for example 5C6-00A30042, 5C6-00A31000 or 5C6-00E20045, will occur.

**CSQY228E**

ACE pool cannot be extended, ACELIM reached

**Explanation**

The internal storage pool used to manage control blocks representing new connections to the queue manager has reached the limit defined by the ACELIM system parameter.

**System action**

Queue manager processing continues. New connection requests might have failed, message CSQ3202E or CSM078E give further information about the affected jobs.

**System programmer response**

Review the configured ACELIM value. It might be useful to use a STATISTICS CLASS(2) trace to establish the normal size of the ACE pool.

See Address space storage for more information.

**CSQY270E**

*csect-name* UNRECOGNIZED MESSAGE NUMBER *message-id*

**Severity**

8

**Explanation**

An unsuccessful attempt has been made to issue the message *message-id*. This message is issued only if the requested message could not be found in the IBM MQ message directory.

**System action**

Processing continues as though the requested message had been issued.

**System programmer response**

Use the message number (*message-id*) and look up the message in this product documentation. If you are using a language other than US English, ensure that you have installed the language feature correctly and that you have the appropriate load library data set concatenations in your job. Apart from that possibility, this might be an MQ system problem; see Troubleshooting and support.

**Note:** Messages are also used to provide text for constructing panels and reports. If such a message cannot be found, message CSQY270E will appear on the panel or report, generally in truncated form.

#### **CSQY271I**

MESSAGE GENERATOR INITIALIZATION PARAMETERS NOT FOUND. DEFAULTS ASSUMED

#### **Severity**

4

#### **Explanation**

The message generator was unable to access the routing code initialization parameter defined by the CSQ6SYSP macro. Default values defined by that macro are assumed.

#### **System action**

Queue manager initialization continues.

#### **System programmer response**

It might be necessary to change the CSQ6SYSP macro. For information about the system parameters for the CSQ6SYSP macro, see Using CSQ6SYSP.

#### **CSQY290E**

*csect-name* NO STORAGE AVAILABLE

#### **Severity**

4

#### **Explanation**

There was insufficient storage available for a system routine. *csect-name* shows the system routine function:

#### **CSQAXDPS, CSQVXDPS**

User exits (other than channel)

#### **CSQXARMY**

Channel initiator automatic restart

#### **CSQXDCTS, CSQXTRPG**

Channel initiator trace

#### **CSQXDMPS**

Channel initiator system dump

#### **CSQXLDXS**

User channel exits

#### **CSQ2GFRR, CSQ2MFRR**

IMS bridge system dump

#### **System action**

Processing continues, but the function provided by the system routine will be inhibited. For example, if the routine is CSQXLDXS, then user channel exits will not be available, and channels that use them will not start.

**System programmer response**

If the problem occurs in the queue manager, increase the size of the its address space, or reduce the number of queues, messages, and threads being used.

If the problem occurs in the channel initiator, increase the size of the its address space, or reduce the number of dispatchers, adapter subtasks, SSL server subtasks, and active channels being used.

**CSQY291E**

*csect-name* SDUMPX FAILED, RC=0000*ssrr*, *dump-identifier*

**Severity**

4

**Explanation**

The system dump routine was unable to issue a dump; the dump identifier was as shown in the message. *rr* is the return code and *ss* is the reason code (both in hexadecimal) from the z/OS SDUMPX service.

**System action**

Processing continues.

**System programmer response**

See the *MVS Authorized Assembler Services Reference* manual for information about the return code and reason code from the SDUMPX request.

**CSQY330I**

Queue manager has restricted functionality

**Explanation**

The installation and customization options chosen for IBM MQ do not allow all functions to be used.

**System action**

Queue manager startup processing continues.

**CSQY331E**

*parm* value not allowed - restricted functionality

**Explanation**

The value specified for the *parm* system parameter is not allowed because the installation and customization options chosen for IBM MQ do not allow all functions to be used.

**System action**

The queue manager does not start.

**CSQY332I**

IMS Bridge not available - restricted functionality

**Explanation**

The IBM MQ-IMS bridge cannot operate because the installation and customization options chosen for IBM MQ do not allow all functions to be used.

**System action**

The MQ-IMS bridge does not start.

**CSQY333E**

Command not allowed - restricted functionality

**Explanation**

The command that was issued is not allowed because the installation and customization options chosen for IBM MQ do not allow all functions to be used.

**z/OS** For example, the queue manager might have been migrated from a previous version, and is currently operating with OPMODE=COMPAT. The function requested is not available in compatibility mode. See z/OS: OPMODE for more information.

#### System action

The command is ignored.

#### CSQY334E

*csect-name keyword(value)* not allowed - restricted functionality

#### Explanation

The value specified for the keyword is not allowed because the installation and customization options chosen for IBM MQ do not allow all functions to be used.

#### System action

The command is ignored.

#### System programmer response

Check for message CSQ5037I, resolve the problem, and restart this queue manager. To access IBM MQ V8.0 capabilities, ensure that you have OPMODE=(NEWFUNC,800) specified in the **CSQ6SYSP** macro.

#### CSQY335E

*csect-name Channel channel-name* unusable - restricted functionality

#### Explanation

The channel cannot be used because the installation and customization options chosen for IBM MQ do not allow all functions to be used.

#### System action

The requested operation fails.

#### CSQY336E

*csect-name keyword* not allowed - restricted functionality

#### Explanation

The keyword is not allowed because the installation and customization options chosen for IBM MQ do not allow all functions to be used.

**z/OS** For example, the queue manager might have been migrated from a previous version, and is currently operating with OPMODE=COMPAT. The function requested is not available in compatibility mode; see z/OS: OPMODE for further information.

#### System action

The command is ignored.

#### CSQY337E

*csect-name keyword* value length not allowed - restricted functionality

#### Explanation

The length of the value specified for the keyword is not allowed because the installation and customization options chosen for IBM MQ do not allow all functions to be used.

**z/OS** For example, the queue manager might have been migrated from a previous version, and is currently operating with OPMODE=COMPAT. The function requested is not available in compatibility mode; see z/OS: OPMODE for further information.

**System action**

The command is ignored.

**CSQY340E**

Queue manager has restricted functionality, but previously had full functionality. Unsupported objects will be deleted (losing messages), invalid attributes will be changed

**Explanation**

The installation and customization options chosen for IBM MQ do not allow all functions to be used. However, the queue manager has run previously without any functional restriction, and so might have objects and attribute settings that are not allowed with the restricted functionality.

In order to continue, these objects must be deleted (which might mean that messages are lost) and the attributes must be changed. The queue manager does this automatically.

**System action**

Message CSQY341D is issued and the operator's reply is awaited.

**System programmer response**

The operator has two options:

- Allow the queue manager to delete the objects and change the attributes, by replying 'Y'.
- Cancel the queue manager, by replying 'N'.

**CSQY341D**

Reply Y to continue or N to cancel

**Explanation**

The installation and customization options chosen for IBM MQ have changed, as indicated in the preceding CSQY340E message.

**System action**

The queue manager waits for the operator's reply

**System programmer response**

See message CSQY340E.

**CSQY342I**

Deleting objects and changing attributes - restricted functionality

**Explanation**

This message is sent if the operator answers 'Y' to message CSQY341D.

**System action**

The queue manager deletes the objects and changes the attributes that are not allowed with the restricted functionality.

**CSQY343I**

Queue manager terminating - restricted functionality not accepted

**Explanation**

This message is sent if the operator answers 'N' to message CSQY341D.

**System action**

The queue manager does not start.

## Advanced Message Security (CSQ0...):

### CSQ0101E

*csect-name* Internal message protection error, reason *reason*, diagnostics: *value1,value2*

#### Severity

8

#### Explanation

An internal error occurred during message protection processing.

#### System action

For a put operation, the message is rejected.

For a get operation, the message is moved to the error queue, **SYSTEM.PROTECTION.ERROR.QUEUE**.

#### System programmer response

You should check that the message has valid WebSphere MQ headers, if not, contact your IBM support center.

### CSQ0105E

*csect-name* Internal error occurred, reason *reason*, diagnostics: *value*

#### Severity

8

#### Explanation

An internal error occurred during message protection processing.

#### System action

The message queue interface (MQI) call fails.

#### System programmer response

Contact your IBM support center.

### CSQ0109E

*csect-name* SDUMP failed, return code *rc*, reason *reason*

#### Severity

8

#### Explanation

An attempt to issue an SDUMP during abend processing failed.

#### System action

SDUMP diagnostics are not generated.

#### System programmer response

Review the return code and reason in conjunction with SDUMP documentation to resolve the problem.

### CSQ0110I

*csect-name* AMS abend *abend*, reason *reason*

#### Severity

8

#### Explanation

An abend has occurred during message protection processing of type *abend* for reason *reason*.

**System action**

The message queue interface (MQI) call fails and the WebSphere MQ subsystem might terminate.

**System programmer response**

Use the abend and reason code information to resolve the issue.

If the problem cannot be resolved contact your IBM support center.

**CSQ0111I**

*csect-name* Module offset *offset*, level *level*

**Severity**

0

**Explanation**

The *module* and *level* are reported for diagnostic purposes following an abend during message protection processing.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0112I**

*csect-name* PSW SDWAEC1, SDWAEC1, SDWAAEC1, SDWAAEC1

**Severity**

0

**Explanation**

Relevant Program Status Word (PSW) fields are reported following an abend during message protection processing.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0113I**

*csect-name* CAB *value1*, *value2*, *value3*, *value4*

**Severity**

0

**Explanation**

Relevant internal fields are reported following an abend during message protection processing.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0114I**

*csect-name R0-R3 gpr0, gpr1, gpr2, gpr3*

**Severity**

0

**Explanation**

General purpose registers 0 through 3 are reported following an abend during message protection processing.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0115I**

*csect-name R4-R7 gpr4, gpr5, gpr6, gpr7*

**Severity**

0

**Explanation**

General purpose registers 4 through 7 are reported following an abend during message protection processing.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0116I**

*csect-name R8-R11 gpr8, gpr9, gpr10, gpr11*

**Severity**

0

**Explanation**

General purpose registers 8 through 11 are reported following an abend during message protection processing.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0117I**

*csect-name R12-R15 gpr12, gpr13, gpr14, gpr15*

**Severity**

0

**Explanation**

General purpose registers 12 through 15 are reported following an abend during message protection processing.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0118I**

*csect-name A0-A3 ar0, ar1, ar2, ar3*

**Severity**

0

**Explanation**

Access registers 0 through 3 are reported following an abend during message protection processing.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0119I**

*csect-name A4-A7 ar4, ar5, ar6, ar7*

**Severity**

0

**Explanation**

Access registers 4 through 7 are reported following an abend during message protection processing.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0120I**

*csect-name A8-A11 ar8, ar9, ar10, ar11*

**Severity**

0

**Explanation**

Access registers 8 through 11 are reported following an abend during message protection processing.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0121I**

*csect-name A12-A15 ar12, ar13, ar14, ar15*

**Severity**

0

**Explanation**

Access registers 12 through 15 are reported following an abend during message protection processing.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0137I**

*csect-name* SDUMP not taken, suppressed by DAE

**Severity**

0

**Explanation**

An SDUMP was suppressed due to Dump Analysis and Elimination (DAE).

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0151E**

*csect-name* Failed to allocate storage

**Severity**

8

**Explanation**

An attempt to allocate storage during message protection processing failed.

**System action**

The message queue interface (MQI) call fails.

**System programmer response**

Increase the amount of storage available.

**CSQ0174E**

*csect-name* Failed to load module *module*, return code *abncode*, reason *rsncode*

**Severity**

8

**Explanation**

An attempt to load a module into storage failed.

**System action**

The WebSphere MQ subsystem fails to start.

**System programmer response**

Use the abend and reason code in conjunction with documentation for the **LOAD** macro to resolve the problem.

**CSQ0175E**

*csect-name* Failed to delete module *module*, return code *rc*

**Severity**  
8

**Explanation**

An attempt to delete a loaded module failed.

**System action**

The module remains loaded.

**System programmer response**

Use the return code in conjunction with documentation for the **DELETE** macro to resolve the problem.

**CSQ0201E**

*csect-name* Message table not available

**Severity**  
8

**Explanation**

An attempt to load the message protection component message file failed.

**System action**

The WebSphere MQ subsystem fails to start.

**System programmer response**

Verify that the WebSphere MQ subsystem has been installed correctly. If the problem persists contact your IBM support center.

**CSQ0204I**

*csect-name* AMS is using *use-size* MB of local storage, *free-size* MB free

**Severity**  
0

**Explanation**

The amount of storage currently used for message protection services is currently *use-size* MB, and a further *free-size* remains free.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0209E**

*csect-name* Message for *qname* sent to error queue, MQRC=*mqr*c (*mqr*c-text)

**Severity**  
4

**Explanation**

During get processing a protected message on queue *qname* could not be processed for reason *mqr*c, and has been sent to the error queue, **SYSTEM.PROTECTION.ERROR.QUEUE** (*mqr*c-text provides the MQRC in textual form).

### System action

The message is placed on the error queue and an error is returned to the requesting application.

### System programmer response

Examine the message on the error queue and the reason code to determine why the message could not be processed.

You should check the sender and receiver policies. For example, when setting the policy:

- Specify the State or Province using ST=
- The following special characters need escape characters:
  - , (comma)
  - + (plus)
  - " (double quote)
  - \ (backslash)
  - < (less than)
  - > (greater than)
  - ; (semicolon)
- If the Distinguished Name contains embedded blanks, you should enclose the DN in double quotation marks.

### CSQ0210E

*csect-name* Failed to redirect message to error queue, MQRC=*mqr*c (*mqr*c-text)

### Severity

8

### Explanation

An attempt during message protection processing to put a message to the error queue, **SYSTEM.PROTECTION.ERROR.QUEUE**, failed for reason *mqr*c (*mqr*c-text provides the MQRC in textual form).

### System action

The get request fails and the message remains on the target queue.

### System programmer response

Examine the message on the target queue and the reason code to determine why the message could not be processed or placed on the error queue.

### CSQ0213E

*csect-name* Internal queue close failed MQCC=*mqq*c MQRC=*mqr*c (*mqr*c-text)

### Severity

8

### Explanation

During open processing for a protected queue protection initialization failed and an attempt to internally close the queue failed.

### System action

The open request fails.

### System programmer response

Examine the completion and reason codes to determine the cause of the failure.

### CSQ0214E

*csect-name* Message protection initialization failed, return code *rc*, reason *reason*

**Severity**

8

**Explanation**

During open processing for a protected queue protection initialization failed.

**System action**

The open request fails.

**System programmer response**

Examine the completion and reason codes to determine the cause of the failure. For more information, see Messages and codes in the *z/OS Cryptographic Services System SSL Programming* documentation.

**CSQ0215E**

*csect-name* Message protection failed, return code *rc*, reason *reason*

**Severity**

8

**Explanation**

An attempt to protect a message failed during put processing.

**System action**

The message is not put to the queue.

**System programmer response**

Examine the completion and reason codes to determine the cause of the failure. For more information, see Messages and codes in the *z/OS Cryptographic Services System SSL Programming* documentation.

**CSQ0216E**

*csect-name* Message unprotection failed, return code *rc*, reason *reason*

**Severity**

8

**Explanation**

An attempt to process a protected message during get processing failed.

**System action**

The message is moved to the error queue, **SYSTEM.PROTECTION.ERROR.QUEUE**, if possible.

**System programmer response**

Examine the completion and reason codes to determine the cause of the failure. For more information, see Messages and codes in the *z/OS Cryptographic Services System SSL Programming* documentation.

**CSQ0217E**

*csect-name* Failed to process object '*objname*'

**Severity**

8

**Explanation**

An attempt to initialize, protect, or process a protected message failed for the object named by *objname*.

**System action**

The open, get or put request fails.

**System programmer response**

Examine preceding or subsequent console messages for more information.

**CSQ0218E**

*csect-name* Privacy policy for *qname* invalid. No recipients

**Severity**

8

**Explanation**

During open or put1 processing, a privacy policy was stipulated for the object *qname*, but the policy failed to identify any recipients.

**System action**

The open or put1 request fails.

**System programmer response**

Modify or delete the protection policy for the object *qname*.

**CSQ0219E**

*csect-name* Message verification error for *qname*

**Severity**

8

**Explanation**

During put or get processing an attempt to process a message failed due to unexpected header values or offsets.

**System action**

The put or get operation fails.

For get processing the message is moved to the error queue, **SYSTEM.PROTECTION.ERROR.QUEUE**.

**System programmer response**

Examine the failing message to determine the cause of the problem.

**CSQ0220E**

*csect-name* Encryption strength not available

**Severity**

8

**Explanation**

During get processing a protected message did not specify an encryption strength.

**System action**

The get request fails and the message is moved to the error queue, **SYSTEM.PROTECTION.ERROR.QUEUE**.

**System programmer response**

Examine the message on the error queue to determine its origin and why it is not correctly protected.

**CSQ0221E**

*csect-name* Message encryption strength *encstr* not valid

**Severity**  
8

**Explanation**

During get processing a protected message did not have a recognized encryption strength.

**System action**

The get request fails and the message is moved to the error queue,  
**SYSTEM.PROTECTION.ERROR.QUEUE.**

**System programmer response**

Examine the message on the error queue to determine its origin and why it does not have a valid encryption strength.

Some encryption algorithms are supported on some platforms, however, not on others.

**CSQ0222E**

*csect-name* Message encryption strength *encstr* inconsistent with policy

**Severity**  
8

**Explanation**

During get processing a protected message did not use an encryption algorithm that matches the expected encryption strength.

**System action**

The get request fails and the message is moved to the error queue,  
**SYSTEM.PROTECTION.ERROR.QUEUE.**

**System programmer response**

Examine the message on the error queue to determine its origin and why the encryption algorithm does not match the expected encryption strength.

Some encryption algorithms are supported on some platforms, however, not on others.

**CSQ0223E**

*csect-name* Message size *m-size* inconsistent with header size *h-size* or original size *o-size*

**Severity**  
8

**Explanation**

During get processing a protected message was found to have a header or overall message size that did not match the original unprotected message.

**System action**

The get request fails and the message is moved to the error queue,  
**SYSTEM.PROTECTION.ERROR.QUEUE.**

**System programmer response**

Examine the message on the error queue to determine why its lengths are inconsistent with the original unprotected message.

**CSQ0224E**

*csect-name* Message buffer length of *m-size* too small

**Severity**

8

**Explanation**

During get processing a protected message was of insufficient length to contain a standard protection header and could not be processed.

**System action**

The get request fails and the message is moved to the error queue,  
**SYSTEM.PROTECTION.ERROR.QUEUE.**

**System programmer response**

Examine the message on the error queue to determine why it is of insufficient length.

**CSQ0225E**

*csect-name* Message header not acceptable, structure identifier is '*strucid*'

**Severity**

8

**Explanation**

During get processing a protected message did not have the expected protection header eye-catcher, but instead had *strucid*.

**System action**

The get request fails and the message is moved to the error queue,  
**SYSTEM.PROTECTION.ERROR.QUEUE.**

**System programmer response**

Examine the message on the error queue to determine why it has an invalid protection header.

**CSQ0226E**

*csect-name* Header version not supported

**Severity**

8

**Explanation**

During get processing a protected message did not have the expected protection header version.

**System action**

The get request fails and the message is moved to the error queue,  
**SYSTEM.PROTECTION.ERROR.QUEUE.**

**System programmer response**

Examine the message on the error queue to determine why it has an invalid protection header.

**CSQ0227E**

*csect-name* Message signature algorithm *sig-alg* not valid

**Severity**

8

**Explanation**

During get processing a protected message did not have a recognized signature algorithm.

**System action**

The get request fails and the message is moved to the error queue,  
**SYSTEM.PROTECTION.ERROR.QUEUE.**

**System programmer response**

Examine the message on the error queue to determine its origin and why it does not have a valid signature algorithm. Some signature algorithms are supported on some platforms, however, not on others.

**CSQ0228E**

*csect-name* Message signature algorithm *sig-alg* inconsistent with policy

**Severity**

8

**Explanation**

During get processing a protected message did not use a signature algorithm that matches the expected signature strength.

**System action**

The get request fails and the message is moved to the error queue,  
**SYSTEM.PROTECTION.ERROR.QUEUE.**

**System programmer response**

Examine the message on the error queue to determine its origin and why the signature algorithm does not match the expected signature strength. Some signature algorithms are supported on some platforms, however, not on others.

**CSQ0229E**

*csect-name* Unable to verify sender distinguished name

**Severity**

8

**Explanation**

During get processing the distinguished name of the message sender was not present to be verified.

**System action**

The get request fails and the message is moved to the error queue,  
**SYSTEM.PROTECTION.ERROR.QUEUE.**

**System programmer response**

Examine the message on the error queue to determine why it does not have a distinguished name for the sender of the message.

**CSQ0230E**

*csect-name* Structure identifier *strucid* invalid for format name *format*

**Severity**

8

**Explanation**

During message protection processing a message header did not have the expected value for the message format indicated.

**System action**

The MQI call fails. For a get request the message is moved to the error queue,  
**SYSTEM.PROTECTION.ERROR.QUEUE.**

**System programmer response**

Examine the failing message formats and headers to determine the cause of the problem.

**CSQ0231E**

*csect-name* Unrecognized version *version* for structure *strucid*, format name *format*

**Severity**

8

**Explanation**

During message protection processing a message header version did not have the expected value for the message format and header indicated.

**System action**

The MQI call fails. For a get request the message is moved to the error queue,  
**SYSTEM.PROTECTION.ERROR.QUEUE.**

**System programmer response**

Examine the failing message formats and headers to determine the cause of the problem.

**CSQ0232E**

*csect-name* Buffer length insufficient for format name *format*

**Severity**

8

**Explanation**

During message protection processing a message length was insufficient to account for the length of a header indicated by the message format.

**System action**

The MQI call fails. For a get request the message is moved to the error queue,  
**SYSTEM.PROTECTION.ERROR.QUEUE.**

**System programmer response**

Examine the failing message formats and headers to determine the cause of the problem.

**CSQ0233E**

*csect-name* Message *msg-size* of size does not match original size of *orig-size*

**Severity**

8

**Explanation**

During get processing a protected message length does not resolve to the original length of the message before it was protected.

**System action**

The get request fails and the message is moved to the error queue,  
**SYSTEM.PROTECTION.ERROR.QUEUE.**

**System programmer response**

Examine the message on the error queue to determine why it has a different length than expected.

## CSQ0240E

*csect-name* No storage for error queue processing for *qname*

**Severity**  
8

### Explanation

During get processing a message that failed protection processing could not be put to the error queue, **SYSTEM.PROTECTION.ERROR.QUEUE**, due to insufficient storage.

### System action

The get request fails and the message remains on the queue *qname*.

### System programmer response

Determine the cause of storage shortage and retry the get operation.

## CSQ0400I

CSQ0UTIL IBM WebSphere MQ AMS for z/OS *vrn*

**Severity**  
0

### Explanation

The IBM WebSphere MQ Advanced Message Security policy utility, CSQ0UTIL, is starting for utility version *v*, release *r*, and modlevel *m*.

### System action

Processing continues.

### System programmer response

None.

## CSQ0401I

Queue Manager Protection Policy Utility

**Severity**  
0

### Explanation

The IBM WebSphere MQ Advanced Message Security policy utility, CSQ0UTIL, has started.

### System action

Processing continues.

### System programmer response

None.

## CSQ0402I

Command Name: *command*

**Severity**  
0

### Explanation

The IBM WebSphere MQ Advanced Message Security policy utility is processing the policy command *command*.

### System action

Processing continues.

**System programmer response**

None.

**CSQ0403I**

Arguments: *args*

**Severity**

0

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility is processing arguments *args* for the current policy command.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0404E**

Insufficient storage available to perform command

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility could not allocate storage to process the input command.

**System action**

The IBM WebSphere MQ Advanced Message Security policy utility terminates without executing the current input command.

**System programmer response**

Determine why there is insufficient storage for the policy utility then rerun the utility when the problem has been resolved.

**CSQ0405E**

An error occurred running command *cmd-number* on line *line number*

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility encountered an error during the processing of command *cmd-number* at line *line-number* of the input.

**System action**

The IBM WebSphere MQ Advanced Message Security policy utility processing fails for the command identified by *cmd-number* at line *line-number*.

**System programmer response**

Examine the failing command and related messages to determine the cause of the failure.

**CSQ0406E**

Invalid command found on line *line-number*. Valid commands are SETMQSPL and DSPMQSPL

**Severity**  
8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility did not recognize the input command at line *line-number* of the input.

**System action**

The IBM WebSphere MQ Advanced Message Security policy utility does not process the command at line *line-number*.

**System programmer response**

Change the input command to either **SETMQSPL** or **DSPMQSPL**.

**CSQ0407E**

Quoted string on line *line-number* does not have a terminating quote

**Severity**  
8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility could not align matching quotes when processing the input command at line *line-number*.

**System action**

The IBM WebSphere MQ Advanced Message Security policy utility does not process the command at line *line-number*.

**System programmer response**

Change the command at line *line-number* to use consistent and matching quotes in the arguments.

**CSQ0408I**

*cmd-count* policy commands have been completed successfully

**Severity**  
0

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility has successfully processed *cmd-count* commands.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0409I**

Reached end of input, *num-line* lines read

**Severity**  
0

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility reached end of input after *num-line* lines.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0410E**

Error opening SYSIN data set

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility could not open the standard input (SYSIN DD) to read input commands.

**System action**

No commands are processed.

**System programmer response**

Determine why the SYSIN DD is unavailable and resolve the problem, then rerun the policy utility.

**CSQ0411E**

Unexpected internal error

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility did not recognize the input command.

**System action**

The input command is not processed.

**System programmer response**

Examine the command input and verify that the input expresses a valid command with valid parameters.

**CSQ0412I**

Policy name: *policy-name*

**Severity**

0

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility is displaying information about the policy identified by *policy-name*.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0413I**

Encryption algorithm: *enc-alg*

**Severity**  
0

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility is displaying the encryption algorithm *enc-alg* for a given policy.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0414I**

Recipient DNs: *recipient-dns*

**Severity**  
0

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility is displaying the recipient distinguished names, *recipient-dns*, for a given policy.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0415I**

Signature algorithm: *sig-alg*

**Severity**  
0

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility is displaying the signature algorithm, *sig-alg*, for a given policy.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0416I**

Signer DNs: *signer-dns*

**Severity**  
0

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility is displaying the signer distinguished names, *signer-dns*, for a given policy.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0417I**

Quality of protection: *qop*

**Severity**

0

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility is displaying the quality of protection, *qop*, for a given policy.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0418I**

Toleration: *toleration-flag*

**Severity**

0

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility is displaying the toleration flag, *toleration-flag*, for a given policy.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0447E**

Failed to open EXPORT DD, exporting to STDOUT

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility could not open the EXPORT DD to process a -export request.

**System action**

The policy export is sent to STDOUT.

**System programmer response**

Determine why the EXPORT DD is unavailable and resolve the problem, then rerun the policy utility.

**CSQ0448E**

Command failed

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility failed to successfully process an input command.

**System action**

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

**System programmer response**

Determine the reason for the failing command by examining related messages, and correct the failing input command.

**CSQ0449I**

Command successful

**Severity**

0

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility successfully processed an input command.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0450E**

Syntax error. Usage: setmqspl -m (qm) -p (policy) -s (sigalg) -a (signer DN) -e (encalg) -r (receiver DN)

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility failed to interpret a command due to bad command syntax.

**System action**

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

**System programmer response**

Correct the syntax of the failing command then retry.

**CSQ0451E**

Invalid queue manager name: *qmgr-name*

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility encountered an invalid queue manager name value, *qmgr-name*, when processing an input command.

**System action**

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

**System programmer response**

Correct the queue manager name value in the input command then retry.

**CSQ0452E**

Invalid policy name: *policy-name*

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility encountered an invalid policy name when processing an input command.

**System action**

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

**System programmer response**

Correct the policy name value in the input command then retry.

**CSQ0453E**

Invalid encryption algorithm

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility encountered an invalid encryption algorithm when processing an input command.

**System action**

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

**System programmer response**

Correct the encryption algorithm value in the input command then retry.

**CSQ0454E**

Invalid signature algorithm

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility encountered an invalid signature algorithm when processing an input command.

**System action**

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

**System programmer response**

Correct the signature algorithm value in the input command and retry.

**CSQ0455E**

Encryption requires the use of a signature algorithm

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility encountered an invalid command that identified an encryption algorithm, but did not also identify a valid signature algorithm.

**System action**

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

**System programmer response**

Provide both a valid encryption algorithm and a valid signature algorithm when defining privacy protection policies.

**CSQ0456E**

Encryption requires a receiver DN to be specified (-r)

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility encountered an invalid command that identified an encryption algorithm, but did not also identify at least one recipient DN via the -r parameter.

**System action**

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

**System programmer response**

Provide both an encryption algorithm and at least one recipient DN when defining privacy protection policies.

**CSQ0457E**

Invalid receiver DN specified: *receiver-dn*

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility encountered an invalid receiver distinguished name, *receiver-dn*, when processing an input command.

**System action**

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

**System programmer response**

Correct the receiver distinguished name in the input command then retry.

## CSQ0458E

Receiver DN is specified while no encryption is enabled

### Severity

8

### Explanation

The IBM WebSphere MQ Advanced Message Security policy utility encountered an invalid command that identified at least one recipient DN, however, did not also identify an encryption algorithm when processing the -e parameter.

### System action

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

### System programmer response

Provide both an encryption algorithm and at least one recipient DN when defining privacy protection policies.

## CSQ0459E

Invalid signer DN specified: *signer-dn*

### Severity

8

### Explanation

The IBM WebSphere MQ Advanced Message Security policy utility encountered an invalid signer distinguished name, *signer-dn*, when processing an input command.

### System action

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

### System programmer response

Correct the signer distinguished name value in the input command then retry.

## CSQ0460E

Signer DN is specified while no signing is enabled

### Severity

8

### Explanation

The IBM WebSphere MQ Advanced Message Security policy utility encountered an invalid command that identified at least one signer DN using the -a parameter, however, did not also identify a signature algorithm using the -s parameter.

### System action

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

### System programmer response

Provide both an encryption algorithm and at least one recipient DN when defining privacy protection policies.

## CSQ0461E

Queue **SYSTEM.PROTECTION.POLICY.QUEUE** unavailable, MQCC=*mqcc* MQRC=*mqrc* (*mqrc-text*)

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility could not open the policy queue, **SYSTEM.PROTECTION.POLICY.QUEUE**, due to an error identified by *mqcc* and *mqrc* (*mqrc-text* provides the MQRC in textual form).

**System action**

Processing ends.

**System programmer response**

Determine the reason the policy queue is unavailable using the *mqcc* and *mqrc*, then resolve the problem.

**CSQ0462E**

Failed to retrieve protection policy, MQCC=*mqcc* MQRC=*mqrc* (*mqrc-text*)

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility could not retrieve a policy from the policy queue, **SYSTEM.PROTECTION.POLICY.QUEUE**, due to an error identified by *mqcc* and *mqrc* (*mqrc-text* provides the MQRC in textual form).

**System action**

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

**System programmer response**

Determine the reason the policy could not be retrieved from the policy queue, then resolve the problem.

**CSQ0463E**

Policy update failed due to concurrent update, MQCC=*mqcc* MQRC=*mqrc* (*mqrc-text*)

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility detected that a policy was changed by another process when it was trying to update or create the same policy, due to an error identified by *mqcc* and *mqrc* (*mqrc-text* provides the MQRC in textual form).

**System action**

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

**System programmer response**

Verify the policy is correct, then update the policy again if necessary.

**CSQ0464E**

Policy definition not found, MQCC=*mqcc* MQRC=*mqrc* (*mqrc-text*)

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility could not find a policy on the policy queue, **SYSTEM.PROTECTION.POLICY.QUEUE**, when a policy was expected, due to an error identified by *mqcc* and *mqrc* (*mqrc-text* provides the MQRC in textual form).

**System action**

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

**System programmer response**

Determine the reason the policy could not be retrieved from the policy queue, then resolve the problem.

**CSQ0465E**

An unexpected error occurred, MQCC=*mqcc* MQRC=*mqrc* (*mqrc-text*)

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility encountered an unexpected MQI error when processing an input command, identified by *mqcc* and *mqrc* (*mqrc-text* provides the MQRC in textual form).

**System action**

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

**System programmer response**

Determine the reason the for the MQI error, then resolve the problem.

**CSQ0466E**

Invalid value specified for toleration flag, specify one of (0, 1)

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility encountered an invalid value for the toleration parameter.

**System action**

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

**System programmer response**

Use a value of 0 (false) or 1 (true) for the toleration parameter when creating or modifying a policy.

**CSQ0467E**

Failed to connect to the queue manager, MQCC=*mqcc* MQRC=*mqrc* (*mqrc-text*)

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility could not connect to the input queue manager to process further input commands, due to an error identified by *mqcc* and *mqrc* (*mqrc-text* provides the MQRC in textual form).

**System action**

Processing ends.

**System programmer response**

Determine the reason the queue manager is unavailable, then resolve the problem.

**CSQ0468I**

No policies found

**Severity**

0

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility found no policies matching the specified parameters.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0470E**

Syntax error. Usage: dspmqspl -m (qm) -p (policy) -export

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility failed to interpret a command due to incorrect syntax.

**System action**

The current command is not processed and the IBM WebSphere MQ Advanced Message Security policy utility attempts to process the next input command, if any.

**System programmer response**

Correct the syntax of the failing command then retry.

**CSQ0499I**

CSQ0UTIL Utility completed return code=*retcode*

**Severity**

0

**Explanation**

The IBM WebSphere MQ Advanced Message Security policy utility, CSQ0UTIL, has completed with return code *retcode*.

**System action**

Processing continues.

**System programmer response**

If the utility did not complete successfully refer to other messages in the output to determine the cause of any errors.

#### **CSQ0501I**

*csect-name* SMF recording enabled for record type *record-type*

#### **Severity**

0

#### **Explanation**

IBM WebSphere MQ Advanced Message Security has enabled SMF record generation for record type *record-type*.

#### **System action**

Processing continues.

#### **System programmer response**

None.

#### **CSQ0502I**

*csect-name* SMF recording disabled

#### **Severity**

0

#### **Explanation**

IBM WebSphere MQ Advanced Message Security has disabled SMF record generation.

#### **System action**

Processing continues.

#### **System programmer response**

None.

#### **CSQ0503I**

*csect-name* SMF record write failed, return code *retcode*

#### **Severity**

8

#### **Explanation**

An attempt to generate an SMF audit record using SMFEWTM failed during message protection processing with return code *retcode*.

#### **System action**

The SMF record is not generated.

#### **System programmer response**

Examine the *retcode* and documentation for the SMFEWTM macro to determine the cause of the failure.

#### **CSQ0600I**

*csect-name* IBM WebSphere MQ AMS for z/OS, *version*, *service-level*

#### **Severity**

0

#### **Explanation**

The IBM WebSphere MQ Advanced Message Security task is running at version *version* and service level *service-level*.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0601I**

*csect-name* Environment variable *varname* has an invalid value, using default '*value*'

**Severity**

8

**Explanation**

A IBM WebSphere MQ Advanced Message Security environment variable, *varname*, was set to an invalid value, resulting in the use of a default value, *value*, for the variable.

**System action**

Processing continues with the default value for the named environment variable.

**System programmer response**

Change the environment variable assignment to a valid value if the default is not acceptable.

**CSQ0602I**

*csect-name* AMS initialization complete

**Severity**

0

**Explanation**

The IBM WebSphere MQ Advanced Message Security task initialization is complete.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0603I**

*csect-name* AMS shutdown requested

**Severity**

0

**Explanation**

The IBM WebSphere MQ Advanced Message Security task has received a shutdown request.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0604I**

*csect-name* LOG option processed: *log-option*

**Severity**

0

**Explanation**

The IBM WebSphere MQ Advanced Message Security task processed a LOG command for log option *log-option*.

**System action**

Processing continues with the new log option.

**System programmer response**

None.

**CSQ0605E**

*csect-name* Incorrect LOG option specified

**Severity**

8

**Explanation**

An attempt by the IBM WebSphere MQ Advanced Message Security task to process a LOG command failed due to an invalid log option.

**System action**

The LOG command does not take effect.

**System programmer response**

Correct the LOG option and retry the LOG command.

**CSQ0606E**

*csect-name* Unrecognized command: specify **DISPLAY**, **REFRESH**, **LOG**, **SMFTYPE**, **SMFAUDIT** or **STOP**

**Severity**

8

**Explanation**

An attempt by the IBM WebSphere MQ Advanced Message Security task to process a command failed because the command was not recognized.

**System action**

The command is not executed.

**System programmer response**

Select a valid command and retry.

Valid commands include **DISPLAY**, **REFRESH**, **LOG**, **SMFTYPE**, **SMFAUDIT** and **STOP**.

**CSQ0607E**

*csect-name* Insufficient storage available

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security task failed to allocate storage.

**System action**

The function being performed by the IBM WebSphere MQ Advanced Message Security task fails.

**System programmer response**

Determine the reason there is insufficient storage and correct or increase, as appropriate.

**CSQ0608E**

*csect-name* Failed to load policy configuration, MQRC=*mqr*c (*mqr*c-text)

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security task failed to load the policy configuration for reason *mqr*c (*mqr*c-text provides the MQRC in textual form).

**System action**

The IBM WebSphere MQ Advanced Message Security task cannot start.

**System programmer response**

Use the reason code, *mqr*c, to determine why the policy configuration could not be loaded from the policy queue, **SYSTEM.PROTECTION.POLICY.QUEUE**.

If the queue cannot start, you can define the queue in the CSQINP2 concatenation. Definitions are provided in SCSQPROC as CSQ4INSM.

**CSQ0609I**

*csect-name* WebSphere MQ AMS for z/OS starting, version *version*, level *service-level*

**Severity**

0

**Explanation**

IBM WebSphere MQ Advanced Message Security task has started for product version *version* and service level *service-level*.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0610E**

*csect-name* Failed to start policy subtask, error *errcode*, reason *reason*

**Severity**

8

**Explanation**

An attempt by the IBM WebSphere MQ Advanced Message Security task to start the policy configuration subtask failed with errno *errcode* and errno2 *reason*.

**System action**

The IBM WebSphere MQ Advanced Message Security task cannot start.

**System programmer response**

Use the error and reason codes to determine why the policy configuration subtask could not be started, then take corrective action.

**CSQ0611E**

*csect-name* Failed to make AMS address space non-swappable, error *errcode*

**Severity**

8

**Explanation**

An attempt by the IBM WebSphere MQ Advanced Message Security task to make itself non-swappable failed with error code *errcode*.

**System action**

The IBM WebSphere MQ Advanced Message Security task cannot start.

**System programmer response**

The error identified by *errcode* is likely to be the return code from the SYSEVENT macro. Use macro documentation to determine the cause of the SYSEVENT failure.

**CSQ0612E**

*csect-name* System function '*function*' failed

**Severity**

8

**Explanation**

An attempt by the IBM WebSphere MQ Advanced Message Security task to use a run-time call, *function*, failed.

**System action**

The IBM WebSphere MQ Advanced Message Security task cannot continue to process the service it was providing at the time of the failure.

**System programmer response**

This message is associated with other messages that are generated at the time of failure. Examine these messages for more information, including error codes that might identify the cause of the failure.

**CSQ0613E**

*csect-name* AMS initialization error *errno*, reason *errno2*

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security task failed to initialize due to a run-time call failure.

**System action**

The IBM WebSphere MQ Advanced Message Security task cannot start.

**System programmer response**

This message is associated with other messages that are generated at the time of failure. Examine these messages for more information, and use the error codes to determine the cause of the failure.

**CSQ0614E**

*csect-name* AMS termination error *errno*, reason *reason*

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security task failed during termination due to a run-time call failure.

**System action**

The IBM WebSphere MQ Advanced Message Security task termination continues.

**System programmer response**

This message is associated with other messages that are generated at the time of failure. Examine these messages for more information, and use the error codes to determine the cause of the failure.

**CSQ0615E**

*csect-name* AMS post/wait request failed, reason *reason*

**Severity**

8

**Explanation**

An attempt by the IBM WebSphere MQ Advanced Message Security task to issue a post or wait request failed for reason *reason*.

**System action**

The IBM WebSphere MQ Advanced Message Security task cannot continue to process the service it was providing at the time of the failure.

**System programmer response**

The error identified by *reason* is likely to be the return code from the POST or WAIT macro. Use macro documentation to determine the cause of the failure.

**CSQ0616E**

*csect-name* AMS runtime environment initialization failed

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security task failed to initialize.

**System action**

The IBM WebSphere MQ Advanced Message Security task cannot start.

**System programmer response**

Examine associated messages for more information about the failure, then take corrective action.

**CSQ0617E**

*csect-name* AMS already active

**Severity**

8

**Explanation**

An attempt to start the IBM WebSphere MQ Advanced Message Security task failed because it was already running.

**System action**

The IBM WebSphere MQ Advanced Message Security task cannot start while it is already running.

**System programmer response**

None.

**CSQ0618E**

*csect-name* AMS initialization failed, program not APF authorized

**Severity**

8

**Explanation**

An attempt to start the IBM WebSphere MQ Advanced Message Security task failed because the module, CSQ0DSRV, is not APF authorized.

**System action**

The IBM WebSphere MQ Advanced Message Security task cannot start.

**System programmer response**

Ensure that the AMS task module is APF authorized and retry.

**CSQ0624E**

*csect-name* SMF audit option invalid, defaulting to 'failure'

**Severity**

8

**Explanation**

An attempt to process the `_AMS_SMF_AUDIT` environment variable or an `SMFAUDIT` command failed because the variable or command value was not recognized.

**System action**

The variable assignment or command is ignored and the default value 'failure' is used.

**System programmer response**

Provide a valid variable or command value. Valid values include 'success', 'failure', and 'all'.

**CSQ0625E**

*csect-name* SMF record type invalid

**Severity**

8

**Explanation**

An attempt to process the `_AMS_SMF_TYPE` environment variable or an `SMFTYPE` command failed because the variable or command value was not valid.

**System action**

The variable assignment or command is ignored.

**System programmer response**

Provide a valid variable or command value. Valid values include numeric values between 0 and 255 inclusive. The `SMFTYPE` value represents the SMF record type for SMF record generation. A value of 0 means no SMF record generation is required. The recommended value is 180.

**CSQ0626I**

*csect-name* SMF audit type is *audit-type*

**Severity**  
0

**Explanation**

The IBM WebSphere MQ Advanced Message Security SMF audit type has been set to *audit-type*.

**System action**

The new SMF audit type takes effect immediately. If *audit-type* is 'failure', all failing puts/gets to a protected queue are audited. If *audit-type* is 'success', all successful puts/gets to a protected queue are audited. If *audit-type* is 'all', both successful and failing puts/gets to a protected queue are audited.

**System programmer response**

None.

**CSQ0629E**

*csect-name* Unable to create security environment for user '*userid*', reason *errno*

**Severity**  
8

**Explanation**

An attempt by the IBM WebSphere MQ Advanced Message Security task to create a thread-level security environment using **pthread\_security\_np()** for user *userid* failed for the reasons indicated by *errno* and *errno2*.

**System action**

The thread-level security environment is not created, and the AMS function being processed cannot be completed. The MQI call fails.

**System programmer response**

Examine the *errno* and *errno2* values in conjunction with **pthread\_security\_np()** documentation to determine the cause of the failure.

**CSQ0630E**

*csect-name* Unable to delete security environment, reason *errno*

**Severity**  
8

**Explanation**

An attempt by the IBM WebSphere MQ Advanced Message Security task to delete a thread-level security environment using **pthread\_security\_np()** failed for the reason indicated by *errno*.

**System action**

The thread-level security environment is not deleted. AMS processing continues.

**System programmer response**

Examine the *errno* value in conjunction with **pthread\_security\_np()** documentation to determine the cause of the failure.

**CSQ0631E**

*csect-name* AMS not started, product is not enabled

**Severity**  
8

**Explanation**

An attempt by the IBM WebSphere MQ Advanced Message Security task to register itself using macro IFAEDREG failed.

**System action**

The IBM WebSphere MQ Advanced Message Security task cannot start.

**System programmer response**

Verify that the PARMLIB IFAPRDxx member has been built with the provided AMS product information, then retry.

**CSQ0632E**

*csect-name* AMS deregistration failed, reason *reason*

**Severity**

8

**Explanation**

An attempt by the IBM WebSphere MQ Advanced Message Security task to deregister itself using macro IFAEDDRG failed.

**System action**

The IBM WebSphere MQ Advanced Message Security task cannot deregister. Processing continues.

**System programmer response**

Examine the reason returned by the IFAEDDRG macro in conjunction with macro documentation to determine the cause of the failure.

**CSQ0633I**

*csect-name* AMS environment variable values:

**Severity**

0

**Explanation**

The IBM WebSphere MQ Advanced Message Security task identifies its environment variables and their values immediately following this message.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0634I**

*csect-namevariable=value*

**Severity**

0

**Explanation**

During startup, the IBM WebSphere MQ Advanced Message Security task issues this message to report an environment variable *variable*, and its value *value*.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0635I**

*csect-name* POLICY refresh complete

**Severity**

0

**Explanation**

The IBM WebSphere MQ Advanced Message Security task has refreshed its policy configuration in response to a **REFRESH** command.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0636I**

*csect-name* POLICY refresh failed

**Severity**

8

**Explanation**

An attempt by the IBM WebSphere MQ Advanced Message Security task to refresh its policy configuration failed.

**System action**

The policy configuration is not refreshed.

**System programmer response**

Examine the console for associated error messages to determine the cause of the failure.

**CSQ0637I**

*csect-name* KEYRING refresh complete

**Severity**

0

**Explanation**

The IBM WebSphere MQ Advanced Message Security task has refreshed its keyring configuration in response to a **REFRESH** command.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0638E**

*csect-name* KEYRING refresh failed, return code *errno*

**Severity**

8

**Explanation**

An attempt by the IBM WebSphere MQ Advanced Message Security task to refresh its keyring configuration failed for the reason indicated by *errno*.

**System action**

The keyring configuration is not refreshed.

**System programmer response**

Examine the console for associated error message to determine the cause of the failure. Use the *errno*, which might represent a System SSL *gsk\_status* to further diagnose the problem.

**CSQ0639E**

*csect-name* Incorrect **REFRESH** option, specify KEYRING, POLICY or ALL

**Severity**

8

**Explanation**

An attempt by the IBM WebSphere MQ Advanced Message Security task to process a **REFRESH** command failed because the refresh option was not recognized.

**System action**

The **REFRESH** command is not processed.

**System programmer response**

Ensure the **REFRESH** option is KEYRING, POLICY or ALL, depending on which option should be refreshed.

**CSQ0640E**

*csect-name* AMS not started correctly

**Severity**

8

**Explanation**

The IBM WebSphere MQ Advanced Message Security task has started incorrectly.

**System action**

The IBM WebSphere MQ Advanced Message Security task fails to start.

**System programmer response**

The IBM WebSphere MQ Advanced Message Security task can only be started internally by WebSphere MQ.

**CSQ0641I**

*csect-name* **REFRESH** command completed successfully

**Severity**

0

**Explanation**

The IBM WebSphere MQ Advanced Message Security task has successfully processed a **REFRESH** command.

**System action**

Processing continues.

**System programmer response**

None.

#### CSQ0642I

*csect-name* **REFRESH** command failed

#### Severity

8

#### Explanation

The IBM WebSphere MQ Advanced Message Security task has failed to successfully process a **REFRESH** command.

#### System action

The requested **REFRESH** command is not processed.

#### System programmer response

Examine the console for associated error messages to determine the cause of the problem.

#### CSQ0648E

*csect-name* Failed to open AMS key ring, reason *gsk-status*

#### Severity

8

#### Explanation

An attempt by the IBM WebSphere MQ Advanced Message Security task to open its keyring failed for the reason indicated by *gsk-status*.

#### System action

The AMS keyring is not opened, and the AMS task cannot start.

#### System programmer response

Examine System SSL documentation related to the `gsk_open_keyring()` call in conjunction with the *gsk-status* code to determine the cause of the failure.

#### CSQ0649E

*csect-name* CRL initialization failed

#### Severity

8

#### Explanation

An attempt by the IBM WebSphere MQ Advanced Message Security task to connect to an LDAP server, based on configuration provided in the CRLFILE DD, failed.

#### System action

The IBM WebSphere MQ Advanced Message Security task cannot perform Certificate Revocation List (CRL) checking. The behavior of certificate validation is determined by the System SSL environment variable `GSK_CRL_SECURITY_LEVEL`. See System SSL documentation for more information.

#### System programmer response

Check the configuration provided via the CRLFILE DD in the AMS started task JCL and verify that the configuration details are correct.

#### CSQ0651E

*csect-name* Failed to open CRL LDAP, *ldap-name*

**Severity**  
8

**Explanation**

An attempt by the IBM WebSphere MQ Advanced Message Security task to open an LDAP directory, *ldap-name*, failed.

**System action**

The IBM WebSphere MQ Advanced Message Security task cannot perform Certificate Revocation List (CRL) checking against the named LDAP directory. The behavior of certificate validation is determined by the System SSL environment variable GSK\_CRL\_SECURITY\_LEVEL. See System SSL documentation for more information.

**System programmer response**

Check the configuration provided in the CRLFILE DD in the AMS started task JCL and verify that the configuration details are correct. Verify that the failing directory is available.

**CSQ0652I**

*csect-name* CRL checking enabled

**Severity**  
0

**Explanation**

The IBM WebSphere MQ Advanced Message Security task has successfully enabled Certificate Revocation List (CRL) checking.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0653I**

*csect-name* CRL checking disabled

**Severity**  
0

**Explanation**

The IBM WebSphere MQ Advanced Message Security task has successfully disabled Certificate Revocation List (CRL) checking.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0660E**

*csect-name* Internal version mismatch

**Severity**  
8

**Explanation**

The IBM WebSphere MQ Advanced Message Security task has received a request for data protection services with an unrecognized request version value.

**System action**

The data protection service cannot be provided.

**System programmer response**

This error implies that a task other than the IBM WebSphere MQ Advanced Message Security Interceptor is attempting to exploit AMS data protection services. AMS data protection services are only available by using the AMS Interceptor.

**CSQ0699I**

*csect-name* AMS shutdown complete

**Severity**  
0

**Explanation**

The IBM WebSphere MQ Advanced Message Security task has shutdown.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0996I**

*csect-name char-diag1, char-diag2, char-diag3, char-diag4, hex-diag1, hex-diag2*

**Severity**  
0

**Explanation**

This message is generated when AMS is running in DEBUG mode, as directed by IBM support center, and provides character and hexadecimal diagnostic values to aid in problem resolution.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0997I**

*csect-name char-diag1, char-diag2, char-diag3, hex-diag1, hex-diag2, hex-diag3*

**Severity**  
0

**Explanation**

This message is generated when AMS is running in DEBUG mode, as directed by IBM support center, and provides character and hexadecimal diagnostic values to aid in problem resolution.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0998I**

*csect-name char-diag1, char-diag2, hex-diag1, hex-diag2, hex-diag3, hex-diag4*

**Severity**

0

**Explanation**

This message is generated when AMS is running in DEBUG mode, as directed by IBM support center, and provides character and hexadecimal diagnostic values to aid in problem resolution.

**System action**

Processing continues.

**System programmer response**

None.

**CSQ0999I**

*csect-name char-diag1, hex-diag1, hex-diag2, hex-diag3, hex-diag4, hex-diag5*

**Severity**

0

**Explanation**

This message is generated when AMS is running in DEBUG mode, as directed by IBM support center, and provides character and hexadecimal diagnostic values to aid in problem resolution.

**System action**

Processing continues.

**System programmer response**

None.

**Service facilities messages (CSQ1...):**

The value shown for severity in the service facility messages that follow is the value returned as the job-step condition code from the job-step during which the message is issued. If additional messages having higher severity values are issued during the same job-step, the higher value is reflected as the job-step condition code.

**Log services return codes**

The return codes set by log services are:

- 0 Successful completion
- 4 Exception condition (for example, end of file), not an error.
- 8 Unsuccessful completion due to parameter errors.
- 12 Unsuccessful completion. Error encountered during processing of a valid request.

**CSQ1000I**

*csect-name IBM WebSphere MQ for z/OS Vn*

**Severity**

0

**Explanation**

This message is issued as the first part of the header to the report issued by the log print utility program.

**CSQ1100I**

*csect-name* LOG PRINT UTILITY - *date time*

**Severity**  
0

**Explanation**

This message is issued as the second part of the header to the report issued by the log print utility program.

**CSQ1101I**

*csect-name* UTILITY PROCESSING COMPLETED, RETURN CODE=*rc*

**Severity**  
0

**Explanation**

The log print utility completed with the return code *rc* indicated. 0 indicates successful completion.

**CSQ1102I**

SEARCH CRITERIA

**Severity**  
0

**Explanation**

The search criteria specified for printing the log follow.

**CSQ1105I**

LOG PRINT UTILITY SUMMARY - *date time*

**Severity**  
0

**Explanation**

This is issued as a header to the summary data set written by the log print utility.

**CSQ1106I**

END OF SUMMARY

**Severity**  
0

**Explanation**

This marks the end of the summary data set written by the log print utility.

**CSQ1110E**

LIMIT OF 50 STATEMENTS EXCEEDED

**Severity**  
8

**Explanation**

The limit of 50 input statements allowed by CSQ1LOGP has been exceeded.

**System action**

Processing is terminated.

**System programmer response**

Resubmit the job using no more than 50 statements.

**CSQ1111E**

LIMIT OF 80 TOKENS EXCEEDED

**Severity**

8

**Explanation**

The limit of 80 keywords and corresponding value specifications allowed by CSQ1LOGP has been exceeded. A keyword with its value is considered as two tokens.

**System action**

Processing is terminated.

**System programmer response**

Resubmit the job using no more than 80 tokens.

**CSQ1112E**

TOKEN *xxx...* EXCEEDS 48 CHARACTERS

**Severity**

8

**Explanation**

An input statement contains the character string beginning *xxx*. This string is not valid because it exceeds 48 characters in length.

**System action**

Processing is terminated.

**System programmer response**

Resubmit the job with a valid token.

**CSQ1113E**

INVALID SYNTAX FOR KEYWORD *kwd*

**Severity**

8

**Explanation**

An input statement contains the keyword *kwd*. The value specified for this keyword is not valid, because it is not of the form *kwd(value)*.

**System action**

Processing is terminated.

**System programmer response**

Resubmit the job with the correct form of the keyword.

**CSQ1127E**

KEYWORD *kwd* UNKNOWN

**Severity**

8

**Explanation**

CSQ1LOGP does not recognize the keyword *kwd*.

**System action**

Processing is terminated.

**System programmer response**

Check to make sure all keywords are valid and resubmit the job.

**CSQ1128E**

END OF LOG RANGE SPECIFIED WITHOUT START

**Severity**

8

**Explanation**

You cannot specify the end of a search range (RBAEND or LRSNEND) without specifying a beginning of the search range (RBASTART or LRSNSTART).

**System action**

Processing is terminated.

**System programmer response**

Resubmit the job providing an RBASTART or LRSNSTART value to correspond to the RBAEND or LRSNEND value given to specify a valid search range.

**CSQ1129E**

LIMIT OF 10 *kwd* KEYWORDS EXCEEDED

**Severity**

8

**Explanation**

The *kwd* keyword appears too many times in the control statements. The limit is 10.

**System action**

Processing is terminated.

**System programmer response**

Resubmit the job providing no more than 10 of these keywords.

**CSQ1130E**

INVALID VALUE FOR KEYWORD *kwd* NUMBER *n*

**Severity**

8

**Explanation**

The value for the *n*th occurrence of keyword *kwd* is invalid because it has invalid characters, it is not one of a list of permitted values, or it is too long.

**System action**

Processing is terminated.

**System programmer response**

Resubmit the job providing a correct value specification.

**CSQ1131E**

INVALID VALUE FOR KEYWORD *kwd*

**Severity**

8

**Explanation**

The value for the keyword *kwd* is invalid because it has invalid characters, it is not one of a list of permitted values, or it is too long.

**System action**

Processing is terminated.

**System programmer response**

Resubmit the job providing a correct value specification.

**CSQ1132E**

NO VALUE FOR KEYWORD *kwd* NUMBER *n*

**Severity**

8

**Explanation**

The *n*th occurrence of keyword *kwd* is not followed by a value.

**System action**

Processing is terminated.

**System programmer response**

Resubmit the job providing a correct value specification.

**CSQ1133E**

NO VALUE FOR KEYWORD *kwd*

**Severity**

8

**Explanation**

The keyword *kwd* is not followed by a value.

**System action**

Processing is terminated.

**System programmer response**

Resubmit the job providing a correct value specification.

**CSQ1134E**

KEYWORD EXTRACT REQUIRES AT LEAST ONE OUTPUT DDNAME

**Severity**

4

**Explanation**

The keyword extract requires at least one output DDNAME for log records to be extracted.

**System action**

Processing continues, however, no log records are extracted .

**System programmer response**

Remove EXTRACT(YES), or alternatively add a DDNAME from the following list: **CSQBACK**, **CSQCMT**, **CSQBOTH**, **CSQINFLT**, **CSQOBS**. Resubmit the job. For more information see, The log print utility (CSQ1LOGP).

**CSQ1135E**

KEYWORD *kwd* SPECIFIED MORE THAN ONCE

**Severity**  
8

**Explanation**

The keyword *kwd* can only be specified once.

**System action**

Processing is terminated.

**System programmer response**

Resubmit the job providing only one of these keywords.

**CSQ1137I**

FIRST PAGE SET CONTROL RECORD AFTER RESTART = *r-rba*

**Severity**  
0

**Explanation**

*r-rba* is the log RBA of a record that serves as an implicit indication that a restart occurred just prior to this point.

**System action**

Processing continues.

**CSQ1138E**

*kwd1* AND *kwd2* CANNOT BOTH BE SPECIFIED

**Explanation**

*kwd1* and *kwd2* cannot both appear in the control statements.

**System action**

Processing is terminated.

**System programmer response**

Correct the control statements and rerun the job.

**CSQ1139E**

SYSSUMRY DD STATEMENT MISSING

**Severity**  
8

**Explanation**

You requested the SUMMARY option, but did not include the SYSSUMRY DD statement in your JCL.

**System action**

Processing terminates.

**System programmer response**

Resubmit the job with a SYSSUMRY DD statement included in the JCL.

**CSQ1145E**

CURRENT RESTART TIME STAMP OUT OF SEQUENCE - TIME=*date time* LOG RBA=*t-rba*

**Severity**

4

**Explanation**

This message indicates that the current log record has a time stamp that is less than the greatest time stamp processed so far. This might be a potential problem.

This message is followed by messages CSQ1147I and CSQ1148I which give the latest time stamp seen.

**System action**

Processing continues.

**System programmer response**

Examine the current log to determine whether multiple queue managers are writing to the same log. (Data might be being overwritten.) This might lead to data inconsistencies.

**CSQ1146E**

CURRENT END CHECKPOINT TIME STAMP OUT OF SEQUENCE - TIME=*date time* LOG RBA=*t-rba*

**Severity**

4

**Explanation**

This message indicates that the current log record has a time stamp that is less than the previous time stamp processed. This might be a potential problem.

This message is followed by messages CSQ1147I and CSQ1148I which give the latest time stamp seen.

**System action**

Processing continues.

**System programmer response**

Examine the current log to determine whether multiple queue managers are writing to the same log. (Data might be being overwritten.) This might lead to data inconsistencies.

**CSQ1147I**

LATEST TIME STAMP SEEN SO FAR - TIME=*date time* LOG RBA=*t-rba*

**Severity**

4

**Explanation**

This message follows message CSQ1145I or CSQ1146I and gives the latest time stamp seen.

**CSQ1148I**

MULTIPLE QUEUE MANAGERS MAY BE WRITING TO THE SAME LOG

**Severity**

4

**Explanation**

This message follows message CSQ1145I or CSQ1146I to indicate a possible cause of the time stamp problem.

**CSQ1150I**

SUMMARY OF COMPLETED EVENTS

**Severity**

0

**Explanation**

This message heads the summary of completed units of recovery (URs) and checkpoints.

**System action**

Processing continues.

**CSQ1151I**

UR CONNID=*cc* THREAD-XREF=*bb* USERID=*aa* TIME=*date time* START=*s-rba* END=*e-rba*  
DISP=*xx* INFO=*ii*

**Severity**

0

**Explanation**

This message describes a unit of recovery that terminated.

*cc* Connection id (for example, BATCH)

*bb* Thread cross-reference id (for example, JOB xxx)

*aa* User id executing the UR

***date time***

Starting time of the UR

*s-rba* Log RBA of the first log record associated with the UR (that is, the URID)

*e-rba* Log RBA of the last log record associated with the UR. If the UR is not complete, *e-rba* is shown as '\*\*\*'

*xx* Disposition of the UR, values include:

- INFLIGHT
- IN BACKOUT
- IN COMMIT
- INDOUBT
- COMMITTED
- BACKED OUT

*ii* Status of the data, one of the following:

- COMPLETE, indicating that all page sets modified by this UR have been identified
- PARTIAL, indicating that the list of page sets modified by this UR is incomplete (this is shown if all records associated with a UR are not available, and no checkpoint is found prior to the UR's completion)

If the UR identifying information is not available, it will be shown as '\*\*\*'.

**System action**

Processing continues.

**CSQ1153I**

CHECKPOINT START=*s-rba* END=*e-rba* TIME=*date time*

**Severity**

0

**Explanation**

This message describes a complete checkpoint on the log starting at RBA *s-rba* and ending at RBA *e-rba*. If the information is available, CSQ1LOGP also returns the date and time that the checkpoint was completed.

When this message follows message CSQ1157I, it identifies the checkpoint that would be used at restart. If no checkpoint is available, message CSQ1158I is printed instead.

**System action**

Processing continues.

**CSQ1154I**

RESTART AT *r-rba* TIME=*date time*

**Severity**

0

**Explanation**

A normal restart occurred at log RBA *r-rba*. CSQ1LOGP also returns the date and time of that restart.

**System action**

Processing continues.

**CSQ1155I**

CONDITIONAL RESTART AT *r-rba* TIME=*date time*

**Severity**

0

**Explanation**

A conditional restart occurred at log RBA *r-rba*. CSQ1LOGP also returns the date and time of that restart.

**System action**

Processing continues.

**CSQ1156I**

ALL URS COMPLETE

**Severity**

0

**Explanation**

There are no URs outstanding for restart.

**System action**

Processing continues.

**CSQ1157I**

RESTART SUMMARY

**Severity**

0

**Explanation**

This message heads the summary of the description of work to be performed at restart. Restart information that follows is based on the scope of the log scanned. If you suspect an error in MQ, see Problem determination on z/OS for information about identifying and reporting the problem.

**System action**

Processing continues.

**CSQ1158I**

NO CHECKPOINT AVAILABLE - RESTART SUMMARY INCOMPLETE

**Severity**

0

**Explanation**

No checkpoint is available within the scope of the log scanned. The information following this message includes:

- URs that have not completed
- Page sets modified by these URs
- Page sets with writes pending

The information cannot be considered complete.

**System action**

Processing continues.

**CSQ1161E**INVALID URE FOUND AT *x-rba***Severity**

4

**Explanation**

While processing the SUMMARY option, an invalid URE checkpoint record was encountered in the log.

**System action**

Processing continues.

**System programmer response**

If the checkpoint record identified in the message is used to restart the queue manager, the restart will be unsuccessful because it will not be able to process the unit of recovery presented by the invalid URE.

Look for other messages that indicate the cause of the problem. If you are unable to resolve the problem, contact your IBM support center.

**CSQ1162E**INVALID RURE FOUND AT *x-rba***Severity**

4

**Explanation**

While processing the SUMMARY option, an invalid RURE checkpoint record was encountered in the log.

**System action**

Processing continues.

**System programmer response**

If the checkpoint record identified in the message is used to restart the queue manager, the restart will be unsuccessful because it will not be able to process the unit of recovery presented by the invalid RURE.

Look for other messages that indicate the cause of the problem. If you are unable to resolve the problem, contact your IBM support center.

**CSQ1163E**

NO CHECKPOINT AVAILABLE DUE TO LOG ERROR - RESTART SUMMARY INCOMPLETE

**Severity**

4

**Explanation**

A log error was encountered. CSQ1LOGP marked any checkpoints encountered before the log error as invalid. There were no complete checkpoints following the log error in the specified log range. The information following this message includes:

- URs that have not completed
- Page set modified by these URs
- Page sets with writes pending

This information cannot be considered complete.

**System action**

Processing continues.

**CSQ1165E**

UR REQUIRES LOG WHICH IS IN ERROR

**Severity**

0

**Explanation**

While processing a UR, information was required from the log, but the log was in error, as indicated by previous messages.

**System action**

Processing continues.

**CSQ1166I**

INFORMATION INCOMPLETE FOR UR - LOG TRUNCATED AT *xx*

**Severity**

0

**Explanation**

Complete information for the UR is not available within the scope of the log scanned.

**System action**

Processing continues.

#### CSQ1209E

END OF LOG RANGE IS LESS THAN START

#### Severity

8

#### Explanation

The end log range value (specified by RBAEND or LRSNEND) is less than or equal to the start range value (specified by RBASTART or LRSNSTART).

#### System action

Processing is terminated.

#### System programmer response

Resubmit the job providing an RBASTART or LRSNSTART value and a corresponding RBAEND or LRSNEND value to specify a valid search range.

#### CSQ1210E

LOG READ ERROR RETCODE=*rc* REASON CODE=*reason*

#### Severity

8

#### Explanation

An error was detected while attempting to read the log.

#### System action

Processing is terminated.

#### CSQ1211E

BAD LOG RBA RETURNED

#### Severity

8

#### Explanation

One of the three problems listed in this topic exists:

- The recovery log data set is damaged
- You identified a data set that is not a recovery log data set
- There is a problem with the log print utility

#### System action

Processing terminates, and a dump is produced.

#### System programmer response

A common error is to specify the first data set on an archive tape (the Bxxxxxxx data set) as a log data set; it is actually a bootstrap data set (BSDS).

Determine if the problem is your error by dumping the data set and determining if it is a log data set.

#### CSQ1212I

FIRST LOG RBA ENCOUNTERED = *s-rba*

#### Severity

0

**Explanation**

This identifies the RBA of the first log record read.

**System action**

Processing continues.

**CSQ1213I**

LAST LOG RBA ENCOUNTERED = *e-rba*

**Severity**

0

**Explanation**

This identifies the RBA of the last log record read.

**System action**

Processing continues.

**CSQ1214I**

*nm* LOG RECORDS READ

**Severity**

0

**Explanation**

This identifies the number (in decimal) of logical log records read during CSQ1LOGP processing.

**System action**

Processing continues.

**CSQ1215I**

NO LOG RECORDS READ

**Severity**

0

**Explanation**

CSQ1LOGP read no log records.

Possible explanations are:

- An error has prevented CSQ1LOGP from continuing, therefore no log records have yet been processed (if this is so, an error message should precede this message)
- You specified the active log data sets or archive log data sets out of RBA sequence
- You specified an RBASTART or LRSNSTART value that is greater than any RBA or LRSN in the active and archive data sets available
- You specified a log range using LRSNs, but the queue manager is not in a queue-sharing group.

**System action**

Processing continues.

**CSQ1216E**

LOG READ ERROR, RETCODE=*rc*, REASON CODE=*reason*, RBA=*x-rba*

**Severity**

4

## Explanation

An error was encountered while attempting to read the log, indicating that either the log has an error in one of the control intervals (CI), or a data set containing the requested RBA cannot be located. The RBA specification in the message indicates where the error was detected and gives the requested RBA. It will point to:

- The start of the CI if there is a problem with the log control interval definition (LCID), or with any of the general control information within a CI
- The log record in the CI if there is a problem with a log record header (LRH)

If this is the first log record read during this execution of the Log Extractor, and if there is a problem with the LCID, the RBA specification will be all zeros.

Before returning any records, the utility checks the control information (LCID) at the end of a CI, and analyzes the LRH to ensure that all records are properly chained together within the CI. If an error is detected while performing this process, CSQ1LOGP will issue this message, before dumping the entire CI. It will not format individual records within the CI, but will, if possible, continue processing by reading the next CI.

## System action

Processing continues.

## CSQ1217E

RBA RANGE WARNING, RETCODE=*rc*, REASON CODE=*reason*, PRIOR RBA=*p-rba*, CURRENT RBA=*c-rba*

## Severity

4

## Explanation

A gap in the log RBA range has been encountered. PRIOR RBA *p-rba* indicates the last good log RBA prior to the gap. CURRENT RBA *c-rba* indicates the log record following the gap, and will be formatted following this message.

## System action

Processing continues.

## CSQ1218I

*nn* LOG ERROR MESSAGES

## Severity

0

## Explanation

CSQ1LOGP distinguishes three classes of errors:

- Code problems existing in the MQ or system code used for CSQ1LOGP. In such cases, abnormal termination with a user completion code of U0153 occurs.
- Incorrect invocation of CSQ1LOGP caused, perhaps, by your having used an incorrect keyword or missed a DD statement. Under these circumstances, CSQ1LOGP issues appropriate error messages, and the program is terminated.
- An error in a particular log CI under the scrutiny of CSQ1LOGP. Such scrutiny is performed before any of the records within the CI are processed. This is an indication of logical damage, and error messages are issued by the utility. The CI or log record in error is printed, and CSQ1LOGP continues to the next CI or log record.

The count *nn* provided summarizes the number (in decimal) of errors CSQ1LOGP detected while accessing the log.

**System action**

Processing continues.

**CSQ1219I**

LOG RECORDS CONTAIN *n* BYTE RBA - QSG(*in-qsg*)

**Severity**

0

**Explanation**

This message is issued by CSQ1LOGP to indicate the format of the log records being processed, and whether the queue manager was a member of a queue-sharing group (QSG). The message is issued before any log records are printed, and whenever the format of the log records change.

The value of *n* identifies the log RBA format of the log records being processed, and can be either 6 or 8.

The value of *in-qsg* identifies whether the log records were written by a queue manager that was a member of a QSG, and can be one of the following values:

**YES** The log records were written by a queue manager that was a member of a QSG

**NO** The log records were written by a queue manager that was not a member of a QSG

**System action**

Processing continues

**CSQ1220E**

ARCHIVE LOG TRUNCATED AT *xxxx* - INVALID LOG RECORDS READ

**Severity**

4

**Explanation**

At a restart of the queue manager, an archive log was truncated. This archive log data set could not be physically altered to reflect this truncation, and invalid log records therefore still exist. CSQ1LOGP has already reported this information in the summary report, and cannot retract it. Nor can it disregard the invalid log information already read in order adequately to summarize what has occurred. Therefore, all information up to this point in the log will be summarized, and a new summary report initiated. Consequently, the same UR might be reported twice with different dispositions and different page sets modified.

**System action**

Processing continues.

**System programmer response**

To avoid this condition, use the BSDS DD statement instead of the ARCHIVE DD statement.

**CSQ1221E**

VSAM ERROR, RETCODE=*rc*, REASON CODE=*reason*, VSAM RETURN CODE=*aaaa*, ERROR CODE=*bbbb*

**Severity**

8

**Explanation**

A VSAM error was encountered while attempting to read the log.

**System action**

Processing continues.

**CSQ1222E**

LOG ALLOCATION ERROR, RETCODE=*rc*, REASON CODE=*reason*, DYNALLOC INFO CODE=*aaaa*, ERROR CODE=*bbbb*

**Severity**  
8

**Explanation**

An error occurred while dynamically allocating a log data set.

**System action**

Processing terminates.

**CSQ1223E**

JFCB READ ERROR, RETCODE=*rc*, REASON CODE=*reason*, RDJFCB RETURN CODE=*aaaa*

**Severity**  
8

**Explanation**

An error occurred while trying to read the job file control block.

**System action**

Processing continues.

**CSQ1224I**

INFORMATION INCOMPLETE FOR LOG RECORD, CURRENT RBA=*c-rba*, CURRENT URID=*c-urid*

**Severity**  
0

**Explanation**

Incomplete information for the log record was found within the scope of the logs scanned. An end of log condition was encountered before all segments of a spanned record could be found. CURRENT RBA *c-rba* indicates the log RBA of the record in question. CURRENT URID *c-urid* indicates the UR to which the spanned log record is related. If there is no URID associated with the log record (for instance, a checkpoint record), then this will show zeros.

**System action**

Processing continues.

**System programmer response**

If complete information for the identified log record is required, extend the RBA range to be processed until the required log data is available.

**CSQ1271I**

START OF LOG RANGE SET TO LRSN=*s-lrsn*

**Severity**  
0

**Explanation**

The LRSN value you specified for the start of the log range is less than the lowest possible LRSN value, which is *s-lrsn*.

**System action**

Processing continues, using an LRSNSTART value of *s-lrsn*.

**CSQ1272I**

FIRST LOG LRSN ENCOUNTERED = *s-lrsn*

**Severity**

0

**Explanation**

This identifies the LRSN of the first log record read.

**System action**

Processing continues.

**CSQ1273I**

LAST LOG LRSN ENCOUNTERED = *e-lrsn*

**Severity**

0

**Explanation**

This identifies the LRSN of the last log record read.

**System action**

Processing continues.

**CSQ1275I**

LRSN RANGE CAN BE USED ONLY WITH A QUEUE-SHARING GROUP

**Severity**

0

**Explanation**

You specified a log range using LRSNs, but CSQ1LOGP read no log records. This could be because the queue manager is not in a queue-sharing group, in which case you cannot use LRSN specifications.

**System action**

Processing continues.

**System programmer response**

If the queue manager is not in a queue-sharing group, rerun the job using RBA specifications for the log range.

**CSQ1276E**

LOG READ ERROR, RETCODE=*rc*, REASON CODE=*reason*, LRSN=*x-lrsn*

**Severity**

4

**Explanation**

An error was encountered while attempting to read the log, indicating that either the log has an error in one of the control intervals (CI), or a data set containing the requested LRSN cannot be located. The LRSN specification in the message indicates where the error was detected and gives the requested LRSN. It will point to:

- The start of the CI if there is a problem with the log control interval definition (LCID), or with any of the general control information within a CI
- The log record in the CI if there is a problem with a log record header (LRH)

If this is the first log record read during this execution of the Log Extractor, and if there is a problem with the LCID, the LRSN specification will be all zeros.

Before returning any records, the utility checks the control information (LCID) at the end of a CI, and analyzes the LRH to ensure that all records are properly chained together within the CI. If an error is detected while performing this process, CSQ1LOGP will issue this message, before dumping the entire CI. It will not format individual records within the CI, but will, if possible, continue processing by reading the next CI.

#### System action

Processing continues.

#### CSQ1277E

LRSN RANGE WARNING, RETCODE=*rc*, REASON CODE=*reason*, PRIOR LRSN=*p-lrsn*,  
CURRENT LRSN=*c-lrsn*

#### Severity

4

#### Explanation

A gap in the log LRSN range has been encountered. The PRIOR LRSN specification indicates the last good log LRSN prior to the gap. The CURRENT LRSN specification indicates the log record following the gap, and will be formatted following this message.

#### System action

Processing continues.

#### IBM MQ-IMS bridge Messages (CSQ2...):

#### CSQ2001I

*csect-name* OTMA REJECTED MESSAGE - APPLICATION ERROR, SENSE CODE=*code*,  
XCFGNAME=*gname* XCFMNAME=*mname* TPIPE=*tpipename*

#### Explanation

Because of an application error, the MQ-IMS bridge received a negative acknowledgment (NAK) from OTMA when sending a message. The information provided in the message is:

*gname* The XCF group to which the partner belongs.

*mname*  
The member name of the partner.

*tpipename*  
The name of the Tpipe used by the partner.

*code* The IMS sense code returned by the partner (the first four characters are the sense code).

#### System action

The message is put to the dead-letter queue, and processing continues.

#### System programmer response

For information about the sense code from IMS, see the *IMS/ESA Communications and Connections Guide* Version 10, document number SC18-9703, program number 5635-A01.

## CSQ2002E

*csect-name* OTMA CLIENT BID REJECTED, XCFGNAME=*gname* XCFMNAME=*mname*, SENSE CODE=*code*

### Explanation

An OTMA client bid command from the MQ-IMS bridge was rejected. *code* is the associated IMS sense code. *gname* and *mname* identify the partner IMS system to which the command was directed.

### System action

No connection is made to the IMS system. Connections to other OTMA partners are unaffected.

### System programmer response

For information about IMS-OTMA sense codes, see the IMS Messages and Codes.

## CSQ2003E

*csect-name* OTMA REJECTED MESSAGE - SYSTEM ERROR, SENSE CODE=*code*, XCFGNAME=*gname* XCFMNAME=*mname* TPIPE=*tpipename*

### Explanation

Because of a system-related error, the MQ-IMS bridge received a negative acknowledgment (NAK) from OTMA when sending a message. The information provided in the message is:

*gname* The XCF group to which the partner belongs.

*mname*

The member name of the partner.

*tpipename*

The name of the Tpipe used by the partner.

*code* The IMS sense code returned by the partner (the first four characters are the sense code).

### System action

If the problem was caused by an environmental error, the IMS bridge returns the message to the queue. Depending on the error described by the sense code, the message send is retried or the queue is closed.

If a severe error occurred, the message is returned to the queue, and the IMS bridge ends abnormally with completion code X'5C6' and reason code X'00F20059'.

### System programmer response

For information about IMS-OTMA sense codes, see the IMS Messages and Codes.

## CSQ2004E

*csect-name* ERROR USING QUEUE *q-name*, MQRC=*mqrc* (*mqrc-text*)

### Explanation

The MQ-IMS bridge was unable to open, close, get from, put to, or inquire about a queue.

If *csect-name* is CSQ2QCP0, the problem was with the message queue associated with IMS or the reply-to queue. If *csect-name* is CSQ2QCP1, the problem was with the reply-to queue. If *csect-name* is CSQ2PUTD, the problem was with the dead-letter queue.

If the reason code received is 2042, it is because the IBM MQ-IMS bridge requires exclusive input access (MQOO\_INPUT\_EXCLUSIVE) to the bridge queue if it is defined with QSGDISP(QMGR), or if it is defined with QSGDISP(SHARED) together with the NOSHARE option.

### System action

If the problem was caused by an environmental error, processing continues.

If a severe error occurred, the IMS bridge ends abnormally with completion code X'5C6' and a reason code which shows the particular error.

### System programmer response

Refer to API completion and reason codes for information about *mqrc* (*mqrc-text* provides the MQRC in textual form).

### CSQ2005I

*csect-name* ERROR PROCESSING MESSAGE, FEEDBACK=*code*, XCFGNAME=*gname*  
XCFMNAME=*mname* TPIPE=*tpipename*

### Explanation

The MQ-IMS bridge encountered an error while processing a message. *code* is the associated feedback code that will be set in the messagedescriptor. The information provided in the message is:

*gname* The XCF group to which the partner belongs.

*mname*  
The member name of the partner.

*tpipename*  
The name of the Tpipe used by the partner.

*code* The IMS sense code returned by the partner.

### System action

The message is not processed.

### System programmer response

*code* is one of the following:

#### 291 (MQFB\_DATA\_LENGTH\_ZERO)

A segment length field was zero in the application data of the message.

#### 292 (MQFB\_DATA\_LENGTH\_NEGATIVE)

A segment length field was negative in the application data of the message.

#### 293 (MQFB\_DATA\_LENGTH\_TOO\_BIG)

A segment length field was too big in the application data of the message.

#### 294 (MQFB\_BUFFER\_OVERFLOW)

The value of one of the length fields would overflow the MQ message buffer.

#### 295 (MQFB\_LENGTH\_OFF\_BY\_ONE)

The length field was one byte too short.

#### 296 (MQFB\_IIH\_ERROR)

The MQMD specified MQFMT\_IMS, but the message does not begin with a valid MQIIH structure.

#### 298 (MQFB\_NOT\_AUTHORIZED\_FOR\_IMS)

The user ID specified in the MQMD was denied access.

3xx IMS sense code xx (where xx is the decimal representation of the IMS sense code). For information about IMS-OTMA sense codes, see the IMS Messages and Codes.

### CSQ2006I

*csect-name* DEAD-LETTER QUEUE UNAVAILABLE, MQRC=*mqrc* (*mqrc-text*)

### Explanation

The MQ-IMS bridge was unable to put a message to the dead-letter queue.

**System action**

If the message was being sent to IMS, it will be retained on the local IMS queue, and the queue will be disabled. If the message was coming from IMS, a NAK will be sent to IMS so that IMS will retain it and stop sending messages on the Tpipe.

**System programmer response**

If *mqrc* is 0, there is no dead-letter queue defined; you are strongly recommended not to use the MQ-IMS bridge unless you have a dead-letter queue defined. Otherwise, there is a problem obtaining the name of the queue from the queue manager; refer to API completion and reason codes for information about *mqrc* (*mqrc-text* provides the MQRC in textual form).

**CSQ2009I**

*csect-name* PREREQUISITE PRODUCTS FOR IMS BRIDGE NOT AVAILABLE

**Explanation**

The MQ-IMS bridge cannot operate because:

- The version of z/OS being used is not correct
- The version of IMS being used is not correct
- OTMA support has not been enabled on IMS.
- An incorrect version of the system parameter module (CSQZPARM) is being used.

**System action**

The MQ-IMS bridge does not start.

**System programmer response**

Refer to the Planning on z/OS for information about what product levels are required.

If required, recompile CSQZPARM with the correct libraries.

**CSQ2010I**

*csect-name* CONNECTED TO PARTNER, XCFGNAME=*gname* XCFMNAME=*mname*

**Explanation**

The MQ-IMS bridge successfully established a connection to the partner IMS system identified by *gname* and *mname*.

**System action**

Processing continues; messages can be sent to the partner.

**CSQ2011I**

*csect-name* DISCONNECTED FROM PARTNER, XCFGNAME=*gname* XCFMNAME=*mname*

**Explanation**

The partner IMS system identified by *gname* and *mname* is no longer available, and the connection from the MQ-IMS bridge has ended.

**System action**

Processing continues; messages can no longer be sent to the partner.

**CSQ2012I**

*csect-name* NO UTOKEN SECURITY REQUESTED FOR IMS SIGNON, XCFGNAME=*gname*  
XCFMNAME=*mname*

**Explanation**

The MQ-IMS bridge signed-on to the partner IMS system identified by *gname* and *mname*. No UTOKEN security was requested for this session.

**System action**

Processing continues.

**CSQ2013E**

*csect-name* NOT AUTHORIZED FOR IMS SIGNON, XCFGNAME=*gname* XCFMNAME=*mname*

**Explanation**

The MQ-IMS bridge tried to sign on to the partner IMS system identified by *gname* and *mname*. However, the queue manager not authorized to establish a connection to this IMS system.

**System action**

No connection is made to the IMS system. Connections to other OTMA partners are unaffected.

**CSQ2015I**

*csect-name* IMS BRIDGE ALREADY SUSPENDED, XCFGNAME=*gname* XCFMNAME=*mname*

**Explanation**

A SUSPEND QMGR FACILITY(IMSBRIDGE) command was issued, but the MQ-IMS bridge to the partner IMS system identified by *gname* and *mname* is already suspended.

**System action**

None.

**CSQ2016I**

*csect-name* IMS BRIDGE NOT SUSPENDED, XCFGNAME=*gname* XCFMNAME=*mname*

**Explanation**

A RESUME QMGR FACILITY(IMSBRIDGE) command was issued, but the MQ-IMS bridge to the partner IMS system identified by *gname* and *mname* is not suspended.

**System action**

None.

**CSQ2020E**

*csect-name* RESYNCHRONIZATION ERROR

**Explanation**

A resynchronization error has occurred. The information provided by this message is:

**IN TPIPE *tpipename* FOR QUEUE *q-name*, BY PARTNER, XCFGNAME=*gname* XCFMNAME=*mname*,  
QMGR SEND=*sendseq* PARTNER RECEIVE=*otmarecvseq*, QMGR RECEIVE=*rcvseq*  
PARTNER SEND=*otmasendseq*, INDOUBT UNIT OF RECOVERY *urid***

where:

***tpipename***

The name of the Tpipe which cannot be resynchronized

***q-name***

The name of the queue for this Tpipe

***gname***

The name of the XCF group to which the Tpipe belongs

***mname***

The name of the XCF member to which the Tpipe belongs

***sendseq***

The recoverable sequence number of the message last sent by MQ to the partner, in hexadecimal

*otmasendseq*

The recoverable sequence number of the message last sent by the partner to MQ, in hexadecimal

*recvseq*

The recoverable sequence number of the message last received by MQ from the partner, in hexadecimal

*otmarecvseq*

The recoverable sequence number of the message last received by the partner from MQ, in hexadecimal

*urid*

The identifier of an in-doubt unit of recovery; a value of 0 means that there is no in-doubt unit of recovery.

**System action**

No messages are sent on the Tpipe.

**System programmer response**

Use the RESET TPIPE command to reset recoverable sequence numbers, to restart the Tpipe, and, if required, to resolve the unit of recovery.

**CSQ2023E**

*csect-name* PARTNER, XCFGNAME=*gname* XCFMNAME=*mname*, CANNOT RESYNCHRONIZE, SENSE CODE=*code*

**Explanation**

MQ was unable to resynchronize with the partner. The information provided in the message is:

*gname* The name of the XCF group to which the partner belongs.

*mname*

The member name of the partner who cannot resynchronize.

*code* The IMS sense code returned by the partner (the first four characters are the sense code).

**System action**

The connection to OTMA is stopped

**System programmer response**

For information about IMS-OTMA sense codes, see the IMS Messages and Codes. Resolve the problem and restart the OTMA connection.

**CSQ2024E**

*csect-name* TPIPE *tpipename* IS UNKNOWN TO PARTNER, XCFGNAME=*gname* XCFMNAME=*mname*

**Explanation**

The Tpipe name was unknown to the partner. The information provided in the message is:

*tpipename*

The name of the Tpipe which the partner no longer recognizes.

*gname* The XCF group to which the partner belongs.

*mname*

The member name of the partner who is resynchronizing

**System action**

The associated unit of recovery is backed out and processing continues.

**System programmer response**

If the partner IMS system has been cold started then this message can be considered normal. If the IMS system has not been cold started consider this message as an alert and investigate the partner IMS system.

#### CSQ2025E

*csect-name* PARTNER, XCFGNAME=*gname* XCFMNAME=*mname*, CANNOT RESYNCHRONIZE TPIPE *tpipename*, SENSE CODE=*code*

#### Explanation

The partner was unable to resynchronize the Tpipe. The information provided in the message is:

*gname* The XCF group to which the partner belongs.

*mname*

The member name of the partner who is resynchronizing.

*tpipename*

The name of the Tpipe which the partner cannot resynchronize.

*code* The IMS sense code returned by the partner.

#### System action

The Tpipe is stopped.

#### System programmer response

See the *IMS V10 Communications and Connections* InfoCenter for information about the sense code from IMS. Resolve the problem and restart or reset the Tpipe.

#### CSQ2026I

*csect-name* PARTNER, XCFGNAME=*gname* XCFMNAME=*mname*, HAS COLD-STARTED TPIPE *tpipename*

#### Explanation

The partner has cold started a Tpipe. The information provided in the message is:

*gname* The XCF group of which the partner is a member.

*mname*

The member name of the partner who is resynchronizing.

*tpipename*

The name of the Tpipe which the partner has cold started.

#### System action

All recoverable sequence numbers are reset to 1, and processing continues.

#### System programmer response

None.

#### CSQ2027I

*csect-name* TPIPE *tpipename* FOR PARTNER, XCFGNAME=*gname* XCFMNAME=*mname*, DOES NOT HAVE AN INDOUBT UNIT OF RECOVERY

#### Explanation

MQ expected a Tpipe to have an in-doubt unit of recovery. The information provided by the message is:

*tpipename*

The name of the Tpipe for which there should be a unit of recovery still in doubt

*gname* The XCF group to which the partner belongs.

*mname*

The member name of the partner for the Tpipe.

**System action**

Processing continues.

**System programmer response**

Collect the following items, and contact your IBM support center.

- Console log
- MQ job log
- IMS job log

**CSQ2028I**

*csect-name* QUEUE MANAGER IS NOT CONNECTED TO PARTNER, XCFGNAME=*gname*  
XCFMNAME=*mname*

**Explanation**

MQ is not connected to the partner. The information provided in the message is:

*gname* The group name of the partner.

*mname*

The member name of the partner.

**System action**

The command is rejected.

**System programmer response**

Resubmit the command using the correct XCF group name when MQ is connected to the partner.

**CSQ2029I**

*csect-name* TPIPE *tpipename* NOT FOUND FOR PARTNER, XCFGNAME=*gname*  
XCFMNAME=*mname*

**Explanation**

The Tpipe could not be found. The information provided in this message is:

*tpipename*

The name of the Tpipe which could not be found.

*gname* The XCF group of which the partner is a member.

*mname*

The member name of the partner for the Tpipe.

**System action**

The command is rejected.

**System programmer response**

Resubmit the RESET TPIPE command with the correct Tpipe name.

**CSQ2030I**

*csect-name* TPIPE *tpipename* IS STILL OPEN FOR PARTNER, XCFGNAME=*gname*  
XCFMNAME=*mname*

**Explanation**

The Tpipe is still open. The information provided by this message is:

*tpipename*

The name of the Tpipe which is still open.

*gname* The XCF group name.

*mname*  
The member name of the partner for the Tpipe.

#### System action

The command is rejected.

#### System programmer response

The most likely cause of this message is that the RESET TPIPE command was issued with an incorrect Tpipe name or that the command was issued on the wrong queue manager in a queue-sharing group. Resubmit the RESET TPIPE command with the correct Tpipe name.

#### CSQ2031I

*csect-name* TPIPE *tpipename* FOR PARTNER, XCFGNAME=*gname* XCFMNAME=*mname*, ACTION REQUIRED FOR INDOUBT UNIT OF RECOVERY

#### Explanation

A Tpipe has an in-doubt unit of recovery, but no recovery action was specified. The information provided by the message is:

*tpipename*  
The name of the Tpipe which has a unit of recovery still in doubt

*gname* The XCF group to which the partner belongs.

*mname*  
The member name of the partner for the Tpipe.

#### System action

Processing continues.

#### System programmer response

Resubmit the RESET TPIPE command specifying an action (COMMIT or BACKOUT) for the in-doubt unit of recovery.

#### CSQ2040I

*csect-name* OTMA MESSAGE FLOOD STATUS=WARNING FOR PARTNER, XCFGNAME=*gname* XCFMNAME=*mname*

#### Severity

4

#### Explanation

This message is issued by the WebSphere MQ-IMS bridge in response to a notification from the partner IMS system, identified by *gname* and *mname*, that an OTMA message flood warning condition exists.

This message indicates that the IMS partner is currently unable to process the volume of transaction requests being sent to it via the WebSphere MQ-IMS bridge.

#### System action

Processing continues but the WebSphere MQ-IMS bridge will slow down the rate at which transaction requests are sent to allow the partner IMS system to process the accumulated backlog.

#### System programmer response

Review the status of the partner IMS system to determine if any action is required. You can use the **/DISPLAY OTMA** and **/DISPLAY TMEMBER** commands to do this.

Perform a check on the partner IMS system to determine if the message DFS1988W has been issued, identifying the severity of the warning condition.

#### **CSQ2041I**

*csect-name* OTMA MESSAGE FLOOD STATUS=FLOODED FOR PARTNER, XCFGNAME=*gname*  
XCFMNAME=*mname*

#### **Severity**

8

#### **Explanation**

This message is issued by the WebSphere MQ-IMS bridge in response to a notification from the partner IMS system, identified by *gname* and *mname*, that an OTMA message flood condition exists.

This indicates that the IMS partner is currently unable to process the volume of transaction requests being sent to it via the WebSphere MQ-IMS bridge. No further requests can be sent until the flood condition in IMS has been relieved.

#### **System action**

All TPIPEs to the identified partner IMS system are suspended until a notification is received from IMS indicating that the flood condition has been relieved.

Messages can still be put to any WebSphere MQ-IMS bridge queue with a storage class specifying the identified IMS partner but will remain there until the TPIPEs can be resumed.

WebSphere MQ-IMS bridge queues for other IMS partners are unaffected.

#### **System programmer response**

Review the status of the partner IMS system and determine what action is required to relieve the IMS flood condition. You can use the **/DISPLAY OTMA** and **/DISPLAY TMEMBER** commands to do this.

Perform a check on the partner IMS system to determine if the message DFS1989E has been issued, identifying the flood condition.

#### **CSQ2042I**

*csect-name* OTMA MESSAGE FLOOD RELIEVED FOR PARTNER, XCFGNAME=*gname*  
XCFMNAME=*mname*

#### **Severity**

0

#### **Explanation**

This message is issued by the WebSphere MQ-IMS bridge in response to a notification from the partner IMS system, identified by *gname* and *mname*, that an OTMA message flood, or flood warning, condition no longer exists.

#### **System action**

If this message follows CSQ2041I, all TPIPEs to the identified partner IMS system that were suspended in response to the flood condition are resumed. The WebSphere MQ-IMS bridge will gradually increase the rate at which transaction requests are sent until the maximum rate is achieved, or a subsequent flood condition is reported by the partner IMS system.

#### **System programmer response**

None required.

## Subsystem support messages (CSQ3...):

### CSQ3001E

*csect-name* - ABNORMAL DISCONNECT FROM SUBSYSTEM INTERFACE

#### Explanation

An online routine was still supporting SSI calls (IEFSSREQ) even though the queue manager had nearly completed termination or was no longer executing. This occurs with *csect-name* CSQ3RS00 or CSQ3RS0X when the queue manager address space has reached end-of-memory and neither normal termination nor online error recovery routines have successfully completed termination of the queue manager. This occurs with *csect-name* CSQ3SSTM when this condition is discovered during online termination.

#### System action

The connection is terminated. All IEFSSREQ requests are handled by the IBM MQ early processing program until the queue manager is restarted. An SVC dump is requested.

### CSQ3002I

INDOUBT RECOVERY BY *connection-name* STILL IN PROGRESS

#### Explanation

There might be IBM MQ units of recovery (URs), related to an identified subsystem (*connection-name*), still in doubt after restart synchronization has taken place. (Indoubt URs are those for which commit has been voted by IBM MQ but which have not yet been acknowledged by *connection-name*.)

This message might appear if the *connection-name* subsystem has begun to do new work before having resolved all in-doubt URs. The *connection-name* subsystem is still in the process of resolving the in-doubt URs.

#### System action

Resources held (locked) by these in-doubt URs are unavailable to any other work units until their status is resolved.

#### System programmer response

The system programmer or system administrator must determine the correct recovery action to resolve the in-doubt situations. This involves either ensure-commit or backout decisions for all in-doubt URs.

The DISPLAY THREAD command should be used to see the URs still in doubt. It will normally show that all in-doubt URs have now been resolved. If not, the RESOLVE INDOUBT command should be used to resolve the in-doubt URs and to release the resources they hold.

### CSQ3004E

SSI DESCRIPTOR GET FAILURE, RC=*rc* REASON=*reason*

#### Explanation

An internal error has occurred during initialization or termination.

#### System action

The queue manager terminates.

#### System programmer response

Ensure that all maintenance has been applied to the IBM MQ program libraries, and then restart the queue manager.

### CSQ3006E

'*rmid*' SSI FUNCTION WAS ALREADY ACTIVE WHEN ACTIVATE WAS ATTEMPTED

**Explanation**

An initialization sequence error has occurred.

**System action**

The queue manager terminates.

**System programmer response**

Ensure that all maintenance has been applied to the IBM MQ program libraries, and then restart the queue manager.

**CSQ3007E**

*'rmid'* SSI FUNCTION WAS ALREADY INACTIVE WHEN DEACTIVATE WAS ATTEMPTED

**Explanation**

A termination sequence error has occurred.

**System action**

Termination continues.

**System programmer response**

Ensure that all maintenance has been applied to the IBM MQ program libraries.

**CSQ3008E**

*csect-name* - ABNORMAL DISCONNECT FOR PROGRAM REQUEST HANDLER(S)

**Explanation**

One or more resource managers are still supporting application program calls through their program request handler, even though the queue manager had almost completed termination, or was no longer executing. This occurs when the queue manager address space has gone to end of memory and neither normal termination nor online error recovery routines have successfully completed termination.

**System action**

The connection is terminated. All application program support requests are rejected with an indication that the queue manager is not active. An SVC dump is requested.

**System programmer response**

If the problem persists, collect the following items, and contact your IBM support center:

- System dump
- Printout of SYS1.LOGREC

**CSQ3009E**

error-info

**Explanation**

An internal error has occurred in RRS exit processing. The message contains error information that will be needed to resolve the problem.

**System action**

Processing continues, but RRS coordination is no longer available to the queue manager. It will probably be necessary to restart the queue manager or RRS.

**CSQ3011I**

*csect-name* Coordinator RRS is cold-starting and has lost its log. In-doubt IBM MQ threads need manual resolution

**Explanation**

IBM MQ has participant responsibility for in-doubt threads. RRS, the commit coordinator, has informed the queue manager that it lost all knowledge of IBM MQ in-doubt threads. The in-doubt threads at this queue manager must be manually resolved with the RESOLVE INDOUBT command.

#### **System action**

Processing continues.

#### **System programmer response**

A list of in-doubt threads where RRS is the coordinator can be displayed using the DISPLAY THREAD command for in-doubt type threads by specifying RRSBATCH as the connection name.

The decision to commit or back out the logical unit of work should be coordinated with any other participant RRS Recoverable Resource Managers. The existence of other participants might not be easy to determine. The information might be available in the RRS recovery log even though information has been lost.

At this queue manager, all in-doubt threads coordinated by RRS must be resolved with the RESOLVE INDOUBT command. Locked data remains unavailable until resolution. Threads that were already resolved with this command are discarded. Threads not yet resolved are discarded after resolution with the command.

The commit or back out decision provided using the RESOLVE INDOUBT command for a logical unit of work is propagated to all downstream participants, if any.

#### **CSQ3013I**

*csect-name* Queue manager was restarted on the wrong system so cannot connect to RRS. There are unresolved URs where IBM MQ is a participant

#### **Explanation**

The queue manager has one or more in-doubt threads and is unable to connect to RRS to resolve these in-doubt units of recovery (URs).

#### **System action**

Processing continues.

#### **CSQ3014I**

*csect-name* In-doubt RRS URID=*rrs-urid* is unknown to IBM MQ. URID recorded for IBM MQ by RRS=*mq-urid*

#### **Explanation**

The queue manager is restarting with RRS where IBM MQ is a participant and RRS is the coordinator. RRS has a unit of recovery (UR) that the queue manager should be a participant in, but it has no knowledge of the RRS unit of recovery, with an ID of *rrs-urid*. RRS has recorded the IBM MQ URID as *mq-urid*.

#### **System action**

Restart with RRS continues.

#### **System programmer response**

This message might indicate a problem in IBM MQ or RRS, or it might be produced because of one of the following prior actions:

- A conditional restart was performed that resulted in the loss of part or all of the IBM MQ log. This conditional restart might have happened at any time in the past.
- The RESOLVE INDOUBT command was used to resolve the IBM MQ UR with ID *mq-urid*.

If one of these occurred, the message can be ignored. If neither occurred, there might be a problem in IBM MQ or RRS.

If the *mq-urid* appears to be a valid log RBA, use the log print utility (CSQ1LOGP) with the SUMMARY option and URID options using the *mq-urid* value. If this finds the UR, the disposition will indicate whether it was committed or backed out. If possible, use the RRS ISPF interface to commit or back out the RRS URID so that they match.

If you suspect an error in IBM MQ, collect the items listed in the Problem Determination section and contact your IBM support center.

#### **CSQ3016I**

*csect-name* RRS has lost data from its log

#### **Explanation**

The queue manager is restarting with RRS and RRS has lost some portion of its log.

#### **System action**

Restart with RRS continues.

#### **System programmer response**

IBM MQ might not be able to resolve in-doubt units of recovery successfully with RRS because of the loss of RRS log data.

#### **CSQ3017I**

*csect-name* RRS function *call-name* failed, RC=*rc*

#### **Explanation**

During queue manager restart, the RRS function specified by *call-name* issued a return code *rc* indicating a failure.

#### **System action**

Processing continues, but RRS functions will not be available. For example, connections using the RRS adapter will not be allowed, and queue-sharing group facilities will not work.

#### **System programmer response**

Investigate the RRS return code from the function specified and resolve the problem. Then restart the queue manager.

#### **CSQ3100I**

*csect-name* - SUBSYSTEM *ssnm* READY FOR START COMMAND

#### **Explanation**

The queue manager has terminated, and can be restarted when required.

#### **CSQ3101E**

*csect-name* - INVALID EARLY PROCESSING PARAMETER

#### **Explanation**

The z/OS command SETSSI ADD or the subsystem definition record in the IEFSSNxx member of SYS1.PARMLIB for the IBM MQ subsystem specified the early processing initialization parameter incorrectly. The name must be CSQ3EPX.

The failing subsystem name is provided in message IEF759I, which follows this message.

#### **System action**

The IBM MQ subsystem with the indicated name is not available.

#### **System programmer response**

Correct the parameter fields in the record of SYS1.PARMLIB member IEFSSNxx. For information about the parameters, see Update SYS1.PARMLIB members.

**CSQ3102E**

*csect-name* - INVALID COMMAND PREFIX

**Explanation**

The z/OS command SETSSI ADD or the subsystem definition record in the IEFSSNxx member of SYS1.PARMLIB for the IBM MQ subsystem specified the command prefix initialization parameter incorrectly.

The failing subsystem name is provided in message IEF759I, which follows this message.

**System action**

The IBM MQ subsystem with the indicated name is not available.

**System programmer response**

Correct the parameter fields in the record of SYS1.PARMLIB member IEFSSNxx. For information about the parameters, see Update SYS1.PARMLIB members.

**CSQ3104I**

*csect-name* - TERMINATION COMPLETE

**Explanation**

The queue manager has terminated. The actual z/OS termination of the queue manager address spaces might have completed earlier. This message is presented for every termination, normal or abnormal.

**CSQ3105E**

*csect-name* - UNABLE TO LOAD EARLY PROCESSING PROGRAM 'CSQ3EPX'. *ssnm* IS NOT AVAILABLE

**Explanation**

Subsystem initialization or early processing refreshing for the IBM MQ subsystem failed because the initialization program (CSQ3INI) could not locate the early processing program (CSQ3EPX).

For subsystem initialization, the program must be either in the linkpack area (LPA) or in a library which is in the link list. For early processing refreshing, the program must be in the LPA.

**System action**

Subsystem initialization or early processing refreshing ends abnormally. IBM MQ subsystem *ssnm* is not available.

**CSQ3106E**

*csect-name* - QUEUE MANAGER STOPPED. COMMAND NOT PROCESSED - *command-text*

**Explanation**

A command was received which cannot be processed due to one of the following:

- The queue manager has not been started (this could be because the START QMGR command was not entered correctly)
- The command was queued for processing while the queue manager was starting, but startup terminated with an error
- The queue manager terminated before the command could be processed

**System action**

The command is not processed.

**CSQ3107E**

*csect-name* - COMMAND REJECTED. REQUESTER NOT AUTHORIZED

**Explanation**

A command was received from a console that does not have the correct authority.

**System action**

The command is not processed. This message is sent to the console that entered the command.

**System programmer response**

Verify that this console should be used for entering IBM MQ commands. If so, authorize it for IBM MQ commands by using z/OS services.

**Note:** If IBM MQ security is not activated, this check is still performed. This authorization is the z/OS console authority, and is not related to the external security manager. The user ID that entered the IBM MQ command must have OPERPARM AUTH with SYS, ALL, or MASTER console authority.

**CSQ3108E**

*csect-name* - COMMAND REJECTED. COMMAND FACILITY PATH UNAVAILABLE

**Explanation**

A command was received, but the path from z/OS consoles to the IBM MQ command processor is unavailable. It might still be possible to enter commands in other ways. You can also receive this message if the early code for the queue manager was being refreshed when the command was issued.

**System action**

The command is not processed. This message is delivered to the console that entered the command.

**System programmer response**

The console command facility is available again the next time the queue manager is started.

If the command was rejected because the early code for the queue manager was being refreshed when you issued it, wait until message CSQ3110I is issued to indicate that the early code has successfully refreshed before you issue the command again.

**CSQ3109E**

*csect-name* - UNABLE TO OBTAIN SUBSYSTEM AFFINITY TABLE INDEX FOR SUBSYSTEM *ssnm*. IEFSSREQ RC=*nn*

**Explanation**

IBM MQ was unable to obtain a subsystem affinity table index for the named subsystem. z/OS did not recognize the named subsystem name as a known subsystem. If this message is issued, a serious error has occurred in z/OS or IBM MQ.

In the message, *nn* is the return code from the IEFSSREQ z/OS service. *ssnm* is the name of the IBM MQ subsystem undergoing IPL-time initialization.

**System action**

IBM MQ ends abnormally with completion code X'5C6' and reason code X'00F30104'. The IBM MQ subsystem with the indicated name is not available for this IPL of z/OS.

**System programmer response**

Try to perform an IPL of the z/OS system. If the problem persists, see Problem determination on z/OS for information about identifying and reporting the problem.

**CSQ3110I**

*csect-name* - SUBSYSTEM *ssnm* INITIALIZATION COMPLETE

**Explanation**

Either:

- IBM MQ subsystem initialization is complete, following z/OS IPL processing or the z/OS command SETSSI ADD.
- The IBM MQ early processing program has been successfully refreshed, following a REFRESH QMGR TYPE(EARLY) command.

### CSQ3111I

*csect-name* - EARLY PROCESSING PROGRAM IS *Vn* LEVEL *l*

#### Explanation

This message shows the level of the early processing program that is being used.

The level is of the form *nnn-mmm* and indicates the capability of the early code.

*nnn* is incremented for each new release of the product and *mmm* can be incremented from time to time when PTFs add maintenance to the early code.

The early code level used must have a capability level corresponding with the highest release of the product you intend to run on an LPAR. You can use the *nnn* value to confirm the level installed.

Corresponding values of *nnn* are:

- **005**: IBM WebSphere MQ for z/OS Version 7.0.1
- **006**: IBM WebSphere MQ for z/OS Version 7.1
- **007**: IBM MQ for z/OS Version 8.0

### CSQ3112E

*csect-name* - INVALID CPF SCOPE

#### Explanation

The z/OS command SETSSI ADD or the subsystem definition record in the IEFSSNxx member of SYS1.PARMLIB for the IBM MQ subsystem specified the CPF scope initialization parameter incorrectly.

The failing subsystem name is provided in message IEF759I, which follows this message.

#### System action

The IBM MQ subsystem with the indicated name is not available.

#### System programmer response

Correct the parameter fields in the record of SYS1.PARMLIB member IEFSSNxx. For information about the parameters, see Update SYS1.PARMLIB members.

### CSQ3113E

*csect-name* - COMMAND PREFIX REGISTRATION FAILED. INVALID CHARACTER(S) IN CPF

#### Explanation

Command prefix registration failed because the command prefix (CPF) contains invalid characters.

#### System action

The IBM MQ subsystem with the indicated name is not available.

#### System programmer response

Correct the CPF parameter in the record of SYS1.PARMLIB member IEFSSNxx. For information about the parameters, see Update SYS1.PARMLIB members.

**CSQ3114E**

*csect-name* - COMMAND PREFIX REGISTRATION FAILED. INVALID CHARACTER(S) IN SUBSYSTEM NAME

**Explanation**

Command prefix registration failed because the subsystem name used as the owner of the command prefix (CPF) contains invalid characters.

**System action**

The IBM MQ subsystem with the indicated name is not available.

**System programmer response**

Correct the CPF parameter in the record of SYS1.PARMLIB member IEFSSNxx. For information about the parameters, see Update SYS1.PARMLIB members.

**CSQ3115E**

*csect-name* - COMMAND PREFIX REGISTRATION FAILED. CPF ALREADY DEFINED

**Explanation**

Command prefix registration failed because the command prefix (CPF) was already defined to z/OS.

**System action**

The IBM MQ subsystem with the indicated name is not available.

**System programmer response**

Correct the CPF parameter in the record of SYS1.PARMLIB member IEFSSNxx. For information about the parameters, see Update SYS1.PARMLIB members.

**CSQ3116E**

*csect-name* - COMMAND PREFIX REGISTRATION FAILED. CPF IS A SUBSET OF A CPF ALREADY DEFINED

**Explanation**

Command prefix registration failed because the command prefix (CPF) is a subset of a CPF already defined to z/OS.

**System action**

The IBM MQ subsystem with the indicated name is not available.

**System programmer response**

Correct the CPF parameter in the record of SYS1.PARMLIB member IEFSSNxx. For information about the parameters, see Update SYS1.PARMLIB members.

**CSQ3117E**

*csect-name* - COMMAND PREFIX REGISTRATION FAILED. CPF IS A SUPERSET OF A CPF ALREADY DEFINED

**Explanation**

Command prefix registration failed because the command prefix (CPF) is a superset of a CPF already defined to z/OS.

**System action**

The IBM MQ subsystem with the indicated name is not available.

**System programmer response**

Correct the CPF parameter in the record of SYS1.PARMLIB member IEFSSNxx. For information about the parameters, see Update SYS1.PARMLIB members.

#### CSQ3118E

*csect-name* - SYSTEM ERROR DURING COMMAND PREFIX REGISTRATION

#### Explanation

A z/OS error occurred during command prefix (CPF) registration.

#### System action

The MQ subsystem with the indicated name is not available.

#### System programmer response

Check the z/OS console for other messages relating to the problem.

#### CSQ3119E

*csect-name call-name* call for group attach table failed, rc=*rc*

#### Explanation

During initialization for the group connect facility, a name token services call failed. *rc* is the return code (in hexadecimal) from the call.

#### System action

Processing continues, but the group connect facility will not be available to CICS.

#### System programmer response

See the *MVS Authorized Assembler Services Reference* manual for information about the return codes from the name token services call. If you are unable to solve the problem, take a stand-alone system dump and contact your IBM support center.

#### CSQ3120E

*csect-name* - IXCQUERY ERROR FOR XCF GROUP *group-name* APPLID= *applid*, RC= *rc* REASON= *reason*

#### Explanation

A CICS region with APPLID *applid* attempted to connect to a queue-sharing group. During processing of the request an IXCQUERY call failed with return code *rc* and reason code *reason*.

The XCF group for which the IXCQUERY request was performed is identified by *group-name*.

#### System action

The request by CICS to connect to the queue-sharing group fails with the reason code MQRC\_UNEXPECTED\_ERROR.

#### System programmer response

See the *z/OS MVS Sysplex Services Reference* manual for an explanation of the IXCQUERY return and reason codes. If you are unable to solve the problem, contact your IBM support center.

#### CSQ3201E

ABNORMAL EOT IN PROGRESS FOR USER=*user* CONNECTION-ID=*conn-id*  
THREAD-XREF=*thread-xref* JOBNAME=*jobname* ASID=*asid* TCB=*tcb*

#### Explanation

Abnormal termination processing has been started for the agent with the values for the USER, CONNECTION-ID, THREAD-XREF, JOBNAME, ASID and TCB shown. These values are the last known set of identifiers for the terminating agent.

The abnormal termination might be the result of an error in the allied agent's address space or the result of the z/OS command CANCEL issued by the operator.

The value for the USER, the THREAD-XREF or both might be blank. The values for the USER, CONNECTION-ID, THREAD-XREF, JOBNAME and ASID are the last values established to IBM MQ for this connection and might represent the current activity of the agent. The TCB value is the address of the TCB that is terminating. Previous IBM MQ work by this agent might have completed successfully.

This message, CSQ3201E, is written to the z/OS console after the agent has been removed from the service task work queue at the time that termination processing begins.

#### **System action**

The agent was previously queued to a service task for termination processing. This message indicates that the agent has been taken from the queue for processing. Any uncommitted changes will be backed out.

#### **System programmer response**

See the Problem Determination section of this message. The z/OS commands CANCEL and FORCE will have no effect. Do not cancel IBM MQ. If an extensive backout is in progress, the subsequent queue manager restart might take a very long time due to additional log activity.

#### **CSQ3202E**

CONNECTION FOR *jobname* FAILED, INSUFFICIENT ECSA STORAGE TO CREATE ACE

#### **Explanation**

*jobname* attempted to connect to IBM MQ using the MQCONN, or MQCONNX, API call.

There was insufficient common storage available to build the control blocks to represent the connection and to the connection attempt failed.

There might be a system wide ECSA shortage, or the storage available for creating new queue manager connections might be limited by the ACELIM system parameter.

This message can be seen for batch applications, including RRS applications; for example, Db2 stored procedures and WebSphere Application Server.

#### **System action**

The MQCONN or MQCONNX API call, used by *jobname* returns MQCC\_FAILED, together with reason code MQRC\_Q\_MGR\_NOT\_AVAILABLE 2059

Queue manager processing continues.

#### **CSQ3580E**

CONNECTION FOR '*ssi-call*' GAVE RC=*rc*, REASON=*reason*

#### **Explanation**

A nonzero return code has been returned to CSQ3AMI2 from the connect to subsystem interface (SSI) call. The variables in the message indicate which SSI call is involved and the actual return and reason codes associated with it.

#### **System action**

The current task is ended abnormally with a system completion code of X'5C6' and a reason code of X'00F30580'. The queue manager terminates.

#### **System programmer response**

Restart the queue manager. Note the values contained in the message, and contact your IBM support center.

## DB2 manager messages (CSQ5...):

### CSQ5001I

*csect-name* Connected to DB2 *db2-name*

#### Explanation

The queue manager has successfully established a connection to the named DB2 subsystem.

#### System action

Processing continues.

#### System programmer response

None.

### CSQ5002E

*csect-name* Connection to DB2 using *connect-name* failed, RC=*return-code* reason=*reason*

#### Explanation

The queue manager's attempt to establish a connection to the named DB2 subsystem failed.

#### System action

Queue manager startup is terminated.

#### System programmer response

This is normally an authorization error.

Consult the *DB2 for z/OS Messages and Codes* manual for an explanation of the codes and attempt to resolve the problem.

### CSQ5003A

*csect-name* Connection to DB2 using *connect-name* pending, no active DB2

#### Explanation

The queue manager is waiting for an eligible DB2 subsystem to become active so that a connection can be established. Alternatively, RRS is inactive or was started after the DB2 subsystems.

#### System action

The queue manager waits for an eligible DB2 subsystem to become active.

#### System programmer response

Check whether the DB2 subsystem(s) are active. If not then start them. If they are active, ensure RRS is active and check that it was started prior to the DB2 subsystems.

### CSQ5004E

*csect-name* DB2 table entry for queue manager in queue-sharing group *qsg-name* is missing or incorrect

#### Explanation

During startup the queue manager was unable to find its entry in the DB2 administration tables, or the entry was incorrect.

#### System action

The queue manager terminates with completion code X'6C6' and reason code X'00F50013'.

#### System programmer response

Check that a queue manager record exists in the DB2 tables for the DB2 data-sharing group specified. Check the QSGDATA system parameter specifies the correct DB2 data-sharing group. If so, check that a queue manager entry exists in the CSQ.ADMIN\_B\_QMGR table.

If you are migrating from a previous release of IBM MQ, check also that you have updated the DB2 tables to the format for the current release. For information about migration and compatibility between releases, see Migrating.

#### **CSQ5005E**

*csect-name* Queue manager release level is incompatible with queue-sharing group

#### **Explanation**

The release level of the queue manager that is being started is incompatible with that of other members of the queue-sharing group.

#### **System action**

The queue manager terminates with completion code X'6C6' and reason code X'00F50029'.

#### **System programmer response**

Verify that the correct load libraries are being used and that the queue-sharing group information in the system parameters has been specified correctly. Also use the queue-sharing group utility (CSQ5PQSG) to verify that the queue manager has been defined correctly in the DB2 administration tables, using the MIGRATE QSG option. Ensure that you use the same version of IBM MQ for the utility, as was used for running the queue manager.

For information about migration and compatibility between releases, see Migrating queue sharing groups.

If the MIGRATE QSG results show queue managers that no longer exist, but are still in the Db2 tables, use the REMOVE QMGR option or, if necessary, the FORCE QMGR option.

#### **CSQ5006E**

*csect-name* Data-sharing groups differ

#### **Explanation**

A mismatch has been detected between the DB2 data-sharing group specified on the QSGDATA system parameter and the queue manager entry in the CSQ.ADMIN\_B\_QMGR table.

#### **System action**

The queue manager terminates with completion code X'6C6' and reason code X'00F50006'.

#### **System programmer response**

The queue-sharing group name specified on the QSGDATA system parameter must match that in which the queue manager is defined in the DB2 CSQ.ADMIN\_B\_QMGR table.

#### **CSQ5007E**

*csect-name* RRSF function *function* failed for plan *plan-name*, RC=*return-code* reason=*reason*  
syncpoint code=*sync-code*

#### **Explanation**

A non-zero or unexpected return code was returned from an RRSF request. The DB2 plan involved was *plan-name*.

#### **System action**

If the error occurs during queue manager startup or reconnect processing, the queue manager terminates with completion code X'6C6' and reason code X'00F50016'. Otherwise, an error message is issued and processing continues.

#### **System programmer response**

Determine the cause of the error using the RRS return and reason code from the message.

Consult the *DB2 for z/OS Messages and Codes* manual for an explanation of the codes and attempt to resolve the problem.

#### **CSQ5008E**

*csect-name* DB2 *db2-name* is not a member of data-sharing group *dsg-name*

#### **Explanation**

The DB2 subsystem to which the queue manager has connected is not a member of the DB2 data-sharing group specified on the QSGDATA system parameter.

#### **System action**

The queue manager terminates with completion code X'6C6' and reason code X'00F50007'.

#### **System programmer response**

Ensure that the DB2 subsystem to which the queue manager has connected is a member of the data-sharing group specified on the QSGDATA system parameter.

Issue the DB2 command DIS GROUP to the DB2 subsystem and check the data-sharing group name matches the data-sharing group name on the QSGDATA system parameter.

#### **CSQ5009E**

*csect-name* SQL error for table *table-name*, code=*SQL-code* state=*SQL-state*, data=*d1 d2 d3 d4 d5*

#### **Explanation**

A non-zero or unexpected SQL return code was returned from a DB2 SQL request.

#### **System action**

The requested operation fails. Processing continues, but the failed request may result in further errors occurring. In some circumstances, the queue manager terminates with completion code X'6C6' and reason code X'00F50014'.

#### **System programmer response**

Determine the reason for the SQL error and correct the problem.

Consult the *DB2 for z/OS Messages and Codes* manual to determine the reason for the SQL error.

#### **CSQ5010E**

*csect-name* XCF IXCQUERY member error, RC=*return-code* reason=*reason*

#### **Explanation**

The queue manager received an unexpected return code from an IXCQUERY request.

#### **System action**

The queue manager terminates with completion code X'6C6' and reason code X'00F50017'.

#### **System programmer response**

Determine the reason for the unexpected error and correct the problem.

Consult the *z/OS MVS Programming: Sysplex Services Reference* manual for an explanation of the return and reason code from the IXCQUERY request.

This message may occur if one or more of the queue managers in a Queue Sharing Group (QSG) do not have a member entry in the XCF group for the QSG.

Enter the following z/OS command substituting the QSG name for xxxx:

```
D XCF,GRP,CSQGxxxx,ALL
```

This will list the members of the XCF group. If any queue managers are defined as a member of the QSG, but do not have an entry in the XCF Group, use the ADD QMGR command of the CSQ5PQSG utility to restore the XCF group entry for that queue manager. The utility should be run for each queue manager which does not have an entry in the XCF group.

#### **CSQ5011E**

*csect-name* XCF IXCJOIN group error, RC=*return-code* reason=*reason*

#### **Explanation**

The queue manager received an unexpected return code from an IXCJOIN request.

#### **System action**

The queue manager terminates with completion code X'6C6' and reason code X'00F50019'.

#### **System programmer response**

Determine the reason for the unexpected error and correct the problem.

Consult the *z/OS MVS Programming: Sysplex Services Reference* manual for an explanation of the return and reason code from the IXCJOIN request.

#### **CSQ5012E**

*csect-name* XCF IXCQUIES group error, RC=*return-code* reason=*reason*

#### **Explanation**

The queue manager received an unexpected return code from an IXCQUIES request.

#### **System action**

The queue manager terminates with completion code X'6C6' and reason code X'00F50021'.

#### **System programmer response**

Determine the reason for the unexpected error and correct the problem.

Consult the *z/OS MVS Programming: Sysplex Services Reference* manual for an explanation of the return and reason code from the IXCQUIES request.

#### **CSQ5013E**

*csect-name* XCF IXCSETUS error, RC=*return-code* reason=*reason*

#### **Explanation**

The queue manager received an unexpected return code from an IXCSETUS request.

#### **System action**

The queue manager terminates with completion code X'6C6' and reason code X'00F50018'.

#### **System programmer response**

Determine the reason for the unexpected error and correct the problem.

Consult the *z/OS MVS Programming: Sysplex Services Reference* manual for an explanation of the return and reason code from the IXCSETUS request.

#### **CSQ5014I**

*csect-name* Connection to *db2-name* lost, DB2 terminated abnormally

#### **Explanation**

The queue manager received an abnormal termination notification from the DB2 subsystem to which it is connected.

#### **System action**

The queue manager will clean up its connection to the DB2 subsystem and attempt to reconnect. If a DB2 group attach name was specified on the QSGDATA system parameter a connection to a different DB2 may occur.

**System programmer response**

Determine the reason for the DB2 abnormal termination. Correct the problem and attempt to restart the DB2 subsystem.

**CSQ5015I**

*csect-name* Connection to *db2-name* lost, DB2 shut down forcibly

**Explanation**

The queue manager received a STOP FORCE termination notification from the DB2 subsystem to which it is connected.

**System action**

The queue manager will clean up its connection to the DB2 subsystem and attempt to reconnect. If a DB2 group attach name was specified on the QSGDATA system parameter a connection to a different DB2 may occur.

**System programmer response**

Determine the reason for the DB2 forcible stop. Restart the DB2 subsystem.

**CSQ5016I**

*csect-name* Connection to *db2-name* quiescing, DB2 terminating

**Explanation**

The queue manager received a STOP QUIESCE termination notification from the DB2 subsystem to which it is connected.

**System action**

The queue manager will quiesce all DB2 server tasks and disconnect from the DB2 subsystem so that it can shut down. It will then attempt to reconnect. If a DB2 group attach name was specified on the QSGDATA system parameter a connection to a different DB2 may occur.

**System programmer response**

Restart the DB2 subsystem so that shared queue operations can resume.

**CSQ5019I**

*csect-name* Disconnected from DB2 *db2-name*

**Explanation**

The queue manager has successfully disconnected from the DB2 subsystem.

**System action**

If the disconnect is due to a DB2 STOP MODE(QUIESCE) the queue manager will attempt to reconnect to the DB2 subsystem.

**System programmer response**

None.

**CSQ5020E**

*csect-name* SQL error, table *table-name* not defined in DB2

**Explanation**

The queue manager attempted to access one of its DB2 tables. DB2 has returned an SQL code indicating the table does not exist.

**System action**

The request fails and processing continues.

**System programmer response**

Check that all MQ tasks to set up the DB2 environment completed successfully and that the correct DB2 data-sharing group name was specified on the QSGDATA system parameter.

**CSQ5021E**

*csect-name* SQL error, table *table-name* index not built in DB2

**Explanation**

The queue manager has attempted to access one of its DB2 tables. DB2 has returned an SQL code indicating that the index for the specified table has not been built.

**System action**

The request fails and processing continues.

**System programmer response**

Check that all MQ tasks to set up the DB2 environment completed successfully and that the correct DB2 data-sharing group name was specified on the QSGDATA system parameter.

**CSQ5022I**

*csect-name* Pending connection to DB2 using *connect-name* ended, queue manager terminating

**Explanation**

The outstanding connection pending request to DB2 has been terminated due to a STOP QMGR request.

**System action**

The pending connect to DB2 is canceled and queue manager termination continues.

**System programmer response**

None.

**CSQ5023E**

*csect-name* SQL error, failed to access table *table-name*

**Explanation**

An attempt by the queue manager to access one of its tables was returned an SQL code indicating that access to the named resource failed.

**System action**

The request fails and processing continues.

**System programmer response**

This message will be followed by message CSQ5009E which contains full details of the information returned from DB2 which should be used in conjunction with messages on the DB2 log to diagnose the problem.

The most likely cause of this problem is contention for a DB2 resource, especially on a heavily-used system. If so, the problem is temporary; retry the action that gave the error.

If not, and the problem persists, determine from the message and the DB2 log the resource concerned and perform the recovery actions necessary to unlock the resource. Such a problem could be caused by a DB2 failure while updating one of the DB2 tables, which will be indicated in the DB2 log.

**CSQ5024E**

*csect-name* Unable to update queue manager status, RC=*return-code*

**Explanation**

During startup and shutdown processing the queue manager attempts to update its status in the CSQ.ADMIN\_B\_QMGR table. This attempt failed.

**System action**

None. Startup/shutdown processing continues.

**System programmer response**

None.

**CSQ5025E**

*csect-name* SQL error, function *function* code=*SQL-code*

**Explanation**

A call to the SQL function specified by *function* returned a non-zero code specified by *SQL-code*.

**System action**

Processing continues.

**System programmer response**

Note the values contained in the message, and contact your IBM support center. Consult the *DB2 for z/OS Messages and Codes* manual for more information about the error code.

**CSQ5026E**

*csect-name* Unable to access DB2, RRS is not available

**Explanation**

The queue manager tried to access DB2, but RRS is not available.

**System action**

If this occurs during queue manager initialization, the queue manager waits for RRS to become available.

If this occurs at other times, the queue manager terminates its connection to DB2, and then tries to reconnect. Some queue-sharing group functions will not be available until RRS is restarted and the connection to DB2 is reestablished.

**System programmer response**

Start (or restart) RRS.

**CSQ5027E**

*csect-name* SQL error for table *table-name*, deadlock or timeout occurred (code=*SQL-code*)

**Explanation**

An SQL call returned a non-zero code indicating that a deadlock or timeout condition occurred.

**System action**

The request fails and processing continues.

**System programmer response**

Retry the command or application involved. If the problem persists, contact your IBM support center. Consult the *DB2 for z/OS Messages and Codes* manual for more information about the error code.

**CSQ5028E**

*csect-name* Unable to access DB2, RRS connection limit exceeded

**Explanation**

The queue manager tried to access DB2, but RRS has reached the limit of allowed concurrent connections (IDENTIFYs).

**System action**

If this message occurs during queue manager initialization, the queue manager waits for an RRS connection to become available.

If this message occurs at other times, the queue manager terminates its connection to DB2, and then tries to reconnect. Some queue-sharing group functions are not available until RRS is restarted and the connection to DB2 is reestablished.

**System programmer response**

Adjust the RRS connection limit if required, then start (or restart) RRS.

Ensure that the DB2 system parameter controlling the maximum number of concurrent users and connections is correct. The DB2 parameter is Max Batch connect (CTHREAD) on the thread management panel DSNTIPE.

See the *DB2 for z/OS* documentation for an explanation of this DB2 parameter to resolve the problem.

**CSQ5029E**

*csect-name* Operation on DB2 table *table-name* failed

**Explanation**

An operation requested for the named DB2 table failed. For example, the table might be full, or there might be insufficient storage available to perform the request.

This is most likely to occur when writing data to one of the tables that IBM MQ uses to store large shared messages.

**System action**

Message CSQ5009E is issued giving details of the associated SQL error codes. The requested operation fails and processing continues. The message or other data is not written to the table.

**System programmer response**

Investigate the cause of the problem as indicated by the SQL codes in message CSQ5009E.

If the table is one of the tables used for storing large shared messages, and the problem is due to insufficient storage, try the operation again later, as the condition might be temporary. If the problem is because the table is full, remove some of the messages; for example, start an application that retrieves and processes the messages. Use the MQ DISPLAY GROUP command to check if there are any obsolete messages in the table space, and delete them. If necessary, increase the size of the table.

**CSQ5032I**

*csect-name* Connection to DB2 *db2-name* in data-sharing group *dsg-name* is suspended

**Explanation**

This is issued in response to a SUSPEND QMGR FACILITY( DB2) command if it completed successfully.

**System action**

All DB2 activity is suspended for the queue manager named, and the connection to DB2 is broken.

**System programmer response**

Use the RESUME QMGR FACILITY( DB2) command when ready to resume DB2 activity.

**CSQ5033I**

*csect-name* Connection to DB2 *db2-name* in data-sharing group *dsg-name* is resumed

**Explanation**

The RESUME QMGR FACILITY( DB2) command completed successfully, reestablishing the connection to DB2.

**System action**

DB2 activity is resumed for the queue manager named.

**CSQ5034I**

*csect-name* Suspend or resume DB2 request pending

**Explanation**

A SUSPEND or RESUME QMGR FACILITY( DB2) command was issued, but such a request is already pending.

**System action**

None.

**System programmer response**

Wait until the pending request completes, then reissue the command if necessary.

**CSQ5035I**

*csect-name* Connection to DB2 *db2-name* in data-sharing group *dsg-name* already suspended

**Explanation**

A SUSPEND QMGR FACILITY( DB2) command was issued, but the connection to the named DB2 subsystem is already suspended.

**System action**

None.

**CSQ5036I**

*csect-name* Connection to DB2 *db2-name* in data-sharing group *dsg-name* not suspended

**Explanation**

A RESUME QMGR FACILITY( DB2) command was issued, but the connection to the named DB2 subsystem is not suspended.

**System action**

None.

**CSQ5037I**

*csect-name* New function not available, incompatible queue managers in the queue-sharing group

**Explanation**

An attempt was made to start the queue manager in new function mode, but some queue managers in the queue-sharing group are either not at a version that is sufficient to coexist with the new functions provided in this level of code, have not been started in new function mode, or do not have compatible QSGDATA parameters.

**System action**

Processing continues, but certain functions will be unavailable.

### System programmer response

Ensure that all of the queue managers in the queue-sharing group have been started in new function mode at the appropriate version, then restart the queue manager. See z/OS: OPMODE for more information on running in new function mode

### CSQ5038I

*csect-name* Service task *service-task* has been unresponsive since hh.mm.ss.nnnnnn. Check for problems with Db2

### Explanation

The queue manager has detected a service task *service-task* that is taking too long to process a request that started at hh.mm.ss.nnnnnn.

### System action

Processing continues, but certain functions might be unavailable.

### System programmer response

Investigate if there are any problems with Db2 or RRS that prevent them responding to IBM MQ requests. For example, the Db2 CTHREAD limit has been exceeded, or Db2 is running slowly because it is short of resources like CPU, I/O capacity, or storage; or Db2 is waiting for log space.

### CSQ5039I

*csect-name* SQL error information

### Explanation

An SQL error has occurred. Additional diagnostic information direct from Db2 follows.

### System action

See the preceding Db2 manager error message.

### System programmer response

Determine the reason for the SQL error and correct the problem.

### CSQ5100I

DISPLAY GROUP report ...

### Explanation

This message is the initial response to the DISPLAY GROUP command. It is followed by message CSQ5102I which is a formatted report of the queue managers in the group.

### System action

Processing continues normally.

### CSQ5102I

Queue managers in group *group-name*

### Explanation

This message is part of the responses to the DISPLAY GROUP command. It provides information about each queue manager in the group, as follows:

```
  Name Num Prefix  Status   Ver  DB2   Connection  name num cpf   qmgr-stat vrm db2-id conn-stat
  :
  End of queue managers report
```

where:

*name* The name of the queue manager.

*num* The internally generated number of the queue manager in the group.

*cpf* The command prefix of the queue manager.

*qmgr-stat*

The current status of the queue manager:

**ACTIVE**

The queue manager is running.

**INACTIVE**

The queue manager is not running, having terminated normally.

**FAILED**

The queue manager is not running, having terminated abnormally.

**CREATED**

The queue manager has been defined to the group, but has not yet been started.

**UNKNOWN**

The status cannot be determined.

*vrn* The function level of the queue manager. The value is a 3-digit number, where:

*v* is the version number

*r* is the release number

*m* is the modification number.

*db2-id* The name of the DB2 subsystem or group attachment to which the queue manager connects.

*conn-stat*

The current status of the connection to DB2:

**ACTIVE**

The queue manager is running and connected to DB2.

**PENDING**

The queue manager is running but not connected because DB2 has terminated normally.

**FAILED**

The queue manager is running but not connected because DB2 has terminated abnormally.

**INACTIVE**

The queue manager is not running and not connected to DB2.

**UNKNOWN**

The status cannot be determined.

Exceptionally, the last line might be either:

**Report terminated, too many lines**

if the report was generated in response to a command from a z/OS console and more than 253 response lines were generated. Only 253 response lines are returned.

**Report terminated**

if there was an error in obtaining the information. The error is described in the following messages.

**System action**

Processing continues normally.

## CSQ5103I

Obsolete messages in DB2 for group *group-name*

### Explanation

Messages are normally deleted automatically from DB2, but in exceptional circumstances obsolete messages can remain. This identifies such messages, as follows:

```
LEID msg-id
```

```
:
```

**End of messages report**

where:

*msg-id*

is the identifier of the message.

Exceptionally, the last line might be either:

**Report terminated, too many lines**

if the report was generated in response to a command from a z/OS console and more than 253 response lines were generated. Only 253 response lines are returned.

**Report terminated**

if there was an error in obtaining the information.

### System action

Processing continues normally.

### System programmer response

Delete the obsolete messages from DB2. For example, use SPUFI to issue the SQL command

```
DELETE FROM CSQ.ADMIN_B_MESSAGES WHERE QSGNAME = 'group-name' AND LEID = 'msg-id';
```

## CSQ5113I

Queue manager is not in a queue-sharing group

### Severity

0

### Explanation

A command that requires a queue-sharing group was entered, but the queue manager is not in a group.

### System action

The command is not actioned.

## CSQ5116E

*call-name* call failed, rc=*rc* reason=*reason*

### Severity

8

### Explanation

During processing for a DISPLAY GROUP command, a coupling facility services call used to get information failed. *rc* is the return code and *reason* is the reason code (both in hexadecimal) from the call.

### System action

Processing is terminated. A following message is issued to identify which type of information was being obtained.

**System programmer response**

See the *z/OS MVS Programming Sysplex Services Reference*. manual for information about the return and reason codes from the call.

**CSQ5117E**

Information not available for group *group-name* - reason

**Severity**

8

**Explanation**

During processing for a DISPLAY GROUP command, information could not be obtained for the group, for the *reason* indicated:

**ERROR**

A coupling facility services call failed, as indicated in the preceding CSQ5116E message.

**CHANGED**

The group size has changed.

**System action**

Processing is terminated.

**System programmer response**

Resolve the problem accordingly.

**Generalized command preprocessor messages (CSQ9...):****CSQ9000E**

*'keyword'* appears more than once

**Explanation**

The named keyword appears more than once in the command. This message will be issued for each occurrence of the keyword after the first.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, and reissue the command correctly. See Building command scripts for information about the rules for building commands.

**CSQ9001E**

*'keyword'* is invalid

**Explanation**

The named keyword is unknown or undefined. It might be misspelled, or it might not be applicable to the command being processed.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, and reissue the command correctly. See MQSC commands for information about the command.

**CSQ9002E**

Unbalanced parentheses following *'keyword'*

**Explanation**

An invalid combination of parentheses has been found following the keyword *keyword*. A closing parenthesis must follow an opening parenthesis before any other opening parenthesis occurs.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, and reissue the command correctly. See Building command scripts for information about the rules for building commands.

**CSQ9003E**

'*keyword*' parameter contains unbalanced apostrophes

**Explanation**

An odd number of apostrophes is present in a parameter value of keyword *keyword*. If the parameter is a quoted string, it must have one apostrophe at each end of the string. If an apostrophe is to appear within the string, two adjacent apostrophes must be entered. If the parameter is a hexadecimal value, it must be entered as X'hex-characters'.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, and reissue the command correctly. See Building command scripts for information about the rules for building commands.

**CSQ9004E**

'*keyword*' parameter specifies range (:) incorrectly

**Explanation**

A parameter of keyword *keyword* specifies a range of values incorrectly. The character used to denote a range is a colon (:); the format is *lower-limit:upper-limit*.

**System action**

Processing for the command is terminated.

**System programmer response**

See MQSC commands to verify that the command you are using allows a range for the given keyword. Correct the error, and reissue the command.

**CSQ9005E**

'*keyword*' parameter does not satisfy generic rules

**Explanation**

For the keyword *keyword*, parameter values can be generic, but the value specified does not conform to the rules for a generic value. The value does not conform to these rules due to one of the following reasons:

- The value contains an asterisk (\*) which is not the last character.
- The value contains a question mark (?) or colon (:).
- The keyword is WHERE and the value is a single asterisk.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, correct the keyword parameter, and reenter the command. See MQSC commands for a description of the keyword and how to enter the command.

#### **CSQ9006E**

'*keyword*' parameter uses asterisk (\*) incorrectly

#### **Explanation**

For the keyword *keyword*, an asterisk (\*) was used in a parameter value. Either:

- The asterisk was not the last or only character in the value. Incorrect examples are NAME(BL\*CK) and NAME(\*LUE); a correct specification is NAME(BL\*) or NAME(\*).
- There is a list of parameter values, for example DETAIL(1,\*).

#### **System action**

Processing for the command is terminated.

#### **System programmer response**

See MQSC commands to verify that the command you are using allows specification of '\*' for the given keyword. Correct the error, and reissue the command.

#### **CSQ9007E**

Either '*keyword1*' or '*keyword2*' must be specified

#### **Explanation**

The command requires that either keyword *keyword1* or keyword *keyword2* is specified, but neither keyword was entered on the command. One of the two keywords must be present in order for the command to be processed.

#### **System action**

Processing for the command is terminated.

#### **System programmer response**

Reissue the command and include whichever keyword is appropriate. See MQSC reference for descriptions of the two keywords, and for information about the rules for building commands.

#### **CSQ9008E**

'*keyword*' may not be negated

#### **Explanation**

The negation characters (NO) appear in front of the keyword *keyword*, but negating this keyword is not allowed.

#### **System action**

Processing for the command is terminated.

#### **System programmer response**

Verify the command entry, and reissue the command correctly. See Building command scripts for further information about this command.

#### **CSQ9009E**

'*keyword*' not specified

#### **Explanation**

The keyword *keyword* must be present, but it was not entered. This keyword must be present in order for the command to process properly.

#### **System action**

Processing for the command is terminated.

### System programmer response

Verify the command entry, and reissue the command including the specified keyword. See MQSC commands for further information about this command.

### CSQ9010E

Required parameter for '*keyword*' not specified

### Explanation

For the keyword *keyword*, either:

- One or more parameters must be specified, but no parameter was entered.
- A fixed number of parameters must be specified, but fewer parameters were entered.

For example, the keyword USERDATA must have a parameter that is a character string. Entering USERDATA() is meaningless; you must either enter a string (for example, USERDATA(MY\_DATA)), or if you want to remove this attribute, you must enter USERDATA(' ').

### System action

Processing for the command is terminated.

### System programmer response

Verify the command entry, supply appropriate parameters for the specified keyword, and reissue the command. See MQSC commands for further information about this command.

### CSQ9011E

Parameter(s) not allowed for '*keyword*'

### Explanation

No parameters can be specified for the keyword *keyword*. This message is issued for each invalid parameter, so it can be issued more than once for a command.

### System action

Processing for the command is terminated.

### System programmer response

Verify the command entry, correct the error, and reissue the command. See Building command scripts for details on how to enter the command.

### CSQ9012E

'*keyword*' parameter is not hexadecimal

### Explanation

Parameter values for the keyword *keyword* must be hexadecimal values. Hexadecimal characters are the numeric digits 0 through 9 and the letters A through F, in either uppercase or lowercase. The value can optionally be specified using the hexadecimal string notation X'hex characters'; for example, *keyword*(123ABC) and *keyword*(X'123ABC') are synonymous.

### System action

Processing for the command is terminated.

### System programmer response

Verify the command entry, and reissue the command, ensuring that the parameters for the named keyword are hexadecimal values.

### CSQ9013E

'*keyword*' parameter '*parameter-value*' length is more than *nn*

### Explanation

The parameter value *parameter-value* for keyword *keyword* exceeds the limit of *nn* characters in length.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry. See MQSC commands for a list of acceptable parameters. Correct the error, and reissue the command.

**CSQ9014E**

More than *nn* parameter(s) for '*keyword*'

**Explanation**

Too many parameters have been specified for the keyword *keyword*. At most *nn* parameters can be specified. In addition to entering too many parameters, this could also be caused by a missing closing parenthesis that has not yet been detected.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, and reissue the command, using no more than the specified limit of parameters for the given keyword. See MQSC reference for further details, and for information about the rules for building commands.

If this error occurs while you are using connection names with the CSQUTIL program you must enclose certain variables within single quotation marks. See CSQUTIL for more information.

**CSQ9015E**

Parameter '*parameter-value*' is unacceptable for '*keyword*'

**Explanation**

The parameter value *parameter-value* is not an acceptable value for keyword *keyword*. Either:

- The keyword parameter can be one of a set of character values, but the value specified is not one of them.
- The keyword parameter can be a bounded numeric value, but the value specified is outside the bounds.
- The keyword parameter can be either numeric or one of a set of character values, but the value specified is neither numeric nor one of the set.
- The keyword is WHERE and the first parameter (the filter keyword) is not one of the acceptable keywords for the command.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, and reissue the command correctly. See MQSC reference for a list of acceptable values, and for information about the rules for building commands.

**CSQ9016E**

'*cmd*' command request not authorized

**Explanation**

The command requires a level of authorization that you do not have, either for the command itself, or for the resource that it is operating on.

**System action**

The command is not executed. Processing is terminated.

**System programmer response**

Contact the system programmer responsible for system security, and request that this person grant you authorization to use the command. Otherwise, you must have someone who is authorized issue the command for you.

**CSQ9017E**

Failure while processing '*cmd*' command

**Explanation**

The command preprocessor ended abnormally while processing the command shown in the message. The error is recorded in SYS1.LOGREC, and an SVC dump is requested. The command might have partially completed. Look at any previous response messages to determine what has been done.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, and reissue the command. If it fails again, collect the items listed in the Problem Determination section, and contact your IBM support center.

**CSQ9018E**

*csect-name* Insufficient storage to process '*cmd*' command

**Explanation**

The command preprocessor was unable to obtain sufficient storage to complete processing of any response messages generated by the command.

**System action**

Processing for the command is terminated abnormally.

**System programmer response**

If the problem persists, you might need to increase the region size used by your queue manager or channel initiator, or you might need to reduce the number of jobs running in your system.

**CSQ9019E**

'*cmd*' command is invalid

**Explanation**

The command, which starts with *cmd*, is invalid. This could be because:

- the command verb is unknown
- no keywords were specified, or none were specified that are valid as a secondary keyword for the command
- there is syntax error at the start of the command

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, and reissue the command correctly. See MQSC reference for the correct command format, and for information about the rules for building commands.

**CSQ9020E**

'*keyword1*' and '*keyword2*' cannot both be specified

**Explanation**

The command does not allow keyword *keyword1* and keyword *keyword2* to be specified together.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, and reissue the command, omitting the inappropriate keyword. See MQSC reference for descriptions of the two keywords and how to enter the command.

**CSQ9022I**

*csect-name 'cmd'* NORMAL COMPLETION

**Explanation**

All synchronous processing for the command completed successfully. Any tasks executing asynchronously on behalf of the command might still be executing when this message is displayed.

**System action**

Synchronous processing for the command is complete.

**CSQ9023E**

*csect-name 'cmd'* ABNORMAL COMPLETION

**Explanation**

The command has not completed successfully. The command has issued one or more error messages prior to this message.

**System action**

Processing for the command has ended.

**System programmer response**

Follow the instructions for the other messages associated with the error.

**CSQ9025E**

*'parameter-value'* is unacceptable with 'WHERE' parameter *'filter-keyword'*

**Explanation**

The parameter values for the WHERE keyword are incompatible. The WHERE keyword must have three parameters, *filter-keyword*, *operator*, and *filter-value*. The error is one of the following:

- The operator parameter is not appropriate for the type of parameter values that the filter keyword requires. For example, the filter keyword requires one of a set of parameter values, but the operator is not EQ or NE.
- The filter value parameter exceeds the length limit for parameter values of the filter keyword.
- The filter value parameter is not a value that is valid as a value of the filter keyword. For example:
  - The filter keyword requires a numeric parameter value but the filter value parameter is not numeric.
  - The filter keyword requires one of a set of parameter values but the filter value parameter is not one of them.
  - The filter keyword requires a bounded numeric parameter value but the filter value parameter is outside the bounds.
  - The filter keyword requires an object or system name, but the filter value parameter does not consist only of characters that are valid for such a name.

Depending on the error, *parameter-value* may be the operator parameter or the filter value parameter.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, and reissue the command correctly. See MQSC reference for information about the parameters for the WHERE keyword.

**CSQ9026E**

*'keyword'* parameter does not satisfy name rules

**Explanation**

Parameter values for the keyword *keyword* are names, and therefore must consist only of characters that are valid for the particular type of name, object name or system name. The valid object name characters are uppercase A-Z, lowercase a-z, numerics 0-9, period (.), forward slash (/), underscore (\_), and percent sign (%). The valid system name characters are uppercase A-Z, and numerics 0-9; the first character must not be numeric.

This message is issued if the name specified contains invalid characters, or if the name is all blank in cases where an all-blank name is not allowed.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, and reissue the command ensuring that the parameters for the named keyword are of the required type. See MQSC reference for a description of the keyword and how to enter the command.

**CSQ9028E**

*'keyword'* parameter is not numeric

**Explanation**

Parameter values for the keyword *keyword* must consist of numeric values only.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, and reissue the command ensuring that the parameters for the named keyword are of the required type. See MQSC reference for a description of the keyword and how to enter the command.

**CSQ9029E**

*csect-name* Failure while processing a command

**Explanation**

An error occurred while processing a command. The command might or might not have been executed. The error has been recorded in the system error log (the SYS1.LOGREC data set), and an SVC dump was attempted.

You can get this message if you have insufficient ECSA.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, and reissue the command. If you cannot resolve the problem, collect the items listed in the Problem Determination section, and contact your IBM support center.

#### **CSQ9030E**

'*keyword*' parameter may not be generic

#### **Explanation**

The parameter for the keyword *keyword* specifies a generic value using an asterisk (for example, ABC\*), but a generic value is not allowed for that keyword.

#### **System action**

Processing for the command is terminated.

#### **System programmer response**

Verify the command entry, correct the keyword parameter, and reenter the command. See MQSC reference for a description of the keyword and how to enter the command.

#### **CSQ9031E**

Syntax error following '*keyword*'

#### **Explanation**

The text that follows the named keyword contains invalid syntax. This is typically caused by specifying an incorrect sequence of special characters, such as equals (=), comma (,), colon (:), or parentheses.

#### **System action**

Processing for the command is terminated.

#### **System programmer response**

Verify the command entry, examining the text following the named keyword. Ensure that you have followed the rules for command entry, and reenter the command. See Building command scripts for information about the rules for building commands.

#### **CSQ9032E**

Requested function is not available

#### **Explanation**

An attempt was made to invoke a command processor that was not loaded.

#### **System action**

The requested function is not performed.

#### **System programmer response**

Verify the command entry, to determine which command caused the error.

#### **CSQ9033E**

Command exceeds allowable length

#### **Severity**

8

#### **Explanation**

The command is so large that its internal form has exceeded the maximum length allowed. The size of the internal form of the command is affected by both the length, and the complexity of the command. (For example, an attempt has been made to use the operations and control panels to create a namelist containing too many names.)

This message could also be caused by commands entered through one of the following:

- the initialization input data sets
- the COMMAND function of the utility program CSQUTIL
- a user-written program that puts commands onto the system-command input queue, SYSTEM.COMMAND.INPUT

**System action**

Processing of the command is terminated.

**System programmer response**

If you are using the operations and control panels to define a namelist, use the edit facility to reduce the number of names in the list. If you are entering a command from elsewhere, determine which command caused the error, and verify the syntax of that command from MQSC commands. Correct the command.

**CSQ9034E**

Command cannot be issued using command server

**Severity**

8

**Explanation**

An attempt was made to issue a command using the command server. The command cannot be issued in that way.

The command server is used by commands entered through one of the following:

- the COMMAND function of CSQUTIL
- the CSQINPX initialization input data set of the channel initiator
- a user-written program that puts commands onto the system-command input queue, SYSTEM.COMMAND.INPUT

**System action**

The command is ignored.

**CSQ9035E**

*csect-name* Required keyword not specified

**Severity**

8

**Explanation**

The command requires one of a set of alternative keywords to be specified, but none was.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, and reissue the command correctly. See MQSC reference for the proper format of the command, and for information about the rules for building commands.

**CSQ9036E**

Command with '*keyword(parameter-value)*' not allowed when queue manager is active

**Severity**

8

**Explanation**

The command has the specified parameter value for keyword *keyword*. The command with this keyword and value can be issued only when the queue manager is not active.

**System action**

The command is ignored.

**System programmer response**

See MQSC commands for information about how to use the command.

**CSQ9037E**

Command must be issued from *ddname*

**Severity**

8

**Explanation**

An attempt was made to issue a command from the specified initialization input data set. The command cannot be issued from that data set.

**System action**

The command is ignored.

**System programmer response**

See MQSC commands for information about how to use the command.

**CSQ9038E**

Command must be issued from console

**Severity**

8

**Explanation**

An attempt was made to issue a command from other than the z/OS console or its equivalent. The command can only be issued in that way.

**System action**

The command is ignored.

**System programmer response**

Issue the command from the z/OS console; it cannot be issued from elsewhere.

If you issued the **DEFINE PSID** command from the console, you must include the additional DSN parameter for the command to complete successfully.

See MQSC commands for information about how to use the command.

**CSQ9039E**

Command cannot be issued from console

**Severity**

8

**Explanation**

An attempt was made to issue a command from the z/OS console or its equivalent. The command cannot be issued in that way.

**System action**

The command is ignored.

**System programmer response**

See MQSC commands for information about how to use the command.

**CSQ9040E**

Command cannot be issued from *ddname*

**Severity**

8

**Explanation**

An attempt was made to issue a command from the specified initialization input data set. The command cannot be issued from that data set.

**System action**

The command is ignored.

**System programmer response**

See MQSC commands for information about how to use the command.

**CSQ9041E**

Command not allowed during restart

**Severity**

8

**Explanation**

An attempt was made to issue a command before restart had completed, but the command cannot be issued at that time. This could be because the command was in the CSQINP1 initialization input data set.

**System action**

The command is ignored.

**System programmer response**

If the command was in the CSQINP1 initialization input data set, delete it.

**CSQ9042E**

Command with '*keyword()*' cannot be issued from *ddname*

**Severity**

8

**Explanation**

The command was issued with the specified keyword from an initialization input data set. The command with this keyword cannot be issued from that data set.

**System action**

The command is ignored.

**System programmer response**

See MQSC commands for information about how to use the command.

**CSQ9045E**

'*keyword*' has parameter(s) and is a 'WHERE' parameter

**Explanation**

The command specifies the WHERE keyword with a filter keyword parameter *keyword*. That keyword is also specified explicitly with with parameters, which is not allowed.

**System action**

Processing for the command is terminated.

**System programmer response**

Verify the command entry, and reissue the command correctly. See MQSC reference for information about the parameters for the WHERE keyword.

**IBM MQ for z/OS codes**

Each component of IBM MQ for z/OS can issue codes and each component uses a unique two character hexadecimal identifier for its messages. Use this topic to identify and interpret the codes for IBM MQ for z/OS components.

The following code types are described:

**Connection manager codes (X'94'):**

If a connection manager reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

**Diagnostics**

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- If you are using CICS, the CICS transaction dump output.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.
- If you are using the WebSphere MQ Operations and Control panels, the ISPF panel name.

**00940001**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6', and the queue manager terminates.

**System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

Restart your queue manager.

**00940003**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

**00940004**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4813 and contact your IBM support center.

00940007

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4813 and contact your IBM support center.

00940008

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6', and the queue manager terminates.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4813 and contact your IBM support center.

Restart your queue manager.

00940028

A requested diagnostic trap has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

This should only occur if the IBM support center have requested that a dump be captured to aid in problem diagnosis

Collect the items listed in "Diagnostics" on page 4813 and contact your IBM support center.

0094002B

An internal error has occurred during ALESERV processing.

**System action**

The current execution unit terminates with completion code X'5C6'. The failing return code from ALESERV will be in register 2 of the dump.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4813 and contact your IBM support center.

Restart the queue manager.

### Topic Manager codes ('X'A3'):

If a topic manager reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

#### Diagnostics

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- If you are using CICS, the CICS transaction dump output.
- Appropriate WebSphere MQ, z/OS, DB2, CICS, and IMS service levels.
- If you are using the WebSphere MQ Operations and Control panels, the ISPF panel name.

00A30001, 00A30002, 00A30052, 00A30053, 00A30054, 00A30061, 00A30062, 00A30064, 00A30065, 00A30066, 00A31000

An internal error has occurred while processing a command.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Collect the items listed in "Diagnostics" and contact your IBM support center.

00A30042

An internal error has occurred while processing a command.

If this error occurs in conjunction with a CSQY227E message then the problem is a lack of 64 bit storage.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Collect the items listed in "Diagnostics" and contact your IBM support center.

You should consider raising the value of the MEMLIMIT parameter. For more information, see Address space storage.

00A30072, 00A30073, 00A30074, 00A30075, 00A30076, 00A30077

An internal error occurred during commit processing.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Collect the items listed in "Diagnostics" and contact your IBM support center.

**Batch adapter codes (X'C2'):****00C20001**

The CSQBSRV program has detected a request for a nonexistent function. CSQBSRV is invoked from batch and RRS-batch applications via a stub such as CSQBSTUB, CSQBRRSI, or CSQBRSTB.

**System action**

The application program ends abnormally, but MQ continues processing.

**System programmer response**

The most likely cause of this problem is incompatible versions of CSQBSRV and the stub. If this is not the cause of the problem, obtain the diagnostic items listed in this topic, and contact your IBM support center.

- Application program listing
- Queue manager job log
- PSW and registers at point of failure

**00C20009**

The task which started an asynchronous MQ thread (for asynchronous message consumption or asynchronous event listening) has ended before the asynchronous thread which it started had ended. Thisabend is raised on the asynchronous MQ thread, because processing cannot continue after the resources allocated by the original thread have been released.

**System action**

The application program ends abnormally, but MQ continues processing.

**System programmer response**

Ensure that an MQDISC is called for all connections which are used to start asynchronous threads before termination of the task which created the connection.

**00C2000A, 00C2000B, 00C2000C, 00C2000D, 00C2000E, 00C2000F**

An internal error has occurred while processing an MQCRTMH call.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Obtain the diagnostic items listed in this topic, and contact your IBM support center.

- An application program listing.
- The queue manager job log.
- The PSW and registers at point of failure.

## Coupling Facility codes (X'C5'):

If a coupling facility reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center. Restart the queue manager if necessary.

### Diagnostics

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- If you are using CICS, the CICS transaction dump output.
- Appropriate WebSphere MQ, z/OS, DB2, CICS, and IMS service levels.
- If you are using the WebSphere MQ Operations and Control panels, the ISPF panel name.
- A dump of the coupling facility structure.

### 00C50006

A backup or recovery of a CF structure failed because the queue manager is not connected to a DB2 subsystem.

#### System action

CF structure backup or recovery processing is terminated.

#### System programmer response

Configure the DB2 subsystem so that the queue manager can connect to it.

### 00C50012

CF structure processing failed, because the CF structure became full during the action.

#### System action

CF structure processing is terminated.

#### System programmer response

Increase the size of the CF structure.

### 00C50014

An unexpected reason code was returned by the DB2 subsystem that the queue manager is connected to.

#### System action

The current operation is terminated.

#### System programmer response

Investigate the cause of the error, as reported in the preceding messages.

### 00C50050

The CF structure is being recovered and cannot be used until the recovery is complete.

#### System action

Processing of the command is terminated.

#### System programmer response

Wait for the recovery of the structure to complete, then reissue the command. Use the DISPLAY CFSTATUS command to view the status of the CF structures.

#### 00C50064

A backup or recovery of a CF structure failed either because the installation and customization options chosen for WebSphere MQ do not allow the queue manager to use structures at the required level, or because the level of the structure is not supported by the current command level.

For example, the queue manager may have been migrated from a previous version and currently operating with OPMODE=COMPAT, and CF structures at the level of the structure being processed are not available in compatibility mode.

See z/OS: OPMODE for further information.

#### System action

CF structure backup or recovery processing is terminated.

#### 00C5004F

This reason code is issued in message CSQM090E when a command has failed. It indicates that a request has been issued for a CF structure, but the request cannot be performed, as explained in the accompanying more specific message.

#### Severity

4

#### System action

The command is ignored.

#### System programmer response

Refer to the description of the accompanying message.

#### 00C5005B

CF structure recovery failed because an error occurred when reading the BSDS of another queue manager in the queue-sharing group.

#### System action

CF structure recovery processing is terminated.

#### System programmer response

Check the log for recovery log manager messages that indicate the reason for the error.

#### 00C50D00

A backup of a CF structure failed because a required SMDS data set is not available.

#### System action

CF structure backup processing is terminated.

#### System programmer response

Ensure that all SMDS data sets used for the CF structure are available, then reissue the backup command. A **RECOVER CFSTRUCT** command can be used to restore these data sets if this is required.

#### 00C51001, 00C51004, 00C51005, 00C51006, 00C5100A, 00C51019, 00C5101A, 00C5101B, 00C5101C, 00C5001D

An internal error has occurred.

#### System action

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C51021, 00C51022, 00C51023, 00C51024, 00C50025, 00C51026, 00C51027, 00C51028, 00C51029, 00C5002A, 00C5102B, 00C5102C, 00C5102D, 00C5102E, 00C5002F

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C50030, 00C51031, 00C51032, 00C51033, 00C51034, 00C50035, 00C51036, 00C51037, 00C51038, 00C51039, 00C5003A, 00C5103A, 00C5103B, 00C5103C, 00C5103D, 00C5103E, 00C5003F

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C50040, 00C51041, 00C51042, 00C51043, 00C51044, 00C50045, 00C51046, 00C51047

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager may terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C51051, 00C51052, 00C51053, 00C51054, 00C50055, 00C51056

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager may terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C51090, 00C51092, 00C51093

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

**00C51094, 00C51095, 00C51096, 00C51097**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

**00C510A1, 00C510A2, 00C510A3, 00C510A4, 00C500A5, 00C510A6, 00C510A7, 00C510A8, 00C510A9, 00C500AA**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

**00C510AB**

The CF structure has failed or connection to it has been lost.

**System action**

This might be issued in response to a command, in which case processing of the command is terminated. Otherwise, the current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Restart the queue manager if necessary. Recover the structure; if the error occurred in response to a command, reissue it.

**00C510AC, 00C510AD**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C51100, 00C51101, 00C51102, 00C51103, 00C51104, 00C51105, 00C51106, 00C51107, 00C51108, 00C51109, 00C5110A, 00C5110B, 00C5110C, 00C5110D, 00C5110E, 00C5110F

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager may terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C51110, 00C51111, 00C51112, 00C51113, 00C51114, 00C51115, 00C51116, 00C51117, 00C51118, 00C51119, 00C5111A, 00C5111B, 00C5111C, 00C5111D, 00C5111E, 00C5111F

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C51120, 00C51121, 00C51122, 00C51123, 00C51124, 00C51125, 00C51126, 00C51127, 00C51128, 00C51129, 00C5112A, 00C5112B, 00C5112C, 00C5112D, 00C5112E, 00C5112F

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C51130, 00C51131, 00C51132, 00C51133, 00C51134, 00C51135, 00C51136, 00C51137, 00C51138, 00C51139, 00C5113A, 00C5113B, 00C5113C, 00C5113D, 00C5113E, 00C5113F

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager may terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C51140, 00C51141, 00C51142, 00C51143, 00C51144, 00C51145, 00C51146, 00C51147, 00C51148, 00C51149, 00C5114A, 00C5114B, 00C5114C, 00C5114D, 00C5114E, 00C5114F

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager may terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C51150, 00C51151, 00C51152, 00C51153, 00C51154, 00C51155, 00C51156, 00C51157, 00C51158, 00C51159, 00C5115A, 00C5115B, 00C5115C, 00C5115D, 00C5115E, 00C5115F

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C51160, 00C51161, 00C51162, 00C51163, 00C51164, 00C51165, 00C51166, 00C51167, 00C51168, 00C51169, 00C5116A, 00C5116B, 00C5116C, 00C5116D, 00C5116E, 00C5116F

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C51170, 00C51171, 00C51172, 00C51174, 00C51175, 00C51176, 00C51177, 00C51178, 00C51179, 00C5117A, 00C5117B, 00C5117C, 00C5117D, 00C5117E, 00C5117F

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C51173

An internal error has occurred.

**System action**

The internal task performing recovery of a CFSTRUCT terminates with completion code x'5C6'.

**System programmer response**

This error is often, but not exclusively, associated with space issues in the coupling facility.

Ensure that sufficient space is available in the cfstructure.

A common source of error is that the INITSIZE and SIZE values do not match in the CFRM policy. During normal use, the structure has expanded through AUTOALTER processing and the structure backup being restored reflects this size.

However, a new structure has been allocated with the INITSIZE attribute that is too small. If storage issues are not indicated, then collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

00C51180, 00C51181, 00C51182, 00C51184, 00C51185, 00C51186, 00C51187, 00C51188, 00C51189, 00C5118A, 00C5118B, 00C5118C, 00C5118D, 00C5118E, 00C5118F

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager may terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C51183

An internal error has occurred.

**System action**

The internal task performing recovery of a CFSTRUCT terminates with completion code x'5C6'.

**System programmer response**

This error is often, but not exclusively, associated with space issues in the coupling facility.

Ensure that sufficient space is available in the cfstructure.

A common source of error is that the INITSIZE and SIZE values do not match in the CFRM policy. During normal use, the structure has expanded through AUTOALTER processing and the structure backup being restored reflects this size.

However, a new structure has been allocated with the INITSIZE attribute that is too small. If storage issues are not indicated, then collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

00C51190, 00C51191, 00C51192, 00C51193, 00C51194, 00C51195, 00C51196, 00C51197, 00C51198, 00C51199, 00C5119A, 00C5119B, 00C5119C, 00C5119D, 00C5119E, 00C5119F

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager may terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C511A0, 00C511A1, 00C511A2, 00C511A3, 00C511A4, 00C511A5, 00C511A6, 00C511A7, 00C511A8, 00C511A9, 00C511AA, 00C511AB, 00C511AC, 00C511AD, 00C511AE, 00C511AF

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager may terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C511B0, 00C511B1, 00C511B2, 00C511B3, 00C511B4, 00C511B5, 00C511B6, 00C511B7, 00C511B8, 00C511B9, 00C511BA, 00C511BB, 00C511BC, 00C511BD, 00C511BE, 00C511BF

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager may terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C511C0, 00C511C1, 00C511C2, 00C511C3, 00C511C4, 00C511C5, 00C511C6, 00C511C7, 00C511C8, 00C511C9, 00C511CA, 00C511CB, 00C511CC, 00C511CD, 00C511CE, 00C511CF

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager may terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C511D0, 00C511D1, 00C511D2, 00C511D3, 00C511D4, 00C511D5, 00C511D6, 00C511D7, 00C511D8, 00C511D9, 00C511DA, 00C511DB, 00C511DC, 00C511DD, 00C511DE, 00C511DF

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C511E0, 00C511E1, 00C511E2, 00C511E3, 00C511E4, 00C511E5, 00C511E6, 00C511E7, 00C511E8, 00C511E9, 00C511EA, 00C511EB, 00C511EC, 00C511ED, 00C511EE, 00C511EF

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

00C511F0, 00C511F1, 00C511F2, 00C511F3, 00C511F4, 00C511F5, 00C511F6, 00C511F7, 00C511F8, 00C511F9, 00C511FA, 00C511FB, 00C511FC, 00C511FD, 00C511FE, 00C511FF

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4817 and contact your IBM support center.

Restart the queue manager if necessary.

**00C53000**

The queue manager cannot use the administration structure because its size is less than the minimum that MQ requires.

**System action**

The queue manager terminates with completion code X'6C6'.

**System programmer response**

Increase the size of the administration structure. See message CSQE022E for more information.

**00C53001**

The queue manager has detected a mismatch between the queue-sharing group creation timestamp in the DB2 tables and the creation timestamp associated with the structure name in message CSQE029E.

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

Verify the queue manager, queue-sharing group and data-sharing group configuration and determine whether a queue manager has configured to connect to a different DB2 data-sharing group.

If the queue manager and queue-sharing group configuration is correct then the structure should be deallocated. Having verified that there are only failed-persistent connections remaining to the structure, deallocate it with the z/OS command

```
SETXCF FORCE,STRUCTURE,STRNAME=ext-struct-name
```

(In this command, *ext-struct-name* is formed by prefixing the MQ structure name from message CSQE029E with the queue-sharing group name.)

**00C53002**

The queue manager cannot use the administration structure because the administration structure is full and remains full despite repeated attempts to wait for space to become available.

**System action**

The queue manager terminates with completion code X'5C6'.

**System programmer response**

Increase the size of the administration structure. See message CSQE038E for more information.

## Message generator codes (X'C6'):

### 00C60001

MQ received return code X'20' when issuing a WTO request to display a console message. This means that there are no message buffers for either Multiple Console Support (MCS) or JES3, or there is a JES3 WTO staging area excess. The WTO request is terminated. The current console message and all subsequent informational console messages are ignored until the problem is corrected.

#### System action

A record is written to SYS1.LOGREC. A retry is requested and execution continues. MQ resumes issuing console messages when the condition is corrected.

### 00C60004

The queue manager was unable to load the message table (CSQFMTAB).

#### System action

The queue manager terminates.

#### System programmer response

Ensure that the message table is in the required library (SCSQANLx, where x is your national language letter), that it is referenced correctly, and that all the libraries in the concatenation are APF authorized. Restart the queue manager.

### 00C60005

An internal error has occurred.

#### System action

The queue manager is terminated, and a dump is produced.

#### System programmer response

Restart the queue manager.

Collect the following diagnostic items and contact your IBM support center:

- Queue manager job log
- System dump resulting from the error

### 00C60006

The MQ utility program was unable to load its message table (CSQFSTAB).

#### System action

The utility program ends abnormally.

#### System programmer response

Check the console for messages indicating why CSQFSTAB was not loaded. Ensure that the message table is in the required library (SCSQANLx, where x is your national language letter), and that it is referenced correctly, and resubmit the job.

The utility program attempts to load this module from the library data sets under the STEPLIB DD statement of the utility address space.

### 00C60007

The MQ CICS adapter was unable to load its message table (CSQFCTAB).

#### System action

The MQ CICS adapter server task terminates.

**System programmer response**

Check the console for messages indicating why CSQFCTAB was not loaded. Ensure that the message table is in the required library (SCSQANLx or SCSQSNLx, where x is your national language letter), and that it is referenced correctly.

CSQCSESV attempts to load this module from the library data sets under the STEPLIB DD statement of the CICS address space.

**00C60008**

The MQ utility program was unable to load its message table (CSQFLTAB).

**System action**

The utility program ends abnormally.

**System programmer response**

Check the console for messages indicating why CSQFLTAB was not loaded. Ensure that the message table is in the required library (SCSQANLx, where x is your national language letter), and that it is referenced correctly, and resubmit the job.

The utility program attempts to load this module from the library data sets under the STEPLIB DD statement of the utility address space.

**00C6000A**

The MQ early processing program was unable to load its message table (CSQ3ECMX).

**System action**

The queue manager terminates.

**System programmer response**

Ensure that the message table in the required library (SCSQSNLx, where x is your national language letter), and that it is referenced correctly, and perform an IPL of your z/OS system or use the z/OS command SETSSI ADD to restart the queue manager.

**00C6000B**

The distributed queuing component was unable to load its message table (CSQFXTAB).

**System action**

The channel initiator ends.

**System programmer response**

Check the console for messages indicating why CSQFXTAB was not loaded. Ensure that the message table is in the required library (SCSQANLx, where x is your national language letter), that it is referenced correctly, and that all the libraries in the concatenation are APF authorized. Restart the channel initiator.

**00C6000C**

The IMS trigger monitor was unable to load its message table (CSQFSTAB).

**System action**

The trigger monitor ends.

**System programmer response**

Check the console for messages indicating why CSQFSTAB was not loaded. Ensure that the message table is in the required library (SCSQANLx, where x is your national language letter), and that it is referenced correctly, and restart the trigger monitor.

**00C600F0**

The Advanced Message Security component was unable to load its message table (CSQF0TAB).

**System action**

The Advanced Message Security component fails to start during queue manager startup.

**System programmer response**

Check the console for messages indicating why CSQF0TAB was not loaded. Ensure that the message table is in the required library (SCSQANLx, where x is your national language letter), that it is referenced correctly, and that all the libraries in the concatenation are APF authorized. Restart the queue manager.

**Functional recovery manager codes (X'C7'):**

**00C70010**

While trying to recover from an error, an internal consistency check indicated a storage overlay, or an internal error.

**System action**

Control is percolated to the z/OS recovery termination manager, and a dump is requested.

**System programmer response**

Retain the dump, and contact your IBM support center for assistance.

Restart the queue manager if necessary.

**00C70020**

A critical procedure recovery routine has ended abnormally, causing a secondary abnormal end.

**System action**

Control is percolated to the z/OS recovery termination manager, and in some cases the queue manager terminates abnormally. A dump is produced for both the primary and secondary errors.

**System programmer response**

Retain both dumps, and contact your IBM support center for assistance.

Restart the queue manager if necessary.

**00C70030**

A request to z/OS to establish an ESTAE produced a non-zero return code.

**System action**

A dump is requested.

**System programmer response**

The return code from z/OS is captured in register 14. See the *MVS Assembler Services Reference* manual for an explanation of the return code.

**00C70040**

This abnormal end reason code was caused by an internal MQ error.

**System action**

Control is percolated to the z/OS recovery termination manager, and a dump is requested.

**System programmer response**

Retain the dump, and contact your IBM support center for assistance.

Restart the queue manager if necessary.

## Security manager codes (X'C8'):

If a security manager reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

### Diagnostics

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- If you are using CICS, the CICS transaction dump output.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.
- If you are using the WebSphere MQ Operations and Control panels, the ISPF panel name.
- The security command issued before the error.

### 00C80001

An attempt to obtain storage for the security manager was unsuccessful.

**Note:** This could indicate a system-wide storage problem.

### System action

The queue manager is terminated, and a dump is produced. Register 2 contains the return code from the storage failure.

### System programmer response

Check that you are running with the recommended region size, and if not, reset your system and restart the queue manager. If this is not the cause of the problem, use these items to diagnose the cause of the problem:

- Queue manager job log
- Information about any other storage-related problems
- System dump resulting from the error

### 00C80002

An attempt to obtain storage for the security manager was unsuccessful.

**Note:** This error code could indicate a system-wide storage problem.

### System action

The queue manager is terminated, and a dump is produced. Register 2 contains the return code from the storage failure.

### System programmer response

Check that you are running with the suggested region size, and if not, reset your system and restart the queue manager. If this is not the cause of the problem, use these items to diagnose the cause of the problem:

- Queue manager job log
- Information about any other storage-related problems
- System dump resulting from the error

### 00C80003

An attempt to obtain a storage subpool for the security manager was unsuccessful.

**Note:** This error code could indicate a system-wide storage problem.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the return code from the storage failure.

**System programmer response**

Check that you are running with an appropriate region size, and if not, reset your system and restart the queue manager. If the region size is not the cause of the problem, use these items to diagnose the cause of the problem:

- Queue manager job log
- Information about any other storage-related problems
- System dump resulting from the error

**00C80004**

An internal error has occurred.

**System action**

The queue manager is terminated, and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

Restart the queue manager.

**00C8000A**

A severe error has occurred during a SAF RACROUTE REQUEST=STAT call to the external security manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. Check your security configuration (for example, that the required classes are installed and active). If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C8000B**

A severe error has occurred during a SAF RACROUTE REQUEST=EXTRACT call to the external security manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the entity being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C8000C**

A severe error has occurred during a SAF RACROUTE REQUEST=LIST (create) call to the external security manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class, and register 3 the address of the entity, being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C8000D**

An unexpected return code has been received from one of the following SAF calls to the external security manager (ESM) during security switch processing at queue manager initialization time:

- RACROUTE REQUEST=EXTRACT
- RACROUTE REQUEST=LIST
- RACROUTE REQUEST=STAT

**System action**

Message CSQH004I is produced containing the return codes from SAF and the ESM. The queue manager is terminated, and a dump is produced. Register 2 contains the address of the return codes.

**System programmer response**

See your ESM documentation for information about the return codes that appear in message CSQH004I (in the job log) or the dump. For information about setting WebSphere MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C8000E**

An unexpected setting for the subsystem security switch was encountered.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the control block containing the switch setting.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829, together with a note of what you expected the switch to be set to, and whether you had defined a profile for it or not, and contact your IBM support center.

**00C8000F**

An internal error has occurred.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class involved at the time of the error.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

Restart the queue manager.

**00C80010**

An attempt to obtain storage for the security manager was unsuccessful.

**Note:** This error code could indicate a system-wide storage problem.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the return code from the storage failure.

**System programmer response**

Check that you are running with the suggested region size, and if not, reset your system and restart the queue manager. If this is not the cause of the problem, use the items listed in "Diagnostics" on page 4829, together with information about any other storage-related problems, to diagnose the cause of the problem. If you are unable to resolve the problem, contact your IBM support center.

**00C80011**

An attempt to obtain a storage subpool for the security manager was unsuccessful.

**Note:** This error code could indicate a system-wide storage problem.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the return code from the storage failure.

**System programmer response**

Check that you are running with the suggested region size, and if not, reset your system and restart the queue manager. If this is not the cause of the problem, use the items listed in "Diagnostics" on page 4829, together with information about any other storage-related problems, to diagnose the cause of the problem. If you are unable to resolve the problem, contact your IBM support center.

**00C80012**

An attempt to obtain storage for the security manager was unsuccessful.

**Note:** This error code could indicate a system-wide storage problem.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the return code from the storage failure.

**System programmer response**

Check that you are running with the suggested region size, and if not, reset your system and restart the queue manager. If this is not the cause of the problem, use the items listed in "Diagnostics" on page 4829, together with information about any other storage-related problems, to diagnose the cause of the problem. If you are unable to resolve the problem, contact your IBM support center.

**00C80013**

An internal error has occurred while processing a security request.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80020**

An attempt to obtain storage for the security manager was unsuccessful.

**Note:** This error code could indicate a system-wide storage problem.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the return code from the storage failure.

**System programmer response**

Check that you are running with the suggested region size, and if not, reset your system and restart the queue manager. If this is not the cause of the problem, use the items listed in "Diagnostics" on page 4829, together with information about any other storage-related problems, to diagnose the cause of the problem. If you are unable to resolve the problem, contact your IBM support center.

**00C80024**

An internal error has occurred while processing a command.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80025**

An internal error has occurred while processing a command.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80026**

An internal error has occurred while processing a command.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80027**

An unrecognized keyword was encountered whilst processing a REFRESH SECURITY command.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the address of the keyword causing the problem.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80028**

An attempt to obtain a storage subpool for the security manager was unsuccessful. This might have occurred during the processing of an ALTER SECURITY command, a REFRESH SECURITY command, or during the automatic security timeout processing.

**Note:** This could indicate a system-wide storage problem.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the return code from the storage failure.

**System programmer response**

Use the items listed in "Diagnostics" on page 4829, together with information about any other storage-related problems, to diagnose the cause of the problem. If you are unable to resolve the problem, contact your IBM support center.

**00C80029**

A severe error has occurred during a SAF RACROUTE REQUEST=STAT call to the external security manager (ESM) during security switch processing for a REFRESH SECURITY command.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. Check your security configuration (for example, that the required classes are installed and active). If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80031**

A severe error has occurred during a SAF RACROUTE REQUEST=LIST (create) call to the external security manager (ESM) during the processing for a REFRESH SECURITY command.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the address of the class, and register 3 the address of the entity, being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. Check your security configuration (for example, that the required classes are installed and active). If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80032**

An unexpected return code has been received from one of the following SAF calls to the external security manager (ESM) during the processing of a REFRESH SECURITY command:

- RACROUTE REQUEST=LIST (create)
- RACROUTE REQUEST=LIST (delete)
- RACROUTE REQUEST=STAT

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the address of the return codes from SAF, and the ESM.

**Note:** If the error occurred on a STAT call, the error is preceded by a CSQH004I message containing the return codes from SAF, and the ESM.

**System programmer response**

See your ESM documentation for information about the return codes from SAF and the ESM. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80033**

An unexpected setting for the subsystem security switch was encountered during the processing of a REFRESH SECURITY command.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829, together with a note of what you expected the switch to be set to, and whether you had defined a profile for it or not, and contact your IBM support center.

**00C80034**

An internal error has occurred.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the address of the class invoked at the time of the check.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80035**

A severe error has occurred during a SAF RACROUTE REQUEST=STAT call to the external security manager (ESM) during security switch processing for a REFRESH SECURITY command.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. Check your security configuration (for example, that the required classes are installed and active). If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80036**

A severe error has occurred during a SAF RACROUTE REQUEST=EXTRACT call to the external security manager (ESM) during security switch processing for a REFRESH SECURITY command.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the address of the entity being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

#### 00C80037

A severe error has occurred during a SAF RACROUTE REQUEST=LIST (create) call to the external security manager (ESM) during the processing for a REFRESH SECURITY command.

#### System action

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the address of the class, and register 3 the address of the entity, being checked at the time of the error.

#### System programmer response

See your ESM documentation for information about any return codes that appear in the job log. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

#### 00C80038

An unexpected return code has been received from one of the following SAF calls to the external security manager (ESM) during the processing of a REFRESH SECURITY command.

- RACROUTE REQUEST=LIST (create)
- RACROUTE REQUEST=LIST (delete)
- RACROUTE REQUEST=EXTRACT
- RACROUTE REQUEST=STAT

#### System action

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the address of the return codes from SAF, and the ESM.

**Note:** If the error occurred on a STAT call, the error is preceded by a CSQH004I message containing the return codes from SAF, and the ESM.

#### System programmer response

See your ESM documentation for information about the return codes from SAF and the ESM. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

#### 00C80039

An attempt to obtain a storage subpool for a security manager user entry block was unsuccessful. This could have occurred during either security timeout processing, or REFRESH SECURITY command processing.

**Note:** This could indicate a system-wide storage problem.

#### System action

The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the return code from the storage failure.

#### System programmer response

Use the items listed in "Diagnostics" on page 4829, together with information about any other storage-related problems, to diagnose the cause of the problem. If you are unable to resolve the problem, contact your IBM support center.

#### 00C80040

A severe error has occurred during security timeout processing. An unexpected return code has been received from the MQ timer component.

**Note:** This could indicate a system-wide problem with the timer component, or the system timer.

#### System action

Messages CSQH009I and CSQH010I are issued. The current execution unit terminates with a completion code of X'5C6', and a dump is produced. Register 2 contains the return code from the timer component that caused the problem.

#### System programmer response

Use the items listed in "Diagnostics" on page 4829, together with information about any other timer-related problems, to diagnose the cause of the problem. If you are unable to resolve the problem, contact your IBM support center.

#### 00C80041

A severe error has occurred during security timeout processing for an ALTER SECURITY command. An unexpected return code has been received from the MQ timer component.

**Note:** This could indicate a system-wide problem with the timer component, or the system timer.

#### System action

Message CSQH010I is issued. The current execution unit terminates with a completion code of X'5C6' and a dump is produced. Register 2 contains the return code from the timer component that caused the problem.

#### System programmer response

Use the items listed in "Diagnostics" on page 4829, together with information about any other timer-related problems, to diagnose the cause of the problem. If you are unable to resolve the problem, contact your IBM support center.

#### 00C80042

A severe error has occurred during security initialization when trying to start the security timer. An unexpected return code has been received from the MQ timer component.

**Note:** This could indicate a system-wide problem with the timer component, or the system timer.

#### System action

Message CSQH010I is issued. The queue manager terminates and a dump is produced. Register 2 contains the return code from the timer component that caused the problem.

#### System programmer response

Use the items listed in "Diagnostics" on page 4829, together with information about any other timer-related problems, to diagnose the cause of the problem. If you are unable to resolve the problem, contact your IBM support center.

#### 00C80043

A severe error has occurred whilst processing a DISPLAY SECURITY command. A parameter has been entered on the SECURITY keyword, but this is invalid.

#### System action

The current execution unit terminates with a completion code of X'5C6', and a dump is produced.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80044**

A severe error has occurred whilst processing an ALTER SECURITY command. A parameter has been entered on the SECURITY keyword, but this is invalid.

**System action**

The current execution unit terminates with a completion code of X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80045**

A severe error has occurred because the last security refresh did not complete successfully.

**System action**

The current execution unit terminates with error reason code X'5C6', and a dump is produced.

**System programmer response**

If you are able to fix the cause of the problem, you must refresh the security again before you can continue. If you are unable to solve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80046**

An attempt to obtain a storage subpool for the security manager Utoken blocks was unsuccessful.

This indicates that there could be a wider ranging problem relating to storage availability.

**System action**

The queue manager is terminated and a dump is produced.

**System programmer response**

Use the items listed in "Diagnostics" on page 4829, together with information about any other storage-related problems, to diagnose the cause of the problem.

**00C80047**

An attempt to obtain a storage block for a security manager Utoken block was unsuccessful.

This indicates that there could be a wider ranging problem relating to storage availability.

**System action**

The current execution unit terminates with X'5C6' and a dump is produced.

**System programmer response**

Use the items listed in "Diagnostics" on page 4829, together with information about any other storage-related problems, to diagnose the cause of the problem. Contact your IBM support center if you need help.

**00C80050**

A severe error has occurred during a SAF RACROUTE REQUEST=STAT call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. Check your security configuration (for example, that the required classes are installed and active). If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

#### **00C80051**

A severe error has occurred during a SAF RACROUTE REQUEST=EXTRACT call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

#### **System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the entity being checked at the time of the error.

#### **System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

#### **00C80052**

A severe error has occurred during a SAF RACROUTE REQUEST=LIST (create) call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

#### **System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class, and register 3 the address of the entity, being checked at the time of the error.

#### **System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

#### **00C80053**

An unexpected return code has been received from one of the following SAF calls to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

- RACROUTE REQUEST=EXTRACT
- RACROUTE REQUEST=LIST
- RACROUTE REQUEST=STAT

#### **System action**

Message CSQH004I is produced containing the return codes from SAF and the ESM. The queue manager is terminated, and a dump is produced. Register 2 contains the address of the return codes.

#### **System programmer response**

See your ESM documentation for information about the return codes that appear in message CSQH004I (in the job log) or the dump. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

#### **00C80054**

An unexpected setting for the subsystem security switch was encountered.

#### **System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the control block containing the switch setting.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829, together with a note of what you expected the switch to be set to, and whether you had defined a profile for it or not, and contact your IBM support center.

Restart the queue manager.

**00C80055**

An internal loop count was exceeded during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

Restart the queue manager.

**00C80060**

A severe error has occurred during a SAF RACROUTE REQUEST=STAT call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. Check your security configuration (for example, that the required classes are installed and active). If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80061**

A severe error has occurred during a SAF RACROUTE REQUEST=EXTRACT call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the entity being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80062**

A severe error has occurred during a SAF RACROUTE REQUEST=LIST (create) call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class, and register 3 the address of the entity, being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80063**

An unexpected return code has been received from one of the following SAF calls to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

- RACROUTE REQUEST=EXTRACT
- RACROUTE REQUEST=LIST
- RACROUTE REQUEST=STAT

**System action**

Message CSQH004I is produced containing the return codes from SAF and the ESM. The queue manager is terminated, and a dump is produced. Register 2 contains the address of the return codes.

**System programmer response**

See your ESM documentation for information about the return codes that appear in message CSQH004I (in the job log) or the dump. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80064**

An unexpected setting for the subsystem security switch was encountered.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the control block containing the switch setting.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829, together with a note of what you expected the switch to be set to, and whether you had defined a profile for it or not, and contact your IBM support center.

Restart the queue manager.

**00C80065**

An internal loop count was exceeded during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

Restart the queue manager.

**00C80070**

A severe error has occurred during a SAF RACROUTE REQUEST=STAT call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. Check your security configuration (for example, that the required classes are installed and active). If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80071**

A severe error has occurred during a SAF RACROUTE REQUEST=EXTRACT call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the entity being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80072**

A severe error has occurred during a SAF RACROUTE REQUEST=LIST (create) call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class, and register 3 the address of the entity, being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80073**

An unexpected return code has been received from one of the following SAF calls to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

- RACROUTE REQUEST=EXTRACT
- RACROUTE REQUEST=LIST
- RACROUTE REQUEST=STAT

**System action**

Message CSQH004I is produced containing the return codes from SAF and the ESM. The queue manager is terminated, and a dump is produced. Register 2 contains the address of the return codes.

**System programmer response**

See your ESM documentation for information about the return codes that appear in message CSQH004I (in the job log) or the dump. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80074**

An unexpected setting for the subsystem security switch was encountered.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the control block containing the switch setting.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829, together with a note of what you expected the switch to be set to, and whether you had defined a profile for it or not, and contact your IBM support center.

**00C80075**

An internal loop count was exceeded during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.  
Restart the queue manager.

**00C80080**

A severe error has occurred during a SAF RACROUTE REQUEST=STAT call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. Check your security configuration (for example, that the required classes are installed and active). If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80081**

A severe error has occurred during a SAF RACROUTE REQUEST=EXTRACT call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the entity being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80082**

A severe error has occurred during a SAF RACROUTE REQUEST=LIST (create) call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class, and register 3 the address of the entity, being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80083**

An unexpected return code has been received from one of the following SAF calls to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

- RACROUTE REQUEST=EXTRACT
- RACROUTE REQUEST=LIST
- RACROUTE REQUEST=STAT

**System action**

Message CSQH004I is produced containing the return codes from SAF and the ESM. The queue manager is terminated, and a dump is produced. Register 2 contains the address of the return codes.

**System programmer response**

See your ESM documentation for information about the return codes that appear in message CSQH004I (in the job log) or the dump. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80084**

An unexpected setting for the subsystem security switch was encountered.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the control block containing the switch setting.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829, together with a note of what you expected the switch to be set to, and whether you had defined a profile for it or not, and contact your IBM support center.

**00C80090**

A severe error has occurred during a SAF RACROUTE REQUEST=STAT call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. Check your security configuration (for example, that the required classes are installed and active). If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

#### **00C80091**

A severe error has occurred during a SAF RACROUTE REQUEST=EXTRACT call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

#### **System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the entity being checked at the time of the error.

#### **System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

#### **00C80092**

A severe error has occurred during a SAF RACROUTE REQUEST=LIST (create) call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

#### **System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class, and register 3 the address of the entity, being checked at the time of the error.

#### **System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

#### **00C80093**

An unexpected return code has been received from one of the following SAF calls to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

- RACROUTE REQUEST=EXTRACT
- RACROUTE REQUEST=LIST
- RACROUTE REQUEST=STAT

#### **System action**

Message CSQH004I is produced containing the return codes from SAF and the ESM. The queue manager is terminated, and a dump is produced. Register 2 contains the address of the return codes.

#### **System programmer response**

See your ESM documentation for information about the return codes that appear in message CSQH004I (in the job log) or the dump. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

#### **00C80094**

An unexpected setting for the subsystem security switch was encountered.

#### **System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the control block containing the switch setting.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829, together with a note of what you expected the switch to be set to, and whether you had defined a profile for it or not, and contact your IBM support center.

Restart the queue manager.

**00C80095**

An internal loop count was exceeded during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

Restart the queue manager.

**00C80100**

A severe error has occurred during a SAF RACROUTE REQUEST=STAT call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. Check your security configuration (for example, that the required classes are installed and active). If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80101**

A severe error has occurred during a SAF RACROUTE REQUEST=EXTRACT call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the entity being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80102**

A severe error has occurred during a SAF RACROUTE REQUEST=LIST (create) call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class, and register 3 the address of the entity, being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80103**

An unexpected return code has been received from one of the following SAF calls to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

- RACROUTE REQUEST=EXTRACT
- RACROUTE REQUEST=LIST
- RACROUTE REQUEST=STAT

**System action**

Message CSQH004I is produced containing the return codes from SAF and the ESM. The queue manager is terminated, and a dump is produced. Register 2 contains the address of the return codes.

**System programmer response**

See your ESM documentation for information about the return codes that appear in message CSQH004I (in the job log) or the dump. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80104**

An unexpected setting for the subsystem security switch was encountered.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the control block containing the switch setting.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829, together with a note of what you expected the switch to be set to, and whether you had defined a profile for it or not, and contact your IBM support center.

Restart the queue manager.

**00C80105**

An internal loop count was exceeded during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

Restart the queue manager.

**00C80200**

A severe error has occurred during a SAF RACROUTE REQUEST=STAT call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. Check your security configuration (for example, that the required classes are installed and active). If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80201**

A severe error has occurred during a SAF RACROUTE REQUEST=EXTRACT call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the entity being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80202**

A severe error has occurred during a SAF RACROUTE REQUEST=LIST (create) call to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

**System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class, and register 3 the address of the entity, being checked at the time of the error.

**System programmer response**

See your ESM documentation for information about any return codes that appear in the job log. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**00C80203**

An unexpected return code has been received from one of the following SAF calls to the External Security Manager (ESM) during security switch processing at queue manager initialization time.

- RACROUTE REQUEST=EXTRACT
- RACROUTE REQUEST=LIST
- RACROUTE REQUEST=STAT

**System action**

Message CSQH004I is produced containing the return codes from SAF and the ESM. The queue manager is terminated, and a dump is produced. Register 2 contains the address of the return codes.

**System programmer response**

See your ESM documentation for information about the return codes that appear in message CSQH004I (in the job log) or the dump. For information about setting MQ security switches, see Switch profiles. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

#### 00C80204

An unexpected setting for the subsystem security switch was encountered.

#### **System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the control block containing the switch setting.

#### **System programmer response**

Collect the items listed in "Diagnostics" on page 4829, together with a note of what you expected the switch to be set to, and whether you had defined a profile for it or not, and contact your IBM support center.

Restart the queue manager.

#### 00C80205

An internal loop count was exceeded during security switch processing at queue manager initialization time.

#### **System action**

The queue manager is terminated, and a dump is produced. Register 2 contains the address of the class being checked at the time of the error.

#### **System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

Restart the queue manager.

#### 00C80206

An unexpected setting for the request type was encountered on an authentication request.

#### **System action**

The current execution unit terminates with a completion code of X'5C6' and a dump is produced. Register 2 contains the request type in error.

#### **System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

Restart the queue manager.

#### 00C80207

An unexpected setting for the request type was encountered on an authentication request.

#### **System action**

The queue manager terminates and a dump is produced. Register 2 contains the request type in error.

#### **System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

Restart the queue manager.

#### 00C81000

A severe error has occurred while processing a REFRESH SECURITY command.

#### **System action**

The current execution unit terminates with error reason code X'5C6', and a dump is produced. Register 2 contains the address of the control block involved in the error.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4829 and contact your IBM support center.

**Data manager codes (X'C9'):**

If a data manager reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

**Diagnostics**

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- If you are using CICS, the CICS transaction dump output.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.
- If you are using the WebSphere MQ Operations and Control panels, the ISPF panel name.

**00C90100**

The object MQ was trying to create was too large to be stored.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

**00C90200**

A page set page retrieved was not valid.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

**00C90201**

A page set page retrieved was not valid. The page was not a header page.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

**00C90202**

A page set page retrieved was not valid. The page was not a data page.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

**00C90300**

MQ was unable to start a unit of recovery for this execution unit.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C90301**

An internal logging error has occurred for the current execution unit.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C90400**

The data manager has detected an invalid log record.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C90401**

The data manager has detected an invalid log record subtype.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C90500**

The data manager was asked to make a change to some data in a page, but the change would have extended beyond the specific data item.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C90600**

The data manager was unable to locate a specific logical record within a data page. The record was required for an update, or to insert a new record immediately after.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C90700

The data manager was unable to locate its *resource access list entry* (RALE).

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C90800

The data manager was requested to put a message on a queue, but told to give the message an invalid priority.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C90900

The data manager was asked to retrieve a logical record from a page, but on retrieving it discovered that the record is invalid.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C90A00

The data manager was asked to carry out a value logging operation with an invalid length field.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C90B00

The space reclamation routines have been asked to deallocate a page that is not in a state to be deallocated.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C90C00

An object type description passed to the data manager is not valid.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### **00C90D00**

A page set that was originally page set n is being presented as being a different page set, probably because the started task JCL procedure for the queue manager has been changed. Register 0 contains the identifier of the page set in error, and register 2 contains the identifier it was previously associated with.

#### **System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### **System programmer response**

Check the started task JCL procedure for the queue manager, and undo any changes to the CSQPnnnn DD statements that specify the page sets. Restart the queue manager. If the problem persists, or no changes have been made to these statements, collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### **00C90D01**

Your data set is not recognized as an MQ page set. This may be for one of the following reasons.

- The data set has not been formatted
- You are attempting to start the queue manager with an older version of MQ and the backward migration PTF for that release is not installed
- You are attempting to start the queue manager with an older version of MQ, but the queue manager had been running with OPMODE=NEWFUNC at the higher release, and fallback to an earlier release is not possible

Register 0 contains the identifier of the page set in error.

#### **System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### **System programmer response**

Investigate the reason code and take one of the following actions:

- format the page set
- install appropriate backward migration PTFs
- start the queue manager with the correct level of code

#### **00C90D02**

This reason code is caused by one of the following:

- An attempt to use a page set that is a valid MQ page set, but does not belong to this queue manager
- An attempt to change the subsystem name

Neither of these actions is allowed.

Register 0 contains the identifier of the page set in error.

#### **System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### **System programmer response**

If you were attempting to use a page set from another queue manager, correct the error. Do not attempt to change the name of your queue manager.

#### **00C90D03**

An internal error has occurred during processing of an MQGET call with the Mark Skip Backout option.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C90D04**

During restart, the queue manager detected that a page set has been truncated. This is probably because the data set allocated during restoration of a backup was smaller than required to hold the backed up data, and so the data has been truncated. It might also occur if page set 0 is larger than the maximum supported page set size.

**System action**

The identifier of the page set in error is put in register 0. Restart is terminated.

**System programmer response**

Reallocate the data set correctly, restore the backed up data if necessary, and restart the queue manager.

**00C90E00**

The data manager was passed an invalid parameter describing the location of a logical record within a data page and page set.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C90F00**

The data manager was requested to update a logical record within a page, but the record had been deleted previously.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C91000**

The data manager was asked to retrieve a message from an object that was not a local queue.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C91094, 00C91095, 00C91096, 00C91097**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C91101**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C91102**

MQ received a return code indicating an error from the RRS ATRSROI service.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

The return code from ATRSROI is in register 3. See the *MVS Programming: Resource Recovery* manual for information about the return code.

**00C91104**

The data manager was requested to carry out a browse message operation, but the required lock was not held.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C91200**

The internal data manager locate-object routine could not find the object it was seeking during UNDO processing.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C91300**

During queue manager startup, an attempt was made to recover an object, the length of which exceeds a single data page. However, one of the intermediate data pages was not available, and MQ was unable to recover the object.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C91400

The data manager was unable to access the header page (page 0) of one of the page sets.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced. The number of the page set with a header page that was unreadable is held in register 2.

#### System programmer response

1. Check for a preceding IEC161I, CSQP060E, or CSQP011E message relating to page set mentioned in register 2.
2. Check the following:
  - For the page set mentioned in register 2, is the appropriate CSQPnnnn DD statement present in the started task JCL procedure for the queue manager, xxxxMSTR?
  - Does this DD statement reference a genuine data set? DD DUMMY statements are not allowed for page sets.
  - Is DEFINE PSID(nn) present in the CSQINP1 initialization input data set?
3. If you are still unable to resolve the problem, collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C91500

During queue manager startup, the data manager was following a chain of objects on disk, and requested the next data page in the chain from the buffer manager. However, the buffer manager could not supply this page.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C91600

During restart, the data manager rebuilds its in-storage structures from page set data. On rebuilding an object, data manager discovered that the object already exists.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C91700, 00C91800

An internal error has occurred.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C91900

During restart, data manager has detected an error in the rebuild of its in-storage object structures.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C91B01**

During restart, the data manager found a queue with messages that are apparently located in a newly added page set. This is probably because the queue manager was run with a page set offline, and a new page set was formatted to replace the original one. This will lead to data loss.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C91C00**

A delete purge request has been issued but the object type is not a local queue.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C91D00**

A lock request has failed during an attempt to lock all pages associated with a long catalog object, or a long message.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C91E00**

During a request issued by CSQIPUT5 or CSQIPUT6, an attempt to obtain a page level lock was unsuccessful.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C91F00**

During a request issued by CSQIPUT5 or CSQIPUT6, an attempt to obtain a record level lock was unsuccessful.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C92000**

An attempt to obtain a page level lock on the owner page relating to an object or message was unsuccessful.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C92100**

An attempt to obtain a page level lock while trying to insert data was unsuccessful.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C92200**

An attempt to obtain a record level lock while trying to insert data was unsuccessful.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C92300**

An attempt to obtain a record level lock while trying to amend data was unsuccessful.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C92400**

An attempt to get a lock on object type concatenated with object name within CSQIMGE1 was unsuccessful.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C92500, 00C92600, 00C92700, 00C92800, 00C92900, 00C92A00, 00C92B00, 00C92C00, 00C92D00,  
00C92E00, 00C92F00, 00C93000**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C93100

A keyed read queue has encountered an error. A problem has occurred in the hash-table structure for the queue.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C93200, 00C93300

An internal error has occurred.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C93500

MQ was extending a page set at startup, based on log records from earlier dynamic page set extend operations. (MQ does this so that any media recovery operation will have the required number of pages available in the page set.)

The page set could not be extended to the required RBA value.

The contents of the relevant registers are as follows:

**R0** The number of the page set that could no longer be extended

**R2** The logged page number that MQ was trying to extend to

**R3** The high page number at restart. This is the base from which MQ was extending.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Create a larger page set, using multiple disk volumes if required, with a larger secondary extent value. The high page number of the page set should at least match that shown in register 2 in the dump.

#### 00C93700

A queue contains messages, but the storage class named in the queue definition does not exist. This is an error.

This reason code is issued on queue manager restart if it is *not* the first time the queue manager has been started after migration to a new version.

Register 2 contains the first 4 characters of the storage class name, and register 3 contains characters 5 through 8.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Collect the dump and a listing of your page set 0 and contact your IBM support center.

#### 00C93800

A queue contains messages, which are on a page set other than that defined by the storage class named by the queue.

This reason code is issued on queue manager restart if it is *not* the first time the queue manager has been started after migration to a new version. It is preceded by one or more instances of message CSQI028E.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the dump and a listing of your page set 0 and contact your IBM support center.

**00C93900**

During MQPUT processing, MQ was unable to acquire a lock on the storage class of the queue.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C93A00**

During MQGET processing, MQ was unable to acquire a lock on the queue it was processing.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C93B00**

During MQPUT processing, MQ was unable to acquire a lock on the queue it was processing.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C93C00**

During MQGET processing, MQ was unable to retrieve a message page from a queue it was processing.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C93D00, 00C93E00, 00C93F00, 00C94000, 00C94100**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C94200

MQ received a return code indicating an error from the RRS ATREINT service. This can occur if RRS is stopped when running an MQ application linked with an RRS stub.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

The return code from ATREINT is in register 3. See the *MVS Programming: Resource Recovery* manual for information about the return code.

#### 00C94300

MQ received a return code indicating an error from the RRS ATRSIT service.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

The return code from ATRSIT is in register 3. See the *MVS Programming: Resource Recovery* manual for information about the return code.

#### 00C94400

MQ received a return code indicating an error from the RRS ATRSPID service.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

The return code from ATRSPID is in register 3. See the *MVS Programming: Resource Recovery* manual for information about the return code.

#### 00C94500, 00C94501, 00C94502

An internal error has occurred.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### 00C94503

A page set that has been the subject of the RESETPAGE function had not previously been through a clean shutdown of the queue manager. Using this page set for subsequent MQ processing would lead to data integrity problems.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Check the page sets that are defined to the queue manager. One or more of the page sets has been the subject of a RESETPAGE operation. Do not run the RESETPAGE operation against page sets that are either of the following:

- Fuzzy page set backups

- From a queue manager that has terminated abnormally

If you are unable to solve the problem, collect the items listed in “Diagnostics” on page 4850 and contact your IBM support center.

#### 00C94505

An internal error has occurred.

An attempt to restart with a log from another queue manager was detected. The queue-sharing group name recorded in the log during checkpoint does not match the name of the queue-sharing group in the queue manager using that log. If the correct log is being used, you can perform the change only after a clean shutdown of the queue manager, that is, after a quiesce.

Message CSQI060E is issued before this error occurs.

#### System action

Restart is terminated abnormally with completion code X'5C6' and a dump is produced.

#### System programmer response

Restart the queue manager using the correct logs and BSDS, or change the QSGDATA system parameter. Note that you cannot change the name of the queue-sharing group that a queue manager uses unless it has been shut down normally.

The following registers in the dump contain helpful values:

- R0 = the queue-sharing group name recorded in the log
- R2 = the queue-sharing group name in the running queue manager

#### 00C94506

An internal error has occurred.

An attempt to restart with a log from another queue manager was detected. The shared queue manager identifier recorded in the log during checkpoint does not match the shared queue manager identifier in the queue manager using that log. If the correct log is being used, the entry in the Db2 CSQ.ADMIN\_B\_QMGR table for this queue manager has been corrupted.

Message CSQI061E is issued before this error occurs.

#### System action

Restart is terminated abnormally with completion code X'5C6' and a dump is produced.

#### System programmer response

Restart the queue manager using the correct logs and BSDS. If the correct logs are being used, correct the entry for the queue manager in the Db2 CSQ.ADMIN\_B\_QMGR table. If you cannot resolve the problem, contact your IBM support center for assistance.

The following registers in the dump contain helpful values:

- R0 = the queue manager identifier recorded in the log
- R2 = the queue manager identifier in the running queue manager

#### 00C94507

An internal error has occurred during processing of Mark Skip Backout.

#### System action

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### System programmer response

Collect the items listed in “Diagnostics” on page 4850 and contact your IBM support center.

#### 00C94510

A request was made to a coupling facility resource manager service within MQ. The coupling facility resource manager service returned an unexpected return code.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C94511**

An attempt to obtain storage for the data manager's use was unsuccessful. This indicates there could be a wider-ranging problem relating to storage availability.

**System action**

The queue manager is terminated and a dump is produced.

**System programmer response**

Check that you are running with the recommended region size, and if not, reset your system and restart the queue manager. If this is not the cause, use these items to diagnose the cause of the problem:

- Queue manager job log
- Information about any other storage-related problems
- System dump resulting from the error

**00C94512**

A request was made to a Db2 resource manager service within MQ. The Db2 resource manager service returned an unexpected return code.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C94513**

A request was made to a coupling facility resource manager service within MQ. The coupling facility resource manager service returned an unexpected return code.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

**00C9451A**

A request was made to a Db2 resource manager service within MQ during restart. The Db2 resource manager service returned an unexpected return code related to a locked table condition.

**System action**

The queue manager terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Restart the queue manager. If you started several queue managers at the same time, try restarting them one at a time to alleviate this condition.

If the problem persists, collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### **00C9FEEE**

An internal error has occurred.

#### **System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

#### **System programmer response**

Collect the items listed in "Diagnostics" on page 4850 and contact your IBM support center.

#### **Recovery log manager codes (X'D1'):**

If a recovery log manager reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

#### **Diagnostics**

- The console output for the period leading up to the error.
- The system dump resulting from the error.
- If you are using CICS, the CICS transaction dump output.
- Appropriate IBM MQ, z/OS, Db2, CICS, and IMS service levels.
- A printout of SYS1.LOGREC, if the reason code is issued by an active queue manager.
- If the reason code is issued by an active queue manager, a CSQ1LOGP detail report containing the log records associated with the problem.
- Contents of the BSDS. Obtain a listing by running the Print Log Map utility (CSQJU004).
- The recovery log manager standard diagnostic information, which is provided in the SYS1.LOGREC variable recording area (VRA) of the system diagnostic work area (SDWA) for many of the reason codes:

#### **MODID**

Name of the module issuing the error.

#### **LEVEL**

Change level.

#### **COMPONENT**

Subcomponent identifier of the recovery log manager.

#### **REGISTERS**

General purpose registers (GPRs) 0-15 at time of the abend.

#### **00D10010**

The end log range value specified on an invocation of the log print utility (CSQ1LOGP) is less than or equal to the start range value.

#### **System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

#### **System programmer response**

Correct the log range input control parameters specified in the invocation of the log print utility.

For more information about log services, refer to CSQ1LOGP.

#### **00D10011**

An invocation of the log print utility (CSQ1LOGP) was unable to obtain the storage required to perform the request.

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

**System programmer response**

It is probable that the REGION parameter on the EXEC statement of the job control language (JCL) for this invocation is too small. Increase the REGION size, and resubmit the log print request.

For more information about log services, refer to Address space storage.

**00D10012**

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because the job control language (JCL) for this invocation did not specify either the use of the bootstrap data set (BSDS) or, in the absence of the BSDS, the active or archive log data sets.

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

**System programmer response**

Correct the JCL and resubmit the log print request.

For more information about BSDS, refer to Managing the BSDS.

**00D10013**

An invocation of the log print utility (CSQ1LOGP) resulted in a VSAM error while attempting to open the bootstrap data set (BSDS).

This reason code, and the VSAM return code are issued with message CSQ1221E.

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

**System programmer response**

Refer to the *DFSMS/MVS Macro Instructions for Data Sets* to determine the meaning of the VSAM OPEN error. Take appropriate action, and resubmit the log print request.

**00D10014**

The job control language (JCL) for an invocation of the log print utility (CSQ1LOGP) specified the use of the bootstrap data set (BSDS), but the utility control statements did not specify values for RBASTART and RBAEND.

The RBASTART and RBAEND values must be specified when using the BSDS, although they are not required when using the active or archive logs.

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

**System programmer response**

Either:

- Continue to use the BSDS, but change the utility control statements to specify values for RBASTART and RBAEND
- Change the JCL to use the active and archive data sets instead

For more information, refer to CSQ1LOGP.

**00D10015**

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because the record format of the bootstrap data set is incompatible with this release of the log print services.

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

**System programmer response**

Ensure that the correct release of the log print services are used with the appropriate BSDS record format.

For more information, refer to CSQ1LOGP.

**00D10019**

An invocation of the log print utility (CSQ1LOGP) resulted in a VSAM error while attempting to open the bootstrap data set (BSDS). The error was determined to be one which could be corrected by use of a VSAM access method services (AMS) VERIFY call, but the VERIFY call was also unsuccessful.

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

**System programmer response**

Collect the following items, and contact your IBM support center:

- A copy of the user's job control language (JCL) that was used to invoke the log print utility (CSQ1LOGP)
- The log data sets that the user was attempting to print

**00D10020**

The log print utility (CSQ1LOGP) issued this message because the end of data has been reached (that is, the end of the log, or the end of the user-specified data sets, or the user-specified RBAEND value has been reached).

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

**System programmer response**

This is not an error. This reason code denotes a normal end of data condition. No action is necessary.

For more information, refer to CSQ1LOGP.

**00D10021**

An invocation of the log print utility (CSQ1LOGP) encountered a gap in the log RBA range when switching log data sets. This indicates that log records might be missing.

Normally, a continuous set of log records is supplied as input by the ACTIVE and ARCHIVE DDnames (or the BSDS DDname if you are using the bootstrap data set (BSDS) to access the log data sets) in the job control language (JCL) used to invoke the utility. If a log data set was removed from the JCL, this condition will arise.

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

**System programmer response**

If the log data set was not removed intentionally, check the JCL to ensure that the log data sets are specified in ascending RBA value order. If you are using the BSDS to access the log data sets,

use the print log map utility (CSQJU004) to examine the RBA ranges as recorded in the BSDS, and note any RBA gaps that might have resulted from the deletion of an active or archive log data set.

If it appears that a log error might have occurred, see Active log problems for information about dealing with problems on the log.

#### **00D10022**

An invocation of the log print utility (CSQ1LOGP) encountered a gap in the log RBA range when switching log data sets. This indicates that log records might be missing. The log RBA of the next record following the gap is greater than the RBAEND value specified in the utility control statements.

Normally, a continuous set of log records is supplied as input by the ACTIVE and ARCHIVE DDnames (or the BSDS DDname if using the bootstrap data set (BSDS) to access the log data sets) in the job control language (JCL) used to invoke the utility. If a log data set was removed from the JCL, this condition will arise.

#### **System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

#### **System programmer response**

Check the JCL and the RBAEND value specified in the utility control statements.

If a log data set was not removed intentionally, check that the log data sets are specified in ascending RBA value order. If using the BSDS to access log data sets, use the print log map utility (CSQJU004) to examine the RBA ranges as recorded in the BSDS, and note any RBA gaps that might have resulted from the deletion of an active or archive log data set.

If it appears that a log error might have occurred, see Active log problems for information about dealing with problems on the log.

#### **00D10024**

An invocation of the log print utility (CSQ1LOGP) encountered a log RBA sequence error. The RBA of the previous log record is greater than the RBA of the current log record.

Normally, a continuous set of log records is supplied as input by the ACTIVE and ARCHIVE DDnames (or the BSDS DDname if using the bootstrap data set (BSDS) to access the log data sets) in the job control language (JCL) used to invoke the utility. If a log data set appears out of sequence, this condition will arise.

#### **System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

#### **System programmer response**

Check the JCL to ensure that the log data sets are specified in ascending RBA value order. If using the BSDS to access the log data sets, use the print log map utility (CSQJU004) to examine the RBA ranges associated with each archive and active log data set. If both archive and active log data sets are used, the first archive log data set must contain the lowest log RBA value. If necessary, adjust the concatenation of the archive and active log data sets in the JCL to ensure that log records are read in ascending RBA sequence, and resubmit the log print request.

If it appears that a log error might have occurred, see Active log problems for information about dealing with problems on the log.

#### **00D10025**

An invocation of the log print utility (CSQ1LOGP) resulted in a VSAM GET error while attempting to read the active log data set.

This reason code, and the VSAM return and reason codes are issued in message CSQ1221E.

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

**System programmer response**

Refer to the *DFSMS/MVS Macro Instructions for Data Sets* to determine the meaning of the VSAM GET error and the RPL error code. Take appropriate action to correct the error, and resubmit the log print request.

**00D10026**

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because an RBA value within the range specified by RBASTART and RBAEND could not be located on a log data set.

This reason code, and the RBA value that could not be located are issued with message CSQ1216E

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

**System programmer response**

Check the utility control statements to ensure that the RBASTART and RBAEND values have not exceeded the lower or upper bounds of the RBAs available on all the active or archive log data sets defined by DDnames in the JCL.

If you are using the BSDS to access the log data sets, use the print log map utility (CSQJU004) to examine the RBA ranges associated with each archive and active log data set.

Correct the JCL and utility control statements as necessary, and resubmit the log print request.

For more information, refer to CSQ1LOGP.

**00D10027**

An invocation of the log print utility (CSQ1LOGP) resulted in a VSAM GET error while attempting to read the bootstrap data set (BSDS).

This reason code, and the VSAM return and reason codes, are issued with message CSQ1221E.

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

**System programmer response**

Refer to the *DFSMS/MVS Macro Instructions for Data Sets* manual to determine the meaning of the VSAM GET error and the RPL error code. Take appropriate action to correct the error and resubmit the log print request.

**00D1002A**

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because an RBA value has been requested in an active log data set that has previously not been opened. A VSAM OPEN error occurred while attempting to open the active log data set.

This reason code, and the VSAM return and reason codes, are issued in message CSQ1221E.

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

**System programmer response**

Refer to the *DFSMS/MVS Macro Instructions for Data Sets* manual to determine the meaning of the VSAM OPEN error and the ACB error code. Take appropriate action to correct the error, and resubmit the log print request.

#### **00D1002B**

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because an RBA value has been requested in an active log data set that has previously not been opened. A VSAM OPEN error occurred while attempting to open the active log data set. The VSAM OPEN error was determined to be one that could be corrected, however, a system error occurred while executing a z/OS TESTCB macro to determine whether the active log data set in question was a VSAM ESDS (entry-sequenced data set) or a VSAM LDS (linear data set).

This reason code, and the VSAM return and reason codes are issued in message CSQ1221E.

#### **System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

#### **System programmer response**

Refer to the *DFSMS/MVS Macro Instructions for Data Sets* manual to determine the meaning of the VSAM OPEN error and the ACB error code. Take appropriate action to correct the error, and resubmit the log print request.

If the problem persists, collect the following items, and contact your IBM support center:

- A copy of the job control language (JCL) used to invoke the log print utility (CSQ1LOGP)
- The log data sets that the user was attempting to print

#### **00D1002C**

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because an RBA value has been requested in a active log data set that has previously not been opened. A VSAM OPEN error occurred while attempting to open the active log data set. The VSAM OPEN error was determined to be one which could be corrected by use of a VSAM access method services (AMS) VERIFY call, but the VERIFY call was unsuccessful.

This reason code, and the VSAM return and reason codes are issued with message CSQ1221E.

#### **System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

#### **System programmer response**

Refer to the *DFSMS/MVS Macro Instructions for Data Sets* manual to determine the meaning of the VSAM OPEN error and the ACB error code. Take appropriate action to correct the error, and resubmit the log print request.

#### **00D1002D**

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because an RBA value has been requested in an active log data set that has previously not been opened. A VSAM OPEN error occurred while attempting to open the active log data set. The VSAM OPEN error was corrected by use of a VSAM access method services (AMS) VERIFY call, but a subsequent attempt to reposition the VSAM pointer back to the beginning of the active log data set (using the VSAM AMS POINT call) was unsuccessful.

This reason code and the VSAM return and reason codes are issued with message CSQ1221E.

#### **System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

#### **System programmer response**

Refer to the *DFSMS/MVS Macro Instructions for Data Sets* manual to determine the meaning of the VSAM OPEN error and the ACB error code. Take the appropriate action to correct the error, and resubmit the print log request.

#### 00D10030

An invocation of the log print utility resulted in an internal error.

#### System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

#### System programmer response

Collect the following items, and contact your IBM support center:

- A copy of the job control language (JCL) used to invoke the log print utility
- The log data sets that the user was attempting to print

#### 00D10031

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because an RBA value has been requested in a log data set that has previously not been opened. The job control language (JCL) has specified that the bootstrap data set (BSDS) be used as the guide to determine which data sets are required. An attempt to allocate the appropriate data set dynamically (using z/OS SVC 99) was unsuccessful.

This reason code, and the dynamic allocation information and error codes (S99INFO and S99ERROR) are issued with message CSQ1222E.

#### System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

#### System programmer response

Refer to the *MVS Authorized Assembler Services Guide* manual to determine the meaning of the SVC 99 information and error codes. Take the appropriate action to correct the error, and resubmit the log print request.

#### 00D10040

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because an RBA value has been requested in an archive log data set (on tape) that has previously not been opened. An attempt was made to open the second file on the archive log tape (the first file normally contains the bootstrap data set) but this was unsuccessful because the archive log data set was not the second file on the archive log tape. The read job file control block (RDJFCB) macro was then invoked to attempt to change the data set sequence number from the default value of 2 to a value of 1, before attempting to open the second file again, but the macro invocation resulted in an error.

This reason code, and the RDJFCB return code are issued in message CSQ1223E.

#### System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

#### System programmer response

Refer to the *MVS/ESA DFP System Programming Reference* manual to determine the meaning of the RDJFCB error code. Take the appropriate action to correct the error, and resubmit the log print request.

#### 00D10044

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because an RBA value has been requested in an archive log data set that has previously not been opened. An attempt to open the archive log data set resulted in a QSAM (queued sequential access method) error.

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

**System programmer response**

Check the console for messages indicating the cause of the QSAM error. Take the appropriate action to correct the error, and resubmit the log print request.

**00D10048**

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because a QSAM (queued sequential access method) GET error occurred while reading an archive log data set.

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

**System programmer response**

Check the console for messages indicating the cause of the QSAM error. Take the appropriate action to correct the error, and resubmit the log print request.

**00D10050**

An invocation of the log print utility (CSQ1LOGP) was unsuccessful because the bootstrap data set (BSDS) was erroneously specified as one of the archive data sets in the job control language (JCL).

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set.

**System programmer response**

Examine the JCL, and remove the occurrence of the BSDS data set as one of the concatenated ARCHIVE data sets. Resubmit the log print request.

For more information, refer to Archive log problems.

**00D10061**

An invocation of the log print utility (CSQ1LOGP) succeeded, but an unexpected physical record length was encountered for the log record control interval (CI) for an active or archive log data set.

The data on the log data set might have been corrupted after it was written by IBM MQ. The data in the log data set might still be usable, but with caution.

The length of a log CI in an active log data set is expected to be 4096 bytes. The length of a log CI in an archive log data set is expected to be 4089 bytes.

**System action**

No error is issued by log services, and no information is written to SYS1.LOGREC data set. The log print request has completed. This reason code is issued as a warning.

**System programmer response**

Ensure that the ACTIVE and ARCHIVE DDnames in the job control language (JCL) refer to active and archive logs correctly.

If the problem persists, collect the following items, and contact your IBM support center:

- A copy of the job control language (JCL) used to invoke the log print utility (CSQ1LOGP)

- The log data set that the user was trying to print

#### 00D10062

An invocation of the log print utility (CSQ1LOGP) succeeded, but the first log record segment could not be found for a middle spanned log record segment.

#### System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set. The log print request has completed. This reason code is issued as a warning.

#### System programmer response

Several possibilities exist for the cause of this condition:

- The recovery log manager component of IBM MQ did not originally construct the log record header (LRH) properly
- The LRH for the log record segment was damaged after it was written by IBM MQ
- The application program continued to process after being informed about a gap in the log RBA values (reason code X'00D10021')

Determine if the LRH of the log record segment is truly in error by looking at the record segments directly preceding and after the record segment in question.

Take the appropriate action to correct the error, and resubmit the log print request. If the problem persists, collect the following items, and contact your IBM support center:

- A copy of the job control language (JCL) used to invoke the log print utility (CSQ1LOGP)
- The log data set that the user was attempting to print

#### 00D10063

An invocation of the log print utility (CSQ1LOGP) succeeded, but the first log record segment could not be found for a last spanned log record segment.

#### System action

No error is issued by log services, and no information is written to SYS1.LOGREC data set. The log print request has completed. This reason code is issued as a warning.

#### System programmer response

Several possibilities exist for the cause of this condition:

- The recovery log manager component of IBM MQ did not originally construct the log record header (LRH) properly
- The LRH for the log record segment was damaged after it was written by IBM MQ
- The application program continued to process after being informed about a gap in the log RBA values (reason code X'00D10021')

Determine if the LRH of the log record segment is truly in error by looking at the record segments directly before and after the record segment in question.

Take the appropriate action to correct the error, and resubmit the log print request. If the problem persists, collect the following items, and contact your IBM support center:

- A copy of the job control language (JCL) used to invoke the log print utility (CSQ1LOGP)
- The log data set that the user was attempting to print

#### 00D10114

IBM MQ failed to read or write member information in the queue sharing group table, CSQ.ADMIN\_B\_QSG.

#### System action

Queue manager initialization terminates.

**System programmer response**

Investigate Db2 SQL errors reported in the queue manager job log immediately preceding this error, to determine the cause. It is most likely due to incorrect table setup, plans not bound or insufficient authority to execute Db2 plans.

**00D10120**

The BSDS version is not allowed by the installation and customization options chosen for IBM MQ. For example, the queue manager might have been migrated from a previous version, and is currently operating with OPMODE=COMPAT.

**System action**

Queue manager startup terminates.

**System programmer response**

Either enable the required functions using OPMODE, or if this is the first attempt to start the queue manager with a BSDS that has been converted to a new version, restore the BSDS to the original version.

**00D10121**

The BSDS is not valid. A non-valid BSDS is the result of a failure during a previous attempt to run the BSDS conversion utility.

**System action**

Queue manager startup terminates.

**System programmer response**

The procedure for running the BSDS conversion utility involves renaming the original BSDS. Restore the BSDS to the original pre-conversion copy by renaming the data sets, then try the conversion again.

When the conversion is successful, try the program that issued the error message again.

**00D10122**

The BSDS version is not supported by this release of IBM MQ.

**System action**

Queue manager startup, or the process that was accessing the BSDS, terminates.

**System programmer response**

Start the queue manager at a version of IBM MQ that supports the BSDS version.

You can determine the version of a BSDS by running the print log map utility (CSQJU004)

**00D10250**

An unrecoverable error occurred while updating either the BSDS or the z/OS catalog to reflect changes in active log data sets.

**System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The queue manager then terminates abnormally.

**System programmer response**

Obtain the SYS1.LOGREC and SVC dump. Correct the error, and restart the queue manager.

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem. In addition, see the description of reason code X'00D10251' for details of the information recorded in the variable recording area (VRA) of the system diagnostic work area (SDWA).

Examine the console log for a CSQJxxxx message preceding this error to determine whether the error was a BSDS error or a z/OS catalog update error. If you cannot resolve the problem, contact your support center.

#### **00D10251**

An unrecoverable error occurred in the log buffer writer.

#### **System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The queue manager then terminates abnormally.

#### **System programmer response**

Obtain the SYS1.LOGREC and the SVC dump. This error is usually caused by a previous error that was recorded on SYS1.LOGREC and produced an SVC dump. The SYS1.LOGREC entries and SVC dump should be examined to determine the primary error that occurred.

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem. In addition, see the description of reason code X'00D10252' for details of the information recorded in the variable recording area (VRA) of the system diagnostic work area (SDWA).

If you cannot resolve the problem, contact your support center.

#### **00D10252**

This reason code is used to define the format of the information recorded in the variable recording area (VRA) of the system diagnostic work area (SDWA).

#### **System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump.

#### **System programmer response**

Obtain the SYS1.LOGREC and SVC dump.

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem. In addition, the following information is contained in the VRA of the SDWA:

- Reason code X'00D10252' stored with VRA key 6.
- The log buffer writer recovery tracking area is stored with VRA key 10.

#### **00D10253**

An application program check occurred in an MVCP instruction that attempted to move a parameter list or other data from the caller's address space to the queue manager address space.

#### **System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump.

#### **System programmer response**

Obtain the SYS1.LOGREC and SVC dump. You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem.

Examine the area from which data was to be moved. It might be in the wrong key, or the address might be the cause of the problem. The incorrect instruction has a DA opcode and indicates the registers showing address and length to be moved.

#### **00D10254**

An application program check occurred in an MVCS instruction that attempted to move data from the queue manager address space to the caller's address space.

**System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump.

**System programmer response**

Obtain the SYS1.LOGREC and SVC dump. You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem.

Examine the area to which data was to be moved. It might be in the wrong key, or the address might be the cause of the problem. The incorrect instruction has a DB opcode and indicates the registers showing address and length to be moved.

**00D10257**

The log RBA has reached or exceeded the value FFF800000000 (if 6-byte log RBAs are in use) or FFFFFFFC00000000 (if 8-byte log RBAs are in use). The queue manager is terminated because the log RBA range has reached a CRITICAL level where the available range is too small for the queue manager to continue.

**System action**

The queue manager terminates with reason code 00D10257.

**System programmer response**

You need to reset the logs before the queue manager can be restarted. If you do not perform this action, the queue manager will abend once again after the next log data set switch.

For information on how to reset the logs using the CSQUTIL utility program, see RESETPAGE.

If your queue manager is using 6-byte log RBAs, consider converting the queue manager to use 8-byte log RBAs. See Planning to increase the maximum addressable log range for further information.

**00D10261**

While scanning the records and record segments in a log control interval (CI), it was discovered that the forward record chain was broken. This condition is the result of an incorrect record length in the log record header of some record in the log CI.

**System action**

This reason code can be issued by an active queue manager as the log buffers are scanned before they are written to the active log, or by the IBM MQ log services GET processor as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active queue manager, a diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by CSQJOFF1, the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'
- If the error was detected by CSQJR005, message CSQJ012E is issued and the calling agent is terminated
- If the error was detected by CSQJW009, message CSQJ012E is issued and the queue manager is terminated
- If the error was detected by CSQJW107, the queue manager is terminated

If this reason code is issued as the result of IBM MQ log services GET processing, no error is issued and no information is written to the SYS1.LOGREC data set.

**System programmer response**

You might find the items listed in “Diagnostics” on page 4864 useful in resolving the problem. If you are unable to solve the problem, contact your IBM support center.

#### 00D10262

While scanning a log control interval (CI), the offset to the last record or record segment in the CI was found to be incorrect.

#### System action

This reason code can be issued by an active queue manager as the log buffers are scanned before they are written to the active log, or by the IBM MQ log services GET processor as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active queue manager, a diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by CSQJOFF1, the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'
- If the error was detected by CSQJR005, message CSQJ012E is issued and the calling agent is terminated
- If the error was detected by CSQJW009, message CSQJ012E is issued and the queue manager is terminated
- If the error was detected by CSQJW107, the queue manager is terminated

If this reason code is issued as the result of IBM MQ log services GET processing, no error is issued, and no information is written to the SYS1.LOGREC data set.

#### System programmer response

You might find the items listed in “Diagnostics” on page 4864 useful in resolving the problem. If you are unable to solve the problem, contact your IBM support center.

#### 00D10263

While scanning a log control interval (CI), the VSAM RDF/CIDF control information was found to be incorrect.

#### System action

This reason code can be issued by an active queue manager as the log buffers are scanned before they are written to the active log, or by the IBM MQ log services GET processor as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active queue manager, a diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by CSQJOFF1, the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'
- If the error was detected by CSQJR005, message CSQJ012E is issued and the calling agent is terminated
- If the error was detected by CSQJW009, message CSQJ012E is issued and the queue manager is terminated
- If the error was detected by CSQJW107, the queue manager is terminated

If this reason code is issued as the result of IBM MQ log services GET processing, no error is issued, and no information is written to the SYS1.LOGREC data set.

#### System programmer response

You might find the items listed in “Diagnostics” on page 4864 useful in resolving the problem. If you are unable to solve the problem, contact your IBM support center.

#### 00D10264

While scanning a log control interval (CI), the beginning log RBA of the CI was not the expected RBA.

#### **System action**

This reason code can be issued by an active queue manager as the log buffers are scanned before they are written to the active log, or by the IBM MQ log services GET processor as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active queue manager, a diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by CSQJOFF1, the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'
- If the error was detected by CSQJR005, message CSQJ012E is issued and the calling agent is terminated
- If the error was detected by CSQJW009, message CSQJ012E is issued and the queue manager is terminated
- If the error was detected by CSQJW107, the queue manager is terminated

If this reason code is issued as the result of IBM MQ log services GET processing, no error is issued, and no information is written to the SYS1.LOGREC data set.

#### **System programmer response**

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem. If you are unable to solve the problem, contact your IBM support center.

#### **00D10265**

While scanning the records and record segments in a log control interval (CI), it was discovered that the backward record chain was broken. This condition is the result of an incorrect record length in the log record header of some record in the log CI.

#### **System action**

This reason code can be issued by an active queue manager as the log buffers are scanned before they are written to the active log, or by the IBM MQ log services GET processor as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active queue manager, a diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by CSQJOFF1, the archiving of the active log data set is terminated
- If the error was detected by CSQJR005, message CSQJ012E is issued and the calling agent is terminated
- If the error was detected by CSQJW009, message CSQJ012E is issued and the queue manager is terminated
- If the error was detected by CSQJW107, the queue manager is terminated

If this reason code is issued as the result of IBM MQ log services GET processing, no error is issued, and no information is written to SYS1.LOGREC data set.

#### **System programmer response**

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem. If you are unable to solve the problem, contact your IBM support center.

#### **00D10266**

While scanning a log control interval (CI), a unit of recovery ID or LINK RBA in some record was found to be inconsistent with the beginning log RBA of the CI.

#### **System action**

This reason code can be issued by an active queue manager as the log buffers are scanned before they are written to the active log, or by the IBM MQ log services GET processor as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active queue manager, a diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by CSQJOFF1, the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'
- If the error was detected by CSQJR005, message CSQJ012E is issued and the calling agent is terminated
- If the error was detected by CSQJW009, message CSQJ012E is issued and the queue manager is terminated
- If the error was detected by CSQJW107, the queue manager is terminated

If this reason code is issued as the result of IBM MQ log services GET processing, no error is issued, and no information is written to SYS1.LOGREC data set.

### **System programmer response**

You might find the items listed in “Diagnostics” on page 4864 useful in resolving the problem. If you are unable to solve the problem, contact your IBM support center.

### **00D10267**

While scanning a log control interval (CI), a middle or last spanned record segment was not the first segment contained in the log CI.

### **System action**

This reason code can be issued by an active queue manager because the log buffers are scanned before they are written to the active log, or by the IBM MQ log services GET processor because a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active queue manager, a diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by CSQJOFF1, the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'
- If the error was detected by CSQJR005, message CSQJ012E is issued and the calling agent is terminated
- If the error was detected by CSQJW009, message CSQJ012E is issued and the queue manager is terminated
- If the error was detected by CSQJW107, the queue manager is terminated

If this reason code is issued as the result of IBM MQ log services GET processing, no error is issued, and no information is written to the SYS1.LOGREC data set.

### **System programmer response**

You might find the items listed in “Diagnostics” on page 4864 useful in resolving the problem. If you are unable to solve the problem, contact your IBM support center.

### **00D10268**

While scanning a log control interval (CI), a first or middle spanned record segment was not the last segment contained in the log CI.

### **System action**

This reason code can be issued by an active queue manager as the log buffers are scanned before they are written to the active log, or by the IBM MQ log services GET processor as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active queue manager, then a diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by CSQJOFF1, the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'
- If the error was detected by CSQJR005, message CSQJ012E is issued and the calling agent is terminated
- If the error was detected by CSQJW009, message CSQJ012E is issued and the queue manager is terminated
- If the error was detected by CSQJW107, the queue manager is terminated

If this reason code is issued as the result of IBM MQ log services GET processing, no error is issued, and no information is written to the SYS1.LOGREC data set.

#### **System programmer response**

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem. If you are unable to solve the problem, contact your IBM support center.

#### **00D10269**

An unrecoverable error was found in one of the buffers, while moving the current log buffer to the static write buffer in preparation for the physical write to the active log.

#### **System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The queue manager then terminates.

#### **System programmer response**

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem. If you are unable to solve the problem, contact your IBM support center.

#### **00D10270**

A LOG WRITE request completed unsuccessfully because the length of the log record header was not as expected. This is an internal error.

#### **System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

#### **System programmer response**

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem.

Examine the SYS1.LOGREC, console log, and SVC dump for information about prior errors during LOG WRITE processing.

If you are unable to solve the problem, contact your IBM support center.

#### **00D10327**

A LOG READ completed unsuccessfully because of an invalid log LOGRBA. A log read, MODE(DIRECT) with a requested RBA does not match the start of a log record.

#### **System action**

An SVC dump is requested and the execution unit ends abnormally. If the log read error occurs during queue manager startup then the queue manager ends abnormally.

#### **System programmer response**

Log read with MODE(DIRECT) is most commonly used in the queue manager for verifying that the start RBA of a unit of work can be found on the log, before a sequential (maybe backward)

read of the log data to recover locks on an in-doubt unit of work, or to back out a unit of work. It indicates that the queue manager is being started with incomplete log data available.

If you suspect an error in IBM MQ, collect the following data and contact IBM support:

- The BSDS
- All active and archive logs
- The SVC dump created by this error

#### **00D1032A**

An unsuccessful completion of a LOG READ has occurred. BSDS does not map the specified RBA into a log data set. Either the BSDS is in error, or the log data set has been deleted.

#### **System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

#### **System programmer response**

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem.

#### **00D1032B**

Completion of a LOG READ was unsuccessful, because an error occurred while attempting to allocate a log data set.

#### **System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

#### **System programmer response**

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem.

Examine LOGREC and SVC dump information. Also, examine any prior messages with a CSQJ prefix from recovery log manager allocation processing.

#### **00D1032C**

A LOG READ completed unsuccessfully, because an error occurred while opening or closing a log data set.

#### **System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

#### **System programmer response**

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem.

Examine LOGREC and SVC dump information. Also, examine prior messages from recovery log manager open/close processing. These messages have a prefix of CSQJ.

#### **00D1032E**

A LOG READ completed unsuccessfully due to an internal error.

#### **System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

#### **System programmer response**

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem. Examine the SYS1.LOGREC and SVC dump information.

**00D10340**

An unsuccessful completion of a LOG READ has occurred. This reflects an internal recovery log manager (RLM) logic error.

**System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem.

Examine the SYS1.LOGREC, console log and SVC dump for information about prior errors during LOG READ processing.

If you cannot solve the problem, contact your IBM support center.

**00D10341**

A LOG READ completed unsuccessfully because an error was detected during a Forward READ of the log record. This is an internal error.

**System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem.

Examine the SYS1.LOGREC, console log and SVC dump for information about prior errors during LOG READ processing.

If you cannot solve the problem, contact your IBM support center.

**00D10342**

A LOG READ completed unsuccessfully because an error was detected during a backward READ of a log record. This is an internal error.

**System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem.

Examine the SYS1.LOGREC, console log and SVC dump for information about prior errors during LOG READ processing.

If you cannot solve the problem, contact your IBM support center.

**00D10343**

A LOG READ completed unsuccessfully because an error was detected during a READ of a log record due to an invalid CI offset. This is an internal error.

**System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem.

Examine the SYS1.LOGREC, console log and SVC dump for information about prior errors during LOG READ processing.

If you cannot solve the problem, contact your IBM support center.

#### 00D10345

A LOG READ completed unsuccessfully because an error was received from a CATALOG LOCATE request for an archive log data set. The requested archive log data set might have been uncataloged or deleted.

#### System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

#### System programmer response

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem. Examine the SYS1.LOGREC and SVC dump.

#### 00D10348

The maximum retry count was exceeded while attempting to read a log RBA.

#### System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

#### System programmer response

Check the console log for related errors. This problem might occur if the user has specified an archive or active log data set to the BSDS with an incorrect RBA range.

If you cannot solve the problem, contact your IBM support center.

#### 00D10354

A LOG READ request completed successfully but the length of the log record header was not as expected. This is an internal error.

#### System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

#### System programmer response

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem.

Examine the SYS1.LOGREC, console log, and SVC dump for information about prior errors during LOG READ processing.

If you are unable to solve the problem, contact your IBM support center.

#### 00D10406

The bootstrap data set access service received a request with an invalid function code.

#### System action

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

#### System programmer response

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem. If you cannot solve the problem, contact your IBM support center.

**00D10410**

An unsuccessful completion of a READ BSDS RECORD has occurred. An error has been returned from VSAM.

**System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**System programmer response**

Check the console log for return codes from VSAM.

If you are unable to resolve the problem, note these values, collect the items listed in "Diagnostics" on page 4864, and contact your IBM support center.

**00D10411**

An unsuccessful completion of a WRITE UPDATE BSDS RECORD has occurred. An error has been returned from VSAM.

**System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**System programmer response**

Check the console log for return codes from VSAM.

If you are unable to resolve the problem, note these values, collect the items listed in "Diagnostics" on page 4864, and contact your IBM support center.

**00D10412**

An unsuccessful completion of a WRITE INSERT BSDS RECORD has occurred. An error has been returned from VSAM.

**System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**System programmer response**

Check the console log for return codes from VSAM.

If you are unable to resolve the problem, note these values, collect the items listed in "Diagnostics" on page 4864, and contact your IBM support center.

**00D10413**

An unsuccessful completion of a DELETE BSDS RECORD has occurred. An error has been returned from VSAM.

**System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**System programmer response**

Check the console log for return codes from VSAM.

If you are unable to resolve the problem, note these values, collect the items listed in "Diagnostics" on page 4864, and contact your IBM support center.

**00D10419**

An error was returned from the z/OS GETDSAB service.

**System action**

The current utility terminates abnormally.

**System programmer response**

Contact your IBM support center.

**00D1041A**

An error was returned from the z/OS SWAREQ service.

**System action**

The current utility terminates abnormally.

**System programmer response**

Contact your IBM support center.

**00D1041B**

The Db2 subsystem that a utility has connected to does not meet the minimum system requirements for this version of IBM MQ for z/OS.

**System action**

The current utility terminates abnormally.

**System programmer response**

Ensure that the Db2 data-sharing group name, and subsystem ID provided in the parameters to the utility are correct, and that the Db2 subsystem meets the system requirements for this version of IBM MQ for z/OS.

See IBM MQ prerequisites for a link to the IBM MQ for z/OS requirements web page.

**00D10700**

An error completion code was returned by SETLOCK OBTAIN.

**System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem. In the dump, register 0 contains the return code from SETLOCK OBTAIN.

**00D10701**

An error completion code was returned by SETLOCK RELEASE.

**System action**

An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4864 useful in resolving the problem. In the dump, register 0 contains the return code from SETLOCK RELEASE.

## Lock manager codes (X'D3):

If a lock manager reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

### Diagnostics

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- If you are using CICS, the CICS transaction dump output.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.

#### 00D301F1

An attempt to obtain storage was unsuccessful. This is probably because there is insufficient storage in your region.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Check that you are running in a region that is large enough. If not, reset your system and restart the queue manager. If this is not the cause of the problem, collect the items listed in "Diagnostics" and contact your IBM support center.

#### 00D301F2

An attempt to obtain storage was unsuccessful. This is probably because there is insufficient storage in your region.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Check that you are running in a region that is large enough. If not, reset your system and restart the queue manager. If this is not the cause of the problem, collect the items listed in "Diagnostics" and contact your IBM support center.

#### 00D301F3

An attempt to obtain storage was unsuccessful. This is probably because there is insufficient storage in your region.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Check that you are running in a region that is large enough. If not, reset your system and restart the queue manager. If this is not the cause of the problem, collect the items listed in "Diagnostics" and contact your IBM support center.

#### 00D301F4

An attempt to obtain storage was unsuccessful. This is probably because there is insufficient storage in your region.

#### System action

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Check that you are running in a region that is large enough. If not, reset your system and restart the queue manager. If this is not the cause of the problem, collect the items listed in "Diagnostics" on page 4885 and contact your IBM support center.

**00D301F5**

An attempt to obtain storage was unsuccessful. This is probably because there is insufficient storage in your region.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Check that you are running in a region that is large enough. If not, reset your system and restart the queue manager. If this is not the cause of the problem, collect the items listed in "Diagnostics" on page 4885 and contact your IBM support center.

**00D302F1, 00D302F2, 00D302F3, 00D302F4, 00D302F5, 00D303F1, 00D303F2, 00D303F3, 00D304F1, 00D305F1, 00D306F1**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4885 and contact your IBM support center.

**00D31094, 00D31095, 00D31096, 00D31097**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4885 and contact your IBM support center.

## **Message manager codes (X'D4'):**

If a message manager reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

### **Diagnostics**

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- If you are using CICS, the CICS transaction dump output.
- Appropriate IBM MQ, z/OS, Db2, CICS, and IMS service levels.
- If you are using the IBM MQ Operations and Control panels, the ISPF panel name.

### **00D40001, 00D40002**

An internal error has occurred while processing a command.

### **System action**

The current execution unit terminates with completion code X'5C6'.

### **System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

### **00D40003, 00D40004, 00D40007**

An internal error has occurred while processing a DEFINE or ALTER command for a queue.

### **System action**

The current execution unit terminates with completion code X'5C6'.

### **System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

### **00D40008**

An internal error has occurred while processing a DEFINE or ALTER command for a process.

### **System action**

The current execution unit terminates with completion code X'5C6'.

### **System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

### **00D40009**

An internal error has occurred while processing a DEFINE or ALTER command for a queue.

### **System action**

The current execution unit terminates with completion code X'5C6'.

### **System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

### **00D4000A, 00D4000B, 00D4000C**

An internal error has occurred while processing a command.

### **System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D4000D**

An internal error has occurred while attempting to establish a processing environment for the command processors.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D4000E, 00D4000F**

An internal error has occurred while attempting to establish a processing environment.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D40010**

An internal error has occurred while processing a command.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D40011, 00D40012, 00D40013, 00D40014**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D40015**

An attempt to write a trigger message to the initiation queue or the dead-letter queue was unsuccessful because of an internal error (for example, a storage overwrite).

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D40016, 00D40017, 00D40018, 00D4001A, 00D4001B, 00D4001C, 00D4001D, 00D4001E, 00D4001F**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

00D40020, 00D40021, 00D40022, 00D40023, 00D40024, 00D40025

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

00D40026

An internal error has occurred while processing a DEFINE CHANNEL or ALTER command for a channel.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

00D40027, 00D40028, 00D40029, 00D4002A, 00D4002B, 00D4002C

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

00D4002D

An attempt to write a message to a queue was unsuccessful because of an internal error (for example, a storage overwrite).

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

00D4002E

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

00D4002F

An internal error has occurred while processing a channel command.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D40030**

The report option requested in a message was not recognized.

**System action**

The current execution unit terminates with completion code X'5C6'. A dump is produced.

**System programmer response**

Correct the value of the report option field (the value specified is given in register 2).

**00D40031, 00D40032**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D40033**

An internal error has occurred while processing a STGCLASS command.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D40034, 00D40035, 00D40036, 00D40037, 00D40038, 00D40039**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D4003B**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887. Also collect details of the queue-sharing group (QSG) and of the queue managers active, as well as the queue managers defined to the QSG at the time of the error. This information can be obtained by entering the following z/OS commands:

D XCF,GRP

to display a list of all QSGs in the coupling facility.

D XCF,GRP,qsg-name,ALL

to display status about the queue managers defined to QSG qsg-name. Contact your IBM support center.

**00D4003C, 00D4003D**

An internal error has occurred while processing a DEFINE CFSTRUCT or ALTER CFSTRUCT or DELETE CFSTRUCT command.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D4003E**

An internal error has occurred while processing an AUTHINFO command.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D4003F**

An internal error has occurred while processing a DEFINE MAXSMSGS or ALTER QMGR command.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D40040**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D40042**

An internal processing error has occurred. The repository cannot locate an object that it has been asked to release.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D40043, 00D40044, 00D40045, 00D40046, 00D40047, 00D40048**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D40049**

An internal processing error has occurred while attempting to create the queue manager object during end restart processing.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D40050**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'. The IGQ agent then attempts to recover.

**System programmer response**

If the IGQ agent fails to recover properly, an attempt could be made to disable the SYSTEM.QSG.TRANSMIT.QUEUE to force the IGQ agent to enter retry, or if this fails, the IGQ agent task can be restarted by issuing an ALTER QMGR IGQ(ENABLED) command or by restarting the queue manager.

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D40051, 00D40052**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

**00D40053**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 together with a dump of the coupling facility list structure that the shared queue is defined to use, and contact your IBM support center.

**00D40054**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887. Also collect details of the queue-sharing group (QSG) and of the queue managers active, as well as the queue managers defined to the QSG at the time of the error. This information can be obtained by entering the following z/OS commands:

```
D XCF,GRP
```

to display a list of all QSGs in the coupling facility.

```
D XCF,GRP,qsg-name,ALL
```

to display status about the queue managers defined to QSG qsg-name. Contact your IBM support center.

#### **00D40055, 00D40056**

An internal error has occurred.

#### **System action**

The current execution unit terminates with completion code X'5C6'.

#### **System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

#### **00D40060**

While performing Shared Channel Recovery Processing, Db2 was found to be inactive.

#### **System action**

The current execution unit terminates with completion code X'5C6'.

#### **System programmer response**

Check why Db2 related tasks are unavailable.

The recovery process is terminated; some channels might have been recovered, while others have not. Any channels that were not recovered will be recovered when the recovery process next runs; alternatively, they can be restarted manually. For more information about recovery and restart mechanisms used by IBM MQ, see Recovery and restart.

#### **00D40062, 00D40064, 00D40065, 00D40066**

An internal error has occurred during shared channel recovery.

#### **System action**

The current execution unit terminates with completion code X'5C6'.

#### **System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

The recovery process is terminated; some channels may have been recovered, while others have not. Any channels that were not recovered will be recovered when the recovery process next runs; alternatively, they can be restarted manually. For more information about recovery and restart mechanisms used by IBM MQ, see Recovery and restart.

#### **00D40067**

An internal error has occurred.

#### **System action**

The current execution unit terminates with completion code X'5C6'.

#### **System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

#### 00D40068

An internal error has occurred.

#### System action

The current execution unit terminates with completion code X'5C6'. In some cases, the queue manager might terminate with completion code X'6C6'.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

Restart the queue manager if necessary.

#### 00D40069

An internal error has occurred.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4887. Also collect details of the queue-sharing group (QSG) and of the queue managers active, as well as the queue managers defined to the QSG at the time of the error. This information can be obtained by entering the following z/OS commands:

```
D XCF,GRP
```

to display a list of all QSGs in the coupling facility.

```
D XCF,GRP,qsg-name,ALL
```

to display status about the queue managers defined to QSG qsg-name. Contact your IBM support center.

#### 00D40070

An internal error has occurred involving the cluster cache.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4887 and the channel initiator job log, and contact your IBM support center.

00D40071, 00D40072, 00D40073, 00D40074, 00D40075, 00D40076, 00D40077, 00D40078, 00D40079,  
00D4007A, 00D4007B, 00D4007C, 00D4007D, 00D4007E, 00D4007F

An internal error has occurred.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

Restart the queue manager if necessary.

#### 00D40080

An internal error has occurred involving the cluster cache.

#### System action

4894 IBM MQ: Reference

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and the channel initiator job log, and contact your IBM support center.

**00D40081**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.  
Restart the queue manager if necessary.

**00D40082**

An internal error has occurred involving the cluster cache.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and the channel initiator job log, and contact your IBM support center.

**00D40083**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.  
Restart the queue manager if necessary.

**00D40084**

An internal error has occurred when opening a managed destination queue.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.  
Restart the queue manager if necessary.

**00D40085**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

Restart the queue manager if necessary.

#### 00D40086, 00D40087

An internal error has occurred while processing a DEFINE or ALTER command for a subscription.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

#### 00D40091

An internal error has occurred.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

Restart the queue manager if necessary.

#### 00D4009C

An internal error has occurred while processing an ALTER SMDS or RESET SMDS command.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

#### 00D4009D

An internal error has occurred while processing a START SMDSCONN or STOP SMDSCONN command.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

#### 00D400B1

While putting a message, an error was detected in the chaining of message headers.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Check the chaining fields (**CodedCharSetId**, **Encoding**, and **Format**) in the MQMD and headers for the problem message to determine which values are invalid or inconsistent.

At each point in the header chain, the field values must correctly describe the data in the next header:

- The **Format** field identifies the correct format of the next header
- The **CodedCharSetId** field identifies the character set of text fields in the next header
- The **Encoding** field identifies the numeric encoding of numeric fields in the next header

#### 00D401F1

Whilst processing a get message request, the specified search type (message identifier or correl identifier) was found to be in error. This indicates a data corruption error.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

#### 00D44001

This reason code is issued in message CSQM090E when a command has failed. This code indicates that an object of the specified name exists, but is of a different subtype; it might not necessarily have the same disposition in the queue-sharing group. This can only occur with subtypes of queues or channels. Message CSQM099I is also issued, indicating the object in error.

#### Severity

8

#### System action

The command is ignored.

#### System programmer response

Reissue the command, ensuring that all object subtypes are correct.

#### 00D44002

This reason code is issued in message CSQM090E when a command has failed. This code indicates that the object specified on the request could not be located. Message CSQM094I or message CSQM125I is also issued, indicating the object in error.

It is also issued in message CSQM086E, indicating that the queue manager object could not be located.

#### Severity

8

#### System action

For CSQM090E, the command is ignored. For CSQM086E, the queue manager fails to restart.

#### System programmer response

If you are using a queue-sharing group, check that Db2 is available and not suspended. Define the object in question. For the queue manager, reissue the START QMGR command to restart the queue manager.

**Note:** An object of the same name and type, but of a different disposition, might already exist. If you are dealing with a queue or channel object, an object of the same name, but of a different subtype, might already exist.

#### 00D44003

This reason code is issued in message CSQM090E when a command has failed. This code indicates that the object specified on the request already exists. This will only arise when trying to define a new object. Message CSQM095I is also issued.

#### Severity

8

**System action**

The command is ignored.

**System programmer response**

Use the object in question.

**00D44004**

This reason code is issued in message CSQM090E when a command has failed. This code indicates that one or more of the keywords on the command failed the parameter validation rules that apply to them. One or more other more specific messages are also issued, indicating the reason for the validation failure.

**Severity**

8

**System action**

The command is ignored.

**System programmer response**

Refer to the more specific associated message to determine what the error is.

**00D44005**

This reason code is issued in message CSQM090E when a command has failed. This code indicates that one of the following situations has occurred:

- The object specified on the request is currently open. This typically happens when an object is in use through the API or a trigger message is being written to it, but it could also arise because the object specified is in the process of being deleted. For a local queue, it can occur because there are messages currently on the queue. Message CSQM101I or CSQM115I is also issued.
- A request has been issued for a local queue, but this queue has incomplete units of recovery outstanding for it. Message CSQM110I is also issued.
- An alter, delete, or define request was made against a storage class that is in use (that is, there is a queue defined as using the storage class, and there are messages currently on the queue. Message CSQM101I is also issued.
- An ALTER CFSTRUCT command was issued and an associated shared queue has messages or uncommitted message activity.

**Severity**

8

**System action**

The command is ignored.

**System programmer response**

Refer to the description of message CSQM101I, CSQM110I, or CSQM115I as appropriate.

**00D44006**

This reason code is issued in message CSQM090E when a command has failed. This code indicates that a request has been issued to delete a local queue. The PURGE option has not been specified, but there are messages on the queue. Message CSQM103I is also issued.

**Severity**

8

**System action**

The command is ignored.

**System programmer response**

If the local queue must be deleted, even though there are messages on it, reissue the command with the PURGE option.

**00D44007**

This reason code is issued in message CSQM090E when a command has failed. This code indicates that a request has been issued for a local queue that is dynamic, but this queue has been flagged for deletion. Message CSQM104I is also issued.

**Severity**

8

**System action**

The command is ignored.

**System programmer response**

None, the local queue will be deleted as soon as possible.

**00D44008**

This reason code is issued in message CSQM090E when a command has failed. This code indicates that the object specified on the request needs updating because the IBM MQ version has changed, but that this cannot be done because the object is currently open. Message CSQM101I is also issued.

**Severity**

8

**System action**

The command is ignored.

**System programmer response**

Wait until the object is closed and reissue the command.

**00D44009**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM112E or message CSQM117E indicating the object in error. It is also issued in message CSQM086E during queue manager restart.

This code indicates that a request has been issued for an object, but the object information could not be accessed because of an error on page set zero.

**Severity**

8

**System action**

The command is ignored or the queue manager fails to restart.

**System programmer response**

Check for error messages on the console log that might relate to the problem. Verify that page set zero is set up correctly; refer to Managing page sets for information about this.

**00D4400A**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM113E indicating the object in error. It is also issued in message CSQM086E during queue manager restart. This code indicates that a request has been issued for an object, but page set zero is full.

**Severity**

8

**System action**

The command is ignored or the queue manager fails to restart.

**System programmer response**

Increase the size of page set zero. Refer to Managing page sets for information about how to do this.

**00D4400B**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM114E. This code indicates that a request has been issued for a local queue, but no more local queues could be defined. There is an implementation limit of 524 287 for the total number of local queues that can exist. For shared queues, there is a limit of 512 queues in a single coupling facility structure, and 512 structures altogether.

For the indexes used by shared queues (OBJ\_QUEUE\_IX1 and OBJ\_QUEUE\_IX2), 48 KB of space allocation is sufficient for 512 queues.

**Severity**

4

**System action**

The command is ignored.

**System programmer response**

Delete any existing queues that are no longer required.

**00D4400C**

This reason code is issued in message CSQM090E when a command has failed. It indicates that the command is not allowed for a particular subtype of an object, as shown in the accompanying more specific message.

**Severity**

4

**System action**

The command is ignored.

**System programmer response**

Reissue the command with the object name specified correctly.

**00D4400D**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM127I. This code indicates that a request was issued specifying a namelist as a list of cluster names, but there are no names in the namelist.

**Severity**

8

**System action**

The command is ignored.

**System programmer response**

Specify a namelist that is not empty.

**00D4400E**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM112E or message CSQM117E indicating the object in error. It is also issued in message CSQM086E during queue manager restart. This code indicates that a request has been issued for an object, but that a page set that it requires is not defined.

**Severity**

8

**System action**

The command is ignored or the queue manager fails to restart.

**System programmer response**

Ensure that the necessary page set is defined in the initialization input data set CSQINP1, and has a DD statement in the queue manager started task JCL procedure. Restart the queue manager.

**00D4400F**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM112E or message CSQM117E indicating the object in error. It is also issued in message CSQM086E during queue manager restart. This code indicates that a request has been issued for an object, but that a page set that it requires is not open.

**Severity**

8

**System action**

The command is ignored or the queue manager fails to restart.

**System programmer response**

Ensure that the necessary page set is defined in the initialization input data set CSQINP1, and has a DD statement in the queue manager started task JCL procedure. Restart the queue manager.

**00D44010**

This reason code is issued in message CSQM090E when a command has failed. This code indicates that a request was issued to change the default transmission queue for the queue manager, but the queue is already in use.

**Severity**

8

**System action**

The command is ignored.

**System programmer response**

Wait until the queue is no longer in use, or choose another queue.

**00D44011**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM128E. This code indicates that a request was issued that required a message to be sent to a command queue, but the message could not be put.

**Severity**

8

**System action**

The command is ignored.

**System programmer response**

Resolve the problem with the command queue.

**00D44013**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM160I indicating the object in error.

**Severity**

8

**System action**

The command is ignored.

**System programmer response**

See message CSQM160I for more information.

**00D44014**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM161I.

**Severity**

8

**System action**

The command is ignored.

**System programmer response**

See message CSQM161I for more information.

**00D44015**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM164I indicating the object in error.

**Severity**

8

**System action**

The command is ignored.

**System programmer response**

See message CSQM164I for more information.

**00D44016**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM163I indicating the object in error.

**Severity**

8

**System action**

The command stops processing.

**System programmer response**

See message CSQM163I for more information.

**00D44017**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM112E or message CSQM117E indicating the object in error. It is also issued in message CSQM086E during queue manager restart.

This code indicates that a request has been issued for an object, but the object information could not be accessed because coupling facility structure has failed.

**Severity**

8

**System action**

The command is ignored or the queue manager fails to restart.

**System programmer response**

Check for error messages on the console log that might relate to the problem. Use the RECOVER CFSTRUCT command to recover the coupling facility structure.

**00D44018**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM112E or message CSQM117E indicating the object in error. It is also issued in message CSQM086E during queue manager restart.

This code indicates that a request has been issued for an object, but the object information could not be accessed because there is an error or inconsistency in the coupling facility information.

**Severity**

8

**System action**

The command is ignored or the queue manager fails to restart.

**System programmer response**

Check for error messages on the console log that might relate to the problem. Check that Db2 is available and not suspended. If the problem persists, it may be necessary to restart the queue manager.

**00D44019**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM112E or message CSQM117E indicating the object in error. It is also issued in message CSQM086E during queue manager restart.

This code indicates that a request has been issued for an object, but the object information could not be accessed because Db2 is not available or is suspended.

**Severity**

8

**System action**

The command is ignored or the queue manager fails to restart.

**System programmer response**

Check for error messages on the console log that might relate to the problem. Check that Db2 is available and not suspended.

#### **00D44023**

This reason code is issued in message CSQM090E and is accompanied by message CSQM117E when a command cannot be executed because a CF structure is not available.

#### **System action**

The command is ignored.

#### **System programmer response**

See reason code MQRC\_CF\_STRUC\_IN\_USE (2346, X'092A') for more information.

#### **00D4001B**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM182E.

#### **Severity**

8

#### **System action**

The command is ignored.

#### **System programmer response**

See message CSQM182E for more information.

#### **00D4001C**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM183E.

#### **Severity**

8

#### **System action**

The command is ignored.

#### **System programmer response**

See message CSQM183E for more information.

#### **00D4001D**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM185E.

#### **Severity**

8

#### **System action**

The command is ignored.

#### **System programmer response**

See message CSQM185E for more information.

#### **00D4001E**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM186E.

**Severity**

8

**System action**

The command is ignored.

**System programmer response**

See message CSQM186E for more information.

**00D4401F**

This reason code is issued in message CSQM090E when a command has failed, and is accompanied by message CSQM190E.

**Severity**

8

**System action**

The command is ignored.

**System programmer response**

See message CSQM190E for more information.

**00D44020**

This reason code is issued in message CSQM090E when a PUBSUB command cannot be executed because PUBSUB is disabled.

**System action**

The command is ignored.

**System programmer response**

See message CSQM292I for more information.

**00D4F001**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4887 and contact your IBM support center.

## Command server codes (X'D5'):

If a command server reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

### Diagnostics

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.
- Any trace information collected.
- If message CSQN104I or CSQN202I was issued, return and reason codes from the message.

### 00D50101

During initialization, the command server was unable to obtain storage. This is probably because there is insufficient storage in your region.

### System action

Message CSQN104I is sent to the console containing this reason code and the return code from the internal storage macro. None of the commands in the initialization data set currently being processed are performed. Queue manager startup continues.

**Note:** If there is a storage problem, startup might not be successful.

### System programmer response

Check that you are running in a region that is large enough, and if not, reset your system and restart the queue manager. If this is not the cause of the problem, collect the following items and contact your IBM support center:

- Return and reason codes from CSQN104I message
- Trace of startup (if available)

### 00D50102

The command preprocessor ended abnormally while processing a command in the initialization input data set.

### System action

Message CSQ9029E is produced, followed by message CSQN103I with this code as the return code, and a reason code of -1 indicating that the command was not processed, and a dump is produced. The next command is processed.

### System programmer response

Look in the output data set to determine the command in error. Check that the command is correctly formed, that it applies to a valid object.

If the command is correct, collect the items listed in "Diagnostics" and contact your IBM support center.

### 00D50103

During initialization, an internal error occurred.

### System action

Message CSQN104I is sent to the z/OS console, indicating the return and reason codes from the internal macro. The command server stops, without processing any commands.

**System programmer response**

Review the job log for messages about other errors that might be related. If you are unable to solve the problem, collect the items listed in "Diagnostics" on page 4906, and contact your IBM support center.

**00D50104**

An internal error occurred during initialization.

**System action**

Message CSQN104I is sent to the z/OS console, indicating the return and reason codes from the internal macro. The command server stops, without processing any commands.

**System programmer response**

Stop and restart the queue manager.

Collect the items listed in "Diagnostics" on page 4906 and contact your IBM support center.

**00D50105**

An internal error has occurred.

**System action**

The command server terminates, and a dump is produced.

**System programmer response**

Stop and restart the queue manager.

Collect the items listed in "Diagnostics" on page 4906 and contact your IBM support center.

**00D50201**

The command server was unable to obtain storage while starting. This return code typically occurs because there is insufficient storage in your region.

**System action**

Message CSQN202I is sent to the z/OS console, indicating the return code from the internal storage macro. The command server stops, without processing any commands.

**System programmer response**

Check that you are running in a region that is large enough, and if not, reset your system and restart the queue manager. If this is not the cause of the problem, collect the items listed in "Diagnostics" on page 4906 and contact your IBM support center.

**00D50202**

An internal error has occurred.

**System action**

Message CSQN202I is sent to the z/OS console, indicating the return code from the internal macro. The command server stops, without processing any commands.

**System programmer response**

Review the job log for messages about other errors that might be related. If you are unable to solve the problem, collect the items listed in "Diagnostics" on page 4906 and contact your IBM support center.

**00D50203**

An internal error has occurred.

**System action**

Message CSQN202I is sent to the z/OS console, indicating the return code from the internal macro. The command server stops, without processing any commands.

**System programmer response**

Issue the START CMDSERV command to restart the command server.

Collect the items listed in "Diagnostics" on page 4906 and contact your IBM support center.

**00D50208**

The command server was unable to obtain storage during startup.

**System action**

Message CSQN202I is sent to the z/OS console, indicating the return code from the internal macro. The command server stops, without processing any commands.

**System programmer response**

Check that you are running in a region that is large enough, and if not, reset your system and restart the queue manager. If this is not the cause of the problem, collect the items listed in "Diagnostics" on page 4906 and contact your IBM support center.

**00D50209**

The command preprocessor ended abnormally while processing a command from the command server.

**System action**

Message CSQN205I is put onto the reply-to queue with COUNT=1, RETURN=00D50209, and REASON=-1 indicating that the command has not been processed. The command server processes the next command.

**System programmer response**

Check that the command is correctly formed, that it applies to a valid object.

If the command is correct, collect the items listed in "Diagnostics" on page 4906 and contact your IBM support center.

**00D5020C**

While waiting for a command, the command server did not recognize the reason for the end of the wait. This is because it was not one of the following:

- The arrival of a message
- The STOP CMDSERV command

**System action**

Messages CSQN203I and CSQN206I are sent to the console, containing the return and reason codes from the request function, and the ECB list.

The command server is terminated and a dump is produced.

**System programmer response**

Issue the START CMDSERV command to restart the command server.

Collect the items listed in "Diagnostics" on page 4906 and contact your IBM support center.

**00D5020E**

The command processor attempted to get a command from the system-command-input queue, but the attempt was unsuccessful because of an internal error.

**System action**

The command server continues processing. Message CSQN203I is written to the console containing the return and reason codes from the API call.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4906 and contact your IBM support center.

**00D5020F**

The command processor got a command from the system-command-input queue, but was unable to process it because the message was not of type MQMT\_REQUEST.

**System action**

The command processor processes the next command message.

**00D50210**

The command processor got a command from the system-command-input queue, but was unable to process it because the command message was of length zero.

**System action**

The command processor processes the next command message.

**00D50211**

The command processor got a command from the system-command-input queue, but was unable to process it because the command message consisted of blank characters only.

**System action**

The command processor processes the next command message.

**00D50212**

The command processor got a command from the system-command-input queue, but was unable to process it because the command message was greater than 32 762 characters long.

**System action**

The command processor processes the next command message.

**00D54000**

An internal error has occurred.

**System action**

The command server is terminated and a dump is produced.

**System programmer response**

Issue the START CMDSERV command to restart the command server.

Collect the items listed in "Diagnostics" on page 4906 and contact your IBM support center.

**00D54nnn**

The command processor got a command from the system-command-input queue, but was unable to process it because the command message indicated that data conversion was required and an error occurred during conversion. *nnn* is the reason code (in hexadecimal) returned by the MQGET call.

**System action**

The command processor processes the next command message.

### **System programmer response**

Refer to API completion and reason codes for information about the reason code *nnn*.

### **Buffer manager codes (X'D7'):**

If a buffer manager reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

### **Diagnostics**

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The WebSphere MQ active log data set.
- The system dump resulting from the error.
- If you are using CICS, the CICS transaction dump output.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.

### **00D70101**

An attempt to obtain storage for a buffer manager control block (the PANC) was unsuccessful. This is probably because there is insufficient storage in your region.

### **System action**

The queue manager is terminated, an entry is written to SYS1.LOGREC, and a dump is produced. Registers 2 and 0 contain the return and reason codes from the STORAGE or GETMAIN request.

### **System programmer response**

Check that you are running in a region that is large enough, and if not, reset your system and restart the queue manager. If this does not resolve the problem, note the register values, and contact your IBM support center.

### **00D70102**

The name of the queue manager being restarted does not match the name recorded in a prior checkpoint log record.

### **System action**

The queue manager is terminated, an entry is written to SYS1.LOGREC, and a dump is produced. This is preceded by message CSQP006I. Register 0 contains the name found in the log record. Register 2 contains the name of the queue manager being restarted.

### **System programmer response**

Change the started task JCL procedure xxxxMSTR for the queue manager to name the appropriate bootstrap and log data sets.

The print log utility, CSQ1LOGP, can be used to view checkpoint records. You might also find the MQ active log data set useful for problem determination.

### **00D70103**

An attempt to obtain storage for a buffer manager control block (a PSET) was unsuccessful.

### **System action**

The queue manager is terminated, an entry is written to SYS1.LOGREC, and a dump is produced. Registers 2 and 0 contain the return and reason codes from the STORAGE or GETMAIN request.

**System programmer response**

Restart the queue manager.

Note the register values, and contact your IBM support center.

**00D70104**

An attempt to obtain storage for a buffer manager control block (a BHDR) was unsuccessful.

**System action**

The queue manager is terminated, an entry is written to SYS1.LOGREC, and a dump is produced. Registers 2 and 0 contain the return and reason codes from the STORAGE or GETMAIN request.

**System programmer response**

Restart the queue manager.

Note the register values, and contact your IBM support center.

**00D70105**

An internal error has occurred during dynamic page set expansion.

**System action**

The current page set extend task is terminated, an entry is written to SYS1.LOGREC, and a dump is produced. No further attempt will be made to expand the page set until the queue manager is restarted. Subsequent dynamic page set extend requests for other page sets are processed.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4910 and contact your IBM support center.

**00D70106**

An internal error has occurred.

**System action**

An entry is written to SYS1.LOGREC, and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4910 and contact your IBM support center.

**00D70108**

An attempt to obtain storage for the buffer pool was unsuccessful.

**System action**

The queue manager is terminated, an entry is written to SYS1.LOGREC, and a dump is produced. Register 2 contains the return code from the STORAGE, GETMAIN or IARV64 GETSTOR request. Register 3 contains the buffer pool number.

**System programmer response**

Provide sufficient storage for the number of buffers specified in the DEFINE BUFFPOOL command.

If the buffer pool is backed by page fixed storage, that is it has a PAGECLAS of FIXED4KB, check that there is enough real storage available on the system. For more information, see Address space storage.

If it is not possible to rectify the problem:

- Alter the definition of the buffer pool in the CSQINP1 data set, to include the REPLACE attribute, and specify a smaller number of buffers, or
- Change the PAGECLAS attribute to 4KB.

#### 00D7010A

An internal storage error has occurred.

#### System action

The queue manager is terminated, an entry is written to SYS1.LOGREC, and a dump is produced. Registers 2 and 3 contain the return and reason codes from the IARV64 GETSTOR request. Register 4 contains the buffer pool number.

#### System programmer response

Increase the value of the MEMLIMIT parameter.

#### 00D70112

A critical process could not be started during queue manager initialization. This could be because there is insufficient storage in your region.

#### System action

The queue manager is terminated, an entry is written to SYS1.LOGREC, and a dump is produced. Register 0 contains the reason code for the error.

#### System programmer response

Check that you are running in a region that is large enough. If not, reset your system and restart the queue manager. If this does not resolve the problem, note the completion code and the reason code and contact your IBM support center.

#### 00D70113

A critical process could not be started during queue manager initialization. This could be because there is insufficient storage in your region.

#### System action

The queue manager is terminated, an entry is written to SYS1.LOGREC, and a dump is produced. Register 0 contains the reason code for the error.

#### System programmer response

Check that you are running in a region that is large enough. If not, reset your system and restart the queue manager. If this does not resolve the problem, note the completion code and the reason code and contact your IBM support center.

#### 00D70114

An internal cross-component consistency check failed.

#### System action

The request is terminated, an entry is written to SYS1.LOGREC, and a dump is produced. Register 0 contains the value in error.

#### System programmer response

Note the completion code and the reason code, collect the MQ active log data set, and contact your IBM support center.

#### 00D70116

An I/O error has occurred.

#### System action

An entry is written to SYS1.LOGREC, and a dump is produced. Register 0 contains the Media Manager reason code from an MMCALL call. In some circumstances, the queue manager will terminate. (This depends on the nature of the error, and the page set on which the error occurred.)

**System programmer response**

Restart the queue manager if necessary.

See the *MVS/DFP Diagnosis Reference* manual for information about return codes from the Media Manager. If you do not have access to the required manual, contact your IBM support center, quoting the Media Manager reason code.

You might also find the MQ active log data set useful for problem determination.

**00D70118**

A page was about to be written to a page set, but was found to have improper format. The executing thread is terminated. (If this is the deferred write processor, the queue manager is terminated)

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Restart the queue manager. If the problem persists collect the items listed in "Diagnostics" on page 4910 and contact your IBM support center.

**00D70120**

No buffers are available to steal. An executing thread needed a buffer in a buffer pool to bring a page in from the page set. The buffer pool is overcommitted, and despite attempts to make more buffers available, including writing pages to the page set, no buffers could be released.

**System action**

The current execution unit terminates with completion code X'5C6'. The API request is terminated with reason code MQRC\_UNEXPECTED\_ERROR, with the aim of reducing demand for the buffer pool.

**System programmer response**

Determine the problem buffer pool from preceding CSQP019I and CSQP020E messages. Review the size of the buffer pool with the DISPLAY USAGE command. Consider increasing the size of the buffer pool using the ALTER BUFFPOOL command.

**00D70122**

An unrecoverable error has occurred during check point.

**System action**

The queue manager is terminated, an entry is written to SYS1.LOGREC, and a dump is produced. Register 0 contains the reason code for the error.

**System programmer response**

Restart the queue manager.

Note the completion code and the reason code, collect the MQ active log data set, and contact your IBM support center.

**00D70133**

An internal consistency check failed.

**System action**

The request is terminated, an entry is written to SYS1.LOGREC, and a dump is produced.

**System programmer response**

Note the completion code and the reason code, collect the MQ active log data set, and contact your IBM support center.

**00D70136**

A critical process could not be started during queue manager initialization. This could be because there is insufficient storage in your region.

**System action**

The queue manager is terminated, an entry is written to SYS1.LOGREC, and a dump is produced. Register 0 contains the reason code for the error.

**System programmer response**

Check that you are running in a region that is large enough. If not, reset your system and restart the queue manager. If this does not resolve the problem, note the completion code and the reason code and contact your IBM support center.

**00D70137**

A critical process could not be started during queue manager initialization. This could be because there is insufficient storage in your region.

**System action**

The queue manager is terminated, an entry is written to SYS1.LOGREC, and a dump is produced. Register 0 contains the reason code for the error.

**System programmer response**

Check that you are running in a region that is large enough. If not, reset your system and restart the queue manager. If this does not resolve the problem, note the completion code and the reason code and contact your IBM support center.

**00D70139**

An attempt to allocate 64 bit storage for internal use failed.

**System action**

The queue manager is terminated.

**System programmer response**

Raise the value of the MEMLIMIT parameter. For more information, see Address space storage.

**00D7013A**

An attempt to allocate storage for internal use failed. Register 2 contains the return code from the STORAGE request.

**System action**

The queue manager is terminated.

**System programmer response**

Provide sufficient storage. For more information, see Address space storage.

**00D7013B**

An internal consistency check failed.

**System action**

The current execution unit terminates with completion code X'5C6'.

### System programmer response

Collect buffer manager problem determination information, and contact your IBM support center.

### Recovery manager codes (X'D9'):

If a recovery manager reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

### Diagnostics

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- A printout of SYS1.LOGREC.
- If you are using CICS, the CICS transaction dump output.
- Appropriate IBM MQ, z/OS, Db2, CICS, and IMS service levels.

### 00D90000

A recovery manager module received control from its FRR for retry and found an invalid retry point identifier. The name of the module in which the error occurred appears in the SYS1.LOGREC entry showing this reason code in register 15.

### System action

Standard diagnostic information is provided. The error is recorded in SYS1.LOGREC, an SVC dump is scheduled, and queue manager termination is requested. The termination reason code reflects the function for which retry was unsuccessfully attempted.

### System programmer response

This is a secondary error. Obtain a copy of SYS1.LOGREC and the SVC dump for this error and for the original problem that resulted in the retry attempt. Examine the SYS1.LOGREC information and the dumps from both the original and the secondary error to determine if the recovery parameter area was damaged or if retry incorrectly restored registers for the mainline module.

Restart the queue manager.

### 00D90002

The recovery manager startup notification routine received an error return code from the recovery log manager when attempting to read a recovery manager status table (RMST) record from the bootstrap data set (BSDS) in one of the following cases:

- When reading the record containing the RMST header. The first copy was successfully read, but the second copy could not be found.
- When reading records containing the RMST entries. A *no record found* condition was encountered before all entries were read.
- When reading either a header record or an entry record. The record exceeded its expected length.

This is an IBM MQ error.

### System action

The recovery manager has no functional recovery routine (FRR) in place when this error occurs. It relies on its invoker, the facility startup function, to perform SYS1.LOGREC recording and to request a dump. The queue manager terminates with a X'00E80100' reason code.

**System programmer response**

The queue manager determined that the BSDS that it was reading has been corrupted. If you are running in a dual BSDS environment, determine which BSDS is corrupt, and follow the procedures described in Recovering the BSDS to recover it from the valid BSDS.

Similarly, if you are running in a single BSDS environment, refer to Recovering the BSDS, which describes the procedures needed to recover your BSDS from an archived BSDS.

**00D92001**

The checkpoint/restart serial controller FRR invoked queue manager termination, because an unrecoverable error was detected while processing a request.

This is a queue manager termination reason code.

**System action**

Queue manager termination is initiated. Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the associated error.

**System programmer response**

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error, and follow the instructions associated with it.

Restart the queue manager.

**00D92003**

The restart request servicer FRR invoked queue manager termination, because an unrecoverable error was detected while processing a restart request.

This is a queue manager termination reason code.

**System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

**System programmer response**

Obtain a copy of SYS1.LOGREC and the SVC dump for the original error and follow the instructions associated with it.

Restart the queue manager.

**00D92004**

The shutdown checkpoint controller FRR invoked queue manager termination, because an unrecoverable error was detected while processing a shutdown checkpoint request.

This is a queue manager termination reason code.

**System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

**System programmer response**

Obtain a copy of SYS1.LOGREC and the SVC dump for the original error and follow the instructions associated with it.

Restart the queue manager.

**00D92011**

An internal error has occurred.

**System action**

The checkpoint process will end abnormally to prevent a damaged URE from being written out to the log, and the queue manager will be terminated. This is to prevent the loss or incorrect processing of an IBM MQ unit of recovery (UR). Restart will use the previous checkpoint and apply all the IBM MQ log records up to the point of the problem. Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4915 and contact your IBM support center.

**00D92012**

An internal error has occurred.

**System action**

The checkpoint process will end abnormally to prevent a damaged RURE from being written out to the log, and the queue manager will be terminated. This is to prevent the loss or incorrect processing of an IBM MQ unit of recovery. Restart will use the previous checkpoint and apply all the IBM MQ log records up to the point of the problem. Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4915 and contact your IBM support center.

**00D92021**

An internal error has occurred.

**System action**

The restart processing ends abnormally, which terminates the queue manager. This is to prevent the loss or incorrect processing of a IBM MQ unit of recovery.

**System programmer response**

Do not attempt to restart the queue manager until the error is resolved.

The log has become corrupted. If you are running with dual logging, try to start the queue manager from the undamaged log.

If you are unable to do achieve this, use the following procedure (you will lose all updates since your last back up):

1. Restore your page sets from the last set of full backups. The queue manager must have been shut down cleanly before taking the backup copies of the page sets.
2. Clear the logs by following the procedure detailed in Resetting the queue manager's log.

See CSQUTIL utility for information about restarting the queue manager from one log when using dual logging, and using the CSQUTIL utility. If you are unable to resolve the problem, contact your IBM support center.

**00D92022**

An internal error has occurred.

**System action**

The restart processing ends abnormally, which terminates the queue manager. This is to prevent the loss or incorrect processing of a IBM MQ unit of recovery.

**System programmer response**

Do not attempt to restart the queue manager until the error is resolved.

The log has become corrupted. If you are running with dual logging, try to start the queue manager from the undamaged log.

If you are unable to do achieve this, use the following procedure (you will lose all updates since your last back up):

1. Restore your page sets from the last set of full backups. The queue manager must have been shut down cleanly before taking the backup copies of the page sets.
2. Clear the logs by following the procedure detailed in Resetting the queue manager's log.

See CSQUTIL utility for information about restarting the queue manager from one log when using dual logging, and using the CSQUTIL utility. If you are unable to resolve the problem, contact your IBM support center.

#### **00D92023**

During queue manager restart in 6 byte log RBA mode, a log record has been encountered that is written with an 8 byte log RBA.

#### **System action**

The restart processing ends abnormally, which terminates the queue manager. This is to prevent the loss, or incorrect processing, of a IBM MQ unit of recovery.

#### **System programmer response**

Do not attempt to restart the queue manager until the error is resolved.

The queue manager might have been started with an incorrect log or BSDS. Ensure that the queue manager is started with the correct log and BSDS data sets. If this was not the cause of the problem, the log or BSDS has become corrupted.

To recover from a corrupted log or BSDS, if you are running with dual logging or dual BSDS, try to start the queue manager from the undamaged log.

If you are unable to do achieve this, use the following procedure. Note, that by carrying out this procedure, you will lose all updates since your last back up:

1. Restore your page sets from the last set of full backups. The queue manager must have been shut down cleanly before taking the backup copies of the page sets.
2. Clear the logs by following the procedure detailed in Resetting the queue manager's log.

If necessary, when clearing the logs ensure that you convert the BSDS to the previous version, using the BSDS conversion utility CSQJUCNV.

See CSQUTIL utility for information about using the CSQUTIL utility. If you are unable to resolve the problem, contact your IBM support center.

#### **00D93001**

The commit/backout FRR invoked queue manager termination, because an unrecoverable error was detected during 'must-complete' processing for phase 2 of a commit-UR request.

This is a queue manager termination reason code.

#### **System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

#### **System programmer response**

Obtain a copy of SYS1.LOGREC and the SVC dump for the original error and follow the instructions associated with it.

Restart the queue manager.

#### 00D93011

A subcomponent of IBM MQ invoked commit when the agent state was invalid for commit-UR invocation. Commit-UR was requested for an agent that was modifying data. Either commit-UR or backout-UR was already in process, or the recovery structure (URE) was damaged.

#### System action

Abnormal termination of the agent results, including backing out (backout-UR) of its activity to the previous point of consistency. This releases all locks held by the agent for its resources.

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled. Additional information, identified in the SDWA variable recording area (VRA) by reason code X'00D9CCCC', is added to the VRA.

If the agent was in a 'must-complete' state (in-commit or in-backout), the queue manager is also terminated with reason code X'00D93001'. When the queue manager is next restarted, recoverable activity for this agent (such as an ensure-backout or ensure-commit UR) is handled to complete the commit or backout process.

#### System programmer response

This is an IBM MQ error. Examine the SYS1.LOGREC data and the dump to establish whether either commit-UR was invoked incorrectly or the control structure that reflects the state was damaged.

#### 00D93012

A subcomponent of IBM MQ invoked commit when the agent state was invalid for commit-UR invocation. Commit-UR was invoked for an agent that was only retrieving data. Either commit-UR or backout-UR was already in process, or the ACE progress state field was damaged.

#### System action

Abnormal termination of the agent results, including backing out (backout-UR) of its activity to the previous point of consistency. This releases all locks held by the agent for its resources.

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled. Additional information, identified in the SDWA variable recording area (VRA) by reason code X'00D9CCCC', is added to the SDWA VRA.

#### System programmer response

This is an IBM MQ error. Examine the SYS1.LOGREC data and the dump to establish whether either commit-UR was invoked incorrectly or the control structure was damaged.

#### 00D93100

This reason code indicates that an IBM MQ allied agent does not need to participate in the Phase-2 (Continue Commit) call, because all required work has been accomplished during the Phase-1 (Prepare) call.

This reason code is generated by the recovery manager when it is determined that an IBM MQ allied agent has not updated any IBM MQ resource since its last commit processing occurred.

#### System action

The 'yes' vote is registered with the commit coordinator.

#### System programmer response

None should be required because this is not an error reason code. This reason code is used for communication between components of IBM MQ.

#### 00D94001

The commit/backout FRR invoked queue manager termination, because an unrecoverable error was detected during 'must-complete' processing for a backout-UR request.

This is a queue manager termination reason code.

#### **System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

#### **System programmer response**

Obtain a copy of SYS1.LOGREC and the SVC dump for the original error and follow the instructions associated with it.

Restart the queue manager.

#### **00D94011**

A subcomponent of IBM MQ invoked backout at a point when the agent state is invalid for invoking the function that backs out units of recovery. Either backout-UR or commit-UR phase-2 was already in process, or the agent structure was damaged.

#### **System action**

Abnormal termination of the agent results and, because the agent is in a 'must-complete' state, the queue manager is terminated with reason code X'00D94001'. When the queue manager is restarted, recoverable activity for this agent is handled to complete the commit or backout process.

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled. Additional information, identified in the SDWA variable recording area (VRA) by reason code X'00D9AAAA', is added to the SDWA VRA.

#### **System programmer response**

This is an IBM MQ error. Examine the SYS1.LOGREC data and the dump to establish whether commit-UR was invoked incorrectly or the control structure was damaged.

#### **00D94012**

During backout, the end of the log was read before all the expected log ranges had been processed. The error is accompanied by an abnormal termination with reason code X'00D94001'.

This could be because the queue manager has been started with a system parameter load module that specifies OFFLOAD=NO rather than OFFLOAD=YES.

#### **System action**

The agent is abnormally terminated with completion code X'5C6'. Because the agent is in a must-complete state, the queue manager is terminated with reason code X'00D94001' and message CSQV086E.

Standard diagnostic information is recorded in SYS1.LOGREC. and an SVC dump is requested.

#### **System programmer response**

Run the print log map utility to print the content of both BSDSs. Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. At the time of the error, registers 3 and 4 contain the 8-byte relative byte address (RBA) of the beginning of this unit of recovery. IBM MQ must read the log back to this point to complete the backout of this unit of recovery.

To restart the queue manager, you must add the missing archive log data sets back to the BSDS with the change log inventory utility, and increase the MAXARCH parameter in the CSQ6LOGP macro (the system parameter module log initialization macro) to complete the backout.

If the missing archive log is not available, or if archiving was not active, the queue manager cannot be restarted unless the log data sets and page sets are all reinitialized or restored from backup copies. Data will be lost as a result of this recovery action.

#### **00D95001**

The recovery manager's common FRR invoked queue manager termination, because an unrecoverable error was detected during checkpoint processing.

This is a queue manager termination reason code.

#### **System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

#### **System programmer response**

Obtain a copy of SYS1.LOGREC and the SVC dump for the original error and follow the instructions associated with it.

Restart the queue manager.

#### **00D95011**

The recovery manager checkpoint FRR invoked queue manager termination, because an unrecoverable error was detected while performing its checkpoint functions.

This is a queue manager termination reason code.

#### **System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

#### **System programmer response**

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error and follow the instructions associated with it.

Restart the queue manager.

#### **00D96001**

The recovery manager's restart FRR invoked queue manager termination, because an unrecoverable error was detected during the restart processor processing.

This is a queue manager termination reason code.

#### **System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

#### **System programmer response**

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error and follow the instructions associated with it.

Restart the queue manager.

#### **00D96011**

The restart participation FRR invoked queue manager termination, because an unrecoverable error was detected while processing log records during restart.

This is a queue manager termination reason code.

#### **System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

**System programmer response**

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error and follow the instructions associated with it.

Restart the queue manager when the problem has been corrected.

**00D96021**

The queue manager was terminated during restart because an error occurred while attempting to read the log forward MODE(DIRECT). It is accompanied by a recovery log manager error X'5C6' with a reason code describing the specific error.

Each time a portion of the log is skipped, a 'read direct' is used to validate the beginning RBA of the portion that is read.

This is a queue manager termination reason code.

**System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

**System programmer response**

Run the print log map utility to print the contents of both BSDSs. Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. Follow instructions for the accompanying recovery log manager error. If possible, remove the cause of original error and restart the queue manager. If you cannot correct the error, contact your IBM support center.

**00D96022**

The restart FRR invoked abnormal termination, because, while reading the log forward during restart, the end-of-log was read before all recovery log scopes had been processed. It is followed by an abnormal termination with the same reason code (X'00D96022').

This is a queue manager termination reason code.

**System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the error before queue manager termination is initiated.

**System programmer response**

Run the print log map utility to print the contents of both BSDSs. Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. At the time of the error, registers 2 and 3 (as shown in the dump or in SYS1.LOGREC) contain the relative byte address (RBA) of the last log record that was read before end-of-log was encountered. Follow instructions for the accompanying recovery log manager error. If you cannot correct the error, contact your IBM support center.

**00D96031**

The restart FRR invoked queue manager termination, because an error occurred while attempting to read the log backward MODE(DIRECT). It is accompanied by a recovery log manager error X'5C6' with a reason code describing the specific error.

Each time a portion of the log is skipped, a 'read direct' is used to validate the beginning RBA of the portion that is read.

This is a queue manager termination reason code.

**System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

**System programmer response**

Run the print log map utility to print the contents of both BSDSs. Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. Follow instructions for the accompanying recovery log manager error. See the accompanying error reason code.

Restart the queue manager.

**00D96032**

During restart, the end of the log was read before all the expected log ranges had been processed. The error is accompanied by an abnormal termination with the same reason code (X'00D96032').

This is a queue manager termination reason code.

**System action**

Standard diagnostic information is recorded in SYS1.LOGREC. An SVC dump is requested. The queue manager is terminated with message CSQV086E.

**System programmer response**

Run the print log map utility to print the contents of both BSDSs. See Finding out what the BSDS contains for more information.

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. At the time of the error, registers 2 and 3 contain the relative byte address (RBA) of the last log record that was read before end-of-log was encountered. Determine where the log went.

**00D97001**

The agent concerned was canceled while waiting for the RECOVER-UR service to complete.

**System action**

The RECOVER-UR function is completed. Abnormal termination of the requesting agent occurs. Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested.

The condition that caused cancellation of the agent was installation initiated (for example, a *forced* termination of the queue manager).

**00D97011**

The queue manager was terminated during RECOVER-UR because an unrecoverable error was detected during RECOVER-UR (CSQRRUPR) recovery processing.

This is a queue manager termination reason code.

**System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested. queue manager terminates with message CSQV086E and return code X'00D97011'.

**System programmer response**

Determine the original error. If the error is log-related, see Active log problems before restarting the queue manager.

**00D97012**

The RECOVER-UR request servicer FRR invoked queue manager termination, because an unrecoverable error was detected while attempting to recover a unit of recovery.

This is a queue manager termination reason code.

**System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

**System programmer response**

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error and follow the instructions associated with it.

Restart the queue manager.

**00D97021**

The RECOVER-UR FRR invoked queue manager termination, because an error occurred while attempting to read the log MODE(DIRECT) during forward processing. It is accompanied by a recovery log manager error X'5C6' with a reason code describing the specific error.

Each time a portion of the log is skipped, a 'read direct' is used to validate the beginning RBA of the portion that is read.

This is a queue manager termination reason code.

**System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

**System programmer response**

Run the print log map utility to print the contents of both BSDSs. Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. Follow instructions for the accompanying recovery log manager error. See the accompanying error reason code.

Restart the queue manager.

**00D97022**

The RECOVER-UR invoked abnormal termination because end-of-log was reached before all ranges had been processed for forward recovery. This error is accompanied by an abnormal termination with the same reason code (X'00D97022').

This is a queue manager termination reason code.

**System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

**System programmer response**

Run the print log map utility to print the contents of both BSDSs. Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. At the time of the error, registers 2 and 3 contain the relative byte address (RBA) of the last log record that was read before end-of-log was encountered. Follow instructions for the accompanying recovery log manager error.

Restart the queue manager.

**00D97031**

The RECOVER-UR FRR invoked queue manager termination, because an error occurred during an attempt to read the log MODE(DIRECT) while reading the log backward. It is accompanied by a recovery log manager error X'5C6' with a reason code describing the specific error.

Each time a portion of the log is skipped, a 'read direct' is used to validate the begin-scope RBA of the portion that is read.

This is a queue manager termination reason code.

**System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

**System programmer response**

Run the print log map utility to print the contents of both BSDSs. Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. See the accompanying error reason code. Follow instructions for the accompanying recovery log manager error.

Restart the queue manager.

**00D97032**

The RECOVER-UR invoked abnormal termination because end-of-log was reached before all ranges had been processed for backward recovery. This error is accompanied by an abnormal termination with the same reason code (X'00D97032').

This is a queue manager termination reason code.

**System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

**System programmer response**

Run the print log map utility to print the contents of both BSDSs. Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. At the time of the error, registers 2 and 3 contain the relative byte address (RBA) of the last log record that was read before end-of-log was encountered. Follow instructions for the accompanying recovery log manager error.

Restart the queue manager.

**00D98001**

The recovery manager's common FRR invoked queue manager termination, because an unrecoverable error was detected during indoubt-UR processing.

This is a queue manager termination reason code.

**System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

**System programmer response**

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error and follow the instructions associated with it.

Restart the queue manager.

**00D98011**

The FRR for the resolved-indoubt-UR request servicer invoked queue manager termination, because an unrecoverable error was detected processing a request.

This is a queue manager termination reason code.

**System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

**System programmer response**

Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. See the accompanying error reason code.

Restart the queue manager.

#### 00D98021

The resolved indoubt FRR invoked queue manager termination because of an error while attempting to read the log MODE(DIRECT) during forward recovery. It is accompanied by a recovery log manager error X'5C6' with a reason code describing the specific error.

Each time a portion of the log is skipped, a 'read direct' is used to validate the beginning RBA of the portion that is read.

This is a queue manager termination reason code.

#### System action

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

#### System programmer response

Run the print log map utility to print the contents of both BSDSs. Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. See the accompanying error reason code. Follow instructions for the accompanying recovery log manager error.

Restart the queue manager.

#### 00D98022

Resolved indoubt invoked abnormal termination when end-of-log was reached before all ranges had been processed for forward recovery. This error is accompanied by abnormal termination with the same reason code (X'00D98022').

This is a queue manager termination reason code.

#### System action

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

#### System programmer response

Run the print log map utility to print the contents of both BSDSs. Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. At the time of the error, registers 2 and 3 contain the relative byte address (RBA) of the last log record that was read before end-of-log was encountered. Follow instructions for the accompanying recovery log manager error.

Restart the queue manager.

#### 00D98031

The resolved indoubt FRR invoked queue manager termination, because an error occurred during an attempt to read the log MODE(DIRECT) while reading the log backward. It is accompanied by a recovery log manager error X'5C6' with a reason code describing the specific error.

Each time a portion of the log is skipped, a 'read direct' is used to validate the begin-scope RBA of the portion that is read.

This is a queue manager termination reason code.

#### System action

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

#### System programmer response

Run the print log map utility to print the contents of both BSDSs. Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. See the accompanying error reason code. Follow instructions for the accompanying recovery log manager error.

Restart the queue manager.

#### **00D98032**

The resolved indoubt FRR invoked abnormal termination when end-of-log was reached before all ranges had been processed for backward recovery. This error is accompanied by abnormal termination with the same reason code (X'00D98032').

This is a queue manager termination reason code.

#### **System action**

Standard diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before queue manager termination is initiated.

#### **System programmer response**

Run the print log map utility to print the contents of both BSDSs. Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. At the time of the error, registers 2 and 3 contain the relative byte address (RBA) of the last log record that was read before end-of-log was encountered. Follow instructions for the accompanying recovery log manager error.

Restart the queue manager.

#### **00D99001**

The checkpoint RBA in the conditional restart control record, which is deduced from the end RBA or LRSN value that was specified, is not available. This is probably because the log data sets available for use at restart do not include that end RBA or LRSN.

#### **System action**

The queue manager terminates.

#### **System programmer response**

See message CSQR015E.

#### **00D99104**

Queue manager restart detected that backward migration of messages was required. For backward migration to be possible, there must be no uncommitted units of recovery present at the end of restart. During restart, however, a decision was made not to force commit a detected indoubt unit of work. The decision is based on the response to message CSQR021D, or by the presence of a service parm which prevents the CSQR021D WTOR from being issued.

#### **System action**

Queue manager restart is terminated.

#### **System programmer response**

Either restart the queue manager with a higher level of code so that backward migration is not required, or, allow indoubt units of work to be force committed during restart.

#### **00D9AAAA**

This reason code identifies additional data stored in the system diagnostic work area (SDWA) variable recording area (VRA) following an error during backout-UR.

#### **System action**

Data is stored in the field indicated by VRA key 38 following the EBCDIC string 'RMC-COMMIT/BACKOUT'. This information is useful for IBM service personnel.

**System programmer response**

Quote this code, and the contents of the VRA field indicated by key 38 when contacting your IBM support center.

**00D9BBBB**

This reason code identifies additional data stored in the system diagnostic work area (SDWA) variable recording area (VRA) following an error during begin-UR.

**System action**

Data is stored in the field indicated by VRA key 38. This information is useful for IBM service personnel.

**System programmer response**

Quote this code, and the contents of the VRA field indicated by key 38 when contacting your IBM support center.

**00D9CCCC**

This reason code identifies additional data stored in the system diagnostic work area (SDWA) variable recording area (VRA) following an error during commit-UR.

**System action**

Data is stored in the field indicated by VRA key 38 following the EBCDIC string 'RMC-COMMIT/ABORT'. This information is useful for IBM service personnel.

**System programmer response**

Quote this code, and the contents of the VRA field indicated by key 38 when contacting your IBM support center.

**00D9EEEE**

This reason code identifies additional data stored in the system diagnostic work area (SDWA) variable recording area (VRA) following an error during end-UR.

**System action**

Data is stored in the field indicated by VRA key 38. This information is useful for IBM service personnel.

**System programmer response**

Quote this code, and the contents of the VRA field indicated by key 38 when contacting your IBM support center.

### **Storage manager codes (X'E2'):**

If a storage manager reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

#### **Diagnostics**

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- A printout of SYS1.LOGREC.
- If you are using CICS, the CICS transaction dump output.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.

#### **00E20001, 00E20002**

An internal error has occurred.

#### **System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

#### **System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

#### **00E20003**

A request for storage indicated that sufficient storage in the private area was not available.

#### **System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

#### **System programmer response**

Increase region size.

If you are unable to solve the problem by increasing the region size, collect the items listed in "Diagnostics" and contact your IBM support center.

#### **00E20004**

A request for storage indicated that sufficient storage was not available because of pool size limits.

#### **System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

#### **System programmer response**

Increase pool sizes.

If you are unable to solve the problem by increasing the pool sizes, collect the items listed in "Diagnostics" and contact your IBM support center.

#### **00E20005, 00E20006, 00E20007, 00E20008, 00E20009**

An internal error has occurred.

#### **System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

**00E2000A**

A request to get storage was unsuccessful.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

Increase the region size.

If increasing the region size does not help you solve the problem, collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

**00E2000B**

A request to get storage was unsuccessful.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

Increase region size.

If increasing the region size does not help you solve the problem, collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

**00E2000C**

A request for storage indicated that sufficient storage was not available because of pool size limits.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

Increase pool sizes.

If increasing the pool size does not help you solve the problem, collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

**00E2000D, 00E2000E**

An internal error has occurred.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

The most likely cause of the problem is a storage overlay or an invalid storage request from a queue manager component. A product other than MQ could cause the storage overlay problem.

Collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

00E2000F, 00E20010, 00E20011, 00E20012

An internal error has occurred.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

00E20013

A request to get storage was unsuccessful.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

Increase region size.

If increasing the region size does not help you to solve the problem, collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

00E20014

An internal error has occurred.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

00E20015

A request for storage indicated that 8K bytes of private area storage in subpool 229 was not available.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

There is probably a shortage of private area storage in the address space in which the problem occurred. Increase maximum private storage.

If increasing the maximum private storage does not solve the problem, collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

00E20016

A request for storage indicated that sufficient storage in subpool 229 was not available.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

Increase region size.

If increasing the region size does not help you resolve the problem, collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

**00E20017, 00E20018, 00E20019**

An internal error has occurred.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

**00E2001A**

An error has occurred with the z/OS ESTAE.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested. Register 15 contains the return code from the z/OS ESTAE.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

**00E2001B**

The 'setlock obtain' function issued a nonzero return code.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

**00E2001D, 00E2001E**

An internal error has occurred.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

**00E2001F**

There was insufficient storage in the common service area (CSA) to satisfy a request for storage.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

Run the monitoring tools available at your installation to review your CSA usage.

Increase the CSA size.

If increasing the CSA size does not solve the problem, collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

#### 00E20020

There was insufficient storage in the private area to satisfy a request for storage.

#### **System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

#### **System programmer response**

Increase region size.

If increasing the region size does not solve the problem, collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

#### 00E20021

There was insufficient storage in the common service area (CSA) to satisfy a request for storage.

#### **System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

#### **System programmer response**

Run the monitoring tools available at your installation to review your CSA usage.

Increase the CSA size.

If increasing the size of the CSA does not solve the problem, collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

#### 00E20022

There was insufficient storage in the common service area (CSA) to satisfy a request for storage.

#### **System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

#### **System programmer response**

Run the monitoring tools available at your installation to review your CSA usage.

Increase the CSA size.

If increasing the size of the CSA does not solve the problem, collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

#### 00E20023

There was insufficient storage in the private area was to satisfy a request for storage.

#### **System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

#### **System programmer response**

Increase region size.

If increasing the region size does not solve the problem, collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

#### 00E20024

There was insufficient storage in the common service area (CSA) to satisfy a request for storage.

#### **System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

#### **System programmer response**

Run the monitoring tools available at your installation to review your CSA usage.

Increase the CSA size.

If increasing the CSA size does not solve the problem, collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

#### 00E20025

There was insufficient storage in the common service area (CSA) to satisfy a request for storage.

#### **System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

#### **System programmer response**

Run the monitoring tools available at your installation to review your CSA usage.

Increase the CSA size.

If increasing the CSA size does not solve the problem, collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

#### 00E20026

A request for storage indicated that 4K bytes of private area storage in subpool 229 was not available.

#### **System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

#### **System programmer response**

There is probably a shortage of private area storage in the address space in which the problem occurred. Increase region size.

If increasing the region size does not solve the problem, collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

#### 00E20027, 00E20028, 00E20029, 00E2002A

An internal error has occurred.

#### **System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

#### **System programmer response**

Collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

#### 00E2002B

This reason code code is used to force percolation when an error is encountered while in storage manager code and the storage manager has been called recursively.

**System programmer response**

Refer to the originating error code.

00E20042, 00E20043, 00E20044, 00E20045

An internal error has occurred.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

00E20046

There was insufficient storage in a 64-bit storage pool to satisfy a request.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

Increase the MEMLM for the queue manager and restart it. If the problem persists collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

00E20047

An internal error has occurred.

**System action**

The invoker is abnormally terminated. Diagnostic information is recorded in SYS1.LOGREC, and a dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4929 and contact your IBM support center.

**Timer services codes (X'E3):**

00E30001

An internal error has occurred.

**System programmer response**

Collect the system dump, any trace information gathered and the related SYS1.LOGREC entries, and contact your IBM support center.

00E30002

This reason code was issued because an attempt to call the z/OS macro STIMERM was unsuccessful. The return code from STIMERM is in register 9.

**System programmer response**

Analyze the system dump, correct the problem from the information contained in the dump, and restart the queue manager.

For information about the STIMERM macro, see the *MVS Programming: Assembler Services Reference* manual.

## **Agent services codes (X'E5):**

If an agent services reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

### **Diagnostics**

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- A printout of SYS1.LOGREC.
- If you are using CICS, the CICS transaction dump output.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.

### **00E50001, 00E50002**

An internal error has occurred.

### **System action**

The requesting execution unit is ended abnormally.

### **System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

### **00E50004, 00E50005, 00E50006, 00E50007, 00E50008, 00E50009, 00E50012**

An internal error has occurred.

### **System action**

The requesting execution unit is ended abnormally. A record is written to SYS1.LOGREC and an SVC dump is requested.

### **System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

### **00E50013**

An MQ execution unit has been ended abnormally.

### **System action**

The agent CANCEL processing continues.

### **System programmer response**

This reason code might be issued as a result of any abnormal termination of a connected task, or a STOP QMGR MODE(FORCE) command. No further action is required in such cases.

If the error results in the termination of the queue manager, and you are unable to resolve the problem, collect the items listed in "Diagnostics" and contact your IBM support center.

### **00E50014**

An internal error has occurred.

### **System action**

An entry is written to SYS1.LOGREC, and an SVC dump is requested.

### **System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

#### 00E50015

An internal error has occurred.

#### System action

The operation is retried once. If this is not successful, the queue manager is terminated with reason code X'00E50054'.

A SYS1.LOGREC entry and an SVC dump are taken.

#### System programmer response

Restart the queue manager if necessary.

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

#### 00E50029

The agent services function which establishes the MQ tasking structure ends abnormally with this reason code following the detection of a load module which was loaded without the 31-bit addressing capability. This is preceded by message CSQV029E.

#### System action

Queue manager start-up is terminated.

#### System programmer response

See message CSQV029E.

#### 00E50030, 00E50031, 00E50032, 00E50035, 00E50036

An internal error has occurred.

#### System action

The requesting execution unit is ended abnormally. The error is recorded on SYS1.LOGREC, and an SVC dump is requested.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

#### 00E50040

Queue manager termination was invoked following an unrecoverable error while processing a terminate allied agent request at the *thread*, or *identify* level.

#### System action

The queue manager is terminated.

#### System programmer response

Restart the queue manager.

Scan the system log and the contents of SYS1.LOGREC for MQ errors occurring immediately before the system termination message CSQV086E. Follow the problem determination procedures for the specific errors. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

#### 00E50041

Queue manager termination was invoked following an unrecoverable error while processing a terminate agent request.

#### System action

The queue manager is terminated.

**System programmer response**

Restart the queue manager.

Scan the system log and the contents of SYS1.LOGREC for MQ errors occurring immediately before the system termination message CSQV086E. Follow the problem determination procedures for the specific errors. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50042, 00E50044**

An internal error has occurred.

**System action**

The current execution unit is ended abnormally. A record is written to SYS1.LOGREC and an SVC dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50045**

Queue manager termination was invoked following an unrecoverable error while processing a create allied agent service request at the *thread*, or *identify* level.

**System action**

The queue manager is terminated.

**System programmer response**

Restart the queue manager.

Scan the system log and the contents of SYS1.LOGREC for MQ errors occurring immediately before the termination message CSQV086E. Follow the problem determination procedures for the specific errors. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50046**

Queue manager termination was invoked following an unrecoverable error while processing a create agent structure request.

**System action**

The queue manager is terminated.

**System programmer response**

Restart the queue manager.

Scan the system log and the contents of SYS1.LOGREC for MQ errors occurring immediately before the termination message CSQV086E. Follow the problem determination procedures for the specific errors. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50047**

An internal error has occurred.

**System action**

The queue manager is terminated.

**System programmer response**

Restart the queue manager.

Scan the system log and the contents of SYS1.LOGREC for MQ errors occurring immediately before the termination message CSQV086E. Follow the problem determination procedures for the specific errors. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

#### 00E50050

An internal error has occurred.

#### System action

The requesting execution unit is ended abnormally.

An X'00E50054' recovery reason code is placed in the SDWACOMU field of the SDWA, indicating that synchronization services was responsible for queue manager termination.

#### System programmer response

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

#### 00E50051

An internal error has occurred.

#### System action

The queue manager is ended abnormally with a X'5C6' completion code and this reason code.

An X'00E50054' recovery reason code is placed in the SDWACOMU field of the SDWA indicating that synchronization services was responsible for queue manager termination.

#### System programmer response

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

#### 00E50052

The z/OS cross-memory lock (CML) could not be released.

#### System action

The queue manager is ended abnormally with a X'5C6' completion code and this reason code.

An X'00E50054' recovery reason code is placed in the SDWACOMU field of the SDWA indicating that synchronization services was responsible for queue manager termination.

A record is written to SYS1.LOGREC and an SVC dump is produced.

#### System programmer response

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

#### 00E50054

The queue manager is ended abnormally by the synchronization services recovery routine when an unrecoverable error is encountered during recovery processing for the SUSPEND, CANCEL, RESUME, or SRB REDISPATCH functions. This is a queue manager termination reason code.

One of the following conditions was encountered during recovery processing for the requested function:

- Unable to complete resume processing for an SRB mode execution unit that was suspended at time of error

- Errors were encountered during primary recovery processing causing entry to the secondary recovery routine
- Recovery initiated retry to mainline suspend/resume code caused retry recursion entry into the functional recovery routine
- Unable to obtain or release the cross-memory lock (CML) of the queue manager address space either during mainline processing or during functional recovery processing (for example, reason code X'00E50052')

**System action**

The queue manager is terminated. This reason code is associated with a X'6C6' completion code indicating that synchronization services was responsible for termination.

**System programmer response**

Restart the queue manager.

Scan the system log and the contents of SYS1.LOGREC for MQ errors occurring immediately before the system termination message CSQV086E. Follow the problem determination procedures for the specific errors. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50055**

The synchronization services functional recovery routine was unable to successfully complete resume processing for a suspended TCB mode execution unit. The resume processing was requested by the CANCEL or RESUME functions.

**System action**

Because the suspended TCB mode execution unit must not be permitted to remain in a suspended state, the recovery routine invokes the z/OS CALLRTM (TYPE=ABTERM) service to end the execution unit abnormally with a X'6C6' completion code. Depending upon which execution unit was terminated, the queue manager might be ended abnormally.

**System programmer response**

Restart the queue manager if necessary.

Scan the system log and the contents of SYS1.LOGREC for MQ errors occurring immediately before the end of the execution unit. Follow the problem determination procedures for the specific errors. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50059**

An internal error has occurred.

**System action**

If the module detecting the error is CSQVSDC0, it will be retried once. If validation is unsuccessful, the queue manager is terminated abnormally with a X'00E50054' reason code.

A SYS1.LOGREC entry and an SVC dump are requested.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50062**

An internal error has occurred.

**System action**

The allied task is ended abnormally.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

00E50063

An internal error has occurred.

**System action**

The task is ended abnormally.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

00E50065

An internal error has occurred.

**System action**

The execution unit is ended abnormally.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

00E50069

This reason code is issued during recovery processing for the suspend function when executing in SRB mode under the recovery routine established by the z/OS SRBSTAT(SAVE) service. Because the recovery routine established by this service is the only routine in the FRR stack at the time of error, normal RTM percolation to the invoking resource manager recovery routine is not possible.

After recovery processing for the initial error has successfully completed, the RTM environment is exited through retry to a routine that restores the original FRR stack. This routine terminates abnormally with completion code X'5C6' and this reason code. This causes entry into the original recovery routine established during suspend initialization.

**System action**

After this is intercepted by the original suspend recovery routine, a SYS1.LOGREC entry and SVC dump are requested to document the original error. The original recovery reason code is placed in the SDWACOMU field of the SDWA indicating the actions performed during recovery processing of the initial error. Control is then returned to the invoking resource manager's recovery routine through RTM percolation.

**System programmer response**

Because this is used only to permit the transfer of the initial recovery reason code to the invoking resource manager's recovery routine, no further recovery actions are required for this reason code. Diagnostic information for the initial error encountered can be obtained through the SYS1.LOGREC and SVC dump materials provided.

00E50070

To enable an internal task to terminate itself, the task has ended abnormally. This is not necessarily an error.

**System action**

The task is ended abnormally.

If the service task is ended abnormally with a completion code of X'6C6', no SVC dump is taken.

**System programmer response**

The error should be ignored if it happens in isolation, however, if it occurs in conjunction with other problems, these problems should be resolved.

If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50071**

An internal error has occurred.

**System action**

The internal task is ended abnormally.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50072**

An internal error has occurred.

**System action**

The queue manager is ended abnormally.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50073**

An internal error has occurred.

**System action**

The current execution unit is ended abnormally. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50074**

This reason code is issued in response to a nonzero return code from ATTACH during an attempt to create an internal task.

**System action**

The ATTACH is retried. A record is written to SYS1.LOGREC, and an SVC dump is requested. If a problem occurs again, the queue manager is terminated.

**System programmer response**

Restart the queue manager if necessary.

Register 2, in the SDWA, contains the return code from the ATTACH request. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50075, 00E50076, 00E50077, 00E50078**

An internal error has occurred.

**System action**

The requesting execution unit is terminated. The queue manager might also be terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager if necessary.

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50079**

An internal error has occurred. This can occur if the allied address space is undergoing termination.

**System action**

The requesting execution unit is ended abnormally. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50080, 00E50081**

An internal error has occurred.

**System action**

An SVC dump is requested specifying a completion code of X'5C6' and this reason code. No record is written to SYS1.LOGREC. Execution continues.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50094, 00E50095, 00E50096, 00E50097, 00E50100**

An internal error has occurred.

**System action**

The requesting recovery routine is ended abnormally. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50101**

MQ was unable to establish an ESTAE.

**System action**

The error is passed on to a subsystem support subcomponent (SSS) ESTAE. Probably, the queue manager is ended abnormally. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

The inability to establish an ESTAE is normally due to insufficient free space in the local system queue area (LSQA) for an ESTAE control block (SCB). If necessary, increase the size of the queue manager address space.

Restart the queue manager.

Review the associated SVC dump for usage and free areas in the LSQA subpools belonging to the system services address space. If you are unable to solve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

#### **00E50102**

An unrecoverable error occurred while canceling all active agents during processing of the STOP QMGR MODE(FORCE) command. This is a queue manager termination reason code.

#### **System action**

The queue manager is ended abnormally. A record is written to SYS1.LOGREC.

#### **System programmer response**

Restart the queue manager.

You might find the items listed in "Diagnostics" on page 4936 useful in resolving the problem. Review the SYS1.LOGREC entries for errors immediately preceding queue manager termination.

#### **00E50500**

A z/OS LOCAL or CML lock could not be obtained during queue manager abnormal termination processing.

#### **System action**

The execution unit is ended abnormally. The error is recorded on SYS1.LOGREC, and abnormal queue manager termination is completed under a different execution unit if possible.

#### **System programmer response**

Restart the queue manager if necessary.

You might find the items listed in "Diagnostics" on page 4936 useful in resolving the problem.

#### **00E50501**

A z/OS LOCAL or CML lock could not be released during queue manager abnormal termination processing.

#### **System action**

The execution unit is ended abnormally. The error is recorded on SYS1.LOGREC. Queue manager termination is completed under a different execution unit if possible.

#### **System programmer response**

Restart the queue manager.

You might find the items listed in "Diagnostics" on page 4936 useful in resolving the problem.

#### **00E50502**

A z/OS LOCAL lock could not be obtained during queue manager abnormal termination processing.

#### **System action**

The execution unit is ended abnormally. The error is recorded on SYS1.LOGREC, and abnormal queue manager termination is completed under a different execution unit if possible.

#### **System programmer response**

Restart the queue manager.

You might find the items listed in "Diagnostics" on page 4936 useful in resolving the problem.

#### **00E50503**

A z/OS LOCAL lock could not be released during queue manager abnormal termination processing.

**System action**

The execution unit is ended abnormally. The error is recorded on SYS1.LOGREC, and abnormal queue manager termination is completed under a different execution unit if possible.

**System programmer response**

Restart the queue manager.

You might find the items listed in "Diagnostics" on page 4936 useful in resolving the problem.

**00E50504**

This reason code is used to define the format of the information recorded in the SDWA variable recording area (VRA) by the queue manager termination processor. The code identifies additional information provided in the VRA for errors encountered in module CSQVATRM.

**System action**

Recording of the error encountered during queue manager termination continues.

**System programmer response**

None.

**00E50505**

This reason code is used to define the format of the information recorded in the SDWA variable recording area (VRA). The code identifies additional information provided in the VRA for errors encountered in module CSQVATR4.

**System action**

Recording of the error encountered during queue manager termination continues.

**System programmer response**

None.

**00E50701**

A problem occurred during Commit Phase-1. This is used to effect backout, deallocation, and end-UR processing.

**System action**

The queue manager is ended abnormally. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50702**

An error occurred while processing in SRB mode which could not be recovered.

SRB mode processing is often used internally by the queue manager to ensure data integrity and consistency of internal state. Where recovery is not possible, the queue manager is terminated with this reason code.

Most occurrences are due to internal errors which should be reported to IBM service for further investigation.

The error is also known to occur where log data sets have been reformatted, without reformatting the pagesets (so they still contain active data). This situation can be resolved by user action.

**System action**

The queue manager is ended abnormally with this reason code. An SVC dump of the original error was requested by the recovery routine for CSQVEUS2 and a record written to SYS1.LOGREC.

**System programmer response**

Restart the queue manager.

Scan the SYS1.LOGREC entries looking for one or more MQ errors immediately prior to the queue manager termination. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50703**

This queue manager termination reason code is used following an error while attempting to resume a suspended execution unit. The successful completion of resume processing was 'indoubt'.

**System action**

The queue manager is ended abnormally. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

You might find the items listed in "Diagnostics" on page 4936 useful in resolving the problem.

**00E50704**

An internal error has occurred.

**System action**

The queue manager is terminated with this reason code. Additionally, if no SDWA was provided to the recovery routine, a dump is requested.

**System programmer response**

Restart the queue manager.

Scan the SYS1.LOGREC entries looking for one or more MQ errors immediately prior to the queue manager termination. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50705**

An internal error has occurred.

**System action**

The queue manager is ended abnormally.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50706**

An internal error has occurred.

**System action**

The queue manager is terminated with this reason code. Additionally, if no SDWA was provided to the recovery routine, a dump is requested. A record is written to SYS1.LOGREC.

**System programmer response**

Restart the queue manager.

Scan the SYS1.LOGREC entries looking for one or more MQ errors immediately prior to the queue manager termination. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50707**

An ESTAE could not be established.

**System action**

The queue manager is ended abnormally. A record is written to SYS1.LOGREC.

**System programmer response**

Review the usage and the free areas in the LSQA subpool of the queue manager address space. If necessary, increase the private area size of the address space.

Restart the queue manager.

If queue manager termination was requested by module CSQVRCT, a standard SVC dump was requested. If insufficient private storage is the cause of the problem, other MQ resource managers might have ended abnormally.

If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50708**

An error occurred while connecting an allied agent to the queue manager address space. The connection must complete so that the allied agent can be terminated.

**System action**

The queue manager is terminated with this reason code. An SVC dump of the original error was requested and a record entered into SYS1.LOGREC.

**System programmer response**

Restart the queue manager.

Scan the SYS1.LOGREC entries looking for one or more MQ errors immediately prior to the queue manager termination.

**00E50709**

An internal error has occurred.

**System action**

The queue manager is ended abnormally.

**System programmer response**

Restart the queue manager.

Scan the SYS1.LOGREC entries for one or more MQ errors occurring immediately prior to the queue manager termination. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50710**

An internal error has occurred.

**System action**

The queue manager is terminated with this reason code. An SVC dump of the original error was requested and a record entered into SYS1.LOGREC.

**System programmer response**

Restart the queue manager.

Scan the SYS1.LOGREC entries looking for one or more MQ errors immediately prior to the queue manager termination. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50711**

An internal error has occurred.

**System action**

The queue manager is terminated with this reason code. An SVC dump of the original error was requested and a record entered into SYS1.LOGREC.

**System programmer response**

Restart the queue manager.

Scan the SYS1.LOGREC entries looking for one or more MQ errors immediately prior to the queue manager termination. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50712**

An error occurred in a latch manager function attempting to terminate the holder of an MQ latch. The holder's task has been set nondispatchable by z/OS and a CALLRTM to terminate this task was unsuccessful.

**System action**

The queue manager is terminated with this reason code. An SVC dump of the error is requested and a record entered into SYS1.LOGREC. Register 3 at time of error contains the latch-holder's TCB address in the home address space and register 4 contains the return code from CALLRTM.

**System programmer response**

Restart the queue manager.

You might find the items listed in "Diagnostics" on page 4936 useful in resolving the problem. Scan the SYS1.LOGREC entries for one or more MQ errors immediately prior to the queue manager termination.

**00E50713**

An internal error has occurred.

**System action**

The queue manager is ended abnormally. An SVC dump is requested by the queue manager termination processor and a record is written to SYS1.LOGREC.

**System programmer response**

Restart the queue manager.

Scan the SYS1.LOGREC entries for one or more MQ errors occurring immediately prior to the queue manager termination. It might be necessary to analyze the SVC dump requested. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50715**

Queue manager termination was requested following an unrecoverable error in an SRB mode execution unit.

**System action**

The SRB-related task was ended abnormally as a result of SRB to TCB percolation. The queue manager is ended abnormally.

**System programmer response**

Restart the queue manager.

You might find the items listed in "Diagnostics" on page 4936 useful in resolving the problem. Scan the SYS1.LOGREC entries for one or more MQ errors occurring immediately prior to the queue manager termination.

**00E50717**

An internal error has occurred.

**System action**

The queue manager is ended abnormally.

**System programmer response**

Restart the queue manager.

Scan the SYS1.LOGREC entries for one or more MQ errors occurring immediately prior to the queue manager termination. If an error preceded the queue manager termination request, diagnostic information can be obtained through SYS1.LOGREC and SVC dump materials. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50719**

An internal error has occurred.

**System action**

The queue manager is ended abnormally.

**System programmer response**

Restart the queue manager.

Scan the SYS1.LOGREC entries for one or more MQ errors occurring immediately prior to the queue manager termination. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4936 and contact your IBM support center.

**00E50725**

Queue manager termination was requested because of an unrecovered error in a scheduled SRB-mode execution unit.

**System action**

The SRB-related task was ended abnormally, due to SRB to TCB percolation. The queue manager is ended abnormally.

**System programmer response**

Restart the queue manager.

You might find the items listed in "Diagnostics" on page 4936 useful in resolving the problem. Scan the SYS1.LOGREC entries for one or more MQ errors occurring immediately prior to the queue manager termination. If necessary, analyze the SVC dump requested by queue manager termination.

**00E50727**

A secondary error occurred during agent services functional recovery processing. This is a queue manager termination reason code.

**System action**

The queue manager is ended abnormally.

**System programmer response**

Restart the queue manager.

You might find the items listed in "Diagnostics" on page 4936 useful in resolving the problem. Scan the SYS1.LOGREC entries for one or more MQ errors occurring immediately prior to the queue manager termination.

**Instrumentation facilities codes (X'E6'):**

If an instrumentation facilities reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

**Diagnostics**

- The console output for the period leading up to the error.
- The system dump resulting from the error.
- A printout of SYS1.LOGREC.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.

**00E60008**

An internal error has occurred.

**System action**

The function being traced is ended abnormally. The queue manager remains operational.

**System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

**00E60017**

This code is an internal code used by the dump formatter.

**System action**

The request is ended abnormally.

**System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

**00E60085, 00E60086, 00E60087, 00E60088, 00E60089**

An internal error has occurred.

**System action**

The request is end abnormally.

**System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

**00E60100 through 00E60199**

The reason codes X'00E60100' through X'00E60199' are used by the instrumentation facility component (IFC) when a trace event occurs for which IBM service personnel have requested a dump using the IFC selective dump service aid.

**System action**

The agent might be retried or terminated, depending upon the serviceability dump request.

**System programmer response**

The reason code is issued on the occurrence of a specified trace event. An SVC dump is taken to the SYS1.DUMPxx data set. Problem determination methods depend on the condition that IBM service personnel are attempting to trap.

**00E60701**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4950 and contact your IBM support center.

**00E60702, 00E60703**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4950 and contact your IBM support center.

**Distributed queuing codes (X'E7):**

If a distributed queuing reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

**Diagnostics**

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The channel definitions being used
- If the error affected a message channel agent, a listing of any user channel exit programs used by the message channel agent.
- The console output for the period leading up to the error.
- The queue manager job log.
- The channel initiator job log.
- The system dump resulting from the error.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.

**00E70001**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

**00E70002**

No adapter subtasks are active. They have failed many times and so have not been restarted.

**System action**

The channel initiator terminates.

**System programmer response**

Investigate the adapter subtask failure problems, as reported in the messages associated with each failure.

**00E70003**

No dispatchers are active. Either all the dispatchers failed to start, or all the dispatchers have failed many times and so have not been restarted.

**System action**

The channel initiator terminates.

**System programmer response**

Investigate the dispatcher failure problems, as reported in the messages associated with each failure.

**00E70004**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

**00E70007**

An attempt by an adapter subtask to obtain some storage failed.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Increase the size of the channel initiator address space, or reduce the number of dispatchers, adapter subtasks, SSL server subtasks, and active channels being used.

**00E70008, 00E70009, 00E7000A**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

**00E70011**

The channel initiator was unable to load the module CSQXBENT.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Check the console for messages indicating why CSQXBENT was not loaded. Ensure that the module is in the required library, and that it is referenced correctly.

The channel initiator attempts to load this module from the library data sets under the STEPLIB DD statement of its started task JCL procedure xxxxCHIN.

**00E70013**

Some adapter subtasks were requested, but none could be attached.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Investigate the adapter subtask attach problems, as reported in the messages associated with each failure. If you cannot resolve the problems, collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

**00E70015**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

**00E7001D**

During startup, the channel initiator was unable obtain some storage below 16M.

**System action**

The channel initiator ends.

**System programmer response**

Investigate the cause of the problem.

**00E7001E, 00E7001F**

An internal error has occurred.

**System action**

The channel initiator terminates with completion code X'5C6'.

**System programmer response**

Restart the channel initiator.

Collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

**00E70020**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Check the console for preceding error messages. If the problem cannot be resolved, collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

00E70021, 00E70022, 00E70023, 00E70024, 00E70025

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

00E70031

An internal error has occurred. A lock is currently held by a task that has terminated.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Determine why the terminated task did not free the lock. This might be due to a previous error. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

00E70032

An internal error has occurred. An attempt to update information held in the coupling facility failed.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4951, together with details of the queue-sharing group and of the queue managers active, as well as the queue managers defined to the queue-sharing group at the time. This information can be obtained by entering the following z/OS commands:

```
D XCF,GRP
```

to display a list of all queue-sharing groups in the coupling facility

```
D XCF,GRP,qsg-name,ALL
```

to display status about the queue managers defined to the queue-sharing group.

Contact your IBM support center.

00E70033

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

00E70052

No SSL server subtasks are active. They have failed many times and so have not been restarted.

**System action**

The channel initiator terminates.

**System programmer response**

Investigate the SSL server subtask failure problems, as reported in the messages associated with each failure.

**00E70053**

Some SSL server subtasks were requested, but none could be attached.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Investigate the SSL server subtask attach problems, as reported in the messages associated with each failure. If you cannot resolve the problems, collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

**00E7010C**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

**00E7010E**

The dispatcher detected an inconsistency in the linkage stack.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

The most likely cause is incorrect use of the linkage stack by a user exit; exits must issue any MQ API calls and return to the caller at the same linkage stack level as they were entered. If exits are not being used, or if they do not use the linkage stack, collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

**00E7010F, 00E7014A**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

**00E7014C**

An internal error has occurred. This can be caused by the channel initiator failing to stop when running against a previous instance of the queue manager and attempting to connect to a later instance of the queue manager.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4951, terminate then restart the channel initiator and contact your IBM support center.

**00E7014D**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

**00E7014F**

An internal error has occurred. This is normally as a result of some previous error.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Check the console for preceding error messages reporting a previous error, and take the appropriate action for resolving that error. If there is no previous error, collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

**00E7015A, 00E70214, 00E70216, 00E70226, 00E70231, 00E70232, 00E70233, 00E70501, 00E70522, 00E70543, 00E70546, 00E70553**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

**00E70054, 00E70055, 00E70056**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

**00E70057, 00E70058**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

**00E70708**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6'.

### **System programmer response**

Collect the items listed in "Diagnostics" on page 4951 and contact your IBM support center.

### **Initialization procedure and general services codes (X'E8):**

If an initialization procedure reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

### **Diagnostics**

- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- A printout of SYS1.LOGREC.
- The system parameter load module.
- The initialization procedure.
- The started task JCL procedure for this queue manager.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.

### **00E80001**

An internal error has occurred.

### **System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

### **System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" and contact your IBM support center.

### **00E80002**

The queue manager address space was not started correctly or an error occurred during z/OS IEFSSREQ processing.

### **System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested. Register 9 contains the address of an 8-byte field that contains the following diagnostic information:

- Bytes 1 through 4 - subsystem name
- Bytes 5 through 8 - contents of register 15 that contains the return code set by the z/OS IEFSSREQ macro

### **System programmer response**

You might find the items listed in "Diagnostics" useful in resolving the problem.

### **00E80003, 00E80004, 00E80005, 00E80006**

An internal error has occurred.

### **System action**

A record is written to SYS1.LOGREC, and an SVC dump is requested.

### **System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

**00E8000E**

An ESTAE could not be established for the queue manager address space control task.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested. Register 9 contains the address of a 4-byte field that contains the ESTAE macro return code.

**System programmer response**

Restart the queue manager.

You might find the items listed in "Diagnostics" on page 4957 useful in resolving the problem.

**00E8000F**

Invalid startup parameters were specified. This was probably caused by an attempt to start the queue manager by some means other than a START QMGR command.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E80011**

The address space could not be made non-swappable.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

You might find the items listed in "Diagnostics" on page 4957 useful in resolving the problem.

**00E80012**

An internal error has occurred.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E80013, 00E8001F, 00E8002F**

An internal error has occurred.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E80031**

An unsupported input parameter was detected for allied address space initialization.

**System action**

The caller's task is ended abnormally. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E80032**

An unsupported input parameter was detected for allied address space termination.

**System action**

The caller's task is ended abnormally. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E80033**

This reason code accompanies a X'6C6' completion code. This module detected that the queue manager was terminating.

**System action**

The caller's task is ended abnormally with code X'6C6'. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4957 useful in resolving the problem.

**00E8003C**

An internal error has occurred.

**System action**

The caller's task is ended abnormally. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E8003D**

An internal error has occurred.

**System action**

Abnormal termination of the queue manager is initiated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E8003E**

An ESTAE could not be established in an address space about to be initialized as an MQ allied address space.

**System action**

The caller's task is ended abnormally. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E8003F**

An internal error has occurred.

**System action**

The caller's task is ended abnormally. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E80041**

An internal error has occurred.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E80042, 00E8004F**

An internal error has occurred.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E80051**

An error was detected in the command that was used to start the queue manager.

**System action**

The queue manager is terminated.

**System programmer response**

Reenter the command if it was entered incorrectly.

If you are unable to resolve the problem, contact your IBM support center.

**00E80052, 00E80053, 00E80054, 00E80055**

An internal error has occurred.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E80057**

An error occurred while trying to start a queue manager address space. One possible cause of this problem is an error in the started task JCL procedure for the queue manager.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

You might find the items listed in "Diagnostics" on page 4957 useful in resolving the problem.

**00E80058**

An error occurred during command prefix registration.

**System action**

The queue manager ends abnormally.

**System programmer response**

See the accompanying CSQYxxx messages for information about the cause of the problem.

Restart the queue manager after correcting the problem.

**00E8005F, 00E80061, 00E8006E, 00E8007F**

An internal error has occurred.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E80081**

An invalid load module was detected.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested. Register 9 contains the address of an 8-byte field that contains the name of the module in error.

**System programmer response**

Check that the installation process was successful.

Restart the queue manager after resolving the problem.

If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

#### 00E80084

A resource manager provided notification of an error during queue manager startup notification processing.

#### System action

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested. Register 9 contains the address of a 4-byte field that contains the RMID of the resource manager that requested queue manager termination.

#### System programmer response

Look for error messages indicating the cause of the problem.

Restart the queue manager after resolving the problem.

If you are unable to solve the problem, collect the items listed in "Diagnostics" on page 4957, together with the contents of the BSDS and a GTF trace, and contact your IBM support center.

#### 00E8008F, 00E80091, 00E8009F, 00E800AF, 00E800B1

An internal error has occurred.

#### System action

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

#### System programmer response

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

#### 00E800B2

The queue manager initialization procedure found that the version of ZPARM loaded was compiled for a higher release of IBM WebSphere MQ, and specifies NEWFUNC.

#### System action

Startup is terminated.

#### System programmer response

Check whether the correct ZPARM has been loaded at initialization.

The existence of this version of ZPARM implies that the queue manager has been running at a higher release of the product.

Check to see if the queue manager has been started on a higher release of the product. If this is the case, you have inadvertently started IBM WebSphere MQ with the wrong version of the product libraries.

It might still be possible to rebuild ZPARM using the macros from SCSQMACS for the current release of the product.

Note, however, that a queue manager that has been operating with OPMODE(NEWFUNC,nnn) at a higher release of the product cannot be subsequently started at a lower release of the product.

#### 00E800CE

An ESTAE could not be established.

#### System action

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested. Register 9 contains the address of a 4-byte field that contains the ESTAE macro return code.

**System programmer response**

Restart the queue manager.

You might find the items listed in "Diagnostics" on page 4957 useful in resolving the problem.

**00E800D1**

An internal error has occurred.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E800D2**

An error was encountered while attempting to obtain the z/OS LOCAL lock.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

You might find the items listed in "Diagnostics" on page 4957 useful in resolving the problem.

**00E800D3**

An error was encountered while attempting to release the z/OS LOCAL lock.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

You might find the items listed in "Diagnostics" on page 4957 useful in resolving the problem.

**00E800DF**

An internal error has occurred.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E80100**

The queue manager was ended abnormally because the queue manager address space control task ESTAE was entered. This reason code is issued for all completion codes, except for the X'5C6' completion code.

The queue manager is unable to determine the cause of the error.

**System action**

Termination of the queue manager is initiated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager after resolving the problem.

The subcomponent that caused the error is unknown. This reason code might be returned if the queue manager is unable to find the system parameter load module you specified on the START QMGR command (the default name is CSQZPARM). Check that the module you specified is available.

This reason code is also issued if the queue manager is canceled by the z/OS command CANCEL. If this is the case, determine why the queue manager was canceled.

You might find the items listed in "Diagnostics" on page 4957, together with the contents of the BSDS and a GTF trace, useful in resolving the problem.

**00E8011D**

An internal error has occurred.

**System action**

Termination of queue manager is initiated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E8011E**

The allied address space task primary ESTAE detected that the secondary ESTAE could not be established.

**System action**

Abnormal termination of allied address space is continued. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4957 useful in resolving the problem.

**00E8011F**

The allied address space task primary ESTAE was entered without a subsystem diagnostic work area (SDWA) provided by z/OS RTM.

**System action**

Abnormal termination of the allied address space is continued. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4957 useful in resolving the problem.

**00E8012D**

An internal error has occurred.

**System action**

Abnormal termination of queue manager is initiated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E8012F**

The allied address space task secondary ESTAE was entered without a subsystem diagnostic work area (SDWA) provided by z/OS.

**System action**

Continue with the abnormal termination of the allied address space. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4957 useful in resolving the problem.

**00E80130**

The FRR that protects the START QMGR/STOP QMGR command processor function was entered while a valid STOP QMGR command was being processed.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4957 useful in resolving the problem.

**00E80140**

An internal error has occurred.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E80150, 00E80151**

An invalid module was detected.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested. Register 9 contains the address of a 12-byte field that contains the following diagnostic information:

- Bytes 1 through 8 contain the name of the load module that contains the initialization entry point list with the invalid entry

**System programmer response**

Restart the queue manager after resolving the problem.

Check that the installation process was successful. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E8015F**

An internal error has occurred.

**System action**

The queue manager is terminated. A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

**00E80160**

The queue manager initialization procedures found that a load module had an invalid AMODE or RMODE attribute.

**System action**

Queue manager startup is terminated.

**System programmer response**

See message CSQY006E.

**00E80161**

The queue manager initialization procedures found that a load module was not at the correct level for the version of the queue manager that was being started.

**System action**

Queue manager startup is terminated.

**System programmer response**

See message CSQY010E.

**00E80162**

The queue manager initialization procedures found that the storage protect key was not 7. The most likely cause is that the program properties table (PPT) entry for CSQYASCP has not been specified correctly.

**System action**

Queue manager startup is terminated.

**System programmer response**

Restart the queue manager after resolving the problem.

For information about specifying the PPT entry for CSQYASCP, see Update the z/OS program properties table.

**00E80163**

The queue manager initialization procedures found that they were not APF authorized. The most likely cause is that one or more of the datasets in the //STEPLIB concatenation is not APF authorized.

**System action**

Queue manager startup is terminated.

**System programmer response**

Restart the queue manager after resolving the problem.

For information about APF authorization for the MQ load libraries, see APF authorize the WebSphere MQ load libraries

#### 00E80170

An internal error has occurred.

#### System action

The request is ignored.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4957 and contact your IBM support center.

#### System parameter manager codes (X'E9'):

If a system parameter manager reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

#### Diagnostics

- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- A printout of SYS1.LOGREC.
- The system parameter load module.
- The initialization procedure.
- The started task JCL procedure for this queue manager.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.

#### 00E90101

An error has occurred while trying to open MQ resources. The most likely cause is that a customized system parameter load module specified on the START QMGR command is not available.

#### System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

#### System programmer response

Check that the system parameter load module you specified on the START QMGR command (the default name is CSQZPARM) is available for use. If it is, collect the items listed in "Diagnostics" and contact your IBM support center.

#### 00E90201

An internal error has occurred while attempting to open MQ resources.

#### System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

#### System programmer response

Collect the items listed in "Diagnostics" and contact your IBM support center.

#### 00E90202

An error has occurred while attempting to open MQ resources. The most likely cause is that a customized system parameter load module specified on the START QMGR command (the default name is CSQZPARM) has been built incorrectly.

#### System action

A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Check that the system parameter load module that you specified is available, and that it was linked correctly. See CSQ4ZPRM for sample link-edit JCL. and for information about the system parameter modules, see Tailor your system parameter module.

Restart the queue manager. If the problem persists, collect the items listed in "Diagnostics" on page 4967 and contact your IBM support center.

**00E90203**

An internal error has occurred while attempting to verify descriptor control information in MQ resources.

**System action**

A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4967 and contact your IBM support center.

**00E90301**

An internal error has occurred while attempting to close MQ resources.

**System action**

A record is written to SYS1.LOGREC, and an SVC dump is requested.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4967 and contact your IBM support center.

**Service facilities codes (X'F1'):**

00F10001, 00F10002, 00F10003, 00F10004, 00F10005, 00F10006, 00F10007, 00F10008, 00F10009, 00F10010, 00F10011, 00F10012, 00F10013, 00F10014, 00F10015, 00F10016, 00F10017, 00F10018

An internal error has been detected in the CSQ1LOGP log print utility.

**System action**

A dump is requested. The utility ends abnormally with completion code X'5C6'.

**System programmer response**

Collect the following diagnostic items and contact your IBM support center:

- Utility report output
- System dump resulting from the error, if any
- The WebSphere MQ, z/OS, Db2, CICS, and IMS service levels

**00F10100**

An internal error has been detected in the CSQ1LOGP log print utility.

**System action**

A dump is requested. The utility ends abnormally with completion code X'5C6'.

**System programmer response**

Resubmit the job.

Contact your IBM support center if the problem persists.

**00F10101**

The stand-alone log read function returned an invalid RBA. See the explanation for message CSQ1211E.

**System action**

A dump is requested. The utility ends abnormally with completion code X'5C6'.

**System programmer response**

If you determine that the data set is a log data set and that it is not damaged, contact your IBM support center.

**WebSphere MQ-IMS bridge codes (X'F2'):**

If a WebSphere MQ-IMS bridge reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

**Diagnostics**

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The IMS job logs.
- The system dump resulting from the error.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.

00F20001, 00F20002, 00F20003, 00F20004, 00F20005, 00F20006, 00F20007, 00F20008, 00F20009, 00F2000A, 00F2000B, 00F2000C, 00F2000D, 00F2000E, 00F2000F, 00F20010, 00F20011

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

**00F20012**

The MQ-IMS bridge received a bad return code from IXCQUERY macro.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Registers 3 and 4 contain the return and reason codes from XCF. Refer to the *MVS Programming: Sysplex Services Reference* for information about these codes.

**00F20013**

The MQ-IMS bridge received a bad return from IXCJOIN macro.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Registers 3 and 4 contain the return and reason codes from XCF. Refer to the *MVS Programming: Sysplex Services Reference* for information about these codes.

**00F20014**

The MQ-IMS bridge received a bad return from IXCCREAT macro.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Registers 3 and 4 contain the return and reason codes from XCF. Refer to the *MVS Programming: Sysplex Services Reference* for information about these codes.

Use the IMS DIS OTMA command to see if the OTMACON member name is already in use. This can be caused by specifying the IMS system instead of the queue manager name in the OTMACON member name.

**00F20015, 00F20016**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4969 and contact your IBM support center.

**00F20017**

The MQ-IMS bridge received a bad return from IXCLEAVE macro.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Registers 3 and 4 contain the return and reason codes from XCF. Refer to the *MVS Programming: Sysplex Services Reference* for information about these codes.

**00F20018**

The MQ-IMS bridge received a bad return from IXCDELET macro.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Registers 3 and 4 contain the return and reason codes from XCF. Refer to the *MVS Programming: Sysplex Services Reference* for information about these codes. Contact your IBM support center to report the problem.

**00F20019, 00F2001A, 00F2001B, 00F2001C, 00F2001D, 00F2001E, 00F2001F, 00F20020, 00F20021, 00F20022**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4969 and contact your IBM support center.

**00F20023**

The MQ-IMS bridge received a bad return code from IXCMSSGO.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Registers 2 and 3 contain the return and reason codes from XCF. Refer to the *MVS Programming: Sysplex Services Reference* for information about these codes.

**00F20024, 00F20026, 00F20027, 00F20029, 00F2002A, 00F2002B**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4969 and contact your IBM support center.

**00F2002C**

The MQ-IMS bridge received a bad return code from IXCMSGO.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Registers 2 and 3 contain the return and reason codes from XCF. Refer to the *MVS Programming: Sysplex Services Reference* for information about these codes.

**00F2002D, 00F2002E**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4969 and contact your IBM support center.

**00F20030**

The MQ-IMS bridge received a bad return code from IXCMSGO.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Registers 2 and 3 contain the return and reason codes from XCF. Refer to the *MVS Programming: Sysplex Services Reference* for information about these codes.

**00F20031**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4969 and contact your IBM support center.

**00F20032**

The MQ-IMS bridge received a bad return code from IXCMSGO.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Registers 2 and 3 contain the return and reason codes from XCF. Refer to the *MVS Programming: Sysplex Services Reference* for information about these codes.

00F20035, 00F20036, 00F20037, 00F20038, 00F20039, 00F2003A, 00F2003B, 00F2003D, 00F2003E, 00F2003F, 00F20040

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4969 and contact your IBM support center.

00F20041

The MQ-IMS bridge received an MQOPEN error.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Contact your IBM support center to report the problem.

00F20042

The MQ-IMS bridge received an MQCLOSE error.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Contact your IBM support center to report the problem.

00F20043

The MQ-IMS bridge received an MQGET error.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Contact your IBM support center to report the problem.

00F20044

The MQ-IMS bridge received an MQPUT error.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Contact your IBM support center to report the problem.

00F20045

The MQ-IMS bridge received an MQOPEN error.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Contact your IBM support center to report the problem.

**00F20046**

The MQ-IMS bridge received an MQCLOSE error.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Contact your IBM support center to report the problem.

**00F20047**

The MQ-IMS bridge received an MQGET error.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Contact your IBM support center to report the problem.

**00F20048**

The MQ-IMS bridge received an MQPUT error.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Contact your IBM support center to report the problem.

**00F20049**

The MQ-IMS bridge received an MQPUT1 error.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Contact your IBM support center to report the problem.

**00F2004A, 00F2004B, 00F2004C, 00F2004D, 00F2004E, 00F2004F, 00F20050, 00F20051, 00F20052, 00F20053, 00F20054, 00F20055, 00F20056, 00F20057**

An internal error has occurred.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4969 and contact your IBM support center.

**00F20058**

The MQ-IMS bridge received an MQPUT1 error.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Contact your IBM support center to report the problem.

**00F20059**

The MQ-IMS bridge received a severe sense code in an IMS negative response.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

The IMS sense code is given in message CSQ2003I.

**00F20069**

The MQ-IMS bridge received an error when trying to resolve an in-doubt unit of recovery.

**System action**

The current execution unit terminates with completion code X'5C6', and a dump is produced.

**System programmer response**

Contact your IBM support center to report the problem.

**Subsystem support codes (X'F3'):**

Many of the following reason codes are returned in register 15 at the time of an abnormal termination with completion code X'0Cx', and not as the reason code for a completion code of X'5C6'. This is indicated in the descriptions that follow.

If a subsystem support reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

**Diagnostics**

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- A printout of SYS1.LOGREC.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.

**00F30003, 00F30004, 00F30005**

An internal error has occurred.

**System action**

The request is not processed. A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

**00F30006**

An internal error has occurred.

**System action**

The request is not processed.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

00F30007, 00F30008

An internal error has occurred.

**System action**

The request is not processed. A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

00F30014

An internal error has occurred.

**System action**

The requester's task is ended abnormally with completion code X'5C6'. A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

00F30027, 00F30030 ,00F30032, 00F30033, 00F30038

An internal error has occurred.

**System action**

The request is not processed. A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

00F30042

An internal error has occurred.

**System action**

A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

00F30048

An internal error has occurred.

**System action**

The request is not processed. A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

00F30052

The recovery coordinator for the caller has already terminated, so the connection from the caller to MQ has been terminated.

**System action**

The request is not processed. The connection from the caller to MQ is terminated.

The caller might reconnect to MQ when the recovery coordinator has been restarted.

**System programmer response**

Identify and restart the recovery coordinator.

This abnormal termination is most commonly associated with a termination of RRS. There might be additional CSQ3009E messages on the console log associated with the termination of RRS.

**00F30053**

An internal error has occurred.

**System action**

The request is not processed. A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30067**

An internal error has occurred.

**System action**

The connection request is not processed. A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30070**

Functional recovery for the connection processing could not be established. The executing module could not establish its ESTAE. This can occur if the current address space has insufficient storage. This might lead to an abnormal termination of the queue manager.

**System action**

The connection request is not processed. The caller is ended abnormally with completion code X'5C6' and this reason code.

**System programmer response**

Restart the queue manager if necessary. A dump should be taken for problem analysis.

Examine the usage and free areas in the LSQA portion of the current address space private area. If necessary, have the size of the private areas expanded.

The caller should produce a SYS1.LOGREC entry and an SVC dump, so that you can examine the LSQA area. You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30071**

An internal error has occurred.

**System action**

The connection request is not processed. A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30075**

An internal error has occurred.

**System action**

A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30078**

An internal error has occurred.

**System action**

The request is not processed. A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30080**

An internal error has occurred.

**System action**

The application program is ended abnormally with completion code X'5C6' and this reason code. A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30091**

The application program issued an RRSF IDENTIFY function request, but RRS is not available.

**System action**

The IDENTIFY request is not processed.

**00F30093**

The application program issued an RRSF TERMINATE THREAD or TERMINATE IDENTIFY function request, but the application has issued an MQ API request since the last invocation of SRRCMIT or SRRBACK and therefore is not at a point of consistency.

**System action**

The function request is not processed.

**00F30095**

An internal error was detected in either MQ or RRS.

**System action**

The application is ended abnormally. The error is recorded in the SYS1.LOGREC data set and an SVC dump is requested.

This error might, in many cases, eventually cause the queue manager to terminate abnormally.

**System programmer response**

This is probably either an error in MQ or in RRS.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30096**

An internal error was detected in either MQ or RRS Context Services.

**System action**

The application is ended abnormally. The error is recorded in the SYS1.LOGREC data set and an SVC dump is requested.

This error might, in many cases, eventually cause the queue manager to terminate abnormally.

**System programmer response**

This is probably either an error in MQ or in RRS.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30101**

The parameter contained in the IEFSSNxx member used to initialize MQ (and other subsystems) is in error. See message CSQ3101E for details.

**System action**

See message CSQ3101E.

**System programmer response**

See message CSQ3101E.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30102**

The parameter contained in the IEFSSNxx member used to initialize MQ (and other subsystems) is in error. The MQ command prefix (CPF) must not be blank. For details, see message CSQ3102E.

**System action**

See message CSQ3102E.

**System programmer response**

See message CSQ3102E.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30103**

The parameter contained in the IEFSSNxx member used to initialize MQ (and other subsystems) is in error or the named module is not resident in a library available during IPL. See message CSQ3103E for details.

**System action**

See message CSQ3103E.

**System programmer response**

See message CSQ3103E.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30104**

Module CSQ3UR00 was unable to obtain the affinity table index for the named subsystem. z/OS did not recognize the named subsystem. See message CSQ3109E for details.

**System action**

See message CSQ3109E.

**System programmer response**

See message CSQ3109E.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30105**

Module CSQ3UR00 was unable to load Early module CSQ3EPX. Either there was an I/O error, or the named module is not resident in a library available during IPL. See message CSQ3105E for details.

**System action**

See message CSQ3105E.

**System programmer response**

See message CSQ3105E.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30106**

The parameter contained in the IEFSSNxx member used to initialize MQ (and other subsystems) is in error. The scope of the MQ command prefix (CPF) is not valid. For details, see message CSQ3112E.

**System action**

See message CSQ3112E.

**System programmer response**

See message CSQ3112E.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30107**

An error occurred during command prefix registration.

**System action**

The MQ subsystem ends abnormally.

**System programmer response**

See the accompanying CSQ3xxx messages for information about the cause of the problem.

**00F30210, 00F30211, 00F30212, 00F30213, 00F30214**

An internal error has occurred.

**System action**

The caller is ended abnormally. An SVC dump and associated SYS1.LOGREC entries are produced.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30216**

An attempt to create a queue manager address space failed. This is probably because the user who issued the START QMGR command has insufficient authority.

**System action**

The current START command processing is terminated. An SVC dump and associated SYS1.LOGREC entries are produced.

**System programmer response**

Check the authority of users and consoles to issue commands. Retry the command.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

#### **00F30217**

The console ID for the z/OS console that entered the current command is not found in the z/OS unit control module (UCM) structure. An internal z/OS command might have been incorrectly issued by an application program that provided invalid input parameters.

#### **System action**

The caller is ended abnormally.

#### **System programmer response**

Retry the START QMGR command. If the command was unsuccessful, collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

#### **00F30218**

An internal error has occurred.

#### **System action**

The current task is ended abnormally. The calling task might have requested an SVC dump or created associated SYS1.LOGREC entries.

#### **System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

#### **00F30219**

An internal error has occurred.

#### **System action**

The calling task is ended abnormally. The calling task might have requested an SVC dump or created associated SYS1.LOGREC entries.

#### **System programmer response**

Cancel the queue manager. End-of-task processing might still work, and it does a more complete clean-up than end-of-memory processing does. If this does not work, issue the z/OS command FORCE for the queue manager. If the problem is still unresolved, it might be necessary to perform an IPL of your z/OS system.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

#### **00F3021A**

An internal error has occurred.

#### **System action**

The calling task is ended abnormally. An SVC dump and associated SYS1.LOGREC entries are produced.

#### **System programmer response**

Stop the queue manager and reissue the START QMGR command.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

#### **00F3021C**

An ESTAE could not be established. This can occur if the z/OS system address space that is broadcasting the command has insufficient storage.

#### **System action**

The caller is ended abnormally (without a dump). The current START command processing is terminated.

**System programmer response**

Retry the command. If the error persists, it might be necessary to perform an IPL of your z/OS system.

Examine the LOGREC entries, and the console log for indications of a z/OS error, and try increasing the storage.

If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F3021D**

An ESTAE could not be established during either the initialization or termination of the queue manager.

This can occur during initialization if the z/OS system address space that is broadcasting the first command (assumed to be the START command) has insufficient storage.

This can occur during termination if the current address space (usually the queue manager, or in the case of EOM broadcast, a z/OS system address space) has insufficient storage.

**System action**

The caller is ended abnormally without taking a system dump. The initialization stops, but termination proceeds.

**System programmer response**

Retry the command after the queue manager has terminated. If the problem persists, it might be necessary to perform an IPL of your z/OS system.

Examine the LOGREC entries, and the console log for indications of a z/OS error, and try increasing the storage.

If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F3021E**

An ESTAE could not be established while in the process of routing control to the actual ESTAE routine. The caller (RTM) is ended abnormally. This causes the original error to percolate to a higher-level recovery routine and causes this reason code to be shown in an RTM recovery environment.

This can occur if the current address space (usually an allied address space) has insufficient storage.

**System action**

The caller is ended abnormally and a dump is produced.

**System programmer response**

Examine the usage and free areas in the LSQA portion of the current address space private area. If necessary, have the size of the private area expanded.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F3021F, 00F30220**

An internal error has occurred.

**System action**

The caller is not ended abnormally. A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30230**

An internal error has occurred.

**System action**

The connection between the allied address space and the queue manager terminated. A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30310**

An internal error has occurred.

**System action**

The invoker is ended abnormally. A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30311**

An ESTAE could not be established during the processing of a resolve-indoubt request. This can occur if the current address space has insufficient storage. This will probably cause an abnormal termination of the queue manager.

**System action**

The caller is ended abnormally.

**System programmer response**

Restart the queue manager if necessary.

Examine the usage and free areas in the local system queue area (LSQA) portion of the current address space private area. If necessary, have the size of the private area expanded.

The caller should produce a SYS1.LOGREC entry and an SVC dump, so that you can examine the LSQA area.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30312**

An ESTAE could not be established during the processing of a resolve-indoubt-UR request. This can occur if the current address space has insufficient storage.

**System action**

The caller is ended abnormally.

**System programmer response**

Examine the usage and free areas in the local system queue area (LSQA) portion of the current address space private area. If necessary, have the size of the private area expanded.

The caller should produce a SYS1.LOGREC entry and an SVC dump.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30313**

A control block could not be allocated. This could occur when the storage pool has no more free space available.

**System action**

The request is not processed. The application program is ended abnormally with completion code X'5C6' and this reason code.

**System programmer response**

A dump should be taken for problem analysis.

Check that you are running with the recommended region size, and if not, reset your system and retry. If you are unable to resolve the problem, collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30400, 00F30401, 00F30402**

An internal error has occurred.

**System action**

The program which made the request might produce diagnostics to report the error.

**System programmer response**

Collect the diagnostics produced by the application program reporting the error, if any, and contact your IBM support center.

**00F30406**

The queue manager has gone to EOM (end-of-memory). This is probably because the z/OS command FORCE has been issued.

**System action**

The queue manager is terminated, and a dump is taken.

**System programmer response**

The queue manager can be restarted after termination completes.

Determine why the z/OS command FORCE was issued.

**00F30409, 00F3040A**

An internal error has occurred.

**System action**

The queue manager is terminated with an SVC dump.

**System programmer response**

The queue manager can be started again after it terminates.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F3040B**

See message CSQ3001E.

**System action**

See message CSQ3001E.

**System programmer response**

See message CSQ3001E.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

#### 00F3040C, 00F3040D

An internal error has occurred.

#### **System action**

The queue manager is terminated with an SVC dump.

#### **System programmer response**

The queue manager can be started again after it terminates.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

#### 00F3040E

An internal error has occurred.

#### **System action**

The queue manager is terminated.

#### **System programmer response**

The queue manager should be restarted.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

#### 00F3040F, 00F30410

An internal error has occurred.

#### **System action**

The queue manager is terminated.

#### **System programmer response**

The queue manager can be started again after it terminates.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

#### 00F30411, 00F30412, 00F30413

An internal error has occurred.

#### **System action**

The queue manager is terminated.

#### **System programmer response**

The queue manager can be started again after it terminates.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

#### 00F30414

An internal error has occurred.

#### **System action**

The queue manager is terminated.

#### **System programmer response**

The queue manager can be started again after it terminates. If the problem persists, request a stand-alone dump, and perform an IPL of your z/OS system.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

#### 00F30415

An ESTAE could not be established during the processing of an EOM SSI broadcast. This is probably a z/OS problem, because these modules are executing in the z/OS master scheduler address space.

**System action**

The queue manager is terminated.

**System programmer response**

The queue manager can be started again after it terminates. If the problem persists, it might be necessary to perform an IPL of your z/OS system.

This can occur if the z/OS master scheduler address space has insufficient free storage. If such is the case, MQ is unable to write a SYS1.LOGREC record or request a dump. The z/OS master scheduler should have produced these diagnostic aids. Examine the dump to determine whether the problem is in z/OS or MQ. Other unrelated errors in the z/OS Master Scheduler address space would indicate a z/OS problem.

If the problem appears to be an MQ problem, collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30416**

An ESTAE could not be established during the processing of an EOM for an allied address space.

**System action**

The queue manager is terminated.

**System programmer response**

The queue manager can be started again after it terminates. If the problem persists, it might be necessary to perform an IPL of your z/OS system.

This can occur if the z/OS master scheduler address space has insufficient free storage. If such is the case, MQ is unable to write a SYS1.LOGREC record or request a dump. The z/OS master scheduler should have produced these diagnostic aids. Examine the dump to determine whether the problem is in z/OS or MQ. Other unrelated errors in the z/OS Master Scheduler address space would indicate a z/OS problem.

If the problem appears to be an MQ problem, collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30417, 00F30418**

An internal error has occurred.

**System action**

The queue manager is terminated.

**System programmer response**

The queue manager can be started again after it terminates.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30419**

An internal error has occurred.

**System action**

The queue manager is terminated with an SVC dump.

**System programmer response**

The queue manager can be started again after it terminates.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

#### **00F3041A**

An ESTAE could not be established by the deferred end-of-task (EOT) processor. This error could occur only during queue manager startup. Probably, an ESTAE could not be established because of a shortage of LSQA space.

#### **System action**

The queue manager is terminated.

#### **System programmer response**

Restart the queue manager.

If the problem persists, increase the size of the queue manager address space private area.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

#### **00F3041B, 00F30420**

An internal error has occurred.

#### **System action**

The queue manager is terminated. A SYS1.LOGREC entry and associated SVC dump were requested.

#### **System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

#### **00F30429**

An internal error has occurred.

#### **System action**

The queue manager is terminated with an SVC dump.

#### **System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

#### **00F30450**

An ESTAE could not be established during the processing of an identify SSI call. This can occur if the current address space has insufficient storage.

#### **System action**

The allied address space is ended abnormally (without a dump). A dump should be produced by the allied task.

#### **System programmer response**

The user can retry the identify request. If a dump is available, review the storage manager's control blocks to determine if all of the private area has been allocated. If necessary, increase the private area size of the allied address space.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

#### **00F30451**

An ESTAE could not be established during the processing of an identify SSI call. This can occur if the current address space has insufficient storage.

**System action**

The allied task is ended abnormally (without a dump). A dump should be produced by the allied task.

**System programmer response**

The user can retry the identify request. If a dump is available, review the storage manager's control blocks to determine if all of the private area has been allocated. If necessary, increase the private area size of the allied address space.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30452**

An ESTAE could not be established during the processing of an identify SSI call. This can occur if the current address space has insufficient storage.

**System action**

The allied task is ended abnormally (without a dump). A dump should be produced by the allied task.

**System programmer response**

The user can retry the identify request. If a dump is available, review the storage manager's control blocks to determine if all of the private area has been allocated. If necessary, increase the private area size of the allied address space.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30453**

ESTAEs could not be established during the processing of a n SSI call other than FEOT, EOM, HELP, COMMAND, and IDENTIFY. This can occur if the current address space has insufficient storage.

**System action**

The allied task is ended abnormally (without a dump). A dump should be produced by the allied task.

**System programmer response**

The user can retry the request. If a dump is available, review the storage manager's control blocks to determine if all of the private area has been allocated. If necessary, increase the private area size of the allied address space.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30454**

An internal error has occurred.

**System action**

The allied task is ended abnormally.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30455**

An ESTAE could not be established during the processing of an identify termination request. This can occur if the current address space has insufficient storage.

**System action**

The allied task is ended abnormally (without a dump). A dump should be produced by the allied task.

**System programmer response**

The user can retry the request. If a dump is available, review the storage manager's control blocks to determine if all of the private area has been allocated. If necessary, increase the private area size of the allied address space.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30456**

An internal error has occurred.

**System action**

The calling task is ended abnormally.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30457**

An internal error has occurred.

**System action**

The caller is ended abnormally. The error might, in many cases, eventually terminate the queue manager.

**System programmer response**

Restart the queue manager if necessary.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30459**

An internal error has occurred.

**System action**

The queue manager is terminated with a reason code of X'00F30420'.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30461**

The queue manager was unable to successfully restart with RRS because of an internal error in either MQ or RRS.

**System action**

The queue manager is not connected to RRS and all services dependent on that connection are unavailable. This means that applications might not connect to the queue manager using RRSF and that WLM-established address spaces might not be used for MQ stored procedures until the queue manager successfully restarts with RRS.

**System programmer response**

Stop and then start RRS. Stop and then start the queue manager. If the problem persists, perform an RRS cold start.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30501, 00F30502**

An internal error has occurred.

**System action**

The requester is ended abnormally, and the request is not processed.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30503**

CSQ6SYSP is missing from the system parameter load module.

**System action**

Queue manager start-up is terminated.

**System programmer response**

Re-create your system parameter load module (if a customized version is being used) and restart the queue manager. For information about the system parameter modules, see Tailor your system parameter module.

**00F30573, 00F30574**

An internal error has occurred.

**System action**

The requester is ended abnormally, and the request is not processed. A dump is taken, and an entry is written in SYS1.LOGREC.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30580**

An internal error has occurred.

**System action**

The requester is ended abnormally.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30581**

An internal error has occurred.

**System action**

The queue manager ends abnormally. The startup/shutdown ESTAE creates a SYS1.LOGREC entry and takes an SVC dump.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30597, 00F30598**

An internal error has occurred.

**System action**

The allied task is ended abnormally, and the request is not processed.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30599**

An internal error has occurred.

**System action**

The connection name associated with the error is probably unable to continue communication with MQ until the queue manager is terminated and restarted.

**System programmer response**

If necessary, stop and restart the queue manager.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30601**

Asynchronous events occurred which caused the premature termination of the thread. The thread could not be recovered.

There might be other errors or messages concerning this allied user indicating what the asynchronous events were.

**System action**

The allied user is ended abnormally with completion code X'5C6' and this reason code.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30610**

An ESTAE could not be established during the processing of an 'end stop-work force' notification. This can occur if there is insufficient storage. This might lead to abnormal termination of the queue manager.

**System action**

The caller is ended abnormally. An SVC dump and related SYS1.LOGREC entry are requested.

**System programmer response**

If necessary, restart the queue manager.

If necessary, increase the private area size of the address space.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30801**

An internal error has occurred.

**System action**

The queue manager is terminated. An SVC dump is requested.

**System programmer response**

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30802**

An internal error has occurred.

**System action**

The task is not ended abnormally.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30803**

An ESTAE could not be established during the processing of an application program support call. This can occur if the current address space has insufficient storage.

**System action**

The allied task is ended abnormally. The allied task might have requested an SVC dump.

**System programmer response**

The user can retry the request. If necessary, increase the private area size of the application address space.

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30805**

An internal error has occurred.

**System action**

The request might have been processed or rejected.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4974 and contact your IBM support center.

**00F30901**

MQ has lost its cross-memory authority to an allied address space because the ally has released its authorization index.

**System action**

The allied address space is terminated.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30902**

MQ has detected a recursive error condition while processing End-of-Task for a task in an allied address space.

**System action**

The allied address space is terminated.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30903**

An error has occurred while processing End-of-Task for the queue manager address space.

**System action**

The address space is forced to 'end-of-memory' with this reason code.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

**00F30904**

End-of-Task occurred for the queue manager address space, and MQ could not establish an ESTAE to protect its processing. Insufficient storage might be the reason the ESTAE could not be established.

**System action**

The address space is forced to 'end-of-memory' with this reason code.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

Attempt to determine if one or more MQ address spaces is storage-constrained. Examination of the console output for the time period preceding this condition might reveal other messages or indications that the terminating address space was storage-constrained.

**00F30905**

End-of-Task occurred for the job step task in an allied address space. MQ would normally attempt to terminate the address space's connection to the queue manager but was unable to protect its processing by establishing an ESTAE. Insufficient storage might be the reason the ESTAE could not be established.

**System action**

The address space is forced to 'end-of-memory' with this reason code.

**System programmer response**

You might find the items listed in "Diagnostics" on page 4974 useful in resolving the problem.

Attempt to determine if one or more allied address spaces is storage-constrained. Examination of the console output for the time period preceding this condition might reveal other messages or indications that the terminating allied address space was storage-constrained.

**00F33100**

The MQ thread is read-only.

**System action**

A prepare issued by the application program was processed through Phase-1. MQ discovered there were no resources modified and no need for COMMIT or BACKOUT to be subsequently issued.

**System programmer response**

This might create a path length saving by not issuing the subsequent commit or backout which normally follows prepare. No further action is required to complete the unit of recovery; the unit of recovery is complete.

## Db2 manager codes (X'F5'):

If a Db2 manager reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

### Diagnostics

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- A printout of SYS1.LOGREC.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.

### 00F50000

An internal error has occurred.

### System action

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

### System programmer response

Ensure that the QSGDATA system parameter is specified correctly and restart the queue manager.

If the problem persists, collect the items listed in "Diagnostics" and contact your IBM support center.

### 00F50001

An internal error has occurred.

### System action

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

### System programmer response

Restart the queue manager.

If the problem persists, collect the items listed in "Diagnostics" and contact your IBM support center.

### 00F50002

An internal error has occurred.

### System action

The task ends abnormally. Queue manager processing continues but the queue manager might not terminate normally and might not register Db2 termination.

### System programmer response

Refer to *Db2 for z/OS Messages and Codes* for information about the completion and reason code in the accompanying message and collect the diagnostic data requested in the manual. In addition, collect the items listed in "Diagnostics" and contact your IBM support center.

### 00F50003

An internal error has occurred.

### System action

The task ends abnormally. Queue manager processing continues.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50004**

An internal error has occurred.

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

Ensure that the following modules are available through the linklist or the steplib concatenation: DSNRLI, DSNHLIR, DSNWLIR, ATRCMIT and ATRBACK. Restart the queue manager.

If the problem persists, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50006**

An internal error has occurred.

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

All queue managers that are members of the same queue-sharing group must connect to the same Db2 data-sharing group. Check that all queue managers in the queue-sharing group have the same Db2 data-sharing group specified in the QSGDATA system parameter. Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50007**

An internal error has occurred.

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

Ensure that the Db2 subsystem(s) specified on the QSGDATA system parameter are members of the Db2 data-sharing group that is also specified on the QSGDATA system parameter. Restart the queue manager.

If the problem persists, refer to *Db2 for z/OS Messages and Codes* for information about the completion and reason code in the accompanying message and collect the diagnostic data requested in the manual. In addition, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50008**

An internal error has occurred.

**System action**

The task ends abnormally and processing continues.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50009**

An internal error has occurred.

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

Restart the queue manager.

Refer to *Db2 for z/OS Messages and Codes* for information about the completion and reason code in the accompanying message and collect the diagnostic data requested in the manual. In addition, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50010**

An internal error has occurred.

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

Restart the queue manager.

See *z/OS MVS Programming: Sysplex Services Reference* for an explanation of the error and the diagnostic information, if any, that you must collect. In addition, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50013**

No queue manager entry was found in the CSQ.ADMIN\_B\_QMGR table for this combination of queue manager and queue-sharing group, or the entry was incorrect.

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

Check the CSQ.ADMIN\_B\_QMGR table in the Db2 data-sharing group and ensure that an entry has been defined for the queue manager and it relates to the correct queue-sharing group.

If you are migrating from a previous release of MQ, check also that you have updated the Db2 tables to the format for the current release. See *Migrating*, for information about migration and compatibility between releases.

Restart the queue manager. If the problem persists, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50014**

An internal error has occurred.

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

Check that the Db2 related installation and customization tasks have all completed successfully. Restart the queue manager.

If the problem persists, refer to *Db2 for z/OS Messages and Codes* for information about the completion and reason code in the accompanying message and collect the diagnostic data requested in the manual. In addition, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50015**

An internal error has occurred.

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

Restart the queue manager.

If the problem persists, refer to *Db2 for z/OS Messages and Codes* for information about the completion and reason code in the accompanying message and collect the diagnostic data requested in the manual. In addition, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50016**

An internal error has occurred.

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

Restart the queue manager.

If the problem persists, refer to *Db2 for z/OS Messages and Codes* for information about the completion and reason code in the accompanying message and collect the diagnostic data requested in the manual. In addition, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50017**

An internal error has occurred.

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

See *z/OS MVS Programming: Sysplex Services Reference* for information about the completion and reason code in the accompanying message.

Restart the queue manager. If the problem persists, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

This error may occur if one or more of the queue managers in a Queue Sharing Group (QSG) do not have a member entry in the XCF group for the QSG.

Enter the following z/OS command substituting the QSG name for xxxx:

```
D XCF,GRP,CSQGxxxx,ALL
```

This will list the members of the XCF group. If any queue managers are defined as a member of the QSG, but do not have an entry in the XCF Group, use the ADD QMGR command of the CSQ5PQSG utility to restore the XCF group entry for that queue manager. The utility should be run for each queue manager which does not have an entry in the XCF group.

**00F50018**

An internal error has occurred.

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

See *z/OS MVS Programming: Sysplex Services Reference* for information about the completion and reason code in the accompanying message.

Restart the queue manager. If the problem persists, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50019**

An internal error has occurred.

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

See z/OS MVS Programming: Sysplex Services Reference for information about the completion and reason code in the accompanying message.

Restart the queue manager. If the problem persists, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F5001C**

CSQ5\_DB2\_UNAVAILABLE

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

See z/OS MVS Programming: Sysplex Services Reference for information about the completion and reason code in the accompanying message.

Restart the queue manager. If the problem persists, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50021**

An internal error has occurred.

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

See z/OS MVS Programming: Sysplex Services Reference for information about the completion and reason code in the accompanying message.

Restart the queue manager. If the problem persists, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50024**

An internal error has occurred.

**System action**

The task ends abnormally and a dump is taken.

**System programmer response**

If the problem persists, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50025**

An internal error has occurred.

**System action**

The task ends abnormally and a dump is taken.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50026**

An internal error has occurred.

**System action**

The task ends abnormally and a dump is taken.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50027**

An internal error has occurred.

**System action**

The task ends abnormally and a dump is taken.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F50028**

An internal error has occurred.

**System action**

The task ends abnormally and a dump is taken.

**System programmer response**

This might be a temporary condition if Db2 or RRS has failed. If the problem persists, collect the items listed in "Diagnostics" on page 4993, together with output from Db2 command DISPLAY THREAD(\*), and contact your IBM support center.

**00F50029**

The queue manager has detected a mismatch between its supported versions of MQ and those of other members of the queue-sharing group.

**System action**

The queue manager terminates, a record is written to SYS1.LOGREC and a dump is taken.

**System programmer response**

Verify the started task JCL procedure for the queue manager (xxxxMSTR) is executing the correct version of MQ. Restart the queue manager. If the correct version is being executed, collect the items listed in "Diagnostics" on page 4993, together with a printout of the CSQ.ADMIN\_B\_QMGR table from the Db2 data-sharing group to which the queue manager connected, and contact your IBM support center.

**00F50901**

An internal error has occurred.

**System action**

The job ends abnormally with a X'5C6' completion code and a dump is taken.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F51030**

An internal error has occurred.

**System action**

The task ends abnormally and a dump is taken.

**System programmer response**

Restart RRS if it has terminated. If RRS has not terminated, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**00F51031**

An internal error has occurred on a Db2 connection thread.

**System action**

The task ends abnormally and a new task is created. A dump is taken if there is an 'in-flight' Db2 request.

**System programmer response**

None. A new Db2 server task is automatically re-created to replace the task that was terminated. If the problem persists, collect the items listed in "Diagnostics" on page 4993 and contact your IBM support center.

**Generalized command preprocessor codes (X'F9'):**

If a command preprocessor reason code occurs that is not listed here, an internal error has occurred. Collect the following diagnostic items and contact your IBM support center.

**Diagnostics**

- A description of the actions that led to the error or, if applicable, either a listing of the application program or the input string to a utility program that was being run at the time of the error.
- The console output for the period leading up to the error.
- The queue manager job log.
- The system dump resulting from the error.
- Appropriate WebSphere MQ, z/OS, Db2, CICS, and IMS service levels.
- If you are using the WebSphere MQ Operations and Control panels, the ISPF panel name.
- The command issued before the error occurred.

**00F90000**

An internal error has occurred.

**System action**

Command execution was ended abnormally. If the command was properly entered, it might have been partially or completely executed.

**System programmer response**

Collect the items listed in "Diagnostics" and contact your IBM support center.

It might be necessary to restart the CICS or IMS adapter.

**00F90001**

An internal error has occurred.

**System action**

Command execution was ended abnormally. If the command was properly entered, it might have been partially or completely executed.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4999 and contact your IBM support center.

It might be necessary to restart the CICS or IMS adapter.

**00F90002**

The routines of the multiple console support (MCS) service of z/OS. were unable to initialize. This condition might indicate an error in the address space.

**System action**

Initialization is stopped, causing the queue manager to terminate.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4999 and contact your IBM support center.

Restart the queue manager.

**00F90003**

The routines of the multiple console support (MCS) service of z/OS were unable to initialize.

**System action**

If the error was issued by module CSQ9SCNM, queue manager initialization is stopped, causing the queue manager to terminate. If the error was issued by module CSQ9SCN6, the command from the associated console is executed, and should proceed normally.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4999 and contact your IBM support center.

**00F90004**

The routines of the multiple console support (MCS) service of z/OS detected a logic error.

**System action**

The command was not executed.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4999 and contact your IBM support center.

**00F90005**

A routine of the multiple console support (MCS) service of z/OS was not able to create an ESTAE recovery environment. This condition is detected when the ESTAE service of z/OS returns a nonzero return code. The command from the associated z/OS console is not executed. See the *MVS Programming: Assembler Services Reference* manual for an explanation of ESTAE return codes.

**System action**

Command processing is terminated.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4999 and contact your IBM support center.

**00F90006**

An internal error has occurred.

**System action**

Agent allocation is terminated.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4999 and contact your IBM support center.

**00F90007**

An internal error has occurred.

**System action**

The statistical update is not completed. The statistics block address is cleared from the CGDA to prevent future problems. No further command statistical counts are maintained. Processing for the command is retried and should complete normally.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4999 and contact your IBM support center.

**00F90008**

An internal error has occurred.

**System action**

The function is ended abnormally.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4999 and contact your IBM support center.

**00F90009**

This reason code is used to document that module CSQ9SCN9 has added information to the SDWA variable recording area (VRA) following the data provided by the CSQWRCRD service. If CSQ9SCN9 records an error in SYS1.LOGREC and the reason code in the VRA is not of the form X'00F9xxxx', the reason code is changed to X'00F90009'. This is done so that anyone examining a SYS1.LOGREC entry can determine, from the reason code, what additional data has been placed in the VRA. The reason code is the first data item in the VRA, as mapped by macro IHAVRA.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4999 and contact your IBM support center.

**00F9000A**

An internal error has occurred.

**System action**

Command execution was ended abnormally. The command was not executed.

**System programmer response**

Collect the items listed in "Diagnostics" on page 4999 and contact your IBM support center.

**00F9000B**

An internal error occurred while attempting to obtain CSA storage. The storage request could not be satisfied, either because no CSA storage was available or because an unreasonably large amount of storage was requested. The amount of storage requested is determined by the length of the command being parsed. Normally, it is several hundred bytes.

**System action**

Command execution is ended abnormally.

**System programmer response**

It might be necessary to restart the CICS or IMS adapter, or the queue manager.

If the problem persists, collect the items listed in "Diagnostics" on page 4999 and contact your IBM support center.

#### 00F9000C

An internal error has occurred.

The command processor invoked attempted to return a message formatted for inclusion in a z/OS multiple line WTO (write to operator).

#### System action

Command execution is ended abnormally.

#### System programmer response

The command in error is identified by message CSQ9017E. It might be necessary to restart the CICS or IMS adapter, or the queue manager.

Collect the items listed in "Diagnostics" on page 4999 and contact your IBM support center.

#### 00F9000D

An internal error has occurred.

#### System action

The queue manager start-up is terminated.

#### System programmer response

Restart the queue manager.

Collect the items listed in "Diagnostics" on page 4999 and contact your IBM support center.

#### 00F9000E

An internal error has occurred.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4999 and contact your IBM support center.

#### 00F9000F

MQ was unable to locate the default userid to be used on a command check. This indicates that CSQ6SYSP is not in the system parameter load module.

#### System action

The current execution unit terminates with completion code X'5C6'.

#### System programmer response

Ensure that CSQ6SYSP is in the system parameter load module. Restart the queue manager if necessary.

#### 00F90010

An internal error has occurred while processing a command.

#### System action

Command execution was ended abnormally. The command was not executed.

#### System programmer response

Collect the items listed in "Diagnostics" on page 4999 and contact your IBM support center.

## IBM MQ CICS adapter abend codes

See the Transaction abend codes section of the CICS documentation for further information.

### QAPI

Unrecognizable API call. All supported API calls are documented in the Function calls.

#### System action

The task is ended abnormally.

### QCAL

The WebSphere MQ CICS adapter has been invoked by CICS for an unknown reason.

#### System action

The invoking task is ended abnormally.

#### System programmer response

Contact your IBM support center.

### QCMG

This abend code is issued because the WebSphere MQ CICS adapter error handler is unable to load the message text module CSQFCTAB or CSQCMTXT. This module must be defined as a program entry in CICS, and exists in the WebSphere MQ library under the DFHRPL DD statement in the CICS JCL.

#### System action

The task invoking the message handler is ended abnormally.

#### System programmer response

Check that the installation process was followed correctly.

### QDCL

An attempt to EXEC CICS LOAD the data conversion service modules was unsuccessful.

#### System action

The task is ended abnormally.

### QGAL

CSQCCON had enabled CSQCTRUE with a global area smaller than that needed by CSQCTRUE. This could be due to a mismatch of version level between CSQCCON and CSQCTRUE.

#### System action

The task is ended abnormally.

### QNST

A task has issued an API call that requires task switching, but there are no server subtasks available. This is because the subtasks have not yet started, or were not started successfully. (Message CSQC472I is issued for each subtask started; there should be eight of these.)

#### System action

The task is ended abnormally.

This abend can also cause CICS to stop. This happens if either:

- In-doubt units of work are being resolved at connect time. The connection process requires a server subtask to execute the resolutions, so if there are no subtasks available, the process stops with this reason code. This abend during the resynchronization process causes CICS to stop.

- The abend occurs in a program list table (PLT) program.

**System programmer response**

Investigate why your system is running so slowly that the subtasks have not yet started.

**QTAL**

CSQCCON had enabled CSQCTRUE with a task area smaller than that needed by CSQCTRUE. This could be due to a mismatch of version level between CSQCCON and CSQCTRUE.

**System action**

The task is ended abnormally.

**IBM MQ CICS bridge abend codes**

See the Transaction abend codes section of the CICS documentation for further information.

**CKB0**

This abend code is issued because the WebSphere MQ CICS adapter error handler is unable to load the message text module CSQFCTAB or CSQCMTXT. This module must be defined as a program entry in CICS, and exists in the WebSphere MQ library under the DFHRPL DD statement in the CICS JCL.

**System action**

The task invoking the message handler is ended abnormally.

**System programmer response**

Check that the installation process was followed correctly.

**CKB1**

An internal logic error has been detected in the CICS bridge monitor.

**System action**

Message CSQC750E is written to the CICS CSMT transient data queue and the CICS bridge monitor task is ended abnormally.

**CKB2**

The CICS bridge monitor has terminated with CICS bridge tasks still active.

**System action**

Message CSQC744E is written to the CICS CSMT transient data queue and the CICS bridge monitor task is ended abnormally.

**CKB3**

The CICS DPL bridge program has detected an error in a request message for this unit of work.

**System action**

All request messages for this unit of work are copied to the dead-letter queue with an MQFB\_CICS\_\* reason code. Corresponding error messages are written to the CICS CSMT transient data queue. An MQCRC\_BRIDGE\_ERROR reply is sent to the reply-to queue if requested. The CICS bridge task is ended abnormally.

**CKB4**

The CICS bridge monitor or DPL bridge program received an abend due to an unexpected return code from an EXEC CICS API call.

**System action**

Message CSQC704E is written to the CICS CSMT transient data queue and the CICS bridge monitor or DPL bridge program is abnormally terminated.

**CKB5**

The CICS bridge monitor or DPL bridge program received an abend due to an unexpected return code from an MQ API call.

**System action**

Message CSQC710E is written to the CICS CSMT transient data queue and the CICS bridge monitor or DPL bridge program is abnormally terminated.

**CKB6**

The CICS bridge message handling program is unable to proceed because its COMMAREA is too small.

**System action**

The CICS bridge monitor is abnormally terminated.

**CKB7**

The CICS DPL bridge program received an abend before processing any messages for the unit of work.

**System action**

All request messages for this unit of work are left on the CICS bridge queue to be handled by the CICS bridge monitor.

**CKB8**

The CICS DPL bridge program received an abend during error processing.

**System action**

An unexpected error occurred during CICS DPL bridge error processing.

**MBRA**

The type of EXEC CICS RECEIVE request does not match the next BRMQ vector.

**System action**

The transaction is abnormally terminated.

**MBRB**

The size of the EXEC CICS SEND MAP request is too large for the output buffer (the maximum size is 20 KB).

**System action**

The transaction is abnormally terminated.

**MBRC**

An error occurred issuing an EXEC CICS SYNCPOINT request.

**System action**

The transaction is abnormally terminated.

**MBRD**

An error occurred issuing an EXEC CICS SYNCPOINT ROLLBACK request.

**System action**

The transaction is abnormally terminated.

**MBRE, MBRF, MBRG**

The CICS bridge exit received an unexpected return code from an MQ API call.

**System action**

The transaction is abnormally terminated. The request messages are moved to the dead-letter queue.

**MBRH**

MQCIH field *ConversationalTask* was set to MQCCT\_NO, but the task was conversational.

**System action**

The transaction is abnormally terminated.

**MBRI**

The size of the request message is too large for the input buffer (the maximum size is 20 KB).

**System action**

The transaction is abnormally terminated. The request messages are moved to the dead-letter queue.

**MBRJ**

The contents of the MQCIH or BRMQ vectors are incorrect.

**System action**

The transaction is abnormally terminated.

**MBRK**

The start data received by the CICS bridge exit is incorrect.

**System action**

The transaction is abnormally terminated.

**MBRM**

The CICS bridge exit received invalid calling parameters from CICS.

**System action**

The transaction is abnormally terminated. The request messages are moved to the dead-letter queue.

**MBRN**

The request message was truncated.

**System action**

The transaction is abnormally terminated.

**MBRO, MBRP**

The contents of the MQCIH or BRMQ vectors are incorrect.

**System action**

The transaction is abnormally terminated.

**MBRQ**

A requested map did not have an associated ADSD.

**System action**

The transaction is abnormally terminated.

**MBRS**

The CICS bridge exit received an unexpected return code from an MQ API call to open a queue.

**System action**

The transaction is abnormally terminated. All request messages for this unit of work are left on the CICS bridge queue to be handled by the CICS bridge monitor.

**MBR1, MBR2, MBR3, MBR6**

The CICS bridge exit received invalid calling parameters from CICS.

**System action**

The transaction is abnormally terminated. The request messages are moved to the dead-letter queue.

**MBR7**

The size of the EXEC CICS TC output request is too large for the output buffer (the maximum size is 20 KB).

**System action**

The transaction is abnormally terminated.

**MBR8**

The mapset name in the next BRMQ vector does not match the CICS request.

**System action**

The transaction is abnormally terminated.

**MBR9**

The map name in the next BRMQ vector does not match the CICS request.

**System action**

The transaction is abnormally terminated.

**MQB1**

The CICS bridge exit received an unexpected return code from an MQ API call when processing a backout request.

**System action**

The transaction is abnormally terminated. The request messages are moved to the dead-letter queue.

**MQB2**

The CICS bridge exit received an unexpected return code from an MQ API call when processing a commit request.

**System action**

The data is not committed. The transaction is abnormally terminated. The request messages are moved to the dead-letter queue.

**MQB4**

The CICS bridge exit was unable to reread messages from the bridge request queue during backout processing.

**System action**

The request messages are left on the CICS bridge queue with MQMD.BackoutCount set to 1.

## IBM MQ component identifiers

IBM MQ for z/OS has a component-based architecture and each component uses a unique identifier code. These identifier codes are displayed in some of the informational messages.

*Table 374. Component identifiers used in IBM MQ messages and codes*

Component	ID	Hex ID
Batch adapter	B	X'C2'
CICS adapter	C	X'C3'
Coupling Facility manager	E	X'C5'
Message generator	F	X'C6'
Functional recovery manager	G	X'C7'
Security manager	H	X'C8'
Data manager	I	X'C9'
Recovery log manager	J	X'D1'
Lock manager	L	X'D3'
Connection manager	m	X'94'
Message manager	M	X'D4'
Command server	N	X'D5'
Operations and control	O	X'D6'
Buffer manager	P	X'D7'
IMS adapter	Q	X'D8'
Recovery manager	R	X'D9'
Storage manager	S	X'E2'
Timer services	T	X'E3'
Utilities	U	X'E4'
Agent services	V	X'E5'
Instrumentation facilities	W	X'E6'
Distributed queuing	X	X'E7'
Initialization procedures and general services	Y	X'E8'
System parameter manager	Z	X'E9'
Advanced message security	0 (zero)	X'F0'
Service facilities	1	X'F1'
IBM MQ - IMS bridge	2	X'F2'
Subsystem support	3	X'F3'
Db2 manager	5	X'F5'
Generalized command processor	9	X'F9'

## Communications protocol return codes

The communication protocols used by IBM MQ for z/OS can issue their own return codes. Use these tables to identify the return codes used by each protocol.

The tables in this topic show the common return codes from TCP/IP and APPC/MVS returned in messages from the distributed queuing component:

- “TCP/IP UNIX System Services Sockets return codes”
- APPC/MVS return codes

If the return code is not listed, or if you want more information, see to the documentation mentioned in each table.

If the return code you received is X'7D0' or more, it is one of the MQRC\_\* return codes issued by IBM MQ. These codes are listed in API completion and reason codes.

## TCP/IP UNIX System Services Sockets return codes

See the *TCP/IP UNIX System Services Messages and Codes* manual for more information and for further return codes.

Table 375. UNIX System Services sockets return codes

Return code (Hexadecimal)	Explanation
0001	Error in the domain
0002	Result is too large
006F	Permission is denied
0070	The resource is temporarily unavailable
0071	The file descriptor is incorrect
0072	The resource is busy
0073	No child process exists
0074	A resource deadlock is avoided
0075	The file exists
0076	The address is incorrect
0077	The file is too large
0078	A function call is interrupted
0079	The parameter is incorrect
007A	An I/O error occurred
007B	The file specified is a directory
007C	Too many files are open for this process
007D	Too many links occurred
007E	The file name is too long
007F	Too many files are open in the system
0080	No such device exists
0081	No such file, directory, or IPC member exists
0082	The exec call contained a format error ( DFSMS error)
0083	No locks are available
0084	Not enough space is available
0085	No space is left on the device, or no space is available to create the IPC member ID

Table 375. UNIX System Services sockets return codes (continued)

Return code (Hexadecimal)	Explanation
0086	The function is not implemented
0087	Not a directory
0088	The directory is not empty
0089	The I/O control operator is inappropriate
008A	No such device or address exists
008B	The operation is not permitted
008C	The pipe is broken
008D	The specified file system is read only
008E	The seek is incorrect
008F	No such process or thread exists
0090	A link to a file on another file system was attempted
0091	The parameter list is too long, or the message to receive was too large for the buffer
0092	A loop is encountered in symbolic links
0093	The byte sequence is incorrect
0095	A value is too large to be stored in the data type
0096	OpenMVS kernel is not active
0097	Dynamic allocation error
0098	Catalog Volume Access Facility error
0099	Catalog obtain error
009C	Process Initialization error
009D	An MVS environmental or internal error has occurred
009E	Bad parameters were passed to the service
009F	HFS encountered a permanent file error
00A2	HFS encountered a system error
00A3	SAF/RACF extract error
00A4	SAF/RACF error
00A7	Access to the OpenMVS version of the C RTL is denied
00A8	The password for the specified resource has expired
00A9	The new password specified is not valid
00AA	A WLM service ended in error
03EA	Socket number assigned by client interface code (for socket() and accept()) is out of range
03EB	Socket number assigned by client interface code is already in use
03ED	Offload box error
03EE	Offload box restarted
03EF	Offload box down
03F0	Already a conflicting call outstanding on socket
03F1	Request canceled using SOCKcallCANCEL request
03F3	SetIbmOpt specified a name of a PFS that either was not configured or was not a Sockets PFS

Table 375. UNIX System Services sockets return codes (continued)

Return code (Hexadecimal)	Explanation
044C	Block device required
044D	Text file busy
044E	The descriptor is marked nonblocking, and the requested function cannot complete immediately
044F	Operation now in progress
0450	Operation already in progress
0451	Socket operation on a non-socket
0452	Destination address required
0453	The message is too large to be sent in a single transmission, as required
0454	The socket type is incorrect
0455	Protocol or socket option unavailable
0456	Protocol not supported
0457	Socket type not supported
0458	The referenced socket is not a type that supports the requested function
0459	Protocol family not supported
045A	The address family is not supported
045B	The address is already in use
045C	Cannot assign requested address
045D	Network is down
045E	Network is unreachable
045F	Network dropped connection on reset
0460	Software caused connection abort
0461	Connection reset by peer
0462	Insufficient buffer space available
0463	The socket is already connected
0464	The socket is not connected
0465	Cannot send after socket shutdown
0466	Too many references: Cannot splice
0467	Connection timed out
0468	The attempt to connect was rejected
0469	Host is down
046A	No route to host
046B	Too many processes
046C	Too many users
046D	Disk quota exceeded
046E	Stale NFS file handle
046F	Too many levels of remote in path
0470	Device is not a stream
0471	Timer expired
0472	Out of streams resources

Table 375. UNIX System Services sockets return codes (continued)

Return code (Hexadecimal)	Explanation
0473	No message of the required type
0474	Trying to read unreadable message
0475	Identifier removed
0476	Machine is not on the network
0477	Object is remote
0478	The link has been severed
0479	Advertise error
047A	srmount error
047B	Communication error on send
047C	Protocol error
047D	Protocol error
047E	Cross mount point
047F	Remote address change
0480	The asynchronous I/O request has been canceled
0481	Socket send/receive gotten out of order
0482	Unattached streams error
0483	Streams push object error
0484	Streams closed error
0485	Streams link error
0486	Tcp error
Other	See the <i>OS/390 UNIX System Services Messages and Codes</i> manual

## APPC/MVS return codes

The tables in this section document the following return codes:

- APPC return codes
- APPC allocate services return codes
- APPC reason codes

See the *Writing Transaction Programs for APPC/MVS* and *Writing Servers for APPC/MVS* documentation for more information.

## APPC return codes

This table documents the return codes that can be returned from APPC/MVS in messages from the distributed queuing component if you are using APPC/MVS as your communications protocol. These return codes can be returned to the local program in response to a call.

Table 376. APPC return codes and their meanings

Return code (Hexadecimal)	Explanation
00	The call issued by the local program ran successfully. If the call specified a Notify_type of ECB, the call processing is performed asynchronously, and the ECB is posted when the processing is complete.
01	The caller specified an allocate_type that was other than <i>immediate</i> . Either APPC/MVS can not establish a session with the partner LU, or VTAM can not establish the conversation. In this case (when allocate_type is <i>immediate</i> ), APPC/MVS converts this return code to "unsuccessful".
02	The conversation cannot be allocated on a session because of a condition that might be temporary. The program can try again the allocation request. The system returns this code when the allocate_type specified on a CMALLOC verb is other than <i>immediate</i> .
03	The partner LU rejected the allocation request because the local program issued an Allocate call with the Conversation_type parameter set to either Basic_conversation or Mapped_conversation, and the partner program does not support the mapped or basic conversation protocol boundary. This return code is returned on a call made after the Allocate.
05	The partner LU rejected an ATBALLC or ATBALC2 (allocate) request because the partner program has one or more initialization parameter (PIP) variables defined. APPC/MVS does not support these parameters. This return code is returned on a call made after the Allocate. It is not returned for allocate requests made using CPI Communications.
06	The partner LU rejected the allocation request because the access security information is not valid. This return code is returned on a call subsequent to the Allocate.
08	The partner LU rejected the allocation request because the local program specified a synchronization level (with the Sync_level parameter) that the partner program does not support. This return code is returned on a call subsequent to the Allocate.
09	The partner LU rejected the allocation request because the local program specified a partner program that the partner LU does not recognize. This return code is returned on a call subsequent to the Allocate.
0A	The partner LU rejected the allocation request because the local program specified a partner program that the partner LU recognizes but cannot start. The condition is not temporary, and the program should not try again the allocation request. This return code is returned on a call subsequent to the Allocate.
0B	The partner LU rejected the allocation request because the local program specified a partner program that the partner LU recognizes but currently cannot start. The condition might be temporary, and the program can try again the allocation request. This return code is returned on a call subsequent to the Allocate.
11	The partner program issued a Deallocate call with a Deallocate_type of Deallocate_abend, or the partner LU has done so because of a partner program abnormal ending condition. If the partner program was in receive state when the call was issued, information sent by the local program and not yet received by the partner program is purged. This return code is reported to the local program on a call the program issues in Send or Receive state.
12	The partner program issued a Deallocate call on a basic or mapped conversation with a Deallocate_type of Deallocate_sync_level or Deallocate_flush. This return code is reported to the local program on a call the program issues in Receive state.

Table 376. APPC return codes and their meanings (continued)

Return code (Hexadecimal)	Explanation
13	<p>The local program issued a call specifying an argument that was not valid. Specific reasons for the return code apply to the following callable services:</p> <p><b>ATBALC2 or ATBALLC (LU 6.2 Allocate)</b></p> <ul style="list-style-type: none"> <li>• The TP name was not 1 - 64 characters long</li> <li>• Either the SYMDEST name or the TP name length were not specified</li> <li>• SNASVCMG is specified as mode name</li> <li>• X'06' is used as the first character of a TP name</li> <li>• An SNA service TP name is used with a mapped conversation verb</li> <li>• The partner LU name was not valid</li> <li>• The mode name was not valid</li> <li>• The local LU name specified is either undefined or not permitted</li> </ul> <p><b>CMALLC (CPI-C Allocate)</b></p> <ul style="list-style-type: none"> <li>• SNASVCMG is specified as mode name</li> <li>• X'06' is used as the first character of a TP name</li> <li>• An SNA service TP name is used with a mapped conversation verb</li> <li>• The mode name was not valid</li> </ul>
14	<p>A product-specific error has been detected. The system writes symptom records that describe the error to SYS1.LOGREC.</p>
15	<p>Indicates one of the following:</p> <ul style="list-style-type: none"> <li>• The partner program made a Send_error call on a mapped conversation and the conversation for the partner program was in Send state. No truncation occurs at the mapped conversation protocol boundary. This return code is reported to the local program on a Receive call before receiving any data records or after receiving one or more data records.</li> <li>• The partner program made a Send_error call specifying the Type parameter with a value of PROG, the conversation for the partner program was in Send state, and the call did not truncate a logical record. No truncation occurs at the basic conversation protocol boundary when a program performs a Send_error before sending any logical records, or after sending a complete logical record. This return code is reported to the local program on a Receive call before receiving any logical records or after receiving one or more complete logical records.</li> </ul>
16	<p>The partner program made a Send_error call on a mapped conversation, or made a Send_error call on a basic conversation specifying the Type parameter with a value of PROG, and the conversation for the partner program was in Receive or Confirm state. The call might have caused information to be purged. Purging occurs when a program issued Send_error in receive state before receiving all the information sent by its partner program. No purging occurs when a program issues the call in Confirm state or in Receive state after receiving all the information sent by its partner program. The return code is normally reported to the local program on a call it issues before sending any information, depending on the call and when it is made.</p>
17	<p>The partner program made a Send_error call specifying the Type parameter with a value of PROG, the conversation for the partner program was in Send state, and the call truncated a logical record. Truncation occurs at the basic conversation protocol boundary when a program begins sending a logical record and then makes a Send_error call before sending the complete logical record. This return code is reported to the local program on a Receive call it issues after receiving the truncated logical record.</p>

Table 376. APPC return codes and their meanings (continued)

Return code (Hexadecimal)	Explanation
18	<p>The local program issued a call in which a programming error has been found in one or more parameters. Specific reasons for the return code apply to the following callable services:</p> <p><b>ATBALC2 or ATBALLC (LU 6.2 Allocate)</b></p> <ul style="list-style-type: none"> <li>• An unauthorized caller passed a nonzero TP_ID</li> <li>• For Sec_pgm-type security, both the user ID and password were not specified</li> <li>• For Sec_Pgm-type security, a user ID was specified with a blank password, or a password was specified with a blank user ID</li> <li>• The SYMDEST name was not found in the side information</li> <li>• The specified TP_ID is not associated with the address space</li> <li>• An unauthorized caller specified a Notify_Type of ECB</li> </ul> <p><b>ATBCFM (LU 6.2 Allocate)</b></p> <ul style="list-style-type: none"> <li>• An unauthorized caller specified a Notify_type of ECB</li> <li>• The Sync_Level field for the conversation was equal to sync_level_none</li> </ul> <p><b>ATBDEAL (LU 6.2 Allocate)</b></p> <ul style="list-style-type: none"> <li>• A Deallocate_type of deallocate_confirm was specified, and the Sync_Level field for the conversation was equal to sync_level_none</li> </ul> <p><b>ATBPTR (LU 6.2 Prepare to Receive)</b></p> <ul style="list-style-type: none"> <li>• A Prepare_To_Receive_Type of Prep_to_receive_sync_level was specified, and the Sync_Level field for the conversation was equal to sync_level_none</li> </ul> <p><b>ATBSEND (LU 6.2 Send)</b></p> <ul style="list-style-type: none"> <li>• The value in the 2 byte LL field was not valid</li> <li>• A Send_Type of Send_and_Confirm was specified, and the Sync_Level field for the conversation was equal to sync_level_none</li> </ul> <p><b>CMINIT (CPI-C Initialize Conversation)</b> The SYMDEST name was not found in the side information</p>
19	<p>The local program issued a call in a state that was not valid for that call. The program should not examine any other returned variables associated with the call as nothing is placed in the variables. The state of the conversation remains unchanged.</p> <p>If the error occurs in one of the following callable services, the conversation was in send state and the program started, but the program did not finish sending a logical record:</p> <ul style="list-style-type: none"> <li>• ATBCFM (LU 6.2 Allocate)</li> <li>• ATBDEAL (LU 6.2 Allocate)</li> <li>• ATBPTR (LU 6.2 Allocate)</li> <li>• ATBRCVW and ATBRCVI (LU 6.2 Receive and Wait and Receive Immediate)</li> <li>• ATBSEND (LU 6.2 Send)</li> </ul>
1A	<p>A failure occurred that caused the conversation to be prematurely terminated. The condition is not temporary, and the program should not try the transaction again until the condition is corrected.</p>
1B	<p>A failure occurred that caused the conversation to be prematurely terminated. The condition might be temporary, and the program can try the transaction again.</p>

Table 376. APPC return codes and their meanings (continued)

Return code (Hexadecimal)	Explanation
1C	The call issued by the local program did not run successfully. This return code is returned on the unsuccessful call.  If this code is returned by the ATBRCVI (LU 6.2 Receive_Immediate) callable service, there is no data to be returned.
1E	The partner program issued a Deallocate call with a Deallocate_type of Deallocate_abend_SVC. If the partner program was in Receive state when the call was issued, information sent by the local program and not yet received by the partner program is purged. This return code is reported to the local program on a call the program issues in Send or Receive state.
1F	The partner program issued a Deallocate call with a Deallocate_type of Deallocate_abend_timer. If the partner program was in Receive state when the call was issued, information sent by the local program and not yet received by the partner program is purged. This return code is reported to the local program on a call the program issues in Send or Receive state.
20	The partner program issued a Send_error call specifying a Type parameter of SVC, the conversation for the partner program was in Send state, and the call did not truncate a logical record. This return code is returned on a Receive call. It is not returned for Send_error requests using CPI Communications.
21	The partner program issued a Send_error call specifying a Type parameter of SVC, the conversation for the partner program was in Receive, Confirm, or Sync_Point state, and the call might have caused information to be purged. This return code is normally returned to the local program on a call that the local program issues after sending some information to the partner program. However the return code can be returned on a call that the local program issues before sending any information, depending on when the call is issued.  This code is not returned for Send_error requests using CPI Communications.
22	The partner program issued a Send_error call specifying a Type parameter of SVC, the conversation for the partner program was in Send state, and the call truncated a logical record. Truncation occurs when a program begins sending a logical record and then issues Send_error before sending the complete record. This return code is returned to the local program on a Receive call that the local program issues after receiving the truncated logical record.  The code is not returned for Send_error requests using CPI Communications.
40	APPC/MVS is not currently active. Call the service again after APPC is available.
Other	See the <i>Writing Transaction Programs for APPC/MVS</i> and <i>Writing Servers for APPC/MVS</i> manuals.

### APPC allocate services return codes

This table documents the return codes that can be returned from APPC/MVS allocate queue services in messages from the distributed queuing component if you are using APPC/MVS as your communications protocol.

Table 377. APPC allocate services return codes and their meanings

Return code (Hex)	Explanation
0	The service completed as requested.
4	The service completed, but possibly not as expected. See the reason code parameter for a description of the warning condition.
8	A user-supplied parameter was found to be in error. For example, a parameter contains characters not in the required character set. See the reason code parameter to determine which parameter is in error.
10	The service was unsuccessful. The cause is most likely a parameter error other than a syntax error, or an environmental error. For example, a syntactically valid LU name was specified, but the LU is not defined to APPC/MVS. An example of an environmental error is that the caller called the service while holding locks. See the reason code parameter for the specific cause of the error, and to determine whether the error can be corrected and the service issued again.
20	APPC/MVS service failure. Record the return and reason code, and give them to your system programmer, who should contact the appropriate IBM support personnel.
40	APPC/MVS is not currently active. Call the service again after APPC is available.
Other	See the <i>Writing Transaction Programs for APPC/MVS</i> and <i>Writing Servers for APPC/MVS</i> manuals.

### APPC reason codes

This table documents the reason codes that can be returned from APPC/MVS allocate queue services in messages from the distributed queuing component if you are using APPC/MVS as your communications protocol.

**Note:** Some of the APPC return codes are not accompanied by a reason code; in these cases, the value in the reason code field can be ignored. See the documentation shown in “APPC/MVS return codes” on page 5012 for more information.

Table 378. APPC reason codes and their meanings

Return code (Hex)	Explanation
1	The address space issued a Register_For_Allocates call that duplicated a previous Register_For_Allocate call (that is, the values specified for TP name, local LU name, partner LU name, user ID, and profile all matched those specified on a previous call to the Register_For_Allocates service).
2	A TP name is required, but none was specified.
3	The specified TP name contains characters that are not valid
4	The specified TP name length is outside the allowable range.
5	A local LU name is required, but none was specified.
7	An asynchronous call failed because a specified parameter was found to be inaccessible.
8	The caller held one or more locks when calling the service.
0A	A transaction scheduler called the Register_For_Allocate service, which is not allowed
0B	The specified symbolic destination name can not be found in the side information data set.
0C	The specified local LU is undefined.
0D	The specified local LU is not receiving inbound allocate requests.
0E	The Register_For_Allocate service was called, but the caller is not authorized to serve the specified TP name on the specified local LU.

Table 378. APPC reason codes and their meanings (continued)

Return code (Hex)	Explanation
0F	The specified local LU is inaccessible to the caller.
10	The service failed because of an APPC failure.
11	The specified allocate queue token does not represent an allocate queue for which this address space is registered.
12	The specified notify type is not valid.
13	The specified timeout value is not valid.
14	The request was canceled while in progress. This might have been caused by a call to the Unregister_For_Allocates service, or the termination of the caller's address space.
15	A Receive_Allocate call completed, but no allocate request was available to be received.
1A	The specified event notification type is not valid.
1B	The specified event code is not supported or is not valid for this service.
1C	The netid retrieved from the side information data set does not match the local netid.
1D	The specified event code qualifier is not valid or supported.
1E	The Get_Event call completed, but no event element was available to be received.
1F	The call to the Get_Event service was interrupted because all event notification requests were canceled for this address space.
20	The call to the Get_Event service was rejected because a previous Get_Event call is currently outstanding.
21	The Get_Event call was rejected because no event notification is in effect for this address space.
22	The specified allocate queue keep time is outside the allowable range.
24	A call to the Unregister_For_Allocates service specified "unregister all" (that is, the allocate_queue_token was set to binary zeros), but this address space is not registered for any allocate queues.
25	The specified event get type is not valid.
26	The specified receive allocate type is not valid.
27	APPC/MVS cannot determine if the specified netid is valid.
29	The service failed because the supplied buffer was not large enough to contain the requested information.
Other	See the <i>Writing Transaction Programs for APPC/MVS</i> and <i>Writing Servers for APPC/MVS</i> manuals.

## Secure Sockets Layer (SSL) and Transport Layer Security (TLS) return codes for z/OS

IBM MQ for z/OS can use Secure Sockets Layer (SSL) with the various communication protocols. Use this topic to identify the error codes that can be returned by SSL.

Table 379 in this appendix documents the return codes, in decimal form, from the Secure Sockets Layer (SSL) that can be returned in messages from the distributed queuing component.

Table 380 on page 5021 in this appendix documents the return codes, in hexadecimal form, from the Secure Sockets Layer (SSL) function 'gsk\_fips\_state\_set' that can be returned in messages from the distributed queuing component.

If the return code is not listed, or if you want more information, see z/OS Cryptographic Services System SSL Programming - SSL Function Return Codes.

*Table 379. SSL return codes*

Return code (decimal)	Explanation
1	Handle is not valid.
3	An internal error has occurred.
4	Insufficient storage is available
5	Handle is in the incorrect state.
6	Key label is not found.
7	No certificates available.
8	Certificate validation error.
9	Cryptographic processing error.
10	ASN processing error.
11	LDAP processing error.
12	An unexpected error has occurred.
102	Error detected while reading key database or SAF key ring.
103	Incorrect key database record format.
106	Incorrect key database password.
109	No certificate authority certificates.
201	No key database password supplied.
202	Error detected while opening the key database.
203	Unable to generate temporary key pair
204	Key database password is expired.
302	Connection is active.
401	Certificate is expired or is not valid yet.
402	No SSL cipher specifications.
403	No certificate received from partner.
405	Certificate format is not supported.
406	Error while reading or writing data.
407	Key label does not exist.

Table 379. SSL return codes (continued)

Return code (decimal)	Explanation
408	Key database password is not correct.
410	SSL message format is incorrect.
411	Message authentication code is incorrect.
412	SSL protocol or certificate type is not supported.
413	Certificate signature is incorrect.
414	Certificate is not valid.
415	SSL protocol violation.
416	Permission denied.
417	Self-signed certificate cannot be validated.
420	Socket closed by remote partner.
421	SSL V2 cipher is not valid.
422	SSL V3 cipher is not valid.
427	LDAP is not available.
428	Key entry does not contain a private key.
429	SSL V2 header is not valid.
431	Certificate is revoked.
432	Session renegotiation is not allowed.
433	Key exceeds allowable export size.
434	Certificate key is not compatible with cipher suite.
435	certificate authority is unknown.
436	Certificate revocation list cannot be found.
437	Connection closed.
438	Internal error reported by remote partner.
439	Unknown alert received from remote partner.
440	Incorrect key usage.
442	Multiple certificates exist for label.
443	Multiple keys are marked as the default.
444	Error encountered generating random bytes.
445	Key database is not a FIPS mode database.
446	TLS extension mismatch has been encountered.
447	Required TLS extension has been rejected.
448	Requested server name is not recognized.
449	Unsupported fragment length was received.
450	TLS extension length field is not valid.
451	Elliptic Curve is not supported.
452	EC Parameters not supplied.
453	Signature not supplied.
454	Elliptic Curve parameters are not valid.
455	ICSF services are not available.

Table 379. SSL return codes (continued)

Return code (decimal)	Explanation
456	ICSF callable services returned a error.
457	ICSF PKCS#11 not operating in FIPS mode.
458	The SSL V3 expanded cipher is not valid.
459	Elliptic Curve is not supported in FIPS mode.
460	Required TLS Renegotiation Indication not received.
461	EC domain parameter format is not supported.
462	Elliptic Curve point format is not supported.
463	Cryptographic hardware does not support service or algorithmn.
464	Elliptic curve list is not valid.
466	Signature algorithm pairs list is not valid.
467	Signature algorithm not in signature algorithm pairs list.
468	Certificate key algorithm not in signature algorithm pairs list.
501	Buffer size is not valid.
502	Socket request would block.
503	Socket read request would block.
504	Socket write request would block.
505	Record overflow.
601	Protocol is not SSL V3, TLS V1.0, TLS V1.1, or TLS V1.2.
602	Function identifier is not valid.
603	Specified function enumeration is not valid.
604	Send sequence number is near maxumum value.
701	Attribute identifier is not valid.
702	Attribute length is not valid.
703	Enumeration is not valid.
704	Session identifier cache callback is not valid.
705	Numeric value is not valid.
706	Attribute parameter is not valid.
707	TLS extension type is not valid.
708	Supplied TLS extension data is not valid.

Table 380. SSL return codes from 'gsk\_fips\_state\_set'

Return code (hexadecimal)	Explanation
03353050	The enumeration value is not valid or it cannot be set due to the current state.
0335306B	The System SSL FIPS mode state cannot be changed to FIPS mode because it is currently not in FIPS mode.
0335306C	The request to execute in FIPS mode failed because the Cryptographic Services Security Level 3 FMID is not installed so that the required System SSL DLLs could not be loaded.
03353067	The power on known answer tests failed. FIPS mode cannot be set.

## Distributed queuing message codes

Distributed queuing is one of the components of IBM MQ for z/OS. Use this topic to interpret the message codes issued by the distributed queuing component.

Distributed queuing message codes are in the form *s 0009 nnn* (in hexadecimal). The error they identify is described in detail by error message CSQX *nnn*, although there are some exceptions. The following table shows the full correspondence. Distributed queuing message codes are used in some error messages, and in the event data for the MQRC\_CHANNEL\_STOPPED event. The event data also contains message inserts. The meanings of the inserts depend on the message code, and are shown in the following table, in the form in which they are given in the message explanation. Where no meaning is shown, the insert is not relevant to the message code, and the value set in the event message is unpredictable.

**Note:** *trptype* can be shown in various forms:

### Message insert

#### Event data

**TCP** TCP/IP

**LU62** LU 6.2, APPC, CPI-C

Message code ( <i>nnn</i> )	Message number	Integer insert 1	Integer insert 2	Character insert 1	Character insert 2	Character insert 3
001	CSQX501I			channel-name		
181	CSQX181E	response		exit-name		
182	CSQX182E	response		exit-name		
184	CSQX184E	address		exit-name		
189	CSQX189E	length		exit-name		
196	CSQX196E	data-length	agent-buffer length	exit-name		
197	CSQX197E	data-length	exit-buffer length	exit-name		
201	CSQX201E	return-code		conn-id	trptype	
202	CSQX202E	return-code		conn-id	trptype	
203	CSQX203E	return-code		conn-id	trptype	
204	CSQX204E	return-code		conn-id	trptype	
205	CSQX205E	return-code		conn-id	trptype	
206	CSQX206E	return-code		conn-id	trptype	
207	CSQX207E			conn-id	trptype	
208	CSQX208E	return-code		conn-id	trptype

644	CSQX644E			channel-name		
999	CSQX599E			channel-name		

### Queued Publish/Subscribe message codes

Queued Publish/Subscribe is a component of IBM MQ for z/OS. Use this topic to interpret the message codes issued by the queued Publish/Subscribe component.

Queued publish/subscribe message codes are in the form 5 *mmm* (in hexadecimal), and the error they identify is described in detail by error message CSQT *mmm*, although there are some exceptions. The following table shows the full correspondence. Queued publish/subscribe message codes are used in some error messages.

Message Code ( <i>mmm</i> )	Message Number	Description
800	No equivalent message	Unexpected error
87F	CSQX036E	Failed

### Messages from other products

Software products on the z/OS platform issue messages and each product uses a unique identifier. Use this topic to identify the different z/OS products using the unique identifier.

The following table shows the message prefixes for other products that you might receive while using IBM MQ for z/OS.

Table 381. Message prefixes

Prefix	Component	Procedure
AMQ	IBM MQ (not z/OS )	Consult Reason codes
ATB	APPC	Consult <i>MVS System Messages</i>
ATR	Resource recovery services	Consult <i>MVS System Messages</i>
CBC	C/C++	Consult <i>C/MVS User's Guide</i>
CEE	Language Environment	Consult <i>Language Environment for z/OS Debugging Guide and Runtime Messages</i>
CSQ	IBM MQ for z/OS	Consult this documentation
CSV	Contents supervision	Consult <i>MVS System Messages</i>
DFH	CICS	Consult <i>CICS Messages and Codes</i>
DFS	IMS	Consult <i>IMS Messages and Codes</i>
DSN	Db2	Consult <i>Db2 Messages and Codes</i>

Table 381. Message prefixes (continued)

Prefix	Component	Procedure
EDC	Language Environment	Consult <i>Language Environment for z/OS Debugging Guide and Runtime Messages</i>
EZA, EZB, EZY	TCP/IP	Consult <i>TCP/IP for MVS Messages and Codes</i>
IBM	Language Environment	Consult <i>Language Environment for z/OS Debugging Guide and Runtime Messages</i>
ICH	RACF	Consult <i>RACF Messages and Codes</i>
IDC	Access method services	Consult <i>MVS System Messages</i>
IEA	z/OS system services	Consult <i>MVS System Messages</i>
IEC	Data management services	Consult <i>MVS System Messages</i>
IEE,IEF	z/OS system services	Consult <i>MVS System Messages</i>
IKJ	TSO	Consult <i>MVS System Messages</i>
IST	VTAM	Consult <i>VTAM Messages and Codes</i>
IWM	z/OS workload management services	Consult <i>MVS System Messages</i>
IXC	Cross-system coupling facility (XCF)	Consult <i>MVS System Messages</i>
IXL	Cross-system extended services (XES)	Consult <i>MVS System Messages</i>

## MQJMS Messages

List of messages with message numbers beginning with MQJMS.

Table 382. MQJMS Messages.

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS0000	MQJMS_EXCEPTION_ILLEGAL_STATE	Method "{0}" has been invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.
MQJMS0002	MQJMS_EXCEPTION_INVALID_CLIENTID	IBM MQ classes for JMS attempted to set invalid connection's client id.
MQJMS0003	MQJMS_EXCEPTION_INVALID_DESTINATION	Destination not understood or no longer valid.
MQJMS0004	MQJMS_EXCEPTION_INVALID_SELECTOR	IBM MQ classes for JMS has given JMS Provider a message selector with invalid syntax.
MQJMS0005	MQJMS_EXCEPTION_MESSAGE_EOF	Unexpected end of stream has been reached when a StreamMessage or BytesMessage is being read.
MQJMS0006	MQJMS_EXCEPTION_MESSAGE_FORMAT	IBM MQ classes for JMS attempts to use a data type not supported by a message or attempts to read data in the wrong type.
MQJMS0007	MQJMS_EXCEPTION_MESSAGE_NOT_READABLE	IBM MQ classes for JMS attempts to read a write-only message.
MQJMS0008	MQJMS_EXCEPTION_MESSAGE_NOT_WRITABLE	IBM MQ classes for JMS attempts to write a read-only message.
MQJMS0009	MQJMS_EXCEPTION_RESOURCE_ALLOCATION	IBM MQ classes for JMS is unable to allocate the resources required for a method.

Table 382. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS0010	MQJMS_EXCEPTION_TRANSACTION_IN_PROGRESS	Operation invalid because a transaction is in progress.
MQJMS0011	MQJMS_EXCEPTION_TRANSACTION_ROLLED_BACK	Call to Session.commit resulted in a rollback of the current transaction.
MQJMS1000	MQJMS_EXCEPTION_MSG_CREATE_ERROR	Failed to create JMS message.
MQJMS1001	MQJMS_EXCEPTION_UNKNOWN_ACK_MODE	Unknown acknowledge mode "{0}".
MQJMS1004	MQJMS_EXCEPTION_CONNECTION_CLOSED	Connection closed.
MQJMS1005	MQJMS_EXCEPTION_BAD_STATE_TRANSITION	Unhandled state transition from "{0}" to "{1}".
MQJMS1006	MQJMS_EXCEPTION_BAD_VALUE	invalid value for "{0}": "{1}".
MQJMS1007	MQJMS_E_BAD_EXIT_CLASS	failed to create instance of exit class "{0}".
MQJMS1008	MQJMS_E_UNKNOWN_TRANSPORT	unknown value of transportType: "{0}".
MQJMS1009	MQJMS_E_NO_STR_CONSTRUCTOR	no constructor with string argument.
MQJMS1010	MQJMS_E_NOT_IMPLEMENTED	not implemented.
MQJMS1011	MQJMS_E_SECURITY_CREDS_INVALID	security credentials cannot be specified when using MQ bindings.
MQJMS1012	MQJMS_E_NO_MSG_LISTENER	no message listener.
MQJMS1013	MQJMS_E_SESSION_ASYNC	operation invalid whilst session is using asynchronous delivery.
MQJMS1014	MQJMS_E_IDENT_PRO_INVALID_OP	operation invalid for identified producer.
MQJMS1015	MQJMS_E_UNKNOWN_TARGET_CLIENT	unknown value of target client: "{0}".
MQJMS1016	MQJMS_E_INTERNAL_ERROR	an internal error has occurred. Please contact your system administrator. Detail: "{0}".
MQJMS1017	MQJMS_E_NON_LOCAL_RXQ	non-local MQ queue not valid for receiving or browsing.
MQJMS1018	MQJMS_E_NULL_CONNECTION	no valid connection available.
MQJMS1019	MQJMS_E_SESSION_NOT_TRANSACTED	invalid operation for non-transacted session.
MQJMS1020	MQJMS_E_SESSION_IS_TRANSACTED	invalid operation for transacted session.
MQJMS1021	MQJMS_E_RECOVER_BO_FAILED	recover failed: unacknowledged messages might not get redelivered.
MQJMS1022	MQJMS_E_REDIRECT_FAILED	failed to redirect message.
MQJMS1023	MQJMS_E_ROLLBACK_FAILED	rollback failed.
MQJMS1024	MQJMS_E_SESSION_CLOSED	session closed.
MQJMS1025	MQJMS_E_BROWSE_MSG_FAILED	failed to browse message.
MQJMS1026	MQJMS_E_EXCP_LSTNR_FAILED	ExceptionListener threw exception: "{0}".
MQJMS1027	MQJMS_E_BAD_DEST_STR	failed to reconstitute destination from "{0}".
MQJMS1028	MQJMS_EXCEPTION_NULL_ELEMENT_NAME	element name is null.
MQJMS1029	MQJMS_EXCEPTION_NULL_PROPERTY_NAME	property name is null.
MQJMS1030	MQJMS_EXCEPTION_BUFFER_TOO_SMALL	buffer supplied by application is too small.
MQJMS1031	MQJMS_EXCEPTION_UNEXPECTED_ERROR	an internal error has occurred. Please contact your system administrator.

Table 382. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS1032	MQJMS_E_CLOSE_FAILED	close() failed because of "{0}".
MQJMS1033	MQJMS_E_START_FAILED	start() failed because of "{0}".
MQJMS1034	MQJMS_E_MSG_LSTNR_FAILED	MessageListener threw: "{0}".
MQJMS1042	MQJMS_E_DELIVERY_MODE_INVALID	invalid Delivery Mode.
MQJMS1044	MQJMS_E_INVALID_HEX_STRING	String is not a valid hexadecimal number - "{0}".
MQJMS1045	MQJMS_E_S390_DOUBLE_TOO_BIG	Number outside of range for double precision S/390 Float "{0}".
MQJMS1046	MQJMS_E_BAD_CCSID	The character set "{0}" is not supported.
MQJMS1047	MQJMS_E_INVALID_MAP_MESSAGE	The map message has an incorrect format.
MQJMS1048	MQJMS_E_INVALID_STREAM_MESSAGE	The stream message has an incorrect format.
MQJMS1049	MQJMS_E_BYTE_TO_STRING	The IBM MQ classes for JMS attempted to convert a byte array to a String.
MQJMS1050	MQJMS_E_BAD_RFH2	The MQRFH2 header has an incorrect format.
MQJMS1051	MQJMS_MSG_CLASS	JMS Message class.
MQJMS1052	MQJMS_E_BAD_MSG_CLASS	Unrecognizable JMS Message class.
MQJMS1053	MQJMS_E_INVALID_SURROGATE	Invalid UTF-16 surrogate detected "{0}".
MQJMS1054	MQJMS_E_INVALID_ESCAPE	Invalid XML escape sequence detected "{0}".
MQJMS1055	MQJMS_E_BAD_TYPE	The property or element in the message has incompatible datatype "{0}".
MQJMS1056	MQJMS_E_UNSUPPORTED_TYPE	Unsupported property or element datatype "{0}".
MQJMS1057	MQJMS_E_NO_SESSION	Message has no session associated with it.
MQJMS1058	MQJMS_E_BAD_PROPERTY_NAME	Invalid message property name: "{0}".
MQJMS1059	MQJMS_E_NO_UTF8	Fatal error - UTF8 not supported.
MQJMS1060	MQJMS_E_SERIALISE_FAILED	Unable to serialize object.
MQJMS1061	MQJMS_E_DESERIALISE_FAILED	Unable to deserialize object.
MQJMS1062	MQJMS_EXCEPTION_HAPPENED	Exception occurred reading message body: "{0}".
MQJMS1063	MQJMS_CHARS_OMITTED	Another "{0}" character(s) omitted.
MQJMS1064	MQJMS_ENCODINGS	Integer encoding: "{0}"=Floating point encoding "{1}".
MQJMS1065	MQJMS_E_COULD_NOT_WRITE	Exception occurred writing message body.
MQJMS1066	MQJMS_E_BAD_ELEMENT_NAME	Invalid message element name: "{0}".
MQJMS1067	MQJMS_E_BAD_TIMEOUT	timeout invalid for MQ.
MQJMS1068	MQJMS_E_NO_XARESOURCE	failed to obtain XAResource.
MQJMS1069	MQJMS_E_NOT_ALLOWED_WITH_XA	Not allowed with XASession.
MQJMS1072	MQJMS_E_QMGR_NAME_INQUIRE_FAILED	Could not inquire upon Queue Manager name.
MQJMS1073	MQJMS_E_QUEUE_NOT_LOCAL_OR_ALIAS	Specified MQ Queue is neither a QLOCAL nor a QALIAS.
MQJMS1074	MQJMS_E_NULL_MESSAGE	Unable to process null message.
MQJMS1075	MQJMS_E_DLH_WRITE_FAILED	Error writing dead letter header.

Table 382. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS1076	MQJMS_E_DLH_READ_FAILED	Error reading dead letter header.
MQJMS1077	MQJMS_E_CONN_DEST_MISMATCH	Connection/destination mismatch.
MQJMS1078	MQJMS_E_INVALID_SESSION	Invalid Session object.
MQJMS1079	MQJMS_E_DLQ_FAILED	Unable to write message to dead letter queue.
MQJMS1080	MQJMS_E_NO_BORQ	No Backout-Requeue queue defined.
MQJMS1081	MQJMS_E_REQUEUE_FAILED	Message requeue failed.
MQJMS1082	MQJMS_E_DISCARD_FAILED	Failure while discarding message.
MQJMS1085	MQJMS_E_RFH_WRITE_FAILED	Error writing RFH.
MQJMS1086	MQJMS_E_RFH_READ_FAILED	Error reading RFH.
MQJMS1087	MQJMS_E_RFH_CONTENTS_ERROR	Unrecognizable or invalid RFH content.
MQJMS1088	MQJMS_E_CC_MIXED_DOMAIN	Mixed-domain consumers acting on the same input is forbidden.
MQJMS1089	MQJMS_E_READING_MSG	Exception occurred reading message body: "{0}".
MQJMS1091	MQJMS_E_UNIDENT_PROD_INVALID_OP	operation invalid for unidentified producer.
MQJMS1093	MQJMS_E_NULL_PARAMETER	A null parameter was passed to the constructor: "{0}".
MQJMS1094	MQJMS_E_INVALID_QUANTITY_HINT	Invalid quantityHint.
MQJMS1096	MQJMS_E_INVALID_MESSAGE_REFERENCE	Invalid MessageReference.
MQJMS1098	MQJMS_E_INVALID_MSG_REF_VERSION	Invalid MessageReference version.
MQJMS1099	MQJMS_E_INVALID_THREAD_VERSION	Invalid MQQueueAgentThread version.
MQJMS1102	MQJMS_E_MULTICAST_NOT_AVAILABLE	Multicast connection cannot be established.
MQJMS1103	MQJMS_E_MULTICAST_LOST_MESSAGES	Lost "{0}" messages in reliable multicast mode.
MQJMS1104	MQJMS_E_MULTICAST_HEARTBEAT_TIMEOUT	Multicast connection disconnected due to timeout.
MQJMS1105	MQJMS_E_MULTICAST_PORT_INVALID	Cannot connect with a specific local port for disthub multicast.
MQJMS1106	MQJMS_DIR_PGM_LIB_NOT_FOUND	Unable to load the native library required for PGM/IP.
MQJMS1110	MQJMS_E_11_NOTSUPPORTED	JMS1.1 Operation not supported by this type.
MQJMS1111	MQJMS_E_11_SERVICES_NOT_SETUP	JMS1.1 The required Queues/Publish Subscribe services are not set up.
MQJMS1112	MQJMS_E_11_INVALID_DOMAIN_SPECIFIC	JMS1.1 Invalid operation for domain specific object.
MQJMS1113	MQJMS_E_11_INVALID_CROSS_DOMAIN	JMS1.1 Invalid operation for cross domain object.
MQJMS2000	MQJMS_EXCEPTION_MQ_Q_CLOSE_FAILED	failed to close MQ queue.
MQJMS2001	MQJMS_EXCEPTION_MQ_NULL_Q	MQ Queue reference is null.
MQJMS2002	MQJMS_EXCEPTION_GET_MSG_FAILED	failed to get message from MQ queue.
MQJMS2003	MQJMS_EXCEPTION_QMDISC_FAILED	failed to disconnect queue manager.
MQJMS2004	MQJMS_EXCEPTION_MQ_NULL_QMGR	MQQueueManager reference is null.
MQJMS2005	MQJMS_EXCEPTION_QMGR_FAILED	failed to create MQQueueManager for "{0}".
MQJMS2006	MQJMS_EXCEPTION_SOME_PROBLEM	MQ problem: "{0}".

Table 382. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS2007	MQJMS_EXCEPTION_PUT_MSG_FAILED	failed to send message to MQ queue.
MQJMS2008	MQJMS_EXCEPTION_MQ_Q_OPEN_FAILED	failed to open MQ queue "{0}".
MQJMS2009	MQJMS_EXCEPTION_MQ_QM_COMMIT_FAILED	MQQueueManager.commit() failed.
MQJMS2010	MQJMS_EXCEPTION_MQ_UNKNOWN_DEFTYPE	unknown value for MQ queue definitionType: "{0}".
MQJMS2011	MQJMS_EXCEPTION_MQ_Q_INQUIRE_FAILED	failed to inquire MQ queue depth.
MQJMS2012	MQJMS_EXCEPTION_XACLOSE_FAILED	XACLOSE failed.
MQJMS2013	MQJMS_EXCEPTION_AUTHENTICATION_FAILED	invalid security authentication supplied for MQQueueManager.
MQJMS2014	MQJMS_EXCEPTION_XACLIENT_FAILED	Queue manager rejected XA client connection.
MQJMS3000	MQJMS_E_TMPQ_FAILED	failed to create a temporary queue from "{0}".
MQJMS3001	MQJMS_E_TMPQ_CLOSED	temporary queue already closed or deleted.
MQJMS3002	MQJMS_E_TMPQ_INUSE	temporary queue in use.
MQJMS3003	MQJMS_E_TMPQ_DEL_STATIC	cannot delete a static queue.
MQJMS3004	MQJMS_E_TMPQ_DEL_FAILED	failed to delete temporary queue.
MQJMS3005	MQJMS_PS_GENERAL_ERROR	Publish/Subscribe failed due to "{0}".
MQJMS3006	MQJMS_PS_TOPIC_NULL	Topic reference is null.
MQJMS3008	MQJMS_PS_COMMAND_MSG_BUILD	Failed to build command "{0}".
MQJMS3009	MQJMS_PS_COMMAND_MSG_FAILED	Failed to publish command to MQ queue.
MQJMS3010	MQJMS_PS_PUBLISH_MSG_BUILD	Failed to build publish message.
MQJMS3011	MQJMS_PS_PUBLISH_MSG_FAILED	Failed to publish message to MQ queue.
MQJMS3013	MQJMS_PS_STORE_ADMIN_ENTRY	Failed to store admin entry.
MQJMS3014	MQJMS_PS_SUB_Q_OPEN_FAILED	Failed to open subscriber queue "{0}".
MQJMS3017	MQJMS_PS_SUB_Q_DELETE_FAILED	Failed to delete subscriber queue "{0}".
MQJMS3018	MQJMS_PS_UNKNOWN_DS	Unknown durable subscription "{0}".
MQJMS3019	MQJMS_E_TMPT_DELETED	TemporaryTopic already deleted.
MQJMS3020	MQJMS_E_TMPT_OUTOFSCOPE	TemporaryTopic out of scope.
MQJMS3021	MQJMS_PS_INVALID_SUBQ_PREFIX	Invalid subscriber queue prefix: "{0}".
MQJMS3022	MQJMS_PS_SUBQ_REQUEUE	Durable re-subscribe must use same subscriber queue; specified:"{0}" original:"{1}".
MQJMS3023	MQJMS_PS_SUB_ACTIVE	Subscription has an active TopicSubscriber.
MQJMS3024	MQJMS_PS_NULL_CLIENTID	Illegal use of uninitialized client ID.
MQJMS3025	MQJMS_E_TMPT_IN_USE	TemporaryTopic in use.
MQJMS3026	MQJMS_ERR_QSENDER_CLOSED	QueueSender is closed.
MQJMS3028	MQJMS_PUBLISHER_CLOSED	TopicPublisher is closed.
MQJMS3031	MQJMS_CLIENTID_FIXED	Can't set clientID after connection has been used.
MQJMS3032	MQJMS_CLIENTID_NO_RESET	Resetting the clientID is not allowed.
MQJMS3033	MQJMS_QRECEIVER_CLOSED	QueueReceiver is closed.
MQJMS3034	MQJMS_SUBSCRIBER_CLOSED	TopicSubscriber is closed.

Table 382. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS3037	MQJMS_MESSAGEPRODUCER_CLOSED	Message Producer is closed.
MQJMS3038	MQJMS_MESSAGECONSUMER_CLOSED	Message Consumer is closed.
MQJMS3039	MQJMS_PS_NULL_NAME	Illegal use of null name.
MQJMS3040	MQJMS_E_BROKER_MESSAGE_CONTENT	Invalid broker control message content: "{0}".
MQJMS3041	MQJMS_E_ALREADY_SET	Field "{0}" already set.
MQJMS3042	MQJMS_E_UNREC_BROKER_MESSAGE	Unrecognizable message from Pub/Sub Broker.
MQJMS3043	MQJMS_E_CLEANUP_REP_BAD_LEVEL	Invalid Level for repeating Cleanup.
MQJMS3044	MQJMS_E_CLEANUP_NONE_REQUESTED	Cleanup level of NONE requested.
MQJMS3045	MQJMS_E_CLEANUP_Q_OPEN_1	Failed to open "{0}": maybe a FORCE or NONDUR level cleanup is running?
MQJMS3046	MQJMS_E_CLEANUP_Q_OPEN_2	Failed to open "{0}": maybe another JMS application is using Pub/Sub with this queue manager?
MQJMS3047	MQJMS_PS_SUBSTORE_NOT_SUPPORTED	Subscription Store type not supported by queue manager.
MQJMS3048	MQJMS_PS_INCORRECT_SUBSTORE	Incorrect Subscription Store type.
MQJMS3049	MQJMS_PS_WRONG_SUBSCRIPTION_TYPE	MQJMS_Messages.MQJMS_PS_WRONG_SUBSCRIPTION_TYPE = Incorrect Subscription type for this Subscription Store.
MQJMS3050	MQJMS_PS_SUBSCRIPTION_IN_USE	Subscription is already in use and cannot be updated.
MQJMS3051	MQJMS_PS_INVALID_SUB_NAME	Invalid Subscription name.
MQJMS4124	MQJMS_ADMIN_PROPVAL_NULL	Property value for "{0}" is null.
MQJMS4125	MQJMS_ADMIN_INV_PROP	Invalid property for a "{0}": "{1}".
MQJMS4131	MQJMS_ADMIN_OBJTYPE_MISMATCH	Expected and actual object types do not match.
MQJMS5053	MQJMS_UTIL_PS_NO_BROKER	*** No broker response. Please ensure that the broker is running. If you are using the IBM MQ broker check that your brokerVersion is set to V1 ***
MQJMS5087	MQJMS_UTIL_PS_INTERNALQ	Unexpected error "{1}" accessing internal queue "{0}".
MQJMS6040	MQJMS_DIR_IMB_BADSOCKNAME	Invalid socket family name: "{0}".
MQJMS6041	MQJMS_DIR_IMB_NOCLASS	An exception occurred while attempting to load socket factory class "{0}", exception: <"{1}">.
MQJMS6056	MQJMS_DIR_MIN_NOMORE	Cannot change parameter "{0}" since no more BaseConfig parameter changes are allowed.
MQJMS6057	MQJMS_DIR_MIN_BADSET	Cannot set parameter "{0}" to value "{1}".
MQJMS6058	MQJMS_DIR_MIN_BADGET	error occurred while getting BaseConfig parameter "{0}".
MQJMS6059	MQJMS_DIR_MIN_SECLDERR	An exception occurred while loading the minimal client security implementation.
MQJMS6060	MQJMS_DIR_MIN_UNXEXC	An unexpected exception in minimal client, "{0}".
MQJMS6061	MQJMS_DIR_MIN_BADTOP	A specified topic was malformed, "{0}".

Table 382. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS6062	MQJMS_DIR_MIN_EOF	EOF was encountered while receiving data in the minimal client.
MQJMS6063	MQJMS_DIR_MIN_BRKERR	The broker indicated an error on the minimal client connection.
MQJMS6064	MQJMS_DIR_MIN_BADMSG	Connector.send was called with an illegal message value.
MQJMS6065	MQJMS_DIR_MIN_BADFIELD	An illegal value was encountered for a field, "{0}".
MQJMS6066	MQJMS_DIR_MIN_INTERR	An unexpected internal error occurred in the minimal client.
MQJMS6067	MQJMS_DIR_MIN_NOTBYTES	A bytes message operation was requested on something that is not a bytes message.
MQJMS6068	MQJMS_DIR_MIN_NOTTEXT	A text message operation was requested on something that is not a text message.
MQJMS6069	MQJMS_DIR_MIN_NOTSTREAM	A stream message operation was requested on something that is not a stream message.
MQJMS6070	MQJMS_DIR_MIN_NOTMAP	A map message operation was requested on something that is not a map message.
MQJMS6071	MQJMS_DIR_MIN_BADBRKMSG	The broker sent an invalid message during authentication.
MQJMS6072	MQJMS_DIR_MIN_UNVPRO	The broker requested an unavailable protocol during authentication.
MQJMS6073	MQJMS_DIR_MIN_AUTHREJ	Minimal client connection rejected because of authentication failure.
MQJMS6074	MQJMS_DIR_MIN_NOQOP	No QOP available in the minimal client.
MQJMS6079	MQJMS_DIR_JMS_NOHDPPOOL	An exception occurred while attempting to load thread pooling support, "{0}".
MQJMS6081	MQJMS_DIR_JMS_FMTINT	An attempt was made to read from a Stream message before a previous read has completed.
MQJMS6083	MQJMS_DIR_JMS_THDEXC	An exception occurred while initializing a thread pool instance, "{0}".
MQJMS6085	MQJMS_DIR_JMS_NEXCLIS	No ExceptionListener has been set.
MQJMS6088	MQJMS_DIR_JMS_KILLMON	The client-side connection monitor is terminating.
MQJMS6090	MQJMS_DIR_JMS_LSTACT	Attempted to synchronously receive on a MessageConsumer for which a listener is active.
MQJMS6091	MQJMS_DIR_JMS_TCSTSTP	An IOException occurred when starting or stopping delivery on the connection, "{0}".
MQJMS6093	MQJMS_DIR_JMS_RUNKEXC	An exception occurred during synchronous receive, "{0}".
MQJMS6096	MQJMS_DIR_JMS_INVPRI	A JMSPriority level of "{0}" is outside the range specified in JMS.
MQJMS6097	MQJMS_DIR_JMS_BADID	The specified JMSMessageID, "{0}", is invalid.
MQJMS6105	MQJMS_DIR_JMS_NOMORE	No more client parameter changes allowed.
MQJMS6106	MQJMS_DIR_JMS_BADNUM	An exception occurred when initializing parameter "{0}", exception "{1}".

Table 382. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS6115	MQJMS_DIR_JMS_TCFLEERR	An exception occurred while creating the TopicConnection, "{0}".
MQJMS6116	MQJMS_DIR_JMS_CLOSED	This operation is not permitted on an entity that is closed.
MQJMS6117	MQJMS_DIR_JMS_BDTOPIimpl	The "{0}" implementation of Topic is not supported.
MQJMS6118	MQJMS_DIR_JMS_PBNOWLD	Topic "{0}" contains a wildcard which is invalid for publishing.
MQJMS6119	MQJMS_DIR_JMS_PBIOERR	An IOException occurred while publishing, "{0}".
MQJMS6120	MQJMS_DIR_JMS_TMPVIO	Attempted to use a temporary topic not created on the current connection.
MQJMS6121	MQJMS_DIR_JMS_TSIOERR	An IOException occurred while subscribing, "{0}".
MQJMS6232	MQJMS_DIR_JMS_TSBADMTc	While creating a TopicSubscriber, attempting to add the subscription to the matching engine resulted in the following exception: "{0}".
MQJMS6233	MQJMS_DIR_MTCH_UNKEXc	An unexpected exception was caught in the matching engine: "{0}".
MQJMS6234	MQJMS_DIR_MTCH_NULRM	An attempt was made to remove an object with topic "{0}" from an empty matching engine: "{1}".
MQJMS6235	MQJMS_DIR_MTCH_NULCH	An attempt was made to remove an object with topic "{0}" from the matching engine, but it did not have a cache entry: "{1}".
MQJMS6236	MQJMS_DIR_MTCH_BDTYP	An unknown check type of class "{0}" was encountered in a type-specific matcher.
MQJMS6237	MQJMS_DIR_MTCH_UNKNM	An attempt was made to access an unknown field named "{0}".
MQJMS6238	MQJMS_DIR_MTCH_BDMsG	In attempting to access a field of a message=the following exception occurred: "{0}".
MQJMS6239	MQJMS_DIR_MTCH_ECPREP	An EvalCache get or put operation occurred when the cache was not loaded.
MQJMS6240	MQJMS_DIR_MTCH_ECNMIN	An EvalCache get or put operation specified an invalid id.
MQJMS6241	MQJMS_DIR_MTCH_TOMNY	Too many content attributes were specified.
MQJMS6242	MQJMS_DIR_MTCH_DUPDET	A duplicate MatchTarget was detected in MatchSpace.
MQJMS6243	MQJMS_DIR_MTCH_NOTPK	An attempt was made to remove MatchTarget "{0}" from MatchSpace, but it has no key (topic).
MQJMS6244	MQJMS_DIR_MTCH_NOSUB	The MatchTarget "{1}" with key (topic) "{0}" could not be removed from MatchSpace because it could not be found.
MQJMS6245	MQJMS_DIR_MTCH_NLTOP	An attempt was made to add a MatchTarget to MatchSpace without a key (topic).
MQJMS6246	MQJMS_DIR_MTCH_BDWLD	An incorrect use of a the topic wildcard character "{0}" was detected.

Table 382. MQJMS Messages (continued).

List of message numbers, constants and explanatory text for messages beginning with MQJMS.

Message identifier	Message constant	Description
MQJMS6247	MQJMS_DIR_MTCH_BDSEP	The topic segment separator "{0}" appears in an incorrect position.
MQJMS6248	MQJMS_DIR_MTCH_CNTL	An error occurred while trying to load or invoke the subscription selector parser.
MQJMS6249	MQJMS_DIR_MTCH_PSTPER	The following exception occurred while parsing a subscription selector: "{0}".
MQJMS6250	MQJMS_DIR_MTCH_BDESC	The escape character was used to terminate the following pattern: "{0}".
MQJMS6251	MQJMS_DIR_MTCH_BDESCL	The escape character "{0}" passed to the pattern tool is longer than one character.
MQJMS6252	MQJMS_DIR_MTCH_UNXTYP	A message field was expected to contain a value of type "{0}" but contained one of type "{1}".
MQJMS6228	MQJMS_DIR_MIN_AUTHEXC	Minimal client authentication failed because exception "{0}".
MQJMS6229	MQJMS_DIR_MIN_QOPDIS	QOP required but disabled for this minimal client.
MQJMS6312	MQJMS_DIR_MIN_NOSUB	Non-authorized subscription to topic "{0}".
MQJMS6311	MQJMS_DIR_MIN_NOXASUP	Transport type 'DIRECT' within a transaction is not supported.
MQJMS6350	MQJMS_DIR_MIN_NOTOBJECT	An object message operation was requested on something that is not an object message.
MQJMS6351	MQJMS_DIR_MIN_TSBADSYN	An exception occurred when creating subscription to <"{0}","{1}>, "{2}".
MQJMS6401	MQJMS_DIR_MIN_PER_NOT_SUPPORTED	Persistent messages not supported for transport type 'DIRECT'.
MQJMS6402	MQJMS_DIR_MIN_TTL_NOT_SUPPORTED	Time to Live > 0 not supported for transport type 'DIRECT'.
MQJMS6403	MQJMS_DIR_MIN_EXP_NOT_SUPPORTED	Topic Expiry > 0 not supported for transport type 'DIRECT'.
MQJMS6404	MQJMS_DIR_MIN_ACK_NOT_SUPPORTED	Client Acknowledge not supported for transport type 'DIRECT'.

## Notices

This information was developed for products and services offered in the U.S.A.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing  
IBM Corporation  
North Castle Drive  
Armonk, NY 10504-1785  
U.S.A.

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

Intellectual Property Licensing  
Legal and Intellectual Property Law  
IBM Japan, Ltd.  
19-21, Nihonbashi-Hakozakicho, Chuo-ku  
Tokyo 103-8510, Japan

**The following paragraph does not apply to the United Kingdom or any other country where such provisions are inconsistent with local law:** INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM Web sites are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this IBM product and use of those Web sites is at your own risk.

IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

IBM Corporation  
Software Interoperability Coordinator, Department 49XA  
3605 Highway 52 N  
Rochester, MN 55901  
U.S.A.

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this information and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement, or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

All statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

#### COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs.

If you are viewing this information softcopy, the photographs and color illustrations may not appear.

## Programming interface information

Programming interface information, if provided, is intended to help you create application software for use with this program.

This book contains information on intended programming interfaces that allow the customer to write programs to obtain the services of WebSphere MQ.

However, this information may also contain diagnosis, modification, and tuning information. Diagnosis, modification and tuning information is provided to help you debug your application software.

**Important:** Do not use this diagnosis, modification, and tuning information as a programming interface because it is subject to change.

## **Sending your comments to IBM**

We appreciate your input on this publication. Feel free to comment on the clarity, accuracy, and completeness of the information or give us any other feedback that you might have.

Use one of the following methods to send us your comments:

- Send an email to [ibmkc@us.ibm.com](mailto:ibmkc@us.ibm.com)
- Use the form on the web here: [www.ibm.com/software/data/rcf/](http://www.ibm.com/software/data/rcf/)

When you send information to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate, without incurring any obligation to you.

Include the following information:

- Your name and address
- Your email address
- Your telephone or fax number
- The publication title and order number
- The topic and page number related to your comment
- The text of your comment

IBM or any other organizations will only use the personal information that you supply to contact you about the issues that you submit.

Thank you for your participation.
